THE PREMIER AS HE WOULD LIKE TO BE

Mr. Neville Chamberlain is frequently photographed when following his favourite recreation of angling, but rarely shown shooting. This picture of him changing guns was taken last season when he was the guest of Lord Swinton at Sole Gill Beck, near Masham, Yorkshire. In order to keep fit for his arduous work Mr. Chamberlain believes in taking as much open-air exercise as possible.

THE NATIONAL TRUST

BY the end of the present month the National Trust will, it is hoped, be in a position to carry out fully their plans in Dovedale and the Manifold Valley. The schemes to preserve the Devil's Punch Bowl at Hindhead and the Downs near Dunstable must also be brought to an almost immediate conclusion if these districts are to be saved at all. Less urgent only in point of time are the efforts to preserve Avebury and Eskdale, for which purpose the Trust has joined with the Council for the Preservation of Rural England and other bodies. It will be remembered with what alarm the intelligence was received some three years ago that Eskdale had been purchased by the Forestry Commission for planting purposes. Happily, this major disaster has been averted, but only if the Trust can compensate the Commission.

It is easy to reflect with complacence on the past and tangible achievements of the Trust, and to let the mind's eye wander in content over the expanses of Stonehenge, Queen Adelaide's Hill and Cissbury Ring. No one would deny that the first duty of the Trust is to acquire such areas and to preserve them for the nation. But there is an obvious danger that amid the dust and heat of raising adequate funds, the constant necessity of discovering what districts are threatened, and the excitement of the last minute effort to rescue beauty from the avid exploitation of commerce, the deeper purpose of the Trust may be forgotten. This surely is not only the actual preservation of lovely tracts of England, but the consequent arousing—one might, in view of increasing subscriptions, say maintenance—of the public interest in its most precious heritage. The measure of success which the Trust has achieved is not to be reckoned simply as an increasing list of properties set out in a report, however much justifiable satisfaction such an exhibition may afford. The true purpose of the Trust is to preserve districts in which an urban population shall willingly feed its soul.

Nor are signs wanting that the public is increasingly adopting this attitude. It would be interesting to discover how many people deliberately chose to spend their holidays this year near land owned by the Trust. The number cannot be inconsiderable if it can be assumed that people like to see the results of their own generosity. For, although the total income has never reached the figure attained in 1928, there has been a steady increase in the number of small but regular subscribers. So the Trust would seem to be fulfilling its purpose in the manner most beneficial to itself and to the public, for while the occasional large donation or legacy is to be welcomed on every ground it is in the knowledge of a certain and regular income that plans may be made most confidently for the future. The increasing number of subscribers shows, too, that the public is willing to shoulder the responsibility itself instead of leaving it to some generous and public-spirited person to save the situation at the last moment.

Various possibilities would come within the range of discussion of a more prosperous Trust. It has been suggested that there might be co-operation with the National Fitness Campaign and with the Holidays with Pay movement. Certainly there seems to be one result of the Trust's activities which was not necessarily foreseen. An extensive area in the Lake District, between Hawkshead and Loweswater, together with land at Langdale, is already owned. If the appeal to preserve Eskdale is successful there will be in the Lake District what is, to all intents and purposes, a National Park.

There must, however, be more general and vigorous support before plans such as these can be contemplated. Unhappily, the Trust is one of numerous bodies demanding support, and many people remain, in Lord Esher's words, "supinely and apathetically open to pressure from the loudest voice or the most skilful propaganda."

DAYS OF TRIAL

IT has always been the pleasant task of the *Field* to deal with the peaceful pursuits of life, and to fight against those influences which menace them; with all those things that make life worth living, the song of birds, the beauty of a garden, the pleasures of the countryside and open air which bring that physical and mental fitness which is the negation of regimentation. In these things lie the essence of our national character and the ability to face emergencies with calm; in fostering it the pages of the *Field*, we may hope, have brought relief from world excursions and alarms; from the scare headline of the "late edition." But while it has never been the practice of the *Field* to take sides in politics and issues outside its own particular sphere, this paper has never shirked duties which particularly devolve upon it. In time of national effort the *Field* has played its part; in time of peace it has never hesitated to remind those in authority of slackness in safeguarding our agriculture and our food supplies; it has exercised restraint in criticism of actions which differed from British conceptions of what is fitting when restraint seemed the wiser course. In writing this we hope that restraint will have served its purpose as the watchword of others during this fateful week!

PROTECTION AND A.R.P.

It may be of some interest to many readers of the *Field* to learn something of a new material called Durasteel. Durasteel is a comforting thought in these troublous hours, for it provides protection against bombs and against fire. Thermit has so far proved the bugbear of every form of protection. At a recent demonstration 2lb. of Thermit was set on fire on top of mild steel plate $\frac{3}{16}$in. thick, and melted its way through in seven or eight seconds, falling to the ground still burning. This same quantity of Thermit burnt itself out on a $\frac{3}{16}$in. panel of Durasteel and the underside of the panel never became too hot to touch. Durasteel is made by Durasteel Proofs, Ltd., of Greenford, Middlesex, and the name is in no way an exaggeration of the effects of a very wonderful invention. The protective effects, it should be added, extend far beyond the range of Thermit—and are such that they should be much more widely known than they are.

WELL DONE, SCOTLAND!

Last week Mr. J. H. Thom's Circe beat Mr. G. Nichols's Goose in races for the Seawanhaka Cup. It was indeed a triumph for Scotland and her representative to beat the Scandinavian Gold Cup winner on Long Island Sound, as many considered Goose to be the faster of the two six-metre yachts. But Mr. Thom is an experienced steersman to reckon with, as he showed after he had won the first and second races by margins of two minutes and half-a-minute respectively. It looked as though Goose was a certainty for the third race, when she had five minutes lead before the third leg, but Circe was not done with, and after reducing the lead slightly her owner picked up a land breeze while his opponent was becalmed on a tack to the finishing line and won by 29 seconds. The cup goes to Scotland for the third time since 1895.

KENNET'S TROUBLE

It is a sad sight nowadays to see Kennet in September. Gone is the rolling current of the spring, with its trailing luxuriance of waving weed and its fleets of hatching duns, flashing to life so suddenly upon its surface; rising, perhaps, to flutter a few yards towards the bank ere the inexorable current swept them seawards; and leviathan rolls up suddenly to engulf the luckless insect which has waited just too long upon its eddied surface. Instead, one finds a scum-infested millpond with scarce stream enough to hold a line afloat, the while a hare's ear or a variant may pass the lie of the chance riser which alone and at long intervals makes breach upon the surface. Men gloomily forebode the time when even Hungerford will join the barren miles of empty stream-bed which now lie only some few miles towards its source, and speak with bitterness of deeply-driven wells which rob the Berkshire chalk streams of their life. Is it not time that men of substance and of wisdom demanded an investigation into the truth about our underground supplies?

SLACK LINES

I sometimes believe in the malice of fate
  And that I am its butt and buffoon,
When I lose all my brown trout by striking too late
  And my salmon by striking too soon.

There *can* be no other good reason, I think,
  For the fact which I frequently note,
That my fly always floats when I want it to sink,
  And sinks when I want it to float.

The water is always too clear or too brown,
  And the wind always sells me a pup
By blowing upstream when I want to fish down
  And down when I want to fish up.

And when I'm alternately watching my flies
  And watching my foothold all day,
The fish look away when I want them to rise,
  And rise when I'm looking away.

But all my reverses their antidote breed
  In the hope which will never grow stale,
That if often I fail when my betters succeed,
  I may some day succeed when they fail.

COLIN ELLIS.

A COUNTRYMAN'S JOURNAL

I ALWAYS look forward to the village flower show and not merely because I compete in it myself. It is the last faint relic of the old village commonwealth. Therein individual ownership and communal undertakings were so perfectly balanced that their modern vicious clash seems a *lusus Naturæ*. There is no deep-set, natural quarrel between them, as the flower show clearly reveals, where the villagers combine in order amicably to compete.

It makes Malthus, Adam Smith and the rest of the economists look the simpletons they are, with their astonishing ignorance of human nature. The obsolete, competitive games of the countryside, before the descendants of such sports were professionalised, even the inter-village rivalries, all kept the co-operative spirit of the ancient village alive, and the fiction of that ogreish figure, the economic man, is exposed by the flower shows of the Trobriand and Nicobar Islanders. They train their flowers and vegetables for months beforehand in the race for supremacy, and when the judgment is passed and the prizes are awarded, share both stakes and rewards in a common feast of jubilation. The influence of the outside world is too strong for us to end our flower shows by making a gigantic pie of the contending vegetables and garlands of the opposing regiments of flowers to decorate a rustic altar or crown the heads of the village maidens in the evening dance. Even our perfunctory sideshows—bowling for the pig, skittles, darts and the like—are a pale remainder of what we lost when the Puritan victory of the seventeenth century fatally depressed the corporate spirit of the villages by discouraging or abolishing dancing, singing, bell-ringing, bowling, wakes, maypoles, Whitsun ales and church holidays. Gone, too, are the days when the squire put his waggon at the disposal of the competitors to take their produce to the show at the little market town and doubled the prize-money.

Yet the earth fails us never, if our rites and observances, our grace for her bounties, are now but a bookish record. In the great tent, pavilion rather, her horn of plenty is set out in state. Eager faces, my own among them, look out for that blue card of victory which is more even than the Tyrian dye of the rotund beetroots against blanched celery, russet carrots, creamy cauliflowers, the greenest of green peas, marrows striped like the fantastic fish of tropic seas and the polychrome blaze of the flowers. No arras nor stuffs of a king's chamber could rival the richness in varieties of form and colour of these earthy growths, nurtured on dung and dishwater. No art, labour nor device is grudged to perfect them: the beans picked, laid in a damp cloth and buried for many days in the soil to prevent them going "corny"; the onions plumped by secret, almost magical nostrums handed down from father to son; the marrows watched into shapeliness (now that the idea of mere grossness in the gourd is discredited) with the vigilance that the flockmaster devotes to his pedigree lambs; sweet peas fed, you may say, on dragon's blood and rosebuds mewed up in the oven. When I secured first prize for runner beans (and third for marrows), as I did this year, without having mixed the spittle of frogs with the juice in the stalks of toadstools beaten up with yeast and the whites of guinea-fowl eggs as their nourishment, I felt as proud as "Turnip" Townshend and Coke of Norfolk in all the glory of their fattened lands.

There were other "observables" (as old Fuller said) that were echoes of a richer but a foundered past, echoes like the church-bells of the East Anglian churches full fathoms five beneath the sea. The lace pillow of a child complete with parchment pattern, bobbins, trolleys, thread, brass pins and a piece of "Little Bud" traditional lace; a patchwork quilt; a bunch of wild flowers, bulrush, yarrow, campion, sorrel, hawkweed and St. John's wort, in the Children's Mixed Bouquet Competition. It is a withered world which regards these things as "a fable, song of fleeting shade," and outside the villages no longer even that. But, gladdened by the earthly treasures of that tent, I seemed to see the bones of that fable dance in its sepulchre and to hear the far-off elfin note of the song——

"There's not a budding Boy, or Girle, this day
But is got up and gone to bring in May.
A deale of Youth, ere this, is come
Back, and with White-thorn laden home.

* * *

Then while time serves, and we are but decaying,
Come, my Corinna, come, let's goe a-Maying."

H. J. MASSINGHAM.

WITHOUT COMMENT

From a description of a film star:

"He likes to spend his time out of doors riding, fishing, hunting. (Hunting in America, means chasing bear, mountain lion, skeet, wild boar and other beasts. On foot, too, with a rifle, but no red-coated huntsmen to keep the fox from springing at your throat.)"

THE LITTLE OWL ONCE AGAIN

Prejudice Against Aliens Dies Hard

ONCE more the little owl has fallen under suspicion. Last January his character was publicly cleared by the British Trust for Ornithology, which after two years of widespread and extensive study reported that his destruction of game, poultry and wild birds was negligible in quantity, and so far as wild birds were concerned was confined to starlings, house sparrows, blackbirds and throstles. The inquiry found that in the breeding season the quantity of wild birds killed might rise to as high as two or three a week for each pair of little owls, but that during the rest of the year it was very much less. The inquiry, in addition, acquitted the little owl of killing birds and mammals in order to attract carrion beetles to their corpses. And the report went further than that: they did admit—a very great admission for any ornithological inquiry—that the little owl did useful rather than harmful things: useful because of its liking for rats and mice, and for the huge number of cockchafers, daddy-long-legs, earwigs, and other insects, most of which are on the Ministry of Agriculture's lists of pests.

A few years ago, there can be no doubt—the report admits this—a good many birds which are easily caught on or close above the ground were destroyed; but this was excused on the grounds that at that time the species was multiplying very fast indeed and the conduct was, therefore, abnormal under circumstances just as abnormal. The report concluded by stating that the little owl should be exempted from persecution and allowed to live a free life.

But the little owl is an alien. It has been resident in this country for only half a century, and so in the eyes of science can be regarded as only recently naturalised. We have a prejudice in this country against alien introductions in the animal world, which prejudices we do not extend to human beings, harmful or otherwise. A prejudice against animals dies hard.

The inquiry of the British Trust for Ornithology should have cleared the little owl once and for all, but it has not. So soon as the report was published, correspondence flooded into this office from all over the country giving examples of the little owl's harmful nature. More recently Mr. Eric Hosking, who is as good an ornithologist as he is a photographer, undertook an independent investigation of his own and published the results in *The Times*. He, too, absolved the little owl. And instantly the little owl was accused again in the columns of that paper. Correspondents accused him of killing pheasants and ducklings and to eating nothing of them but the brains and others accused him of murdering little birds, not because he was hungry, but just for the love of killing them.

It really is an extraordinary position that competent, earnest and unbiased scientific workers, together with a large number of competent, earnest and unbiased field ornithologists, should combine to prove the little owl guiltless and that instantly he should be accused afresh by those whose interests he is thought to damage. One is tempted to ask whether the evidence which is furnished immediately the inquiry closes was forwarded to that inquiry for independent investigation; and if not, why not? Those whom one may take to be completely unbiased prove him guiltless; those whom it would be difficult to prove unbiased (though no one would suggest that they would deliberately cause the extermination of an animal in order to satisfy their own instincts) claim him guilty.

It is true that few big shooting landowners, no gamekeepers, and very few farmers regard the little owl with anything but enmity; on the other hand it is true that science knows how important it is to sift any evidence which may be placed upon it, and one cannot doubt that much evidence was placed before the inquiry conducted by the British Trust for Ornithology by landowners, farmers and gamekeepers.

I feel very sorry for the little owl, just as at times I feel very sorry for the squirrel and the musk rat. None asked to be brought to England: they were brought by man for man's use. And when it was found that they destroyed more than their enjoyment was worth, then man, who brought them, turns round and says that the balance of nature must be redressed. Of course, the real fault of the little owl, if this is so—and I am quite sure that this is really the case—is that he, like the squirrel, and the musk rat, provides no sport.

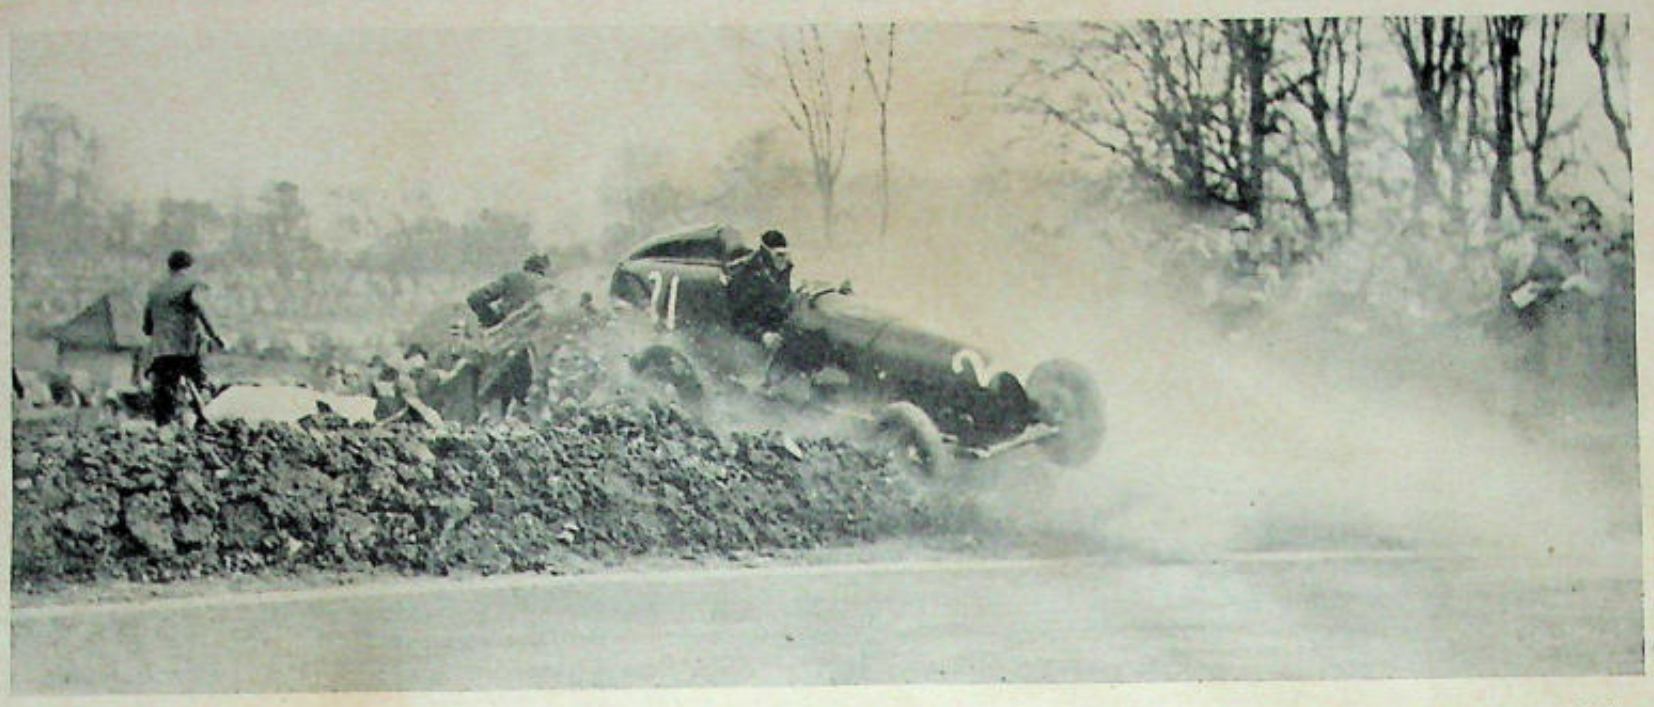
The fox does quite a lot of harm from time to time. The fox can wreak far more damage on a poultry run than any little owl. But the fox provides fun and the fox provides money, the fox is tied up with finance—and the fox is protected. And deer break fences and trample down crops and kill trees. But man must have his stag hunt—and deer are not threatened with extermination. But the little owl can put forward no such plea for protection, and so his life is asked of him by those who would shoot more duck and pheasant and by those whose business is to rear those birds for shooting. But that is a very narrow way of looking at the question.

There is no possible doubt about the number of rats and mice and daddy-long-legs and earwigs and cockchafers and other insects of that account that the little owl kills. *There is no possible doubt about it.* We know that rats and mice are harmful; we know that many of the insects of which the little owl takes great numbers are harmful. They are harmful to the community as a whole. Duck and pheasant, and the rearing and shooting of duck and pheasant, are beneficial to but a small proportion of the community. Furthermore, if one refuses to believe the results of the various inquiries that have been made, it means that one refuses to believe that the little owl is guiltless; then equally one must submit that one cannot take it as proved that the little owl is harmful to any great extent to ducklings and pheasant chicks.

Which is the greater evil? That is the whole question, and, like so many very simple questions, it is one that rouses much argument around it and about, and one that no man whose interests are affected will think clearly about. We have had sufficient evidence of that recently; we shall have more. But the question—it is utterly ridiculous to call it a problem—remains unaffected.

There can be, I submit, no shadow of doubt that the little owl is useful rather than harmful. If he takes a pheasant chick or two or a wild duckling or two, count those against his rats and mice and insects. And let him live a free life in what, we maintain, is a free country.

BRIAN VESEY-FITZGERALD.



"THE IMPORTANCE OF KEEPING THE CAR INTACT, QUITE APART FROM THE VALUE OF THE RACE ITSELF, IS OBVIOUS WHEN IT IS REALISED THAT A RACING CAR COSTS ABOUT £5,000"

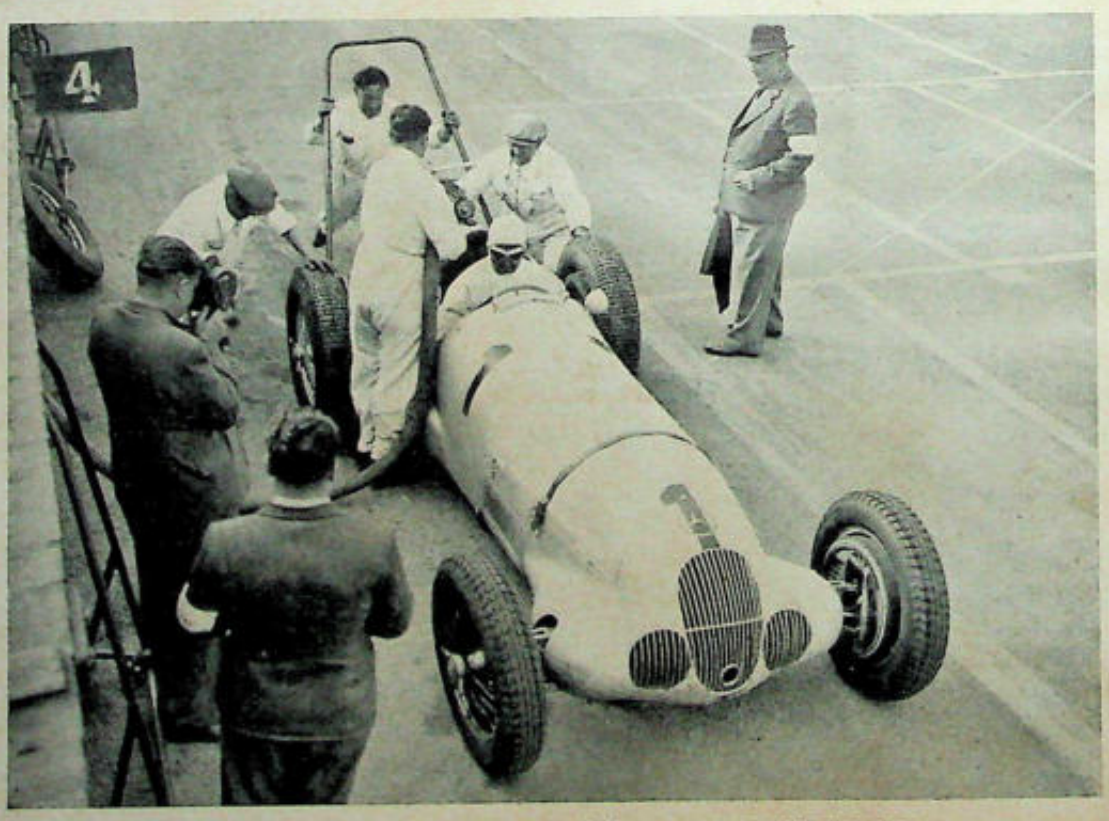
WHAT DOES MOTOR RACING MEAN?

Practice and Experience the Essentials of Success

WELL do I remember returning from the hill-climb at Shelsley Walsh in 1937, for, quite apart from a most enjoyable afternoon's entertainment, the day was notable, so far as I was concerned, for an enforced stop of about two hours on a steep hill not far from Broadway in a position somewhat similar to that of the Grand Old Duke of York who, "when he was only half-way up, was neither up nor down." This irksome state of affairs, due to mutiny on the part of the petrol pump, had its amusing moments, for many of those who had earlier been spectators at Shelsley were returning home by the same route.

Now this hill needs reasonable care when being negotiated in either direction, since it possesses, in addition to its gradient, a blind corner about two-thirds of the way up. It was just below this corner that I found myself perforced to stop, and from here I was treated at intervals to some extraordinary exhibitions by returning racegoers, who were trying their best to emulate the brilliance of the drivers they had been watching.

One car, in particular, I remember. It was a magnificent grey sports model, worthy of a far finer driver than the young gentleman who was at the wheel. It approached the corner at a ridiculous speed, braked suddenly amid a shower of loose road surface, skidded wildly on the right-hand side of the road, and then, by the goodness of Providence, got away again to disappear from view, leaving behind a cloud of dust, a strong smell of Castrol, half-a-dozen or so somewhat scared spectators, and the tumultuous, rather unmaidenly squealings of the two fair occupants of the back seat ringing in the air.



RUDOLPH CARACCIOLA IN HIS MERCÈDÈS AT THE DONINGTON PITS

This photo was taken at the 250-mile International Grand Prix Race last October, when the Germans took the first five places. Caracciola was third

I am certain that the tale of the magnificent ascent was noised abroad in the young gentleman's club, but I am even more certain that the dear lady who appeared about a minute later in the reverse direction, grinding down in bottom gear, had she known what would have been met if she had driven a shade faster, would never have travelled in a car again.

Quite apart from the danger in an effort such as this, it was so far removed from the correct method of cornering as to leave me with a feeling of pity for a driver who could learn so little of what to do in a whole afternoon.

Hill-climbing, like all forms of motor racing, needs tremendous skill coupled with long practice and experience. It is seldom the driver who slithers all over the track at his corners who puts up a winning time.

The course at Shelsley, the only hill-climb in England, deserves a description for those who do not know it. It starts on a fair gradient at the bottom, and, after a slight bend, curves left and right before straightening for a moment prior to the left-hand turn of an S bend situated on a steep gradient. Thirty or forty yards and then comes the right swerve of the S; after that the car roars up the straight to the finish, 1,000yds. from the start.

The road is typically English with high grass banks on one side, upon which the spectators sit, while on the other, the road falls away rapidly to the left. If there does happen to be trouble, it usually results in the car running into the banked side, but should the driver be so unfortunate as to go off to the left, there are plenty of bushes and trees to check his descent.

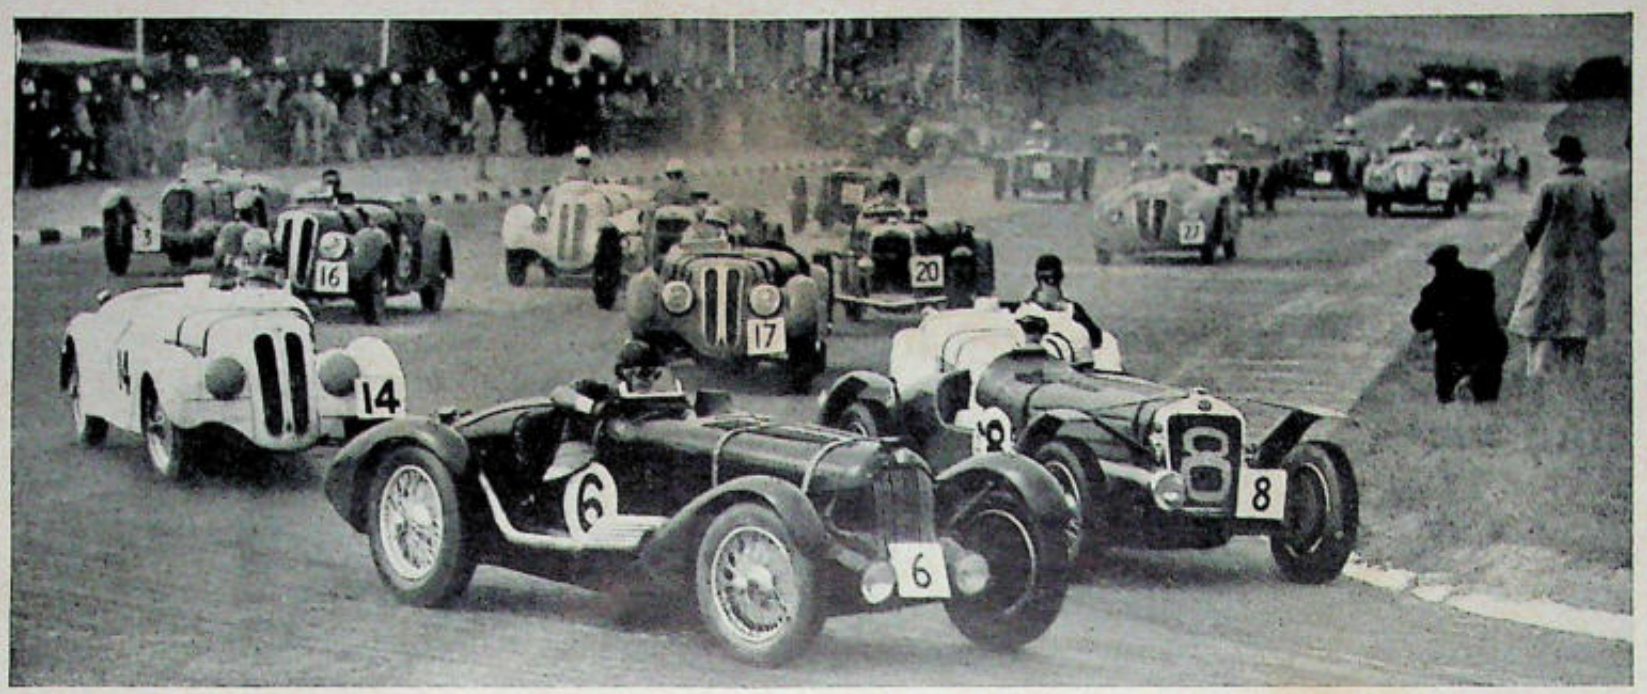
Raymond Mays, the winner of this year's race, covering the distance in 37.86sec., always provides a very fine example of how the climb should be done. A fifth of a second establishes a new record, but a fifth of a second is a great deal over 1,000yds. of curves and corners, and to knock off very nearly a second, as did Mays, when the record already stood at a remarkably low figure, is a fine achievement.

The car is chocked up at the back so that it is not necessary to use the brake to hold her, and then, without a lot of wheel spin if all is well, away she goes in bottom gear. A change to third for the two curves, a full-throttled dash to the S bend, and then the excitement begins. The surface is bumpy and the speed at this point may be about 90 m.p.h. On go the brakes, a quick change, and without much tail-wag if it is a good climb, the car opens out for the 30yds. or so prior to the second bend. Perhaps there is a deliberate skidding of the back wheels here as engine power is used to kick her tail round; and then away for all she's worth to the finish.

Tremendous concentration is essential for Shelsley, and a man who can do a fast time here is fairly certain to show a good performance in other forms of racing.

Shelsley Walsh is less than half-a-mile long, and therefore the slightest lapse gives victory to another. On the Continent there are other famous climbs, but all very much longer. One of the most famous runs, over the Stelvio Pass, lying between Milan and Innsbruck, is nearly nine miles long, and it has, quite apart from bends, about 50 hairpins. Perhaps the best-known climb in the world is on Swiss territory, over the Klausen Pass with 130 hairpins and other corners concentrated in thirteen miles. This is by no means the record number, however, for the German climb at Freiburg, in 7.5 miles, produces 167 corners, and the record speed for the run stands, I believe, at round about 55 m.p.h.

What is true of hill climbing is the truth also of



COMPETITORS IN THE RECENT INTERNATIONAL TOURIST TROPHY RACE AT DONINGTON PARK ROUNDING THE FIRST BEND AFTER THE START OF THE RACE. LOUIS GERARD WON IN HIS DELAGE (8) AT AN AVERAGE SPEED OF 67.61 M.P.H.

the road race, only here is added a need for an even higher standard of physical fitness. The professional driver begins the race several days before the arrival of the spectator, especially if he has never before seen the course, for he then has to accustom himself to the lie of the track. This he may do in several ways. Some drivers walk round on foot, some use a bicycle, and some a slow car. Often all three come into play, for a Grand Prix course is usually something like seven miles long, and to walk round it five or six times is no joke. Perhaps the driver will use a car for about three laps, and then walk another two, followed by a couple more on a push-bike, stopping at the corners and at any other difficult places to think out how best to take his car through them at speed.

When all this is done he is by no means finished, for his car will have arrived, all tuned up as far as possible, but whereas the ordinary individual is quite without knowledge of the finer points of carburation and gear ratios, the racing man knows these things to be of the greatest importance. Whereas the car may have been in perfect trim when tuned on one of the French *routes nationales*, if it is to race on the Nurburg Ring, the biggest motor course in the world, it would almost certainly need adjustment on the spot. Gear ratios may not be perfect for coping with the gradients, and height may have affected the carburation sufficiently to rob the car of maximum power. Carburettor settings have to be adjusted, too, for a very hot or very cold day, while the wet may change everything once again.

After all this has been done and the car is on the top of its form, it will probably be put away until the great day, and a spare car used during the last three days for high-speed practice. This usually takes place very early in the morning, for normal traffic must not be dislocated during the busy hours, and equally certainly practice cannot be done with the possibility of meeting a farm cart round the next corner.

During these three days it is possible that a driver may stand on a bend and watch his rivals go through their corners, and thus learn something of how a split second may be gained by clever placing, braking and acceleration. The knowledge is important, for in a race such as a Grand Prix, where the average speed will be somewhere in the region of 90 m.p.h., a fifth of a second gained on every corner means about 45yds. in one complete circuit if there are five corners to be negotiated.

It is quite extraordinary to see an expert cornering, for on every lap his wheels seem to hug the same portion of the track to the very inch. Dick Seaman, probably the greatest English driver of the present day, is a notable example, while Pat Fairfield, unfortunately killed quite recently, was another excellent exponent of the art.

The importance of keeping the car intact, quite apart from the value of the race itself, is obvious when it is realised that a racing car costs about £5,000, and even a large concern, let alone an independent owner, cannot afford to lose such a sum.

In the early days it was usual for nation to drive against nation, but now this is changed so far as the participants are concerned, although the spectators very often pin their preference on a driver of the same nationality as their own. *Marque* racing against *marque* is the modern idea, and it is considered in no way unpatriotic, for instance, if a British driver races for a German team.

It is hardly possible to say much about the work of the pits here, but, none the less, it may well be here that a race is won or lost, for if it is worth while saving a fifth of a second on a corner, it is infinitely more worth while saving five seconds during a stop. Petrol and oil is no longer delivered from the original tins as in the old days, but is usually turned out into five-gallon churns and emptied from there into the tank via a large funnel, although pressure pumps are sometimes used.

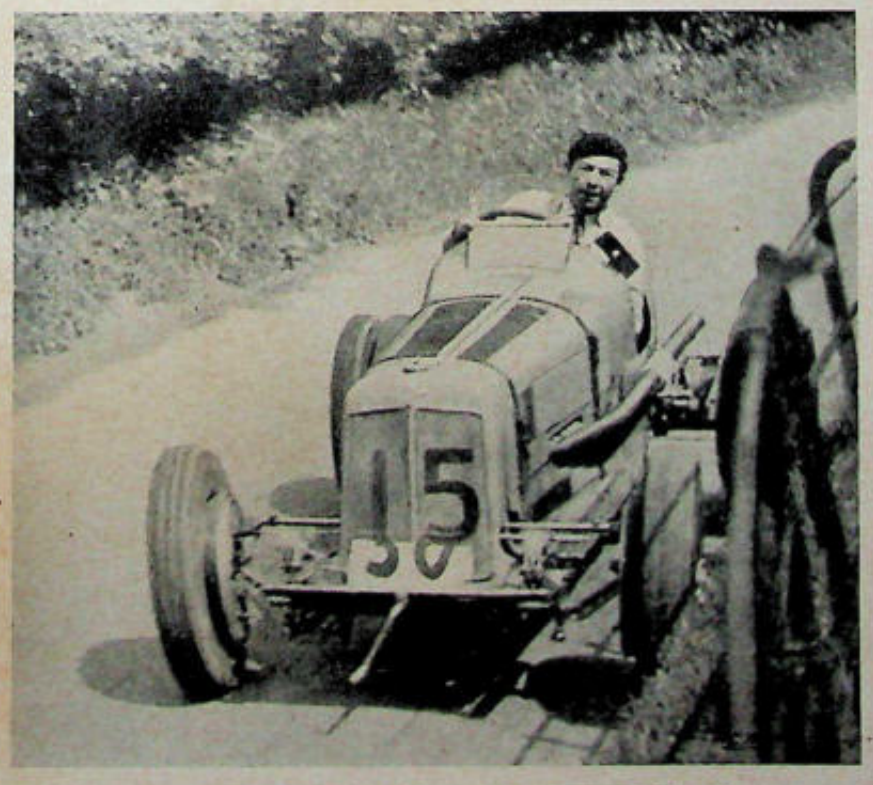
The axle is raised from the ground in one movement by a jack with a handle long enough to obtain the necessary leverage, thus the hub caps can be knocked off, and wheels removed in an incredibly short space of time. When the German teams of Mercédès and Auto-Unions came over to Donington last year they returned wonderfully low figures for pit work, changing both rear tyres and refuelling in under 30 seconds, while at Muller's pit (Auto-Union) the perfectly incredible time of 26½ seconds was recorded.

And what is the use of all this racing? Does it achieve anything other than the provision of a few hours of thrills for the onlooker? The answer is sure beyond question, for what racing discovers to-day, is found in the private saloon of to-morrow. A very large percentage of motor car development was born on the track.

L. N. RADCLIFFE.

ABOUT TO MAKE A FOUR-POINT LANDING

A Bugatti leaving the ground as the result of taking a hump-backed bridge at high speed. No wonder motor racing demands a high standard of physical fitness



RAYMOND MAYS CLIMBING SHELSLEY WALSH IN 1935

Mays put up a record of 39.6sec. for the hill in that year, a record since lowered to 37.86sec. by the same driver in 1938

THE OCTOBER MEETINGS

"A Playful Double on Michoumy and Snake Lightning"

AT the time that these notes are being written no one seems to know what is going to happen, and owners and breeders have arrived at Newmarket for the First October Meeting and the annual sales talking more of international politics than racing or breeding. At the same time there seems the probability of much good bidding, as there was at the Doncaster Sales, when there was also a crisis.

There was a lot of good racing last week at Gatwick and more especially at Newbury, but a few notes on the Edinburgh meeting at the beginning of the week may not be out of place. It could not be claimed that the Musselburgh course is of any quality. It is, indeed, a very bad racecourse, and may soon cease to exist, a new course being projected now on the other side of Edinburgh, near to Lord Rosebery's place, Dalmeny. The present stands are old and inadequate, but there is yet a charm about the place, and there could be no kinder host at a meeting than Lord Rosebery, who always takes a great interest in these Edinburgh meetings.

A year ago he won the Edinburgh with Edgehill, and after the race, the very same afternoon, sold the horse to Mr. A. Redmond, who later went shares with another leading brewer, Mr. Hamer, and the two of them sent the horse to be trained by Carr at Bolton, where Mr. Hamer's brewery is. It will be recalled that Edgehill was well backed by his new owners to win last year's Cambridgeshire, but failed to do so, although he ran well. For the second year Edgehill won the Edinburgh Gold Cup, and once more his owners have backed him to win the Cambridgeshire and have doubled him with their own horse Sir Calidore who, however, ran most disappointingly later in the Scottish fortnight, when he was only third at Lanark in the race won by Lord Rosebery's Aprodisia, who incidentally, had not been placed behind Edgehill at Edinburgh, being then ridden by Finney.

This rider, who is attached to Jack Jarvis's stable at Newmarket had won a race earlier on the second afternoon for Jack Jarvis on the Douceur filly. There was no doubt that this filly was kindly handicapped, but no one seemed to have heard of Finney, with the result that they thought that he was a small apprentice, and did not bet as they would have done. Finney is far from being an apprentice, and has ridden many winners abroad. He now rides a lot of work for Jack Jarvis, and does it very well. Further he can ride at 7st., which for a strong and grown man is a convenient weight. Lord Rosebery looked after the horse in the trainer's absence, and gave the rider the instructions which helped him to win, telling the rider to come up the stands side of the course, where the going was much better than it was on the other and more popular side of the course.

No one can deny that Newbury is one of the best places at which to race in this country, for even if the draw for places at the start on the straight course seems unsatisfactory, the racing is always good; the stands are quite good and are being improved, and the catering is as good as if not better than that on any other southern racecourse. It will never be better than that on a Scottish racecourse, which shall be anonymous, in case there is nothing left for me there next year.

Toward Point having at last got beaten in a selling race, Pitou beating him in the Ilsley Selling Plate, the first race at Newbury, quite possibly a small coup was brought off in the next race, the Letcombe Selling Nursery, with the filly named Honour M. She started at long odds, 100 to 8, but ridden by D. Smith she won easily from the New Navy filly and Zoo. The winner had run well at Brighton when ridden by an unknown boy, and had then run at Ayr when only beaten by House of Lords, and he is better than any ordinary selling-plater. These two first winners at Newbury were trained by Donoghue, who has made a most propitious start to his new career as a trainer. Not only are his horses well trained, but they are also very cleverly placed.

A curiously named filly, Bob Adams' Apple, a name no doubt thought of by that incorrigible enthusiast Mr. H. Rich, won the Highclere Nursery in spite of being badly drawn at the start, and it is to be hoped that her success will cheer up her trainer, Bob Adams, who is ill in a nursing home. Little Abbot, once known as the Lady Abbess colt, ran well enough from a bad place, to be noted as a probable winner soon, but it seems to me that the Little Flutter colt is finished.

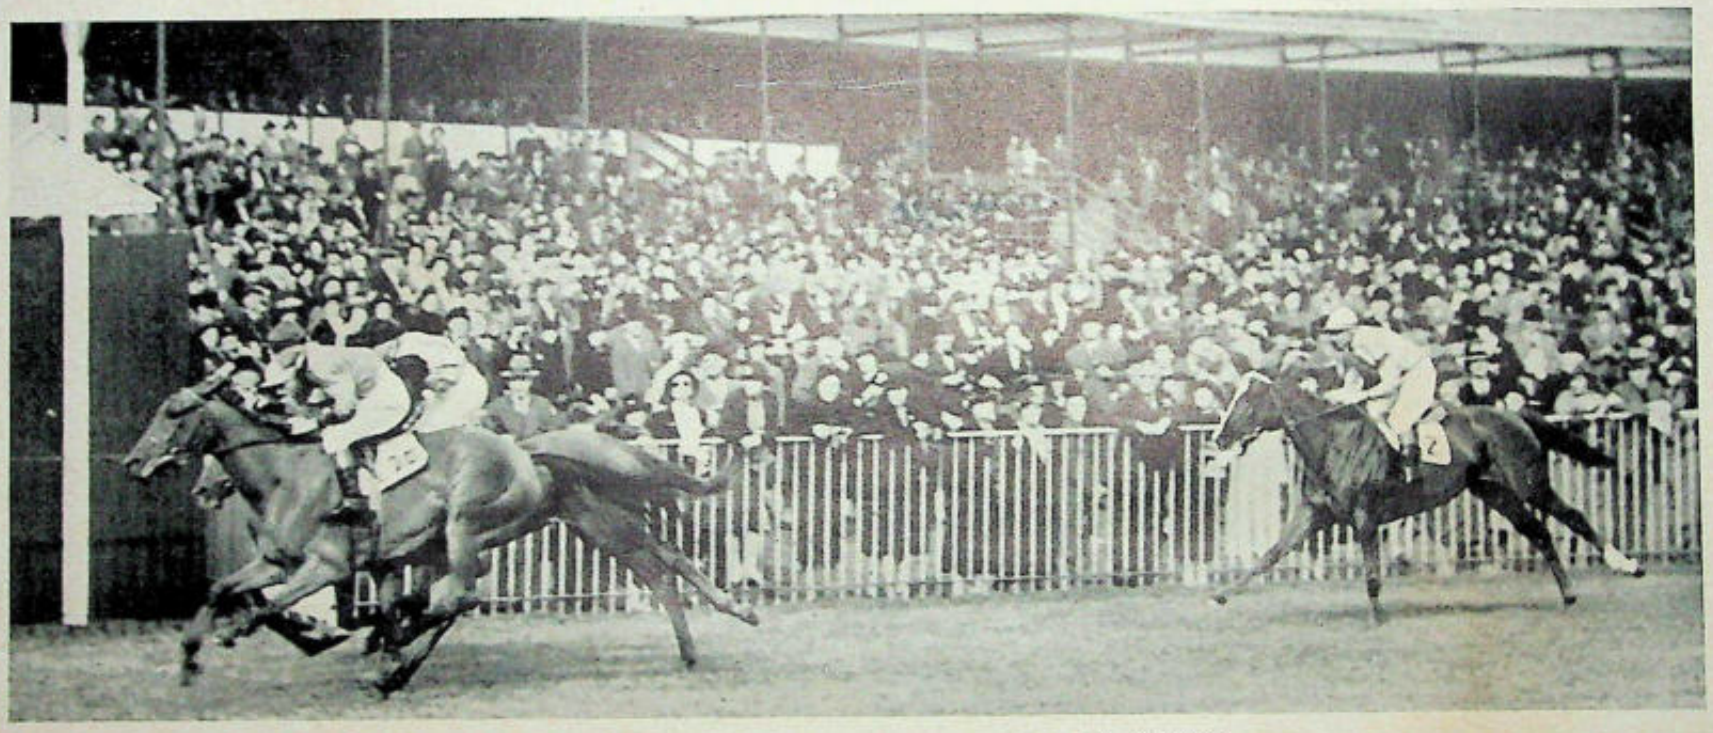
I still do not know what to make of the three-year-olds. There is no doubt that Scottish Union is the best of the three-year-old colts, but whether he is as good as Rockfel or another filly, Solar Flower, I cannot say. Times suggest that Rockfel is better than the colt, but times are not the same as a race. I had hoped, as indeed everyone else had hoped, that Rockfel would take on Foxglove II in the mile-and-a-half race for the September Stakes, but her owner and trainer decided that the ground was too hard for her to be risked, and so the older Columcille took her place, and what is more, won the race about which there was much talk.

Foxglove II, who no doubt is some way behind Pasch over the latter's own distance, made his own running, but was being passed early in the straight by Benedict and The Tweed. As they went to him they closed on him and Foxglove II had to be severely checked. He was out of the race from then on, and although he finished fast he was at the end rather more than a couple of lengths behind Columcille, who came with one run in the straight and won by a clever neck from Benedict. Those people who should know most about Rockfel and Columcille, and the two horses are in the same stable, have no doubt that Rockfel would have won the race with ease.

The race for the Newbury Cup has often in the past suggested the winner of the Cesarewitch. Indeed, the two races have been won before now by the same horse although the winning of the first one entails a large penalty for the second. This year's winner, Pylon II, is not in the Cesarewitch. Ridden by the best of our present-day long distance riders, and a worthy successor to Childs, H. Wragg, Pylon II came from last, and in the end won by two lengths from Snake Lightning, who, after beating off several challengers, seemed to have the race won.

His finishing speed, however, could not match in the least the burst of Pylon II. The winner, who is trained by Captain Bertie Holland and owned by Mrs. Bennett of Ewhurst, is by Pharos, the sire of, among other very good horses, Nearco, and he gets his stamina, which is only just now being discovered, from his dam, Pyramid, who was by Papyrus out of a Swynford mare. He seems to be better at a mile and a half than he was at a mile or a mile and a quarter. He was bred in France by Lord Derby, who sold him at the end of his second season during which he had won one little race. He never ran as a two-year-old.

This was a good race to watch, but it did not give anyone the thrill that the win of Wavelength did in the Donnington Maiden Plate for two-year-olds, for Wavelength is owned by the King and was also bred by him. When she began to draw away from her opponents rather more than a furlong from the finish with the race won there was a great outburst of cheering and much clapping of hands, and then a second or even less later, when it was seen that victory was assured, up went hundreds of hats and some of them came down, like the famous arrow, I know not where. And that as a distinguished soldier who was there said should be a proper object lesson to all European dictators. Wavelength is as good looking a two-year-old filly as I have seen this season, and is by Fairway out of Wireless, the dam of Marconi and other Royal winners, but this filly is certainly her best progeny so far and quite a likely classic winner next year. What a scene there will be if she wins the Oaks at Epsom.



THE FINISH OF THE HIGHCLERE NURSERY HANDICAP AT NEWBURY
Bob Adams' Apple winning from Red Snapper and Dellmont

And now, having had a look at the past, let us have another look at the future, and especially the Autumn Double. Michoumy, whom I suggested in these notes as the probable winner of the Cambridgeshire, was then at twenties, but is now at half or less than half those odds. If all goes well with him he will, in my opinion, not only win, but also probably will start a very short-priced favourite. He is also in the Cesarewitch and might, indeed, win both races. This has been done before. It is, however, to be noted that Mr. Rank, his owner, also has Black Speck in the longer race, and he, as I write, is favourite for that race.

It has been already stated that Mr. Rank is a very lucky owner. He has had luck, but behind all his success this year have been much hard work and a great ability to choose men to work for him and with him. It has been the same with his Great Danes and Irish Wolfhounds and Shorthorns, and no doubt also in his enormous milling business, for no man could do what he does by himself, not even a man of his dynamic energy. Domaha is another much fancied candidate for the Cambridgeshire, as is Agincourt, but I thought then, and still think now, that Michoumy's performance at Doncaster was better than either of theirs.

Snake Lightning ran a very good public trial at Newbury on Saturday for the Cesarewitch, and a playful double on Michoumy for the Cambridgeshire and Snake Lightning for the Cesarewitch might not hurt us.

GNOSTIC.

CUBHUNTING MEANS EARLY RISING FOR MASTERS AND EARLIER RISING FOR STABLEMEN

STABLEMEN AND MASTERS

A Girl is Out of Place in a Stableyard

I AM afraid that there are grounds for the charge of slovenliness. Much work in stables in England is of a slovenly character, which is cloaked over by a fair amount of eyewash, but it is not all the grooms' fault. Masters are every bit as much to blame for imposing tasks that are too great on the grounds of economy. Nowadays a new type of groom has come into being, and that is the girl groom. My experience of them is limited, for this type of groom is not much found in hunting and polo stables. Girl grooms are more frequently found with hacks, and in hacking stables.

To me a girl is out of place in a stable yard, for it is a rough place, where beer and bad language flow. Picking up droppings, and dressing horses are not jobs for the fair sex. As I have remarked, they are not found much with hunters, which is a good thing, for doing a hunter and its tack after a dirty day is hard work, needing the expenditure of much energy; that is, if it is to be properly done. Personally, I do not think girls are physically suited to hard stable work, and I should not care to have any girl I cared for or respected round about when the "cussin' and blindin'" starts.

These girls frequently work with horses not of necessity, but just because they like it and it gives them something to do. They usually perform their duties for a small wage, and sometimes for nothing. Erstwhile, this was poaching on an able-bodied man's job, and causing unemployment where it ought not to be; but now, of course, with the industrial revival perhaps it is different, though even girl grooms do not seem so plentiful as heretofore. In addition to stablemen and girl grooms, there are the stud grooms, the sergeant-majors of the stable yard. They keep us in our places, or kick us out of them, as the case may be.

There are two kinds of stud grooms. The stud groom pure and simple. He who supervises, sees to the feeding, minor doctoring and general turn-out of the horses, saddlery, stables, saddle rooms and men. He has reached that stage in his career where he need no longer be an ardent soiler of his hands. He certainly shows no great desire to get dirty; no doubt he has been through the mill and is now entitled to some respite and the pleasure of watching others doing these things.

Then there is the working stud groom. This kind is more in vogue these days. He is an economy, for he helps in many ways in the stable. In addition to the ordinary stud groom's duties of supervision and doctoring he does the clipping, mane plaiting and gives the men a hand with the grooming when the occasion arises. By doing these things he saves the employment of an extra man. There are good and bad stud grooms. It is unnecessary to dilate upon the qualities of the former, suffice it to say to the employer, when you have got one, hang on to him.

Of the bad ones, it may be said that they are up to many tricks, which work out to their benefit, but to the detriment of their masters and horses. They will have a working arrangement with the farrier, regarding commission on shoeing. The owner's horses will be shod regularly, and also frequently; the latter adds to stable expenses. Exercising horses on hard roads is a favourite way of wearing down the metal of the shoe in quick time. This type of man will, of course, be supremely indifferent to the effect of hard roads on horses' feet, or to the quality of the shoeing. In fact, he will be in no position to say nay to the farrier, and neither will he be disposed to make a change, even if the shoeing is outrageously bad. The forage merchant will also have him in his grips, so when the owner's horses are planted with mouldy hay and musty oats they, poor creatures, will just have to lump it—that is eat it, which is bad for the wind—or leave it, which is bad for the body. He may also have an arrangement with the saddler, and the repair bill will be high. Needless to say such practices are reprehensible, and it is regrettable that they are to be found.

Now that we have dealt with some of the horse-mastership aspects of the stableman's life let us look to his horsemanship, which in many cases is an important item in the routine of the stable. You, master, leave much of the exercising to your men. You do not care much about the dullness of a simple morning exercise or hack. It must be borne in mind that by leaving this work entirely in the hands of a groom who is a bad rider and rough of hands the risk is being incurred of spoiling good horses. During my travels I have been amazed to note how some owners will leave well-bred and valuable hunters to the tender mercies of a mutton-fisted groom. The master, who lies abed on autumn mornings, or is even absent from his property right up to the time of the opening meet, is, of course, quite ignorant of what is going on behind the scenes.

It must not be deduced from the foregoing remarks that *all* horses are pulled and knocked about by *all* grooms. I have seen some very fine riders around stable yards, in fact as good as I have seen anywhere. A variety of seats is to be found among stablemen. Some of the recognised type, and others of the nondescript pattern. There are the hunting, military and forward seats among the former. In the latter category is to be found, among others, the monkey on a stick, jockey pattern, more suitable to the training establishment and the specialities of flat racing. Then there is the backward seat (mid-Victorian 1872 pattern). I presume that among my readers most of the forementioned types of seats are known, with perhaps the exception of the last, and this can best be described by stating: The reins are held in the hands after the fashion of the oarsman, and the backward pull is made in the same manner, and with the same dynamic force. The reins and bit are not only looked upon as a means for steadying or stopping the horse, but also as a chastiser, as for every little mistake it makes it is given clearly to understand by the hands, the reins and the bit that this must not occur again, albeit it usually does, only in a more pronounced manner.

As regards the seat itself, it is, as stated, backward, in fact decidedly so, almost over the cantle of the saddle. The grip is by the heels, which are turned in, and upwards along the legs to just below the knees. There are what are known as windôws at the knees, and as for the rest of the structure, it is akin to a basket of eggs at sea in a heavy storm. This seat is of such a character that it causes much correction via the oarsman's hands. Taken all round this is, except perhaps at the walk, a good seat for ruining a horse's manners.

From grooms we go to masters—people of importance, and therefore to be treated with respect, for do they not provide us with our bread-and-butter, or perhaps, in our case, I should say beer and 'bacey, and are we not, therefore, at their mercy? There are many kinds of masters—country gentlemen, plutocrats, officers and gentlemen and just officers, dealers, livery yard and riding-school folk. The country gentleman is the master that I have found it best to work for. Unfortunately, he is hard to find, and I am told that his race, as such, is dying. This, if true, is a cause for sorrow and regret. There is an atmosphere about working in a genuine country gentleman's place that cannot be met or matched anywhere else. There is a quiet peace pervading over all things here, little fault-finding, much understanding between master and man, to which may be added devotion and affection on the man's part, for he is usually part and parcel of the whole domain.

His master's interests are his, and the things appertaining to the place are the man's special pride. The master, on his part, is kindly, and interested in his man's welfare, without being intrusive, interfering or patronising. There have been many cases of devoted and long service in places of this kind, and I well recollect speaking only a short while ago to a man who had been 40 years in the service of the same master, and never once during all that time had there been, he assured me, one cross word or a difference of opinion between them. Can you beat it?

R. M. S. Barton.

The Gun Month by Month

DEER-STALKING DAYS RECALLED

TO all of us there may come some day a time when the realities of the country are unattainable. Then, when we doze before the fire while others face the wind and the wild autumn weather, there will come to us pictures in which are all the colours of past days and seasons. Recollection is the best of everything, and perhaps these retrospective days with the gun will prove the best that the realities have to offer. As we mutter and cough and stiffly rearrange our slippered feet, we shall have the best of the weather and of the sport when we want it instead of having to go out to look for it.

Upon what will the man who has shot game, either by convention or from love of the country, look back in October, when the first cold winds are blowing the smoke and he must settle himself for a long winter to be spent for the first time mostly indoors? October represents different things to different people; probably to those who have stalked it will mean, firstly and foremostly, stags. But many who stalk scarcely see a stag until it is balanced upon the foresight of a rifle, so perhaps the stags themselves will not form a very large part of the pictures—unless it be on a pony, or turning broadside on a ridge-crest 400yds. away as the first stampede of the hinds slows down. But stalking days and the hills that are their setting return to many people so vividly and with so much detail that they must surely play a large part in the senile dreamings of a sportsman on the half-pay list.

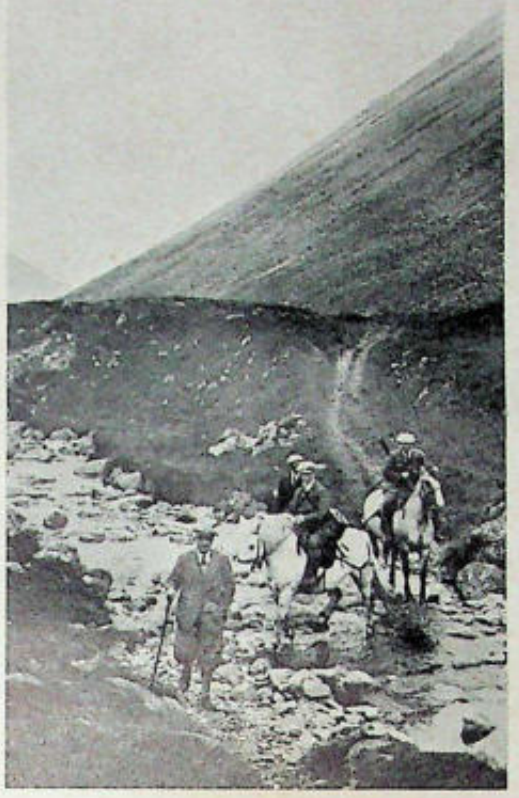
It is generally said that smell has a greater power of vivid recollection than any other sense. There are stalkers who can smell a stag in much the same way as a retriever smells a grouse or a pheasant. Personally, I have only smelled deer really strongly once; but the stalker with me told me that he thought he could always smell several beasts together, were they within 100yds. or so. He also gave proof of the fact. In the middle of the morning we had spied some hinds with whom was a shootable stag, an old switch going back. They lay in some high and rocky ground where the uncertain wind made them very difficult to approach, and we had abandoned them in favour of a big stag who lay by himself, a mile away on the opposite face of the glen. We did not get the stag, and decided to try the lot we had spied first.

It was a steep and difficult stalk, and when more than two hours later we looked over the big rock which should have been within 100yds. of the nearest hind, there was nothing before us but tumbled grey boulders among which little patches and tendrils of wet mist clung and curled. We crawled forward very slowly, expecting to see a hind rise from behind every rock as we came abreast of it. My face was an inch or two from the ground, and suddenly the smell of deer was pungently strong in my nostrils. So strongly, it seemed, that I should not have been aware of cigarette smoke had it been blown in my face. I hissed to the stalker, and whispered to him that the deer had not been long gone, that they must be near at hand in front of us. He looked surprised, but said nothing, so that I flattered myself that my discovery must have seemed to him like magic. A minute or two later he turned round to me and said in a low voice: "They are not in front of us—they are to the right, more than a hundred yards, but they are not moving." I peered into the moving mist, but could see nothing. I asked him how he knew all this, and whether he could see them. "The smell of them is strong," he replied, "but it would be coarser if they were nearer hand, and the scent on the ground is stale." We turned at right angles, and wriggled between the rocks for 30yds., but now I could smell nothing but wet earth and heather and the faint smell of wet granite chips. Suddenly the stalker stopped and reached his hand back to me. I came up beside him, and there below us the beasts were scattered among the rocks 100yds. away. Some were lying, a few fed quietly, and here and there a hind shook the wet from her in a flurry of fine spray; I did not see the stag until he moved to scratch his flank with a dowdy and undecorated horn. He rose a few minutes later and gave the simplest of all shots, so that the pony was soon plodding up from the glen below. It was late in the season—October 9th—and the stag was much run. Perhaps one would not have winded him a month earlier, but I am certain that that stalker would.

That stalk, though it was not protracted nor particularly thrilling, will be a vivid picture in septuagenarian days; the reek of the stag among the wet moss and quartz, and the mist blowing up to leave the Ross hills staring and darkly wet with towering silvery clouds all around the horizon. Very high above us a buzzard wheeled and banked on stiff upturned pinions, its wild wailing mew floating down thin and clear.

Side by side with this picture is another, a moonlight scene—a strange thing to connect with October and deerstalking. It was at the end of a long day's stalking, and it was almost dusk when we killed a stag seven miles from the lodge. When we topped the last ridge we looked down upon a flat sea of mist from which the tops of the lesser hills looked out like little conical islands. The moon stood round and bright in the middle of an empty sky, and in the distance the solitary peak of Schiehallion, white-tipped with its first powdering of snow, looked more like the subject of a Japanese painting than a homely Scottish hill. When we came lower down we entered the flat blanket of mist, and the stalker, the pony and the gillie were phantoms in a cold wet world that made one shiver.

There are other pictures bound up with October; Argyll birchwoods sloping steeply to the shores of a loch. In them the light is cool and dim as a cathedral; there is green moss and green grass, and the moss and the grass and the trees are always wet, for the warmth of the sun never reaches the floor of the woods. Quick-running burns cut the steep slopes, but they seem to make no noise until one is upon them, for they run between deep rock banks grown over by damp trailers of moss and weed which shut out all sound. There are ant-hills in the woods, sometimes 3ft. high, and here the blackgame come to feed. The old sentinel cock will perch upon the tip of the cone, while the hens or others of his brood will scratch and peck for the ants' eggs round the foot of it. Rabbits dodge in and out of the trees, showing a flashing white tail in the dim green surroundings, but they make no sound—even one's own footsteps are swallowed noiselessly by the foot-deep carpet of moss.



THE ASCENT TO THE HILLS

In the woods the familiar bracken of the hillside gives place to fern, and on them the moisture clings in feathery constellations to the spiders' webs. Sometimes one comes to a little clearing in the birch-woods, where the grass is bitten short by rabbits, and an old blackcock lumbers with clumsy but noiseless flight from a branch of some tree in the sun.

The birchwoods are very different in winter when the ferns are brown and heaped and the leaves are gone. Snow fills the watercourses and the woods are empty and white against an empty grey sky that is always heavy with snowclouds. But they are not empty in reality, for when the first snows fall the woodcock come in. They spring in twos and threes from the heaped dead ferns, flutter from among the twisted roots of the birches, or run dodging along the snow, too tired to take flight. Then the woods are cold and desolate and a thin biting wind rattles the branches, so that it is difficult to recognise in them the fairy birchwoods of the summer and autumn.

It was in October that I shot for the first and only time at a stag over water instead of rocks and heather. We lay at the edge of a little loch between high cliffs at the head of a long corrie. It was evening, and the sun was setting from a clear sky, so that the stag stood startlingly red against the black cliffs behind him, and a long stilted shadow stretched away from him like the ghost of a great stag of old days. In the water a yard from my eyes were brightly-coloured stones, and a little trout waved his way lazily across them. After the shot the hinds ran out up a narrow pass in the high cliffs, sending little cascades of stones falling behind them, and when they neared the top they paused to look back, still washed in the same yellow light.

And so we will leave our elder selves before the fireside, to recapture with whisky and tobacco smoke the colours of our present days.

GAVIN MAXWELL.

ON THE WAY TO THE FOREST

A CORNISH STREAM OF A MORE SUBSTANTIAL NATURE THAN THAT DESCRIBED IN THIS ARTICLE BUT WITH SOMETHING OF THE SAME CHARACTERISTICS

LITTLE CORNISH TROUT

Adventures of a Novice's Red-Letter Day

OUT of the pride of a wonderful day's fishing, I can recommend the Cornish moor streams to any amateur fisherman, who wants to catch a lot of fish, always provided he does not worry about the size of what he catches. Recently I started out with a friend for Bedrawl Bridge on the De Lank stream. We reached the edge of the water at about a quarter to eleven in the morning, and after secreting our lunch and mackintoshes under a rock, we put up our rods in readiness to begin. My friend, who is a first-class fisherman, advised me to go about a mile and a half up the stream, to where it divides into two rocky torrents, before casting, while he himself started by the bridge and fished upstream.

Now I must admit at once that I am a very enthusiastic but poor fisherman, before I give myself away utterly. My first mistake was that I disobeyed my companion and started to fish only about half a mile upsteam, where the water lay in deep, quiet, tempting pools. My second mistake lay in the fact that I put on a Blue Upright as my tail fly, and a March Brown on my dropper, completely disregarding the advice given me concerning Pheasant Tails and Coch-y-bonddus.

I fished very carefully at first, choosing only the ripples, but for an hour I had hardly a rise; then suddenly things began to happen: I had three rises, and missed three fish in one pool. I realised my fault lay in not striking, and I made resolutions accordingly. Five minutes later I had another rise; this time I was ready, and struck with such unseemly violence that I not only pulled the fly out of the fish's mouth, but caught it up in the rushes behind me. Several minutes of untangling followed, and then, muttering something to myself, I threw the fly into the rushes on the bank in front of my feet. I remember grinning the smile of hopelessness as I grovelled on my stomach at the water's edge, trying once more to loosen my flies. By this time every fish in the pool had seen me and I was forced to move on.

I walked on, fishing perhaps less patiently than at first, and several pools later hooked a fish; it dashed across the pool at great speed, and I, hardly daring to breathe, gently reeled in my line and then flicked my catch on to the bank . . . gasping and wriggling, there lay a little trout of 3in. long!—and back it had to go into the stream. However, I felt my self-esteem returning; I should not have to go back to lunch and admit that I had caught nothing.

My next adventure was managing to get hitched up on the further bank. It is a thing I have done before, and doubtless I shall do again. I had been casting into the rippling water, close to the opposite bank, and overdid it. I gave a gentle pull, with no success; I pulled harder, and then remembering that the tops of greenheart rods are not things to be flirted with, I took hold of the line and jerked recklessly until the fly managed to loose itself. However, my slender store of flies was not to go undepleted, and soon I heard the sinister crack, which I have come to realise signifies that the cast is flapping helplessly without a tail fly. I tied on my last Blue Upright and hoped for the best.

My second fish I hooked in a pleasant shallow ripple; whether I struck at the right moment, or whether it took real trouble in hooking itself I do not know, but it must have been very well attached to the fly. I had not the courage to flick it straight out, although I knew it was a small one, and my cowardice betrayed me: the cunning fish dived under a curtain of weed and disappeared from sight.

I was furious. So angry was I at having, as I thought, lost it that I put down my rod and rearranged my empty creel before attempting to disentangle my fly from the weed. After a few seconds I picked up the rod once more and proceeded quite cautiously to jerk my line free. Imagine my surprise and joy to see my fish emerge from the waterweed, still pathetically hanging on to the fly! I got it safely on to the granite stone beside me, and before taking it off the hook measured it—5½in., and 6in. was the requisite size laid down by my friend. The question was should I keep it or not? At that moment it made up its own mind, by slipping off the hook to which it had hung with such tenaciousness and sliding back into the water. It looked a little jaded as it swam away!

By lunch time I had almost reached the division of the stream and managed to catch one more, but needless to say it was too small to keep.

I found my friend still fishing, and shouted across the stream to discover how many he had caught, but he made no answer. Now I knew he was a little deaf, so I shouted again, still louder, and he glanced up as he threw back his line and shouted back "Shut-up!" So down I sat and waited humbly until it should be his good pleasure to walk back to lunch. "If he shouts 'Shut-up' at me he must have had a bad morning," I deduced. "Perhaps he will only have some five or six fish, or maybe only two—instead of my three!" I watched him fish; he crouched behind the rushes on the edge of the bank and never seemed to cast in the same place twice. Suddenly I saw him jerk a fish straight out of the water on to the bank. It was all unbelievably quick; he did not seem to strike and then flick the little fish, but simply to take it out of the river with one movement of the wrist.

Then he relaxed. "It's about one o'clock," he said solemnly, and began to walk back. "How many fish have you got?" I asked once more. "I'm not sure," he replied nonchalantly. "Thirty-one anyway, but only eight fit to keep." "Oh," I said; that seemed to be all there was to say, though I felt a little ashamed when he asked to see my catch.

After lunch I started off upsteam to where I had originally been sent, in great humility of mind. I determined I would catch at least ten fish, of which five would be keepable. I would use coch-y-bonddus and pheasant tails, and I would go up to where the stream divided. However, I could not resist fishing two or three of the big pools on the way up, and managed to catch two in the first quarter of an hour.

Then I reached the rocky pools of the two tributaries of the De Lank. The place is called Whisky Point, after an unfortunate doctor, who once fell into the stream while hunting and was given two—or was it three?—bottles of whisky before he came to himself. I nearly followed suit, so far as falling in was concerned, but I doubt if I should have received the whisky.

Now comes the really wonderful part of my day's fishing. I actually began to catch fish. I had to creep and clamber over the rocks and drop my fly into the water without much attempt at casting in many places. I remember I had five rises in the first pool and missed them all, but before four o'clock I had caught no less than eighteen fish, of which seven were in my bag. It was staggering—at last I had learned the art of striking; indeed, at the time I wondered if I had not learned the whole art and craft of the game.

There had been several accidents. One fish I had flicked out of the stream into the bracken behind me, and it had dropped off the hook and got lost. I admit I felt a sneaking sense of shame at the idea of the beautiful little brown and golden trout lying gasping its life out among the ferns when it should have been back in the stream again, going on with its attempt to attain its full 6in. The other mishap was the fact that I lost the one bigger fish that I hooked. It sped down a tiny crack between one pool and the next and got free of the hook as it did so.

By this time I had got away from the rocky pools up to the higher reaches of the stream that run under Cornwall's one mountain—Brown Willy—and I felt too tired to do any more fishing and flung myself down among the heather and bracken to read my now somewhat fishy edition of Oscar Wilde. At the end of a couple of hours I returned to the consciousness that I was there to fish, not to read, and I got lazily to my feet once more, returned Oscar Wilde to the company of the fish and strolled back, catching three more fish on the way.

I found my companion still diligently fishing, but this time he was better pleased to see me. He had caught 97 in all, a record even for him, and we carried home 28 between us.

I thought it showed a sportsmanlike spirit when he declared to his family that we had caught 118 between us, not mentioning the division of labour.

DAMARIS MAGOR.

"I KEPT REPEATING TO MYSELF, 'KEEP COOL, PICK A BIRD'"

AN AFTERNOON WITH PINTAIL

Unusual Flighting Opportunities

BACKED by a strong west wind, the late autumn tide came rushing up the estuary, covering the mud flats with a carpet of grey tossing water fringed with white where wind-whipped waves broke in masses of spray on the edge of the salting. Heavy clouds swept across the sky: the world seemed clothed in a mantle of leaden greyness.

Out on the troubled surface of the tideway parties of black dots could be seen bobbing high on the crest of a wave only to become engulfed an instant later in the trough of the next line of breakers. Each dot was a pintail riding out the rough tide, but I felt certain that on the first ebb they would all flight to the flooded marshland to feed.

Gradually the maze of gutters intersecting the salting filled to the brim and then overflowed, and what was, a few moments before, a stretch of grey-green marsh grass became a vast salt water lake with never a leaf showing on its ruffled surface. Half an hour later the ebb tide had uncovered the higher parts of the salting, but every hollow was now a miniature lake, an irresistible magnet for pintail.

With a bagful of decoys slung over my shoulder, I hurried across the marsh in the wake of the receding tide, jumping many narrow gutters and wading through standing water so as not to miss this rare opportunity of a pintail flight, perhaps the most thrilling of all forms of duck shooting.

As I neared my goal—a shallow mud-bottomed depression in the marsh now brimful of sea water—I could see parties of pintail lifting from the tide as the ebb bore them seawards and pitching again nearer to the edge of the salting. They were sick of being tossed about by the waves, and only waited for a lead to begin their flight.

Placing my decoys in the shallows at the edge of the pool I crouched down in a gutter half-full of running water, hoping that its steep muddy bank would afford sufficient concealment. I had not long to wait, for almost at once a flock of eight pintail rose from the tide, and, after sweeping over the marsh in a wide semicircle, alighted on a pool some 200yds. behind me. They were the advance guard, the scouts for the main body, and their unmolested passage was the signal for a general flight; then the fun began.

My first visitors were a big flock, over 30 strong, coming high and fast down wind. I thought they had passed me by, but the leaders, catching sight of my decoys, checked, turned into the wind, and the whole flock came planing down right on top of me.

I suppose this nose dive occupied but a few seconds, but I seemed to be watching that approaching forest of outstretched necks for ages. I kept repeating to myself, "Keep cool, pick a bird," when fortunately the chocolate head and white neck of a grand old drake caught my eye.

My first barrel took him fair and square, dropping him stone dead among the decoys. I was conscious of another splash as a second dead bird hit the water, and then the flock zoomed upwards. Gone were my good resolutions. I fired my second barrel wildly into the midst of a mass of rapidly beating wings and never touched a feather. Still, I had two ducks with two shots which sounded well.

If you have ever tried shooting from the slippery bank of a marsh gutter you will know the difficulty of killing with the second barrel. The arc through which the gun can be swung is so circumscribed that a right and left is something of a triumph.

I was debating whether to retrieve the slain when five more ducks came straight for my pool. I bravely decided to let them pass, hoping they would turn and come up wind to the decoys, but at the last moment my nerve failed me and I fired both barrels at them as they sped by. One pintail turned a complete somersault in mid air and hit the ground with a satisfying thump, but I am not prepared to answer rude questions as to which bird I aimed at or which barrel did the execution.

By this time the gutter in which I stood had become less of a raging torrent and I was able to secure a firmer foothold, a fact that probably accounted for a pleasing right and left I obtained out of a line of five ducks passing high overhead.

The main body of pintail still seemed determined to feed in the flood water on the salting, and even the noise of my shooting did little to disturb them, those down-wind of my position jumping at the report, but soon settling again to their interrupted meal.

Other wildfowlers, realising what was happening, began to make their way out from the edge of the marsh, and in so doing they drove two parties of duck in my direction. Each time my decoys attracted their attention, and each time they left one of their number to swell the bag.

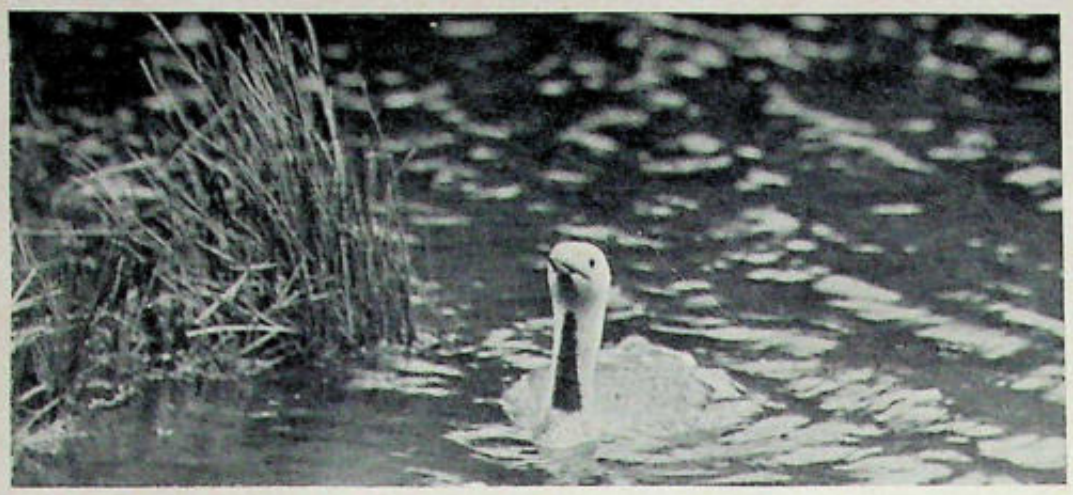
Just as I imagined the flight was over, a single pintail, a drake, crossed my pool on his way to the sea. He was moving fast even against the wind, and I feared I had shot behind him, but, after flying for 50yds. apparently unharmed, he suddenly towered and dropped stone dead.

"PLACING MY DECOYS IN THE SHALLOWS"

So ended a memorable afternoon's shooting, one of the few occasions on which I have managed to flight pintail after a high tide, the only time in my experience that they ever come to the saltings in any numbers.

This is not surprising when one considers that their food—marine crustacea—lives in salt water and, apparently, dies when the water has remained stagnant for even a few hours. An odd pintail or two may be killed with the wigeon at evening flight; but a real pintail flight needs a high tide to fill the hollows with "fresh" salt water, and a strong wind to make things uncomfortable on the estuary.

GUY B. FARRAR.



THE RED-THROATED DIVER, ENTERING THE LITTLE BAY . . . AT SPEED

NESTING OF RED-THROATED DIVERS

The Male More Nervous than the Female

ALTHOUGH the red-throated diver spends the greater part of its life at sea, far from the haunts of man, it may be readily observed during some months of the year when it frequents inland waters for the purpose of rearing its young.

It was on the shore of a sandy loch, cradled between the heather-clad hills of a northern island, that I located the nest at which my photographs were taken. It contained the usual complement of two eggs—large and rich chocolate coloured.

For a number of years a pair of divers had used this loch for their summer home; occasionally making their nest upon a boggy promontory, and at other times upon a grassy island not more than 3ft. across. This year, however, they had chosen the shore of a small sandy bay on the west side of the loch, in a position most suitable for my purpose of observation.

I spent many happy days during the month of June, hidden within 12ft. of the divers as they brooded their eggs. This duty was performed by both parents, and although the sexes are described as being alike, it was not long before I was able to judge which of the two was at the nest.

The diver that I took to be the male was the larger and had a longer beak, the red of the throat was more extensive and of a brighter hue, while the female had a tendency to the white-speckled back more associated with winter plumage.

Apart from appearance, there was the difference in behaviour, the male being much more casual during incubation than the female. On one occasion I watched the latter for seven hours, during which time she hardly moved once, beyond occasionally turning her head from side to side when distant voices were heard, or gave an anxious upward glance when a flock of gulls came nearer than was desirable.

The male bird was rather restless, and would change his position at frequent intervals. He certainly was the more interesting to watch and gave me many typical poses. Apart from his restlessness, he usually appeared tired, and at times could hardly keep awake. One moment his head would be up, all alert, the next his eyes would close and his head would fall back as he dozed. He would awaken with equal suddenness and look around with a startled air—as if conscious of having neglected his duty.

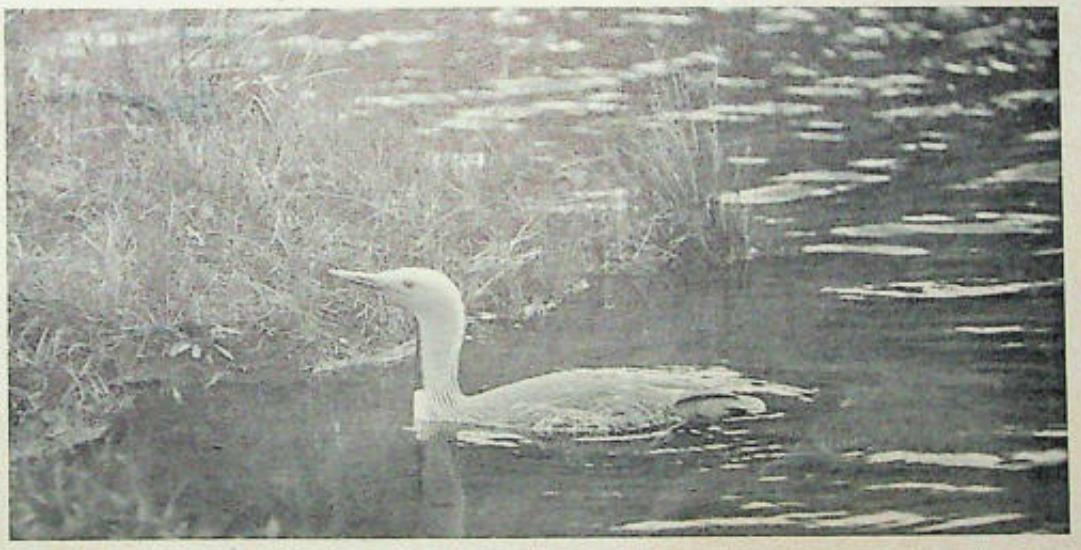
During the first fortnight the female appeared to brood during the evening, and usually she was on duty during the forenoon. At about 2 p.m. to 2.30 p.m. the male bird would come in from the sea, flying high—his approach often being heralded by his pleasant trumpeting note. Down he would glide to the loch and, with a splash, scud along the surface, leaving a foaming wake. Occasionally he would make a sudden drop from a height, with an almost incredible rushing noise.

The female, noting his arrival, would slip quietly off her eggs and disappear with a neat dive, coming to the surface many yards away and joining her mate. Together they would preen and splash, at times swimming low until the ash-brown colour of their backs so blended with the surface of the loch as to render them invisible. Or they would turn on one side, exposing their white underparts to the sun, leaving the impression of some graceful yacht heeling to the breeze.

The female diver did not appear to leave the loch at any time, so far as I was able to observe, and towards the end of the incubation period both birds were in close attendance; while one was sitting the other would be within a hundred yards or so, engaged in fishing or preening. Only once did I note both parents at the nest together, but from observations made upon other occasions, it would appear that this is a fairly frequent occurrence, particularly when the young have arrived.

Although the female was the more thorough in her labours at the nest, she was the less courageous, and on two or three occasions, when alarmed by intruders, was reluctant to return to her eggs. She was observed to join her mate in the middle of the loch, where from time to time long wailing cries would be uttered, and eventually both birds would swim towards the little sandy bay. It was invariably the male bird that returned to the nest and took over duty; sometimes when nearing the shore, even he was doubtful, and would swing round, dive suddenly and remain under water for perhaps 50yds. Then, with courage regained, would boldly swim inshore and land at once. When about to submerge the divers would first sink low in the water, then with a very quick downward dip of the head would disappear, leaving very little more than a ripple upon the surface.

The nest at first consisted of a patch of ground where the grass had been trodden down, but as time went by tufts of dead vegetation were added, until a considerable mass had accumulated. This matter was never used in connection with the eggs, but was pulled around the sitting bird as a protective covering.



THE MALE DIVER ABOUT TO SPRING ASHORE

While the eggs were fresh the divers when alarmed would spring off the nest and dive into the loch with remarkable speed, their departure being in marked contrast from their usually laboured progress on land. For, as is well known, divers are almost unable to walk at all, and, when ashore, slide forward upon their breasts impelled by their legs used as levers.

When incubation was well advanced, however, the divers, like other birds, were very reluctant to leave their eggs and would remain at the nest even when intruders were in close proximity, crouching low amongst the grass and extending their necks to the utmost in order to avoid discovery.

Noting these changes in behaviour, I was anxious to be present when the eggs were hatching, but, unfortunately, had to leave before this interesting occurrence took place. Subsequently, however, I learnt that the young ones duly arrived but did not survive long. It is to be feared that they fell victims to some of the many gulls that frequented the district.

This is the fate of many young birds, and the indiscriminate protection afforded in gulleries and elsewhere is, in my opinion, responsible for the loss of far too many young of other and more interesting species.

The red-throated diver is more numerous than our only other British-breeding diver, the black-throated, and is claimed to be the more sociable. It is recorded as breeding in colonies both in Baltic islands and in Iceland, but this is certainly not the rule in the British Isles. In the case of all nests that I have had under observation, whether on small or medium-sized lochs, one pair of divers only was accommodated and "territorial" rights were strictly enforced.

CROUCHING LOW, WITH NECK EXTENDED

An attitude adopted by both birds to render themselves less conspicuous

WITH THE WIND AT "FORCE 8"

A Homily on Shipwreck

By COMMANDER JOHN IRVING

I HAD been over to "the other side" on a four-days hard sailing cruise and, returning to a strange yachting port with a most hospitable club, was "arm-chairing" by the club fire.

Really, I suppose, we were thawing out, for the breeze that day had veered to NW., and it had been pretty cold on the wind across Channel. Probably the fact that we had awaited a tide on the other side until the wind *did* make a little northing started the ball rolling but, whatever the real reason, club conversation turned to wind and weather, and then swung sharply over to discuss the number of minor yacht "disasters" there had been already this season. What with dismastings and sails blown to ribbons, engine breakdowns and strandings there seemed indeed to have been an unconscionably large collection, and as the files of the daily Press were ransacked for details, the sum total grew and grew until we could find well over 50 instances of "trouble" since March.

Looked at thus, in a collective way, the total does indeed seem formidable, but actually I doubt if it is very much in reality. It is, of course, hopelessly unjust for the elders of the sport to compare these figures with the "troubles" of, say, 1898, or any other pre-War year.

The number of yachts, both owner-sailed and chartered, afloat to-day vastly exceeds the numbers of other years, as a casual glance at Lloyd's Register or the membership list of any thriving yacht club will show. And where there are greater numbers, it is not unreasonable to anticipate a greater share of ill-luck. Nor is it possible to pin the share of misfortune down to any one particular type or size of yacht, or any particular type of owner—except that there seems to be a most noteworthy absence of N.O.s and other professional sailors from the list of unlucky owners. This should give the lie, if such rebuttal were needed in these days of "Snow White and the Seven Dwarfs of Malham," to the ancient canard that there were four things never to be taken aboard a yacht—a cow, a wheelbarrow, an umbrella and a naval officer!

Re-examining the cases of salvage and so on that have occurred, it was particularly noticeable that in the list sail predominated very strongly over power, and that "fire," the old-time deep sea bogy, was responsible for only one really bad total loss. This again is interesting, for it suggests, as far as "fire" is concerned, either that Diesel-engined craft are very much on the increase or that the petrol-paraffin engine with its gadgets is really becoming the fire-proof sea-god promised by its manufacturers.

That sail should get the worst of it is also quite understandable, for the palm for long-distance cruising must still go the the sticks and string fraternity. Ocean racing has been remarkably free from incident; for that matter many ocean racing experts have been grumbling at the calms and light airs that have pervaded the season. The Kristiansand to Sunderland race early in the year brought its tale of misadventure, but everyone got in all right and under own power.

And since neither racing nor ocean racing has been responsible for the majority of the calls on the lifeboat and so on, clearly cruising is to blame. Nearly every instance of misfortune, in fact, actually has happened to a cruising yacht on passage either coastwise or cross-seas.

Some have been fraught, undoubtedly, with more risk of disaster than others. One that comes particularly to mind is the misadventure to a yacht in the North Sea. Temporarily disabled, she drifted for several days until food and water ran out before being picked up by very welcome rescuers. This, apart from the actual damage, must lend power to the warning given by Worth and others that one of the biggest sea risks for a sail yacht to-day is to run short of food or water when broken down. On the once great sail trade tracks nowadays often enough only a yacht's sail is seen, and that but rarely. The sea tracks of steam do not interlace with those of sail, and it is possible for a vessel disabled on the sail routes to drift for days and even weeks without being sighted.

Apart from this, however, any analysis of the season's yacht rescues reveals such a majority of torn sails and hard weather that an inevitable conclusion is that most of the trouble has been occasioned by being "caught out."

To begin with, there is, of course, very little reason indeed why anyone should ever be "caught out" by bad weather. A sound working knowledge of weather signs and portents should be as much part of an owner's equipment as a tiller or an anchor. Very rarely indeed in these latitudes of ours does a gale get up with no warning whatsoever; always there is some hint of what is to come, and then—away for the nearest port to leeward while yet there is time. Much harm is done undoubtedly by the "tough" advice to seek an offing and see a blow out in deep water.

Applied to a well-found, well-manned and sizable craft, one would have no fault to find with the advice; but to apply it to the small 5- or 6-tonner manned only by owner and wife is to court trouble. The strength of the chain is its weakest link and that, as far as cruising craft are concerned, is, I think, the personnel rather than the material.

Rather than take such sweeping advice as "seeing it out" as gospel it would be better for owners to plunge a little more deeply into the ways and wonders of meteorology. Most owners have an inkling of the business; some of them have their own systems of forecasting. One owner, encountered the other day, had his own criterions for Beaufort's Wind Scale: Force 7, "anxiety"; Force 8, "anxiety tinged with fear"; Force 9, "undoubted fear"; Force 10, "terror"! Most yachtsmen these days ponder the weather charts in the morning Press; most yachtsmen know the doubtful doggerel rhymes, and listen-in for the wireless weather news.

The real problem, however, seems to me to be able to correlate all these things, and, having read the morning paper and listened to the evening weather forecast, to be able to condense this into an accurate picture of the night's weather. Synoptic charting is, of course, the only way in which this can be done soundly, and if the B.B.C. could be induced to broadcast *en clair* each evening the few series of official numbers which make up the coded weather conditions of the moment, yachtsmen could from these numbers construct their own evening weather charts.

In point of time the reading at dictation speed of these series of numbers would take less than two minutes, and the result, worked out in hundreds of yacht cabins (and trawler wheelhouses, too), would unmistakably lessen the annual toll of minor sea mishaps. Quite how the B.B.C. could be induced to help yachting in this very valuable way, I do not know, but I fancy that the leading clubs whose members cruise could, if they worked together, make out a very good case for the innovation.

PRIDE OF THE CLYDE

Mr. A. S. L. Young's Mylne-designed Thendara built by Messrs. Alexander Stephen & Sons Ltd. at Linthouse in 1937

ALL ABOUT THE "THIRTIES."—In *The Book of the 30 Square Metre* the enterprising association for this class furnishes some very interesting particulars concerning the yachts which are new to British waters. An historical survey of the class has been compiled from notes furnished by Mr. Knud H. Reimers, which is accompanied by illustrations showing its development. Strongly established in Sweden and Germany, the "Thirties" soon became popular in the United States and Switzerland, and it is interesting to note that in 1935 boats were sent from Sweden to Annam, Australia, France, Brazil and Peru, while in 1936 one appeared in Chinese waters. The case for the class is well presented. Details of the constitution of the British association and its members are given; there is a coloured plate of racing flags; there are notes on the technique of sailing the 30 square metre; rules for Solent racing; a list of allied associations, and sail numbers of yachts at home and abroad; and a plate of the lines of a "Thirty." The British association's offices are at Capel House, New Broad Street, London, E.C. 2.

Letters to Young Shooters

COMPANIONS OF THE GUN

(Sketches by Maurice Tulloch)

MY DEAR GEORGE.—It is well that you should know something of the place and purpose of the gundog in the shooting field. This letter will go no further than give you a few elementary generalisations on the subject. But since you say you know nothing about it, I take it this is the sort of information you want. Gundogs may be used for three broad purposes, or for a combination of any of three. They may "point" game—*i.e.*, find it by scent and then stand sentinel till the guns shoot it; they may be used to force the reluctant target to the waiting guns; or they may be used to bring the dead or wounded victim to hand. In the first category we normally place pointers and setters; in the second, spaniels; and in the third, retrievers. But the spaniel is, broadly speaking, a dual-purpose dog, and whereas there are, of course, a few that are never asked to do more than retrieve, there also are comparatively few that cannot retrieve at all.

We in Britain are, I think, inclined to be much more hidebound than is necessary about gundogs. Any intelligent dog can be trained to do almost anything. We should not regard it as a cardinal sin, for instance, for a pointer to retrieve, for that is the common practice. On the Continent I admit, of course, that a good retriever is more likely to come of a proved line of good retrievers. But poodles, for instance, have been brought up to as high a standard as a good Labrador, and I have seen a large dog that looked like a dachshund put game out of thick cover with the best of them.

You will, or should, want to know what are the principal breeds that you are likely to encounter. Let us first take the pointers and setters. The pointer is the most distinctive of all breeds and cannot be mistaken, and his name suggests his functions. They are, I believe, the oldest known breed of gundog, and have been used in this country for a good 200 years. In former times they were the mainstay of the partridge manor, but to-day they are seldom seen south of the Tweed. After the War the number of private kennels was limited, but now they are on the increase. But the great majority of the pointers you see in the Highlands are hired for a short six weeks from three of four famous pointer kennels. As you know it is the duty of the pointer to go in front of the guns—two guns for choice—"quartering" the ground this way and that, till he finds game. He then "points," standing rigid and motionless till the approaching guns flush the covey. I know of nothing so symbolic of vital eagerness as a pointer graven as in stone, nose forward, tail straight, and, were the birds not to flush, likely to remain on point till Gabriel's trump. An adult dog can usually manage a stretch of two hours work or so, but when he is taken off to rest he should be put out of sight of the guns, for otherwise he wears himself out with impatience, since he is a highly nervous subject.

The functions of the setter are the same as those of the pointer, and he is really a pointer with a thick coat and feathered tail; but in appearance he is more like the retriever class of dog. Setters, I always think, are the most beautiful of all the gundogs. They have breeding stamped all over their lovely bodies. The popular breeds are the English, the Gordon, and the Irish. The English are normally white flecked with black, lemon or liver; the Gordon are normally black and tan; while the Irish are the familiar rich red tan. It is sad that their peculiarly beautiful coat so often turns them into suburban pets, a fate entirely divorced from their own instincts.

The two best-known breeds of spaniel are the cocker and the English springer. The cocker is a dapper little fellow, the Jimmy Wilde or Benny Lynch of the dog world. The most vivid shooting memory of my youth is a little black cocker brought out by one of the guns at my first day behind the guns when partridge driving. I had, after the first pick-up, no eyes for anything else. He would sit behind his master as devoid, apparently, of any particular usefulness or interest as the accompanying lovely lady. But the ease and mastery, the zest and (I think) humour with which his twinkling little feet brought back bird after small brown bird will never be forgotten. He is a most delightful companion, the cocker, easily packed away in a small car, and full of courage when forcing his way through thick cover in pursuit of his vocation. Although the cocker cannot push through certain obstacles as the bigger breeds, he can, and does, squeeze round them.

The English springer stands no less high in my regard. He has not the same long ears which I always think encumber the modern cocker, and the foundation of his colour being white, he is fairly easy to distinguish. Moreover, his size gives him an advantage over a cocker when faced with an 8lb. hare! I should say that he is increasing in solid favour as much as any breed, and he, too, can be a delightful companion. He is really an offshoot of the field spaniel, a breed of old standing which, after a period of decline, is now coming into his own again. He is a smaller dog than the springer, but not much so, and he is normally bred to one colour and is not flecked with white. Mention must be made, too, of the red and white Welsh springers, the low-in-the-chassis golden-liver Sussex spaniel, and the Irish water spaniel, whose coat, reinforced against the waters of Shannon or Swilly, recalls the poodle. There are also the Clumbers, an ancient breed, once as closely guarded in the Dukeries as Pekingese in the celestial empire. In aspect the Clumbers are heavy and benign: they have none of the alert impertinences of the cockers, but their real function is team work in thick cover in place of beaters. There is a famous Clumber kennel at Sandringham, where King Edward VII introduced them to flush the pheasants from the rhododendrons.

Of the retrievers there can be no doubt which is the most popular breed. The cult of the Labrador is not, as religions go, an old one. It dates from the appearance near some canine Mecca of the prophet Flapper, who holds in Labrador breeding the same sort of position as the Darley Arabian does in the world of the horse. That is only 30 years ago, but is there a covert shoot to-day where one does not see in the majority their sleek and lovely black coats? One cannot always persuade the owners of other breeds that this supremacy is justified. "Like a ginger biscuit, hard in the mouth and goes to pieces in water" has been said of every breed of retriever impartially; and "among those present" will always be the very lovely goldens with their beautiful coat and expression of collie-like fidelity; the flat-coats, higher and straighter on the leg and longish in the nose; and the curlies, the retrievers of my youth, who are now creeping back into the picture again. No! No! Not creeping. The beloved curly never crept. He is my very earliest memory of the gun as a visitor to the nursery, and his mien was as bold as his nature amiable!

If you are asking me, as no doubt you will, what is the best gundog for the one-dog man, I should suggest a springer. As you know, this is one of the things that people get all hot under the collar about in the shooting world. You may impugn the virtue of a man's wife, but if you suggest that all is not well with the type of gundog he affects it is pistols for two and coffee for one. The English springer I select because he is a dual-purpose dog, which is more or less essential to the one-dog man who is going in for rough shooting. And because he is long enough on the leg to move quickly, has the strength to push through thick cover and grapple with his retrieve, fits into a car, and has no less of courage, fidelity and intelligence than other breeds.

Having acquired him, as other men, you will, of course, consider him a paragon. How often have I seen men of acute perceptions and delightful character watch their ewe lamb caracolling after a hare with the gay *insouciance* of Harringay, or if to prevent this they are attached to their master's belt, bucketing him suddenly into a briar patch. One cannot argue with those whose geese are swans. But do not take your swan to a shooting party unless he is invited. You would not intrude a friend unasked to a dinner party. Do not bring your dog unasked to a shooting party. If he is the paragon you think him he will very soon be asked on his merits. And if you think his light is remaining under a bushel you can always ring up and ask if he would be *gratissima*.

Finally, by all means let him be a housedog. I am not one of those that believe that all gundogs should be kennelled without. Many of the best of them have been housedogs. If he is your companion away from the gun as with it your delight in him will be doubled. And in dogs lie much of what is most lovely in the shooting world.

Your affectionate
UNCLE RALPH.

BLAGDON AT ITS BEST

The Finest Chance of All for a Big Fish

By H. D. TURING

APPEALS for uniformity in the opening and closing of fishing seasons leave me cold. Admittedly it is annoying to find that some particular water on which one had depended for a day's sport early or late in the season is not open for fishing at the time one had need of it. But a few weeks' variation in opening and closing dates is probably much better for the fish in individual waters, and has, besides, the inestimable advantage of prolonging the angler's season at one end without, as it were, curtailing it at the other. At all events those extra few days in October when Blagdon "goes on when all the others have stopped" is pure gain. Had one to choose, for example, between taking the last chance of a good basket on one's favourite chalk stream or tempting fortune in the shape of a 6-pounder from Blagdon at the end of September, the decision surely would create much heart burning. As it is, one can finish the season creditably (let us hope) in the south, and subsequently turn westwards into Somerset, secure in the knowledge that whatever luck may be in store, at all events one has missed no other chance by making an offer for it.

And there is another advantage in an autumn visit to the lake. In most years the trout, the really big ones, show a greater tendency to feed inshore late in the season than they do during the spring or summer, and a man can fish comfortably on his own feet without the feeling that he is, perhaps, missing his chance by not being afloat. Boat fishing for hours on end is apt to be a distressingly cramping business, even with the aid of that excellent hammock seat which was introduced by Cummins a few years ago.

BLAGDON LAKE IN THE AUTUMN

In October there is really very little difference in the chances of the shore angler and the boat angler. A light south-westerly breeze just sufficient to disturb the line of foam which stretches across the bar at Butcombe Bay, and it is odds that the fisherman wading slowly out from the beach will see that occasional swirl which denotes a fish ranging the shore line in search of fry which have collected near the sparse rush stems, thrusting their now broken stems here and there above the surface. Now let him stand still, even at the sacrifice of that extra yard which may be gained by a step or two forward without risk to the top of his stocking waders, for the wash of even a careful pace forward may disturb the fry and distract the attention of the fish when it comes near the reeds.

They are moments worth waiting for, those times when the fish can be seen feeding just out of reach (as is their lamentable habit). Will the rises, which have been approaching in an irritatingly circuitous course, suddenly turn offshore? Or can one shoot that extra yard of line which will just take the fly to the last whorl, the bubble from which still rides the waves beyond the compass of one's ordinary cast? But the angler, be he well advised, will make no such effort. Rather he will cast to the reeds in good hope that they will also have attracted the trout's attention; and in many cases he will be right; for these fish seldom seem to show themselves so close inshore, but make, I think, a sudden raid along the bottom, chasing the fry from their holt and seizing them underwater as they scatter. The sudden wash of a Blagdon fish as it takes a fly in shallow water is worth much anxious watching of the rings which to the shore fisherman seem to lie so persistently beyond his reach.

Those are times, I admit, when one is assailed by a horrible suspicion that one ought to be afloat and following the fish along the shore line instead of waiting patiently (as the saying is; patiently, forsooth!) for the fish to arrive within reach. But I doubt if the suspicion is well founded. It is extraordinary how sensitive these fish seem to be to the presence of a boat. In an evening rise, perhaps, it is otherwise. Fish then will feed all round a boat, as if its presence were of no significance; but in the daylight, even with a stiffish breeze, it is generally the long cast which pays. One of the most successful anglers at Blagdon uses a long, double-handed rod—11ft., I should think—and simply casts a line from a boat, drawing in the fly by lifting the rod point and casting again straight in front of him for the most part. Presumably he manages to get his fly just beyond the fish's danger zone.

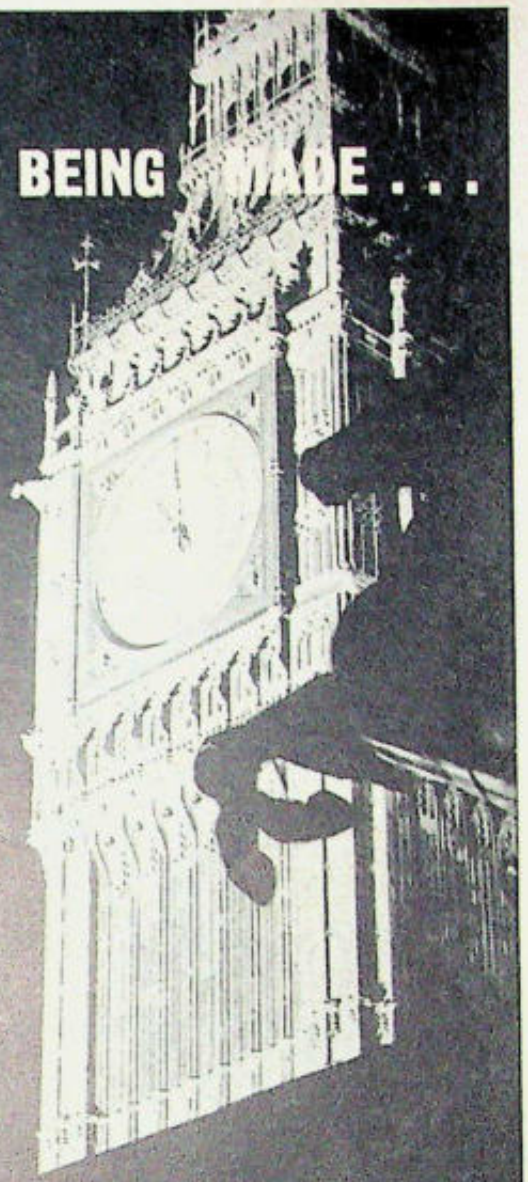
What makes the Blagdon fish so shy? It is a common axiom that big fish are always shy, otherwise they would not have lived long enough to grow big; but this pre-supposes that a big fish is necessarily an old one. This can hardly be the trouble at Blagdon, where a 2-pounder is often only in its third year and has not yet arrived at spawning maturity. No doubt the real monsters are appreciably older than this, but the medium-sized fish, getting on for 3lb., let us say, are probably in their third or fourth year; quick-growing fish which must hustle to obtain food enough to keep up their high growth rate, even in a lake where food is exceptionally plentiful. Nor do these fish appear to attain that kind of "education" which makes old stagers in a chalk stream examine and reject anything which looks suspiciously artificial. Nearly all of them are taken on what may conveniently be classed as small salmon patterns.

It may be, of course, that the explanation is a perfectly simple one; the fish do not often see a fly. This seeming impossibility may have more in it than appears at first sight, for the records show that the number of fish caught per acre, assuming the lake at its full height, may be taken as two or three in a year, and the chance of a fish seeing a fly in any given acre must be small.

But the number of fish in the water must be vastly greater than the number actually caught. Anyone who has seen a really good rise at Blagdon will have no doubts as to the lake's holding capacity. All of which adds to the mystery. But since Blagdon fish have been known, on occasion, to attain an age of nine years or so, it also adds to the chance of there being a collection of old timers hidden away in one or another recess of the bottom, one of which may make an incursion shorewards some autumn evening, and in spite of its shyness be surprised into an attachment for a Dunkeld cast listlessly by a weary angler into a lake which for the last half-hour has lacked any sign of life.

"A MAN CAN FISH COMFORTABLY ON HIS OWN FEET WITHOUT THE FEELING THAT HE IS, PERHAPS, MISSING HIS CHANCE BY NOT BEING AFLOAT"

WHEN THE CHANCELLOR SPOKE THE "BUDGET CARS" WERE ALREADY BEING MADE . . .



ENTIRELY NEW, WORLD IMPORTANT

FLYING STANDARDS

DEDICATED TO ECONOMY

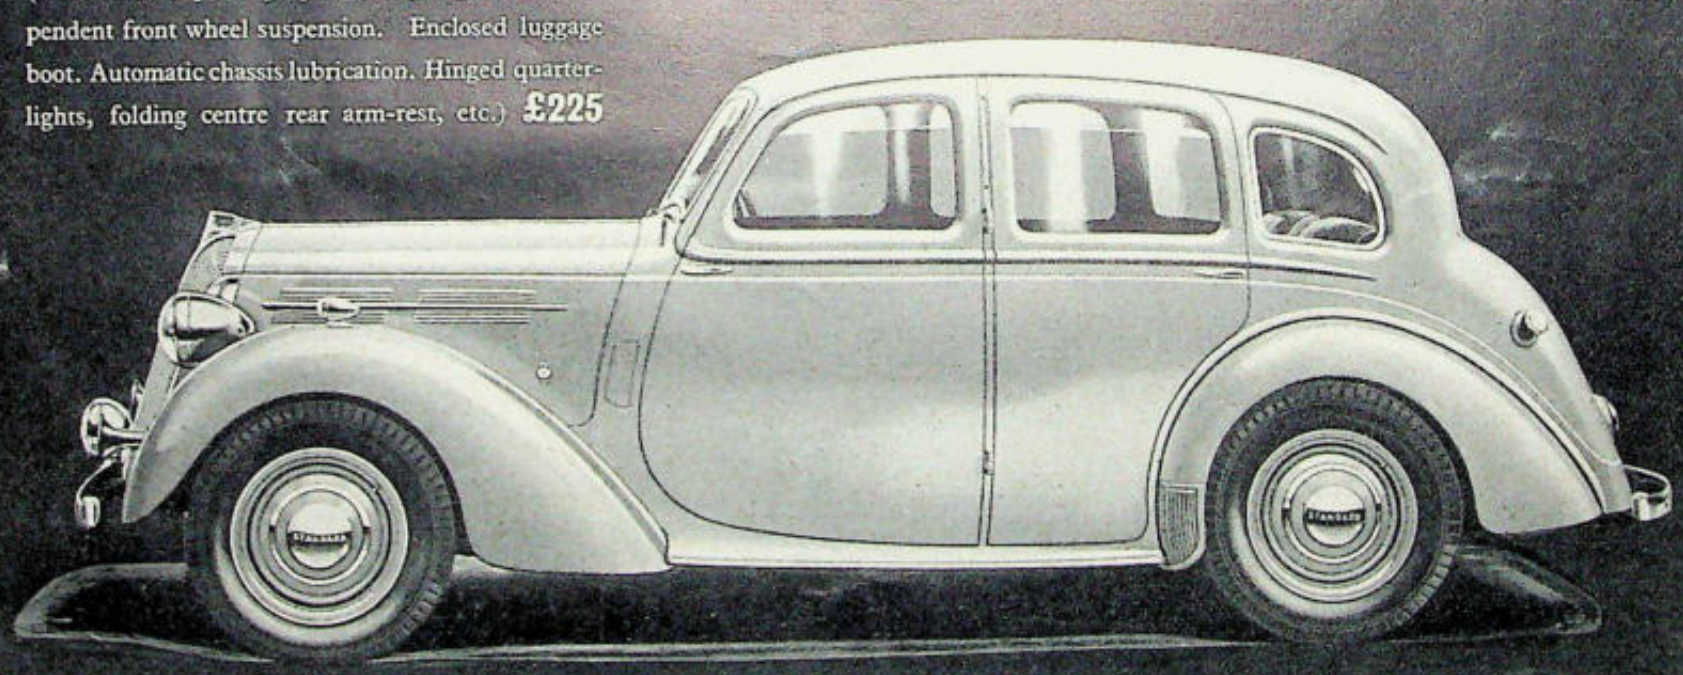
Five months ago a Chancellor spoke—decreeing still more burdens on an already heavily-taxed population. An era of *thrift* began! And the Standard Motor Company, ever alert to future trends in public demand, were already building a new series of cars *dedicated to ECONOMY!* THE 1939 FLYING STANDARD "BUDGET CARS." Including three complete newcomers to the range . . . . . .

THE NEW FLYING STANDARD "EIGHT" from £125

THE NEW "TEN" SUPER SALOON £185

THE NEW "TWELVE" SALOON DE LUXE

(Petrol consumption 30-32 miles per gallon. Independent front wheel suspension. Enclosed luggage boot. Automatic chassis lubrication. Hinged quarter-lights, folding centre rear arm-rest, etc.) **£225**



Other 1939 Flying Standard models include:

The "Nine" from £149, the "Ten" from £169, the "Twelve" Saloon at £205, the "Fourteen" from £249 and the "Twenty" at £325. Dunlop tyres. Triplex Glass. All prices ex works.

VISIT THEM AT STAND 145, EARLS COURT

BRITISH CARS ARE BEST—IN THE LONG RUN

4K

THE ART OF GOOD LIVING

By ANDRÉ SIMON

AUSTRALIA is a very long way off, and the vinegrowers of Australia have a very different outlook from that of the majority of those of Europe. In Europe, the grower's chief interest is to make as much wine as he, his wife, his children and friends can drink from one vintage to the next; also, but it comes second, to make as much and as good wine as he can sell to merchants who will pay for it and distribute it among the thirsty masses cooped up in large cities or beyond the seas.

This is not the outlook of the average Australian vinegrower. To begin with, he rarely if ever drinks wine himself, his wife and children never; tea is the family tipple. So that from the start he has not the same personal interest, nor the same inside knowledge. What he wants is to make all the money he can out of the craving for strong drink which exists among a large class of the population in the Mother Country, England.

Hence, when we look at the official statistics of the production of wine in South Australia, the State that is responsible for four-fifths of the total Australian yield of wine, we find that the wine made during the fiscal year 1936 37 was 15,000,000 gallons, of which 7,592,332 gallons were wines sent to the still and only fit for distillation; 6,115,515 gallons were "fortified" wines, blends of wines and brandy; and only 1,318,655 gallons were "unfortified" wines, or natural wines destined to quench the thirst of men, women and children. For the year 1938 the official estimates of the Australian wine yield are as follows:

South Australia	16,400,000	gallons
Victoria	1,364,000	,,
New South Wales	2,659,000	,,
West Australia	400,000	,,
Queensland	25,000	,,

The principal centres of wine production in Australia are as follows:

(*a*) The Hunter River district, in New South Wales and the Great Western and Lilydale districts of Victoria, which produce the best beverage or natural wines.

(*b*) The irrigation areas, where the greatest quantities of the worst wines are produced which are unfit for consumption as wines and are sent to the still and made into brandy used for "fortifying" other wines.

(*c*) The Rutherglen and Corowa districts, which produce some of the best "sweet" or dessert wines.

(*d*) The Watervale (Springvale) and other districts of South Australia responsible for the largest quantities of wines suitable for export.

(*e*) The Queensland and Perth vineyards, which produce a limited quantity of beverage and sweet wines.

Climatically and geologically, Australia is capable of producing, and has produced, wines of fine quality, but it is not apparently the type of wine which Australian vineyards are mostly made to produce at present.

FIFTY YEARS AGO

From the *Field* of September 29th, 1888.

SHOOTING to Spaniels.—"Where any dog was specially reserved for the purpose of retrieving only, that dog was invariably a spaniel. Some sportsmen used to boast teams of spaniels so well broken that when a bird fell not one would run in to retrieve it till bidden, and then only the dog which by name was singled out and told to do the duty. But with dogs the substance of the spaniel, the task of lifting a hare, especially a struggling one, was no easy one: hence, when the retriever breed was invented, the value of it for this particular detail alone gave it pre-eminence. Besides, the restriction of the duties of the animal to one alone, that of retrieving, made it steadier and more easy to break than an animal who had to do the double duty of first finding and subsequently retrieving."

The Australian Tour.—"With a record of nineteen victories and fourteen defeats, the eighth Australian tour ended last Saturday. The programme extended over 20 weeks, during which 40 matches were played, and the fact that only seven of these were drawn, shows what work the team went through. It was fortunate for them in some respects that the weather was more or less wet for most of the time, and the wickets all against long scoring. . . . The wet may have robbed the tour of much of its pleasure; but judging from the experience of past years, it probably helped to swell the list of wins, for Australians have always proved comparatively better than English elevens on bad wickets."

THE FALLEN CITY

A section of one of the tapestries in the Rufford Abbey Sale

IN THE SALEROOM

REFERENCE has been made in these columns to the great ten-days sale of the contents of Rufford Abbey, which starts on October 11th. A magnificent catalogue of 202 pages has been compiled by the joint-auctioneers, Messrs. Knight, Frank & Rutley, and Messrs. Christie, Manson & Woods, detailing the furniture, silver, antiques and effects which have been acquired by the ancestors of the Savile family over a period of three centuries. The tapestries are a great feature of Rufford Abbey, and the illustration given above shows part of one of a series of three Brussels tapestries. It depicts a fallen city (apparently in the act of falling), with a ceremonial procession in the centre and a hunting scene in the foreground.

A NATURALIST'S NOTEBOOK

THE other day I went to Whipsnade, which is a thing I do fairly frequently, but one of the great joys of Whipsnade is that every visit produces something new to see. That, of course, is true to a certain degree of the London Zoo, but there you have got to walk past the same new specimen exhibited in a cage which you have seen many times before, even though at those times it held some other creature.

* * *

At Whipsnade there is almost always some new animal or bird to be seen, and if there is not there is always something fresh about the scenery. The great sweep below the bluff of the downs by the marmot enclosure is never the same. I have seen it on a cold November day with the rain beating in hard sheets across the down, and the valley shrouded in a mist so that it looked not altogether unlike Lake Como in a mist; I have seen it in spring with the fields a chequer board of greens and browns, and the little church tower in the middle distance standing out like a sundial placed in the centre of some ornamental garden; I have seen it as summer draws to a close with the crops golden beneath the high sky, and the poppies redder than any poppy of Flanders. And I saw it the other day in all the beauty of a very hot day with a haze that made the horizon dim and the fields below dance so that the glasshouses in the distance seemed like a great still pond.

* * *

And, of course, I saw things that I have not for some reason seen before. I saw the raven flying. I have often seen the raven at Whipsnade before, but never in flight. He flew on the edge of the down from the bison enclosure to the porcupines and back again. He did circles and sweeps, and his long but very ragged wings were yet powerful enough to recall just for a moment memories of the gorgeous flight of ravens by the cliffs of Pembrokeshire. And he was ridiculously tame. So tame that he would hop about at your feet, giving ridiculous little sideways flaunts just before he accepted a monkey nut with powerful, but gentle beak. By the way, he did not like his monkey nuts fully dressed. He looked at them with great disdain in that condition. But taken from their shell and peeled, and split in half, they were very acceptable. But he did like dog biscuit, and the last I saw of him was perched on the wire of an empty enclosure with a large biscuit in his beak.

* * *

And, of course, there were birds. All the parrakeets that built the large communal nest in Sanctuary Wood, just by the entrance, had left, and were high up in the trees above the elk, filling the air around with their gossip and slander. And there were young birds, too. A young crane which, when I last saw him, was just a round ball of down, is now almost as big as his parents, and, so I think, very much more beautiful with his beige-coloured head and neck. And I saw a sparrowhawk driving through the scrub below the lion pit, and causing consternation among all the many small birds who live down there.

* * *

It is really astonishing how extraordinarily tame the inhabitants of Whipsnade have become. Almost it would not be an exaggeration to say that it is the human beings walking on their views between the wire fence that are caged, and the animals free. Certainly, many of the animals have far better manners than those that go to see them. And also it is astonishing what tastes the animals have acquired. I know a black buck that likes chocolate biscuits, but not other sorts of biscuit. The wombat has a passion for ice cream, which he puts into his mouth, paper and all. There is a long pause, while the jaws work frantically, and then the paper, long and straggly and very wet re-appears. But, just before it is entirely pushed out of the mouth, it is sucked back in again and subjected to a last comprehensive lick before being discarded. The wombat on Sundays—and presumably holidays—disdains other forms of refreshment, though I did see him accept Mackintosh's toffee from a small boy. During the week, however, the wombat is quite pleased with the common monkey nut, and will not say no to bread and butter.

* * *

Whipsnade improves year by year, week by week. The lay-out of the grounds is little short of marvellous. The hideosity which was the new Elephant House has tuned into its surroundings so that it now looks no more than a rather refined gasometer. The service in restaurants and kiosks is beyond praise. Only the Fellows' Pavilion remains an eyesore, and it is not altogether surprising to find a small group standing outside the wire searching earnestly for queer creatures inside. Even the manners of the keepers, which, to begin with, compared very unfavourably with those of the London Zoo, have improved. B. V-F.

Whither Photography?

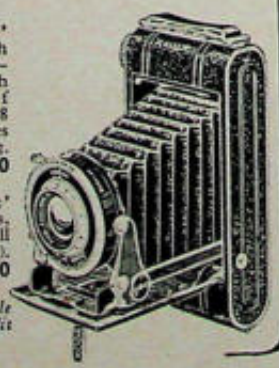
The more cameras improve nowadays (complain some advanced amateurs) the smaller the picture becomes. That, fortunately, is not altogether true, *vide* the new '*Kodak*' *Special*. This excellent camera gives you all the advantages of compactness and high performance, plus a really good-sized picture. Folds to pocket size; beautifully finished in chromium and leather.

Ask your photographic dealer for his 1938 Kodak catalogue, or write to Mr. F. Taylor, Dept. 57, Kodak House, Kingsway, London, W.C.2. *Tel.: Holborn 7841.*

The Six-20 'Kodak' Special (illustrated), with f 4.5 Anastigmat lens, 9-speed shutter (1 to 1/400th sec.) and jerk-proof shutter-release, takes 8 standard-size pictures (3½" x 2½") at a loading. **£13.10.0**

The Six-16 'Kodak' Special with similar lens, shutter, etc., gives a still larger picture (4½" x 2½"). **£14.10.0**

Deferred terms available under Kodak's new 'Credit Account' plan.



SIX-20 and SIX-16

'KODAK' *Special*

THE RIGHT FILMS. Kodak's famous '*Panatomic*' film is specially recommended for pictures of Exhibition quality with these and other cameras. Its smooth 'gradation' takes care of every subtle distinction of shade. Fast, panchromatic, and so fine-grained that big enlargements present no technical difficulty at all. If extra speed is needed—Kodak *Super Sensitive Panchromatic* (30°) is available.

LETTERS TO THE EDITOR

HALICHOERUS GRYPUS

SIR,—We were out deep-sea fishing from two boats early this September in 30-35 fathoms in the hope of catching what ling and conger the long-liners had left us, when there appeared in our midst a large great grey seal bull with a conger in his mouth at about 60yds. range. The seal had the conger by the head, and the tail of the conger was lashing round and round in the air and round the seal's neck. After a few minutes the seal gave the *coup de grâce* to the conger (about a 15-pounder).

It is an interesting evolution, for although I have often seen seals dealing with conger before, I have never been able to witness the whole struggle from first to last.

When the seal has sufficiently quietened the conger, the process of skinning begins. The seal holds the conger in his flippers and tears away with his teeth about a foot of the skin nearest the neck, pulling down with his flippers and up with his teeth till the head is vertical. When this part of the operation is complete the seal takes the head of the conger between his teeth: then, inserting the claws of his flippers into the top of the skin, pulls as before, and the whole of the rest of the skin is torn right off in one act and floats away. The performance of this almost scientific operation takes roughly six or seven minutes. The conger is then eaten, the seal biting off great chunks until the whole is consumed. The seal dived many times after we had first seen it and on four occasions came up with a conger. It spent about four-and-a-half minutes under water on each occasion, and the longest time down was five minutes, when it came up without a fish. On one of the occasions it came up within 15yds. of us and we could see the whole skinning operation perfectly.

Once it came up about 30yds. off us and right between the two boats with what seemed to be a huge ling. As I could not stand this, I sent away the dinghy with two lads and a gaff to dispute the ownership. They rowed up to the seal, and my son gaffed the fish, when the seal slowly dived again after being abruptly told to let go. Instead of a ling it had got a large angler, *Lophius piscatorius*, weighing, as we discovered later, 42lb., which the seal had already ripped open.

There was always a great deal of puffing and blowing made by the seal when it came up, and for some time after arrival on the surface, as if to get its wind again. But it is remarkable that it can go diving to such a great depth. Both conger and angler are bottom-feeding fish. The seal had a conger in its mouth when we left the ground and was then some 200yds. away and for all I know may still be eating. Anyway it had consumed four conger, and would have eaten the angler, while we were looking. Yours faithfully,

Tresco Abbey, Isles of Scilly. ARTHUR A. DORRIEN SMITH.

A NEW CRICKET RULE?

SIR,—Will you permit me to endorse Mr. Neville Cardus's condemnation of slow cricket in a recent issue of the *Field*. Hutton's huge score was compiled at the rate of 26 runs per hour.

County matches are frequently as dull and financially unprofitable as baseball would be if, in that game, each batsman were permitted to continue batting until he succeeded in making a stroke which ensured a safe run to first base. Cricket's "go as you please" method of scoring is unquestionably the cause of its decline. It needs both speeding up and making more decisive to bring it into line with other sports, and the adoption of less perfect wickets would, I believe, in that they would make the batsman's task harder, and for that reason make him more cautious still.

Incidentally, baseball is one of the many recreations which are ousting cricket from public favour. In 1900 there were 10 baseball teams in the British Isles, in 1935 150, in 1936 300, in 1937 470. To-day there are 750 teams, and many schools—both Public and elementary—are seriously taking to the game. I am indebted to the secretary of the National Baseball Association for these figures.

Cannot county cricket be saved from the creeping paralysis which is overtaking it? Unfinished matches would be comparatively rare were it not for the anomaly of the rules that a decision is only possible if *two* innings have been played, but if full points were awarded for first innings victories, it is certain, *with the rules as they are*, that the side going in first would try, by slow and careful batting, to play itself into an unassailable position. This difficulty could, however, be overcome. May I suggest that wickets be reduced in height and width and the following rule be tried:

"An extra shall be added to the total for every ball scored off (including wides, byes, &c.), and an extra deducted for every ball not scored off."

In order to escape penalty the batsman would have to score a minimum of three singles off any one over—a rate of scoring often maintained even with the larger wicket introduced nine years ago. The "extras" could be quickly calculated from the analysis after each over. They would be entered, not after each delivery, but upon the completion of each over. As an illustration, the analysis of five imaginary overs is appended.

• 1	1 1	• 2	• •	4 1
2 (+2) •	• (Nil) •	1 (-2) •	• (-6) •	1 (+6) 2
1 2	1 •	• •	• •	1 1

Under this rule full points could be awarded for first innings victories, for there would be no persistent stonewalling. The possibility of scoring, in any over, six extras "above the line" should help to liven the game.

Yours faithfully,

Andover. W. A. POWELL.

LONG-DISTANCE RACING

SIR,—The results of the recent European Athletic Championships showed Great Britain finishing with a modest fourth place. Though there is still a school of thought in England which may hold that such a place is quite good enough, because we did well on the track and that we need not worry about field events at all, there is no school of thought which can regard with equanimity the fact that we were not even fully represented on the track, and that in two track events in which Britain used to excel we took no part at all.

I refer to the 10,000 metres flat and the 3,000 metres steeplechase. In short, middle and long-distance races, and in the steeplechase, we used to have runners of Olympic standard. We still have them of this standard for the short and middle distances, so surely we might expect to have them for the longer races?

I maintain that we still have men of the required ability in the country, for one only has to look at the results of the international cross-country races of the past few years to see how England still holds a leading position in this winter branch of athletics. It is among the cross-country runners that the long-distance track and steeplechase men are found, so it seems reasonable to suggest that a bigger effort should be made to encourage the leading cross-country men to run on the track.

I am aware that C. A. J. Emery, and others of our best cross-country men, do run in the summer, and run very well, but I am sure that if a strenuous effort was made by those responsible for our track teams to enlist the support of all our leading winter season runners, then we would once again have a selection of men in the steeplechase, three- and six-mile races who could hold their own with all comers, even the redoubtable Finns.

Perhaps I may suggest three ways in which the governing body might encourage these men to follow their sport in the summer?

1. Circularise all cross-country clubs and the leading cross-country runners personally, as to the need for cross-country men in our track teams.

2. Urge athletic clubs and county associations to stage as many steeplechase events as possible, and to include an occasional six-mile instead of a three-mile race in their sports programmes.

3. Introduce the steeplechase into every international match and into all fixtures of the A.A.A. first and "A" teams, and include a six-mile race whenever possible. Yours faithfully,

Lyme Regis, Dorset. F. W. COLLINS.

WEIGHT OF AFRICAN GAME

SIR,—In some recent issues you published some correspondence regarding the size and weight of large game animals of Africa. I was much interested and was in hopes that the correspondence might be extended even farther afield.

Record weights of the large game animals of the world, and especially of East and South Africa, have constituted a subject in which I have been considerably interested for some years, and a vast amount of reading has thrown comparatively little definite light on the subject. Most of our mighty hunters have contented themselves with superlative adjectives, quite exhausting the English vocabulary—great, enormous, huge, gigantic—leaving the reader in considerable suspense as to whether the oncharging monster weighs half a ton or a ton, or more. Even when it has not been possible to secure any weights, the narrator may not even use a dependable yardstick, such, for example, as a comparison of a giant eland with a very large ox, which any farmer or farm boy at least will visualise at perhaps 1,600lb. or 1,800lb. We all know that a big Clydesdale weighs a ton or more, but I have never seen this animal used as a comparison with an African buffalo or an American bison.

I would like to know the general conception of big-game hunters of the weight of a large or record black rhinoceros; also a white bull rhinoceros.

This last brings up a question for which I have in vain sought a definite answer:

What is the second largest land mammal; the African elephant being first and disregarding other elephant species, is it the white rhinoceros or the hippopotamus?

The scientific mammologists can furnish all kinds of information about size of teeth and other details, but what is the height, size and weight of the huge, gigantic, enormous, tremendous onrushing animal which will trample the hunter to death unless he is able to get in one well-placed bullet? Of course, the hunter does not care whether the creature before him weighs two tons or three tons; in either event he has got to be stopped, but the armchair hunter would like to know, I am sure.

Some phases of big-game sport are very carefully measured, such as the length and size of horns, tusks, the weights of big fish and the length of lion skins; but why not the poundage of the creatures, the same as you would try to guess the weight to a nicety of a fine horse or a marketable steer?

I think this whole idea started with me in trying to get the relative weight of a very large black rhinoceros and a very large bull giraffe. My final conclusion was that the giraffe, in spite of his apparent slenderness, weighs as much, and probably 500lb. in excess of the largest bull black rhinoceros. Some correspondence among naturalists gave me a range of estimates for a large bull giraffe from 1,200lb. to 3,500lb.

The usual reply to a request for weights of great animals is that you cannot weigh them in the field. But why not? A million dollars may be spent on the safari, and if it is of any importance at all to know, before the great white rhinoceros is extinguished, which is the second largest animal in the world, it seems to me that it would not be very difficult to dismember such a creature in the field and get the approximate weight.

Will our posterity—that is, another generation from this one—be unable to say, as we are, which was the next largest land animal to the elephant?

Would it be of possible interest to your readers to submit a list of the probable eight or ten largest African game animals and get some of your readers to indicate their estimates of the relative weights?

Yours faithfully,

GUY E. MITCHELL.

United States Department of the Interior, Geological Survey, Washington.

IRISH LAKES

SIR,—I was most interested in "O. M.'s" letter in the *Field* of August 20th as I have fished extensively in Ireland since 1908. I am afraid that his conclusions are only too true.

All sorts of excuses are made, some of which he has given. The other classic one is the awful depredation made by pike. This I think will not hold water, as any serious pike-fisher will tell you that most of the big lakes are hardly worth while fishing now—at least for good fish.

But this is not even the end of the tale. Not only have the great mayfly lakes gone off to such an extent as to be hardly worth the trouble, but the tiddler fishing has suffered as well. By this I mean the thousands of lakes in which great sport could be had with trout of three to the pound average, with the occasional pounder. These have become but a shadow of themselves all over the country.

The reasons, if anglers would only be like "O. M." and face it, are obvious. They are: (1) over-fishing: (2) poaching and illegal fishing.

The first is not half so serious in Ireland as the second. It must be remembered that, except for local fishing associations, the brown trout is nowhere represented. The various boards of conservators deal merely with salmon. Sea trout come under their government, but their interests are usually ignored. In nine cases out of ten the board is controlled by netting interests, whose sole idea is to kill as many salmon as possible.

The poor brownie is utterly ignored, and in one case I know there was no winter watch placed on any of the main brown trout spawning ground last year at all. Yours faithfully,

Angler's Hotel, Pettigo. F. R. EUSTACE.

JACOB'S SHEEP

SIR,—When reading Mr. Hardy's interesting note about wild cattle I was reminded of an advertisement I saw recently in a back number of a magazine offering for sale two Jacob's sheep, and I am wondering if Mr. Hardy or any other reader has any historical notes about them. It would be interesting to know how they compare with the sheep of the Bible, and also how many flocks there are still in this country.

Yours faithfully,

Rossett, Wrexham, Denbighshire. J. F. BOYDELL.

"ONE HAND ONLY MUST HOLD THE REIN"
(See letter "The Calgary Stampede")

THE CALGARY STAMPEDE

SIR,—I read with interest the article appearing in the *Field* of September 10th on the Calgary Stampede, and I enclose a photograph which shows quite clearly how that "one hand only must hold the rein . . . the other hand must stay high in the air." The illustration shows a rider, Pete Knight, scratching forward on Pistol Pete.

Yours faithfully,

Bombay. A. M. MACKIE.

DESTROYING BRACKEN

SIR,—Your correspondent H. F. Thomas, in your issue of September 3rd, states that bracken cannot be killed by cutting. This is quite untrue. On my estate in Radnorshire I have entirely killed it on many acres of hill land simply by cutting, and it does not come back—except by the roots gradually spreading in from the edges of the cleared land. I experimented for some years to find the best method of dealing with it, and the secret is to wait to cut it until the leaf is almost entirely unfurled—in Wales generally in mid-June—and then to cut it again the third week in August. One year of this treatment will weaken the plants very considerably, and the second year nearly kill it all.

The third year what survives should be pulled by hand—but it will be a very small remnant.

There is another matter I intended to write to you about.

Our drive here consists of a long beech avenue, and at one point for about 40yds. the chalk is exposed on the sides of the road, as a bank about 3ft. high. For many years now the woodpigeons have settled on this exposed chalk, and apparently peck it. Nearly any day one will find two or three clinging to the chalk—the other day there were a dozen or more. I have never seen woodpigeons do this on any other spot, and there are many places here where the chalk is exposed. Can any of your readers explain this?

Yours faithfully,

Dalham Hall, Newmarket. LAURENCE PHILIPPS.

SIR,—If the writer of a long letter on bracken in the *Field* of September 3rd will cut this plant in second or third week of June, when the stems are about 6in. high, and the fronds uncurled, and repeat this for the following one or two years, the roots will be entirely destroyed. This is a well-known fact which I have proved myself for many years, and the work is most easily done. To cut in autumn is quite useless and has no effect on the roots.

Yours faithfully,

W. STEUART-MENZIES OF CULDARES.

Arndilly,
Craig Ellachie, Scotland.

[This correspondence is now closed.—ED.]

PINE MARTENS

SIR,—In your issue of September 3rd, 1938, I noticed a letter from the Duke of Portland as regards the trapping of a pine marten at Langwell in Caithness. The Duke says he understands that, except in one district, the pine marten is considered to be extinct. In the north-west of Sutherland, the marten would appear to be increasing. Three were trapped on one estate during the last twelve months. The trapping was unfortunate, and resulted from the fact that a greatly increased number of the destructive wild cat have caused keepers to set traps in places where, unfortunately, the marten is apt to frequent. The supposed increase of martens, therefore, might be due to the increased number of traps being set in order to trap cats. One will realise that it is almost impossible to deal with the wild cats without running the risk of catching the martens.

Yours faithfully,

Hope. J. D. MILBURN.

SIR,—Letters occur in the *Field* from time to time on the supposed occurrence of the pine marten in the south of England. In nearly every case recorded, the animal has been seen but not secured.

Might not these supposed martens be escaped minks from some fur farm?

On the other hand, there is no reason why the pine marten should not have become commoner and be extending its range in the same way that the grey squirrel has done, there being hardly a county—if any—where this alien has not found a footing.

Quite recently a gamekeeper reported having shot a pine marten on a Sussex estate not many miles distant from Brighton. On being asked what he had done with the corpse, said he had thrown it away. This, too, might possibly have been an escaped mink from a fur farm established in the neighbourhood. The pine marten is an exceedingly shy and wary animal, and in some of the woods of southern England may still exist though quite unsuspected. Their exceeding wariness and habit of utterly vanishing on being detected struck the writer on the only occasion on which he has seen the marten in the wild.

Both the polecat and the wild cat increased during the War period, and the years immediately following it.

Reports of the former in southern England occur at intervals, but in nearly every case these turn out to be feral polecat ferrets.

Mr. Eric Parker, however, records one instance of a genuine wild polecat having been seen in Surrey during the early days of the War.

Yours faithfully,

J. GORDON DALGLIESH.

Horsham, Sussex.

SPARROW HAWK AND GROUSE

SIR,—Recently while grouse driving on our hill my son saw a covey settle about 70yds. in front of his butt. A sparrow hawk settled in the heather among the grouse, and my son saw a struggle and the sparrow hawk fly away, when it was shot from the butt by my son. Coming along with my spaniels with the beaters I picked up the grouse and the sparrow hawk. The grouse was a well-grown bird and the back and top of its skull was fractured. Retribution was swift. Is this a very unusual occurrence? I have never seen a sparrow hawk kill a full-grown grouse before.

Yours faithfully,

Plas Llwyn Owen, Llanbrynmair, Montgomeryshire. WINTRINGHAM N. STABLE.

GREY SQUIRRELS

SIR,—I should be obliged if anybody could inform me of what I have some reason to think may be a redeeming feature in the character of the grey squirrel. I am aware of the destruction he creates among small birds while in the nest, and of his liking for eggs of all sizes; also of the damage he does in gardens. But I have noticed that he has a habit of planting in holes some of the nuts, acorns, &c., that he gathers from trees, and I should be glad to know if there is any evidence that such planting ever results in seedlings coming up. Also, although this district has been infested with grey squirrels for many years now, I have no first-hand knowledge of this squirrel biting off the tops of the leaders in young plantations.

Yours faithfully,

Savernake Forest, Marlborough. AILESBURY.

THE SCORPION ORCHID

SIR,—Perhaps your readers may be interested in the enclosed photograph of one of the Malayan orchids, Renanthera (Aracanthe), or Scorpion Orchid. It blooms two or three times a year, and one spike may have 50 or 60 flowers on it all out at the same time.

The flowers are pale green with crimson markings, and although they do not look very much like scorpions on the stalk, a single one lying on the grass at dusk can be horribly life-like.

Yours faithfully,

5, Royal Road, Alexandra, Singapore. (Mrs.) E. F. WATKINS.

"THEY CAN BE HORRIBLY LIFE-LIKE"
(See letter "The Scorpion Orchid")

You can't always be hole-high, but you can make sure of enjoying the 19th if you always ask for Johnnie Walker by name. All the finest whiskies in Scotland, fully matured after years in the wood, go to make the famous round blend of Johnnie Walker. No wonder

walks away with it!

Born 1820—still going strong

HAWARDEN CASTLE

SIR,—I think that Hawarden Castle is known sufficiently well in connection with the Right Hon. W. E. Gladstone to warrant this letter and illustration. The Castle was long in the possession of the Earls of Chester, and after several changes it came into the hands of the Stanleys, only to be sold by them in 1653 to Chief Justice Glynne, whose family afterwards added greatly to the beauty and value of the estate.

The old castle of Hawarden was originally of a like nature to the "peels" of the Borderland, and served a similar purpose in watching over and guarding against the wild mountain freebooters from Wales. Owing to this situation and purpose, the old castle several times suffered assault, and on one occasion, in 1281, a Welsh incursion in a night attack took it by storm and partly burned the old place. Though this outrage was repeated, even after the complete subjugation of Wales by Edward I some time later, a complete end was not put to these experiences till the Civil War, the castle falling into the hands of the Parliamentarians. A force of Royal troops from Ireland then laid siege to it, but the garrison held out till assistance came from Chester to aid the Royalists, when the castle yielded after a fortnight. The Royalists held possession till the surrender of Chester to the Parliament, when the old castle was obliged to capitulate. Shortly after, the new Government ordered the disgarrisoning and dismantling of many of these fortalices on the Welsh border, and Hawarden Castle is now reduced to the dimensions of a ruinous tower covered with ivy, but still an object of historical interest. The modern Hawarden Castle dates from 1752.

Yours faithfully,

3, San Remo, Hove, Sussex. (Mrs.) KINGSLEY BUTT.

"A RUINOUS TOWER COVERED WITH IVY"
(See letter "Hawarden Castle")

ISABELLINE WHEATEARS

SIR,—A pair of isabelline wheatears were seen by my daughter and myself on September 13th in open country below Sussex Downs (beyond Portslade) on a mass of rough stones; the hen flew away, but the cock remained sitting on the stone for a long time, and we were able to approach and watch it at such close quarters that the glasses were unnecessary. It repeatedly made small flights and returned to pitch on the stone again. I see that Coward, in his book, mentions that the isabelline wheatear was last seen in spring of 1911 and 1912, also in Sussex. I thought this may interest readers of the *Field*.

Yours faithfully,

L. A. LUTHER.

51, The Drive, Hove, Sussex.

AN ALBINO WILD RABBIT

SIR:—A short time ago a correspondent remarked on some unusual birds' eggs he had found in Essex, and I am now sending a photograph which shows what this county can produce in the way of rabbits.

I discovered this albino in a warren amid a wilderness of brambles and broom, a long way from any houses. As far as I can discover nobody has liberated any tame rabbits in the neighbourhood and, as it was seen there when quite young, it was probably born in the warren and is therefore a genuine wild albino, with pink eyes. One does not realise how inconspicuous rabbits are until one sees a white one in a wild state. As might be expected, it was very shy and a good deal of patience was required to get a photograph of it.

Yours faithfully,

Hartford End, Near Chelmsford, Essex. (Miss) D. J. BROOKS.

VERMIN AND THE FORESTRY COMMISSION

SIR,—I feel I cannot let the two letters pass, which have recently appeared in your columns above the signatures of John McNab and H. Mortimer Batten, without having my say.

For many years now I have stalked roe with a rifle in England, Scotland, Poland and Austria, and the one thing that stands out in my mind is the difference with which this very sporting little animal is treated on the Continent and here. The roe is classed in Europe as a fine trophy worthy of any true sportsman's skill—here it is labelled vermin and treated as such.

I know it is not popular to compare European sportsmanship to our own, but you cannot evade the facts.

Why all this continual talk about destruction to trees, &c.? Are not the Continental forests pretty good? Roe are not butchered there with shotguns and snares.

I blame the rabbit for 90 per cent. of the damage attributed to the roe. Strangely enough you do not see the rabbit population abroad that you see here. It makes one think.

Yours faithfully,

East Riding, Morpeth, Northumberland. H. STUART TEGNER.

"ONE DOES NOT REALISE HOW INCONSPICUOUS RABBITS ARE UNTIL ONE SEES A WHITE ONE"
(See letter "An Albino Wild Rabbit")

LIGHT BLUE WITH BLACK SPOTS
(See letter "Tern's Spotted Eggs")

TERN'S SPOTTED EGGS

SIR,—A recent correspondent mentioned having found a common tern's nest with one white egg in the clutch. We enclose a photograph of a common tern's nest with three light blue eggs with black spots. This was found on Mew Island, one of the Copeland Islands, in June, 1937. On the same afternoon we found two other clutches each with two normal eggs and each having one egg similar to those illustrated in the above nest.

Yours faithfully,

M. N. and D. H. RANKIN.

11, Hopefield Avenue, Belfast.

THIS BY-PASS BUSINESS

SIR,—Personal experience is that the Restriction of Ribbon Development Act, 1935, has achieved very little in the way of preserving the amenities of the countryside.

The idea of restricting development on the principal roads started life as an attempt to preserve the amenities of the countryside. During the propaganda period it was found that the word "amenities" had been so misused that thoughtful people were disinclined to take it seriously. Someone had the brilliant idea that the same end could be achieved by contending that ribbon development was dangerous in its relation to swift-moving traffic. The idea bore fruit, and the Act of 1935 saw the light of day as a Ministry of Transport measure rather than, as at first intended, as a Ministry of Health measure.

The result is that, according to the wording of the Act a highway authority's refusal of an application to build adjoining a main road must be based on the ground of substantial detriment to the highway. This principle appears again and again in the Minister of Transport's Review of Decisions, referred to in your leading article.

This question of interference with the traffic has been met in most cases by the provision of subsidiary building roads running parallel and close to the main road. This, whilst meeting the needs of the traffic, does not, and cannot, prevent the encroachment of houses in the form of attenuated spiders' legs along the main roads into the countryside.

This undesirable practice is still continuing, although it is true that highway authorities now refuse applications (and the Minister of Transport upholds their refusal) to build single houses adjoining main roads right out in the country.

May I, therefore, give very full support to the sentiments expressed in your editorial?

Yours faithfully,

East Grinstead, Sussex. REGINALD DAVEY.

Where should a Father draw the line?

"Give and take" in the home is all very well—until it comes to taking all Father's Gold Flake. They mean so much to a man, you see. The distinctive flavour of really fine Virginia tobaccos has made them his good companions for years. Now that women appreciate that flavour, too, Father has decided to draw the line and insist that the girls buy their Gold Flake themselves.

WILLS'S
GOLD FLAKE
is the man's cigarette that women like

N.B. You can get Wills's Gold Flake Cork-tipped as well as Plain. Ten for 6d. Twenty for 1/-

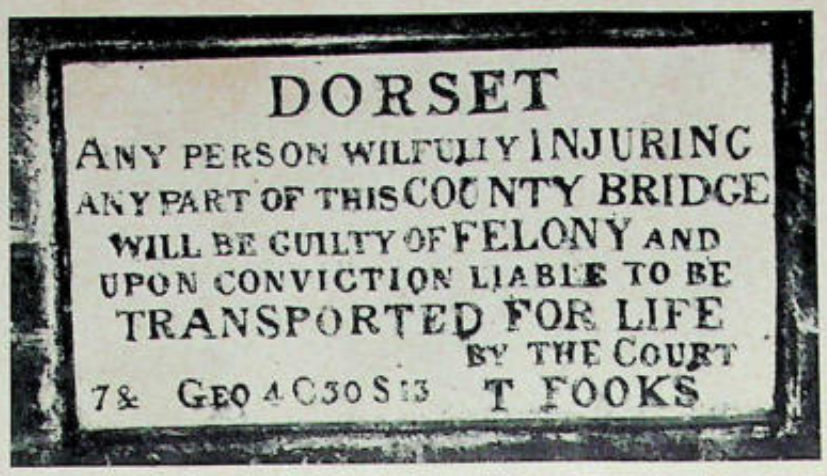
A WARNING TO TRIPPERS

SIR,—I enclose a photograph of an old notice on a bridge in Dorset. I took the picture when on a recent holiday in that county, and feel that it would be of interest to your readers.

Yours faithfully,
A. W. J. COBHAM.

81, Warwick Road,
Earl's Court.



TRANSPORTATION FOR AUTOGRAPHING
(See letter "A Warning to Trippers")

STOAT'S LONG SWIM

SIR,—Quite recently, when fishing Loch Veyatie, in West Sutherland, near Inchnadamph, we noticed a stoat swimming across the loch which, at that point, was approximately three-quarters of a mile wide. It passed quite close behind the boat in which we were drifting and kept a straight course over to the other side. There was a slight ripple on the water at the time. Through field glasses we watched it land on the other side, apparently quite undistressed, as it immediately commenced to hunt the clefts in the rocks near the water edge.

We are wondering if this is a somewhat unique, or just an ordinary occurrence, and shall be glad to know your opinion. To us it seems amazing that so small an animal could not only swim the distance but also keep direction and land so undistressed.

Yours faithfully,
T. P. PARMETER.

31, Mosley Street,
Newcastle-upon-Tyne.

HOOKED THROUGH THE GILLS

SIR,—I had a similar experience with a sea trout several years ago. It was too early to start night fishing, but I made one short cast into the pool to let the gut soak, and left the rod lying on the bank. Some time later, when I picked up the rod, I was surprised to find a fish on, and in due course landed a sea trout of 2lb. The fly had gone in at the mouth and out by the right gill, and the hook had then looped itself over the gut, securely noosing the fish.

I suggest that Mr. Reid was fishing a very loose line, and the salmon, instead of turning down at once, came forward some distance after taking the fly, and so he felt nothing. I have had this happen when spinning, but in this case one feels the sudden cessation of any tension from the resistance of the bait. I mentioned this in my last book, *Modern Salmon and Sea-trout Fishing*. Alternatively, the salmon may have taken the fly fished deep without moving from its lie. It seems to suggest that fish, when they reject something taken, do not invariably "spit it out," but allow it to pass on through the gills.

Yours faithfully,
WEST COUNTRY.

Devon.

CHARTLEY CATTLE

SIR,—Mr. Eric Hardy says the Chartley cattle were never crossed. I have the head of one shot in Chartley Chase by my father. He said that it was from Lyme Park, Cheshire, and that it was an ox—which it looks like. The only reason I can think of for a Lyme Park ox to be in Chartley Chase is that its dam in calf was introduced for fresh blood, and that producing a bull calf, the purpose of this was to prevent too great admixture. There were only three of these wild cattle left at Lyme Park when I was a boy.

Yours faithfully,
G. E. MOULD.

The Grange,
Kimberworth,
Near Rotherham.

THE SPORTING DOG AND FIELD TRIAL CLUBS

SIR,—May I suggest that your readers refer to Volume VIII of the *Kennel Club Calendar and Stud Book* for 1880, published 1881. Page 121 shows the club mentioned in the letter appearing in the *Field* of July 9th as the owner of the black and tan setter bitch, Belle II, and the club is stated to be at Kilvington, Thirsk, Yorks. On page 43 of the same volume is an account of Thirsk Field Trials, held by the Sporting Dog and Field Trial Clubs.

Yours faithfully,
DAVID WAGSTAFF.

Tuxedo Park,
New York.

HUNTING ON SNOWSHOES

SIR,—Is it possible to wear shoes with hobnails in the soles when using snowshoes? I am aware that in Canada moccasins are used, but in Scotland in deep snow snowshoes would, in places, be useful getting out after hinds, if one could wear brogues as well when one came to stony areas of hillsides, and had to climb.

Yours faithfully,
ENQUIRER.

Southampton.

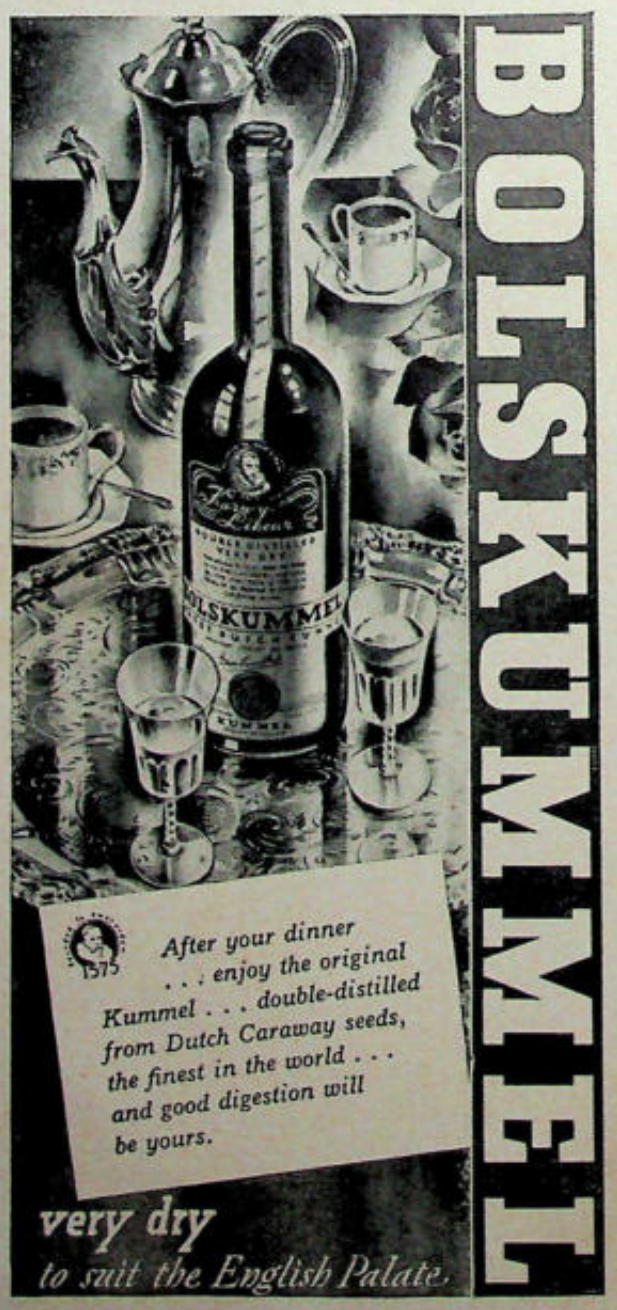
CLIMBING EELS

SIR,—If your correspondent wishes to assist the eels up the concrete dam, all he has to do is to fix a hay or straw rope at the edge of the stream at the top and let it reach to the water below and let the water run down it. This is the method used for helping the young eels, or elvers, up much higher walls.

Yours faithfully,
WILLIAM COATES.

Wellington Hotel,
Harrogate.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, ask your help for two sisters, well over 60, who are in great distress. For many years they ran a seaside apartment house with the aid of their younger sister, but after her sudden death they were forced to give up the enterprise. Lonely, without income and with rapidly dwindling savings, their situation is most precarious, for they have to wait three years before the elder lady is eligible for her old age pension. She, poor soul, is practically bedridden, and is devotedly nursed by her younger sister, who also does all the housework. With undaunted courage they are even trying to let their extra bedroom, for they are in terror of the future. The sum of 10/- weekly is urgently needed to keep these two poor ladies, and we plead for at least £20.



IN THE CITY

By OUR CITY EDITOR

IT is amazing how Stock Exchange prices react to industrial news according to the mood and temper of the markets. There has been clear illustration of this quite recently. In the first place I will mention interim dividends which came from Cammell Laird and Vickers, Ltd.

Standing on their own, interim dividend statements may not be highly important. They do, however, give some indication of the earning power and the view which the board of directors adopts concerning results for the twelve months. The two interim dividends I have just mentioned were rather exceptional.

In each case they were the first interims paid for many years. That, in itself, must be pleasing to holders of the securities, for they do get some indirect insight into the affairs of the concerns, although no profit statement or remarks are made by the directors.

When these interims came along markets happened to be in a very despondent mood due to political tension. The result was that the statements passed almost unheeded. Naturally investors in the companies derived some satisfaction but had no compensation in seeing any particular move in the price of their securities.

These dividend statements were followed a few days later by an increased dividend on the ordinary capital of United Steel Companies, Ltd. That came on a day when markets were in a more responsive mood. The immediate effect was to raise the price of the £1 ordinary by 3/- to 24/-. That move straightaway added £1,323,273 to the market capitalisation of the ordinary stock.

Current prices for iron and steel shares appear beggarly in comparison with those ruling in the early part of 1937. It is admitted that in practically every section of the Stock Exchange prices have tumbled seriously from the giddy heights of 1937. That has been only partly due to disturbed politics. Much has been made of trade recession in this country and it certainly looks as if current ideas of iron and steel values are far too low to-day even allowing that the tops of 1937 represented undue optimism.

United Steel Companies dividend for the year to June 30th is 10 per cent. against 8½ per cent. in the previous year. The Cammell Laird interim is 4 per cent. against 8½ per cent. for the whole of 1937. Vickers interim is also 4 per cent. Total dividend on Vickers ordinary for each of the previous two years was 10 per cent.

These distributions do not suggest recession on the part of the organisations. As a matter of fact they speak encouragement. It can be accepted that the directors would refrain from distributing profits if they considered the position and outlook adverse.

Yet we find United Steel Companies £1 units at 24/3 compared with 34/6 as the top last year. Vickers 10/- units are about 20/9, a level which compares with 39/3 as the best in 1937. Cammell Laird 5/- units are about 7/9 with a top last year of 17/7½. The inference is that those with courage to buy at current prices should see capital appreciation when markets become more normal.

These examples by no means exhaust the list of undue capital depreciation. I find in several quarters an opinion that John Brown 10/- ordinary are worth investment attention at a price of 28/9, which compares with 41/3 as a top in 1937. The company paid 17½ per cent., free of tax, for the year to March last against 15 per cent. the preceding year.

Many can be found who regard Hadfields 10/- ordinary as worthy of speculative investment attention at a price of 27/3. Here is a company known to be particularly well engaged on armament work. Distribution for 1937 was 22½ per cent. with earnings of about 32 per cent. The top price for the shares last year was 42/4½.

BREAKING CAMELS

IT has always been the custom of the Bactrian, or two-humped, camels at the London Zoo to work for their hay by giving rides to young visitors between their humps. To carry a burden is nothing new to these beasts, for, in the East, unlike their single-humped brothers, they are used as pack animals. Now, however, the authorities have decided to train one of their Arabian racing camels for the same purpose, and Sheik has been taken into hand by his keeper and is being prepared by stages for his ultimate task in life. At the moment he is being led about to accustom him to a bit, but the fun may begin when his dignity is insulted by having to carry his keeper. Breaking a horse to the saddle is not an unknown art to *Field* readers, but, much as we praise the Zoo's efforts to tap their natural resources, we are extremely glad that the breaking of racing camels does not come into our line of work.

ZOOLOGICAL GARDEN Kolkata 701227 Acc. No. 577 15/12/06

HEIGHT AND GOLF

Hitting, a Question of Forearms and Wrists

By E. R. TIPPLE

IS it necessary to be tall in order to be a good golfer? Is physical strength important? And, if so, where should one be particularly strong? How do professionals train for the game? These and other questions are being discussed as a result of the success of D. J. Rees in the recent *News of the World* match play tournament.

For the second time in three years this diminutive Welsh golfer has become the unofficial match-play champion of Great Britain. With the solitary exception of the Open Championship, no tournament is so difficult to win. Qualifying medal rounds are held in various parts of the country, then follow four consecutive days of matches. It is a gruelling test.

Rees must be one of the smallest first-class professionals in the world. His height is about 5ft. 6in., and he weighs very little more than 9st. Yet he contrives to hit the ball farther than most normal-sized persons; indeed, few golfers can outdrive him by many yards. It would appear that height is of little importance so far as playing really good golf is concerned. Braid, Compston, Barnes and Boomer are exceptions. They all were in the first flight in their time, and they all measured around 6ft. On the other hand, one can remember scores of little men who possessed outstanding playing ability. As examples, in addition to Rees, take Gene Sarazen, Bobby Cruickshank and P. J. Mahon. Lack of inches did not prevent them from being particularly successful. And they are not finished yet by any means. Those who saw the genial "Italian wizard," Sarazen, win the Open Championship at Prince's, Sandwich, in 1932, will never forget his astonishing display of skill over a links which has defeated many a big hitter.

It has been said that it is better "to be a good little 'un than a good big fellow." There seems to be some truth in that. No doubt the small golfer can keep his balance more easily when a wind is blowing than the tall man can. Height does not necessarily mean great length off the tee or with the iron clubs. I saw Rees reach the new thirteenth green at Walton Heath with a drive and a No. 2 iron, and that hole measures 530yds. in length.

Sarazen at his best was a master of the low iron shot. He used to astonish the spectators just as Rees amazes those who follow him to-day. How is this length obtained? What is the secret? Correct timing, velocity of the club-head at impact, tremendous strength in the forearms, wrists and hands. If you did not know that Rees was an expert, you would say that he ducked his body during the downward swing in a manner likely to produce ill results. This is a personal mannerism, so need not be regarded seriously; certainly it would not be worth copying. Rees swings the club quickly, but with absolute control, and he lashes at the ball with youthful vigour, always following through decisively.

All first-class professionals, whatever their size, have powerful forearms and wrists. Previous occupations have helped some of them in this direction. The brothers Whitcombe and S. C. King came of farming stock; Vardon, J. H. Taylor and Mitchell were at one time gardeners; Braid used to be a carpenter. No farmer, no gardener and no carpenter ever had weak wrists or lacked strength in the forearm.

The average player's physical powers are undeveloped. How can he obtain this desired extra strength and so improve his play? Henry Cotton believes that "The best exercise for golf is the golf swing." That advice is practical and sound. Many of us, however, cannot find the time to practise our swings with an ordinary club during the winter months. At home there is often little room to spare for such exercise. Short clubs, not 3ft. in length, can be obtained with the head specially weighted and when these are swung all the ordinary movements can be made. Thus practice can be carried out in confined areas, and if this method is regularly adopted the individual will be surprised at the beneficial results.

The professional golfer uses his left arm and hand, few amateurs do so properly. The right hand and arm are invariably the stronger, and so are apt to take command during the swing. To develop the left hand and arm the best exercise is, again, the swing. I remember watching the Open Champion, R. A. Whitcombe, practising in his shop at Parkstone. He swings a club daily for several minutes, gripping with the left hand only. He does not do this slackly, but concentrates on carrying out the swing correctly just as if he were using his ordinary double-handed grip.

The best and most used exercise for increasing the power of the wrists is to practise swinging two or three clubs at the same time. One word of warning. This should not be carried out for any long period of time. A little goes a long way, and it is as bad a mistake to practise too much as not to practise at all.

Strong wrists and forearms not only help the player in the long game, but are of great assistance for those awkward short pitches and run-up shots. Rees is an adept around the greens. At Walton Heath he saved himself time and again with wonderful pitch shots, often from very difficult positions, the ball stopping within a few feet. Such strokes cannot be played with slack wrists. The ball must be hit crisply, and there is never anything indecisive about Rees's game. The ordinary golfer, either through lack of physical strength or just because he cannot make up his mind to be bold, is rarely firm enough with strokes of this kind.

Never before in the final of any important tournament have there been two such small opponents as Rees and E. E. Whitcombe. Both sons of professionals, both only recently appointed to clubs themselves, and both exactly the same age, they have something else of far more importance in common—outstanding skill with the putter. Lest it be thought that I have laid too great a stress on long driving and physical powers, I would point out that without their astonishing displays on the greens, these two young experts would not have reached the final.

Against his uncle, the champion, young Whitcombe played in such a disrespectful manner and with such assurance that one would have been pardoned at concluding that he was the title-holder himself. Putts of all lengths went down with ease, and his new club—with the popular square grip—certainly achieved a worthy baptism. Rees treated his opponents in a similar manner. The little men on the links have a champion whose example can be copied.

IN TOUCH

A Preparatory School Homily

LAST week railway termini all over the country were brightened by every variety of multi-coloured cap, tie and blazer, for young Britain had come to an end of summer holidays and was in the throes of making its way back to school.

Although it has absolutely nothing to do with Rugby football, I cannot resist remarking upon the queer scene a school train presents, with its freight of young humanity. There is the wretched new boy going to his Preparatory School, trying hard not to weep in front of his sisters; the rather scared annoyance of another who, on his departure for a first term at a Public School, objects strongly to his mother's constant warnings as to the inadvisability of lying on the damp ground after a hot game. A third—and I may say the most unpleasant—is he who has found his feet, and therefore becomes a lordly, all-sufficient young snob, smiling cynically at the various "new bugs" who are to have the misfortune of travelling in the same compartment as himself.

Lastly, of course, there is that exclusive coterie of young gentlemen—captains and kings when they enter their houses once more—who stand somewhat apart and argue dogmatically, from a most imperfect knowledge of the salient facts, as to whether So-and-so is likely to get a blue at Cambridge.

I remarked that this has nothing to do with Rugby football. Perhaps I am wrong, for among this motley crowd stands potential Rugby brilliance. The homesick youngster who does not wish to weep before his sisters may yet thrill these same maidens by a glorious try at Twickenham; or at least he may prove himself to be a useful member of a first-class Club side, providing he is properly trained during his schooldays.

Now here is the whole problem. By "properly trained in his schooldays" I do not only mean training when he arrives at his Public School, for by then he has quite probably been made or marred.

It is on the "five hundred acres of parkland high up in the Dorset hills" which surround his Preparatory School, and where the game is constantly in abeyance that the blood and tears of early efforts may be assuaged, that the International is born.

If a small boy starts Rugby rightly he will progress, but once allow him to become frightened, and then bawl at him for shirking a tackle, or leave him in doubt as to why he should keep behind the ball and not go plunging all over the field, and he will probably never rise far.

A youngster is much more reserved and shy than some people realise, and as often as not will say he understands what is expected of him if he thinks he may appear foolish by admitting his ignorance, when, in fact, nothing is farther from the truth.

It is like a snowball. Because he does not understand, he thinks he dare not ask; because he dare not ask, he goes wrong again; because he goes wrong again, he is shouted at; and because he is shouted at, he is even more fearful of inquiry. Thus, by the age of fourteen, he has learnt to perfection the art of imitating others and of keeping well in the middle of a hurly-burly in the hope that he will kill two birds with one stone by appearing to be doing some stout work in the maul, and by keeping clear of anything which needs individual brilliance. All these years he has been learning to sing in his heart a song I once heard, containing the words:

"I don't like rugger a bit,
I don't like rugger a bit—
My mother was right when she said it was rough,
Others may like it but I've had enough.
I don't like rugger a bit."

The boy goes to his Public School with an inferiority complex which condemns him to the slough of the "C's" and "D's", where he remains with other unfortunates, bereft of all enthusiasm, until he makes an inglorious Rugby exit from school life. Quite naturally, now that it is no longer compulsory to play, he drops out of the game altogether, and is lost to his Old Boys' team or to one or other of the nearby Clubs.

Quite understandably, at the beginning of schooldays, it is the best developed boy and the most courageous (the latter quality is so often born of the former) who soars into the lead, and it is all too easy to neglect the careful groundwork of the majority, for an over-interest in the few paragons. Brawn and courage are valuable—indeed, the latter at any rate, is essential—but they are both of little value without intelligence, and that is a quality which does not always go in partnership with the other two. The more slightly built lad may possess the brains his more exuberant fellows lack, and when he has broadened out, may eclipse them all.

The task of the Preparatory schoolmaster is exacting, and, quite frankly, seldom very inspiring—he sows where others reap. None the less, he may justly claim the gratitude of the Rugby football world if his task is well done. Praise is given to the Public Schools for many outstanding players of the day, praise which more rightly belongs to those who first hacked and hewed at the raw materials.

New Books

THE FUTURE OF URBANISM

A History of "The Good Life"

The Culture of Cities. By LEWIS MUMFORD. (Secker & Warburg; 21/-.)

"MEN come together in cities in order to live; they remain together in order to live the good life." Aristotle spoke these words a very long time ago. They are noble words and in Aristotle's day they clothed a noble ideal. To-day? Well, any man who spoke those words to-day would be a cynic beyond reform. For to-day we know that but the smallest fragments of that ideal are fulfilled in the modern world; to-day we know that barbarism and despair are rife in a world which has substituted ideology for ideal.

But Mr. Mumford takes those words as the starting point of his book and he ends with them. His book is a noble book, as noble in its concept as the ideal which Aristotle put into words. He starts with a full-length description of the mediæval town. Towns then were dominated by the cathedral and the market square. The church and trade ruled. Learning, to a very large extent, went hand in hand with commerce. The mediæval town had few ideas on sanitation, and the church rigid ideas on commerce, but the town then was not too bad a place. That town gave place, with the rise of national spirit, to a city ruled by the army and the army's rulers—the bureaucracy. And that one can well imagine was not a pleasant city for the ordinary civilian. And then came the industrial revolution and what Mr. Mumford calls Coke Town. This is really the key section of the book. It was then that men first went mad for money. But a few made the money—millions suffered for the madness. These industrial cities are not cities at all—but dung-heaps of brick and mortar, thrown up not as refuges for the people living in them, but as offerings to the machines that feed on them. And after Coke Town (but Coke Town has not vanished) came what Mr. Mumford calls Megalopolis—the city of prestige, the city of credit finance, the bastard child of Coke Town—London, Paris, New York, Berlin, Chicago—congested, decivilised, devitalised, barren of light, air, health, initiative.

And after Megalopolis? Whither go we? To Tyrannopolis? That Fascist city of straight lines and straight rules, that cubist nightmare of rigidity in thought and action that a few years back seemed impossible; and now is not so impossible? Perhaps. And thence to Necropolis, the city of the dead, along the broad highway of war and revolution and starvation and disease. And again perhaps.

But Mr. Mumford sees another city. He stands as the prophet of a new world. He sees a new creative order, a city abundant in life, a city thriving, instead of throttling, on the technical advances of modern science. And that is his book.

I have said it is a great book. I could go on saying that, and yet never convey what it is that I really feel about the book. It is a book that makes you think, a book that you put down but cannot forget even for a moment, so that almost immediately you are picking it up again and reading enthralled. A great book. Yet in some way a disappointing book, for to my mind too little stress has been laid on the human element—and even that may have been deliberate.

That this modern city of ours is indefensible is surely beyond contradiction. You have but to live in London, to travel in London tubes in rush hours, to board London buses, to realise just how indefensible. You see young men and old, young women and old, herd on and herd off; you see tired faces, dull unintelligent eyes, bowed shoulders and flat feet; you see human machines. You see the progeny of Coketown living in Coketown's progeny Megalopolis. You see—if you have eyes to see—all the elements of tragedy. The results of that tragedy can result—in this age of civilisation—only in Tyrannopolis and then Necropolis. It is easy enough to talk of new cities and new creative forces. The elements of the tragedy lie deeper than that. You can remove the elements of tragedy only by removing the Coketown complex—and that is a greater problem. At the moment science has conquered men. Mankind must conquer science; all mankind—the little man in the bowler hat, the little typist with her rouge and her high heels and her "boys," no less than the big man behind his cigar.

Mr. Mumford is not as concerned with this human element as I, for one, would wish. And yet it is through the reading of his book that I am so conscious of the human element. I have been unconsciously conscious for a long while, for I, a countryman, have been pitchforked into the stress of tube strap-hanging and have not yet entirely lost the independence of mind that belongs to the high downs and the changing seasons. But it was Mr. Mumford that brought home to me the greatest sore in the "great wen."

I can only say, again, a great book.

Nothing but Dogs. By A. F. BARKER. Illustrated by the Author (A. & C. Black; 10/6).

Whether or not you already know a good deal about dogs, you will find here a book of enthralling interest. Mr. Barker knows his subject about as well as it can be known, and deals with most breeds from dachshund to deerhound, or perhaps I should say from papillon to bull mastiff. Not only are we given in most readable form a great deal of information about the feeding and care of dogs of all kinds, but the author has also dealt in some detail with the characteristics of each individual breed, and this will be of great assistance to any prospective dog owner. I am sure his excellent drawings of all dogs, especially the adorable ones of puppies with their "trousers" falling off, will appeal greatly to all dog lovers, grown-ups and children alike.

Introducing Britain. By various authors. (George Allen & Unwin; 7/6.)

We have lately had a glut of books on Britain. The more urbanised we become the more we look to the country; the more we long to get there; the more we turn to the countryside writer. As a result, countryside writers have increased vastly and countryside books are legion. This is certainly not an outstanding one. It is no better than some, no worse than others; it is, indeed, saved from mediocrity only by the writing of Thomas Burke—on London!—and the few, but remarkable, photographs. Two years ago this would have been a very good book. To-day it is by no means a bad one. As propaganda for tourists it is no doubt excellent.

Grassroot Jungles. By EDWIN WAY TEALE. (Putnam; 15/-.)

Have you ever thought of exploring in your own back garden? It is quite good fun—even in a London suburb—and with Mr. Teale it is jolly good fun. You see, Mr. Teale has a much more entertaining garden than you will find anywhere in England, and Mr. Teale has a camera and a very good camera at that, and he can (plenty of people with good cameras can't) take jolly good photographs. So far so good; but there is more. Mr. Teale is a first-class entomologist, and you cannot (unless, I suppose, you are yourself a first-class entomologist) read one page of this book without enlarging your knowledge of the insect world. And that surely is the hall-mark of any serious work on natural history. For English readers, whose main interest naturally lies with English insects, there is much in this book about insects which is beyond the scope of our island wild life. For true naturalists that will prove to be but an added incentive to buy the book. By-the-bye, this is most definitely a book to buy—if you borrow it from a library you will certainly find yourself paying for it sooner or later—if only for the photographs. The photographs are by far the best of their kind I have seen—and there are few I have not seen.

We Were in the Ark. By GEOFFREY HOLME. (Studio Publications; 6/-.)

This is, at first glance, a volume more suitable for the nursery than the library; but on closer investigation it is obviously a book to be enjoyed by everyone from the age of seven or thereabouts upwards.

What must be the oldest club in the world was inaugurated, it appears, at the time of the Flood, when feeling among the animals ran high owing to widespread discontent with the treatment accorded to them by Man. This discontent was forcibly, but in strictly alphabetical order, expressed at the Extraordinary General Meeting of the Ark Club, and the record permits us to see ourselves as a number of the leading members see us. The meeting, under the chairmanship of Mr. Lion, was a very lively one, and it is to be regretted that the proceedings were brought to such a very disorderly conclusion.

We are indebted to the author not only for some very frank opinions of Man, as expressed by the animal fraternity, but also for some excellent portraits of the club premises and of some of the more distinguished members.

This book is really great fun, and can be heartily recommended to anyone who can join in a laugh at his own expense.

* * * *

Right into the Heart of the Amazon. By EARL PARKER HANSON (Gollancz; 12/6).

Mr. Hanson's expedition to Manaos was a scientific one. He was sent by the Carnegie Institution to study at various given points (set up many years previously by other explorers) "terrestrial magnetism." A host of knowledge lies in those two words, but the author has refrained from writing upon the subject. Only in his last chapter does he lightly explain why terrestrial magnetism should be studied.

But Mr. Hanson made a very interesting journey, apart from his work. He travelled in 1931-33, a time when Venezuela and Brazil were undergoing most disturbed conditions. Mr. Hanson, in addition to the normal difficulties of a traveller, was encumbered by much luggage of a valuable nature. He made his way along the Negro River from place to place, gathering his food and credentials as he went, and struggling to keep his health, or at least sufficient strength to work his instruments. He was appalled at the state of malnutrition among the whites and natives all along the river. His own supply of quinine could have been used many times, and he suffered for his generosity. Lack of fresh foods is the author's reason for this state of ill-health, and he visualises improved conditions with the reed land used for food production and the "white" man ready to colonise in the true sense of the word: at present his position is decadent, the civilisation is falling back, and the boom of the rubber kings, with their mansions built with stone from Europe, has long since fallen.

Here, too, is probably the first real account of that romantic figure, Tomas Funes. His name is still too great a terror in the Orinoco territory for anyone to speak freely of him, but Mr. Hanson gleaned a little knowledge of his reign in power, and has since been able to add to his supply. It is the tale of a remarkable "dictatorship" which makes particularly interesting reading to-day.

This is most definitely a good book. It is written by an American who was seeing the country with fresh eyes. Missionaries, the British, Whites and Blacks, are all examined, weighed and summed up with an open mind. Here is the spirit of wide vision which is not easily developed in Europe to-day.

C. N.

BOOKS IN BRIEF

Rather a grim little play is *Frozen Glory*, by Leslie and Sewell Stokes (Secker & Warburg; 3/6). The situation is not very original—six stormbound with their food supplies almost exhausted. But the play grips and the characters are good. An opportunity for fine acting.

Once again the Annual of Camera Art—(*Modern Photography*, 1938-9, edited by C. G. Holme (Studio; 7/6)—has made its welcome appearance. Comparisons are odious, but this number has some truly exquisite pictures which outshine their predecessors. The colour film work is intensely interesting and the commercial subjects show a striking presentation of facts combined with beauty.

POINTERS AND SETTERS AT PYNES

FINE weather favoured the Devon and Cornwall Pointer and Setter Society's working trials on September 14th and 15th. They were held on Lady Rosalind Northcote's and adjoining estates, at the Pynes, near Exeter. Mr. W. East and Captain Conway Williams were the judges, and Major Anstey and Major Knight Bruce were the official guns, with Mr. H. Tresawna, the secretary.

The Novice and Brace Stakes were run on the first day, and the Open and Qualifying on the second day. Mrs. R. M. Foot's Beorcham Welcome, winner of last year's Field Trial Championship, won the Open event. Welcome ran a perfect trial, showing pace, nose and style, and being absolutely obedient to its handler's orders, and gave the spectators a real treat in setter work in his second round. Placed second was Mrs. F. Nagle's Irish setter dog, Sulhamstead Bluff D'Or, Field Trial Champion this year, who worthily upheld his great reputation as a game finder and gundog. In each of his heats he showed nose and perfect breaking. Carswell Orangeman, Mrs. A. Badenach-Nicholson's English setter, and a winner in the Kennel Club this year, was placed third. He gave a fine display, always going sensibly and looking for game, and showing nose in a most charming style on point. Reserve was Tiverton White Cloud, Mr. Miller's and Miss Moir's pointer, a dog just out of puppyhood, but of the highest class, both in work and looks.

In the Novice Stake, birds were rather scarce at the start, but improved later. First, Captain Colville's pointer Penheale Donald found a covey in very fine style in the first round in a root field. He also got in a very nice point in the second heat and won the stake. Close behind him was Mr. Miller's and Miss Moir's pointer bitch Tiverton White Coral, who did some perfect work, but the winner just beat her. Another nice pointer was Penheale Vixen, placed third. Mrs. A. Badenach-Nicholson's pointer bitch, Carswell Pride, was reserve.

Mrs. Nagle's Sulhamstead Bluff D'Or and Sulhamstead Vie D'Or were first in the Brace Stakes, with Mrs. Holt's Keane O'Moy and Rosina O'Moy second; both braces Irish setters. The pointers, Tiverton Falcon and Tiverton Bronze, were not as well matched and want more brace experience.

Mr. Braddon's red Irish setter, Red Guide of Ide, was awarded a working certificate. The cup for the best handler went to Mr. G. H. Abbott.

THE OCTOBER BORDER

Colourful Late-Flowering Plants

By ELEANOUR SINCLAIR ROHDE

THE October border is becoming a feature in many gardens, especially as August and September are holiday months. It is a comparatively modern development, for the glory of the herbaceous border used to be over by the end of September.

The late-flowering Michaelmas Daisies are very fine. One of the best of the newer varieties is Wonder of Staffa. It is a hybrid of *A. Frikartii*, but it is larger and better and quite a foot taller. I think it will soon be in every garden. Although listed for so long in most catalogues, *A. Thomsonii* is still far from commonly grown, yet this delightful Aster has the merit of flowering continuously from July till November. A first-rate front-row plant growing about 15in. to 18in. high, with big pale blue flowers, it associates delightfully with Gladioli.

Amongst the tall-growing Asters the pick of the late-flowering new varieties are Blue Gown, which grows nearly 6ft. high with branching stems and rich blue flowers, and Spire, with flowers quite 3in. across and a beautiful pyramidal habit of growth. In common with all varieties of branching growth both these need plenty of space and should never be allowed to produce more than a few stems to each plant. If only three stems are left to develop, Spire flowers right down to the ground, a much more attractive sight than a mass of stems bare of flowers except at the top. Mulberry, which is perfectly described by its name, grows 4ft. high. Amongst the other October flowering Asters the following are, I think, the best: Ruby Tips, Maid of Colwall, Queen Mary, Rosette, Brightest and Best, Harmony, Taplow Spire (generally regarded as the best of the new pinks), Heather Glow. All of these grow about 4ft. high. The new Petunia grows only about 3ft. high and associates well with the lavender flowers of Owen Wells, which grows about the same height.

Kniphofias always look well with Asters. The old *K. maxima globosa* is grand, attaining quite 7ft. and flowering throughout October and November. It associates well with late-flowering tall Asters such as the universally grown Climax, King of the Belgians and Sam Banham (a white seedling of Climax). *K. erecta*, which grows a little over 3ft. high, begins flowering in August, but it goes on usually till the end of October; so do the semperflorens hybrids.

The latest flowering Heleniums are Chipperfield Orange and *H. rubrum*. Crimson Beauty, though it grows only 18in. high, is invaluable, for it flowers from June to the end of October. *Heliopsis incomparabilis* is also indispensable. Then there is that fine old Lobelia, *L. cardinalis*, which, unlike the new hybrids, usually flowers all through a fine October. It associates well with the late-flowering Gypsophilas, *G. Oldhamiana* and *G. pacifica*. Both these Gypsophilas are pink flowered and both grow the same height as *L. cardinalis*, *i.e.*, about 3ft. *L. cardinalis* needs to be put in groups to look effective. *Aconitum Wilsoni* is in most gardens, the best form being Barker's, which is taller than the type and has richer blue flowers. Gaillardias are always showy, the best being the Monarch hybrids. The tallest growing, however, is The King. The latest flowering Rudbeckias are *R. nitida Herbstonne* (6ft.) and the new Monplaisir, which has flowers nearly 5in. across (3ft.). The Japanese Anemones are dubbed as weeds by many folk, but in October one is thankful for them, and the white varieties help to lighten the border. The white-flowered single kind is always lovely and Kriemhilde, with pretty semi-double red flowers, grows quite as tall. Most of the red and pink kinds are not so tall-growing.

Anthemis Sancta Johannis is amongst the indispensable border plants, for it flowers from May to October and into November in a mild season. The best form is Well's variety, which grows well over 2ft. high with flowers about 3in. across. *Salvia azurea grandiflora* is an old favourite that might be more commonly grown. Its long racemes of rich blue flowers are always attractive and the plant has a pleasant old-fashioned look. *Scabiosa caucasica*, both the type and the white variety, usually flower well into October, but the lovely powder-blue Constancy does not last as a rule longer than September.

The Geums usually flower well through October, notably *G. Borisii* which, on our sandy Surrey soil, goes on till nearly Christmas. *G. rivale*, Leonard's variety can, as a rule, also be relied upon to flower at least till the end of October. The only trouble with *G. rivale* is that it increases so rapidly and has to be divided up every two years. It is a first-rate front-row plant because its foliage is so handsome. Senecios are rather too coarse growing for the average border, but *S. pulcher* is valuable not only for its late flowering (usually till nearly the end of October in the south) but also because it grows not much over 2ft. high and the flowers are so striking.

On light soils Pentstemons go on flowering profusely till well into November and look particularly well if the cherry red and mauve varieties are grown together. As for the cheery little button Chrysanthemums, they usually flower when every other flower is dashed with wind and rain till the middle of December.

THE ART OF THATCHING

OF all rural occupations the most mysterious and highly skilled are perhaps thatching, charcoal burning, hedge laying and timber felling, and these trades are said to be declining.

Regrettably true, but are the arts to be lost for ever? Of course not; one of the things that we have learnt in the twentieth century is that progress and knowledge lies in the future and not in the past.

Charcoal burning during the War was carried out under the direction not of a skilled burner, but of an observant and intelligent officer. Thatching in a similar manner is equally capable of being undertaken by the intelligent though inexperienced.

Except in Norfolk, where reeds are used, the materials required are wheat straw (it takes 7cwt. per square of roof surface), tarred string of the thickness of binder twine, cleft hazel cut to the size of bean sticks and cleft into two or three wands.

The tools required are a pitchfork to handle the straw, an iron needle 1ft. 6in. long with an eye large enough to take the string, a pair of sheep shears to trim the eaves, a ladder capable of reaching to the ridge of the building to be thatched, and a special rake made like a large hair comb of a length of 3ft. with wire teeth set ¾in. apart and continuing for half the length of the rake. This rake is used to comb the loose straw from the finished roof.

Methods vary considerably in different parts of the country, and while the best methods give a roof lasting 20 years or more, the inferior methods result in a life of little more than half this period. To decide the best method to adopt it is necessary to consider the theory of thatching.

When a hay stack or straw rick is thatched the layer of straw is held in position by rows of thatch rods traversing the roof in a horizontal direction, usually two at the ridge and two or sometimes one at the eaves. In addition rods are placed in three or four rows round the hips or gables. These rods are held in position by hazel staples formed by taking a piece of rod 1ft. 6in. long, giving it a twisting bend to form a U shape, sharpening the ends and cutting the rod partly through to form barbs, so that when the staple is placed over a rod and then pushed into the rick it is retained in position by the barbs.

When thatching a building it is possible to have access to the under side of the thatch, so that the rod method of securing the thatch can be augmented and to a large extent replaced by the stronger method of securing the straw to the rafters and battens by sewing with string.

The principle of thatching buildings is, therefore, to commence at the eaves and lay a continuous carpet of straw, which should be from 7in. to 9in. thick, and when the ridge is reached the top layers are butted together and secured with rods, or the ridge is capped over with straw and secured with rods as will later be described. The important point is that the roof straw is firmly sewn on to the rafters.

Thatch has two great enemies. The wind is the more serious. A light material like straw is very liable to be lifted by the wind. This lifting tendency is most noticeable on a flat surface, which aerodynamic research has proved to cause eddies that are not produced on a curved surface. This is the modern justification for the age-old custom of the best thatchers to vary the thickness of the thatch, increasing it in the middle of the roof slope so that the finished roof presents a curved and rounded appearance like the bellying of a yacht's sail.

The other serious enemy of thatch is birds and small rodents, which burrow into the thatch for nesting purposes. To combat them all thatch should be covered with ¾in. mesh wire netting.

Penetration of water into a well-thatched roof is not considerable. None will pass right through, but on a wet day inspection at the eaves will show that penetration into the thatch itself is confined to the uppermost 4in. This indicates that at about the middle of the roof only the top 2in. or so will be saturated, but this depends upon the slope: 45 degrees is the best angle, but 40 degrees is quite satisfactory, any slope less than that requiring an extra thickness of thatch.

A future article will describe the process of thatching and the special treatment of eaves, hips, ridges, gables, verges, valleys and abutments of chimney breasts. Before considering details there is a word of warning with regard to the straw. Use only wheat straw. Oat and barley straw are neither so stiff nor so resistant to decay. Get the best and longest wheat straw and lay it on the roof with the stalk ends and *not* the heads protruding.

The practice of some thatchers to mix the straw and have some heads and some butts protruding has nothing to recommend it, and increases the risk of wind damage.

REGINALD DAVEY.

GARDEN POOLS—II

Preserving a Balance Between Animal and Vegetable Life

By F. AUSTIN WATSON

I ENDEAVOURED to explain in my last article the necessity for preserving a balance between animal and vegetable life in a garden pool, in order that the whole community may remain happy and healthy in clear, sweet water, the aim and object of every pondkeeper. Much depends upon the type of life chosen, of course, and I propose to deal more intimately with that now.

I stressed the necessity for oxygenation by plants. The best plants in a fairly wide group for this work are *Elodea crispa* and *Myriophyllum spicatum*, both of which grow entirely submerged and, apart from their invaluable contribution to the self-management, offer admirable shelter to baby fishes when these come along in the normal course of events. Common names for these two are Canadian Water Weed (though this should, more correctly, be applied to *Elodea canadensis*, of which *crispa* is a sub-species) and Milfoil respectively. The *Elodea* has very long stems, occasionally branched, with narrow reflexed leaves thickly clothing them, while the Milfoil has even denser, hair-like, finely-divided leaves.

Somewhat resembling the latter in its submerged foliage, but most distinct in its aerial foliage and flowers, is the Water Violet, *Hottonia palustris*, which is an excellent oxygenator so far as its submerged foliage is concerned, while giving an added attraction with its white to lavender flowers thrust anything up to a foot above the surface. The latter prefers a depth not exceeding 18in., whereas the two former will tackle almost any depth. There are many others, of course, but these three are in popular use owing to their great efficacy, and do not come into the category of plants chosen for their beauty so much as utility. Oxygenation is the one point to bear in mind with these submerged plants, many of which have no decorative value whatever.

Then comes the question of sub-aquatics. The usual procedure is to allow the same number of plants as there are square feet to the surface area, dividing this number into three or four, allowing a third or a quarter submerged plants, and the

THE MARSH MARIGOLD (*CALTHA PALUSTRIS*)
Also known as King Cup, this most attractive plant has bright green foliage and golden yellow flowers, being a most excellent plant for carpeting between taller aquatics

remainder sub-aquatics. This term is applied to a tremendous group of plants which root in soil with their crowns submerged under a certain depth of water. The majority prefer shallow water, 6in. or so being admirable, while certain of them, such as Lilies and the nuphars, will stand from 2ft. to 4ft. of water.

Their value in the pool cannot be over-estimated. Their powerful roots and great appetites account for most of the waste matter in a pool, the roots converting the rubbish such as falling leaves, fish excreta, &c., into a harmless detritus after extracting their own nourishment therefrom. It is almost impossible to use too many of them, though Water Lilies should be chosen with circumspection, for many are too powerful for one another, and in most smaller pools it is better to rely upon one or two only for central pool attraction and surface shade, innumerable upright sub-aquatics being stocked round the shallow planting border to which I referred in my last article.

Such a large choice is available, and most people have their preferences for colour and character, that it is difficult for me, in the space available,

THE FLOWERING RUSH (*BUTOMUS UMBELLATUS*)
Sometimes referred to as the Water Gladiolus, this is a magnificent sub-aquatic adapted for 6in. or so of water. Its foliage is dark green and triangular, while its delightful rose-coloured flowers are carried in large umbels at the heads of bold leafless stems

to refer to many, but chief among the most delightful of sub-aquatics are the Sagittarias or Arrowheads, with spearhead leaves and lovely white flowers, *Macrophylla* and *Japonica plena* being particularly lovely. *Thalia dealbata* is noteworthy for its magnificent foliage of glaucous blue, carried on stems from 4ft. to 6ft. high, while *Glyceria spectabilis variegatus*, with its yellow, white and green striped foliage, should never be overlooked.

The Zebra Rush (*Scirpus zebrinus*) is very attractive also, possessing the most unusual (in plants) feature of being striped horizontally in pale green and yellow bands. Many of the Irises are essentially sub-aquatic in character, too, while the native English plants *Acorus calamus* (Sweet Water Flag), Flowering Rush (*Butomus umbellatus*) and Water Plaintain (*Alisma plantago*) are always worthy of a place. The Bog Bean is a useful carpeting plant, as is the always lovely little *Mimulus ringens*, for filling in the gaps between the taller sub-aquatics, and our native Marsh Marigold has some lovely varieties, notably *Caltha palustris plena* and *alba*, to serve the same admirable purpose. Touching on the loveliest of all, the Water Lilies, by expressing my inability to discuss this terrific subject in the space at my disposal, I cannot leave the plant subject without a reference to *Pontederia cordata*, a lovely sub-aquatic possessing that rare virtue among water plants, blue flowers.

Fish are not so large a subject. Many of our native fish such as perch, pike, &c., do not make good pool fish, and have little attraction about them. The Continental species and varieties known as "coloured domesticated fish," stand, and have always stood, pre-eminent for their beauty, hardiness and tameness. For those preferring the common goldfish, much too well known to need description, I would say that on purchasing them make sure they are well acclimatised, for thousands die off in their first few months in this country.

The golden orfe, finest of all pool fish and the hardiest, with his regal bearing and salmon yellow body reaching a length of up to 20in., always looks magnificent when cruising barely submerged, snapping at flies, &c., as is the habit of all surface feeders. The golden carp, resembling the goldfish but distinguished from it by its barbels, is as good, if not better, than the goldfish, but possesses the same, to me, bad habit of submerging deeply too much, a thing the orfe does not do. Much smaller, but infinitely attractive and possessing the advantage of being bred in England and needing no acclimatising, is the shubunkin, offshoot of the goldfish, available in a myriad colours—pink, white, red, gold, black, blue and every variation of these.

Remember the rule of stocking with ample vegetation, and go to the other extreme in stocking with fish. To be really safe, and ignoring all rule-of-thumb methods once relied upon, reckon the size of every fish when full-grown, irrespective of its size when purchased, and allow double the number of gallons for the fish. Then you can never go wrong, and a few healthy thriving fish are better than a larger number of overcrowded unhealthy fish.

(Concluded.)

NORTHERN AND MIDLANDS' SPANIEL CLUB.—It is announced that Mr. W. McCall will be unable to judge at the above club's forthcoming Field Trials to be held at Kinmel Park, Abergele, on Tuesday and Wednesday, November 1st and 2nd. Mr. H. L. May has accepted the invitation, and will act as one of the judges, along with Mr. R. R. Kelland.

RHODESIAN RIDGEBACK DOGS

By A. CROXTON SMITH

ANY little peculiarity exhibited in a breed is sure to excite attention, whether it be in conformation, size, colour or distribution of coat; and many, who have not had practical experience of the possibilities of creating new forms in a comparatively short time, express surprise that domesticated dogs should all have sprung from the wolf, and possibly one or two species of jackals. It is difficult to believe that a tiny creature weighing not more than 3lb. or 4lb., or the dogs with massive heads and practically no muzzles, should have all had the same origin as mastiffs or Great Danes.

Ordinarily, the Rhodesian Ridgeback dog has nothing to distinguish him from the common run of others of the same size. He may stand about 26in. in height and weigh up to 70lb. His smooth coat is usually wheaten-red or fawn, with perhaps white points, and he is sturdy and muscular in build. Just a good, honest working dog without any fireworks or any special beauty that will make the ladies exclaim on seeing one. For all that, he has aroused enough conjecture to make the scientists talk about him, simply because he has one peculiarity entirely his own. That is the characteristic ridge of hair that runs along the back in the opposite direction to the rest of the coat.

The standard of the Rhodesian Ridgeback Club of Salisbury, Southern Rhodesia, explains that "this ridge, which must be regarded as the escutcheon of the breed, is broad behind the shoulders and tapers off towards the root of the tail. It should be clearly defined and start immediately behind the shoulders, and continue up to or over the loin. A dog without a clearly-defined ridge is not recognised as belonging to this breed." Evidently, no ridge, no Ridgeback. This seems to be rather a hard saying because, as we know, dogs that are pure bred in every respect sometimes fail to conform to a point laid down, although they may be useful for breeding from, not passing on their fault.

How did this strange peculiarity arise? No one seems to know, and the matter was brought under the notice of the British Association eleven years ago by Professor J. L. Myers. The booklet published by the Rhodesian Club mentioned remarks that the most generally accepted view of the origin of the breed seems to be that it is the result of a cross between the Cuban bloodhound and the Hottentot hunting dog, the latter supplying the ridge. Theal, in his *History and Ethnography of South Africa*, refers to the dog of the Hottentots as having been an "ugly creature, his body being shaped like that of the jackal and the hair on his spine being turned forward."

It has been said that this dorsal eccentricity is to be seen on the dogs of the Island of Fu Oc in the Indo-China Sea and in a part of Malaya. There is a possibility that the Hottentots may have settled in South Africa from Asia and taken their dogs with them.

Mrs. Edmond Foljambe, of Osberton, near Worksop, when on safari, used some of the Ridgebacks, and brought several home with her, which was the start of the breed in England. That was some ten years ago. Since then a few exhibitors have added them to their kennels and some are often seen at the principal shows. They give one the impression of being a good type of working dog, and it may be that their admirers will increase in numbers. At first they went under the name of Rhodesian Lion dogs, and that, though incorrect, is still used occasionally. They are "lion" dogs in the sense that big-game hunters use them. Selous, Van Rooyen, Waller of Nairobi among the rest. Their job is to worry the lions by pretending to attack them until they are brought to bay, and that enables the hunter to get a steady shot at close range.

The club booklet referred to declares that there is no finer pal for a man, and that the dogs can be trained satisfactorily for the gun, as they have excellent noses and are teachable. They are also valuable for clearing baboons off the farm. Perhaps they have not the qualities that appeal to exhibitors so much as those shown by many other breeds, but those who have kept them have told me how very satisfactory they are in every way. I never care to predict, however, as to what is likely to capture the fancy of the public, for the popular mind works in a peculiar way.

[From time to time we are asked where Ridgebacks are to be had in this country, and will be pleased to supply information as to the various breeders.—ED.]

MR. W. J. WALLACE, SHEDDING THE SHEEP DURING HIS WINNING TRIAL WITH JED

SHEEPDOG TRIALS AT SOUTHPORT

Northumbrian Handler Takes the Honours

THE greatest pastoral event of the year, the International Sheepdog Trials, which are held alternately in England, Scotland and Wales, took place on the Municipal Golf Course, Southport, on September 14th, 15th and 16th, when a Northumbrian handler, Mr. W. J. Wallace, of East Otterburn, scored a great personal success.

Not only were his two dogs, Jed and Foch, placed first and second respectively in the supreme championship on the final day—the first time since the War that any one handler has held these positions—but he also managed to secure second and third placings in the International Farmers' Cup contest on the preceding day, was the winner of the "Land of Burns" Cup for the highest points at the national and international trials together, and was placed fourth (with Jed and Fly) in the brace, or "doubles," championship on the opening day. In addition, he had the satisfaction of seeing his dog Foch establish a record for the shortest time ever run in an international, namely 15min. 56sec.—a wonderful feat when it is remembered that the course for this event entails the collie in runs totalling some two-and-a-half miles, as well as a great deal of difficult technical work.

The course was one with many difficulties. Golf courses have been used for these contests before, but in the general opinion of the competitors few have presented the same obstacles and required more careful and closer driving and following. Sand dunes and bunkers were sprinkled liberally about, and in many cases the handlers found that they were unable to see either sheep or collie. In one instance, a Welsh handler gave an entirely wrong command through working in the "blind" at a critical moment in the course.

On the final day, when the full course of 675yds. was being used, a morning haze had its effect on the morning's work, although conditions bettered themselves as the day went on. Few perfect runs were made, however. For the qualifying contest, with which is incorporated the International Match, on the preceding day, conditions were very good, but on the first day heavy drizzle in the morning considerably hampered the work of the hired shepherds and in the afternoon a strong breeze meant that the collies engaged in the brace championship were many times unable to hear their masters' commands.

It was not until late afternoon on the final day that Mr. W. J. Wallace came on with what was to be the ultimate winner and his Jed, an eight-year-old bitch which has represented England six times in these contests, made a delightful run. After a rather wide outrun, she made a perfect gather of the first batch of sheep and then returned to fetch the second batch in first-rate style. Good driving and really clever shedding made this one of the best runs of the day, and it was obvious that only exceptional work from either of the two Welsh handlers that were to follow could wrest the winning position from Jed. When the final result was announced, it was found that the three judges had only deducted 10 points, and she secured 170 out of the maximum of 180.

Earlier in the day, Mr. Wallace had a wonderful round with his two-year-old Foch, who gathered both batches of sheep without hesitation, following this with a good drive and assisting his master to make what was easily the fastest shed of the day. Foch obtained 162½ marks.

One of the outstanding features of each dog's performance was the wholehearted obedience to command and Mr. Wallace never had the slightest difficulty in making either of them understand his wishes. His somewhat unusual "Walk" is obeyed almost instinctively by his collie slackening pace.

JED, WHO GAINED THE SUPREME CHAMPIONSHIP AND (RIGHT) FOCH, WHO TOOK SECOND PLACE

The son of Mr. W. W. Wallace, who was winning trials 50 years ago, and who, despite the fact that he is now approaching 80 years of age, competed in the English National trials at Ilkley some weeks ago, "W. J." reveals many of his father's characteristics, and it is obvious that the name of Wallace is going to be heard in sheep dog circles for many years to come.

Mr. W. B. Bagshaw's Glyn, which was the first runner, secured third place. He ran a steady course, but missed the second gate and was a trifle uncertain in the shedding. Glyn is, of course, the "Owd Bob" of the famous film, and throughout the trials was a great favourite with both spectators and cameramen.

Another feature of the contest was the eclipse of Mr. James M. Wilson's Roy, winner of three supreme championships. In the qualifying trials, Roy, who in addition to the fact that he is blind in one eye, was severely handicapped by lameness, was unable to find a place in the first twelve, but Mr. Wilson did much better with his Jimmie, a two-year-old dog from Yorkshire, who, in the qualifying contests, shared fourth position with Mr. J. Walker's Risk. Jimmie made a brave show in the final championship, revealing fine form in gathering and driving, but having his efforts frustrated by the stupidity of one sheep who refused to leave the others at the shed and allowed the time to run out. Mr. Wilson was awarded the "Hard Luck" for Jimmie's heroic effort.

The winner of the Farmers' Cup in the qualifying contest, Mr. T. Roberts, was unable to reproduce the same form in the supreme championship, and his Jaff II had to be content with sixth place, and Mr. A. Storie, who was the only hired shepherd to compete on the final day, could only secure ninth place with his Queen. Mr. Storie won the Challenge Cup for the highest placed shepherd in the second day's event.

Of the three national champions, only Mr. W. F. Miles, of Treharris, South Wales, got through the qualifying tests, both Mr. J. M. Renwick, the English champion, and Mr. David Murray (Scotland) being eliminated.

In the competition for the Team Shield, Scotland was handicapped by the fact that only ten of the twelve dogs were able to start, and the English team scored a decisive victory. Wales was second, over 200 points below the winners.

Mr. James M. Wilson had the satisfaction of retaining the brace championship with his clever pair, Roy and Nell, but he had only half a point to spare from Mr. D. C. Morgan, of Aberystwyth, whose Lad and Meg put up a fine fight. Another Welshman, Mr. Ted Jones, of Carrog, winner of this year's Welsh national, was third.

Mr. Andrew Templeton, of Girvan, with York, won the special hired shepherd's class on the opening day, and Mr. John Jones, of Trawsfynydd, with Blackie won the driving competition in which 50 sheep had to be driven by one dog.

In this Driving Competition, 50 Swaledale sheep had to be driven 800 yds. from the handler and through three gate obstacles, Mr. John Jones, as stated, won the first place with Blackie, Mr. David Murray the second with Sweep, and Mr. J. M. Renwick the third with Kep.

At the conclusion of the event on Friday, Mrs. Anthony Lowther, M.F.H., presented the awards, Lord Mostyn, the President of the International Sheepdog Society, presided.

SYDNEY MOORHOUSE.

THE DAIRY SHOW

The Present Position of the Average Farmer

ONE afternoon twelve years ago Lord Baldwin, or Mr. Baldwin as he then was, found himself faced with the threat of a General Strike. Instead of sitting in Downing Street to seek a solution, he betook himself for the afternoon to the London Zoo. I discovered his wisdom this week at the Dairy Show; there is something eminently satisfying and reasonable about cattle after the very artificial and improbable world which we have created for ourselves.

The Dairy Show, organised by the British Dairy Farmers' Association, this year reaches its sixtieth anniversary. It is a great tribute to their courage and pertinacity that in spite of the unsatisfactory state of the industry as a whole the Diamond Jubilee Show should be one of the largest and best in the history of the association. They have, indeed, in Mark Tapley's words, "come out strong."

There have been several important alterations. A year ago, when conditions were only a little worse than they are now, the courageous decision was taken to hold the show at Earls Court. Those who remember the intense—but always friendly—jostling of former years, found themselves walking comfortably in the vast halls of the new building, in which it is amazingly easy to become lost in no time. The opening of the show in September instead of October necessitated the introduction of a new class for cows in calf, and another important innovation was the institution of a horticultural section. Indeed, the variety of exhibition made it quite clear how much of an indivisible whole farming is becoming.

No branch of farming is more mechanised than the milk industry. As the Dairy Show comes round year by year it makes the position of those who would prefer the old methods more and more obviously untenable. There are, of course, few farmers who would wish to ignore this mechanical progress, for it proves in full the wisdom of J. L. Motley's words: "Durability is not the test of merit in human institutions." In a few more years the present methods will doubtless have undergone unrecognisable improvements.

Yet the average milk farmer must experience some strange emotions as he walks round this show. All around him are the necessary means to prosperity, and many of them are just as far beyond his financial grasp as were the blue grapes beyond the reach of Tantalus. He must reflect that he has ample cause for self-congratulation if he can pay his bills and keep his old cowhouses and equipment reasonably clean. Nor is the average farmer to be blamed. Indeed, few things call for more admiration than the dauntless spirit which he invariably exhibits under conditions which weekly drive the less courageous from the English soil. More and more milk is being sold every year. Would it not be a reasonable thing if a greater proportion of the profits found their way into the pockets of the producers? The present year has been an exceptionally hard one for the dairy farmer, ever since the spring drought forced many of them to continue winter feeding well into the summer, and to open and use for grazing fields which had been set aside for other purposes. I talked with many farmers at this show and was struck with their spirit, but it might be well for the Government to remember that everything has an end—even the patience of a farmer. And in time not even that quality can conquer insuperable odds. It appears to be a very strange thing to me that in an industry of actual and potential prosperity many of those who are responsible for its success receive the least from it, and are often compelled to work with hopelessly out-of-date machinery.

Another reflection which occurred to me with some force was the possible danger of the record-breaking cow. It can so easily be forgotten that the whole of the milk industry is founded on the unnatural production of vast quantities of milk. Every device is considered which might maintain or increase this yield. At the present time there is a serious shortage of hay, and many formulas are being suggested which might take its place without causing a loss of milk. The 2,000 gallon cow is a financially useful animal, but it may well be questioned whether the stamina of the breed will not eventually suffer. Many of the leading and most successful breeders are beginning to realise this possibility, and few of them care to exploit the milk yield up to this level. If that is the attitude adopted by the large and successful breeders, still more should it be the policy of the smaller farmer. For it is no part of his duty to produce records. He exists to give a satisfactory yield of milk from a sufficiently strong and useful animal. Yet this ideal is impossible in the present conditions of the industry, where everything tempts the farmer to produce as much milk as possible without thought for the well-being of his herd. Until the Government's policy envisages and makes possible the conception of a prosperous farming community, the state of the industry can only essentially deteriorate, however much subsidies and agreements about the price of milk may afford a temporary relief.

The Dairy Show has really two objects. The farmers have learnt over a great number of years to look to the show as a place in which they may learn something of profit to themselves. Their support is therefore certain, and never before has the show contained so much calculated to assist them. But there is also a wider purpose—that of increasing the interest of the townsman in the affairs of the countryside, and the problems and welfare of the farmer. International crises have done much to impress the town dweller with the importance of the produce of the land as a vital element of defence. They are, in fact, much more considerably impressed by that reflection than the Government appears to be. But however that may be, it remains true that the best way of increasing this public interest lies in persuading them to attend shows of this kind. Yet the public cannot be expected to appreciate the highly technical and mechanised state of modern farming, and it is therefore very much to the credit of the president, Major G. Miller Mundy, and his colleagues, that so much of a more general but related interest was included in the programme of the show.

Most important of these features was the horticultural section, and it speaks well for the enthusiasm of the exhibitors that no fewer than 34 firms of repute organised the section in two weeks. Cattle, all of which had, for the first time in the history of the show, passed the tuberculin test, and of which there were no fewer than 340 entries, were rightly given the most important position in the show, where they attracted much public interest and attraction.

Very few of the public have any idea of the steady progress of the milk industry brought about by continual research. Some conception of the gradual steps which have led to the present technical condition was given by a well-chosen series of some 50 photographs, prepared by the Sparsholt Agricultural Institute in Hampshire. The health-giving value of dairy products is a subject on which most people are well informed, but an instructive lecture gave many interesting details, as did the account of the many and various articles which are made out of casein.

It is still true to say that farming is the most important industry from the economical point of view in any country, and one essential to its success is a public interest in its problems and ambitions. It cannot be doubted that this show—even though it came at a time when interest was largely centred elsewhere—has greatly contributed to that end.

It is impossible to think of the Dairy Show without enquiring as to the future of the industry. At present discussion is more concerned with prices and the best manner of distribution—in which there seems to be a certain amount of avoidable waste—than with the actual production of milk. There are those who argue that prices should be fixed on a national basis, and although opponents of such a scheme are not wanting, the arrangement would do much to end the bitterness which exists between farmers in the east and the west. It cannot be maintained that the present arrangement of the compensation levy has been as successful as had been hoped.

More serious is the attitude which is spreading through the farming community towards the Government. If a ceaseless grumble is ascending from the farms of England, it is only after the farmers have done their best to co-operate with the Government's plans and have sincerely endeavoured to follow out official instructions. The great failure of agricultural policy at present lies in its lack of breadth and cohesion. One scheme is started which admittedly benefits one branch of farming, but at the same time it injures perhaps two others. Is it impossible to consider agriculture as a whole, and to work out some comprehensive and balanced scheme which will put the industry on a sound and lasting basis? Such a question should certainly be considered and answered before the next General Election. CREAGHT.

SOME OF MR. A. F. LOYD'S GUERNSEY HERD AT LOCKINGE PARK, WANTAGE

SUNSHINE AND SHADOW BETWEEN MOFFAT AND LEADBURN. THE CAR IS A TWO-LITRE M.G. SALOON

OVERLOADING THE PRIVATE CAR

"Penny Wise and a Pound Foolish" Policy

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

NEVER have I seen so many overloaded cars as when motoring to the coast last August Bank Holiday. In practically every instance the vehicles so overburdened were of the 7 h.p. to 10 h.p. variety, and were therefore of the type that are least able to withstand this kind of rough treatment.

In many cases I passed cars that had been designed, at the most, to seat four persons, carrying six, and in one instance seven, but even worse possibly than this was the manner in which heavy luggage was carried in addition.

For many miles in a long, and what appeared at first an apparently unending line of traffic, I followed behind a small car containing five people, on the grid of which was a huge trunk, so large, in fact, that it completely covered the rear light. On each occasion the car went over a bump, the grid could be seen flexing, and every moment I expected it to break and deposit the trunk and its belongings in the road immediately in front of me.

Now this kind of procedure is fraught with danger, as had the brackets given way, other cars following might quite conceivably have become involved in an accident. In any case, the driver's rear vision was so completely obstructed that, during his entire journey, he was unable to see when other vehicles were about to overtake him. I made a point of noticing that he had no outside mirror and therefore, by obstructing his vision in this manner, he was guilty of breaking the law, and the police would have been in order had they stopped him.

As the law stands at present, the mere fact of overloading a private car with luggage is not an offence, unless the police can prove that it constitutes a danger—a difficult matter to establish in a court of law. As far as I understand, no action of this kind has been brought in recent times, and the police have not been instructed by the authorities to look out for instances of this nature.

I really cannot understand why some people are so short-sighted and have so little consideration for their car, by overloading it in this manner; I can only conceive that they do not realise what effect it is having on the ultimate life of their vehicle.

A FLAGRANT EXAMPLE OF OVERLOADING

The policy of a penny wise and a pound foolish is never to be recommended, and although a small sum of money is saved through not consigning the heavy and bulky luggage to its destination by train, the owner will eventually find that it would have cost him far less had he adopted this course.

Every car is designed to carry up to a certain load, with an ample margin, since the weight of an adult passenger may vary from 130lb. to as much as 280lb., although it is, of course, unlikely that four persons, each weighing 20st., would be accommodated in a light 8 h.p. or 10 h.p. car at the same time. If, therefore, the carrying load is greatly exceeded, the suspension of the vehicle must ultimately suffer, as well as certain other parts of the mechanism, and the tyres.

It is interesting to note that one of our most famous firms who build luxury cars, always insist on ascertaining the maximum number of passengers that will ever be carried in the car, when the order is placed, and the exact weight of the body, so that they are able to mount the correct type of springs to suit the particular chassis, before it is delivered to the coachworks. If, therefore, this successful firm is so meticulous in matters of this kind, it is obvious that grossly overloading a light car must have severe effects.

Whilst on this subject, I would point out that considerable damage can be done to the upholstery if luggage is carelessly placed on the back seats of a car. Nothing looks worse on a car than spoiled upholstery; moreover, it is impossible to rectify the damage, once it has taken place, short of replacing the leather, which is a most expensive business.

If the interior has been affected in this way, it will certainly reduce the value of the car enormously when the time comes to dispose of the vehicle; so this important consideration should always be borne in mind. I always make a point of never carrying bags on the back seat if it can be avoided, but if I do have to adopt this procedure, I always place a rug on top of the seat, and wedge another at the back, to ensure that no damage is done.

Incidentally, I often wonder why motorists do not invest in a small trailer, so that this can be used when the family is going away to the seaside for their summer holidays. These very useful adjuncts are comparatively inexpensive to buy in the first instance, they will last almost indefinitely, and need never be sold, even when the car is being changed for a new one.

The only drawback to using a trailer is that speed must be limited to 30 m.p.h., but as soon as one's destination has been reached, the trailer is detached, and not used again until the homeward journey is made.

I venture to suggest that the saving of damage to the interior of the car alone will soon be sufficient to reimburse the motorist for the actual cost of a trailer, and it must not be forgotten that if luggage is carried by this method, the full complement of passengers can be accommodated without discomfort.

UNDERNEATH THE ARCHES.—Parking cars in London is an increasingly difficult procedure, and those whose way leads them towards the Strand will rejoice to hear that a new garage has recently been opened, with accommodation for 500 cars, under the management of the Savoy Hotel, known as the Savoy-Adelphi Garage. It lies between the Strand and Savoy Place on the site of the old Adelphi.

GIANTS OF THE AIR

How the Aeroplane Continues to Grow Up

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

THE eagerly awaited Ensign air liner has at last been delivered to Imperial Airways and taken into service. This, as is generally known, is a landplane designed to give an equivalent comfort and speed to those of the Empire flying boats. It is a monoplane of beautiful streamline form and carries 40 passengers in the European version, and 27 with 1¼ tons of mail and freight in the Empire variation, at a speed of round about 200 m.p.h.

On seeing this machine for the first time, the spectator is impressed by its great size. The length of the fuselage is 114ft. and the wing span as much as 127ft. The landing wheels, the largest ever made, are each 6ft. in diameter.

This fact is testimony to one of the most remarkable trends of aeronautical design in the past few years; that towards ever-increasing size. The growth of the aeroplane has been beset by many difficulties, and it is not so long ago since many well informed engineers contended that there was some kind of limiting size, beyond which progress might be impossible.

The argument then ran that the structure weight would increase disproportionately to the lineal dimensions; thus the large machine would become increasingly inefficient until a point was reached at which further advance would be impracticable or, at least, uneconomic.

This view is no longer held, and, indeed, it was never uncontested. New methods of construction, greater knowledge of aero-dynamics, new materials, progress in power plants—these and many other factors have contributed to the now generally expressed opinion that theoretically at any rate the limits of aircraft size cannot be forecast, if, in fact, any do exist.

Yet the efforts of the aeroplane to grow up have been beset with many difficulties, and practical experience suggested for a long time that the large aircraft could not attain real success.

During the War, machines of wing span of 100ft. and more were produced and seemed to indicate that great size was attainable. In 1919, the Tarrant triplane, then the largest machine ever built, at any rate in this country, was completed. The tragic crash that attended the first test flight, in which the machine overturned, cast doubts not only on the soundness of this individual design, but of the idea of size altogether.

Another large machine built in this country some ten years ago or more was the Beardmore Inflexible. Here, again, practical experience was not encouraging, and though the average size of aircraft was already tending to increase, the outstandingly large design continued unpopular.

It was the famous Dornier Do.X that first drew practical attention to the merits and possibilities of the very large aircraft. This vast machine—the largest of her kind in the world at the time—successfully made an Atlantic crossing. Her success was not altogether unqualified, but, like all pioneer efforts, she demonstrated an important principle. From that time, progress in aircraft sizes has been continuous, and great advances on existing machines are envisaged, not merely as possibilities of the remote future, but as practical proposals for immediate construction.

Particularly in regard to flying boats is the practicability of very large machines established. The successful Empire boats weigh 40,500lb. fully loaded, and a 60,000lb. type is under construction. Boats of 100,000lb. have been under discussion for some time. Several designs of this size have been projected in America. The Boeing 314 now under test weighs as much as 82,500lb., and has a wing span of 152ft. The possibility of starting work on a 100-passenger development of this machine is already under consideration.

Interest in large flying-boats is very strong in America, and the seriousness with which they are regarded is seen from the fact that the Glenn Martin Company have done initial design work on a machine weighing as much as 250,000lb. and have built an assembly shed capable of housing a wing span of 300ft.

For large machines, the flying boat seems to offer special advantages. These relate particularly to the problems of taking-off and landing. No artificial boundaries are imposed on the length of run open to a marine aircraft. On the other hand, a landplane of great weight demands specially constructed aerodromes, and the dangers involved in forced landings are, naturally, great. It is not merely that the surface of the land must be specially prepared to operate machines of great weight; the difficulties of designing and constructing undercarriages, especially if retractable, capable of sustaining not merely the dead-weight of a large machine, but the enormous stresses involved in landing, are obviously very considerable indeed. One objection urged against the large landplane is that, apart from these handicaps, it must necessarily demand a long run, which, in turn, requires aerodromes of vast size. Recent progress in aerodynamics and experience with fuelling in the air tends to weaken this argument.

That the difficulties in the way of the large landplane are not insuperable is apparent. The Ensign weighs some 46,500lb. when fully loaded, and her tests seem to have been eminently satisfactory. The construction of proper aerodromes for even larger and weightier machines would seem to be no more difficult than the provision of docks to take such liners as the Queen Mary. In time, the slight danger of forced landing will disappear.

Altogether, it is obvious that the aeroplane, which has made such remarkable strides in size recently, will continue to grow up, and that the machines we regard as giants to-day will seem singularly unimpressive in a few years' time.

Chas. E. Brown

"THE EAGERLY AWAITED ENSIGN AIR LINER HAS AT LAST BEEN DELIVERED TO IMPERIAL AIRWAYS. . . . IT IS A MONOPLANE OF BEAUTIFUL STREAMLINE FORM AND CARRIES 40 PASSENGERS IN THE EUROPEAN VERSION, AND 27 WITH 1¼ TONS OF MAIL AND FREIGHT IN THE EMPIRE VARIATION"

ON THE NORTH-WEST FRONTIER

"The Best Training Ground in the World"

A SHERANNI FROM THE ZHOB VALLEY

PASSING over Attock bridge, the deep rumble of the train mingled with the roar of the turgid Indus swirling through the rocky gorge far below is the usual accompaniment of the visitor's entrance into the North-West Frontier Province of India, and the long low Mogul fort topping the cliffs a mile higher up, opposite the junction of the Kabul River, gives some kind of hint of the ancient importance of the crossing.

Peshawar seems peaceful with its broad roads and lovely rose-filled gardens, and the comfortable hotel and glorious cold weather days are apt to lull any sense of insecurity, until perhaps shots in the night or the report of some daring armed dacoity remind one that the peace is only superficial.

The romance of the frontier has been stressed by too many writers. There is little romance in murder and treachery, in raids and torture, or the kidnapping of trembling Hindu banias for ransom; and such things are frequent happenings there. Nor have I ever been able to discover any romance in being sniped from behind some undeterminable rock while walking abroad peacefully and unarmed.

The Khyber, with its railway, its broad triple road and stream of motor vehicles, is well worth obtaining a permit to visit up to the Afghan frontier at Landi Kotal; and still the caravans of great shaggy camels, laden with goods from Central Asia, sway down their own allotted road to the walled city, Persian kittens often perched upon the bales, led by hook-nosed bearded ruffians accompanied by straight-limbed youths and girls often as blue-eyed and rosy-cheeked as any from my own West Country.

Therefore the North-West Frontier is no place for our own womenfolk, except in heavily wired and patrolled cantonments, where even then they are not always too safe. Therefore I adjure every visitor to follow local instructions and advice with the greatest care, lest friends curse him for his disobedience and arrive too late except to avenge him. Also there are no hotels and few dak bungalows on the frontier, and while the good word of friends will pass him from camp to camp, without friends he will be homeless and unwanted. There are few idle folk between Peshawar and Quetta.

From Peshawar the Malakand Pass may be reached in a day; forty miles to the home of the Guides at Mardan, thence to Dargai, with the jagged Buner hills on the right of the road, and the more rounded ranges of the Mohmand country farther away to the west, and then a nine-mile climb to the fort on top of the pass.

This is the road to Chitral, and it winds across the fertile valley of the Swat River for another nine miles to the mud fort of Chakdara which guards the iron bridge across the river, famous for its mahseer fishing.

Nowadays, as the result of our "forward policy," good roads have been made through much of the debatable land between the Indus and Afghanistan, and one can motor from Peshawar to Quetta without re-crossing the river; but everywhere these squat mud forts remind one of the insecurity of the land, the inhabitants of whose barren hills have always lived by raiding those of the fertile plains below them.

From Peshawar the frontier runs south-west, through the Afridi country to Kohat, which lies at the mouth of the Kurram Valley. On the way, by currying favour with local authority, may be seen the famous Kohat Pass rifle factory, where Pathans turn out weapons quite efficient for their purpose, which are mostly used against our own people.

If it be the harvest season it may be noticed that the fields have white stones erected on their boundaries. These indicate that a blood feud is temporarily in abeyance, and will be resumed when the stones are removed on completion of the harvest.

At the head of the Kurram Valley lies Parachinar under the loom of the snow-capped Sufed Koh. It is the headquarters of the Kurram militia, and its aerodrome is only 80 miles from Kabul as a 'plane flies, which may explain why we have had so little trouble with the Afghans of late.

The frontier is seamed with a succession of big valleys running from west to east, and the next to the south is the Tochi, with Bannu at its mouth, and here we come to the most troublous country of all—Waziristan.

The great tribes of Wazir and Mahsud have given us more hard fighting and anxiety in the last 20 years than all the others put together, and were it not for the "circular road," with Razmak and its brigade at the far edge of the circle, 6,000ft. above the sea, the trouble would be worse.

Through the centre of their country flows the Takki Zam, passing through a series of narrow gorges, which are called "tangis," in its passage from 11,000ft. Pir Ghal to the plains of the Derajat, and scene of much bitter fighting in the years just after the Great War, and more recently.

Then comes the Gomal, which sweeps round from within Afghanistan northward and then eastward to its junction with the Zhob near Kajuri Kach, the "plateau of dates." The Zhob is in Baluchistan, and to the south of Kajuri Kach the great mass of the Kaisar Ghar and Takht-i-Suliman overhangs the Derajat. The tribes are not reckoned such good fighters hereabouts, and the Sheranni, though just as treacherous, is more fearful of the consequences of his desire to murder.

Our domination is dependent on the roads, now that the Pathan has modern weapons, and the old camel convoys have given place to lorries. We have the aeroplane and the armoured car, but the first can see little in broken rock and bush of the hillsides.

New roads are constantly being made, and with them comes greater facility for transporting troops rapidly to raids and risings, and each road means more fighting and sniping, with perimeter camps strung out like beads along the cord of the road, and sangared pickets crowning the hills about them to keep the Pathan from lying in ambush for the motor convoys; while the pickets themselves have to watch that they are not ambushed in the course of a relief.

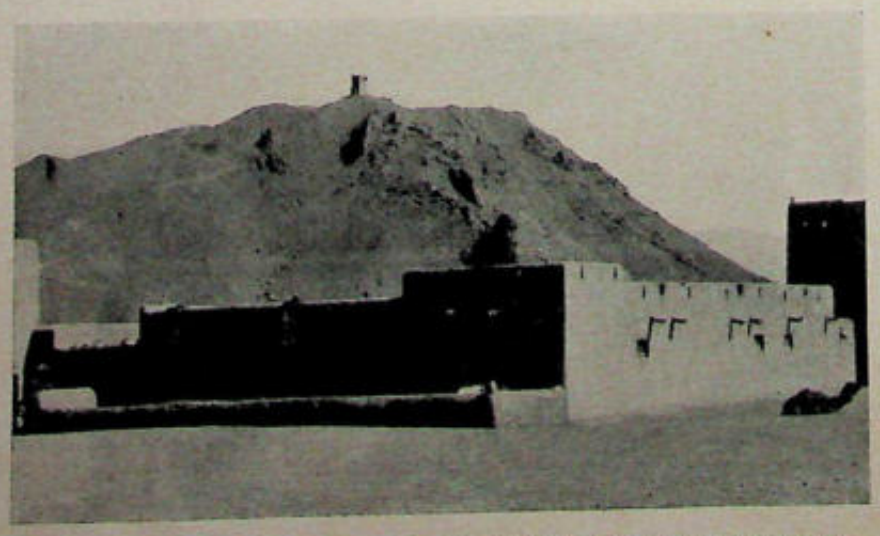
That is frontier warfare—eternally trying to outwit the other side in minor tactics. Never making a habit of any movement, or using the same track more than twice running when relieving pickets, except under adequate protection.

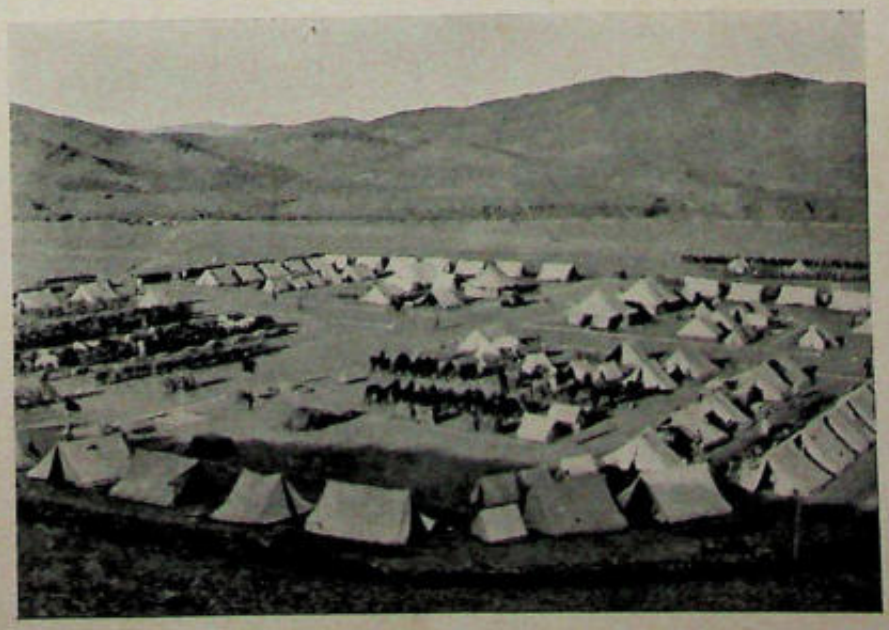
In perimeter camps, stonewalled to give cover from bullets and a forming point for the line in the dark, no lights can be shown at night or the sniper will use them as an aiming point to shoot into mess or canteen. Sentries shoot at anything doubtful without challenge; for only those with evil intentions are abroad at night in frontier country, and the honest man will call to the sentry to give warning.

The frontier is the best training ground in the world, for the Pathan is ever ready to point out tactical errors. I have called him savage and a murderer and treacherous, and so he is. But one cannot help liking the cheery ruffian, whose ideas and upbringing are not ours, and many a good day's sport I have had in their company; fishing or lying out in bivouac after markhor or oorial, listening to tales of rapine and bloodshed, salted with a crude humour, hardly suitable for a drawing room or the ears of the too civilised, but typical of the man and his hardihood.

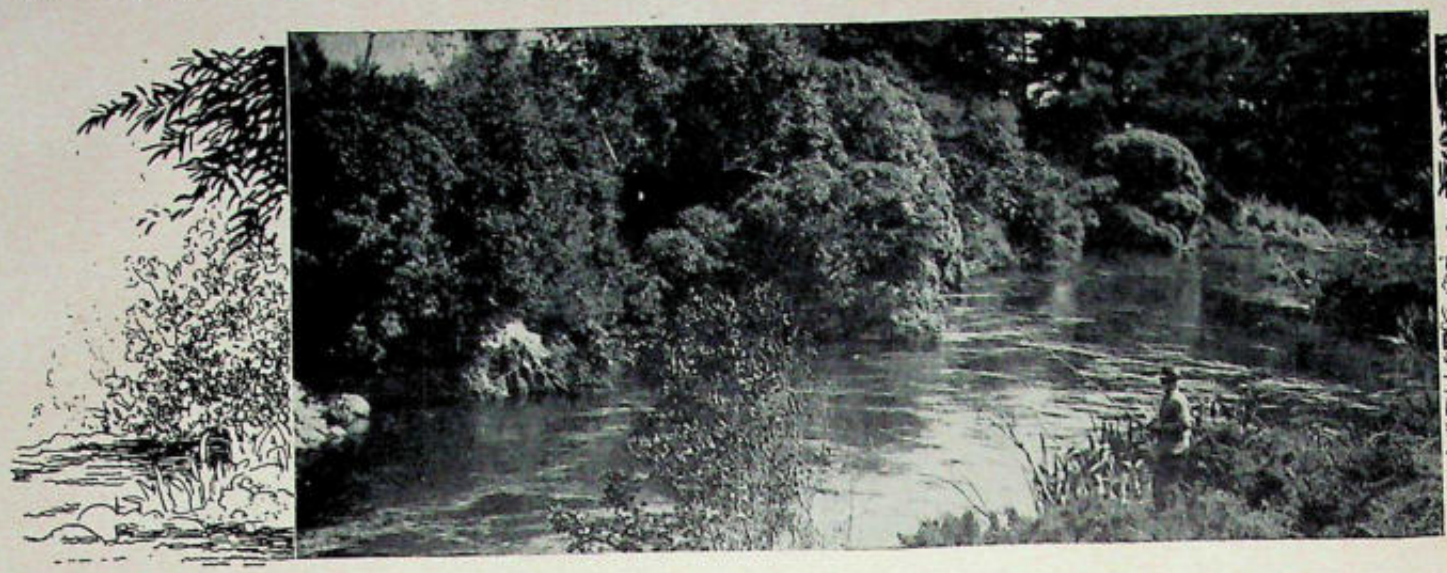
C. H. STOCKLEY.

A POWINDAR CAMP: THE POWINDARS ARE A NOMAD TRIBE WHO LIVE AND GRAZE THEIR FLOCKS BOTH IN INDIA AND AFGHANISTAN





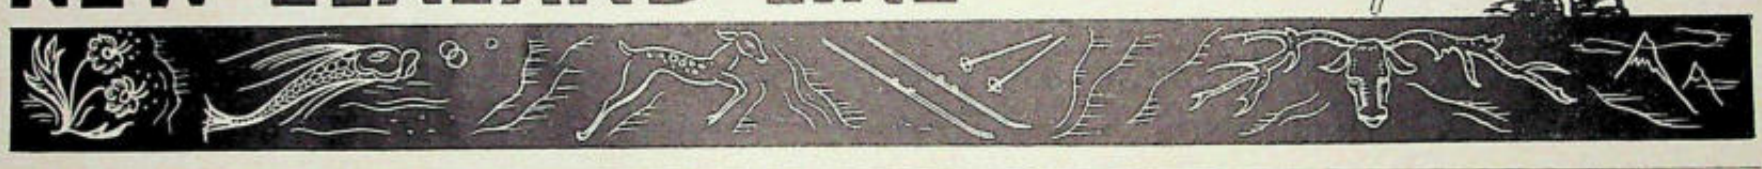
A MUD-WALLED FRONTIER FORT (ABOVE) WITH A PICKET TOWER ON THE HILL BEYOND, AND (RIGHT) A PERIMETER CAMP FOR HALF A BATTALION OF INFANTRY AND A SECTION OF MOUNTAIN ARTILLERY



NO country in the world within the relatively small compass of 100,000 square miles, or less than the area of the British Isles, can offer its visitor such a diversity of sport or wealth of scenic attractions as the Dominion of New Zealand. Nowadays it takes but 34 days to reach this "Sportsman's Paradise" and a Round Voyage allowing 30 days in New Zealand waters can be achieved in 98 days at a cost of £155

Apply: N.Z.S.Co., Ltd. (Agents, J. B. Westray & Co., Ltd.), 138, Leadenhall Street, E.C.3, or Trans-Pacific Passenger Agency, Ltd. (W. L. James, General Manager), 14, Cockspur Street, S.W.1, or principal Travel Agents.

NEW ZEALAND LINE



R

in the Month

Autumn delicacies appear on an impeccable menu. The sun retires earlier, perhaps because it works harder. Otherwise Summer would seem still to linger.

One swims, plays golf, tennis, squash, or one just dances and is unrepentantly idle.

Anyway, it costs no more to enjoy the unparalleled amenities at the Palace—we merely insist on the unbridled enjoyment of bed and board. Please yourself whether you use the gymnasium or not.

Phone: Torquay 2271

Palace, Torquay

P.S. Are you going to enjoy Christmas or will you write to us too late?

FOR RIDING ON THE GLORIOUS SOUTH DOWNS

Stay at the New and Wonderful

OCEAN HOTEL

SALTDEAN, BRIGHTON

Inclusive weekly terms - - from **£4:4:0**

A WEEK-END FOR £1:5:0

AERIAL VIEW OF THE OCEAN HOTEL

The Saltdean Riding Stables have horses always available for riding on the gently undulating Sussex Downs. Also excellent hacks for hunting and coursing over some of the finest sporting country in England, which is within easy reach of the Ocean Hotel. Miles of Downland with bridle paths open to guests.

- **MAGNIFICENT FULL-SIZE TILED SWIMMING POOL**
- **MORE THAN 400 BEDROOMS**

First-class cuisine. Licensed, with American Bar. Every bedroom furnished with most comfortable box spring bed, central or electric heating and running hot and cold water. "MINE EASE AT MINE INN"

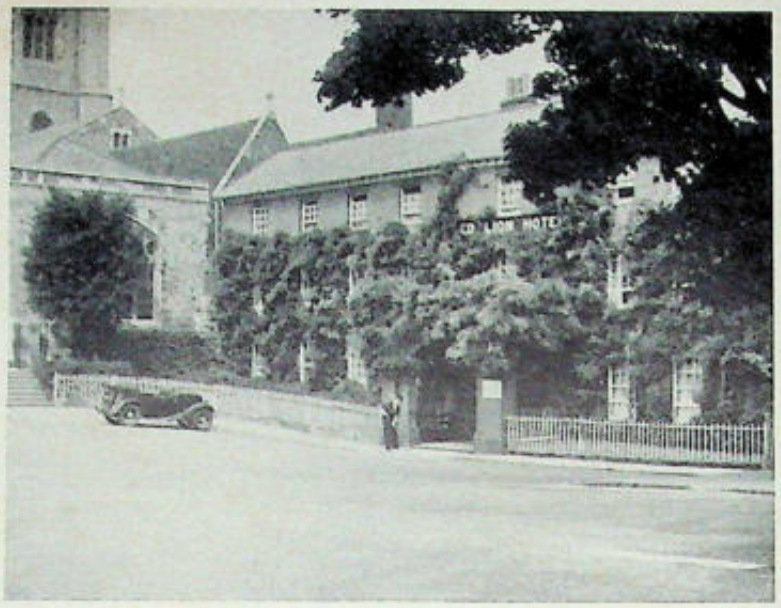
By WILLIAM G. LUSCOMBE



"TIS A FINELY-TONED, PICTURESQUE, SUNSHINY PLACE"

IF you acquired a copy of Mr. E. K. W. Ryan's pleasant book, *The Thames from the Towpath*, you would see that he refers to the Red Lion Hotel at Henley as "one of the largest and most comfortable hostelries on the Thames."

> "'Tis a finely-toned, picturesque, sunshiny place,
> Recalling a dozen old stories;
> With a rare British, good-natured, ruddy-hued face,
> Suggesting old wines and old Tories."

Certainly it is a most charming place to come by on your travels. It was a hot August morning when I first made acquaintance with the hotel, and it was pleasant indeed to sit in the spacious lounge and find myself with plenty of breathing space and an ice-cold drink. During the morning I had driven down from town in a small open car, so that my first view of the hotel was really taken in a hurried glance across the Thames from the Maidenhead bank.

Crossing the bridge—there are records of a bridge at Henley in 1232—you find the hotel on the other side immediately on the right. It is an historic place, and you have only to see it from the yard to realise its age. As long ago as 1632 Charles the First paid it a visit, while he again stayed there in 1642 with Prince Rupert. In later years the hotel was again visited by Royalty when in 1788 George the Third and his Queen came to Henley. We also know that George the Fourth, when Prince of Wales, dined at the hotel.

And I must not fail to tell you that the great Duke of Marlborough stayed at the Red Lion on his way from Blenheim to London. This refers, of course, to Blenheim Palace, granted to the Duke after his famous victory. He was, however, battling on the Continent most of his life, and he can thus have had little time to enjoy the fruits of his labours.

In 1899, during restorations at the hotel, a Royal coat of arms painted over the fireplace in 1632 (nearly a century before Blenheim) in one of the upstairs lounges was brought to light. This is now preserved behind a glass panel and provides a most interesting link with years gone by.

Mention of glass reminds one that it was at the Red Lion that Shenstone was supposed to have written his famous verses in 1750 on one of the window panes. You may recall the best known lines:

> "To thee, fair Freedom, I retire
> From flattery, cards, and dice, and din;
> Nor art thou found in mansions higher
> Than the low cot or humble inn"

That was the vein Shenstone commenced in, and his final verse went:

> "Whoe'er has travelled life's dull round,
> Where'er his stages may have been,
> May sigh to think he still has found
> The warmest welcome at an inn."

so that it was obvious the poet had received the very best attention wherever it was he was staying at the time. That is what makes me think it was the Red Lion at Henley; yet there is no sign of the window in question, and it seems strange that any proprietor should have destroyed so valuable an heirloom. Possibly, however, it has been sold to an American visitor at some time or other, or else Shenstone was writing somewhere at Henley-in-Arden.

However, the point about receiving a warm welcome at an inn holds good for the Red Lion to-day. Bedrooms are comfortable and furnished in a style compatible with modern requirements, while the cuisine leaves nothing to be desired by those trained in "the art of good living."

The writer will be pleased to answer any queries from readers concerning hotels.

London

¶ Brown's Hotel still maintains the respect for tradition that has made it the favourite resort of an exclusive society . . . here, as a matter of course, is to be found both comfort and convenience and that rare personal touch that is everywhere identified with the idea of distinguished perfection.

Yet every bedroom at Brown's has a private bath or running water, exchange telephone.

Rooms and suites with or without central heating.

BRIDGE

DIFFICULTIES REAL AND IMAGINARY

Some Elementary Points

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

THIS week I propose to deal with some of the questions submitted recently by correspondents, and I think the best way is to put them in the form of question and answer.

(1) *Why do you say that you should not raise partner's initial bid of one of a suit unless you hold three of it with an honour or four without an honour? Surely with A, x or K, Q only you are justified in raising, since these may be the cards required to fill it out.*

Answer: The reason for not immediately raising is that Declarer may have opened on a suit of four only. If you supply two only you then have only six between you, and it is improbable that the best contract has been found. If, however, you raise on three you know you have at least seven trumps in the joint hands. Four small cards qualify, but three do not unless one of them is a Queen or a King or an Ace.

(2) *Holding support in my partner's suit, should I raise immediately or show my side suit?*

Answer: After an initial bid of One of a major suit, a good minor should be shown if it is headed by Ace, King or Ace, Queen. But, after a bid of One Spade, it is not right to bid Two Diamonds holding K, J, x, x, x in the suit and nothing else of value except support in Spades. The bid of Two of a minor over a major is ambiguous, as it may be a take-out to show absence of the major. A bid of Three of a minor is, however, encouraging and provocative. It promises game. Immediate minimum raise of partner's suit is mild encouragement, but does not suggest game possibilities on the part of the bidder. Distinction must, however, be made between majors and minors. After an opening bid of One Club or One Diamond you should make a bid of One of a major on a five-card suit even when you have support for the minor. The reason may be briefly stated. An opening bid of a major *invites* support. An opening bid of a minor *offers* support.

(3) *If a minimum bid of a minor over a major may be made as a take-out or warning how is opener to recognise it?*

Answer: He may not be able to know for certain immediately. But the "context" of his own hand generally will enable him to diagnose the position if there are no intervening bids by the opponents.

Thus: Z, One Spade; A, No bid; Y, Two Diamonds; B, No bid. It is possible here that both opponents like or do not object to Spades or Diamonds as trumps. But neither Hearts, Clubs nor No Trumps have been mentioned. Z, in this position, should re-bid if he can, and it looks as if he can. He should argue in this fashion: "My partner has made a minimum response in a minor suit. He cannot hold great length or strength in it as otherwise he would have bid Three of it." Z has several choices. He may re-bid his Spades if they are long enough. He may support the Diamond bid or try Two No Trumps with guards in Hearts and Clubs. But he should not pass, as Y may be able to show support of Spades on second round.

(4) *How far should partner of player who has opened be influenced by an interposing bid?*

Answer: This is a difficult question to answer briefly because there are many considerations. As a general principle partner should bid as he would have done if the interposing call had not been made. Or if this is impossible he should stretch a point. To make this clear: Z opens with One Spade, A bids Two Hearts. Y has support in Spades Q, x, x. He also has five Diamonds to A, K. A bid of Three Diamonds is sound and does not *deny* Spade support. It is better than an immediate raise of Two Spades, which tells opener nothing about the Diamond suit. The point to realise is that Y is trying to help his partner and not deter him from further bidding.

(5) *The bidding has been: Z, One Spade; A, Two Hearts. Y holds: ♠ J, 7, 4; ♡ A, J, 9; ◇ A, 8, 7, 3; ♣ J, 6, 5. What should he bid?*

Answer: Two No Trumps. This shows a good guard in Hearts, and is not a denial of support in Spades. If Z has his quota game is likely in Spades or No Trumps and Z should not pass. Actually, my correspondent writes, Y bid Two Spades and Z, having little more than a minimum, also passed, although game was makeable in No Trumps or in Spades.

(6) *In the bidding Z shows two suits. Partner's holding in both is equal. Which should he support?*

Answer: The first. As a rule the longer suit is bid initially, and partner is entitled to assume that this is the case. But here again distinction must be made. If Z has opened with One Diamond and then on the second round, after partner's support or opponent's intervening bid, calls Spades or Hearts the Diamond may be short "tops" and the Spades or Hearts long without tops.

When partner bids first one and then the other major suit he is showing a two-suiter, and partner, with equal length in both, should support the first.

Another situation: Z bids One Club; A, One Diamond; Y, Two Clubs; B, No bid. Z now bids Two Spades; A, No bid. Y with ♠ Q, 5, 4; ♡ Q, 6, 5, 2; ◇ J, 8, 6; ♣ K, J, 7 should bid Three Spades, not Three Clubs. It is true that his hand is weak. But as Z has shown two suits he should keep it open.

BUXTON CONGRESS

For the third time the British Bridge League, in co-operation with the Buxton Corporation, is holding its Autumn Congress at Buxton from October 7th to 10th.

The Congress is not mainly for experts. Newcomers are welcome and all those who have not taken part in Duplicate contests before. Everything is made easy for them. The Congress is not confined to members of the British Bridge League. There are numerous prizes and trophies; no money stakes.

Although you can enter for any of the Open Pairs Contests when you arrive it is better to send in your entry at once to Mr. J. E. Boddington, Thermal Baths, Buxton. Entrance fee for all events, 10/-.

CHESS

A NEAT FINISH

The following game, from the fifth round of the Premier Tournament at Plymouth, shows a neat finish by Dr. Alekhine.

(Ruy Lopez.)

WHITE. H. V. Mallison.	BLACK. Dr. Alekhine.	WHITE. H. V. Mallison.	BLACK. Dr. Alekhine.
1. P to K 4	P to K 4	26. B P takes P	Kt to B 4
2. Kt to K B 3	Kt to Q B 3	27. R to K Kt sq (*l*)	Kt (4) to R 5
3. B to Kt 5	P to Q R 3	28. B takes Kt	Kt takes B
4. B to R 4	P to Q 3 (*a*)	29. Q to K 3	P to Q Kt 4 (*m*)
5. P to B 3 (*b*)	Kt to B 3	30. P to R 3	Kt takes B
6. P to Q 4	B to Q 2	31. P takes Kt	Q to R 2
7. Castles	B to K 2	32. K R to K sq (*n*)	Q to B 4
8. R to K sq	Castles	33. Q takes Q (*o*)	R takes Q
9. Q Kt to Q 2	B to K sq (*c*)	34. R to K 3	Q R to Q B sq
10. Kt to B sq (*d*)	Kt to Q 2	35. P to Q R 4 (*p*)	P to Kt 3
11. Kt to K 3 (*e*)	Kt to Kt 3	36. P takes P	R takes Kt P
12. B to Kt 3	K to R sq	37. Kt to Kt sq	P to B 4
13. Kt to Q 5	B to Q 2	38. P to B 3	P to B 5 (*q*)
14. Kt takes B	Q takes Kt	39. R to K 2	R takes B P
15. B to K 3 (*f*)	B to Kt 5 (*g*)	40. K R to R 2	P to R 5 (*r*)
16. P to K R 3	B to R 4	41. K to Kt 2	B to K sq
17. P to Q 5 (*h*)	Kt to Kt sq	42. Kt to K 2 (*s*)	R to K 6
18. P to Kt 4	B to Kt 3	43. R to Q B sq	P to R 6 (*t*)
19. B to Kt 5 (*i*)	P to K B 3	44. R to B 8	R to Kt 7
20. B to Q 2	B to B 2 (*j*)	45. R takes B, ch	K to Kt 2
21. K to R 2	Kt (Kt sq) to Q 2	46. R takes R (*u*)	P takes R
22. Q to K 2	P to B 3 (*k*)	47. Kt to B 3 (*v*)	R takes Kt
23. P to B 4	P to Q R 4	48. R to Kt 8	R to B 7, ch
24. B to B 2	K R to B sq	Resigns.	
25. B to B 3	P takes P		

(*a*) Dr. Alekhine's favourite defence to the Ruy Lopez.

(*b*) Alternatives here are 5. B takes Kt, ch (to be followed by 6. P to Q 4) and 5. P to B 4.

(*c*) The Kecskemét variation, Dr. Alekhine's own invention. The Bishop makes way for the King's Knight to go via Q 2 to Q Kt 3 and the removal of the Knight from K B 3 allows P to B 3, if necessary.

(*d*) If 10. B takes Kt, then 10. . . . B takes B; 11. P takes P, P takes P; 12. Kt takes P, B takes P; 13. Kt takes B, Kt takes Kt with an even game.

(*e*) Kt to Kt 3 is, we think, to be preferred. After the text-move White has no good square for the Queen's Bishop.

(*f*) P to K R 3, to prevent B to Kt 5, seems better.

(*g*) This pin is annoying and eventually induces White to weaken his King's side (see move 18).

(*h*) If he intended to play P to Kt 4, he might as well have done so at once and replied to B to Kt 3 with Kt to Q 2 followed by P to B 3. The text-move has several disadvantages: (1) It reduces the scope of the King's Bishop; (2) it abandons control of Black's Q B 4, a fact of which he takes advantage later on (see move 26); and (3) it allows Black to force open the Queen's Bishop's file.

(*i*) Loss of time.

(*j*) Played so that he can reply to Kt to R 4 with P to Kt 3.

(*k*) Beginning an action on the Queen's side which forces the opening of the Queen's Bishop's file and eventually leaves White with weak Queen's side pawns.

(*l*) K R to Q B sq is better.

(*m*) Threatening P to Kt 5 followed by Kt takes P.

(*n*) After 32. Q takes Q, R takes Q; 33. K R to Q B sq, Q R to B 2 the Queen's Bishop's pawn falls.

(*o*) There appears to be nothing better.

(*p*) If, instead, R to Q B sq, then P to Kt 5.

(*q*) A strong move. If now 39. R to Q 3, then 39. . . . R to Kt 7, ch; 40. K to R sq, R to B 4 and White is helpless against the threat of B to K sq followed by P to R 5 and B to Kt 4.

(*r*) A neat move. If now R takes P, then R to Kt 7, ch, followed by R (B 6) to B 7 and wins.

(*s*) Not R takes P because of R to Kt 7, ch, followed by B takes R.

(*t*) A good move, threatening R to Kt 7. If now R (B sq) to B 2, then R (Kt 4) to Kt 6, to be followed by B to Kt 4.

(*u*) If 46. R to R sq, then 46. . . . R (K 6) takes Kt, ch; 47. K to B sq, P to R 7 (threatening R (K 7) to B 7 followed by R to Kt 8, ch); 48. R to Q B 8, R (K 7) to B 7; 49. R takes R, R takes R (threatening R to Q Kt 7 followed by R to Kt 8, ch) and wins. If, instead, 46. R takes R P, then 46. . . . R (Kt 7) takes Kt, ch, and mate in two more moves.

(*v*) If R to Q Kt 8, then R takes Kt, ch, followed by R to Q B 7 and wins.

A GOOD GAME BY PIRC

The following game, from a tournament at Bad Harzburg in June, was well played by the Jugoslavian master, V. Pirc.

(Ruy Lopez.)

WHITE. K. Richter.	BLACK. V. Pirc.	WHITE. K. Richter.	BLACK. V. Pirc.
1. P to K 4	P to K 4	20. B takes B	Q takes B, ch
2. Kt to K B 3	Kt to Q B 3	21. R to Q 4 (*g*)	Q Kt to Q 2 (*h*)
3. B to Kt 5	P to Q R 3	22. P to Q Kt 4	Q to B 2
4. B to R 4	Kt to B 3	23. P takes P	Q Kt tks P (*i*)
5. Castles	B to K 2	24. P to Q R 4	R to K sq
6. P to Q 4 (*a*)	P to Q Kt 4	25. Kt to R 3 (*j*)	Kt to B 3
7. B to Kt 3	P to Q 3	26. R to Q 2	R to K 4
8. P to B 3	B to Kt 5 (*b*)	27. Q to B 3	Q R to K sq
9. B to K 3	Castles	28. R to K sq	P to R 3
10. P to K R 3 (*c*)	B takes Kt	29. K to R sq	R to Kt 4
11. Q takes B	Kt to Q R 4	30. P takes P	P takes P
12. B to B 2 (*d*)	Kt to B 5	31. P to K 5 (*k*)	R (Kt 4) tks KP
13. B to B sq	P to B 4	32. R takes R (*l*)	Kt takes R
14. P to Q Kt 3	Kt to Kt 3	33. Q to Q sq	Kt (K4) to Kt 5 (*m*)
15. P takes K P	P takes P	34. P takes Kt	Kt takes P
16. R to Q sq	Q to B 2	35. P to Kt 3 (*n*)	Q takes P
17. B to K 3	P to B 5 (*e*)	36. Q to K B sq	P to Kt 3 (*o*)
18. Q to B 5	K R to Kt sq	37. Q to K Kt sq (*p*)	Q to R 6, ch (*q*)
19. P to B 4 (*f*)	B to B 4	Resigns.	

(*a*) The usual move is R to K sq.

(*b*) Not Kt takes K P because of B to Q 5.

(*c*) P to Q 5 is better.

(*d*) After this move White gets seriously behind in development. He should, instead, play Kt to Q 2.

(*e*) A good move.

(*f*) Very risky, for it creates a weakness in the diagonal from his K Kt sq to Q R 7.

(*g*) If, instead, K to R sq, then Q to B 7.

(*h*) Guarding the Queen and so threatening P takes R.

(*i*) Black has now a strong square at his K 4, and in the subsequent play he makes good use of it.

(*j*) Not Kt to Q 2 because then Kt to B 3 wins the exchange.

(*k*) White decides to sacrifice a pawn in the hope of freeing his game.

(*l*) Not good. He should, instead, play R (Q 2) to K 2.

(*m*) A very good move to which White has no satisfactory reply.

(*n*) Not R to Q 6 because of Q takes R, followed, if Q takes Q or Q takes Kt, by R to K 8, mate.

(*o*) Threatening R to K 8, which, if played at once, would be refuted by R to Q 8, ch and mate next move.

(*p*) There is nothing to be done. If 37. R to Q sq, then 37. . . . Kt to B 7, ch; 38. Q takes Kt, Q takes Q, threatening R to K 6. If, instead, 37. R to Kt 2, then 37. . . . Q to R 5, ch; 38. K to Kt sq, R to K 8.

(*q*) Stronger than R to K 8.

PROBLEM No. 3981

By V. FÜHRER.*

WHITE (11 pieces): King at Q R 2, Queen at Q R 4, Rooks at K sq and Q sq, Bishops at Q Kt sq and K R 2, Knights at Q B 2 and Q Kt 4, Pawns at K Kt 2, Q Kt 3 and Q 4.

BLACK (12 pieces): King at K 5, Queen at K R 3, Rooks at K B 5 and K 7, Bishop at Q B 8, Knight at K Kt 8, Pawns at K B 2, K 3, Q 3, K B 3, K B 4 and Q B 4.

White to play and mate in two moves.

* First prize, *Deuken und Raten*, 1932.

SOLUTION OF PROBLEM No. 3980

1. Q to Q B 6 (threatening 2. Q to R 4, ch). If 1. . . . R to Q B 5, then 2. B to K 4, &c. If 1. . . . R to K 5, then 2. B to B 4, &c. If 1. . . . R to B 6 or R to Kt 6, then 2. Q to R 4, ch, &c. If 1. . . . P to K 5, then 2. Q to B 6, ch, &c.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 484

ACROSS.—1, Farmer who has little; yet has all 6, Both halves are essential to this game. 7, Shoots—mostly birds. 10, Dine at seven for this. 11, Back out of 6 across. 13, Subject of the Mediterranean. 14, The common herd. 17, With which the angler has fed even grown-up fish! 18, Lariat that always causes a tear. 21, Vegetables put in sport. 22, May be one of any stag party. 24, Empty. 25, An enclosure. Or a rural measure perhaps. 26, Ideal ground for needy farmers.

DOWN.—1, A surgical boot for this fielder? 2, A short weight worn by priests. 3, Flowers deceptive towards the end. 4, The key to this vehicle is within. 5, Should help one keep to the grain. 6, Could a Navy runner be thus described? 8, Tender—as is a young cabbage. 9, The best step to take to get over a difficult fence. 12, A flower beginning in Ancient Greece. 15, Naturally underneath 12. 16, Vehicles in vehicles. 19, Hedge split in the middle. 20, A plot in hilly country. 23, "It's me!" exclaimed the bird here.

A prize of one guinea is offered for any crossword puzzle, dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Fish Dying in a Pond.—The fish you sent for examination only showed signs of trouble in the gills. It is probable that with the continued drought the water level has fallen and with the rising temperature the bed of the pond has been giving off gases due to fermentation composed largely of sulphuretted hydrogen, and that this has poisoned the fish. The gills showed clearly that they had been affected; they were very much swollen and intensely red. When the bad gases have escaped the remaining fish should be safe. The dead fish ought to be removed from the water as soon as possible.—*S. G. C., Sussex.*

Cats

Persian Cats.—The name and address of the breeder about whom you inquire are Miss Langston, 8, Cranfurd Road, Maidenhead.—*G. A., U.S.A.*

Garden

Cultivation of Wild Rice.—"Canadian wild rice" (*Zizania aquatica*) is a native of Eastern North America; it is an annual grass, growing only in fresh water. This aquatic grass has grown well at Kew and some years ago efforts were made to acclimatise it in the country; seed obtained from Canada being distributed to various estates. During the winter it is necessary to store the seed in water, and when it is required to import fresh seed it is advisable to convey this in water or pack so as to keep it quite moist. Messrs. Vilmorin-Andrieux & Co., 4, Quai de la Megisserie, Paris, stock seeds of *Zizania*. Full particulars of the cultivation, &c., are given in *Kew Bulletin* No. 9, 1909, pages 381 – 390 — including information on "Manchurian Water Rice" (*Zizania latifolia*), an aquatic perennial which grows well at Kew on the margins of the lake. See also "Wild Rice" in "Propagation of Wild Duck Foods," by W. L. McAtee, *U.S. Dept. of Agric. Bulletin No.* 465, 1917. Seeds are not dependable every year and fresh seeds are usually obtained annually from Canada for sowing at Kew.—*H. V. T., S.W.* 1.

Kennel

Treatment of Sores.—It is possible that the sores or ulcers are of a malignant nature and may refuse to heal, but try the effect of painting them once daily with a 1 per cent. solution of picric acid in water.—*E. R. D., Southwold.*

Haziness of Eye in Dog.—We should suggest placing a very little of the yellow oxide of mercury ointment B.P. under the upper eyelid twice daily, closing the lids and giving gentle massage with the tip of a finger, to distribute the ointment over the cornea. Whether the haziness will clear up or not remains to be seen, as it depends upon the original cause, but the use of silver nitrate is liable to render it permanent.—*P. G. P., Lyndham.*

Treatment for Hysteria.—The general line of treatment for hysteria is to place the subject on an easily digested and suitable diet, such as raw meat 80 per cent., stale brown or wholemeal bread, fed dry; clean cold water to drink *ad lib.* To keep the bowels regular with doses of medicinal paraffin. To avoid all undue excitement and fatigue. To remove such exciting causes as worms, parasitic ear canker, &c. To give a course of sedatives, bromide of sodium or potassium.—*E. J. G. H., Bristol.*

Legal

Lights on Horse-Drawn Vehicles.—In this case the law is the same as for motor cars; you must have two white lights in the front and one red to the rear. There are, however, these two exceptions. If the vehicle has one axle, your two white lights must be level with the axle or in front of it, while if it has two they must be fixed not more than 18in. behind the front axle. Actually there is no need for you to have a separate red lamp in the rear if the white lamps in front show red in the rear; but it then makes its way out on the ground or vegetation. They are sometimes found in large quantities in gardens.—*E. B., Breconshire.*

Caterpillars Identified.—The caterpillars are those of the pine sawfly (*Lophyrus pini*). Often causing great damage to fir plantations, unless checked they multiply year after year, ravaging large areas. As the caterpillars form cocoons in the litter under the trees to pass the winter, the litter should be collected into small heaps and burnt, which is the best prevention.—*A. P. G. C., Forres.*

Post-Mortem Examinations

Capillariasis of a Pheasant.—A second-year cock pheasant was picked up dead through the threadworm infection of the bowels known as Capillariasis. This disease is spread through contamination of the food and ground by the worm-containing droppings of infected birds, *e.g.*, poultry, partridges and other gallinaceous birds.—*J. M., Renfrewshire.*

Overgrown Incisor Teeth of Rabbit.—Illustrated notes on the overgrowth of incisor teeth of rabbits were published in the *Field* of February 15th and 29th, 1936. A keeper has sent us the head of a wild rabbit, whose upper and lower incisor teeth were elongated and incurved, resembling those illustrated in 1936. The lower molar teeth on either side were irregular, and their inner borders were sharpened, thus having a resemblance to the "shear mouth," which used to be met with in commercial horses in the "old days." Despite the malformation of the teeth, all the affected rabbits we have had the opportunity of examining have been able to eat sufficient food, and were in a good state of nutrition.—*G. L., Notts.*

Feather-mites of a Woodpigeon.—Enclosing five flight and tail feathers of a woodpigeon, a correspondent reported that about nine months ago her dog picked up the pigeon. It was unable to fly, so she put it into a large aviary containing doves and cardinals. The pigeon now appears to be in very good health and perfect feather except for its flight and tail feathers. The specimen feathers were heavily infested with feather-mites, *Falculifer rostratus*, which are barely visible to the naked eye. The mites reproduce at the base of the quills and feed on the tissues of the feathers, particularly of the tail and wings. In the earlier stages of the infestation tiny holes, like pin-pricks, are seen when the affected feather is held in front of a strong light. Later the feather loses its sheen; it is ragged owing to the loss of so many barbules; and it is readily fractured. Feather mites are commonly found on pigeons and doves, as well as other species of aviary birds, which are kept in improperly managed lofts and aviaries. The living quarters of any species of birds should be regularly cleaned out, and this means the burning of droppings and litter together with a thorough scrubbing with hot soda water and soft soap of the entire interior and all its fittings. Water baths or sprays should be provided for the birds, and these require daily cleaning. Nest boxes should be thoroughly scrubbed out after each nest, and should be removed for storage outside the breeding season. Ornamental aviaries, however much they may satisfy the æsthetic sense of the owner, are to be condemned as living quarters for birds, since their shrubs, fancy rockeries, plots of grass, &c., prevent any owner applying the rudimentary measures for cleanliness. Fixed aviaries should be provided with an impervious properly drained floor (*e.g.*, of concrete), and their fixtures (perches, trays, baths, nest-boxes, &c.) should be of simple design permitting thorough cleaning at regular intervals, preferably not less than once per week. In his book on parrots, Lord Tavistock describes the principles of a very good movable aviary, which necessarily must be small enough for moving on to fresh patches of ground at regular intervals, and thus plenty of land must be available. To return to the wood-pigeon, its inability to fly when caught was not due to feather-mite infection; the disease is a blemish for exhibition purposes and an irritant particularly during the nesting season; but it does not prevent flight. In this case we are of the opinion that the wood-pigeon contracted the mite infection from the aviary.—*A. J. C., Ireland.*

Naturalist

Eggs Identified.—The eggs are the eggs of a moorhen. We can only imagine that either there was a stream in the neighbourhood of the barn or that someone had taken the eggs and placed them on the chaff.—*G. E. S., Lewes.*

Worm Identified.—The specimen is a hair-worm (*Gordius aquatis*). In the earlier stages it is parasitical on small insects, gnats, &c.; it then makes its way out on the ground or vegetation. They are sometimes found in large quantities in gardens.—*E. B., Breconshire.*

Caterpillars Identified.—The caterpillars are those of the pine sawfly (*Lophyrus pini*). Often causing great damage to fir plantations, unless checked they multiply year after year, ravaging large areas. As the caterpillars form cocoons in the litter under the trees to pass the winter, the litter should be collected into small heaps and burnt, which is the best prevention.—*A. P. G. C., Forres.*

Miscellaneous

Cleaning Swimming Bath.—The trouble experienced with the bath is probably caused by the growth of algæ, and can most conveniently be stopped in the small pool by the use of chloros—a hypochlorite containing 10 per cent. available chlorine. To obtain the best results, the bath should be emptied and the walls cleaned of slime by applying a solution of 1 quart of chloros in 2 gallons of water, allowing this a few minutes' contact, then scrubbing off with a stiff brush and rinsing with water. After this, add ½ pint of chloros to the clean water as it runs into the bath, taking care to ensure its thorough distribution. If this cannot be done, dilute the ½ pint of chemical with about 20 times its volume of water, and sprinkle the mixture evenly over the surface of the pool by means of an ordinary watering can. When both bath and water are clean, one surface sprinkling in the week will keep it so, but in warm weather it may be necessary to spray twice weekly. Regular treatment in this way will keep the pool sterile and free from algæ. Treatment will not in any way affect bathers. When the chemical has done its work only a little common salt remains in the water. A booklet describing the uses of chloros for the sterilisation of swimming bath water can be obtained free of charge from Imperial Chemical Industries, Ltd., Millbank, London, S.W. 1.—*Mrs. H. O. C., Bordon.*

Motoring

Racing on the Road.—Of course, racing on a public highway is illegal, and anyone promoting a race or trial of speed is liable to be prosecuted. So even if the drivers were only having a friendly race they were running a risk.—*C. B. D., Annan.*

Silencers necessary.—It is essential that the engine of your car should be fitted with a silencer. The only legal specifications of the silencer are that (*a*) it must be "suitable and sufficient for reducing noise as far as may be reasonable," and (*b*) the silencer must be fitted in such a way that the exhaust gases cannot escape into the air without first passing through the silencer.—*H. D. G., Darlington.*

Speed Limits.—No, there is now no universal speed limit for cars and motor cycles if (*a*) all wheels are fitted with pneumatic tyres; (*b*) the vehicle is adapted to carry not more than eight passengers, including the driver; and (*c*) it is not a heavy motor car, *i.e.*, weighs not less than 2½ tons unladen. It is only cars that are not fitted with pneumatic tyres that are limited to a speed limit of 30 m.p.h. There are, of course, local regulations.—*W. G. K., Brighton.*

Shooting

Coverts in Flat Country.—If you are going to drive birds out of covert in flat country, you must try and make flushing points some little way inside your coverts and with some sort of a belt of trees in front of them. For this purpose, we would suggest planting *Lonicera Mitida*. Very good results have been obtained at one shoot which we know of by flagging the birds with men holding flags in front of the coverts, but we, personally, think this savours too much of the artificial. But undoubtedly the best way of getting high birds in flat country is to block the birds out of the coverts where they are fed into gorse or out on to the roofs and then put them back into their coverts, the reverse process of what normally happens. They are doing this at Euston with great effect, and we believe the King is going to try the same thing at Sandringham. The guns then stand in front of the covert, and the birds should be put up some way from them; thus they gain considerable height and will offer fairly sporting shots, as they will be in a sort of "plane" by the time they pass over the guns.—*A. T. C. L., Ipswich.*

Cartridge Tests

The "Bond" loading machines have not been made for the last 20-25 years; the firm who manufactured them are not now in existence. We understand Mr. Monk, gun-maker of Chester, was interested in the patent and may be able to assist you; the present whereabouts of Mr. Bond is unknown.—*R., Dumfries.*

Your violet cartridges contained 33 grains of a smokeless powder of the appearance of Walsrode and a bare 1⅛oz. of No. 6½ shot. Velocity recorded averaged 1,074ft. per second. Recoil slightly heavy for a gun under 6¾lb. weight. Pressures normal. With one exception the results obtained were very regular and they should prove effective against game at normal range.—*A. J. C. L., Westerfield.*

Your blue cartridges contained 32½ grains of Smokeless Diamond powder and 1⅛oz. No. 5 shot. Velocity recorded averaged 1,100ft. per second with medium recoil. Patterns were even and averaged 60 per cent. (full choke barrel, 30in. circle, 40yds.). It would have been more satisfactory had you sent a larger quantity, four being inadequate for testing velocity, pattern and load; however, from the results obtained it is apparent they should kill well.—*F. S. M., Lochboisdale.*

THE FIELD

THE FARM AND THE GARDEN

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

A LESSON TO LEARN

THE news has just come through—and by the time this is read will be stale—of agreement reached in Munich. The relief occasioned by that news can be seen clearly on every face, and in the walk of the people in the streets, and in the lightened atmosphere generally. The shadow of immediate war, and all that modern war must mean, has been lifted. We have stood in these last days on the edge of a precipice; we have seen all too clearly the dread spectre of that savagery which would ruin our civilisation. It is natural that in so great a reaction we may think that much which we have passed through we imagined and that the future holds no horrors.

But from this crisis we should surely learn a lesson. It is the same lesson that we should have learned from our national experiences of the years 1914–1918—a lesson that we did not learn. It is this, that the days when it was possible for England to muddle through are past. Communications are too rapid, frontiers too nebulous for such an outlook to carry any consolation in the future. It must be plain to anybody, who seriously thinks about the events of the past few weeks, and particularly of the events of the past few days, that we must readjust our ideas. There was a very great difference between our conception of national defence before 1914 and our conception of national defence in this crisis; there must be just as great a difference between our present conception of that state of the nation and our ideas for the future. That we were better prepared than in 1914 is, I think, beyond dispute. But we were better prepared only because we had made a great national effort rather too late, and we were certainly not so very prepared as we should have been had we made that national effort sooner and over a longer period of time. That is the lesson.

Some form of national service seems to be indicated. For a free people such as ourselves compulsory national service seems to be abhorrent, but there are democracies in which that service is undertaken and which remain no less democracies. Moreover, national service does not necessarily mean national military service. Indeed, it should go far beyond that. It means in its widest conception that the nation should have at its disposal at any time the best in its land, whether that best be physical or mental. There was a saying in the last war "The farther from the front the greater the reward," and that saying was horribly true. There were men in the last war who made fortunes because others were willing to subordinate their interests and their lives in their country's defence. Such a state of affairs, a horrible and degrading state, could not exist were there some form of national service.

In this present crisis we were as prepared as years of indecision would allow. But our agriculture was in no state to stand a sudden national emergency and agriculture must have been but one of many departments of the national life. Crises in these days grow very quickly. This particular one was punctured but a few hours before it would have burst. And though we have every hope and have every right to hope that in our time there will be no other crisis of such a nature, it would be the height of folly to sit back now and indulge again in the form of idealism which in the long pleasant years following 1918 led Europe to the brink of tragedy and civilisation within measurable distance of destruction.

WIRELESS AND WAR

IT is a matter of interesting speculation as to whether the whole course of history might not have been changed had there been wireless sets beside the family hearths in 1914. The power of wireless made itself felt during the period of the Great Strike, and the last few days have shown it to be a vital force during a crisis. In the hands of a Government determined to use it to ventilate facts, wireless can be used to neutralise propaganda. There is no doubt that Mr. Chamberlain's quiet and dignified message to the nation, together with other news broadcast from this country in foreign languages, made a deep impression abroad. You can suppress news in the Press, but you cannot confiscate wireless receivers without a slight suspicion arising that you are trying to prevent people listening to something about which they should not be kept in ignorance. The wireless, too, is a wonderful factor in discountenancing rumour, preventing panic, and organising services. Its use in national emergency we saw demonstrated when the school children were to be removed from possible danger zones. Wireless in the recent upheaval has played a part in peaceful settlement that cannot be exaggerated.

FIELD HUNTING NUMBER

In our Hunting Number, which is to be published next week, we have endeavoured to cover as many aspects of the sport as possible. Amongst others there is an article on keeping up the supply of hunters (a very important question), and one on "dressing" hunters, a rather piquant question under modern conditions. "Is Hunting Becoming Too Artificial?" will supply an answer with which you may or may not agree. The history of bit-making is also discussed, and the Oxford University Drag and the famous men connected with it are described. "The Size of Beagles" is another article which may provoke comment. "Farmers Who Have Hunted Hounds" will bring back many memories, and "Looking After Hunt Gates and Jumps" should prove a useful basis of instruction for hard-worked secretaries. All these articles are written by people who know their subject, and, in addition, there will be a coloured cover by Eric Meade King, and three pages of colour within the number. Cubhunting reports and lists of Masters, Secretaries, Huntsmen, &c., are, as usual, included.

"IT'S AN ILL-WIND ——"

The Territorial Force must be congratulating itself on the numerous recruits that have now swollen its ranks. Pessimists who lugubriously announced that the youth of the country would never rally to the colours as they did in 1914 have been signally confounded. The spirit of Britain does not change. But how deplorable it is we have to wait for trouble to rouse that spirit. "I'll come when I'm wanted" is the attitude, whereas if these young men only came in time they would be of real value as trained soldiers and not useless material for the many months which have to be tided over by their efficient companions in arms. There is something wrong with the works somewhere, and it must be in the method employed to stimulate patriotism in peace time. As we have so often remarked, we still believe "The soldier follows the drum." From strange quarters come tentative suggestions for a form of conscription which, it is supposed, would have to be based on the Territorial scheme. Were it ever adopted the Territorials would wish to retain their voluntary status and any new organisation would have to be established under another heading.

THE FOOD HOARDERS

One of the regulations of a state of emergency should surely be a measure which at the outset prevents tradesmen supplying unusual quantities of foodstuffs to their customers. The food hoarders were with us in 1914. Some of the cars returning from the countryside this week contained crates of provisions. People who normally limit themselves to a few pounds of sugar actually demanded a hundredweight from their grocers. Such demands not only deprive others of their fair share, but are liable to cause a temporary shortage which may lead to a food scare. There is no term hard enough to apply to the food hoarders. No regulations could be too severe.

NOW FOR THE GRAYLING

Weather prophets in the guise of the oldest inhabitant are speaking cheerfully of a fine autumn. It may be no more than a reflection of the optimistic mood which happenings at the end of September evoked, but fine weather prophets seldom lack a welcome, except in times of drought, and anglers who were cheated of the closing days of the trout season are quoting from letters saying that grayling are rising well and pugnaciously making preparations for "giving them something to rise at." At the moment it may be hoped that St. Swithin has done his worst (his time limit of six weeks has expired these many days), and that autumn will reflect the spirit of peace which has settled on mundane affairs, and give us the still, frosty mornings and sunny noontides, with grayling making those sudden dimples in midstream which betoken, in prospect at least, a real red-letter day, when the angler, free of the shackles of limit bags and dry-fly ethics, may fish as his fancy dictates, and carry home his catch without fear of criticism afterwards.

AUTUMN'S MORNING

Now Autumn's gold medallions, dewspangled
In a mist that's haloed like an angel's head,
Cry to the skies content of consummation
In morning glory, temperate and peaceful.

Air, purified of August's heavy humours,
Drifts, laden in perfect poise, too fine to last,
Balanced between an overblown, rank sweetness
And barren rawness bred of dead winter's dearth.

I would this perfection did not have to die;
To cry "Perfect stays"; yet think my cry will be
To empty seats of power, I know not whose,
For Winter will come, and Spring and Summer, too.

A. H. V. L.

A COUNTRYMAN'S JOURNAL

I ROUNDED the corner of the Manor House and came face to face with the Great Plane. Before that day I had never so much as heard of its existence, though it grows in a countryside of whose natural riches I believed that not one had escaped me. No countryman had ever mentioned it to me and book-lore is silent about it, though it has plenty to say about the mansion where Queen Elizabeth was confined as a prisoner and later took her revenge by appearing there as a guest. Yet a nobler, a more truly Gothic tree I had never seen.

The Rycote tree, which I had discovered by accident, is an Oriental Plane, and the legend is that the Oriental Plane was introduced into this country by Francis Bacon, but Loudon declared that it was " in British gardens before 1548." If that be so, the Rycote specimen must surely be one of the very few originals planted before the middle of the sixteenth century. Apart from all other signs and evidences, the width of its bole testifies to its great antiquity. The average circumference of the trunk of a well-grown plane is from 9ft. to 12ft., and that of the Rycote tree as I roughly measured it 5ft. from the ground is 26ft. 4in., nearly thrice the normal girth. That is 2ft. wider than the bole of the largest yew-tree in Hampshire, growing in the churchyard of Boarhurst, and calculated by that fine Hampshire archæologist, J. P. Williams-Freeman, to be 1200 years old. The Boarhurst Yew is itself larger than the celebrated Selborne Yew, whose measurement Gilbert White gave as 23ft. The Rycote Plane is, indeed, smaller round the bole than the two mightiest trees I know, the Newland Oak (41ft.) on the east bank of the Wye and the Spanish Chestnut (50ft. in 1766) of Tortworth in the South Cotswolds, presumed to have been planted in A.D. 800, and certainly the biggest tree in England. But the growth of a plane is, of course, much more rapid than that of oak or chestnut.

The Rycote Plane grows on a mound, and so displays its grandeur and spaciousness to the best advantage. Seven massive limbs, each as large as a full-grown plane, extend from its tower of bossed, warted and corrugated timber, and their growth, being more horizontal than vertical, gives the whole tree an amplitude of space that increases its majesty. The Oriental Plane of Lee Court, mentioned in Evelyn's *Memoirs* and figured by Jacob George Strutt in *Sylva Britannica*, covers nothing like so generous an area, and its branches are inclined but little out of the straight. It is the spread, not the height, of a tree that gives it supreme dominion on earth and makes it venerable beyond all living things. The age of the Rycote Tree is written upon it in characters not to be mistaken, but what excites more wonder still is its agelessness.

The Newland Oak and the Tortworth Chestnut have both seen more centuries pass over their unbowed heads than has the Rycote Plane, but though they yet live it is as colossal ruins. The Tortworth Chestnut especially gives an impression of immortality, because a whole grove of vigorous great trunks has sprung from the parent bole that is slowly disintegrating into dust. The Rycote Plane achieves the same effect of everlastingness after a different manner. It stands there on its mound in a perfection of health and vitality. It looks as young as it is old, and hangs its bristling round fruits and outspreads its polished bright green leaves as though for the first time on earth it were welcoming the sunshine and the rain.

How benedictive seemed its power as it looked over the pastures towards the distant lake! Were moots held under this more than kingly canopy, and did here the villagers pursue their peaceful rites and make their appointments for the common fields? So royal it looked in its beauty and its strength that my fancy asked whether even the madness of men might not be stilled beneath its shade. Surely no man could look upon such a tree without humility, tranquil as it stood there as is the earth itself, tranquil like time slipping at last into eternity. I thought to myself as I turned to go: " O Tree, live for ever! "

H. J. MASSINGHAM.

WITHOUT COMMENT

Contributed by a reader from a book on golf, published in 1887, which disparages golf as a game for ladies.

" You can ride at a stone wall for love and the lady, but what part can she take in driving at a bunker? It is natural that Lady Diana should fall in love with Nimrod when she finds him in the plough, stunned, broken legged, the brush, which he had wrested from the fox as he fell, firm in his lifeless grasp.

" But if beauty found us prone on the putting green, a 27½ embedded in our gory locks, she might send us home to be trepanned; but nothing could come of it, a red coat notwithstanding."

The Prime Minister and Mrs. Neville Chamberlain with the King and Queen at Buckingham Palace

THE MAN AND THE MOMENT

Mr. Neville Chamberlain's Work for World Peace

JUST over a week ago the British Empire was on the brink of war. That another world conflict would bear no comparison with the last was realised by every man and woman in this country, for the potentialities of the modern aeroplane have been bloodily advertised.

We know well enough the ruin and devastation that follows in the train of war to-day, and it is poor consolation to say that it would mean the same thing for the other fellow. Which does not infer that we would burke the issue were the safety of the Empire or the freedom it stands for endangered. Mr. Chamberlain made this fairly plain when he spoke of the larger issue involved in the Czechoslovakian crisis following his second disappointing visit to Herr Hitler, and that issue is the substitution of threat for negotiation in world politics.

Providence has watched over the destinies of Britain in sending her at this juncture a Neville Chamberlain. We have needed a man at the head of the State able to face realities and capable of taking a bold decision. Where others would have hesitated he had the courage to go direct to Herr Hitler; to stand up to the charge of lack of dignity and loss of prestige; to avert the certainty of war. " What do you think of your Prime Minister now, going with his hat in his hand to Hitler? " one woman was heard to remark to another. " I would not care if he went with his boots in his hand," was the reply, " if he could make sanity supplant stupidity." This must have echoed the sentiments of many people in the country.

And Mr. Chamberlain did not despair when his efforts seemed abortive. He did not scruple to cast diplomatic procedure to the winds. His speech to the House was a plain statement, a review of the situation robbed of ambiguities, clichés, and all flights of rhetoric. It contained no references to paths which lie in dark places, nor spoke of " avenues to be explored." It was a speech which did not seek to disguise difficulties, which showed how sand had been thrown into the machinery of negotiation whenever there appeared a chance of smooth working; but for the dramatic interruption to its peroration it would undoubtedly have outlined the stern duty with which the nation would be confronted in the event of an impasse. Neither the French, the Italians, nor the Germans themselves welcomed a world war, despite Herr Hitler's statement of what he was willing to risk. The assertion has been made that he has obtained what he desired by bluff, without fighting. He has obtained what was offered to him after British compromise had played its part.

When Mr. Chamberlain went on the third aeroplane journey of his life the country waited upon him and he held its trust. Many of us that Thursday night must have stood by our wireless receivers, anxiously tuning in to each announcement, at midnight, and after 1 a.m., to learn that no decision had been announced. If we felt tired under the strain of three weeks of uncertainty, what, we asked, could be the feelings of a man of nearly seventy, after his superhuman exertions of the past week; who had risen in the early hours of the morning to journey by 'plane to Munich to take part in a complicated discussion with so much dependent upon it and which was lasting into the next day?

Mr. Chamberlain has had to face many tough situations in his life: he was facing the hardest of all with the fate of the world at stake. He returned in triumph as the man who Won the Peace. The fact that there are at least four other claimants to the title is in itself testimony to his efforts. He will not grudge them their claim. When his aeroplane landed at Heston the Prime Minister bore in his hand a pledge signed by Herr Hitler to improve relations between Germany and ourselves and to remove differences by consultation. If Cabinet Ministers had cheered Mr. Chamberlain on his departure, their sentiments must have been those of the enthusiastic crowd who gave him so whole-hearted an ovation on his return—he had indeed caught his fox in the dark. The police in Downing Street, when that sanctuary had been invaded by the public, were smiling as broadly as any of those who were welcoming back the Premier with acclamations which could not have been as great for any conquering hero. He did not deny that crowd a further example of his fortitude when he responded to their demand for an appearance. One of the photographs which must take its place in the gallery of historical pictures is that which shows Mr. Chamberlain beside his wife on the balcony of Buckingham Palace acknowledging the plaudits of the multitude, with the King and Queen on either side of them. King George's father would have been as proud as his son to have accorded them such honour.

The Premier, after his labours, deserves a much-needed rest, but there are difficult days still before him until the present situation becomes stabilised.

As this paper goes to press early in the week history is still marching relentlessly on. While thanksgivings are being offered up for the averting of war, Mr. Chamberlain has to face envy, in some cases malice, and also the opposition of those who bear the honest conviction that his policy has been unsound. But many of the voices now raised against him were strangely silent last week, and will seek shelter behind the excuse of not wishing to embarrass him during the crisis. The members of Parliament who cheered him and wished him God speed on his journey have been accused of suffering from " mass hysteria." Those who point the finger of reproach at the Premier would, in the words of an American contemporary, do well to " search their own souls " as to whether they would have committed the lives of their nearest and dearest for the point at issue. One of the anomalies always with us is the warlike attitude of pacifists.

Memories of past actions and statements in *Mein Kampf* have caused doubt to be cast on the value of the German Führer's word. He has expressed his desire for European peace, and where the methods employed by other statesmen of approaching him in the past have failed Mr. Chamberlain's may well succeed. Should they fail, we know where we stand and what devolves upon us. Herr Hitler himself is under no illusion as to the indomitable will which can be displayed by the British peoples and the sacrifices they can be counted upon to make when antagonised. But let us give peaceful methods, backed by preparedness, a chance against power politics.

The economic position of the Czechoslovakians and their plight under the tremendous self-denial they have been called upon to make has been stressed. Let it be asked what would have been their position had war broken out? When we eventually prevailed, as prevail we should, would there be a Czech state to reconstruct, or any Czechs to rebuild it? Let us take our fences as we come to them, and pin our faith to the pilot who is showing the way. Much remains to be accomplished before settlement in Europe is reached, and we trust that a calm issue out of present difficulties may enable Mr. Chamberlain to pursue the great work of bringing the nations together. He does not seek the rewards so many would like to shower upon him for what he has already accomplished, but surely, when the goal is reached, Friday, September 30th, will be for ever dedicated to him.

FLOODING WHICH THE DRAINAGE SCHEME IS INTENDED TO PREVENT

DANGER WHICH THREATENS THE AVON

Work Which is Canalising a Lovely River

By BRIGADIER-GENERAL H. E. CAREY

IT is a sad sight, but not a surprising one, to see a valley devastated by war, but it is indeed strange to see public funds utilised to devastate a lovely bit of English country; yet this is what is being done, and will continue to be done, unless that final arbiter in most British controversies—public opinion—is aroused to call a halt. The work referred to above is that of the Avon and Stour Catchment Area Drainage Board, and the valley affected, the Upper Avon Valley.

This board is steadily *canalising* the lovely river under the protection of an Act of Parliament, which, despite the protests of the local river conservators, gives the board powers which can only be described as extravagant. The interests of the riparian owners, fishery lessees and consequently the employees of these individuals do not appear to be a matter of concern to this board. To judge by a county council order recently served on me, the obsession of the engineer is to "cleanse the river, resection, regrade and free from all in-growth and deposit."

The object of the scheme is presumably to prevent flooding of villages and towns, especially Salisbury.

From fairly frequent inspections of the work that has been, and is being carried out, it appears that all along the length of the river the banks are being repaired by cutting them back with the spade until sound earth (free from water-rat holes, &c.) is reached, and the spoil thus "won" is thrown up to render the bank higher. At the same time all trees and shrubs within 10ft. of the water are liable to be removed, and the result is a drain or ditch which may be almost as pleasing to the eye of an engineer as a "pipe line," but to the lover of things that *are* lovely it is a massacre and an outrage.

Together with the destruction on the banks, the bed of this river beloved of trout anglers is "skinned" of all the weed so necessary to afford lies, food and shelter to the fish. Let me examine in detail the activities of this board, and in all humility attempt to add some constructive suggestions instead of relying solely on destructive criticism.

In the first place, the board, though interfering extensively in the province of the river conservators, does not, I understand, consult them as to policy or programme; and it also appears that riparian owners and lessees of fisheries are not in a position to hold their own against the carrying out of works which to them are disastrous. Not even the fact that lessees of fisheries are heavily rated will save them from the activities which not only ruin their sport during the time the operations are in progress, but are also likely to spoil their fisheries for many seasons to come.

The provision of food for trout is largely a matter of the skilful and intelligent culture and cutting of water weeds—a matter which takes years of experience and study—and yet the Drainage Board steps in "where angels fear to tread." Let us turn to the work as carried out by the Drainage Board: To those who are well acquainted with the irrigation system of the water meadows of the Avon, one fact is evident, and that is that the canalisation of the main river is not the best way to avoid flooding. Before proceeding any further, it seems best to digress for a moment and consider the system of irrigation by which the water meadows are watered, or to be exact, used to be watered, for, alas! in many meadows, the farmers have been unable to face the expense of their upkeep, and the side streams have been largely trodden in and obliterated by cattle.

The bed of the Avon falls very gradually and the pace of the flow is gentle. There are certain points, however, where man has taken advantage of sudden drops to establish mills or other barrages and hold up the flow with sluices (hatches), thus obtaining an abnormally high level above the river and meadows below. The bed and banks above these hatches are artificial, and at a higher level than the old river courses which can usually be detected in the vicinity. Some of these high levels are mill

SCENERY WHICH IT IS AN OUTRAGE TO RUIN

leets, others are merely quiet reaches above the barrage of the hatches.

In many cases where these waters are well raised above the surrounding meadows "spillways" are provided. These are holes in the river banks, controllable by hatches, which can conduct an excess of water via the old course of the river, direct to the lower reach without its passing through the main hatches. It is evident that given a head of water, raised up above the downstream meadows, it only remains to conduct that water to the meadows, water them, and return the excess to the main river. The water is led by side-streams known as "carriers" to the side of the meadow furthest from the main river, and thence running through the "feeders" and many little subsidiary streams or "carriages," which are traced across the meadows and separated from each other by the tables of slightly raised meadow land, the excess water from these many rills finds its way into another side stream known as a "drawn," and so is led back to the main river.

It is evident that repairs to banks above mills and hatches, and the upkeep of the hatches themselves are vitally important to the whole scheme, as these banks, being above the general level of the river, can only retain the head of water necessary for irrigation if they are maintained in repair; also all hatches must be capable of being easily lifted. The assistance of the Drainage Board in such repairs can be invaluable, but (and it is a large but) the repair should not be done by cutting back the banks and throwing the mud on them, but the eroded and destroyed bank should be rebuilt on the old alignment by revetment, and by the packing in of gravel or suitable material behind the revetment. In this way the river is not allowed to widen, the scouring action which is at its strongest when the hatches have been drawn is retained, and the channel prevented from silting up.

Mention has been made of "spillways," "carriers" and "drawns"—their maintenance is of the utmost importance. If floods come it is evident that when, despite the drawing of all hatches, the water piles up at mills or hatches, the spillways afford immediate relief, and, *provided that the old river course below them has been kept in order*, the excess of water can go safely down to the reach below without overflowing of the banks and flooding of the adjacent country. On the other hand, if it be all allowed to pass through the main hatches a "bar" of silt will be deposited further down the river.

Here, then, is a repair for the Drainage Board, and one that would earn them the thanks of all concerned with the river, namely, the maintenance of the spillways, and the side streams which conduct their waters to the main.

No signs of work of this nature have been noticed in the activities of the board in the vicinity of Enford and Upavon. Again, it is evident that in flood-time, when it is desired to save towns and villages from flooding, enormous potential reservoirs for flood waters exist in the water meadows themselves, which, in the Avon Valley, are of very large area, and on to which thousands and thousands of tons of flood water can be discharged without deepening the amount of their immersion by more than an inch or so, while the deposit of silt is of value to the herbage. And here, again, unless the carriers are maintained in order, the main river banks above mills and hatches may not be relieved of pressure as quickly as is necessary, and danger of "breaks through," overflowing and flooding will exist.

Enough has been said to show that the maintenance of the irrigation system which is still carried on by some farmers, and can even now be traced everywhere on the ground and in the ordnance maps, has a direct remedial value against floods. These side-streams are also of immense value to fisheries as nurseries for young trout.

It is not sound practice to repair banks by cutting them back as is being done now. Except where extensive ingrowth has been permitted, and where cattle tread in the banks, the general tendency of a river is to spread: it should be the object of its custodians to restrict this tendency and not to encourage it.

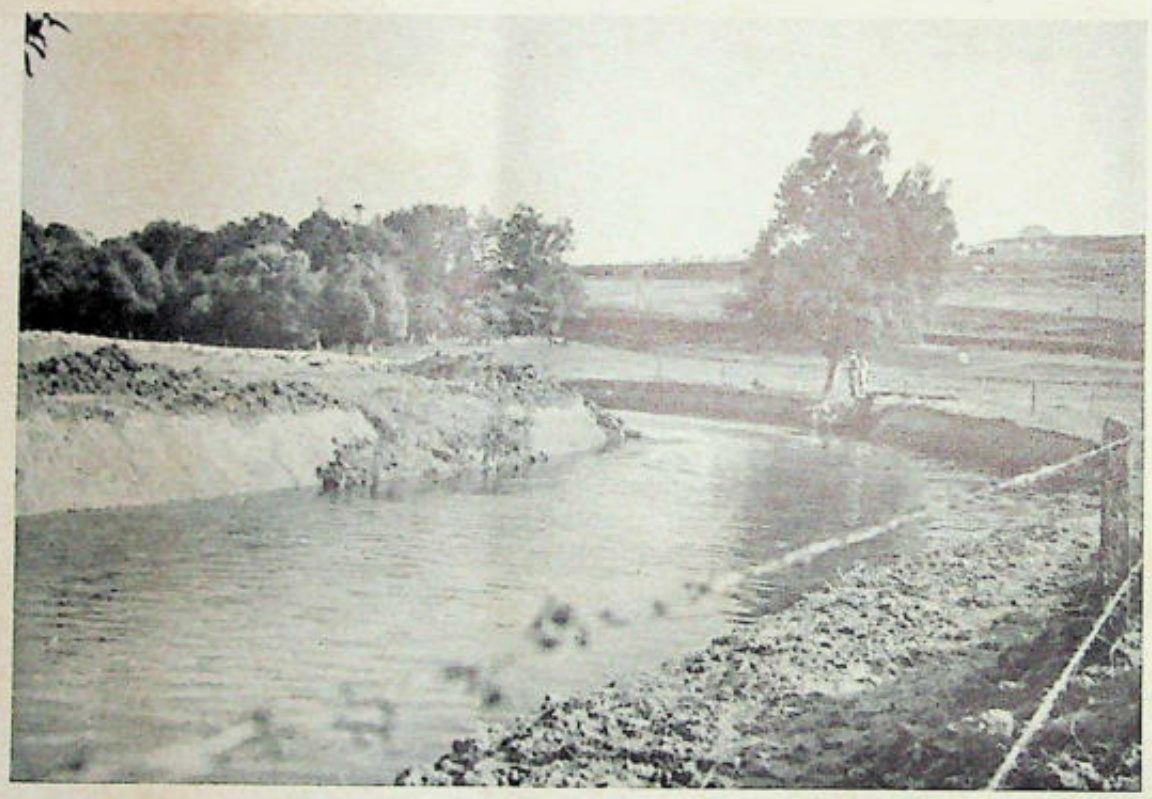
The more the spread the less the scour, and the greater the silting up of the bed. Cutting back of banks also deprives farmers of grazing acreage, and where fishermen's paths are fenced, entails the movement of the fence farther back from the river.

To refer back to the provisions of reservoirs for flood water by the natural use of the water meadows, certain points should not be missed in this connection. The formation of these temporary lakes not only prevents a force and volume of discharge with which the lower reaches of the river (especially where tidal) may not be able to deal, but it also allows of soakage through the subsoil and chalk, and assists the conservation of water in wells, springs and subterranean reservoirs which would otherwise be sent headlong down to the sea, and entirely wasted, and bitterly regretted in times of drought.

So far the main trend of this article has been utilitarian. There is another side, the spiritual side, which cannot be ranked as of less importance. The Drainage Board by its "canalisation" of a lovely river, and the wanton destruction of all the beauty wherewith the stream had clothed itself, is guilty of the unforgivable sin. Gone now is the flowering herbage from the banks and gone are the willows which shaded the pools, and whitened in the wind. The waving bars of crowsfoot, long the objects of loving care and attention by the river keepers, have been ruthlessly hacked out, and "all the fashion of the earth is changed," but that change, alas, not for the better.

What is the object of it all? To prevent flooding? How does this desecration prevent flooding?

It is hoped that sufficient has been said in this article for its readers to echo the question "How?"



ANOTHER VIEW OF THE UNSPOILED AVON, AND (BELOW) A PHOTOGRAPH OF THE CANALISED RIVER

And if it does not, what is the use of it, and what possible excuse is there for it?

To sum up, the conclusions which appear reasonable and of constructive value are:

1. All work to be done by Drainage Boards on the river should be agreed to in conference with the local Board of Conservators, riparian owners, lessees of fisheries and any others who may be concerned. An Inspector of Fisheries should invariably be present at the meetings to represent the Ministry of Agriculture and Fisheries. Also a representative of the River Avon Biological Research from Southampton University College, whose advice is invaluable in all matters concerning this river.

2. It is hoped that sufficient arguments have been preferred in this article to induce the Drainage Board to turn their activities to the upkeep of the existing irrigation system, including the maintenance of side streams (carriers and drawns), which, if kept in proper order, will not only help to prevent flooding, but will also assist farmers and anglers as well, and earn their good will, and the wastage of public money will cease.

3. Except when serious "breaks through" exist and large repairs are necessary, it should be left to the parties intimately concerned with the river to keep the main river and its banks in order, under the supervision and, if necessary, with the assistance of the River Board of Conservators and the Drainage Board.

LOOKING DOWNSTREAM FROM ENFORD BRIDGE

After about a year, all that has taken place as regards recovery!

RACING AND THE CRISIS

Captain Hogg Resigns His Post

THE crisis spoiled lots of things, and it ruined the Newmarket First October Meeting. I have never seen so few people at a Newmarket Meeting, and the few that were there did not seem in the least interested in the racing. There was a complete apathy over the whole proceedings, which was a great pity for the four days' programmes were full of quite good events.

Perhaps the most important parts of last week's racing were those which related to the Cambridgeshire, which is to be run at Newmarket on Wednesday. It was hoped that the Norwich Handicap, run over the course and distance of the Cambridgeshire, would help us to solve the problem as to what would win next week. The winner of the race was that bogey horse, Never Surprised, and if ever a horse lived up to his name he has done so ever since he was a two-year-old. Never Surprised, for a time, would not face the gate, but when he did so he started all right. Even then no one ever gave him a thought while he lay in behind the leader, until suddenly he swooped from behind them into the lead and once more no one had time to think about him before he was home and dry, having won by four lengths from Lady of Shalott, with Golden Sovereign third. Never Surprised is not in the Cambridgeshire, but the second and third are in the race. Still, on this form they should not win it. If, indeed, I had to choose one from this field to win the Cambridgeshire, it would be Carlisle, who, in my opinion, was really second best. He looked all over a winner until the actual winner sailed away with the race. He was then eased and not finished, cantering just out of a place. He has a chance next week.

The second so-called public trial for the Cambridgeshire took place at the end of the week at Kempton Park, where, with the crisis over, there was a large crowd. The race in question was the Duke of York Handicap of a mile and a quarter. Like the Norwich Handicap, it was won by a horse who is not in the Cambridgeshire, namely, Rodeo II, who has been winning bumper races this season, and, so it had seemed, would run for only that good amateur rider, Mr. Hislop.

He was ridden last week by Michael Beary, a lovely horseman for whom most horses go kindly. Rodeo II, after giving an exhibition at the start and getting rid of his rider, swooped down on the leader, Ramtapa, at the distance, and sailed home a very comfortable winner by a length and a half. Couvert just missed second place, while Sansalvo was close up fourth and Knole Star a good fifth. The first four, apart from the winner, are in the Cambridgeshire, but the form hardly seems good enough to make any one of them a probable winner of that race. Ramtapa ran the best race that he has done since he won his only race, at Ascot, more than a year ago.

Even then he disappointed his trainer, Lawson, for there is no doubt that he is a very high-class colt at home and on more than one occasion has put up a wonderfully good gallop. Through Couvert, however, none of these four should beat the Northern-trained Domaha, and in my opinion he should not beat my original choice for the race, Michoumy. Agincourt blotted his copybook too badly in the Norwich Handicap to have any chance. I still think that Michoumy, who is doing wonderfully well in his work at Druids Lodge, is one of the best things that I have seen for the Cambridgeshire for many years.

It was generally felt that when the rain came we should see some better two-year-olds than we had seen before this season. By better, I mean colts or fillies who might well be classic winners next season. Such as Panorama, fast as he is, should never stay even a mile. Captain Boyd Rochfort, the trainer of Panorama, has now produced two colts either of whom might develop into a Derby winner. They are Foxbrough II, a full-brother to Gallant Fox, the best horse that there has been in America for many years, and Casanova. The former doddled the Hopeful Stakes at Newmarket last week, while the latter was beaten by only a short head in the rich Imperial Produce Stakes at Kempton Park.

Foxbrough II is by Sir Galahad III out of Marguerite, and was bred in America, while Casanova is by Hyperion out of Double Life, and so a half-brother to Precipitation, who would have won the St. Leger of his year if he had not been attacked by heel bug just before the race. Foxbrough II had not had a race before his Newmarket success, but he ran as straight as a gun barrel. He is well grown and a lovely mover. Whatever wins the Middle Park Stakes will have him to beat. Casanova had had a race before, when he was unplaced but far from disgraced in the race at Doncaster, won by Vesperian. At the end of five furlongs on Saturday he looked certain to win, for he had then gone past Heliopolis and appeared to have him beaten. Suddenly Heliopolis came again, and won by a short head.

Heliopolis also is a possible Derby winner, for he to is by Hyperion out of Drift, a mare that won races for Lord Derby, the owner of this nice colt. It will be recalled that Heliopolis had given Panorama a race at York. He had then started very slowly at Doncaster in the Champagne Stakes won by Panorama. He behaved rather childishly at the gate at Kempton Park, but got away as well as anything else and was soon in front. There are great possibilities about him, but I do not like colts, or fillies, who are uncertain at the gate. Another two-year-old who had not been seen before ran in this Kempton Park race and made a great appeal to me. This was Lord Rosebery's colt, Blue Peter, by Fairway out of Fancy Free. He ran really well but a little greenly, for when he was leading those of the field running in the middle of the course he looked round and was beaten. He will know his business better another time and it will be surprising if he goes into winter quarters still a maiden.

Fairchance, owned by Mr. Middlemas, also showed promise in this race and may well be the best horse yet owned by that enthusiastic owner and very kind man. What he does for the poor children of the East End no one but himself knows, and he seldom talks about it except to get other people interested in his schemes for taking those children out into the country for the day or the evening, all the summer.

The success of Challenge at Newmarket in the Jockey Club Stakes of a mile and six furlongs suggests strongly that, after all, the three-year-old colts are not such a bad lot, for among those who finished behind him were the four-year-old Sultan Mahomed, who ran very well in last year's St. Leger and was one of the best of last season's staying three-year-olds, and Senor, who had only just failed to win the Ascot Gold Cup and the Goodwood Cup, but had, it is true, then failed badly in the Doncaster Cup. Challenge won this race at Newmarket so easily that his connections began to think that he should have won the St. Leger. So he might have done if Scottish Union had not been in the field. I still think that without any doubt Scottish Union is the best of the three-year-old colts, and after this race at Newmarket a much better one than I had thought. I am still wondering whether he is as good as the best of the fillies, Rockfel. No doubt Scottish Union and Challenge will be strong candidates for the cups next summer, but we are all inclined to forget Chulmleigh, who has not had a race this year. He won last year's St. Leger and is so far in front of Buckleigh that he must have won the Gold Cup at Ascot this summer. The present idea is to keep him in training another season.

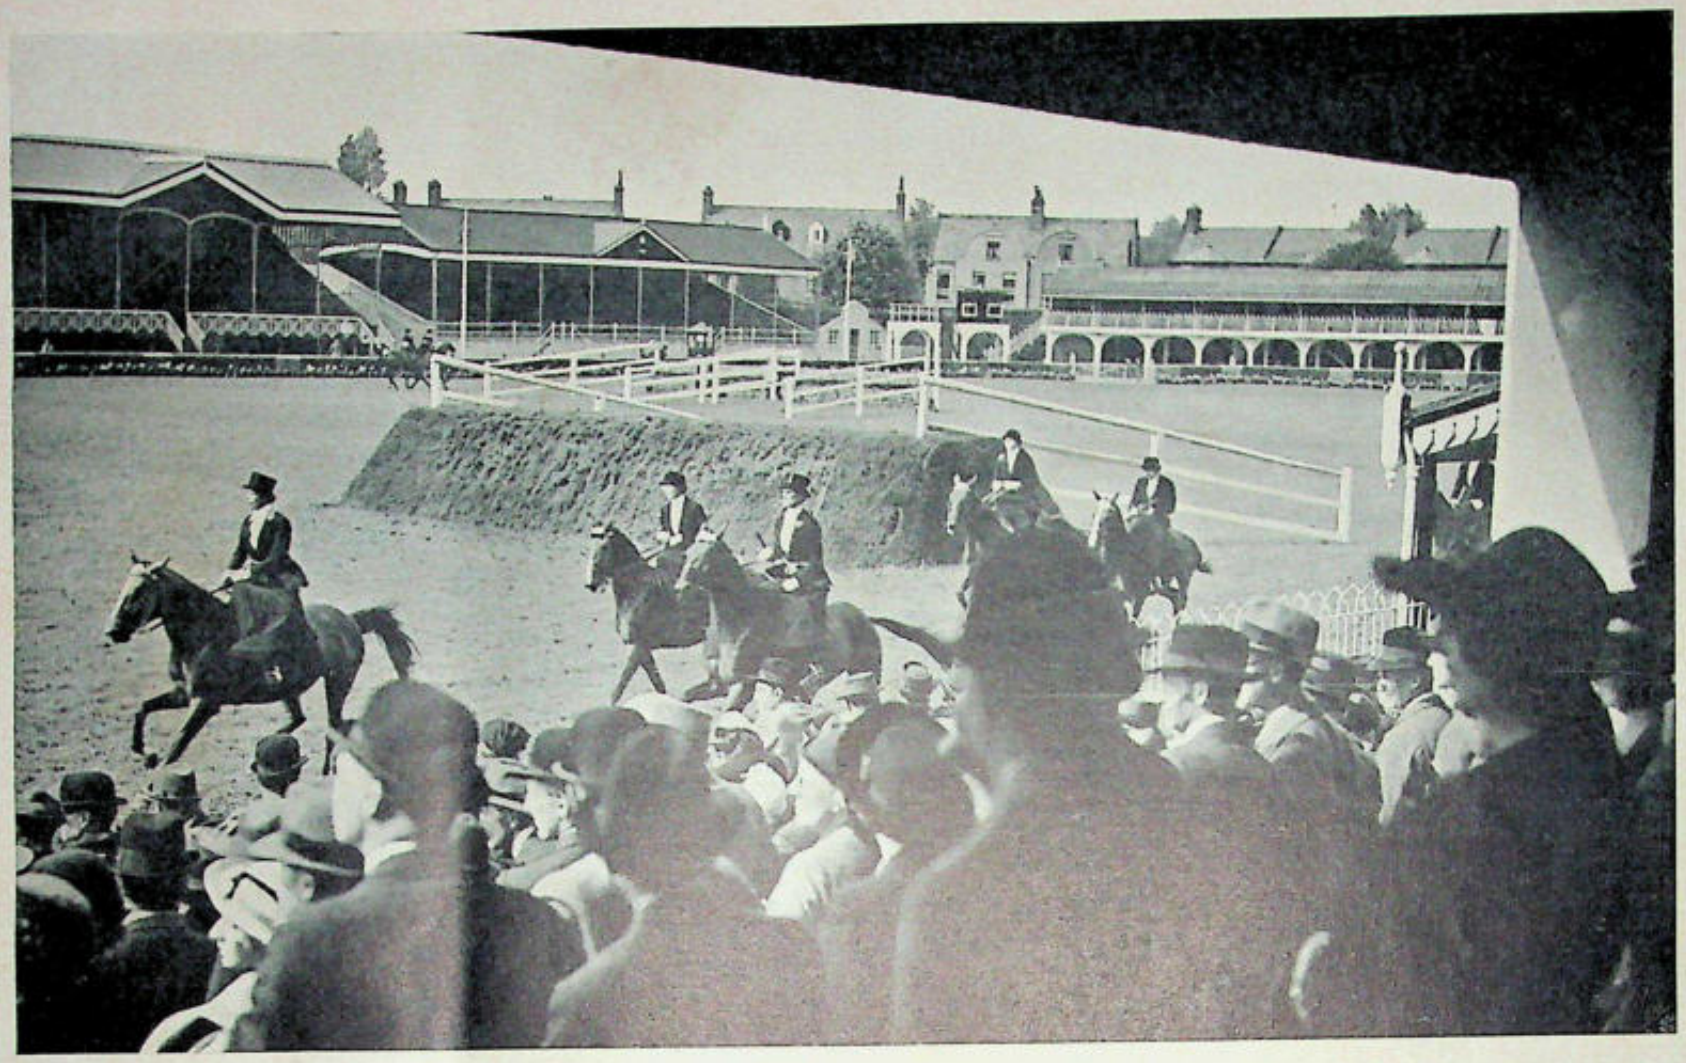
ON THE HEATH

Soon after the start of the Bretby Nursery Handicap; Roman Spring (No. 14), the winner, leading in company with Creme de Menthe, Crown Colony, and Boscastle II (second)

Mention of this good colt reminds me that his trainer, Captain Hogg, has decided to resign his post as private trainer to Lord Glanely at the end of the present season. No one is sorrier than Lord Glanely, for no owner and trainer have ever got on better than these two. The partnership has lasted for ten years, some of them most successful ones and others not so good. I have known Captain Hogg for many, many years and no one could have a kinder or dearer or more cheerful friend and companion. He is resigning because, as he says, he has been working hard ever since he was nine years of age, and he is now sixty and does not see why he should not have a rest. Before he became a trainer he was a most able and successful veterinary surgeon, qualified before he was of age from that severe school, Edinburgh University, but unable to practise until he was 21 years old. Even when he retired from practice and trained he has been known to perform a most serious operation when such had to be done on the spot. As a trainer and as a man he will be terribly missed until he comes back from his long holiday in his beloved South Africa, where it is much to be hoped his health, which has not been too good recently, will be completely restored. He may then train a few horses for himself.

Captain Hogg has saddled the winners of nearly all the great races, but not so far of the Derby, which surely, however, should have been won by Colombo. The Leger, the Oaks and the Guineas have all been won by horses trained by him, in addition to the Gold Cup at Ascot and numerous important long-distance handicaps. He never had a superior as a trainer of stayers. I do not know who will succeed him at La Grange at Newmarket, but whoever gets the job will be lucky.

GNOSTIC.



MISTRESSES COME INTO THIS DISCUSSION AS WELL AS MASTERS

STABLEMEN AND MASTERS

"Women are More Exacting than Men"

THE plutocrats: these are the successors to the fast-dying country gentry. They consist of rich stockbrokers, beer barons, multiple-store magnates, munition mongers, war profiteers, and various other affluent gentlemen. It is the custom for some people to speak of them with contumely, but the countryside owes to them a debt of gratitude for keeping alive the things appertaining to it. For what would have happened to our hunting had not these gentry stepped into the breach unavoidably created by their predecessors? As employers they are generally good, but I have found service with them lacks the personal touch which is so endearing when one has the good fortune to be placed among the genuine country gentlemen. These Croesuses are more often than not absentees from their properties except at hunting time, or else townsmen, who bowl down in the Rolls for the hunt, perhaps staying over-night somewhere in the district.

Their interest and knowledge of things peculiar to the countryside, therefore, cannot be so profound, neither is their understanding of the country folk, and this is a great pity, though perhaps no fault of theirs. Their horses are used just for hunting; when that is over they are handed back to the second horseman to jog home, the while Mr. Moneybags returns townwards in his limousine. With this manner of doing things, the stable yard loses much of its intimate touch. There is no kind master to come out at the dusk of eventide to ask after the hunters, and to go round their boxes and have a look, and also thank his hunters for the day, or to ask the stableman, who is probably still slogging at his job, whether he has had his tea. I personally can always let my tea wait until my job is done, but it is nice to know that the man you are working for has you in his mind.

Perhaps at times it is unfortunate that Mr. Moneybags's cash goes to his head, and makes him a little intolerant, and here let me tell you a short story: "There was a Master of hounds, who was fabulously rich. He arrived at the meet in the Rolls—or was it the Lanchester?—from which he descended, and walked across the King's highway, disarranging his dress. Arrived at the back of a car in which was a lady, he proceeded with his business, and then walked to his horses, adjusting his dress the while. Said one who saw this: 'He has got money, and that is about all he has got.' And another: 'Ah! Well, you cannot turn a carthorse into a racehorse.'" With those two comments we leave the subject.

Next we come to the military. Officers more often than not have their own soldier servants to deal with their hunters. Those home on furlough usually have to engage their own grooms. The soldier "log" are generally good horsemen, brave and intrepid, and fair horsemasters. They like putting up a good show, though unfortunately they are frequently not able to pay the price. My experience of them is that they are good, but apt to be meticulous and didactic. Having held the King's commission three times, and served in fourteen different units of His Majesty's Army, I would say that the nature of their profession makes them thus. Work in dealers' yards, livery and bait stables is onerous. Here it is a matter of business pure and simple. The man is paid his fee, and for that he must give unto his last ounce of energy. The hours are long, the work heavy, the pay poor, the horses many and the grooms few.

Lastly, we come to deal with the ladies as employers, whom I suppose, for the want of a better term, must with some trepidation be called our mistresses.

Women are generally more exacting to work for than men, and are usually more money-minded. They want the maximum value for the wage they pay, which, more often than not, is less than a man pays, and some complain that they are not so generous with their tips. They can be very meticulous and fault-finding. Nevertheless, it is rather enchanting after a hard day's work on hunters, if the pretty lady comes out to the stables to see and inquire how the hunters are; and even if she does fault-find us, we can bear it, for her presence is a tonic for our sore eyes and tired bodies, and brings a ray of sunshine into our drab lives. But, of course, if she does not fault-find us, and is gracious instead, from thenceforth we become her devoted slave. Believe me, a kind word can work wonders, and a kind word from without a pretty face can perform miracles.

One sometimes wonders, without wishing to be ungallant, whether the term pretty lady is applicable to the present-day sex complex visions one bumps into, with their plucked eyebrows, false lashes, lifted faces, painted cheeks, vermilion-gashed mouths, and finger nails akin to the talons of the eagle which has been clawing at its prey. For all beauty comes from God and nature, by which it is adorned and decked. Fresh air, the wind, the rain, and the sunshine bring roses to the cheeks and a lustre to the eyes, which artificial beauty culture can never do, and that all too rare phenomenon the English sunshine brings glints and tints from without the glory of my lady's tresses, which will gladden the eye of the simple countryman who gazes thereon.

To you, mesdames, perhaps an old sweat may be permitted to give a word of advice, which may at times save both you and your grooms discomfiture. Never approach a stable unawares, always give warning of some sort of your pending arrival, such as an audible cough at a distance. This is not to warn us to put our cigarettes away in case we should be smoking, but in order that your finer and more sensitive feelings may not be hurt by the continual "cussin' and blindin'" that will probably be going on within. Grooms, I suppose, should not curse and swear; nevertheless, they nearly all do. A prerogative, I imagine, handed down to them through the ages, which, all the same, they do not care about blasting upon the dainty ears of a fair lady.

As there are many kinds of masters, similarly it takes all sorts to make up a hunting field. There are those who ride to hunt, and those who hunt to ride. Then there are the "socialites," the people who hunt because they think it is the thing to do, and that by doing it they will be in the social swim. They tell me that in this last category the fair sex predominate. Erstwhile, hunting was the simple sport of the country gentlefolk and yeoman farmers, but now, with the advent of the motor car and airplane, the covering of long distances has become an easy and rapid matter, and it would sometimes seem that hunting has been turned from a simple sport into a spectacular "tamasha."

At the conclusion of this dissertation, we of the saddle-room and stable-yard would say to you our masters, that your interests are ours, the horses you place in our charge are our pride and pleasure. At heart we are snobs, for nothing pleases us more than to see you better turned out and better mounted than the others, or to hear of your prowess in the saddle, the hunting field and on the polo ground. Perhaps, master, you would be surprised were you to know of and overhear the arguments that take place in saddle and tap rooms, of your and your horse's valiant deeds, and how your faithful varlets champion you against allcomers.

Be kind to us, O Master, for we would serve you well.

R. M. S. BARTON.

THE OLD WAY AND THE NEW

Some Serengeti Contrasts

WE arrived at a suitable camping place at about 2 p.m., and were met by my old native hunter, who had come ahead to spy out the land. He told me that there was good water in the river bed nearby, and that he had seen a fair amount of game about. If this were true, I decided that I would spend a week or more of my leave here, as I was mad keen to shoot a few trophies, and my porters, a very cheery crowd, were just as keen to have a good supply of meat.

Having selected the most shady tree, the next thing was to pitch the tent. An art, indeed, is this business; the direction of the prevailing wind must be ascertained prior to anything else, so that the tent can be pitched to face in the opposite direction. Having done this, you are pretty certain to wake in the middle of the night to find your shelter being blown out like an inflated airship, and a heavy rain storm driving straight on to your face, and in this case it was so, for at about 1 a.m. my tent almost collapsed on me and all my belongings were soaked. However, as I was out to enjoy the free life of the bush, it did not really worry me, and I was soon asleep again.

At 4.30 a.m. my boy appeared with what he said was tea; he had brewed it himself, and assured me that there was not a dead bat in the teapot, but I had my doubts. We left camp at 5.30, my old hunter leading, followed by myself with field glasses, and behind me a gun bearer with my light rifle and a second bearer with my heavy one. A dozen porters brought up the rear, their function being to bring in any meat and trophies. Having been with me before, they well knew the penalty for disobeying my orders about following in my tracks and keeping well out of sight.

Presently, whilst going through some long grass, the hunter did the famous pig-hole trick, and disappeared legs first into a large hole. He was out pretty smartly, though, so was the wart hog that had been in residence therein.

After we had been going up-wind for about two hours, we came across fresh roan spoor about an hour old. There were seven of them, and one was a good-sized track, so my spirits rose; I should indeed be lucky if I could take home a roan head. I took the light rifle, put the hunter like a terrier on to the spoor, and sent the empty-handed gun bearer back to the porters. Then we moved forward. Once we lost the tracks completely where they passed over rocky ground, and wasted nearly half an hour of valuable time before picking them up again; this work was made easier by our spreading out in a fan formation and searching every inch of ground. On such occasions I always went a little ahead, with my eyes skinned, in case there was a chance of a shot.

A whole hour passed before we found some fresh droppings still warm, which warned me that the herd was quite near. I crept forward in front now, keeping as low as possible, one eye on the spoor and the other staring ahead. (This is when the glasses are so useful, for when one is all keyed up with excitement tree stumps, rocks and shrubs all seem to resemble beasts.) I had not gone more than 100yds. or so when I spotted a movement behind a bush; my old hunter at my back was also getting excited, and gave the signal that he, too, had seen something moving. The glasses showed a swishing tail, but as I could not make out any body attached to it, I crept forward again, tested the wind with some dust, and, finding it not too good, edged a little to the left. Once again I had a look, and now I could see several roan grazing quietly about 200yds. away. There was nothing worth shooting in the bunch, and at that moment a number of tick birds, who were feeding on the animals' backs, spotted me and flew off into a neighbouring tree with a loud twitter; off went the herd at a gallop, and I got no chance to shoot the bull, which had loomed up by a bush to see what all the excitement was about. I must admit that I was not the only one to be extremely fed up, for the expression on the hunter's face clearly said: "Can't you do better than that?"

By now it was nearly noon, and the tsetse were very trying, and obviously preferred me to anyone else, so I retired to a shady tree and drowned my sorrows in luke-warm water, and ate a few sandwiches, after which I was ready for the fray once more and took up the spoor again. But my luck was out that day, and though I managed to get near the roan bull after about an hour I fired and missed, and away went the herd so far that I did not see it again.

The following morning I was more successful, and managed to track down and shoot a kongoni, so I returned to camp well pleased and left the porters to bring in the meat rejoicing. That evening I went out again and stalked rather a nice bushbuck, but he evaded me too successfully. The porters were back in camp about 5 p.m., and as the kongoni head was quite a good one, though on the small side, I decided to keep it. Everyone was cheerful that night, and there was much chatter and laughter. I even ventured to discuss the roan affair with the hunter, and as he laughed and said it was all "Shauri ya Muungu," meaning that it was all an act of God, my misfortune had evidently been forgiven and forgotten.

It was three days before I got that roan bull, and then only after following a blood spoor for three hours: I had hit him too far back with my first shot, but managed to bring him down in the end with a long one. He had a fair head of 27½in., which was not too bad.

I stayed at that camp for seven days altogether, but obtained no more trophies. However, I was well pleased with the two I had, and thoroughly enjoyed myself. It was during this trip that I was shown the spoor of Grant's gazelle for the first time, but I saw no sign of the animals themselves, which was disappointing.

CASPAR—A SERENGETI FAVOURITE

On the way home I asked the cook what had happened to his "Backbone of Africa." "Oh," he said, "you ate that the first night in camp!" "But," said I, "you knew my instructions about fowls. What do you mean?" "Perhaps," said he, "but you ate it all the same!" And that was that!

* * *

And here is the new way.

The party was out for a fortnight, and it was out for all it could get. Mr. and Mrs. Puffler did not know anything about shooting, or, for that matter, about the different animals they were out to shoot, but they had engaged Captain Harry Balder, a white hunter, for their trip. So far everything had been arranged very well. A fully equipped safari had gone ahead, and they were going to fly down and meet it at a pre-arranged spot. They had spent rather a lot of money on necessities such as a refrigerator, a wireless set, a large quantity of soda water and so on, for, after all, they were going to rough it in Darkest Africa, and it was just as well to be as comfortable as possible, and they heard that the water was likely to be dirty.

Before they left civilisation they made a few more purchases, such as fresh fish, butter, vegetables, &c., for, as their hunter had told them, they were going right into the "Blue."

They duly arrived at the camp, and were met by Captain Balder, who was a most thoughtful man; the camp looked so nice, tents all pitched under shady trees, the super box-body 30 h.p. touring car and the two lorries were all nicely parked behind the tents, lunch with cold iced beer was all ready, and the boys looked so nice in their clean white kanzas: Mr. Puffler thought that he could see some animals feeding on something about half a mile from the camp, they must be tigers surely? But the hunter told him that it was a pride of lions that he had all ready to photograph after lunch, when it was a little cooler.

Lunch was a great success, and afterwards they felt rather sleepy, so Captain Balder told them to go and rest for a bit, adding that the ruddy lions would stay there; Mr. Puffler was a little surprised at the language, but, as he told his wife afterwards, no doubt the poor fellow had been in Africa too long, and that they must make excuses for him. Mrs. Puffler was quite sure she had heard him shortly afterwards swearing at the poor niggers, but, well, perhaps it was best not to hear too much.

After early tea, and later, breakfast, the party climbed into the box-body car; there was plenty of room for all, including a couple of gun bearers; Mr. Puffler had a revolver strapped to his belt, dangling cowboy fashion, and the belt was stuffed with ammunition; he also carried a further supply of cartridges for his two rifles, on each side of his coat. He resembled a travelling armoury, but, after all, they were out in the wilds, so one had to be careful.

By ten o'clock they had seen a considerable amount of game, and had shot five beasts, but they were not sure what kind; there was very little in it really; one drove about till Captain Balder decided that he had found a suitable head; it was really wonderful how close he managed to drive up to the selected trophy, and he was so good in covering their shots, just to make sure that the beasts did not get away. The hunt was all over in a few minutes. Captain Balder refused to let them shoot any more as there was already a considerable amount of work for the skinners, so they went back to an early lunch and a rest, and the remainder of the evening was spent in writing letters and filling up their diaries. A 'plane was due the next morning, bringing fresh vegetables, and would take their letters back with it.

The following day was devoted to lion hunting, and it was not until they had seen 37 lions that they found a fine big fellow asleep under a tree; they drove up to inspect him, and decided that he would do. The lion took no notice, and after a casual glance to see if the party had brought him a meal he continued his sleep, from which he was never to awaken again.

The hunt was all over in a few minutes, and Captain Balder explained that it was Mr. Puffler's shot that had killed the lion stone dead, his own shot having gone high. Mr. Puffler was rather hot and puffed; it had been a nerve-racking crawl of 50yds. from the car to the very convenient ant hill. (Captain Balder was one of the old-time hunters and had no use at all for this kind of shooting, but if the trip were to be a success they must get on with the business.) They bundled the dead lion into the car and moved off in search of further victims.

On the fifth day it was decided to call on the Game Ranger before shifting camp to another area next morning. On the way, the party managed to collect a cheetah, an eland, a roan and a waterbuck, and they duly arrived about 10 a.m.

The Game Ranger appeared to be rather a grumpy sort of fellow. He gave a casual glance at their trophies and kept looking at their boots. Something must be wrong, yet they had been well polished that morning before leaving camp, and there was not a speck of dust on them.

Captain Balder went into the office, and after about half an hour he came out looking very worried about something. He admitted later that they had been a bit slack about various game laws in connection with the use of a car, and somehow or other the Game Ranger had found it out. Secretly, he expected his professional hunter's licence to be cancelled at the end of the trip.

In five days Mr. and Mrs. Puffler had shot 25 trophies between them, including two fine lions; so their shoot had been a great success; all their films were finished, chiefly photographs of dead beasts with the mighty hunters posing in various positions. Of the four impala they had shot two were thrown away as they were considered too small.

Niall Rankin

A VIEW OVER LAKE OSSIAN, IN WESTERN INVERNESS-SHIRE

A FEW ACRES AND SOME GROUSE

A Season's Fun for the Poorer Sportsman

THERE is an old saying that "Half a loaf is better than no bread," and it has a peculiar application to grouse shooting. While most of us gladly accept invitations to shoot, there is nothing quite like having a place of your own, no matter how small. Be it only a few hundred acres of heather-covered allotments and rough hill pastures which harbour a small stock of birds, you can have no end of fun on it, either shooting alone, or in company with one or two friends. I can honestly say that during the last 40 years, some of my happiest days have been spent on what I may term rough grouse shoots in Yorkshire and Westmorland.

After a season or two on such a shoot you will know more about grouse than you ever did before, and the knowledge will have been gained by the sweat of your brow. Here, perhaps, a word of advice may be useful. Do not take a place of this sort, especially if the going is rough, unless you are prepared to work—and work hard—for what to most people would be a totally inadequate bag. I have, for example, been quite satisfied with a season's kill of 34½ brace of grouse, 8 brace of blackgame, 4 pheasants, 2 partridges, 4 snipe, 1 woodcock, 1 wild duck, 2 teal, 1 curlew, 5 pigeons, 9 hares and 91 rabbits. A mere drop in the ocean as bags go, but the getting of it provided plenty of fun, to say nothing of hard exercise.

The amount of pleasure to be got out of a rough shoot cannot be measured by the size of the bag. There is as much satisfaction in outwitting an old blackcock or a wild pack of grouse, as in killing 30 or 40 driven birds.

Even on a rough shoot you can try your hand at driving. Many a time have I acted as walking gun, and done my best to put birds over a couple of friends hidden behind a stone wall or amongst the peat hags. It takes some doing, believe me, to drive grouse so that two guns covering a narrow front can take toll of them. Failures are frequent, but there are days when things go right, and you would not change places with the owner of a Wemmergill or Abbeystead.

Much of one's shooting is done single-handed with a retriever as companion. A dog that is out with you day after day gets to know your every look and movement, and will draw on grouse almost as well as a pointer. He is useful, too, when you are hunting up stuff amongst the coppice woods and rough patches of covert near the moor border, where anything from a blackcock to a wild pheasant may get up.

You make your largest bags during the early weeks of the season, when birds lie pretty well; but in the back-end when grouse are wild and strong, it means scheming and stalking to kill a brace or two. One of the first things you learn in this sort of shooting is the necessity for treading softly. Sound carries far on a still day, and grouse have ears to hear. How often have I been out with fellows who coughed loudly or clattered over stones just as they were getting within shot of a particularly "smittle" spot. Watch your step, and never let your attention wander, otherwise you will miss many chances.

Needless to say you should be suitably shod, otherwise on steep ground you will never feel at ease. Let your shoes or boots be well nailed, for it is half the battle to be able to walk without slipping. When moving birds on a small shoot, due consideration must be given to your boundary. It is quite easy to send grouse into "Naboth's Vineyard," but impossible to get them back again. Luckily, grouse are home lovers, and generally return to their own area as soon as possible.

When walking up grouse, or what a Yorkshireman would call "peeping" the likely places, it pays to work down wind. Not only will birds be found lying in the lee of the knolls and ridges, but flushed birds fly down wind, thus you have them in front of you, and can refind them. You will soon discover that grouse have their favourite resting places. Like us, they love the sun, and are fond of basking in it. By the end of your first season you will have learnt the best way to walk your ground, and I have generally found it pays to stick to a regular-route except when you happen to mark birds down and decide to go after them. Certain areas are far less resorted to by grouse than others, but when crossing them it is wise to keep alert, for the unexpected often happens, and it is easy to be caught napping.

In the back end, when the mornings are cold and frosty, you can try your hand at another form of grouse shooting, *i.e.*, beeking.

Before the sun rises cock grouse do a lot of calling, uttering their "err-beck, beck, beck, goback, goback, goback" as they flutter up to a height of 15ft. or so, and alight on a hillock.

If you can imitate the call of a hen grouse by means of a clay pipe stem, a performance that requires considerable practice, you can generally draw one or more cocks within range of your hiding place behind a peat hag or stone wall.

The call of the hen sounds something like "youe, youe, youe," and is produced in a soft key. You must be on your ground before daybreak, and wait until you hear a cock grouse begin to call. You then answer him at intervals, and, at last, if all goes well, the bird arrives within shot. It is not so easy as it sounds to kill a bird on the ground, especially in the dim light of early morning. The best way is to aim below him, raise your gun barrels until they cover his feet, and then pull.

If you have a few blackgame on your ground so much the better. They are fine sporting birds, and make a welcome addition to the bag, although they add considerably to its weight, which is a consideration when you have to carry it yourself. I consider the grouse is our finest game bird, but an old blackcock runs it a close second.

The majority of blackgame I have killed were shot on the open moor. In snowy weather it pays to try the woods for them. They eat far less heather than grouse do, subsisting largely on other ground plants such as yellow hawk's-beard, plus berries and buds. When the snow lies deep you will find them in the birch trees, eating the catkins, buds and young shoots.

The pace at which blackgame fly is deceptive, as you will soon discover. Their wing-beats are slower than those of grouse, but they can easily overtake and pass the latter.

One advantage of a shoot such as I have attempted to describe lies in the fact that you can carry on right through the season from August 12th to December 10th. You need make no preliminary arrangements either. Just fill your pockets with cartridges, let out the dog, and you are ready.

RICHARD CLAPHAM.

"YOU SHOULD GET YOUR SHOTS PRETTY SOON"

Letters to Young Shooters

GOOD DAYS WITH FERRETS

(*Sketches by Maurice Tulloch*)

MY DEAR GEORGE,—I suppose one of the oldest shooting stories in existence is of two men out ferreting on either side of a fence. They began their operations in hope, and faith and charity, but after a deal of waiting they decided that the only thing to do was to dig out the ferret. They fetched a couple of spades and set to work. At the end of an hour they had each put up a useful sort of adjunct to the Maginot Line. At the end of three hours they had completed a hole that would have done credit to a month's excavation by a party of archæologists at Pompeii. Then Bill said to Tom: "I suppose you *did* put the ferret in the burry?" "Good Heavens! No!" said Tom. "I thought you had!" It was still in the bag!

Now to a lot of people that means all there is to ferreting. Long exasperating waits followed by hours of back-aching digging. Yet if I was starting to learn to shoot I think that ferreting and walking rabbits in thick cover is as good a way as any that I know. Certain arts are best learnt at the shooting school, but fur or feather adds an element that no little clay plate can ever give, and that is where I would first of all have you learn it.

For some reason I have never understood ferrets are rather a despised class of animal, and are so often held up as dirty and degraded little beasts. This is far from the fact. In all cases they are by nature clean, and the fact that their cages are often dirty is due to an unsuitable diet or an unsuitable cage. The characteristics of a good ferret are loyalty, courage and zeal. Not all ferrets are thus compounded, but if you find such a one stick to it and breed from it. Curiously enough they make very good pets.

One can, of course, ferret with nets as well as with the gun, but I will not deal with the former. I suppose the ideal way to ferret is with a small team of ferrets and a platoon of henchmen following behind with spades, so that you may pass from target to target without delay. But as anybody who can afford to work on such a scale is probably renting a grouse moor in Angus, let us consider working with one attendant and say two or three ferrets. Whether there should be more than one gun is open to doubt. As a rule, better not. It makes in extreme cases for danger, and in almost any case for uncertainty. Some people like to take a dog: others do not. That seems to me to depend on the dog.

In these modern days there is seldom any difficulty in finding well-stocked burries. For choice choose the smaller burries in the more open ground, as this makes shooting easier, remembering, however, that in absolutely open country rabbits do not bolt as well as when they know their exit is to some extent covered. A ferret should not be too hungry on the day you take him out. It does not make him duly keen, it merely makes him ravenous, and he will make a hearty meal off the first rabbit he can get at, and sleep it off. Feed him, then, at mid-day the day before use on raw flesh (his natural food), and again with a little bread and milk on the morning of the shoot.

The most common mistake made in ferreting is, I suppose, to make a noise like a Dictator at the microphone as one approaches the scene of operations. Rabbits below decks use their ears as their only connection with the world above, and much stamping or shouting overhead makes them far less likely to bolt. This cannot be too strongly emphasised.

If you have white ferrets they are more easy to spot, and the danger of shooting the ferret is less likely. Some people muzzle their ferrets, as a bitten rabbit has less market value, though personally I do not like this. The life of a ferret is something akin to that of Proserpine or a "tweeny" (the worst of both worlds), and he naturally takes to the dark, but I cannot believe that to be muzzled is anything but a severe handicap to him below ground. The same thing applies to line ferrets. I do not like using them. Apart from hampering the ferret, the line is sure to get caught up somewhere below, and the ferret less easy to retrieve than ever. Line ferrets are sometimes useful in moving a ferret that is lying up, but apart from that they are to be avoided; that is as I think, but I knew an old keeper in Berkshire who did a tremendous execution with a pair of line ferrets and nets. If line ferrets are to be used to fetch back the truants, then let the line ferret be a dog, the loose ferrets bitches, on "the female of the species . . ." basis.

There is, too, another thing to be borne in mind as you approach the burry, besides keeping quiet. Approach it against the wind. For though the rabbit depends on his ears, yet if, as he is about to bolt, he gets a whiff of alien taint, he will turn back. Imagine his feelings, doubly sharpened by the terror behind, as he realises there is danger ahead! Would you face it? Then again, supposing you are ferreting on ground that is kept well clear of rabbits, and you are not certain of where to put your ferret, look for droppings and other signs of recent occupation.

Having put your ferret down the hole if he is working well, and if the rabbits are bolting nicely, you should get your shots pretty soon. If he does not, you must wait as long as your patience lasts. When it is exhausted you must dig. But before digging, try your line ferret, if you have one. Place your ear to the ground like a Chingangtook listening for the approach of a Pale-face, and you may perhaps, after a time, hear the commotion below. Well, then, try and dislodge the ferrets who are making a meal off the rabbit with your line ferret. He will probably drive them off. Put him down the hole, and have the line so marked that you can tell how much line is played out. And then, if the ferrets still linger, you must dig.

Do not despise ferreting. It is a thing one grows out of perhaps, or that some people grow out of, but simply because you have killed a few driven grouse with Uncle Alastair do not despise the simple pleasures you enjoyed with Ben at Thornley. There are many things less satisfactory in the shooting world than the somersault of a rabbit cleanly hit in the head.

Finally you ask me about cleaning guns. I had intended to deal with this next week, but rather than let a brand new weapon lie sullied for seven days, let me suggest the following, which is the method I adopt. First, take the gun to pieces and wipe off all moisture and dirt. Then I wrap the metal "jag" which screws into the top of the cleaning rod with tow, so that it fits firmly but not too tightly into the barrels. Then I rub them again with tow wrapped in "Three-in-One" oil. Rub the barrels clean. If they are then bright and shining, well and good; but if there are streaks of lead fouling, I use my wire brush to remove them. Then I leave the barrels slightly oiled. Finally I lightly clean the outside of the barrels with "Three-in-One" oil, and thoroughly clean the small parts, triggers, levers, &c., with a cloth or small brush. And last of all I see that the stock is lightly oiled.

Your affectionate

UNCLE RALPH.

A WHITE FERRET IS BETTER THAN A DARK ONE

1888 1938 DUNLOP 50 YEARS OF GROWTH

Just as the Dunlop Fort Tyre with its 2,000 "teeth" is distinctive in the world of road travel, so Dunlop Clothing is equally distinctive in the realm of fashion. When buying Sportswear, Rainwear and Tyres, let the name Dunlop be your assurance of satisfaction.

FATA MORGANA

Mirage Pictures on the Hungarian Pusztas

ITS mirages form one of the most remarkable features of the vast Hungarian plains known as the Pusztas and are spoken of in Magyar as déli-báb. For mile upon mile the plains stretch their sparse vegetation alternately with meadowland, barren wastes, or marshes, famed for their wildfowl. In this setting mirages produce the most fantastic scenes throughout the summer and in the autumn when the sun warms up the earth's surface. Trembling church spires, woods, horsemen and peasants, even railways and towns, are mirrored on the silver water-like surface of the air. If a light wind springs up the pictures become distorted, men grow long legs, horses develop giraffe necks, and objects which appeared quite close are suddenly transported miles away. As the spectator is lured on so the mirage recedes from him.

AN INTERESTING BENTLEY SALOON WITH ATTRACTIVE COACHWORK TO BE EXHIBITED AT EARLS COURT BY THE CAR MART.

FINANCIAL FLUCTUATIONS

A Comparison of Pre-War and Present-Day Costs

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

I HAVE often been asked whether motoring is cheaper than it used to be, and although it is difficult to draw a comparison, since conditions during the early part of this century were so totally different to those now ruling, yet notwithstanding the heavy burden of taxation which every motorist to-day is obliged to bear, I do believe that, taking all things into consideration, motoring at the present time costs less than it did in the old days.

Perhaps I should make one reservation when making this statement, since it occurs to me that prices and running costs were abnormally low shortly before the Great War. When I obtained my first driving licence in 1904, the price of petrol was then 8d. per gallon, in 1905 it was raised to 9d., and for a great many years it remained at 10d. per gallon.

Petrol consumption was never regarded as a serious item of expenditure in the old days, as it is now, for the reason of its low cost, and because it was seldom that long journeys were undertaken. Added to which, high speed, which means increased consumption, was impossible. It was seldom that a car at that time could exceed a maximum of 40 m.p.h. on the level, usually 35 m.p.h. was all that could be expected, since apart from inefficient engines and high weight, the roads of that period were, for the most part, atrocious. Possibly it was just as well that cars were then comparatively slow, since the brakes could never have coped with an emergency if speeds had been higher. As a rule, a 10 h.p. car used to average about 18 to 20 miles per gallon.

Although, as I have said, petrol consumption was never regarded seriously, the pioneer motorist certainly did have to watch his tyre bills, since a set of covers and tubes involved an outlay of anything up to £60 or more for a large car, and their life was very limited. On the credit side, chauffeurs' wages were very low—35/- per week or even less was usually paid, unless the driver happened to be a first-class mechanic, when he commanded more.

Lubricating oil used to cost about 4/6 per gallon, and sparking plugs around 1/6. Of course, the latter were not reliable, as they are to-day, but then all engines had a very low compression ratio and did not have to withstand high temperatures. There was, of course, no compulsory insurance, and it cost only 5/- to register a motor cycle, and £2 per annum a car, provided the vehicle weighed no more than 2 tons.

Makers invariably charged for repairs or replacement of parts, while the local garage attendants were usually only mechanics by name—they knew nothing, possessed no practical experience, and invariably a car had to be returned to the factory after they had finished tinkering with it.

The tyre bill was then the biggest consideration, and tyres seldom lasted for more than 3,000 miles, whereas to-day it is common practice to run 20,000 miles without suffering from a single puncture.

THE 1939 HUMBER SUPER SNIPE SALOON

A high-performance car with a top speed of 85 m.p.h. and an acceleration of 10-30 m.p.h. in 6¼ seconds, this model sells at £385

It is interesting to compare the prices of cars in 1904 with those ruling to-day, and I have before me all these details, contained in a book published in 1904, entitled *Cars and How to Drive Them*, which was recently very kindly forwarded to me by a Mr. Norman Ferguson.

In the voiturette, or light car class, the 6 h.p. single cylinder De Dion, seating four *vis-à-vis*, was listed at £200, the 4½ h.p. two-seater Swift £185, and a single cylinder Clement of 5 h.p., seating two, cost £170. It will be seen, therefore, that these prices compare somewhat favourably with our modern 8 and 10 h.p. vehicles, although from a point of view of reliability and performance, a comparison would be absolutely impossible.

In the £200 to £250 range, the 8 h.p. Darracq four-seater was listed at £250, but the engine was still only a single cylinder, and in this class there were many other makes that few have heard of, such as Firefly, Primus, Kilto, &c. Even cars costing up to £300 were invariably equipped with single cylinder motors, the Duryea being an exception, having three cylinders of 10 h.p. rating, and priced at £295. The most expensive single cylinder car at that period was the 8 h.p. De Dion at £325, although the 9 h.p. Renault ran it close at £321.

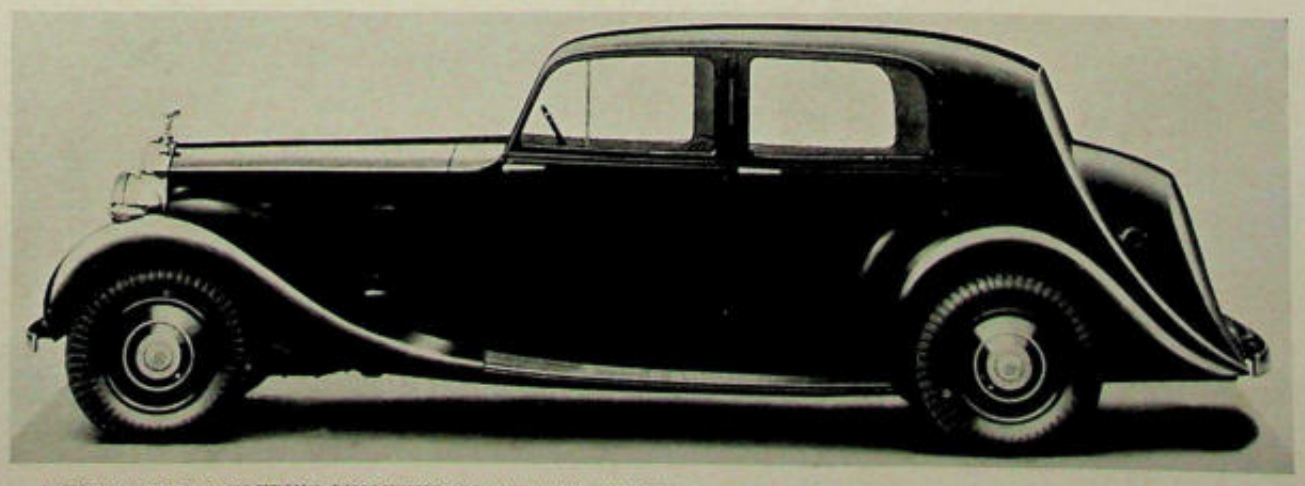
The highest-priced car of that day was the four cylinder 30 h.p. Panhard, which was listed at £1,850, and next to that came the 40 h.p. four cylinder Napier at £1,740. Although there are many luxury cars on the market to-day which command much higher prices than those mentioned above, it must be remembered that the modern vehicle gives almost unlimited service, whereas the life of their early prototypes was very restricted.

Another point which must not be overlooked is that cars are now sold complete in every way, whereas formerly, the lamps, horn, speedometer, hood, windscreen and even the tools were charged for as extras, and these items alone often cost £100 over and above the list price of the vehicle.

Specialised coachwork certainly cost far less before the War than it does at the present time, even though all the panels were of aluminium and hand-beaten, and all the painting was carried out by hand, but it is really remarkable when we consider that notwithstanding that practically every commodity costs far more to-day than it used to, yet motor manufacturers are able to offer the ordinary vehicles at less money than that demanded before the War.

This satisfactory state of affairs has been made possible by employing the most modern methods of construction, which has enabled cars to be produced in vast numbers, thus reducing their cost. The most difficult period through which the industry passed, when prices kept soaring upwards, was in 1919–1920, when manufacturers were switching over from war to peace conditions. The demand then was far greater than the supply, and consequently high premiums were offered for immediate delivery, the general public at that period having ample means at their disposal.

The 11.9 Morris Cowley, always a leader in the inexpensive category, was listed at one time at £525, and all other makes commanded a proportionally high figure. Then came the slump in 1921, when literally hundreds of thousands of pounds were lost by those engaged in the motor industry. To-day a healthy situation prevails, only marred, possibly, by the second-hand car problem, which is indeed one that is difficult to solve.



A STANDARDISED TOURING LIMOUSINE COACHWORK BY MESSRS. PARK WARD ON A 25/30 H.P. ROLLS-ROYCE CHASSIS

The design particularly suits the shape of the radiator and bonnet, and the lines are clean, while all seats are within the wheelbase

A *BENTLEY* ANNOUNCEMENT

AN IMPROVED 4¼-LITRE CAR WITH OVER-DRIVE GEARBOX

A number of important improvements have been effected in the 4¼-litre Bentley resulting in a car that is superior to its predecessor in MAXIMUM SPEED, GENERAL CONTROLLABILITY, ACCELERATION, SILENCE AND SMOOTHNESS.

1 MAXIMUM SPEED—The provision of an over-drive gearbox enables a higher maximum speed to be attained without exceeding maximum engine revolutions.

2 CONTROLLABILITY—Steering of improved design which is appreciably lighter to operate, coupled with the employment of larger tyres on smaller wheels, provides greater controllability under all conditions.

3 ACCELERATION—By reason of the modified gear ratios and slight engine modifications, acceleration is improved under certain conditions.

4 SILENCE AND SMOOTHNESS—The slower running engine under normal driving conditions, due to the use of the over-drive gear, coupled with the slight engine modifications, gives greater silence and smoothness.

5 OTHER FEATURES.
Centralised chassis lubrication.

Automatic shock absorbers with over-riding hand control.

Improved illumination of instruments.

Chassis £1,150 Saloon £1,510 Coupé £1,535

FROM COACHES TO CARS

The Birth and Re-birth of A Great Industry

IT is a popular habit to bewail the passing of the coach and all its pleasant associations, but when the subject is stripped of its romanticism there are few of us who would willingly relegate our modern motor cars, with their luxurious comfort and graceful lines, to the breaker's yard and travel awheel again in the none-too-comfortable and slowly-moving horse-drawn vehicles of distant decades.

The modern car, in so far as the bodywork is concerned, is of noble lineage and directly related to the carriages of earlier days, which owed their motive power to physical horses instead of mechanical ones—the skill of craftsmanship remains, handed down from father to son, as it was in the past, even though the medium and application are somewhat different. It is not without interest, therefore, to look back across the intervening centuries and behold something of the problems and achievements of the early coachbuilder.

Even as late in history as the Elizabethan era carriages were unusual and, like the chariots of the Greeks, were used almost entirely in processions. This was very largely due to that indefinable thing known as public opinion, for it was believed to be effeminate and likely to lead to physical degeneracy to ride in a coach—even the Elizabethans believed in "keep fit campaigns," it would seem! Added to this, Pope Pius IV opposed their introduction, and in 1560, when he voiced his sentiments on the subject, it took more than a firm conviction in their value to induce a Roman Catholic to travel in a coach at the price of his soul.

About the commencement of the sixteenth century, however, there was a revival of coachbuilding in Italy, France, Spain and Germany, and it is a matter of some question as to which country may claim to be the originator of the name "coach." The introduction of this mode of conveyance, as already stated, came slowly, and in 1550 there were only three coaches in the whole of Paris. One belonged to the Queen of Francis I, another to Diane de Poitiers, and the third to a rotund nobleman whose paunch forbade him the saddle of a horse.

In England, 1555 saw the first coach, which was built to the order of the Earl of Rutland by Walter Rippon, who subsequently made coaches for Queen Mary and Queen Elizabeth. By 1660 their numbers had increased considerably, and Taylor, the watermen's poet, complains that "coaches have increased with a mischief, and have ruined the trade of the watermen by hackney coaches, and now multiply more than ever."

Glass did not feature in coachbuilding, so far as we know, until after 1650, but when it did come it made a great deal of difference both to comfort and design. The coachbuilding trade began to look up, and in 1677, Charles II founded the Company of Coach and Coach-harness Makers. The trade began to flourish still more under this royal impetus, and coaches became embellished with an incredible amount of ornamentation which gave the appearance, as was intended, of overpowering opulence, even though, as often as not, neither good taste nor beauty emerged with it.

Mr. Pepys, the indefatigable diarist, made numerous remarks about coaches. In 1666 he "went with Dr. Wilkins, Mr. Hook, Lord Brouncker, and others, to Colonel Blount's, to consider again of the business of chariots, and to try their new invention which I here saw Lord Brouncker ride in, where the coachman sits astride upon a pole over the horse, but did not touch the horse, which is a pretty odd thing."

Pepys's pride in his own first coach is almost childlike: "To the Coach-makers, and find many ladies sitting in the body of a coach, which must be finished by to-morrow, the Lady Marquess of Winchester and Lady Bellasis, eating of bread and butter and drinking of ale; my coach is silvered all over, but no varnish yet laid. I stood by it till eight at night, and saw the painters varnish it, and it dried almost as fast as it can be laid on. I sent, the same night, my coachman and horses to fetch the coach home."

The value of smaller and lighter chariots was soon realised, and we read of Dean Swift driving in his chariot and pair from London to Windsor, doing the 23 miles in 2 hours 40 minutes, while he covered the distance from Windsor to Bucklebury, 26 miles, in four hours.

Of the State Coach much might be written, but since space does not permit of it, the delightful account in *The English Mail Coach*, by De Quincey, of the presentation of a State Coach to the Emperor of China must suffice—it certainly is a feast in itself.

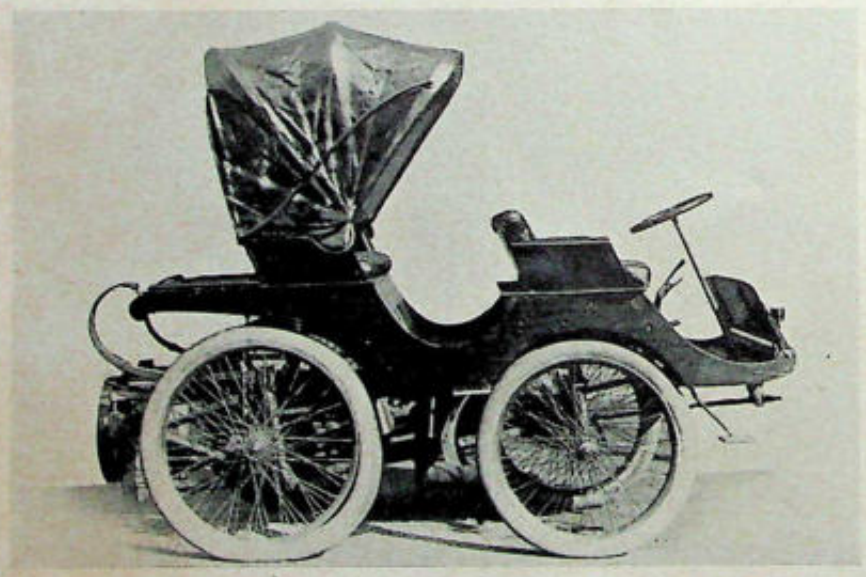
"Amongst the presents carried out by our first embassy to that country was a state coach. It had been especially selected as a personal gift by George III; but the exact mode of using it was an intense mystery to Pekin. The Ambassador (Lord Macartney), indeed, had made some imperfect explanation upon this point; but, as his excellency communicated these in a diplomatic whisper, at the very moment of his departure, the celestial intellect was very feebly illuminated, and it became necessary to call a cabinet council on the grand state question, 'Where was the Emperor to sit?' The hammercloth happened to be unusually gorgeous; and partly on that consideration, but partly also because the box was the most elevated seat, was nearest the moon, and undeniably went foremost, it was resolved by acclamation that the box was the imperial throne. . . . There was but one discontented person, and that was the coachman. This mutinous individual audaciously shouted, 'Where am I to sit?' But the privy council, incensed by his disloyalty, unanimously opened the door and kicked him into the inside. . . . 'I say,' he cried out in an extempore petition, addressed to the Emperor through the window—'I say, how am I to catch hold of the reins?' 'Anyhow,' was the Imperial answer, 'don't trouble me, man, in my glory. How catch the reins? Why, through the window, through the keyholes—anyhow.' Finally this contumacious coachman lengthened the check-strings into a sort of jury-reins, communicating with the horses; with these he drove as steadily as Pekin had any right to expect."

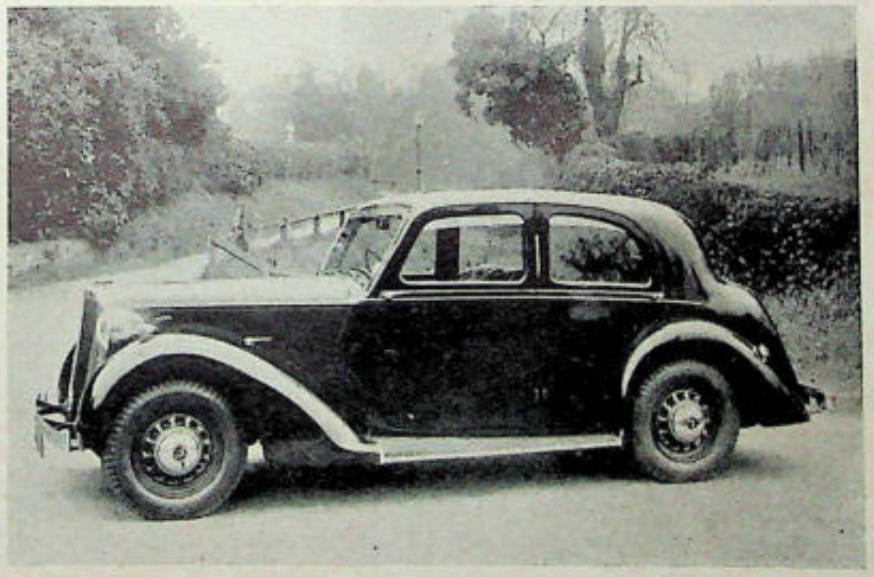
It is extremely interesting to grasp the measure of the numerical growth of carriages in Great Britain during the nineteenth century. In 1834 there were 49,000 four-wheeled carriages, in 1844 62,000, 68,000 in 1854, in 1864 102,000, while by 1874 there were 150,000. Of two-wheeled carriages the returns were 50,000 for 1834 and 285,000 for 1874.

Then came steam, and with it came temporary annihilation for the coachbuilding trade. For 68 years the roads were practically deserted by serious traffic, the hobby-horse and cycle holding sway instead. For the coachbuilder, after the storm came the calm or, put differently, after the steam came the car, and once more a great trade fought its way back into public recognition.

The better coaches and carriages of past days were undeniably graceful, yet the coachbuilder of 1938 may, with honesty, say: "It is a far, far better thing that I do, than I have ever done."

L. N. RADCLIFFE.





THE CRUDITY OF THE MECHANICAL BOX ON WHEELS HAS CHANGED: THE CAR OF TO-DAY IS A THING OF VERY REAL BEAUTY

The first four-wheeled petrol-driven motor car which was made by the Lanchester brothers in 1896, and the £375 Lanchester Roadrider de Luxe which, with its lively yet silent six-cylinder engine and independent front wheel suspension, is a product of 1939

COMFORT WEDDED TO SPEED

The New Fashion of Silent Sports Cars

A FEW years ago the sports car was an entirely different vehicle from the touring model. Comfort and appearance were both sacrificed on the altar of speed; a couple of cushions on the floor constituted all the upholstery; there were no doors and often no hood or screen. You had to be a "he-man" to drive one, even in the finest weather.

After a few years, however, people became more sensible. They began to ask themselves whether it was not possible to have the same performance coupled with real comfort. Thus there was born a new generation of sports cars, in which comfort and appearance counted every bit as much as speed, and to the Bentley people must be given the credit for setting a new fashion in *silent* sports cars.

The sports car of to-day is more often than not a closed model. The low-built chassis, designed for first-class road-holding, provides coach-builders with an opportunity of building those low, streamlined bodies that are associated with speed.

Acting on the principle that a sports car is no longer a toy for fine days, but a faster, more roadworthy edition of the family touring saloon, nearly all modern cars in the speed category have adequate accommodation for luggage. More often than not there is a built-in container at the rear, the lid of which lets down to form a flat luggage grid for carrying heavy trunks. The seating, too, is as luxurious as in any limousine, and thanks to the low underslung chassis at present in vogue, the necessity for footwells in the rear compartment has been eliminated, and many sports cars have perfectly flat floors.

Contrary to the belief held by a large section of the non-motoring public, the true sports car is safer to drive than the standard family saloon, because the low bonnet makes both front wings visible and gives the driver a very much better view of the road ahead than he would obtain in a car with a high bonnet.

On the whole, there is a tendency in these days to go in for the higher-powered sports cars. The impressive Lagonda, for instance, has an engine of no less than 4½-litres capacity, whether it is a six-cylinder power unit or a "Twelve." The Alvis people sell a 4.3-litre job, while the most popular of the alternative Bentley models is the higher-powered 4¼-litre car. Then there is the S.S. Jaguar, a 3½-litre saloon, the 2½-litre M.G., and the 2-litre Aston Martin. Of course, some firms list different models. There is a 1½-litre and also a 2½-litre S.S. Jaguar. They all have the same chassis and body as the 3½-litre, but the power-units are, of course, smaller. In addition to the 2½-litre M.G., there is the well tried 2-litre model, the 1½-litre and the "T" type Midget.

Needless to say, sports cars are well ahead when it comes to technical considerations, particularly in the matter of springing. The Alvis, Bentley and Lagonda cars all have independent front-wheel suspension on at least some of their models, high-geared steering is the rule, and brakes are extremely powerful. Another good point on the modern sports car is the very large petrol tank capacity, enabling considerable distances to be covered without any need for replenishing the fuel supply.

Practically all the best-known sports cars have been improved in the last two years in the matter of silence. Double expansion chambers are in most cases fitted into the exhaust system, while special care in the design of valve gear has eliminated a prolific source of mechanical noise.

In many ways the typical sports car has more thought devoted to it than the accepted type of family vehicle. The question of driving position, for instance, is usually settled by expert drivers who have had experience of handling racing cars. The seating position is generally more upright than in the touring car, and the steering wheel is so placed that when sitting as he should, with his hands grasping the lower part of the rim of the steering wheel, the driver's arms above the elbow are in line with his spine.

The seat is not too low, and is sufficiently close to the pedals to ensure that the driver's legs are never fully stretched out, even when he is applying the brakes to the maximum amount. Ample support is given to the knees and the thighs, and high up the back without restricting unduly the movement of the shoulders. This upright driving position affords admirable control, besides the maximum possible visibility.

The accessibility of the brake and gear levers and other controls are also features which are generally dealt with very capably in the case of sports cars. Both levers can be reached without any stretching or leaning forward on the part of the driver, and the dashboard switches, horn button, window winders and so on are all so placed that they can be reached simply by raising the hand a few inches from the rim of the steering wheel.

The equipment of sports cars which used to be of the most Spartan nature, has now been amplified to such an extent that it is more lavish than that of the ordinary automobile. It is realised that sports car drivers want to be able to keep up a good average speed even under conditions of poor visibility, and powerful fog lamps are usually fitted in addition to high-powered anti-dazzle headlamps. An adequate warning device, too, is most necessary, and twin horns are the rule.

Large dial instruments, permitting easy reading at speed, a revolution counter, water thermometer and oil-pressure gauge are also instruments which are not found on the less expensive touring models. On the whole, the sports cars to-day are, if anything, more comfortable and more luxurious than many family type vehicles, and it is this fact, coupled with the high performance of which they are capable, that makes them such an attractive proposition to the keen owner-driver.

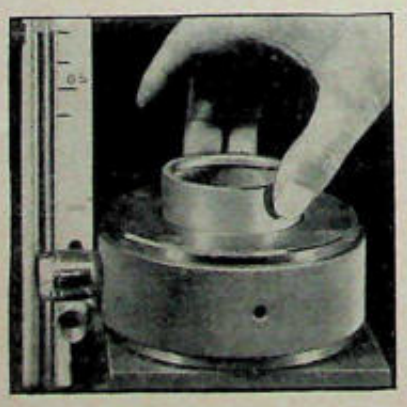
Problem for Visitors to the Motor Show

Can you detect the difference between these two pistons?

To *see* the difference between these two pistons you would have to have eyes like microscopes that magnified hundreds of times. For a piston has to be accurately machined to within 1/10,000th of an inch before it is passed for use in an Austin engine. Pneumatic micrometers and many other intricate machines do the "seeing" for Austin test engineers.

Every Austin car is built and tested by precision methods. When you visit the Motor Show remember this accuracy. It is something you cannot see on the Stand but it soon shows up on the road. To its unfailing observance in manufacture you owe the unfailing safety, performance and economy of your Austin car.



AUSTIN PISTONS are machined oval for positive lubrication. In addition to the diameters being checked to 1/10,000th of an inch they are also carefully balanced by pairs for correct weight: on this careful process of selection the smoothness of Austins largely depends.

AUSTIN STAND

No. 150

If you cannot visit us at the Motor Show be sure to see the new range of cars at your local dealer, who will also be happy to give you a fascinating little book called "Making Cars and Making Certain."

BRITISH CARS—BEST IN THE LONG RUN

THE NAME THAT UPHOLDS BRITISH *Prestige*

The new type 'C' speed model (streamlined all-metal body) in its very first race, the R. A. C. Tourist Trophy, achieved a 1st in Class 3 and 2nd in Handicap Race, and thus continues worthily to uphold both British prestige and the Aston Martin reputation for reliability, so amply demonstrated by a long series of meritorious successes in almost every country in Europe.

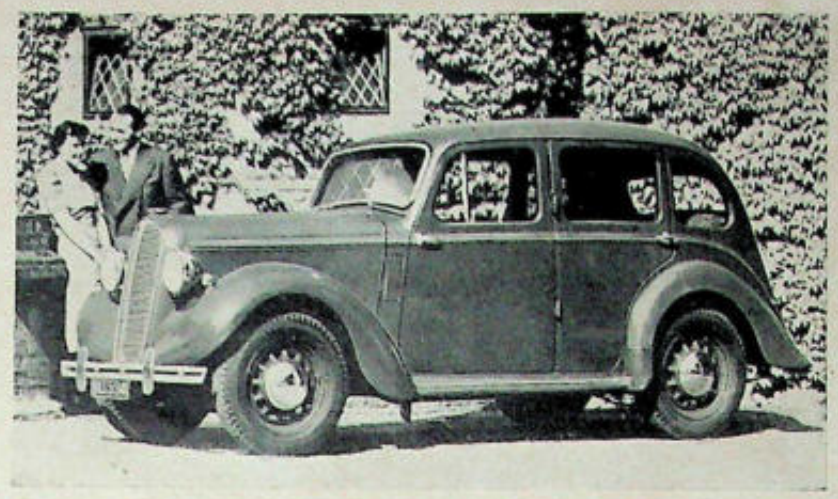
LIGHT CARS AND LARGE FAMILIES

The Economy and Convenience of a Second Vehicle



THE 1939 SAFETY SALOON HILLMAN MINX, PRICED AT £163

NO sooner has the harassed parent paid off his son's debts at Oxford and his daughter's finishing fees in Paris and, blotting the cheques, heaved a sigh of relief, than the problem of family transport zooms into the foreground.

It was simple enough when the children were young. The big car would take them all easily. And, of course, they never had any say on where they went or what they did. But to-day it is different with grown-up sons and daughters always darting off somewhere, their activities as varied as their scope.

The family car can no longer compete with the dizzy comings and goings that this new social whirl would thrust upon it. And, anyway, the young people want a car or cars of their very own. Other sons and daughters are so blessed, and so, quite naturally, they want one too.

The harassed parent promises to look into it. And he'll soon discover that the problem is not nearly as grim as he thought. In fact, the addition of a second car may actually prove an economy. Certainly it will be an advantage. For there are so many times in the course of the week that the big car is sent on trifling errands to the village, down to the station, to a tennis or shooting party and so on, when a lighter, smaller vehicle would do the work quite as well and much more cheaply.

And then as far as convenience is concerned, every one-car family knows the amount of give and take that is necessary to dovetail their various engagements into one another. Someone is either kept waiting or has to start too early or cut an engagement, while someone else is doing the same sort of thing somewhere else. Yes, this "fitting in" stuff with only one car can be an infernal nuisance.

The solution is a second car of anything from 8 h.p. to 12 h.p., price roughly £130 to twice that amount. Let me give some actual figures to show the extraordinary economy of operating, say, an 8 h.p., figures which prove over a distance of 100,000 miles that these small cars are capable of the most astonishing reliability and endurance. Petrol consumption averages 35 m.p.g., tyres 36,000, oil 2,000. All in costs approximately 1d. a mile, including tax and insurance, which would be reduced with a two-car stable. Decarbonisation and brake relining once every 20,000 miles. Maximum speed 55 m.p.h., and average over several hundred miles say 36 m.p.h. These figures may seem astonishingly good, but they are based on actual experience.

There is no reason why the figures for the 10 h.p. and 12 h.p. class of car should not be proportionately good. The difference is that the larger cars naturally give rather more accommodation, comfort and better amenities.

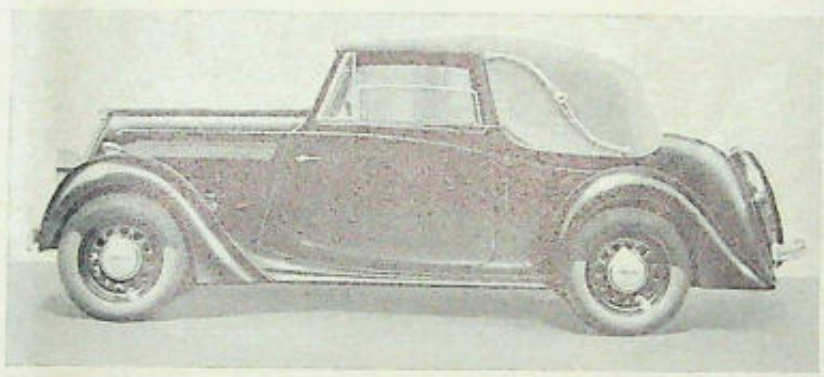
Ease of handling is another point in which the light car excels. It needs less room in the garage, less space in the car park. It can be turned about more quickly in a narrow street and slip through a rift in the traffic more safely.

It is noticeable that most of our motor car constructors include a light car in their programme in addition to the roomier, more lavishly equipped and higher powered models. That applies to Daimler-Lanchester, Austin, Armstrong-Siddeley and Morris to name but a few. Concerns like Standard and Singer, on the other hand, have specialised in light cars since pre-War days, and made a tremendous success in this branch of engineering. Indeed, unless one has tried some of these modern twelves, tens and eights, one has no idea of their amazing capabilities. Only a few years ago one of the best cars of 14 h.p. rating developed a little over 32 h.p. on the bench. To-day one car of 12 h.p. or 1300 c.c., which is well under 1½ litres capacity, actually produces nearly 50 h.p. This increase of power is reflected in enhanced performance with the result that to-day's tens and twelves are doing the work of yesterday's fourteens and sixteens and at a fraction of the running costs.

The nature of our roads and the immense volume of traffic their meagre width is called upon to carry have also influenced the current trend of design in favour of the lighter, more compact vehicle. For what is, the use of designers and technicians producing big cars with terrific performance if the road engineers will not open up the roads to accommodate them?

There are many excellent examples of the class of car under review. One of the highest grade is the Lanchester. One of its chief claims to distinction is its self-changing gear, most simply operated by pre-selector hand lever and pedal. This gear was first introduced by the Armstrong-Siddeley people, who have now added what they term a balanced drive as an extra refinement. This detail of design in conjunction with an automatic clutch gives exceptionally smooth running. Friends who have tried this year's Armstrong-Siddeley six-cylinder Twelve are universal in their praise of its enhanced performance and general sweetness.

Possibly the most popular Ten on the road is the Austin. Almost since British motoring began Austin cars have been noted for two things, dependability and the commonsense displayed in their design and specially in their coachwork. Good views front and back, wide doors, easy entrance and exit, plenty of head, leg and elbow room, these are the qualities that have made whole families Austin-minded for more than a generation.



A SMART SINGER DROPHEAD COUPÉ, BEING MARKETED AT £279

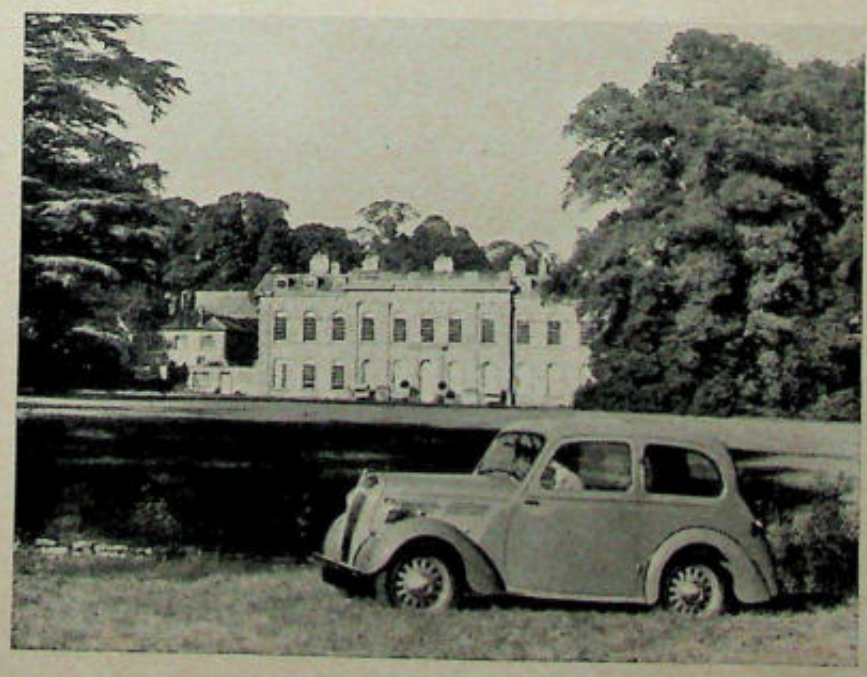
Another car in the 10 h.p. class which I tried recently was the Singer. An immense amount of thought and energy has been built into it during the past year. Its performance is alert, its layout appeals to a practical driver, and its road manners are precise and well behaved. Obviously it incorporates much that has been learned from the famous team of Singer competition cars that has done so well in trials.

For the constant comings and goings demanded by the various members of the household a well-planned body is essential. It must have room for luggage, parcels, papers, bags and sports gear, not to mention coats, rugs and umbrellas. Well, ever since I drove a Standard I've been impressed by the ingenious furnishing and fitting of its body. What you want and where you want it seemed to be the keynote to the body plan. And after all, to-day we judge a car by its body comfort and general arrangement as much as by its behaviour on the road. We take the nuts and bolts part of the car for granted because we cannot see it. But we can see, feel and use the body gadgets, and in this respect the Standard people have achieved a marked advance in convenience and comfort. For whether it is a day's shopping or a fortnight's holiday in Scotland that takes the car out, these little details do make all the difference to one's enjoyment.

And now *pater familias*, if only for his own peace of mind, will have to sign another cheque.

W. G. McMINNIES.

AN INTERESTING 14·60 H.P. WOLSELEY. THIS FULL 5-SEATER SELLS AT £285



THE FLYING STANDARD "EIGHT" SALOON DE LUXE, TO BE SOLD AT £139

When the Law says
'You may 'ave ***left*** *your lights*
on, sir, but they aren't on now'

YOU HAVE BEEN WARNED

it's time you got an

Exide

BATTERY

'Still keeps going when the rest have stopped'

Your lights fade, your horn mutters, your starter *doesn't* start. Don't get hot and bothered! Get an Exide. Exide is famous as the battery that *still keeps going when the rest have stopped.* Exide is relied on by nine out of ten British ships at sea.

★ *There are Exide batteries for every model of every make of car, at prices to suit every pocket — obtainable from your usual garage or any of the 600 Exide Service Stations.*

At the Motor Show, Earls Court, October 13th—22nd

THE "ELTO" ACE—AN INTERESTING OUTBOARD MOTOR TO BE SHOWN BY THE BRITISH MOTOR BOAT MANUFACTURING COMPANY, LTD.

MARINE MATTERS AT THE MOTOR SHOW

By LIEUTENANT-COMMANDER A. M. KINNERSLEY SAUL

PREPARATIONS are now practically complete for the 1938 Motor Exhibition at Earls Court—the 30th since its inauguration at the Crystal Palace in 1903.

It is interesting to recall to-day that this first venture at the ill-fated "Palace" included a Marine Section, which was transferred with the Motor Exhibition to Olympia in 1905, and yachts and motor boats with their accessories continued to form a part of the Exhibition until 1913. During the War the entire show was suspended, and on its resumption in 1919 the Nautical Section was absent because—it is said—of lack of support.

Interest in marine matters, however, was soon revived, and in 1921 the craft again took their place and they have continued to hold that place ever since. Last year's "Show" was held for the first time at the new Exhibition buildings at Earls Court.

This year there are approximately 40 exhibitors in the Marine Section. It should be nearer 400, but if quantity continues to be lacking in this section there is much compensation to be found in the steady improvement in quality. They will include:

ASSOCIATED EQUIPMENT COMPANY, LTD., who are showing a four- and a six-cylinder high-speed compression-ignition engine. This company's propelling outfits have been adopted by the Metropolitan Police and many well-known yachts and other craft.

ASSOCIATED MANUFACTURERS' COMPANY (LONDON), LTD., who are showing, for the first time, a new Gray marine engine which is claimed to mark a very decided advance in Diesel development. Yachtsmen will appreciate the fact that it can be easily arranged to rotate either right or left handed.

ARTHUR BRAY, that hardy annual without whom no show with a nautical flavour would be complete, is having his usual range of Chris-Craft, including a new 29ft. enclosed cruiser with a 118 h.p. Chris-Craft motor and a 16ft. racing craft powered with one of the same company's 121 h.p. engines. There will also be on this stand a smart-looking new Swedish Koster "Viking" sailing yacht of 5½ tons (T.M.) with a very complete specification.

BRITISH MOTOR BOAT MANUFACTURING COMPANY, LTD.—The exhibits on this stand will include a complete range of "Elto" and "Evenrude" outboard motors, and also a Britannia "Ensign" and a "Solo." The great popularity of both the "Elto" and "Evenrude" with both users *and* others is the fact that both are effectively silenced.

BRITISH POWER BOAT COMPANY will display a 500 h.p. "Power" Napier and a range of "Power" Meadows engines from 8/28 to 100 h.p. They will also exhibit a comprehensive array of marine accessories manufactured by themselves.

LOCKHEED HYDRAULIC CONTROL, who are exhibiting for the first time a power-operated hydraulic steering gear which exerts a torque at the rudder-head of 18,000 lb. in. at 35 degrees maximum rudder angle with finger-tip movement of the steering-wheel. A great feature of this appliance is that the power, whether derived from the main propelling plant or an electric generator, becomes immediately and automatically diverted to ordinary hand steering should a failure occur. The well-known manually operated steering gear and throttle control will also be shown in action.

MORRIS MOTORS will, as usual, be exhibiting in both sections, and their Marine Stand will include samples of their popular "Vidette," "Navigator" and "Commodore" models. A new feature of the latter is an arrangement for adapting the rotation of the shaft to right or left handed. They will also show complete installations from engine to rudder.

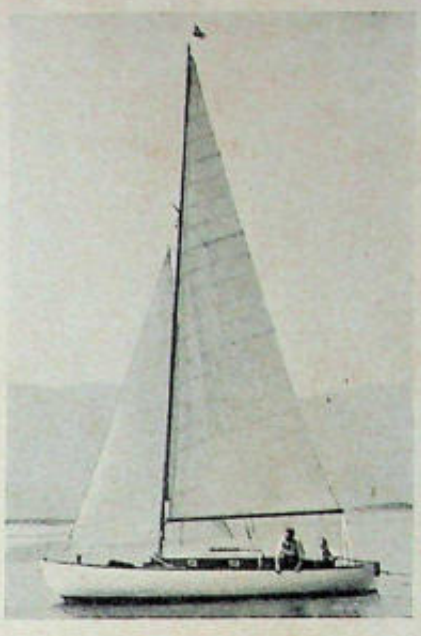
JOHN MORRIS (GOSPORT), LTD., will present two of their famous Toledo steel cruisers of 28ft. 6in. by 8ft. 6in. One a 15-knotter powered with a 6/71 h.p. Gray marine engine and the other having a Morris "Navigator."

NORRIS, HENTY & GARDNER, LTD.—Four Gardner oil engines will be on view, including a two-cylinder of 19 b.h.p. at 1,000 r.p.m., a four-cylinder of 38 b.h.p. at 1,000 r.p.m. and an eight-cylinder of 136 b.h.p. at 800 r.p.m., the latter with compressed air starting.

WILLIAM OSBORNE, whose express cruiser Ramille recently won the Pavillon d'Or, will have two vessels on his stand. A new Standard "Eagle" cruiser of 40ft. with a specially designed saloon-wheelhouse. This craft is mahogany planked on oak timbers and is powered with two Morris "Commodore" engines. The other—a "Swift Senior" of 26ft.—is powered with a 6/71 Gray.

JOHN I. THORNYCROFT & CO., LTD., are showing a very interesting craft in the shape of a high-speed Diesel-engined launch. A somewhat similar craft is at present operating in the Persian Gulf covering about 120 nautical miles every day without a hitch. They will also show a model of the 18 b.h.p. Diesel which has been installed in the lifeboats in the Queen Mary and which has also been selected for those in the Queen Elizabeth.

STUART TURNER, LTD.—A full range of this well-known firm's generating and propelling outfits, as well as a



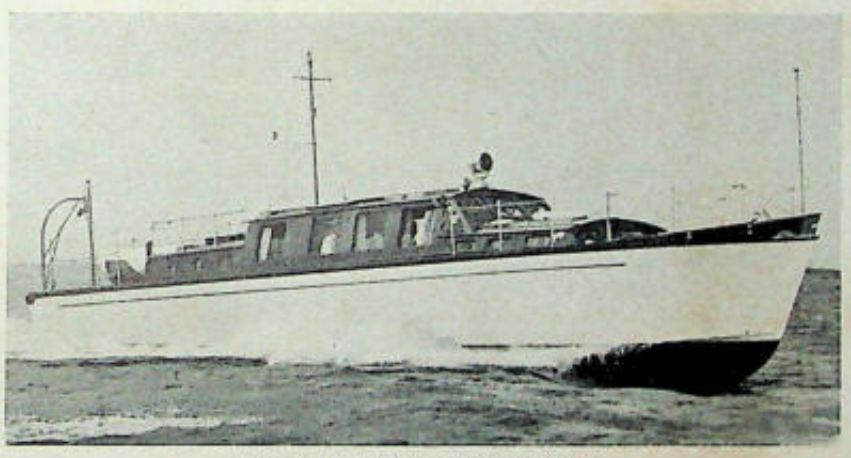
"A SMART-LOOKING NEW SWEDISH KOSTER 'VIKING' SAILING YACHT OF 5½ TONS," SHOWN BY ARTHUR BRAY

very small Diesel auxiliary such as they supply to the Royal National Lifeboat Institute, will be on view on this stand.

VOSPER, LTD., are having two very interesting high-speed craft on view. One a 20ft. boat with streamlined superstructure of light alloy specially built for Captain the Lord Louis Mountbatten, with a speed of 35–40 m.p.h. The other is one of the Vosper "Jollyboats," a 30-knotter specially designed for use as a tender in yachts of 50 tons and upwards. They are also showing a 1,150 h.p. Isotta Fraschini (for which engines they are the British licensees and sole selling agents) such as are installed in their successful 47.6 knot motor torpedo boats—said to be the fastest craft of their kind in the British Navy.

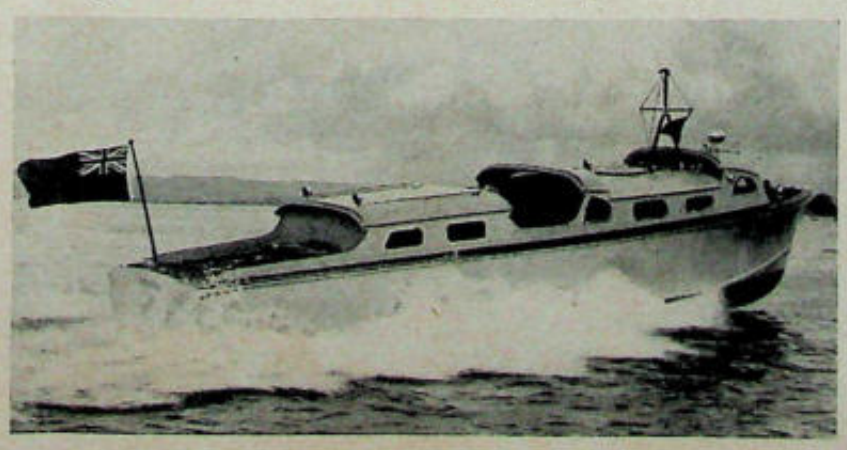
WALTON YACHT WORKS, LTD., are concentrating on one exhibit, that of one of their attractive 47ft. midship bridge craft. Notable features of this well-designed and well-equipped little ship are the 15ft. by 9ft. sound-proofed saloon, the rubber-mounted Gray motors on the firm's own patent steel engine bearers and the sound-proof passage between the motors.

CAPTAIN O. M. WATTS, LTD.—It has become a habit to look for everything that is new and up to date in yacht equipment on this firm's stand, and this year there will be still another feature in one of their "Z" four-tonners complete. There is to be also a new type of "Dead Beat" compass with internal magnification; a wonderful collection of books on the sea and little ships and the latter's management; and also a full range of the new "Onazote" life-saving and other appliances, including a yacht's life-buoy, a 12in. "Tiderider," life-saving cushions, &c.



TWO WELL-BUILT MOTOR VESSELS

The British Power Boat Company's 22 m.p.h. Sportsman's Cruiser equipped with two Power—Meadows 100 h.p. marine engines (above) and a Thornycroft motor yacht "Prunella," designed and built for Mr. F. H. Muirhead



A BUSINESS-LIKE LOOKING CRUISER

This vessel, a 40ft. cabin cruiser built by Vosper, Ltd., of Portsmouth, has a speed of 24 knots

MOTORING'S CAMP FOLLOWERS

Some of the Important Accessories at Earls Court

By H. E. SYMONS

WHEN I go to the Motor Show I get just as much entertainment from touring round the accessories stands as I do from meandering through the serried ranks of brightly-polished cars.

As usual, there are fascinating working demonstrations on the Lucas stand, amongst them being a demonstration of the well-known compensated voltage control system, which has now been provided with temperature compensation. Among the lamps pride of place goes, of course, to the latest edition of the regal-looking new P 100 high-power projector. There is also an entirely new range of headlamps, known as the M type, of modern streamline shape. Talking of lamps, there is a fine new range of flat-topped beam fog-lamps and pass-lights, headed by the luxurious new FT 67, the largest and most powerful lamp of its type. It is meant to put on high-powered cars and gives a wonderfully powerful, wide-spread driving beam. The already well-known FT 57 and FT 37 are, of course, on view.

In these days of fast travel, an efficient warning device is essential. Personally, I like the Mellotone windtone horns, which give a sweet-sounding note reminiscent of the post-horns of coaching days. These horns have been improved, and are shorter, so that they can be fitted on the latest model cars with restricted frontal space. They are supplied in matched pairs and give alternative signals, soft for town and loud for country. Among novelties is a handsome new mirror for wing fitting, selling for only 7s. 6d., and technical enthusiasts will be interested in the sports ignition coil, giving a higher voltage to high compression cars, and also the vertical camshaft magneto.

Quite a lot of my motoring is done in roadless countries or where conditions are very bad owing to mud or snow, and I am therefore always interested in the latest devices in the way of non-skid chains. The Parsons Chain Co. invented and introduced Parsons non-skid chains 36 years ago, and they make various grades of chains, to fit every size of wheel. Amongst these fittings are the emergency grip, which can be strapped on in a moment to meet any sudden need for extra road grip, while the company is, of course, showing the usual range of non-skid chains of the zig-zag and ladder patterns. Diagonal bar reinforced chains, an exclusive Parsons feature, are incorporated in the exhibit of non-skid chains and emergency tyre grips, and give 100 per cent. more wear and added safety.

The colonial type of chain is also shown, being specially designed for use in out-of-the-way parts of the world, where roads are frequently little more than tracks, and mud and heavy soil are encountered. Another device of outstanding interest on the stand is the B.W.T. variable level oil intake, fitted as standard on Armstrong Siddeley, Austin, M.G., Morris, Standard and Wolseley cars.

Although in these days of closed cars we perhaps pay less attention to rugs than of yore, there is no doubt that the discovery of a really cosy rug in the back of a car pleases one's passengers immensely. Of all the rugs of which I have had experience, the Motoluxe, made by Lee Bros. Overwear, Ltd., and shown at Earls Court, on the stand of Brown Bros., Ltd., are the most luxurious. The standard quality rug, a lovely, thick, soft article, sells at 5½ guineas. It is as light as a feather and warm as a blanket. Then there is the Super Motoluxe rug, made of the finest alpaca yarn, and the Super Super Motoluxe rug, which costs 8 guineas. In addition, there is an owner-driver's rug which hooks round the waist like a belt, a clip-on rug, a pocket rug which has a zip fastener pocket in the front, and a bag rug which really keeps your feet warm; besides this, there are, of course, the well-known Motoluxe foot muffs and the "baby sack," out of which the most active child would have difficulty in wriggling!

I suppose every motorist has heard of Exide and Drydex batteries, which are fitted to the majority of cars in use throughout the world. The Exide stand at the Motor Show will be notable for a zoological exhibit, an electric eel. This is only a youngster, a bare 18in. long, but he produces so much electricity that he is able to light a neon lamp! An electric eel can generate sufficient energy to stun a horse or even kill a man. A full-grown electric eel may be 4ft. or 5ft. long. In addition to this interesting natural battery are the well-known Exide double-life car batteries, with their two-years unconditional guarantee. The company's representatives will be available at the stand to explain the double separation which almost entirely abviates the possibility of internal short-circuiting of the plates.

The Castrol stand at Earls Court may be likened to a palace of variety, for these very enterprising people, Wakefields, the producers of Castrol oil, have provided a means for listening-in to Captain George Eyston, Sir Malcolm Campbell and Miss Jean Batten, describing their thrilling experiences of speed on land, on water and in the air.

Should anybody have doubts as to the advantages of the new lighter Castrol over the old thicker oils, a sort of "test-your-strength" machine gives a conclusive answer. As usual, there will be available on the Castrol stand oiling charts for an incredible number of present and past (and perhaps future!) models of all known automobiles.

On the Triplex stand will be seen windscreens and windows of motor cars, sun vizors, louvre-lights, dazzle-proof back lights and motor boat screens, while other interesting exhibits include goggles and interior driving mirrors, all made from Triplex Safety glass. Triplex Toughened glass, which has largely superseded the older laminated type of safety glass, consists of a single sheet of specially treated glass which is proof against discoloration, blisters and similar defects. When broken, it crumbles into small, harmless fragments. I am merely one of many thousands who can thank Triplex for saving their eyesight in a bad motor smash. If I had not been wearing Triplex goggles when I took a header off a motor cycle on to my face some fifteen years ago I should probably have been blinded for life.

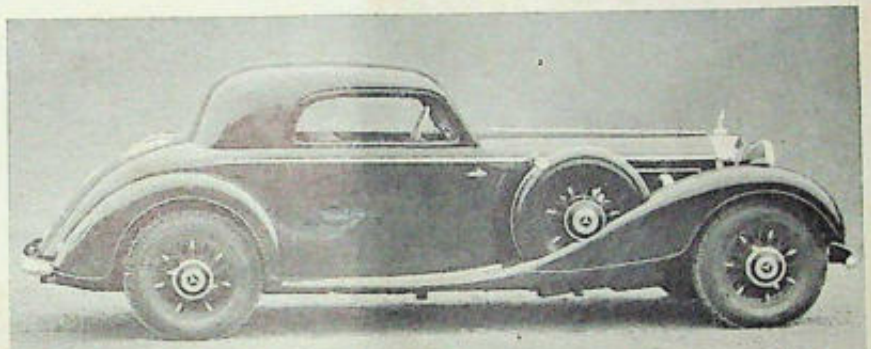
Early visitors to the Lodge Plugs, Ltd., exhibit at Earls Court may obtain gifts of spark-gap gauges, and in addition the exhibitors are distributing a booklet entitled, "Advice on Trouble-free Motoring," which contains a number of practical general maintenance hints, with special emphasis, naturally, on the ignition question. All types of Lodge plugs are on view, as well as special radio-screened plugs and waterproof plugs. The former are designed to prevent the ignition circuit interfering with radio reception, while the latter, being totally enclosed as a protection against water, are invaluable for use in marine engines, including outboard motors.

A very useful weatherproof terminal which can be fitted to any standard type of Lodge plug, and which gives protection against heavy rain and water sprayed up from flooded roads, will be appreciated by those living in low-lying countries. What used to be called the "baby" plug, the 14 mm. size, is now standardised on almost all well-known makes of car instead of the usual 18 mm. size, and there is now an even smaller plug, the 12 mm., used in the engines of baby cars.

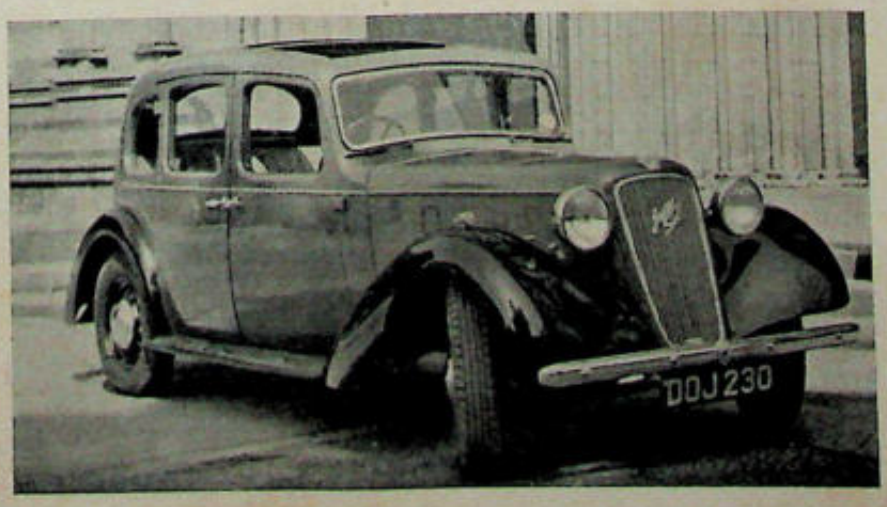
The exhibit of the Dunlop Rubber Co. is always interesting. Not only are all types of the Dunlop E.L.P. and Fort tyres on view, but there are special extra low-pressure tyres, such as the 9.00 x 13, designed for crossing sandy deserts and roadless country generally. Amongst the Dunlop exhibits are, of course, the Dunlopillo upholstery, now standard on so many popular cars; while the same famous concern makes both wire and pressed-steel wheels, jacks, repair outfits and a host of other useful accessories. Tyres with special treads are available for negotiating very muddy country, perhaps the pioneer of these being the famous Dunlop Trakgrip, which I myself have used with success on several Monte Carlo Rallies, and events of a similar nature.

Visitors to Earls Court may miss the Shell exhibit, but they will have ample opportunities of seeing what Shell-Mex, Ltd., are doing at exhibitions which are being staged all over the country. The general title of the show is "How Your Car Works." I went to the opening exhibition at Shell-Mex House, and found it of absorbing interest. The working of the modern motor car is demonstrated by actual sectional models of engines, gearboxes, back axles and so on, while there were small-scale models of independent wheel-springing systems, the differentia', and so on.

THE NEW 16 H.P. ARMSTRONG SIDDELEY COACH SALOON PRICED AT £380



A TWO-SEATER COUPÉ SUPERCHARGED MERCÉDÈS-BENZ PRICED AT £1,890



TWO WELL-TRIED MODELS

AIR RAID PROTECTION

Special Types of Shelters for Use in Emergency

IN order to discuss this subject it is necessary to realise essential requirements and deal with each separately.

As you may wish to shelter one day from the sun and the next from the rain, so in A.R.P. are there several different things to shelter from, and each must be catered for quite differently though all may be necessary on the one job.

The three main precautions to be taken are against Gas, Bombs and Panic. The place of shelter will be either the home, place of employment or public accommodation.

Home Shelters for outdoor use. These, apart from extemporised forms, are specially made, and the most common type is one sunk a few feet into the ground and then covered with earth and concrete. The shelter itself is of semicircular steel, and can be erected at a reasonable figure and made any length according to the number of persons required to occupy it.

The shelter must contain two rooms, one very small to be entered before the other, for use as an Air Lock, the doors should be of gas-proof type, and a chemical closet should be kept here screened off. All removal of contaminated clothing would take place here before opening the second twin door, and a contaminated clothing bin should be kept available.

The larger room should be provided with seating benches, lockers, battery lighting and ventilation, secured by a very long upward pipe to reach above any likely gas, and a hand-operated fan to circulate air which is far more important than introducing fresh air. Emergency exit is provided at rear end. Food and water should be stored here, also cards and games, since wireless will be absolutely useless for obvious reasons.

There are about a dozen companies making shelters, some on the above principle, others in steel or concrete tubes. The shelter can be sunk down into the earth if desired, being approached at either end by steps covered with a trap-door. In this way the existence of the shelter is barely noticeable. The accommodation may serve as a garden hut, and the more regularly it is used the better to ensure dryness and cleanliness at all times.

Adapted Home Shelters for indoor use. A room must be chosen and its floorboards rendered gas-proof by corking or adhesive filling. A new gas-proof door should be bought and fixed, an air-lock chamber created where possible, also special splinter-proof recoil spring window shutters that can be fixed in a minute. The fireplace should be bricked up and all leaks stopped. This method costs no more actually than laying in stocks of sticking paper and trusting to do the sealing at the time of emergency. The job is permanent and as nearly perfect home protection as is possible.

All the electric "points" and switches should, at the last moment, be covered with brown paper to prevent entry of gas through steel tubing. Emergency lighting by battery should be provided, also food, fan, toilet essentials, &c.

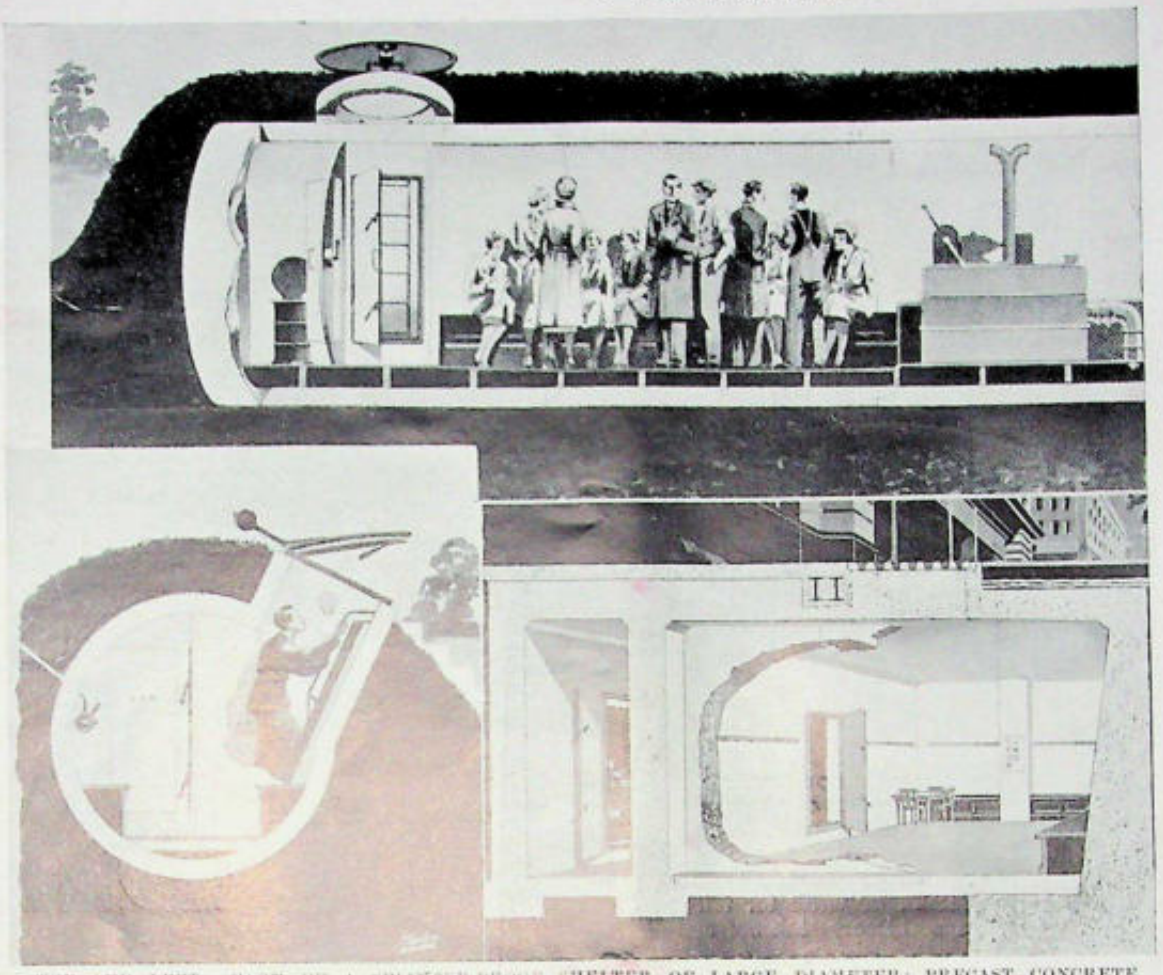
There is no reason whatever why the room in everyday use should look ugly or appear obviously adapted for emergency, and therefore it is advisable to choose a comfortable room in the basement or on the ground floor. There is no reason to shiver in a cellar or to treat a normal safety measure as a "funk hole."

Expert firms are specialising on adapting rooms for a quoted price. In one case, probably more, it is possible to arrange to have the whole job done at once and to pay by monthly instalments over a period. The manufacturers of chemical closets, bins, &c., will arrange to supply on deferred terms also.

Public Accommodation.—As far as can be ascertained from municipal authorities, it is not considered wise to provide large public shelters. These tend to panic rushing and hysterical herding.

Measures have been put in hand to provide for persons caught away from home at the time of emergency. Police posts, first aid posts, &c., fitted with decontamination equipment and every latest device were in hand before the recent crisis arose, and no member of the public has any right, still less reason, to "fear": but each *must* take an interest in the National Safety Precautions, and take any reasonable steps he can to safeguard himself and his family, domestic staff, &c.

It is not proposed, in this article, to go into details of the very intricate equipment necessary for such sheltering as that referred to above.



TOP AND LEFT: PART OF A SPLINTER-PROOF SHELTER OF LARGE DIAMETER; PRECAST CONCRETE TUBES, LAID IN SECTIONS LIKE A SEWER, EITHER PARTIALLY OR WHOLLY BELOW GROUND. EMERGENCY EXITS CAN BE ARRANGED AS DESIRED. BOTTOM: REINFORCED OFFICE OR BUILDING SHELTER

A SEMI-CIRCULAR TYPE OF SHELTER, COVERED WITH AN EARTH MOUND

Office or Works Shelters.—Perhaps the public are not even now aware of the vast sums that many private concerns have expended on A.R.P. to shelter and safeguard their staff.

In office blocks, the owners and an A.R.P. expert select a part of the lower ground floor or basement. In a works a "sunk" set of chambers is usually built underground. This is then rendered flood and gas-proof. It is equipped with decontamination requisites, air locks, first aid, chemical lavatories, seating, auxiliary telephones, electric lighting and fans: the existing air conditioning plant is adjusted, intercommunication telephones and direction indicators are fitted in all parts of the building, and the premises can be used for every-day purposes under normal conditions. Such accommodation can be got ready within seven minutes, and be in perfect running order, if the staff are kept practised as to their allotted jobs of work in preparing the premises at the warning. Such accommodation is proof against anything except direct hit by heavy bombs.

Finally, the whole matter seems to be one of cool common sense, not fear. Gas must be considered as a risk, and precautions taken: but the actual risk of serious trouble to anybody from this is almost negligible. Fire is likely to be localised, and be taken care of by trained squads. Bombs are unlikely to seek you out, and where precautions have been taken, a staff trained and instructions adhered to, there should be no cause for undue alarm, as the experience of the Barcelona air raids shows.

The greatest protection is *provision against risks* and insistence on *orderly behaviour* when emergency arises.

One would not cross the Channel in a ship without lifeboats, and A.R.P. may be taken to represent lifeboats and safety. Safety.

[Full particulars of supplies of necessary goods and of consultant experts will be given to readers upon request to the Editor of the *Field*.]

To Judge Dogs in India.—Mr. W. Stanley Hunt, of Ottershaw, is a well-known authority on canine matters, and it is a tribute to his knowledge that he has been invited to judge a show of dogs of all breeds for the Bombay Presidency Kennel Club on February 12th and 13th. He has accepted this invitation, and as doubtless other appointments to judge in India, Ceylon and other countries will follow, it is likely Mr. Hunt may have to be absent from home early in January for an indefinite period.

At the Restaurant you will observe that Wills's Gold Flake
is the Man's cigarette that Women like

THE SONG THRUSH

Chorister of Our Gardens

FAMILIARITY is said to breed contempt, so I expect that its very commonness and easy accessibility have led bird photographers to neglect the song thrush, the chorister of our gardens. This is strange, for it makes a particularly attractive subject for the camera and nests are often to be found in very picturesque and photographable situations.

The illustrations to this article were taken at three normal sites—a privet hedge, a gorse bush and an apple tree—at which I watched the process of rearing baby thrushes.

I found the nest in the privet hedge when three eggs were laid, so was able to observe the complete nesting period. The first egg hatched on the fourteenth day, and exactly twenty-four hours later the first chick forced his way out of the shell.

While the young were hatching the hen was very restless, continually looking into the nest as shown in one of the illustrations. I saw the removal of empty egg shells on two occasions, the bird taking them in her beak and dropping them some 20yds. away on a grass lawn.

As an experiment, I replaced the discarded shell in the nest, and when the hen returned she again carried it away, only this time to a greater distance—she was running no further risks of its replacement. But I remembered having seen a nearby nest containing two deserted eggs, so carried on my experiment with them after first cutting the tops off and emptying out their contents.

These extra eggshells appearing in the nest seemed to cause the thrush no surprise—she was evidently not a mathematician. Daintily picking each from amongst the newly-hatched chicks, she bore it away beyond my field of vision. Unfortunately the light was too bad for photography, otherwise I might have recorded this removal of the shells.

I wanted to discover exactly what interval elapsed after hatching before the young were fed, and after keeping a close watch for the whole day, saw no food brought to the first-born. He must have lived on his own fat for more than 24 hours, a fact borne out by the removal of excreta from the nest during this period. The following day feeding was in full progress, but, of course, it was impossible to see which chick was being fed.

Birds are strange things. I have often wondered why a thrush should carefully plaster the inside of her nest with mud when a blackbird, which is only a dark-coloured thrush, prefers an inner lining of dead grass. Also from whence comes the accumulation of fine grey dust that one always finds in a thrush's nest after the young have flown?

The nest in the gorse bush I only discovered after the eggs were hatched; it was the nestling period I watched there.

The four young were fed at ten-minute intervals, interrupted by rest periods, the timing being very regular throughout the day, except between 5 and 6 p.m., when the rate quickened, an extra supply being given, presumably to tide the nestlings over the period of darkness. I have noticed this acceleration of feeding towards evening in quite a number of species in which the food is brought in the beak and not partly digested before being given to the chicks.

At this particular nest, it was the hen that was timid and suspicious of the camera and hide, the cock being as bold as brass. A pair of linnets were nesting in an adjacent gorse bush, and if the male bird alighted near the thrush's nest, he was promptly chased away with much angry chattering. A blue tit actually perched on a spray above the young thrushes, but, fortunately for him, neither parent was at home.

A rather unusual incident occurred at the nest in the privet hedge during the period of incubation, a cock blackbird perching on a bough just above the nest and pouring forth a most wonderful flood of melody. Peeping through a slit in the hide I was unable to see the songster, but I felt certain it was no thrush, so I cut a hole in the tent to make sure

HEN BROODING NEWLY-HATCHED YOUNG

who was serenading the sitting bird. Why this feathered Othello should forsake his own Desdemona and serenade the wife of another, I am unable to explain. Perhaps the sight of any sitting bird was quite enough to arouse his amorous instincts.

The young reared in the gorse bush left the nest on the fifteenth day after hatching; I saw them the evening before, wedged tightly in the nest looking very uncomfortable, and on the morning following they had gone, sundry shrill chirps revealing their presence in the dark recesses of the belt of gorse.

SHE BECAME VERY RESTLESS WHILE THE EGGS WERE HATCHING

A friend of mine had ringed these birds, and, three days later, I picked up a headless body, bearing the identification number, lying in the middle of the lawn. What caused the decapitation of the young thrush, or why the body should remain untouched and the head disappear, we never discovered. A bird of prey would certainly have carried off the carcass, or left a mass of bones and feathers to mark the tragedy.

In each case, these young thrushes were reared during a period of intense drought, when the ground was bone dry and as hard as a macadam road. I was particularly interested to notice what food was brought by the parent birds, and was astonished at the number of worms they managed to find. On more than one occasion caterpillars figured in the menu, and three times a curious white substance looking like cream cheese was given to the youngsters.

I thought at first that this substance must be part of a slug, but it seemed to be far too white and too creamy. If any readers of the *Field* have noticed young thrushes being fed this spring, perhaps they can suggest what this unusual diet was, a diet much appreciated by the recipients.

Although it is very exciting to journey to distant places to photograph rare birds, it is equally pleasant to make the intimate acquaintance of one of our most lovable garden friends, an exquisite singer and a brave and devoted parent. A female thrush, as she sits with upturned beak, still as death on her nest, almost allowing one to touch her, is as charming a sight as can be found throughout the countryside.

HEN FEEDING WEEK-OLD YOUNGSTERS

A NEST IN AN APPLE TREE. THE YOUNG ARE TWELVE DAYS OLD—ALMOST READY TO LEAVE

THE BURBERRY

is the sportsman's favourite

At point-to-point meetings, hunts, and other sports in the "wide, open spaces," The Burberry reigns supreme. No other topcoat gives such a feeling of dependability under every weather extreme, no weatherproof has such a reputation of lasting worth, economic investment and all-purpose wear.

A topcoat that is serviceable in any sort of weather is a boon indeed. The virtues of The Burberry are so many, so reliable and so consistent that as a covering against the elements it attracts — and has attracted — the attention of men whose life out in the open calls for a natural observance of the common regards to healthful comfort and weather security.

WARNING

No garment or material, unless it is the manufacture or merchandise of Burberrys Limited, may be described as "BURBERRY," a Registered Trade Mark protected all over the world.

N.B.—Proceedings will be taken against offenders using the word "Burberry" wrongfully, whether with or without knowledge.

Dry on wet days, cool when the weather is mild, airy-light, air-free, warm in the coldest wind; these are the attributes of The Burberry, the topcoat of complete and satisfying utility.

Patterns and full particulars sent on mention of "The Field"

BURBERRYS LTD. **HAYMARKET LONDON, S.W.1**

THE ART OF GOOD LIVING

By ANDRÉ SIMON

ITALY is but one long vineyard from the Engadine to Sicily. The quantity of wine made in Italy year after year is enormous, and second only to the yield of France's vineyards, but most of it is made by small-holders and for their own consumption, so that the exportable quantity of Italian wines is, comparatively speaking, not considerable and there are but few of the many different types of Italian wines known in England. And yet there are many Italian wines which English tourists have enjoyed in Italy and in Switzerland other than the wines offered by the Soho restaurants.

There are some very agreeable wines, for instance, made in the Valtellina, probably the highest vineyards in Europe, stretching from the northern shores of the Lake of Como to the Stelvio Pass, over 9,000ft. above sea level. These exalted vineyards produce the Sassella, Inferno and Grumello wines which one is offered in most of the good hotels of the Engadine; they are light wines, and it is quite possible that they would not be so happy nor please us quite so much in London as they do in their native heights, but they certainly possess a great charm of their own.

In near-by Piedmont, which adjoins Savoy and where the French influence can easily be traced in the vine-growing and wine-making methods in favour, they make the best red wine and the best sparkling Italian wine, both of which are procurable in England, chiefly in hotels and restaurants, but also from some wine merchants.

The red wine of Italy which is practically universally acknowledged to be the best is the Barolo, whilst the best Italian sparkling wine is the Asti spumante. Barolo is a full-bodied red wine which cannot bear the name unless made from the vineyards of Barolo itself and of six neighbouring parishes known as La Morra, Monforte, Castiglion Faletto, Serralunga, Perno and Grinzane. Barolo is made almost entirely from the Nebbiolo grape.

Barolo is the best red wine of Piedmont, but by no means the only one: Barbera, Gattinasa and Freisa enjoy locally a large measure of favour, and so does the wine sold under the name of the chief Piemontese grape, the Nebbiolo.

South of Piedmont, in Tuscany, they make the most popular of all Italian wines, even granting that Barolo may be the noblest. It is from Tuscany that comes Chianti in its straw-covered flasks. Chianti is generally made from a variety of grapes; as a rule two-fifths are Canajolo and two-fifths Sangioveto black grapes, and the last fifth either white Trebbiano or Malvasia grapes. This is why red Chianti is never so dark as a Barolo, for instance. There is also a white Chianti made, but it has never obtained popular recognition outside its own country. As to the Chianti which one gets in Florence and elsewhere in Italy, but never in England, the *Bera fresca* or *fresh* Chianti, it is made by the addition of some concentrated must to the new wines and it would not stand a voyage overseas. The vineyards from which genuine Chianti is made are also strictly delimitated by the laws of Italy.

Kensington Gore

"Hawkins, the sticking plaster. I've cut my chin. My hand, for some reason, is somewhat unsteady."

"Very good, Sir."

"And while you're about it, Hawkins, you might get something to cure a headache. Enough to cure four men."

"I did not know we had guests, Sir. Where did the three other gentlemen sleep?"

"There are no other gentlemen. The hangover in question belongs to me. It is probably the fiercest specimen now in captivity."

"I'm sorry to hear it, Sir. I myself am largely to blame. Knowing you were to attend last night's re-union, I had intended to lay in some Rose's Lime Juice. The matter unfortunately slipped my memory."

"What on earth are you getting at?"

"I was explaining, Sir, the therapeutic action of Rose's. A stiff glass, taken after a convivial evening, has the property of banishing these distressing mornings after — apart from which, Sir — it slakes the thirst in no uncertain manner."

"Hawkins, you're not romancing?"

"SIR!"

"Of course not, Hawkins, of course not. Slip out and order a case of this Rose's. Never mind about the sticking plaster. I don't think I'll need it again."

SHORT DRINK—2 parts Rose's, 3 parts Gin.

LONG DRINK—add soda.

FIFTY YEARS AGO

From the *Field* of October 6th, 1888.

GAMBLING and Betting. "Lord Beaconsfield may or may not have spoken truthfully when he described horse-racing as 'a vast engine of national demoralisation,' but there is at least something to be said for the other side. To stop gambling in all forms would indeed be a gigantic undertaking, and if carried out would not improbably end in the stagnation of commerce and enterprise. When gas and the electric telegraph were first invented, the persons who took shares in the companies were to a certain extent gamblers—that is to say, they backed their judgment against the chance of non-success. Every investor is a gambler—and when Mr. Banner Oakley's famous bank came to grief it was discovered that a large number of his dupes were maiden ladies and clergymen. In our own opinion the facilities now afforded for gambling in stocks are ten times more hurtful to society than all the race meetings put together."

An Amateur Oarsman. "A meeting of representatives of the Universities and principal boat clubs had been called at Putney, in the Spring of 1878, for the purpose of defining an amateur. . . . The council unanimously adopted the following definition:

"'An amateur oarsman or sculler must be an officer of H.M. Army or Navy or Civil Service, a member of the liberal professions, or of the universities or public schools, or of any established boat or rowing club not containing mechanics or professionals:

"'And must not have competed in any competition for either a stake or money or entrance fee, or with or against a professional for any prize; nor have ever taught, pursued or assisted in the pursuit of athletic exercises of any kinds as a means of livelihood; nor have ever been employed in or about boats or in manual labour; nor be a mechanic, artisan, or labourer.'

"However, nothing was done at Henley, and the Stewards had the gruesome pleasure of seeing a desperate battle between the President of the O.U.B.C., Mr. T. C. Edwards Moss . . . and the American professional, G. W. Lee. During that very Henley week Lee tendered an entry for the Wingfield Sculls to the hon. secretary of the amateur championship, who was at Henley, but the latter, relying upon the original deed of gift, refused off-hand to accept the entry, as Lee was not a gentleman, and was a foreigner to boot.

"Apparently scared by the Lee *fiasco*, the Henley Regatta Committee, in the spring of the following year, set to work to define an amateur for themselves instead of accepting the regulation which had only just been framed by experts better qualified for the task than themselves. Their ruling on the amateur question was embodied in the following definition, dated April 8th, 1879:

"'No person shall be considered an amateur oarsman, sculler or coxswain

1. Who has ever competed in any open competition for a stake, money, or entrance fee.
2. Who has ever competed with or against a professional for any prize.
3. Who has ever taught, pursued, or assisted in the practice of athletic exercises of any kind as a means of gaining a livelihood.
4. Who has ever been employed in or about boats for money or wages.
5. Who is or has been by trade or employment for wages a mechanic, artisan, or labourer.'

"They thus rejected and omitted from their rules the qualifying clause of the Putney regulation which specified what an amateur must be, and retained merely those specifying what he must not be."

IN THE SALEROOM

ON October 14th, Messrs. Puttick & Simpson are disposing of the property of a private collector, containing some very interesting pieces. It consists of a collection of old English and Continental treen, comprising bowls, platters, vases, caddies, &c., early ivory and wood carvings and bronzes, including pieces of Jacobite interest, and a collection of English and French snuffboxes of gold, silver, tortoiseshell piqué, wood and composition, some with miniatures of the seventeenth and eighteenth centuries. In addition there are a few pieces of antique miniature furniture. The whole property has to be sold with reserve.

A NATURALIST'S NOTEBOOK

AT school I was never fond of history. Latterly I have seen a good deal of history in the making—and some history unmade—and the more I see of this process the less I like it.

* * *

One day in this crisis I spent in the Cotswolds, at Bibury and at Coln Rogers. It was a perfect Cotswold day—rain never very far away, a mist shrouding the higher curves, the valleys smiling in a soft sun; and as the day advanced the mist giving way to sun, and the whole land, stone walls, green earth and red, green trees and trees turning, valleys filled with meadow crane's-bill and wolds in naked bleakness smiled.

* * *

Bibury is true to its fame. It is one of the most beautiful places in a beautiful country. Yet that that is Bibury is no better than many another Cotswold village: that famous Arlington Row of cottages, gabled and joined, is no whit superior to many a similar row in the Cotswolds. It is enchanting because of its position: isolated from other buildings, set across the water-meadows of the Coln against the background of rising ground and tall trees. In rain and in cloud and in mist the cottages and the background are one. In sunlight the Row stands out boldly—a memorial to craftsmanship that springing from the soil has no equal in England to-day.

* * *

I walked beside the Coln on short grass. On the further bank great trees came to the water, and reflections lost themselves in mirrored sky against the water-grasses. There were trout in plenty, and I watched their graceful swiftness and the languid sinuous power of them as they came head-to-stream in some favoured spot. And I watched them leap, a gleam of silver from green-brown water, and heard the music of their return. And I wondered would I ever return to the Coln and watch the trout leap? And did I do so, would I be as I am now, and would I be in the same dear company?

* * *

A kingfisher flashed blue against the darkest pool: woodpigeons called in lazy beauty from the tree-tops: rooks were busy: a jay scolded: a robin sang his gentle, wistful song with its underlying cheerfulness from a stone wall green with moss. Here were all the things I loved best in all the world; all the things I had taken more or less for granted: here in my mind were thoughts and hopes and ideas that should not be: and over all the shadow of one man, and the shadow of that savagery he could so easily loose upon me and all this world that I was regarding—for the first time, probably, with true appreciation.

* * *

Coln Rogers is Cotswold: set in water-meadows with wooded hills away to this side and the sweeping wold to that. There is small mention of Coln Rogers in the books. Like most of the best things in life, it has been overlooked. But it has a Saxon church, more perfect, I think, than any in England, and a yew set upon a mound (as yews should be) and that yew is old as we do not count age—more than 1,000 years, perhaps much more. And the churchyard is such as you will not find in any other village: perfectly kept and perfectly tended, with grass mown and hedges clipped and graves (how many Bartons are buried here?) cared for.

* * *

The church had that lovely intimate smell, cold and damp yet welcoming, that is the smell of old village churches. I looked at the ancient arches and the squat pillars with their crude pellet ornamentations. And I thought of those men who so many hundred years ago built to the glory of God; and of how near we were to glorifying another God. The march of civilisation is a queer drunken roll.

* * *

In the porch is a war-memorial—the only one, I should imagine, of its sort in all the world. Upon it are the names of 25 men and one woman, and beneath the words: *All of whom by the great mercy of God returned safely.* I spent a good deal of time looking at that war-memorial and wondering what those men and that woman thought of the things they had fought to achieve.

* * *

Rank sentimentality you say. And you are right. But I am not ashamed. The crisis is over, and the world is filled with I-always-knews and I-told-you-sos. I know quite a number of them personally. A few days ago they were looking white and shaken and uncertain. To-day they are busy on the old, old road—making money to burn it.

* * *

I am not ashamed. My stomach for the first time for many days is in its normal place. I know myself very much better than I did before. The experience has, I think, done me good. I only hope I shall not forget the lessons I have learned.

B. V-F.

LETTERS TO THE EDITOR

SOUTH AFRICAN WILD LIFE

SIR,—My attention has recently been drawn to more than one attempt by advertisement and otherwise to entice overseas sportsmen to the Union of South Africa with promises of facilities for big and small game hunting.

These promises are couched in language that is unjustifiably optimistic, not to say misleading.

There is still much good hunting to be had in many parts of South Africa, but mostly on privately owned farms, where in many cases game is carefully preserved.

Speaking generally game is to a great extent strictly protected by law throughout South Africa, particularly in the Transvaal, and permits for shooting certain species of game are only granted in those districts where those particular species are fairly numerous.

Roan antelope are being strictly protected everywhere. Only in special circumstances will permits be issued for shooting oribi, reed buck and sable antelope. Permits to shoot wildebeest, zebra, kudu, impala and waterbuck are only issued in those districts where these animals are sufficiently plentiful. Permits to shoot elephant, hippo, rhino and giraffe are not to be obtained.

Even a farm of 10,000 acres well stocked with game might easily be deserted by game, other than birds, after a week or two of intensive shooting, and disappointment is bound to be the lot of many who come to South Africa on the strength of such promises.

Sportsmen who propose visiting South Africa in the hope of getting some big or small game hunting will be well advised to make the closest inquiries before concluding arrangements with persons offering hunting facilities.

My society is prepared to give advice on game to any one who desires to visit the Union of South Africa on a shooting trip.

Yours faithfully,
J. W. H. WILSON
(Secretary, The Wild Life Protection Society of South Africa).

P.O. Box 3916,
Johannesburg.

SEVENTY-SIX YEARS OF CRICKET

SIR,—My letter in a recent issue of the *Field* has brought me an extremely interesting letter from Mr. Ray Sambourne on Cobden's famous over. It suggests a fresh aspect of the case, and throws a new light on the disputed point.

He states that in 1917 he met the Rev. A. T. Scott, of the Cambridge eleven, who was fielding during the over. In answer to Mr. Sambourne's inquiry as to whether Hill played the first ball of the over to the off or the on he replied that it was so long ago (47 years) that it was impossible to remember every detail, but he felt sure that Hill played the ball to the on, and that he, Scott, ran in and fielded it, but could not save the single. Mr. Sambourne mentions that Bourne had fielded the last ball of the previous over bowled by Ward at leg, and caught the second ball of Cobden's over, and suggests that he may have confused the last ball of Ward's over with the first ball of Cobden's. My own recollection, as I have stated, is of seeing Hill's stroke fielded at the off. Of course it is possible that I am mistaken, but it is difficult to believe that I mixed up a drive with a catch.

Referring to comparison between W. G. Grace and Don Bradman and other great cricketers in my article, and in recent articles and letters in several newspapers, the following is an extract from a letter to which I omitted to refer.

"For an example of W.G.'s prowess take the following recorded from memory. It was the Canterbury Week of 1876, and the M.C.C. were playing the County. The club were doing badly, but Grace was found with 133 not out on the Friday evening. Tried hard to save the match on the Saturday and added 211—total 344.

"Back to Clifton, where on the following Monday he went in against Notts and obtained 177. Waited until the Thursday following to bat again. Result—not out that day, 216 against Yorkshire. Continued on Friday with a further 102 not out—total 318 not out.

Friday, not out	133	344
Saturday, out	211	
Monday, out		177
Thursday, not out	216	318
Friday, not out	102	
		839

"839 runs in three consecutive innings, once not out—average 419.50.

"Mark the sequence of centuries (two of them double ones), all within eight days' cricket."

I have not been able to check the above figures, but in any case they are very illuminating as to Grace's skill.

Yours faithfully,
Exmouth Club, F. J. STUART-EDWARDS.
Exmouth.

FORT GEORGE BEAGLES

SIR,—I should be much obliged if you could publish the following details concerning the Fort George Beagles in your list of hunts. If you require any further information I shall be very pleased to send it.

The pack is now known as the Fort George Beagles, and is owned by the officers of the 1st Batt. The Highland Light Infantry. There are fifteen couple of 14½in. beagles, the kennels being at Fort George. The country hunted extends to Burghead in the east and round to the Black Isle in the west on the north-east coast of Scotland. The Hunt is the most northerly one of any description in the British Isles, the nearest Hunt being over 100 miles off. The days for hunting are Mondays and Thursdays, and occasional Saturdays. The pack is private, there being no subscription or cap for the followers.

Hunt officials: Master and Secretary, A. W. Cottrill, The Highland Light Infantry; Whippers-in, D. M. Anderson, C. D. Gray, J. D. H. Whitcombe, J. H. M. Barwick, P. O. K. Kindersley, all of The Highland Light Infantry; Kennel Huntsman, C. Nutley.

Yours faithfully,
A. W. COTTRILL
(Master).

1st Batt. The Highland Light Infantry,
Fort George,
Inverness-shire.

RED SALMON

SIR,—I have been following the letters on red salmon with interest and would be very grateful if you would allow discussion on the following. Is a "spring red cock" salmon legally a clean fish or not? He is unspawned, therefore not a kelt: is a curse to the river, as he takes up the best positions and chases away any decent fresh fish that come near him. He is a grand fighter and usually a big, heavy fish, and apparently on the Slaney, if not elsewhere, he is classed as an unclean fish and cannot be taken, although some people say he is far the best for pickling and quite good, wholesome eating, and one knows he is going to die pretty soon and will never be any good for breeding. At present there is great doubt if one cannot be "run in" for killing him, and we asked the Department for a ruling, but they shirked the answer and we could get nothing definite out of them. I am told that in Scotland and England they are regarded as lawful. Of course, I refer to the spring fish not the autumn one.

Yours faithfully,
Borleagh, R. P. WEMYSS QUIN.
Inch, Co. Wexford.

BIRDS ON THE BRITISH LIST

SIR,—I have been perusing the List of Birds in the *List of British Vertebrates*. The following first-hand notes may be of interest:

Continental Goldfinch (?)—Solitary goldfinch seen Holy Island, November 20th, 22nd, 1936, and February 28th, 1937. "Brilliantly plumaged: gold on wings and scarlet on head at their brightest. Three notes of his song as call, *ittilew-wit*." (Only goldfinches recorded on island, I think.)

Northern Bullfinch.—Holy Island, April 13th, 1937.

Little Bunting.—One or two observed, spring and autumn, Scolt Head and Holy Island (never full notes).

Water Pipits.—One, Solway, January 21st, 1938.

Continental Coal Tit (?)—A coal titmouse observed at distance. Holy Island, autumn migration, 1936. (No other titmice recorded on island personally or otherwise?)

Red-hearted Flycatcher.—Regular spring and autumn migrant, Holy Island.

Little Gull.—One fully plumaged, Solway, April 27th, 1938.

Grey Crow.—Eight non-breeding hoodies summered, Holy Island, June 5th to September 4th, 1937.

White Wagtail.—Bred successive summers, 1936, 1937 and 1938, Holy Island.

Singing on Tweed, February 13th, 1937.

Scandinavian chiff-chaffs and Northern willow-warblers are hardly distinguishable in the field from their British representatives. Why, then, are there no Continental species recognised of wheatear and redstart, plainly distinguishable from the British species in the field?

Yours faithfully,
North Devon. RICHARD PERRY.

IRISH LAKES

SIR,—I read a letter from your correspondent "O. M." in which he discusses the falling off of his bag of fish in an Irish lake. I have been fishing in Ireland for the last five years—four years at one lake, where I noticed that the catch was progressively worse, and I put it down to the fact that the fish were feeding more on caddis, or underwater larvæ, as well as snails, rather than on the insects on the surface. I got some confirmation of this by ceasing to dap, or fish with a wet fly, and used Mayfly nymphs and other nymphs, and the sport improved somewhat. For the fish were coming short at the wet fly, but they would take the underwater insect, deeply sunk, better.

The boatmen say this is due to the fact that many more eels are taken from the lakes than used to be the case, and they were large consumers of caddis grub. Now the trout have begun to eat them, instead of the surface insects. At another lake close by I hardly ever got a rise on the dap, and became rather weary. It was a very wild day and, not wishing to change the fly (for we were rather short), I let the fly sink—and had it taken under water. This happened nine times on that particular day. It is a lake in which the fish are dour risers; there are a large number of gulls, and some pike.

In 1938 I visited another lake. I was there a month, from May 18th to June 18th. The lake rose about 20in. in a fortnight, and it was bitterly cold. The fly was blown off the water the moment it hatched and, I imagine, found it difficult to come back to lay eggs. But we had a good season, better than the other four. Our party caught trout up to 5lb. on the dap, including a number of fish from 3¾lb. down to 2¼lb. But the smaller fish were taken on the wet fly. The best bag I saw was one 3¾lb., one 3¼lb., one 3lb., and four from 2¾lb. to 2lb. 6oz. All were caught on the dap, and on a cold, cloudy, windy day. The fish seem to rise better if there is a fairly strong wind, if it is not cold.

I venture to think your correspondent is unduly pessimistic, from my own small experience (if he does not mind my saying this) I think the trout are there, not so large as used to be the case, or so many large ones.

Yours faithfully,
Oakleigh, T. MOORE HICKMAN.
Tettenhall Wood, Wolverhampton.

SIR,—I have read with interest the correspondence in your columns concerning the fishing in Irish lakes. "An Exile" rather wanders away from the original subject, but hits the nail very severely on the head on several occasions as regards the question of overfishing and poaching.

There is a new Fishery Bill before the Dail of which we have great hopes, but the recommendations of the committee who formulated this Bill were so far-reaching that it seems rather doubtful that the courage of our legislators will stand up to the test and pass it without very drastic modification. However, it may be of interest to past visitors and those who have yet to come that more and more interest is being taken by us locals in maintaining and improving the fishing in our own areas. Local angling clubs are springing up and doing all they can to assist both the fish and our legislators in this task.

As regards the lakes, I do not think the stock is greatly depleted, and as regards my own river I know it is not, but despite this fact I have seldom known such a bad year for fly-fishing. Last year was bad also, and so was the year before, so that I do not believe that the stock was greatly depleted by rod fishing.

As regards my own preserved water, which is primarily salmon fishing, I had practically no salmon this year owing to the early drought. But also, owing to this drought and its consequent clear low water, I was able to study the inhabitants, with the aid of polarised glasses, as never before. I could see a very large stock of good trout. In fact, I was surprised by the number of fish of from 2lb. to 3lb., and even several running up to 5lb. size. Yet one very rarely takes a 2lb. fish on the fly, though I did see one of 4¼lb. so taken this year, and one of 5½lb. taken by the salmon nets lower down last year. I believe, if we could find how to lure these larger fish to our fly we should find the real secret of the big catches.

I am of the opinion that for all-round fishing sport at low cost this country has no peer, not even excepting New Zealand, where I have tried fishing, and which also suffers from the self-same troubles. And against any superiority in the way of fish weight must be offset the enormous expense and distance to travel.

I believe much good could be done by visiting fishermen writing to the Irish Tourist Association and pointing out what they think should be done to improve matters, as this Association is very alive to the value of the country's fishing.

Yours faithfully,
Tipperary. LIGHTFISH.

WHAT ARE THE BUILDINGS IN THE BACKGROUND?
(See letter "A Fishing Cup")

A FISHING CUP

SIR,—I enclose two photographs of an engraved horn cup, which may interest your readers. It stands 7in. high, and is turned under the lip, and at the base; the diameter at lip is 4in.

I am puzzled by the buildings in the background, but these may be a mill on a Derbyshire stream, which one of your readers may be able to identify.

On the third segment, not illustrated, is the magic monogram of I.W., C.C.

Yours faithfully,

Pethuel Lodge, Broadway, Worcestershire. SIDNEY M. PAYNE.

GOOD SHOOTING

SIR,—It does not surprise me that "A. W. L." considers "O. E.'s" shooting record "astonishing." I cannot claim to have shot for 60 years, but my experience over 50 years, in which time I have shot with a good many of the best shots, and "stood behind" others equally good, leads me to say that I have never yet, and do not expect to, met anyone who claimed to have a better average than one kill to two cartridges through a season. In my own personal opinion, if one can go through a season and kill driven grouse, walked-up snipe, flighted duck, high woodpigeon coming in to roost, driven partridges in a gale, the much maligned rabbit knocked up in rough grass, and really tall pheasants, and kill one in every four cartridges expended, one has nothing to grouse about. No doubt some will kill all the above with an average of one in three, but very few, I fancy; and fewer still, if any, at the rate of one in two. If such exist, I have not met them, and if I did I should certainly remove my hat to them!

Yours faithfully,

Knockgray, Carsphairn, Castle Douglas, Scotland. ERNEST B. F. WRIGHT.

CHEAPER SQUASH

SIR,—As a builder it is with some interest that I read the article on squash courts by Richard Sudell. I have built a completely new court on virgin soil for £450 to the customer. This includes all items mentioned by Richard Sudell, namely gallery, ventilators, glass in roof, flush door, white wood floor and specially treated walls to prevent sweating. I suggest that squash rackets has suffered for years from the high cost of building, and I have made a study of the subject resulting in a large economy.

Yours faithfully,

JOHN SHEFFIELD.

John Sheffield Construction Co., Ltd., Little Normanby, Scunthorpe, Lincs.

MIRAMICHI KELTS

SIR,—I read with interest Mr. W. V. Goodbody's letter in your issue of June 11th, 1938, in which he quotes from a friend's letter describing the fine fishing enjoyed on the Miramichi River, New Brunswick, Canada, for a spring run of salmon downstream. This form of angling is most popular on the Cains River, a tributary of the Miramichi, and may be described as a "racket" started by certain professional angling camps and catering to ignorant American anglers, who do not know a kelt when they see one.

It is a shame that these fish are not allowed to return to the sea without being killed or injured. Last year I wrote to the Bureau of Fisheries at Ottawa regarding the matter, and attach the official answer to my letter.

Yours faithfully,

Tuxedo Park, New York. DAVID WAGSTAFF.

Our correspondent's enclosure reads: "While the Department very much sympathises with your attitude, there seems to be no doubt that the salmon in the Cains River that are returning to the sea in the early season are unusually bright, and afford some worth-while sport to anglers. You will note that under the provisions of paragraph (c) of subsection 10 of section 17 of the Special Fishery Regulations for New Brunswick, in catching such salmon barbless hooks must be used, and each angler is permitted to retain only one salmon for each day's fishing."

RABBITS OR TIGERS?

SIR,—I have read your Golfing Correspondent's recent article and, as Convenor of a Green Committee, was particularly interested in the subjects discussed.

Our course is typical of hundreds of others in the country in that there are some 300 members, few of whom are good golfers. We have on occasion tried to teach them how to enjoy themselves, and with expert advice, but almost without exception alterations which have provided a drive, such as depicted from the architect's tee in your correspondent's diagram, have been unpopular.

For whom are we to cater? The 95 per cent. who golf for recreation and in mild competition, or for the remaining 5 per cent. and the occasional visiting tiger?

Yours faithfully,

London. CONVENOR GREEN COMMITTEE.

DEARTH OF OLD TROUT

SIR,—Mr. Pechey opens up a very interesting problem about which I, for one, would like to know more. That brown trout will go upstream some distance to spawn is pretty certain, but it is obvious that they do not stay in the upper waters or there would be a crowd of big fish in the upper reaches of all streams.

After much observation I have come to the tentative conclusion that there is an instinct in all brown trout to drop back downstream permanently as they get older (or is it bigger). A lowering of the water level is probably the signal that prompts them to seek heavier water downstream. I believe this is the reason why the trout caught in the weirs and lashers of the lower Thames are always big fish, and never small ones, and are fish that have dropped back from the tributaries of the Thames such as the Churn, Coln, Windrush, Kennet, &c. It would be interesting if the scales of these Thames trout could be examined and the age of the fish recorded. Whether they finally go back to the sea or not would be difficult to discover.

When a kinsman of mine rented a chain of lakes near here, he put wire-netting gratings at the outfalls of each lake and stocked up with fish. While those gratings remained there was always a fair stock of big trout, but since they have been taken up there has never been anything much over ¾ lb. in them. When I had to lower the level of my lake one autumn to repair some sluices, I found several fish dead on the turbine grating which had an automatic inlet hatch. They had backed in and then got cut off, but they were always the bigger fish.

So little is known about the life and habits of the brown trout that it is high time some proper investigations were made.

Yours faithfully,

Colesbourne, Cheltenham. H. C. ELWES.

A FLY THROUGH THE GILLS

SIR,—In connection with a letter by D. J. Reid, "A Fly Through the Gills," in September 17th, 1938, issue of the *Field*, it may be of interest that on October 13th, 1925, fishing with 1in. blue charmer in Lady Planting Pool, Craigendinnie Beat, on the Dee, my wife killed a 16lb. salmon hooked in precisely the same way. Presumably this fish came well "up" to the fly, and as it closed its mouth the fly passed out through its gills with the water so driven out.

Yours faithfully,

Deeside. SILVER DEVON.

UNQUESTIONABLY WITHOUT COMMENT
(See letter "Sausages")

SAUSAGES

SIR,—I am venturing to send you a photograph of an amusing road sign which I recently came across near Scole, Norfolk. It is quite obviously "Without Comment."

Yours faithfully,

Ipswich. R. A. N. DIXON.

You can't always be hole-high, but you can make sure of enjoying the 19th if you always ask for Johnnie Walker by name. All the finest whiskies in Scotland, fully matured after years in the wood, go to make the famous round blend of Johnnie Walker. No wonder

Johnnie Walker

walks away with it!

Born 1820—still going strong

DOG FISHING

SIR,—The enclosed snapshot may be of some interest. I have never known a dog to spend hours at a time seriously fishing. This bitch of mine stands by the pools on the coast here, which are full of diminutive dogfish (from ½in. to 4in. long) and watches every movement. When she thinks one is sufficiently near to make a catch she plunges her head under the water to make her grab.

I know dogs become fascinated by goldfish in a bowl, but as a rule their interest is short-lived, whereas the day I took this snap my bitch had been at it without ceasing from 11 a.m. until 3 p.m.; and would have gone on still only I wished to move myself. She remains mute until her patience is exhausted, but I think realises that her bark drives the prey away and soon settles down for another bait. I have seen her let them get right up to her feet before she will allow herself a dart at them.

Yours faithfully,
Lingfield. P. M.

TORTOISE EGGS

SIR,—I read with interest your letter on tortoise eggs published in the *Field* of September 3rd.

On July 15th, 1938, our tortoise, who was at that time staying with some friends of ours, dug a hole in the earth in the garden. She then laid three eggs in the hole and scraped back the earth into the hole and completely buried the eggs. Like your tortoise she then walked off and "took no further interest in the situation." But we did! Our friends unburied the eggs and gave them to us. We gave them to the Professor of Zoology in the University College of Dundee, who put them in an incubator, but as we have heard nothing further the eggs cannot have hatched. While our tortoise was laying the eggs she was watched by the son of our friends. He told us that she laid them one after another with hardly any pause in between.

Yours faithfully,
The Hollies, KATHARINE BUIST.
Brought Ferry, Dundee.

SIR,—I am extremely interested in the letter which appears in the *Field* for September 3rd. We have two pairs of tortoises at my father's house at home, and some five or six years ago one of them made a nest such as you describe and deposited therein three eggs. I very much wonder whether your correspondent has done anything with the eggs laid by his tortoise? We put ours in a tin full of sand and stood the tin on the top of the boiler that heats the water of the house. We took a look periodically at the box to see if there was any sign of life, and at the end of two months had given up hope. However, we left them there, and one day at the end of the third month our chauffeur arrived in great excitement to say that the eggs had hatched. One baby tortoise was found on the ground damaged, one was on some coke near by, and the third was sitting on the top of the sand by his broken egg. The two that had fallen out (how they had done so was a mystery, as the top of the sand was well below the top of the tin) died within a day or two but we reared the other successfully, mostly on flower petals (recommended by the Zoo), young lettuce leaves, tomatoes and so forth. We had him five years, and I sent a photograph of him with the old pair to the *Field*, with an account of his hatching and rearing. He came to a tragic end—a rat gnawed through his shell and ate him. The whole family was cast into gloom at this tragedy, which we felt we should somehow have prevented, but we had been put off by the fact that the rats had never attacked the older tortoises. We kept the baby tortoise in the greenhouse in a special box and run all through the winter and frosty spring nights and days.

Yours faithfully,
The Priory, C. S. STACEY.
Eynsford, Kent.

"SHE REMAINS MUTE UNTIL HER PATIENCE IS EXHAUSTED"
(See letter "Dog Fishing")

IRISH GROUSE DRIVING

SIR,—Maybe the following instructions issued at an Irish grouse drive may amuse your readers: "(1) *I implore* you *not to* speak on the way up to your butt. (2) If you wish to help me, please keep *perfectly still* and do not show your head during the drive. (3) The birds abhor nudity and bright colours."

Yours faithfully,
Dublin. B.

A CHARGING ELEPHANT

SIR,—I think the enclosed snap of a wild elephant starting to charge may interest your readers. It was taken in the Mysore jungles in Southern India. I was stalking a herd of elephants to photograph them, when the old bull eventually got our wind, and swung round and charged down a clearing in the bamboos; he passed quite close to me and I got the enclosed snap.

Yours faithfully,
London, S.W. 1. P. C. SAUNDERS.

"THIS ENGLAND"

SIR,—Three photographs and a few lines entitled "This England" should not be the final word on my family's agricultural and sporting association with Donnington, which has lasted for many hundreds of years.

Due to many circumstances, which I will not go into here, the northern part of this estate, which adjoins the town of Chichester, has in the last few years been sold by us for development.

If your correspondent will pass through this developed area along the Chichester—Selsey road to Donnington Village and towards Sidlesham Common he will see that the country here is completely rural.

We asked the authorities to zone this as a "rural area," which I understand has now been done, so that it will be preserved for all time.

With the money obtained from the developed land, which is less than one-tenth of the whole, it has been possible to put the remainder of the estate in repair, and recondition houses, cottages and farm buildings. The means of keeping the estate together is probably as objectionable to your correspondent as to us, as it has spoilt one of our best partridge drives on this beat.

Finally, I would ask your correspondent to walk with me over 900 acres of typical "Manhood" agricultural land, with its farmsteads and barns thatched with Donnington wheat straw by Donnington men, before he passes judgment.

Yours faithfully,
A. LESLIE HARRIS
(Trustee, Donnington Estate).
20D, Collingham Gardens, S.W. 5.

A DOG'S GRAVE

SIR,—During recent alterations to the back of this old Tudor house, the slate slab of which I enclose a photograph was found lying face downwards underneath the back doorstep. The quaintly worded inscription is as clear as on the day it was carved.

It is an interesting find, in view of the fact, that it is a family legend that before a death a white terrier is seen in the garden. Perhaps it is the ghost of Jacob!

Yours faithfully,
Maes-y-Neuadd, LOWRI KIRKBY.
Talsarnau, Merioneth.

A BULLTERRIER RETRIEVER

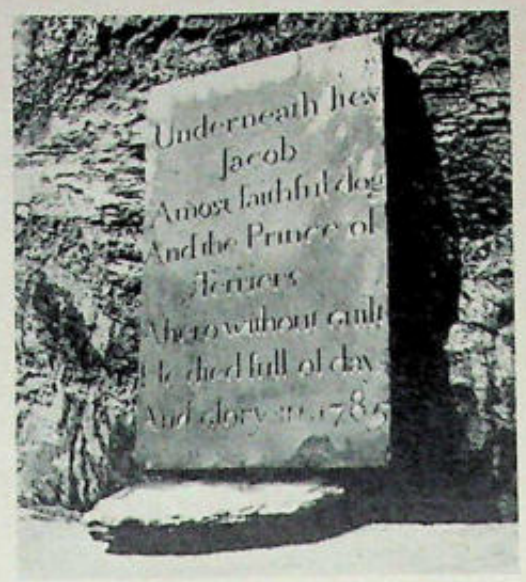
SIR,—I was interested to read about your correspondent's retrieving bullterrier. I had a bullterrier in India which I used to take out pigeon shooting. The pigeon flighted over a deep, swift-running stream, and frequently dropped in when shot. I then threw a small stone near the floating bird, and my bullterrier would dive in and bring the pigeon back to my feet without a ruffled feather. Probably any dog who is fond of water could be trained in this very simple manner.

Yours faithfully,
42, Clanricarde Gardens, HAROLD JOHNSON.
Hyde Park, W. 2.

A RAT TAKES THE FLY

SIR,—I thought you might like to have details of a very interesting incident which occurred when I was fishing at Eastleach on July 30th. I was casting over a fish which had just risen about 8yds. away, when a water rat came swimming across the stream straight towards the spot where the fish was lying. I tried to shoo it away quietly, but it persisted in its course, so I light-heartedly cast my fly over it and drew it back, with the result that I found to my astonishment that I had hooked the rat well and truly, and as it turned out a minute or so later I had caught him right in the snout.

I played him gently until I had taken in my line, and then hailed my friend, Mr. Stanley Woodrow of Wellingborough, who was just round a bend in the stream, to come and see what had happened. The immediate problem that faced us was how to take the fly from the nose of our sporting friend and release him, but, fortunately, while he was still in the net it came away without showing any signs of damage.



A GHOST'S TOMBSTONE
(*See letter "A Dog's Grave"*)

The rat was then shaken from the net, and he proceeded on his way slowly to the stream very much shaken and somewhat fatigued. However, after he jumped into the water, I saw him swim away with his former alacrity. I am wondering whether any of your readers have had a similar experience. It must surely be a very rare one in any case.

The rat was fully grown and played very lightly, equivalent to a fish of not more than 4oz. The fly on which it was caught was a small black gnat.

Yours faithfully,
Snowshill Hill, JOHN BOURNE.
near Moreton-in-Marsh, Glos.

FLYING HIGH

SIR,—Flying from Le Touquet to Croydon about a month ago, I saw something which surprised me very much indeed. When the plane, a D.H. 86, was over Tunbridge Wells, we passed three mallard flying very fast for the Kentish coast in the direction of Dungeness. Our height at that moment was 2,400ft.: we were some distance above the clouds, which were very thick and low across the Channel and extended as far as Croydon.

Duck on migration fly at a tremendous height; but these were obviously native birds, and I can only surmise that they had been bred in inland waters and were making their first trip to the sea. But even so, is not such an altitude very unusual for the time of year?

Yours faithfully,
Marston House, L. E. COTTERELL.
Marston St. Lawrence,
Banbury.

LANDSEER PICTURE

SIR,—Can any of your readers tell me where Landseer's picture of the "Hunters at Grass" can be seen—surely one of the most restful pictures ever painted? The three horses would appear to be two browns and a light bay or chesnut from the engraving. I have come across an oil painting—two browns and a grey. They appear similar in conformation to Landseer's horses, and the picture is signed J. Herring, which appears to be rather an enigma.

Yours faithfully,
Arthur's, A. M.
St. James's Street, S.W. 1.

NOUNS OF ASSEMBLAGE

SIR,—I wonder if your correspondent, Mr. J. H. Caesar, has heard of the following plurals?

"A sheaf of wheatears."
"An intelligence of professors."
"A galaxy of film-stars."
"A bevy of daughters."
"A singular of spinsters."
"A plague of women."

Yours faithfully,
Union Society, J. K. ADAMS.
Oxford.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1. Will someone who knows the miseries of diabetes help a man aged 69 who is now a chronic diabetic, until he gets his old-age pension. This poor man and his wife have not a penny in the world except 9/- weekly given by their three children, who are all married, and cannot afford more from their difficult budgets. The man was a butcher, but owing to ill-health and terribly bad luck (including unpaid debts from a bankrupt), his business collapsed, and they have now finished their savings. Do, please, send us £8 10s. that we may give them 12s. 6d. weekly until he gets his old-age pension, for unless we help him he cannot live.

IN THE CITY

BY THE CITY EDITOR

IN normal times the Stock Exchange derives its support from a public with as divergent views on finance and commerce as on politics. There is the investor, speculative investor, and the punter. All have their views and opinions on the merits of various securities.

All to-day are in the same pot. They scarcely know which way to turn. It is well known that in normal times the public makes the markets, but in times of stress, such as now experienced, the Stock Exchange member takes the whip hand.

Quite recently genuine investors were rather staggered by news that dealers in the market in British funds had come to a gentlemanly agreement not to deal in the funds below stipulated prices. Some jumped to the conclusion that any quantity of stock could be realised at the prices quoted. That, however, was far from being the case.

The fact is that a dealer will accept Government stocks at the prices quoted providing he has on the other side of his book a buyer prepared to give just a turn more for the security. The usual position of the market is, therefore, changed. The normal rule is for the jobber to make two prices for a particular stock. For instance a price of 93 to 93⅛ would be about normal for 3½ War Loan.

The seller on that basis would have to accept 93, whereas the buyer would have to give 93⅛. The broker could possibly do a little better between competitive dealers in the market, but under minimum prices the dealers quote 93 for War Loan stock and leave it to the buyer to name a price above that level which he is prepared to give.

All this became necessary not because of any excitement on the part of the British public or a strong desire to throw British Government stocks overboard, but because of pure panic on the part of Continental holders. British funds are very largely held abroad. They are regarded in all countries as sound and stable investments.

Threatened hostilities, however, play on the nerves. The one desire has been to send credits as far away from distressed Europe as possible. The United States has been adopted as the best funk hole. Attempts were, therefore, made to sell British stocks in lines more than the market dealers would cope with.

In practically every instance the proceeds of sales were transferred into American dollars. Hoarded gold in London held by foreigners was also sold and turned into American currency. It was one mad scramble to turn credits into dollars. It is noteworthy that American securities were nothing like so popular as the American dollar itself.

Other sections of markets took their cue from the gilt-edged dealers. Business became a matter of negotiation. Free dealings were impossible. In many instances buyers and sellers were brought together, but the smooth working of the Stock Exchange machinery broke down.

This experience is not entirely new. Times of stress call for exceptional measures. Somewhat similar conditions prevailed prior to the outbreak of the Great War in 1914, and there have been other times of financial disturbances, unconnected with politics, which have clogged the machinery of the Stock Exchange.

It is, of course, impossible to predict the future. Past experience, however, proves conclusively that the methods always adopted by British investors in maintaining a calm front during times of acute uncertainty have proved beneficial. Time and again it has been proved that those who have avoided panicky liquidation of stocks have come out successful winners.

Dealings are difficult on the Stock Exchange There are, however, a number with sufficient capital resources quietly picking up supplies of stocks and shares in British industrial undertakings. Many such concerns have weathered serious storms in the past, and there is no reason to believe that anything less than success will attend their future direction.

REPTILIAN REPRIEVE

It was not the human race alone that was in danger of destruction last week but part of the animal kingdom also, for quite elaborate precautions had to be taken by the authorities at the Zoological Gardens against possible emergencies. On the outbreak of hostilities all poisonous snakes and spiders were to have been destroyed, while should any of the larger animals have escaped owing to damage to their cages arrangements had been made for them to be shot. Some of the most valuable animals were to have been sent away to Whipsnade in the company of all the irreplaceable and specially valuable books, records and scientific material, while the remaining stock of animals would have been reduced gradually in order to save valuable foodstuffs.

New Books

SEA FISHING IN AMERICA

A Handbook of Big Fish and Small

Salt-water Fishing. By VAN CAMPEN HEILNER. (Herbert Jenkins: 25/- net.)

SALT-WATER anglers in this country may well envy their American confrères. Owing to the great length of coast line which runs from north to south both the Atlantic and Pacific littorals, American anglers have a choice of fish, from those which find sustenance in the Arctic current to those which inhabit tropical seas, which our temperate waters can never offer; and, moreover, many more of them seem to grow to a size which makes them more attractive to the man who likes to catch something that is really difficult to land after it is hooked—and most anglers share that prejudice.

The publishers in their announcement rather suggest that this is a book on big-game fishing. It would hardly be regarded as that over here, since it includes many fish which rarely exceed 20lb. or so, and even such more common game as bluefish and flounders. But the book itself is all the better for that. The real big-game fish of 200lb. and upwards, let us say, though the excitement and danger accompanying their capture gives them a welcome (and possibly unduly prominent) place in the "news," rarely offer those chances of finesse and ingenuity in their capture which, after all, is angling's real claim to be an art.

Mr. Heilner, who is responsible for the volume, is a true angler and a true artist. It is evident he takes as much pleasure in the capture of a small fish which requires brains and skill to deceive as he does in the muscle-cracking struggles with a leviathan. His own "first love," he tells us, is the channel bass. Unfortunately, we have no channel bass over here. *Sciaenops ocellatus* is not a true bass, though perhaps it has something of the general appearance of one, apart from its colour. The only member of the species which seems to be found in our waters is the Meagre, the South African kabeljou, but it is so rare a visitant that it cannot be counted as an angler's fish here at all. Channel bass are believed to spawn in fresh water and are caught mainly in estuaries, on river bars, and in the surf, which offers more attractive possibilities for light tackle fishing than can usually be had from off-shore fish.

Americans can also "go one better" among the true bass, for they have what used to be considered the doyen of all the anglers' sea fish, the striped bass. It is true we have here our own sea bass, and anyone who has caught it on light tackle may be difficult to convince of any other fish's superiority; but the striped bass seems to select by preference those dangerous rocky coasts which are hammered, even in summer, by a surf which we rarely see in these islands, and Mr. Heilner's account of the fishing loses nothing in the telling.

But if the author may be believed, even the striped bass, and the tarpon, must give place to the bonefish as a fighter—another claimant of the honour of being "the gamest fish that swims." This is a tropical species which starts life as a ribbon-like creature, after the manner of the eel, ending up as a long and slender fish rather like an attenuated herring. It is found among the Florida Keys; a shallow-water feeder; and like most fish which come into shallow water, takes line and will not be denied: "The line actually flies through the water with a ripping sound that scares you. Your reel has become but a blur, and the speed is so great that your thumbstall has become red hot. Four hundred feet away the bone fish suddenly breaks water, turns and rushes at you as fast as he went from you." The fishing is not all excitement, for Mr. Heilner warns you that the boat, a specially-constructed flat-bottomed affair, may have to be hauled over the dry banks in your search for the fish which will take you one or two days to locate; but it has provided the subject for one of the best chapters in an excellent book.

A very convenient system has been followed throughout the volume. For the most part one particular species is dealt with in a chapter. The author starts by describing it and his own experiences in its capture, and at the end, in smaller type, gives a brief "guide" containing information as to its habits, where it can be found, and suggestions for tackle and bait, so that the volume can be consulted readily for information as well as enjoyed as a narrative. It is plentifully illustrated in colour and half tone. Mr. Heilner is to be congratulated on producing so readable a volume with so wide a scope in its information. H. D. T.

* * * *

Pageant of Wings. By DOUGLAS GORDON. (John Murray; 8/6.)

Nature's strong appeal to mankind through wild life is the theme which Mr. Gordon has drawn. Thanks to education, fewer people to-day than ever before need the urge to be kind to the animals and birds which come their way, even if the laws and acts for the preservation of wild life pass them by unmoved. Unfortunately, the chance of really getting to know and study the ways of the countryside is now further out of reach of the majority of our population than hitherto: the increase of building, the shortage of time and increased expense are difficulties which town dwellers must overcome before they can approach the country. To these people, reading is the alternative, and a good one. Mr. Gordon has written a book which will prove to be ideal for many readers in such a condition: he has flowed gently through the pages in no set course, but ambled under the broad headings to his chapters. Personal observations and anecdotes accompany the essays, which are also full of practical ideas and questions, such as the reasoning of a bird or animal mind, their attitude towards darkness, the limitations of their powers of exploration as a means of escape, their reaction to unnatural silence. These are only a few of many points upon which Mr. Gordon has enlarged.

We are shown a glimpse of Nature through the eyes of a philosopher, but the eyes are clear, and the temptation to lay them aside and go nearer is irresistible. C. N.

* * * *

Speckled Nomads. By H. E. TOWNER COSTON. (Faber and Faber: 10/6 net.)

Mr. Towner Coston has written one of the narrative-type Nature books such as Mr. Haig-Brown gave us in *Silver*; but this volume deals not with a salmon, but with a trout. With two trout, to be exact, for one is the imaginary life history of an Itchen fish; the other of one of the great trout in the Tongariro River in New Zealand.

He takes his "heroes" through the vicissitudes of life as it occurs in rivers and portrays the danger of a growing fish from all the enemies that would prey on it, giving an account of its adventures from the time when, as an egg, it is deposited in the gravel, until as a mighty fish it succumbs to the deception of a Silver Sedge and gains immortality in a glass case.

A feature of the book is a number of unusual photographs, micro-photographs of trout eggs and the like, as well as some attractive landscape studies. H. D. T.

* * * *

"Kingfisher" Abroad. By T. and T. RISING. (Jonathan Cape; 8/6.)

Canoeists will enjoy *"Kingfisher" Abroad* because it is both personal and practical. The book concerns the rivers of Central Europe, which are to-day becoming increasingly popular with English paddlers, and is written in such a way that, if you have already been on like excursions to some of the places mentioned by Mr. and Mrs. Rising, you find yourself saying: "That happened to me, too!"

This, to my mind, is half the fun of the book. Who, for example, has not scrambled aboard the Dover train at Victoria just as it was leaving and been obliged to start the journey in the guard's van? Or, who has not sent off their canoe and arrived at their destination to find that it was not yet there? When the authors of *"Kingfisher" Abroad* ("Kingfisher" is the name of their canoe) finally reached Trier, where they intended to start their trip, there was no canoe. At first no one understood their broken German, but eventually the word *kanu*, as it always does in that country, worked miracles.

Throughout the book you come across "your own experiences in print." It is written in the main in diary form, which adds to its value, for minute by minute problems have been put down before they have been forgotten. If you are intending to journey by canoe on the Danube, through Germany, Austria and Hungary, or the Neckar, or the Moselle, you should read this book. It will whet your appetite for the visit and give you an insight into the grand welcome which is always a feature of a canoe voyage in Germany.

Stevenson had it so well when he wrote about boats: "Will anyone dare to tell me that business is more entertaining than fooling among boats? He must have never seen a boat, or never seen an office, who says so, and for certain the one is a great deal better for the health." And Mr. and Mrs. Rising will also impress you with that fact, for they have obviously found "messing about in boats" great fun as well as an education. W. G. L.

* * * *

Plain Jane. Written and illustrated by MARY COLVILLE. (Collins; 6/- net.)

This altogether charming book inevitably reminds the reader of Anna Sewell's "Black Beauty," although it owes nothing in the way of invention to that immortal classic, nor does it suffer from an obviously didactic purpose. Its subject is the life story of a Shetland Island pony, Plain Jane, and the fact that its author and illustrator is only thirteen years of age adds an interest, but does not affect its intrinsic worth. For the book, taken on its own merits, is good. The description of Shetland is finely done, especially in winter when the gales drive the snow across the voes, and the sea throws great boulders on to the top of cliffs 200ft. high. The calm acceptance of these conditions by the ponies strikes the human observer with some force. In time Plain Jane leaves Shetland for the mainland, where her first owner treats her badly, but where the second family which buys her proves to be her real friends. Finally, she arrives at an honourable old age, and from this safe position views her successors, in the shape of a string of new horses, walking into her stable without regret. The author displays a sound knowledge of horses and has combined a fertile imagination with it to produce a book of unusual charm. R. C.

* * * *

Adventure in Hollywood. By MADELINE BRANDIES. (Chambers: 5/-.)

For the majority of people whose acquaintance with the great cinema industry is limited to an occasional visit to "the pictures," this book throws an interesting light upon what goes on "behind the scenes."

We are given here an insight into the difficulties that beset the path of the aspiring Hollywood story-writer as experienced by Babs's young friend, Sandy. These two have a hard struggle, but they are blessed with a sense of humour and unbounded optimism, without which it is doubtful if any would-be movie maker would go far.

Even as it takes all sorts to make a world, so it takes all sorts to make a film; but as in Babs's own words, "few are called and fewer chosen" and we are given a glimpse of the Central Casting Bureau where 12,000 names are registered as "extras," and perhaps 500 are employed from day to day.

Here is an authentic description of life in the studios and offices of the world's greatest film colony by an author who knows her Hollywood. V. R.

BOOKS IN BRIEF

In a country which is renowned for its love of antiques, the clocks have strangely been neglected. That is largely due to lack of knowledge and information. *The Old English Clockmakers and their Clocks, 1670–1820*, by Herbert Ascinsky (George Routledge & Sons, Ltd.: 15/-), will provide ample facts for the possessor of an old clock or the would-be purchaser to make sure of his possession.

Siegfried Sassoon describes his childhood, schooldays at Marlborough and his career at Cambridge, in *The Old Century* (Faber & Faber; 8/6). The characters are those of the Sassoon family, and such personalities as you meet at places of education. Mr. Sassoon's memories are mainly happy ones, and the book possesses that charm which we connect with the author's name.

George A. Birmingham can be safely relied on to provide amusement, and he has once again achieved this valuable art in *Magilligan Strand* (Methuen: 7/6). How a dignified and delightful Dean spent an adventurous holiday in Ireland when he was supposed to be fishing, but actually became entangled in the smuggling of sweepstake tickets in a manner which involved much explanation in his "Close," will provide a mirthful evening's reading.

Why not enjoy sunshine this Winter instead of fog and sleet and biting winds? Exchange the familiar social routine or business round for new scenes and novel experiences in an atmosphere which is different yet not foreign.

Visit South Africa. See the majesty of this golden land where Nature works on a gigantic scale and where you can follow your favourite recreations, such as riding and golf, fishing and surfing. Experience the physical and spiritual exaltation that springs from days spent in glorious sunshine and air like champagne.

Eight weeks will be sufficient to ensure a comfortable visit to South Africa, including four weeks of delightful fair-weather cruising out and back. The cost will not put an unduly heavy strain on your pocket. Illustrated publications are obtainable from the South African Travel Bureau, Trafalgar Square, London, W.C.2.

LIGHTENING THE CADDIE'S BURDEN

Fourteen Clubs an Ample Selection for Golfers

By E. R. TIPPLE

AT the autumn meeting of the Royal and Ancient Golf Club, at St. Andrews, the resolution to limit the number of clubs to be used to fourteen was carried without a debate. Confirmation of this will be obtained at the spring meeting next May, and thereafter the new rule will be in force. It will read, I understand: "The clubs used by a player during the round shall not exceed fourteen, and the clubs carried shall be restricted to that number." So you will not be permitted to carry, say, eighteen clubs in the bag, even if you actually use less than fourteen during the game! Penalty for disregarding this new rule in competitions will be disqualification.

This decision will not surprise the majority of golfers, for it has been under discussion for a considerable time. In the early part of last year a similar proposal was defeated as it failed to secure the necessary two-thirds majority. Since then the various golfing bodies—the national unions included—in this country and overseas have been consulted. Even the ordinary club golfer, as I mentioned in the *Field* of March 19th this year, had an opportunity to give his opinion on the matter, but the response to that was very meagre. With one possible exception all the various groups of officials agreed to such a restriction, so now the rest of the world has fallen into line with the United States Golf Association, who enforced the same rule in America some time ago.

The regular caddies in the various tournaments will be delighted. Their burden will be considerably lightened. The days of the huge "batteries" of clubs are numbered. No more shall we see bags containing 20 and more clubs, together with all the other equipment such as special ball bags, shooting sticks, umbrellas and a complete mackintosh suit, without which the modern expert does not care to travel. A blow has been struck at these extravagances, and an attempt made to put an end to a mathematical age which was destroying the art of the game.

For some years the tendency has been to have one club for one particular shot, and to use it for that only. This specialised idea seemed to have no reasonable limits. Pre-War golfers never possessed more than eleven clubs, and most of them managed to play very adequately with even less. In those days the technique was different. One club was used for a variety of purposes—half-shots, quarter-shots and many that cannot be described in words!

Undoubtedly many hold the opinion that these modern matched sets have tended to discourage individual skill. According to the various attractively optimistic advertisements, a golfer to-day can purchase a golf shot by obtaining the "demon" club or whatever name it may be called. All he has to do is to swing it, and the club will do the rest. Quite simple, but scarcely true. Admittedly modern golf clubs have made the game easier, but improved upkeep of courses has done likewise. And however good is the player's equipment, he must possess some skill to be able to obtain the best results. I can think of only one club—the special "blaster" type of niblick—which the ordinary golfer can handle with comparative ease.

Whether wrongly or rightly, these modern matched sets of clubs have been blamed for the loss of the old art of golf. Some players will object to this restriction. They will not like anything that interferes with their freedom of choice. Dictatorial attitudes are unpopular, particularly just now. But the Rules of Golf Committee has the difficult task of preserving the game and its familiar characteristics. If golf became a mathematical business and was standardised, interest in it would wane and few would play. Too much attention should not be focused on the actual implements of any game, so that the actual manner of playing is overlooked.

The new rule in America seems to have proved satisfactory. Leading professionals do not appear to have been handicapped, for the scoring has been as good as before the days of restriction. And there has been little controversy on the subject, which perhaps is rather surprising. I have heard it said that this limitation of weapons will injure the trade of the professional attached to the smaller clubs, if not the whole business. This is utter nonsense. Golfers will still buy as many new clubs as they used to whether they are all carried at once or not. And the lesser-known professional does not deal with players who use more than fourteen clubs in any case.

I used to have twenty clubs in my bag, and after discussing this question I decided to ascertain how many of them I used regularly. For a par round of 72 over an average length course I discovered that only eight had been employed. Naturally, when one is playing badly, the number used would be greater. But this proved to me that I carried several clubs quite unnecessarily. The modern golfer certainly is ultra-cautious.

The official total of fourteen clubs allows plenty of scope and freedom and does not entail any hardship on the individual. He can have four woods, clubs—and no one in their right senses would want more—and ten irons. Four powerful irons, two mashies, a mashie niblick, a niblick, a putter and an extra pitching club would make up the required number. Surely that is quite reasonable? If anyone cannot play with this number of clubs the addition of a few more would not be of any consequence.

The new rule will only affect a small minority of players in this country. I should imagine that not 5 per cent. at present use more than fourteen clubs. If this is so, and I believe it is correct, a special rule hardly seemed essential. Yet, as I have said, the committee felt the time had come to put an end to fads and to place a premium on skill. Some would have gone further and made the limit ten and even seven clubs, but that would have been too great a restriction. It was also announced that an attempt would be made regarding a new specification that will reduce the distance the modern ball can be hit. But that will take some time and entail consultations with various organisations throughout the world. Those in charge at St. Andrews never act rashly, and by this new decision they have shown once again that the interests of the game are in safe keeping.

UTILITY GUN DOG SOCIETY.—On Wednesday next, October 12th, field trials of the Surrey and West Sussex branch of the Society will be held at Hever Castle, Edenbridge, Kent, by kind permission of Major the Hon. J. J. Astor. The meet will be at Somerden Farm, Chiddingstone, at 9.30 a.m. The nearest station is Penshurst, and hotel accommodation can be had at The Henry Eighth, Hever, Edenbridge, Kent.

PLANNING EARLY SUMMER BORDERS

Suggestions for Decorative Effect

By ELEANOUR SINCLAIR ROHDE

SO much attention is concentrated on the queens of the early summer border, notably Delphiniums and Lupins, that the placing of the other plants does not always get the attention it deserves. In the average border it is impossible to have Delphiniums and Lupins in large masses on account of the "holes" they leave after their flowering period is over and they have been cut down. But for rich effect it is essential to have the other plants in big drifts. I think it is a good plan to have clumps of Delphiniums and equally large clumps of Anchusas at the back of the border, leaving just enough room between for tall-growing Dahlias and the smaller-growing Dahlias in front to succeed in early autumn. By the time the Delphiniums and Anchusas are cut down the Dahlia foliage is spreading so rapidly that the blanks are soon filled. Anchusas are invaluable for their long flowering, and the new variety Morning Glory is outstanding. The flowers are much larger than those of Dropmore.

Oriental Poppies have a very short flowering period, and the colours of most of them are so glaring that they kill the more delicate colours of other flowers. Personally, I like only the deep mauve and rich crimson kinds, and that curious variety called Masterpiece with flowers that can only be described as bronzy pink. Some of the dwarf varieties are attractive, notably Peter Pan, with cherry red flowers on stems 18in. high. Even if no other Oriental Poppy is grown I think this one deserves a place.

The Geraniums are amongst the most decorative early summer flowers, and they need the minimum of labour. In most gardens they do not require even staking. *G. armenum* strikes a vigorous note with its fine port wine coloured flowers, but the best of all I think is the one that is least commonly grown, i.e., the old double Geranium.

All through June and July it is smothered with its lovely bright flowers like miniature lavender blue roses. I have bushy clumps nearly 4ft. high and more across that are still in full beauty for at least three weeks after the Delphiniums have been cut down. *Campanula lactiflora coerulea* though not so brightly coloured is another first-rate border plant. The type has milky white and not very decorative flowers, but the variety mentioned is first rate. Both these plants deserve a place in every border, and unlike Delphiniums and the other tall Campanulas, they require no staking beyond a bough or two to keep them in position.

Two of the easiest and most decorative red flowers for the early border are the deep cherry red Achillea and Centranthus ruber. Both have a long flowering period, and they associate so well with the many blues of the summer border. Both the Achillea and Centranthus are easily raised from seed, but I find that in the seedling stage rabbits find the former irresistible. The white-flowered Centranthus is also very attractive.

Erigerons are universally popular, and apart from their decorative value they are useful for picking. Quakeress is an attractive lavender pink, and the white form is also pleasing. The common Goat's Rue (*Galega officinalis*) is rather a weed, but there is a charming double pink kind, also a lavender pink (Lady Wilson). Niobe is a better white form than the white variety of *G. officinalis*, and Her Majesty is a soft pretty blue variety. All the Goat's Rues flower for at least three months.

The pick of the Geums is undoubtedly *G. Borisii*. From April to October it is one of the most decorative border plants with its fine foliage and large scarlet-orange flowers. Mrs. Bradshaw and Lady Stratheden are both still popular, and two of the best orange-coloured varieties are Fire Opal and Prince of Orange. *G. heldreichi splendens* has as long a flowering period as *G. Borisii*, but is not so striking. Orange and scarlet are not common colours in the early summer border, and the Geums are indispensable. Amongst the Potentillas the most decorative are, I think, the hybrids Etna (deep red flowers), Gibson's Scarlet, Don Quixote (double yellow flowers with red centres) and Carnival (orange red). *G. recta macrantha*, with dainty single yellow flowers, is in bloom all through the summer. *Centaurea dealbata*, with its abundant fern-like foliage and pink flowers, is grown in most gardens, but *C. macrocephala* not so often, though when exhibited at shows its great yellow heads of flowers always attract attention.

Foliage plants are frequently forgotten in the desire to make a colourful border, but they are important, for the eye soon wearies of a continuous "blaze of colour." I am very fond of the old Gardeners' Garter (*Phalaris arundinacea variegata*), once such a favourite in cottage gardens. It should be near the front in order to see the stripes which are its beauty.

TO GARDEN LOVERS.—On October 12th, 13th and 14th, at The Old Gardens, Tunbridge Wells, Messrs. R. Wallace & Co., Ltd., of The Old Gardens, Bayham Road, are holding their seventeenth annual auction sale of shrubs, herbaceous plants, bulbs, &c. For many years this has been an event eagerly looked forward to by those who are contemplating planting their gardens. The Old Gardens themselves are well worth a visit, for the gorgeous colouring of the shrubs is seen on every hand at this time of the year. Catalogues either from Messrs. Protheroe and Morris or Messrs. Wallace & Co., Ltd., The Old Gardens, Tunbridge Wells.

THATCHING PRACTICE

ARMED with good wheat straw, tarred string, hazel rods and the tools listed in last week's article, how should we proceed? The first step is to remove the existing thatch. The rafters will probably be found to be sound, but the battens, which are laid in a horizontal direction and nailed to the rafters, should be renewed. Hazel thatch rods are quite suitable for this purpose, or 1in. by 1½in. slating battens may be used, and secured by galvanised or copper nails. The battens should be 15in. apart.

With the roof stripped the straw should now be "pulled" by hand with the object of retaining long stems and rejecting the short and broken pieces. The straw as it is pulled is laid in a trough of water to soak and soften, so that it can be bent and will lie closely. Removed from the soaking rack, the straw is bundled together, a short piece of rope tied round the middle, and the bundle thrown over the thatcher's shoulder and carried up the ladder.

Starting at the corner and working from eaves to ridge, and from right to left, the thatcher takes handfuls of straw, and with the butts downwards lays them evenly along the eaves battens to a depth of 7in. or so. He then takes his needle, threads it, passes it round the straw and makes two half-hitches round the batten on the far side. He then draws the string tight and makes two half-hitches round the batten on the side nearest to him. The straw is then held firmly. Another handful of straw is laid against the last, and pushed well underneath its left edge and sewn, passing the needle partly through the first swath. This gives a secure overlapping stitch.

The thatcher will be able to reach a band about 4ft. wide from a single setting of his ladder, so that when he has laid this length of eaves he will proceed to cover it with another layer laid a foot or so higher up the roof and similarly sewn with string tied about the middle of the straw bundles.

The art is to avoid an appearance of ridges. The straw should be laid uneven ended, so that the final roof presents an even appearance, with none of the string exposed.

When the eaves have been completed for the 4ft. length, they are trimmed up to a straight line with hand sheep shears. As each 4ft. length of thatch is sewn on the loose ends are removed by combing with the special rake.

When the eaves are reached the topmost layer of thatch should be slightly raised by horizontal bundles of straw laid close to the ridge. The top layer is secured with wood as well as by sewing, and the West Country finish, which is to cut the thatch ends to a vertical line at the ridge and butt the ridge thatching of the other slope, has much to recommend it. The other method is to bend the straw forming the ridge capping over the ridge, securing it with rods on either side.

The verge of a gabled building is formed in the same way as the eaves, the straw adjoining being inclined in the direction of the gable so that the butts protrude and are cut to a straight line with the shears.

A hipped roof presents no exceptional difficulty, if it be remembered that the hip is a danger point for wind damage, and the thatch be extra securely sewn, but in exactly the same manner as for a straight surface.

A valley is a different story. Attempts to render it watertight purely with thatch are invariably unavailing, and the best treatment is a lead or zinc valley gutter carried well up the slope on each side, dressed over the tilting or cheek fillet as in a tiled or slated roof. The thatch is then laid to weather this fillet exactly as if it were a gable end or an eaves.

Places where the thatch abuts against chimney breasts or walls require similar treatment. The top side of a chimney breast calls for a lead gutter formed by a sheet of lead let into the brickwork, dressed down the stack and then up the roof slope over a cheek fillet. The thatch is then finished over the fillet as if it were an eaves. The side abutment calls for a lead flashing stepped and let into the brickwork, dressed down over the rafters and over the usual cheek fillet, the thatch being finished over the fillet as if it were a gable end.

The lower side of a chimney stack reverses the order of things. Here the need is that the thatch be finished right up to the stack in the same way as for a ridge. The lead flashing is then let into a joint of the brickwork, dressed down the chimney and over the thatch for a distance of 9in. or so. Extreme care is needed to ensure that the secret gutters at the side of the chimneys discharge their water over and not under the lower flashing.

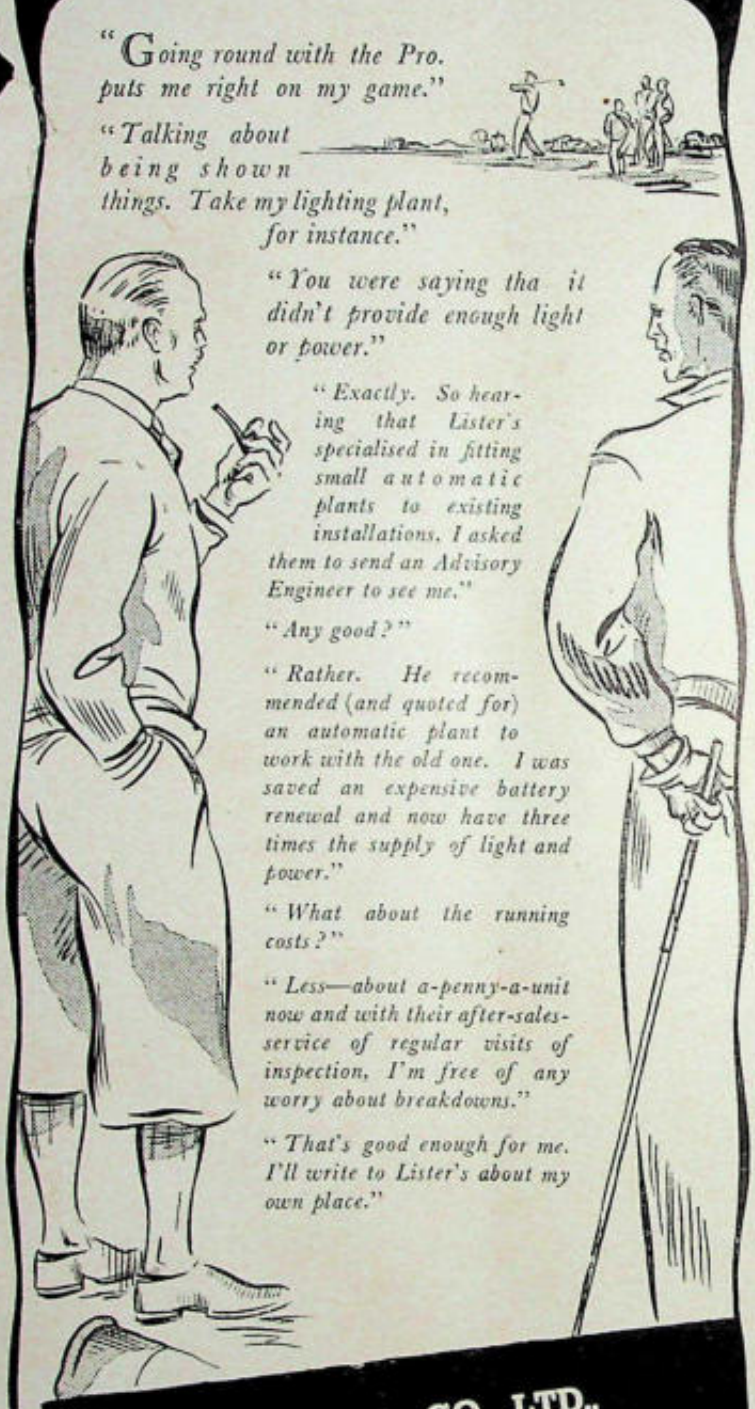
Water & Electricity
IN THE COUNTRY – BY LISTER'S



"Going round with the Pro. puts me right on my game."

"Talking about being shown things. Take my lighting plant, for instance."

"You were saying tha it didn't provide enough light or power."

"Exactly. So hearing that Lister's specialised in fitting small automatic plants to existing installations. I asked them to send an Advisory Engineer to see me."

"Any good?"

"Rather. He recommended (and quoted for) an automatic plant to work with the old one. I was saved an expensive battery renewal and now have three times the supply of light and power."

"What about the running costs?"

"Less—about a-penny-a-unit now and with their after-sales-service of regular visits of inspection, I'm free of any worry about breakdowns."

"That's good enough for me. I'll write to Lister's about my own place."

TWO FORMS OF INDOOR DECORATION FOR THE AUTUMN

On the left dying leaves and ripening fruits make a decoration which is both old and new, while on the right a simple bowl of chrysanthemums, lit from below, that would be suitable in the exclusive hall of a modern house

INDOOR FLORAL DECORATION

Developments of the Past Half-Century

By MARGUERITE JAMES

It is generally dangerous to survey any contemporary art, and perhaps still more dangerous to apply the term modern to a particular mode of artistic expression. In the case of flower decoration the position is specially difficult, for we have few records of the past with which to compare present-day styles. Indeed it has been stated by one authority that the use of cut flowers as we know it is itself entirely a modern practice, at least in western civilisation. I think this example casts a little doubt on the theory that cut flowers and conventional vases do not belong to the age of cultivated gardens and dark panelled halls and dining-rooms.

But if we venture to say that the basic principles underlying the art of arranging flowers have changed but little, we must admit that the whole spirit of the modern movement has had a profound influence on the way in which flowers are used in the home. Indeed, the whole attitude of mind towards the art has undergone a change, and the modern woman approaches the subject with a seriousness of purpose and a freedom from convention which would have been unthinkable in the days when a profusion of flowers was considered the only correct thing, and when every household possessed a gardener who grew them in quantity.

Just how has the change been brought about? In two ways, at least, the modern woman has given a very personal and original impetus to the art of floral decoration. Frequently she does the flowers herself, and if so the floral arrangements reflect her temperament and personality. It is this increased interest of cultured women in flower decoration which is probably responsible for the originality seen in the choice of material, which is a very typical feature of modern style. Flowers in the home are no longer valued just as they are appraised on the horticultural show bench, for the quantity, size and rarity of the blooms, but rather for inherent decorative qualities of colour and form. The modern artist uses such unlikely material as the flowerheads of rhubarb, the foliage of early kale and beet, the seed heads of innumerable weeds, bare winter stems, and even dried empty receptacles and seed pods from the meadow.

A second change in connection with floral art is one which, without wishing to seem ultra-feminist, I attribute in a large measure to the entry of educated women into the business world. One or two of these women with highly trained artistic sensibilities and a natural flair for home beautifying have almost revolutionised commercial floral decoration. Certain of their ideas, it is true, have come across the Atlantic, for schools of floral art flourished in America for some years before they became [illegible]. The use [illegible] pottery, for instance, is an American [illegible]

While partly owing to the modern floral artist's study of perhaps the finest appreciation of line and form that it shows. In the old style decorations a rather formless mass of colour was common, such as a single kind or pair of one kind of flower, and the artist was satisfied if that solitary mass was set in the right position and was in harmony with the general decorative scheme of the house.

The modern artist seeks an intimate beauty of line in every arrangement. The grouping of modern exhibition vases is perhaps the most striking example of this. Here, possibly modern ideas have had their influence, but the fact remains that the modern artist has realised that beauty in every decoration depends largely on the line of the flowers and foliage. Where possible

TWO FORMS OF INDOOR DECORATION FOR THE AUTUMN

On the left dying leaves and ripening fruits make a decoration which is both old and new, while on the right a single bowl of chrysanthemums, lit from below, that would be suitable in the entrance hall of a modern house

INDOOR FLORAL DECORATION

Developments of the Past Half-Century

By MARGUERITE JAMES

IT is generally dangerous to survey any contemporary art, and perhaps still more dangerous to apply the term modern to a particular mode of artistic expression. In the case of flower decoration the position is specially difficult, for we have few records of the past with which to compare present-day styles. Indeed it has been stated by one authority that the use of cut flowers in water is itself entirely a modern practice, at least in western civilisation. I think this assumption a little drastic, though it must be obvious that flower-and-water-filled vases do not belong to the age of unglazed windows and dark or draughty halls and chambers.

But if we cannot go very far back in our comparisons, we can at least note some remarkable developments of the past half-century. First, there is the changed attitude of the housewife herself. I never believed much in the Victorian damsel who rose early, dressed in pink and white muslins, tied the ribbons of her garden hat under her pretty chin and sallied forth with scissors and trug to cut roses for the breakfast table. She existed, I think, mainly in novels. Even if (well gloved) she did cut a few roses, the risk of thorn and stain to delicate white hands probably made her hand over the basket to domestics, who would deal with the flowers in conventional manner. The result was seen in the inevitable epergne (a safety-first device !), alternating with the "cakestand" decoration, in which formally massed flowerheads were arranged in flat tiers—two devastatingly popular styles which were repeated everywhere, *ad nauseum*.

Just how has the position changed ? In two ways, at least : first, the modern housewife takes a very personal and serious interest in her everyday floral decorations. Frequently she does them herself, and if so the floral arrangements reflect her temperament and personality. It is this increased interest of cultured women in flower decoration which is probably responsible for the originality seen in the choice of material, which is a very typical feature of modern styles. Flowers in the home are no longer valued just as they are appraised on the horticultural show bench, for the quantity, size and rarity of the blooms, but rather for inherent decorative qualities of colour and form. The modern artist uses such unlikely material as the flowerheads of rhubarb, the foliage of curly kale and beet, the seed heads of innumerable weeds, bare winter stems, and even dried empty receptacles and seed pods from the meadow.

A second change in connection with floral art is one which, without wishing to seem ultra-feminist, I attribute in a large measure to the entry of educated women into the business world. One or two of these women with highly trained artistic sensibilities and a natural flair for home beautifying have almost revolutionised commercial floral decoration. Certain of their ideas, it is true, have come across the Atlantic, for schools of floral art flourished in America for some years before they became common here. The use of all-white pottery, for instance, was an American idea.

What particularly marks the modern floral artist's work is perhaps the great appreciation of line and form that it shows. In the old-style decorations a rather formless mass of colour was common, such as a single bowl or jar of one kind of flower, and the artist was satisfied if this colour mass was set in the right position and was in harmony with the general decorative scheme of the house.

The modern artist seeks an intrinsic beauty of line in every arrangement. The streamlines of modern architecture are in part responsible ; they actively demand line beauty in every decoration. Where available material lacks character in this respect, scissors are freely used. Thus the drooping lines of Leycesteria formosa's purple green bracts, and Solomon's Seal's hanging bells are shown to advantage by the removal of every leaf from the stems. Just now, the multi-coloured berries of berberis species, sea buckthorn, cotoneaster, firethorns, roses, hollies, vines and privets are ready to gather in every garden, and if every spray is stripped of foliage, so that the characteristic form of the different berries is accentuated, the decoration becomes twice as effective.

Line and form are naturally dependent on colour —witness the different effects of a white arum (*a*) with its outline accentuated by a background of crimson carnations or dark copper beech leaves, and (*b*) among white carnations where its characteristic form is obscured.

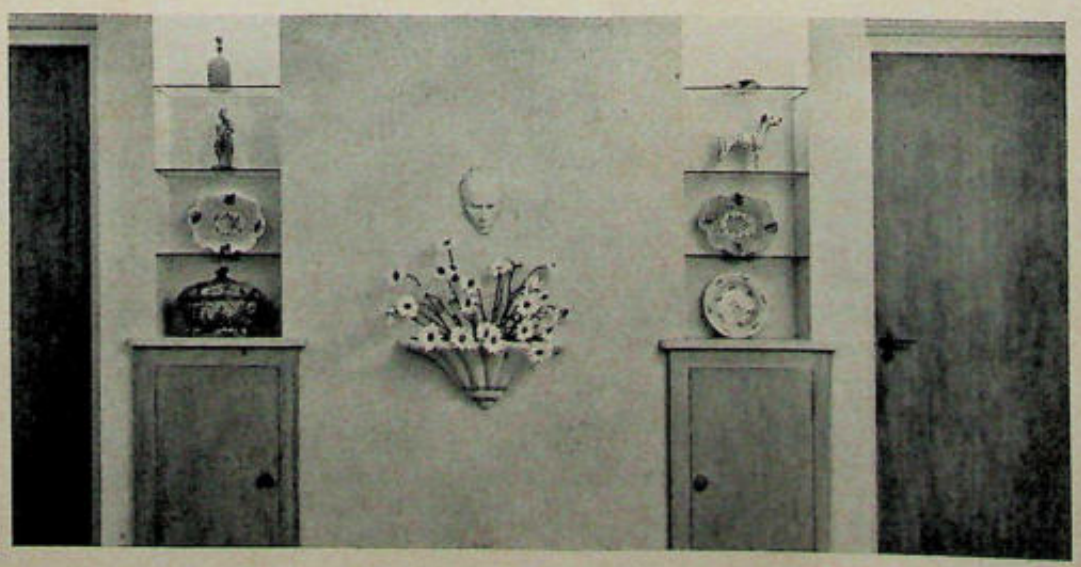
Line, form and colour are all affected by light, and the chiaroscuro of floral art is particularly studied by the moderns, who have at their disposal almost unlimited resources in this sphere. Anyone who has given thought to the subject knows how much colours are affected by ordinary daylight variations, how blues demand a window position where they catch the falling sunbeams, while yellow and orange flowers make their own sunshine and can stand away from the window, on a table, or against a neutral background.

Colours are even more affected by artificial light, and some delightful daytime flowers become insipid when the electric lamps are lit. Mauve and blue are generally unhappy at night, while certain flowers in which two bright colours are blended—the sweet pea, Mrs. A. Searle, for instance, in which cerise and gold mingle—look even better by artificial light than by day.

The colours of this month—the browns and golds and scarlets of the autumn countryside—are for the most part happiest in daylight. So are the delicate shades of the garden Michaelmas daisies, and many of the chrysanthemums, but there are some varieties of the chrysanthemums that light up well at night. I have seen Edith Cavell chrysanthemums associated with dark crimson carnations in a surprisingly effective dinner-table decoration.

For a large entrance hall or loggia, where the light is plentiful both day and night, I should choose at this season a large mixed display, chiefly of outdoor material—hips and berries, pampas grass, honesty, Cape gooseberries, tinted foliage of all kinds, and a few red hot pokers. (But then I have a personal preference, which most of the modern floral artists do not share, for keeping to natural associations in my decorations. I do not care to mix hothouse flowers with wildlings except on rare occasions.) A mixed display of this kind should be a really massive affair, set in a tank or plant tub, and placed where the strongest light falls on it from one side. This is actually the common lighting of the photographer's studio, and produces a very natural effect.

In a small entrance hall, particularly where the furnishing is of the ultra-modern type, a table bowl of chrysanthemums lit from below would be more striking.

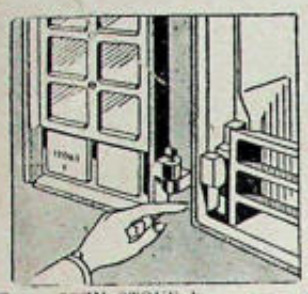


FOR A ROOM WITH WALL LAMP BRACKETS

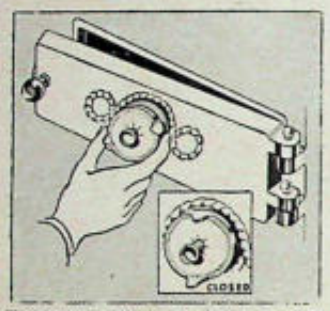
The clear outlines of daisies are exactly right in this wall bracket

Scientific Construction makes them *highly efficient*

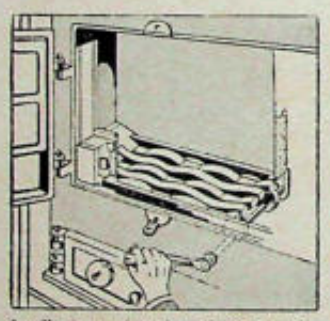
★ NO SPECIAL FUEL IS REQUIRED FOR COZY STOVES



Every COZY STOVE burns open or closed as required on ordinary kitchen coal, and is guaranteed to burn 12 hours without attention. This is largely made possible by precision in workmanship, which results in all doors fitting perfectly. The air draught, at all times, is under complete control.



The amount of air required to ensure proper and complete slow combustion depends upon the type of fuel used. The air regulating device in COZY STOVES is situated in the ash door and is operated by a disc. It is a most efficient arrangement.



Small pieces of coal not burnt to ashes can still give off heat. Dropped through to the ashpan they are wasted. With the new patent Rocking Grate fitted in all large size COZY STOVES the maximum efficiency is obtained. When used it may not show much movement on the surface, but down under the fire very little but the dead ashes fall through, which is as it should be.

COZY STOVES are scientifically designed to give maximum heat with minimum fuel consumption during the whole 24 hours. For efficiency, adaptability, and economy, YOUR home needs a COZY. There's a wide range of models available to suit all requirements.

Write for catalogue or see them at your local dealers.

COZY STOVES are available on easy terms.

"FOR LIFTING THERE ARE MANY FORMS OF POTATO RAISERS"

ASPECTS OF THE POTATO HARVEST

Some Conditions of a Satisfactory Yield

THE area of potatoes grown in England and Wales this year amounts to 474,600 acres, or nearly 20,000 acres more than in 1937. Of this area 416,100 acres are main crop and second earlies. The acreage marks a welcome change from the annual decline that had been recorded since *1933, for* potatoes are a valuable national food. The Ministry of Agriculture points out that the acreage returned is larger than that returned to the Potato Marketing Board by registered growers, since it includes all areas of one-quarter of an acre and upwards on holdings over one acre in extent. If these 474,600 acres produce no more than the ten-year average yield of 6.5 tons (and the forecast has been good, the crop suffering little from disease) then the yield would be 3,084,900 tons.

Well, a three-million-ton crop needs a great deal of work in the harvesting, sorting, storage and marketing! Care must be exercised in the lifting, whether by hand, mould-board plough or spinner, for serious damage to many tubers may well result in the entry of disease that will end in rotting in the pies. Also, when the potato disease (*Phytophthora*) has been present in the field it is essential that tubers showing any signs of infection should not be included in storage.

This serves to remind one that the potato harvest may be facilitated by destroying haulm and weeds by spraying with sulphuric acid (12½ per cent.) or copper sulphate (17½ per cent.), 100 gallons per acre, a short time before lifting. The spraying should not be done before the haulm reaches maturity, or the yield may be reduced. On occasion the season may induce the haulm of some varieties (*e.g.*, King Edward) to remain green unduly late, and then spraying may take place rather sooner. Further, such spraying may be helpful in reducing late "blight," whereas if it is carried out too soon the yield may suffer. Spraying with copper sulphate may usually take place three or four weeks before lifting, especially if late "blight" is feared: sulphuric acid destroys haulm and weeds much more rapidly and may usefully be done a week before lifting. Reports on trials of spraying to kill potato haulm were given in the *Journal of the Ministry of Agriculture* in June, 1935, August, 1936, and September, 1937. It seems highly probable that spraying with a 1 per cent. solution of sodium chlorate would also be effective in destroying haulm and weeds, without having any injurious effect on the soil in relation to the following crop. Indeed, if it were carefully carried out, the haulm and weeds sprayed with the chlorate might well, on drying, be burnt over, this serving the treble purpose of destroying haulm and weeds, disease, and weed seeds without injury to the tubers still awaiting lifting.

For lifting there are many forms of potato raisers, including the plough type, rotary and spinner machines, elevator group, and combined lifter-sorter-bagger machines. The plough, rotary and spinner machines are most commonly employed, one or other being selected according to the area to be harvested and the class of soil involved. The cost of harvesting varies widely. In the big potato-growing districts, gathering up the tubers after they have been brought to the surface is commonly undertaken by women. Harvesting a heavy crop naturally costs more than an average or small one, not simply for gathering, but for cartage, storage, riddling and sale—though, of course, less per ton yield. There are very great differences in yield, not only as regards variety, soil and climate, but in accordance with treatment: whereas the average yield for England and Wales is 6½ tons per acre, yields of 10 to 15 tons are commonly obtained, and bumper yields of 20 tons have been recorded for small areas, while trials have yielded as much as 24 tons. Admittedly, a 15- or 20-ton yield of potatoes may be as rare as a 12-quarter yield of oats, but it is probable that both might be more common on good land—and on an economic basis at that!

After harvesting, the dry and collected tubers are most commonly stored in clamps or pies of more or less triangular section. The site chosen should be dry and well drained, and conveniently situated by the hedgerow near a gateway, to make subsequent riddling, bagging and carting as easy as possible. Drainage is made more certain by the fact that soil immediately surrounding the pie is placed upon the first covering of straw, bracken or other litter, which is also used as a base, on which to pile the tubers. After first piling, the potatoes are covered nearly to the top of the heap and left to settle and avoid heating. Eventually the top receives a substantial covering of straw, the sides are covered in with soil, and finally the top—at any rate in the North—is also well covered with soil. Good protection against frost is essential or heavy loss may occur. Further, special observation should be made from time to time to ensure that the pies are not invaded by rats. At the time of storing, potatoes are sometimes given a sprinkling of lime and sulphur as a protection against the spread of Sclerotinia disease. In this connection farmers should obtain the Ministry's collected leaflets on diseases of potatoes, as well as a bulletin on potatoes generally.

When the time comes for riddling and sale it is well for farmers to bear in mind the regulations of the Potato Marketing Board—and who can avoid it! It is, however, most certainly true that close observance of "good practice" pays in the long run—what consumer desires to buy mixed samples of potatoes for the table?—big and small together; too often in the past smalls were apt to predominate if the housewife were in the least careless about her purchase.

The potato crop provides a huge amount of very valuable food for the nation, and it deserves all the most careful attention we can give it—not only in the growing, but in the harvesting, preservation, marketing and proper use. For human consumption damaged potatoes or very small tubers (chats) have no value, but find a ready outlet in the feeding of various classes of farm livestock. Numerous trials have demonstrated the value of potatoes for feeding pigs. At Kirton, Wallace found that "in proper balance, the potato may be fed in large quantities with as great a nutritive economy as a balanced ration of meal alone," and that 4lb. of potatoes may be taken as equivalent to 1lb. of barley meal. Further, potatoes may be employed as usefully for producing small-weight bacon pigs as for heavier-weight carcases (*Jour. Min. Agric.*, September, 1934). It is, therefore, clear that no part of the potato harvest need be wasted.

H. C. Long.

GREAT numbers of turkeys and geese are now being raised in England and Wales, and it is hoped that the public will buy them in preference to imported birds. In order that home-reared birds may be easily distinguished from their foreign rivals, they will carry a National Mark, which will also be a guarantee that they are of the grade and quality specified by the Ministry of Agriculture.

KATERFELTO
REGISTERED
THE PERFECT HUNT COAT
GUARANTEED

absolutely waterproof!

Katerfelto Coats are the most perfect hunting and riding mackintoshes made. Not only are they worn by leading hunting men throughout the country, but these coats have been regularly supplied to Officers of H.M. Forces, both at home and abroad. They are eminently suitable for walking and driving.

Made in reliable quality mackintosh cloth in Light Fawn, Khaki, and White. Fitted with leg straps, wind cuffs and saddle flaps, and manufactured in several different weights.

SPEED OR SPACE?

Which Matters More to the Air Passenger?

By LORD SEMPILL, A.F.C., F.R.Ae.S.
Aviation Editor of the "Field"

MUCH discussion has resulted during the past few months from the growing use of American air liners on the airways of this country, and the delivery of a new batch of Lockheed 14's to British Airways for preliminary work on the West African route has again brought the matter to the fore. Yet practically all examinations of the topic have been confined to aspects of policy and to affairs not directly interesting the air passenger. In the long run, it must be the paying passenger who has the last word on the advisability of using specific types of aircraft; for that reason, it is as well that the relative characteristics of machines should be considered from his view-point.

Generalisations are always dangerous, nowhere more so than in connection with aviation; yet if anyone with any knowledge of the facts were asked to sum up the basic differences between British and American thought on air-liner design he would almost certainly say that, hitherto, British designers have given first place to comfort and reliability, while American constructors have given the greatest prominence to performance. Such a statement, while requiring a great deal of modification, does indicate a general trend, and it brings up a matter that has been constantly debated ever since serious commercial flying began.

Comfort or speed—which matters more to the air passenger?

Theory and practice have varied considerably in finding an answer for this important question. In the very earliest days of air travel, nearly 20 years ago, the only advantage the aeroplane had to offer was speed. That certain travellers were prepared to pay heavily for this was shown by the readiness with which high fares were accepted for places in machines whose accommodation was little better than a roofed-in cockpit. Conditions improved; reliability was established; but still relative discomfort was accepted as a matter of course by air travellers.

So far as British development was concerned, there followed, a little later, a period in which performance was largely sacrificed to a desire to make air transport competitive with rail and boat in the matter of comfort. The era of the big machine arrived sooner in this country than in America, at any rate for regular service. To some extent this step was inevitable, since expansion was concentrated on the Empire routes, and passengers intending to travel long stages in tropical and subtropical conditions could not be expected to endure being cooped up in small cabins. As non-stop stages grew longer, so the need for greater space and comfort increased.

In America, on the other hand, the primary emphasis was on mail carrying, in the earlier stages. The aim was to save every possible minute, and for this reason performance steadily mounted. The experience thus gained was translated into terms of the medium-size air liner of high speed. Thus, a few years ago, the contrast between speed and comfort, as between British and American machines, was well marked.

Eventually the inevitable happened. In this country criticism of the relative slowness of our airways, as compared not merely with American ones but with Continental lines, grew. America, too, found that speed by itself could not build up a self-sufficient air-transport system. The aim of designers should be to provide both speed and comfort; they should not regard the two as mutually exclusive. Hence, during the past year or two, there has been a steady convergence of what were previously regarded as two distinct lines of development.

The introduction of American designs on the European airways, and, later, on our own, indicated the importance of speed; more significantly still, it showed that a very high degree of comfort could be achieved without losing performance. On the other hand, the advantages of space and luxury were becoming better appreciated in the United States. When the Empire flying boats were put into service on the Bermuda–New York route, American critics were quick to point out the unfamiliar comfort and convenience of the British machines.

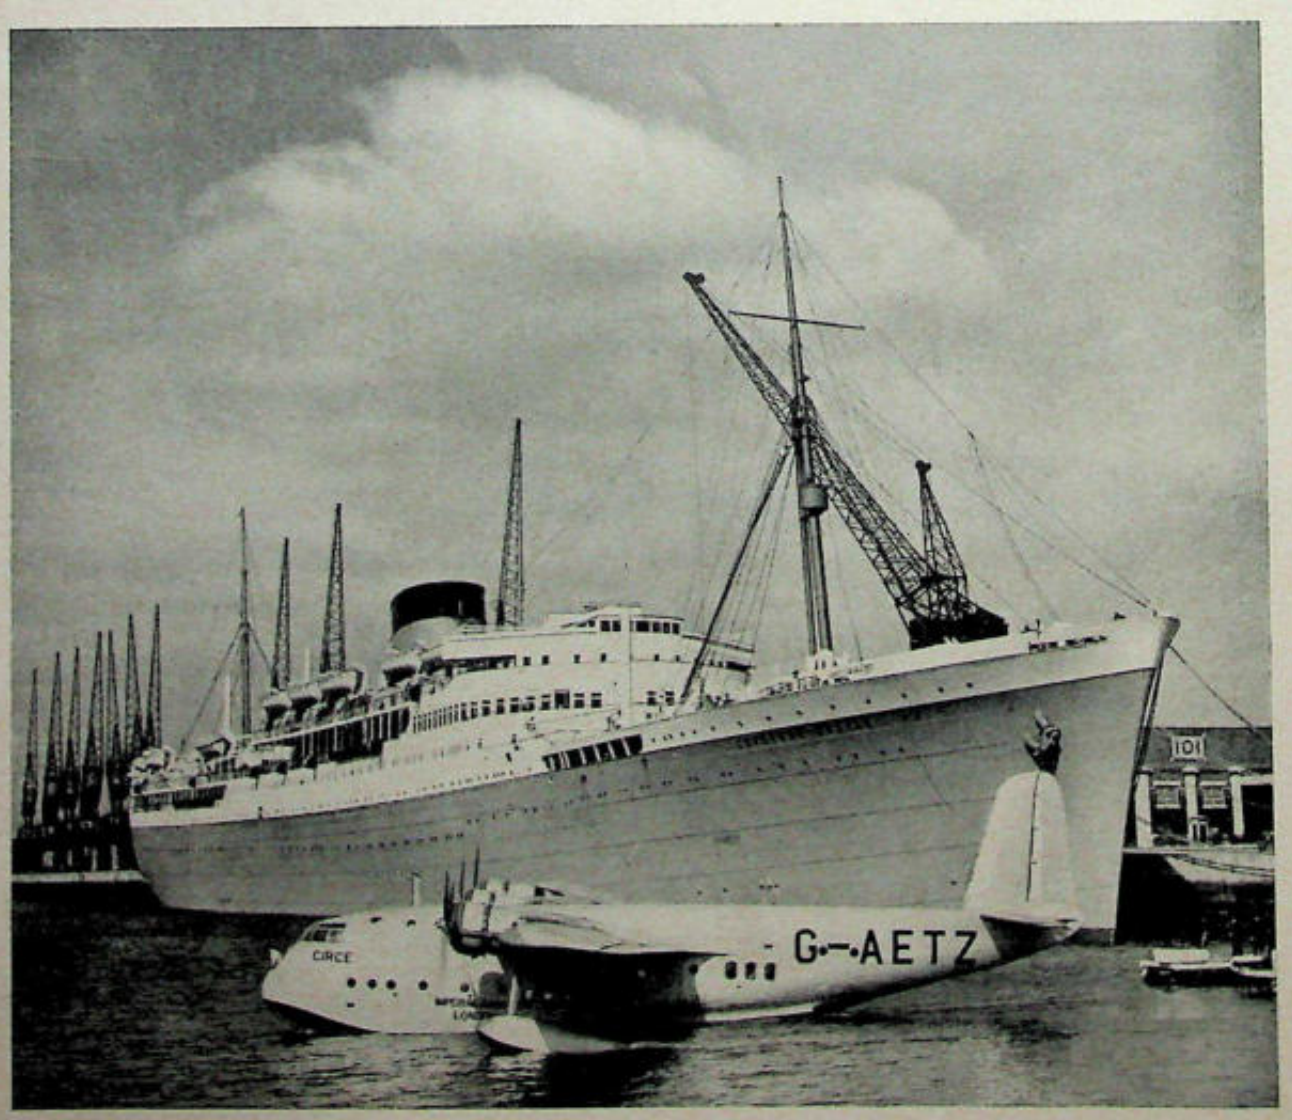
Air transport has now reached a stage when it cannot be content with partial solutions of its problems. Admittedly the chief advantage it has to sell is speed; but it must aim, too, at providing that speed, while conforming to standards applicable to all forms of transport. It may be true that the air traveller is prepared to put speed first; the increase in the proportion of London–Paris traffic carried by the French air lines since faster machines were put into service is only one indication of this fact. Nevertheless, under to-day's conditions it should be accepted that there is no longer any reason why comfort and speed should not be combined in the same machine.

All the signs are that this is now fully realised. New American construction seems to be focused on large machines with luxury passenger accommodation, yet with that performance we have come to regard as typical of the American commercial aeroplane. New British types, while sacrificing nothing of their previously attained standards of comfort and spaciousness, are drawing level with American designs on the score of speed. There is a process of integration going on, which cannot fail to benefit the air passenger materially.

A few years ago the combination of first-class comfort and truly high performance in one machine may have seemed an ideal incapable of realisation. It is not so to-day. As regards the air traveller, he has become discerning and, as in other spheres, will naturally patronise the best. In some circumstances speed at any price may be worth a great deal; in others, comfort may claim first place. But air transport cannot be considered to have outgrown the experimental stage until it provides both together in the highest degree.

A WORLD SIGN-POST

This indicator at the airport at Amsterdam points the way to practically every town of note in Europe



GRACE AND BEAUTY BY SEA AND AIR

The air liner Circe, under the recent schedules, reaches the Cape in just under 5 days. The liner, the Capetown Castle, makes the journey in the scheduled time of 13½ days

A WINTER PLAYGROUND

"In Contrasts the Charm of Cornwall Lies"

A TYPICAL CORNISH STREET IN FOWEY

THAT the winter months are only tolerable in the sunshine of the Côte d'Azur is a myth long since exploded. It may be that comparatively few of us have the leisure for extensive travel nowadays, and prefer, in any case, to dissipate our hard gotten earnings nearer home. Or it may be that, since motor cars began to make a hollow mockery of distance, we have come to appreciate virtues, unrecognised aforetime, in the English countryside. The fact remains, at any rate, that in increasing numbers every year people are discovering that as a playground it offers much that foreign countries lack.

To the sportsman and the tourist the West Country makes particular appeal. Until Easter there is the stag-hunting on Exmoor, unique in its associations and environment; there is the Dartmoor pack, whose followers on Shanks's mare are as like to see as much of the fun as those who ride to hounds. There are the South Devon, the Tiverton and the North Cornwall hunts; the Dart Vale and the Fowey Harriers; while at Lifton, Launceston and Wilseydown, as well as on many parts of Bodmin Moor and the coastal marshes, really good snipe and duck shooting are free to visitors at local hotels. Then in early spring the Dart and the Teign, the Tavy and Camel rivers offer anglers plenty of variety.

Nowhere are there finer seascapes than on the northern coast of Cornwall, when the Atlantic sweeps in fury against its giant cliffs. Nor anywhere is there greater luxuriance of winter vegetation than in its sheltered combes and valleys in which sub-tropical plants flourish in profusion in the open. It is in fact in these contrasts that the charm of Cornwall lies. From tame to wild is but a step; both are present in the same view, and the scattered cottage gardens which listen all day to the roar of the sea are steeped in a riot of colour long before the primroses are awake in other parts of England.

PORT GAVERNE, ON THE NORTH CORNISH COAST

It is this dual influence that lends a peculiar charm to a ramble through those Cornish glens. From the wide arterial road that leaves Dartmoor behind and winds through Launceston over Bodmin moor, you branch off on to leafy lanes, not wide enough in many parts to take two cars abreast, and then drop sheer down into little old-world villages, with crooked houses leaning outwards on to their cobbled streets. St. Kew, St. Mabyn, St. Breward and others of that ilk, all commemorate some Celtic saint of pre-Augustine times; nearly all have ancient stones and crosses rudely carved, such as that which bears the device of a crook and is built into a hedge on the Bodmin Road. It recalls the privilege granted by a Prior of Bodmin to the poor of gathering as much firewood on his land as they could reach with a crook, and hence it is reported comes the saying, "By hook or by crook."

It is a lovely walk along the cliffs from Padstow through little old Port Isaac and Port Gaverne to Tintagel, though one meet rather for a summer than a winter's day. Yet to stand among the roofless ruins of King Arthur's Castle and watch a grey sea breaking into Merlin's Cave is worth the stiff climb up the hill. Incidentally the stranger to Tintagel should not omit to visit the Great Hall in the village, built of Cornish granite, onyx and other coloured rocks. Here the immortal story of the Knights is figuratively told in 70 stained glass windows, mural paintings and rich vestments, even to a jewelled replica of the sword Excalibur.

To many people the North Cornish coast seems rather inhospitable in winter. It is true that some parts are exposed to every wind that blows; on the other hand, many favourite resorts lie snugly sheltered. Padstow, for instance, whose harbour is almost comparable to Fowey; Wadebridge and Rock, where the St. Enodoc golf links, laid out by James Braid, is said to be one of the finest natural courses in the country, lie well within the Camel estuary. St. Ives and Newquay also are almost completely sheltered from prevailing storms and have a mean winter temperature of 52 deg.

Falmouth is often said to be the pick of early spring resorts, but Fowey runs it very close. For river and coastal scenery, blending with its old-world houses and narrow terraced streets, dropping sheer down to the harbour's edge, it is hard to beat. When the wooded hills on either side the estuary are just bursting into leaf and the terraces are ablaze with flowers, Fowey is a veritable kaleidoscope of colour. Though one is never quite certain if it is not as beautiful by night as by day. For when to the illumination of the shipping in port is added that of the tiers of houses clinging to the slopes of Polruan and Bodinnick, the scene is rather like a fairy play.

For the botanist this is a happy hunting ground, though of that science I am unfortunately almost completely ignorant. But bird life is infinite in its variety. The cliffs between Tintagel and Port Isaac are a shimmering mass of gulls of all sorts and sizes. Terns, oyster catchers and dunlins dart restlessly above the flowing tides; the Camel estuary is a happy hunting ground for cormorants and shags, which are darkly silhouetted against the pale green of the sea as they stand to dry their wings on the great rocks that guard the harbour. From little strips of marsh come the cries of curlew and redshank, and now and then a buzzard hovers over the woods that crown these mighty cliffs. There are rare birds, too. I spent half an hour on the heights above Trebarwith watching a raven, and then turning inland up a steeply wooded glen, came suddenly upon a pair of golden orioles.

It is in these sudden contrasts of the softness and the rugged strength of Nature that the charm of Cornwall lies.

J. B. DROUGHT.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE THREE SALMONS AT USK

IT may seem strange that I should choose this week to write about a delightful little fishing inn. It is, after all, the close season for trout, and rods lie idle in odd cupboards all over England at the moment. People are only talking about fishing; they are not actively engaged in Izaak Walton's favourite recreation.

But the *Field* goes all over the world. It is its pride that it goes into more homes overseas than any other paper published at the same price. There may be fishermen, therefore, at Aden or Adelong, Melbourne or Victoria, at Madras or Bombay, Ontario or Toronto—or many other places which I could name here—who are planning a visit to England next year. They will want to know in good time where they can be sure of a real welcome, and that is why I write about the Three Salmons Hotel at Usk "out of season." This does not mean, of course, that English people should refrain from going there at this time of the year. Far from it. The hotel, like the river, never packs up or goes into winter quarters. So if you have nothing special to do one week-end, why not go there?

You will like the Three Salmons. It has been standing at Usk for 300 years, as you will see from the thickness of the walls (how they did build houses in those days!), the varying heights of the ceilings, and the queer twists and turns in some of the passages. Naturally, there have been changes in the building from time to time, as witness the old mounting step in what is now a covered scullery (once an open yard), while the interior has been modernised to bring it up to demanded standards of everyday comfort. Electric light, "h. and c." in all the principal bedrooms, and easy chairs in the lounges, have been added without spoiling the character of the house. In the dining room you will see fine old prints showing the old turnpike gates at Usk.

Do you remember what William Combe said about inns?

"Along the varying road of Life,
In calm content, in toil or strife;
As morn or noon, by night or day,
As time conducts h'm on his way,
How oft doth man, by care oppress'd,
Find at an inn a place of rest?"

That was written some time between 1734 and 1763, and yet it holds good to-day. If you are tired after a heavy week's work a week-end sojourn at the Three Salmons will act as a splendid tonic. It is a quiet little place, and in the evening you can sit in the bar parlour and discuss with the local farmers all the country news. That is half the fun of a holiday here. Townsman you may be when you go, but countryman you will be at heart when you leave. Believe me, that's true. Once you get talking to the local inhabitants you will probably tire them with your questions. And they are always ready to discuss fish and fishing at any season of the year.

It does not need my pen to extol the beauties of the Usk or the neighbouring Wye Valley. Others have done it far more successfully than I could ever do. October is a lovely month anywhere, but especially in a wooded river valley like the Usk. The stillness all around, the absence of chirping and singing life, the slight frost that holds the ground, impose restful conditions which those whose minds are in proper harmony with Nature only too gladly accept. Despite a rather noisy world a visit to the Three Salmons will prove to you that there are still districts vacant of shriek and rattle, that the England of Parson Adams and Lavengro still exists.

So whether you read this article in England or abroad, make a note in your diary that you will one day put your rod and tackle in your car and head towards Usk with "your foot well down."

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

QUESTIONS AND ANSWERS

Points that Puzzle Beginners

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

LAST week I gave six questions and answers, and I now give an additional ten.

(1) *What is the One-over-One System?*

Answer: This is better described as a method rather than a system. Its essential principle is keeping the bidding low until the best playing suit has been discovered. It involves a response from partner, on almost any hand that is not trickless, to keep the bidding open, such as a five-card suit headed by the Queen, providing the balance of the hand contains a Queen and a Knave. A six-card suit headed by ♠, J, 10 may be bid even though the hand is a blank otherwise.

(2) *What is the Two-Trick Rule?*

Answer: This is a valuable rule which insists that, except upon a certainty, you should not make a "business" double within one trick. That is to say, if you think you can defeat by one trick only do not double, because there may be unseen "snags." You double only when you can expect to defeat the contract by two tricks.

(3) *What is cue bidding?*

Answer: Showing possession of the Ace or first round control of a suit. This as a rule should be done only after agreement as to the suit which is eventually to become trumps. A cue bid does not necessarily mean that a slam is possible, but it is a slam suggestion.

(4) *What is meant exactly by a big pre-emptive bid?*

Answer: It is a bid of Three or more made with a view to shutting out the opponents from a bid which you have reason to fear. It is also a warning to your partner that you have little or no defensive values in your hand and not necessarily the Ace of your suit. He should not, therefore, double opponents if they over bid unless he has the "setting" of the contract in his own hand. Nor should he make a shift bid in a suit or in No Trumps unless, of course, he has a certainty.

(5) *How many tricks must a player hold to justify a pre-emptive bid?*

Answer: For a Three bid in a major suit, not vulnerable, six to seven playing tricks; vulnerable, seven to nine playing tricks. Four bid, not vulnerable, eight playing tricks; vulnerable, nine playing tricks. Playing tricks are tricks to be won through length of the suit. Thus with K, Q, J, 10, 8, 7, 6, 4 you have seven playing tricks in the suit.

(6) *What is the reason for the distinction you make between pre-emptive bids in major and minor suits?*

Answer: A long major suit may produce game if partner has tricks in the side suits. A long minor is unlikely to do so. Hence unless you can make a game bid in a minor it is better to restrict the bidding of Three to the occasions when you hold a solid suit of six headed by A, K, Q. The bid is then useful as an invitation to partner to bid No Trumps, which he can do on slender material, as he knows you have six or more "ready-made" tricks for him. The bid of Three of a major means "Don't take me out." The bid of Three in a minor means "Do take me out," preferably in No Trumps.

(7) *To make an opening bid of One No Trump is it necessary to have all four suits guarded?*

Answer: No! If you adhere to this rule you will miss many chances and opportunities. A bid of One No Trump may be made with a solid minor and a guard in two other suits. It should mean that the Declarer can make five or six tricks as soon as he gets in. I do not advocate a No Trump bid on ragged strength or light No Trumpers, and there should be no such thing as a "Dealer's No Trumper" when it means, as it so often does, an ultra-optimistic bid.

(8) *Is it permissible on the Simple System to make an initial bid of One of a suit, holding six to K, Q, J and nothing else of value?*

Answer: Certainly not! Your hand must contain at least two tricks in defence, as there is no assurance and little likelihood that the suit will become trumps. It is an absolute fallacy that if you do not use artificial conventions you can bid as you please. An opening bid at any score and in any circumstances should be sound always.

(9) *If you do not use artificial conventions how can you arrive at slams?*

Answer: By a process of reasonable deduction, using cards as cards and not as ciphers. It is not true that natural bidders do not get slams. In fact they are just as likely to do so as those who employ elaborate devices, while they are less often liable to bid them when they are unmakeable. Space will not permit me to enumerate the bids which under the Simple System indicate by inference that slams are possible. They are given in *Contract Bridge Without Conventions* (Seeley Service; 6/-).

(10) *Is it right always to lead the highest of your partner's suit?*

Answer: Against a suit declaration it is generally advisable to open with the highest, but against a No Trump contract, holding three or four of a suit with an honour (Ace, or King, or Queen or Knave), the lowest should be led. The reason is that an honour in Declarer's hand may be trapped. This is likely when he holds Q, x, x.

CHESS

A STRONG ATTACK

The following game, played in a recent tournament at Leningrad, shows a strong attack by the well-known master, M. M. Botwinnik.

(Indian Defence.)

WHITE. Sokolsky.	BLACK. Botwinnik.	WHITE. Sokolsky.	BLACK. Botwinnik.
1. P to Q B 4	Kt to K B 3	22. Kt to R sq	P to Q 5 (*k*)
2. Kt to Q B 3	P to Q 4	23. Q to K 2	Kt to K 4
3. P to Q 4	P to K Kt 3	24. P takes P (*l*)	P takes P
4. Kt to B 3	B to Kt 2	25. R takes R	B takes R (*m*)
5. P to K 3 (*a*)	Castles	26. R to K sq (*n*)	P to Q 6 (*o*)
6. B to K 2 (*b*)	P to K 3	27. Q to Q sq	B to Kt 5
7. Castles	P to Kt 3	28. Q to R sq (*p*)	P to Q 7
8. P takes P (*c*)	P takes P (*d*)	29. R takes Kt	P to Q 8—Q
9. P to Q Kt 3	B to Kt 2	30. R to K 8, ch	R takes R (*q*)
10. B to Kt 2 (*e*)	Q Kt to Q 2	31. Q tks Q (B 6)	B to K 7 (*r*)
11. Q to B 2	P to Q R 3	32. Kt to Kt 3	B to Kt 2 (*s*)
12. Q R to B sq	R to B sq	33. Q to B 6	R to Kt 1
13. K R to Q sq	Q to K 2	34. Q to B sq	Q takes Q
14. Q to Kt sq	K R to Q sq	35. B takes Q	R to K 8
15. B to B sq (*f*)	P to B 4	36. B to K 3	R to R 8
16. P takes P	P takes P (*g*)	37. P to Q R 4	B to Q 6
17. Kt to K 2	B to R 3 (*h*)	38. P to B 4	R to Kt 8
18. B to R 3	Kt to Kt 5 (*i*)	39. K to B 2	B takes B
19. Q to Q 3	Q Kt to K 4	40. Kt takes B	R takes P
20. Kt takes Kt	Q takes Kt	Resigns.	
21. Kt to Kt 3	Q to B 5 (*j*)		

(*a*) Rather tame. Either B to B 4 or Q to Kt 3 would give better chances.

(*b*) Another tame move.

(*c*) Playing to close the diagonal in which Black is going to post his Queen's Bishop. The move is, however, of doubtful value as it opens the King's file for Black. P to Q Kt 3, to be followed by B to R 3, seems better.

(*d*) If Kt takes P, then P to K 4.

(*e*) White would do better to bring this Bishop to bear on Black's Q B 4 by playing B to R 3.

(*f*) White plays this move to free his K 2 for his Queen's Knight.

(*g*) Black has now got "hanging" pawns which in some positions are a weakness. Here, however, some of Black's pieces are better placed than White's and the pawns are strong.

(*h*) A very good move, threatening P to Q 5.

(*i*) If P to Q 5, then Q Kt takes P. The text-move threatens 19. . . . B takes P followed, if 20. P takes B, by 20. . . . Q takes P, ch; 21. K to R sq, Kt to B 7, ch; 22. K to Kt sq, Kt to R 6, ch; 23. K to R sq, Q to Kt 8, ch; 24. Kt takes Q, Kt to B 7, mate.

(*j*) A strong move. If now 22. R to B 2, then 22. . . . Q to R 5; 23. P to R 3, Kt takes K P; 24. P takes Kt, Q takes Kt.

(*k*) Another strong move. Black has a splendid position.

(*l*) If 24. B takes P, then 24. . . . B to B 6 followed, if 25. P takes B, by 25. . . . P to Q 6 and wins. If, instead, 24. R takes B P, then 24. . . . R takes R; 25. B takes R after which Black has the choice between (1) 25. . . . B to B 6 followed, if 26. P takes B, by 26. . . . P to Q 6 and (2) 25. . . . Kt to B 6, ch; 26. P takes Kt, B takes B P; 27. Q to K sq, R takes R; 28. Q takes B, Q to Kt 4, ch; 29. Kt to Kt 3, Q takes B.

(*m*) Black now threatens 26. . . . B to Kt 5; 27. P to B 3, B to K 6, ch; 28. Kt to B 2, Kt takes P, ch followed, if 29. P takes Kt, by 29. . . . B takes P and wins.

(*n*) If 26. P to R 3, then 26. . . . P to Q 6; 27. Q to Kt 2, P to Q 7 with a winning position for Black.

(*o*) A strong move. White cannot play 27. Q takes Kt because of 27. . . . Q takes Q; 28. R takes Q, P to Q 7; 29. B to K 2, P to Q 8—Q, ch and wins.

(*p*) If 28. P to R 3, then 28. . . . Kt takes P, ch; 29. P takes Kt, B takes P and wins, *e.g.*, (1) 30. Q takes P, Q to Kt 3, ch; 31. Kt to B 2, R takes Q or (2) 30. Q to Kt sq, Q to Kt 4, ch (P to Q 7 also wins); 31. K to B 2 (if 31. Kt to Kt 3, then 31. . . . Q to K 6, ch; 32. R takes Q, B takes R, mate), B takes Kt.

(*q*) Not 30. . . . K to Kt 2 because of 31. B to B 8, ch, K to Kt sq; 32. B takes B, ch, R takes R; 33. Q takes Q (B 6) and wins.

(*r*) If 31. . . . R to K 8, then 32. Q takes P after which Black cannot play 32. . . . B to K 7 because of 33. Q to B 8, ch, K to Kt 2; 34. B to B 8, ch, K to B 3; 35. Q to B 6, ch, K to Kt 4; 36. Q to B 5, ch, P to B 4; 37. Q to K 7, ch and wins.

(*s*) A precautionary measure—White threatens B to Kt 2.

CONGRESS AT BRIGHTON

A game from the eighth round of the Major Open Tournament.

(Sicilian Defence.)

WHITE. J. Mieses.	BLACK. B. H. Wood.	WHITE. J. Mieses.	BLACK. B. H. Wood.
1. P to K 4	P to Q B 4	15. Kt to K 3	Q R to Kt sq
2. Kt to Q B 3	Kt to Q B 3	16. P to K Kt 4 (*d*)	P to Q Kt 4
3. P to K Kt 3	P to K Kt 3	17. P to K R 4	P to K R 3
4. B to Kt 2	B to Kt 2	18. R to K B sq (*e*)	P to Kt 5
5. K Kt to K 2	P to K 3	19. P to K B 4	P to B 3
6. P to Q 3	K Kt to K 2	20. P to B 5	K Kt P tks P
7. B to B 4 (*a*)	P to K 4 (*b*)	21. K P takes P	B to Kt sq
8. B to K 3	P to Q 3	22. P to Kt 5	B P takes P
9. Q to Q 2	B to K 3	23. R P takes P	Kt takes P (*f*)
10. Kt to Q 5	Kt to Q 5	24. Q to R 5 (*g*)	B to R 2
11. P to Q B 3	Q Kt takes Kt	25. Kt tks Kt, ch	R takes Kt (*h*)
12. Q takes Kt	Q to Q 2 (*c*)	26. Q takes P, ch	K to R sq (*i*)
13. B to R 6	Castles (K R)	27. R takes R (*j*)	Q takes R
14. B takes B	K takes B	28. B to K 4	Resigns (*k*)

(*a*) The usual move is B to K 3, to which Black replies with Kt to Q 5 followed by K Kt to B 3. The text-move is played to tempt Black to play P to K 4 which (1) closes the diagonal in which his King's Bishop is posted and (2) creates a "hole" at his Q 4.

(*b*) Black should, instead, play P to Q R 3.

(*c*) Black should castle. After the text-move he is forced to part with his King's Bishop and the defence of his King's position is weakened.

(*d*) Starting a King's side attack which soon becomes very strong.

(*e*) A good move.

(*f*) If R P takes P, then Q to R 5.

(*g*) A strong move. If now 24. . . . Q to K 3, then 25. Kt takes Kt, ch, R takes Kt; 26. P takes P, ch, K to B 3; 27. P to R 7 and wins.

(*h*) 25. . . . B takes Kt is better, but after 26. Q takes P, ch, K to B 2; 27. B to B 6, Q takes B (not Q to K 3 because of Q to R 7, mate); 28. R takes B, ch, K to Kt sq (if 28. . . . K to K 2, then 29. R takes P, ch, K to Q 2; 30. Q to Kt 7, ch and wins), 29. Q to Kt 6, ch, K to R sq; 30. Castles White has a winning game.

(*i*) If K to Kt sq, then P to Kt 6.

(*j*) P to Kt 6 also wins.

(*k*) After Q to Q 2 or B 2 there follows P to Kt 6.

END-GAME STUDY

By A. O. HERBSTMANN.*

WHITE (6 pieces): King at K R 3, Queen at K R sq, Knight at K B 2, Pawns at K 5, K B 6 and K R 6.

BLACK (5 pieces): King at Q 7, Queen at K B 5, Bishop at Q 6 Knight at K 6, Pawn at Q 5.

White to play and win.

* First prize, *Tadjmča Shakki*, 1935.

PROBLEM No. 3982

By A. BARTHELEMY.*

WHITE (12 pieces): King at K Kt 5, Queen at K R 8, Rooks at Q sq and K 8, Bishops at K R 2 and Q Kt 5, Knights at K B 4 and K B 6, Pawns at K Kt 4, K B 5, K Kt 6 and Q Kt 6.

BLACK (9 pieces): King at K 4, Queen at Q R 6, Rook at K 5, Bishop at Q R 7, Knight at K R 8, Pawns at K 2, Q 4, Q R 5 and K 6.

White to play and mate in two moves.

* First prize, Cercle de Lutèce, 1933.

SOLUTION OF PROBLEM No. 3981

1. Kt to Q 5, Any move: 2. Q, B, Kt or P mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 485

ACROSS.—1, Naturally enough, an ageing brain may become somewhat confused in making a contract. 6, The crisis, apparently, is of small account to me. 10, If you get under it irregularly it may mean trespass. 11, Paddington and St. Pancras, for example. 12, You may find shoes are definitely out of fashion in this summer resort. 14, It provides agreeable exercise, but does it really make the sunburn disappear? 16, The censor tires appearing as a benevolent mediator. 19, Foot attachment discovered first in Skibbereen. 20, Just a little bit out of proportion. 22, A re-arrangement of topical airs dealing with fishing. 24, In this the bulk of the community expresses agreement. 25, A common garden feature constructed from a horse has (hyphenated). 28, Harmonised. 29, Anybody should find it most difficult to stir up hatreds here. 30, "Cromwell, I did not think to —— a tear in all my miseries—" (*Henry VIII*). 31, Stroller—and emperor, possibly.

DOWN.—1, Enticement is, certainly, a bit out of place here. 2, Concerning entertainment in a quiet resort. 3, It may not be described as a distressed area, but sometimes many of the inhabitants find it hard to make ends meet (hidden). 4, A game family but pretty close, by the sound of it. 5, Mineral salt. 7, Plaintiffs or defendants, they are merely these to the lawyers. 8, I suppose it is scarcely surprising to see real idiots masquerading here as leaders! 9, Musical performance that requires the co-operation of an eloquent speaker with an Egyptian goddess. 13, A maiden may lead them in a fine game! 15, They are designed to improve the vision and enlarge the outlook. 17, Answering in this way is largely a matter of expressing falsehoods. 18, Graceful birds. 21, The list, having been revised, shows the required word. 23, Stained (anag.). 25, He requires less to describe his horse without him. 26, "Girt with many a —— bold" (Gray). 27, Usually bright though half starving! 29, It only requires a drum to complete the monotony.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Pug-nosed Trout.—The head of the trout you sent is suffering from the deformity known as "pugnose." These turn up from time to time, though up to the present the actual cause of the deformity is unknown. It used to be supposed that it was due to some injury to the egg, but nowadays we believe the better-informed view is that it is some complaint which prevents the lower jaw from developing properly.—*A. H. H., Suffolk.*

Destruction of Weeds in a Slow-running Stream.—Possibly the matter could be remedied by "hurdling." Hurdles of hazel or corrugated iron are fixed at intervals of 100yds. or 200yds. at various places across the stream. Mud and plants collect on the downstream side of the hurdles, while on either side an increased current scours out clean gravel beds. The whole matter of improvement of streams is dealt with fully in *River Management* (Lonsdale Library). The use of copper sulphate should certainly be avoided. In the absence of further details it is not possible to say whether the stream in question is within an area under the jurisdiction of a land drainage authority.—*R. O. S., Stevenage.*

Country House

Sundial Reading.—Cheshire is 2 degrees 30 minutes west of Greenwich, and therefore, owing to the difference of longitude, your sundial should read on September 1st 10 minutes slower than ordinary Greenwich mean time, not counting summer time. If you set your sundial in this way, the stile will be pointing correctly to the North Star.—*C. L. W., Sandiway.*

To Bottle Passion Fruit Juice in India.—Passion fruit juice yields the best-flavoured product when it is sweetened by means of sugar to the extent of about 45 per cent. by weight. The sweetened product can be bottled and preserved by sterilising for about 30 minutes at 170deg. F., but this product will not keep more than a few days after the bottles have been opened. In this country, most fruit cordials—such as orange and lemon squashes—are not sterilised by heat, but are preserved by the addition of a little sulphur dioxide, which is allowed to the extent of 350 parts per million. Sulphur dioxide may be used either as a gas, or as calcium bisulphite, or as potassium metabisulphite. It would be advisable, in the first instance, to try the addition of 1oz. of potassium metabisulphite per 10 gallons of cordial. The product should then be analysed in India to ascertain if it would conform to the food laws in that country.—*S. J., Lindfield.*

Garden

Fungus Sent for Identification.—*Lycoperdon giganteum*, one of the "puff-ball" fungi. It is found in pastures, gardens and on roadsides between May and November.—*H. G. H., Bideford.*

"Brown Patch" on Lawn.—Use Toll Lawn Dressing No. F. A 1lb. tin is sufficient for spraying 1,000 sq. yds., making 20 gallons of solution. Use a tablespoonful to a gallon of water, preferably clean rain water or soft water. Spray 1 gallon over 50 sq. yds. Dressing obtainable from Toll Lawn Dressings, Ltd., Buxted, Sussex.—*G. F., Denbigh.*

Cupressus Macrocarpa for a Hedge.—Although hardy when allowed to grow to the dimensions of a tree, *Cupressus macrocarpa* is not a satisfactory hedge plant because of the continual pruning and consequent exposure of the shorn branches to cutting winds. The plants frequently die out after a few years.—Yes—specimens raised in the open are best.—*R. J. R., Sudbury.*

Shelter Belt of Hemlock Spruce and Austrian Pine.—A planting distance of 4ft. by 4ft. would be suitable. It would be advisable to adopt a triangular formation. Austrian Pines are liable to disturbance by wind immediately after planting owing to their heavy foliage, but this can easily be corrected by making the plants firm again until the roots become active and get a grip of the soil. After they have established themselves, they are amongst the most wind-firm trees, and there is no fear of their being wind-thrown if kept as a hedge, say 8ft. in height. There does not seem to be a wholesale firm in Cornwall or Devon, but the plants could be obtained from Messrs. Hillier, Winchester.—*W. E. S., Falmouth.*

Kennel

Hound Food.—Either of the foods might take the place of hound meal if wet mash feeding is the practice, but digestive troubles are less liable to arise if the meat and hound meal are fed dry.—*K. D., Devon.*

Training Spaniels.—*Spaniels: Their Breaking for Sport and Field Trials*, by H. W. Carlton, published by this office, price 5/–, should give you all the information you want.—*G. H. A. L., Sherborne.*

Training Dogs.—We know of no small book that would answer your purpose. There is, indeed, need for one. *Police Dogs and their Training*, from *Our Dogs*, Manchester, price 2/1½ post free, might give you some assistance.—*M. C., Ivybridge.*

Training Retriever.—We have had no actual knowledge of the trainer in Somerset, but probably he would do the work satisfactorily. Could you not see him and get some references from him? We have not the address of anyone else in that neighbourhood.—*R. P. C. S., Cornwall.*

Kennelmaid.—The charges for training for a kennelmaid vary a good deal. You might write to the Bell Mead Kennels, Haslemere, Surrey, and the Ardross Kennels, Ashford, Middlesex, at which the schooling is very thorough. It is possible sometimes for one to get experience by giving one's services in large kennels, but, of course, the training is not nearly as thorough.—*E. M., Wallasey.*

Golden Retriever.—We can recommend a young Golden Retriever just ready to leave the trainer, Mr. H. Venables-Kyrke, of Anningsley, Wambrook, Chard, Somerset. This dog is the property of a member of this club, and we can recommend him from personal experience. He was also a winner on the bench at several of this summer's shows. His price is £21. He is by Normby General, ex Silence of Tone, a well-known Field Trial winner.—*A. R. B. S., Norwich.*

Motoring

Driving Test.—You should apply to the Supervising Examiner for your area; the address can be obtained from the Licensing Authority. He will notify you as to the time and place for the test and provide you with a provisional licence, while you of course will have to provide the car. You will have to satisfy the examiner that you (1) are conversant with the Highway Code; (2) can read a car number plate at 25yds.—you will be allowed to wear glasses if necessary; (3) can start the engine, move off straight ahead or at an angle, and steer properly; (4) can stop in an emergency, and normally in a suitable position; (5) can drive in reverse and back the car into an indicated position; (6) can turn round in the road, using reverse gear; (7) can give proper signals to other traffic by hand or mechanical indicator; (8) act correctly on signals given by traffic controllers, "lights" and other drivers; (9) are generally competent to drive without danger to other road users. If you are successful, the examiner will give you a certificate which you produce when applying for a licence. In the case of your failing to pass the test, you will have to wait a month before trying again. Another provisional licence is needed for the purpose.—*S. W. F. D., Thornhill.*

Post-Mortem Examinations

Balled-foot of a Sparrowhawk.—A correspondent sent us the legs of a male sparrowhawk which had been shot. A claw of each foot was enveloped by a hard dense ball of dried blood, feathers and earth. This type of "balling" of the foot is due to the hawk failing to clean its claws, which have gripped and penetrated the prey before its death. The congealed blood, feathers and flesh become mixed with earth, forming a very dense mass encircling one or more of the claws. It is a not uncommon affliction of sparrowhawks.—*J. G., Wilts.*

Zinc Poisoning of a Budgerigar.—We have to report another example of the common form of fatal poisoning in budgerigars due to the bird picking at pieces of solder in the wire front of the aviary. Budgerigars are very prone to peck at metal, especially with a rough surface. It is unwise to use pierced zinc sheeting in an aviary; also zinc or lead tray-linings and perch sockets should be avoided. Cheap fancy cages with gilt or enamelled wiring should not be used, since their joints are badly finished off with rough soldering. Zinc and lead poisoning is usually a relatively slow illness of some two to four weeks' duration; the affected bird becomes very thin, listless and appears to be "tied in the moult."—*S. D., Glos.*

Avian Tuberculosis.—A correspondent reports that tuberculosis has been diagnosed in a hen which died, and asks if there is any danger in eating the eggs from the other fowls in his flock. Provided the eggs of tuberculous fowls were adequately cooked, and not eaten raw, they would be fit for human food. But the question need not arise if our correspondent would only take the proper measures. He should invite his veterinary surgeon to apply the tuberculin test to his fowls; those infected with tuberculosis will react to the test and should be destroyed, their bodies being burned. There is no curative of tuberculosis. There is another danger to be avoided on mixed farms in that the tuberculosis of fowls and game birds is infectious for pigs, cattle and horses. Land on which tuberculous birds have been penned should be kept free of farm stock for at least two years, since the germs of tuberculosis are capable of remaining alive for many months on the ground. Preferably the land should be laid down to arable for three or four years. We also received the body of an old hen pheasant, a penned bird, which died of generalised tuberculosis.—*C. A. F., Yorks; T. C., Sussex.*

Shooting

Second-hand Gun.—In reply to your inquiry, if you get into touch with any of the firms advertising second-hand guns in the *Field* you will not run the risk of buying a defective gun. Generally speaking, the main thing to be careful about is the barrels. If you see a line which looks like rust you should scrape it carefully with a pen-knife to see if it is in fact a crevice which has been filled up, possibly by the late owner. If such is the case, you should remove the woodwork, hang the barrels up and strike them, when you can tell by the sound whether they are defective or not.—*D. McC., S.W. 7.*

Cartridge Tests

Your dark red 20 bore 2½in. No. 6 cartridges contained 23 grains of [illegible] powder and 1½oz. shot. Velocity recorded averaged 1,040ft. per second with medium recoil. Pressure, however, was high and should be classed as dangerous. Your dark red 20 bore 2½in. No. 8 shot cartridges contained 22½ grains of clermosite powder and 1⅛oz. shot. Velocity recorded averaged 1,027ft. per second with medium recoil; pressure was slightly higher than developed by the No. 6 shot, and must be classed as dangerous. Your light red 20 bore 2¾in. No. 6 shot cartridges contained 24½ grains of a flake powder similar in appearance to Walsrode, and ⅞oz. shot. Velocity recorded averaged 1,075ft. per second with medium recoil. Pressure slightly below the average for the class of cartridge, and less than half that developed by the dark red 2½in. cartridges. Your light red 20 bore 2½in. No. 8 cartridges contained 25 grains of the same powder as employed in the No. 6 and ⅞oz. shot. Velocity recorded averaged 1,088ft. per second with similar recoil.—*A. R., Scarborough.*

Travel

From Shrewsbury into Wales.—You would like the Lion Hotel at Shrewsbury, of which Charles Dickens said, in a letter to his daughter one hundred years ago: "We have the strangest little rooms, the ceilings of which I can touch with my hand. The windows bulge out over the street as if they were little stern windows of a ship. And a door opens out of the sitting room on to a little open gallery with plants in it, where one leans over a queer old rail." To-day those same windows still "bulge over the street." From Shrewsbury you might proceed to Ross-on-Wye and stay at either the Mounterave Hotel (four miles from Ross), or at the Royal Hotel, which is situated in the town itself. This latter has a very nice garden and overlooks the River Wye. Near Tenby there is the St. Brides Hotel at Saundersfoot, and from there you could proceed up the Welsh coast to Portmadoc, where the Portmeirion Hotel is delightfully situated at the head of Portmadoc Bay. On the way home from Portmadoc, you can visit the Waterloo Hotel at Bettws-y-Coed. The beauty of Bettws-y-Coed is renowned. Situated at the junction of five main roads, it offers an almost endless source of circular tours, covering the whole of North Wales and Snowdonia. The rugged peaks of the Snowdon Range and the wild uninhabited tracks of the Denbigh moors, making a striking contrast with the peaceful and low-lying valleys of the Conway, the Gwynant, and the scenery along the Menai Straits. After dinner, for instance, it is pleasant, as the first cool touch of evening descends into the valley, to stroll down to the stepping stones and Church Pool, where the Conway and the Llugwy meet. Another pleasant, if longer, walk takes you across Waterloo Bridge, up the hill, along a grass track between dwarf stone walls, until you come to a grassy knoll from which you can get a splendid view of the mountains over the opening of the Lledr Valley. Besides such walks you will find an endless number of enjoyable motor drives in the district, while fishing and rough shooting can be readily arranged. If the Duke of Wellington put the name of Waterloo in the history books, the inn at Bettws-y-Coed puts the name of Waterloo on the scroll of hotels where one can get "a little food, a little drink, and an immense quiet," and which would have appealed to that connoisseur of English inns, Dr. Johnson.—*R. S. N., Freshford.*

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/– each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

MISS ENA ADAMS

With her father, Miss Adams was, until this season, joint Master of the Southwold. She is now sole Master. From 1923-1926 Miss Adams was Master of her own pack, which hunted in Bilsdale, and her father whipper-in to her. The hounds were 16-17inch straight-legged bassets, of the Cadogan strain, and were hunted from a horse; this experience is no doubt of the greatest help in her present position as Master of Foxhounds

Capt. G. E. T. Eyston
says
(in "The Sunday Pictorial")

". . . without question, a peer among British cars. It is a car in which are blended external grace and dignity, craftsmanship of a very high order and the sort of road performance about which passengers speak with generous approval."

FOXHUNTING'S MINORITIES

IT seems to us that the present and past political situation has its counterpart in another world; foxhunting, too, has its minority areas and people; and if the future is to be made safe for "the Noble Science," much should and can be learnt from the wider implications of the world. Many countries are happy and contented in their foxhunting administrations; others are not so happy, and it is of these that we would speak.

The first lesson, surely, is that if you do not master circumstances, circumstances will master you with an increasing power as time drifts on. There is some need for a jump forward in apprehension of new situations before those situations have become really troublesome or out of hand. The situation in many countries, particularly those near big towns, has altered radically during the last few years. Shooting syndicates, poultry farmers, smallholders, building and a novel outlook on life with increased contacts outside made by rural people, have all played their part in this alteration. In many countries where building and selling of smallholdings is rife a truly Sudeten question has developed, and many hunt committees have debated "Shall we cede this area or attempt to woo it for the Hunt?" and again, "Is it worth the expenditure in time and money to keep open a piece of country which, on mature reflection, seems hardly worth the trouble?"

About the poultry farmers, the question must often arise as to whether it is worth standing guarantor for large damages to a concern which may spoil that particular piece of country from the hunting point of view, and preserve foxes at the risk of enormous expense where they are least wanted. But, of course, the question of example and precedent must come into this too.

Some shooting syndicates are a very difficult problem indeed, and settlement is not helped by resentful ignorance on one side, and barren intolerance on the other. Some shooting syndicates do not like hounds in their coverts until after Christmas, and it seems to us that these people are making a business of pleasure, and forfeiting the right to be called either countrymen or sportsmen. On the other hand, abuse of them by the foxhunter, even carelessly spoken, only helps to exacerbate further a difficult situation.

Things have changed, and methods and outlooks have changed with them. It seems that *now* is the time to settle and endeavour to appease these conflicting minorities which exist in almost every hunting country.

The time has come when, if the people who enjoy foxhunting want to go on enjoying it, they must be prepared to take a little more trouble and be ready to help the administration in every possible way. Many people are ready to do that, but a great many regard going out hunting in the same way that they regard going to the cinema. You pay your money, and are given value for it; but that simply won't do. The easiest and most destructive way out of these difficulties is to buy the country and hunt foxes in it; but that is not foxhunting.

THEIR MAJESTIES' CANADIAN VISIT

THAT the King and Queen are to visit Canada at the suggestion of her Prime Minister, Mr. Mackenzie King, will cause intense rejoicing in the Dominion. We may anticipate that the warmth of their welcome will be overwhelming, for the Canadians will admit no rivalry in expressions of loyalty. It is strange to think that this visit will be the first to be paid by a reigning sovereign, although Canadians in the past have had personal contact with their future monarchs. The occasion will thus be a landmark in Canada's history, and during their three weeks tour Their Majesties will be given an opportunity of viewing some of the most magnificent scenery which the Empire can boast. And a very great part of their Empire is well known to them. Africa, Australia and New Zealand have hailed their future King and Queen; the West Indies have greeted them; and in circumnavigating the globe they have obtained first-hand knowledge of the lives their peoples lead. King George VI will undoubtedly be the widest-travelled sovereign in history, for after Canada the call will come to visit India, as indeed was outlined in the speech from the Throne.

OUR COLOURED COVER

The picture reproduced on the cover of this issue is from a painting by Mr. E. Meade King showing the V.W.H. (Earl Bathurst's) whipper-in hollo-ing the hunted fox away near Fairford. Mr. Meade King is a young artist who has made rapid progress within the last few years. His pictures deal realistically with incidents, and his work, to be seen at the Greatorex Galleries, 14, Grafton Street, New Bond Street, W. 1, includes paintings of the Whaddon Chase, Duke of Beaufort's, Cotswold, Croome, North Warwick, Ledbury, North Hereford and other hunts.

LORD HAWKE

With the passing of Lord Hawke the game of cricket, not only in this country but wherever it is played, has lost a brilliant player, the most capable of administrators and a firm friend. But perhaps this loss will be felt more than anywhere else in that great county which has maintained an almost uninterrupted dominance over county cricket since the War and which we have come to regard as well-nigh invincible. Yorkshire, *mirabile dictu*, were at the bottom of the table when Lord Hawke commenced his playing career; but under an inspiring leadership and clever captaincy they rose to the top to become champions eight times; and they were champions in an age of champions, the age of Ranjitsinhji, of Maclaren, of Tom Richardson. Now, in an era when the whole game is said to be slipping into decadence and oblivion, Yorkshire alone maintain the standard of the past and make progress. And the name of Lord Hawke, with his work, goes on with them.

FREEMAN OF THE RIVERS

To contribute towards a gift for the Prime Minister that would express in a small degree their gratitude for the strenuous work he has done and is doing for the cause of international peace has been the wish of many people in this country. That Mr. Neville Chamberlain does not desire personal recompense prevents us from printing letters from sportsmen outlining various plans. But from anglers came two ideas that must be mentioned. One was that they should contribute to purchase for him the finest salmon and trout beats procurable. The other suggestion was that every club and owner of water should invest him with the right to fish whenever he liked. To give him, in effect, the title of Freeman of the Rivers. No doubt Mr. Chamberlain is assured of that title in any event, but he will appreciate the intentions of these fellow anglers as much in the thought as in the deed. As a keen naturalist he already belongs to that great gathering upon whom the countryside has bestowed a gift that is to be had for the asking.

TAY GOES OUT

Yesterday saw the close of another salmon-rod season on the Tay, and when Tay "goes out" it is the beginning of the end. In a couple of weeks now most of the salmon rivers will be deserted, the fish left to attend to their business of providing sport for anglers four or five years hence. The 1938 season on the Tay has passed without, perhaps, many tears being shed over its demise. It is true that it has not been of the disastrous character which has made anglers in the south-west of England curse the climate and Atlantic salmon with equal impartiality. There was a brief period in the spring when a summer-like March and a good head of water combined to delude fishermen into the belief that millennium had arrived in the Tay valley; but the spring drought soon dried the smile on their lips, and the autumn, at all events up to the beginning of this week, has done little to bring it back again. All the same, there must be a large stock of spawning fish in the river, and in an understocked water that may be better than immediate sport.

ROSES INDOORS

It is a rather sad season of the year when the gales cover the grass and flower borders with twigs and leaves, when the plants are dying down and the work of clearing up has to begin. Although Michaelmas daisies, Japanese anemones, and sunflowers still make a brave show and the chrysanthemums have yet to come to their best, we are filled more with thoughts of spring bulb planting and putting in the new roses than anything else. But the established roses have something to offer for many weeks to come. Buds which, when left on standards and bushes will not open in the cold out of doors can be made to provide a fine display if brought inside and put in water. If ever so slightly breaking they will open out in the heat of a room into well-shaped blooms of even more vivid colour than in summer time. The rose has yet to be beaten for the reward it brings the grower.

THE ADDER

There is an old saying in the West Country that a dragon fly will hover over an adder as a warning from God.

I watched an adder lying in the sun,
It's arrowed head lay smooth and flat
And still as death;
But overhead, poised in the quivering air,
A dragon fly with jewelled radiance shone
God's warning of the silent terrors one
Coiled underneath.

I. FOULIS.

A COUNTRYMAN'S JOURNAL

THE first chapel still revealed faint memorials of its Norman foundation. It stood alone on the side of the hill by the hamlet of Shorthampton in the north-eastern Cotswolds, and looked over to the bold curving ridge on the other side of the sedgy Evenlode. Though the fourteenth-century artificers had widened the nave and inserted an enormous squint into the chancel, though a fourteenth-century flat leaded roof had replaced the open timbered original of the twelfth, there was enough Norman work left to bear witness to its extreme simplicity. But those stark walls had not been bare when the chapel had embodied a living idea. It had been covered with mural paintings, some of the twelfth, others of the fifteenth century, even along the deep splays of the Norman windows. Some were portraits of sumptuously-clothed ecclesiastics; others figured incidents from the New Testament or represented the more familiar saints, like St. Eligius the farrier, with their symbols, another was a delightful picture of the nursling Christ's miracle with the clay birds.

The wall painting was in fact the cinema of the Middle Ages, except that sacred knowledge supplemented the pleasure of the eye in pictorial and dramatic scenes. It seemed to me then, as I gazed round those speaking walls, that they conveyed an idea very strange to us now, namely, the inter-penetration of the religious with the secular manifestations of life. God both worked and played with His people.

The second chapel is in the grounds of Rycote Park, from 20 to 30 miles further east. Its interior has practically nothing Gothic about it except the barrel-vaulted roof of the middle fifteenth century. It was painted blue with stylised clouds and stars, and this very unusual treatment is magnificently supported by the furniture of the chapel, most of it Jacobean. The arcaded and intricately carved pulpit has its fellow in many churches. Not so the lordly pews facing the altar, one with a domed canopy, the other, also painted with thoroughly post-impressionist clouds and stars, with two stories, the pierced panels of the upper one being carved into the most profuse ornamentation. The other pew opposite it has arcaded sides, with carved devices in the spandrils, painted decorations of flowers and leaves and the richest mouldings.

At the west end is a minstrels' gallery with carved capitals to the rounded pillars in the Inigo Jones style, and here, too, the ceiling repeats the motive of the pews and the roof. Even the font-cover, probably of the fifteenth century, is carved from top to bottom, and even the more plebeian pews are adorned, one with a fine poppy-head. The exceeding richness of this forsaken little chapel, upon whose floor and benches the rain drips from the fissures in the roof, seemed to reveal the Renaissance that was mainly responsible for it as a sunset in the full pomp of its emblazoned standards. A sunset not a sunrise, for the densest of souls could not fail to realise that something has flown out of the windows of the chapel at Rycote which still clings to the faded pictures and gaunt structure of the chapel at Shorthampton. That is the religious sense. The Rycote carvings are incomparably superior as works of art to the naïve murals of Shorthampton. But pride has displaced aspiration there; splendour has trampled upon warmth and community.

The third chapel is at Chiselhampton, a few miles from the second. It is a formal eighteenth-century building with no touch of previous ages in it at all. Urns stand on brackets at the east and west ends of the exterior, an imposing bell-turret familiar to Palladian outhouses is the substitute for a tower, while the altar within looks with its keystone and classicised arch like an elegant setting to a conference room. The nave is very plain with admirable woodwork and fittings, and the chandeliers are exquisite. But the chapel is utterly vacant; it is impossible to believe that men ever prayed and drew together in it. It is merely a monument, perfectly meaningless; a handsome toy made not for children but only for men of the world. H. J. MASSINGHAM.

WITHOUT COMMENT

From a daily paper:

"It so happens that I live adjacent to a sporting estate where the shooting is considered to be extremely good. . . . On Saturday, seven hundred birds were killed with six guns. Pheasants and partridges are so tame that they walk about in great flocks of fifteen or twenty and are about as wild as the average middle-aged chicken. . . . The beaters can hardly scare them into flying, yet it is thought great fun to slaughter these amiable birds by the hundred. Great numbers are, of course, wounded and manage to fly away to some place, where they die a lingering death. It is not at all uncommon for gamekeepers to come across birds with their legs shot off."

Two Interdependent Units—Horse and Hound

A VITAL HUNTING PROBLEM

How to Keep Up the Supply of Horses

By R. ANSELL WELLS

THE ultimate future of foxhunting gives rise from time to time to various waves of speculation, the outcome of which is generally the sounding of an optimistic note by those who draw conclusions from the storms which have been weathered in the past and the many healthy signs which augur well for the future. I do not propose to expatiate upon the merits of hunting; sufficient to say that so long as it remains the splendidly democratic sport which it is, and always has been, we need entertain no very serious fears for its future, but directly this democratic character is lost that future will be dark indeed.

This brings us to a most vital problem which should receive a great deal more attention than is at present being accorded to it, by which I mean the production of horses suitable for use as hunters. If ever there should be a pronounced shortage of such horses the law of supply and demand will force up the price to such an extent that none but the rich will be able to afford them, and disaster will then be not far off. Already the ever-increasing number of people who are going hunting are in need of more horses than are readily available, and the causes which are at work to produce this condition must just now, at the commencement of another season, come in for some consideration.

We are fortunate in that we have a Premium Scheme for Stallions and an excellent Brood Mare Scheme which make it possible for anyone with a little land to produce foals at what can only be considered a nominal charge. The first necessity is the little land, and by far the greatest number of people who have this are small farmers who form the backbone of the breeding strength of the country, and, in the aggregate, annually produce the largest number of potential hunters. Experience has shown that any one of these farmers can produce a four-year-old at grass at an average cost of from £40 to £50; the stallion fee is small, the paddocks are there, any additional food that is needed is probably grown on the farm and can therefore be included at cost price, while such care and attention as is necessary can be given by the owner or stockman in the normal course of his duties.

All over the Midlands horses are being produced in this way, only to provide subsequent disappointment for their owners who are doing their best to "keep the flag flying." One example will be sufficient to draw attention to hundreds of similar cases: A farmer had three four-year-olds which he was offering for sale, unbroken, at from £40 to £60, and the best offer which he could get for any one of them was £20. This man was fortunate in that he could spare a certain amount of time in which to undertake to school these horses, one at a time; schooling demands that the time which is expended upon it should be a regular daily routine, and a farmer who can give his time regularly must be looked upon as an exception.

The first of these four-year-olds was taken in hand and the owner, when hacking it on the road, was offered £70 for it as it stood, but having gone so far he decided to finish the business, which he did, and subsequently sold the animal as a made hunter for £150, an experience which has, happily, been repeated with the other two horses. In other words, the value of the animals, unbroken, was £60 against a broken and schooled value of £450, which makes the schooling of three horses worth £390!

That this should be so is due to the fact that the majority of modern foxhunters are business men who earn their livings in towns and have neither the time nor the ability to school their own horses. No one will grudge the dealer a fair profit in his capacity of middleman, but something must be done to ensure that the breeders can get their money back, and a little more, on the sale of their young stock, or else more and more men will drop out of the business with the most disastrous results.

Farmers in fashionable hunting countries ask higher prices for their young stock than their less fortunate neighbours, but they do not always get it, as people will travel the extra 30 miles to see a horse which may be as good and is £25 cheaper. The same thing is true of the more affluent farmers who hold out for their price; they are continually being under-sold by neighbours who are in need of the ready money, and so the price falls until it now stands at an absurd and uneconomic level. If this is allowed to continue the production of low-priced horses will be a waste of time and money, and will do nothing to support the breeding activities of the country at large.

Is there any remedy? I think there is. We have Premiums at one end of the scale, why should we not also have them at the other end? It should be possible, if the sympathies of the hunting community were enlisted, as they must be when the gravity of the position is realised, to appoint a body in each hunting country, which should include those actively interested in the Premium Stallion Scheme, and could then be in charge of such a scheme as I will outline.

This committee could appoint an efficient and reliable man, either amateur (and there are plenty of them about) or professional nagsman and pay him a subsidy of, say, £100. His appointment would be for one year, and in that time for which he was in receipt of the subsidy he would have to take young horses which were the property of farmers, as defined in the M.P.C. Rules, and which had been bred by a premium stallion, and break them and school them for a fixed maximum fee payable by the owner of, say, £5. A scheme such as this would ensure a living to the man or men employed and would provide just that opportunity which the smaller farmers need to reap the full benefit from their efforts, while the cost, which would be spread out among potential buyers of horses, would very soon be saved on the subsequent prices.

Some Masters of Hounds have already discovered that it is practical politics to pay the wages of a permanent nagsman and buy unbroken horses; by so doing they get their hunt horses for less money than would otherwise be possible and are, at the same time, in a position to benefit their countries by paying the farmers better prices than they could obtain in the "cut-throat" market. If this system can work well in a private establishment there is no reason why it should not do so on a broader basis; if the hunting community could be certain that farmers' horses which were for sale were well schooled it would pay more attention than it does at present to a convenient market which should receive everyone's interest and support.

If some scheme such as this can be brought into existence a step will have been taken which will place the breeding of light horses beyond the reach of that doubt and uncertainty which at times threaten to overwhelm it.

A PROLOGUE TO THE REGULAR SEASON
Members of a Quorn Cub-hunting field waiting while hounds draw Bardon Wood

OUR OWN HUNTING CORRESPONDENTS

"A Good Working Lot, Who Catch Their Posts"

I WONDER how many readers of this paper really appreciate how much they owe their enjoyment (we hope) of the hunting portion of this paper throughout the season, to the work of our hunting correspondents? For that reason, I should like to thank them publicly and urge them to still further efforts. A description of the procedure may amuse. On Friday afternoon a sense of impending doom descends upon me, and after ascertaining what hounds have been lucky enough to have a really outstanding hunt during the week, I possess myself of a dozen or so telegram forms, and retire to my mossy editorial cell.

In my desk there reposes in a drawer, or there *ought* to repose in a drawer, a list of those helpful ladies and gentlemen who swell the columns of this paper weekly. Having found out who "the selected" are, and where they live, a telegram is despatched saying, "Please send report Wednesday's hunt, reach *Field* Monday morning." If they are new correspondents a "Thank you" or "Greatly obliged" is added, as a sop to inexperience, inconvenience, or lack of time; but not so to our "Tenth Legion," who, in the three years I have been here have never once let us down.

I am sure they and others will not take it amiss if I make a variety of suggestions, by which my work may be made easier and their efforts even more effective. As their accounts arrive here on Monday morning, and we go to press on Tuesday, Monday is rather a hectic day for me, and I have to go through, edit, and head their accounts as quickly as may be. For that reason it helps if accounts are written on one side of the paper only, so that, in a rush, *two* compositors can take one sheet each, instead of *one* compositor taking the equivalent of two sheets. As you will see, this saves considerable time. Paragraphing also saves more time than you would think. Legibility is highly desirable, for obvious reasons.

And then punctuation! "I werrily believe" that when I die, "punctuation" will be written upon my heart, either hyphenated or in *very* small letters. I will give you an example of what I mean, but would hasten to add that this kind of "run on" is caused more by an ardent imagination than by inability.

"Hounds then ran like smoke over the Smithson Lane and pointing towards Greatoak turned left-handed before reaching there where the fox was viewed dead beat and it looked odds on hounds catching him but he was a stout animal and they were still hard at him when they reached Skittles the field having had galloping and jumping enough for anyone and many empty saddles though I am glad to say no serious injuries and finally ran him to ground with the leading hounds snapping at his brush after 1 hour and 25 minutes of the best and one of the best days that anyone could remember so home and everyone highly satisfied though bad luck on hounds not to catch him Hemp."

To turn that into an orderly and gripping procession of words is comparatively easy, but it takes time when time can ill be spared.

You will forgive me if I give instances of one or two things that should not be done, and I do not say that they *are* done by our correspondents. "Stretching the Point" is an ancient but not particularly honourable rural pastime. It can be done quite easily by canting the ruler, and judging the curves with an eye that can with difficulty remain unbiased. To do this is to do no service to your Hunt, because it is sniggered at locally, and doubted elsewhere.

It is, I think, doubtful if the following is of any interest to anyone. "The first draw was Pamphlet Copse. Hounds found there and ran hard over Mr. Blaggs' farm to Yesbattle Wood, through Popkins and Gherkin Grove, right-handed to Spanish Chesnut, on through Fireaters, and finally lost just outside Hangmans. Hounds then drew Flimp, Faggots, Folly, Foxash and Flagpole blank, but found in Aston Anchors, and ran slowly to Filibusters Brink, where they turned right-handed, left Mr. Mangold's farmhouse on their left (mental note 'Mr. Mangold must either have been difficult lately, or he is a pillar of the Hunt') and were finally run out of scent about a mile and a half from the kennels at Dollyplash Cross Roads. The Master then gave the order for home."

As far as I can see, the only useful information contained in this account is that the kennels are one mile and a half from Dollyplash Cross Roads, and that information could only be used under rather eccentric circumstances.

Now to the more positive side of the picture. I name no names, but some of our correspondents' accounts are so real and so alive that they make my Monday mornings a pleasure rather than a pain. In many accounts the love of their countryside, the love of sport and knowledge of sport, and the pride, and a very proper pride, in their hounds and in the way things are carried on in their country, are easily to be seen. It always makes me rather proud to think that people of so much imagination, intelligence and vitality should be numbered amongst the ranks of the foxhunters.

There was one account I remember which described how a certain pack of hounds ran on into the moonlight and finally killed their fox at some exceptionally late hour. That account had lyric and epic qualities which impinged upon my imagination, and it was almost as if I, myself, had not only been there, but had been a double of the storyteller, and experienced precisely the same emotions.

I suppose it is like throwing your voice—you throw your imagination and sight on to paper in the form of words which are either good coin and can be traded into other people's mental sight and imagination, or are counterfeit coin, and so bad currency which will not flow, and remains static and barren. It is really extraordinary this power that words can have of conjuring up scenes and emotions through shapes painted with printer's ink on a background of paper.

It is not easy, but I want our correspondents to

write such writings as will give those who were there "two for the price of one," and touch that chord of imagination which is common to all who have ever hunted the fox, so that they can transmute it regardless of time and place. It is a tall order, but if it could be done the result would be something more worth reading than anything I have ever seen (as a whole, of course) in the way of a weekly body of hunting reports.

It seems to me that these are the elements which make up, together, into a hunt of one sort or another. Pace: a really fast hunt is a glorious affair for the few who see it, and medium, patchy or slow hunts all have therein aspects of interest. Venery: the art of, or instinct for, making the best of natural circumstances, animal, vegetable, mineral and barometric. Weather and setting: which is obvious. Drama: that is the story of a hunt from as many sides as possible. "Country": that is, terrain related to riding over it. In the relating of a hunt, experience, reasons for various circumstances, personal opinions, accurate chronology and comparisons should all have their place, and blessed is he who can weld them all into a balanced and telling whole.

I expect you will say: "But this fellow is fighting with the other man's body: he doesn't have to do it himself." Well, that is, to a certain extent, true, but I am so keen that these accounts in the *Field* should stand head and shoulders above every other that I hope you will forgive me for giving you some personal advice and some personal opinions. And remember that they are personal, and that, even if you think them nonsense, no harm is done.

To finish, I should like to say again how grateful we are for the way in which our correspondents really do behave with the most professional punctilio, and never, except under absolutely impossible circumstances, fail this paper. It is a compliment of which we are extremely proud. I cannot keep a pack of hounds myself, so that I am driven, without impertinence I assure you, to look upon my correspondents as a human substitute: and, though I say it as shouldn't, they are a very good working lot who catch their posts!

BREEDING A PACK OF FOXHOUNDS

Some Gentle Advice to the Novice

By A. H. HIGGINSON, M.F.H.

IT often seems to me that it must be a very puzzling matter to a young man taking on a pack of foxhounds for the first time to decide in his own mind the objective which he wishes to attain, to say nothing of the best method by which to accomplish the desired result. In these modern days, when the expense of keeping up a pack of hounds is so great, long Masterships, which were fairly common 40 or 50 years ago, are now very much the exception; and, save in a few cases, the country which can boast a Master whose reign exceeds five years is rare.

In the old days the famous packs of Great Britain were, many of them, fortunate in being ruled in a more or less autocratic manner by one Master over a long period of years; and even up to that period which was marked by the Great War, which brought about excessive taxation, there were many "family packs" where the Mastership descended from father to son, sometimes over several generations. Under such conditions the chances that the policy of breeding remained more or less the same were great, and certain packs, bred in a country for work in that country, acquired characteristics which were well known to any real student of hound breeding and hound conformation.

For example, I remember well, when I had a pack of foxhounds of my own in America, that in one season I brought over drafts from three famous packs of hounds—the Brocklesby, the Fitzwilliam (Milton), and Mr. Fernie's. It was in the early days of my experience, and I did not, at the time, realise, as I do now, the necessity of adhering to a definite sort. To my kennels one day came an Englishman, a Master of Hounds in his own country, and he said to me: "I am told you have recently imported a large draft from England. I should like to see them." I remember that, as they came before him a couple at a time, he said to me: "Yes, of course, that hound is from the Fitzwilliam," pointing at one individual, "and that," indicating another, "is from Mr. Fernie's." And so on till we had seen them all, and in not one case did he fail to designate correctly the kennel from which the hound had come. In those days it seemed to me a remarkable feat, until my guest showed me the characteristics which were prevalent in each case, and explained the reasons.

I think that such a performance would be impossible to-day, except in the case of a very few of what I may still term the "family packs," and, oddly enough, one of the cases where this individuality still remains is the Fitzwilliam (Milton); and if one looks at the pedigrees of that pack one will soon realise that the painstaking blending of the strains of the best blood, under the master hand of the late George C. W. Fitzwilliam, is responsible for that fact. Of course, there are a fair number of packs of hounds to-day, notably the Berkeley, Lady Curre's, Lord Bathurst's, and the South and West Wilts, possessing very marked pack characteristics, but there are many more which have suffered from short Masterships, which have changed their characteristics half a dozen times in the past 25 years.

But I am straying somewhat from my subject, which was the objective to be attained in the breeding of a pack of foxhounds. What is that objective in these modern days? Is it to show a fast burst to a hard-riding field, with maybe a lost fox at the end of it? Is it to show a slow hound hunt to a lot of people who appreciate good hound work, perhaps marking a fox to ground at the end, or, if lucky, killing him? Is it to win "on the flags" at Peterborough or Aldershot? Is it to kill foxes? Or, is it a combination of two or more of the above? I think, myself, that the third qualification ought not to be seriously considered if, as is sometimes the case, it interferes with the final one, which, in these modern days, is to me all important. Perhaps it is because I am a Master of Hounds that the killing appears so important. I know from experience that unless foxes are *killed*—not merely "accounted for," mark you, but killed—the farmers will not be satisfied; and it seems to me that this must be the first consideration.

In America it is otherwise; foxes are not sufficiently numerous to be a serious menace to farmers, or even to poultrymen, but in Great Britain, where one finds ten foxes for every one in the average American country, they are a real menace to a farmer if not properly kept down, and it is absolutely essential for the well-being of a country to kill with a fair degree of regularity, and to let it become generally known that if a fox is bothering someone he will be summarily dealt with if the Hunt is told of the fact. The riding men who want a gallop must be considered, and so must those who like to see a bit of hound work; but, after all, your true foxhunter, with the interests of the pack and the country at heart, should be, and usually is, content to take his sport as it comes, and to remember that his individual tastes cannot be considered as of paramount importance. If, then, the killing of a fox is the first consideration, we are faced with the problem of how best we can breed a pack of hounds to accomplish that.

We must remember that conditions have changed enormously in the last 60 years, and are changing even to-day. Railways, motors with their attendant macadam roads, and now the electrification of railways, all make it more difficult to accomplish the desired result; and we must add to this the increasing difficulty and decreasing efficiency of earth-stopping. The long slow hunts of 60 years ago are a thing of the past; the modern foxhound has to work under much less advantageous scenting conditions than did his forbears of 50 years ago—better drainage, artificial manures, tarmac roads, all play their part—and one has only to study the records of the past as compared with those of to-day to ascertain that hunts of long duration are comparatively infrequent. In those times, when scenting conditions were better, and earth-stopping better too, it was often possible to kill an exhausted fox at the end of a long hunt.

To-day, I am willing to venture that 80 per cent. of the foxes killed are killed inside of 40 minutes from the time they are found, and if one breeds a type of foxhound that can "burst" his fox in the first 25 minutes he is much more likely to kill him in the end. In order to do this one must breed hounds which are quick and can be gotten away close behind their fox when he is found; hounds which will push him hard from the outset, and yet possess nose enough to be able to press their advantage and kill him in the end. It does not seem to me an important matter to breed a hound whose sphere of usefulness extends beyond his fourth season. I shall be criticised for this statement, but I cannot see the use in sacrificing dash and efficiency in the field to longevity.

We are told that many of the great hounds of the past "hunted at the head of the pack right up to the end of their seventh, or eighth, or ninth, or even tenth, season." I am glad they did—more power to 'em—but does it not often strike one in reading of these feats of prowess that the pace of that pack must have been very slow? What racehorse has ever been bred who retained his speed after middle age? What man has ever been able to stand hard physical work after he has passed his prime? Why should a Master of Hounds wish to keep a foxhound after he has done four, or possibly five, seasons? The strength of a pack lies in its second and third season hunters, and a Master, if he is a first-class breeder of foxhounds, should be able to produce a first-class entry year after year; and if one grants the above, what is the use in sacrificing certain qualities in order to obtain longevity.

If a man cannot produce something better—not as good, but better—each year, he is a failure as a breeder; but if he produces something better the old must make way for the new. It seems to me that constitution, combined with nose, voice and drive—with speed as a matter of course—and good looks and uniformity as a very pleasing, but not essential, attribute, should be the goal sought after; and that, to sum up, the most important thing, which must never be lost sight of, is that a "pack of foxhounds" should be bred that can kill foxes regularly and in a proper style.

THE OBJECT OF ALL FOXHOUND BREEDING

To kill foxes after as good a hunt as possible; the Cattistock hounds, bred by the author, after killing their fox

THE SIZE OF BEAGLES

An Important Modern Controversy

By J. IVESTER LLOYD

ONE of the most important problems which must be settled by every master of a new pack of beagles is that of size. A true beagle may be anything from 12in. to 16in. in height and, in the case at any rate of the bigger ones, there are widely differing types. On choice of size depends the whole character of hunting. Beagling in the Shires with 13in. hounds which anyone of moderate health and fitness can keep in view by running, is a very different proposition from going across the roughest country as best one may, satisfied with the occasional sight of 15in. beagles. Yet another form of the sport is "running cunning" over ploughland while a 16in. pack work the wet ridge and furrow.

If he is wise, the budding M.H. will let the size of his hounds be regulated by the nature of his country. The ideal beagle for a country is the one which will show the best sport across that country. By "sport," of course, I mean an average number of good hunts in which it is never quite certain that the hare will be caught at the end, and not merely a long tally of masks at the season's close. To hunt a good light grass country with 16in. beagles is no more fair on hares than using 13in. beagles on heavy ploughland is fair on hounds.

Plough countries require big hounds with stamina to enable them to stand up to long runs over heavy country in pursuit of hares made strong by a life spent on such fields. The Bushmead Beagles, who hunt near Bedford, are a good example of such a pack. A level lot, over 15in. in height, these are most successful over a difficult country.

There are conditions other than plough, which call for a big beagle, such as dykes, forest land and steep hills. The Holderness district of Yorkshire abounds in wide, deep dykes draining into the Humber: dykes that would drown small hounds. Yet they are common obstacles in runs with the Burton Constable pack.

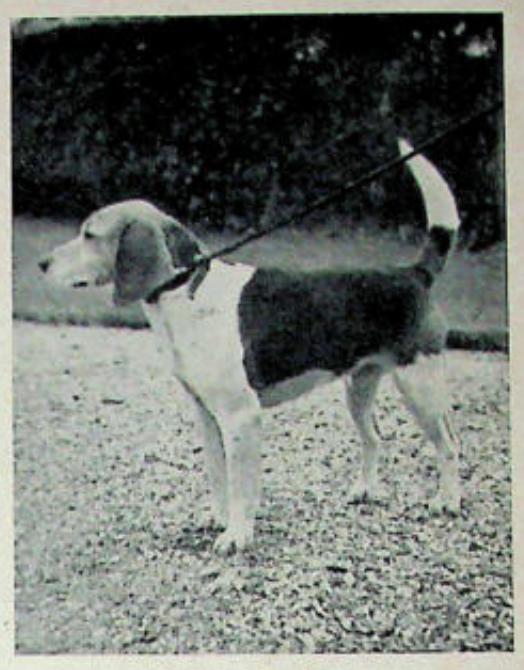
If the prospective Master of beagles intends hunting forest or moorland, he would be well advised to put in a day or two with the New Forest, who are of the same stamp and quality as the Old Berkeley Beagles—that is, 15in. miniature foxhounds with plenty of bone, capable of standing up to long days in a stiff country. They can deal with heather, bracken and thickets of the forest and are a picture to look at. The Old Berkeley Beagles hunt among the Chiltern Hills and, as all beaglers know, your hill-bred hare is often more than a match even for good harriers.

There is another stamp of beagle, often 16in. in height and much less of a foxhound in appearance than the typical 15in. Neither is he as fast as the latter nor as handsome, but he is often possessed of a very good nose and is remarkably steady. Actually he comes of a strain bred to work but with little or no attention to looks.

At the other extremity of the beagle world is the 13in. hound. This generally inclines to a rather round "apple" head, very long ears and a high-pitched, piping voice. There are at least two packs of these in the Shires—the Pipewell Foot and the Thorpe Satchville—the latter hunted by Mrs. Otho Paget, whose husband, the late Captain Otho Paget, was one of the greatest authorities on beagles and beagling. Both of these show excellent sport, their countries being almost perfect: nice rolling grassland and, what plough there is, as light as plough can be. Midway between these two are the 14½in. hounds, such as the Widford, kennelled at Bishop's Stortford, and capable of working over any average country.

Breeding is another consideration when deciding upon the character of a pack. The 15in. hounds probably breed more true to type than any others. One can put a favourite bitch to a suitable sire and have little fear how the progeny will turn out. Neither is there usually much difficulty in actual whelping. Unfortunately, the very small beagles are not so easily bred. One litter may include a puppy which grows into an amazing little creature of no more than 9in. in height, while its brother or sister may be over 14in. Thus it is often necessary to breed 10 couples of puppies in order to produce an entry of no more than 5 couples of the right size. Then great care must be exercised in selecting a sire. "Loaded" shoulders or a big head may mean the loss of the bitch.

Yet, in spite of all these difficulties in the way of producing a pack of small beagles, they are well worth the trouble if the country is suited to them. The actual difference in results between these and bigger hounds is that the little fellows have one long hunt and, possibly, kill one hare while the bigger ones are having two shorter runs and killing a brace.



NEW FOREST WARLOCK

A good example of the 15in. beagles

Apart from country, there is another factor in choosing the type of hound. That is, the running powers of huntsmen and whippers-in. While undoubtedly hounds work better for not being interfered with, in the case of a new pack it is desirable that someone is within reach. With even the best there is some danger of riot and all are liable to change to a fresh hare.

If it is not possible for the prospective Master of beagles to run around and see these various hounds at work in the countries to which they are suited, he can see most of the types in the ring at Peterborough, or as drafts in the sales ring at Leicester, and there try to make up his mind whether when he enters the good-natured rivalry of the beagle world, his pack will be classed as "ruddy harriers" or "tiddlers."

THE PIPEWELL FOOT BEAGLES

These are a very excellent 13in. pack, and show great sport in the Woodland Pytchley country

THE NORTH BUCKS BEAGLES

These are a pack of 16in. hounds and would probably be too fast for some countries

FOR CLEANING PINK HUNTING COATS

To 1oz. of oxalic acid put 1 quart of *boiling* water; stir while adding water and continue to stir for two or three minutes.

To 2oz. of salts of sorrel put 1 quart of boiling water, &c. Mix the two liquids evenly—1 pint of oxalic to 1 pint of salts of sorrel; into each quart of the mixture (while hot) pour 1 teaspoonful of acetic acid.

While still hot colour with Judson scarlet dye (one small "Judson" is sufficient to colour 3 quarts).

Take the coloured mixture in quarts and bring it to the boil; be careful to remove it from the fire at the first sign of boiling.

Wash the red coat in cold water, hang up to drip for one or two hours, then brush in the dye while the coat is still very wet. Use neat where stained and diluted to half water where not.

IF HUNT GATES AND JUMPS ARE PROPERLY LOOKED AFTER, PEOPLE SHOULD BE ABLE TO GO AS STRAIGHT, IF NOT AS HARD, AS THE GENTLEMEN IN THIS PICTURE, WHO ARE ACTUALLY RIDING IN A "CROSS" COUNTRY RACE

UPKEEP OF HUNT GATES AND JUMPS

A Useful and Interesting Job

MODERN conditions having rendered it necessary for most hunts to put in a large number of wicket gates and made-up jumps, all of which have to be maintained in good order at the hunt's expense, it may be of some interest to those who look after them if I explain a system that I have found of use in a big area on the Borders.

The first essential, after dividing the country into "wire districts," is, of course, to find a man or woman for each who is keen to help the hunt, is fond of walking and has the time at his or her disposal. I have done this work for some years, but about wire itself I have nothing to say, having, fortunately, had little to do with it. The limits of the district to be looked after being decided, the hunt will no doubt supply a sheet of the 6in. ordnance map to cover the area; but if, as may happen, it is not quite a new one, I would advise you to spend a few shillings in getting a fresh copy.

If the sheet covers more than you require cut off the spare, and take the piece you want to a stationers who, at very small cost, will make you a stiff board of double strawboard to which you can either paste or fix it. A drawing board of the size would be costly and clumsy.

The other stores required are two notebooks, one to be kept indoors with the map, the other for use in the field, a few sheets of tracing paper, red and black ink and some pencils of coloured crayon—red, blue, green and brown. Your map being ready, find out the boundaries of the different farms, and mark them on it with a line in black ink. I have also found it useful to indicate railway lines, roads, streams and coverts, the first with a broad black ink line, the other three in crayon, brown, blue and green respectively. The next step is to mark in all the hunt gates and made-up jumps. This I eventually do in red ink, showing gates by two short parallel lines through the fence—so ‖—and jumps, by a sign like a channel iron—so ⊏.

It is very desirable that these indications should be accurately placed, so, even if an old map can be got as a guide, I would advise anyone doing the work not to make any markings in ink on the map till he has been over the ground and satisfied himself that all the gates and jumps are actually there, that none have been omitted and that those shown are in the right place.

If you do not know the farmers already, this is a good chance for making their acquaintance. Apart from getting their consent to go round their fields, they will be able to tell you where to find what you want, and in talking things over you may quite well come across some suggestions as to how the hunt and the farmers may accommodate one another—some of which may be worth passing on to the Master or the secretary.

Sheets of 6-inch map are not convenient things to carry about. So I get over the difficulty by making tracings of the particular places I intend going to. These are quite easily made by cutting off enough tracing paper to cover a convenient bit of country—say a couple of adjoining farms—pinning it on the ordnance map and making a pretty careful tracing—ink or pencil—of the things you are interested in, particularly farmhouses, boundaries of farms, outline of fields, roads, coverts, &c. This tracing I have found most useful. It is so very portable, costs nothing and is easily reproduced if lost or destroyed. With that and your pocket notebook you can end a walk round a farm with a lot of information, not only about the hunt gates and jumps but about fences, wire, field gates, &c., part of which will be transferred to the ordnance map and your other notebook when you get home.

Besides these uses, I find if I have occasion to write the secretary about anything or send a joiner instructions about repairs or repainting, any amount of correspondence is saved by sending him the tracing with gates, gaps, &c., clearly numbered. He may not be very handy at reading a map, but if the farmhouses are clearly named (block letters, please) and the direction of the roads indicated, he will not have much trouble in finding the places you mean. For such correspondence it is desirable to use a copy letter book, which may be purchased for 1/–.

In this district we have a tin tally on all hunt gates, with a running number, which is, of course, entered on the ordnance map in red ink and on the tracings. The home notebook I always write up in ink, heading the page with the name of the farm I have been to and the date. Down the left side I put the running numbers of the gates, and any notes I have made about them, say "O.K." or "2 coats," or "hanging post loose," &c., &c.; while on the opposite side I note the date when repairs are ordered, in pencil, for which later on I substitute in ink, the time when the work is actually done, and by whom. A good deal depends on this book being carefully kept.

All this may seem a fuss about nothing, but work is sure to be done more thoroughly and economically if it is done systematically, and to those who are keen to help the hunt and who like tramping the countryside, this is a pleasant job and a useful one.

R. A. M.

JUMPING HONEST TIMBER IN THE SOUTH HERTFORDSHIRE COUNTRY AFTER A MEET AT WATER-END, NEAR HEMEL HEMPSTEAD

HAS HUNTING BECOME TOO ARTIFICIAL?

Rented Country Will Doom "the Noble Science"

IT has always been said that the fortunes of farming and foxhunting go hand-in-hand. Is this as true to-day as it was 60 or 70 years ago, and, if not, what has brought about the divorce of interests? The question is prompted by the fact that agriculture in recent years has been in the depths of depression, while foxhunting, superficially at any rate, is more popular and flourishing than ever. That is to say that there are more hounds and horses kept, and more people hunting than at any time previously.

To arrive at an estimate of the present relations between the farmer and the foxhunter, it must be remembered that in the old days foxhunting was a sport shared almost exclusively by the squires and the farmers themselves, the provincial hunt of the 'fifties and 'sixties being almost entirely parochial, and the field composed of local worthies who rode over each other's land impartially. Hunting was the farmer's sport: most of them hunted, and many of them kept a pack of hounds themselves. Apart from the ducal packs, the history of almost any Hunt in the country shows the influence of the farmer in its early stages. Instances can be multiplied, but, as one, it may be mentioned that the first Master of the then newly-formed Newmarket and Thurlow in 1883 was a *tenant* farmer, Mr. R. Gardner.

The word "trespass" was not in the vocabulary: the right of hounds was unquestioned, and even the most cross-grained would not court the unpopularity consequent on putting any obstruction in their way. Hunting was natural to the countryside, and though it might occasionally take on an artificial aspect, such as the remedying of a shortage of foxes, it was accepted by those most concerned as part of their normal life. In the course of time, however, certain aspects have changed, and it is well to examine these changes, and see what effect they are having on sport of the present.

Perhaps the most important is the change in the countryside itself. The big estates have been broken up, and the farmer, no longer having a beneficent landlord behind him, to help him in his troubles and undertake the larger part of his repairs, finds that, despite his former "insecurity of tenure" with which he made such play in the past, his former status as tenant had much to recommend it, compared to his present position as nominal "owner." Incidentally, his former "security" was merely dependent on his own good farming, with considerable benefit both to himself and to the land.

This change of ownership has not helped foxhunting. Whereas in former days the Hunt had only a handful of big landowners to deal with, whose estates were their hobby, and whose chief concern was their proper maintenance, there now may be 400 or 500 small owners to consider, most of them under the weather, and unable either to maintain their farms in good order, or to make any other contribution to the cause of sport. With the advent of the motor car, the farmer's cob, who would go in the gig to market or carry his master for a day with hounds, has disappeared, while the farmer's son, having also taken to his car, is no longer seen making and selling young horses in the hunting field.

Consequently the number of hunting farmers has fallen to infinitesimal proportions, being chiefly confined to those who have the money as well as the inclination to keep a hunter for the special purpose, and who can leave a bailiff behind to look after the farm in their absence. At the Point-to-Point nearly every executive has to rely on the adjacent Hunts to fill their Farmers' Race, while the old cob-riding farmer is almost a relic of a past age; but how welcome when we see him!

Farming, then, has to a large extent lost its personal interest in foxhunting, and, it may be asked, in how many countries nowadays is the Hunt of much financial benefit to the local farmers? I think most people will bear me out that it is difficult in a great many cases to buy oats and hay locally in any quantities, save from the corn merchant. Few farmers seem to have really good hay for sale, though there is plenty of inferior quality about, suitable enough for their own stock but quite unfit for hunters. Despite the recent rise in the price of oats, it is rarely, save in a plough country, that one's neighbours has any to offer. True enough, when you buy, you may be putting money into the pocket of Mr. McTavish up in Perthshire, and it is better there than in a foreigner's but this is not the same thing as having a deal with John Smith down the village.

Since then, the farmer can but rarely hunt himself or derive any direct benefit from the sport, it would not be surprising were he to regard it with less enthusiasm than formerly. It is in fact an amazing tribute to his sportsmanship that he continues to welcome hounds over his land.

Another change, and one that has an important bearing on the question, is that which has taken place among those who now ride to hounds. As has been pointed out, Hunts in former times were more local affairs than they are now, and the farmer found himself among friends and neighbours. Nowadays, more than half the people he sees riding over his fields are strangers. Trailers and horse-boxes arrive at the meet, having come Lord knows how many miles to get there, and when the horn blows "home," followers are whisked away in their limousines and seen no more till next hunting day.

They are not to blame; they are conscious enough of their indebtedness, having been constantly reminded of the fact since their pony club days. But the *tempo* of modern life does not permit of the old leisurely contacts. Save for a few old friends, relics of a previous generation, the farmer finds himself entertaining people who, though they may throw him a vague "good morning" as he stands in a gateway, have no idea who he is or whose land they are riding over. They break his fences and cut up his pastures, comfortable in the assurance that, having subscribed to the Damage Fund, the Hunt will see to the rest; fences may be repaired, and even maintained by the Hunt; compensation may be paid; but the old friendly relationship is in danger of disappearing.

A FASHIONABLE FIELD OF TO-DAY

Under such conditions the present sense of obligation to the agriculturist did not exist, apart from the matter of preserving foxes. It is true that, with the advent of the railways, certain countries became "fashionable," and their fields were swollen by the advent of strangers. Such favoured establishments, however, were usually those presided over by the sporting noblemen of the time, and the visitors at any rate took hunting boxes and spent much of their money locally. At this time, indeed, the farmer was beginning to find that foxhunting might prove a source of revenue, providing a ready market for such fodder as he had to sell, and offering the opportunity of making a bit on a young horse.

The hard-riding farmer, generally on top of hounds in his efforts to show off a youngster, was a common feature of the hunting field, and our friends were discovering that profit could be combined with pleasure.

The question of "damage," too, the secretary's nightmare at the present day, hardly arose. Hounds ran almost entirely over the big estates, whose owners were the chief financial supporters, and who saw to it that their tenants provided a country fit for foxhunters.

Sport must be paid for; the wire problem is chiefly one of £ s. d., and in the effort to preserve foxes, enormous sums are paid out in poultry claims, often to people whose acreage is negligible. This is well enough, but the principle, if extended, has an inherent danger. Should the time come when the farmer is tempted to sell his status as an amateur of sport, and foxhunters in mistaken generosity, be inclined to pay expressly for the privilege of riding over his fields; in short, should it ever come to pass that a hunt has to rent its country, then foxhunting will have become artificial, and the sport doomed.

HON. SEC.

OXFORD UNIVERSITY DRAG

Cecil Rhodes and Other Famous Men

WE do not know what Mr. Jorrocks would have said about Drag Hunts, but as he tells us very clearly what he thought of stag-hunting, harehunting and coursing we need not strain our imagination to breaking point to guess what it would have been. Nor need we unduly worry ourselves as to what he would have said on the subject, for Mr. Jorrocks is convicted of having himself broken one of the great cardinal laws of foxhunting when he laid a drag line on the famous Pomponius Ego day and got away with it, or believed he had.

Whether we call it a sport or a pastime, drag-hunting is a fine and stimulating school for teaching young men to ride straight across a country and to acquire a fondness for any kind of hound; nor does it in any way prevent their becoming later the most ardent lovers of the legitimate sport of fox-hunting, as the records of this pack alone, which I am describing, will fully bear out.

Very few young men keep diaries or records of any kind, and since the O.U.D.H. has always been managed by young men it is not, therefore, surprising that the annals of this pack are extremely meagre. Nevertheless, it is to be regretted, for many famous sportsmen and Masters of foxhounds have started their career with this pack, and it would certainly be interesting to hear of their experiences when they first started to carry the horn at Oxford. 1856 is the year given for the formation of this Hunt, although it has been stated that some sort of a pack was in existence some ten years previously. We do not, however, get a complete record of the Mastership until 1862, and it is probable that the existence of the Hunt had lapsed for some years previous to this.

The first name on the list of Masters is that of Mr. John Hill, of University College, and his whippers-in were Messrs. Everington, Ashton and Forster. From this date, 1862, the names of the Masters and staff are now faithfully recorded until 1879, when the pack again went out of existence until 1892.

In this year the Drag Hunt was once more re-established under the Mastership of Lord Cottenham, and with the exception of the War years has gone on uninterruptedly ever since. During part of this interval between 1879 and 1892, Mr. Nigel Baring, afterwards Master of the Limerick Hounds, had shown good sport at Oxford after the carted stag. I understand that he hunted with bloodhounds. This is not the only digression from aniseed in the annals of this pack, as for some years previous to 1879 the Hunt had been controlled entirely by Christ Church men, and they had elected to hunt the hare.

Giants have always lived in the past, and the largest giants in this Hunt flourished most in the '60's and '70's. Nevertheless, the whole long list of the Masters and their whips teems with the names of men who have not only proved themselves first-class men with hounds, in or out of kennels, but many of them fine steeplechase riders in addition.

Let us, however, take some of the numerous past-Masters who have distinguished themselves, not only where the horse is concerned, but in the wider walks of life. In 1866, the fifth Lord Lansdowne, afterwards Secretary of State for Foreign Affairs and a Viceroy of India, carried the horn; in 1870 the Earl of Donoughmore; in 1872, Viscount Castlereagh, afterwards to become Postmaster-General, First President of the Board of Education and Lord Lieutenant of Ireland. He was succeeded in 1873 by Lord Harris, who reverted to the principles of aniseed. Lord Harris had for his staff the Hon. A. Parker, H. J. Hope and the Hon. F. Parker, and no one who ever knew him would suggest that his whips were not made to do their work well.

His Lordship, a descendant of the man who had stormed Seringapatam and conquered Mysore, could safely be described in these democratic days as being imbued with strong autocratic tendencies. Of a very distinguished appearance, and commanding presence, he inspired in all who saw him not only a feeling of respect but possibly one of awe. Captain of the English cricket XI, an Under-Secretary of State for War, Governor of Bombay, a territorial magnate and M.F.H. in his own county, chairman of the Consolidated Goldfields of South Africa, Lord Harris had always been first in anything he took up, and first he was going to be out hunting to the end of his life.

Trifles such as growing wheat and seeds, whether his own or anyone else's, were not going to deflect him from his purpose. He rode over them, as he would over any other obstacle, the pack very often far in his wake, and occasionally the fox also. Once I remember this was too much for a certain amateur huntsman who was hunting hounds at a time when his Lordship transgressed in this way, and disdaining the consequences he bellowed out: "Hold hard, my Lord, hold hard! These aren't goldfields you're riding over now!" Certainly a wittier form of rebuke than most of the ones we hear delivered out hunting.

In 1875 we have that great agriculturist and a future First Lord of the Admiralty in Mr. Walter Long as Master. Three years after Mr. Long gave up the Mastership, Cecil Rhodes, I suppose the most internationally famous of all the Drag Masters, took over. He was succeeded, in 1879, by another great figure in Lord Desborough, at that time Mr. W. H. Grenfell. Lord Desborough, by common consent, is probably the best all-round athlete and sportsman that any of us now living have ever known. His record in these respects, and in many other spheres of life, are too well known to need any mention in this article. Lord Desborough has very kindly sent me some notes of his recollections of his Mastership of the Drag, and I quote them as written to me:

LORD DESBOROUGH
W. H. Grenfell on Cavalier, when he was Master

"It is quite true that Cecil Rhodes, whom I knew very well at Oxford (and, indeed, he asked me to join him in South Africa), came into my room and said I must take on the draghounds.

"I did this although I was very busy at the time in other ways. The hounds were not up to much, and I got rid of them, and was lucky enough to get some good drafts from the South Oxfordshire, the Heythrop and other packs, by the kindness of friends, and I took them over here in the vacation, and got them into pretty good condition.

"The hounds were kept down a street opposite to the entrance to Christ Church. The drag man made a cunning decoction with a very little aniseed, which the hounds would run some time after it was laid down, and open well.

"As I could not find a successor, I sold the hounds to go to Pau, and the Master came over to see them in the summer term, and I had a drag laid across country and the hounds started and came in with no one with them, and were all bought and went to France.

"When I first went to Oxford there were two drags, as Christ Church had one, and University College had another pack, which was kept at Woodstock. The country round Oxford was a glorious place for draghounds. On the Woodstock side there were stone walls, and nearer Oxford there were some formidable brooks, and towards the Thame country there were fine pastures and upstanding fences.

"Cecil Rhodes was very popular at Oxford, in the Bullingdon Club, and a great talker, but nobody then paid much attention to what he said, which perhaps was a pity. He had a loose and casual seat on a horse, but enjoyed the ride. Tommy Maguire, the best mathematician at Oxford at the time, and afterwards one of the founders of Rhodesia, and a Fellow of All Souls, was one of my Whips. He was not a very experienced rider, and I can see him now jumping one of my horses into a road, and on to a heap of flints."

Lord Desborough also tells me that amongst his field during his Mastership was Sir William Eden, the father of the late Secretary of State for Foreign Affairs, and that Sir William, mounted on the best of thoroughbred horses, went very well. Those of us who have read that charming biography, *Tribulations of a Baronet*, will not be surprised to hear this. For this versatile man did everything brilliantly that he did at all. To be an artist of repute, a man of letters, a brilliant rider with his own hounds across the stiff Durham country, to shoot straighter and with more grace than any of his friends, to be a fine whip on a coach, a clever boxer in the ring, to have a great knowledge of birds, beasts and flowers and to marry a beautiful and gifted woman were all simple matters to this remarkable man. In 1894 and 1895 Lord Villiers, afterwards the Earl of Jersey and one of the greatest authorities on Turf matters of his time, carried the horn.

And so the story goes on down the long vista of peaceful years before the Great War; a succession of keen young Masters riding hard when at Oxford, and working hard at something or the other after they had left it. It is true that many of them had only to stretch out their hands to pluck the golden fruit, but yet, are there not many born into this world under similar conditions who cannot even undertake that exertion? No fewer than three former Masters of the Oxford University Drag Hunt have met their deaths through riding accidents. They were all incurred steeplechasing. Mr. Ralph Brassey in 1905 at the Cambridge University 'Chases at Huntingdon; Mr. Ralph Faber in 1908 at V.W.H. Hunt Steeplechases; and his successor in the Mastership, Mr. Hugh Lloyd Thomas, as we can all sadly recall, was killed only this year at Derby a few days before he was going to ride his own horse Royal Mail in the Grand National, the favourite at that time for the great race and a previous winner of it. This was 29 years after he had first carried the horn at Oxford. Surely a great riding record if there ever was one.

To come to the present. The O.U.D.H. kennels are at Gosford, near Kidlington. They were built in 1910 and formally opened by the late Mr. Albert Brassey, who ruled for so long over the destinies of the Heythrop Hunt.

During the season some ten couples of hounds are generally kept in kennels, the majority of these hounds being drafts from other packs and generously given by friends and past members of the O.U.D.H.

During the Christmas and first half of the Easter term the hunting days are Tuesdays and Fridays. When the "Grinds" start in February, Wednesday is the hunting day, leaving the end of the week free for all the necessary arrangements in connection with them. There are now about a dozen different meets, some with two and some with one line.

Probably the best lines now are the ones starting near Bletchington, Lew and Northleigh, but there are very few which do not take a lot of getting over, and the brooks encountered in the Oddington and Cuttleslowe lines have been well-known obstacles for very many years.

Last season was a good one under the Mastership of Mr. J. G. Gilby, who worked very hard in and out of kennels to keep up the standard of the Hunt.

For the coming season 1938-9 Mr. Philip Profumo, Magdalen College, will carry the horn, and he will have as his whippers-in Earl Haig, Christ Church, and Mr. Leslie Melville, Balliol. The traditions of the pack under this regime should be maintained.

What a grand thing it would be if the past surviving Masters of this Hunt could meet together for dinner, if only for once, under the presidency of Lord Desborough. I commend it as an idea to some organising spirit.

CHARLES HIGGINS.

THE FOX IN HIS VARIOUS MOODS. A SET OF STUDIES BY MICHAEL LYNE

YELLOW PERIL

The Ingratitude of a Bold Dog Fox

THE YELLOW PERIL

I CHRISTENED him "Yellow Peril" partly because of his curious colour—in sunlight he looked almost as golden as a Jaffa orange—and partly because he possessed to an amazing degree the cunning, the courage and the ferocious cruelty which have always distinguished the descendants of the Samurai.

I had known him from cubhood, when, as a tiny pink-eared bundle of yellow wool, he used to play with his brothers and sisters at the mouth of the big earth in Oldham Wood, where he was born. All the other members of his family were gone—some killed, others migrated to different parts of the country. He alone remained to be a plague and a menace to all the farmsteads around.

His crowning achievement was to leap over the orchard wall in broad daylight and, seizing Jemima, my fattest Aylesbury, by the neck, essay to leap back with her. In this foul deed he was foiled by the garden boy who, being providentially in the orchard, hurled a large divot of earth at his head, thereby causing him to drop his prey. The noise that ensued—Jemima quacking, hens clucking, boy yelling and dogs barking—brought me out of the house in time to see a small yellow object float down off the wall as lightly as an autumn leaf and disappear across the neighbouring fields.

"This," I said to myself, "becomes intolerable!" and I forthwith sat down and wrote a letter to Lord Essendon, our M.F.H., informing him of the depredations of the Yellow Peril, and begging him to come and draw the neighbouring covert as soon as possible.

Nevertheless, when, a fortnight later, hounds met in the village and moved off towards Oldham Wood, I had an utterly ridiculous sensation of having betrayed an old friend. And when, five minutes after they entered the covert, I espied a well-known yellow figure emerge from the wood and go swiftly skimming across the grass field beyond, I would, if I could, have prevented Jack, the second whip, from uttering that yell of "Garn away!" which proclaimed that our quarry was afoot.

The hounds came pouring out of the covert like a beautiful mottled wave, with that screaming ecstasy which to those who love hunting is the most soul-stirring music in the whole world.

But to-day, as I galloped in pursuit of hounds, I felt no thrill of pleasure in the chase. I knew how cunning the yellow fox was, and I prayed that he might shake off the pursuit of his enemies—yes, even if it meant the death of every duck I possessed. I realised to the full how preposterously inconsistent I was. As we swung along in all the speed and fury of full-cry I told myself foxes were beasts of prey, to hunt or to be hunted. Far better for him, I told myself, to die like this than to be mutilated in a trap or, blinded by a gun, die by inches as I had seen one unfortunate fox lately.

As a matter of fact, I do not believe the Peril took our pursuit of him very seriously. After leading us a circular tour over the worst line he could have found, he elected to hark back whence he had come and went to ground in a big rabbit bury only a mile from Oldham. The Master sent for the terriers, and turned to me with a glint in his eye.

"Now your ducks will be avenged!" he said grimly.

He reckoned, however, without the boldness and quickness of this prince of foxes. They dug, and they dug, and they dug, while the terriers shrieked defiance down in the bowels of the earth, and the rabbit bury showed signs of stretching nearly to Australia.

Suddenly, like a torpedo from a gunboat or a cork from a champagne bottle, the Yellow Peril burst from the hole, cannoned against the Master (neatly throwing him on his back), ricochetted between the legs of the first whip, slid like a shadow through the snapping jaws of eighteen couple of hounds, and disappeared from sight before we could even realise what had happened.

But he had been in the bury for nearly 20 minutes and had grown stiff. Furthermore, scent had greatly improved, and the hounds, mad for blood, were after him like a pack of wolves. I realised that he had little hope of escape, and not caring to see him killed, I turned my horse for home. As so often happens on these occasions the hunt seemed to pursue me, and as I rode up the drive to my house I heard hounds in full cry only a few fields away. I had given my horse to the groom and was crossing the stable-yard when a draggled yellow object came slowly crawling round the corner and vanished like a wraith into the open door of the wood-shed.

Hurriedly I slammed and bolted the door and ran down the drive, just as the Master and the pack with half the "field" behind them, swept into it from the road.

"Your fox," I gasped, purple in the face, "the gardener headed him—he's gone left through the village—chased by my dogs!" Lord Essendon thanked me (oh, shame! oh, shame!) and withdrew with his hounds and much doubling of his horn in the direction I had indicated; and I saw them no more.

Half an hour later when all was quiet I returned to the wood-shed, unlocked the door and flung it wide. "Come out, you rascal!" I cried; "and never expect me to do this again!"

From the wood-shed came no sound or movement, but in the shadowed darkness at the far end I perceived two baleful yellow eyes glaring at me with unquenchable hatred and distrust. I retired leaving the door open. The next morning I found that the Yellow Peril had gone; but alas! not alone, for he had taken Jemima with him.

"I HAD KNOWN HIM FROM CUBHOOD . . . WHEN HE USED TO PLAY WITH HIS BROTHERS AND SISTERS AT THE MOUTH OF THE BIG EARTH"

AN ERA THAT IS PAST

Farmers Who Have Hunted Hounds

" For to keep a farmer's spirit up, 'gainst things be gettin' low,
There's nothin' loik fox-huntin' an' a rattlin' tally-ho ! "

SO said the old Cheshire farmer to his " missus " in the song of the " Chesher Fox Dugs and Tom Rance "—and a few of these old-time farmers, not content with having a day's sport occasionally with the " fox dugs," have even taken on the job of hunting the hounds themselves—and a rare good " job " they seem to have made of it, too !

Perhaps the best known of these farmer-huntsmen was the hero of the famous hunting song, " John Peel "—John Peel, a Cumberland farmer, who was born on November 13th, 1776, at Greenrigg, and died on the same day of November, 1854. John Peel bred his own hounds and showed all the farmers of his country wonderful sport. The pack were not kept together in kennels, as is now the case, but hounds were lodged and boarded at various farmhouses in the district. On a hunting morning (it was always very early) Peel blew his horn and at the sound of it the hounds were freed and came streaming in from all points of the compass to the appointed meeting place, followed by folk eager for the chase.

" For the sound o' the horn caw'd me frae my bed
And the cry o' the hoons me oft has led ——"

says the song.

In one particular point John Peel did not follow in hunting tradition—he wore no hunting " red," but a grey coat of home-spun wool, generally known as " hodden grey "——

" Did ye ken John Peel wid his cwote sae grey ?
Did ye ken John Peel at the breck o' the day ?
Did ye ken John Peel gaein' far, far away—
Wid his hoons and his horn in a mwornin' ? "

His horn also was not the orthodox hunting horn, but of a curved shape ; somewhat the same style as the horn once used for deer hunting. John Peel's bosom friend, John Woodcock Graves, wrote the song. Peel and he were sitting in a snug parlour at Caldbeck, whilst in the next room a woman was singing her child to sleep, her lullaby being an old Border tune called " Bonnie Annie." Inspired by the lilt, Graves took up his pen and wrote, impromptu, the song of " John Peel." By the time of Peel's death the song had become familiar in the northern hunting circles, and when Graves heard that his old friend was dead, he added the last verse :

" Yes, I kenn'd John Peel wid his cwote sae grey,
He lived at Caldbeck yance on a day ;
But now he is gone, and he's far, far away,
We shall ne'er hear his voice in a mwornin'."

A farmer who also hunted what was termed a " trencher-fed pack " was Thomas Hilton, who lived near Faversham, Kent—his pack being the forerunner of the present-time Tickham Hunt. This Thomas Hilton was commonly known as " Glory " Hilton the name originating in his devotion to a favourite hound named Glory. He had his kennels at what is now an orchard at Norham, Selling, and his stables close to his house called Marches. Each member of the Hunt brought his own hounds, generally a couple, to the meet, and there was great rivalry as to whose hounds were the best, especially at a check, and this led to Thomas Hilton being named " Glory " Hilton.

In the *Sporting Magazine*, 1822, it says of him : " This good tempered, kind hearted, hospitable, entertaining gentleman, although 74 years of age, mounts and dismounts with all the agility of youth, was never known to be out of spirits, or had the headache, for which blessing he thanks the health-enlivening chase." How very few of the present-day farmers could say the same ! But he did not live in our bustling age !

" Glory " Hilton was followed a few years later by another foxhunting farmer, one Giles Morgan, who farmed Macknade, a large farm a few miles out of Faversham, " and although a very busy farmer he hunted the Tickham hounds for his pleasure " from 1830 until 1844, William Rigden, Esq., being the Master. I believe Giles Morgan received £100 a year for his services and found his own horses ; and showed good sport, as his praises were sung in the *Sporting Magazine* of 1831 in a poem of five verses, the refrain ran :

" Hurrah for the Tickham, rare devils for speed,
'Tis better to hunt than dry novels to read,
Hurrah for Giles Morgan, I hear his horn blow,
A good 'un to work at, a good 'un to go."

This Giles Morgan had a rather unique experience. A draft of hounds had been purchased from Ireland and he went to Holyhead to fetch them home. Coming through London difficulty was experienced in keeping the pack together, as the butchers' shops around Cheapside proved too great an attraction. Giles Morgan, therefore, went up the steps of St. Paul's Cathedral and sounded his horn, rallying his hounds to the top of the steps, afterwards taking them safely back to Kent.

An old earth-stopper used to relate that he was at the kill of Giles Morgan's last day's hunting. This was at Doddington, near Dully Wood, and as he threw the fox to the pack he exclaimed, " That's the last one I shall give you ! " and burst into tears.

Nor was the practice of a farmer hunting a pack of hounds usual only in the southern counties, for in Durham that pack now known as the Hurworth took its name from a village four miles south of Darlington, which for years was the residence of the Wilkinson family, who kept hounds here for many years.

Old Tommy Wilkinson and his brother " Matther " had the hounds in 1825, and the latter was an extraordinary character in every way. He was a welter-weight, but the most indefatigable man that ever got on a horse. He could not swim a yard, but would jump into the Tees at any point on an

THOMAS GIBBS HILTON, OF " MARCHES," NEAR SHELDWICH, FAVERSHAM, WITH HIS FAVOURITE HOUND, GLORY
(By permission of George Selby, Esq.)

old grey mare, and on getting over lie on his back and hold up his heels to empty the water out of his boots, and his breeches were double the size of anyone else's.

He would exclaim, " Lads, h'ad my horse till I let watter out of my boots." In 1835 Matthew Wilkinson gave up hunting the hounds himself and was succeeded by Frank Coates, who lived on his own farm at Hilton, ten or twelve miles from the kennels, on the banks of the Leven. He kept his own horses and was a very good rider, but a very jealous one. He was called the heaven-born huntsman and no keener man ever lived. He had a fine eye and a knowledge of the country, and this pack never had better sport than when he hunted them, and it was an unfortunate thing for the country when he and Thomas Raper Wilkinson quarrelled and parted.

The old sign-board of the Hilton Inn was a curiosity, showing the trend of mind of the population of that village in those days. On it was a painting of hounds running a fox in view and the field following, with these lines below :

" The fox he runs the hounds him view,
Come take a glass and then pursue."

Now-a-days farmers have less time in which to show sport to their neighbours, I am afraid.

Another farmer who took on the duties of huntsman was James Morgan, commonly called Jem Morgan. He was cousin to Giles Morgan of the Tickham pack, and had a farm at Hare Hatch, near Romford. He became huntsman to the Essex hounds when Henry John Conyers, Esq., of Copt Hall, Essex, was the Master, and sometimes had 33 miles to ride from his farm to where the hounds were kennelled. Here he would have a second

JEM MORGAN, HUNTSMAN TO THE ESSEX FOX-HOUNDS FOR SIXTEEN SEASONS. HENRY JOHN CONYERS, THE MASTER, IS IN THE BACKGROUND
From a print dated 1843

breakfast and then take the pack ten miles to draw. He was a most cheery man and an intrepid rider, and when he got to a rough, queer place would say, " Come up, horse," and get him through or over anything.

He delighted in jumping timber, and to his latest day would go out of his line to ride over a stile. Once after jumping a fence in a very good run he fell and dislocated his shoulder. Calling to a Mr. Whitfield to stop, he coolly said to him, " Just lay hold of my hand, put your other hand under my arm and pull hard." The shoulder went in with a crack. " All right," said Jem and, jumping on his horse from the other side, went on again as if nothing had happened.

He was a very jealous man and did not like anyone to get before him, and would resort to many a dodge to keep back those who passed him. He was also a regular sticker and once, in the spring of the year, after they had had a very hard day and got a beaten fox into Dunmow High Wood, Mr. Conyers said to him, " You had better give him up and go home, or you will spoil all my hounds." Jem said, " If you will go home I will try to catch my fox ; I wish you'd go home. Do you see that moon ? I can have him now." So at length the Squire went. Then a lot of foot people heard the hounds and came out to see the fun.

" Here, my lads," said Jem, " I'll give you some beer if you'll form a line and walk the cover," which they did and, getting the fox again on foot, killed him. They had then 20 miles to go home with tired hounds and horses, and crossed the park as the clock struck one in the morning ! Having put the hounds right, Jem saw the butler, and asked if Mr. Conyers was in, adding, " Tell him I'm going home."

" Who's that ? " shouted the Squire, " A pretty time in the morning to be asking for me. Have you brought my hounds home ? " " Yes," answered Jem Morgan, entering with the fox's head behind him. " You must be tired, sit down and have a glass of wine." Jem, nothing loth, obeyed, at the same time showing the head. " Well," said the Squire, with a few adjectives we need not repeat, " if he has not brought the head home ! "

Jem Morgan gave up hunting the Essex hounds in 1848, but still kept a hunter however and enjoyed a day's sport. On January, 1862, when he was 77 years old, he was out with the Old Berkeley hounds on a young horse which he had bought out of an Irish drove. He pounded the whole field at a hog-backed stile and at the next fence, a little trappy one, his horse fell. However, he remounted, viewed the fox away, and gave the " Tallyho ! " and followed over three fields, but felt faint so rode to a neighbouring farmhouse. Here he lay on a sofa, and when his scarf was removed his head fell forward, and he was dead instantly—dying as he had lived, on the hunting field.

Nowadays farmers can ill spare the time for even a day out with the hounds now and again ; but until this year the Tedworth, Wiltshire, Hunt have had a farmer honorary whipper-in. This was Charlie Perrin, of the Manor Farm, Shipton Bellinger, who for three seasons has helped to show sport to his neighbours with this pack on Salisbury Plain and on the downland around. Unfortunately he found he could not spare the time to continue in this position so has resigned, and I do not know of another farmer huntsman of the present day. Surely " the old order changeth, giving place to new."

KATHLEEN E. MORGAN.

THE ART OF THE LORINER

Bit-making Through the Centuries

By WILLIAM ALBERY, Senr.

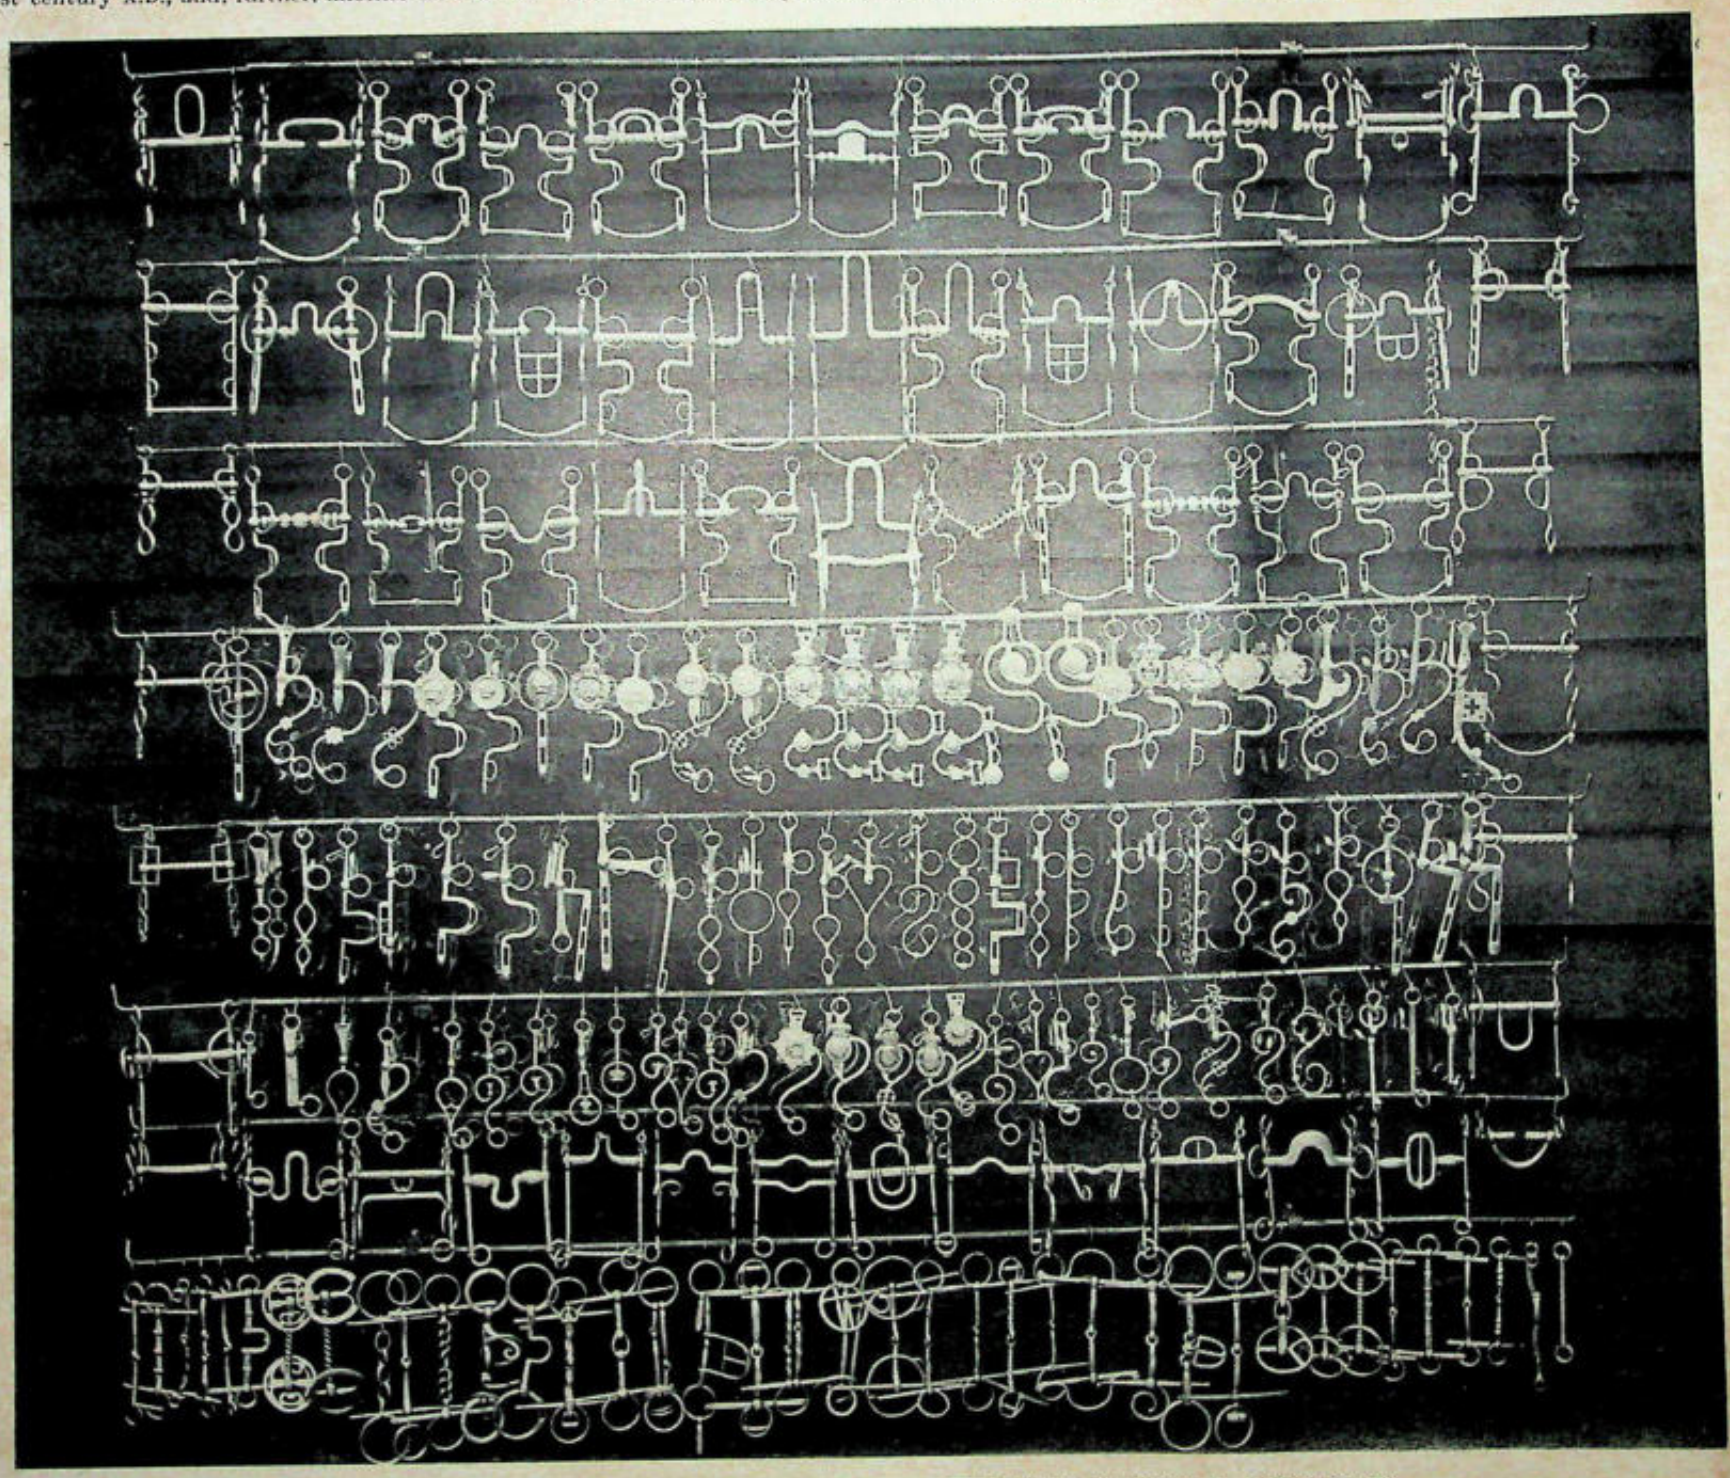
THE antiquity of the horse bridle bit is, of course, prehistoric, and may almost be said to have originated with the horse. It was no doubt the first instrument, together with the head-piece and reins, applied to him for the purpose of his subjection.

In the Iron and Bronze Age Gallery at the British Museum can be seen two ancient iron bits from a chariot burial. There is also a collection of about a dozen British bits made of bronze with a considerable amount of workmanship about the first century A.D., and, further, another iron bit of the Viking period about A.D. 850. These are all jointed single ring snaffles, a few with a twisted link in the centre making a double joint. The rings vary from 1¼in. diameter to about 3in., most of them about 2in. or 2¼in. inside measurements.

In the Bayeaux Tapestry, of the many horses with trappings there shown, none has a ring snaffle bit. The drawings are very crude, but all the bits are shown with long angular shaped cheeks and used with a single rein.

In the Victoria and Albert Museum there is a cast of an Italian equestrian monument dated 1352 showing a bit very similar to those shown in the Bayeaux Tapestry, but with brass bosses. Here also are shown a few sixteenth and seventeenth century bits, mostly foreign, of elaborate workmanship.

In the Tower of London and at Warwick Castle are also shown many bits of the Tudor and Stuart periods. They are all similar in principle, with a short upper cheek and a long lower cheek, both together measuring from 9in. to 12in. (in one case 15in.), some with curbs, some without; some with a bar mouth, others with a jointed snaffle mouth, and some with a mild port, nearly all of them used with a single rein. As the lower cheeks rake back considerably, but in varying degrees, their effect on the horse would be similar to that of a ring snaffle and nothing like so severe as a long straight perpendicular cheek with a curb. In the Guildhall Museum they have a large number of ancient spurs and some stirrups, but very few bits, and though in



THE AUTHOR'S REMARKABLE COLLECTION OF BITS, A DESCRIPTION OF WHICH IS GIVEN BELOW

1st row, excluding the two outside bits.
1. Buxton, Greenwood mouth.
2. ,, Hanoverian mouth.
3. ,, full port mouth, Chiffney cheeks.
4. ,, double port mouth.
5, 6, 7. ,, Higman's patent mouth.
8. ,, double Greenwood mouth.
9. ,, Hanoverian mouth.
10. ,, high port, roller mouth.
11. ,, double bar mouth, Chiffney cheeks.

2nd row, excluding the two outside bits:
1. Liverpool, with port roller mouth.
2. Buxton, with double port mouth.
3. ,, with grid (Lord Henry Bentinck).
4. ,, reversible bar mouth.
5. ,, Dunchurch with rollers, barred port mouth.
6. ,, Dunchurch plain.
7. ,, Dunchurch with rollers mouth.
8. ,, port mouth with grid.
9. ,, high port with Turkey curb.
10. ,, up Mullen mouth.
11. Liverpool, with port mouth and grid.

3rd row, excluding the two outside bits:
1. Buxton, cherry roller mouth.
2. ,, egg roller mouth.
3. ,, down port mouth.
4. ,, fan port mouth.
5. ,, Segundo mouth.
6. (A very cruel unnamed bit; this is not steel but iron, painted aluminium.)
7. Stockton, very rough mouth.
8. Manchester, with high port mouth.
9. Buxton, cherry roller mouth.
10. ,, movable mouth.
11. ,, bar mouth.

4th row, excluding the two outside bits. Cheeks:
1. Double guard Liverpool.
2, 3, 4. Dress harness bits with roses.
5, 6, 7, 8, 9. Ducal and baronial state carriage bits.
10, 11. Pair of baronial state carriage bits with Lord Henry Bentinck roller mouth.
12, 13, 14, 15. Set of four George III state carriage bits, with Royal Arms and Crowns.
16, 17. Pair state carriage, silver-plated, believed Queen Anne or early Georgian period.
18, 19, 20, 21, 22. State carriage bits.
23. Pembroke state bit, with rose.
24, 25. Dress harness with roses.
26. Marmaluke with Turkey curb.

5th row, excluding the two outside bits:
These show a variety of fancy cheeks of carriage and gig bits, including elbow, Chiffney and Stanhope.

6th row, excluding the two outside bits:
These show a selection of ladies' old riding or hacking bits of a variety of patterns, including several Chiffneys and, excepting the five centre bits, with bosses; these are military.

7th row, excluding the two outside bits. Chiefly freaks.
1. No name.
2. No name.
3. Down port roller mouth.
4. Jim Crow.
5. Willis's patent.
6. Double slide mouth.
7. Slobbering.
8. Brighton.
9. Wynn's patent.
10. No name.
11. No name.
12. Barred double port.

8th row, excluding the two outside bits:
These show a variety of snaffles, of which the five on the left, excluding the third, and the four on the right, excluding the two outsides, are the oldest riding snaffles, *circa* 1820–1830. The remainder are ring, cheek, chain, double mouth, snaffles and metropolitan.

Outside bits. Left side, downwards:
1. No name.
2. Curb gig.
3. French pattern gig.
4. French pattern gig.
5. Liverpool, with square guard.
6. ,, with extra ring.
7. No name.

Right side, downwards:
1. Pelham, port mouth, loose eyes.
2. Manchester.
3. French pattern.
4. Fancy cheek curb gig.
5. French pattern.
6. Liverpool with loose port.
7. Parisian.

the Victoria and Albert Museum there are many magnificent specimens of bright steelwork of various kinds and periods, I do not know of any museum with an adequately representative collection of steel bits either of an early or late period.

The modern English artistic polished steel driving bit, I think, can date only from the late middle eighteenth century, soon after the hard turnpike roads had been made, which brought into being the era of driven horse-wheeled traffic, such as was known until 30 or 40 years ago.

The most famous loriner or bit-maker in London in the late second half of the eighteenth century was one Latchford of Oxford Street. This name, with various initial letters and addresses, persists thence through the London Trades Directories until the early 1880s, and this name was perhaps the longest-lived of loriners. The next best known name as a hand-forged steel bit-maker was Benjamin Cope of Walsall; also, later, J. H. Hawkins and —— Chevasse, both of Walsall. Some of the large wholesale saddlers' ironmongers at Walsall (which place during the whole of the nineteenth century was the chief seat of the saddle and harness trade) employed journeymen bit-makers, and a few of the best saddlers made their own bits, but most, in fact nearly all, of the London and provincial saddlers' bits were made by Latchford or the others named, with the saddlers' names stamped on them instead of those of the actual maker. Latchford's illustrated book, *The Loriner*, published in 1871, gives 110 different patterns of bits. Cope's book, published about 1880, gives over 500.

The six-horse coach and the stage and mail-coaches disappeared with the advent of the railways in the last century. At the beginning of this century, as we all know, there set in the rapid decline of the use of the light horse for wheeled transport in favour of the motor car, and there followed the almost complete disappearance of the private four-horse coach, the pair horse carriage, the tandem, the brougham and gig. For these past 25 or 30 years there have been but very few of these kinds of vehicles or harnesses made, and correspondingly but few bits. Carriages have been broken up, harnesses less durable have been worn out or cut up, and many thousands of steel bits have gone as old iron. Even before this period the loriner had encountered to his loss a formidable trade competitor by the appearance about 1880 of the cast white metal bit, and since that time the demand for his skill has been reduced almost to vanishing point. Concurrently with the harness maker, his average age to-day, like their standard of work, is very high, and it is to be feared their combined craftsmanship will soon have faded out of the skilled industrial picture.

The horse, it has been facetiously said, "is an animal with four legs," but it has only one mouth and it certainly appears that man has given a more varied attention to that mouth than to his own or that of any other animal. Bits may be almost completely divided into two sorts, riding and driving—although some few serve both purposes—and these again sub-divided into two sorts, namely, snaffle and curb. It is curious to reflect that the Irish bradoon ordinarily used to-day almost exactly corresponds to the Romano-British bits previously referred to. To all the bits of the four divisions have been applied during the last century an almost infinite variety of mouths and cheeks. The greater number of these bits have definite names, some place names such as Liverpool, Manchester, Weymouth; others personal names such as Chiffney, Higman, Pelham, Segundo, Wynn—the latter names as patentees; but a great many bits were mere freaks without name or much usefulness; they materialised ideas in the minds of cunning and oftentimes cruel individuals for the subjection of the horse.

The assortment of 182 bits shown in the accompanying photograph is part of the unique collection of about 800 in my possession at 49, West Street, Horsham. These are all (except four or five) of hand-forged bright steel, which have been saved by an instinctive love of good workmanship during the last 30 years; some of them were here in my father's and grandfather's time; but the majority have been rescued from scrap heaps and odd corners in various parts of Great Britain, and re-polished. Many of them have lain in old-established shops up and down the country undisturbed for generations, and only a few show signs of hard wear. Intrinsically, according to present prices, they are worth over £1,000; commercially, they are not worth a five-pound note. They give a remarkable and nearly complete exhibit of the loriner's art from the late middle eighteenth century to the beginning of the twentieth. All these bits, except pairs, differ one from the others in principle or detail, and it is certain their like will never be made again. It is equally certain there will never be any faked imitations, as they would cost more to produce to-day than ever before, and the art of the loriner as applied to horse bits is almost completely gone.

YORK AND ALEXANDRA PARK

"Mr. Nightingall's Sunday Dinner Winner"

IT is things like the accident to Mr. Rank's Michoumy that make people lose interest in ante-post betting. This French bred three-year-old was favourite for the Cambridgeshire for three weeks at least before the date of the race only to rap himself the week-end before the event, to get a filled leg and damage to a suspensory. Of course he had to be scratched, and the Ring got thousands of pounds. The colt had been backed down from 25 to 1 to 17 to 2, and was coupled with his stable companion, Black Speck, and others in the Autumn Double to win fortunes.

It has happened before, and it will happen again, but it is very annoying none the less for all that. No one was more upset than Mr. Rank himself. He does not bet in any serious manner, in fact he hardly bets at all, but he knew that thousands and thousands of small punters all over the world had backed his colt separately and in doubles, and he was worried for them. And that is that.

Racing at York is always enjoyable and always good, even if the minor meetings there are rather spoiled by the great meeting in August. Still, the course is the same and the racing is always of a high quality. Further, few executives try and do more for visitors. Captain Boyd-Rochfort continues to produce high-class two-year-olds, it would seem, almost with the case that the conjurer produces rabbits from a borrowed top hat. It is all very well stating that he has the best of bred horses in his stables, but other trainers have had them and have not won the races that he wins each year. He is certainly an exceptionally able trainer who makes the best of the material at his disposal.

He introduced us to another high-class one at York. This was Signal Light, a chestnut colt by Pharos, whom Captain Boyd-Rochfort bought for Mrs. Corrigan at the Doncaster sales last year. The colt did not run until he was started last week for the Malton Plate. He has straight pasterns, which would make it difficult to train him so long as the ground was hard. He is a fine mover, and won by two lengths from Cougar, who was two-and-a-half lengths in front of that good filly, Belle Travers. It is true that the second was giving him 11b., and the third 11lb., but he beat the second by much more than a pound, and the third by the weight that she gave him and perhaps a little more.

Mention of this nice two-year-old brings me to the fourth edition of Captain "Sam" Long's two-year-old handicap. He naturally still has Panorama at the top of the handicap, with the Apple Ring colt and Portobello second, only 3lb. behind him. He has had to place the Apple Ring colt there on the Champagne Stakes form at Doncaster, but I thought that Panorama won with more in hand than the verdict suggested, and I know that Beasley, who rode him, thought the same. Still, it is not likely that either Panorama or Portobello will worry us next year except as short distance horses, and as Portobello is a gelding he does not matter much anyhow. Prometheus, who is also high in this handicap, will never be more than a sprinter.

I am interested in Easy Going, who has been given only 7lb. less than the top weight and is lumped there with Foxbrough II, Meadow and Prometheus. Easy Going is, therefore, made the best of the two-year-old fillies. She is by Felstead out of Complacent, and is owned and was bred by Lord Derby. Felstead has at last come into his own as a sire, and this is the best two-year-old that he has had, in my opinion; for Rockfel—whatever she may have done since, and it is a lot—was a very moderate two-year-old, once running, and without success, in a selling plate at Sandown Park. Easy Going is bred to stay well enough to win the Oaks and may well do so.

Casanova, who has run only once, Cockpit, who was taken out of the Derby before it was realised how good he was, Heliopolis and Wheatland come next with 8st. 9lb. Easy Going, Cockpit and Heliopolis are all owned by Lord Derby, who, in addition to having so many good two-year-olds, has also had, apart from them and what they mean for the future, the best year as an owner he has enjoyed for a long time. No one deserves it more, for he breeds his own horses, and there has never been a more faithful or loyal owner and master to his servants in my time. What is more he thoroughly loves it all and attends all meetings that he can whether they be small or great. This year he is top of the winning owners with more than £33,000 won in stakes, and he is also top of the winning breeders with more than £30,000 won.

Lord Derby has stated, and no one will question him, that it costs between £500 and £600 a year to keep a horse of any kind in training. That sum includes everything—keep, training fees, jockeys' fees and entrance charges. If, therefore, one has 40 horses in training it means that one has to make £20,000 in stakes before the stable has cost one nothing. This year Lord Derby and other owners, such as Mr. Rank, Mr. Morris and Sir H. Cunliffe-Owen, must have had their fun for nothing. I doubt, however, whether the Aga Khan, in spite of his stake money, will have made it pay, and it is certain that Miss Paget cannot have done so, although she has won more races than before. They have, however, for the most part been small ones. Yet she battles away, hoping she will have a flat race horse to be compared, not unfavourably, with her wonder steeplechaser Golden Miller.

If one mentions Alexandra Park to some of the more serious racegoers and owners one receives very often a sarcastic smile or a rude reply to the effect that one is referring to the frying-pan. Yet there is no more pleasant little place on which to spend a Saturday afternoon racing. A number of the starts take place opposite to the stands; indeed, the starts for all races except the five furlongs races do so. It is very rare for a start on any other course to be seen by the public unless they walk miles from the stands. It is good for them to see the difficulties of the starter, for they are all too apt to blame him when a horse that they have backed does not get too well away. It is true that lots of the running at Alexandra Park cannot be seen from the lawns, but everything can be seen from the top of the tall stand, half of which is for members and the other half for Tattersall's Ring.

Yet there is hardly ever a member on the part of that stand reserved for members. There is a corner up there for Stewards, and it is set aside from the ordinary member by a white line on the floor. I have been up there hundreds of times to watch the racing and have never seen a Steward in his little pen. And now, having stated this fact, I shall, I am afraid, be crowded out at the next Alexandra Park meeting. As, however, there is not one there until next year, perhaps these notes will have been forgotten and I shall be able still to pretend that I am at last a Steward.

There was a meeting there at the end of last week, and, as usual, there was a large crowd, including a distinguished lady, who had never been there before and is quite certain that if all is well she will go there as often as she can next year. All the North London race-lovers were there in force. It is their own particular meeting. There are plenty of race meetings south of London, but this is the only one in the north of the metropolis. I could not pretend that the racing was of great importance, but it was amusing. At the same time it may have been expensive for most visitors, as all sorts of outsiders kept on turning up. As, however, one of them was trained by Walter Nightingall, and the day was Saturday, lots of small punters would have a good day. It is strange how this trainer always has a winner or two on every Saturday of the year, not only on the flat but also over the jumps. It has come to be known as the Sunday dinner winner.

It is a strange thing that the winner he had at Alexandra Park—Royal Marcus by name—was not in the least fancied by his owner and trainer. He was backed for merely the proverbial bob by those people who should have known most about him. Indeed, I understand that Nightingall would have sold him a short time before for £50, and, in any case, so little did he think of the horse's chance that he had him down to be sold later in the afternoon. He only bought the animal as a yearling because he was going for nothing and was by Lord Marcus, whom he used to train and who was a very good servant to him. After the race, the Juvenile Selling Plate, he let the gelding go for 100gs. He has not room for such animals in these days.

Another surprised owner to win during the afternoon was Lord Glanely. He generally has a runner at two of these meetings, but seldom goes there now. However, he was there last week-end when most people imagined he would be at Chepstow. Some visitors thought that if he could come to Alexandra Park he must have come for some purpose. He had a loser in the first race of the day, a selling handicap, although the beast had bottom weight. He then had a fourth. Now, said the visitors, the time has come. He must have come to see Trafalgar win the Autumn Cup. They then saw that the stable apprentice—a boy of much promise named Littlewood—was to ride the horse. Even that did not dismay them. The horse won with ease.

GNOSTIC.

LEU IN ! LEU IN ! TRY !
The North Warwickshire going into covert from a Cubhunting Meet at Skilts

CUBHUNTING REPORTS

A Courtesy by Masters and Secretaries

ALDERSHOT COMMAND.—Cubs killed so far: 5 brace. Supply of cubs good. Scenting conditions moderate. Best day so far: August 24th. Hounds running for two hours and accounting for 2 brace. Scent good.

ATHERSTONE, NORTH.—Cubs killed so far: 5 brace. Supply of cubs very good all over the country. Scenting conditions above average. Quality of the young entry excellent. Entering well. Best day so far at Lindley. A good show of cubs; 1 brace killed.

BEAUFORT.—Cubs killed so far: Above the average. Supply of cubs excellent. Scenting conditions good. Quality of the young entry very good. Best day so far: No particular one outstanding.

SOUTH BERKS.—Cubs killed so far: 7 brace. Supply of cubs good. Scenting conditions above average. Quality of the young entry good.

OLD BERKSHIRE.—Cubs killed so far: 4 brace. Supply of cubs good. Scenting conditions poor so far. Quality of the young entry good and all entering well. Best day so far: Friday, September 2nd, from Beckett, where hounds accounted for a brace of cubs after two hours' good work in covert.

BICESTER AND WARDEN HILL.—Cubs killed so far: 15 brace. Supply of cubs very good. Scenting conditions fair. Quality of the young entry very good.

BLACKMORE VALE.—Cubs killed so far: 16 brace. Supply of cubs plentiful. Scenting conditions fair. Quality of the young entry good. Best day so far: None outstanding.

BRAES OF DERWENT.—Cubhunting not begun yet.

BRAMHAM MOOR.—Cubs killed so far: 2½ brace in seven mornings. Supply of cubs very good. Scenting conditions bad. Quality of the young entry all entering well.

BROCKLESBY.—Cubs killed so far: 4½ brace. Supply of cubs good. Scenting conditions good. Quality of the young entry good. Best day so far: September 3rd.

DUKE OF BUCCLEUCH'S.—Cubs killed so far: Average. Supply of cubs good. Scenting conditions fair. Quality of the young entry good.

BWLLFA.—Cubs killed so far: 2 brace. Supply of cubs plentiful. Scenting conditions good in early morning, poor after 10 a.m. Quality of the young entry: Hounds entering well (old Welsh type). Best day so far: August 15th, twelve miles run on an old fox.

CAMBRIDGESHIRE.—Cubs killed so far: 3½ brace. Supply of cubs good. Scenting conditions bad. Quality of the young entry good.

CARMARTHENSHIRE.—Did not start cubhunting until September 13th owing to late harvest. Supply of cubs is very good—except in that part of the country where commercial rabbit keeping has become the custom—there, all game and foxes and vermin is exterminated every winter, but the number of rabbits has so increased as to render agriculture almost impossible. In the three-quarters of the country which is still untrapped, and to which commercial trapping has not been allowed to spread, game, foxes, vermin and rabbits are normal. Young entry small in number owing to distemper, but good in quality and have entered well.

CATTISTOCK.—Cubs killed so far: 31½ brace. Supply of cubs excellent. Scenting conditions fair. Quality of the young entry very satisfactory. Best day so far: None outstanding.

CHIDDINGFOLD.—Cubs killed so far: Stopped by foot and mouth disease. Supply of cubs good. Quality of the young entry very promising.

CLEVELAND.—Not started up to date, very little corn having yet been cut.

COLLEGE VALLEY.—Cubs killed so far: 4 brace; only had nine mornings, small part of the country only hunted; so far satisfactory supply of cubs. Scenting conditions very bad. Quality of the young entry excellent.

COTSWOLD.—Cubs killed so far: 11 brace. Supply of cubs plentiful. Scenting conditions fair. Quality of the young entry good. Best days so far: 2 brace at Little Humblebee.

NORTH COTSWOLD.—Cubs killed so far: 29½ brace. Supply of cubs excellent. Scenting conditions, on the average, poor. Quality of the young entry, good. Best day so far: September 8th.

CRAWLEY AND HORSHAM.—Cubs killed so far: 14 brace. Supply of cubs well distributed. Scenting conditions very poor; still no rain; going very hard. Quality of the young entry: All entered well.

EAST DEVON.—Cubs killed so far: 1 (only just started). Supply of cubs good. Scenting conditions, poor so far. Quality of the young entry good.

SOUTH DORSET.—Cubs killed so far: 12 brace. Supply of cubs excellent. Scenting conditions, moderate up to the present. Quality of the young entry first class. Best day so far: Started cubhunting August 22nd.

EAST ESSEX.—Cubs killed so far: 9 brace. Supply of cubs very satisfactory. Scenting conditions fair. Quality of the young entry good and entering exceptionally well. Best day so far: September 6th. Wormingford Mere and gorse, best scenting day; hounds running hard for two hours and accounting for a badger and a brace of cubs.

FITZWILLIAM.—Cubs killed so far: 12½brace. Supply of cubs good in most of the country. Scenting conditions poor to average. Quality of the young entry good. Best day so far: Nothing outstanding, but hounds have accounted for at least one cub on next day out.

GRAFTON.—Cubs killed so far: 25 brace. Supply of cubs plentiful. Scenting conditions moderate in the thick coverts, good in the open. Quality of the young entry: An excellent entry. Best day so far: Saturday, August 6th. From Seven Copses an old fox was hunted for two hours and killed. Later a brace of cubs were hunted and killed stone cold above ground.

EARL OF HARRINGTON'S.—Cubs killed so far: 5 brace for three days' cubbing. Supply of cubs plentiful. Scenting conditions good. Quality of the young entry excellent. Best day so far: August 31st, 3 brace.

HAYDON.—Cubs killed so far: Above the average. Supply of cubs very good. Scenting conditions good early, deteriorating rapidly after 9 a.m. Quality of the young entry good and shaping well. Best day so far: Saturday, September 3rd. Bonsyrigg. After hunting round the demesne, hounds went away on a strong cub, and marked it to ground at Sewing Shields Range, a point of over three miles.

SOUTH HEREFORDSHIRE.—Cubs killed so far: Cubhunting has not yet started owing to foot and mouth disease. Supply of cubs excellent. Quality of the young entry very good.

HERTFORDSHIRE (NORTH PACK).—Cubs killed so far: Too early to give figures. Supply of cubs very good. Scenting conditions very fair. Quality of the young entry satisfactory though early days yet to answer such a query.

HUESLEY.—Cubs killed so far: 3 brace. Supply of cubs very good. Scenting conditions good so far, but country beginning to get dry and hard. Quality of the young entry: 19 couple, of which all seem to be entering well. These hounds have only been out four days so far.

HUEWORTH.—Cubs killed so far: 6½ brace. Supply of cubs good. Scenting conditions moderate. Quality of the young entry: All entered well. Best day so far: Owing to the late harvest a start was not made until August 27th.

ISLAND.—Have not started cubbing yet. Supply of cubs very good.

LAMERTON.—Cubs killed so far: Average number. Supply of cubs good. Scenting conditions average. Quality of the young entry a matter of opinion.

LLANGIBBY.—Cubs killed so far: 6 brace. Supply of cubs very good. Scenting conditions fair. Quality of the young entry good.

LUDLOW.—Cubs killed so far: Average. Supply of cubs: Average. Scenting conditions good so far. Quality of the young entry: Few, but have entered with success. Best day so far: Bleath Wood, when 2 brace were killed.

MEYNELL.—Cubs killed so far: 23 brace. Supply of cubs plentiful. Scenting conditions poor during last week. Quality of the young entry good.

MIDDLETON.—Cubs killed so far: 9 brace. Supply of cubs good. Scenting conditions fair. Quality of the young entry exceptionally good, especially the young bitches. Best day so far: Good morning at Welham.

MIDDLETON, EAST.—Supply of cubs very good. Scenting conditions good, becoming dry. Quality of the young entry very good.

COLONEL MILVAINS.—Cubs killed so far: 2 brace. Supply of cubs fair. Scenting conditions moderate. Quality of the young entry good. Best day so far: None specially good. September 7th ran five mile point, nine as hounds ran but stopped among fresh foxes.

MINEHEAD.—Cubs killed so far: 2 brace (in six days). Supply of cubs fair. Scenting conditions variable. Quality of the young entry good.

MONMOUTHSHIRE.—Cubs killed so far: 7½ brace. Supply of cubs excellent. All very well grown and almost impossible to "hold up" in coverts. Scenting conditions much better than last season's start. Young entry (12½ couples) doing well. Prospects for season excellent.

MORPETH.—Cubs killed so far: 9 brace. Supply of cubs good. Scenting conditions fair. Quality of the young entry good.

NEWMARKET AND THURLOW.—Cubs killed so far: 4½ brace. Supply of cubs good. Scenting conditions fair. Quality of the young entry: All entered well. Best day so far: September 1st. Hounds ran well in Glass Wood and Wadgells and killed 2 brace.

WEST NORFOLK.—Cubs killed so far: Average number. Supply of cubs: Plentiful in most places. Scenting conditions poor, very dry. Quality of the young entry good.

SOUTH NOTTS.—Cubs killed so far: 2½ brace. Supply of cubs good. Scenting conditions rather better than corresponding period last year. Quality of the young entry very promising. Best day so far: 1½ brace at Gonalston on September 1st.

SOUTH OXFORDSHIRE.—Cubs killed so far: 11½ brace (none dug). Supply of cubs good. Scenting conditions fair. Quality of the young entry very good indeed. Best day so far on August 29th. Hounds killed a brace of cubs after two small circles out of Waterstock Covert. Going on to the Old Paddock, another brace was killed, and then getting away on an old fox hounds ran fast over Lubbersdown Hill to Moreton Gap and through Thame Park to Holliers, where they were stopped.

PEMBROKESHIRE.—Cubs killed so far: 1 brace. Supply of cubs good. Scenting conditions very fair. Quality of the young entry promising. Best day so far: Thursday, September 8th. Hounds met at Cold Blow and hunted hard for three-and-a-half hours; 2½ to 3 brace of cubs afoot. Killed 1.

PENTYRCH.—Cubs killed so far: An average number. Supply of cubs good. Scenting conditions fair. Quality of the young entry good.

PENYLAN.—Cubhunting not began owing to preparation of new kennels and stables. Supply of cubs promising.

PLAS MACHYNLLETH.—Cubs killed so far: 2. Supply of cubs moderate. Scenting conditions fairly good. Quality of the young entry very good.

PYTCHLEY.—Cubs killed so far and supply of cubs: Slightly above the average number. Scenting conditions fair to date. Quality of the young entry excellent.

R.A. (BORDON).—Cubs killed so far: 2½ brace. Supply of cubs good. Scenting conditions moderate. Quality of the young entry very good. Best day so far: Opening day, August 20th, killed 1 brace.

RUFFORD.—Supply of cubs good. Quality of the young entry good. We have not begun yet.

SCARTEEN (THE BLACK AND TANS).—Cubs killed so far: 2½ brace; hounds were out six times. Supply of cubs well up to the average. Scenting conditions good. Quality of the young entry good, and all have entered.

NORTH SHROPSHIRE.—Cubs killed so far: 10 brace. Supply of cubs good. Scenting conditions good. Quality of the young entry very good. Best day so far: September 1st. The bitches ran beautifully for two hours and killed 2 brace.

SOUTH SHROPSHIRE.—Cubs killed so far: 3 brace. Only three mornings hunting. Supply of cubs good. Scenting conditions good. Quality of the young entry good.

SINNINGTON.—Cubs killed so far: 8½ brace (in eight mornings). Supply of cubs very good. Scenting conditions good. Quality of the young entry excellent.

WEST SOMERSET.—Cubs killed so far: 14½ brace to August 30th. Supply of cubs very good throughout the country. Scenting conditions have been good for the time of the year. Quality of the young entry all entering well. Best day so far: August 26th, Lannington Park. Killed 2½ brace in the open and marked another brace to ground.

SOUTHDOWN.—Cubs killed so far: 22¼ brace. Scenting conditions moderate.

STAFF COLLEGE.—Cubs killed so far: 3 brace. Supply of cubs plentiful. Scenting conditions fair to good. Best day so far: None outstanding. Started hunting August 1st. Stopped by foot and mouth disease August 29th.

NORTH STAFFORDSHIRE.—Cubs killed so far: 7 brace. Supply of cubs excellent in all districts. Scenting conditions so far have been variable. Quality of the young entry good.

STAINTON DALE.—Cubs killed so far: Owing to the lateness of the harvest we have not yet been able to make a start. Supply of cubs said to be very plentiful. Quality of the young entry: The best we have had for some seasons.

TAUNTON VALE.—Supply of cubs very satisfactory. Scenting conditions fair. Quality of the young entry excellent. Won first prize at Peterborough, 1938. (1) Best two couples working hounds. (2) Best unentered bitch.

THURLES AND KILSHANE.—Supply of cubs good. Quality of the young entry good.

TICKHAM.—Supply of cubs quite up to average. Scenting conditions poor until ground gets wet. Quality of the young entry very good.

TIPPERARY.—Cubs killed so far: 2 brace, 1 brace badgers; only three days' hunting; corn not cut. Supply of cubs good. Scenting conditions bad so far. Quality of the young entry good.

WARWICKSHIRE.—Cubs killed so far: 25 brace. Supply of cubs good. Quality of the young entry good.

NORTH WARWICKSHIRE.—Cubs killed so far: 9 brace in six days; started August 29th. Supply of cubs good. Scenting conditions moderate. Quality of the young entry good.

WATERFORD.—Supply of cubs very plentiful. Quality of the young entry good, though few, owing to losses through distemper.

WEST PERCY.—Cubs killed so far: 10 brace. Supply of cubs very satisfactory. Scenting conditions variable. Quality of the young entry above average. Best day so far: August 25th, Hazelton Rig, 2 brace killed.

WHEATLAND.—Supply of cubs excellent. Quality of the young entry good.

WILTON.—Cubs killed so far: 6½ brace. Supply of cubs quite good, generally speaking, for 75 per cent. of the country. Scenting conditions very fair; better than last season. Quality of the young entry useful. Best day so far: August 28th. Killed four above ground; the fourth gave us a three-mile scurry around Essex's Gorse; hounds met at Coombe Bissett in a cold northerly wind.

WIRRAL.—Cubs killed so far: 6½ brace, five mornings. Supply of cubs very good and strong all over the country. Scenting conditions only fair. All the young entry have entered well.

V.W.H. (CRICKLADE).—Cubs killed so far: 12 brace. Supply of cubs plentiful. Scenting conditions fair. Quality of the young entry hard-working. Best day so far: From Nell Farm, Hannington, hounds were racing in the open all day and caught 1½ brace. Another good day hounds caught 2 brace above ground at Alvescot, mostly in the open.

YORK AND AINSTY (SOUTH).—Cubs killed so far: 6 brace in seven mornings. Supply of cubs fair. Scenting conditions bad. Quality of the young entry excellent. Best day so far: September 8th, Court House Wood, killing 2 brace above ground.

A Soldier at Waterloo

WHEN I was sufficiently recovered to be permitted to take some nourishment, I felt the most extraordinary desire for a glass of Guinness, which I knew could be obtained without difficulty. Upon expressing my wish to the doctor, he told me I might take a small glass. . . .

"It was not long before I sent for the Guinness and I shall never forget how much I enjoyed it. I thought I had never tasted anything so delightful. . . . I am confident that it contributed more than anything else to the renewal of my strength."

From the Diary of a Cavalry Officer, June 1815, *after being severely wounded at the Battle of Waterloo*

Ethel M. Richardson, "LONG FORGOTTEN DAYS." (Heath Cranton, 1928.)

Note.—An interesting point about this extract is that before it came to light, the earliest known reference to the export of Guinness was in 1816, the year after Waterloo. The fact that Guinness "could be obtained without difficulty" in Belgium in 1815 shows that export must actually have begun some time before this.

"SKETCHES BY BOZ'

"The chattels of Mrs. Bloss were forwarded by instalments. First there came a large hamper of Guinness's stout and an umbrella. . . ."

(*Later*)

"Married!" said Mrs. Bloss, taking the pill and a draught of Guinness — "Married! Unpossible!"

Charles Dickens, "SKETCHES BY BOZ" (1836.)

R.L.S. ON GUINNESS

"Fanny ate a whole fowl for breakfast, to say nothing of a tower of hot cakes. Belle and I floored another hen betwixt the pair of us, and I shall be no sooner done with the present amanuensing racket than I shall put myself outside a pint of Guinness. If you think this looks like dying of consumption in Apia I can only say I differ from you."

Letter dated: "At Sea, S.S. Mariposa, Feb. 19th, '93." Quoted in "THE LETTERS OF ROBERT LOUIS STEVENSON," Vol. V.

Toast

"Here goes," said Tom Delancey, and sung the following lyric, of his own composition:—

"Dear Jack, this white mug that with Guinness I fill,
And drink to the health of sweet Nan of the hill," etc.

William Makepeace Thackeray, "BURLESQUES" (published in book form 1869).

A Moral he who runs may read
In this unique affair:—
Drink Guinness, when it's strength you need—
And get a lion's share.

"An ESSE Cooker is easy on the pocket"

The ESSE pays for itself. Hundreds of letters on our files confirm this. The explanation is simple—whenever waste is eliminated, money is saved. The ESSE is designed to reduce expenses in the kitchen. Testimonials confirm the "astonishing" fuel economy. Kitchen routine is simplified. Time is saved. Many users emphasise that they have less kitchen redecoration as there are no fumes, soot or dust—no greasy walls or smoky ceilings. Without flames and fierce, direct heat to dry up the essential juices, meat cooked on the ESSE goes further, while the flavours are improved. Let us prove this with your favourite dish. Arrangements will be made to cook it at our Conduit Street Kitchens upon receipt of a postcard. You will be convinced that there is something decidedly better about the ESSE heat storage method of cooking, which is so "easy on the pocket."

ESSE Cooker Company

ESSE COOKER COMPANY
Proprietors: Smith & Wellstood Ltd. Est. 1854
BONNYBRIDGE, SCOTLAND

LONDON SHOWROOMS
63 CONDUIT STREET, W.1 &
11 LUDGATE CIRCUS, E.C.4

Also at
LIVERPOOL: 20 Canning Place
EDINBURGH: 17 Greenside Place
GLASGOW: 11 Dixon Street, C.1

ESSE HEAT STORAGE COOKERS are continuous-burning, using solid smokeless fuel, preferably anthracite. The PREMIER ESSE, illustrated above from a direct colour photograph, and the ESSE MINOR are for larger residences. The ESSE FAIRY is suitable for smaller homes. The ESSE MAJOR is specially designed for large scale catering. All ESSE Cookers are available with or without Water Heaters. Catalogues and address of nearest stockist on application. Hire purchase up to four years

The ESSE Heat Storage Cooker is an entirely British invention made to suit British kitchens. The ESSE Cooker is patented in all the principal countries of the world, and the patents are the sole property of Smith & Wellstood Ltd. Agents with showrooms in the principal towns of Australia, South Africa, Rhodesia, India, Ceylon, New Zealand, Argentine, Uruguay, Switzerland and Holland.

YOU CANNOT HAVE A BETTER WRIST WATCH THAN

BENSON'S

"TROPICAL" WATCH

Benson's Tropical Wrist Watch, Silver or Stainless Steel £6/6/0, 9-ct. Gold £10/10/0, 18-ct. Gold £16/16/0. Leather or washable White linen strap.

WATERPROOF · SANDPROOF · SHOCKPROOF

The sportsmen's ideal watch is Benson's "Tropical" Wrist Watch—specially made for hard use in all climates. Specially constructed, reinforced case renders this watch absolutely waterproof and sandproof. It has a 15-jewelled lever movement, with shock-absorbing balance, an unbreakable glass which will not discolour, and a clear white dial with luminous numerals and hands. This watch is covered by Benson's written guarantee of accuracy. Call, or write, for Wrist Watch Catalogue and fuller details mentioning this issue of the *Field*.

"DRESSING" A HORSE

"Mane Plaiting is a Post-War Fashion"

WHAT an important rôle dressing horses plays in the day of a stableman. Dressing is to the horse what make-up is to the woman: it supplies the extra touch and finish, which lends so much to the appearance. It can be compared in this way to grooming, which is to the horses more or less what massage is to the athlete, and after all our hunters and polo ponies are equine athletes. It will therefore be deduced that dressing is merely beautifying, whereas grooming, in addition to being beautifying, is also beneficial. It is a truism to state that in these times in many stables, especially in those where there are many horses and few grooms, dressing is indulged in much more than grooming. It is not so laborious, and for this reason probably more popular. It is a great pity that grooming is so much substituted by dressing, for the former makes for condition, and is good for the muscles, skin and coat.

Some items in dressing are essentials, such as sponging the eyes, mouth, nostrils, picking out the feet, and trimming the mane and tail. Debatable items under this heading are: Washing the feet, plaiting the mane and water brushing the quarters. Sponging the eyes, mouth, nostrils and dock are important items, and if this is done with a mild solution of disinfectant added to the water it is beneficial, and also a good preventative against coughs, colds and kindred ills.

The feet, of course, must be picked out if we wish to avoid thrush, but it is when we get on to such subjects as hoof washing and oiling that arguments and theories arise. Excessive use of water makes the horn of the hoof brittle, and liable to crack. When feet are caked with mud and filth, after riding in heavy and dirty going, it is obvious that if they are washed when the horse returns to stables much time and labour is saved, but in many stables it is the practice to wash the hoofs on every occasion upon which the horse returns from work. This is not only unnecessary, but also not good. It would not matter so much if they were dried off immediately afterwards, but never have I seen this practice carried out by grooms in this country.

I wonder how many times farriers have instructed me when horses' feet are brittle, not to put water on them. This year when my horses were brought up from grass with their feet in a rather chipped and ragged condition, it was due to what may be termed one of those half-and-half sort of summers. The action of the alternate drying and wetting of feet causes the brittleness. A very dry or very wet summer is not apt to be so damaging. So it will be gathered that the action of this hoof-washing without drying afterwards is the same as that of the half-and-half sort of summers upon the feet, and therefore one to be deprecated. I kept horses for many years in India, and Kenya Colony, to say nothing of having also had them in such countries as Egypt and Irak, and I never found it necessary to put water to the feet. The water brush was an article unknown in my stables. What is more, when I was in Remounts, where we had some 3,000 animals of all sorts and kinds, from R.H.A. horses down to pack mules, I never saw a water brush used for this purpose about the place. The going can be very dirty in those countries during the rains.

So why, it may be asked, is it so necessary to wash the feet in England, especially if there is any suspicion of this practice being harmful? To those who still persist in believing that washing is beneficial, I should like to add for their information that one of the best known trainers in England forbids the washing of horses' feet under ordinary circumstances.

Next we come to oiling the hoofs. This certainly does make them look smart, and gives a good finish. In many places where I have worked this has always been the usual routine after morning grooming has been completed, when it is left to the last, with the exception of bandaging the tail. This latter is always my last ritual in the stable, as if one is tinkering and pottering about around a horse it usually swishes the tail, and with the bandage on this will prematurely loosen it.

Some people are of the opinion that oil is harmful to the feet, and that by applying it this interferes with the natural oils of the hoof. I can only write from my personal experiences, and I find that if I have been on a messy job, wherein I have had to handle oil or grease, the nails of my fingers appear to benefit by this, and I can only presume that this is the same for the horse. No case has ever come to my notice of oil harming a horse's feet, but here a word of warning is necessary, and that is care must be taken that only approved and beneficial oils are used. These can be purchased fairly cheaply from a saddler's shop. If you are not inclined to run to this extra expense, some mutton fat boiled down in a saucepan over the saddle-room fire is a good substitute, and in fact is a very excellent thing for brittle feet. Another thing for hoofs is horse fat boiled down, which can be got in tins or kegs. This article is penetrating, and is the product of an animal kindred to that to which you are applying it; there really should be no possible reason for it being harmful. This fat is much in demand in certain hunting areas, and its use has been found beneficial.

Such an eminent authority as Major-General Geoffrey Brooke tells us in *Horse-sense and Horsemanship of To-day*, that in dry climates a dressing of castor oil will prevent the feet from becoming brittle, so the inference is, in any case, that oil prevents brittleness. To revert to our word of warning, it may be added that the practice adopted by some stablemen of popping round to the nearest garage and soliciting some sump oil to place on the feet is not a wise one.

Plaiting the mane is a most fashionable post-War dressing. This form of equine beauty culture emanates from the racing stable. It gives an air of breeding to the horse, which is, of course, associated with the Turf, from whence all blue horse blood comes. Nowadays in the hunting field and in the show ring all the best people are seen with their mounts' manes plaited. A pretty lady, side-saddle on a well-dressed horse with plaited mane, is a truly delightful, gracious and most enchanting sight, that speaking of personally I would walk or hack miles just to gaze upon, but I fear me that is where mane-plaiting begins and ends.

They tell me that the ladies are particularly addicted to plaited manes. Vanity, just vanity, my dear men readers, but who am I to throw stones in glass-houses, when I have worn boots so tight for me that I have had to rush into the local village emporium and have them ripped open with a knife, for which I got a free neat brandy, because I appeared so exhausted.

A horse is endowed by Nature with a mane, no doubt for some very good reasons: one perhaps to make it look pretty, the other to assist it in keeping flies and other pests from irritating it to distraction.

Man, it seems, has other ideas about this, for when riding he prefers the mane hogged or plaited. The former method of dealing with the matter is the lesser of two evils. A plaited mane is a stableman's bugbear. It is the cause of skimping much grooming, which, as I have already tried to point out, is so beneficial to the horse, but more than that, it is bad for the mane, and often painful to the horse. To demonstrate my meaning I will next week give you an instance which recently occurred at the place where I am working.

R. M. S. BARTON.

THE DEVON AND SOMERSET STAGHOUNDS ON THE MOOR AT HAWKCOMBE HEAD

GRAYLING IN THE SOUTH

When Wet Fly Pays Better than Dry

By H. D. TURING

CONTROVERSY over the question of "grayling in chalk streams" seems to have died down in recent years. Possibly it is due to the fact that so many owners nowadays keep down their grayling by netting and do not allow them to interfere unduly with the well-being of their trout. I should like to think that this view is wrong, and that chalk-stream anglers take more interest in grayling fishing; but I doubt it. On rivers like the Wylye and Nadder, of course, in which grayling are famous, there are a number of rods who make a regular practice of extending their fly-fishing season by a visit in October and November, or even in December, if the weather is attractive enough. But in Hampshire, it seems to me, there are fewer grayling fishers than ever.

Possibly it is really weather which is at the bottom of this lack of interest in grayling fishing in the south. During the greater part of the trout season one may hit on the English climate in a bad temper; still, one can generally go out. There is pretty sure to be some part of the day when fishing can be done. But in the autumn and winter, the weather may be completely devastating; storms of rain and wind may be lashing the water into a condition when fly fishing is perfectly impossible; and spending an autumn or winter day in the village "pub," divorced from one's usual means of distraction, is not every man's idea of contentment.

All the same, it would seem that in these days of rapid transport, when a favourable day can be snatched without having to make plans some time ahead, weather, behave it never so vilely, cannot be the only reason for this lack of interest in autumn fishing. There are, I fancy, two reasons which may possibly account for a good deal of it: one, the habit many fishery owners have of netting out grayling early in the autumn (which not only reduces the stock but seems to make the residue uncommonly hard to locate); the other, the habits of the fishermen themselves, which have imprinted dry-fly fishing, or at least upstream fishing, so firmly on the chalk streams that most people feel a certain delicacy in adopting any other method, a feeling, as it were, that an apology should be offered for turning our back on the source of the stream, and a half-ashamed explanation that only the necessity of ridding the stream of these competitors of its rightful owners causes one to adopt such an irreverent attitude.

It would improve matters somewhat if grayling were netted during their spawning season instead of in the autumn, and would probably be a more efficient way of reducing their numbers, but it is doubtful whether many owners would be willing to alter their present practice. Netting in spring, it is claimed, interferes with trout fishing, and autumn netting removes many fish which hang about near the trout redds in December and are supposed to devour trout spawn. Whether the charge of devouring trout ova can properly be maintained is doubtful, since except for some few which may be swept out of the redd, the eggs are covered by several inches of gravel, and are unobtainable except by excavation. But from the presence of grayling just downstream of spawning trout it is quite likely that big ones, at all events, interfere to some extent in the process; so there may be some justification for the claim.

Prejudice against wet-fly fishing in chalk streams, for grayling that is to say, is not particularly new. It is probably more in the nature of a vague feeling that it is one of the things which "is not done" than any really substantial part of the ethics of chalk-stream fishing, for hardly anyone will raise objection to the practice if the matter is put to them, but few seem to adopt it on the water. H. A. Rolt, who published his *Grayling Fishing in South Country Streams* in 1902, evidently found much the same aversion, if it really is an aversion, from the use of the wet fly in the latter part of the last century. "On a river like the Itchen I have made the keeper open his eyes in wonderment at big bags I have made with a wet fly. Here nearly everyone affects the dry article, and the result often comes about that with 'floaters' sport late in the season is very poor as compared with that obtained by fishing wet. The plan I adopt is to stroll quietly downstream. I first find my fish. As grayling keep generally in shoals, this is no difficult matter."

With that last sentence I fear I cannot agree. It is true that grayling keep in shoals, at least in open water; but I wish I found them easy to locate. Indeed, it is just that discovery of a shoal which seems so difficult. In a water one knows well it may be otherwise, but as a rule there is still a good deal of weed in chalk streams in autumn, and the shoals are difficult to find, except on those delightfully still days when an autumn sun has cleared the mist from the valley, when the yellow gravel shows up finely against the darkening patches of weed, when the red and gold curtain of trees on the opposite bank seems to light up the whole water, and the spangled shadows of fallen leaves move swiftly along the bottom, sweeping confusingly over the shadows which are stationary or move but slightly from side to side as some edible morsel trickles through the gravel. Then one may settle down to a shoal in the sure conviction that sooner or later a fly cast across and downstream will move some of them to take an interest in what is passing overhead.

To the autumn fisherman with only a short day at his disposal it is a blessed habit, this shoaling of grayling, for once a shoal is found it can be fished for hours on end, as long as nothing happens to disturb the fish. Contrary to the habits of trout, they are seldom disturbed by fishing over them. Why grayling should be so much more amenable to a wet fly fished downstream is, to me, a mystery. Is it that they are abnormally gut shy? Or is it simply that the fly, hampered by the drag of the line in the water, travels more slowly as it swings across the current? A grayling with its habit of rising from the river's bed, instead of lying poised some 6in. under the surface like a trout, must have a much larger area of "window," and more gut would consequently be visible. Gut lying on the surface would not, presumably, be very noticeable in the "mirror" which surrounds the window, and it may be that the habit of oiling part of the gut to make it float, recommended by a *Field* correspondent many years ago, was inspired by an experience which this fact would explain. In downstream fishing the fly comes into view before the gut.

But I am inclined to think that the depth from which the fish rises is a more likely explanation. Grayling in at all a swift stream often seem to miss a fly. They do not rise "short" in the manner of a trout; at all events they do not appear to change their mind about its edibility on close inspection as trout seem to do, or how explain their coming again and again at the same fly? They do not, or at least very rarely, swim up to a fly to take it, nor do they drift backwards in the manner of trout and then lift their neb and suck it in. They appear rather to make a spring from the bottom, as if shot out of a catapult; once the impulse is made there is no altering direction; the shot is made for good or ill; that is what it looks like.

In this case a fly moving rather more slowly than the current is possibly easier to get. It seems unnatural that an insect should move more slowly than the current, but are we not inclined to attribute more reasoning powers to fish than they really possess? In a river there must be lots of errant currents, small eddies and the like, where stones or weed obstruct the flow and where grubs being carried along will change course suddenly, a phenomenon to which fish must be well accustomed.

I remember a wonderful shallow on the Kennet at Halfway frequented by grayling and big dace. There was always a shoal of grayling on that shallow, and one could almost invariably get a rise at any point along its course of some couple of hundred yards; but the grayling seemed to come "short," as we used to consider it in those days, when no one thought of fishing anything but dry fly. A dry fly fished semi-submerged always got more rises than one which stood up properly on its hackles. One cast straight across stream, for the water was wide and the fish lay in the middle. The slack water at the side caused inevitable drag, but it was when the fly had swung round and hung momentarily downstream from the line that rises most frequently occurred. Fish were seldom hooked at such a time, which was natural, for grayling are not the fish to wait for the slack to tauten up from a heavily bowed line; but looking back upon it now I have no doubt many more grayling would have been caught if anyone had had the gumption to fish a wet fly across and downstream over the shoal; and those grayling were worth catching, too.

The main difficulty in fishing down and across is to get one's fly to sink far enough below the surface. In a fairly rapid current a fly is apt to ride up directly there is any drag from the line. This would be well enough if the fly got properly down first. Rolt comments on a practice of those days of using a split shot on the cast (an abominably uncomfortable gadget, by the way; it makes casting a misery) and records his own method: "When dressing a fly, I pad the hook slightly with thin lead wire—not too much of it—a couple of turns is ample." Is Rolt, then, the originator of the leaded nymph? It reads as if it was his own invention, though it was written not later than 1901 before nymph fishing, as such, had been developed, but it looks a little as if nymph fishermen to-day are indebted to the grayling for what is likely to become, in the future, a regular feature of their craft.

A WINDY DAY ON A TEST CARRIER

From a photograph by Dr. E. A. Barton

"ANYWAY THE VIEW IS WORTH THE CLIMB"

SNAPSHOTS FROM THE IRISH HILLS

A Day's Shooting in the Mayo Mountains

"IF we don't get a lot of shooting, we shall see a lot of stuff, and anyway the view is worth the climb." Thus our host, who spoke no more than the truth. Mile upon mile of rock and bog and heather lay between us and Clew Bay; southwards the great outline of the Connemara mountains cut the sky. We looked down from a thousand feet upon the Killaries, and up to yet another thousand of Maumtrasna, and the gradient of the latter was a trifle more appalling than the former.

If shoots, on which one accepts small mercies with becoming gratitude, are fittingly described as rough, then rough and tumble may more accurately apply to such as embrace the Mayo mountains. For tumble you certainly will, until, as my friend Patsy Feeney puts it, "ye have the right feel of the shragh between yer toes." If you do, the depth of your immersion will, under Providence, depend on the nearest solid ground to the Antipodes. And even if you do not, when a clammy mist blots out the hills, and the wind gets up to half a gale and the ground is waterlogged, so that a whole bog springs to life before your band of hope has well set foot upon it, the lighter aspect of adventure is decidedly obscure. A sense of humour is an asset in bog trotting.

For undoubtedly it cramps one's style, just as two snipe rise confidingly convenient to be violently assaulted from behind. "Ye was all but in it that time," remarked my rescuer genially, adding the reassuring intelligence that this part of the bog was reputedly responsible for the mysterious disappearance of two local worthies. And the higher ground, also, if less nerve wracking, was no picnic. Ankle-twisting slopes of nearly knee-high heather, studded with enormous boulders peeping out of tangled whins and bracken, do not conduce to easy shooting. One loped one's way through the *chevaux-de-frise*, usually to hear a whirr of wings just when in the process of disentanglement from some peculiarly obnoxious snag, and unashamedly I confess that a single snipe saved me from the ignominy of rendering a blank return for that first beat.

Then mercifully the gradient became gentler and the heather less abominably thick. One pack of grouse was fairly easy money, and in a life-like imitation of the serpent on its belly, the keeper and two beaters worked round some scattered oat patches to send another lot clean over us. Eight grouse in October is some bag in this part of the world, but that was the last we saw of them. They were heading non-stop for Croaghpatrick at something like 60 miles an hour, and I should not wonder if they got there.

The afternoon's first problem was the shooting of a cutaway bog in a cleft in the hills, and fringed with stunt scrub and whin clumps, sizeable enough to conceal elephants were such indigenous. They clothe the steeper slopes, which fall into tiers of rock-strewn heather, and for safety's sake the only method of procedure was for the guns to keep well ahead above and below, while the beaters fought their way through the entanglements as best they could. The yield, one must regretfully admit, was meagre, though the speed of such birds as came in more or less the right direction was terrific. Snipe shot from the cutaway like skaters on smooth ice, and as we were a good 30yds. to the flanks, we were usually a good 6in. behind as they streaked into the stratosphere. And alas! two out of three woodcock, rather surprisingly emerging from the whins, defeated the combined efforts of two guns.

But into the final drive across the biggest of the bogs was crowded most of the excitement of the day. It is a huge strip of country, half cutaway, half red bog, and one never knows what it may hold from wild geese to jacksnipe. The beaters love it for that reason, and as they lined out in the distance I found myself wishing that experts in the art of driving could have watched that effort. For each man had the lung power of a dozen, and one or two were equipped with a species of rattle akin to those in vogue, I fancy, among football fans. These were swung with ear-piercing and unnecessary frequency whenever the storm troops sighted anything near or distant.

In less time than it takes to write the words the whole bog was awake. First came a stand of golden plover, which kept low enough in the teeth of the wind to be shorn of half a dozen as they passed. And then the snipe and duck, but chiefly the former, twisting right up into the sky, and swerving left-handed whenever a movement in front betrayed the forward guns. For half an hour the fun was fast and furious, and the charm of the sport lay in its variety; a snipe would join forces with a mallard, a bunch of teal would seem to race the golden plover, and a few wigeon, curlew and minor etceterns all contributed to the gaiety of the proceedings. For some reason or another most of the duck in the place seemed to have congregated in the last hundred yards or so of the beat, and it was a question of loading and firing as rapidly as rather numbed fingers would allow. The teal, as usual, headed off up the river, but most of the full duck came forward and, circling higher and ever higher, gave almost every gun an object lesson in speed and angle. What was the proportion of hits to misses during the whole beat I have no idea, but if my own performance was any criterion, it must have been extraordinarily low. Still, if good mixing makes the *sauce piquante* of shooting, we had that good and plenty. For the day had yielded eight different species of birds—94 head all told—and there was no one with a sufficiently analytical type of mentality to wish to count the empty cartridge cases.

And here is one last picture of this day of happy memory. We came on our homeward way to a little group of coverts by the loughside, and all six guns lined out for a grand finale. Then was a woodcock halloed forward, and he came twisting and dipping in and out the silver birches. Two of the professors missed him hurriedly and handsomely, and it was left to the only youngster in the party to make suitable amends. And not content with this, the same lad stopped another 'cock a split second after the writer had fired two barrels quite a foot behind it. Which, as all contemporary old buffers (or old duffers) will certainly agree, was a most indecent incident.

And so home. We seemed to have got "the right feel of the shragh" between our toes, for we had more leisure and greater confidence in watching the shadows creep along the mountains and in absorbing that atmosphere which is quite peculiar to an Irish twilight. The hills seemed gentler and the heather surprisingly penetrable—or was this simply because we were filled with the quiet exultation that only comes at the end of a successful fresh air enterprise?

J. B. DROUGHT.

"SOUTHWARDS THE GREAT OUTLINE OF THE CONNEMARA MOUNTAINS CUT THE SKY"

"WE LOOKED . . . UP TO YET ANOTHER THOUSAND OF MAUMTRASNA"

"A DIM, DULL, DREAR SORT OF DAY, ALL MIST AND OYSTER CATCHERS"

A PUNT GUN AND POLITICS

Spy Fever on the East Coast

ALTHOUGH some of the hardiest folk in the world live on the coasts of the Baltic, the big, hard-featured man crouching in the reeds shivered and grumbled at the cold. The shore of an East Coast estuary in mid-winter is no place for comfort. But Captain Bardowick was a conscientious and earnest man, who had been brought up and trained with an iron discipline to do his duty.

There was a rumour abroad that the Royal Navy of Great Britain had a new submarine which was something entirely novel in the history of warships. She had been built at the large naval port near, and was said to be conducting her trials in the estuary. So Captain Bardowick cursed the snow flurries and the cold damp banks of mist, while a few hundred miles away his superiors awaited his report with tense anxiety, for it was a dim, dull, drear sort of day, all mist and oyster catchers.

As the snow stopped for a while the mist receded a little, and the watcher suddenly grabbed his binoculars. It was not clear, and the mist distorted everything, but there was something moving on the water. The binoculars revealed a low, flattish structure, on which a gun was certainly mounted. It appeared larger than the top of an ordinary conning tower, for Captain Bardowick assumed that it was a submarine nearly submerged, but it puzzled him to notice that no periscope was fitted.

Then the vessel passed into the mist, and the captain wondered how he could get a closer view of her. Suddenly a dull roar sounded over the waste of mud and water, quickly followed by another. The cries of startled waterfowl were followed by lesser reports. The spy's bewilderment increased. Why have target practice in such weather, and what sort of a gun was it? What did the fire of small arms mean? A shot came from behind him, and then another on his flank. There was a splash in a pool.

The spy realised that he was in a tight place. Suspicions must have been aroused, and the marsh was being combed by soldiers, who had so far missed him in the snow showers and mist. What they were shooting at Bardowick could not imagine, but the district had become very unhealthy.

A sharp snow shower swept down, and the spy began to move cautiously through it towards the road. Then he came into contact with one of his pursuers, who appeared like a parti-white ghost through the snow. Both were startled, but the captain knew the fate of spies, and he was desperate. With one savage wild blow he knocked the other flying into one of the little pools which dotted the marsh. Then he ran.

Captain Bardowick was no coward, and he was no stranger to trouble. He had served his country as a soldier in two wars in which it had intervened. But he always looked back on that day as one of the worst in his adventurous career. The bad visibility which hid him also hid drains and pools from him. He found it quite easy to get in these, but very difficult to get out. He lost all sense of direction, and although the shooting had stopped he could hear shouts, and men moving about.

When at last he found the road, where he had hidden his motor cycle, he had to hide until the slow winter dusk hid the state of his clothes, which would have attracted attention at once. But before he went down for a record bout of influenza he managed to get off his report, with a sketch of what he had seen. It was greatly appreciated.

* * *

The vast building was crowded with little groups which began to drift away. A great Naval Conference had been held, but no treaty or pact had been concluded, for several reasons. One of these had been a grave suspicion that Great Britain possessed weapons which were undisclosed and powerful, and the astonished denials of her delegates had failed to remove the impression. Two of these delegates walked from the last sitting of the conference, which had concluded with the usual platitudes, to a Service club.

"What beats me," said the elder, "is that cock-and-bull yarn about the new submarine. We haven't got such a thing, and if we had old Frock-Tails (here the speaker alluded to a Very Responsible Statesman by his Service nickname) would have given them the plans as soon as they mentioned it."

"Two or three crowds have got hold of the rumour," said his companion. "And they wouldn't believe there was nothing in it."

"Oh, all these foreigners get each other's information sooner or later. Once a useful thing is known it soon gets known again."

"Did they give you anything to go on?" asked the junior officer.

"Yes. After I denied all knowledge of it at the committee meeting Pulkava drew me aside and told me one of their people had actually seen it. Probably thought I should tell him a bit then."

"What did he tell you?"

"Well, it seems that one of their agents was hiding somewhere on the coast below Hardwick's basin, and he saw the top of a conning tower, with no periscope, running almost awash, and shortly after he heard two shots in quick succession, after which he was hunted by our military and had a frightful job getting away. As they only knew of two of our old submarines being refitted there at the time, and they were both in dock, they are naturally a bit suspicious."

"But we don't know anything about it."

"No. And the military are another conundrum. We haven't got any military there, and if we had they would have known if they had been hunting anyone."

The junior officer thought for a bit, and then he asked a question: "When did this new submarine show up?"

"A week or two after Christmas. You had the second squadron there then, so you wouldn't be far away."

"No," said the man who had been taken from his command to listen to a lot of hot air. Then he gave a start and began to grin.

"What's the matter?" asked his senior. "If you've thought of a good story, let's have it."

"I have, but it may not be the right answer. I think I know old Pulkava's sub." He laughed. Then he called a waiter. "Ring up the Burlington and see if Lieutenant Druridge is there, and if so ask him to come and see me here at once." Then he turned to his companion. "My nephew. I have an idea he may be able to clear things up a bit."

About twenty minutes later a big, tanned, quiet young man was conducted to the two Admirals. "Well, Jim," said his uncle, after introducing him to his friend, "we want some information from you."

Lieutenant Druridge looked rather amazed and apprehensive. Admirals, even if they also happen to be uncles, do not send for a man on leave merely to inquire about his health. "Yes, sir?" he said.

"You did a good deal of punt-gunning in the winter, I understand?"

"Yes, sir. I got a double-barrel specially made by Bland's, one of the biggest they've ever turned out, and I had to get a bigger punt to carry it. I hoped it would give me a bit extra range. The fowl are very wild."

"Yes. Do you remember anything out of the ordinary happening about a week or two after Christmas?"

"No, sir."

"Well, did you hear of anything happening ashore while you were out?"

The Lieutenant thought for a little, then he spoke: "Well, sir, I did hear of something which happened to a shore shooter after a couple of shots I had. It was a vile day, and I hadn't seen anything, and I was coming in. The mist thinned a bit, and I saw a gaggle of pinkfeet on the mud. I gave them both barrels and picked up fifteen. I heard the shore shooters popping away. They always try to get a chance of a shot when a punt drives fowl off their feeding grounds. When I got in, some time later, old Pintail Billy, who looks after the punt for me, told me there had been a fight on the marsh. It appears that one of the men had shot a goose when I set them up, and he was going to get it when someone went for him and knocked him down. He could not recognise him, and he and his friends tried to find him, but he got away."

Both Admirals laughed. "The blunder has been made," said his uncle.

"How?" asked Druridge.

"By the gentleman who knocked your shore shooter down," said the older Admiral. "Your two shots killed more than geese; they've killed a conference!"

BRENT.

Letters to Young Shooters

GUNS, POWDER AND SHOT

(*Sketch by Maurice Tulloch*)

MY DEAR GEORGE,—The number of shooting men that have a deep knowledge of gun making and ballistics is very limited indeed, and there are many who, quite frankly, say they know nothing whatever about it and seem to get on perfectly well. All the same, it is as well to know something of the tools of your trade, if only to keep up your end with those annoying people one meets from time to time who talk to you in an unintelligible and highly technical jargon.

The gun you use is more or less the same gun, *i.e.*, the breech loader which has been in vogue for 70 years. It has two primary differences. The absence of hammers, which began to come in about 1875, and the ejectors, which throw out the cartridge and make for quicker loading. The principle of the hammer and the hammerless gun are the same, except that in the latter the hammer or tumbler is inside the gun. Up till the time of the War one still saw a good many hammer guns about, and two of the great shots of all time, Lord Ripon and King George V, both used them.

The ordinary guns in use are the 12-bore, the 16-bore, the 20-bore, the 28-bore, and the .410. Each of these is, as you know, a slightly less powerful weapon than the one before it in the list. The origins of the term twelve, sixteen, &c. bore is not uninteresting. They are derived from the weight of the spherical lead bullet exactly fitting the bore of the gun. Thus a bullet, of which twelve go to a pound, exactly fits the bore of a "twelve," and so on.

Everybody, of course, wants to own a "best" gun, one of those beautiful pieces of craftsmanship which originate from one of an odd half-dozen or so makers, and which are made to measure in every particular, each individual part being the work of the maker's own firm. Such a gun might cost £120, though you can get a good gun made to measure for less than half that price. Now, equally, if you can afford neither £120 nor yet £50, you can buy a good gun for rather less than £20, which is safe, reliable and a killing weapon. Why, then, pay more? The answer is threefold. Firstly, a gun that is fitted to you will nearly always improve your shooting. If you have a chest like a gorilla or a neck like a giraffe—and, my dear George, I know that you have neither—you will find it an even greater help. Secondly, the life of a "best" gun (that is the expression given to the product of a first-class London maker) is at least double, and probably treble, that of the "off-the-peg" article. And, thirdly, it will always keep its price. Read the secondhand lists to see how certain names always appear among the high prices. That is really all there is to be said about it. There are lots of poor men who shoot excellently and get a great deal of fun out of cheap guns.

Now into each individual gun can be put various refinements. First of all, there are single triggers and over-and-under guns. It is claimed for the former (it has a double action on one trigger) that it slightly accelerates speed of shooting; for the latter, which has the barrels one above the other, that they make for easier aiming. It is a matter for choice, but neither are, as yet, very widely adopted in this country. Next we come to barrel lengths. After the War there was a tremendous movement to shorten barrels. At the present time it seems to be somewhat less fashionable. It is claimed for short barrels that they make for extreme quickness, and some very remarkable weapons, which look as if they had been borrowed from a Chicago hi-jack, have certainly been seen to do a great deal of execution. But equal execution is done with the old-fashioned 30-in. barrels, for which a greater accuracy is claimed. It is a subject which aroused acute controversy, and if everybody gets what makes them happy and confident, what more need I say? Old-fashioned sportsmen assert that these 25-in. barrels are only fit for apes. If I had, after the manner of the late Lord Beaconsfield, to choose between the 25-in. apes and the 28in. angels, like his lordship I should be on the side of the angels.

There are two other points I must deal with. Firstly, the choking of the barrels. Choke means what its name implies. It has been found that by very slightly constricting the barrels at the end a denser and improved pattern is obtained. No gun barrel, I believe, is quite devoid of choke—*i.e.*, a perfect cylinder. Choke is gauged by "points," and a point is $\frac{1}{100}$th of an inch. It varies from 3 to 40 points of choke. It is quite clear that if you want to shoot at long ranges you must have more choke. In the old opulent days many sportsmen bought their guns with a second pair of choke barrels for high pheasants. But for most of us the normal choking holds good of having the left barrel "choke" and the right barrel constricted to a lesser degree known as "improved cylinder." This means that at 40yds. the choke barrel puts 75 per cent. of the charge into a 30in. circle, the improved cylinder 50 per cent. It is curious that this system of barrel arrangement still seems to give the best results, as it derives from an epoch when most game was walked, and the second barrel fired at longer ranges. With driven game the reverse must often be the case.

In making a gun, I suppose the gun-maker's most important adjustment is to get the length of the stock so that it falls easily into the shoulder. This depends primarily on the length of the arms (the aforementioned gorilla). The second measurement is the "drop" or "bend" of the gun, which is the amount the stock is bent down below the barrels, so as to bring the barrels dead on the object. This depends on the length of the neck, I presume (the giraffe). And, finally, the "cast" of the gun, which is a matter of eyesight. Whereas bend is in the perpendicular, cast is the same thing in the horizontal. If one has defects of vision, or indeed in habits of shooting, which cause one to shoot to the right or the left, they can be rectified or mitigated by cast. Thus if one is found to be shooting to the left of the target, the stock is pulled to the right of the plane of the barrels, and this is called "cast off." If it is pulled to the left the results are opposite, and it is called "cast on." Work it out with pencil and paper; it's quite simple. (Task for term time No. 1.)

Finally, a word about proofing. The only two things I can think of that you can buy guaranteed by Government as danger-proof are an aeroplane and a gun, unless in these days it be a gas mask. Aeroplanes, however, are inspected from time to time, and guns are not. Thus proofing cannot last for ever. A pair of barrels, even though the genial shade of the great Joe Manton descended from the celestial coverts to cast them, cannot be expected to last till the crack of doom. So, if buying second-hand guns, they may need to be inspected and reproofed. Proofing is done by two sources—the Worshipful Company of Gunmakers in London and the Birmingham Proof House. There are two proofs: First, the provisional proof, which is of barrels only and shows the gunmaker it is fit to carry on with. The second is the definitive proof. This is the final hall-mark. It has three variations. Since 1925 such proof consisted of one proofing for all powders; between 1896 and 1925 there was, as nitro powders came into use, an additional proof for nitro powders. Previous to that there was only one definitive proof. It may interest you to explore some standard book such as Major Barrard's *Modern Shotgun* and identify the various proof marks. (Task for term time No. 2.)

Now comes the last part of the gun: the powder and shot. Well, as you know, this is a subject which causes more apoplexy in Service clubs than any other topic short of Younger Generals. It has broken up shooting lunches, week-end parties and lifelong friendships. If you find you can kill driving grouse the better with Celer et Audax Powder, and old Colonel Doodlepop in the next butt is certain that he does far more deadly execution with his Nulli Secundus—so be it. Let it be a source of pride to both of you, not of quarrelling. And if Studley-Jones kills his hundred snipe with BB, and Blubberhouse-Smith his score of geese with eights, let us marvel and pass on. We will stick to our fives and sixes for ordinary work and get along very happily.

But it is well to know what a cartridge consists of. Let this be task for term time No. 3, if you can lay your hands on a cartridge. Take one and cut it down the side. There is a little disc with the size of the shot printed on it on the top. It is very firmly wedged, which makes for the accuracy of your cartridge. Below this is the shot. The top part of the cartridge case is filled tight with shot. About a third of the length of the cartridge below the top disc there is another similar cardboard disc; these discs contain the top and bottom of the shot. Immediately below is a brown felt wad, though in the latest cartridges they are "pneumatic" wads, a sort of air drum of hard paper, which has exactly the same effect as a felt wad, but gives a slightly more even pressure on the shot when it is propelled forward. Below this again is a third disc, but thicker and more carefully balanced. These wads and discs are the piston, worked, as it were, by the steam of the powder. Below the lowest disc of all is the powder. Below this you can see the brass head of the cartridge containing an iron cup. This brass head has a cap on it; turning over the case you can now see the cap without, the flash hole within. What sets off the flash, that explodes the powder, that propels the wad, that hurls the shot that hits the house that Jack built? Don't pry any further into the cartridge—and I hope you have sprinkled the powder into the garden and not the pupil room fire—but take it that inside that brass head is a small pointed anvil and a copper shell with a tiny quantity of explosive composition. The plunger of your gun forces the plate on which this composition is spread on to the anvil, and that, say I.C.I., is that.

Your affectionate,

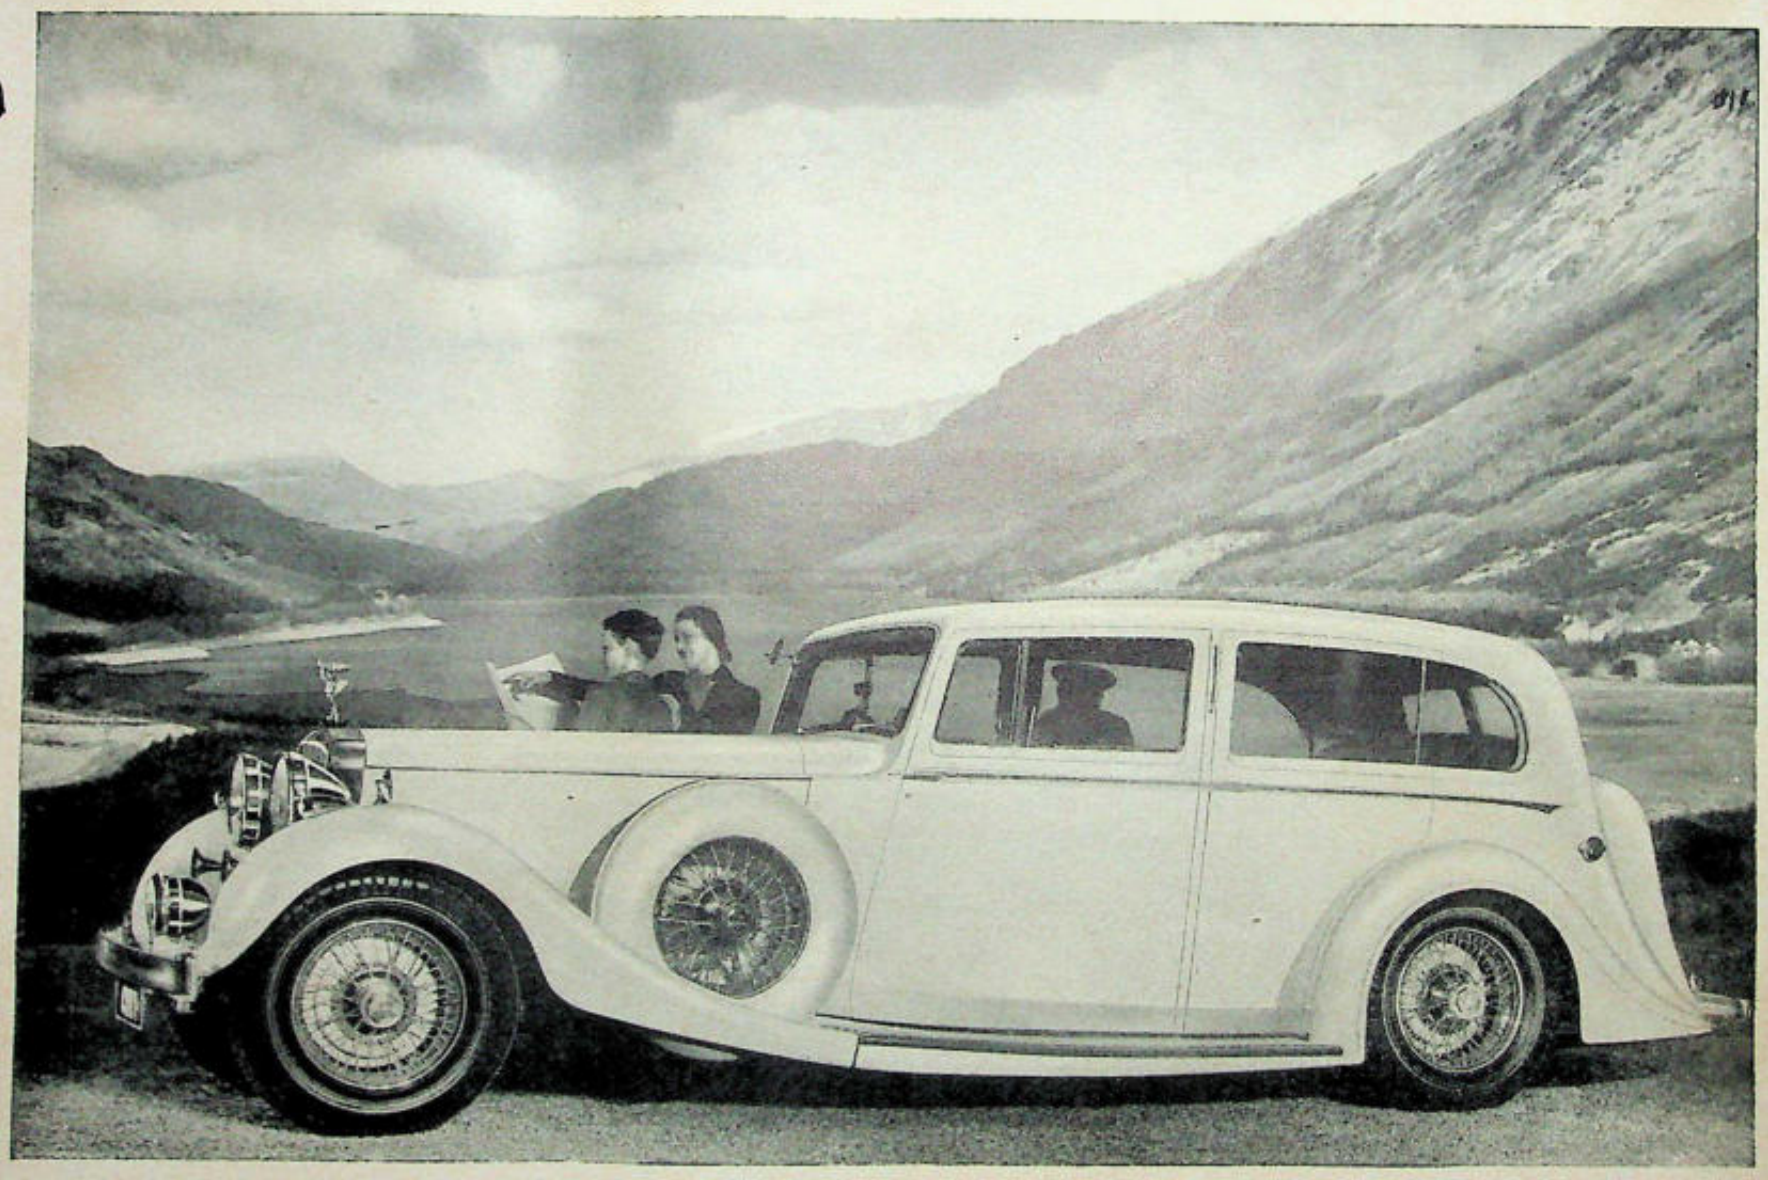
UNCLE RALPH.

AN ARGUMENT ABOUT CARTRIDGES

The Daimler Vogue

BY APPOINTMENT TO HIS MAJESTY THE LATE KING GEORGE V

AS INTERPRETED BY FAMOUS COACHBUILDERS



TOURING LIMOUSINE

designed and built for

DAIMLER

by Rippon Bros. Ltd.

on the Straight Eight chassis

Even the Daimler Straight Eight chassis has never carried a more magnificent limousine. This is the car that gained premier coachwork awards in all the leading British Rallies. A Daimler of notable individuality—a car in which every detail of the amazingly lavish interior equipment has been personally designed. An outstanding example of the current Daimler vogue.

A SALMON FISHER'S CRI DU CŒUR

Bad Luck which Calls for Explanation

By WEST COUNTRY

A COMMON type of angling article is one which seeks to instruct, amuse or enlighten readers; this one is different, for it is an attempt by the writer to glean information which will pierce the impenetrable darkness wherein he is wandering. In short, it is a confession of failure.

For years now most of my salmon fishing has been on one river, and I think I may claim, without false modesty, that I have been moderately successful. It is hard-fished association water, and as such affords the best test for comparison, for when the same rods are fishing the same water year after year, the element of chance, which can play so large a part in the sport at times, is, to a considerable extent, eliminated.

For a decade or more my catch at the end of the season has invariably been amongst the first two or three, and several times I have had more salmon than anyone else. I say this in no sense of boasting, for, in my view, boasting is the most stupid of all stupidities, because it impresses none save the boaster. But it is necessary to make it plain that I am neither a beginner, nor, judged on past results, completely incompetent in this fish-catching business, or my present plight could not be regarded as exceptional, and this article would lose its chief point. The question in brief is this: Why have the tackle and methods which have been successful in other years failed so lamentably in 1938? I may say that by standards of even a few years ago I fish light, with tackle that is as fine as that used by any other rod on the water, and finer than most.

We have had on this particular river, and, indeed, in all the others in the same area, the worst season I ever remember. The spring was one long drought; but lack of water has not been the only trouble. There were very few spring salmon, and summer fish are almost as scarce. Added to this, those that did come into the pools have taken very badly, and the number of lost fish, and rises and runs which did not metamorphose into anything further, have been far above the usual percentage. At first sight this might be accounted sufficient reason to explain my lack of success. But such is not the case. Since the beginning of the season, in March until mid-July, I met exactly two salmon. One came unstuck after a couple of minutes, incidentally the first I have lost since June, 1935; the second I killed.

Two salmon in four and a half months, although there were, of course, weeks in spring when no fishing was possible. Still, by my diary, I find that I have been out 38 times. "Out" may mean anything from a couple of hours before lunch or after tea to a "day" of five or six hours, this being about the limit of my endurance and perseverance when I cannot stir a fish.

Now, it is true that, with one exception, the record of other anglers on the same river is not impressive, indeed, not much better than mine if actual catches are considered. Three or four have each had a couple of salmon; but they have been meeting fish; they have lost several, and have risen or run others with fly or bait fairly frequently, considering how few the pools hold, whereas I have gone for day after day, and week after week, without being able to rouse the slightest interest in the fish's mind, spin I never so wisely.

One man has been far and away more successful than anyone else, and his total reaches the almost astronomical figure—for this year—of ten salmon. In one day he met three fish, more than I encountered in four months. In that week he had nine come at fly or bait; he killed two and lost two others, and twice he has landed a brace in a day. This individual knows the river as well as, but not better than, I do; possibly he is on the water rather more hours a week than I put in, and his catch in recent years has been usually near the head of the list; in 1937 he was second, one fish below me. Yet this season he has killed a thousand per cent. more salmon than I have, and has met 20 against my two!

WHY? Can anyone suggest an explanation, save the very unsatisfactory one of luck? It is true that most anglers can recall extraordinary manifestations of good and bad fortune in salmon fishing. In 1932 I caught eight out of the first nine salmon killed in this river. A year or two ago a lady had seven fish in a week when the total catch for all rods was nine, and I remember a case of a very good fisherman, who the year before had headed the list on an association water, going the whole season without landing a single salmon. Yet to put the whole thing down to luck is somehow unconvincing and unsatisfactory.

Is there any other explanation? There are undoubtedly many things in heaven and earth, and in the waters under the earth, that we do not understand; is it possible for some mystical influence to affect for good or evil one's fishing? Fish generally are known to be extremely sensitive to differences of pressure, temperature and electrical charges; is it too utterly far-fetched to imagine that these extreme manifestations of what we usually call luck are in reality due to something in the angler, some state or condition which is quite unknown and unrealised; some varying psychological or physiological factor which emanates from him at times, and is communicated like an electric current through rod and line to the fish, enticing or repelling them, so that they are attracted to his lure or leave it severely alone?

AUTUMN SPATE IN THE NORTH: THE DOCHART AT KILLIN WHERE THE RIVER ENTERS LOCH TAY

Better Motoring for less Money ... VAUXHALL *alone* combines all these features

Complete range of new models for 1939 season on display at the Motor Show

10 H.P. *40 M.P.G. The new edition of the popular Vauxhall "10." Smooth performance; many refinements. Ample room for four adults and a child. Exceptional economy. Saloons from* **£168**

12 H.P. *35 M.P.G. Costs less to buy and less to run than any other "Twelve." Bigger and more powerful than the Vauxhall "10" —yet costs little more to run. Saloons from* **£189**

14 H.P. *30 M.P.G. Worthy successor to the famous Vauxhall "Fourteens" which has always been the leader in its class. Fuller details below. De Luxe Saloon* **£230**

25 H.P. *20 M.P.G. The aristocrat of the Vauxhall range. Exceptionally roomy; maximum speed 80 m.p.h., outstanding acceleration. Saloons from* **£345**

Limousine prices from £555

VAUXHALL'S LATEST
The New "14" Six

Every year since 1933 when the first Light Six made history, successive Vauxhalls have been the most popular cars in the 14 h.p. class.

For 1939 we offer a new "Fourteen" that will more than maintain the lead established by its predecessors.

It is a bigger, roomier, more impressive car, with hydraulic brakes, controlled synchromesh on all forward gears, an adjustable steering wheel, many new luxuries, an even livelier performance and yet will still do 30 miles to the gallon.

It has the torsion bar system of independent suspension which, in addition to improving all roads, gives extra stability, safer cornering, is trouble-free and requires very little attention.

IN every Vauxhall there are certain basic features which cannot be found together in any other cars in the world. Those features, the products of Engineering Leadership, are responsible for the unusual combination of performance, comfort, roominess and economy for which all Vauxhalls are famous.

We do not suggest that any motorist *should* buy a Vauxhall. Instead we ask you, in your own interests, to try every car that is available at the price you are prepared to pay. Any Vauxhall dealer will arrange for you to try a Vauxhall.

REAL ECONOMY With normal driving, Vauxhalls give approximately 20% more m.p.h. **PERFORMANCE** All Vauxhalls have lively acceleration and excellent top gear performance. **INDEPENDENT SPRINGING** Changes riding into gliding and improves stability, steering, cornering and road holding. **SAFETY.** Hydraulic brakes give smooth, powerful, effortless braking. **DRIVING EASE** Vauxhall *controlled* Synchromesh helps the expert to make a good gear change and prevents the learner making a bad one. Steering is accurate and shock-free. All controls are handy and light. **COMFORT** Body Conformity front seats. Exceptional leg-room and head-room No-Draught Ventilation and sliding roofs on de luxe models. Ample luggage space. **QUIETNESS** Great success has been achieved in the prevention and insulation of car noises.

Separate booklets on all models and an interesting book "Engineering Leadership" will gladly be sent on request. Vauxhall Motors Ltd., Luton, Beds.

PUTTING OR DRIVING?

Cotton Defeats the Ladies

By E. R. TIPPLE

IS a first-class woman golfer as proficient as a first-class man? Obviously not, because of the difference in physique. On level terms the man would win practically every time. But, in receipt of varying handicap allowances, the women usually defeat the men in their annual match at Stoke Poges. An amateur finds it extremely difficult to concede six strokes in an eighteen holes game with a leading member of the feminine ranks. How would a professional fare in such a game? His task would be easier than the amateur's, and, unless he was very much off form, he would not be beaten. But if he had to play three outstanding women golfers, what then?

To answer that question an entirely new kind of exhibition match was arranged at the Maylands course, Essex, in aid of Mr. Robert Middlemas's Fairplay Fund—which has provided thousands of poor children with daily outings in the country—and Henry Cotton played the best ball of Lady Heathcoat-Amory, formerly Miss Joyce Wethered, Miss Enid Wilson and Mme. Rene Lacoste, better known as Simone Thion de la Chaume. These famous feminine players between them had won 29 national championships and the former two in particular had no equal when they were at their best. Beforehand opinion as to the result was sharply divided. Some said Cotton would win comfortably; others that he had not a chance.

It was felt that Cotton's great length off the tee would prove too big a handicap even for these three illustrious players, for they all had to use the back teeing-grounds. There were four holes on the course that were quite beyond the reach of any woman golfer in two shots. So those holes were written off as certain losses. Cotton certainly did outdrive his opponents—in some instances by as much as 80yds.—but he won only one of these long holes. He fared better at the short ones, winning two, which was contrary to expectation. His length did not give him the victory. An inspired spell of deadly putting brought about the women's downfall.

Great length is not so essential as some would believe. Naturally it is very exhilarating to hit the ball nearly 300yds., but when all is said and done the finishing of the hole is what matters—the approaching and putting. The team of three did not combine to help each other on the greens. They were not at their best, so that Cotton's task was not really as difficult as it had appeared in cold print. Both Lady Heathcoat-Amory and Miss Enid Wilson drove magnificently and with admirable consistency, but they threw away chances by inaccurate seconds and very indifferent putting. The common fault of being over-anxious to be up to the flag with their seconds caused many of their shots to finish beyond the green. It was noticeable that when their shots pitched, the ball ran on for several yards, whilst Cotton's ball stopped dead on the greens, often jumping back a few feet. Even the very best woman golfer finds it difficult to put that vital "stop" on the ball with the iron clubs. Lack of strength in the wrists and forearms is no doubt the reason for this.

Lady Heathcoat-Amory, with that delightfully graceful, rhythmic swing—and hickory-shafted clubs—obtained length with the minimum of effort. As a contrast, Miss Wilson, in characteristic fashion, hurled herself at the ball, putting every ounce of her weight into each shot, showing that there are a variety of ways of hitting a golf ball. If they made little Madame Lacoste appear almost insignificant off the tee, the dainty Frenchwoman showed them how to putt. Her partners, using steel putters, jabbed at the ball and appeared as uncomfortable as they must have felt. But Madame Lacoste, with a big flat wooden-headed putter, made famous by Jean Gassiat, the former French Open Champion, was confidence personified. First finger of the right hand pointing down the shaft, a short back swing and a pronounced follow through, head kept well down, feet fairly close together, was her successful method. She won the first hole for her side—the ninth—by sinking a putt of quite 6yds. for a "birdie" three, and kept Cotton at bay for several more holes by her long accurate seconds followed by her sound displays on the greens.

Madame Lacoste was, without exception, yards behind the others off the tee, but when within range her next shot finished on the green. With the assistance of their greater length her partners failed to be so accurate. Their best ball was 71 against the bogey of 74. Good, but not good enough when Cotton returns a 67. The former Open Champion made only two slips in an otherwise perfect display of skill. After a disappointing season Cotton was the old Cotton who restored the prestige of British golf. His swing seemed more graceful than ever, and the power was imparted without apparent effort. In this round his putting was above reproach—in contrast to his performances in the tournaments. With his feet still left wide apart, legs straight, he swung the putter firmly and followed through as if he wanted to hit the ball a second time. Four single putts on four consecutive greens removed all doubt as to who would win this unusual match.

The game attracted so much interest that another is possible. If he won again then another woman might be called in to increase the partnership, then another, until the women triumphed! In fairness to the women, the venue of such a match is important. A course with long carries off the tee would make it impossible for them, and the playing conditions—hard or soft ground—could be important also. But no team of women golfers, whatever the number, would beat Cotton or any other first-class professional unless they putted exceptionally well. Putting may not be as thrilling as long driving, but it produces the required results.

FIELD TRIALS

Retrievers at Lockeridge

THE Western Counties and South Wales Working Retriever Society's trials were held at Lockeridge, near Marlborough, on October 5th and 6th, by kind permission of Mr. A. B. Simpson. The judges were Sir John Goodwin, Mr. R. G. Heaton and Mr. H. Saunders. No doubt the weather on the first day accounted for some of the moderate work shown, but it does not follow that because the work was poor the dogs are necessarily so. The fact should not be forgotten that field trials often take place when the wise shooting man goes home. On the other hand, though the conditions may be far from pleasant, qualities in dogs may be brought out which, under different circumstances, might not be discovered.

In the case of the winner of the All-aged Stake, Avishay's Brush, a golden retriever, the weather was a matter of entire indifference. Whatever he had to do, he did it with care combined with enjoyment, and proved himself a real all-weather dog. I don't believe he lost a bird all day. He made what other dogs found difficult look quite easy.

I noticed in some cases handlers were not putting sufficient trust in their dogs. When walking up too much restraint was being put upon them, and quite needlessly, so far as I could see. Love of hunting and courage should not be confused with excitement. The more interest a dog takes in what is going on around him the better dog he will be. Again, to be critical, I thought there was too much unnecessary whistling—of which, in many cases, little heed was taken.

Colwill Diamond, winner of the Non-winners' Stake, was an exception without a doubt—an exceptionally nice dog this, and it was easy to see that he had been very well broken by his handler, F. Clarke. There is no more important time in a puppy's life than when he is learning to hunt, and if I may be allowed again to criticise, I thought he should have been allowed a bit more licence on occasions to concentrate on the good work he was doing rather than have his attention diverted from it. He is under perfect control. We were walking roots the whole time, and Mr. Garner, the head-keeper, had made admirable arrangements. There was a good stock of partridges, due, as he informed me, to the Euston system, which has been most successful on the estate. Results:

ALL-AGED STAKE.—1st, Mrs. Hextall's d. Avishay's Brush; 2nd, Miss Despencer-Robertson's b. Painted Lady of Wilbury; 3rd, Dr. Collins's d. Colwill Diamond. Reserve, Mr. Simpson's d. Bill of Upper Lodge. Certificates of merit: Miss Bickerton's d. Shelsley Mickey and Miss Newton Deakin's b. Silence of Tone.

NON-WINNERS' STAKE.—1st, Dr. Collins's d. Colwill Diamond; 2nd, Mr. Simpson's d. Roy of Upper Lodge; 3rd, Colonel Cotgrave's b. Tickle. Reserve, Major Despencer-Robertson's d. Peter Pilot of Wilbury. Certificate of merit, K. Malcolm's d. John of Glenmorag.

ERNEST TURNER.

COCKERS AT ROSSMORE PARK

THE Cocker Spaniel Club of Ireland held their eighth annual field trial meeting at Rossmore Park, Monaghan, on Saturday, October 1st, by kind permission of Lord Rossmore. The judges were Mr. J. Scoff and Mr. P. Taylor. Results:

OPEN (ALL-AGED) STAKE (COCKERS ONLY).—Equal 1st, Miss Hardy's b. F.T. Ch. Carramore Avril; equal 1st, Dr. Dawson's d. Flush of Fews; 3rd, Mr. Clarke's d. Puca of Fews. Reserve, Mr. Clarke's d. Beats Shaun. Certificates of merit: Miss Fagan's d. Lick Bla Blaze, Mrs. Scott-Moore's d. Irish Michael, Miss Fagan's b. Indigo Jane, Mrs. Scott-Moore's b. Dowery.

IN TOUCH

The Rugby Football Annual

WE live in a queer world. Because a European dictator sees fit to juggle with an obscure portion of the same continent to which few of us have ever been and of whose population it is probable that we know no single specimen, it becomes necessary in England for the Old Cranleighans and United Services to scratch their Rugby football fixtures for a week and hosts of other teams to play comparatively hotch-potch teams.

I suppose it is ungrateful to complain, however, for many of those who will now be doing sterling work again as though nothing had happened might very well have left only their names to a brief immortality—if I may be excused the paradox—among the *Rugby Football Annual* obituary notices.

And this brings me to the point at which I have been aiming since I commenced—the *Rugby Football Annual* (published by Sporting Handbooks, Ltd., 12, Warwick Lane, E.C. 4). So often with reference books it takes an age to find what is required in the midst of an ocean of trivialities which seem to have burrowed their way into the wrong half of the book. It is not so here. What is wanted is where it is expected to be and is set down clearly and concisely.

I will admit that I spent the best part of an hour (when I should have been working at something else) dipping into this book. Being left-handed I started at the back and soon found myself reading right through the "Rugby History in Brief," where I found a number of interesting things. For instance in 1871 there was played on March 27th the first match between England (F. Stokes, captain) and Scotland (the Hon. F. I. Moncrieff, captain). Twenty-a-side played—13 forwards, 3 half-backs, 1 three-quarter and 3 full-backs.

I passed over a page or two more and there I found the Rules of the game. I have played Rugby for a number of years and have always been fully alive to my reprehensible lack of knowledge of the laws, but I am no longer ashamed of my ignorance, for the rules cover 27 pages, and it takes more than my memory to recall a tithe of them even in an armchair much less in the heat of battle.

One thing I found that did amuse me—a note appended to the scrummage laws which reads: "Referees should stop the dangerous practice of players forming down some distance apart and rushing together, and deal with it under Law 34 (a) (3)." I waded to law 34 (a) (3) dealing with "Illegal tackling, pushing, charging or obstructing," the penalty for which, I read, was that the "Referee shall award a penalty kick at the place of infringement (subject to Law 20 (f)), and on the first offence shall either caution the player or order him off the playing enclosure. For the second offence he *must* order him off." The wretched referee ordering the whole issue of forwards off the "playing enclosure" on their second onslaught would be highly entertaining.

I am not morbid by nature, but the obituaries held my attention for a long while. The very first two were at once interesting, for they were the names of T. Anderson, who had the unique distinction of representing Scotland at both Rugby and cricket while still at school, and G. C. Beresford, the original M'Turk of *Stalky & Co.* His love of rugger may not have been very pronounced, but his connection with Kipling gives an excuse for quoting the latter's sole description of a rugger match: "The technique of that match belongs to a bygone age. Scrimmages were tight and enduring; hacking was direct and to the purpose; and round the scrimmages stood the school, crying 'Put down your heads and shove!' Towards the end everybody lost all sense of decency, and mothers of day-boys too close to the touch line heard language not included in the bills. No one was actually carried off the field, but both sides felt happier when time was called, and Beetle helped Stalky and M'Turk into their overcoats. The two had met in the many-legged heart of things and, as Stalky said, had 'done each other proud.'"

So I might go on for several columns, but it cannot be. I can only recommend readers to invest 2/6 and buy a copy of the Annual for themselves—it will not be money wasted.

L. N. R.

We have been asked to rectify a printer's error in the Wolfschmidt Riga Kummel advertisement which appeared in the *Field*, October 1. The line "The original Kummel from Riga since 1857," should read since 1847.

WHY REMAIN GREY?

FREE TREATISE

Nothing is more ageing than prematurely greyed hair, and until recently few things were more difficult to combat. The woman of taste disliked the idea of hair dyes because they were hard and artificial in effect, yet there was no other treatment available.

Now science has discovered a way to bring back the colour and gloss to faded hair by natural methods. That not only restores the colour, but tones up the scalp and promotes the growth of new hair—that re-creates naturally your hair's real colour and beauty from root to tip, no matter how long the greyness has existed.

You'll find the secret of how to look five, ten, fifteen years younger between the slim covers of the Boudoir Book.

It will be sent free on request.

TOTALITARIAN CLIMBING

A Game not Worth the Candle

By C. F. MEADE

THE last and most celebrated of the great unclimbed precipices in the Alps was ascended this summer when two young Germans and two young Austrians succeeded in engineering their way up the north face of the Eiger.

This ice-bound, avalanche-swept wall, towering 10,000ft. above Grindelwald, has proved even more destructive to its assailants than has the north face of the Grandes Jorasses, and ten lives have been sacrificed on it. The extraordinary publicity obtained from the Press has long ago made the attempts upon this side of the mountain notorious, and the prohibition issued by the cantonal government had to be withdrawn. Indeed, it was evident that Swiss disapproval was actually a stimulus to the Nazi and Fascist devotees, who fluttered frantically round the lethal candle without pausing to consider whether the game might be worth it.

Probably the news that "the enemy" had arrived in the neighbourhood accelerated the German plan of attack. At any rate, the party were aware that two Italians, flushed with triumph after spending three nights out, suspended in bags on the vast precipice of the Grandes Jorasses, were now hurrying to Grindelwald in the hope of adding to their laurels by "conquering" the Eiger. Finally, all the conditions seemed favourable; the weather was good, and never before had such a flood of publicity so garishly illuminated the great mountain. As an official journal of the Italian Alpine Club said, these young German gladiators had cause for satisfaction in the universal attention they were attracting. Even an unsuccessful attempt would secure them a prodigious advertisement, personal as well as national. In fact, the stage was well set, and nothing was wanting; preparations were even made for illustrating the story of the ascent with photographs taken from an aeroplane.

From the moment of departure all went well, and the climbers made rapid progress. Those who had fallen in previous campaigns had shown the way. The dreaded middle portion of the ascent, beginning at about 10,800ft., and consisting of an absolutely overhanging precipice, was audaciously and skilfully skirted by ascending to the left. As a sequel to this desperate work 700ft. of merely vertical cliff must have seemed almost a relief, and after it an ice-slope of some 500ft. led the party to the summit of the mountain, not, however, before one of their number had been severely wounded by a falling stone.

We are not told how many ice- and rock-*pitons* were used during the climb, but it is stated that altogether there were no fewer than three bivouacs on the face. Bad weather is mentioned in the final stages of the ascent, and admittedly the whole performance is a gamble undertaken in the hope that during at least three days the weather may never be sufficiently bad to overwhelm the whole party as has happened in the past.

What is to be said of such an exploit? What is in fact foolhardiness cannot be excused under the heading of national advertisement, and the fact that the supply of new Alpine climbs is becoming exhausted should make us thankful—if only for the sake of the guides. The latter, although they are not totalitarians, yet feel an honourable obligation to face the appalling danger of rescuing the casualties in such expeditions as the ascent of the north face of the Eiger.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

MARSALA is to an even greater degree than port and sherry, a wine which owes its popularity to the enterprise of English wine merchants. It had never been heard of until a Mr. John Woodhouse settled in Sicily during the second half of the eighteenth century; it was he who shipped to London, in the year 1773, the first Sicilian wines to which he had added some of the local Sicilian brandy to help it bear the sea voyage.

The wine was received with favour; it was something new and it was very inexpensive. During the Napoleonic wars, Nelson purchased large quantities of Marsala for the Mediterranean Fleet, and in 1812 Benjamin Ingham laid the foundation of the firm of Ingham, Whittaker. He was followed, in 1832, by Vincenzo Florio, the founder of the House of Florio. These firms share the trade in Marsala wines.

Marsala is made from two sorts of Sicilian grapes, quite distinct from all other Italian grapes, the Catarratto and Inzolia, grown on volcanic soil also peculiar to Sicily. It is a blended wine made up to the standard of definite "marks," a fact that ensures its regularity of quality and its comparatively low price.

Falerno and Lacrima Cristi are much older wines than Marsala, the Falerno being accepted as the direct heir to the Falernian so dear to Horace and many of the poets of classical Rome. Both wines are also made from vines growing on volcanic soil, under the shadow of Vesuvius, not far from Naples. The wines of the Island of Capri, in the Bay of Naples, are more popular to-day than either the Falerno or Lacrima Cristi. This small and delightful island produces both red and white wines, but its vinous reputation rests upon its white wines, wines of a rich amber colour and a pleasant dry finish.

Further north, the Latium or Roman province is one of the largest wine-producing provinces of Italy. Its best known wines are those of Frascati, Albano and Genzano, and there are many other local wines known under the name of *Castelli Romani* which are quite pleasing when young and consumed in Rome or in Italy, but they are not good travellers.

Between the Latium and Tuscany, in Umbria and the Marches, the vine flourishes among some of the most picturesque of the old walled cities of Italy, and there are many local wines which are a surprise and a joy to the tourist who meets them for the first time on their own heath. There is also a white wine from those parts with more than local reputation: it is the white wine of Orvieto of which there are two kinds, the *secco* and the *abboccato*, the dry and the sweet.

Further east, in Apulia, the province which fills the "heel of the boot" of Italy, there is also much wine made, mostly red. In the Gioja del Colle and Altamura districts there is a light and pleasant red wine, which is known by the name of the grape from which it is made, the Primitivo, but the better known wines, those of Trani, Bari and Barletta, are full-bodied, dark red wines more suitable for blending purposes than the enjoyment of epicures.

Why not enjoy sunshine this Winter instead of fog and sleet and biting winds? Exchange the familiar social routine or business round for new scenes and novel experiences in an atmosphere which is different yet not foreign.

Visit South Africa. See the majesty of this golden land where Nature works on a gigantic scale and where you can follow your favourite recreations, such as riding and golf, fishing and surfing. Experience the physical and spiritual exaltation that springs from days spent in glorious sunshine and air like champagne.

Eight weeks will be sufficient to ensure a comfortable visit to South Africa, including four weeks of delightful fair-weather cruising out and back. The cost will not put an unduly heavy strain on your pocket. Illustrated publications are obtainable from the South African Travel Bureau, Trafalgar Square, London, W.C.2.

FIFTY YEARS AGO

From the *Field* of October 13th, 1888

ANIMAL TAMERS.—"Within a comparatively recent period wild beast performers have been in sufficient jeopardy to afford no inconsiderable amount of amusement to that section of the public who love to see others run risks they would not encounter themselves at any price. It has been left to M. Peronnet, 'the crocodile tamer' of Bona, Algiers, to make himself the subject of the latest sensation. A man who habitually plays with seventy crocodiles necessarily carries his life in his hands; and, in spite of the precaution of wearing sea boots and carrying a stick, the encounter in which the tamer has been engaged can scarcely come within the category of the unexpected. M. Peronnet used to feed his pets at stated times, and on this particular occasion was sitting, as was his wont, on the back of the largest specimen, *à la* Waterton. Becoming too ravenous, one of them tried to snap the food out of the tamer's hands, a second bit him in the stomach; then came a *mauvais quart d'heure* for the tamer and a panic for the spectators, who mostly fled, and thereby showed how very much alike crowds of all nationalities are. Peronnet was badly wounded; but if he survive his injuries he will have had a splendid advertisement."

Puppy Walking.—"To make an estimate of the walks a country may require, it may be taken as a good line that a six-day-a-week country cannot be well hunted without from 75 to 80 couples of hounds in kennel, and to keep up such a body of hounds there should not be less than 80 couples of puppies at walk. Such a number should be easily walked in a country big enough for six days a week. The more ordinary four-days-a-week country can be done with 50 couples of hounds, but it is much more usual to keep 60 couples for such work, and 60 couples of puppies should be walked for such a pack. Three days a week cannot be done with less than 45 couples, and this is as good a number as any to make a good pack out of, with 50 couples of puppies at walk. Of the many packs I see, though averaging from 45 to 50 couples, the usual number of puppies I am told of as being walked in the country is from 28 to 30 couples. Now, this is the reason why so many packs go down in their fashionable repute, and in nine cases out of ten it is the fault of the committees or the Masters. There has been a sort of coolness or neglect in keeping up the walks, and perhaps the numbers have decreased from 100 to 60."

THE ANTIQUE DEALERS' FAIR AND EXHIBITION

THIS fifth fair, at Grosvenor House, Park Lane, is being held from October 27th to November 11th. It promises to be of even greater value than the previous ones to collectors and all interested in antiques and works of art, the dealers having reserved many pieces of outstanding interest to exhibit and sell. The Marquess of Willingdon is opening the fair on October 27th, at 3.15, and the private and Press view is from 10.30 to 5 p.m. of that day. Those who have visited the previous fairs will know how artistic is its general appearance, and how well arranged the stands are, and how freely would-be purchasers are able to view and handle the exhibits, and with what joy the exhibitors dispense their great knowledge of the lovely things they offer for sale. The genuineness of every piece, as heretofore, is guaranteed, as each exhibit has to be passed by an advisory committee of experts on every class of antiques. They have full powers to reject any article which was not made prior to the year 1830, and is not of the period it is represented to be.

The present time is one which gives the buyers an opportunity of purchasing fine goods at rather less than their cost twelve months ago, and genuine pieces can be had at figures which should prove a profitable and safe investment in the years to come.

A NATURALIST'S NOTEBOOK

EVERY year round about this time there appears from His Majesty's Stationery Office, at the extremely modest price of 6d., the report of the Committee on Bird Sanctuaries in the Royal Parks of England. I do not know any more interesting annual publication than this. And it is particularly interesting to those who like myself are forced by the exigencies of life to spend the major part of the year or the whole year in London when we would so very much rather be living somewhere else.

* * *

I think that the most astonishing record this year is that of a pair of waxwings in Kew Gardens on March 30th. These birds, of course, are already recorded in *British Birds*; but the record has probably been forgotten by most people. It is, I think, all the more astonishing because of the date, and it would be most interesting to know what other records there are for waxwings so late in the spring. The waxwing is an irregular visitor now, and, though the books say from October until March, I would expect the majority of records to be between October and January. Last year, of course, there was quite an irruption, but even so I find this record for the end of March and in London of the greatest interest.

* * *

Other not uninteresting records are for a woodcock in the sanctuary in Kensington Gardens on October 30th, for a lesser spotted woodpecker on November 7th in the Broad Walk, which bird I myself saw on the following day, and for a mynah, an escape from captivity, which frequented the banks of Longwater for some weeks in the autumn.

* * *

The rather heavy gales of January produced a visit from a red-necked grebe which spent about ten days on the Round Pond in Kensington Gardens, which appears to be the first record for London; and a five days' visit to the Serpentine from a Slavonian grebe, this being the second London record. Against this there is the disappearance of the nightingale from both Bushey and Hampton Court, though the bird has reappeared in Richmond Park and has also been seen in Greenwich Park.

* * *

I wonder how many people really realise the tremendous variety of bird life which the largest (if it is still the largest) city in the world can boast. One gets so used to the London pigeon and the London sparrows and the London starlings that the average person does not expect to see any other birds, except those which are normal to ornamental waters, and which most people regard as captive. But a very great number of birds on the British list pay visits of varying duration to London at some time or another in the year, and a great many more pass over. I have stood in a quiet London street at night listening to the cries of curlew passing overhead, and I have heard in the night cries that I have not been able to recognise from flocks passing from the Far North to winter in the sunshine.

* * *

Normally such cries are drowned in the stream of traffic and London machinery. And normally, too, very very few people look upward in this modern world, and, walking with their eyes fixed in front of them or cast down to their boots, see nothing of the wild life around them. Every now and again one does see sights which, if not uncommon in the bird world, are sufficiently thrilling for a mere Londoner engaged about his business. I very well remember seeing twelve herons flying at no great height above one of London's main arterial roads. They flew more or less in line, with slow, heavy wing beats, but at a great pace; and were on a course which must have taken them, if they held to it, very well over the West End of London, and as they flew strong sunlight struck lavender from their greyish backs. And I have seen a wheatear on the bridge in St. James's Park; that was on March 8th of this year, and I can remember that I was excited about it for a very long time.

* * *

At the same time it must be remembered—and reading this report it is easy to forget—that the normal birds of London are the pigeons, the starlings and the sparrows. Personally, I dislike London pigeons, and am not too fond of London sparrows, though I like both pigeons and sparrows in the country. But starlings I love, and particularly in autumn when their chatter is music over London's hum in the trees of Leicester Square, on Charing Cross, and in the quiet square of Lincoln's Inn.

* * *

Every year as I read this report I swear most solemnly to myself to keep my eyes open wider in the following year. And I believe I do and every year when the report comes out I am astonished anew. And that says a great deal for the people who make up the report.

B. V-F.

LETTERS TO THE EDITOR

THE LITTLE OWL

SIR,—In the article on the above subject by Mr. Vesey-Fitzgerald, published in your columns on October 1st, he says that "those whom one may take to be completely unbiased prove him (the little owl) guiltless; those whom it will be difficult to prove unbiased, claim him guilty."

I can only presume that poultry-keepers and game preservers are intended to be included in the latter category, and I therefore write to say that the British Field Sports Society, as representing the game preservers, was itself entirely unbiased until it had carried out its own inquiry into the subject, the results of which were published in 1935. In addition, as we are accused of being biased, I think it is only fair that your readers should be made aware of certain facts with regard to the views on field sports of those whom the writer of the article describes as "completely unbiased." In actual fact, the name of Miss Alice Hibbert-Ware, who wrote the report of the recent inquiry and acted as analyst, has appeared for some years amongst the list of subscribers to a society which is bitterly opposed to all that the British Field Sports Society represents, whilst Dr. W. E. Collinge, who is one of the signatories of the Foreword of the Report, is a Vice-President of the same society.

I may say in ordinary circumstances I should have preferred not to refer to these matters, but in view of the accusation of bias, I feel that it is essential that they should be made public.

The article referred to also says that "one is tempted to ask whether the evidence which is furnished immediately the inquiry closes was forwarded to that inquiry for independent investigation." This, of course, I cannot answer, but in the report there is a complaint that "in spite of special appeals being made to them, people interested in game took part in the inquiry to a very limited extent."

I should, therefore, like to make it clear that the British Field Sports Society was never approached to assist in this inquiry, although our own report showed that we were in an ideal position to do so. Is it possible that the organisers were "biased" against the society?

The society, however, has no wish to see the little owl exterminated, but is extremely anxious that those who suffer from its depredations should be allowed to defend themselves and that it should not be possible, as happened in 1934, for a keeper to be summoned and fined for shooting a little owl whilst it was actually carrying away a pheasant poult in its claws.

Yours faithfully,
JAMES W. FITZWILLIAM
(Secretary).

British Field Sports Society,
3, St. James's Square,
London, S.W. 1.

PONIES AND MOTORISTS

SIR,—Is it possible to save the ponies of the New Forest from being maimed and destroyed by inconsiderate motorists? While passing along the Lyndhurst—Southampton Road on September 7th I was distressed to see a lovely little colt knocked down and its leg broken by a car driven at nearly forty miles an hour. Despite the fact that there were mares and foals grazing on both sides of the road, liable to cross at any moment, the motorist was quite unable to see that he had committed any enormity; and so ignorant was he that he could not credit the fact when I told him the animal's leg was broken and it would have to be destroyed. To make matters worse no official could be found nearer than Lymington, ten miles away, to attend to the matter; and when he came could do nothing without the help of a couple of "marksmen," or forest rangers—who were apparently very difficult to find—to lasso the pony before it could be destroyed. After waiting one-and-a-half hours unavailingly to see this done I was obliged to continue my journey, but the memory of that terrified little creature dragging its broken leg haunts me still.

A resident of the forest, who noticed my distress, told me that nearly a hundred of these unfortunate animals have been killed in this way since the beginning of the year. (One mare was left for four hours, with both hind legs broken, before anyone could be found to destroy her!)

We have innumerable powerful societies for the welfare of animals—the R.S.P.C.A., the Animals' Welfare League, the Institute of the Horse, to mention only a few. Why cannot these for once pool their vast resources and their influence in order to put an end to such a disgraceful state of things? If, as the law stands, it is impossible to insist on a 30-mile speed limit through the forest, it would be simple to promulgate a special Bill to this end. What is the Hon. Member for South Hants doing in this respect? In the meantime a qualified veterinary official installed at Lyndhurst, two or three more rangers on the forest roads, and numerous warning notices to motorists on both sides of all roads, would have great effect in lessening the toll of suffering.

Yours faithfully,
EVA DUNBAR.

Ashill House,
Ilminster, Som.

THE ARMANT DOG

SIR,—In the course of research into the origins of sporting dogs, I have come across a number of references to the Armant dogs of Egypt. This sheepdog or watchdog dates from Napoleonic times and appears to be of Alsatian origin, but was subsequently crossed with the native dogs of Egypt. The head usually resembles that of an Alsatian, although I have seen an Armant which resembled a woolly sheepdog.

Can any reader tell me whether these dogs have ever been broken to the gun or used for any sporting purposes? In view of the Egyptian State Tourist Department's plan for developing shooting in that country for visiting sportsmen, it would be interesting to know whether this dog could not be turned into an efficient gundog. It is cumbersome and difficult to take a gundog from England to Egypt because of the obvious regulations of quarantine, customs, and so forth. This is where it seems to me that the Armant dog, properly trained, could be put to a very useful purpose in a country which abounds with wildfowl of every description and can offer some of the finest shooting in the world.

The Armant can be grey, fawn or black in colour, and is of medium size. It is a muscular, deep-chested type and very much a one-man dog. The eyes, which are hazel in colour, take on an unusually timid expression when the dog is with its master, but the moment a stranger appears this expression changes entirely. It can be one of the fiercest of all dogs, and as a watchdog or sheepdog it probably has no equal anywhere. With this heritage of intelligence, hardihood and individual character, the Armant surely could be put to good sporting uses.

The Arabs know how to handle them, but I doubt if any Englishman could make the most of one of these dogs unless he lived on the spot all the year round or took the trouble to introduce it to this country and develop it here. It is a highly individual breed and although it cannot claim anything like the ancestry of the Saluki, it nevertheless merits attention as an outstanding indigenous type.

Yours faithfully,
J. WENTWORTH DAY.

St. James's, S.W. 1.

A FEATHER FLOAT

SIR,—Possibly the following method which I have recently devised and used with much success in dealing with recalcitrant fish late in the season is already known to experienced fishermen, but it may, nevertheless, be of interest to some of your readers. Every chalk-stream fisherman knows those days, particularly towards the end of the season, when the water may be ringed with "rises," and every dry fly in the collection may be offered without result to fish that are manifestly feeding below the surface. "Nymphing" is not very practical unless one can actually see the fish and therefore observe when it takes the bait, and in low clear water they will not permit the fisherman near enough to make this possible.

May I suggest the following method of dealing with the situation?

Tie a long 4X point with a blood knot, leaving 3in. projecting after the manner of a point in wet-fly fishing. To this attach the largest dry fly of suitable pattern, preferably one of Lunn's long hackled type or a "Ride-Right" with ample flotation, and on the end of the cast the equivalent nymph. The moment the fish takes the nymph the surface fly will drag visibly and in a different manner from the ordinary drag applied by the line.

The incurably orthodox may be shocked, so much so that it may be necessary to invent a name for this type of fishing. It could be said that fly fishing will have turned a complete circle back to the float, but it is very delicate float fishing indeed, and surely excusable late in the season when hand-reared fish are better out of the river.

Yours faithfully,
G. O. J. FAIREY.

Bossington House,
near Stockbridge, Hants.

BIRDS OF CENTRAL GERMANY

SIR,—Midway between Kassel and Marburg—the town associated with the life history of Martin Luther—lies Bad Wildungen, a little town in the woods famous for its waters; there I spent the best part of August. I was struck by the great variety of birds that are to be found in this district.

Within a radius of one mile from my hotel I identified in the course of two days no less than 35 species of birds, namely, song thrush, blackbird, black redstart, robin, garden warbler, goldcrest, nuthatch, great tit, marsh tit, coal tit, crested tit, blue tit, long-tailed tit, tree creeper, water wagtail, grey wagtail, spotted flycatcher, swallow, house martin, swift, greenfinch, serin, hawfinch, bullfinch, goldfinch, chaffinch, house sparrow, linnet, crossbill, yellowhammer, green woodpecker, great spotted woodpecker, jay, buzzard, redbacked shrike. The most common bird was the black redstart (I saw no ordinary redstart); the least common the house sparrow.

In addition to the above species, there were numerous other warblers which I lacked the time to identify, and I was told that only a few miles away the bluethroat (*Cyanosylvia suecica*) too is to be found.

Soaring over the Edersee—a lake that lies at a distance of about ten miles from Bad Wildungen—I saw the kite, very appropriately called "der rote Milan" by the natives, a bird almost extinct in Britain. The weather could not have been more favourable for observation. The white head of the bird, the reddish plumage of the upper parts and the forked tail were clearly discernible in the brilliant light of the day. It would be interesting to learn if any of your readers have ever seen such great a variety of birds in so small a circle, particularly so many song birds, including such comparatively rare species as the goldcrest and the crested tit. Not only was the variety great, but so also was the number of individual birds. I ascribe these conditions mainly to the numerous nesting boxes provided by the local inhabitants.

Yours faithfully,
A. A. JUCKER.

Union Club,
Manchester 2.

AN APPEAL TO TROUT FISHERIES

SIR,—During the next few months many owners of trout fisheries will be netting their streams for coarse fish and grayling. In the ordinary course of events the probable fate of these fish would be burial in the banks, or, at best, conversion into fish manure. This wholesale waste of fish life, which no doubt the owners themselves are the first to deplore, is the more regrettable when it is realised that there are many coarse-fish angling clubs who would joyfully welcome such an addition to their stock.

I should, therefore, be very grateful for the help of your columns in promoting a scheme for remedying this sorry state of affairs by bringing together the sources of supply and demand.

Briefly, the idea of this association is to invite owners of trout fisheries to notify us of the dates when it is proposed to undertake netting operations. The association will then get into touch with the secretary of the angling club nearest to the water in question, informing him that the fish are to be had for the asking if he cares to send suitable transport.

This, of course, is only the bare skeleton of the plan, and it is fully realised that there are several difficulties in the way of its practical operation. One which will at once occur to mind, for instance, is that netting operations are necessarily dependent on the weather. But this and other difficulties can doubtless be overcome in the light of further experience, and with the goodwill of all parties to the transaction. The chief thing at present is to make a start.

With this object, therefore, I ask those owners of trout fisheries and secretaries of angling associations who may be interested, to communicate with me at the address below. I need scarcely add that any suggestions for the practical application of the scheme will also be most cordially welcomed.

Yours faithfully,
C. F. WALKER
(Secretary, National Association of Fishery Boards).

Room No. 639, Grand Buildings,
Trafalgar Square, London, W.C. 2.

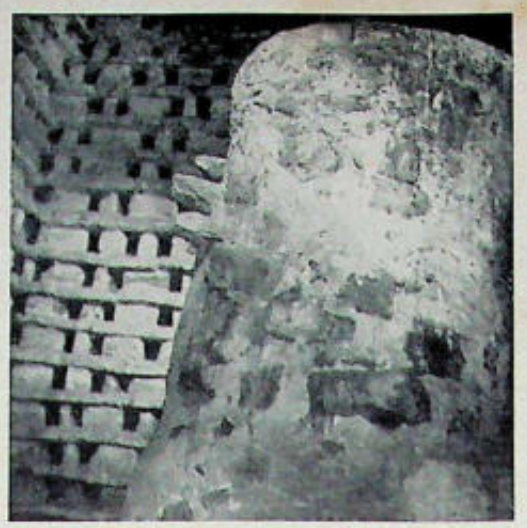
A HEIFER'S HOMING INSTINCT

SIR,—The following instance of the homing instinct in animals seems worth recording. On September 5th a three-year-old heifer was taken by lorry to Gloucester Market from the farm at Oxlinch, where she had been born and which she had never left. She was bought in the market and taken by train to Dudbridge Station and was one of a dozen cattle turned out for the night in a field about one-and-a-half miles from the station. The road and rail journey together would be about 20 miles. She was still in the field at 7 a.m., Tuesday morning, but had got out by 8.30.

Just when she got home is not known, but she was in the field from which she was taken the previous morning by 6 p.m. Tuesday night. She must have walked at least six miles to reach home and gone over ground rising 700ft. to do so, and the contour of the ground makes it quite impossible for her to have seen anything visible from her home field.

Yours faithfully,
W. F. B. WARMAN.

The Woodlands,
Stroud, Glos.



AN EARLY SEVENTEENTH-CENTURY COLUMBARIUM
(*See letter "The Penmon Dovecote"*)

THE PENMON DOVECOTE

SIR,—I enclose two photographs, which I hope you may think worth printing, of the very unusual columbarium at Penmon Priory in Anglesey. I think that the privilege of keeping pigeons, which in the Middle Ages was restricted to lords of the manor and great monastic and other Church establishments, was by the reign of Elizabeth abolished, with the result that many more dovecotes were built. At any rate, there are a good many still existing of the sixteenth and seventeenth centuries, although many are unfortunately being allowed to fall into decay.

This one, attached to the Priory of Penmon, was no doubt of early seventeenth century date, as the barn adjoining, which blocks the east window of the dovecote, bears the date 1637. The whole range is built of stone, probably obtained from the ruins of the Priory buildings, which were allowed to decay after the Dissolution in 1536.

As will be seen, it is a square building, 25ft. across and 20ft. high to the eaves, from whence there springs a stone vaulted roof. In the apex is a circular opening, covered by a cupola. The interior is lined with the usual nesting holes, in nineteen tiers, and it is said that of these there are nearly a thousand, perhaps a record number. There is a window in each wall and a narrow doorway to give entrance.

But the feature which I think must be unique is the stone potence, a thick stone pillar, with the remains of some of the steps by which it was climbed to reach each nest. The usual form of potence is, of course, the revolving ladder fixed to a central post running up to the roof of the building, of which a fair number remain in some of the circular dovecotes of the Middle Ages.

The second photograph, taken from the door of the Penmon dovecote, shows this massive central pillar, which is large enough for several people to stand upon at once, some of the projecting stone steps by which it can still be climbed and a corner of the inner walls with the nesting boxes.

Yours faithfully,
M. W.

Mordiford,
Hereford.

LETTERS TO YOUNG SHOOTERS

SIR,—The letter of Mr. John E. Howard (*Field*, September 3rd, 1938) is important and interesting, and reminds me of an almost identical experience many years ago. The explanation of the gun going off was that my Norfolk jacket had "leather knot" buttons instead of bone buttons. Repeated experiments with the two kinds satisfied me that the "knot" button is a real danger, particularly if the head and shoulders are turned to look back. I have many times since demonstrated to other "guns" so equipped this possible danger; and one and all have made the change to bone buttons. If the sleeve also has buttons these should not be forgotten. The reason appears to be that the knot button does not easily disengage itself. It would be interesting to know if Mr. Howard had leather or bone buttons.

Yours faithfully,
C. B. HEALD.

27, Park Crescent,
Portland Place, W. 1.

KING JOHN'S HUNTING LODGE

SIR,—Reading in a recent issue of the *Field* the notice of "Henry VII's Hunting Box," I write to correct the statements of your correspondent. For generations it was in my family's estate of Dogmersfield, the head keeper's house, and always known as "King John's Hunting Lodge." The present Odiham Wood (?)—the corruption by the Hampshire dialect of "Woodiham"—is the remains of a vast forest, formerly a royal game preserve, where King John hunted when in residence at Odiham Castle—a single bastion of which still stands. It was from Odiham Castle that the King was fetched by the barons to sign the Magna Charter at Runnymede.

Yours faithfully,
ISABEL ST. JOHN MILDMAY.

The Dower House,
Dogmersfield, Basingstoke.

BULL TERRIER RETRIEVER

SIR,—I was interested to read a letter in the *Field* of August 20th referring to a bull terrier bitch who retrieved. I also have a bull terrier bitch who is as good a rough shooting dog as I have ever known. She will bring to hand any of our game birds, and they are many, with the exception of snipe, and these she will find, but will not pick up.

I recently winged a spar-winged goose, which fell in the middle of a large dam. Jane went in after it, and although the bird was only a few pounds lighter than she, she brought it ashore. When one realises the power of a winged goose in its own element, I think you will agree that this was no mean achievement. She will always retrieve duck from water, but I was doubtful as to the outcome of her scrap with the larger bird.

Frankelin are our commonest game bird, and it is very rarely that Jane fails to get her bird, even though the grass is in many places 5ft. to 6ft. high. One of her best efforts was to "take off" after a guinea fowl which had been brought down, but which got up again, only to be brought to earth once more by the tail from at least 5ft. up.

I could tell of more of her encounters with animals ranging from mice to a wounded roan antelope bull, but your valuable space is limited, and I may be prejudiced.

Yours faithfully,
ALAN J. C. HEWITT.

Makeni Estate,
P.O. Box 10, Lusaka, N.R.

HIGH WATER

SIR,—In your issue of September 17th you publish a letter and photograph from a correspondent, C. M. de Launay, regarding the high-water mark at Abbotsbury on November 23rd, 1824.

From your correspondent's letter it may be thought that prior to November, 1824, the site of the Abbotsbury Swannery was permanently submerged, whereas the high tide which is referred to on the notice at the entrance to the swannery was merely the result of an exceptionally violent storm. Records exist showing that the swannery and the land in the vicinity were, for many centuries before the storm, much as they are to-day. The statement that "in little more than a century, land that was some 22ft. under water is now the scene of Dorset Hills, &c." is not quite correct.

Yours faithfully,
DOUGLAS F. WOODFORD.

The Earl of Ilchester's Estate Office,
Evershot, Dorset.

THE EWE LAMB

SIR,—While fishing a Shropshire stream in the spring I witnessed a curious little comedy. I was eating my lunch, and in an adjoining field were a pony and a ewe with a very small lamb. The latter had evidently strayed from the next pasture. The pony had clearly "taken" to the lamb, which was too small to do more than hobble. At any rate it was bent on keeping mamma away from her baby, and was frisking round the lamb, never kicking, now and then nosing, the little creature which seemed rather to enjoy the attentions. Mamma ewe was plainly worried—and perhaps jealous—and kept bleating sadly. If she tried to get her child away the pony at once followed up and jostled her off in between its own feeds. This went on while I watched for perhaps half an hour, when more serious matters called me away. It struck me as an unusual liking.

Yours faithfully,
J. E. KEMPE.

Knighton,
Radnorshire.

DING DONG WELL

SIR,—The enclosed photograph, taken from below as an Indian well-jumper was falling down a well, may be of interest to your readers.

LOOK OUT! I'M COMING
(*See letter "Ding Dong Well"*)

This feat is performed in several places in India, but is not so well known as snake-charming, the rope trick, fire walking, sitting on spikes and other strange performances.

The jumper leaps into the well, which is about 7ft. in diameter, and falls some 70ft. in the sitting position before striking the water. No attempt is made to dive, and it is questionable whether a dive would be possible in such a restricted space.

The "trade" of well-jumper runs in families, and is practised by male members of all ages.

Yours faithfully,
D. A. BOYLE.

Bude,
North Cornwall.

Watch your step, Mother!

Don't you remember how the Old Man carried on the last time you carried off his Gold Flake? It's all very well saying you like their flavour. So does he. And you appreciate the fine Virginia tobaccos they are made of. So does he—and has done for years before women came into the field and developed the taste for a man's cigarette. Come now, be reasonable, and buy your own Gold Flake in future.

WILLS'S
GOLD FLAKE
is the man's cigarette that women like

N.B. You can get Wills's Gold Flake Cork-tipped as well as Plain. Ten for 6d. Twenty for 1/-

G.F.B. 574

GREY SQUIRRELS

SIR,—In our garden here are several baby trees (chestnuts and nuts), planted some years ago by a grey squirrel who was very friendly with us for a time. The Marquess of Ailesbury takes the usual view that these animals are destructive. I am glad to testify that our visitor left both eggs and small birds in the garden untouched. He learned to come to the bird table and to take food from my hand, and we were sorry when he moved elsewhere.

Yours faithfully,

Fairfield, Burnham, Bucks. GWLADYS MCKENNA.

AN EXCEPTIONAL INDIAN ELEPHANT

SIR,—You may be interested to have the details of a huge rogue elephant which I shot in February, and which must be, if not the record for India, at least something very near it.

The elephant had killed a number of people, and having shot a number of bad elephants under the Elephant Control Scheme of Assam, I had tried to shoot it for nearly a year, but the animal was very cunning. I give below one of the letters reporting some of its depredations as sent in by a timber contractor:

"I have the honour to say that one tusker having one of his tusks broken is giving immense trouble to cartsmen going up beyond Bismuri. He has killed men, buffaloes and wounded some cattle. He roars near about the Lungsung path. Unless this naughty elephant is killed it will be simply impossible to continue the work now.

"I therefore beg, sir, you will be kind enough to arrange for shooting the said elephant."

As it lay, the animal measured 10ft. 10½in. One tusk measured 6ft. ½in., and was 17¾in. in circumference, and the other, which was broken, was 4ft. 11in. and 18in. in circumference.

The footprints, measured on many occasions, were invariably 21¾in., and the circumference of the feet, as checked by Major Darrell-Hill and two other officers of the Cameronians, was 5ft. 4½in. Twice this is usually accepted as coming very close to an elephant's height, and thus it would be 10ft. 9½in.

Yours faithfully,

Calcutta. G. MACKRELL.

SPEARS FOR MONKS

SIR,—This curiously shaped stone, which stands among the gravestones in the churchyard at Alkborough, Lincs, was used by the monks of the neighbouring monastery for sharpening their spears. The sides are worn with the metal, and there are

A USE FOR GRAVESTONES
(See letter "Spears for Monks")

grooves where the points of the spears were rubbed. If one wonders why monks had spears, it should be remembered that this church was built by the three knights who murdered Thomas à Becket as a penance for their crime. Doubtless even peaceful monks needed defensive armaments at times.

Yours faithfully,

Nottingham. EDWARD RICHARDSON.

HOODIE TRAPS

SIR,—I should like to call the attention of owners of what are known here as "Hoodie Traps" to the great cruelty which may be occasioned by leaving them in operation during the non-nesting season. During the season they are, I hope, periodically visited, and the catch removed and destroyed, but later, if the netting is left down, birds get in and die of starvation and thirst. I passed one the other day, near here, in which was the body of a hawk which had got in and been left to perish miserably.

Yours faithfully,

Gilmerton House, St. Andrews, Fife. R. W. PURVIS.

ANCIENT COMPASS

SIR,—I have enclosed a picture of a ship's compass of three centuries ago. The compass belongs to Mr. W. H. Thorne, of Charminster, near here, and nothing is known of its history, which no doubt would be interesting.

The compass is in a box with a lid, and on the bottom of the box is cut the date "16th March, 1623," when Charles I was King. The sextant—no doubt this originally formed part of the outfit—is missing. The maker's name, Henry Sutton, can be seen clearly.

Friends who have examined the compass wonder whether this Henry Sutton was a well-known craftsman in those days. Perhaps he was one of those who made compasses for the Navy?

Yours faithfully,

28A, High East Street, Dorchester, Dorset. L. A. J. HAWKINGS.

MOVEMENTS OF HORSES AND CAMELS

SIR,—In your issue of September 17th, Major C. E. Radclyffe provides excellent photographs to show the action of the horse.

I suggest that as he has mentioned camels he should provide a set of photographs and give their movements a close study.

He repeats the traditional statement that a camel raises both feet on the same side at the same time.

With all respect to the authorities I venture to disagree and to suggest that a camel walks like a horse, with the possible modification that he may raise the fore foot appreciably before the hind on the same side lands behind it.

In watching a camel the eye is caught by the prominent line of the femur, which is, broadly speaking, kept parallel to the radius, and this creates an illusion that the two legs on one side move forward together.

Will any of your correspondents support me against tradition?

A camel walks slowly, but with dignity and rhythm. No rhythm would exist if he moved with a succession of lurches from side to side.

Yours faithfully,

90, Princes Street, Edinburgh. C. W. INGRAM.

FIELDFARES IN SUMMER

SIR,—Respecting the letter in the *Field* of July 16th, it may interest Mr. Medlicott that I obtained a male fieldfare on August 14th, 1907, at Hockley, Essex. It was larger than other specimens I had measured, and heavier, weighing 3½oz., having an expanse of wing from tip to tip 17½in., and wing from carpal joint to end of primaries 6in. It had been feeding on a number of gooseberries. I also on August 2nd, 1927, saw a fieldfare on a grassy slope of a cliff at Worth on the Dorset coast. Occasionally fieldfares are late in their departure, and have been as late as the first week of June, which, of course, is exceptional.

Yours faithfully,

Sutton, Surrey. F. W. FROHAWK.

GOOD SHOOTING

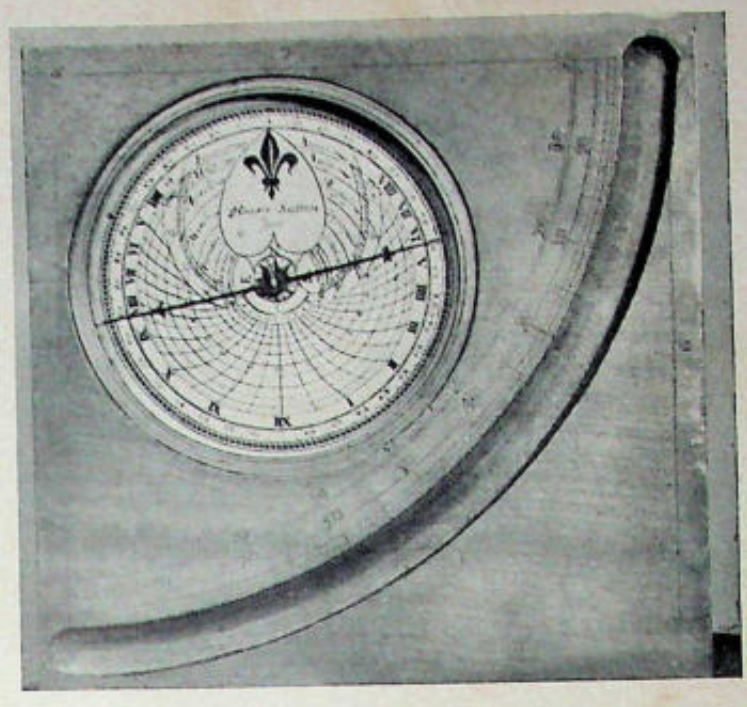
SIR,—In reply to a letter signed "A. W. L." in the *Field* of September 10th, expressing interest in the shooting record of "O. E." over a period of 60 years.

Frequently during the last twelve years I have seen "O. E." shoot, and I have also seen the bag for each day in his game book, which is entered up at once, and never left to memory.

The answer to the keeper's comments is that "O. E." has been, and still is, in spite of his years, "a wonderful shot," and I discountenance the alternative suggestion that his shots were picked. Actually other expert shots frequently average 53 per cent. of kills to cartridges used. Two of the higher totals in "O. E.'s" record are driven grouse and partridges, which do not particularly lend themselves to picked shots.

The interest in the record is that it is probably unique over 60 years.

"O. E." pointed out in his letter that he has never been concerned with big bags, and it is very seldom indeed that he has taken part in the killing of over 400 pheasants in a day, which, with eight guns, gives an average of 50 pheasants to him—a not difficult number for his loader and himself to count fairly and with accuracy.



"HENRY SUTTON FECIT 1623"
(See letter "Ancient Compass")

It may further interest "A. W. L." to know that "O. E." has always shot with 16-bores.

Yours faithfully,

Chirk. J. L. P.

DEVON BUTTERFLIES

SIR,—I have been much interested in your notes in recent years calling attention to the decrease in butterflies.

On September 27th at 2 p.m., wind south-west and warm sunshine, I counted in one herbaceous border at the Manor Hotel, Moretonhampstead, South Devon, 37 red admirals, 5 peacocks, 1 comma, 52 small tortoiseshells, but only 2 cabbage whites; all were feeding on the Michaelmas daisy plants. Personally I have not seen such numbers in a small space for many years.

Yours faithfully,

Roehampton Lane, S.W. 15. COLIN C. AYLMER.

The daily application of Larola makes such a difference to your skin. Autumn winds have no ill-effect on your complexion when protected by this delightful preparation. It prevents roughness and coarseness, leaving your face and hands exquisitely soft, white and smooth. Use Larola regularly throughout the year with the same confidence as it has been used by many generations of women. Larola is absolutely free of all pre-clogging ingredients.

GOOD KASHMIR RIVERS

SIR,—I enclose a snapshot of sixteen trout caught by myself and my wife recently on the Madmati in Kashmir. There had been rain the night before and the fish were taking freely. In addition to these, and apart from small fry, we returned another fourteen trout of just under 10in. to the river.

We had booked 27 days, and on eight of these conditions were quite hopeless; our beats included six different rivers.

We kept 145 trout over 10in., and returned 188 over 9in. to the rivers, making a total of 333 trout; added to this we took 23 country fish. Best fish 3¾lb., 2¾lb. and 2¼lb., with a large number between 1lb. and 2lb.

The Kokarnag and Madmati are far away the best sporting rivers, as the others are now overfished.

Yours faithfully,
Rawlinson Barracks, T. B. BUTT.
Mingaladon, Burma.

A FINE BAG OF TROUT
(See letter "Good Kashmir Rivers")

HYSTERIA IN DOGS

SIR,—It would be interesting to know if any of your readers have tried and found success in the following treatment brought out by a French chemist (name, Nocord): Nephtol, 1 drachm; ether, 3 drachms; olive oil, 10 drachms. Six to seven drops in each ear, plug with cotton wool for 15 minutes. Repeat in two days. Hold dog for 15 minutes to prevent it shaking out cotton wool.

So many cures have been suggested and tried that this may be worth trying.

Yours faithfully,
Foresters' Lodge, F. FENWICK.
Wolsingham, Co. Durham.

KENNET'S TROUBLES

SIR,—I am quite sure your observations will be read by a large number of people with great interest in regard to the Kennet at Hungerford.

I happened to be visiting Hungerford in August, and the water bailiff head keeper informed me the river was not less than 15in. below summer level in normal seasons. 1938 was particularly curious in respect to rain, and whereas here, for instance, there were floods, no rain fell at all except odd showers for the whole of August in Cambridgeshire, where I was staying.

I sincerely hope that your remarks on the flow of the stream is entirely due to this abnormal absence of rain in certain districts and possibly the Kennet was so affected, and not due, as you appear to indicate, to some tapping of the stream elsewhere.

You will excuse my writing, but I, too, was particularly impressed with the absence of stream or rather the flow one associates with a river of this character. Perhaps you will pursue the matter, and give details in the *Field* upon the result?

Yours faithfully,
The Sefton Hotel, J. D. WEBSTER.
Dawlish, Devon.

PARTRIDGES AS FOSTER PARENTS

SIR,—One late afternoon during July I heard a game fowl chick cheeping in some long grass in a meadow. On looking around I saw a brace of very distressed partridges quite close to me; so I retired discreetly.

Two hours later my gardener found a partridge's nest in the same meadow containing twelve eggs, which were stone cold, but on them was an Old English Game Hen's egg shell which had evidently hatched out. Ten yards away he found an Old English game chick, cheeping also, at least a fortnight old, carrying a sturdy tail with wing feathers fully fledged.

The inference is that one of my game hens had laid an egg in a depression, and that the hen partridge began incubating that single egg before she had actually started laying her own clutch. The game chick was hatched out alone, and being a nuisance the parent partridges must have deserted their own eggs in order to look after the singleton. Having no game chicken under four months old I am wondering whether I can rear the little fellow, who at the moment is in a large aviary of canaries, supplied with plenty of egg-food, milk and dry meal, for being a partridge by environment and feeding he is extremely wild and he may succumb to the complete change of living conditions. I might have said that all the partridge eggs had chicks in them.

Yours faithfully,
The Warren, G. T. WILLIAMS.
Warren Row,
Wargrave-on-Thames.

TIGER MOTHS BY THE MILLION

SIR,—I visited the island of Rhodes last month and was taken to see a very remarkable sight.

Near the village of Peveragno there is a wooded ravine in which there are thousands—I think I may say millions—of one species of moth.

They swarm in every bush and tree, and when disturbed fly out in their multitudes.

I was told that this ravine is the only place in the island in which the moths are to be found and also that they reappear year after year.

On referring to *Morris's British Moths* the moths would seem to be the same as our common tiger.

Yours faithfully,
13, Wellington Square, N. N. BLOMEFIELD.
Chelsea, S.W. 3.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—To be elderly, in failing health, and to have literally no income, is the tragic plight of a widowed gentlewoman, aged 69 years. Too ill with chronic rheumatism to work, at the moment she is receiving charity from a kind friend in the form of room and board. Until she is eligible for her Old Age Pension she has not one penny of her own for chemist's or doctor's bills. Will someone send us £13 so that we may promise her 5/- weekly for one year? Even this tiny allowance would be literally a godsend for the poor soul.

IN THE CITY

By OUR CITY EDITOR

THERE are so many "ifs and buts" about stock markets at present that the average operator scarcely knows which way to turn. A short period of adjustment is considered necessary following the hectic times experienced during the recent crisis. Many are busily engaged in an attempt to total up the cost to the country of recent emergency measures.

One conclusion arrived at is that more taxes are coming in the next Budget. That I find one reason why fixed interest bearing stocks, including the funds, have been thrown overboard. An increase in income tax, already extremely heavy, will naturally reduce net income on fixed interest securities.

Many fight shy of the leading industrials. Prices for such issues are largely based on dividends. There have been several indications recently giving the direction of the wind. Dunlop Rubber directors have reported material reduction in trading results so far this year "owing to extremely unsettled conditions." Electric and Musical ordinary dividend has been cut from 10 per cent. to 5 per cent.

Other examples can be given indicating loss of trade. Recent employment figures have been anything but satisfactory. Provincial cheque clearances have shown hefty contraction. Goods receipts on the railways are steadily dwindling. All these point to trade recession, so that industrial equities are much less favoured than they were twelve months ago.

That, of course, is taking industry in general. Some companies are believed to be doing exceptionally well. I understand that Ever Ready Company (Great Britain) met with an embarrassing demand for its products during the crisis.

Ever Ready has a most consistent dividend record. Total dividend on £1,010,402 of ordinary capital for the year to March last was 35 per cent. Previous to that, regular and substantial dividends had been forthcoming and always the dividends have been well covered by earnings. The 5/- ordinary units, despite the good record, are not particularly popular. They stand around 18/6 to yield as much as £9 10s. per cent. on the last distribution basis.

I hear optimistic views concerning the outlook for Cork Manufacturing Company. This is another company which can point to a good and regular dividend record. The market for the shares is admittedly a rather narrow one. That, however, is immaterial, as long as the buyer is prepared to put the shares away for a time.

This company has a subsidiary called Flexo Plywood Industries, Ltd. The chairman of Cork Manufacturing, at the annual meeting on June 30th last, said the subsidiary company was enjoying greatly improved business. I hear indirectly that the plywood section is now doing extremely well. Cork Manufacturing 5/- shares can be picked up around 8/-. Total dividend for the year to April last was 12½ per cent. Here is a prospective yield of over £7 15s. per cent.

American stocks are popular at the moment on a belief that trade recovery is coming in the United States. There is speculative buying of such shares as American Radiator and Standard Sanitary Corporation at a price around $17½. The theory is that the American building trade must participate in any industrial revival.

Still others turn their attention to the more speculative South African gold shares. They buy such shares as Western Holdings, Marievale and Venterspost. Most operators, however, desire some dividend return from their securities. The developing gold shares will not produce results for years to come. That is why the average public are partial to industrials outside the leaders. Bargains can be snapped up just now, but it is as well to keep a watchful eye on trade developments and cash in while the going is good, otherwise one may be left with securities the market in which has dried up.

AUTUMNAL APPETITES

It was remarked last week that had there been a war all the poisonous snakes in the Zoo were to have been destroyed. This dark cloud hanging over the reptile world must not be thought, however, to have been responsible for the recent loss of appetite displayed by these creatures. Like most other inmates of the Gardens, although they are kept at a constant temperature of between 75 deg. and 85 deg., the snakes automatically attune their systems to the seasonal changes of this country, and as a result, the rats, pigeons and rabbits which form their diet find their way into their cages at much less frequent intervals. Some of the animals, however, refuse to be led astray by their new environment, and still continue to behave, even to the production of families, just as they did in the days of yore when cages were outside their comprehension and the stars of another hemisphere winked down upon them.

New Books

"SWEAT IS THE THRESHOLD OF MANY VIRTUES"

A Farmer's "Design for Living"

Farmer's Creed. By CRICHTON PORTEOUS. (Harrap; 8/6 net.)

IF the precepts of the ancient poet are still to be believed, farmers must be among the most virtuous of men. For it will be remembered that Hesiod observed: "Sweat is the threshold of many virtues." In this book Mr. Porteous has recalled the manner in which he began his farming career, and it was a period when a great deal of courage, determination and hard work was necessary.

Mr. Porteous was born in Leeds and educated in Manchester. But even with a more rustic childhood I believe he would inevitably have found his way to work on the land, for never have I read a book in which appreciation of the joys of country life and work triumph more sincerely over a knowledge of its hardships and troubles. It is fatally easy to write a passably good book on the charm of country life, but only a man who has actually seen and encountered every aspect of the farmer's round can produce an authentic picture. Such a man is the author.

When he was quite young his uncle, who had made a fortune out of cotton, kindly undertook to make him equally wealthy, in the course of time and by "starting at the bottom," through the same means. Even now the longing for farming was on him, but filial gratitude triumphed and he became an office boy in the firm of his uncle. It was no less the confinement, dirt and apparent purposelessness of the office than the contemplation of his wealthy relative's character that made him decide to leave and chance his arm in the country. A family conference followed at which all that could be said against farming and for the desirability of a fortune from cotton was duly said. The author, however, though by no means sure of his reasons, had instilled an ideal into the farmer's purposes, and this book may be regarded as the search for a crystallisation of that ideal through actual experience. Not until the last few pages does he capture the vision splendid.

He was taken on at a farm in Cheshire, where a quite unjustified hope that everything would come right in the end seemed to be the system of work. This naturally became depressing, and he wondered whether there was, after all, much difference in the purposes of farming and the cotton trade. But a friend advised him to go to a farm in the Peak District, where he was fortunate in meeting a farmer who was also a philosopher. This man's ideal was work, but he viewed it in a peculiar way. For he had a system and a purpose. Mr. Porteous was not slow to see the nature of the system, but it was months before he appreciated the purpose which was the mainspring of his master's life. He had begun seriously to doubt his ideals, for it seemed that farming was carried on to make a profit just as much as the cotton trade. But what he had been trying to find for years suddenly became clear when the farmer pointed out the quotation from *Unto this Last*, where Ruskin observes that a man who can make two ears of corn grow where there was only one before is of infinitely more use to his country than innumerable politicians.

The description of the country and the work of the farm labourer is an integral part of this search, and it gains enormously in effect because none of it is irrelevant. Mr. Porteous is not to be led into raptures over a sunset; he certainly saw it as a thing of beauty, and as a relief from work, but not as something separate. It would not have had the same effect if he had seen it at sea. He delighted in hard work and the manner in which it improved his physique simply because it made him a more efficient farmer. His delight in the local agricultural show was intense because he felt himself to be a part of it. He was, of course, greatly helped to adopt and sustain this attitude because the farm on which he worked was practically self-sufficient. Had it not been for this, and for the character of Mr. Boone, his master, Mr. Porteous might by now have been a cotton merchant.

There is a candour about these pages. The author makes no pretence of being an idealist, but having had thrust upon him the necessity of testing his idea that there was a noble purpose in farming, he had the courage to search for it and the capacity to recognise it. R. C.

* * * *

Charcot of the Antarctic. By MARTHE OULIE. (John Murray; 12/6.)

Seldom can any biographer have had a richer subject than Jean Charcot. Few men have been so truly "great" as he was: renowned firstly for being his father's son, his own personality quickly won him the good will of his friends, and finally his prowess and achievements in his voyage to the Antarctic earned him a place on the list of men whose names will never fade.

As a small child Jean was asked whether he really did want to be a sailor; "Pourquoi pas?" was his reply, and those words he took for his motto, and also became the names of his famous ships; it was whilst on the last "Pourquoi pas?" that Charcot met his death in 1937.

Parental discipline ordained that Jean should be a Doctor of Medicine, and he was sufficiently devoted to his father to cheerfully comply. But when he was twenty-four his father died, leaving him much wisdom and also money. Jean was then able to follow the wish of his heart and own his own ship and travel the seas. His first voyage North was in 1901, when once again a Frenchman entered the list of Antarctic explorers; from that day he made many expeditions, the achievements of which have become history and are fully described in this book.

But as a man Jean Charcot was probably as near fulfilment as any human being has been, for he was most definitely human. A strong democrat, a powerful leader inspiring amazing affection, and the possessor of a courage and physique of the gods; all this was crowned by a simple trust and belief in his Maker which found practical expression in his daily life.

One of Jean Charcot's last acts in this world was to loose from its cage a tame gull which had lodged on the "Pourquoi pas?" As the ship sank with her leader on the bridge the bird flew free. A few days later as Charcot's coffin was raised from the French destroyer to a quay-side in Brittany, a white gull hovered over the body for a few seconds. Some people say this was the same gull: "Pourquoi pas?" At any rate, the legend is in keeping with the memory of the great man.

The biography is well written; it is by a woman, and I think that such a life requires a man's hand and understanding to do full justice to it upon paper. C. N.

Family Golf. By ELEANOR E. HELME (Published by Dent & Sons at 5/-).

There was a time when golf was considered a game designed exclusively for crinolines, indisposed colonels, and the older generation, for the simple reason that it was a game which did not demand an excess of exertion. But, not surprisingly, "times have changed." They have been changed by the rising of a new generation with a new attitude towards sport; an attitude that, instead of taking things for granted, demanded reasons for things and, above all, improvement and progress. And that golf should change was inevitable.

This book is quite typical of the modern attitude towards the game. It is the story of a family who go to Scotland for their summer holidays, mainly to play golf. It is really a sort of sugared pill, the pill being instructions, transformed nowadays almost into hard-and-fast rules, on how to play the game. It is a good book and will doubtless achieve its purpose in improving the play of both young and old. But whether it will help golf as a family game is a matter of opinion. It all depends on whether you play golf merely to see how few shots it takes you to get round in or whether you play for the exhilaration of hitting the ball out of sight. In any case, it is well worth reading for the reason that it provides a novel medium for teaching the most studied and most scientific of all games. J. H. D.

Soil-less Growth of Plants. By ELLIS AND SWANEY. (Chapman & Hall, Ltd.; 13/6.)

That it is possible to grow plants without soil has been realised for some years. This is the first introduction of the conditions which bring this fact to pass. It is, of course, a matter of science; other mediums than soil are produced to take its place.

The plant can be grown in sand with the food which is normally supplied by the soil substituted by a solution containing the required nutriment. The three recognised methods of soil-less growth are explained (water culture, sand culture and sub-irrigation): the systems are clearly described. The advantages of this form of horticulture appear impressive; the diseases from the soil can be eradicated, and in glasshouses much space and time can be saved. These points are beneficial for commercial production. There is possibility here which is worthy of fair trial. B. V-F.

Thrills of the Northern Trawl. By Skipper ALBERT HUTCHINSON. (Hutchinson; 12/6.)

This is one of the best sea books yet written. The author has been a fisherman on a Grimsby trawler for 31 years; he wrote this book at sea, putting into it the daily happenings and events of the members of his crew. Thrills there are in plenty, and also laughter and jokes in the true seaman's tongue. But other memories have crept into these pages which are sufficient to make one look at our next succulent herring or cod with respect. Memories of men who will never return from the northern waters, memories of men who remember four years of mine sweeping as the easiest days of their lives, and men whose worst fear is embodied in the word "glut." This is no purged edition: it is written by a seafaring man in the only language he knows. With every page the sea breezes blow and the armchair by the fireside seems doubly precious. C. N.

* * * *

Kilmarney Line. By K. BALBERNIE. (Martin Secker; 7/6.)

For generations the Kilmarneys have lived in a red bricked manor house, now mellowed with age, protected from vulgar curiosity by hills and encircling trees.

Through the ages this family have lived adventurously and lived boldly, and in their descendants of the present age we find the same emotions and passions that characterised the lives of their ancestors.

For those who love an aspect of England which is disappearing all too fast, the setting of this story about an old English family will have an irresistible appeal. The author portrays this study of hereditary instincts breaking through the barrier of modern sophistication in a vivid and convincing style. V. R.

BOOKS IN BRIEF

Once again the Cotswolds are the subject of a book. In *Mr. Prune on Cotswold*, R. Blake Brown (Martin Secker; 10/6), the author, draws special attention to the larger types of country houses. These beautiful buildings, their surrounding villages and the hills in the midst of which they all are set are described in an effervescent and original style. Many lesser-known places are introduced which (like Mr. Prune) readers will find deserving of repeated visits.

An Indian Army officer's life is well described in *Khyber Calling*, by Rajput (Hurst & Blackett; 7/6). Details of the existence on the frontier, the mess, the enjoyments and the trials of the routined life, all form part of the story which culminates in active service. At a time when the "North-West Frontier" is one of many problems, this tale is interesting for its vivid description of the conditions confronting the Army and politicians. A straightforward and well-written book.

Mr. J. A. Hunter has spent a life of excitement caused by big game hunting. In his book *White Hunter* (Seeley Service; 15/-) he describes many of his experiences. He has learnt extensively of the ways of the wild beasts, and there is practical advice here for every sportsman who visits East Africa, and especially for the young hunter. The style of writing may be called old fashioned (it is deeply courteous), but the wise and proved advice cannot be safely ignored.

The English call it "lilly"

. . . it happened one day in Paris that un anglais was tempted to try a Lillet, which he pronounced bon, and then to the horror of the French asked the waiter to bring encore garçon avec two-thirds Lillet and one-third gin which as all the English are mad anyway the waiter did. So our travelled Englishman brought Lillet from France and it has been welcomed by conservative clubmen ever since as not so bad old boy, not so bad.

A DIFFICULT TIME IN THE GARDEN

Planning Summer and Early Autumn Borders

By ELEANOUR SINCLAIR ROHDE

IN planning the summer and early autumn border, I think the most difficult time and one frequently forgotten is the pause, so to speak, between the flowering of the queens of the summer border, *i.e.*, the Delphiniums, Campanulas, &c., and the splendours of the autumn border when Michaelmas Daisies, Heleniums, Rudbeckias and so forth are in full beauty. The really decorative plants that bridge this gap are invaluable.

I think I should put in the first rank for filling this gap the delightful old-fashioned favourite, the French Honeysuckle (*Hedysarum coronarium*), *Clematis recta*, all the Bergamots, *Nepeta grandiflora*, Phloxes, *Heliopsis scabra imbricata*, *H. S. incomparabilis*, *Gypsophila paniculata* and the pink-flowered species *G. Oldhamiana*.

The French Honeysuckle is not a perennial and is best treated as a biennial, but it makes such a bushy, handsome plant that it is well worth a place in the border. With its abundant foliage and heads of deep crimson clover-like flowers, it strikes an unusual note. This native of south-western Europe flourishes in almost any soil and on rather light soils sows itself. Bees love it. *Clematis recta* is surprisingly absent from most borders yet it is one of the most attractive and graceful white-flowered plants, holding its heads of numerous small scented flowers bolt upright on stems about 4ft. high. This perennial is quite easily raised from seed and succeeds in most soils.

The Bergamots I find particularly fascinating, and in rich soil what more decorative from July right into late autumn than their handsome whorls of flowers borne in tiers one above another? I like to associate them with the pink-flowered Hyssop, for Hyssops have as long a flowering period. Also with that lovely Persian *Nepeta*, *N. grandiflora*, to my thinking one of the most decorative of all the Nepetas. It makes bushes quite 4ft. across and nearly as much high and is continually haunted by bees and butterflies. Next season I am going to grow a border of Phloxes in mixed colours with this Nepeta, Bergamots in various colours and Hyssops (both the blue and the pink) and Winter Savory massed in front. Winter Savory would be appreciated as a late summer sub-shrub if it were not also a kitchen herb. This border anyhow in the South should be lovely all through late summer, *i.e.*, from July onwards right into October.

Great breadths of Bergamots in mixed colours are always a delight. It strikes me as curious that so few firms list seeds of them. They are quite easy to raise from seed, which is, however, at least in my experience, rather slow in germinating—usually about six weeks. The earliest to flower are the scarlet and white forms of *Monarda didyma*, and the varieties of *M. fistulosa* flower as a rule about three weeks later. It is never worth growing these handsome plants in dry soils. They make miserable growth, usually only a foot high, and produce only one head of flowers and not the characteristic tiers of bloom.

WITH NUMEROUS BLOOMS HELD BOLT UPRIGHT

Clematis Recta is one of the most attractive late-flowering herbaceous plants

Gypsophila paniculata is grown in most gardens for it is invaluable for picking all through summer, and how the bees love it, though it is not usually listed as a bee plant. The double form is also attractive. The pink-tinted species, *G. Oldhamiana* will, I fancy, soon become popular for it is very dainty and attains about the same height as *G. paniculata*. The comparatively newly introduced *G. pacifica* also has pink flowers, but it is later flowering. The annual species *G. elegans*, especially the white form, is a charming white-flowered plant for the annual border, but not so commonly grown as it might be.

Most of the varieties of *Heliopsis scabra* grow about 3½ft. to 4ft. high, and they are not only amongst the most decorative yellow flowers for the border, but useful for picking. They make a pleasant change from Heleniums in mixed bouquets. The most recent introduction is *H. scabra patula*, which has very large golden flowers.

The Pentstemons are, I think, amongst the most attractive of all the late summer-flowering plants and on warm soils they continue in beauty till late autumn. I like them grown in mixed colours. Amongst the pick are King George V (vivid crimson), George Home (scarlet with white throat), Countess of Dalkeith (purple with white throat), Pink Beauty, Princess Elizabeth (cherry red and white throat, a most attractive hybrid), Mrs. Fulford (red flowers, white throat) and Emperor (blush pink and white throat). Pentstemons are so easily increased by cuttings taken in late August and struck in very sandy soil in a cold frame, that it is not expensive to get up a big stock of them. Only in the mildest parts can they be left out of doors during the winter. Otherwise they have to be treated like Geraniums, *i.e.*, housed through the winter in a cold greenhouse and kept as dry as possible.

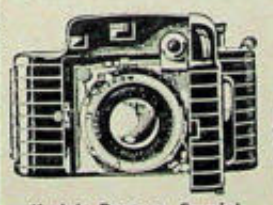
Many of the most imposing *Hemerocallis* flower in late July and August, amongst the pick are those costly treasures Byng of Vimy, *H. fulva rosea Flavia* (the flowers of this hybrid are 6in. across), and June Boissier. But there are also less costly kinds which are nearly as decorative, notably *Thunbergii*, Sir Michael Foster, Mercia, Imperator and *H. multiflora Luna*. The Day Lilies are still rather neglected plants in the average garden though they have every good quality. They are both beautiful and vigorous, perfectly hardy and flower for weeks on end. Cut for indoor decoration they are delightful in big jars and they have an attractive scent. Although they do best in a waterside position they succeed admirably in most borders provided they can have full sun.

Sunflowers are sadly absent from most modern borders, and many people despise them, but when all is said and done no other flowers diffuse so much light and warmth in a border as they do. As a rule they begin flowering early in August, and continue through early autumn. One frequently hears the comment that modern kinds are not so imposing as those cottagers used to grow. I think this is due to the fact that cottagers saved their own seeds. The finest plants are those raised from seed saved from the first very large heads produced by the plants. Unfortunately, birds have a marked preference for these heads, and will strip them as soon as the seeds are sufficiently formed and long before they even begin to turn colour. The seeds on the smaller heads are often left untouched.

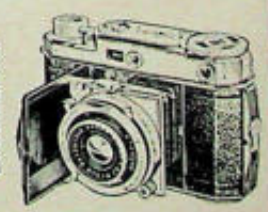
The dwarf annual Sunflowers are not, I think, very attractive. Their colourings compared to those of the tall kinds are somewhat dingy. I had, however, seed of dwarf annual kinds sent me from California, and the difference is marked.

"Always something new"
out of
KODAK

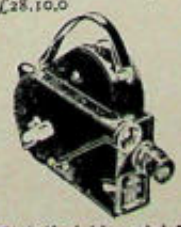
Behold a selection from the latest additions to the Kodak family. On my left, a miniature with a difference. On my right, a precision camera with the finest type of coupled range-finder, yet costing from £30 *downwards*. Below, two 16 mm. *Ciné*-'Kodaks' that make home movies laughably easy. There are now over 50 different Kodak and Ciné-'Kodak' models.



Kodak Bantam Special. New kind of 'miniature.' Picture-size 40 x 28 mm. 8 at a loading. Extra-precision coupled range-finder; f 2 lens, 9-speed shutter (1 to 1/500th sec.) etc. Takes grainless 'Kodachrome' colour. With ever-ready case. £28.10.0



'Retina' II. A fully-fledged 36-exposure 'miniature' at unusually low price. Extra-precision coupled range-finder; lens f 2, f 2.8 or f 3.5; 9-speed shutter (1 to 1/500th sec.). Takes grainless 'Kodachrome' colour. £20 to £30.



Ciné-'Kodak' model E. 16 mm. Lens f 3.5 or f 1.9. Slow-motion. Viewfinder shows (1) picture-area, (2) amount of film being used, (3) amount still unexposed. Takes 'Kodachrome.' £20-£25.

Magazine Ciné-'Kodak.' 16 mm. Loads up, or switches to 'Kodachrome' colour, in 5 secs. Lens f 1.9. Slow motion, etc. Long-focus and wide-angle lenses available. £40.

Deferred terms available under Kodak's new 'Credit Account' plan.

Ask your photographic dealer for a Kodak catalogue; or write to Mr. F. Taylor, Dept. 57, Kodak House, Kingsway, London, W.C.2

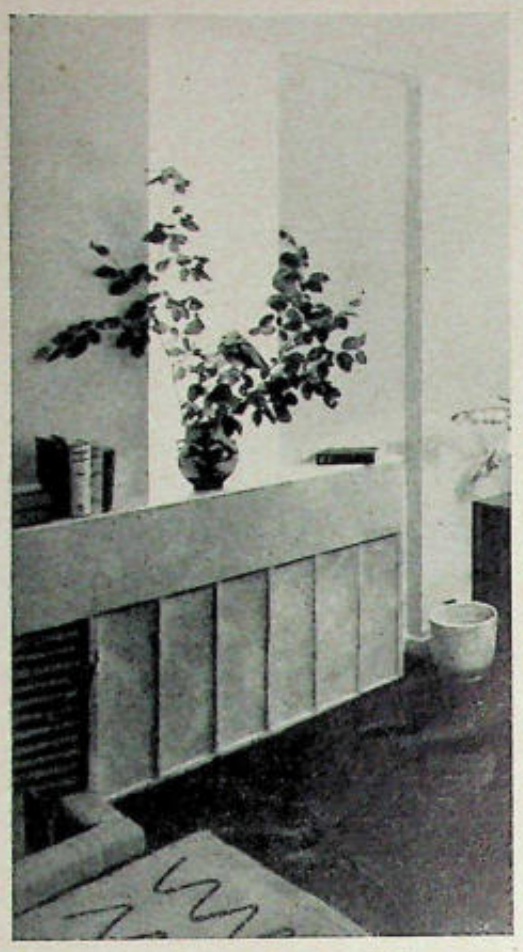
NEW LIGHT ON YOUR FLOWERS

The Art of Indoor Floral Decoration

By MARGUERITE JAMES



MODERN STYLE DECORATION
Autumn leaves silhouetted against the light

IN a modern house I visited recently a wall niche is lit from below by hidden lights. In the niche stands a plant of *Ficus elastica*, the Indiarubber plant. I remember this because at first glance I failed to recognise it. Electric lighting from unusual angles has that effect ; it turns plant friends into strangers, and gives us new impressions of familiar flowers.

I do not think that all the attempts so far made with flowers and plants and lamps have been successful, but I am quite sure that electric lighting as an integral part of floral decoration has come to stay. That this section of floral art is still in the experimental stage adds to its interest, and both amateur and professional floral artists are toying with the idea and trying out various decorative schemes.

Special lighting of plants in wall niches and angles of the wall is useful in two ways : the light is reflected, and adds to the general brilliance of the room, while plants and flowers which might otherwise be overlooked are brought into prominence. Niche lighting is generally similar in effect to the floodlighting used in the open, and just as outdoor floodlighting is most effective when the light is directed on to objects of sculptural or architectural merit, so niche lighting is successful when the subject has good, bold outlines and is of some substance.

Colour naturally plays an important part, but outline and shadows (where a single light is used) are chiefly responsible for the success of the decoration. That is why a simple floral arrangement is best ; a complicated mass of foliage and flower loses rather than gains by unusual lighting effects.

Wall niches illustrate the modern taste for built-in or permanent furnishings and decorations. They are almost a necessity, for nothing could be more out of place in the modern house than odd vases set about on the floor and on occasional tables in the casual way they are distributed through old-fashioned houses.

Floral decoration in the modern house demands very restrained treatment. A single vase, such as a tazza loaded with fruit, a tall vase of dried Pampas Grass, or a clear glass globe holding three or four large blooms may be enough for a large room.

Dinner table decorations are more elaborate. They may be lit by (electric) candles, and by lights below as well as above. At least one interior decorator uses a dining table of mirror glass, with a central panel of light, so that the flowers of the centrepiece are lit from below. Still another table is of black glass with a light panel. The effects produced are definitely interesting, and worth still more experiment. On the lighted panel of the tables it is found that clear glass dishes and vases and light-coloured flowers are generally most successful, but very good effects can also be obtained by the use of foliage with bold characteristic outlines. Good subjects are the leaves of Virginian Creeper (*Vitis quinquefolia*), asymmetrical Begonia leaves, and the circular discs of Nasturtiums ; these last are particularly good. Floated on water in plain glass bowls they somewhat resemble the leaves of Waterlilies, while tiny Monthly Roses floated in the same way among them add to the effect.

A ring of light round a bowl or vase of flowers is another idea. This throws the flowers into sharp relief, and on polished or glass tables it creates charming reflections.

Such lighting devices are, in my opinion, very good indeed, but I believe we shall do even better when we have become more familiar with our flowers and foliage seen from these unusual angles.

In brief, then, we can sum up distinguishing features of modern flower decoration in this way. First there is an unfettered choice of material. Nothing is too humble, too bizarre, or too artificial to be included in the popular mixed arrangement. Treatment of the materials is, however, restrained. Bold architectural outlines, and comfortably harmonising or matching colours are imperative, while in size the modern arrangements tend to be smaller than of old.

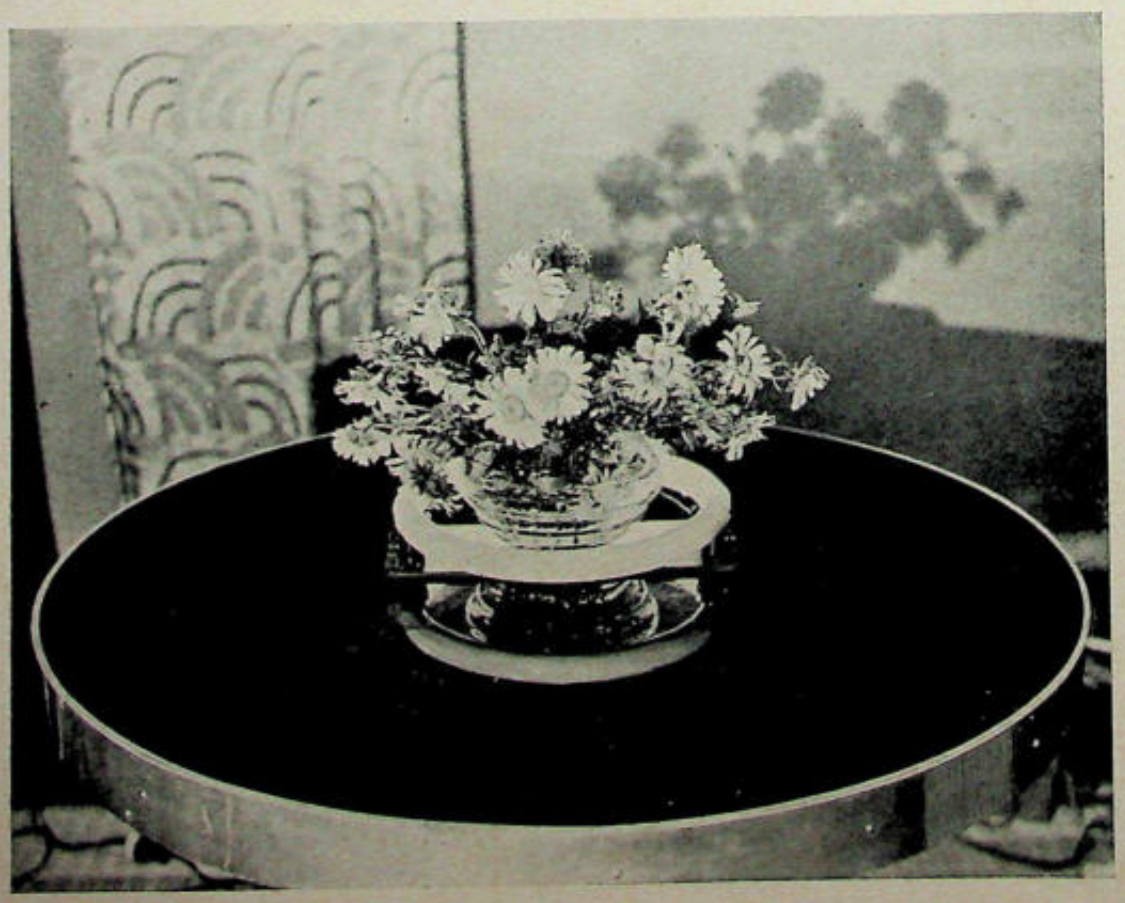
There is less use of the "splash of colour" type of decoration — the bowl-of-marigolds-in-a-blue-room. But not all decorations are mixed, and a subdued, even severe, arrangement of two or three flowers is quite right for a wall niche or staircase. The eye is led to this kind of decoration by lighting effects and not by vividly contrasting colours. For instance, in a room with peach pink walls, the only floral decoration might be a few spikes of Gladiolus "Apricot" standing in a flood of light.

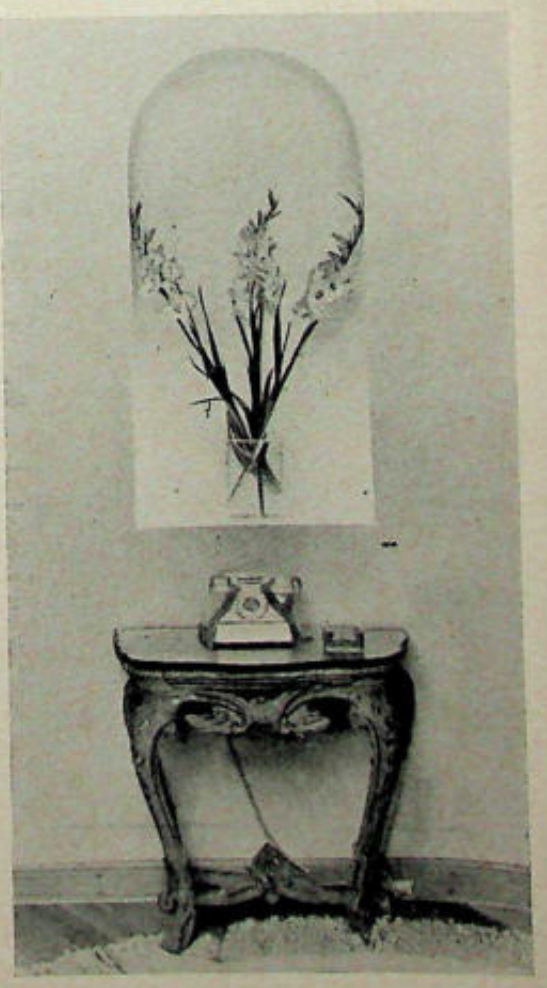
Apart from this, infinite care is often given to the arrangement of small intimate decorations which express the mood and personality of the artist, and which stand perhaps on dressing tables in guest rooms, or beside each plate on meal tables. These small touches are perhaps our nearest approach to Eastern floral art, in which every leaf and every line is significant of some emotion or thought. I often wonder if we shall ever get nearer.

The delicate adjustment of colour harmonies in modern decoration places increased responsibility on the gardener. A little too much pink or gold in a Gladiolus flower and the modern decoration may be ruined. That is why we anxiously await the use of the new Horticultural Colour Chart by nurserymen and seedsmen. It will never, I think, be an infallible guide ; colours of flowers vary according to the soil in which they are grown, and even the same flowers look different in different settings ; but at least it will help.

To know that on any special occasion your own greenhouses can supply Carnations, Roses, Sweet Peas or Chrysanthemums of just the right tone for your rooms is particularly useful in country homes. Even if you do not supervise the decorations yourself, it is probably better to employ a trained floral artist (a holder of the R.H.S. Diploma is to be preferred) to arrange your own flowers than to be entirely dependent on market produce.

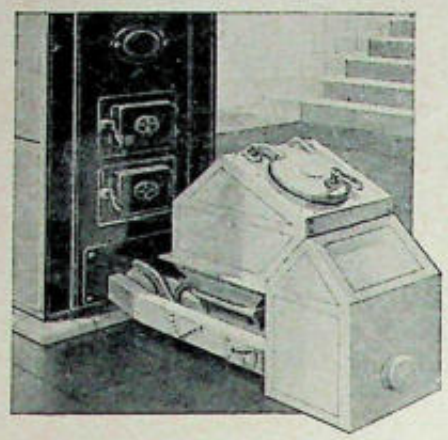
A BOWL OF FLOWERS WITH RING LIGHTING EFFECT
Delightful reflections in the table top add to the charm of this simple decoration





WHERE CORRECT COLOUR IS CHIEFLY IMPORTANT
A niche floodlit from below needs but the simplest form of decoration

Coal can be an automatic fuel with the 'Iron Fireman'



Coal is the cheapest fuel to use, and, with an 'Iron Fireman' Automatic Coal Stoker in your boiler house, it can be the most efficient fuel. Hand-stoking is eliminated and lower fuel bills obtained.

The electrical controls of the 'Iron Fireman' ensure definite predetermined temperatures during specified periods. It will pay you to investigate the advantages and the economy of this scientific system of coal stoking and combustion. Your existing boiler can be adapted.

BORON AND BROWN HEART

Crops which Need the most Important of the "Minor Elements"

FOR many years it was believed that if the soil were kept in good condition, and if plants were supplied with the usual fertilisers, containing nitrogen, potash and phosphates, then they should obtain adequate nourishment.

It is now known that various other substances are necessary to keep a plant well fed and healthy. Although they are necessary in only very small amounts, crops cannot thrive if even these small amounts are absent.

One of the most important of these "minor elements," as they are called, is boron. Generally speaking the soil contains sufficient for the plant's needs, but here and there the available supplies are becoming exhausted.

During the last few years an increasing number of plant diseases due to lack of boron have appeared in various parts of the world, and it is not generally recognised that some of them are prevalent in parts of the British Isles.

English crops very susceptible to lack of boron are the beetroot, mangold, turnip and swede. Root crops suffer because they use more boron than other types, and a close watch should be kept for the symptoms, especially in districts known to suffer in this way.

Beetroot and mangold suffer from a disorder known as heart rot or crown rot, which has a harmful effect on the yield of beet and the sugar content of the root. Fortunately, the symptoms, which first appear somewhat after mid-season, are easily recognised.

The young heart leaves are first affected. They stop growing and curl outwards, and dark brown scurfy patches appear on the stalks. These become brittle and the leaves turn black and die. Later, the older leaves may be similarly affected.

Finally, the crown of the root is attacked by a kind of dry rot, which gradually spreads downwards into the flesh.

Brown heart of turnips and swedes (known as "Raan" in Scotland), another disease resulting from boron deficiency, is not so obvious as heart rot. It attacks only the inside of the turnip, and for this reason is sometimes overlooked.

The flesh of roots afflicted with brown heart is mottled greyish or brown, and often has a kind of water-soaked look. They are hard and stringy when cooked and have a bitter taste, being quite unfit for human consumption.

Brown heart is first marked when the bulbs are about 2in. across, that is, at about the beginning of August. It is not unusual to find them badly diseased in one part of a field, while in another they may be quite healthy. One or two roots should, therefore, be pulled up for examination in several areas.

Although these crops are the chief ones to be seriously affected in this country, there are several others which are known to be very susceptible to boron deficiency.

Lack of boron causes a disease of celery known as "cracked stem," which may cause serious losses. Browning of cauliflowers, arising from the same cause, produces a big percentage of unmarketable heads.

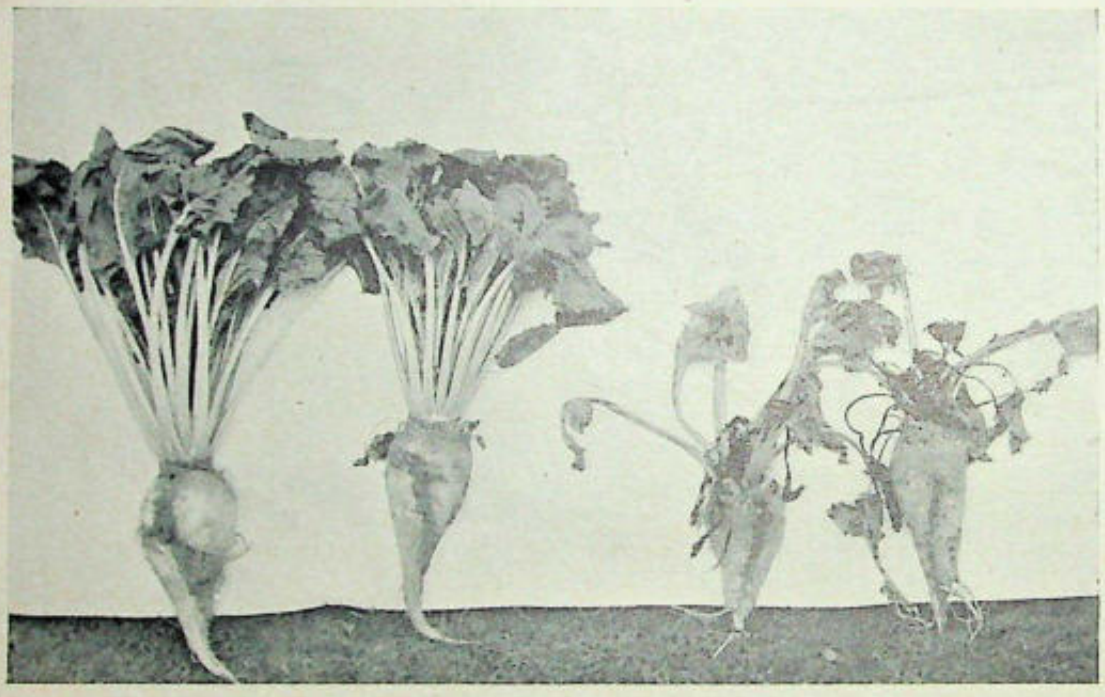
Potatoes suffer from a form of leaf roll which may be due to insufficiency of boron, while brown cork-like spots develop in the interior of apples. Another apple disease known as "measles" probably arises from the same cause.

Fortunately, these diseases can be checked quite easily, simply by adding a little boron to the soil. This should be done at the rate of about 1oz. per square yard. Although best results are obtained by treatment at the time of planting or sowing, a big improvement can be produced by dressing the soil as soon as symptoms appear. In the case of apples, a solution applied to the roots is beneficial.

Even distribution of the boron is essential, because too much of it may damage the plants. It should, therefore, be mixed with dry soil, or sand, or other convenient material. Suitable mixtures are now being marketed for this purpose at a reasonable price.

The boron is sometimes mixed with artificial fertilisers, but if this is done, care should be taken to add sulphate of ammonia last, to avoid unnecessary loss of ammonia.

RONALD QUARENDON, Ph.D., B.Sc.



TWO LOTS OF SUGAR BEET FROM NORFOLK

Needless to say, the beet on the left has been treated with boronated basic slag, and its healthy condition is in marked contrast with the brown heart on the right

WELSH HILL FARMS

WHENEVER people talk of farms and agricultural policies they appear to think in terms of large farms, farms which in time of war could easily be disorganised by disease bombs. Surely the time has come to consider especially the hill farms of Wales, which have the advantage of being near to the Midlands but off the track of possible raiders.

Tucked away in the hills are some of the healthiest herds of sheep and cattle in the whole country. The calamity of the sheep industry has hit them very hard, but expenses are low and young cattle have been selling well.

It is to that district that the dairy farmers of Cheshire go for strong stock.

A surprising number of herds are T.T. Very nearly all of them could be if the farmers so desired, but the irksome visits of inspectors deter the hillmen, who are used to being their own masters.

Motor transport has brought them very much nearer to England in time, and a railway line runs up the Dee Valley from Chester to Bala and on to the coast. Another line follows the north coast through Bangor and Caernarvon, so that Liverpool is only about three or four hours away from the majority of farms in that area. Naturally, the more remote they are, the more time it will take, but roads have been greatly improved in recent years.

Professor Stapledon has shown the advances that can be made in the grasslands of Wales, and it is well known that the encroachment of bracken is largely caused by the decrease in the number of cattle.

If the rearing of stores and the improvement of grassland to feed them to the finishing-off stage could be encouraged, the fertility of the land would be increased.

But red tape will not accomplish this increase. The farms are difficult to inspect and the farmers would not stand for the officialdom that exists on English farms.

The men and their methods must be understood, for they live a hard life without any luxuries. The same applies to their animals, which are hard, lean beasts with strength and stamina. It would be difficult to find a beast in those small markets properly finished off, and, therefore, it would be foolish to encourage it. The better trade exists in yearlings to be finished in the yards or deep pastures of such districts as the Midlands and Cheshire.

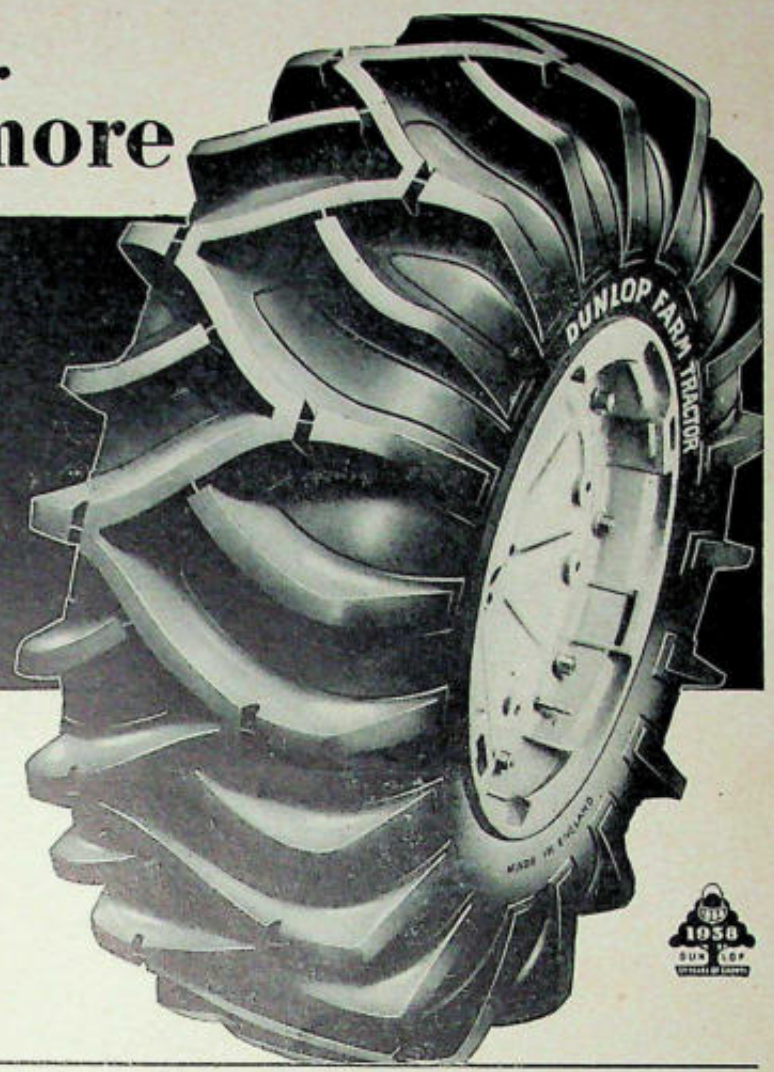
Without doubt the output of the hill districts of North Wales could be doubled, and most of the farmers have the necessary capital for expansion. But they need to be assured that the market exists. To try to force them to increase their stock would be fatal. They are the kind of men who must be asked, for they will not endure orders.

Once their co-operation was secured, and the increase of their stock was recognised, they would be a very great help to the big Midland populations when the country is at peace, but of inestimable value in the event of war when enemy 'planes, chased from the towns, might well unload their bombs on the big Midland farms on their way home.

J. F. BOYDELL.

It costs you no more... yet it gives you *far* more

THE *NEW* DUNLOP TRACTOR TYRE



Dunlop, without raising the price above that of other tractor tyres, have been able to incorporate two notable improvements—enormously increased grip and supreme durability.

GREATER GRIP

This has been achieved by giving the tyre maximum flexibility, which permits the greatest possible tread area to make contact with the ground and prevents the divisions between the lug bars from clogging.

LESS WEAR

Dunlop have embodied a new scientific method of linking each tread bar which prevents excessive wear, especially on hard surfaces.

A 1939 MODEL 2½ LITRE DAIMLER, IN THE PEACEFUL VILLAGE OF URCHFONT, ON SALISBURY PLAIN

REDUCING THE RUNNING COSTS

The Standard Car Programme for 1939

By CAPTAIN SIR MALCOLM CAMPBELL
(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)
(Motoring Editor of the "Field")

THE Standard Motor Company, of Coventry, have announced their programme for 1939, and a very interesting and comprehensive one it appears to be. The range of cars consists of an Eight, Nine, Ten, Twelve, Fourteen and Twenty, and prices run from £125 for the Eight Open Tourer, to £325 for the Twenty Saloon.

There are three entirely new models in this range, namely the Eight, Ten and Twelve, all of which are fitted with four-cylinder engines. It appears obvious that for 1939 all the manufacturers, at any rate those who are constructing light cars, are concentrating their energies more than ever on reducing the running costs of their vehicles. The Eight is a typical example of the trend of modern design. Here we have a grand little car costing only £129 for the four-seater saloon, which has a maximum speed of just over 60 m.p.h. and is capable of averaging 45 to 48 miles on a gallon of petrol; on second gear a speed of 40 m.p.h. can be achieved. The four-cylinder engine has a bore and stroke of 57 mm. by 100 mm., the cubic capacity being 1,021 c.c. R.A.C. rating 8.06 h.p., and the tax £6 per annum.

The motor, which has a compression ratio of 6.7 to 1, develops as much as 31 b.h.p. at 4,000 r.p.m., and is flexibly mounted in the chassis. The carburettor is fitted with an air silencer, and the tank situated at the rear of the chassis holds six gallons of fuel, sufficient for a journey of at least 270 miles. Cooling is carried out on the thermo syphon principle and is assisted by a fan, and ignition is effected by means of a six-volt battery and coil. The gearbox has three speeds and reverse, top and second being synchro-mesh, and all the gears are helically cut; the ratios are as follows: Top 5.14 to 1, second 8.63 to 1, and bottom 18.75 to 1.

The brakes are Duo-Servo operated by enclosed cables and the emergency brake, which also actuates on all four wheels, is fitted just under the scuttle, and within easy reach of the driver.

The new 8 h.p. Standard is most up to date in design and the little car is equipped with independent front wheel suspension with transverse spring, the rear suspension being effected by means of half elliptics. Easy-clean steel wheels form part of the car's equipment and they are shod with Dunlop tyres, size 4.75 by 16. The four-seater two-door saloon body is of all-steel construction, and there are no foot wells—an excellent feature. The driver's seat is adjustable, and there is plenty of room for four adults with a large enclosed suitcase locker at the rear. The spare wheel is housed in a separate compartment below the luggage locker, in which are also stored the tools, jack and wheelbrace. The equipment of the car is very comprehensive, including self-cancelling direction indicators, Triplex glass to all windows, an accessible jacking system, and an electric windscreen wiper.

A de luxe model is available at £139, which has a sunshine roof, chromium-plated lamps and real leather upholstery. The chassis dimensions of the Eight are as follows: Wheelbase 6ft. 11in., track 3ft. 9in., and the extreme length of the complete car is 11ft. 4in.

SIR KINGSLEY WOOD, WITH CAPTAIN J. P. BLACK, ENTERING THE FIRST OF THE NEW 8 H.P. FLYING STANDARDS AFTER AN INSPECTION OF THE STANDARD SHADOW AERO FACTORY

The rating of the new Ten Standard is 9.99 h.p., the bore being 63.5 mm. and the cubic capacity 1,267 c.c., the engine giving off 36 b.h.p. at 4,000 r.p.m. Petrol consumption on this model works out at approximately 40 miles per gallon, with a maximum road speed of 63 m.p.h. The specification is somewhat similar to that of the Eight, although it is a larger car, the wheelbase being 7ft. 6in., and the overall length of the complete vehicle 12ft. 6in.

The Ten turns the scale at 17¾cwt., being ¾cwt. heavier than the Eight, and the price with Standard Saloon body is £169, with de luxe coachwork £179, or with a super saloon body £185. All three types of coachwork have, however, six lights, and are fitted with four doors. In addition the Ten has a four-speed gearbox, top having a ratio of 5.29 to 1, third 7.68 to 1, second 12.84 to 1, and first 20.86 to 1. On this model the electrical system is a 12-volt, and both the de luxe and super saloons include twin electric horns and windscreen wipers.

The new Twelve is a most attractive looking car, with a wheelbase of 8ft. 4in., and an overall length of 13ft. 9in. This vehicle is a four to five seater, and weighs 21cwt. unladen; it has a petrol consumption of thirty-two miles per gallon and is capable of a speed of 70 m.p.h. on the road. The engine, although rated at only 11.98 h.p., actually gives off 44 b.h.p. at 4,000 r.p.m., and is priced at £205 with a four-door light saloon body, or at £225 for the de luxe model. I have not yet had an opportunity of driving any of these new models, but am looking forward to doing so in the near future. They are all good-lookers, and this feature is particularly pronounced so far as the Twelve is concerned.

The Standard Motor Company are to be congratulated on bringing out for the coming season such a comprehensive range of vehicles which are so up to date in design, and I feel sure that they will meet with the success which they so thoroughly deserve.

"I can take SIX of you!"

SIX PASSENGERS IN SEARCH OF A CAR will find there is plenty of room for themselves and a driver in the Austin '18'. The Austin "Windsor" and "Iver" 7-seater saloons are remarkable cars. They are big but easy to handle; fast but they are safe; powerful but they are quiet. For those who want a smaller car of the same horse-power, to seat 5 instead of 7, there is the "Norfolk" Saloon.

To drive an Austin '18' is to experience a new feeling of confidence and control. From the driving seat there is a clear view well over the bonnet and both side lamps are visible. The improved engine with aluminium cylinder-head gives a very brisk performance. The car has adjustable steering, pistol-grip handbrake, synchromesh gears, powerful Girling brakes and many other features of mechanical interest. The comfort of the car is all-embracing and the equipment complete to the smallest detail.

THE GRACE OF THE GLIDER

A gull-like glider, piloted by Doret, the French stunt pilot, about to land near Toulouse

A GREAT YEAR FOR BRITISH GLIDING

Some Notable Achievements of the Season

By LORD SEMPILL, A.F.C., F.R.Ae.S.
Aviation Editor of the "Field"

THE issue of the 1,000th British gliding certificate by the Royal Aero Club is a significant indication of the progress that motorless flying has been making quietly in this country. It is little more than eight years since the first of these certificates was issued, and in view of the difficulties the movement has had to face the advance can be considered highly satisfactory.

Even more important, however, is the growth in the number of "C" licences issued. It is not until he holds the "C" licence that the sailplane pilot can be considered fully qualified, for it demands at least five minutes' soaring. In 1930, the first year in which certificates were issued, of the total 115 awarded, only five were in the "C" category. To-day, as many as 427 out of the 1,000—more than 42 per cent.—are "C" certificates, which indicates that the increase in numbers is accompanied by a comparable advance in skill.

It is fitting that the 1,000 mark should be passed at this time, for the season now drawing to a close has seen an all-round advance in the movement. Some very notable flights have been made, and the prophecy made in these articles on the eve of the National Gliding Contests that the gap between British and Continental achievement would be lessened has been gratifyingly fulfilled.

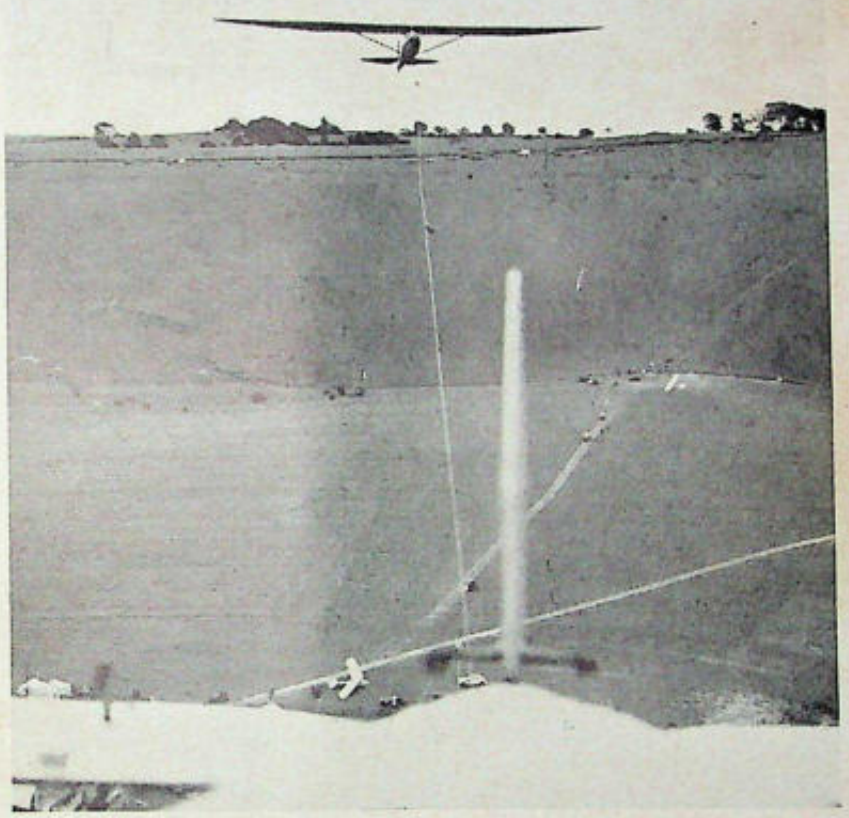
At the contests, the most publicised flight was, of course, that which set up a new world's record for duration in a two-seater machine. On that occasion, Flight-Lieutenant Murray and Stanley Sproule stayed aloft for 22 hours 13½ minutes.

This was a very notable achievement, but perhaps the most significant aspect of the meeting was the general standard attained. That it revealed a steadily advancing technique, by newcomers as well as old hands, was generally admitted. New machines were seen, and there was every evidence of vigour.

The two-seater duration record is, of course, the only world's sailplane record held by this country, and, even then, it is not an "absolute" record, the greatest duration of soaring flight so far attained being held by Germany at 41 hours. Nevertheless, progress is being made, and in the past two or three months other new British records have been established.

On July 31st, Mr. H. O. Pick put up new duration figures for single-seater sailplanes, when he beat the three-year-old record held by Mr. J. C. Neilan, by 20 minutes, returning a total time of 13 hours 27 minutes. This new record was not allowed to stand for long. Three weeks later, Flying-Officer A. N. Young, of the Fleet Air Arm, increased the British duration figures for single-seaters to 15¾ hours. This achievement was all the more notable in that the pilot had been practising motorless flight for only five days.

In the early part of the season, Mr. Philip Wills established a new height record of 10,080ft. Though this figure still stands officially, it has been exceeded by a British pilot, Mr. Peter Davis, who, on August 6th, attained an altitude of 11,300ft. This flight was not admitted for record purposes as it was made from an aerotow, the sailplane being released at a height of 1,500ft. In height records, this country still has a lot of leeway to make up, since in the same week that Mr. Davis attained 11,300ft., a German pilot, released from an aerotow, broke the world's record by rising to 23,190ft.



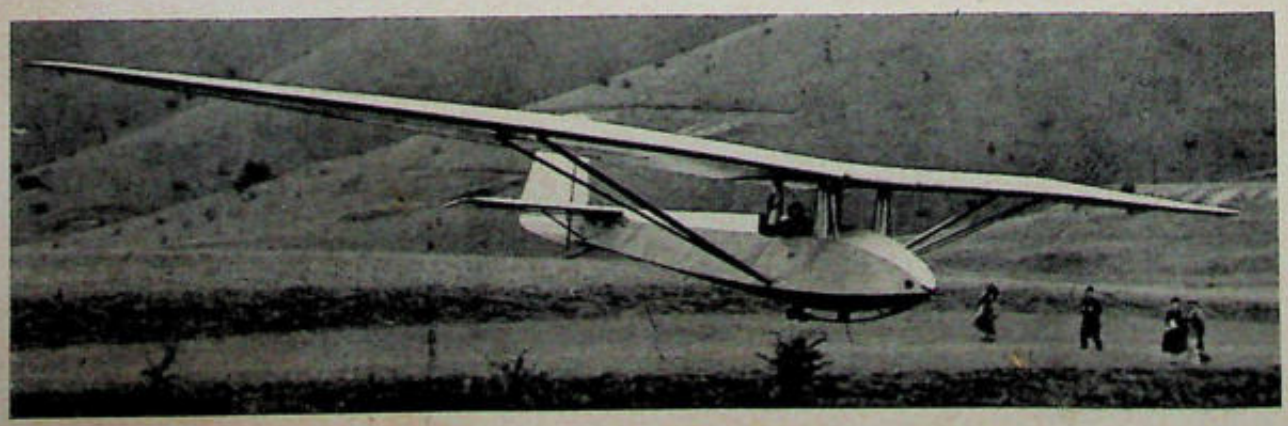
REFUELLING A GLIDER IN THE AIR

While Murray and Sproule were in the air they ran out of food and attempts were made to transfer supplies from another glider. This photograph shows the relief glider being towed into the air by an aeroplane, from which it was taken.

Records, however, are not the true indication of the progress of a sport such as gliding, the whole *raison d'être* of which is that it offers the nearest approach to flying for all yet available.

That British motorless flying is acquiring that solid foundation of achievement which marks, in particular, German and Russian gliding, is to be seen in various ways. The Dunstable competitions revealed that the ability to make cross-country flights—which alone render gliding a real flying sport—is becoming much more general. Actually no fewer than 90 per cent. of the competitors took part in such flights, while the number of "goal" flights, which aim at reaching a specific destination, was greater than ever before.

There can be little doubt that with the steadily increasing support accorded to the movement and the stability given by the subsidy, motorless flying is establishing itself in this country. The time cannot be long delayed before some of the absolute world's records fall into the hands of British pilots. In the past, the prestige of the British movement has been in relatively few hands; to-day, skill is more widely distributed. Applications for membership of the Civil Air Guard indicate the keenness of the men and women in this country for the air, and it is evident that many must wait for some time before flying instruction can be given them. Increased gliding facilities might well help to bridge the gap; for though the value of motorless flying as a preliminary to normal power flying instruction is still debated in some quarters, there can be no doubt that the sport does accustom people to the air. An association of a movement that has done so much in the face of so many difficulties and setbacks, with the new broadening of interest in aviation, might well make gliding as important a branch of aviation in this country as it has become elsewhere.



STANLEY SPROULE AND FLIGHT-LIEUTENANT MURRAY LANDING AFTER THEIR FLIGHT OF 22 HOURS 13¼ MINUTES

They landed at 2.24 a.m. after an adventurous flight during which they were ankle deep in water and half frozen

Deep-chested males who enjoy nothing better than "a crust of bread and cheese at the local, old man," whose holidays are riots of self-sacrifice in tents on the edges of cliffs—such men (we refuse to believe there are such women) are demoralised by the sinister luxuries with which we surround them.

Our offer of free golf, tennis, squash, swimming and a complete gymnasium is of no avail—our beds have sapped their energy, our menus have broken their iron wills. . . . Oh, good heavens, no! They like it.

LONDON TO CAPE TOWN

An Escape to the Atlantic Isles

ON many of the ships which make the voyage round Africa there are nowadays to be found several passengers who, while avoiding much of the rigour of an English winter, are indulging a mild attack of wanderlust by seeing new places at a cost rather less than they would have incurred by staying in England. Some of them do the whole round trip on the same ship, others take advantage of the two months' break allowed on their tickets, and spend it seeing something of the Union of South Africa, or perhaps the wild animals of Kenya.

The voyage is, in itself, most pleasant, and the latter half of November a good time to be steaming down channel, on the second day out passing the forbidding cliffs of Ushant with their

THE TORTOISE AT GOVERNMENT HOUSE, ST. HELENA, REPUTED TO BE 200 YEARS OLD

memories of Admiral Howe's great victory over the French on the "Glorious First of June" gained within sight of them, and Cape St. Vincent on the fifth, after a crossing of the dreaded Bay of Biscay, which at that season of the year is just as likely to be calm as rough.

If on one of the Union Castle "intermediate" ships, the Canaries, once known as the Fortunate Isles, will be sighted after about a week at sea, with the great cone of Teneriffe, looming 13,000ft. above the sea, away to the west as the ship steams along the coast of the Grand Canary to enter Las Palmas at its southern end.

It was from Las Palmas that General Franco flew to start his rebellion in Spain, and the black-clad customs police spend much of their time at the head of the ship's ladder returning Fascist salutes from passing small craft. There is little to see on shore, for the cathedral which looms squatly above the long line of the town is so dark that it is difficult to appreciate its interior; but fruit is usually plentiful and cheap, 50 bananas being purchasable for a shilling, and grapes are also good. Last time I was there a Greek steamer with a shell hole in her side bore witness to there being a war.

The next land seen is Cape Verde, the westernmost point of Africa, jutting out just north of the French port of Dakar, with a row of wrecks lining the reef inside the headland's lighthouse.

Then the "Line" is crossed, about four days out from Las Palmas, with deck sports in full swing, varied by lazing in a chair watching the porpoises leaping in the bow wave of the ship, and about 30 hours later she will be drawing up to the rolling green and brown hills of Ascension Island, rimmed with black rocks and white foam.

Since it was discovered by the Portuguese on Ascension Day, 1501, the island's only claim to fame has been its trade in live turtles, now discontinued. Its inhabitants are employees of the Eastern Telegraph Company, and myriads of seabirds, conspicuous among them the wide-awake, or sooty tern, whose flocks come in their thousands to nest there every eight months and then disappear into the South Atlantic, while frigate birds are certain to be seen wheeling overhead, the long scissors tail opening and shutting.

Then comes a 700-mile run to St. Helena where, having hired one of the numerous cars in Georgetown, it will immediately climb some 1,500ft. and take the visitor to Napoleon's tomb, where he lay buried for nineteen years before his remains were taken to his magnificent Paris mausoleum. The tomb is in a hollow beside a spring which Napoleon visited every day to drink its water, and is shaded by trees planted after his death. Then Longwood, the house

"THE LONG BLUE ARM OF HOUTS BAY"

in which Napoleon lived throughout his stay in the island (for he never occupied the new house which was being built for him a furlong away), and which contains many relics of that wonderful man, and also an atmosphere of death and dry rot.

The car will then complete the round through lovely hill country past Government House, and finally down the terrific zigzag hill crowned by the marine barracks, up which climb the 700 steps of the "Jacob's Ladder," by which ammunition was brought up to the guns long ago.

Before returning on board from Georgetown it is well worth looking at the naval monument in the gardens by the old Customs House. It records the deaths of ships' crews stationed there a century ago, and is remarkable for the terrible percentage of loss, and the youth of many of the victims.

The next land sighted will be the guano-bearing Dassen Island, 30 miles north of the Cape Peninsula, and 25 miles south of it is Robben Island, which used to house South Africa's lepers, but does so no longer, and then comes Cape Town, with Table Mountain dominating the city and harbour.

There is plenty to see in the country round Cape Town, with its mixture of old and new, rustic and urban. If a modern view be wanted from an ancient standpoint, then ascend to the top of Table Mountain by the cableway, but there will be no view if the "tablecloth is laid," as is termed the mist which often lies on the flat top and swirls around it. Nor will the cableway be working if that bane of Cape Town, a south-easter, be blowing, and if this horrible wind be at its worst, progress through the streets will mean holding on to one's hat all the time, and being blown round corners with imminent danger of collision with other pedestrians.

It is well worth taking a car to do one of the advertised tours in the country behind the city. One I can strongly recommend is some 50 miles in all. Up to the top of Kloof Nek, where the city and harbour are spread beneath one; then down to Camps Bay and up again, overlooking Cape Town's chief beauty spot, the little bay called Llandudno, and down over the next ridge to the long blue arm of Houts Bay. Then turn left, along a shady road with fruit trees all around and old Dutch houses sometimes right on its edge, to cross a ridge and descend through oak forest with the vineyards of Constantia clothing the hills to the right, and so to the villa suburb of Wynberg. Then comes Rondebosch and the imposing building of its University, high above its playing fields, its harder outlines softened by a garment of creepers, and just after leaving the gate the driver will certainly stop for you to admire the ancient windmill. One more long ridge and the car drops gently down into the centre of Cape Town once again.

While at Cape Town try the South African white wines. They are cheap and really made of grapes; an excellent accompaniment to a dinner preliminary to visiting one of the city's excellent cinemas.

P&O - FOR SUN IN WINTER

HAVE YOU BEEN THERE?

Ever fallen for the lure of South America in Winter . . . ever followed the sun beyond the blue horizon, 'rolling down to Rio' and those other fabulous cities of pleasure? If you have, then its charms live forever in your memory . . . one chapter at least in your record of wanderlust brilliantly written, dazzlingly illustrated!

A magic continent this . . . steeped in the romance of storied Inca and Conquistador. Land of vast pampas . . . of the mighty Andes . . . of impenetrable jungle and deep-flowing river. A country of Latin verve and tropic beauty . . . where one can bathe one's being in sunshine, drench one's soul in colour.

Rio de Janeiro, with 'Sugar Loaf' standing sentinel over the sparkling blue bay . . . Buenos Aires . . . Monte Video . . . Santiago . . .

Gay cities, these, with their plazas and their boulevards, their race-tracks and casinos. As modern as the hour . . . as sophisticated as Paris, London, New York. Where one can lounge in the bar and hear drinks called in a score of tongues in as many minutes.

Cities that live in 'carioca time.' Not the coldly efficient carioca we know in the North. But the passionate native rhythm that swings you irresistibly into the dance . . headlong into the swim of things!

For the coming season Cooks have a rich menu of travel plans featuring South America. Here are some 'stars':

CRUISES ROUND SOUTH AMERICA
M.V. "Gripsholm"
82 Days, from 144 Gns.
Sailing from Southampton, Jan. 16.

M.V. "Reina del Pacifico"

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE FOX INN AT NORTH ASTON

EVERYWHERE at this season of the year the gardener is busy sweeping away the autumn leaves. Changing hues make the countryside wonderfully attractive; and now, indeed, is the time to go down into the Cotswolds. Cub-hunting is in full swing, and there are few finer sights than this lovely district bathed in the early morning light. I could direct your steps to many a cosy little inn among these hills and valleys, but at the moment my thoughts are—one might say, naturally, considering the season—of The Fox, at North Aston.

Situated on one of the easternmost spurs of the Cotswolds, this hotel is built of the characteristic stone of those parts. It is difficult to give the house a definite age, for, unfortunately, there has not as yet been discovered a record of its early existence, but it is undoubtedly of considerable age. So far as is known it began as a posting inn, and later the mail coaches running between Banbury and Oxford used to change horses there.

About 40 years ago the licence lapsed and the house became a farmhouse. Gradually the building fell into neglect, but a few years ago the Lord of the Manor, whose property it is, realised its possibilities as a private house if carefully reconditioned. A considerable amount of money was accordingly spent. Modern improvements, such as central heating, bathrooms, and electric light, were added. It was thus as a fully equipped modern house that the present proprietor took it over and hung out the sign of "The Fox." Although it is now an hotel the private house atmosphere still prevails, and this, perhaps, is a part of its natural charm.

The entrance hall used to be the bar in the old days. During alterations it was necessary to take up some of the stone flags, and it was then discovered that some of them were tombstones still bearing the inscriptions. One wonders how many other old inns have similar stone-flagged floors!

You will like the wide open fireplaces in the hall and dining room, where in winter log fires are kept burning. And is there anything more attractive on a cold day than a log fire? Probably years ago there hung over these fires iron pots from which would come forth bubblings and gurglings, and a vague suggestive steaminess. You still get these smells—warm, rich and varied smells, which are such a delight to hungry people—in farmhouses where the cooking is done over an open fire. But although they do not do their cooking in public at The Fox, the hotel is well famed for its excellent cuisine. The best English food is always provided for guests.

The Big Room at The Fox, used as a sitting room for guests, was in former days the Manor Court Room. This accounts for a dignity of proportions unusual in houses of this date. You cannot help admiring the Adam bookcases in this room; while the house is furnished throughout with old furniture in keeping with its age.

It is the object of the proprietors to conduct the hotel exactly as a pleasant, well-run private country house. The furnishings and appointments are as one would find in such a place, and the attention and consideration shown to guests are exactly as would be shown in a friend's house.

There is much in the neighbourhood to interest and amuse guests. Hunting can be enjoyed with the Heythrop and the Bicester, or golf nearby for those who do not ride, while the motorist is in a beautiful district for exploration trips. And in the evening you will gather round the glowing embers of the great log fire and picture yet again the yellows and browns of the countryside as you discuss the success or otherwise of a stout running fox.

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

THE ACOL SYSTEM OF BIDDING

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

THERE are fashions in Systems, as in women's dress, and at present, and particularly amongst the younger players, there is a vogue for the Acol System which first came to notice in 1937. The System derived its name from a London club, where it was developed by a little group of players who met with considerable success in duplicate tournament play. Originally it was published under the title of the "Acol Two Club," but as the Two Club bid is only a part, in the recently published *Summary* (Joiner & Steele; 1/-) it has been re-named "The Acol System."

What are its characteristic features and essential differences from other systems? First, it gives considerable latitude in the opening bid of One of a suit allowing it on a hand containing as little as one-and-a-half honour tricks in certain conditions. But, lest you should imagine that a light opening bid is permitted or recommended, it is necessary to observe that a bid on the minimum is to be made only (*a*) when the *distribution is good*, (*b*) *the hand contains a sound re-bid*. Thus, holding ♠ K, x, x, x, x, x. ♡ A, x, x. ◇ Q, x, x. ♣ x, you should bid One Spade because of the distribution, and the fact that you can re-bid Spades if your partner responds with Two of any other suit. This is contrary to the doctrine that opener should have at least two quick tricks in defence, and some say two-and-a-half. But I am prepared to believe that there are advantages in it.

Yet as the same bid of One is to be made on a very strong hand even containing as many as five or six honour tricks "when it is not of game-going strength," partner is left in doubt as to conditions.

On the point count, A=4, K=3, Q=2, J=1, he must pass when not holding five points and bid One No Trump on five to nine points and Two No Trumps on eleven to thirteen points, Three No Trumps on fourteen to sixteen points. Also he should prefer a suit response to No Trumps response when the suit can be bid at the range of One. I find little to criticise in this. It has elements of the One-Over-One and common-sense bidding, and the principle of preparedness or anticipation.

Another feature which I like is the Two Bid. In Spades, Hearts or Diamonds (Clubs are reserved for an artificial bid) you should open with Two on hands with exceptional strength. In placing the minimum strength as eight playing tricks I consider this is rather too high. The Simple System allows six tricks when not vulnerable, and seven when vulnerable, and that I believe to be better.

On Acol principles the gap between a One and a Two bid is too wide. If you guarantee eight playing tricks (and mark, of course, this has nothing to do with honour or quick tricks) you limit, as I consider unnecessarily, your opportunities for making this useful and valuable bid.

On my System the bid of Two is highly provocative, and a strong invitation to partner to keep the bidding alive. And that, I believe, in the long run achieves better results than a stereotyped eight tricks.

On the Acol System the bid of Two is forcing for one round, and lacking values necessary for another bid, responder must say Two No Trumps.

The Acol Two Club bid is reserved for hands containing a minimum of five honour tricks. It is forcing to game with one exception.

Holding a balanced hand and not less than 23 points, Two Clubs should be opened and Two No Trumps called over Two Diamonds. This is the only situation in which a Two Club bid may be allowed to die short of game. In this respect the "Acol" differs from other artificial Two Club systems.

Pre-emptive bids are much on the same lines as "the Simple System." Opening Three bids show five to six playing tricks not vulnerable and six to seven when vulnerable. But I do not agree with the recommended bid of Three Clubs on ♠ x, x. ♡ x. ◇ x, x, x. ♣ Q, J, 10, x, x, x, x. While a pre-emptive bid may be sacrificial in purpose a bid of Three Clubs on such a hand is, in my opinion, useless. It cannot deter opponents, but may convey a totally wrong impression to partner. It is a bad bid.

A bid of Two No Trumps by defender over an opening One No Trump demands a take-out and is forcing to game. Partner must bid his longest suit. This, it is stated, is a new bid published for the first time. It may have advantages, but unless the opener has made a very light or psychic One No Trump, I doubt its efficacy.

In presenting this brief precis of the Acol System I neither endorse it nor "crab" it. In so far as it is the work of practical players who have devoted considerable thought to it, I would recommend you to study it for yourself.

CHESS

A GOOD FINISH

In a game in the first round of the Premier Reserve Tournament at the recent congress at Plymouth the following position was reached after White's 35th move:—White (H. Saunders): King at K Kt 2, Queen at K 2, Rooks at K sq and K R sq, Bishop at K Kt 3, Pawns at Q 3, K B 3, K Kt 4, Q R 4, K B 5 and Q B 5; Black (T. D. van Scheltinga): King at K Kt 2, Queen at Q 2, Rooks at K sq and Q Kt sq, Bishop at Q B 2, Pawns at K B 3, Q B 3, Q R 3, K 4, Q 4 and K Kt 4.

Black now finished off the game as follows:

WHITE. H. Saunders.	BLACK. T. D. van Scheltinga.	WHITE. H. Saunders.	BLACK. T. D. van Scheltinga.
35. . . .	P to K 5 (*a*)	42. R to K Kt sq	P to K 6
36. B takes B	Q takes B	43. Q takes R P (*g*)	Q to K 5 (*h*)
37. B P takes P	P takes P	44. R(Kt sq)toKt2(*i*)	P to K 7 (*j*)
38. P to Q 4 (*b*)	R to Kt 6 (*c*)	45. Q takes K P	Q takes Q
39. R to R 2	Q to B 5 (*d*)	46. R takes Q	R to B 8, ch
40. K to R sq	R to Kt 6	Resigns (*k*)	
41. R to K B sq(*e*)	R to K B 6 (*f*)		

(*a*) Beginning a break-through in the centre.

(*b*) If P takes P, then Q to K 4, threatening either R to Kt 7 or Q takes Q B P.

(*c*) Threatening Q to Kt 6, ch followed by R to R 6, ch. If now 39, R to R 3, then 39. . . . R takes R; 40. K takes R, R to R sq, ch; 41. K to Kt 2, R to R 7, ch; 42. K to B sq, Q to B 5, ch; 43. K to Kt sq, Q to Kt 6, ch and mate next move.

(*d*) Now Black threatens R to Kt 6, ch followed by Q takes Kt P.

(*e*) 41. R to K Kt sq is better, although after 41. . . . R takes R, ch; 42. K takes R, R to Q Kt sq White has a big advantage in position. If (instead of 41. R to K Kt sq) 41. R to Kt 2, then 41. . . . R to R sq, ch; 42. K to Kt sq or R to R 2, R (Kt 6) to K R 6.

(*f*) Much stronger than Q takes Kt P. If now 42. R takes R, then 42. . . . P takes R with a winning game. (If 43. Q takes R, then 43. . . . Q to B 8, ch and mate next move.)

(*g*) White has no satisfactory move.

(*h*) Threatening R to B 8, ch followed by R to R sq, mate.

(*i*) If 44. Q to R 7, ch, R to K 2; 45. Q to R 8, then 45. . . R to B 8, ch; 46. R to Kt 2, P to K 7 and wins.

(*j*) Finishing neatly. If now R takes P, then R to B 8, mate.

(*k*) After 47. K to Kt 2 there follows 47. . . . R takes R, ch; 48. K takes R, R takes R.

A FINE GAME BY ELISKASES

The following game, from a tournament at Milan in April, was finely played by Eliskases.

(*Sicilian Defence.*)

WHITE. Castaldi.	BLACK. Eliskases.	WHITE. Castaldi.	BLACK. Eliskases.
1. P to K 4	P to Q B 4	23. Kt to B sq	B takes B, ch
2. Kt to K B 3	P to K 3	24. R takes B	K to R sq
3. P to Q 4	P takes P	25. Kt to Q 3	Kt to K 6
4. Kt takes P	Kt to K B 3	26. Kt to Kt 4 (*j*)	Q to B 4 (*k*)
5. Kt to Q B 3	P to Q 3	27. P to R 3 (*l*)	P to K 5 (*m*)
6. B to Kt 5, ch(*a*)	Q Kt to Q 2	28. P takes P	P to B 6
7. B to K 3	P to Q R 3	29. Kt to Q 5	P takes P
8. B takes Kt, ch	B takes B	30. Kt takes Kt	R takes R (*n*)
9. P to Q R 4	B to K 2	31. K takes R	R to Q 7, ch
10. Castles	Castles	32. K to B 3	R to Q 6 (*o*)
11. P to B 3	Q to B 2	33. Q to Kt 6	R takes Kt, ch
12. P to R 5 (*b*)	B to B 3 (*c*)	34. K to B 2 (*p*)	R to K 8, ch
13. Q to K 2	P to Q 4	35. Q takes Q (*q*)	P to Kts=Q, ch
14. P takes P	B takes P (*d*)	36. K to B 3 (*r*)	Q takes Q
15. Kt takes B	Kt takes Kt	37. R takes R	Q to R 4, ch
16. B to B 2	Kt to B 5	38. K to Kt 3	Q to K 4, ch
17. Q to K 4 (*e*)	P to K 4 (*f*)	39. K to B 3	P to K Kt 4
18. Q to K sq	P to K 4 (*g*)	40. R to K 3	P to R 4
19. Kt to K 2	Kt to Q 4 (*h*)	41. P to Kt 4	Q to B 5, ch
20. P to B 3	P to B 5 (*i*)	42. K to K 2	P to Kt 5
21. Q to Q sq	Q R to Q sq	43. P to K 5	P to Kt 6
22. Q to Kt 3	B to B 4	Resigns (*s*)	

(*a*) Not good, for White has either to exchange the Bishop for a Knight or else to retreat with loss of time. The usual move is B to K 2.

(*b*) White now has control of Black's Q Kt 3.

(*c*) Preparatory to P to Q 4.

(*d*) Black now threatens B to B 5. Moreover, White has a weakness at his K 3.

(*e*) A mistake. White should, instead, play 17. Q to K sq, to be followed, if 17. . . . P to K 4, by 18. Kt to B 5 or, if 17. . . . B to B 4, by 18. Kt to Kt 3. If (instead of 17. Q to K sq) 17. Q to K 3, then 17. . . . B to B 4, or, if 17. Q to Q sq or Q 2, then 17. . . K R to Q sq.

(*f*) A very good move. If now 18. Kt takes K P, then 18. . . . P takes Q; 19. Kt takes Q, Q R to B sq; 20. B to Kt 6, B to Q 3; 21. P to K Kt 3 (the only move), Kt to K 7, ch; 22. K to B 2, B takes Kt; 23. K takes Kt, B takes B; 24. P takes B, R takes P, ch with advantage to Black.

(*g*) A strong move.

(*h*) Not 19. . . . Q takes B P because of 20. Kt takes Kt, P takes Kt; 21. Q takes B.

(*i*) Black's plan now is to exchange Bishops and then occupy White's K 3 with the Knight.

(*j*) Preparatory to Kt to B 2.

(*k*) A very strong move. If now 27. Kt to B 2, then Black has the choice between three advantageous replies, viz. (1) 27. . . . Kt to Q 8, (2) 27. . . . R to Q 7, to be followed, if 28. Kt takes Kt, by 28. . . . P takes Kt, or, if 28. R takes R, by 28. . . . Kt takes Kt, ch, and (3) 27. . . . Q takes R P.

(*l*) Played to prevent a subsequent Kt to Kt 5.

(*m*) Threatening P takes P followed, after P takes P, by R to B 3.

(*n*) Not Q takes Kt because of Q to Kt 6.

(*o*) Threatening Q takes Kt, ch. If now 33. R to K sq, then 33. . . . R takes Kt, ch; 34. R takes R, P to Kt 8=Q.

(*p*) If 34. K takes P, then 34. . . . Q to Kt 4, ch; 35. K to B sq, Q to B 5, ch with a mating attack.

(*q*) If K takes P, then either Q takes Q or Q to Kt 4, ch.

(*r*) He might as well resign here; his game is hopeless.

(*s*) If 44. P to K 6, then 44. . . . P to Kt 7; 45. P to K 7, Q takes R, ch and wins.

A STRONG ATTACK

THE following game, from a recent tournament at Örebro, shows a strong attack by the Swedish master, G. Stahlberg.

(*Queen's Gambit Declined.*)

WHITE. Stahlberg.	BLACK. Sundberg.	WHITE. Stahlberg.	BLACK. Sundberg.
1. P to Q 4	P to Q 4	12. R takes Kt	P to K 4
2. P to Q B 4	P to K 3	13. B to Kt 3 (*a*)	P takes P (*b*)
3. Kt to Q B 3	Kt to K B 3	14. P takes P	Kt to Kt 3
4. B to Kt 5	B to K 2	15. R to K sq	Q to B 3 (*c*)
5. Kt to B 3	Q Kt to Q 2	16. Q to K 2 (*d*)	B to B 4 (*e*)
6. P to K 3	Castles	17. Q to K 7	Kt to Q 2 (*f*)
7. R to B sq	P to B 3	18. Kt to R 4 (*g*)	B to K 3
8. B to Q 3	P takes P	19. R takes B (*h*)	P takes R
9. B takes P	Kt to Q 4	20. Q takes K P, ch (*i*)	R to B 2 (*j*)
10. B takes B	Q takes B	21. Kt to B 5 (*k*)	Resigns.
11. Castles	Kt takes Kt		

(*a*) Alternatives here are P takes P, Q to B 2 and P to Q 5.

(*b*) This move has the disadvantage of opening a file for White's King's Rook and a rank for his Queen's. 13. . . . P to K 5 is better, *e.g.*, 14. Kt to Q 2, Kt to B 3; 15. Q to Kt sq, B to B 4 followed, if 16. R to B 5, P to K Kt 3; 17. R to K 5, by 17. . . . Q to Q sq, threatening 18. . . . Kt to Q 2.

(*c*) Q to Q 3, with a view to playing Kt to Q 4 and (if B takes Kt) Q takes B, is preferable. White, however, can obtain good attacking chances by playing either Kt to K 5 or Kt to Kt 5.

(*d*) Kt to K 5, threatening R to B 3, is a very good alternative.

(*e*) 16. . . . B to Q 2 is better. After 17. Q to K 7, K R to K sq; 18. Q takes Q, P takes Q Black has a chance of saving the game.

(*f*) After 17. . . . Q takes Q; 18. R takes Q White would have a very great advantage in position.

(*g*) Threatening to win a piece by Q takes Q followed by Kt takes B. If now 18. . . . Q R to K sq, then 19. Q takes R, R takes Q; 20. R takes R, ch, Kt to B sq; 21. R to B 3, Q takes Kt (not P to K Kt 3 because of Kt takes B); 22. R takes B (threatening either B takes P, ch or R takes P) and wins.

(*h*) A fine move.

(*i*) Not Q takes Kt because of Q takes P, ch and mate next move.

(*j*) If 20. . . . K to R sq, then 21. Kt to Kt 6, ch, Q takes Kt (or 21. . . . P takes Kt; 22. R to R 3, ch and mate next move), 22. Q takes Q and wins, for, if 22. . . . P takes Q, then 23. R to R 3, mate. If (instead of 20. . . . K to R sq) 20. . . . Q takes Q, then 21. R takes Q, ch, R to B 2 (if K to R sq, then Kt to Kt 6, ch and mate next move); 22. Kt to B 5 (threatening Kt to Q 6), K to B sq; 23. B takes R, K takes B; 24. Kt to Q 6, ch, followed by 25. Kt takes P and (if 25. . . . R to Q Kt sq) 26. R to Q Kt 3 with a winning game for White.

(*k*) Threatening either (1) Q takes Kt or (2) Q takes Q followed by Kt to Q 6. Black has nothing better than 21. . . . Q takes Q, which after 22. B takes Q, K to B sq; 23. B takes R and 24. Kt to Q 6, ch gives the variation in note (*j*) arising from 20. . . . Q takes Q.

PROBLEM No. 3983

By the late A. M. A. VAN DER VEN.*

WHITE (8 pieces): King at K Kt 7, Queen at Q B sq, Bishop at K sq, Pawns at K Kt 2, K B 3, K 4, Q 5 and Q B 6.

BLACK (7 pieces): King at K Kt 4, Pawns at Q B 2, Q 3, K R 3 K 4, K B 5 and K Kt 6.

White to play and mate in three moves.

* *De Schaakwereld*, 1938.

SOLUTION OF PROBLEM No. 3982

1. R to R 8, Any move; 2. Q, R, B or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 486

ACROSS.—1, This puzzle has it. 8, Hurry up for this. 9, Batsmen like it high, golfers low. 11, Both malt and meat are mixed in this. 12, End Sorting (anag.). 13, A bee in this is absolutely worthless. 15, A pleasant tract, but hardly religious. 18, Directors' work. 22, Oh! You saints shouldn't be excommunicates. 25, Belonged to the English for a few months. 26, Threads. 28, "For who would embrace virtue if you removed her ——?" (*Juvenal*). 30, Medical men swallowed by fishes. 31, Back to front to hear. 32, Sounds as if some holes had been made—to let the rain in perhaps.

DOWN.—1, No burglar would walk like this though he would like the start he would get. 2, Fits fits. 3, I mean noted (anag.). 4, Watched by politicians, doctors and stockbrokers. 5, Backward alternative in a famous race. 6, Not particular. 7, Both deer and flowers are this. 10, Platonic virtue or Gnostic powers. 14, Scientist discredited by many, but with a change of two letters acknowledged by all. 16, This should come out pat with a bit of wangling. 17, Sustained musically. 19, In front of the fire, at the back of the train. 20, This this for short. 21, Was oval (anag.). 23, For this Marlborough used wood, Wellington metal. 24, Pressingly persists. 27, Dogberry knew he was this. 29, Ferric hydroxide to some.

A prize of one guinea is offered for any crossword puzzle, dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Trout Scales for Examination.—No. 1 appears to be five-six years old; No. 2, four-five. Trout scales are never so distinct in summer and winter growths as salmon, but the ages given above seem fairly distinct. The growth seems to be rather slow, with a very short winter non-feeding period or reduced feeding period.—*E. E. J., Mont.*

Forestry

Conifers.—Conifers are subdivided into groups of which the principal are the pines, the firs, the cedars, the larches, the sequoia, the yews and the species cupressus, with which can be grouped the thuyas and junipers. Under the heading of firs would be grouped the silver firs (*abies* species), the spruce firs (*picea* species) and the Douglas firs (*pseudotsuga* species). The distinction between a cupressus and a thuya is as follows: *Cupressus*—The twigs are frond-like, much branched and covered with small scale-like leaves compressed against the stem and overlapping in four ranks. *Thuya*—The twigs at the ends of the branches are flatter and wider than cupressus and more tape-like. These two characteristic distinctions are sufficient to enable the two species to be distinguished, but there are, of course, botanical differences which I will enumerate if you desire further information.—*P. S. L., Birkenhead.*

Garden

Orchid Sent for Identification.—This is an abnormal specimen of *Ophrys apifera* (Bee Orchid).—*L. W., Bridport.*

Pears Sent for Identification.—(1) Beurre d'Amanalis. (2) William. (3) Marie Louise. Flower sent arrived too faded to identify.—*E. M., Helston.*

To Eradicate Tree Stumps.—The quickest method would be to have them blasted out, but an expert should be engaged for the job.—*L. C. B., Lockerbie.*

Flowers Sent for Identification.—(1) *Teucrium scorodonia* (wood germander or wood sage); (2) *Geranium pratense* (meadow cranesbill).—*D. M., Dornoch.*

Preserving Passion Fruit.—It would be advisable to apply to the Research Station for Preserving Fruit and Vegetables at Campden, Gloucestershire.—*H. C. B., Cambridge.*

Tomato Leaves Sent for Inspection.—These have evidently been scalded, *i.e.*, the sun has shone on them when they were very wet. The fact that the fruits are not ripening properly indicates wrong cultivation, though it is impossible to say exactly what is wrong without knowing the whole process.—*N. P., Builth Wells.*

Kennel

Haliverol.—You may give up to fifteen drops of Haliverol daily to an adult basset hound, and eight to ten drops to your Jack Russell terrier.—*J. St. A. F., Teignmouth.*

Border Collies.—The dogs that are most numerous at sheepdog trials are Border collies. They are of the collie type, but a good deal smaller than the show dogs, and are black or black-and-white. Sometimes they have a little tan. They are rough-coated. The sheepdog most often seen in Wales is generally a blue merle in colour and smooth-coated.—*C. A. T., Okehampton.*

Distemper Vaccine.—(1) The producers of the vaccine, Messrs. Burroughs Wellcome, have a branch at Bombay, and would be in a better position to advise you as to the possibility of obtaining the vaccine, &c., by Air Mail. (2) Dirt eating is quite often due to a lack of potassium salts in the diet, and may usually be controlled by the addition of black treacle in doses just short of relaxing the bowels unduly.—*J. C. W., India.*

Unruly Lurcher.—It is the most natural thing in the world for your lurcher to chase hares or rabbits, and if you cannot make him biddable, the only thing will be to put him on a lead when he is exposed to temptation. Of course, if a dog is disinclined to come in when called, and is thrashed when you catch him, he will take good care to keep out of your way. A small bribe in the shape of a bit of biscuit or something of that kind will be more likely to bring him to heel. We would suggest putting him through a course of training that can be done when you are out for a walk. Put him on a leash or, better still, a long check cord such as is used for preventing gundogs running in when they are being trained. Take him where there are rabbits, and as soon as he attempts to chase pull him up smartly, saying, "No. Heel!" Pat him if he goes quietly and tell him he is a good dog.—*H. R., Ipswich.*

Naturalist

Caterpillars Sent for Identification.—The caterpillars which you sent for identification are those of the Noctua moth, *Agrotis exclamationis*, which is a common species. This caterpillar feeds on a number of different plants, and by day hides in the ground. They are not at all uncommon in gardens.—*R. F. B., Liss.*

Post-Mortem Examinations

Air-sac Mites of a Bantam.—A bantam's death was due to inflammation of the lungs brought about by air-sac mites, *Cytodites nudus*. The bird was also badly infected with tapeworms and round worms of the bowels. These findings are evidence of the insanitary conditions of the pen and house. We advise the removal and burning of the litter and nestbox material, followed by a thorough scrubbing of the entire interior of the house with hot soda water and soft soap to each gallon of which a cupful of paraffin has been added. The in-contact birds should be culled, wasters being destroyed. The remainder should be housed on sawdust and treated with the Nicotine Compound Pill (Willows Brand), a second pill per bird being given after an interval of seven days. On the ninth day the treated birds should be removed to the disinfected house, and penned on a clean piece of ground.—*R. P. G. V., Sussex.*

Gapes.—The threadworm infection of the windpipe and lungs known as gapes sometimes appears, especially during a wet season, about the last week on the rearing field. Usually, however, the disease is first observed among poults after they have been a few weeks in covert. Well-nourished birds are picked up dead in the earlier part of the epidemic, and among the coverts no snicketting can be heard, and the stock looks well. These earlier specimens usually die rapidly from pneumonia or blockage of the windpipe by the worms. Snicketting and weakened birds are observed after the disease has been spreading for several weeks, usually during the latter part of September and October. The disease is spread through contamination of the ground, food and drinking-water supply by the worm-containing droppings of infected birds. Since curative treatment, which is practised on the rearing field, is not practicable for birds at liberty, our measures are limited to attempting to stop the spread of the disease. Any poults showing signs of disease should be destroyed and their bodies should be burned. Food should be laid on fresh patches of ground each day, and in order to reduce the risks of birds crowding together the feeding places should be dotted about the coverts. Another factor which aids the propagation of the disease is damp ground and shade. Thus water-logged areas in the coverts should be drained. Sunshine and air should be let into the coverts by cutting down thick undergrowth and thinning out some of the trees. Poults, particularly, require sunshine and fresh air for their healthy growth. Patches of ground on which coops have stood and food has been laid should be dressed heavily with quicklime. Some owners stock up their coverts with part-grown birds. Before turning them into covert, these newly-purchased birds should be penned for at least a week, during which they can be closely observed for signs of disease. The fewer the birds per pen the better. Should gapes appear in one or more pens the affected birds can be treated or destroyed while they are under control. A common method of treatment is blowing a mixture of equal parts of camphor and chalk upon the birds within a coop. Some keepers use chloroform as an inhalant. Others prefer to inject 1 c.c. of a 5 per cent. watery solution of sodium salicylate into the windpipe of each infected bird by means of a hypodermic syringe. Usually it is cheaper and more efficient to destroy the gapers at the outset of the trouble. Among the specimens was a mallard infected with the species of gapeworm *Cyathostoma*, which is almost invariably confined to waterfowl; our other specimens were pheasants infected with *Syngamus Trachea*.—*J., Berks; J. W., Cumberland; A. C., Suffolk; W. E., Berks; G. A. M., Leicestershire.*

Shooting

Advice on Gun Purchase.—We should certainly advise you to take a pair of guns as, apart from the possibility of large bags, there is always the chance that one of your guns may develop a defect, and then you will be placed in the embarrassing position of having to borrow one from a member of the party. You can safely assume that your host will provide you with a loader, and it might be as well if you tried to get some practice in exchanging guns before you actually arrive at the shoot. It is quite in order for you to write to your host and ask him how many cartridges you will be likely to require, but in any case it is as well to arrange with your gunmaker to forward you further supplies on the receipt of a telegram. The question of whether you ought to take your retriever with you depends largely on the nature of the shoot, but as you say that you have not got a dog at present, it will be safe to assume that your host will provide one. As a general rule, it is unwise to take a dog with you that is not used to sleeping away from home, as he is likely to howl for the greater part of the night. When you arrive at the shoot, you will probably find that there are seven guns, and it is likely that you will draw numbers for positions. Every time the line moves on, you will move up too. A great temptation for a rough-shooting man who suddenly finds himself with a party is to shoot his neighbour's bird, and you must be careful to avoid this. It would, we think, also be advisable if you were to take a cartridge bag, and one made of canvas will be quite adequate.—*J. C. T., Shipley.*

Cartridge Tests

It is practically impossible to judge the ballistical merits of cartridges when only four are available; however, judging from results obtained your red cartridges should certainly prove effective against game, both velocity and pattern being well up to standard. Pressure was normal for the load employed, namely, 31 grains of powder and 1⅛oz. No. 6 shot.—*M. P., Halkirk.*

Stable

Food for Horses.—The ordinary raw linseed oil is suitable for adding to the food of horses, but not the boiled as it contains driers which are poisonous.—*S. R. G., Potters Bar.*

Travel

Hotel in Ireland.—We are certain that you would like the Butler Arms Hotel at Waterville. Waterville is built on a narrow neck of land which divides the sea from the island-studded Lough Currane, claimed to be the best free fishing fresh water lake in Southern Ireland. Situated midway between the seashore and the lake is the Butler Arms Hotel, which gives a view from its verandah of sea and mountain scenery of surpassing beauty. Visitors to the Butler Arms can enjoy free salmon and sea-trout fishing on the lough, and also reserved fishing on the famous Waterville River, about half-a-mile in length, which connects the lough with the sea. There are also excellent beats on the Inny and Cummeragh Rivers, and the best drifts on Lake Derriana and others. Fishing starts from February 1st and closes on October 15th, and for the convenience of guests a supply of the suitable flies and tackle is kept at the hotel. The present-day Waterville is made lovely in the summer by the rich delicacy of flowering myrtles and arbutus, while the ruins of the sixth-century chapel on Holy Island, Lough Currane, remind one of its quiet, long drawn past. Here St. Finion prayed for the "forgiveness of the sins of all mankind," and possibly other holy men with no such universalist hopes interceded for many who seemed past praying for. Quite near Holy Island to-day are certain deep pools, where are to be found plenty of small brown trout whose forbears may have seen St. Finion quietly praying. Many place names in the district perpetuate the saint's name, whilst in Waterville are relics of all periods of Irish history, and personal and place names help us to realise historical continuity down to the present day. The proprietor of the Butler Arms Hotel also owns the Southern Hotel, Caragh Lake, and the Royal Hotel, Valentia, and meals and fishing are interchangeable. The distance separating the three hotels is about 30 miles, and such an opportunity of visiting different neighbourhoods without consequent expense is very rarely offered. It is a chance which should appeal to many. Caragh Lake, only 21 miles distant, is embosomed in broom and heather-covered hills. It is six miles long and provides good salmon and trout fishing, whilst excellent sport may also be obtained in the Caragh, Caraghbeg, Oregarriv and Meelagh Rivers. The visitor who stays at the Butler Arms Hotel can enjoy the beauties of Killarney's Lakes when he has a will to do so, returning to sleep far from the madding if friendly crowd of American and British visitors to Killarney. Here at Waterville is a neighbourhood "where anglers gather" in a paradise all their own. Good cuisine and home comforts are guaranteed at the Butler Arms and its two associated hotels. What more could anyone wish for than ideal sport in a beautiful land by day and genuine comfort and peace when day is done? To save you the trouble we have asked the proprietor of the Butler Arms to send you his brochure and terms.—*A. M., Wilts.*

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

THE CAMBRIDGE STAND-OFF HALF CUTS THROUGH

R. B. Bruce-Lockhart, stand-off half of the Cambridge team, is one of the most valuable players in the University side. He uses his head as well as his body when he plays Rugby, and may be expected to produce the unusual at any moment in a match. This photograph, taken at Twickenham last Saturday, shows him side-stepping a Harlequin player coming up behind him. From the balance of their bodies there is little doubt that he "got away with it."

TOWN AND COUNTRY

THERE is more than one reason why the importance of preserving the English countryside is not universally regarded as one of the most important problems of the day. The great majority of townspeople regard the country as a place to which they may periodically retire, but to which they owe no obligation. The seasons of nature appear to revolve, and they suppose that the farmer's sole and easy duty is to follow them and to sell the produce—for, after all, are not the shops full of the yield of the land? The increased urban acquaintance with the countryside which the motor car has produced has not been accompanied by a similar increase of sympathy, and there are still many townsmen who cheerfully stroll across the farmers' fields, yet who would be infuriated if the farmer were to walk across the lawn of their town house. It is difficult to see a satisfactory solution to this problem.

The farmer, on the other hand, is not quite clear in his mind as to the exact nature of the question. The land, to him, exists in order that he may make his living from it, and he may be pardoned if, when looking at a field of wheat, he is more concerned about how many bushels to the acre it will produce than with any æsthetic qualities it may possess. In the present state of agriculture he is only too pleased to allow advertising hoardings to be erected on his land, and any concern he may once have had for the beauty of his farm has long since been lost in the all-absorbing struggle to make it pay its way at all.

Yet the preservation of rural England is an integral part of the economic welfare of the country. No one—least of all the Council for the Preservation of Rural England—wishes to create a dormant but pleasant countryside. For, indeed, that conception is but a contradiction in terms, and Professor Abercrombie did well to emphasise recently that the beauty of the countryside is wholly dependent on its prosperity. Not until the disastrous lack of balance between town and country is redressed can our economic position improve and the face of England be preserved from pollution. Such questions as ribbon development and the making of new roads are invariably regarded from the townsman's point of view. A new road makes possible quicker transit and a decrease in accidents. The townsman has, therefore, less opportunity than before to watch the country, and a lovely and useful tract has been sacrificed to the doubtful advantage of the careless driver. The advantage to the countryman is practically nothing. Ribbon development is, perhaps, the greatest menace, and there are few towns of any size in England whose approaches are not consistently hideous. Yet it is the melancholy truth that many farmers are struggling on with the sole idea of finally selling their land for these abominable purposes.

There would seem, therefore, to be only one solution to this problem, and it undoubtedly lies with the Government. If an agricultural policy were framed and put into execution which was capable of restoring a general prosperity to farmers, their land would necessarily become more beautiful. A greater measure of farming wealth would make possible an appeal to the farming conscience in such matters as hoardings and the sale of land for urban development. A successful policy of this kind would also combine town and country into one effort for prosperity, and a united England would bring both confidence and beauty to the rural areas.

PRIDE OF CRAFT

HEDGING, thatching, shearing, and wood-work and metal-work, which were part and parcel of our rural industries it has long been said, are being added to the catalogue of lost arts, and it is good to learn that they are taking their place in the curriculum of agricultural institutes and colleges. With their decay, as the autumn issue of *Rural Industries* justly points out, much of the beauty of our rural life is being sacrificed, and any movement which tends to revive a pride of craftsmanship is to be welcomed. Not only is it necessary for those of the future generation who are taking up farming to have a grounding in the elements of the old crafts to restore the soul of agriculture and its allied occupations, but also from a practical angle to enable them to undertake and supervise necessary repair work. In this way shoddy makeshifts which are an eyesore will disappear, for the skilled instructor will breed an abhorrence of slovenliness. The disappearance of the apprentice has been a vital factor in the deterioration of village crafts, and it is good to hear that an effort to bring young blood into village trades in the Eastern Counties is meeting with success.

THE LATE LORD STANLEY

In the death of Lord Stanley the country has suffered a loss which is incalculable, coming at a time when young shoulders are badly needed to carry the burden of responsibility. His death, at the age of 44, occurred when he was reaping the reward of a career of steady endeavour, one that could, indeed, be divorced from political interests, as having displayed that sincerity of purpose and devotion to national affairs which is the tradition of his family. When the Prime Minister appointed him Dominions Secretary it was realised that here was a fitting position for his particular qualities and for one who had Dominion interests at heart. Lord Stanley maintained his family's association with the Turf, and it will be recollected that the running of Quashed under his colours against the American Omaha in the Ascot Gold Cup race was an outstanding event of 1936.

The nation's deepest sympathy will go out to Lady Stanley, tragically laid up with an injured ankle in the nursing home to which her husband was taken, and to Earl Derby in the loss of his eldest son.

SCOTTISH ART IN LONDON

After the Empire Exhibition at Glasgow it seems only fitting that the Winter Exhibition of the Royal Academy of Arts should in honour of the occasion deal with Scottish Art. So on January 6th we are to have a national display not only of Scottish pictures at Burlington House, but also of silver, pewter, glass, embroideries and representative examples of the elaborate decoration lavished on arms and weapons and accessories to Highland dress. Jacobite relics and other articles of historical or romantic, as well as artistic, interest will add further variety. Their Majesties the King and Queen have graciously given their patronage to the exhibition, which will contain a number of choice examples from the Royal collections, and many exhibits will be loaned from private sources in England as well as Scotland. Scottish pictures with established dates are known from 1620 onwards, and though many a Scottish artist has made his name renowned in the world of art it is anticipated that much work little known outside Scotland will be on view.

NOT TOO OLD AT FORTY

When Jean Borotra beat D. W. Butler at Queen's Club with the loss of a set he won the covered courts lawn tennis title for the ninth time. Since 1926 he has only suffered three defeats, losing twice to H. W. Austin and once to K. Schröder, of Sweden, where the indoor game predominates. In spite of all that is said about the modern game the old hands can prove a stiff proposition for the younger school, and Borotra's victory recalls memories of many players who, when far older than he, could prove a stumbling block to aspirants to championship honours at Wimbledon. They often made up by craft what they lacked in agility; though a charge of inactivity cannot be levelled against Borotra! To reach the final the French player had beaten C. M. Jones and M. D. Deloford, to each of whom he dropped a set.

PIKE AND THE TROUT STREAM

October's last week generally sees an attack on the pike of a trout stream. A spring netting is more favoured than one undertaken in autumn and more profitable in the size of the bag as a rule. Also, since pike feed less in cold weather, it is probable that (if only one attack in the year is contemplated) the removal of pike in the spring when fish have moved up from other waters, and may stay if they find their new habitat "empty, swept and garnished," is a better protection to a water than one undertaken in October. But in either case, if pike are to be removed wholesale, a fairly severe weed-cutting must first be made. Which raises that perennial difficulty: when to cut weed to the best advantage. If it is done in the spring a good deal of fly life will be lost; if it is done in the autumn the winter floods will carry off the silt in which, according to some anglers, a great deal of immature fly life exists. But the merits of a clean, hard bottom to a river are held by many owners of fisheries to be worth the risk of a serious wash-out should the winter be wet.

LORD HAWKE

The autumn gales go by with troubled voices
Across a darkening world of bodeful truce,
And that in which the summer's heart rejoices
Moves dimly while the Fenris-wolf runs loose.

But some there are for whom no summer ceases.
One passes now who held a sovereign sway.
Amid the driving storms that hide the creases,
The greatest Yorkshire captain goes his way.

And though the hour be one of wildest weather,
Green memory sees him strong and striding forth,
Keen as a moorland wind that shakes the heather,
The dour and dauntless victor of the north.

G. D. MARTINEAU.

A COUNTRYMAN'S JOURNAL

THE contrariness of autumn! More changeable than spring, richer in experience than summer, as many-mooded as our Shakespeare's Cleopatra, autumn is all things except staid and dull. That famous lady's requiem on the more-than-human stature of her dead lord: "For his bounty, There was no winter in't; an autumn 'twas That grew the more by reaping." Hers and Keats's empurpled Ode both immortalise the aspect of fruitfulness in autumn. So, too, Hardy enlarges and symbolises the figure of Giles Winterbourne, stained with sweet pumice after the cider-making: "He looked and smelt like Autumn's very brother, his face being sunburned to wheat-colour, his eyes blue as corn-flowers, his sleeves and leggings dyed with fruit-stains, his hands clammy with the sweet juice of apples, his hat sprinkled with pips."

An apple-tree whose russet globes are half-hidden, half-disclosed among cloudy branches, there is no kinder sight in all the world, and that is so because it is at once the product and the emblematic device of autumn, the witness of its abundance and the embodiment of its spirit. There is another aspect, close-allied to that of plenty and fulfilment, which may be called the benignity of autumn. This is best "felt in the blood and felt among the heart" on those calm evenings upon which all things—the tranced trees, the hushed air, the swooning light, the floating scents of flowers, a booming dumbledore, the unruffled navigation of amber- or rose-tinged clouds towards the dusk—contrive to shed their benediction. At such a time of grace the whole earth is full of music, the more ravishing, the more penetrative because it is unheard. Autumn is ripeness, the full of the year, but on such a vigil evening, transparent also, since through it "we see into the life of things."

And then the Maenad. Gale bursts upon the earth like the elements upon the head of Lear. The apples are wrenched from the boughs, the wind gives tongue like a pack of wolves, leaves panic in an infatuated mob, grasses hiss, trees crack and disjoin and gardens are deflowered. Clouds race and elongate as though distorted in a mirror, scuds of rain lash the panes like a drunken carter belabouring his team. The sheep huddle under the hedge and gusts scalp its tousled crest. On the crown of the hill a grove of whitebeams winks against the pell-mell of the blast. The air roars like Gargantua, twilight swallows noon and the very sun is sodden. A few hours ago and the earth was "quiet as a nun"; now the cloak is torn off its back with a violence that apes the senseless malignity of human power.

The mood changes. The winds have outrun their passions and on the bruised apple in the plundered orchard the red admiral prinks down and sips. Tortoiseshells and painted ladies pulsate upon the dishevelled heads of the Michaelmas daisies, "all-Danae" to the sloped beams of the sun. The wild cherry repeats the vision that Abraham saw; the bracken flushes in the softer showers; the elm lights its torches one by one; dogwood, maple, blackberry, spindle and wild rose clothe themselves for "a wedding or a festival." This is the Church Ale of autumn, when every shade from tawny to pale yellow, from crimson to the silvers of the Traveller's Joy declare a medley of song and laughter with a something of religious pomp. A slow mist rises to curtain the rich revels, and the next morning the first frost has unpeopled branches with a more deadly sureness than all the equinoctial rages. The gaiety of the plumed twigs is off, and against the mockery of the sun they stand "more black than ash-buds in the front of March."

But the repertory of autumn is not done. "From death to life thou mightst him yet recover" the old, famed sonnet ends, and life and death sit at the same board in autumn. The strangest of its variations is a second spring. The roses bloom once more and innumerable seedlings clutter trim garden-borders and reach the pale light from choked ditch-bottoms. Furred fruit-buds accompany the apples that make their branches droop. Each separate season congregates upon one bough and the robin sings his rival down as when his mate was sitting. Autumn is Proteus: each form succeeds another and denies it until the uniformity of winter acts Cromwell and sourly closes down the play.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a Sunday newspaper dated October 9th:

"The Hon. Mrs. Ashley is now having her second shoot at Six Mile Bottom. . . . Pheasants were plentiful at the first drive a fortnight ago."

From an answer to a correspondent in the *Field*:

"Undoubtedly the best way of getting high birds in flat country is to block the birds out of the coverts where they are fed into gorse or out on to the roofs."

The morning feed

EFFICIENCY IN THE PIG INDUSTRY

A Problem of Confidence

THE terms of the contracts embodied in the Bacon Industry Act have recently been published, and farming opinion is at present divided as to whether the scheme can succeed. The end of this month is the first critical date in the progress of the plans, and before then it may be useful to remember the purpose of the Act and the means considered by authority to ensure its working. It will then be possible, in the unhappy event of failure, to apportion the blame fairly between farmers and the Board.

The Act was passed "for the better organisation of the bacon industry and the pig producing industry and in that connection to provide for payments out of and into the Exchequer. . . ." This ideal of greater efficiency has been entrusted to the Bacon Development Board, made up of representatives from the Pigs Marketing Board, the Bacon Marketing Board and five other persons selected for their experience.

The measures so far taken display considerable foresight, much of which is based on a recollection of the causes of failure in the similar schemes of past years. Undoubtedly, one of the main reasons why the previous plans broke down in 1936 was because a considerable number of farmers—chiefly those farming on a small scale—were unwilling to help in the effort to make the scheme succeed. They believed that more profit lay in the chances of the open market, and accordingly they were content to prefer their own advantage to the possibility of a general prosperity. This attitude has now, as far as possible, been prevented. In future, with certain exceptions, "a producer of pigs who is not registered shall not sell any pigs to any registered curer."

It is hoped that the Act may bring a sufficient prosperity to the industry to enable it to work without assistance in three years. The Government, therefore, have guaranteed the prices for that period only, and—so great is their confidence—the payments will be on a declining scale. The basic price for the first contract period is 12/6 a score, for the second 12/5, and for the third 12/3. These prices will, however, be adjusted every month where there is a rise or fall in the price of feeding stuffs—the standard rate of which is 8/6 per cwt. If this standard rate should fall below 8/6, the result would be no less critical than curious. Yet the risk had to be taken, for such a standard was essential. No Government guarantee will be available unless the producer sells to the curer under a "long contract" as defined in the Act.

There are various kinds of contracts of which the producer may avail himself, and it should be easy for the individual producer to decide which suits him best. Every contract made must pass through the hands of the Pigs Marketing Board, and there is an implied authority given by the producer that the Board should carry through the contract for him. He is at liberty himself to decide what nature the contract shall take, but after that responsibility passes to the Board.

In one type of contract the producer may inform the Board of the name of the curer with whom he wishes to deal. The Board wisely makes no promises, but should this be impossible the producer will receive an extra sixpence for each pig. If no curer is named in the offer to the Board, each pig will have a premium of two shillings in addition to the contract price. The smaller pig producer has not been forgotten. He will be unable to name a curer in his offer, but for his benefit the group system has been reorganised, and every pig sold under such a contract will have the two shillings premium. This will find its way into the pocket of the agent acting for the producer. New grading arrangements have been made, as a result of which only two classes are left in which pigs may be offered to the Board. Two obvious facts emerge from a consideration of these contracts. They embody most of the demands which pig producers have been making since 1936, and it is quite clear that if they are to be useful farmers must submit wholly to them. For a half-hearted co-operation in a scheme of this sort is just as fatal to it as a widespread hostility.

The arrangements for transport should be welcomed by the pig producer. The prices guaranteed will be increased by the cost of conveyance on the railway, and if a producer delivers pigs in his own vehicles he will be able to claim compensation at definite rates. Provision has also been made for payments in the event of loss of weight during conveyance. The standard pig envisaged by the framers of the Act has now been duly defined by the Minister of Agriculture, and he has, in the last Regulations, prescribed the "weight, quality and kind." Finally, it should be noted that any possible attempt at preferential treatment has been rendered impossible by the appointment of official inspectors.

These proposals frame a very definite policy, the success of which depends, in the last resort, on co-operation. It may be assumed that the Development Board will carry out its duties: the attitude of the farmers is still in the balance. There are, of course, those who take Grumpy's words on their lips as an article of faith, and are already "agin 'em." More reasonable farmers point out that November 1st is the last date on which the Pigs Marketing Board will consider offers, and they wonder whether, having regard to the fact that there has been for some time a steady decrease in the number of pigs, sufficient animals will be available to carry out the scheme. This is a reasonable doubt, but in any undertaking—most of all in farming schemes—chances must be taken. Without any plan the pig industry could only deteriorate: with these proposals it may regenerate itself. At all events, a very strenuous effort should be made by farmers to make it succeed, and this can be done only if they submit themselves wholly to its provisions. Law can provide for much, but the success of any Act, whether it refers to pigs or road accidents, is finally dependent on the spirit of those for whose benefit it was passed.

In conclusion, and incidentally, it is interesting to note that a proportion of white fish meal has been officially allowed for in the standard ration. The value of this food was long regarded with a certain amount of scepticism, but it has been gradually establishing itself and appears now to have achieved a recognised position. Its inclusion in the standard ration is to be welcomed as giving support to a growing industry.

CREAGHT.

LOOKING ACROSS LAKE DERWENTWATER TO WALLA CRAG FROM ST. HERBERT'S ISLAND
"Then there will come a time when it is the only place in the world for you"

LAKELAND A NATIONAL PARK

The Only Way to Save Its Natural Beauty

"Ramble from stone wall to stone wall, from beck to beck, from top to top, and you will know that you are with friends. Then there will come a time when it is the only place in the world for you."

IN the above words Sir Hugh Walpole once summed up his feelings towards the English Lake District. There are many besides the well-known author who are as strongly attracted to this lovely compact stretch of country, yet I wonder whether many of us fully realise how this district is being spoiled by the hand of man. Some, of course, do not care, others are too lazy to appreciate the dangers, but certain it is that ugly telegraph poles, electricity pylons, road construction and widening, iron and concrete railings, ribbon development, petrol pumps and incongruous architecture have invaded the Lake District without nearly enough opposition.

To-day you will find steel pylons on Shap Fells, a cats-cradle of electric wires over the charming little village of Braithwaite, gruesome fencing at South Coniston, Whinlatter covered by commercial spruce, and untidy and ineffective hotel signs in many beauty spots. As far as has been possible voluntary societies, such as The Council for the Preservation of Rural England and The Friends of the Lake District, have done all they can to stop such desecration, but real success can only be obtained if the district is State controlled. In Lakeland there are at the moment seven separate planning authorities. Necessarily they cannot have a common standard, and they are not bound to consult each other. This, more than anything, should demonstrate the urgent need for Government control.

A NATURAL AND PRETTY STONE BRIDGE
This is one of the beauty spots of the now famous walk over Watendlath

There are, after all, few more suitable districts for a National Park. When I speak of a National Park I do not mean merely the preservation of mountain peaks, but also the lakes and the villages which grace the vales. Heaven knows they need a protector. You have only to compare the natural shore of Derwentwater or Elterwater with the now dammed, droughty, ragged, afforested shore of Thirlmere. Half the folk in Manchester drink, and bathe in water from Thirlmere, and during a dry summer they little realise what they are doing to a once beautiful little lake. While one might reasonably have hoped Manchester had enough rain without going elsewhere, the danger of other corporations raiding Cumberland for their water supply is obvious. It is human nature to follow a lead given by another.

Then there is the vital question of the roads. Often enough the spoliation of nature's gift to the countryside is carried out by quite well-meaning people. Motor traffic has increased so enormously during recent years that new roads have had to be made. People no longer tolerate winding roads. The straightest line between two points is what is demanded, so that here and there the Lake District hedgerows, flower-sprinkled banks and, worst of all, the old moss-covered stone walls have had to be sacrificed in "the interests of progress."

New bridges have had to be erected. With examples like Eamont and Newby the planning should have been easy, for both these bridges, being well designed, add to the beauty of their surroundings. However, the authorities prefer a "standard"

bridge. They have failed to realise that a design which is suitable for Whitehaven or Carlisle (both industrial Cumbrian towns) does not fit into a Lakeland valley. I remember being in Keswick four or five years ago when there was a great deal of trouble over the widening of the Greta Bridge. The townsfolk rebelled against the side walls being made of cement posts. Only after a stubborn fight with the county authorities were the old "coping" stones replaced. A National Park would eliminate such quarrels.

To-day the widened roads have assisted charabancs to approach within a mile of the Gable and Scafell, yet when I went to the Lake District only something like sixteen years ago, I used to ride by coach from Keswick. People tramped along beside the road in comfort, but can the same be said to-day? Easier roads have increased speed, and instead of the cheery rattle of harness a rude motor horn tells us of the approach of a vehicle. No longer is there a friendly wave of the hand and a "Good morning" call from a coach-passenger; all we get to-day is an unholy row from a supercharged sports car and a mouthful of dust as it passes. No one who has grown to love the Lake District as strongly as I have done can think without abhorrence of this invasive mechanisation, this racing consumption which devours its beauty.

And, despite the Town and Country Planning Act of 1932, Lakeland is slowly becoming disfigured by buildings which do not fit into their natural surroundings. In the main, the dwellings of the Cumbrian dalesmen are simple in the extreme and strongly localised. It is largely the climate which has dictated the essential shape of the Lake District house: low horizontal lines, few gables or awkward jointings on the roof, heavy chimney-stacks, small window openings, and porches built for shelter. Equally notable are the good composition of the house groups which make up a hamlet and the good composition of the units which compose the house.

I remember with pleasure my first sight of the Swan at Grasmere. Here the whitewashed roughcast of a long low building sinks into its background without conflict. It is all the more distressing, then, to find to-day houses without conformity sprouting up which have no right to be erected. Only by having the whole district as a National Park can design be really controlled.

To constitute the Lakes thus will bring no harm to local agriculture. The fells are rough grazing occupied by Herdwick sheep; and, since there is no conflict of interest between sheep and those who walk, the local agricultural system and free access are good partners. Besides, nearly every farmhouse caters for the visitor, so that a National Park—which would encourage the tourist—would be welcomed.

You must, however, understand this to get the full value of the idea. A National Park does *not* mean confiscation or a breaking up of traditional life. Rather does it mean preserving the beauty and the peace of the district as we know it to-day. If you have never been to Lakeland, then try and go there now. There are few lovelier sights than Lake Derwentwater on an October morning when the faded foliage of the stately oaks speaks of the glories of a summer passed, when clouds and mountains are reflected in the water round Friar's Crag and everything is still. If you could only see it thus—as I have many times—you would understand that these things are worth fighting for. In a world which is plagued by wars and rumours of wars we can do with the preservation of all the beautiful things of the world, not least of them the magnificent loveliness of the Lake District.

At the moment it is left to the voluntary bodies to organise opposition to any steps which would tend to destroy the beauty of the district. They cannot always succeed, as witness the ugly petrol pumps by the lake at Ambleside and the areas at present being ruined by afforestation. Even to-day there is a scheme afoot for bringing a new 33,000-volt cable on pylons through the Vale of Keswick. While there is every likelihood that an objection lodged by the Cockermouth Rural District Council will be upheld this latest danger does show the red light clearly enough.

Surely it is the duty of all those who have learned to appreciate the grandeur of these hills and lakes of Cumberland and Westmorland to join one of the public-spirited societies who are doing their utmost to save them from the hand of the Philistine. To ensure that at least they cannot be accused of having allowed some of the finest scenery this country can provide to be sacrificed for want of a little effort on their part. Now is the time to make that effort, for we have had enough examples of the fate which overtakes the most beautiful stretches of our countryside when realisation of what is happening to them comes too late.

UN CAMBRIDGESHIRE FRANÇAIS

Carslake's Wonderful Riding This Season

So much has already been written about the Cambridgeshire that one feels averse to writing any more ; but as some of the readers of these notes live far away from anything, in the far corners of the world, and rely for their sporting news on this paper, it is only fair that it should be recorded that a five-year-old mare, French-bred, French-owned, French-trained and French-ridden, won the Cambridgeshire by a head from another French-bred, owned, trained, &c. The mare was Helleniqua, owned by M. Mellor, ridden by Guimard, and trained by Webb, an Englishman who has lived for many many years in France. Helleniqua started at 50 to 1. Khasnadar was second, and Domaha third. Couvert was beaten by another head for third place, with Edgehill close up fifth.

After Michoumy had had to be taken out of the race—and incidentally he may not run again this year, if ever—Khasnadar was made favourite, and very nearly won. He started at 8 to 1, and Domaha at 100 to 9. The winner is a very small mare, and when some visitors saw her in the paddock before the race they thought that she had got there by mistake. She stands just less than fifteen hands. She has, however, wonderfully good action, and must be as game as they make them, for she held off the long-striding Khasnadar all the way up the long hill leading to the winning post. It was a most gallant effort and reminded some of us who are not so young as others of those wonderful races at Queen's Club years ago, when the tall and lanky Cornwallis used just to beat the little Crabbe in the Oxford and Cambridge half-mile.

Really, it looked as if Helleniqua could have walked under the seventeen hands high Khasnadar. I believe that the real reason that Helleniqua was sent over from France to run was that she might find a buyer before the race as a brood mare, as she had won a number of small provincial races in her own country. Mr. Rank, Steve Donoghue and Mr. M. H. Benson were all offered her, but they did not want her when they had seen her. It may be that Domaha was a little unlucky not to have won, for he was stopped in his work shortly before the race and was drawn on the far side of the course. Further, he had to carry 2lb. overweight, as G. Richards could not quite do the weight. The first and second were drawn on the stands side of the course, which in the Cambridgeshire is generally considered to be the better side. Couvert had to race by himself in the last quarter of a mile in the middle of the course. Richards was certain that he had won, but the onlookers had no doubt that the verdict was the correct one, while more than one photograph taken from behind the judge's box on higher ground proved that it was so.

There has been much discussion ever since about the race, it being considered by a lot of people generally regarded as being of reasonable intelligence that Mr. Fawcett, the handicapper to the Jockey Club, let in these French horses too lightly. How can any one justify such a statement ? After all, the race was won by a head, with another head between second and third, and yet another head between third and fourth, with the fifth on the top of the four other horses. If all five horses had been trained in England Mr. Fawcett would have been praised and praised, but as the first two came over from France he is being blamed. I am certain that he made one of the best handicaps that even he has ever made, and there let us leave that point.

WINNER OF THE NEWMARKET TOWN PLATE
Mrs. S. Langley with her horse Lucky Patch which she rode to victory

Another point of interest is the number of races that are being won in this country by horses bred in France or in other countries. By those horses I do not mean those who are merely foaled in France, but are really bred there, for a number of foaling mares are sent to France each year to visit French sires and naturally foal there while on the visit. The Grand National was won this year by an American-bred horse. The Derby was won by a French-bred horse, and now the Cambridgeshire has been won by another French-bred horse. To make matters worse, the best two-year-old of the year, Foxbrough II, was bred in America and is a full brother to that great American racehorse, Gallant Fox. It is no use arguing the point, but it would really seem that other countries have now got as good, if not better, blood than we have.

Foxbrough II had suggested by his running at the First October Meeting that he was a two-year-old of great possibilities, but he had then, when winning, been in receipt of a lot of weight from the second. He showed how good he was when, last week, he made all of the running in the Middle Park Stakes of six furlongs and won in good style by a length and a half from another very promising colt, Blue Peter, with Rogerstone Castle third, beaten for second place by three lengths. Excuses were made after the race for Rogerstone Castle, it being stated that that colt had recently been coughing. Cough or no cough, I shall be surprised if Rogerstone Castle ever beats the two colts who finished in front of him last week.

There is no doubt that Foxbrough II is a really useful two-year-old who, on looks and breeding, should make a great three-year-old, and quite likely one of the few American-bred horses ever to win the Derby. If I had to choose now a colt who might beat him and keep that great race in the country of its birth it would certainly be Lord Rosebery's Blue Peter. I called attention to this colt's promise after he had run well, but greenly, in the Imperial Produce Stakes at Kempton Park, his only race before the Middle Park Stakes. Once again he ran rather greenly, this time early in the race, but he was running on at the end and suggested by his manner of finishing that he would stay. He is, however, by Fairway, and his stock have not always stayed well, while in some cases they have been inclined to be temperamental.

The running of Rogerstone in this race would suggest that Foxbrough II is better than Panorama. The two of them are trained by Captain Boyd-Rochfort. I do not know whether they were ever put together, but I should doubt it, and if they were it is none of our business. In the fourth edition of his two-year-old handicap Captain Long has placed Foxbrough II 7lb. behind Panorama, but in the final edition I have no doubt that he will place the American colt at the top, even if he has to couple Panorama with him. The only other two-year-old that may also be with them is Portobello, who made a reappearance at the Second October Meeting in the Clearwell Stakes, which he won with ease. He is a gelding, and will not run again this season. He, like Panorama, is likely to be only a sprinter next year, but it will be fun if they ever meet, say, in some such race as the Fern Hill Stakes at Ascot.

Foxglove II, who won yet another race for Mr. P. Beatty, this time the Jockey Club Cup of two and a quarter miles, is also really French bred. He won with ease from Dubonnet, the pair running at level weights. As a result of this race Dubonnet has been made favourite for the Cesarewitch to be run at Newmarket next week. I did not think, at the time, that this public trial was good enough, but someone who knows much more about Foxglove II than I do was of the opinion that no better trial could have been run and that it gave Dubonnet a great chance next week. Another Cesarewitch candidate to win at Newmarket was Mr. Rank's Black Speck. So long as Michoumy was in the Cambridgeshire this horse was kept favourite for the Cesarewitch in order that doubles on the two races should not be too serious.

When Michoumy had to be scratched Black Speck went out to long odds, but he came back with a rattle when he won the Visitors' Handicap by inches from Colorado Boy and Aristocracy. He was carrying 9st. 7lb. Carslake has never ridden a better finish. It is true that the distance of the race was only a mile and a quarter and that the Cesarewitch is run over two miles and two furlongs, but the race showed that Black Speck retained his speed. I am not sure that he will stay the last quarter of a mile in the Cesarewitch, but if he does, then his fine burst of speed at the end of a race will take him first past the winning post. He will be ridden by Carslake, who has never in his long and distinguished career ridden better than he is doing this year. Indeed, his riding in the St. Leger and the Doncaster Cup made that Doncaster meeting historical.

The death of Lord Stanley, although it did not surprise his many friends, was none the less sad, and everyone will sympathise with his father, Lord Derby. Lord Stanley was only 44 years of age, and was a most charming and modest man. He had a few horses in training for a number of years, and had been a member of the Jockey Club since 1924. His best horses were Versicle and Quashed, each a daughter of Verdict and leased during their racing career from their breeder, Lady Barbara Smith. Versicle won at Ascot, but was never as good as Quashed, who won the Oaks and the Gold Cup at Ascot among many other races.

Those of us who were privileged to see that Gold Cup must count ourselves lucky. All the way up that long climb to the winning post Quashed and the American challenger, Omaha, fought a mighty and thrilling duel. Neither would give way an inch, and the two riders on them were at their very best, Perryman on Quashed and Rufus Beasley on Omaha. I have never seen such a race, and if ever I have the great luck to see such another I shall be amazingly lucky. In the end the filly got the better of the horse and won amid silence. But when her number went up the place was in an uproar, and there was a rush to see her come back to the unsaddling enclosure.

When the time came Lord Stanley would have been a great owner and, no doubt, a great Turf administrator. His eldest son, who is 20 years old, is just as interested in racing and hunting as have been all his ancestors.

GNOSTIC.

DURING HUNTER TRIALS NEAR KNEBWORTH
Mr. R. H. Nicholson on Knock Knock and Miss Nicholson on Alphonso

"DRESSING" A HORSE

The Evil of Using Water

IT is the cubbing season ; a gentleman, a London stockbroker, who is a real enthusiast, comes down to Leicestershire to go cub-hunting every Saturday morning (he arrives, of course, on Friday night), and as in September the meets are at the early hour of 6.30 a.m., and he likes his manes plaited, it can well be imagined that this business of plaiting needs very careful consideration, as for some meets the hunter has to be ex stables "*completement pret avec* second horseman" by five "ack-emma." What does all this mean to the stableman ? There is the horse to be fed, the stable to be mucked out, the grooming and dressing to be done, and the saddlery (which has, of course, been got ready overnight) to be fitted.

Our stableman is an Irishman and deaf, though by no means dumb, for he has been continually moaning around the yard that he could work much better if only he could get some more sleep. Incidentally, he is a glutton for this latter, for he sleeps after breakfast, after mid-day dinner, and all night long. What with all this afore-stated work and sleep combined, he decides to do the plaiting overnight, for in his own words, he did not see the point of getting up at midnight in the cubbing season to get a hunter ready for Mr. Permanent Wave (his nickname for his master). It is worthy of note that country gentlemen, as compared with townsmen, do not expect their hunters' manes plaited for early morning cubbing.

I happened to stroll into the box while Danny was doing his nocturnal plaiting (it reads more like putting a flapper—if such a thing exists—to bed), and there he was perched on a stool at his tonsorial art, cussin' an' blindin' in the most approved and groom-like manner the while. Now manes have to be plaited and threaded tightly, if they are to stay put, and this takes a long time to do. This process is painful to the horse, for every time it stretches its neck down it tears at all the roots of the hair of the mane. Horses with plaited manes have been known to break out into sweats on this score before now, and my worthy friend Danny proceeded to give me a practical demonstration of what this meant, by giving my few remaining, and alas rapidly greying hairs, a vicious tug, and exclaiming "Glory be to God, and now you yourself knows what it will be feeling like. The divil take them and their manes ! "

So now perhaps you, O gentle reader, may gain some idea of what this mane plaiting entails ; though I doubt if my remarks will make much impression on the fair sex, who are themselves quite prepared to have their eyebrows plucked out root by root and hair by hair to satisfy their vanity, but I can at least add that, while this operation is in progress, they are not careering about the fields and jumping fences at the same time. As no doubt eyebrow plucking will eventually go out of fashion, it is to be hoped that plaiting horses' manes will do likewise. This mane plaiting is so popular that I am firmly of the opinion that, given two horses of equal quality and merit in the show ring, the one with plaited mane and the other without, the prize would go to the former.

I was glad to note, when I was up in Leicestershire at the beginning of the hunting season of 1937–38, that one gentleman very well known in the hunting field (he had been Master of two packs at different times) refused to have his horses' manes plaited, and furthermore, if he had occasion to lend them or send them away, his instructions invariably were that no manes were to be plaited. Would that more folk emulated his example.

There are two methods of plaiting, the ball and the sausage. The former is smarter, more painful, but usually more popular. The number of plaits to the mane is another source of controversy. Major Faudel Phillips tells us that six plaits and the forelock plaited is the correct thing. At one crack place where I worked seven plaits were made, and at yet another only five. Where I now work, we dress to Major Faudel Phillips's formula. With so much diversion of opinion, who can lay down the law as to how many plaits there should be ? Far better trim the mane, and leave it in its natural state.

Putting water to a horse's body is a practice which is very severely condemned by all knowledgeable horsemasters. The experts are very much in unison upon this point ; in fact, it may be said that it is one of the few points of stable management upon which they are in complete accord. Nevertheless this practice of using the water brush upon the horse's body is almost universal amongst grooms in England. The quarters, the hocks, the knees, and under the belly are favourite spots where grooms like to apply water. Where there are stains, ruffled hairs, and straw marks, they are invariably treated in this manner. When a man has got four horses to do he has no other means of getting through his work than by adopting this method. Of course, the proper method is to brush the dirt away with a dandy brush, but as this often needs the application of a certain amount of elbow grease, and entails much time to eradicate, it is not popular.

An impression is abroad among stud grooms, especially those of the old school, that straw marks left on the coat by lying down during the night is a sign of bad grooming. There is only one way to get these marks out with despatch in the morning, and that is with the water brush. Now water, if not thoroughly dried off, is bad for the skin ; it is apt to crack and chap it, that is when horses are in stables and regularly groomed, to say nothing of being clipped, the grease in their coats is being continually removed, and therefore the skin is deprived of its natural protection. Further, this practice tends to make the coat scurfy and the hair matted. In fact, applying water in this manner is bad stablecraft.

What does it matter if a few bed marks are imprinted upon the hairs of the coat ? Exercise will take them out. What does matter is that the skin is loose, the coat healthy, and with a fine bloom. Using a water brush or damp rag gives a superficial bloom only to the coat, whereas the dry brush loosens out the hairs, cleans and massages the skin, and promotes a healthy circulation. As already stated, where there are few grooms and many horses, the water brush is the main utensil used in grooming, but the writer, when he has been forced to work under conditions where it is impossible to do his charges to his satisfaction, has found a better way of dealing with this matter of making a horse good in the coat than by reverting to the water brush. From his hard-earned and poor pay he prefers to buy a little linseed oil, some powdered sulphur and resin mixed in equal parts (note the linseed oil is not mixed with the powder), and with these he adulterates the feed, perhaps twice a week, on different occasions with each ; it really depends upon the condition of the coat, which will get a good bloom ; the skin will be healthy, and the internals will be benefited as well by this method, which may cost a few pence, but is well worth the extra expense.

Singeing is another item in dressing, and it is a useful way of removing whiskers and cats' hairs. When using a singeing lamp, it is necessary also to have some tissue paper at hand, in order to remove the burnt ends from the hairs whilst they are still warm. If this is not done, the marks will remain for some time, which is unsightly. Grey horses should not be singed, as even with the use of tissue paper the marks still show up.

It is fashionable to remove the whiskers round the muzzle, the contention being that these are unsightly ; this is a debatable point, for some contend that these hairs act as feelers for the horse, and therefore should not be removed. No less an authority than Captain Hayes was against this practice of depriving the horse of its whiskers, contending that they are sensitive and become painful when shortened and pressed upon. Some like to clip the eyelashes ; this is neither necessary nor beautifying. Perhaps even the ladies will agree with that, for I am told that, rather than remove their own lashes, they add artificial ones.

R. M. S. BARTON.

BEST DAYS WITH HOUNDS

Our usual hunting accounts will appear throughout the coming season, starting the week after next, with the issue of November 5th. The Pytchley, Cottesmore, Belvoir, Quorn, and Duke of Beaufort will be reported regularly ; other packs according to their sport.

PIKE FISHING ON HICKLING BROAD

"I consider a Devon as no more than 'ropes in beer' compared with a spoon in still water"

WHO DEVISED A SPOON?

Reflections on a Well-known Spinning Bait

By H. D. TURING

SOME years ago a correspondent, writing to the *Field*, asked: "Why does a spoon spin?" If one comes to think of it that question is something of a poser. In the case of other forms of spinning bait no such difficulty arises, for they are fitted with fans which correspond very nearly with the blades of a propeller, and if they are drawn through the water, the resistance pressing against them pushes the blade out of its way, as it were; since the surface of the blade is inclined at an angle with the line of resistance, it naturally follows that its path must be a spiral and the blades with the bait attached revolve. But there is no such simple inclined surface in a spoon. No doubt the reply given at the time is correct; that a perfectly-balanced spoon drawn through perfectly still water in a perfectly straight line would not spin; it would simply take up a position which would allow the friction on the inside and outside of the spoon to balance and move along thus without revolving.

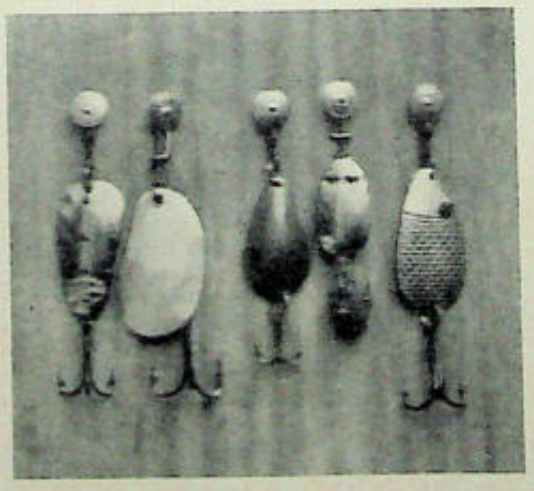
It is really the problem of the flapping flag: Why does not a flag simply stand out at right angles to its mast instead of waving in the air? And the answer: That no wind ever maintains a constant direction but varies with every yard of its course—applies equally to a bait pulled through the water by an angler; it is impossible for the motion to be truly even and in a straight line; some slight variation in the line of pull causes the free end of the spoon to move sideways and follow a spiral; once started the spiral becomes more marked until a balance is established and we have the perfect "spin" which spoons, above all other spinning baits, seem to give.

I should like to know who first invented the spoon. I do not think it can be a very old form of spinning bait. March, in his *Jolly Angler* (1833) does not mention it, though he comments on "an artificial bait much in fashion of late years, commonly called a *Devil*, which is to be bought at any of the tackle shops. This is manufactured of silk, tinsel and other gaudy materials, in the shape of a minnow with a bright tin tail." The tin tail, I take it, was bent at an angle after the manner of the tail of a natural dead bait mounted on a Thames flight. Apart from that, it does not seem to differ materially from the artificial minnow used by Izaak Walton: "the mould or body of the minnow was cloth, and wrought upon or over it, thus, with a needle; the back of it with very sad-green silk towards the belly, shadowed as perfectly as you can imagine." He says nothing about any hooks, so presumably it was mounted on a flight after the manner of a dead bait. There is no mention of this artificial minnow in the first edition, by the way, so possibly it may have been invented, as well as made, by the "handsome woman that had a fine hand and a live minnow lying by her." Are anglers to-day indebted to a woman for the idea of an artificial spinning bait?

But that does not help me towards discovering the inventor of the spoon. Whoever he, or she, was, the invention has certainly been of enormous benefit to the spinning community, for even to-day, when every kind of ingenuity is exercised on devising new forms of artificial baits, it probably accounts for almost as many fish as all the others put together. At one time, I remember, I had very little faith in spoons, partly, I expect, because I used them in swift rivers, but even more because I had not realised the paramount importance of keeping them spinning evenly. I had adopted a sort of sink-and-draw motion with the idea of making them more "lifelike," thus destroying the illusion I was trying to create.

This question of the lifelike appearance of a spinning bait is one on which almost every inventor of a non-spinning bait goes astray. How very "unnatural" it is, they say, for a minnow to revolve in the water. No doubt it is; but the bait does not appear to be revolving to the fish. The effect of a spinning motion on a spoon, for example, is to create the illusion of a solid body, and a remarkably fat and attractive body it has, too, as it comes through the water. And this is where the importance of an even spin comes in, for if the bait stops, or slows up noticeably, this illusion of a solid body is momentarily lost, and a fish detects the deceit and turns back instead of seizing it.

I fancy this also accounts for the comparative ill-success of a spoon in swift rivers as compared, let us say, with a Devon. If it is cast across stream and recovered "across and down," as it must be in a swift river, there are sure to be variations in the current which will affect its spin and defeat one's efforts; whereas with a Devon, which has something of the shape of a small fish even when at rest, the



VARIOUS TYPES OF SPOON

Left to right: (1) *Reversed spoon. This travels wide end forwards; not as good a type for spinning as the others, but has a different motion in the water.* (2) *Kidney bar spoon in mother-of-pearl; the most successful spoon I have ever possessed.* (3) *Standard silver and copper spoon, probably the most generally successful type.* (4) *Canadian bar spoon. This has a red tassel and is made in halves so that it collapses when seized by a fish; good just as the water is clearing.* (5) *Red and silver spoon. The fancy design is of no particular advantage, but a spoon which is red enamelled inside has a good appearance when spinning*

alteration in the speed of the spin is not of such great consequence. In lakes it is otherwise. I consider a Devon as no more than "ropes in beer" compared with a spoon in still water; especially a bar spoon with a feathered triangle on its tail with which, I think, I have done better than with any other type.

A hunt through nineteenth-century angling literature (a formidable task) might possibly reveal the origin of the spoon. The late H. T. Sheringham, who wrote a series of articles on the early days of tackle dealing, makes no mention of spoons but records the invention of the phantom minnow (was this the first minnow with fans?) by William Brown, the originator of the well-known Aberdeen tackle house, Brown & Co. This was in the '50's. Was the spoon earlier or later? Perhaps some of our tackle makers can say when they first began to list them.

FISH OF GREAT AGE

A Pike 250 Years Old?

By T. G. BRIDGES

SOME months ago a letter appeared in the *Field* mentioning the death of a goldfish which had attained the ripe old age of 30 years. This fish had lived all its life in a pond. The carp family are proverbially long lived. The big golden carp which inhabited the Roman bath at Bath, and was so tame that it would take food from the fingers of visitors, was at least 20 years old when it died in 1923. It was known as the "Knight Commander of the Bath."

There are many stories of aged fish, some no doubt apocryphal, but that of the Royal carp of the Emperor Josef II is well authenticated. When the Emperor was fighting the Turks on the Danube Serbian fishermen brought him a large live carp as a present. The Emperor rewarded the fishermen, fastened a golden ring bearing the date (1788) to the fish and released it. At the same time he established a fund from which any fisherman who caught the carp and brought it alive to the authorities at Temesvar was to be paid twice the value of the fish on condition that it was released, unharmed.

Five times this great carp was captured, paid for and released. The fifth capture was in the year 1835. In 1934 the carp was taken for a sixth time. Alas, there was now no fund left to redeem its life, and this wonderful creature, at least 150 years old, was cut up and sold in the market for 8d. a pound.

Even this is not a record, for in 1497, in a fish-pond in Swabia, an immense carp was taken, in the gills of which was a copper ring with this inscription in Latin: "I am the first fish that was ever placed in the pond by the hand of Frederic II, governor of the World, on the 5th day of October in the year of Our Lord 1230." So this fish was at least 257 years old.

The pike shares with the carp the record for longevity. Gesner relates that, at about the same date of the taking of the ancient carp just mentioned, a very large pike was captured in a lake near Heilbron. This had a brass ring attached to it, recording that it was placed in the lake in the year 1230, making this fish 250 years old.

As a general rule eels, when seven years old, leave fresh water and go down to the sea to mate and breed. Then presumably they die. That an eel can, however, live to a much greater age is proved by Samuel, an eel which belonged—and may still belong—to a family named Collins living in the Commercial Road in London's East End. In 1921 Mr. Collins, visiting a local fish shop, saw a little elver alive on the slab. He took it home and placed it in a home-made aquarium, where it not only lived but grew and flourished. It soon became very tame, so tame that it refused to eat food dropped into the water but only what was offered it by the hands of its master and mistress. In 1936 Samuel had an accident. A stone fell on him and damaged his eye. He was taken to the People's Dispensary for Sick Animals and there treated and cured. At fifteen years of age Samuel was still fit and lively.

In 1932 a marked flounder was taken off the coast of Norway. The label proved that this fish had been marked by the German Expedition near Seven Islands off the Murmansk on June 21st, 1913. So this flounder was at least 20 years old. The age of flat fish can be accurately estimated by examining the otoliths or ear stones in which alternate white and dark layers each represent a year's growth. In the case of round fish, such as cod, haddock and whiting, a microscopic examination of the scales gives the age.

Among shell fish lobsters probably live longer than others. In 1921 there was taken at Shag Harbour, New Brunswick, one of the largest lobsters of which record exists. It was 3ft. 1¾in. long, including its feelers, 1ft. 4in. round the body, while the spread of its claws from tip to tip is said to have been ¼in. over 8ft. It weighed 33lb. Such a lobster must have reached a great age.

It is interesting to speculate on the possible age of some of those gigantic octopods which live in the great depths. It may be that their tale of years exceeds even that of the whale. The age of sperm whales is estimated from the size and number of laminæ of the whale bone, and it seems fairly certain that a whale may live to become a centenarian.

Letters to Young Shooters

SOME UNCONSIDERED TRIFLES

(Sketches by Maurice Tulloch)

MY DEAR GEORGE,—There are a few matters which may generally be arranged under the heading "Deportment," with which I will deal in this my last letter. It is rather a ghastly word, suggesting one of those handbooks telling you how to phrase a letter to the angry brother of a discarded fiancée or the correct use of the finger bowl. However, let it cover here a multitude of those sins you will never commit.

First of all about clothes. There is very little to be said about clothes, and if there is I am not the person to say it, so you may in all decency please yourself, but the young should avoid extravagances. Elaborate spattings may grace the calf of the alderman of sixty or so: they ill become the legs of his grandson of sixteen. If you are buying a tweed shooting suit let it be not too dark in colour, though so-called heather mixtures do not in fact sink any better into the background than other patterns. A poacher's pocket is always useful, and good, big outside pockets with flaps. You will find in Scotland that a certain number of guns wear a very loud check. I sported one myself for many years. Uncle Harry called it the McRalph tartan. These colours, being a form of camouflage, sink very well into the background: witness the number of deer stalkers who wear them.

Beyond this there is not much to say. A fair head of hair such as yours is best shrouded in a grouse butt by cap or hat, and there are so many different sorts of good waterproof on the market that you may take an infinity of choice. Personally, I prefer those like the clerical bosom, which from neck to tummy are unbroken by stud or button: the sort which pulls over the head and is worked by a zipp fastener. And remember that no waterproof or coat known to man will ever effectively and ultimately keep the knees dry. The only other question that may worry you is whether to wear shorts or not. Personally, I like shorts, and think they are a healthy and sensible dress. I should not hesitate to turn out for a day's grouse driving in shorts and an open collar. But you must remember that they annoy some of the older school of thought immoderately. If, therefore, you are bidden to shoot by old Colonel Doodlepop, and he is known to be touchy on the point, wear plus fours or breeches. As between the merits of these last two you will notice that men who go in for rough shooting usually favour the latter.

As regards the rest of your equipment eschew gloves like the plague, as they rid you of all tactile sense, but you may, if you feel inclined, wear mittens, which take the chill off ice-cold gun barrels. Cartridge bags have much similarity of appearance in a shooting van, so either have your initials stamped clearly on yours, or have one easily distinguishable. There are few things more annoying than when you have scaled the steep ascent that leads to that far, far distant butt locally known as the Eyrie, to find yourself accompanied by a bag just like your own, but containing the 16-bore cartridges of your host's sister, who, at the bottom of the Gadarene slope you have just mounted, is busily trying to find out why your "twelves" don't fit her weapon. And be sure that your cartridge bag has a large opening. There must be no fumbling in moments of stress. I am no exponent of the shooting stick for the young, but for grouse driving, at any rate, let it be an adjustable one. The walls of a butt are not built to a sealed pattern height. And, finally, you will find one of those shooter's knives with a screwdriver, a 16-bore and 12-bore cartridge extractor, a big blade, a button hook, and a corkscrew, of use some day. Yes—even the button hook and the screwdriver.

THIS TIPPING BUSINESS

Now there comes the question of tips. This is a difficult subject, especially for the young. There is no doubt that the size of tips is growing steadily, and growing beyond reasonable bounds. This has led to the sort of defensive alliance—the local tariff, the let's-all-do-the-same-anyhow sort of attitude. Now the object of the tip is a form of expression of one's pleasure, and the attitude I have described, though perhaps inevitable, is obviously not an expression of pleasure. But here are three points to bear in mind. Firstly, I have never known a small tip accepted ungraciously, despite the many stories to the contrary. Secondly, very few keepers indeed would expect a young man to tip on the same scale as his elders. And, thirdly, as a rule we are inclined to overtip. This is the opinion of one of the best known shooting men of his generation on the subject: "The tipping question has latterly reached such an absurd height that it is a very dangerous subject. When I shot regularly 10/- a day was the correct tip for *any* covert shoot, and generally 5/- for a day's grouse shooting. — who shot a very great deal in the 1890's, never gave more than 10/-, which was the proper thing to do." And here is the *de profundis* of your cousin Charles—what is he?—26 and almost as good a shot as he thinks he is: "I shot three days at Ich Dien last year; 800 pheasants; and we arranged to give the keeper £4 each. My loader was thirty bob, and there was a butler and a footman, half a crown for the housemaid and something for the chauffeur. There was a first return ticket to North Wales—I had to travel first because I went down with old Moses Muttlebury—and my cartridges and what I lost at poker. There wasn't much left out of three five-pound notes."

I have tried to remind you of both sides of the question, the idea that we are all inclined to overtip, and the undoubted fact that keepers do a lot for one, and that one wants to do the same for them as other people. Yet things may reach such an extent that one must refuse invitations, and you may even have to do this. There was one famous deer forest with many beats, each with a stalker, gillie and pony man of its own. One might perhaps, in a week's stalking, have employed six of each category, each of whom would probably have shown one good sport. It looked like an expensive week. But the very understanding old lady who arranged these things would draw one aside and let it be known that one tip to the head stalker was considered enough, if that fell in with your ideas on the subject. And it generally did.

I suggest that if you are at a loss to know what to give as a tip work on the scale of 10/- a hundred head. You are not likely to go to many shooting parties at present where more than 200 head is slain. Of course one could hardly put the tip for a 3,000 head day at £15. (Yes, they have happened, but they are not likely to come your way, or mine.) But that is a matter of adjustment. If, say, 500 head have been killed and the guns congregate at the end of the day and suggest giving £2, that is all to the good. Go with the others: there is no need to give more, and if £2 is beyond you—well, give less. There are also local tariffs. I was talking about shooting tips to a friend who shoots without cessation (except on the Sabbath) from mid-August to mid-October. He remarked—quite firmly: "In this part of Scotland we give 10/- for a day's grouse driving. Whether it is a 50 brace day or a 200 brace day the tariff does not alter." Do not, therefore, my dear George, dance on local corns in these respects.

If a loader is engaged for you 10/- a day is the normal pay, and, since he is your servant, no tip. If an odd man carries your cartridges and waterproof let it be two bob or half a crown. There only remains the question of the keeper of the beat. Some men say he does much of the work that has made the day enjoyable, and that the headkeeper should not pocket the tips. But remember that

HOME WITH FULL GAME BAG

the headkeeper was an under-keeper once. Some headkeepers divide their tips with their subordinates. Others do not. I should leave it at that, and not tip the keeper of the beat.

Finally, remember that a "few kind words," or a real interest shown in just how that splendid high rise at the last stand before lunch was evolved, cause very genuine pleasure. I know it is difficult in that stroll round to the back of the lodge while one's luggage is being put into the car, in that misty half light as one is piling into the shooting brake of a November evening, to think of something original, kindly and truthful to say. It is like a bread-and-butter letter. But try to do it. And by the same token never fail to write that letter by return of post. Most people say they don't want it, but few fail to notice its non-arrival. And if you are asked to shoot at fairly short notice a telegram only costs 6d., and it gives your host more time to make his arrangements, and will certainly be counted unto you for righteousness.

There now only remains the question of safety catches in shooting. You tell me that you were taught by your gunmakers at their shooting school to automatically push forward your safety catch when you shoot, and that you can do it without slowing up your shooting and quite automatically. Well, anything that makes for greater safety in shooting is obviously to the good, and if you can manipulate the safety catch to this good purpose by all means do so. I do not consider it essential, but heaven forfend that I should call it wrong! My generation learnt to shoot on hammer guns, or were taught by men who learnt on hammer guns. There must be many like myself, who, when walking up game, provided the ground offers tolerably secure foothold, keep their safety catch forward, and would never in middle or old age get into the habit of pushing the safety catch forward as the gun comes up. Hence I say that to do so would inevitably lead to lost chances.

First and foremost bear in mind that the real measure of safety in shotgun shooting is the direction where the muzzle of the loaded gun is pointed. It has been proved conclusively that a gun can be jarred off with the safety catch *on*, but if it is pointing at a turnip at the time it will only damage a useful but nevertheless easily replaced vegetable. I raised this point with the best known shooting school in England, where hundreds of thousands of cartridges are fired in a year. They do not teach the pushing forward of the safety catch as essential, though they do not pretend that it is in any way wrong or even undesirable. I raised it also among a number of shooting friends. Their opinion is divided to the extent of about fifty-fifty. In general, the elders are among the Yeas, or I-keep-it-forward school, the younger ones principally among the Nays, or I-don'ts. So if you find that you can make the action automatic follow the lead of your contemporaries.

As editors say when a battle of words has degenerated beyond the average of fatuity or insult, "This correspondence must now cease." I have done no more than try to give you some ideas to chew on, and I wish you many, many happy shooting days for their mastication. One can only pray that you will never be called on to fire at aught save fur and feather, and that you will get a deal of that.

Your affectionate,

UNCLE RALPH.

[*This article concludes the series of Letters to Young Shooters, which are to be published later in book form by Rich & Cowan.*]

GOOSE SHOOTING ON JAMES' BAY

A Memorable Week in Northern Canada

THE tremendous tidal marshes fringing the low-lying southern shores of James' Bay, that southern offshoot of the great semi-Arctic inland sea known as Hudson's Bay, are a gathering ground in late September and early October for vast numbers of blue geese (*Chen cærulescens*) on their southern migration from their breeding ground in Baffin Land, 1,000 miles to the north, to their winter quarters on the Gulf of Mexico.

The writer was fortunate in being a member of a shooting party which spent a week at this season of the year in this flat and swampy locality, and some account of the shooting of the blue goose and the terrain where it is conducted may be of interest.

Moosonee, ten miles from the mouth of the Moose River flowing into the Bay, is now the northern terminus of the Temiskaming and Northern Ontario Railway; the journey from Toronto takes 25 hours, of which ten is taken up by the 190-mile stretch from Cochrane to Moosonee completed about six years ago, which is periodically traversed by a train of many times this age.

Three miles from Moosonee on an island in the river lies the old-established Hudson's Bay Company's post, Moose Factory, some of the buildings of which, incidentally, are the oldest in Ontario. Thanks to the Hudson's Bay Company's organisation and the trouble taken by the post manager, the arrangements for the expedition were made.

The journey from Moose Factory to the shooting grounds is made in large freighting canoes equipped with outboard motors and takes from four to 36 hours, depending on how far it is desired to go, and the weather and the tides. Of these the latter are the controlling factor, as access to what, for want of a better term, is known as land can only be made at high tide, and then only at the mouth of a river or creek, the extreme flatness of the shore making a tide of only 1ft. or 2ft. all the difference between success and failure in attaining one's objective.

Our objective in this case was a small scow cast up beside one Partridge Creek by the highest tide on record and since that time immovable on the mud. The time of its casting up could no doubt have been determined by a competent archæologist by means of the successive strata of egg-shells, goose bones and feathers, tin cans and other debris left by previous shooting parties, all somewhat reminiscent of the ancient kitchen-middens found in certain parts of Europe left by the prehistoric lake dwellers.

The scow was our shelter for six days. About a mile to the north-east were the brackish waters of the bay, although at low tide it was impossible to distinguish where the mud ended and the water began. At normal high tide grass and weeds commence, becoming denser and more solid going towards shore to the limits of extreme high tide, where sparse willow clumps begin to grow. These, in turn, become denser, interspersed with alternate patches of swamp and finally patches of poplar growth until, about two miles to the south-west can be seen the low saw-tooth outline of the pines which mark the true dry land. This dry land, of course, we never reached; the intervening marshy scrub made a hard barrier even at this time of year; in summer, with black-flies and mosquitoes, it would have been an inconceivable inferno.

Fortunately these marshes and mudflats are passable, the soft mud being seldom deeper than a foot or two and usually only a few inches, with a hard clayey bottom; the outflowing creeks and watercourses in fact have a gravel bottom. Walking, therefore, is slow and tedious, but reliable, although as one goes inland through the willow-swamps it tends to get worse.

The blue geese, or "waveys" as they are called locally, fly in large flocks up and down the coast or feed on the eel-grass near the water during the day, flighting to or from the land at dusk or dawn. It is best, although not essential, to be on the shooting ground at daybreak, a place where birds have been feeding being selected. Decoys are set out, and blinds consisting of circles of cut willows planted on either side. The most effective decoys are simply lumps of the grey mud turned up with a spade with an artificial white head of the typical old bird planted at one end; if this is not available a white feather serves equally well. If the weather is stormy and the geese are flying low and decoying, these crude lures will bring a small flock within easy shot over the decoys. If one can then succeed in bringing down the leader, the remainder of the flock may almost be counted upon as a certainty, for the younger birds will return again and again, searching for their late lamented parent or elder relation, until they are annihilated.

Our party, however, was cursed with fine weather during most of their stay, with flocks flying high overhead or occasionally wheeling to give our decoys a cautious inspection at a tantalisingly extreme range. Encouraged by the calls of our guides, later imitated by the rest of the party, a flock occasionally would present one or two of its members to a long shot, or more rarely, simply flighting overhead and being subjected to an intensive "anti-aircraft" bombardment, would lose some unfortunate. More usually, however, on these occasions, after an intense moment of agonised indecision, one refrained from firing. Such an event inevitably called for post-mortems, with the subsequent impression that, after all, perhaps they were within range and consequently would be followed by a long-range fusillade upon the next delegation, which perhaps would be even higher. Fortunately, a bird which was evidently hit but failed to fall immediately could be followed with the eye and its subsequent fall on the bare mudflats marked, with a fair degree of probability of later retrieving it.

Thanks to the weather which prevailed, most of our shooting was of this nature, from blinds at high-water mark, and, although the bags were not heavy, the satisfaction of the occasional high bird crashing down compensated for the lack of numbers. There was fascination, too, in watching the high V's of grey birds, picked out with the dazzling whiteness of an occasional snow-goose, forming, re-forming and wheeling in their steady, unhurried flight, their almost musical cries resembling nothing so much as a pack of hounds in full cry. Then to watch the flocks at dusk against the flaming sunsets, with the jagged edge of pines far inland etched on a pale cold northern sky, repaid the aggravation of the unproductive high shots, and the low-flying bunches of black duck, pintail and teal swooping in after dark afforded opportunities to retrieve fancied disgraces.

Then there was the day, a day of rain turning to wind from the north, when our guides, either by good luck or good judgment, led us over some miles of swamp and tidal flotsam to where two flocks of perhaps a thousand birds in each arose from their feeding ground among the willow clumps. The second flock turned downwind and flew right overhead about 25yds. up, giving the writer his first chance at a right and left, mercifully, for his subsequent peace of mind, successfully accounted for. We then installed ourselves in blinds on this feeding ground after laying out decoys, and for four or five hours had experience of shooting blue geese when really decoying.

It cannot be claimed that a blue goose decoying into the wind is a difficult shot, although one turning downwind may be different, but the novelty of shooting a large-sized bird under new conditions has a fascination of its own. Compared to its larger cousin, the Canada goose, the blue goose is a stupid and somewhat slower-flying bird. Like the Canada, it may be attracted by calling, its particular call being a sort of high-pitched yelp, followed by a "ga-ga-ga-ga," said to be the feeding cry: this feat of calling was successfully accomplished by members of the party, sceptical scoffing by other members notwithstanding. Unlike the Canada, it is comparatively easy to attract by decoying, when conditions are right, and apparently shows much less intelligence than a Canada or a black duck in spotting an ill-concealed hunter or crude decoy. Again, too, a wounded blue goose makes no attempt at concealment and only thinks of making for open water if there is any available; those who have shot black duck or mallards will appreciate the difference.

As mentioned previously, the lovely white snow-goose flies with the flocks of blue geese indiscriminately, the proportion apparently being about one in twelve; in fact the Indians consider them as merely an albino form, and indeed there is little difference in size and shape. The young, though fully grown, blue goose is of a dull grey nondescript plumage and does not attain the characteristic white head and mottled blue-and-grey wing and black plumage until its second year. The weight is 6lb. to 8lb., with small variations.

THE GUNS AND THE BAG

The south shores of the bay apparently form the main gathering place for the flocks before they start the long part of their flight south. When the freeze-up comes or a particularly severe north gale blows they all usually leave almost at the same time. At Hanna Bay, about 25 miles to the east of where we shot, are the main hunting grounds of the Indians, who shoot "waveys" literally in thousands, depending on them for their main winter food supply. Contrary to popular conception of the Indian habit, there is no waste; the meat is smoked, including tongues, livers and even feet, and the heads and entrails eaten at the time.

The difficulties of shooting at Hanna Bay are the tides, and the chances of being held up by high winds, rendering it impossible for the traveller with limited time on his hands to count on catching the train at Moosonee on a given date.

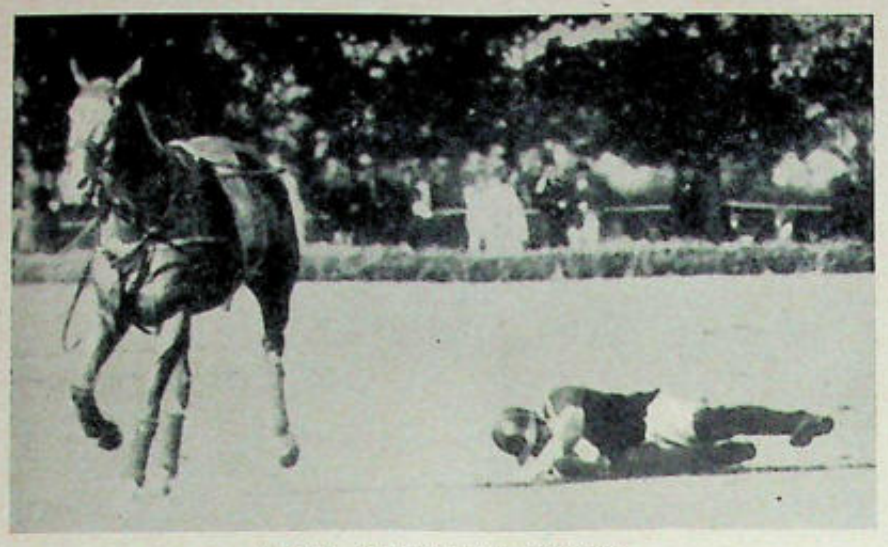
Little or no mention has been made of other game. Canada geese are rare on the south shore, although they are reported more common on the west shore; duck are about equal in number to geese and so less conspicuous, and are represented mainly by pintail, blacks and teal in order of frequency. Snipe, last but not least, are in abundance, and form a welcome diversion when walking to and from the blind when the geese are not flying; on an average one can count on a snipe for every five minutes of walking if one's eye is in. This should satisfy the most spoiled sportsman.

The non-migratory wild life of this desolate region is as limited as one might expect, being chiefly represented by white fox, the mainstay of the local fur trade and chief source of revenue of the natives and the Hudson's Bay Company, together with its natural prey, the Arctic hare. Local nomenclature notwithstanding, there are practically no moose, their northerly limit in this section being about 100 miles to the south; this, of course, applies even more to deer and black bear. The nearest polar bear are found on the Belcher Islands at the mouth of James' Bay, about 400 miles north.

The traveller or sportsman therefore may be thankful to coincide his southward journey in October with that of his quarry, and re-embark on the creaking coal-oil lighted "Moosonee Express," before its tri-weekly journey gives way to its winter schedule of bi-monthly, leaving this bare country of marsh and stunted timber to the first winds of winter blowing down from the Pole.

POLO OF THE SUPERLATIVE ORDER

Pony Power and the Westchester Cup



A SPILL IN THE FIFTH CHUKKER

Mr. Cecil Smith's pony, Cacique, crossed its legs and its rider fell, chipping a piece of bone out of his right elbow. The accident prevented him, after the game, from playing polo for the rest of the season

THE American Open Championship at Meadow Brook established beyond question that the Old Westbury team, which totalled 34 goals on handicap, is the strongest and best organised team that has taken the field for a good many years past. What, also, was made clear is that Mr. Tommy Hitchcock is unquestionably the greatest player in the world and, I am prepared to add, still the greatest player of all time. The victory of Old Westbury over Greentree in the final round was by 16 goals to 7, which, on paper, looks overwhelming. But although defeat for Old Westbury never once seemed in the least probable, the game was in fact a great deal closer than the scores suggest. Last year Old Westbury, with the same team, won the final against Greentree, with Mr. G. Balding in place of R. Cavanagh, by 11 goals to 6.

Old Westbury, consisting of Mr. Michael Phipps (No. 1), Mr. Cecil Smith (No. 2), Mr. Stewart Iglehart (No. 3) and Mr. S. V. Whitney (back), the first three of whom are pretty certain to fill the same positions in the American team for the Westchester Cup next year, were most gloriously mounted. They played consistently together as a real team, and their combination could not be disturbed even by Mr. Hitchcock. Greentree lined up with Mr. G. H. Bostwick (No. 1), Mr. Roberto Cavanagh (No. 2), Mr. T. Hitchcock (No. 3) and Mr. J. H. Whitney at back, and their handicap in the aggregate is 30 goals.

Substitute Mr. Hitchcock at back in the Old Westbury side and there you have next year's American team, totalling 39 goals and well worth it. That is unless they decide to put up Mr. Phipps to 10—an almost unprecedented rating for a No. 1, which is not in the least unlikely, both on his performances and by way of little propaganda against next June, when they would be a 40-goal side. Added to that is the fact that all are certain to be mounted on the pick of the ponies in America, most of which were playing in the Open, and it is clear that their team will be desperately formidable.

The final was, despite the discrepancy in the scoring, quite one of the finest games of polo that I have ever seen. Played at absolutely top pace from start to finish, with beautifully long and accurate hitting on that really glorious ground, it was a game that will be long remembered by all who saw it; and there were more than 36,000. If one can single out one player where all went splendidly, I think it must be Mr. Cecil Smith, who brought out a really terrific game, several times almost immobilising Mr. Hitchcock, his opposite number.

Mr. Phipps and Mr. Iglehart demonstrated their perfect understanding of each other. Those long hits-up, those oblique passes judged to a yard and taken on time and time again by Mr. Phipps, who has the art always to have his ponies (and they are very fast ones) going in the right direction at top pace at the right moment, were tremendously impressive. So, too, was the drive and good riding of Mr. Bostwick, always a most popular figure with the crowd, who only suffered by comparison with Mr. Phipps, and the long hitting of Mr. Cavanagh—if only he were a rather more accomplished horseman—and above all, the valiant and brilliant play of Mr. Hitchcock, who, towards the end, sustained an almost single-handed defence. All were men of might. The Whitney cousins, both rated at 5 goals, played a really fine game, and were worth considerably more than their handicaps. They are splendidly mounted, and Mr. Jock Whitney, for his part, certainly has never played better. Mr. Sonny Whitney, despite a painful accident in the second chukker, made very few mistakes.

Where Old Westbury really had the advantage was in pony power. After I had seen the Greentree ponies I could not imagine that any other side could have much of a pull in the matter of mounting. None the less, Old Westbury did have it, and to Mr. Ivor Balding, who manages Mr. Sonny Whitney's stable, they owed a great deal. Outstanding ponies were Mr. Smith's mounts, Cacique, Jemima and Estalista; Mr. Whitney's Slippery Sand, Fuss Budget and Tornasol; Mr. Iglehart's grand little old chesnut pony, Little Red and Housemaid; and Mr. Whitney's Rubisela, whom Mr. Iglehart rode. All played two chukkers, the last-named, three. That wonderful grey pony, Brown Fern, also played three—one with Mr. Iglehart and two with Mr. Phipps; and, so far as I could see, was perfectly fit and ready to play a fourth if he had been wanted. Of those played by Greentree, Mr. Bostwick's chesnut mare Marcelina, from Argentina; his brown Hawaiian-bred Be Charming and Douglas Dawn showed remarkable pace (all his, indeed, do), and Mr. Whitney's Pampero, a liver-chesnut gelding of Mr. Luis Duggan's breeding, Nodmore and Perla Negri all did well for Mr. Hitchcock.

On that very big International field in a fast game, no pony that is not of superlative quality is of any earthly use. I had been told so many times and, now that I have seen it for myself, I can reiterate that statement. Perhaps during the past London season I have insisted on the importance of pony power to the point of tedium, but I am now persuaded that this is even more important than I dreamed. I noticed, too, that not a single pony (and some of them were young ones) showed the least sign of "greenness," which proves the efficiency of their schooling.

There was one great disappointment, and that was the showing of the Jaguars. At first it had been hoped that Mr. Hesketh Hughes, summoned by cable, could be mounted to play at No. 1, which which would have meant three likely British Internationals in the team, but the ponies could not be procured, and accordingly Mr. Hughes, as I think rightly, withdrew from the team both on public and private grounds. Mounted indifferently, he was unlikely to do himself justice, but that would not have been considered against the fact that a team containing three of our Internationals had taken a heavy beating. It was too steep a chance to take. The virtue of preliminary propaganda is nowadays recognised. The Walker Cup match at golf proves its value.

One player, not in the least to my surprise, who has covered himself with glory during the Open and Monty Waterbury Cups is Mr. Eric Tyrrell-Martin. In London, playing behind a victorious team, he was consistently excellent. On Long Island, playing behind a rather disorganised team, he has been nothing short of brilliant. He has been criticised for coming up into the game too much in the Greentree *v.* Jaguars match, but he did not do so until it was clearly a case of a losing battle. He has had several of the Hurlingham ponies to play, and the black Docker pony, French Cottage, has, I think, proved her class. The big Argentine gelding by Rico, Alarido, may turn out well, but is as yet a trifle green. Miss Destiny and the showy Atalanta may prove to be of real class, and Velos and Trece de Abril (by Footman) have, on occasion, played well.

Mr. Gerald Balding has played well in parts; indifferently for him in others. He seems just a trifle stale, and an opportunity to think of his own game exclusively would, I think, put him right. Of Mr. Rous's ponies that he has been playing the chesnut Waler mare Royal Mint, by Goldmint, has gone really well, even when compared with the *élite* of America. Brown Sherry, another Waler, has gone well, but could do with a rest, and Elaine has also distinguished herself. Of his others Peperina, a chesnut Argentine mare, is too, I am persuaded, quite of International class.

Captain C. T. I. Roark, who is a member of the Aknusti team in which are the Gerry brothers and Mr. Raymond Guest, has been showing much of the form that has made his American reputation. They rate him at 9, whereas in London at the end of the season his handicap was reduced to 6. He is a strong and splendid horseman and a joy to watch. The true surface of the ground at Meadow Brook suits his style of hitting—what a lovely wrist he has—and American critics regard him as still one of our finest players.

Impressive as has been the polo shown by the American teams I am still convinced that, after plenty of hard (and I accentuate the "hard") practice early next year, and the collection of really top-class ponies to play, there is no reason at all to regard the chances of our team as hopeless or anything like it. It would be idle to suggest that the Americans will not be immensely powerful, but they, too, have their pony problem, and no team is invincible. For ourselves we have the best team of players we have had for years. Given the ponies and a well-developed team technique they will, in any case, put up a very close game.

TEAM PLAY ON THE BOARDS DURING THE OPEN CHAMPIONSHIP FINAL

Mr. Cecil Smith (on left) frequently had the better of his duel with Mr. Hitchcock (centre). Mr. Stewart Iglehart is on the right

The results and the teams in the Open Championship are given below:—

First Round.—Greentree (30) (G. H. Bostwick (7), R. Cavanagh (8), T. Hitchcock, jr. (10), J. H. Whitney (5)) beat Jaguars (30) (T. P. Mills (7), W. F. C. Guest (7), G. Balding (8), E. H. Tyrrell-Martin (8)) 15—9.

Old Westbury (34) (M. R. Phipps (9), C. Smith (10), S. Iglehart (10), C. V. Whitney (5)) beat Aknusti (29) (E. T. Gerry (7), R. L. Gerry (6), Captain C. T. I. Roark (9), R. R. Guest (7)) 13—7.

Semi-final Round.—Greentree beat Ramblers (23) (W. G. Reynolds (5), G. S. Smith (6), R. E. Strawbridge, jr. (6), J. C. Rathborne (6)) 20—7.

Old Westbury (Ivor Balding No. 1 substitute for M. R. Phipps) beat Aurora (22) (S. H. Knox (6), F. S. Van Stade, jr. (6), L. Smith (4), R. S. Santamarina (6)) 14—8.

Final Round.—Old Westbury beat Greentree 16—7.

JEMADAR.

COLONEL HAWKER AND THE CREATURE COMFORTS

IN 1844, when Colonel Hawker finished off the final edition of his *Instructions to Young Sportsmen in All That Relates to Guns and Shooting*, he made it clear in his preface that he had left out everything that he considered inessential to his young sportsman's knowledge. In spite of this he did find it necessary to include a chapter of advice on the health and comfort of the young sportsman which, to those of us who get a glow of righteous self-esteem out of the mere physical achievement of spending a night on the mudflats waiting for the geese, must come as something of a dampener. For the Colonel thought fit to advise on food—not what to eat when arrived at headquarters, but what to take with one to avoid death from starvation or stomach trouble; on drink and how to make it palatable; on the ills of the body, and these, be it said, included, in his estimate of the possibilities, the risks of malaria, bronchitis, pneumonia and enteritis; finally, he advised on the possible ills of the soul and the proper use of leisure.

The "young sportsman" of a hundred years ago, in fact, had to take a very different view of life and his sport from the young sportsman of to-day, with his shooting school behind him, his organisation of keepers and beaters and loaders at his service, and his creature comforts of hot food, hot water and cheering stimulants on tap, within a few minutes by car of his sport. The Colonel opens his chapter of advice so disturbingly as to turn most of us moderns from shooting to some comparatively gentle and luxurious sport like cross-country running.

His admirable but, as it turns out, somewhat understated object is to save his young sportsman from "unnecessarily hard fare when quartered in a small public house," and he opens with a distressing picture of the landlords of such public houses living exclusively on fat pork and tea—in coastal districts, red herrings and tea. Small wonder that later on the Colonel says of one of his specifics, tartar emetic, that it "sometimes performs wonders among the common people who are subject to having the stomach disordered by eating voraciously of bad and unwholesome food"! Even a nobleman, in the Colonel's experience (and here, perhaps, a hint of bitterness creeps in, as of a commoner bit, when he says that the nobleman is, of course, "by common people thought in the greatest extreme better than a gentleman without a title"), is only likely to improve on the salt pork or herring diet to the extent of a chop or a steak. And what a chop or steak—one that the commoner, if able to get it at all, can either despise and so starve himself to death, or eat and so kill himself with indigestion.

For drink, the young sportsman, nobleman or not, gets beer, sour enough to be comrade in arms with the meat in the attack on his digestion, and brandy or gin, the first "execrably bad and unwholesome" and the second almost certainly diluted. This dilution is a practice to which gin will probably ever be subject: things have at least improved since the Colonel's day when it was deliberately distilled "above proof" so that it could stand a certain degree of dilution without complete ruin. In fact, the process of dilution then was so far from being dishonest as to be the common practice, "not only with many respectable innkeepers, but by retail merchants themselves."

But to return to the young and unprepared sportsman. Having chewed his leathery meat and either made things worse with bad brandy and beer, or failed to cheer himself with ineffective gin, he takes his pain-racked body to bed. The bed, unaired as it is, brings on rheumatism, and the unchecked draughts give him toothache (here the modern attitude has changed, although the difference between fresh air and a draught still leads to argument). Next morning he arises to break his fast with milkless tea and is so "bedevilled" that he cannot touch a feather all day and returns empty handed to be double bedevilled again that evening and night.

So, presumably, in an ever narrowing and vicious circle until rheumatism, toothache and indigestion or starvation finally carry him off.

But Colonel Hawker, unlike some of our modern social and political theorists, does not expose a condition without suggesting not only proven remedies but proven measures for preventing recurrence. He certainly paints the worst of the picture, but he then sets out to suggest palliatives which, even to the pampered modern ear and stomach, raise hopes that, in spite of all, shooting in 1840 could be made tolerable and even enjoyable.

Although he tends to digress in this chapter, as he does through the whole book (and these digressions, for one reader at least, make up a great deal of the charm of his work), his palliatives can broadly be divided into headings which fall intelligibly, and some of them happily, on the modern ear—food, drink, tobacco, physical good sense, medicine and, lastly, for the Colonel was philosopher as well as sportsman (as some of our modern sporting journalists are also wont to be), the proper use of leisure.

One by one in this series I hope to review each of the Colonel's palliatives for the miseries of shooting, and see how we have changed or how we have stood still. And, although the final analysis is not yet made, it begins to look as if one can say of shooting, in its incidentals at least, that *plus ça change, plus c'est la même chose*.

It is to be hoped that Colonel Hawker's gloomy estimates of the discomfort his "young sportsman" would have to face were partly coloured by the natural desire of the expert to instil a proper respect into the novice. But his adjectives on the question of drink—"sour beer, execrably bad brandy, diluted gin"—hint at a bitter and general experience.

His slashing condemnations, however, were directed only at the remote country publican's

LIEUTENANT-COLONEL PETER HAWKER
Author of "Instructions to Young Shooters"

wares, and do not mean that the Colonel was an opponent of the bottle. He was in this, as in most things, impartial and temperate in judgment and behaviour; he had views on the value of alcohol, and had much to say to his young sportsmen about it.

The task he set himself was to advise how to deal with the bad liquor his pupils would meet on their more remote travels. Sour beer, the first danger to the young, he suggested masking with nutmeg or powdered ginger and brown sugar, but he recognised that this process was akin to coating the pill with sugar—the evil was there even if its face were hidden—so he recommended a little carbonate of soda as well. This hint, if it works, as it reasonably might, is one that some modern landlords might well take.

The Colonel's way with bad spirits was to refuse them, and drink rum instead, as a spirit which would "soon be spoiled by adulteration." Why this should prevent it being adulterated like his gin and brandy, I cannot see; perhaps the Colonel had more faith in his own power of detecting adulteration of any spirit than in his young pupils'. But that is by the way. The sportsman is advised to get his rum, which no one will have dared to adulterate, and will have brought with him some lemon-juice. The inn provided sugar and the "focus of a good punch" on the formula, "One sour, two sweet, four strong, eight weak," was there. The Colonel only claims his punch as a basis, a sort of iron ration among punches, and he suggests refinements such as pounding the sugar very fine, using a little orange juice instead of part of the lemon, and reserving the addition of the spirit until the end. But his moderation leads him to issue a stern warning against excessive embellishment. "It becomes a necessary caution against error to accept that punch which is composed with all the dainties of an alderman, who, by the way, is welcome to them, and to the gout which follows." For the warmer weather the Colonel has a cold punch, the recipe for which he got in Glasgow (although it contains no whisky). Reduced to a similar simple formula to that of the hot punch, it runs: "One sour, two sweet, four strong and twenty weak."

This one carried a true punch; it is one of those innocuous hot-weather drinks distinguished to-day by some benefactor's surname, with which the unwary still get trapped. "After wine," the Colonel writes, "it is a drink to metamorphose a man into what he would not like to be called, by making him drunk." Can this be the beverage which was the undoing of Mr. Pickwick? Can Colonel Hawker (for Pickwick's was a shooting party, too) have been the "unknown compounder" to whom Pickwick drank his third glass of the series which led him so swiftly to disgrace in the village pound? Perhaps not, but had fact met fiction the two of them would have found much in common to discuss.

The Colonel, leaving punches, starts on what is half digression and half logical sequence, for he turns to medicine, and in particular, medicine for those who have made "too free with French wines, or hard, stale port." Thence on to port drinking itself, where he prepared the ground for serious argument with some of the moderns by recommending early bottling into magnums. But he modestly disclaims the ability to deal properly with wine, although he does say one thing which should bring a response from those of us who object to the modern trend in wineglass design. "Let no silly fashion dissuade you from drinking your wine out of a narrow-bottomed glass . . . fashion is all very well, but reason has a prior claim."

There is a suspicious sound about the Colonel's next use for alcohol—as a night-time dentifrice. Suspicion *of him* is actually unjustified, for he had the same doubts, and recommended adding a little camphor to the brandy or whisky, not only to preserve it, but also, very wisely, "to prevent the vassals of the place from drinking it."

His dentifrice provides a bridge from the social to the medicinal aspects of drink. He rejects morning spirit drinking, even of a very popular mixture of rum and milk called a "Doctor"—a concoction familiar in name and not unfamiliar in content to the modern cocktail drinker. The rejection is not really complete, for he does except "purl," a mixture of spirits and beer, with the actual spirit unspecified. More picturesque names, like "dog's-nose," have grown around "purl" since, and in these days such drinks are taken for pleasure. There is a good one made of rum and strong ale. But the Colonel saw no pleasure in "purl" for he says that "if it is not thought too disgusting a beverage hot at night, or cold in the morning, it is one of the most powerful stimuli of all things an ale house can provide." Incidentally, he recommended it against "the ague"; from his attitude towards it as shown in the previous quotation it performed more than one of the functions that quinine now performs for us.

The Colonel has much more to say about drink, from the medical point of view, but as another article in this series is intended to examine his medical theories, it may well wait until then.

H. A.

MOOSE AND WAPITI IN NEW ZEALAND

Reports from time to time indicate that the moose herd in Dusky Sound are holding their own so far as numbers are concerned, but to what extent they have increased it is impossible to estimate owing to the dense bush and rugged nature of the country. They are still only in an area confined to a radius of not more than 20 miles from the point of original liberation. Very few animals have been shot and only one head taken (a small one). The cast antlers picked up do not indicate any exceptional growth of horn, rather the contrary.

All restrictions have been raised by the Government for the taking and killing of these animals, and last summer a party of Government deer killers visited the Dusky Sound area and spent some three months in the Seaforth Valley and vicinity. No statement has been made officially, but the information has been obtained that only one cow moose was killed. This was wounded heavily by .303 rifle fire, and eventually escaped to die in the dense forest. Many fresh signs of moose were seen from time to time, but the animals are very elusive and cunning, and only an expert with plenty of time and patience would be successful in the country they inhabit.

The wapiti herd is doing well and splendid heads are still being taken. The Government cullers were in this country also during the summer and did a great deal of damage to the herd. A cast antler which measured 64½in. long was picked up this season.

HOOKING A TROUT

To Strike or Not to Strike?

By JAMES DICKIE

I HAVE seen it stated in print that it is not necessary to strike trout when one is using an artificial fly. Admittedly, this may be so where one is fishing with a sunk fly in a lake or across and downstream in a river: if the trout snatches at a fly of the Alexandra type or at a small salmon fly, it may hook itself—or it may not.

But to say that it is unnecessary to strike when using a wet fly, fished upstream, or a dry fly seems quite absurd. Cases are quoted where fishermen left their rods with their flies on the water to keep the gut damp and sat down to have lunch; on returning they found trout hooked. Some of these incidents are well authenticated, but they do not prove the point at issue.

A trout, when it discovers that it has sucked in an uncomfortable and tasteless conglomeration of feathers and hook, undoubtedly tries to blow it out again. In spite of the fact that its teeth point backwards and the hook may catch in its gills, it succeeds nine times out of ten. On days when trout are feeding strongly, about one in ten is hooked in the gills, and no amount of blowing by the trout will shift a hook from there. It is exceedingly difficult to do so by hand after the trout is caught; a fact which causes the death of many undersized trout. I suggest that these are the trout which have given rise to the story that one need not strike.

How soon, then, should one strike? That depends on many different factors. I propose, as rough directions: (1) In sunk-fly fishing strike as you see or feel the line begin to tighten. The difficulty here is with the trout which follows the fly and takes it in its mouth. Once in Lough Arrow, I was fishing a sunk Invicta; it was sunny, and we drifted into the lee of an island, where the water was, I thought, too calm. I was just taking in my line to move when a wave followed the fly.

I rested the fish and cast again; this time the line definitely began to tighten, and I struck, but met nothing solid—just the faintest pull as if the fly had caught a floating weed; I had to fish deep as the water was so calm, so I could not see what was going on. A third time I threw out, waited for the fly to sink and, with the top low, took in line, under my forefinger, 6in. or 1ft. at a time. Again the line began slowly to tighten and I snatched—I was into a biggish trout. I had it on for a couple of runs and it jumped; that fish was certainly over 4lb. It kicked off, as all shy risers are liable to do, but that trout proved for me that a deep fly may kill without a ripple and in the sun.

Incidentally, if the rules allow, fish an Invicta deep in rain; especially in the evening, the results can be amazing. If it is raining a breeze is quite unnecessary.

In sunk-fly fishing you cannot be too quick if you watch the line, but you can be too quick if you see the wave or swirl of the fish. Keep your top low and take in line, as in fishing for summer salmon; try to make the trout take a fly on a taut line.

Never fish very fine with the sunk fly; trout sometimes hit it with a bang that will break 2x gut. (2) In nymph fishing, striking is the main difficulty. Trout will suck in a nymph, sunk a few inches, without the slightest disturbance of the surface. If you can see the trout come for the nymph, strike as it turns; sometimes, all one can see is the drag of one's cast on the water. In any event, strike at the slightest suspicious sign, you will be amazed how often a trout is there. (3) In wet-fly fishing strike quickly; the only possible exception is in the case of a big trout, seen before it takes. In that event do not quite "half-volley" the rise, but never be really slow. A deliberate rise calls for a deliberate strike, a quick rise for a quick strike.

In dry-fly fishing this last rule holds good, though, sometimes, with very heavy trout, one should strike quite slowly (about a second between the rise and the strike). The smell of the Liffey, as is well known, is one of the "sights of Dublin," but in its upper reaches, it is a very beautiful river. I was fishing in Co. Kildare and was after a famous local trout called, for some unknown reason, Mary Anne. She lived under a spreading tree; I forget if it was a chestnut; anyway, it spread near enough to the water to make casting, from across or below, impossible. I was determined to compass the destruction of Mary Anne; I crawled to the edge of the water and lay flat under the tree within 3yds. of where she was eating light olives.

Without raising my top more than couple of feet off the ground, I flicked a fly in her direction, and, by some fluke, it fell right. Against the dark water it shone like a good deed in a naughty world, until engulfed by Mary Anne. Being in those far-off days, still a disciple of the late Mr. Halford, I paused before I struck, there was a flurry a foot under the water, and I saw my light olive shoot into view, blown violently at least 4in. clear of the mouth of the horrified Mary Anne. I am told she was not seen for days after—gave 'er quite a turn, it did!

I saw the other side of the picture a few years ago, on the Kennet. My host said it was useless to fish, but I found one trout—a greyish-brown shadow, picking amongst spinners. Not another trout did I see that afternoon, but my grey-brown friend was worth all my attention; it looked about 3lb.—it also looked as if it would eat a small tup. The tup was a bad guess; it was inspected and rejected; apparently a tup looked to this trout (as it does to me) exactly like a tup.

I tried several other flies, still the same; some were inspected, others ignored. Then I tried a small pheasant tail of my own tying, one with a nice brassy hackle and a black thorax. The fish came up very deliberately, and down went the pheasant tail; I struck and pulled it sideways out of its mouth, before it had closed. Slow rise—slow strike; that time I was too quick.

Try to guess when the trout closes its mouth, that is the moment; then drive in the hook, as firmly as your gut will stand. Big hooks need more driving in than small ones.

UNHOOKING THE CATCH

A nice 1¾ pound trout from Linlithgow Loch. The loch on which stands Linlithgow Castle formerly contained only perch and other coarse fish. It has now been stocked with trout and produces some good fish of 1lb. to 1½lb. Tickets can be obtained locally

COASTAL SALMON

Some Observations of Their Habits

IT is a mistake to suppose that salmon cannot be caught by angling in salt water. Evidence that salmon were taken in Loch Fyne and Kilbrannan Sound by an angler who caught the fish on large phantom minnows in water up to 50 fathoms in depth came into my possession many years ago. That evidence was conclusive, for it was had from an eye witness, the actual gillie of the angler who, beginning to troll for salmon in the salt water near Inveraray, continued to try all the way down Kilbrannan Sound. He hooked and lost a good few salmon in a six-weeks trial, but actually landed four, the largest of which, a 16-pounder, was caught in 50-fathom water off the Arran coast. Sinkers of different weights according to rates of tide flow were used, and the minnows were 4in. and 5in. blue and silver phantoms.

I have a record of a grilse being caught in the Sound of Jura on a blue and silver phantom, and I know that flounder fishers who use sand eels for bait, have caught salmon and sea trout, as well as grilse on their set lines.

Salmon and grilse which arrive on our coasts in July are constantly seen leaping within easy casting distance of the rocks, but in all my experience I never once saw a salmon or grilse come at any kind of lure in shallow coastal waters. Investigation of the shallow spots where the fish are seen leaping near the beaches reveals the fact that the bottom of the salmon "lies" is heavily covered with tangle and is full of rocks and rock ledges. Cover is, in fact, as essential for the safety of a salmon in salt as in fresh water, so the shoals of migratory salmon swim stealthily from one wrackbed to another along our coasts.

Seals await the fish in the open sandy places, but a salmon which has a wrackbed at hand is in no danger from a seal, as at a glimpse of danger it is under a tangle-covered rock. So, also, when a big salmon is pursued by a grampus or killer whale. Of course, a seal or grampus does occasionally beat a salmon in the race for cover, as on more than one occasion I saw. Seals are adept at herding salmon in partly-enclosed ports or runnells of deep water on shallows, and the killer whale can take a salmon in the run-up; in fact, I saw one catch a salmon as it fell back towards the water after a tremendous leap in the air.

At Westport, in Kintyre, there is a gathering place for salmon, which, in fine clear weather of July and August, hesitate to cross the five or six miles of sandy ground which lies between Westport and the Mull of Kintyre.

That the salmon know it is useless for them to seek entry into rivers in dry weather is very evident from their behaviour, for when the glass falls and the raindrops patter on the surface, the fish leap in numbers from the water, particularly at the turns of the tides.

Close observation showed that the local seals are very clever indeed at snatching a salmon which is on the move outside of its cover at late evening or earliest dawn. I cannot recollect seeing a seal with a salmon except at earliest dawn or latest dusk, and the seals spend most of the daylight hours asleep on the rocks. The animals know that salmon and other fish change their quarters chiefly at high tide, so it is when there are high tides at dawn or dusk that one is most likely to see a seal bring its hunting to a successful conclusion.

DUGALD MACINTYRE.

SOME WADERS OF

WHEN, some months ago, we published for the first time some of Mr. Farrar's photographs of waders, considerable interest was aroused among ornithologists. Here is another selection from Mr. Farrar's latest pictures, and we feel sure that our readers will agree that they fully maintain the very high standard he set himself with his first photographs. Mr. Farrar is, we believe, the first photographer—artist would be a better word—to take photographs of waders at close range on the shore. Reading from top to bottom of this page these photographs are of :

1. A young bar-tailed godwit, a bird of the year, with oyster-catchers.
2. Whimbrel resting at high tide. Whimbrel are seldom photographed anywhere—and very rarely away from the nest.
3. A group of turnstone, knot, dunlin and sanderling resting at high water.
4. A group of adolescent sanderling photographed in late July. These little waders require more than one season to attain maturity.

A FLOCK OF SANDERLINGS RISING FROM THE EDGE OF THE TIDE

FOURSOME GOLF AT WORPLESDON

A Bright Spot in an Over-loaded Calendar

By E. R. TIPPLE

ANOTHER long season of competitive golf has ended. All the various kinds of tournaments that make up a much over-crowded calendar of events have been held, and now only the usual Alliance meetings and the matches between the London clubs and the two 'Varsities will disturb the peace of the winter months. Many will be relieved because it is felt that the position has been reached when too many tournaments are staged.

There was a time when the general cry was for more and yet more tournaments. That appeal was answered, and new fixtures were added to the list year after year. To-day there are so many that clashings are unavoidable, and hardly a week goes by without some event of so-called importance being played. From the leading professionals' point of view, this is all to the good: the more tournaments the more chances they have of adding to their incomes. Most of these competitions are sponsored for publicity purposes, but because of the number of them they will not receive support indefinitely.

The ordinary club golfer will not go to watch more than a certain number of events, and if several are held over his own course, thereby interfering with the play of the members, he will object in no uncertain terms. The time has come when the whole position should be reviewed, and the number of open events curtailed. Even professionals cannot expect to participate in all the competitions—if they did, their clubs would hardly see them at all! Their members expect the services for which they are primarily engaged. Some professionals complain of lack of business, but they are away so much, leaving assistants, who are not so competent as themselves, in charge, that they cannot expect anything else.

If the amateur player entered all the events open to him he would not have time to do anything else. The national championships are naturally important, but many of the subsidiary competitions could be omitted without much loss. At present they are fighting each other and defeating themselves, for only a few are receiving large entries. Unfortunately, too many amateurs are treating the game as a business, forgetting that, when all is said and done, golf is just a game.

Two tournaments are different from all the rest—the Halford-Hewitt event and the Worplesdon Mixed Foursomes, of which the latter has just been concluded. At Worplesdon, in particular, games under ideally pleasant conditions are enjoyed, and the winning of them is not overstressed.

Having won the event eight times with seven different partners and playing over her home course, Lady Heathcoat-Amory is always the main attraction. For the second time she unsuccessfully tried to establish another record, and with her husband be the first victorious husband and wife partnership. They were beaten by a young couple, Miss J. Gordon and J. O. H. Greenly, the old Oxford "Blue," whose consistent golf merited their victory.

Foursome golf is not easy. Two brilliant exponents of the game do not necessarily make an impressive partnership. Foursome golf demands far more than individual brilliance, although at times this is necessary. Team work and a complete understanding of, and confidence in, each other are essential. So one often finds two moderate golfers making a strong partnership and overcoming two better players.

At Worplesdon the men do not have the heaviest burden to carry. Indeed, I think the ladies suffer more than their partners. The superb course is a great test, and the wayward player quickly finds himself up to the knees in bracken and heather or hidden by a gorse bush. The lady players consequently have to extricate the balls from places they never visit themselves, and that they can do so with some success is always astonishing.

Even for a husband the task of partnering a great golfer is difficult. Sir John played well until the fourth round, and then committed several cardinal errors. Lady Heathcoat-Amory was by no means her immaculate self, for many of her shots lacked the usual accuracy, although at times she produced a brilliant recovery stroke such as only she is capable of executing. For example, at the short thirteenth Sir John sent his tee shot into the wood at the back of the green. The ball lay behind a jagged tree stump, and the line was between two tall pines standing close together. Lady Heathcoat-Amory judged the pitch to a nicety, the ball rose sharply, just missed the tree branches, dropped on the green near the hole, and the putt was sunk for a much-needed half. A magnificent shot which only put off the inevitable defeat as their opponents were then two up.

It is true of all match play events that the winner has at least one narrow escape from defeat. Mrs. Garon and E. F. Storey, after a struggle lasting four hours, finally won at the twenty-fourth from Miss Henderson and G. Grant-Govan. This was an extraordinary game—one of the most drawn-out in the history of any event.

In the final Mrs. Garon and Storey easily overcame Miss Wanda Morgan and Morrice, who earlier had combined particularly well. Morrice played a number of destructive shots, and his partner, for once, could do little right on the greens. The winners, on the other hand, putted impressively, and rarely left the beaten track. Brilliant putting ousted other notable partnerships, and the usual crop of surprises were recorded.

Throughout the meeting the standard of play was as high as ever, some couples achieving wonderful scores. The best game of all was undoubtedly that between the Amorys and the Critchleys, which the former won. The players themselves, as well as the interested spectators, thoroughly enjoyed the match. That, after all, is the object of all who play at Worplesdon, and indeed it should be of any golfer anywhere.

IN TOUCH

A Mixed Rugby Bag

THE British team, whose play seems to have won the admiration of the South African football enthusiasts, have now returned home, and their tour is settling down into its allotted niche in Rugby history, where, with the passage of time, it will assume its true proportions. It is doubtful whether it will ever be spoken of—even over in Africa—in the same breath as such tours as the famous 1924-25 All Blacks visit to this country, but that it was a sporting success there can be no shadow of doubt.

In winning the third Test match Britain showed she could produce a team capable of beating an international side, and not merely provincial teams, and South Africa, be it remembered, is probably the strongest of the Rugby-playing countries at the moment. Playing 23 matches in all, the British team lost only six, winning the remaining seventeen, to emerge with an aggregate score of 407 points against 272, which, it must be admitted, is good going.

When the tour commenced the ground was iron hard—an unusual condition over here—and a nasty crop of casualties resulted, which fact, added to the necessity of making long journeys between matches, may fairly be considered to have accounted for some of the six losses, which of course included the first two Tests.

The first Test was a defeat for the forwards. Africa seemed to have had the heavier pack and, added to this, the loss of W. H. Traviers's hooking meant the loss of the ball in many of the tight scrums. The third Test was quite another story; here was a fine display of form on both sides—every man doing his bit and no one trying to do someone else's. As a result the game was notable for its sporting and attractive play.

One of the most extraordinary aspects of the whole tour was the number of penalty kicks awarded. The British score shows a bag of 24 penalty goals, and that of their opponents, 25 (they only scored 27 ordinary goals). It would seem that these kicks were not so much the offspring of unsporting play as of strict refereeing. In the ultimate, the game's the thing. A tour will never become famous through its scores, and so there is little need to bewail this unusual quality of the matches.

One interesting matter which has come to light in the tour is our preference for the forward 3—4—1 formation in place of the more orthodox 3—2—3. It has been suggested that 3—4—1 formation may find its place in English Rugby teams as a result of the tour, but personally I doubt it. We are a terribly conservative nation, and any change so radical would necessitate an upheaval of Rugby temperament. It may sound a poor argument—indeed it is—but time will, I think, prove me right.

The Oxford and Cambridge trials would seem to give rise to comment. Whether Cambridge will win the 'Varsity match this year is a matter of opinion. She did not do so last year, although to my mind she had the more finished team. Readers may not agree with this, but I feel that, had the Cambridge forwards shown the understanding in the loose scrums that they displayed in the tight, the result might have been substantially different, for behind the pack they showed a very good field with some sure hands and fast legs.

Oxford have lost all but three of the forwards who took the game so effectively into the enemy half last season, so, in a sense, they are an unknown quantity this year, while the Light Blues are in an exactly opposite position, having lost only three of their scrum. Were I cynical I might suggest that this last fact is a great pity, but with the hope that in the twelve intervening months they have learnt how to deal with ugly forward rushes, I will restrain myself.

Oxford may be short of forwards, but H. D. Freakes, their captain, must find the number of potential stand-off halfs quite embarrassing, for, amongst others, he has D. M. Strathie (Rugby and Trinity), a freshman who last season played in the centre for the Scottish Public Schools. I. H. Watts (Sutton Valence and St. Peter's Hall), who played in this position in the final Oxford Trial, and who will no doubt ultimately fill the position, and M. J. Davies (Bishop's College, South Africa, and Trinity), another freshman of high quality. I see that one Rugby writer, in a burst of enthusiasm, described Davies as "a ready-made stand-off already up to any post-War 'Varsity standard, and one who may yet be compared with the three greatest Oxford Blues in that position—Munro, Stoop and Cunningham." This seems a little optimistic so early on, but there would seem to be little doubt that Davies is a really sound player. In the Freshmen's Trials he played opposite Strathie and played brilliantly, while in the final trials he played in the three-quarter line for the Possibles with Strathie at stand-off.

Lastly, I must make mention of a new book on the game written by H. F. Macdonald and J. Idwal Rees entitled *Rugger Practice and Tactics* (Arnold; 3/6). The authors are coaches at Fettes, and Idwal Rees, of Welsh international fame, is of course right up to date, since he first appeared in the Welsh team in 1934 and was much in evidence in all three internationals last season.

The book is largely designed for schoolboys and has that all-important feature of being readable, while each short section such as Tackling, Dribbling, Body-swing, have bold titles which make reference easy. One of the best features of all is the illustrations, many of which were especially taken for use in the book. There is nothing like a well-captioned photograph to explain important technique; indeed, I would go so far as to say that the ideal book on how to play the game would be made up of nothing but photographs with adequate interpretation alongside. There can be few evolutions in the game which could not be photographed, and human beings are so much more understandable than dots and squares and arrows.

I especially recommend this book to those who are still within hailing distance of their schooldays, but I think that some of those whose rugger is, of necessity, played at the ringside or at the fireside, will find in this volume something constructive which will help them to grasp some of the important principles of the modern game—principles of which some of us appear to be painfully ignorant.

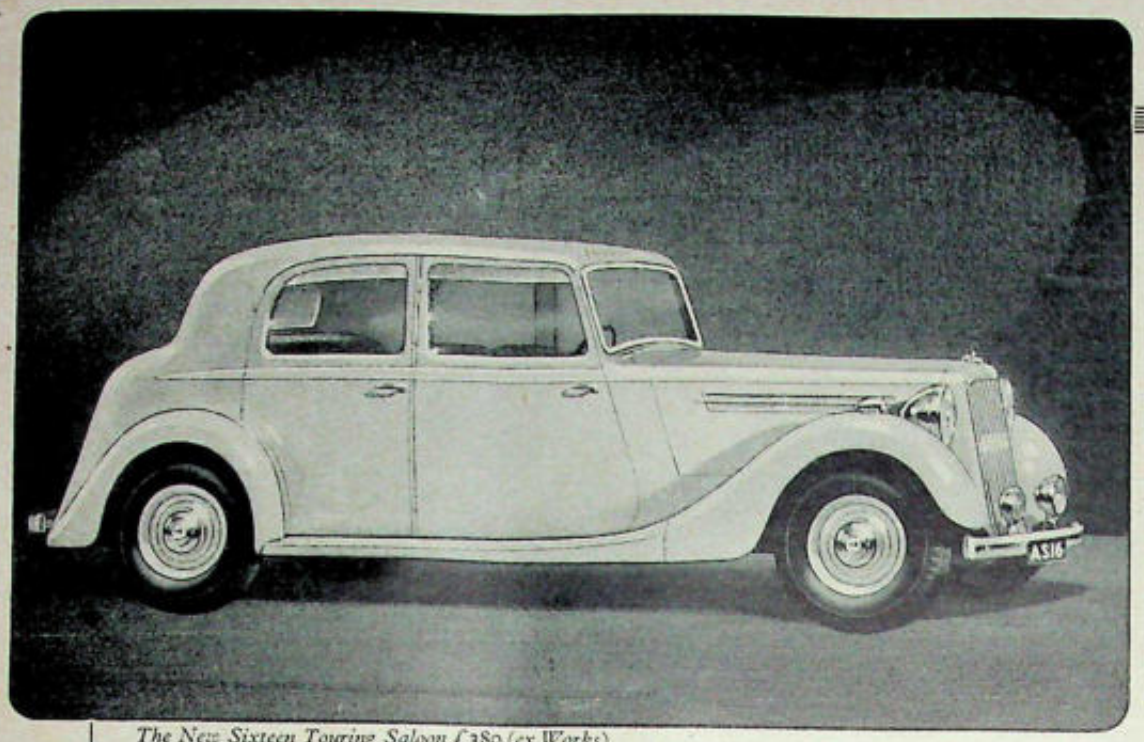
L. N. R.

UTILITY GUN DOG SOCIETY

BY kind permission of Major the Hon. J. J. Astor, the Surrey and West Sussex Branch of the Utility Gun Dog Society held their trials at Hever Castle, Edenbridge, Kent, on October 12th. The judges were Captain A. K. Hole and Messrs. W. H. Ecott and E. Crosswell.

In the Ordinary Members' Stake for any variety of dog, Mr. W. T. Turner's Labrador Jester of Fullers was placed first, with Mr. A. E. Butterfield's Labrador Donald Duck second and Mr. S. J. Ling's Labrador Beeding Maxim third. Reserve and certificate of merit, Mr. G. S. Evans's Labrador Buckswood Shot.

Mrs. H. G. Gregson's Labrador Muntham Quaint was first in the Honorary Members' Stake (any variety of dog), and she won the challenge cup presented by the society outright. Second place was filled by Miss A. M. Bickerton's crossbred Shelsley Niky, and third by Sir Clive Baillieu's Golden Retriever bitch Golden Wattle. Reserve and certificate of merit, the Hon. Mrs. D. Carnegie's Golden Retriever Heydown Grist; certificate of merit, Miss V. Cuff's Golden Retriever Rakelands Swank.



The New Sixteen Touring Saloon £380 (ex Works)

FIVE BRILLIANT NEW CARS. Embodying every modern refinement, these Armstrong Siddeley cars give a new conception of sparkling effortless performance. Their high-efficiency 16 and 20 h.p. engines are based on the latest aero engine experience. Their stylish coachwork is outstanding for its comfort, spaciousness and good luggage accommodation.

You are invited to write for our illustrated catalogue and our new booklet "How Balanced Ride is achieved". Please mention 'The Field'.

THE COUNTRY BOOK FOR THE COUNTRY HOUSE

The Old Enchantment

by SIDNEY ROGERSON

VISCOUNT HALIFAX

"Mr. Rogerson's sketches of English character and the English scene depict various aspects of the countryside. I recommend them unreservedly to the attention of all Englishmen." (*From the Foreword.*)

A. G. STREET

"One does not suspect the enchantment of these sketches until one has fallen under their spell. Anyone who appreciated the country life of years ago will enjoy reading this book."

BONAMY DOBRÉE

"This is the rare sort of book one would like to see more often published. An 'uncommercial' book which, however, should sell, since it will appeal to all who love the country as it is and as it was."

GEORGE A. BIRMINGHAM

"Mr. Rogerson, though compelled to be a city dweller, retains a love for country people and country ways, which makes his book a sheer delight to those who, like him, grow weary of the 'pavement grey.'"

COINTREAU

Extra Dry for England

The well Balanced Liqueur

"As one of the oldest 'Coasters' now in West Africa, I would like to add my tribute to the ever-reliable qualities of Barneys. Never too dry, even in blazing sunshine! Never too damp, even when the rain is pelting down! And so mild on the palate that one's enjoyment of both labour and recreation is trebled. It is sheer joy to lean back and give way to the mood of the moment when Barneys fills the bowl."

(The original letter can be inspected)

Barneys (*medium*), Parsons Pleasure (*mild*), Punchbowle (*full strength*). In "EVER-FRESH" Tins: 1s. 2d. oz. "READY-FILLS": Cartons of 12, 1s. 2d.

"... As one of the oldest 'Coasters' now in West Africa"~

We have received many wonderful letters from Barneys smokers, but never one which gave us a greater thrill than this. The man who sent it is a "*doer*" (he has built up a thriving business in West Africa), yet out of sheer friendly appreciation he has given us a word-picture of Barneys and the men who smoke it, unexcelled for happy turn of phrase or obvious sincerity.

There is little need *for us* to say more about Barneys . . . just read *his* letter and remember, we have been getting letters like it for twenty years: from Africa and Asia, from the New World and the Antipodes.

Barneys

(T. 103) Made by John Sinclair Ltd., Newcastle-upon-Tyne, England.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

THE Portuguese introduced viticulture into the island of Madeira in the early part of the fifteenth century, and Alvise da Mosto, a Venetian traveller who visited the island in 1455, wrote that the vines of Madeira were the finest sight in the world, "la piu bella cosa del mundo da vedere."

During the following 200 years the growing of sugar canes was the principal occupation of the people of Madeira; grapes were not grown to any considerable extent, and most if not all the wine made was consumed by the islanders.

The sugar canes were uprooted and replaced by vineyards, and the export of wine became the chief source of revenue of Madeira during the latter part of the seventeenth century, owing to an Ordinance of 15 Car. II, cap. 7 (1663), by which it was enacted that:

"Wines of the growth of Madeira, the Western Islands or Azores, may be carried from thence to any of the Lands, Islands, Plantations, Colonies, Territories or places to his Majesty belonging, in Asia, Africa or America, in English-built ships."

At the time no wine nor any other commodity was allowed to be shipped from France, Spain, Portugal, Italy or Germany to the British West Indies and British Settlements of North America, two important markets the supply of which, as regards wine, became from 1663 the monopoly of Madeira and the Azores.

The taste for the wines of Madeira was brought to England by officers and merchants returning from the American plantations, as they were then called, and the West Indies and there was no more popular wine in military and naval messes than Madeira during the first half of the nineteenth century. The taste for Madeira declined after the two successive visitations of the odium, in the '50's, and the Phylloxera 20 years later. Many of the vineyards that were destroyed then were never replanted, and supplies of good wines became more difficult to procure, and more expensive.

The wines of Madeira have always been known by the names of the species of grapes from which different types of wines are made and not by the name of any individual vineyard. The three finest species of grapes of Madeira are the Sercial, from which the driest wines are made; the Malvazia, from which the richest sorts of wine are made, which are known under the name of Malmsey; and the Boal, pronounced Boual, hence the English spelling Bual, which is not so dry as the Sercial nor so luscious as the Malmseys. Madeira is a fortified wine, and the best Madeira is the oldest, provided that it was made from good grapes in the first instance and happily blended. There is no wine, with the exception of Tokay, that keeps so long and improves so much with age as Madeira. The finest old Madeiras are not kept in casks but in great jars or demi-johns for many years before being bottled. From the driest Sercial to the richest Malmsey, there are ever so many different grades and qualities of Madeira to suit all tastes and circumstances.

Six and Eightpence

"Meredith, I want to make my will. My fox-head scarf-pin to my Uncle Philip, unless he remarries. My collection of film stars' portraits, autographed, I leave to the Mess. To my faithful butler, Albert Hawkins, the contents of my cellar . . ."

"But, Lord Henry, isn't this rather sudden? It was only last night that I chanced to catch sight of you in Regent Street on the roof of a taxi-cab, sounding a fanfare on what appeared to be a hunting-horn."

"Don't remind me of it, Meredith. If you only knew how I feel. Not a morsel of food has passed my lips since a brace of devilled bones at three a.m."

"I am indeed sorry to hear that, Lord Henry, but in all my long experience I have seldom known a hangover prove fatal. Are you not cognisant of Rose's Lime Juice?"

"I think so, Why?"

"Because the said Rose's, whether taken as 'Gin and Lime' or consumed before bed, does, by virtue of its therapeutic properties, neutralise the after-effects of alcohol and render hangovers null and void."

"Is this true, Meredith?"

"I am speaking, Lord Henry, as your solicitor."

"Thank you, Meredith, from the bottom of my heart. You have given me fresh hope. Believe me, when I *do* come to make my will you shall not be forgotten."

SHORT DRINK—2 parts Rose's, 3 parts Gin.

LONG DRINK—add soda.

FIFTY YEARS AGO

From the *Field* of October 20th, 1888.

MANNERS of Masters. "Modern hunting men may possibly congratulate themselves that manners and customs incidental to the chase are not what they once were. In the home counties, Mr. Oxendon in Kent, Mr. Craven in Sussex, and Mr. Conyers in Essex, appear to have been what are called rough diamonds. A run of exceptional excellence was, as often as not, celebrated by something very like an orgie, and even Colonel Cork, who wrote *Observations on Foxhunting*, was by no means a desirable acquaintance when in his cups, which, if his friends are to be believed, was of frequent occurrence. Mr. Conyers never claimed to be a considered leader of society, and it was his custom to take his stand, with a friend, at a hunting wicket when the field were coming through, and to pass remarks upon them, at the same time announcing in a stage whisper the amount of each man's subscription—which, by the way, was in Surrey fixed at £100."

* * *

Lord Walsingham's Bag of Grouse. "Many of our readers having manifested some curiosity to know the guns and charges used by Lord Walsingham on August 30th last, when, as subsequently recorded in our columns, he killed 1,070 driven grouse to his own gun, his Lordship, in reply to our inquiry, has been good enough to supply the following information.

"'On August 30th, when I killed 1,070 grouse to my own gun in the day, I shot with four breech loaders. No. 1, a gun made in 1866 by Purdey, subsequently converted from pin-fire to central principle, to which new barrels were made last year. Nos. 2 and 3, a pair of central-fire breech-loaders, made also by Purdey, about 1870, for which I have likewise had new barrels. No. 4, a new gun made by Purdey this year to match the two mentioned above, but with Whitworth steel instead of Damascus barrels. The guns are all 12-bore, with cylinder 30in. barrels, not choked. My cartridges were loaded by Johnson, of Swaffham; those used in the down-wind drives containing 3¼drs. Hall's Field B powder to 1¼oz. No. 5 Derby shot; those used in the up-wind drives (where the birds, of course, came slower) had 3drs. only of the same powder, with the same shot; not hardened shot in either case. . . . The Whitworth barrels become hot much more rapidly than the Damascus; and this is a serious drawback, especially to a man who shoots without gloves. . . . I am now replacing them with Damascus, as in all my other guns.'"

IN THE SALEROOM

SOTHEBY'S are holding one of their first autumn sales on October 27th and 28th, at which porcelain, pottery and furniture in the collection of the late Dr. J. Maurice Harper and Mrs. Ada Dollar will be auctioned. The sale includes a quantity of interesting Staffordshire pottery of the late eighteenth and early nineteenth centuries, among which are some rather fine Toby jugs, a figure of a sportsman in green tunic, and another of a falconer, a falcon on his wrist; a rare figure of a military officer leaning on a gun; a Ralph Wood figure of a sailor boy similar to one in Falkner's "The Wood Family of Burslem"; and a Wheildon figure of a soldier with a musket at his side. Also in the sale are some interesting English drinking glasses and lustres, while the furniture contains some sound old English pieces well worth viewing.

The *pièce de resistance* in the sale world of pictures is that of the Mensing collection to be held at Amsterdam by Frederick Muller, on November 15th. The catalogue, containing 65 illustrations, is worth a place on any bookshelf, as the reproductions of paintings of Rembrandt, Jan Steen, Jacot and Salomon Van Ruysdael and many other great Dutch masters are perfect. In addition, there are masterpieces of the French, Italian and German schools from the fifteenth to the eighteenth centuries. The famous portrait of Maerten Looten from the Holford collection, and Antony and Cleopatra from the Ribblesdale collection, should, and quite possibly will, fetch record prices.

A NATURALIST'S NOTEBOOK

A FEW weeks ago a friend of mine asked me to go with him to Thame. He had from somewhere or another—and by devious and, I suspect, doubtful means—acquired a car, and he wished, I have no doubt, to share the somewhat spurious glory bestowed on one by driving a smart car about the countryside with his less fortunate, or less skilful, friends. Of course I accepted. I never turn down a free ride any way—London is far too expensive.

* * *

We went to Thame: not by Western Avenue (these new-fangled roads do not meet with approval from the middle-aged), but by Ealing and Southall and Hayes and Uxbridge. That is not one of the most pleasant ways out of London, for having left the more or less dignified architecture of class-conscious suburbia as manifested by Edwardian Ealing, you visit in turn the purely commercial sore that is Southall, and from there journey through wens, that would have made Cobbett, whose opinion of London was low if accurate, search the dictionary anew for adjectives, in the form of Hayes and Hillingdon. Much music comes from Hayes: Orpheus would not, I think, have been pleased with his modern headquarters. What comes from Hillingdon has, I doubt not, defeated those more astute than myself.

* * *

And then Uxbridge. I think if you desire to see tragedy in little you may see it in Uxbridge. There are fine buildings here, and small, inconsequent, winding streets and little cottages with walls aslant and windows askew. There is atmosphere and dignity—that atmosphere and dignity that clings to the things of craftsmen, something of the atmosphere that there is about an old shepherd. Yes, and next door some modern nightmare of straight lines and ferro-concrete; some neo-Georgian-Tudor villa planned on Queen Anne lines with synthetic mullioned windows, and doors that do not fit and a garden gate that warped in the first shower.

* * *

If you think of a town like Uxbridge—or even High Wycombe (though that is as yet saved from complete extinction atmospherically by its Market Square and by its surroundings)—you must surely think of modern life, with its all too prevalent tragedy of standardisation and its concomitants of loose thinking and loose building. Our bodies still retain the grace and strength and beauty that was theirs by an intention beyond our knowing. But on them we build—synthetic lips and synthetic eyebrows, false complexions and false minds, false thinking and false values. Uxbridge—how the Town Council is going to hate me—is rather like that. A tragedy that will not die; a tragedy that cannot even make haste—the bridge has been building for quite two years; a tragedy that is, I think, symptomatic of modern life.

* * *

But beyond High Wycombe is country—the same country in essentials as woad-dressed Britons travelled. Country with the trees just turning, and the land red in fallow and green in pasture; country where woods tumble down the hillsides (they call such woods hangers in Hampshire, but I do not know that Buckinghamshire has an especial name for them) black against the light, and of a surprising greenery where cloud has passed before the sun.

* * *

And Thame. A dull town. Yet again typical: and how typical on this day, with the show over—and the fair—so large a fair that there was but little of Thame free for the passer-by (which was, perhaps, not unintentional), so large a fair that I wondered how it could be made to pay. And that thought alone is enough to show where I live. For must country fairs pay? They are a bit of Old England: a bit of the old peasant life: crude, vulgar, loud, hearty, honest. So very different from the polite, garish, languid, over-painted, spurious shows of to-day. Their very name has a ring about it. Fair. Would you want more? And if you are above dinkums and dodg'ems, swings and round-about, coconut shies and try-your-strengths; if you distrust the owners and dislike the unwanted guests you may perhaps pick up, then I submit you are blasé and lacking in the warm spark of vitality that makes life a generous, exciting thing.

* * *

And in Thame I saw something that helped, I hope, to put for me the whole of a rather depressing journey in its proper perspective. For out of a narrow side turning came a large tractor—so large that its length was the width of the main road—and attached not one, not two, but four cumbersome trailers. They were part of the fair; they were hauled by a fair man, dark, saturnine, dirty, unimpressive. But he turned the lot out of that side road, in the face of traffic, without one reverse, without one pause of indecision, without expression, without elation. His job of work. Nothing, I understand, worries the B.S.M. The countryman does it without advertising. There must be a moral there somewhere.

B. V-F.

LETTERS TO THE EDITOR

THE ARAB

SIR,—The remarks under the above heading in your issue of September 17th call for a reply which I trust is within reasonable bounds seeing that the tone of your correspondent is clearly that of a captious critic.

He claims that all three of the so-called male progenitors were Arabs, and unconscionably straight away turns down my argument that the Godolphin was neither Turk nor Barb.

I quoted G.S.B.I. 391 that the Darley Arabian was a Turk (probably), and the G.S.B. in general is the accepted authority.

In substance, and as regards the Byerley Turk, he recommends me to refresh myself with a classic writer's books. This I have already done in which respect he himself fails. On pages 143, 144 of *Early Records*, the author not only accepts Captain Byerley's charger as a Turk, but quotes the church register on the correct spelling where your correspondent fails.

I might resent the way in which he puts his next point, but will courteously remind him that it is not to me, but the authorities, he should tender his advice. He has, however, either forgotten, or does not know that, after much controversy, some 60 years ago, the Jockey Club supported his idea by instituting an annual race for Eastern horses reared in, or imported into, this country. The first attempt at Newmarket in 1884 was little more than a fiasco. Next year trainers who had brought over upwards of a dozen such horses were agreed that a common English plater could give them 2st. and beat them. The idea was abandoned after a sorry exhibition at Newmarket when Iambic, a second-rater, in a match over three miles, gave the Arab champion Asil no less than 4st. 7lb., and such a beating as has seldom been seen. The moral of which is that half a century of care and acclimatisation might peradventure reward your correspondent's ambition, and that studs of the sixteenth and seventeenth century have so infinitesimal an influence on present-day breeding, in tail-male blending inheritance, as to be not worth considering, and how many breeders or even individuals do such studs interest ?

Yours faithfully,

Coombe Cottage, Fetcham, Surrey. E. W. BISHOP.

THE LITTLE OWL

SIR,—Allow me to congratulate you on the very sensible article on the little owl controversy appearing in the *Field* dated October 1st. The worst of it is that both sides exaggerate, and in consequence neither of them will believe a word the other says ! It is unfortunate that during the course of the B.T.O. Inquiry very few results came in from the rearing-fields. Why not ? Indifference on the part of owners, perhaps ; or lack of time on the part of keepers, or possibly because they knew. The only way to get to the bottom of this rearing-field problem is to make a list of owners who are willing to give definite instructions to their keepers to report to some central authority all harm that the bird does in one particular season, with, of course, the necessary evidence in the shape of pellets, dead chicks, gizzards and so on. Then if the list contained, say, 25 names and only one reported any harm, we should know where we were. There is no doubt from the B.T.O. Report that the harm done by the ordinary out-in-the-country little owl is infinitesimal. Personally, I believe that the partridge, wild pheasant, mallard and barn-door fowl are quite capable of looking after their own chicks ; I have had ocular evidence that the last two species more than held their own against carrion crows. But if a rearing-field (do they have hen pheasants there ? I am very ignorant of these matters) or a chicken-farm happens to have a little owls' nest close by, I can quite imagine that the latter, if hungry, would take their toll, just as a "rogue" kestrel sometimes does. In such cases it ought to be legal to destroy the bird, but that is quite a different matter from shooting all little owls simply on suspicion.

There is, I think, only one point in the article with which I do not agree. My own experience (limited, certainly) is that farmers do not as a rule dislike the bird.

Yours faithfully,

Reigate House, Laugharne, Carmarthen. J. F. THOMAS.

SIR,—I agree with you that it is utterly ridiculous to call the question of the little owl's guilt or innocence a problem, and I venture to suggest that the question is not whether it is guilty or innocent, but rather "what right has it to be here at all" ? It, in common with the grey squirrel and the musk-rat, are admittedly aliens, and all were introduced by man, *i.e.*, unnaturally and, in my opinion, quite unnecessarily and undoubtedly inadvisedly. There is no necessity for any one of them to be here at all. So far as the owl and the squirrel are concerned they were not introduced to help any of our native fauna to overcome an outbreak temporary or permanent of some local pest, and the owl competes, quite needlessly, with all our fauna that feeds on the same food as itself. The squirrel is an insufferable nuisance and of no real value, except sentimentally, because it has engaging ways—a futile argument not to be weighed against its ill-deeds. As for the musk-rat, that also is utterly unnecessary, because there is no reason for wearing fur in this country, and the excuses ought not to have any weight. The existence of all three of these creatures should be terminated without delay, before any of them does irreparable damage.

Yours faithfully,

Tresillian, Truro, Cornwall. C. NICHOLSON.

FIELD TRIAL JUDGING

SIR,—The field trial season has only just begun, but already we have seen how the lack of any basis from which judges make their awards, militates against the gamefinder.

Once again, as strongly as possible, do I put forward the plea that awards in trials should go to the dogs which do not fail to find during the day, and that those who do fail should not, for one reason or another, be placed above dogs which "deliver the goods." Once more I stress the obvious : Retrievers are required to fill the game-bag, and questions of style, pace and perseverance *without* a retrieve resulting, should not prevail over the first principle of finding. The present system is the cause of more discontent amongst handlers than anything else, to say nothing of the bewilderment of spectators who go to see retrievers *retrieving*.

I am in this case speaking as a spectator.

Yours faithfully,

Chequers Hotel, Newbury. W. M. CHARLESWORTH.

WHITHER WEEDON ?

SIR,—I should like, through your columns, to bring up the subject of the future of the Army Equitation School at Weedon.

If any reasonable standard of equitation is to be kept in the British Army surely the circle of those eligible to go there should be increased from the four remaining horsed regiments and the few gunners who have the good fortune to get there.

Horsemanship is still an integral part of an officers' training (even the Army Council realises this, as shown by its inclusion in the curriculum at both the R.M.C. and R.M.A.), and yet the number of those being trained as instructors is practically negligible. The French, indeed, still send a certain number of their mechanised officers to Saumur because they realise the extreme importance of equitation as a training for the officer (and they still have quite a considerable amount of cavalry).

Even if the War Office are bent on total mechanisation, surely Weedon should still exist as a training centre open to more than half a dozen officers. In the event of a return to the horse, a body of instructors would then be available and the re-horsing would have a good start. Expense is of small account when a particular training is so necessitous. As a last resort no doubt a small contribution might be exacted from those taking the course (I pray we do not have to descend as low as this).

The bulk of the population, even now, is extremely suspicious of the Government's policy of complete mechanisation—viz. : letters to this effect in every kind of magazine and newspaper throughout the country. It is time something should be done to show that the general public does take a definite interest in this vexed question of mechanisation.

Yours faithfully,

York. AMAZED.

THE FILM "OWD BOB"

SIR,—At a Liverpool cinema the film "Owd Bob" was recently shown to an audience of six collies and six Alsatians, or German shepherd dogs, as a test of canine reaction. From notations published in the leading dog journal we learn that the Alsatians were keenly interested in the picture, their emotional control being somewhat strained during certain episodes during its projection. At the time I read of their attitude rather indifferently, but since having seen the film I confess to wondering why the Alsatians were even so mild, for of the hundreds of varieties of dogs available to the picture-producing centres the poor Alsatian was chosen to enact the rôle of villain !

Mr. Bagshawe's Glyn, a sheepdog, is in this film the hero—all very good ; but Mrs. Griffin's Black Wull, an Alsatian, must needs be the villainous "killer," which is *not* so good. Why ? Well, in the first place, some ten years ago the Alsatian fancy was having a pretty rough time. Folks called Alsatians "wolves of the streets" ; they were "treacherous" ; were given a bad name—a bad name which stuck for years. However, these dogs "turned the other cheek," as it were, and were trained to do guide work for the blind, police work, &c. ; became the Service Dog No. 1. This was done in a desperate effort to regain public confidence in the breed. Now, remember, public confidence is of paramount import to this much-slandered breed, yet, on the very eve of its being regained, the British film chiefs must connive to undo all the good work done by Alsatians and their breeders by dubbing this breed a "Black Wull," a villain, renegade and killer ! What is otherwise the most enjoyable British film yet made is thus marred by thoughtless bias.

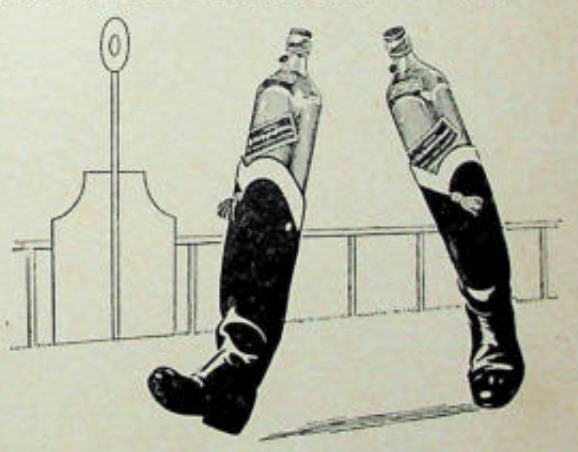
In the American film, "Killer-Dog," some consideration for the Alsatian fancy was shown by revealing the "Killer-Dog" itself as a wild coyote (*Canis latrens*)—an exposure which offended no one, as the coyote was never the most popular breed, with over a score of clubs behind its welfare—and the Alsatian actor as the hero. Well, granted that *we* cannot produce coyotes, hey presto ! : granted that even the inventive genius of the picture-production world has its limits, why in the name of all fairness did the killer in "Owd Bob" *have* to be an Alsatian ?

I submit that the welfare of the Alsatian fancy will suffer considerable reversals through the warped and twisted portrayal of "Black Wull" in this film. Moreover, as the breeding of dogs is a national industry of the British to-day, is it not a serious error in film production to jeopardise the markets and goodwill of a branch of that institution by the release of such a derogatory, biased film as "Owd Bob" ? The psychological reaction to the minds of the uninitiated after seeing the shooting of the killer-of-sheep "Black Wull" in "Owd Bob" is that the Alsatian is "not to be trusted"—an attitude throwing back to the old fallacies of a decade ago—whilst when those who already are no friends of the breed will leave their cinemas with an air of "I *told* you so !" which defeats rational argument.

Is it not a tragedy that whilst the film "Owd Bob" is the first full-length British dog film, incidentally a fine piece of propaganda for the sheepdog trials of which Mr. Moorehouse wrote so instructively in a recent issue, it should at the same time be labelled as a venomous libel upon our most dependable, intelligent and useful canine product, the German shepherd dog or Alsatian ?

Yours faithfully,

445, Portswood Road, Southampton. CANIS.



Here's a favourite that's always a winner !

Your most-fancied horse may fail you, but Johnnie Walker is always true to form. Many fine whiskies, each one specially chosen for its distinctive character, each one fully matured in the wood, meet together in the blend of Johnnie Walker. The result is always the same—Scotch Whisky at its best and smoothest. Always ask for Johnnie Walker by name.

Johnnie Walker

walks away with it !

Born 1820—still going strong

SPRING FLOWERS FOR COVENT GARDEN
(See letter "Flowers from a Hat Box")

FLOWERS FROM A HAT BOX

SIR,—The Scilly Islands are now well known as the Flower Islands, but the origin is, perhaps, curious.

Some years ago, when trade was bad in these islands and the potato crop failed owing to bad weather, a friendly visitor noticed some early flowers, daffodils and narcissi in particular, growing in profusion. It was suggested that a box or two be sent to Covent Garden to see if they would sell. The only receptacle available was a hat box. This was packed and posted to Covent Garden, and so well received that others were soon following.

Now the business has grown into a great and specialised industry, and the photo which I enclose shows boxes of flowers being loaded on the quay of the island of St. Martin's. They are sent by the motor boat to St. Mary's, and loaded into a larger boat, which the Scillonians have purchased specially for this industry, a boat named The Scillonian. From there they go to Penzance, and then by train to London, and very often it is a special train load.

As St. Martin's has a population of only about 100, and the other islands of Bryher, St. Agnes, Tresco, also have a population of about the same number, while St. Mary's has a population of about 1,200, it will be gathered that this industry has grown considerably, judging by the single load waiting to go by this one boat.

And a hat box started it all!

Yours faithfully,
G. L. H.

Enfield.

ACREAGE OF FIELDS

SIR,—With reference to my article on "Methods of Checking the Acreage of Fields" (*vide* issue of September 24th), you will be interested to learn that recently 22 farmers were fined at Lincoln for giving wrong returns of the acreage under cultivation with potatoes. The fines totalled £106, and the prosecution was the result of action taken by the Potato Marketing Board.

Yours faithfully,
Hull. F. R. BARKER.

BEAGLING

SIR,—I came across the following in the section devoted to hunting in the *Encyclopædia of Sport*, published in 1897:

"BEAGLES—the pursuit with beagles is no doubt a form of hare *hunting*, and a very prolonged method, too. There is but seldom any hare *catching*. If beagles are small enough to give their field any chance of living with them, they will want a rare scenting day and a long one to effect a kill. If the pack is not of the miniature size, a man may easily do serious injury to heart or lungs without seeing much of what happens in the chase. It is absurd to ride to the little fellows, a horse is wasted on them, so why not have rather more size and a pace that will kill the pursued instead of the pursuer?

"Still, beagles are better than nothing. . . ."

Apropos the article in your Hunting Number on the "Size of Beagles," I thought this might prove interesting.

Yours faithfully,
27, Hadlow Road, Tonbridge, Kent. JOHN WILLIAMS.

TREE PARASITISM

SIR,—As I cannot recall cases of parasitism among English trees I am sending you this photograph, taken on the golf-course at Samaru, Northern Nigeria, of a fine example of tree parasitism. It shows a fig parasitic on a shea butter tree. The tree with large leaves and pale trunk and branches (on the left in the photograph) is the fig (*Ficus platyphylla*), while the one on the right with the smaller, narrower leaves and darker, rougher bark is the shea butter tree (*Butyrospermum Parkii*), which is called after the explorer Mungo Park. Both species are of economic importance, the fig being the producer of red kano gutta, and *Butyrospermum* of shea butter.

The life history of *Ficus platyphylla* is only now coming to be fully understood. The young tree begins life either as a parasite or a saprophyte. The seed germinates in a hollow or fork of a living or dead tree, and roots are sent downwards either through the trunk of the host or enfolding it. Once its roots have reached the ground the young fig ceases to be parasitic or saprophytic, and begins to grow very rapidly, encircling, strangling and finally killing its host. I have seen one of this species of fig parasitic upon a dum palm; the fig had entirely enveloped the trunk of its host and only the dead crown of the dum palm remained visible. The seeds of the fig are dispersed by birds.

Yours faithfully,
Forestry Department, Zaria, Northern Nigeria. JAMES DUNDAS.

TITS IN DISTRESS

SIR,—It may interest some of your bird-loving readers to hear of my experience with a pair of tits.

I was sitting reading in the summer-house in our garden in Herefordshire, and was much disturbed by two tits who kept up a continual chirping cry in the tree overlooking the summer-house. They became more and more noisy and insistent, lighting on the lowest branches and peering into the summer-house. At last I gave up trying to read and went out to see what they wanted. They flew up a little higher, but continued their noise. Then at last I discovered what was the matter. From low down, near my feet I could hear a weak, squeaking sound, and on examining the wall of the summer-house found a round hole in the rough-cast with remains of a nest sticking out . . . but the nest itself was gone and the squeaks came from down between the laths and plaster. The wall was double, and evidently the nest had fallen off the ledge where it had been built, and together with the young birds was now resting on the ground a good 4ft. from its original situation, and completely out of reach of the parent birds. I knelt down and cut a round hole at the foot of the wall with my knife. Before the last bit of plaster was out of the way the mother bird shot over my shoulder into the hole with a large worm in her beak, to be greeted by her offspring with squeaks of joy.

After that I was left in peace to continue my book, but I had been much interested to see how such usually wild birds as tits appealed to a human to help them in their distress.

Yours faithfully,
Hellens, Much Marcle, Ledbury. HELENA GLEICHEN.

"HUNTERS AT GRASS"

SIR,—In reply to your correspondent's question as to where Landseer's picture, "Hunters at Grass" can be seen, about twelve years ago I was asked to lunch at Lady Fitzwigram's, at Lee Park, near Havant; and in the dining room was Landseer's "Hunters at Grass." I recognised it at once—one of the horses was a chesnut, the others bays or browns. Whether the picture is still there I know not.

Yours faithfully,
Alresford, Hants. NORTHBROOK.

TIGER IN BARRACKS

SIR,—Officers attending the course here were very interested in the letter written by Mr. A. G. Sandeman in the *Field* dated September 17th. Particularly so as Mr. Sandeman is well known to some of us as a *burra shikari* (big hunter). We questioned the mess mate (gardener) on the matter, who became very excited and said: "Han ji; Sandeman Sahib Bâhâdur jo ek mâzâz khandani Sahib hain." (Yes; Sandeman Sahib very highly-bred gentleman and very brave.)

Apparently this was a very daring performance, and all concerned showed great coolness except for Banta Singh, the motor driver, who went to ground in the mess office.

I had a man down to measure the tiger, which now measures 10ft.—a magnificent specimen.

Yours faithfully,
Ahmednagar Wing, Small Arms School, Ahmednagar. C. J. JOHNSTON.

SIR,—It was with extreme interest that I read the account by Mr. Sandeman of his experiences with tiger in Ahmednagar, in your issue of September 17th. I was staying there myself only the other day and went round to the mess to see the famous trophies that were presented by Mr. Sandeman during his course at the Machine Gun School. Unfortunately the tiger in question was no longer there. There was, however, a magnificent panther skin, shot, I was informed, under identical circumstances by Mr. Sandeman himself at about the same time that he shot the tiger. Mr. Sandeman is always extremely reticent about his experiences, which is, perhaps, why he did not mention the panther in his letter. Mr. Sandeman is an intrepid shikari, and there is a saying in the Punjab, "Jidhar Sandeman Sahib jate, udhar jate makhi." It means, of course, "Where Mr. Sandeman goes, there go the flies"—a delicate compliment to his prowess with a gun.

A FIG PARASITIC ON A SHEA BUTTER TREE
(See letter "Tree Parasitism")

Yours faithfully,
Cavalry School, Saugor, C.P. R. MASSEY.

Carreras Ltd. 150 years' Reputation for Quality C.A. 510.

PURE WHITE GREBE

SIR,—It may be of interest to record that on October 8th last I had a close view of a pure white grebe (great crested) on Fleet Pond. I am well acquainted with the winter plumage of the great crested grebe, but this bird, except for the faintest tinge of blue-grey along the back, was white from beak to tail.

From its size it was doubtless an adult bird, and it showed a considerable crest as if it had not started the autumn moult.

My one regret was that I had no camera, otherwise at a range of perhaps 60ft. I might have obtained some sort of picture.

Yours faithfully,

Parliament Mansions, Orchard Street, S.W. 1. J. C. M. NICHOLS.

GOLDEN ORIOLE

SIR,—I think it may interest readers that a male golden oriole was seen one day in the middle of September on the Isle of Coll by two ladies who were fishing by a loch side. The bird, from their description to me, was unmistakably an oriole. They saw it when quite near, making short flights from tree to tree, and one lady, who has lived in Africa a good deal, said for brilliance of colour she had never seen there any bird so bright in colour as this bird.

Yours faithfully,

Ballaig, Crieff, Perthshire. A. J. CAMPBELL-COLQUHOUN.

OLD-TIME FIRE FIGHTING

SIR,—In these days of auxiliary firemen in connection with Air Raid Precautions, it may be of interest to your readers to see an illustration of an olden time fire fighting appliance.

The photograph shows a large wrought-iron hook, something like a big boat hook, with a slender conical base—for fixing on a stout pole—and two strengthening stays. This hook was used in the

EFFICACIOUS IN ITS ACTION
(See letter "Old-Time Fire Fighting")

old days for pulling the burning thatch from the roofs of cottages that were accidentally set on fire. Its massive strength and its generous proportions seem to suggest that it would be efficacious in its action!

This curiosity was found reposing in the village church of Harringworth, Northamptonshire. The hook there is unmounted, as shown, but a few miles away, at Lyddington, in the same county, tucked away in the rafters of the fourteenth century Bede Houses, there is an exactly similar hook, but in this instance it appears "ready for action," for it is mounted upon a stout pole some 15ft. long.

Yours faithfully,

ERASMUS E. ELCOMBE.

Nottingham.

MEAT READY KILLED

SIR,—My brother, in Southern Rhodesia, has sent me the enclosed photograph of a python sleeping beside a dead duiker it had killed. He says that after taking the photograph he shot the python and ate the duiker.

Yours faithfully,

The Sol, Cookham, Berkshire. V. ST. G. DE LA RUE.

A SKELETON IN OAK

SIR,—No motorist travelling along the London-Colchester Road of late can fail to have noticed this derelict building on the outskirts of Springfield Village. Lath and plaster work has almost entirely disappeared, and the gaunt framework with its rotting timbers made a striking picture as seen against the western sky a few days ago.

"Vain transitory splendours! could not all
Retrieve the tottering mansion from its fall?
Obscure it sinks."

Some of the roofing appeared to be modern, but the main structure of this old country house would seem to date from about the time when Goldsmith penned his immortal lines.

Yours faithfully,

122, Kenilworth Court, Putney, S.W. 15. E. P. OLNEY.

"VAIN TRANSITORY SPLENDOURS!"
(See letter "A Skeleton in Oak")

A REMARKABLE ADONIS

SIR,—Since the Clifden or Adonis blue (*L. bellargus*) is rather local and, like the other blues, subject to considerable variations, it may be of interest to record that, on August 20th, the writer saw two fresh (second brood) specimens—a male and a female—on a heather-clad hillside in North Hants. The female, which was very elusive, was captured and subsequently released; it proved to be more or less normal, though, as is often the case with this species, a fair amount of the male's blue was exhibited on the upper side of the wings.

From the lepidopterist's point of view the most striking thing about the male (which, after some initial shyness, allowed me to examine it from every angle) was the colouration of the under side of the wings: instead of being greyish, the ground colour was creamy white washed with pale blue. On the upper side the wings were of the usual brilliant and faultless blue, the white borders (through which the nervures appeared black) being very marked. This superb butterfly was strikingly conspicuous whatever the type of background; in vulgar parlance it "stood out a mile."

This season, on those Hampshire and Hants-Surrey border heaths which I have visited, blues have been fitfully common, the silver-studied species being more numerous than the common and chalk-hill blues. In this locality they consort with graylings, small heaths, gatekeepers (hedge browns), and the brown argus and small copper.

Yours faithfully,

56, Cranmore Lane, Aldershot, Hants. PETER MICHAEL.

TUNNY OFF ALDERNEY?

SIR,—While fishing recently between Alderney and the Caskets a big fish kept jumping out of the water within about 20yds. of the boat. From photographs I have seen in the *Field* it struck me it might have been a tunny. Are they found as far south as Alderney?

They appeared to me to be about 4ft. long, of a blue grey on the back and almost white underneath. I am sure they were not porpoises; they had not a fin on the back and did not go in and out of the water like a porpoise. I shall be interested to know if you can identify it from my poor description. We were amongst the rocks at the time and fishing for mackerel.

Yours faithfully,

Les Poumiers, Guernsey. JOHN H. WELCH.

[Tunny are warm-water fish extending in Europe as far south as the Mediterranean. They have rarely been seen at all far up the English Channel, but the temperature would not deter them from travelling up it, though their usual route to the North Sea seems to be by way of Western Ireland and round the North of Scotland.—ED.]

THE PYTHON SLEEPS BESIDE ITS PREY
(See letter "Meat Ready Killed")

It's time to visit SOUTH AFRICA

DON'T you ever feel, when you come to the last page of a particularly vivid book of travel or adventure, that you yourself would like to do something different, to face new experiences and see how other people live?

Well, why not? Pack your trunks and take a holiday in South Africa. It is a country reserved by Nature for holiday-makers. Picture a land where the sun but rarely hides his face, where the air is as exhilarating as champagne, where flowers and trees deck hillside and meadow with a mantle of brilliant hues, and everywhere the mysterious lure of Africa surrounds you with its subtle hypnotic charm.

Picture the mighty scenic wonders of Africa—the Victoria Falls, an epitome of inexorable power and faerie loveliness, the magnificent Drakensburg Mountains, the unparalleled opportunity to study wild animal life at close quarters, the fascinating Native life and customs, the gay social life of the busy modern towns.

Go to South Africa this year and bask in the sunshine of an alluring land. The voyage there is one of restful comfort and takes only 14 days. Illustrated brochures obtainable from the Travel Bureau, South Africa House, London, W.C.2, or accredited Travel Agencies.

MERLINS' NESTS

SIR,—In Mr. Witherby's *Practical Handbook of British Birds* (1924 edition), it is stated that the merlins' nest is "generally on the ground, sheltered by heather, a mere scratching with apology for lining, a few heather stalks or grass bents. In trees and cliffs old nests of other species are annexed while in sand-dunes a fairly neat nest of bents and marram grass is made." Coward says that the merlin makes no real nest. Howard Saunders writes that it is but seldom that even a few twigs of heather are found as a border. Mr. Walpole Bond (in *Field Studies of Some Rarer British Birds*) writes that if the casual and possibly accidental presence in the scrape of a few wisps of cotton grass, broken moss, heather twigs or rootlets are excluded no nest proper is ever made.

In May, 1938, I discovered merlins nesting in a nest in which ravens bred in 1936, but not in 1937. The wool lining of the ravens' nest had quite disappeared, and there was a distinct subsidiary nest inside the ravens' structure in which the merlins' eggs were laid. In June, 1938, I found another merlins' nest on the ground in heather; in this case also there was a distinct nest of fine heather bents, not a mere scratching, nor a fortuitous collection of twigs.

In May, 1926, merlins nested in an old crow's nest lined with wool, and in July, 1936, the same species

YOUNG MERLINS IN THE RAVEN'S NEST
(See letter "Merlins' Nests")

nested in an old ravens' nest, also wool-lined. In neither of these instances was there any sign of a subsidiary nest of twigs. The inference is that in these instances, as wool lining already existed, no further nest-making was undertaken by the merlins. But the two 1938 instances show that nests similar to those made by merlins in sand-dunes are sometimes constructed in tree nests and among heather.

The enclosed photographs show the young merlins when recently hatched, and when partly fledged in the ravens' nest of 1938. In the earlier photograph the young birds cover most of the subsidiary nest, but some portions of it are just visible on each side of the nestlings. By the time the later photograph was taken the subsidiary nest had been trodden into the structure of the ravens' nest.

Yours faithfully,

Holt Anstiss, Porlock, Somerset. E. W. HENDY.

MUSHROOM GROWTH

SIR,—While exercising my dogs in the park recently, I was astonished to find a huge mushroom, quite by itself. It was a perfect bell-shaped thing, with its tender pink inside, covered with soft white substance. We have no mushrooms locally this year, though usually the shops in the nearest town get a fair supply. Each morning since, I found one similar mushroom—they were excellent eating—but on the day of writing I discovered one weighing 6½oz., also the only mushroom, and evidently produced in 24 hours, as I had been over the ground the previous day. Also in texture and colour it was a very young mushroom. It seems difficult to account for this curious distribution. No spawn had been scattered; horses and cows are always in the park, and the grass is well eaten down.

Yours faithfully,

Peover Hall, Cheshire. D. M. G. PEEL.

REGROWTH OF GONADS

SIR,—Can you or any of your readers inform me at what exact or approximate date it is suggested that the perennial regrowth of the gonads begins in the following species of birds: Fulmar petrel, oyster-catcher, shelduck, lapwing, robin, skylark, pied wagtail, curlew, ringed plover, mute swan.

Yours faithfully,

North Devon. RICHARD PERRY.

LATE HOUSEMARTINS

SIR,—I have to-day (October 4th) seen young housemartins in their nest here, being fed by their parents. Surely even for these birds it is extremely late to be doing so in October—and what chance have these young birds of surviving their long flight across the ocean?

Yours faithfully,

Walden, Brockenhurst, Hants. (Mrs.) ELEANOR D. LEECH.

ARROW *v.* REVOLVER

SIR,—I was greatly interested in Colonel Chichester's letter under this heading, which appeared in your issue of September 10th. I feel sure the 15,000 archers in England were interested too.

At the recent International Archery Meeting in London, I shot at the next target to Mons. De Rons, Belgium's champion. The accuracy of his shooting, especially at the short ranges, filled me with awe. At 25-metre range he shot 60 arrows, making a 7in. group. It would be interesting to hear what a crack revolver shot could do under the same conditions.

Yours faithfully,

Threshers, Fordham, Colchester. J. WESTON MARTYR.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—Tragedy always stalks where old age and poverty join hands. We are trying to help a poor widow, absolutely stranded until she gets her old age pension next year. Her husband died eight years ago, leaving her no income and a mortgaged cottage. Her daughter manages to give her 5/- a week from her slender earnings, but beyond this she is absolutely penniless. Now the mortgage has been foreclosed, and she is faced with roofless starvation. Please send us something for this pathetic woman.

IN THE CITY

BY THE CITY EDITOR

THE development of the Northern Rhodesia copper field with the aid of British capital is a romance in mining history. Just one company, Rhokana Corporation, has concessions in Northern Rhodesia which are about the size of England. They extend right across the northern portion of Northern Rhodesia for a distance of about 400 miles. The greatest breadth is about 200 miles.

This company was originally known as Rhodesia Congo Border Concessions. The name was changed in 1931. The first profit made by Rhokana was for the year to June, 1933. The profit then was £40,863. The last available balance-sheet to June 30th, 1937, showed profits of £1,969,866. First dividend was 12½ per cent. for the year to June, 1935. For each of the past two years dividends have totalled 62½ per cent.

This must be regarded as amazing progress over a few years. It had been known for many years that Northern Rhodesia possessed undeveloped mineral resources, particularly copper resources, of great potential value. The character of the ores, however, made it impossible for successful development until Minerals Separation, Ltd., came along with new methods of great simplicity for treating the ores. From that moment there has been no looking back.

There are many points favouring rapid development. The climate of Northern Rhodesia is healthy. It is one in which white men and their families can live in comfort. Native labour is available in plenty. Working costs with the new treatment methods are low and allows the copper companies of Northern Rhodesia to compete favourably with other producers in world markets.

Recently a good deal of interest has been taken by investors and speculators in Northern Rhodesia copper shares. Besides, the Rhokana Corporation there are several actual producers. Roan Antelope Copper Mines is one. This company has just announced a dividend of 20 per cent. on a capital of £4,991,085. The 5s. units are a popular market around 18/6.

Control of Rhokana Corporation is in the hands of Rhodesian Anglo-American, which is a finance undertaking. Besides holding 1,340,288 fully paid £1 ordinary shares in Rhokana, the Rhodesian Anglo-American has share interests in many other copper undertakings. Each £1 share in Rhokana is worth about £12 in the market. Rhodesian Anglo-American 10/- shares stand about 27/-. Dividend for the year to last June was 15 per cent. The shares are popular with the speculative investor because the price is more suitable for the average pocket than that for Rhokana.

In years gone by Rio Tinto Company was one of the world's biggest producers of copper. That property is in Spain. The directors of Rio Tinto are to be congratulated on their foresight in investing large sums of money in Northern Rhodesian copper stocks and shares. Income derived from such investments has kept Rio Tinto from sinking as a result of the destruction of its Spanish business through the Civil War.

Rio Tinto is to-day in the unfortunate position of having to sell its production to General Franco's Government for pesetas of very doubtful value, or even promises of pesetas. The company is, however, able to pay interest on its debenture stock and preference share capital from income derived on investments in Northern Rhodesia.

There has been no dividend on Rio Tinto ordinary since 1930, but the £5 ordinary shares command a market price of £14 10s. One day when peace returns to distressed Spain the company will be on its feet once more.

Meanwhile Rio Tinto holds some 425,000 shares of £1 each in Rhokana Corporation, and a similar number of shares in N'Changa Consolidated Copper Mine, besides well over £1,000,000 worth of good class miscellaneous investments. The value of its investments in Rhodesia alone at the end of 1937 was given as £2,788,827. The total issued share capital of Rio Tinto in preference and ordinary is £3,750,000.

That largely explains why the £5 ordinary shares which have been without dividend for years have such a high market price.

DINNER DRAMA

SNAKES seem to thrive on publicity—and on their fellows presumably, for news has come that a large spitting cobra at the London Zoo sufficiently forgot its table manners last week as to swallow completely its smaller dinner companion. It appears that a slight *contretemps* occurred over the menu, for both began to masticate the same rat, and owing to the backward rake of the teeth, when they met at the waist-line it was a matter of the weaker going to the wall—or should one say to the stomach?

THE POWER OF THE WORD

Mr. Rogerson on Propaganda as a Weapon

Propaganda in the Next War. By SIDNEY ROGERSON. (Geoffrey Bles; 5/-.)

THE last war was a long drawn-out, and more or less stationary, affair. It also had a definite fighting front, and civilian populations were for the most part untouched by the more savage weapons of warfare. The next war, we are told, will be swift and mobile, and directed mainly against civil population. That it will be mobile and directed against the civil population is, I think, beyond argument; but recent evidence in Spain and the Far East does little to support the theory that it will be of short duration. Be that as it may, the next war, when or if it comes, will come suddenly. There will be a crisis, a sudden uprising of national feeling, and in all probability the courteous formalities which we observed in 1914, in the form of official declarations of war, will be dispensed with. The first people to feel the brunt of any future war will be the civil population, as they go about their business. There will not, therefore, be very much time for propaganda to get into its stride, yet if propaganda was necessary in the last war to keep up the spirits of the home population and to dampen those of enemies' population, it will be even more essential in the next war if the spirit of the home front is to be kept sound and strong.

This is really the dominant note of Mr. Rogerson's book, though he covers all the ground (enemies, allies and neutrals) and gets into a very small compass a great deal of very important matter. He points out, and points out forcibly, that we start at a grave disadvantage. The essence of Dictatorship is that action should follow immediately upon—not infrequently coincide with—the spoken word; that a call to arms should meet with a prompt and enthusiastic support; that there should be no dissentient voice; and the whole of the propaganda of Dictatorship is used, and has been used for years, to ensure these results. Thus Mr. Rogerson contends it would be merely waste of time to conduct an anti-Hitler propaganda in Germany—the mass of Germans have been made proof against it. And to a very large extent the same holds good of Italy.

We, on the other hand, are in a very different state. As a nation our minds are confused. The British people cannot, at the moment, think clearly. As Mr. Rogerson says:

"For fifteen years they have been alternately stunned by the power of fear and soothed by the propaganda of optimism. Simultaneously they have been misled by the propaganda of labels, until they do not know where they stand or what to believe."

For this very unsatisfactory condition the State, according to Mr. Rogerson, is largely responsible.

"There is no unification or constructive policy. No one concrete idea is steadfastly advanced; instead there is a vague, intermittent warning to the public that democracy is at stake, and unfortunately a far greater appeal to fear—fear of bombs, fear of gas, fear of Germany, fear of the future, all with the idea of getting recruits for the various services."

I do not think that anybody could deny honestly that that was so. We have absolutely no co-ordination, so far as public opinion is concerned. Possibly this was all right before 1914. But the world has changed, communications are now so fast that frontiers to all intents and purposes are non-existent; and in Europe are countries ruled absolutely by one man, and, to use an Americanism, in those countries what that man says goes. In such conditions there is now no longer time for public opinion to form and strengthen.

Mr. Rogerson would replace the confusion which now exists by co-ordinating appeals delivered to the public against a background of truth and good will. He would have a central co-ordinating council on which would be represented the Press, the B.B.C., the cinemas, and Government Departments. This is the core of Mr. Rogerson's book. He would have this machinery and thinks that it would make systematic propaganda possible. It would stress the vital connection between voluntary service and democratic principle. It would stir the public conscience until the will to serve for democracy was active and voluble, and it would then indicate various forms of service to which that will might be put. Mr. Rogerson would make as little use as possible of politicians and soldiers, not because he thinks they would be poor propagandists, but because he realises that they would be suspected of having axes to grind. He would recruit his propagandists from the Church and the scholastic professions, from doctors, from journalists and from business men. He realises clearly that the various ways in which propaganda can be diffused must be co-ordinated, and in this connection he utters a warning that the use of wireless in war-time would have to be restricted because a transmitter in action would automatically give enemy aircraft their direction: and here he deplores the attitude of the Government towards re-diffusion, a method which has a great deal to recommend it in war-time, as it cuts out wireless waves with all their dangers.

Personally, I think Mr. Rogerson is right in almost everything he says in this book. Propaganda is a word which has a nasty sound for English people, but propaganda was invaluable to us in the last war—a worthy, if belated, tribute is paid to Lord Northcliffe in this book—and in any future war would be even more invaluable. The time when Britain can muddle through has gone. We have got to organise and we have got to make use of weapons which in themselves are clean enough, even though their titles are open to misconstruction. I very much hope that this little book will be read, and digested, by every Member of Parliament, and particularly by those to whom we have entrusted the fortunes of this country in a very difficult time. I hope, too, that it will be read by every responsible man and woman. It deserves to be. I can well believe that its contents will disturb, but I am quite sure that they will also give rise to serious thinking. And if that is so, the half of the battle has been won. This is one of the most important books published during the last 20 years, and one which contains constructive proposals of the most vital importance to this country.

In Korean Wilds and Villages. By STEN BERGMAN. (Gifford; 2/6.)

At the present moment Korea is much in the public eye. Her two near large neighbours, Japan and China, are at war, and she herself is the scene of a dispute between Russia and Japan.

This book is an account of a journey through Korea; it is written in a peaceful, simple style, telling of the quiet (sometimes termed lazy) dwellers of that land. It is an intimate description of the country from the north, south, east and west; the towns and villages and temples, the capital, Keijo, with the fairy-like festival each year to welcome the cherry blossom.

But Dr. Bergman is more than a traveller who can use his pen, he is a scientist and a sportsman. One of the reasons of his journey was to collect specimens of birds and animals for the Stockholm Museum. He tells of many birds and beasts which will interest naturalists, but unfortunately he has given no index to his work, and that detracts considerably from the practical value.

The author's accounts of his wild boar hunting and pheasant hawking cannot fail to arouse envy in most sportsmen. Another form of sport which he was lucky enough to experience was fishing all night from a native junk; the dawn saw a catch of sardines which broke the nets but supplied an excellent photograph.

This is in every way an easy and absorbing book to read, and the translation has been admirably performed.

Birdsworth. By KIT GUNTON and DONALD HUGHES. (Published by Basil Blackwell at 5/-.)

This book, as its title suggests, is chiefly concerned with birds—and puns and poetry; a courageous combination for any book, but, in spite of some rather drab drawings, it succeeds admirably. For example:

"I met a sparrow looking queer and half asleep,
And asked him 'How d'you feel, my dear?'
He answered 'Cheep!'"

Or, on the skylark:

"Herbert: 'Hail to thee, blithe skylark!
Sprite thou never wert!
Shakespeare loved a skylark!'
Henry: 'Don't Bysshe Shelley, Bert!'"

We cannot resist mentioning that we derived Hughes enjoyment from the poet's verses; anyway, he Donald the work.

Troubadour Sails On. By B. J. KLITGAARD. (Seeley Service; 10/6.)

This is one of the most charming books which I have read for months. The author and her Troubadour husband are already well known to readers through *Sailing Troubadour*, but this new book will surely make for them both fame and fortune.

This time the cruise was through Germany via the Kiel Canal to Denmark; here, again, Mr. Klitgaard gave his song and guitar concerts each evening from his boat, which have proved so popular.

The author's chief asset is her utter naturalness and absence of sentimentality; it is refreshing. She recounts the small events of the daily life and work on the boat, and they become as vital to us as if we were members of the crew of two. Trials and tragedies passed over the boat for the Troubadour is now really blind, and many times existence has been precarious; but there have been plenty of good days, and a cheery couple who knew how to make the most of them.

One other endearing quality is possessed by Mrs. Klitgaard; she loves dogs. She tells of her two dogs (Mike, sad to say, has a successor) with a happy understanding which is rare. The dogs were important people in this sailing home.

Manga. By RICHARD C. GILL. (Chambers; 5/-.)

This is the story of a young Indian boy whose home is in the jungle of the Amazon country. We see him first of all as quite a youngster being taught by his father, the head-man of the village, how to fashion his own spears and blow-pipes, and there are several very interesting hunting episodes which illustrate the effect of the deadly curari poison. He is joined later by a young white explorer whose chief mission is the photography of native life in the head-waters of the Amazon. These two have some perilous adventures hunting in the jungle and exploring the territories inhabited by hostile tribes. In these days of aeroplanes and wireless there is something peculiarly thrilling about this authentic account of life as it is still lived by the natives of South America.

V. R.

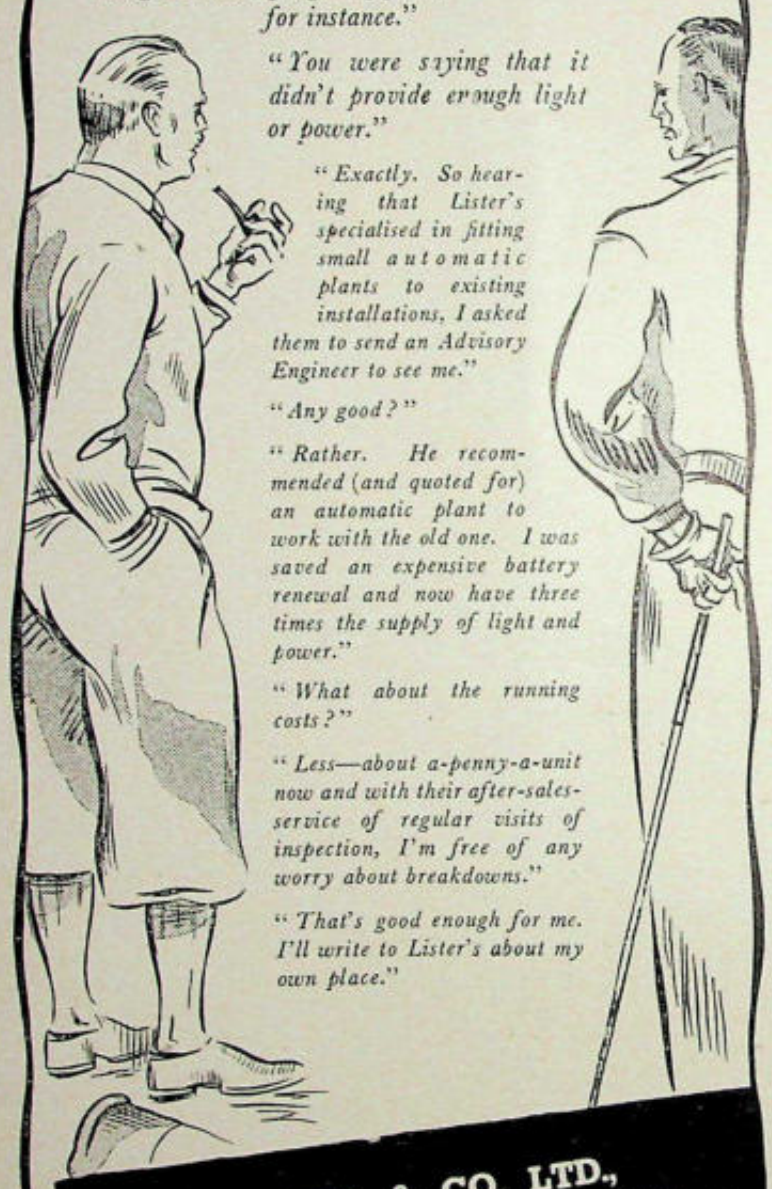
BOOKS IN BRIEF

A very useful and efficient new cookery book has recently been published. It is *Madame Prunier's Fish Cookery Book*, edited by Ambrose Heath (Nicholson and Watson; 6/-). The recipes are clear and concise, and not over elaborate. It is sad, though, to see that the cutting up of live lobsters is still apparently considered a normal occurrence. There are recognised humane methods of killing lobsters which should (and can) be practised by all cooks worthy of the name.

MISS WINIFRED DUKE states of her latest book—*Prince Charles Edward and the Forty-five* (Robert Hale; 10/6)—that she has nothing new to give. That may be perfectly true, for history has delved pretty thoroughly in the "Young Pretender's" strange story; but what is new is the style with which Miss Duke deals with her subject. It is an entirely readable book, and that can seldom be said of Jacobite literature. The facts and information are given, but the tale is a real one. The romance and pathos are expressed with a charm worthy of the subject. A book which cannot fail to interest historians of that period.

Obtainable from all leading Hotels, Restaurants and Wine Merchants.

Water & Electricity
IN THE COUNTRY – BY LISTER'S



"Going round with the Pro. puts me right on my game."

"Talking about being shown things. Take my lighting plant, for instance."

"You were saying that it didn't provide enough light or power."

"Exactly. So hearing that Lister's specialised in fitting small automatic plants to existing installations, I asked them to send an Advisory Engineer to see me."

"Any good?"

"Rather. He recommended (and quoted for) an automatic plant to work with the old one. I was saved an expensive battery renewal and now have three times the supply of light and power."

"What about the running costs?"

"Less—about a-penny-a-unit now and with their after-sales-service of regular visits of inspection, I'm free of any worry about breakdowns."

"That's good enough for me. I'll write to Lister's about my own place."

R. A. LISTER & CO. LTD.,
DURSLEY, GLOUCESTERSHIRE. PHONE DURSLEY 177

will send, without obligation an Advisory Engineer to report on an Independent Electric supply or water pumping.

Largest manufacturers of small Diesel Engines in the World

R.S.V.P.

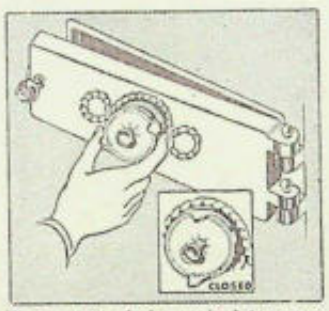
INCREASED WEAR RESISTANCE

Lister Diesel Engines are now fitted with Listard processed (Van der Horst Patents) chromium-hardened cylinders which have 400% increased wear resistance. Owners of Lister Diesel Engines not treated with this process can, when requiring a rebore or new cylinder liner, have existing cylinders Listard processed.

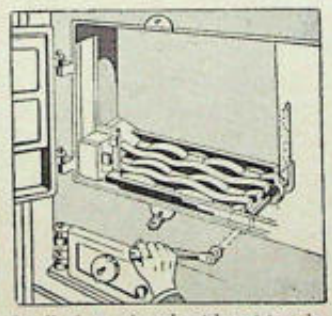
Scientific Construction makes them *highly efficient*

★ NO SPECIAL FUEL IS REQUIRED FOR COZY STOVES

Every COZY STOVE burns open or closed as required on ordinary kitchen coal, and is guaranteed to burn 12 hours without attention. This is largely made possible by precision in workmanship, which results in all doors fitting perfectly. The air draught, at all times, is under complete control.



The amount of air required to ensure proper and complete slow combustion depends upon the type of fuel used. The air regulating device in COZY STOVES is situated in the ash door and is operated by a disc. It is a most efficient arrangement.



Small pieces of coal not burnt to ashes can still give off heat. Dropped through to the ashpan they are wasted. With the new patent Rocking Grate fitted in all large size COZY STOVES the maximum efficiency is obtained. When used it may not show much movement on the surface, but down under the fire very little but the dead ashes fall through, which is as it should be.

COZY STOVES are scientifically designed to give maximum heat with minimum fuel consumption during the whole 24 hours. For efficiency, adaptability, and economy, YOUR home needs a COZY. There's a wide range of models available to suit all requirements.

Write for catalogue or see them at your local dealers.

COZY STOVES are available on easy terms.

"THE LILY OF THE VALLEY IS ONE OF OUR FEW NATURE FLOWERS THAT IS STILL REGARDED AS AN INDISPENSABLE GARDEN PLANT"

The Country House

LILIES OF THE VALLEY

"A Flower mervallous sweete . . . Cultivated in Gardens"

By ELEANOUR SINCLAIR ROHDE

THE Lily of the Valley is one of our few native plants which is still regarded as one of the indispensable garden plants, and although it has been cultivated for three centuries, it has mercifully not been "improved" by the hybridist. Formerly it must have been a common wild plant, for it was not till the close of the sixteenth century that it became a garden plant. For this we have the authority of Thomas Hyll, who in his *Profitable Arte of Gardening* (1577) says: "The wood Lillie or Lillie of the Valley, a flower mervallous sweete . . . the same of late years is brought and cultivated in gardens." Gerard says that it grew on Hampstead Heath. Parkinson, in his *Paradisus*, says that it grew wild abundantly in many parts, but the pink-flowered variety "only in the Gardens of those that are curious lovers of rarities." He mentions "Liriconfancie" as one of its popular names.

Unlike most sweet-scented flowers the scent of Lilies of the Valley is never cloying. John Lawrence, the first parson author of a gardening book, truly observed of this scent that it was "the sweetest and most agreeable perfume; not offensive or overbearing even to those who are made uneasy with the perfumes of other sweet-scented flowers." Medicinally this plant has been used from time immemorial, and its virtues according to Apuleius were taught to Æsculapius by Apollo. The old herbalists extolled it for its power of strengthening the memory, and, according to William Coles, a noted seventeenth-century herbalist, the flowers distilled in wine were "more precious than gold." Our great grandmothers valued the flowers for cosmetic purposes. They used to steep the flowers in olive oil, putting fresh flowers in the same oil until it was sufficiently impregnated and scented with them.

Lilies of the Valley never look so well in the open as in woodlands, where the soft light pours through the rich green leaves and the snowy bells are seen to perfection in this soft subdued light. In many gardens there are semi-woodland conditions which are often left vacant, but which they would adorn. Planting is best done in October. Lilies of the Valley do best in a thoroughly well-dug loam with a good supply of leaf mould in it, and if inclined to be heavy lightened with a liberal supply of sand. Soil that is too light should be enriched with leaf mould and very well-decayed manure. To secure blooms the first season it is customary to buy "selected crowns," but this is an expensive method on a large scale. The cheapest way is to buy clumps and divide them up, putting each crown in separately about an inch below the surface and 4in. apart.

It is waste of time and money to put Lilies of the Valley into hurriedly prepared ground. The site needs thorough preparation two spits deep and after planting the ground made really firm. The roots should be left undisturbed for four years, and the plants benefit greatly by an annual dressing of leaf mould and sifted well-decayed manure. Another important point is protection through the winter in all but very mild parts. These plants grow naturally in woodlands where they have a great deal of protection, and in the open exposed to severe cold they cannot produce such fine flowers unless given this protection. Leafless boughs laid over them make all the difference to the quality and size of the flowers, which are at their critical stage during what are usually the bleakest weeks of the year. Anyone who has tried it knows the difference this little extra care makes.

For pot work it is best to get selected crowns. The compost should be two parts fibrous loam and one part leaf mould and a little sand. In October put the crowns in an inch apart in 6-inch pots, the tops of the crowns being almost level with the soil. It is essential to make the roots very firm. Keep the pots sunk in ashes in the open till the turn of the year, and then in early January they can be brought into a temperature of 60 degrees. Nothing is gained by bringing them in earlier, for it is the sudden transference from cold to warmth that makes for early and vigorous flowering. It is important to see that the plants in this warmth never suffer for lack of water. If possible use rain water, for that from the main is poor stuff. Do not give the water until it has stood in the same temperature for 24 hours. Cold water gives all plants in a warm house a severe check. If neglected in the matter of watering, the crowns will almost certainly go blind.

Retarded crowns can be planted any time from now until spring, and they usually flower within a month or so of being potted. There should be no delay in potting them as soon as they arrive from the nurseryman. Never put Lilies of the Valley on bottom heat or the flowers will develop without foliage. Retarded crowns are popular for Christmas flowering and for this purpose they can first be put in a cold frame after planting for a week and then transferred to warmth. The drawback to these plants when grown in artificial warmth is the very pale colour of the leaves.

For scent nothing equals the old Lily of the Valley. The giant kind is handsomer, but not so graceful, nor so sweetly scented. Pink Lilies of the Valley have their admirers, but I cannot believe anyone prefers them to the type.

CARE OF THATCH

DECAY in thatch is brought about by a variety of causes usually acting together to effect the destruction of the roof. When one considers thatch, it is a little astonishing that a life beyond three or four years can be expected. Yet we find straw thatch lasting for 20 years and reeds for 60 years. Herein lies the justification for the thatcher's art, because with a material as obviously perishable as straw, laid in a carpet in a manner calculated to hold the dampness and encourage the attentions of nesting birds and mice, and withal a material so light as to be easily damaged by the wind, a beautiful and durable roof covering has been evolved.

The secure sewing of the straw to the rafters and battens, as described in a recent issue of the *Field*, is the great safeguard against wind damage, and is augmented at the ridge by strips of hazel held in position by hazel staples. When the job is well done in the first instance little damage by wind need be feared, but in exposed positions weaknesses at the hips and gables will be exposed by the next strong wind. The remedy is to remove all loose straw, fill the cavity with fresh straw tightly sewn to bring the surface level, and then to cover the area affected with a thin coat of new thatch held in position with rows of hazel rods 15in. apart.

Bad workmanship soon becomes apparent in another position, and that is on the flat of the roof between the different lands of straw. Each land is the band of straw set in position from one ticing of the ladder. When the ladder is moved to a new position, the junction between the new land and the old is always a source of weakness. In the best laid roofs it is here that the wet first penetrates, and the slovenly thatcher is soon exposed by wet gaining access along these lines. When a roof leaks in this manner it is necessary to fill the valleys that will have formed between the lands with fresh straw well sewn on to the rafters and thoroughly tucked into the gap between the lands. When the roof has thus been made level again, the new work is covered with a thin coat of new thatch set to weather the old work and held in position with hazel rods set 15in. apart.

Thus are the two principal defects remedied, and other holes in the thatch may be treated similarly, but the whole roof is liable to a gradual and unavoidable deterioration due to the decay of the straw. Wheat straw is the most lasting of the various cereal straws, but when set in a thick carpet on a roof it is exposed to the elements. Most of the rain and dew that falls on the roof runs off with little penetration, probably not more than 2in. except at the eaves, where it may be double that figure. Surface tension and capillarity inevitably ensure that some of the moisture remains in the thatch until the next spell of sunshine or drying wind causes it to evaporate. The straw is thus for the greater part of the year moist in its top layers, conditions which encourage fungoid attack. The first signs are a green mould which envelops and tends to soften the straw, and add to its retention of moisture. As decay progresses it penetrates more deeply into the thatch and finally the roof is no longer watertight.

If the roof is not allowed to deteriorate too much before it has attention, it is possible, instead of going to the expense of rethatching, to case the roof with a layer of straw. This is, in effect, to set a thin coat of thatch on top of the old. A life of ten years or so may be expected from a cased roof, and the straw needed will be 4cwt. per square of the roof surface. The labour cost is 7/- per square, as compared with 7 cwt. of straw and 10/- for rethatching.

Generally speaking, casing is not very economical, and it is far better to strip, rebatten and rethatch an old roof. Casing is to be recommended for a roof which was thatched not so long ago, but where, owing to bad workmanship, all the divisions between the lands have sunk and leak, or where an unprotected roof has become badly bird-holed.

Birds and mice find the conditions in a thatched roof ideal for nesting, a tribute to the water-tightness of thatch. Birds also find the straw, unless tightly sewn, tempting as nesting materials if their homes be elsewhere. The remedy is simple and effective and consists of covering the whole of the roof with wire netting as described in the *Field* of October 1st. The eaves and gables require particular attention as the netting must be carried right round the exposed ends of the thatch and secured to the rafter feet in a manner which prevents birds gaining access to the thatch at those points.

A thatched roof is not a suitable stand for ladders, or rest for hand tools, nor should it be stood upon during painting or chimney repairing operations.

REGINALD DAVEY.

LIGHTING FOR PERIOD ROOMS

Modern Methods of Illumination

By A. B. READ, A.R.C.A.

THERE are differences of opinion as to the most appropriate methods of lighting new rooms furnished in the contemporary manner and with present-day furniture. In period rooms or rooms of a traditional character with period furniture, there inevitably arises the added difficulty of using modern services and facilities without making these appear incongruous or incompatible with their setting.

There exist rooms with their furnishings that are so completely true to their period that their lighting must remain a matter for particular care and very special treatment. Generally, however, the so-called period room is an ensemble of period pieces, possibly of different dates, carefully chosen and arranged in a fairly traditional setting.

In these rooms lighting from period fittings is impossible unless by the most elaborate faking and disguise, and lighting fittings that were originally intended for real candles can be adapted for electric light and the electric bulb substituted for the flickering candle flame. We have, however, come to like and require higher standards of illumination, and it is here that the real difficulty of lighting for period rooms is encountered.

The period fitting is quite unsuited to carry high wattage lamps, and it seems only logical to find other methods of producing effective and suitable illumination. Here, surely, is the great opportunity for the employment of indirect lighting whereby fabrics. By using electric light in this way, slavish imitation and the shamming of old forms are avoided. The flexibility and ease with which electric lighting can be used to give light, interest and colour, can supply an added atmosphere of romance and gaiety to old rooms, and the quality of material and workmanship of period decoration and furniture under the soft, kind lighting that is now possible, has more than original charm.

There are also great possibilities in the design of lighting fittings inspired by period forms and qualities. The crystal chandelier with its movement, liveliness, and the play of light on faceted crystal and metal was a thing of great beauty, and although there is something a little immoral in the exact reproduction of period fittings to accommodate electric light, there is great scope in the evolution of simpler contemporary treatments of the basic principle of the effect of light on and through glass of varied form, surface and colour.

After all, jewellery gains all its interest and brilliance from direct lighting, whereas the effect of totally indirect light on it is deadening. It is to relieve this rather muffled totally indirect light that really decorative lighting fittings, which are both effective and efficient, are so necessary.

Floor standards incorporating in the same way insets of crystal glass in their stems are now being

A SIMPLE ROOM WITH PANELLED WALLS, ESSENTIALLY ENGLISH IN CHARACTER
The lighting fitting serves a more decorative than useful function, and the illumination is from niches and portable lamps

light can be diffused on to ceiling and wall surfaces from almost concealed sources. It is impossible to give a formula for producing this additional illumination as rooms vary so much in proportion, colour, formation and also in their furnishing. However, in almost all rooms light can be incorporated either into cornices, recessed into the tops of fitments, directed on to curtains from pelmets or on to ceilings from standard lamps designed to be in character with the rooms.

By these means the level of illumination of a whole room can be raised exactly to our requirements and liking without interfering in any way with its general character, and where period fittings are employed, the lamps can be of very low wattage, while the real illumination is provided by these indirect light sources carefully concealed.

Totally indirect lighting tends to be, if used without relief, a trifle monotonous and uninteresting, but in period rooms there are almost invariably fittings, either pendants, wall brackets or table lamps, that can form lively points of interest in a pleasantly lighted room.

It is quite certain that had the immense possibilities of electric lighting been available to the period architect or designer, he would have welcomed it to enhance the beauty of mellow woods, decorated wall and ceiling surfaces, and have used it to the full for the lighting of niches, alcoves and used quite extensively, and there are hundreds of very beautiful table lamps with shades of a normal traditional form, but made of old materials with new trimmings, and with stems or bases of glass composed of faceted discs or rounded forms which sparkle with life forming little scintillating points of interest wherever they are used. A well-designed and well-made piece of furniture or piece of interior equipment whatever its period remains satisfactory indefinitely provided it is used intelligently. There is no reason, therefore, why a lighting fitting, logically designed of pleasing material and good workmanship, should not be in the same company as other pieces of well-designed furnishings of other periods.

Many of the loveliest buildings incorporate additions built at various times, and often employ different building materials, but they are linked together by this basic quality of good design and general seemliness.

There has undoubtedly been an orgy of modernist lighting fittings, which are quite out of place not only in the period rooms, but even in contemporary ones, and these are, and will always be, out of place and wrong wherever they are used. There must be a place for the really well-designed light fitting, which could be as happily placed in a period room as a crystal chandelier could be in the simple modern one.

Three of Mrs. P. Croysdale's Corgis

DOGS OF SOUTH WALES

By A. CROXTON SMITH

WALES has few breeds that are distinctly its own. Were we to go back to the beginning of things we might perhaps say that they can claim only the cattle dog, or Welsh corgi, the blue merle sheepdog that is used by shepherds and farmers, and the Sealyham. In all probability the Welsh terrier and Welsh springer are theirs by adoption, as the chances are that the one is the survivor of the old English black-and-tan terrier, and the other in all probability, though much further back, came from an English red-and-white spaniel. Our Welsh friends, however, deserve the honour of having made these breeds what they are.

About their right to the Welsh corgi there can be no dispute, the breed, it is supposed, having existed for centuries in the Principality. Some cite the laws of Howel the Good (tenth century) in proof of the belief that it was then known, for there is a reference to the cur dog, a name that is still in use. The word itself is said to come from "cor," a dwarf and "gi," a dog—dwarf dog. In some respects the history of the Sealyham and corgi run on parallel lines, both having been common to Pembrokeshire before anyone conceived the idea of making them more widely known through the instrumentality of shows. The terrier got the start of the cattle dog, having been first exhibited in London in 1910.

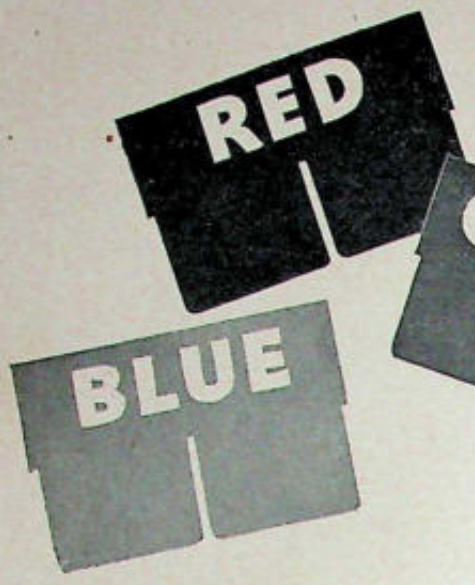
The corgi did not come until about 1926, when men and women with restless minds were looking about for novelties for the show ring. In that year the Welsh Corgi Club came into being at a meeting at Haverfordwest. After that we were told that these short-legged, foxy-headed dogs were used on cattle, and were common about the farms. They had the merit of being unusual in looks, and I wrote almost immediately expressing the opinion that they had a future before them.

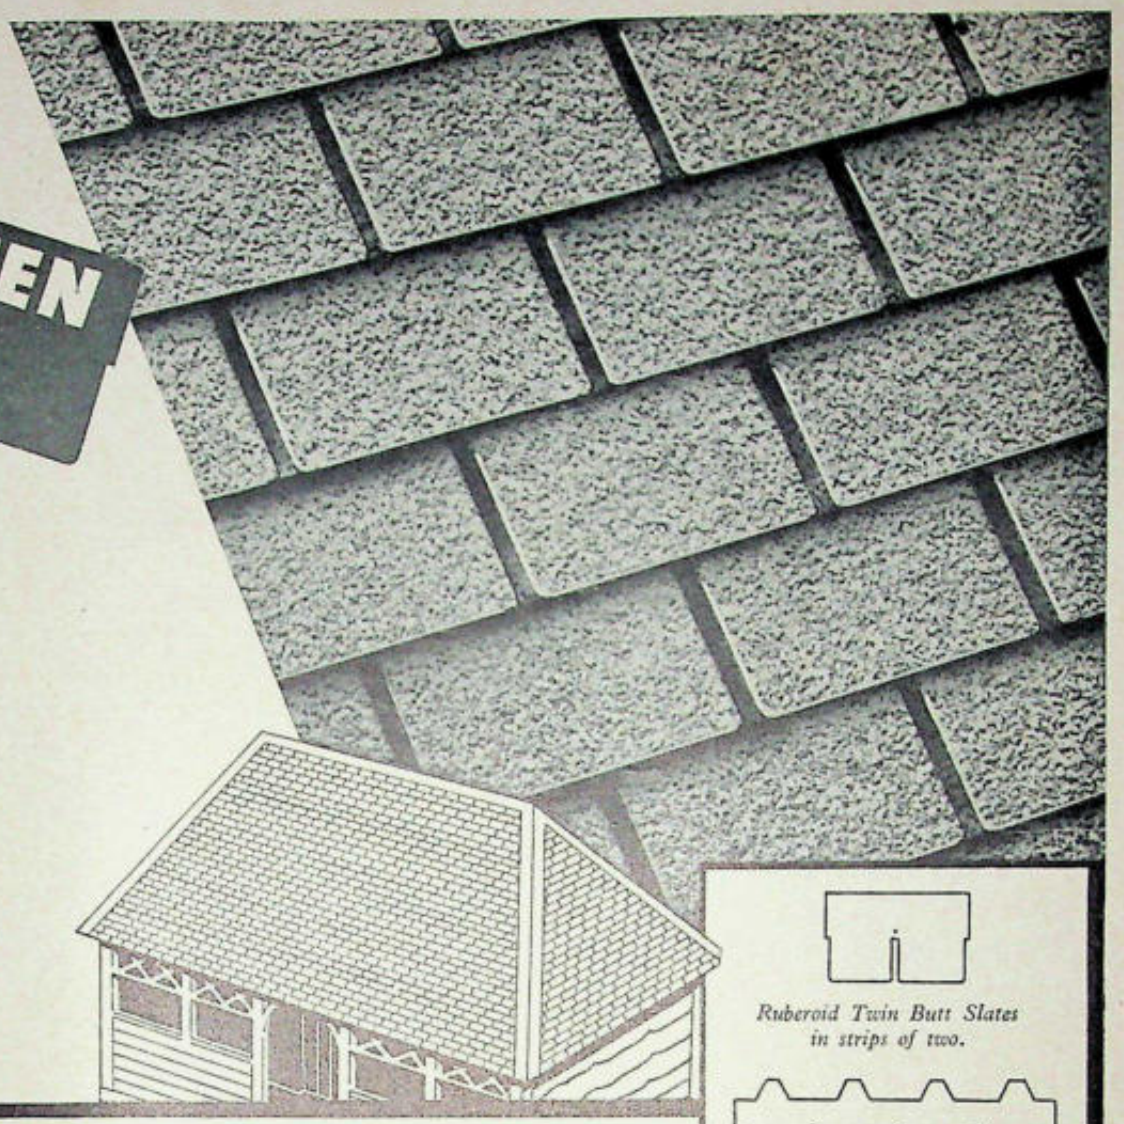
Experience has proved time and again that it is only a matter of a few years to put quality in a breed provided that it gets into the right hands. Corgis, having worked out according to plan, have now the quality and family likeness that we demand in show dogs. At the principal shows the average merit is so high that a judge has to do a good deal of thinking before marking his book, and when he has done he has a feeling of regret for some of those that have to go away unrewarded.

Before the Pembrokeshire dogs had been many months in the field the situation was complicated by rival claims brought forward on behalf of the Cardigan dogs, which were also corgis beyond a doubt, but there were differences. In one cardinal point it was a case of Gulliver's Big-Enders and Little-Enders over again, the Pembroke tykes having short tails and the others long. They were two incompatibles that were difficult of reconciliation. Although both recognise any colour except white, the Pembroke are often red or red-and-white. Both have foxy heads and erect ears as well as short legs. Also their coats are short and smooth.

For some years they had to be judged together, a matter that added to the difficulties of judges, who realised that they were dealing with different types. If this state of affairs had continued there is no doubt that progress would have been hampered, but four years ago the Kennel Club straightened things out by recognising them as two breeds, and offering challenge certificates to each. The wisdom of this decision has been justified by events, and corgis have gone along rapidly, especially the Pembrokes, which were aided very much by the fact that their Majesties took a fancy to them.

The purchase by the King of a brace from Mrs. Phil Gray was the means of calling public attention to them, and since then entries at shows have increased considerably. At Cruft's, last February, they were among the first half-dozen, which is remarkable for so young a breed that a few years ago was just an ordinary cattle dog. Perhaps the explanation of their success is that, besides being hardy and companionable, they have a distinctive appearance that cannot be mistaken. One might add that it is now permissible to dock the tails of Pembroke puppies if they happen to come long.





Ruberoid Slates are light—flexible—permanent. They make an attractive roof for Bungalows, Garages, Summer-houses and Garden Shelters. They can be laid easily with clout nails and hammer. Will not crack, break or slip. Storm and weatherproof. Supplied in three pleasing colours—Venetian Red, Westmorland Slate Green and Steel Blue. Standard or Rustic finish. Stocked by leading Builders' Merchants and Ironmongers. Specimen Slates and instructive booklet sent on request.

PART OF LORD CRANWORTH'S HERD AT ELMTREE

ADVANTAGES OF RED POLL CATTLE

The Evolution of the Dual-Purpose Animal

By LORD CRANWORTH

IT may be said that Norfolk and Suffolk can take equal credit for the evolution of the present justly celebrated Red Poll breed of cattle. A century and a half ago there existed in a small portion of Suffolk, not far from Ipswich, a type of cattle known as the Suffolk Polled cattle, very popular for milk production. Their colour was usually, but not invariably, red with white faces. Over a large part of Norfolk there existed another equally famous type known as the Norfolk Blood Red, which was a horned type of all-red cattle especially esteemed for its beef qualities. Some people believe that these cattle were the same as the Norfolk dun cow, but I think this more than doubtful. They would certainly appear to have had the merit of longevity as there is a well-authenticated instance of such a cow attaining the age of 35 years. The careful and selective mating of these two types over a period of years produced the origin of the present breed, and in 1846 prizes were first given for Norfolk Polled cattle. In 1873, by which time Suffolk would appear to have pressed her claim, the first standard description was produced for "Norfolk and Suffolk Red Polled Cattle." It is interesting to observe how "dominant" characteristics have their way. Thus the red colour of the Norfolk cow decided the colour, while the poll of the Suffolk animal ruled the head. Certain small breed points were established, such as a clear white nose. Not, of course, that there is any essential merit in such a point, but because it is important in establishing and building up a breed to ensure its purity. When a succession of herd books, extending over many generations, have established the breed, these technical characteristics cease, perhaps, to have the same importance.

In 1882 there came into existence the Red Poll Cattle Society of Great Britain and Ireland, which owed almost everything in its early days to its first chairman, Mr. Harry Mason, of Necton. Successive sovereigns have been its patron, and a new President is elected yearly. Continuity of policy is rendered easier by the maintaining of the same chairman over a period, though he is, of course, subject to annual election. During its long history the society has had but three.

During their existence of over fifty years the Red Poll Society have set their face firmly, and on the whole consistently, to the perfection of a breed which shall be a farmers' animal. They do not aim at spectacular yields of milk. They have received repeated evidence of the cost, both in cash and constitution, of the forcing of the last 100 and 200 gallons. Nor do they desire the highest prizes for open competition in the show ring, though they often get them. Their desire is to produce an animal which is calculated to pay the farmer to keep, and their experience has taught them that such an animal is one which will give a high average yield of good quality milk without any undue forcing and on rations that can be entirely, and should be mainly, produced on the farm itself. Such an average at the present time should be in the region of 850 gallons, though, of course, in many instances a 1,000-gallon average is exceeded. With such a milk yield they desire the production of the very highest quality of beef, all the calves to be reared and the steers to fatten quickly and cheaply into prime joints such as the housewife, and consequently the butcher, desire. In this latter object the society have already obtained almost 100 per cent. efficiency. It is rare indeed in my experience that steers, reasonably and economically prepared, fail to achieve the Quality Premium, while those who attend the Smithfield Show regularly will know the excellence of the super animals that appear there. Moreover, they never fail to be there or thereabouts at the top of the average price when the sales take place. This is due to the absence of excess of fat and the low percentage of waste.

It is interesting and satisfactory to note that last year's Smithfield Show, as indeed in previous ones, most of the winning Red Poll steers were the progeny of 800- to 1,000-gallon dams.

In fine, the object of the society is to produce dual-purpose cattle which they maintain with increasing conviction every year is what the farmer, as apart from the agriculturist, wants for the good of his pocket. The distinction between the two will be known to most readers: "The agriculturist makes his money in the town and spends it on the farm, while the farmer makes his money on the farm and spends it in the town."

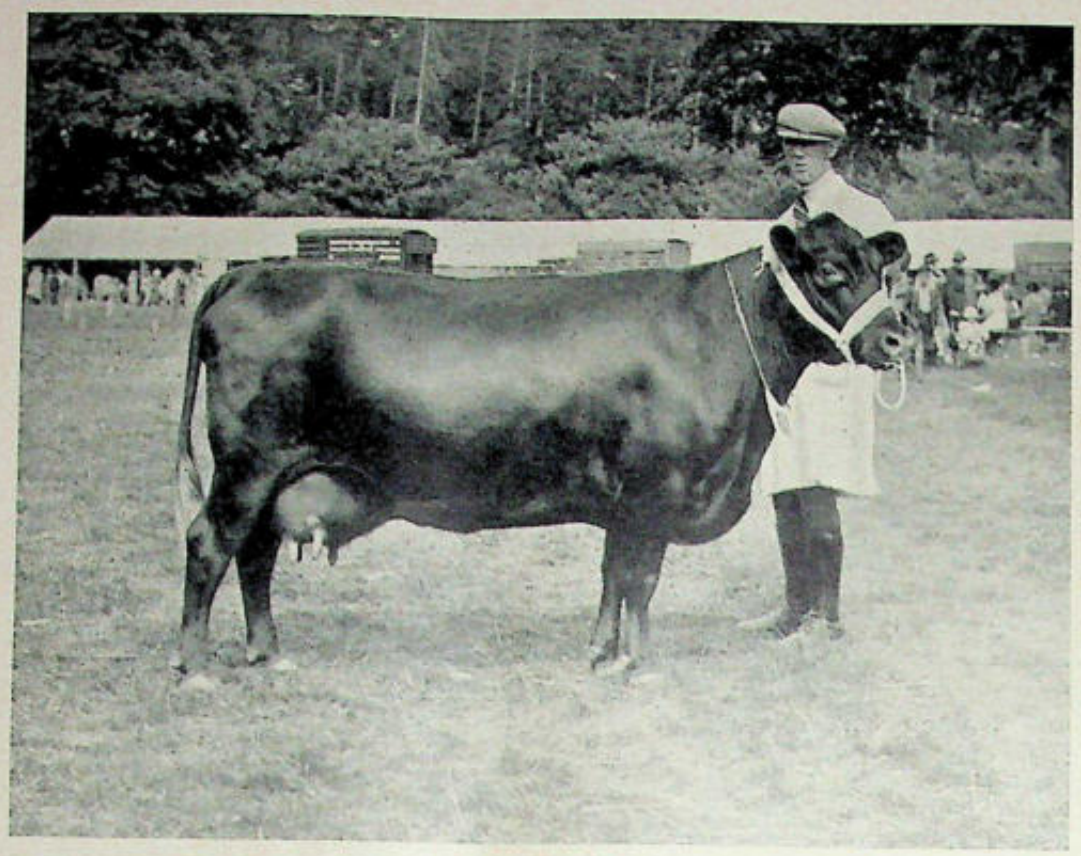
Among exhibitors there will always be some who stress one side or other of our two characteristics. Some value most highly success obtained at the Dairy Show, while others are made happier by an award at Smithfield. The society, however, endeavour to hold the balance even. I would quote from their standard description:

"The Red Poll is a dual-purpose animal. The breed was evolved to combine the production of the very highest standard of beef with a satisfactory milk yield. Accordingly, judging should aim at deciding the best *combination* of these qualities. Moreover, an obvious deficiency in one cannot be counterbalanced by superlative excellence in the other."

On this short paragraph all good Red Poll judges base their awards, and long may they continue to do so.

It would, of course, be foolish to suggest that the ideal animal has yet been evolved in this, or, indeed, in any other breed. When I first made the acquaintance of Red Polls, alas, 40 years ago, their marked deficiency lay in pendulous and unsightly bags. Forty years has enormously decreased this defect, and at the big shows udders will be seen of which any breed might be proud. It would, however, be altogether an overstatement to say that this is the case throughout the herds in general. Indeed, I think that it will be another 40 years before, in this respect, we can challenge comparison with, say, the Ayrshire. The council are especially keen on accelerating the improvement. For even if what comes out of the udder is more important than what it looks like, appearance, convenience and a freedom from accident are very real desiderata.

It must be admitted that in some quarters there is an antagonism to dual-purpose cattle, and I sometimes rack my brains for the reason. It is easy to understand that a dairy breed or a beef breed should resent competition from any quarter in its particular line, but I fail to see any legitimate cause for opposition in other quarters, and even in the Ministry itself. After all, if an animal were evolved which invariably produced the maximum of milk yield with the highest quality of beef and the maximum of constitution that would be unquestionably the perfect animal. Then surely those that aim at perfection should be encouraged, the more so when their progress is so marked. I would also point out that we live in a day of wars and rumours of wars. Should such ills eventuate, which God forbid, that will be no time to kill bull calves, but maximum production on both sides will be the cry. I would not, however, have it thought that I would decry the great single-purpose breeds, as, for example, the Ayrshire, the Guernsey and again the Aberdeen-Angus—splendid animals for whom I have the greatest admiration. But there is room for all, and an ill-service is done to the farmer by those who advise him to beware of dual-purpose.



A RED POLL COW, HALLINBURY RUBY 3rd

There are one or two special aspects of Red Polls that an enthusiast like myself would wish to stress. One is longevity. Throughout the county the average service life of a milking cow is little over four years, in many "flying" herds it is but little over two. In the Red Poll herds which I have possessed, the average life has been over seven lactations, and this I believe to be entirely typical, and I have had many a cow breed regularly and milk steadily up to seventeen or eighteen. Another proof may be found in the fact that in the list of the Ministry's Certificates of Merit for milk production in the last two years, the Red Poll entries averaged over ten years in one year and over eleven in the other. This longevity is the result of constitution, a characteristic of inestimable value. To keep such constitution is the determination of the society, and is one of the reasons why they set their faces against forced milk yields. High yields are very easily obtained. I would have little doubt that in a very few years I could obtain by breeding, selection and feeding, an average of at least 1,200 gallons for the herd. I am equally sure that I should lose in longevity, constitution and appearance, and that, on balance, I would be heavily down. This is why the council urge the necessity of raising our general average milk yield slowly even if surely.

Another characteristic is hardiness and a capacity to bear extremes of temperature. Not only can the Red Poll stand out of doors in such counties as I know, eleven months in the year, but he is an even stronger resistant of extremes of heat. In the last great drought in South Africa some two or three years ago, it was said to be most noteworthy how the Red Polls kept condition in comparison with the emaciation of most, if not all, other breeds. Recognition of this has been shown in the surprising demand from that Dominion, a demand which breeders in this country have found the greatest difficulty in meeting, and which persists increasingly notwithstanding the high cost and inconveniences of transport. The same applies to Kenya where the breed is very popular and where it is extensively used for crossing with the native cattle with admirable results.

The Red Poll is an old breed and a dominant breed, just as red is a dominant colour and the poll a dominant characteristic, and they are apt, in crossing, to pass on these points to their progeny. The native (Zebu) breeds are invariably humped and usually heavily horned, yet the third cross will usually eliminate these points and a group of such will be mainly polled and red, looking at a comparatively short distance remarkably like the genuine article. This same potency has been favourably commented on in Australia, and must obviously be of especial value wherever a large export trade in meat exists.

During my association with the breed there has always been a steady demand from overseas, though territories from which the demand comes have varied and will continue to vary. The Empire has been a steady customer and fine animals are to be found in many parts and especially in Australia and New Zealand.

But, after all, the real market is, as it should be, the British Isles. The "Scrub" Bulls Act, the effects of which are only just becoming apparent, means that "any old bull" will no longer do, but that something increasingly better must be used as a sire. The merits of a Red Poll for crossing are steadily becoming more apparent. Used even on such an acknowledged dairy breed as the Guernsey, admirable steers of high fatting quality are the result and command good prices, as has even been the case when mated with the Friesian cow.

I have known and loved the Red Poll breed for a lifetime. His evolution and improvement have given me continual enjoyment. Indeed, to go round the herd is to-day a thing to look forward to, even though disappointments are from time to time inevitable. Where is there to a farmer a more beautiful sight than a well-matched herd grazing in a well-timbered park or in a lush meadow? Their deep red colour, their white noses, their deep gleaming bodies on their short strong legs, seem to complete the beauty of a summer evening and satisfy my eyes, at all events, far more than any herd of deer. What is more, they pay! Their popularity is growing steadily, and I venture to think will continue so to do.

PEDESTRIANS AND ARTERIAL ROADS

Foolish Demonstrations Which Aggravate High Feeling

By CAPTAIN SIR MALCOLM CAMPBELL
(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)
(Motoring Editor of the "Field")

I HAVE been a consistent champion of road safety for many years, sparing no personal effort to advance the progress of schemes devised to decrease road fatalities. The appalling number of road deaths which confront us week after week is eloquent testimony that much remains to be done before the Minister of Transport can justifiably claim that his department is operating successfully.

Blame has been laid at the door of the driver, who has been accused of carelessness and negligence; criticism has been levelled at the incidence of mechanical failure resulting in fatal accidents: whereas the fault undoubtedly lies with the highways.

From time to time I have urged that drastic steps should be taken, and have advocated bold re-planning of our national highways as the only means to effect a real decrease in road mishaps which so frequently mean permanent injury or death to motorists and pedestrians alike.

We need long, safe, fool-proof highways, dual carriage-ways, complete removal of "blind-spots" and the widespread use of non-skidding surfacing. These demands are well known to the average driver who appreciates the acuteness of the problem which the efficient handling of modern traffic presents. But apparently the pedestrian remains to be convinced.

I say this because recently there have been a number of demonstrations by pedestrians on several arterial roads and by-passes. There have been protests on Western Avenue and on the Kingston-by-pass. Large crowds of pedestrians have gathered, and have caused deliberate obstruction to the motor traffic on these roads. In long lines they have moved slowly across the road, thereby causing inconvenience and annoyance to all other users of the thoroughfares, and creating that bugbear of modern traffic—congestion.

By this action they hope to force the authorities into imposing the 30 m.p.h. speed limit along the particular stretch of road near to which they happen to reside.

I cannot too strongly deprecate both the motives which prompted this action and the methods used by the people concerned to air their grievances.

If protests are to be made at all, they should be made to the proper quarter—in this case to the local authority which is, in turn, responsible to the Ministry of Transport. Such public displays only serve to aggravate high feelings between motorists and pedestrians and tend to antagonise them. This is surely illogical when it is remembered that the aim of both is identical, in that the common goal is safety.

Another regrettable thing about these demonstrations was that large numbers of children were encouraged to take part, parents even leading their children by the hand. I take the gravest view of this particular aspect of the question, because if we are anxious to see road safety in the future, we must start by inculcating into the children the correct behaviour on public roads. I believe that it is through children that the most gratifying results can be achieved, and that they should be taught most carefully, in the schools and elsewhere, what is, and what is not, the correct procedure on the roads. But here were parents, who are presumably concerned with the welfare of their youngsters, actually committing a breach and setting the most unworthy example and encouraging their children to follow them.

Such action must inevitably instil the wrong spirit in the minds of the children. All the good work done by instruction in road safety is destroyed in one fell swoop when the pupils—and the road-users of the future—are led astray in this manner. It is tantamount to teaching children to behave in an irresponsible manner on the roads and is courting danger.

I have always had the keenest interest in road instruction for the coming generation, believing it to be one of the most vital factors to ensure road safety. As chairman of the Advisory Council of the Junior Road Fellowship, I have been able to see the amazing results achieved by intelligent juvenile education in the matter of road manners, and it is because of this that I feel so strongly about the participation of children in such demonstrations.

Apart from this, there is the undeniable argument of the motorist. He realised that the building of the arterial road and the by-pass was the first move in the right direction for the provision of an adequate national highway system and was designed to ease congestion, speed up traffic and, above all, to obtain some measure of safety.

The primary function of an arterial road is to obviate any traffic dislocation by pedestrians and to eliminate the danger from the jay-walker. At the inception of the plan for arterial roadways, the motorist believed that at last he was freed from the dangers attendant upon passing through a populated area. But the jerry builder shattered this dream by erecting innumerable houses, ribbon fashion, along these roads, thus saving all sorts of expenses incurred by road-making and estate planning.

Ribbon development means the downfall of the conception of a road for motorists, and despite the fact that it has been going on for years the Ministry have done nothing to prevent the practice. Now these residents living by the side of such roads realise that the average motorist is not apt to slow down, as is the case in a village or town, and give way to pedestrians wishing to cross the road, nor is he ready to accept the imposition of a speed limit.

Surely here the motorist has right upon his side, because it must be granted that a speed limit at frequent intervals on such a road must defeat the purpose for which it was originally constructed. I believe that the Minister of Transport is not inclined to grant any concessions to pedestrians in this direction, deeming such speed restrictions undesirable and inadvisable, preferring to see instead the construction of bridges or tunnels.

This will mean further heavy expenditure—which will doubtless be drawn from the pocket of the motorist—whereas legislation at the outset to prevent the building of houses along arterial roads would have saved money, bother and a great deal of bad feeling. It is another example of the manner in which the authorities refuse to look ahead in the question of road planning. I contend that in the event of further demonstrations being organised, stronger preventive measures should be instituted to restrain those citizens who wish to impede traffic by obstructing the road, in order to register their disgust.

Legally, I believe that if a motorist causes obstruction upon the highway, he is liable to be fined—does this not equally apply to pedestrians?

32 MINUTES TO SPARE

SUCH a large body as the 1,200 members of the British Legion who were to have gone to Czechoslovakia needed transport, and in all 25 vehicles were to be taken. There were six Vauxhalls (25 h.p. models) to serve as staff cars; the other nineteen were Bedfords—light vans, lorries and ambulances. All the drivers were naturally ex-Service men, those who were to handle the six staff cars being London taxi drivers. The Vauxhall people were sending three mechanics, who also are ex-Service men. A condition of the order—which was placed on the morning of Tuesday, October 4th—was that the entire fleet had to be ready to drive away by the evening of Thursday, October 6th. Although this involved the building of four ambulances "from the ground" and the special painting of the other fifteen Bedfords, they were all ready exactly 32 minutes inside the allotted time.

"I stopped experimenting . . ."

"In my younger days I've been offered liqueur brandy in impressive looking bottles, dim with the dust of decades. Alas! Often enough, the only thing 'impressive' turned out to be the price. I stopped experimenting when I found this Hennessy "XO." The bottle may look modest; but believe me the liqueur brandy it contains comes from a very venerable cask. Age alone is *something*; but in Hennessy "XO" age is beautifully balanced with body and bouquet—and that is *everything*."

It's the age in the cask that counts . . . . .

MERCURY TAKING OFF FOR AN INDEPENDENT FLIGHT

AFRICA AND SOUTH AMERICA

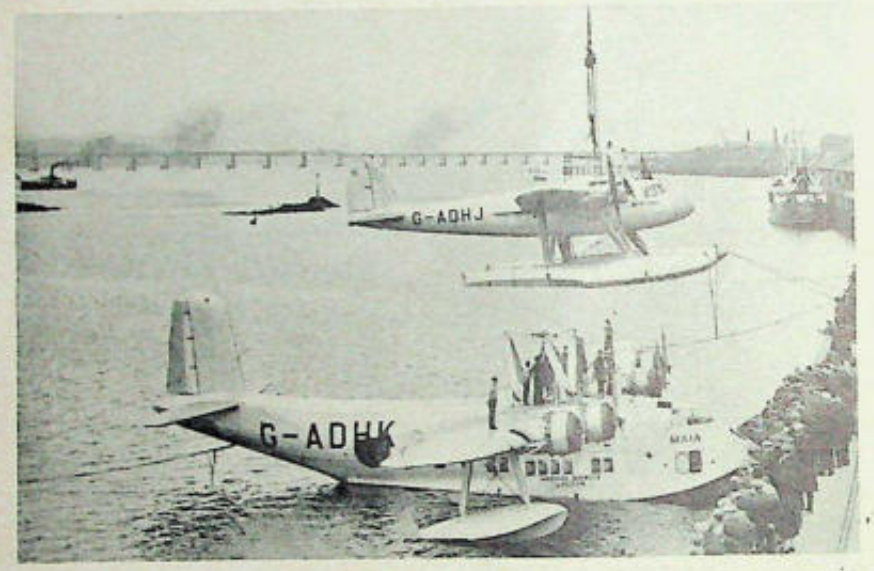
Inaugurating an Important Airway

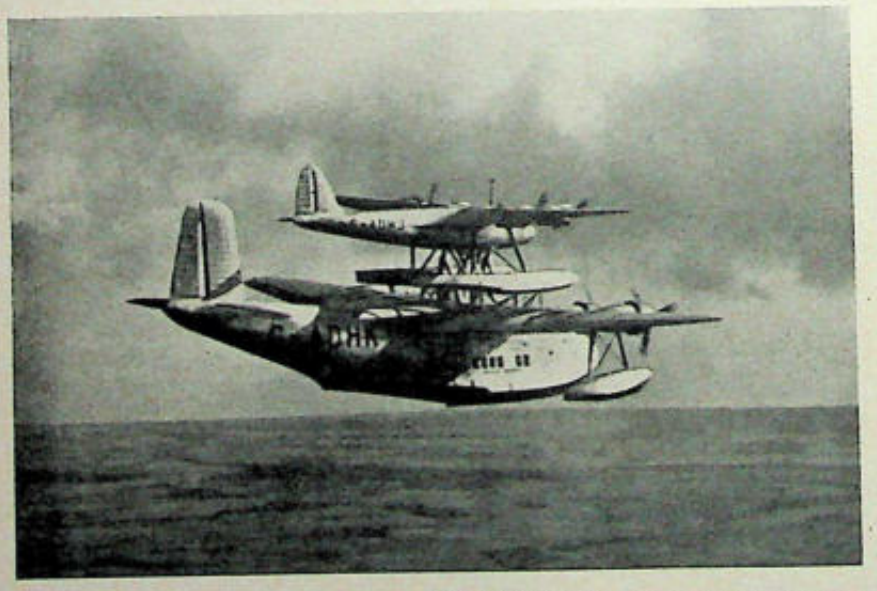
By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

THE inauguration of the London-Lisbon airway this autumn is the first stage towards the establishment of British air connections with West Africa and South America, and represents an important step in the development of our communications.

British interests in West Africa are many, and the present dependence of this country on the services of other nations has caused grave disquiet for a long time. Moreover, the South Atlantic air mail has been highly developed by German and French associated with the West African and South American project have been unnecessary. It has been argued that on this route much of the pioneer work has been done, that German and French operators have gained a great deal of practical experience, and that the ground organisation already exists.

Yet it is just this comparatively developed state that has been responsible for the apparent tardiness of the West African development. On the North Atlantic route, somewhat spectacular success has been won on





FOUR STAGES IN THE SEPARATION OF THE TWO COMPONENTS, MERCURY AND MAIA
From top left to bottom right: Mercury being lowered on to the back of her parent craft Maia, then the dash across the water, prior to the take-off, and finally, the parting of the two units

concerns, which carry British air mails in considerable quantities. Apart from any question of prestige (which is serious enough in itself), practical needs emphasise how essential an all-British airway is. This view was taken by the Cadman Committee in its report issued in March. In stressing the fact that "national prestige and the interests of British civil aviation require . . . first-class air services," the committee recommended that "every effort should be made to expedite to the utmost the inauguration of the proposed service to South America."

In view of the progress made on the North Atlantic route, which is generally regarded as the more difficult, many have felt that the delays preliminary flights through the close co-operation of the various countries concerned: Great Britain, Eire, Newfoundland, Canada and the United States. On the South Atlantic, however, the British service must necessarily enter into competition with existing services. Rights to fly over the territory of various foreign countries have had to be obtained. Moreover, the very fact that France and Germany have already built up highly efficient organisations makes it specially necessary for the British plan to attain a like efficiency from the very start.

These facts were stressed recently by Mr. W. D. Roberts, who is leading the British Airways' mission in South America—a body whose object is to clear the way for British operation on the other side of the South Atlantic. He pointed out that the very fact of other companies having already provided their own organisations necessitated that British Airways must evolve something as efficient or even better; and he drew attention to the problem of flying stock.

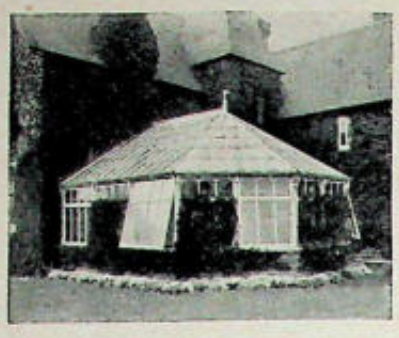
Suitable machines have, indeed, been one of the principal difficulties involved. It has been initially solved by the purchase of four Lockheed 14 machines from America, and it is these which are being used for the first flights between London and Lisbon. No decision has yet been taken regarding the type to be used on the South Atlantic crossing, but it is probable that the Lockheeds will be used when the Lisbon stage is extended to Bathurst in Gambia, the jumping-off place for the ocean flight.

In deciding on American aircraft for the preliminary work, the operators adopted what seems to have been the only course open to them. But it seems clear that British types are now being developed with characteristics suiting them for the duties of the route.

As already indicated, the proposed route lies between London, Lisbon, and Bathurst, on this side of the Atlantic, with some terminal in the Argentine on the other side. In the speech already mentioned, Mr. Roberts announced that the Argentine Government is going to construct a modern central airport in Buenos Aires. This will, no doubt, ultimately form one of the terminals in South America, though the fact that the mission intends to negotiate with the Governments of both Brazil and Uruguay indicates a wide conception of British participation in South American air transport.

It must be recognised that this project is quite distinct from the Atlantic flights that have been so much in the news this summer and last. In connection with those, a "southern route" has frequently been mentioned, but it must not be confused with the true South Atlantic airway. The former is the crossing via the Azores; its terminal on the western side is in the United States. The route under discussion here aims at providing an air link, under British control and direction, between this country and the South American republics.

This project is of the highest importance in itself and on the lines laid down for development, but it has another aspect of special interest to the Empire. With the route to Gambia in operation, a step will have been taken towards providing the British territories on the West African Coast with the same facilities for mails and rapid communications as those now possessed by the eastern ones. It has often been suggested that the West Coast route would be an ideal one for flying boats, and, indeed, the first official survey was made along it by this means. With the establishment of a British organisation over the difficult first stage, conditions are created in which further development might proceed. Thus, this new project, now nearing realisation, may well be not only a new link in world communications with Britain, but yet another aerial bond of Empire.



Appropriately designed

If you are requiring a conservatory or a greenhouse, you can be sure that from Boulton & Paul both the design and the quality will be appropriate. For over one hundred years we have specialised in this class of work. Designs are not only in harmony with the surroundings, but are evolved to provide the best growing conditions.

We shall be pleased to send illustrated catalogue 575 upon request.

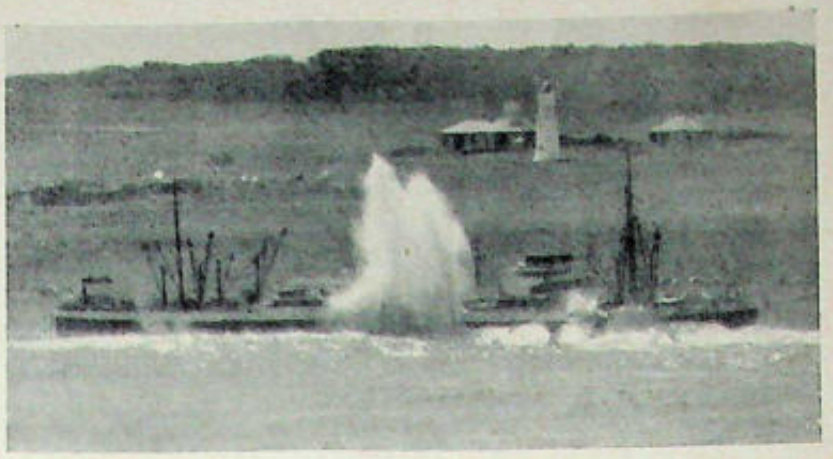
UP THE EAST AFRICAN COAST

The Return to England from the Cape



WAVES BREAKING OVER THE WRECK OF A 13,400 TON VESSEL AT EAST LONDON

FOR a ship leaving Cape Town for the East African coast, the first port of call is Mossel Bay, a small town with a background of scrub-covered sandhills which continue all the way to Durban. Its chief interest is Seal Island, the home of several hundred Cape Sea Lions, which can be visited by launch from the ship. On the way, one or two will be met leaping through the sea, to be mistaken for porpoises until quite close; also groups of tails just above the water, which belong to sea lions feeding on the crustacea of hidden rocks. The island is a rock mass 150 yds. by 40 yds. and about 30ft. high, so crowded with sea lions of all sizes that there seems to be no room for any more. Their barking is incessant, and the smell on the leeside appalling, but it is well worth the visit.

After Mossel Bay comes Port Elizabeth, famous for its Snake Park, where anti-snakebite serum is made for most of Africa; but, like all the new towns of South Africa, its buildings are more for utility than beauty.

East London is another day up the coast and possesses a fine bathing beach, while a trip up the Buffalo River, at whose mouth the port is situated, will reveal some grand scenery. It is a regular port of call for Finnish grain ships, and as many as four out of the seven large sailing ships left in this world of steam and motor may be seen there at once about December; they are beautifully kept and look most graceful with their lofty masts and spars.

Durban is the capital of Natal and quite one of the pleasantest towns it has been my good fortune to see. There is an atmosphere of freshness and cleanliness about it which I have only seen equalled in my native town of Plymouth; its shops are excellent, while almost any one of the row of fine hotels facing out to sea above the bathing beaches is well worth occupying for a couple of nights while the ship is wrapped in the gloom and dirt accompanying coaling.

The scenery of the Valley of a Thousand Hills is worth the motor drive, and if a permit be obtained to visit the Zulu Reserve, advantage should be taken of it to get a look at this fine nation before it is modernised out of existence.

Durban is also the centre of the South African whaling industry, and at times there are six or seven whales on the fleansing slips; though the whaling station, on the seaward side of the island at the mouth of the harbour, is not too easy to get at. Probably some whales will have been seen from the ship on the way up from Cape Town.

Lorenço Marques' fine harbour is about 30 hours from Durban, and here it will begin to get warm, though one does not swelter as in Beira; but the drive up to the big hotel on the hill behind the town, through flower-embowered villas, is a welcome change from dockside, while the beach below it provides excellent bathing. An expedition by rail-coach or launch to the hippopotamus reserve 40 miles up-river will appeal to many.

At Beira, the next stop, which is equi-distant from London either way round Africa, it will certainly be hot and there will be considerable cargo to be loaded. Most of the copper from Rhodesia comes here to be shipped, and a stay of four days is not improbable. Still, there are compensations, and a trip up the Buzi River to see a sugar factory and something of native life is almost sure to show hippo at fairly close range and crocodiles in plenty. It is flat, jungle-covered country, and wild animals, including lion and buffalo, are to be found within ten miles of the port.

A STREET SCENE IN ZANZIBAR
"Now the centre of commerce in such romantic-sounding merchandise as cloves, cinnamon and pimento"

WALTER HAGEN GETTING OUT OF A BUNKER ON THE GOLF COURSE AT TANGA

There is a good golf course at Beira just alongside the bathing beach, so altogether the time can pass quite pleasantly.

Through the Mozambique Channel and the Primeira Islands will be sighted a day before reaching Dar-es-Salaam, a lighthouse on stilts straddling above the casuarina trees. It was on Fogo Island, the outermost of the group, that fires were lit from July to October in the seventeenth century to guide galleons from India.

Dar-es-Salaam is a pretty little port, with evidence of the War still conspicuous in the form of ships sunk by the Germans to block the harbour entrance, but beyond a drive into the interior it provides no especial interest; though this cannot be said of Zanzibar, which island is reached next day.

The headquarters of the east coast slave trade and now the centre of commerce in such romantic-sounding merchandise as cloves, cinnamon and pimento, a drive round the island to see the spice plantations should be followed by a walk through the town. High, narrow streets, with a population drawn equally from Asia and Africa, many beautifully carved doorways to Arab houses and curios in the shops, all serve to make the usual stay too short; so that the six or seven hours of the trip across to Tanga will be occupied in regrets until daylight reveals this lovely little arm of the sea.

Tanga always looks as if it had just had a freshening shower of rain, with its red and white bungalows embowered amongst green trees on the edge of a long, low red cliff above the blue sea. Again a motor ride into the interior is the usual way of occupying time.

Leaving Tanga in the evening, the ship will be entering Mombasa, or Kilindini as the port is called, at dawn next morning. A beautiful inlet, lined with green forest and coconut palms, there are the Gedi ruins and old Portuguese fort to be seen, while a train leaves in the afternoon for Nairobi, getting in there about nine o'clock next morning, after passing through country where herds of game come right up to the railway line. It is also easy to fly there and back at very little more than the cost of the railway ticket, and if I were taking my two months' break between ships it is here I would do it.

Mombasa is the last of the east coast ports and the next stop is Aden, not nearly as bad a place as it is usually painted. Its ancient tanks, disused now that a good supply of water has been piped to the town, should be inspected, if only to wonder at the immense amount of labour involved in their excavation from rock.

Then past Perim Island, with its thirteen white inhabitants and three golf courses, set right in the gullet of the Red Sea, with a tide rip which will probably have several wrecks to show for its efforts, and half-way up is Port Sudan, built on hot and barren desert at the edge of the sea where the coral reefs are so steep that a hundred yards from the wharf it is too deep to anchor. There is a glass-bottomed boat here in which a trip may be made to view the many and multi-coloured fish which inhabit the jagged reefs.

The last lap lies to Suez and the Canal. Here we come to a part of the world which has been over-written by novelists and over-crowded by tourists, so that my theme is exhausted. Even the snow-capped hills of Crete, flaming Stromboli seen at night, or Napoleon's first prison, the island of Elba, will hardly stir the traveller's pulse, for, even if he has not seen them, he will have read of them to repletion.

C. H. STOCKLEY.

WORLD CRUISE.—An attractive world cruise has been planned for the Empress of Britain lasting 123 days and commencing on January 21, 1939. The fares range from 438 guineas and include the cost of innumerable shore expeditions. Starting at Monaco, the cruise takes into its itinerary such places as Jerusalem, Cairo, Bangkok, Bali, Cape Town, Rio de Janeiro and Havana.

"Snug as a Motoluxe Rug"

There is an air of quiet dignity . . . an atmosphere of luxury associated with a Motoluxe Motor Rug. It gives comforting warmth without bulkiness, and colourings are obtainable which will tone with any shade of upholstery. At the standard price of 5 guineas it is an excellent investment in comfort, and will remain an asset to the appearance of your car for all time.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

YE OLDE BELL AT BARNBY MOOR

NO animal, according to the rules of animal-etiquette, is ever expected to do anything strenuous or heroic or even moderately active during the off-season of winter. But man, like a river, has no off-season. He is always hurrying somewhere all the year round, and you have only to travel on the Great North Road to-morrow to find out the truth of this statement.

If you are travelling from London to Carlisle, your best half-way halt is Ye Olde Bell Hotel at Barnby Moor. You may be tempted to push on through the night, but if you do you will hardly be fit for anything next day, and certainly you miss an introduction to one of the most comfortable hotels on the Great North Road. It was built in the days when a journey to the north was a long and sometimes tedious job. Coaches seldom exceeded a speed of ten miles an hour, usually averaging about eight, and it is obvious that no great distance could be covered in a day. To meet the needs of the travelling public old inns sprang up all along the route. Each has its own history, for each provided the visitor with good cheer, rest and comfort, and they were popular "stopping places" indeed.

None more so than Ye Olde Bell, where mine host, one George Clark, did a large posting business and kept a breeding establishment and training stable. Some idea of the extent of his enterprise may be gained from the fact that he had stable accommodation on the premises for 127 horses.

Even in 1776, before Clark's days, this old coaching hotelry, sometimes known as the "Blue Bell," was well famed. When the Rev. Thomas Twining was ambling about the country on "Poppet," making picturesque notes, he referred to the Bell as "a gentlemanlike, comfortable house."

With the advent of locomotives most of the old hostelries of the Great North Road lost their source of livelihood, amongst these being the Bell, which was bought by Mr. Beevor, himself an enthusiastic whip, and converted into a private residence. Here he and his family resided for over 60 years, when the premises were once more adapted to their original purpose.

The owners had no simple task before them. It was essential to provide every modern improvement and yet preserve the ancient character and traditions of the old coaching inn. So cleverly has this been done that, with the exception of the main entrance, which has been altered, and the hall (or lounge), which has been greatly enlarged, the general external appearance of the old inn is practically the same as when our forefathers were wont to sample old George Clark's celebrated bin of port.

If you are a racing man, note that Ye Olde Bell is only fifteen miles from Doncaster, and handy for York, Lincoln and Nottingham; if you hunt, there are eight packs of hounds from which to choose: The Grove, South Notts, the Fitzwilliam, Burton, Blankney, Belvoir, Badsworth and Rufford.

Although stage coaches have vanished and the cry of the post-boy, "Next pair out," has long ceased, the motor car has taken the place of the former and the mechanic that of the post-boy, Ye Olde Bell still stands as a fine example of those quieter days.

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

END PLAYS

Useful Books for Students

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

THERE are various kinds of End Play whereby tricks can be won which are not apparent on the surface. The chief methods employed are elimination, stripping a hand, the squeeze, the throw-in play and forced lead play.

Examples of how to make an extra trick or tricks by means of these and other devices have been given from time to time in the *Field*. Recognition of how and when to use them is a necessary part of the equipment of every good player.

A brilliant American writer, Mr. George S. Coffin, has published recently a third revised and enlarged "Master" edition of his book entitled *End Plays* (The Ad. Press, Ltd., New York City; price 2½ dollars). It deals with eliminations, squeezes and coups, "clearly revealing the inmost secrets of Bridge scientifically classified for quick reference." In classifying them the author invents many new fantastic names which will be strange to most players.

Here are some of them: "The Exit Fork Strip," "Forced-Fork Strip," "Two-Forked Strip," "Criss-Cross Squeeze," "Split Automatic Double Squeeze," "Jettison Squeeze Finesse," "Hexagon Squeeze," "Barco Squeeze," "Hexagon Squeeze Strip," "Double Squeeze Entry Strip."

Let no one be put off by the use of this high-sounding nomenclature. The play involved is not so difficult or complex as the titles might suggest. I agree with the late Louis Watson, who wrote: "It does not matter what the play is called just so long as the player knows how to execute it."

The essence of all End Play is that the opponents are not given any chance of protecting themselves. They appear to have tricks. They think that they have tricks. But by the application of the principles explained these tricks vanish into thin air. It is not necessary to learn the names of these plays and coups. In fact a player at a London club who announced that he had just successfully brought off a "Triple Squeeze Fork Strip" would be likely to be fined drinks all round and then be thrown out of the window!

All the same I recommend this book to the earnest student. It is a veritable store-house of information, and no one can read it without profiting by it. As the writer of the Foreword suggests, it should be taken in "small doses," as most of the analysis is too deep for casual reading.

The following is described as "A Cross Ruff Throw-in":

	♠ 9, 2 ♡ 8, 7, 3, 2 ◇ Q, J, 7, 3 ♣ A, 10, 4	
♠ 5, 4, 3 ♡ K, Q, J, 9, 5 ◇ 5, 4 ♣ K, 7, 6	Y A B Z	♠ A, K, Q, J, 8, 7, 6 ♡ 4 ◇ 2 ♣ 9, 8, 3, 2
	♠ 10 ♡ A, 10, 6 ◇ A, K, 10, 9, 8, 6 ♣ Q, J, 5	

Both sides vulnerable. Z the Dealer. The bidding was:

Z	A	Y	B
One Diamond	One Heart	Two Diamonds	Four Spades
Five Diamonds	No bid	No bid	No bid

A led the King of Hearts.

With two losers in the Heart suit and a loser in Spades game looked hopeless. But Z followed the bidding clues. A probably held five Hearts and no high Spade. For End Play to succeed B had to hold only one Heart and the quart major in Spades. Therefore Z won the first trick with the Ace of Hearts, took two rounds of trumps, finessed Clubs successfully for three tricks and then led a Spade, which B won with the Knave.

B led the King of Spades and Z *discarded* a Heart!

B was now stripped of all but black cards to lead. Whatever B led, Z simply discarded his last otherwise losing Heart, while Dummy trumped. The play is called a "Cross-Ruff Throw-in" because the throw-in is made before the stripping process has been completed.

It is to be noted that if A opens with a Spade and B, winning with the Knave, returns a Heart, Z can employ similar tactics. He wins the second trick with the Ace of Hearts, makes his two top Diamonds and then his three Clubs and puts B in by leading a Spade from Dummy.

CHESS

INGENIOUS PLAY

THE following game, from a tournament at Bad Elster in June, shows some ingenious play by Gilg.

(Indian Defence.)

WHITE. Eliskases.	BLACK. Gilg.	WHITE. Eliskases.	BLACK. Gilg.
1. P to Q 4	Kt to K B 3	18. B takes R	R takes B
2. P to Q B 4	P to K 3	19. Castles	P to Q 4
3. Kt to Q B 3	B to Kt 5	20. B to B 4	P to B 4 (*j*)
4. P to K 3	P to Q Kt 3 (*a*)	21. Q R to Q sq	P to Q 5
5. Kt to K 2 (*b*)	B to Kt 2	22. Kt to K 2	P to Q 6
6. P to Q R 3	B to K 2	23. Kt to B 3	Kt to Q 5 (*k*)
7. P to Q 5 (*c*)	Castles	24. K to Kt 2	Q to Kt 3
8. P to K Kt 3	P to Q Kt 4 (*d*)	25. R to Q 2	R to K sq
9. P to K 4 (*e*)	Kt P takes P	26. P to B 3 (*l*)	Kt to B 7
10. Q to Q 4 (*f*)	P takes P	27. Kt to Q sq	R to K 7, ch
11. P takes P	P to B 3 (*g*)	28. R to B 2	Q to K 3
12. B to Kt 2	P takes P	29. P to K R 4 (*m*)	Kt to K 8, ch
13. Kt takes P	Kt takes Kt	30. K to B sq	R takes R
14. B takes Kt	Q to R 4, ch	31. B takes R	Kt takes P
15. Kt to B 3	B to K B 3 (*h*)	32. B to B 3 (*n*)	Q to K 5 (*o*)
16. Q takes B (*i*)	P takes Q	Resigns.	
17. B takes B	Kt to B 3		

(*a*) Dr. Alekhine has expressed the opinion that Black's best move here is 4. . . . Castles, to be followed, if 5. Kt to K 2, by 5. . . . P to Q 4, or, if 5. Kt to B 3, by 5. . . . P to Q Kt 3.
(*b*) This move is inferior to B to Q 3.
(*c*) Kt to B 4 is, we think, to be preferred.
(*d*) A very good move.
(*e*) If B P takes P or Kt takes P, then P takes P.
(*f*) 10. B to Kt 2 is better, although after 10. . . . Kt to R 3; 11. Q to Q 4, Kt to B 4 White cannot well play 12. Q takes P because of 12. . . . B to R 3.
(*g*) A good move. If now 12. P to Q 6, then 12. . . . P to B 4 leads to the gain of the exchange, *e.g.*, (1) 13. Q takes P (B 5), B takes P (not B takes R at once because of P takes B); 14. Q takes B, B takes R, or (2) 13. P takes B, Q takes P, followed by 14. . . . B takes R.
(*h*) This move gives Black a winning advantage.
(*i*) There is nothing better. If, instead, 16. Q to Q 2, then 16. . . . B takes Kt; 17. P takes B, Q takes B, winning a piece.
(*j*) Preventing White's Knight from going to K 4 in reply to P to Q 5.
(*k*) Threatening to win a pawn by 24. . . . Kt to K 7, ch; 25. K to Kt 2, Kt takes Kt; 26. P takes Kt (not B to Q 2 because of Q to Q 4, ch), Q takes B P.
(*l*) Played so that he can reply to R to K 7, ch with R to B 2.
(*m*) White has no satisfactory move.
(*n*) If R takes Kt, then Q to K 7, ch, followed by Q takes Kt, ch and Q takes B, ch.
(*o*) Threatening Kt takes P, followed, if P takes Kt, by Q to R 8, mate.

A STRONG ATTACK

THE following game, from a tournament at Milan in April, shows a strong attack by White.

(French Defence.)

WHITE. Riello.	BLACK. Castaldi.	WHITE. Riello.	BLACK. Castaldi.
1. P to K 4	P to K 3	14. Q to B 4	Kt to Q 2 (*f*)
2. P to Q 4	P to Q 4	15. P to K R 4 (*g*)	Q to K 2
3. Kt to Q B 3	B to Kt 5	16. Kt to Kt 5	Kt to B sq
4. P takes P (*a*)	Q takes P (*b*)	17. Kt tks B P	R to Q R 4
5. Kt to B 3	Kt to K B 3	18. Kt to Kt 5	P to K R 3 (*h*)
6. B to Q 2	Q to Q sq	19. B to B 4, ch	K to R sq
7. B to Q 3	Kt to B 3 (*c*)	20. R to Q 8 (*i*)	R to K B 4
8. Kt to K 4	B takes B, ch	21. Q to Q 2	P to Kt 4 (*j*)
9. Q takes B	Castles (*d*)	22. B to Kt 3	P to Kt 5
10. P to B 3	R to K sq	23. Q to Q 3 (*k*)	R takes Kt (*l*)
11. Castles (Q R)	P to K 4 (*e*)	24. P takes R	B to R 3 (*m*)
12. P takes P	Kt takes P	25. Q to Q 5	Resigns.
13. Kt takes Kt	R takes Kt		

(*a*) The most important alternatives here are P to K 5 and Kt to K 2.
(*b*) P takes P, the usual move, is preferable (see Black's sixth move).
(*c*) Black's idea is to free his Queen's Bishop by playing P to K 4 later on.
(*d*) Not 9. . . . Kt takes P; 10. Kt takes Kt, Q takes Kt because of 11. B to Kt 5, ch, winning the Queen.
(*e*) This looks quite good—but White's fourteenth move places Black in difficulties.
(*f*) Black has no completely satisfactory move. If (1) 14. . . . R to K 3, then 15. B to B 4 wins the exchange; if (2) 14. . . . R to K B 4, then 15. Kt takes Kt, ch, R takes Kt; 16. B takes P, ch, K takes B; 17. Q to R 4, ch and wins; or, if (3) 14. . . . Q to K 2 (perhaps best), then 15. Kt takes Kt, ch forces the disruption of Black's King's side pawns.
(*g*) Threatening Kt to Kt 5. If now 15. . . . P to K R 3, then 16. P to K Kt 4 (threatening P to Kt 5); or, if, instead, 15. . . . P to K B 3, then 16. Kt to Kt 5 followed, if (1) 16. . . . P takes Kt, by 17. B to B 4, ch, K to R sq; 18. Q takes R, or, if (2) 16. . . . P to K Kt 3 by 17. B to B 4, ch, and a check by the Knight. The move Black chooses seems the best, although it results in the loss of a pawn.
(*h*) If, to prevent B to B 4, ch, Black plays 18. . . . B to K 3, then 19. K R to K sq, to be followed by 20. Q to K 4. If (instead of 18. . . . B to K 3) 18. . . . P to Kt 4, then 19. K R to K sq, Q to B 3; 20. B takes P, ch, K to R sq (if 20. . . . Kt takes B, then 21. R to K 8, ch, Kt to B sq; 22. Q to K 4, B to B 4; 23. Q takes R and wins); 21. Q takes Q, P takes Q; 22. B to K 4.
(*i*) A very strong move.
(*j*) If, instead, 21. . . . Q to B 4 (threatening R takes P), then 22. Kt to B 7, ch, K to R 2; 23. B to Q 3.
(*k*) Threatening R takes B followed by Q takes R.
(*l*) If, instead, 23. . . . P to Kt 3, then 24. P to Kt 4 followed, if (1) 24. . . . R takes P, by 25. Q to Q 4, ch, R to B 3; 26. Kt to K 4; if (2) 24. . . . R to B 3, by 25. Q to Q 5; if (3) 24. . . . R to R 4, by 25. Q to Q 4, ch, and wins (if 25. . . . Q to Kt 2, then 26. R takes Kt, mate); or, if (4) 24. . . . B to Kt 2, by 25. Q to B 4, Q to Kt 2; 26. P takes R, B takes R or R takes R; 27. P to B 6 and wins.
(*m*) If 24. . . . Q takes P, ch, then 25. Q to Q 2. If, instead, 24. . . . B to B 4, then 25. Q to B 4 followed, if 25. . . . Q takes P, ch, by 26. P to B 4 or, if 25. . . . B to K 3, by 26. R takes Kt, ch, R takes R; 27. Q takes B. The text-move loses at once.

DR. EUWE'S GAMES

WE have received for review a copy of a book which we would say at once is a very valuable addition to chess literature. It is a selection of 75 of Dr. Euwe's best games in the last eighteen years, annotated by himself and with a descriptive paragraph to each game from the pen of Mr. F. Reinfeld, of New York, who has acted as translator. Dr. Euwe's reputation as an annotator is very high indeed, and in this book he is at his very best. His notes are thorough, lucid and very instructive, and the opening, the middle-game and the end-game have been treated with equal care. The result is a remarkably fine book, one of the very best ever written on the game. We very heartily recommend it.

From My Games. By Dr. M. Euwe. (Published by G. Bell & Sons, Ltd., York House, Portugal Street, London, W.C. 2. Price 10/6 net.)

PROBLEM No. 3984

By Dr. A. CHICCO.*

WHITE (10 pieces): King at Q R 7, Queen at K Kt sq, Rooks at Q R 4 and K R 6, Bishops at K R sq and K B 8, Knights at Q B 6 and Q 8, Pawns at Q Kt 3 and Q B 5.

BLACK (11 pieces): King at Q 4, Queen at K 4, Rooks at K 5 and K B 7, Bishops at Q Kt 8 and Q R 8, Knights at Q 2 and K R 7, Pawns at Q B 2, Q B 6 and K 7.

White to play and mate in two moves.

* *Settimana Enigmistica*, 1933.

SOLUTION OF PROBLEM No. 3983

1. B to B 3. If 1. . . . P to R 4, then 2. Q takes P, ch, &c. If 1. . . . K to R 4 or R 5, then 2. Q to R sq, ch, &c.

SOLUTION OF END-GAME STUDY

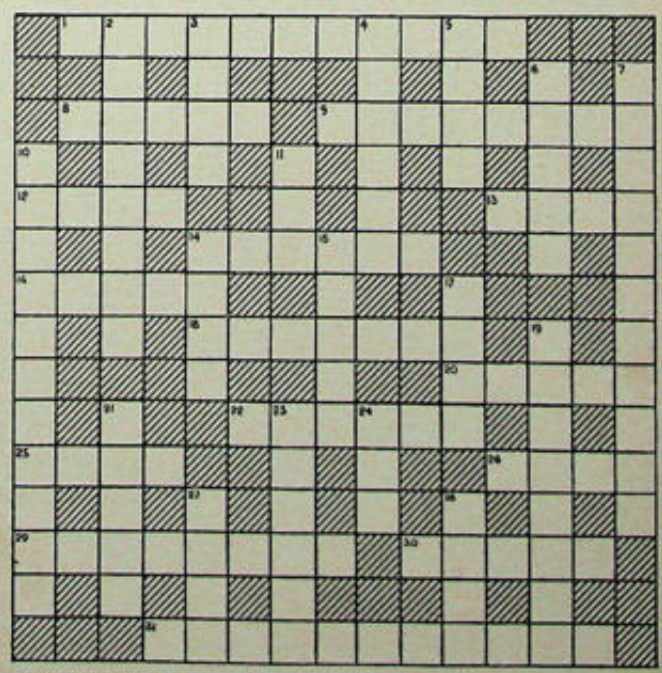
1. Q to K sq, ch, K to B 7; 2. Q to B sq, ch, K to Kt 6; 3. Q to Kt 2, ch, K to B 5 (if K to R 5, then Q to Kt 4, ch and wins); 4. Q to Kt 4, ch, K to Q 4; 5. Q to Q 6, ch, K to B 5; 6. Q to B 5, ch, K to Kt 6; 7. Q to Kt 4, ch, K to B 7 or R 7; 8. Q to Kt 2, ch, K takes Q; 9. Kt takes B, ch and wins.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 487

ACROSS.—1, A hawk-moth and yet a bird that sings under its breath. 8, If we change the middle letter of northerners we get the southern end, so to speak, of rabbits. 9, A hawk-moth with a fine trunk to its body presumably. 12, We often hope this responsibility will not be. 13, A hawk-moth which may be quick. 14, Four in the middle of a bush makes this hawk-moth. 16, Down on fruit and plants. 18, The science of modernising the language. 20, Striking result of a few turns round a cleat. 22, No deep clue here. 25, "O most small fault, how —— didst thou in Cordelia show!" (*King Lear*). 26, Most of this part of the wall makes a lot of bother. 29, Solve. 30, "Secret shades of —— Ida's inmost grove" (*Il Penseroso*). 31, Yes, a sore arm makes a salt-marsh plant.

DOWN.—2, Disjoin—trucks, for example. 3, This flits into several of the clues. 4, Perhaps it might be similar. 5, Oil is obtained from the seeds of this plant. 6, Customary for riding. 7, Administration of an oath. 10, This hawk-moth's a bit of a weed. 11, Dernier ——. 14, This hawk-moth shouldn't do this—it is so bad for the nerves. 15, "It is the rust we ——, not the gold" (Pope; Satires). 17, We've done this to many a hawk-moth. 19, Looks as if this hawk-moth has gone in for rowing. 21, Dazzling re-arrangement of sovereign epithet. 23, A suburban hawk-moth. 24, The whole point is just the reverse of what we could eat. 27, William Morris describes himself as: "The —— singer of an empty day." 28, "Let concealment, like a ——'i' the bud, feed on her damask cheek" (*Twelfth Night*).



A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Age of Trout.—Unfortunately all the scales except one proved to have regenerated centres, which render them useless for accurate reading. The one scale which seemed to be perfect showed either seven years or eight years, the last year or so being doubtful on account of the erosion from spawning marks. The fish spawned from its fourth year onwards.—*M. P., Hants.*

Country House

Pond for Goldfish.—In all probability the depth of your pond will have to depend, very largely, on how deep you have to go before arriving at an impermeable stratum, but, as a sort of general principle, you may take it that the pond should be not less than 3ft. deep and not more than 6ft. If you are going to put goldfish in a pond which also contains water lilies, you will be well advised if you watch the lilies very carefully in the autumn and clear out the old leaves the moment they decay. It appears that water lilies contain some kind of alkaline poisoning which, on occasion and under certain conditions, seems to be very destructive to goldfish.—*C. G. O., Kent.*

Golf

Books on Golf.—The best books on the subject you mention are the following, and from them you should be able to get all that you can require on the architectural side of golf: *The Architectural Side of Golf*, by Wethered & Simpson; published by Messrs. Longmans, Green & Co., 39, Paternoster Row, London, E.C. 4, at 3 guineas. *The Game of Golf*, by Bernard Darwin, Horace Hutchinson, Joyce Wethered, Roger Wethered, T. Simpson; published by Seeley Service & Co., 196, Shaftesbury Avenue, W.C. 2, at 15/-. *Golf Courses — Design, Construction and Upkeep*, published by Messrs. Sutton & Sons, Reading, at 15/-.—*A. P. Q. T., Nepal.*

Kennel

Registration of Springer Spaniel.—You should write to the Secretary of the Kennel Club, 84, Piccadilly, London, W., for a registration form, on which you will see full directions. You have to select a distinctive name for the dog that has not been taken in that variety for the last ten years. You will be told if the name is already booked. Fee 2/6. You have to give the names of the parents and say if they were registered. If either or both were not, you will be told the procedure.—*J. W. D. M., Castle Douglas.*

Falling Hair.—Constant shedding of the coat seems to be a weakness of some dogs. If your Alsatian has not been dosed for worms we should advise giving him a vermifuge as a preliminary, and then put him on a course of Parrish's Chemical Food. You might let him have a dessertspoonful of linseed oil with the food two or three times. Does he have plenty of meat? We assume you groom him thoroughly every day. That is usually beneficial to the skin. If the skin is dry, brush in a little coconut oil occasionally.—*K. E. H., Birmingham.*

Manchester and Bull Terriers.—We regret to say that there are very few breeders of the old Manchester terrier, and we know of none in your neighbourhood. The most likely are Miss J. C. Thackeray Schwabe, The Grove, Ashbourne, Derbyshire; Miss Ratcliff, 18, Station Road, Barnes, London, S.W. 13; Mr. W. Anstey, 59, Hill Street, Coventry. For coloured bull terriers try Mr. R. H. Glyn, Gaunts House, Wimborne, Dorset; Mrs. McNeill, 6, Wilton Crescent, London, S.W.; Miss E. K. Ayris, Broomrigg, Sarisbury Green, near Southampton.—*Brig.-General, Chippenham.*

Miscellaneous

Collective Terms.—Many of these old phrases giving collective terms come from the book of St. Alban dated 1486. Some of them are rather peculiar, and you would not hear to-day of a "harras of horses" which appears in the list, while the second term you refer to is a "shrewdness of apes." There are a good many others, such as a "murmuration of starlings" and an "exaltation of larks."—*W. A. W., Renfrewshire.*

Rowing

World's Sculling Championship.—We give below a list of the winners of the World's Sculling Championship from 1920 to 1935:

1920.	E. Barry	beat	A. Felton.
1922.	J. Paddon	,,	D'Arcy Hadfield.
1923.	J. Paddon	,,	D'Arcy Hadfield.
1924.	J. Paddon	,,	A. Felton.
1924.	J. Paddon	,,	Major Goodsell.
1925.	Major Goodsell	,,	J. P. Mellevitt.
1925.	Major Goodsell	,,	J. P. Hannan.
1925.	Major Goodsell	,,	J. Paddon.
1926.	Major Goodsell	,,	Tom Saul.
1927.	Major Goodsell	,,	H. A. Barry
1928.	H. A. Barry	,,	Major Goodsell.
1930.	E. A. Phelps	,,	H. A. Barry.
1930.	E. A. Phelps	,,	H. A. Barry.
1932.	E. A. Phelps	,,	Major Goodsell.
1933.	R. H. Pearce	,,	E. A. Phelps.
1934.	R. H. Pearce	,,	W. G. Miller.
1935.	E. A. Phelps	,,	H. A. Barry.

—*J. M., Bromyard.*

Rugby

Tackling.—In reply to your questions, we refer you to Law 16 of the laws of the game. (*a*) After a tackle the ball must be brought into play with a foot. (*b*) When a player is tackled, but not brought to the ground, he must *immediately* release the ball so that it falls to the ground between himself and his opponents' goal line. (*c*) The tackled player, if lying on the ground, must *immediately* release the ball, roll away from it, and get up before playing it with his foot. (*d*) No player shall prevent a tackled player from releasing the ball, or getting up after he has released it. (*e*) No player shall pick up the ball after a tackled player has released it, or when it is on the ground after a player has been tackled, until it has been played with a foot. (*f*) No player lying on the ground after a tackle shall interfere with the ball in any way until it has been played with the foot of a player who is not lying on the ground. The penalty for any of these infringements is a penalty kick awarded at the place of infringement. In the case of a player being merely thrown or knocked over, he may continue his run even though the ball has touched the ground. The law concerning the lying on the ground with the ball in your possession is that you must play the ball immediately or get up, or roll away from the ball.—*D. J. C., Oxford.*

Shooting

Cartridge Tests

Your cartridges contained 33½ grains of E.C. powder and ⅞ oz. of mixed shot, mostly size 6. Velocity averaged 954ft. per second, which is much too low for ordinary game shooting; pressure developed was also extremely low, a little more than half standard for the powder employed. From the results obtained, one is forced to conclude that they must be most unsatisfactory.—*D., Bramley.*

Travel

Touring Norfolk and Suffolk. Your first stopping place would be the Bull at Long Melford. Although its outside appearance will attract the wayfarer there is nothing to show that it conceals an interior so old and interesting. So far as is known, the sign of the Bull, so common in mediæval times, was first displayed there in 1580. There is much which is beautiful about the structure and decoration. Although the front is of painted brick, severely plain, at the back charming old timbers can be viewed from a quaint court, while inside the age of the house is much more evident. Having inspected the curiosities of the inn, visitors often like to inspect Melford Church, which dominates the town. The body of the church is notable as being entirely of one period—the latter part of the fifteenth century and early part of the sixteenth—though the handsome square tower is not original, having been built to replace an earlier one destroyed by lightning in 1711. As with the town of Long Melford, length is a striking feature of the church, which is 153ft. long. After that you might proceed to the Rutland Arms at Newmarket. In the neighbourhood of this hotel is famous partridge country. Pike fishing is to be had at Barton Mills, eight miles away, and golf on an eighteen-hole course about a mile from the hotel. The roads in the district make motoring a pleasure, and the hotel includes an excellent garage with all the necessary facilities. Although the main part of the hotel is of considerable age, it has been brought thoroughly up to date in its appointments and equipments. Real home comfort and excellent food are provided, and the splendid sporting facilities in the district make Newmarket an ideal holiday centre. Then on to The Bell at Thetford. This is Thetford's oldest surviving inn, and it appears that while Columbus was "going all out" to discover America, Britons were quietly drinking their beer in the Bell parlour with satisfaction to themselves and the host of what was even then a very prosperous establishment. Just how much of the original structure remains to-day is not quite clear, but it seems probable that there is a good deal of it in the wing that abuts on King Street. Undoubtedly this is the oldest part, and there are timbers there that might well be of fifteenth-century workmanship. In room No. 9, for instance, there still remains a fragment of the original wall decoration on some of the old timbers. A few words in Gothic lettering may be traced, while the sight of a crowned *rose-en-soleil* will recall the radiant rose first adopted as a royal badge by Edward IV. This was also a favoured badge of Henry VII, in whose reign the first extant record of The Bell was set down. From Thetford you could make for King's Lynn and stay at The Duke's Head Hotel. To-day this hotel looks out upon the cobbled grass-sprinkled market place from behind a defacing coat of "compo," which hides an original brick front from view. Built in the Renaissance style, its two great features are the broad, shallow-stepped seventeenth-century staircase that leads from ground to attics, and its delightfully proportioned, white-panelled lounge. In the coffee room there are to be seen the solid Georgian chairs, probably used by the "great" folk who once arrived by "private carriage only." Old sporting prints on the walls tell observers much of the inn's past history. A new wing of modern bedrooms was recently added, and the stabling turned into garage accommodation. Yet all this has been done with due caution, and the character of the building remains unimpaired. After this push on to Blakeney, and possibly stay at the Blakeney Hotel. It is a grand spot for a holiday. There is a bird sanctuary quite near, while the countryside is wild and uncultivated. After staying at Blakeney, it would be quite a good plan to move in line to the Maid's Head Hotel at Norwich. Two or three times this hotel has come into our national history, very definitely. Thus, in 1549, the leaders of the Royal Army there fortified themselves with breakfast on the day that they made an end of Ket's Rebellion. It was the headquarters during the Civil War of the local Royalists, who were several times attacked there by the Roundheads. Queen Elizabeth is reputed to have slept in the fine old room named after her, but although she visited Norwich in 1578, there is nothing to show that she stayed at the Maid's Head. The house is, indeed, full of interesting ancient rooms. The long lounge has a beamed ceiling, a great open fireplace, and a sixteenth century fireplace that had long been concealed by a modern grate. Adjoining it is the delightful little Jacobean room used as the bar. Another, and even earlier, fireplace was discovered in the thickness of the drawing room wall; now, fitted with dogs and a hood, it makes a handsome picture. The billiard room is panelled and the dining room, once the assembly room, so favourite an adjunct of hotels in the eighteenth century, has the usual music gallery. You will now be travelling towards London and no doubt you would enjoy a stay at the White Lion Hotel at Eye. While the face of England changes in many places, the ancient borough town of Eye in North Suffolk remains much as it was when coaches were the gondolas of the road. Eye, after all, means an "island," and living up to such a name the town has always been sufficiently "off the map" to resist too much modernisation. That is one of the reasons why the White Lion Hotel has changed so little in appearance during successive centuries. Inside, of course, the owners have seen to it that the inn has kept abreast of the modern demand for comfort. So as to be within easy reach of London on your last day, we would suggest a visit to the Crown Inn at Woodbridge. The inn to-day is typical of the eighteenth century, with its rambling corridors, odd corners and changing levels. Some reports have it that the Crown first put out its sign during the Wars of the Roses, when such a symbol could offend neither side, but local historians affirm that the house was the principal tenement of the Manor of Woodbridge-Ufford, the manorial courts of which were held there until the last century.—*N. W., London.*

HORSE SALES OF THE WEEK

Leicester

A FULL catalogue of horses was dealt with at Messrs. Warner, Sheppard & Wade's usual weekly sale at Leicester on Saturday last, and a fair number were sold. Lord Leconfield sent up a string of six, all of which changed hands, his bay gelding, Patrick, going for 175gs. and black gelding, Poodle, 130gs.; whilst Colonel Wiggin got 125gs. for his chestnut gelding Stirling. The following is a return of horses which made 30gs. or more. Property of Mr. W. J. A. Shephard: Ch m, 48gs.; b g, 32gs. Property of Mr. Tim Curtis: B.B., b g, 65gs.; Baroness, br m, 46gs. Property of Colonel W. H. Wiggin: Stirling, ch g, 125gs. Property of Lord Leconfield, M.F.H.: Poodle, bl g, 130gs.; Ploughboy, br g, 92gs.; Patrick, b g, 175gs.; Phosphorous, ch g, 48gs.; Polecat, ch g, 61gs.; Pippin, bl g, 34gs. Property of Mr. Derby Haddon: Smasher, b g, 40gs. Property of Lieutenant-Colonel Trollope-Bellew: Lady Tawny, b m, 42gs. Property of Messrs. Baillie Brind & Co., Ltd.: Samson, b g, 50gs.; Cottage Boy, bl g, 45gs.; First Chance, ch g, 30gs.; Laxton, b m, 60gs. Property of Mrs. Colin Cooper: Br m, 84gs.; gr g, 94gs.; br g, 60gs.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

UNDER THE EYE OF THE EXPERT

Lord Desborough watching work in the tank after opening Imperial College Boat House which was built by the students at a cost of £17,000. The new quarters by Putney Hard are splendidly equipped. On the ground floor the boats are stored in an ingenious manner on racks which move on ball bearings; on the first floor is the dining room and dressing rooms with showers, &c., and on the roof the covered-in tank. From the balcony there is a view of the Boat Race course from the start to Hammersmith Bridge. Imperial College crews, with these facilities, should soon be able to show the way to their rivals on the Tideway

WEEK-END COTTAGE

NO historical contrast could be more sharp than the difference in attitude towards the country between the Restoration and the present age. "Beyond Hyde Park," said Sir Fopling Flutter, "all is a desert." Yet it is precisely the modern Sir Foplings who are most insistent on a connection with the pursuits of the country. It is difficult to say why people who are essentially at home only in towns should derive a satisfaction by periodically making themselves thoroughly unhappy in the country—unless their attitude can be ascribed to a general discontent and to the insidious activities of the gossip writers. Such people are sometimes photographed on the way to the meet or while walking to another stand, and these are the most courageous. Those with less heart fall back on the ease—always coupled with a suitably vague atmosphere—of the week-end cottage.

We would not have it thought that everyone who possesses a cottage in the country is necessarily a fraud, for that would be far from the truth. The type of person we have in mind is the type which has the time to spend every week-end in the country. Dr. Johnson praised the countryside in his verse in a manner which left no doubt as to the sincerity with which he praised the city in his prose, and it is this same attitude which prompts the dweller in towns to own a cottage in the country to-day: for a definable connection with the countryside has become a social responsibility. Formerly the squire and his family, though lords of all they surveyed in their own village, were uncomfortably aware that they were nobodies in Town. Nowadays the most confirmed city dweller must, in order to be recognised, be able to speak largely of his life in the country.

Much harm has been brought about as a result of this social movement. It does no good to the country or to the men and women who strive to make their living there. The week-end party descends on the country peace complete with everything it needs for the duration. No attempt is made to understand the rustic problems with which they are surrounded, no effort is made to do anything except to have a change. No visible advantage is conferred upon the countryside, and, if Mr. Punch is to be believed, the energy required in the pursuit of a week-end's pleasure in the country is infinitely greater than that needed for a week's work in Town.

But it is fortunate that there is another type of cottage, frequently abandoned, it is true, for months at a time, yet still a cottage to whose occupation the local countrymen look forward. This is the cottage whose owner is exiled in a city, and who is thankful if he can escape to the country even once a month. He snatches a day's hunting or a day's rough shooting, and by his presence the countryside is happier. For he talks at great length, and with much sympathetic knowledge, to the local farmers; he hears their grievances in silence, only speaking when he is sure that he can hold out a prospect of hope. And he himself is also a gainer, for in those few precious hours he has been able to remind himself that in the countryside there is still an occupation where a man may work and remain unvulgarised by the taints of the city.

OF SERVICE TO THE STATE

IN any voluntary national effort it is obvious that organisations connected with sport must play their part; where there is the machinery to hand use can be made of it in any emergency scheme, as was instanced during the War. That very much alive body, the Institute of the Horse and Pony Club, Ltd., has taken time by the forelock, and through its chairman, Sir Hubert Gough, has offered its services to the War Office. In spite of, or rather because of, mechanisation, there is bound to be a call for those who have experience of duties connected with horses, and here are volunteers who have the requisite training. Elder members of the Pony Club and adult members of the Institute of the Horse might usefully be employed in collecting and looking after horses for the Army Remount Depot. The Institute is in touch from its headquarters with District Commissioners in all parts of the country, and there are over 130 branches of the Pony Club, whose members could be utilised for local services. The action of the Institute is to be commended; it had the support of all its representatives at a recent meeting and of its president, the Duke of Beaufort.

In every section of the community there are willing hands ready to tackle any job which will help to bring this country into a state of preparedness to meet any possible eventuality. Active tasks can be performed by athletic associations, and those who are beyond physical work will find occupation in organisation. The material is there for the Government to direct into proper channels. Sport and the spirit it engenders has proved its value in the past and it can again be enlisted in the service of the State.

THE SOUTH AFRICAN TOUR

With the departure last week of the sixteen English players on their journey to South Africa, cricket again takes its place in our thoughts. Many enthusiasts who assembled to see them off must have gone back to the time three years ago, when the South Africans enjoyed a most successful tour; to their magnificent defeat of Yorkshire at Sheffield; to Bruce Mitchell's classic innings on a very nasty Lord's wicket, and the opportunism of Langton and Balaskas, which gave the visitors their first Test match victory over England; to the "back-to-the-wall" innings of Wade at the Oval which virtually gave them the rubber. But there is another reason why we shall follow this tour with especial interest. Cricket is having its crisis, for the type of game exemplified by the genius and googlies of Faulkner and his men could never have lived in the modern timeless fiascos, and provides another argument against over-prepared wickets. It is significant, too, and, we hope, symbolical, that there is an organised movement in South Africa for rapidly replacing matting by turf wickets.

"KNEES BEND" FOR CORPORATIONS

The Physical Fitness Campaign can claim to have justified itself when the Lord Mayor of London announces that he touches his toes without bending his knees twenty-eight times on getting out of bed every morning and issues challenges to other leading City officials. Basing judgment on photographs, there are many prominent Continental fitness enthusiasts who would find the test a bit of a trial. If at any time "Knees Bend" or "On the Hands Down" threatens to become an athletic preliminary to taking office, City Fathers may apply for a ruling that it is an unreasonable demand, on similar lines to the American lady who protested at being called upon to get out of bed and stand smartly to attention when the national anthem was played on the wireless.

DONINGTON SIDELIGHT

Last Saturday England experienced one of the greatest motor races in her history, when British cars chaperoned the Auto-Union and Mercédès teams in their tremendous struggle at Donington Park. Although the British had no hope of victory on the track, they have received tribute enough, from Herr Huehnlein, chief of the Nazi Motorised Corps, to make the nation blush. He said he was tremendously impressed by the "discipline and perfect functioning of the often gigantic traffic in London shopping districts." Britain, he considered, was far superior to his own country in this respect. He praised our traffic lights and our good road manners, which he described as the "knightly consciousness of responsibility of every individual," which quality he hoped to instil into his own people on his return to Germany. May we remain worthy of such high praise.

SCOTTISH SALMON BILL

When Parliament reassembles it is to be hoped that the urgent claim for the new Scottish Salmon Bill to come up for consideration during the autumn will not be overlooked. With many matters of importance to the welfare of the whole country impending, there is always a tendency to forget the urgency of reform for any one part. The object of the Bill is primarily to improve a small but important part of the food supply of the country, and one, moreover, which requires next to no assistance from public funds. Every year which goes by puts this improvement another twelve months in arrear. Now is the time for anglers and fishery owners to drop differences on detail, if differences there be, and unite to impress upon their representatives the real need for new legislation to be passed.

FALLING LEAF

Leaf by leaf the limes are shedding
Golden glory on the grass,
Carpet for the fairies' treading,
Pillows for an elfin bedding,
Roadway for the gnomes to pass.

Leaf by leaf the burning beeches
Fling their rubies down the rides,
Where the winds in forest-reaches
Blowing from the ocean-beaches
Lilt their love to woodland brides.

Rustling feet of hounds and horses
Stir the waves of gold and red,
While with all their old resources
Foxes thread their chosen courses
Through the coloured drifts ahead.

In the naked aisles surrounding
Wake the distant echoes now,
Trembling to the horn's resounding,
Till the music all-abounding
Shakes the last leaf from the bough.

WILL H. OGILVIE.

A COUNTRYMAN'S JOURNAL

IT is easy to see that both the quality and the security of the basket-maker's craft depend upon him renting or owning an osier-bed or withy-ait. Therein lay the strength of the old rural craftsmen, that they controlled not only the processes but the material of their trades. There are at least 30 different sorts and degrees of osiers suitable for basket-making, though the botanical species are only two—*Salix viminalis* and *S. purpurea*. The multiplication of differences in the basket-maker's eye is due partly to special treatment in the pollarding of the trees and bushes and partly to the inclusion of various species of willow among them.

My particular friend preferred what he called the "stone osier," a yellow rod with a bright red top, and the "black maul" of Northants, "a nice, kind and narrow rod," by which I think he meant the purple osier or rather one of its varieties. A neglected osier-bed means not only that the trees themselves deteriorate, but that the tapering rods lose their pliancy and suppleness and become too "rough" for use. Therefore, when the rods are imported, the basket-maker ceases to be the good cultivator, he no longer exercises any choice in the selection of the right material, he finds the earth cut from under his feet, his trade is rendered more precarious, and land that is "kind" to the osier but not to crops goes derelict.

My man's scorn of the "muck" he had no alternative but to buy, when he had to give up his three osier-beds, was a lesson in the fundamental incompatibility between rural economy and commerce. Only the basket-maker himself is able to tend the osier-bed, and if it fell into the hands of the farmer in the way that the turner, the hurdler and the besom-maker lost their underwood coppices, then the osiers were planted too thinly or too densely or in a too swampy ground or the wrong kinds were grown and had "no nature in 'em." Nothing could demonstrate more clearly than basketry the interdependence between agriculture and the crafts.

The rods used to be cut in February, carefully graded and sorted and stacked for at least a year, better still, for eighteen months, and best of all for two years. Before actual usage, they were soaked for 24 hours in the boiler and then stripped by the "brake." This, like so many of the old implements of husbandry and craftsmanship, is of the simplest structure—two iron bars joined by a loop at one end to be hung on a nail and widening outwards like a pair of tongs. The butt-end of the rod was drawn sideways between them, and the hand that held them at the wide end contracted as the rod tapered.

The actual tools that the basket-maker uses depends upon the baskets made and the trades supplied. My master-man made coal and flint baskets, fruit hampers, innkeepers' "bottles," chaff and feeding baskets and those in use by butchers and greengrocers. One of his specials is a "butter-plat," a basket with a lid holding three dozen pounds of butter, three pecks of fruit and eight ducks.

Consequently, his tools are more numerous than those in use among village craftsmen who supply (or supplied) a narrower and more strictly localised market. He displayed to me no fewer than four bodkins, pegging, shell, stake and ordinary bodkins, whereas an old basket-maker I know on the banks of the Severn used only one to make baskets so solid and beautiful that they will long outlive the flimsiest of all periods, our own. He used two picking knives for slicing off the ends of the rods, short broad knives with elliptical butts often made from pear-tree wood that with beech used to be the material of the old wooden ploughs. Then comes an iron or maul for straightening out, a "shop-knife" for paring off, shears to cut off dry sticks—he has had these for more than 40 years—pincers, a cleaver to split a rod into three pieces, and a shave to fine it down.

They were as pretty a set of tools as a man could wish to see, but profitless without a traditional method of use inherited from a long line of ancestors, and yet perfectly combined with personal freedom and initiative. The biologist says that the past lives on in the present, but the words expressed something more than a vacant truism when pairs of unseen hands were supplementing his own. If the alimentary canal between the past and the present be choked in any rural industry, the craft itself shrivels and dies.

H. J. MASSINGHAM.

WITHOUT COMMENT

A suggestion for catching the Streatham fox:

"I should think that there are a number of people in the district who have hounds and they might be willing to give them a little hunting practice."

"Beagling is Fox Hunting with the lid off"

HORSE FIRST, HOUND SECOND

And the Ideal Way of Combining Both

DO you hunt to ride or ride to hunt? The answer to this question would divide into two classes those who follow hounds and, although there is, of course, considerable overlapping, undoubtedly those who hunt to ride predominate.

There are so many more people who have an intimate knowledge of horsemanship than of hound-work and hound-management, that it is unfortunately often very difficult for the budding Nimrod to find an adequate mentor in the latter subject. The result is that the general procedure is for him to learn to ride first, and then, and only then, to glean as best he may the rudiments of hunting lore.

There is, however, I would suggest, one very simple solution to this problem . . . beagling. Beagling is, in effect, foxhunting with the lid off! It enables the humblest member of the field to see the whole proceedings, and I am satisfied that I myself learnt more about hounds and hunting in my first day with beagles than in all the foxhunting I had ever had, and it is a fact that many who to-day carry the horn served their apprenticeship in pursuit of the hare.

It is well nigh impossible for a beginner, be he child or adult, to be consistently near enough to foxhounds to enable him to appreciate the finer points of the hounds' working and, in a woodland country, there must of necessity be long intervals when the "music" is the only sign that hounds exist.

With beagles, however, one can see the "draw" and the "find," and it must come as a great surprise to the inexperienced to see how very easily a pack of hounds can be suddenly at fault when only a moment before they were apparently screaming on a breast-high scent. This may, of course, be due to a variety of causes; for example, it may be that the pack was running to "view" and that the quarry, having turned sharply, has simply disappeared, or that the pack, carried away by undue enthusiasm, has "flashed over" the line.

Thus for the first time the novice gets an insight into the difficulties with which the huntsman's task is fraught, and learns to contain himself in patience in the early stages of the proceedings; that period when, alas, there is such a temptation to jockey for a good start. He can appreciate, too, the vagaries of scent and, what cannot be seen in covert, how too many foxes or hares baffle hounds by jumping up in front of them, or by crossing and foiling the line they are hunting.

So many people imagine that scent lies exactly on the line of the quarry's pads that they get a rude awakening when they see for the first time hounds hunting parallel to the line, as much as 30yds. or 40yds. away from it, down wind; let them thus learn not to pester the huntsman by persisting in telling him that his hounds are at fault because they are not on the exact spot where the fox was viewed.

The beagling enthusiast can see for himself the technique of a "cast," first forward, then all round. In watching the place where hounds last spoke and where they hit off again, he can learn to read the mind of a hunted hare and possibly to anticipate her wiles; how she may run down one side of a fence and double up the other, or swim down a stream leaving no trace, until she emerges upon the opposite bank, some distance below. Her twists and turns should bring home practically and forcibly to the would-be foxhunter that if he gets too near when a cast is being made, he is in grave danger not only of getting a well-deserved cursing, but what is far more important, of ruining completely the sport of the whole of the field.

The tyro, by watching the whippers-in and the more experienced members of the field, can learn rapidly how to be of great help by keeping his ears and eyes open . . . and his mouth shut! Unnecessary chatter at crucial moments does incalculable harm, and longevity amongst foxes would be substantially reduced if every one remembered never to holloa when hounds are running—since up go their heads and valuable time is lost—and, if holloa they must, let them learn at least to distinguish between the hunted fox or hare and a fresh one.

Meanwhile, however, I can hear those who "hunt to ride" champing at the bit at the length of my digression upon the necessity of appreciating the finer points of hound-work, and perhaps with just cause.

Clearly, for the man whose hobby is horses, hunting is fundamentally the excuse for a gallop across land and fences to which he would not otherwise have access, and very naturally to him a day's hunting without a good gallop and much jumping is a day wasted. After all, though the interest for the huntsman may be never failing, there are few things more depressing than sitting outside a large covert on a cold, wet day waiting for a hunt which does not materialise.

Then a holloa! We key ourselves up to a state of intense excitement, cram our hat on our head and gallop all out for the first fence or gate, only to find that there is not an ounce of scent and that hounds have checked and cannot run a yard. It's maddening, but it merely serves to stimulate the enthusiasm until at last comes the real thing . . . a fast 40 minutes over good grass country with plenty of "lepping" and no wire. Cares vanish and one's sole thought is how to keep going until, perchance, one is alone with hounds . . . that sublime ecstasy which passeth man's understanding.

Far be it from me to draw any odious comparisons between the one class and the other, between those who are sublimely satisfied, regardless of all else, provided hounds have hunted well and those whose sole idea is to go and go well; the ideal is a union of the two. Suffice it to say that if only the partisans of the horse appreciated more fully the intricacies of the huntsman's craft, they would, on bad days, derive solace from their additional understanding, and, by applying religiously the precepts culled from their days with beagles, they would on many more occasions enjoy the gallop of their dreams.

GEORGE H. PEILE.

"ON REACHING THE SHOOTING POINT WE FOUND THE STAG WAS UP"

HIGH AND TO THE LEFT!

"Emotion Recollected in Tranquillity"

By LORD DORCHESTER

THE stalking season of 19— had proved a failure up to date, fog had alternated with storms during the past month, while an unfavourable wind had kept hundreds of good beasts in the sanctuary, and so the forest was still some 40 stags short of its quota. This, almost the last day, promised well, however, for the weather was fine and the wind in the right quarter, and moreover my host had dispensed with the limit, adjuring his guests to smite and spare not.

So all was *couleur de rose* until I was informed that a clumsy gillie had dropped and broken the stock of my rifle. This was indeed a facer, for the only other rifle available was an old Ross of doubtful accuracy owing to a bent foresight, which had never been properly readjusted. *Faute de mieux*, since I had to take the Ross or stay at home, I decided to chance the "dud," but as a precaution my host and I took it down to the iron stag and tried some sighting shots; the result was not encouraging.

With a normal sight at 100yds. the rifle threw at least 20in. high and to the left. Several of us tested it—one a very good shot—and all the results tallied. Under these circumstances, I felt very doubtful about accepting the loan, feeling sure that at the moment of firing I should forget to make the necessary allowances, but finally I yielded to persuasion, and decided to try my luck.

I may add in parenthesis that this decision was wrong, but I was a good deal younger in those days, which must be my excuse.

On arriving at the rendezvous, Macbean, the stalker, told me that a travelling stag, a good eight-pointer, had just come in and was settled, he thought, behind a knoll some 400yds. from the pony track, and that we might as well go for him at once.

The stalk was nothing, just a walk across dead ground to the knoll, with no hinds to bother us. On reaching the shooting point we found the stag was up and pacing to and fro, roaring at intervals, and it was the waiting for him to turn broadside on that made me forget altogether about "high and to the left." Presently another stag challenged in the distance and my quarry immediately wheeled round and stood at gaze giving me a beautiful broadside target at about 100yds., and I counted him as good as in the deer larder. Bang! followed by a splash of water and a spurt of mould in the peat hag above his back; nor did he wait to see whence the shot had come, as they sometimes do, but away with him on the instant without giving another chance.

Macbean looked unutterable things, even after I had explained the defect in the rifle, and how in the excitement of the moment I had omitted to make the necessary allowance. I felt in my bones that he discounted my excuses, and thought the less of me for having made them.

This first stag was an interloper, a wanderer from over the march, and we had, so to speak, taken him *en route* to where the stalker had spied a good beast, an eleven-pointer, early on before my arrival. A short spy found him and a lot of hinds grazing down a ridge on the confines of the sanctuary, and quite undisturbed, since the scene of my misadventure was out of both sight and hearing.

This approach necessitated a widish turning movement by way of a thicket of self-sown fir trees and tall heather, and I was following close on the heels of the stalker when he dropped suddenly, an example which I imitated.

Turning, he whispered that he had caught sight of the horns of a beast lying in the heather not 40yds. in front. The stag was not visible, but we could see the horns quite plainly as he swung his head from side to side knocking off the flies and midges.

We waited for some time to see if he would move, and finally decided to whistle him up; so I got ready to shoot, and this time was determined to remember all about the eccentricities of my rifle.

Having signified that I was ready, Macbean whistled, but nothing happened; again he whistled, again the stag took no notice; he whistled a third time, and more loudly, but without result except that the horns ceased to move, showing that he had heard us at last. Finally, in exasperation, Macbean spoke loudly and firmly, as though apostrophising an unruly dog "Sit, wull ye, Jock. Sit, I tell ye!"

At this the stag rose quite leisurely and gazed about him, giving me a good view of his forehand. I took him, as I thought, behind the point of the elbow and down he slumped, stone dead.

"The neck shot is the best of all for making sure, but a wee bit chancy," commented Macbean.

Chancy! I should say it was. I had aimed for the shoulder and broken the neck just behind the ears. Once more had I omitted to make allowance for that bent foresight, but this time I said nothing about it.

"Anyway, we'll not go home clean, and here's more blood," with which requiem we left that most unlucky of beasts and took up the thread of our interrupted stalk of the eleven-pointer.

To make a long story short, we located him and another very good beast feeding on a grassy flat just beyond the foot of the ridge on which we had first spied him. The spur of the ridge gave us cover to within 50yds., as it ultimately transpired, whereas we had thought that we should find the deer at least 100yds. further on, so we came upon them too quickly, and since their heads were down we did not see their horns to warn us. Also, I think Macbean was a bit careless getting in.

Anyway, we had barely breasted the rise when we found the two stags quite close to us. I snatched the rifle which Macbean practically thrust at me, movements which the deer caught at once; and up went both heads. There was not a moment to lose, but even so it was a wonderful chance for a "right and left." Both stags broadside on, one to the left, the other to the right and certainly within 60yds. I took the eleven-pointer first only to see the bullet splinter a rock just over his neck. Miss number one! I turned and took a snap shot at the other, who was already trotting stiltily across my right front. Another miss! the track of the bullet showing clearly above his loins as it furrowed a line of dewdrops along the deer grass beyond him. Miss number two! Once again I had forgotten the lesson of the sighting shots.

This second misadventure so infuriated me that I decided to go home e'er worse befell and I should wound a stag. Three times had I found it impossible on the spur of the moment to recollect what I should do and aim accordingly.

This decision greatly offended Macbean; he was always desperately keen, ready to go from dawn till dusk, and I felt in my bones that he attributed my failures to bad shooting, and nothing else, especially as I had not been man enough to plead guilty to a fluke when making my neck-shot. He therefore pleaded with me to go on, urging that the

day was yet young and that the change in the wind had drawn a lot of good stags out of the sanctuary, and, as a final inducement, he promised to take me so close that I could not miss. Much against my better judgment I decided to carry on. At the point which we had reached the open forest descended in a succession of stony terraces to the tree line marking the commencement of a vast range of fir woods which here clothe the lower slopes of the hills, and Macbean proposed to skirt the woods and spy their openings.

Very soon we picked up some beasts feeding in a glade some quarter of a mile below, four stags there were, two with good heads, as well as a lot of hinds, calves and knobbers.

The stalk was very simple, a gentle slide down a heathery slope and then, when we got among the trees, an easy approach with plenty of cover to where a rock, covered inches deep in moss, gave a perfect shooting rest within about 90yds. of the biggest stag, who was grazing immediately below us. This time I was determined that there should be no mistake and that all due allowances should be made.

The potential victim was feeding away from me and downhill a little to my left front, a position which caused his head to be much lower than his stern, notwithstanding which the whole of his right side was fully exposed, giving me a beautiful chance, and the shot should have been a certainty.

In addition, I was shooting from what I call a "pulpit," the rock sloping gently upwards and cushioned, for my elbows, in moss; moreover it rose well clear of those grass blades and heather tufts which so often blur the foresight.

Since the shot was downhill I decided to take him a little behind the right shoulder-blade so that the bullet should rake forward through heart or lungs, or both.

He fell on the shot, but to my surprise was not dead when we reached him, only paralysed in the hindquarters. I went close up and took a shot at his neck and missed! I fired again with the rifle at touching distance, and so ended his misery. On searching for my first bullet I found that I had broken his spine just forward of the root of the tail.

This decided me, and I told Macbean that I would not go on, that it was not fair on the deer or him, or myself, so having signalled the pony Macbean set about the gralloch.

This last stag was a good, heavy beast, with a wide, wild head bearing ten points, and altogether a trophy to be glad of under other circumstances.

Macbean was performing the gralloch and I was smoking when we heard a deep roar down in the wood which presently was repeated, and much nearer, and from the way the stag was heading it seemed likely that he might pass near us as, fortunately, he was coming across the wind. We therefore took cover to await events.

LOOKING DOWN THE GLEN

Presently two hinds came climbing up a steep deer track that passed within 40yds. of where we were crouching. I paced the distance later. We were both well hidden, and the dead stag lay in a hollow out of sight, so, quite undisturbed, the hinds passed on.

Meanwhile we could hear their admirer clattering on the stones and uttering an occasional roar as he climbed in pursuit, and in due course a really heavy stag—an eleven-pointer—appeared, and just when he was opposite to us he stopped to roar.

"Ye maun shoot that ane; ye canna muss at forrrty yairds; aye and it's a gran' beastie!" whispered Macbean hoarsely—and indeed I had already sighted on the spot where the hinds first came into view, and I really thought that this time it would be all right. But it wasn't!

I still recall that sickening, sinking feeling that came over me—I have it when the line comes back and the rod flies up straight, or when my opponent sinks the long putt that means the match—as I saw the bullet smash a chunk of bark off a tree well to the left and above his back.

Macbean was livid: "I wad nae hae believed it; we'd best be awa' hame."

At that I turned on him.

"I told you I did not want to shoot, but you persuaded me; now take the rifle yourself and try and hit that d—d tree over there!" pointing to a big fir some 30yds. away.

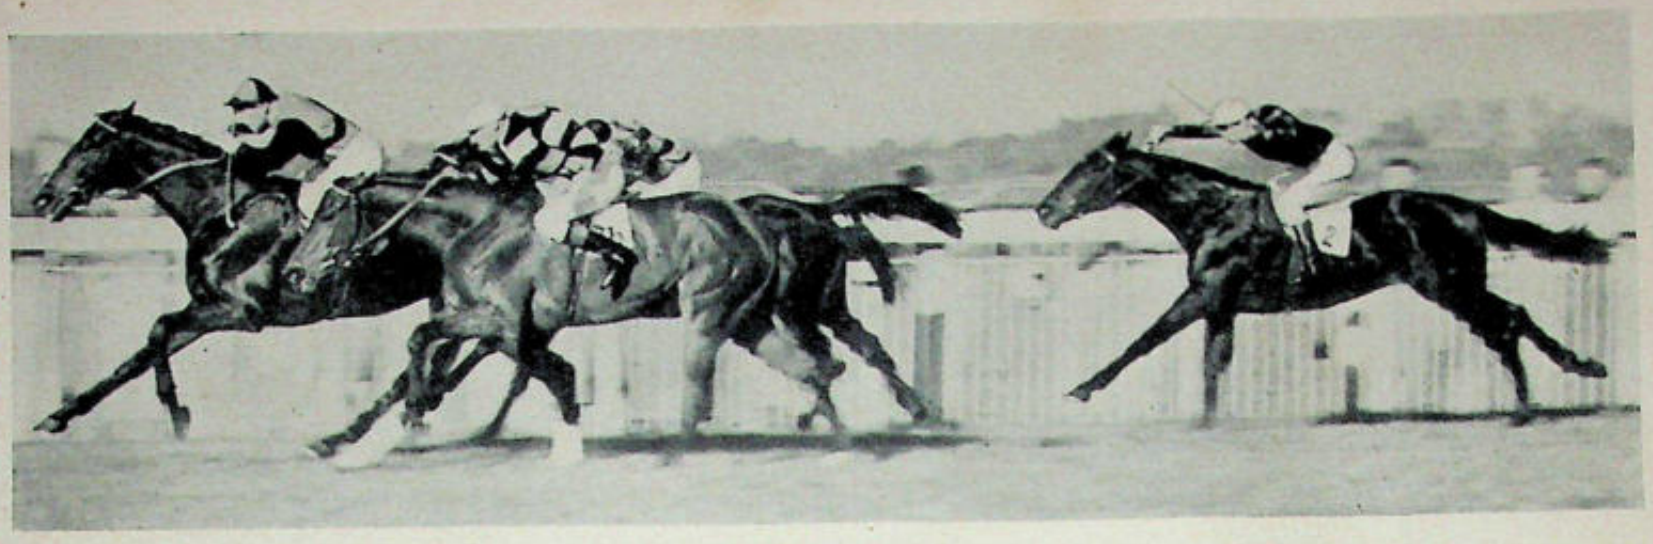
Three times he shot, and three times he missed, and he was a good shot.

"Do you believe it now?" I asked him.

"Aye, perhaps it was na' a' your fault!" he added grudgingly.

All this happened many years ago—Macbean, by now, should be head stalker in the Happy Hunting Grounds—but it taught me never to take the hill with a doubtful rifle.

THE RIVER ARKAIG ON ITS WAY THROUGH ACHNACARRY FOREST



THE OCTOBER NURSERY HANDICAP AT NEWBURY
Fairchance (far side), the winner, Statute (hoops), and Happy Day racing together

SANDOWN PARK AND NEWBURY

Superb Weather for the Autumn Racing

IT is not always the great weeks' racing that is the most enjoyable. Last week's racing, for example, was not as important as the weeks that went before and followed it, but it was most enjoyable, especially the two days at Sandown Park and the two at Newbury. The weather, which was perfect—October alone can provide such days—had not a little, it may be said, to do with the enjoyment. And let it be stated at once that on the whole the Ring had the better of the argument, so that the enjoyment cannot be said to have been due to financial gains, although they would have made it still more enjoyable.

On a wet day Sandown Park is far from an ideal place for racing, for the members' stands are far from adequate. I suppose that they will be rebuilt one day. Let us hope that it is soon. Like many other people who love Sandown Park, I always regret that when the coffee room caught fire a few years ago that fire was at once put out. On the other hand, when the weather is fine, Sandown is an ideal place, especially for jumping, and we had a day's jumping last week.

We can leave out the two Selling Plates with which the Sandown Park days flat racing was begun, and turn for a moment to the Orleans Nursery. The previous week-end two of the visitors had been told that there might be a good thing in this race, by name Wild Lavender II. Nothing more was heard of the "tip," and when it was seen that the filly in question, by Mr. Jinks, had drawn number thirteen at the start, the very outside of the field, that was considered to be the end of the tip. Naturally the beast won after being in front or second all the way, and at the long and pleasant odds of 100 to 6. That was not the end of the tragedy, for the second half of the daily double was won by Sybil, who was considered by the visitors in question to be a good thing. Sybil won the rich Atalanta Stakes for Lord Bicester. She is, I think, the only flat race horse that this great patron of jumping has in training. Sybil is a full sister to April the Fifth, and is leased to Lord Bicester, better known as Mr. Vivian Smith, for her racing career, after which her owner, Mr. S. McGregor, will breed from her.

So much has been said, and written, to the effect that April the Fifth was a freak result of breeding, and therefore not likely to make a great sire, that it is pleasant to see this useful and good filly bred on exactly the same lines. It should do April the Fifth good as a sire. Sybil won on the stands side of the course at Sandown Park, generally known as the Jack Jarvis By Pass. Some years ago, when the course at Sandown Park was watered—for the benefit, be it noted, of trainers—Jack Jarvis discovered that the watering arrangements covered only half the course with water, so he instructed people who were riding for him to leave the far rails where the going was soft and come up on the hard unwatered ground on the stands side of the course.

The first time that he did that Miracle won the Eclipse, and his riders have had instructions to do the same ever since with much success. The Sandown Park executive then thought that they would stop that, and that trainers should use the part of the course that they had (at great expense), had watered for the trainers' benefit, as they had complained of the going. Accordingly they placed rails on the stands side of the course, thus keeping the runners all on the wetter ground. Still Jack Jarvis ordered his riders to come up the stands side of the course along the new rails, and still horses running there win.

It now transpires that it was not only on account of the watering that caused Jarvis to try his plan. He had been down the course many times, and looking up to the winning post from the beginning of the straight he found that the shortest way to the winning post was to run wide and come up along the new rails. I wonder how many other trainers have walked down the courses and studied the lie of the land for themselves. Such men as Jarvis deserve their success.

I wonder what sort of a two-year-old Cupid's Dart can be? This gelding, by Bold Archer, has had only one race, when he won a race at Chepstow by six lengths from Skylarking, who has since won at Newbury with Heather B not in the first three. Heather B won the Maiden Plate at Sandown Park from a bad draw, and will no doubt win again. The best two-year-old in that field, however, may turn out to be Romulea. She was having only her second race, and was drawn on the rails, things which she had never had to race alongside before. She was also running in a very large field. The result was that she began slowly and then ran very greenly. Even then she ran very well, and could have been much nearer to the winner if she had been ridden all out.

Her rider, however, quite properly dropped his hands when he saw that she could not get even a place without being severely punished. The breeding of Romulea is most interesting. She is owned by Lord Londonderry and trained by Captain Bell. She is bred on much the same lines as Rockfel, the winner of the One Thousand Guineas and the Oaks, the only difference being that Colorado takes the place of Santorb. It is interesting to note that Rockcliffe, the dam of Rockfel, was owned by Lord Londonderry, who sold her to Sir Hugo Cunliffe Owen. I shall look forward with interest to Romulea's career as a three-year-old. She may well be a very good one.

The jumping at Sandown on the second day of the meeting does not call for much comment, but it is to be noted that fields were large—a sign of a most successful season when racing under National Hunt Rules really comes into its own again after the flat race season ends with the Manchester November meeting, and that, sad to record, is not far off. Indeed, Christmas is only two months away.

Visitors who went to Newbury expecting to find soft ground were disappointed, for although the ground was not hard it was not soft. Still, it was good enough for any ordinary horse, and the turf printed nicely. Mr. Middlemas has been a good supporter of racing for many years, and it has to be admitted that he has had his fair share of winners. Fairplay, especially, won many good handicaps for him, including a Royal Hunt Cup. He has, however, probably his best horse in Fairchance, a two-year-old colt by Fairway. This colt has run well several times in the best of company this season, and has now won the October Nursery. It is true that the handicapper seemed to have treated him kindly, but then it is to be noted that the weights were made before Fairchance ran so well in the Imperial Produce Stakes at Kempton Park, and also before Blue Peter, who had also run in that race, had finished second in the Middle Park Stakes at Newmarket.

Fairchance did seem a good handicap thing at Newbury, but even then there was opposition to him, and he started at, in the circumstances, the good odds of 5 to 2. He duly won, but hardly as easily as was expected, Statue chasing him home and being beaten by less than a length. Apart from his success as an owner and as a business man, Mr. Middlemas is known as the originator and organiser of one of the best charities that I know. He sends throughout the summer thousands of poor East-end children out into the country for a day's outing.

I remember after Nadushka had won the Park Hill Stakes at Doncaster last year coming to the conclusion that she would have a most successful career. She did not win another race until the second day of Newbury, when she won the Newbury Autumn Handicap in admirable style by half a length from Hesperian, with Elgar third. Nadushka is beautifully bred, being by Vatout, the sire of William of Valence and Bois Rousell, the winner of this year's Derby, out of Fleche d'Or, the dam of Golden Sovereign. She is thus yet another good winner in this country to be bred in France. She must have been difficult to train to have gone so long without winning a race. On the other hand, it may be that she can show her best only in the autumn. Many other fillies that I have known have been like that. She now, so I understand, goes to the stud.

I have never understood how anyone can judge a human baby or foretell what will happen to him or her when he or she grows up, so that I fail also to understand why anyone should be able to give a valuable opinion on a foal or even a yearling when one sees one. Nor can anyone be even reasonably certain about their prospects. Mrs. Lionel Corbett had a number of yearlings, and not thinking that two of them were as good as some others that she had and was sending to Captain Bell to train, she gave them to her son John. Mr. J. Corbett sent them to be trained by Tommy Rayson, more usually associated with steeplechasers and hurdle racers. Here, once again, opinions were wrong, for the two yearlings that Mrs. Corbett had given to her son won two races at Newbury at the week-end.

The first of them was Skylarking, who won the Theale Maiden Plate with great ease at 100 to 6, and the second of them was Bridge of Sighs, who won the Reading Nursery by a most comfortable neck. Skylarking had been beaten by six lengths in his previous race at Chepstow by Cupid's Dart, but had then been tried to be two or so lengths in front of Bridge of Sighs at home. The wager on Skylarking was small, but when it became known what the trial was, all those visitors who heard betted accordingly on Bridge of Sighs and had no reason to regret the race rumour, for once in a way true. I understand that before winning a short time ago with Bridge of Sighs, Mr. Corbett had never won a race that was not a Selling event. He had won some 50 of them, but no matter how many of them one wins they are not so profitable as ordinary races.

GNOSTIC.

BEST DAYS WITH HOUNDS

Our usual hunting accounts will appear throughout the coming season, starting next week, with the issue of November 5th. The Pytchley, Cottesmore, Belvoir, Quorn, and Duke of Beaufort's will be reported regularly; other packs according to the sport which they enjoy each week.

THE "CHAIN" OF AN OTTER

Examination of this Interesting Phenomenon

CORRESPONDENCE in various papers from time to time has shown that there is a great deal of debate as to whether the chain of an otter comes from its fur or its nostrils. Generally speaking, most authorities are agreed that it comes, without doubt, from the latter, and yet, after some years of regular otter hunting and a good deal of thought on the subject I must confess that, although I am convinced the chain does not come from the fur, the explanation of it coming from the nostrils is not fully convincing in that it does not meet all the circumstances.

There are a whole lot of questions on this subject which one can ask oneself, or indeed any authority on the subject, but for which no completely satisfactory answer is ever really obtained. Why, for example, should one otter show a chain and another not? And why should the same otter sometimes show a chain and sometimes not? One has heard it said that when an otter is getting exhausted he tends to show a greater chain, and yet many regular hunters will agree with me that they can remember, as I can, a well-beaten otter showing no chain at all for a long swim in water with limited cover, where the chance of his venting without being seen was remote. And, as a matter of fact, does it not really seem doubtful whether an otter can contain in his lungs as much air as appears to be given off, judging by the chain of some long swims that I have seen?

No, I am afraid that, in spite of the many authorities who have pronounced in favour of the theory that the air comes from the nostrils, I have remained unconvinced, and I have, as a result, sought for some time to find a theory which would meet all the variations that one normally finds in the production, or non-production, of chains by otters. But now that I have found it, it seems to me to be so obvious scientifically and so difficult to find any point which cannot be explained by it, that I am almost in a state of distrust of my own theory and cannot understand, in any case, why it has not been propounded before; and so, perhaps, the ventilation of it will enable other people to give their opinion as to whether they think the old one is sound or that the new one can be given as the scientific explanation.

As to the theory itself, almost all water in rivers and streams contains a greater or less amount of air in suspension or solution; it also probably contains a certain amount of gas liberated by the decomposition of matter on the river bed and partially absorbed by the water. Water in which any gas is absorbed—and air is, after all, only a combination of two gases—will, when suddenly compressed, tend to liberate the gas it contains in solution, and the greater the pressure and the more gas in solution, the greater amount of gas will be liberated. Surely we have here the explanation of the chain shown frequently, but not always, not only by the otter but, also, by the moorhen and the duck when diving under water, and even perhaps large fish travelling at high speed.

That they all at times show a chain is, I think, agreed in general, even in so far as the fish is concerned, and in their travelling under water they all exert pressure in one way or another. In the case of the fish I suspect it is direct pressure, which explains the comparative rarity of a chain shown by a fish since it has to be moving very fast to produce it. In the case of the two birds mentioned, it is produced either by their feet or, more probably, their wings, if, as some authorities maintain, they use these for under-water propulsion. And in the case of the otter, the chain is produced most probably by the pressure of water immediately between the shoulder and the chest—the equivalent of the armpits.

Owing to the structure of the otter and its position when swimming, it appears possible that the air liberated tends to come out from the front, rising to the surface above the shoulders past the head, and hence the previous impression that the chain has come from the nostrils. It is possible that a careful viewing of the cinematograph films that, I understand, have been taken of an otter swimming under water, may actually confirm this in spite of the fact that it is supposed to have confirmed that the air comes from the nostrils.

The theory explains, also, why an otter sometimes gives a good chain and sometimes only a slight one. The amount of gas in solution in the water will, I believe, vary according to the depth, and will, also, vary to a very great extent between rivers. Probably rivers running down over rocky or stony falls will—other things being equal—tend to incorporate in the water more air than a slow-moving, placid-surfaced stream. The amount of air in solution in the water may even vary between different stretches of the same river. The amount of air in solution will obviously, therefore, cause the extent of the chain to vary; but, in addition, no air will be liberated until the pressure exerted by the otter reaches a certain degree—the greater the pressure the more liberated—and this explains why sometimes no chain is shown since the otter is travelling relatively slowly and not exerting sufficient pressure; as he travels faster the greater pressure will produce greater bubbles, and, in addition, they will increase in intensity the nearer to the surface he swims, since there is likely to be more air in suspension in this part of the water.

Scientifically, I think, this theory is sound, although it is extremely difficult to test in practice. Perhaps some of your more scientific readers will be able to comment on this point. One thing that can be said for it is that it does quite definitely allow for the absence or presence of the phenomena which one witnesses during a hunt. I feel, perhaps, some of the great authorities on otters and otter hunting may not be disposed to accept a theory so different from that which appears generally acceptable to them, but there must be many like myself who either are already, or if they ask themselves honestly will find themselves, unconvinced by the usual explanation, and I feel it likely that their views would interest many of your readers, as I know they would interest the writer.

Since writing the above I have had the opportunity of watching a long hunt in which two otters and three moorhens were all on the swim at once! The thing that impressed me most was not only the difference between the otter's chain and that of the moorhens, but the extent of the latter. On seeing the amount of air rising to the surface of the water, one could only conclude that it was impossible for a moorhen to contain the quantity liberated.

AN AWKWARD SPOT UNDER THE BRANCHES

"If one is to be at all successful at fishing under trees, it is necessary to become proficient in several casts not required on open water, the most important of which is the low horizontal one"

TACTICS ON SMALL STREAMS

Some Methods of Overcoming Difficulties

By Dr. A. H. B. KIRKMAN

THERE is a tendency amongst fishermen, old and young, to avoid working parts of thickly-wooded water on small streams, in which places the best fish are generally to be found. Excuse to fish only the open water should be allowed the elderly, whose stability on an irregular rocky bottom is, to say the least, uncertain, as is also their ability to crawl and stoop in avoiding awkward obstructions to body, rod and cast; but there is no reasonable excuse for any undeformed or non-rheumatic young fellow of, say, up to three score summers, failing to get down to it.

The patience and good temper (or even lost temper and high explosives) required in the accomplishments of creeping, crawling, lying and peering associated with constant minor personal discomforts, such as bangs on the shin or a wader full of water, or such annoyances as a hung-up fly at a most critical juncture, all so necessary if one is to get pleasure and success from fishing in wooded brooks, are equal, only in a different sense, to those of the coarse-fish enthusiast, who is satisfied to watch by the hour for the tremble of a float, his only danger meanwhile being an old bull in the adjoining meadow. But no one can deny that we fly fishermen do combine our piscatorial pleasure with physical exercise of the first water, which hardly obtains in the case of the float enthusiast.

If one is to be at all successful at fishing under trees, it is necessary to become proficient in several casts not required on open water, the most important of which is the low horizontal one, either on the right or left side of the body parallel to the surface of the water, and on special occasions not more than a few inches from it; this to avoid low boughs in front, and, more particularly, behind. The expert is capable of dropping the fly on the water behind him prior to the flick whip forward. Short whip casts of all kinds are well worth practising on the garden lawn in off-seasons to acquire proficiency. The kind of cast one finds constantly necessary when angling in small streams to fish rising under the right bank is one made at all angles to the water from over the left shoulder.

On wooded streams it is the short cast which gets the rise. Before making any cast on thickly wooded streams, a wise precaution is to make sure that one's footing is secure, and also satisfy oneself that it is possible to reach the site of the rising fish.

In order to do this it is often necessary to back well into the bank, or even to spend some little time clearing low bushes from over the water in front and behind to make room for the movement of rod and flight of line. When moving quietly under trees it is no uncommon thing for a trout to rise within a few feet of the fisherman, so close, in fact, that it is impossible to get a fly over it, and on occasions it is necessary to step back a few steps before making a cast. This state of affairs is most common where cattle stand regularly in the water, and I take it that the humble fisherman is mistaken for a big ruminant.

On one unforgettable occasion, I cast a small tup a distance of only 10ft. to a rising fish immediately under the whipping tail of a milch cow, standing hough-deep in a pool on the upper Exe, and secured the big trout of the pool, a monster of ½lb.

A type of fishing but little adopted, possibly because it wants special practice and is not easy, is casting at right angles to the line of the stream from a position well back on the bank. I have found this method particularly useful on the high-banked waters of the Culm. It is almost impossible to secure the big 'uns on certain sections of this, and many other waters, when one is casting directly upstream, however low one keeps, the fish being almost uncanny in their ability to recognise an enemy long distances below them.

When casting at right angles, or at an angle of between 40 and 70 degrees to the line of the stream, it is often wise to mark some object on the bank opposite the rising fish (seen from a distance with or without field glasses) as a guide to the spot to drop the fly.

In the case of very shy fish one can occasionally succeed by casting on to water which cannot be seen and raising the point at a carefully judged second. Many a goodly trout has fallen to this manœuvre. Having made an unsuccessful cast and not wanting to disturb the water, special methods are required to recover the fly, and my own personal dodge is to do so by a considerable number of small, very small, jerks done with the greatest patience.

Nineteen times out of twenty this method will succeed, whilst any attempt to recover in the ordinary way will mean a hang up. Morley Roberts advises giving a little quick, circular twist to the rod point, which he assures me is nearly always successful. These methods are well worth serious practice, since nothing is so annoying as having to show oneself and disturb good water where fish are feeding.

When fishing any water, one of the chief causes of putting down fish is casting so that the gut falls over the creature's back, a common fault with most tyros. If in any way possible the fly should be made to fall a foot or two ahead of the fish with the line of the cast oblique to the run of the current. This, of course, in narrow waters is not always possible, and it is not so important in quick water as in smooth. In many cases a fly dropped carefully just over the nose of a shy fish, or, better still, 9in. or a foot on your side of him will do the trick.

A little dodge well worth remembering in the case of a fish, although unfrightened, persistently refusing to take you, is to wait until the fly is floating near the fish, and then with a little shake of the point cause an irregular movement to the fly indicating to the fish that it is alive and struggling.

LONG FIGHTS WITH FISH

By T. C. BRIDGES

IT is not his biggest fish that remains most dearly in the angler's memory, but rather the one which fought hardest and took most time and trouble to land. The one which I remember best is a 2lb. brown trout hooked on the West Dart, near Two Bridges, where a trout of a quarter that size is a rare prize.

I was clear-water worming with the finest possible tackle at the time, and could hardly believe my eyes when I first caught sight of the big fellow. Naturally, I did not time the contest, but it must have lasted nearly 20 minutes, for the fish, which was in remarkably good condition, put up a fine fight.

It was at Two Bridges Hotel that I met a man who told me a queer story of a long battle with a big fish. He and his two brothers, all keen fishermen, were in the habit of taking their summer holiday together. In the previous year they had been to Norway. I cannot remember the name of the river, but the water was low and sport not too good.

The last day came, and early in the afternoon one of the brothers hooked a very big salmon. It showed just once, and that glance was quite enough to convince him that it was by far the biggest salmon he had ever seen. "How big?" I put in, and his answer was between 60lb. and 70lb. Then the fish bored and sulked at the bottom of the deep pool. All the usual artifices were tried for moving it, but with no effect. The brother who had hooked it held on till tea time, then was relieved by another brother. Later the third took his turn. They had intended to start at ten, and the latest hour at which they could leave and still catch their boat was twelve. Once or twice the fish moved enough to prove that it was still on, but that was all. At a quarter to twelve the three conferred. Then they cut the line. They were business men and had to be back at their office.

Some of us have had the fortune or misfortune to hook a salmon on a trout fly. On September 22nd, 1909, a member of the Liverpool Fly Fishing Club had a day on the Wyre at Garstang. He failed to return to dinner, the hour grew late and his friends, becoming anxious, organised a search party. It was nearly midnight when they found him. He was hanging on to a salmon which he had hooked at dusk. He had just been able to hold it and that was all. With the help of his friends he landed it and tramped home in triumph.

To come to more modern times, on June 18th, 1926, Mr. John Girdwood, of Ayr, hooked a very big fish in the Swallow Brae Pool of the River Doon. The fish took the fly at two in the afternoon, and the battle went on for eight-and-a-half hours. Most of the time the fish sulked at the bottom of the pool, which is about 200yds. long, but at long intervals moved up and down. By degrees a crowd collected, and by eight o'clock quite 200 people were eagerly watching the long fight. Two men rowed Mr. Girdwood to the opposite side of the river, but this change of tactics had no result. At half-past ten an attempt was made to prod the salmon with long poles. This resulted in fouling the line, and the fish, making a final dash, escaped.

It would be interesting to know if anyone has ever fought a salmon, single-handed, for a longer period than eight-and-a-half hours.

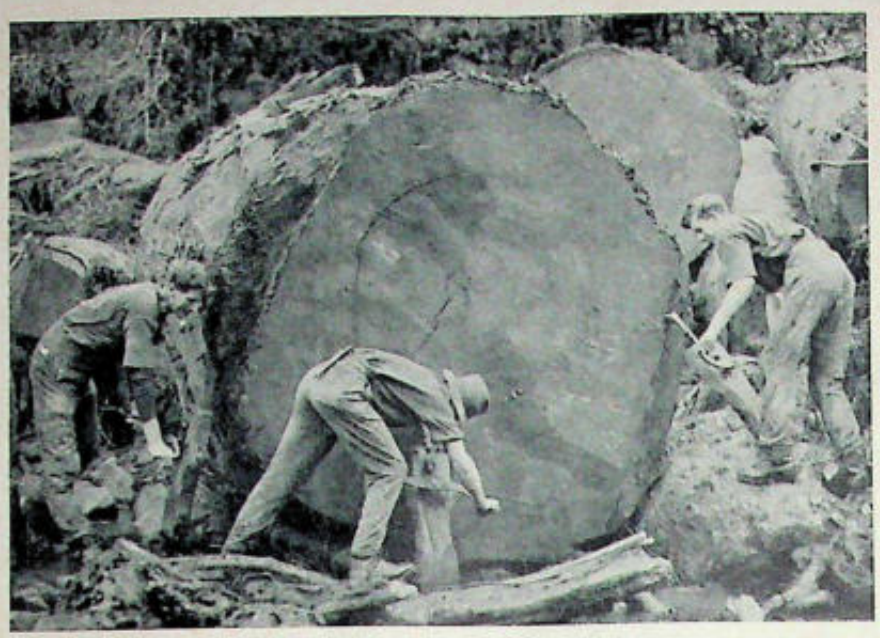
I have heard huge rays jumping by night off the coast of Florida, falling back into the sea with a boom like a cannon shot. It is a favourite sport to harpoon these monsters. Some years ago Florenz Ziegfeld and Leonard Replogle were returning to Palm Beach after a day's fishing when they saw a very big ray.

They had harpoons aboard and went after it. Another motor boat accompanied them. Both boats landed harpoons in the monster, which at once turned and drove seawards. The creature towed the two boats a distance of 40 miles and, though eight rifle bullets were fired into it and four harpoons embedded in its body, the wounds seemed to have no effect upon its tremendous strength.

Night had long fallen and the sea was getting up when first one, then the second, rope parted and the ray escaped. Its hunters reckoned that it weighed at least 2 tons.

GIANT OF THE FOREST

The Kauri, King of New Zealand Trees



THE SIZE AND WEIGHT OF THE LOGS MAKES THEM DIFFICULT TO HANDLE

KING of the New Zealand trees is the kauri. Some of these giants towering high in the forest to-day were saplings when Julius Cæsar invaded Britain. A kauri grows about a foot in diameter in 80 years, and specimens have been found measuring as much as 24ft. and 26ft. across. These, it must be granted, are of an exceptional size, but the average kauri, both in bulk and in the majesty of its appearance, is something to inspire awe.

The timber of the kauri has been used since the early arrival of Europeans in New Zealand. The tree was discovered in May, 1772, by the expedition of the Frenchman Marion du Fresne. His two ships put into the Bay of Islands, in northern New Zealand, in order to obtain some spars for one of the ships, which had lost her mizzen-mast and bowsprit in a collision with the other vessel.

FROM FOREST TO CITY

(Above) A bullock team dragging logs. (Left) The wooden Government buildings at Wellington

Searching for suitable timber, du Fresne came across what he described as "a cedar with the leaves of an olive." He had two of the trees cut down whose trunks were more than 100ft. high from the ground to the lowest branches, and about 4ft. 6in. in diameter. The wood was very suitable for making masts, but the spars were never completed. One night du Fresne and fifteen officers and men were attacked and massacred by the Maoris. The survivors of the expedition were unable to move the partly-made spars, and the remains of these were seen 87 years later. As time went on other vessels, notably whaling ships, sheltered in the Bay of Islands and other northern harbours. Many needed repairs, and kauri was often utilised for making spars.

The early nineteenth century saw the beginning of the export trade in kauri. The first shipment was to the Cape of Good Hope for the use of the Royal Navy, and subsequently trade was started with Australia. In 1820 a cargo was taken to England for the Admiralty which, needing spars 75ft. to 85ft. in length for the larger ships of the Navy, was so satisfied with the kauri that for the next 20 years supplies were received from New Zealand. At the present time kauri is used for building purposes, in manufacturing furniture, for shipbuilding, for constructing bridges and wharves, and for making brewers' vats. It is a pine, and is neither a soft nor a hard wood. Close in grain, it is very smooth and easy to work. A house, built of heart of the kauri at the Bay of Islands over 100 years ago, is still inhabited. The Government Buildings at Wellington, the largest wooden building in the world, are constructed almost entirely of kauri.

Some of the larger trees of the forest are said to contain over 63,000ft. of timber.

To the wild and beautiful New Zealand forest the kauri trees add a noble dignity. Travelling down the winding road leading to the Waipoua State Forest, the great kauri reserve in northern New Zealand, one sees hundreds of kauris with their distinctive busby tops looming in clumps above the other trees. Inside the forest their massive proportions can be properly appreciated. Some of the trunks rise for more than 80ft. without a branch, tapering but slightly from base to summit, and all are smooth, grey and glistening. At the base of each trunk is a huge mound of débris caused by the fall of the bark, which is regularly cast off in large flakes. From the top of each trunk spring short but immensely thick branches, which, with branchlets and foliage, form a high vaulted roof to the forest, through which daylight filters to the ground. The northern portion of New Zealand alone is kauri country, the trees flourishing in hilly localities and in clayey soil.

Extensive tracts of kauri forest have been swept out of existence by felling and milling operations. When the trees have been brought to earth, they are cross-cut into suitable lengths and logs, and in most instances, these are either floated down stream or river to the sawmills or are conveyed by means of a tramway constructed through the forest. The size and weight of the logs makes them exceedingly difficult to handle, and the process of getting them to the mill is often a strenuous and lengthy one. Formerly, the logs were dragged by teams of bullocks and horses, and this spectacle is still occasionally provided on rough forest roads in the less accessible regions.

The value of the kauri commercially is increased by the resinous substance contained in it and known as kauri gum. Any injury to the bark causes a flow of this gum. It is soft and viscid and of a whitish colour, and gradually hardens on exposure to the air, becoming more transparent and forming lumps ranging in size from small drops to irregularly shaped masses many pounds in weight. Great deposits of this gum have been recovered from the sites of forests that disappeared hundreds or even thousands of years ago.

Kauri gum is used in the manufacture of the finest kinds of oil varnishes and also in the manufacture of linoleum. Its value is enhanced by its suitability as a substitute for amber. The kauri forests have been so depleted that practically all those remaining to-day are in protected reserves. W.O.S.

TWO FINE KAURIS IN THE WAIPOUA STATE FOREST, NORTH AUCKLAND

THE LITTLE OWL

Some Observations on Feeding

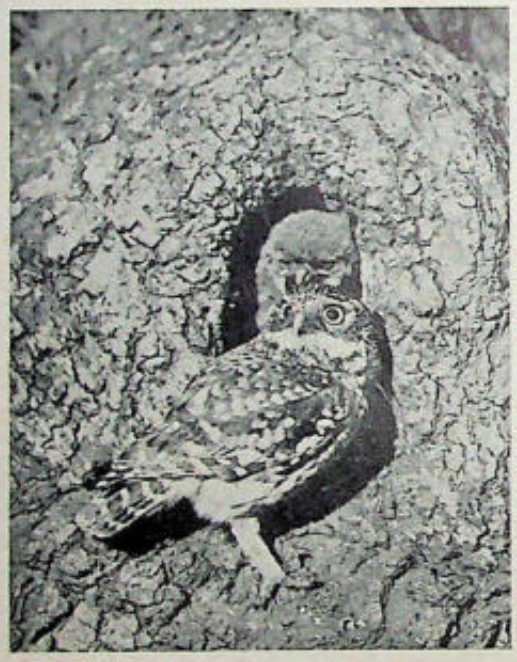
ALTHOUGH the recent official inquiry into the predatory habits of the Little Owl acquitted the bird on charges of extensive damage to game, an element of doubt still lingers in the minds of many whose interests lie in game preservation.

When, therefore, a nest was found on an estate in Berkshire where game was extensively reared it seemed an admirable opportunity of observing whether the abundant supply of young pheasants would prove too much of a temptation for the birds.

This nest was situated in the hollow limb of an old oak tree, and when found on April 23rd of this year contained three eggs already in the process of incubation.

The young birds hatched out on May 14th. They were curious little bundles of creamy-white down, with the typical face, hooked beak and round head of their kind. The parents brooded them almost continually for the first few days, gradually leaving the nest for longer periods as the young grew stronger.

Most of the food was brought by the cock-bird, and consisted at first solely of insects, which proved to be the main item of diet. Although a great variety of insects were taken, beetles were predominant. The dor seemed to be a favourite, and the nest was strewn with their violet-black wing casings regurgitated in the pellets. These beetles are probably the easiest for the bird to



SURPRISED AND NOT PLEASED

secure on account of the numbers in which they appear at dusk.

Compared with other species of owl, the Little Owls took surprisingly few mice, and although an examination of pellets occasionally revealed the presence of fur, mice were never actually observed being brought to the nest.

When the young were twelve days old two young pheasants were carried to the hole, followed by three more on the succeeding night. These were the only occasions when game was known to have been taken.

I spent the first three nights of June in my "hide," only 6ft. from the nesting hole. On the second night I arrived at 8.30 p.m., and the young were then nineteen days old, still in their coats of down, but with the feathers beginning to show through. When I arrived it was still quite light, and it was not until dusk that the old birds put in an appearance.

Shortly after ten o'clock the hen arrived and flew up with a beak full of insects, perching on the bough by the side of the nesting hole. The scratch of her talons on the bark was the signal for a chorus of welcoming hissing from the hungry young birds. She paused for a moment to make sure that all was well, glaring at the hide with her fierce, pitiless eyes, the bright yellow irises gleaming strangely in the waning light. Thus she stood for fully a minute in tense silence, and then scrambled to the hole and vanished within, reappearing at the entrance a few moments later. The insects had been given to the young, who, temporarily satisfied, had relapsed once more into silence.

The fierce expression had now gone, and in its place was one of contentment, as she sat peering out, idly surveying the wilderness of gorse and bracken which was her hunting ground. Roused some ten minutes later by the renewed hissing of the young she gave a loud "kelp, kelp," and flitted silently away.

The flight of these birds is absolutely noiseless, and at the dead of night the only intimation that the bird had arrived at the nest was the scratching on the bark of the tree as she alighted, and the renewed hissing of the young birds inside.

Two distinct types of cry were used by the Little Owls. Firstly, the sudden yelping cry used on all occasions; and, secondly, a long drawn-out screaming cry, almost exactly the same as that of the Barn Owl. This was only used when perched, listening for the tell-tale movement of prey and was probably intended to frighten creatures into disclosing their whereabouts.

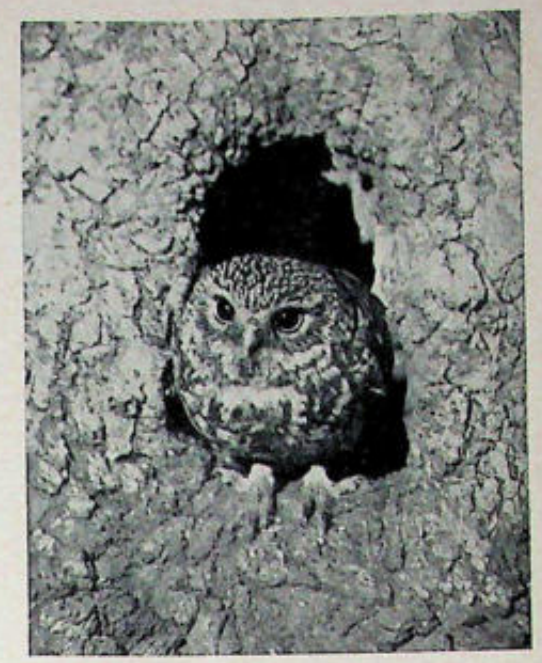
After 10.30 p.m. both birds were coming to and fro with food, one or other coming to the nest every three minutes or so. This continued until 11.30 p.m., when it was completely dark. From about 11.30 p.m. until 2.30 a.m. there were only three visits, but from 2.30 a.m. till 3.30 a.m.—the corresponding dusk of early morning—visits were again every three minutes or so.

Shortly after 3.30 a.m. an adult blackbird was disturbed, hawked down and killed in the open, being brought intact to the nest and left for the young birds to deal with themselves. This was the last visit of the early morning.

There was only one visit during the day, when more insects were brought. The hours of daylight were spent for the most part roosting in the surrounding trees, where small birds could be heard mobbing them from time to time.

At dusk the feeding began once again. This was always the case. The birds were active only at night-time, chiefly during twilight. Although the Little Owl is frequently abroad during the hours of daylight, I personally have never known it to hunt seriously on such occasions.

The frequency of visits and periods of feeding is of importance. It is not possible to go far afield in three minutes, with the result that food must have been gathered near the nest. The birds could be heard calling frequently while hunting, but never more than 150yds. away. The rearing field was a quarter-of-a-mile distant. This was never visited to my knowledge, and also, owing to the fact that the coops would be shut up for the night, such visits would in any case have proved fruitless. The five young pheasants taken were



IS THE COAST CLEAR?

doubtless the young of a bird which had hatched out her brood in the vicinity of the owl's nest.

It would seem that the owls did not stay near the nest through any preconceived intention, but did so merely because there happened to be an abundance of food at hand, so that longer excursions were unnecessary.

Once the young pheasants had been discovered the owls no doubt revisited the spot repeatedly until the supply was exhausted, but they showed no marked preference for a feathered meal, classing it, together with mice, beetles and other things, simply as food.

F. GIBSON PHILLIPS.

[Controversy still rages around the little owl. The *Field* is of the opinion that the position can be cleared up if opinions are ventilated, and for this reason we shall be pleased to open our correspondence columns to letters containing relevant observations.—ED.]

THE October issue of the *Agricultural Magazine* contains a personal appeal for the International Committee for Bird Preservation, by David Seth-Smith. This very well-written appeal states the case for the committee clearly and strongly, and deserves to receive widespread support. Among other articles, "Round about Dutch New Guinea," by S. Dillon Riplay, and "Breeding of Mitchell's Lorikeet," by J. M. Derscheid, deserve special mention. We notice with regret that there is no coloured plate in this number.

A VERY FINE FLASHLIGHT PHOTOGRAPH OF A LITTLE OWL RETURNING AFTER A NOCTURNAL HUNT

TROUT FISHING IN KULU

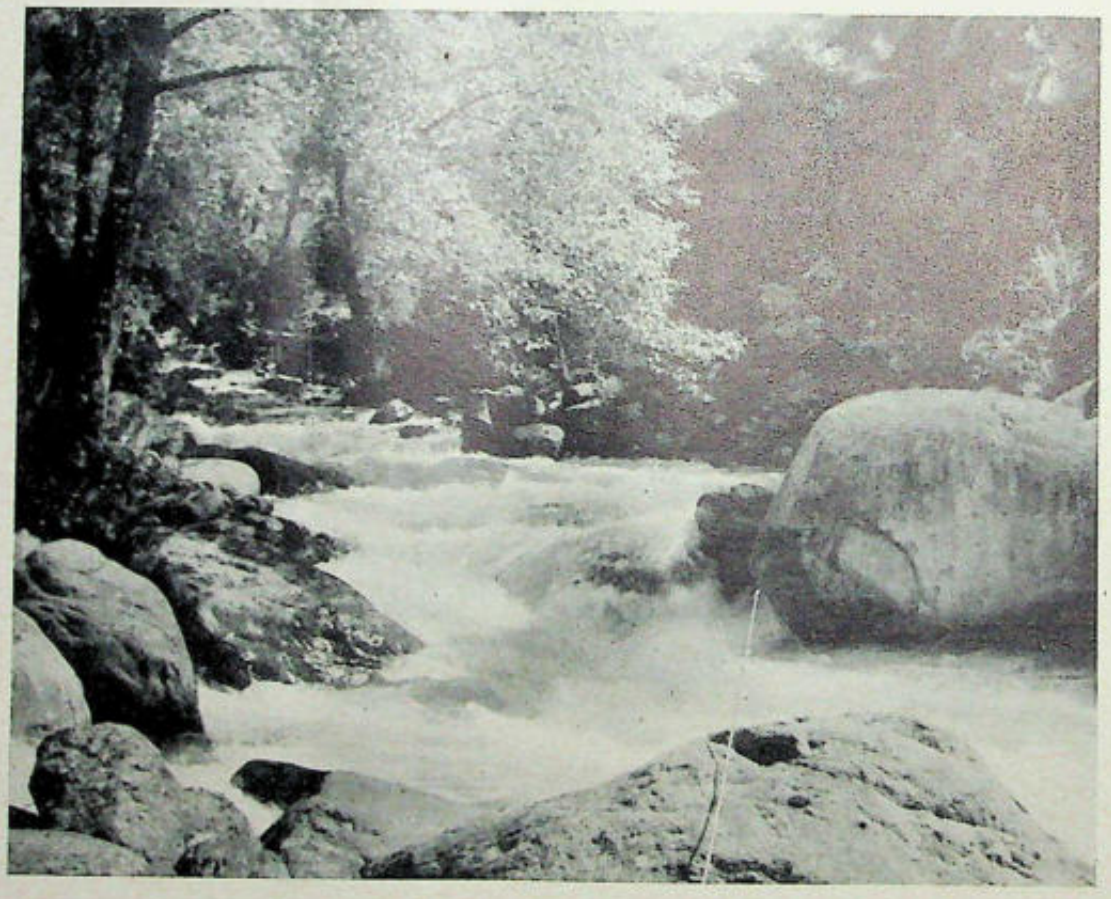
Cheap Sport and a Vast Mileage of Water to Choose From

THOUGH the delights of Kashmir as a trout-fisher's paradise are heard on every hand, few have written of the excellent sport to be had in the Kulu valley, situate in the Kangra district of the Punjab. I do not pretend that it vies with the rigidly preserved beats of Kashmir, but it does offer excellent sport at much less expense, and is much more easily accessible. The scenery in the valley is delightful, and accommodation may be had almost at the water's edge.

The Kulu valley is best reached via Pathankot by car. The motor road for a distance of about 100 miles (through Mandi State and the Kulu district) is bad; but by careful driving and careful attention to one's car before the start the journey can be accomplished without mishap. Fortunately, the best fishing periods are those in which least trouble may be expected on the road. During the monsoon months (June, July, August) the journey is somewhat of a hazardous undertaking, and the rivers are also in full flood.

The season is a long one, extending from March 15th till October 15th. The month of April, the last fortnight of September and first fortnight of October are probably the best periods for the bigger fish. The waters are stocked with brown trout and rainbows. The former, however, represent most of the bag. A successful crossing of rainbow and brown trout has been effected, but the results did not justify a further continuance of the experiment. During the past year about 100,000 fry and ova were "planted" in the various streams

A MORNING CATCH ON THE PHOJAL RIVER
Three trout totalling 5 lb.



A TROUT STREAM IN THE KULU VALLEY
"The scenery in the valley is delightful, and accommodation may be had almost at the water's edge"

of the district. The size limit for takeable fish is 10in., and one is limited to eight fish a day on a single licence—or twelve fish per day on a "family licence" (to include man and wife).

Personally, I was not fortunate enough to take a fish over 2lb. in weight. But every year fish of well over this weight are killed, the largest fish of last season being a brown trout of 10lb. netted at the junction of the Sainj and Tirthwan rivers. Another of 6lb. was taken by an angler just below Kulu town, on the worm.

Unlike Kashmir, the river is not divided into beats. The visiting angler, therefore, has a vast mileage of water to choose from. The angler is allowed to use fly, spinning bait (artificial or natural) and worm on the main Beas river. In the side streams, however, worm is not permitted. The cost of a licence to cover all trout waters in the district is Rs. 25 per month for the single angler or Rs. 30 to include his wife as well.

The main Beas river and the side streams running into it from just above Kulu town (Sultanpur) to its source, constitute the "Angling reserve." Actually the part of interest to fishermen is that between Manali and Kulu, a distance of about 24 miles. Into the Beas run the Sujjain, Phojal, Chakki and Chirid streams. In the main river there are excellent long deep pools which contain some remarkable fish. They are, however, difficult of access as the water is fast and a good deal of wading is necessary. The side streams offer the best sport, particularly the Phojal and Sujjain nalas. They are on an average some dozen yards in width, and remind one of the streams of Yorkshire and Scotland. The water should be gin clear for the best results, as the fish are bold takers. In the early part of the year the main river contains nearly all the fish, but as soon as the water warms up the fish move up the side streams. The banks of these side streams are much overgrown, with the result that the services of a local shikari are desirable in order to save loss of tackle. (Pay Rs. 15 per month.)

Apart from these waters there are many small mill streams or kuhls running off the Beas river. These offer the only real opportunity of using the dry fly; as they are small waters, however, the size of trout does not compare favourably with the bigger streams.

There is a good deal of accommodation available in various places in the angling reserve. I feel, however, that I could not do better than advise an intending angler to write to my friend Mr. T. Tyson at Katrain, who, apart from offering very comfortable quarters, is the acknowledged expert in all matters pertaining to trout in the district. He will also supply or hire suitable tackle.

Below Kulu town the main river is netted by local natives, and this detracts from its popularity with visiting sportsmen. The Sarbarri river joins the Beas here also. This stream used to offer the best trouting in the valley, until netting was permitted. If, however, one is prepared to walk upstream for some four miles there is still very fair sport to be had. The visiting sportsman may fish any of the above streams whilst residing, as I did, "at mine ease in mine inn," but for the rivers mentioned hereafter camping and "bandobast" are necessary.

Some seven miles below Kulu on the right bank the Parbati river joins the Beas. This stream has been regularly stocked for years, and with the exception of the occasional forest officer or local native is never fished. The licence is ridiculously cheap, costing but a few rupees. The fishing is magnificent, but the sportsman must take full camp equipment and supplies. Furthermore a good servant is essential, as the natives who inhabit this area, and for that matter the whole valley, are as indolent, dirty, unhelpful and disobliging a crowd as one could wish to avoid the world over. About 25 miles below Kulu, on the same bank, are the Sainj and Tirthwan rivers. Again the rod licence for these rivers costs about 5 rupees per month. The fishing is also excellent.

The Sainj river rises in Spiti, and joins the Tirthwan near Larji. The upper reaches are well off the beaten track and camping is necessary. There is, however, a Forest Rest House at Sainja, permission to occupy which may be obtained from the Forest Officer. The Tirthwan is a first-class fishing river. The best fishing is probably obtained in the four or five miles below Manglour bridge and between Manglour and Banjar. There are Rest Houses at Larji and Banjar which may be occupied. This river lies across the pack road from Kulu to Simla, and forms an interesting and pleasant trek from the latter resort. The prospect of fishing in future years is very favourable. A hatchery exists at Katrain, and another is shortly to be opened. Research work on the food supply and insect life on the trout waters has also been taken in hand.

And now a word as regards tackle. I used throughout an Allcock-Stanley threadline reel and Light Caster rod, for wet fly, spinning, and worming. As most of the pools in the side rivers are of very small area I was able to use the threadline outfit for wet fly by pinching a largish shot on to the cast between the flies. This may sound strange, but with the strong water one fishes it is necessary to get one's flies down to the fish quickly. Golden fly spoons (½in.) are very killing. My list of flies included Coachman, Dark Olive, Yellow Dun, March Brown, Teal and Green, Butcher, Alexandra and Silver Doctor. The Coachman and Teal and Green are the flies par excellence and seem to catch fish in all conditions of water. Long casting is quite unnecessary, in fact a short line and use of natural cover offer the best chances of success.

For spinning, the natural minnow mounted on a crocodile spinner I found best. Spinning accounted for most of my fish. Accurate casting in the small pools is necessary. Fish religiously upstream and success is assured.

For those who wish to combine shooting with fishing, a variety of big and small game is available, the game list including brown and black bear, snow leopard, ibex, bharal tahr, serow, goural, barking deer and musk deer. It is difficult, however, to obtain the services of an efficient or reliable shikari.

In conclusion I add the following summary from my fishing diary. In 70 days' fishing, during none of which did I fish more than six hours, I killed 2¼cwt. of trout, including eight fish of the 2lb. mark. This represents fishing at various seasons (over 50 per cent. in the worst periods of the year). On my best day I landed 49 trout.

YAWNOC.

COLONEL HAWKER AND THE CREATURE COMFORTS

The Place of Food and Leisure

COLONEL HAWKER was too much a man of refinement to subscribe fully to that earthy adage, "The way to a man's heart is through his stomach." That, in any case, is more usually preached to the other sex, and *Instructions to Young Sportsmen* is above all a man's book. But he did recognise the stomach's importance in life, and he traced to it most of man's physical ills and some few of his joys. The limited resources of the country inn of the 1830's have already been mentioned, as have some of the Colonel's suggestions for making the fluid part of the resources more palatable. As to the solids, which, it will be remembered, consisted of unpromising raw materials like tough meat, local vegetables and herbs which the sportsman had to seek out for himself, the Colonel was full of ideas.

Even for the Colonel, the raw material was too slight; he recommended the sportsman to take as well a basket containing eggs, sausages, a fowl, olive oil, lemon juice, anchovies, herbs and a cake of "portable soup," with which hoard the toughest of meat could be made tractable.

The Colonel's methods of doing this are not so much different from those which to-day turn a poor steak into a good tournedos or casserole dish. A 3lb. slab of meat in water, simmered down from 2 quarts to 3 pints with carrot, onion and turnip, about a pound of the fattest part then cut off and put in reserve, and the rest boiled to pieces. The result a soup and enough material for a meat dish, seasoned with mustard, raw parsley and anchovies. Alternative to the soup and stew, tournedos or casserole is what the Colonel calls "a mess—as wholesome as anyone who can rough it could ask for where there is not a piece of meat to be got." The foundation is a fowl, boiled for three hours with pearl barley, mace (nutmeg husk), peppercorns and salt to taste. This treatment will make eatable a barn-door fowl or old game that has been shot to pieces, and if the trimmings are suitably altered to mask the flavour—onion, fish sauce, lemon or a glass of Madeira instead of the more simple dressings—even curlew, coots, gulls or heron can be consumed without too much distaste!

Having by these expedients avoided starvation on the first day, the experienced pupil will be able to fare decently with the help of his rod and gun, whereas "some helpless exotic would have spurned the place, left it in disgust before he had killed a bird or a fish, and as likely as not be laid up and fleeced at the next inn, saddled with some country apothecary." The Colonel has plenty more advice about food. A warning, for instance, which still holds good, about wildfowling on an empty stomach: the recipe, if a start is to be made before service can be obtained at the inn, is a crust or a biscuit and a glass of milk with sugar, nutmeg, ginger and an egg yolk in it. Another interesting dodge, which shows that we are not after all so modern, is this one: "If you have no biscuits for your wine, cut some very thin slices of potato and broil or fry them crisp with oil." So that the ubiquitous potato crisp, which has penetrated to the aristocracy of the cocktail bar and accordingly been re-christened the "Smythe Cryspe" in at least one, has actually a long tradition behind it.

Is it doubt of his own recipes or native caution that turns the Colonel from food to medicines, and particularly those for the stomach? Caution certainly prompts this disclaimer, "I have not the slightest pretensions other than personal experience, so I must premise with saying that what would be an effectual medicine for one might not answer with another."

Nearly all his ailments and medicines sound familiar, and go to disprove the theory that the minor ills that beset us are due to our increasingly artificial existence. Magnesia for heartburn, acid on the stomach and as a "trifling preventive" of the gout. Essence of peppermint, particularly good after making "too free with French wines." Calomel—well, calomel stands where it did, and the Colonel suggests an alternative which will not "keep the patient a prisoner all day"; 30 grains of aloes, 30 grains of scammony (consult the Oxford Dictionary about this), and enough Venice turps to make fifteen pills.

Then there is Tartar emetic—good for dogs and the common people, "who are subject to having the stomach disordered by eating voraciously of bad and unwholesome food." The Colonel mentions a friend who was for years the successful quack of his village with this preparation. The well-to-do, who also needed an emetic at times, were recommended mustard.

The Colonel found space for more specifics than we can, but a few of them should be mentioned. Tincture of bark for the nerves; a "new French remedy" for the ague, consisting of sulphate of quinine (the Colonel mentions this one because "nothing could be more desirable in a work on wildfowling"; modern wildfowlers can be thankful for the disappearance of our malarial swamps). "Poor man's plaster" for a pain on the chest, snuff for the teeth in the morning and brandy or whisky for them at night. A toothache remedy is a tablespoonful of rum, the same of vinegar, and a teaspoonful of salt, held in the mouth, but the Colonel was at the time coming round to the alternative which still holds good—Eau-de-Cologne.

And lastly, a hint at a sorely needed new line of country for cigarette and tobacco advertising: "Our sportsman will have taken care to provide himself with a little good tobacco or a few cigars which, before you inhale a vaporous atmosphere, is the best preventive from catching the ague when fen shooting and, perhaps, one of the greatest preservatives from cold and illness of anything in existence."

Let all those (to continue in the Hawker vein) who condemn the follower of "blood sports" as an uncouth fellow, distinguished only from the beasts of the field in that he pursues by superior intelligence which he perverts to their better destruction, read Hawker and learn otherwise. For the Colonel had those two all-important attributes, a sense of humour and a sense of the humanities, and so far as they can be permitted to appear in a volume with so portentous a title as *Instructions to Young Sportsmen in all that Relates to Guns and Shooting*, the Colonel permits them to appear.

Although, in the chapters we have already rather impertinently tried to review, the Colonel tries as often as he can to suggest means of prevention of the physical ills that may beset his pupils, instead of leaving them until a cure is necessary, he is, like us all, unable to prevent one of man's major ills, bad weather, and has to be content instead with advice on preventing its psychological ill-effects.

He imagines his young sportsman, having arrived at the "miserable hole" which gave rise to all the previous good advice we have examined, being greeted in the morning with the news of a wet day, and so being "confined a close prisoner to the pot-house, looking alternately to the windward clouds and the plastered walls of the room." In these more democratic days, some of us in such circumstances would feel inclined to join in the "discordant merriment of drunken fellows" which the Colonel expected his young sportsman to hear through a thin partition from the next room, and we might even enjoy inhaling, with them "the breezes of a smoky, wood fire, and the fumes of their shag tobacco."

This, however, would not have been a success in the Colonel's time. The ubiquitous dart board had not then introduced the townsman to the joys of the bar parlour nor had the countryman discovered that the game he had skilfully played for years could be a profitable one when the gentry descended to the "tap."

So the young sportsman of the eighteen-forties would be stuck, annoyed rather than tempted by the sound of others enjoying themselves, and left to whatever his own resources might be. And their value to him depended on whether or not he had read the Colonel's discourse on the proper use of leisure. The word discourse is used advisedly, for the Colonel himself hastened to make it plain that he was not beginning to write a sermon. How near a sermon he actually got is a matter for the reader's judgment; at all events, his sermon, if such it was, had the great virtue of practicality which all too many of them lack.

"The habit of idleness," wrote the Colonel, "is of all things on earth that which makes a man low-spirited, unhappy, or nervous." And to check all possibility of an attack on his platitudinous moralising from a spirited young sportsman, he follows this up by pointing out that "being nervous is, of all things the most likely to put even a crack sportsman off his shooting, to make a young angler whip off his flies, or be too eager, and therefore unskilled in killing his fish."

With which joint disclaimer of the intention of moralising and excuse for doing it none the less, the Colonel proceeds to his advice, in which he himself has sufficient faith to claim that it is sound enough to make the man with sufficient resources almost resent the news that the weather has improved, so engrossed will he be in his pastimes. *Sufficient resources* are modest enough; the pocket alone can carry them. For, although the *miserable pothouse* will have neither books, newspapers nor stationery, there is no excuse for *sheer idleness*. (The italics are the Colonel's.)

If the victim of circumstances is devoted to some particular study the pocket will easily carry some small volume about his subject; if he is an artist, limited though his scope may be, happier days will be made all the happier by a souvenir sketch to remind him of his present misery. If he is a musician, without his instrument, a few exercises in harmony will while away the time; if a writer or an author he is "never at a loss" (fortunate the writers of the Colonel's day). Or if none of these cultured pursuits are his, he may yet be a "merry fellow who sings a good song over his bottle," and if he has provided himself with a volume called the *Pocket Nightingale*, he may refurbish his song stock against the day when he will return from exile and entertain his friends again. Even if he is an enemy of the Muses, a "dry fellow," what to-day we call (and sometimes pride ourselves on being) a practical man, he can always pass a happy or unhappy hour reviewing his fortunes and planning how to restore or increase them.

But (and here the Colonel's moralising comes in full spate, and deserves full quotation) "If he is an idler, destitute of all resources—why, I will not say, Lord help him, but let him help himself. Let me advise him to embrace, in this day, a moment for reflection and consider it as an example, perhaps, of many hours and days he may have to spend at an age when he no longer has youth and vigour to distinguish himself among the field of sportsmen, and make a determination to embrace some pursuit that will be to him a source of amusement, and he will then, I think, have reason to consider this one of the most successful days in his calendar."

So the Colonel leaves us with food for thought. The problem of the use of leisure affects more of us now than it ever did in the Colonel's day, and is likely to do so increasingly. Those whose pleasure, like his, lies in shooting and fishing, might do well to read or re-read his evergreen book. So also might those whose pleasures lie in opposing the sportsman's pleasure. Live and let live is a good adage; a little more tolerance and understanding from both sides would do no harm to-day.

H. A.

LONGPARISH, THE HOME OF COLONEL HAWKER

THE SPRINGER SPANIEL IN INDIA

Hardy Gun-dogs That Can Stand Up to Conditions

DESPITE the fact that the springer spaniel is among the hardiest of gundogs and has proved his worth at home in numerous field trials, both as a worker and a retriever, yet he is by no means common in the Indian peninsula. Apart from the kennels maintained by field trial enthusiasts like the late Maharaja of Patiala and the Maharaja of Jind, there have been few well-known breeders of this type of spaniel.

At the dog shows that are held all over the country, the springer class is invariably one of the smallest, and compares most unfavourably with the classes for cockers and Labradors. Yet the springer is, in most respects, well suited to the country; though not a fighter by nature, he is big and plucky enough to make an excellent watch-dog and act as a deterrent to the presence of unauthorised natives on the premises. He requires a considerable amount of exercise, but not more than an energetic man or woman can give him on foot; and he can, and will, follow a horse without getting distressed. He does not stray, like some other breeds, nor wish to chase jackals or "pi-dogs," which is important, in view of the prevalence of rabies in the country.

There are critics who say that the springer spaniel's comparatively thick coat distresses him in hot weather and renders him liable to be infested by ticks, and so to get tick fever. There is a certain amount of truth in both these objections, but, as regards the former, the writer kept springers both in the north and the south of India, and found that, provided the dog got frequent water, he could do a full day's shooting without getting more tired than master! As regards the risk of tick fever, the secret lies in personal grooming: provided that the dog's coat is well dusted daily with "pulvex" or smeared with "neem oil" well rubbed-in by hand, ticks are seldom, if ever, found on him.

The springer is an excellent worker, both after pheasant or jungle-fowl in the wooded hills, and after partridge, duck and snipe in the plains. The writer has never heard of a thoroughbred dog or bitch being gun-shy; on the contrary, all the dogs that he has seen have been enthusiasts, regarding the gun as the most important item in the house. A gundog in India, where some of the cream of the shooting is after duck and snipe, must face water boldly. In this respect, the springer is, in the writer's opinion, second only to the Irish water spaniel; all our dogs were given a long swim daily in the hot weather, and thus became keen and powerful swimmers, and retrieved in water with the greatest enthusiasm.

The following suggestions, culled from personal experience, may assist the sportsman who contemplates importing a springer into India. If his primary object is to have a good gundog, he should select a dog in his or her first year, who has been at least partly broken. The outstanding qualifications are a good nose and good bone; the former because scent is, generally speaking, very much poorer than it is in England. This fact was vividly brought to the writer's notice during a spell of dry October weather when scent was poor. Two springers brought from India revelled in the scent, while a home-bred dog was definitely puzzled. Good bone is most important, because the ground is very hard, days are long and tiring and, in the sub-montane districts, stamina will be tested severely as the dog works the steep khuds. Emphasis is placed on the necessity for good body configuration—in fact it is just as important for a purchaser to have an "eye for a dog" as it is to have an eye for a horse at Tattersalls. Yet judges at shows in India appear to miss this point and to consider the possession of a dark eye more important than a compact, well-balanced body.

Although it is most desirable that springer strains in India should be improved by the introduction of fresh blood, yet the newcomer to the country will not, for his first season at any rate, stand up to a gruelling day as will the dog born on the spot. In fact a dog brought out from home should be taken quietly until he is thoroughly acclimatised; he should not be worked during the mid-day hours, nor should he be exposed to the evening chill without being thoroughly dried. He should be exercised by his master early in the morning, and before sunset, and compelled to rest in the bungalow during the heat of the day. The health and efficiency of all gundogs in the East depends largely on their dieting; we attribute our success in this respect to the fact that we always fed the dogs ourselves and made sure that they always got plenty of good meat. Those who are content to leave the feeding and exercising of their dogs to a "dog-boy" always have trouble.

The springer is, perhaps, more liable to minor ailments and mishaps incurred during work than other sporting dogs. He is a strenuous worker, and his job often takes him into thorn scrub and palms, and the sportsman is well advised to carry with him a serviceable thorn extractor. Speargrass, during the weeks when the seeds are ripening, is another source of trouble, and spaniels collect these sharp-pointed seeds in the neck, under the forelegs, and between the toes. If allowed to remain they may put a dog out of work for several days.

On the whole, conditions in India are favourable for breeding springers, especially in the south and in the hill stations in the north; the litter shown in the photograph arrived in March when the mid-day temperature was well over 100 degrees. Their mother, who had been well fortified with sheeps' heads and lactol, weaned them all without outside assistance. Three months after birth, they were taken 350 miles by train and won first prize at the Bangalore show. The judge commented on their good bone.

A short description of the parents may be interesting to dog-lovers, especially as both came to England with us. To give them their family names: Mac, the proud father, was born in the Himalayas; both his parents were champions, but his sire was not broken to the gun; his dam was, however, a field trial champion in India. He came to us at the age of three months and had retrieved his first peacock before he was six months old. He won prizes at Delhi show as a puppy, but caught canine typhus there and nearly died. After recovery, as the result of hard exercise in the hills, he developed into a very powerful dog.

Rightly or wrongly, depending on the point of view, he considered that a day's shooting was his show. Nothing mattered except that he should find, flush and retrieve game. Unfortunately his zeal often carried him too far in that he was inclined to range too wide and to run in to retrieve before ordered. The lead he loathed, and no amount of rating or even beating would prevent him from raising his voice in protest at the insult. He has always been, however, a tireless worker in every sort of cover, and peerless at finding a lost bird. While he is out shooting nothing else matters at all; thorns, cuts, bruises he ignores, so long as he can carry on. In the house he is an understanding, unassuming person, completely devoid of jealousy. He will give up his bed, his bone and his dinner to any other doggy member of the household. He is an excellent father, playing with the puppies when they are young and helping to train them as they grow older.

Brownie, Mac's wife, has an entirely different character. Coming to us as a yearling, in replacement of her sister who died from poison, she had never seen a gun. However, she is bred from the well-known Harting strain, and quickly learnt to hunt and to retrieve. She has a sensible, placid temperament, is steady and obedient, and a devoted mother. She was most patient in quarantine, and has taken to English shooting with enthusiasm. She has developed a partiality for woodcock, and works them with considerable skill and patience.

It will doubtless be gathered from the above that the writer is a springer "fan"; hastily one is glad to admit the impeachment, for these dogs are thorough sportsmen and gentlemen. Their sturdiness may be gauged from the fact that both our dogs went through two very hard seasons' shooting in the south of India, without missing more than an occasional day through minor injuries, and then went straight from the quarantine kennels to two successive hard days' work in the New Forest.

R. GRAEME.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

THE natives of Colchester—and we must not make the mistake of including the Colchester-born inhabitants among the natives—have been held responsible for the invasion of Britain by the Romans, who were so partial to Colchester oysters that they had devised means—so far unexplained satisfactorily—of transporting Colchesters all the way to Rome, where the masters of the then known world insisted on having all that was best in the world.

Be that as it may, the fact remains that Colchester oysters are responsible for peaceful invasions year after year from large numbers of gourmets and gastronomes. Last week, the Mayor of Colchester entertained the Duke of Kent and a brilliant assembly at the traditional oyster feast, and the Wine and Food Society members took two bites at the Colchesters, invading the peaceful city on two successive days, as their numbers were too large to be accommodated on one single day.

Sir Gurney Benham, chairman of the Pyefleet Fisheries, acted as mentor to the large and distinguished company on both days, and the information which he imparted to them greatly added to the pleasure of partaking of oysters at their freshest. His explanation of the name *Pyefleet* oysters, was that they were the oysters dredged from a "fleet" or creek where the oyster-catchers or seapyes assembled in vast numbers, seapye being the marine opposite number of the magpie, a plover-like bird that never caught oysters, but found its food among the mudflats uncovered at low tide close to the oyster beds.

The Pyefleet oysters are the oysters from that part of the Colne River estuary, the creek or small stream, hence the fleet of the seapyes or oyster-catchers. They are the finest Colchester oysters. There are others; there are oysters brought from distant beds and "relaid" where they get the benefit of the Colne River fresh water and cold North Sea salt waters happily mixed; a wonderful mixture for oysters to judge from the Natives, those that never knew any other, and from the "Relaid," those that were born in milder waters, the Gulf Stream waters of the Brittany coast, and have responded so well to their new treatment.

A feature of the Colchester oysters which must be sorely puzzling to all believers in the theory of evolution is their immutability; the members of the Wine and Food Society were shown specimens of shells found in Roman remains at Colchester, and unquestionably 2,000 years old, which were identical in size and markings with those straight out of the sea that very same morning.

And what a groan went up when Sir Gurney Benham stated that the price of Colchester oysters had been, a very long time ago, 2/- per 1,000! Colchester oysters are very dear, but they are very good; undoubtedly they are the best. And there is a ray of hope: the spat, this year, was the best recorded during the last 25 years, so that we should have more Colchesters, and not only more but cheaper Colchesters in five or six years' time.

Ten years appears to be the natural life of an average oyster, that is if it is permissible to call the life of an oyster a natural one, considering its quaint habit of changing its sex three and sometimes four times during the season, when it reaches manhood or womanhood, that is when four to five years of age. And what a dull, monotonous life is the life of an oyster! It is really merciful to introduce into its existence and its shell an element of excitement in the shape of a sharp knife which will make it free to come to us and receive the appreciation which it so richly deserves.

It's time to visit SOUTH AFRICA

DON'T you ever feel, when you come to the last page of a particularly vivid book of travel or adventure, that you yourself would like to do something different, to face new experiences and see how other people live?

Well, why not? Pack your trunks and take a holiday in South Africa. It is a country reserved by Nature for holiday-makers. Picture a land where the sun but rarely hides his face, where the air is as exhilarating as champagne, where flowers and trees deck hillside and meadow with a mantle of brilliant hues, and everywhere the mysterious lure of Africa surrounds you with its subtle hypnotic charm.

Picture the mighty scenic wonders of Africa—the Victoria Falls, an epitome of inexorable power and faerie loveliness, the magnificent Drakensburg Mountains, the unparalleled opportunity to study wild animal life at close quarters, the fascinating Native life and customs, the gay social life of the busy modern towns.

Go to South Africa this year and bask in the sunshine of an alluring land. The voyage there is one of restful comfort and takes only 14 days. Illustrated brochures obtainable from the Travel Bureau, South Africa House, London, W.C.2, or accredited Travel Agencies.

FIFTY YEARS AGO

From the *Field* of October 27th, 1888.

THE new Cambridgeshire. "We are among those who lament that the Jockey Club should have found it necessary to transfer the Cambridgeshire winning post from 'the top of the town'—the site and scene of so many exciting finishes, and around which the traditions of great horses and great jockeys will linger—to the end of the Rowley Mile. . . . The course was one *per se*. There was nothing like it in this country—a grand trial of speed and stamina, and a grand sight. . . . And the new one is like unto any other handicap run on the Rowley Mile or elsewhere. There are thousands of handicaps decided over a mile or a mile and a distance during the season, and the new Cambridgeshire takes its place as one of them. An important one, no doubt, but with no special feature about it that is not shared by many others. We must, however, in justice own that the start on the new course will be much better than it was on the old. From the nature of the ground, those on the lower portion of it were much at a disadvantage, and this defect will on the new course be remedied."

Safeguarding the Amateur. "Two cases reported from the Press. In the first the accused was charged with 'unlawfully obtaining by false and fraudulent pretences from Edward Herbert Blunt a Gladstone bag, value £2 2s. The bag in question had been offered by the prosecutor, who was the proprietor of the Marble Baths, Junction Road, as a prize to be competed for in a swimming race, open to amateurs only, under the rules of the Amateur Swimming Association. The prisoner had entered for the race under the name of Henry Clarke, representing himself to be an amateur, and had obtained the prize. . . . The magistrate, 'You entered in a false name, and I must sentence you to fourteen days' imprisonment.'"

"At Northampton Quarter Sessions, Benjamin Burns, *alias* Hughes . . . and Frederick Keeton were sentenced to four and six months' imprisonment respectively for having conspired to defraud the committee of the Northampton Amateur Club of £10. Burns ran at the recent sports in the name of Hughes, having been previously entered by Keeton, who had paid for Burns's keep at a professional trainer's."

IN THE SALEROOM

ON November 3rd Sotheby's are selling a collection of old English and foreign silver, the property of Major E. Knatchbull-Hugessen, of Gawdy Hall, Norfolk. There are many real collectors' gems in this collection, notably a salver, 11¾in. wide, engraved with the arms of Nash, by Wm. Peaston, London, 1750; a Queen Anne castor, with the arms of Collier, 6½in. high, London, apparently 1708; a fine pair of Charles II "lace-back" spoons, maker's mark A.K., London, 1682; two apostle spoons, one pricked with the monogram I.G., maker's mark a crescent enclosing W. London, 1600, and the other with maker's mark T P in a shaped shield, London, 1648. These should be seen together with the rare seventeenth century star-shaped watch, in parcel-gilt, by David Ramsey, one of the finest of the early clockmakers, who was clockmaker to the King in 1613. This watch, and the two spoons, were discovered in a recess at Gawdy Hall some 80 years ago, together with some papers relating to the troublous Cromwellian period, and were, apparently, hidden away when Gawdy Hall was seized at that time.

REFLECTION IN A WINDOW

THE other day I stopped in front of an animal shop in Camden Town. I was there by accident rather than design, and I was rather bored as I stood and looked in at the window. There were all the usual things that one sees in an animal shop—or at least I suppose there were, for I must confess that I do not stop and look into animal shop windows as a general rule. There were guinea pigs, and kittens, and rabbits, and puppies, and one or two hens, and white mice, and goldfish swimming about in bowls, and wonderful multiple-coloured fish swimming about in tanks, and a monkey or two and all sorts of other things. And there was a great noise. And over the door in a small cage were two tiny birds with brilliant green plumage.

* * *

And as I looked at them a door in my memory opened and I was no longer standing on a pavement in Camden Town.

* * *

I was tending sheep in Australia. I was riding across a hot and dusty plain in search of some straying ewes, and my eyes were sore and smarting. My horse plodded along very slowly with its long tail swishing from side to side, and my little dog—Moses his name was—his little feet pattering on the hard iron clay, looked up reproachfully every now and again as the sun beat down upon us and the hot dry wind swept sullenly over the plain.

* * *

I was searching for a break in that monotonous, never-ending skyline for scrub and gum trees that I knew could not be far away, but always not very far in front of me there was the dancing mirage with its shimmering, cool, tree-shadowed water, and always the sun-baked clay. And at length, thinking that my sense of direction had failed, I was about to turn my horse's head and to retrace our steps when a low murmuring came up from behind and above us. There approached at tremendous speed a small black cloud some 20ft. from the ground. The sound increased to a high-pitched drone, and as it flashed overhead the sun turned that cloud into a myriad of sparkling jewels, and then, in a moment, it was but a black patch fading in the distance. But I knew where the scrub was, and where water was. And I knew the black cloud for a flight of budgerigars returning to their nesting places in that scrub.

* * *

And so at last we came to the edge of the scrub, and as we fought our way through the tangled barrier with but one thought in all our minds, my horse shied and the dog yapped, and in that moment a large kangaroo bounded out of the open and paused for a second, sitting up like some gigantic hare, and then, with a great leap, disappeared amongst the trees. But she had left something behind—a baby kangaroo, that now, with hesitant steps, hopped towards the nearest tree. There was no kangaroo in that Camden Town shop, but there might have been, so vivid was the memory, and I might easily have touched it. I must, I think, have been the first human being that baby kangaroo had seen, for it hesitated on its way to the tree, hopping to and fro indecisively, and finally stopping, unable, I think, to understand the sudden awful loneliness, and sat up with short forearms hanging limply in front of it, taking stock of me, and my horse, and my dog. And so we eyed each other gravely. And then the mother appeared again, and gave a short, commanding bark, and instantly the baby was in its rightful place, and we went towards the water.

* * *

The water, such as it was, was muddy, and wound between low moss-covered banks. I slipped the bit from my horse's mouth, and as I did so a commotion arose in the thick bushes clustered at the water's edge. And once again a vivid shower of colour flashed across my eyes and sparkled for an instant in the sunshine, and was lost in green darkness. My budgerigars were at home.

* * *

The vision faded. My feet were not in stirrups, but on hard pavement. I was looking, not at budgerigars in all their freedom, but at two green captives huddled together on a perch in a small cage. And the proprietor was looking at me with puzzlement, not so very different from that of the baby kangaroo that I had seen all those years ago. Realisation of my surroundings came as a shock. There was dirt and noise, and discomfort, and things in cages. I went on my way, feeling not so very different from those two little creatures that had given me for a moment a glimpse of the earth.

A. B. G. D.

LETTERS TO THE EDITOR

CANALISING THE AVON

SIR,—I have read General Carey's article on the work of the Avon and Stour Catchment Board on the Upper Avon between Enford and Chisenbury with peculiar interest, since I have had the opportunity of fishing this part of the river at regular intervals throughout 1938.

He condemns the work of the Board wholeheartedly, but in my opinion he overstates his case.

He says that the "general tendency of a river is to spread." This is only true of large rivers in their lower parts. It is not true of a small river running through water meadows, like the Avon between Enford and Chisenbury. Such a river tends to become progressively narrower, because the cattle tread down the banks and the ground so trodden in is consolidated by rushes and other riverside herbage. This progresses until bottlenecks are established here and there behind which mud gradually accumulates and thus the flow of the stream is impeded at these points.

He says, and says rightly, that to avoid the danger of flooding, it is essential to clean out the carriers and the old bed of the river in places where it has been diverted to form mill dams. But it is quite futile to do this unless there is an adequate flow in the main stream to carry off the water from the carriers. The Catchment Board have made such a flow by cutting back the banks to their original margins; but only to their original margins, as is obvious to anyone who has had an opportunity of seeing their work in progress, as I have.

But they have done more than this; they have cleared out the acid mud which has accumulated for many years and is inimical to the well-being of trout, and they have left a clean gravel bed on which silt can now be deposited. It is not true to say that they have scoured the river bed of all the weed which carried trout food. One need only look at the river between Enford Bridge and Littlecott Mill, where they finished their work last May, to appreciate this. This stretch is already stocked with weed and on two Sundays in September I caught a dozen or more trout in it, all of them in first-class condition.

Now let us come to what General Carey calls "the spiritual side." It is obvious that if the banks are cut back an aspect of regularity is given which may be described as "canalisation." But this is only *temporary*. In a very few months the grasses of the river bank cover the edges completely once more. If anyone disbelieves this, let him look at the stretch between Enford Bridge and Littlecott Mill, to which I have already referred, or even to General Carey's photograph of the river below Enford Bridge. The work of the Catchment Board was finished here in May and the photograph shows internal evidence that it was taken not later than August, barely three months afterwards. The caption reads, "After about a year all that has taken place as regards recovery." This photograph defeats its own object, since it really shows that in a few months the signs of "canalisation" have practically disappeared.

It will be seen that I am at variance with General Carey, and I am strongly of the opinion that, when next year's fishing season opens, the Upper Avon will be in every respect a much improved river.

Yours faithfully,

4, Park Square West, Portland Place, N.W. 1. IVOR BACK.

SIR,—I think the article in the *Field* of October 8th is hardly fair to the authorities who are cleaning out the Avon. The river is in a very bad state through years of neglect, and I am afraid that we fishermen are largely responsible. We shall now have to suffer a little temporary inconvenience, but in a few years we shall reap the benefit of the operations now in progress. I cannot help feeling that if we bore in mind that any river is just one indivisible whole and that unless we all do our own share of cleaning, &c., such work as we do is utterly wasted if our next door neighbour neglects his part. As regards the co-operation between the various affected persons and the catchment board, I can only say that my "fishing landlord" is working in the closest harmony with that board and that he is quite satisfied with their work, and so am I. I hope to live to enjoy greater sport on my little stretch than I have had in the past six years.

Yours faithfully,

Devizes. MUCKLE FLUGGA.

SIR,—I was particularly interested in reading the article in your paper giving an account of the desecration of the Stour and Hampshire Avon. We are now watching the same hideous process on the banks of our Avon. This river runs through Bradford-on-Avon, Bath and Bristol. There is one material point that your article does not mention, possibly because it does not apply to the two rivers. But this point will arise when the next flood takes place on our river here.

In theory our river here is being turned into a nice tidy canal to prevent floods, by letting the flood water down more speedily than formerly.

It is quite obvious to anyone who is not an official that the opposite effect will be produced, and consequently floods in these towns will be worse.

The whole of the water levels from the mouth of our Avon to some miles above Bradford depend on the weirs and bridges. In times of floods the water piles up against these obstructions. The more water that comes down in any given period of time, the higher will be the water levels above the weirs and bridges, and the worse the floods will be.

Yours faithfully,

Duckmead, Bradford-on-Avon. E. C. PINCKNEY.

THE PAINT BILL

SIR,—Referring to your article on this subject, the real reason why white lead does not always give the satisfaction one has a right to expect will surprise many of your readers. They ask for best white lead and they do not get the best, for the term "best" in the paint-grinding trade is applied only to second grade white lead. If you want the very best you must ask for "genuine."

A certain master painter in the North of England rarely did a painting job himself, but when he did it invariably wore better than any job done by his workmen, although he used the same materials. He once painted, grained, and varnished the woodwork in a farm kitchen. When I saw it 20 years later it looked very little the worse for wear.

"Those —— painters of mine use far too much thinner," he used to remark. "I can't get 'em to understand that 'elbow-grease' is the best thinner. If you mix your paint thick you can still put a thin coat on the woodwork if you rub it out thin with the brush; but those —— are terribly afraid of an aching wrist."

In those days many of the women were reading Ruskin, and they objected to graining, "because graining is imitation; and imitation is not art." Nevertheless, graining will "stand the gaff" much better than plain painting.

In the days when I was "common strapping" I was kept on one summer to paint all the woodwork inside and out. I was told to take plenty of time and choose any colour I liked, so I burnt off all the old paint, spent a long time in rubbing down the woodwork until it was as smooth and sleek as a woman's shoulder, and then painted it harrier green and Belvoir tan. The white lead was Walker Parker's genuine, the yellow ochre cost 56/- a hundredweight (wholesale), and the varnish was Williamson's, of Ripon, which in those days was better varnish than that sold elsewhere.

The time spent rubbing down was not time wasted; and that job still looked well ten years later, although the green had faded considerably. Green is one of the worst colours for standing strong sunlight. I mixed that paint so stiff that it nearly broke my wrist to put it on, but I did not leave it thick on the woodwork.

Varnish should not be applied in any but dry weather; and in your English climate it should not be applied on outside work before nine or ten in the morning or after three in the afternoon.

Far too many housewives ruin varnished work with scrubbing brushes, cleaners, and soap suds. All it needs is a chamois leather and cold water.

If cows are grazing near where you are using white paint they are quite likely to come and lick it all off.

Yours faithfully,

Calgary, Canada. A COMMON STRAPPER.

IRISH LOUGHS

SIR,—I have read with interest the letters of "O. M." and other correspondents about fishing in Irish loughs. If you can spare the space I should like to state my own experience. Since 1926 I have spent two or three weeks nearly every year on one of the famous loughs in the West of Ireland. My visits, for personal reasons, have always been in late August and September; I have never been over for the mayfly season.

My fishing diaries give the following figures:

1928 fished 16 days, 37 trout weighing 45lb.
1931 fished 22 days, 53 trout weighing 86lb.
1934 fished 17 days, 55 trout weighing 78lb.
1935 fished 24 days, 66 trout weighing 110lb.
1937 fished 9 days, 27 trout weighing 49lb.

All these were brown trout. I nearly always fish the wet fly, and my boatman the dap (daddy long legs). A few fish were taken, on calm days, on the troll. Thus in 1937 the figures were 16 on wet fly, 10 on dap, 1 on troll. It is my experience that the fishing now is every bit as good as it was twelve years ago and, so far as I can see, there is no reason why poaching should be more prevalent now than in the past. When it is remembered that the fishing in all the big West of Ireland loughs is free, it must, I think, be agreed that the sport is incomparably better than any that can be obtained—on the same terms—elsewhere in the British Isles.

As I do not wish to "boost" either the lough in question or myself, I enclose my card and beg leave to sign myself

Yours faithfully,

London, S.W. 3. MUGDRUM.

JACOB SHEEP

SIR,—With reference to Mr. Boydell's inquiry in your issue of October 1st about Jacob sheep, he may be interested to know that in the *Field* for May 2nd, 1936, was a letter from Mr. J. C. Bristow-Noble on the subject, and the reproduction of a photograph of a flock kept by Sir Merrick Burrell, Knepp Castle, West Grinstead. These sheep were described as being "black and white, horned and as graceful and light in their movements as deer or goats." In the issue of May 23rd, 1936, Lord Bradford stated that "I have a list of seventeen ladies and gentlemen who possess flocks of this interesting breed, with many of whom I have from time to time exchanged rams."

Yours faithfully,

14, St. Andrews Avenue, Wembley, Middlesex. J. BANBURY.

FISHING IN ITALY

SIR,—I feel sure the most charming place Madonna di Campiglio, situated well north of Brescia and to left of Trento and Bolzano in the Dolomites, will interest English tourists, especially if they take a rod. The small town is at 1,560 metres, and in the summer season (July 1st to September 1st) there are the following attractions: Plenty of very nice hotels; good food; climbing of all sorts with the most amazing scenery; golf on a nice nine-hole course; several hard tennis courts; riding; swimming; dancing; and a special reserve of well-stocked fishing in several rivers and lakes, covering, in all, some 60 kilometres of rivers, with fish up to 4lb. I was there for six days and had a bag of 105 trout, rainbow and brown, amongst which were several fish of 2lb., and the average must have been about ¾lb. I caught about 70 on wet-fly, 15 or so by spinning, and the rest on Stewart tackle in mountain torrents. An American angler caught 32 one morning on dry fly.

The Italian State fishing licence is necessary (obtainable at Trento), costing with tips, say, about Lire 65. The charge for the fishing is Lire 150 (except in three special hotels at only Lire 50—these hotels being part-owners of the fishing), and the rule is that the fish are returned to the keeper at Madonna di Campiglio, who lets one take such as are wanted for eating, whilst the rest are weighed and credited at so much a kilo, so that if an angler has good luck, he might well be able to wipe out his Lire 50 or Lire 150 and earn a credit. The fish so surrendered are sold at Lire 18 a kilo to the hotels. There is no doubt that the fishing is better early and late. August is not a good month. Once it gets too hot, the glaciers above start melting too fast, and the result is that some of the streams get too milky. I should imagine the best months would be May–July, and then after September 15th. In the winter, Madonna di Campiglio is a much frequented winter sports centre.

I can only add that the rivers and lakes (of which there are several) are well looked after, and poaching is kept down. No nets are allowed in fact, only fishing by rod and line.

Yours faithfully,

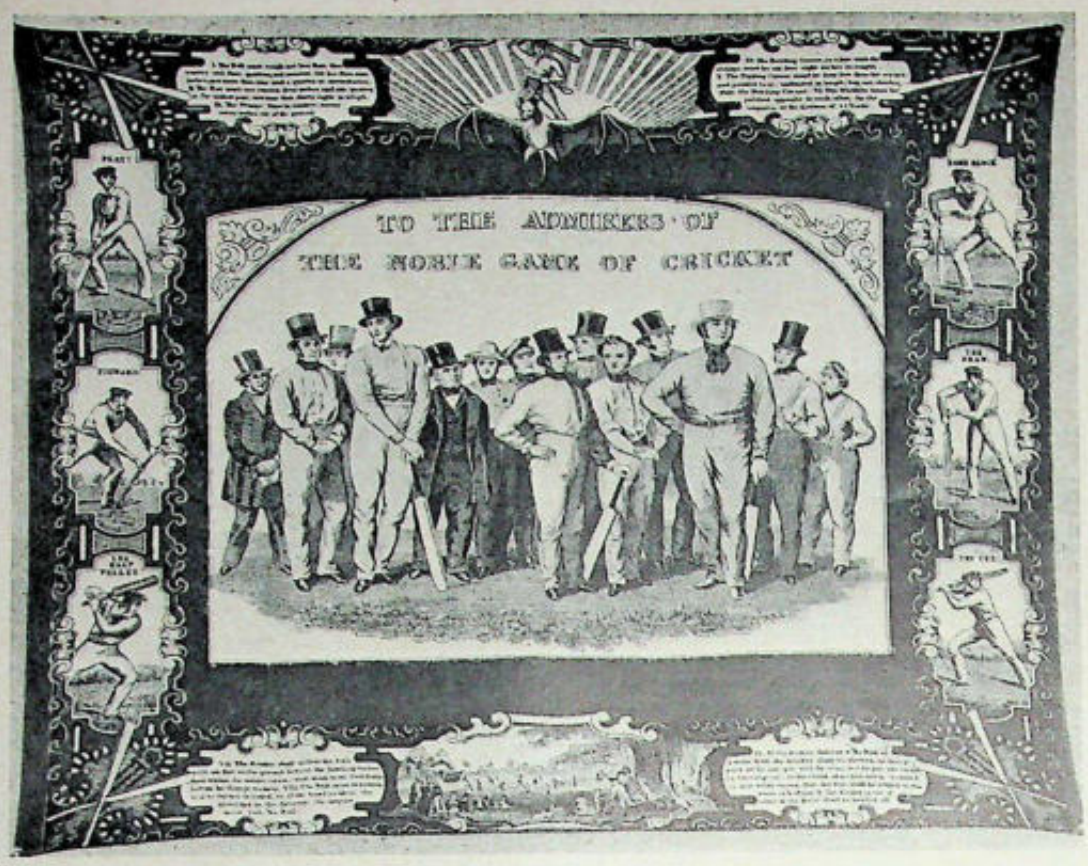
Carrara. GREVILLE CRIPPS.

GREY SQUIRRELS

SIR,—I have read with interest the question asked in the *Field*, "If grey squirrels are of use in the planting of trees by burying acorns and nuts." In the United States this good action of the grey squirrel has been noticed by those interested in forestry. I feed our squirrels on maize in the winter and have never seen more than eight at one time. In the early spring they eat a few buds of the tulip trees, but never ring a tree as red squirrels do here. They do take a few pears and apples, but not many, as the dogs are on the look out for them if they cross an open space. One hundred and fifty years ago they were a pest, as the settlers had killed off many of their natural enemies, and the greatly increased numbers of squirrels raided the cornfields. One night last year I scattered some maize for their breakfast, but by morning there was 5in. of snow on the ground. Nevertheless, the squirrels were digging down through the snow and seemed to know exactly where each kernel of maize was. They must have found it by scent, as the maize was widely scattered. The numbers of squirrels on our place remains the same except when every seven or ten years a plague kills off many. At home I do not think they trouble birds or nests, but they have no doubt changed their habits when transported across the sea. It would be interesting to hear if they do any damage near Capetown, where I have seen them in numbers near Rhodes's house.

Yours faithfully,

Daviot House, Daviot, Inverness-shire. GEORGE L. HARRISON.



WHO ARE THE PLAYERS?
(See letter "The Noble Game of Cricket")

THE NOBLE GAME OF CRICKET

SIR,—I am the daughter of James Pagden, who lived at Fragfoile, Alfriston, Sussex, and who played cricket for Sussex during the middle of last century. Among my late father's possessions (he died in 1892) I have a large printed handkerchief dealing with the game of cricket, bearing in the centre what is clearly a portrait group of a cricket team.

I enclose a photo of this handkerchief as I think it may be of interest, and I hope that you or some of your readers may be able to tell me the team portrayed. The writing round the border gives the rules of the game.

Yours faithfully,
(MRS.) FLORENCE A. WINSTANLEY.

The Old Apiary,
Alfriston, Sussex.

AN EXPERIMENT WITH DUCK

SIR,—Few people seem to know what a very little trouble can increase the potentialities of certain lands for wildfowling. On an estate in Sussex there was a piece of land which two seasons ago was desolate and barren, in the dry weather just an expanse of brown, dry, cracked mud as hard as iron. It was decided to take it over and make a duck shoot.

So when the rains came and partially flooded this place it was dammed up, but so arranged as to be under control with a drop sluice dug into a deep ditch for permanent water feed when required. A screen of willow, bamboo, &c. was planted for gun cover within killing range of the dammed-up water.

Roots of flags, edge, reed, &c. were dumped in for the use of duck, snipe and other fowl, for these birds love nothing better than this sort of cover and find a large amount of aquatic insect life. All this was done less than two years ago, the result being astounding. Mallard, wigeon, teal, a few geese and hundreds of snipe now take advantage of it, and it is no exaggeration to say that teal especially come here in huge flocks.

They are easily got at now, thanks to these efforts, it being possible to almost get to the water's edge without undue disturbance. It seems to me that nearly every estate contains some sort of water or marshy meadow that could be put to the same use.

Yours faithfully,
C. W. BALCHIN.

The Tower,
Firle Park,
Sussex.

HUNTERS AT GRASS

SIR,—I have an engraving of Landseer's picture "Hunters at Grass," on the back of which are pasted the following particulars

HUNTERS AT GRASS.

Algiers, br. horse, by Salamanca, foaled 1816.
Ballyany, br. horse, by Osiris, foaled 1817.
Hainault, ch. horse, by Osiris, foaled 1819.

The above were bred by Mr. Wigram out of his mare Elizabeth, by Waxy, by Pot 8 os, by Eclipse.

Many years ago I had an opportunity of seeing the original oil painting, when it was at Messrs. Vokin's establishment for cleaning. I thought it a delightful picture, and noted several interesting details, one of which was that the chesnut horse, Hainault, had evidently been fired on his near fore, the marks of which show up very plainly in the engraving.

Yours faithfully,
M. F. REYNARD.

Sharow, Ripon.

OX GOAD THEORY

SIR,—Flying across the Sudan I have just seen your questions and answers in the issue of September 17th.

I remember looking up the origin of rod, pole or perch some time ago, and I was under the impression that it came from an ox goad of 5½yds. If so, could we reconstruct primitive measurements as follows? :

1 ox goad = 5½yds.
4 ox goads = 1 chain.
10 chains = 1 furlong.
(1 furlong multiplied by 1 chain = 1 acre or 22 furlongs = 1 acre.)

It all depends whether there is anything in the ox goad theory.

Yours faithfully,
CHARLES PONSONBY.

Cobbe Place,
Lewes.

WHALES OFF DEVON

SIR,—The accompanying photograph, which I took whilst fishing off Beer Head on September 2nd, may interest *Field* readers.

When about one mile from the shore, two or more large creatures were sighted in-shore, They appeared and plunged at intervals, and were at first thought to be porpoises. Attempts were made to get nearer, and it became obvious from the large fin and the general bulk of the creatures that they were whales. The fisherman owner of the boat thought they were grampus whales, as such were occasionally encountered, but later in the year.

Observation was maintained for almost an hour, during which attempts were made to follow the whales. At last they were seen making out to sea, when four whales were clearly discerned. It was at this time, when they came to the surface for a few moments, that this photograph was obtained. Concluding the whales had departed, my party resumed fishing. Some time later the whales were seen again between the boat and the shore, making toward the shore.

In the hope of getting a closer view, the course was altered to get between the whales and the shore, and ultimately the party were rewarded by seeing three of the whales appear, coming towards the boat and plunging again some 50ft. from the boat.

As to the size of the whales, various estimates were made by the members of the party, but perhaps a fair conclusion was that of the boat owner, Mr. Fred Newton, of Beer, who said, "They are longer than my boat, and that is 25ft."

The photograph was sent to the British Museum of Natural History, South Kensington, and identified by Mr. P. Stammwitz, who states in his report :

"They are two bull killers and large specimens. No other cetacea have the large dorsal fin as seen in the photograph (the cow of this species does not develop such a large fin). This is an unusual visitor to the British coast. A bull was caught in the Humber in November, 1885, and we had a young cow stranded in Inverness-shire in April, 1932.

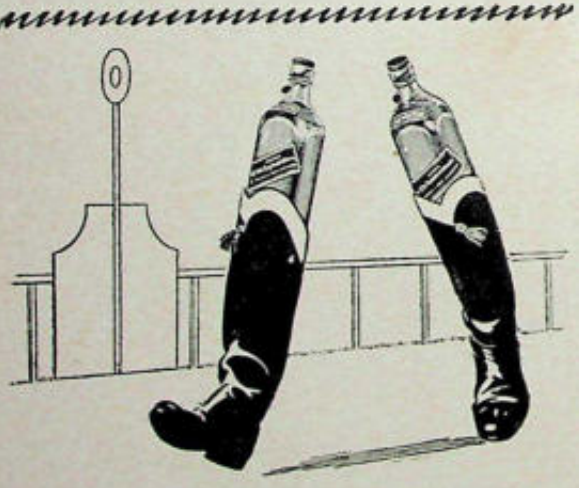
"The Killer (*Orca Gladiator*) is the only one of the cetacea that feed on mammals. Its chief feed being seals and penguins. It reaches 40ft. in length, has very strong white markings on its sides, and two rows of powerful teeth. It is known as the 'wolf of the sea.'"

THE LARGE DORSAL FINS OF TWO BULL KILLERS
(See letter "Whales Off Devon")

The party found great interest and some excitement in following and observing these creatures, but there is no doubt that had they been able even to guess at the real nature of the whales, as now disclosed by Mr. Stammwitz, this photograph would never have been taken.

Yours faithfully,
A. D. BUDD.

Loxwood,
Sauncey Avenue, Harpenden.



Here's a favourite that's always a winner!

Your most-fancied horse may fail you, but Johnnie Walker is always true to form. Many fine whiskies, each one specially chosen for its distinctive character, each one fully matured in the wood, meet together in the blend of Johnnie Walker. The result is always the same—Scotch Whisky at its best and smoothest. Always ask for Johnnie Walker by name.

Johnnie Walker
walks away with it!

Born 1820—still going strong

HALICHŒRUS GRYPUS

SIR,—Major Dorrien Smith's account of a great grey seal battling with congers reminds me of the very friendly pair of young (year old ?) grey seals which we saw on July 16th last at the landing creek on the islet of Grassholm, Wales. These youngsters had caught a conger quite as long as they were—say, about 6ft. It was writhing feebly, but they quickly opened it out, biting the vitals, and tossing the entrails on one side as if they were distasteful. First one and then the other worked at it, holding it with fore-flippers and teeth. But, like cats that have finished with a mouse, they now displayed no further interest in the conger, which floated dead on the surface of the sea. The young seals were evidently full-fed already, for they now began to play very prettily in the rocky harbour, diving around and under our boat, and coming up to rub against it, and press their nostrils against the white planking as if this process gave them some pleasure. I have never seen wild seals so tame.

The grey seal certainly uses its claws much when feeding. One winter's day I watched a large bull struggling with a very large ray which was curling and lashing its long tail about the body and upper parts of the seal. The ray's tail was remarkably long, but it was impossible to say whether the fish was a sting ray, a whip ray, or what species. I only noted that once it seemed to encircle the seal's thick "shoulders" completely with its tail. The seal had gripped the skate firmly with his long claws buried in the central cavities of its ventral surface, and there was not much doubt about the issue. The seal had evidently had trouble with the ray under water and had brought it up in order that he might have air to breathe while the struggle went on. A ray has formidable teeth for crushing shells, and possibly the old bull was wary of these. At any rate it was a long time manœuvring before at last striking with his teeth, while the ray continued its wild lashings. The seal seemed to get a big bite in just below the mouth of the ray, and, having gripped thus, he pushed away with his flippers, tearing out a large mouthful of flesh. He now released the ray, which swam away feebly, while he swallowed the lump of flesh. The ray vanished, but the old bull had his eye on it, and soon dived and brought the fish to the surface for a much shorter struggle and another bite. This was repeated thrice, the ray now *in extremis*. I could not follow much after this, as the seal was drifting farther off with the current, and a cloud of gulls close overhead were looking for scraps from the feast.

The claws of the fore-flippers of the grey seal are indispensable when big fish have to be dealt with.

Yours faithfully,

Skokholm Island, Pem. R. M. LOCKLEY.

SEVENTY-SIX YEARS OF CRICKET

SIR,—I have received another interesting communication from Sir Jeremiah Colman, this time in reference to the Rev. A. T. Scott's recollections of the decisive over in Cobden's match, as described in my letter in your issue of October 8th.

Sir Jeremiah states that Scott played in a few matches for his cricket team at Carshalton Park in 1883, and G. H. Goldney, who introduced him, told Sir Jeremiah that it was through Scott's fine fielding that Cobden had his chance, as Scott saved an apparently certain four on the *leg side*.

Sir Jeremiah suggests that if Scott's place in the field was mid-on it is fair to assume that he fielded the ball from that position, and if so, it is some confirmation of the view taken by Mr. Sambourne, as stated in my letter.

I must now leave readers to form their own conclusions, but what really happened seems, like the disappearance of the crew of the Marie Céleste, likely to remain an unsolved mystery. I find that a mistake in the date of the Eton and Harrow match in which C. I. Thornton hit over the Pavilion has crept in in some way. It should, of course, be 1868, not 1870. Yours faithfully,

Exmouth Club, Exmouth. J. F. STUART-EDWARDS.

A BABY GREY SEAL SHOWING ITS FORMIDABLE CLAWS
(See letter "Halichœrus Grypus")

SHOWER BATH FOR A ROBIN

SIR,—I expect the following is one of many interesting incidents brought about in bird and animal life by the drought experienced earlier in these parts.

While watering the vegetable garden one evening some weeks ago a young robin flew down among the asparagus fern, in the direct stream of the hose. I altered the direction, but it followed the spray and perched on a young pear tree, where it sat for about fifteen minutes enjoying a shower bath, preening itself and fluffing its feathers while the hose played on it. Yours faithfully,

White Cottage, Galley Hill, Waltham Abbey, Essex. A. C. MOLONY.

FOREST FIRE

SIR,—For any of your readers who may know Vancouver Island, it struck me that they might like to hear exactly what damage has been done by the awful forest fires that raged in the northern section of the island during July. In August I motored from Comox to Campbell River and on to Elk Falls. Driving to Campbell River nothing much was noticeable except off on the sides of the hills, where the trees have been thoroughly scorched and small puffs of blue smoke were still to be seen ascending from the burnt patches.

Campbell River itself has remained untouched, though the fire did get within five or six miles. Strangely enough, the settlement was hardly affected by the pall of smoke and rain of ashes that spread right "down island," and even as far as Vancouver.

On the way to Elk Falls, the road winds through the worst part of the burnt area, and it is terrible to see on all sides a blackened desolate country of stumps, logs and trees denuded of every bit of green. It is wonderful that the timber round the Falls was saved, as the fire must have come within a few hundred yards. Proceeding on towards Forbes Landing there is again continual evidence, on each side of the road, of where the fire passed.

In spite of days of strenuous effort to save the little Inn at Forbes Landing, the fire conquered, and this most lovely spot is now a sad sight, and the hotel which Mr. Forbes, a pioneer, started long ago, has gone. The day I was there, men and trucks were at work clearing up the debris. Several shacks on the edge of the lake escaped the flames. None but those who fought day and night, endeavouring to control the fire, know what a ghastly conflagration it was—the worst for years—and it will surely be a very long time before the countryside returns to its normal beauty. The loss of merchantable timber is also extremely heavy, thousands of acres having been rendered useless.

Yours faithfully,

Vancouver Island, B.C. (Miss) C. MORRISON.

IN THE PATH OF THE FLAMES
(See letter "Forest Fire")

Watch your step, Mother!

Don't you remember how the Old Man carried on the last time you carried off his Gold Flake? It's all very well saying you like their flavour. So does he. And you appreciate the fine Virginia tobaccos they are made of. So does he—and has done for years before women came into the field and developed the taste for a man's cigarette. Come now, be reasonable, and buy your own Gold Flake in future.

WILLS's

GOLD FLAKE

is the man's cigarette that women like

N.B. You can get Wills's Gold Flake Cork-tipped as well as Plain. Ten for 6d. Twenty for 1/-

G.F.B. 574

LOOPED ROUND THE NOSE

SIR,—The correspondence in your recent issues under the heading of "Hooked Through the Gills," gives me courage to ask you whether you have heard of many instances of salmon being "hooked" in the following way. Fairly recently I was fishing the Usk, near Usk, as a guest, and hooked a fish in a fairly fast run on a very small "thunder and lightning." After about 15 minutes the fish came into shallow water obviously nearly finished and was missed by an over-zealous gillie.

It then took on a new lease of life, and was eventually gaffed nearly an hour later. The cast was then round the top of its snout three times, *i.e.*, it was hooked in the left corner of its mouth, the cast passed through its mouth from left to right, over the top jaw and through its mouth again twice (I was fishing from the left bank). I do not think this had happened when the fish first came into the gaff, and can only conclude that it rolled three times with its mouth open as it went away from the gaff, when in the general turmoil of a "missed" fish. I may have given it some slack line. The cast bit deeply into the top of the snout and presumably took the weight off the fly and produced the effect of a fish foul-hooked in the head—hence the new lease of life. I should be grateful to know of similar experiences.

Yours faithfully,
F. W. S. ROBERTS.

78, Cadogan Place, S.W. 1.

FURTHER HUNT CHANGES

THE following are additions and corrections to the table of Hunts published in our issue of Oct. 15th:

FOXHOUNDS—ENGLAND.

APONWY.—Master, Committee. Secretary, Mr. E. Hughes, Wernwyd, Llanwrthol, Llandrindod Wells.

ALBRIGHTON.—Secretary, Mr. C. Horell, Wheatstone Park, Cosall Wood, Wolverhampton (only).

BLACKMORE VALE.—Huntsmen: Colonel Wingfield Digby (Monday and Thursday), F. Anyan (Tuesday and Saturday).

BLANKNEY.—Master, Commander F. J. Alexander. Secretary, Colonel Hugh Tallents, D.S.O., Coddington, Newark.

BURTON.—Joint-Masters, Major C. Wilson, Mr. E. St. Aubyn. Secretary, Major A. G. de Bunsen, the Grove, Tealby, Lincoln. Huntsmen, the Masters. Whippers-in, G. Ives, A. Dale.

CRAVEN.—Master, Mr. S. D. Player. Secretary, Mr. J. C. Ainsworth, Middle Bockhampton, Lambourn, Berks.

DEVON, MID.—(30.) Subscriptions, minimum 5 guineas. Cap, non-subscribers 10/-; 2/6 Damage Fund. Towns: Okehampton, Moretonhampstead, Chagford. Days: Tuesday and Saturday. Master, Major A. C. Arden. Secretaries: Miss M. Ryan, Whiddon Park, Chagford; Mr. F. G. Underhill, Rushford, Chagford. Huntsman, the Master. Whipper-in, Mrs. Arden, Kennels, Higher Stiniel, Chagford.

DEVON, NORTH-WEST.—Eighteen. Subscription, 2 guineas; cap, 5/-. Towns, Barnstaple and Bideford. Days, Wednesday and Saturday. Master, Lieutenant-Colonel R. Longstaff, D.S.O., J.P. Secretary, Major C. V. B. Hodson, Bye-Cross, Georgeham, N. Devon. Huntsman, the Master. Whipper-in, J. Lyne (h.h.). Kennels, Twitchen, Mortehoe, N. Devon.

EGGESFORD.—The hon. secretary is Vice-Admiral S. H. Radcliffe, C.M.G., Bridge House, Umberleigh, Devon.

ESSEX AND SUFFOLK (ESSEX SIDE).—Secretary, Major A. J. Waller, Boxted, Colchester. Assistant secretary and treasurer, Colonel R. Cockburn, O.B.E., Braiswick House, Colchester.

ESSEX FARMERS.—Joint-masters, Mr. A. H. Stevens and Mr. J. Derek Wigan. Secretary, Mr. P. G. Ledger, M.R.C.V.S., Bedford House, Maldon. Huntsman, Mr. Stevens (Saturday) and Mr. Wigan (Wednesday). Whippers-in, Messrs. Eric Stevens, H. P. Roberts, W. R. B. Dodgson, P. M. Lambert.

FERNIE.—Secretary, Colonel A. Main, Lubenham, Market Harborough.

GELLYGAER.—Fifteen. Master, Captain Douglas Neale. Secretary, Mr. K. D. Treasure, Ty Gwyn, Gellyhaf, Rengoed, Glam. Whipper-in, E. Lewis.

GOATHLAND.—Master, Mr. W. P. Ansell, Raithwaite Hall, Whitby. Huntsman, the Master.

KENT, WEST.—Kennels, Puttenden Manor, Shipbourne, nr. Tunbridge.

LEDBURY, NORTH.—Joint-masters, Mrs. J. F. Twinberrow and Mr. M. F. Higgins. Secretary, Miss P. M. Twinberrow. Whipper-in, Miss Twinberrow.

MELBREAK.—Secretary, Mr. N. Edmondson, Buttermere Hotel, Buttermere.

MENDIP.—Secretary, Major J. Portal, Lodge Hill House, Westbury-sub-Mendip.

NORTHUMBERLAND, NORTH.—Master, Mr. A. Hall Watt.

OAKLEY.—Joint Masters, Hon. Pearl Lawson-Johnston and Mr. W. H. F. Brunskill. Huntsman, Mr. Branskill.

OLD SURREY AND BURSTOW.—Thirty-seven couples of hounds. Minimum subscriptions: One person £25 (plus £7 10s. to the poultry and wire fund, two members of a family £40 (plus £10 to the poultry and wire fund), for three members of a family £40 (plus £15 to the poultry and wire fund). Non-members (three occasions only during season) cap £2 on Surrey side, £1 in Sussex. At each meet 2/6 is collected from each follower for the farmers' damage fund. Hunting days: Wednesday, Saturday and alternate Mondays. Master, Mr. Douglas Benson. Hon. secretary, Mr. Harrison Martin, Crossways, Godstone, Surrey. Huntsmen: The Master and Alfred Petts. Whippers-in: Jack Howells and Jack Wilson. Kennels: Felbridge, East Grinstead, Surrey.

PYECHLEY, WOODLAND.—The whippers-in are J. Stanley and L. Christian.

RHANDIRMWYN AND LLANDOVERY.—Joint-masters, Mr. A. W. Jones, Mr. G. V. Lloyd. Secretary, Mr. D. Nicholas, Cefyn Llan, Llandovery. Kennels, Nantiorest, Llandovery.

SOUTHWOLD.—Mr. W. Jessop is huntsman.

SURREY UNION.—Huntsman, J. Goddard. Whippers-in, L. Amies, F. Hazeltine.

SUSSEX, EAST.—Sam Wright is now first whipper-in to this hunt, H. Gould having gone to the Vine.

TIVY-SIDE FARMERS'.—Twenty. Monday and Thursday. Towns: Newcastle Emlyn, Cardigan. Kennels: Penwalk, Newcastle Emlyn. Joint-masters: Mr. E. J. Jones (1937), Tanygroes, Cardigan; Mr. A. F. Brook (1938), Pentood, Cardigan. Secretary, Mr. J. J. Jones, Dolcoed, Newcastle Emlyn. Huntsman, Lewis Williams. Whippers-in, Mr. J. R. Morris, J. R. Thomas. Station: Newcastle Emlyn (G.W.R.). No fixed subscription: visitors capped.

TOWY AND TEIFI.—Thirteen-and-a-half. Three days a week. Towns: Llanddewi-Brefi, Tregaron. Kennels, Troedrhiwbwlchau, Rhandirmwyn, nr. Llandovery. Master (1926), Mr. Thomas Thomas, Kennels, Huntsman, Mr. D. E. Thomas. Station, Llandovery.

WEST STREET.—Master, Committee. Acting-Master, Major J. Hawker. Secretary, Rev. C. J. E. Peshall, C.B.E., D.S.O., R.N. (retired), Great Mongeham Rectory, Deal. Huntsman, the Master. Whippers-in, S. Waghorn (k.h.) and S. Owen.

YORK AND AINSTY (NORTH).—Master, Major L. B. Holliday, O.B.E., T.D. Secretary, Colonel H. Rhodes, M.C., T.D., Oaklands, Whixley, York. Huntsman, The Master (H. Goddard, K.H.). Whippers-in, G. Turnbull and J. Normington.

FOXHOUNDS—SCOTLAND.

EGLINTON.—Joint-masters, Captain and Mrs. J. G. O. Thomson. Secretary, Colonel E. B. Maxwell, 24, Sandgate, Ayr.

FOXHOUNDS—IRELAND.

AVONDHU.—Secretary, Mr. C. E. Magnier, M.R.C.V.S., Duntaheen House, Fermoy.

KILKENNY, NORTH.—Forty Couples. Hunting days: Monday, Tuesday, Friday and Thursday every other week. The Masters: The Marquis of Kildare and Mr. R. C. Prior-Wandesforde; hunt whipper-in, A. Fairnington.

WATERFORD, WEST.—Master, Miss Anne Hickman. Secretary, Mr. R. Keane, Belleville Park, Cappoquin.

WESTMEATH.—Master (1938), Committee. Secretary, Captain J. B. Grant, Jamestown Court, Castletown, Geoghegan, Co. Westmeath. Huntsman, Captain C. E. Winter. Second Whipper-in, W. Wallace.

HARRIERS—IRELAND.

CLARE.—We have been informed that Captain Brady Browne, who appears as Master of the Clare Harriers, died some time ago. We very much regret this unfortunate error.

BEAGLES—ENGLAND.

ROYAL ROCK BEAGLES.—Eighteen. 15½in. S.B. Beagles. Subscriptions: 6 guineas, 3 guineas; ladies, 2 guineas; cap 2/6. Days, Wednesdays and Saturdays. Master, Mr. G. V. Churton. Hon. secretary, Mr. E. N. Wood, Street Hey, Willaston, Cheshire. The Master hunts on Saturday, P. O'Neill on Wednesday. Whippers-in, Messrs. P. Laird, E. N. Wood, E. D. Gayford and G. C. Callender. Kennels, Ledsham Station, Wirral.

DRAGHOUNDS—ENGLAND.

*CAMBRIDGE UNIVERSITY.—Master (1937) and Secretary, Mr. B. Van Cutsem, 16, Jesus Lane, Cambridge. Huntsman, D. Hadland. Whipper-in, D. Llewellyn. *No particulars have been received for this year.

TRING AND DISTRICT.—Master, Mr. John T. de Fraine. Secretary, Mr. W. Norris Bazzard, Town Mill, Amersham. The Master hunts. Whippers-in, Messrs. G. P. Brazil, G. Roberts and T. Witherby. Kennels, Marsworth, near Tring. 'Phone: Tring 184.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—There is an old widow of nearly 80, so poor that the tiny sum of 2/- a week would make life different for her. She lives in an almshouse in London, and has only her old age pension, no relations, and now that she is old and ill, hardly a friend. We ask your generosity for a gift of £8 that this poor old soul may have a few comforts in the late evening of her days.

IN THE CITY

By OUR CITY EDITOR

ONE of the most popular exhibitions of the year in London is the Motor Show. This year's exhibition has just been held, and reports say that orders for new cars have been coming in very satisfactorily. The motor industry is one of the first to feel bad effects from trade recession. It is also one of the first to recuperate when better times return.

That is very well known to the average investor, whether a motorist or not. Several motor manufacturing companies have recently issued reports and accounts covering experience over the past twelve months. The figures plainly show a setback caused by falling off in trade and serious upset caused by political uncertainties.

Share values have been tumbling. Ruling quotations for most motor manufacturing shares look sick compared with the values placed on them twelve months ago. This, I think, might be carefully noted by the investor. There is a possibility that in another twelve months' time the motor trade will be in a more flourishing condition, with a natural reflection upon share values.

The successful operator in stocks and shares invariably buys when the market is poor and sells out when conditions are more prosperous. Quite a selection of motor manufacturing shares is available. First thoughts, when a share purchase is contemplated, turn to Rolls-Royce. Here is a company which, in good as well as less prosperous times, gives a particularly good account of itself. That is why we see the £1 units of ordinary stock standing at a price of over 100/- each.

Such a price for a single unit is outside the scope of some investors. Those able to pay the price certainly secure a most reliable investment. Total dividend for 1937 was 22½ per cent. on an issued capital of £1,096,312. On this basis the yield at 100/6 per unit is about £4 8s. per cent., which return indicates the high standing of the security in the investment world.

On most other motor shares, yields are substantially more. Take the case of Standard Motors. The company has just published a report for the year to last August. Profits crumbled from £300,746 to £170,366. The directors are confident that the company secured a very fair share of the orders going last year. The profit figure, however, does show the result of recent uncertainties.

Standard Motor dividend on £720,000 of ordinary capital is 22½ per cent. The 5/- units, which at the time of writing stand at 15/- with the whole of the dividend in the price, yield as much as £7 10s. per cent. I should imagine that no great harm would come from picking up the security around this price.

The report of Austin Motors for the year to July 31st last also reflected trade recession. Ordinary distribution was 30 per cent. against 50 per cent. We find Austin Motors 5/- "A" ordinary shares standing around 23/6 to yield about £6 8s. per cent.

Profits of Rover Company for the year to July showed some falling off. The dividend was 15 per cent., as was the case the previous year; but a 2½ per cent. cash bonus was missing for the last twelve months. Rover shares have a nominal value of 8/- and a market price of about 15/6 to yield about £7 5s. 6d. per cent.

The financial year of Morris Motors ends on December 31st. There was some setback in earnings during 1937, but the company again paid 45 per cent. on its ordinary stock. The 5/- units standing around 28/6 yield as much as £7 18s. per cent. on that dividend basis.

It is extremely difficult to forecast a year's prospects for the motor manufacturers. An enormous amount depends upon actual trade conditions in the country. That, of course, affects the purchasing power of the public. At the same time I am of the opinion that those entering the market for motor shares just now, and sitting on the purchases for about a twelvemonth, will, during that period, be able to enjoy a profit on the investment.

MUD-MINDEDNESS

Mud is the all-sufficient joy of small boys, but when they become men childish things are laid aside. This is not so, however, with the African Lungfish, for throughout life mud is its crowning glory. Some of these queer creatures, the gift of Captain C. R. S. Pitman, the Game Warden of Uganda, have recently arrived at the London Zoo, complete with local African mud, out of which they had to be extracted by means of chisel and hammer. The fish has the swim bladder converted into a normal breathing organ so that, as the hot weather approaches, it can wall itself up in the river bank and spend the days of drought happily ensconced in a mucous-lined cell it has constructed. Breathing is carried out through a narrow tube extending to the outside world—a sort of remote control.

New Books

MOUNTAINS AND MOUNTAINEERING

Contrasts in Modern Methods

Blank on the Map. By ERIC SHIPTON. (Hodder and Stoughton ; 18/-.)

Himalayan Assault. By members of the French Himalayan Expedition, 1936 ; translated by NEA MORIN. (Methuen ; 15/-.)

MOUNTAINEERING, judging from the number of books recently published, has a remarkable grip on the public imagination. And this I find very surprising, for but a minute percentage of the book-reading public can ever have mountaineered or, indeed, hope to mountaineer, and but a very few indeed can ever have seen real mountains. For some time I dallied with the idea that it was the photographs that appealed—for the photographs are, as a rule, outstanding and brilliant—but I have come to the conclusion that the appeal is really to that sense of adventure that lies in all of us, and which to-day has less and less chance of fulfilment.

There are not to-day too many regions in the earth in which adventure is possible (always admitting, of course, the adventure of war), but there is—and I think will be for many years to come—always the Himalayas and the Arctic and the Antarctic Regions. Of these the Himalayan Regions and its surrounding country, particularly Tibet, has proved a fruitful source of travel books in the past few years. And for many years to come will prove a happy hunting ground for explorers both of the professional type and of the happy amateur type who wander gaily about inhospitable regions with little food and a push-bike.

The two books mentioned here—and they should certainly be read together, for between them they give a most instructive idea of the economics of travel amongst high mountains—are both what I would call the professional type. That is to say, they are accounts of journeys undertaken by men of attainments, who knew what they wanted and why they wanted it, and had very good ideas of how to get it, even if in one case they were not successful.

Blank on the Map is the account of the journey undertaken by Messrs. Shipton and Tilman to produce a map of an area hitherto unmapped. In 1887, towards the end of his amazing journey from China to India, Sir Francis Younghusband reached the Valley of the Shaksgams River from the Aghil Mountains, and climbing upwards between its source crossed the Karahorams into Baltistan through the Mustagh Pass. Since that day the area has remained a blank to the map-makers and a challenge to mountaineers. It was into that area that Mr. Eric Shipton and Mr. Tilman, accompanied by Mr. Michael Spender and John Auden, penetrated ; not to climb its peaks, not to amass a great list of new names of hitherto unnamed peaks and passes, not to make any record-breaking journey, but just to make a map. A very dull and prosaic objective, but it has produced a most interesting book. They were there for just five months. And their map, which has been developed with the assistance of the Survey of India, covers 1,800 square miles.

Now Mr. Shipton and Mr. Tilman believe in travelling light and in travelling fast even in the Himalayas ; and they believe in the minimum of fuss and the minimum of equipment and supplies. They are great believers in accomplishing much at a low cost. They set themselves a good many problems of that sort on this journey. And I do not think that they could have accomplished what they did—for they were cut off for more than three months from all supplies and from help of any kind—had they not developed their own somewhat spartan technique to perfection. And so the book is much more than a mountaineering book, and much more too than a book about map-making. It is an essay in frugality. Illustrated with very fine photographs, and written with humour and modesty, it is also a record of a great success—and wildly exciting.

Himalayan Assault, on the other hand, is a record of mountaineering on a most elaborate scale. It describes the first French attempt on one of the greater Himalayan peaks—the Hidden Peak, which is peculiar in that it sets its climbers their swiftest task on its lower slopes. If the climber can surmount an enormous buttress rising 6,000ft. from the Baltoro Glacier, he has a comparatively simple task before him. The French party who feared monsoon conditions in July made their attack early in the year, and had almost conquered the buttress when severe blizzards forced them to retreat. Their story is very different to Mr. Shipton's. It is written in a lively and rather dramatic manner, the tale being taken up in turn by the various members of the expedition. It is no less interesting because of its failure, but to get its full flavour it should be read in conjunction with *Blank on the Map*. The two books are complementary, and they set a very pretty problem for those who in the future intend to attack some portion of the Himalayan Region.

Side Saddle. By DOREEN ARCHER-HOUBLON. (Country Life ; 12/6.)

IN this attractively slim volume, beautifully produced by "Country Life," Mrs. Archer Houblon comes nearer to providing the key to successful side-saddle riding than any other teacher I know. Not only the novice, but the expert will gain much information and delight, both from the letterpress and the admirable illustrations—the latter being chiefly from slow-motion films of the authoress at all paces and in most positions on a side-saddle.

Mrs. Houblon bases her theories on modern Weedon School practice, which she has cleverly and ably adapted to the side saddle in her own case, and which she now offers to all who ride sideways in simple, yet scientifically proved terms. A few persons may be so old-fashioned as to feel glad that they learned to ride before the days of a scientific approach to everything—including the horse ; but most people will revel, as I did, in Mrs. Houblon's masterly description of Diagonals, Aids, Impulsion, Collection, Lateral Movements, "the indirect rein of opposition," &c. To-day there is a great revival in riding for riding's sake, and not only as a means of hunting and seeing hounds. Also, it has become increasingly suicidal with slippery roads and wire abounding, to be so stupid as to ride horses that shy, fall down, swerve or are out of control at any time. So it is increasingly necessary to have horses trained to move correctly at all paces ; but to ride these horses, the rider, whether astride or side saddle, must know the correct methods of control, in the same way as she learns to use a car or an aeroplane. Mrs. Houblon conveys the technique of modern side saddle riding in a most attractive and understandable form and is to be much congratulated on her book. "Side saddle" teaching revolves as of old round the best method of transferring one's weight to one's horse—Mrs. Archer Houblon demonstrating very clearly her method of placing her weight at all speeds and at all paces. A few may question whether it is possible or advisable to keep the weight so far forward when jumping an awkward place or "drop" out hunting, and some will always prefer to learn on the old hit-or-miss principles, taught by finding out for yourself and by making mistakes. But to all those who want to know, and who welcome a book that provides a little exercise for the grey matter as well as for the muscles, yet which can be "popped through" in an hour, I recommend this excellent *Side Saddle*. It should also be read by fathers, sweethearts and husbands to learn the reason why, so as to be able to help their women-kind improve. *Side Saddle* will make good riders out of bad, show experts how it is done, and make good riders better.

FIELD FARE.

* * * *

"*Britain Calling.*" By S. P. B. MAIS. (Hutchinson ; 7/6.)

Mr. Mais pays the penalty of a popular broadcaster—he has a large correspondence. He admits that he has produced this book partly to save himself trouble : the impression from the format of the book itself is that Mr. Mais was also in rather a hurry. When you have read his book you will realise that Mr. Mais can scarcely ever have a quiet moment.

Last winter "The Microphone at Large" was a very successful radio feature : the script of those evening chats are given here ; the local voices and atmosphere are lacking, but they are a charming little series nevertheless.

Many ways of visiting the countryside are suggested by Mr. Mais ; one chapter deals with highways and roads and another with the advantages of buses and motor coaches (you get clear views over the hedges), and, of course, on foot (many young people have cause to be grateful for Mr. Mais's assistance with their Sunday rambles via the Southern Railway). But best of all with the ideal companion, the horse.

Downs, hills, moors, sea shores, and tracks and ways all over England, Scotland and Wales are breezily taken in Mr. Mais's stride and pages. You are bound to have visited some of the beautiful places he mentions, and you will be charmed anew. If other favourites are omitted, deal gently with this author, for he is only human after all and cannot get everywhere however hard he walks, and no one can deny that Mr. Mais has been most energetic.

But the chapter on "Some English Inns" is not pleasing, in fact it grates and has unpleasant similarity to "Luxembourg Programmes." To deal fairly with such an immense subject as English inns is material for one book alone, and his list is too sketchy and has outstanding omissions.

C. N.

* * * *

Flying Feathers. By HORATIO BIGELOW. (Garrett and Massie, Virginia ; $3.00.)

This book has an accent ; it is essentially American—not of the land of maddening modernism about which we hear so much and too much nowadays, but of a country which provides some of the greatest sport and the most enthusiastic sportsmen in the world. And it is the author's great enthusiasm for the simple pleasures of hunting that takes us with him over the vast hunting grounds of Pennsylvania, Virginia and South Carolina after a variety of game ranging from deer to ducks, and turkey to doves. But although it is of necessity the personal account of the successes and failures of a man with a gun, it is told with all the modesty, simplicity and graphic style of the countryman. It tells of the "scaipe-scaipe" of jack-snipe as he zig-zags away over the frozen marshes ; of the rapture of listening to a "sight-ery" as the pack hustles the deer in your direction ; of rising partridges "grass-cutting" the tops of the corn as they whirr away into the mist. It is the plain tale of an outdoor man ; a tale of nature. And it is essentially American because it presents us with new ideas written in a new way. Whether they would be readily accepted in this country with its most definite opinions on sport is a matter for conjecture, but the true spirit of their author will doubtless gain him a place in the hearts of all sportsmen who read his book.

J. H. D.

* * * *

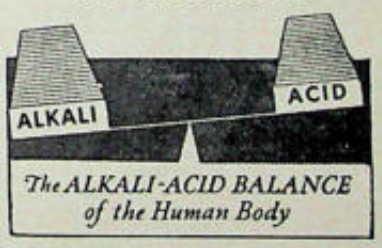
Stop and Go. By FOUGASSE. (Methuen ; 5/-.)

The author of this book is really an institution and he never fails us. In this Diary for 1939 we are given another example of that marvellous economy of line which has made the work of Fougasse unique. His artistry is not confined to the drawings, for on each day of the calendar we are given a verbal sample of the shrewd wit with which he pokes such subtle fun at our foibles.

V. R.

Not always does a successful West End play make equally successful reading. But in the case of *The Flashing Stream*, by CHARLES MORGAN (Macmillan, 6/-), this is so. The manuscript is enthralling and interesting, and the theme of its purpose is explained and enlarged by the foreword and essay with which the author prefaces his work. Those who are intending to see this play need not be afraid of spoiling their evening's entertainment by reading it beforehand—rather will they enhance their pleasure. And if the play has been already seen, the text will clarify and enrich a memory which, in all probability, is a haunting one.

The Vital Factor of Health



This diagram illustrates the fact that the alkali in the system should always just outweigh the acid.

Modern conditions make the preservation of the alkali-acid balance impossible without help. The best help is obtainable from Eno's 'Fruit Salt' because it possesses many of the beneficial properties of fruit in concentrated form. The importance of ENO as an alkalizing agent can be judged by the fact that one teaspoonful is equal in alkalizing value to nearly a tumblerful of pure, fresh orange juice.

ENO is not a medicine, it is a health drink, and should be taken regularly as such, sparkling or still, just as you please.

ENO contains no sulphates, no irritating mineral salts and no sugar. Its action is twofold, cleansing and alkalizing. Take a teaspoonful first thing in the morning, half a teaspoonful last thing at night, to cleanse the intestinal tract and reinforce the alkali reserve, the preservation of which is essential to balanced health.

A fuller explanation of the Alkali-Acid Balance will be sent on receipt of a postcard addressed to J. C. Eno Limited, 160, Piccadilly, W.1, asking for booklet entitled "Balanced Health."

ENO'S "FRUIT SALT" FOR BALANCED HEALTH

A LEADER OF AGRICULTURE

Lord Daresbury a Great Countryman

AN outstanding figure of the agricultural and sporting world was lost to us when Lord Daresbury died in London last Monday at the age of 71. He had been ill through heart trouble for about a week. Lord Daresbury, first Baron and second Baronet, was born on March 30th, 1867. He was educated at Eton, where he boarded at Everards, and in 1894 he succeeded his father as Sir Gilbert Greenall.

Lord Daresbury will be remembered as a great pedigree stockbreeder and as a great foxhunter and a great Master of Foxhounds. He was honorary director of the Royal Agricultural Society's Show from 1906–1930. He did a tremendous amount for the society and was largely responsible, during the time which followed the dark years before his directorship, for reviving the prosperity of the society and putting it in the pre-eminent position in the world of agriculture that it occupies to-day.

A very apt tribute was paid to Lord Daresbury when the Royal Agricultural Society elected him president for the second time in the year when their show was held in his native county of Chester. Large white pigs were Lord Daresbury's particular forte in pedigree stockbreeding, and he won many prizes with them; his lines of blood, too, were highly regarded by fellow pedigree stockbreeders.

Lord Daresbury, upon leaving Eton, took a commission in the Cheshire Yeomanry, and served with them for several years, and in 1907 he was high sheriff of Cheshire. In 1900 he married Francis, daughter of the late Captain E. W. Griffiths, and they had two sons. The elder, Gilbert, was killed in a tragic motor accident near Windsor in 1928.

The second son, Edward, born in 1902, succeeds his father; he is at present Joint Master of the Belvoir, and has held that office since 1934, so that already father and son between them can show a long connection with that famous pack which they have both served so well.

Lord Daresbury was Master of the Duke of Rutland's Hounds from 1896-1912, and in the whole annals of foxhunting there has certainly never been anyone who was more successful than he was. He had, in a remarkable degree, as is shown by his activities with the Royal Agricultural Society, that gift for welding together, and giving enhanced expression and prestige to, any concern with which he had to do. But, in addition, he had that still rarer gift for improving a concern to the advantage of all, which is a very difficult thing to do.

During his Mastership, the hounds reached a very climax of perfection. Pedigree stockbreeding is all of a piece, and his knowledge could be applied to the hound on the flags as well as the pig in the pen. That famous foxhound, Brocklesby Rallywood, was "the headpiece and corner" of this feat of close-breeding without loss of stamina, bone or hunting qualities. From the use of this sire came Belvoir Rallywood (53). During Lord Daresbury's Mastership from 1896–1912, Dexter ('95) (had been entered the season previously), Dasher (1900), Vagabond ('99) Handel ('99), Weaver (1906) and Ragman (1906) were in the kennels. What a galaxy of beauty and talent is this. Of Weaver it was said, "On the flags he was a masterpiece, handsome even for a Belvoir hound, with the deepest rib measurement, 34½in., ever seen in the kennel. His opening note was the finest thing you ever heard." It was indeed a kennel of which to be proud.

A picture of Lord Daresbury out hunting during his Mastership is given by Mr. Cuthbert Bradley. Hounds had met at Rippingale on February 23rd, 1906, and a great hunt with an eight-mile point was the reward. Sir Gilbert Greenall rode his favourite grey horse Phantom throughout this hunt.

"Pulling up at the Grantham end (of Ingoldsby Wood) low corner, Sir Gilbert held up his hand, and we stood, a cloud of steam rising from the horses. 'Just in time! Yonder he goes, with back arched and tongue lolling, a beaten fox leaving the covert.' The Master's horn summoned Capell and hounds, Lady Greenall galloping forward to view over the Grantham Road." A little later on: "He has beaten us and robbed the run of its crowning reward! But, no! Sir Gilbert's quick eye viewed a tan hound carrying the line on. The next moment the Master's horn started us going again." And so the doghounds killed their fox after a great hunt.

We have lost a man who was great in his own genius; he worked hard and he played hard, and made a success of both, and he stood for, and furthered, all those things which are best in English life—all the sane things and the old things, and the things that do not die.

THE LATE LORD DARESBURY WITH LADY DARESBURY

THE LATE SIR CHARLES FREDERICK

It is with the deepest regret that we learn of the death of Sir Charles Frederick, at Lamport Grange, last Friday at the age of 62. He was one of the pillars of the Pytchley Hunt, and had been hon. secretary 1901–1913, and Master 1919–1921. Many of our readers, who did not know him personally, will miss his interesting and knowledgeable writings about foxhunting, under the *nom de plume* of "Spraggon."

The great experience he had to draw upon, and his ability to balance the past with the present, made him an authority whose counsel will be sadly missed. The Pytchley have lost a valued friend who could ill be spared, a hunting enthusiast whose personality and charm impressed all who came in contact with him.

IN TOUCH

Cambridge Form Against the Harlequins

ALTHOUGH the match between Cambridge University and the Harlequins is now of no news value, since it took place last Saturday week, it was a match which deserves comment rather than description, even at this late date. Most things they say improve with keeping, and I trust that this may be true of criticism.

I went to the match. It was a day just made for an open, fast game. The empty stands of Twickenham (or so they appeared, for three or four thousand people do not go far towards filling an arena built for over seventy thousand) gazed down vacantly upon the field the green grass of which appeared from a distance more like a bowling green than a Rugby field.

The first half was a pitiful exhibition by both teams, neither of whom seemed able to get going. The Harlequins had the heavier pack and saw a good deal of the ball from the scrummage, keeping the game in University territory for most of the half, but it could not be said that their presence there was any tribute to their play, which was thoroughly uninspired.

Only three members of their team could be honestly considered worthy of praise—B. D. Napper, the veteran full back who, although he did not have a great deal to do, did what there was with a will, and the two wingers, M. J. Daly and R. B. Horsley who, had they been supported more efficiently by their brethren, might have made the score look very different at the end.

An extraordinary state of affairs arose during the first 20 minutes of play, for within three minutes of the kick-off the Harlequins were awarded a penalty kick for a scrummage infringement right in front of the Cambridge posts, whereupon K. H. Chapman kicked a goal. The game continued for a minute or two. Again the whistle. Again a penalty goal by Chapman. Further play and another penalty kick for the same cause, which did not affect the score, and then Chapman was given a fourth kick, and this time managed to put it over the bar. Score, nine nil to the Harlequins, and every point a gratuity.

W. O. Chadwick, the Cambridge captain and hooker, cannot altogether be blamed for the position, since he hooked as he has done for many a long day; neither can the referee well be blamed, for Mr. W. W. Wakefield, the old England and Cambridge captain, should know the rules if anyone does. Most of the blame lies with the scrummage laws, which are notorious. What Chadwick's particular transgression may have been, I do not pretend to know—perhaps he, too, is ignorant, but there is little doubt that some responsible body will have to get down to the simplification of the rules, for until then it will hardly be possible to obtain any sort of uniform interpretation amongst referees and players. At the moment a hooker's lot is not a happy one.

After this series of Cambridge disasters the Harlequin score was brought into double figures by a very pretty dropped goal from T. G. K. Bishop.

The second half was much more exciting, but for the flashes of genius which appeared at intervals in the Cambridge efforts rather than for a consistent performance. J. G. S. Forrest played well, but not so well as he can, and although he ran to no small effect on several occasions, he will have difficulty in beating H. D. Frenkes when the 'Varsity match comes, on the form of this match.

R. B. Bruce-Lockhart, Cambridge's scrum half, who produced such magnificent Rugby last year, also disappointed. Last week his picture graced the frontispiece of this paper, but it was, I fear, more a tribute to the past and an encouragement for the future than praise in the present.

Of the University forwards the less said the better. Last week I remarked that possibly it was a pity that Cambridge have lost only three of last year's pack; I am now convinced of it. They herded round the field, in the first half, as if doubtful as to what was expected of them next. The only difference in the second half was that they were tired and strung out more, while there was much excited shouting—generally a bad sign.

A University side have ample facilities for keeping fit all the week, and when playing ordinary clubs should find their forward stamina a tremendous asset, for a club member is probably at work in a city office all day long, and can only train at night. Here, however, there was little doubt as to who were the fitter pack by the end, and I noticed a good deal of late packing in the Cambridge scrum, as well as a substantial rear guard to the main forward advance. This is interesting, for it was remarked by several witnesses that Oxford, when playing Gloucester last week, showed an extraordinary come-back in the last half which completely overcame their opponents.

I have, I fear, been rude—extremely rude—to very nearly every member of the Cambridge side, and to most of the Harlequins. If I may be permitted, however, to present one bouquet, it goes without question to K. I. Geddes (Loretto and Caius), the Cambridge full back, who played a very fine game indeed, kicking with power and precision. Only once did I see him fail to gather the ball cleanly from a kick, while in his tackling I noticed little for reproach. Geddes has, I think, come to stay, and he is very welcome, for it would appear that he will have plenty to do if matters remain as they are at present. His red head and scarlet mittens were undoubtedly the most cheering things to be seen in the match.

L. N. R.

RETRIEVERS AT COMLONGON, DUMFRIESSHIRE

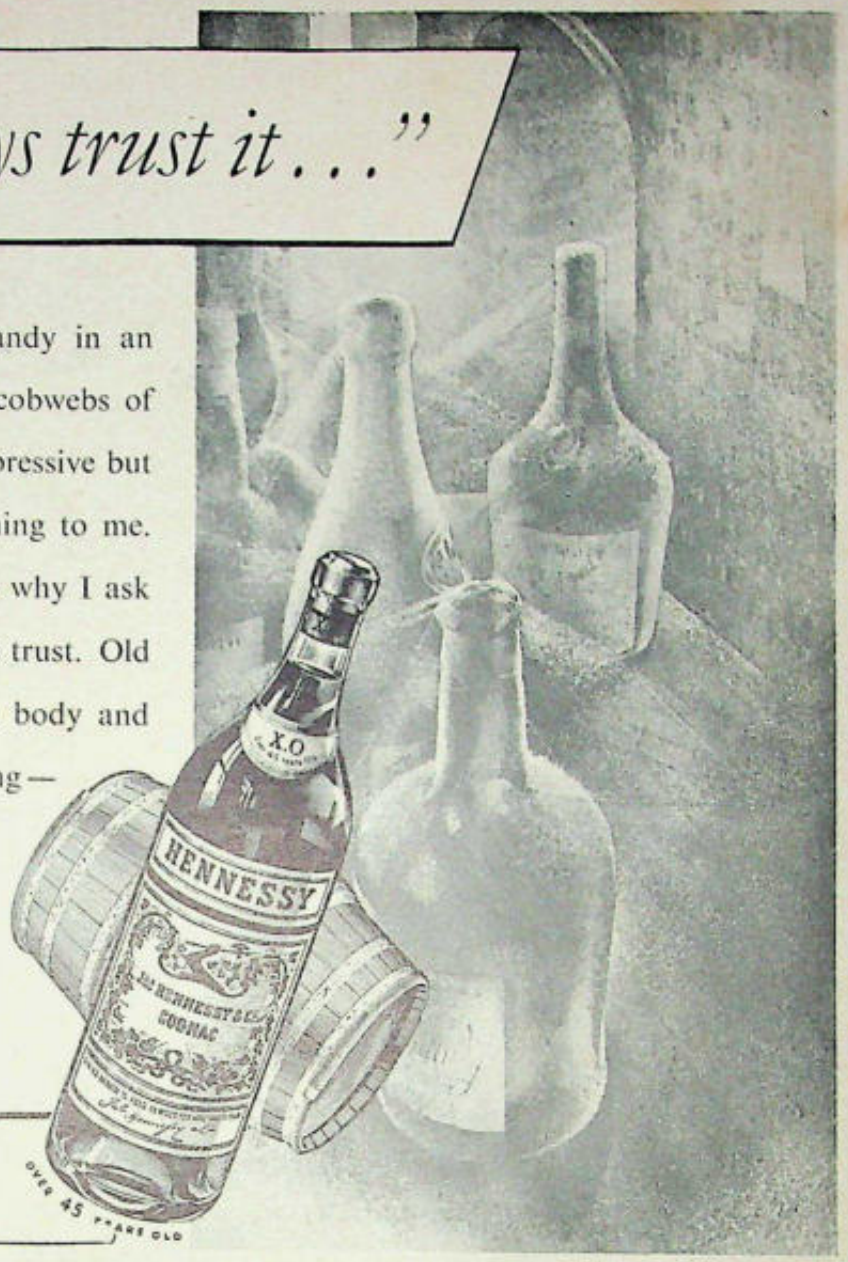
ON Tuesday and Wednesday, October 18th and 19th, the Gamekeepers' National Association Retriever Trials were held at Comlongon, Ruthwell, Dumfriesshire, by kind permission of the Earl of Mansfield. The judges were: Colonel J. G. Crabbe, Captain J. D. Macpherson and Mr. J. Scott.

In the Castle Milk Stake (Open, All-aged), for fifteen dogs and bitches, the *bona-fide* property of ordinary members of the association, Mr. J. MacDonald's Labrador Tullymurdoch Spanker was the winner, with Mr. R. Hunter's yellow Labrador Braeroy Fairy second, and Mr. P. Coleman's yellow Labrador Lady Gainly third. Reserve, Mr. Ronald MacDonald's Labrador Staindrop Sportsman. Certificates of merit were awarded to Mr. W. M. M'Call's yellow Labrador St. Mary's Charm, Mr. J. Coupland's Labrador F.T. Ch. Ingleston Nora, Mr. W. Watts's Labrador Broadhill Dawn, Mr. W. Lightfoot's yellow Labrador Wee Fly, Mr. H. McGinn's Labrador Mick Milad and Mr. I. S. Kynoch's Labrador Sporting Ballistite.

In the National Stake (Open, All-aged) for fifteen dogs and bitches of hon. members of the association, Lord Joicey's Labrador F.T. Ch. Font of Flodden was first, Captain R. G. Sharp's Labrador Punch of Clava second, and Lady Angela St. Clair Erskine's yellow Labrador Lochar Marigold third and Mr. J. Eccles's Golden Retriever F.T.Ch. Hanlstone Brock fourth. Reserve and certificate of honour went to Lieutenant-Colonel W. R. P. Henry's Tealy and certificate of honour to Mr. J. Arthur Rank's Withington Van. Certificates of merit were awarded to the Hon. B. Brassey's Labrador Apethorpe Scoter, Sir Charles Cayser's Labrador Kinpurnie Kira and Captain J. F. Hodge's Labrador F.T. Ch. Glenravel Nimrod.

"One can always trust it . . ."

"When they produce liqueur brandy in an old, old bottle covered with the cobwebs of centuries . . . well, it may look impressive but cobwebs on the bottle mean nothing to me. Their place is on the cask. That is why I ask for this Hennessy 'XO'—it's a liqueur brandy one can always trust. Old enough to be smooth as silk; but with age nicely balancing body and bouquet. And in that you have a rare and very beautiful thing—*a perfect liqueur brandy.*"



HENNESSY "XO"

Fine Liqueur Cognac Brandy

It's the age in the cask that counts . . .

Wool

I'll tell thee everything I can;
There's plenty to relate.
I saw a lovely woolly sheep
A-standing by a gate.
"How are you, kindly sheep," I said,
"And how is it you live?"
And Ba-Ba's answer (which was good)
I now proceed to give.

He said "From Lambhood's days I stroll
Among the grassy braes:
I frisk and gambol in the hills,
I tread the mountain ways.
And when I chance upon a mere
Or shaded woodland pool,
I ponder on the thought that I
Provide the world with wool!"

"Oh! Gentle Sheep," I gladly cried,
"Man owes so much to you.
Suppose you hadn't any wool
Whatever would he do?"
"Ah-ha!" my fleecy friend replied,
In accents mild — but bold,
"If such misfortune were man's lot,
He'd simply die of cold!"

BROOMS TO BE PLANTED NOW

Beautiful Spring Backgrounds for Wallflowers and Tulips

By ELEANOUR SINCLAIR ROHDE

BROOMS are amongst the hardiest, most graceful and prolific bloomers of spring-flowering shrubs, and as a background for Wallflowers, Tulips, &c., they are unrivalled. Further, they are amongst the few highly decorative shrubs that revel in the poorest soils, and are invaluable for planting on slopes so hot and dry that few other plants except sub-shrubs such as the Lavenders would tolerate. I remember a spring garden surrounded with Brooms, the adjacent bed all round filled with Wallflowers and Tulips, and edged with *Dicentra formosa* and the four centre beds filled with Tulips in mixed colours carpeted with mauve Violas. For succession the Tulips would probably have been succeeded by Antirrhinums or China Asters.

The earliest Broom to flower is the Portuguese species *Cytisus albus*, an old and well-tried favourite that is invariably smothered with its delicately scented flowers by mid-April. *C. præcox*, a hybrid raised from *C. albus*, grows only about 3ft. high, and its creamy yellow flowers are very strongly scented. It deserves, and usually has, a place in every garden.

Our native Broom is scarcely worth cultivating, but it is the parent of many first-rate varieties, amongst the most popular being the Andreanus group which originated in a crimson and yellow sort of *C. scoparius* found in Normandy. Other first-rate *scoparius* hybrids are Cornish Cream (raised by Mr. P. D. Williams), the gorgeous Dorothy Walpole and Burkwoodii, Geoffrey Skipwith and Donard Seedling. Where space is limited these are the Brooms I should choose for their varied and exquisite colourings.

And if there were space for only one it would be Geoffrey Skipwith, which is not only early flowering, but is smothered with flowers which make a cloud of crimson and rose. There is a dainty beauty about this Broom which puts it in a class by itself. *C. monspessulanus*, which grows about 6ft. high, blooms in May and the flowers are a rich yellow. This species, unlike most Brooms, flourishes in a chalk soil. It is a parent of the fine Porlock Broom, a profuse bloomer and with unusually good foliage. Its foliage it probably owes to its other parent, *Genista fragrans*, so commonly grown as a pot plant in cool greenhouses.

Spartium junceum, the Spanish Broom, which does so well on poor soils and in gardens on hillsides, flowers from the end of June onwards. In the poorest and driest soils, this beautiful Broom never fails to do well, and it is very hardy. For quite three months it produces its fragrant yellow flowers, which with the graceful rush-like branches are most useful for indoor decoration. It is very easily raised from seed sown either as soon as ripe or in spring.

In late summer come those beautiful Brooms *Genista cinerea*, *G. virgata* and *G. ætnensis*. *G. cinerea* grows about 7ft. high, and its dainty little yellow flowers borne in such profusion are perfectly set off by the soft foliage. *G. virgata* flowers poorly in the young stage, but when it has grown to its full height of 6ft. to 7ft., it is covered with masses of brilliant yellow flowers. *G. ætnensis*, which grows on the slopes of Mount Etna, flowers in August, and with its cascades of green foliage and scented flowers is amongst the pick of late summer-flowering shrubs.

Latest of all comes *Cytisus nigricans*, which flowers well into autumn. Its habit of growth is very erect, and it attains about 4ft. Like *C. monspessulanus*, it does well on a chalky soil.

Brooms are of the easiest cultivation, and they grow quickly; but the little they need they must have. They are frequently neglected after flowering, and in the case of old Brooms which have been left untouched for years, even the mildest pruning is apt to kill them. From the start the shoots that have flowered should be cut off, taking only the flower heads. This is best done in showery weather, and the late flowering Brooms should not be touched till the following spring.

Brooms are amongst the plants that should always be bought in pots for they resent root disturbance. They are best put in in October or early November, and transplanting them has to be done with the utmost care. All Brooms, *Genistas* and *Spartium junceum*, like a position in full sun and a well-drained soil. The species can be raised from seed sown as soon as it is ripe in sandy soil, but the hybrids do not come true from seed and are propagated by cuttings. These should be taken in August, each cutting about 2in. to 3in. long and with a heel and struck in sandy soil in a cold frame. When large enough they should be transferred to pots till they can be put in their permanent positions. Some Brooms, notably *C. scoparius Dallimorei*, do best when grafted on Laburnum stocks.

Various Brooms are very suitable for the rock garden. For early flowering there is *C. Ardoinii* from the Maritime Alps, which grows only 6in. high; *C. Beanii*, which is semi-prostrate in growth and grows about 15in. high; and *C. hirsutus*, with brown-stained yellow flowers which is rather taller growing. Flowering in late July and onwards, there are *C. austriacus*, which grows about 3ft. high and has bright yellow flowers at the tips of its branches, and the closely allied *C. supinus*. The most attractive of the dwarf Brooms apart from *C. præcox* and *C. kewensis*, is, I think, *C. versicolor*, which grows about 2ft. high and has pale fawn flowers with mauve pink shading.

TREE SURGERY

IT is often necessary to remove a living branch from a tree in garden or park. If the branch be small, it is merely sawn through close to the stem and there is an end of it. The tree, if healthy and growing, soon heals over the cut which, in course of time, disappears. A large branch treated in the same way would result in a snag and a badly split stem, giving access for water and fungi and endangering the health of the tree.

When amputating a large branch it should first be supported towards the end, either by roping to a higher branch or, if it be near the ground, by a strut. The first cut is made below the branch about a foot from the stem and continued until the branch binds the saw. Another cut is then made on the top side of the branch about 1in. beyond the undercut, and is continued until the branch falls. The snag left is then sawn off close to the stem, as close as is possible.

In some species to remove a branch really close to the stem would leave an unduly large oval scar. On a young growing tree this would soon heal over, but on an older tree, especially of beech, which is a notorious bad healer in later life, it is better to make the final cut nearly, but not quite, at right-angles to the branch close to the stem. The support for a large branch must be secured sufficiently far from the stem to ensure that the cut portion falls. Otherwise, if the outer end of the branch falls, the cut end will rise suddenly and may injure the woodman.

A man engaged on lopping operations requires a long ladder, the top of which should always be secured to the tree by roping. He will also have a mate to help him with the ladder and burn or cord the material that he cuts. Most of his work will necessitate leaving the ladder and balancing himself on the branches of the tree. It is thus clear that the man must possess cool nerves and intelligence.

With the best nerves and the highest intelligence the occupation is nevertheless dangerous, and the woodman should be provided with a safety belt and made to use it. The City of Paris is the best type, and may usually be borrowed from the head forester of a large estate, from the official in charge of the trees and parks in any city or large town, or, failing that, the post office would loan one of their safety belts. The essential is a belt to be tied firmly round the waist, two stout ropes attached to the rings in the belt. One rope to be attached to a higher branch to take the weight of the man should he fall; the other rope is shorter, and may be used to prevent the falling man from swinging against the stem; or it may be used to extend the man's reach in the manner of a foot rope. Two or three hooks at the back of the belt to carry tools are useful.

The tools required in addition to ladder, rope safety belt are pruning saw of the hand pattern (much preferred to the bill hook), single-handed cross-cut saw for large branches, small pruning axe for finishing the trimming back of the snag close to the stem, and a large axe for cutting up the fallen branches into cordwood or for burning.

Also, there must be provision for the protection of the exposed surface. The normal practice of painting it is useless. The use of tar is considerably better, though a little more trouble to apply owing to the necessity for heating. But it is far from perfect.

What is required is that the wood should be disinfected, so that any fungi spores that do gain access are immediately killed or prevented from reproducing. The best substance for this purpose is creosote, the proprietary brand "Presotin" being excellent. But the bark and cambium of some species, notably beech, is liable to be damaged by creosote. In this case the bark ring should be coated with shellac varnish before the wood is creosoted.

But creosoting alone is insufficient. It has no waterproofing properties, and will not exclude rain, nor will it prevent the wood drying-out and cracking. Tar is not ideal for waterproofing because its elasticity, though better than paint, is very limited. The recently-discovered bitumen products promise to give the best results. They are very adhesive, but will not stick to damp wood, so the scars must be left a few months after creosoting to dry out before the bitumen is applied. "Arrowseal," semi-liquid, or "Rufmat," plastic, are both suitable. Applied with a trowel or putty knife, the stuff never really dries. It forms a hard external skin, remaining plastic inside. It is perfectly elastic, responding to all movements of the tree and the cambium grows satisfactorily over it.

Finally, an owner who intends to carry out pruning operations must remember specially to insure his men, as the risk is not covered by the ordinary policy.

REGINALD DAVEY.

A FINE *CUPRESSUS MACROCARPA* HEDGE IN THE GARDEN AT OMEGA, RADLETT
This type of hedge thrives particularly well by the sea, and is useful for screening a lawn tennis court

HEDGES IN GARDENS

The Screen Which Also Serves as an Adornment

HEDGES are some of the most important features of the garden, and all too often they are planted with the least possible consideration to variety, aspect and appearance.

How frequently, for instance, one sees ugly hedges in the formal parts of the garden, or encounters those which, although originally intended for shelter and barriers, are now masses of bare patches and thin places. Again, how monotonous are those rows of front gardens, each with its hedge of privet or evergreen euonymus? Most of them are tidy and neatly clipped, but what a welcome change could be brought about with another kind of plant here and there.

Hedges are planted in a garden to fulfil several main purposes. Where there is no wooden fence or wall surrounding the garden, some kind of barrier must be put up to prevent the entry of dogs, cattle, and other unwelcome visitors. In this case, it is necessary to use plants which are noted for their quick growth and which are bushy at the base, as well as at the top. If the shoots or leaves are prickly, so much the better.

Another type of hedge is that intended to give shelter from cold prevailing winds. This windbreak may have to be planted on the boundary, as an extra protection to a particular part, such as the rock garden. Here, again, it is essential to use shrubs which are quick growing; they should grow rather taller than those used for the boundary, although dense growth is not so necessary.

A third type of hedge is that which divides one part of the garden from another; screens the vegetable plot from the flower garden or hides the rubbish heap. Here, it is better to use dwarfer-growing subjects, which are tidy and compact in growth, particularly at the base. Such hedges should be objects of beauty and one of the ornamental shrubs should be used. There are several which are easily kept within bounds and which do not object to being clipped or pruned.

While a great deal of the success with hedges lies in correct cultivation and treatment, some, at least, depend on whether the right type of plant has been selected in the first place. The hawthorn, or "quick," is perhaps used more for boundary hedges than anything else. It is cheap to buy, grows rapidly and thickly, is thorny, thrives in any soil and will stand up to the worst treatment. One disadvantage for country dwellers is that rabbits and horses are very fond of it.

The cherry plum and the sloe are also widely used but both take longer to form a solid barrier. Often all three of these plants are used together in the same hedge. One point against this, however, is that they are attacked by pests which also attack fruit trees, so that the method should not be used near an orchard unless precautions are taken to spray the hedges as well as the trees.

Holly makes a very thick barrier, but is rather slow growing, though some of the variegated varieties are most decorative. Gorse is sometimes used, but is apt to get rather "leggy" at the base. One often sees yew hedges as outside boundaries, but this is never advisable since, in spite of the fact that the leaves are very poisonous, horses and cattle will eat them. Yews, therefore, should be confined to the garden, beyond the reach of any animal.

Beech and hornbeam are not used as much as they might be. Both retain their dead leaves well into the winter, and these serve as extra protection. Beech will not grow in exposed positions near the coast, but can be used very effectively as a dividing hedge within the garden. The golden-brown leaves give colour in the autumn, and the fresh young leaves in spring are very attractive, mixed with the remainder of last year's foliage. Beech does very well on chalky soils.

The ordinary green privet is very popular, but though it grows quickly it tends to become bare at the base. The variegated and golden varieties, while they are more attractive, are unfortunately not so hardy and, of course, are more expensive. One of the main points against this shrub is that the roots grow near the surface, and since the plant is a heavy feeder, the soil round about is very considerably impoverished.

Tamarisk, sea buckthorn, escallonias and veronicas are suitable for planting near the coast, since they do not mind salt spray and high winds. Sometimes the evergreen oak is also used in sheltered positions by the sea.

Most of these shrubs may also be used as windbreaks, although the spiny ones are unnecessary for this purpose. Hardiness is an essential though, and one of the hardiest is *Thuja plicata*, known also as *T. Lobbii* and *T. giganteum*. This shrub grows fast and although other varieties of thuja may be used, they are slower-growing. The plant is definitely the best conifer for this purpose. No evergreen is entirely satisfactory, and it is to be hoped that nurserymen will concentrate on the raising of one which is really suitable for use as a windbreak.

Cupressus Lawsoniana and its varieties are also used a great deal. *C. macrocarpa* is not quite so hardy but thrives by the sea.

For dividing hedges in the garden, plants with bright flowers, berries or leaves should be used. This gives something different from the ordinary kinds that everyone has.

Lavender hedges are fairly popular. They are suitable for calcareous soils and should be kept rather low, say, 3ft. The secret of success lies in clipping hard back immediately after flowering. If this is done, there should be no difficulty in retaining a neat appearance. Good hedges, at least fifteen years old, are often seen. Rosemary may be used, too, but it is rather an untidy plant.

Hedges made from sweet briar and other briar species, such as *Rosa rugosa*, are easy to keep in order. Flowers are produced in early summer and numerous red fruits in the autumn. The leaves of these shrubs are fragrant, especially after a shower of rain; they are particularly attractive if used as a background or surround for the rose garden.

Fuchsia hedges can, unfortunately, only be grown in specially mild districts. They are a delightful feature of many gardens in Devon and Cornwall.

W. E. SHEWELL-COOPER.

MAKING A DOG A GENTLEMAN

"DUM that dum'd dog!", exclaimed "David Harum." "I'd give a five-dollar note to git one good lick at him. I'd make him holler pen-an'-ink once. Why anybody's willin' to have such a dum'd wuthless pestiferous varmint as that 'round's more'n I e'n understand." Most of us feel like that when we come across a bad-mannered brute that has made himself objectionable to everybody. Nor do we feel any regard for the snappy darling that is allowed to do what he pleases and has to be coaxed and coddled before he will condescend to eat food put before him.

As a matter of fact, the dogs, as a rule, are not to blame for these manifestations of ill breeding. It simply means that their education has been neglected by careless or over-fond owners. Few are so stupid or stubborn that they cannot be taught decent manners if one does but take a little trouble with them at an impressionable age. A certain amount of training can be given from the earliest days without overtaxing the young mind, although the serious business may be left until they approach eight or nine months. Soon after a puppy "leaves the nest" he is capable of appreciating the meaning of the word "No" uttered with emphasis, and perhaps guided by a restraining hand.

At a couple of months he can be got used to a lead so long as one makes him believe it is a game and not a punishment. A few take to it naturally, but most of them make a fight at first, and then have to be coaxed and not frightened. It is no use storming at a puppy because he does not understand instinctively. He has to be taught, not intimidated, and the amount of instruction necessary will depend a good deal upon his disposition. One must study the temperament of a puppy as one would that of a strange child. Those who have had experience of dogs are aware how much they differ in temperament. Some are bold, others nervous, some stubborn, others most anxious to please, and each class requires a different method of approach.

As fundamentals, we want dogs to go quietly on the lead, to come to heel smartly on being called, to lie or sit on command, and to follow closely when in traffic. If they have acquired these accomplishments even "David Harum" would not "dum" them. They can be deterred from getting into mischief or endangering their lives in motor traffic because they have learnt the elements of obedience.

A. CROXTON SMITH.

The NEW
KODAK FILMS
for 35mm. CAMERAS

These new Kodak films supply two of the chief needs of miniature camera owners: more speed, with no loss of fine grain; or finer grain with no loss of speed. Price of each film: 36-exposure cassette, 3/6.

Kodak PLUS-X	About double the speed of Kodak's famous 'Panatomic,' yet the grain is even finer. Panchromatic. Non-halation. Suggests itself as the future all-purpose film for 35mm. cameras.
Kodak PANATOMIC-X	An emulsion of the finest possible grain — considerably finer even than 'Panatomic.' For big enlargements of remarkable brilliance with no appreciable graininess, many times the original negative size. Speed at least equal to 'Panatomic.'
Kodak SUPER-XX	Fastest of all Kodak films — about four times as fast as 'Panatomic.' Has finer grain than any other film of comparable speed. With a high-speed lens, it is unequalled for action shots or indoor pictures in otherwise almost hopeless lighting conditions.

Besides these, there are five other Kodak 35mm. films: 'Panatomic,' Super Sensitive Panchromatic, Super-X, E.F. (fine grain), and 'Kodachrome' for grainless colour. Ask your Kodak Dealer for detailed information on all Kodak 35mm. films, or write to Mr. F. Taylor, Dept. 57, Kodak House, Kingsway, London, W.C.2.

SHEEP, DUST AND MEN

Knights of the Golden Fleece in Western Queensland

LET us understand something from the start. In Australia, far in advance of fences and roads, in the old days when the land-seekers could ride ahead of the crowd in search of pastures, when the right place was found, the pioneer pastoralist squatted or halted to prepare for permanent occupation. Having in due course obtained from the Government a lease over these Crown Lands, he thus became a "Squatter." And because he who squats will be fixed, located, placed —or according to the synonym preferred by the Australians, "stationed"—it soon became usual to refer to the abode of a squatter as his station. So, in the parlance of "down under," unless the allusion is confused, in which case one uses the adjectives "sheep" or "cattle" when one talks of station life, it has to do with producing wool, not freight for the railways.

The word "ranch" is creeping in quite a lot, but this is amongst the younger folk, particularly the cattlemen. It will be a pity if this goes on, for station is particularised in favour of Australia, just as is "selection," which refers to the smaller holding of the "selector," between whom there is unending war, no less curious than the antipathy which all stockmen have for the prospectors who search upon their pastures for minerals, gold especially.

Having thus tried to floodlight certain colloquialisms which may have been obscure, let us imagine we are with the jackeroos in their quarters at some station in the far west of Queensland. Believe it or believe it not, we are not sleeping in a local zoo. Jackeroo and kangaroo have no affinity except the keenness of every jackeroo to kill his first kangaroo, so that its pelt shall be warm for his feet when he leaps out of bed on a frosty morning. This young apprentice works the same as a station hand, but sleeps and has his privacy in special quarters and often his meals at the main homestead with the boss and his family, if any.

Well, having digressed, the cook's bell brings us rudely to realities. The sun is just appearing over the horizon and long shadows are attached to the windmill and the buildings. The coats of a few horses feeding near the homestead glisten in the new light as though freshly groomed.

The air is sharp and the hurried wash in a basin is invigorating, if unkind upon delicate skins. Around a long table the six young jackeroos break their fast as though Ramadan was beginning at once. After porridge they have liver and bacon, or chops or steak with thickened gravy, washed down with deep draughts of tea or coffee, packed home with bread, butter and jam.

Soon, indeed, the overseer gives his orders for the day, tells them to ride the fences in this paddock, tend to the windmill at that place, muster sheep, move sheep, spray for fly or re-wire a fence that is getting old. An hour after sunrise the horses which have been run in from the horse paddock (which may be a mile by a mile) are saddled for the day. Those workers who cannot be close to the house strap quart-pots to their saddles, for the boiling of a one-man draught at lunch time. Into the saddle bag a paper package of meat, bread and brownie (bush cake) is stuffed, stirrups are grasped, reins tightened—and saddles are full for the day.

North, south, east and west these knights of the Golden Fleece ride in the early sun; sombreros high peaked, spurs jangling, pipes leaving little trailers of grey smoke in the crystally clear air of the plains. Their coloured shirts with rolled-up sleeves are picturesque against the yellowed grasses of the downs. Their trousers, with short concertina leggings, hang loosely, for everyone rides very long in the deeply padded stock saddles of these stations.

THE THREE KELLY BROTHERS, KNOWN AS THE KELLY GANG, ARE WELL KNOWN SHEEP DROVERS IN WESTERN QUEENSLAND

And then—silence till the end of the day. At least, not absence of sound, but quietness, for the laughter and jokings of the jackeroos leave us till they ride home again not long before the sun says good-bye.

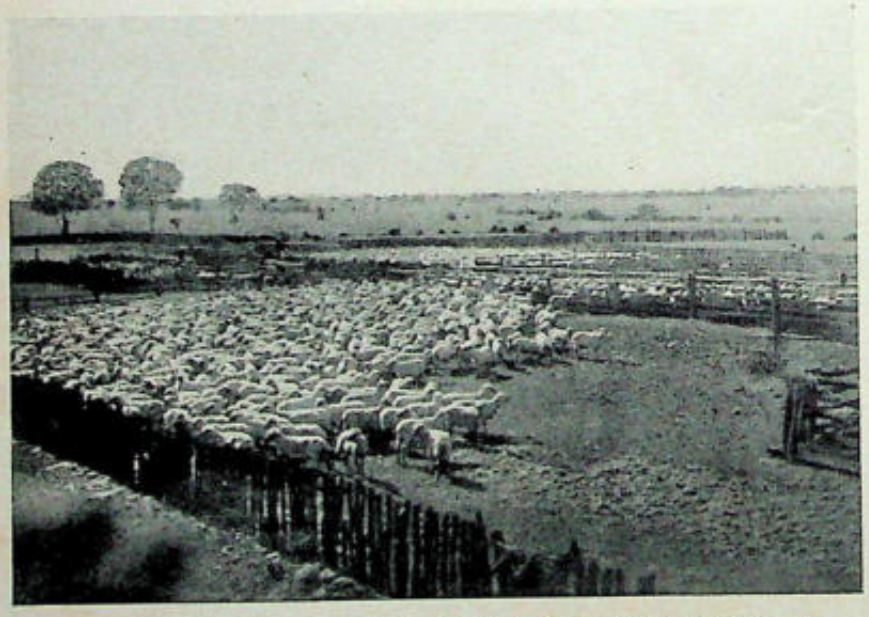
Soon we hear them talking on the way to the quarters, and after a little while the splash of men beneath shower baths says that a good flow comes from the huge galvanised tank, erected high on a wooden staging near the homestead. From the well, a tall metal-sailed windmill raises many hundred gallons in each 24 hours, for all the uses of the station hands and jackeroos and homestead folk who are grouped about it in the buildings of corrugated iron. For though all meet on common ground during the hours of work, there are definite distinctions for the hours which follow, a convention already deeply rooted in the habits of a youthful democratic people.

There is a great deal of similarity in work most of the year. It may be hot, it can be cold indeed; rain may come or drought set in, but, whatever the climate may force upon man and beast, the annual shearing takes place. During the winter months, generally between May and October, every ewe, wether, lamb, or ram is mustered for the shears. To-day, almost invariably, mechanical shearing clips off the fleece, even so a few places use the old style "hand blades," either because the flock is very small or, as in instance of Wallal Station, near Broome, because the dust, being bad, fouls combs and cutters too quickly. And yet, despite the efficiency of machines, the Commonwealth record is still held by a Queenslander, Jack How, who, in eight hours, sheared 320 sheep.

I worked in Wellshot Shed some years ago, when we raced Terie-Terie for the largest tally, the greatest number off the blades that year. We sheared 198,000, but our rivals beat us, their almost incredible performance being to lift the wool off, if I remember correctly, 207,000 jumbucks. There were 42 men shearing in the shed that year at Wellshot Station and we had some of the fastest shearers in the Commonwealth. Herricks, who died later over in Western Australia, was then "gun shearer" of the Commonwealth; he used to arrive at the shed in a seven-seater car. He was paid 35/- per hundred, and averaged just less than 300 a day, meaning that his cheque for the week worked out at about £25. This, compared with the 30/- per week including keep paid to the jackeroo, may seem a terrific wage, until one appreciates that it is seasonal employment and there are idle times between sheds. A specialist like Herricks may average for the year £10 per week, whereas many a shearer, with travelling expenses, lost time and so forth, just keeps his wolf from the door.

When the shed is humming with the noise of the machines it is fine to look at the activity. I have done more—I have worked as a rouseabout, and for 90/- per week and keep become so weary after the eight hours' shift that bed and still more bed meant more in life than food itself. And I have had that most horrible joke of the shearer played upon my person. I have had the hot buzzing machine pressed (on its flat) on my backside because I was bending down too close to the man at work. Horror, terror seized me. Surely I was attacked by the point? The buzz meant cutting, the heat torn flesh—I leapt away in a frenzy. And became the laugh of the "board" until another luckless young person, also clearing up the wool after it had fallen from the sheep, was likewise put on the spot.

And after shearing quietness returns to the homestead. When sheep are back in the paddocks, the tenor of life settles once more to that long slow pace of the stockmen—until the boss decides to sell, and then paddocks, five miles wide and broad, have to be mustered, and possibly thousands of sheep passed through the drafting gates so that the sex and type he would put upon the market shall be separated. And then at six miles a day, perhaps for a month, the drovers take their charges to the railing point either for some city or to another station. It is a wearying job, this droving in the saddle from sunrise to sundown. Particularly if a head wind envelops you in the dust which, good



SOME OF THE SHEEP AT WELLSHOT STATION ON THE DOWNS OF WESTERN QUEENSLAND

IN THE FAR NORTH OF AUSTRALIA THE WHITE MAN MOSTLY SUPERVISES THE ABORIGINALS, BY WHOM THE STOCKWORK IS DONE

season or bad, but particularly in the bad, is raised by the flock you drive with cracking stock-whip and barking dogs. When, as with the Kelly brothers on the Barcoo River, 7,000 are moved in one unit, there are times when the rider cannot see his fellow 50yds. away, or else observes but his head above a fog, wherein nothing can be seen, but only heard: for ever and always the cries of bleating sheep mingle into an unceasing sound, without which one might doubt their presence.

When, however, rains have been generous and enclosing fences do not deter, the drover may allow his flock to spread widely. Then one has merely to ride backwards and forwards behind and beside the sheep, keeping up stragglers, turning back adventurers, in an air clear and fresh where sun beats down cheerfully and the song of the stockman mingles with the cries of his charges.

At noon one halts for an hour or perhaps two. Round the jumbucks the unhorsed drovers idle in the shade, smoking, or thinking, or just dozing, as I did once, to the great curiosity of an old crow perched high in a gum tree whose shade I had selected. "Caw, caw," it went, cocked its head, looked at me with evident perplexity, and went "caw, caw" again. Through my almost closed lids I watched this wily bird break off a twig and drop it on me. It watched and I moved not a limb. Again it dropped a twig, so that, because I did not bat an eyelid it was almost sure I was dead. Encouraged thus, at last it came to earth hard by, and step by step, came closer. Then I moved and the game was over. But I had moved deliberately, knowing full well that it came close to tear out my eyes, for that is how the beastly things incapacitate even the poor little lambs which in weakness lie down to rest.

To torment such vermin is, or can be, highly amusing. Like that dark night when everyone was thrilled by the Pippingarra Comet. Away up into the sky it arose, swung over the homestead from the direction of the woolshed a mile away, came down to earth seemingly miles out in the scrub. Into every available sort of motor every available person tumbled, driving hastily to where the last of the fiery ball of celestial iron had come to earth. Hunting high, wide and handsome, we found not a trace, and so separated for our beds, puzzled and dissatisfied. Next year, the story came out. Shearers told how they had caught a crow, attached a piece of wire to its tail, and that after nightfall they had let it go with a lump of cotton waste, saturated with kerosene, trailing behind. My word that bird flew, yes, and had to keep on flying to save its feathers. So if ever you find a crow with some inches of wire mingled with its tail feathers you will know you have found out all about the famous Pippingarra Comet.

MICHAEL TERRY.

PIGS AT PETERBOROUGH

A Uniformity of Size and Quality

NOTHING but hearty congratulations can be offered the N.P.B.A. on the success of one of the greatest exhibitions of bacon and pork carcases that has been seen at any show, and especially must the Association feel proud that their Peterborough annual event should have become so famous, not only at home but abroad, for many foreigners were present and these unanimously proclaimed the fact that they had never seen a better-staged show, or one at which the uniformity of size and quality were so pronounced.

One of the principal objects of the carcase competitions organised by the N.P.B.A. is to indicate that pedigree pigs, both pure and as cross-breds, are capable of producing the highest quality bacon and pork, while these competitions are of educational value to breeders themselves by stimulating interest in the type of carcase required by curers and butchers. Judging was carried out by experts, who assessed the practical value of the carcases, and then Dr. John Hammond, of the School of Agriculture, Cambridge, measured the carcases, and this leading expert knew exactly how many points should be allotted for the length of the carcase, the proportion of back fat, and the thickness of the eye of meat in the loin. Dr. Hammond works to a scale drawn up as the result of examining many thousands of carcases.

The Boswell Down Cup that is awarded for the best two sides of bacon in the pedigree classes, went to the Agricultural Research Council of Compton Newbury for sides made from Large Whites that scaled 168lb. and obtained 93½ points. Reserve went to sides from Large Whites exhibited by Mr. F. A. Currey, of Southsea, that weighed 179lb. and took 90½ points.

The Cross-bred Cup was secured by the Herts Institute of Agriculture, St. Albans, with sides of the Large White—Wessex Saddleback cross that scaled 162lb. and gained 85½ points, while reserve to this came other sides of the same cross shown by a Nantwich exhibitor, Mr. W. C. Jones.

The Thornton Cup, which is looked upon as the Supreme Championship, as it is awarded for the best exhibit in the pedigree bacon and pork classes, was won by Mr. George Bletcher of Doncaster, who had been first in the class for pork carcases weighing 80/100lb., and whose Large White tipped the beam at 90½lb. and scored 90½ points. Mr. Bletcher had secured a third prize in the bacon classes, and these exhibits were so good that he secured the cup, which he has now won four times. Reserve went to Sir W. Hyde Parker, also for Large White exhibits.

The Champion Cup for Pork was won by Mr. W. T. Vint of Doncaster, also with Large White carcases that had won the class for pork carcases weighing 100/120lb., with a carcase scaling 101½lb. and scoring 91 points.

Mr. Bletcher's exhibit that had won the previous class was reserve. Experts considered that in the pork section the traditionally high standard was maintained throughout, and it was particularly difficult for the judges to separate some of the exhibits in the light-weight pork class.

The exhibits were almost perfect from the butcher's point of view, and although some of the exhibits were a little short in leg formation, the general quality of the exhibits outweighed this. Never before had there been so many exhibits seen at this show with such fine shoulders, and this is a feature of which the N.P.B.A. may be justly proud. Moreover, a glance down the lines showed how parallel were the sides.

As regards the bacon it was considered to be an exceedingly good show of bacon of the right type, and demonstrated that the British producer realises the necessity for producing a uniform pig as required for the English market. This was borne out by roughly 75 to 80 per cent. of the pigs exhibited qualifying for the bonus. Moreover there was no outstanding exhibit, this again demonstrating the fact that producers are getting nearer to a standard. Again there was a noticeable improvement in the belly measurements, and the depth of the streaky was a great improvement on all previous shows. It seemed that the practice of only having single pig entries had everything to commend itself and was of great assistance to the show.

In the Live Pig Section all the five breeds within the N.P.B.A. had three classes apiece and the Large Whites and Wessex Saddlebacks were the most numerous. Trade was unfortunately slow for most of the breeds, but the Large Whites enjoyed a fair demand. Top price was 68 guineas, paid by Mr. O. G. N. Turnbull for the Large White boar that was Supreme Breed Champion. This was the champion male in the Large White classes, Mr. R. T. Atkinson's Appleton King David 4th, while the Reserve Supreme Champion was the Champion Large White sow, Mr. Ernest Harding's Packwood Brocade 76th, that made 53 guineas to Mr. Fletcher. Buyers were present from all over the country, and it was generally conceded that the classes were the strongest seen at Peterborough before. Messrs. Thornton, Hobson & Co. conducted the sale, and one of the purchasers was Monsieur De Vallence, who is President of the Large White Pig Society of France.

E. WALFORD LLOYD.

FLOWER GROWING FOR MARKET

THERE is something more attractive about flower farming than any other type of agriculture. The sight of several acres of tulips or daffodils is something to cheer one in the spring, but the same may be said for the brightness of the Michaelmas Daisy or the Chrysanthemum grown in large quantities for the autumn trade.

Some flower farmers concentrate on one flower only and therefore become experts on that individual subject. There are the violet growers, the carnation growers, the rose growers, and so on. Many grow flowers under glass as well as outside, some combine flower growing with vegetable growing, while others find it convenient to grow certain flowers in the shelter of fruit trees. A man may have an acre of flowers and make a reasonable living, or he may have 30 or 40 acres and so send his flowers to various markets to be distributed throughout the country.

To be successful as a flower grower it is necessary to standardise. If the beds can be made of the same width planting can be carried out at uniform distances apart. In this way the number of plants per bed is standardised and mechanical cultivation is made much easier as there is no re-setting of wheels or tools from bed to bed. Many of the smaller growers use a 4ft. bed with five rows to the bed 1ft. apart. Naturally, in order to fit in the five rows the two outside rows are planted on the extreme sides of the bed. Other growers prefer the 5ft. bed, or have a compromise and use a 3ft. bed for chrysanthemums, gladioli, &c., and wider beds for other plants.

Whatever the plan, it should be standard in that particular field or for that type of flower. It should be possible to pick the whole of the bed easily without having to walk on it, and for this reason temporary paths should be provided on either side of each bed 18in. or 2ft. wide. Should the field be a long one, wider paths may be arranged every six beds so as to allow for the wheeling away of the cut flowers in trucks and the carting-on of manures.

In some cases it is necessary to cover the beds with lights with the idea of encouraging the plants to bloom earlier or to protect them during a severe winter. These lights can be put on to a temporary skeleton of posts and plank-like timber. The posts and the planking should be standardised so that they are interchangeable and can be used on any bed at any time. It does not take long to erect the skeleton timber and to put the lights in position, providing the same scheme is used throughout. In the autumn hessian can be run round the outside of the framework to act as a curtain and protect the plants from frost. With the lights above a temporary glass shelter is thus provided. Many an autumn flowering chrysanthemum has been saved in this way.

Annuals are not perhaps the best cut flowers in that they do not fetch the highest prices. They are free flowering and, because of this, per acreage, annuals have proved to be a good proposition. To get the highest prices the seed should be sown in the autumn, with the result that the annuals flower much earlier than those sown outside in the spring. The most suitable annuals for autumn sowing are the Cornflower, Calendula, Nigella, Annual Larkspur and Candytuft.

Many of the half-hardy annuals are suitable cut flowers—the China Asters, which normally flower in July and August; the Ten-week Stocks, which flower at the same time; and the East Lothian Stocks, which can be got into flower in May. Zinnias grow well in hot summers, and are sent to market in August and September. These latter, however, do better in the South than in the North. Everlasting flowers like Helichrysum and Statice have sold well the last few years, and are used to make up little baskets and bowls which keep bright throughout the wintry months.

It is, however, the perennials which are sold in the greatest bulk, and of these the following are perhaps the pick: Alstromeria, Scabiosa caucasica, Pyrethrum, and the Chrysanthemum. Bulbs, of course, are very popular, particularly daffodils and tulips.

PEVERIL FARTHING.

INCREASE OF WHEAT QUOTA

Acting under the powers conferred upon him by the Wheat Act of 1932, the Minister of Agriculture has, after consultation with the Wheat Commission, issued the following two orders:

The first prescribes that the amount of the quota payment which every miller and every importer of flour shall be liable to make to the Wheat Commission in respect of deliveries of flour during the period commencing October 16th, 1938, shall be 2/– per cwt. This amount is equivalent to 5/– per sack of 280lb. An increase is thus made of 1/6 per sack on the rate which was in force from August, 1938.

The new Quota Payments Order came into operation on October 16th, 1938, and quota payments were due at the new rate in respect of all deliveries of flour which took place on or after that day. In cases where flour and bread was exported on or after that date, the repayment of quota payments to the exporter has been, and will continue to be, made by the Wheat Commission at the new rate.

The second order concerns "anticipated supply." The quantity (known as "anticipated supply") of home-grown millable wheat of their own growing which the Minister of Agriculture expects will be sold by registered growers during the cereal year ending July 31st, 1939, will be 31,850,000cwt. This Order takes the place of a former Order, under which the "anticipated supply" was prescribed as 30,500,000cwt.

TRAVEL BY LAND SEA AND AIR

A VERY SMART TWO-SEATER BENTLEY BY HOOPERS, IN THE COMPANY OF A HAWKER 'PLANE AT BROOKLANDS

THE HUMBER SUPER SNIPE

Internationally Competitive Both in Performance and Value

By CAPTAIN SIR MALCOLM CAMPBELL
(*First to achieve* 300 *m.p.h. on land, and holder of the Water Speed Record*)
(Motoring Editor of the "Field")

FROM the very early days of motoring I have watched with particular interest the fortunes of the Humber Company and, like others, they have ebbed and flowed. During recent years, however, the company has been going from strength to strength, for the reason that their business and goodwill has been built up on really sound lines, and their cars, in consequence, have found a ready sale amongst a certain section of the motoring public.

The Humber Company were among the first of our leading manufacturers who were determined to meet American competition, and although at the outset they were unable to offer their products at competitive prices, they have now got the task so well in hand that their latest product, the Super Snipe, is, without doubt, internationally competitive from the points of view of both performance and value.

This new car has a six-cylinder side-by-side valve engine with detachable aluminium head, the bore being 85 mm. and the stroke 120 mm. The capacity is just over 4 litres, the R.A.C. rating 26.88 h.p., and the tax £20 5s. per annum. The engine, however, has a very large reserve of power, and actually develops 100 b.h.p. at 3,400 r.p.m., and as the weight of the complete vehicle is 31cwt., which works out at approximately 34lb. per b.h.p., the car's performance on the road is really outstanding.

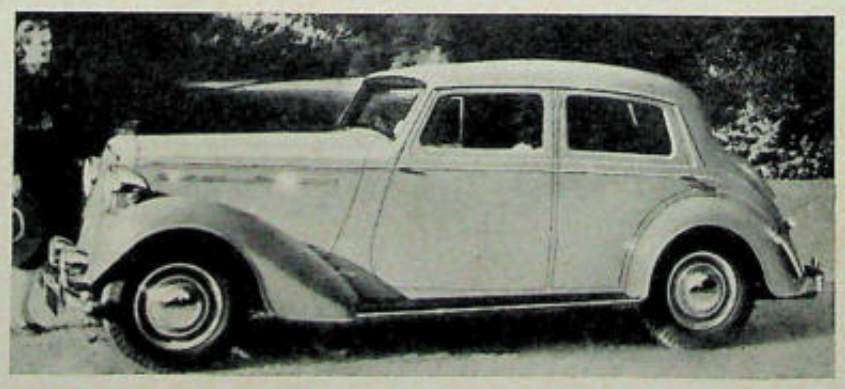
The motor is of very clean design, and all important parts are extremely accessible; I was glad to see that the oil filter and dip stick were so positioned as to give ready access, an important point which, I am afraid, is so often overlooked by other manufacturers. The carburetter is of the down-draught type, and the fuel is fed from the tank which holds 13 gallons, by means of an A.C. mechanical pump; the consumption works out at approximately 18 miles per gallon.

The gear-box, with central control, has four speeds, top and third being synchro-mesh, and the ratios are as follows: top, 4.0 to 1; third, 5.99 to 1; second, 10.1 to 1; and first, 15.13 to 1. It will be seen that the top gear is fairly high for a car of this type, and that third and high are in close ratio, a good feature. Cooling of the motor is carried out by means of an impeller pump, which is assisted by a fan, and the temperature of the water is thermostatically controlled.

It is interesting to note that the radiator shell and front wings are carried in a cradle, which is flexibly mounted on the front cross member—another excellent point. The suspension is a special feature of the car, the front wheels being independently sprung by the even-keel method, a system which has been used on Humber cars for the past three years. To stop rolling when the car is being driven fast around corners, a new device has been introduced, which is called a "sway-eliminator." This consists of a spring steel bar, working on the torsional principle, and is fitted to the back of the car, being connected to the rear shock absorbers.

The brakes are Lockheed hydraulic, and the hand-brake, situated well forward on the right-hand side, is mechanically operated and works on all four wheels. The steering is particularly good, and is of the worm and nut type. The length of the column can be altered by means of the Bluemel adjustable wheel, the spokes of which are sprung. A D.W.S. Easi-lift hydraulic jacking system is fitted, there being special brackets which are permanently fixed to the chassis frame. The dimensions of the chassis are as follows: wheelbase, 9ft. 6in.; front track, 4ft. 7½in.; rear, 4ft. 8in.; and the overall length of the complete car 14ft. 7in.

Two types of coachwork are available on this chassis—the six-light saloon and the four-light sports saloon, both of which have four doors. The price of the former is £385, and the latter £430. The car that was loaned to me for the purpose of a test run was the saloon, and I found that both front and rear seats were most comfortable, there being ample head and very generous leg room. Forward vision is excellent and true to Humber traditions, the coachwork is very well finished and great attention has been paid to details. There are two large dials fitted to the facia board and immediately in front of the driver, the one being the speedometer and the other containing the oil, petrol, ammeter and water temperature gauges.



THE HUMBER SUPER SNIPE SPORTS SALOON
This car, priced at £430, is a 27-h.p. production with a remarkably good top gear performance. It is fitted with Evenkeel independent front wheel suspension

On the left is a large glove locker, in the lid of which a clock is fitted. All the instruments are illuminated at night and controlled by a rheostat. No-draught ventilation is fitted and all windows, including the quarter lights are made to open. Twin electric windscreen wipers are included in the specification, also twin horns and a sunshine roof. The windscreen is not a fixture and can be opened wide, it being operated by a winder which is fitted in the centre and just above the facia board. Discs are fitted to all wheels, there are dual fog lamps and an independent reversing light.

The performance of the car on the road is very creditable, its main features being really good acceleration, excellent brakes and road holding qualities, and extremely good suspension.

The steering, gear change, and brakes leave nothing to be desired; the steering particularly impressed me because, although fairly highly geared, it is light and precise.

The maximum speed of the car is in the region of 85 m.p.h., but it gets up to its maximum quickly and without any fuss whatever. When accelerating through the gears, a speed of 60 m.p.h. can be reached in under 17 seconds, which is decidedly good, and when travelling in top at 10 m.p.h. the same speed can be reached in just over 17 seconds. Notwithstanding its comparatively high gear, namely, 4.09 to 1, the car I drove climbed Pebblecombe Hill, which has a gradient of 1 in 5½ on top gear. Since the bottom corner was not taken at a greater speed than 30 m.p.h., this is a very creditable performance.

I consider that the new Humber Super Snipe is a very fine car indeed, and the claims which the makers have made concerning its performance are fully justified. The only criticism I have to make is that the luggage space is somewhat confined, unless the rear locker is let down, and it is a pity that the gear lever is not set further forward, as in its present position the driver cannot conveniently use the near side door; the door handles have somewhat sharp ends, and are inclined to hurt one's hands, but these are small points, when it is remembered that all the other features of this car are so outstanding.

"I find that the more we motor the more we are apt, unconsciously, to demand higher standards. We become connoisseurs, and then it isn't so much a matter of *what* a car will do as the *way* it does it. Lots of cars today, taxed to their uttermost, their engines protesting, their drivers tense, will do their seventy or even eighty miles an hour. Only a favoured few will combine with that high performance the polished ease and safety that make for restful motoring.

Need I add that M.G. Cars are in that select company."

MACHINES FOR THE CIVIL AIR GUARD

A New Stimulus to Small Aeroplane Design

By LORD SEMPILL, A.F.C., F.R.Ae.S.
Aviation Editor of the "Field"

THE response to the Civil Air Guard scheme has revealed conclusively how great is the desire to fly among all classes to-day, and has stressed that the principal barrier in the past has been—as has been so often argued here—that of cost. The problem of economical flying is not, of course, solved by the distribution of subsidies, which may even, in extreme cases, encourage inefficiency. But in this case, it is clear that the State assistance provided to the clubs cannot be truly effective unless machines of reasonably low operating costs are employed.

One of the most encouraging results of the C.A.G. scheme has, in fact, been the announcement of several new types in the smaller classes of aeroplane. These may be summed up, in the main, as on the one hand a return to the original conception of the light aeroplane, and, on the other, a development of that smaller class which has been called the "ultra light."

THE AERONCA CHIEF FITTED WITH A CONTINENTAL "FLAT FOUR" ENGINE OF 50 H.P.

intended; all bear names well known in private flying, and they may, therefore, be taken as typical.

The Moth Minor is a low-wing monoplane with a new engine—the Gipsy Minor of 90 h.p. Thus, in power, it approximates to the original light machines of some twelve years ago, though modern aerodynamic advances give it a much livelier performance.

Of the two smaller machines, the Aeronca Chief has a Continental "flat four" engine of 50 h.p., while the Tipsy is fitted with a Waler Mikron II of 62 h.p. These powers are, of course, greater than those associated with the ultra-light machines that gained publicity two or three years ago, while the aeroplanes themselves follow very largely the lines standard in bigger machines. They are, in fact, small, modern aeroplanes with sufficient power to make practical flying possible with ample reserve, yet engines small enough to ensure economical operation.

This trend is one that all students of private flying will welcome. Modern private touring machines are undoubtedly highly efficient as aeroplanes and extremely comfortable as vehicles; but it cannot be denied that the majority of current types have outgrown the original idea of the light aeroplane. It was realisation of this fact that led to the introduction of the ultra-light types, such as the Drone and the first Aeronca, both of which established some very remarkable performances.

Yet these machines, for all their excellence, could not be regarded as all-round aeroplanes. Their power margin was low, and they were single seaters. The designs now appearing, with engines of 40 to 70 horse power, are a logical and desirable extension of the ultra-light machine upward, and of the current touring aircraft downward, in the power table.

That such an extension was desirable has long been felt by those who believe in the future of popular flying. Only by such a step could economy be combined with really useful flying characteristics.

This, however, is not the only benefit that is likely to accrue from the new stimulus to small aeroplane design. It is clear that these new demands must reduce flying to its bare essentials and to bring a new atmosphere into design. It has frequently been pointed out here that there has been a growing complication in flying of recent years: a complication desirable from many points of view, but not absolutely essential. The original light aeroplanes were proved useful touring vehicles, not comparable, of course, as regards comfort or refinement, with to-day's touring types, but capable of giving good service and, above all, requiring a minimum of skill for their operation.

Simplicity is essential for the widespread popularity of flying. Refinements may easily be an embarrassment to the beginner and to those who can carry out comparatively little practice. The enthusiast of limited means is always willing to forgo luxuries if he can enjoy his enthusiasm more freely. Motoring has shown that, to name but one example. Flying, in which cost is a considerably greater problem than in motoring, is doing well by re-learning that lesson.

The full benefits of the C.A.G. scheme can come only when machines are simple and safe to fly, economical to run, and easy to master. This is flying reduced to its simplest terms. And it is thus that real popularity will be attained.

Since the C.A.G. scheme was announced, there have been very many criticisms; some have even considered the plan inimical to the private-flying movement. Whether one agrees with those points of view or not, it cannot be denied that, even should the scheme as a whole fall short of what its sponsors effect, if it gives a new impetus to light aeroplane design and evolves the practicable, sturdy machine, the running costs of which are within the reach of the many, the scheme will have been an immense benefit.

Progress on these lines may well bring new life to private flying, irrespective of the new subsidies. The idea that the movement must be a luxury one exclusively can do flying no real good. There is room in the air for all who wish to fly. Private flying can well look forward to as wide a range of appeal as modern motoring provides.

TWO VERSIONS, THE OPEN AND THE COUPÉ, OF THE D.H. 94 MOTH MINOR WHICH IS A LOW-WINGED MONOPLANE WITH A GIPSY MAJOR ENGINE OF 90 H.P.

It would be impossible here to give details of the various designs either actually introduced or projected. But as example of the larger newcomers, the Moth Minor may be mentioned, and of the smaller ones, the Aeronca Chief and the new Tipsy. In mentioning these, only a general indication is

THE TIPSY TRAINER FITTED WITH A 62 H.P. WALER MIKRON II ENGINE

KANO—CITY OF THE HAUSAS

The Most Picturesque Place in Northern Nigeria

NORTHERN NIGERIA, a little-known British Protectorate in West Africa, is notable for the fact that the life and customs of the people, both Moslem and Pagan, have hardly changed with the passing of the years; while the walled towns, or *birni*, of which Kano is the most notable example, remain to remind us of the days when slave raiding flourished and defence was essential. In view of such attractions it may seem surprising the country should only be known to Government officials, merchants and a mere handful of travellers. But then we must remember West Africa has always suffered not only from a bad reputation as regards climate, but also from the absence of permanent motor roads and hotels, so that travel in the Protectorate has been both expensive and difficult.

Nowadays, however, owing to drainage, anti-malarial measures, and a general improvement in the standard of comfort provided for Europeans, there seems no reason why the more healthy parts of Nigeria should not in winter be visited by many travellers.

There are two ways of reaching Kano, the capital city of the Hausa Province. Most people will no doubt choose the sea route from Liverpool to Lagos, travelling by the comfortable Elder Dempster steamers, and then complete their journey in the boat train; while the very adventurous will be tempted to try the trans-Saharan motor route via Algiers, Ghardaia and Timanrasset — a far more uncomfortable and precarious approach, which is compensated for by the extreme interest of crossing the Sahara Desert and passing through the land of the Veiled Tuaregs.

The city of Kano, for centuries the great commercial centre of the Hausas—an Hamitic people conquered and Mohammedanised by the Fulanis—is perhaps the most picturesque place in the whole of Northern Nigeria. It is surrounded by great mud walls and rises up from the plain, beneath the shadow of the twin peaks of Daura and Kazauri, like a veritable citadel of olden days. The ramparts are 40ft. high, guarded by a deep, dry moat and pierced every now and then by the fifteen great gates, some of which still show marks of the damage inflicted on them by the British guns when the city was carried by assault in 1903.

On entering Kano city one is taken back hundreds of years, for although the buildings themselves cannot be old, they are rebuilt in the original design and there are no European houses to spoil the African effect. Life centres on the market place, which is in the evening most animated and spectacular, where country people, in addition to the citizens, come to buy and sell their wares. Most of the objects sold are only European junk, and I, for my part, after watching the people — these happy chattering negroes are most intriguing—always find amusement in a visit to the money-changers who keep, in addition to old French coins, the handsome "Maria Theresas." These silver crowns, though still minted to-day, bear the effigy of the long-dead Empress and are always used by any rich Nigerian making the pilgrimage to Mecca.

VEILED TUAREGS—STRANGE WARRIORS FROM THE DESERT

There are few buildings of note and all are primitive. The Emir resides in a large walled enclosure, and hears the prayer in a mosque shaped like a giant mud pie. Some of the palm-shaded houses are picturesque enough, the walls being decorated in crude design, and surmounted by knobs in a manner reminiscent of a Christmas cake. During the day these buildings cast great shadows in the narrow streets which seem even more substantial than the walls themselves, and it is hot enough to keep everyone indoors except mad dogs and Englishmen. But at evening time Kano becomes really beautiful, and if you mount up to the flat roof of a house as the sun sinks to rest you will look over a rose-red city which seems, like Petra, half as old as time.

The Hausas, who provide the large majority of the inhabitants, are noted for their ability as traders and their bravery as soldiers, and also possess some degree of Moslem culture. Their embroidery of the great gowns, or rigas, so dear to the Nigerian heart, is excellent, and everyone admires their embroidery of leather work and the way they decorate brass, copper and silver trays with an old Moslem pattern.

Kano is the capital of the Province, headquarters of the Emir and the British Resident. The system of government is an indirect one with the white officials remaining discreetly in the background, and thus the Hausas have the satisfaction of still being ruled by their own potentates without suffering from such inconveniences as slavery and slave raiding, which were formerly so prevalent. This indirect rule is without doubt the secret of British success, and accounts for the fact that perfect order is maintained among a war-like people by a handful of soldiers and police.

During the winter the harmatan, a dry, cold, dusty wind, blows down from the Sahara and fires are lighted in all the houses. It is at this time of the year that the Veiled Tuaregs come into Kano with their swaying camel caravans, bringing ground nuts to the trading companies. Armed with a straight sword and steel lance their appearance is romantic to a degree, for they veil their faces so closely that only the eyes and the upper part of the nose remain visible. The origin of this strange custom is lost in the mists of time, but it does seem to possess some tribal significance as only the knightly Tuaregs veil, and not their servants, the Buzus.

They are a race of gallant desert warriors; they belong to a little known people: there is nothing in Nigeria as interesting as these picturesque caravans with their veiled guardians swaying slowly into Kano.

But it may be that the death warrant of these caravans is signed, for it appears as if the motor will kill them. More and more motor cars are used in the country, and fewer and fewer caravans come in through the gates of the walled city. Perhaps the ship of the desert, the camel, who carries his head so proudly because, so tradition says, he knows the hundredth name of God, will, in time, become as much a back number in Nigeria as the horse has in England.

But romance and pageantry die hard. The Emir of Kano still rides out amidst pomp and circumstance associated with Eastern potentates since time immemorial. Guards with drawn swords, clad in gleaming coats of mail, surround him; an umbrella is held over the royal head; and musicians blow a tucket on the long royal trumpets as they walk backwards before their lord.

It is romantic scenes like these that make the long journey to Nigeria so well worth while. F. H. MELLOR.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE BALLACHULISH HOTEL, ARGYLL

ALREADY our noses are in another winter and, as Kenneth Grahame wrote, we are again in a season when we take a somewhat sad account of the past year's words and deeds, which, vital enough as they may have seemed at their doing and saying, none the less surely now strew our path with their withered leaves, rustling with recollections. Cold and frost and miry ways may—not necessarily, mind you—keep you much indoors, and if you are intending to go for a short holiday at th's season it is essential to choose a comfortable hotel if you are to enjoy your vacation.

That is why I am writing about the Ballachulish Hotel. Situated beside the Narrows which divide Loch Leven from Loch Linnhe, and Inverness-shire from Argyll (150yds. across), the hotel has only recently been modernised in all departments. Hot and cold water has been installed in all the bedrooms, which are electrically lighted and heated, and provided with "Somnus" beds.

There is a splendid road to Ballachulish from the south, skilfully engineered to avoid any steep gradients, which provides wonderful scenery all the way from the Forth of Clyde. Glencoe, after all, is world famous, and the road takes you through the Pass to the level of Loch Leven. You can, of course, take the road from Oban, by Loch Creran, and through Appin, and thus along Loch Linnhe. Whichever way you go you are assured of magnificent mountain scenery—Ruskin referred to mountains as the beginning and end of all natural scenery—and by the time you have reached the hotel you should have caught something of the romantic atmosphere of the district.

As you drive up to the hotel you will at once be aware of its exceptionally fine situation. All the principal public rooms and bedrooms face south or west, commanding views of the rugged outline and beauty of the Ardgour Mountains or the Glencoe Range, with the waters of Loch Linnhe and Loch Leven in the foreground. Naturally such a region is a real paradise in the spring or summer, but even at this time of the year you may be lucky with the weather and enjoy some grand walks.

And when it is raining you can sit round the lounge fire and discuss the tragedy of the massacre of Glencoe which took place in 1692. Under "Letters of Fire and Sword," signed by William III, the families of the Macdonalds—a Jacobite clan—were treacherously butchered one winter night by a party of Government soldiers commanded by an hereditary enemy, Campbell of Glenlyon. Even to-day ruins of the Macdonalds' cottages still remain, and you can visit the caves among the rugged cliffs where a few of the survivors sheltered.

In 1752 yet another tragedy took place in this valley, for, following the rebellion of "forty-five," Colin Campbell of Glenure was murdered about two miles west of where the hotel now stands, and James Stewart "of the Glens," of whose innocence of the murder no doubt now remains, was executed on Knap Chulish, where his monument now stands. That, however, is the grim side of the district; there are more cheerful tales of fairies and wishing wells which will enthral those whose imaginations are in healthy working order.

If you cannot visit the Ballachulish Hotel at the present season, make a note in your 1939 diary that you will go there in the early summer, when the weather is good and settled, days are long and sunsets beautiful.

The writer will be pleased to answer any queries from readers concerning hotels.

20 miles from a station, hidden away in one of the loneliest corners of this island, in 400 acres of private grounds and beaches, you will find

LEE ABBEY
Near LYNTON, N. DEVON

THE GROUNDS, a natural bird-sanctuary, are now a delight to the eye. The

PRIVATE GOLF COURSE

is in perfect condition, the weather is fine and the terms are moderate.

Why not spend this Autumn . . . with us? At any rate, write for an illustrated brochure or

TELEPHONE LYNTON 24.

PAYING GUESTS

CO. DUBLIN.—PAYING GUESTS RECEIVED. Comfortable Country House, modern conveniences within easy reach of hunting horses kept or hired, also golf.—Box 1758, EASON'S ADVERTISING SERVICE, Dublin.

EXPERIENCED SPORTSMAN.—Rough SHOOTING, coarse FISHING FREE. Proprietor's bag (one season): 1,100 snipe, besides duck, woodcock, plover, curlew, rabbits. Unsurpassed local knowledge. Golf (two links); horses available. British and Colonial recommendations.—TOM STUDDERT, Clifden, Corofin, Clare.

GUESTS RECEIVED in comfortable Irish house; hunting with Wexford and Kilkenny Hounds six days a week. Hirelings available, also stabling, grooms' accommodation for own horses.—Box 3244, FIELD Newspaper, Bream's Buildings, E.C. 4.

GENTLEFOLK, residing amidst the finest rough shooting, fishing, free; prepared TAKE GUESTS; terms 3½ gns. weekly; horses, golf, &c.; highly recommended.—EYRE STUDDERT, Cragmoher, Corofin, Clare.

GUESTS.—Gent.'s private Country Residence, modern, centre Bray Harriers Hunt; large bedrooms with h. and c.; first-class attendance. Terms £3; hunter included, £5 5s.—BURNS, Merrymeeting, Wicklow.

HUNTING AND SHOOTING.—PAYING GUESTS TAKEN, Castle Hyde, Fermoy, Co. Cork. Hunting three packs, rough shooting; every home comfort, electric light, central heating.—Apply MANAGERESS.

HUNTING.—PAYING GUESTS TAKEN for hunting, Ormond and East Galway. Comfortable House; good horses. Also plenty of shooting. Five guineas weekly.—ESMONDE, Dromynagh, Borrisokane, Co. Tipperary.

SUSSEX.—GEORGE IV SHOOTING BOX, 300 acres of rough shooting, clay pigeon trap. Shooting tuition, riding. Thirteen miles Eastbourne. Home produce, every comfort. 3½ guineas.—BATTEN, Cralle Place, Vines Cross, Sussex.

PUPILS AND SCHOOLS

BRANKSOME-HILDERS, Haslemere, Surrey, BOYS' PREPARATORY SCHOOL. Health, happiness and efficiency in perfect surroundings.—Prospectus Y.

HOME TUITION (postal)—Economic scientific Mixed Farming. Pig, Poultry, Fruit. Colonial Farming, Estate Management.—FIELDING, D.S.O., N.D.A., P.A.S.I., Agricultural Correspondence College (Sec. K), Bath.

THE ROYAL AGRICULTURAL COLLEGE, in consequence of considerable extension, has VACANCIES for October, 1939. Courses of instruction are held for future FARMERS and FARM MANAGERS, LAND OWNERS and AGENTS, ADMINISTRATORS and ADVISERS IN AGRICULTURE. There are THREE FARMS and over 3,000 ACRES OF WOODLAND for PRACTICAL INSTRUCTION. Write for Prospectus.—BURSAR, The Royal Agricultural College, Cirencester.

VACANCY FOR FARM PUPIL on large mixed FARM, all crops grown, all descriptions of stock kept, including dairy and pedigree flock Oxford Down sheep; good hunting and shooting.—HUGH STILGOE, Adderbury, Banbury, Oxon.

VACANCY FOR PUPIL.—Thousand-acre mixed FARM; world-renowned pedigree Dairy Shorthorn cattle and Oxford Down sheep; clean milk dairy, good hunting, shooting, fishing—HOBBS & DAVIS, Kelmscott, Lechlade, Glos.

WYNDHAM HOUSE, North Wootton, Norfolk.—Mrs. Lacey's HOME SCHOOL, boys and girls under twelve; trained governess; moderate fees; entire charge taken, personal supervision; wonderful air and surroundings; well-equipped house, large garden and play paddock; car.—'Phone Castle Rising 232.

BRIDGE

SQUEEZE, ELIMINATION AND EXIT PLAY

Interesting Examples

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

THIS week, by especial permission of the author, Mr. George S. Coffin, I give further examples from his valuable book on "End Plays."

First a case of Simple elimination play:

	♠ 6, 5, 4, 3, 2 ♡ Q, 4, 3, 2 ◇ 2 ♣ 4, 3, 2	
♠ K, 8 ♡ J, 10, 9, 8 ◇ 10, 9, 8, 7 ♣ J, 10, 9	Y A B Z	♠ J, 10, 9, 7 ♡ 7 ◇ 6, 5, 4, 3 ♣ 8, 7, 6, 5
	♠ A, Q ♡ A, K, 6, 5 ◇ A, K, Q, J ♣ A, K, Q	

Z is playing a contract of Six No Trumps.

A leads the Knave of Hearts.

At first sight it appears that Z must lose a trick in Spades and in Hearts.

But by the "stripping" process he need not.

All he has to do is to play out his Diamonds and Clubs thereby eliminating both suits from A's hand. Then after making his winning Hearts he throws A into the lead on the fourth round of the suit and A has nothing left but Spades to lead.

Quite easy but still often missed in play!

Now I give an old hand which is described as an "Obscure Jettison exit."

	♠ 8, 6, 2 ♡ 9, 7, 5, 3 ◇ K, 8, 4 ♣ A, J, 3	
♠ A, 10, 9, 7, 4 ♡ J, 8, 2 ◇ 6, 5, 2 ♣ 10, 5	Y A B Z	♠ Q, 5 ♡ A, 4 ◇ J, 10, 7, 3 ♣ Q, 9, 6, 4, 2
	♠ K, J, 3 ♡ K, Q, 10, 6 ◇ A, Q, 9 ♣ K, 8, 7	

You are shown the deal and given five to 30 minutes to decide whether you as Z can make Three No Trumps or whether A and B can defeat this contract.

Suppose that you wager you can make it.

A leads the 10 of Spades and you allow B's Queen to win. B returns the Six of Spades and your Knave forces A's Ace. Everything appears easy. You have only to lead from Dummy towards the King, Queen of Hearts and then win a Spade trick, three Hearts, three Diamonds and two Clubs, making nine tricks. But what will happen if at trick three when A leads a Spade *B throws on it the Ace of Hearts?*

Try and make Three No Trumps now.

This hand which was first published in the *New York Herald* is said to have been a source of much profit to many gamblers as most players are ready to wager that Z can make his contract against any defence.

The following end play was achieved by Mr. Coffin himself in a rubber game:

	♠ 6, 4, 2 ♡ 8, 7, 6 ◇ A, K, Q ♣ A, K, Q, J	
♠ K, Q, 9 ♡ J, 10, 9 ◇ 10, 9, 8 ♣ 10, 9, 8, 7	Y A B Z	♠ 3 ♡ 5, 4, 3 ◇ J, 7, 5, 4 ♣ 6, 5, 4, 3, 2
	♠ A, J, 10, 8, 7, 5 ♡ A, K, Q, 2 ◇ 6, 3, 2 ♣ None	

The bidding was:

Z	A	Y	B
One Spade	No bid	Three Clubs	No bid
Three Spades	No bid	Three No Trumps	No bid
Four Hearts	No bid	Four No Trumps	No bid
Five No Trumps	No bid	Six Spades	No bid
No bid	Double	No bid	No bid
No bid			

A was, we are told, a "fair lady" who thought she had Mr. Coffin "hooked."

While Six No Trumps was a lay-down, Z succeeded in his contract of Six Spades by the following play:

A led the Ten of Diamonds, and when Dummy was exposed, "She smiled smugly at her two trump tricks that she felt sure would come home."

Dummy won the first trick, and then a Club was led and a Heart discarded by Z.

A second Club from Dummy ruffed by Z and three winning Hearts made.

Y's hand was re-entered with a Diamond, then a Club led and trumped, another Diamond led and the last Club trumped.

After all three suits had been eliminated Z led the Knave of Spades and A was compelled to lead Spades up to Z's Ace, 10.

This is an interesting example of not leading trumps until the elimination has been completed.

CHESS

TOURNAMENT AT NOORDWYK

A game from the fifth round of the tournament at Noordwyk in June. It shows some very good play by Eliskases.

(Queen's Gambit Declined.)

WHITE. Eliskases.	BLACK. Landau.	WHITE. Eliskases.	BLACK. Landau.

7. Q to B 2 (*a*)	P to B 3 (*b*)	28. P takes P	P takes P
8. R to Q sq	P to Q R 3 (*c*)	29. P to Q R 4	Q to Q 3 (*l*)
9. P to Q R 3 (*d*)	B to K sq	30. B to B 6	K to K 2
10. B to Q 3	P takes P (*e*)	31. R to Kt sq (*m*)	Q takes P
11. B takes P	Kt to Q 4	32. B takes B	Q to K 5 (*n*)
12. B takes B	Q takes B	33. Kt to B 6, ch	K to Q 3
13. Kt to K 4 (*f*)	K Kt to B 3	34. R to Q sq, ch	Kt to Q 4
14. B to Q 3 (*g*)	Kt takes Kt	35. R to Q 8, ch	K to B 4 (*o*)
15. B takes Kt	P to R 3	36. R to B sq, ch	K to Kt 3
16. Castles	P to Q B 4	37. Kt to Kt 8 (*p*)	Kt to B 6
17. R to B sq	P takes P	38. R to Q 6, ch	K to R 2 (*q*)
18. P takes P	Kt to B 3	39. Kt to B 6, ch	K to Kt 3 (*r*)
19. Kt to K 5	R to Kt sq (*h*)	40. Kt to K 7, ch	K to R 2
20. B to B 3	B to Q 2	41. R to Q 7, ch	K to R 3 (*s*)
21. Q to Q B 5 (*i*)	B to Kt 4	42. Kt to B 8	Resigns.

(*a*) R to B sq is the usual move, but the text-move, at one time frequently played by Rubinstein, appears to be coming into favour again.

(*b*) P to B 4 is generally played, although the text-move is seen occasionally.

(*c*) Black wishes to delay playing P takes P until White has played B to Q 3 and so has to lose a move with the Bishop in re-capturing. It seems, however, that 8. . . . P takes P is better. In a game Dr. Euwe v. Spielmann in the same tournament the continuation (after 8. . . . P takes P) was 9. B takes P, Kt to Q 4; 10. B takes B, Q takes B; 11. Castles, Kt takes Kt; 12. Q takes Kt, P to Q Kt 3; 13 P to K 4, B to Kt 2; 14. K R to K sq, Q to B 3 with good chances of an even game for Black. Dr. Euwe continued with 15. P to Q Kt 4 (to stop P to B 4) and Spielmann replied with 15. . . . P to Q R 4, the next few moves being 16. P takes P, R takes P; 17. Q to Kt 4, P to B 4; 18. P takes P, Q to K 2; 19. R to Q 6, R takes B P; 20. K R to Q sq, R to B 2.

(*d*) This move is very useful for at move 13 it prevents Q to Kt 5, ch as a reply to Kt to K 4.

(*e*) In reply to P to Kt 4 White can play P to B 5 with advantage.

(*f*) A good move. If, instead, 13. Castles, then 13. . . . Kt takes Kt; 14. Q takes Kt, P to Q B 4; 15. P to Q 5, P takes P; 16. R takes P, P to Q Kt 4 followed by B to Kt 2 with a good game for Black.

(*g*) Another good move. If, instead, Kt to Kt 3, then P to B 4.

(*h*) After 19. . . . Kt takes B; 20. Q takes Kt Black would have great difficulty in developing his Bishop.

(*i*) Preventing K R to Q B sq. Black cannot exchange Queens because after 21. P takes Q White's pawn majority on the Queen's side would give him a decisive advantage.

(*j*) Black has a difficult game. If 22. . . . P to Q Kt 3, then 23. Q to B 7, or, if 22. . . . Kt to Q 2, then 23. Q takes Q, R takes Q; 24. R to B 7. 22. . . . Q to Q sq, to be followed by R to K 2, appears to be best.

(*k*) Black has no really satisfactory move. If 24. . . . Q takes Q; 25. R takes Q, R to K 2, then 26. K R to Q B sq, threatening R takes R followed by R to B 7, ch.

(*l*) A mistake. Black should, instead, play P to Kt 4, to be followed by K to Kt 2.

(*m*) Threatening R to Kt 7, ch. If now 31. . . . B takes B, then 32. Kt takes B, ch, K to Q 2; 33. R to Q 8, ch and wins.

(*n*) If 32. . . . Kt takes B, then 33. Kt to B 6, ch. If, instead 32. . . . Q takes Kt, then 33. R to Kt 7, ch and wins, *e.g.* (1) 33. . . . K to B sq; 34. B takes P, ch and mate next move; (2) 33. . . . K to Q 3; 34. R to Q 8, ch, K to B 4; 35. R to Kt 5, ch; (3) 33. . . . Kt to Q 2; 34. R takes Kt, ch, K to B 3; 35. R takes P, ch, K to Kt 3; 36. R to B 8, ch, K to R 2; 37. R to R 8, ch, K takes R; 38. B to Kt 6, mate.

(*o*) If K to B 2, then R to Q 7, ch followed, if K takes Kt, by R takes Kt, ch; if K to B sq, by R to R 7; or, if K to Kt 3, by Kt to Q 8.

(*p*) Threatening Kt to Q 7, ch.

(*q*) If K to B 2 or B 4, then R to B 6, ch. If, instead, K to Kt 2, then B to B 6, ch.

(*r*) If 39. . . . K to R sq, then 40. R to Q 7. If, instead, 39. . . . K to Kt 2, then 40. Kt takes P, ch, K to R 2; 41. B to Kt 5.

(*s*) If 41. . . . K to R sq, then 42. Kt to B 6. If, instead, 41. . . . K to Kt sq, then 42. Kt to B 6, ch, Q takes Kt (if K to B sq, then R to R 7); 43. R to Q 8, ch, K to B 2; 44. B takes Q, Kt to K 7, ch; 45. K to B sq, Kt takes R; 46. R to Q sq and wins.

A MISTAKE IN THE OPENING

In the following game, played in a tournament for the championship of Prague, White cleverly took advantage of a mistake in the opening.

(Indian Defence.)

WHITE. Gilg.	BLACK. Dr. Glas.	WHITE. Gilg.	BLACK. Dr. Glas.
1. P to Q 4	Kt to K B 3	13. P takes Kt	B tks Kt, ch (*c*)
2. Kt to K B 3	P to K Kt 3	14. P takes B	Kt to B 3
3. P to B 4	B to Kt 2	15. R to K Kt sq	K to K sq (*f*)
4. Kt to B 3	P to Q 3	16. B to Q 3 (*g*)	P to K Kt 4 (*h*)
5. P to K 4	Q Kt to Q 2 (*a*)	17. P takes P	P takes P
6. P to K 5	P takes P	18. B to Kt 6, ch	K to B sq
7. P takes P	Kt to Kt 5	19. B takes P	R takes P (*i*)
8. P to K 6	P takes P (*b*)	20. R to Q sq (*j*)	K to Kt 2
9. Kt to K Kt 5(*c*)	Q Kt to K 4	21. R to Q 8	R takes P (*k*)
10. Q takes Q, ch	K takes Q	22. B to Kt sq	R to R 8
11. P to B 4	P to K R 3	23. B to R 6, ch(*l*)	Resigns (*m*)
12. Kt to B 3 (*d*)	Kt takes Kt,ch		

(*a*) A mistake of which White immediately takes advantage. Black should, instead, play 5. . . . Castles.

(*b*) Q Kt to K 4 is better. If, instead, 8. . . . Q Kt to B 3, then 9. P takes P, ch, K takes P; 10. Kt to Kt 5, ch, K to K sq; 11. Q takes Q, ch, K takes Q; 12. Kt to B 7, ch followed by 13. Kt takes R.

(*c*) Threatening either Kt takes K P or Q takes Kt.

(*d*) A good move.

(*e*) If at once Kt to B 3, then B to Q 3, winning the King's Knight's pawn.

(*f*) If R to K Kt sq, then B to Q 3.

(*g*) Best. If, instead, R takes P, then K to B 2 followed by B to Q 2 and Black soon completes his development.

(*h*) Black cannot hold the pawn and so makes the text-move in order to open a line for his King's Rook.

(*i*) This allows White to get an overwhelming attack. 19. . . . B to Q 2 is preferable, although after 20. P to K R 4 White has the better game.

(*j*) A strong move. Black cannot reply with B to Q 2 (because of B takes Kt) while after Kt to Q 2 he has no way of completing his development.

(*k*) Black has no good move. If 21. . . . K takes B, then 22. B to B 4, ch: or, if, instead, 21. . . . R to R sq, then 22. B takes Kt, ch, P takes B; 23. B to B 2, ch.

(*l*) This move would also have been the reply to 21. . . . R to R 7.

(*m*) White mates in two more moves.

PROBLEM No. 3985

By N. K. MALACHOFF.*

WHITE (13 pieces): King at K 8, Queen at Q R 4, Bishop at Q 2, Knights at K Kt sq and K Kt 3, Pawns at K 2, K B 2, Q R 2, Q B 3, Q R 3, K B 5, Q B 6 and K 7.

BLACK (3 pieces): King at K R 5, Pawns at K Kt 5 and Q Kt 5.

White to play and mate in three moves.

* First prize, *Schachmatny Listok*, 1931.

SOLUTION OF PROBLEM No. 3984

1. R to K R 5, Any move; 2. Q, R, B or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 488

ACROSS.—1, He's not a flyer but he's a fine swimmer. 7, Pursuit in a female automobile? 10, Extra cool in this. 11, Not in armour. 12, A donkey is a help to find this. 17, An Arab forgot his latch-key. 20, It doesn't matter a jot. 21, A sleep at the card table. 22, Begins a match and ends a ride. 23, A sun-tanned spirit? 25, One hopes it will not be necessary as a result of 22. 26, Our giver of light is known by this name. 27, Place where. 28, As peas in a pod. 30, The law is sometimes sharp. 31, A cloth agent? 33, Ill temper. 34, When fresh, it's very wholesome. 36, Ebenezer's wife? 37, Some gases are this. 39, Not quite the best at the range. 40, Out of condition. 41, "Heaven's best —— is wasted upon men who to themselves are false" (Wordsworth) 42, To weary. 44, I'm wan. 47, You are told to follow this sometimes. 49, Fetter. 51, Vamoose. 52, Wealth untold without the pounds and pence. 53, This clue's a bit of a bore. 55, Twice two are four. 57, Horses jib, but this is the nautical kind. 58, He is not generally one of the pet sons—or is he? 59, Point of compass.

DOWN.—1, Cheap, but obsolete means of travel. 2, Old Screws. 3, We hope we shall not go there. 4, North-easterly European dwellings. 5, A possession of the female element of the young idea. 6, We often lose money on this course. 8, Heat it singly (anag.). 9, Common to lanes and deer. 13, At an early date. 14, Plural of five. 15, A herb. 16, Bird-like sport. 18, The gardener does not fear these dragons. 19, Found in the Salle d'Armes. 29, "Particular —— may speak a general truth" (George Eliot). 32, Ink on the carnations. 34, A kind of sauce in the Bible. 35, They would be annoyed if you suggested they were the junior. 38, Point of compass. 43, You may flush a bird here. 45, "All —— to dash through thick and thin" (Cowper). 46, Not an outsider at this price. 48, A see —— and very comfortable too. 50, That refreshing draught. 56, The position of many in relation to a pole.

A prize of one guinea is offered for any crossword puzzle, dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Identification of Weeds.—The sample sent was largely American water weed (*Elodea canadensis*), but there was also one sprig of pondweed (*Potamogeton densus*) and a good deal of filamentous algæ mixed up with it. When you attack the American weed, be sure to get the root out and take the plant right out of the water. Odd bits are liable to root themselves lower down.—*H. U., Wilts.*

Garden

Dealing with Gaps in Hedges.—The most satisfactory way would be to dig out the unwanted thorn and privet and replant with beech or whatever species you desire. A cheaper method would be to cut the plants just above ground level in the autumn, bore holes in the stem and insert weed killer or saltpetre, but in this case you will still have to remove the roots if you are going to replant the gaps which will appear. Weed killer is usually most effective in killing hedges when one does not want it to, and, if applied in spring when the sap is up, it should not fail in its purpose. As regards the mice, although traps require rather a lot of attention, it is our experience that cats and traps are the most effective methods of ridding a garden of field mice. In the wood and also in gardens many people make a practice of dressing seed with red lead and of sowing three times the amount that would be required for the final plants, but red lead, although a deterrent, will not stop really hungry mice. Lloyd's Chemical Co., Ltd., of Station Buildings, Maidenhead, Berkshire, supply most excellent poison for rats, and it would be worth while writing to them to see if they can recommend anything in the way of poison for mice. We do not know of any effective type of water trap.—*A. M. S., Lanarkshire.*

Kennel

Treatment for Worms.—An appropriate dose for a small foxterrier would be: ½ grain calomel, ½ grain Santonin, 2 grains jalap, made into a pill and administered after a fast of 24 hours.—*E. M. P., Bedford.*

Skin Eruption.—This reads like follicular mange, but it would be well to have this tentative diagnosis confirmed by a veterinary surgeon, as a microscopical examination is needed.—*R. Derby.*

Working Sheepdogs.—Sheepdog trials are held under the supervision of the International Sheep Dog Society, which, no doubt, is the body to which you refer. Mr. James A. Reid, hon. secretary, 28, Anderson Street, Airdrie, Scotland, would be able to supply you with the information desired.—*A. N., Borth.*

Quarantine Regulations.—All dogs imported into this country from abroad must undergo six months quarantine in approved kennels. The necessary permission to land has to be obtained from the Ministry of Agriculture and Fisheries, Whitehall Place, London, S.W. 1. The only relaxation made is in favour of performing dogs, which have to be carefully segregated and kept under observation.—*A. G., Iran.*

Post-Mortem Examinations

Emaciation of a Greenshank.—The wader shot by you on the marshes was a young cock greenshank (*Tringa nebularia*). Its poor condition was probably due to the bird being on migration; no sign of recently taken food was found. No disease was present.—*T. T., Warwick.*

Capillariasis of a Song Thrush.—A correspondent picked up the body of a newly-dead immature hen song thrush (*Turdus musicus*). The body was very emaciated. The bird's death was due to a severe inflammation of the bowels produced by a thread-worm infection known as capillariasis.—*R. G. W., Devon.*

Coccidiosis Among Birds at Liberty.—Earlier reports have described the heavy losses due to coccidiosis on the pheasant rearing fields, the poultry farm and among the young partridges. Our last batch of cases of this widespread disease comprise pheasants from eight different coverts, a partridge, a pullet and a Carolina duckling. Two of the outbreaks among pheasants were complicated by gape-worm infection. One reason for the prevalence of this disease is the powers of resisting climatic conditions possessed by the germs. They are capable of remaining alive, when passed in the droppings of an infected bird, for some 12 to 24 months on the ground. Thus if one or more infected birds are turned into covert, the ground, particularly about the feeding, drinking and roosting sites, very soon becomes a source of infection to healthy birds. Then the behaviour of the infected bird is another factor tending to the spread of the disease. Whereas the disease rapidly produces ill-health and frequently death among young chicks, it takes a slower course in the bird attaining maturity. All older birds may continue to excrete the germs for some days or weeks before it becomes sufficiently weakened to attract the keeper's attention or falls a victim to a predator. Those who wage war on the predators (animal or bird) might reflect on their value in ridding the fields and coverts of birds which are weakened by contagious disease.—*J. E. N., Carnarvonshire; C. A. M., Kent; J. M. B., Wilts; R. H. R., North Wales; A. G. W., Somerset; S. C. D., Hereford; J., Berks; M. J. N. W., Mon.; R. E., Herts; G. A. T., Devon; W. N., Devon.*

Rugby

Injury to Kicker.—You state that you were injured when making a mark (technically known as a fair-catch), and inquire what is the correct ruling for this. By the laws of the game you should have been allowed three minutes in which to take the kick, after which the kick would have been void. A scrummage, of course, would have followed, and in the event of the mark being made behind the goal line, 5yds. in front, on a line drawn through the spot parallel with the touch line.—*R. E. G., Durham.*

Kicking from a Fair-Catch.—Yes, you can take either a drop at goal or a place kick from a fair-catch. The drop is, on the whole, more frequently used because, when taking a place kick you have to make your hole so much farther back from the place the mark was made to give yourself ample time to take the kick in comfort; even then the opponents' charge is apt to put the kicker off. In the case of the kick being taken from behind the goal line the ball must cross that line, unless, of course, it is first played by an opponent.—*R. W. G., York.*

Formation of Clubs.—The following is a list of some of the earliest clubs to be formed, and the dates of their formation, which we hope will answer your question. Blackheath, 1862; Richmond, 1863; Manchester and Bath, 1865; Bradford, 1866; Liverpool, 1866; Harlequins (under the title of Hampstead), 1867, changed to Harlequins, 1870; Wasps, 1867; Brighton, 1869; Burton and Ipswich, 1870; Civil Service, 1870; Streatham, 1871; Clifton, Exeter and Leicester, 1872; Moseley and Carlisle, 1873; Beckenham, 1874; Trojans, 1874; Twickenham, 1875; Saracens, 1877; London Scottish, 1878.—*R. E. G., Durham.*

The 'Varsity Match.—Given below is a list of the results of the 'Varsity match which, we hope, will substantiate your argument:

1919–20	Cambridge	7 pts. to 5
1920–1	Oxford	17 pts. to 14
1921–2	Oxford	11 pts. to 5
1922–3	Cambridge	21 pts. to 8
1923–4	Oxford	21 pts. to 14
1924–5	Oxford	11 pts. to 6
1925–6	Cambridge	33 pts. to 3
1926–7	Cambridge	30 pts. to 3
1927–8	Cambridge	22 pts. to 14
1928–9	Cambridge	14 pts. to 10
1929–30	Oxford	9 pts. to 0
1930–1	Drawn—Oxford, 1 penalty goal; Cambridge, 1 try.	
1931–2	Oxford	10 pts. to 3
1932–3	Oxford	8 pts. to 3
1933–4	Oxford	5 pts. to 3
1934–5	Cambridge	29 pts. to 4
1935–6	Drawn	No score
1936–7	Cambridge	6 pts. to 5
1937–8	Oxford	17 pts. to 4

After the 1920–1 season the contests have been held at Twickenham. Other grounds on which they have been held are at Oxford, Cambridge, Oval, Blackheath and Queen's Club.—*A. H. C., Worcester.*

Shooting

Cartridge Tests

Your 12-bore No. 14 Hungarian cartridges contained 33.2 grains of Rex powder and 1 3/4 oz. of mixed shot, sizes 8 and 9. Velocity recorded averaged 1,042ft. per second, with rather heavy recoil.

Your 16-bore No. 12 cartridges contained 27.7 grains of Rex powder and 1 oz. of No. 9 shot. Velocity recorded averaged 1,120ft. per second, with average recoil.

Your 16-bore No. 14 cartridge contained 25.5 grains of Rex powder and 1oz. of No. 9 shot.—*A., Ludlow.*

Your red cartridges contained 30½ grains Smokeless Diamond powder, air cushion and card wads, and 1⅛oz. No. 6 shot. Velocity recorded averaged 1,080ft. per second with medium recoil. Patterns with one exception were even and averaged 56 per cent. (40yds. 30in. circle, choke barrel). Your blue cartridges contained 35½ grains E.C. powder, best felt and card wads, and 1oz. of No. 5 shot. Velocity recorded averaged 1,160ft. per second with medium recoil; patterns were even and averaged 63 per cent. Both cartridges should prove effective against game. The blue, however, have the advantage of greater regularity combined with higher velocity.—*G. R. B., London.*

Your orange cartridges contained 29½ grains of smokeless powder of the appearance of Walsrode Feltine and card wadding, and 1oz. of No. 6 shot. Velocity recorded averaged 1,110ft. per second, with medium recoil. Patterns (30in. circle, 40yds. choke barrel) were even and averaged 62 per cent.

Your grey cartridges contained a bare 33 grains of British Smokeless powder, air cushion and card wadding, and 1⅛oz. No. 6 shot. Velocity recorded averaged 1,067ft. per second, with medium recoil. Patterns were even, but only averaged 46 per cent. On account of the higher velocity, combined with closer pattern, preference should be given to the orange.—*R. B. G., Edgbaston.*

Your red cartridges contained 43 grains of Schultze powder felt, cork and card wads, and 1⅛oz. No. 6 shot. Velocity recorded averaged 1,024ft. per second with medium recoil. Patterns, with one exception, were even and averaged 68 per cent. (30in. circle, 40yds. choke barrel).

Your blue cartridges contained 32 grains of E.C. powder air cushion and card wads, and 1⅛oz. No. 6 shot. Velocity recorded averaged 1,080ft. per second, with medium recoil. Patterns, which were inclined to be uneven and patchy, averaged 50 per cent.

Your brown cartridges contained 31½ grains of Smokeless Diamond powder air cushion and card wads, and 1⅛oz. No. 7 shot. Velocity recorded averaged 1,067ft. per second with medium recoil. Patterns were even, and averaged 62 per cent.

It is impossible to recommend a load that you could absolutely rely upon at all times, so much depends upon the gun; your gunmaker, however, would advise you. Of the three kinds tested, the brown certainly came out best, the average velocity of the red being too low and the shooting of the blue irregular.—*C., Devon.*

Travel

Hotel in Yorkshire.—We think you would like the Bridge House Hotel at Catterick Bridge. It was probably constructed about the year 1422, when Catterick Bridge was built across the Swale, and stands at the southern elbow of the bridge to offer hospitality to travellers along this busy highway. Not always has it been known by its present sign. Once—and a lease dated 1535 is our proof—it was called the Bridge Inn, while later, during the coaching days, it was known as The George. Between 1911 and 1915, the old house was used as a private residence, and it was during this period that several bedrooms were added and the original kitchen of the inn was converted into what is now the hall. Old oak beams which had been encased in plaster were uncovered, and electric light was installed. Further improvements have been a splendid ballroom, two suites of bedrooms each complete with bathroom, while all the furniture in this additional wing was specially designed for the hotel, and is made of 300-year-old English oak. It is a good centre for meets of the Bedale, Zetland, South Durham and Hurworth hunts, while there is trout fishing in the district, and, of course, the well-known racecourse.—*A. A., St. Neots.*

HORSE SALES OF THE WEEK

Leicester

THERE was a good attendance at Messrs. Warner, Sheppard & Wade's weekly sale at Leicester on Saturday last, when several of the lots offered realised three figures. The top price was given for Mr. Vivian Bishop's grey gelding Exchange, which, after spirited bidding, went for 210gs., whilst his bay gelding Tatters made 190gs. Mr. A. Cadbury accepted 200gs. for his bay gelding Bighorn. Another lot which went for 200gs. was Mr. and Mrs. Jock Atkins's bay mare Mother Hubbard. Mrs. Maurice Bevan's Paper Moon and Keystone III sold for 130gs. and 125gs. respectively. The usual return of horses making 30gs. or more is appended. Property of Mr. W. Adlam: Bisley, b g, 34gs. Property of Mr. R. H. Barker: Gr m, 70gs.; g h, 33gs. Property of Major C. Macnaughtan: B g, 90gs. Property of Mr. Vivian R. Bishop: Merrie England, b g, 140gs.; Exchange, gr g, 210gs.; Tatters, b g, 190gs. Property of Mr. James Montagu: Brunhild, ch m, 55gs. Property of Mrs. C. Heber Percy: Shooting Star, b g, 58gs. Property of Mr. and Mrs. Jock Atkins: Mother Hubbard, b m, 200gs. Property of Mr. G. A. Wilson: Wild Page, ch g, 50gs. Property of Mr. F. H. Brewitt: Faithful, ch m, 125gs.; Ballymoty, gr g, 35gs. Property of Mrs. Maurice Bevan: Paper Moon, ch g, 135gs.; Keystone III, br m, 125gs. Property of Mr. R. F. Haworth: Diomede, ch m, 60gs.; Moonlight, ch g, 130gs.; Limerick, ch g, 65gs. Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

SANCTIFICATION OR EXPLOITATION?

MATTERS which come under this question are to be found in every activity of modern man; but we will confine ourselves to asking it only about matters of sport and agriculture. Is the money token, from henceforth, to mean more than the living token, and are future generations to be left to gather what they may from exploited remnants of past strength, succour and goodness? For how long shall we be able to play with Nature and with manners? Can we, for evermore, make a quick turnover of profit on racehorses, by accelerating performances without the backing of that slower guarantor, Nature. It is impossible to commercialise nature; you may safely commercialise the *results* of her activities, but if you attempt to commercialise the activities themselves, you, or your followers, are heading not necessarily for a monetary bankruptcy but for a bankruptcy of elemental natural resources. The over-racing of two-year-olds and the over-commercialisation of the land on which horses are run will *eventually* have to be paid for by someone; not by the first exploiters, of course, because Nature is slow to decline and slow to mend; that is why this sometimes unconscious exploitation is so insidious; it is not obvious, and its workings are not such that *everyone* "who runs may read."

Is there never again to be the idea that fisheries and shootings are only their owners *pro tem.*, and are, or should be, held in trust for other human beings, at some time or another? Although "blood is thicker than water," there is no real reason why obligations held under an ownership by monetary contract should not be discharged in the same way as obligations held under an hereditary contract, succeeding purchasers receiving from good countrymen the same consideration as succeeding sons. Though not absolutely general, there is no doubt that nowadays many shootings, and a number of fisheries, are exploited by sport thieves (there is no other word for them). They are stripped and left, with no more repentance than Napoleon's soldiers felt when they had looted a conquered town.

In agriculture, is the land or the money made out of it the more important? In a certain country you will find that a farmer, when he knows that he will soon die, spends his savings in buying land, so that all his sons may become farmers in their turn. Would you find that in this country? Is the land, the veritable motherland of the entire human race, from whose fruits they partake of food, drink, clothes and shelter, to be sanctified or exploited?

We, with our lack of imaginative comprehension, are "outrunning the bailiff," and the bailiff is Nature, the most inexorable creditor in the wide world.

COUNTRY REFUGES

THERE has been a good deal of discussion on measures which are necessary for evacuating towns in time of national emergency, but little has been said concerning the organisation required for the country to receive a sudden increase in population. It is not enough to say this village or this big house will take so many people, or children, or invalids, and billet them without further ado, although there should be some form of forcible billeting is evident, otherwise the solution of where to put the refugees would be impossible. We had a few examples of the result of appealing to good nature during the War when it was only a question of affording temporary housing for troops.

But it is one thing to say a house or farm will accommodate so many billetees and quite another to make the owner responsible for them. He may not have the necessary means for administering to invalids or children; he or she may have to leave on national service and abandon a house; and one country householder raises the quite reasonable question as to whether he would in that case still be responsible for the rates and taxes on his property.

Surely the only way to be prepared for an emergency, even though, we trust, we will never have to face it, is to have a system of decentralisation worked out for rural areas, and, above all, have local committees with a knowledge of the villages, their accommodation and food supplies, to allot and supervise the distribution of refugees. This work can be done by volunteers. It would be interesting to have the experiences of those who were approached for emergency billeting during the recent crisis.

THE ADELPHI

Two years ago many people viewed the demolition of the Adelphi Terrace, which had housed so many distinguished persons, with a certain degree of resignation and cynical regret. Everyone is now agreed, however, that the new Adelphi is, in the words of the Mayor of the City of Westminster spoken at the special opening, "truly worthy of its great position." The Mayor recalled how, in 1769, the Duke of St. Albans granted a lease to the Adam Brothers to build, and the result was one of the finest terraces in London. The present builders owe much of their success to their wisdom in consulting the L.C.C. and the Westminster City Council, and have at some considerable cost arranged for the preservation of wide surrounding streets. We agree with Mr. Hamp, the architect of the building, that the brickwork is some of the finest in London.

THE SHAPE OF THINGS TO COME?

The sensation of this week was the extraordinary effect the broadcast of one of H. G. Wells's plays had on a large number of Americans. The rapidly spreading news brought astonishing results. Large-scale evacuations started from New York; church services stopped abruptly with the disappearance of the congregation; gas attacks were reported; and, in one case, a large cinema was emptied completely in about two minutes. And then there was the gentleman who "saw a large metal cylinder land and animals jumping out of it." Possibly he thought history was beginning to repeat itself again and that Noah was returning in the modern equivalent of the Ark to rescue them all from the day of doom. His reaction is not stated. Much more probably the animals were common or garden pink elephants.

INDIAN FOOTBALL

It is a matter for wonderment as to where big business ends and sport begins in the unfortunate game of Association football, for queer troubles and bad blood always result in games where the purse rules the performance, but we may be grateful that in this country we do not go to the lengths of some of our Empire teams. News comes from Gaya (Bihar) that a football club has filed a suit in the civil court for a declaration that a goal awarded against it is null and void. Added to this, the team demands that the football tournament shall be held up until the matter has been decided. Litigation is, of course, one of the most important hobbies of the Indian populace, but we feel that some of our own leading clubs might well have thought of the idea before the novelty had been worn off in the Orient.

INN SIGNS

Inn names, and the signs and notice boards by which they are displayed to view, have for long crystallised many of the facets of social life and history from the long past of this country. Often they are remarkable for the light they throw upon the English sense of humour rather than upon the English sense of solemnity. "The Swan with Two Necks," "The Blackboy and Stomach Ache" and "The Case is Altered" are good examples of a rather delightful irresponsibility. And to judge from the 228 entries at the Brewers' Exhibition which opened last Saturday, topical inn signs will soon be a feature of our highways. "The Neville Arms," "The Lambeth Walk," and "The Tired Tyre" are examples of twentieth-century advertising which must have caught the eye of many visitors to the Agricultural Hall this week.

BLAGDON'S SEASON

Trout fishing on the famous Somersetshire lake does not seem to have suffered by this rather trying season at all to the extent one would have supposed from results elsewhere in the West. Actually, the total number of fish caught has been 255 more than last year. This increase has been due entirely to rainbow trout, which seem to have shown up better in the catches, rather surprisingly, since a cold season does not usually favour them. Rainbows, which are normally rather smaller fish than brown trout at Blagdon, are probably also responsible for the fall in the average weight, which has dropped to 2lb. But the season has been a bad one for big fish, only ten trout of 4lb. and over being recorded. Many habitues will think sadly of great seasons in the past, like 1924, when no fewer than 264 fish of this weight came to the net, though to the occasional visitor the additional chances of sport represented by nearly 50 per cent. more fish in the total will be some compensation.

AUTUMN

The royal march of Autumn
Is all with flags express'd;
And down the streets the house fronts
Are dizen'd in their best,
With carmine hues and crimson
And pennons of bright flame,
Where the Virginia creepers
A kingly pomp acclaim.

Like vine-leaves dyed in murex
And pampinus of fire,
The consul's blood-red symbol,
The imperial webs of Tyre,
All in the wild October
The Promethean gifts outspread
Herald the passing glory
Of Time that seeks the dead.

EDMUND CASSON.

A COUNTRYMAN'S JOURNAL

THERE is something about cider-making in October which goes to my head as though I had drunk deep of the "pummy" (Thomas Hardy's "pommy") squeezed out of the cider-press before it is fermented. Farmers say it is mild as milk—let them say! I am "mombled," as they say in Gloucestershire, not so much by a deep draught of the amber liquor, not even by the sweet heavy pungency of the apple-scent that drifts off the mill-like steam, but by the intoxicating sense of the rich continuity in this glorious ritual of autumn. But it is not merely sentiment that makes me turn up my nose at cider made by the "scratter" (scratcher), because it is a paltry mechanical device. Cider that is made by the machine is far inferior to cider made by the natural processes of millstone and press, for the simple reason that the former fails to crush the kernel, and so impoverishes the flavour. The old way is the good way because it gives the best drink.

The cider-mill is a simple massive structure of wood and stone, with an upright beam in the centre of the circular stone or wooden trough, 18 in. wide, into which the apples are poured from a copper-hooped wooden bucket for the millstone to grind them. A braced arm projects at right angles to the beam right over the horse which is harnessed to it, and the huge wheel, nearly a ton in weight, revolves by an axle pivoting upon it. Round and round plods the old horse in the low shed with its earthen floor, and round and round the "chase" (trough) swings the bevelled millstone, crushing the apples to the "pummy" (pulp) that is then ready for the press.

I know of no sound in the world to compare with that of the pulverizing of the apples under this peaceful, joy-bringing Juggernaut. It is a squashy, blubbery, water-ploppy note that even John Phillips in *Cyder* (1706) with all his ponderous Latinisms and mythological aids to description, quite failed to convey. As the sweet load in the chase becomes a mash, more bucketfuls are poured in, and the old horse is brought almost to a standstill by the impact of the millstone upon the fragrant pile.

Though I know nearly every shed or barn or outhouse in Gloucestershire where a cider-mill, like some gigantic Eocene mammal, has its stable—and God knows how few they be and hard to find—this was the first time I had actually seen cider in the making. Now that I have seen it, I long for another October that I may see it again, since there is no sight, no scent, no sound which has so rich, so traditional an earthiness about it. "Out of the lion comes forth sweetness," that archaic, unintelligible apothegm is made true and full of meaning.

When the pummy is quite ready, it is scooped up by a broad wooden ladle, with two slits in the centre for grasping, into buckets and heaved out upon the "hair" (Giles Winterbourne cider-making in *The Woodlanders* speaks of his "bags of horse-hair"), which is spread out within a wooden frame upon the press. The bucket-bearer squashes and flattens it down on the hair with his bare hands (we do not bother about pernicketty and over-civilised methods when we go cider-making) and drapes another hair over it, as many as twenty in all.

The square frame is removed from the soaked rug until more pummy is shovelled up, and at last the hairs reach the top of the press. They are then boarded over and the press is screwed down capstan-wise upon its spiral iron uprights. This is called making a "cheese," and all the time the odorous juice trickles down into the vat at the foot of the press. Before fermenting, it is put through a strainer into old rum and brandy casks that hold anything up to 120 gallons. The only other tool used is a "scraper" for thrusting the heady stream along the chase and keeping the millstone free of caking.

It is an elementary business, but the cider-makers know that the more you trust to nature, the better she will do your work for you. Her processes are intricate and mysterious enough, but man is wisest and happiest when he is content to lend them a helping hand. H. J. MASSINGHAM.

WITHOUT COMMENT

Sent by a reader as coming under this heading.

Extract from advertisement: "Can any gentleman recommend thoroughly reliable chauffeur. . . . careful driver; good mechanic; . . . knowledge Scotland, loading, simple valeting a recommendation; fond of dogs. . . ."

Extract from reply: "With reference to your advertisement I can tell you of a chauffeur who can be entirely recommended . . . a careful driver . . . able, so to speak, to take the car to pieces and put it together again. . . . By loading I presume you mean fixing portmanteaux, &c. on a car, and certainly he would be very good at this, and he is fond of dogs. . . ."

THE MOVEMENT FROM THE LAND

"You Cannot Work Land Without Men"

DURING the past few years men have been leaving the land in an ever-quickening stream. Since 1921 agriculture has lost more than a quarter of a million men, and there is no sign of a slackening in this movement from the land: no sign whatever.

Thinking upon the matter broadly, no one can blame the agricultural labourer. He does not receive sufficient inducement to remain upon the land—either in the way of financial reward or in the way of home comforts. His lot is a hard one. It is easy enough to say that his wages are higher to-day than they have ever been; there are plenty of people ready enough to say that and to point out eagerly that he gets in one way or another a number of perquisites. It is easy enough to say, and it is true.

But the farm labourer works hours which would kill the normal town worker (always supposing that you could get a town worker to observe them), and his 35/- goes no further than 35/- will go anywhere else. He does not get an early-closing day. He does not get the entertainment of the local cinema or dance hall (and if these are available, which is rare, he cannot afford them). He does not get a cottage complete with every modern convenience. He is indeed very lucky if he gets a cottage with any conveniences at all.

But he does see, not so very far away, men no better than himself, physically or mentally, earning better money and getting apparently greater benefits. And so he leaves the land. You cannot blame him. If he is offered more remunerative and less arduous work he will take it. So would you and so would I. And I do not know any farmer who would refuse a bigger income earned with less trouble.

Most farmers, if asked to account for this movement—and it is by no means the least of all the many troubles that beset our agricultural industry—would say that owing to the policy adopted by local authorities (encouraged by the Government) in carrying out roads and drainage schemes, and by the Government itself in the building of aerodromes, munition factories and so forth, born of the rearmament programme (and now to be greatly accelerated), alternative employment, more remunerative and almost certainly less arduous, is provided in rural areas for the genuine agricultural worker. These are, I am sure, the immediate causes for the movement from the land. They are in themselves good causes, that is to say, each one is in itself of first-rate national importance. The farm labourer is not leaving his work for work of no importance, but he is leaving, and his work is of importance. It would seem—to one unversed in the ways of Government departments, that there is something very wrong—and very foolish—in public expenditure being the means of robbing the farms of labour, the while enormous sums of money are being spent in public relief and unemployment benefit. One can account for it only by assuming that the Government do not realise the very great value of the agricultural labourer to agriculture, and the very great value of agriculture to the nation.

It is true that in this country the increased use of fertilisers, the enormous improvements made in agricultural machines and implements, and the modern methods of husbandry, have made it possible to decrease the staff employed without decreasing production to too noticeable an extent. But if that is true, it is not a whole truth. The whole truth is that you cannot work land without men.

But the men are leaving the land. And as they leave the land the farmer, with less labour, has still to make that land pay. Farming is not a paying proposition at the moment. Rather it is a proposition filled with worry and a sort of cynical despair. Almost every farmer knows that what is taken out of the land must be put back again; and to-day almost every farmer finds that what he takes out of the land he takes out of the land for ever. You cannot blame the farmer who allows big business companies to place hoardings in his fields, or who, seeing an opportunity for selling some land to the builder, takes that opportunity. The farmer has got to live—and if that is the only way in which twentieth-century economics will allow him to live, then that is not the fault of the farmer.

One cannot expect the farmer to pay higher wages to keep men on the land; one cannot expect the young labourer to be content when he sees his neighbour earning more money on the roads or elsewhere. One cannot expect it, and reasonably one does not expect it.

But in any major national emergency the farmer and the good English earth would be expected to provide suddenly, much after the manner of a conjurer, all that the urban population needed. And such an attitude is totally unreasonable.

If one must apportion blame for the present unhappy state of English farming, then one cannot blame the farmer or the farm labourer, one can only blame the system or the lack of system which has brought the land to its present condition; and that means blaming the man whose interest—more, whose job—it is to preserve English agriculture for the benefit of the nation. It would not be fair to apportion all the blame to Mr. Morrison. Mr. Morrison has inherited the fruits of past idealism and lack of knowledge, a peculiarly vicious combination. But Mr. Morrison is the present Minister, and cannot altogether escape blame. He has always refused to take any strong measures for the preservation of English agriculture. When he was asked to place English agriculture on a basis from which it could do valuable work in the event of war, he replied "War may never happen"—and within an infinitesimal space of time this country was on the very brink of war. It is just this happy-go-lucky, it-may-never-happen attitude that has brought English agriculture to its present pathetic condition.

I suppose we all learnt something from the crisis. On some aspects of national preparedness we learnt a great deal. We have also learnt—though the matter has not received much publicity—that the English agricultural industry is indispensable to the life of this country. A very great deal has to be done before English agriculture is on even a fairly good peace footing. Much has been done in the way of boards, and marketing schemes and so forth. But these are only palliatives. The cure has not been attempted. The labourer must be brought back to the land, and the land must be tended. You cannot work land without labour. B. V-F.

A FOX LEAVING COVERT, AFTER THE WARWICKSHIRE HOUNDS HAD MET AT HANWELL, AND WONDERING WHETHER TO RISK THE FOOT BATTERY

ALL INSIDE SEVEN DAYS

A Diverse Autumnal Sporting Tour

IT can fall to few people to hunt, in the course of their work, fox, otter and hare, all in one week, and to see a stag in the country where they are hunted. Such, however, was my experience not so very long ago, and an account of it may amuse you.

The week started from Barcombe Mills with the Crowhurst Otter Hounds, and it started well. Drawing upstream above the mill pool, which, by the way, holds some very big sea trout, hounds soon hit a fresh drag, and hunted it beautifully and with a great cry past Isfield, carrying it across to a side-stream, and then back again to the main river. This was really first-class hound work to watch, and at times they were racing. Eventually, Lawyer found his otter some distance above Isfield in a very difficult and bad-scenting stretch of water. They could hardly swim him a yard and were very soon beaten. But the drag had made the day most enjoyable.

Sunday passed in replete contemplation; and on Monday morning, Mr. Peter Wood, who has this season joined Colonel Alexander in the Mastership of the Exmoor foxhounds, very kindly asked me if I would motor down to the west country with him, and have a day's cubhunting with the bitch pack, which he hunts, and perhaps see something else besides.

Tuesday morning was wet, with scuds of rain driving over the hills; but the ride on by Oare water, and so over the head of the watershed, and on to Lucott Farm, was as beautiful as anything I have ever seen. As each curtain of rain lifted, everything seemed to glow with renewed life and colour, and some sleepy campers ran out to see the hounds go by. Hounds meet late for cubhunting in these parts; people like to get out from long distances, and there is always the chance of a gallop since you cannot possibly hold up cubs in the big bracken-covered moor coombes or lower down in the hanging coverts, and these cubs are distinctly enterprising.

However, to resume our day's hunting. I had been accommodated with a steady grey steed, and one suited to the country and the work in hand; and one, also, who knew the moor and the dangers thereof like the frog of her hoof; a very safe pleasant, comfortable ride.

Hounds drew several places blank, and eventually found in a steep gorse-covered coombe-side, right up in the moor. And what gorse it was; chest-high in some places and practically impenetrable. Mr. Wood, who was drawing it on foot, went in fearlessly, but he must have felt as if he was battling for his life with hundreds of hedgehogs. However, I do not think he feels much when a fox is on foot.

Unfortunately, several hounds had slipped in by themselves, and leaving at the lip of the top-end, they ran very fast in a smallish circle over the open and brought him back, right-handed, into a tributary coombe. If only a fair body of hounds had got away with them, I think this little burst would have done a lot towards killing him, but what with thick gorse, thick bracken and the queer acoustics of these coombes, it is very difficult for hounds, as well as humans, to hear their companions. But these hounds certainly can travel, and they are really good hunters and wide drawers (which they must be to achieve success here). I notice one thing, that they spread a draw much better *uphill* from their huntsman than *downhill*, and I should be interested to know why.

There was a little misunderstanding after they had brought their cub back to the coombe, so that several minutes were lost before they hit him off again. Then they hunted very prettily indeed down to the bottom of the coombe, where, although they tried their best, he beat them. So home, with the sight of the Bristol Channel shimmering across to Wales, as a liqueur to the morning.

Next day, I had the pleasure of meeting Colonel and Mrs. Alexander (Colonel Alexander hunts the doghounds) and of looking at some of the bitches. They are a smallish, light type, but one which I personally like very much. Bone has always seemed to me to be a matter of proportion; if you have enough bone to carry the body above and stand fair wear and tear, it seems unnecessary to have a surplus. I wonder how often, when people say certain hounds lack bone, whether they mean there is not symmetry of legs in proportion to top and body, *or* that they prefer bigger bodied hounds and that if the hounds they are looking at *were* bigger bodied, they would be light of bone? If there is symmetry, size, surely (within reasonable limits, of course), is not of paramount importance.

Most of these hounds have symmetry, very good backs and good length to the hock. There is nothing heavy or clumsy about them; there is nothing "*baronial*" about them, if you know what I mean, and they have a varminty fox-catching look. Of them I liked best Dainty, Darter and Duster ('37), by Dartmoor Denmark ('33) ex Garnet ('33), and Rattle and Ringlet ('37), by Ragman ('32) ex Gossamer ('34); but there are six or seven couple of those bitches which any young Master should be proud to have in his kennel. They can *go*; that is the point. Victor Martin's kennel discipline is excellent, and there are an unusually good lot of draft hounds from the Warwickshire, who should be a very useful incorporation.

After seeing the hounds, we went over to luncheon nearby, and I had the pleasure of seeing some amateur horse-coping tried out upon the guileless young M.F.H. But nothing came of it; the coping was excellently done, but the horse wouldn't play up, or perhaps one should say, *would* play up.

Next morning, it was a matter of rising early and motoring over to near Tiverton, where Mr. Gerald Heathcote Amory, who has just taken on the Christ Church, was meeting at 7.30 o'clock at Crazelowman, in an endeavour to embarrass a local hare. This he succeeded in doing after a very pleasant hunt. I *do* like the way these hounds hunt; they waste no time, but it is not loose flashiness, since they keep a very good lateral line and turn with their hare. They have a good cry, and run up well together and, most important, they are not sluggish of brain, but very alert and very quick on a hare; in fact, they are good killers as well as good hunters, a fine but major distinction.

If I may say so, I thought Mr. Heathcote Amory hunted hounds well, and he blows his horn musically, which is always a pleasant adjunct. My host, who had been Master of these beagles, showed that he had not been drowned in seas of foxhunting and came up for the second time at the critical moment. So home; and everyone pleased with the way hounds had hunted, and with the eventual outcome. After a very good breakfast, not so good golf, and a very good luncheon, an expedition was made to see the Tiverton Foxhounds and the Christ Church Beagles in kennel, for the beagles were temporarily next door to the foxhounds during their stay in Devon.

The Tiverton are, in my opinion, remarkable for the fact that the dogs have more quality than the bitches, which is very unusual. As you know, they are a famous pack in their work, and as I have very little space to spare, I will just remark on one or two hounds, though I took an interest in all of them. Of the bitches I liked Rakish ('35) best, by Vagrant ('31) ex Ransome ('32). "A very nice, active, small hound; just the type I like. Look into this sort carefully, and you will see that it is all there, though not *displayed* so much as in the heavier sorts." Of the dogs, Boundelay ('36), by S. and W. Wilts Roundelay ('31) ex Suitable ('32), is "a hard-looking dog, short coupled, with great length to the hock, and full of quality."

Pedlar ('37), by Pedlar ('29) ex Norah ('31), "should turn into something good; a nice free shoulder"; and Lictor ('37), by S. and W. Wilts Latimer ('32) ex Radiant ('34), "is like an Alken print; a really first-class hound; beautiful

balance and activity, quality, and can go like the wind, I expect."

The beagles are a very quality, level lot, and I like Pagan better than ever. Pagan is by Major Birkbeck's Finder ('31) ex Pansy ('34). Pleasant, by the same sire out of the same dam, is a very strong bitch; perhaps a trifle short in the neck, but a good mover. Croft Foreman ('36), by Major Birkbeck's Finder ex New College Countess ('30), has, I thought, "a better front than Pagan, but not such a good middle piece."

Hector ('31), by New Forest Harbourer ('25) ex Marigold ('27), is "a nice quality dog, with scope." Of Harbourer ('37), by Hector ('31) ex Rapid ('32), I said, "a very nice dog, but, on second thoughts, perhaps a trifle bosomy." I must say that I thought this pack of beagles displayed the most remarkable *quality* all through.

Next day my host's pack were meeting at Malmsmead, near our comfortable quarters at Oareneaad, and we were lucky enough to have a very pleasant hunt indeed, my trusty grey friend again being requisitioned. The big wood, steep, thick and not too good to get about in, was first drawn, and after bustling round there for a time, news came that a fox had left at the top by the moor. Hounds could just own his line, and hunted on slowly above the headwaters of Badgeworthy, and down to the coombe near its top. I had the honour during the day to be appointed a kind of minister without portfolio in the whipping-in line, and was lucky enough while galloping on, to see a large stag cross the coombe, and gallop away, with that rocking-horse motion, over the skyline.

THE WARWICKSHIRE HUNTSMAN, GILLSON, GALLOPING DOWN A COVERTSIDE

THE WARWICKSHIRE HOUNDS TURN BACK WITH THEIR CUB AFTER MEETING AT HANWELL

A GRAFTON "BELLE DAME SANS MERCI"
Stately, prize-winning bitch at the Grafton puppy show, with two companions, after hounds had met at Paulersbury, near Towcester

Hounds either fresh found, or found, a fox here, and getting well away with him, ran very hard in a small circle, then back up the coombe, and crossing it, went along the opposite slope; I was on the near side, and it was a beautiful sight to see them, hovering and driving along over the purple heather. You could see every movement, as the slope was like the side of a house, and it was as if you were flying along above hounds in a horse-aeroplane. Eventually they turned from me, but, after running through a small bit of in-country, swung back again over the moor, with their fox almost beaten, and a short distance in front.

From this point scent got worse and although hounds and huntsman tried well, and it was pretty to watch, they had eventually to own defeat in the original covert. Considering that at that time Mr. Wood had only hunted these hounds twice, they worked exceedingly well for him, and I hear that since then he has been killing foxes regularly, and that takes a little doing in this rough, but thoroughly enjoyable and beautiful country.

So home, and I should like to thank all my kind hosts and hostesses for a care-free and kaleidoscopic week.

A. H. V. L.

DEVON AND SOMERSET SPORT

And the Last of the Cubhunting

SCENE OUTSIDE HAGLEY WOOD
Bob Pooler, the Albrighton Woodland huntsman, cheers his hounds into cover

DRAWING Burrow Wood from the meet at Tarr Steps, the tufters soon had a warrantable stag on the move, and ran him through the Punchbowl and on to Riscombe. Here he doubled and went back into the Punchbowl and down through Withycombe and almost into Winsford Village. Crossing to the Exe just above the village hounds turned up towards Nurcott and then came back to the Exe by Larcombe Foot. Here the stag turned up right-handed again, making a prodigious leap over the wire on the high bank off the road below Tarr Cottage.

Hounds then hunted very prettily through the fields parallel with the Winsford—Exford Road and turned up right-handed by Pinn Quarry as if to make for Dunkery. Here, however, the stag had turned again and run through Foxcombe, and on through the fields to Exford Rectory, where the leading hounds were held up.

Let go again, hounds ran across the road again and up to the bottom almost to Combe Farm, where they turned again and ran past the Quarme Kennels and across Truncombe to the Mill Lane Cottages, whence they turned down to the Exe again below Downscombe. Here the stag had taken a short turn up the Alcombe water, but had returned to the Exe and followed it up past Riscombe and Western Mill, and on to the bottom of Orchard Combe.

There was some very pretty hunting up the water, only the old hounds being able to own the line here and there. This doubling stag had gone up Ranscombe for some distance before turning left-handed through the fields under Warren Allotment and back to the Exe again.

Hunting upstream, hounds came up to their stag below Warren Bridge, and from here raced him up the Exe to Raven's Nest, below which he was taken, after an exceptionally interesting hunt with a point of nearly nine miles. PINKERY POND.

THE PYTCHLEY'S PROMISING ENTRY

OWING to the lamented death of Sir Charles Frederick, hunting has been overshadowed and curtailed this week. Hounds met at Badby House on Wednesday, the 26th, but except for making a fox to ground in one of the Staverton coverts and scoring a hunt of all too short duration from Badby Wood, little was accomplished. This was the first occasion since August 26th, on which hounds had failed to kill a fox.

After the useful scents which have been such a welcome feature of this excellent cubhunting season, it is curious to see the bad effect on scent of a cold north wind. On Thursday, from the River Avensthorpe, conditions were the same—a thin scent after a few degrees of frost over-night. A circular hunt of some 35 minutes was much enjoyed from a kale field near the place of meeting. The mixed pack made the best of what scent there was, and drove hard for a few fields on the homeward journey, but had to own defeat on badly foiled ground at length. The day was not without profit, as a fox was killed just outside Ravensthorpe Gorse, and the cubs in the Bryants and Guilsborough Gorses received a lesson which will be beneficial, no doubt.

On Friday, at Waterloo Gorse, there seemed a rare scent inside, and after 30 minutes, with a good cry, a cub was killed. He had every chance to take to the open, but it seemed hounds were always too close to him to allow of that. Another cub was killed after he, too, had ample chance to escape in the Oxendon Strips before a good litter in Mr. Marks's spinney were dispersed.

Hounds raced round Rabbit Hills and Sunderland Wood, thence ran really fast past Harrington. On the ironstone land beyond this village they were run out of scent, with the old workings and Rothwell Wood just ahead. More rain is badly wanted, for as yet the going, so much better than for some years past, is on the firm side.

The country, owing to lack of moisture in the spring, is pleasantly "unblind"; in fact, the ditches are mostly visible enough. Although records and numbers are well known to be of little, if any, use, to sport of any kind owing to the prolific fox supply and other factors, these hounds have killed a far greater number than for many seasons. They will begin the season full of confidence with an entry of great promise, riper in experience than usual, as may be observed from the way in which they fly to the horn and swing with their elders when at fault. EMERITUS.

DUKE OF BEAUFORT'S SUCCESSFUL CUBHUNTING

EVERYTHING seems set for a first-rate season. Weather conditions have been almost ideal for cubhunting—plenty of moisture being vital for scent in this part of the world—so that with favourable going for horses and hounds the new huntsman, F. Hollands, has had a very promising start. He is proving himself excellent in kennels—where half the foxes in a season are killed; he is quick and keen, and appears to have that enviable gift—an eye for a strange country—which is invaluable in this far-flung country, with its variety of obstacles and conditions.

The season's cubhunting has reduced the foxes by the record total of 140 brace, but there are more than enough left everywhere. Hounds look exceptionally fit, and the young entry of all three packs are well up to the usual standard in work and appearance—more need not be said.

The last week's cubhunting, as always in this country, has provided excellent sport and good fun for everyone, though at times a fast 20 minutes in St. Luke's sun made even rat-catchers seem exceedingly warm.

On Monday the dog hounds met at Hinnegar Lodge in honour of the eighth birthday of Sir James Scott-Douglas, the son of Lady Blanche Douglas, resulting in a busy morning in and around Bull Park and a nice little hunt at the finish from Luckley Brake towards Luckington, hounds killing their cub in the open.

Hollands again put in some execution on Tuesday from Cherrington around the unpopular Gatcombe, and on Wednesday the Duke had a pleasant morning from Codrington at the Gorse, concluding with a very nice hunt across the Vale by Doynton to the Rocks. Saturday produced a lot of galloping and jumping over some puzzling country, foxes running new and unexpected lines and appearing in every rough field. The fences around Pigg Lane proved very hairy, so that even the Field Master, Captain F. Spicer, who is always "invariably there," was at times missing.

Hounds divided near Bradfield Wood, after finding in Captain Melville's new spinney, the lot that the Duke was with running very fast indeed over the brook by Westfield Park and on, parallel to the Chippenham Road as far as the new aerodrome, where their fox was viewed into Stockwood. Little more could then be done, the whipper-in reporting six foxes away and hounds hunting a leash inside! Later, two brace of Mr. Smith's litter were killed, and there was another little hunt by the polo ground towards Baker's Gorse, where hounds again divided.

The opening meet is on Monday, at Lyneham Green. FIELD FARE.

BELVOIR PRELIMINARIES AND PROSPECTS

WHAT a lovely feeling it is to be on the brink of another hunting season! The fact that, scarcely a month ago, any such diversion seemed unlikely (to put it mildly) makes one's hopeful expectations all the greater. Happily for us, the Mastership remains in the joint hands of Colonel Colman, commander-in-chief on Tuesdays and Fridays, and Lord Daresbury, who as Mr. Greenall has proved himself more than equal to controlling the Wednesday and Saturday traffic. No mean task. The recent death of his father is much regretted by those who had the privilege of enjoying Sir Gilbert Greenall's friendship or acquaintance during his long Belvoir Mastership from 1896 to 1912.

Needless to say, George Tongue has got his hounds in the pink of condition, and the zeal with which both packs have been cubhunting is a delight to the ear and eye; for the quick, brave and lucky, there have been numerous diverting sorties over the grass in Leicestershire to whet the appetite. In one notable week, the Wednesday field was treated to as good a day of galloping and jumping as could be wished for at any time of the year, and what bliss it is to have only a handful of friends with whom to share such hunting, before the locust-like crowd of "pink coat" time descends!

The following Saturday Holwell Mouth was on the menu; 9 a.m. is a most reasonable time to meet and there was no excuse for late arrivals. Still, many is the dull and chilly hour that has been spent on its bleak slopes, so it was hardly surprising that the majority of the field turned up at the rendezvous nearer ten than nine. Judge of the dismay on hearing that hounds had got on to an old fox immediately, and were away into the vale with only half a dozen people to cheer them on and subsequently to gloat. A pause on Slyborough Hill allowed a few more feverish followers to get within hail, but they never really caught up and were condemned to the tantalising state of seeing the backs of the leaders bobbing relentlessly on, always three fences in front, whilst the pack poured past Long Clawson Village, on to Hose and back again towards Sherbrookes.

The feelings of those on the hill who never got started at all may best be imagined. They heard later of the ravishing going, the seductive little cut-and-laid fences which embellished the hunt and all the maddening delights which are inevitably described on such occasions. To fill the cup of bitterness even fuller, they were then treated to an arid interlude at Old Hills. This decided many on home and lunch, thereby missing another good hunt from Clawson Thorns in the afternoon! There is an obvious moral to this story.

The Lincolnshire side, too, has had its share of the fun. The heath country round Ancaster on either side of the High Dyke is notorious for its miserable scenting qualities. Yet this year hounds have been able to run well over it on more than one occasion. The latest feat was a five-mile point, scored after meeting at Sapperton. This hunt had another unusual feature, that of starting from Ropsley Rise without the endless delay and difficulty which so large a wood often occasions. In went the hounds, out popped the fox, and off they all streamed at best speed past Abney Wood to Welby. Up to here the small, ditchless fences hardly count as impediments, but later when the wall country was reached, hounds got the better of the horses and these were quite ready to rest and be thankful by the time Syston came in view. Next day at Redmile scent was not so obliging, but enough jumping exercise was available to put one in trim for the season's debut, after the best cubhunting in recent years. UNBRIDLED.

NINETY MINUTES WITH THE QUORN

BY gad! the end of September looked black for foxhunting, and now, by the grace of God, we are once more all agog for Monday, when, if Sir Harold Nutting has not altered his plans by the time these lines appear in print, we shall once more assemble at dear old Kirby Gate. Like the writer, many, I feel sure, would be interested to know how many times these hounds have met at this famous fixture. As I have already written, the exact number I am not certain about, but we do know it was customary to open the seasons either at Kirby or Brooksby away back prior to 1830, and that's going back a bit.

Is it too much to hope for another magnificent season such as last? At any rate, if the cubs in Gartree Hill (and take it from me there are some) can claim parentage from that gallant and stout old fox found at this same little covert on March 11th last and killed close to his home after 1 hour and 45 minutes of the very best, there is going to be more fun in the future. The great sportsmanship and love of hunting of the occupiers of the land is again in evidence as one casts his eye over the beautifully green enclosures surrounded by those dark old fences of nearly every description, and free from wire. Yes, free from wire, excepting, of course, just those few places that are either unjumpable or bordering somebody's kitchen garden.

There is a good supply of foxes everywhere, although litters were smaller than last year, hounds having killed foxes most mornings. Although scenting conditions have been none too good on the whole, it has been a good cubbing season. I think the two outstanding mornings must go to Quenby and Langby New Wood, as at both places there was a tremendous good show of foxes.

On the occasion when they met at Mr. Burton's farm at Kirby they roused a good litter in this good sportsman's kale field, hounds thinning them out by one. Going on the same morning they next found an old dog fox in Sanham House gardens, and a real good 'un he proved, standing up in front of hounds for 90 minutes over the Gaddesby, Semham and Thorpe Satchville country before they finally pulled him down in the open one field short of Salters Hill.

Another nice hunt of a fortnight ago lasted 35 minutes over the Hoby Vale before hounds were stopped in Ragdale Wood when fresh foxes were encountered. Going back to the day from Mr. Burton's farm, a very extraordinary thing happened which I feel well worth mention. The whole day through hounds neither drew nor entered a covert of any description. I cannot remember this happening before in this country—five hours' hunting and never entered a covert.

Before I wind up these notes I should like to mention how pleased both Sir Harold Nutting and George are with the eighteen couple of young hounds; all have entered well and are doing as well in the open as in covert. Here's to another great season. SCARLET RUNNER.

before we were able to force a fox out, which ran through the Lovers' Walk, through Launde Park Wood into Launde Big Wood, where I think our fox got to ground. Cheseldyne Spinney did not respond, and as it was getting late only a small part of the field went on to see Orton Park Wood drawn; they were well rewarded with a very brilliant gallop.

Our fox slipped away before hounds had found him, and we were soon racing over a big line towards Knossington. Holding hounds round the spinney, and not hitting off his fox, Mr. Hilton-Green threw hounds in, and out went our fox, and hounds on good terms at once started to run very hard, and with Owston Village on our left and Newbold on the right we pointed towards Marefield. Then turning right, and leaving Hames Gorse on the right, we climbed the hill towards Burrough Manor. Horses were now showing visible signs of distress as the pace had been fast and the obstacles large. However, we pegged on behind the flying pack, and leaving Mrs. Coates's house on our right crossed the site of the old Roman Camp and finally lost our fox just short of the Punch Bowl after a really brilliant gallop of 47 minutes and a five-mile point.

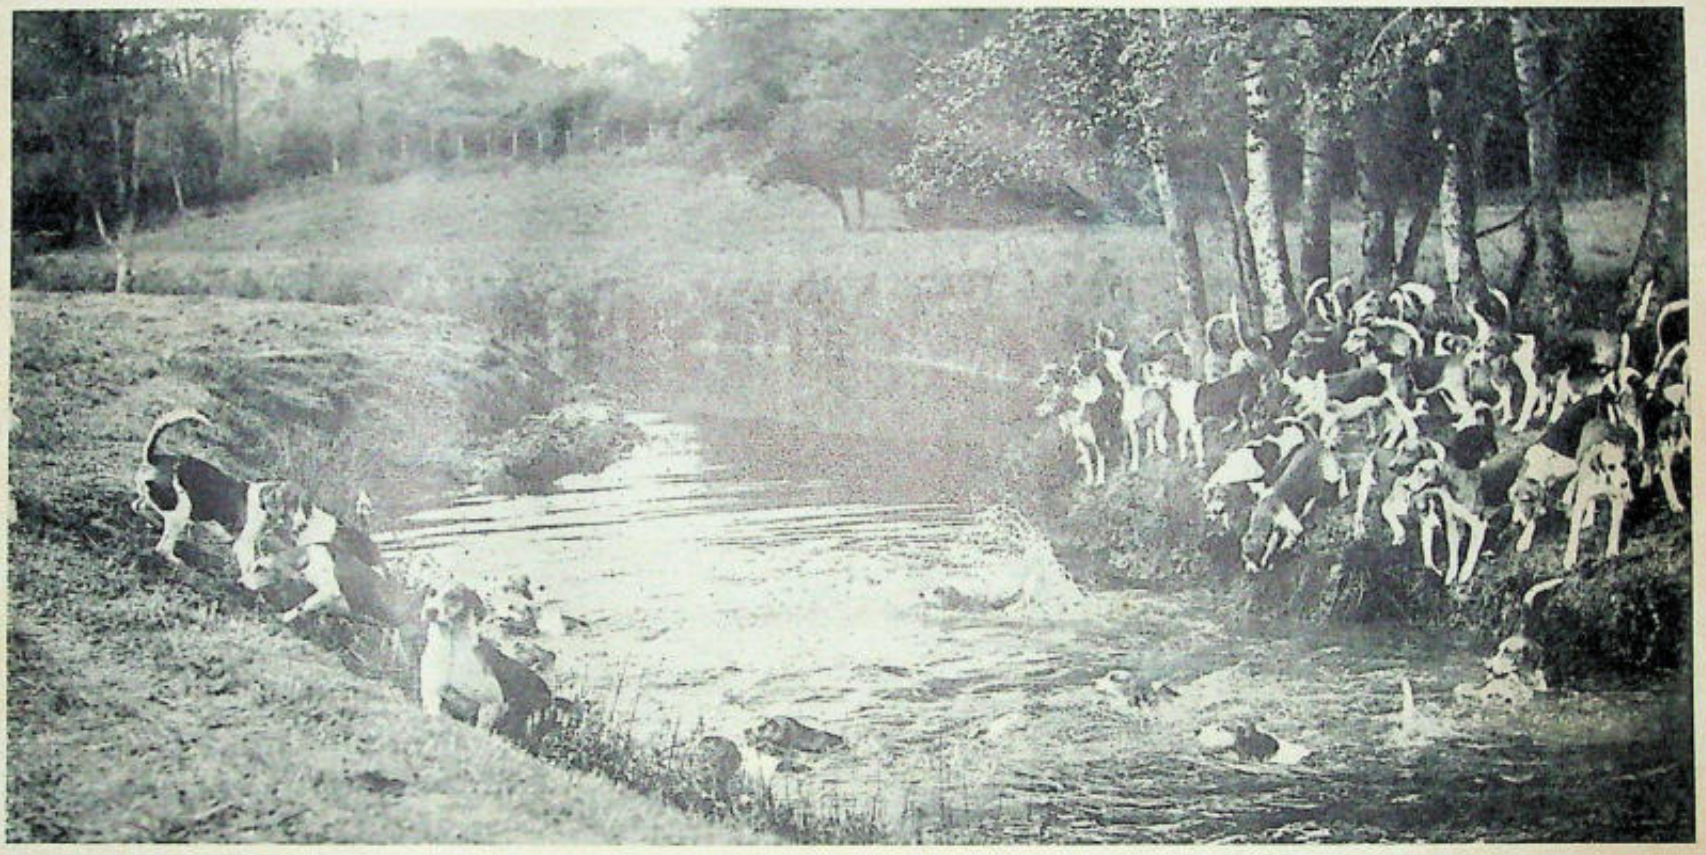
I regret to say Mrs. Henry Tate, one of our keenest and best, had a nasty fall near Knossington, dislocating a collar bone. We all wish her a speedy recovery. FOXY.

in 1913, he resigned, and served all through the Great War with the Northamptonshire Yeomanry, being rewarded with the O.B.E. (military).

On his return from France he consented to undertake the Mastership of the Pytchley, a most onerous task, and at such a time an exceedingly unenviable one, under exceptionally difficult circumstances. We had all returned with our nerves on edge, expecting to find things just as they were when we had bid Lord Annaly farewell in the glorious spring of 1914.

We did not realise that the country had been almost derelict for five years, in spite of the heroic labours of Lady Lowther and Colonel Faber, that horses fit to carry hunt servants over the country were not to be had for love or money, that more than half the coverts required replanting and the pack doubling in numbers.

For two seasons, ably assisted by his wife, Sir Charles fearlessly faced and overcame these endless difficulties, but the expense was crushing, wages (twice pre-War), hay £14 a ton, and oats 70/- a quarter. A hunt servant's kit cost as much then as a Guards officer's! When it was known he was resigning, a monster petition from the farmers was



THE SURREY UNION HOUNDS CROSSING A STREAM WHILST OUT CUBHUNTING

A COTTESMORE DIARY

FOLLOWING our great hunt from Little Dalby on October 15th, the next week-end gave us two extraordinarily good days' sport—days that those who were lucky enough to participate in will remember for a long time; they will be hard to beat in the regular season, now almost at hand. Both these days took place under the same conditions, viz., a bright and very hot sun and the going underfoot very much on the hard side; still, hounds could run, and run fast.

From our fixture at Cottesmore on the 21st we drew Barrow Thorns, where there were several foxes, and getting away at once with one we ran through the adjoining gorse and parallel with the Ashwell Road for a few fields before turning right-handed across the vale, and hounds running very fast finally lost their fox near Teigh after a real good 20 minutes over a delightful line of country.

Calling on Barrow Thorns again we ran practically straight to Woodwell Head, and pushing our fox out of this covert ran back almost to Barrow Thorns, where scent failed. After killing a fox in a kale field near by we found a very stout-hearted fox in a root field below Cottesmore Gorse, and a really great hunt began. Crossing the Ashwell Road, we turned left-handed at Colonel Blair's house, ran on past Chapel Farm, Watkins Gorse, Rattling Jack Spinney and into Cottesmore Wood.

With no delay here we skirted Exton Park, crossed the Great North Road and ran straight through Osbonall, Woolfox and Clipsham Park Wood and finally lost our fox just short of Castle Bytham Village after a great fox hunt, the point being over eight-and-a-half miles almost straight and over a most unusual line.

On Saturday, the 22nd, from Whadborough Cross Roads, we spent a long time in Big Owston Wood

"JACK SPRAGGON" AN APPRECIATION

Gone, he has left us for a far-off Country, a distant bourne,
And through Northampton's Shire, Castle and Cottage his loss will mourn;
Never again when note of hound is ringing the covert through
His silver horn the slumbering echoes shall wake round Waterloo.

THOUSANDS of readers will pick up their *Field* and turn in vain to find that well-known signature. They will feel a personal loss, though they may not even know the man hidden behind this familiar name who, until recently, each week since the days of Brooksby, has related the doings of the Pytchley. When a correspondent of over twenty years drops out, his loss is felt far beyond his own immediate circle of friends.

"Oh that mine enemy would write a book!" said Solomon, for he knew that no man can hide his personality once he has taken to ink. Lacking perhaps the sparkle of Brooksby, Spraggon's articles were as sound port to Brooksby's champagne. Behind them one realised a kindly man, dyed in the wool with hunting lore, who rode to hunt, not hunted to ride, who loved a hunt, a hound and his fellow men. His style was scholarly more than racy, sparsely flavoured with dry humour, but never an unkind hint or innuendo.

One would guess a genial squire of the old school, and would guess right, for Spraggon hid Sir Charles Frederick, sometime Master of the Pytchley Hounds. He was born in 1876, and was educated at Eton, becoming Secretary to the Pytchley in 1908. On succeeding his father as eighth baronet

got up, many saying they would take their wire down for no one else.

As he said himself, he had ridden too many bad horses in his youth to be ever able to take his own line across the Pytchley country, but he was always there or thereabouts, always on good terms with his horse. All said and done, I doubt if a better all round sportsman, foxhunter, fisherman, shot, will ever again grace this county. If so, may I have the honour to call him my friend.

When the great book is opened, it will not be what one has done or said that will count, but what one was. Freddy, as he was called by his innumerable friends, was sound, the man who pushed the stuck wagon from behind, rather than he who gave directions from the bank. He preferred the thankless position of treasurer of the Conservative Association to that of president. He took on himself all the dull burdens of country life. He was High Sheriff, Justice of the Peace, and sat on endless dull committees, contributing sound common sense, without frills or froth.

On him fell the editing of the *History of the Althorp and Pytchley Hunt*, begun years before by the late Reginald Loder, but after two years' work on it, he found it too great a task in his failing health and handed all his work over to another, without any thought of recompense or even acknowledgement for all his labours. He will ever be remembered as the editor of the Lonsdale Library volume on *Hunting*.

He was fortunate in his married life, for he had a partner who shared in his joys and sorrows, and to whom all our sympathy goes out. The Pytchley have lost one of the fast-thinning band of pre-War Knights of the White Collar, one we can ill afford to lose, the world of sport a delightful hunting correspondent, and England a great gentleman.

GUY PAGET.

FRANCE LANDS THE OTHER LEG

Contrevent's Victory in the Cesarewitch

ANOTHER French-bred and French-owned horse has won another important handicap in this country, Contrevent winning the Cesarewitch by a length and a half from Dubonnet, who was the same distance in front of Fet. Black Speck was fourth and Earthstopper fifth. Clout, who is English born but has been in France for many years, trained the winner, which was ridden by Tucker, who was born in Birmingham but has ridden for several years in France, where he was apprenticed to Clout for whom he still rides. This was only his second ride in this country, his other having been in the Cambridgeshire. That is all very interesting and does not sound very thrilling, but it really was, for as soon as the race was over lots of silly little men and women started running around at Newmarket and alleging that the handicapper should be certified at once for having given the three-year-old colt by Deiri out of Persian Princess bottom weight. They were also alleging that our breeders knew nothing about breeding. A number of these funny little men and women assailed me and stated that if I were half the man, or woman, that they were I would flay the handicapper with my pen or typewriter.

I have no intention of flaying poor Mr. Fawcett, although before now he has made an attempt to flay me, and quite rightly so, as I had made a serious allegation against him, which was not even founded on fact. It is true that Contrevent carried bottom weight, but he was not the only French horse in the race, and Mr. Fawcett most certainly consulted the leading French handicapper and acted on his advice. No other French candidate was placed. The truth is that Contrevent, like many another three-year-old at this part of the season, has made a lot more than normal improvement since the weights for the Cesarewitch were made known. He had won a long distance race in the summer, and another one after the handicap was made.

I am in complete agreement with Mr. Standring, who writes so entertainingly on Newmarket matters and racing generally, and consider that the handicap should be left until after the Doncaster St. Leger meeting instead of being published the week before. In any case, if Contrevent had not run would anyone have been alleging that the handicapper had given Dubonnet too little weight? Contrevent won because he had a few pounds too little and because he is a very genuine stayer. Like many other good winners of recent years he is not in our Stud Book, having an American ancestor named Aethelstan, who is not eligible. Apart from that the pedigree of this winning three-year-old is an excellent one and full to the top with staying blood, among the ancestors being two winners of the Cesarewitch.

Old Fet ran gallantly and finished third. Black Speck was equal favourite with Solonaise, and after the race excuses were made for each of them. To Carslake's absolute amazement Black Speck, instead of leaving the gate in the usual manner, trotted out with him and lost some fifteen lengths. He then half galloped a rood, with the result that he was lengths and lengths behind the leaders when the Across the Flat was reached. By the time that the Bushes had been reached Black Speck was close enough to the leaders, but he had lost too much energy making up the lost ground to have any chance and was not ridden all out. He might win at Liverpool next week.

As the tapes went up Solonaise threw up her head and got Lacey one full on the nose, which did not help that good little rider at all. Still, Solonaise was leading coming to the Bushes, but was then beaten, in my opinion, for want of finishing speed. She stays for ever, but is slow. Griggs on Snipe Wood rode well, but it is only natural that these little boys cannot ride this severe two-and-a-quarter miles as well as the older men, and I have seen a number of them come in dead beat after riding in this race.

All the season there has been a controversy going on among people who race seriously as to whether the three-year-old colts or fillies were the better. I have always had the opinion that the best three-year-old in the country this year was Rockfel, by Felstead out of Rockcliffe. She was a most unlucky loser of the Free Handicap, in which she finished third, and she was beaten at Ascot carrying a hunting burden and not being physically at her best. Those are the only two races that she has lost this season. She won the One Thousand Guineas and the Oaks in faster times than Pasch and Bois Roussel won the Two Thousand Guineas and the Derby, and it is to be noted that the conditions were almost exactly the same for the two sets of races.

Rockfel, unfortunately, was not entered for the St. Leger, but after that race and the Park Hill Stakes had been run at Doncaster the times again suggested that the fillies were better than the colts. Still, I was in a minority. At last Rockfel and Pasch have met. They raced against each other and others in the Champion Stakes at Newmarket. The distance was a mile and a quarter, "Across the Flat." The Pasch camp would not hear of the colt being beaten and acted like men, with the result that Pasch started at evens and Rockfel, to the delight of her staunch friends, at 2 to 1, surprisingly good odds in their opinion, but ridiculously cramped in the eyes of the other camp, they thinking that Rockfel had no chance at all. Poor folk and deserving of sympathy. Rockfel made every yard of the running and won by five lengths without being asked a serious question, and Pasch was second, four lengths in front of a nice French colt named L'Oragan III, who has since been bought by Mr. Whitelaw. Richards, who rode Pasch, stated after the race that Rockfel had him beaten from the time that the tapes went up and that there was nothing wrong with his mount. Fred Darling had nothing to say except to admit that his colt was a really good one, but that the filly was much better.

Experienced trainers and breeders who have been racing for years stated that in their opinion Rockfel was as good a filly as ever they had seen and worthy to be considered a real champion. Her head and neck do not give pleasure to everyone, but her quarters are magnificent and her action is real poetry. Pasch does not run again, having been taken out of training to be sent to the stud. Rockfel remains in training for another year and if all goes well with her, and I pray that it does, will run for such races as the Coronation Cup and the Gold Cup next year. She seems to be certain to beat those of her own age, but many people seem to be forgetting that Chulmleigh is to remain in training as well. He won last year's St. Leger, but could not be seriously trained during the hard summer. I saw him at Newmarket last week, and he looks a most handsome colt. He could make rings round such as Buckleigh and Marcus Superbus early in the season when he was only half trained; still, good colt as he undoubtedly is, I cannot think that he will beat Rockfel with the filly at her best. Her owner, Sir Hugo Cunliffe-Owen, has had many good horses, including Felstead, who won the Derby for him, but he can never have been so pleased with any of his horses as he was with this filly whom he watched win at Newmarket.

It seems that it was only the other day that we set out for Lincoln for the first week of a new season, and now the season under Jockey Club Rules has only three weeks to run and they may be interfered with by rain, frost and fog, separately or all together. The three good meetings left are Liverpool, four days next week, Derby, three days the week after, and then Manchester, also three days, with the Manchester November Handicap on the last day of the season. The best of these three meetings should be Liverpool with its important steeplechases and its flat races.

While writing about fixtures it seems to have escaped general notice that the season for 1940 under Jockey Club Rules will be started at Kempton Park on Easter Monday, which comes towards the end of March. Such a thing has happened once before in my racing career, in 1913.

Writing last week in these notes I called attention to the great and almost insurmountable difficulty in forecasting the racing value of a yearling. I mentioned in this connection two two-year-olds who have been winning races this season, Bridge of Sighs and Skylarking, each of whom had just won races on the same afternoon at Newbury. I pointed out that they were bred by Mrs. Corbett and given to her son, who owns them now, when they were yearlings as Mrs. Corbett thought so little of them. I have now learned from Mr. Corbett that this is not quite correct. His mother sent them into training, and after the trainer had had them for some months he came to the conclusion that neither was worth keeping. Mrs. Corbett, who did not want them to go just anywhere, offered them to her son and each has won races in good company.

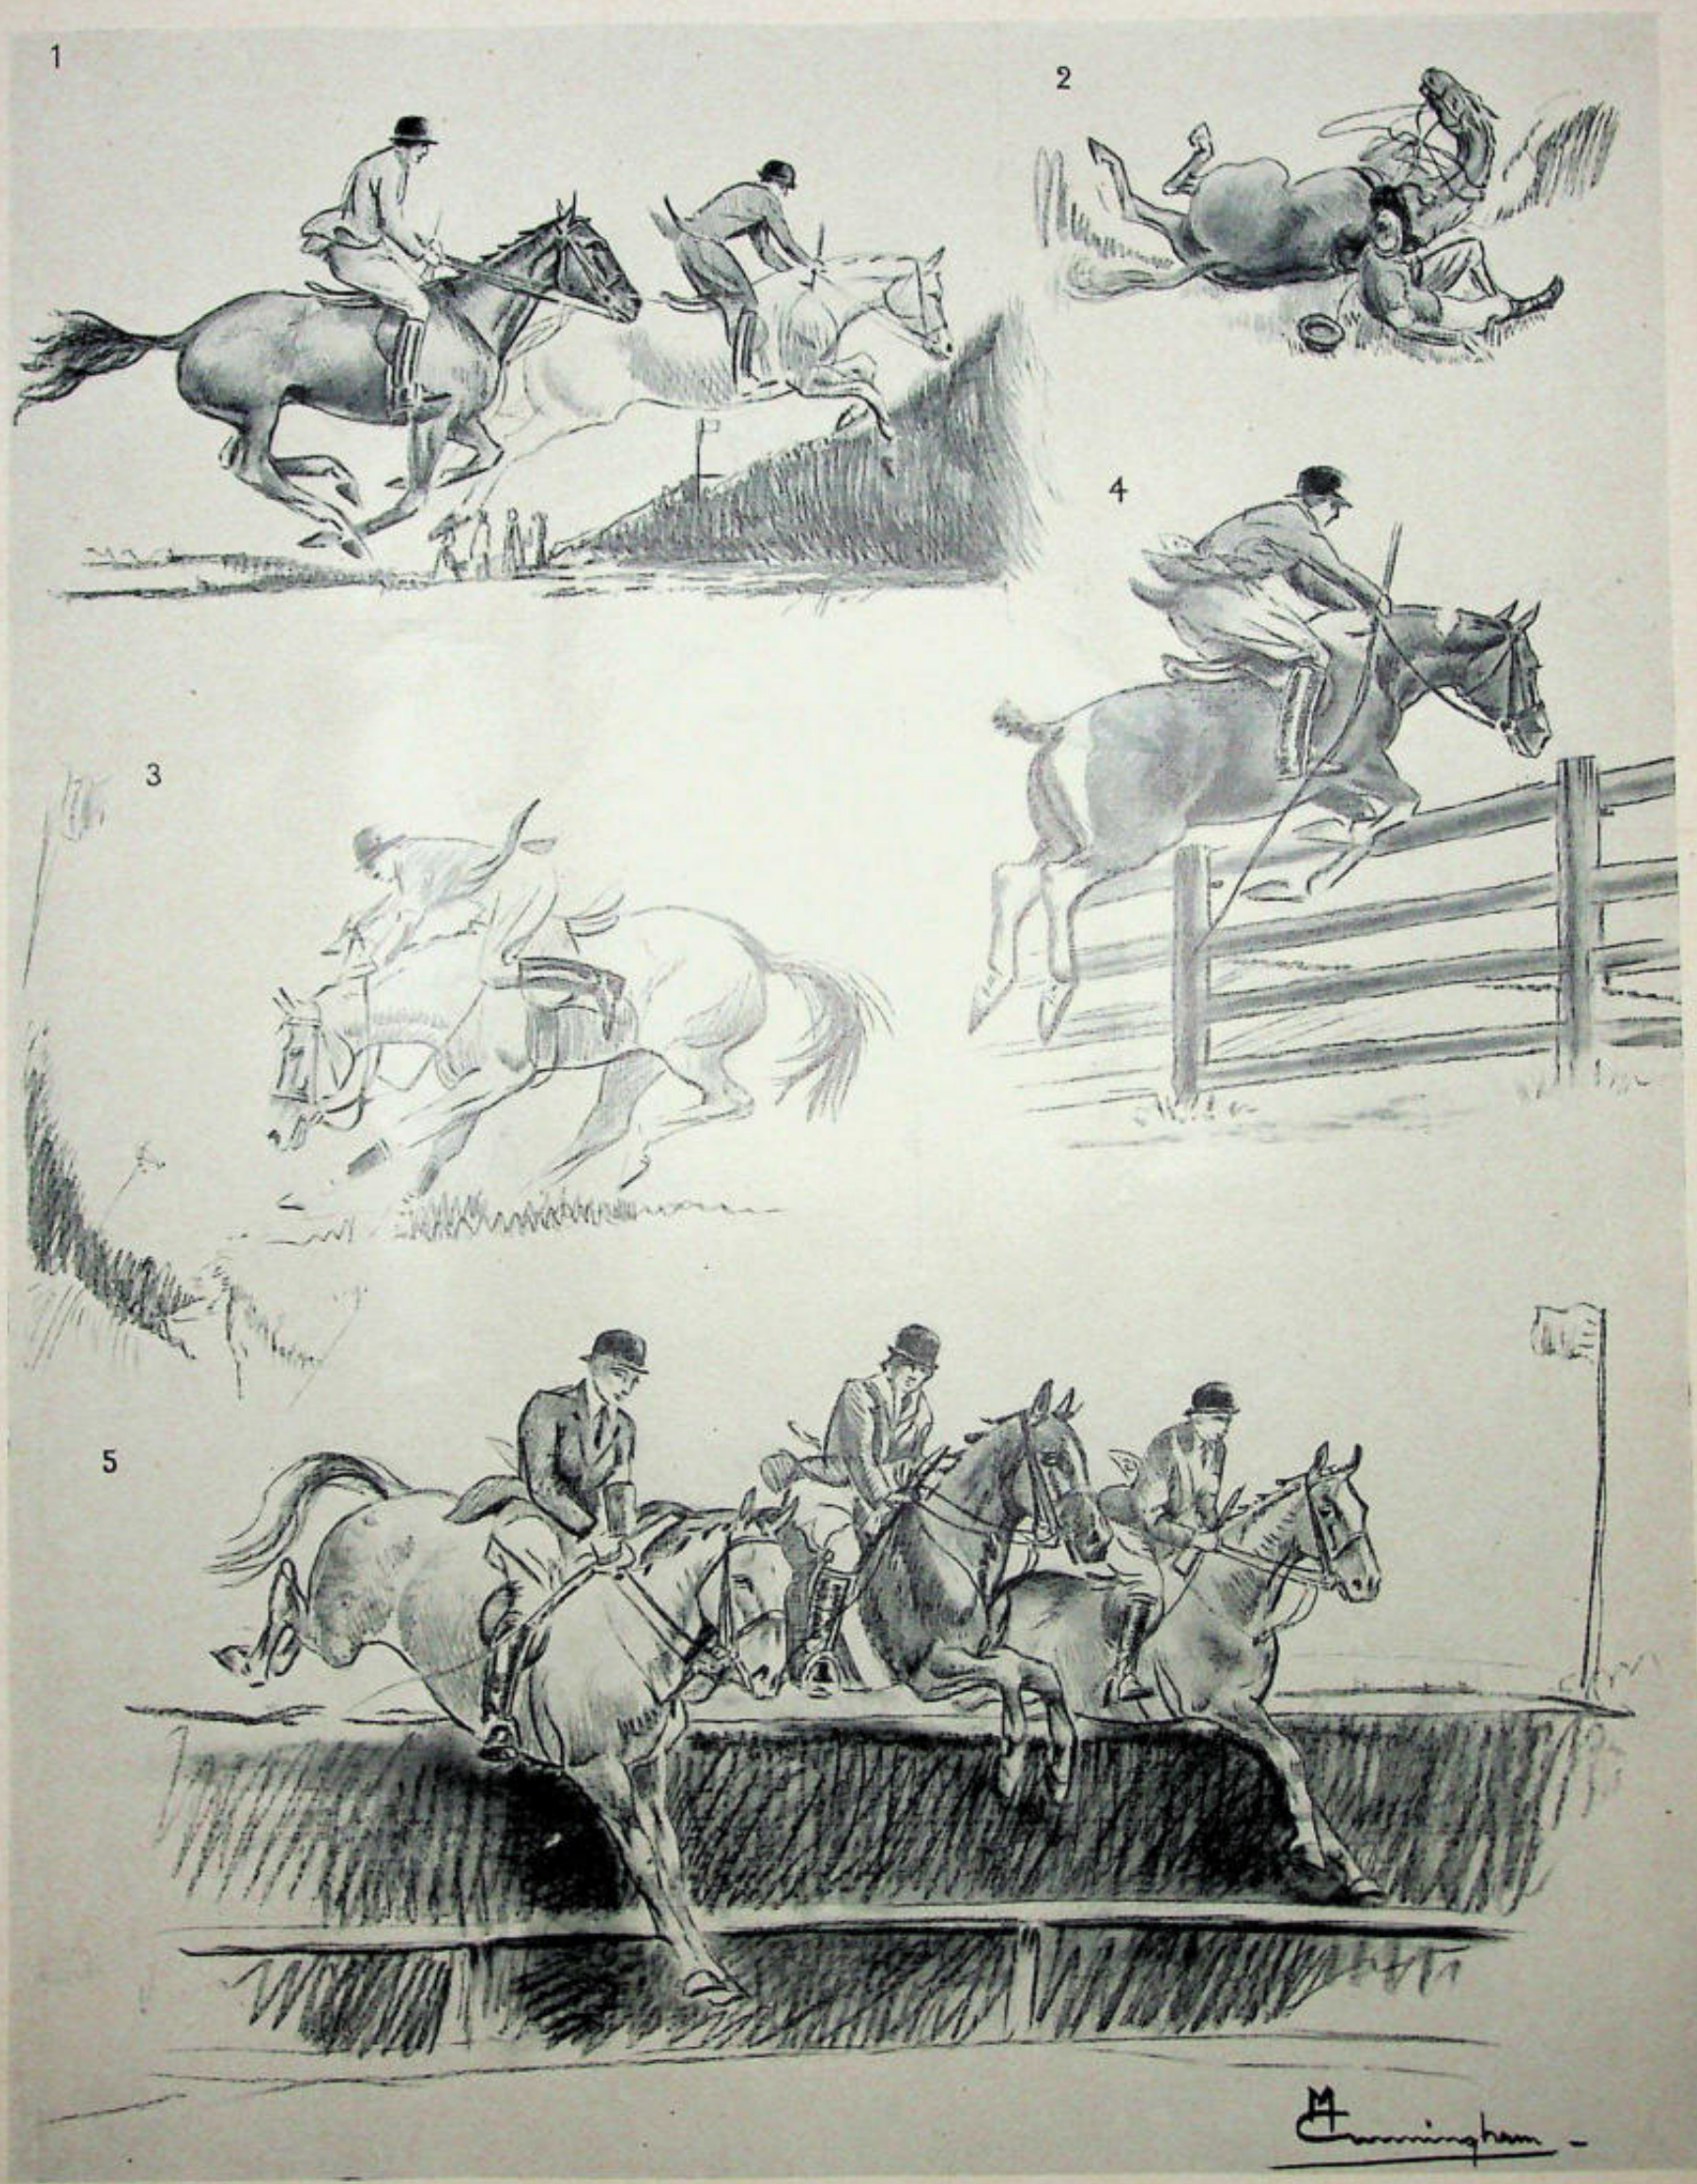
"SAFETY FIRST" SCHOLARSHIPS.—A travelling scholarship to the value of £100 is offered by the National "Safety First" Association to the writer of the best essay on "The Prevention of Accidents Among Young People." The scholarship has been provided by the generosity of Imperial Chemical Industries, Ltd., and is designed to promote the study of accident prevention. The scholarship fund will be expended on a visit to the United States or Canada, or both, during the summer of 1939. The successful candidate will be required to submit a report on return, and if this report satisfies the examiners, a further monetary award, not exceeding 20 guineas, might be given. Entrants must be between the ages of 18 and 25 and must be students. The closing date for receipt of entries will be March 1st, 1939, and entry forms and all additional particulars may be had on application to the General Secretary, National "Safety First" Association, 52, Grosvenor Gardens, London, S.W. 1.

LORD LECONFIELD'S HUNTER TRIALS



MISS MARGARET CUNNINGHAM'S IMPRESSIONS OF HORSES AND RIDERS AT LEE PLACE, WISBOROUGH GREEN

1. Miss K. Hole (left), a well-known follower of the Southdown, on her bay gelding Nickie in Class F of the Farmers'. 2. A chesnut gelding falls at the Ditch, with his feet caught in the brush fence. It took some minutes to extricate him, but he was unhurt. 3. The Open Ditch, where most of the trouble occurred; the bright sunshine cast a strong shadow on the take-off side. 4. Pinto, a skewbald cob, ridden by Miss Faulkner, competing in the class for members of Lord Leconfield's Hunt. 5. A Hunt team representing Lord Leconfield's. This year the team including Mrs. Lund, Miss T. Wyatt and Miss D. Oyley-Mann, was mounted on three hunters (a grey, a bay and a chesnut) owned by Mr. E. G. MacAndrew, of Pallinghurst.

"IN BROKEN HILLY COUNTRY THERE IS NOT THE SAME DIFFICULTY IN GETTING PHEASANTS TO RISE"

ON SHOWING PHEASANTS

An Ever-changing Problem

WHEN Darwin observed that many mental faculties, of which men claim monopoly, are really shared by birds, he may have had in mind a large cock pheasant in a large wood. For one might even say, without Darwinian acumen, that where there are a lot of large cock pheasants, and where the large wood runs up to a hilltop, they will generally show a good deal more intelligence than the average crowd of yokels, whose job it is to shift them. Though one may also grant that, if in the process their flying powers are to be fully tested, no little strategy is called for.

I think it is in the memoirs of her husband's Viceroyalty that the late Lady Dufferin tells a story of a shoot. She inquired of her Indian servant how the guests had shot. "Beautifully," he answered, "but Allah was very merciful to the birds." Likewise we, too, are merciful sometimes, for reasons unconnected with the "beauty" of our shooting. For unless we can get birds to rise we cannot shoot at all, and this fundamental axiom the pheasant learns at birth. Which leads him perhaps to ponder an equally true bill—that his legs will often save his neck more surely than his wings.

Who shows pheasants to advantage is a master of his art. First and foremost, I would suggest, because in no two coverts in the country can birds be relied on to behave in precisely the same way. Moreover, the tactics which may answer admirably in one season may be quite useless in the next. The growth of different types of coppice wood is not constant. In its process timber felling may cause extensive clearings; fresh thickening or thinning may occur at vital spots. All of which considerations may call for drastic revision of the plans of yesteryear. New flushing areas may have to be devised, which in their turn may involve the widening of existing or the cutting of new rides. For one very good reason. On the density of undergrowth in relation to its distribution, pheasant distribution in its turn very largely depends. And the latter is almost, if not quite, the most important factor in covert shooting.

For have we not all experienced at one time or another the irritation that comes of waiting half an hour for half a dozen shots, while at adjacent stands two or three hundred birds process *en masse* over two or three guns, who cannot possibly keep pace with them? Almost invariably this is the consequence of uneven distribution, fostered by a keeper with a passion for "hot corners." By lavish feeding day in day out in the self-same place, pheasants are herded until they scarcely know their way out of these little "sanctuaries." Or, at best, the exit is a one-way street. To my mind this is a short-sighted policy in the close season, because poults closely packed are more vulnerable to foxes and vermin than when scattered through a covert. In the open season, it is definitely bad generalship. The more dinner-tables there are the better, within reason, as tending to split up hand-reared birds, whose natural inclination to herd together is quite pronounced enough. For thus do they acquire an eye for country, so to speak, and will assuredly fly better from various parts of a big wood than birds which, huddled always in one corner of it, lose their bearings on their first time out.

For often the first covert shoot is quite literally the first occasion on which they see the outer world. It may be true, in fact, to say that most of our ungrateful recollections of pheasants, collecting at a covert's edge to rise *en masse* head high and quite unshootable, are due to their complete bewilderment. They have never learnt to use their wings. Some keepers, apprehensive of wholesale desertions, drive their birds back and back again whenever they show their noses out of covert. This again is bad policy. There is only one cure for the confirmed straggler and that is an ounce of lead. But if regularity is the keeper's watchword, the bulk of his pheasants roving in the daytime will seldom miss the evening meal at home. And the active bird which forages afield will make a stronger flier than the one which is cribbed and cabined and confined.

In broken hilly country there is not the same difficulty in getting pheasants to rise as in woods which are entirely flat. The latter demand a much more careful study in respect of the density desirable to rise the birds at intervals. Pheasants will invariably rise from any point that is made a "corner," but there must be enough cover for them to run under before they are flushed, yet not so much as will cause them difficulty in rising. They will get up better out of fairly high stuff than from short cover which they have no difficulty in "skimming." Wood of eight or ten years' growth with an undercover of fern and bramble makes an ideal holding for birds at a point. Out of this kind of stuff they will usually rise well, and if the guns are far enough back there will be some really pretty shooting.

Sometimes pheasants exhibit a reprehensible reluctance to rise out of what seems the most suitable cover for the purpose, and adventitious aids are necessary. Of course, sewelling is an obvious method, and the cutting of a very narrow ride not less than 50yds. from the end of a beat will often have the desired effect if it is suitably stopped. This is preferable very often, I think, to wire netting, because against wire birds running forward so often tend to bunch as a preliminary to legging it towards the flanks and then breaking back.

In woods of a fair size, and especially on level ground, I think that flushing points not less than 100yds. back are desirable as giving the birds plenty of time to get going and ensuring a pretty steady rise. But in this connection a good deal depends on the clearings and sparse cover patches in a beat. Where there are large bare spaces within close distance of the flank or front edges of a covert, it is essential to improvise patches of thinnings for the birds to run under. And these are obviously the places to which planting attention should be directed in another year. For if pheasants are permitted to get into a belt within a shortish distance of the covert's edge, and in front of that belt is an open or thinly furnished space, they will simply run across it, and the best beating in the world will not get them up. The birds will huddle in the boundary ditch till the beaters are treading on their tails, and will then skim *en masse* over the batteries in front so low that no one for his credit's sake may fire. Most of us have seen this kind of thing time and again, and I dare to say that in most instances it is due to extreme conservatism (or pigheadedness). It becomes more or less traditional to take the same old beat in the same old way, and the extent to which a year's growth or clearing may influence the movements of its inhabitants is overlooked.

"AN UNDERCOVER OF FERN"

This is a temptation which is, perhaps, natural enough, for it is difficult to convince oneself that tactics which produced a really good day only a few months ago should, in so short a space of time, prove to be almost useless. Yet it is better to allow a good day to remain a pleasant recollection, and to view each season as a fresh event.

J. B. DROUGHT.

HYBRID BROWN-RAINBOW TROUT

A Possible Case of Natural Crossing

Markings of the Trout from the Nyeri Chania River
● BLACK SPOT ○ RED SPOT

IT is seldom that cases of wild hybrid brown-rainbow trout are recorded. It has been suggested that the principal reason why natural crosses do not take place is that the two species usually spawn at different seasons. It is not due to the fact that the milt of the one will not impregnate successfully the ova of the other as since 1870 successful crossings have been made under hatchery conditions. In Kenya, however, owing to the climatic conditions, both rainbows and browns are ready for spawning at the same period, and with both fish in the same river cross fertilisation may quite possibly occur at some time or another.

In the past hybrids have been claimed from Nyasaland, but despite rumours none have been examined from Kenya waters until the specimen to be described was obtained. This came from the Nyeri Chania River, and was caught by Mrs. W. A. Winter. The Nyeri Chania River was for many years a brown trout stream, having been originally stocked high up above the forest line at about 9,000ft. In the high cold-water regions the brown trout throve, but only in seasons of high floods would they be brought down to the lower and more accessible parts of the river. These lower stretches are from 6,000ft. to 7,000ft., and have a water temperature which never drops lower than 56 degrees F., even at night in the cold weather.

The number of fish being caught fell off, and about three years ago rainbow trout were introduced into the river below a high waterfall about four miles within the forest boundary. The waterfall effectually stopped the upstream migration of the rainbows on to the spawning grounds of the brown trout, but the brown trout could come down-stream on to the spawning grounds of the rainbows. It will be seen from the sketch that the fish is very deep and well above the Sturdy scale.

With reference to the general body colour: One side of the fish was rainbow with black steel-blue back, silver flanks and belly. On the other side it had the brown-black back, silver sides and yellowish tinge on the belly line of the brown trout. Both sides had the pale pinkish band of the rainbow. The position of the body spots and their colour will be seen from the sketch.

The caudal is completely unspotted. With the Kenya rainbow the caudal is always densely spotted whilst the brown has no spots. The adipose fin is also spotted in the rainbow, but that of the browns is not.

The following is a comparison of the ray counts of the supposed hybrid, as compared with a brown and a rainbow trout.

	Hybrid	Brown	Rainbow
Anal	8	10–12	8
Caudal	20	19	20
Ventral	7	9	9
Pectoral	11	14	10
Dorsal	10	13	12

The fish was a yearling female and the ovaries just beginning to form. There was no sign of parr marks. In a great number of rainbow trout in Kenya parr marks are retained to 10½in. in length and never lost until the fish is 9in. long. The following are other particulars: Length 9¾in., girth 5¼in., weight 7¾oz. Should this prove a true hybrid, it is hoped that it will be fertile and that hybridisation will extend in this river, for it may be that hybrid brown-rainbow trout might be the fish of the future for Kenya.

HUGH COPLEY.

MR. HUGH COPLEY'S suggestion of natural hybridisation between brown and rainbow trout in Kenya, will rouse many speculations on the possibility of improving native strains of brown trout by the introduction of foreign blood. It is too early at the moment to say whether these Kenya trout are really hybrids between brown trout and rainbows. Trout are extraordinarily plastic and seem capable of changing their structure, even in such matters as the number of rows of scales, simply through environment and without the assistance of cross breeding.

It may be remembered that Dr. Mottley, when studying the rainbow trout of British Columbia, discovered that the number of rows of scales could be varied by using a higher or lower water temperature during early development, and records also that "by introducing the rainbows from the Selkirk mountains into lakes at lower elevations containing a rich food supply that many of the other characters used to describe the various forms, such as the head and body proportions, could also be modified." With such a vast change of environment as Central Africa presents—high altitude combined with high temperature—it is evident that identification of hybrid characters is going to be inordinately difficult.

One of the problems is going to be the question of hybrids' fertility. Among the many attempts at crossing rainbows and brown trout, no one, I believe, has succeeded in producing a permanently fertile race of hybrids. Mr. Skinner, who is conducting experiments in hybridisation on Sir Ernest Wills's water at Littlecote, in addition to the salmon x brown trout cross described in the *Field* of July 30th, tried also this brown x rainbow cross. The cross itself was perfectly successful, but he told me, on a recent visit, that the progeny had proved sterile. But conditions in Africa are very different from those in England, so it is not necessary to conclude, as yet, that all such crosses will not produce fertile young.

Mr. Skinner is doing most useful work at Littlecote. It is a common criticism of trout hybridisation that the fish produced are "of no practical use" since they will inevitably revert to one or other of the parents and be indistinguishable from them in the course of a few generations. Since salmon and trout probably had a common ancestor (the original sea trout in the opinion of many people) there is possibly some logic in that conclusion, but a knowledge of the characters likely to be transmitted would be very useful to fish breeders, and that is a point on which at present we are quite in the dark.

I noticed, for example, at Littlecote that the male parents external features seemed to be reproduced in the males, and the females external features in the females. The successful salmon x trout cross was made by using the milt from a brown trout to fertilise the ova from a salmon. All the cock fish in the hybrid pond had the appearance of brown trout. I doubt if anyone, unless the more slender shape had been pointed out to them, would have noticed anything unusual about them had they been found in a brown-trout water. There was the long maxillary—in some fish very long indeed—extending well behind the eye, the lack of any very noticeable "wrist" in front of the tail, and a typical brown-trout coloration. The only point in which they seemed to favour the salmon was in a rather (for a trout) pronounced kype in the older specimens. But I have often seen just such a kype in old brown trout, though not perhaps in five-year-old fish, as were these.

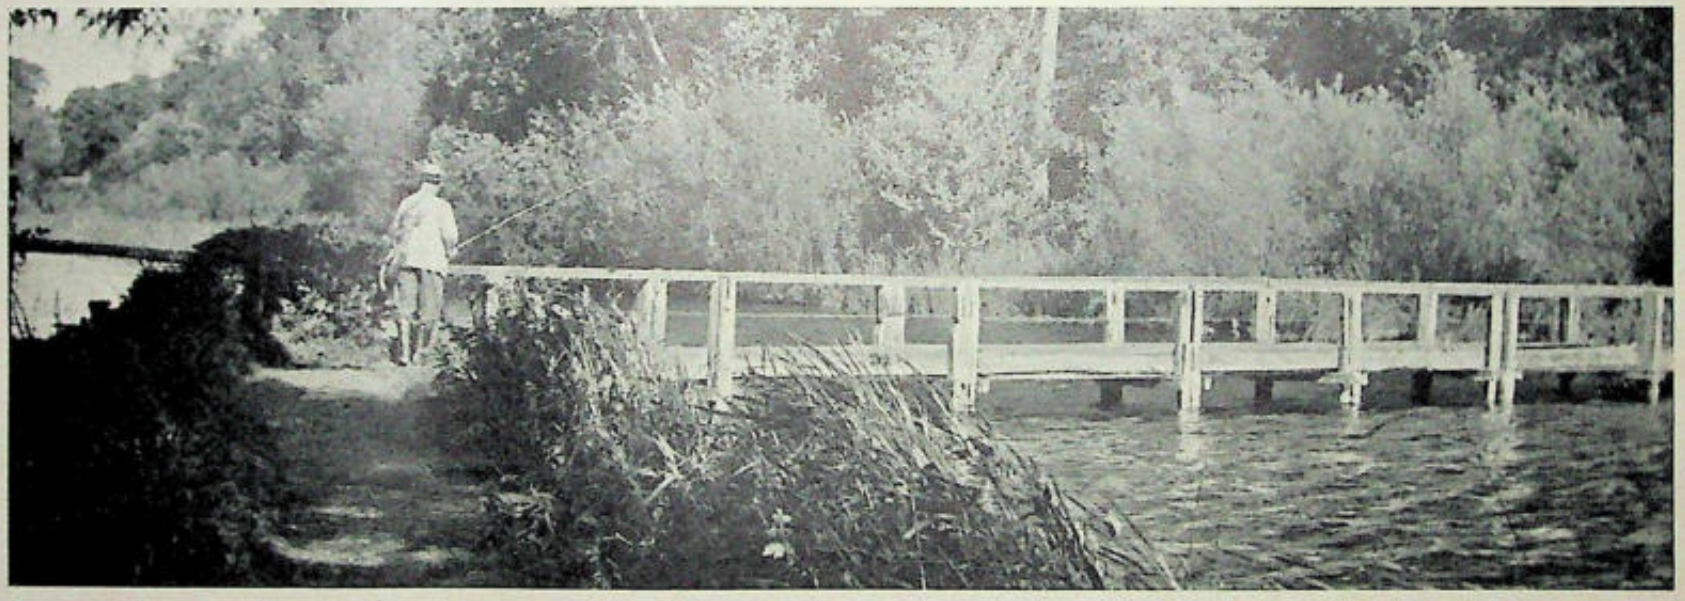
The females, on the other hand, were much more like salmon. Though their coloration was that of a trout (coloration is at least partly a matter of feeding), they had the short salmon maxillary and a definite, though not very pronounced, "wrist" in front of the tail, the head was small, and the shape more stream-lined than any of the males.

What is of more immediate interest to anglers, perhaps, is that the growth rate was better, apparently, than either brown trout or salmon (in fresh water). It is a puzzling problem, this ability to grow fast. In the Scottish Fishery Board's investigations it was shown that in early life brown trout grow more quickly than either sea trout or salmon; the salmon being the slowest grower of the three, though when it once gets to sea the salmon outpaces the trout altogether even when the trout is the progeny of sea-going parents. Yet in fresh-water salmon, whatever their age, never seen to grow at all rapidly.

These hybrids have evidently inherited the brown-trout growth capacity for freshwater, since one of them has attained a weight of over 5lb. Does this mean that it is the male fish which transmits growth capacity or is it simply that salmon have a greater inherent growth capacity, which, however, cannot be developed in freshwater? If this is the case there would appear to be a lucky combination of two qualities in these hybrids: a growth capacity inherited from the salmon parent, and an ability to make use of it in freshwater from the trout.

On the other hand, it may be simply the size of the egg. Professor Knut Dahl demonstrated many years ago that in trout the original impulse, so to speak, for rapid growth came from the size of the egg and was irrespective of the type of growth made by the parent fish. If such is the case, this characteristic will presumably tend to drop out in future generations, though it may be retained to some extent by artificial feeding. An experiment which might throw some light on this growth-power problem would be to put a few of the second-generation hybrids into a running-water stew from which they could not escape, but in which they would depend on the natural food supply. The third generation might then provide useful data for consideration.

H. D. TURING.



FISHING ON SIR ERNEST WILLS'S WATER AT LITTLECOTE
It is near the bank of the Kennet at Littlecote that Sir Ernest Wills is experimenting with hybrids

OWNER-GROOM

Trials and Tribulations Which are Worth It

ELSEWHERE, I have touched upon the subject of stablemen, or professional stablemen, as some of them are pleased to call themselves with pride. More often than not, those who are so proud of the professional part of the business are the greatest water brush and damp-rag flourishers. Here it is proposed to deal with the pleasures in the life of that happily placed person, the owner-groom.

To own and groom a horse yourself has many compensations, and there is no doubt that provided the owner-groom has a sound knowledge of horsemanship, and general stable management, the horse will benefit at his hands, for it will have that personal attention to detail paid to it, which, with all due respect, your professional stableman is inclined to overlook, especially when he is in a hurry to knock off work after a tiring day. It is only human nature for mankind to take more care of and pride in his own property than he will with somebody else's. Owner-groomship has many joys and few drawbacks; we will deal with the former first.

There is the early morning stable work, the mucking-out. Now this is one of the most unpleasant tasks in a stableman's day, but it is nice to know that the box has been thoroughly cleaned out, and you are sure of this, because you have done it yourself. There will be no droppings surreptitiously hidden here, and dirty straw stacked there. The same corners will not be used each day for stacking the saved straw from the bedding, they will be changed on alternate days, which means that the corners of the box will have been cleaned out, and that certain corners are not neglected from a sanitary point of view.

Then there are the little economies in this branch of stable management which you can practise, such as placing damp straw in a thin layer in the yard for drying and airing on fine sunny days, whereby it can be saved from premature condemnation to the manure pit, and by doing this you will have the pleasure of knowing that you are saving your straw bill, but at the same time your horse is not being denied any of its usual comfort. This is sound stable economy, as contrasted to false economy, whereby the horse suffers privation, which means loss of condition.

It is said that the soil of England is suffering from lack of fertility, as horses are not used so much for transport and also for work upon the land; therefore there is a scarcity of manure. In spite of this theory, there is frequently difficulty in disposing of the manure from the stable yard, but you, owner-groom, will no doubt see to it that if it can be possibly managed, this manure is sold to someone who has use for it, which will bring a small reduction in your stable costs. Much depends on the area you live in, as to whether you can dispose of this manure with profit, and I must add that I have frequently found difficulty of doing any business in this line in certain districts where I have lived.

Feeding is an all-absorbing subject, and the art of scientific feeding is a valuable asset which takes time in acquiring. As an owner-groom, you have splendid opportunities for observation, and you will be able to note the results of your methods of feeding upon your charge. You can ring the changes to suit your theories, and it is to be hoped the horse's needs. You can indulge in four or five feeds a day as you desire, and you can go down at night time (between 8 and 9 o'clock) and give the late night feed. You will not be overwhelmed with a wrongful solicitousness and fear of disturbing the horse when resting, which seems to obsess the professional stableman, and you can rest assured that you are not, as the latter terms it "tormentin' the 'orses," for when you give the late night feed, you will no doubt perceive that your horse is anxiously waiting for you, and on the following morning at early stables you will find that the manger has been scooped quite clean.

WHEN THE OWNER-GROOM REAPS WHAT HE SOWS
A good gallop with the foxhounds

You will always be in a position to know what are the special *bonnes-bouches* pleasing to your horse's tastes. Some like sugar, others do not. Nearly all are partial to carrots, and then there are those which like treacle, which you can give electuary fashion on a flat stick. You will also be able to regulate the quantities of food given according to the exercise taken, and you will be able to make such additions and subtractions as you think fit. Though this part of the feeding is dismissed by a few words, it actually calls for skill and forethought, and if done on the correct lines, which only you by constant habit and practice with your individual horse will know, the results should be good and apparent.

Watering can also bring to you its interests and problems. There are the different methods of watering to consider, that is, to water at given periods, which is sometimes called "watering by hand," or to have water always in the box, day and night. Each method has its ardent advocates, though it is probable that the latter is more popular. Methods of watering can affect the animal's digestion, and therefore need observation and study. For instance, it may be found that where the state of a horse's droppings show that it is not digesting its food properly, the water had better be given at given periods, as one of the causes of indigestion is drinking copiously on top of a meal, but only your observations will tell you what to do. It may be as well for me to add that horses which have water always in front of them are not usually such prolific drinkers as those which are watered at given periods.

Not only are there methods of watering that need consideration, but there are also the types of water given to ponder over. Shall it be rain water, tap water or pond water? Rain water is soft, but looks dirty; tap water is hard, but looks clean; pond water is dirty, and sometimes upsets the digestion. The results of your labours, theories and practices in the commissariat department will be shown in the appearance of your horse.

Grooming is another item of interest, and of course in this branch of stable management there are also many different ways of setting about the job. You will have the opportunity of finding out the various methods by which horses are strapped in this country, and here let me assure you that no two horsemasters are in agreement upon even such a simple subject. You will be able to discover for yourself which method answers the best in your case. I think you will find, though, if you give your horse its real good "do" after exercise, that you will extract more dirt and bring a better bloom to its coat. There is pleasure and pride to be derived from your work here. With your tack you will also be able to set about it in a thorough manner, and get into nicks and corners, behind buckles, the dees and spring bars of the saddle. Soft, supple, pliable and well-cared-for saddlery hanging tidily in a warm saddle room, or else correctly fitted upon a well-groomed horse, is a pleasant sight. Well-burnished bits and irons also add lustre to a good turn-out.

When all these things have been done to your satisfaction, you then come to what is probably the best part of your hobby, and by which you earn the reward of your labours—I refer to the riding, daily exercise, or perhaps you may be one of the kind who put in a day's hunting a week or three days a fortnight. This last is a very satisfying affair, though somewhat arduous, and you will have to be fit to do it. Turning round and doing a tired and muddy hunter after a long and hard day is not everybody's meat, and one must indeed be a great lover of hunting and horses to undertake to do this. But it can be and is done. Many men take two horses on to the meet at 9.30 a.m. Do second horse up to between 1 p.m. and 2 p.m., make the change, ride home, and turn round and start grooming, when probably just as they are finishing off, the other hunter comes clattering into the yard.

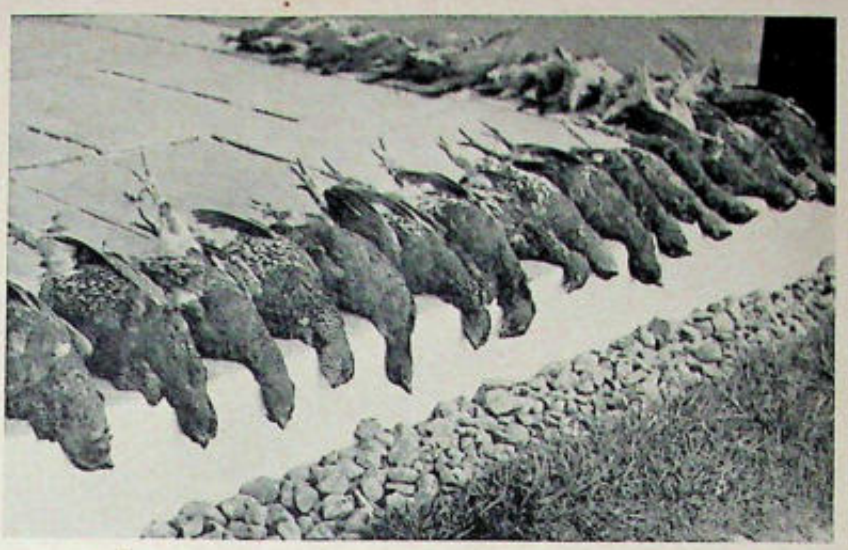
You, owner-groom, have a great advantage over the owner pure and simple, when it comes to riding. The horse will know every intonation of his master's voice, and it will answer, and come back to his master's hand and bidding readily and willingly. The horse trusts the hand that feeds and cares for it. It is a clever and grateful animal, in spite of what some theorists have to say about its lack of brain power, and ingratitude, and I could give you many genuine instances where these things have been demonstrated to me in many quarters of the globe, and which are not the sloppy meanderings of my sentimental imagination. But, my dear owner-groom, this is neither the time nor the place for a dissertation upon the endearing traits in a horse's character of which you and I are so cognisant. You will find this business of a horse "coming back to you" a very gratifying one, but not only is it that, it is also most useful, for at times of distress and disaster it is a real boon.

There are ailments and diseases to look out for, preventions and precautions to take. By your constant association with your horse, you will almost sense at once if there is anything amiss when you go into the box. A glance, and the animal's demeanour will signify to you in a moment if there is anything wrong. You owner-grooms have a great chance of becoming first-class horsemasters in a limited sense. I say limited, because you probably only have in your charge one or perhaps two horses. In fact, to be an owner-groom you have an all-absorbing interest.

There are the drawbacks, but they are few, and are well compensated by the benefits. Among the latter are not only those enumerated but also those appertaining to your own health and well-being. There are the exercise, the fresh air, and the regularity, this last such a good thing for self discipline. The main drawback is that you are tied seven days a week. Even when horses are not exercised and groomed, they must be watered, fed, and have their bedding seen to. There is, however, nothing irksome to the genuine horse-lover in the constant tie which keeps him to his horse.

R. M. S. BARTON.

A KEEPER'S COTTAGE AT DARWEN



LANCASHIRE GROUSE

LANCASHIRE HOT-POT

Grouse Among the Mill Stacks

MOST of us are dimly aware that the late King, and also King Edward, have shot grouse on Lord Sefton's moors at Abbeystead. But Lancashire grouse seldom creep into the pages of the *Field*.

Yet the birds are as good as Scotland's best (their foot feather is remarkable), and they fly as fast, and at times as awkwardly. They are preserved even better, for the keepers have not that ravaging devil, the greater black-backed, to deal with; and grouse chicks are rarely short of water or frozen up. (I write subject to correction.)

On the other hand, the heather is patchy—one might almost say sooty—and the moors are often restricted by main roads and manufacturing towns.

Factories are, in fact, so close that grouse packs have been seen flying round such a mill stack as that of Pope's mill at Withnell. And many an August drive has been entirely spoilt by hikers

ABOVE: THE VIEW OVER DARWEN
LEFT: LANCASHIRE BEATERS

A SPRINGER RETRIEVING ON THE WITHNELL MOOR

unconcernedly wandering through the middle of it. Nevertheless the bags obtained are impressive. On both the Abbeystead moors and at Bleesdale, owned by Messrs. R. Silcock & Sons, 2,000 brace provide an average year, and some of the smaller moors are surprisingly productive for their size. For example, on Mr. E. C. Deakin's Darwen moor of 2,000 acres it is a bad year if they do not kill 350 brace, and on the Withnell Moor, let to a syndicate by the Liverpool Corporation, 400 brace is shot in a good average year.

It is not merely, however, the chance of having warm gun barrels which will excite the visitor. Seated in his butt before the opening drive, he will contemplate the smoking factory chimneys in the misty valleys down below him; the sun on the hills, with the Pennines in the distance; and the strange cloud effects which only Lancashire can provide.

Later in the morning he may be lucky enough to drop in at the old stone farmhouse for a glass of beer and a bite of Lancashire cheese (why is Lancashire cheese not known outside the county, M. André Simon ?). And for lunch he will be regaled on hot-pot, amidst friendly Lancashire back-chat.

What will please the visitor most, however, are the enthusiastic beaters—most of them unemployed mill hands in heavy hob-nailed boots—and the general excellence of the dogs.

No Lancashire sportsman minds paying a good price for a dog, and he takes a good deal of pains over training. With little high heather breed is immaterial. One of the best performers I saw was a springer owned by a sporting Ormskirk solicitor, Mr. William Kennedy.

Perhaps, however, good retrieving is not surprising, for where else in the world will you take your dog for a walk before breakfast; drop in at the mill for a minute or two afterwards; and be reading the *Manchester Guardian* in your butt by 9.30 ?

A. P. THOMPSON.

WHICH END OF THE DAY?

TROTTING FOR GRAYLING

A Light-Tackle Method of Bait Fishing

IN both "swimming" and "trotting" for grayling the essential principle is the same—the manipulation of one's tackle so that the hook, whether baited with the alluring cockspur or the luscious maggot, swims in a state of apparent sweet ingenuousness down the current a few inches from the bottom, where, theoretically, a big, low-lying grayling is waiting for it.

The trout fisher who regards grayling fishing as no more than a between-seasons makeshift, and brings only his fly-fishing rod and tackle to the pursuit, limits himself in float fishing to "swimming," *i.e.*, he only fishes the water within reach of the length of his rod and the line he has out for the cast, unless, indeed, previously to casting he holds back a long loop of line (as he would in preparation for shooting the line in fly fishing) and gradually pays this out when, otherwise, the float would reach the end of the swim. In this is the correct depth, the angler casts his outfit into the stream. All he has now to do is to pay out sufficient line to allow the float to carry the bait swimming along nicely clear of the bottom until the end of the long swim is reached or something happens in the meanwhile. Sounds easy! But is it? To obtain the best results calls for the exercise of a certain amount of dexterity combined with some knowledge of rivercraft. In a free-flowing current the surface water moves appreciably faster than that at a greater depth, which means that, if given untrammelled freedom, the float would outrun the bait, and, in the event of a bite, the angler would have to make his strike along the two sides of an angle, not to mention that the float, dragging the bait after it, would also lift it out of its sphere of greatest usefulness.

On the other hand, if too much restraint is put on the pace of the float, the current raises the bait towards the surface and, literally, above the notice of the fish. Still, in the ideal swim the bait should travel in advance of the float, though near the bottom. This is effected by allowing, in adjusting the float, a foot or so of line more than is necessary to reach the bottom if hanging plumb, and regulating the speed of the float correctly. Sometimes the current will be sufficient to pull off line; at others a tap of a finger on the reel will ease a strained situation just as the braking touch of a sensitive digit will check the course of the too rapid float.

The tyro should not let what I have written discourage him. Even in his novitiate the probability is that he will catch some fish, but as experience teaches him when to pay out line and when to retard the float, he will find himself catching more and more.

W. CARTER PLATTS.

A DERBYSHIRE GRAYLING STREAM

On the Manifold and other Derbyshire streams trout and grayling seem to thrive together

way he can add a yard or two to his range, or, when no obstacles in the way of trees or bushes impede his progress, he can follow his float down the bank.

But the angler who makes a speciality of float fishing for *Thymallus* takes a leaf out of the coarse-fisher's tackle book and "trots." "Trotting" may be described as long-distance "swimming," the swims in this instance being anything up to 20yds. or so; indeed, the distance is only limited by the suitability of the water and the angler's ability to see his float. Bank obstructions have no terrors for him, if, from his standpoint on some projecting bit of bank or patch of shingle, the gently-flowing current pursues the "noiseless tenor of its way" downstream, free from snags, over a gravel bottom.

His equipment may well consist of a light 12ft. whole-cane rod, fitted with split-cane or greenheart top, stiffish in the butt and middle joint, but tapering quickly towards the tip. This affords all the necessary play and ensures a quick strike. It should be furnished with some form of upright rings, standing well away from the rod to give the greatest freedom possible to the passage of the line. The line should be of fine undressed silk, but must be well greased with one or another of the numerous flotants to guarantee a quick pick-up when striking from a long distance.

There is an inclination in some quarters towards the use of the fixed-spool reel in "trotting." Certainly no other type of reel gives off line so freely; but when it comes to regulating the speed of the float—to be referred to hereafter—a free-running revolving reel of the Nottingham type has its advantages. The float may be the small spherical cork with a wooden plug through it, usually associated with "swimming" for grayling, though the angler nurtured in the faith of the roach fisher may prefer a quill with a double-tapered cork body. The thing that really matters is that, without advertising its presence in glaring headlines, it should carry the tackle and be reasonably visible. Usually 3X gut will be found fine enough, and the cast need not be more than a couple of yards. I prefer a "crank-shanked" hook when baiting with worm, though a "crystal" hook will be found as good as any when the maggot is the *bonne-bouche*.

Having adjusted his float to what, in his judgment,

COMMUNITY FISHING IN KASHMIR

WE had not meant to fish at all. We had had two days' fishing; blank except for a 2lb. "choosh." But early that morning I was awakened by a wild cat in my room. I could not go to sleep again; so at 6 a.m. I shouted for baths and breakfast. By 7 a.m. we were fishing. At 8.30, Peggy, who had never done any fishing before, was into a big mahseer—and so the day opened.

She played it beautifully for half an hour—the fish fighting savagely, with strong rushes—then suddenly said: "I've got terrible cramp in both arms. Can you take the rod?" We were fishing in a 24ft. punt, 3ft. wide in the middle, with pointed ends, in which it was not easy to move about, for its gunwale was only about 3in. above water-line. Two men were paddling. I crawled out of my comfortable seat to where Peggy was perched in the bows and took the rod, while my "Marngie" ("Marngie" means houseboat owner. He was one of the men paddling. He held the reel for five hours without loosing up at all) crawled past me and tried to massage Peggy's arms.

With all three in the bows, I found I was sitting in a puddle of water—rather nice and cooling. After a bit Peggy tried again, but it was very hard work, the fish tearing off in all directions, taking out all the line. Then I found the reel was coming off its seating; the bottom rivet had sheered (a nearly new reel). So while I held the reel with my left hand and the rod with my right, Peggy, from behind me, wound in or let out, and the Marngie managed to tie the reel to the rod, top and bottom, with strong string.

After a bit the top rivet went, and my hand was no longer strong enough to hold the reel on, when a rush came. So my Marngie, Karima Daraz, held it with both hands, and I held the rod and worked the reel, or Peggy did it round my side. This was about 1 o'clock. Every few minutes we said: "This must be the last rush." We got the fish in quite often, but the moment it came near the boat or to shallow water, it would go off in a wild rush, taking out all the line, and we would have to race after it. At 2 p.m. we were quite close in, and my people brought us biscuits, whisky and soda, with which Peggy fed me and had some herself, as we were both quite done.

All the way down the stream, as soon as we got near the shore, my boat people waded in waist deep and cleared out all the weeds, so that the line should not tangle in them; this was done about fifteen times. Many times, too, the shikari got out of the boat to land the fish, but off it went as strong as ever. On the bank was the Marngie's father, a very fine old man, with long white beard and huge turban, rather like one's idea of Moses, solemnly praying with hands outstretched and eyes shut, that we should land the fish. About 20 or 30 people were behind him, and five Europeans. This had multiplied to 80 or 90 people by the time we finished.

At 3.30, kind English people in a houseboat nearby sent us two cups of tea, which Peggy (by this time in great pain from her arms) laced with whisky and held for me to drink. I had been sitting all this time on the flat bottom of the boat, leaning against Peggy's knees. At 4 p.m. I gave in. I simply had to move, so gave the rod to Peggy with the Marngie holding the reel, and crawled back to my comfortable seat; but Peggy could not carry on, and once I had the comfortable seat I felt much better. So she and Karima crawled inch by inch till they could give me the rod, and Karima got over the seat still holding the reel and crouched in front of me. Peggy got beside me, and again we took short turns at it, fishing under great difficulties.

At 4.30 the fish was obviously not quite so strong. So with infinite trouble, because of the loose reel we got ashore. One English fisherman said: "Pull him in, he must be done by now." So I said, "Put your hand on the rod just above mine and feel the pull"; and he said: "Good heavens, I had no idea a fish could pull like that." This was after eight hours fighting, so you can think what it was like to start with. Another man sent his shikari, reputed the best on the river, to help. My shikari, Raza Khan, a splendid shikari, pulled the line in then with his hands, letting go at every rush. Finally at 4.45 he got the fish in quite close; the other shikari got it with both hands by the gills and lifted it out, my shikari having it short by the head, and Peggy having the rod for the final landing.

Eight-and-a-quarter hours from beginning to end; it weighed 38lb., and was in prime condition. The rod was a rather heavy 9ft. split cane with 200yds. light salmon line and backing.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

WHILST South Africa has by far the largest vineyards within the Empire and Australia by far the greatest share of the trade in Empire wines, Canada produces an average of some 6,000,000 gallons of wine every year, Cyprus an average of 5,000,000 gallons, and other lands painted red on the map of the world smaller quantities.

The vineyards of Canada are greatly handicapped by the long and severe winters which check the growth of the vines and give them a very limited space of summer time within which they must hurry and bring their grapes to full maturity. The better—that is, the European—grapes, cannot get acclimatised to the Canadian winters, but the native American vines thrive in the vineyards of the Niagara Peninsula, in Ontario, and they yield a wine that is never free from either the "hen-coop" or "foxy" stink which render them quite unfit for sale to any wine lover in Europe and only a limited number of wine drinkers in America. However, strange as it may seem, the Canadian wine industry is a growing one, and there must be a generation growing which has acquired a liking for the peculiar and very obvious bouquet of Canadian wines.

Cyprus, which has had the benefit of being under the Union Jack since 1878, has been the home of one of the greatest and most famous wines of the world during many centuries past. It was from Cyprus that the first Malmsey wine was shipped to England, in the Middle Ages, and it was from Cyprus that came the vines which were first brought to the island of Madeira where they took so kindly to the soil that they supplied the civilised world with Malmsey long after the Turks had uprooted the vines of Cyprus. In modern times the best wine of Cyprus has been the wine which reached us under the name of *Commanderia*—it was said to be a wine made from grapes from the ancient vineyards surrounding the headquarters or *commanderie* of the Knights Templars. Both Cyprus wine and Cyprus brandy are sold in England, the first being a tawny, sweet, dessert wine which is said to be made from Malvazia grapes, the original native grape of Cyprus, whilst the brandy might very well suit sultanas and corinths in the making of plum-puddings.

Palestine, once upon a time a land of many vineyards, lost all its vines, and much else, during the Turkish occupation, but the new settlers have, under Zionism, replanted some 10,000 acres of vineyards, and there are both Palestinian wine and brandy sold in England at the present time.

Malta does not export any of her wines, but there are some 2,000 acres of vineyards in the island, not an inconsiderable proportion of the total available land fit for cultivation, and the Maltese themselves would not exchange their own wine for the finest Lafite, Yquem or Johannisberg in the world. As it happens, no one has as yet attempted to rob them of their native wines.

First Class Tip

"Might I enquire, Sir, whether you have recently visited Spitzbergen or Baffin Island?"

"Of course I haven't."

"Then no doubt you are interested in some commercial form of refrigeration — chilled beef, for instance?"

"Nothing to do with it."

"In that case, Sir, you will have no objection to closing that window. It is exceedingly cold, and the draught is ferocious."

"I beg your pardon, Sir. I'm terribly sorry. Fact is, I've a most appalling headache, and the cool air does it good. I attended a most enjoyable party last night, and I'm feeling much the worse for it."

"My dear fellow, why didn't you say so at first? Trouble is, it's so long since I've had a hangover myself, I've almost forgotten the symptoms. Was there no Rose's Lime Juice in your corner of the Shires?"

"Afraid I don't follow you."

"Rose's Lime Juice, I said. Cancels hangovers in advance. You either mix it with gin, or swallow a stiff glass solo before bed. Why, man, it's smoothed the paths of thousands."

"You're telling me that Rose's fills this long-felt want?"

"I've never known it fail."

"Then, Sir, I am deeply indebted to you. Here is my card. I trust that we shall see more of each other. Much more. Are you by any chance free to dine tonight? Wonderful how these chance encounters change the course of one's whole life."

SHORT DRINK—2 parts Rose's, 3 parts Gin.
LONG DRINK—add soda.

FIFTY YEARS AGO

From the *Field* of November 3rd, 1888.

ADVENT of the Totalisator. "This machine was invented very soon after the passing of the Act 31 & 32 Vict. c. 52, which, in amending a previous statute, was designed to punish 'idle and disorderly persons, and rogues and vagabonds, so far as relates to the use of instruments for gaming.' It would seem that, having carefully studied the provisions of sect. 3, some ingenious speculator set himself to work to see if he could not drive the proverbial coach and four through the Act, and his cogitations ended in the construction of the totalisator. This outcome of ingenuity made its maiden appearance in England, on Wolverhampton racecourse, on August 10th, 1870. . . . Having made himself acquainted with the working of this new invention, a Wolverhampton police inspector came to the conclusion that its keepers infringed the Act.

"The owners of the *pari-mutuel* were convicted, and the conviction was confirmed on appeal, though the defence was as ingenious as the invention. On behalf of the owner of the concern it was argued that it was not an instrument of wagering, inasmuch as the wagering took place quite independently of it, and that it only served the purpose of a betting book, or register of wagers; and secondly, it was contended—unreasonably, perhaps, as some may think—that horse racing is not a game of chance.

"For scientific betting the totalisator is obviously unfitted; but for the average punter it is about as good a system as can be devised. The temptation to welsh is minimised. . . . its proprietor must win on every race by reason of his commission. The investor, too, can see at a glance how the money stands; and as it is the speculators themselves, and not a bookmaker, who shorten the prices, the punter can wait till the last minute before making up his mind which horse to back. In short, for those who indulge in post betting merely for amusement, the *pari-mutuel* has much to recommend it as the most harmless form of betting."

IN THE SALEROOM

THE remaining part of the collection of antiques and pictures of Rufford Abbey will be sold at Christie's on November 17th and 18th. This is the more important, and includes some very fine French and English furniture, a number of important tapestries, objects of art and ship models. The ship models are interesting, and include a British merchant vessel, 64in. long, *circa* 1770, probably an East Indiaman; an early frigate, *circa* 1680–1690, 32in. long, probably a 44-gun two-decker; a merchant ship, 83in. long, *circa* 1770–1780, appears to be a ship-rigged "buss," and is possibly of Dutch origin; a sailing cutter, 17in. wide, *circa* 1790–1810, bearing the Prince of Wales's feathers, is possibly a "hoy," a small passenger and cargo coaster, or a yacht. The tapestries are Beauvais, Flemish (Pre-Gobelins) and Gothic. The pictures, to be sold on November 18th, include some fine works by the greatest masters: Three Italian views by Canaletto; Crome's "A View near Norwich"; Gainsborough's famous work "The Ford"; and his portrait of Paul Sandby, R.A.; "A Woody Landscape with a Cottage and Angler," by Hobbema, and three other works by the same master; Hogarth's "Portrait of a Man, in a fighting attitude"; and works by Holbein, Lely, Rembrandt, Raeburn, Velazquez.

On November 10th, at the same rooms, will be sold an exceptional collection of rare Gothic, early Renaissance, and later European glass, which was formed under the professional guidance of a leading Dutch expert and is therefore, perhaps, somewhat unique. To mention a few particular pieces: there is a small German engraved and inscribed Roemer of very pale green tinted glass; a massive German "unbreakable" beaker of cylindrical form, and a goblet, the upper half engraved with a stag-hunting scene, Hessian, *circa* 1750.

A LONDONER'S BIRDS

WHEN reading Mr. Massingham's delightful column I am often surprised at his intransigent attitude towards the town-dweller. No doubt he is right when he inveighs against the soullessness of commerce, which hits town and country alike; but, an authority on all that concerns rural affairs, does he try to read the townsman's mind aright? Paradoxical as it may seem, many of the latter are countrymen at heart. Give them a patch of earth and they will either struggle to raise flowers on a desert or grow vegetables among the brickbats.

* * *

As regards nature, it is a case of "eyes and no eyes" where countrymen and townsmen are concerned. Nevertheless the company of birds is a solace to those who are of necessity divorced from field and hedgerow, and I count the sparrows among the personalities of my small garden. I can even distinguish some of them individually, and there is one of them minus a leg who has to feed resting on his breast. He does very well under the handicap and gets extra rations.

* * *

Another character of the garden is "Chock," the veteran blackbird with fierce yellow beak and a pate as bald as a coot's. His name is self-bestowed. In spring he confined his activities to the front garden, where he had a passion for dislodging moss from the garage roof. Great chunks of it would be found in front of the door, and the cause of the mess would watch us sweep it up and give a defiant "Chock." When young blackbirds arrived Chock took to the more expansive domain of the back garden. There he made himself an unmitigated nuisance to my wife by continually removing the tufts of grass with which she was endeavouring to cover bare patches at the edge of the rockery. The old villain is outside now splashing the water of the bird bowl all over the place. He has a sinister look in his eye, and is in every sense a black bird.

* * *

Doubtless we miss rare visitors a countryman would see. A friend entering our garden the other day spied a nuthatch on the fence. We were polite but unbelieving. However, he was right, for later two nuthatches turned up under the blue-tit's acacia tree. This tree is reserved for the tits, who by the way consume monkey nuts all the year round. They are strung on electric bell wire and a couple of score last for five or six days.

* * *

On examining our rings we found a number of nuts half broken and came to the conclusion the husks were too hard for the tits to get through. By chipping off these hard ends we found this to be the case as the nuts then soon disappeared. A method of feeding described in the *Field* was tried, that of fixing a forked twig into an inverted bowl of melted fat. It proved a great success until the starlings discovered they could get a hold on the twig and peck upwards. Things became impossible for the tits, and it has been decided to try a single stick to frustrate the starlings.

* * *

A new bird is a great event in the townsman's garden. After the discovery of the nuthatches we were rewarded by the appearance of a tree pipit. He was discovered amongst the sparrows, and is a single but regular visitor, even coming down to the ledge opposite the kitchen window. A wren busy on the aubrietia provided more excitement, and one day an almost pure white arrival suggested a rarity that would cause commotion in the office of the *Field*, especially as it had a ring on one foot. It perched on the fence, came down quite tamely for some crumbs, then burst into magnificent song. It was a canary! * * *

Thrushes common in spring are but occasional visitors now. A pair of youngsters just out of the nest perched on the rose trellis in June. They were trying their wings, and the sun shining on their pearly white plumage seen against a background of pale blue sky made them an unforgettable sight. Our chaffinches mingle with the sparrows pecking daintily at the bread crumbs. The red breast of the males in June rivals that of the robin. And, of course, we have our pair of robins always waiting for someone to dig up a piece of earth, and someone is generally obliging. The robin is a bird fond of novelty. Put a spade in the ground and he will perch on the handle; build a new trellis or drive in a stake and he will try it out at once, cocking his eye from side to side in approval.

* * *

There are town and suburban gardens molested by cats, which can boast a far better assortment than ours, or at least owned by naturalists who can identify the rarer visitors. But the unadulterated townsman gets a lot of pleasure from his birds who bring the country to his garden. At least this is true of most townsmen, for I had forgotten the man at the back who fired a .22 at one of our pair of fat maize-fed woodpigeons. The bullet splashed on our chimney. But was he a townsman or a countryman in town? R. N. R.

LETTERS TO THE EDITOR

JACOB'S SHEEP

SIR,—In reply to Mr. J. F. Boydell's query regarding Jacob's Sheep in a recent issue of the *Field*, I think that the note which he saw regarding these animals appeared in the *Estate Magazine*, and perhaps the following observations from an article and correspondence in the *Estate Magazine* may be of interest.

The article read: "A motor drive deep into the most rural and beautiful district in Sussex, to see for the first time a small herd of the world's oldest breed of sheep, has just been my interesting experience. Strangely, the breed, though a foreign variety, has been peculiar only to England for at least five centuries, and perhaps for a much longer period. Recently it was reported to be extinct. The small herd of strange-looking animals that I saw is owned by Sir Merrik Burrell, Bart., this year's [1936] President of the Royal Agricultural Society, and they roam the pasturts of his Knepp Castle estate at West Grinstead, Sussex.

"The sheep are known by the name of Jacob's sheep. They are said to have originated in the Holy Land as long as 3,000 years ago, and are believed to be the identical breed (the spotted, speckled and ring-streaked) which Jacob received from his Uncle Laban in return for his services.

"A flock was brought into this country during the Roman occupation, and others during the Conqueror's reign and the first Crusades, and whilst the breed has become extinct in other parts of the world, if it was ever known in other countries besides Palestine and England, it transpires that a few widely-scattered small flocks still survive on British parklands.

"Sir Merrik Burrell's is the largest flock, and the most typical of the variety, which, for a breed that was originated in the East, is extraordinarily hardy, being much more robust than our native breeds, including the Shetland, and thriving where other sheep succumb to hunger and the vicissitudes of the weather.

"Sir Merrik Burrell inherited his herd on succeeding to the title and Knepp Castle estate some years ago, his predecessor having acquired them from a distant relative and friend, Sir Henry Dryden, of Northamptonshire, more than half a century ago. The Duke of Devonshire, also, has a few of these nearly extinct animals at Chatsworth.

"The sheep resemble a deer and goat cross. The creatures are white, profusely splashed with black, and are horned, and resemble deer in their movements and build.

"The breed is noted for milk yielded by the ewe, and sweet, lean mutton. Once the custom was to kill and eat a selection of the lambs (generally twins or triplets) or to rear them on cows' milk, and to use the milk of the sheep mothers for household purposes. The delicacy, the richness and the delicious flavour of milk and flesh alike are beyond dispute.

"They will not fatten as will the Southdown and our other commercial breeds because of their restless nature; and though their wool is superior to all other for hand spinning and weaving it is not suitable for spinning and weaving by mechanical means.

"Sir Merrik Burrell himself is inclined to believe that the sheep were brought into this country, not direct from the Holy Land, but from Spanish royal pastures, as presents for some of England's nobility, probably during the reign of Mary Tudor, with Philip of Spain as donor.

"Incidentally, it was during Mary Tudor's reign that the Spanish chestnut tree was introduced into England, and some that were planted at about that time on the Goodwood estate in Sussex still stand. The theory may not be unfounded, though the curious fact remains that there are now no sheep in Spain bearing any resemblance to them, and Ministers of Agriculture have failed to trace that there ever were any.

"In Palestine there are still sheep that do bear some resemblance to them, and where they do exist they are known by such other names as Andalusians, goat sheep, Spanish and Syrians.

"Although so old an importation, the sheep are quite unknown except in the localities where the few flocks survive, for no attempt has ever been made to popularise them or save the breed from ultimate extinction.

"J. C. BRISTOW-NOBLE."

The correspondence ran:

"SIR,—I would suggest that there may be far more flocks of the above than Mr. J. C. Bristow-Noble thinks. I have a letter from the late Mr. Heatley Noble, saying he knew of over 50 flocks—and probably there were many more.

"One feels sure that many people would keep some if it were not that the local butcher is not a buyer, combined with their habit of getting out of any field—*if* they want to—unless the fences are very good, or sheep wire-netted. They are so attractive to the eye and so very hardy. Their origin in this country Mr. Heatley Noble could not discover, but there exists a picture at Tabley, painted in 1760, and another at Wentworth by Stubbs of about the same date.

"The Bible (Genesis XXX, verse 35) mentions goats as 'ringstraked' (the American revision calls it 'ring-streaked'), but no mention of *sheep*. A curious feature of the breed is the rams having four horns, and if care is taken when young, they become very fine ones, but in youthful play they knock off easily. The ewe lambs often have four horns, but the lower two are usually only skin attached. There were three flocks in France in 1925, and rams were sent out from Great Britain for change of blood.

"The oldest breed of all must surely be the 'Soay Island Sheep,' close to St. Kilda. The late owner of those isles stated that no change of blood could ever be traced. Perhaps because nowhere else are similar sheep found—if this fact is accurate.

"SPOTTED SHEEP."

An advertisement for the sheep appeared quite recently in the *Estate Magazine*.

Yours faithfully,
EDITOR, The *Estate Magazine*.
The Country Gentlemen's Association, Ltd.,
Letchworth.

LAKELAND A NATIONAL PARK

SIR,—I have read with much appreciation your article on "Lakeland a National Park." May I make a few comments on the subject-matter of the admirable photographs by which the article was accompanied, for I have seldom read an article in which the illustrations afford a more exact proof of the main argument of the article itself.

One of the photographs shows three reaches of Ullswater, "where there is no sign of development." Why not? Because in the summer of 1937 a private enthusiast, Mr. Francis C. Scott of Windermere, bought up the lake shore, which the photograph displays, in order to preserve it from building. To exploit the building values under Place Fell would be the ruin of Ullswater. The land was up for auction, and the auctioneer's catalogue read as follows: "The fields and woodlands at the water edge afford the most beautiful sites in the whole Lake District. The land can be utilised, if required, for any number up to 106 small houses or week-end cottages with garages. . . . The present is an opportunity which will probably never recur." Fortunately it will not recur; but that is no thanks to the Town and Country Planning Act, which allowed one house per acre to be built on the shore of Ullswater. As you rightly say, "Despite the Planning Act, the Lake District is greatly endangered." No rural area of low rateable value can afford to sterilise itself against building in critical places, at the expense of the ratepayer; only national aid from the Exchequer, through a Commission for National Parks, can make "planning" effective.

Another photograph illustrates the road along Buttermere, and is entitled "a grand road for walkers." It *was* a grand road for walkers, but the Cumberland County Council, with a grant from the Ministry of Transport, turned Honister Hause into a full-dress motor road, and what was a charming place on foot is now a hum and bother of cars. And things might have been worse than they are, for this year the Highways Committee of the County Council proposed to widen a mile of this road, lower down, by the foot of Crummock Water, to a width (over all) of 40ft.; in that event, the whole of the lakeside road would eventually have been condemned to a similar fate. After great public agitation, conducted by voluntary bodies, the County Council turned down its own Highway Committee's scheme. At present the protection of the Lake District rests largely with voluntary bodies. What is needed is a Commission for National Parks, enforcing sensible standards both upon the Ministry of Transport and upon the misguided ambitions of local authorities.

The third photograph is of the mountain summits near Sty Head: the title is "Looking over the suggested National Park." The magnificent walking route from Wasdale to Sty Head can be seen in the photograph, full in the foreground. In 1934 a special committee of the Cumberland County Council, looking about for methods to relieve unemployment, suggested turning this noble route, perhaps the grandest in England, into a motor road. "Cumberland," so the Committee wrote, "has some of the finest scenery in Great Britain, and it would appear worth while for the Government and County Council to make this a paying proposition." The central fells of the Lake District were described by the same Committee as "a countryside which is gradually being forgotten." Ye gods! The scheme was dropped, amidst an uproar of protest; but it was not the first time that it had been produced, and it will not be the last, unless we have a sound protective system with the Lake District administered by a common and considered standard. For this the creation of a National Park is necessary.

A fourth photograph shows Watendlath and its "famous walk." Here again an attempt has been made in recent years by the same county council to turn a pleasant lane into a motor road, and to debase the famous triangle from Ashness Bridge through Watendlath to Rosthwaite into a haunt of mechanical transport. The attempt was made quietly; it was defeated by the roadside landowner.

Private persons and voluntary bodies cannot indefinitely protect areas of great natural beauty against statutory bodies, Government departments, local authorities, and building development. Common defence, common standards, a *unified* and stringent planning system under a State authority can alone save the future. A National Park is an urgent need. To propagandise for this idea, the Friends of the Lake District exist, and they invite the support of all who wish the district well.

Yours faithfully,
Wood Close, Grasmere. H. H. SYMONDS
(Hon. Secretary, Friends of the Lake District).

ARTIFICIAL HUNTING

SIR,—I have read with interest the article entitled, "Has Hunting Become too Artificial?" in your number of October 15th. It seems that if, as your correspondent says, artificiality would mean the beginning of the end, then foxhunting in this country cannot continue for much longer. His statement that ". . . . in the effort to preserve foxes, enormous sums are paid out in poultry claims" drives home my point suitably enough.

If foxhunting is designed to rid the countryside of an admittedly destructive form of vermin, surely the sooner it fulfils its purpose the better! I will not enter here into the age-long question of which is the most humane and effective method by which to achieve this end. But as soon as the preservation of foxes begins, and I refuse to be persuaded that compensation is paid to poultry farmers to spare the fox for humanitarian reasons, hunting acquires some other purpose which it is not very difficult to appreciate. Despite the economic advantages which it may or may not entail, it becomes merely a nice question of conscience for those who follow hounds and at the same time pay a subscription to the R.S.P.C.A. It is one thing to kill vermin; it is another to preserve them for killing. The difference is artificiality.

In your editorial you describe those members of shooting syndicates who resent hounds in their coverts until after Christmas as "making a business of pleasure and forfeiting the right to be called either countrymen or sportsmen." Are they perhaps guilty of the crime of preservation? The pot appears to be calling the kettle black, and the kettle, at any rate, cannot be accused of preserving vermin.

Yours faithfully,
Vincent's Club, Oxford. W. J. H. LIVERSIDGE.

PONIES AND MOTORISTS

SIR,—I have read with much concern the letter from Mrs. Dunbar on this subject. I cannot understand why our local inspector apparently was not called upon to deal with the injured animal, as all A.A. Scouts and other officials have his address and telephone number. As the number of accidents to animals in the New Forest increased from 49 in 1936 to 74 in 1937 my council went most thoroughly into the whole of this question with the New Forest officials concerned in the early part of this year.

In conjunction with the A.A., the Hampshire County Council were approached with the suggestion that the gorse should be cut to within 2ft. of the ground at certain spots where accidents most frequently occur. The council accepted the suggestion and voted £100 towards the cost. We are aware that this suggestion is only a palliative, and that the main causes of the difficulty are that the foresters have the right to allow their animals to wander at will through the forest, and that the roads are not capable of bearing the summer traffic.

If a speed limit of, say, 30 miles per hour were imposed it would obviously mean that the novice would drive up to that speed, and there are places in the forest where one can drive even at that low speed and run serious risks. As the gorse has only recently been cut, time alone will show whether it will greatly reduce the number of accidents. If this does not happen, then your readers may feel quite confident the R.S.P.C.A. will make further strong representations in the proper quarter.

Yours faithfully,
FERGUS MACCUNN
(Captain, Chief Secretary, R.S.P.C.A.).
105, Jermyn Street,
London, S.W. 1.

THE WALK OF HIM WHO KNOWS THE HUNDREDTH NAME OF ALLAH
(See letter "Movement of Camels")

MOVEMENT OF CAMELS

SIR,—May I venture to offer an explanation which will, I think, account for the opposing views, held by Major Radclyffe and Mr. Ingram, with regard to the similarity, or otherwise, of the action of horse and camel (*vide* the *Field* issues of September 17th and October 15th).

The former states that the camel raises both feet on the same side at the same time: the latter disagrees, and maintains that a camel walks like a horse. I suggest that both are right; the explanation being that they are referring to different paces.

The camel has three paces—the walk, the trot (which is not a trot), and the gallop.

In the walk the sequence of movement of the feet is similar to that of the horse, allowing for differences of conformation. The movement is slow, dignified and terribly uncomfortable. This is the normal action of a baggage camel, and baggage on a camel has a rough passage.

In the "trot" the two legs on the same side move together, striking the ground and being lifted as one. In fact, the action is not unlike the two-legged action of a running hen, and there is the further similarity that the head is shot forward and drawn back, parallel with the ground, at each step. This is the only comfortable pace for a rider, and it can be maintained for long periods.

The gallop is ungainly, in fact ludicrous. It should not occur, but is sometimes seen in a desperate finish of a race.

A careful perusal of a large number of somewhat indifferent photographs, which I have by me, clearly bears out the above statement but, unfortunately, I have none taken for that purpose. I enclose three prints, however, in case you may find them suitable for reproduction:

1. *Walking.*—A camel, carrying the war-drums of the Kababish Arabs of the Northern Sudan, beginning to walk. In this the near hind has just been placed, the near fore is in motion and will be followed by the off hind, off fore, &c.
2. *Walking.*—A camel caravan entering Tokar.

WHERE CHANGE IS NOT DESIRABLE
(See letter "Stone Coin")

This shows a number of camels in different attitudes of the walk.

3. "*Trotting.*"—A detachment of the Egyptian Camel Corps at the 1913 Inspection at Khartoum. The near hind and the near fore of the camel nearest to the camera can be seen to be firmly planted, while the off side limbs are raised and coming forward.

But I write rather from memories of a period when it was my lot to spend most of my days on camel back, and to know my dignified, ungainly, complaining, supercilious, evil-smelling but gallant and enduring animals perhaps as well as a mere man is allowed to do. Incidentally, the supercilious attitude of the camel is said to be due to his consciousness that he knows a further attribute of Allah, unknown to man. Others say that it is due to the activities of a large, fat, parasitic grub which usually inhabits his nasal sinuses. Judging from the size and vigour of specimens which I have seen ejected by an extra violent snort, they might well keep his mind pretty fully occupied. Some Arabs hold that, but for the presence of these parasites, the camel would be unmanageable.

Yours faithfully,

The Old Vicarage, J. NIELD CAMERON.
Wetherby, Yorks.

SIR,—With reference to your correspondent's letter in this week's *Field* about the movement of camels, I have a number of photographs taken at various times during the War, when I was on service in Egypt, Sinai and Palestine, and saw plenty of camels both at rest and in movement. As a result of his letter I looked up the book of photographs, and in every case of a moving camel both legs on the same side are moving in the same direction at the same time.

I would respectfully suggest that your correspondent can never have ridden a baggage camel, as I have, or he would not be able to write as he does.

Yours faithfully,

Underhill, E. FRASER STANFORD.
Pilgrims Way, Westerham.

PLEASE GIVE GENEROUSLY

HAIG FUND

20 YEARS AGO

"They shall grow not old, as we that are left grow old:
Age shall not weary them, nor the years condemn.
At the going down of the sun and in the morning
We will remember them."

Poppy Day is the finest opportunity we have to remember, in a practical way, the heroism and sacrifices of the War. Poppy Day finances the work of the British Legion for the survivors, thousands of whom to-day are gravely handicapped by age, sickness and the strain of the War years. These men, and the dependants who share their need, have the strongest possible claim on your sympathy. Please help the Legion to help them by giving as much as you possibly can for your Poppies of Remembrance.

POPPY DAY
Nov. 11

DONATIONS will be thankfully received by Poppy Day Committees or by Captain W. G. Willcox, M.B.E., Organising Secretary, Haig's Fund, 29, Cromwell Road, London, S.W.7. POPPY SELLERS ARE URGENTLY NEEDED. Ladies willing to volunteer for this work should communicate with the Local Committees or the Headquarters of Haig's Fund.

This space is donated to Earl Haig's Appeal Fund by Messrs. John Walker & Sons, Ltd., of Kilmarnock, Proprietors of Johnnie Walker Scotch Whisky

A FINE FRENCH BRONZE

SIR,—I have a very fine bronze, apparently French, depicting a golden eagle on a rock standing on a young stork, which must weigh about ½cwt. It is signed, and appears to me to be "É. de Labrone." Are you able to tell me whether this sculptor is known in "Bronze circles," and if his works are of value?

Yours faithfully,

Hampshire. E. E. J.

OLD-TIME FIRE FIGHTING

SIR,—The fire-fighting hook illustration in your issue of October 22nd reminds me of the grand assortment of such hooks brought to fires by the Mih-hoo-loong Hook & Ladder Company of the Shanghai Amateur Fire Brigade when I joined the brigade in 1906. The motto emblazoned on their pony-drawn four-wheeled brakes was: "Say the word, and down comes your house." They were a great asset in fighting many a fierce fire in narrow alleyways at a period when Chinese shops and dwelling houses were flimsy and highly inflammable.

Yours faithfully,

Easton, M. O. SPRINGFIELD.
Woodbridge, Suffolk.

STONE COIN

SIR,—I enclose a photograph of a stone coin I picked up on the farm the other day, and which, I think, may interest your readers. Collecting stones has been a hobby of mine all my life.

Yours faithfully,

Tayport, JAMES M. CHRIAH.
Fife.

A PRECARIOUS NEST

SIR,—While homeward bound from the Far East my ship took on some cargo at Bombay. In the gib of one of the great cranes loading up the ship was a hawk sitting serenely on its nest, apparently unconcerned at the long swaying motion of its elevated home.

At this height it would have been difficult to photograph the bird on the nest, but after waiting long and patiently, the hawk left its nesting place, and in the accompanying photograph the nest can be clearly seen at the point where the bird is leaving.

Yours faithfully,

Farnham. J. F. FRIEND.

WHEN THE CRANE WORKS THE CRADLE WILL ROCK
(See letter "A Precarious Nest")

AN ANCIENT JUNIPER

SIR,—I enclose a picture of a rather remarkable juniper tree. The photograph was taken in a Tibetan village on the border of Spiti, at a height of 13,000ft. This particular valley is 30 miles long, and except for those in the picture there is not a single other tree throughout its length. For a juniper it is immense, and it would be interesting to speculate on its age.

Yours faithfully,
10th/1st Punjab Regt., J. F. S. OTTLEY.
Jhelum,
Punjab.

AN ERA THAT IS PAST

SIR,—In the delightful article by Kathleen E. Morgan about farmers who have been huntsmen, there is only mention of a few, but I presume reasons of space have prevented mention of others.

In the concluding paragraph of the article these words occur: "Unfortunately, he found that he could not spare the time to continue in this position, so has resigned, and I do not know of another farmer-huntsman of the present day."

It is possible that only foxhunting was in the mind of the writer, but in case it was not, I think she will be interested to hear that the huntsman, Mr. F. H. Gaunt, of the Penistone Hunt (Foot Harriers), is a farmer. His two young daughters help as whippers-in, and there is a third coming on.

May I add that on the side of the country where there are no foxhounds we occasionally hunt fox.

If your correspondent will send me her address, I will gladly send her some more particulars.

Yours faithfully,
The Kennels, THE HON. TREASURER.
Cat Hill Hall Farm,
Hoylandswaine,
Penistone,
Near Sheffield.

A PARTRIDGE FLEW IN AT THE WINDOW WIDE—

SIR,—An unusual incident occurred at the Rifle Depôt, Winchester. At about 9 o'clock in the morning on October 18th, a fully grown partridge flew into the Officers' Mess ante-room through a half-open window, and settled on the floor. It was caught and examined, no injury being found. It was then liberated. The Rifle Depôt is situated in the middle of the town.

Yours faithfully,
Rifle Depôt, C. M. SMILEY.
Winchester.

GOOD LUCK SIGN ?

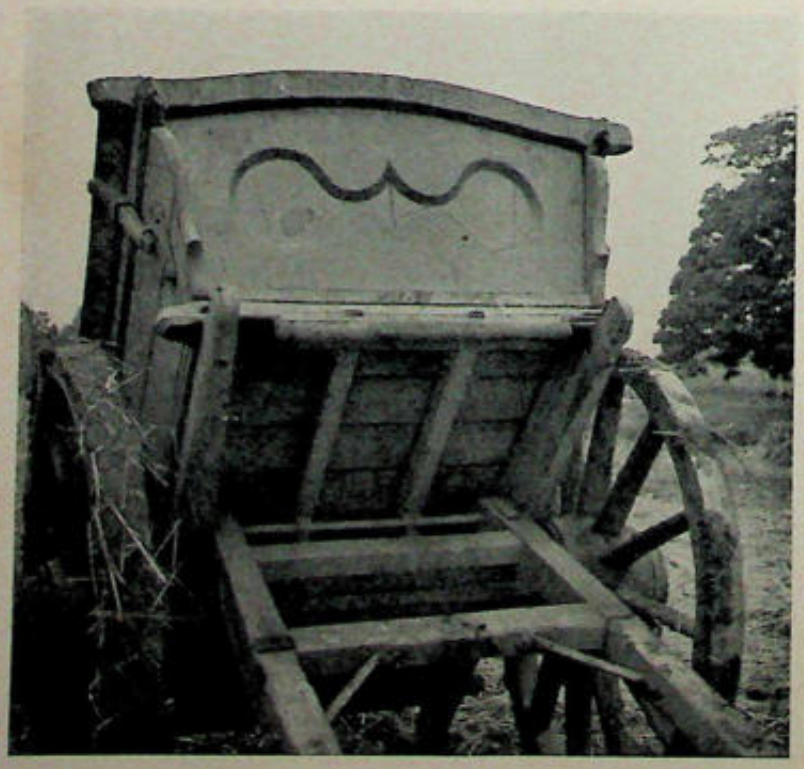
SIR,—The design on this cart front is typical of many to be found in the counties of Lincoln, Leicester, Rutland, Huntingdon and Cambridge, and in parts of Nottingham, Northampton, Bedford, Hertford, Essex, Suffolk and Norfolk.

It is known to wheelwrights as the "spectacles," but its origin or purpose is obscure to them. The front of the cart consists of two thicknesses of wood and the design is cut on the outer board, exposing the wood underneath. This construction allows rain to penetrate between the two layers of wood and rot it, so that the original reason for the ornament must have been a strong one. A good luck or fertility significance has been suggested and this is probably the correct explanation.

As most examples in the pure form still occur in the Fenland, this district would appear to be the distributing centre. The design found on the carts in districts on the edge of the Fenland are degenerate.

The design is found most frequently on the Scotch cart, but tumbril carts and wagons also have it and it sometimes occurs in harness stitchery.

Yours faithfully,
Villiers House, MARGHARITA RICHARDSON.
Villiers Road,
West Bridgford, Nottingham.



A FARM CART WITH SPECTACLES
(See letter "Good Luck Sign ?")

A QUESTION OF RECORDS

SIR,—Lord Derby's stallion, Hyperion, sired the three placed horses in the Imperial Produce Stakes at Kempton Park, on Saturday, October 1st, and many people were wondering if it was a record.

Comus's first crop of foals did even better, being first, second and third in the St. Leger. They were, Reveller, Ranter and The Marshall, the first two being out of mares that were sisters, and bred by Mr. H. Pierse.

Later, in Theodore's St. Leger, three Comus colts started and beat everything except the winner.

I am sorry the Countryman's Queries have been discontinued. There were two answers published, however, with which I did not agree. Daniel O'Rourke was only 14.3 when he won the 1852 Derby, although he subsequently grew to 15.1½, so he was smaller than Little Wonder by ½in. Bloomsbury, and not Hermit, won the snowstorm Derby in 1839.

Yours faithfully,
Royal Military Academy, G. C.
Woolwich.

POULTRY DIET

SIR,—I am endeavouring to gather reliable data with regard to results achieved with cod liver oil.

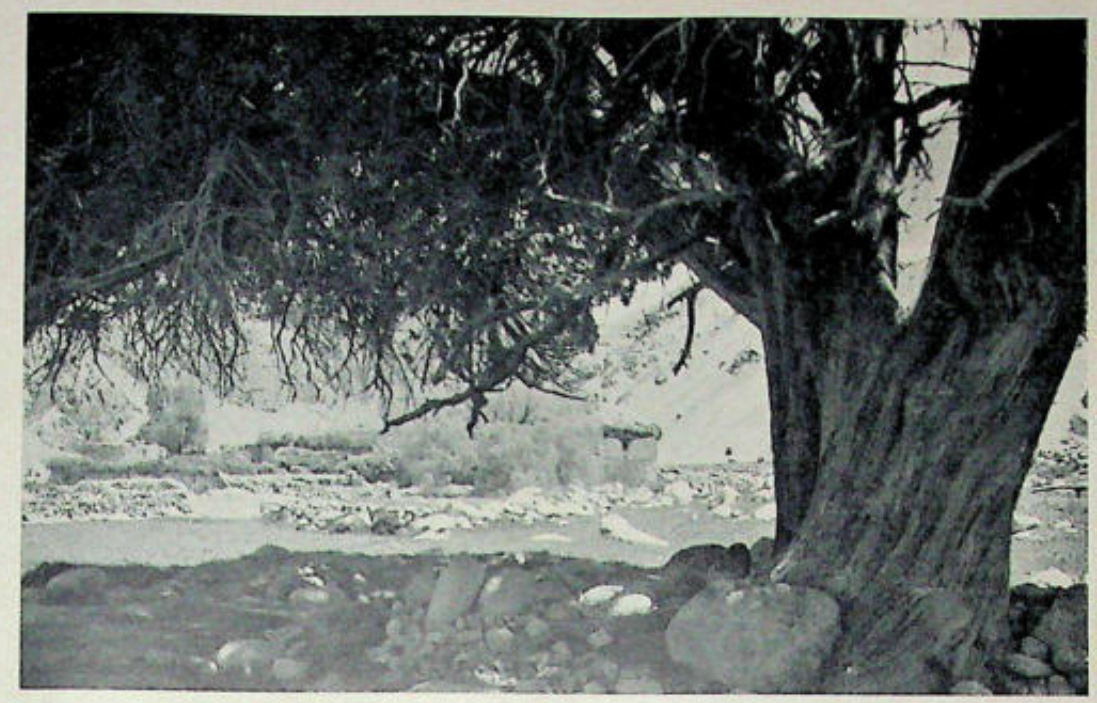
There is abundant evidence of success with pigs (*vide* work carried out at Reading) and what has proved to be good for the pig may well prove to be good for the laying pullet.

Perhaps readers who are using cod liver oil would inform me on the following points: 1, Dosage; 2, When given; 3, Changes noted.

Yours faithfully,
GEORGE GODWIN.
43, Curzon Street,
London.

AFRICAN ELEPHANTS' EARS

SIR,—The excellent photographs you give on page 779 in the *Field* of October 1st are interesting, especially the lower picture of the Kalahari elephant. Its ears are extraordinarily small for an African elephant, and when compared with the ears of those in the upper photograph, which are by no means exceptional in size, the contrast is striking.



AN ENORMOUS JUNIPER 13,000 FEET UP IN THE HILLS OF TIBET
(See letter "An Ancient Juniper")

The farthest-off animal in the top illustration shows how the ear-flap is turned inwards, which is the usual fold, and I never saw one whose ears were bent outwards. The top and front of skull of the Kalahari elephant are slightly peculiar; and altogether this animal is not exactly typical of the African elephant in shape.

With regard to the letter by Mr. Guy E. Mitchell on the "Weight of African Game," I once read that Jumbo before he was sent to America weighed 6 tons, and I doubt whether he had reached his greatest weight. Therefore there is no reason to doubt that a really large African bull does sometimes weigh about 7 tons when living a natural life in the wilds.

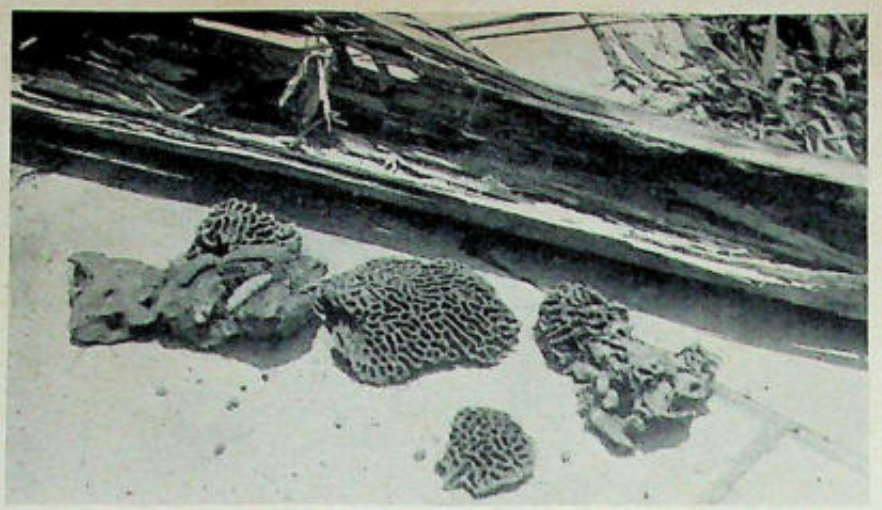
Yours faithfully,
Belmont, DENIS D. LYELL.
Moffat.

Obtainable from all leading Hotels, Restaurants and Wine Merchants.

WHITE ANTS

SIR,—The ravages of that scourge of the East, the white ant, are visible only too often, but the termitaria, which, in the main species, is always underground, is rarely seen.

I enclose a photograph of a white ant termitaria and behind it the post which had been eaten away. The inner nest is a solid structure of earth, cemented together with saliva and excreta, and can be seen on the left with the grub-like queen showing clearly. This bloated bag of eggs is attended by workers, who feed her and wash and carry away the eggs as she lays them at the rate of one every two or three seconds over a period of nine or ten years. The king is undersized, and is usually hiding under the queen. As soon as her fecundity shows signs of diminishing she is left without attention and dies of starvation, and is then eaten with relish by her erstwhile attendants.



THE WHITE ANT QUEEN IN THE TERMITARIA
(See letter "White Ants")

Maurice Maeterlinck, in his book, *The Life of the White Ant*, gives astonishing examples of the destructive powers of these pests, their "ravages wrought in secret and made manifest only at the moment of disaster." They devour anything. To get at corks they will pierce the tin capsules on the tops of bottles. Metal is dealt with by spreading on it a juice which rusts it. They can pierce lead of any thickness as the Post Office Underground Cable Depot has reason to know. They secrete a liquid which will rasp glass and give them a foothold.

It would be hard to believe the following, but Maeterlinck, in his preface, vouches for the truth of all his statements. A man returning to his bungalow after an absence, found that a set of engravings had been completely eaten, frames and all, but the glass in each case was still there, cemented to the wall by the earth tunnels in which these amazing insects carry on their ceaseless work of destruction.

Yours faithfully,
E. F. WATKINS.

2nd Battalion The Loyal Regiment,
Gillman Barracks, Singapore, S.S.

WEIGHT OR MEASUREMENT

SIR,—I send some papers for your and other fishermen's opinions. There has been a competition for a year, and in the scaly section I sent in a fish that weighed 6lb. I and several of the best fishermen in Natal think the decision should have been a dead heat. Perhaps you would be kind enough to publish this and get the decision of other fishermen. I should say there are three sorts of scale fish here. One is a greenish grey with a humpback, going thin to the tail. The second is the Berg fish, a long thin fish (I have taken those only weighing 3lb. 2oz., but going up to 23in. in length). The other, the sort I got, is a very compact fish, bright yellow with a very small head. I think it should have been given level, and have been fished over again for a month. I should be so much obliged if you would kindly give me your opinion.

Yours faithfully,
JAMES PENISTON.

Weenen,
Natal, South Africa.

[A letter from the *Natal Mercury* to our correspondent (which he enclosed) explains that two fish of 6lb. were entered. Our correspondent's measured 20in. long by 12in. girth, whereas the winner's measured 21½in. by 14¼in., and was consequently awarded the prize. We understand that the term "scale fish" in South Africa is the popular name for a species of barbel, but if there are, as our correspondent seems to suggest, more than one species known as scale fish, it would be better if competition rules gave the species its scientific name. On the particular point raised (and without reference to the rules, which we have not seen), we should hold that the umpire's decision was correct. It is the *size* of a fish which is the question; its weight is a convenient method of comparing size, since it is more accurate than measurement, but where weights are the same, we should regard comparison by measurement as the natural alternative. Dead heats are better avoided where possible.—ED.]

KILLING GAME

SIR,—For years I have endeavoured to discover some quick and clean method of killing a wounded pheasant when hampered by a gun under one's arm.

Perhaps some of your readers will describe the methods they use.

Yours faithfully,
PUZZLED.

Havant.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—The faithful servant for twenty-four years of an English family in Spain has appealed to us for help. Her employers have lost everything they possessed in the civil wars, and now she is faced with starvation, being unable to obtain her old age pension for another seven years. She has lost one eye, the other is weakening, and the only thing she can see sufficiently to do is work for an undertaker, a grim task indeed, adding to the gloom of her miserable existence. For some time now the most she has ever had is 9/6 a week for rent, food and everything, and the lack of nourishment is telling on her health. Please send us £13 that we may give her 5/- weekly for one year.

IN THE CITY

BY THE CITY EDITOR

STOCKBROKERS are coming out of that shell into which they retired during the crisis. There is, however, a fairly general consensus of opinion that any concern in the luxury trade might be left out of reckoning for the present.

I consider such advice quite sound. They might, in my opinion, go a bit further and include most of our leading industrials. The reason is recent falling off in trade and, whether we like it or not, we shall have to face more direct taxation next year.

That must also adversely affect prices for trustee securities. More tax will clip a bit more off the net return, and market values must be adjusted accordingly. That is why many advise holding only trustee stocks which are definitely redeemable within about fifteen years.

Securities of that description appeal strongly to insurance companies, and prices show more resistance to any downward trend than is the case with stocks with a distant redemption date or no redemption date at all. Yields on comparatively short-dated stocks are, however, decidedly small already. Take, for instance, Conversion 2½ per cent, definitely redeemable in October, 1949, with a price of 97 to yield only £2 16s. 9d. per cent. less tax, including redemption.

Such a return cuts very little ice with the average investor but trustees are tied to such securities. The average investor has more rope. He can, and does, look elsewhere for a better return on his money. His chief difficulty is to find securities of a debenture type. Supplies are extremely small, and as a rule stocks command premiums on the redemption level.

Many stockbrokers I find now advising shares in companies producing primary commodities. These include Rhodesian copper and the Australian Broken Hill issues. I dealt with the Rhodesian copper situation some weeks ago. I still feel confident regarding prospects for that market from a purely speculative angle.

Still others, and they are many, believe in the outlook for undertakings concerned with re-armament. The most important armament firm in the country is Vickers Limited. It is well-known that the firms comprising the Vickers group are forced to let out a good deal of work to other companies by way of sub-contracts. They are overburdened with work, and this is likely to continue for some time. Vickers 10/- ordinary should be worth putting away for a year or two.

I favour the chances of some of the smaller engineering companies. Indirectly, they benefit from re-armament. One firm in this position is Craven Brothers (Manchester).

This is an old-established firm manufacturing high-class machine tools. The present company was formed as a public concern a few years ago and has been really successful. Orders on hand, despite an increased output, will keep the works going for two-and-a-half years. Dividend for 1937 was 15 per cent., while the interim for the current year has been raised from 5 per cent. to 7½ per cent. The 5/- shares are now about 12/- each. They should be worth putting away for a time.

I receive good accounts of Grayson, Rollo and Clover Docks. This firm is engaged as ship repairers and engineers. Much progress has been made during the last three years. There was a 7½ per cent. dividend for 1937 out of earnings of over 48 per cent. on the capital of £105,100 in ordinary shares of 2/6 each.

These shares have a somewhat limited market. They stand around 3/6. Although the directors follow a conservative dividend policy, it is reasonable to expect some increase in the distribution this year. Shares of this description should not be regarded as permanent investments, but they are very useful in raising the average yield on an investment list when trade conditions are brisk.

AXIS ARRIVES

We have heard much lately of the Rome–Berlin axis, and now Regent's Park, following in the line of fashion, has a new axis of its own. This little deer, which was born in one of the cattle sheds, has to be guarded carefully from its father, since the latter would be dangerously clumsy with the faun at best, and would more probably be responsible for infanticide. The baby already shows the family likeness, since it is spotted in an exactly similar manner to its parents, except that these markings appear to be even more pronounced owing to the smallness of the creature. Another result of its delicate build is an ability to pass under the railings of its paddock into the enclosure of its father (just another proof that "Stone walls do not a prison make, Nor iron bars a cage"), and thus it has been found necessary to restrict its peregrinations to the "inner ward."

New Books

A NOVELIST AT THE RINGSIDE

Tales of Famous Boxers

"Shake Hands and Come Out Fighting." By L. A. G. STRONG. (Chapman & Hall; 10/6.)

BOXING is like murder: the retelling never palls. Mr. Strong in this book tells again the stories of famous fights, some of which he saw himself and some of which he has collated from the reports of others. For the most part he tells of heavy-weights, beginning with the great fight between Jim Corbett and Bob FitzSimmons and continuing down to the present day. He calls this "the big stuff," and in between he has inserted what he terms "interludes," which deal with minor fights and fighters.

Prize-fighting is one of those things which passing time makes more glamorous—we think of Gentleman Jackson and Bendigo and Tom Sayers and their kind with affectionate reverence; we believe that in those days boxing was a clean and manly sport, while we have a horrible suspicion nowadays if still a manly sport is not so clean as it might be. This is a view with which I personally do not agree. Though I cannot speak from experience I feel convinced that all the trickery and roguery which is associated, rightly or wrongly, in the minds of the public with boxing to-day, was present in the good old days. Certainly boxing to-day is not so romantic as it was, and that is because we live in the era of big purses and much publicity and ballyhoo, and this era started, according to Mr. Strong, with the victory of Jackson over Tommy Burns, after which fight the victor was immediately offered and accepted a five weeks' contract on the music halls at £350 per week. Be that as it may, the people who will read this book are those who for the most part have no knowledge of any other era in boxing than the ballyhoo era, and Mr. Strong, I submit, is quite right in devoting his attentions only to modern fighters.

He gives very vivid accounts of the big fights at the beginning of the century and pays a well-deserved tribute to the extraordinary prowess of Fitzsimmons, who, never more than a good heavy-weight, did not hesitate to take on, and in most cases to defeat, men far heavier than himself. He pays, too, a well-deserved tribute to Jack Johnson, who, no matter what one may think of his bearing outside the ring, was beyond all manner of doubt the greatest defensive boxer of all time. From then he goes on to deal with the much disputed Willard-Godson fight, the rise to fame of Jack Dempsey, the story of Carpentier, of Gene Tunney, down to the fight between Louis and Tommy Farr. But he does not, in my opinion, always give praise where praise is due. There is but the smallest mention of Max Schmeling. Schmeling would have been world champion for a good many years had he not been shut out of the American ring by methods of which no unbiased observer could possibly approve. His final crushing defeat by Joe Louis was due, I think, not to any great skill on Louis's part, but to the combination of all those slights and forced inactivities to which the American public had forced him. Again he does not give sufficient credit, I think, to McTigue—and he is in agreement with most English writers—for that Irishman was as a matter of fact a very fine boxer indeed with a very fine punch, and his defeat of Siki was certainly as clear cut as Dempsey's defeat of Carpentier, even though the manner in which it was accomplished was not so dramatic.

Mr. Strong is not afraid to hint on many of the abuses which are present in British boxing: and I hope that his book will be read by those who I suppose control the sport. It is not too much, I think, to say that too great attention is paid in this country to champions, bouts for eliminating championships, to levies of purses and to all the red tape of control, and far too little attention paid to the honest hard-working professional fighter out of whom an unscrupulous manager—and there are plenty of them—makes easy money.

This is a very good book, very well illustrated. I have read it right through and shall read it right through again, and it has brought back to me memories of many good fights that I saw myself, and the photographs have recaptured for me momentarily many a thrill that I have half forgotten. That, I think, is an achievement of which Mr. Strong may well be proud, for the retelling of a story that has been told so many times before is not nearly so easy as those who do not write but imagine. Mr. Strong has, I suspect, failed in his immediate object. He wrote the book apparently because a disgusted friend could not understand why he liked going to fights; he makes out a very good case for himself, and for all those who like going to fights, but I very much doubt whether he has convinced his friend. B. V-F.

* * * *

Marlborough: His Life and Times. Volume IV. By the Right Hon. WINSTON S. CHURCHILL. (Harrap; 25/-.)

Mr. Winston Churchill has completed in this, his fourth volume, the only really authentic full length picture of John 1st Duke of Marlborough, and though his subject is by the nature of things his hero, it is an interesting fact that it has taken nearly two hundred years for the character of the greatest British soldier to be divorced from intense political prejudice. Mr. Churchill does not fail to draw political comparisons—"the story is pregnant with applications to the period in which our lives are cast"—but he does not attempt to gloss over the weaknesses of his ancestor. The volume is in many ways the best of the four. It lacks the shrillness of the first and the too purple patches that at times disfigured the third.

Mr. Churchill makes no efforts to write down the huge presents that Marlborough was offered and accepted under circumstances quite foreign to modern standards, nor does he deny the unlovely avaricious side of Marlborough's character: but he does resist to the full the peculation charge brought against him after his fall, and clearly the maladministration of funds is unlikely in a man to whom waste and lack of value would have been as a bruise to the soul.

This volume is, alas, most unpleasant reading in the week of the Godesberg conversations. It deals with the desertion by England of the Grand Alliance, which was so nearly akin to the modern League of Nations, and it shows how a triumphant country can be bereft of its conquests by pacifist reaction. The weakening of the will to war in England led inevitably to a prolonged resistance on the part of the French, so that the triumphant issues of 1709 were in the course of a very few years frittered away. Marlborough was driven from the scene of his triumphs, Sarah from the scene of her dominations. It is not to be supposed that such chances as this are lost on the pen of Mr. Churchill.

In the military sphere the volume deals fully and clearly with the final victory of Malplaquet, in many senses a Pyrrhic triumph, but one that showed certain sides of the duke's unruffled control to the full. But its reactions on his critics may in some respects be likened to that of the autumn battles in Flanders to those who doubted Sir Douglas Haig. Finally, we have that last scene over the deathbed of Queen Anne, when but for the implacable and iron control of the Whigs and the shifting opportunism of Bolingbroke, the Stuart Succession might well have been assured.

The end of the volume deals with Marlborough's last years, and the period of rest in which the walls of Blenheim rose, and the malignant fires of party politics began to be banked. The powers of John were failing, but those of his Duchess—"Sarah prowled round his couch like a she-bear guarding its slowly dying mate, and tearing all, friend or foe, who approached"—remained dominant. And though the words are well known one cannot refrain from quoting once again her reply to the "proud" Duke of Somerset's proposal in her widowhood: "If I were young and handsome as I was, instead of old and faded as I am, and you could lay the Empire of the World at my feet, you should never share the heart and hand that once belonged to John Duke of Marlborough." There is nothing there but dignity and restraint: none of the fuming termagant of the Queen's Bedchamber.

In any ordinary historical writer this book, carefully compiled, containing many entirely new sources of information, and written in something of the Grand Manner of Gibbon, would be an achievement of the utmost distinction. Coming from the pen of a man who throughout the whole period of its writing has been fully and closely preoccupied with great events it is likely to remain unique. M. T. S.

* * * *

The Good Pain. By ELIZABETH HOLLISTON FROST. (Martin Secker; 6/-.)

This is an unusual novel, the scene of which is laid in the French village of St. Ciry-la-Popie. The book is written in the form of a succession of tales, each one dealing with one or more members of this strange little community.

The "Good Pain" runs through the book like a refrain, constantly recurring, a refrain which may not be to everybody's taste, but which throws an interesting light on the customs and traditions of a lovely part of Southern France. V. R.

* * * *

Lad. The story of a Border Collie. By Lady KITTY RITSON. 15 illustrations. (A. & C. Black; 5/-.)

Here is an excellent book for all children who love dogs. Which is not to say that this story will have no appeal for the older generation, but it is written in such a way that, to my mind, the volume would be most suitable as a school prize or birthday gift. We are told all about a Border Collie who, had it not been for his young mistress, would not have survived the early days of puppyhood. His training and subsequent exploits are related in a simple form which, nevertheless, has much of interest and not a little charm. V. R.

* * * *

In Czechoslovakia's Hinterland. By HENRY BAERLEIN. (Hutchinson; 12s. 6d.)

Mr. Baerlein is probably right when he says that few people in England know where Ruthenia is. They will be little the wiser when they have read what Mr. Baerlein has to tell us, and there is no map. But they are almost certain to be charmed with his pictures of the inhabitants of that district; and beginning to wonder about the quickest routes to such a delightful spot—at least that would have been the reaction a few weeks ago!

The author writes fluently, and has an exquisite style for conveying the human touch. This is really a series of conversational essays, and though we shall learn little of the political controversies, the best way of getting to know people is to chat with them. It is books such as this that we stand in need of to-day. C. N.

* * * *

Ride to Russia. By BERNARD NEWMAN. (Herbert Jenkins; 10/6.)

Bernard Newman and "George" (his bicycle) have made yet another journey through Europe. Their jaunts are occasions for rejoicing amongst their "fans," and this time Mr. Newman rode to Russia via Germany and Czechoslovakia—the present European crisis adds interest to the choice of route. Once again we are told that the author is not interested in politics, but in people, and only where those touch does he stop to discuss the former; he recounts a few conversations he had, where the theme was political, but definitely that is not the object of the book. This is refreshing. Mr. Newman's publishers allow him 5/- a day to live on, to ensure his staying in inns and lodgings not frequented by the luxury or normal tourist. This state and Mr. Newman's abounding tact certainly achieve the object and he has made most original and entertaining contacts. He visited and mixed with all classes of the countries, from the peasants and factory workers, gypsies, "minorities," State officials, to a stray princess and a prominent President.

There is a charm in humour which is irresistible even when languages are unknown, and this asset Mr. Newman has to the full; it is apparent on every page and has supplied him with countless opportunities. There is a sane common sense tucked into those travels which is stimulating. C. N.

It's time to visit SOUTH AFRICA

DON'T you ever feel, when you come to the last page of a particularly vivid book of travel or adventure, that you yourself would like to do something different, to face new experiences and see how other people live?

Well, why not? Pack your trunks and take a holiday in South Africa. It is a country reserved by Nature for holiday-makers. Picture a land where the sun but rarely hides his face, where the air is as exhilarating as champagne, where flowers and trees deck hillside and meadow with a mantle of brilliant hues, and everywhere the mysterious lure of Africa surrounds you with its subtle hypnotic charm.

Picture the mighty scenic wonders of Africa—the Victoria Falls, an epitome of inexorable power and faerie loveliness, the magnificent Drakensberg Mountains, the unparalleled opportunity to study wild animal life at close quarters, the fascinating Native life and customs, the gay social life of the busy modern towns.

Go to South Africa this year and bask in the sunshine of an alluring land. The voyage there is one of restful comfort and takes only 14 days. Illustrated brochures obtainable from the Travel Bureau, South Africa House, London, W.C.2, or accredited Travel Agencies.

MR. R. G. HEATON'S CHEVERELLS AMBER RETRIEVES A PHEASANT

FIELD TRIALS

RETRIEVERS AT SOUTHILL

THE Herts, Beds, Bucks and Berks Retriever Trials were held by kind permission of Mr. S. H. Whitbread, at Southill, Bedfordshire, on October 21st and 22nd. The judges were Mr. B. B. Riviere, Major H. Doyne-Ditmas and the Hon. W. Holland Hibbert. Game was plentiful, well shown on both days and the weather perfect.

The Non-Winners' Stake, on the 21st, was won by Mr. R. G. Heaton's Cheverells Amber, handled by Mr. R. Leach. This dog went a good pace, had plenty of drive and brought well to hand. The second and third prizes were awarded to Miss Bickerton's Shelsley Nymph and Mr. W. H. F. Brunskill's Bolnhurst Bet, the former of these also ranged freely, and retrieved a good runner, but did not always deliver well to hand. Bolnhurst Bet worked steadily and found two runners. Certificates of merit were allotted to Miss Hyde Harrison's Pavenham Vivid, the Hon. Mrs. Hill-Wood's Hiwood Cry, Mr. Gilbert Turner's Abbott of Winscales and Major G. H. Barnett's Lochar Lido Lady (Gyp).

The Nomination Stake and Knutsford Challenge Cup on the 22nd, was won by the Hon. Mrs. Hill-Wood's Hiwood Mike, who put up an excellent performance, particularly excelling himself in finding a bird in roots that four other competitors had failed to pick. He not only marks his birds well, ranges well out, and retrieves quickly and to hand, but when necessity arises works every inch of the ground with his nose well down. Mr. R. G. Heaton's Cheverells Amber secured the second prize. She was a good runner-up, and fully confirmed the decision of the previous day. Her handler, Mr. R. Leach, won the prize for the best keeper-handler. Third prize was awarded to Mr. H. S. Loebl's Hesloe Nigger, handled by Mr. R. Buckell. Nigger is a fast worker and showed himself a very useful performer.

Scent was not good on either day, birds being especially difficult to find in brussels sprouts. This made it impossible for the judges to award any prizes in the Nomination Stake except the first three, and this fact should please some critics of retriever trial judging, who wrongly maintain that dogs are judged solely on style and not on their success in finding dead or wounded birds. After luncheon the chairman, Sir Lionel Halsey, made a sympathetic reference to the recent death of Mr. Peter Clutterbuck, who, with the late Lord Knutsford, was one of the original founders of the society. Sir Lionel also thanked Mr. J. H. Whitbread and his son for their great kindness in allowing the trials to be held at Southill.

EASTERN COUNTIES RETRIEVER SOCIETY

By kind permission of Lord Somerleyton, these working trials were held at Somerleyton Park, Lowestoft, on October 18th and 19th. The judges were Mr. J. Bell, Major J. I. Benson and Mr. E. Winter.

The first prize in the All-aged Stake went to Mr. H. M. Peacock's Labrador bitch Greatford Shy, second and third places being filled respectively by Major D. G. Astley's Labrador Dander and Mr. C. H. Kennard's Labrador Pettistree Dan. Mr. H. M. Peacock's F.T. Ch. black interbred bitch Greatford Quickstep was fourth, and Captain E. H. Buxton's Labrador bitch Maryrose of Saxmundham reserve. Awards of honour were made to Wing-Commander P. K. Wise's Labrador Sweepson and Mrs. Breitmeyer's brown curly-coat Snapehill Brown Boy. The following received certificates of merit. Mr. J. Whitworth's Labrador Tolly of Hamyax. Mr. B. B. Riviere's Labrador bitch Belmore Gin, Lord Somerleyton's red Labrador Peter the Piper, Dr. W. Collin's Labrador Colwill Diamond, Mr. H. Whitworth-Smith's Golden retriever bitch Quick of Yelme and Mr. F. P. Busuttil's Labrador bitch Desta.

SPRINGERS AT WOODALE

On Thursday and Friday, October 13th and 14th, the North Western Counties Field Trial Association held their spaniel trials on Captain W. R. Burrill-Robinson's ground at Woodale, near Middleham, Yorkshire.

The weather was wild and stormy on the first day, but the second day was fine, if somewhat windy. Game was plentiful in spite of the adverse weather conditions, and some really splendid spaniel work was seen on both days. This ground is ideal for spaniels, and the dogs were really well tried out for stamina and game-finding properties. The Novice Stake in particular was very keenly contested and was won by Mr. A. Byrne's Tedwyn Toddy, a win which was undoubtedly very popular. Mr. T. B. Laird's English springer, Solo Event, winner of the Open Stake, gave a very polished performance which stamped her as a springer with a future. Mr. C. A. Phillips's cocker bitch, Rivington May, won the Open Cocker Stake, and was very creditably handled by C. Thompson, a worthy son of Mr. Phillips's old handler, J. Thompson, so well known to all spaniel trial enthusiasts. The meeting was on all sides voted one of the most successful and enjoyable held by the Association. The results were as follows:

OPEN STAKE (ANY VARIETY EXCEPT COCKERS) RETRIEVING SPANIELS.—1st, Mr. T. B. Laird's English Springer b., Solo Event; 2nd, Mr. A. Byrne's English Springer b., F.T. Ch. Tedwyns Tonic; 3rd, Captain J. H. Rhodes's English Springer b., Harstonia Sally; Reserve and Award of Honour, Mr. Selwyn C. Jones's English Springer b., F.T. Ch. Style O'Vara; Award of Honour, Captain A. Beal's English Springer b., Wistful; Certificates of merit: Mr. J. F. Houstoun-Boswall's English Springer d., Glanton Sport; Dr. J. A. Jamieson's English Springer b., Peerless Tess; Mr. J. Mortimer's English Springer d., Wag Hill Dash; and Mr. Selwyn C. Jones's English Springer b., Squib O'Vara.

NOVICE STAKE (ANY VARIETY).—1st, Mr. A. Byrne's English Springer d., Tedwyns Toddy; 2nd, Wing-Commander P. K. Wise's English Springer d., Raithburn Prince; 3rd, Captain A. Beal's English Springer d. Garrigill; Reserve and Award of Honour, Captain A. Beal's English Springer b., Wistful; Certificate of Honour, Wing-Commander P. K. Wise's English Springer d., Raithburn Rughe; Certificates of Merit: Mr. J. Mortimer's English Springer d., Wag Hill Dash; Mrs. R. T. Amour's English Springer b., Swift Arrow; Mr. G. Blacklock's English Springer d., Cocky Leekie.

OPEN STAKE FOR COCKER SPANIELS.—1st, Mr. C. A. Phillips's b., Rivington May; 2nd, Mr. C. C. F. Addie's b., Yoredale Jen; 3rd, Wing-Commander P. K. Wise's d. Raithburn Smut. Reserve, Mr. E. A. Walker's d., Markover Titch. Certificates of Merit: Mr. C. C. F. Addie's d., Yoredale Snipe; Mr. G. Blacklock's b., Browster Bridget; Mr. E. A. Walker's d., Yoredale Yorker; Mr. C. A. Phillips's b., Rivington Bean.

The judges were Messrs. G. H. Turner and G. Girdwood.

BLACKGAME.

GOLDEN RETRIEVER CLUB

By kind permission of Sir Thomas Cook, M.P., the Non-Winners Stake of the Golden Retriever Club was held on October 26th, at Sennowe Park, Guist, Norfolk. The judges were Sir Giles Sebright, Bt., Sir Hugh Ripley, Bt., and Captain H. F. H. Hardy. The stake was for twelve dogs and bitches, and the results were as follows:

1st, Mr. H. Wentworth Smith's b., Veritas of Yelme; 2nd, Mrs. Nagle's b., Sulhampstead Dazzle D'Or; 3rd, Commander Mack's b., Sea Rose. Reserve and Certificate of Merit: Mrs. Hervey-Bathurst's d., Colin of Tyrconnel.

A Qualifying Certificate was granted to Mr. J. Whitworth's Yellow Labrador b., Tessa of Hamyax.

SPANIEL SOCIETY

On October 24th and 25th the fourteenth meeting of the society was held at Stratford-on-Avon. The judges were Captain Gilbert H. Turner and Mr. John Cady. The results of the trials were as follows:

JUDGING GOLDEN RETRIEVERS IN THE WATER TEST AT SENNOWE PARK. MRS. HERVEY-BATHURST'S COLIN OF TYRCONNEL RETRIEVING

OPEN ALL-AGE STAKE for Field Spaniels only.—1st, Mr. Lewis G. Beaumont's b. Saxpence of Skerries; 2nd, Major H. Beaumont's Brag of Stronds; 3rd, Miss S. Beaumont's Newburie Chips. Reserve, Major H. Beaumont's Bairam of Stronds.

NON-WINNER STAKE for any variety of Sporting Spaniel which has never won a first prize (excluding specials) at Spaniel Trials prior to November 10th, 1937.—1st, Mr. F. M. Prime's English Springer Mr. Sprigg; 2nd, Mr. H. C. Cumberbatch's English Springer b. Blendworth Linda; 3rd, Mrs. F. C. Hollingsworth's English Springer Dagnall Duncan. Reserve, Captain N. W. Tredinnick's English Springer Newburie Sport. Certificates of Merit: Miss J. Featherstonhaugh's English Springer b. Rockstead Footflash, Lieutenant-Colonel C. D. Horsley's English Springer Laughal, Major H. Beaumont's Field Spaniel Bairam of Stronds, Mr. C. McNeill's English Springer Spanks Son, Mr. H. S. Lloyd's Cocker Spaniel b. Golden Ray of Ware, Captain O. P. Traherne's English Springer b. Noranby Pelican, Miss S. Beaumont's Field Spaniel Newburie Chipps, Mrs. W. R. Calvert's English Springer Eromtew Pod, Rev. E. J. Nelson's English Springer Blendworth Jack, Mrs. W. R. Calvert's English Springer b. Eromtew Judy, Mr. A. M. Horsburgh's English Springer Goldeneye Drake, Mr. W. K. Hulme's English Springer b. Grendon Judy (First Reserve).

OPEN ALL-AGE STAKE for any variety of Sporting Spaniel other than Cocker.—1st, Major H. Beaumont's Field Spaniel b. Butter of Stronds; 2nd, Captain O. P. Traherne's English Springer b. Bryngarw Daisy; 3rd, Captain O. P. Traherne's English Springer b. Bryngarw Fireside. Reserve, Mr. W. D. Edwards's English Springer Hillhampton Spark. Certificates of Merit: Mrs. F. C. Hollingsworth's English Springer Dagnall Duncan, Captain N. W. Tredinnick's English Springer Newburie Sport, Major H. Beaumont's Field Spaniel Brag of Stronds, Mr. F. M. Prime's English Springer Mr. Sprigg, Mr. L. G. Beaumont's Field Spaniel b. Saxpence of Skerries, Cadet J. Calvert's English Springer F.T. Ch. Bobble, Mrs. W. R. Calvert's English Springer Staindrop Stop Bright, Lieutenant-Colonel C. D. Horsley's English Springer Spaniel b. Holefield Sally.

OPEN ALL-AGE STAKE for Cocker Spaniels only.—1st, Mr. R. MacDonald's Rockstead Footspur; 2nd, Mr. R. Hill's b. Nip of the Links; 3rd, Miss J. Wykeham-Musgrave's b. F.T. Ch. Poddle Crankle. Reserve, Miss J. Wykeham-Musgrave's b. F.T. Ch. Poddle Cricket. Certificates of Merit: Mr. R. MacDonald's b. Rockstead Foothopper, Miss A. L. Beaumont's Bisto of Stronds, Mr. H. C. Cowles's b. Glenley Bess, Mr. H. S. Lloyd's b. Golden Ray of Ware, Miss M. Carnegie's b. Heydown Dinah, Mr. H. S. Lloyd's Nawn.

Qualifying Certificates Granted: Mrs. A. Kirk's Golden Retriever Abbots Trust, Mrs. Gwen Broadley's Black Labrador b. June of Sandilands, Mr. M. D. Withers's English Springer Showman of Shotton.

Problems of Scrummage Formation

NOT only is the scrummage the storm centre on the playing field but in committee meetings, clubs and periodicals the storm rages on throughout the year.

Only last week I drew attention to the deviating interpretation of the scrummage rules during the match between Cambridge University and the Harlequins earlier this month, when Mr. W. W. Wakefield seemed to be of one mind and W. O. Chadwick of quite another. The former, being the referee, had the advantage and Chadwick suffered accordingly.

The rules of hooking are but one difficulty of many. Another is the devastating habit of the modern wing forward to pounce on the opposing scrum half before that unfortunate individual has had time to get rid of the ball. We have all grown extremely warm over this last point, and although in some ways it is an unfortunate state of affairs, the wing forward is unduly maligned, and more rubbish has been spoken and written to his degradation than any one individual fairly deserves —especially since his behaviour is legally justified and is born of an ability and quickness which are the outcome of modern methods and practice.

It is interesting in the light of all these conflicting opinions to consider the merits and demerits of the two systems of scrummage formation. The one known to all of us is the usual 3-2-3 "lay-out," forming a solid block of heaving, sweating manhood from which emerges much bad language, innumerable law infringements and, if all goes according to plan, the ball.

The second is the 3-4-1 system which was used by both sides during the recent South African tour and has been adopted this season, up to the present at least, by the Oxford University side. Much weighing up of its merits was done when the South Africans toured this country in 1931–32, forming down in this manner with such excellent results. Now the problem has become even more — well, "pressing" would seem to be the most appropriate word.

The relative value of these two formations is difficult to assess since we have experienced too little of the 3–4–1 style to offer judgment with any fairness, but that it has its uses with certain conditions prevailing there can be no doubt.

I see that Walker, the English captain in the South African tour, said: "The South Africans were particularly strong forward, the pack being big and fast and able to handle like three-quarters. They played the 3–4–1 formation in the scrums, and it proved so successful that we adopted it. From that time onwards we began to get the ball in the scrums. It is obvious that more thought will have to be paid to this formation in British Rugby."

The whole problem is one of weights and measures, and the great point of a 3–4–1 arrangement of forwards is to have three front-row men of exceptional bulk. Without them an orthodox scrummage will easily have the ascendency because, as can be seen from the accompanying sketch, the shove of the outside man in the second row (shown as D) is only indirectly exerted on the scrum, while orthodoxy presents a solid and compact front. Mathematically, this is obvious, but in practice, of course, the thrust from the back row (U T S) is transmitted through the second row, and because the human body has a certain spring effect and no second-row player can be expected to be perfect in other ways, a good deal of the drive is lost, while in the other conformation it is at least direct thrust.

Potentially, the unorthodox packing is a line short, and the ball comes out more cleanly and with more speed, while the odd man (H) at the back can guide it to whom he will.

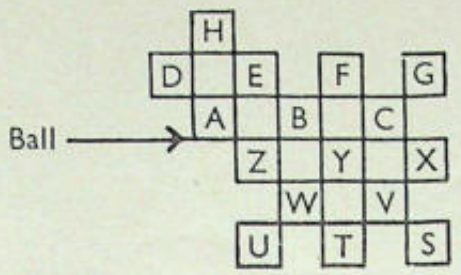
The presence of D and G make it increasingly difficult for the enemy to get at the ball, which has found its way, via H, out to the scrum-half. According to some, H himself constitutes a problem. If he is allowed to pack down between D and E and the ball comes out—as in 99 cases out of 100 it will—between E and F, he is hindering the defending scrum-half from getting at his opposite number, and is thus causing obstruction in a manner which is a contravention of the spirit, if not of the letter, of the law, since he forces the scrum-half into an offside position.

It has been suggested that H should be made to pack between E and F, and nowhere else. I have been speaking to a friend who at one time played as H for a well-known Midland team, and he tells me that he was made to pack in the middle—much to his indignation. A large proportion of the value of this type of scrummage goes when H is not allowed to become an unknown quantity.

From the sketch it can at once be seen that the preponderance of weight is on the side of the top scrum's loose head (A), and that to wheel the scrum right round is simple. If H decided to go down with F and G instead, even with X on the other side being the loose head, it would be very little more difficult to slue the whole pack the other way. Fix H, and this quality is lost.

The position which arises when both teams are packing 3–4–1 is interesting, for the wing forwards are closer to one another now than in the other formation, and therefore a row nearer the opposing half-backs which offers obvious advantages to the defending team and is an effective counter to the value of the quick heel.

Whatever the finer points of the matter may be



there is no doubt that with the orthodox scrum the weight and importance lies with the second row, while in the 3–4–1 method the front row must supply the bulk. It may be remembered that in the 1932 team the South Africans played Kipling, Mostert and Louw, who stood 6ft., and tipped the scale at about 15st.—that is enough to bear the brunt of almost any opposition!

Experiment will show which is the most favourable formation, but I cannot help feeling that 3–2–3 will remain ultimately as the more efficient. Without weight and experience 3–4–1 is hopeless, and if it were to be introduced generally the result would be, I believe, disastrous. The wingers would begin to shove even less than they do now in the old formation. It does not necessarily follow that what is an enormous success in an International team will be similarly effective in ordinary club or school Rugby.

L. N. R.

FROM TEE TO GREEN

I.—The Drive

By E. R. TIPPLE

THE drive is probably the most spectacular and most popular shot in golf. As it is the beginning to a hole much depends on it. Within limits we are allowed to choose where we shall stand and where we shall tee up the ball. Everything is in our favour so that we cannot blame a bad lie for a bad shot. Yet how many golfers handicap themselves and fail to do themselves justice on the tee.

No doubt one of the most common faults is to try to do too much. Too many players hit hard and hope for the best. They see the fairway before them and are satisfied if their ball finishes somewhere on it. In other words, few have a definite target at which to aim when driving. A little foresight beforehand would save many wasted strokes. The studious golfer, before he drives off, will look beyond the immediate fairway to the green, notice where the flag is, and decide from which angle he can best attack it. This practice of planning the next stroke in advance can be followed by any handicap golfer. He will not always succeed, but his play will improve by degrees. As Lady Heathcoat-Amory has pointed out: "The object should be to use technique intelligently rather than automatically . . . at some holes there will be nothing gained by striving for excessive length; at others a decided effort may very likely be called for."

The ideal tee-shot achieves the desired direction, length with as much run as possible, the maximum power of the individual being applied. It should be a straightforward shot without spin. That demands a sound swing, free movement of the arms, correct weight transference and balance. The slightest suspicion of any tension will ruin the stroke. The methods adopted must vary according to the individual and his physical capabilities. If you are short and stout it is not the slightest use trying to emulate the example of, say, Archie Compston. If you are tall you will not benefit by attempting to imitate Jones. The local professional can assist you more than anyone as regards the various movements of the actual swing. Personal idiosyncrasies do not matter so long as the fundamental principles are carried out faithfully.

The width of the stance for the tee-shot depends on the height and build of the player and his natural walking stride. It is imperative to be comfortable. Cotton says that when in doubt "you should stand too near the ball rather than too far away from it, but not so near that you are all cramped up or so far away that you have to stretch out to reach the ball." In gauging the distance between the player and the ball this old method may be of help. The ball should be so situated that when the club is laid with its heel to the ball the end of the club shaft touches the players' left knee. But this measurement naturally varies according to the "lie" of the club. As the drive is a sweep rather than a hit the ball should be either opposite the left foot or at a point just inside it—the experts differ, but all agree that it must not be nearer the middle of the stance.

Cotton walks with his toes slightly turned inwards, so he has found the "pigeon-toed" stance the most suitable. Others believe that an open stance is to be preferred. Padgham uses practically a square stance, but he has his left foot turned outwards, slightly to ensure, as he calls it, "a snappy follow-through." This stance, or one rather more open, does help to get the weight through. And the question of weight transference is all-important.

Abe Mitchell is one of the finest exponents of good driving, even when a gale is blowing. Like the Whitcombes he appears, and is, perfectly steady on his feet and keeps his weight behind the ball. In his book, *Length on the Links*, he lays stress on this vital point—weight transference. "The back swing should be made in such a way that the weight is transferred from foot to foot along a line parallel to the line of flight. The back swing should begin at the feet, not at the shoulders," he says. "Hitting at the top of the swing is proof of a natural anxiety to complete the stroke." Mitchell believes that this is caused by "the legs not holding so that the player feels he must use his arms at once." Therefore he bids us concentrate on our feet and legs to get length and "not to go all out with the arms."

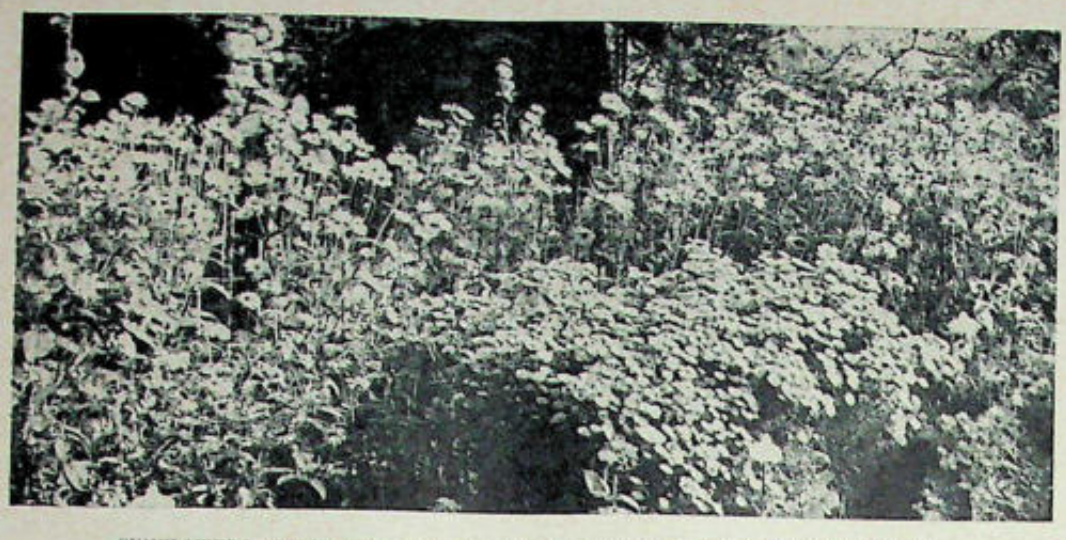
The famous American professional, Alex. J. Morrison, has proved one of the most successful tutors of his time, and he lays stress on aiming the chin at a point just behind the ball and keeping it there until the ball has been hit. Mitchell also advises looking at the ball with the left eye, and thus your weight will be behind and not in front at impact. I have noticed that the majority of first-class players have adopted this practice, and I am convinced that it helps the follow through in particular.

It has been said that one can tell whether a shot has been a good one or not by looking at the player's finish. Certainly one can always discover the good players by their position at the end of the swing. The follow-through is not a pretty poise for the benefit of any stray photographer or admirer, but is a definite reflection on how the swing has been made. Even the experts vary as to how they finish their drives. Some have their hands held high, others have turned their bodies to a great extent, but all have preserved their balance. They are steady on their feet and have not moved. It is not too much to assume that if a player is correctly balanced at the end of his swing he has been in control during it.

If a player is falling over himself after the ball has been hit—one foot up in the air or feet both turned round facing the objective—it is obvious that faults have occurred before the moment of impact. Compston puts the matter in a nutshell when he states that we should "visualise the proper finish" before we play the shot. Our ideas will differ according to our capabilities, but if we try to gain a sense of balance we will eradicate many of our faults.

The question of the driver itself is a personal matter. The modern tendency is to use a deep-faced club with hardly any loft. If such a one is used a high tee is necessary. It gives maximum amount of run. On the other hand a shallow-faced club is easier to handle, and I know one golfer who has improved his driving by having a little loft put on the face of his club. He told me this alteration has given him greater confidence, and whatever club we decide to use, we must be confident of it. It is wiser to use a light club than one that is heavy. Too heavy a head will tend to destroy any rhythm that our swing may possess, and before the round is finished it may tire us so that we can hardly wield it.

Some tee-shots are more difficult than others—or at least we like to think they are. The trouble is the mental attitude. So many players are beaten before they take up their stance. Morrison's words should be remembered: "The ferocious effort to 'concentrate' results in rigid muscles and stiff joints, which are fatal." If the word relaxation is substituted for concentration then good driving would be easier than many golfers imagine possible.



SUNFLOWERS ASSOCIATED WITH MICHAELMAS DAISIES IN AN AUTUMN BORDER

The Country House

SUNFLOWERS

"Most Precious for the Autumnal Garden"

By ELEANOUR SINCLAIR ROHDE

IN spite of their beauty many folk despise Sunflowers, but those of us who share cottagers' tastes like their hearty splendour and the warmth and light they diffuse in a border. We are at least in good company in liking them for the late Mr. William Robinson described them as "most precious for the autumnal garden when well placed." The annual Sunflower he described as "one of the noblest flowers we have and one of the most effective for various positions."

The annual kind was probably more appreciated when introduced over 300 years ago, when the tales of the Sunflowers made of gold worn as diadems and breast-plates and carried in their hands by the virgins who officiated in the temples of the Sun in Peru, were still fresh. The splendour of this spectacle greatly impressed the Spaniards and the flowers, when first introduced, speedily became popular. Gerard grew them in his London garden under the name of "The Flower of the Sunne or Marigolde of Peru." He states, proudly, that with him they had attained a height of 14ft., but that in Spain they had been known to grow 20ft. high. Parkinson, in his *Paradisius*, calls the Sunflower "a goodly and stately plant," and comments on the characteristic downward curve of the flower head which he describes as "bowing downe the head unto the Sunne." The popular error that the flowers turn to the sun has been perpetuated through the centuries, especially in the French name Tournesol. So far from this being true the plant branches in all directions, and the flowers do not change their positions. Thomas Moore used the poetical idea of turning with the sun in one of his most popular Irish melodies.

> "As the Sunflower turns to her god when he sets
> The same look that she gave when he rose."

When first introduced the annual Sunflower was grown not merely for its decorative value but for food. The heads were cooked and eaten in the same way as Globe Artichokes. Parkinson observed "they are accounted of some to be good meate, but they are too strong for my taste." The peeled seeds are supposed to have an almond-like flavour, and were used in salads, but I think the resemblance is remote.

I like the tall-growing annual Sunflowers, associated with Hollyhocks, *Bocconia cordata*, Hemp Agrimony and other giants. In a border about 60ft. long by 10ft. wide, and in the rich soil they like, I am going to try a mixture of annual and perennial Sunflowers, associated with Hollyhocks, *Bocconia cordata*, Hemp Agrimony, the giant Fennel (*Ferula gigantea*) and *Molopospermum cicutarium*. With the splendid foliage of the *Molopospermum* in front, this border should look effective in late summer.

The varieties of the annual Sunflower are now fairly numerous. The tallest growing is *H. giganteus* Russian giant. *H. citrinus* is always pleasing. The miniature species *H. cucumerifolius*, which grows about 3ft. high, is a native of Texas and the most popular varieties are the Stella Red hybrids. Well grown and given sufficient space, they make fine plants branching in all directions, but I never find the colourings attractive. Last season, however, a friend sent me seed from California. What a difference! Instead of the rather rough untidy foliage and the dingy colouring of the small annual Sunflowers commonly grown in this country the foliage was glossy and handsome, and the flowers for the most part an almost metallic yellow or rich butter colour. Some of them were poorly coloured, but seed of the best I am carefully saving after taking steps betimes to see that my diligent little bees have no chance of hybridising them.

All the annual kinds do best where they are to flower, but in bleak parts they are commonly sown in boxes in March or April and planted out in May.

If you save your own seeds it is more important with Sunflowers than with almost any other annuals to take them from the first large heads produced by each plant. Anyone who grows Sunflowers in quantities notices that the flowers vary greatly. Some are magnificent 8ft. to 10ft. high, branching splendidly, whereas others grow only about 5ft. high and have comparatively small flowers. The finest plants are those raised from seed of the first very large flowers, the only ones that have the characteristic downward bend. Birds are very discerning where Sunflower seeds are concerned. Before those in the large heads even begin to turn colour the birds attack and strip them. It is, therefore, necessary to cover the heads with muslin bags in time, for if you leave them even a few hours too long you will probably find every seed taken and the ground strewn with husks. The secondary heads the birds hardly trouble about.

The perennial Sunflowers, like the annual kinds, have the merit of a long flowering period, usually six weeks. *H. multiflorus*, a native of Virginia, was introduced in the sixteenth century. Apart from the double form, there are now numerous varieties, and like the type they are amongst the few showy flowers that succeed in town gardens. None of them set seed in this country, but they are all easily increased by division. Amongst the best varieties are Loddon Gold, which was awarded the A.M. of the R.H.S. in 1922, H. major, Meteor and Soleil d'or. The earliest to flower is the anemone-flowered variety Queen Victoria.

The handsomest of the perennial Sunflowers is indisputably *H. sparsifolius*, sometimes listed as Monarch. This magnificent species, with flowers on 8ft. stems, does not bloom as a rule till mid-September, but it continues till November. Like the better Asters, it is a slow spreader, whilst the poorer sorts are rampant growers.

H. orgyalis, a native of the plains of Nebraska and Texas, was introduced in the nineteenth century It is a remarkably graceful species with its 8in. willow-like leaves on stems 8ft. high. The flowers are small. Except in wind-swept parts the stems, in spite of their height, need no staking. Miss Jekyll used to pull the stems down and peg them across and between Eryngiums, and in this position the plants are seen in full beauty, for the flowers in the axils of the leaves are all visible.

H. rigidus syn Harpalium rigidus, a native of Georgia and Texas, is a very variable species. The best forms are Miss Mellish and Daniel Deware. The former produces flowers in overwhelming profusion, and the latter has florets twisted like those of Japanese Chrysanthemums.

H. tomentosus is very attractive with its greyish downy foliage. It attains about 4ft. By many this is regarded as the best of all the Sunflower tribe, and it is certainly worthy of a place in every border.

TREE SURGERY

MANY trees planted to form terminal features to lawns have grown beyond a useful size and now dominate the gardens to such an extent as perhaps to dwarf the house and the lawn completely, to shut out sunlight, or to reduce the usable area of the lawn. It is the unfortunate effect of lack of foresight on the part of our ancestors in planting large quick-growing species instead of the smaller trees, the red horse chestnut, the common maple. Skilful surgery can reduce the span and height of a tree, but still retain its essential and typical form, and the more simple operations can be undertaken by the amateur.

The reduction in the span of the tree does not present any great difficulty. It is not a very hard task to examine the branch system, remove those that are likely to rub and thus damage better branches, and to cut back the ends of all the branches 3ft., 4ft. or 5ft., thus reducing the span of the tree by twice that amount. The aim must be to leave a framework of sturdy branches capable of producing healthy shoots.

The lower branches will usually sweep the ground, and if it is desired to give headroom under the tree it may be necessary to remove the lowest ring of branches. These will all be large, and there may be five or six of them. They may be removed by cutting in the manner described last week, but it would be fatal to cut all at once. The tree would never be able to manufacture enough callus to heal all over, and quite apart from this the shock would be very severe, and if a dry summer followed the tree might die. The removal of a single large branch is a severe shock, comparable with the removal of a limb from a human being, so it is clear that the cutting of five or six large branches should be spread over three years, cutting two a year.

The effect of the removal of a large branch or branches is very different from the removal of a limb from a human being. The tree is stimulated to active growth and to reproduction. It will seed fruitfully, and immediately start to heal over the cuts. It will also start to branch rapidly, and this active growth appears to increase the susceptibility of the tree to disease, hence the need for protection of the cut surfaces as described last week.

The older a tree is the less vitality it possesses, and the less its healing power, and power of making fresh shoots. For instance, in an old beech, cutting of a branch produces nothing but a few weak and straggly shoots. The best course is to cut a tree when in its early prime, when little but shortening back of branches is needed, and to repeat the operation every five years or so, training the tree into the desired size and shape, but being careful to make the shape the natural one for the species. When this has not been done it may be found that the height of a tree needs reducing to let more light to the house or lawn, or to reduce the dominating effect of an over-large tree on a small lawn.

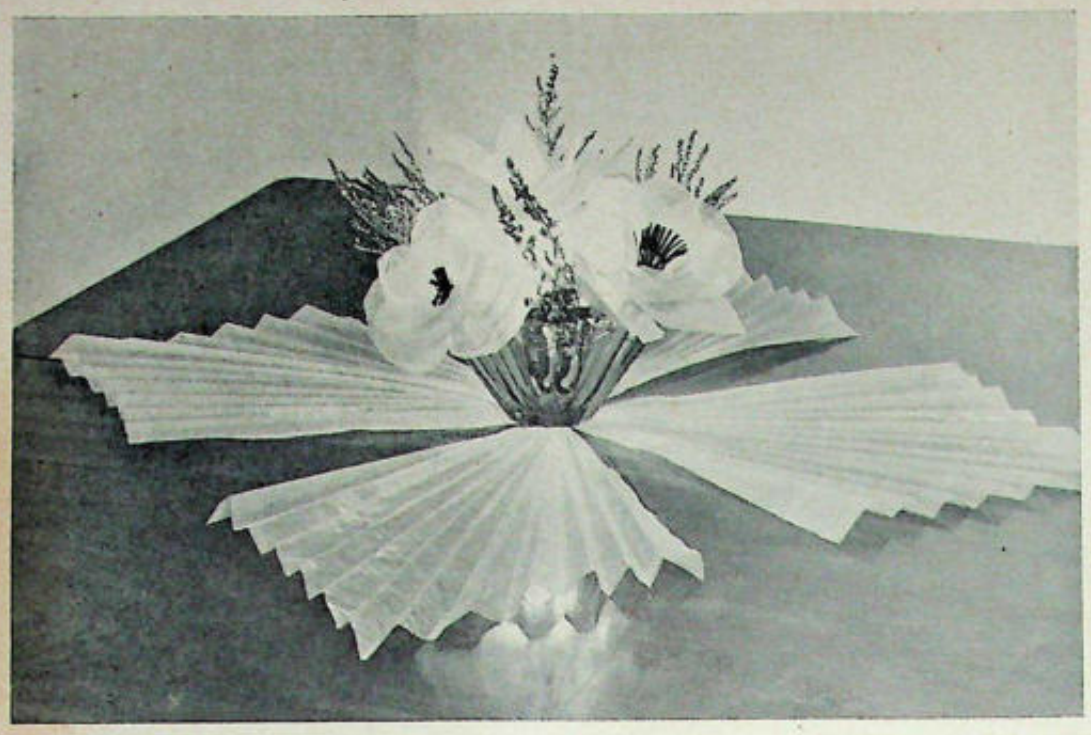
This operation requires skilled advice, but its principles may be set down. Trees are of two types. The best type is that which has a leading shoot carried right up to the highest point of the tree. The leading shoot is the prolongation of the stem, and it should be fairly straight and considerably larger than the principal branches, which should be arranged in a subsidiary manner. Elms are always of this type. Most young oaks, ashes and beeches conform also, but in later life they sometimes tend to lose it and not infrequently their mature rounded crowns give no indication of the leading shoot.

The type of tree less favoured by foresters is where the stem ends in a bunch of branches, all more or less of the same size like a brush.

For this latter type of tree the lowering of the crown is a simple matter, consisting of shortening back the branches as described above for reducing the span of the tree. For the better type of tree with a definite leader, and for the more pyramidal elms and conifers, lopping is a skilled operation only to be undertaken by a man skilled at the task, or the falling top may be fatal to the man who cuts it. The cut is made with an inclination so that water runs off and is protected in the same way as a branch stump. Judgment is needed in deciding the best point to make the cut, having regard to the likelihood of the tree reclothing its pollarded top. Beech cannot be relied upon to do so, and should only be pollarded if it has other branches that can be left a little higher to mask the naked top.

The amateur tree surgeon should not dare too much without good advice, because different species respond in different ways to the stimulus of pruning, and some will scarcely respond at all. He will also desire that the final result shall conform to the typical shape of the tree, and so must study the natural shape of the species.

REGINALD DAVEY.



HEATHER WITH ARTIFICIAL FLOWERS, AND AN EXTRA TOUCH OF LIGHT FOR THE TABLE

PARTY PREPARATIONS

Good Winter Material for Floral Decoration

By MARGUERITE JAMES

WHEN Cleopatra gave a party it is at least possible that the Rose of the Nile, or White Lotus, and the traditional overhead rose wreath of the Roman banquet were wedded by this accomplished mistress of pageantry and pomp in flower and water decorations ostentatious enough to out-Hollywood Hollywood. But in one respect at least Cleopatra was handicapped: she had no electric lamps at her disposal.

These thoughts were prompted by the dinner party decorations of a clever hostess. Suspended horizontally above the dining table was an enormous circle of white roses, a sort of grown-up version of the popular posy ring. It was hung just below a strong ceiling light, and was at once the *pièce de résistance* of the whole scheme. A little foliage drooped from the circle of flowers, but the ring was so placed that no heavy shadows fell on the table. Also, of course, there were other lights present. On the table itself was a wide pool of water on which white waterlilies floated. Subdued green light from below the water level suggested a greater depth of water than was obviously possible. Green and white crystal bowls filled with white flowers occupied other positions on the table.

The party was an intimate, mainly family, affair, and it was the laughing reminder of the hostess that all conversation would be *sub rosa* that brought Rome and Egypt to my mind. The Critic—there is always one—thought it "rather elaborate for a small dinner party," but surely the perfect hostess is she who makes a few personal friends feel they are as important as a roomful of notorieties, and equally can make a roomful of Public Personages feel they are her personal friends.

Floral decorations should help in this. It is an eloquent gesture to stage a brilliant display for a few friends, while at larger parties a small surprise for each individual guest is equally felicitous. One hostess recently used, among her living flowers, a number of tiny Purbeck posies, one of which she handed to each lady guest as a memento. (Purbeck posies are of artificial flowers, made in the Purbeck studio. They are delicate works of art, and frequently so life-like as to defy detection when set among real flowers.)

When I am consulted about party decorations, I usually think of two factors. First the season of the year. Autumn is possibly the easiest time of all for daytime floral decorations, for every meadow and woodland will furnish material that needs but little skill in arrangement. Beech leaves gathered when half the leaves have turned colour, and set into glycerine and water, make a good background for many different arrangements, and last the whole winter in good condition. Cape gooseberries and all the so-called "everlasting" flowers mix as well with the beech as do the various berries of the shrubbery. The creamy-yellow Achillea, which keeps a better colour if the heads are dipped into boracic powder, is particularly useful in the autumn mixed display.

Evening parties are more difficult, for autumn browns and buffs and the greenish grey of seed heads and lichen-covered twigs are not too good by artificial light. Chrysanthemums are an excellent stand-by; deep cream, gold, white and bright salmon-pink varieties all light up well. A point to remember in this connection is that white, primrose and golden yellow flowers add to the brilliance of a room, whereas pink and golden brown, though attractive, absorb light instead of reflecting it. In other words, an arrangement of white or cream flowers can be better lit by lower-powered lamps than if the chief flowers were golden brown. As for red—our grandmothers were right in rejecting all crimson and magenta shades, for these colours reflect only a small percentage of the light rays, which makes them difficult to use indoors either by day or evening light.

The other thing that concerns me immediately is space. A party is usually an event where guests move freely, and decorations are therefore best kept to walls and ceilings. A series of characteristic flower arrangements set in wall niches is good, or similar arrangements in wall vases, or standing on small brackets (not quite so good!) may be acceptable. Those fortunate enough to have old Staffordshire chine wall vases, or old Chinese vases of similar type, will find them useful. Both date generally from about the end of the eighteenth century, when wall vases seem to have been fashionable.

From modern studios there are several types. One is a china frame, oval or round, with a flower-vase to one side of the base, so that a single flower or spray set into it appears to be framed. This should take an exotic flower such as an orchid. Then there is the hand-worked metal vase, large enough to take branches of preserved beech, or evergreens, or a bold mixed group of dried leaves, berries, and seed heads. This metal holder will take water (or glycerine and water) as required.

An alternative style in wall decorations is made of ropes, loops or circles of evergreens or flowers, or sometimes of muslin with floral additions, the important thing being to keep a sense of proportion, and never to allow the decorations to become undignified.

Children's wooden hoops make a good foundation for wall decorations. For autumn and winter parties they can be covered with foliage and berries, and hung flat against the wall, or set as frames to wall vases of more highly-coloured flowers. They can also hang high above the heads of the guests, singly, or in threes like chains, or pushed one inside the other to form globes. Perhaps they are most useful at Christmas, covered with white or scarlet ribbon, and hung with icicles or with silver bells.

Christmas party decorations are not difficult. White, silver and vivid scarlet, *a la* Santa Claus, is almost inevitable as a colour scheme. If a Christmas tree is used, I think most of us want a *real* tree, though usually this is improved by the judicious use of secateurs to give it rather the tiered formality of the indoor Araucaria. Arrangement of the lights on the tree can also improve its formality and balance.

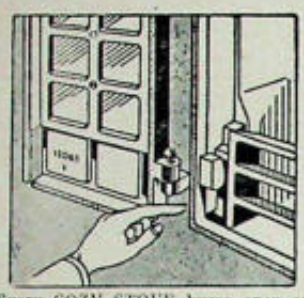
I saw a very charming decoration for a children's party made almost entirely of bare branches enamelled silver and white, and hung with silver icicles. The holders for these branches were actually crumpled handfuls of chicken wire, covered with frosted cottonwool so that they resembled snowballs. A large posy ring of white pottery surrounded each snowball on the centre of the table, and was filled with whitened and frosted holly and bunches of scarlet berries.

Smaller snowballs and twigs stood by each plate, but in these individual decorations the posy rings held two or three brightly coloured crystallised fruits in paper cases, instead of holly berries. It seemed safer!

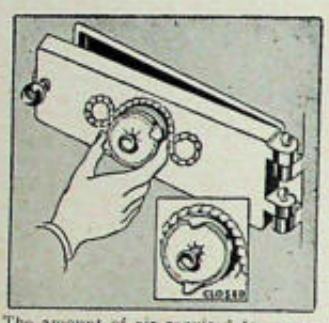
ELECTRIC CANDLES GIVE A FESTIVE AIR TO FLORAL DECORATIONS

Scientific Construction makes them *highly efficient*

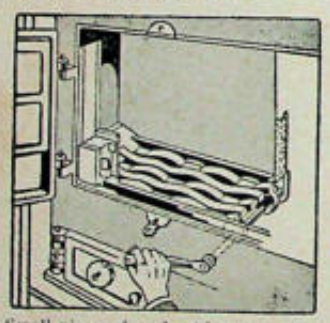
★ NO SPECIAL FUEL IS REQUIRED FOR COZY STOVES



Every COZY STOVE burns open or closed as required on ordinary kitchen coal, and is guaranteed to burn 12 hours without attention. This is largely made possible by precision in workmanship, which results in all doors fitting perfectly. The air draught, at all times, is under complete control.



The amount of air required to ensure proper and complete slow combustion depends upon the type of fuel used. The air regulating device in COZY STOVES is situated in the ash door and is operated by a disc. It is a most efficient arrangement.



Small pieces of coal not burnt to ashes can still give off heat. Dropped through to the ashpan they are wasted. With the new patent Rocking Grate fitted in all large size COZY STOVES the maximum efficiency is obtained. When used it may not show much movement on the surface, but down under the fire very little but the dead ashes fall through, which is as it should be.

COZY STOVES are scientifically designed to give maximum heat with minimum fuel consumption during the whole 24 hours. For efficiency, adaptability, and economy, YOUR home needs a COZY. There's a wide range of models available to suit all requirements.

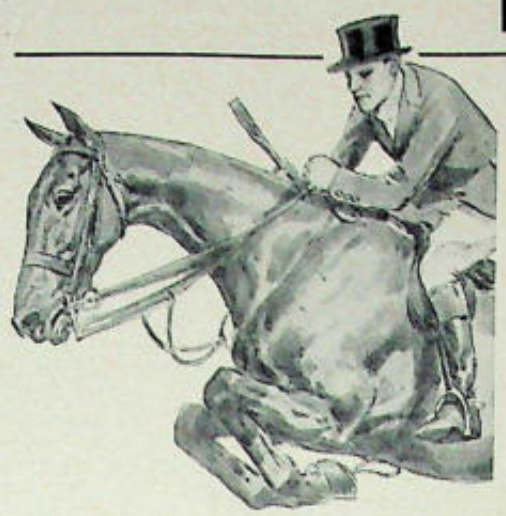
Write for catalogue or see them at your local dealers.

COZY STOVES are available on easy terms.

THE COZY STOVE CO., LTD.
43, Berners Street, London, W. 1

COZY STOVES

Every rider needs the Linia Belt



The advantages of a compact weight

THE sense of firmness and well-being, the exhilarating feeling of lightness, the knowledge that your weight is scientifically under control, add immensely to the enjoyment of hunting. Enjoy this feeling with the Linia Belt. It is woven on scientific lines to give controlled compact weight. It holds you in correctly, without restriction or harmful pressure. Men who have had to hunt in slow countries because of that "top-heavy" feeling, have worn the Linia Belt and gone back to their nicely fenced country; so much difference does the Linia Belt make.

The lack of perfect control and balance experienced by the man with the "corporation" accounts for half the fatigue of a hard day's hunting—of horse as well as rider. The heavy-weight, or the man whose muscles have been weakened by a sedentary existence for most of the year, should wear the Linia Belt for hunting.

The patented Linia Belt is made of unusually strong elastic tricot, porous, light, hygienic and washable. Be careful that you get the genuine Linia Belt—for its success has led to many worthless imitations. Order now—perfect fitting guaranteed or money refunded in full. Write to-day for descriptive booklet.

The Prices of the Linia Belt, including a Linia Jock Strap, are: Popular Model, 3½ gns. (Black, 4 gns.). De Luxe Model in pure silk, extra light quality, 6 gns. (Black, 7 gns.). Standard Model, 2 gns. C.O.D. 1/- extra.

On Sale Only at **J. Roussel, Ltd., 177 Regent St., London, W.1**

Branches in **London** and at **Belfast, Birmingham, Bournemouth, Bristol, Edinburgh, Glasgow, Hove, Leicester, Liverpool, Manchester, Nottingham** and **Southport.**

Telephone: Regent 7570

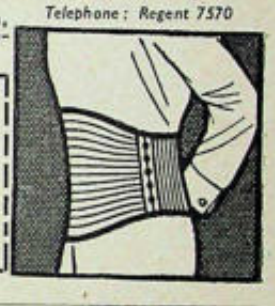
J. L. Roussel, Ltd., 177 Regent Street, London, W. 1.

★ Please send me a Linia Belt, price..... including the Linia Jock Strap. My **maximum** measurement round the body is.....inches.

I enclose cheque, *OR* please send C.O.D., 1/- extra.

★ Please send me a free copy of the booklet fully describing the Linia Belt.

My name and full address are attached. L77



UNDERNEATH —but not OVERLOOKED

A PARTICULAR MAN can face his tailor's eagle eye even when attired in his underwear, because he chooses his underwear-maker just as carefully as he does his tailor. Braemar makes the kind of underwear that satisfies particular men—underwear that gives unimagined comfort and fit because of first-class quality and workmanship. Braemar Underwear for Men is sold at most good shops and stores at prices from 10/6 a garment.

BRAEMAR

UNDERWEAR FOR MEN

you will be well in WOOL

PLEASE SEND ME *the new leaflet* 'Why You Should Wear Wool', *containing full particulars of Braemar Underwear for Men.*

THE SCIENCE OF MUSHROOM FARMING

Methods That Increase the Crops

MUSHROOMS have always been a popular dish, but during the last year or so their popularity has increased out of all knowledge. Several years ago it was the French growers who received the benefit derived from marketing the mushroom in this country, but with the imposition of certain tariffs the English grower was given the opportunity of showing what he could produce.

To-day, owing to steady publicity, combined with a big drop in prices, there is a demand for mushrooms which far exceeds the supply. During the first weeks of August, in spite of the almost unprecedented early arrival of the "field" mushroom, there was a demand for mushrooms which could not be met.

It is in this sphere, then, that many may look for an interesting, steady, and lucrative career. Large numbers of landowners and farmers have the facilities for growing vast supplies of this delicious fungus, but never seem to attempt cultivation—presumably because of the supposed necessity of costly buildings, or the mythical existence of some mystery pertaining to the successful growing of this unusual crop.

Actually mushrooms may be grown in practically any kind of shed or building—also, under certain conditions, in open pastures.

I started with a capital of fifty shillings, and put down my first beds in a disused garage, which I had first of all most laboriously cleaned and prepared in accordance with the instructions gleaned from some admirable little booklet.

Later on I apprenticed myself to one of the biggest growers in the country—a most excellent plan for anyone who is really thinking of making this his, or may be his son's, career. I worked my way through a farm, and then obtained a post as manager on the mushroom farm which I have recently purchased for myself.

There are at present eight long, low, thatched sheds. Two more will shortly be erected—a manure "turning" shelter, a small office, and a neat packing shed.

Specially selected "long" horse manure arrives at the farm every third week, 30 tons at a time, and is then immediately shaken out and watered with a special disinfectant, before being stacked in a long heap about 10ft. wide, 5ft. high, and 25ft. in length. A couple of long thermometers are now plunged into the stack, and in a day or so a temperature of around 160 degrees F. may be recorded. The "compost" is left for five days and then "turned" again—inside to outside, and *vice versa*, more water with disinfectant being added where necessary.

From three to six "turnings" may be necessary before the several definite tests may be properly carried out, and the "compost" passed as ready for bed-making. These days gypsum is added during the last turning to prevent the "compost" from becoming wet and "soapy," a condition which in the old days made failure more or less certain.

There is now a special mould and tool for every stage of mushroom cultivation, and directly the manure has passed certain tests it is wheeled into one of the sheds, which has previously been carefully prepared to receive it, and is then restacked and fumigated with either sulphur dioxide gas or calcium cyanide.

Two or three days later the "compost" is compressed into special wooden moulds, and when these are lifted away there is formed a very neat section of a ridge-bed. When all the bedding has been completed the house is shut up for a day or so, until the beds reach what is known as "peak heat," when they are again fumigated to ensure that there are no flies, maggots, or other pests lurking in the manure. For if the manure, at "peak heat," rises to above 110 degrees F., all the insects' eggs within the bed will have been destroyed, and all flies driven to the bed's surface, where they are immediately destroyed by the poisonous gas liberated in the tightly-sealed shed.

A steady temperature of 58–60 degrees F. must be obtained in the shed, either by electric heating or by the usual low pressure water heating plant. Under these conditions the beds should lose their heat in about six to nine days. Directly the bed-thermometer registers 80 degrees F. spawn must be inserted.

Only the best known makes of special sterilised pure-culture mushroom spawn must be used—one carton spawns about 50 square feet, and costs between 3/6 and 3/9 per quart carton.

When spawned, each bed receives a casing of sterilised soil. Special implements are used for this operation, and the soil is spread on to the beds and smoothly plastered evenly over the surface of the compost, 1in. to 1½in. on flat beds, and on ridge beds it varies from 2½in. at the base of the walls to 1½in. at the summit of the bed.

Nearly every large farm has its own soil sterilising plant, some type of apparatus, either steam or electric, which heats the prepared casing soil up to about 170 degrees F., thus destroying all harmful bacteria. Temperatures higher than 170 degrees F. will render the soil an inert mass, incapable of maintaining growth, therefore ruining it so far as mushroom casing is concerned.

After casing and until the first button mushrooms show on the surface, the air temperature and the humidity of both atmosphere and casing soil are the only points for consideration. An air temperature of 55–60 degrees F. must be steadily maintained, and should the beds show signs of drying out they may be very lightly sprayed with warm water, paths being carefully damped down at the same time. Atmospheric humidity at this stage is not so important as during the period of cropping, and is maintained chiefly by moisture evaporated from the casing soil or from the paths.

"SPECIAL STERILISED PURE-CULTURE MUSHROOM SPAWN MUST BE USED"

"A FEW DAYS LATER THE WHOLE BED WILL BE COVERED WITH MUSHROOMS"

A constant temperature of about 58 degrees F. induces rapid growth of the spawn—or mycelium, as the small fluffy white strands, which shoot out from each portion of spawn, are technically called. The usual period of waiting is about six to eight weeks, but beds have often been known to lie dormant for as long as six months before there has been any sign of cropping.

However, with all conditions favourable, mushrooms can be expected to appear in six weeks from the planting of spawn.

Watering is permissible after the first few buttons have come through, but only through a very fine rose, great care being taken to see that no actual water soaks through to the compost beneath the casing soil.

A few days later the whole bed will be covered with mushrooms, and this should be the case every few days over the total cropping period—which is usually about ten to twelve weeks. Mushrooms are gathered daily, each mushroom being twisted from the bed—never cut—the stalk then partially removed with a sharp knife, and the mushrooms then packed in special chip baskets, each basket holding about 4lb.

Every salesman is on the lookout for a regular supply of cultivated mushrooms—the markets are many, whether the grower resides in north or south. I send mine to Covent Garden, Brentford Market, Swansea, Merthyr Tydfil, Liverpool, and Southampton—besides having quite a valuable little private clientele of restaurateurs and hotel keepers. The prices vary considerably throughout the year, but I have worked out the average price per pound over last year was 1/3, which is a distinctly useful price.

There are several diseases and many insect pests, but the modern grower need have no real fear of serious damage or loss, for scientists have been kind to us and have found a cure or antidote for each of these troubles, whether it be a milky solution of lime-water for Fusarium, soil sterilisation for Mycogone, and Xylaria vaporia—or fumigation with nicotine shreds, dusting with pyrethrum powders, or gassing with poisonous gases to drive away the Phorid fly, the Sciarids, or the Cecidomyiidæ. Science has now met, and conquered, each of these old-time causes of complete failure with which the mushroom grower of a few years ago had to contend unarmed as it were. The would-be modern grower need have no qualms, if he carefully sticks to a strict "hospital-like" routine—and let his motto be: "Prevention is better than cure."

TRAVEL BY LAND, SEA AND AIR

A CONVERTED LIFEBOAT UNDER SAIL OFF THE ISLE OF WIGHT AT BEMBRIDGE

MOTORING'S THEME FOR 1939

Increasing Refinements of Comfort and Economy

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

NOW that we have had an opportunity of seeing what the motor manufacturers have to offer for the coming season, it is possible to make a general survey of the developments in design and construction.

Undoubtedly the theme for 1939 is economy in running costs without sacrificing performance and comfort. The manufacturers of the popular cars have sought a new high level, and judging by programme announcements, have succeeded in attaining a striking standard.

A petrol consumption in the region of 40 miles per gallon or more is claimed for the Vauxhall "Ten," and similarly the Morris, Hillman, Standard and Austin concerns described the performance of their respective products which are every bit as admirable.

Economy has been achieved by the introduction of a new system of carburation and by sweeping weight reductions as well as certain ignition improvements. I feel that this constitutes a move in the right direction, since it will encourage car purchase by the man of limited means, and should, to a certain extent, result in improved sales figures for the entire motor-car industry which, as a whole, did not experience any too satisfactory a year in 1938 as compared with 1936–1937.

Secondly, with the weight reduction there is a more favourable power-weight ratio, which obviously results in improved performance. For a number of years now I have put forward the view that British cars could be stripped of much superfluous weight without impairing stability and ease of handling, providing amendments were made in design, and I am now gratified to see that many manufacturers have made much progress along these lines.

Comfort is a consideration which has not been neglected, and the 1939 models can show several new advantages in this respect. Many believe that comfort is the most important factor to be borne in mind when purchasing a car, and I am inclined to support this theory. No matter what phenomenal acceleration a car may possess, no matter how efficient the power unit may be or how economical, motoring cannot be enjoyed unless a really high standard of comfort is maintained.

Sensible seating arrangements for driver and passengers, ample head and leg room, and improved upholstery as well as easy entry and egress, are features of the new ranges. These are the obvious things which can be demonstrated in the showrooms, but there are two other integral factors which mean much more. I refer now to good suspension and quiet running.

A great deal of effort has been expended to ensure the isolation of engine noises by carefully sealing the bulkhead between interior and the engine unit, and by the application of sound-deadening floor coverings. Flexible rubber engine mountings are still in vogue, as is the spraying of panels with special preparations, which prevent the transmission of noises.

In the matter of suspension there has been a notable advance, and many manufacturers have introduced praiseworthy improvements. The Standard Company have incorporated independent front-wheel suspension in their newest models together with several other concerns, and I believe that this should result in increased comfort and vastly improved steering accuracy.

Personally, I would always recommend independent suspension, because it ensures easier handling and the precision of steering promotes confidence. Shock absorbers, spring flexibility and rubber mounting of the axle on the springs, all contribute to greater comfort and sound elimination, as does the employment of Silentbloc bushes. Stability has received increased attention, and the usage of anti-roll bars is general in the 1939 cars.

Now we come to the all-important question of luggage space. This is a point which I invariably emphasise because it means so much to the enjoyment of a trip, and yet is not infrequently overlooked by designers. I have seen and driven more expensive and luxurious cars, but my opinion of them has often been influenced by the remarkable inadequacy of luggage facilities.

For those who do a fair amount of travelling, it is essential to have reasonable accommodation for luggage. Nothing is more annoying than having to wrestle with a suitcase that is wedged between the top of the luggage boot and the petrol filler pipe after a long day's driving, neither is a passenger likely to be in the best of spirits if he has been forced to nurse a bag throughout the drive, or had to sit with his knees under his chin because of a case on the floor.

If I am purchasing a car I take a great deal of trouble when it comes to considering luggage space and might even reject a car if it was lacking in this respect—even if it was good in other directions. I am, therefore, pleased that this year manufacturers have spared a little thought to this problem, and practically every new model has decent equipment. The scheme finding general favour is to provide a large boot at the rear, which also carries the spare wheel. In the majority of cases the rear panel opens downwards thus providing a commodious and firm platform for additional baggage, which may be strapped on. I commend this method, for the lines of the car are in no way spoiled, nor are the passengers incommoded.

Instrument panels show a vast advance, being more easily visible since, generally, they have been set higher and at an improved angle. Cubby holes for maps, gloves and other odds and ends are greatly increased in size, in some cases extending the whole width of the dashboard.

Summing up, one can say that the new season's productions show no startling or revolutionary changes, coachwork is excellent and finish sets an extremely high standard. Prices have not undergone any noteworthy alterations—although they are definitely on the downward grade—yet this year's cars do offer increased value for money.

One thing which pleases me particularly is that British manufacturers have followed some of the innovations of our overseas competitors. Although our cars retain their own characteristics, at the same time they incorporate some of the best ideas emanating from advanced American design. Short-sightedness is not one of the failings of our manufacturers, so that they are not loath to adopt ideas which have been used and tested and which have proved their worth in other countries. I could mention a host of recent improvements which originated in America, and which have been, quite rightly, taken up by designers in this country with every success.

Nineteen-hundred-and-thirty-nine also brings it home that Great Britain unquestionably leads the world in the production of the light car. The preponderance of light cars upon our roads to-day is illustrative of their popularity and the excellence of their design.

ANIMALS ON FRENCH ROADS

For the guidance of British motorists, the following exposition of the French law regarding animals on their roads, obtained from the International Association, may be helpful: "Rural populations have habits which are a nuisance; they frequently consider the road a pasturage or a fowl run. The law has fixed that no indemnity is payable to the owner of an animal which, wandering at liberty on the road, is killed or wounded by a vehicle. The Code of the Road and the Penal Code maintain definitely this principle of forbidding the wandering of animals on public highways. The driving of herds or flocks of any kind of animals on public roads must be effected so that it shall not inconvenience public circulation and so that meeting or passing may be done conveniently; flocks must not be stationary on the road."

LOOKING TO TO-MORROW IN AERODROME PLANNING

A Growing Problem of the Airways

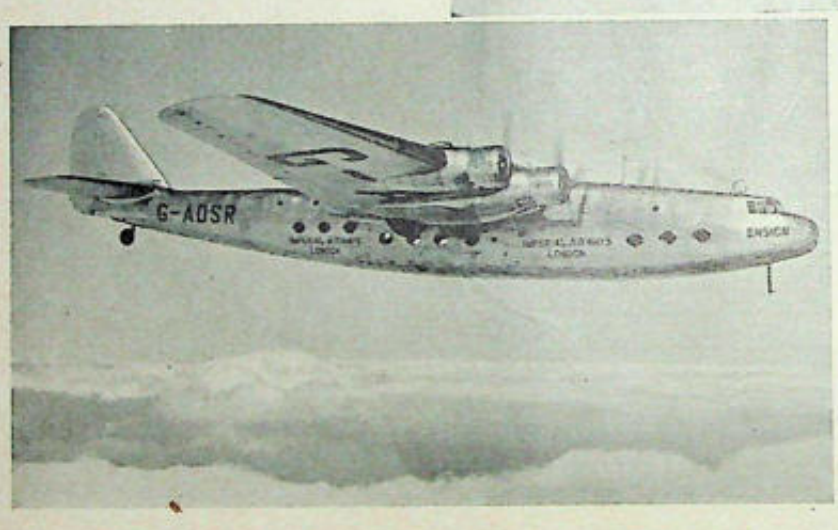
By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

IT is a paradox oft-repeated, yet none the less true, that the progress of aviation is very largely determined by the development of ground facilities. "Aviation grows on the ground" is a truth that no one can afford to neglect; and recent reports from various parts of the Empire airways have demonstrated that its application is not merely to the provision of aerodromes, but to their being kept constantly in line with expanding requirements. That airports should become unfit for use by the most modern machines means that commercial aviation is handicapped. An unusable airport is worse than no airport at all, for an aeroplane may set out for it and arrive to find landing impossible, thus being forced to make an emergency landing elsewhere.

There are ample signs that the problem of airports, always one of prime importance to commercial aviation, is becoming increasingly complex. Just as the great transatlantic liners demand special docking facilities that only a few ports can provide, so the large aeroplanes of to-day are imposing more and more rigorous standards on airport owners and operators. In the past year or so there have been many reports of our Empire air liners bogged at various intermediate places of call; unless airport construction keeps pace with increasing weights of aircraft such incidents cannot but multiply, until they might well constitute a serious burden on the airways.

THE NEW ENSIGN MONOPLANE, WHICH WEIGHS, FULLY LOADED, SOME 21 TONS

THE ENSIGN IN FLIGHT WITH ITS UNDERCARRIAGE RETRACTED (BELOW)



HERACLES (ABOVE), SIX YEARS AGO THE LARGEST AIR LINER IN THE WORLD, WEIGHING ABOUT 13 TONS

This question of weight is highly important; an example will show clearly how serious it is becoming. When the H.P. 42 (Heracles) class of aircraft was put in commission by Imperial Airways, it was the largest commercial type in the world. In its heaviest European form, its loaded weight was 29,500lb., while in the Empire version, with lower seating capacity, the figure was 27,100lb. The world's biggest air liner, then, of six years ago, was of the order of 13 tons in weight.

To-day, the new *Ensign* class is taking over many of the duties that the H.P.42 formerly performed. Its weight is 46,500lb. fully loaded. This, some 21 tons, is more than 60 per cent. greater than the weight of the earlier type. Clearly, the demands on the surfaces of aerodromes are increasing very rapidly. When it is remembered that in the six years or so during which weights have grown by more than 60 per cent. the air lines have been pushed out rapidly in many directions, it will be seen that the strain on ground organisation is becoming serious.

It is this question of weight which is one of the greatest problems of the moment. In the past, the major problem has been concerned with size. As machines grew, the length of run required for take-off extended, until to-day a first-class airport should approximate to 2,000yds. in all directions. This by itself is a serious enough matter, since obviously the difficulties of securing the necessary area in reasonable proximity to the great towns that need airports are immense.

But to some extent this angle of the aerodrome problem is declining in importance. It may even be that a limit in size is being approached. The past few years have seen notable aerodynamic advances that make for shorter take-off runs, and the announcement that a landplane version of the Mayo composite aircraft is to be built is an indication that assisted take-off may offer a solution for this problem of area. An ingenious scheme recently proposed for equipping machines with castoring tricycle undercarriages so that strip aerodromes can be used, the machine always being able to assume the correct relative angle to the wind with a more or less constant ground path, whether practicable or not, is a further sign that designers are seeking to solve the aerodrome problem by improving the aircraft.

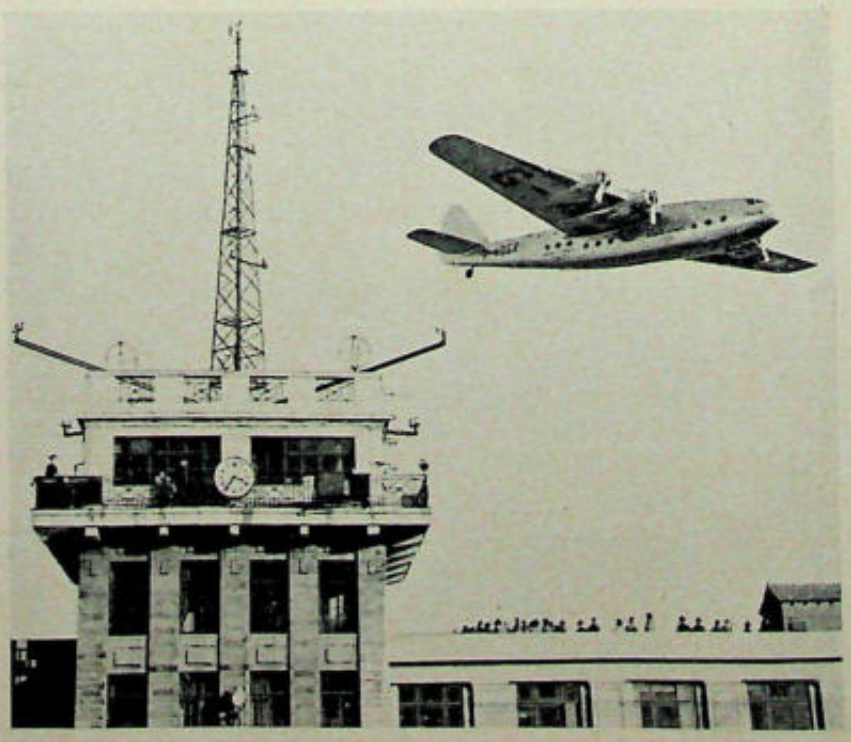
While, then, a solution for the aerodrome size difficulty may be discovered, the weight problem will not merely remain but increase. If, for example, the landplane composite proves an economic type, it will obviously demand a very carefully prepared aerodrome surface capable of sustaining a heavy load. There can be no doubt that the whole trend of aircraft design in the commercial field is towards ever greater weights. This development, so essential to the future of commercial aviation from the financial standpoint, must not be artificially checked by any lagging behind of airport facilities. If harbour authorities consider it worth while to construct special docks and the like for vessels such as the Normandie and the Queen Mary, those responsible for aerodromes must pursue a similarly enlightened policy—the more so, since large terminal airports are frequently State owned.

ONE OF THE HUGE WHEELS OF THE ENSIGN

The remarkable quickening of interest in the large flying-boat recently is to some extent due to this difficulty of equipping land aerodromes for big machines. Within limits, the larger a flying boat the less it needs specially sheltered water, for as size increases so does sea-worthiness.

Flying boats, however, are, in the main, suitable only for long-distance routes. The future of the shorter airways lies with the land-plane.

If, as does not seem improbable, the question of take-off and aerodrome size is solved, then aerodrome design must concentrate on devising the perfect surface. In the near future, no airport will be considered first-class unless it is capable of being used in all weathers by machines of perhaps 30 tons in weight. There, briefly, is the pressing problem of to-morrow; and with civil expansion going forward and new aerodromes being proposed, it is essential that these facts should be faced now.



THE GIANT ENSIGN FLYING OVER THE AIRPORT BUILDING AT CROYDON. SHE IS DESIGNED TO CARRY 42 PASSENGERS, AND A CREW OF SIX, AT OVER 200 m.p.h.

No more than ninety miles away from London but a world away in atmosphere. Health is in the fresh keen air at the Forest Park Hotel: healing in the quietude of forest glades, happiness in games and sports enjoyed against a background of green and tranquil beauty. Within the hotel, service, cuisine, comfort make the perfect compromise between country simplicity and the amenities of urban life.

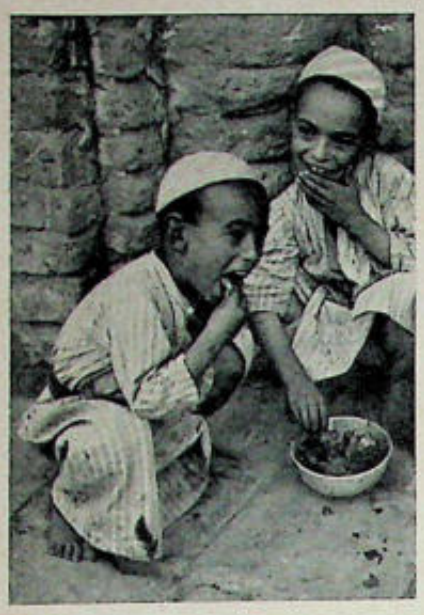
CITY OF ARABIAN NIGHTS

A Day in the Bazaars of Baghdad



A COUPLE OF ARAB IMPS FEEDING IN A BAGHDAD COURTYARD

AN elderly gentleman accosted us as we drove up to the hotel in Baghdad. We were in no mood for polite conversation, for as we had been 27 hours on the road we were very hot, dirty and tired and our one thought was: "Food and rest."

"Where have you come from? Where are you going to?" he demanded.

"We are on our way to Persia."

We explained that we were merely making a holiday tour from England in our car, and we were anxious to see something of these ancient countries of which we had heard so much.

He roared with laughter and exclaimed: "Do you mean you have come all this way to see this God-forsaken hole? There is nothing to see in Baghdad, and even less to see in Persia."

Somewhat disheartened, we unpacked our belongings and in almost less time than it takes to tell, were sound asleep in our beds.

Our journey across the Syrian Desert from Damascus had been exceedingly tiring, for with the exception of the half-way station of Rutbah Wells there is nowhere to stop, and no chance of obtaining food, water or petrol. Only the very roughest tracks exist, until the River Euphrates is reached, and then a comparatively good road of 80 miles leads into Baghdad.

Baghdad—City of the Arabian Nights—City of Enchantment. No words could sufficiently describe its charm and its glamour. Few cities have undergone as many and as violent changes of fortune as this. In a life of under twelve hundred years she has served as the heart of a world civilisation, the pontifical seat of a universal religion, a provincial capital of the Mongols, a bone of contention between Turkoman tribes, a Persian possession, a Turkish colonial town, an outpost of the British Empire and the metropolis of a youthful Arab state.

There has been no attempt to modernise Iraq's capital. The people are dressing, living and working in exactly the same way as they did many hundreds of years ago. The bazaars, with their characteristic smells, filled to overflowing with the glowing colours of oriental silks and rugs, and resounding with the clang of the metal-workers' hammers, are an intricate maze in which one would quickly become lost without a guide.

The first impression of the Caliph's city is its most morbid aspect—a long, low, straight street, a dingy hybrid between East and West, with the unattractiveness of both. The people look unhealthy and sallow; the children are pitiful; the shops are ineffective comparisons with the poorest of European shops, but as soon as one leaves the main street and walks into the long bazaars or into the Jewish or Moslem quarters, the West and its civilisation is left far behind and forgotten.

At the bazaar gates where white-turbaned Indians, Arabs, Kurds, Turks, Jewish and Armenian merchants rub shoulders, civilisation has halted, though their silks and spices, their indigo and pepper, the sugar and velvets no longer travel the old Aleppo Road, but are delivered by air.

Persian pilgrims still walk with silent, bare feet through the shadows of the dark and airless ways. Strolling vendors come along, shouting the wares they carry on their heads in round trays—bananas, dates, pickles, European cottons, manna from Mosul. If one waited long enough there would hardly be an accessory of life that did not pass by one's door.

Through Baghdad flows the Tigris, a muddy river about 400yds. wide, and it is the only sweet and fresh thoroughfare of the city. It is best at evening time, when the sun is setting and casting yellow shadows across the water. Water buffalo come down to drink and wallow in the cool muddy stream; Arab women descend to the water's edge with their jars on their shoulders, and boatmen tow their craft up against the strong current.

"Kalaks" come down-stream from Mosul, their planks and the inflated goatskins which support them hidden under a cargo of brushwood; there are slender "mehelas" with pointed, overhanging bows and sloping masts; long rectangular barges called "shaitums," such as one sees in Assyrian sculptures, and little motor boats run by Arabs in their ragged head-dresses, and sometimes pilgrim steamers packed to overflowing with passengers on their way to the holy cities.

One evening just before the sun had set we drove out of the town a few miles to see the Golden Mosque. At first we were only able to get glimpses of the interior through open doorways, since Christians are not permitted to enter. Here we saw men chatting and smoking their hookah pipes quietly, children noisily playing, and the more devout swaying backwards and forwards till their foreheads touched the floor, praying undisturbed. Our guide took us through a series of alleyways to a nearby house, and as we mounted to its roof we heard the "Muezzin" calling from one of the minarets. Four huge rounded domes with minarets surmounted the mosque, and each was completely covered with real gold, which, in the dying light, assumed ever deepening shades of colour. As the muezzin began calling the faithful to prayer, the towers of the minarets were suddenly lit up by circles of electric lamps. We stood in awe and wonderment at the scene before us. The chanting voice, powerful and shrill, moved one strangely; and then, suddenly on the roof adjoining ours, a raggedly dressed "Mullah" joined in and took up the cry. For a full five minutes he called, his hands cupped before his mouth, turning in all directions. Of us he took no notice at all—as Christians we were beneath his notice.

A BAGHDAD SILK WEAVER PLYING HIS TRADE IN THE COOL

"La Allah, il Allah, Mahommed resoul Allah." "There is no God but God, and Mohammed is His Prophet. Oh, Faithful, come to prayer. Come and pray."

The next morning we left Baghdad just before daybreak on our way to Persia. At the outskirts we stopped to watch the agricultural efforts of the peasants, whose digging caused us much amusement. It is facilitated by the ingenious invention of two men with a rope attached to the spade. The digger inserts the spade the helpers pull it out—a method which is said to enable three men to do the work of one in just double the time.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE OLD GEORGE INN AT CRAWLEY

ONLY the other day I was discussing inn signs with a friend of mine. He told me that there were Acts of Parliament from the days of Richard II to those of Henry VI with definite rulings on the signs which innkeepers were allowed to display, and at one time there was a law stating that "in all the streets no signboard should hang across, but that the sign be fixed against the balcony, or some convenient part of the side of the house." Quite naturally from that point our conversation turned to the subject of inns which had signs spanning the road to-day—signs, by the way, which caused Moritz to remark, in 1782, that "they have the appearance of gateways, but the whole apparatus is intended for nothing more than to tell the inquisitive traveller that there is an inn."

Thus we came to the George Inn at Crawley and its fine old gallows sign, so well known to travellers on the Brighton Road. A hundred years ago as many as 50 coaches changed horses here in 24 hours, but I am afraid your imagination would have to be in very healthy working order to picture such a scene at Crawley to-day.

"The coach stops here half an hour, gentlemen: dinner quite ready!" will never again be shouted by the hostler at the doorway of the George.

Tradition has it that the building was first used as an inn about 1615, though doubtless it must have been a private house for nearly a century before this. It shows every sign of having been a building of importance from the fifteenth century. Naturally there have been constant alterations, but they have been unable to obliterate entirely its original form.

Everywhere in the George massive oaken timbers meet your eye. The lounge, which used to be the old Coffee Room, is full of old oak. So, too, is the billiards room, while the ceilings of the cosy old-fashioned bar and its jolly little smoking room adjoining are rich in great dark beams. Writing in *Tales of Old Inns*, the author says of this Sussex inn: "One of the first things of interest to hold the visitor's attention is immediately on the left as you enter the hall. It is a well-proportioned stone fireplace, older than the date, 1615, carved boldly upon it. There is a story that this was brought from another house, but there is no reason why it should not belong to the George; it is just the sort of fireplace to have been put into such a house as this must have been in Tudor days, when fireplaces were counted modern improvements."

Another author to mention the George was Conan Doyle. You may recall that it was at this inn that Belcher trained Boy Jim for his fight with Crab Wilson on Crawley Down, a few miles away. Buck Tregellis and his nephew drove down on the eve of the great fight and in the description of this journey (*vide Rodney Stone*) the passage runs: "At Kimberham Bridge the carriage lamps were all lit and it was wonderful, as the road curved downward before us, to see this writhing serpent with the golden scales crawling before us in the darkness. And then, at last, we saw the formless mass of the huge Crawley elm looming before us in the gloom . . . and the high front of the old George Inn, glowing from every door, and pane, and crevice in honour of the noble company who were to sleep within that night."

Since then, of course, time has wrought changes at Crawley. But the George still stands, cosy, hospitable and always ready to welcome travellers along one of the most famous highways in England.

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

THE CURSE OF CONVENTIONS

A Plea for Simplicity

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*.)

"SPEAKING generally the fewer conventions a game has the better. It is perfectly ridiculous if, when sitting down to a game of cards, your partner has to put you through an elaborate series of questions as to your method of bidding. There are certain people who are convention-bound and who would like to see every kind of call coded so that from it they might deduce with absolute accuracy what cards the bidder possesses."

This is an extract from an article I wrote no less than nineteen years ago. Its reference was to Auction Bridge as Contract had not then come in. Its application to the present game is still more cogent. Auction Bridge had comparatively few conventions and, after we had settled down to it, most of them disappeared. It was discovered that we could do as well or better without them.

Contract Bridge has had to pass through and is still passing through similar stages. For years convention-mongers ran riot until the authorities in the United States, who had been, many of them, the chief offenders, saw the necessity of crying "Halt."

England, which had been chary at first of adopting the more extravagant and fantastic ideas which emanated from America, then took a hand. At the period when things were quietening down in the United States scores of English writers and successful players in Duplicate Tournaments rushed into print and produced numerous novelties for which they made sensational claims. Each asserted that his was the one and only method of successful bidding. He was the only "real friend." The others were inadequate or spurious. And so it went on and still goes on, although there are signs of abatement.

That I am not exaggerating is shown by the experiences given in a recent number of the *Bridge Magazine* of a player who went as a stranger to a "mixed" club. She played seven rubbers and had seven partners, each of whom had a different convention which had to be explained, while she also had to be catechised as to her methods and procedure. This occurred, mark you, in the year of grace 1938. And surely, if ridicule could kill, this statement of fact should do the work!

Strangely enough, ridicule so far has not achieved the object. There are numerous players who positively love conventions and take great pleasure in learning and practising them. Whether it is because they absolve the player from individual thought and judgment or whether it is because they like them for their own sakes I cannot say. I only know that women players are the chief supporters and that many men players use them half-heartedly or unwillingly because they think they *must*. This appearing on the fifth of November will be an appropriate date for making a bonfire of the lot!

And note that there is a distinct tendency towards abandonment of all but the simpler conventions and it is only a matter of time before this desirable result is actually achieved. There is a growing revolt against artificialities. The wisdom of the Portland Club which, after in the early days toying with and abandoning the Vanderbilt Club Convention, set its face against it and all other new devices will in the end be acclaimed.

There are two schools of thought. The first consists of those who regard conventions as an evil, but a necessary evil. They argue that they assist in effective partnership and are indispensable in slam bidding.

This I deny, and I base my denial upon long and elaborate study of the methods of the experts at revealed in Duplicate Tournaments. It has never yet been proved that the systems on which these experts work, and from which, by the way, they frequently depart, is the cause of their success. And this I assert in face of the fact of the victorious career of the Viennese team using the Stern System in International Contests organised by the International Bridge League. I attribute their success not to the system, but to the fact that individually they were better players.

The second school advocates artificial conventions because they help the poorer player and put him, if he learns them properly, on a par with the expert. This is a fallacy. So far from doing anything of the kind they are a stumbling block. They reduce the game to a rule of thumb and prevent him employing his common sense. If they sometimes help they more often hinder.

Moreover, life is short. Every player cannot be expected to learn and master the intricacies of every system. Many of them resolve themselves into a code of secret signs. They lend themselves to sharp practice. Here is an extract from a writer:

"One of the pairs had an arrangement that while Two Diamonds, Two Hearts and Two Spades should be regarded as ordinary strong Two bids an opening of Two Clubs was always psychic. As their opponents were unaware of this arrangement, it enjoyed considerable success." For such play there is no excuse or defence whatever. It is definitely crooked. But I agree with the teller of the story that the difference is only one of degree between such a definite plot and a tacit understanding. For example, two partners who play constantly together may evolve all sorts of seemingly innocent little bidding habits, which in fact, in so far as they assist them and deceive opponents, are dishonest.

The publication of the cheap edition of my book *Contract Bridge Without Conventions* (Seeley Service; 3/6) will enable those of you who have not already read it to learn my views about artificial systems which introduce us into an "Alice-in-Wonderland" realm. Although it first appeared two years ago, I have nothing to retract. I still believe that the Simple System which I give in it is the pleasantest method. And just as profitable!

CHESS

THE TWO BISHOPS

The following game, played in a match between Germany and Scandinavia at Bremen in June, shows the great strength of two Bishops when they have open diagonals along which to operate.

(Sicilian Defence.)

WHITE. Pettersen. (Scandinavia).	BLACK. Carls. (Germany).	WHITE. Pettersen. (Scandinavia).	BLACK. Carls. (Germany).
1. P to K 4	P to Q B 4	12. Kt to R 4 (*d*)	B takes Kt
2. Kt to K B 3	P to Q 3	13. Kt to Kt 6 (*e*)	Q to K 3
3. P to Q 4	P takes P	14. Kt takes R	Q takes K P
4. Kt takes P	Kt to K B 3	15. Q to Q 3	B takes B P
5. Kt to Q B 3	P to K Kt 3	16. Q takes Q	Kt takes Q (*f*)
6. B to K 2	B to Kt 2	17. Q R to B sq	Kt to Kt 6
7. Castles	Kt to B 3	18. K R to K sq(*g*)	B to K 5
8. R to K 3	Castles	19. Kt to Kt 6	B takes Q Kt P
9. Kt to Kt 3 (*a*)	B to K 3	20. R to B 4 (*h*)	P to Q 4
10. P to B 4	Q to B sq (*b*)	21. R takes B (*i*)	P takes R
11. P to K R 3	P to Q R 4 (*c*)	Black won (*j*)	

(*a*) This is the move most frequently played here, the object being to prevent P to Q 4. The late Dr. Tarrasch, however, condemned it on tie grounds (1) that it does not further White's development and (2) that the Knight usually has to return to Q 4. He recommended, instead, 9. Q to Q 2 after which Black cannot well play 9. . . . P to Q 4 because of the continuation 10. P takes P, Kt takes P; 11. Q Kt takes Kt, Q takes Kt; 12. B to B 3, Q to B 5; 13. P to Q Kt 3, Q to R 3; 14. Kt takes Kt, P takes Kt; 15. P to B 3, B to B 4; 16. Q R to Q sq with advantage in position to White. Black's best reply to 9. Q to Q 2 is 9. . . . Kt to K Kt 5, but after 10. B takes Kt, B takes B; 11. P to B 4 (threatening P to R 5) White has attacking chances.

(*b*) Not P to Q 4 because of P to B 5.

(*c*) A good move, threatening P to R 5 followed by P to R 6. White appears to have nothing better now than 12. Kt to Q 4 for, if, instead, 12. P to Q R 4, then 12. . . . B takes Kt, spoiling the formation of White's Queen's side pawns.

(*d*) A tempting move—but it turns out very badly.

(*e*) If, instead, R P takes B, then Q to K 3.

(*f*) Black has two pawns for the exchange, and his Bishops are very strong.

(*g*) 18. R to B 2 is slightly better. After 18. . . . R takes Kt; 19. R takes R, Kt to Q 5; 20. B takes Kt, B takes B; 21. B to B 3 Black regains the exchange, but White has a better chance of making a fight than he has after the text-move.

(*h*) If, instead, 20. Q R to Q sq, then 20. . . . B to Q B 6, followed, if 21. B to Q 2, by 21. . . . B to Q 5, ch; 22. K to R 2, Kt takes B; 23. R takes Kt, B to Q 6; 24. K R to K sq, B takes Kt and wins.

(*i*) If 21. R to R 4, then 21. . . . B to B 7 and wins. If, instead, 21. R to B 5, then 21. . . . B to R 6; 22. R to Kt 5, B to Kt 5 and wins.

(*j*) White might well have resigned here. The remaining moves were: 22. B to B 4, R to Q sq; 23. B to B 2, B to Q 5; 24. Kt to Q 5, P to K 3; 25. Kt to K 3, Kt to B 4; 26. Kt to B 2, B takes B, ch; 27. K takes B, R to Q 7, ch; 28. K to K 2, R takes R, ch; 29. K takes R (B takes R is better), P to Q Kt 4, and White resigned. (If R takes Kt P, then either Kt to Q 5 ch. If, instead, B to Kt 3, then P to R 5).

A GOOD GAME BY STAHLBERG

The following game, from a recent tournament at Örebro, was well played by the Swedish master, G. Stahlberg.

(French Defence.)

WHITE. Nilsson.	BLACK. Stahlberg.	WHITE. Nilsson.	BLACK. Stahlberg.
1. P to K 4	P to K 3	14. P takes P	Q takes P
2. P to Q 4	P to Q 4	15. B to Kt 2	B to Kt 5
3. Kt to Q B 3	Kt to K B 3	16. K R to K sq(*d*)	Q to R 4
4. B to Kt 5	B to K 2	17. Kt to K 6	P to Q 5
5. P to K 5	K Kt to Q 2	18. Kt to K 2	K R to K sq (*e*)
6. B takes B	Q takes B	19. Kt (K 2) to B 4	Q to B 2
7. Q to Q 2	Castles	20. B to R 3	B takes B (*f*)
8. P to B 4	P to Q B 4	21. Kt takes B	R takes Kt
9. Kt to B 3	Kt to Q B 3	22. Kt to Kt 5	R takes R
10. P to K Kt 3	P to B 3 (*a*)	23. Kt takes Q	R takes R, ch
11. K P takes P	Kt takes B P	24. K takes R	K takes Kt
12. Castles (*b*)	P takes P	Black won (*g*)	
13. K Kt takes P	P to K 4 (*c*)		

(*a*) A good move, much better than P to Q R 3 which has been played in this position as a preliminary to P to Q Kt 4.

(*b*) The continuation in a game L. Steiner v. Staldberg (Ujpest tournament, 1934) was 12. B to Kt 2, P takes P; 13. K Kt takes P, P to K 4; 14. Kt takes P, K Kt takes Kt; 15. B takes Kt, ch, K to R sq; 16. Kt to K 2, B to Kt 5; 17. Castles (Q R), Q R to Q sq; 18. P to B 4, Kt to Kt 5 with a very good game for Black.

(*c*) A good move.

(*d*) Not good. He should, instead, play Kt takes Kt followed by Q R to K sq.

(*e*) If, instead, B takes Kt (K 3), then Kt to B 4, followed by Kt takes B.

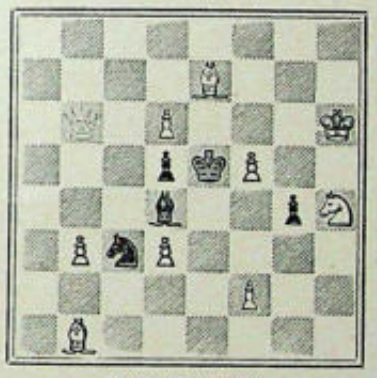
(*f*) Better than B takes R.

(*g*) The Rook and the two Knights are stronger than the Queen. The remaining moves were 25. P to K Kt 4, P to K R 3 (if Kt takes P, then Q to B 4, ch, followed by Q to B 7); 26. P to K R 4, R to K sq; 27. Q to B 4, R to K 5; 28. Q to B 7, ch, R to K 2; 29. Q to B 4, K to K sq; 30. Q to B 5, K to Q sq; 31. P to Kt 4, Kt to K 5 (not Kt takes Q Kt P because of Q to R 5, ch); 32. Q to K B 8, ch, K to B 2; 33. P to R 3, P to R 3; 34. Q to B 4, ch, K to Kt 3; 35. Q to B 8, Kt to B 6, ch; 36. K to Q 2 (not K to B sq because of R to K 8, ch and mate next move), Kt to Kt 8, ch; 37. K to Q sq (if 37. K to Q 3, then 37. . . . R to K 6, ch; 38. K to B 4, Kt to Q 7, ch; 39. K to Q 5, R to K 4, ch; 40. K to Q 6, Kt to K 5, ch; 41. K to Q 7, Kt to B 3, ch; 42. K to Q 6, R to Q 4, ch; 43. K to K 6, Kt to Q sq, ch and wins for, if 44. K to K 7, then 44. . . . R to Q 2, mate), Kt takes R P; 38. Q to B 5, Kt to Kt 4; 39. Q to B 5, ch, K to B 2; 40. P to Kt 5, Kt to B 6, ch and White resigned. (If 41. K to B sq, then 41. . . . R to K 8, ch leads either to mate or the gain of the Queen).

PROBLEM No. 3986

By P. G. L. F.

BLACK (5 pieces).



WHITE (10 pieces).

White to play and mate in three moves.

SOLUTION OF PROBLEM No. 3985

1. Q to Q sq. If 1. . . . P to Kt 6, then 2. Q to Q B sq, etc. If 1. . . . P takes B P, then 2. Q to R sq, etc. If 1. . . . P takes R P, then 2. Kt to R 3, etc.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 489

ACROSS.—1, "Quinquereme of ——" (Masefield). 5, Seen in some theatres. 9, This tree seems burnt. 10, Piscatorial lure. 11, Increase, including U.S. policemen. 12, You, singularly, are the object. 13, This is just the contrary. 16, Well-known figure in detective novels. 18, A nitrogen salt. 20, The little demon starts to stamp. 22, Scottish mull. 23, To hold back, concerning the tension. 25, Military body is mostly limb. 29, "Beg rice" (Anagram). 30, Devotee of pleasure finishes with healing. 31, Forty-five inches. 32, Central figure in many Spanish fights. 33, Slim, with its end in the middle.

DOWN.—1, Bird's home is hidden in fine straw. 2, An equine negative? 3, The aim of the avenger. 4, A sheltered place, even when decapitated. 5, To make keen, with A.R.P. at heart. 6, Produced by confusing the gears. 7, To this a wire is shocking. 8, Note this. 14, Pungent. 15, Owing to the loss of a vowel the insect has become a nut. 17, "Stern peer" (Anagram). 19, Experimental. 21, Perhaps the result of a stag-party. 24, A tendency to tear apart when beheaded. 26, To form, or to decay. 27, The projector screens it. 28, A fruit more singular than would at first appear.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Cricket

Catching.—There is no mention in the laws of cricket of your suggestion that if the ball is caught with the hand actually touching the ground it is not a catch. The ruling in Law 22 on this subject seems to us to be final: "The striker is out, if the ball, from a stroke of the bat or hand, but not the wrist, be held before it touch the ground, although it be hugged to the body of the catcher—'caught.'" The largest number of catches ever made in a match by a player was when W. R. Hammond caught ten of the Surrey eleven out in the Gloucestershire *v.* Surrey match at Cheltenham in 1928; incidentally, his total for the season was 76.—*P. S., Whitby.*

Particulars of the South African Tour.—The M.C.C. selected in all 15 players to tour South Africa. Their names are: W. R. Hammond (captain), L. E. G. Ames, H. T. Bartlett, W. J. Edrich, K. Farnes, P. A. Gibb, T. W. Goddard, L. Hutton, E. Paynter, T. D. Perks, B. H. Valentine, H. Verity, L. L. Wilkinson, D. V. P. Wright, N. W. D. Yardley, while Flight-Lieutenant A. J. Holmes, the Sussex captain, is going as manager. They will play five Test matches—two at Johannesburg, two at Durban, and one at Capetown, while there are fourteen other games on their fixture list against the various provincial teams. The duration of the first four Test matches has been fixed for four days, and the fifth will be played to a finish if at the end of the fourth the difference between matches won and lost is not greater than one. The actual conditions of play will be practically the same as they are over here, with two notable exceptions—eight balls will be bowled to the over and matting wickets will be used in many cases.—*W. H., Sevenoaks.*

Forestry

Destroying Oak Stumps.—The destruction of tree stumps without uprooting them is not a very difficult matter. I understand that in your case you are concerned mostly with oaks, and these, in common with other species, can be made to decay quite rapidly with the aid of saltpetre. The method is to bore three holes with a ¾in. auger, each hole in the top of the stump pointing downwards for a distance of about a foot towards the roots. These holes are then, in the autumn, filled with saltpetre crystals, which rain is allowed to dissolve and wash into the substance of the wood. If this treatment is repeated for three winters, the stumps should be so rotten as to be capable of being removed piece by piece with the aid of a small mattock. If a more rapid destruction is required, the saltpetre treatment in the autumn can be followed next summer by the burning of the stumps. The method is to collect some cordwood and light a fire on top, when it will be found that the stump will catch and burn down to the roots for a surprising distance. This burning is facilitated if a small hole be dug at the side of the stump and a transverse auger hole be drilled at the bottom of the hole into the root and connected with a similar hole bored downwards from the top of the stump. This creates a draught which is most helpful. There is one other method of removal which should be referred to, and that is the immediate one of having the stumps blown up by high explosive. Gelignite is used, but the work should not be undertaken save by a firm who specialise in explosive engineering.—*H. R. B., Gironde.*

Garden

Flower Sent for Identification. *Impatiens glandulifera.*—*R. S. R. T., Builth Wells.*

Apples Sent for Identification.—These are old apples no longer in commerce, and, with few exceptions, it is impossible to identify these old kinds. In addition, these specimens are poor and also not mature.—*E. C., Devizes.*

Mushrooms Sent for Identification. This is a *Psalliota*, a mushroom genus, but it is impossible to say whether it is edible or not without seeing the entire plant.—*G. F. C. P., Budleigh Salterton.*

Privet Hedge. You say you are in doubt about the wisdom of planting a privet hedge bordering a field where cattle are kept because it is said to be poisonous. Privet is poisonous and the animals would certainly suffer damage if they ate it.—*F. M. P., Ightham.*

Injurious Effects of Pine Needles.—Nothing can be done, but there are a few decorative plants that do well under pines, the best being *Scilla hispanica* (*syn. campanulata*). This scilla, which resembles a bluebell, is far handsomer than our native bluebell, and grows quite 15in. high. It is a rapid and vigorous spreader.—"*Oak*," *Englefield Green.*

Kennel

Correct Food for Labrador.—A bitch of the weight stated would need at least 1½lb. to 2lb. of meat and an equal amount of hound meal of biscuit fed dry. Slops and fattening foods such as rice should not be given, and in this particular case no fats should be allowed.—*W. F. W., Scarborough.*

Treatment for Tapeworms.—Starve her for 24 hours, and then give 30 grains freshly-powdered areca nut in a little warm milk sweetened with glucose, and exercise until the medicine takes effect. It is important that the intestines be as empty as possible, so it is usually advisable to give an enema of warm soap water to empty the lower bowel both at the commencement and termination of the starving period.—*A. N. P., Winchester.*

Motoring

Cars for Trailer.—You ask whether a Ford 8 h.p. car could be used for pulling a one-horse trailer. The answer is in the negative, as this load would be excessive, and very detrimental to a vehicle of this light weight. Although trailers are extremely useful for transporting luggage, &c., they are not really to be recommended for use in conjunction with an ultra light car, and we would suggest that nothing less than a 12 h.p. vehicle should be used for this purpose. For towing a one-horse trailer, however, we consider that at least a 20 h.p. vehicle would be necessary, and tremble to think what might happen if an 8 h.p. car was used in this connection if it had to negotiate a steep hill having a gradient of, say, 1 in 5.—*L. P. T., Morebath.*

Naturalist

Eggs Sent for Identification.—These were those of the common snake; they are laid during July and August under heaps of leaves or stones.—*D. W., Lincoln.*

Post-Mortem Examinations

Trichostrongylosis of Game Birds.—Trichostrongylosis is a contagious thread-worm infection of the bowels, which is spread through contamination of the ground and food by the worm-containing droppings of infected birds. Such droppings may remain infective on the ground for many months. Every season it is the most prevalent disease among young pheasants within a few weeks of their being turned to covert. The young susceptible birds contract the disease from the infected ground around the feeding sites. Waterlogged ground and areas shut off by dense foliage from fresh air and sunshine are more liable to harbour the worms. Thus valuable preventive measures include draining and widening the rides, choosing fresh sites for laying food as often as practicable, daily cleaning out the drinking-water troughs, and moving the coops until vacated by the birds. We frequently receive requests for "something" which can be added to the food or drinking water as a curative. Curative measures in covert are impracticable, for the simple reason that the only known specific medicine must be administered to the individual bird, and the dose, preferably in pill or capsule, should be repeated after an interval of seven days. Consequently for treatment birds must be under control; moreover, they must be housed on sawdust or similar absorbent, which with the birds' droppings must be removed and burned each day. These measures for poultry, aviary birds or penned birds cannot be applied to pheasants in covert. Consequently sanitation is the keeper's slogan for his coverts; and one of his most valuable sanitary measures is letting in sunshine and drying air, keeping grass trimmed short, removing undergrowth and too much topgrowth. The desire of keepers for shade over the rides can be overdone, with the result that August and September bring their outbreaks of trichostrongylosis. We have to report the disease among pheasants from eight different estates and among partridges from three shoots. This season to date we have received grouse and blackcock with trichostrongylosis from only four moors—an unusually low record. From reports received from several moors in Scotland it would appear that the disease is far less prevalent this season. A big increase in grouse next season may be anticipated.—*H. M., Somerset; C. H. S., Oxon; D. P., Sussex; E. F. H. E., Worcester; W. M.; Dumphail; R. H. S., Glos; R. B. E., Salop; R. D. H., Glos; C. P., Yorks; H. S. G., Dumfries; W. N. H., North Wales; R. L., Beds; F. B., Hants; C. W. C., Inverness; G. N. H., Cheshire.*

Rowing

Diamond Sculls.—Beresford has won the Diamond Sculls four times since 1929. The other winners are given in the list below:

1920.	J. Beresford, jun.
1921.	F. E. Eyken.
1922.	W. M. Hoover.
1923.	M. K. Morris.
1924.	J. Beresford, jun.
1925.	J. Beresford, jun.
1926.	J. Beresford, jun.
1927.	R. T. Lee.
1928.	J. Wright, jun.
1929.	L. H. F. Gunther.
1930.	J. S. Guest.
1931.	H. R. Pearce.
1932.	H. Buhtz.
1933.	T. G. Askwith.
1934.	H. Buhtz.
1935.	E. Rufli.
1936.	E. Rufli.
1937.	J. Hasenohrl.
1938.	J. W. Burk.

A. L. T., Norwich.

Rugby

Formation of Rugby Union.—The Rugby Union was formed on January 26th, 1871, when the following clubs met at the old Pall Mall Restaurant at Charing Cross to discuss certain problems which confronted the game at the time: Blackheath, Richmond, Wellington College, Guy's Hospital, Harlequins, King's College, St. Paul's, Civil Service, Marlborough Nomads, Queen's House, West Kent, Wimbledon Hornets, Gipsies, Clapham Rovers, Flamingoes, Law, Lausanne, Addison, Mohicans, and Belsize Park.—*W. F. S., Yorks.*

"All Blacks."—It was the 1924–25 New Zealand ("All Blacks") touring team which subsequently became known under the title of "The Invincibles" on account of their triumphal series of victories over the Rugby teams in this country. Here is their international record: November 1st, 1924, beat Ireland at Dublin; November 29th, 1924, beat Wales at Swansea; January 18th, 1925, beat England at Twickenham; January 18th, 1925, beat France at Toulouse. The last time they came over was in the 1935–36 season, and again we give their international record: November 23rd, 1935, beat Scotland at Murrayfield by 18 pts. to 8 pts.; December 7th, 1935, beat Ireland at Dublin by 17 pts. to 9 pts.; December 21st, 1935, lost to Wales at Cardiff by 13 pts. to 12 pts.; January 4th, 1936, lost to England at Twickenham by 13 pts. to nil.—*S. W. F. D., Thornhill.*

Shooting

12-bore 2in. Guns.—You will find that for general shooting the 2in. 12-bore gun is as effective as a standard 2½in. at normal range; it, however, should be understood that with a shot charge of ¾oz. the same results cannot be obtained at long ranges as with 1⅛ oz. charge at present employed in the longer cartridge. However, as fully 90 per cent. of shots are obtained well within 35yds., this slight disadvantage is outweighted by the reduction in weight of at least 1lb., enabling one to bring the gun quicker to the shoulder and to swing better, not to mention the great saving in fatigue experienced at the end of a long day. As these guns shoot very close patterns we would recommend you having the right barrel improved cylinder and the left modified choke. A very good load is 27 grains of Diamond Smokeless powder and ¾oz. shot.—*Brown, Damerham.*

HORSE SALES OF THE WEEK

Leicester

A FULL catalogue was dealt with at Messrs. Warner, Sheppard & Wade's Leicester Repository, on Saturday last, and some good prices were again realised, the best being the 210gs. paid for Mr. A. Smith-Bingham's chesnut gelding Ridley, whose stable companion, Hereford, a bay gelding, sold for 200gs.; that amount was also given for Mr. G. M. Gibbs's chesnut gelding Cartoon. Major E. A. Fielden's brown gelding, Help Yourself, went for 160gs., and Captain and Mrs. Beck's chesnut gelding changed hands at 135gs. The prices of 30gs. and over were as follows: Property of Mr. E. A. Coombe: B g, 50gs. Property of Mr. A. Hanbury: Derry Boy, b g, 70gs. Property of Mr. F. Porter: Martini, br m, 42gs. Property of Mrs. B. E. T. Parsons: June, b m, 34gs. Bicester Cubhunters, the property of Mr. R. E. Field-Marsham: Owlpen, ch g, 34gs.; Belcot, b g, 52gs.; Dandy, gr g, 55gs.; ch m, 47gs.; Smut, br g, 30gs. Property of Captain and Mrs. Beck: Acknowledge, ch g, 135gs.; Jack, b g, 75gs. Property of Mr. G. M. Gibbs: Cartoon, ch g, 200gs. Property of Captain and Mrs. Benn: Prioress, ch m, 70gs. Property of Mr. A. Smith-Bingham: Hereford, b g, 200gs.; Oliver, b g, 65gs.; Ridley, ch g, 210gs.; Authority, br g, 190gs. Property of Mrs. H. Rosell: Simon, gr g, 57gs. Property of Major E. A. Fielden: Help Yourself, br g, 160gs. Property of Mr. W. N. Seymour: Anna Karina, ch m, 32gs. Property of Mr. D. Brownlow: Headlights, bl m, 72gs. Property of Lieutenant-Colonel A. E. Lawrence: Fire Escape, b g, 40gs.; Admiral, gr g, 50gs. Property of Captain D. R. Daly: Night Cap II, ch g, 47gs. Property of Mr. J. H. Hudson: B g, 40gs.; b g, 40gs.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

Printed in Great Britain by Hudson & Kearns, Ltd., Hatfields, Stamford Street, S.E. 1, and Published by The Field Press (1939) Ltd., The Field House, Bream's Buildings, London, E.C. 4, in the County of Middlesex, Saturday, Nov. 5, 1938

SCOTTISH SALMON BILL

NOW that a new session of Parliament has started, it is to be hoped that a real effort will be made to place the new Salmon Fisheries Bill for Scotland on the Statute Book. At the moment it is a private member's Bill, but surely the Government should be sufficiently interested to give facilities for its discussion? Salmon legislation is urgently needed; it has been urgently needed for years past, and the time is coming when a Government measure will become inevitable to save this important industry from hopeless deterioration. Every year that passes makes matters a little worse; puts off the recovery and allows more men to drop out of country employment.

So it is important that salmon interests, rodsmen, netsmen and proprietors, should join forces so that the Bill may be passed as a practically unopposed measure. The prime object of the Bill is, of course, to improve the stock of salmon in the rivers. It is quite evident from past records that our rivers are not holding anything like the number of salmon that they used to do, and quite possibly not more than half the salmon which a system of modern conservation might provide. That the legislation proposed will go a long way to restoring prosperity is admitted by all, but there is a feeling in some quarters that the cost of this improvement is not so evenly divided between the rod and net interests as it might be.

The principal point on which agreement seems difficult to attain is the weekly close time for nets. This is, perhaps, the most important move for increasing stocks, as it allows a certain percentage of each run of salmon to get up the river. That reduction in netting eventually achieves this object was shown by the figures published in 1933 for the Conon by Colonel the Hon. I. M. Campbell. He gave figures for 30 years, for the first ten of which intensive netting was carried on, and showed that in the last ten years of the period there were many seasons when the comparatively few nets operated actually caught more salmon than when, earlier, far more nets were in use; and this in spite of the fact that the sea nets, outside this experiment, must have been getting a large share of the benefit.

But when reduction in netting takes place the first people to benefit are the rods; they get a share of the additional salmon running through. The nets have to wait for their dividends until these salmon have spawned and the increased stock has gone to sea and come back again; it takes time. When it does return, however, the nets get 90 per cent. of the increase, since rods only take one fish for every ten caught in the nets. This is emphatically a case for a long view. Scotsmen have an enviable reputation for being long-headed, and some compromise between the proprietors and the netting lessees will be necessary. The proprietors are sure of their return; the netsmen can only get it if their lease is long enough.

Immediate, though eventually lesser, advantage to the rodsman may be admitted, but his benefit to the community as a whole should not be forgotten. His is the interest which brings money and employment to the countryside. It is probable that the number of gillies alone is equal to the total number of men employed in netting; in subsidiary employment his sport is still more beneficial. Already there is a tendency for men to seek their sport elsewhere, and once this kind of dry rot sets in it is difficult to stay. An effective Bill, giving hope for improvement, will go a long way towards restoring confidence. Salmon interests in Scotland, by setting aside small differences and making a combined effort, can get this Bill on the Statute Book and pave the way for restoring prosperity to commercial and sporting interests alike.

THE "FIELD" CHRISTMAS NUMBER

Next week's issue of the "Field" will be a special Christmas Number. It will contain many notable features. There will be six pages in colour, including J. Pollard's picture of the Peace Coach of 123 years ago; "Sprees at Melton Mowbray," two of Alken's Sporting Anecdotes; two humorous suggestions for Masters and Field Masters by G. W. Allinson; six plates in colour photography of the Sporting Year; and "Bird Life on the Mudflats at Christmas," by Dr. E. A. R. Ennion.

Among special literary features are: "The Changing Face of the Countryside," by R. H. Mottram (author of "Spanish Farm" and winner of the Hawthornden Prize); "I Fear the Greeks," by Major C. S. Jarvis; "Mistletoe, a Romance of Christmas Numbers," by Patrick Chalmers; "Christmas Creel," by Robert Hartman; "Handley Cross and Leamington Spa," by Alan Fox-Hutchinson; "A Dog of Character, the Labrador in Canada," by R. Leckie Ewing; and many seasonable articles in addition to the usual contents.

The cover of this issue is a colour reproduction from George Morland's "A Country Alehouse," in which the artist is said to be the central figure.

THE ROTHAMSTED CENTENARY

THE Rothamsted Experimental Station at Harpenden is the oldest institution of its type in the world, and will, in 1943, celebrate its centenary. Ever since it introduced artificial fertilisers, the station has continued to render the greatest service to agriculturists not only at home but in many parts of the world. Indeed, many farmers abroad are more familiar with its experiments than are those in England. Besides the work carried out at Harpenden, the station has trained a fine body of experts, whose knowledge is now serving the Empire and foreign countries.

Our aim has been the constant inspiration of this century of service—that of practical assistance to the farmer by advising him as to his soils, crops and fertilisers. The increasing number of farmers who apply for this information is itself a sufficient warrant for the appeal for £125,000 with which to bring the buildings and equipment up to date on the occasion of the centenary. The King has opened this fund with a donation of £100.

PER ARDUA AD ASTRA

Another flying record has found an abiding place under the British flag—the long-distance record. The facts of it have been reiterated many times during the last week, but no opportunity can be neglected to offer unstinted praise both to the men who made the flight and to the R.A.F. as a whole. To find good reason for criticism and grumbling is a national vice, but here at least is something tangible which should still a number of wagging tongues, for, in effect, the three Vickers-Wellesleys of the flight were "taken out of stock" and, apart from extra petrol tanks, they are twin brothers to numerous other Wellesleys powered with Bristol Pegasus engines. All these aeroplanes are capable of carrying the extra tanks in their wing structures, and capable of topping 7,000 miles non-stop. Perhaps our aircraft is not so inefficient as some critics would have us believe!

BE PREPARED!

Amusing, if pathetic, is Lord Addison's account of the recruiting of the master gauge-maker during the War, and how he was eventually discovered on fatigue duty picking up paper on Wimbledon Common. The *L.R.B. Record* publishes one or two stories of the crisis in similar vein. One anti-aircraft unit, it is stated, on embodiment, found that the painters had preceded them to paint the drill hall. In one village, respirators had been put in charge of the local warden, who had locked them in the family strong room and departed on a world cruise taking the keys with him. But the best yarn concerns the unit which arrived at headquarters to find a dog show in progress, a lady judge greeting a much harassed officer with the remark: "Isn't it fun? Now I can judge two lots of Terriers at once!"

NOVEMBER ROACH

Apart from the summer day recently dedicated to Guy Fawkes, November this year has treated her fishermen to sour looks; for this, in the opinion of many rods, is the great month of the year for roach and perch. In a properly-ordered November there should come, after St. Luke's little summer has cheered the grayling fisherman by revealing the face of his stream bedecked with dimples, a fortnight of soft, still weather which keeps the golden leaves upon their boughs and allows a well-poised float to swim uninterruptedly save for that sudden dip which means a fat and feeding roach on unsuspicious business bent; or allows the spinner with his shining spoon to see obstructions, whereby he may ensnare a perch, that handsomest of fish, without lament for tackle lost. Maybe these early winter storms precede a period of quietness, but up to now we have had a ruffled and unseemly surface strewn with clogging leaves.

LATE HEDGEROWS

I walked in Spring between
The hedgerows green,
When tiny-leaved they soared
In sun, and music poured,
Here, there, from nests unseen.

So dense they grew and high
With Spring gone by,
That loitering I could see
Only a trinity
Of hedge and road and sky.

Now thinned in wintry sun
The hedgerows run.
Between the thorn-twigs bare
Light pours and frosty air.
Spring, Summer, both are done.

ERIC CHILMAN

A COUNTRYMAN'S JOURNAL

WHENEVER I talk to a master-man in any surviving local and rural industry, I see a whole series of unities and correlations interwoven before my eyes. It is as though I were listening to a piece of music. The tyranny of time is snapped because all master-craftsmen express a stable reality as independent of present time as are they themselves of laws of supply and demand that have no relation to human needs, of over-specialisation, of cheapjack mass-production, of the machinery which robs a man of his hand and eye, and of urban unrealities. My man was a basket-maker; he owned a small greengrocer's shop; he brought up his son to be his apprentice, and he used to rent an osier-bed and cut his own rods from it. I do not know how he now survives, but in surviving he illustrated a pattern of life and a rhythm of work utterly lost to-day.

In the craft-guilds of the Middle Ages, masters, workers and shopkeepers were parts of one whole. Here he was, all three in one. When the local crafts flourished, the bridge between producer and consumer was not yet broken down. It was still holding—in the little back-parlour of the basket-maker. Of old, the master experienced the whole process of his trade from raising the fruits of the earth to the last touch of his hand on the product. My master-man could no longer cut his osier-beds, because inferior, dumped rods from South America had ruined their cultivation. But there was a time when he made his finest baskets out of the best rods, English and his own. This, in its turn, introduced the most profound and intimate bond of all, the bond between agriculture, craftsmanship and industry. By that bond every community must abide or perish.

Most of the master-men I know are of a grave deportment, as well they may be in such times for them. But this basket-maker, with his dash of French and Irish blood, was as merry as a grig. His trade has been established in a small market-town for a century, and with a mixture of gusto and slyness, of pride and shrewdness, he told me something of his family fortunes. His ancestors were Breton basket-makers and the first emigrant was his great-great-grandfather. Though there was a biggish firm of basket-makers already in possession in the town, his grandfather's uncle, a mill-wright, bought him a small shop there at the back of a pub whither he used to travel in his carrier's cart. This was a family that lived to make baskets as much as it made baskets to live, and the sturdy grandfather taught his son to make them when he was eight years old, after he himself had begun by tramping round the farms with a handcart to sell his baskets and had triumphed in the end by buying up the rival firm.

With a wealth of dramatic effect, his grandson informed me that he was one of the six best basket-makers in England—"just as I am myself." He never, I gathered, stopped working at all except to penn hurdles on market-days, and this the grandson still does, though, unlike his grandfather, he can no longer live on basketry alone. The tradition of work, as among all true craftsmen, is maintained to the present day and, while he no longer works in a cellar as his forbears did, he used to put in twelve hours a day and three entire nights in a week. As much for the passion in his blood as to keep his family, since such modern factors as the time-sheet and regulated hours of labour have no relevance to a master-craftsman, because a man who controls and fashions his own product, enjoys his labour, and so is preoccupied with the thing in itself rather than with what he makes out of it. In the ancient days, indeed, such craftsmen lived by barter, and so to this day understand money at its true value—as a medium of exchange. The same principle is implicit in what he told me of his father who at one time kept an inn and paid his rent—in baskets.

The last job of his grandfather at 71 was to teach his grandson to make baskets, and now at eighteen the great-grandson is "almost a basket-maker." What rest, what hope, what superiority to change and decay there is in such a continuity! As the tale unfolded, his quips and quiddities, his very boastfulness spouting out from the grin of a happy child brought me a sense of unfathomable assurance. I was in the presence of reality, and the phantoms of our own age that throws men like these aside, fled gibbering away. It is a reality that has lasted and will live again when the night of our own time is passed.

H. J. MASSINGHAM.

WITHOUT COMMENT

From an illustrated daily: "Beagles are used nowadays in hunting hares and rabbits. They are followed on foot. Eton pack meets twice a week in winter. So far this season the dogs have caught fifty hares."

Rowlandson's famous picture of the George Inn at Crawley in 1789

"THE WARMEST WELCOME"

Some Thoughts on the Ideal Host

TO write about British hotels is perhaps to court trouble. There are so many of them and so many different ways, apparently, of running them. Doubtless many proprietors will disagree with what I say here, but I would ask them to remember that an article is often little more than a sort of clothes-line on which one pegs a string of ideas, quotations, allusions, and so on.

In a way a reader has before him or her the mental undergarments of the writer; some possibly fairly new, others which seem rather old and patched. And sometimes, owing to the invisible clothes-line, ideas seem to have no connection or continuity, for language was ever intended to be spoken to the ear. Who will deny that it is always easier to thrash out a subject by word of mouth than ever it is to link together a series of paragraphs for a page of print?

Those who have read the late Mr. Arnold Bennett's *Imperial Palace* will know that it is concerned with the modern conception of a great hotel as a living organism. It is a book which is well worth reading, and the rapid evolution of several hotels to-day might serve as an appendix, for they furnish modern examples of what happens following the revival of road traffic. When the railways challenged the coach traffic and won, many a good inn—which previously had been the centre of enormous trade—was forced to close its doors or else became little more than a "pub" frequented by local agricultural labourers.

Then came the motor car, and once again prosperity entered the portals of many an inn or hotel on the main roads of England. Hotel owners would do well to remember just how much they owe to the motorist. Only the other day I received a letter concerning an article I had written in our series "Mine Ease at Mine Inn." The writer, who had recently returned from the East, asked me why it was that some hotel keepers looked upon the motorist as someone to fleece. Why was it, he asked, that proprietors usually charged a motorist for garaging his car during his stay at their hotel? After all, many of the hotels on the Great North Road would do little trade were it not for the motorist.

Now in all the hotels I have visited where the garage has been free of charge to guests there has been what one might term an ideal host. Chiefly he is met in the smaller hotel where one man is master; in the larger hotel, which Arnold Bennett pictured, it is never easy to find out who is really in control. Many tail-coated and condescending gentlemen will welcome you on your arrival at the hotel run on the Grand Babylon scale, but few visitors ever reach a decision in their own minds as to who is in control. And it is not among the ways of the English to ask.

In the small hotel, however, we often meet the perfect host. He shows thoughtfulness in everything he does. He makes it his business to understand his guests without ever appearing to ask questions. In his hotel you do not have to look for ashtrays—there are plenty—nor do you have to crane your neck into the most awkward position before you can shave in the morning. Everything has been tested and arranged perfectly; no need to unscrew the mirror from the wall and take it over to the window. That may sound absurd, but I was once forced to do this (or risk cutting myself to pieces), and when I tried to put the mirror back in its original position the screws simply would not hold in the wall. I did the only thing possible under the circumstances—I fled. But the good host never causes his guests to be in such a predicament. He realises that if people are to return to his hotel they must not be irritated by any minor stinginess on his part.

Watch a really efficient proprietor or manager and you will see an artist at work. He is always on the spot yet never in the way. He knows a good deal yet gives his guests the impression that they know more than he does. On your arrival he greets you; on your departure he regretfully speeds you on your way. During your visit he makes you feel that it is "your hotel" more than his, but take liberties over that score and you will soon find the error of your ways.

There is a quiet, almost old-world courtesy about the civility which permeates the whole of his staff, and this has no small part in sustaining the atmosphere of comfort and refinement which makes his hotel so unusually attractive to discriminating visitors. If the proprietor likes signs of the antique (so many do to-day) they are so placed that the visitor remains only subconsciously aware of their presence, for it is always the modern disposition or contrivance that answers instantly our mental questions as to whether this or that is as it should be. A well-lighted dining room, an inviting and comfortable lounge, and a cosy little card room give a sense of social intimacy to which it is always a pleasure to return.

Now I am not trying to suggest that British hotels are adequate; they most certainly are not. It has, for example, long been a mystery to me as to how and why some hotels are awarded so many stars by the A.A. I do think, however, that in the main our hotels are much better than some people (usually, you find, they spend their holidays abroad) make out. Perfection is only met with, however, where the proprietor or manager has acquired a real understanding of human nature. That, I believe, is the key to a successfully run hotel, and it must have been one of the reasons why Shenstone wrote that he always received "the warmest welcome at an inn."

W. G. L.

NATIONAL PARKS AND NATURAL BEAUTY

An Urban Problem Which Must be Solved by Countrymen

IN 1926, the Council for the Preservation of Rural England was formed to co-ordinate the efforts of many national associations, societies and institutions, each of which is interested in preserving the artistic and historic features of country towns and villages. Its main objects are:

1. To organise concerted action to secure the protection of rural scenery and of the amenities of country towns and villages from disfigurement and injury.

2. To act directly or through its members as a centre for furnishing or procuring advice and information upon any matters affecting the protection of such amenities.

3. To arouse, form and educate public opinion in order to ensure the promotion of these objects.

The preservation of the artistic and historic features of country towns and villages, the protection of rural scenery and the amenities of country towns and villages from disfigurement and injury, these things do not necessarily imply a desire for the static preservation of the countryside in its ancient form. In certain cases such preservation is, of course, essential, but in most rural areas development is not only inevitable but desirable. The C.P.R.E. has always recognised that, but never so clearly, I think, as to-day, if one may judge by the spirit of realism shown in the speeches delivered at the recent conference at Chester.

Development is, indeed, inevitable. Nature is quite unable to stand still, and if not guided and tended slips rapidly back to a state which is, from our 20th-century point of view, not very beautiful and certainly not productive. A crowning example of this may be seen in certain areas of derelict land in Hampshire—land which I can remember when it was as beautiful and as highly farmed as any in England. To-day it is wild, and some might, not knowing it of old, call it beautiful; but no longer is it useful. No, development is inevitable and desirable. The C.P.R.E. demands that such development shall be along orderly lines, so that the new things—many of them foreign altogether to the countryside—shall carry on the traditions of the old, shall harmonise so far as possible with the landscape of which they form part.

These are aims with which I am in most hearty agreement. And they are aims which the C.P.R.E., in the face of many difficulties, has fulfilled nobly. There are those—I meet quite a number—who complain that the work done is too parochial in character. So far the work has necessarily been somewhat parochial in character—a moment's thought will show that that must always be so. But is there any reason why it should not also be national? No reason at all, that I can see, beyond public apathy.

With the growth of urbanisation love of countryside is growing. More and more men are realising that their spiritual existence is bound up not in bungalows and tubes and the clicking of typewriters, but in the earth as God made it. To satisfy this desire—the desire of urban populations for the open country—is a national duty. The planning of green belts, the laying out of more and yet more public parks and recreation grounds, while excellent in themselves, do no more than scratch the surface, are no more than palliatives. What is needed, is essential—indeed, inevitable—is a new orientation between town and country.

Plenty of people realise this, but cannot agree as to the best means by which it may be brought about. There are two schools of thought more or less violently opposed to each other. The one school would, once and for all, like to have done with huge cities, and in their place to scatter throughout the country moderately sized industrial towns. The other desires to keep town and country as distinct as possible; to erect, in effect, a sort of walled city. And between the two camps are those who support the idea involved in ribbon development, only rather better planned than it is at the moment. I must confess that the idea of a multitude of small industrial towns scattered up and down the country appals me. I cannot see how such towns could be kept within bounds, and I can see a time when the whole country would be but an urban-rural hybrid, sterile and unbeautiful. I must confess that the idea of any extension of ribbon development fills me with nausea. I am, therefore, a staunch advocate of the walled city idea.

SUNSHINE IN SOMERSET AND THE QUAINT, COBBLED STREET IN THE "OLD TOWN" OF MINEHEAD

But acceptance of this idea carries with it acceptance of the obvious corollary that the large city implies abundant facilities in the country for the holidays and week-ends of the urban worker. At the moment, though we have large cities enough, such facilities do not exist. They can exist only in the formation of national parks. The movement for the setting up of such parks has been launched. I do not know what the response has been; I do not know how near we are to seeing national parks formed in Britain. But I do know that their formation is long overdue.

There are national parks in other countries, and two—the Yellowstone Park and the Kruger National Park—are very well known (by hearsay, at any rate) in this country. These two famous parks—they are really game reserves rather than parks—have given in the minds of many Englishmen quite a wrong idea of the meaning and purpose of a national park as it would be in Britain.

The purpose of a national park is twofold—the preservation of natural character and the provision of recreation for the people. Every national park should satisfy both conditions. It is not a prime consideration that rare species of fauna and flora should be preserved in British national parks, though it is, of course, implied in the words *preservation of natural character*, that neither they nor species common to the district should be persecuted. There are, since we are blessed with a wide variety of geological structure, many well-defined forms of scenery, each with its typical fauna and flora, in Britain. No scheme of national parks could, therefore, be considered complete that did not preserve the natural character of each type of scenery. Dr. Vaughan Cornish has enumerated six types of scenery (he considers the whole area of enclosed agricultural land to be unsuitable for inclusion in any scheme of national parks—an opinion with which it is impossible to disagree) mountain, moor and down, woodland, fenland, river and coast.

Adopting his six types, we can all think of areas which we would like to see preserved in perpetuity

for the nation. But in the choosing of areas two points are essential and must not be overlooked. They must be pre-eminent in their own peculiar beauty; and they must be distributed, so far as possible, in relation to the big industrial centres—London, Cardiff, Birmingham, Newcastle, and that dreadful desert of brick that includes Manchester and Leeds. For it must always be remembered—it is a point we are, all of us, too apt to forget—that national parks are designed primarily for the benefit of the townsmen.

There are other points worth remembering also. Firstly, national parks, properly chosen, would be beyond the radius of a day trip from any big industrial centre: they would be places visited for a holiday. For this reason such wild places as still exist on the outskirts or in the immediate neighbourhood of a big industrial centre should be a municipal, at most a regional, concern, and not a national one. Secondly, national parks should be planned, not with the idea of extending the facilities for organised athletics or communal pram-pushing, but with the idea of providing opportunities for those basic forms of recreation which we have so sadly neglected—walking and climbing and swimming and boating—together with the intellectual recreation provided in the study of nature and in contact with beauty.

Bearing these essentials in mind, certain areas immediately present themselves as suitable for national parks. Probably each one of us has his own ideas, each visualising some favourite stretch of country. Here are my own: the Lake District, since it combines mountain and wood and water, and is situated ideally for the industrial desert of the Lancashire-Yorkshire borders and for the closely populated industry of Tyneside; Snowdonia, as a mountain group and within the reach of industrial Lancashire, industrial Birmingham and the Black Country; the cliff coast of Pembrokeshire, which is as beautiful as any in the world and so happily placed for Cardiff (the only other cliff scenery to compare with it is to be found around Land's End, and that seems to me to be rather out of reach for most urban workers); the New Forest, one of the last remaining areas of deciduous woodland in Britain, and well placed for London and all South-Eastern England; the Fens, which, though scarcely comparable to the Lakes in point of size, yet supply some 200 miles of waterways and are within easy reach of a number of industrial centres. Of river scenery there is a wide choice. My own would be the Wye by Ross, which is an almost perfect example of river-gorge scenery allied to woodland, and fulfils the requirements so far as access from industrial centres is concerned. Each and everyone of those will arouse objections of varying value from a wide variety of people. I put them forward only as examples, no more.

Objections, of course, there will be to any proposed national park. The formation of a national park anywhere is bound to cut across private interests to some extent. I hear a good many objections from time to time—not necessarily directed against national parks as such, but against allowing the public—by which I presume the urban public is meant—access to land. And I know that the public, when it has access—or forces its own access—to land, does do a certain amount of harm. I am not so sure that the same harm would be done if the land belonged to the public. We are *en masse* extremely jealous of our rights and our property; we are rarely jealous of the rights and properties of others.

If farming land is to be excluded, as it must, from any scheme of national parks, then the main interests which would or might be damaged are those connected with sport. Hunting would not, I imagine, be affected—and might well be enhanced. But shooting, in the areas chosen, would undoubtedly suffer, for obviously one could not allow of shooting on ground open to the public, and equally it would be impossible to preserve game in such areas.

I do not feel qualified to discuss the whole of this question, but I feel certain it is not one beyond solution. Further, I have heard it said in connection with shooting that a national park, by encouraging vermin, would affect the sporting properties in the immediate neighbourhood; but I cannot imagine a properly conducted national park encouraging vermin to that extent.

But, despite objections (of which there could be many), despite difficulties, I remain a strong advocate of such parks. I am a countryman, and I know the inestimable advantages the countryside possesses, and can convey to those who have the ability and the inclination to sojourn therein. The beauty of the countryside, the beauty of scenery, is not a luxury contingent upon wealth and the time to live pleasantly: it is a factor in the formation of national character. Its preservation is essential to the national well-being. The influence of natural beauty upon personality is manifold—visual, temperamental, æsthetic—and always beneficial. We are beginning at long last to cultivate the habit of receptive contemplation of beauty, that habit which is a source of spiritual inspiration far greater in strength than is commonly realised. We cannot but be the better for that, individually and nationally.

It is for these reasons—and those inherent and evil in our present gigantic and unstable industrialisation—that we must seek out once more the land that made us. The need is urgent, for the attack upon the land is incessant, and inaction is, perhaps, the dominant trait in the English character.

But do not let us delude ourselves into imagining this to be a problem for countrymen alone. It is not. Primarily, the problem of the Preservation of Rural England is an urban problem. It is an urban problem which must be solved by countrymen.

BEST DAYS WITH HOUNDS

With the Pytchley from Mr. Clarke's

THE week under review has not been without incident during the process of clearing the ground for the regular season, which had its inception on Monday, the 7th. On Monday, the 31st, besides other useful work and a cub handled, hounds ran well for fifteen minutes from Old Pooks and located an unsuspected hole near Old Village in so doing.

On Wednesday, the 2nd, hounds ran really fast from Stanford Park over a delightful and rideable line of country to Kilworth House. Thence at the pace of a hunting run to the starting-place, where, among deer—and there is no more puzzling foil than this—plus nettles, a really tired fox saved his brush. A cub was killed, and at least five marked to ground before the day ended.

On Friday, the 4th, the mixed pack provided a really good day's sport. A fox from Watford Covert was hunted at a fair pace as though for Winwick, but under considerable pressure was forced to return to where he was found. Watford Covert is of a considerable acreage and uncommonly thick, but for another 30 minutes hounds were hard at work, and hunting him away finally killed in the open near to West Haddon. Not far from Welton Mr. Clarke has made on his farm a snug little covert, and in so doing supplied a long-felt want. Several were in evidence on this day, and the one to which hounds settled was a stout customer. The pack began to run well at once and returned to this spinney, having completed a circle via the Sallow Beds and Ashby Village at a good pace and over a line of grazing ground which bears comparison with any in the country.

The fox had not gained on his pursuers in the meantime, and so the pace increased considerably as the hunt continued, this time in a larger circle. Welton Station, Ashby Old Park, the Cleeves and Braceborough were passed on the right, and the field were hard at work to keep the pack in sight. As the fox turned towards Welton Village a kale field was encountered. This field held a fresh fox, and his presence, added to a good deal of conflicting information, caused some delay. On account of this, although a line of sorts was carried in the direction of Daventry, a good gallop of 25 minutes ended without the conclusion which looked many times so probable. Saturday the 5th, from Haselbeach, on account of the heat largely, was disappointing. A brace of cubs were killed on the Cottesbrooke Estate, and a little excursion from Creaton Covert provided some galloping and for the enthusiasts some jumping. EMERITUS.

THE BELVOIR BEGIN

TWO more attractive sites for opening meets than Leadenham House and Croxton Park could hardly be devised. This dual celebration is a peculiarity of the Belvoir Hunt, though Lincolnshire really has the honour of "starting the tambourine a-rolling." The social amenities of a lawn meet having been enjoyed at Leadenham House, a record gathering was taken off to the Hilltop. Any discontent this move might have occasioned in those with an eye on the Vale must have been dissolved by the sight of the perfect view afforded. The long shoulder of land which stretches to the brink of Lincoln was mellow in the sunshine, whilst the lower ground wandered off into the horizon, replete with all the soft greys, greens and russets of the autumn tapestry, pricked by the stone fingers of the scattered churches.

Fresh horses everywhere seemed galvanised to extra antics by the sight of scarlet coats. But before long, a sharp though all too short dart over the little heath fences, made most of them amenable. Scenting difficulties arose after finding each successive fox; there were plenty of them about, but they clearly knew they could do what they chose with hounds, and, with the exception of one caught napping in Willson's Osiers, the laughs were all with the foxes.

The temperature underwent a change overnight, so that shivers were the fashion at Croxton Park next day. A smaller field than usual attended the Leicestershire debut and nothing of note enlivened the morning. Each "aisle" of Bescaby Oaks seemed colder than the last, but a useful fox was discovered, surprisingly enough, in the least protected part of the covert; not only did the wind whistle over it, but the main pedestrian traffic walked and talked within a few yards of where he was found. A perfect gentleman, this fox obliged by departing in the most desirable direction and laid the foundations to a hunt of two hours or more. The best of it was fast to Sproxton Thorns—and anyone who knows the country need not be reminded of the resilient grass, the serried rows of sleek thorn fences which ornament the route. There was every reason to suppose we were in for a good thing, but after the first fine burst the pace diminished. No one could grumble, as much of the best Wednesday country was covered, and from Coston hounds ran very fast towards Wymondham, to the alarm of those fortifying themselves with lunch and a fresh horse: checks certainly have their uses, but we could have done with rather fewer to make it a high-class hunt.

What the thermometer registered at Long Clawson is not known, but so phenomenally hot was the day that the gross tonnage of the field must have been enormously reduced, and the hounds' periodic swims in the canal were the envy of all. As a hunting eye-full, the approach to Sherbrookes takes a lot of beating. The covert is so perfectly placed in a limitless sea of grass, and the gallant assembly which cantered across the preliminary fields were all turned out in their best, and riding horses to dream of. But pity the poor stranger who wishes to locate the high commands. Lord Daresbury has always worn a tall hat in preference to a Master's cap, and now that Colonel Colman is similarly disguised, nothing but second sight can help the uninitiated; to add to the confusion, the rank of first flighters who wear a cap for accidental reasons, has had a further addition!

There was not long to wait before the covert-side ride was quietly crossed by a small brown fox, full of purpose. He first left the Smite on his left, but, changing his mind, caused the huntsman a nasty jolt. George had to gallop back to cross the bridge, and in his hurry his horse slipped up on the greasy wood. One of the nastiest variety of falls, this one luckily let him off with slight deflation and delay. Hounds were meanwhile slipping along nicely towards Hose. Although one shrinks from suggesting that virtue is frequently penalised, the fact remains that those who did not wait for the huntsman were the only ones to see the fun, which was, however, only fast for a few fields and then, unfortunately, left off altogether, as a holloa back proved the fox had been headed. This ultimately caused his undoing in covert.

Hose Thorns was full, which is a most satisfactory state of affairs. The most resolute member of the tribe made off towards Clawson Village, but hounds were occupied with one of his brethren, and were not extracted in time. A nice quick spurt from Harby Covert came to an end, all too soon, in the main drain at Langar. In the enforced absence of a terrier, it might have been possible to steam out the fox, so many people and horses having by then reached boiling-point. Hopes were again raised at Kaye Wood with another bustle for a field or two, but this flattering pace was largely caused by the necessity of galloping for a bridge to cross the Smite, and it was home for all soon after.

UNBRIDLED.

A COTTESMORE DIARY

PROCEEDING with the diary from October 22nd, hunting has taken place under the same abnormal weather conditions, namely, a hot sun and drying winds, thus rendering the going very much on the hard side. How many times overnight have we made the resolution not to jump to-morrow; alas! with the sound of Herbert's shrill whistle and the cry of hounds in our ears, this good resolution is quickly forgotten. A period of remorse follows; one avoids the studgroom next morning and peeps nervously over the open door to view the bay horse's legs, and if all is well how happy one feels. True, we had some rain on Monday night, the 24th, but not enough to get into the ground and take off the jar when landing over fences.

Some very good gallops have been scored during the past few days, the most notable of which were an excellent 32 minutes from Wheathill on the 29th, a nice 20 minutes from Kennel Spinney on November 4th, and to wind up the cubbing season on November 5th a rattling good hunt of 48 minutes from the Wild Gorse on Mr. Barnett's Farm above Oakham. Mr. Hilton Green is more than satisfied with his young entry, and with the country splendidly stocked with foxes we only want a good scent to ensure a great season.

Some slight changes have taken place on the staff: Herbert Norman becomes first whipper-in in place of Will Garrett, who has gone as huntsman to the Berkeley, and his son, John Norman, takes his father's place of last year. We have also a new Field Master, Sir Thomas Ainsworth, who replaces the Hon. R. Cubitt, who has gone to reside in the Quorn country. To him we tender our most sincere thanks for the excellent way he carried out his duties in the past two seasons, with the loyalty and help of the field, essential to any Field Master.

I have not the least doubt Sir Thomas will prove equally efficient. The wire district managers have been hard at work in their areas for some time, and the country will be quite clear of this menace by the opening meet at Greetham Inn on November 7th. FOXY.

DUKE OF BEAUFORT'S RUN OVER A GOOD LINE

BRIGHT sun and steadily-falling glass did not suggest a scent for the opening day at Lyneham Green, and the same conditions were present for Tuesday at Newnton Lodge. Wednesday was much better. Hounds ran well with a fox from Dodington Grove and killed him in the park. A kale field fox found below Springs Farm was lost after a nice gallop to Lyegrove, and another put out of Mr. Hall's stick heap ran a ring over the vale before he was pulled down by the Rectory.

Friday from the Kennels was the best day of the week, and scent was excellent all day. There was a brace of foxes in the thick privet of Bath Verge (which is also now full of fast-flying young pheasants) and hounds were quickly away. Running a line at the back of Badminton Village, their fox turned from Withymore, was viewed over the station road, and went on by Cape Farm towards Badminton House. Then a fresh fox jumped out of a tree just in front of hounds and they raced him to Allengrove, whence a brace more went away. Hunting beautifully the mixed pack took the line of their own fox alongside the boundary wall and crossed the Luckington Road by Manor Inn.

Here there was a brief check, their fox having turned alongside the brook to Brook End, and they went on by Widleys Hill to the Grove, where the second whipper-in got a view of the hunted fox running the road near Lady's Wood. Getting on better terms, hounds ran very fast over the cream of what is now a perfect wireless country, thanks to the organisation of the Rev. Jack Gibbs, and on by the New Plantation and Lord's Wood. The fox could not face the railway cutting and turned back, to be bowled over in Lord's Wood—to finish a capital hunt. Later a fox from Allengrove provided a good second hunt, and a last from Centre Walk, at racing pace to Cherry Orchard, finished a first-rate day's sport.

Saturday at Sevington proved disappointing, as in spite of good scent foxes never ran straight or far, and the day was spent making them see the error of their ways! At the meet Captain Simon Browne, who resigned the Secretaryship at the end of last season in order to take on the joint-Mastership of the Percy, received his presentation picture; neat speeches were made by everybody concerned, and everyone was glad to see Sir Audley about again. FIELD FARE.

PATCHY WEEK WITH THE QUORN

UNLESS something outstanding takes place I always think the last week of cubbing falls a bit flat and happenings are all the harder to write about when readers have enjoyed a week of the real thing before these lines appear. Anyway, I trust I may be forgiven if I am particularly boring to those who are sufficiently forbearing to give these notes a glance. To begin with, the sport was marred by the accident to the very popular wife of the Belvoir joint-Master last Monday week. What jolly bad luck, and how Lady Daresbury will be missed from the ranks of first-flighters when hounds run.

However, there is good news, kindly given me from Waltham House this morning for the hundreds of anxious Point-to-Point followers who, in the past, have cheered this gallant and brilliant Point-to-Point rider to victory. The news is that Lady Daresbury is progressing as well as can be expected.

Going back to Monday's sport, one or two foxes were allowed to go before hounds went away with a fox through Charlton's Gorse, across the Fosse Road on by Craddock's Ashes, down to Ella's and then by Willoughby to Widmerpool, when he was lost. Before writing more I should like to apologise for the names of two places in my last week's notes appearing incorrectly spelt all through my extremely bad writing. The names referred to are Langley New Wood and Sanham House.

After losing their fox at Widmerpool, hounds next found a fox at the back of the Six Hill's Hotel, and ringing round crossed the Old Fosse Road and went right-handed over the Melton—Loughborough Road down into the Hoby Vale and back by Lord Aylsford's and Bridgetts down to Old Dalby and into the Broughton Vale, when they lost him after a real nice hunt.

Friday spent in the Monday country proved rather disappointing owing to foxes preferring the open and sunshine to the coverts, and it was not until the "Curates" was reached that a fox was found. I never remember anything like the heat of

the sun on Saturday last for the time of year, and foxes were simply trotting along in front of hounds in that huge covert, Quorn Wood—there wasn't any scent at all.

While talking to an ex first whipper-in, who at one time turned hounds to the late Lord Harrington when he hunted the Forest side of this country, an enormous bright deep yellow butterfly flitted past and settled on some blackberry blossom, and later on, when hounds were giving a litter of cubs a pretty warm time in Mr. Moss's Spinney, I noticed a field smothered in bright red poppies. Surely this is a bit out of the ordinary? If these bright, sunny days continue it will be certain to affect the going, and we are badly in need of a frost or two. Many places are dangerously blind yet.

SCARLET RUNNER.

EXMOOR'S WONDERFUL HUNT

NOVEMBER 3rd was an ideal day from every point of view. The weather was all that is typical of the autumn at its best, and the colours and shades on the moor ranged from a purple that would in no way have dishonoured the toga of a Cæsar to the fiery red of a December sun as it sinks to a frosty horizon. There was a slight crispness in the air that made promise of a good scent, and in this we were not disappointed. For even if scent could never earn the soubriquet of "screaming," there was always enough of it to keep every rider who wished to see hounds galloping hard.

There was a fair-sized field to meet the bitch pack at Shallowford, but from the moment Mr. Wood cheered hounds into Thornworthy Gorse, its ranks became thinner and thinner. It seemed at first as though all prognostications about scent were but to prove the truth of John J.'s dictum. Several people saw the fox, and did not hesitate to tell the Master so in no gentle way. But the gorse was as thick as a wall, and hounds seemed to be able to make nothing of it. Eventually, however, they settled to him, and running him through the gorse from the Shallowford end, he was holloaed away by Mr. Saunders—who had "harboured" this fox for us—at exactly 11.25.

Hounds came away well, and were no more than a minute behind their fox; but still scent seemed only moderate, and it was at merely a steady pace that they ran over the lane and on to Stock Wood. From here scent took a definite turn for the better. So definite, in fact, that the Master was badly left, and missed the first quarter of an hour of this hunt.

After a turn round Stock Wood, hounds went away at the far side and ran over Stock Lane, with Lyn Down on their left, to Furzehill. There was a slight check here, but the whipper-in righted them—the Master being busy hunting his hounds—and on they went left-handed down to Woolaway. Crossing the combe they ran straight over Cheriton Ridge and down the far side to Farley Water, which they crossed on to Middle Hill. Everything looked set for a straightforward gallop to Badgeworthy, but the fox had different ideas. Turning right-handed up Farley Water, hounds hunted him to Holcombe Burrows, and then right again over Cheriton Ridge into Hoar Oak. This may have been some disappointment for those four members of the field who had got such a flying start from Stock Wood, but it was a fortunate turn for the Master, who could now see a hound and finally settled down to it in the wood. After running for a couple of minutes their whole cry altered to a deeper and more menacing note, which seemed to shake the very trees themselves. It was obvious he was not very far in front of them now. With the same deep angry cry they ran through Coombe Park Lodge and checked on the main road. In a moment, however, they had hit it off the far side into Boutin Wood, and the huntsman's heart failed him for once in that there would be 20 fresh foxes for every tired one.

But the fox himself had different ideas for his safety, and turning left-handed went out on to the open fields above the Bristol Channel. If once he got to the cliffs he was safe. Lyn Cleeve loomed ominous and large to the Master as he topped the ridge, and saw hounds running and a white wave advancing towards him with a great cry over the purple heather.

Crossing Hoar Oak hounds swung right over Stock Common down into Lyncombe. "I see'd 'e, I see'd 'e!" shouted an excited gentleman on the combe side as a spotlessly clean yellow fox brushed past him; but luckily hounds understood as little of his speech as did the Master, and consequently they paid attention to nothing but the job in hand. Without any hesitation they took the line straight across the coombe and over the fields at the far side into Cheriton, where their cry brought many a good lady from cooking her midday dinner. But hounds were not to be seen for long, since they were through Cheriton and into Cheriton Wood as quick as a horse could get there. At Cheriton Wood things looked bad. Sheep foiled the line and our fox had done some intricate twists and turns.

Hounds, however, were given plenty of time up the slope towards it, past Ladycombe Lake. But he saw something else as well which accounted for their sudden whimpering stillness—a small, dirty brown figure only a bare half field in front of them. Horses that could hardly raise a trot were made—God knows how—to canter, and as the Master, his whipper-in and four members of the field topped the rise they saw hounds in that ominous "rugby scrum," which can mean only one thing. In sight of the sea, having found on the moor, and within 25yds. of safety, hounds had killed a very big and very stiff dog fox after a first-class gallop of 80 minutes, with hardly a check, and covering twelve miles of country. Indeed may we say with Whyte Melville, "To Triumph!"

"HEDGEHOG."

THE CATTISTOCK HAVE A GOOD DAY

IF the first week's sport is any criterion for what is to follow, the members of the Cattistock field can look forward to a good season this year. It must be gratifying to their new huntsman, Fred Gosden, to be able to show such a brilliant day to the field as that which can be recorded for Saturday last, when hounds met at Red House, Key, on the borders of the Blackmore Vale country. The East Coker withybed can always be counted on to produce foxes, and when hounds were thrown in there on the day in question, a brace was quickly afoot.

THE NORTH ATHERSTONE MOVING OFF AFTER A MEET AT OSBASTON HALL, THE RESIDENCE OF BRIGADIER-GENERAL SIR THOMAS COPE

I am afraid, however, that the earth-stopper had not done his work too well; for the first one got to ground within a mile, and the second, though he did give hounds a short gallop, might almost be said to have committed suicide; for when he found himself unable to join his brother, whose earth was blocked by a whipper-in, he sat in a hedge and waited for hounds to kill him. However, Major Budden's home coverts—the gorses on the bank above the river opposite Sutton Bingham Manor—provided a fox which made up for all the deficiencies of the early pilots. It so happened that the writer was unable to be on a horse on that day, owing to a slight accident early in the week, but he was on the Yeovil Road when that fox broke from the covert and, breasting the hill, ran past the Sutton Bingham stables and over the Halstock Road, heading for Coker Wood.

Hounds came tumbling after him, scarce a field away, with the Hunt servants and the field, a hundred or more strong, close behind. They swept over the road and I feared that we should lose sight of them; but two fields short of Coker Wood the pack swung right-handed back to us, and leaving East Coker to the north, recrossed the railway and drove on past Netherton to Closworth, over a lovely line of country, where the field could

(Continued on col. 3, page 1126)

CHELTENHAM AND WINDSOR

An Appreciation of Sharples

THERE have in the past been occasions when the fields were too large for the course. Indeed, on more than one occasion a race on the flat has been started in two lines, a most unsatisfactory thing. Under National Hunt Rules races have been divided into two parts and run as separate events. There have been too many starters more than once this season, although courses such as Newbury and Newmarket can take all that they have ever had to take. It is different with some other courses. Even Manchester at the end of the month is to have too many starters, probably, for a race for more than eighty have been entered for an event there, and it is highly probable that some fifty of them will be started.

There were too many starters in one event at Windsor for the course. It is true that an accident might not have happened, but even if there had been no accident half the field could never have had a chance of winning from the start, for they were badly drawn, and a large number of them were bound to be barged about and so severely handicapped. As the result of the accident in this particular event poor Sharples was killed. I have wondered many times when the fields were even smaller that there are not more falls, for it happens too often that horses fail to keep anything like a straight course. It is the wonderful ability that a horse, if left alone, has of keeping on his feet that prevents more serious accidents. Sharples, who had been trained by that greatest of all schoolmasters, Stanley Wootton, was a very capable light-weight rider who would have earned a comfortable living as a jockey for many years to come. He might never have made an outstanding rider. He was a very nice young man, an exceptionally honest one, and he had a good brain. He will be much missed, and the sympathy of all followers of racing will go out to his widowed mother and brothers and sisters with whom he lived.

The authorities must do something about these large fields. I would suggest that when an entry is above a certain figure the race should be made into two. Totalisator funds, it has been suggested, should be used in such cases to make the second prize. I was asked the other day if I ever got tired of going racing, and I was able to answer, as I have done before, very truthfully, that so far I had never done so. I admitted that towards the end of the flat race season I am longing for a change not from racing but rather to a new sport, that of steeplechasing and hurdle racing. I, therefore, went last week to Cheltenham with the greatest of pleasure.

It is true that there was no flat racing on those two afternoons, but I should have gone to Cheltenham in any case. I thoroughly enjoyed it all, but I should have enjoyed it more if those two fine riders under National Hunt Rules, Wilson and Hobbs, had not been so seriously injured. Wilson broke five ribs and punctured a lung by a fall in the last race of the first day, while a day after he had fallen in a race there it was found that Bruce Hobbs had fractured a vertebrae in his spine. It will be some time before Wilson rides again, and still longer before Bruce Hobbs can go near a horse. Still, these steeplechase riders are the toughest young men that ever I did know, and I suppose that both will be back in the saddle much sooner than any of us think. Like all other admirers of brave men I most sincerely hope that they will.

If the attendances at the two Cheltenham afternoons are anything to go by, this season's racing under National Hunt Rules is going to be a great success. It is true that the weather on both days was fine, and that Cheltenham is in the middle of a great sporting country. The racing also was good, with several promising horses seen out. Bachelor's Gown, who won the Cheltenham Handicap Steeplechase, is only a five-year-old, but he jumped well and stayed well. He won a race on the flat two years ago at Lincoln when trained by Briscoe for the late Mr. Foster.

Some visitors thought that the horse was Bachelor's Call and backed him accordingly, for Bachelor's Call is a proved steeplechaser. Another visitor had forgotten who Bachelor's Gown was, but would have backed him if he had remembered, for he was Mr. Foster's brother-in-law. Racing is, indeed, a funny game, or rather the betting side of it is. Another nice young steeplechaser who won at the meeting is Pedigree. This young horse—he is seven years old—has shown promise before and had then been sold to Mr. J. V. Rank, who, however, must have been rather displeased with him, for the next thing that I knew was that he was back with Earl and was running in his name and colours. As a matter of fact, the horse is really a partnership horse owned by Mr. Rank and Earl, and trained by Earl. He is going to win more races for the two of them. He is a bold fine jumper and can stay. He is of the type that wins at Aintree.

I wonder how many times Alarmist has been out alone in front when running over fences and has then been caught and beaten. He had got the name of being chicken-hearted when he heard hooves thundering behind him, and who should say that he was not altogether right? He seems now to have overcome that complex and he ran a great race at Cheltenham to win the Charlton Park Steeplechase of three miles. He was soon out in front, and without ever being headed he won by five lengths from Away. But this time he must have heard the horses behind him, for Away got to him close home, but Alarmist was no longer living up to his name and went away again. He is owned by Mr. Berry, one of the best supporters of racing under National Hunt Rules that there is.

Stevedore, a well-bred colt by Trimdon out of Jonah's Choice, was rather a disappointment on the flat, but he suggested by his winning the Rosehill Hurdle that he may make a name for himself under National Hunt Rules. Much was hoped of Trimdon when he went to the stud, but so far he has not done what was hoped of him. It may be that he gets the stock all right, but owners will not wait with them. After all, he did not appear on a racecourse so far as I remember until he was a three-year-old. He won two Gold Cups at Ascot, but he ought never to have kept the first of them, for no matter how one argues no one will ever convince me that he did not interfere seriously with Singapore in that race.

Windsor is not by any means an ideal course for the spectator nor the rider who does not know it inside out, yet it is a popular place, and for a comparatively minor meeting there were lots of people there on both days. Fields were large but winners terribly hard to find, and the ring should have made money, even admitting the fact that there was not much betting. At this time of the season many of the bigger operators go very lightly. Everything comes to him who waits, or so it is said by people who have never had to wait.

Three years ago Knighted won the Fern Hill Stakes at Ascot for the second time, the only horse ever to have done so. Since then he had never won a race until he was successful on the first afternoon of this Windsor Meeting. Further, his rider, none other than G. Richards, had not ridden a winner for very nearly thirty races, an amazingly long losing run for this famous man. Knighted having at last won may do so again, for he is still a useful sprinter.

Another horse to win at long last was Manorite. At the end of last year it was thought that he might well be a Derby winner, but all this season he has been toiling away without ever winning. At last he also has won, for he won the Apprentices Plate of a mile and a half. He finished first and kept the race, but he seemed to me to bore Portefeuille all across the course in the last furlong. Still, one cannot expect little boys at the end of a mile-and-a-half race to know really what is happening at the end of the contest and nothing was done. This really seemed to me to be a case for action by the Stewards, but they are a kind body of men, and it would not have done either small boy any good. Little Wilson, who rode the second, so far regarded as a non-stayer, is a very small boy and to ride 7st. 9lb. had to put up some 3st. of lead. He shows much promise and is not lacking in confidence.

After disappointing him many times Mr. Tattersall sold Elgar, a colt by Hurstwood out of Foliation, and so purely home-bred. G. Bennett bought him and very nearly won the Newbury Autumn Handicap with him. Indeed, he ran so well in that race that racegoers forgot what a nasty little dog he had been for several years and piled the money on him to win the Runnymede Plate at Windsor.

Not all the barons in the Kingdom could have induced reason into him and his name was not signed in as being in the first three. Beary did all that a great horseman can do with a horse, but Elgar would have none of it. Surely his name should be changed. Great horses deserve great names; bad horses deserve the worst and silliest names that can be given to them, if they deserve names at all.

GNOSTIC.

BEST DAYS WITH HOUNDS (*Continued from page 1125*)

spread out and take the fences as they met them. It was a very pretty sight to watch them cross the Yeovil Road below Closworth, and turn to their right over the open fields towards Melbury Bubb.

I went down the road in my motor car, and was able to see hounds drive into Lord Ilchester's well-known covert—Eighteen Acres—and out the other side, where they swung left-handed toward Chetnole withybed. I lost them here for a moment, but my chauffeur knows the country well, and by breaking all speed laws we cut around over the Great Western Railway bridge, and turning left through Chetnole, caught sight of the pack as they streamed over the beautiful Blackmore Vale country towards Yetminster. Hounds were half a mile from me, but they were always in sight and their cry came to me across the fields very clearly. On this hill above Yetminster I waited, and from the gorses I saw a very beaten fox go down the hill towards the railway line, cross the line, and disappear in a small withybed alongside of it.

My chauffeur comes from hunting stock; three of his brothers are in Hunt service, and his father was a well-known huntsman before he died. The hunting spirit is in the man, and he started down the hill for that withybed before I could speak. Hounds checked on the hillside opposite to me, and the huntsman must have been glad to hear the welcome holloa from the railway line, where I saw my chauffeur, cap held high, cheering on the pack as they came to his holloa. The fox was very beaten by this time, and hounds caught him within 100yds., after as nice a hunt as one could wish to see. An hour and thirty-five minutes of the best, and a dozen miles as hounds ran, though only a five-mile point.

LINCOLN.

THE WHADDON CHASE'S TWO GOOD POINTS

NOVEMBER 1st the opening meet, and at 7 a.m. a driving, pouring rain and no prospect of better weather. Could anything be less auspicious for a new huntsman, new staff, new horses—in fact, nearly everything new except the fact that we were meeting at Cublington. It turned out to be just another case of meeting trouble instead of waiting for it, as by eleven o'clock the sun was shining and a gentle wind from the west made one think scent was a possibility. Mr. and Mrs. G. T. Stevens kindly dispensed hospitality to a large field. A word of thanks and appreciation is certainly due to the county constabulary for the way they control the cars, horses, &c., at the meet; without them complete chaos would reign.

According to custom the Hook Covert was drawn first, and it responded to the tune of a brace—one went away for Littlecote, the other hounds hunted up to Dunton Field; here, no one person but scores of footpeople headed him, and he swung back into Hartwell Covert, where he was accounted for. The Jubilee Covert, still on the right side of its third birthday, situated in the centre of Creslow Great Ground and consisting of gorse, blackthorn and privet, was called upon next in the hope that it would produce its first fox.

Anxious moments were followed by one clear holloa from the second whipper-in, and the first fox was away, leaving a brace behind in the covert. Hounds streamed across the Great Ground in a right-handed direction for the Aylesbury Road. Keeping right-handed, the fox went into the Hook Covert; it was the old fox of the family as could be plainly seen when he left the covert in full view of the field. Scent was good and any coffee-housers were left as hounds ran fast in the direction of Whitchurch.

Crossing the brook, the fox breasted the hill, went on the Bushmead Road to Mr. Bickard's earths, but Kempster of Cublington had been there the night before, and so, facing the big pastures, the fox went on left-handed to Weedon Village. Under the village, hounds made a short turn to the left, which saved many of the followers from seeing no more of the hunt. Going parallel with the brook, the fox went on to Norduck. After a momentary check, hounds ran right-handed, leaving Aston Abbotts Village on their left, for the covert.

With no thought of sanctuary here, the fox missed it by yards only and set off up the hill for Rowsham. Sinking the valley, and leaving this small hamlet on their left, hounds checked on reaching the brook, and here the pace for the first time slackened. But hunting on, with no real assistance, they accounted for their fox in Mr. Gurney's brickyard at Bierton, after running for just over 70 minutes. The point is five miles and a good hunt for any time of the year, but for an opening day, and really the first time that hounds have been let go, a brilliant one.

The rough field at Hardwick provided the next customer, but he intends to run another day, as after a quick run round Weedon he found safety in a drain at the Lillies. From Puttenham, last Thursday, a good hunt followed to ground at Aston Abbotts, this being a point of six-and-a-half miles. May these two days be an omen.

FOLLOWERS OF THE WHADDON CHASE BUNCHING AT A BRIDGE WHEN HOUNDS WERE RUNNING

NOVICE'S STABLE LORE

Terms and Their Meanings

AT THE BORDON HUNTER TRIALS

Miss E. Campbell's Toreador II jumping the water in the Novices class

THERE are expressions in stable parlance which are unique, and the cause and derivation of some of these terms remain a mystery. There must be many terms which, to the novice, are puzzling, and others at which even the old-timer and equine expert must sometimes pause and ponder how they came about, and yet others which by their nomenclature appear to have no connection with the work, or the subject in hand. Many words used are, of course, quite obvious, so there is no necessity to dwell upon these here.

The man who grooms a horse is frequently called a strapper, and the act of grooming is referred to as strapping. Had these names been applied to cleaning tack, there might perhaps have been something a little more appropriate about them, for there is a lot to do with straps and buckles there. Strapping actually is a reference to giving a horse a thorough grooming, as compared with quartering. Quartering seems a more appropriate name for the action the word performs, for it has to do with the quarters, and no doubt originally meant brushing down the quarters at early morning stables, after they had become soiled from the night's rest when lying down on dirty straw. Nowadays, this expression refers to light grooming, as compared with strapping—a thorough grooming.

From grooming we go to the actual names of parts and descriptions appertaining to the horse. Some of these names are odd, to say the least. When we talk of wind-galls, the mind naturally turns to wind and air, therefore it is often not understood why this name should be applied to the puffy swellings usually found in the vicinity of the fetlock joint, which contain fluid and not air. It is said on good authority that this name is derived from the fact that in the days of the ancient Egyptians the impression abroad was that wind-galls were swellings caused by air, hence the misnomer. A hogged mane is one that is clipped. A bang tail is one that is squared at the end by cutting with a banger.

There are certain descriptive markings of the horse which are to be found noted in veterinary certificates, among these are :

Star—A white mark on the forehead.

Race—Described as short, broad, or faint, consists of a narrow white stripe down the face, and is also sometimes called reach or stripe, the latter not to be confused with the stripe along the back.

Snip—A white mark between the nostrils.

Blaze—A white splash down the face, may be distinct from star and snip, or may comprise both.

The above markings have to do with the face and head ; there are also distinctive body markings, and here are some :

List, Ray, or Stripe—This term is used for dark lines, which are sometimes seen running along the horse's back.

On the legs we get socks and stockings, which are white in colour, the sock being the white hair which extends to just above the fetlock ; when this is prolonged it is referred to as a stocking.

In addition to these markings many parts of the horse have gained various descriptions, some of which are odd :

Roman Nose—Where the line of the nose is prominent.

Stag Faced—Where the line of the nose curves inwards, as opposed to Roman Nose.

Lop Ears—Floppy ears, said to denote laziness, but on the other hand usually a sign of good nature and easy temperament.

Fiddle Headed—Fiddle-shaped head, drawn in excessively, especially round and below the jaw.

Ewe Neck—Is a neck shaped like that of a sheep, and in which the curve is the wrong way.

Backs are sometimes described as "hollow," and "roached." A hollow back is a clear description, and applies to horses which have the back deeper than usual. A roach back is the reverse to a hollow back, and the curve instead of dipping is upward. The roach back is a strong formation, whereas the hollow back is a weak one.

Slack Loins—Those which are long, narrow, and weak.

Well Sprung Ribs—Those which are hooped and deep.

Well Ribbed Up—Ribs which reach well back, leaving little space between the last rib and the point of the hip.

Herring Gutted—Smallness of ribs and belly, shaped like those of the fish of that name, when looked at sideways.

Riding Shoulders—Those which are sloped and long in the blade, covered with muscular flesh, of which the muscles should not be lumped together.

Loaded Shoulders—Those which have the muscles lumped together, and are bulky at the point.

Upright Shoulders—Those without sufficient slope of blade.

Short Shoulders—Insufficient depth from wither to elbow.

Calf Knees—Knees which are calf-like in appearance, sometimes termed "back at the knee."

Tied at the Knees—Where the tendons are drawn in just below the knee, giving the appearance as if they had been tied, as compared with the lower portions of the tendons.

Gummy Legs—Those wherein the tendons are not well defined, general fulness of the legs, rounded appearance.

Goose Rump—Quarters which slant excessively.

Ragged Hips—Those that are prominent with the points wide apart.

Cow Hocks—Those that turn inwards towards each other.

Sickle Hocks—Those which are too bent.

Split Up—Quarters lacking muscle in between the thighs.

Flat Feet—Those which are large, sloping and low, frequently with thin soles.

Oyster Feet—Flat feet with ridged or ringed horn.

Boxy Feet—Sometimes called mule feet, contracted, small feet, with high heels, and a small frog.

There are some strange names given to various kinds of action :

Dishing—Faulty action of the forelegs, bending the knee outwards when bringing it back, throwing the feet outwards.

Plaiting—Bending the knee in a manner to cause the toe of forefeet to turn inwards, faulty, and apt to be dangerous action.

Brushing—When in action knocking one leg against the opposite one, causing bruises and cuts on the fetlock.

Speedy-Cutting—A form of high brushing, causing wounds and cuts above the fetlock, and below the knee.

Forging—Clicking the outside of the hind shoe against the fore shoe. A habit caused by laziness and slackness. Horses that are tired sometimes do it, and those that are not up to the mark, such as when coming up from grass, are apt to do this.

Over-reach—Striking the foreleg with the hind leg, causing injury. Above the fetlock—high over-reach ; below the fetlock—low over-reach.

Then we come to the breathing apparatus, and terms applied to defects here :

Whistling—A respiratory noise caused by excessive breathing under pressure when in action.

Roaring—An aggravated form of whistling.

High-blowing—Not to be confused with whistling or roaring. A noise caused by the air passing through the nostrils.

When riding, some expressions frequently used must often be somewhat puzzling to the novice ; here are some :

Boring—Bearing down on the bit.

Into His Bridle—A horse which is well up into its bit, neither behind it, nor over it.

Jibbing—Resistance, refusal to move forward, and sometimes even backing. In fact passive resistance, to which some activity is added at times.

Nappy—Bucking, over-freshness, shying at nothing, and trying to dispose of its rider. Rebellious resistance craftily carried out, sometimes caused by overfeeding and under-exercising.

Balanced—Equal distribution of the weight on all fours.

Collected—Correct flexion, and the hocks well under the horse. The exploitation of balance. Readiness of body and mind, and ability to answer the aids and indications at the given signal, at any pace.

Flexion—Important part of collection. "Direct flexion," giving of the lower jaw, bringing the head inwards, and bending from just behind the poll. "Lateral flexion," turning the head sideways, bending from the poll, and giving the lower jaw.

Giving the Office—Correct indications given by the rider to the horse about to clear a fence. The balanced horse is collected, presented to the jump, and given the office. With a well-trained horse it is mutual, that is, you indicate to the horse you want it to jump, and it indicates to you that it is ready. This means rhythmic jumping.

Calling a Cab—The act whereby the rider when jumping raises one of his hands in the air, usually the right one.

Forward Seat—Sitting forward, and not swinging the body back when landing over a fence.

Show Jumping Seat—Exaggerated forward seat, used in the show ring to assist in the clearance of successive high obstacles within a limited area.

Turning to a lighter vein, I recently overheard the following two descriptions :

A Horseman—Is a man who knows a great deal about very little, and goes on learning more and more about less and less, until he finally knows everything about practically nothing.

A Horsemaster—A man who knows very little about a great deal, and goes on learning less and less about more and more, until he finally knows nothing about anything.

R. M. S. BARTON.

A BRITISH TRIUMPH.—The Shell lubricating oil used for each of the three Bristol-engined Wellesley monoplanes was refined at Shell Haven, Essex, by the new solvent extraction process. Although it was, of course, an aviation oil, it was basically the same as the new Shell oils sold at all garages for private cars. Any motorist can give his car similar protection. The record flight of 7,162 miles is spectacular proof of the way in which this oil stays on the job under all conditions of standing, starting and running.

BLACKBUCK AND CHEETAH

An Exhibition of High Speed

A STILL morning in April in an Indian State, with every prospect of a hot day to come, necessitates an early start so as to be well away before the heat of the sun becomes too great. The visitors assemble under the porch of the palace where the Maharajah's big orange painted charabanc is waiting to take the party to the cheetah camp some ten miles away.

The first good mornings and salaams over, the charabanc leaves to the accompaniment of a recital of the Maharajah's titles and accomplishments delivered in a strong baritone by the Keeper of the Keys. The drive out is uneventful except for an occasional jolt as the charabanc takes a pot-hole in its stride, and the cheetah camp is reached with the party none the worse for wear.

The camp is situated on a rise in what may be best described as down-like country. From this point of vantage one can get an uninterrupted view for miles across tree-less stretches of undulating grass-covered land. At this time of the year the grass is burnt brown and, except for a little scrub, there is no vestige of green anywhere. Here and there one can see patches of jungle in the middle and far distance, which melt into the blue horizon in the heat waves that are already rising from the warm earth.

The inhabitants of the camp are an odd and interesting mixture of men and animals. The centre of interest is the double row of charpoys, on each of which sits a cheetah in leash and unhooded, the keepers tending their charges as one would a pet dog. These cat-like members of the dog family are well worth studying. Their movements are certainly feline, but one can hear an occasional growl, and a further reminder of their canine descent are their greyhound-like proportions. They are definitely speed models.

The cheetahs are inspected by the visitors, the outstanding peculiarities of each one being explained by the expert who is in charge of all the Maharajah's sporting activities and who has a full knowledge of the capabilities, characteristics and training of each animal.

The collection of vehicles is of interest, too. Two large brakes are the chief exhibits, for it is from these that the actual hunting will be conducted. There are dog-carts, pony carts, bullock carts, motor cars, motor lorries, and several kinds of nameless two-wheeled vehicles each provided for a particular purpose.

The number of retainers, assistants, camp followers, guards and other officials is legion; but each has his own particular job in this country of specialisation.

There is a delightful feeling of co-operation in the air. Everyone, no matter what his particular duty, is one of the team from the Maharajah down to the humblest camp follower. Shall we find plenty of buck? Will the cheetahs show their best paces? Will the brake teams be able to put up the necessary burst of speed when the psychological moment arrives? These and a hundred other questions pass through the assembly as the eight big black horses are led out and harnessed to the two brakes.

The guests are divided into two parties, one party to each brake. The guests of honour sit by the driver, and the remainder sit on either side in jaunting-car fashion, with a keeper and his hooded cheetah next to them. The head keeper stands behind the box seat, holding on to a pole in case of accidents.

We move off into the open country, and the camp takes on a new life. Spare teams for the brakes are sent out in various directions. Relays of cheetahs in bullock carts, each cheetah protected from the sun by a large umbrella, move out into the open, and motor lorries with refreshments and spare attendants get under way. The brakes take divergent courses. Everyone is hoping for the best, and we strain our eyes in the hopes of catching sight of the buck. After a little while a small herd is sighted and the fun begins.

The success or failure of the hunt will depend upon the handling of the brake. The object to be aimed at is the placing of the brake in the correct tactical position, slightly in advance of the herd of buck, so that the cheetah has not got to go too far before it can make contact with the quarry. This necessitates the brake making a wide circling movement, driven at full speed as soon as the probable direction of advance of the herd can be estimated in the hope that it may be possible to get into the correct position before the herd changes its direction.

The driver gets his team nto a steady trot and studies the situation. His mind made up, off at full speed, the team being encouraged by a variety of sibilant noises from the driver. The passage to the desired position is an exciting one. Nullahs have to be avoided, dried river beds have to be crossed, and we hold on as best we can as the brake sways from side to side. The brake mounts a rise in the ground, and there we are in as good a position as could be wished for.

Herd and brake are now moving at their best speed, and all is set for the cheetah's release. The cheetah, unhooded now, can see the herd and is in a state of tense excitement. The head keeper lifts his hand, the cheetah is slipped, and the next few seconds give us an unequalled exhibition of high speed, for this time the cheetah has selected his buck without hesitation.

THE INDIAN BLACKBUCK

It is a wonderful sight. The movement of the cheetah is a perfect combination of grace and speed; it is something to be marvelled at and remembered. The chase is a short one. The buck, as soon as it realises that it has been marked out by the cheetah, starts to gink, each turn being accompanied by a little cloud of dust from the dry earth. The cheetah turns too and is soon close enough to give the critical stroke with its forepaw on the buck's hindquarters. This causes the buck to lose its balance and so, in falling, allows the cheetah time to get to its throat. Strangulation follows quickly, and all is over without the spilling of blood.

Sometimes it is not quite so easy or simple as this. A cunning buck can outwit the cheetah, for the cheetah's staying powers are limited. Perhaps the brake has not obtained the optimum position and the distance is too great for the cheetah to maintain its full speed until contact is made. In that case the result is disappointing from the point of view of everyone except the buck, as the cheetah sits down, having given up the chase at the first indication of difficulty.

Occasionally the cheetah commits the sin of selecting a hind instead of a buck and its reputation suffers severely. The training of the cheetah to ensure that buck are selected and hinds left undisturbed is a difficult matter. The object that the trainers have in mind is to make the cheetah associate dark colour with something that it wants. This is done by the cheetah always being fed by a man in a black blanket. This appears to have the desired effect, for mistakes in the selection of the quarry are not frequently made.

There are occasions when the cheetah fails to make up its mind as to which buck it should select, and, crouching flat on the ground, it wastes precious seconds, after which the issue is in doubt, for the distance may be too great for the maintenance of full speed.

So it happens that quite a large element of doubt can enter into each particular hunt, and so the sporting interest is maintained until the last moment.

Changes of horses are frequent, for the strain of hauling a heavy brake over rough ground at full speed in the hot sun is a great one and cannot be maintained for long.

At a prearranged time the hunt is stopped, and the two brakes meet so that notes can be compared and much-needed refreshment indulged in, for the heat has been increasing with every passing minute.

After a welcome rest the hunt is continued, and finally abandoned so that the visitors can rendezvous at the luncheon bungalow for an early lunch after the early morning start.

Lunch over, the game is inspected and photographed, visitors are garlanded and everyone is thoroughly hot and happy.

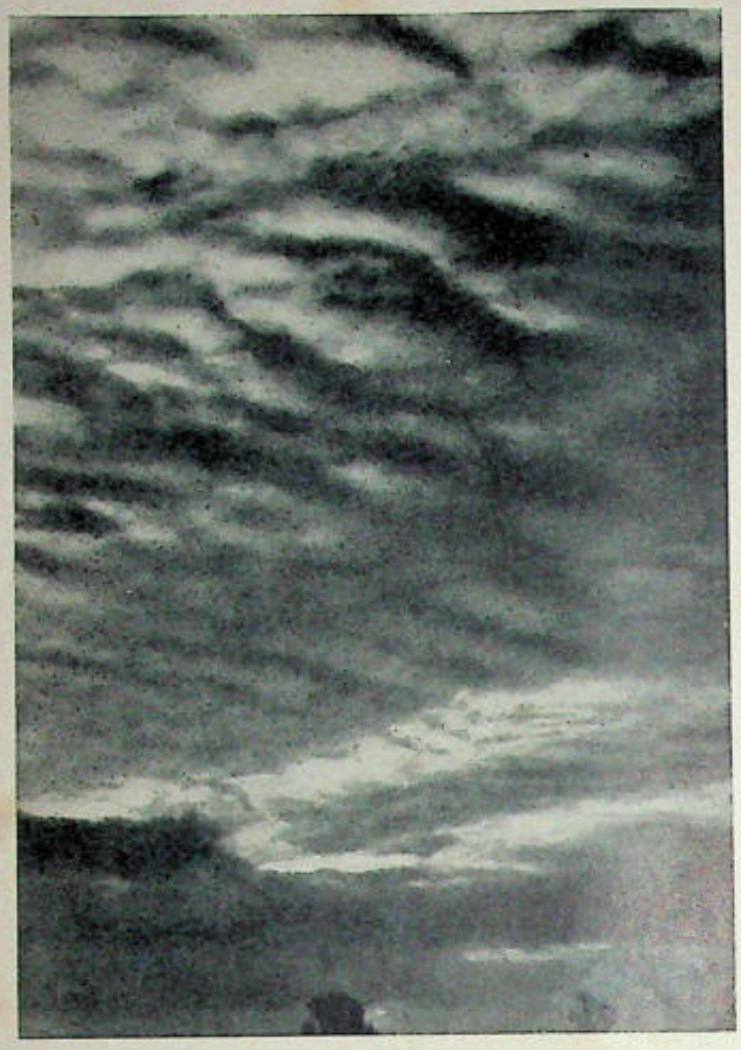
On the particular occasion of which I write sixteen buck and one hind were killed. It was interesting to see that there were no marks of teeth on the bucks' throats. One or two showed the marks of the cheetah's paw on a hindquarter.

On one occasion the cheetah was allowed to stalk on its own. The brake was driven so as to allow a rise in the ground to shut out the herd of buck from the direct view of the cheetah. As soon as the cheetah was slipped it crept forward, taking what cover it could and moving like an animated shadow until it could see the herd. Then, when it had selected its buck, it went at full speed and succeeded in bringing down its quarry.

To those who have never seen this particular type of sport it may seem that it is all too easy. The dice are certainly loaded in the cheetah's favour, but long and careful training is necessary and no one can tell until the hunt is over what the result is going to be.

As an exhibition of high speed it is something to be remembered.

HERBERT FITZHERBERT.



"THE DAPPLED MACKEREL SKIES OF WINTER"

The Gun Month by Month

THE ETHICS OF PUNT GUNNING

MOST people who wildfowl at all have their own favourite place, and no other, however full of fowl, ever holds quite the same attraction. With the coming of November and the east winds these places assume again their familiar appearance. All through the summer they have looked strange and unreal with long green grass and green trees, where a goose would look as much out of place as an Esquimaux in the tropics.
