By my own favourite marsh there stand three trees where the salt marsh joins the fields. They are twisted, unhappy-looking trees, that have carried the burden of so many gales that they are bent like hags. Yet every year they become unrecognisably green and young again for a few months, so that they look like old women wearing grotesquely youthful wigs. A week before the wildfowl come they are still covered in leaves, but when the first goose calls from high overhead they seem to shed their leaves in a day as though afraid of being ridiculed. I shot my first goose from below one of these trees, and the sight of them sums up wildfowling for me in a single picture—moonrise between their tangled skeleton branches, fantastic sunsets, and the dappled mackerel skies of winter. One walks in darkness across two boggy fields to the trees, and stops by them to listen for the calling of the geese. Sometimes it is blowing too hard to hear, but often the first waking calls of the geese come from far out on the mud. As it grows lighter they become visible as a long dark line, and presently the clamour grows more continuous. Suddenly it swells to a babel as the first bunch take wing for their feeding grounds. There is something absolutely unmistakable about that sudden clamour that comes from rising geese, and immediately after it there is usually a complete silence, for every goose in the long line is listening and watching. Only the bunch of geese that is flighting gives a few low notes that are quite unlike their calling on the ground. Should the first bunch reach the feeding grounds in safety, the talk out on the mud soon begins again. Every now and again an old gander flaps the stiffness from his wings, till there is another sudden clamour and the second lot are on the wing. Under absolutely natural circumstances the grey geese flight in lots of not more than ten or a dozen, but where they are much disturbed the whole body will sometimes rise together and fill the air with a deafening clamour as they flight in to feed. When they do this they will generally wait until it is almost broad daylight before they flight, but very occasionally they do the same by moonlight.

One very cold night in January we waited for the greylags to flight under the full moon. The talking out on the tideline was almost continuous, but the geese were nervous and would not flight. At two o'clock in the morning we decided that they would not flight until dawn, and made our way to an old barn in a field near the edge of the marsh. The barn was full of straw, and we slept comfortably for an hour. I was awakened by the sound of about 2,000 geese about to alight within 200yds. of us. They had been too hungry to wait for the light and had moved in a body, not to the salt marsh which they considered dangerous, but to the near fields. Greylags probably do this very seldom, though pinkfeet will often move in big skeins by moonlight.

It is difficult, however, to draw any hard and fast rules on the behaviour of geese in any given circumstances—no one, however experienced, can make any statement with absolute certainty. A most remarkable incident in proof of this fact took place on a morning in December two years ago at morning flight. We had misjudged the flight line of the geese, and the first lot alighted 300yds. to the right of the right-hand gun. Thinking that it would be better to move them, he showed himself, but they paid no attention. He began to walk towards them. He walked within 50yds. of them, and shot one. During the course of the morning we "walked up" three more geese. There was a gale blowing, but no gale before or since has ever had such an extraordinary effect on the geese. It would have been worth a lifetime of shooting to have had a camera that morning.

It is a peculiar thing that pinkfeet will not sit with greylags. They will sit within a few hundred yards of them and flight at about the same distance, but never feed or flight among the greylags. Sometimes when the dawn comes and the long line of geese out on the mud becomes gradually visible there is a small bunch 200yds. or 300yds. to one side of them, and the glass will usually make them out to be pinkfeet. Once they were bean, but they flighted with the greylags and fed amongst them.

This year there was a strange visitor to the marsh. He arrived in the early summer and stayed for a fortnight, and the bay seemed empty when he had gone. I was asked whether I would like to see a white heron which had been seen the day before on the salt marsh, and we set out to look for it. After a few hours we found it, and at once remarked that it was the smallest heron we had ever seen. It was a day of high gusty wind, and we approached within 200yds. before the white bird rose, but before that the glasses had unmistakably made out a little egret. It took a good deal of hard work to persuade certain gentlemen that its carcase was of no value.

Much has been said during recent years upon the ethics of punt-gunning. Most of the arguments against have been arguments against its implied cruelty, and most of the answers have excused this on the grounds of the infrequency of the shots. This would surely appear to approach the problem from an entirely wrong angle. It is justifiable for any man who does not shoot to criticise any form of shooting on the grounds that it causes unnecessary suffering, and it is exceedingly difficult to answer such criticism. But those who shoot at all live in glasshouses, and to them the answer is easy.

Assume for a moment that A. is going to a large covert shoot on the same day as B. is going punting. Even if A. is a very good shot indeed—and very good shots are sufficiently rare to make this a concession—he may be quite certain of wounding ten birds on a day when 500 or 600 are killed. At the latter figure, each of six guns must kill his 100 pheasants, and each must wound *at least* ten. Therefore A. goes forth in the morning with the absolute certainty of seeing 60 birds wounded. This sounds a high figure, but it is surprising how easily such things may be overlooked when guns are busy. Some of these birds may be picked up on the same day, some on the next, but the degree of cruelty necessary to any form of shooting is still there. B., on the other hand, will be unfortunate should he wound and lose half a dozen, if he exercises due care. His gun is loaded with very heavy shot—rarely smaller than BB—so that a single pellet in the body is usually sufficient to cause swift death. For any winged birds there is the cripple-stopper, commanding a radius of 50yds. from the punt. (Diving ducks are an exception, but there can, in any case, be little excuse for killing quantities of almost inedible fowl with the punt-gun.) There are careless and criminal punt-gunners as there are careless and criminal game-shots, but both are unnecessary. So let any game-shot who disapproves of punting confine himself to the plain statement that it is not a form of sport that would appeal to him; which is, after all, a purely personal matter. The effect of punt-gunning on the status of wildfowl within a given area is a very different question, and deserves very much more serious consideration.

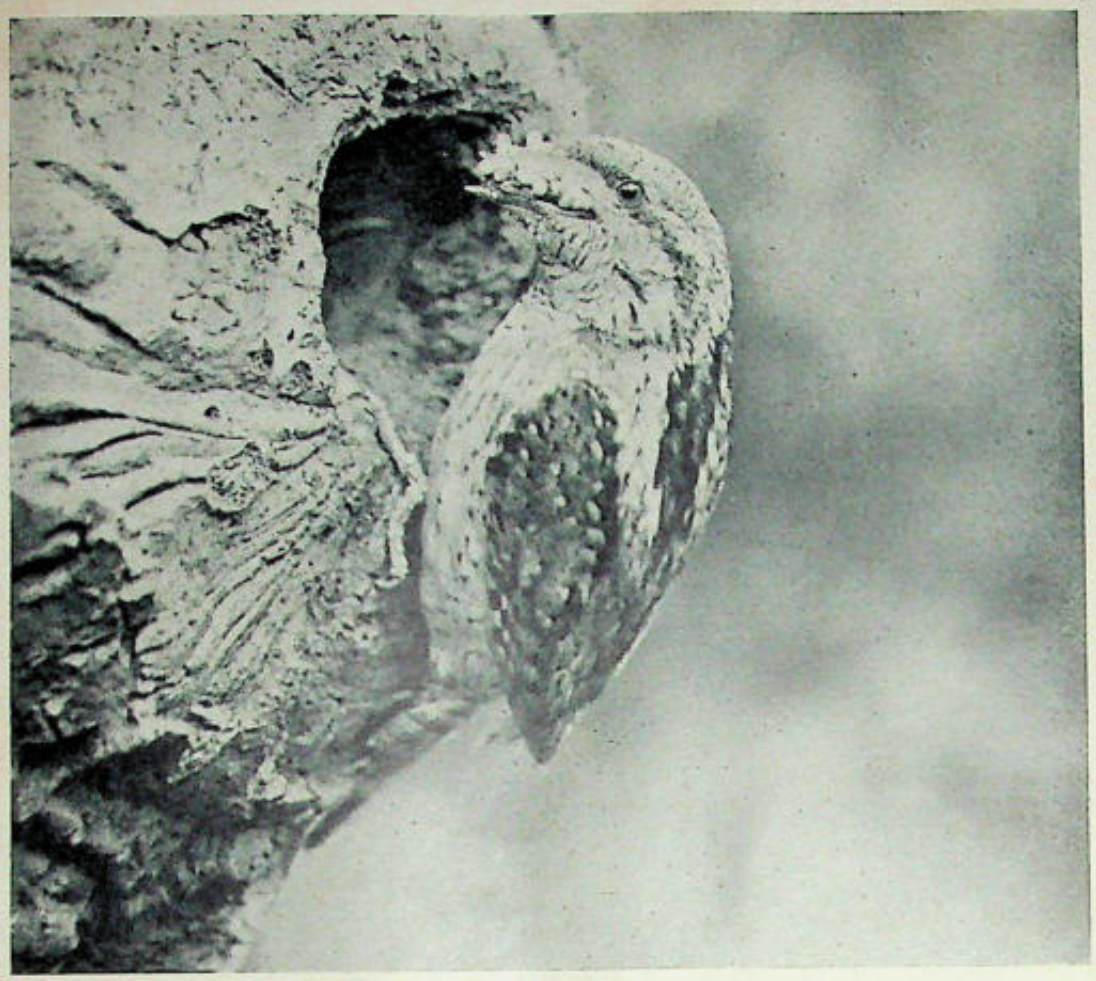
"A. GOES FORTH IN THE MORNING"



WITH A BEAK FULL OF ANTS' EGGS
A Wryneck returning to the nesting hole with the family dinner

THE CUCKOO'S MATE

Observations on a Curious and Inconspicuous Bird

MANY people have never seen a wryneck, and, until a few years ago, I had not done so, either. My first introduction to this curious bird was somewhat tragic. I had, with some reluctance, accepted the temporary custody of a relative's cat, a huge, villainous looking black Persian. Two willow warblers and a thrush nesting in the garden soon came to an untimely end, while large tufts of black hair on the surrounding brambles left no doubt as to the culprit. Then, one day on returning home, I discovered a half-eaten body on the lawn which I was able to identify as that of a wryneck. After that dear Minnie was speedily moved to new quarters.

The following May I was puzzled by a persistent kestrel-like call in the wood adjoining my garden. Eventually, I was awakened by this curious call, and I looked out to see a pair of wrynecks sitting on a nest-box outside. Since then I have seen (and heard) a great deal of these birds, as each year they return, waking me up at the crack of dawn during most of May, pulling out half the tits' nests in the garden and thoroughly annoying the neighbours who, though they never see the birds, think that they ought to be shot.

I never tire of watching these birds going through the ritual of choosing a nesting site, as not only is it interesting, but indeed comical. I have some 30 nest-boxes in the garden, with entrance holes of two sizes, the larger of which will just admit a wryneck. Although two or three boxes are favoured more than the others, the majority are visited, and wherever possible, the tits' nests are pulled out—often in one piece. Wrynecks seem to hate the tit family, and appear to take a fiendish delight in pursuing any activity detrimental to them, whether it be ejecting the nests or baiting the owners of those which they cannot reach. I have several times seen a wryneck put its head into a nest-box to withdraw it rapidly at each vicious hiss from the sitting occupant. This process was repeated time and time again, the wryneck obviously enjoying itself thoroughly. One box visited in this way contained a sitting blue tit. The wryneck could only get its head inside, but, unfortunately for the tit, a split about ⅛in. wide developed in the side of the box, and the wryneck lost no time in pulling out most of the nest through this. Once I saw one trying to enter a box containing young blue tits. The owner returned and quizzed angrily at its tormentor. Eventually the latter moved a few feet away and the tit made for the entrance, but before it got there the wryneck interposed itself again. The unfortunate tit was kept from its nest fully half an hour by the wryneck's continuous repetition of this "dog in the manger" attitude.

On another occasion I focused my reflex camera on a much-favoured box and sat down in a deck chair a few yards away, hoping to obtain a photograph by means of an electric release. Within a few minutes the wryneck arrived and flew on to a small tit box nearby, where it met with the usual reception from inside. Then, curiously enough, it flew on to the camera and examined it carefully before hopping on to the edge of the telephoto lens, where its antics were very amusing. Clinging on to the rim, it hung downwards, twisting its head round at all angles, trying to understand, presumably, its own reflection in the glass. I feel convinced that, had the lens not been there, it would have gone inside the camera, hoping no doubt, to find another tit's nest to ransack!

A starling in search of a nesting hole will endeavour to enter any tit box, however remote its chances of success may be. Once I was watching a box which a wryneck had just entered and a starling flew on to the top. The wryneck peeped out and climbed up to the top also, where both birds eyed one another closely. The wryneck then flew down to the lawn and, squatting flat, remained motionless. The starling, as if accepting a challenge, flew down alongside. The wryneck, still maintaining the squatting position, spun quickly round and, with neck outstretched, faced the intruder. The starling hopped back, only to be again confronted in this way. After a few repetitions, the starling seemed completely baffled, and flew off. I do not pretend to understand the significance of this episode but it was a curious bit of bird behaviour.

Although it has some points in common with the woodpecker, the wryneck has quite a character of its own. The flight and appearance show a marked resemblance, but the beak and tail feathers quickly dispel any suggestion that it belongs to the same family. The wryneck endeavours to utilise its tail feathers for support on a vertical surface, but being soft, their assistance is limited. I have seen a green woodpecker clinging motionless to a tree-trunk for over an hour, a feat which I feel sure is well beyond the wryneck's capabilities. In fact, when taking these photographs, I was particularly struck by the apparent weakness of the feet and the somewhat unbusiness-like application of the claws to the bark. The fondness for ants' eggs is another point of similarity, and it is surprising what a large number of these can be collected at once. During my observations, ants' eggs were brought exclusively to the nest, and on some occasions, so many were brought that it was almost impossible to see anything of the bird's beak or eyes.

It is generally thought that the number of wrynecks visiting this country each year, is rapidly diminishing. Why this should be so I cannot understand, unless it is a case of the accepted idea of increasing rarity being a contributory cause. This year I knew the whereabouts of some five or six pairs in Surrey, within quite a small radius, and from all accounts they seem to be fairly evenly distributed in the southern counties. It is a bird which is seldom seen in the ordinary way and seldom identified when seen. Its presence is advertised with irritating thoroughness just prior to nesting. During incubation it is comparatively quiet, but the youngsters are among the noisiest imaginable. One would think there would be little chance of a nest hatching off unnoticed in its immediate vicinity, at all events. Yet very few nests seem to be found.

In spite of the attentions they have paid to my nesting boxes, they have not yet paid me the compliment of nesting in one. Each year I put up new types and sizes to try and induce them to stay, but so far without success—still, there is always next year!

ONE OF KENYA'S TROUT STREAMS

In Central Africa trout are growing too fast for the food supply

KENYA'S TROUT PROBLEM

How Salmonidæ are Faring in the Tropics

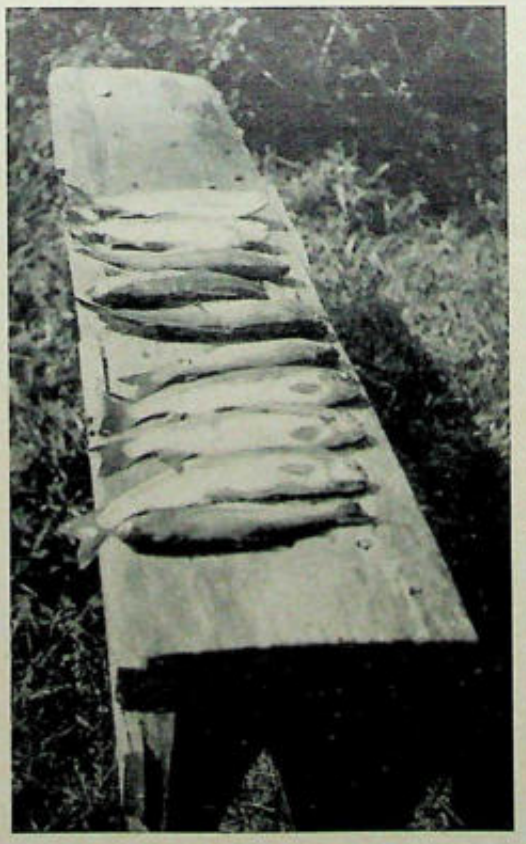
By H. D. TURING

FOR many years past, especially since air transport became a commonplace of travel, fishermen's eyes have been turned towards those tropical highlands of Kenya which lie so close to the equator and yet are high enough for a white man to live without having his "soul sweated clean till the yellow stains of it came through his pores," as Tom Sawyer would have put it. A land where summer lasts all the year round, where there are dancing streams gurgling through sub-tropical vegetation, where the trout grow portly and still retain their youthful enthusiasm for "colourable imitations," and where there is no close season, seems a very Mecca to some of us when the season here has closed and winter's raw damp is getting uncomfortably near. A recent report, however, from that delectable country is a reminder that if Eden was made in a day, there is no mention of trout in the records which have come down to us. The trout which have been introduced to Central Africa are not, as it were, taking their transfer lying down.

The Committee of Anglers, under the chairmanship of Major A. W. Sutcliffe, and having a most efficient secretary in the person of Mr. Hugh Copley, was appointed by the Government to make "recommendations for the control and development of fishing in every river in the Colony that holds, or might hold, trout," and generally to advise on the best way of developing and protecting what has now become a valuable asset to Kenya. The suggestions, very naturally, have to do largely with local administration (a difficult matter in sparsely populated country which has native questions on its hands) and its recommendations are, briefly, that control should be exercised largely through clubs, both private clubs which own fishing, and what may be called public clubs which anyone can join at a moderate fee, the fees (with the assistance of grants-in-aid) being used to improve the water.

Public fishing rights, though they come into the recommendations, are very wisely relegated to a subordinate position—the disastrous effect of such rights (where the Government undertakes continual restocking) in other parts of the world has no doubt been recognised. At all events, it is good to know that Kenya does not seem likely to fall into that trap. But for the English reader—and the report deserves to be widely read by trout fishermen whose interest in their sport goes beyond the mere capture of fish—the value of the report lies more in those sections devoted to the history of the trout, the apparent change in their habits, and the possible steps to be taken to prevent a deterioration in the fishing, which already shows signs of setting in.

In some respects the history of trout stocking in Kenya follows closely along the lines of that of other waters where trout were previously unknown: the fish grew enormously with the prolific food supply and comparative lack of natural enemies, and were soon providing good sport as they spread down the rivers. But there is one peculiarity of the Kenya streams. Owing to their latitude and their position in mountain ranges, the fish have only to travel a few miles to get from temperate waters into the tropics, and these waters are too warm for spawning. This in itself might not matter provided the fish could get upstream again to the spawning grounds, but the effect of the climate, it seems, with two rainy seasons instead of one winter, has been to induce bi-annual spawning, which practically puts a stop to any effectual growth once maturity has been reached;



A BAG OF KENYA TROUT FROM THE LIKI

and rapid growth or some unknown condition, has made even brown trout start spawning at two years old. This, combined with the exhaustion of the food supply, has caused a rapid falling-off in the ultimate size to which the trout attain in the middle sections—those immediately above the lower warm water reaches where trout are few and big.

Both brown and rainbow trout have been introduced into Kenya streams, the latter, according to the report, being steelheads (Pacific Coast of America sea trout), and these seem to provide an even more difficult problem than brown trout since they grow more quickly and reduce the food supply to a greater extent than the browns. On the other hand, they are more tolerant of warm water than brown trout and their original habitat in mountain streams, which provide cold water for spawning upstream, and warm water for growth lower down, would seem to be more in keeping with Central African conditions than the temperate streams of these islands from which the brown trout came. Even rainbow trout do not necessarily grow quickly unless the conditions, principally, no doubt, the food supply, are suitable, for Mr. John MacOnie recently discovered a race of pigmy rainbows in New Zealand in which trout of less than 10in. were three-and-three-quarter years old. They were found in a tributary of the Waitati, which had been stocked 30 years ago, and from which the trout had "disappeared"—another example no doubt of rainbows growing too big for a water migrating, but leaving behind them a brood suitable for Nature's balance in the stream.

Is this the kind of balance Nature is going to strike in Kenya when rainbow trout, reproducing their kind prolifically, have reduced the available food supply to famine proportions? It is evident that the committee are alive to the possibility and its recommendation that no further stocking with rainbow trout be done until a river has been tried for brown trout is sound common sense. If fish are growing too fast, to stock with the slower-growing species is a step in the right direction.

But the main question still remains: how to maintain a satisfactory head of trout which will not deteriorate into fingerlings. I gather from the report that what is happening at present is that the middle reaches (what may be called the fishable parts of a river) are fairly well stocked with young medium-sized fish which are showing a tendency to deteriorate slightly in size. These fish spawn and then drop downstream to the lower, warmer water, where most of them disappear, but a few grow to outstanding size, though they probably count but little to the fly fisher. The upper reaches, however, are swarming with fry. It is the problem of an overstocked water in an acute form.

It is an axiom of fishery management in this country that in an overstocked water good results can be obtained by reducing the stock, and it is evident that schemes with this end in view have been mooted in Kenya. The report mentions such suggestions as dynamiting and netting out the fish (the rocky nature of the bed makes this difficult) as having been made to them; but as long as rapidly-growing parr are taking toll of the food supply this removal of fish by whatever means would have to be repeated year after year, and would surely be too costly to undertake on any extensive scale where access to rivers is difficult?

There is a possibility of obtaining slower-growing fish by keeping fry in stews and selecting those making slow growth for stocking purposes. The report explains the difficulty of using hatcheries which have to be located in the colder portions of the streams to which access is difficult, but if this difficulty can be overcome it would probably be worth while trying some such scheme for a new water. Individual trout in the tropics, as elsewhere, show very different rates of growth. Scales of brown trout sent from Tanganyika show fish of the same age varying from ½lb. to 2lb., all hatched from the same batch of eggs. Though all of these show exceptionally good growth for their age (less than two years) there is obviously as great a difference in the growth rate proportionally as is found in trout parr at home. A system of starting with a poor growth rate and letting Nature adjust it upwards according to the food supply might easily give better results than starting with rapidly growing fish and waiting for a deteriorating balance.

But in the streams already stocked such a scheme would have no noticeable effect; it is a reduction of superfluous stock that is needed, so as to allow the remainder to grow better and not to drop downstream. It may well be that this habit of dropping downstream is not altogether due to the quantity of food needed, but to its size. Investigations over here seem to suggest that a trout needs a big size of food if it is itself to attain to large dimensions. Many of the small-trout waters have been proved to contain a much larger amount of food than the trout consume; so it is possible that these middle reaches do not provide the size of fare needed by trout beyond a certain size.

Would it not be better to try the effect of providing deeper water in parts by damming the streams periodically along their courses? If the trout could be induced to stop in the middle reaches, which it is quite likely they would do if quiet, deep water can be provided, there is a possibility they may find the size of food necessary among their own all-too-abundant fry. This would have the effect of reducing the superabundance of fingerlings without the necessity of slower-growing fish. Rapid growth is all to the good if it does not result in exhausting the food supply.

COMPETITORS IN THE POSTPONED KENNEL CLUB RETRIEVER TRIALS AT CHEVERELL'S

Left: Cheverell's Busybody retrieving a pheasant. Centre: Miss Bickerton, with Shelsley Nymph, talking to Mr. R. G. Heaton, who lent his ground for the trials. Right: Zelstone Big Ben takes a wire fence in his stride

FIELD TRIALS

Kennel Club Retriever Junior and Non-Winners' Stake

AT the request of the Ministry of Agriculture, this meeting, which should have taken place in Kent, was unfortunately cancelled at the last moment, owing to an outbreak of foot-and-mouth disease in the district. The Kennel Club was fortunate, however, in receiving an offer from Mr. Heaton to hold the trials at Cheverell's in Herts. Although he had only just come into residence there and was in no way prepared for such a contingency, he most generously sacrificed his shooting to the interest of those holding nominations, so preventing an abandonment. In spite of the short time at his disposal to make arrangements, Mr. Heaton was able to provide equal tests for all competing.

At many of the trials held early in the season, it has been found impossible to try the dogs in cover to test their courage, one of the natural qualities a retriever should possess, on which every judge should insist. Style and pace are two other attributes which rightly appeal, and if a dog has keenness, you can depend upon him having a good nose.

I mention pace, because there are some who think that judges should give more credit to the slow dogs which do actually find game, but in their own time and invariably requiring much encouragement from their handlers. They maintain that these dogs pick more game and fewer birds are lost. Even if this argument was sound (and it is completely unsound) the fact remains that prizes would be given to dogs with no natural qualities, such as style, perseverance and pace, which I believe to be hereditary.

If a dog has not style no one can give it to him, and pace, which is a very necessary attribute, can be controlled by the trainer. The best dog is the dog that best fills the bag and this is undoubtedly the fast dog. These inherent qualities are what judges should be out to find, and what the man who wishes to breed on the right lines is out to discover.

I was glad to see that Lady Wigan, Major Jack Wormald and Mr. Saunders, the three judges on this occasion, seemed to be in accordance with these views by the awards they made, and so helping to assist breeders to select the best working strains. Colwill Diamond, a puppy which has already been successful on former occasions, deservedly won. I rather question the policy of running this dog so much; it struck me he was not going with quite his usual dash. So much travelling could easily undermine the constitution of anything but a very hardy dog, and I should be sorry to see him suffer in consequence. Tinker of Trofts, another puppy, was rightly awarded second prize; he was one that thoroughly worked his ground, and needed little assistance. He has the makings of a good one and only wants experience. I don't think he failed at all. I thought Cheverell's Busybody was the unlucky one, though on the results of the two days she could not have been placed higher. A puppy of great promise, she had very difficult work to do, and did it well without actually achieving her object. Time will prove that this was the best puppy in the stake.

Results: 1st, Dr. Collin's Colwill Diamond; 2nd, Major Montfort-Bebb's Tinker of Trofts; 3rd, Mr. Heaton's Cheverell's Busybody; reserve and certificate of honour, Mrs. Radclyffe's Zelstone Big Ben; certificate of honour, Mr. Chance's Krinkle of Benann; certificates of merit, Mrs. Brassey's Greatford Nan, Sir Clive Baillieu's Golden Wattle, Mrs. C. Breitmeyer's Snapehill Brown Boy.

ERNEST TURNER.

SPANIELS AT KINMEL PARK

BY kind permission of Colonel H. B. L. Hughes, the Northern and Midlands Spaniel Club held their trials at Kinmel Park, Abergele, on November 1st and 2nd. The judges were Messrs. R. R. Kelland and H. L. May, Mr. R. J. Shoesmith acting as referee. The official guns were Admiral R. Rowley-Conway, C.M.G., Captain W. Piers Jones, Major J. D. Greenshields and Mr. W. David D. Evans. Results:

OPEN STAKE (for any variety of spaniel, except Cockers).—1st, Captain A. Beal's English Springer b. Wistful; 2nd, Major H. Beaumont's Field Spaniel b. Butter of Stronds; 3rd, R.N. Cadet D. L. Calvert's English Springer F.T. Ch. Bobble; reserve, Mr. C. A. Phillips's English Springer Rivington Flight. Certificates of merit: Major H. Beaumont's Field spaniel Brag of Stronds, Mr. Selwyn C. Jones's English Springer Sprint O'Vara, Mrs. W. R. Calvert's English Springer b. Eromtew Judy, Mr. W. D. Edwards's English Springer Hillhampton Spark, Mr. L. G. Beaumont's Field spaniel b. Saxpence of Skerries, Captain O. P. Traherne's English Springer b. Bryngarw Fireside.

NOVICE STAKE (open to any variety of sporting spaniel which has not won at the date of closing of entries—October 24th, 1938—a first prize in any single stake at a recognised field trial meeting).—1st, Mr. C. A. Phillips's English Springer Rivington Flight; 2nd, Mr. Selwyn C. Jones's English Springer Spur O'Vara; Captain O. P. Traherne's English Springer b. Noranby Pelican; reserve, Mrs. W. R. Calvert's English Springer Stalndrop Stopbright. Certificates of merit: Dr. J. A. Jamieson's English Springer b. Peerless Tess, Lieutenant-Colonel N. E. Tilney's English Springer b. Clonyard Flare, Major H. Beaumont's English Springer b. Biretta of Stronds, Mr. H. S. Lloyd's English Springer b. Delia of Ware, Mr. W. D. Edwards's English Springer Pierpoint Painter, Mrs. W. R. Calvert's English Springer Eromtew Pod, Mr. E. A. Walker's English Springer Dene of Balcary, Major H. Beaumont's Field spaniel Bairam of Stronds, Captain A. Beal's English Springer Garrigill.

OPEN STAKE (for Cocker spaniels).—1st, Mr. C. C. F. Addie's b. Yoredale Jen; 2nd, Mr. C. A. Phillips's b. Rivington May; 3rd, Mr. E. A. Walker's Markover Titch; reserve, Mr. R. Macdonald's b. Rockstead Footspur. Certificates of merit: Captain C. T. Traill's b. Sobenhal Binnie, Mr. E. A. Walker's b. Markover Nan, Mr. H. S. Lloyd's Golden Ray of Ware.

AMATEUR STAKE (for any variety owned and handled by persons (not professionals) whose dogs have not won a first prize at any meeting held under Kennel Club Rules previous to September 1st).—1st, Lieutenant-Colonel N. E. Tilney's English Springer b Clonyard Flare; 2nd, Dr. A. Jamieson's English Springer b. Bint's Bairn; 3rd, Mr. T. Radcliffe's English Springer Saighton's Snipe; reserve, Mr. C. C. F. Addie's Cocker Yoredale Snipe. Certificates of merit: Major H. Beaumont's English Springer b. Birette of Stronds, Mr. T. Radcliffe's English Springer Spinner O'Vara, Mrs. W. R. Calvert's English Springer Eromtew Pod, Miss S. Beaumont's Field spaniel Newbarie Chips. Qualifying certificate granted: Mr. A. J. Dyke's Welsh Springer Margiam Marquis.

SOME OF THE COMPETITORS AND GUNS ON THEIR WAY THROUGH THE AUTUMN-TINTED WOODLANDS

BULLETS AND BRUSHWOOD

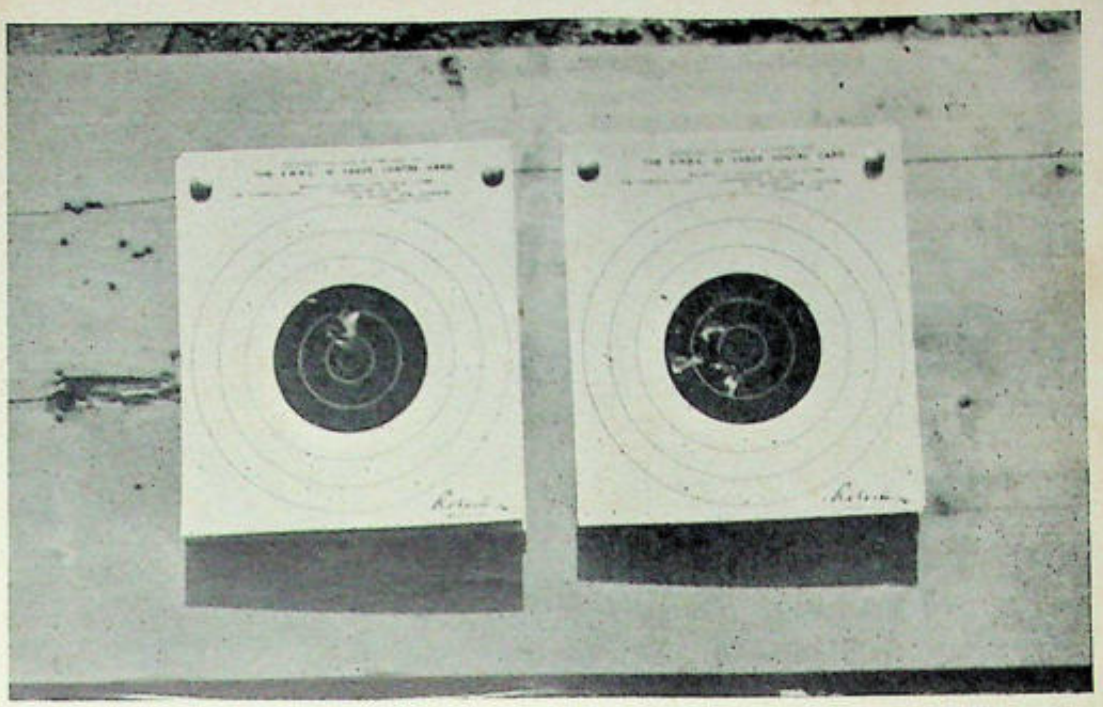
Results of an Experiment in Deflection

By CAPTAIN PAUL CURTIS

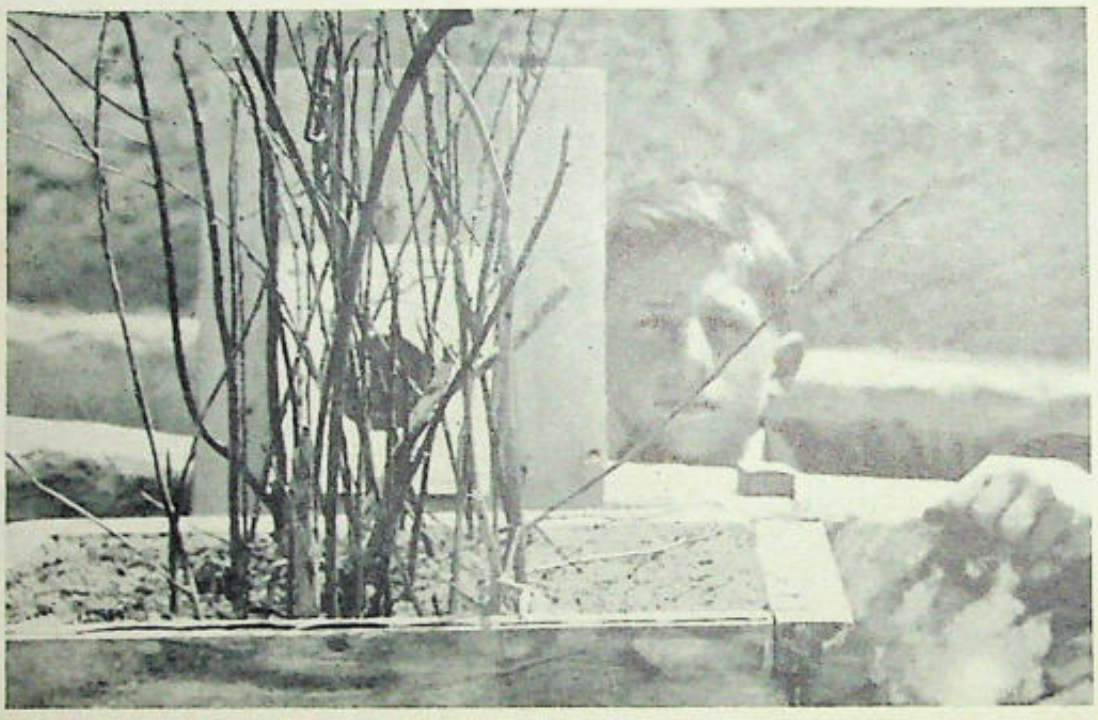
AMONG the many theories still supported by riflemen is the contention of those who favour the large bore to the effect that light small-calibre bullets, and particularly pointed ones, are deflected from their true course by intervening brush more than heavy ones. That is the alibi which is offered for almost every bad shot made in cover.

For many years I believed in the deflection theory, for I was a large-bore man. It was so well established that, like one's religion, it was one of those things which the devout accept without question. Then one day came an agnostic who asked "Why?" and proposed that we should make a thorough test and settle the matter once and for all to our own satisfaction.

Our plans were made accordingly, and against a steep hillside we erected a long frame in which



THE .22 TARGETS



THE SCREEN USED FOR THE .22 TEST

we stuck brush, freshly cut from a nearby cover. It was principally of black alder, birch and swamp maple and wild cherry, which was tough and hard and which had been carefully selected for uniformity in size. When finished the screen looked like the temporary brush jumps used in hurdle racing, only while it was not as thick it was of much greater depth.

The frame was about 10ft. or 12ft. in length, so that we could make an exhaustive test of every cartridge selected for trial, and a long screen meant that we did not have to renew the brush as frequently, as we could shift the targets behind it.

The target frame was then set up about 10ft. in back of the brush screen, and to it we fastened large sheets of white paper, on which were painted 12in. bulls. After the target was erected we proceeded to fill the screen with brush until the bull could barely be seen, and we were ready to begin the test. Of course, we did not have to use such large bulls as we could have set up a small disc for an aiming point in front and simply measured the dispersion on the white paper, but at the time we wanted to make the conditions as similar to those in the woods as possible. The firing point was fixed at 75yds. from the target, although in my own experience the average distance in forest shooting has been much less.

The rifles were selected from our own batteries and represented the most popular bores in the States and Canada; at any rate, they contained two radical extremes which we were anxious to prove, namely, the .250-3,000 and the .45-70. There were also a .33 W.C.F., a 6.5 Mannlicher, .401 Automatic, .30-06 and a .303 Enfield.

It would be unnecessarily boring to recite a dry account of the results with each rifle and cartridge used. Let it suffice to state that there was not a single exception to refute our conclusions, but the results were most revolutionary and contrary to our expectations.

The .250-3,000, with its tiny 87-grain bullet, which would make a 1¼in. group in the clear, only showed a dispersion of 3in. through the brush for a string of ten shots, and every one of its soft-point bullets struck at least one or more twigs. The .30-06 (150-grain bullet) and the .303 Mark VII showed similar disdain for the obstructions, averaging 3in. dispersion. All of these tests were made with ten-shot strings, using expanding bullets at high velocity and shifting the target from time to time as the brush was weakened.

The flat-nose .33 W.C.F. opened up to an average dispersion of 6in., which was an increase of 50 per cent. over what it would do in the clear with the sights involved, and then we came to the most astounding thing of all.

The grand old favourite of the big-bore die-hards in America, the .45-70 with its 300-grain bullet at only 1,800ft.-seconds of muzzle velocity, which the men in the backwoods say will plough through anything, capable of 3in. groups or better in the open at that short range, spread out to a mean horizontal of 8in. by 9in. vertical. Naturally after that it was a foregone conclusion what the 250-grain short slug of the .401 Automatic would do (although it was designed for deer shooting in the bush), and it did it—we got an 11in. group.

So bang goes the theory on deflection, knocked into a cocked hat! We have got to find a new excuse for our rotten shooting in cover. Two things are evident—that light-pointed bullets at high velocity are not more easily deflected by intervening brush; conversely, they are much less easily deflected than heavy low-speed bullets with round or flat points. Therefore, to my way of thinking the high-velocity cartridge is just as good in cover as it is in the open, which explains why I have used it as satisfactorily under those conditions which exist in Eastern Canada and Central America as I did in the wide open spaces of the North-West.

These tests were made several years ago, and as in the States and Canada the woods are full of enthusiastic squirrel stalkers, armed with the all-popular .22 calibre—to say nothing of the hunters who use it as a "pot" gun about the world—I decided to see what the miniature would do under the same conditions.

The shooting was done at 25yds. with the brush screen set up 2ft. in front of the target. The cartridge was the .22 Long Rifle Hollow Point. In the illustrated groups the one on the right is a string of five, all of which hit more than one twig and measures 1in. The target on the left is a string of ten fired with the brush so thickened that the bull was barely discernible. That, I believe, accounts for the wider dispersion, as we could not tell exactly where we were holding, but at that only one of them would have missed the head of a squirrel and none of them a rabbit's.

(To be continued)

EGGS BY AIR

IT occurred to the writer that to make a really serious effort to rear pheasants in Kenya eggs might be brought out by air from England. By the kindness of Lord Riverdale, of Sheffield, 100 eggs were despatched to Kenya. An unfortunate delay occurred between the time of collecting and despatching, so that the eggs when received in Kenya were actually sixteen days old. Broody hens had been collected in readiness, but owing to the late arrival of the eggs some of them were sitting some time before the pheasant eggs arrived. All the 100 eggs were received in excellent condition, but owing to the fact that they were so old already, they were not rested more than eighteen hours. It might have been better to have rested them twice as long. Considerable trouble was experienced with the broody hens, as some of them escaped from the stable in which hatching was taking place, the writer not having had the tip then to tie the hens up with a cord when feeding daily.

Another unforeseen trouble was a most serious infestation of red mites, which swarmed all over the hens, eggs and nests. Dusting with an insecticide did not seem to do much good, and the attack was responsible for the death of no less than four broody hens. Some 25 of the 100 eggs had been placed in an incubator as a second line of control in case the broody hens did not do their duty, and immediately the hens were found to be dead, their eggs were rushed to the incubator, the hatch being due in 24 hours. The final result of both broody hens and incubator was a hatch of five pheasant chicks out of the 100 eggs. The 95 eggs were all broken and examined, and of these only nine were found to have partially formed chicks inside. The five live chicks were taken to one of the broody hens, when two were promptly trodden underfoot. The three remaining chicks were taken away again in an endeavour to save them, and put into a box with a hot water bottle and a lamp. All three eventually died within a very short time.

Whilst the above attempt to raise pheasants from eggs by air was being made another consignment of some 120 eggs had also arrived in the district. Of these some 70 were put under hens, and the remaining eggs put in an incubator worked by experienced poultry folk. Here again the results were most disappointing, only five chicks being hatched out under the hens and only four from the incubator.

H. BRIAN BATES.

MY THIRTEEN-YEAR-OLD TROUT

Observing Rainbows in a Garden Pond

THOSE of you who are in the fortunate position of having a small pond in your garden or grounds, under your control, have an opportunity of observing fish life which is both fascinating and valuable. Not only is it a source of pleasure to yourself and your friends, but the results of observations will prove instructive if you are an angler, and absorbing if you are a naturalist. I have such a pond into which I introduced both brown and rainbow trout for purposes of observation, and it is of these trout which I write.

When I first spoke of putting trout into a pond only 30ft. long by about 8ft. wide, my friends said that they would not live. Admittedly, the space is cramped, and there is not sufficient food to maintain any but the smallest number without some artificial feeding. Still, I decided to try the experiment, and as a result I have left two rainbow trout which have reached this year the remarkable age of thirteen years. They are strong and healthy and plump, and remarkably active.

There has been much controversy, I know, as to the length of life of rainbow trout. Some have stated that they will only live six years, others nine years. None, so far as I know, has ever ventured to say that they will live to thirteen years, and such an age seems almost a record. As they were two years old when I got them, and as I have had them eleven years, the age of thirteen cannot be denied. They have spawned occasionally, but there has been no result. No young trout have ever been seen, and the two left are the original stock, or all that remains of it.

Admittedly, they live under sheltered conditions. Their natural enemies do not seem to have bothered them. No otter has so far visited the pond, and while an occasional heron flies over, none has ever been known to alight; probably because of the close proximity to the pond of the gardener's house.

But first let me tell you of the pond. It is fed by an underground spring of pure water, assisted by field drains. Some fifteen years ago, as there seemed sufficient water, we enlarged it to its present size. To ensure its holding the water we concreted the bottom, which has now a covering of some 3in. of mud. Even in flood, its extreme depth is not much over 2ft. to 2½ft. The inlet and outlet being close together at one end, much of the pond is sluggish, and because of this sluggishness the manager of the hatchery from whom I obtained my fish recommended rainbows as being more suitable for still water. In this he proved to be correct, for of the eight trout I put in—two brown trout and six rainbows—the rainbows lived longest.

The two brown trout died after two years. They seemed to prefer the end of the pond where the fresh water came in, and in summer were listless and inert. One was found dead, the other simply disappeared. The advantage of such a small pond is that I can observe every individual fish. I can study their most intimate habits at any time of the day or evening; summer or winter. I have got to know pretty well what they will do under given conditions.

I introduced watercress, which I find quite the finest harbourage for all sorts of water insects, shrimp, caddis, eggs and grub of various life, and flies. I have two plants of water lilies for additional shade, and also patches of water ranunculus, which is the bane of my existence and most difficult to keep in check once introduced. I have some minnows, which have a poor time of it, and while they continue breeding, their numbers are kept down by the feeding trout. A few loaches live under the stones round the edge, and I have five small perch. These latter have become so tame that they will take worms from the hand, but the trout are always nervous of any sudden movement, as, indeed, are all fish; a point for anglers to remember.

After the death of the brown trout the following is a history of the six rainbows. About five years ago one rainbow jumped out on to the bank and was found dead. One disappeared seven years ago, most unaccountably. One disappeared the same way in 1935, and last year another disappeared. This leaves me with the two fish. As to the disappearance of the rainbows, the outlet is so well trapped that I cannot think they got away there. The inlet goes underground, so, unless they are dead up the pipe I am unable to say where they have gone to. They could get a little way down the stream which leaves the pond. There is a smaller pond there, but no trout has ever been seen in it. So the matter remains a mystery.

One point interested me very much in view of the fact that rainbows apparently do better in sluggish water than brown trout. I watched two lying close to each other under the bridge. They had not been recently fed, but opened and closed their jaws in a chewing movement, which I took to be their breathing. I found that the brown trout seemed to breathe about 80 to the minute, whereas the rainbows breathed 60 to the minute. I thought that probably the quicker-breathing fish was, therefore, more suited to rapidly moving or "lively" water. One of the officials at the Edinburgh Zoo was particularly interested in this, and took the pulses, as it were, of trout in the aquarium. He found that the breathing was quite the reverse. The rainbows breathed quickly and the brown trout slowly. I understand he is observing other fish. Whether this can be taken as an indication of the suitability of different fish to different types of water I am unable to state authoritatively. Further investigation might elucidate the point. It is possible that my brown trout were breathing more quickly because it was a hot day.

FEEDING THE TWO THIRTEEN-YEAR-OLD RAINBOW TROUT IN THE POND
The pond is 30ft. long by 8ft. wide. It is fed by an underground spring of pure water, assisted by field drains, and the concreted bottom has a covering of some 3 ins. of mud. Watercress provides a harbourage for all sorts of water insects.

The rainbows grew rapidly. My larger fish remaining is about 2½lb., but his fellow (the male) is only half that size. I think it largely a matter of feed, because the larger fish always wins in a scramble for food, and drives the smaller away. Temperature of the water, too, must be considered. I think that rainbow trout will always do better in a pond of higher temperature. The result of my observations leads me to the conclusion that warmer lakes with ample food are the best suited to rainbows. I have frequently been asked to advise on the stocking of lakes, and have always advised against rainbows being put into cold lakes in high altitudes. Blagdon seems to suit rainbows, and the reason, it seems to me, is because it is warmer, perhaps it is not so rough, and there is ample food.

As to their habits I find many of absorbing interest. For instance, whether they have a keen sense of smell I do not know, but if I throw a small piece of meat, unseen by them, into the weed they will nose round near the place, like a dog, and eventually find it. They usually come out in the evening for their main food quest. They will, of course, cruise round during the day, but in hot sun hide in the weeds. I feed them once a week on small pieces of liver and lights, boiled. Some of the meat is light and floats, and I can simulate with it a fly dropping on to the water. Nine times out of ten if a trout misses its aim it swings round again to the same spot. Even if it gets the morsel at the first chance it generally turns to the same place to see if it has missed anything. This would prove the advisability of anglers casting quickly if they have missed a fish (provided the hook has not pricked it), as it is more than likely the fish will still be there.

Their sense of hearing is remarkably acute. They know when I am feeding them, and if I throw quite a small piece of meat immediately behind them when they, one would think, cannot see it, they at once swing round. One has always had the idea that an angler standing immediately behind a trout is invisible to it. Do they, to some extent, like hares, see what goes on behind them? In a lake this would seem to be the case, but in the running current of a stream perhaps it is not.

Sounds in the air do not seem to affect them so long as they do not see movement; but in the water they hear everything. If I tap the stones on the bank—keeping out of sight—they are at once on the alert. If I go to the top end of the pond and hit or move the water with my hand, they sense it at once. Sight seems to be their prime defence from danger, but hearing runs it very close.

One point I must not omit, as it is useful to anglers: before a thunderstorm when the air is still and sultry, the trout are quite listless and do not seem to move. *Immediately* after the storm is over, however, they are abnormally active, and feed, which would tend to show that just after such a storm is one of the best times to fish.

How long my two trout will yet live of course is not possible to say—I hope for many years, but thirteen has, I admit, already surprised me.

PERCY MAIL.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

THERE are many corners of the world within the boundaries of the British Empire where grapes grow and wine is made on a limited scale. There are vines, for instance, just outside Nairobi, in Kenya, almost directly under the Equator; wine is made there by some French missionaries, a red wine which I have tasted with pleasurable surprise.

Of course, such vineyards as those of Nairobi and similar places are not commercial, and whatever wine they produce is never marketed. But there are others; there are very important vineyards within the Empire, chiefly those of the Union of South Africa, Australia and Canada. Canadian wines have not yet reached the English market, but the wines of South Africa and of Australia are sold in England in rapidly increasing quantities, and they are fully deserving of the success which they have achieved.

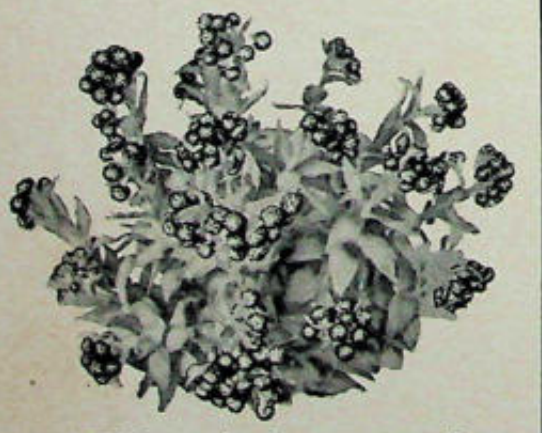
The wines of South Africa deserve the first place—first as to seniority and next as to importance. The vineyards of South Africa date back to the seventeenth century. They owe their origin in a roundabout way to Louis XIV and the Revocation of the Edict of Nantes, when the Huguenots left their native land for the nearest protestant countries, chiefly England and Holland.

The Dutch having little room at home for the newcomers, they shipped most of them to their South African Colony, at the Cape, and to this day the De Villiers, Langlois and many other French names are quite common in the Paarl Valley, from French Hock to Huguenot, villages the names of which still bear witness to the nationality of the early settlers who first brought the vine and planted the Cape vineyards. In 1822, the London Society of Arts offered a gold medal to the person who would import the finest wine made from grapes grown at the Cape of Good Hope, "or parts adjacent," as an encouragement to the Dutch colonists to extend and improve their vineyards, and to prove to them that they had every reason to trust the new régime, namely the English rule, which had succeeded to the Dutch a few years previously.

As a matter of fact, the imports of wine from the Cape into England during the first 30 years of the English occupation of the country rose from quite an insignificant quantity to close upon a million gallons, in 1829, when the wines of Constantia were at the height of their fame.

Unfortunately, the vineyards of the Cape did not escape the blight of the Phylloxera. Since then the vineyards have been replanted and extended, and they produce an abundance of red and white wines, some of which are of very fair quality indeed, but none, so far, equal in distinction and excellence to the old wines of Constantia which once upon a time graced the cellars of the Tuileries and some noble châteaux in France, as well as the tables of the royal family and many noble families in England.

The
CAPE COUNTRYSIDE
is *ablaze*
with WILD FLOWERS



THERE can be few more magnificent spectacles than the South African countryside when the wild flowers and shrubs are in bloom and the landscape is decked in a mantle of riotous colour.

The orchards and vineyards are now laden with fruit, and their sun-ripened crops add new significance to the pleasures of the table.

Visit South Africa and lay up a store of memories you will cherish throughout your life.

Consult your Travel Agent or the Travel Bureau, South Africa House, Trafalgar Square, London, W.C.2. Special steamer fares apply by certain sailings during Winter.

South Africa

FIFTY YEARS AGO

From the *Field* of November 10th, 1888.

DANGERS of the road. Under this heading comes the following: "Chimneypots and slates fall off as of yore, more often, perhaps, thanks to that modern institution the Jerry builder; and in addition we have telegraph and telephone wires to break and cut us more or less in pieces, trains to collide, unguarded electric light wires to send us in one brief second into eternity, infernal machines worked by infernal beings, bridges and other public works built by contract, and streets so full of horses and carriages that the crossing of them is a work of difficulty and danger."

An Eye for Country. "It is well known that some of the hardest men to hounds, though they have lived in the same country for years, have never acquired the knack of knowing where hounds are running. It was only last season—and the incident may be still fresh in the minds of readers of the *Field*, for I believe it was recorded at the time—that a lady pointed to a house nestling in some trees not half a mile distant, and inquired of her neighbour, as hounds came to a check after a twenty-minutes' burst, 'Who lives there?' The reply, as may probably be divined, was short and to the point—'Yourself!' However, I only quote this as instancing the truth of what has been said—H. S. D."

Wire. "A single individual may effect a good deal in the matter of getting wire taken down, but he cannot possibly meet with the same measure of success as would attend the efforts of a hundred; and, on this account, it appears to be the paramount duty of every influential man who has the interests of foxhunting at heart to go round and canvas the tenant farmers *of his own immediate district*, one by one, and in the same manner as he would were he bent on becoming a candidate for Parliament, and was anxious to secure their votes. It is only *by combined and united action* of this kind that we can hope to grapple with an evil that, unless taken in hand at once, and vigorously dealt with, must inevitably ring the death knell of hunting before the lapse of many more years."

IN THE SALEROOM

SOTHEBY'S are disposing of a number of objects of vertu, gold boxes, miniatures, &c., on November 17th, the property of four well-known collectors. Included is a rare hawking whistle, and three small seventeenth century hawk's rings, engraved with the owners' names, and bearing an old label, inscribed: "To tye upon Hawkes Leg's that the Owners name be known"; an English court sword, London hall-mark, 1793, maker Cornelius Bland; a boxwood triptych, 7¼in. high, Italian, sixteenth century; and an artillery level and sight, dated 1575, made by Ulrich Klieber of Augsburg, apparently, for some high officer of the artillery to more carefully check the rude calculations of the gunner. A cannon sight by Jost Miller, of Strasburg, dated 1609, which is in the British Museum, is neither so fine nor so elaborate as this latter article. There are also a number of interesting silhouettes of the late eighteenth and early nineteenth centuries; and a fine miniature of Admiral Sir Jahleel Brenton, Vice-Admiral, who was born in Rhode Island, served in the Royal Navy in the War of Independence, and towards the end of his career was Lieutenant-Governor of Greenwich Hospital.

At the same rooms, on November 18th, is to be held a sale which includes model coaches removed from the Badminton Club, one a fine model of the Nottingham—Leicester—Harboro—London Coach, complete with passengers inside and out, and drawn by two pairs of horses, length overall 25in.; another of wood and metal, painted black, with crests on the doors, 10¾in. long by 6½in. high, both of which were exhibited at the Great Exhibition of 1851, and were presented to the club by Thomas H. Holdick; a model of a horse-breaker's gig, and one of the "Magnet" coach and team. Among the ship models also in this sale is one of a three-masted man-o'-war, fully rigged, the work of French prisoners of war, and there is also some very interesting furniture, carpets and rugs, some of the latter half of the seventeenth century.

A NATURALIST'S NOTEBOOK

YOU must, of course, have noticed how often St. Martin's Day falls in the midst of a spell of warm, light weather. We call this spell St. Martin's Summer, and it is rare indeed that we do not, as with St. Luke's Summer, get around the Saint's name-day a few days of weather as perfect as any in our summer proper.

* * *

I first noticed this when I was at school. On St. Martin's Day the inter-house Rugger matches commenced. They were gory affairs in which the ball played a very minor rôle, and I played in the scrum. I played in the scrum normally, and that is always a hot place. But on St. Martin's Day the sun always shone with greater power and I was always very much warmer than usual.

* * *

I look forward to it, as I look forward to St. Luke's Summer a little earlier, but in a rather different spirit to that in which—a good many years ago now—I used to do. Then I was roused to a pitch of enthusiasm and excitement: now I relax and regard the brief return of summer—the last flicker of a candle that is dying—contemplatively and know that when it has passed there will be fogs, and rain and cold winds, and days in which the twilight commences soon after the luncheon hour.

* * *

But how perfect are these few short days. The sunshine is so brilliant and so delicate. Summer has gone, but here is the memory of summer, a gentle, tranquil memory clothing the dying glories of the year. The early mists have changed the elms, clothing every bough with orange and with gold. And as you walk between the hedgerows there is a magic in this great glory of decline.

* * *

The trees are ablaze with colour beside which the brightness of summer was dim. The sun shines in a sky unclouded, a sky of exquisite blue so different from the metallic blue of August. And in the soft noon hours the throstle sings amidst the gold. I would have no more. The ranked splendour of elms by the laneside; the glory of elms crowded so closely beneath the down that they hide every other tree: the flame of elms eclipsing the deep orange and crimson of beeches and the russet of oaks that will still be smouldering when every elm leaf has fallen to decay.

* * *

I would have no more. It has the greater glory for being brief. I know that in one night of storm the whole may vanish. In the very air is the sense of decay. The leaf, indeed, is glorious, but it depends for its glory and its continued life upon the calm of the sky. The sun, indeed, is bright, but it shines aslant from the heavens, from a point so low that but a small ground mist may eclipse it suddenly—and without warning. In the heart of all the glory of St. Martin's Summer there is, ever-present, the sense of life ebbing.

* * *

Of all the abundant flowers that filled the fields and hedgerows in summer there remains but a thistle-head, a stain of purple against the brown of grass; and the mayweed blossom on land yet to be ploughed. The earth is littered with the summer's ruin. The woodland scents are dank, their fragrance corrupt. The rank herbage of the hedgerow is full of decaying verdure, not yet down-trodden and withered. And the rooks, cawing in flight at sunset, are not returning to nest but are flying high, bound for the deep woods.

* * *

The year is dying: but is not dead. Indeed, I do not think that the year does die. There are all around the signs of death and of approaching death, but in the midst of them are signs—even in November—of life, new life, springing up afresh, vigorous and strong. And first of these, for me, is the renewed song of the throstles, though long ago the robins were trilling in garden and copse. And the starlings are chattering again, quaint and piping, and you may notice how any glimpse of the blue above, any lightening overhead, will set them all agoing once again, musically loquacious.

* * *

It is natural—it is a primitive tendency—as the days shorten and the cold grips, to think of the earth as sharing our human distaste at the change. Poets, in particular, support the idea. But it is quite wrong. If we would but watch without attributing to the earth human feelings, the earth disdains, we would see that the passage from one season to another is quite untroubled, that the process of decay is every whit as beautiful as that of growth.

* * *

The warmth and brightness of St. Martin's Summer cannot cloak the decay. But there is no need of sadness at the passing of summer's memory. The first fallen leaf of autumn is the first sign of spring. And in the elm the throstle heralds April.

B. V-F.

LETTERS TO THE EDITOR

CANALISING THE AVON

SIR,—I have read carefully the letters regarding the canalising of the Upper Avon in your issues of October 8th and 29th. I am, personally, greatly interested in the matter, as I have had a rod on this part of the river for some years. Until recently, the stream was a very attractive one and well stocked with trout and grayling.

I found the chief charm of the river to be that it was to a great extent natural, the flowery banks shaded by an occasional willow tree, the winding course of the stream and the abundance of bird life made a day spent on its banks a very real delight. Now the charm is gone, and gone, I fear, for many years to come.

I cannot in any way agree with the views expressed by Mr. Ivor Back and Muckle Flugga; I wish very much that I could do so, but it is impossible. I am in complete agreement with the views expressed by General Carey, and I do not think that he has in any way overstated his case.

I am now, I regret to say, advanced in years, and although my devotion to fly-fishing remains unabated, yet I realise that I have not many years left in which to enjoy it.

I have resigned my rod on the Upper Avon, for it would give me no pleasure to spend a day—nor an hour—on the river in its present transformed condition, and I do not think it can recover even a fraction of its former charm during my remaining years. Therefore, I must be content to live on the happy memory of the river as it was and refrain from seeing it as it is.

Yours faithfully,

Allington House, near Devizes, Wilts. JOHN GOODWIN.

SIR,—I entirely sympathise with General Carey, particularly in his regret at the arbitrary actions of the Catchment Board. For more than 20 years I have rented the fishing in about a mile of a brook that joins the Avon at Fordingbridge. Every April I go over twice to fish and see when weeds should be cut (usually about the end of that month, for the brook grows a great quantity). About four years ago I made my usual visit, and was surprised to find no weed at all, except some undesired flags. I came again for my usual fortnight's fishing towards the end of May; still no weed. On inquiry, I was told that the board had had three or four men in the stream for a week or more *digging* up all weed. I had to replant, and for two years the fishing was spoilt. Just beyond my lower boundary there is a considerable fall, and above this is a run-out and sluice gates, so that the farmer, by closing these, can flood the meadows to some extent. When the sluice is clear of the water, the banks are about 6ft. above the water level. Surely this work was an unnecessary expense to the public, and also totally wasted.

Yours faithfully,

10, The Green, Marlborough, Wilts. J. H. ELVERSON.

SIR,—I was recently shown the result of the activities of the Avon and Stour Catchment Board on the upper reaches of the Salisbury Avon at Enford, about ten miles north of Amesbury. In my opinion the result is appalling. What is being done is to clear all the vegetation and trees off the banks, to tear all the weeds out of the river, to cut back the banks for a considerable distance and to heap the soil on the sides of the river. The result is to produce a wide, desolate canal with a thin trickle of water of a uniform depth of about 4in., very ugly and completely useless for fishing.

The object of this barbarity is to prevent flooding. I suggest it will ultimately fail, as the much-reduced "scour" must eventually cause serious silting. A better plan, I should have thought, would be to repair disused flood hatches and to clean out the carriers. I would strongly suggest that any of your readers who are interested in the amenities of our South Country chalk valleys should go and see the desolation that has been achieved, in order that they may be on their guard to prevent its happening elsewhere.

Yours faithfully,

London. P. M. HAMMOND.

FIELD TRIALS

SIR,—Having handled dogs at field trials on some thirty or forty different occasions, it seems to me that many judges attach too much importance to every "eye-wipe" which occurs. No doubt on many occasions the dog with the better nose and better method of working will find the bird on which other dogs have failed. But I am sure it often happens that the bird (particularly a partridge) lies in such a position that it gives off no scent whatever and unless a dog stumbles right on it, would possibly be lost. I remember a year or two ago at the E.C.F.T.'s there was such a bird. Every one knew where this dead bird was. I think my dog was the ninth to be tried. The judges pointed to a spot some 50yds. the other side of a low hedge. My dog went there and made nothing of it. But a spectator said to me: "I know the bird is under that large yellow sugar-beet leaf." I called the dog back, and pointing to the leaf sent him out straight to the leaf. As he reached it I stopped him. He looked at me, then down at his feet. "By gad! Here's a partridge!" He looked really surprised. Had I been a judge I would not have attached much importance to it. Shortly afterwards the same thing happened again, but my dog was one of the failures.

To my mind both cases were pure flukes. It was a warm, windless day. On the other hand, quite lately, at some trials, my dog "wiped the eyes" of nearly the whole card on a partridge lying in shallow water surrounded by nettles in a wood. In this case, too, the three judges knew exactly where the bird was, having been to look for it when about eight dogs had failed. But I think the nettles were the cause of the trouble. And the failures should have been, and probably were, penalised. But I have seen so many cases where failure on a dead bird has prevented a really high-class dog from getting into the prize list, perhaps at the very beginning, whereas some inferior animal, which has had nothing but easy ones, is placed first, second or third because he has not failed. If I were a judge, instead of a very deaf handler, I would say such-and-such dogs have put up the best *all-round* performance, and should take the prizes. I would not hail every "eye wipe" with joy, as eliminating a likely dog and shortening the trial. A dog has so little to do for the first day and a half that he cannot pile up points enough to counterbalance the blot of a possibly lucky "eye-wipe." Well, the judges *do* have a very difficult job, and most of them do it splendidly.

Yours faithfully,

Orchard House, Woodbridge, Suffolk. C. H. KENNARD.

SIR,—With reference to Mrs. Charlesworth's letter *re* "Field Trial Judging," appearing in a recent issue of the *Field*, I would like to say how completely I am in agreement with all that she says. I could write at some length on this subject but will content myself with saying that until Mrs. Charlesworth's remarks are acted upon by field trial judges, awards will continue to be made which can only bring field trials into disrepute.

Yours faithfully,

Dall, Rannoch. F. W. VERNON-WENTWORTH.

THE ARMANT DOG

SIR,—I was extremely interested in Mr. Wentworth Day's letter about the Armant dog in your issue of October 15th. Presumably there is no purely sporting breed in Egypt that could be trained for local shooting. Mr. Day's suggestion seems to me an excellent one, but brings us to the controversial subject of a herding breed working as a gundog.

Now, in a recent issue of *Our Dogs* there is an indignant letter from "Canis" on this subject, where he says "the employment of pastoral breeds for shooting over is all wrong; they are the artisans of the canine world, not the showy leisure dogs," a sentence which, in itself, appears to be contradictory, as both breeds are artisans. He ends by saying that someone had tried to train an Armant to the gun, but "the experiment failed, as it surely deserved to do."

To my mind, this attitude shows a totally narrow-minded viewpoint. I have always understood, for instance, that the present-day Golden retriever evolved from a foreign pastoral breed, and indeed he does very much resemble the Kuvasz type of sheepdog in shape and placid temperament.

To go much further back, one feels convinced that primitive man needed and used his dog companion as a hunter before ever he turned him into a herder. Is there any reason, then, why one should not turn the herder back to the original hunter? If one can, of course. It is purely a matter of adapting and training the brains that are already there.

Personally, I have always been struck with awe and admiration for the man who used a pig for retrieving partridges; for another who employed poodles exclusively; and even for the man whose pekingese or dachshund can work through a covert, spaniel-fashion. In Scandinavia and Germany dachshunds are used extensively with the gun; in some other countries, beagles or harriers. One admires the poacher's lurcher who can "hunt, kill, and retrieve silently to hand or car." Incidentally, in this same issue of your paper you publish a letter about the praiseworthy feats of a very sporting bull-terrier. More power to all of them! These people have taught their animals something useful—something helpful—something that fits in with their own sport. Is not that what dogs are for?

I myself have kept and trained for some time two distinctly pastoral breeds for gun work—Alsatians and Welsh Corgis. I find the sheepdog brain the most delightful of all with which to work, quick-developing and adaptable. Both these breeds retrieve naturally on land and water, and both may be used in the double capacity of retriever and spaniel. Taken all round, quite honestly, perhaps they are not quite so efficient as genuine gundogs, but they are certainly not far behind in performance, control and willingness.

Whether the Armant dog is descended from the Alsatian or Briard (another Continental herding breed), I feel sure he could be trained for shooting purposes; that is, in the capacity of spaniel or retriever, but not as a pointer. One would start with a litter of young puppies, eventually select a suitable one, or two, and finally evolve a strain of shooting dogs who would inherit, without doubt, the capabilities of their trained parents. What a pity there are no Armant puppies in this country on which one could test and prove the soundness of Mr. Day's proposition!

Yours faithfully,

Yarcombe, Devon. HULDINE V. BEAMISH.

SIR,—I was the temporary owner of two of these dogs (inherited from my predecessor and bequeathed to my successor) when in the Egyptian Army, in the Sudan, during the War, but I am afraid I cannot answer Mr. Wentworth Day's question as to whether they can be broken for sporting purposes. If taken in hand young enough, it is possible, though I should doubt it. My dogs would be very friendly one day, but very independent another. They were, however, excellent watch-dogs, and although one knew they were somewhere about the premises the only time one was sure of seeing them was when they were fed at night by my sons or myself. One rather curious incident may be worth recording.

Sitting one night under my verandah reading at a small table, I was nearly frightened out of my wits by a civet cat springing out of the dark on to the table. This, equally frightened, immediately jumped off and was quickly seized by my dogs, though I had no idea they were so close at hand. Although elusive and exclusive, they had a certain "personality," and one became very fond of them.

Yours faithfully,

Hoon Ridge, Derbyshire. A. H. BETTERTON.

THE SONG THRUSH

SIR,—Having had considerable experience of song thrush families in the garden, I read the article in this paper for October 8th with considerable interest, and can say that until my wife and I began to pay attention to these birds we had no idea what delightful pets they could be. In 1932 we had a pair of old birds and their three broods of young (nine in all) in and about the garden, and they used to come, like poultry, to be fed at certain times of the day. A family of eleven tame wild thrushes at once must be something of a record I should think. We are not photographers, but we picked up a lot of information about them, and, incidentally, the habits of birds in general, which could probably not be acquired under any other circumstances.

May I point out an apparent slip in the third paragraph of G. B. F.'s article? The word "first" in the last line of it should surely be "last." From paragraph 8 is one to infer that G. B. F. is unaware that both blackbird and thrush plaster the inside of their nests with mud, but only the blackbird adds the inner lining of dried grass?

Considering the difference between the songs of blackbird and thrush, it seems curious that "G. B. F." had to cut a hole in the hide to identify the cock blackbird who "poured forth a flood of melody" to the sitting thrush (paragraph 12).

In paragraph 15 "G. B. F." expresses surprise at the number of worms found by his thrushes in a period of intense drought. This *is* remarkable, because worms are usually scarce at such times. Heavy dews will bring some out at dusk and in the early morning, but at other times they would be scarce except in damp woods and such places. Insect food in general is not plentiful in long spells of drought, and even caterpillars may be by no means common.

If "G. B. F." has neighbours who feed the birds could the "cream cheese-like" substance possibly be soaked white bread, or rice pudding? I cannot think of any "natural" food that it could be, as, so far as I am aware, thrushes do not feed their young by regurgitation. Is not the fine grey dust in the nest after the young birds have flown simply the wear and tear of the mud in their moving about in the nest?

Yours faithfully,

Tresillian, Truro, Cornwall. C. NICHOLSON.

PALACE GATE FARM AND THE RUINS OF ODIHAM CASTLE
(See letter "Odiham Palace and Castle")

ODIHAM PALACE AND CASTLE

SIR,—I was interested to see the photograph of King Henry's shooting box in the *Field* a few weeks ago, and noted that your correspondent mentioned the Royal Palace that once existed at Odiham, and also the Castle.

Where the Palace once stood, Palace Gate Farm stands to-day, and the entrance to a subterranean passage, over a mile in length, that once connected the Royal residence with the Castle, may be seen yet. I have several times gone down underneath the farm kitchen at Palace Gate into a cellar that dates from the older building, and seen the bricked up arch, and longed to explore what lay beyond.

The farm has long been divided into several tenements, and the portion to the right of the photograph lies immediately over the beginning of the passage. One of the occupants once told me that the wood flooring requires constant renewing, owing to the damp air rising from the subway below. I had an opportunity to explore a branch section of the passage on one occasion, but the foul air made it impossible.

Palace Gate as seen from the front with its old stone facings, or from the rear with its beautiful gabled roof, bears yet much of the charm and dignity of other days.

Odiham Castle stands almost forgotten in low-lying fields near where the Whitewater passes under the Basingstoke Canal. As far as one is able to judge from the keep, which, with a few traces of the ditches which once surrounded it, is all that remains of the stronghold to-day, the Castle was as small in size as it proved great in strength. It became famous in 1216 for its gallant defence against the Dauphin of France, when, with a garrison of only thirteen men, the French army was kept at bay for fifteen days.

It was at Odiham Castle that King John spent the last night before coming up to Windsor and Runnymede to meet the Barons.

In later years, when Odiham became a great hunting centre, a large stud was maintained at the castle.

Yours faithfully,
122, Kenilworth Court, E. P. OLNEY.
Putney.

PALE CLOUDED YELLOW

SIR,—I have not heard whether the pale clouded yellow (*Colias Hyale*) has been in evidence this autumn or not, but when out walking one overtook, and flew slowly by me, enabling me to see it was a fine female in good condition, on June 19th, in the New Forest at Brockenhurst.

Yours faithfully,
The Evergreens, ERNEST E. JOHNSON.
Lyndhurst, Hants.

DON PABLO LARIOS

SIR,—You were kind enough to publish an appeal for subscriptions to a fund which we are raising as a memorial to the late Don Pablo Larios, who for 45 years was Master of the Royal Calpe Hunt.

Thanks, largely, to the publicity which you gave to the appeal, a sum of £300 has been received.

It will be remembered that among the objects to which the fund was to be devoted was the purchase of a suitably inscribed piece of plate for presentation to the Marquesa de Marzales, as a mark of the admiration and affection of past and present members of the Hunt for their late Master.

It was originally intended to make the presentation to the Marquesa in the presence of members of the Hunt, but owing to the international situation prevailing at the time, it was decided by the hunt committee that the presentation should be private.

His Excellency the Governor, who had consented to make the presentation, gave a small luncheon party on Tuesday, September 27th, at The Cottage, at which were present the Marquesa de Marzales, several members of her family, and the president and hon. secretary of the Hunt.

His Excellency, in presenting the salver, spoke of the admiration which the late Master had inspired in the followers of the Hunt during the last 45 years, and on behalf of past and present members he asked the Marquesa to accept this token of their feelings.

The following letter from the Marquesa de Marzales has been received by His Excellency:

"San Bernardo,
October 12th, 1938.

"MY DEAR SIR CHARLES,—I am writing to thank you and all the members of the Hunt most sincerely for the truly beautiful token and souvenir of my husband's life-long association with the Royal Calpe Hounds. I know how extremely proud he would be of such an expression of appreciation. I can assure you that it will be greatly treasured by my family.

"I was extremely touched at your very kind words and real sympathy, and this I will never forget, nor will I ever forget your extreme courtesy and friendship to my husband and that, owing to this, the last years of his life were made happy.

"Again my very best thanks to you and to all those whose feelings you have expressed in so genuine a manner.

"Believe me, very sincerely yours,
"(Sgd.) PEPITA DE MARZALES."

It will be of interest to subscribers to know that the original from which the salver was copied was made by a Huguenot refugee in London in 1721. It is 21in. long and 16¼in. wide, and weighs 116oz. It was purchased from Messrs. Tessiers of Bond Street.

I enclose a photograph of the salver, and would be most grateful if you could publish it—with this letter—for the benefit of those who have so generously subscribed.

I may add that the fund is still open, and subscriptions will be gratefully acknowledged by the hon. secretary, Royal Calpe Hunt, Gibraltar.

Yours faithfully,
H. P. CURREY
(President, Royal Calpe Hunt)
Royal Calpe Hunt, Gibraltar.

"IN TOKEN OF THEIR ADMIRATION AND AFFECTION FOR THE LATE MARQUES DE MARZALES, M.F.H."
(See letter "Don Pablo Larios")

A WEASEL HUNT

SIR,—The other day I was walking across the Kingswood Golf Links after tea, and my three small hunt terriers made good quite a small patch of rough grass on the fairway. I saw great excitement amongst the dogs, and then heard a lot of squeaking, hurried over to the dogs and found each terrier killing a weasel—a full-grown one and two three-quarters grown. We proudly brought the bag home. A good performance, as the terriers are small, going about 10lb. each.

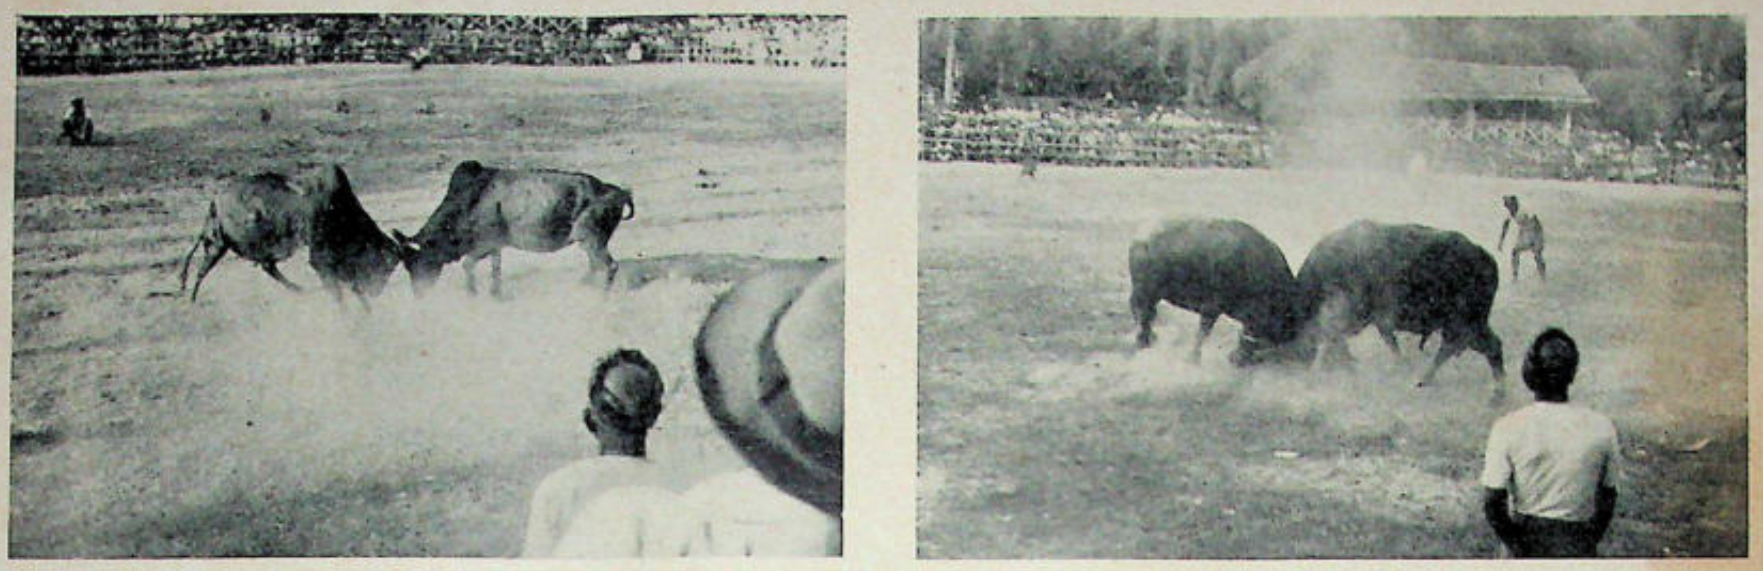
Yours faithfully,
The Shiel, RUTH A. GOAD.
Kingswood,
Surrey.

IT'S A GIFT!

Johnnie Walker has the gift of making finely-balanced whisky by skilful blending—so Johnnie Walker makes the perfect Christmas gift. Your wine-merchant or licensed dealer stocks special Christmas cases, containing 2, 3, 6 or 12 bottles of Johnnie Walker, ready for sending off to your friends.

JOHNNIE WALKER
walks away with it!

BORN 1820—STILL GOING STRONG



THEY EMERGE FROM OPPOSITE GATES MEETING WITH AN APPALLING CRASH
(See letter "Bull Fighting")

BULL FIGHTING

SIR,—It may interest your readers to hear of what is, I believe, an obsolescent sport, though practised in the Malay State of Kelantan and in Siam, namely, the fighting of bull against bull.

The local domestic animals are used: the Lembu, not unlike the average English bull, but lighter, and the Kuban, a tremendous water buffalo with long curved horns.

The Lembus are docile enough, and are led up to each other by a nose string. They generally leap into action at a range of about 6ft. when the string is withdrawn. The first animal to run away loses the bout. Theoretically, the best of three bouts decides the issue; but in nine cases out of ten the defeated bull, after it has been caught by its owner, very sensibly refuses to make a fool of itself a second time, and retreats at once, though it may have contested the first bout gallantly for 20 minutes.

Kubans are not handled in the same way; there is no need for a nose string. They emerge from opposite gates and charge each other, meeting with an appalling crash. An exit is left open, and through this the vanquished flees, pursued by the victor through the fields, coconut groves or even the streets of the town. There is no question of catching them until they have calmed down.

In spite of the spectacular nature of these combats, the animals apparently do each other considerably less damage than a couple of brisk amateur boxers in three rounds with well padded gloves.

Yours faithfully,
C. H. G.

Kelantan, Malaya.

GOING DOWN!
(See letter "Choked to Death")

GREY SQUIRRELS

SIR,—I have just read with much interest Mr. G. L. Harrison's letter in the *Field* of October 29th concerning grey squirrels. He finishes up by saying: "At home I do not think they trouble birds or nests, but they no doubt change their habits when transported across the sea." In these woods at Cobham, Kent, the keepers have killed nearly 300 in two seasons, and only this week, just before pheasant feeding time, the underkeeper was just going to start to feed and the birds were coming on to the ride from all sides when I heard a commotion behind the feed hut, and on going round I saw a big grey squirrel attacking and attempting to catch hen pheasant after hen pheasant—to be accurate, eight in all and one cock. One hen ran in under some cut brushwood and the squirrel went under and over and hunted her like a stoat. She eventually got away. The head-keeper said he had often seen them try to catch a pheasant, though the underkeeper said he had never seen such a sight before. If they will attempt to catch a full-grown pheasant, then what chance have young pheasants with the brutes. They hunt the whole woods for young birds and eggs of any sort. They do not do much damage to partridges, if any, as they never go far from a tree for safety.

Yours faithfully,
CHARLES MCNEILL.

Cobham, Kent.

A SALMON FISHER'S CRI DU CŒUR

SIR,—The cause of the lamentations of "West Country" in his interesting article in your issue of October 15th may be due to a slight attack of that dread disease of the mind, popularly ascribed in these days to inferiority complex, the psychological and physiological factors of which would surely communicate themselves to fish, which he rightly says, are known to be extremely sensitive to differences of pressure, temperature and electrical charges. The same agency is communicated to horse and dog instanter.

During 60 years of salmon and trout fishing I have seen this agency at work on many occasions, and, indeed, have suffered from it myself from time to time. "West Country" may comfort himself with this prescription: The best man wins in the long run every time, in spite of good or bad luck, and that the "flag" must ever be kept erect.

Yours faithfully,
PISCATOR IN PURBECK.

Purbeck.

CHOKED TO DEATH

SIR,—The accompanying photograph shows a 6olb. garrick which was choked to death by a 2½lb. silver bream wedged in its throat.

The large fish was seen by two ladies on the Natal South Coast lashing the surf in great distress, until it was pulled ashore in a suffocated condition. The bream had spread its fins, which became wedged in the garrick's gullet with fatal results.

Yours faithfully,
R. W. JOHNSTON.

Box 598, Durban,
South Africa.

ECZEMA IN DOGS

SIR,—Last spring my Cairn terrier developed a very bad attack of eczema. A friend told me that I ought to try "Kurmange." I did so, and the result was a complete cure. I was so grateful that I wrote a short letter to our local weekly paper advising dog-owners to try it. A few days ago I received a letter from a lady in South Africa, saying: "My Cairn terrier was suffering from skin trouble, and I had made up my mind to have her destroyed, as her whole body was inflamed—burning hot and painful. I happened to see your letter in the paper which a friend had sent to me from England. I took your advice, and after three applications she is completely cured, and I felt I must write and thank you."

I trust that you will publish this letter, as I feel that if a letter in a small local paper has saved the life of one dog from misery and subsequent death, one in the *Field*, which is read in every part of the British Empire, will be the means of saving many dogs from a similar fate. It is hardly necessary for me to state that I have no financial or other interest in "Kurmange," which can be obtained at any chemists. Also may I say that I have been a constant reader of your paper for over half a century.

Yours faithfully,
J. MUSGRAVE.

Cuckfield, Sussex.

ROOKS NESTING

SIR,—A pair of rooks have built a new nest at the top of a high lime tree here, which was only noticed after the leaves fell. From the way the cock bird is feeding her, there seems no doubt that she is sitting. Unfortunately, we cannot get to the nest to investigate.

Yours faithfully,
C. L. FORSTER.

Wellisford, Somerset.

You will notice the difference in quality at once! Craven 'A' are so exceptionally smooth, so cool and fresh. Remember too, that these cork-tipped cigarettes will *not* affect your throat. Switch to Craven 'A' they will give you *real* smoking satisfaction.

In the 'easy-access' inner foil pack and sealed fresh in moisture-proof Cellophane.

ANIMAL TOPIARY

SIR,—On one of my rambles into the country a short time ago I came upon a field in which were a number of gorse bushes, all of which bore curious shapes. These had been formed by the rabbits nibbling away the young shoots as they grew.

Many of the bushes were in the form of cushions; one had the shape of a lamb. But the most peculiar of all was that portrayed in the accompanying illustration. Here the rabbits have controlled the growth of the bush so that it resembles one of themselves sitting up in the listening attitude so characteristic of these animals.

Maybe it stands as a memorial to one of the bunny folk who has performed some epic feat in the rabbit world, and was invested with the Order of the Crested Ears?

Yours faithfully,

84, The Broadway, Exeter, Devon. R. W. J. NORTON.

POSSIBLE REPLACEMENT OF THE FANGS OF SNAKES

SIR,—Can any of your readers produce evidence of the replacement of fangs in viperine snakes? It is commonly believed that an axillary pair grow into place should the main pair of fangs be accidentally broken, but I am informed by an authority that there would seem to be no likelihood of such replacement.

It should not be difficult to prove this in view of the fact that the fangs are often extracted during the life of a snake.

It would appear that both reptiles and sharks, representing primitive types of life, are provided with reserve rows of teeth which never come into use. As their teeth are movable with the gum, they are less liable to injury than if they had been embedded in sockets. They do not come into use so constantly as those of mammals, though only in the fresh state is it possible to observe how much the teeth move or become exposed whilst the snake is biting.

Yours faithfully,

South Africa. F. GORDON CAWSTON.

LIONS AND GUINEA FOWL

SIR,—On Monday, July 18th, at about eight o'clock in the morning, from a low bluff on the dry River Luia, near Chioco, in Portuguese East Africa, I watched through field-glasses three lions walk across about 200yds. of the sandy river bed. There was nothing remarkable in that. But in rear of the lions and close behind, following them

"THE ORDER OF THE CRESTED EARS"
(See letter "Animal Topiary")

across the whole distance, was a troop of about 50 guinea fowl, which, with outstretched necks, were evidently proclaiming to the world that marauders were abroad.

Once, the third lion in line stopped for a moment and gazed up stream; the guinea fowl stopped, too, with an almost visible jerk, but the moment the lion resumed its walk the guinea fowl did also.

The procession did not break up until it was within 10ft. of the dense jungle of thorn and palm trees at the edge of the river.

I have never seen anything quite like this before, and would be very interested to know if any readers of the *Field* have seen anything similar. In my previous experience, the lesser things of the veld have always made themselves remarkably scarce when lions are about.

Yours faithfully,

The Salisbury Club, Salisbury, S. Rhodesia. L. M. HASTINGS.

PONIES AND MOTORISTS

SIR,—It is also possible to read Miss Eva Dunbar's letter to you upon the above matter and find nothing at all irrational or ignorant in a car driver for failing to see any "enormity" about hitting an animal straying across the public highway, because similar roads exist all over the British Isles where there are no fences, but not often a similar idiotic neglect to enclose animals. The car driver was not to blame for such a regrettable accident, but the people responsible for the care and keeperage of their livestock. I well know the New Forest. Let them see to it. They put human life to the hazard which is a far more serious matter. The same applies to some other places.

Yours faithfully,

194, Handside Lane, Welwyn Garden City, Herts. SYDNEY J. ENGLAND.

GULL WARFARE

SIR,—A few evenings ago, when driving along a main road in Scotland, I noticed a group of common gulls rise from near a river, together with a lesser black-backed gull.

The latter separated one of the common gulls from the rest, and proceeded to pursue it, always trying to rise above, as though to strike. The common gull had nothing in his bill apparently. A casual observer might well have thought a hawk had been hunting the gull.

The pursuit went on for a considerable distance, and at some height, but unfortunately I was unable to remain to watch the finish.

I should be interested to know whether lesser black-backed gulls often deliberately hunt other gulls in this way, and how the smaller gull usually fares in the end.

Yours faithfully,

Scotland. M. W.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, need help for a plucky old lady of 81. Her father, a horse trainer, died in the 'seventies leaving his daughter to support herself. Although only partially trained she took up nursing, and one of her old patients has written to us on her behalf. The old lady is now an invalid, and often bedridden for days with acute heart trouble. Her home is an almshouse in Somerset, where she pays a rent of £10 a year, but this does not include fires or any service. Her great wish is to remain independent in her tiny home for the few remaining years of her life, but as she has only her Old Age Pension and a few shillings annuity she is without many little comforts so essential to very old age. Please send us £13.

Yes, my darling daughter?

So that explains the decline and fall in Father's stock of Gold Flake. Of course, she's only one of many these days. Women have developed a liking for a man's cigarette. And a Wills's Gold Flake—*the* man's cigarette—certainly *is* something worth smoking. It has the distinctive flavour of really fine Virginia tobaccos. Look how men have been loyal to Gold Flake for years and years and years.

WILLS'S

GOLD FLAKE

is the man's cigarette that women like

IN THE CITY

By OUR CITY EDITOR

INVESTORS in high-class stocks are still sitting on the fence. They visualise increased taxation to meet rearmament expenditure. That will naturally cut into income on investments. Strangely enough, there is a definite move in markets towards armament shares.

The Prime Minister recently recalled that the country is now in the third year of the rearmament programme. The initial intention was to rearm over a period of five years. Another two years of hectic activity for rearmament firms can be more or less relied upon.

Several firms on the fringe of rearmament work have recently held annual meetings. In every case chairmen have been able to state that they can look forward to prosperity for several years to come. The order-books are full. The margin of profits may not be great but this is made up on a large turnover.

This supplies the reason for the return of iron, and steels, and engineering shares to popularity with the speculative investor. Some of the engineering shares seem to deserve attention. They are standing at prices substantially below the levels reached a year or two ago.

Even if it is allowed that previous top prices were the result of ultra-optimism, present prices discount the earning capacity of the concerns. Naturally shares in this category cannot be approached as permanent investments. They should be turned over if a profit accrues. It may also be advisable for the buyer who finds himself on the wrong horse to cut his loss with the best grace possible.

I hear quite optimistic views concerning Beans Industries. This is a firm of general engineers which was made public in January, 1937. For the year to November 30th, 1937, there was a total dividend of 30 per cent. Interim for the year to November this year has been raised from 8 per cent. to 10 per cent.

Whether the larger interim is merely to equalise distributions over the year or not is impossible to say. I do, however, hear that the company is very successful. It is most unlikely the dividend will be less than 30 per cent. this year. The 5/– shares around 18/– should be worth putting away just as a speculation.

I might mention that Trojan (Holdings) has a considerable investment interest in Beans Industries. Here is another little company which is successful and doing good business. Dividend for the year to last August was 10 per cent. The 5/– shares are now a shade under 6/–. They went to practically 12/– at one time last year.

A concern with a reasonably successful record over many years is Davis & Timmins. It manufactures screws as well as nuts and bolts. It has quite a number of activities in the engineering trades. A company of this description stands to make real good profits in times such as these.

Except for 1931, which was a depression year, dividends have been regularly paid on the ordinary capital. True, distributions have varied. Only 5 per cent. was possible for 1932 and 1933. Since then there has been gradual increase in distributions. It is noteworthy, however, that dividends have been very conservative on earnings. For instance, two distributions totalling 30 per cent. were paid for 1937. Earnings that year were over 44 per cent.

Interim for the current year has been maintained at 10 per cent. Market dealers tell me they expect at least 30 per cent. for the year. We find the shares standing to-day in the neighbourhood of 18/6. The price went as high as 27/– last year. This share gives a particularly good return and, in my opinion, is one which can be put away for a year or two with reasonable confidence.

INSECT INDUSTRY

Probably most of us have chuckled appreciatively over Robert Graves's delightful *Lost Love*, where he speaks of the "clashing jaws of moth chumbling holes in cloth," and "the groan of ants who undertake gigantic loads for honour's sake." It may, as Graves suggests, be necessary for a man's senses to be quickened by grief before he can hear these things; but the London Zoo has at least enabled him to see them under the best possible conditions without the need for sorrow as a stimulant. In the Insect House there is an excellent arrangement whereby their world may be viewed at leisure. There are magnifying portholes through which the smaller creatures may be viewed—furniture beetles, grain weavers and silver fish; while the clothes moth can be seen, not only "chumbling," but in other of life's duties. The wood-tunnelling larvæ of such unpleasant creatures as the stag beetle and the goat moth, of lamentably filthy smell, are on the other side of the corridor by the entrance. All are worthy of a close acquaintance.

New Books

BIRTH OF A CITY

Activities of the Men Whose Administrative Ability Established New York

New York's Making. By MARY DE PEYSTER RUTGERS MCCRAE CONGER. (Methuen ; 6/- net.)

IN the light of recent events in Europe and elsewhere it is of especial interest to note the mentality and methods of the rival Colonists in the earliest days of New York. Forests of trees may give place to cities of steel and stone, but that the mind of man changes little is instanced by the case of the English Admiral who, in 1664, requested the surrender of New York from the Dutch, backing up his demand with the observation that in the event of any resistance the onus of bloodshed would rest upon the defenders !

The author of this book paints a picture of New York as few people in these days can visualise it—a New York that came into being through the efforts of those early Dutch settlers who, by trading with the Indians and bringing with them new methods of cultivation, laid the foundations of what was to become one of the most valuable tracts of land in the American continent.

How many present-day New Yorkers, I wonder, realise what America owes to those pioneers, the Dutch West India Company, whose first directors, such men as David de Vries, did so much by their administrative ability to pacify the Indians and establish the city as a centre of trade and commerce.

In reading this book one cannot fail to be struck by the situations of those early days that have their parallel in modern times. The dictatorship of Willem Kieft—whose methods were resented by Indians and Europeans alike, with the result that much blood was shed on both sides—and the able diplomacy of his successor, Johannes de Peyster, who was largely instrumental in negotiating the treaty by which the city was handed over to the English on the understanding that religious freedom and rights of property were respected. (It is illuminating to note that in those " bad old days " the exchange took place with the minimum of unpleasantness !) Then, again, during the War of Independence, we have the " incident " of the American Jane McCrae, who was brutally murdered while on her way to be married to an officer in the King's Army. The blame for this tragedy was naturally laid, by the Americans, at the door of the British, and recruiting for the American Army received a tremendous stimulus ! The second, and perhaps equally vivid, impression to be gained from this chronicle is that civic leadership and administration was very much of a family affair, the sons and daughters of the first colonists intermarrying and forming a closely-knit clan. We see them with their coaches and negro retainers, at receptions and dinners, with powdered hair and patches, as members of the State Legislature and as founders and organisers of universities and charitable institutions. They had their quarrels and misunderstandings, their schemes and plans, successes and failures, but no one can deny that these old families gave of their best in every sphere of their activities for the good of the community.

It is 300 years since Johannes de Peyster landed on Manhattan Island, where forests of trees reared their topmost branches to the sky, where the Indians hunted the wolf and deer, planted the clearings with corn and dived for fish in the waters of the Hudson. Now the forest is of sky-scrapers, resounding not with the shrill cry of the whippoorwill, but with the never-ceasing clangour of modern machine-made life.

In a small compass the author of this book has given us a clear outline of six generations from old Johannes down to the present day ; and we are left with a profound sense of the sincerity and steadfastness of purpose which characterised the lives of those pioneers of New York. V. R.

* * * *

Sailing All Seas in the Idle Hour. By DWIGHT LONG. (Hodder & Stoughton ; 9/6.)

How many times a week do you hear people say : " I'm fed up ! " It is an odd, illogical saying, for it has no connection with food at all. Usually it is meant to infer that the speaker is either sick of a suburban life or of office life generally. Yet few of the people who moan like that ever do anything about it. They just grouse and grizzle their way through life, and before they have decided what it is they do want they have qualified for an old age pension. Others have dreams but never quite fulfil them, owing usually to a lack of self-confidence or courage.

Mr. Dwight Long, however, possesses both these qualities. No one could accuse him of being a " grizzler," but he was definitely not content to laze away his life on a job " which had no future." At seven years of age he was carrying circulars from door to door in order to earn enough money to buy a row-boat. He succeeded. Later he changed it ; and in the course of ten years he bought and sold fourteen boats, each time making money on the deal and each time investing it in something bigger and better.

His enthusiasm deserved the success it received. In the early twenties he spent every penny he possessed in acquiring the 32-foot ketch Idle Hour. Business life offered him nothing, so he went off in her to see the world. He sailed her from Seattle down among the Islands, to Tahiti and Samoa and Tonga and all those lovely far-off places. He weathered hurricanes and avoided reefs, he learnt the ability to suffer much and the value of true companionship with one or two men confined to a small boat for weeks on end.

You will find that *Sailing All Seas in the Idle Hour* is a grand yarn about a true sea-wanderer and his companions. It holds the reader, and is the next best thing to making a round-the-world trip yourself.

Patagonian Year. By PEDRO RUBIO. (Methuen ; 7/6.)

Patagonia is hardly the place most people would choose to visit if they could possibly go anywhere else. It is an inhospitable place with mile after mile of grassland, desert and dried-up salt lake peopled by sheep and by human beings strangely reminiscent of the twopenny adventure magazines beloved of boyhood days. Despite all this Pedro Rubio, the Norwegian author of *Patagonian Year*, confesses that " after a time one longs to be back just as ardently as one had longed to get away."

The World War gave an impetus to the development of Patagonia, and the price of wool—sheep farming is the be-all and end-all of the country—rose by four or five hundred per cent., with the inevitable result that, where previously there had been land enough and to spare without worrying about exact boundaries, the influx of new farmers threatened the lands and livelihoods of the old *pobladores*.

It being an ill wind that blows nobody any good, the author found surveying a profitable occupation, and in his book he tells something of this queer land where sheep, cars, wine and women seem to be the whole horizon of the average inhabitant.

It is a pity that the author did not launch out into something a little less inconsequently than *Patagonian Year*, for quite obviously he knows what he is writing about—not always a feature of modern day travel books—but his choice of material is rather more reminiscent in style of a novel than of a serious travel book. No doubt translation from the Norwegian has detracted from its effect, for there is almost always an indefinable something rarely found in a translated work which makes so much difference to the original. *Patagonian Year* is not to be ignored, but to be read when the mind does not feel equal to more weighty topographical works. L. N. R.

The Cambridge Region. Edited by H. C. DARBY. (Cambridge University Press ; 6/- net.)

For the purposes of this survey the Cambridge region is defined as the two and separate administrative counties of Cambridge and the Isle of Ely. The book takes the form of a comprehensive account of those districts from fifteen different points of view. The chapter on place names is as fascinating as these inquiries usually are, and it is interesting to note that, owing to phonetic changes and popular etymology, the form " Grantchester " is the one at which " Cambridge " should have arrived. The agricultural survey points out the four main changes which have taken place in Cambridge farming since the beginning of the century, and outlines the present condition, while the historical description of the draining of the Fens is one of extraordinary interest. The industries of Cambridge also find a place, among which the old Sawston Paper Mill, and the fruit preserving and canning industry, made necessary by the prospect of an over-production of fruit, are perhaps the most typical of the district. Nearly all of the 160 villages in Cambridgeshire are mentioned in Domesday Book, which is a striking indication of the extent to which the country districts have remained the same. It is impossible to do more than indicate the extent of this survey, which has the unusual quality of being a very readable book of reference. R. C.

My Irish Sketchbook. By LIONEL EDWARDS. (Collins ; 21/-.)

The Silent Horn. By ERIC MEADE-KING. (Collins ; 12/6.)

The search for Christmas presents looms ever nearer. To many recipients, books are the ideal gift and then the real agony begins—unless we escape through a " token."

But this year if you are searching for a horse-loving friend (better still a hunter) you have two winners ; both are books, largely composed of illustrations, and both have colour work augmented by pencil sketches ; and both are very beautiful.

In the first, Lionel Edwards has concentrated his superb skill upon Irish hunts. He has depicted the Irish sport with its backgrounds which no shire can compete against. He has a humorous twist to his pencil, and many little points of difference between the Irish and English " going " are shown in the sketches. The histories of the famous packs are briefly given, and the coloured illustrations which accompany them are exquisite.

In *The Silent Horn* we have rather a different setting. It is England's countryside during the quiet months which have no " R's " Here we see the other side of the sport as displayed by Mr. Edwards. Mr. Meade-King has caught the idleness of the midsummer, in the kennels and the paddock. The group of mares in a Leicester field with their aristocratic foals ; the hounds stretched out in the sun-baked yard, visited by the flies ; the busy kennel man attending to the irresistible puppies ; and occasionally the frayed temper in a flying hoof. This is perhaps the less serious book, for Mr. Edwards has been attracted by the importance of the peak of the season.

There is much more in these pictures than good artistry or even hunting records. There is a smell of the " good earth," the oats and the saddle—there are sounds from the yard and harness room, and a glimpse of a slinking red form.

Choice is difficult ; but see both, buy both, take them home, and if you are wise keep them for yourself.

C. N.

BOOKS IN BRIEF

The Behaviour of Animals, by E. S. RUSSELL, D.Sc., F.L.S. (Arnold ; 10/6), will be of immense interest to all biologists ; this is the second edition of the book, whose object is to show the principles which should govern one's observations of animal behaviour. This is not merely a scientific attitude, but one which includes all owners of animals, who have the greatest opportunities of recording the daily and natural actions of their charges. A new theory is discussed here relating to whether an animal perceives only the objects and happenings taking place around him which concern only himself. The naturalist and field sportsman who observe animal life in its wild state, can help in this, as yet, undeveloped science.

Mr. A. G. STREET always brings joy to the country lover with his novels, and in his latest one—*Already Walks To-morrow* (Faber & Faber ; 7/6)—this is again the case. But this time a deeper note is introduced. The author has often made it clear that he has fears for the farming industry and our national food supply in an emergency. It is of such a predicament that he now writes, and his plans for frustrating such ugly fears becoming realities are worthy of note. There are plain stated, basic facts here, interwoven with a charming story. Quite one of Mr. Street's most successful ventures

IN TOUCH

The Sports Writer, the Spirit, and the Secretary

OUR valued contemporary, Mr. Punch, has quite rightly mimicked the modern sports writer in one of his articles. The latter invariably heads his column at least once a year, "What is Wrong with Hop-scotch"—or hockey or hoop-la, according to his particular subject. So insistent is he in finding fault with something no one else had hit upon the previous season that a long-suffering public have at last grown tired of being told that things are not what they were in the old days, and as a result, many a true word being spoken in jest, Mr. Punch has aired a legitimate grievance.

On the other hand, is the unfortunate writer to blame? He is desperately trying to till a living from the sports field, and is quite aware that if, for instance, he smiles at some misconduct on the field and, in effect, murmers, "Boys will be boys," his public (and what is more important to him, his employers) tell him he doesn't know his job, and never has any opinions of his own, while if he thunders down a column striking out left and right he is dubbed a carping critic and obviously one who has never played the game. Since any reasonable sports writer would rather be a carping critic than a jobless journalist, he chooses the lesser of two evils, and thus, "What is Wrong with Rugby Football?" still finds its place in newspaper and magazine indices.

I cannot help the feeling that there is far less wrong with Rugby football to-day than most enthusiasts imagine.

Generally a certain amount of intelligence is displayed and without question there is far more open play now than in past decades. This is a very good sign, for the attitude of "We're tough, and we can take it" may be great fun when being worked out on the field, but to watch it is desperately reminiscent of an East End street brawl—and far less exciting—and effectively destroys that science which is so great an asset to Rugby, and which the Association football fan loves to insist does not, in reality, exist.

The other Saturday I watched Richmond play Gloucester. Just prior to the game someone in the Press box said, "Well, are we going to see a great game, or a dog-fight?" It proved to be neither, and was indescribably dull to watch. More brainless play I have seldom seen—wild passing to imaginary players, when a short punt ahead would have brought a try, elementary dribbling, wild kicking, and well nigh every other sort of offence. Providence was kind; the fog settled over the field, and although Richmond changed into white shirts at half-time, it became increasingly difficult to follow the game, and I left before the finish with further words from the same gentleman as before sounding in my ears: "They can thank their stars that the gate comes before the match and not after it, or they would not get much."

Admittedly, it was a terribly unscientific kind of game, but no more. Bad play can be corrected by practice; it is bad temper which causes so much difficulty these days. A contagious disease is temper, and it takes very little time to stir a couple of teams into a ferment, and when this happens the watchers see but little of the game for froth. Most readers who have played Rugby know that "hell for leather" feeling which sometimes results from a purposeful and quite unwarranted hack in the back. They will also know, I think, that for all their scrambling, hacking, running and cursing, they have achieved infinitely less by the end than during the period of comparative sobriety.

Last season there was much criticism of the rough and unsporting play seen at some matches; fortunately there has been little need for rebuke this year, and this is most certainly a cheering sign. Enthusiasm and spirit are essential to the game, but when they outgrow their functions they become a menace. So long as the spirit is right there will be little need to cry that there is something wrong with the game.

We have seen the result of over-exuberance in most games played in this country, of which ice hockey provides a good example. It would not be modern ice hockey if there were not a few stand-up fights and a continual stream of players making their way to the penalty box. I watched such a match some time ago, and when the crowd had booed itself into a moment of comparative silence, I was informed that I must not mind that sort of behaviour, nothing was really meant by it and, anyway, it was good fun to have the opportunity of a hearty boo because someone had hit his opponent on the head when he thought the referee was watching the puck and not the players. That is a disastrous though all too common attitude, and it says a tremendous amount in favour of Rugby that, though it presents more opportunity for foul play than any other team game, on the whole it sets an example in honest-to-goodness sport.

Players are usually the butt of abuse, but perhaps secretaries and other exalted officials are not above reproach, for many of them seem to imagine that their functions quite definitely end with their own club arrangements. Surely this is not so. Much good work might be done, and many good players be brought to the fore, were it not for club parochialism.

Some time ago, the exact date I cannot remember, there appeared some interesting correspondence in this paper on the vexed question of forward play. These letters were reprinted in leaflet form and sent round to about 28 of the leading Rugby clubs, asking for their opinions on the matter. Of them but one replied—Cambridge University, to be precise. Now from that correspondence something really constructive might have arisen had the necessary enthusiasm been present.

This spirit of *laisser faire* seems especially to be present in the smaller clubs, much to their hurt and to the detriment of Rugby in general. I cannot get away from the feeling that there are, somewhere in the British Isles, a team of Rugby footballers capable of giving any one of our four International sides a thorough trouncing. Unfortunately the players are never discovered.

The Selection Committee cannot be blamed, for they are only human, and Rugby football is not their only interest and job in life, and to cover all the teams in England is a sheer impossibility, and thus it is that, with a few notable exceptions, the personnel of our International sides are recruited exclusively from the first-class clubs, such as the 'Quins, Coventry, Blackheath and Leicester; and though county Rugby does something to help the smaller club, it is a small something. Surely there is some Rugby genius to be found in the Muckton-on-Slosh team or that at Muddle-in-the-Mire, and if only local secretaries would do their part in pushing these players into public notice we might yet see the greatest International teams ever. As it is we spend our time talking of the matches of a decade ago, and more's the pity that we should need to do so.

L. N. R.

FROM TEE TO GREEN

II.—The Brassie

By E. R. TIPPLE

THE modern golf ball is blamed, rightly or wrongly, for many alterations in the playing of the game, one being the fewer opportunities when a brassie need be used. In pre-War days wooden-club play through the green was essential even for the leading golfers. Now the first-class professional or scratch amateur under normal conditions has to take a brassie out of his bag only once or twice during a round. But if he hits the present very sympathetic ball so far as not to require this club, the ordinary golfer still finds it very useful.

A brassie shot can be both a valuable and a highly destructive stroke. It may win a vital hole for you or it may cost you the match. It probably causes more trouble than any other club, for it is one of the most difficult clubs to use really well. Most of the leading authorities are agreed that there is little important difference in technique between the correct use of the brassie and the driver.

The chief problem, of course, is getting the ball into the air. How we do top our brassie shots! Why? The primary reason is because we try to do too much, and in attempting the impossible fail to achieve even a moderate result. We see the ball lying on the fairway, the lie perhaps is rather close, and we imagine that we will have to force the ball up into the air. Consequently any rhythm that our swings may usually possess disappears as we scratch at the ball and slog blindly. It cannot be repeated too often that the loft of the club elevates the ball—that is what it is there for—not merely the action of the individual.

For the drive we are allowed to tee up the ball as we wish. For the brassie we have to take the ball as we find it. But the loft of the latter club is adequate compensation. There is no need to alter the actual swing. Some experts say that, in the address, the ball should be nearer the middle of the feet and not played from a point opposite the left foot, but that is a question for the individual to answer for himself, by experiments. I know several good golfers who have found that they obtain better and more consistent results by holding the club nearer the middle of the grip. This shortened grip—two or three inches, not more, of the shaft showing above the hands—certainly gives greater control than if the club is held at the end of the "handle."

W. W. Lowe gives sound advice when he states: "Don't close the face of the club even a little, but hit the ball with an open face in exactly the same way as you would hit a drive." And the follow through is extremely important. So many handicap golfers are inclined to dig at the ball and finish the stroke as the club head meets the ball and sinks into the turf. The shot must not be stopped in this way but completed properly, the club being swung through freely and the feet left in position.

If you have a spell of bad driving use your brassie off the tee for a change. I was told that years ago and the advice has always proved profitable. The extra loft of the club will give you just that extra confidence. As you place the brassie behind the ball you will see that loft instead of the straight face of the driver, and this will help you to swing more easily and will relieve you of a great deal of anxiety. Particularly at the beginning of a round—or when there is a following wind—is the use of a brassie off the tee advantageous.

Most players when they take out a brassie are thinking of length and nothing else. The brassie shot must be placed just as we try to place a mashie near the flag. It is a good idea to have a definite objective in mind, whether we aim at the green or at a point just wide of a hazard or at any other target. It is obviously essential for each player to have a definite knowledge of his capabilities. As Cotton puts it: "The art is in knowing what is a brassie lie and also your own limits."

He suggests a useful method of practice. Begin by playing brassie shots off a wooden peg, lowering the tee by degrees until you are hitting the ball off the ground. Always practice from good lies until you get accustomed to the stroke and the length of the shots. Then in the course of a game you can estimate the distances with some accuracy. All this may sound very elementary, but I have watched scores of experienced players who have not the slightest idea of how far they can hit a brassie shot, simply because they have not taken a little trouble to discover their own limits.

Most golfers find that their brassie shots fade away to the right at the finish. This is nothing to worry about, and is infinitely better than a disastrous hook which can never be controlled. I think it was Abe Mitchell who said if you find yourself slicing aim deliberately to the right this will force a reaction. If you show a tendency to pull, aim to the left of the fairway. Padgham, for one, agrees with this idea. It is sound, but needs courage to put into practice.

As I mentioned last week, the tendency to-day is to use deep-faced wooden clubs. This is both sound and helpful so far as the driver is concerned, but a deep-faced brassie is not suitable for most players. A shallow-faced brassie, because the centre of gravity is lower, picks up the ball more easily. I looked over a stock of new brassies in a large store recently, and discovered only three with reasonably shallow faces. The majority are too difficult to handle. With a deep-faced club the ball is hit more often than not below the middle of the face; then the player wonders why he never hits a good, high brassie shot.

There is a tendency on the manufacturers' part to produce brassies with big heads. These large heads are not suitable for the average player. The length of the face is just as important as the loft. No golfer needs inches of spare hitting surface, although some margin of safety is naturally essential. With a big-headed brassie a shot out of a "cupped" lie is practically impossible, because either or both ends of the head will prevent the club from striking the ball properly. A shallow-faced brassie with a small narrow head, on the other hand, will extricate the ball out of many difficult lies with astonishing ease. Even to-day we rarely find the ball sitting up on a tuft of grass, so that we must be prepared to use a brassie from awkward lies. A careful examination of brassies now in use would be worth while. Even a good golfer cannot play well with indifferent weapons; yet many a handicap man goes on, year after year, using clubs and brassies, in particular, that are totally unsuitable for him, or indeed for anyone else.

BRANKSOME CHALLENGE CUP MEETING

Once again the annual Branksome Challenge Cup meeting proved a great success. The principal award was won by P. J. Urlwin Smith, of Hindhead, with an aggregate of 146 over the tricky Parkstone course. His scores were 75 and 71. From a record entry of 64 B. Woodburn, also from Hindhead—this club's members seem to have caught the Ross method for success—won the handicap prize with a total of 140 net from a handicap of 15. That will be noted for future action by the handicapping committee! Owing to the death of the organiser, E. M. Cockell, A. F. Carris, hon. secretary and president of the Hazards Golf Society, undertook the difficult task of arranging the details of the tournament, and it is to his credit that this first attempt proved so very enjoyable. The open champion, R. A. Whitcombe, was present at the subsequent dinner at Branksome Tower Hotel, where the many prizes were presented by Miss Jane Duprez, T. V. Haydon, the originator of this competition, being in the chair.

The Country House

"COTTAGERS' FLOWERS"

The Beauty of Bergamots

By ELEANOUR SINCLAIR ROHDE

In spite of the modern demand for gorgeously coloured flowers, Bergamots are far from being commonly grown. To those of us who appreciate them they are amongst the most delightful of old-fashioned flowers. At one time they were regarded as "cottagers' flowers," and it is a surprising fact that they are not even mentioned in such standard eighteenth and nineteenth century books as Abercrombie's *Dictionary* and Loudon's *Encyclopædia of Gardening*.

In Victorian times they were grown in nearly every cottage garden, and in my childhood they were amongst the favourite scented herbs carefully folded in a clean handkerchief and laid inside the prayer-book to take to church on hot Sundays for their refreshing scent. I never look at them without thinking of the passage in *Daddy Darwin's Dovecot* and the Bergamot which Phœbe's mother said was "more refreshing than Old Man (Southernwood) and not so common."

Bergamots are associated with no less than three names famous in the annals of gardening—Nicolas Monardes, John Tradescant the Younger, and Peter Collinson, the great Quaker gardener of the latter half of the eighteenth century, who had a famous garden at Mill Hill. The genus was named Monarda in honour of Nicolas Monardes, the Spanish doctor, who, in 1569, published the first American Herbal. The book, written nineteen years before the defeat of the Armada, is full of the pride of a Spanish subject in what was then the greatest empire in the world. The tallest species, *M. fistulosa*, was introduced by John Tradescant the Younger, son of John Tradescant who was gardener to Charles I and Queen Henrietta Maria, and the far showier *M. didyma* (*syn. M. Kalmiana*) was introduced by Peter Collinson.

The popular name Bergamot was bestowed on the plant owing to the similarity of its scent to that of the Bergamot orange, from which oil of Bergamot is made. It was also called Bee Balm, for bees revel in the flowers. There are about half a dozen species and various named hybrids, and their nomenclature is in a confused condition. *M. fistulosa* is very variable. In good soils it grows 5ft. high, and is a first-rate border plant. The flowers, ranging in colour from white to every shade of lavender, violet and purple, are not so numerous as those of *M. didyma* and less commonly produced in tiers. *M. didyma*, sometimes called Oswego Tea because the inhabitants of that part of North America used to make a tea of the leaves, has handsome flower heads borne in tiers and the colours vary from the richest scarlet to purple, lavender and white. Cambridge Scarlet is one of the best forms, and Mrs. Perry is perhaps even more effective. The purple forms figure under different names, *M. d. violacea superba*, *M. d. purpurea*, *Parma*, &c. The white variety is a most attractive plant. The pink variety is an elusive treasure. I have a real rose pink form with no trace of lavender in its colour, and it associates delightfully with mauve kinds. *M. didyma* and its varieties flower earlier than the other Bergamots. *M. magnifica* has rather rich salmon scarlet flowers.

M. citriodora is seldom listed. I noticed a clump of it in the border at Wisley last time I was there. The leaves have a flavour suggestive of lemon and pepper combined, and it makes a pleasant aromatic tea. *M. Russelliana* I have not seen for many years. The flowers are not so large as those of the species mentioned above, and they are tinted and veined with purple. The leaves are larger and unlike any other Monardas, the stems are rounded.

Bergamots are charmingly decorative grown in big masses either in the border or the herb garden. In my herb garden I associate them with clumps of the pink-flowered Hyssop, also with Horehound, which, with its whorls of white flowers and twisted stems flung in all directions, makes a good contrast to the brilliant colouring and upright growth of the Bergamots. The rather rare upright Pennyroyal, which grows about 2ft. high and has dainty whorls of mauve flowers, comes in the same group. The Bergamots also go well with Lavenders and with *Nepeta grandiflora*, which is I think the finest of all the Nepetas. This Nepeta grows nearly 4ft. high when well established, and the clouds of lavender-blue flowers make the perfect foil for any of the Bergamots, especially the scarlet *M. didyma*.

All the Bergamots do best in a rich moist soil, for they are closely related to the Mints. But they are accommodating and do well even in sandy soil, provided it is enriched with a little humus. On dry soils they should not be planted in full sun. Even in moist soil they last longer in flower and produce more tiers of flowers if planted in part shade. On very poor soils they produce miserable stunted growths and small flowers and are apt to die out in a long spell of drought.

The Bergamots are easily increased by division, and the outer parts can be taken off the plants at almost any time. Raising them from seed is not so easy. Possibly this accounts for the fact that seed is not offered in the leading catalogues. The seed is slow in germinating, and, in my experience, often takes two months. It is best to sow in shade, in drills ¼in. deep, and the seedlings should be pricked out in part shade as soon as they are large enough to handle. The following spring they can be put in their permanent positions.

OBEDIENCE CLASSES FOR DOGS

ONE of the greatest attractions to the public at any dog show which is held to-day is sure to be the ring where the Obedience Classes are being judged. Here onlookers will be crowded together, shoulder to shoulder, watching dogs of various breeds doing exercises designed to test their obedience. The watcher who possesses a logical and inquiring mind, together with an interest in canine matters, is bound to ask himself whether these tests are of any real use to the dog or his owner. Like most questions, it has two sides, and needs consideration.

Before summing up and giving judgment it is as well to know something of the history and evolution of these tests. It is to lovers of Alsatians, now becoming better known as shepherd dogs, that we are indebted to for originating a plan whereby the intelligence of the breed could be seen and appreciated by the general public.

A series of graded exercises based on the usual preliminary training of these dogs were arranged and performed by Alsatians at some of the larger shows and gained instant public attention. At that time there was no thought that these exercises were to be the end all of a dog's education; they were only practical adaptations for competitive purposes, of the preliminary training of a dog intended to work in a far larger sphere. Not unnaturally, the owners and admirers of other breeds could not let it be assumed that their favourites were not as clever or sagacious as Alsatians, and before long poodles, Shetland sheepdogs, Corgis, Rottweilers and even Papillons, together with various other breeds, had all joined in, and performed the allotted tasks extremely well, and obedience training, without the wider view that it was only a preliminary step to a wider education, became an accepted side-line amongst the dog-showing enthusiasts.

The interest involved in training dogs for obedience work undoubtedly gave dog breeders and dog lovers a new and valuable interest. It was no longer sufficient to breed entirely for outward beauty; intellectual power became a necessary adjunct to other points that go to make up the prospective prize-winner.

It is admirable that a dog should be obedient, walking at heel both on and off the lead, lying down when he is told, staying in one place on command and able to do a little elementary retrieving and scent discrimination. It is not too much to say that almost every dog should be able to do these things if he is to be a satisfactory companion and if, by watching the tests at shows, members of the general public are going to be awakened to the latent capabilities of their own dogs then the value of the obedience classes is more than half-way to being proved.

So far so good, and these points alone weigh the scales heavily in favour of obedience classes and the encouragement of them in every way, but the constant onlooker may begin to think further and wonder whether the very excellence of the work done in these classes is not defeating its own ends. At show after show the tests done are exactly similar until the routine comes to resemble a drill. Since dogs are not machines one may perform well one day and badly the next, but what is expected and hoped of him is that he will do exactly the same thing in the same way every time he appears in the ring.

The exercises were originally planned to be elementary obedience lessons capable of being put to practical use in ordinary daily life but they have developed a trimming of red tape, and undue importance is attached to, and marks are given for, details of execution that have no bearing on obedience. So far has this gone that when a dog or his handler makes a mistake and the dog, by the use of his intelligence, rectifies the matter for all practical purposes, the judge is apt to knock off marks.

This narrowing of the issue, and the insistence on obedience rather than intelligence, is a very real danger. Surely it would be of far greater benefit to the dogs, and far more interesting and amusing to the spectators, if there were a number of set tests covering a certain number of possibilities likely to arise in the daily life of the dog and his owner. The pair could then enter the ring and deal with the contingencies in the way that seemed best to their combined intelligences. Certain practical conventions should be retained, such as the dog invariably walking on his master's left-hand side so as to leave his right hand free, but insistence on petty conventions such as unnecessary "sitting" on the part of the dog and standing to attention on the part of the handler could well be done away with.

S. M. LAMPSON.

Some Principles of Gate Design

By RICHARD SUDELL

ALTHOUGH the craft of the smith is one of the most ancient in the world, we do not find any records of the use of wrought iron garden gates and grilles in general use in England until the latter part of the seventeenth century (although great use of this material had been made on the Continent for some time before). It was not until the constructing of the wrought iron gates, &c., at the Hampton Court Palace that the craft became firmly established in this country, and it was from this period up to the end of the eighteenth century that some of the finest examples of English work were carried out.

The style of gate developed in this country was very different from the intricate and, one might almost say, florid work turned out by the Italian and French craftsmen. For instance, the ornament was confined to the top, or pediment, and the side panels, while the centre portion of the gate was filled with vertical square section bars, making the whole rather severe, but giving a great dignity to the arch or pillars in which it was set.

Wrought iron for garden fences has not of recent years received its just recognition, partly no doubt on account of the initial expense involved, but, where finances will allow, it is the best material for this class of work, adding enormously to the appearance and dignity of the house.

In the best periods of English garden design wrought iron work was held to be almost essential to its highest development and should it be decided to utilise this material the soundest advice to offer would be to keep the fence as simple and strong as possible, with the ornamental emphasis seldom occurring, and concentrated at special points to pronounce main lines of the composition. This result is obtained by reserving the ornament for the pilasters and gates.

Writing of the necessity for keeping the design of the fence simple and strong, reminds me of a point which I cannot over-emphasise regarding the construction of the pillars or walls upon which the garden gates are to be hung. Although I have seen many excellent examples of timber pillars used for this purpose, it has always seemed to me that the material is not quite suitable for this class of work, owing to its rather soft, one might almost say, weak, appearance. I think this is mainly due to the difficulty of obtaining large baulks for carrying the heavy gates; I am referring, of course, at the moment to the double swing type of gates generally used at drive entrances.

Ideal gate pillars are built of brick or stone, or a combination of the two; this not only gives solidity, but provides a challenge to the architect to show his skill in design. The pillars should reflect, as far as possible, both the character and period of the house with which they are connected; but one should take care that the balance between the two is well maintained.

In designing a gate of this type, one should remember to repeat, as far as possible, the main lines of the pillars; the repetition will give a pleasing sense of uniformity. For instance, on the pillar generally seen in a house of the Elizabethan period the ornament is usually confined to the base and cap and therefore when choosing a gate suitable for it particular care should be taken. The centre should be free from any distracting curves or scroll work, these being only on the pediment and bottom of the gate, and the central portion should be filled with straight vertical bars in which there could be set the name of the residence, or even, in some cases, the armorial bearings.

More complicated designs of hand-wrought scrolls are seen at their best when combined with brick pillars as this material lacks the severity of mason-wrought stone. I would, however, point out at this juncture, that all scroll work should be carried out in rather lighter material than that previously described, otherwise the whole work tends to look clumsy.

A type of drive entrance which, I am glad to say, now appears to be dying out, is the double swing lodge gates. These were so built because of a mistaken and slavish following of the principles of symmetry and love of grandeur. As far back as the beginning of the nineteenth century a famous landscape architect, Humphrey Repton, was campaigning against their construction, and the objections which he raised then apply with even more force to-day, when the living conditions of the world are more balanced.

Walls are sometimes pierced, not only for gates, but for windows. Such a feature is known as the "clairvoyie," and is covered with a wrought iron grill or similar work. Its purpose is to give the passer-by a glimpse of the garden, or alternatively from within to give a view of what is happening outside. In England it tends to make draughts in what might otherwise be considered a sheltered area and to counteract this, I would suggest that a plain movable wooden shutter be fixed.

There are, of course, an infinite variety of shapes that one can use for these openings, and, as a matter of fact, I am at present constructing an oval gateway in a garden in Sussex, which can be revolved on a central pivot. I have also built, on another occasion, a circular gate of about 6ft. in diameter, filling the opening in a brick-built European version of the Chinese Moon Gate.

The garden gateway and gate really merit a little extravagance that redounds to the credit of the whole enclosure; if any extravagance is to be indulged in, let it be there. Above all things, do see that the gate piers are firmly founded and built, and massive enough to stay plumb and straight, so that the gate will not sag after a few years.

THE PERSONAL TOUCH

HOW frequently does misunderstanding arise between a landowner and his tenant which is usually avoidable and which is almost always based on ignorance of one another's point of view. It is the duty of the land agent to smooth out these difficulties, and as far as possible to anticipate them.

Some little discourtesy is resented by the tenant. A keeper is untactful, or maybe the owner is seen in the vicinity and does not call to pass the time of day, or maybe after a successful shoot the present is a brace of rabbits instead of pheasants. Some real or fancied slight, because tenants set a great store upon the little acts of courtesy and kindness of the owner. An agent should be able to set such matters right.

On the other hand, other fancied slights may follow, the tenant now being in the mood to take offence easily, and the goodwill that should exist between landlord and tenant is destroyed. The tenant commences to see in what way he can return the compliment, and the owner receives demands for repairs, or the sanitary inspector mysteriously becomes active in connection with cottages. Other disagreements follow and an ultimate rift becomes inevitable.

Directly it is apparent that a tenant feels aggrieved it is imperative that the owner in his own interest should call and see him, or at least arrange for his agent to do so. And the tenant must receive the impression, the correct impression, that the owner is genuinely interested in his welfare.

An owner whose time is fully occupied should see that dealings with his tenants are conducted by someone with knowledge of the countryside and of the management of estates, and not by his, in many respects, most estimable private secretary.

A small example of misunderstanding arose recently. A tenant rented the home farm. The owner had some hunters, ten of them, and failing to appreciate that when a farm is let to a tenant at a rent he is entitled to possession without interference, turned out his hunters in the nearest paddock without a word to the tenant. In that paddock at the time were some in-calf heifers, which the horses chased about, fortunately without harm. An ugly situation was averted by a tactful agent, but only after the owner had nearly precipitated a breach by stating his intention of doing what he liked with his own land. R. D.

The NEW

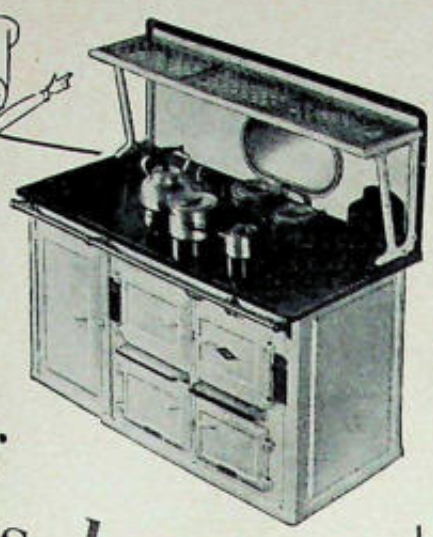
KODAK FILMS

for 35mm. CAMERAS

These new Kodak films supply two of the chief needs of miniature camera owners: more speed, with no loss of fine grain; or finer grain with no loss of speed. Price of each film: 36-exposure cassette, 3/6.

Kodak PLUS-X	About double the speed of Kodak's famous 'Panatomic,' yet the grain is even finer. Panchromatic. Non-halation. Suggests itself as the future all-purpose film for 35mm. cameras.
Kodak PANATOMIC-X	An emulsion of the finest possible grain — considerably finer even than 'Panatomic.' For big enlargements of remarkable brilliance with no appreciable graininess, many times the original negative size. Speed at least equal to 'Panatomic.'
Kodak SUPER-XX	Fastest of all Kodak films — about four times as fast as 'Panatomic.' Has finer grain than any other film of comparable speed. With a high-speed lens, it is unequalled for action shots or indoor pictures in otherwise almost hopeless lighting conditions.

Besides these, there are five other Kodak 35mm. films: 'Panatomic,' Super Sensitive Panchromatic, Super-X, E.F. (fine grain), and 'Kodachrome' for grainless colour. Ask your Kodak Dealer for detailed information on all Kodak 35mm. films, or write to Mr. F. Taylor, Dept. 57, Kodak House, Kingsway, London, W.C.2.



An ESSE Cooker provides better cooking at much less cost

ESSE Heat Storage Cookers are noted for the improvement of delicate flavours in food cooked, great fuel economy and continuous service—instantly ready night and day. There is an ESSE for every size of household. Catalogues will be gladly sent on request. Favourable hire purchase terms are available.

"The Joys of Man"

by

Sir

HUGH WALPOLE

Here is Sir Hugh Walpole at his best, on a subject in which his insight is matched only by his personal delight.

"I came to cigars rather late in life — that is, for many years I smoked them because I thought that I ought to, rather than because I wanted to. Now I'm old enough to know that there's no obligation. If you smoke a Havana cigar it's because you like to smoke a Havana cigar. All day? No—But at the right hour, slowly, delicately, and with full realisation of the wonderful peace and goodwill that their flavour and richness give me.

One of the reasons that I hope I may live long is that I may enjoy again and again, the peace, the sense of security, the receptiveness that smoking a Havana cigar quietly, selfishly, gives me."

Issued by the Cuban Government to further the smoking of

WHITE-FISH MEAL

A Food of Growing Importance

IN these days of apprehension when great nations resort almost to the point of actual force with all its resultant horrors, it is pleasing to record one of the few bright features which emanated from the Great War. Again necessity became the mother of invention, for export difficulties, allied with a shortage of foodstuffs, transformed what had been just a means of getting rid of 200,000 tons of surplus white-fish waste into the development of the thriving fish meal industry of to-day.

Prior to the years 1912–13 this valuable residue had been mostly exported to Germany, Japan and to the United States for use as a fertiliser, though a little had been sold in the home counties as fish guano. But Germany has a very large pig population, and experiments were carried out in that country and Norway which proved the possibilities of producing a meal eminently satisfactory for pig fattening and bone formation. The traditional conservatism of the British farmer, however, did little to assist the sale of white-fish meal for his cattle, pigs and poultry, and the pioneers of the industry found the corn merchants equally nonchalant. It was not until the real scarcity and heavy cost of foodstuffs became apparent that any headway was made by the manufacturers of this new product which has proved so invaluable to stock-raisers. To-day the home consumption of white-fish meal alone has reached the record figure of 65,000 tons annually, and thanks to lengthy experiments and vastly improved factory methods the industry provides a high-grade flesh- and bone-forming meal suitable for all classes of stock.

The daily landings from our extensive and ever-generous fishing grounds are disposed of by the wholesalers on the dockside inside three hours, though little more than 30 per cent. is despatched the same day to the shops, restaurants and fish friers for human consumption, as the operation of "heading" and filleting accounts for the remainder. Thus fully half of the merchants' purchases on the market is packed into barrels and speedily transported to the fish meal factories, along with any surplus white-fish which has not been disposed of at the morning's auction. For convenience these modern factories are usually located on or near the dockside, for the raw material must be fresh, and then the work of processing into white-fish meal commences, and when supplies are plentiful the factories are kept working day and night to avoid accumulation. Meal bagged and ready for dispatch is often from that day's landings, so ingenious and elaborate is the machinery employed during the process of conversion.

Only those who have watched the speedy transformation of this white-fish surplus could recognise the fine, medium or coarse brown meal available in bags ready for transport two-and-a-half hours later, yet this is a daily routine made possible by the most modern mechanical plant. A brief description of the method of converting white-fish waste into white-fish meal is helpful to gain an insight into the nature of this feeding product.

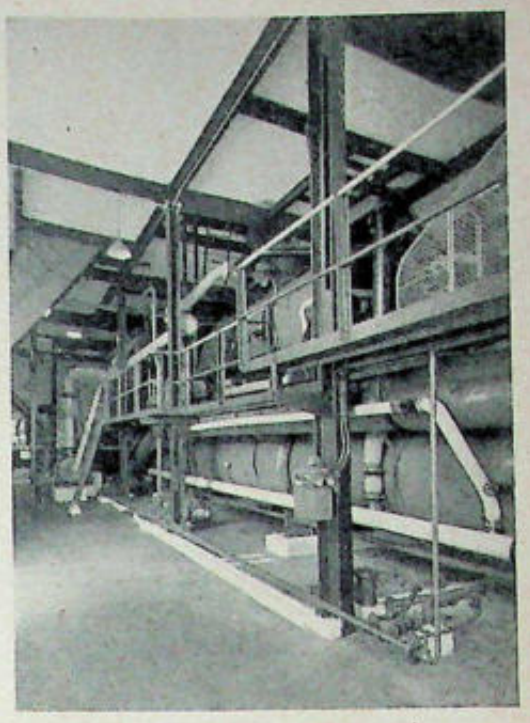
The first operation is to turn the raw material into a pulp. This is done by rotary, steel-toothed rollers resembling a series of circular saws. These fulfil a somewhat similar function to the human teeth, breaking up the fish so that the digestive processes can function uniformly.

The "hacker," as it is called, chops the fish into pieces, pulverises the pieces, and passes the pulp to other machines. The material then goes into the sterilising chamber for a period of 15 or 20 minutes and afterwards drops into conveyers which carry it into the drying cylinders.

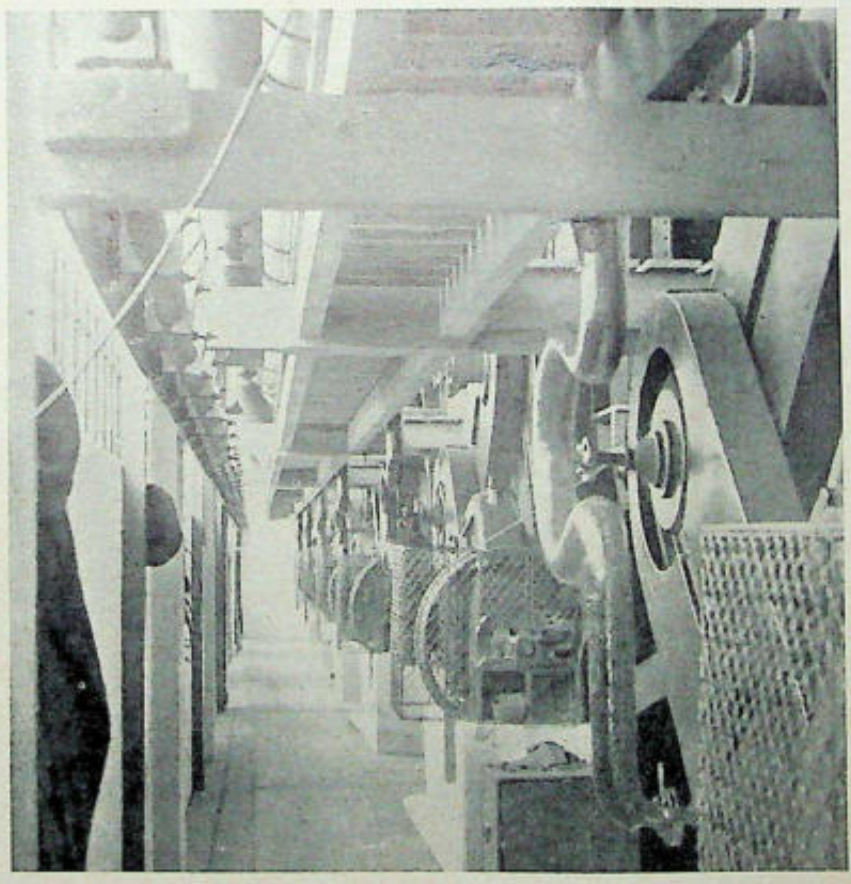
Fish consists of 75 to 80 per cent. of water, and it is necessary to reduce this to about 10 per cent. For this purpose there are huge steam-heated cylinders, placed deck above deck. Carried to the top deck, the material is passed through a succession of cylinders from deck to deck which deprives it of moisture. This journey normally takes two-and-a-half hours, though some machines which incorporate a vacuum principle still further reduce the time, the material finally emerging as an uneven yellowish-brown meal.

After passing over powerful electro-magnets which extract any fish-hooks that may have been embedded in the raw fish, the meal travels into grinding mills and thence to the dressing machines, where it is graded by passing through appropriate wire meshes to suit customers' requirements, *i.e.*, into fine, medium or coarse. From the dressing machines the meal gravitates to the automatic bagging and weighing machines and is ready for despatch to all parts of the British Isles.

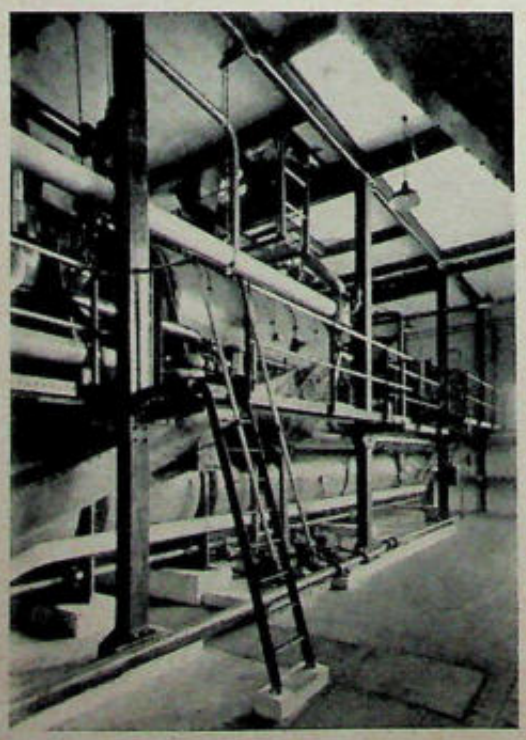
By the latest processes this transformation is achieved by one continuous mechanical operation without the material being once touched by hand.



FISH MEAL DRIERS



"FISH CONSISTS OF 75 TO 80 PER CENT. OF WATER, AND IT IS NECESSARY TO REDUCE THIS TO ABOUT 10 PER CENT."



A VIEW OF A FISH MEAL DRYING PLANT

Prepared by these methods, white-fish meal has a light yellowish-brown colour and a characteristic smell, slightly fishy, but somewhat pleasant and appetising. White-fish meal is now used extensively in balanced rations without any fear of producing fishy taint in the flesh of livestock. If stored in a dry, cool place it will keep indefinitely and for many years has proved most beneficial to cattle, pigs and poultry.

Factories at Aberdeen, Glasgow, North Shields, Hartlepool, Leeds, Hull, Grimsby, Warrington, London, Milford Haven and other towns employ large numbers of workers, and the home consumption is increasing annually. The following figures give some idea of the consistent advancement the industry has made:

	1933–34	1934–35	1935–36	1936–37
Tons ..	41,000	51,000	57,000	64,000

The present year shows a further substantial increase, but it is realised there is a much larger potential market for this valuable product.

The question naturally arises as to whether the use of white-fish meal is economical. To obtain an insight into this matter it may be compared from this standpoint with certain other protein-rich foods. The comparison must be based on a consideration of protein and mineral content, since white-fish meal is used specifically to supply these constituents. It can be shown that 1 ton of white-fish meal contains as much digestible protein and minerals as 2¼ tons of linseed cake supplemented with about 2cwt. of lime phosphate. Obviously, white-fish meal is a somewhat cheaper source than linseed cake of digestible protein (but not, of course, of starch equivalent).

For pig-feeding, however, a fairer comparison would be with extracted soya-bean meal, since the latter, when supplemented with minerals, is probably the best feeding stuff of vegetable origin for use as a substitute for white-fish meal in pig rations. One ton of white-fish meal contains as much protein and minerals as 1⅞ tons of extracted soya-bean meal plus about 2½cwt. of lime phosphate.

It is a tribute to the worth of white-fish meal as a food for livestock that many of the shrewdest and most successful stock-raisers continue, in all circumstances, to use this feeding stuff in the rations of their livestock, and that the standard ration prescribed by the Minister of Agriculture under the Bacon Industry Act for the new pig contract includes 10 per cent. of white-fish meal.

In the current Journal of the Ministry of Agriculture, Mr. S. J. Wright contributes some reflections on the present meaning of the word "mechanisation" in modern farming. He points out that the initial farming prejudice against machines has been dissipated by the increasing spectacle of their worth, and only doubts as to future policy and the immediate lack of capital prevents a more widespread use. Mr. Wright points out some of the facts which have prevented a universal adoption of machines. Among these are holdings which are too small, and those intersected by unnegotiable roads and hedges. We take the view that the adoption of machinery on English farms will be very much accelerated by a wiser view of taxation. Many tractors are taxed although they may simply cross a road occasionally and hardly ever proceed along it. The present state of legislation, too, is hardly encouraging for young boys leaving school to take up tractor driving. There can be no doubt that practical demonstrations and lectures on engineering should become a regular feature.

"I stopped experimenting . . .

"In my younger days I've been offered liqueur brandy in impressive looking bottles, dim with the dust of decades. Alas! Often enough, the only thing 'impressive' turned out to be the price. I stopped experimenting when I found this Hennessy "XO." The bottle may look modest; but believe me the liqueur brandy it contains comes from a very venerable cask. Age alone is *something*; but in Hennessy "XO" age is beautifully balanced with body and bouquet—and that is *everything*."

It's the age in the cask that counts . . . . .

DORLAND

A message from Britain's leading WHITE-FISH MEAL MANUFACTURERS

Over 20 years of use have proved the value of home-produced White-Fish Meal. It is the finest, most easily digestible concentrate for bone and body building in all farm stock. Its mineral and protein content is uniformly high . . . its oil content uniformly low. Inferior substitutes, which have only low price to commend them, have appeared on the market, and to protect farmers against these, British manufacturers are co-operating to offer assistance and advice to all stock-feeding problems and to make it easy for buyers to identify GENUINE home-produced White-Fish Meal.

There are a dozen good brands . . . your merchant can supply, or write to the Association who will be pleased to assist you in solving your feeding problems.

"SABLE-VESTED NIGHT"

Driving Between Sunset and Morning

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

FROM my early motoring days I recall an "old-hand" saying as he left his country retreat in brilliant sunshine: "We must see the lights of London before dusk." In those days of fitful oil lamps and almost non-existent road lighting, this was a wise enough precaution, and even now, with our advanced car equipment and improved street illumination, it serves to illustrate the vast difference between day and night driving.

Despite modern refinements, I still regard driving from sunset onwards as a whole-time job, requiring every atom of a motorist's concentration. According to some American records for 1937 which I have before me, over 60 per cent. of the traffic deaths in that country occurred during the hours of darkness when normally there is less than half as much traffic as in daytime. From such statistics it is not possible to discover to what causes the major proportion of these fatalities are attributable, but the amazingly high incidence of night accidents does point unhesitatingly to the increased danger factor.

There are so many more difficulties to contend with at night-time, especially during wet weather, which should be borne in mind, and which necessitate the adoption of quite a different technique from driving by day.

First of all, the range of visibility is lowered so that the power of observation must become more acute in order to compensate for this loss of vision. In this the headlights of approaching vehicles play a most important part. They reveal twists and sudden bends in the highway, and also serve to silhouette objects on the highway because these interrupt the beams of light shining towards the driver from the opposite direction. Hill crests are revealed, as are narrow bridges and road junctions.

Oncoming headlights should be watched—but only up to a certain distance. Here I must sound a warning. It is a mistake to look into the headlights coming towards your car when they are fairly close. It is imperative when two cars pass at night for both drivers to slacken speed and to watch the nearside kerb or pavement intently. There are two major reasons for this practice, the first being that it reduces the intensity and amount of light which enters the eye, consequently allowing more time for readjustment to the comparative dimness when the cars have passed, and the second that by keeping to the near side all risk of collision is obviated, although the danger of overtaking cyclists is ever present.

Obviously it is not possible to lay down a hard-and-fast rule for the distances at which the entire attention should be focused on the edge of the road, because of the variation of individual requirements and the speed of both vehicles at the time—but experience is the best teacher.

Some drivers believe that unless they watch an oncoming car it will not be possible to avert a collision, because they will not know where the other car is and where to steer in order to avoid it. But in the words of one expert:

"When two drivers are approaching each other, each looking into the other's lights and not watching the edge of the road, it is a matter of the blind leading the blind. Neither knows just where he is going. The only thing that each knows is that he is not striking the other driver."

I believe the phrase "blind leading the blind" meets the case admirably, and endorse it unreservedly, especially when it is remembered that, if and when the passing has been negotiated successfully, each driver will emerge from the brilliant glare into unrelieved darkness in which his own headlights will be temporarily ineffective until vision returns to normal. During that "blind" period—which may only be a matter of split seconds—the worst can happen, danger being more pronounced when speed is high.

Overtaking at night is a hazardous business which demands the exercise of extreme caution. Personally, I always give myself an ample margin of safety before attempting the manœuvre, no matter what car I am driving and how efficient its electrical equipment. I bear in mind that the other fellow is an unknown quantity and may do something inexplicable, while the road ahead is always liable to undergo a rapid and disconcerting change—particularly in this country. The loss of a few seconds for safety's sake is a good investment.

Speed is, of course, a vital consideration, and must be varied according to conditions prevailing. Along one or two of our newer trunk roads lighting systems have been installed which permit sustained high speed, but, unfortunately, such stretches of road are all too rare. Curves call for a degree of deceleration far greater than that which is normal in daytime, as do bends, crossings and bridges.

Built-up areas offer new obstacles at night because they are, in the main, poorly illuminated, and shop signs are apt to be confused with traffic signals. Belisha beacons are rarely visible and pedestrians far more difficult to discern than in the daytime, owing to the decreased surface detail which is visible. Two-thirds of our accidents occur in the built-up areas, so there is every reason to proceed with care, especially late at night, when recourse to the horn is prohibited by law.

Much has already been written concerning dipping and dimming of headlights so that it is hardly necessary for me to dilate on this theme. I cannot, however, too strongly urge courtesy to other road users in the interests of general safety.

During recent years the research conducted by electrical experts has shorn many hazards from night driving. The standard of equipment for lighting is an exceedingly high one, and even the cheapest car has an effective and well-designed system. The best advantage is not always taken of this, for motorists are notoriously careless about correct focusing to give maximum visibility and general efficiency. New alignment and refocusing can be carried out at home, but for the sake of a few shillings I would advise that a good service station should be delegated to do the work, and periodically to check over the wiring and bulbs. A stitch in time in this direction can save all sorts of tiresome delays through minor breakdowns, and save anxiety over lighting failure.

All things considered, motor-car bulbs have a very rough passage, subjected as they are to excessive vibration and the effects of bad weather. As compared with the ordinary domestic lamps, motor-car bulbs seem to enjoy a charmed existence. They must retire from service sooner or later, and I advocate a thorough inspection every few months, particularly during the winter. A nasty situation would arise if, for example, the headlamps both failed when one is travelling at fairly high speed even if the road is reasonably straight and clear.

I notice that there is a marked tendency now to have passlights fitted, and believe the day will come when these are included in the standard equipment of all cars. They are now being produced by the reputable manufacturers and are inexpensive, besides being simple to fit to any existing electrical system. I recommend the passlight most heartily because not only does its adoption simplify night driving, but also makes for increased safety. The special low beam does not inconvenience other road users.

Dazzle still represents a problem sufficient to cause electrical illumination specialists a great deal of difficulty, but I know they do not regard its elimination as an insuperable task. The past five years have seen much improvement, and it is my opinion that patient research will ultimately yield a non-dazzle, penetrating beam with long range. This, allied with kerb-side reflectors, light-coloured road surfaces, and intelligent road illumination, will do much to effect a worthwhile reduction in the number of night accidents and relieve the motorist of excessive strain.

THE MAIA FOAMING ITS WAY ACROSS SOUTHAMPTON WATER PRIOR TO THE TAKE-OFF

THE AIR CONQUEST OF DISTANCE

Mercury's Great Flight and its Significance

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

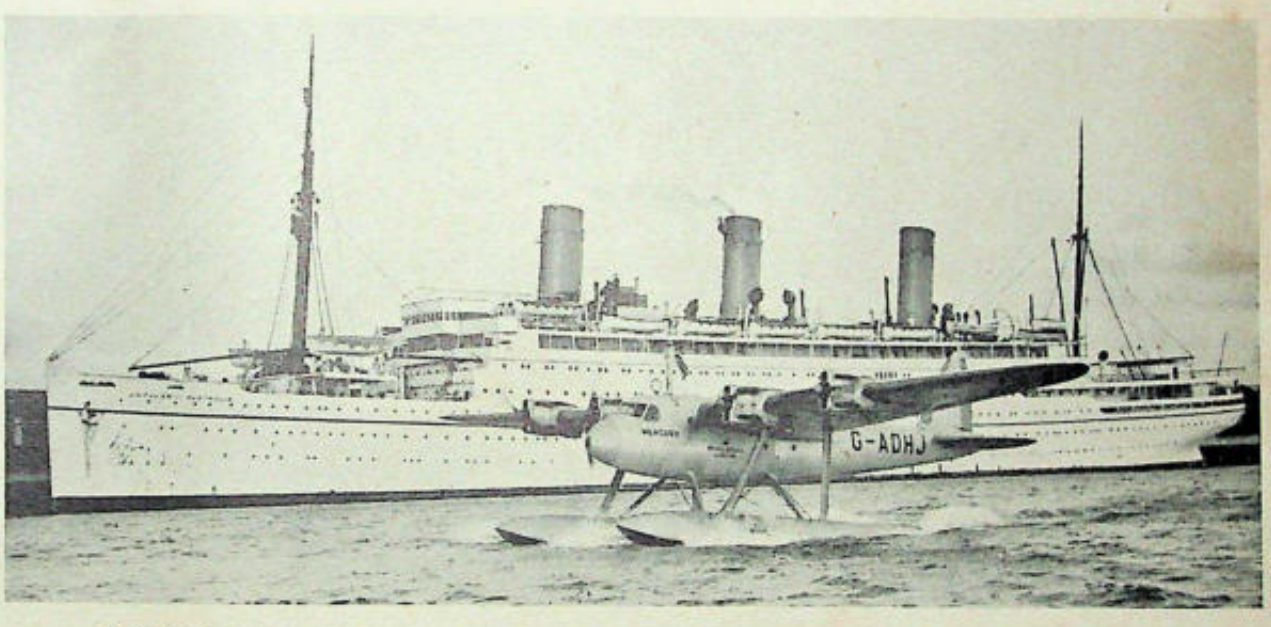
THOUGH Mercury failed to establish a new absolute distance record on her recent flight to South Africa, there can be no doubt that her performance was one of the most outstanding in recent aviation history. The distance covered was 6,045 miles, which falls short of what was the world's record, held by Russia, by only 260 miles, though it surpassed the previous seaplane record standing to the credit of Germany by the handsome margin of 825 miles. With better luck and more favourable conditions, the absolute record seems to be well within her capacity.

The flight has, however, an importance considerably greater than the mere making and breaking of records. It has given a most convincing demonstration of the practicability of the composite system of launching and has shown strikingly how long-range non-stop flight is gradually coming within the realm of everyday commercial aeronautics.

Of this, there could be no more telling demonstration than a comparison between the outward and homeward flights of Mercury. When launched from the lower component Maia, she was able to travel more than 6,000 miles non-stop. Forced to take off under her own power, she had to fly back by short, easy stages. The return journey occupied close on a week, as against 42 hours 6 minutes for the non-stop journey.

The point that this comparison emphasises is that the introduction of ever-increasing non-stop stages is of vital importance to commercial flying, if overall journey times are to be reduced to the periods that contemporary high-speed aircraft make possible. Practically this reduces very largely to the problem of take-off. The ability of modern engines to operate reliably for extended times has been abundantly proved, and the aircraft of to-day has grown large enough to make passenger comfort possible on long journeys. For mails, of course, the range of machines could be increased to the maximum, provided that proper arrangements are afforded for relief crew.

Mercury's flight, then, may be taken as a significant index of the progress towards solving the take-off problem. The launch, at a height of 4,700ft., was made with a greater all-up weight than any previously made under working conditions—the actual all-up weight being 27,500lb., as compared with 20,800lb. on the Atlantic flights. The ease with which the separation was made proves conclusively that the Mayo composite system is an important contribution to getting machines into the air with a considerable overload.



MERCURY LANDING ALONGSIDE THE EMPRESS OF AUSTRALIA, AT SOUTHAMPTON, AT THE END OF HER RETURN FLIGHT FROM THE CAPE

THE COMPONENTS OF THE MAYO LANDING TOGETHER ON THE CALM WATERS OF THE MEDWAY AFTER ONE OF THEIR EARLY FLIGHTS

The present upper component is, of course, a relatively small seaplane, with no passenger accommodation and only limited space for mails when the maximum petrol load is on board. The next step must be to explore the possibility of launching larger types by this method. If it proves possible to adopt the system for extra large machines, non-stop flights of very long duration should become practicable and the aeroplane given a range that, a few years ago, would have seemed possible only to the airship.

It is only natural that this flight should again have brought into prominence the whole problem of assisted take-off, and, though the subject has been discussed here before, it is worth while briefly to touch on the chief points again.

The method of catapult launching, which has proved so useful on the German South Atlantic service, is not truly comparable to the Mayo method. In the former the machine is merely accelerated into the air, and the dangers and difficulties of gaining a safe height with a fully-loaded machine remain. The machine is not so much assisted to safe flying conditions as propelled into the air. Practically the only gain is that the length of take-off run is reduced.

Refuelling in the air is, in fact, the most potential alternative to the Mayo system so far available. In this method, of course, the machine, lightly loaded, ascends to the desired height and there takes on her full load of fuel from another aeroplane. Imperial Airways have been experimenting with this system, though comparatively little has been heard of the results of the tests.

It has been argued that the composite system's chief drawback is that the upper component cannot utilise its long-range capacity unless a properly designed lower component is available, and that this means the provision of a large and expensive fleet of auxiliaries.

This disadvantage is shared with the refuelling method, but it would appear that the composite method scores. The lower components of the Mayo design are, except for the launching gear, normal commercial aircraft, and might be used for normal service work when not employed in separation duties. Thus the provision of these machines at chosen bases on the air routes stands some chance at least of being economic.

On the other hand, the fuelling aircraft—or "flying tanker," as it has been called—is a specialised machine that could hardly be employed on any duties but refuelling in the air and would, therefore, be forced to stand idle when not so engaged. This seems to be a point of some importance, assuming the merits of the two systems, from the launching point of view, to be approximately equal.

Whether this is so can, of course, only be established by practical experience. Data on fuelling in the air, as applied to commercial flying, are so far comparatively scanty. On the face of it, however, a slight advantage would appear to lie with the composite system, not only for the reason just mentioned, but on a time basis. The composite aircraft goes into the air with the upper component ready for her flight; there is no delay when height has been gained. Fuelling must necessarily take some little time during which the two machines must cruise in company. This is an aspect that actual experiment and experience must illumine more fully.

In the meantime, Mercury's flight is a very heartening development, and lends new interest to the construction of the promised landplane version and the further tests in prospect. It brings us one step nearer non-stop long-distance commercial flying by heavier-than-air machines.

VANISHING GAME OF THE CAPE

"Vaal Rhebok—One of the Dreams Accomplished"

I HAD been keeping a weather eye open for news of Vaal rhebok for the last ten years, and had had two or three blank hunts up in the north (O.F.S. and Transvaal), so this year I made them my true objective. Inquiries convinced me that Cape Province was the best locality. They are unknown north of the Vaal River, and in the few places in which they occur outside the Cape they are rightly strictly preserved.

In my own heart I had written down Vaal rhebok as one of the almost extinct survivors of the past, soon to share the fate of quagga and bontebok. I am glad to be able to refute this theory entirely.

We started investigations in the Cape Peninsula in early January, 1938. I had an old acquaintance in the Director of the Cape Town Museum, who, knowing my aspirations to complete a museum collection, was good enough to promise his help. But before I applied for permission to shoot Royal game (as Vaal rhebok are) out of season I meant to know more about them. I am a keen collector, but I will not shoot a farmyard sheep inside a wire fence.

I have several friends among the farmers of the Cape, and invitations to visit their farms and to stalk and photograph their rhebok came in thick and fast. Hospitality to strangers is one of the salient qualities of the Union of South Africa, and, Dutch or English, I found my hosts of the best. But there was no question yet of shooting. On each farm of several thousand morgen I found one or two herds of rhebok, averaging about five beasts in number, very wild and strictly guarded.

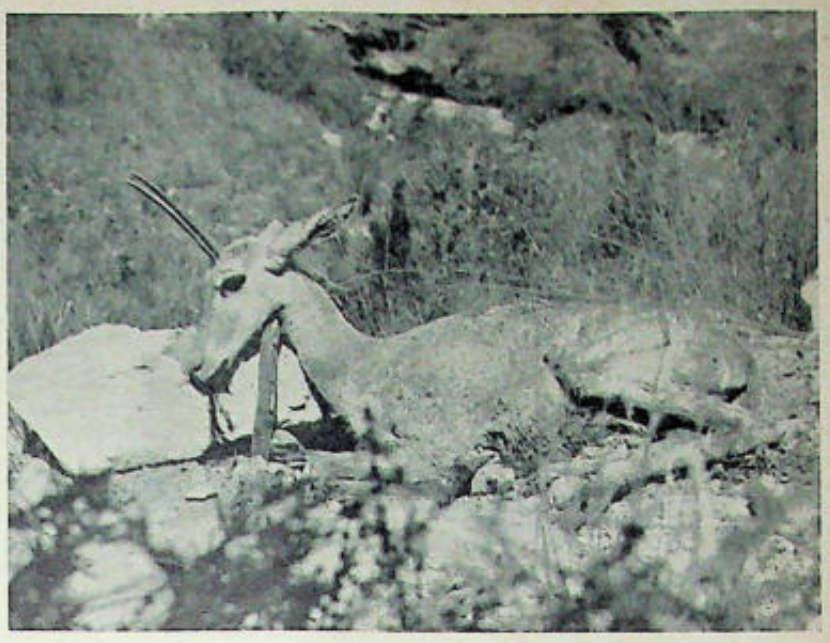
They would have been very difficult to shoot in their dull surroundings—a low kopje or two set in fenced acres of cultivation. At 500yds. I could see no outstanding rams. I got my first photos of a cleverly driven herd at 100yds. Very poor results.

Then I heard rumours of rhebok near Cape Point—the very toe of the Peninsula—and we sighted our first herd of rhebok at our first cast on Smith's farm within sight of Lighthouse Hill. Smith was agreeable, and in a day's jaunt a week later we counted six or seven herds, numbering 27 beasts, scarcely having to leave our car, between Scarborough Settlement and Smith's farm. At a rough and ready estimate I would put the rhebok inhabitants of Cape Point at at least a hundred head. Even the authorities were amazed; they had estimated them at a weak herd of twelve, survivors of thirty.

From a casual seat in a motor car we sighted one herd of Vaal rhebok in the stony hills behind Sir Lowrie's Pass above the Reservoir and another herd of five later by the roadside between Swellendam and Heidelberg. The latter is a fine strip of game country and well worth further investigation.

We reached George—300 miles north-east of Cape Town—in early February. I have no space for rustic eulogy, but George deserves its fame.

Inquiries met dead-end after dead-end; it is amazing how few among the actual inhabitants knew what a rhebok is. The Director of Forests in George proved the god out of the machine. Vaal rhebok? Of course, numbers of them on the Reserve. I could go and look at them and welcome. Strictly preserved, of course, the very apple of his eye, and so likewise of his wardens. But enthusiasm is catching; you would share your last shirt with the man who is really keen. Besides, as I pointed out, I only wanted a really old ram, whose services were no longer of much use to the herd.



"I PICKED AND SHOT THE BEST"

THE VAAL RHEBOK, SHOWING THE COMPARISON OF FAIR LENGTH HORNS TO THE ANIMAL'S PRICKED EARS

ON TREK IN THE BREDASDORP COUNTRY

Surely his head was of more value as a treasure than rotting on the veldt? I could promise him good company; and scoff was cheap, in case I had to sit on the Forest Department doorstep, begging for ever. "Right," said the Director, "one ram, and see to it that he is the patriarch."

We spent one day in the car prospecting 30 miles from George, above the Knysna Road. We counted and stalked six herds that day, between noon and 5 p.m., varying from five to ten beasts, and including one solitary ram, whose horns I was never close enough to judge. My summary was: plenty of rhebok, not too wild but suspicious; at least three days' hunting necessary to bag a good head. I was back two days later, rationed and equipped for four days.

The first day it rained, but the following morning dawned fine and bright. Van der Walt, the local F.O., came along with his mountain pony (in case of a kill), and John, my Cape boy, carried lunch. We were intent on exploring new ground across the sheer ravine of the Diep River, where a circle of low kopjes looked tempting. The crossing was an hour's job of sheer up and down, threading a dense finger of bush in the vale. There was a bite in the air, and we were far enough away from civilisation to feel a thrill. We walked straight on top of a single rhebok ram before we reached the bottom. At 100yds. he looked a fair head, and instead of bolting he merely trickled off in the bush. I refused a shot before I had explored thoroughly. I was already concluding—after many estimates by field glasses—that the test of a good head was by how much his horn tips topped his pricked ears. If they stood out a clear 2in. he was good.

Before we quitted the gorge we had sighted two more herds of five beasts at 500yds. Both held one ram, but nothing exceptional. I stalked one herd and got within 20yds. of them for a photo.

We left the gorge and began to encircle the kopjes group. Shallow, coverless valleys dropped to us one after another, and in almost every valley was a herd of rhebok. They were always 500yds. away, and they always saw us first. To pick up rhebok (27in. at the shoulder) on a stony hillside—before they move—is the hardest job I know. At nearer approach the rhebok did not bolt but just mooched across into the next nullah. We had counted eight herds, all told, before I had picked a head. Even then it was a toss-up, as at 400yds. a ram is hard to distinguish.

We tried a long circular stalk, butted into a herd of fourteen, no good heads, and set the heights into a tumult with rhebok trotting in all directions, and naturally our stalk failed.

We sat down to lunch to rest them. A herd of three rhebok walked on top of us at 50yds., but there was no good head.

At 2.30 we started operations against the low ground, where the nullahs debouched into a tributary of the Diep River. We picked up and disdained one herd of seven a long way off. Van der Walt mounted and did a long scouting chukker. He came back jubilant. A herd of three rhebok in a valley foot a mile away. Let me go down to the river and guard the neks below; John would act as flank stop, and Van der Walt himself would drive down river. The plan, by a fluke, worked right; my stand happened to be perfectly sited and the buck—avoiding sky-lines—walked into the trap.

At 100yds., first one, then two and three rhebok trotted round a corner and halted. I picked and shot the best, 8¼in., but I am almost certain now that it was not our selected herd. Number two was a small ram, number three was a female, while a fourth buck, head unseen, escaped unnoticed far above us. I have a gnawing qualm that we left a 10-incher on those hillsides, too wide awake to wait for the salt for his tail. But it was a good shooting day, and ten hours on the hillsides earned my sleep that night. Besides, were not Vaal rhebok now one of the dreams accomplished?

SWITZERLAND

If you wish to enjoy a real good holiday go to the

GRAND HOTEL VEREINA
Klosters 4000 FEET
GRISONS

FIRST-CLASS, 200 beds. The homelike atmosphere of the house, the select class of people you meet there, the grand ski-ing grounds in the Parsenn district, will render your stay a most pleasant one. En pension rates from sh. 16/- :: Ask for Booklet W.

Twirl the globe. Send Suez spinning gently clock-wise and your gaze will fasten on one of the world's most romantic fields of travel—India . . . Burma . . . Ceylon . . . Malaya . . . Java . . . Bali.

There's a foreignness, a strangeness about them . . . that fathomless mystery of the East . . . the perfect escape from 'every-day' !

Cities that have come through the whirlpool of history unchanged. Scenes in which nature has run riot in lavish mood. Fairy-story temples, towers and minarets . . . fantastic dances . . . weird rituals. Jungles ablaze with every hue . . . exotic flowers . . . strange luscious fruits.

The colour, the tumult, the pungent perfumes of native bazaars . . . where you meet every race, every creed . . . where you can bargain for anything under the sun—from an 'antique' gramophone to a dancing elephant. Yesterday and to-day marching side by side . . . rickshaw and motor car, bullock-cart and tram-car.

A rich motley of life and experience . . . one that will add so much to your treasure-house of memories !

For those who are thinking of sailing East this Winter, Cooks have planned a series of really comprehensive tours.

Here are two examples:

Select Escorted Tour

INDIA - BURMA - CEYLON

Accompanied by an expert.

14½ Weeks .... £392 'All-in'

Leaving London Dec. 23rd.

Inclusive Independent Tour

JAVA and BALI

66 Days from £150. 10. 0. per person 'All-in'

Minimum of three travelling together.

Frequent departures throughout the season.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

IN THE RESTAURANT AT HATCHETT'S

LONDON has many famous and delightful restaurants, and there are none more so than Hatchett's White Horse Cellars in Piccadilly. Founded in 1720—the same year, incidentally, as the "South Sea Bubble"—it soon became one of the most fashionable eating-houses in the Metropolis. Ladies vied with each other for the honour of being the "best-dressed" lady in Hatchett's of an evening. It is strange to think how utterly different are the fashions of to-day. How we should laugh if a gentleman came in to dine wearing a square-cut coat of silk stiffened with wire or buckram (to ensure its sticking out at an inconvenient angle), a waistcoat sprigged or otherwise adorned, which reaches to the throat, silk stockings drawn up over the knee, large hanging cuffs or ruffles and square-toed shoes with the flap standing up over the instep (the heels were often coloured red)! Yet when Hatchett's first opened its doors those were the fashions of the day.

The heyday of Hatchett's popularity as a house of call for coaches was undoubtedly during the earlier years of the nineteenth century, when anything pertaining to "the ribbons" or "the road" was looked upon with favourable eyes. How well Hazlitt and De Quincey wrote their impressions of the stage-coach, as did Dickens. Indeed, the latter immortalised Hatchett's in *Pickwick* when he sent Sam Weller to the White Horse Cellars after the famous trial of Bardell *v.* Pickwick "to take five places by the half-past seven o'clock coach next morning."

As it turned out the day was unpropitious for such a journey. "The horses in the stages that were going out, and had come through the city, were smoking, so that the outside passengers were invisible; the newspaper-sellers looked moist and smelt mouldy; the wet ran off the hats of the orange vendors as they thrust their heads into the coach windows, and diluted the insides in a refreshing manner."

Perhaps one of the most extraordinary coach incidents connected with the White Horse Cellars occurred on July 13th, 1888. On that date the Brighton Coach—"Old Times"—was driven from Hatchett's to Brighton and back for the wager of £1,000 to £500 against it being accomplished in eight hours. The 104 miles journey was made in the record time of 7 hours 50 minutes, and the veteran "whip" thus won his wager.

The story of how the old coaching-house came by its name is not uninteresting. The first owner, Abraham Hatchett, was arguing with his wife and some friends about the best sign, when a groom in livery appeared.

"Is this the White Horse Hotel?" asked the groom.

"It ain't and yet it might be," was the pert answer.

"What do you mean?"

"Well, I mean this place hasn't got a name yet; but if you'll join the company and suggest such, perhaps my old woman will hearken to you."

Now it so happened that Abraham Hatchett had that afternoon successfully wagered five guineas that he could beat a certain gentleman's horse and the groom had come to deliver the stakes. The only description he had of Hatchett was that he was "an old man with a red waistcoat, who kept a white horse in Piccadilly." While his friends were congratulating him on getting his prize—there were some doubts as to whether he would—Mrs. Hatchett hit upon the idea that the establishment should be called "The White Horse Hotel."

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

SAFETY PLAY

Guarding Against Adverse Distribution

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*.)

ALTHOUGH someone said or wrote that "*Safety first is the motto of mediocrity*," this should not deter the Bridge player who seeks to improve his game.

"Safety" play is not cowardly play. When "up against it" you must take risks. The player who never takes risks will not be a winner in the long run. Risks have to be incurred. Real safety play at Bridge is not a sign of mediocrity, but of expert common sense.

The principle is that you should never take unnecessary risks for the sake of extra tricks, and that you should guard against adverse distribution which may be unlikely and mathematically improbable, but which yet may exist. The improbable or apparently impossible may occur. Miracles happen at Bridge!

Numerous plays with which we are all familiar come within the category. The hold-up of the Ace or master card in a No Trump declaration, the refusal to take a finesse when another line of play is available, timing of the play, the deferring of drawing trumps—all these and many more are well-known safety devices for making or trying to make extra tricks. But the form of safety play which is less well known is the deliberate sacrifice of a trick in order to avoid the possibility of losing two tricks.

Take this position:

♠ J, 5

Y

A B

Z

♠ A, K, 9, 7, 4, 3, 2

Spades are trumps and Z can afford to lose one trick in the suit, but not more. How should he play?

It is obvious that if the Spades are divided 2 and 2, Z need not lose a single trick if he plays out his Ace and King. If they are divided 3 and 1 he must by this play lose one trick if A or B has Q, x, x. Z is missing the Q, 10, 8, 6. Should they all be in one hand by the play of the Ace, King he will lose two tricks in the suit.

The "safety" play is to lead a low Spade to Dummy. If A has all four trumps this will hold him to one trick. If he plays the Queen Y's Knave will later draw one of A's trumps and the Ace King the other two. If he "ducks" the Knave wins, and the play of the Ace and King will reduce him to the lone Queen.

Now suppose A is void and B has Q, 10, 8, 6. This play is also successful. The Knave forces out B's Queen and later the finesse against his 10 reduces the loss to one trick. Yet many, if not most players cheerfully lead out the Ace or King from this combination. And, of course, in many cases it proves to be successful play. If, for instance, A or B had only the Queen single it drops, and no tricks need be lost.

But this does not make the play "correct," and if the success of the contract depends upon losing only one trick in trumps you will be well advised to adopt the safety method, even although you may find later that it has cost you a trick.

The following hand from play shows a different position:

♠ Q, 4
♡ J, 10, 6, 4, 3
◇ A, Q
♣ A, Q, 7, 5

♠ A, K, 10, 6, 2
♡ 5
◇ 7, 6, 3
♣ J, 9, 3, 2

Y / A B / Z

♠ J, 8, 7, 5, 3
♡ 9
◇ K, J, 10, 9, 8, 2
♣ 4

♠ 9
♡ A, K, Q, 8, 7, 2
◇ 5, 4
♣ K, 10, 8, 6

Score A B nil; Y Z game. Z the Dealer. The bidding was:

Z	A	Y	B
One Heart	One Spade	Four Hearts	Four Spades
No bid	No bid	Five Hearts	No bid
No bid	No bid		

A led the King of Spades, and as B played the 3 and Z the 9, A switched to Diamonds. Z put up Dummy's Queen and B, winning the trick with the King, returned a Spade. Z ruffed, took a round of trumps and then, thinking he had nothing to fear, led the 6 of Clubs, played Dummy's Ace and then the Queen, and had finally to lose a trick in the suit, thus missing his contract, A B winning a trick in Spades, in Diamonds and in Clubs.

Now this was bad play on Z's part. He had contract, game and rubber sitting by two methods of play. He should not have finessed the Diamond. Playing the Ace he should have led a Spade and ruffed, played one round of trumps, and then thrown the lead to A or B with a Diamond. This must succeed, as whoever has the King of Diamonds must then lead a Spade, a Diamond or a Club. Whatever he selects Z will win the rest.

Actually, without knowing the distribution of the cards, the proper safety play is as follows:

After winning with the Ace of Diamonds, Z should trump a Spade, play one round of Hearts and make his Ace of Clubs. Having made it and all following suit he should then lead the Queen of Diamonds, which produces the same result however the cards lie. The mistake was to take it for granted that Clubs would fall. Knowledge of safety tactics would have prevented Z committing this error.

CHESS

LIVELY PLAY

The following very lively game was played in the British Championship Tournament at Brighton last August.

(*Queen's Gambit Declined.*)

WHITE.	BLACK. P. S.	WHITE.	BLACK. P. S.
H. Golombek.	Milner-Barry.	H. Golombek.	Milner-Barry.
1. P to Q 4	Kt to K B 3	17. Castles	R takes P
2. Kt to K B 3	P to Q 4	18. Kt to B 3 (*i*)	R to K sq
3. P to B 4	P to K 3	19. Kt to Q 4	Kt to R 4 (*j*)
4. Kt to B 3	P to B 4	20. P to K Kt 3	R to K 4
5. B P takes P	B P takes P (*a*)	21. B to R 3, ch	K to B 2 (*k*)
6. Q to R 4, ch (*b*)	B to Q 2	22. K to B 2 (*l*)	R to B 4, ch
7. Q takes Q P	P takes P	23. K to Q 3	B to B 5, ch
8. Kt takes P (*c*)	Q to R 4, ch	24. K to K 3 (*m*)	R to K 4, ch
9. Kt to B 3	Kt to B 3	25. K to B 3 (*n*)	B to Q 4, ch
10. Q to Q sq	Kt to K 5	26. K to B 4	R to K 5, ch (*o*)
11. B to Q 2	Kt takes B	27. K to B 5	R to K sq (*p*)
12. Q takes Kt (*d*)	Castles (*e*)	28. Kt to Kt 5, ch	K to B 3
13. Kt to Q 5	Q takes Kt (*f*)	29. R takes B	P to Kt 3, ch
14. Q takes Q	B to Kt 5, ch	30. K to B 4	R takes P (*q*)
15. Kt to Q 2 (*g*)	B to K 3	31. Kt to Q 4, ch	Resigns
16. Q tks R, ch (*h*)	R takes Q		

(*a*) The usual continuation is 5. . . . Kt takes P; 6. P to K 4, Kt takes Kt; 7. P takes Kt, P takes P; 8. P takes P, B to Kt 5, ch. The text-move leads to a position similar to that which occurs in the Von Hennig-Schara (or Duisburg) Gambit (1. P to Q 4, P to Q 4; 2. P to Q B 4, P to K 3; 3. Kt to Q B 3, P to Q B 4; 4. B P takes P, B P takes P), with, however, the important difference that here each side has developed the King's Knight.

(*b*) If Kt takes P, then Kt takes P; or if, instead, Q takes P, then P takes P. The text-move leads to the gain of a pawn at the cost of a disadvantage in development.

(*c*) The essential difference between this line of play and the Von Hennig-Schara Gambit is now evident. Black having a Knight at his K B 3, White is forced to make this capture with the Knight and allow Black to gain valuable time by Q to R 4, ch.

(*d*) In our opinion Kt takes Kt is better.

(*e*) White has now a very difficult position. With his next move he plays for simplification.

(*f*) 13. . . . Kt to Kt 5 is much stronger, *e.g.*, 14. R to B sq, ch, B to B 3; 15. P to K 4, K to Kt sq; 16. B to B 4, P to Q Kt 4; 17. P to Q R 3 (if B to Kt 3, then Kt to Q 6, ch), B takes Kt (not 17. . . . P takes B; 18. P takes Kt, B takes P because of 19. Kt takes B, R takes Q; 20. Kt takes B, ch and wins); 18. B takes B, Kt to Q 6, ch; 19. K to K 2, Q takes Q, ch, followed by 20. . . . Kt takes R with advantage to Black.

(*g*) Best. If, instead, 15. K to Q sq, then 15. . . . B to K 3; 16. Q takes R, ch, R takes Q, ch; 17. K to B sq, R to Q 4, threatening R to B 4, ch.

(*h*) An alternative here is Q takes B, ch, to be followed by Castles. White is then a pawn ahead, but has little chance of a win. The text-move is better.

(*i*) This move involves White in serious difficulties. He should, instead, play Kt to K 4. Black cannot reply with R to K sq (because of Kt to Q 6, ch) while, if, instead, he plays R takes R, ch or R to B sq, he has no more chances of an attack.

(*j*) 19. . . . R to K 4 is much stronger, *e.g.*, 20. Kt to B 2 (not Kt takes Kt because of R to B 4, mate), R to Q B 4; 21. P to K 3, Kt to R 4 (threatening Kt to Kt 6, mate); 22. P to Q Kt 3, B takes P.

(*k*) It is not until six moves later (see note *p*) that it becomes evident that the King should, instead, have gone to Kt sq. It was, of course, extremely difficult to foresee this at this stage of the game.

(*l*) If, instead, 22. R to Q 3, then 22. . . . R to B 4, ch; 23. K to Q sq, Kt to B 5 (threatening Kt takes P, ch). (If 24. P to K 3, then 24. . . . Kt takes P, ch; 25. K to K 2, B to B 5.)

(*m*) K to K 4 is better, Black having nothing better in reply than B to Q 4, ch, recovering the exchange and giving an even game.

(*n*) Not K to B 4 at once because of B to Q 3.

(*o*) Not good. He should, instead, play 26. . . . Kt to B 5, threatening either (1) 27. . . . B takes R or (2) 27. . . . R to K 5, ch (best); 28. K to B 5, Kt to Q 3, ch; 29. K to Kt 5, P to B 3, ch; 30. K to R 5, B to B 2, mate. If (in reply to 26. . . . Kt to B 5) 27. P to B 3, then 27. . . . P to Kt 4, ch; 28. K to Kt 4, Kt to K 6, ch; 29. K to R 5, P to Kt 5, ch and wins. White's best reply to 26. . . . Kt to B 5 is 27. P to Kt 4 so that he can reply to 27. . . . R to K 5, ch with 28. K to Kt 3.

(*p*) If Black's King were at Kt sq, instead of B 2 (see note *k*) 27. . . . B to K 2 (threatening P to Kt 3, mate) would be decisive. Now, however, it would be refuted by 28. Kt to Kt 5, ch, K to B 3; 29. R takes B, K takes R; 30. Kt to B 3, ch. If (instead of 27. . . . B to K 2) 27. . . . P to Kt 3, ch, then 28. K to B 6, B to K 2, ch; 29. K to Kt 7, R takes Kt; 30. R takes R, B takes R; 31. R to Q 7, ch and wins. The text-move is, however, a mistake made under time-pressure. Black should, instead, play 27. . . . R to K 2. If, in reply, 28. Kt to Kt 5, ch, then 28. . . . K to B 3; 29. Kt takes P, ch, K to B 4, after which White has nothing better than 30. R takes B, ch (if, instead, R to B sq, ch, then Kt to B 5). The game then is even in spite of the fact that White is a pawn ahead.

(*q*) If R to K 2, then K R to Q sq.

END-GAME STUDY

By L. B. SALKIND.*

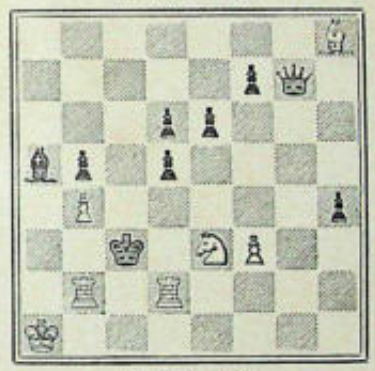
WHITE (3 pieces): King at Q Kt 5, Pawns at K B 3 and Q Kt 7.
BLACK (4 pieces): King at Q 4, Rook at Q R 8, Knight at Q Kt 8, Pawn at K B 5.
White to play and draw.

* Second prize, 28 *Rijen*, 1925.

PROBLEM No. 3987

By G. H. DRESE and DR. M. NIEMEYER.*

BLACK (9 pieces).



WHITE (7 pieces).

White to play and mate in three moves.

* First prize, *Limburgsch Dagblad*, 1937.

SOLUTION OF PROBLEM No. 3986

1. Q to B 5 (threatening 2. Kt to Kt 6, ch). If 1. . . . B takes Q, then 2. P to Q 4, ch, &c. If 1. . . . B to K 6, ch or 1. . . . K to B 5, then 2. Q takes B, ch, &c.

CITY OF LONDON CHESS CLUB.—The championship tournament of this club has attracted the following very strong entry: E. G. Sergeant (holder), C. H. O'D. Alexander (British Champion), Sir George Thomas, Bart., P. S. Milner-Barry, E. Klein, F. F. L. Alexander, Dr. M. Benger, F. G. T. Collins, E. G. R. Cordingley, J. M. Craddock, D. I. Croker, C. A. S. Damant, H. Fraenkel, C. B. Heath, J. Montgomerie, R. H. Newman, F. Parr, H. Saunders, R. Spitz, Dr. LI. Storr-Best, P. N. Wallis and G. S. A. Wheatcroft.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 490

ACROSS.—1, How to tell a Conservative. 9, It's Susan. 10, Form in the midst of success. 11, This from one's native land may induce 2. 12, This peasant has all the makings of the person in 1. 13, It is suggested that school authorities should do this to holidays. 15, Week-end ice. 17, Strikes his tent? 19, Unwise in France. 22, Hardly the result of a stiff leg. 24, Anger is, as here, so often the centre of pluck. 26, He doesn't approve of the constituted order of things. 27, Parisian hooligan. 28, 3, 5, 7 is an example of one: 2, 6, 18 of another.

DOWN.—2, "The deep, unutterable woe which none save exiles feel." 3, This will be harmonious work. 4, A dotty system. 5, The spider which ran in the middle. 6, The wanderer is finished soon after he began. 7, This clue will be split into halves. 8, That which goes out as quickly as it comes. 14, We are, that you will have some difficulty in solving it. 16, Road speed (anag.). 18, Sovereign remedy. 20, Without ease or grace. 21, Turned upside down into the consonants. 23, Religious poet. 25, Foreigners sometimes seen in our streets.

A prize of one guinea is offered for any crossword puzzle, dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Fish Dying of Cold.—Our biologist reports that he could find no sign of disease nor anything wrong which will give a clue as to the cause of death of these fish. He suggests that it looks rather like a case where little fishing is done, and constant inbreeding has gone to weaken the stock, with the result that a fall in temperature very often kills off a certain number. This state of affairs usually continues for about a week or so at the beginning of winter, after which the hardier individuals in the stock live on as before.—*C. W. S., Shropshire.*

Forestry

Forestry Commission.—The Commission is a Government department. It was set up in 1919 for the purpose of assisting private forestry, conducting research and, especially, acquiring land for afforestation. The number of acres now under its care are about 375,000 in England and Wales, and 215,000 in Scotland. 30,000 acres are to be planted annually in future, a number which excludes the laying out of 200,000 acres in and near the special areas. In all there are about 6,000 persons employed.—*B. M., Hastings.*

Garden

Weeds on Fernden Hard Court.—Use Atlacide, which can be obtained from any nurseryman.—*P. V. M., Sherborne.*

To Rid a Lawn of Moss.—Use Toll Lawn Dressing No. 1, obtainable from Toll Lawn Dressings, Ltd., Buxted, Sussex.—*L. C. D., Bristol.*

Kennel

Treatment for Worms.—Small doses of syrup of iodide of iron given daily over a period of ten-fifteen days will often bring away worms which more drastic remedies have failed to dislodge, and a dog of the size mentioned might be given ten drops of the syrup in a little water twice a day.—*K. D., Horrabridge.*

Alsatian's Ears.—It is not usual for the ears to be so late in assuming the erect position, but as the ears to some extent reflect the general condition of health, it should be worth while giving this puppy a course of Parrish's Food to tone him up, and also a daily dose of the best cod liver oil. Massage of the ear muscles by gentle pulling may also be given a trial.—*C. P., Kingsdown.*

Library

Book on Small Garden Lay-out.—A book which deals with the layout of small formal gardens, together with designs for paths, walls and beds, is *The New Garden*, by Richard Sudell, published by The English Universities Press at 5/-.—*G. M., London.*

Naturalist

Larvæ Sent for Identification.—These little larvæ are those of a beetle belonging to the family *Cryptocephalus*. We do not know of any popular name for them, and should very much doubt if they have ever acquired one. Normally they live in caves and cellars and rough cast walls. They protrude their legs to crawl from one place to another, and feed on low growing plants.—*A. G. L. C., Shepperton-on-Thames.*

Post-Mortem Examinations

Lead Poisoning of a Bantam.—An in-lay five-and-a-half months old bantam died of lead poisoning; seven partly eroded lead shot were found in its gizzard. We frequently report deaths of various species of birds from metal poisoning. Lead shot, copper shavings and galvanised roofing nails are swallowed by the gallinaceous birds and waterfowl. Aviary birds are attracted by solder or zinc galvanising on the wiring of the aviary or cage. If lead-lined trays for food or grit are used in an aviary great care should be taken that there are no breaks in the surface or jagged edges. Perforated zinc sheeting is sometimes used for the doors of flights; budgerigars especially appear to delight in gnawing at the holes until shreds of the metal are bitten off and eaten. The poisoning as a rule is a relatively slow process, the bird dying some seven to fourteen days after swallowing the metal. Recently one of our correspondents was laying felt on the roof of a poultry pen and left his box of tacks on the ground beside his tools while he went for lunch. He noticed on his return that he had insufficient tacks for the job, and thought nothing more about it until he received our post-mortem report on three of his pullets, which had died about a week later. The missing tacks, fourteen of them, were recovered from the gizzards of his birds. The ostrich is not the only bird with a capricious appetite. Among animals the cow beats all records; hob-nailed boots, beer bottles, fencing wire, umbrellas, felt hats and broken tea cups have been recovered from the bovine paunch.—*D. D., Essex.*

Coccidiosis in Aviary Birds.—The contagious germ infection of the bowels known as coccidiosis caused deaths among the aviary birds of four readers; the birds comprised waxbills, canaries, cordon-bleus, pigeons and a monal pheasant. The history of one aviary strongly suggested that the disease was introduced by a batch of newly-purchased birds. We continually urge in this column the necessity for quarantining all newly-purchased birds for at least four weeks before liberating them in the aviary. Another source of the disease is wild birds roosting on the flight of the aviary; coccidiosis is one of the most common diseases of wild birds of the garden, particularly of young birds. In a properly constructed outside aviary coccidiosis can be eradicated by thorough and regular cleanliness; but how few aviaries are built on sound sanitary principles? Most of them appear to be constructed for æsthetic reasons; a garden ornament containing flowering shrubs, rockeries and beds of plants. Owners are encouraged by trade catalogues to construct food trays resembling Chinese pagodas complete with swings, tinkling bells and fancy mirrors, baths and other toilet conveniences for the dear little birds. Anyone proposing to build an outdoor aviary should appreciate that every part of the aviary, including all its fittings, should be so constructed that it can be thoroughly scrubbed at regular intervals throughout the year with hot soda water and soft soap, which, with "elbow grease," is the most efficient method of disinfecting an aviary.—*M. H., Somerset; L. H., Elgin; D., Bucks; J. S., Northumberland.*

Fowl Paralysis.—Further cases of fowl paralysis have been received for examination. This disease is inherited from the parents who usually are "carriers" of the taint and do not reveal signs of the disease in life or at post-mortem. Usually the disease is manifested as the birds attain sexual maturity, though in some instances affected chicks between one to two months of age show the paralytic symptoms. The disease is frequently confused with coccidiosis, a contagious germ infection of the bowels, which causes weakness and consequent unsteady gait, but not a true paralysis of the limbs. Stock carrying the blood lines of birds affected with fowl paralysis should not be bred from; they should be destroyed for table purposes.—*R. T., Oxon.; R. B. J., Lancs; G. S., Warwickshire; E. C. P., Warwick.*

Rugby

England v. Scotland.—The first match between the two countries played at Murrayfield was in the 1924-5 season, and we give a list of the subsequent winners as you required:

1924-5	Murrayfield, Scotland	14 pts. to 11
1925-6	Twickenham, Scotland	17 pts. to 9
1926-7	Murrayfield, Scotland	21 pts. to 13
1927-8	Twickenham, England	6 pts. to nil
1928-9	Murrayfield, Scotland	12 pts. to 6
1929-30	Twickenham, Drawn	No score
1930-1	Murrayfield, Scotland	28 pts. to 19
1931-2	Twickenham, England	16 pts. to 3
1932-3	Murrayfield, Scotland	3 pts. to nil
1933-4	Twickenham, England	6 pts. to 3
1934-5	Murrayfield, Scotland	10 pts. to 7
1935-6	Twickenham, England	9 pts. to 8
1936-7	Murrayfield, England	6 pts. to 3
1937-8	Twickenham, Scotland	21 pts. to 16

—*D. C., Denmark Hill.*

France and Rugby.—As you suggest, it was in 1931 that this country ceased to arrange fixtures with France and French clubs. On February 13th of that year, following the breakaway of twelve important clubs from the French Federation, a committee of representatives from each of the four home unions met in London and passed the following resolution, which the Rugby Union duly sent to the Federation in March: "After examination of the documentary evidence furnished by the French Federation and the dissentient clubs, we are compelled to state that, owing to the unsatisfactory condition of the game of Rugby Football in France, neither our Union, nor the clubs or unions under its jurisdiction, will be able to arrange or fulfil fixtures with France or French clubs at home or away after the end of this season unless and until we are satisfied that the control and conduct of the game has been placed on a satisfactory basis in all essentials."—*B. F., Belfast.*

Shooting

Cartridges Loaded with No. 1 Shot.—Whereas the continual use of large shot in light-weight sporting guns is certainly not to be recommended, its occasional use should have no prejudicial effect on the barrels. The chance of damage should be no greater from maximum shot cartridges than from cartridges of any standard make employing a similar size of shot.—*I., Cockermouth.*

Travel

Hotels at Buxton.—We think you would like The Old Hall Hotel at Buxton. The Old Hall dates back to the time when the Earls of Shrewsbury were the principal owners of Buxton and the surrounding district. Even in those days people came to the town for the benefit of the baths, and between the years 1570 and 1583 Mary Queen of Scots was taken there at least four times, staying always at the Old Hall in the close custody of the Earl of Shrewsbury. In a letter from Buxton dated August 10th, 1570, she refers to the benefits which she derived from the use of the baths. It is to be hoped that at The Old Hall she enjoyed at least a few hours of happiness, for in a troubled life she must have learnt the truth of the saying: "Happiness is not steadfast but transient." There is also the Palace Hotel at Buxton. This is, of course, a much larger place than The Old Hall, but the idea that the hotel is so large that guests come and go without being noticed is quite wrong. Every guest who is at all pleasant and, so to say, "clubbable," is made welcome at The Palace, and becomes for the time part of the organism of the hotel. Perhaps the constant return of many of the guests is the most convincing tribute that memory pays to a very pleasant stay. If you wish to be sociable you will find a gathering ground for those who wish to chat; if you wish for solitude you will find secluded nooks without undue trouble. This is, of course, one of the advantages of a large hotel such as The Palace; it can cater for the varying moods of all kinds of guests.—*M. E. F. R., Dundee.*

Staying near Stevenage.—We would recommend the Cromwell Hotel at Stevenage. During the days of the old-time coaches—the York Highflier, the York Express, the Hertford Mail, the Stamford Regent and the Rockingham, are names which come readily to mind—the central portion of the Cromwell Hotel was a solid looking farmhouse. While being, in a sense, a 20th-century inn, it has yet the hospitality and peacefulness which are so often found in an eighteenth-century establishment. You will find the Cromwell Hotel furnished and appointed in a manner which includes every modern comfort. The public rooms are spacious and include an oak-panelled dining room, a music and dancing room and a luxurious lounge. Even now, however, extensive alterations are being made and additional suites are being added. In the grounds, two acres in extent, are delightful old-world gardens, charmingly laid out with rockery and lily pool, lawns and ornamental pond.—*J. M. S., London.*

Wildfowling in Norfolk.—We think you may be referring to the Buttlands Hotel at Wells. It is unlicensed, but caters especially for shooting parties and wildfowlers. The terms are from 4 to 5 guineas a week according to the season. If, however, you should decide to go to Blakeney, we would strongly advise you to write to Mr. Mat Long, 2, Moreston Road, Blakeney. He is a wildfowling expert in the district, and would be only too glad to assist you.—*L. S. B., St. Albans.*

HORSE SALES OF THE WEEK

LEICESTER

A good many horses changed hands at Messrs. Warner, Sheppard & Wade's Leicester Repository, on Saturday last. All but one of the six sent up by Colonel R. L. McCreery were sold, his bay gelding Sparkford making the highest price of the sale, 250gs., whilst three others in the same stud went well over three figures. Lady Helena Hilton-Green's bay gelding Quorn made 200gs., and Mr. C. Hilton-Green accepted 150gs. for his roan gelding Blue Boy. Competition was keen for Mr. P. S. Akroyd's two horses, his brown gelding Bill making 210gs. and chesnut gelding Buster 150gs. Mr. and Mrs. C. Harman Hunt's five-year-old horse Holdenby and bay mare Polly found new owners at 130gs. and 110gs. respectively. The prices of 30gs. and over were as follows: Property of Mr. J. Hunter: Summer Time, b m, 46gs.; Amber Rose, b m, 64gs. Property of Major J. H. Hirsch: Mr. Fisher, b g, 63gs. Property of Captain C. W. Wilson: Golden Corrin, ch g, 36gs.; Nicholas, gr g, 46gs. Property of Mrs. O'Brien: Rufus, ch g, 100gs. Property of the Hon. A. F. Phillimore: Bryony, b m, 31gs. Quorn cubhunters, the property of Sir Harold Nutting, Bart., M.F.H.: Inspector, br g, 56gs.; Buckle, b g, 70gs.; Whitesocks, ch g, 33gs. Property of Lady Helena Hilton-Green: Sportsman, b g, 31gs.; Quorn, b g, 200gs. Property of Mr. C. Hilton-Green: Blue Boy, r g, 150gs. Property of Major E. G. Gillilan, D.S.O.: Gr g, 70gs.; gr g, 30gs. Property of Colonel R. L. McCreery: Triple Crown, b g, 175gs.; Sparkford, b g, 250gs.; Gleam III, ch g, 94gs.; Tambo, b g, 165gs.; Gemma, b m, 170gs. Property of Mr. Hugh Morrison: Jack, b g, 100gs.; Monument, br g, 100gs.; Dunrobin, br g, 65gs.; Ginger, r g, 65gs. Property of Mr. D. H. Machin: B g, 80gs. Property of Mr. P. S. Akroyd: Bill, br g, 210gs.; Buster, ch g, 150gs. Property of Mr. M. S. B. Vernon: Br g, 90gs. Property of Mr. St. George Smith: Cheval D'Or, ch g, 31gs.; Mullingar, gr m, 50gs. Property of Mr. and Mrs. C. Harman Hunt: Holdenby, 130gs.; Polly, b m, 110gs. Property of Major R. C. Matthews: Marigold, ch m, 31gs. Property of Mr. H. Newgass: The Artist, b g, 62gs. Property of Mrs. Hope Barton: Ednas, ch m, 68gs.; Matilda, b m, 32gs. Property of Mr. N. Watney: B g, 40gs.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

AUSTRALIA'S ROYAL GOVERNOR-GENERAL

H.R.H. the Duke of Kent, will sail this time next year with the Duchess of Kent to take up his appointment as Governor-General of Australia. He will be the first member of the Royal Family to hold such an appointment in the Commonwealth. The year 1939 will also be noteworthy for the unprecedented visit of a reigning sovereign to Canada and the United States, when their Majesties the King and Queen respond to the invitations extended to them by Mr. Mackenzie King and President Roosevelt

THE IDLE SPEAR

ALL countrymen are aware of the strange sense of peace which invests the woods and fields on a Saturday evening. It is a peace which was recognised long before the townsman looked forward to the country scene as a respite from a week's labour in the city streets. All nature seems to have come to the end of a period of effort, to have striven and to call for rest. We do not believe that this atmosphere can be ascribed solely to the human habit of resting as much as possible during two arbitrarily fixed days. For does not the hunter, hacking home in the winter cold and darkness, or the wildfowler, pursuing his rigorous path across the flooded marshes, detect an atmosphere which is quite peculiar to the time? The countrymen we meet return our "Good nights" in a tone of voice in which there seems to be a tincture of reverence, for it is impossible to deny that there is cast about a Saturday evening in the country an unescapable mantle of holiness.

When Christmas Eve falls, as it does this year, on a Saturday, it is inevitable that these emotions should take on a wider and a deeper significance, for the origins of the Festival are bound up for ever in the atmosphere of a country story. We cannot believe that the greater part of modern life has a place in the divine purpose: only in the steady and useful revolution of the country cycle is a coherent sanity preserved.

The many aspects of peace are the continuing and customary meaning of Christmas, but this year the minds of English men and women will play and ponder on the possibility of international peace, for the Festival will be celebrated in very different circumstances from those which we dreaded only a few short weeks ago. Mr. Bernard Shaw has remarked that Members of Parliament might conceivably be rendering a more useful service to their country by retiring to bed than by enduring an all-night sitting. However this may be, it is our conviction that international politicians would be far more likely to preserve peace if they were compelled to take an active and regular part in country life and sport. For they would perceive that the ennobling battle is not the conquest of territory for commercial gain but the exploitation of the soil for the greater service of humanity. However much courage and generosity of soul a war may bring forth—and we should be the last to deny that this is so—we maintain that nobler and finer characteristics are necessary for the struggle of agriculture. And when the countryman has won the tussle against the odds which nature sets up against him, he has performed a useful purpose and is a finer man in himself. National virility is not to be bought only at the expense of a hardening of hearts and an abandonment of culture: it can be promoted by means which are in themselves of national service. It is safe to say that the greatest political leaders in England have also been great countrymen.

It would be well to consider this truth at Christmas, when the spear is yet idle and the chariot yet "unstained with hostile blood." In vain we look for peace in the places from which our way of life has led us to expect it to emerge. No institution, no code of behaviour and no political faith is so united that its adherents regard the world with the calm eye of a balanced sanity. Only the ancient pursuits of the country and the ceaseless struggle with the soil, divested of its political trappings, can bring back an international virility of body and mind.

CHRISTMAS CRICKET

MANY a sportsman will be wondering this Christmas how the M.C.C. team have fared in the first day's play of the Test match at Johannesburg; and many a sportsman will doubtless extend to them the customary seasonal greetings. But there will be none, or very little, of the usual celebrations; the first Test match will be "no picnic" in more ways than one. There is a defeat to avenge—the first defeat of England in this country when Wade's men beat us at Lord's. Moreover, the manager has probably heard all about the last time our cricketers celebrated Christmas Day in the midst of a South African Test match. Then, it would seem, celebration produced results of truly seismic proportions. Hammond's promising innings of Christmas Eve was abruptly ended on Boxing Day. And the South Africans, linking Christmas Day with victory, told us quite firmly that they wanted Christmas Day with the first Test again this year. We know that, if not a victorious Christmas, it will be at least a happy one. And we suggest that if all matches were played in the spirit of those in South Africa, there would truly be peace in the cricket world.

OUR COLOURED COVER

The "Inside of a Country Alehouse" is the subject of the painting by George Morland, the central portion of which is shown on the cover of this issue. The engraving, by W. Ward, was published in 1797, and the reproduction is from a particularly fine copy kindly loaned by Messrs. Frank T. Sabin, of 154, New Bond Street, London, W. 1. Additional interest attaches to this picture by Morland, as it is considered that the central figure in the red waistcoat is a portrait of the artist himself.

"THE MAILS MUST GO THROUGH"

British traditions attaching to the phrase "the mails must go through" are to be upheld this Christmas by the assistance of some of the eight new Short flying-boats, modified versions of the four-engined Empire mail and passenger craft, which have inaugurated flat rate postage of 1½d. per half-ounce under the Empire air mail scheme. This will be the first Christmas on which the benefit of fast and safe transit of all first-class mail by air to the Empire is to be undertaken. The new fleet, as everyone knows, has been designed primarily for long range transoceanic flights such as the Atlantic and the Tasman Sea, but in order to give the new craft maximum usefulness and allow the mails to go through to schedule to Australia and intermediately this Christmas certain equipment for long range flying may be omitted. Doubtless our friends "down under" will appreciate our festive wishes all the more now they know we have posted them only a few days before Christmas instead of in the middle of November.

STAMPEDE

Philately is hardly a *Field* subject, but the sale which took place recently of three sets of Port Fuad stamps issued in Egypt on December 21st, 1926, recalls an amusing incident, so reminiscent of an inter-village Rugby scrum in the Rhondda Valley as to serve as excuse for mentioning the occasion. All that was necessary, thought the Levantines, was to buy up the stock at face value and then sell them to the outside world at a large profit. The idea was popular, and, at the appointed hour of opening, the local profiteers bore down upon the post office to buy the said stamps, with such energy that the doorway became a solid jam, while others dived through the windows or removed a portion of the roof in truly Scriptural style. The death roll was four, and many more were injured. A genuine case—if such an expression may be excused—of being stamped to death.

AT THE HAYMARKET

A very pleasant and amusing show, under the title of "A Party for Christmas," is now running at the Haymarket Theatre. It is not brilliant and it is not spectacular, but it hits off the foibles of an ordinary family, gathered together at the "season of good will" (*sic*), with devastating exactitude. Mr. Milton Rosmer's performance, particularly during the dinner scene, is worth going a very long way to see, and Miss Sydney Fairbrother gives a perfectly proportioned performance. Among the younger members of the cast, Mr. Hugh Burden seems to be an actor of real ability. Of all the characters, different people, if they are honest with themselves, will say, "There, but for the grace of God, go I." You can pass a pleasant, chortling evening at the Haymarket.

WINTER FLOOD

In summer when the stream is low
It seems a flock of sheep that passes,
A rippling flock that row by row
Spreads out to snatch the bank-fed grasses.
All silver-fleeced they thread the leas
And wander through the wooded hollows
While after them the summer breeze,
A slow and careful shepherd, follows.

But when the rain has lashed the hills
And every mountain rill runs stronger
A thud of hoofs the valley fills;
We see the silver flock no longer;
For, tossing high their tawny manes,
Spurred by the storm-wind's restless forces,
With reaching stride and loosened reins
Come ramping down the red-brown horses.

O, fair may seem the silver sheep
With buttercups beyond them growing,
But give to me the swirl and sweep
Of squadrons with their trumpets blowing;
The foam-flecks flung, the plunge of pride,
The serried ranks set out for slaughter;
The saddles where the tempests ride,
The thunder-threat of trampling water!

WILL H. OGILVIE.

A COUNTRYMAN'S JOURNAL

I TRAVELLED far to find out what is happening to the old reed-thatching industry of Dorset, even as far as Burton Bradstock, a place historic in the annals of the earth rather than of man. Like other pivotal areas along that peerless coast, it is a place where various geological strata all meet, as once did Caspar, Melchior and Balthazar in all the glitter of the East to worship One humbler and greater than they. Something of the same kind of thing happens at Burton Bradstock under the eye of the great heavens. The liassic brown stone comes in from the west with a long train from Devon of giddy and turbulent hills; the great chalk and Purbeck ranges sweep in vastly from the east, and the noble oolite limestone ends its long journey from the Humber in the blaze of orange cliffs at the back of the village. This is where they used to "draw the reed."

This kind of thatching is totally different from that of East Anglia, where the genuine reed is used. Dorset reed is not reed at all, but the red wheat, the very same that Justice Shallow once sowed somewhere near Nibley in the South Cotswolds. To see it in the sheaf is to realise at once its superiority over the average wheat-straw. In the first place, it is very much longer: I measured one length and found it no less than 42½in., and that had been cut by the machine which leaves a considerably shorter straw than the scythe once did. Even when the sickle cut off the ears, the straw cut later was longer than that cut by the self-binder. Reed-straw, again, is straighter and slenderer than that of the wheats mainly grown to-day, and it is possible to see at a glance its ideal qualities for thatching purposes. Up to quite recent years it was cut, stripped of its flag and lopped of its ears, all by hand. In some of the barns both at Burton Bradstock and Dottery to the north-west of Bridport, it is still possible to see the curious press by which the crop was deprived of its ears. It is a trestle-like arrangement of wood from about 8ft. to 10ft. long with mortised peg-holes in the uprights at each end by which the loose sheaves were held together with their ears all facing one way to be chopped off by a kind of billhook. Then, the straw was also combed of reed before use by a wooden rake.

A reed-thatched Dorset cottage where, according to the gracious and individual local mannerism, the thatch makes rounded penthouse eyebrows over the dormers or upper windows, can be detected at once. The hazel or withy stretchers are absent from most reed-thatched cottages except along the roof-ridge, possibly because the reed-thatch makes so close and compact a surface that it has no need to be pegged with "spicks" on the outside. The colour, too, is much darker even than the oldest thatch of wheat- or rye-straw, and I am reminded when I look up at a reed-thatched roof of the silky texture and purple glow of the mole's coat. The straw has to be well wetted before being carried up on the roof by (in the old days) a hod-like wooden carrier called a "bowl."

On the way back I had an odd adventure, which will make my journey to one of the last homes of reed-thatching for ever memorable to me. In a very lonely part of the road I stopped to eat a sandwich by the wayside. A white gate led into a wild pasture patched with gorse and swamp. On the gate was written "Labour-in-Vain Farm," while a neat notice board close by had this legend in black and red lettering: "Warning. Vipers and lepus corniculus at large. Beware of the Bull." Never in 30 years' wanderings over the face of England had I seen before so astonishing a notice. I do not care to ask whether it was true or not (I could see no evidence that it was). I love to think that in our brutishly violated England there may still be a fantastic and primeval pasture where lepuses, serpents and *Bos longifrons* (surely it must have been *Bos longifrons*) prowl "at large." A mile or two further on I passed a fungus by the side of the road—the ubiquitous gaudy English roadhouse. Here was the England of fact, but a man may still have his dreams.

H. J. MASSINGHAM.

WITHOUT COMMENT

Remarks on a hawk shoot from an Irish paper:

"'As we make a point of shooting all hawks about the place, I got out my gun and went down. I was surprised to find that I was able to approach within a distance of about 2yds. from the bird before it flew away.

"'My first impression was that the bird was wounded, but I realised my mistake when it flew off without any signs of distress. After it had flown about 30yds. I shot it, and found that a strong piece of leather was attached to both legs, and a bell to the left leg.

"'This sort of thing certainly does not happen every day.'

"I quite agree. Can any reader suggest why the hawk should have been so burdened?"

"It is as well to remember"

"QUICK, THY TABLETS, MEMORY"

Some Reflections Upon Christmastide

THE Christmas Number. And I must write something about Christmas. That should be easy enough. After all, Christmas comes round every year, and I am quite familiar with the festival by now.

I know that—in things temporal—it means Christmas cards; the posting of cards to friends and relations and the pleasant feeling when the deed is done that no one has been forgotten—and the sudden frantic rush to Woolworths on Christmas Eve in order that Aunt Agatha (who has not sent a card for ten years) shall not realise that I had forgotten I had an Aunt Agatha. I know it means presents, and long painful walks round the shops attempting to find something you think will please someone of whose intimate tastes and desires you know nothing; I know that it means eating an enormous luncheon or dinner. I know that it means sleeping a good deal. I know that in all probability it means indigestion, though M. Simon tells us elsewhere that it need not.

Yes, and more. Christmas is a happy festival. It is a holiday. It provides an excuse for spending more than one can afford and eating more than one can digest; but it also provides an opportunity for something much more important: the opportunity for showing goodwill, which means surely the opportunity for happiness, for being natural. People are more natural at Christmas; much more themselves, much more human, much less irritable, much less mechanised. At Christmas I generally have to go into shops devoted to the sale—at what I consider exorbitant prices—of ladies' clothing and accessories. I have to go into such places at other times of the year also—generally birthdays—and I notice a great difference in atmosphere. Birthday visits are trials. I am pushed by other shoppers—and the female elbow is a dangerous, hurtful weapon—I am regarded with pitying condescension. I buy something I did not mean to buy, and something which does not enhance my reputation in the eye of the ultimate recipient. At Christmas I am helped. I may be pushed, but the elbow is not driven by malice aforethought. I get what I want—and sometimes I am even smiled upon. Truly a great festival, since it can soften the heart of commerce.

And you must notice the same air about people in the streets and tubes and buses. The London bus conductor, whose life must be more than trying, is normally genial; at Christmas he radiates. He helps with parcels; he gives advice; he patters up and down stair whistling. And in the street there are smiles, occasional good-mornings from complete strangers, an air of geniality. Even in my tube; my tube carries business men, grim and bowler-hatted and important and silent, with tight lips and tight waistcoats. They rush in in the morning, very shiny about the cheeks and the shoes, and hide themselves behind important-looking newspapers. I often wonder whether they read them. We travel in silence. We do not smile. But at Christmas we smile, sometimes we bid each other good day. We unbend; one may even see a beetle-browed banker carrying a Donald Duck. Somehow it looks quite natural because it is Christmas.

It is this air of happiness, this sudden softening of the steel, that makes a modern Christmas. No doubt it was so in the past—it must have been. But then, if we may believe the Christmas cards, snow was a commonplace, the holly was always prolific, yule logs blazed—and so forth. Happiness was part of Christmas. To-day the yule log has given place to the electric fire, snow is a rarity, and when it falls is instantly a brown-grey slush; and the holly, so I gather, is no longer what it was. But the happiness is left. Happiness is Christmas.

And Christmas, in myself at least, induces a spirit of contemplative retrospection. I dare not look forward—for that means contemplation of the eternal struggle to wrest a living from a sterile world. I look back. I doze before my fire, as any well-fed cat, and stretch and live again the things that I have enjoyed. Some small intimate things that can concern no one but myself and those near me—the small laughs, the brief excursions, the idle joys and quick sorrows that make life so grand a thing. And some that I have enjoyed with others: a tall forward in dark blue booting the ball far into the December mist and with long stride outstripping a three-quarter in light blue in the race for the try; the great roar as Oxford pass below Barnes Bridge, one rung further up the ladder from decadence to normality; the greater roar as Shaw dives over at the corner and Scotland are three points nearer the Calcutta Cup; the polite clapping as Bartlett smites the Players' bowling everywhere over Lord's, and all the while looks nonchalant; the stunned silence and then the shout as Doyle swings himself out of the ring and leaves Phillips the victor, in what had at least been a fight.

And days of countryside: Leckhampton Hill, and Bibury; and the banks of the Itchen with the trout fat and fearless and myself with no rod to my hand; and the sudden whirring as a cock pheasant gets up beneath my feet at Burley and startles the woodland into life with his clamour. Of the wind whipping off the sea at East Wittering, and the gulls mewing; of hot windless days on down tops with England panoramic below, and the hum of a tractor afar off; of the gentle green of larches in spring and the rich orange of beeches by Harting in autumn; of many things.

Christmas is the time of memories no less than of mottoes. There may be longing, there may be regret, in some of the memories—there should always be peace. And it is fitting that at the end of the year we should consider the year that is passing. We, probably, did many things during the year without due consideration—almost certainly we did—and probably we enjoyed ourselves sometimes because we did not consider; and now looking back?

One should look back, and not only on the pleasant things—though they will predominate—such is the effect of good food and the things that help to make good food good—for that is beneficial. And there is so little time for retrospection in these hurried days; it is so easy in the hustle to forget the past and the lessons it should teach. Time goes more quickly with each passing year. Matthew Arnold knew that

> "Ere the fleeting hour go by,
> Quick, thy tablets, Memory!"

Christmas is fleeting. It is as well to remember.

And before I forget I must get some presents. It is as well to remember.

BRIAN VESEY-FITZGERALD.

THE CHANGING FACE OF THE COUNTRYSIDE

By R. H. MOTTRAM

(Author of "The Spanish Farm," &c., and winner of the Hawthornden Prize, 1924)

SUPERFICIALLY this is not a subject on which a bred and born townsman such as I am should have much to say. Yet, like so much else in English life, that conclusion is deceptive. Not only is it partly true that "Lookers-on see most of the game," but, further, there is no real boulevard type in England. The Cockney is not a townsman, he is an exile from the country. I, who was born and grew up within sight and hearing of the biggest agricultural market outside London, have always had a strongly developed interest in the country. I could not help it. My father, although he belonged to a family of which every generation for a century had been born within the city gates, in his capacity as a bank manager was quite as much and perhaps more concerned with farming and land owning than with town industries and conditions. My mother was a country-bred woman. And every Saturday my native place became the scene of the weekly market. There were more country people in the streets than townsmen, great herds of cattle, flocks of sheep and poultry were being conveyed to the acres of open pens that lay only a stone's throw from our windows, and the sound and odour of them filled our house.

The country then, to me, was no mere place to which I went for a holiday. It was that only incidentally. It was my father's business, my mother's background. And from the topmost windows of our tall house I could see clearly where the roofs and chimneys, spires and gardens left off, and the fields began, the ploughland that was golden or chocolate brown, the pasture that was grey-green, yellow-green, emerald green by turns. Nor did the prospect lack the lovely horizon of smoke-blue, steel-blue or blue-green coverts, the sand and heather of Mousehold Heath, the broad shining silver of the River Yare. For the country to me was no mere landscape. It was a place where people worked. Ploughmen and shepherds, teamsters and wherrymen all had their parts, and on the farthest hills the sails of windmills whirled incessantly. That was the townsman's outlook. I have to survey the changes that were and are taking place in it. I can do so easily, for that must have been almost the first serious subject I heard discussed. My father was full of it. Farming was not what it had been. He regarded the subject gravely. My mother was full of it. She welcomed any change. She had never forgiven the narrow limitations and half-animal surroundings of the village in which she had been one of the two educated women. She had made the utmost haste to get away from it. He used to describe the glories of the old Essex homestead of his cousins, in the 'fifties, and only incidentally it transpired that the labourers lived in earthen-floored hovels and were riddled with small-pox, among other things. She lamented the utter lack of privacy of her early home, the way everything she did was common gossip. In her unguarded moments she also lamented the flowery and ferny lanes she had quitted for the town streets, and with tears in her eyes showed us rare plants and birds. Such were two personal contacts with the country in the 'eighties. They were very typical. They were discussing two different chapters of one of the oldest stories in the world, and I can only make my later chapter useful by showing it—a mere incident—in its true relationship to the whole.

The countryside is changing. It always has been. I wonder what was said by the man whose flint arrow head I picked up on Thetford Heath, when he found his neighbours scratching the soil and growing corn instead of hunting mammoths like gentlemen as he had always done. I can imagine quite well the consternation of a later generation of Britons, who saw their fields dotted with the country houses of the Romans, whose ornamental pheasants ate their crops. I sometimes think the Saxon age must have been the golden one of agriculture. No one did anything else to speak of. And we know that the Norman kings had to make savage laws to preserve game. The controversy over this change in the countryside still lingers, perhaps more noticeably than the one that followed it, which arose from the hotly debated question, were the monks good landlords? Military service in respect of land was no good to them. They wanted payment in money or kind. And mixed up with their administration of the countryside (of which they owned in Norfolk one-eighth, and we may be sure it was the best farmed) was the most dramatic change of all—the first enclosures, and the introduction of commercial sheep farming. Nothing that has happened in the twentieth century has effected anything like the drastic displacement of population and alteration of the landscape. Not that the sheep-farming Cistercians and their imitators began it. The drift to the town is older. I find that the names on a Norwich jury list of the year 1288 are half of them country names of men who had come in from the surrounding villages. Why? For precisely the same reason that makes men do it to-day. They think they can get more money for less work.

For, although my father didn't realise it, the prosperous farming of his boyhood was a freak and a brief one. Farming never has "paid" for very long, and the real reply to the question, "Were the monks good landlords?" is "Any landlord is better than none. He has got to keep up the buildings, roads and drains because they are his!" Many a man who bought his farm in 1920 knows that. Anyhow, the monks went. They may not have started the drift to the towns, but we know for certain that before Elizabeth's day it had already assumed formidable size. The Orders for the Poor for Norwich tell their own tale. But the countryside went on changing. Then there came the day of the great landlords, Townsend with his turnips, Coke the model agriculturist. Then came Free Trade and Steam Transport, and it became cheaper to bring wheat from Canada and mutton from New Zealand. It was over this I first remember hearing the lamentation, and once again men said the countryside was changing. Well, it was, and high time. I have heard the older type of landlord

lament the hedger and ditcher who worked better because he was illiterate, but my belief is that in reality the old country type had the virtues that go with extreme poverty and bad conditions, which made him endure a good deal and work because he knew of nothing else to do.

Fortunately, it seems impossible to keep people at that level. Knowledge, hope and ambition will leak out somewhere. I do not believe that the man who drives a reaper and binder is a worse man than the one who used to mow with the scythe and bind with his hands. I do not believe that the man who works a tractor is a worse man than the one who used to walk behind the plough. Every time I see a farm cart with pneumatic tyres a weight that used to drag at the old horses' shoulders is lifted off mine. Every time I see a smart boy delivering clean milk in sealed bottles I do not sigh for the (often imaginary) dairymaid. I do not believe eggs are worse for being carried in proper containers, or that apples suffer from being properly packed.

No, I rejoice in all these things, because I know that the drift to the towns is over and we are most of us going back to live in the country. The glamour of the town is gone. Better cottages, pure water, proper drains, wireless and 'bus are more and more within reach of the cottager. The electric pylon strides across the countryside. More and more people want to move away from the street. Whenever I see that the acreage under cultivation has shrunk I ask myself how much of it is due to houses built for people who used to be herded into mean streets. Does it sound too rosy a picture? I will qualify. The new countryside towards which we are going is not going to be made without effort. The old one was not. Someone mapped out the old common strips of fields. Someone protected the growing crops and stock. Our problem is not quite that. The day is over when drought or flood, foot-and-mouth disease, or sea erosion could bring famine and disaster. The danger is rather that our new countryside will be over-mechanised. The first sign is ribbon development and the bungalow. The electric pylon can be forgiven, and how much do we worry about the railway? No, it isn't that. It is the lack of squire and parson, the lost sense of the village being a family with a common life.

Let me hasten to add that I am fully aware that there were bad squires, indifferent parsons in the old days, and that the old family life was often lived by the very poorest of its members. I am simply reporting what I hear. When a billiard room is provided the villager won't play with his like. He wants someone from a slightly higher social sphere to lead off. We must get over that. Then there is the fact that many of us can never belong to the village as its inhabitants used to, because our job is not there, it is in the nearest town. Again, who shall make the petrol pumps look as the smithy used to look, or the road house take the place of the inn, or the evening off by bus or tandem bind us together as the morning service or church once did? Yet I do not despair. What would Gurth the Saxon have said of the life of Sir Roger de Coverley, what would the builder of Silbury Hill have made of Sweet Auburn, loveliest village of the Vale?

DOWN IN DORSET
The gentle curve of the street at Milton Abbas, with its horse-chestnut trees and yellow walled cottages

This seems to me the central problem of the changing countryside. I could easily go into rhapsodies over the Old English village, most picturesque in the world. Experienced travellers tell me there is nothing like it for its immense range and variety and character in so small a country. And, indeed, I know this to be true, even as against Ireland and Scotland. Perhaps the Cotswold or Chiltern stone-built villages are the best, but are they much better than Essex or Midland timber and thatch, East Anglian colour-washed plaster and red tile, the whitewashed purple-slated ones of the West? Where else on earth is there, apparently, so complete a social microcosm, the hall behind its coverts, the church among its stones, the dwellings round the green, the windmill on the heath, or the watermill by the bridge, the alehouse at the cross roads, the market house, the pound, the stocks?

But I have to go deeper and ask myself if the life was always as placid and its rewards as well distributed as its appearance might warrant our supposing. And I have to confess that the village was not always so perfect as it looks. If it had been there would have been no transportation or emigration, no constant urge towards the towns. Now comes the point: Can we make the new village which is arising any better? We shall be hard put to it, to make it look as seemly. But I think we shall succeed if there is someone in the Hall who really takes the lead, and if the church really means something that we want and that all the comfort and sanitation in the world cannot give us. The rest is easier. It isn't difficult to find the men (and women) who will play games on the green, although they may call it the Recreation Ground, or more simply the "Recker." Nor to play darts in the pub.

The countryside has changed, it is still changing. If we can make the future even as good as the past, we shall do well.

I FEAR THE GREEKS

By MAJOR C. S. JARVIS

THERE WAS A DEAFENING CRASH, A BLAZE OF FLAME . . .

IT was Christmas Day, not in the workhouse, but in 1918, and I had only just recovered from the War, Spanish 'flu, and the celebration of Armistice Day in Shepheard's Hotel. With all three there had been a considerable risk of losing one's life, but I was never nearer death than during the famous Australian versus Yeomanry pillow, bedding and bedroom utensil fight on the staircase at Shepheard's when a 3ft. pot complete with palm thrown by an Australian V.A.D. hurtled down three storeys and swept away the rank-badges from my shoulder. I had heard that there was to be an even more convivial celebration on Christmas Day, but I had had enough of War, and instead I decided to spend the day peaceably and safely on Lake Mariut after duck.

Lake Mariut, which is an enormous stretch of shallow water on the west of Alexandria, owes its existence to Abercrombie in 1801, when he opened the dykes to cut off the French Army from Cairo. Years ago it had been the most wonderful duck sanctuary in the world and then the vast cosmopolitan population of Alexandria had imitated the Briton by taking up shooting and, when the Egyptian fellahin in the villages round the lake followed suit from mercenary motives, the migrating duck very wisely gave Mariut a wide berth.

Then came the War, martial law, prohibition of firearms and acute shortage of cartridges. After three years of perfect peace on Mariut Lake in the midst of universal war, the duck realised that something must have happened and returned in their thousands. At the western end near my station of Amria one could see any morning at sun-up myriads of skeins of duck of every variety known to Egypt passing from one feeding haunt to another until about ten o'clock in the morning, when they would all settle on the water in the centre of the lake to sleep, forming a dense black mass that extended to the horizon. I feel, therefore, that I have been most restrained in writing of them as coming in thousands; one might almost be excused if one used the word "millions." The trouble about the dense black mass, however, was that it remained in this condition all the hours of daylight, and nothing would break it up or set the birds on the wing again until dusk fell.

Well, the duck were there and so was the boat and its *reis*, a very cross-eyed Arab from the Aulad Ali tribe. My gun I had just retrieved from my heavy kit, where it had been since 1915, and the only difficulty was cartridges. An exhaustive comb-out of all the Alexandrian shops, however, with a British policeman assisting, produced a hundred very doubtful-looking Belgians. They cost £4, and I was given to understand by the Greek who sold them that they were cheap at the price.

When I was at school I used to wonder why old Virgil had let himself go over those lines that run, "*Timeo Danaos, et dona ferentes.*" After that day I felt inclined to agree with him, and in fact was prepared to go a bit farther and say that Greeks are just as much to be feared if they are not giving away things, but are in fact overcharging for them.

On Christmas Eve I had dined at the Royal Air Force mess at Amria, and when discussing the shoot I intended to make, the Squadron Leader had had a sudden brain wave. I had explained that the shoot would be over at 10 a.m. as the duck went to sleep and nothing would shift them.

"Nothing?" he asked. "Supposing I swooped over them in a 'plane and flew up the line of them?"

I admire the Army, I love the Navy, but for initiative give me the R.A.F. No one has ever heard of a Colonel offering to drive a friend's partridge shoot with his battalion, nor of a naval Captain putting his cruiser at one's disposal for tunny fishing at Scarborough, but the Royal Air Force will do anything to oblige.

The next morning—a very chilly one—I set off with Mohammed of the Aulad Ali in his boat. It was not a very good boat, or perhaps the bailer was not up to its work. An ordinary bully-beef tin cannot keep time with a boat that is more seams than planks, but I will say that Mohammed was a very rapid bailer—one of the best I have ever seen—and at no time did the water rise above the tops of my boots. The only thing that puzzled me was his surprise at finding the boat in its leaky condition and his remarks to the effect that he did not know how it had occurred. Judging from what I could see, it had been in that state shortly after Abercrombie had let the water into the lake in 1801, and nothing had been done about it since; but in those days the Arab was more or less new to me.

Owing to the bailing we progressed very slowly over the shallow lake to our hide in the rushes, and this was irritating, for the sky was streaked in every direction with flights of duck, all of whom, of course, kept well out of range of the boat. Eventually, however, we arrived, and Mohammed, having pulled the boat up on to a ridge of mud, thus keeping the water level inside below the Plimsoll mark, we settled down to serious work, and very serious work it was.

Immediately we had hidden ourselves in the depths of the reeds—the same reeds that had once hidden the infant Moses—the duck in flights of tens and twenties came swooping past within easy range. Swinging down to the rather derelict and part-worn wooden decoys that Mohammed had set out would come a great mass of wigeon, and as one fired there would be a whistle of wings from the opposite direction as a huge flock of teal swept by. Then would follow pintail, conspicuous with their white patches and extremely long necks; pochard, looking fat and heavy; mallard, so common in England but so rare in Egypt; shoveller, with their rather top-heavy silhouettes; ferruginous, glorious in their black, white and chestnut, but foul to eat; and all the time teal and more teal in clouds of 30's, 40's and 50's.

The Belgian cartridges spluttered, fizzed, popped and banged, and if one had been shooting grouse at Glendye or pheasants at Abbotsbury there might have been little to show for the expenditure of ammunition, but these duck were easy and plentiful. If a cartridge did hang fire for a second and so missed a passing pack of wigeon, it exploded at just the right moment to rake the ranks of a huge flight of mallard coming up from the opposite direction, and if the next one missed fire altogether one did not notice it in the excitement.

Then suddenly the flight so far as I was concerned ceased completely. The air was still full of thousands of duck, but they kept well away and out of range, and then I realised that there was someone else shooting on the lake. From a patch of rushes some 90yds. from me, and between me and the open stretch of water, I caught the glint of a gun-barrel and saw two puffs of smoke followed by a double report. Then heading straight for me came a fine flight of pintail, which were at least 150yds. from the interloper, and therefore of no interest to him. However, up went the gun-barrel—plop—plop—and the duck swung off to westward hopelessly out of shot.

For some time I watched this display with increasing choler. In the first place I was commandant of the area, and all permits to shoot had to be issued from my office, and nothing arouses the rightful ire of the Government official more than some unlawful infringement of his personal perquisites. Secondly, my neighbour obviously belonged to that very despicable and jealous type who says to himself, "They're out of range for me, but I'm damned if the other fellow's going to get a chance."

For the next quarter of an hour my neighbour, who must have had an enormous store of pre-War cartridges, fired at every duck that came within sight, from those which passed him at 5yds. to others that appeared on the horizon a quarter of a mile away, and I sat doing nothing—smoking my pipe and chewing on the stem.

Then I called Mohammed to me. "Go and tell that man there," I said, "that I wish to shoot also. Tell him to leave those duck that are far from him, and let them come to me."

"*Mafoom*" ("Understood"), said Mohammed, and holding up his skirts in Victorian style he paddled slowly across the open water to the rushes.

In a quarter of an hour he was back again. "He is a bad man—no good. He say you go to hell and damblastbloody. Very bad talk."

"Who is he?" I asked.

"*Huwa wahid Kawagha Greeki*" ("He is a Greek gentleman"), said Mohammed. "I know him well. He has a shop in Alexandria; he sells those dambad cartridges you have."

"You go back and tell him," I said firmly, "that the next lot of duck he fires at that are out of range I'm going to fire at *him*."

Mohammed was on his way back to me after delivering the message when the opportunity occurred. My friend fired wantonly at a large pack of birds that were at least 200yds. from his hide, so I put up my gun and solemnly fired two barrels into the brown of the rushes. One must remember it was only a month or so after a war in which one had been shooting at Germans, Austrians, Bulgarians and Turks indiscriminately, so a couple of barrels at a Greek was hardly worth considering.

The result, however, was electrifying and most satisfactory, for a boat suddenly shot out of the rushes in a cloud of spray and, with both the Greek and his boatman striving to emulate "Goblets" form, disappeared in the haze of the horizon. The Greek must have had far more faith in his cartridges than I had, but perhaps he had been unlucky enough to get one of the overproof ones. Most of them were definitely underproof, but every now and again there turned up one that was a real "bonzer," as the Australians have it, and if one of these had raked the rushes it explained adequately the sudden slump in Greek stock.

After this the sport improved considerably, and I had a very satisfactory time until ten o'clock came with its concomitant cessation of all movement and a dense sleeping mass of duck on the surface of the lake.

Then I heard the distant drone of an aeroplane and saw at a great height heading towards me the outline of a pale yellow machine—the Royal Air Force, sharp on time, had come to the rescue. The 'plane circled twice to obtain an appreciation of the situation, and there was some movement and uneasy splashing among the duck below. Then suddenly the nose of the machine dipped and down she came with a straight dive at the birds.

Some 50ft. from the surface of the lake the machine flattened out and with the engines in a full roar swept up the line of duck. The great black mass of birds broke into a travelling line of white foam like a swiftly-rushing wave. There was a rush of wings and in a moment the air was full of duck—a disordered crowd at first, but then, sorting themselves out into species, they winged outwards in Vs and skeins.

In half a minute my gun was nearly red hot as I fired right and left and overhead at the rushing flights, and then, realising that my very expensive and unreliable cartridges were running low, I steadied up to take only certain shots. At this moment a flight of mallard passed right overhead at a considerable height and I threw up my gun, firing the left-choke barrel in the hope of getting one.

There was a deafening crash, a blaze of flame, a stunning blow on my shoulder and head, and when I came to I was lying in the mud on my back with several long, warped planks floating away from me. After a while it struck me that these planks were all that remained of the boat, and I crawled to my feet to look for Mohammed. He was sitting in the water 10yds. behind me and looking so surprised that his eyes were quite straight for the first time in his life.

"What happened?" I gasped. And then Mohammed handed me from the mud my gun, or what remained of it. The left barrel had gone entirely and so had the middle rib, and the stock was shattered into slivers and splinters.

"The cartridges," spluttered Mohammed, blowing the mud from his mouth. "That Greeki very bad man—damblastbloody."

As the *Field* explained afterwards, the burst must have occurred through a very weak cartridge that had left the full charge in the barrel so that the next shot had exploded in the chamber and blown the gun to bits. Although the Greek had got one of his overproofs for himself, there seemed no doubt about the fact that I had reserved a very special one for myself, and one way and another it seemed that he had won the contest not only on points but on the knock-out also.

MISTLETOE

A Romance of Christmas Numbers

By PATRICK CHALMERS

CHRISTMAS EVE was to-morrow and, at Mulberry Park, the seat of Sir Marrable Daukes, the two younger members of the Daukes family, their cousins, the Quantock girls, and the Quantocks' brother Billy, were regaling themselves with China tea, hot cakes and cress sandwiches. The room they sat in was a cheerful one, known, for no particular reason, as the gun-room. It had a wide hearth and an exuberant fire. Its ceiling was low, its walls panelled, its chairs saddleback. At the moment it provided a pleasant contrast to the wet, grey-and-yellow gloaming without.

The party calls for little description; it was youthful and rather noisy, and Miss Angela Daukes, at the age of 20, was extremely pretty. She was a slim slip of a girl dressed in red. Her face and its clean-cut features varied but slightly from the classic mould. Yet her profile had a character-bestowing hint of goblin liveliness. Her complexion was excellent, her eyes green-grey and her fair hair, the hue of ripe barley, hung in bright coils on each side of her small head. David Daukes was eighteen months younger than his sister, of whom, even to a low-pitched voice, he was a handsome replica. David was a prefect at Clifbury, and while unprominent at games he was proficient in mathematics. He was said also to have some ability as an amateur actor.

"Tell us about him," pleaded Muriel Quantock. She had the bright inquisitive eyes of a starling.

"About who?" pretended Angela. She helped herself to a sandwich.

"About the Milden man, of course."

"Though I have hitherto been spared his acquaintance," said David, "nevertheless *I* can expound to you Mr. Giles Milden. He is arriving on the 4.25, presumably he will be here almost at once. He is a great hulking soldier of the brutal type. He has won something called the middle-weight championship. A boxing contest. He comes here to shoot and, probably a secondary consideration, to woo the girl Angela."

"You little beast," said Miss Daukes impassionately. She offered her sandwich to a plethoric black pug who refused it. But her words she addressed to her brother. She had lately said "No" to an over-sudden offer of marriage on the part of Giles Milden, a denial private to Giles and herself. Now she was aware that she regretted that "No." It would, she supposed, in the circumstances, have shown better taste if Giles had cancelled his acceptance of the Christmas invitation sent to him by Lady Daukes some weeks ago, before, of course, he had made such an idiot of himself. But was it not she, Angela, who had been the idiot? Anyhow, she was angry with herself, irrationally angry with Giles, and found David's character-sketching puerile.

"Did he really win the middle-weights?" Billy Quantock inquired.

"Something muscular of the sort," said David, "it's extraordinary what girls will admire. And mind always triumphs over matter."

"Is that what they teach you at school, dear child?" asked his sister.

"Yes, sweetest, one of the things; it's called an epigram in case you didn't know. Another is that biggest is not always best."

David's green-grey eyes sparkled impishly, and he added, as one who tempts a challenge: "What's more, these big brutish men usually have a yellow streak in them. Tell you what, my pretty one, I'll bet you half-a-crown that within the next twenty-four hours little David will find a reason to pull Goliath's nose or box his ears and that no reprisal will be dared."

"Well, I don't suppose he'd actually *hit* a little squirt like you——"

"We are unhappily alike——"

"But it would be to your benefit if——"

"Will you take me on?"

"No, of course not, I——".

"Cowardly——"

A car hooted in the avenue's bend. "Oh, well, all right, and I hope he——"

"Done."

"Here he is," said Billy Quantock.

David took a cigarette, tapped it in the du Maurier manner, and left the room singing aloud that journeys end in lovers meeting. Angela's eyes followed him balefully. A few minutes later she was shaking hands with Mr. Giles Milden, hopeful that in the kindly firelight no one would notice that she was blushing. Giles was blushing blatantly. He was a big, blue-eyed young man, long limbed and with a tinge of red in his hair. He blushed like a boiled crab. Though a fighting man, his manner was subdued and shy. He sat on the edge of his chair and said: "Oh I say, Miss Quantock," when Muriel asked of his Etonian tie, if it was that of the Old Clifburians. His conversational powers seemed to be those of the jelly-fish. In spite of which Angela once more thought of herself as an idiot. Clearly she would now never marry anyone. She said that she thought she heard her father calling her, and, jumping up, she left Giles to the Quantock girls.

"AS HE STOOPED, SHE SLAPPED HIS FACE WITH A GLOVED HAND"

Sir Marrable Daukes, owner by purchase of Mulberry Park, was a highly successful surgeon. Doing his best to cure on five days in the week, he, during the shooting season, on the sixth day, did his best to kill. But Sir Marrable was a busy man, and so he wisely left the detail of a shooting day to Pingle, his head gamekeeper. To-morrow would be a shooting day and, for a Christmas shoot, the Mulberry Park coverts had still a good stock of pheasants.

Mr. Milden had been asked to shoot them. He was a good shot. And, though a shy young man, he was an optimist who rarely said "No," and never took it for an answer. He had therefore kept to his Christmas date at Mulberry Park and had not abandoned hope of building out of the visit a more permanent engagement. Since his arrival it was true that Angela's treatment of him had been a discouraging mixture of casual friendship and fixed bayonets. But, as he dressed for dinner, he reflected that there were three days to go and that three days gave time for a change of fortune. He looked healthfully forward to an excellent dinner in the society, even the perverse society, of his beloved, and, in the morning, to the shooting of some of the highest and best pheasants in three shires. With agreeable anticipations he tied a neat black bow under his square chin.

As he did so David Daukes, in the rambling back premises of his home, was taking thought with Pingle for the morrow, and the interests of the guest. David had a mathematical mind, and Pingle, perfect in his way, had not. Therefore David felt it incumbent upon him, this time anyhow, to see that the numbering cards were foolproof. To see, in fact, that each card told its recipient what his number would be at each stand of the short winter day. Thus there could be no mistake. For instance, David was desirous that Giles Milden's number should work out with Giles standing No. 7 at the last stand of the afternoon. The covert would be Lower Catfoss. No. 7 would stand in the fringe of the timber at the far end of the wood. No. 7 would find his place under the crab-apple tree whereon grew, white-berried and parasite, a big bunch of mistletoe. He, David, would hand Giles the card himself, and No. 7 was a productive stand, as testified the litter of empty shells among the shrivelled windfalls.

David's calculations had required a little more than common care since he had to allow for an idea, amounting to a certainty, that one of the guns would fall out shortly after luncheon. But this eventuality was now arranged for and, content, the numerator smilingly joined the sherry-drinkers in the drawing-room just as the gong sounded.

Next morning, in the silver of weak sunshine, the Mulberry Park shooting party assembled. Four guns were of the house, four of the locality. The last threw their greatcoats into their cars, rummaged in cartridge bags, and stamped their feet on the damp gravel sweep. Mr. Chapman-Formby's Labrador, with the courtesies of his kind, made acquaintance with Jane and Jess, Sir Marrable's spaniels, who met his advances with a tuck-tailed pretence of the coy. Somebody struck a fusee; it hissed and spluttered and the fragrance of a newly-lit cigar warmed the grey air.

David dealt out the number cards, and the guns, in twos and threes, presently moved off through an iron handgate and across the broad paddock which, on notepaper and elsewhere, lent the dignity of "Park" to the Daukes's address. Among red bracken beds rabbits dodged to shots and shoutings, experienced cock pheasants ran back, less wily ones swung over at immeasurable altitudes and, now and then, a soft creamy-brown woodcock, missed a dozen times, flipped lazily through bare branches and was gone. Lunch was eaten indoors and, after lunch, the ladies of Mulberry Park went out with the men. The wind had shifted to the west and, rising, had brought with it a light drizzle, a dampness sufficient, and no more, to justify Angela in wearing gum-boots and a waterproof, and in pulling her dark-green hat well down over her ears. But her face, kissed with the wind, looked even more lovely than usual, at least so thought Giles Milden.

At luncheon Angela had avoided Giles's attempt to occupy the chair by her side. He had therefore sat opposite to her and been the tongue-tied witness of his lady's apparent delight in the humour of young Mr. Chapman-Formby. The latter was a big, cheerful, plump fellow, and Giles wished that he might have three minutes with him in a twelve-foot ring.

"Stand with me, Angela?" implored Giles as

the procession presently crossed the avenue and went to Pyecrofts.

Angela said, "Not this time, Giles, I must stand with Mr. Chapman-Formby," and, except when she shed a brief patronage on her father or brother (who closely criticised her hat), she fulfilled the obligation to Mr. Formby throughout the afternoon.

At 3.30, in the last of the shooting light, Giles Milden's programme placed him by the crab-apple tree just where David had last evening visualised him. For, as David had foreseen, one of the guns had fallen out. "Who's short?" enquired Sir Marrable. Billy Quantock told his uncle that David had, of a sudden, found his gun going off, disconcertingly, both barrels to one trigger pull. Therefore David had hurried back to the house in search of another and more trustworthy weapon.

So Giles, at the far end of Lower Catfoss, was, as we have seen, posted under the crab-apple tree. The drizzle had taken off, and Angela, whose tweeds were becoming, had followed David's suggestion that he should carry her waterproof home. Giles, since his enchantress was avoiding him, knew nothing of David's chivalry. But now a twig cracked and the small sound caused him to turn his head. He was delighted to see Angela, not more than 3 yds. away, upon her shooting stick. That she should be wearing the waterproof in which he last saw her naturally caused him no surprise. Nor, to his optimistic mind, did her so tardy condescension.

"Giles," she cooed, "why have you been avoiding me? I hardly thought you so cruel, so *unkind*. Won't you be friends?"

Thus attacked, Giles, a simple soul, dithered. "Angela——" he began.

But his companion cut him short. She glanced upwards at the mistletoe: she sat immediately beneath it. "Mistletoe," she said dreamily, "the *mistion* of our Saxon forefathers. '*Mistion*' meant 'a state of being mingled,' did it not, Giles? And you don't seem aware, or perhaps you don't care, that I'm sitting under——."

Giles was not such a simpleton as all that. He made one step of it to the speaker's side and (No. 7 stand at Lower Catfoss is out of view of the remaining stands) he, I have no doubt, would have treated Angela according to custom and invitation only, as he stooped, she slapped his face with a gloved hand, told him he was a cad, and walked off with such dignity as a wearer of gum boots may assume. Giles rubbed his cheek: he said to himself, dolefully, that he would never understand girls, and that he had better catch an evening train to town.

The drive was beginning, sticks tapped in the wood. Round the corner came the sound of shooting, and the occasional crash and thud of a fall among the thorns and hollies.

Upon the hidden ride the wearer of the mackintosh met another figure, its duplicate, but in tweed. "*David*," said the latter, "you motley little fool—what on earth——"

"I want half-a-crown, please, Angela," said David Daukes, "that great bruising lout of yours has been hit without hitting back." He explained briefly.

"You, you little *beast*."

"Well, you can go and kiss the place and make it well," said her brother, rudely. "I'm going home to change your things, my dear (how alike your hats are by the way) and to put Billy's boots back in his room before he comes in."

He retreated into the shadows. Angela, swinging her shooting-stick confusedly, told herself that if she turned back now she'd regret it always. She had been, as a sleep-walker, gravitating towards No. 7. She bit her lip and advanced with the traditional firmness of the culprit who walks to the scaffold.

Once more Giles heard a footstep behind him. Once more he turned. Once more he saw Angela upon her stick beneath the bough. But, somehow, it was a different Angela. It was not the absent waterproof that made the difference, but something in her grey eyes was so clear and so kindly that even Giles, who, a moment ago, had found young women incomprehensible, could read the riddle.

"I didn't mean to hit you," said she. "I didn't mean anything *ever*, it's all been a mistake——"

"Darling, *do* you mean——?"

"Yes, Giles, I mean anything you want me to mean, *anything* you like."

So, as a beginning, Giles, once more, helped this time rather than hindered, put the mistletoe to its time-honoured use while the last flush (four white-collared cock pheasants) streamed, unshot at, over No. 7 stand.

At tea, an hour later, Angela cascaded half-a-crown's worth of copper down the neck of David Daukes.

SPORT IN THE PERSIAN GULF

Varied Bags with Gun and Rod

THE Persian Gulf is notorious for its climate, but few people who have not been there know anything of the opportunities there are for sport. During six months in one of H.M. ships in the Gulf I enjoyed first-class shooting and sea fishing.

For shooting, Basra is a good base, from which the country can be reached by car or motor boat, both of which can be hired cheaply. Though the roads were rough and very soft in wet weather when I was there, there was a prospect of them being improved and no difficulty in transport should be experienced.

In February black partridge, duck and snipe were plentiful, and on three different days the bags were:

48 brace black partridge and 1 hare (3 guns).

150 duck, 2 geese and 1 pig (5 guns).

25 couple of snipe (2 guns in an afternoon).

On October three guns shot 98 brace of sand grouse on one morning.

The locality in which duck are found depends on the amount of flooding in the river basin, and it is advisable to send out a shikari a few days in advance. The Hammar Lakes appear from the map to be the best place, but are apt to be too deep, and our shikari took us further north near Shatra al Amara. This necessitated a drive by road of three hours, and a further hour by motor boat up a narrow irrigation channel, and then a short distance in one of the picturesque native canoes, with high curving prow. This long journey was, however, well worth while, not only for the sport we obtained but for the view of the countryside, taking us as it did through the Garden of Eden, where we were shown the tree from which Eve took the apple. Dawn was breaking when we stopped, and the moon reflected in the river was all the light we had by which to see it.

After unloading guns, rifles, food and cartridges from our canoes we built hides round a vast expanse of reeds into which the duck flight, and soon the sport began. The duck we shot were teal, wigeon, pintail and marble, with a few shovelers.

Rifles were taken as a precaution against attacks by pig, which have several times worried shooting parties, and on this occasion one of our party had to put down his gun in haste to repel an attack from the rear by an old pig. This later provided us with 2 cwt. of rather tasteless boiled pork.

Towards sunset pelicans flying in single line ahead, about 200 strong, made a wonderful sight, with their long thin bodies and enormous wings flapping across the sky. After every ten beats of his wings the leader stopped and glided for a few seconds, each of the remainder doing so in succession, so their line traced an almost perfect wave towards the glowing west.

Black partridge shooting does not require such a long journey from Basra, and in my opinion is better fun, as there is plenty of walking to be done. We went to the neighbourhood of Ezra's tomb, in the fertile corn and date-growing land between the Shatt al Arab river and desert. I do not know the correct name of this variety of partridge—it is about the size of a grouse and coloured like a guinea fowl, but black instead of grey is the predominating colour. They are strong runners, and a spaniel is a great help. Their flight is deceptive, appearing to be slow, but I soon realised that they move every bit as fast as their English relatives.

The country consists of corn and date gardens, in which there is generally long, coarse grass which provides shade in the middle of the day. Further from the river there is a stretch bordering the desert where camel thorn grows in clumps about 2ft. high. Birds were found in any of this cover, and the natives had no objection to our shooting in their date gardens, which are unfenced or in the young corn; nor was there any difficulty in getting boys to carry bags and beat—in fact, rather the opposite happened, and it was hard to persuade them that all were not required. This was overcome, however, by giving round brass discs threaded on string to those we wanted. At the end of an hour or so we paid "backshish" to those wearing the tallies, and the others soon disappeared. Over these matters an interpreter is a great help, and we were lucky in having an Irqi who acted as such, knew all the country, and was, in addition, a first-class shot. It was owing to his help that we were always sure of such good sport.

The snipe shooting was arranged hurriedly and without local knowledge, but proved successful. Two guns, mediocre shots, got 25 couple one afternoon a few miles up river from Basra on the left bank, opposite Ashrafi Creek. Conditions were not ideal—there was too much water—but we had some very pleasant shooting.

In October sand grouse were flighting in large packs to a lake beyond the old fort at Shaibah, about two hours by car from Basra. They come in from 20 miles out in the desert, flying high and chattering loudly till they drop down to the water, giving easy shots. The beginner soon finds that by aiming for the leading bird he will probably kill two or three every time. It is really too easy, and enormous bags have been made. The flighting ends soon after 9 a.m., and anyone who had not seen it would never imagine there was a bird in the desert, so silent and barren is it.

As far as sea fishing goes, I give the result of our efforts, and a few remarks. I was in the Gulf in February, March and April, and July, August and September, so cannot speak for the whole year.

Place.	Date.	Fish.	Weight.
Elphinstone Inlet	March 3rd.	1 caranx	41lb.
		4 barracouta ...	15lb.–22lb.
Khor Fakkan ...	March 29th	2 barracouta ...	4lb. and 22lb.
Duhat Shisa	April 2nd ..	4 barracouta ...	
		3 caranx	Total 120lb.
		1 seer	
Duhat Shisa	Sept. 9th..	1 caranx	29lb.
Khor Kuwan ...	July 21st..	1 caranx	11lb.
	July 22nd .	1 caranx	15lb.
	July 28th .	2 caranx	13lb. and 33lb.
	July 29th .	1 caranx	33lb.
	Aug. 1st ..	1 rock cod	17lb.
		1 dagalla	17lb.
		1 barracouta ...	7lb.
	Sept. 29th.	3 caranx	7lb., 9lb. and 53lb.
		3 dagalla.....,	13lb. and 15lb. (2)
		1 barracouta....	3lb.
	Sept. 30th.	2 caranx	44lb. (2)
		1 dagalla	9lb.
		2 seer	23lb. and 33lb.
		1 golden bream (?)	8lb.
Khor Jarama ...	Sept. 4th..	1 rock cod.....	15lb.
	Sept. 5th..	2 caranx	9lb. and 15lb.
	Sept. 6th..	1 dagalla.....	10lb.

The fish named "Caranx" was similar to those illustrated in the *Field* of April 25th, 1936, which were caught in the Red Sea. Our local name for it was "Prau," which, I think, is the Indian name; rock cod of several varieties were caught, but the commonest and largest were of chocolate colour. The fish described as a golden bream had not been seen before locally and was identified from a coloured cigarette card. I should be interested to know whether golden bream are found in those waters. Dagalla is the Indian name for a silvery fish with five distinctive yellow marks on its side.

The bait used was almost invariably a 6in. Wilson spoon. Fishing never started before 4 p.m., as it was too hot, and stopped not later than half an hour after sunset. Three rods usually went out and fished from a motor boat at slowest possible speed.

At each place fish were caught off a rocky coast, and it was our experience that few are found off sandy shores. Opinion was divided as to whether a strong tide rip was an advantage, but I think generally a moderate rip gave best results. Other conclusions were that the best time was from half an hour before till half an hour after sunset, and that a pink sky was ideal. The hottest months give the poorest sport, and fish jumping and tearing about at small fry on the surface seldom take a spoon.

Other places where fish are plentiful are round the islands Tunb and Bu Musa. I have not fished there, but have often passed and seen large numbers of fish. At Gwadar, not strictly in the Persian Gulf, great sport was had with "Yellow Tails," a form of bream, I think, and we caught a great many on trout rods up to 4lb. in weight.

The places I have mentioned, except Gwadar, are inhabited by natives only, living in mat huts, and no supplies of provisions nor water in large quantities are available, but they could easily be visited by a yacht, supplies being obtained from Muscat, Bunder Abbas or Henjam. The climate is very unpleasant from mid-May to mid-September, but quite comfortable though damp at other times. Imperial Airways machines now call at Bahrein, Basra, Sharjah and Gwadar, and there is a regular mail service from Karachi by sea as well as the overland route by train or bus to Baghdad, so the Persian Gulf is no longer the isolated corner of the world that it was.

A DOG OF COURAGE AND ENDURANCE

The Sporting Career of Gay's Vesta, a Labrador

By R. LECKIE-EWING
(Of Ewing's Landing, B.C.)

VESTA AND A VERY PROMISING DAUGHTER

I DO not think the *Field's* canine Hall of Fame would be complete without my giving its readers the story of my Labrador Vesta. My excuse for writing this story may be accepted when I say that for over half a century I have owned, and shot over, every breed of gundog. Many I have owned, chiefly amongst the curly-coats, were splendid gundogs, but amongst them none quite came up in all-round excellence to my Labrador bitch, Gay's Vesta.

Vesta was born ten years ago; her sire and dam were Ch. Beningbrough Tanco and Ch. Vidi of Adderly, and so her blood lines were excellent. She was shipped to me from Scotland when three years old, in whelp to the fine and well-known Ingleston Nith.

Before I got her she had had some six months training in Scotland, and the reports I received of her work were quite satisfactory if somewhat meagre. "Vesta is getting along nicely, she is very fast at all her work." That is all I knew of her until she arrived in British Columbia. She was a dog of medium size, a very lovely specimen of the breed; strongly built all over and with a fine head. I only regret that I never managed to get a really good photograph of her.

It did not take me long to find out what she was made of. She had brains; a superlative nose; was a first-class marker, and extraordinarily fast at everything she did. All her retrieving was done at a gallop, even a big Canada goose could not slow her up. She was also very obedient for a highly-strung dog. But more than all her other qualities I got to love her most for was her unfailing courage and keenness; she was a dog that never tired, and would work just as keenly at the end of a long day of punishing work as she did at dawn. Weather made no difference to her whatever, the more she had to do the more vile the weather, the better she seemed to like it.

When I got her she had been trained for retriever work only, but this type is not suitable for our British Columbia shooting; one must have for our land birds a dog that will hunt and find your game as well.

Labradors of intelligence very soon learn to do spaniel work, and she was no exception and soon became a first-class hand at finding and hunting her birds. The thickest cover or the most trying work in clumps of almost impenetrable blackthorn and snow berry had no terrors for her. If she scented birds in any sort of stuff she would work her way through and push them out. I do not know how she did it, but nothing could stop her. On runners she was perfection, and even now, as I look back on the four short years in which I shot over her, I can count on the fingers of two hands the birds which I think she should have got but failed to retrieve.

Vesta was an absolutely fearless water-dog, and her courage and powers of endurance in the coldest of weather were almost beyond belief. She would spend the whole day practically retrieving duck and geese when the water was at freezing point, howling north winds blowing, snow and ice all around.

I remember on two of our wildfowling shoots in the early winter months she would, after about a week's shooting, be the only dog left doing duty for four guns. She kept on cheerfully retrieving anything and everything we shot. The other retrievers—good as many of them were—had had about enough of it, and what they did keep on doing they carried out with no heart in their work.

One could hardly blame them; the weather was bitterly cold and thin ice had often to be broken before the dogs could reach their birds. On summer days Vesta almost lived in the water. She would stay in for hours paddling slowly about, often submerging completely and swimming under water. If she saw anything white beneath her she would dive and retrieve it.

She took a real delight in taking flying dives off the end of our wharf some 9ft. above the water, and I have had her dive from a height of 20ft. She showed no fear, and had I asked her, would have taken off, I think, from almost any height.

Vesta loved our camping trips, and she loved a boat or a car, for she knew well what it led to.

A SON OF VESTA
Most of her pups turned out splendid gundogs

One long day's shoot stands out in my memory as I write.

It was early winter; the weather was none too promising, but I got my dunnage together, Vesta and the rest of my stuff for a week's camping and wildfowl shooting before our lake froze over. We made the trip all right in my small dinghy and outboard engine.

I got our camp fixed up and everything ready for an early start next morning. Through the night I could hear flocks of duck on the lake, and many geese were on the move. During the night the cold became intense, and on looking out at daylight I saw a dreary landscape—ice on the lake, snow falling, and a howling north wind blowing. I began to wish I had not come.

Vesta, who always slept in my tent and often beside me in my sleeping bag, rolled out, cheerful and eager—as always—for the hunt. Many flocks of duck and geese were around us. A quick breakfast and we were off. In such weather I always find it hard to keep my hands and fingers warm, especially my trigger one, and this does not help one to shoot too straight. However, we were soon amongst the wildfowl. The wind, although bitterly cold, was a big help in bringing the birds within range.

I shot as many as I could to fall on land, so that Vesta should escape, as far as possible, getting too many cold swims. However, through the day she had to take many a long rough swim after a crippled duck or goose. The wind had cracked up the ice, and through this broken stuff she had to force her way. Not for one moment did she hesitate; if there was a bird to retrieve she got it. However, I had about enough of it myself; I could not keep my hands warm enough to shoot.

Dusk was creeping over land and water; we were some five miles from our base, and so I called it a day and turned campwards. I had given away most of my birds to passing Indians. These fellows never shoot, but their families are always glad to get any "easy meat." About half a mile from camp I saw a big flock of Canada geese heading upwind towards me. A heavy fall of snow was now coming down, and it was hard to see.

The big birds were getting closer, and as they passed over me I gave them a right and left. I knocked over my two birds—one fell close at hand, the other some 200yds. out into the icy lake. Vesta soon brought the nearer bird to me, but the other had drifted out and seemed to have stuck in a clump of rushes and mud. I did not want her to go after this bird, so called in my bitch. Very reluctantly she obeyed. She had seen, and marked, the second fallen bird, and was eager as ever to fetch it. Well, we got back to camp, half-frozen both of us, or at any rate I was. Being an old hand at the game I soon had a roaring fire going. It was nearly dark outside.

I looked round for Vesta; she was nowhere to be seen. I could not understand, and became worried about her when she did not come to my whistle. She was away the best part of half an hour. I looked everywhere for her. Suddenly, along the narrow trail I saw an object moving slowly through the snow, and on coming up closer I saw it was my dog.

She had gone back to my last shot and retrieved the goose, a bird only slightly winged. She was rather humble about delivering it to me, thinking that maybe she had done wrong disobeying orders. It was a hard bit of work, dragging a 9lb. wounded goose through deep snow, but that was Vesta all over, a dog of unlimited courage and endurance. I could cite countless instances in her short life with me of a similar nature.

But one other spectacular retrieve—this also with a wounded goose—which will always stand out in my memory demands recording. I was in the middle of a stubble field, when a big flock came sailing overhead, out of range, I thought. I took a chance shot at the leader and was lucky enough to hit him. He turned in his flight and planed slowly down, not badly wounded. Vesta got her eye on the bird and, in her usual manner, was off full gallop.

Slowly the goose moved lower; it was now several hundred yards ahead of me and still in the big flat stubble field. I had a grand view of the chase. As the goose neared the ground, and within a few feet of it Vesta made a leap at the bird, caught it by the wing close to the body and without a moment's rest swung round and galloped back, not so fast, of course, and delivered her bird—a beautiful bit of work.

Many of Vesta's pups have turned out splendid gundogs, and have inherited, to a marked extent, her superlative qualities of brains, drive and pluck, but none, I think, will ever prove her equal.

I lost her one autumn; she was, I think, either run over or stolen by some passing car. I can only guess, but it was a sad day in my life when supper time came and no Vesta there to feed! I shall never get over the loss of this most perfect and most lovable dog.

She crowded into the four short years I had the good fortune to own her as much real hard work as the average dog performs in a life time.

I may be wrong, of course, and possibly somewhat prejudiced in her favour, but I do not think that amongst all the field trial dogs, past or present, she ever had her superior, and certainly this would have been so if awards were given for sheer courage and endurance.

PEACE ON EARTH

Boxing Day—and a Year to Live

"I TOOK A NICE FOWL . . . ."

Under the wide and starry sky
In my earth I go to lie,
And I lay me down with a will.
Geese are birds for the likes o' me ;
Fat they are—or they ought to be.
Killing is fun, and I've slaughtered three.
I'm the hunter home from the hill.

Under the wide and starry sky
In my earth I creep to die,
And I lay me down with a will.
Years have passed and still am I free ;
Hounds have hunted my brush and me ;
But now in my earth beneath this tree
I'm the hunter home from the hill.

THERE is a nice smell in the air to-night, and I am hungry. I've had a grand sleep. My ! how well I feel. I can stretch forward like this . . . and backward like this . . . and not a twinge do I feel. Ha ha ! I am nine (I must be), and I can remember old Uncle Charles James being very stiff and lame when he was nine ; he was caught just after his tenth birthday, and I was not a bit surprised. We had a narrow shave with him the week before, and I really couldn't go on laying trails for him for ever.

Still, to-day's been good, whatever to-morrow may bring. "Get over Boxing Day safe, and you have one more year to live," is my motto. To-day's been a grand day—"Christmas" the "two-foots" call it, and I knew it yesterday. (I'm clever, I am.) I had spent a disturbed morning. I was out—not been home the night before—it wasn't wise. I slept in Dewsbury Spinney ; it's comfortable and it's dry, and there is a fairly good hole on the Canal Bank, though I must say that Billy Badger doesn't make anything like the good holes Bertie does on "Tipup Hill." But I was all right, and got well away when the "two-foots" came on their horses to the spinney. I diddled them—and I was back at Dewsbury by midday—and then I saw what was happening. Oh, cubs, wasn't I pleased ?

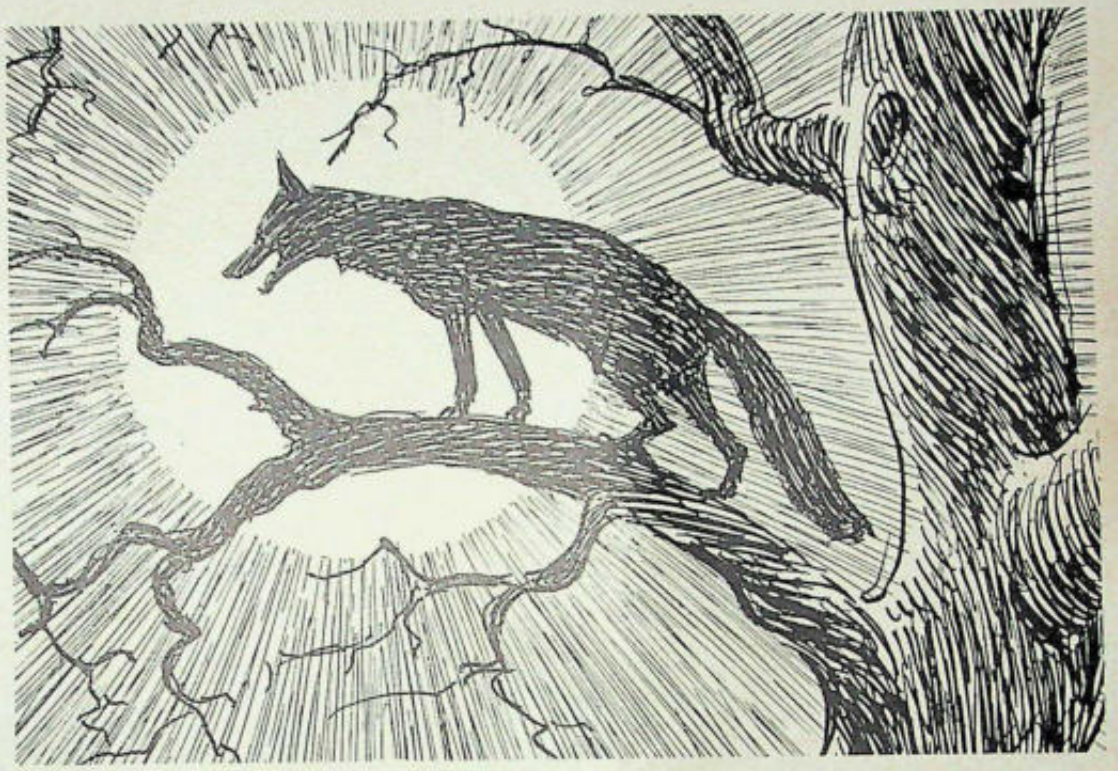
There was the church door wide open (I had gone up to the village to see if the poor silly creatures' van had left the Manor, and it hadn't, so they were still running about somewhere), but there, as I said, was the church door wide open, and in and out ran ladies and children with holly from the lych gate—and the gentleman in black (who once opened a door for me when I was in rather a hurry) carrying a pair of steps.

Ah, I knew ! "I shall go home to-night," I said, "and sleep in my house ; they won't be out to-morrow ; not they ! They will be eating and talking and going to see the holly in the church."

So I went home. I took a nice fowl for Rennie ; she likes 'em, but I didn't wait to kill many (the sillies might be coming back) and there were fewer hens about. That's always a sign of Christmas, and the way the turkeys vanish. I was getting suspicious. Well, I got home, and I ate the fowl, and then I slept—and I slept. Like a summer's night it was and no cubs to bother me either. But I woke up at last. I believe it was those bells, or Rennie (she is such a nuzzler). Anyhow, I got up. I had a lot of business to do. I hadn't been seen around home much lately, and that doesn't do. The rabbits get cheeky, and those birds ! So I climbed a few trees to scare 'em, and how they shrieked ! and I lay down and I sprang and I bounded and I jumped. They were all watching with their eyes popping, and Rennie says I did it very well (it's good for her, too, to see how fine I am). My teeth are sharp and all there, and I can creep and slink as well as ever. Feathers ! I'm all right.

Well, I went down to the village later, and looked around. I like watching the "two-foots." They seemed very happy, all shut up in their stone huts. I went to look in at old Fred first (dirty old cheat). There he was asleep by his fire, with a bottle on the table and a teapot on the hearth. His spade was bright and shiny by the door, and that nasty little dog of his—white, he is, with bitten ears—curled up by the fire, too. "Dreaming," I thought, when he scuffled his legs and grunted.

Then I went to the farm. They were having a rare do. So many of 'em in one room, and such a fug on the window that I could hardly see in, but old Mr. Weathers looked as if he was having a good time. Food all over the place, and floppy bits of paper and frightful bangs ; so I came away and went to have a look at the gentleman in black. He was reading by a fire—very pleased he looked—and nearby were other people doing something with bits of cards on a table and eating things in boxes. There was no one in the kitchen, only that fat ginger cat, just blown out, on a cushion ! (He's pansy, that cat, and what a colour !)



"SO I CLIMBED A FEW TREES TO SCARE 'EM, AND HOW THEY SHRIEKED!"

"SOME DON'T EVEN LOOK COMFORTABLE, NOR THEIR HORSES, EITHER, AND THEY MAKE ME GET SLACK"

I left his Lordship till the last. It was beginning to rain, and I had not much time to spare, but I know the Manor garden, and was soon there. I like his Lordship ; he and I know each other well, but I don't go to see him often—only on Christmas Day, when I know his hounds are in their kennels. His Lordship looked fine ; he is a grand sight on Christmas night—all white down the front (not as nice as mine, of course), and he had glass and silver things all round him. There was some holly on a picture just like his Lordship on the wall behind his chair. Her ladyship was too aglitter to be comfortable to look at, and the young ones aren't the same. No, they are not. (You should have heard Uncle Charles James on them.)

I know a lot about the "two-foots" round that table (the sillies had let their pudding get on fire). I know 'em all ; they look funny on their horses if you look up from the ground. Some don't even look comfortable, nor their horses, either, and they make me get slack. They don't really know much about me, and I don't believe they care. The young men like the rush and the young ladies like the men ("depot," I've heard Sam call them, so that's the word). But I like to see his Lordship, and I like Sam with his silly tail-wagging creatures. I laugh at them, and they laugh, too, and many a race we've had. And I've always won, and I shall win till I get those pains like Uncle Charles James, and then how should I live, old and lame ?

No, I shall run till I can't run, and then one day I shan't laugh for a minute, and that will be that.

Yes, to-day's been grand, but I'm hungry. I must be off to Midway Down to-night to be ready for Boxing Day. They won't catch me this year ; but first I must just see if Mrs. Weather's duck is still loose. Duck is good to run on.

C. N.

IS "HANDLEY CROSS" LEAMINGTON?

A Spa Moved to Suit Requirements

By ALAN FOX-HUTCHINSON

"NOVELISTS," Mr. Denis Mackail has told us, "don't draw portraits, and if they did, they wouldn't be novelists." Other writers have said the same, but, in spite of warnings, to hunt the "originals" of their characters and places is a sport that never loses its fascination. R. S. Surtees's books, like most of his contemporaries', are so well adapted to it that, to quote but one instance, thousands of words are still published every year on the probable locales of Handley Cross.

Gradually the possibilities have been narrowed, and since the appearance of General Cowie's letter in *The Times Literary Supplement* of March 11th, 1926, it is generally accepted that Ashford in Kent supplied Mr. Jorrocks's creator with the original of his "unrivalled spa."

That letter drew attention to the opening instalments of *Handley Cross* as they first appeared, under the title of "The Gin and Water Hunt," during 1838, in the *New Sporting Magazine*. In them it is positively stated that the Vale of Sheepwash lies "in the western part of the county of Kent," and that its southern end gradually opens away upon "the chalky downs that extend to the coast."

On that and later evidence, such as mentions of Deal, Tonbridge, Ashley Downs and the Garden of England, it may be right to declare that the Vale of Sheepwash is the Vale of Ashford, but it clearly is wrong to assume solely on that account that the town of Ashford is therefore Handley Cross. I believe that it is not, and that it is impossible to identify Handley Cross by reference to the Vale of Sheepwash or, for a reason I shall give later, by reference to the chronicles of "The Gin and Water Hunt."

Remember, novelists don't draw portraits. Equally their novels are not guide-books. The spa's creator was free to transport any town he wished into his vale. I think he exercised that right, and the original of Handley Cross is to be found by comparing Chapter 2 of *Handley Cross* with Charles Clarke's *Reminiscences of the Spa*, his account of the rise of Leamington.

That chapter is a later insertion, not to be found among the instalments of "The Gin and Water Hunt" as first published in the *New Sporting Magazine*. Like much else at the beginning of the book, *Handley Cross*, it does not appear in them at all, and that is why I say their help should not be relied on when seeking an original of the town of Handley Cross.

Of Leamington in his *Reminiscences* Clarke says:

"That magnificent lounge the Pump-room—its billiards, its reading-room, its dinners, balls and rubbers—all grew out of one little bubbling well of filthy water; the very nastiest to taste you can well conceive. . . . A few ruined cottages, three slate-covered houses, and the modest abode of a rustic apothecary, were the humble originals of this modern Palmyra."

Compare this with (*Handley Cross*, Chapter 1) "the whitewashed, thatched-roofed cottages . . . round a village green" that with rustic Dr. Dumpling's modest abode and the Fox and Grapes public-house formed Handley Cross until (Chapter 2) Dr. Roger Swizzle's exploitation of its mineral spring led to the erection of "The Grand Esplanade." Then "buildings shot up in all directions. . . . A fortune was expended on a pump-room, opening into spacious promenade and ballrooms, but the speculators never flagged."

During the 40 years Michael Hardey was Master of its hounds Handley Cross grew from a village to a town: just as the population of Leamington increased from 543 in 1811 to 15,692 in 1851. Leamington, moreover, is like Handley Cross in that it possesses two springs—the "old," that is Camden's Well, and the "new."

Continuing his *Reminiscences*, Clarke then asks: "Whose was the harlequin's rod that . . . raised the price of bricks and mortar and frightened the propriety of a sober county by erecting an emporium of fashion in its midst?"

He answers:

"No other than a doctor. He was the Leamington Cimon who threw up terraces; laid out gardens; . . . and squandered the ten thousand pound a year he made by 'a glass of sherry and a mutton chop' on his beloved Athenians. . . . Then Dr. Bonassus becomes the rage: he was a second Abernethy: bullied a marquis out of the gout: crushed incipient paralysis out of a dowager duchess; made a member of Parliament walk into Leamington from the fourth milestone, having carried him out dead-lame in his own carriage and laid him down in the turnpike road."

Compare this with Dr. Roger Swizzle who took a lady a mile or two out of Handley Cross "in a fly when, suddenly pulling up, he told her to get out and walk home, which she at length did, to the great joy of her husband and friends."

There are several other comparisons. The more one studies them the closer they become. They

cannot be fortuitous. The coincidence would be too strong. They convince me that the original of Handley Cross, in so far as it has any original, is Leamington Spa.

Where, having created Handley Cross out of Leamington, Surtees then placed his creation is hard to say. Probably in the Vale of Ashford; certainly to begin with in Kent; but I believe that as the book progressed both Handley Cross and with it the Vale of Sheepwash were moved, to meet their creator's needs, out of Kent into a county much farther from London.

Surely if the spa had been anywhere within reasonable reach of the metropolis Mr. Jorrocks, the business-men who thought nothing of a dash "Beckford in one pocket—order book in the other," by rail into the Midlands, would never have "bought a pig in a poke," either when taking the hounds or when renting Diana Lodge; particularly after he had realised from Doleful's imbecile letters how little chance he had of getting "information by correspondence." He would have gone down for a day by train to inspect the place for himself.

Equally, if living in Kent, he never would have had his business-letters sent from London in weekly batches. He would have travelled up for a non-hunting day each week in his beloved counting-house; just as he would have interviewed his traveller Mr. Buggins there instead of meeting him (and the Cut-em-down Captains) most inconveniently at Loop-line Junction.

It is an important fact, too, that after the early part of the book no more is heard of the sea, except that James Pigg is given a drink of contraband Hollands, and Whisky Tim—though whisky is a British spirit—is described as a "smuggler."

On this evidence, external and internal, I contend that Handley Cross in the main was Leamington, placed probably in the Vale of Ashford and transferred with it to some mythical county that was far from London; but was not in the North, for Mr. Jorrocks remained wholly ignorant of the position of Newcastle-on-Tyne.

WHITE WATER

Thrills and Spills on Rapid Rivers

EASTWARD the clouds were massing themselves in a low reddish bank; below them, to north and south as far as eye could reach, a narrow streak of gold ran out and stretched away, straight along the horizon. Somewhere a huntsman's horn was blowing, clear and thin, while very far off I could hear the roar of a swollen river rushing through the valley on its way to the sea. The masterful wind was up and out, shouting and chasing the dead leaves down the roadway. Such was the background of my first taste of "white water" on a November morning some years ago.

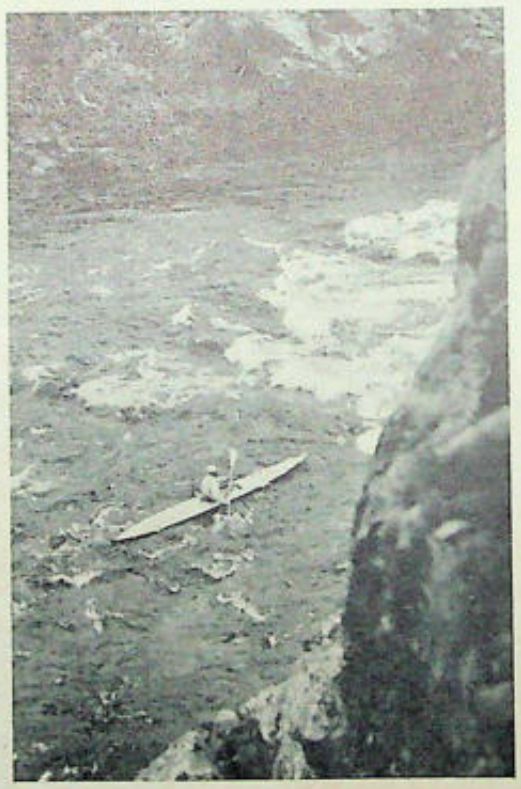
Since that first trip I have grown used to such an environment, but the old thrill remains, and every time I hear the loud chatter of successive rapids on any river the sound magnetises me. I recall many splendid voyages. Sometimes my canoe has been smashed to pieces and I have crawled from the torrent half drowned; on other occasions my arms have ached intolerably with the strain, as when I went through a heavy sea from Dover to Calais, yet every rough water trip I have experienced has always made me look forward to "the next time."

It would be difficult to explain the irresistible appeal of rapid rivers. I only know that when I am near one I travel colt-like to its bank. It may be that white water has a peculiar and direct and special attraction which no one else can entirely share; but whatever it is, I repeat the words of the Mole when on a visit to Toad Hall: "Well, never mind what done it!"

Once get yourself a canoe and "ride the rapids" and you will find the appeal will stick to you stubbornly. It is an unforgettable thrill which is high life to those who understand it. Your canoe may be smashed to pieces; but almost immediately you start saving up to buy another one so that you can try your luck again on that very river which has once already had the better of you. That is the fun of rapids; you become rivals, yet you are friends. Each tries to master the other, neither grudges a victory.

And there are to-day quite a number of canoeing enthusiasts in this country who do not put their canoes into dry dock during the winter months. At the present time they are enjoying to the full the excitement of a sport more often associated with canoeists on Continental rivers such as the Ems, the Traun, the Salzach, the Isar and the upper Rhône.

The first essential in shooting rapids is caution.



IN FINLAND
A kayak approaching rapids in a rocky river valley

It is no use rushing round corners on fast rivers without first having a look to see what is round the bend. It is a nuisance, of course, continually getting in an out of the canoe, but it is the only sensible thing to do. Once in a rapid you can rarely get out of it, and there are some rapids which are not meant for the fragile collapsible canoes so popular in England at the present time.

Recently a friend and I successfully brought a canoe down the River Greta in Cumberland. We were quite proud of the achievement, for no other boat has ever previously made the passage. The rapids on the Greta are complicated, there being no clearly defined passage. It is, therefore, chiefly a question of dodging from one bank to the other in order to avoid the many heavy boulders which lie just beneath the surface. Fortunately a splash of white water behind the boulders proves only too well where they lie, though it is not always such an easy thing to dodge them. If hit a submerged boulder you must, then my advice is to hit it hard; this will at least give you a sporting chance of clearing it. If you go slowly and get your craft grounded, then it is usually a case of saving up for another canoe.

I remember once watching a beginner on the Wye try to make his canoe run clear of an obstacle by merely back-paddling so as to swing the boat round and away from it. What actually happened in his case was that the bow of the canoe cleared the obstacle but the stern fouled it, with awkward and amusing results. My own particular journey down the Wye started from Builth Wells, and the first 20 miles gave me all the excitement I wanted from a spring spate. Once or twice, as with the Greta, I decided a rapid was too risky and waded down it waist deep, lowering my canoe ahead of me by means of a long rope.

Another splendid river in this country for winter canoeists is the Eden. I have heard of paddlers who have gone north expecting a voyage full of heavy rapids only to be disappointed, but that is all in the mood of a mountain river. Her temper changes according to the rains. I can say, however, that no keen canoeist should miss this trip.

Starting from Kirkby Stephen the journey to Carlisle is between 50 and 60 miles, and in this distance the river falls 480ft. You will have to carry round Appleby Weir, just near the castle, after you have gone eight miles. Three miles further on you will encounter some rock-studded water and it is as well to inspect this carefully before going through it, while another danger is Lacy Falls, something like 36 miles from Kirkby Stephen. This is no easy rapid in a certain state of water, and if you feel at all nervous about successfully getting through it is far better to lower your canoe down or carry it round. Four miles after Lacy you can come to the Nunnery rapids,

LEARNING TO MASTER A CANOE IN WHITE WATER

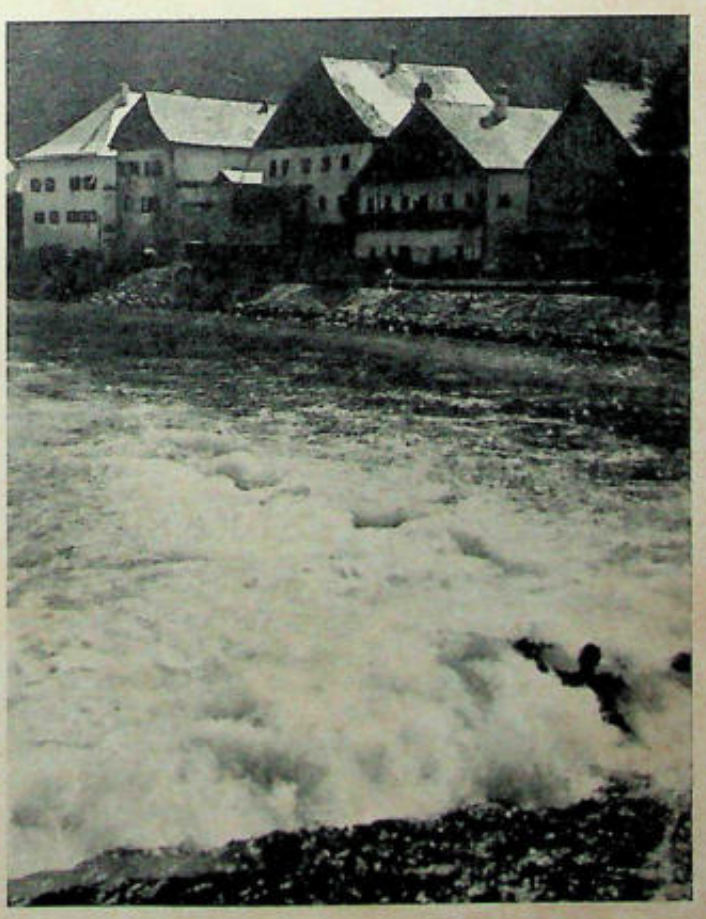
WELL INTO IT

Ready to swing the canoe away from Teddington Weir



INTO A FOAM BATH

An Austrian canoeist tackles a difficult rapid

which run between steep tree-clad banks lasting for three miles. Novices must needs think twice before starting to ride them. After that all is plain paddling until Corby Castle (near Carlisle), where you will find your last real obstacle.

In Yorkshire you can make an exciting trip from Buckden to Ilkley on the River Wharf. In the first few miles there are several rapids of varying degrees of difficulty to contend with, but the chief danger is "The Strid." It is worth while noting that there is no record of anyone having fallen into this particular rapid getting out alive. The best plan is to carry round, for the river is obviously not canoeable at this point. Another Yorkshire river which provides white water enthusiasts with certain sparkling adventures is the Ure.

To my mind, however, Wales provides the best facilities for those in search of rapids. There is, as already stated, the Wye, but the Usk is even more boisterous. It was following an article I once wrote in the *Field* that an ardent canoeist wrote advising me to try my luck on the Usk. Like all Welsh rivers the Usk will provide plenty of fun for the experienced canoeist. Only 70 miles in length, it makes an admirable "long week-end" trip from Senny Bridge. Your first day will be one of continual struggle with rapids which are to be found practically every three miles. Here again, as with other mountain streams, it must be borne in mind that a flood will make a much smoother passage. There is, by the way, a nice little inn about a mile below Langwerne Bridge which is well worth a visit if you are near there one evening.

Then there is the Dee, which has its source in Bala Lake and falls 530ft. in its course to the sea. The scenery is grand, and the rapids, except for the stretch between the Horseshoe Falls, Llantysilio, and Llangollen, are merely good fun without being dangerous.

In Scotland the Tay provides exciting rapids. The river falls 300ft. in the first 40 miles and 500ft. in 90 miles. A good starting place is Crianlarich, easily reached by bus or train.

Wherever you go, in this country or elsewhere, you will find your white water enthusiast. He will have found, like the writer, that it is the most exciting, most exhilarating sport riding down a rapid. He is ever ready to talk river-shop, which is long shop and talk that is endless, and he has learnt that splendid lesson — achievement ever includes defeat.

WILLIAM G. LUSCOMBE.

A CHRISTMAS CREEL

By ROBERT HARTMAN

I HAVE often enough been called "a poor fish." I have been called other things; I have been called a ——! and even a ——!! But when I am alluded to as a fish without means I sometimes wonder whether the exchange would not be all for the better. Consider, for instance, a trout at Christmas time. It is unmolested. Has any human being been able to lay his hand on his heart and say with honesty that he ever enjoyed a similar privilege? The Christmas trout is its own master. Time and tide, the price of War Loan, the quarterly output of pig-iron, Greenwich mean time, the 5.30 p.m. from Waterloo, changing for dinner, the value of the dollar in terms of yen, the rent, gout, sock garters, income tax, how many miles to the gallon, Rupert's school fees—none of these things mean anything to the Christmas trout, poor fish! It is as free as the element in which it lives.

And now consider the Christmas trout fisher, what of him? For one thing he is not allowed to fish for trout, and so, the light of his existence being for the time extinguished, he might just as well induce a state of coma and hibernate in peaceful unconsciousness. But is he allowed to do so? By no means. Organically constructed to respirate fresh air and to look across open spaces he is, 99 times out of 99, condemned to earn his living in a stuffy office with frosted-glass windows. Nor is that all. Fast as he earns his living faster is it taken away from him, until the year ends with the jolly, old-fashioned Yuletide bankruptcy of not being able to call even his soul his own.

The bell rings. It is the postman, but this time he is concerned less with the letter-box than with the Christmas-box. The bell rings again. It is the cornet quartet. They hand in their book, and on the first page the Duke of Norfolk and Mr. Neville Chamberlain, in singularly ill-formed handwriting, have given the onerous example of subscribing £5 each. Again the bell rings. Who can it be this time? It is the laundry man. He carries no basket; he has come for a box. He is followed by the baker's boy, the greengrocer's boy, the other or ordinary grocer's boy, the butcher's boy, the fishmonger's boy, the—but enough, enough. With a demented scream the harassed, innocent, peace-loving trout fisher rushes upstairs, locks himself into his room, and seizing his fishing diary opens it at random to lose himself in the recollection of days which he spent as himself.

At least that is what I did—for all this time I have been talking about myself.

I opened the book at random, I repeat, and on the remarks page I saw these words, "Blank. The gillie broke my rod." It was a terse entry, and it referred, as it happened, to a day spent not after trout but after salmon. As I looked at those five words I slipped back into the past, present troubles faded away, and there rose before me the form of that monstrous gillie.

To say that he stood 6ft. 6in. in his stockinged feet would be to give but a three-quarter length impression. Besides, he was wearing nailed brogues, huge great things that looked like Thames barges studded with rivets, beneath the tread of which gravel was ground to dust. And if his height was remarkable, his breadth was even more so. I do not doubt that his chest expansion could have been measured in yards. He was covered all over with a tweed that would have rasped the skin off a lesser man.

Silently he touched his cap and took my rod. He examined my gaff. "We'll no be taking that," was his verdict as he replaced it in the porch and tapped his pocket, as though to indicate that it contained a better gaff than any that I should ever be likely to own.

"Where are we going?" I inquired.

"Brecherchn," he replied, and set off down the drive.

I was reminded, as I ran by his side, of a circus where I had seen a little dog run in and out between the forelegs of a horse which walked sedately round the ring. I did not, of course, try any such fancy tricks myself; it was as much as I could do to keep up.

"Brecherchn," it appeared, was a pool distant rather more than three long miles from the lodge. As we approached it I detected a low, flat rock. For the moment I saw nothing else; it beckoned to me with all the allure of a Turkish divan, and my soul cried out to it as must that of the long-distance runner to the tape which marks the end of his toil.

"You'll just starrrrrt at the top," he said, handing me my rod and seating himself on the rock. Obediently I set to work. I fished carefully and, all things considered, I fished with commendable skill. I may not have covered the fish which lay on the far side of the river, but I certainly covered all the water on my own side, water which, had I been on the opposite bank, it would have been my ambition to reach.

Meanwhile I was being watched. The gillie had risen from the flat rock and was following me down the pool. Never before or since have I seen silent contempt expressed with greater mastery. Every line of his massive frame was eloquent of disdain, his cold blue eyes stabbed me with a withering scorn, his shoulders shrugged their derision, and even his brogues assumed a superior and haughty look as though they had suddenly become luxury liners.

I pretended not to have noticed. I pretended that I was enjoying myself, and continued to fish, but with a skill that became less and less commendable.

As so often happens when one is salmon fishing, nothing happened at all. I fished down to the tail of the pool without eliciting any response from a fish, and then, allowing my fly to hang in the rough water, I waited in the hope that perhaps it might be taken by a speculative trout.

"It's wasting yourrrr time fushing where y'are noo," he observed, and extending a hand he took my rod from me with the quiet firmness of a grisly bear. There were 20yds. of line hanging in the stream, and these he switched across the river with a flick of the wrist. "It's a poor thing," he remarked, addressing the distant hills, and apparently referring to my 14ft. three piece (with spare top and waterproof case) greenheart, cork-handled, agate-butt-and-end-ringed salmon rod. And then, adding another 30yds. to the line already in the water, he attempted to throw the entire length into the backward half of the overhead cast. The rod snapped just above the middle joint—as indeed it had every right to do.

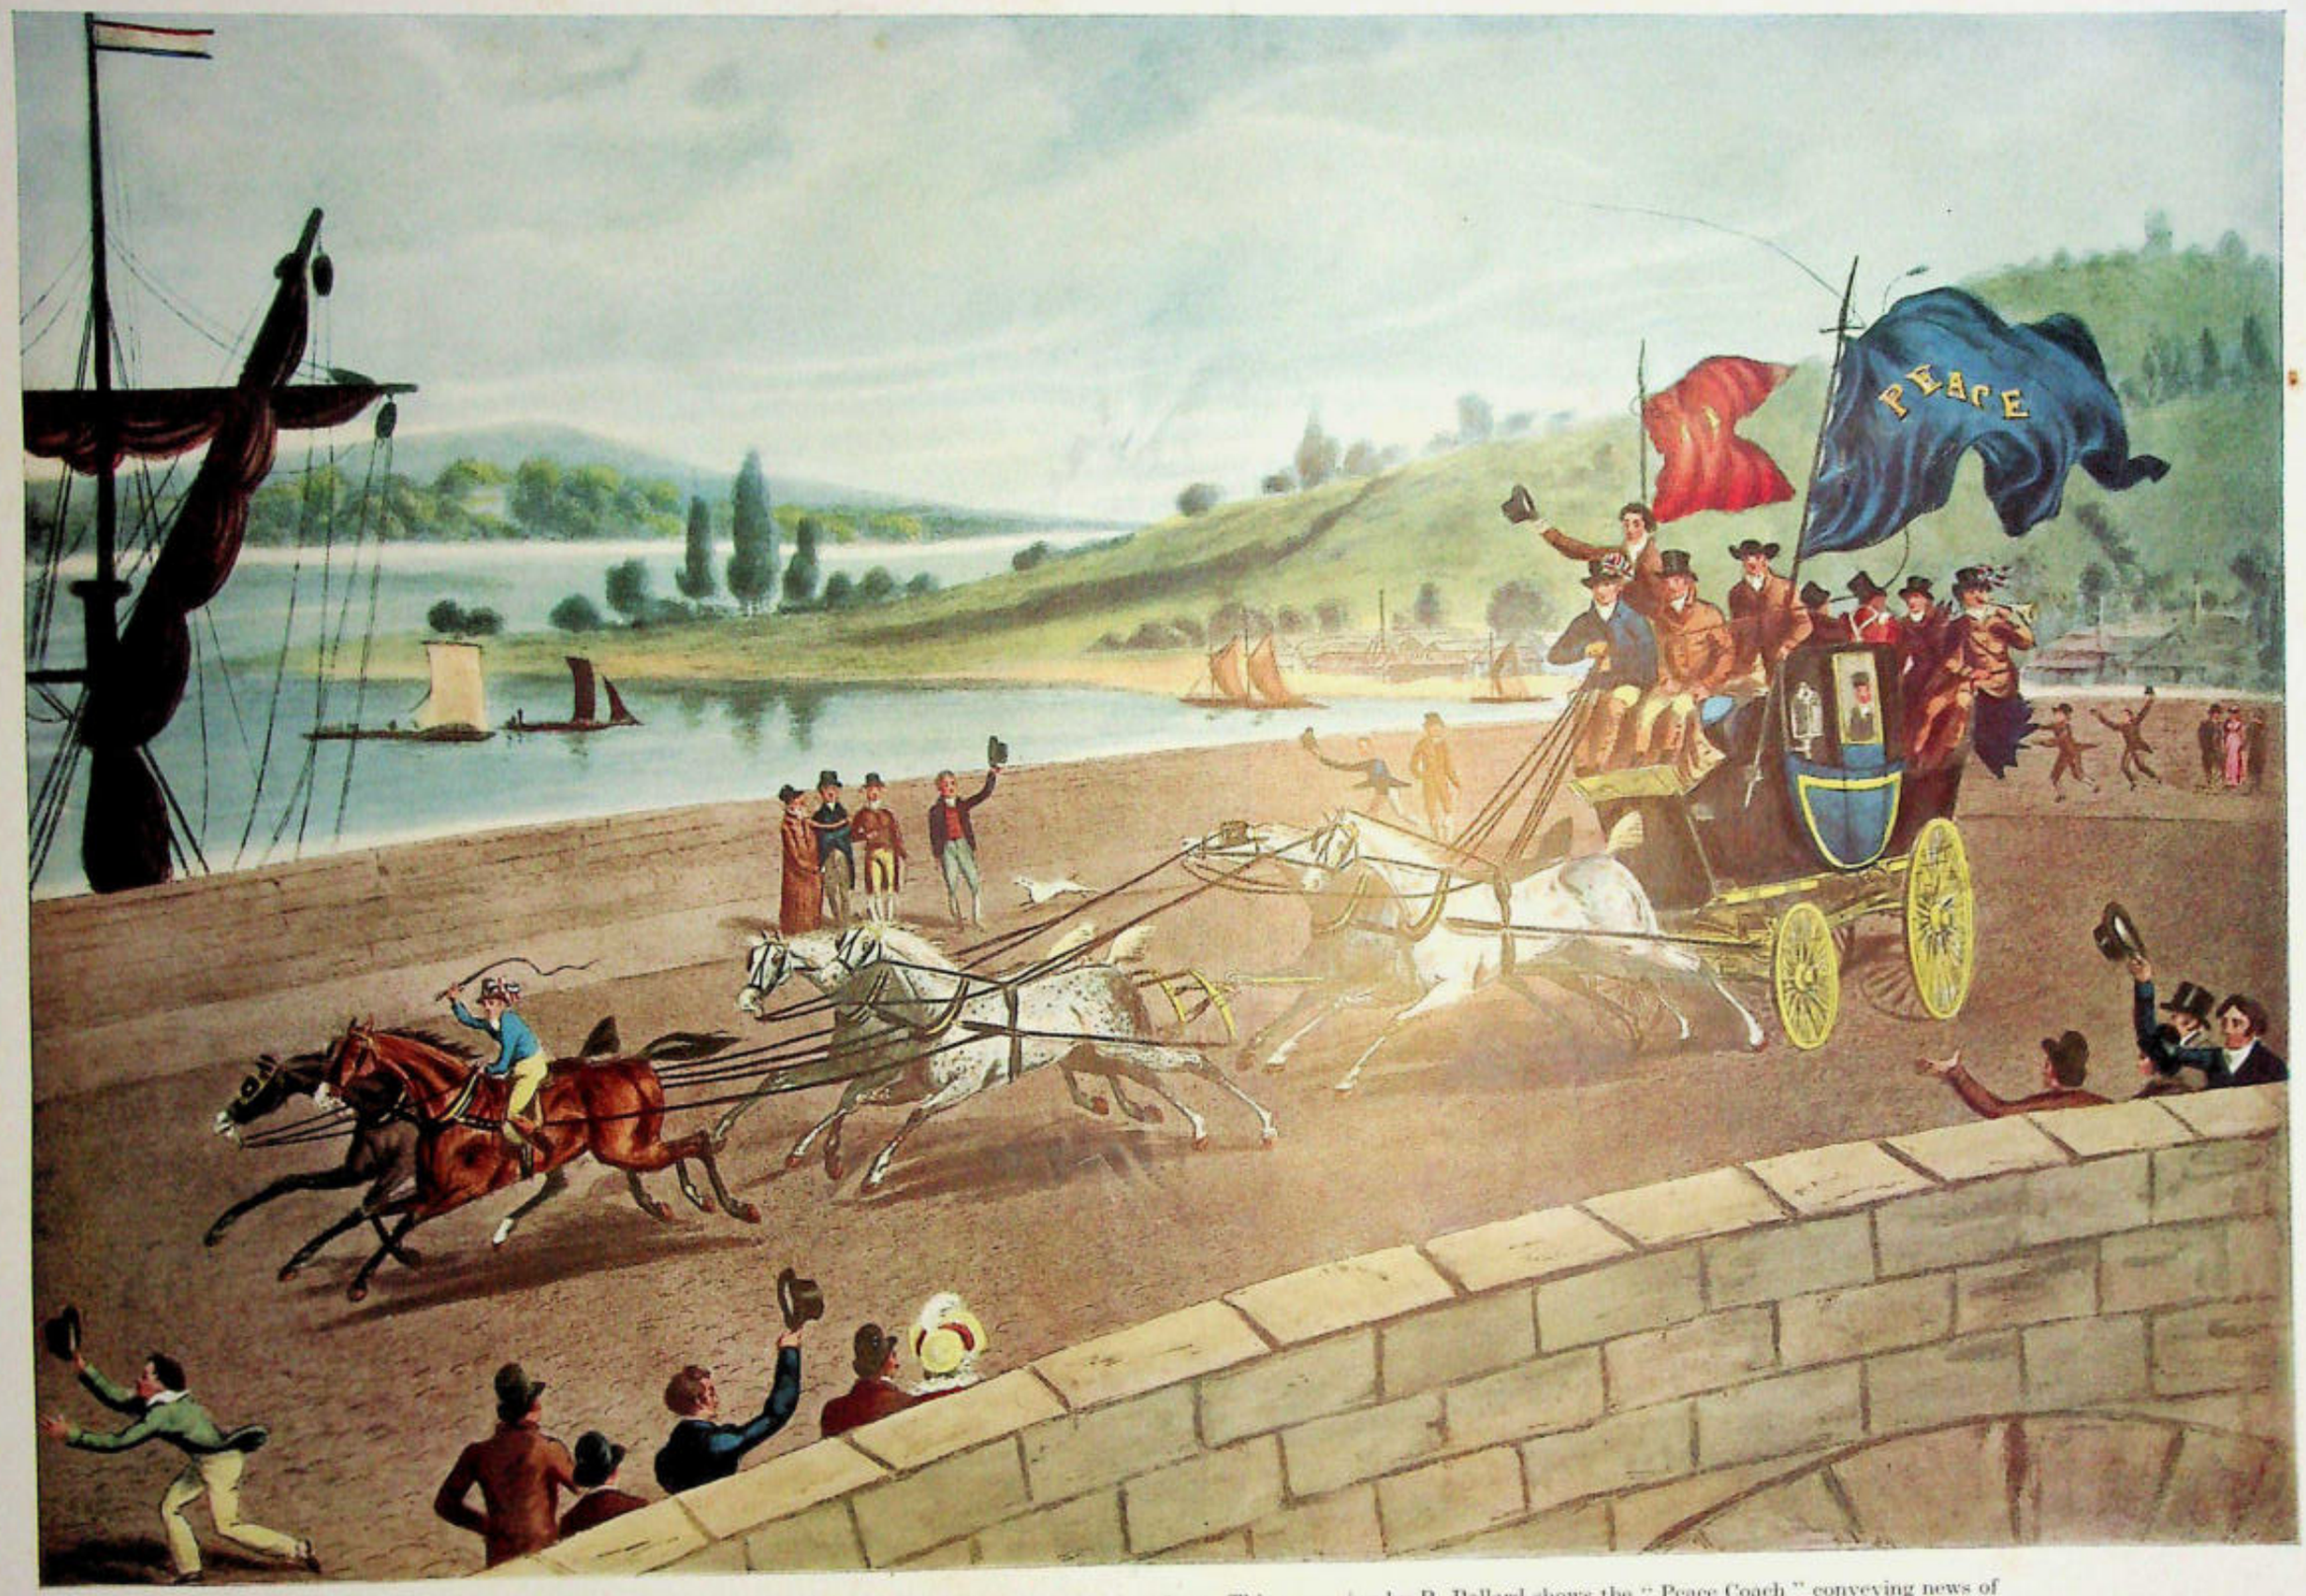
"Bah! It's no' a rod at a'," he cried.

Had he been a smaller man than I, that is to say about one-eighth his actual size, there is no knowing what I might have done. As it was, I turned on my heel and with acid-like dignity (acid is invariably dignified) walked back to the lodge in my own time. On arrival I found the broken pieces of the rod stacked pathetically against the gaff.

Looking back I find it now in my heart to forgive that gillie. I had so much fun ordering myself a nice new rod for Christmas.

"'BAH! IT'S NO' A ROD AT A',' HE CRIED. HAD HE BEEN A SMALLER MAN THAN I, THAT IS TO SAY ABOUT ONE-EIGHTH HIS ACTUAL SIZE, THERE IS NO KNOWING WHAT I MIGHT HAVE DONE"

"PEACE ON EARTH, GOOD WILL TOWARDS MEN"



A picture with an appropriate note a hundred and twenty-three years after. This engraving by R. Pollard shows the "Peace Coach" conveying news of the Victory of Waterloo crossing Rochester Bridge.

"THERE ARE MORE THINGS IN HEAVEN AND EARTH"

By ALEC ASHMOLE

WHEN old Tom Manners was found dead on the moor he had been Master of the Dartridge for 43 years.

Hounds had killed after 35 minutes of the best, and we went to draw a fir copse just under Saddle Tor. Trumper, the first and only whip, went ahead, and Tom trotted slowly through a gap into the covert after his hounds.

We heard him for some time, and then his voice died away, for the covert, although small, was long and narrow, and sound plays queer tricks up on those moors.

We were all "coffee housing," and the time passed quickly until someone said: "Where's Tom? Has he slipped us?" And then, in one of those panics which sometimes take a field out hunting, we all galloped hard for the other end of the wood.

Trumper met us near the far end. "Master's dead," he said. "I was sitting up there waiting for him to break, and presently hounds came out and wandered round. So I went in to see what was up. I found the Master down by the stream, and Jess was nosing him. I tied her up and came to find Dr. Barnes."

"Heart," said Barnes. "Well, it was the sort of death he would have liked. How he loved it all."

He had the funeral he wanted, too. He had always grudged a day's hunting lost through a funeral, so he had provided for it in his will. The funeral was to be at 10.30 in the morning, and Trumper was to hunt hounds afterwards.

It was a glorious morning as I rode down the hill into Hazard Village. The high banks were yellow with primroses and the birds were busy on their lawful occasions. It was one of those days we get in Devon after a week of rain on a south-west wind. The wind had veered in the night, and although the air was cooler, the sun was bright and warm.

All the world seemed to be in Hazard that day. The news had been in the papers, and there were many who had come from curiosity, as well as members of the Hunt and personal friends of Tom. Of course, all the villagers were there, friends as well as tenants of the old man.

I gave my horse to a man I knew, and went into the church. Such colour had rarely been seen there before. They buried Tom that morning with the honour he deserved. The coffin came, borne on a farm waggon drawn by two of his magnificent Shires, and behind came Jess, saddled and bridled, with horn on saddle, and led by old George, his man for 50 years.

The earth fell on the coffin lid, and it seemed the end of an epoch, so long had he been with the Hunt. It was everything to him, and he ran it autocratically, swearing hard and often, but entirely without malice.

We left the churchyard, and I took my horse from Bill Stone. "Us'll never see the likes of him again, sur," he said. "He was a proper gentleman, 'tho' he did cuss me something terrible sometimes."

It was nearly eleven o'clock, and along the road from the kennels came Trumper with the hounds, and with him as whip his kennel helper.

Trumper was only eight years younger than Tom, and his eyes were moist as he looked over the churchyard to where the sexton was filling in the grave of the Master he loved. He had to ride Tom's misfits, yet he went over the moor like a scalded cat and fear had no place in his make-up.

Eleven struck from the church tower, and with a note on his horn Trumper gathered the hounds and threaded his way through the crowd. The draw was a furze-covert lying behind Tom's old home, about a mile to the westward.

Behind came the field, strangely silent, at least 150 on horseback. A large field for the Dartridge—50 is our usual mark, and none too well turned out either—but that day they would have been a credit to any Hunt. And behind the field, on their way back to Hazard Hall, came the waggon, empty now, and George leading Jess—Jess, that marvellous hunter that Tom had ridden for the past five years. Quite small she was, only 15 hands, but clever as a cat, never putting a foot wrong on all that trappy moor, and carrying Tom's 10st. like a feather through all the length of a long hunt.

And with Jess the crowd of other followers, in cars, on bicycles, and on foot, going with hounds hoping to see a hunt.

They never saw a hunt that day. No sooner had hounds gone into Calefornia Brake, and before the whip could get forward, they gave tongue, and in a screeching swirl they broke the far end where the fox left as they entered.

It began to look like trouble at the gate at the far end of the field, where already a group had bunched.

I was riding Jan Stewer that day, by Uncle Tom Cobley out of an Irish mare, Teapot. He was rising five, and I hoped to Point-to-Point him in the spring. Jan was as mad as the rest, but I managed to draw out to the right over an open drain to firmer ground, and by the time we had got to the far end he was well in hand.

I jumped the bank well away from the gate. Our "in-country" is so ruined by rabbits and the consequent wire, that we usually look first and leap afterwards, but here on Tom's ground it was perfectly safe. In all his land was not one inch of wire, and the banks were broad and big, and jumpable.

As I went over I glanced towards the gate. I could see there had been a smash, someone was down, and the press was so great it was some time before they could get the gate open. Luckily no one was hurt, I found out afterwards.

Some half-dozen had jumped before me, and I could hear the thud of hooves coming up behind, but the pace was too hot to look back. Hounds were a quarter of a mile ahead, just disappearing over the brow of the hill, with Trumper a field behind them.

Through a gate we cantered, I grazing a post with my knee, then left up a sunken lane and right through another gate on to the grass, with a flock of sheep bunching and staring in a corner. I was lying flat on Jan's neck, my head well down, and the mud shot up from the horse in front was singing past me and pattering on my hat like hail.

On the grass I drew out and let Jan go his own pace up a long stretch to a low granite wall at the top. Hounds were well away and going hard on the strong scent which comes with a north-east wind after a week of warm rain.

"IT BEGAN TO LOOK LIKE TROUBLE AT THE GATE AT THE FAR END OF THE FIELD"

We flew the stone wall and galloped on to the top of the rise. The furze grew here in golden splendour. Jan threaded his way through the clumps, jumping the smaller bushes and finding his own way as a good horse should on the moor. On ahead were two garrison officers on hirelings from Paynter, a girl looking uncomfortable on a raking great chestnut, two farmers from the edge of the moor, and a stranger from the Mid-Devon country.

Behind, as I looked back, were the rest, pink and black and drab, coming up like a cavalry charge, and away over Calefornia the chimneys of Hazard Hall, and away again the tower of Hazard Church, where Tom lay midst all the shining network of red and green fields. This I saw at a glance without checking my horse, for hounds were driving on. "Poor old Tom," I thought, "how he would have loved this hunt.

The ground fell steeply here, one of those slopes which would scare Meltonians stiff. Half-way down was a small wood through which they had run, and Jan took this in three strides—he slid the rest of the way. At the bottom was a stream and a boundary fence crossable at only two points, and here my knowledge of the country came in useful. Away on my left one of the garrison blokes was fairly stogged and the other was coming towards me hell for leather.

Up another hill almost as steep, and then across three large fields down the Fowlescombe Valley. I could see hounds in full cry going past the old mansion, now a blackened shell with ivy and ash saplings completing its destruction. Hounds were once kept there, and one night the huntsman went down to quell a fight, stopping only to put on his boots. Only the boots were found in the morning.

Over the bridge I rode, with the fishponds, now empty, on either side, through the deserted courtyard still ringing with the cry of the pack, and out on to the grass once again. They had gone straight on past the old kennels, now covered with brambles, towards Brent Hill, and as I topped the next rise I could see them three fields on going hell bent for election. Trumper was with them, Bill Salter and Henry Luscombe some little way behind. The Mid-Devon stranger had turned the wrong way at Fowlescombe; I shouted to him as I went past.

Scent was as good as ever, but as they crossed the Huish road they swung right towards Corsewell. Past Witchcoombe they drove, and here I gained some ground and was now riding parallel to Luscombe and Salter. Behind was a solitary rider—the boundary fence at Brownston Wood had stopped most of them.

We passed the ancient camp at Stanborough and the large bury they had opened years ago. It was the tomb of a chief and inside he had sat with his weapons round him, and on his head a circlet of soft gold. He still sat there watching the hunt go by, though his regalia had long since gone. Such sport as this was not known in his day.

Here the fox had jinked sideways under a bank, and such was their drive that they overran him by half a field, but by the time we were there they had circled and picked up the line again.

A trapper stood on the road and waved his hat, but there was no need, hounds raced on. Trumper was swearing to himself: "Damn the feller, hope he's set his traps in."

"Gone to Bloody Pool earths," yelled the trapper as we swept past, and from over the next bank, where the ground sank in a gentle slope and then rose again to the foothills of the moor, I saw far away sheep bunching in a corner and a brown speck moving up towards the heather.

The fields were small and the banks narrow. Salter's youngster turned a somersault over one of them, but both landed on the right side. I saw him pick himself up, knock out the crown of his bowler, and get on again looking none the worse for wear. Jan was banking perfectly, on, a kick, and off. The pack poured over in a living stream of black and white and tan.

Over two fields of plough, riding up the furrow where the going was best. A thresher was working in one corner but had stopped when we passed. A man waved and pointed, and a sheepdog ran at Trumper, who swung his whip at him. Rooks were circling over the field ahead.

Hounds came to Bloody Pool earths but never wavered, straight past they went. "Old dog fox," said Trumper. "He's going right home." We splashed down a narrow lane, more like a bog than a lane, and on to Yelland. Sparks flew as we crossed the cobbles, scattering a flock of ducks and seriously impairing the dignity of an old cock turkey.

Past Yelland they checked for a moment, a terrier slinking back was obviously the culprit. I pulled Jan up and wiped the tears from my eyes. Trumper sat still and watched his hounds.

Beyond was the open moor, yellow with furze and the deep red of the dead fern, rising steeply to the broken height of Shipley Tor. A few ponies and sheep grazed the scanty grass, and across the skyline a loose stone wall staggered drunkenly. The wind, blowing strongly here, whipped the light clouds across the deep blue of the sky, driving them in wraith-like patches of mist along the higher slopes of Riders Hill.

Four miles it was to that check, and we were glad when it came, but it didn't last long. Luscombe was wiping the mud from his face. "Monstrous fine run. Monstrous fine run," he kept on repeating. Suddenly old Comet, a great old hound, rather dark for a moorland pack, gave tongue by the farmyard wall. Horses were coming down the field behind, but the pack didn't wait.

To the left they ran, over the bog greener than the moor, with pools of water, blue and silver, lying here and there. Trumper went for the crossing and I followed. Jan had got his second wind and was going great guns. Up that boulder-covered hill they ran, nearly mute now. Up and on through that bad patch near Shipley Tor, where the rocks are so thick there is scarcely room for a horse's hoof. Trumper had gone by the track, but I kept straight on, up through the hunting gate in the lichen-covered granite wall.

Hounds had got well ahead up the hill, but when I reached the top I could see them, nearly half a mile on and no one between us. I could hear a horse coming up behind, and I wondered who could be pushing so hard up the steep slope.

The mist was touching the moor here, swirling in fantastic shapes with the sun gleaming through. A magpie swore as it fluttered away, and far overhead two buzzards soared effortlessly above the crags. As the mist came down I heard a horse passing on my right, and mentally cursed the rider for showing no consideration to his nag. And then, as the mist rose again, I saw there was no rider to curse, for it was Jess, saddled and bridled, trying to catch her beloved hounds.

George told me afterwards: "As soon as she heard the hounds, sur, up she goes in the air and wrenched the bridle from me hand. I was proper scared with all they cars round, but she took and goes through the lot of 'em, and left me standing like a great gawk."

I looked round and saw only Trumper. The rest of the field had been left below Shipley Tor. They had seen a fox go away down the valley and had waited in vain for hounds. Trumper shouted and pointed and I guessed it was about Jess, but didn't hear his words. They were running on level moorland now, covered with a short growth of heather which had been swaled two years before. And still they ran. Such a scent I had never known, and I blessed the stout dog fox who was giving us such a wonderful run.

The ground dipped suddenly, in a narrow gorge, and then rose to the mile long slope of Riders Hill. Trumper caught me just past the gorge. "Look, sur," he yelled, "look." "Yes," I said, "it's Jess; she's got away." "My God, sur," he said, "don't you see?"

I looked at Jess again, and my scalp rose under my hat and my knees suddenly felt weak against the saddle. Jess was going over some broken ground and pitching like a boat in a rough sea, but her stirrup leathers were taut as bars of iron, and her snaffle rein was tight and holding her head, and there was no one in the saddle. . . .

Trumper was as white as a sheet and I must have looked the same. There was nothing to say. It came to me that we were alone on that broken haunted moor, the same since the dawn of history, and the thought gave me cold comfort.

Up the hill our horses could hardly raise a canter, and the pack, going like smoke down wind, were drawing rapidly away. On the crest of Riders Hill I saw the fox and the pack saw him, too. They streamed up the ridge with Jess just behind them and poured over the summit. "He'll never make his point," I said. "No," said Trumper, "the rocks are a good mile further on."

We reached the top in a trot, and as we got there we heard the bay of hounds that have made their kill. Then we saw them by that ancient trackway which runs across the roof of the moor, and we saw a dead fox in the air, and the pack leaping to the worry. And across the heather came the voice of Tom Manners and the note of a hunting horn echoed away.

THE FOX AND THE BRAMBLES

A FABLE

Before the pack for many a mile
A Fox had sped in gallant style;
But gasping with fatigue at last
The clamorous hounds approach'd him fast;
Though painful now the toilsome race,
With draggled brush and stealthy pace
Still onward for his life he flies—
He nears the wood—before him lies
A tangled mass of thorn and bramble;
In vain beneath he tries to scramble,
So springing heedless of his skin,
With desperate bound he leaps within.
The prickly thicket o'er him closes;
To him it seems a bed of roses,
As there he lay and heard around,
The baying of the baffled hound.
Within that bush, his fears allay'd,
He many a sage reflection made;
"'Tis true whene'er I stir," he cried,
"The brambles wound my bleeding side,
But he who seeks may seek in vain
For perfect bliss; then why complain?"

R. E. Egerton Warburton.

CELEBRATING THE RETURN FROM THE DRAW

THE BURBERRY

is the sportsman's favourite

AT point-to-point meetings, hunts, and other sports in the "wide, open spaces," The Burberry reigns supreme. No other topcoat gives such a feeling of dependability under every weather extreme, no weatherproof has such a reputation of lasting worth, economic investment and all-purpose wear.

A topcoat that is serviceable in any sort of weather is a boon indeed. The virtues of The Burberry are so many, so reliable and so consistent that as a covering against the elements it attracts — and has attracted — the attention of men whose life out in the open calls for a natural observance of the common regards to healthful comfort and weather security.

WARNING

No garment or material, unless it is the manufacture or merchandise of Burberrys Limited, may be described as "BURBERRY," a registered Trade Mark protected all over the world.

N.B.—Proceedings will be taken against offenders using the word "Burberry" wrongfully, whether with or without knowledge.

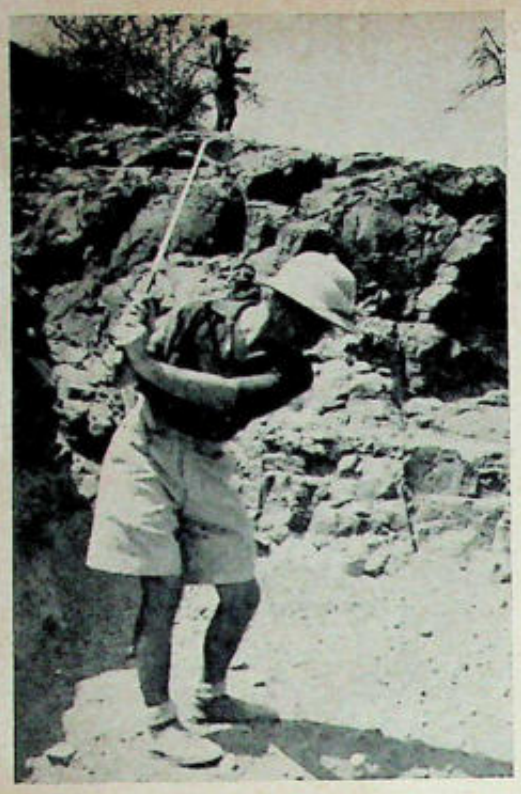
Dry on wet days, cool when the weather is mild, airylight, airfree, warm in the coldest wind; these are the attributes of The Burberry, the topcoat of complete and satisfying utility.

Patterns and full particulars sent on mention of the "Field"

BURBERRYS LTD. HAYMARKET LONDON, S.W.1

NORTHERN LAKE RUDOLF G.C.

A Hole in 3,923



"THE FIRST WATERFALL PROVED TROUBLESOME AT FIRST, BUT AFTER ONE OR TWO ATTEMPTS BOTH PLAYERS CLEARED THE TOP"

THE golf course for which the north end of Lake Rudolf has long been waiting—the Royal Lodwar supplies the south end—has at last been opened.

"CAMELS, GOATS AND ALL OTHER SPECIES OF LIVESTOCK MAY BE TREATED AS CASUAL HAZARDS AND MAY BE REMOVED BEFORE PLAYING THE BALL"

It is, we venture to think, unique amongst golf courses. It has only two holes. There is the long first, from the Abyssinian frontier to the Lokitaung boma, a distance of 27 miles, and the short second, a distance of a mere eight miles or so along the gorge through which the Lokitaung River runs, on the rare occasions when it does run. The first hole, by the way, has never yet been played.

The rules of the Royal and Ancient Game of Golf apply, but, as with most other courses, we have some additional ones to suit purely local conditions. The most important of these are :

(*a*) That if a leopard is seen approaching the game may be held up indefinitely.

(*b*) That if a goat, whose tastes are catholic during the dry weather, should eat the ball, another may be dropped without penalty.

(*c*) That camels, goats and all other species of livestock may be treated as casual hazards and may be removed before playing the ball.

Before playing a game, a certain amount of organisation is needed. In the first place, there is the question of followers. Two caddies are not sufficient on our course. You have to have an orderly with a rifle (see bye-law (*a*)). You have to have a cook, and a boy to assist at table (for, owing to the necessarily early start, it is essential to make a halt for breakfast). Then you need a caddy to carry one or two extra clubs, for you are certain to break or bend at least one, according to whether you are using wooden or steel shafts. And, finally, a boy with exceptional mathematical capabilities has to be found who can write down the scores.

The short hole is what might be described as natural and decidedly sporting. The greater part of the eight miles consists of the river-bed, which is strewn with boulders. At times, the country allows one to use sandy foot tracks. Here, though, one must be careful to go straight, as the rough on either side is quite impenetrable, consisting as it does of wait-a-bit thorn and cactus.

In two places one has the unusual experience of playing up a dried-out waterfall. This calls for skill, determination and a considerable amount of accuracy. The home straight lies up a long and steep hill at the end of which is the finely constructed club house. This is made of mud, and has a grass roof. As the members of the club are noted students of nature, they share it with several colonies of white ants and a family of snakes. These snakes, of course, are real, and not purely imaginary, as is the case in some other club houses.

The first round was played on a 1st of April. The joint-captains, and the only playing members, tossed for the honour, and the first ball was driven off at 7 a.m., a fine rasping drive of some 7ft. The match proceeded very evenly for some time, and at the breakfast interval the score was 1,128 to 1,110. After breakfast, though, troubles began. Following a rash and careless shot of quite 15yds., a ball struck a boulder and disappeared beneath a thorn bush. By dint of some fine left-handed play it was at last extricated after 25 shots. The next trouble was caused by a small hole belonging to a rat or snake. A short spell of sapping and mining solved this difficulty.

The first waterfall proved troublesome at first, but after one or two attempts, at each of which the ball hit the rock face and rebounded past them, both players, using mashie-niblicks, cleared the top. At this time the score was 2,158 to 2,175, and the excitement was running high. Shortly after one of the players, Captain X, forged ahead for a short while after discovering that, using the principles of a tramway, the ball could be played along the tracks made by a lorry. This stratagem was soon followed by Lieutenant Y, the other player, who used the other wheel track.

A mile from home the competitors were met by the district officer, who had previously been elected a non-playing member, a reward for having assisted to stock the club house cellar.

At fever heat the last hill was played. Lieutenant Y, with some fine forcing play, set the pace up the slope, neatly avoiding a hazard of barbed wire, and ran out the winner by 3,923 strokes to 3,950, after 5½ hours play.

The district officer, by the way, is now no longer a member. He has been expelled. He suggested that the match was not yet finished, as the first hole still remained to be played. J. K.

"OWING TO THE NECESSARILY EARLY START IT IS ESSENTIAL TO MAKE A HALT FOR BREAKFAST"

"THE SHORT HOLE IS WHAT MIGHT BE DESCRIBED AS NATURAL AND DECIDEDLY SPORTING"

SPANIELS AT LLANGERNIEW

THE Cheshire, North Wales and Shropshire Retriever and Spaniel Society held its spaniel trials on November 3rd at Hafodunos, Llangerniew, by kind permission of Mr. E. Lynton Vicars. The judges were Messrs. J. L. Marriott and D. Johnson.

The All-Aged Stake for any variety of spaniels was taken first, and produced some really good spaniel work. First prize was given to Mr. Selwyn C. Jones's Spur O'Vara, for putting up a first-class show. This dog ran consistently well under both judges, and never left the issue in doubt. He was working hard all the time and brought off a fine retrieve in a ravine. Captain O. P. Traherne's Bryngarw Fireside was second, after running a very good trial ; hunted fast and well and retrieved game smartly ; a fine performance. Third prize was shared by Mr. W. D. Edwards's Hillhampton Spark and Major H. Beaumont's Butter of Strouds. Hillhampton Spark ran very well, especially first time down, found rabbits quickly, and gathered and brought them to hand in convincing style. Second time down towards the end he was a little exerted, but ran very well. Butter of Strouds was very consistent and hunted her ground in a most workmanlike manner ; she was unlucky in having a lean patch second time down.

The work of the majority of the remaining competitors in this stake was of a high order. Certificates of merit were awarded to Cadet D. J. Calvert's F.T. Ch. Bobble, Miss S. Beaumont's Newburle Chips, Major Beaumont's Braga of Strouds and Saxpence of Skerries, Mr. Selwyn Jones's Squib O'Vara and Mr. R. MacDonald's Rockstead Footspur.

Mr. M. D. Withers's Beauchief Bahram was granted a qualifying certificate after putting up quite a good performance.

The Novice Stake, taken after lunch, was reduced to seven competitors. Mr. T. Radcliffe, the hon. secretary, very sportingly withdrew his entry in order to shoot, because one of the guns had to be absent. Captain Traherne's Noranby Pelican meant business right from the start and ran an excellent trial. She soon found rabbits and hunted quickly and with method. Could just do with holding on to her rabbits longer on delivery. Major Beaumont's Biretta of Strouds won second prize, through sound hard hunting, was most consistent and should do well in the future ; she had rather a bare patch of ground first time down. Mrs. W. R. Calvert's Staindrop Stopbright, third, hunted very well in bracken during his first run and finished off with nice retrieves. Altogether a good trial.

Mrs. Calvert's Eromtew Tod was placed reserve with certificate. He carried out a clever performance amongst bushes of gorse on a hillside and found plenty of rabbits, although earlier was not running up to the form of the dogs placed in front.

Mr. W. D. Edwards's Pierpoint Painter thoroughly deserved his certificate. Others to be awarded certificates were Major Beaumont's Bairam of Strouds and Miss Fetherstonhaugh's Rockstead Footflash.

It's a gift!

Johnnie Walker has the gift of making finely-balanced whisky by skilful blending—so Johnnie Walker makes the perfect Christmas gift. Your wine-merchant or licensed dealer stocks special Christmas cases, containing 2, 3, 6 or 12 bottles of Johnnie Walker, ready for sending off to your friends.

Johnnie Walker walks away with it!

Born 1820—still going strong

THE "TOWERED" PARTRIDGE

The Case for Cerebral Anæmia

IN view of the lengthy controversy which has prevailed among shooting men for so many years as to what causes a partridge to "tower" after it has been shot, the following information will, I am sure, attract the special attention of those whose interest takes them not only into the shooting field but also into the field on physiology and pathology.

My father, during the last and many shooting seasons prior to his death in March, 1935, collected and examined, first by X-ray and subsequently by dissection, a number of shot partridges, each of which was observed, by an experienced party of guns, to "tower" in the true sense before final collapse. Each, too, was found lying on its back, and a few were bleeding at the beak.

From the notes my father made on his investigations and the conclusions he finally arrived at as the result of them, I will endeavour to set out, as briefly as possible, the views he established for himself.

I propose to record here the results, in order, of the first six birds he examined, as they can be taken as typical of the remainder of the series which merely tended to confirm his earlier conclusions.

They were as follows:

1. *X-ray Examination.*—One flattened pellet seen lying just inside the pelvis, which is fractured on the right side.
   P.M. Dissection.—A large hæmorrhage occupied the pelvis and lower parts of the abdomen.
2. *X-ray Examination.*—No pellet seen.
   P.M. Dissection.—Left side of head bruised and torn. Fracture of the skull with hæmorrhage inside causing pressure upon and partial destruction of the brain.
3. *X-ray Examination.*—One pellet seen in the upper part of the chest.
   P.M. Dissection.—Lung torn and profuse hæmorrhage within the chest.
4. *X-ray Examination.*—Three pellets seen in the picture. Two are within the abdomen at its upper and lower parts respectively. The third pellet lies in the tail feathers.
   P.M. Dissection.—Extensive hæmorrhage within the abdomen.
5. *X-ray Examination.*—One flattened pellet lies within the upper part of the abdomen.
   P.M. Dissection.—Large hæmorrhage in the abdomen.
6. *X-ray Examination.*—One pellet seen in the left thigh. The right thigh bone is broken.
   P.M. Dissection.—Extensive hæmorrhage both inside the abdomen and in the right thigh. The pellet seen in the picture appears to have traversed the right thigh and pelvis, finally lodging in the left thigh.

The examination of this series of cases does not tend to confirm the sometimes accepted view that birds which are seen to "tower" before finally falling have been shot through the lung. On the contrary, the examination tends to show that the lung is not necessarily the seat or even the commonest seat of damage; for, as has been seen, in only one instance (No. 3) of this series was there evidence that the lung had been penetrated.

The outstanding feature in all these cases was the presence of extensive hæmorrhage in one region or another—most commonly in the abdominal region. Now it is a matter of common knowledge that whenever profuse hæmorrhage, from whatever cause, occurs in *any* being, not only the lungs but *all* the organs are deprived of a supply of blood and, consequently, of oxygen, adequate for their normal activities. Temporarily, each vital organ (brain, heart and lungs) in its own peculiar way, takes an increased or even disordered activity in its attempt to grasp that which it is losing. Of all these activities "air-hunger" or "fighting for breath" is the most easily observable to the naked eye. But this "fighting for breath" is not, as may be readily supposed, merely the expression of lung failure. It is something of far greater importance—it is the outward evidence of "cerebral anæmia" or loss of blood to the brain; or, to be more precise, of that part of the cerebral nervous system called "the medulla," in which is situated the "centre" or controlling station for the movements of breathing.

Increasing cerebral anæmia is the invariable accompaniment of continuing hæmorrhage. Unchecked, it culminates in unconsciousness, and it is at this moment the bird falls like a stone. In the phase of oncoming unconsciousness the bird doubtless opens wide its beak, throws back its head, and soars upward in its instinctive search for more air.

Many years ago, before the discovery of X-rays, Mr. W. B. Tegetmeier established the view that a bird "towers" because it has been shot in the lung. This view, I venture to suggest, is not now acceptable to all observers.

IAN O. FULLER.

NO FINER WHISKY GOES INTO ANY BOTTLE

TROUT WHICH ARE FOND OF FROGS

The Success of Dry Fly Imitations on Kashmir Streams

By MAJOR R. T. CAMERON

BESIDES the snails, shrimps, larvæ, and so forth, which form the diet of Kashmir trout, there are of course the indigenous fish, the loach and the young of the choosh and chirroo. And do not let us forget the frog—by no means forget the frog—for it is of that which I now write. The frog is found in most profusion where there

ONE OF THE THREE-POUNDERS THE AUTHOR SECURED WITH HIS METHOD, WHICH HE DOES NOT PRETEND WILL CATCH THE BIGGEST PRIZES

are rice fields adjacent to the river. They seem to breed in great numbers in the heated, shallow waters which lie in these fields. Many find their way into the main stream—they either tumble in, may be swept in by one of the frequent spates, or may be silly enough to take to the river in play. But, however they get there, they do not remain long, for the trout simply love them. I have seen trout in home waters gorged with mayfly; but I have never seen excelled the extent to which Kashmir trout will cram themselves with frogs.

This frog feed is not wholly common to every stretch of water. The head stretches of nearly all the rivers start in narrow gullies, much too steep and broken to allow man to terrace them into rice fields. It is only lower down, when the rivers reach more open ground, that the rice fields start. So that, high up amongst the pines, or where the cultivation is of the dry sort—mostly maki or Indian corn—the frog is comparatively scarce, and my method of imitating it not nearly so effective.

Some five or six years ago, then, a brother officer and myself were struck with the possibilities of presenting the bi-visible bulk of a frog to the fish, in the shape of a large dry fly which would have to be capable of floating on and through very heavy water, for the majority of rivers are much broken up by boulders and are fast flowing. The idea came through seeing the American salmon dry flies. It was with these that we started the theory, and we at once had startling success with the Palmers—black, grey and red, although it is a long time since we discarded everything but ginger cock hackles in the make up of the fly. Many experiments have been made until now I think that one cannot do better than use the Hardy series of Loch Ordie flies. Of these the No. 1 is used for three-quarters of the time, but occasionally, when the fish are afraid of it, the No. 2 comes into its own. Which to use is all a matter of the light on the water, and what the trout is seeing from its own side. It was the No. 1, "the big one"—as my orderly called it—which did the damage on Koka Nag.

These flies will float through the roughest of water for a very long time. I use a liberal dose of cerolene to help matters, and grease the whole of my 3x cast as well. There are many attractions in this novel way of fishing. To begin with, one always sees the rise, which is by no means the case when using the better-known wet lures and large salmon flies. You have to be able to keep the fly afloat. The more buoyant the fly, the better the light plays on the hackles, and the better the fish will

THE ASOKA POOL, ERIN NULLAH, KASHMIR, WHERE THE LOCH ORDIE FLY DID EXECUTION. NOTE THE TERRACED RICE FIELDS ON THE LEFT

what is, after all, a poor representation of Master Frog.

There is the art of fishing the far edge of the current without drag; but perhaps the greatest skill is to know where to find the fish on the look-out for frog. It is possible, by careful wading and stalking, to search those very likely little shallow junctions of side stream or mill stream—sometimes literally an inch or two of water only—or the boulder behind which the prize may be—places practically impossible to cover properly with the wet fly, used either upstream or down.

But being by nature extremely lazy, my chief joy is just this: The average fisherman and shikari will insist that you must make your basket either before the sun is on the water, or after it is off it for the day. If before, I detest the rise at break of day—it savours too much of morning parades in the hot weather! I abominate still more the necessity of having to fish with the dandy lure, the silver doctor, the coachman or the white moth at twilight and after, when the fishing is "blind," with never the gleam and flash of the turning fish to delight the eye. With my theory there is the leisurely start after breakfast at a Christian hour.

As a rule, the best time for frog theory is when the sun is on the stream, and the water temperature is rising. Perhaps an hour after tea, but long before you lose sight of the rise, you will have to put the brake on if you are not to finish the weekly limit in the first or second day. (Most beats in Kashmir are for one week, and the present limit is 36 trout for the week.)

There is, however, this word of warning. I do not pretend that this method of fishing will catch the biggest prizes which Kashmir streams offer. It will not. I may as well confess that I have not exceeded a fish of 3lb., and have had only two of that weight. Larger fish have been on, and departed, and I was once smashed by a great thing. Offers from the larger fish have been quite rare. But I will get one yet, and on my little 8½ft. rod and the 3x or 4x cast this will put the finishing touches to the delights I have had with this method.

There are two little tips: Instead of the usual white-throat hackle of the Loch Ordies, I sometimes substitute a red one for streams with a great amount of white foam, such as the Mantar tributary of the Densoo. The red shows up well against the white, and does not put the trout off. May I repeat, the fly is representing bulk—and not colour. I do not have the flying treble as dressed on the original pattern. It is not necessary, and tends to detract from the desired buoyancy of the fly.

It is as well to remember that the theory works only where there are frogs. But it is worth trying when things are otherwise dull, even on the Madmatti and the high reaches of Densoo and Nooboorg, where frogs are very scarce.

Just one word more about method. I have fished Kashmir mostly from mid-July to the end of the season on September 30th. The dry fly succeeds very well throughout this period. Indeed, it has often saved the day, when ordinary wet fly is doing nothing. I have only fished earlier—in May and June—once. Whether I stuck more to the lures in the hopes of a big one during their unsophisticated hunger at the beginning of the season, I am not quite certain. All I can say is that I formed a clear conviction that the trout were not feeding on frog to any great extent, and I did not persevere with the dry fly then.

I have often wondered if fisheries at home could not be greatly improved by introducing this frog feed? Unfortunately, the exact species of frog which the Kashmir trout love so dearly is not known by name, nor whether the high temperatures of the rice-field waters is necessary for their breeding and well being. I rather doubt it, as I have met the frog as high as 7,500ft., at Gurais on the Gilgit Road, and had great fun with the Loch Ordie there.

Experiments in this country might lead to quite startling increase in weight of fish. I can think of nothing against introducing them; and nobody will gainsay that the frog-feeding Kashmir "brownie" is a bonny fish, small of head, deep, red-speckled and a magnificent fighter. It leaves nothing to be desired on the table.

1938 DUNLOP

The dependability of DUNLOP Tyres—and the safety they ensure—are accepted universally. So now is the supreme excellence of DUNLOP Weather-wear and Sports-wear in which, again, the protective factor is inseparable from style, distinction and inherent quality. In fact the name .DUNLOP is synonymous with safety and protection.

MUDFLATS AT CHRISTMAS

By DR. E. A. R. ENNION

"WHAT! —— at Christmas? Honestly? Heavens, man, I had to spend a day there in July once. Enough for me—couldn't bathe, sea had gone clean out of sight, no pier, no shops, no nothing. And you're going down there for Christmas! Doctors ought to know better. What was that mental state you were telling us about last night—claustro something?"

"Claustrophobia? Call it that if you like. At the worst I'm harmless to others and hardly certifiable yet, and anyway—I'm going."

And certainly when I left the village asleep behind me and set off in the lee of the sea wall it all looked rather grim: one of those reluctant dawns when the gods try stingy winds and showers and quiet intervals by turn as if uncertain which to order for the day. Then ahead of me rang 'coorlie, 'coorlie, and five curlew crossed the wall, scudding like wraiths before a gust of wind. Had there been any doubt before I knew now I would sooner listen to the magic of their music than to all the bells of Christendom. For there *is* magic in the whistle of the waders, from the clean pipe of the greenshank to the little dunlin's trill: an elusive quality which haunts long afterwards and makes you wonder when you lie abed whether stray notes come trickling through the wind or from actual waders calling through the darkness overhead—the enchantment lies not only in their loud call notes and whistles of alarm, but even more in the small talk and inward murmurings which reward the listener after a successful stalk. We are only on the threshold of understanding this intimate vocabulary of birds. We know a little of the backchat of the tits and linnets of our gardens, but these waders who travel across half the world on their migrations, what tales they seem to tell when, once in a while, we elude their wariness.

I reached the turn of the sea wall, where samphire beds mark the limit of the saltings and the mudflats begin. The sky was clearing and already a promise of sunshine strayed through thinning clouds. I chose a gap to look through between two tussocks in a sag of the wall. Never choose a high place—the sea wall's rim is the skyline for a myriad wary birds' eyes on the flats and a head poked over it must do so in as inconspicuous a place as possible, or be seen at once. The mud was half covered by a creeping tide. A creek at the salting's edge filled lazily, and on its banks curlew and a few whimbrel whiled away the hours until their feeding grounds should lie uncovered once again. They preened and rested, scratched themselves and moved in a desultory way—just "dinnicking about" in fact. The creek was too deep for them to wade in and pull worms out of the mud. They hunted for small crabs instead; and often found them difficult to manage, too. Despite vigorous jerkings on the curlew's part, crabs refuse to travel smoothly up between the long curbed mandibles—they *will* keep slithering back or slipping out sideways. I have known curlews give the task up in disgust and mouch away after something else. The whimbrels looked much smaller than the curlews as they mingled on the banks. Even alone and too far off for the split buff crown to be seen, the short bill and legs and neater form distinguished a whimbrel at once. It was not so easy to decide between single birds in flight unless they called; the whimbrel calls more softly and its notes fall in a descending scale.

Redshanks, for ever restless, were flying round. One, wheeling above the wall, caught sight of me and fled shrieking away. When redshank or oystercatcher sound the tocsin it is wise to lower your face and lie still. Both cry wolf so often that other fowl heed them much as the jungle did the bandarlog—no cause for panic, but as well to proceed with caution for a little while. When curlew, heron or godwit cry danger, exodus from the danger zone soon begins.

Heron and curlew are the first to go with godwits, shanks and whimbrels a good second. Grey and golden plovers and the big gulls follow close upon their heels. The little waders (although the larger the flock the sooner they depart), oystercatchers, smaller gulls and terns generally remain until the threatened danger manifests itself and then a wide area of mud lies empty. An odd dunlin, turnstone or ringed plover stays on as caretaker and sometimes these singletons are so tame that you may have them run alongside for a 100yds. before they fly.

Already the flowing tide had shepherded knots and dunlins to the higher sweeps of mud. As each crest drowned in turn there rose a cloud of birds to twinkle against the sky until it joined the ever-deepening stipple of their fellows on the next highest mound. Always a greenshank or a few godwits would be left behind to feed on feverishly for the extra ten minutes longer legs allowed. Three godwits flew across the flats towards me and settled by the creek. Each sipped, and straightway slipped its beak among its scapulars and slept, head to wind and pivoting on one leg as a moored boat sways when it stems the running tide. These were bar-tails, outsize snipe in silhouette, though they had upturned beaks and longer, thinner legs. The black-tailed godwit never seems to find the time to rest; tide or no tide it is always guzzling in a vain attempt to plump out its scragginess—both kinds wade belly-high to feed, and thrust their heads beneath the surface with no more scruple than a tip-tilt duck. Once in a while when preening they vouchsafe a fleeting glimpse of barred or black-banded tail as the case may be. You never happen to be looking at the moment, and so it is less tedious to judge by size and shape—the bar-tailed is a Mutt—the black a Jeff.

Whilst I lay watching godwits a great cloud of waders, driven from their last stronghold by the tide, lit close to the wall on a sandspit a little to my right. They were a mixed company: knots, all in grey livery, short of leg and bill, but round of belly as the alderman who prized them above all else at their feasts of old; ringed plover; thirty odd sanderlings, so pale in white plumage that they shone like flecks of foam against the drab; and dunlin, in their hundreds. More careful scrutiny found several curlew-sandpipers amongst these dunlin: the tell-tale wedge of white above the tail was hidden unless they stretched or raised their wings above their heads and the bill (so dutifully curved in bookplates but often, in practice, no more so than some dunlin's) was not so good a distinction as the dark streak which runs from it through the eye. This line gives them an intelligent expression in contrast to the dunlin's, whose fat cheeks and beady eyes suggest the sleek but small mentality of mice. I found little stints among the dunlins too, miniature knots whose light collars

ruffed round their faces every time they puffed their feathers up. And turnstones with still shorter bills and smoky cheeks; I could just discern their dull orange feet.

Time passes swiftly on the tideway. How many hours had I lain there on the wall—six? seven? It is absurd to take a watch on these occasions. We are slaves to time from mothers' milk-four-hourly until a funeral rids us of all clocks. Cramped limbs and empty feelings are swift enough reminders. I slipped my sketch-book in my pocket and went on behind the wall. Presently sandhills crowned with blue-grey marram grass peeped over the top, and this suggested cover to approach another point. Rabbits sat back on their scuts to watch me as I passed. What do these sandhill rabbits live on? No vegetation looks less nibblesome than the harsh stems of marram; samphire and sueda bushes are apparently untouched. I found a hollow in the sandhills where I could sit and watch out over sand and shingle ridges piled above high-water mark. This was the waiting place for oystercatchers. There must have been 200 of them standing round a pool (they won't stay long where they cannot get a sip). I had my lunch, and with it more amusement than I should ever have found at any Christmas pantomime—the oystercatcher may be the most striking of our shore birds—it is certainly a born buffoon. I saw a comedy played over many times that afternoon: the actors were two oystercatchers, a turnstone and a black-headed gull. One oystercatcher (always the same bird) came running up the beach with a crab it had caught in a runnel that led from the pool. The second followed it with the gull in close attendance, and the turnstone pattered behind, short legs a blur in its efforts to keep pace. Oystercatchers eviscerate a crab by jabbing viciously with their vermilion bills at the underside until a breach is made through which to pick out piecemeal the content of the shell; they savour each morsel leisurely as gourmets should. After a few helpings the first bird stepped aside to let the other take a portion and presently returned to the waterside to sip this meal down and meditate on the next. No sooner had the second oystercatcher finished than the gull minced up and fed, delicately, lest the meat should soil its spotless napery. And finally came the turnstone's turn to pick the carcase clean—its agility had already won a few snatched fragments on account. As each finished it went back to the water, oystercatchers prancing, gull gliding, turnstone scurrying, to await the capture of another crab. This happened a dozen times.

There was a whine of wings and a soft whistling: six grey plover raced across the sand and alighted by the oystercatchers' pool. Each tiptoed a yard or two with wings uplifted before coming to rest, and the dark wedges of their armpits showed plainly against the white. A grey smudge on the cheek was all that lingered of the black underparts they flaunt in Spring—the Prince of Plovers in his black and silver livery is then worth running a mile to see.

The tide had turned before I got back to the wall. When I left it a few hours ago nine out of every ten birds seen stood asleep on one leg apiece with their bills tucked away. Now the air was vibrant with the whickering of wings and excited cries. Along the coast waders of all kinds whistled and wheeled. I wondered if there was a peregrine about, but could not see one anywhere; perhaps it was only the outcome of that restlessness which besets all waders the moment the tide turns. In half-an-hour the flats would be uncovered once again, and nothing but black-headed gulls within range of the wall. I struck inland to walk home over the fresh marshes. There would be sandpipers by the ditches and snipe round the shallow pools. One rough meadow was alive with peewits and golden plover—they, too, had sensed the turning of the tide and were unsettled and called incessantly—the hard wailing of the peewits tempered by the mellow pipe of the golden plover. I flushed jacks from the withered rushes; they rose listlessly with none of your full snipe's slashing getaway, and pitched after a short flight. I never yet knew a jacksnipe zig-zag properly and go swinging aloft on a tour of the clouds before coming to earth again. They drop without that silvery shudder of the wings, and if they speak at all on rising it is but a squeak any half-grown rat could better. I fancy they look for the greater part of their food in the drier tangles of the marshes—rail-fashion—although sometimes they certainly paddle about and probe the mud.

It was almost dusk when an incident closed the day. Over my head passed a single greenshank, calling, and out of a ditch at my feet sprang its pocket edition, a green sandpiper, whistling too. I followed the easy winnowing flight of the one and the errant course of the other by the white gleam of their saddles until both were lost in the gloom. And for minutes more I could hear them calling. They seemed to echo each other and their music still rings in my mind.

LITTLE WADERS ARE BUSY

AND OYSTERCATCHERS ARE HUMORISTS

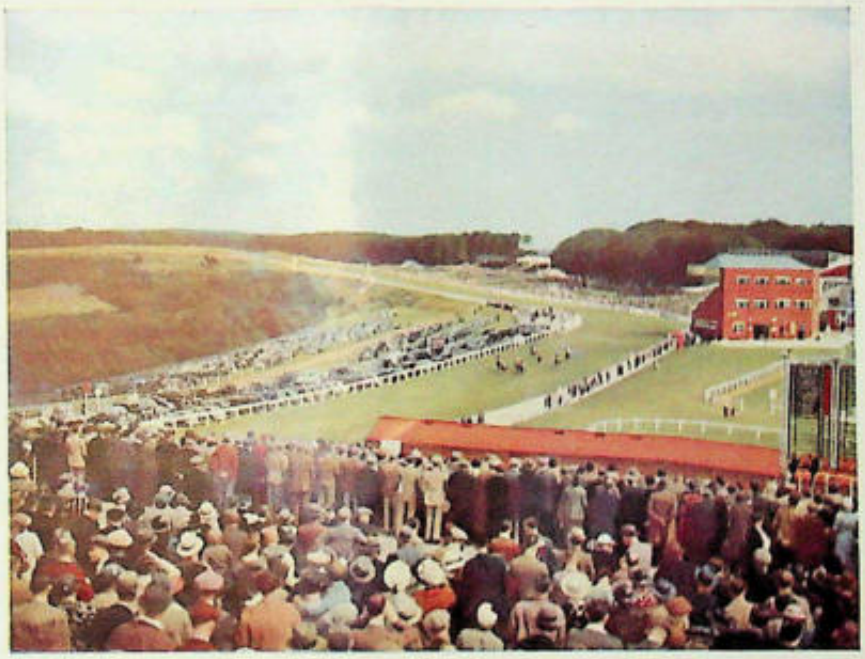
BIG WADERS ARE STATELY

COLOURFUL CAMERA RECORDS OF THE SPORTING YEAR

Violet blue of the water, white clouds, light blue skies and dark green rushes. A record of a summer day's shooting on the Fens

White sails against a pale blue sea with mist on the horizon. Looking across the Solent off the Royal Yacht Squadron during Cowes Week

Grey Church Tower against the sky, dark green foliage and rich grass of the pastures contrast with the chestnut and browns of horses and riders at this West Country meet of the Devon and Somerset Staghounds



A gay scene at Goodwood looking from Trundle Hill as the horses race to the finish. Even the Tote building's red roof of corrugated iron does not spoil the natural colourings of the picture

Sunlit clouds, dark masses of trees, and the play of light and shadow over green, fairway, and bunkers on Sunningdale Golf Course

And last, the finest sight of all—the purple heather of the moor and the blue mountains of Scotland viewed from the butts at Clune, Inverness-shire

The rapid progress which has been made in colour photography enables any amateur photographer to-day to secure faithful records of subjects which were previously confined to the brush of an artist. In the old days colour photography was limited in its scope as time exposures were necessary, but now the snapshot camera can be loaded with films and quite brief exposures given up to about a 25th of a second, a speed which is quite sufficient to arrest any but the most rapidly moving objects. At present only transparencies can be obtained in the ordinary way, but experiments are constantly being made, and the day may not be far distant when we will have pictures to show on paper equal to those seen by transmitted light

PARTRIDGE SHOOTING IN FLORIDA

A Day with the "Bob White"

HAVING recently returned from several weeks' Bob White quail shooting in the States of Florida and Georgia, it occurs to me that a short description of this bird and the story of a typical day at this sport may well be of interest to British sportsmen.

The Bob White quail (*Colinus Virginianus*) or "Bird," as he is called in the South, is a partridge and not a quail. There are no quail proper in the United States. His distribution is from New England and Canada to the Gulf of Mexico, and west to South Dakota, Kansas and Texas. As civilisation has moved westward the quail has followed, for he thrives on carelessly cultivated lands—though essentially a wild feeder. In size he is intermediate between the quail and the partridge of the old world. In appearance trim and handsome; colour in general, brown marked with black; throat and stripe over the eye white; top of head and neck dark brown; also back, rump and upper tail coverts; breast and under parts white with black markings; bill black; legs and feet grey. Female similar, but throat and stripe over eye are buff, instead of white. He is conceded to be the best game bird in America. He lies exceedingly well to the dog, and is a fast and cunning flyer. He leads a covey life, each covey consisting of from twelve to sixteen birds. The covey roosts on the ground, and feeds and travels as a unit. Normally each covey will inhabit or "use" a given small favourable area year after year.

This area will usually not exceed a quarter-mile square, and will include woodland and open fields and as many hedges and hedge-rows as possible. The characteristically untidy negro tenant cultivation of South Carolina, Georgia and South-Western Florida, which in turn made it possible to establish large preserves, is here responsible for his abundance. The act of preserving in this part of the world usually means that, for cover, there must be kept a balance between woods, broomstraw fields, and cultivated areas; that woods must be sufficiently thinned out to allow an undergrowth of seed-bearing plants; that broomstraw fields must not be too unbrokenly large, and cultivation must include crops which favour the birds; that each year, in February, practically the whole preserve must be burnt over, at night or on still days. This is necessary to control too matted and rank a growth, to help germinate the seed of certain valuable legumes, and to discourage an enemy called the cotton rat. Previous to burning, fire lanes should be ploughed to protect plum thickets, berry patches and seedling trees.

It is late January: a cold, clear morning with a slight frost showing in the low spots and a skim of ice on all sheltered water. Later in the day it will be warm, and there is a promise of a southern breeze from late morning to sunset. At the door by 9.30 in the morning is the personnel and equipment for the day's shoot. Two saddle horses for the host and myself. From each saddle is slung a scabbard for our 20-gauge guns. The white-jacketed dog handler mounted on a fast walking horse. The shooting wagon, drawn by two fine mules, and driven by an old darky, also in a white jacket. A young darky, who acts as horse holder and general utility boy, mounted on an able pony. The dog handler on the larger preserves, be he white or black, usually the former, is mainly responsible for the conduct of the shoot, the training and handling of the dogs and, in many cases, the game management of the preserve. He occupies the equivalent position and performs almost the same function as any Scotch or English gamekeeper.

A SHOOTING WAGON AND ITS ATTENDANT

The shooting wagon deserves a few words owing to some of its unique features. This wagon is of long box-body type, well sprung, and sufficiently rugged to be driven across country over logs, ditches, &c.; in fact, wherever a horse is capable of travelling. It has a strong hand brake. A wooden box about a foot in width by 18in. in height, with a hinged top, is in place of the usual dashboard. In this box is installed a metal water tank with an outboard spigot at one end. This water is for the dogs on hot and arid days. The driver's seat and the shooters' seat behind it, both heavily stuffed, cross the wagon body and extend a few inches over the sides. The shooters' seat can be used by the guns, who at times may prefer to be driven. Attached to the rear of the driver's seat is an upright gun rack lined with woolly sheepskin; also two racks for hanging quail. Immediately behind the shooters' seat is a solid top, wooden frame, wire mesh dog crate, capacity about eight dogs, in two compartments with gates to the rear. Below the gates is a hanging hop-up step for the dogs that divides the distance to and from the ground. The roof of this crate, surrounded by a 6-in. railing, provides a space for coats, cartridge cases and other gear needed in the day's sport. An overall waterproof canvas cover snaps tightly over the railing, protecting the contents from the weather.

In the wagon are eight pointers, fined down to a condition of hardness that is seldom seen except in this country. The American top pointers and setters are required to run three-hour heats in field trials, and the best shooting dogs are bred from this stock. Usually one of the eight is a single-bird dog, chosen because he is adept at working close to the guns on birds that have been flushed, scattered and marked down after the covey rise. He should be absolutely steady to shot, besides being an expert trailer and retriever.

The preserve is divided into courses, or "beats"; each course of about 1,200 acres, the area covered during a normal day's shoot.

Arriving at the starting point the handler calls for two dogs to be put down—Dot and Dash—and moves forward on his course, closely followed by my host and myself. The wagon and the pony follow after, wherever we may go. Dot and Dash range ahead some 200yds., and cover a front of about the same width. We have been riding at a comfortable walk for a varying time when Dash, far forward on our right, in skirting a point of open wood that projects into a cornfield, suddenly whips to a point; a moment later Dot, in her traverse to the right, freezes into a back.

The handler raises his hand, signifying a point, and the cavalcade comes to a halt some 30yds. in the rear of Dash. We all dismount and the black

boy takes over the horses. A few steadying words from the handler to the dog and we close on him; the handler is in the centre, I am 3yds. to his left, my host an equal distance on his right. The dog is standing at the very edge of the open cornfield, apparently pointing an object 5ft. in front of his nose, in a fringe of broomstraw some 20yds. wide, that forms the boundary between the field and an open stand of pine. The wind is blowing, not too hard, towards the left front of the dog. I surmise, owing to the wind, that the birds are probably nearer to me than to my host and even may be somewhat to my left. I, therefore, attempt to walk slightly slower than he, so that, if I am correct, he will not be baulked by my position. When we are a few yards beyond the dog, the covey explodes into the air, leaving the ground not a yard from my feet. The rise, so close, is actually a blur of speed—the twelve or more birds lace and twist, frantically reaching for the wood. I pick an outside bird, feel rather than see him crumple, and swing to the next one to his right, by this time among the trees; he jinxes to avoid a limb as I fire and I score a miss. I have heard two shots from my companion—we reload at once and move forward. One step—a delayed bird jumps and flies down my side of the wood and, unfortunately for him, offers an easy mark. We have three sure birds and another one, a runner, from my host's long second shot in the wood.

The dogs retrieve the three dead, are then crated and Bob, the single-dog, is loosed to find the cripple. It is cleverly trailed and run down in a couple of hectic minutes. Though not marked, the majority of the covey has probably flown to a known small area of broomstraw and small pine saplings, and we move to this spot on the off chance. As we approach the broomstraw, Bob is 20yds. in front, working cautiously. He disappears in the straw and we follow his course by the movement of the tops. The movement stops—point—we pass the dog—out comes a bird and I damage a sapling, but not a feather. At the shot another bird jumps and is gathered by my host. We now have five birds. We could surely get more, but this covey may be shot again during the season. No covey should be reduced to less than five birds, and seldom is on a good preserve. The dog handler gives a call, the horses and wagon come up, Bob is crated, Dot and Dash put down, and we ride on our course. Ten minutes later Dash appears to be making game in a stretch of thin broomstraw far ahead; he suddenly drops as a large covey takes wing, flushing wild 30yds. before him. The wagon driver, owing to his position, has been able to mark some of them near a plum thicket, a live oak and a briar patch 300yds. away. The dogs are taken up and Bob is put down. As we approach the spot, Bob points a single—we gather it; then two more points, two more birds, and we move on to find another covey.

Thus, with varying fortune, the morning passes; each covey is found in an entirely different setting, each bird a different type of shot. The target is small, very fast, and very able in taking care of itself. The dogs, working in pairs, show their different personalities and abilities. One rabbit, one litter of pig have been pointed, as well as many quail. No one's record is perfect. A short successful stalk of a feeding redtail hawk reveals the fact that his prey is a female Cooper's hawk—a fairly surprising discovery. We also jump two deer and a firm hand is needed to prevent the dogs chasing.

At 12.30 we arrive at a flat pond surrounded deeply by live oaks, cypress and maple, each draped with Spanish moss. We have found eight coveys and taken eighteen birds, have had a fair share of good shots to be quietly remembered and a share of misses to be laughed at. The horses are unsaddled and picketed in the shade. The dogs are taken from the wagon and tied to separate trees. A station wagon from the big house is waiting at the pond, and a hot luncheon of soup, omelette, quail, salad, cheese and coffee is soon on the table. This is made more enjoyable by the constant active natural life on the pond. Several white heron stand at attention among the lily pads, a few ringneck duck are moving in an open spot, swallows are skimming over the surface and, to complete the picture, two red cows and a white horse are standing hock deep near the shore with a background of age-old live oaks. Innumerable birds of many varieties are singing and calling from every tree and thicket.

By two o'clock luncheon is cleared and my host suggests that we do a walk-up of the pond for jack snipe. We walk down wind, he one side of the pond and I the other. The handler, mounted, with Bob at heel, comes along to retrieve. After 20 minutes of brisk and amusing shooting at all angles, we stop, having bagged fifteen fat birds—enough fun and enough birds, and plenty left for another day.

At three we continue on our quail course. It is one of those fortunate days when the scent remains good and the dogs find a covey approximately every 20 minutes. During the late afternoon our course takes us to a country which borders a swamp famous for wild turkey. I place a few cartridges of larger pellets in a convenient pocket for the eventuality of a shot. Dot begins to make game in the heavy broomstraw. All her movements suggest that it is not quail; before I can dismount, a large gobbler breaks from the straw and, with slow motion but amazing speed, sails away for the swamp. I am off my horse and tramp the straw, hoping to flush one within range. Two hundred yards off another turkey which had been running under cover of the broomstraw, jumps and scales to safety. No turkey!

At 5.30 our course has brought us back within striking distance of home. We have found sixteen coveys, have watched the dogs perform their always amazing feats of instinct, training and endurance, have taken our limit of 30 quail, have bagged fifteen snipe, have seen two fine turkey and two deer, and have had an altogether gorgeous day. We leave the wagon to its slow progress and canter in to that pleasant moment that should follow all such delightful experiences.

BULLETS AND BRUSHWOOD

The Power of Light Bullets

(*Continued from last week's issue*)

BUT irrespective of whether we are considering the small-game or the big-game rifle, there is another thing to be gleaned from this experiment—that the difference in dispersion is not sufficient with the worst of them to account for a miss if the aim is true. Even the .401 would strike in the shoulder area of a deer. Whether the dispersion of all of them would have been greater if the brush were thickly scattered over the entire course of the bullet one cannot say. It is obvious that such a test would have entailed strings of hundreds of shots, taking the mean of the lot for each cartridge under trial before we could have reached any definite conclusions, as each bullet would not have contended with uniform conditions. But the fact remains that the thing we were after was proven—*light bullets at high velocity are not more easily deflected than heavy ones at low speed.*

"Ah, but there is more to it than that!" I hear someone argue. "The light bullet lacks the knock-down power at short range."

With that, too, I disagree. I started shooting, in my youth, with the .45-70, .45-90 and similar loads, all of them good "woods" cartridges in their day, but they never remotely demonstrated the shocking power of the .30-06 even at short range. Time after time I have knocked a big moose off its feet, too paralysed to kick, with a single 180-grain bullet at short range, and stopped a grizzly in its tracks at 15ft. from the muzzle. The old slugs would put them down, but did not so utterly demoralise them. While they had a heavy punch they did not have the surgical shock, they did not disrupt tissue and bone with the same explosive force that a bullet has when driven at around 3,000ft.

I have had the .30-06 and the .300 do the same thing on caribou, moose and bear, to say nothing of sheep and goats at 200yds. and 300yds. This being so, why should they not do so better at short range where the energy is higher, if they are as accurate or, as we proved, even more so in cover? I think the answer is obvious.

I hope my readers will remember that I am not arguing with the jungle shooter in the Orient, who adheres to his double Express for thick-skinned game and dangerous carnivora at the shortest quarters—as bullets are to-day, I would myself. These remarks are applied to the shooting of North and Central America and the Continent of Europe, where most of the big-game shooting is in the woods, though, of course, it applies to the average run of buck and antelope shooting in Africa and Asia as well.

One of the principal factors in promoting the popularity of the small-bore magnums is the fact that a lot of ultra high velocity cartridges, designed for long-range shooting on woodchucks (a species of marmot), prairie wolves and similar forms of vermin, are being used more and more for heavier game. In their present form such cartridges should not be so used on heavy or medium-size game, as the bullets are unreliable. I refer to the .220 Swift, driving a 56-grain bullet at 3,760ft. velocity, and the .257 Roberts, with its 87-grain bullet at 3,350ft., but there are always some chaps who know better and insist on trying them on sheep and similar game. The claim is frequently made that even when paunched—or lung shot—they go down as if pole-axed. The lungs or intestines are literally blown up and the victim succumbs to shock. Why? Because there is more fluid in these parts of their anatomy and water, being non-compressible, the bullet demonstrates its greatest efficiency as a result of a poorly-placed shot, the fluid actually acting as part of the explosive force.

Unfortunately, the users of such loads do not write home about it when the bullet strikes heavy bone first, and the miserable victim wobbles off to die with a ghastly surface wound because the bullet exploded, so to speak, on the surface without sufficient penetration to kill quickly. Nice sportsmanship, that!

But the trouble is not with the velocity. It is in the bullet; the load is not properly balanced. To attain these super-velocities the bullet weight must be sacrificed to keep the breech pressure within safe bounds. As there is a limit to the reduction in calibre it therefore has to be shortened. The result is that when the expansion of the point starts on impact the bullet breaks back until the base is split, and, of course, the small particles lack the penetrative power of the whole. That is what we mean by "explosive effect." It is just as ineffective as an aerial bomb exploding against an emplacement as compared with a shell. It has a wide, superficial dispersion, but does not blow things up when it meets solid resistance; it simply blows itself up. That is exactly what happens when it strikes a small animal, or the fleshy parts of a large one—the area around the point of ingress is pulped by pressure and minced by the small particles of the broken bullet. But it does not necessarily kill when it hits in the tough shoulder of a big stag, moose or grizzly.

Nevertheless, we cannot afford to overlook the fact that they do upon occasions demonstrate a shocking power that is lacking in all of the large bores, for even a .577 will not lay out a moose as quickly if hit too high in the chest cavity or too far back. That is, we cannot afford to overlook it if we intend to progress as we always do. That demonstration of the superior killing power of velocity as compared with bullet weight, poorly assisted, is too apparent. Either we have got to design steel cases that will restrain the pressure when harnessed to heavier bullets, or we have got to design light bullets of tougher construction.

Experiments have already been made with the pressure cases and as far back as 1921 I assisted the late Colonel John Caswell in some experiments with a special bullet of his own design, which had a solid boat-tail base of special metal that remained intact under the drive of the highest velocity we could give it with safety in the .30-06. With one I killed one of the largest moose I ever saw at over 200yds., the bullet smashing both shoulders, and when recovered it still weighed 90 of its original 150 grains. None of the loading companies would produce it at the time because it was expensive to make. Perhaps we should look into it again.

At any rate, the demonstration of high velocity in several rifles, from the Highlands to Central America, and in every province of Canada, has convinced me that velocity is superior to bullet weight within normal limits even now.

Where anything but thick-skinned game and bison or buffalo are concerned, the .30-06, with its 180-grain bullet delivering 2,915lb. energy, and the 150-grain at over 3,000lb., the .275 Holland and Holland Magnum 160-grain, developing 2,780lb. and the .300 Magnum with its 3,743lb., defeat anything at any range, long or short, driving heavier bullets at velocities under 2,500ft. per second, as they do not deliver the same surgical shock.

Paul Curtis.

FROM MOOR AND FOREST

SCOTLAND

Isle of Jura (Ardlussa) (owner Mrs. A. Innes).—Total stags, 43. Average weight, clean, without heart and liver, 15st. 5lb. Heaviest two stags, 18st. 2lb., 18st. Best head, one 10-pointer. Season early; weather fine early, later stormy. Winter very mild, stags in good condition.

Perthshire, Dalnacardoch.—Major W. E. Mann and Mr. F. T. Mann and party, six guns in all, walking in line, have bagged 911 brace of grouse in 21 days, making an average of 43 brace a day. This bag is 240 brace in advance of last year, which was also a good season.

Perthshire, Innerwick and Roro, Glenlyon.—Captain R. A. Oldham and party. Chief items in the season's bag: 580 brace grouse (675 young, 485 old), 64 brace ptarmigan, 8 salmon, 22 stags. Incessant gales and rain for the past month ruined what should have been an excellent grouse season. Birds plentiful and strong; no disease or heather beetle. Of the salmon, six were killed in one day between 11 a.m. and 5 p.m. by Mr. R. D. Oldham, fishing "greased line" on a Blue Charm; heaviest fish 25lb. Stags killed averaged about 13st. 3lb. clean. Two good heads, 9 and 10-pointers were killed, the remainder included four of five switches and others "better off the hill." Heaviest beast, 15st. 2lb.

IRELAND

Co. Wicklow, Luggala, Roundwood (owned by Lady Granmore and Browne).—Ten stags killed, average weight 19st. Two heaviest, 21st. 7lb. and 21st. 12lb.

This England . . .

Hawnby Hill—North Yorkshire.

NOW is the work of storage at an end, and summer's riches have been laid away. The hay is in rick and the roots are in clamp, the hams are hung up and the wood in the shed, that man and beast may be warmed and fed against the winter harshness. Nor must we forget another great storage of the summer's wealth—our Worthington, rich compound of the barley and the hop. Hold it to the light and see the sunshine gleam again—taste it and feel the vigour of those open days return. Remember, too, that it was devised by our fathers to protect and comfort when the day dies at four and the wind's in the east. A Worthington, then, to your winter health!

EAGLES FLYING ROUND THE 'PLANE AND (BELOW) ONE STRUCK BY THE WING AND KILLED

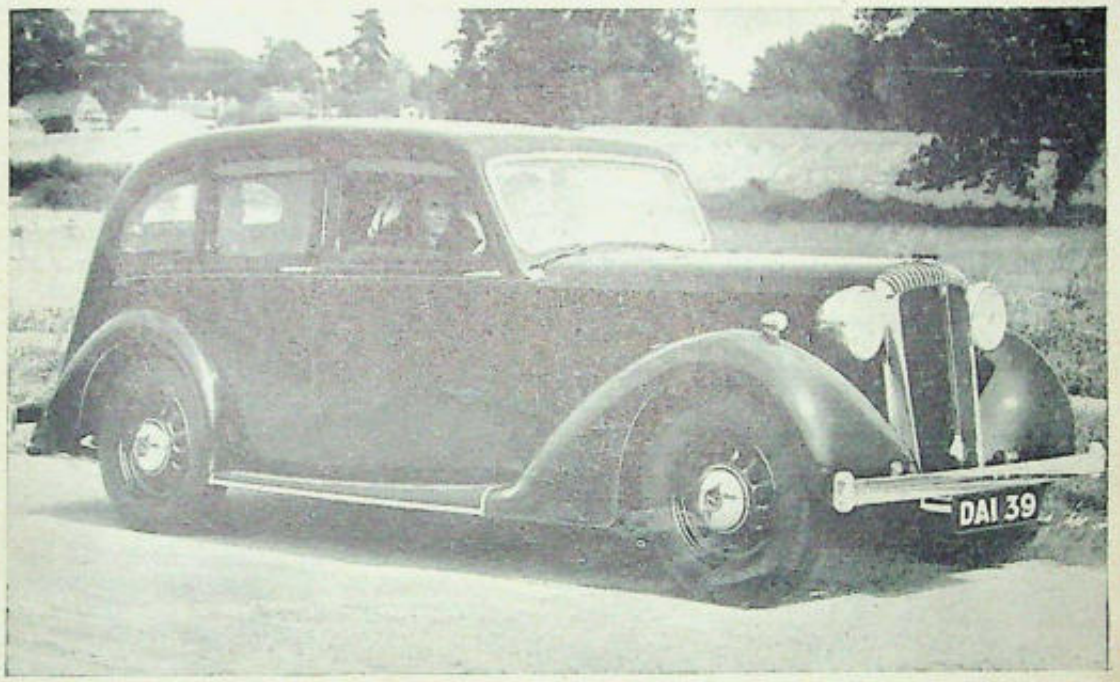
AERIAL ATTACK

Ruskin it was who wrote, "In general, pride is at the bottom of all great mistakes"—a statement which does not, it would seem, apply only to the human race, for the photographs on this page show that in the world of birds also pride goeth before a fall. These pictures, taken in the air between Luxor and Assuan during a German flight from Cairo to the Cape, show the death of an eagle which with others attacked the invading "monster." These desert eagles flew directly at the 'plane and over it, until the pilot became fearful lest one should shatter the propeller, and so crash the machine. This avian attitude of "we were in the air before you came" is somewhat reminiscent of the cyclist's opinion of the motor problem, and unfortunately the results are often similar "There is nothing new under the sun."

EXAMINING THE DAMAGE: TORN FABRIC COVERED WITH BLOOD AND FEATHERS

NEW HIGH PERFORMANCE ENGINE FOR THE DAIMLER 'FIFTEEN'

Delightful liveliness through whole speed range



Again the most interesting car of the year

THE DIFFERENCE OF DRIVING A DAIMLER

Stop and restart on Hill

ORDINARY CAR CONTROL. Car climbing in second gear. Driver declutches, puts on hand brake. Car stops. Driver moves gear lever into neutral, lets up clutch. Declutches, moves lever into first; then accelerates engine, eases up clutch and eases off hand brake all simultaneously. Has to balance all three movements skilfully to make clean start.

DAIMLER FLUID FLYWHEEL. Daimler climbing in second. Driver brakes. Car stops with engine running in second gear—*and holding car stationary through Fluid Flywheel.* Driver accelerates engine. Daimler moves forward. Hand brake untouched throughout. No judgment needed. Two things to do instead of nine.

LAST YEAR they spoke of the Daimler 'Fifteen' as the year's most interesting car. This year it earns that title afresh — with a new, more powerful engine.

With its new 2½-litre engine, this is a car of amazing versatility. As silent as ever, as tractable — but possessing a new reserve of power for instant acceleration. A car that offers the comfort and ease of Daimler coachwork and steering and suspension—but adds the zest of spirited performance. An interesting car, indeed! A car you must try.

THE NEW Daimler 'FIFTEEN'

- *Independent front wheel springing*
- *Anti-roll control bar*
- *Inter-axle seating. Positive steering*
- *Daimler Fluid Flywheel Transmission with pre-selective self-changing gearbox*

WINTER FAVOURITE FOR THE DERBY

Foxbrough II and Next Year's Classics

A SPLENDID SPRINTER

Portobello, who is a gelding and thus barred from next season's classic races, likes a race over five furlongs

AFTER many years as a regular follower of racing I have come to the conclusion that no one can tell with any hope of being correct how a yearling will develop. However, we do know rather more about this year's two-year-olds than we knew about them as yearlings a year ago. Even then it is not easy to forecast their future lives. It is not many years since I went to a famous stud and saw a yearling, and then later I saw him as a two-year-old being most carefully kept so that he should be at his best as a three-year-old. He could not be faulted, but what happened? He grew the wrong way, along and not up, and never won a race until, as a somewhat aged gelding, he won a selling hurdle at some minor meeting whose name I will not give as I am a member of it.

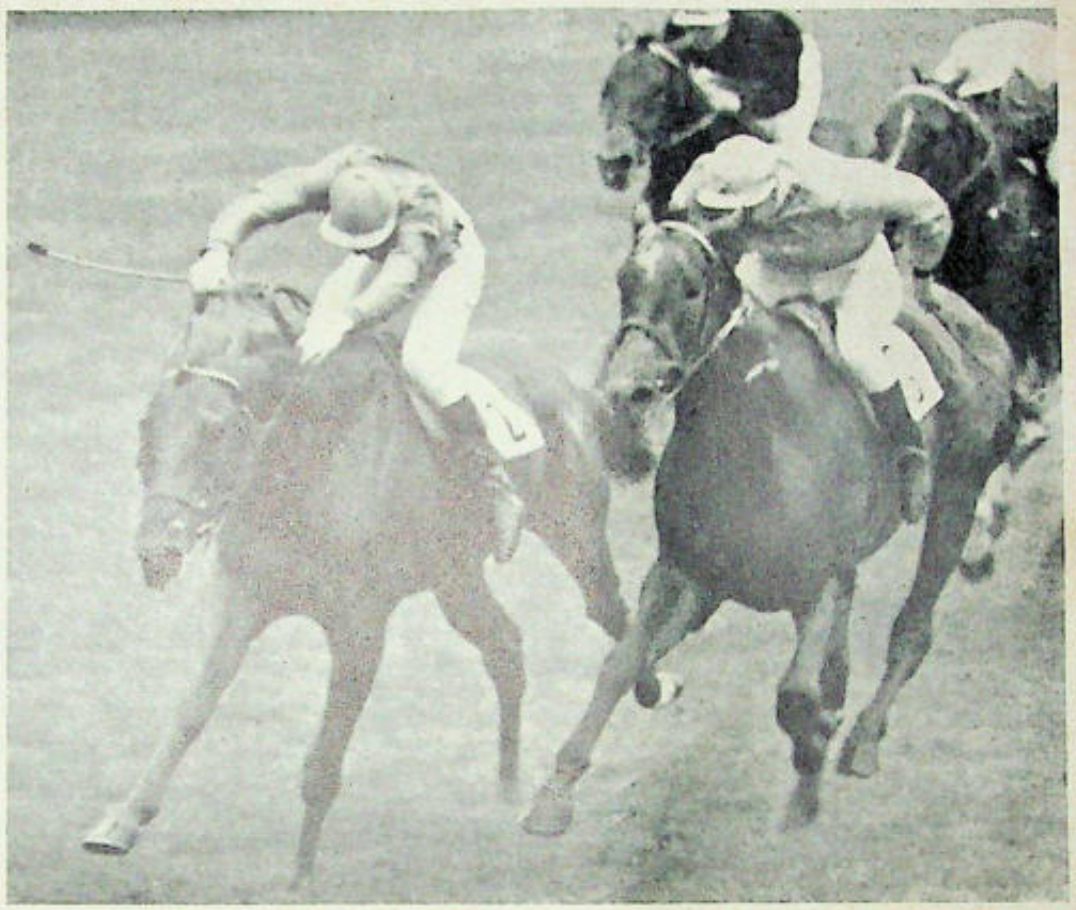
In any case, we can divide the two-year-olds of any season into two classes—those who will not stay and therefore will not make classic horses, and those who are at their best as "children" and will improve with age. They may win sprint races, but, after all, such races should not concern those of us who are thinking of the only real reason why racing is allowed, the improvement of the blood-stock of this country.

Like many other writers on racing, and indeed like all other people interested in racing, I always believe in using other people's brains as well as any that I may have myself. I have therefore been looking through Captain Sam Long's final edition of his two-year-old handicap. He is, in my opinion, the best handicapper that I know of a two-year-old, and he has been at his best this season. He considers that the best of the season's two-year-olds is Foxbrough II, a colt by Sir Galahad III out of Marguerite.

This colt did not make his first appearance until the autumn, when he won the Hopeful Stakes with ease and elegance. He ran then as if he knew all about racing, for he galloped straight on all the way. He next appeared in the Middle Park Stakes of six furlongs, one of the most important two-year-old races of the year. Again he won, but this time in much better company, while meeting his rivals on level terms. He won by a length-and-a-half from Blue Peter, who was also having his second race of the season.

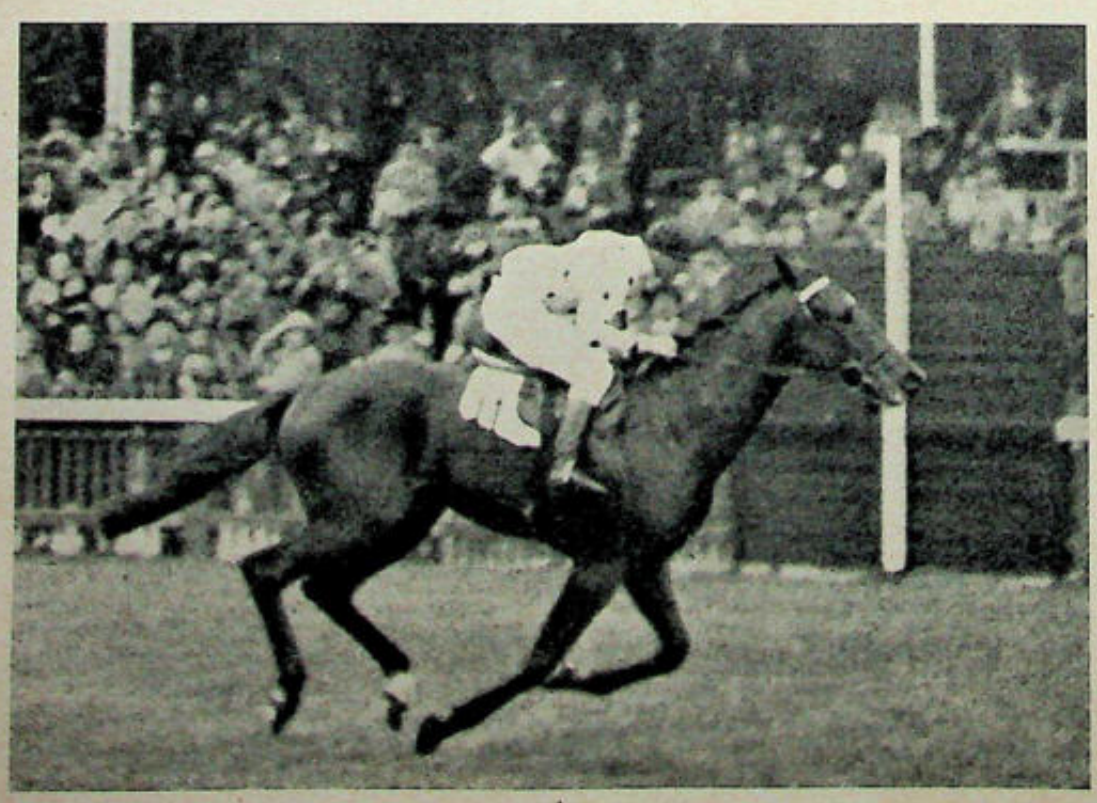
Blue Peter is by Fairway out of Fancy Free. He had run very well in the Imperial Produce Stakes at Kempton Park, but had then started slowly, had run into the lead and had then dropped back. Rogerstone Castle was third in the Middle Park Stakes, and here was a horse on whom anyone could make a handicap. It was stated after the race at Newmarket that Rogerstone Castle was not at his best as he had been coughing, but it is my opinion that if they ever meet again Foxbrough II will beat Rogerstone Castle and that Blue Peter will also finish in front of him.

I cannot quite make up my mind about Blue Peter. It cannot be denied that there is evidence that some Fairways have their own ideas about racing as he himself had. It may well be that Blue Peter is one of them. After all, he has run twice and each time he has not run as honestly from gate to winning-post as one could have wished. The first time I put it down to greenness, but that cannot really be the excuse the second time. I must therefore come to the conclusion that he is a doubtful colt and that his temperament may beat him.



FIGHTING OUT THE FINISH OF THE CHAMPAGNE STAKES

Panorama, another brilliant sprinter, wins from Apple Ring and Titan



FIRST PAST THE POST

Foxbrough II, the most likely two-year-old of the season, winning the Middle Park Stakes

I suppose that one is justified in agreeing with Sam Long that the two other best two-year-olds are Panorama and Portobello. They are quite possibly the best of the year if the distance is kept to five furlongs, but neither of them is in the least likely to play any part in next year's great races for three-year-olds. In the first place, Portobello is a gelding, and so barred from the classics. He is also by Portlaw, who has always been regarded as the sire of sprinters rather than stayers, although in this connection it is to be noted that Portefeuille is by that sire, and she has now shown that she can stay. More than one St. Leger winner was also by The Tetrarch. Still, for physical reasons we can leave out Portobello.

Panorama has been financially the most successful two-year-old for many seasons. He has never been beaten. He has been racing since early in the season, and has won each of the seven races for which he has been started. If his trainer, Captain Boyd Rochfort, needed an advertisement (which he does not) he could use this panorama. It is a wonderful feat of training to keep a two-year-old all the year at his very best and win race after race with him, most of them gained with the greatest of ease. Panorama may be one of the great sprinters of next season, together with Portlaw. Of the two I have come to the conclusion that Portlaw, being a gelding, may be the better of the two.

And when I have written of Foxbrough II and Blue Peter I am going to confess, sadly it is true, that I do not know whence on form I am going to find any other classic hopes of next season on the breeding

WINNER OF THIS YEAR'S IMPERIAL PRODUCE STAKES
Heliopolis, by that great sire Hyperion, out of a mare who could stay

WINTER FAVOURITE FOR THE DERBY *(continued)*

and the running of this year. Let us hope that hidden somewhere at Manton or at Newmarket are two-year-olds bred to win classic races who, on account of the hard early part of the season, have not been trained.

How good, I wonder, is Meadow? He won two races and then he finished third at Sandown Park in a very rich and important two-year-old race won by Rogerstone Castle, then known as the Apple Ring colt. Since then, and that is a long time ago, Meadow has not run. He is by Fairway, and after he had won the New Stakes at Ascot I thought that he must be a very high-class colt. He was then drawn on the far side of the course, and yet won like a good colt. It is, however, in this connection to be noted that the horses who finished behind him then have not done much good since. I have yet to hear that there is anything wrong with him, and it may well be that the Master of Manton, Joe Lawson, decided that a long rest and time to grow to himself was the best thing that could be done for him. There are great possibilities about this colt.

There are no doubt great possibilities about Rogerstone Castle, but in my opinion not in a classical way, for this colt, owned by Mrs. Thomas, is by Mr. Jinks out of Apple Ring. Mr. Jinks is a very good sire, but not of stayers, though certainly of short distance horses, and this colt is not bred to stay on the dam's side. I have already stated that excuses were made when he was beaten in the Middle Park Plate, it being stated on the best of authority that he had been coughing. I have no doubt that he had been coughing, but even if he had not been doing so he would not have won, as in that company six furlongs is too far for a colt bred as he is. Still, like everyone else who knows his owner, I hope that I will be wrong and that the colt will be a better three-year-old than I think that he will be. If he were mine I would concentrate on the Guineas with him, but if I found early in the year that he did not stay, back to sprinting he would go and the Fern Hill at Ascot would be my objective.

Gold Vista surely never will stay, and no one will expect that she would, but she will win good races, and not in any way disgrace her famous sire, Gold Bridge. Heliopolis is a colt of great possibilities, for he is by Hyperion, a little horse who is going to be a great sire, out of a mare who could stay, named Drift. Heliopolis won the Imperial Produce Stakes, at Kempton Park, from Casanova, who had seemed once to have the race won.

Since then Casanova has suggested that he is either not genuine or not a stayer. I am inclined to think that all that he is suffering from is ignorance of racing. He has had very little racing. He is by Hyperion out of Double Life, the winner of the Duke of York Stakes, and the Cambridgeshire in the same year. It may be that he is aptly named, for Casanova was a very naughty gentleman. At the same time I am going to give his godson a chance, and it will not surprise me in the least if by the end of next season he has not made a name for himself, and indeed may have won the St. Leger, and as I am writing more than a year in front of the date of the race that is something which may seem strange. Still, this, in my opinion, is a very high-class colt in the making.

Easy Going seems to me to be the best of the season's two-year-old fillies, but it is to be doubted at the moment whether she is too genuine. Still, being by Felsted, it may be that her time will come. Seaway, a filly by Fairway, was bought recently at Newmarket by Lord Glanely for a very large sum of money. She won at Newmarket on the July course, and then failed at Goodwood. Later, she won on the Rous course, at Newmarket, in the autumn in the style of a filly who would stay. Her owner and breeder, Major Courtauld, who is giving up racing, sent her up for sale, and she was sold to Lord Glanely. It was thought that his Lordship bought her on the advice of his new trainer, Basil Jarvis, but such was not the case. He bought her as he wanted her for her blood for the paddocks. I shall be doubtful if the buy, apart from that, was a good one, and I do not think that she will improve with age.

I cannot see any other two-year-old that needs to be written about, although many of them will win races. Still, they will not win classic races, and that really is all that matters. However, as I have stated earlier in these random notes on the first-season horses, there may well be some that have not yet run, or have not been seriously trained, who may beat all those who have been mentioned by me.

Who would have thought at this time last year that Rockfel would be the best three-year-old that we have seen for years? Who had ever heard of Bois Roussel, or had thought that Scottish Union would stay well enough to win a St. Leger? I am quite certain that his owner never thought so. And so let us sleep on the glorious uncertainty of it all, and wake up one day to find that we have been right.

GNOSTIC.

CRISIS IN FRANCE

An Interrupted Rest Cure

"VIENS ici Marquis, mon brave—hein! Pas de chien comme toi?—hein! N'sommes heureux. D'vrais amis, Marquis?—hein!"

Marquis was a small black dog with pointed ears and a long tail which curved over his back in an arc. M. Alfred, his master, had a voice which would have done credit to a drill sergeant, or, had it been trained, would have made Alfred's fortune in opera, for it was resonant and of magnificent timbre. Far into the night the voice continued.

My wife and I were not annoyed. We had set out to cross the Channel (only just) and to find, off the beaten track, a village which would offer us quiet and country scenery. M. Alfred suggested we had found local colour, if not exactly quiet, and we bore with him accordingly.

The method of selection had been somewhat unconventional. One of the old War-time maps of the Pas de Calais had been consulted. Quite close to the coast and the dunes there was a spot which augured well. A small stream ran down to the sea. On each side were woodlands, and a lake stood close to a small village which ran well back from the route nationale.

This was our place, and we set out for it. Suitcases were parked at the railway station. The waiter at the restaurant where we lunched produced a confrère who knew the village, and said that it was paradise on earth. A bargain was struck with a taxi-driver, who collected our luggage, found us a hotel "avec bonne cuisine," arranged everything with Madame, and installed us in the Villa Rose, where we were billeted.

This holiday promised us the perfect peace we desired. The country was beautiful, the hotel cuisine was all that had been promised. From our bedroom window the view extended across meadows and hedgerows to the lake. Beyond the lake was the forest crowned by a hill which was covered by a blue haze.

Opposite the hotel was the Abbaye, approached through an avenue of trees. The brook ran beside the village street and then followed a chalk path bordered by thick hedges, skirted the woods of an estate and came to an abrupt end at the entrance to a pinewood by the ruins of two brick pillars.

Here there was a barbed wire fence and a notice which read "Propriété Privée." Apparently no one paid much attention to it, but either made their way, on horse or on foot, over the sandy embankment at the side, or else pulled up a strand of the barbed wire and passed on to a rough cart road which led through the pinewoods. From this road several tracks branched off.

One of the sandy tracks leading to the sea was full of surprises. It skirted the beautiful thirteenth green of the golf course at one place. It went uphill and down until the waters of the brook, now a stream running in small cascades, were reached again, and then led to fresh scenery, where the pines were replaced by larch and silver birch. There the sun shone through the trees upon masses of wild flowers alive with butterflies. Then came the dunes and sands which stretched for miles on either hand.

If you go off the beaten track in France, or elsewhere for that matter, you must be prepared for some inconveniences. We had not the staff of the Grand Hotel to wait on us. Jugs of hot water had to serve for our morning ablutions. There was a real bath at the villa, but this we saw being prepared for another resident, the major, and it was a lengthy process. I would like to describe this bath, but the major's wife has claimed copyright in it for her article of "Baths I Have Known."

So this brings us to the major and also the troubles in Europe. The major was interested in the news of Czechoslovakia. He had a professional interest for he was on the reserve of officers. He would come into the bar parlour and manipulate the wireless receiver in order to get the English news bulletins; and those bulletins became very ominous. The Sudeten affair threatened to spread beyond the activities of Herr Henlein.

"Looks pretty serious," said the major. The French residents thought so, too. One of them seemed to know a tremendous amount about the Rhineland. He also was an officer on the reserve.

We went out the next day feeling subdued. The sun still shone, the trees and the fields were as beautiful as ever, but the spirit of peace had departed. We halted by the local memorial to those who had died that this might not happen. We visited the church and noted an inscription on a tombstone, that of M. Ferdinand Beaucourt, who had died on May the 8th, 1888, aged 75 years. It was recorded in English that Charles Dickens had said of him: "I never did see such a gentle kind heart."

We returned to the wireless to learn that there had been disturbances at a place called Marisch Ostrau. The Sudetens had suspended talks with Prague. France had manned the Maginot Line.

The major was in difficulty. He had paid a deposit on a car, a French car he wanted to drive to the Riviera. Apparently he could drive a car anywhere in the world except in France, and to do this he had to get documents from the Prefecture and pass a test. To get anything from a Prefecture is an exceedingly painstaking performance at the best of times; also the man who undertook the tests was away on his holidays. The major was not pleased.

M. Alfred came along to give us a light interlude. He arrived for some vin rouge and brought the Marquis with him. The Marquis was of a most friendly disposition. He was pleased with the assembled company and darted round like one possessed. He jumped up at the ladies, who did not share his enthusiasm.

Somewhat damped, the Marquis raced into the dining-room. There were sounds of anger and Madame made her appearance with the light of battle in her eye. M. le Marquis had consumed half a pound of cheese in less time than it takes to say it. Madame told Alfred to go, and take his dog with him.

It was some time before Alfred realised the force of her remarks. The affront robbed him of speech, and it took a lot to do that. But the pair departed. Madame must have mentioned gendarmes. That night Alfred spoke to the Marquis long and earnestly upon the subject.

"Hein!—Gendarmes, Marquis—hein! Tu les morderas mon brave—hein! Ou ne vent pas de nous—hein! On se moque de ça—hein!"

We had not visited the Abbaye, so asked permission of one of the nuns to do so. She not only gave leave, but graciously escorted us round. Three houses during past centuries had stood on that spot, all built upon the massive foundations of a castle constructed by Charlemagne. There were dungeons below the towers, and now in these dungeons were row upon row of neat iron bedsteads and excellently fitted bathrooms for the use of poor children from the towns. For these the once grim castle had been turned into a holiday camp. Dungeons may not seem the best place for dormitories, but the nuns had made them dry and warm, and had had the massive masonry broken through to provide light and air.

Others had slept their last sleep in these dormitories, for skeletons had been found in making the alterations, where walls had been built round the living. And so the old castle remained to carry on a great work of humanity in an age of bombs and devastation.

Britain stands by France. Meetings in Downing Street. Speeches in Germany. Britain takes precautionary naval measures. The wireless messages were becoming more and more alarming. A speech by Herr Hitler was awaited.

Meanwhile the major was to pass his car test. And the car when he got it was likely to prove an embarrassment to him. He had paid a deposit of 3,000 francs and had promised the balance of 30,000 francs on delivery. It became a question of whether he would be obliged to pay for a car he could never own. A minor worry in the affairs of Europe, but quite a big one for the major.

That Sunday we took the crowded little motor bus to the big town, and visited its cathedral. I had spent a week there during the great crisis of 1918, and had often sat on a bench on the old fortifications wondering when I would rejoin my battalion and if there would be a battalion to rejoin. I sat on the bench again to reflect on another great crisis impending just 20 years after the war to end war.

An old lady came up anxious to converse. She had known the war of 1870. She reminded me of a conversation I had with another old lady on the Somme in 1917. She also had known the war of 1870. We sat in a room filled with furniture of a past age. There were pictures on the walls of herself and her sister carrying absurd little parasols. In that room the Prussians had dined after they had ridden through the streets one frosty morning. Did I think the Germans would ever return to the village again? I replied, "No" and then believed it!

"C'est malheureux, c'est malheureux," exclaimed my old lady of the ramparts, and went on her way.

The major returned. He had passed his test. Herr Hitler had made his speech. Everybody said it was reassuring. The door was left open for negotiation. The French officer of reserve left suddenly to attend "an important business conference in Paris."

But the situation seemed easier. The major would be able to use his car after all. We looked forward to the village atmosphere brightening up. There had been a double funeral that day which seemed to have provided the inhabitants with some excitement. We were also intrigued by a rumour, brought by the major's wife, that the Pope intended to leave Rome and instal himself in a château near Boulogne.

In glorious sunshine we did a ten-mile walk the next day along deserted roads through the forest. We got back in time for the wireless depression. There had been riots at Eger. Crowds had been fired on. A State of Emergency had been proclaimed in Czechoslovakia. It was definitely time to go. We little realised, although so short a distance from home, that people in England had not had their crisis and would ask us what all the excitement was about! The major had paid for the car, was prepared to jettison it, and had asked the Consul to ring him up to announce any news.

How peaceful and still the countryside. A horse and cart came along, with a woman driving. She stopped to talk to a friend, and broke down, sobbing. Her man had been called up.

That night the major went to his room to do some packing, saying he would let me know if he got a ring. We remained in the bar parlour. I talked to a Frenchman. He came from Alsace, was not a friend of Germany, and said so.

Then came a dramatic moment. As we stood in a circle gloomily discussing things the Italian chef put a muffler round his neck and went down to the cellar. He came back with a bottle of champagne. Glasses were brought in on a tray and filled. We ceremoniously clinked glasses—Madame, the Frenchman from Alsace and his wife, the chef, the bright little Italian waiter, his fiancée (the young girl who attended to our room), the elderly lady who always worked behind the scenes in the kitchen, my wife and myself. What were the toasts we drank I must not say, in the light of after events.

As I stood there and looked around at our strange gathering there was only one scene I could visualise—the last act of "Idiot's Delight." Only we were not actors.

As we prepared for our departure and the finish of our "quiet, restful holiday," the voice of Alfred broke the silence of the night.

"Eh bien, Marquis—hein! En avant—hein! Nous allons faire la guerre. Nous allons aux trenchées. Tu porteras mon sac—hein! Vivo la France!"

R. N. Rose.

IN TOUCH

Rugby Diet, or a Christmas Interlude

OUT OF TOUCH

OWING to the *Field's* Saturday publication, a Rugby correspondent's lot is not a happy one. The match he visited one week is out of date by the next, from a news point of view at least, and he is reduced to using it as illustration for some point of policy, instead of waxing eloquent upon the thrills of the game itself.

I explained this difficulty to a friend some weeks ago in the hope that he might produce from a fertile imagination a subject to stir the Rugby pulse.

His suggestion was that I should write upon the perfect winter's day. He was vague as to how the morning might be spent, though I suspect much of it was in bed, but the afternoon, I well remember, was to consist of a visit to a Rugby match of such excellence that it dwelt in his imagination alone, and was to be followed by hot buttered scones and watercress eaten in bedroom slippers round a large fire. Liquid refreshment, the nature of which I cannot call to mind save that it was not tea, was also a feature, though just where it fitted into the scheme of things is a little beyond me. It is doubtful if watercress and intoxicants would have a very settling effect upon hot buttered scones.

Quite rightly, I pointed out that it was hardly excusable to fill a column or more of much valued space in describing events so personal and utterly divorced from the stress and strain of the football field. However, someone has said that the best sermon you hear on a Sunday is the one you preach to yourself while the other man is speaking, and so it came about in this case, though in more temporal matters than spiritual, for remembering the Christmas number, I then and there laid plans—if such an Eastertide simile may be used—with the hope that they might hatch out in that issue.

Now I have great admiration for the man who takes his Rugby football really seriously. He has to train on his free evenings, he has to deny himself various foods, and he has to go to bed early the night before a match. When Christmas comes round my admiration knows no bounds, indeed, it is not unmixed with pity, for while I sit exhausted in my chair like one of Bob Cratchit's children, "steeped in sage and onions to the eyebrows," and fiddle with the debris of a multitude of nuts, my Rugby enthusiast sits in his place modestly nibbling I know not what, but undoubtedly something other than that which causes me such a feeling of infinite well-being.

To-morrow is to be his triumph, as he tears down some field, ball under arm, amid the cheers of an exuberant Boxing Day crowd. He will return that night, maybe, battered but triumphant, and who is to say that his outlook is not of greater sanity than mine. He is still young and can gambol in the mud, still finding pleasure therein, while a meagre pasturage is more fitting to his stomach's needs than a succulent diet. Time enough when he himself is sage to fill himself by stuffing, so once more he feeds in all humility on I know not what, while I return unashamedly to my sage and onions.

Now I, too, play Boxing Day Rugby, but not with any seriousness, for I am a Rugby correspondent and as such my job is to take, not my own, but other people's football seriously—not infrequently an exceedingly difficult task.

This match is an event forming quite a feature of Christmas celebrations. It is played by 30 people, in appearance not a little reminiscent of Falstaff's army, ranging in age from about 14 to 40. The battle is joined on the ground of a well-known London Old Boys Club, and the gallery consists of wives, sweethearts, parents, and any others who know nothing of Rugby rules or technique but who feel the need of air on a Boxing Day morning.

The game begins. Every dog has its day, they say, and mine was yesterday and, maybe, will be again to-morrow, but in the present I feel as sick as man's best friend. As I run my legs are heavier than even the pudding of yesterday's feasting. I am far behind the pack, now running with the ball, and like Hotspur I cry, "This sickness doth infect the very life-blood of our enterprise," and stagger forward once more into the heaving mêlée.

Somewhere a whistle blows for a scrummage. I dare not bend yet must do that very thing that most I dare not do. Thus I battle on, while before my glassy gaze Christmas puddings, the currants of which fall in never-ceasing cascades before my vision, float football-like at the feet of a great flock of turkey-cocks which flutter round my head. Undoubtedly, I tread in the footsteps of those who run before, but like the page of the carol, I can go no longer.

Everything ends at last, and with the final whistle the turkeys slowly recede dribbling their puddings before them, and once more the air is peopled by birds of a more natural size and shape.

Never is a bath more welcome. The warm water wraps round the body like a cloak, enveloping bruises and all other bodily ailments for a happy quarter of an hour. Then home again to nurse the bruises by the fire—with scones and watercress, if you will.

Did I enjoy the game? they enquire. Why, most certainly. Did I not feel ill after a Christmas Day's roistering? But why should I? Provided you are fit, a little food does no harm to anyone. Hotspur it was upon the field, but Falstaff now it is who holds his rightful place upon the stage, for "What is honour? a word. What is that word honour? What is that honour? air. . . . Therefore I'll none of it. Honour is a mere scutcheon: and so ends my catechism."

FROM TEE TO GREEN

III.—The Spoon and the Wooden Cleek

By E. R. TIPPLE

THE spoon is probably the most useful club in the whole bag. Because it is more lofted than the brassie it is much easier to handle. In order to play a good spoon shot it is not essential for the ball to be perched up: indeed, the club will extricate the ball from really bad lies. Adequate distance combined with accuracy can be obtained with comparative ease by all types of golfers—no wonder it is so popular!

The players in the '90's included in their sets a graduated series of spoons. As the late H. G. Hutchinson wrote in the Badminton book: "There was the long spoon, the mid-spoon and the short spoon, with their various modifications shading off into each other and into each extreme . . . the 'baffy,' with which the golfer of old used to approach the hole is now replaced by the lofting iron. The practised iron player is always ready with the retort that the reason that men ever use the baffy now is because they cannot play the iron."

That remark is still very familiar among the players of to-day. Those who prefer to use their wooden clubs, and play controlled shots with them, instead of taking the powerful irons, are criticised by the golfers who can play an iron as it is meant to be played. But they need not, and, I think, do not worry. It seems to me that each of us, in our own individual way, should make the game as easy as we can for ourselves, and if we prefer to use wood when our opponent takes a No. 2 iron, what does it matter? Results count.

Many players would do better if they used a spoon instead of a No. 1 or a No. 2 iron for the long short holes—holes measuring 180yds and over. For the average golfer a hole of, say, 180yds. calls for a really perfectly struck iron shot, and that sort of shot is obtained only too rarely. With the spoon, however, he has more margin of safety: he does not need to hit hard, and therefore can concentrate on accuracy.

The club itself should not have a large head. A short, narrow head, with a shallow face is ideal. As I have pointed out before, deep-faced clubs threaten to smother the ball, and are difficult to use through the fairway, so the actual depth of a spoon should be not more than 1⅛in. That is Abe Mitchell's opinion, with which most experts agree. Mitchell advocates "slightly less whip as the shaft is shorter" than the brassie or driver, "but it is a mistake to use stiff shafts for all these clubs." Regarding the choice of a shaft for the spoon—or any other wooden club, he says quite rightly that "the first point to see that there is enough 'give' in the shaft to make the club-head feel much heavier than it is, and, further, that the 'give' is near the grip."

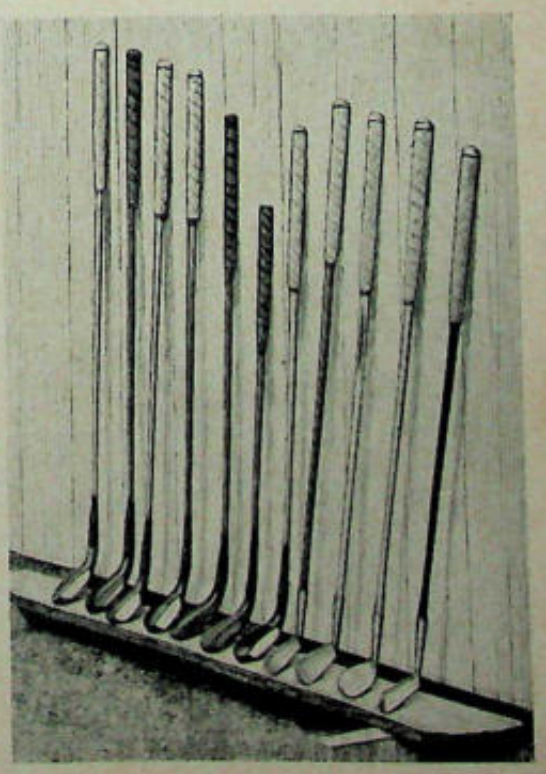
The question of whip in the shaft depends on the age and physical make up of the individual. The limber shaft suits most ladies and middle-aged men. Ray and Sandy Herd have found that it has rejuvenated their game. A whippy-shafted club certainly helps weak swingers. But to get the best results with it you must swing slowly, otherwise you will find yourself hitting the ball before you are ready for it.

The spoon is a useful ally when the ball is in a bad lie. It can often produce reasonable results when an iron would fail. Especially is this the case in short rough grass. The iron club is apt to get caught by the grass; then the club turns in your hands and the stroke is ruined. But the spoon with its broader face will force its way through such obstructions. When using this club an open stance is the best, and the player should stand fairly close to the ball. The cut-up shot is the natural stroke to play and the easiest. If the ball is lying badly or on a downward slope, we should stand a little more in front of the ball than usual—the ball nearer the right foot. On the other hand, if the ball is on an upward slope, the player should be farther behind the ball; then he will be able to maintain his balance. But for all shots from any kind of lie the open stance should be adopted.

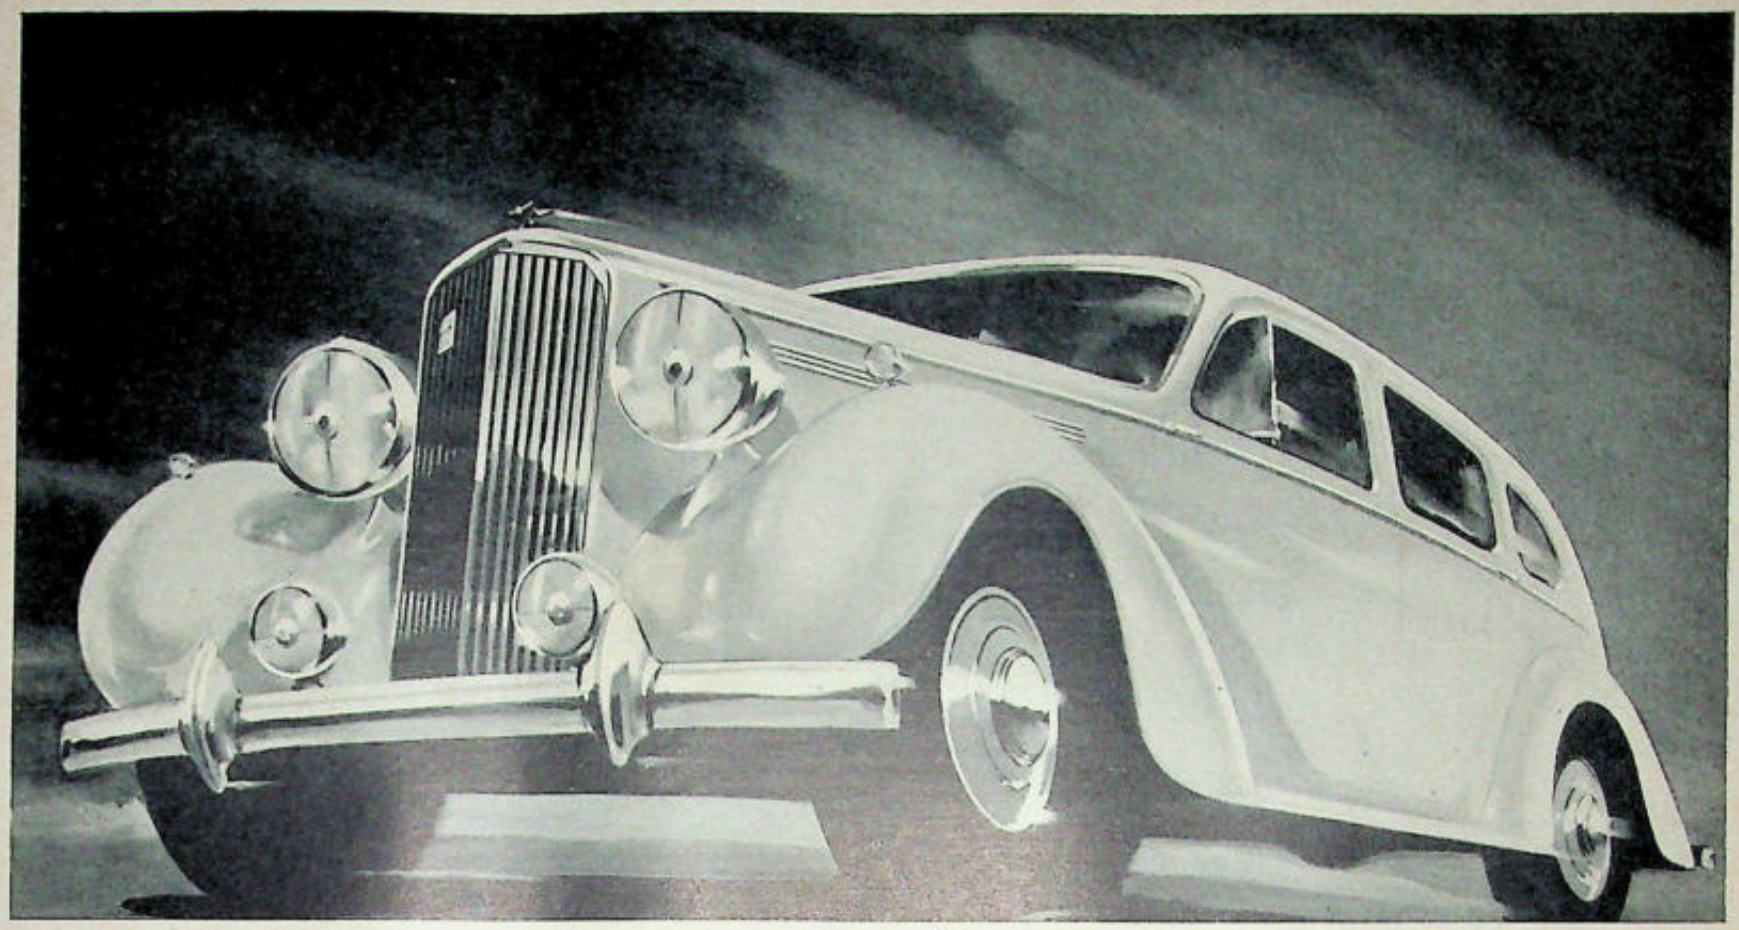
Cotton believes that golfers should pay more attention to how they place their feet; "get yourself so placed that you are gripping with the toes and pressing from the insides of the feet. If you have a very free body movement, then play with the left foot out a little and keep the heels down, both in the back swing and on coming through. If you are inclined to play with your feet flat on the ground, that means that you play too much with your arms and shoulders, and you should get more life into your footwork by standing less on the heels at the address and by leaning forward a little; to turn both toes in slightly when learning the movement of the knees will also help you." I am convinced myself that most golfers pay too little attention to this all-important question of footwork.

Usually only one spoon is to be found in a player's bag. There should be two. Like the experts, I have a second spoon, a wooden cleek, or what is called in this numerical age a No. 4 wood. This is a stroke-saving club. Smaller than the ordinary spoon it can be used when the ball is in a particularly bad lie. It gets maximum length with the minimum of effort—that is what we lazy folk want! The head of the club is rather like the old-fashioned pear-shaped head very popular twenty years ago. The depth of the face is just over 1in., the width of the head only 2in., and the length from socket to nose 3in.

Even if you are faced with a cupped lie, this small head will pick up the ball cleanly, whereas an ordinary wooden club would be obstructed by the ground. An additional advantage is to have the weight of the head at the bottom of the club. Most wooden cleeks I have seen possess a heavy brass plate at the bottom, and no lead in the back of the head itself. The weight of the club for the average player should be about 13½oz. Anything heavier will be too difficult to handle. Particularly for feminine golfers will such a club prove a boon, for few women are proficient with the irons.



"MODERN" GOLF CLUBS OF ABOUT 1890 AS ILLUSTRATED IN THE BADMINTON LIBRARY



The New

HUMBER

SUPER SNIPE

THE CAR HITHERTO LACKING IN UNITED KINGDOM MANUFACTURE

Superb appearance, docile but sports-car performance, amazing flexibility on top gear, 10 to 30 m.p.h. in 6¼ seconds. Comfortable speed 85 m.p.h. Independent front wheel suspension. Anti-roll stabiliser, hydraulic brakes. Only a trial run can fully demonstrate these outstanding features of the new SUPER SNIPE.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

THERE are people whose first reaction upon any festive occasion is to burst into song. There are others, there are many more, in fact, whose first thought is to celebrate a red-letter day with wine and food, something good to eat and drink—a really fine dinner, cost what it may.

Every year, when Christmas approaches, all good Christians and many more who have no title to be called either good or even Christians, must have a turkey to roast and a bottle of wine to celebrate the greatest of all birthdays. It so happens that Christmas, in England, offers more and better gastronomic delights than almost any other season of the year, with the exception of fresh, home grown fruit. Beef is in its prime and so is pork; oysters, pheasants, capons, geese and turkeys are also at their best; whilst, even more important than actual supplies, the first really cold and dismal winter days make generous wines all the more welcome and a homely or friendly fireside a greater delight, and to be enjoyed at greater leisure than during the finer months of the year.

Plato, who never heard of Christmas but anticipated its spirit, recommended an occasional surfeit to break the monotony of habitual moderation. And everybody knows that Plato was a wise man. Far be it from me to recommend a Platonic Christmas dinner. On the contrary, the Christmas dinner is inseparable from the satisfaction of our appetites and our appetites seldom pay any attention to our inward limitations. It is the one day in the whole year when it is permissible to eat and drink more than is good for us, that is to say, more than it would be good for us to eat and drink every day. It is one of the deepest rooted instincts, a religious instinct shared by the most civilised and the worst savages among the races of the world. Of course, among civilised people, reason never loses its controlling influence and excess does not mean gorging nor bestial drunkenness.

The classical Christmas dinner consisting of a plate of soup, some boiled turbot, some roast turkey with its attendant sausages and stuffing, vegetables and gravy, then the Christmas plum pudding, mince pies and fruit is wonderful fare, nourishing and tasty, wholly admirable but obviously too much to eat day after day. Whether it is going to make us happy or ill depends very much upon the liquid accompaniment to the feast.

If, with so much nourishing food we drink sweet "minerals," we shall be sick, and after being sick probably none the worse for a very unpleasant experience. If we drink cold tap water, we shall have indigestion and be thoroughly miserable. If we settle the soup with a glass of sherry, the turbot with a glass of champagne, the turkey with a couple of glasses of claret and the dessert with a glass or two of port, we shall be all curves and smiles, at peace with ourselves and the world, full of the Christmas spirit of goodwill towards men, sleep the sleep of the just and wake up the next morning as fresh as a daisy, fit for the coming year's battles which we must win before Christmas comes round again. At least, that is my opinion.

All Our Yesterdays

"Good party last night, wasn't it?"

"Er—yes—I suppose so. Somehow I don't seem to remember things very clearly. I've got a vague recollection of somebody wearing a fez."

"Yes. That was you."

"Oh, I see. Tell me, Philip — do you remember me being dropped head downwards from a great height on to a concrete floor, by any chance?"

"Slight headache, eh?"

"Philip — I wish I had your flair for understatement. I feel as though I had lived on an exclusive diet of iron filings and broken glass for the last five years. What amazes me is that you seem to be so disgustingly cheerful and bright this morning."

"I know. It must be very exasperating. A gypsy warned me to stick to gin and lime at parties. So I always take the precaution of bringing my own bottle of Rose's Lime Juice. You may cock a sceptical eyebrow, Edwin — but it works."

"How?"

"Rose's Lime Juice is the latest thing in therapeutic agents. It restores the metabolic balance. In simple non-scientific parlance — suitable for a mind such as yours, Edwin — it prevents hangovers."

"Why in the name of Santa Claus didn't you tell me this last night?"

SHORT DRINK—2 parts Rose's, 3 parts Gin.
LONG DRINK—add soda.

FIFTY YEARS AGO

From the *Field* of November 17th, 1888.

ESTATES in the Market. "It is melancholy to read the lists of substantial country seats, with sporting estates attached, which are for disposal, and to observe the prices now asked, as compared to what the same would have fetched in 1870 or later. It is said that at this moment, for instance—or, anyhow, a month ago—there was for sale, for the trifle of £50,000, an estate of 1,500 acres, in a home country, with a first-class historical mansion, deer park, half-a-dozen park lodges, elaborate pleasure grounds, ten minutes' drive from a railway station, and 30 miles from town. Fifteen years ago we question whether double the price now asked would even have been looked at by the vendor."

Racing in "100-Tonners." "We on this side of the Atlantic have had many years' experience of the excitement of racing '100-tonners,' and we always refer to it as the grandest of all sailing; but we are afraid American yacht owners come and go too frequently to get well into the sport. We have hitherto had enough men on this side of the Atlantic to stick to the sport to keep it alive, and if occasionally a man had only a transient but, perhaps, brilliant career with a racing yacht, his coming and going had very little effect on the sport generally. Whether we shall continue to preserve the old stock is perhaps open to doubt, but, at any rate, we think next season will show that we shall not have to put up with '40-footers' just yet."

Presentation to the King of Denmark. "Thursday last, the 15th, was the Jubilee of the King of Denmark, the father of the Princess of Wales. . . . The best-known horsemen in Copenhagen have banded together and presented His Majesty, who, in spite of the weight of 70 years, is still an accomplished equestrian, with two of the best horses procurable. The chief riding master was dispatched to England in the spring charged with the duty of making a selection, and he applied to Mr. Michael Young of Cockermouth, Cumberland, from whom were purchased a hunter and a charger, both Irish bred."

IN THE SALEROOM

THE very important collection of Japanese prints and drawings formed by the late Sir R. Leicester Harmsworth, Bart., is being offered for sale at Sotheby's on November 21st and 22nd. One of the largest that has come into the market for some time, it covers a wide field, and includes examples of all the best known artists from the sixteenth century to the present century. Lot 1 is a Kuge's visit to a group of seven court ladies, sixteenth century; then there is a Samurai and a young lady standing in conversation, of the Miyagawa School, signed Nihon Eshi Tōsandō Rifū, late seventeenth century; a woman coming from the bath, signed Tanjōdō Ishikawa Shūha, with seal, Toyonobu, 1711–1785; Komokato Aki no Tsuki, "Autumn Moon at Komokata," a Geisha landing from a boat, one of a set "Fūryū Yedo Hakkei," signed Harunobu; a scene in Kingyo-ya, the Gold Fish House, very beautiful; Hashirakake; an Oiran standing by the corner of a screen looking down at a man lying on a bed, signed Koryū; a scene in a bath house, one of the set Hakone Shichitō Meisho, "The Seven Hot Springs of Hakone," signed Kiyonaga; and Sawamura Sōjūrō III as Sadakurō, the murderer of Yoichibei, in the Chūsingura play, in a straw raincoat and holding a gun, hoso-e, signed Sharaku—this is not mentioned in Kurth's "Sharaku."

The works by Utamaro are numerous, and merit special attention, particularly Lot 92, "Benten visits the City," which is signed as practically all are. There are two by Utamaro II, the dates of which, however, are unknown, but are believed to be about 1807–1810. It seems a great pity that such a wonderful collection, which must have been made with great discrimination, has to be dispersed, but it gives an opportunity to lovers of Japanese colour prints and drawings to obtain delightful, authentic examples.

A NATURALIST'S NOTEBOOK

NATURE in England hardly knows winter. Our spells of cold, hard weather are brief and may come at any time between October and May. Neither the birds nor the plants of our countryside acknowledge any absolute gulf between autumn and spring. There is no month of the year in which you may not hear an English bird singing, and there is no month of the year in which some plant is not flowering.

* * *

But if neither birds nor plants acknowledge any gulf between autumn and spring, the whole earth acknowledges ten of the shortest days of the year: the ten days by Christmas.

* * *

At no season of the year is there such utter quiet as in these ten days. So quiet is the earth that the notes of a singing throstle travel far across the fields, and the robin's brisk challenge in a wood stresses the space among the boles. The stillness is not broken by such sounds, rather it is emphasised. The throstle's notes are but a thin shadow of the full song of spring; they recall that omnipresent music, and in doing so they make us the more conscious of the calm.

* * *

In these brief days the life of the wood and the field and the hedgerow seems only half to awaken between one long night and the next. Their aspect is one of peace and the days are quiet. The life of both animals and birds flows on, but seemingly with diminished volume. The forces of decay and growth are stilled, at an equipoise. There is silence. The voice of a singing bird rings in the silence as if under an empty dome. There is peace and the days are quiet. But it is the quiet, not of life running low, but of expectancy.

* * *

Five days or so before Christmas a truce is called in Nature's ceaseless war. There is a lull in life. And five days or so after Christmas, when life is taken up again—though it be full winter as we see it—it is not the force of decay that is in the ascendant but the force of growth. There is lengthening light in the evening, a new timbre to the voices of birds, a bustle in the tree tops, life in the roots of small plants, sap mounting in the trees. There may be snow on the ground, there may be frost hard and black, and the water may be still, and the earth cold. But everywhere there is hope. The great battle has been won. A new year, a new life begins.

* * *

And the sky of these ten days. The variances of light and cloud-effect, contrary to the general belief, tend in the main not towards turbulence and gloom, but towards harmony and serenity. Calm days around Christmas—and it is usually calm weather around Christmas—almost always pass into nights of star-jewelled or moonlight calm, nights of pure tranquillity. Even a boisterous day, a day of resounding wind and racing strife-born cloud, will end calmly with no breath of wind and just a formless radiance. A typical day in these ten begins diffidently, the morning light coming late and tentatively. All day there will be great masses of cloud in the sky, scarcely shifting from hour to hour, now dimming, now brightening the fields. But with sunset all the dubiety will vanish.

* * *

There is purpose now, one set purpose—to weave wonder. In the eastern sky the clouds divide into endless ribbons and festoons and trailing garlands, all of them delicately carved as out of alabaster, and laid out upon a cloth of diaphanous blue, shading down towards the earth into a pure soft green. And every cloud, every fleck of cloud, from horizon to zenith, is shot through and through with gold, almost intolerable in its glory; and each golden plume is clear cut against the living emerald or amethyst or sapphire of uttermost space.

* * *

There is no shadow to sully, no dim colour to cool the magnificence, no one colour merging in another. It is all clear cut—burning gold upon burning blue or molten emerald, and, beneath, the coal-black line of earth. Heaven looking down on earth. The earth is hushed. But there is just that murmur of sound, of expectancy—the murmur of a great congregation expectant in God's own cathedral.

* * *

For these ten days by Christmas there is peace. All the little birds that have weathered the great storms that shook our houses and tore branches from the trees, the trees themselves, the winds, hunter and hunted, are still and at rest. If there is good will round human hearths, there is no less surely peace and good will in all Nature, because 2,000 years ago a Child was born. B. V-F.

LETTERS TO THE EDITOR

THE LITTLE OWL REPORT

SIR,—The following letter on the subject was written in March. I find that I cannot entirely agree with the findings of the report. In the first place, very few people interested in sport took part in the enquiry, as acknowledged. In the second place, no assistance was asked of the British Field Sports Society. Thirdly, there is very little evidence on what the parents fed their nestlings. This seems to me the most important of all, for my contention is that that is the very time they do the most damage amongst birds both old and young. Examination of stomach contents is not always infallible, as the following shows. Dr. Collinge, in connection with C.L. partridge disease (England, 1932), found 40.5 per cent. of animal matter in the stomach contents, of which 30 per cent. was insects. Mr. A. D. Middleton and Miss Helen Chitty (*Journal of Animal Ecology*) dissected 424 crops taken at all times of the year, and found only 2.5 per cent. of insect food. Comment is needless.

The laying out of dead birds as beetle-traps is dismissed as merely an invention of the Press. I have the evidence of two independent gamekeepers to show that they have actually witnessed the little owls turning over the putrid chicks and eating the beetles underneath. The letter of one signing himself "Norfolk" was published in the *Shooting Times*, July, 1936.

Letters from gamekeepers and others appear in all the shooting journals showing by eye-witness that it is as guilty as a bird possibly can be. Surely, sir, gamekeepers are the men who are more likely to be right than workers in laboratories, as far as field work is concerned? The weak point in the enquiry is that it set out to prove the innocence of the little owl, and such being the case, was biased from the start.

Yours faithfully,

Lancaster. H. W. ROBINSON.

"RARE" BIRDS

SIR,—It is pleasant to be able to record the usual crop of "rare" visitors to the British Isles—at first hand, two spotted redshanks; at reliable secondhand, two spoonbills and a whiskered tern. The significance of such "rare" visitors is often overlooked. The "blown out of its normal passage route by gales" is a vastly overworked epithet. Any "rare" bird, particularly of the wader kind, appearing in the British Isles usually has an excellent reason for doing so. I, personally, know three places where one might consider oneself unfortunate if a year's prolonged observation did not include a spoonbill. No doubt there are several other places in the British Isles equally favoured. Many such records of "rare" birds apply to birds that once nested in the British Isles: spoonbill, avocet, black-tailed godwit. The latter, of course, is not a "rare" bird. It may be seen in most suitable places about the British Isles in spring and especially autumn; in two places I know, it is abundant for a prolonged period in the autumn, and in one may be seen in any month of the year.

The conservative nature of a bird's hereditary instincts is intense. The urge to return to ancestral nesting haunts, or, more likely, to follow ancestral migratory routes, is deep-rooted in every species of bird. The point is that those observers of bird life able to be in the right place at the right hour can be numbered on the fingers of one hand. How many ornithologists in this country are aware that two spoonbills were present in a certain place in the British Isles from mid-June to mid-August, or that two spotted redshanks were in another place from the end of August onwards? And, incidentally, if the news was broadcast, how long would it be before they were "collected"? In this present year alone there must be scores of such "rare" records unharvested—and how many more unseen or unidentified? The whole system of classifying "rare" birds requires overhauling. I cannot doubt that their passage over the British Isles is perennially constant, whether they be once-nesting species, such as spoonbills, avocets, black-tailed godwits, or migrants whose passage between Africa and their Continental nesting territories takes them over the British Isles: Wood sandpipers, little buntings, red-breasted flycatchers.

Their observation depends upon someone being in the right place when unfavourable weather conditions have forced passage migrants to alight on British coasts, or when once-nesting species visit their former haunts. I think that the great point to keep in mind concerning the majority of "rare" visitors to the British Isles is that they nest on the western edge of Europe, and that a normal migration from Africa will carry a greater or lesser percentage of them over the British Isles. To consider a "rare" visitor solely from the point of view of personal rarity is not helpful. The first questions one should ask oneself are: "Did this bird once breed in this or any other district of the British Isles?" "What are now its winter quarters and its nesting territories?" Approached from that angle we might learn a lot, and, not least, to refrain from describing commonly observed birds, such as ruffs and Ortolan buntings, as "rare."

Yours faithfully,

North Devon. RICHARD PERRY.

THAMES FISHING

SIR,—After dark days and anxious moments, during which many of us must have wondered when, if ever again, we should be able to take down our rods and go fishing, the clouds have passed, and once again we are able to go out and breathe the pure air of the waterside.

Those who live around London are not all aware of the dark clouds which weekly overhang thousands of ordinary folk, who are glad to get away from it all and go fishing at week-ends in the Thames, whose broad streams, fair banks and whispering weirs have brought solace to many. The "many" have increased twentyfold since the Great War, and they rely for the most part on the Lower Thames for their recreation.

Father Thames stands up to the added strain nobly, but even Nature has a limit and has to be assisted at times, and it would have been an impossibility for the excellent standard of sport which has been and is being maintained on the Lower Thames had not the Thames Angling Preservation Society, in many cases with the kind co-operation of the Metropolitan Water Board, kept on netting and netting, and turning the fish into the Thames. In actual fact, over 2,100,000 fish have been put in since 1919.

The society is a band of voluntary workers relying on donations alone to carry on this public-spirited work, but there are times when even a well runs dry.

For one hundred years the society have continued their work, and now find it necessary to appeal for help, and so long as *Field* readers angle, or are interested in the sport of others, they are asked to help the society.

Yours faithfully,

M. A. KAUSMAN (Secretary).

49, Essendine Road,
London, W. 9.

SCOTTISH GROUSE DECLINE

SIR,—From careful observation over a number of years I have become convinced that since the War there has been a steady and very appreciable decline in the head of grouse on Scottish grouse moors in general, and I am inclined to think that the modern system of drainage may be responsible to a large extent for the present state of affairs.

On a number of moors one now sees trenches as much as 3ft. deep with steep sides which constitute a death-trap to young grouse. But I go further, and believe that this deep draining is having a bad effect on the heather.

No doubt there are many places where careful draining is a benefit when properly done, but the best moor I know is not drained.

It would be interesting to know if the views and experiences of your readers coincide with mine, as if there is a real decline I feel that nothing but good can come from a full discussion of the subject.

Yours faithfully,

Alresford Place. PERCY LAMING.
Alresford, Hants.

A FLY THROUGH THE GILLS

SIR,—Reference your valuable paper of September 17th, 1938, which is eagerly read by all here, I, in particular, read with interest D. J. Reid's letter, "A Fly through the Gills," as I have had two similar experiences during 25 years of practical fishing. One in England and one in India.

During September, 1916, I was fishing for pike in a small private lake in Hampshire with a single No. 2 hook and live bait when I had a short "run"—thinking the fish had left it I decided to wait a few minutes "just in case"; my wait was only a few seconds, as off went my float and continued to move in a circular manner. On striking I found enough resistance to warrant a fairly good fish, but instead of the usual "run" and "play" I felt only a "see-saw" movement. Minutes went by and I eventually landed *two* pike on *one* hook and line. What obviously happened was that the first pike (3lb. 14oz.) took my bait, did not like it and ejected it through its gills; the second pike (4lb. 5oz.) seized and gorged it, as it was found that the hook was firmly embedded in the base of the tongue.

My second experience was while fishing the Ganges Canal, near Meerut, India. Bottom fishing for mahseer, and using boiled "atta" I received a run of about 20yds., and was about to strike when I saw a slack line and I thought my mahseer had seen my movement. However, winding in my line I found a little resistance, and then again another long run of about 30yds. Feeling my fish, I was surprised to find more movement than usual, and that the movement was confined to one particular spot. After over half an hour of pulling and walking towards the spot downstream, where my fish was, I succeeded in causing it to move to my landing-place. Imagine my surprise, when, in the clear pool, I saw two fish.

My next cause for anxiety was how to land them. However, I decided to gaff the one at the end of the line (by this time there was a yard of line between the fishes), and issued instructions to my shikari accordingly. I was delighted once again to have succeeded in taking two fish with one hook. Both fish were in tip-top condition and weighed 8lb. 2oz. and 6lb. 14oz. respectively. No doubt by the time you receive this little experience you will have had many more, but I should like to add it is my belief that fish *do* eject food (which for some reason or other they do not like) through their gills. Probably this is (and explains) the case of D. J. Reid's "A Fly through the Gills."

Yours faithfully,

W. J. C. NOAKES.

The Green Howards,
Razmak, N.W.F.

SIR,—"West Country," in your issue of October 1st, suggests that Mr. D. J. Reid was fishing "a very loose line," or that "the salmon may have taken the fly fished deep without moving from its lie." There are, however, two other alternatives: (1) A fly with which the angler was in touch; (2) a very fast-moving fly, but a faster fish!

My first experience of hooking a salmon through the gills happened with a fly with which I was in touch, and like Mr. Reid, was puzzled how the trick had been performed. On the second occasion I had risen a fish twice, then, casting a shorter line, I dropped the fly just in front of it and pulled it away quickly; it came like a speed-boat along the top of the water towards it, and without feeling anything I lifted the rod sharply and the fun began.

I gaffed the fish, with which I had been in touch throughout the fight, without leaving the river, and wading ashore suddenly stopped in my tracks on seeing the fly securely fixed under the root of the fin just below the right gill cover. The fish on the gaff was foul-hooked in about the worst possible place to kill a salmon on a trout-rod, while I had obviously played it from the mouth! On reaching the bank the mystery was solved as the fly and gut had passed through the gills.

That fish, one of the fastest travelling ones I have ever hooked, had taken the fly and instantly ejected it through the gills in its single rush. This makes one wonder how many of these summer fish sample our offerings and reject them in the normal manner without our knowledge.

In both the cases mentioned I was fishing from the *left* bank of the river while the fly had passed through the *right* gills on the side nearest me. Mr. Reid's drawing shows the gut under the right gill cover. Am I right in assuming that he also was fishing from the left bank? The illustration depicts a rather heavily dressed fly. Is this correct?

Both my experiences occurred when using a lightly-dressed hackle fly, and I consider a heavily dressed one would experience great difficulty in navigating the gills!

Yours faithfully,

The Kerne Lodge, ROBERT PASHLEY.
Ross, Herefordshire.

THE CHAIN OF AN OTTER

SIR,—The very interesting article in the *Field* of October 29th, under the above heading contains, I think, a fallacy in the statement: "Water in which any gas is absorbed . . . will, when suddenly compressed, tend to liberate the gas it contains in solution."

In fact, water or any liquid will tend to liberate such gas only when the pressure on it is reduced. For example, soda water only bubbles on its release from the syphon, or when the pressure inside the syphon is reduced by drawing off some of the soda water in it. If the movements of the otter under water were so violent as to produce a partial vacuum in its vicinity, then I think a small amount of air or gas might be liberated from the water.

Referring to the chain made by birds swimming under water, I have observed a common guillemot to make one. The guillemot's feathers were partly clogged by oil, and I was trying to catch it from a boat in order to give it a petrol bath. It swam strongly under water at first, but the more exhausted it became the more marked was the chain it made. This seemed to indicate that the bubbles came from its lungs; it was in fact getting out of breath. It had to breathe out all the time it was submerged and to come to the surface frequently to breath in.

I have also seen a chain of bubbles to come from the beak of a winged duck, which was hiding among reed stems under water and not swimming at all.

Yours faithfully,

E. R. J. ODDIE.

H.M.S. Undine,
c/o G.P.O., London.

"IT IS INTERESTING TO NOTICE THE DELIGHTFUL DETAILING OF THE GABLES
(See letter "Two Cottages—5/-")

U.S. CRICKET

SIR,—Readers of the *Field* may be interested to hear that cricket has been regularly played for several years in the capital of the United States. The Washington Cricket Club plays on a private estate just two miles outside the borders of the district of Columbia, in Maryland. Altogether some 25 games are played in the course of the season, and we pride ourselves that we are one of the few clubs still playing on grass instead of matting, as is usually the custom here. Members of our Embassy here frequently don their flannels and several of our opponents are of coloured race originating from the B.W.I.

Yours faithfully,
Langley Park, L. McCORMICK-GOODHART.
Silver Spring, Maryland.

Critical pipe smokers

are those most appreciative of Chairman, for they realise how rare it is to find a tobacco combining so many virtues.

Without a vicious trait, Chairman daily helps to make the rough smooth, to soften the judgment and lend a rosy tint to life's spectacles.

It is not commercially possible to produce a finer pipe mixture. Greater cost could not improve it nor lesser price provide it.

Chairman

In 3 strengths: **Chairman**, medium; **Boardman's**, mild; **Recorder**, full. 1/2 per ounce. In 1 oz., 2 oz. and 4 oz. vacuum tins. Sold by tobacconists everywhere.

Made by the successors to R. J. Lea Ltd.

Ⓟ 304

TWO COTTAGES—5/-

SIR,—While staying at Overhaddon, Derbyshire, this summer I came across two very interesting deeds showing the sale of two cottages for 5/-; this sum included all out-buildings and quite a quantity of land.

One of the cottages is still standing and occupied, and the owner very kindly gave me permission to photograph both the cottage and the deeds. The roof and chimney of the cottage are, of course, new, but it is interesting to notice the delightful detailing of the gables, so typical of even the meanest cowshed in that district.

The deeds are engrossed on parchment, and the cost of preparation together with the 1/6 stamp must have been far above the value of the property in those days.

It can be seen from the deeds that the "Over" Haddon of the present day was then (1778) "Upper" Haddon. I have not been able to find out when the change took place or the reason for the alteration.

Yours faithfully,
Saddlegate, R. BARRAUD.
Wollaton, Nottingham.

THE FENNY POPPERS

SIR,—A curious, though noisy custom, is observed at Fenny Stratford, Bucks, on St. Martin's Day (November 11th). At the little town on the London—Birmingham highway, Armistice Day is not only "Poppy Day" but "Popper Day," and has been for the last 208 years. The "Fenny Poppers" are six little cannon or mortars, not unlike mugs in appearance. The only occasion on which they are used is St. Martin's Day, when they are brought from the church belfry, where they are kept during the rest of the year, and fired off in a field. The first salvo is at 8 a.m., and this is repeated every four hours, the last discharge being at 8 p.m. The custom has been regularly

MORTARS, NOT MUGS
(See letter "The Fenny Poppers")

observed since St. Martin's Day, 1730, when it formed part of the celebration of the consecration of the parish church—dedicated to St. Martin—built by the antiquary Browne Willis, who was born on St. Martin's Day in St. Martin's Lane, London.

The poppers are of gun-metal—forged, not cast, and then bored—and each weighs about 19lb., and is 7in. in height. The charge is 4oz. of "shilling powder," fired by applying a red-hot rod to the touch-hole.

Yours faithfully,
Norbury, JOHN B. TWYCROSS.

LOCUSTS IN THE LAND

SIR,—I enclose a photograph of a swarm of locusts over our garden at Meru. They arrived at 1.15 p.m., and, in spite of seven or eight people trying to beat them off, there was not a blade of grass left when they departed at 5 p.m. During the whole of that time the sky was dark with them, and their wings made a noise like wind rushing through dry leaves. Since then we have driven through two tremendous swarms in the car. One swarm extended for a distance of six miles.

Yours faithfully,
Meru, Kenya. PHYLLYS BARKAS.

CATCHING EELS

SIR,—With reference to the letter in your issue of September 17th, "Catching Eels," an effective and amusing way of ridding the streams of these pests in Devon, known as "clotting for eels," has given our family many happy days on the banks of the Exe. The method is as follows: Acquire a vast quantity of lob worms by watering a section of lawn and sallying forth at night with a lantern, gathering them as they lie on the surface or by the more laborious method of applying weak mustard and water to the worm casts along the path edges; in a few moments the worm emerges at high speed, considerably irritated. If this method is adopted the worms should be washed, as eels dislike mustard with their meat.

Next, thread 3ft. of plain grey worsted on a packing needle and, putting a knot at the end, thread each worm on to the worsted till a long string of worms is formed. Tie the ends after removing the needle and make into a series of small loops, tying the whole with another piece of worsted. This is the clot. Place several of these in a box of damp grass sprinkled with a little milk, to harden the worms, and keep for two days.

The method of fishing is primitive: a length of salmon line 5ft.–8ft. is enough, tied round the clot; if necessary, a piece of lead foil to weight it. A strong withy stick for a rod. Throw your clot in the stream and soon eels will appear from all quarters. Wait till the eel starts off downstream with the clot in its mouth and its belly showing white, tighten your line and hoist with all your might. If the eel is free of rocks, it will fly high in the air into the meadow as its teeth are freed from the worsted. Then rush to get it before it gets back to the stream. I have taken ten to fifteen eels on one clot before it got too ragged for further use. As children we were much encouraged in this form of sport by our elders and betters, who preferred the more gentlemanly sport of luring the wily trout, *not* with a worm.

Yours faithfully,
Kobe Club, C. H. OWEN.
Kobe, Japan.

PHEASANT AND FLY

SIR,—When fishing Mr. Laurence Field's water at Honiton, East Devon, on September 14th, on the river Otter, I had just stepped over some low barbed-wire fencing and had commenced my cast, when at my feet two hen pheasants rose, one of which flew into my cast and hooked itself in the wing. She struggled across the river and flopped down into thick brambles; the predicament was an awkward one—how to release her without damage? In the end I had to hand-jerk the line, and the result was the loss of 2ft. of my cast and blue upright fly. Later I crossed over and examined the spot, but she had evidently gone off, and I feel sure none the worse for her experience. West Country sportsmen please note, as the finding of this gear would be interesting, but unlikely.

Yours faithfully,
Rochampton Lane, COLIN C. AYLMER.
S.W. 15.

BRIGHTER CRICKET

SIR,—I have read with interest Mr. Powell's letter on the subject of the present-day slowness of cricket. Could not most matches be "speeded up" by the suggestion of a friend of mine, to this effect:

"For every maiden over a bonus of, say, ten runs would be added to the bowler's side. The other cricket rules to be unaltered, except, of course, the bowler would not be expected to bowl 'wides' deliberately."

Yours faithfully,
Dacca Club, JOHN D. A. PHEASANT.
Ramna, P.O., Bengal.

SIX MILES OF LOCUSTS
(See letter "Locusts in the Land")

DUNANS CASTLE BRIDGE

SIR,—The Gothic bridge, leading to Dunans Castle, situated in Glendaruel, Argyllshire, the seat of the Fletcher family, of Dunans, which claims descent from Kenneth MacAlpine, King of Scotland, was built in 1815. This unique structure, spanning the deep gorge through which winds the River Ruel down to the head of Loch Ridden, is the only one of its kind in Scotland, and for this reason I thought that a photograph might interest your readers.

Yours faithfully,
Hants. A. T. L.

WHITHER WEEDON?

SIR,—In reply to your correspondent "Amazed," writing in your issue of October 22nd, I should like to point out that there is now a fortnight's course at Weedon every summer for serving subalterns of all Yeomanry Regiments and Scouts.

"Amazed" cannot have read Mr. Hore-Belisha's masterly reconstruction scheme for the Territorial Army, announced some weeks back, or he would not be so insistent upon our lack of cavalry. The War Minister then stated definitely that he would keep all existing yeomanry regiments (of which there are fourteen), and all scouts regiments (of which there are two), to act as a reserve of horsed cavalry for the British Army. Surely this arrangement should prove adequate to meet the country's needs in this line, as there are Indian cavalry and the two Household regiments (in addition to the Greys and Royals) still mounted.

Or does "Amazed" think the yeomanry are too inefficient to be worth considering?

Yours faithfully,
Cheshire. TAX-PAYER.

WHAT HAPPENED TO THE BEES?

SIR,—I think the enclosed may interest your readers who keep bees.

During the time the hives were on heather in the Crown Lands, near Whittingham, Northumberland, a swarm emerged and was lost in the surrounding trees.

When preparing the hives for return to the apiary recently, the enclosed festoons of comb were discovered hanging among the branches of a small spruce tree some 20ft. or 30ft. from the site occupied by the hives.

Apparently the swarm had failed to find a suitable homing site and had returned to the vicinity of the hives, there to again cluster on a branch and commence setting up a colony.

When found, there was no trace of bees or larvæ in the comb, which had evidently been picked clean by birds and washed with recent rains. The question raised is, what has become of the original insects? Have they taken shares in an already occupied hive, or have they all died off? The latter is most unlikely, as no dead bees were found in or about the comb.

The photograph shows a view of the two distinct layers of comb, the larger festoon being some 18in. in length, and from 10in. to 12in. wide.

Yours faithfully,
19, Lindisfarne Road, J. A. MILES.
Alnwick, Northumberland.

TWO DISTINCT LAYERS OF COMB
(See letter "What Happened to the Bees?")

TREE PARASITISM

SIR,—Is Mr. Dundas quite satisfied that the fig tree he mentions was really parasitic on the shea butter tree? It seems to me that the case might very well have been a parallel to the case of our own ivy growing on so many trees. The ivy is not a parasite, but uses the tree it grows on merely as "a stepping-stone to higher things." It certainly throws out adventitious roots with which to cling to the bark, but it is not considered to derive any nourishment from the tree, which, if allowed to, it will eventually smother by depriving it of air and light, or by its weight causing it to crash. Honeysuckle also may kill its support by strangulation, but it is not a parasite. Mistletoe, on the other hand, is a partial parasite, because it derives its salts from its host (which it may kill), and its carbon from the air. It seems to me that the fig in question may live at first on dead leaves in the partly hollow trunk of the shea butter tree, and eventually kill it by a combined process of smothering and strangulation as it grows larger.

Cornwall. BOTANIST.

THE ONLY ONE OF ITS KIND IN SCOTLAND
(See letter "Dunans Castle Bridge")

GRASS DRYING

SIR,—As you often touch on grass drying I enclose an account of my experience in September, in the hope that others will be able to give an explanation of what surprised me a great deal.

Part of a ten-acre field was carried with a Cutlift to my drier between September 2nd and 20th, with an analysis:

Carotene, 300; fibre, 17.9; protein, 12.6 per cent.

I was then stopped drying for over a week by a mechanical breakdown, and since the grass was getting too long I cut it on the 20th and 21st, intending to make hay, but since it rained on the 22nd, 23rd and 24th, I thought hay was rather hopeless, so dried it, for super-hay, on the 26th–28th. I had expected a protein content of about 7 per cent., but the analysis showed 14 per cent. This was so unexpected that I sent two other samples. They showed both grasses to be 13 per cent. This grass has lain out for six days in the rain, and yet was equal to the shorter grass

This was my first attempt to make super-hay, although I had been drying grass for three seasons. The costing of half of the field which I cut with Cutlift worked out at £3 10s. per ton for *all* labour, while the super-hay cost £2. But the chief advantage was that the super-hay only occupied one-third of the time.

In this wet district one's chief difficulty is to deal with grass fast enough to prevent it getting too long, and therefore I am anxious to learn if others using a drier have had at all similar experiences.

The Grass Drier's Association did the analyses, and by their price scale both came into the same category.

Yours faithfully,
Buckland Filleigh, A. S. BROWNE.
Beaworthy,
N. Devon.

BULLFINCHES TALKING

SIR,—You have recently published several letters on bullfinches. Many years ago I knew a man who kept one of these birds in a cage, which could talk. This bird, on the cage being opened, would come out, perch on the man's finger and say such words as "Kiss me" and "Pretty dear" quite distinctly. Have any of your readers any recollections of hearing a bullfinch talk?

Yours faithfully,
Forest Row, GEO. SIMPSON.
Sussex.

A STALKING CURIOSITY

SIR,—I thought the following incident might be of sufficient interest to you and your readers to warrant publication.

Whilst stalking on October 12th with the second keeper, R. Garrogie, I saw three very small stags, one of which was still in velvet. It appeared to be in perfect condition, and I wondered if there was any reason for its not having shed the velvet by that date.

Yours faithfully,
Inverness. THEWLIS C. JOHNSON.

CANINE HYSTERIA

SIR,—I read Mr. Fenwick's letter on a cure for canine hysteria with interest, as I have had experience with a similar cure. Some years ago I received from a well-known gundog breeder and trainer a prescription which he told me had cured about 24 retrievers of his own. This contained—I cannot give the proportions—Lysol, naphthol, ether and olive oil, and the application was the same as given in Mr. Fenwick's letter, viz., in the ears. I tried this on a puppy whom I considered quite incurable. She never had another fit. I sent the same prescription to a man in Yorkshire who had a number of dogs. I still have his delighted letter saying it cured them completely. I was so impressed by these few examples that in an article I wrote for the *Dog World* some time ago, I suggested that ear-mites might be a contributory cause to canine hysteria. (To anyone who is prepared to cast the inevitable sack-of-biscuits-theory at my head, please note the word *contributory*.)

Yours faithfully,

Yarcombe, Devon. HULDINE V. BEAMISH.

"OWD BOB"

SIR,—Apropos the recent correspondence in the *Field* by "Canis" regarding the film "Owd Bob," I thought you might like to reproduce this photograph I took of "Owd Bob" (Bagshaw's Glynn) at work at the recent International Sheepdog Trials at Southport, where the famous collie gained third place.

As one who owns and works the collie sheepdog, I cannot but think the film has illustrated an accurate, if not too common an episode of sheep-rearing country, for although the well-bred and well-trained Alsatian is certainly not a sheep-killer, there have been odd cases of sheep-killing stray dogs that have necessitated organised hunting of them before they are destroyed on the hills. No doubt these would be ill-trained or mongrel dogs, bred by cheap-jack dealers to meet the demand of the popular fancy for the Alsatian in the post-War years when the production of pedigree dogs was taxed to its limits.

Nevertheless, the sheep-killing dog on the hills is just as much a fact as is the poaching stray in the pheasant coverts, and shepherd and keeper alike know how such dogs end their days. Fortunately, the damage is rare enough to give an author the approach to the unusual, but I must admit in fairness to the collie that I have never yet known a working collie sheepdog become a "killer," although reports of stray Alsatians and others have not been unknown from Press accounts of such damage.

A FILM STAR IN HIS OWN RIGHT
(See letter "Owd Bob")

However, the film "Owd Bob," as shown here in Liverpool and elsewhere, has at least put a British dog's abilities on show, and no one can deny that the sheepdog trial is a utility trial and an asset to agriculture and of national advantage, whereas so many Alsatian obedience and other trials, carrying flat-irons and climbing ladders, are fast becoming circus stunts of no use to police or army work, as the Germans originally trained their wonderful dogs. Moreover, the collie is a dog trained to work sheep; the Alsatian a fighting dog bred to drive off wolves attacking the flocks, like most of the Continental sheepdogs introduced to this country. Hence the latter's instinct as a "killer."

Yours faithfully,

Wavertree, Liverpool, 15. ERIC HARDY.

LATE HOUSE-MARTINS

SIR,—On Saturday, October 22nd, there were young house-martins in a nest in this house. The old birds were about, feeding them, &c. On Sunday, October 23rd, by 10 a.m. the nest was empty, and there were no house-martins anywhere about.

Is it possible that the young martins migrate immediately on leaving the nest? Also is not it a very late date for migration? This was certainly the second brood reared in the same nest, and possibly the third, but of that I cannot be sure.

Earlier in the summer a house-martin's nest fell from the house wall in another position before it was finished, presumably owing to the drought prevailing at that time. Possibly it was the same pair of birds who were thus delayed in nesting who had the late brood.

Yours faithfully,

Daneway, Leiston, Suffolk. J. MARJORIE GIMSON.

TITS IN DISTRESS

SIR,—It is not a rare occurrence for birds in difficulties to seek human aid, as in the interesting instance described by Lady Gleichen. I have read of a number of cases from time to time, but the only one I can quote at present is that related in the issue of the *Western Morning News* for December 28th, 1934, by an anonymous correspondent, substantially in these words: A wild duck hid her nest amid the rushes and other plants of an East Cornwall river, and there hatched her family of ten. One day the ducklings ventured into a nearby mill-leat, and were carried into an offshoot which was some inches below the level of the leat, so that they could neither go on nor return. Only human aid could come to the rescue, and the poor duck fluttered frantically overhead, quacking frenziedly. Fortunately a passer-by was able to help her, and as soon as he had rescued her treasures her agitation ceased.

I have just remembered another instance, in which a small bird pursued by a sparrowhawk flew literally into the arms of a passer-by, and the hawk sheered off and disappeared.

Yours faithfully,

Tresillian, Truro, Cornwall. C. NICHOLSON.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—We ask your practical sympathy for a very pathetic household of gentlefolk. An old mother of 80, a son-in-law in failing health, and his wife, who for years past has pluckily struggled to earn a living for them all. Now they have literally nothing but the old lady's Old Age Pension, and were it not for the fact that the little villa in Cornwall in which they live is rent free for life, they would be forced to enter an institution. Will some generous reader send us £19 10s. so that we may send them 7/6 weekly and save these gentlepeople, who, through no fault of their own, are now faced with starvation?

IN THE CITY

BY THE CITY EDITOR

MR. NEVILLE CHAMBERLAIN, during his distinguished term of office as Chancellor of the Exchequer and Prime Minister, has, on many occasions, stimulated flagging spirits in the City. Once he slipped and slipped badly.

That was when he introduced, as Chancellor of the Exchequer, the original N. D. C., subsequently substituted by another which, though better than the first, still left a nasty taste. That fall from grace has been amply retrieved. He now champions an upward swing in British trade. That suits the business community.

It may be argued, however, that already signs of activity are returning to several branches of industry. I hear, for instance, of a tremendous volume of activity in the Midlands as a result of widespread demand for machine tools and other engineering equipment. Companies in that branch of industry, as I mentioned a few weeks ago, are doing really well.

There has been an influx of buyers for stocks and shares in such companies. Prices have risen but, in my opinion, there is room for further improvement in many instances. I must, however, impress upon a possible buyer that the work on hand is largely a reflection of re-armaments. Present prosperity must not be expected to continue indefinitely. That certainly places the shares in a speculative category.

Aircraft construction is speeding up. This industry is highly specialised. New companies have been formed but have yet to establish a standard. Unless they can produce machines which answer the requirements of the Air Ministry they must be dependent upon sub-contracts. That may prove profitable in times of hectic activity, but when more normal conditions return, the contracts available can be executed without outside assistance.

Here is a sound reason why shares in the smaller and lesser-known aircraft concerns must be regarded as highly speculative. The story is somewhat different in the case of companies producing component parts for aircraft and the motor trades. They, too, must be prepared for varying degrees of fortune, but they can at all times depend upon replacements.

I have in mind a company such as Clifford Motor Components. It specialises in the manufacture of valves and piston rings, for internal combustion engines. It is known that a subsidiary company has secured an important contract for valves from one of the best known aero-engine manufacturers. This contract alone will keep the works going for some two years.

The company is perfectly sound. It distributed 20 per cent. on a capital of £170,000 for the year to May 31st last. The dividend took only £24,863 out of the year's net profits of £47,617. It is reasonably safe to look for an increased distribution for the current year.

The 2/- shares of the company have a market price around 5/9 to yield practically 7 per cent. on the 20 per cent. dividend basis for last year. I consider that this share will make quite a good lock-up investment over a moderate period. Price fluctuations will doubtless take place, but I believe that a buyer around the present price will see a profit.

Another somewhat similar concern is Aircraft Components with a capital of £200,000 all in 5/- shares. In this instance, however, the market price of the shares is discounting past dividends. Distribution for the year to March 31st last was 7½ per cent. With the shares standing around 11/9 the yield on the previous dividend basis is small.

This undertaking specialises in the manufacture of aircraft landing equipment, shock absorbers, and retractable undercarriages for aircraft. I am told that the company is very successful. That is not at all surprising in view of such activity in aircraft construction, but the company can look forward to steady employment even when the aircraft construction drive comes to an end.

This share is regarded as one giving distinct prospects of substantial income and price appreciation. I find in certain quarters exceptionally optimistic views concerning its prospects. There is a distinct speculative element in the shares. It is necessary to watch the market carefully and to consolidate a reasonable profit when one accrues. Such a policy, however, should be adopted in the case of all securities which experience violent degrees of business fortune.

New Books

TROUBLES NOT WITHOUT HUMOUR

A Parade of Egyptian Memories

Desert and Delta. By Major C. S. Jarvis. (John Murray; 10/6.)

MAJOR JARVIS has the great gift of investing any subject he touches with so much humour that no book he pens comes under the heading of "something to read in moments of leisure." Leisure or no leisure, once started you have to go through with it to the end. And that sense of humour must have stood him in good stead during those thirteen years he served as Governor of Sinai; when he had to hear with patience the results of actions of Egyptian officials and those at home, who could chant in chorus: "We don't care a jot for the man on the spot, the stuff that he spouts is all tommy-rot."

Though Major Jarvis writes of Egyptian affairs and of his own particular quarter of the Arab world in light vein, there is sound instruction in his text. Many of us are inclined to dogmatise on Oriental matters of which we know absolutely nothing, and a book like this is an excellent corrective for distorted views. A course of literature on similar lines would work a vast amount of good in Whitehall.

Policy and lack of policy in Egypt, government and misgovernment, are dispassionately dealt with by a man who knows not only the characters of the governed and their reactions to certain lines of conduct, but who can also appraise the governors. High Commissioners and notables are reviewed, and there are words of appreciation for the late King Fuad. Of disruption, corruption, foolish but serious student riots, incompetence and the rising of the Wafd party there is an instructive survey. The sketch of the Wafd Parliament that sat after the elections of 1923 is pathetic, if funny:

"Its keynote was lack of discipline and at any debate half the House were on their feet at the same time shouting their views, while the other half yelled to them to sit down. The President at the opening of Parliament was provided with one of those small bells that one strikes with one's forefinger; this he broke at the first sitting by hitting it with his fist; and small blame to him. At the next sitting he was presented with a more efficient Mark I bell that also proved useless, and, having tried a railway station-master's variety, he was finally equipped with an electric fire-alarm buzzer the noise of which was so terrific that the whole House, including the President, had to rush into the lobbies to save their ear-drums."

Among the confusions of Egyptian administration which may be instanced was the position which arose when Mr. Brown, of the horticultural section of the Ministry of Agriculture, resigned, and services and posts in his department were filled by Egyptian officials who had deserved well of their country as politicians but were not a conspicuous success as horticulturalists.

"When an Egyptian takes over a post from a Englishman he at once proceeds to prove to the world how much more he knows of the work than his predecessor, and to do this everything has to be changed. In this particular branch it took the form of changing the labels on the trees." The results of this procedure may be imagined. They led the Egyptian Government to conclude it was time Mr. Brown returned to the country and took up his post again.

Major Jarvis is at his best when picturing the Arabs of his own district, the fishermen, the prisoners, the men of the desert, Bedouins, Bardawals and boisterous Bayyadins. He thoroughly debunks the film version and the travel writer's conception of the Arabs. They have their good points, very good indeed, but there is "a lot of bad in the best of us," and the Arabs have their share, especially of wiliness, and are far from romantic sheikhs.

Nearly every page in the book contains a good story, and two at least must be extracted. Major Jarvis describes a tarantula-scorpion duel (a War pastime), when he dined at G.H.Q. mess at Kelab in Palestine and came into contact with Lord Allenby.

"Lord Allenby's entry, a magnificent heavy-weight tarantula, presented by one of the divisions in the command, was put into the ring. As luck would have it he met my scorpion, who was only a middle-weight and had no reputation whatever. Whether the representative of the Commander-in-Chief took matters too easily, despising his opponent, or whether he was off colour that night, the fact remains that my scorpion dashed in in the first round, planted his sting in some vital spot and the Palestine champion at catch weights rolled over dead. It was all very lamentable—there was no question of foul play, of course, and the fight was a perfectly fair one, but it was definitely regrettable that a scorpion owned by a junior major should publicly defeat the tarantula of the Commander-in-Chief."

There are tales of administrative work, of turning the desert into a garden, with great opposition from Arabs; of road building to link up Egypt and Palestine, with opposition from vested interests; and of fighting malaria, with much difficulty from everyone, including the Health *Sol*, or equivalent of military sanitary inspector.

The Health *Sol*, by digging little drains that refused to run, had created more breeding haunts for mosquitoes than had been the case when a marsh was in its virgin state. "The *Sol* when this was pointed out to him first refused to see the mosquitoes, but when I ladled 50 or so into the palm of his hand he had to admit he noticed something.

"'Oh,' he said delightedly, 'but they are not anopheles, but only culex, and I was draining the marsh to free it from anopheles only.'

"Of course it is the anopheles variety that causes malaria, the culex only being capable of infecting one with elephantiasis, but my friend had quite ignored the fact that a breeding ground for one species will do equally well for all others."

And so *Desert and Delta*, with some fresh reflections on Jewish endeavour, goes into the treasure rack of the bookshelf. R. N. R.

* * * *

Vegetable Cultivation and Cookery. By Eleanour Sinclair Rohde. Illustrated by Helen Kapp. (The Medici Society; 7/6 net.)

Whatever aspect of the garden Miss Rohde chooses to write upon she never fails to impress the reader with her own enthusiasm and love for her subject, which is combined with a most unusual and comprehensive knowledge of every detail. It might not be imagined that what is, after all, a technical treatise on vegetables could also be a fascinating armchair book. Any doubts on this point are agreeably dispelled after the first paragraph.

Before coming to an examination of vegetables individually, Miss Rohde provides an extremely valuable introduction. She points out the importance of vegetables in the balanced diet, and their power to counteract undue acidity. The ill-treatment which vegetables undergo when they are being cooked is well calculated to destroy their health-giving powers, and there is a useful section explaining how the maximum good may be retained—largely in the form of raw salads. The virtues of the different kinds of soil are explained, and the various methods of digging are discussed. Miss Rohde is rightly against all forms of artificial manures, and she explains how much that is usually collected under the name of useless rubbish may be used with great advantage in the soil. Two essentials of success are the correct use of lime and the right rotation of crops.

After this introduction comes a most detailed and interesting account of the correct cultivation of vegetables, the diseases and pests which afflict them, and hundreds of recipes to make them delectable to the most fastidious. Miss Rohde can scarcely fail to have caused a revolution in cookery, and to have reinstated the vegetable garden to its proper, but recently neglected, position. R. C.

* * * *

Europe at Play. By E. H. Tattersall. (Heinemann; 12/6.)

Not only is Mr. E. H. Tattersall well versed in the art of good living at home and abroad, he understands how to convey his information readably and entertainingly to others. Even for the reader who had no intention of leaving his native land, this would be a worth-while book. The colourful little stories, the vivid pen pictures of personalities in the news—and of many others equally worth hearing about but less familiar to the average journalist—provide page after page of fascinating reading which can be picked up at any point with the certainty that it will only be put down again with regret. But in some ways one hesitates to recommend the volume to anyone who is not himself proposing to travel to at least some of the resorts described. To read of so many rare and delicious dishes, of so many fine wines, to be obtained in many cases at a price which one would scarcely have thought possible, would be too near to the torments of Tantalus to be altogether pleasurable to any but the most strong-minded reader.

For the man or woman with a holiday to look forward to the book can be recommended without reserve. Written by a distinguished cricketer and all-round sportsman, it is only to be expected that sport occupies a deservedly high place in these pages, but in addition to the wild duck, the trout and the ski-runs, the reader will find opera, pictures, food, wine, and casinos, and although many of the places discussed are well known and much visited, Mr. Tattersall's introduction to them shows new and unexpected aspects. The book combines, indeed, the qualities of a practical guide with the æsthetic and discursive characteristics of letters of travel. Charles Dickens, writing of his own *Pictures from Italy*, spoke of his book as "a series of faint reflections—mere shadows on the water—of places to which the imaginations of most people are attracted in a greater or less degree, on which mine had dwelt for years, and which have some interest for all." Much the same might be said of *Europe at Play*. To read it is akin to receiving letters from a friend spending his or her holidays on the Continent, but from a friend with both the time and inclination for letter-writing and the rare ability to write them well. G. W.

A Natural Golfer: Hand Action in Games. By J. Forrest, M.B. (Published by Thomas Murby & Co., 1, Fleet Lane, London, E.C. 4; price 10/–.)

Great golfers have emphasised over and over again that the hands play a vital part in the swing. Vardon advised players to concentrate on the hands rather than on the countless other matters which handicap players think of and so become confused. Sarazen has said that "the great golfer plays with his hands, the average player tries to play with his head." In the majority of instructional books the action of the hands is dismissed very quickly, chief attention being given to the stance, arms and actual swing. J. Forrest, M.B., who has made a careful study of the game for years, has written a new book setting out in minute detail the action of the hands in golf and other games. *A Natural Golfer*—that is his aim for all players.

He maintains that the chief difference between the scratch and handicap golfer is in the use of the hands. Because of the speed of the swing this important difference is difficult to discern. One's aim should be "to deliver the whole of the power through a twist of the hands which is the action of wringing a towel and whose chief merit is its superiority of control." This "wringing action," says the author, can now be acquired quickly and with ease. "At cricket a flick of the hands sends the slow ball to the boundary;" in tennis and hockey the same principle applies. The natural games player obtains power by apparent effortless ease. Forrest maintains that this is not an "uncanny gift," but "arises from an action we all possess, but have not been taught to use."

He believes that the golf stroke is "a wringing action. Beginning on the inner side of the left wrist the wringing seems to take place under that wrist. . . . In two-handed games the same principles apply . . . in one-

how time flies

It is nearly twelve years ago since George that incomparable barman introduced Lillet into the Guards' Club adding just a dash of orange bitters to two-thirds Lillet—one-third Gin.

* * *

Since that time the glad news has gone round Piccadilly . . . through Mayfair and out into the wide open spaces where men hunt foxes and hostesses hunt lions. 'Try a Gin and Lillet' has become 'the usual, please' and Lillet now wears laurels round its neck BECAUSE it carries all before it in cocktail competitions.

And to assist the reader the author has included 146 photographs, many of which are action studies. E. R. T.

* * * *

Mirror of Angling. By E. MARSHALL-HARDY. Vol. II. (Herbert Jenkins; 2/- net.)

Mr. Marshall Hardy has published a second volume of his series called *Mirror of Angling* in which he is gathering all kinds of tips and dodges from angling correspondents. The idea is a good one, for there are occasions when, through some accident, a piece of tackle which should be in the creel is reposing on a table an hour or more away, and a makeshift may mean all the difference between a day's fishing and a weary journey home. Mr. S. L. Matthews, for example, found himself by the Thames, and separated by many miles from the hempseed he had intended to use as bait; whereupon he inserted a wisp of white wool from his sweater into a split shot, pinched it on his hook, and with this impressionist imitation of boiled hempseed was enabled to make a creel of roach. Needless to say, he stationed himself a short way downstream of an angler who was ground baiting with the real article.

Another suggestion for artificial hempseed on the hook is a small piece of the insulating rubber tube one finds on electric cables, and which has a white cotton lining. This introduction of artificial baits is interesting for if they can be successfully developed coarse fishing will be freed of one of its principal objections: the necessity for carrying large quantities of bait.

The "tip," which was first discovered only a few years ago, that an eel will lie still if placed on a sheet of newspaper, is here repeated. No one yet has been able to explain it, though comments have, of course, been made on the paralyzing effect of certain newsheets. Possibly paper absorbs the mucus which covers a fish, and warns it not to lose more by wriggling about on it.

There are a number of dodges described, some of them of use to others besides coarse fishermen, such as a method of drying the inside of rubber boots. Altogether a good two-shillingsworth. H. D. T.

* * * *

Peaks and Valleys. By F. S. SMYTHE. (Black; 12/6.)

The literature of hills has progressed more rapidly than the art. In all but a few instances the beauty and power of this scenery has defied the artist's mediums.

But there is one form of artistic expression which has recently explored this subject and produced startling results—it is the camera.

Mr. Smythe upholds the opinion that simplicity is the keynote of success in the reproduction of mountain and hill pictures; on this point the artist with a pen or brush appears to have an advantage as being able to eliminate unnecessary details, but Mr. Smythe himself has proved how the film can be the perfect presentation of this fact.

The photographs which Mr. Smythe has chosen for this collection are exquisite; each one calls forth admiration, and it is impossible to choose any one picture for special merit.

The sweeps of white snow unfolding to display the delicate tracery of a peak; a solitary pine or weather-beaten clump of trees; the foliage of the Himalayas, or the effect of mists and clouds. Here is beauty concentrated in one volume, a wealth of loveliness such as is seldom found in one exhibition of art.

This is a book to have and to hold, thereby experiencing that everlasting joy "of lifting up one's eyes unto the hills." G. N.

BOOKS IN BRIEF

CHRISTOPHER WHITFIELD'S *A World of One's Own* (Country Life; 8/6) is a collection of very pleasant essays about the countryside of Warwickshire and the North Cotswolds. It is a quiet book; one to be kept and read at leisure. It is written with that intimacy that is born of deep knowledge. The wood engravings by Geoffrey Miller are good.

If you like boxing you will like JIMMY WILDE'S autobiography *Fighting was My Business* (Michael Joseph; 15/-). You will like it anyway, for Jimmy Wilde has had an interesting life. The book is modestly and amusingly written, and giving a vivid picture of the heyday of boxing, when money was big and boxers boxed.

"FISH-HAWK" is a very good bird artist, and a keen and observant naturalist as well (the two do not always go together). His new book, *Birds Through the Year* (Duckworth; 10/6) contains some really excellent illustrations. The letterpress is not so good, largely, I think, because the author has tried to be too simple. But do not miss the illustrations.

PATRICK TURNBULL'S *Black Barbary* (Hurst and Blackett; 15/-) is no ordinary traveller's account of Morocco. He journeyed off the beaten tracks and visited towns and villages of which we hear little elsewhere. In doing so he became well acquainted with the Berbers, a race whom the author likes and describes well. He also has had first-hand experience of the Foreign Legion. These wanderings are intermixed with history told in a style which interests and informs. There is more in this book than descriptions, and it is well worth studying.

Journey of Tapiola. By ROBERT NATHAN. (Constable and Co.; 2/6.) This is the story of a Yorkshire terrier and a canary who decide to seek adventure together. They are joined by an ancient rat, whose speech is richly embellished with Biblical allusions, and they meet with more adventure than they bargained for. An unusual and amusing little tale.

The history of American influence upon South Africa is contained in *Stars and Stripes in Africa*, ERIC ROSENTHAL (Routledge; 15/-) The survey is an extraordinarily thorough one from the days of Christopher Columbus—not merely a chronicle of dates and events, but a tale of adventure and courage and far-reaching progress. This is a history of the "white man's" vision, and advancement of his culture, which we as a colonising nation will do well to observe.

There is romance in the history of insurance, and the Norwich Union Life Insurance Society in a booklet it has issued tells many an interesting story of the town of Norwich and of early insurance. Through its merger with the Amicable Society it can claim to be the oldest life office in the world. John Hartley, who was responsible for the formation of the Amicable, conceived the idea of forming a society of 2,000 members who, irrespective of age, should pay a fixed contribution of £6 4s. each year, these contributions, less expenses, being mostly divided at the end of the year among the representatives of those members who had died during the year. One reads of moidores and caroluses "Lockt in the Chest."

There may be some readers to-day who like to know a few facts and details of outstanding men taking part in the present European critical political drama. If so, they will enjoy reading *Goring*, by H. W. BLOOD-RYAN (John Long; 15/-). This is an account of Hermann Goring's career to date. It is, needless to say, a life of colour, vigour and even romance—one which in its way explains the spirit of Germany to-day. A well-written and unbiased book.

The chief centre of interest in *Tin Can Island*, by CHARLES STUART RAMSAY and CHARLES P. PLUMB (Hurst & Blackett; 15/-), is the island of Niva Fo'ou, one of the Tonga group. Mr. Ramsay has spent twenty-five years as a copia trader, and has many adventures to relate. He was the man who acquired fame by swimming out to meet the ships in order to obtain the mail which was flung overboard in a tin can. The tone of the book is highly coloured, and does not entirely escape from the romantic legendry with which the islands are viewed by many "whites."

To describe Miss PERSIS KIRMSE'S drawing is impossible; but her talent can be appreciated to the full in her new book, *Shakespeare and the Birds* (Methuen; 6/-). Miss Kirmse has already shown us her animal pictures in this series, but the birds are new. The medium is pencil—sketches which are soft and delicious, with a movement and life which is irresistible.

"J. M. K." is a signature that has been well known to the Yorkshire sporting public for some time. A collection of his cricket writings was published last year under the title of *In Search of Cricket* and the author introduced to a wider public all over the country. Both public and critics found him in the tradition of great sporting writers, and this little book will act as a companion to *In Search of Cricket*. It tells of Rugger played all over the country; International Rugger, 'Varsity Rugger and ordinary Saturday afternoon football as it appears to the kindly if shrewdly critical mind of "J. M. K."

ARTHUR BARKER

ETHICS OF EGG-COLLECTING

By

ERIC PARKER

Preface by Lord Desborough

A summary of letters on the subject and from information supplied to "The Field" as to the depredations of egg-collectors, with chapters devoted to an analysis of the situation and possible effects on the bird life of the country.

BEST DAYS WITH HOUNDS

Excellent Sport with the Duke of Beaufort's

ON Monday hounds met at Leighterton at 10 a.m. for the benefit of the many keen Etonians on "long leave"—and with happy results, for they enjoyed excellent sport. The first hunt was the best, finding without delay close at hand in Leighterton Spinney, hounds ran at racing pace to Bowl Down, which they circled twice, running with a grand cry and a wonderful scent. Within a few minutes they forced their fox away from Colonel Menzie's good covert on its north side, and they continued very fast over a delightful line of stone walls and grass pastures now owned by Mr. Kenneth Harper, member of the hunt committee, and farmed by his tenant, Mr. Comley, who, with his daughter, also hunts. Fairly flying, hounds ran thus for 20 minutes, bearing left from the Beverstone Road, by the aerodrome, and killed their fox near the Stroud Road at Boxwell Lodge. Later there was a nice hunt by Lasborough and Kingscote to the hills to finish a most enjoyable day with the mixed pack.

Wednesday, from West Kington, was an unlucky day. There was a brace of foxes in Shirehill Bottom, but one was headed by cyclists, &c., and the other by second horsemen. It was after 1 o'clock before there was another chance of a hunt. Finding in Warren Gorse, hounds forced their fox away upwind towards Lowndes covert, but he was headed back by the gorse, and then crossed the line of another fox which had come from Tormarton, resulting in two lines.

The Duke unerringly selected the line of the first fox, and hounds ran very nicely past the village and over the road into Dodington Park. Here they continued to hunt on rather indifferent scent for some half-hour, during which time many of the field stood about on the top of the hill or changed horses, so that they got left when hounds went away at the bottom. The few away with them enjoyed a sporting hunt over the hairier part of The Vale and Kingrove Common. The fox crossed the railway and went on by Chipping Sodbury to be marked to ground near Stanshawes Court, a six-mile point from Warren Gorse. Unfortunately, on this day, Mrs. Violet Kingscote got badly kicked by someone else's fresh horse—kicking horses are becoming a menace in the hunting field, considerably worse than wire or even slippery roads in this country.

The weather has remained unseasonably warm, and with a constantly falling glass, wind and rain, scent has been disappointing. FIELDFARE.

THE PYTCHLEY CONTINUE GOOD SPORT

DESPITE poor scent and going on the firm side, hounds continue to show such sport as is better than can be expected. On Monday the 7th, on the day of the opening meet at Brixworth, a leash of foxes were killed, a brace marked to ground. Besides these satisfactory episodes in a busy day, two amusing gallops were included. The first was from Keedles Gorse, when hounds ran well and fast to near Hannington, where they killed. Another fifteen minutes at top pace from the Scaldwell Oak Spinney to ground at Clint Hill. On Wednesday the 9th, from Newnham Hall, a fox was killed almost at once, and the day ended with a sparkling 50 minutes from Hogstaff Spinney to Fawsley Dingle, where this hard-run fox was lost on doubly-foiled ground, after many miles of country traversed.

On Friday, after meeting at Marston Trussell Hall, a good hunting run which began at Twantry Gorse, and which included some really fine woodland hunting, ended at Sulby Hall, where the fox was marked to ground, after 45 minutes. Then came a gallop of 25 minutes from Longhold, in a circle, it is true, but over a delightful country. The fox was headed near Mill Hill Farm, but touch was regained, and, being forced away from Naseby Covert, was killed short of Paisnell Spinney, a good performance of 60 minutes inclusive. Saturday the 12th, from Spratton, was productive of good sport, and at 2.30 p.m. the Pytchley field started homewards in that contented frame of mind which only those who have participated in a really good run can attain.

The first fox from kale near the place of meeting was given up when a further drift into the Monday country was deemed unwise. The fox had obviously joined some others in a kale field near Pitsford. Another from Spratton Sands was raced over the large enclosures which lie beneath Spratton, across the brook, past Merry Tom to ground at Chapel Brampton. He was lucky to find a refuge. From some kale near Holdenby Mill began a fine hunt. A full itinerary would be out of place, perhaps. Suffice to say that hounds arrived at East Haddon with the field well strung out. After a turn towards Buckby Folly, and after a pause, hounds ran on fast, swinging towards West Haddon.

This occupied 35 minutes over a big, wild and most attractive country. The fox began to run short now, and hounds required frequent help, as they ran in snatches over a line which had to be jumped, arriving eventually at the top end of Guilsborough Gorse. Ten minutes with only a whimper now and then ensued, till suddenly the chorus broke out anew, and hounds ran into their hunted fox in front of Guilsborough Grange—75 minutes, which contained almost every phase of foxhunting at its best. EMERITUS.

THE QUORN'S EARLY DAYS

IF with the passing of the hack, postillion phaeton, dogcart and buggy, a certain amount of the old pomp and glory of the opening meet of these hounds has gone, there still remains the splendour of the Quorn hounds in that traditional and beautiful setting at Kirby Gate. The field at the meet was meagre in the extreme compared with bygone days. There were motor buses, cars, pony traps and bicycles, with at least 500 foot-people waiting on the top of Gartree Hill. More riders joined hounds on their way to this famous little covert, and the usual contingent waiting by the covertside can perhaps be excused on account of the motor traffic.

A strong wind from the south-west was again helping to dry the already firm going. I noticed last season that "steplings" in rides and gateways had never gone down from the previous winter rains, and those same steplings are still in evidence to-day. And now to the sport. Although there were a brace and a half of foxes in Gartree Hill, none for some considerable time could be persuaded to run the gauntlet of the huge crowd. However, on things getting a bit too warm in covert the first fox of the 1938–39 season made for the open over the Little Dalby Lane and went on down to the Lake Spinney.

It was at once evident that scenting conditions were going to restrain that beautiful mass of driving, swerving, feathering bone and muscle from settling down to run, and it was not surprising the hunt came to an end on the Pickwell side of Little Dalby.

It must have come as a great disappointment to the cluster of foot-people standing on Borough Hill when the wood was drawn blank and hounds went on to Adam's Gorse. Then the fun began in earnest, no less than seven foxes being afoot. Time was not wasted in breaking a fox up that hounds killed almost immediately on entering the covert, and George got them nicely settled down to a fox that had gone on under the hill and Thorpe Satchville. Pointing for Ashby Folville, possibly feeling the wind, he bore right-handed by the Trussels, over the railway and Great Dalby Road, nearly to Gunn's Hill, and from there to Great Dalby, where he was confronted with a yapping terrier. Hounds, being now close at him, drove on to pull him down in Mr. Bonser's paddock.

Going back to Thorpe Trussels, hounds soon roused a fox and pushing him away over the Thorpe-Ashby Road, hunted him over part of the Twyford Valley and then left-handed to Thorpe Village, where they lost him. Adam's Gorse was then called upon for the second time, and with the dim mists of a late autumn afternoon falling, hounds screamed away with a fox over the Bakers Lane. Pointing for Great Dalby Village, running beautifully, they swept along right-handed and racing up to their fox pulled him down at Little Dalby after a topping hunt of 40 minutes. And so the day ended with a leash of foxes to hounds credit.

A good-sized field met on Tuesday on the forest side at Woodhouse Eaves, and although sport was not good, another perfect day went a long way in compensation. After hounds had found a fox at the foot of the Beacon, they hunted him quite nicely down to the Nanpanton Road, where he was headed and, turning back right-handed, he made his way into the Rhododendrons. There, owing to the usual brainless motor followers surrounding the place, he was unfortunately killed, and possibly a good hunt was spoilt. Finding again in a small nearby covert, a slow hunt resulted in the fox getting to ground in the New Covert just short of Nanpanton. In Whittle Hill hounds momentarily spoke to a fox, but could do nothing further with him. Nanpanton Wood, the Privetts, British Piece and Ive's Head were then drawn and hounds went home.

Invariably when there is a blue mist hanging about scent is catchy, and this I think goes for the Friday, when Beeby was the scene of a large meet. When hounds moved off to draw Scraptoft Gorse it was difficult for followers who had arrived a bit late to get to them owing to the narrow road being filled with cars. Fernie's had run through or very close to the Gorse on Thursday, and this might have been the reason for the covert being blank. The Oaks Spinney, however, produced a brace, one of which was hunted right-handed down to Old Ingarsby, where rather a strange thing happened, and I venture to hold the opinion that a change of foxes took place. Hounds had never burst their fox which seemed a strong, healthy sort, and I feel sure would have stood up in the ordinary way for some time, but, on reaching the post and rail field, a big old fox, very stiff, was seen to leave a hedgerow and slowly and as best he could to make his way on to Ingarsby Station platform, where three hounds got up to him. Standing his ground and freeing himself, he continued on to the embankment and the bushes, where the end came.

Now what may have happened was this. Fernie's after a good hunt from Thurnby had lost their fox hard by Loseby, and it is just possible that this poor old unfortunate beggar had been during the night making his way in a direct line back to Thurnby and had at daybreak laid himself down to rest. I may, of course, be wrong.

A host of foxes were then found in Botany Bay, and hounds, getting away quickly to a holloa on the Houghton side, hunted one to the Houghton big field. Here he was headed right-handed for Ingarsby and, still bearing round to the right, brought hounds back to the Coplow and away again over the Bellesdon and Ingarsby Road as far as Sludge, where the hunt ended. Going back to Quenby Spinneys hounds wound up the day by killing a fox after about fifteen minutes on the railway embankment. SCARLET RUNNER.

GOOD HUNTING WITH THE BELVOIR

ALTHOUGH November still masquerades as spring, and the absence of appreciable rain helps foxes rather than the hounds, this pack have had a most useful week. As much of their domain is low-lying, the going on the grass held out against the balmy days longer than in most countries, but if the winds come, as prophesied, and rain still keeps away, there will soon be a rattle in the ground. However, there is no real cause for complaint yet, and we have much reason to be grateful for the fare provided. Mrs. Henderson's hospitality was all-pervading on Tuesday, at Rauceby Hall. Not only did she supply encouragement for the field, but her foxes were numerous and enterprising. The light ploughs and unexpectedly frequent pastures rode well, and there is a scope about this part of the country which allows an uninterrupted view of the hounds even if one is not too fortunately placed. The rolling ground, unspoilt except for a few alarming tarmac high roads, is split up by small thorn fences and bijou stone walls which, though solid enough, give one an adventurous feeling without too much danger; and, what is more, they are calculated to make the idlest horse jump the most important half of the obstacle. The "clou" of the day was a hunt over the Blankney Border, measuring about four miles, with a victorious finish at Ruskington.

Scalford is apt to be frowned on as a rendezvous, compared with other Wednesday meets. Marshall's Spinney (pre-War readers will recall this as Melton Spinney to their mind's ear and eye) is not a popular draw, hemmed about as it is with brook and railway, and the environs of Scalford are all too well protected by entanglements. Nevertheless, it provided a capital pipe-opener, hounds going away in the finest style at a roaring pace. It was only too sad that the fox found a hole under the railway and so brought this heartening burst to a premature conclusion. Then came a lull, and as Harby Hills came nearer and nearer, longer and longer grew the approaching faces.

This foxy stronghold had a lot of cubbing time spent on the education of its inhabitants. That this policy pays hand over fist was again obvious; instead of the inevitable difficulty of getting an uninitiated fox to leave so large a harbourage, the lesson previously learnt was enough to set him off at once.

Running fast along the side of the hill towards Clawson Thorns, skimming the edge of the Point-to-Point course, hounds clearly meant business, and the memory of a similar excellent hunt last Christmas-time warned their pursuers that there was no time to poke and peer. Actually, it did not turn out so enjoyable from a riding aspect, as the line went through a corner of Holwell Mouth and on along the hill at Little Belvoir to Old Dalby, in the Quorn country. Climbing along the cat-walks of this steep bank is always a test of fitness, and after so brisk a 20 minutes there were many signs of distress, and the little gates along the route came in handy. Just before reaching Old Dalby Wood the pack turned left, ran through Grimston Gorse almost to Saxelbye. Hunting slower now, they returned to Grimston, and had to own defeat after

BEST DAYS WITH HOUNDS (*Continued from page 1240*)

a fine hound hunt of an hour-and-a-half with a seven-mile point.

On Saturday the bitches were again in form after meeting at Normanton-by-Bottesford, that delightful corner of Leicestershire which is tucked away out of sight of the fashionable "vale" meets, but which is far from being out of mind with those who have once sampled the possibilities. Normanton Little Covert was, as usual, the first draw. A blustery wind and much conversation made it hard to hear what was going on, but there was no doubt about a fox being within. The trouble was, he took a long time deciding to leave. After several false alarms he most kindly went off the way we should have chosen for ourselves; that is, towards Staunton and then over a most attractive line to Moss and Plumbs. Here he was very close to being caught, but was again holloaed away in the direction of Allington. So much exercise in covert at the start had told on him, and hounds rolled him over in a stack-yard five fields on.

Hardly had the company recovered their breath, or changed their horses, than another fox was found in Allington Low Covert. With a tremendous cry hounds hurried up the slope to the Debdale Lane, pressed on past Keeper's Plantation, left Sedgebrook on the right and went on over rather a Non-Man's-Landy bit of country as if for Barrowby Thorns. This is very seldom crossed, and the wire therefore may be understood, particularly as there is still an immense amount of keep in fields and ditches. If only the wire could be dealt with, there is no more sporting region. Short of the railway a left-handed turn took the pack over the Allington—Gonerby Road almost to Foston turn-pike. The Foston Beck is always a serious consideration, but luckily did not impede progress as the fox obligingly crossed near the ford on returning towards Allington. He was marked in a stick-heap, whence, surprisingly enough, he elected to emerge again after a short pause. One more turn towards Barrowby Thorns was enough for most people, who, if they were not more than satisfied with an excellent's day's foxhunting, must be hard to please.

UNBRIDLED.

COTTESMORE'S BRILLIANT GALLOP

ON Monday, November 7th, we opened our regular season, as usual, at Greetham Inn, an inn no longer but now a commodious farmhouse. In old days the London coach changed horses here, and travellers partook of whatever refreshment they fancied. Despite the hard ground and summerlike weather a very large field assembled to greet Mr. Hilton-Green, Master and huntsman, and a capital day's sport was enjoyed.

Beginning with Greetham Far Wood, hounds were soon away on excellent terms with a good fox, and passing Woolfox hounds ran very fast straight through Athwood and through the middle of every field, to the edge of Pickworth Wood. Not entering here, we ran past the Stone Quarry and up to Clipsham, where the dog pack, with the help of a couple of bitches, ran into their fox in the open after a most brilliant gallop of 20 minutes, done at top pace all the way. Calling on Osbonall next, we duly found, and ran very nicely to Exeter's Gorse. Pushing our fox out of here, we ran on to Pickworth and finally lost our fox just short of Woodhead Wood after a very good hunt of 47 minutes. To wind up the day, Greetham Near Wood and a root field were drawn blank.

From Tilton, on Tuesday, with the ground really too hard for jumping in this undulating country, Mr. Hilton Green very wisely confined his efforts to giving the local coverts a good dusting. A most enjoyable morning was spent, mostly in the open, hounds finally killing a well-hunted fox between Tilton Wood and Tilton Village.

Launde Big Wood, drawn in the afternoon, held several foxes. The selected one gave a small ring in the open before taking us over the Lovers' Walk to Witheote, where we bore right-handed, finally losing our fox short of Prior's Coppice. Scent was moderate all day, especially so in the afternoon.

From Sewstern, on Thursday, scent was again poor. We began the day by killing two foxes in a kale field near the village. Those had been doing a lot of fowl killing, and were well out of the way. Marriott's Spinney, so jealously guarded by Tom Marriott and his son, who were both out, held several foxes, and we hunted one at a good pace to the back of Wymondham, where it vanished suddenly and, I am told, ran the railway line.

Another fox meantime had left Marriotts, and the pack being laid on ran through the Belvoir Covert, Coston, and on to Sewstern, and turning here came back to Coston, where he was left, Mr. Hilton-Green not wishing to disturb the covert any more with the Belvoir having an adjacent meet soon. As usual, Woodwell Head held several foxes. One was hunted well past Market Overton before turning back to Woodwell Head. Going out again from here, we ran almost to Marriotts, where hounds were stopped. Scent was very moderate all day.

Saturday, November 12th.—A little rain fell during the previous night, but not enough to do any good. Before meeting a very pleasant ceremony took place, viz.: the christening of Mr. and Lady Helena Hilton-Green's little daughter, the Rev. Jack Gibbs officiating. A large number of friends attended in full hunting dress, and I have no doubt the little lady will, in years to come, ride over Leicestershire in the same courageous way her father and mother do. Commencing with several blank draws, foxes mostly lying out this abnormal November weather, we did not find till we got to Laxtons. From here our fox soon found sanctuary in a drain under a gateway. Leaving this, he ran up towards Whissendine before turning left and again getting below ground. Bolting again, we ran him up to Laxtons and through here to the Deroy, where we lost him. From Wymondham Roughs it looked like a good hunt, hounds running well towards Edmonthorpe, but, alas! he also popped into a drain. It was late when we got to Cottage Plantation, and, of course, finding, we ran towards Saxby Station and almost to Long Spinney, where hounds were stopped in the dusk at 4.20 p.m.

FOXY.

THE GOOD CROOME SATURDAYS

WHEN the thermometer registers 60 degrees in the shade on a hunting morning in November one cannot help feeling that something has gone distinctly wrong with the seasons. We should have been otter hunting, or bathing, or playing lawn tennis on Saturday, November 5th, but for a trifling discrepancy in dates. And yet in spite of the extraordinary heat, hounds contrived to hunt remarkably well and killed their fox after a good morning hunt of nearly two hours.

Strensham is a pleasant little village, and its old stone cottages made a picturesque background for the scarlet coats of the Hunt staff as hounds came trotting through to the meet there. It was the turn of the mixed pack.

A brace of foxes awaited them in Church Covert, which lies on the slope north-east of the village overlooking the River Avon, and hounds had not been in covert more than a few minutes before Sam holloa'd one away over the Moat Farm, going in the direction we had hoped for, towards the

BEST DAYS WITH HOUNDS (*Continued from page 1242*)

Rhidings. This is a nice line of country, with some good fences and ditches "not so deep as a well, nor so wide as a church door: but enough." The sun was beating down with almost midsummer heat, but hounds fairly flew, and in little more than five minutes had crossed Marsh Common and entered the Rhidings, usually the home of half the foxes in the world. Hounds did well, therefore, to stick to their hunted fox and force him away, after a spell of covert hunting, into the open again for Woodmancote Rough. There he turned right-handed and went behind Bourne Bank as if he meant to return to his original covert, but he doubled back short of Lower Strensham, pointing for the Rhidings again.

Children headed him here, and he had to change his mind at the last moment, and, running the Rough Banks to Manor Farm, made for Strensham after all. Hounds came to a check at the road, but Pavitt cast them forward, and they hit off the line again below the church. But, curiously enough, though he was now home again, he did not enter the covert, continuing instead over the lane and through the orchard which runs down to the river. Hounds put him out of the osiers at the bottom, and he leapt into a fisherman's punt, as a last bid for safety. Alas! for his hopes. Piscator ejected him speedily and without ceremony, and the pack closed in on him at the mill pool, thus terminating nearly two hours' hunt.

The next Saturday, November 12th, the bitches were out, and this too was a good day and great fun. It was still incredibly mild, but the dry weather had broken at last and there were frequent storms of rain, accompanied by a strong southerly wind. We all know what a southerly wind and cloudy sky proclaims, and though we did not scorn our downy bed before the sun rose we had quite an early start to reach Stonebow by eleven. Mackintoshes were in evidence, and a smaller field than usual at this meet had turned out, probably owing to the weather.

Peopleton Rough lies only a few hundred yards from the meet, and a quick find in this covert was presently followed by a holloa on the far side as their fox was viewed away. Then followed a glorious fast burst to Shutwell Bushes and Naunton Beauchamp, over some good country where there was jumping for all and the devil take the hindermost. So we went, from leap to leap, and from field to field, rejoicing, until hounds were pulled up short by a succession of plough lands, behind Naunton Beauchamp, where scent became very catchy. Inch by inch they puzzled out the line until they reached grass fields again, and drove on once more. But there was further plough beyond, and their fox must have gained a considerable lead, besides which he was running down-wind. Presently we found ourselves at the village of Bishampton where hounds swung right-handed towards Tilesford. And there scent finally petered out altogether and the hunt came to an end after exactly one hour.

At 2.30 in the afternoon, following a succession of blank draws, we came to Low Hill. There hounds soon informed us that a fox was at home—in fact, there proved to be a brace—and in a few moments we viewed a grizzled-looking customer going away at the north end. Through the Oaks, over the main road to Worcester country and hounds were threading their way through Churchill Wood and making for Crowle Thrift. This covert stands at the top of a steep hill above the point-to-point course. The field had thinned out considerably by now and very few were left with hounds as they climbed the bank where, unfortunately, a sheep dog had elected to join in the chase, coursing their fox, with the inevitable result that scent disappeared. And the "Good night" horn sounded for home.

D. M. M.

CATTISTOCK'S GOOD WEEK

ALTHOUGH the wind and the rain played havoc with scenting conditions on the Friday morning, when hounds met at Upwey (they were robbed of what looked like a good hunt at the start by a violent storm, which eradicated every vestige of scent,) very similar conditions on the following day apparently had not the slightest effect, hounds running as if tied to their foxes. It only goes to show that, as Shaw says, "you never can tell"—what is in store for one. On the Friday afternoon, when the storm had cleared off and the wind abated, hounds, finding in Buckland Wood, ran hard for 35 minutes behind an old dog fox, who was holloaed away from the covert almost before hounds had begun to draw it. The bitches came flying to the holloa, and settling to the line, they were away up the valley towards Nottington at a rattling pace. Those of us who came through the covert had to ride hard to get on terms with them, though more than half the field coming up on the outside saved a bit of time. Just short of Nottington Village the fox must have been headed, for hounds swung left-handed at an acute angle, and crossing the Upwey Road, they ran past "Armistice," and leaving Paynes and Hewish on their left, they drove on over the hill that overlooks the Waddon Valley near its head.

At a farmstead they checked, but a welcome holloa from one of the whippers-in who had galloped on to get a view, sent them over the railway and, hitting off the line, away they streamed across the vale, running well together, with the hunt staff all close up, and the field coming on behind as best they could. Hounds ran very fast across the vale and up the opposite hill, and by the time we had struggled up the steep slope we could hear them running hard in the covert below, driving on towards Upwey House Gardens. Here their fox was viewed with hounds close at him, but he jumped the high wall, crossed the Wishing Well Road outside, and made a last bid for liberty up the steep side of Ridgeway Hill, only to be killed not far from the Roman road near its top, after a capital 35 minutes.

This was probably the best day of the week. Tuesday had seen a capital 40 minutes from Breakheart across the Sydling Valley, hounds killing their fox near Grimstone, and Wednesday, though a busy day, was hardly up to the others. But on Saturday the biggest field of the week had a most enjoyable if somewhat wet day from that ever-popular meet, North Perrott. I have already mentioned the fact that the weather was anything but promising, but those who braved the elements were fortunate, for hounds found a fox in the first covert they drew—Crundle Hill—and ran fast through the Holts, to mark him to ground on Crook Hill, at the end of a fast 30 minutes. Coming back to Horse Hill to draw, they soon had another fox afoot, and this one chose the opposite direction from his predecessor and ran past Matravers' Gorse and through East Leaze Plantation, to be marked to ground in Wetham's Bushes, below Hardington Village. Deciding not to disturb this good fox after his sanctuary had been gained, hounds were being taken to draw Coker Wood when an outlier—evidently an East Coker fox who had been visiting friends at Hardington—was spied stealing down the valley.

To lay hounds on his line was but the work of an instant, and away we all went again. This time our pilot must have wanted to give the Cattistock field a gallop, for he could not have chosen a better line. Good clean fences, perfect going, and the pace a cracker—there were not a few empty

BEST DAYS WITH HOUNDS (*Continued from page 1244*)

saddles as hounds swung left through East Coker Village, after running down the Hardington Vale, and crossing the Point-to-Point course, marked to ground near Red House, Key, after the best hunt of the day. It was a good ending to our second week at Cattistock, and if sport is to be of this order week after week, there will be need for some new horses before the old year is out.

LINCOLN.

THE SILVERTON FOXHOUNDS

THESE hounds, who started cubbing on August 23rd, have been out on 23 mornings. They have killed seven brace of foxes and marked four brace to ground. Scent on the whole has been poor. Everywhere hounds have found large and strong litters of cubs.

The opening meet, at Thoverton, on the 4th, was attended by a record field of some 120 besides a huge crowd in cars and afoot. The weather was ideal, being warm and sunny. Moving off to Lynch, eighteen-and-a-half couple soon had a brace afoot, one of which immediately sought refuge in the badger earth. The other went away almost towards Chapel Corner, but swung right-handed: he climbed up over Raddon Tops and down through Armour Wood, where he bore left-handed to Wolland Brake. Leaving this, he was headed by motors on the Tiverton—Crediton Road. He swung back left-handed, and leaving East Coombe on the right, ran on to Mr. Tucker's Brake, where he was killed.

Another fox having gone on into Strong's Brake, hounds were quickly taken there, and found a leash of foxes. Forcing one away, they left Tuckers on their left to climb Raddon Tops, but being headed here by the large crowd of spectators he turned back left-handed through Armour Wood, and leaving Wolland Brake on the left this one managed to cross the Tiverton Road and on through Grew and past Fox's Cross and Wolland Farm. He left Farleigh Farm on his right, crossed the Cadeleigh Road to Coombe Wood and ran on past Well-Town Farm, through Coombelands. He managed to get to ground in Down Brake. From the time we left Farleigh we were in the Tiverton territory, and as we were then some four miles from our nearest draw, besides most of the horses having had enough, home was the order. The line was six miles, a six-and-a-half mile point, and over nine as hounds ran. Scent was very good all day.

D.

A BUSY DAY FOR THE BROCKLESBY

WHEN the Brocklesby met at Bradley Wood on November 9th hounds found their first fox in Scartho Wood, and, going away at a great pace, pointed for Scartho. Swinging right, they hunted him into Bradley Gears, and, forcing him away from this covert, they again ran fast to Scartho Wood, and hunting him through this covert continued at a great pace to Tenninson's Holt. Going away they ran nearly to Scartho, and, swinging right, with the Isolation Hospital on their left, ran into Bradley Gears. They gave their fox no peace here, but drove him through the covert and raced him on to Scartho Wood, then through it and over Mr. Belton's farm, and killed in the open short of Tenninson's Holt. The time was 74 minutes.

Hounds found their next fox in Mr. Osmond's kale. Going away over the Bradley Vale, they pointed for Bradley Wood, and, swinging left, ran fast, leaving Laceby Hospital on their right, crossing the Teme Gate drain. Swinging right, they nearly reached the Barton Street at Welbeck Hill, where their fox was headed. Swinging left again, hounds ran on to Barnoldby-le-Beck, and, leaving the village on the right, hunted on to Mr. Osmond's farm, where they were beaten.

Hounds found their next fox in Cartwright's Osiers and hunted him through the Blowwells Covert to Aylesby Mill. Swinging left, they ran on to the golf links at Little Coates, and, continuing through the Blowwells, nearly reached the Aylesby Great Coates Road. But going left they ran over the Laceby Beck to Laceby Village and on over the breeding earths at Laceby. They crossed the beck and went on, with Shannon Grove on their right, continued on with Aylesby Mill on their left, and were stopped short of Cartwright's Osiers. Home was then the order.

A. L.

EIGHTY MINUTES WITH LADY CURRE'S

LADY CURRE'S hounds opened their season on October 31st by meeting at Itton Court. After drawing Itton Common and the Coedcae blank, a fox was found in Wern-y-cum, and after some delay in covert he broke away at the bottom end and ran nearly to Cae Pwtta. Bending left-handed, he circled back to Wern-y-cum, but was eventually forced away towards Wolvernewton Church, and bearing left-handed, ran to Coed-y-Duke, where another fox was disturbed, but hounds, sticking to the hunted one, bowled him over below Coed-y-Duke. Hounds were then taken to Tredean, where several foxes were on foot, and one was soon rattled away with a great cry towards Wern-Birrs, but turned sharp right-handed in the direction of Coblers Plain. He then ran along the wooded slope parallel with the main Monmouth Road to Llanishen Village and across the valley to Lower Llanishen. Running the road under the Prisk Wood as far as the old mill, he turned right-handed into the Woolpitch Covert. After some delay the fox was away again at the Trelleck side, and after being bustled along a few fields in the Monmouthshire country was headed and doubled back through Cae-Garw into Woolpitch, where he was caught. This was a most enjoyable hunt of 80 minutes.

On November 3rd these hounds met at Llansoy, and, as usual, the Great House Wood held a good fox which provided a really nice hunt. Running fast to the larches the fox bore right-handed to Wern-Birrs, and after running a circle in the covert was forced away to the Pwllth. The pursuit was carried on, and hounds ran past Llanvihangle Court into Ty-Mawr. The fox ascended the hill near Coblers Plain and over the main road into Crumlin Gorse, where he was lost and the hounds deprived of a well-earned reward.

A FOX TO REMEMBER WITH THE WARWICKSHIRE

SHUCKBURGH HILL was invaded by the North Warwickshire hounds on the Tuesday of last week, when they had a very good hunt from Bunker's Hill; but this did not prevent the Warwickshire from finding there 48 hours afterwards, when they went away pointing for Napton, turned left-handed, and killed their fox on the lane leading to Helidon. Sawbridge was then visited, and found to hold several foxes.

Hounds went away with one over the railway line, pointing for Calcutt's. The fox was, however, headed back over the railway and then took a line towards Broadwell; turning again, he crossed the canal, and ran more or less parallel with the Southam—Daventry Road, which he kept to his left, until he came to the cross roads on the Shuckburgh side of Napton village. Here hounds checked; and when they recovered the line were brought to slow hunting, as they pointed towards Southam.

A left-handed turn took them over the Daventry

THE ROCKWOOD HARRIERS WORKING OVER TYPICAL COUNTRY

BEST DAYS WITH HOUNDS (*Continued from page* 1247)

Road, with their heads set towards the Welsh Road Gorse. They maintained to the line up to the Gorse; in all probability their fox had only touched a corner of the covert, and had kept it to his left, running between it and the Welsh Road itself. Hounds then pointed for Ladbroke. The fox was headed back towards Napton, and crossed the road leading to the village and the canal. Hounds ran in a sort of circle by the village, and it was then seen that the fox meant to make his point for Shuckburgh Hill.

He rose the hill to the Beacon end of it, at its highest point, which overlooks such a glorious stretch of grass country; and he then turned left-handed in the covert on the hill, pointing towards Shuckburgh House, and ran the full length of the covert, turned towards the park, and got to ground in an unsuspected earth near the pond not far from the Shuckburgh House stables, when he was close to the pack which had worked so well for him. Mr. Laken made the time of the hunt to be an hour and a half; and the distance, as hounds ran, in a large sort of horse-shoe shaped line, was made out to be twelve miles.

PATIENCE.

TWO GOOD HUNTS WITH THE B.V.H.

A LARGE field turned out when hounds met at Green Man, Pulham, on Thursday, November 10th. Colonel Digby, who has now been Master of these hounds for 29 seasons, was hunting his pack. The first draw was Pointings Gorse, more commonly known as Rankesboro', thus renamed by a former M.F.H., and owner of Sherborne Castle, Mr. George Wingfield Digby. A fox was soon away on the east side of the covert and hounds raced away across the River Lydden, near Hazelbury Mill, this obstacle thwarting a large portion of the field. Running on over the Turnpike, down through Arnold's Gorse and without a check through Trevis Copse, leaving Rookesmoor on their left, hounds ran on right-handed through Deadmoor Common, checking on the far side below Badbury Copse, enabling some of the less lucky to catch up. After hunting round the common, hounds then ran out by Sedge Copse, and crossing Holbrook Green, killed their fox in a shed by New House Farm, near Lydlinch.

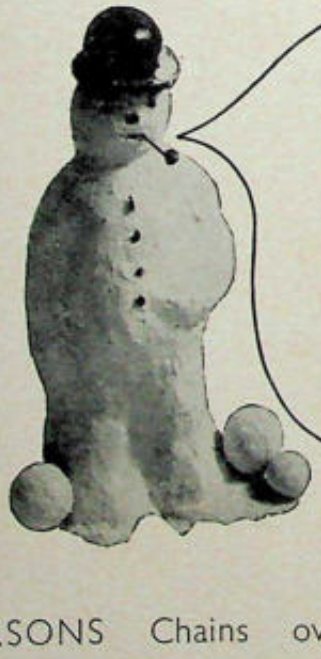
A move was now made back to New Gorse, Pulham. From this covert hounds ran towards Rodmoor Copse, and bearing left ran down to Woodbridge Farm, having probably been headed off the main road by cars. Now running on fast parallel to the turnpike, hounds crossed the Caundle Brook, and went up the hill to Caundle Wake, where they checked, and hunting on over the main road towards Laines, they nearly reached Caundle Wood, before turning back again to Laines Covert. Here they nearly caught their fox in the Covert fence, and fairly raced him to Holwell Church and on up to Andrew's Gorse. After some delay they hunted him across the river by Cornford Bridge and to ground just behind Mr. Foot's Farm. These were two very enjoyable hunts—both over a good line of country with a good scent.

On Thursdays this season, the Master is assisted by Frank Anyan, who turns hounds to him—Anyan hunting the other pack on Tuesdays and Saturdays: also Tom Watchhorn, who acts as second whipper-in. These two have joined us from the Belvoir and the Meynell respectively, and if their enthusiasm and keenness is any augury for good hunting this season, we should, with luck, get it. I have omitted to mention Ted Vickers, our first whip, who has been two seasons with the B.V. All the B.V. hounds are now again kennelled at Charlton Horethorne. Our joint Master, Mr. E. Nuttall, has been untiring in his efforts to produce good sport on that side of the country, for which he is responsible, and with everyone's wholehearted support, an excellent staff and plenty of foxes, we should, with a slice of good fortune, have a real good season.

TRUE BLUE.

THE LATE MAJOR BURNABY

It is with the greatest regret that we record the death of Major Algernon Edwyn Burnaby, whose loss will be felt far beyond the limits of his actual presence. Major Burnaby, Master of the Quorn for fourteen years, died on Sunday, at Baggrave Hall, Leicestershire. He will long be remembered among the followers of the Quorn for his cheery countenance, courteous manner and enchanting smile, and many a farmer will think with gratitude of the grace with which he attended to the small grievances which are inevitable. Major Burnaby's military career ended when he was invalided out of the army after service in Gallipoli, and he will be remembered not least as the winner and last survivor of the famous moonlight steeplechase, ridden at Melton Mowbray in March, 1890. Mrs. Burnaby was joint Master of the Quorn—incidentally the first lady ever to act in that office—and to her the *Field* would offer its sympathy in her very sad bereavement.



SNOW USE—is only one use for PARSONS CHAINS

PARSONS Chains overcome safely and inexpensively the danger and delay of snow and ice-bound roads and wheel slip on grass, sand and mud. Parsons pioneered and invented Tyre Chains over 36 years ago, and to-day still lead the industry with the latest and greatest improvements and inventions. There is a Parsons Chain to fit every type of wheel.

Vivat Havana!

by

EVELYN WAUGH

The author of "Decline and Fall" and "Scoop" dedicates this message to the Younger Generation.

It always strikes me as odd that cigars should, almost universally, be regarded as the symbols of wealth. I know of no other physical pleasure which can be purchased as cheaply, and leaves behind it so few regrets or responsibilities. Cigarette smoking is a habit, pipe smoking a hobby, but smoking Havana Cigars is a delicate and profound delight. I think perhaps the reason why, in fiction and films and caricatures, we always see cigars associated with the elderly and opulent, is that it is one of the pleasures we all can share with them. How little we count most of their possessions and habits; their great traffic-logged motor cars; their secretaries and surgeons, their divorces and remarriages, their supertaxes and death duties, their air-conditioned offices and penthouse apartments! And how much in their harassed routine they need those exquisite hours when the Tobacco of Havana comes to calm their apprehensions and woo them into self esteem. We, too, have our worries and we, too, turn to the same source of comfort. The most futile and disastrous day seems well spent when it is reviewed through the blue, fragrant smoke of a Havana cigar.

Issued by the Cuban Government to further the smoking of

CHRISTMAS BERRIES

Legends of the Festive Decorations

By ELEANOUR SINCLAIR ROHDE

THE traditional use of the berried shrubs of mid-winter, notably Holly and Mistletoe, for decoration takes us back to pre-Christian times, for even to the Druids the Holly was a holy tree, a symbol of vigorous life when all around in the woodlands suggested death. In mediæval carols the Holly figures conspicuously and is always associated with joy, in contrast with the sombre associations of Ivy. Mistletoe, on account of its use in Druid rites, has from the earliest times been banned by the Church for decoration, but it has always figured in house decoration, and in olden times it was also used in the garlands hung up in the streets at the festival of Christmas. The Parliamentarians made great efforts to suppress Christmas festivities, and in 1647 the Lord Mayor and City Marshal, with their followers, set fire to the street decorations in the City, thereby incurring no small amount of unpopularity. For, as one Member of Parliament informed the House: "The people of England do hate to be reformed."

Holly has always predominated in Christmas decorations, and it is a happy thing to have in the garden an abundant supply of a first-rate berrying kind. For not all Hollies fruit freely, and some do not fruit at all. One of the loveliest for indoor decoration is the Moonlight Holly (*Ilex aquifolium flavescens*). The young leaves are golden, and it berries freely. *I. a. Hendersonii* is a smooth-leaved kind, and is noted for its free berrying. *I. a. camællifolia*, generally believed to be of hybrid origin, has leaves suggestive of those of a Camellia, and the berries are very large. For long graceful branches the common weeping Holly (*I. a. pendula*) is first-rate and it berries well. Then there are the golden and orange-berried varieties, and though these are not so popular, they add greatly to the beauty of indoor decoration, especially when associated with the milky-white berries of our native Mistletoe. The pick of the yellow-berried kinds is the variety Golden King, and it is listed by most nurserymen who specialise in trees and shrubs, but the orange-berried kind is a rarity.

Mistletoe is fairly common in many parts of the south, but scarce in northern parts of these islands. The origin of the custom of kissing under the Mistletoe is still a subject for discussion amongst the learned. On the Continent the custom is unknown. In the north a substitute for Mistletoe was formerly made in the shape of two hoops covered with evergreens and fruits, the hoops being tied together to form a rough globe. This affair was called the "kissing bunch."

The favourite hosts of Mistletoe are the Apple, Poplar and Hawthorn, and it is easy to grow one's own Mistletoe. The seed is sown by squeezing the berries when they are fully ripe in early March

POPULAR CHRISTMAS DECORATION

This photograph shows the way Mistletoe usually grows among the branches of a tree.

against the underside of a young bough of one of the trees mentioned. For a year there is no sign of life, but the following spring a small green growth appears. The next year a pair of leaves are produced and from that time onwards each pair of leaves give place to two leafstalks, and each of these produce a pair of leaves. Consequently, the number of joints between the root and the tip of any perfect branch indicates the age of a plant.

Nurserymen usually supply Mistletoe growing on Apple trees, and if berries are required it is essential to obtain both male and female plants, either on the same host or on separate trees. Supplying Mistletoe has long since been commercialised, but even as late as Elizabeth's reign the plant was held in such veneration that when cut it was never allowed to fall to the ground. This information is given both by Gerard and William Langham, the author of *The Garden of Health*. The berries were used both medicinally and as amulets. If for the latter purpose, they were enclosed in little silver boxes. Mistletoe is one of the few native plants about which an entire treatise has been written. Sir John Colbatch, a noted eighteenth-century physician, wrote *A Dissertation Concerning Mistletoe*, which was published in 1719.

Although Holly and Mistletoe berries have always predominated and presumably always will predominate in Christmas decorations, there are other berries which are valuable for indoor decoration at this festival. Most berried shrubs are long past their best in December, but a few are still in first-rate condition. Amongst these, the Butchers Broom (*Ruscus aculeatus*) and the Snowberry (*Symphoricarpus racemosus*) are the most important. Butchers Broom figures conspicuously in the foliage, stained every colour from silver to a dreadful magenta, hawked in the streets of most cities in mid-winter. Why do they not, instead, sell the branches with their vivid red berries? They are charming for decoration. As with Mistletoe, it is essential to grow both sexes of this plant if berries are desired.

The Snowberry is usually looked on as a weed, but the variety *Symphoricarpus racemosus lævigatus* is one of the finest-berried shrubs with lovely white fruits the size of cherries. The type is an accommodating plant that will grow positively anywhere, even on precipitous banks, but the variety named needs at least fairly good soil to produce its gorgeous berries in profusion.

Another plant that is valuable for its berries at this season is the Gladwin Iris that country folk used to call Gladdon. This native plant has inconspicuous flowers, but the brilliant scarlet berries in triple rows in their big capsules can hold their own amongst any berries in mid-winter. Like the Snowberry, this Iris will flourish in shade, and in the poorest soil, and if only for its berries deserves a place in the wild garden.

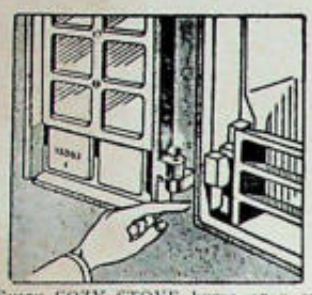
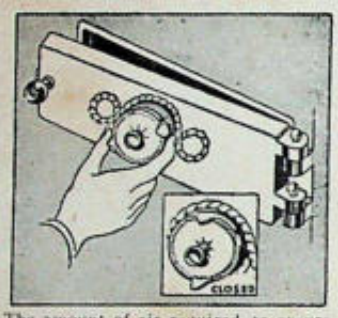
Scientific Construction makes them *highly efficient*

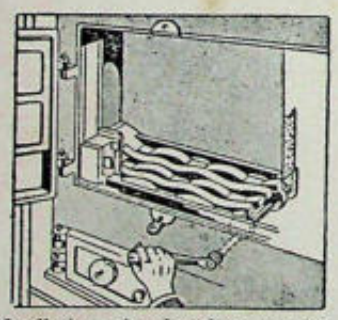
★ NO SPECIAL FUEL IS REQUIRED FOR COZY STOVES



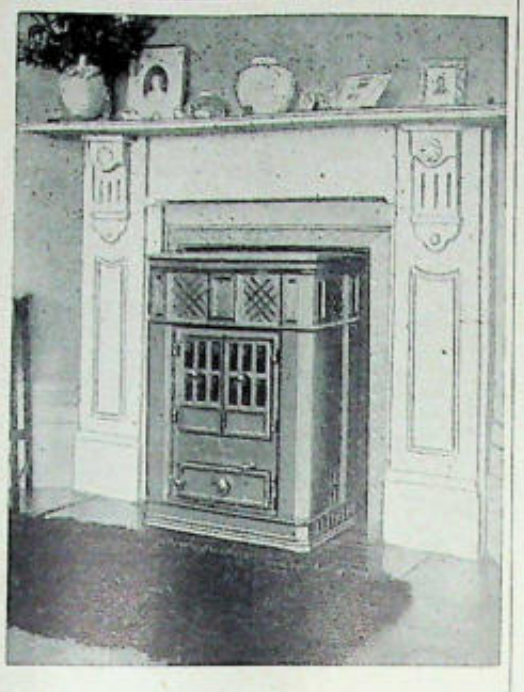
Every COZY STOVE burns open or closed as required on ordinary kitchen coal, and is guaranteed to burn 12 hours without attention. This is largely made possible by precision in workmanship, which results in all doors fitting perfectly. The air draught, at all times, is under complete control.



The amount of air required to ensure proper and complete slow combustion depends upon the type of fuel used. The air regulating device in COZY STOVES is situated in the ash door and is operated by a disc. It is a most efficient arrangement.



Small pieces of coal not burnt to ashes can still give off heat. Dropped through to the ashpan they are wasted. With the new patent Rocking Grate fitted in all large size COZY STOVES the maximum efficiency is obtained. When used it may not show much movement on the surface, but down under the fire very little but the dead ashes fall through, which is as it should be.



COZY STOVES are scientifically designed to give maximum heat with minimum fuel consumption during the whole 24 hours. For efficiency, adaptability, and economy, YOUR home needs a COZY. There's a wide range of models available to suit all requirements.

Write for catalogue or see them at your local dealers.

COZY STOVES are available on easy terms.

THE VALUE OF SEASONAL BORDERS

Colour in the Garden Throughout the Year

MOST people are away on holiday for a few weeks every year, and so miss seeing their garden during this period. Very often they are absent for the same times each year. This being the case, it is foolish to grow plants which are in flower at such a period. Instead, it is best to concentrate on arranging for a brilliant display for the periods when the owner is at home. This is made possible by growing in the same border all those plants which flower round about the same time. By this method there will be no "blank spaces" in the border, as the plants finish blooming more or less together.

In some large gardens separate borders are planted for each season—the spring border for the months of March, April and May, the summer border for June, July and August, the autumn border for September and October, while even a winter border may be planned for the remaining months of the year. These seasonal borders, although bare of flowers for a longer period than the all-season border, certainly possess more individuality than the latter, and give a much more definite display of colour when the plants are in bloom. If all the borders can be seen from some part of the house, so much the better, but it is advisable if each border can be arranged in a different part of the garden so that no part is dull for too long a period.

Hardy perennials are doubtless the best type of plants to use, but there are many beautiful bulbs and annuals which can be included as well as some of the dwarfer shrubs. Some varieties of Brooms, Rhododendrons and Spireas will be found suitable, and those which grow only 2ft. or 3ft. high are best, as they do not spread outwards too much and are easy to keep under control.

Each border should have a suitable background in the form of an evergreen hedge, such as Yew or Holly or a well-weathered brick wall. Part of the lawn, a gravel path, or crazy paving makes a good foreground. Before planting, the borders should be planned out on squared paper so that the plants are arranged with regard to height and colour. Each variety should be planted in fairly large groups so that the whole border consists of bold drifts, each colour harmonising or contrasting with those on either side of it.

On the whole, flower colours do not clash with each other, as is often the case with those which are produced artificially. It is advisable however, to avoid putting certain colours together, such as a bright scarlet and a magenta, or scarlet and bright pink. White flowers should not be used a great deal, though some are suitable for separating two

EARLY FLOWERING PERENNIALS FOR THE FRONT OF THE BORDER INCLUDE VIOLAS

rather strong colours. The best are those which have fairly small flowers, as these will not give an impression of heaviness. There are white varieties of Achillea, Campanula, Catananche, Gypsophila and Lavatera. Grey-leaved and other ornamental foliage plants are useful for this purpose also. These include *Achillea argentea*, *Anthemis tinctoria*, *Cerastium tomentosum*, *Gypsophila paniculata*, *Stachys lanata* and *Veronica incana*.

The spring border will provide for a display lasting, roughly, from the beginning of March until the end of May, and will consist mainly of bulbs and early flowering perennials. No annuals will be early enough for this border, but there are a few shrubs which may be put towards the back, if required. Of bulbs, there are any number to choose from. Dwarf kinds for the front will include Scillas, Snowdrops, Crocus, Chionodoxas, Grape Hyacinths and bulbous Irises, *e.g.*, *Iris reticulata* and *I. histrioides*. For the middle and back of the border there are Hyacinths, Narcissus and Tulips. Some early-flowering, mid-season and late-flowering varieties should be chosen to give a succession.

Early-flowering perennials for the front of the border include Violas and Pansies, Primroses and Polyanthus, Alyssum Saxatile, Forget-me-nots, Aubrietia and Double Daisies. Of the taller kinds, there are Doronicums, Wallflowers, Aquilegias and Geums, with the earliest of the Pæonies for the back of the border. Spaces at the back could also be filled in with dwarf shrubs. For instance, some of the Dwarf Rhododendrons such as *R. præcox* and some of the early-flowering Brooms might be used here.

The summer border, arranged for flowering from the beginning of June till the end of August, will consist mainly of perennials mixed with a few bulbs and some annuals. Among the bulbs suitable for this border there are late-flowering Tulips, *e.g.*, some of the late Darwins, bulbous Irises of the English, Dutch and Spanish types, Lilies and early-flowering Gladioli. These are all fairly tall.

The front of this border can be furnished with some of the shorter annuals, *e.g.*, Nemesia, Dwarf Nasturtiums, Lobelia, Ageratum, Petunias, Phlox Drummondi, &c., together with a few dwarf perennials such as *Aster alpinus*, Violas, Pinks, Pansies, Nepeta and Rock Roses. And the back of the border will present no difficulty at all, since the majority of hardy perennials flower during these months. A selection may be made from the following: Alstroemeria, Verbascums, Heleniums, Coreopsis, Geums, Evening Primroses and Gaillardias for the yellow and orange part of the border. For blue flowers one may have perennial Cornflowers, Aconites, Anchusa, Delphiniums, Erigeron, Eryngium, Echinops, Salvias and Scabious.

Red flowers include Dielytra, Geum, Lychnis, Monarda and Oriental Poppies. There are pink Phloxes and Sidalceas, mauve Galega and white Achillea, Gypsophila and Phlox. In addition to

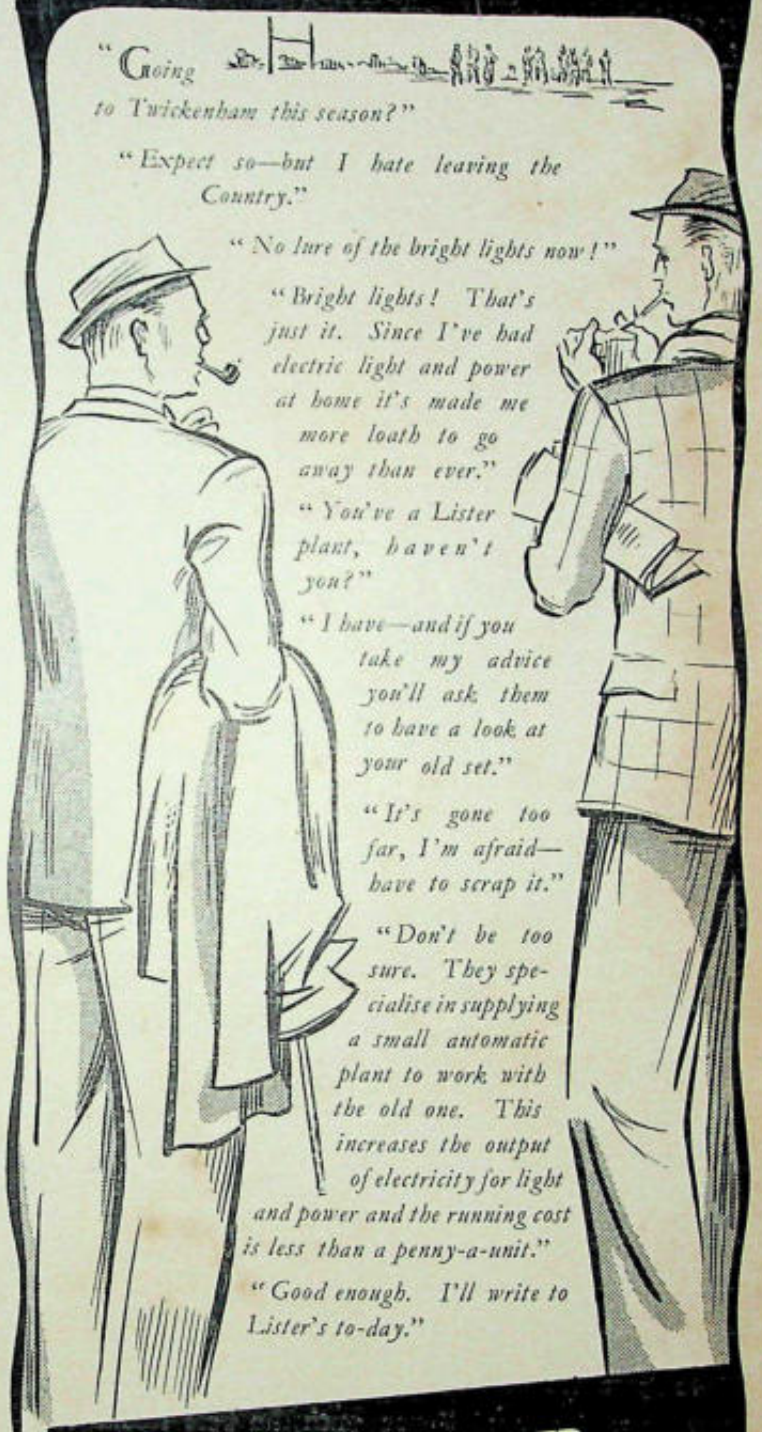
Water & Electricity
IN THE COUNTRY – BY LISTER'S



"Going to Twickenham this season?"

"Expect so—but I hate leaving the Country."

"No lure of the bright lights now!"

"Bright lights! That's just it. Since I've had electric light and power at home it's made me more loath to go away than ever."

"You've a Lister plant, haven't you?"

"I have—and if you take my advice you'll ask them to have a look at your old set."

"It's gone too far, I'm afraid—have to scrap it."

"Don't be too sure. They specialise in supplying a small automatic plant to work with the old one. This increases the output of electricity for light and power and the running cost is less than a penny-a-unit."

"Good enough. I'll write to Lister's to-day."

R. A. LISTER & CO. LTD.,

STANMORE **PATTISSON** MIDDLESEX

THE VALUE OF SEASONAL BORDERS (*Con. from p.* 1252)

these there are several plants which produce flowers in a variety of colour, *e.g.*, Aquilegia, Campanula, Foxglove, Hollyhock, Lupin, Pyrethrum and Thalictrum. The bearded Irises must not be forgotten, unless a separate border is to be made for them. They enjoy a sunny situation and a light soil containing plenty of lime.

An attractive autumn border for the months of September and October could be made up entirely of different species, and varieties of Michaelmas Daisy, or of a selection of these mixed with Dahlias and early-flowering Chrysanthemums. Other perennials will give additional interest and colour. There are the perennial Sunflowers, Golden Rod and Anemone Japonica, as well as late-flowering Gladioli. Any gaps in the front of the border may again be filled with annuals.

The winter border, for flowering from the beginning of November until the end of February, is naturally the most difficult of all to furnish. Nevertheless, the number of plants which will flower during this part of the year is surprising, and if these are grouped together in one border the result is very effective. This border should be in a sunny spot, as sheltered as possible from cold winds. Christmas Roses should be planted in fairly large groups, since they may be obtained in many shades varying from white to deep maroon. Then for the front of the border there are several varieties of Viola which will bloom in mild spells all through the winter. Primula Wanda gives a fine splash of colour just after Christmas, and Violets will be out soon after. The Dwarf Cyclamen Coum is useful here, as it usually flowers in February.

The main groundwork of the border can be filled in with various species of Erica. Even when not in bloom the dark green of the foliage is not without interest. There is no need to have a special peaty compost for Ericas, for many of them will grow quite happily in ordinary garden soil. The first to flower will be *E. hybrida darleyensis*, and this is soon followed by *E. carnea* and its varieties, of which there are many. *E. lusitanica* also starts to bloom in January.

Several early-flowering bulbs can be used in this border. *Iris unguicularis* flowers in January and February, so do Snowdrops, Crocus and winter Aconites. Just as the autumn border can be made up entirely of Michaelmas Daisies, so the winter border may be composed of Ericas only.

W. E. SHEWELL-COOPER.

"SEA DOGS"

THE bulldog has long been popularly associated as a pet with British sailors, but in fact many different breeds of dog are carried on board ships as mascots or ship's pets. The battleship Malaya, for example, had for some years an enormous mastiff, which had been presented to the ship by a Malay sultan, while at the other end of the scale a gunboat employed on patrol duties on a Chinese river kept a tiny Pekingese.

Dogs enjoy shipboard life and, like cats, are good sailors. Kennels are constructed by the ship's carpenters for their canine shipmates to live on the upper deck, though when the weather is rough the ship's dog is usually to be found in some snug berth made for it on the men's mess deck. Sailors are inordinately fond of animals, and the greatest difficulty of the man officially in charge of the ship's mascot is to prevent the crew from killing it by overfeeding.

Like the ship's cat, dogs grow used to one vessel, and when the crew pays off, there is little likelihood of the ship's pet pining at the loss of its masters, for the new crew, whom it welcomes enthusiastically, takes over the dog together with the ship. Thus some ships' dogs spend almost their entire lives on board one vessel without knowing much of this country beyond occasional runs in the dockyards.

On board ship, dogs become extremely sure-footed and very rarely fall overboard. Like all good house dogs, they are exceedingly suspicious of strangers boarding their floating homes, and when it is remembered that there are sometimes as many as 1,000 men in the crew of a battleship, their instinct for an unfamiliar figure is truly remarkable. On one occasion I remember our faithful mascot, a white fox terrier with one impudent black eye, following the admiral round the assembled ranks of the ship's company suspiciously sniffing at his heels during the great man's inspection, much to the latter's amusement.

Dogs on board ships have frequently been the cause of amusing incidents. On one vessel in which I was serving, the captain was presented with a tiny bull-terrier only a few days old. The embryo mascot was placed in the charge of the captain's cabin sentry, and at regular intervals during the day the hard-bitten marine would carefully lift the tiny scrap of doggy life from its cotton-wool-lined box and tenderly feed it on warm milk with a fountain pen filler.

On board another vessel, which sported a fine three-year-old bulldog, a sentry also had charge of the animal. Bulldogs have to be fed rather more carefully than most dogs, and "Bill's" attendant would often be seen solemnly consulting the type-written sheet which was pinned up over the dog's bed and labelled "Bill's Diet" before proceeding to draw the animal's ration of special meat from the butcher.

A battleship on the Mediterranean station was presented with a pointer, which the officers were informed was a good gundog. Anchored for a week off a particularly wild part of the coast of Albania, the officers, together with the dog and a dilapidated Ford car, landed in high spirits on a shooting expedition. Very late that night the members of the shooting party were embarked minus car, dog and bag. The Ford, it transpired, had broken down miles from anywhere, and the dog, after hearing the first shot, had incontinently bolted. The next day the pointer, looking very sorry for itself, was duly re-embarked and subsequently presented by the disgusted officers to the ship's company.

The Pekingese, which belonged to a gunboat in China, was the particular pet of the motor boat's engineer, and at any time of the day or night when the dog heard the boat being lowered he would run to the davits and stand there barking and whining in his eagerness to be on board and off on a trip with the engineer.

On one occasion, while working in the boat alongside the ship with the little animal his companion as usual, the man, by some mischance, fell overboard.

P. J. EDMONDS
Itchen Abbas, nr. WINCHESTER
Contractor to the Air Ministry

Swept away from the boat in the swift current the engineer struck out for the gangway, and the Pekingese, which had been barking excitedly as it anxiously watched its friend's efforts, finally leapt overboard, too, and swam with him to the gangway steps.

This ship also owned another and larger dog, full of energy and a great favourite with the men. When one day she somewhat apologetically produced no fewer than eleven puppies the ship's company were highly diverted. As soon as the pups were old enough to leave their mother they were solemnly "drafted" to other ships of the squadron. One of the litter was retained on board, and some time after the death of her mother she, too, presented the admiring crew with a further ten pups. When I left the station there seemed to be every indication that each ship of the entire China fleet would have as ship's dog one of the descendants of the gunboat's original gallant mascot.

A. Cecil Hampshire.

GETTING RID OF TREE STUMPS

NOT all of us are faced with a problem of the magnitude of that confronting the new owner of a certain agricultural estate. Twelve acres of woodland had been partly grubbed with a view to the reclamation of the land for agriculture. The contractors had pulled over all the trees, removed the timber, and then, unable to complete their contract, had left the ground littered with tree stumps of all sizes, some 2,400 of them.

With a view to planting the land with trees, it was necessary to dispose of the stumps. A firm of contractors offered to remove the earth adhering to the stumps by hand and then to pull them by steam engine and dump them in a heap in an adjoining wood. Their price was £50 per acre. A start was made to remove the soil from the stumps and fill the pits left by their extraction, and the cost worked out at £30 per acre, but the stumps remained. Attempts to split them with black powder failed.

A demonstration by a firm of explosive engineers using gelignite was convincing. The stumps were split sufficiently to be burnt where they lay, and the earth adhering to them dropped off nicely into the hole. The cost was estimated at £30 to £35 per acre, and this probably is the way in which the owner will have the work carried out.

Not all of us have a bill of this size to meet, but most of us at one time or another possess some tree stumps that we wish to see the last of. In a great many cases it will be sufficient, after the tree has been felled, for the stump to be cut with an axe to 3in. below ground level and then turfed over. If this is not practicable it can be dug out and hauled away, an operation costing perhaps £2, and best carried out when the timber fellers cut the tree. If the root is required to be removed a trench should be dig encircling the tree and all the main supporting roots cut. The tree can then be pulled over by a tractor and the trunk cross-cut from the root. If the soil be then removed from the latter it is ready for hauling away to be dumped in some disused pit.

If the stump has not been got to the surface in this way it is always possible for a man to dig round it and below it and let it 2ft. or 3ft. deeper into the ground. The cost will not be any less, but the stump will be out of sight and out of harm's way. The man who is doing the undermining must strut the root carefully or he may be pinned beneath it.

When a stump is sufficiently far away from the house it can be completely destroyed by high explosive. Gelignite is used, and three or four charges set deep in the stump in auger holes. This high explosive should never be used by gardeners or woodmen, whose blasting operations should be restricted to black powder. A firm of explosive engineers should be called in to do the work. These people fully insure themselves and their assistants, but if an estate employee has occasion to use black powder he must be specially insured, as the ordinary workman's compensation policy does not cover this special risk.

A less dangerous method and one suited to any tree stump in any position is to hasten decay by the use of saltpetre. This substance possesses extraordinary disruptive powers and will bring about the decay of an oak stump in three years. At the end of this period the stumps will be so far decayed as to be easily broken up with a mattock.

The saltpetre is used in crystalline form. Three ¾-inch auger holes are bored from the exposed surface of the stump well down into the root. These are filled with saltpetre, which the rain washes into the pores of the wood. If this be done in autumn it is most effective, and the holes can be refilled each succeeding autumn until decay is far advanced.

If the stumps in question are so situated that a fire is permissible without any danger of its spreading, or being a nuisance, then advantage may be taken of the inflammable nature of saltpetre. The spring after the first treatment will find the stumps so saturated that a hot fire of cordwood sited on top of a stump will in all probability completely burn it out. One cannot always rely upon the success of this method unless the stump is properly prepared beforehand.

An auger hole from the top of the stump should be driven downwards as far as possible to act as a chimney. A small hole should then be dug adjoining the stump, and from this another auger hole should be bored into the side of the main stem as low as possible, and so as to connect with the vertical hole. In this way a draught is created, and once the stump is well alight it can be relied upon to burn even down the principal roots.

This method is quite cheap, probably 7/- or 8/- per stump as against 30/- or £2 for digging and hauling away, or for burying. It compares favourably in cost with the use of high explosive, the cost of which might be 10/- per stump, but varies somewhat according to the number of stumps to be demolished, situation and necessary precautions.

Reginald Davey.

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, games, country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, December 20th. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Bream's Buildings, Chancery Lane, London, E.C. 4. 2. Only amateur photographers are eligible to compete. 3. Photographs should be sent unmounted, and no prints will be returned. 4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final. 5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6. 6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.

Entries from abroad not arriving in time will be placed in the next of the series. Do *not* send negatives.

WINTER IN THE German Alps

Don't put it off any longer. Spend this winter's holiday in Austria or Bavaria and learn to ski. More and more visitors come every year because those who have once experienced the exhilaration induced by sun, snow and skis never fail to return. The atmosphere is very friendly, and the cost is out of all proportion to the benefits of health and recreation received. When it is grey and foggy, remember that in the German Alps the sun shines down on virgin snowfields and glittering snow-capped peaks tower into a clear, blue sky. Why not 'phone up to-day?

Ski on the SUNNY SIDE of the Alps

CERVINIA (6,600 *ft.*), *in the Italian Alps: wire-rope railway to the foot of the Matterhorn*

At Sestriere, Claviere, Cervinia, Cortina d'Ampezzo, Ortisei, etc., there are wire-rope railways to transport you to altitudes of eight, ten and eleven thousand feet. Before buckling on your skis you will probably have a "refresher" and bask awhile in the radiant sunshine. Then begins a thrilling glide over soft powder snow, swift descent—Slalom, Christiania, "Stem," Telemark—down, down to six or five thousand feet. In the evening a dance, a talk over the day's thrills, a few hours' sleep and another day dawns, sunny (as usual) and full of expectancy for more adventures.

Apply to your Travel Agent (*or write direct to the* ITALIAN STATE TOURIST DEPARTMENT 38 *Piccadilly, London, W.*1) for descriptive booklets of Italy's winter sports centres and for particulars of the Special Tourist Rate of Exchange, Hotel Coupons, etc.

WINTER SPORTS IN ITALY

A VALLEY NEAR BODMIN

CHANGES ON BODMIN MOOR

The Possibilities of Large Scale Ranching

A FEW years ago, when people travelled to Cornwall by train, the country between Bodmin and Camelford was unknown to strangers. But now they often go by car, and most motorists have crossed Bodmin Moor, though few stop to explore it, and fewer still consider its importance to the farmer. The moor is a rolling treeless expanse of heather, bracken and coarse grass, lying mostly between 700ft. and 1,000ft., but rising in isolated granite tors to just under 1,400ft. In soil and climate it resembles Dartmoor, of which it is the western extension, and the same granite formation can be traced westwards through St. Austell and Redruth to the wild hills that lie between St. Ives and the Land's End.

Soil and height between them fix the type of farming. Granite is late, cold and seriously deficient in lime and in certain other minerals, while growth is checked by excessive winter rainfall and cold winds in spring. Good crops of oats and potatoes can be grown, but the land must be dressed with lime or sea sand. Sheep and store cattle do well, provided that young stock spend several weeks in the year away from the granite, or they are likely to become "moor-sick." Moor-sickness has long been something of a mystery, and has now roused the interest of scientific investigators. It is undoubtedly caused by the lack of some necessary mineral in the moorland soil, and can be avoided by periodical change of pasture.

Moorland farms are small, with rarely more than 50 acres enclosed, and are often without roads. But extensive common rights enable the farmer to keep far more cattle, sheep and horses than would be possible on a similar holding off the moor. At one time, the number of stock turned "out moor" by any one commoner must not exceed the number he could winter on his own farm. But now, so few commoners care to exercise their rights that the moor is understocked, and there is less reason for limiting the number allowed to each individual. Also, the introduction of mountain sheep and rough cattle needing little or no winter feeding has made this rule irrelevant. Not long ago a man with a 20-acre holding kept on the moor about 200 rough cattle, most of which had nothing but moorland grass all the year round. The cows calved in spring, and their calves, though naturally not of first quality, were hardy and quite saleable. The profits on each beast would be small, but low costs and large numbers produced a decent income with very little labour. This old rancher had no "change" for his cattle; but most moorland farmers find it worth while to rent a few acres on the "red soil" to which young stock may be sent for a fortnight or so at a time, and from April to November one constantly meets on the road large droves of cattle, travelling to or from their "change" in charge of one or two mounted herdsmen.

In former days, and even quite recently, the central valleys of the moor, remote from road or village, sheltered a few small farms, approached by cart tracks and surrounded by stone-walled fields. Here families would live and work, supporting life on home-grown meat, milk and potatoes. Flour, groceries and other necessaries—few enough according to our notions—were bought with the price of store bullocks, pigs and ponies. Coal was unknown, and the open hearth was supplied with peat from the marshes. A cart and riding ponies were the only means of transport. Men would walk miles to work in clay pit or quarry, and women ride to town with a child in front of the saddle. But now this life, hard, primitive and independent, has gone beyond recall. A higher standard of living, and that dread of loneliness which seems the chief bugbear of our age, has robbed the moor of its natural inhabitants. The walls are fallen, the fields gone back to the wild, and the houses either in ruin or converted into holiday cottages. It is sad, but I suppose inevitable, and only a part of the rapid ebbing of life from the remoter fringes of our land, which has left islands with centuries of human history to rock-climbers and ornithologists.

There are still cattle and ponies on the moor, but fewer than there were, while sheep have almost disappeared. The decline in sheep can be explained by the difficulty of providing a "change," and the trouble of keeping them from breaking into arable and grass fields adjoining the moor, but, above all, by the fall in the price of wool and the unpopularity of large mutton. Formerly it paid to keep flocks of mature wethers for several years for the sake of their wool, while at the end the carcass was still saleable. And wethers are little affected by mineral deficiency, whereas the breeding flocks that are needed to produce lamb and small mutton are specially susceptible. Moor farmers of to-day confine themselves to small flocks of Devon Longwools kept in the fields away from the moor, except perhaps for a few weeks in summer, when they are turned out coupled in pairs to prevent breaking. The decline in ponies is, of course, due to general mechanisation, while the increase of milk production has made farmers unwilling to use the moor for cows required for milking twice a day. This is natural, but the trouble of gathering cattle on free range with dogs and ponies is much exaggerated. Cows, like sheep, keep to their regular beats, and in winter, when mounted herding is least pleasant, they come home themselves. There are still numbers of store cattle on the moor, but not enough to keep down the summer grass, which in many places grows rankly, leaving a withered mat to check next season's growth.

There is no doubt that the moor has great potential value, especially if we are forced to depend on supplies of home-bred meat. Professor Stapledon, in his review of our hill-grazing resources, considers that the whole of Bodmin Moor is worth improvement; it has easy gradients, an equable climate (as compared with the north, or even with Dartmoor), and a high proportion of grass. There is probably a long and profitable future for hardy cattle of the Galloway type, which need less winter feeding than Devons, bred with first-class Shorthorn or Angus bulls, and also for hill sheep—Cheviot, Exmoor or Blackfaced. Further, the boom in riding might make it worth while to improve the local ponies by crossing them with stallions of the best saddle breeds, much as a useful farm cob has been evolved by breeding pony mares with cart stallions.

All this needs time and capital. There is some sign that larger farmers are getting interested in the moor instead of dismissing it as a bleak and unprofitable desert. In the lean years of agriculture there was too much ranching on land that deserved more intensive methods. But the moor is made for the rancher, and there he can live a life which is free, pleasant and profitable. There are, of course, a number of problems to be tackled first, and in the small space that remains I can do no more than mention them. First there must be more research into "moor sickness," and the possibility of checking it by adding the necessary mineral to food, or by applying it as a top dressing to meadows and pastures. Dangerous bogs should be fenced or drained, bracken checked, and moor-burning put and kept in the hands of authorised persons. Roads leading off the moor should be protected by automatic stop-gates or stock-proof grids, and motorists be legally forced to respect them.

A POOL ON BODMIN MOOR

The old moor farming has gone and will never return; but there is no reason why the common grazings so useful in the past should not carry larger and better flocks and herds for the profit of their owners and the good of the nation.

MARGARET LEIGH.

MOTORISTS AND THE POLICE

Let Us Have More Understanding Co-operation

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

DESPITE the really fine work which our Police Department is doing every day in the interests of road safety, one often encounters among motorists an attitude of open antagonism towards policemen.

Where the roads are concerned, both the police and we motorists seek one and the same thing—safety. Therefore, since our ultimate aims are identical, there should be a generous measure of co-operation as opposed to open contrariety. I am convinced that if the road users and the police would "play ball" in an even more marked degree than at present we should see an appreciable difference in road conditions.

After all, the police have their job to do and, I know, endeavour to fulfil their duties conscientiously and justly. There are, of course, exceptions, but this is true of every walk in life.

The police have an arduous task on hand when they are tackling traffic duties, and since their aim is to reduce the number of accidents and raise the standard of driving, then the full support of the motorist should be forthcoming.

Every day one can see ample evidence that Scotland Yard is anxious to make progress and claim results. One excellent example was provided by their stand at the Earls Court Motor Show this year. This took the form of an advisory bureau for motorists, where all sorts of useful tips could be obtained. There was a fine model of a road showing clover leaf fly-over crossings, which are seen in increasing numbers in the United States and in Germany, but not in this country.

A section of the display sought to illustrate how police are trained for special roadwork; while reaction-testing equipment was available to visitors who were able to assess their ability for controlling a car in an emergency. Police were present to advise and instruct on road problems and safe driving, and, I believe, were bombarded with all manner of queries concerning road safety.

Again, there is the establishment of the motor cycle patrol—aptly dubbed "Courtesy Cops" by the popular press—which is undeniably a move to ensure the drastic reduction in the incidence of road accidents.

It has been reported that on the roads they patrol in or near London mishaps have decreased by 20 per cent. They have been on the highways since April last, and gradually their numbers are being increased.

I understand, however, that Hendon Police College is only capable of putting about twenty such men on the roads each month, since the lack of equipment and accommodation is a severe handicap. This state of affairs should be remedied without delay for the effective furtherance of our safety measures.

Here are some startling figures which reveal in no uncertain fashion the results which are attainable by these police motor-cyclists.

Following the enlistment of a number of additional motor-cycle patrolmen in the City of Columbus in Ohio in the United States, there was a sharp reduction in traffic deaths and accidents which this table illustrates:

Traffic deaths (July, 1937) 6; (July, 1938) 0.

Accidents involving bodily injury (July, 1937) 180; (July, 1938) 97.

Traffic deaths for the first seven months of 1937, 50; 1938, 22.

THE VAUXHALL "25" LUXURY SALOON, PRICED AT £345, HAS A MAXIMUM SPEED OF 80 M.P.H.

Accidents involving bodily injury for the first seven months of 1937, 1,324; 1938, 808.

Thus there was a decrease in the number of lives lost within a month of six, with a reduction of 83 in the number of accidents involving injury. Over a period of seven months the figures for death and accident were reduced by 26 and 516 respectively—and this in a city with a total population of 308,771! (1930 census.) When these records were compiled Columbus was in its thirty-seventh day without a motor fatality.

These compelling statistics, therefore, put the case for the "Courtesy Cop" in a new and forcible light, and such figures cannot be ignored. Personally, I like the methods they employ, and believe the idea can usefully be extended because warning without prosecution will deter the majority of careless or thoughtless drivers without creating any bad feeling.

The use of police cars for controlling crowds and for admonishing pedestrians by loudspeaker for wandering aimlessly across controlled crossings when the motorist is entitled to precedence, or some similar offence, is an idea worthy of praise. Outspoken reprovals in public places are often the most effective lessons, and should prevent repetition of the offence.

Policemen are also seconded to deliver schoolroom lectures on road manners and procedure, a scheme which, I know, is appreciated by parents and school authorities alike. There are many other facets to the duties of the police which we hear little about, but which ultimately benefit the motorist in a number of ways.

I have often visualised the Ministry of Transport and Scotland Yard working in closer co-operation, and have imagined that together they could overcome almost insuperable difficulties. The liaison to-day could be improved to the advantage of everybody.

As practical men with a wealth of experience gleaned from almost constant road observation and surveillance, the police undoubtedly have much to offer our theoretical road experts.

For instance, I believe a policeman would have advocated the night illumination of Belisha Beacons, or their suspension over the roadway instead of on the kerbside, where they are liable to be completely obscured by passing vehicles. There are, of course, thousands of instances where their knowledge could be applied.

So many of our visitors have said—if latterly with a glint of impish humour in the eye—"I think your policemen are wonderful," but there are times when the motorist can say it and, moreover, mean it with all sincerity. In trying moments the policeman is frequently a blessing in disguise.

Chas. E. Brown

THE THREE SPECIAL WELLESLEY LONG-RANGE 'PLANES WHICH BROKE THE RECORD, FLYING ABOVE A CLOUDBANK

THE YEAR'S MOST SIGNIFICANT FLIGHT

A Great Triumph for British Aviation

By LORD SEMPILL, A.F.C., F.R.Ae.S.
Aviation Editor of the "Field"

THE establishment of a new long-distance record by machines of the R.A.F. Long-Range Development Unit has an importance that, in these days, but rarely attaches to a flying record. Spectacular in itself, it has a number of lessons to teach, vital to both military and civil aviation.

Coming so soon after the flight of the Mercury to South Africa, it is undoubtedly the most impressive demonstration of British aeronautical efficiency since successive victories won the Schneider Trophy outright for this country. At a time when, both at home and abroad, there have been freely expressed beliefs that Britain was lagging behind others—notably the United States and Germany—in the production of high-performance military and civil aircraft, the record should go far to put the true facts of the situation before the world.

From this point of view it is important to consider the R.A.F. flight and Mercury's performance together. Both were made as a matter of routine by organisations concerned with the development of long-range flying, the one for military purposes, the other for civil. Both were carried out by standard types, modified only so that a maximum load of petrol could be carried. In both instances, the machines were equipped with engines that are in regular production in the British industry. The point of special significance here is that, despite these general similarities, the aircraft and engines were different in each case—a tribute to the various resources on which this country can draw.

The special significance of the Mercury's flight has already been discussed in these articles, and there is no need to refer to it again. The new absolute record by the R.A.F. machines has, however, a number of special points that need stressing.

Its importance was made greater by the fact that it was not a mere individual flight, but an organised formation demonstration. The fact that machine No. 2 was forced to land on account of fuel shortage does little or nothing to detract from the significance of this, for this machine had already broken the then existing Russian distance record by some 350 miles before it was forced down; and on refuelling it was able immediately to re-take the air and join the two successful aircraft at Port Darwin. The flight, too, was not—as so many distance attempts have been recently—a mere trial of physical endurance on the part of the pilot. Proper sleeping quarters were arranged for the pilot off duty. In this sense, the record is a demonstration of what can be done when a 24-hour basis of flying is properly organised.

The average speed of the R.A.F. machines over 7,162 miles on the record flight was 149 m.p.h. The commercial service between Alexandria and Darwin, a distance of 8,300 miles, using machines of very similar performance as regards cruising speed, has an over-all average of some 67 m.p.h. on account of the overnight stops. Nothing could do more to emphasise commercial aviation's need for adopting continuous flying over the longest possible stretches of route, especially for mail carrying.

It is not, of course, suggested that any machine at present available could operate non-stop on 6,000 or 7,000 mile stages with a useful commercial load. What it is desired to stress is that the record flight, by its elimination of the "stunt" element, is a very practical demonstration of an ideal.

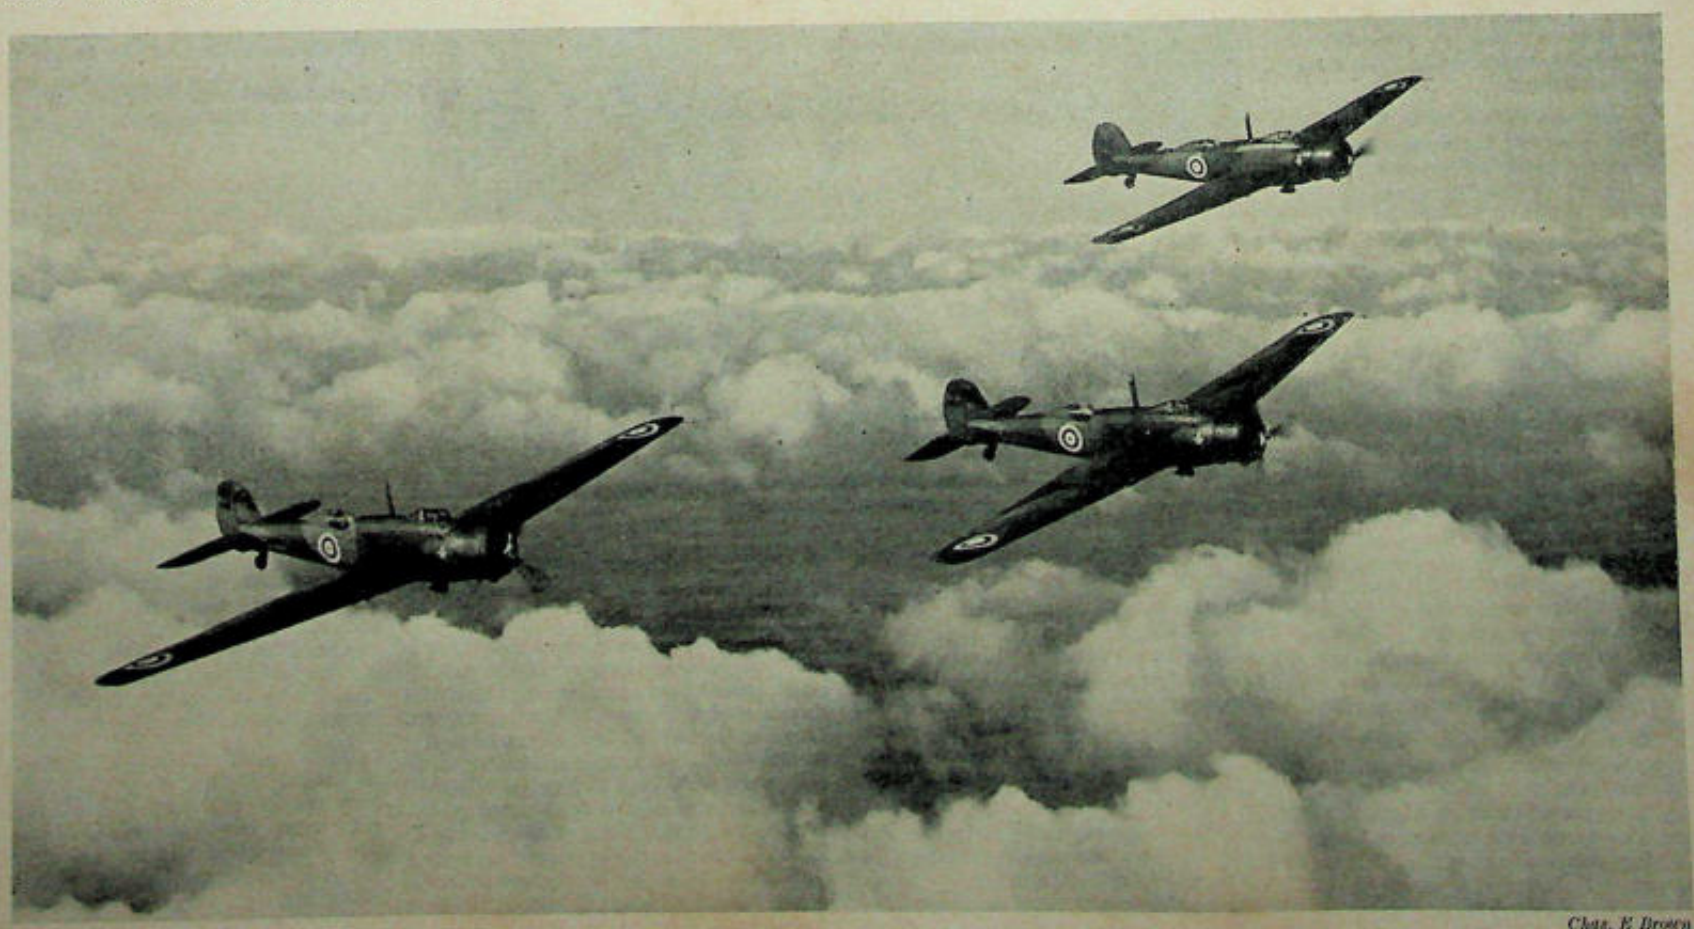
On the military side, the flight is a striking indication of the performance of the modern bomber. The lesson here has two facets. On the one hand, it should be impressive as an index of the striking range of our Air Force. On the other, it will bring home convincingly that there are few, if any, important centres in this country that could be considered unlikely targets in the event of war.

Another military lesson that the flight stresses is the feasibility of locating vital units of the aircraft industry in the farther parts of the Empire. Canada, whose participation in our aircraft production programme is now assured, is certainly immune from air attack from Europe, but is well within the range of modern bombing machines in which the armaments load is replaced by additional petrol tanks. It seems, then, that air delivery might well solve one of the most vital problems of our air defence schemes: the assurance of continued production of bombers without the risk of disorganisation through the destruction of key factories at home.

Yet another military aspect is concerned with the maintenance of communications, which is essential to the Empire, and which might become seriously threatened in time of war. Whether as courier or troop- or supply-carrier, the long-range aeroplane is an essential part of our aerial equipment.

These are only some of the more obvious lessons of the flight. A full examination of the results, which will follow automatically, as it is no mere demonstration, but part of a carefully organised research, will reveal many more of both technical and strategical interest.

Putting aside all these significant considerations, however, the flight by itself is one of the most remarkable in history, worthy to take its place alongside the other great formation flights of the past—such as the crossing of the Atlantic in 1919 by the U.S. flying boats, and Marshal Balbo's "mass flights"—and as fine a testimony to man's conquest of the air as any could desire.



Chas. E Brown

"THE FLIGHT IS ONE OF THE MOST REMARKABLE IN HISTORY, WORTHY TO TAKE ITS PLACE ALONGSIDE THE OTHER GREAT FORMATION FLIGHTS OF THE PAST"

ON THE WHITE NILE

By Government Mail Steamer Through the Sudan

AN ANIMATED SCENE ON THE PLATFORM OF THE CENTRAL STATION, KHARTOUM

IT may be a cause for wonder, by those who do not know the Sudan of the Blue and White Niles, why it is that this land exercises such an attraction that travellers—even those desiring only winter sunshine and interest—return again and again to explore, hunt big game, or just laze away the days somewhere in its vastness.

When one has wandered far and wide over the world, the discovery of a country still free from the ultra-sophistication which is fast reducing lands and peoples everywhere to a monotonous sameness, provides a thrill, and when to this is added a warm and sunny winter climate, vivid colouring, and the facilities for seeing primitive Africa in 20th-century comfort without being awakened to 20th-century reality by incessant demands for "service," "teeps," "backsheesh," or other forms of blackmail, then to the thrill of discovery comes also the peace of travel.

Add a dash of adventure, inspired more by the sight of swarthy giants carrying glittering spears as they move through native markets, or by a herd of wild African buffalo, elephant, eland, hartebeeste or other big game, than by any *real* peril to one's life, and the thrill is intensified. Gorgeous desert sunsets, an African moon silvering a lonely river, perhaps hundreds of miles from civilisation, the throb of native drums coming from a village amid the jungles of Central Africa, and the words "interest" and "lure" are subconsciously added—and so one lives and dreams, with a *seeming* adventure around every corner in this wedge of Africa, a million square miles in extent, that we call the Sudan.

I am standing on the deck of the Government mail steamer which carries passengers for a thousand miles up the White Nile into the heart of Central Africa. Khartoum, the capital of the Sudan, and Omdurman, the greatest purely native city in the dark continent, have been left behind. The sun is just setting in a blaze of colours, and it is certainly a novel experience to have my customary iced cocktail while watching a barbaric display by spearmen on the river banks; to see, also, within the radius of a few hundred yards, the great open mouths and flat white teeth of half-a-dozen yawning hippopotami in the gleaming waters around.

Life on board a White Nile steamer is peculiarly fascinating. One meets many interesting people on the broad promenade deck or in the observation saloon. Each ship is, in fact, an oasis of civilisation which passes through that sea of primitive, unspoiled—often barbaric—life, which was the Africa of Baker, Emin Pasha, Stanley and Gordon—the same to-day as in those bygone years of the great pioneers of the nineteenth century. Beyond the thread-like line of river communication and transport all else is wild nature. And it is the natives, the big game, and the scenery of desert, then grass-jungle, and, finally, equatorial forest, in combination with sunlight and moonlight, that have made this thousand-miles voyage the *dernier cri* of travel off the beaten track.

It may be of interest to give here some practical facts concerning climate and costs. As far south as Khartoum the winter temperature is delightful, with warm sunny days and cool nights. As one proceeds south of this point, however, the climate becomes more tropical and the cool desert wind of the night gives place to a warm equatorial stillness. At this time of the year mosquitoes are almost unknown in Khartoum, and are by no means numerous on the White Nile steamers, which are specially screened, because they ply also during the rainy season.

In point of cost this Nile adventure is also reasonable. One can travel by steamer, motor car and rail, through north-central Africa, from Khartoum to Mombasa, on the Indian Ocean, for about £45, inclusive of food, sleeping accommodation and travel. The time occupied can be reduced to fifteen days, but most travellers will desire to break the journey at various points. Hotels vary in price, but an allowance of 30/– a day will cover everything in this respect.

Through the game warden in Khartoum, hunters and photographers are able to arrange for completely equipped expeditions.

On board the steamer in which I travelled there was a party of explorers who intended making their way across country to Nigeria; a lone hunter whose objective was a famous—and not mythical—herd of over 1,000 elephant, whose habitat is on the northern fringe of the great *sudd*, or swamp; men and women who were making this voyage solely for pleasure and to escape the rigours of a northern winter; and Government officials, whose number diminished at each stop of the steamer at a little native town or village.

The scene around, as we penetrated deeper into the centre of the continent, was extraordinary because of its complete antithesis of all that goes to make up a civilised land. Crocodiles sprawled on the muddy banks. In the early morning, when the river resembled a bar of silver between the black walls of the still shadowy forest, huge lumbering hippopotami could be seen lurching down the bank from their grassy beds. A flutter of excitement thrilled those passengers who were seeing big game in their natural haunts for the first time at comparatively close range, when less than a quarter of a mile distant the black humps and huge horned heads of a large herd of buffalo came into view above the elephant grass. A few minutes later these beasts got the scent of the steamer and a wild stampede followed.

After passing through the *sudd* region, where the hippopotami and crocodiles are so numerous as to be a danger to the little *ambach* (light wood) rafts of the natives, the ground on both banks becomes more solid, and the elephant country is entered. Soon the raised trunks of these beasts could be seen above the undergrowth. Hereabouts, also, are rhinoceros, leopard, cheetah, hyena, wart-hog, duiker, gazelle, eland, roan antelope, reed-buck, white-eared cob, hartebeeste, lion, and such game birds as the bustard and the guinea fowl.

Almost every day I landed at a village of pointed *tukls* or mud-walled and thatched huts. These are the dwellings of the Shilluks, a weird race who dress their hair in elaborate style and walk about among the thick grass with hunting spears. They are a friendly people, still much interested in the "gadgets" of civilisation. On the east bank may be seen wandering bands of Dinkas—naked ebony giants with barbaric customs. They powder themselves all over with a fine white ash which they consider enhances their beauty.

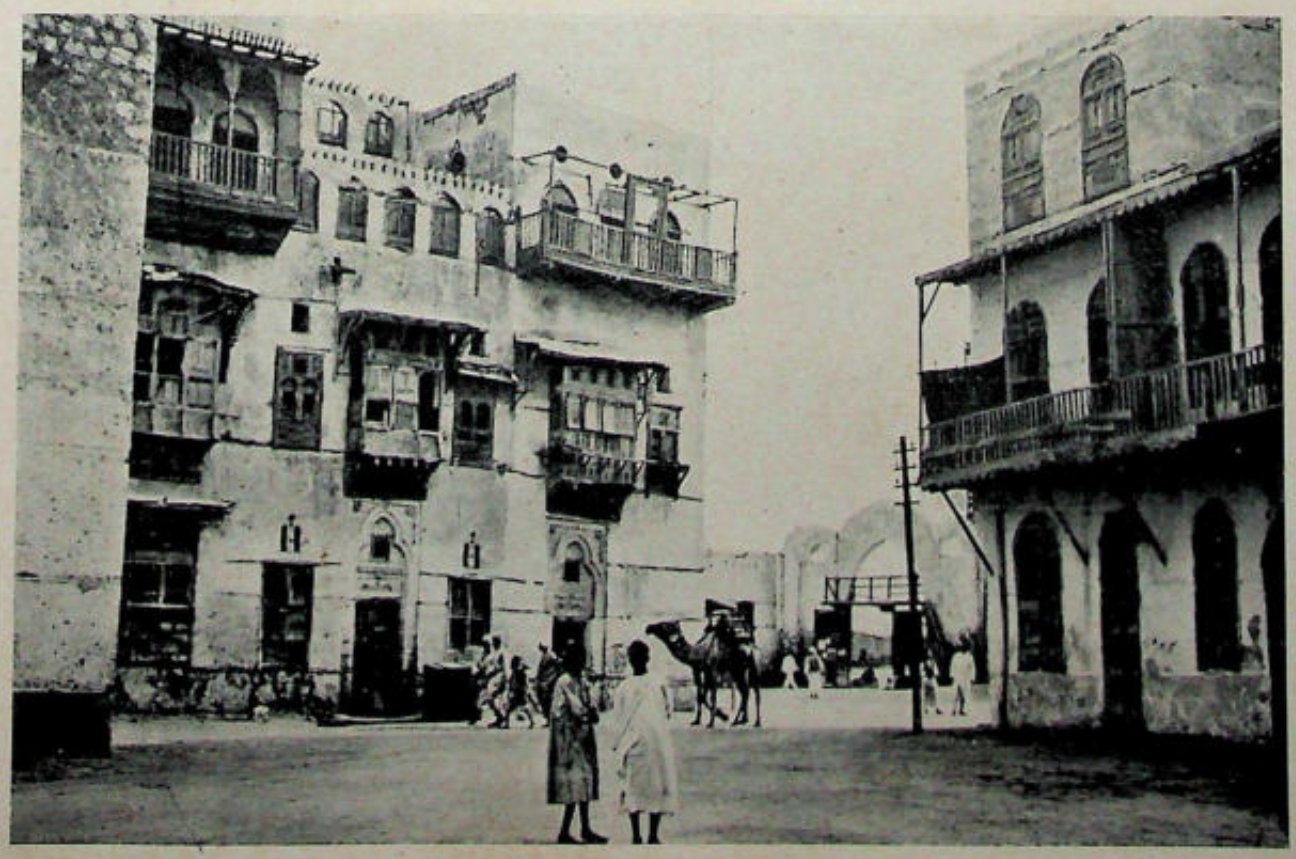
When the Dinka village of Bor was reached there was much unloading of

THE BARBER'S SHOP AT KOSTI, ON THE WHITE NILE

guns and equipment belonging to the hunter who was going into the interior to obtain ivory. At Juba, just over 1,000 miles south of Khartoum, the steamer came to final halt on the borders of Uganda and the Belgian Congo.

Further progress can be made by motor car, steamer and rail to the Victoria Nyanza—Africa's inland sea; the Great Rift Valley, often 2,000ft. deep and 30 miles wide, with volcanoes rising from its floor; to Mounts Kenya and Kilimanjaro, snow-capped although situated on the Equator; and to the Ruwenzori, or Mountains of the Moon, with their pigmy forests.

C. W. DOMVILLE-FIFE.



RICKETY-LOOKING ARAB HOUSES IN THE SUDANESE TOWN OF SUAKIN

WHERE TO STAY

HOTELS AND APARTMENTS FOR THE SPORTSMAN AND SPORTSWOMAN AT HOME AND ABROAD

Grand Resumé

We occupy, *sans doute*, the grandest position in Torquay—on the water front and on the level.

Our terms include all life's choicest luxuries, together with Golf, Tennis, Squash and nightly dancing to Harry Evans and his famous band . . . Grand Fun!

Our food is prepared by our Grand Panjandrum of a Chef in the tradition of the greatest masters of the Kitchen.

Our terms are all-inclusive and moderate. In winter we have a philanthropic scheme whereby the longer you stay the less you pay! A line to R. Paul, Manager, will bring you full details of a Grand Bargain in Winter Residence.

THE GRAND TORQUAY

200 rooms and suites, many with private baths
A.A. (five star) and R.A.C.

Telephone: 2234

FISHING AND SHOOTING IN WALES
LAKE VYRNWY HOTEL

Via Oswestry. Tel.: Llanrhaiadr 244
FISHING, reputedly the finest in Wales. 1937: 4,470 trout (3,380 lbs.).
SHOOTING, 21,000 acres, comprising all game.
RIDING.
Mr. and Mrs. MARTIN study individual requirements. Lessons given in the above sports.
See page 1165

BRACKEN BANK
Lazonby (Nr. Penrith), Cumberland.

NOVEMBER, DECEMBER, JANUARY — Covert and rough shooting, including pheasant, partridge, woodcock, and duck and snipe shooting. Excellent accommodation. Spring salmon fishing commences January 19th.
Tel. 41 and 48.

WILDFOWL AND GEESE
For the best shooting in the Fens, write:
CHEQUERS HOTEL, Holbeach, Lincs.
A.A. and R.A.C. H. and C. all rooms.

AT THE CARNARVON ARMS, DULVERTON, SOMERSET, you can find warm and friendly COUNTRY QUARTERS. Hunting with five packs, stag and fox hounds. Good horses from our own stables. Rough shooting and billiards. Write for booklet.—Wire NELDER, Dulverton. 'Phone 2.

BRIGHTON.—OLD SHIP HOTEL. Garage. Telephone: 4680 Brighton.

SOUTHPORT.—PRINCE OF WALES. "The Leading Hotel." Great golf centre (7 links).

THREE WAYS, MICKLETON, GLOS.—An attractive old world hotel with all modern appointments, situated at the foot of the Cotswolds. Excellent hunting centre. Stabling & garage, use of car. R.A.C. Special Winter Terms.

WEST SOMERSET.—Superior FARM-HOUSE ACCOMMODATION between Dulverton–Minehead; centre of staghunting, riding, rough shooting; good stabling; grooms lodged.—Box 3323, FIELD Newspaper, Bream's Buildings, E.C. 4.

20,000 ACRES GROUSE AND MIXED ROUGH SHOOTING, comprising all game; keepers and dogs provided; combined with salmon and trout fishing in lakes and rivers.—COMDEN'S HOTEL, Capel Curig, Carnarvonshire.

SCOTLAND

GOOD SHOOTING.—Snipe, duck, pigeon, wild geese. Terms on application.—Barony Hotel, Orkney Islands.

FINANCIAL INVESTMENTS, PARTNERSHIPS, ETC.

500 SALMON per season abroad. Also in England, three-and-a-half miles trout, shooting 500 acres, hunting, golf. Sporting estate owner would like to discuss sharing certain expenses.—Box 3318, FIELD Newspaper, Bream's Buildings, E.C.4.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE BRIGHTON MAIL CROSSING THE MOOR IN 1836
(Reproduced by courtesy of Messrs. Arthur Ackermann)

CHRISTMAS fashions have changed a good deal since Charles Dickens decided to send Marley's ghost to visit Scrooge. Of those days the latter's nephew, Bob Cratchit, was really plain "Mr. Everyman," and by gathering at his own fireside with his family for Christmas dinner he was merely following the custom of his time.

Doubtless they were good days. Deep snow outside and log fires inside must have made for a very cosy atmosphere. One likes to imagine breadwinners of that period walking home on Christmas Eve, bracing themselves against the cold north wind on the final stretch—the stretch they knew which was bound to end in the rattle of the door-latch, firelight and warm, familiar things—eager to be home, yet content to linger here and there and listen to carol singers grouped round their lanterns or bid a cheery "merry Christmas" to an acquaintance in the village. Surely there was more romance about the old-time Christmas than that of to-day?

But in this twentieth century our standards and ideas of amusements are very different from those of Bob Cratchit's period. There are many reasons why this is so. The scale of wages is, on the whole, higher, travel is easier, a "white Christmas" is rare, and finally there are few large families to-day. Who will deny, after all, that Christmas is the children's mecca? Some of them still believe in Santa Claus, but they now have only one brother and sister to join them in their fun next day when their urgent requests "up the chimney" have been answered.

And parents have long ceased to enjoy that "unhappy state" which comes from eating too much turkey and having too little exercise. The old performance of sleeping in front of the fire all the afternoon is not so popular; and about this season the question in many homes is: where shall we go this year?

Now I'm not going to say how I'm going to spend my Christmas, but *if* I were wanting to combine both the family party and the visit to another locality I should seriously consider the scheme planned by Messrs. Trust Houses. It is, at all events, the perfect solution to the Christmas problem of the host whose party is bigger than his house, for it is possible to hire a whole hotel for the duration of the holiday. The resources of the hotel are placed at his disposal, and all that it is necessary for the host to do is to assemble his guests and plan his own programme. The price naturally depends on requirements, but a tariff of 18/6 per day is quoted as an indication of rate.

The scheme embraces hotels in Norfolk, Suffolk, Sussex, Wilts, Hunts, Essex, Herts, Bucks, Berks, Beds and Oxon. The number of hotels to let is limited, and it is advisable to write up early if you are interested. It certainly seems an excellent idea if you have decided to cut away from the "stay at home" Christmas.

But wherever you spend the holiday I sincerely hope you will agree that:

"Life still has one romance that naught can vary—
Not Time himself, who coffins Life's romances—
For still will Christmas gild the year's mischances,
If Christmas comes, as here, to make him merry."

The writer will be pleased to answer any queries from readers concerning hotels.

WINE AND FOOD
A GASTRONOMICAL QUARTERLY

To all who wish to cultivate the art and enjoyment of good living this official journal of the Wine and Food Society will prove of inestimable value.

FROM BOOKSELLERS, OR FROM THE "FIELD," BREAM'S BUILDINGS, E.C.4

QUARTERLY
Price 2/6

PAYING GUESTS

EXPERIENCED SPORTSMAN.—Rough SHOOTING, coarse FISHING FREE. Proprietor's bag (one season): 1,100 snipe, besides duck, woodcock, plover, curlew, rabbits. Unsurpassed local knowledge. Golf (two links); horses available. British and Colonial recommendations.—TOM STUDDERT, Clifden, Corofin, Clare.

GENTLEFOLK, residing amidst the finest rough shooting, fishing, free; prepared TAKE GUESTS; terms 3½ gns. weekly; horses, golf, &c.; highly recommended.—EYRE STUDDERT, Cragmohler, Corofin, Clare.

HUNTING AND SHOOTING.—PAYING GUESTS TAKEN, Castle Hyde, Fermoy, Co. Cork. Hunting three packs, rough shooting; every home comfort, electric light, central heating.—Apply MANAGERESS.

OSBERSTOWN HOUSE, NAAS, EIRE.—GUESTS RECEIVED for hunting season; up-to-date Private Hotel centre Kildare hunting country; ten loose boxes, saddle rooms, accommodation for grooms.—Apply MANAGEMENT.

PAYING GUEST DESIRED.—Sympathetic horseman or woman to hunt good horse all or part of season. Devon. 4 guineas.—Box 3355, FIELD Newspaper, Bream's Buildings, E.C. 4.

TO SPORTSMEN IN NORTH DEVON.—RESIDENTIAL CLUB, exceptional cuisine, hot and cold water all bedrooms, central heating; cocktail bar. Good rough shooting 900 acres. Inclusive 4 guineas weekly. Westward Ho! Golf Course one mile.—For illustrated particulars, SECRETARY, North Devon Country Club, Northam, North Devon.

IRELAND

CONNEMARA.—MONGAN'S HOTEL, Carna. Excellent white and brown fishing; 60,000 acres good rough shooting free to guests; sea fishing, bathing; electric light, h. and c. running water; garage.—Particulars PROPRIETOR.

DUBLIN.—SHELBOURNE, The Premier Hotel. Private baths and toilet, h. and c. running water.

MILFORD, CO. DONEGAL.—MILFORD HOTEL. Salmon and Trout Fishing. Shooting. Golf. Garage.

RENVYLE HOUSE HOTEL, Connemara, Co. Galway. The most modern Hotel in Ireland, on a lake amid the Connemara Highlands, by the Atlantic Ocean. Central heating, electric light. Salmon and trout fishing in numerous lakes. 40,000 acres of rough shooting. Sea fishing. Strand bathing. Ponies for children. Most bracing climate.—Apply MANAGEMENT.

CONTINENTAL HOTELS

HAUS ISLA, AROSA.—Modern first-class FAMILY HOTEL in sunny and sheltered position among the pinewoods. Good cooking; fresh eggs, fruit and vegetables. Inclusive terms during summer from Frs.13.50, during winter from Frs.16.50.—M. HAERLIN.

PUPILS AND SCHOOLS

BRANKSOME HILDERS, Haslemere, Surrey. BOYS' PREPARATORY SCHOOL. Health, happiness and efficiency in perfect surroundings.—Prospectus Y.

CHARTERED LAND AGENT AND SURVEYOR, Berkshire, has VACANCY for PUPIL; nine estates and three home farms managed; also extensive general practice; wide and varied experience offered.—Apply Box 3358, FIELD Newspaper, Bream's Buildings, E.C. 4.

HOME TUITION (postal)—Economic scientific Mixed Farming. Pig, Poultry, Fruit. Colonial Farming, Estate Management.—FIELDING, D.S.O., N.D.A., P.A.S.I., Agricultural Correspondence College (Sec. K), Bath.

THE ROYAL AGRICULTURAL COLLEGE, in consequence of considerable extension, has VACANCIES for October, 1939. Courses of instruction are held for future FARMERS and FARM MANAGERS, LAND OWNERS and AGENTS, ADMINISTRATORS and ADVISERS IN AGRICULTURE. There are THREE FARMS and over 3,000 ACRES OF WOODLAND for PRACTICAL INSTRUCTION. Write for Prospectus.—BURSAR, The Royal Agricultural College, Cirencester.

VACANCY FOR FARM PUPIL on large mixed FARM, all crops grown, all descriptions of stock kept, including dairy and pedigree flock Oxford Down sheep; good hunting and shooting.—HUGH STILGOE, Addertbury, Banbury, Oxon.

VACANCY FOR PUPIL.—Thousand-acre mixed FARM; world-renowned pedigree Dairy Shorthorn cattle and Oxford Down sheep; clean milk dairy, good hunting, shooting, fishing.—HOBBS & DAVIS, Kelmscott, Lechlade, Glos.

Prince of Wales Hotel, Harrogate

BRIDGE

INITIAL LEAD OF A TRUMP—I

Indications Necessary

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

IN defence a trump lead is *often* the very best lead that can be made against a game or slam contract. Indeed, it is my favourite lead, and I have proved its efficacy on numerous occasions.

But this does not mean that it always should be made. Like a singleton, it may prove to be either the best or worst lead. Therefore I do not endorse unreservedly the words of an American writer who advises: "If you play Duplicate—lead a trump every time you defend."

Actually that requires considerable qualification. The old Whist rule, "When in doubt lead trumps" does not apply at Contract Bridge. Doubt is not the essential feature. That is to say, you should not necessarily lead trumps just because you are puzzled as to what to open.

The initial trump lead should be made only as part of a carefully considered plan, and it should be embarked upon only under certain conditions when it appears favourable. What are these conditions?

They are revealed generally by the bidding. When Declarer and his partner have bid only one suit, especially when Dummy has given a pre-emptive raise in it, the probability is that ruffing ability has been shown. By leading a trump that ruffing capacity is reduced at the outset, and that may make all the difference. Of course, this is not infallible. Declarer or partner may have a strong, solid side suit, and the lead of the trump may help instead of hinder. But it is a fair assumption that, no second suit having been shown, and a game bid only having been reached, that Z and Y see no slam probabilities and that they are relying for a trick or more on using their trumps separately.

That is point Number One. A second and important indication is when Declarer and partner, after each showing a suit, have arrived finally at a game contract in a third suit. Then you may deduce that neither of the first two suits "fit" and that there is likely to be a cross-ruff.

Third point. When as defender you have a hand which you would have liked to be played in No Trumps you are likely to profit by the trump lead. Let the Declarer do his own work instead of leading a side-suit yourself.

I suggest further that even with an available and apparently harmless opening from an A, K; K, Q, J or Q, J, 10 side suit the trump lead may often prove the best. Many players prefer to have a look round. They open a sure winner, but they fail to realise that this involves frequently a loss in the time factor.

The opener wins, and on the second round a trump is led; but it proves too late. If a trump had been led initially it would have made all the difference.

Here is a typical hand from Duplicate play given in the *Bridge World* of America.

	♠ 10, 9, 6, 2 ♡ A, 7, 6, 5, 2 ◇ Q, 5 ♣ 9, 4	
♠ A, 7, 4 ♡ Q, J, 10, 8 ◇ 6, 2 ♣ Q, J, 10, 5	Y A B Z	♠ 5, 3 ♡ K, 9, 4 ◇ A, J, 10, 4 ♣ 8, 7, 3, 2
	♠ K, Q, J, 8 ♡ 3 ◇ K, 9, 8, 7, 3 ♣ A, K, 6	

Both sides vulnerable. Z the Dealer. The bidding was:

Z	A	Y	B
One Diamond	No bid	One Heart	No bid
One Spade	No bid	Two Spades	No bid
Four Spades	No bid	No bid	No bid

What should A open?

At all tables when he made the normal opening lead of the Queen of Clubs Z made his contract. But if A leads a low trump—mark that he should not lead his Ace—the game may be saved. Z wins the first trick in his own hand with the Knave. His object now is to make his long Diamonds and also get a ruff in Clubs.

The initial lead of a trump may defeat him.

He leads at trick two a small Diamond, and B wins with the Ace over Y's Queen and returns a Spade. A wins and leads a third Spade, reducing Z and Y to one each.

The position then is:

	♠ 10 ♡ A, 7, 6, 5, 2	◇ 5 ♣ 9, 4
♠ None ♡ Q, J, 10, 8 ◇ 6 ♣ Q, J, 10, 5	Y A B Z	♠ None ♡ K, 4 ◇ J, 10, 4 ♣ 8, 7, 3, 2
	♠ J ♡ 3	◇ K, 9, 8, 7 ♣ A, K, 6

It is Z's lead and he plays his Ace and King of Clubs and leads a third and ruffs in Dummy. Then he leads a Diamond from Y. If B is incautious enough to put up an honour, Z can win with the King of Diamonds and force out the remaining honour with the 9. But what if B plays a low Diamond?

Should Z finesse his 7 or try to drop a blank 10 or Knave in A's hand? To finesse would appear to be Double Dummy. Yet if Z puts up the King, B makes altogether three tricks in the suit.

All I can tell you is that at the tables where Z was defeated, A opened with a small trump and A B made either three tricks in Diamonds, and a Spade or two tricks in Diamonds, a Club and a Spade. Work it out as you like, and I think you will find that it is profitable as Z, if trumps are led early, cannot ruff both Clubs and Diamonds.

CHESS

TOURNAMENT IN HOLLAND

A VERY important double-round international tournament is in progress in Holland. For propaganda purposes the play is to be in no fewer than ten different towns.

This tournament is undoubtedly the strongest in the history of the game. The records of the eight players show conclusively that they have the best claims to places in this select tournament. The eight players are: Dr. Alekhine (France), the World's Champion; Dr. Euwe (Holland) and J. R. Capablanca (Cuba), two ex-champions; S. Flohr (Czechoslovakia), the International Chess Federation's nominee for a championship match with Dr. Alekhine; M. M. Botwinnik (Russia); S. Reshevsky (U.S.A.); R. Fine (U.S.A.); and P. Keres (Estonia).

The tournament is being organised and financed by an enterprising Dutch radio-transmitting company, the A.V.R.O., and it will doubtless always be referred to as the "Avro" Tournament.

At the end of the second round's play the scores were as follows: Fine 2, Dr. Euwe 1½, Dr. Alekhine, Capablanca and Keres each 1, Botwinnik, Flohr and Reshevsky each ½.

A good game by Fine.

(French Defence.)

WHITE. Fine.	BLACK. Botwinnik.	WHITE. Fine.	BLACK. Botwinnik.
1. P to K 4	P to K 3	17. Q to K sq	P to Q R 4
2. P to Q 4	P to Q 4	18. Q takes P	B to R 3
3. Kt to Q B 3	B to Kt 5	19. K R to R sq	B to Kt 4
4. P to K 5	P to Q B 4	20. R to Q 4 (*h*)	Q to K 2
5. P takes P (*a*)	Kt to K 2 (*b*)	21. R to Q 6 (*i*)	P to R 5
6. Kt to B 3	Q Kt to B 3	22. Q to K 3	R to R 2
7. B to Q 3	P to Q 5 (*c*)	23. Kt to Q 2	P to R 6
8. P to Q R 3	B to R 4 (*d*)	24. P to Q B 4	B to R 5
9. P to Q Kt 4	Kt tks Kt P(*e*)	25. P takes P	Q takes P
10. P takes Kt	B takes P	26. R takes R P	R to K sq
11. B to Kt 5, ch	Kt to B 3 (*f*)	27. P to R 3 (*j*)	R (R 2) to R sq
12. B tks Kt, ch	P takes B	28. Kt to B 3	Q to Kt 7
13. R to R 4	B tks Kt, ch	29. Kt to K 5	Q to Kt 8, ch
14. B to Q 2	P to B 3 (*g*)	30. K to R 2	Q to B 4
15. Castles	Castles	31. Q to K Kt 3 (*k*)	Resigns (*l*)
16. B takes B	P takes B		

(*a*) An unusual move. Either B to Q 2 or P to Q R 3 is generally played here.

(*b*) If 5. . . . P to Q 5, then 6. P to Q R 3, B to R 4; 7. P to Q Kt 4, P takes Kt; 8. Q to Kt 4.

(*c*) B takes P is, we think, to be preferred.

(*d*) After 8. . . . P takes Kt; 9. P takes B, P takes P; 10. B takes Kt P, Kt takes Kt P; 11. B to K 4 White has the better position.

(*e*) Better than 9. . . . P takes Kt, *e.g.*, 10. P takes B, Q takes P; 11. Castles with a good game for White.

(*f*) Not good for after the exchange that follows the text-move his Queen's Bishop has very little freedom of action. He should, instead, play B to Q 2.

(*g*) Not 14. . . . Q to Q 4 because of 15. B takes B, P takes B; 16. R to Q 4 and wins.

(*h*) A good move and much better than 20. R takes P for after 20. . . . R takes R; 21. Q takes R (or 21. R takes R, Q to Q 8, ch; 22. Kt to K sq, Q to K 7), Q takes Q; 22. R takes Q, R to Q sq Black would have good counter-chances.

(*i*) White now threatens R takes R P.

(*j*) Better than R takes B P.

(*k*) A strong move, threatening R to K B 3 followed by R to B 7 or Q 7.

(*l*) The best move for Black appears to be R to R 2 (not R to K 2 because of R takes B). However, his position then would still be very bad—probably hopeless—and as he had only a few seconds in which to make his next ten moves, Botwinnik decided to resign.

THE MIDDLE GAME

We have received for review a copy of a fourth edition, new and completely revised, of M. Znosko-Borovsky's well-known book, *The Middle Game in Chess*. This book, first published in 1922, was the first to deal at all systematically with the problems of the Middle Game; now, of course, there are several books on that subject.

The revision that M. Znosko-Borovsky has made has resulted in the production of what is virtually a new book. It is divided into two main parts, The Elements, and The Middle Game, and the author deals very instructively and entertainingly with such subjects as The Preliminary and Inner Analysis of a Position, The Construction and Execution of the Plan, Between the Opening and the Middle Game, Between the Middle Game and End Game, and Various Means of Remedying Inferiority in Position.

The book is one that we can heartily recommend. Much benefit should be derived from a study of its contents.

The Middle Game in Chess. By Eugene Znosko-Borovsky. (Published by G. Bell & Sons, Ltd., York House, Portugal Street, London, W.C. 2 price 7/6 net.)

PROBLEM No. 3988

By F. MOOR.*

WHITE (11 pieces): King at Q sq, Queen at K sq, Rook at Q 6, Bishops at Q Kt 3 and K R 4, Knights at Q Kt 5 and Q 8, Pawns at K Kt 2, Q 3, K B 3 and Q 5.

BLACK (11 pieces): King at K 4, Queen at K Kt 3, Bishop at K 5, Knights at K Kt 2 and Q Kt 8, Pawns at Q Kt 2, K B 3, K B 4, Q B 4, K B 5 and K Kt 6.

White to play and mate in two moves.

* Solving Tourney, Zurich, 1934.

SOLUTION OF PROBLEM No. 3987

1. K to R 2 (threatening 2. R to Q sq followed by 3. R to Kt 3, mate). If 1. . . . P to Q 5, then 2. R (Q 2) to B 2, ch, &c. If 1. . . . P to K 4, then 2. Kt takes P, ch, &c. If 1. . . . P to B 3, then 2. R (Kt 2) to B 2, ch, &c. If 1. . . . B to Kt 3, then 2. K to R 3, &c.

SOLUTION OF END-GAME STUDY

1. P to Kt 8—Q, Kt to R 6, ch (or 1. . . . Kt to B 6, ch; 2. K to Kt 4, R to Kt 8, ch; 3. K to R 3, R takes Q, stalemate); 2. K to R 4, Kt to B 7, ch (or 2. . . . Kt to B 5, ch; 3. K to Kt 3, R to Kt 8, ch; 4. K to R 4, R takes Q, stalemate); 3. K to Kt 3, R to Kt 8, ch; 4. K to R 2, R takes Q, stalemate.

CONGRESS AT HASTINGS.—The nineteenth annual Christmas congress of the Hastings and St. Leonards Chess Club will be held in the White Rock Pavilion, Hastings, from December 28th to January 6th. The programme will consist of a Premier Tournament (limited to ten players, by invitation) and Premier Reserves, Major, First, Second and Third Class Tournaments (each in sections of ten players). Full information can be obtained from the Hon. Sec., Mr. A. A. Rider, at the Chess Club, 7, Carlisle Parade, Hastings. The closing date for entries is December 9th.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 491

ACROSS.—1, Christmas fare that blushes 8, "——work when vines are in the flower" (Butler). 9, The ghost of Old Marley, for instance. 12, A poetic evening. 13, The snowman's enemy. 14, The Christmas one, we feel, is the last place to be on December 25th. 16, After dinner the schoolboy does this to his belt. 18, A beastly king when young! 20, This method of cooking leaves a lubricant at the end. 22, Straight and narrow paths to marriage. 24, Balance the cargo with the edge outside. 25, Climb up the leg? 29, Snow, punch, waits and coaches are all essential in what is considered to be this sort of Christmas. 30, Champagne does. 31, A study of hieroglyphics will bring you very close to being the answer.

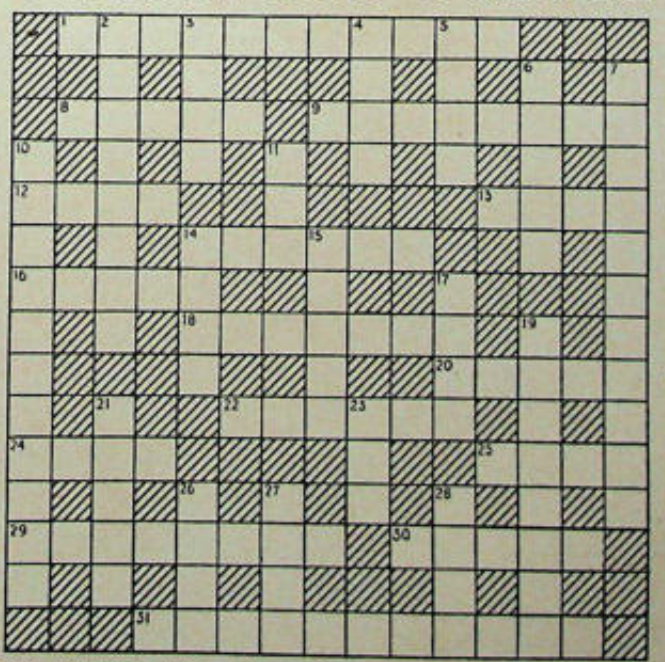
CHRISTMAS CROSSWORD



DOWN.—2, Creation ends in poetry. 3, Have a care when you go down on it, for, when broken, it is sharp. 4, If you muddle the paintings you will soil them. 5, A knot in the wood. 6, "To be wise, and love, exceeds men's ——" (*Troilus and Cressida*). 7, You may be hit on the back of the neck when this is going on. 10, Christmas is a great time for it. 11, The small boy's fate the day after Boxing Day. 14, It's all lies. 15, Valuable members of the family at the festive season. 17, The European huntings recede. 19, The spirit of a Parisian Christmas. 21, Presents difficulties. 23, Poet's field. 26, "Short swallow flights of ——, that dip their wings in tears" (Tennyson). 27, You may wash your hands of this one. 28, An Indian game, but a game Venetian.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Spawn-bound Trout.—Our biologist reports that your trout was in very good condition as regards colour—both internally and externally. Also, that the fish was free from disease. The cause of death appeared to be that it was unable to spawn, probably because there were no proper facilities for a fish to carry out this function. The fish was a female, quite ready for spawning, and the ovaries had grown so much as to interfere with the shape and function of the liver, which apparently had not any longer enough room to function properly.—*P. W., Denbigh.*

Boxing

Middle-Weight.—It is very difficult to state with any certainty the middle-weight champions before 1909 because the championship was so closely bound up with the heavy-weight championship. The first middle-weight champion of England was Richard Humphries in 1786, and we know that Hooper the Tinman was champion in 1790. Then followed Jack Randall in 1817, and after him Harry Harmer, Arthur Matthewson, Pat Halton, John Callaghan, Tass Parker, Nat Langham, Posh Price and Jack Baldock. In the days of the prize ring it was every middle-weight's ambition to become the champion heavy-weight, and Tom Sayers, Joe Goss, and Jem Mace all fought at about the middle-weight limit. Charlie Mitchell, too, was first glove champion in 1882, and then went on to become heavy-weight champion. We give a list of the champions from 1909 to 1921, as you required. 1909, Tom Thomas; 1910, Jim Sullivan; 1912, Jack Harrison; 1914, Pat O'Keefe; 1916, Bandsman Blake; 1918, Pat O'Keefe; 1920, Tom Gummer; 1921, Gus Platts; 1921, Johnny Basham; and 1921, Ted "Kid" Lewis.—*E. F. G., Birmingham.*

Curling

Origin, History and Particulars.—Wherever the game is played it is controlled by the Royal Caledonian Curling Club, which began its career in 1837, and had its first constitution adopted in 1838. It has branches and constituent clubs all over the world. In England and Scotland there are over 500 clubs, and in Canada, New Zealand, Australia, China, United States, Switzerland, Sweden and France there are branches and constituents. Edinburgh, Glasgow, London, Manchester and Perth have ice rinks, which are opened and remain open until April. International matches are played between clubs in England and Scotland in each of these countries alternately. The centenary of the Royal Club was celebrated on July 25th of this year. Should you require particulars further than these, we recommend you to write to the Secretary, A. H. Hamilton, Esq., 22, Duke Street, Edinburgh.—*J. L., Edinburgh.*

Farm

The Piggery Floor.—The question as to the most suitable material for the floor of a piggery has been under examination for some years past at the Midland Agricultural College. The most expensive type—plastic rubber on a concrete base—costs about 22/6 a square yard, and the cheapest, either hollow clay blocks on concrete or 3in. land drain-pipes on concrete, cost 7/- each per square yard. It was discovered that floors beneath which was left an air space dried more quickly. You will find an interesting article on these experiments in *The Journal of the Ministry of Agriculture* for November of this year.—*J. B., Sussex.*

Garden

Pæonia Woodwardii.—This paeony is regarded by the authorities at Kew as identical with *P. Veitchii*. It is obtainable from Mr. Amos Perry, Hardy Plan Farm, Enfield, Middlesex.—*R. E. N., Falmouth.*

Fungi Sent for Identification.—The fungus in the blue box is a species of *Clitocybe*, but impossible to say which, as they arrived very crushed. The fungus in the red box is *Hygrophorus pratensis*. The latter is edible, but not the former.—*H. R., Malvern.*

Kennel

Treatment for Sore Toes.—It would be well to keep the feet clear of mud-balls and matted hair, and to cleanse them each day with warm water and washing soda, and to dip the feet into a hardening solution, such as a teaspoonful of alum dissolved in ½ pint of water, three to four times a week.—*M. E. H. C., Saxmundham.*

Miscellaneous

Quarantine.—Apply for full information to the Secretary, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1.—*L. E. N., Sussex.*

Post-Mortem Examinations

Egg Binding.—Obstruction of the egg-duct by a fully developed egg is usually due to cramp of the egg-duct following the contraction of a chill during the early stages of laying. We found this had caused the death of a budgerigar, a cockatiel and a partridge. The budgerigar had only been in its owner's possession for four days, and for the three days preceding death it sat huddled up on a perch. Its egg-duct had ruptured, so that the cause of the trouble was almost certainly the transport of the bird during the laying process. If aviary birds on the nest are observed to be straining, or to be standing huddled up with a pendulous abdomen or everted vent, they should be held over the mouth of a jug of boiling water. The steam should pass on to the vent-region, care being taken so to hold the bird as to avoid compressing its chest. Usually the application of moist heat to the abdomen for 15 to 20 minutes relieves the cramp and enables the bird to pass the egg. Forcible removal of the egg should not be attempted; the passing of an instrument up the vent is a dangerous procedure. If home treatment with moist heat is not effective it probably means that the egg-duct is badly injured as well as obstructed, and such cases require surgical treatment under anæsthesia by an expert. Egg-binding is a common sequel to allowing young hens to breed too early or too late in the season. Partridges are the most susceptible of our game birds to this fatality.—*W. E. C. B., Brecon; J., Berks; M. G. C., Perthshire.*

Skin Irritation.—This reads like an irritation of the trophic nerves of the skin, and at her age it is doubtful if it is preventable, but it would be worth while trying the effect of five drops of halibut oil with the food every day, together with an alterative powder such as milk of sulphur 5 grains, cream of tartar 5 grains, sulphate of magnesium 10 grains.—*S. W. B.-S., Pembrokeshire.*

Shooting

Snaring Rabbits.—Under the Ground Game Acts the occupier and one other person authorised by him (who is a member of his household or in his service) may kill ground game with firearms. Any number of persons (being members of his household) can kill ground game otherwise than with firearms. Perhaps you have that distinction in mind. When a lessee of shooting rights takes a lease of such rights for an owner, and there are farmers who are lessees of the land and have no sporting rights other than the inalienable rights regarding ground game (*supra*), the lessee of the shooting rights has whatever rights his lease gives him. Usually, in the absence of restrictions in the lease, he can snare rabbits freely. (The farmer under the Ground Game Acts must not set spring traps except in rabbit holes.) The lessee of shooting rights usually agrees to "keep down" rabbits, and that clause in the agreement does not provide that he shall shoot them.—*E. B., Woldingham.*

"Cast Off."—The term "cast off" is used when a gun is being fitted, and arises when your left eye is master. If when looking along the top of the gun, the right side of the right barrel is making an obtuse angle with the right side of the stock, then the stock is "cast off." If the same thing happens on the left side, then the stock is "cast on." The object in both cases is to bring the barrels into line with both eyes when you are in a natural shooting position. It is always worth while having this done by a really good gunmaker, as it is a matter of extreme importance.—*A. W. B. L., Norwich.*

Partridges.—French partridges are an entirely different bird from the grey English partridges. They are much brighter in colour and have brilliant red legs. They were introduced into England about 250 years ago and were at first unpopular, as it was thought that they drove away the English partridges. This view has, however, since been abandoned. As to Hungarian partridges, some years ago the *Field* conducted an inquiry as to their use, and the results were published in the book called *Partridges Yesterday and To-day*, price 3/9 post free, obtainable from Field Press, Ltd. I do not know of any book devoted exclusively to these subjects, but you will find a good deal of information about them in *The Elements of Shooting*, by Eric Parker, also published by Field Press, Ltd., price 15/6 post free, and the book on shooting in the Lonsdale Library, published by Seeley Service, Ltd.—*L. J., South Croydon.*

Travel

In Sussex and the Cotswolds.—You would like the Tudor Close Hotel at Rottingdean. This is an old-world hotel constructed from original Tudor buildings, and shows what can be done with period architecture whilst keeping well in mind modern requirements. The management has wisely seen to it that the decorations and furnishings of the hotel harmonise with its exterior, without omitting any modern comforts. The sheltered position and the rich soil keep the flowers blooming in the gardens of the hotel until Christmas. If you do not mind being a little farther inland, you might like the Star at Alfriston. In the Cotswolds we would recommend the Old Swan at Minster Lovell. The 20th-century comfort of the Swan has behind it 500 years of tradition. Logs flame on the fires, old oak gleams brown and iron-hard, and you breathe the atmosphere of centuries of quiet ease and well-being. Oak, elm, chestnut and careful stonework, at one time covered by paint, paper and plaster, so that the very heart of the Old Swan was hidden, now appear as their craftsmen saw them. The old house, with its neat arrangements and conveniences, seems to link up the ages of English history and relate us to forbears who loved a day in the English countryside and the hospitality of an inn to return to at eventide. In Burford—a charming Cotswold town—there are three very nice inns. These are the Cotswold Gateway, the Bull and the Bay Tree. Some other hotels which we are sure you would like to visit when you are in the Cotswolds, are: The Bull at Fairford, the Swan at Bibury, the Shaven Crown at Shipton-under-Wychwood, and the White Hart at Chipping Norton.—*E. A. P. T., Liverpool.*

HORSE SALES OF THE WEEK

Tattersall's

LIGHT HORSES

LAST Monday's catalogue at Knightsbridge included the entire stud of hunters of the Holyport branch of Messrs. W. J. Smith, Ltd. The following were the principal lots that changed hands. Property of Messrs. W. J. Smith, Ltd.: Moorhen, b m, by Wingman, 200gs.; Medway, br g, by Bayardop, 120gs.; Marcus, b g, by Greystone Manor, 200gs.; Magnet, b g, by Wilson, 200gs.; Magnum, b g, by Philammon, 170gs.; Majestic, ch g, by Rose Wreath, 300gs.; Mountain Lad, gr g, by Flying Hackle, 150gs.; Merlin, br g, by Chevalier, 135gs.; Maureen, b m, by Kwang Su, 150gs.; Mendip, ch g, by Austin Friars, 100gs.; Holyport Idol, ch g, by Birch Broom, 280gs.; Holyport Lad, b g, by Chevalier, 300gs.; Moonlighter, ch g, by King O'Malley, 260gs.; Miller, ch g, 96gs.; Mudros, br g, by Dunholm, 145gs.; Malacca, br g, by Ballina, 130gs.; Mayfly, bk m, by Protocol, 110gs.; Manna, br g, by Brighter London, 135gs.; Liberator, b g, 65gs.; Marquis, b g, by Romus, 50gs.; Sailor, b g, 55gs.; Rocket, br g, by Mankato, 110gs.; Betty, b m, 135gs.; Maze, ch g, 100gs.; Judy, b m, 66gs.; Monty, br g, 120gs.; Cherry Brandy, 70gs.; Mitre, ch g, 52gs. Property of the Earl of Macduff: Ever Ready, b g, 68gs. Property of Mr. F. E. Mars: King o' Hearts, br g, by King O'Malley, 80gs. Property of Captain D. W. G. Ray: The Roamer, b g, by Perfectus, 100gs.

Leicester

A LARGE number of horses catalogued for Messrs. Warner, Sheppard & Wade's sale on Saturday last changed hands. The top figure, 250gs., was given for Mr. R. Midwood's chestnut gelding Red Rufus, whilst Mr. W. H. Midwood's chestnut gelding Wirrall went for 240gs. Mr. T. L. Parke got 160gs. for his bay gelding Adam. Mrs. Philip Fleming sold her bay gelding Hiawatha for 150gs., and 130gs. were paid for Mr. B. A. Selby's brown gelding Mark Royal. The prices realised of 30gs. and over were as follows: Property of Mr. K. J. Beeston: Ch m, 30gs. Property of Captain J. R. Macardle: Gipsy, b g, 130gs. Property of Mr. B. A. Selby: Mark Royal, br g, 130gs. Property of Mrs. Philip Fleming: Hiawatha, ch g, 150gs.; Red Deer, b g, 50gs.; Bonzo, ch m, 40gs. Property of Mr. W. Lancaster: Here Goes, b m, 90gs. Red Fox, ch g, 58gs.; Winnie, br m, 31gs. Property of Major General John Vaughan: Sycamore Lad, br g, 90gs.; Spearpoint, b m, 30gs. Property of Miss Ena Adams: Fisherman, ch g, 50gs. Property of Mr. N. Adams: Toby, b g, 40gs. Property of Colonel Sir G. S. Church: Forrard, br g, 62gs.; Floodlight, br g, 41gs. Property of Captain J. N. Bailey: Far Isle, b m, 35gs.; Ch m, four years, 37gs.; Skyola, ch polo p 38gs. Property of Mrs. M. Burne: Sandy, ch g, 72gs.; Diana, b m, 50gs. Property of Mr. M. F. Higgins, M.F.H.: Jackdaw Junior, br g, 65gs. Property of Mr. R. Midwood: Red Rufus, ch g, 250gs.; Fox Catcher, b g, 35gs. Property of Mr. W. H. Midwood: Midas, b g, 55gs.; Wirral, b g, 240gs.; Castletown, b g, 100gs.; Trumpeter, ch g, 50gs. Property of Mrs. Campbell: Ned, b g, 64gs.; Property of Mr. E. E. Marsh: Goldseeker, ch g, 40gs.; Mekah Star, b m, 35gs. Property of Mr. T. L. Parke: Adam, b g, 165gs.; Friendship, b m, 50gs. Property of Major J. C. Dugdale: Harpenden, b g, 75gs.; Br g, 35gs

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

COUNTRY BILLETING

IF the arrangement for billeting children and adults in the country under a national emergency scheme is to work smoothly, it would appear that there will have to be considerable revision of the system as it exists at present; a number of statements have been made drawing attention to its inadequacies. We know that any measures taken will have to be of an arbitrary nature, for when it comes to allocating responsibilities no loopholes must be left for shirkers. Nevertheless circumspection in billeting is necessary. It is far from sufficient to launch population from the towns into mansion and cottage and consider the matter settled; to leave both sides to make the best of the bargain and any rearrangement to be dictated by circumstances.

Recent experiences, we are told, have revealed weaknesses in our defence system which will have to be repaired. Now, then, is the time to see that any flaws which exist in plans made for the sudden exodus of millions from urban to rural districts are remedied, and to prevent unnecessary hardship occurring through lack of foresight. There are many factors involved in emigration of this kind; among them may be specified provision for proper sanitation, for food and water supply, and the enlisting of people competent to deal with an influx of individuals who, accustomed to the amenities of a town life, are not the best qualified to shift for themselves. There will be a good deal of smoothing-out work to be done.

If some of the examples of billeting procedure which are now being related are any criterion of the whole, then, while it is unfair to criticise harshly arrangements which were hurriedly put into force, it must be realised that the system calls for more care in its execution. Cases of billeting which we are assured can be vouched for border on the fantastic. For the working of any system affecting the evacuation of civilians in wartime, it is certain that in the main the work will fall upon elderly people, as the active and physically fit will be required elsewhere. Even so, there must be a limit to what those who are advancing in years can be asked to do, and one cannot very well imagine octogenarians being considered capable of administering to the wants of young children, probably turbulent children at that, or bachelors being saddled with a similar responsibility! Many incidents of incompetent billeting which are cited certainly come within the category of the Might Have Been, yet are no uncertain index of what Would Be in time of trouble should the organisation not be placed on a sound footing.

The time is now ripe for anyone who can point to instances of incompetence in his or her district insisting upon the thorough investigation of each case in order to discover who is directly responsible, and so track down any weakness in the organisation. This is a duty which devolves upon the individual in any national defence scheme. It should not be a matter of difficulty in any country town or village where billeting is contemplated for responsible inhabitants to find out exactly what drafting is proposed and how it is to be operated; to discover whether those who are scheduled to take in adults or children are capable of doing so, or whether, in national emergency, the scheme would be negatived by the services of these people being required in other spheres of activity. Would it not be possible for a country district to be so subdivided that those in each section definitely know not only what is expected of them but also the practical issues involved? Would it not also be possible for people who are called upon for billeting to have some idea of where their charges are likely to come from and have some idea of their status?

Capable people who know the limitations of their neighbourhood should be in charge of country billeting.

GREAT SPORTSMEN

ONE by one the sportsmen of the Golden Age are leaving us, and the last weeks of November have taken toll of three of them. They were great men who enjoyed to the full a vigorous open-air life, leaving memories of their prowess behind them and dying at a ripe age. The Mackintosh of Mackintosh, chief of the Clan Chattan, was 87 and was included among the finest shots of his day. It is said that he was reticent regarding the bags made at Moy Hall, but Mr. Hugh Gladstone has a note in *Record Bags* of 1,368 grouse having been killed there on August 23rd, 1910, when Count Clary killed 107 in one drive. He refers to a statement in which The Mackintosh was credited with a bag of some 900 brace, "curtailed by three drives unaccomplished and a resulting shortage of 300 brace owing to dilatory tactics during the pick-up by some of the guests." Not only was he renowned in his own country but also in Wales, where as M.F.H. he had the Glamorgan Hounds from 1897 to 1900.

The Coaching Club has lost its President, Sir Leonard Powell, at the age of 85, and so a famous whip will be absent from the front rank of the gathering at the Magazine, Hyde Park. In his youth Sir Leonard was a keen oarsman, and he had shared the Mastership of the Tedworth with Major Henry Connop. His services as a judge of horses will be missed, and it is typical of his enthusiasm that his death was due to the effort he made to attend the opening meet of the former pack.

Major Algernon Burnaby, associated with the Mastership of the Quorn from 1919 to 1932, was 70 when he died last week. His name, as already recounted, will always be linked up with the story of the Midnight Steeplechase at Melton Mowbray in 1890 which, over fences outlined by oil lamps, he won when Count Zborowski fell at the last of them. He is not, however, the last survivor of this race as has been stated. And so the great figures of sport pass on leaving their spirit behind in an age which cannot reproduce the atmosphere which surrounded them in their hey-day.

THE LIGHT-WEIGHT CHAMPIONSHIP

The news that Dave Crowley has been matched to defend the light-weight championship of Great Britain against Roy Boon, and that the match has received the approval of the Board of Control, has caused much heart-burning in various quarters. Crowley has recently been well beaten by McGrory in a match at a little over the light-weight limit, and the supporters of Danahar, who is certainly no worse than Boon, as well as the supporters of one or two other men in addition to McGrory, are not feeling too well pleased. The point, however, is not whether Boon is the best man to challenge, or not. The point is that Crowley, as champion, must defend his title, and if he is to remain in idleness while a long series of eliminating bouts are completed he stands but little chance of doing so. The eliminating system has been proved farcical in its tediousness, and if Crowley desires to defend his title against Boon he has every right to do so.

SELBORNE'S BY-PASS

Mrs. Bibby, the present owner of Gilbert White's old home, "The Wakes," and her son, Major Bibby, who owns the adjoining land, have covenanted with the National Trust not to erect any buildings on their land other than two cottages for estate purposes. And every lover of Selborne, and every naturalist, and every lover of rural England, will rejoice. For the effect of this covenant is that no longer will it be possible for the supporters of the by-pass, which would of necessity pass through the land so covenanted, to urge that it would safeguard the amenities and prevent any encroachment by building. A by-pass is not necessary so far as traffic is concerned, even though the volume of traffic has increased of recent years. And it is to be hoped that through the generous action of Mrs. and Major Bibby we have heard the last of a proposal that was yet another example of the modern confusion between vandalism and progress.

WORK ON THE TROUT STREAM

November's work on the streams should include planting for shelter where it is necessary. There are many streams where shelter from the prevailing wind would make fishing much more enjoyable for the angler and probably go a long way towards improving hatches of fly. High winds across a stream in June must carry a lot of spinners to places from which neither they or their progeny ever return. But it is important that new plantations should be set well back from the river. It may be that nowadays anglers cast further than they used to do, but it is extraordinary how many plantations seem to have been made just too near for a fly to be dropped under the opposite bank without danger to it in the back cast. The full width of the stream and something more should always be allowed.

WAYFARERS

When long the swallows have left our eaves,
When November is sad for her falling leaves,
When shadows come early on meadow and mead,
Over my garden God's travellers speed.

Full and fed from the new-ploughed lands
Gulls going West to the Solway sands,
Cleaving the dusk with a steady flight,
Steering a course by the sun's last light.

Wedges of grey geese, straight of neck,
Clanging their faith on their lakeland trek;
And, tossed on the tide that the night-wind brings
Dark rooks homing on weary wings.

And, fairest of all that eye can see,
Breasting the sky-waves royally,
The great wild swans on their pinions proud,
Their white plumes pale on a rose-red cloud.

WILL H. OGILVIE.

A COUNTRYMAN'S JOURNAL

ACCORDING to Mr. Rex Wailes, in a paper he read at the Institution of Civil Engineers last October, 23 tide mills may still be deciphered in the torn and disfigured manuscript of English rural industries. Of these, ten are still worked by the tide, and the one that I know is at Beaulieu, in the New Forest. It occupies nearly the whole of one side of the bridge across the Beaulieu river, which separates the village from the mournful relics of the Cistercian abbey upon which our bluff King Hal, in spite of the obsequious attitude of the last abbot, vented a particular spite. The parent tree was hacked down, but its two acorns, that had become full-grown oaks before the crash of their sire, they by some freak of time and forgetfulness of progress survive—the tithe barn of Great Coxwell, near Faringdon, and the tide mill of the pretty woodland village. What is still more extraordinary, they both carry out their proper functions, and what indeed I found the hardest of all to believe, the tide mill still grinds corn that is locally grown and locally consumed. As such, it is indeed an unregarded jewel of what is left of England's rifled treasure. Wordsworth's heart leaped up when he saw the rainbow: mine leaped when the miller set his great wheel going under the floor for my especial benefit. The spray dashing past my face as I looked through the trap-door, the boiling of the whitened waters, the hiss and roar of the great wheel, 12ft. 4in. in diameter and 4ft. 6in. wide, mounted with its 24 buckets on its wooden shaft of an 18-inch diameter, this was more to me than many rainbows. The only machinery—and this drives a sack hoist and two further pairs of stones over and above the two pairs mounted on a hurst on the ground floor that are driven by the wheel—is an electric motor of 8 h.p.

Part of the mill is built out on piles into the river and is weatherboarded, while the rest of the building is a warm red brick roofed with lozenge-shaped and rounded tiles, which I believe are called fish-tiles. All the interior is of wood—ladders, bins for the meal, floor-boarding, square pillars, beams, narrow passages, fittings, shaft rising to the first floor and all. So ramshackle is the arrangement of the props and supports that it is a wonder why the whole edifice does not tumble about the miller's ears like a pack of cards. The point is that it has stood in this very way for something like six centuries, and that gives the explorer into its dusky depths a more penetrating notion of how the old builders could build, more than does a Gothic church or even a cathedral. The pulse and swing of the great wheel sets the whole building in an ague, but it will still be standing when all the flimsy excrescences of development between Beaulieu and Poole have fallen down. I thought I should never see sacks of barley meal in a mill nor smell that peculiar musty-dusty fragrance of flour again. But the old mill still lives and I had heard the throb of its heart.

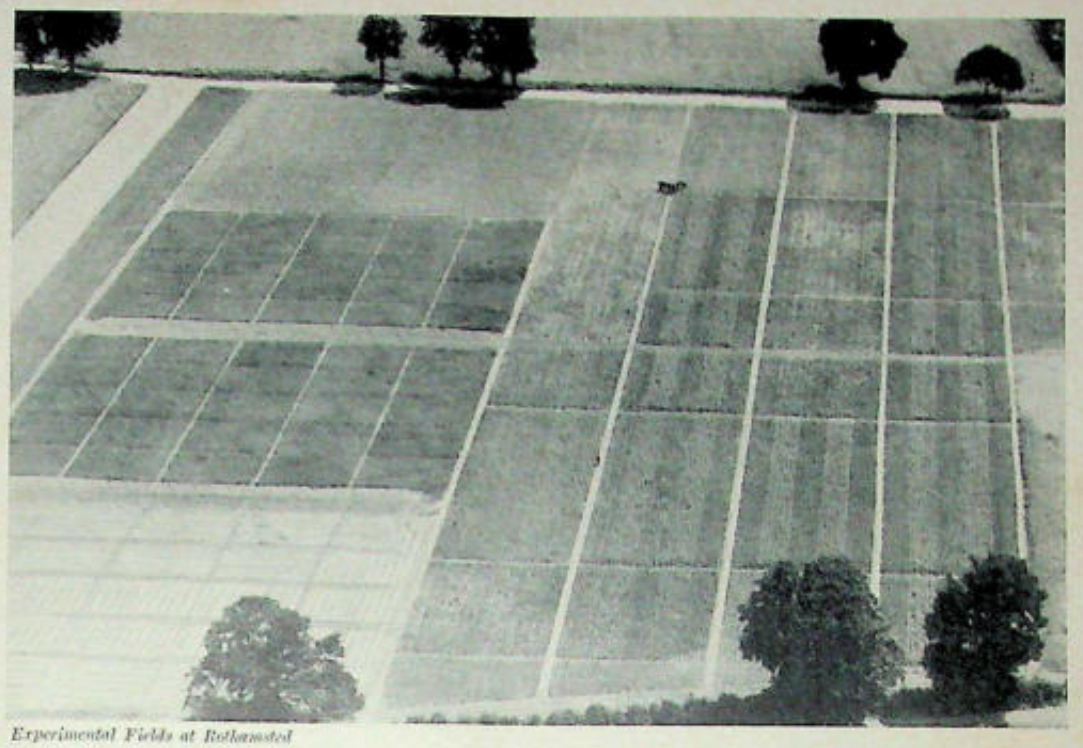
As I left, a queer kind of a carter in an even queerer cart—such a cart as Mr. Hennell of "Change on the Farm," would have delighted to draw—drove up for his sack of meal. I am not sure that this was not the best sight of all. If a lorry had appeared and carried off some sacks to London, the incongruity of it would have destroyed half my pleasure. But Beaulieu Tide Mill is a true local institution, though, of course, the miller cannot live by flour alone. He has to supplement what he makes by his mill, and this he does in proper country fashion by his wooding. He makes garden and sheep hurdles, gateposts (a few even of oak), besoms and the like, buying his raw material from the underwoods of Redlynch and elsewhere not too far from home. I could walk out from the smell of flour into the smell of wood next door, past the low roofs, toy gables and poking dormers, realising as I did so something of the marvel of this survival when the weight of the whole world is against it. The disheartening fact about the rural crafts and industries is that they vanish in spite of their natural soundness, serviceableness and durability. Both for use and for beauty there has never been a flaw to find in them. Among all the wreckage, the Beaulieu Tide Mill stands out like a lighthouse.

H. J. MASSINGHAM.

WITHOUT COMMENT

From instructions on riding:

"Very little effort is needed on the part of the rider to break from the trot to a canter. Spurring or hitting the horse is wrong and unnecessary. The correct method is as follows: (*a*) Sit well down into the saddle and remain so throughout the canter. (*b*) Slightly and evenly increase the pressure on the reins. (*c*) 'Squeeze' your horse, with your legs, behind the girths (the pressure from both legs must be an even one). All the above movements must take place simultaneously. As soon as the horse starts cantering, the pressure from the legs must be released, although the slightly increased pressure on the reins is maintained for the purpose of control."



Experimental Fields at Rothamsted

AGRICULTURAL RESEARCH

The Farmer's Point of View

THE approaching centenary of the Rothamsted Experimental Station, at Harpenden, in Hertfordshire, provokes a general inquiry into the purposes and achievements of institutions of a similar nature. The station at Rothamsted is the oldest centre of agricultural research in the world, and one of its earliest discoveries was that of the artificial fertiliser—a discovery which did much to revolutionise certain aspects of farming as well as to found a most prosperous and useful industry.

Since that time, and largely because of that attitude, the scientific approach to agriculture has gained in strength. Among the most recent problems which have engaged the attention of scientists is the effort to prevent late blight in potatoes, and thereby to save potato farmers from a very considerable loss. Experiments which may later lead to the prevention of foot and mouth disease have received a fresh impetus from the knowledge that an animal which has been infected is, on that account, more likely to be immune in the future. Nor has the engineering side of farming been neglected. There are now nearly 50,000 tractors in use throughout the country, and efforts are being made to teach their users not only to drive them but also to understand their mechanism sufficiently to be able to repair them, and thereby to save what is otherwise a very considerable repair bill. The question of land fertility has received Government assistance, and it is refreshing to observe that the cause of this assistance is the realisation of the fact that one of the most important purposes of English agriculture to-day is to render the English nation, so far as is possible, self-supporting in food supplies. The whole question of soils and their correct and suitable fertilisation is being examined from this point of view. But modern conditions have also created their own problems. The rotation of crops, which has been accepted for centuries, has, it is pointed out, been wholly upset by the fact that conditions have driven farmers to grow only those crops which suit their own land. This has resulted in an increase of pests and created a new and urgent problem with which agricultural scientists have to deal.

It cannot be sufficiently emphasised that every scientific experiment carried out in an experimental station should have only one object in view—to benefit the farmer. It is satisfactory to note that this is the object for which the stations throughout the country work. If the farmers benefit from this research it follows that their labourers will reap the benefit and that ultimately the nation as a whole will have cause for gratitude. The scientists who quietly pursue their inquiries are too apt to be regarded simply as abstruse research workers, whereas they are really most valuable contributors to the national welfare. Especially is this so at the present time, when every effort to increase home production must be made. We can no longer, in view of the international situation, be content to rely on an assured influx of imports: and it is to the agricultural scientists that we must look for assistance. Every discovery which they make is an added bulwark to the national defence.

It seems a pity, therefore, that the average farmer in England is not more conversant with the work of these experimental stations. It is perfectly true, as Sir John Russell recently pointed out, that many farmers in Australia, and even in foreign lands, are more familiar with English research than are our native farmers. No doubt this is partly due to the fact that our stations send out some of their most brilliant scientists to serve in the Empire, but I incline to the view that an insufficient effort is made to acquaint English farmers with the results of experiments. It cannot be denied that many hundreds of farmers make an annual pilgrimage to these places of research and that they lose no time in putting what they learn into practice. This is an argument for increasing scientific research, but it is equally a reason why definite steps should be taken to make the results of experiments more generally known. It has at last been realised that tractor drivers should also be engineers, and to this end official demonstrations and lectures are being given. It is not easy to imagine the whole benefit which must result from this plan, and it is equally difficult to see why the same effort should not be made to spread the results of agricultural research. Farmers who live a remote life are among those who would benefit most, and yet they are also those who are least likely to participate in this valuable knowledge. Some effort should certainly be made to impart this information to every English farmer.

Yet it must always be remembered that a certain measure of agricultural prosperity is necessary before farmers can reap the full benefit of agricultural research. I believe that the present uncertainty in the farming world is the chief reason why more advantage is not taken of the accumulation of knowledge which is gradually growing. No one can blame a farmer for carrying on in the same way, when he is not assured that the money which he must spend on the adoption of new methods will be repaid to him by their adoption. It is one thing to present a farmer with the scientifically proved fact that a tractor will increase the daily acreage which he can plough; but it is quite a different thing to convince him that his outlay of capital in purchasing the tractor will justify itself. It is no use explaining to a farmer how a certain method of fertilisation will increase his production if he cannot be persuaded that it would be to his advantage to produce a larger output.

Agricultural research can be justified only if it produces a better condition among farmers, and it can do so only if farmers can afford to take advantage of its discoveries. It would perhaps be possible to make Government grants to this end, but this course would not justify itself in the long run. What is needed is an agricultural policy which would restore farming confidence to such an extent that farmers would be eager to learn of any method that would increase their output, make their financial returns more certain and justify a capital expenditure. So long as farmers do not know which branch of agriculture is next to be the subject of Government attention, so long will agricultural research tend to be a valuable but largely untapped source of extremely important knowledge.

CREAGHT.

A. Klopfenstein, Adelboden

THE SKI-COMPLEX

The Psychological Background of a Social Comedy

LEAVES fall in England. Snow falls in the Alps. The sun retires to above the snow-line, and minds go wool-gathering in its wake. In another month the vanguard of a legion in search of their errant fancies will be invading alpine Europe, and winter sports will begin again.

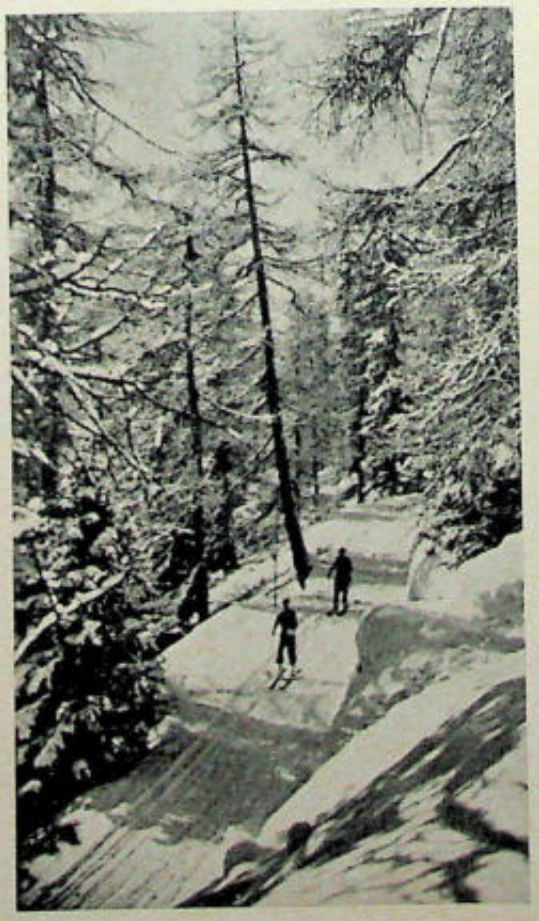
The sequence—this change in our weather, this yearning after sunshine and snow, and this fulfilment—is now almost as well established as the succession of the seasons themselves. Winter holidays, now largely implying ski-ing, are so fashionable as to be taken for granted, so much looked forward to that their newness, their peculiarity is forgotten. However, they are still, in an Anglo-Saxon sense, a phenomenon. We have been given a new set of toys to play with, and the novelty of them has not quite worn off.

The physical background to ski-ing is familiar enough; the winter landscapes that magazines must conjure up, the hotels, the crowded slopes, the funiculars, the little groups of learners. All these fragments blend into a picture now almost as conventionalised as a hunting print. But the psychological background to this performance is lesser known. The social comedy, in which we all delightfully take part, has been unconscious.

Fundamentally, of course, ski-ing is simply another means of having a good time; but it also stands for the studious rationalisation that men must inflict upon the simplest things they do. There are few spectacles more droll than our insistence upon justifying happiness and good times. We cannot say of an activity, "This is fun. . . . I like it." We must explain its deeper significance, solemnly and dully.

Thus a sport cannot be lightly dismissed as something you do for the fun of the thing. Its protagonists must describe it as a spiritual "builder-upper." It must be moralised over, and organised. It must develop its particular pomposities and prejudices, the rules and hocus-pocus that inhibit and formalise it. It must take itself seriously. And when a new sport appears it must run this civilising gamut in order to win its way to popularity despite its friends.

Ski-ing is in the midst of this. Like riding or walking or cycling it was and is essentially a practical means of locomotion; and the pleasure it gives is a personal, non-competitive pleasure. When discovered by those to whom it was a novelty, it became a sport. As riding developed style and manners in the show ring, walking its hazards and ritual on a mountain side, and cycling its abnormalities in the six-day-race arena, so ski-ing was developed in the Alps. Its homespun humanity was seemingly sophisticated away, and its technique was advanced and refined to a point that it almost lost its original identity. Moreover, so far as we are concerned, two added factors had influence. It became anglicized, and it felt the qualms of mountain sickness.



SKIERS COMING DOWN A PATH THROUGH THE WOODS AT ST. MORITZ

Anglification meant that ski-ing became a class sport, because it was expensive and surrounded by parliamentary procedure and witty debate. Moreover, because the mad English suddenly got rather good at it, other nationalities were piqued to emulate them, and a sport that had come to rank with 'untin' and shootin' was taken up by quite ordinary foreigners in Europe. In fact it became professionalised, with the officially representative amateurs highly subsidised.

The mountain sickness that assailed it came with altitude. As ski-ing gained height it suffered from Alpinism, the spleen that had Ruskin tilting at the climbers and had the climbers everlastingly divided among themselves over niceties of Alpine dogma. There is a heady quality to mountains, and people who have anything to do with them in their spare time seem to get a little unbalanced.

The cumulative effect of all this upon ski-ing—this elevation to the plane of sport, this nationalisation and specialisation—was unfortunate. Otherwise normal, happy people would be rude to each other over technicalities. First purists held to the Scandinavian style, or what they thought it was. Soon they were developing passionate opinions over jumping, over stem turns as compared to telemarks, and over downhill racing as opposed to cross-country or landlauf ski-ing. The same preoccupied comedy has been played out in every established sport in terms of boxed foxes, sitting birds, steel shafts and iron *pictons*.

But at last ski-ing is growing up. Its natural goodness, its innate sense of happiness and well-being, is reasserting itself. Thanks to the pioneers, it has become popularised—vulgarised, some would call it—and commercialised. Thousands try it for the first time each season and return to try it again. Hotels reopen and special railways are built for skiers. The sport has caught on, and those who are caught do not give a tinker's curse about technicalities so long as they are taught how

to ski quickly. They are doing it just because they find they like it.

Which brings us to the common denominator—Fun. Ski-ing has so many sides that people can find fun in it in many ways; and this season a new spirit enters into it. There is less high-pressure competition, a subtle maturing of view-point, a willingness to ski and let ski. But let us examine skiers as a species and see how they variously interpret their denominator.

As leaves fall at home and snow falls abroad, the ski-minded yearn for several distinct kinds of happiness. One who longs after one type is apt to sneer at one who longs for another, but they each have their points.

First, with curiosity taking the place of yearning, come the rabbits, the learners who get swayed by travel propaganda and who join organised parties. They probably have never seen snow in any quantity before, perhaps never crossed the Channel before; and they are excited and overwhelmed by spectacular scenery, queer foreigners, un-English customs and by a hilariously ridiculous sport that can send them topsy-turvy without their getting hurt. Everything they do is to them new and different. They shamble happily about on the skis they hire from their hotels, the rental of which may be included in their tour, and they laugh uproariously at one another. Because they have not had time to develop any ski conceits, no one minds them, although people having such an obviously good time, indoors as well as out, are to be regarded somewhat askance.

But there are learners and learners, and a good percentage take their ski-ing seriously enough. They want to get somewhere, without falling. They go to ski-classes and work at simple movements as a skater will conscientiously work at his test or school figures. They, if the object is to get the most ultimate pleasure out of the business, are the wisest. They know the misery of a hundred minor defeats and the elation of a thousand minor victories. Each tumble, each bungling of a turn under the eye of a teacher, is sorrow and humiliation; each successful turn, each gain in strength and confidence and skill is ecstasy beyond measure. Can you remember what it was to hit your first drive off the tee? Or to get the feel and control of a fast service at tennis for the first time? Ski-ing has all those physical thrills for the learners, and thousands who are fearful duds at everything else at last come upon something they can do well. It is a restoring experience, and they thrive under it.

Next come the brash graduates, learners in their second or third season, who ski well enough to clatter down the beaten runs about their favourite resorts, reducing the time they take and the number of falls they make. They are much abused, but they are having fun in their own peculiar way, and it must not be begrudged them. It is the "lift" known to the motor-racing driver or a motor cyclist; the sense of speed, of control, of steeling one's nerves and muscles, of rushing, hurtling, crashing and smashing through space. Back and back they go up the funiculars to hurl themselves once more down the beaten slopes. They have the gusto and courage of youngsterhood, and some of them eventually make superb downhill racers.

C. Brandt, Arosa

SKIERS AT AROSA

". . . the sense of speed, of control, of steeling one's nerves and muscles, of rushing, hurtling, crashing and smashing through space"

C. Brandt, Arosa

SETTING OUT FOR THE DAY

Parties of skiers making for the slopes, with the sleighs which have conveyed them from their hotels in the background

Then come the tourers, the foot-loose, skiers who like to wander about on minor expeditions. They like to ski in small parties with box lunches neatly prepared by their hotels, to see new country, new scenery, to picnic and rough it in ways not overwhelming to an urbanite. They are usually the more experienced, the more leisurely minded. They know the mountains, or they want to know them. Their skis are no longer an end in themselves, but a means towards an end.

In a class by themselves are the ski-mountaineers They make ascents in winter. They run the greatest risks, of slipping into eternity or of being buried by an avalanche. They are usually the oldest hands at the game, and the canniest. They are on more than pleasant nodding terms with mountains. They know snow in all its vagaries, the way a pilot knows the currents and winds and tides as marked on the surface of the water. In the eyes of their fellow men they are a little mad.

And so each of these several types yearns after his ski-ing as autumn turns to winter, and each yearns in his especial way. They share images of trains and funiculars and ski-equipment; the smell of ski-wax floods in from some odd corner of the brain; sunshine makes each picture sharp and clear, with just enough memories of blizzards and foehn to put them into relief. The heart beats faster as the mind is possessed with this magic, and in imagination one performs prodigies of speed and daring. Of course, each skier thinks humanly as well as romantically, and there is plenty of ambition, conceit and jealousy blended into his emotion. But, on the whole, anticipation is healthy and happy. The sense of prospective escape, from oneself, from the future, is complete.

Yes, something rather pleasant happens to the mind as snow falls in the Alps.

BRIAN MEREDITH.

BEST DAYS WITH HOUNDS

Belvoir Have Two Splendid Leicestershire Days

THE dog hounds were eclipsed by their sisters last week, although it was not their fault that the fog curtailed their activities before one o'clock on Tuesday from Hough. As it was, they soon ran out of sight, and it was too risky to continue. Next day, the bitches came to Buckminster on a mild dull morning which had the smell of a hunting day in it, though visibility was none too good. All the home coverts were investigated without result, and nearly two hours had gone beyond recall before Coston was approached; this splendid little place on the brink of the Cottesmore boundary is always a widow's cruse of foxes in spite of the fact that it gets constant visits from both sides of the border. After terrific tow-rowing within, a holloa came from the most desired direction, but, unfortunately, some over-excited infantry turned the fox back and the whole process had to be repeated.

Next time there was no doubt about it, and as one watched the pack streaming over the grass and across the brook, one could settle down to ride with a clear conscience. In three minutes we were returning our neighbours' recent call, and, as it turned out were to spend the rest of the hunting day as guests of the Cottesmore, jumping in and out of the dividing road, then over a bottom as best one might — we came on a glorious series of good grass fields and cock fences, jumpable anywhere. The music ahead filled the still air, as hounds sped on: short of the Wymondham road, a slight check was complicated by the arrival of a bridleless horse which threatened to gallop through the middle of the pack. However, disaster averted, George cast forward, and in spite of considerable vehicular congestion the bitches picked up the line again and hunted quite beautifully past Edmonthorpe, to the confusion of those who had decided on Woodwell Head as the goal!

Every yard was worked out, yet they kept relentlessly on, quite fast enough for enjoyment to be combined with observation, yet not too speedy for those with young, old or supposedly unfit horses. Ultimately arriving at a kale field, this good hunt appeared to be over and the Master was on the point of withdrawal when news came that a couple of hounds were still speaking in a corner. That it was not idle gossip was proved within a few minutes; away again, with the loud pedal on the music, as hounds crossed a railway and pointed to Ashwell Spinney; they then veered left and worked up to their gallant though well-deserved fox to kill him below Market Overton. The sequel to this capital performance lasting two hours was that second horses were found nearer 4 p.m. than 3 p.m., and it was just as well that Sproxton Thorns failed to supply any further quarry as light was already failing.

Friday night brought much wanted rain; the wind which accompanied it was hardly the most promising prelude to a foxhunt on the morrow; however, at Landyke Lane all was peace again, except for a good deal of jostling by the participating talent. Holwell Mouth being the inevitable though unappreciated draw, its slippery hills were soon hopping with fresh horses, but nothing was found to take the edge off their exuberance. Clawson Thorns is just as unpopular, and on this occasion it seemed a hopeless proposition; every slope was dotted with spectators, so how could a fox go away? Good ones evidently can, and an outsize bright yellow one ultimately came out under the noses of the waiting field, on the Harby Hills side. The huntsman got hounds away with remarkable speed, and a small right-handed circle brought everyone back to much the same position as before. But this good pilot did not fancy going back into covert; instead, he kept on towards Holwell Mouth. This is no new departure, but his subsequent movements were just what one hopes for and seldom gets.

Picture the scene: Holwell Mouth and Clawson Thorns lie like great woody rugs on the edge of a high ridge which dominates the Belvoir Vale. Sixteen to twenty miles of chess-board patterned grass stretch into the distance. It is impossible for a foxhunter to look at this unrivalled view without yearning to ride over the pastures spread out below. Needless to say, few foxes are bold enough to leave the security of the tangled hillside, but, on this occasion, there was something in the way in which the bitches poured into the lower half of the "Mouth" to make hopes rise. Sure enough, out they came without delay—a wedge-shaped, piebald mass, and made straight for the vale. For seven or eight fields they went all out, with a wonderful cry; every fence seemed "made to measure," and there appeared to be no end to the possibilities.

All of a sudden something made the fox take a sudden turn, so that hounds were confused. With infinite patience, George cast them this way and that, to be rewarded with renewed bursts of music as his charges crossed the road to Sherbrookes. Now was the time for "under-riding" if possible, though it seemed reasonable to think the best was over, with so attractive a refuge at hand. Not at all: leaving the covert to the left, on we went along the Smite (always wondering if it would be really necessary to jump this trappy piece of water), and it was only on arrival at Hose Thorns that other foxes intervened to save the splendid fellow which had given us so good a ride.

UNBRIDLED.

THE QUORN RUN WELL

OWING to the recent sad death of Major "Algy" Burnaby these hounds did not hunt until Friday in last week, when they met at Mr. Burton's farm, Kirby-Bellars, a huge field turning up. Although there is now, from a foxhunting point of view, a welcome change in the weather, the fair and warm conditions lasting until the 19th had undoubtedly encouraged foxes to lie out, and probably accounted for so many usual strongholds being blank. Not one of the two brace found in Mr. Burton's kale field the last time hounds paid a visit were at home, possibly on account of the very wet state of the kale through the recent fogs, and no other had replaced the vacant lair of that good old dog fox of 90 minutes fame found in Banham House gardens at the end of October last.

The news of the sudden death of the Queen of Norway was received with as much regret in England as in the country of her adoption. From her earliest days she was keen on salmon and trout fishing and was an enthusiastic horsewoman. A frequent visitor to England, she often hunted with the West Norfolk hounds, at one of whose meets the above picture shows her

There was no improvement when Thorpe Trusset was blank, but when Ashby Pastures was reached almost at once those beautiful shrill notes of the lady pack dispelled all disappointment of the last half-hour, and the pastures echoed back the good tidings that more than one fox had been roused. Going to the holloa on the Gaddesby side hounds quickly settled down on the line pointing for Cream Gorse. Bearing slightly to the right they then went back left-handed by the brook side, leaving Rotherby Spinneys on the left and continued by the Leicester Co-operative farm to the Leicester and Melton turnpike. Hunting on slowly from here they eventually lost their fox at the back of Kirby-Bellars. Cream Gorse, Brooksby Spinneys, Gaddesby Privetts, and Sherrards all failed to produce a fox, and hounds were taken home.

On Saturday from Osgarthorpe hounds ran beautifully with their first fox from Breedon Cloud Wood. Going away on the quarry side they went on through Langley Gorse pointing for the Priory, then turning right-handed crossed the Diseworth Road and leaving Diseworth village on the left ran fast nearly up to Long Whatton before turning right-handed over the hill by Dry Pot, and on through some root fields over the Loughborough—Ashby Road into Oakley Wood. Scent though good in the open was the opposite in covert, and some minutes elapsed before a very tired fox was seen to cross over into Piper Wood. Hounds were quickly out of Oakley but could do nothing on entering Piper, and although they and their huntsman worked hard they were defeated by a beaten fox who had very probably crawled under the thick brambles and laid down. It was bad luck for hounds as they certainly deserved blood.

SCARLET RUNNER.

MIXED SPORT WITH THE PYTCHLEY

AFTER meeting at Mears Ashby, on a morning more suited to May than November, a fox was found in some kale near by, and just as hounds had begun to run hard he slipped into a hole. Another from a different kale field disappeared almost at once, but with a third from yet another kale field near Vivians a good hunt began. The fox was finally marked to ground in Cow Pasture, very beaten and only a few seconds in front of hounds, after he had been well hunted through some famous and intricate woodlands, without a change, although many other foxes were in evidence.

On Wednesday from Shawell a good, though twisty, hunt took place from some kale near Lutterworth. The end came in the South Atherstone country after an hour, when the fox got to ground barely half a field in front of hounds, which had hunted and driven with exemplary patience and dash. They raced from Mrs. Tate's spinney in the evening in very doubtful light, for 20 minutes, over the now delightful country which lies between Swinford and Kilworth House. The fog by the time the latter coverts loomed ahead had become so thick, that during the first hesitation hounds had to be stopped. This might be accounted an unlucky day, as many seem to be, when hunting has to be conducted in half light.

The first part of the day from Whilton on Friday was productive of some amusement for the field, and for the huntsman; and for the mixed pack of great disappointment. A fox from the osier bed was run hard, marked to ground in a field drain, bolted of his own accord, and was practically killed, his life saved by two express trains as he was struggling to gain the Railway Gorse near by. Two other short quick gallops, either of which might have materialised into something much better, were nipped before blooming over unstopped earths. There seemed a scent, and not for some time has the fox supply been so good in the very pleasant environment.

Saturday 19th, Maidwell. Rain at last, heavy rain overnight, and so badly wanted. Scent seemed moderate, while a bright sun shone till the afternoon was wearing on. One fox marked to ground, one lost at Purser's Hills, and a brace killed—one after a short, sharp engagement between Moss Hall, Haselbeach Hill and Mitley, another in Maidwell Dales.

Then came a gallop which made all amends for an otherwise undistinguished day. A flying start from Berrydale, hounds settled in two fields, and a fox pressed so hard that he had no time to plan his route. The Gorse at Pursers Hills he dared not enter, so led the field and pack over a fine big country on its right. The speed was great enough for horses, as without a pause hounds pushed their fox straight through the Privet and on to Creaton Covert. No chance for him to find a substitute therein; the same at Hitmore Hill; and just before Duke's Lodges hounds killed a really beaten fox, after 40 minutes of the best.

EMERITUS.

COTTESMORE BEST RUNS

AT last we have had a drop of rain, not really enough to get very far down into the ground, but still it gave one a better feel to ride on. From Castle Bytham, on the 14th, we had a small field out, as the ground is harder here than other parts of the country. Lawn Wood was first called on, and proved blank; but we found a good-looking fox in Cabbage Hill Wood, and ran fast through Lawn Wood and out into a grand wild country, and unluckily what looked like a real good hunt was nipped in the bud by our fox getting to ground. Dodsey and Elliotts were blank, and unfortunately we could not draw two of our best coverts—Beaumont and Tortoiseshell—owing to shooting arrangements; so Mr. Hilton-Green had no alternative but to go on to Haw Wood. From here we had a lot of local hunting between this place and Clipsham before being run out of scent. From Pickworth we got away at once, and had a very nice hunt, running fast nearly to Hardwick before turning through Ashwood and through Osbonall, where we lost our fox.

Langham.—Tuesday (15th) was one of the hottest days in November in the memory of the oldest inhabitant. A search for outliers in the vicinity of Loodle Lane proving unsuccessful, we went on to Ranksborough Gorse, found there, and after completing a ring killed our fox near the Fish Ponds. At the same time another fox was viewed, and

hounds, being at once laid on, ran very fast past America Spinney, and leaving Pickwell on our right marked our fox to ground beyond Somerby, after an excellent hunt of 40 minutes. Orton Park Woods, the hero of very many good gallops in the past, did not fail us to-day, and we were soon away with a good fox which, first of all, took us fast towards Braunston before turning left-handed, and still running fast we passed by Ranksborough Gorse and America Spinney and on to Leesthorpe, where we killed our fox after a first-class hunt of one hour, over a good line and a four-and-a-half miles point.

Thursday (17th).—North Luffenham. Mrs. Guy Fenwick having refreshed all and sundry, we began with Luffenham Pastures, which was full of foxes; after some hunting in covert we ran up to the Edith—Weston Road, back through the covert and over the river and railway, and lost our fox a few fields further on. Hambleton Wood not holding, we went on to Gibbett's Gorse, found, and ran into Hambleton Wood, where we lost our fox. The Thorns at Lax Hill was blank, but the adjacent Wild Gorse held a brace, one going across the Durham Ox Vale and the other we hunted very fast through Gibbett's Gorse and Hambleton Wood, and finally killed our fox below Gibbett's, after a very cheery gallop of 32 minutes.

bitches raced away with Whitebarns on the right and with Lady Wood also just on the right, over the road past Furneaux Pelham Hall and Patient End to race across Albury Park, through Ninna Wood to ground just below Upwick Wood after a clinking 60 minutes with only one slight hesitation. This gallop was in the form of a horseshoe measuring a three-and-a-half mile point.

Two days later, on the 18th, the dog hounds put in a capital day's sport from their Patmore Heath meet, beginning with a fast ten minutes, when the fox was badly headed and lost. Then from near Farnham Green an excellent hunt through Home Wood, by Parsonage Farm, nearly to Maunden Mill; then swinging right-handed through Pinch-pools and Wakelands, on through Broom Wood, Catherine Grove and Northey, to lose their fox after a big hunt of 75 minutes. Then another capital 35 minutes and a four-mile point with a travelling fox near Upwick Hall, hounds being stopped in the dusk at Up End. B.

FITZWILLIAM'S FIRST-CLASS DAY

THE Fitzwilliam bitch pack met at Catworth Guide Post on Wednesday, November 16th, and had a first-class day's sport. Prospects did not appear very good: the glass was falling, country. It looked as if the fox was making for that well-known Oakley covert, Shelton Gorse, but unfortunately he was headed by a tractor and turned back to Hargrave. Here the fox ran a lane and went round some buildings: it seemed that hounds had lost their fox, for Agutter had cast all round and was coming back to make his ground good, when two hounds slipped through the fence and hit off the line exactly where the whole pack had failed three minutes before. I wonder if the explanation of this is that scent had lifted in the first instance—there was no obvious visible cause.

Hounds were now compelled to hunt out every yard of the line; the fox was twisting and turning very short and appeared out of his country, for he did not make for Raunds Old Meadow, which is a stronghold for foxes, and where, in all probability, he would have been safe, but he turned left-handed again across Black Lodge Farm before turning back across Friendly Lodge Farm, where hounds ran into him only 100yds. from Raunds Old Meadow.

This was a really good hunt of 90 minutes, with a six-mile point. Hounds had run very fast for the first half of this hunt, but had to work very hard during the last half, and fully deserved their fox. C. A. F.-M.

THE OLD BERKELEY MOVE OFF TO THE FIRST COVER AFTER MEETING AT CHENIES
This popular meet is always attended by a large field

Saturday (19th).—Beaumont Chase. The field was on the small side for a Saturday, and scent was never good. Found, of course, in Wardley Wood and ran up to the toll bar. Before bearing right-handed and leaving Uppingham on our right, we ran through Stoke End and completed a biggish ring into Wardley Wood where we lost our fox after a nice hunt of one hour. A fox from Ayston Spinney we could not hunt at all owing to lack of scent. Found another fox in Wild Gorse next to Quakers, which shortly got to ground in the vicinity. Again finding in some wild gorse near the Hog's Back, we ran smartly to ground close to Ridlington Village. From Prior's Coppice, we ran to ground close to covert; our fox eventually bolting was hunted very fast towards Jubilee Lodge, but found a hole before reaching this, and thus ended a rather disappointing day. "Foxy."

60 MINUTES WITH THE PUCKERIDGE

THE Puckeridge Hounds had a good gallop from their meet at Brangtring, on the 16th. Finding a fox in Roger's Wood, hounds ran very hard through Jubilee and Hawes Burrow, then with Mutton Hall on the left, and driving on hard over the Furneaux Pelham—Little Hormead Road they left Hormead Park just on the left, and went on through Patrick's Wood, down into Brent Pelham Bourne. Screaming along this old ravine, the melodious there was the suspicion of a blue haze, and the ground was as hard as it usually is in August.

The first fox was found in Leighton Long Spinney. Hounds got a good start with him and ran very fast to within a field of Old Weston Grove, where they swung left-handed. They left Brington on their right and ran on hard down the valley to the Huntingdon Road, where the fox was headed by cars. Hounds checked here and were never able to really get going again with this fox. But they hunted on to Leighton Village and over the Barham Road into Spaldwick Rough Field, where fresh foxes complicated matters and hounds were stopped. This was a good hunt of one hour; the first 20 minutes was very fast.

Mr. Frank Cheney's kale at Spaldwick was the next draw. As expected, hounds found a fox here. The fox hardly indicated his character at first, for it was some time before he left. Hounds fairly raced away to the top end of Catworth Gorse, swung left-handed to cross the Kimbolton Road near Tilbrook Grange; on across Mr. Stanley Measures's Farm and over the railway. This good fox left Covington on his left and ran to Three Shire Farm. This farm is in Huntingdonshire, Bedfordshire and Northamptonshire. Hounds checked here, but Agutter hit off the line across the Chelveston Road and hounds crossed into the Oakley

ANOTHER GOOD WEEK AT CATTISTOCK

CAPTAIN C. M. WELLESLEY-WESLEY, the Master of the South Dorset, and the senior Master of the Cattistock, dined together last Friday evening, and as is usually the case when Masters of Hounds dine together, the conversation after dinner turned on the week's sport. Mr. Higginson had just come in from a good day in the Friday country—a day that had ended with a very good hunt, when hounds marked their fox to ground after 50 minutes of the best, and his guest had had an equally good day; in fact, both men were in the very best of moods, although perhaps both were inclined to extol the excellent work of their respective packs. Said Captain Wellesley-Wesley to his host: "Have you ever seen the country so wet at this time of year? If this keeps up I shan't have a horse left by Christmas. Most of 'em are lame now. How are your's getting on?" "Well," said Higginson, "if we have many more like this evening's hunt I shall have to close down—or go to the nearest dealer's and see what he can find for me. We had a fair morning; killed one fox which hounds found at 'Isle of Wight'—not your old country, but the covert that goes by that name—and a good gallop in the afternoon with a fox from Bredy Copse that hounds lost near the Bridport

Road after a motor car exuding fumes that would have confused any hounds—except yours," he added, laughing. "Everyone except three enthusiasts went home, but we kept on drawing, hoping for the best, and, as is so often the case, we were rewarded. In the last half-acre of the last covert drawn—a little thicket near the Litton Cheney Road—hounds found a good dog fox that meant business. He broke over the road, ran hard to

THE GARTH FOXHOUNDS MOVING OFF

Litton Cheney Village, where he ran the main road for 50yds. and then turned in through a garden, and setting his mask for Eggardon Hill sailed away over a nice line of country. Hounds lost a bit of time in the village, but Gosden set 'em straight and away we went in the gathering twilight, crossing the Bridport Road and going on to Stancombe at top pace. At Stancombe hounds swung right-handed, driving on through Brake's at a pace that made it hard for us to keep 'em in sight, and the going, even on those hills, was very heavy—what it would have been in the vale could only be imagined by a couple of ploughed fields that we crossed where horses fairly floundered in the deep going. Our pilot went straight on till he came to the border of the Maltby Farm, and there—as if knowing that Maltby might be happier if we didn't go over his fields in the heavy going—he swung right-handed across the road again. Hounds were close to him when he straightened out on the downs beyond, so close that they were running with their quarry in view and gaining on him fast, and I don't honestly think they were 3yds. behind him when he got into the main earth at Shells. We left him there—he was too good a fox to bother further, and anyway," he added, "it would have been a long job, and we had had a good hunt." "Sounds like a good hunt," the South Dorset Master said. "Too bad you didn't kill. Now, we killed a brace to-day, &c."

Almost every Saturday night these two Masters ring each other up on the telephone, and vie with each other in telling of the week's sport, and to an outsider who hears both sides it is most amusing. At least, that is what their respective "better-halves" tell me.

We had a brilliant day from Bradford Peverell House on Tuesday, hounds adding two brace to the tally, the first two after good hunts of over 30 minutes each with a kill in the open, adding further laurels to the Cattistock pack and to their new huntsman, Fred Gosden, who is showing excellent sport. LINCOLN.

THE BICESTER ENJOY TWO GOOD HUNTS

JOHNSON was hunting the mixed pack on Tuesday, when hounds met at Kirtlington Park, where Mr. and Mrs. Hugh Budgett, as usual, entertained the field. Hounds brought off two good hunts, and though the reward of killing their fox was denied them on both occasions, never were they more deserved. Contrary to custom, too, there was little parkland hunting, and the field had their work cut out to keep with hounds over a wild country, interspersed with rivers and railways.

Finding directly in Mr. Laye's kale field beside the Roundabouts, hounds hunted across the park through Caudle and the Peat Pits to Ash Wood and Baker's Copse. Then with Bletchington on their right, they ran fast to Busby's Spinney. Going straight on down to the River Cherwell, they crossed it near Hampton Gay, and turning left-handed, they marked their fox to ground in a drain in Kidlington Village. This was a good hunt of an hour with a four-and-a-half-mile point.

The next hunt started from Black Leys; hounds first made a right-handed circle by Heathfield, Baker's Copse and Ash Wood, then went over the main Oxford Road and raced through Mead's Close to Weston Wood. They continued through Warmhoof and crossed the L.M.S. Railway near Lone Farm, then over two tributaries of the River Ray to the Merton—Islip Road, which they crossed with Merton on their left. They went over the River Ray near Astley Bridge Farm, and continued to Boarstall Lane, where they lost their fox. Hounds worked well all day. The second hunt was without a check and over rather an unusual line of country, and only about half a dozen of the field saw the end of it; the point was five-and-a-half miles, and time an hour. Altogether an excellent day's foxhunting.

WITH THE SOUTH CHESHIRE

UP to the time of writing twelve days have passed since the opening meet. Scenting conditions have been distinctly poor, but in spite of this, Arthur Redfern has managed to add seven brace to his cubhunting bag of 58 brace. This with a very young pack, one-third at least being unentered hounds, is undoubtedly a most creditable performance.

A small field met at Duddon Heath, the morning starting well with 40 minutes from the Waterless Covert (Stapleford). Hounds running fast in the early stages to Hoofield Hall, leaving the covert on the right, bore left-handed over the brook and on via Iddenshall to the back of Tarporley; from here, hunting slowly, hounds ran pointing for Clotton, crossed the main road on to the racecourse, to lose their fox near Ash Wood.

Colonel Verdin's estate always provides foxes, and with one from the Raven Pipe, after meeting at Darnhall Knobs, Mr. Barbour and a small field enjoyed a nice hunt of 35 minutes over the Poole Field - Aston - Tall Trees - Paradise country before hounds lost their fox, having crossed the River Weaver into the North Cheshire country. How vastly Mr. Rigby has improved this country.

As might be expected, a big field for these days turned out at Bowlesworth Castle, the home of Mr. Barbour, Mr. Clegg also being out. From a riding point of view a disappointing day—one never really got into the best of this wire-free estate. Hounds accounted for a brace on the day. Those who went out with Mr. Barbour at Saighton never drew rein all day—possibly more like cub-hunting than hunting proper, but what a pleasure it is, and how grateful we are to the Duke for his country, completely devoid of wire to this day, to ride over.

The best hunt since the season started was after meeting at Poole Hall, where Mr. Rigby entertained a large field. In spite of the good show of foxes in the home coverts things just went wrong, foxes choosing to either run to the river or the town of Nantwich, both lines being equally depressing. Late in the afternoon, drawing one of the coverts Mr. Midwood still kindly looks after for us (Calveley, New Gorse), a fox went away towards the park, swung right-handed, pointing for Oulton. Hounds, hunting really well, left Pages Wood, Philo and Oulton Lowe on the left, ran on through Wettenhall Wood nearly to Paradise, and back through Wettenhall Wood, past Darnhall Hall, to lose their fox near Ashbrooke Towers after an hour and 20 minutes. J. SMITH-MAXWELL.

GOOD SCENT WITH THE LEDBURY

"Of all delights that Earth doth yield
Give me a pack of hounds in field."

FRIDAY, November 18th, these hounds met at Longdon. It was a remarkable day, and I have never before seen such a scent in the Ledbury country. The first draw was Blacklands, and hounds were soon away on a fox pointing for Pendock. They reached Kitel Bank, then swung round, coming back nearly to Blacklands, but this time leaving the cover on the left. They drove on over the bank, pointing for Longdon Hall, the fox two or three fields in front, hounds running delightfully with grand music right over a field where cattle had foiled the line, to cross the Gloucester—Upton Road, circle round the Rampings nearly to Sam Hill, then left-handed through Aggboro' and the Grove, which is tremendously thick, out round the top side of Gurnice Farm to pull him down at Stone's Osiers. Longdon Church chimed the hour when they were breaking him up—40 minutes from the find and from six to eight miles as hounds ran. It was then learnt that two very unfortunate accidents had befallen Tait and Sturgeon, huntsman and first whipper-in respectively. They had fallen at a stiff bit of timber out Pendock way, Tait breaking his collar-bone and Sturgeon receiving concussion and a bad bruising—real hard luck on a day like this, with a scent which must be a huntsman's dream of heaven.

THE GRAFTON GALLOP ON

After killing their fox, hounds returned to Blacklands and chopped one in covert. Perhaps he thought it was the easiest way to die!

The next find was in Harry Rayer's Osiers. Reynard left pointing for the Stanks, but then turned left-handed through a piece of kale over the hill on to Longdon Marsh. Hounds ran like fiends to Birtsmorton, over the Marsh Road for the Red House; then, circling back to Birtsmorton, they again killed. The order was then given for home soon after 2 p.m., just to save a few foxes for another day. Laver, the second whipper-in, carried on after the accidents and did what little was required of him quietly and efficiently. GIN AND TONIC.

THE GROUSE MIGRATION ENQUIRY

Second Report on Ringing During 1938

THE first report published recorded returns of rings up to the middle of August. This report covers the period from mid-August to October 24th, and during that period 58 rings have been returned, so that up to date the total number of rings returned numbers 71. Of these, however, thirteen belonged to years before 1938, leaving the returns from this year's birds at 58, which included one from a game-dealer and one which had been placed upon a woodcock. This year 4,300 rings were issued, but it is safe to say that a considerable number of these were not used. Unused rings ought to be returned after the ringing season has finished in order that we may keep our records correct, but there is no doubt that in many cases this is not done.

After making all allowance for unused rings, however, the fact remains that the percentage of used rings returned is ridiculously low, and it is thought that this must be largely due to inefficient examination of the birds at the close of a shoot. Where we know that proprietors and keepers are really enthusiastic the returns are on quite a different scale. For example, on Colonel Nicol's estate of Ballogie, Aboyne, Aberdeenshire, where 20 birds were ringed, there were seven recoveries, or 35 per cent.; on Delnadamph, Aberdeenshire, where 50 were ringed, returns number ten, or 20 per cent.; on the Sutherland Estates, 179 birds were ringed, and there were sixteen returns, or almost 9 per cent.; from Bamff, Alyth, there were three returns from 20 rings, or 15 per cent. Such results show that where sufficient care is shown in examining birds and returning rings, the returns should cover at any rate about 10 per cent. of the birds ringed in their first year; and the poor return over the whole enquiry points to the need of more careful watching, if the results are to be commensurate with the labour involved.

The results so far indicated by the rings which have been returned this year may be summarised as follows:

1. *Grouse tend to remain during their first year on the moor where they hatched.* Of the 56 grouse returns from this year's ringing 52 were from birds shot on their own moors, some on the same beat, or within 100yds. to 400yds. of the spot where they were ringed, that is 89 per cent. were stationary.

2. *Movement during first year.* Of the four birds which had moved during their first year, three appeared on neighbouring moors from one to two miles away, and one bird had made a greater journey from Cabrach near Rhynie to Glenkindie on Donside, a distance of about eight miles, across a range of hills exceeding 1,500ft. altitude.

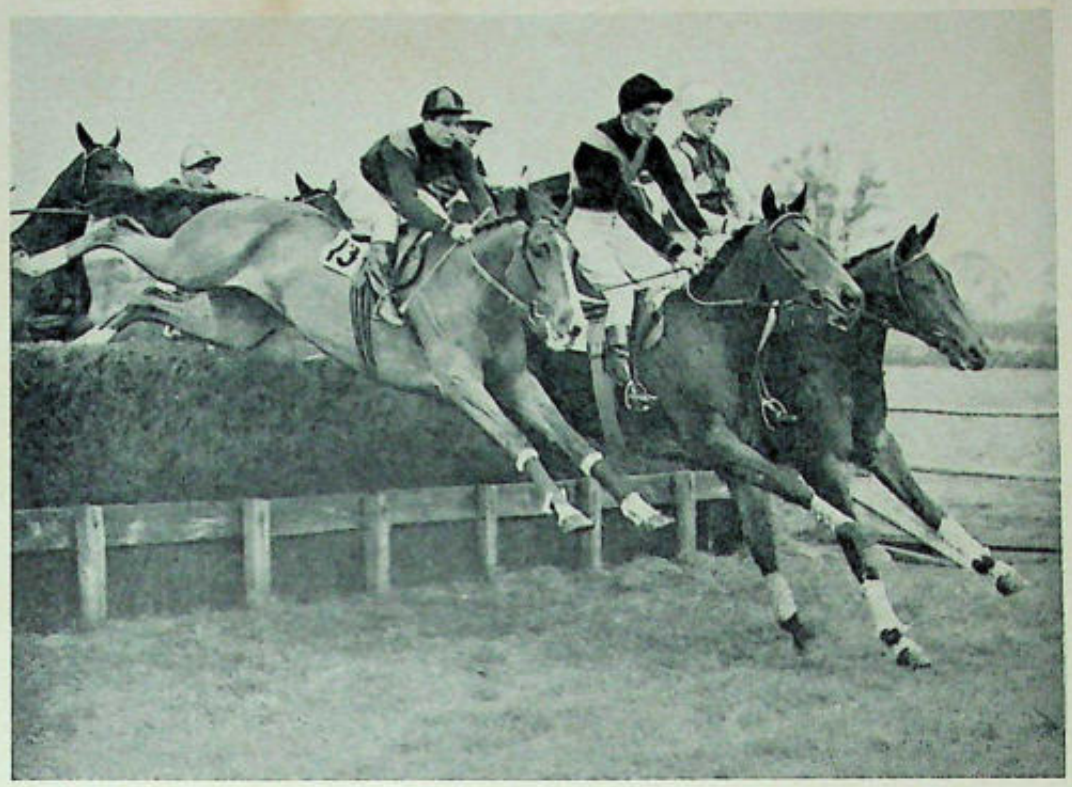
3. *Movement amongst older birds.* The 1938 returns include thirteen from birds ringed in 1937 or earlier. One was recovered from a game-dealer, and the locality at which it was recovered is unknown. Of the remainder, seven were found on their own moors; these included four birds in second year, one bird in third year, one in its fifth year, and one in its seventh year.

The other five had moved short distances to neighbouring estates one or two miles away, except one which, ringed on Dunachton, Kincraig, was shot at Clunie near Tomatin, some twelve miles off.

4. *Summary of Movement.* The indications from this year's results, therefore, are that during their first summer grouse practically all remain upon the moor where they were hatched, and that any tendency to wander appears after the first autumn. Of the small number of older birds recovered this year seven remained on their own moors and five had moved elsewhere, so that the tendency to movement appears to be very much accentuated in older birds and to affect a very considerable proportion of the population. But it would be unwise to generalise on so few numbers.

5. *Age of birds.* It is clear that the great proportion of returns are from birds in their first year, and as is to be expected, the numbers of returns fall off rapidly in succeeding years. Nevertheless, it is worth recording that one bird recovered in 1938 was ringed in 1932 and was therefore in its seventh year, one in its fifth year, one in its third year, and six in their second year.

[*Information about the Grouse Migration Enquiry may be obtained from the Editor or from Mr. C. E. Stewart, W.S., the Secretary of the Committee, at 43, Castle Street, Edinburgh, to whom donations should be sent.*]



A SATISFACTORY RACING SEASON

The Performances of Rockfel

WHEN these notes appear the season will have one more day to run, that is if the weather allows the last afternoon's racing at Manchester to take place.

On the whole it has been a most satisfactory season. For a long time it was considered that the three-year-olds, always regarded as the most important of the horses in training, were a very moderate lot. Then at the end of the season came the wonderful performances of Rockfel, so good that most experienced owners, trainers, breeders and jockeys were convinced that she was one of the great three-year-old fillies of the last 50 years, and quite likely of all time. It seems to me that she is a long way in front of any other three-year-old, but it may not be certain that she is very far in front of Scottish Union. They have never met, but through other horses the filly would seem to be much the better. Sir H. Cunliffe Owen has told me that he would be willing to run Rockfel against Scottish Union over any distance named by Mr. Rank, the owner of Scottish Union, for £5,000 aside over any course. What a match that would be. Of the other three-year-olds I have no doubt that Scottish Union is the best, and he is, therefore, the best three-year-old colt of the season. Some silly statement has come from the far side of the American continent to the effect that he will be sent over there early next season to race, but there is not the slightest truth in that statement. Scottish Union will be kept in training in this country next year and run for such races as the Coronation Cup and probably the Gold Cup, although it may well be that Mr. Rank will have a better Gold Cup candidate in Michoumy, who is probably a more genuine stayer. I am not convinced that Scottish Union is a real stayer, although he won the St. Leger. Still his stamina may improve during the winter, which, it is stated, he will spend at Newmarket. Mr. Rank believes in giving his horses a change of surroundings, and I am sure that he is right. Even human beings get benefit from such things.

Pasch, after winning the Two Thousand Guineas, was a failure at Epsom, but then won the Eclipse, and once more it was claimed for him that he was a great three-year-old. He failed miserably in the St. Leger, and was then slammed at Newmarket by Rockfel. He has gone to the stud, where his career will be watched with interest. He was a very pretty colt, but one who never appealed to me. No doubt he was very good on his own day, but there were other days when he was not so good. It is not for me to say whether such horses will make great sires.

Foxglove II showed that he was a good second class three-year-old, and that he could stay. More will be heard of this much inbred colt next season. It was sad that nothing was seen after the Grand Prix of Bois Roussel. He had won the Derby in such storming fashion that he was hailed as an outstanding colt. He was then beaten in Paris by Nearco and Canot, but was considered by his rider, Richards, to have been most unlucky in running. He met with a mishap in that race or shortly afterwards, and was not seen out again. I am wondering now, as are many other people, if the Derby win was a fluke, and that he should not have won it. Still the record shows that he won easily, and it is to be hoped that he will be fit for the cup races next year.

Much has been written and still more talked in places where after racing men talk of nothing but horses, of the successes this season of French bred animals. Too many times those people have forgotten that all so-called French bred winners are not really French bred at all; they have merely been foaled in France while their dams have been on a visit to a stallion standing in France, not infrequently an English bred stallion. Still the Cambridgeshire, Cesarewitch, the Derby and other races have been won this season by French bred animals, French bred really. The handicapper has been blamed for their wins in the two great Newmarket handicaps, but how he could have been blamed for the Cambridgeshire weights I do not know, considering that five of the field finished almost in a line across the course. The winner of the Cesarewitch may have been given a few pounds too little, but that has happened before in the case of a horse bred in England. At the same time there is some blood in France that we could do with. Breeders who breed for sale are blamed for much of this, but after all they are limited in their ideas by reason of business. They have to breed what they think, and, indeed, know, the buyer will pay the highest prices for. After all they are not in the game simply to improve the bloodstock of this country, but to make a living. Further, they cannot always get the blood that they want. It is becoming the case that most of the best sires are in the hands of men who breed to race, and they want their own sires for their own mares. And if they want outside blood they do a swop with another owner breeder, with the result that their own best sires—and they are becoming the best sires in the country—are full to their own nominations or the nominations of other owner-breeders. Which really is all very well for racing, for the backbone of it is the big owner breeder, but it is not making life any easier for the public breeder, the man or woman who breeds for sale.

That this argument is sound is borne out by the fact that only two Bahrams have come up for sale this season. The other mares that he covered were owner-breeder mares, and so would not come up for sale. I am wondering how that great racehorse will do. One of the two yearlings that was offered for sale did not sell, but the other, out of the dam of Scottish Union, Trustful, was bought by Mr. Rank for 13,000 guineas. Opinions are still divided as to the real value of that colt, some wise men asserting that he was cheap, while other wise men allege that he was not worth half that sum. I understand that the colt is doing very well and giving his trainer and owner every satisfaction. It is seldom in these days, however, that such a highly priced yearling does any good. GNOSTIC.

"HUNT HORSES REPRESENT QUITE A LARGE AMOUNT OF INVESTED CAPITAL"

HUNT HORSES

The Value of the Huntsman's Advice

IT is one of the more remarkable features of fox-hunting that that which is the chief attraction for a large number of its devotees is of only secondary importance to the sport itself, and is looked upon by the majority of those who are responsible for the conduct and maintenance of that sport simply as a means to an end. It is true that hunting could not continue in its present form without horses, but the sport is dependent in the first place upon the fox and the hounds, and it is a love and a true appreciation of the fascination of hound work that leads the individual to aspire to the letters M.F.H. after his name.

There have been in the past, and will be again, many Masters of Hounds and many huntsmen, both amateur and professional, who have been keen horsemen and horse-masters, but few, if any, of these have left a name behind them, or have played any important part in the history of the chase. Years ago the *élite* of Melton society risked their necks and their horses in order to earn for themselves the reputation of being what were called "customers," and things are not very different to-day; in all hunting countries are to be found those who hunt to ride, and in their ranks are many excellent men and women, but they do but little for the sport, and posterity, if it ever hears of them at all, will do so only by name and will have no facts upon which to adjudge their merit. With the true hound-men things are very different: each one adds something to the total of his predecessors and leaves the world richer than when he found it; their names are famous for all time and their work lives after them, a continual memorial more lasting than bronze, and more valuable. Such men were Peter Beckford, Lord Henry Bentinck, Tom Smith and the late Lord Willoughby de Broke, to name only a few.

Pre-eminence can be attained only at the expense of versatility and the man who would be a past-master in the art of hunting and breeding hounds must occupy himself with them entirely and will then have but little time left to devote to horses. It is said of one of the leading amateur huntsmen of the present day that he has never once, in the course of a long career, asked what horse he is going to ride, or expressed an opinion upon a horse which he has ridden. This is probably true, and a study of the man in the field lends credence to the story; when he is with his hounds he has no mind for anything else and frequently seems to forget that the crossing of a country makes any demands upon him at all. Such, then, is the type of mind to which hunting owes so much, and in view of it it may perhaps seem surprising that the majority of hunt servants are as well mounted as is the general rule. There are, however, many complications, and not infrequently cases in which those who are responsible for showing us sport are made to work under quite unnecessary difficulties which have been imposed upon them by the thoughtlessness of their Masters.

However much the frequent changes in Mastership, which are experienced by all but the most fortunate packs, may be deplored, it is not possible to alter the dictates of circumstance which compel some to give up their Masterships, or the natural desire for advancement which leads others to make periodic changes; these are in the nature of things, and we must make the best of them. It is the consideration of that best which is the purpose of this article.

Everyone is familiar with the usual procedure which follows upon the announcement of a change in Mastership. The existing Master resigns and the committee advertise for another; when the new Master has been elected, and sometimes before, the hunt horses are sold and notice is given to certain members of the staff. The in-coming Master may be going to hunt hounds himself, or he may be bringing his own huntsman with him; anyhow, a great deal of re-arrangement takes place as a result of which the country, the hounds and the sport probably suffer for at least the first season afterwards. In other cases the new Master may decide to retain the services of the huntsman to the pack which he is taking over and then, if he is wise, he will take advantage not only of his services, but also of his advice—and yet how seldom is this done.

The hunt horses represent quite a large amount of invested capital, and it is only natural that those who have paid up that capital should be anxious to realise it, or as much of it as possible, whenever there is a change in Mastership. The horses may belong to the retiring Master, to the committee or to a body of guarantors, any of whom will be anxious to realise their assets before the change; the new Master may have certain horses which he wishes to bring with him, and under these circumstances it is inevitable that some of the horses will have to be disposed of.

This in itself is not a bad thing; horses, after they have reached the age of seven, are wasting assets; as they grow older so do they become less valuable, and the life of a hunt servants' horse is not such as is conducive to long wear or to continued good looks. Long days in the field, and the many awkward places which a hunt servant is continually being called upon to negotiate, often on a tired horse, together with the necessity for horses to take their turn in spite of minor troubles, cannot be entirely offset by good stable management and the care of a first-class stud groom. At the end of the season they will have left their marks, and he who would avoid an undue amount of depreciation is wise to part with the hunt horses while they have still good reputations, and before they have acquired so many "lumps and bumps" as will interfere with their efficiency.

This is common knowledge, and has been proved sound practical politics, but the danger lies in extending the practice and making it a general rule which permits of no exceptions. In these days it is essential that a pack of hounds should be run on sound financial lines, but it must be remembered that the whole object of the expenditure is, in the first place, the showing of sport, and an inability to make exceptions in the case of the hunt horses will, on occasion, lead to an unnecessary deterioration in the quality of that sport, out of all proportion to the amount of money which is saved.

The horses of the hunt servants are a means to an end, and the sole purpose of their existence is to enable the huntsman and his whippers-in to be with hounds, but it is of no use at all their being with hounds if, when they are with them, they are not in a position to give them their complete and undivided attention. The majority of really good hunt servants are capable horsemen of a rather rough-and-ready kind, and their job is such that to do it properly they must be able to concentrate upon it and not have to be continually switching their attention from their hounds to their horses. The horses are the means to an end, and the ideal hunt horse is the animal which will do most of its work without attention; it should be capable of being ridden more or less as one rides a bicycle, and the only attention which it should require is, in the words of the horse dealers, "A kick in the guts to make it go, and a ringing of the bell to make it stop!"

There is more even than this when one comes to consider the duties of a huntsman's horse. A horse that is accustomed to having hounds hunted from its back seems to know instinctively what is required of it, in much the same way as troop horses get to know every movement of cavalry drill, and will, without any definite instructions from its rider, so manœuvre itself that the huntsman is in the best position when with his hounds. Horses that can do this confer incalculable advantages upon their riders and contribute in no small measure to the success of the day. It is in their case that exceptions should be made.

Masters of hounds and others responsible for the mounting of hunt staffs would do well to remember these points and to try, whenever possible, to ensure that their servants are mounted upon horses which they know and in which they have the confidence which is born of long association. The justification for this point of view is to be found in that place where all the different theories about foxhunting must stand their trial—the field. In many different countries is to be found ample proof of the value of the "old favourite." In hunt stables up and down the land grooms will point out one or two horses with the remark: "The huntsman thinks the world of him," and there is one old lop-eared horse which makes his regular appearance with one of the Midland packs, although long past the normal span of active life in hunt service. To inquiries after his welfare the huntsman usually replies: "Yes, he keeps going, and I'll ride him as long as he does; worth two of any of the others; wish I could find some more like him!" Many people will remember some of Frank Freeman's favourite horses, and none of those who have ever seen that greatest of huntsmen sailing across the stiffly-fenced Pytchley country, cutting out the work in front of one of the best mounted fields in England, will deny the value of that mutual understanding between man and mount which is born of long association.

So, then, in conclusion, the moral is this, that it is to the ultimate interests of all concerned to see that their hunt staffs, and their huntsmen in particular, are mounted upon horses which they know and like, and in which they have confidence. It will be to the good of sport if a huntsman is so mounted, and his advice should be taken, whenever possible, upon the choice of his horses. Masters who are engaging a new huntsman will be well advised to make some effort to purchase the horses in which he has especial confidence, and which he has been riding in his last situation, provided always, o course, that the animals themselves are not unsound and are suitable for the country to which they are going. Hunt committees which are changing their Master but retaining the services of their huntsman should try to make some arrangement whereby the best and most suitable of the horses are taken over by the new Master and are not included in a general dispersal sale. The small amount of trouble which this will entail will be amply repaid, and it is now, in the early days of the season, that the advantages will be noticed in the standard of sport and the general smooth running of the establishment.

R. ANSELL WELLS.

HOUNDS AND TRAPS

AFTER meeting at Buncton Cross Roads on the 17th, the Crawley and Horsham had a very enjoyable day. The morning was spent mainly around Chanctonbury Ring. Luckily the thick early morning mist had risen, and there were two interesting hunts.

In the afternoon not much was done, but an unusual feature occurred when hounds were drawing a covert and, instead of a fox, a deer broke away and bounded off over the Downs. Later in the afternoon a hound's foot was caught in a trap. This is becoming more and more usual all over the country, and provides an illustration of the apparently inevitable clash between hunting and farming on some points, for rabbits must certainly be exterminated and traps afford one of the most effective methods.

The afternoon provided one of those pictures which are granted only to the foxhunter, and to him only in hilly country. For, standing on a hill opposite Chanctonbury, we could see the huntsman and whips on the far side of the valley, and later, down below, the hounds working out their line. All this in a perfect November sunset!

BARNACLE GEESE OVER THE BREAKERS

A FORTUNATE MISTAKE

And the Value of Obedience

"AND let me tell you, Mr. Gedney, that a mistake can always be hidden. Your ridiculous and thoughtless admission has only made your stupid blunder worse. You appear to have mistaken your vocation. I will let you know the decision of the directors later. You may go."

Sniffker, the manager of the bank, was on his best form. He had taken a dislike to Gedney as soon as he saw him. A big, pleasant, quiet sort of youth, but obviously from the country and like a fish out of water in London. Sniffker wanted all his staff to be smart and glib like himself. Those who disappointed Mr. Sniffker usually left him. Gedney had made a slight mistake which a choleric customer had made the most of, and since Gedney had frankly admitted his fault the manager seized his chance. He could have hushed the matter up, but his report to the Board of Directors hid nothing.

A few days later George Gedney knew his fate. He was to take charge of a tiny branch at Saltcreek, his staff consisting of a junior-clerk-cum-office-boy. In spite of the polite and formal wording of his instructions, George gathered that the directors were not pleased with him.

Saltcreek was reached after four changes in slow trains. Gedney arrived in a damp, cold fog which came straight from the Dogger Bank. It would have been difficult to find a more dismal place. The village was situated on a flat, marshy coast which looked equally depressing at high and low tide. Inland there were only large fields separated by deep dikes and weedy shallow pools of brackish water. The village itself consisted of a few superior farms, the usual village shops and trade premises, and cottages.

Gedney's predecessor met him at the station. He was jubilant at his release. "I've got lodgings at the Post Office," he said. "They are about the only rooms in the place, so I suppose you'll take them over."

"Yes, I suppose so," said Gedney, as they left the station. "Hello! Geese?" Through the fog came a sound as of hounds in full cry.

"Maybe. I don't know anything about birds."

A skein of pink-feet passed overhead, and Saltcreek took on a new aspect to Gedney.

His predecessor departed the next day without regret, and Gedney entered into his kingdom. His work was light, and his junior proved a cheerful, hard-working youth. Gedney had always been keen on shooting, and Saltcreek gave him plenty. The marshes were a favourite haunt of wildfowl. The remoteness of the place kept it from being spoilt. Inland, most of the farmers were glad to have rabbits and woodpigeons shot, and generously invited the bank man to shoots and odd days.

One afternoon in January, Gedney took his gun to a flooded potato field where he was likely to find duck. The duck were there in force, and Gedney enjoyed himself. He was shooting above his form. There are few things which a shooting man likes more than to bring off difficult shots at a worthy quarry under bad conditions. At such times one will attempt shots which prudence would not advise under normal conditions.

As Gedney was crossing a swampy field a couple of snipe rose from some rushes. The first fell to the right barrel. The second swerved and flew low along a hedge. The left barrel missed it, but there was a roar of surprise and wrath from the other side of the hedge. Hastily Gedney ran to it and looked through. What he saw made him gasp for a moment. Then he turned and fled, and the misty dusk hid him.

Mr. Sniffker had been deputed by his Board of Directors, who valued him greatly, to inspect branches in the district which included Saltcreek. He had planned a surprise visit to Gedney, and was now in a thoroughly bad temper. The journey was vile enough, but a minor mishap to a goods train had temporarily blocked the line a couple of miles away from Saltcreek and Mr. Sniffker had to walk, an exercise he did not relish. A farmer had obligingly shown him a short cut, but being a townsman Mr. Sniffker missed his way and converted it to a very long cut.

At that time a series of daring bank robberies had been committed. They were evidently the work of a very clever gang, who varied their methods with much success. On one occasion an important bank official had been kidnapped and held in a disused barn while a member of the gang in his clothes and with his papers had impersonated him. The fraud had cost the bank several thousand pounds. Mr. Sniffker's mind was occupied on this depressing subject as he hurried along a hedge which a gamekeeper had told him would bring him to Saltcreek.

His thoughts were interrupted by a shot which seemed only a few yards away. Full of alarm, he turned, when another report sounded, accompanied by severe pains in Mr. Sniffker's person. Mr. Sniffker yelled. A peppering can be pretty smart punishment, and the shock is no light matter. For a minute the unfortunate man was beside himself with pain and fright. Then he tried to collect himself. He could see no one, and night was falling.

It was long past closing time, but there was a light in the bank. Mr. Sniffker, escorted by two farm labourers who had found him in a drain and brought him to Saltcreek, hammered at the door. After repeated assaults Gedney opened it: "We are closed," he said severely.

"Gedney," said Mr. Sniffker brokenly, "it's me, Mr. Sniffker."

Gedney looked at him suspiciously. "Mr. Sniffker?" he said incredulously.

"Yes. I've been shot and got lost, and I'm nearly dying. I want a doctor."

Gedney was quite as dense as Mr. Sniffker thought he was. It was a long time before he grasped the whole thing. He could hardly believe the muddy, frightened object before him was the neat, precise bank manager he had known. Once he did understand the facts he sent for a doctor and the policeman, and did what he could for his old enemy.

It was a very subdued bank manager who left Saltcreek a couple of days later. Nothing could be found of his assailant, who had apparently vanished. Mr. Sniffker had changed his mind about Gedney. A man who could stand such a horrible wilderness where bank officials were shot at by unknown assassins, and who worked overtime and who was on good terms with his clients, must be fairly good. Mr. Sniffker said so in his report.

Something of his old manner came back as he bade farewell at the station. "You have improved, Gedney. I am pleased to see you have not forgotten what I was at such pains to teach you."

Gedney looked at him. "You mean about hiding mistakes, sir? Yes, I shall not forget it."

E. H. BAXTER.

MALLARD RISING FROM LAKE DERWENTWATER

BOTH the illustrations on this page are taken from the originals by Mr. J. C. Harrison. They may be seen, together with other examples of Mr. Harrison's work, in the exhibition at present being held in Messrs. Vicars Brothers Galleries, at 12, Old Bond Street, London, W. 1.

"A VISTA OF WHITE-CAPPED MOUNTAINS AND SNOW-POWDERED HILLS"

JOE ON THE HILL!

A Dog as a Potential Tracker

I AM not proud of my share in the happenings of which I tell, and the only excuse for their narration is my desire to stress, as emphatically as I can from personal experience, the value of a dog in recovering a wounded beast.

My hero, Joe, is a Lakeland terrier, perhaps not quite out of the top drawer if it came to a show-down at Cruft's, but one who for grit and endurance is a worthy representative of his intelligent and hard-bitten breed.

His official business is vulpicide, and he has no superior in routing the big Highland foxes out of their cairns, or in killing them if he can get to grips, while his lighter moments are passed in a perpetual war on rabbits and the lesser vermin; but now Joe has been promoted to deerhound, and this is how he earned his brevet.

The morning of October 7th heralded the arrival of winter all over the Cairngorms, so that when the Colonel (my host and owner of Joe) and I stepped out of the bothy, situated at the 2,000ft. level, we gazed upon a vista of white-capped mountains and snow-powdered hills, while a biting nor'-wester and black clouds to windward gave promise of more snow to come. At the moment, however, the panorama was one of surpassing beauty with the rays of a brilliant, if transitory, sun illuminating a vast expanse of tumbled peaks, gaunt hillsides and riven corries, cliff and crag a-glitter with diamond snow, while on the lower ground tarn and lochan gleamed golden in a waste of peat hags.

"No day to go far from home, and anyway this weather will be sending the beasts down to us," remarked my host, prophetically as it proved, for at that moment Stewart, the stalker, who was spying the hillface above the bothy, announced that a good stag with hinds had just come in over the top and was making for the shelter of a burnhead not far above the bothy.

Meanwhile the clouds once more shut out the sun, and down came the snow. The blizzard, fierce while it lasted, was of short duration, and when it cleared Stewart and I set out on what proved to be an easy but exceedingly wet stalk, duly accounting for the stag, a good beast carrying a nice wide head of ten points.

The Colonel now joined us as spectator, bringing Joe on a lead, because the quarrelsome little brute, having taken a dislike to one of the retrievers at the bothy, was likely to get himself killed if left at home; and thus reinforced we went on to try for another shot.

Owing to the wild weather there were plenty of deer on this part of the ground, but the stags with hinds were very restless and rounding up their harems, while others not so blessed were perpetually on the move, and several attempted stalks failed because travelling, and consequently unexpected, stags crossed our wind, while at intervals heavy snow showers drove us to such shelter as we could find in that desolate region.

With the afternoon well advanced we were about to "call it a day" when Stewart picked up a stag and a few hinds in what he called a "just possible" place.

The deer were lying among some shallow peat hags at the foot of a hill, and cover for getting in was very poor, so that the stag was up and moving when I took the shot. He plunged heavily and almost fell, and I thought it was all right, but he suddenly recovered himself and went off after the hinds, unfortunately presenting only a tail-on target, which I missed with my second barrel, and by the time I had reloaded he was well away and did not give me another chance.

Judging by the way the stag was moving when we last saw him we did not think he could go far, but it was all important for us to reach the crest, over which he had disappeared, so as to keep him in sight on the hillside beyond. Stewart, who is many years my junior and very fast on the hill, soon began to outdistance me on the 1 in 3 slope, so I told him to go on ahead and not wait for me.

When, done to a turn, I finally gained the crest, Stewart was already far down the reverse side with the deer, presumably, below him but out of sight in dead ground where the hill dips steeply to the glen of the Alt Glas burn, and it was at this moment that Joe came into the picture, racing up from behind me and streaking down the mountain in apparent pursuit of Stewart.

Joe's somewhat startling arrival was explained later on by the Colonel. The latter, who had kept back during the stalk, on hearing my second shot, followed on after us and presently spotted us pounding up the hill, from which he inferred that we were following a wounded beast; it was while hurrying in pursuit that Joe showed unmistakably that he could wind something, and so, since he could do no harm and might do good, his master let him go.

I, meanwhile, realising that I could not overtake Stewart, to whom by the way I had given the rifle, lay down on the ridge and glassed the ground below me for the stag, and while so engaged the Colonel joined me. At first the only movement came from the rapidly descending and receding Stewart running and stumbling far below us, which verified my guess that the stag was making for the burn, although temporarily out of sight in dead ground. This proved to be the case, for presently the stag came into view, among the peat hags that here flank the burn, which he crossed, and after landing, stood for a moment on the far bank, a pause of which Stewart took instant advantage.

It was a very long shot, but even so Stewart scored a hit, but too far back to prove a stopper and the stag continued on his way.

From now on we could keep our glasses on the stricken beast toiling so painfully up the opposite face, taking a very slanting course to ease the stiff gradient, and so we held him focused until he lay down near the top of the opposite ridge about on a level with ourselves.

I feared that stag would never be got, and bitterly did I curse myself for taking a moving and a hasty shot with its attendant risk of leaving a wounded beast to die miserably on the hill.

A whoop from the Colonel cut short my self-reproaches. "Look at Joe! Look at Joe!" and then I, too, caught sight of the little beast heading straight for the Alt Glas.

We watched him reach the burn, bank high in brawling water, where he paused a moment before jumping in, and we could see plainly how the current swept him downstream before he could make his landing.

Once on the far bank he cast himself upstream and upwind and presently hit off the line again and away with him on an apparently burning scent, and soon the wisp of bedraggled blue-grey hair was lost to sight in the background of bleak hillside. Again we switched our glasses on to the stag couched so forlornly, if in fancied security, and presently we saw that drooping head uplifted and swing round, saw the stag rise laboriously and attempt once more to climb to higher ground. Joe, however, although we could not pick him up at that distance, must have got above him, for the deer turned and came down the full length of the hill to stand at bay in a pool of flood water on the burn edge.

Then at last we could see Joe leaping round the pool and his staccato yelps came borne to us down the wind.

Harassed, no doubt, by the nearness of the dog, for the pool was only a small one, the stag attempted to break away and plunged heavily through the Alt Glas, his greater splash followed immediately by Joe's lesser troubling of the waters; but finding that he could not shake off his tormentor, he turned to bay once more in a small lochan, and here Joe held him for Stewart to end the matter with a shot at close range.

Well done, Joe! But for you little dog the poor beast might have lingered in agony for days.

I have been stalking for close upon 40 years, and this is only the fourth occasion on which I have seen a dog round up a wounded deer, but it would weigh upon my conscience if I did not try to impress upon all in control of deer forests two lessons taught to me by those four occasions.

Firstly, that any intelligent sporting-minded dog is a potential tracker and needs but the minimum of practice to become the finished article; witness Joe! who had never hunted a deer before his debut on the hill. My second lesson calls for a little more imagination on the part of those who condemn a dog as likely to disturb the ground. Let such a one, say I, when next he hears of a wounded beast, imagine it is himself who is struggling along on three legs or with a stomach wound, and then let him ask himself whether he is justified, for no better reason than the safeguarding of his prospective sport, in neglecting any means whereby such suffering can be shortened.

DORCHESTER.

UNORTHODOX SALMON FISHING

Baits and Lures which Meet with Success

PERHAPS in the most advantageous conditions of height of water and temperature salmon are the easiest of all fish to catch in fresh water; at times they will greedily grab at almost any lure presented to them, and really are not over particular about the manner in which that lure is presented. But when the conditions are adverse, with the river down to summer level, and the temperature of the water around 60°, it is almost impossible to tempt them with any lure at all. And it is under conditions such as these that the very highest art is required by the angler to bring success.

Local knowledge, especially the exact position and the slope of the ledge or boulder which may form a shelter for the resting salmon, is one of the first necessaries for success, as under these conditions salmon are very loth indeed to move any distance after even the most fascinating bait, and one has to float any lure almost up against the fish's nose before it will take any notice of it. Even then the chance is no notice is taken of it. But all the same there are times when in a very half-hearted manner a fish may be enticed to take an interest in a small artificial fly, or even a very small natural or artificial minnow, especially if it is fished a few inches or so directly above its lie and it does not see the bait approaching by degrees down the river. The fact of it suddenly flashing into view, as it were, unexpectedly, may result in the reaction which causes a "rise."

I do not think that either of these artificial lures are as likely to be successful as natural baits, and in order of merit for low-water salmon fishing the worm and a small natural fresh shrimp easily take first and second place, although at times a small fly just floated over its nose may be very successful. But the worm is the most likely to kill. A great many salmon anglers look with scorn on worm fishing—why I do not know, as it is about the hardest of all baits to fish, and the technique required to fish it well is of a far higher standard than that of fishing a fly, minnow or shrimp.

A salmon usually takes a worm in quite a different manner from the way in which it takes anything else, picking it up and dropping it again and again, and if the slightest drag comes, often leaving it altogether and refusing to take the slightest notice of it. So one must try by some means or other to avoid the slightest drag, and this can only be done by letting your line run freely through a ring on your lead, so that there will be no stoppage whatever after the salmon first picks up the worm until it has had time to suck it in and swallow it down. While doing this it may have moved quite a few yards. The length of pause is entirely a matter for one's own judgment. But it is almost impossible to wait too long. The length of time given by myself is longer than that given to a pike after one's float has disappeared, when one is live baiting.

It is advisable, as in other forms of summer salmon fishing, if one knows where a special salmon may be lying, not to float a worm right down the stream towards its lie, but to toss it in so that one can pay out line, say, 3yds. or 4yds., until the worm is resting as near as one can judge in close proximity to the fish, and there for five minutes or so leave it quietly resting on the bottom, when the fish may move out and very gently indeed pick up the worm and return with it just between its lips to its original haunt. If one has been successful in getting the line to run freely through the ring on the lead, or through the hole in the lead, one can then feel every little movement of the fish—this at times is so slight that it is almost impossible to believe that it is a salmon and not a small eel, that is playing with the worm. A series of small twitches almost always denotes an eel, while a more or less steady drag is a salmon's favourite way. The tackle should be as fine as possible, and a large bunch of worms is often disregarded when two fairly good-sized ones meet with success.

A small fresh shrimp may also be tried, always remembering that the chances of catching a fish are greatly diminished if one fishes the shrimp religiously all the way down the pool from the top and does not suddenly place it as closely as possible within view of the salmon already marked down. This will in no way interfere with the orthodox manner of fishing down a pool for some problematical salmon. But first give the one you know a chance. If one has a stretch of water and the time to spare, even if it is only a day or two, under adverse conditions it always pays to spend far more time working out a special way of presenting your pet lure and studying every current above the lie than to fish straight away for it. Often a fish is lying tucked away under some ledge of rock or in some cleft, especially when the river is very low; or even in some mass of tangled underwater roots (always an almost impossible place to catch a fish), where, likely enough, its view is obscured, and it is only by experimenting with small twigs that one can be certain of the action of an almost imperceptible current upon a bait with little or no weight attached.

There is one time of the day in which success will come far more often than in any other—the half-hour before sunrise. This is partly, perhaps, because the temperature of the water is then lower than at any other time, and partly because at that hour of the morning, after a peaceful night, no shadows passing, no cattle wading in to drink, a salmon will be less suspicious than later in the day. If it is a shaded pool this half-hour may extend to the time when the rays of the sun make objects stand out clearly. Even with a fly this hour is worth, in my opinion, the whole of the rest of the day put together.

To take, now, another type of river; one in which every mile or so there may be one deep holding pool, generally with some back currents, of considerable depth where salmon in summer congregate in considerable numbers. Likely enough there will be from a dozen to 20 or more fish in this one pool; while, for a mile up or down, there will be scarcely a fish to be found. In a pool such as this it is absolutely impossible to know exactly where the fish may be lying, but by taking a very fine greased line, a thin cast with two or three shot on it, an ordinary roach float and a shrimp baited on a single hook one can, after first finding out the different depths of the pool, float this shrimp round and round as close to the bottom of the river as possible. At times, even under very bad conditions, this will be successful.

I have known a shrimp to float round for well over two hours before it was taken. Again, as in worm fishing, it is very necessary to have such a light float that as little drag is put on the line as possible, since a salmon will take a shrimp fished in this manner in much the same way as it takes a worm, picking it up and letting it go often several times before finally deciding to swallow it. A very free-running reel, or better still coils of line already laid out where nothing can catch in their easy running, is absolutely necessary for success.

Coming to the more orthodox style of summer salmon fishing—that is with a fly. First of all, as in trout fishing, the necessity for keeping out of sight cannot be emphasised too strongly. The second important point is to use as light tackle as one dare and never to fish the flies any deeper than can be helped, just as long as they are submerged. Another point is that two flies fished close together, say 17in. or so apart, seem to interest salmon far oftener than will a single fly. And a hackle fly will often do the trick where a winged fly fails. But in nearly all cases the body of the fly, whatever colour it may be—silver, gold, ribbed green or plain black—must be as thin as possible; a bushy body made with a hare's ear or wool does not hold the same attraction as a fly built more on the Greenwell Glory pattern or even a quill body. The most modern greased-line flies are dressed so fine and so short in the body that they are scarcely as noticeable in the water as an ordinary trout fly. The least movement given to these flies seems to go a long way towards spoiling the chance of getting a fish to take. Why a very lightly dressed March Brown just floating down the river to all intents and purposes dead, should be taken sooner than one that looks as if it were just struggling to get to the surface is a mystery. But in my view the fact remains that the less movement there is, the more chance there is of a fish.

LOW WATER IN WALES

A reach of the Dee near Llangollen where a drought makes such a notable difference in the appearance of the river

THE SNOWY OWL—BIRD OF THE ARCTIC

THE ORIGIN OF ARCTIC FAUNA—I

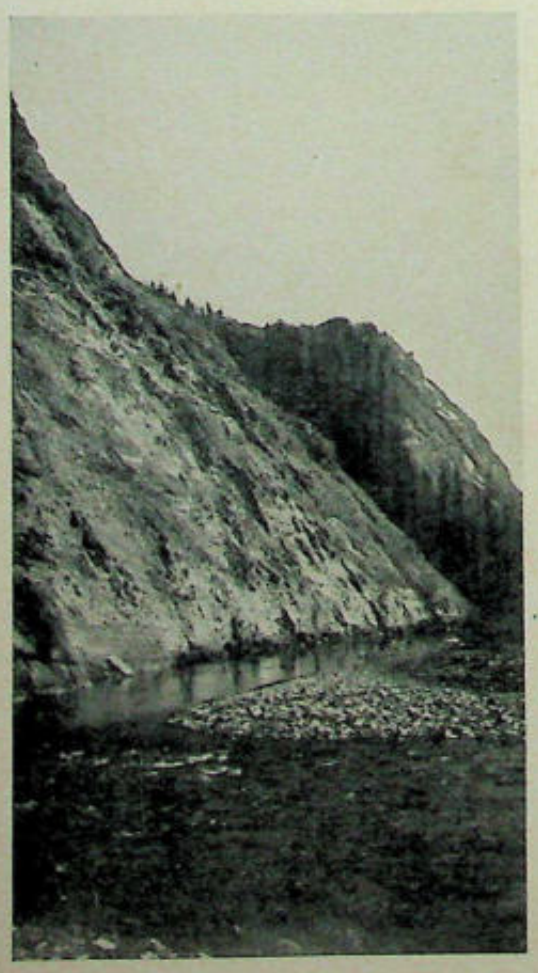
Discoveries of Russian Zoologists

By MALCOLM BURR, D.Sc., F.R.Ent.S.

THERE are few parts of the world of which the fauna is so little known as the Arctic. The very expression "Arctic Region" is a misnomer, for the frozen north is not a region in the same sense as the Palæarctic, Ethiopian and other regions of the zoogeographers. To the ordinary man the word conveys a picture of snow and ice, inhabited by polar bears and snowy owls, with seals and walruses in the seas.

The activities of Arctic explorers have mostly been by sea, directed into geographical and geophysical channels. The only animals that have attracted much attention being those which thrust themselves upon the notice of man. The invertebrates have been seriously neglected.

In recent years, however, great progress in the study of Arctic life has been made by Russian zoologists, who have the advantage of a more direct approach than ourselves, with a wide expanse of their own territory falling under arctic conditions. One, the eminent lepidopterist, N. Y. Kuznetsov, has recently published a remarkable article upon the origin of the Arctic fauna of Eurasia, based mainly upon his own order of insects.



THE COASTAL BELT OF SIBERIA

He begins by defining the Arctic area as comprising not only the ice-bound islands, but the "complex of territories occupied by the tundra and forest-tundra." He thus includes not only the lands under the ice-cap, where life is almost exterminated owing to its separation from the soil on which it depends, but also the coastal belt of north Siberia to the north of the forest zone or *taigi*, a country almost unknown to Englishmen. This is logical, for although the tundra is not ice-bound, the ground is perpetually frozen, the summer thaw penetrating only a few inches.

Kuznetsov confines himself to the terrestrial and fresh-water fauna, and touches on the flora only incidentally. This, upon which all animal life ultimately depends, consists of stunted shrubs, with mosses and lichens and perennials with a short vegetative period; annuals and biennials are few; there are many evergreens, and trees are absent. The most important features of the climate are not only the low mean temperature, but the aridity and the great length of daylight during the vegetative period. The tundra is, in fact, a cold steppe, and the flora has a marked xerophilous character.

To-day the tundra has its longest boundary in common with the *taigi* or forest belt, but in the post-glacial dry period it was largely co-terminous with steppe. It is easier for steppe to be converted to tundra than for forest, and there is in fact little difference between the tundra and such arid, cold steppes of extreme continental type as we see on Tian Shan and in Mongolia.

The author is of the view that the tundra is younger than the division of the ancient Angara land into steppe and forest, which took place probably in early Tertiary times. He admits that it is indisputable that the recent Arctic fauna is the final result of pleistocene glaciation, which shifted the climatic and, consequently, the biological zones. Reinig considers that the tundra arose with the pliocene cooling, with the reservation that a considerable portion must be of much later date, perhaps from the last glaciation. Its fauna is marked by poverty, uniformity and stability. Localised forms are rare, if not unknown. It is, however, richer than generally believed, for there are 5,259 species of terrestrial and freshwater animals known, and the author thinks that research will treble this number.

Of mammals there are 63 species, of which less than a dozen are purely terrestrial. The white fox reaches latitude 85 degrees, the furthest north attained by any Eurasian terrestrial mammal. There are half a dozen other endemics confined to the Arctic. "Euarctics," as Kuznetsov calls them, adapting Wahlgren's term, to which might be added the reindeer, though it penetrates as far south as 51 degrees, and the musk ox, now extinct in the old world.

Kuznetsov does not attach much importance to the 270 species of birds upon the list, whose presence led some writers to regard the Arctic as an independent zoogeographical region. He points out that most of these are migratory or attached to the seas and coasts. Of terrestrial birds, there are but seven to eight species, such as the ptarmigan, the willow grouse, the snowy owl and snow bunting, regarded by Reinig as having evolved on the spot during the pliocene. Tugarinov and Shtegman derive the avifauna from a hypothetical pre-glacial Behringia Land.

The two reptiles and half a dozen amphibians that reach the area are negligible, and the 85 fresh-water fishes occurring in Arctic Eurasia are evidence of the extent of extermination by the glaciation.

It is when we come to the invertebrates, and especially to the insects, that the surprises begin. Here we are dealing not with dozens of species, but with thousands, with a high proportion of "euarctics," which afford a reasonable basis for deduction. The most numerous order in the area are the hymenoptera. There are 221 sawflies, including a good number of euarctics, and of the remaining, hymenoptera 565, mostly ichneumons and the genus *Bombus*, the latter pointing to a steppe origin. The beetles are well represented by 627 species, the great majority being carniverous forms, such as the *Carabidæ*, *Dytiscidæ* and, above all, *Staphylinidæ*, while phytophagous forms are few. There are few circumpolar beetles, but 50 euarctics, a fairly high figure.

Of the diptera, 325 species have been recorded so far, of which no less than 62 are tipulids, that is daddy-long-legs, and there is a good proportion of endemic species and even genera. When the study of boreal diptera and hymneoptera is complete, we may hope to draw from it material of the greatest interest to philosophical zoologists.

The dragonflies and stoneflies have suffered severely from the glaciation, as only nineteen species of the former and 59 of the latter are recorded. The Mayflies, which sometimes appear in vast swarms, number 53. The caddis flies are more important, as there are as many as 167 on the list, mostly of widely distributed species. The more obscure groups have been little studied. There are 30 thrips, 11 fleas and 18 book lice—all widely distributed species; of bird lice 80, not unexpectedly, from the number of birds in the area. Of collembola there are 61, of which 18 are euarctic. These primitive insects reach further north than any other, and when more thoroughly studied will no doubt afford valuable material for generalisation. It is noteworthy that this is the only order of insects detected also in Antarctica. Thysanura, entropha and protura have not yet been detected in the Arctic.

Of the bigger orders, there are but nine grasshoppers and two cockroaches, and the bugs are feebly represented, as of this numerous order only a few dozen are recorded. Kirichenko considers that these two orders are here on the extreme northern limit of their capacity for living.

It is the butterflies and moths that afford Kuznetsov the material for his views, for of this order we find a relatively rich and varied fauna. The fine collection in the Zoological Institute of the Soviet Academy of Sciences has not yet been adequately worked out; it certainly contains a number of new and undescribed species, and even genera, and the author is of opinion that it will bring the list of Arctic lepidoptera over 400, of which at least nine are euarctic, including three fritillaries.

The other invertebrates have not been sufficiently studied. Arctic mollusca are virtually unknown. A certain exception must be made for the spiders, of which there are 447 on the list. There are also 97 mites, 96 oligochaete worms and 200 rotifers, but the distribution of all these is too little known to be useful for our purpose. The planarians are more important. These have been relatively well studied, and there are 179 species on the list, of which no less than 75 are endemic. There are 6 leeches, 5 bryozoa, 26 acanthocephala, 100 nematode, 68 cestode and 25 trematode worms. But these lists of parasitic worms are certainly very incomplete and of little interest to the zoogeographer.

(To be continued.)

TYPICAL SCENERY IN THE TAIGÁ

VIGNETTES OF A SUSSEX SHOOT

The Charm of an Informal Day

BACK end shoots are in many ways the pleasantest of all. More particularly (and parenthetically) to those who, like myself, are only moderate performers. For on the great occasions early on, when birds are counted by the hundred and the bag is all important, one feels a weight of responsibility, sometimes painful if it happens to be one's day off. In any case one retains little more than a confused impression of clouds of birds in successive flushes, many falling doubtless, but none especially flattering to one's vanity.

About the Christmas shoots there is no such tension, for they belong in a special sense to the younger generation home from school. And on familiar ground, where keepers, beaters, even the dogs are old friends, the bag is a secondary consideration. One's host grins as broadly when one misses sitters in the open as when his own young hopeful wipes his eye by some astounding fluke. Even the keepers relax their sterner discipline; the rusties incline to mild if somewhat Rabelaisian wit, and everyone is happy, quite informal and delightful.

And if there is less to shoot each shot is more worth while. For the last few weeks have taught cock pheasants more about covert shooting than is contained in all the classics on the subject. Hens are obliging birds, which fly straight, albeit high, unto the twentieth time of asking. Not so their lords. Listen, squat and run—those are their tactics—back for preference through the beaters' legs and out and up and over the one unguarded salient.

Nor are December partridges one whit their inferior in low cunning. Fast, high up, swerving, crossing, changing direction as often as they make one change one's mind, they take as much hitting as any birds that fly. Especially when they come from least expected quarters. For, incidentally, to-day, as we took our stands outside a 20 acre wood on the slopes of the South Downs, the ball was opened amazingly by two coveys which rose from somewhere at the back of it, and together with a host of pigeons came off the "high tops" looking rather like a cloud of sparrows. Four guns were stationed along a central ride and four others in the valley, out of

A TENSE MOMENT DURING A STAND

WALKING THROUGH THE WOODS TO A FRESH STAND

"To me the charm of a day like this lies more in what one sees than in what one kills"

which a lot of pheasants, foraging in the juniper and furze, and startled by the first few shots, were seen to be legging it still further from the fold. But the keeper, to whom be praise, knew a trick worth two of that. He halted the line, detached half the beaters and three spaniels to fetch back the grass and scrub. Then the whole line moved crescent-wise toward the valley, and the outlying pheasants, having already heard firing inside the wood, decided that the opposite direction was the right one. They rose determined to put 500yds. between themselves and the concealed batteries in the ride, and sailed across the valley guns instead at a height to test the experts, while their brethren, breaking away from the barrage of the forward line, gave precisely similar shooting to the guns along the central line. It was as pretty a show of two cross streams of high pheasants as I can recollect, and if less than 30 birds out of perhaps 150 crumpled up, each was a skyscraper.

The second beat is not unlike the first—a hanging wood with plenty of shot cover and rhododendrons, sloping down from a maximum height of perhaps 200ft. to the guns below. Here you never get a low bird, while those that break from near the crest are wellnigh untouchable. They came at all heights and angles, curling and twisting in the wind, and one rather felt that every bird pulled down qualified one for inclusion in those "twelve best shots." Behind the line of guns here runs a small stream, normally some 3ft. wide, but to-day swollen to the extent of a torrent, and one feature of the day was an elderly gentleman with a long pole, on to the end of which was fixed a kind of wire cage, who was detailed to retrieve any birds falling into the river. Several did so, and his efforts with the "landing net" were fully appreciated. It was not as easy as it looked, owing to the swiftness of the current, and it says much for his agility that he only missed one "fish" which, incidentally, he recovered in the evening about a mile downstream, where it had tried conclusions with a fallen tree.

Forty-eight pheasants and four partridges was the result of three beats up to lunch-time, and a very short afternoon, partially spoilt by rain at intervals, was devoted to two short drives across the Downs, where in the whins and coarse grass we struck a mixed collection of partridges and pheasants. A round-up of the hand-reared duck was the last item on the programme, and we surrounded a small lake, towards which the beaters drove the river meadows. Failing light with heavy lowering clouds made shooting difficult, as after the first rise the duck were right up in the skies and distance was extremely hard to judge. They seemed to tire rather quickly, however, against a heavy wind, and in some circles came down a bit to within reasonable distance, albeit still long range, and a total of nineteen represented very fair shooting.

A total bag of 68 pheasants, 25 partridges, the duck and an odd snipe and "various" was, all things considered, quite a good one. Though personally, and heretic as I may be, I set small store by bags. To me the charm of a day like this lies more in what one sees than in what one kills; in the uncertainty as to what is coming next, and in the absence of cast-iron rules of procedure. The big day sometimes so grievously disappoints; perhaps it is because one expects everything to go so well.

One's plans are perfectly laid, no detail is omitted, yet for some unaccountable reason the birds decline to fall in with your views, and go in all directions save the right one. Contrariwise, you get a day, such as I have tried to describe, after unprecedented bad weather, and the reverse occurs, and you finish up as we did, wet, muddy, and draggled, it is true, but with that lively feeling of satisfaction that things could not have gone better.

J. B. Drought.

WHAT MAKES TROUT RISE?

A Reason for the Scarcity of Red-Letter Days

MORE than forty years ago my flybook bulked hugely with a weird and wonderful collection of patterns, and when fishing I wasted a deal of valuable time in changing them. Then a copy of Stewart's *Practical Angler* came to hand, and I soon revised my methods.

As most fishermen know, Stewart pinned his faith to six flies—three winged and three hackled. The winged flies were woodcock and yellow, hare's ear and blae wing, and black and blae wing; and the hackle or "spider" flies, black spider, red spider and dun spider. The black spider was Stewart's favourite fly, and he claimed that it was the most killing imitation he knew. It is made of the small feather of a cock starling, dressed with brown silk.

Using Stewart's patterns, I killed plenty of trout, particularly with the black spider. Another fly, a winged pattern not on Stewart's list, known in the north as Lee's favourite, or black spinner, also stood me in good stead, and gradually I began to pin my faith to it and the black spider alone. For many years my flybook—now slim and upright—has held nothing but these two patterns, and with them I have killed some thousands of trout in rivers, tarns and lakes. Not only have they proved their worth in North Country waters, but as far south as Cornwall they have more than held their own against the favourite local patterns.

Both should be very lightly dressed. Many shop-bought flies are far too heavily hacked, and fail to hook as they should do. There is little to choose between the killing qualities of the black spider and black spinner. The former is perhaps the more deadly when the water is very low and clear, but I should be quite content to fish the season through with either of them, and kill more trout than I could ever hope to eat. Even when the mayfly was up, I have fished the black spinner with good results.

It seems to be a more or less general belief that to kill trout successfully you must fish with a fly or flies which are a close imitation of the insect or insects on which the fish are feeding at the time. Any angler who has fished steadily for a period of years and has had time to test such a theory thoroughly must surely have seen the fallacy of it.

Many anglers set great store by colour and detail in their artificials, yet during a long day's fishing the colour and shape of a fly may alter to a very considerable extent, yet if the trout are taking really well this change makes not the slightest difference. Scores—yes, hundreds!—of times have I begun the day with brand new flies, and by afternoon they have been reduced to almost bare hooks, with little on them but a fine silk wrapping. Did the trout ignore them for that reason? No; they came at them as savagely as ever. In human eyes these torn and dilapidated flies represented no particular insect, yet the fish were wild for them.

A long experience of trout fishing on many waters has convinced me that there are times when no matter how good the man behind the rod may be, or how well-tried his flies, it is a case of "nothing doing," or nearly so. A brace or two of trout are always possible, but the real red-letter days are comparatively few each season. If you have kept an angling diary over a period of years, turn back its pages and I think you will find I am right.

What, then, one may ask, is responsible for the red-letter days when trout come ravenously at your flies and continue to do so although the latter have been reduced to practically bare hooks? The question is not an easy one to answer, and one can but surmise that some disturbance of the atmosphere governs the feeding habits of the fish.

Trout are only hungry when food is there in plenty, and even then, unless atmospheric conditions are suitable, they will not feed. If trout always took our flies (in the ordinary course of events some of them should be always hungry) our streams and lakes would soon be depleted. Both eels and pike are susceptible to atmospheric influence. Do not the former come forth from their muddy lairs before a thunderstorm, while the pike cease feeding long before we are aware of the coming disturbance? In both cases some state of the atmosphere exerts its influence on the fish.

The conditions underlying the weather phenomena that we can see are pressure and temperature. Does temperature influence the mood of the trout? It seems doubtful. Trout often rise well when the thermometer is low. There are plenty of instances of good baskets having been made when snow was falling, and the day was bitterly cold. Again, trout often rise well when the thermometer is high, and the weather hot. The same applies to medium temperatures. While temperature may influence the trout's choice of lying places, it does not seem to affect their rising.

A change may affect both thermometer and barometer, but as far as the trout are concerned it seems to be the pressure only which keeps them down, or tempts them to rise. Before a storm the trout, like most other things except char and eels, feel sluggish owing to the low pressure of the atmosphere. After the passing of a storm centre their mood becomes lively, for then the barometer is rising. How often, when a thunderstorm has broken overhead with heavy rain, has one found the trout beginning to rise freely?

High pressure, by itself, is not a sign of the trout's willingness to feed, for often when the barometer is high they do not rise well. It is the sudden increase in pressure that gives you the chance to have a red-letter day.

RICHARD CLAPHAM.

TROUT FISHING ON THE GLASLYN, NORTH WALES: MOELWYN IN THE BACKGROUND

THE LAST BEAT

Saving a Blank Day

IN September last I had a day on a charming little loch high in the hills of North Perthshire. When I went out before breakfast the thermometer on the porch registered 47 deg., the light breeze was almost north and there was not a cloud in the sky. It was a glorious morning for shooting, but there is no need to explain how hopeless the outlook was for fishing. When we reached the loch a little after ten the breeze had died and the surface shone like brown glass under the cold sun. I tried dry fly, but there was not a fish moving. Small wonder, for not an insect of any sort was abroad. It was so cold that I wore my Burberry.

Two hours later a few catspaws ruffled the surface and we actually saw a trout rise. I got it, but it was not worth keeping. Then it fell calm again and we went to the bank for lunch. Excellent pasties and hot coffee from a thermos gave us fresh energy and at one we were out again. Still no clouds or wind. Only occasional puffs which we watched and followed but without result. I tried fly after fly but nothing availed. The fish were not moving. Why should they? There was no feed on the surface.

At half-past four the car came for us and my nephew, who was pulling, suggested that we might as well call it a day. I hated the idea. When you live in a country where fish are not, and when you know that it will be a year before you get another chance on this same loch, it is only natural to wish to stick to it until the last minute. We pulled in and our chauffeur announced that he had brought tea. This gave me a chance to bargain. We would have tea; then one last beat.

At five some large soft clouds drifted across the intense blue and a light but steady breeze began to blow. Once more I changed my cast and put on two small wet flies, a hare's ear and a red quill. I had long ago given up ordinary loch flies. We were only 100yds. from the bank when there came the first real rise of the day, and instantly I was fast in a good rainbow. It jumped twice then went down into the weeds. When I got it out it seemed to weigh a ton, and I saw that a mass of pale-green water weed clung round the cast. Carrying all this stuff the fish cruised round slowly and I dared not put on any strain, my cast was so light.

For at least five minutes I hung on, then the fish turned and came close to the boat. My nephew snatched up a net and got it under the trout. It was one of those collapsible nets and the hinge was out of order. It doubled up and away went my trout.

Yet it was still on and the cast held. I take off my hat to the maker of that gut, the last strand of which was only 4x. Another two minutes, which seemed like two hours, then again the trout was alongside. This time I had my own net ready and now there was no mistake. A beautiful fish of 1¼lb. It had taken the tail fly, the red quill. "We have broken our duck," I said. "Do you feel like making it a brace?"

There was no objection and we drifted on down the lake. Nothing happened until we were quite close to the far bank, then came a repetition of the first rise. There was no weed here, and within a couple of minutes this fish, too, was netted. Another rainbow just a size smaller than the first, taken on the hare's ear. On the way home we met the owner of the loch and were warmly congratulated on saving a blank day.

T. C. BRIDGES.

THE WINTER SPORTS SEASON

BURBERRY WEATHERPROOFS

and

WINTER SPORTS DRESS

THE BURBERRY

On Request . . .
The Burberry Weatherproof Booklet, together with patterns and prices; also illustrations of other Winter Kit Models and a copy of "Concerning Winter Sport," on mention of "The Field."

TIELOCKEN BURBERRY

Rain or shine, mild days or cold days, The Burberry Weatherproof provides the most bodily-satisfying protection. If a bitter wind is blowing, no discomfort is occasioned. If the season is sultry, The Burberry is airfree and airylight—the last word in topcoat freedom.

Never mind the weather, never mind the rain. Take The Burberry with you and the cares of watching the barometer will vanish. The elements can be faced without fear or favour.

Burberry Winter Sports equipment has many essential points. It is practical yet smart, warm yet light in weight, weatherproof yet airfree.

Colourings are varied to meet all tastes, light shades for some, although the most practical exponents of Winter Sports favour navy blue or black.

All these are essential points which Burberrys have studied since the inauguration of Winter Sports, guided by their own experiences, together with expert practical advice in all branches.

BURBERRYS LTD. HAYMARKET, LONDON, S.W.1

SKI-ING ACCORDING TO PLAN

A Methodical Progress Through the Seasons

OF course, people have different ideas and tastes. Some go to winter sports for the mountain air, the scenery and the sun, some for the social life, the dancing and the making of romantic friendships, others to skate, curl, bob, luge or sleigh, but most go to ski. To-day, ski-ing is enjoyed by more people of all nations than any other sport, with the possible exception of swimming, and its popularity is fully deserved, for it calls for courage, confidence, judgment and skill to a high degree, and in return promotes physical and mental fitness, and a feeling of exhilaration and well-being not experienced in less inspiring surroundings.

To all who have never breathed the pure intoxicating air and revelled in the clear warm sunshine as they speed over the dazzling white fields of crisp powdery snow, with the blue mountains in the background, I can only say try it this winter. It is the beginner, and those who I feel do not get the most out of their holidays, that this article is written.

Careers are planned years ahead, and the same idea ought to be applied to ski-ing, if a maximum amount of pleasure is to be derived from it. My plan is intended for anyone of average athletic abilities who expects to spend a few weeks every winter in the Alps. For the first two seasons go to one of the big resorts in Austria or Switzerland, join the ski-school, and use the funiculars so as to get as much downhill running practice as possible, pass as many tests as you can, and do a little racing. The racing is important, as it is a fine tonic for "nerves"; you will find yourself taking slopes, straight and without a fall, which you regarded previously as quite out of the question.

When you can do all the local runs in fast time and with only an occasional tumble, you must not get a swelled head and imagine you can ski. You are like a baby that has just learned to walk, or a pilot who has achieved his first solo—you can control a new form of movement under favourable conditions, but you cannot put it to practical use. The object of ski-ing is the same as walking or flying, to get from one place to another, and it is only by so doing that real satisfaction can be obtained. So far you have been confined almost entirely to hard snow, beaten flat by the passage of others; you have never had to find your own way, you know nothing about climbing, snow, avalanches, wax or skins.

For your third season choose a centre where you know the runs to be steeper and more difficult, and in addition to polishing up the lessons already received, practise turns in deep snow and the jump turn for breakable crust. I have seen the humiliation of too many badge-covered nursery slope experts when taken on cross-country trips and confronted with unaccustomed conditions. It must be remembered that hard, not including spring, snow is the easiest on which to swing and keep control in these days of steel edges and heel springs, and is seldom met when touring.

The next step for the fourth season is to go on short expeditions with a guide, and to observe carefully his climbing technique as well as the line he takes downhill. When he uses wax or skins do not fail to find out why he does it. The art of going uphill is to get to the top as quickly as possible with a minimum expenditure of energy. During the summer you can usefully do a little home-work, teach yourself to read a map, buy books on snow formations and the science of correct waxing.

For your fifth season try to join a party of slightly better performers than yourself, who intend to do tours in an easy district. Ask them now and then to let you lead, so that you can develop the instinct for steering the fastest course consistent with reasonable safety. Look at the snow with renewed interest, not only for the likelihood of avalanches, but so that you can distinguish changes in the type of surface. I have seen a competent runner break a leg by dashing heedlessly from unbreakable crust into a deep drift—a change which should have been obvious to him at a distance. The sixth year may be regarded as the last of the training period, and for it here is a revolutionary idea. Get three friends of comparable ski-ing strength to your own and motor to a point in the Western Alps which you can regard as your headquarters. I suggest the West for two reasons—one is that it is a short journey, and the other is that the snow is apt to vary in quality more frequently than it does in Switzerland or Austria. Grenoble, for instance, is ideal. I want you to plan your own expeditions and to use the car to take you to the starting points of your climbs. This ensures that you will be ski-ing in strange country every day, and forces you to be self-reliant.

You have got to make the decisions—when to

BREATHING THE PURE INTOXICATING AIR, AND LEARNING THE RUDIMENTS OF SKI-ING AT THE KLOSTERS SCHOOL

turn back so as not to be caught by nightfall halfway up a mountain, whether there is danger of avalanches or fear of the visibility deteriorating to such an extent that you cannot find the way, and remember there will be no one to help if you do make a mistake.

By this time you should have a sound knowledge of first aid, and be prepared to cope with accidents if they arise. Do not forget that a broken ski or binding may prove serious if you cannot deal with it. There are huts, kept open in the winter, which can be reached in five or six hours at a comfortable climbing speed, and you might stay in one of these for a few nights. You will find it a memorable experience to do at least one expedition by moonlight.

The next winter you can undertake the leadership of a party. If you do, here are a few hints. You are responsible for the safety of your companions. You must make it quite clear before you start that everyone is expected to keep together and abide by your suggestions. Make sure that all equipment is in good order, and that no weak runner who will hold back the others is coming. Check up the number at the bottom of every slope, a mishap to one, particularly if not spotted at once, may involve all the others.

I honestly believe that if people were to go about their ski-ing in a less haphazard way than the majority do at present, they would enjoy it more, and at the same time there would be a decided drop in the number of accidents.

HUMPHREY WINN.

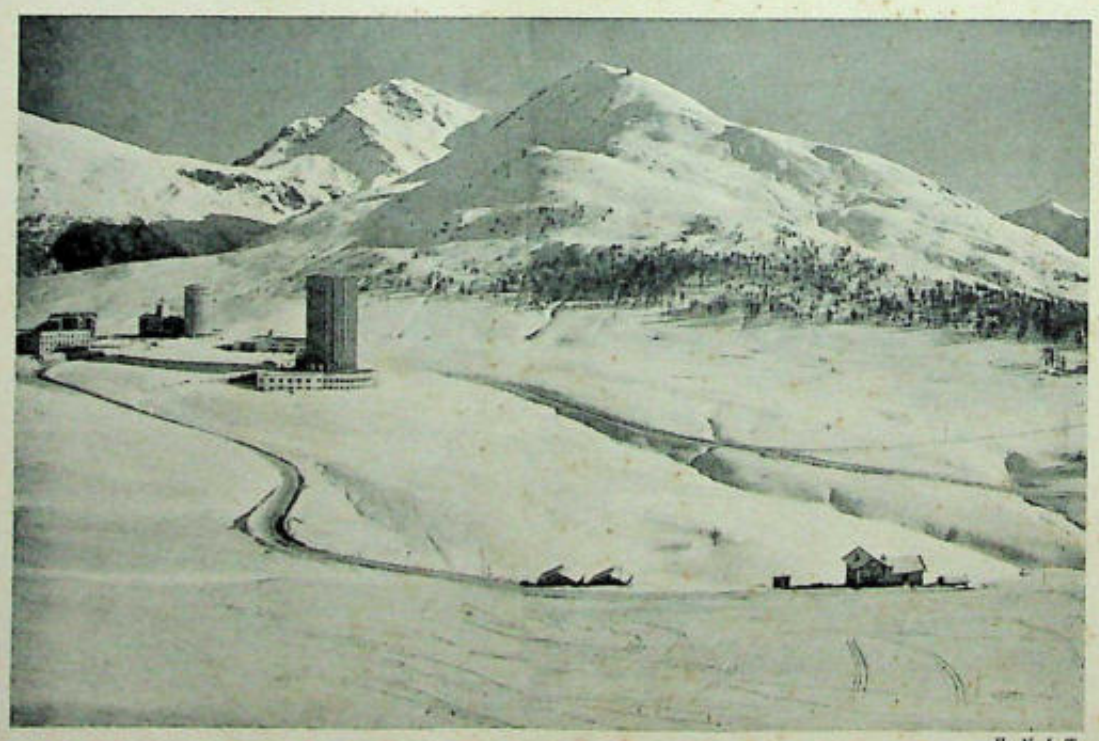
AFTER AN EVENING OUT, THE RETURN HOME BY SLEIGH AND TAILING

WINTER SPORTS IN NORTHERN ITALY

New Centres to be Explored

ALTHOUGH it is only within the last few years that winter sports have developed to any extent in Italy, there are several resorts on the southern slopes of the Alps, and in the Dolomites, that have secured prominent places in the list of first-class European centres. There are dozens more excellent ski-ing centres for those who consider the sport to be of greater importance than the social side, but which as yet are unknown to British visitors.

The resorts situated on the southern side of the great Alpine barrier are favoured by an abundance of sunshine and an absence of biting north winds. Yet the altitudes are sufficiently high to ensure perfect snow conditions from mid-December to the end of March, and often until the end of April or early May.



E. N. I. T.

SESTRIERE AND ITS SKI-ING SLOPES

In the Piedmont region there are three winter sports centres of major importance—Sestriere, Claviere and Cervinia. The first two are within 20 hours of London, and are reached by taking the train to Ulzio (on the Paris—Rome main line, a few kilometres to the south of the Mont Cenis tunnel), and then proceeding by road to over 6,000ft. Cervinia is at the foot of the Matterhorn, which the Italians call Monte Cervino.

The growth of Sestriere is remarkable. In 1926, before snow sports became popular with the Italians, Signor Agnelli (son of the director of Fiat's motor works at Turin) was ski-ing in the region above Ulzio and realised that here would be an ideal centre for all forms of winter sports. In those days there was only one small hotel, and this remained open only during the summer. In the space of four years Agnelli converted Sestriere from a region of virgin snow to one of Italy's most popular places for winter sports. Three new hotels were built (two in the form of circular towers), and there are now four wire-rope railways by which skiers can "fly through the air with the greatest of ease" to altitudes of over 8,000ft. From the surrounding peaks there are many downhill runs to 4,000ft., where motor buses are in readiness for the return to Sestriere. This year there will be a new skating rink for ice hockey, curling, &c.

Claviere, which is "just over the way" from Sestriere, has retained its charm as a simple Alpine village. In contrast to gay Sestriere, the social side of Claviere consists of sitting in a homely inn in the evenings, yarning with officers of the Alpini, who welcome every opportunity of speaking English.

Cervinia is reached via Turin, where a change of train is necessary to continue to Chatillon in the Aosta Valley, whence a motor coach service operates to Valtournanche and on to Cervinia. It was from Valtournanche that Whymper made many attempts to reach the summit of the Matterhorn. Another association with England is the visit in 1936 of the Oxford and Cambridge Universities' Ski teams to this centre. From Cervinia, which lies at 6,600ft., there is a wire-rope railway to about 8,500ft., and by Christmas this will be extended to Plateau Rosa (11,500ft.) between the San Théodule Pass and Monte Rosa.

At Plan Maison (at the top of the first section of the wire-rope railway), there are gentle inclines for beginners, as well as steep slopes which give experts all the thrills they could wish to have, and the runs down from the San Théodule Pass are among the finest in Europe. Undoubtedly there is a big future ahead for Cervinia; new hotels are being built at the rate of one a year, and the demand for accommodation would fill them all two or three times over during January, February and March.

Situated in the beautiful Ampezzo Valley at a height of 4,000ft., sheltered from the winds and framed by forests of pine and fir, Cortina presents a vision which is enhanced by the background of the lofty Dolomite peaks.

Cortina has three ski-jumps: the Barone Franchetti, offering leaps of over 100 metres; the Balilla, jumps of 20 metres; and the practice jump at Zuel, about two miles from the town. The downhill "competition" track for speed events is one of the most important in the Alps, and a splendid new bobsleigh track, used for important international events, was completed a year ago. There is also a large rink for skating and hockey, and matches may be watched in comfort from the heated verandah of the pavilion.

Although Cortina is by far the most important winter sports resort in the Dolomites, there is no lack of other localities. Less renowned places, such as Ortisei, Santa Cristina and Selva in the Gardena Valley, San Martino di Castrozza, Madonna di Campiglio, Colle Isarco, Solda, San Vigilio di Marebbe, and scores of others, are scattered over the whole region. Most of them are over 5,000ft. above sea level.

With the exception of half-a-dozen or so centres, the winter sports resorts in the Alps and Dolomites are as yet little known beyond the confines of Italy, with the result that terms at hotels have not "sky-rocketed" to unreasonable heights; 12/6 per day is an average price at all but the "luxe" hotels. Skis can be hired for less than 1/- a day, and a really good pair can be purchased for a couple of guineas. A course of instruction (under experts who are members of the Italian Winter Sports Federation) costs 16/- for six days, and a book of 20 tickets for the skating rink at Cortina costs 7/-. Thus it will be seen that a winter sports holiday in Italy is an economical proposition.

OXFORD V. CAMBRIDGE.—For the first time half blues will be awarded for ski-ing on the results of a match between Oxford and Cambridge Universities, which is to take place at Sestriere. Each university will have five teams of five men. Mr. Donald Garrow will captain Oxford and Mr. Michael Muir, Cambridge. All told, between 100 and 150 students leave the two universities for Italy on December 5th, and on December 17th there will be downhill and slalom races between them and the Italian universities. The Oxford v. Cambridge event takes place from December 20th-22nd.

MISS BIRNIE DUTHIE, CAPTAIN OF THE BRITISH LADIES' SKI TEAM LAST SEASON, AND MISS EVELYN PINCHING, LADIES' WORLD CHAMPION IN 1936 AND NOW A SKI-ING PROFESSIONAL

NOT SO STEEP AS IT LOOKS

A bird's-eye view of a trailing party at St. Moritz

THE SKI-RACING SEASON

THIS season the World Ski Championships will be held from February 12th to 19th, at Zakopane, in Poland. It is hoped that Great Britain will enter teams, particularly in the ladies' events, since it was at Zakopane, in 1929, that a downhill race was included for the first time in the programme of a FIS Meeting. Downhill racing was still on trial, and the FIS Congress had refused official recognition to ladies' races. The British, therefore, decided to enter Miss Doreen Elliott and Miss Durell Sale-Barker for the men's race, of which the subsequent *Polish Ski Year Book* contained the following account:

"The race gave a good opportunity to the downhill race champions to show all their skill. The game was won by the Polish skier, Bronislaw Czech, who arrived a few seconds before the English champion, Bracken. The English team, as well as the Swiss, exhibited really high-class technical capacities in this type of race. The two English ladies who took part in it *hors concours* were the success of the day. They covered the course in really good time, coming 12th and 13th, and were warmly welcomed by the public." The results show that they beat 45 men.

The development of downhill racing has been extremely rapid, and the British no longer hold the lead they held in 1929, though an English girl, Miss Evelyn Pinching, won the Ladies' World Championship in 1936. Miss Pinching turned professional last season, but Miss Isobel Roe was tipped as a possible World Champion until she broke her leg last January. She hopes, however, to be able to race again this winter.

The performances of our teams last year at Engelberg were not encouraging, and the only competitor really up to the exacting standards of a modern FIS Meeting was J. Palmer-Tomkinson, who did not do himself justice. In these circumstances it is probable that the Ski Club of Great Britain will not go to the expense of sending full teams to Poland, but will almost certainly enter one or two competitors for the downhill events.

The Arlberg-Kandahar will be held at Mürren on March 18th and 19th. I understand that the use of that name depends on whether Hannes Schneider returns to St. Anton as head of his ski school or not. I was in St. Anton last March, just after Schneider was arrested a few days before the Arlberg-Kandahar should have been held. The Kandahar Ski Club immediately cancelled the race.

R. E. GARDNER RACING FOR THE DUKE OF KENT'S CUP AT WENGEN

ROBERT READHEAD, OXFORD CAPTAIN AND WINNER OF LAST YEAR'S ROBERTS OF KANDAHAR CUP; AND MISS PHILIPPA HARRISON, IN LAST YEAR'S BRITISH TEAM AND IN THE KANDAHAR LADIES' TEAM WHICH RACED IN NORWAY

Herr Schneider is an honorary member of the Kandahar and of the Ski Club of Great Britain, and it was largely due to his co-operation that the race which Mr. Arnold Lunn founded in 1928 had achieved its immense popularity and prestige. The Arlberg-Kandahar has been held in alternate years at Mürren and St. Anton, and I understand from the Kandahar Club that if Herr Schneider does not return the name of the race to be held in Mürren will be changed, and negotiations are already going forward with another club as to the venue of the race in 1940.

The Parsenn-Derby, which was also founded by an Englishman, Mr. Edlin, will be held at Davos on February 26th. The French Championships will take place at Superbagnères from March 2nd to 8th, and the Swiss Championships at Unterwasser from March 3rd to 5th. The ASAL, the University World Championships, in which the British have a good record, will be held from January 6th to 8th at Grindelwald, and Grindelwald has also been chosen by the Swiss Ladies' Ski Club for their meeting on January 14th and 15th. The Lauberhorn Cup will be raced for at Wengen on January 15th.

The Mürren T.T. Races were held for the first time last season, and consisted of races down each of the four courses on the Schiltgrat, which have been popularised by the erection of the new ski lift. The event was a great success, and will be held again this season on January 28th and 29th.

The British Ski Championship will be organised this year by the Downhill Only Club and held at Wengen on January 12th and 13th. After a brief career as an Open meeting the British Championship was closed again last year, when it was won by R. E. Gardner. Miss Isobel Roe won the Ladies' Championship. The Ladies' Ski Club Championship, won last year by Miss Jeannette Kessler, will be held at Wengen on January 3rd.

The Kandahar Ski Club announces a full programme of races in the Oberland, of which the most important event, after the Arlberg-Kandahar, is the Duke of Kent's Cup on January 8th at Grindelwald. This event, with its entry restricted to skiers from the lowlands and the towns, attracts a large entry.

Other important events include the Andrew Irving Slalom on December 27th and the Infante Alfonso Relay Race on December 31st at Mürren, the Prince Chichibu Cup on January 3rd and the Scaramanga Roped Race on January 6th at Grindelwald, the Roberts of Kandahar on January 5th and the Alpine Ski Slalom on January 16th at Wengen, and the Silver Ski on January 28th and the Arnold Lunn Cup on January 29th at Mürren.

THE ART OF GOOD LIVING

By ANDRÉ SIMON

"GOOD wine needs no bush" is a Horatian dictum still unchallenged after nearly two thousand years. But even if not in need of either bush or push, good wine demands, and repays, a great deal of care and consideration. Good wine never is so good as when we drink it in good company, from the right kind of glasses and with the right kind of food.

The company is the most difficult factor because it is the most uncertain: one is rarely quite free to ask none but the guests one would really like to dine and wine with. It may be that a delightful lady has a bore of a husband, or that your best man friend has a wife who either will smoke cigarettes between each course or else use such an abundance of scent or cosmetic that your wine will have no chance in her presence; and yet it is quite possible that you cannot or dare not invite the one without the other. Nor can you ever be certain of the mood in which every one of your guests will come to your party. Yet it is of the utmost importance that they should all be happy in each other's and your company, if the wine which you are to serve is to give the full measure of joy within its power.

Glasses are a much simpler proposition; true, they may, and some day or other they are sure to, be broken, but they can always be replaced. What is of great importance is to select glasses which in style and size are going to help you and your guests to enjoy your—and their—wine. One can do without glasses altogether; many people do so every day, but the wine which they drink straight from the bottle itself is the type of gargle wine which keeps the working classes of wine-growing lands working and happy: it is dark, strong and young wine, and it does them good, but it is not good wine.

Good wine must be drunk from a glass, and not from any glass, but a glass that will show off the colour of the wine, be it ruby or golden; one that will be large enough to hold a generous measure of wine, so that its delicate "bouquet" may be enjoyed to the full; one, also, that will be of flimsy and silky fabric and greet the lips in a lady-like manner.

There are people with more money than sense who serve wine in beautiful glasses absolutely admirable as works of art but quite useless as friends; a friend is he or she who can be depended upon for help in time of need. This is what the wineglass should be.

We do not shut out the light of the sun by using smoked glass windows, and we should never let our wineglasses spoil the sparkling, joyous colour of the bottled sunshine that is wine by their own artificial colourings. Only the purest white glasses are dependable friends; coloured glasses are mockers. As to small glasses, the miserably undersized misfits which one is obliged to face so often in private houses, are an insult to the spirit of hospitality and to good wine.

The friendly wineglass has room not only for a right measure of wine, but also for one's nose to bow, enter and pay due homage to the sweet aroma which all good wines offer so discreetly, sometimes so hesitatingly, and only to the deserving.

Yes, my darling daughter?

So that explains the decline and fall in Father's stock of Gold Flake. Of course, she's only one of many these days. Women have developed a liking for a man's cigarette. And a Wills's Gold Flake—*the* man's cigarette—certainly *is* something worth smoking. It has the distinctive flavour of really fine Virginia tobaccos. Look how men have been loyal to Gold Flake for years and years and years.

WILLS'S

GOLD FLAKE

is the man's cigarette that women like

N.B. You can get Wills's Gold Flake Cork-tipped as well as Plain. Ten for 6d. Twenty for 1/-

G.F.8. 592

FIFTY YEARS AGO

From the *Field* of November 24th, 1888.

HUNTING Dress. In the matter of boot tops "the tint which was supposed to be the result of applications of champagne, has now disappeared, and, with commendable taste, fashion to-day decrees in favour of a 'self' or light brown colour. Lord Alvanley alone has the credit of having adopted top-boots of a different cut, and he astonished all Leicestershire by coming out in boots of monstrous appearance. The father of the late Duke of Rutland, in consequence of an injury to his knee, wore one boot similar to those worn by the Household Cavalry: but Lord Alvanley came out in a pair of them, with the tops reaching far above his knees. 'The neat and conventional Napoleon' has, indeed, been recommended by one writer; but in a general way, black boots, though unquestionably much worn now, have been rather tabooed.

"'A cap for the chase' was gospel when Mr. Warburton wrote his song; but caps, on their re-appearance, had a comparatively short reign, going out of fashion, it is said, when the Marquis of Waterford met his death, having, as was reported, saved his head at the expense of his neck. The discomforts of a tall hat on a windy day are known to every hunting man; yet at the behest of fashion this headgear is worn with scarcely a murmur, and will continue to be until someone of mark has the moral courage to appear in a headdress more suited to hunting."

Game Guns. "On the advent of chokes it was commonly said that everyone in Scotland, almost to a man, started out with them, and there was never known such wretched marksmanship as in this their first year in the North. A friend of mine who has shot for 30 years in Scotland told me that when the first season of chokes was over, you could pick up a splendidly finished choke-bored gun at Paton's, the gunmakers, at Perth, for a mere song, so disgruntled were men with their want of success with the new weapon.* The sportsmen of the North no doubt realised that what they wanted was spread accompanied by velocity; in other words a good gun for getting game, namely, a first-class cylinder. PURPLE HEATHER."

[*The sportsmen who sold their splendidly-finished choke-bores for a mere song must have been very short-sighted individuals, seeing that the choke could have been so easily reduced, or taken out altogether.—ED.]

IN THE SALEROOM

THE sale of drawings and pictures at Christies on December 2nd merits more than usual attention, including, as it does, two original drawings, four printed drawings, seventeen wood blocks, and a set of electrotypes of William Blake. The original drawings are "The Infant Jesus Praying with Angels," 12¼in. by 13¾in., signed with initials; and a figure of a man, apparently intended for that of an Evangelist (perhaps St. John in Patmos), pencil on wood, 5in. by 3¼in. The wood blocks are the only ones that Blake ever cut, and, dated 1820–21, were for the woodcuts illustrating the First Eclogue of Dr. R. J. Thornton's Pastorals of Virgil. The pictures in this sale include works by Corot, "A Peasant Woman with Goat on a Sandy Road," 9¼in. by 7in.; Farquharson's "Winter Comes to Close the Varied Year," 28in. by 42in.; Crome's "Cottages Among Trees," on pane, 6¾in. by 6in.; J. F. Herring's "Horses and Pigs in a Farmyard"; and P. J. De Loutherbourg's "A Sea Fight by Night," 38in. by 50in.

On December 7th the final portion of the late Mrs. A. A. Watney Weguelin's casket of jewels is being dispersed at these rooms. The taste of the late owner of these lovely gems was undoubtedly very high, and the collection before dispersal must have been remarkable.

A NATURALIST'S NOTEBOOK

WHEN did gulls first commence flying in a V formation? Long, long ago, one would imagine, and yet I cannot find any reference to the habit in old books that I have consulted. One is apt to think that birds do not change their habits, but I cannot remember having noticed the V formation used by gulls until quite recently.

* * *

When I was a boy I lived, as it were, with gulls. They were part of my life, the background against which I played, and ate, and walked, and slept. In those days I knew gulls well, and I am quite certain that those gulls did not use the V formation in flight. I should certainly have noticed it had they done so; I should certainly not have felt any surprise when noticing the same thing many years later. But I was surprised when I first saw gulls—I cannot remember the date—flying in a V.

* * *

Even so, I cannot say that I have noticed it frequently until quite recently. Once or twice I have seen small V's following the Thames inland. But the other day in Hampshire I saw the V on a large scale.

* * *

The house where I was staying is some six miles inland—as the crow flies—and set upon a hill. Every morning, so soon as the first light was strengthening in the east, the gulls commenced coming in from the sea. They would pass for an hour or more, flying anyhow and higgledy-piggledy but swiftly and with purpose, on their way to the high downs behind the house. And in the evening, as the light commenced to fade, from about a quarter to four for about an hour, they would return over the garden on their way to the sea.

* * *

It was then, on two fine still evenings, that I noticed the V formation on a large scale for the first time in my life. The gulls came over in waves, all following the same line, all flying at approximately the same elevation, and each wave a V. Some were small V's, but some were large, and one had 60 or more birds in each arm. And I noticed, too, that the flight in this formation was swifter than is usual and much more steady. There was but a moment or two between each V, and I reckoned that in the space of an hour I saw some thousands of gulls fly over the garden.

* * *

And on the second fine evening it was the same. The gulls came over punctually at 3.45. The first V passed over and I watched it southwards—and then, about a quarter of a mile away, it suddenly broke up. There was a swirling, haphazard mass of gulls—a great fluttering of white handkerchiefs dipping and circling. The birds scattered, and before I had time to see if they would re-form, another V—a very large one—was overhead. At just the same spot as its predecessor this V broke up, and there was a mass of weaving, circling individuals in place of the ordered discipline of a moment before. And so with a third and a fourth. And then I noticed that in the distance the Vs re-formed.

* * *

And what made them break? A pocket in the air? Some strong current of air indiscernible to the human eye? And then high above them—and they had not been flying low—I saw a bird. A bird of prey, most obviously, and black in the evening light. I had no glasses—and no time to go and fetch some—and I could not say what bird it was. The flight soaring and circling always around that spot was buzzard-like, but it appeared even at that height too large a bird; and then high above it, so high that I should certainly not have noticed it in the ordinary way, was another with similar flight, but at that elevation no larger than a swallow. I do not know what birds they were. But they frightened some thousands of gulls.

* * *

The next three evenings were dull and cloudy, and there was some rain, and a strong blustery south-westerly wind. The gulls came at the same time. But they came in no order—now one, now two, now eighty, now ten—and they flew in leisurely manner, using the wind as gulls do and sweeping hither and thither, but always progressing due south.

* * *

The V formation was used only in fine, still weather and only in the evening. Rough weather meant individuality, and the morning obviously meant every bird for himself. It would be interesting to know why—or, as that will probably never be known, to hear if others have had a similar experience at any time. Is it normal for gulls on their journey back from the fields to use a V formation, and is this formation only used in fair weather? In other parts of the country, do the gulls fly to their feeding grounds in formation? And if they do, what part does the weather play in governing their actions? B. V-F.

LETTERS TO THE EDITOR

THE ARAB

SIR,—Mr. Clark is quite correct that all three foundation sires were Arabians. Turk was merely one of the old names for an Arab dating from the days when Syria (which was then the chief Arab horse marketing centre) was owned by Turkey.

If Mr. Bishop and "E. B. W." will read *Thoroughbred Racing Stock and its Ancestry*, recently published by Allen & Unwin, they will find the whole evidence carefully sifted and conclusive, together with authentic contemporary pictures of the three sires, showing them to have been unmistakably Arabian.

The trouble with most of the people who have argued on the subject is that they do not know the Arabian type when they see it, yet it is as impossible for an expert in Arabs to mistake an Arab for anything else, as for a Jersey cattle breeder to mistake a Jersey for a Shorthorn. The matter will be still further explained in my forthcoming book, *The Authentic Arabian Horse*.

It is absurd to call "Asil" the "champion Arab." He was receiving weight up to 1st. 7lb. from other Arabs on the only two occasions when he won. In all his other races he was beaten, not only by the T. B. Iambic, which was only natural, but by *other Arabs*, both at long and short distances.

Mr. Bishop will find much more recent and interesting records if he will study *Thoroughbred Racing Stock*, notably the world's record performance of a Crabbet Arab, which won the hardest 310-mile race in history, carrying 17st. 7lb., and competing against thoroughbreds in 1921. The following year, when Arabs were barred over a less difficult course, not a single horse finished out of seventeen starters, and the race was afterwards given up as too severe.

Again, Mr. Bishop will find that a horse by an indifferent T.B. sire out of a Crabbet Arabian mare won 22 races in England against thoroughbreds, was second nineteen times, and third twelve times. If he will look up the breeding of the wonderful steeple chaser Easter Hero and the descendants of the Arab mare Debora, he will find other records. Alfragan, son of a mare by Bend'or out of a Crabbet Arab won the Dee stakes in 1894, and the Drayton Highweight Handicap by six lengths at Goodwood.

These are only a few of hosts of races which demonstrate that the Arab is the only potential racehorse other than his descendant, the specialised racehorse. For this reason he is worth preserving. I cannot, however, quite agree with Mr. Clark that the time has yet come when we can afford to use Arab blood as a regenerator at a loss of speed. The time *may* come when we might be thankful for anything which would make our racehorse sounder and better tempered (and there certainly is nothing else which could do it); but meanwhile we must not forget Brown Jack and our very fine Grand National horses.

It is true that our horses cannot run off any number of four-mile heats in a week as they used to do, but even as stayers they still take some beating.

Yours faithfully,

Crabbet Park, WENTWORTH.
Poundhill, Crawley, Sussex.

THE CHAIN OF AN OTTER

SIR,—I read with interest the contribution in your issue of October 29th, concerning the origin of the "chains" arising from otters and other diving animals. I should like, however, to raise one or two points with regard to the evidence produced in support of this theory.

The theory takes, as its basis, the assumption that water, when violently compressed, tends to liberate gases from solution. Although, during at any rate normal changes in pressure, exactly the opposite occurs, the volume in solution decreasing with the pressure, it can still be argued that sudden depressions occur in the eddy behind the webs, during the propelling stroke. Whether these are sufficient to free gases is hard to say. Personal observations on fish, particularly pike, both accelerating when disturbed and boring while being played, have failed to show liberation of gas, although it is certain that the water is subjected to sudden and violent changes in pressure by the rapid movements of the caudal fin. On the other hand, I have seen moorhens produce distinct chains, on the same piece of water.

Comparable to that of the swimming animal and much more easily observed, is the effect of the marine propeller. It would be interesting to hear whether anyone has noticed a chain so produced, particularly by a boat in fresh water, as this would be strong supporting evidence.

Another point concerns the supply of gas available. The volume of water in the immediate vicinity of the web must necessarily be small, and, in consequence, it would have to contain a large quantity of gas per unit volume, if a noticeable chain was to be produced. I cannot give figures for the amount liable to be present under natural conditions; but they are available and could be obtained.

Your contributor expresses the belief that the lungs of the animals concerned would be incapable of containing the air necessary to produce the length of chain observed. I am not qualified to speak with regard to the otter, but, among birds, much of the body cavity is occupied by air sacs, into which the air is drawn through the lungs. It would seem quite reasonable to suppose that, if these sacs were filled at the surface, satisfactory respiration could be performed, while diving, by gradually passing the air out, through the lungs, to the nostrils. As the bubbles arising from a moorhen are very small, a long chain could be produced by a single deflation of the air sacs.

Yours faithfully,

Kirkcudbrightshire. D. B. R.

CANALISING THE AVON

SIR,—I have been interested in the correspondence in your columns on the work of the Catchment Board on the Upper Avon, and possibly a short account of a riparian owner's experience of the work of the board may be of interest. I have a garden frontage on the river, and the fishing rights over two adjoining meadows belong to a farmer—some three-quarters of a mile in all. The opposite bank is a water meadow belonging to the War Department.

The Catchment Board's workmen started early this spring digging the banks in the farmer's meadow without any word to him; they also started, unannounced, I understand, on the W.D. land. My first intimation was seeing a plank bridge being thrown across the river early one morning on to a flower-bed in my garden. The board's employees were perfectly courteous when remonstrated with, and moved the bridge to a more convenient spot. They did no harm to the garden during the number of weeks they used it as a right-of-way. The engineer to the board, when I wrote to him, restrained the gang from cutting down a large and ornamental willow, on my giving a formal undertaking to remove it from the river if it ever fell in. On the opposite bank some sixteen trees (all there were) were cut or dragged up by the roots with winch and tackle. Four of these were definitely liable to fall into the river, but the rest, to all appearance, were perfectly sound, and not in the least likely to do so for years. Their destruction was presumably lawful, but the result, from an artistic point of view, deplorable.

As regards the spoil from the river, the farmer was unable to give the services of a horse, cart and man for more than a week or so, consequently there still remains in one meadow along the edge of the stream an unlovely mound of mud some 300yds. long, being gradually overgrown with weeds. The river bed was hoed completely bare. The river weeds have grown again, but in the shallower stretches the rushes, instead of being in banks along the margin, have rooted in scattered clumps all over the stream. I am quite prepared to believe that the removal of much mud, fallen trees, old iron, &c., will be to the benefit of irrigation and, in the long run, of the fishing, though as regards the latter the immediate results are rather trying. For a month or so in a particular stretch there are no fish at all; as the work moves on they gradually return till there are more than usual, but the water is kept dead low, and except at week-ends, when the board's operations are suspended, it is, for several months, impossible to fish during most of the day owing to mud and floating weed. Perhaps this week-end respite accounts, in part, for the most ardent support of the board's methods, coming apparently from those who spend their week-ends only in the district; while the trend of opinion among others who have lived, and fished, on the river for years is not so enthusiastic.

Many questions suggest themselves to the lay mind—the mind, that is, of one who is not an irrigation engineer.

Why, for example, has the clearing started at the *top* of the Upper Avon? If the five miles of deepening and (*pace*, Mr. Bach in your issue of October 29th) widening proves effective next spring in drawing the flood water off the Enford meadows, what will happen in the next five miles down stream where the Netheravon and its meadows have as much flood water already as they can do with at such times? Would it not be more practical, where carriers duplicate the main stream, as they do for most of its length, for the board to clear these (as the farmers cannot, or do not) and make them available for excess water *when wanted*, rather than enlarge the main channel to such an extent that it will carry all the flood water during a few weeks, while for the rest of the year the river is shallow, with a sluggish stream, or is unduly draining the chalk hill reservoirs along its course.

Is it *really* an improvement to replace as a revetment to the stream a sound, upright willow holding the bank together by a clay slope? It may be necessary for the board to have power to remove any tree likely to fall into the river in the near future, but to fell, for instance, a stout willow 6ft. from the bank, but unfortunately within the legal limit, as I have seen done, seems to be exercising power without discretion.

Yours faithfully,

"The Grange," C. B. HARVEY.
Enford,
Marlborough.

SIR,—As to the work of the Catchment Board on the Upper Avon, which I have fished for some nine years, I am quite incompetent to express views either on the habits of trout or how the work of the Catchment Board affects them.

I do know, however, that at Endford the beauty of the river has been much spoilt, especially the stretch below Endford Bridge, by the cutting down of all the willows, and when work was being carried on it became quite useless to fish.

Yours faithfully,

The White House, S. C. WELCHMAN.
Market Lavington,
Wilts.

THE LITTLE OWL

SIR,—While on a large pheasant rearing field in Gloucestershire I had a splendid chance to study the habits and diet of the little owl closely. I also thoroughly discussed the matter with the practical minded keepers who were always ready to condemn the bird.

I think I can justly claim that the rearing field was the largest in Gloucestershire (18,000 birds were placed on the field), and when the total area was wired in it became unnecessary to shut the birds up at night, as the little owls were quick to discover.

The little owls had populated the district long before a site was chosen for the field, and I do not think their numbers increased unduly during our stay. No pheasants had been reared in the vicinity for at least 20 years, which is plain proof that the little owl does not rely solely on game chicks for food.

When the G.H.Q. has been fully established on the field it did not take us long to discover that the little owl does not ignore game chicks when obtainable. In fact, every little owl in the district must have eaten its fill of pheasant before any action could be taken (we were short-handed at the time). When action was taken many fell victims to the gun when found roosting in nearby trees during the daytime. I prided myself on having a nice lot of birds until I started to find small piles of feathers which told their own tale. Even when lamps were hung along one part of the wire (not for the little owls, but other vermin) and a regular night watchman engaged the killings were just as frequent.

Admitted game is not an essential part of the little owl's diet, but wherever game preservation is carried out on any scale, however large or small, the little owl is a danger to be reckoned with.

A wholesale persecution of the little owl would thin numbers out to such an extent that there would be a danger of its becoming extinct unless it could afterwards be once again put on the Protected List. In the event of this plan being adopted it would be continually on and off the Protected List at the discretion of the Home Office authorities.

Yours faithfully,

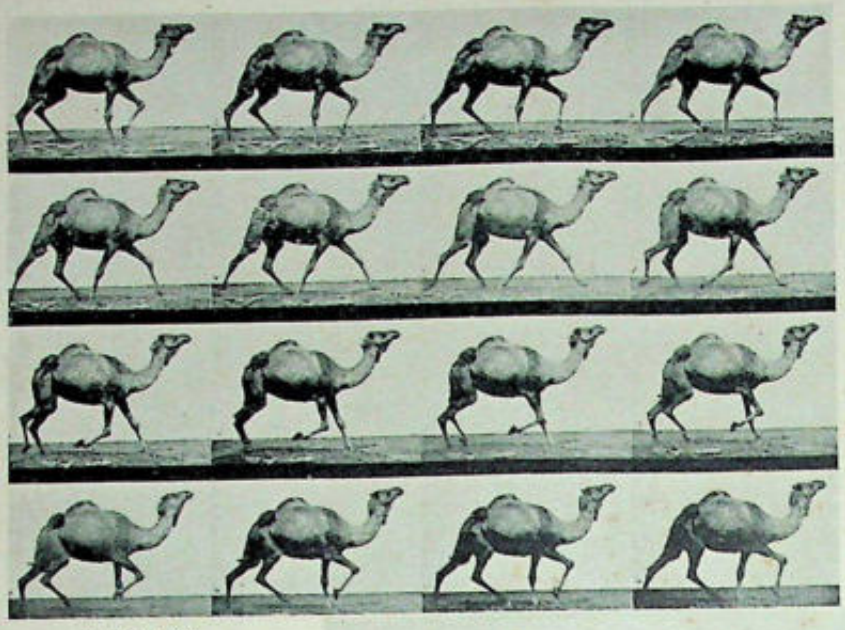
Somerset. GERALD SCOTT.

SIR,—For many years little owls have nested in a hollow tree close to my house, and have made this a base throughout the year. They have frequently been seen to take their prey on the lawn.

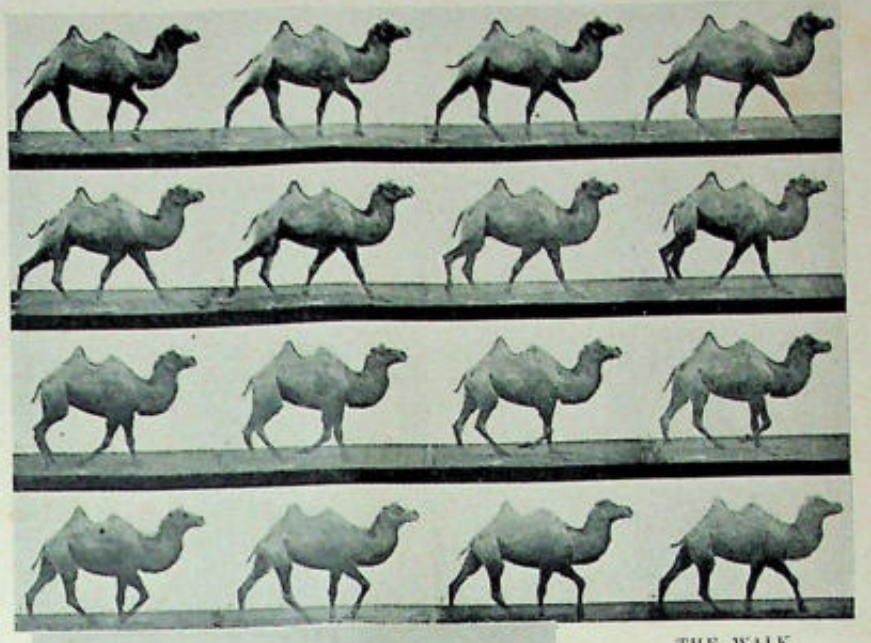
Mr. F. Gibson Phillips has, I think, the key to the subject of the bird's diet, when he says in his article in the *Field* (October 29th, 1938), that the birds he watched never went more than 150yds. My birds have a hunting ground of about fourteen acres outside of which I have not seen them, but they feed chiefly in that part of their territory which is nearest to the nest or base. They appear to take any suitable prey which is abroad during their hunting hours, and which they can seize upon the ground in this area. Usually they roost during the daytime in trees close to the base, but when they are nesting, and occasionally during exceptional weather conditions, the hunting period is extended up to 9.30 a.m. (in summer) and begins again at any time during the afternoon. Consequently, if game were reared upon this territory, during the time that the owls were feeding their young, I should expect them to take many of the pheasant chicks. On the other hand, I should not expect a rearing field outside their territory to be molested.

Yours faithfully,

Kent. R. E. PODMORE.



THE RACK
A half stride in fifteen phases



THE WALK
A half stride in fourteen phases

DIGNITY IN DEPORTMENT
(See letters "Movements of Camels")

MOVEMENTS OF CAMELS

SIR,—In reply to your correspondent Mr. C. W. Ingram, I should like to say that camels move by means of what is known as the rack. The rack is a gait natural to the camel, the giraffe, and some few other animals. To describe this gait I cannot do better than quote the words of Professor E. Muybridge, the greatest authority known on the movements of animals. He says: "In the rack, the legs of the animal are used in lateral pairs, instead of, as in the trot, diagonal pairs. The same uncertainty with regard to precedence of the fore or hind foot-impacts prevails in this gait, as in the trot; in contradistinction to the latter, priority is usually given in the rack to a hind-foot, this being so immediately followed by its lateral fore that, practically, they may be said to swing simultaneously."

Everyone who is interested in the movements of animals, &c., should get a copy of that wonderful book, *Animals in Motion*, by E. Muybridge; Chapman & Hall, Ltd. This extraordinary work, which took thirteen years to compile, can now be purchased at a very reasonable price. It puts at rest for all time discussions *re* how certain animals move, and is the standard book of reference for many animal artists.

At the time of writing I have not got here any of my own photographs of camels, &c., but am sending to you a collection of photographs by Professor Muybridge, from which selections can be made showing how both the ordinary Egyptian and the Bactrian camels move at a walk and a trot. In these pictures the lateral movement with two feet off the ground at one time on either side of the animals can be clearly seen.

Yours faithfully,
Forss House, Thurso. C. E. RADCLYFFE.

SIR,—I was interested to read the recent correspondence on the subject of the walk of the camel. Although I have lived among camels for some 20 years, I must admit I was under the impression that, though they trot by moving the two near legs and then the two off, they walk as other animals do. When I read Major Radclyffe's letter raising the question, I looked through a collection of photographs of the animals and enclose two that apparently solve the question and prove Major Radclyffe to be right. In both these photographs the camels are shown walking with the two legs on one side in movement, whilst the other two are on the ground.

Yours faithfully,
Chele Orchard, C. S. JARVIS.
Ringwood, Hants.

SIR,—It amused me to note the indignation caused by my letter on a horse's action. At the time you published it I was so busy with the L.A.F.S. that I did not know you had published what I sent you.

May I remark that the pictures you have published since illustrate my point admirably, *i.e.*, that the fore and hind on the same side are forward at the same time. By moving "together" that is what I meant. Not even the American pacer moves his fore and hind on the same side *at the same time*. It is always the hind foot which comes down first when going *forward*. The camel, mentioned by another correspondent, moves like the pacer, and incidentally like an Alsatian dog. The pace is very rhythmic, and many a time have I ridden the very comfortable American saddle pacers out in Virginia. By the way, one of your correspondents mentions a "running" pace. "Running" in U.S.A. means galloping. Perhaps he refers to another saddle pace, the "running walk," which is entirely different. There is also "the rack" and the "single foot," but in all these paces there is only a difference in "time" and not in the sequence of putting the feet down. I repeat, if anyone has the energy and patience to walk, trot, canter and jump on all fours they will discover why a four-legged animal moves like he does; for reasons of muscular reach and balance.

How do the people who believe in "diagonal" action account for the fault known as "forging"? Surely they do not suggest a horse does this with "diagonal" action? The same thing applies to "over-reaching."

I recently saw a picture of the Shetland foal in the children's zoo, running free without any interference from man. His two near-side legs are forward, while the two off-side ones are back. His weight is obviously mostly on his near hind and about to be transferred to his near fore, which is just coming down. The action of *two-legged* animals is diagonal, because there is vertical balance instead of horizontal. The girl who is chasing the animal in the picture has her weight on the "off hind" instead of "near hind," while her arms and legs show almost the same position as those of the pony. The pony is leaning to the near-side, however, while she is leaning to the right, both of them leaning to the side where the weight is being carried.

When I referred to the hackney's "pose," I did not infer he was stationary, but abnormally bent knees and hocks is not natural horse-action except in "sticky" ground or water or when taking off to jump. No racehorse bends them up, nor do the American trotters, who can beat the hackney round the track any time, and, unlike the hackney, the trotters never "break."

Yours faithfully,
London. ONLY A CHAUFFEUR.

[This correspondence is now closed. —ED.]

OYSTER'S SEX

SIR,—I fear that our native oyster (*Ostrea edulis*) was much maligned in your issue of October 29th, p. 1028. It was accused of "changing its sex three or four times *in a season*" (the italics are mine) "when it reaches manhood or womanhood, that is, when four or five years of age," and quite possibly insulted by the dictum, "What a dull monotonous life is the life of an oyster." If the oyster had a record of this kind, life would become truly hectic after the early tender years. There is undoubtedly enough adventure in the early days of roaming the seas, the metamorphosis into a baby oyster on a possibly precarious foothold, and the growing up to become an active male in one, two or three years according to the total warmth and feeding in the spot finally chosen. Then not long afterwards it changes into a prolific mother, but no sooner has it got rid of its young than it becomes almost immediately again, within a few weeks, a potential father. In following years both parental rôles may be undertaken annually, or less frequently if conditions are not good. But these activities, along with the getting and the quality of food—those universal anxieties—and the unknowable and disturbing changes in temperature and saltness of the water, are probably enough to render the life of the oyster anything but serene, apart from other considerations. Really, there is good reason to believe that the oyster's lot is not entirely a happy one.

Yours faithfully,
University, Liverpool. J. H. ORTON.

IT'S A GIFT!

Johnnie Walker has the gift of making finely-balanced whisky by skilful blending—so Johnnie Walker makes the perfect Christmas gift. Your wine-merchant or licensed dealer stocks special Christmas cases, containing 2, 3, 6 or 12 bottles of Johnnie Walker, ready for sending off to your friends.

JOHNNIE WALKER
walks away with it!

BORN 1820—STILL GOING STRONG

VICAR'S AUCTION

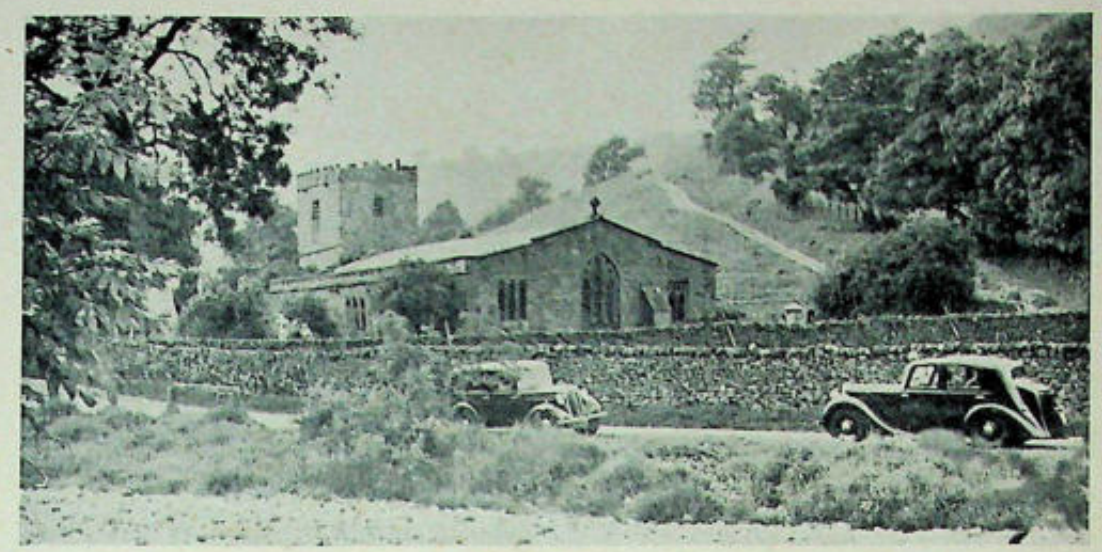
SIR,—I enclose a photograph of Hubberholme Church, Upper Wharfedale, Yorkshire, whose vicar actually becomes an auctioneer every New Year's Eve. Here is the story of the strange proceedings as given me by an old resident.

It is the vicar's duty to auction the "letting" of Poor's Pasture, a local piece of ground left in trust for the poor of the parish centuries ago. The auction takes place within "The George," the village's ancient inn, which belongs to the Ecclesiastical Commissioners. Two rooms are used for the auction. One is occupied by the vicar and his wardens, and is referred to as the "Lords"; the other room, known on this day of the year as the "Commons," is occupied by the farmers who assemble to bid for the "letting."

The auctioneer keeps visiting the "Commons" for bids, and the "letting" is, of course, knocked down to the highest bidder.

Before this ceremony a service in commemoration of the donor is held in the church. The Trust allows six shillings to the vicar for this part of the proceedings, while the innkeeper gets five shillings for the use of his rooms.

Yours faithfully,
Roundhay, Leeds. G. B. WOOD.



HUBBERHOLME CHURCH, THE SCENE OF A STRANGE CUSTOM
(See letter "Vicar's Auction")

WHALES OFF DEVON

SIR,—I was much interested in Mr. Budd's letter in the *Field* of October 29th, and his excellent photograph of the killer whales seen recently off the Devonshire coast. In August, 1928, and again in 1931, when I was salmon fishing at Campbell River on the East coast of Vancouver Island, schools of these monsters came on several occasions within half-a-mile of the mouth of the river. They were attracted by the annual run of Pacific salmon which come down this coast each August. It was an awesome sight to watch 20 or 30 killer whales tumbling about with their big black dorsal fins standing vertically out of the water, and through glasses we saw them actually seizing the salmon. As a rule they appeared several times during the six to eight weeks of the run of fish. Locally they were known as "black fish" or "killers," and their coming inevitably ruined our salmon-catching for a day or two. Their arrival was a signal for our guides to row us ashore. We were told that the killers did not attack boats, but their plungings had been known to cause accidental upsets.

Yours faithfully,
The Chine Hotel, Boscombe, Bournemouth. LEWIS SMITH.

LETTERS TO YOUNG SHOOTERS

SIR,—Some of your readers may recognise the following quotation: "Readiness to be content with half measures is the outward sign of inward decadence."

Uncle Ralph in the interesting letters to Young Shooters, seems to go perilously close to the above in his advice over the safety catch.

"Anything that makes for greater safety in shooting," he writes, "is obviously to the good, and if you can manipulate the safety catch to this good purpose, by all means do so."

"I do not consider it essential" (query the safety or the catch?).

"Many . . . would never in middle or old age get into the habit of pushing the safety catch forward as the gun comes up." (His letters ostensibly are addressed to *Young* Shooters.)

"To do so would inevitably lead to lost chances" (of hitting a bird or one of your companions?)

"The best known shooting school in England does not teach the putting forward of the safety catch as essential, though they do not pretend it is wrong or undesirable. (Half measures with a vengeance!)

For the benefit of any "Young Shooters" who are interested, may I remark that even if you do learn on hammer guns as I did myself, you can easily teach yourself to push the safety catch forward as the gun comes up to your shoulder *if* only you apply yourself to learn, *and* you need have no reason whatever to excuse "lost chances" for so doing.

You will, however have the pleasure of knowing you have done your best in this direction to become a "safe shot" by using a device for that end, provided for you by the skill and ingenuity of the gunmaker.

Yours faithfully,
Chorlton Hall, Malpas, Cheshire. D. H. BATES.

AN ALBINO GREY SQUIRREL

SIR,—You may be interested to hear that on a recent Saturday I shot a white squirrel, evidently an albino of the American grey squirrel. Of the latter I have already shot 54 this year on my small place of sixteen acres, which shows how they have overrun this part of Ashdown Forest.

Yours faithfully,
The Ridge, Coleman's Hatch, near Tunbridge Wells. CHAS. LEHMANN.

A DELIGHTFUL VIEW OF PARK RASH AT KETTLEWELL
(See letter "The Pennine Country of Yorkshire")

THE PENNINE COUNTRY OF YORKSHIRE

SIR,—In view of the recent proposals for the preservation of large areas of the lovely Pennine scenery of Yorkshire, including parts of Airedale and Upper Wharfedale, I think the enclosed picture may be of interest—showing part of the majestic type of hill country involved.

The picture gives a view of the famous Park Rash, the rough mountain road which has been the scene of innumerable motor cycle trials, and which runs from Kettlewell in Wharfedale over to Coverdale. This track skirts under the face of Great Whernside (2,310ft.) at a height of 1,600ft., indicating a rise of almost 1,000ft. in a distance of less than three miles out from Kettlewell.

There can be no doubt whatsoever that any measure for preserving such areas, which are so readily accessible from the large industrial districts of the West Riding, deserve the fullest possible support.

Yours faithfully,
Harrogate. BERTRAM UNNE.

KILLING GAME

SIR,—Your correspondent, "Puzzled," might try this way of killing a wounded pheasant. Hold the unloaded gun in left hand by the grip in front of the trigger guard, thumb under grip, finger round barrels, barrels pointing to the ground in front of shooter's feet, heel of butt towards shooter. Hold bird in right hand with lower breast in palm, fingers and thumb round body and both wings. Hold bird's head about 3 in. above heel of butt plate and bring back of skull down on heel of butt plate with a sharp rap. This fractures the skull and kills the bird instantly. The toe of a good heavy shooting boot may be used instead of the butt plate if the toe is lifted well up and heel pressed into ground with foot kept rigidly straight, but the butt plate is best.

Yours faithfully,
Connaught Club. J. W. H. SEPPINGS.

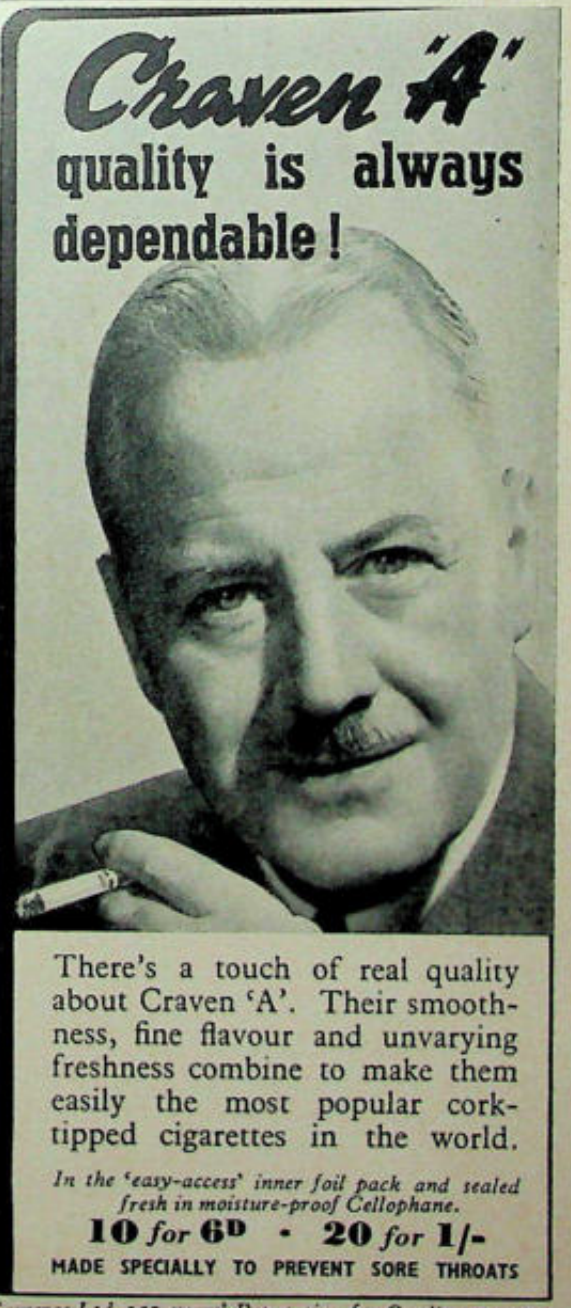
FOX KILLS CALF

SIR,—Can any of your readers give me any information on the subject of foxes killing new born calves?

I have had a case in which the farmer has lost four calves; in the first three he found the bodies partly eaten, and in the last case he actually saw a fox at the calf.

Luckily he showed it to a veterinary surgeon within a few hours, and his opinion was that the calf had been alive when or just before it was born, but it had no air in its lungs.

Yours faithfully,
London. WORRIED SECRETARY.



A MALFORMED STAG

SIR,—The enclosed photograph of a malformed stag's head, shot by Captain G. S. L. Whitelaw, on September 20th, 1937, may be of interest to the deer-stalking world. The measurements are: Length of each antler, 25in.; span, 18in.; beam, 6in. The hooked tops were the result of the antlers, when in velvet, coming in contact with the ground when the stag was feeding.

Yours faithfully,
Glenfeshie Lodge, Kincraig, Inverness-shire. D. MACDOUGALL.

BIRD SCARCITY

SIR,—I wonder if any of your readers can explain the scarcity of our common bird life about Torquay and neighbourhood despite the excellent cover afforded.

About Liverpool there is an abundance of all our common wild birds, while in Sefton Park, in the centre of the city, magpies and even the kingfisher and woodpecker are to be seen.

Yours faithfully,
Torquay. JAS. SNAID.

HOOKED THROUGH THE GILLS

SIR,—Mr. D. J. Reid asks if anyone has had an experience such as he had in catching a salmon with the fly having passed through the gills. My experience was almost more curious. Many years ago I was fishing on Loch Shin for trout with a cast of three tiny flies, and hooked a good fish which turned out to be a 7lb. grilse. To my surprise, when it was landed, I found the tail fly had passed through the gills and was firmly hooked into the back fin. This was 69 years ago, and I have forgotten whether it was also hooked in the mouth.

Yours faithfully,
Holt, Norfolk. A. H. UPCHER.

HUNTERS AT GRASS

SIR,—It may be of interest to your correspondent to have further particulars of this picture.

In the centre is Algiers, bay gelding, foaled 1816, sire Salamanca, dam Elizabeth, by Waxy. In water, Ballcury, bay gelding, foaled 1817, sire Osiris, dam Elizabeth. Left-hand side, Hainalt, chesnut gelding, foaled 1818, sire Osiris, dam Elizabeth. All were bred by William Wigram, Esq.

These particulars were given to me by John Wigram, Esq.

Yours faithfully,
The Grove, Ashbourne, Derbyshire. H. THACKERAY SCHWABE.

ONE RESULT OF FEEDING WITHOUT DUE CARE
(See letter "A Malformed Stag")

PRODUCER AND CONSUMER

SIR,—I have just seen Mr. Berlin's letter, "Producer and Consumer," in your issue of September 17th and should like to point out to him that farmers will agree that it can only be to the common good if it is possible to establish a community of interest amongst all. Unfortunately the farming industry feels (with some cause) that its interests have suffered for the benefit of other trade interests, and that they are being asked to compete with overseas producers whose standards of life, climatic conditions or political policies give us little chance of a square deal.

May I point out that his example of the B.B.C., whilst sound in theory, is in effect not practical, since the B.B.C. is not under direct government control, whilst agriculture is. For this reason there is no stability in policy.

In simple language farmers might be very much more contented with their lot if the industry were to be released from the political maelstrom and under the control (if control it must have) of some sort of permanent corporation with a number of practical agriculturists as members.

Yours faithfully,
Bodmin, Cornwall. V. A. JACKSON.

SPOONBILLS

SIR,—Further to my previous letter *re* spoonbills, it is pleasant to be able to record one at first-hand this time, on the same old route as last year, south-east, and at the same time in the early afternoon. This year on October 31st, last year on November 7th. The which affords a minor confirmation of my firm contention that *rare* birds are nearly all perennial visitors, if one is in the right place to catch them. And further to my previous arguments, as Mr. R. F. Moore has pointed out to me, Pembrokeshire, north-west of Devon, is a former nesting ground of spoonbills. This is suggestive—as is also the arrival of the first short-eared owl of the autumn the following day. Presuming this spoonbill to be on an ancestral migratory passage over Pembrokeshire, south-east to its winter territories, the question is, what was its line of flight from the north to Pembrokeshire, for its European nesting haunts do not extend, I believe, much farther north than Holland?

Presuming this bird to have continued on its south-east line of flight, it should have crossed the south coast somewhere in the region of Dartmouth. It would be interesting to hear whether a spoonbill has been seen anywhere on that part of the coast from November 1st onwards.

Yours faithfully,
North Devon. RICHARD PERRY.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—A little hunchback woman with a weak heart was left 10/- weekly by her late father, a cabinet maker. Her two widowed sisters are giving her 1/- a week each, and this 12/- is her entire income. She is at present in lodgings, where the landlady is kind and thoughtful for her, and it is her great desire to stay in this room, which with food and firing costs 20/- weekly. If anyone can imagine what life must be like to be born deformed, and after middle age to have to face real privation, will they please send us £26, that we may continue the 10/- weekly allowance we have been giving her.

The
CAPE COUNTRYSIDE
is *ablaze*
with WILD FLOWERS

THERE can be few more magnificent spectacles than the South African countryside when the wild flowers and shrubs are in bloom and the landscape is decked in a mantle of riotous colour.

The orchards and vineyards are now laden with fruit, and their sun-ripened crops add new significance to the pleasures of the table.

Visit South Africa and lay up a store of memories you will cherish throughout your life.

Consult your Travel Agent or the Travel Bureau, South Africa House, Trafalgar Square, London, W.C.2. Special steamer fares apply by certain sailings during Winter.

South Africa

IN THE CITY

By OUR CITY EDITOR

IT is frequently said that there is scarcely a town or hamlet in this country without someone residing there having an interest in rubber shares. Those who have followed the fortunes of the industry have experienced many disappointments. There have also been periods of hectic activity with substantial profits accruing to shareholders.

Unfortunately the average investor in rubber shares only buys when the market is booming. They are always left with shares on their hands when the inevitable reaction materialises. The shrewd operator buys when the market is virtually on its beam ends. He sells when conditions are good. That has been done over and over again with much success.

Just now rubber shares are hesitant. Production of rubber is under the control of the Rubber Regulation Committee. This committee was formed jointly by British and Dutch producers of rubber for the purpose of procuring a fair and equitable price for the commodity suitable for consumers and producers alike.

America is the largest consumer of rubber. The latest deterioration in the American trade adversely affected the rubber industry. Demand fell off and stocks piled up. The Regulation Committee stepped in and reduced the exportable quota of rubber production to 45 per cent. of standard. Quite recently it was decided that from next January the quota will be raised to 50 per cent. of standard.

Stocks are already too heavy, was the comment of dealers in raw rubber. An increase in exports will make the position worse. The producers in their turn say that a 50 per cent. quota is better for them as long as the price does not fall below 8d. a lb. A larger output will reduce overhead charges and lead to the employment of more labour. There is also a ray of hope for the industry in evidence of reviving industry in the United States.

Many I find who consider the time is opportune to purchase rubber shares. It is realised that dividends this year must in many cases be less than a year ago. Dividend cuts are probably discounted by present share values. The buyer must be prepared to exercise patience, but in a twelvemonth from now it is probable that the rubber market will be well on the road to a fresh recovery.

Company Meeting.

HAWKER SIDDELEY AIRCRAFT

THE third ordinary general meeting of the Hawker Siddeley Aircraft Company, Ltd., was held on November 21st.

Mr. T. O. M. Sopwith, C.B.E., F.R.Ae.S., the chairman, said stock and work in progress on July 31st amounted to £6,397,875, compared with £4,287,843 on the same day last year, and the volume of work was being increased from week to week.

The revenue for the year was £821,953, and the directors recommended a final dividend of 17½ per cent., together with a cash bonus of 10 per cent., both less tax, making a total on the ordinary shares of 32½ per cent. with a cash bonus of 10 per cent., both less tax, carrying forward £108,190.

The year had in many respects been difficult for everybody. The automobile section was affected by prevalent depression, but the new models this year were better than any they had yet produced.

Their export trade, which they regarded as of paramount importance, had been an appreciable asset and one which they would continue to develop.

The directors were very proud of the way in which the operating companies had gone to work and of the satisfactory proportion of aircraft produced. The Secretary for Air recently announced that orders had been given on behalf of the Government for the erection and equipment of two factories, at Manchester and Gloucester, at a cost of over £2,000,000, to be operated by two of the subsidiary companies, a tribute to the proved productive ability of A. V. Roe & Co. and Gloster Aircraft Co.

The programme of the immediate future was one of the utmost importance for the country. The board proposed to raise further capital so that, whatever the demands of the Government might be, private enterprise would be in a position to meet those demands in the most economical, speedy and efficient manner.

The order book was of very considerable magnitude. The extra manufacturing capacity, plant and equipment, were provided by the Government, and this company would occupy these factories on a mutually agreed rental basis by arrangement with the Air Ministry.

It was imperative that the group should be adequately provided with funds to finance the work in progress, not only in the new factories but also the additional output in those existing. The directors therefore sought permission to create £5,000,000 of short-term first debenture stock, of which it was proposed to issue £3,500,000 now and the balance as and when required.

The report and accounts were unanimously adopted, and the proposed borrowing sanctioned.

ALL THE WORLD IS A CAGE

A Book on Zoos and Life in General

Zoo. By LOUIS MCNEICE. (Michael Joseph ; 10/6.)

I DO not really know how to define this book. Mr. McNeice in almost his last paragraph makes the discovery, and a depressing one to him, that his book has been announced under the title Belles-lettres. He objects, saying that "the belletrist is interested in writing rather than in what he writes about. Whereas I am, and always have been, very interested in zoos and in animals, and also in the people who look at them." It seems to me that if Mr. McNeice is interested in zoos and animals he has not confined his attentions to them and the book is a very much happy-go-lucky, go-as-you-please affair. He has hung on to the zoo a quantity of very delightful meditation. He is not, I think, concerned with writing in the sense in which belles-lettres are written so much as in meditating. But it would be utterly wrong to suggest that he meditates only for the zoos and animals and the people that go to zoos to watch the animals. He puts down anything that comes into his head, an afternoon watching lawn tennis at Wimbledon, a visit to Belfast, anything. If this is not writing for the love of writing in the belles-lettres manner, it is writing for the love of writing in another, but very similar form, and the visits to the zoo (on which the writer is not and does not pretend to be an expert in the technical sense) are merely excuses.

The best chapters in fact are those which do not deal with the zoo. These chapters—in particular that on the visit to Belfast and that entitled "Zoos in Paris"—are much more firmly welded and have a much greater descriptive power than those which deal with the zoo. Mr. McNeice paid a succession of visits to the Zoological Gardens in the course of last summer. He tells us something about the history of the zoo and something about its architecture and its planning, quite a lot about its relation to the rest of London life, and a great deal about the things he noticed both about the animals and the people on various visits. I cannot say that I gained very much knowledge from the descriptions of these visits. They contain, indeed, a great many observations of no particular importance, and one has, as it were, continually to retrace one's steps in order to pick them up.

That all sounds like carping and criticism. And perhaps it is. I can only say that I read the book at a sitting, and that I have read it twice since. I have no doubt that I shall read it several more times, and no doubt at all that I shall buy one or two more copies this Christmas to give away. The writing is delightful. I should hesitate to say that Mr. McNeice has a style in prose composition, but he definitely has an atmosphere, he is witty and observant, and one or two of his descriptive passages attain heights seldom reached in modern English literature. And there are some delightful illustrations by Margery Sharpe. It is an inconsequent book and it is a happy one. It is in fact a volume of belles-lettres and a very good one. Mr. McNeice should amuse many people this Christmas.

* * * *

Serengeti. By AUDREY MOORE. (*Country Life* ; 10/6.)

This charming and unpretentious little book is written by the wife of the Game Ranger in charge of the New Serengeti National Park, in Northern Tanganyika. It draws a most sympathetic picture of the birds and beasts of that halcyon area, without ever descending to the saccharine sentiment of the pets' corner. In particular, the accounts of the lions are delightful. "Simon was greatly bothered by his family. There were far too many of them, and if one of the lionesses, or Simon himself for that matter, killed, there were twenty-seven mouths to fill before he even had a look at the meal. The lionesses were always squabbling amongst themselves, and poor Simon was tried beyond words by their quarrelings. Should one lioness come and rub herself against him caressingly, another would sure to be at her heels clawing angrily at her flanks, and Simon hated being fought over."

But from the point of view of the preservationist, far the most important chapter is that on native hunting. It discloses a state of things to the general public which has long been common knowledge to the sophisticated. Coming from such a source, the facts cannot be gainsaid.

There can be no doubt that the laws of the Territory as regards native hunting are being openly flouted. We have had some experience of allowing this sort of thing in Palestine. Are we to allow it, in fortunately different circumstances, in Tanganyika ? Would the Germans allow it ? We are trustees for the native, and if we are allowing him to dissipate his capital we have betrayed our trust, and where meat is necessary to him there will soon be none left.

The book is illustrated by a number of first-class animal photographs, and I heartily recommend it. Within its limited scope it is first class. M. T. S.

Tackle Making for Anglers. By L. VERNON BATES. (Herbert Jenkins ; 10/6.)

Anglers who like to occupy the winter months in the pleasant handicraft of rod or tackle making will give Mr. Bates's book a ready welcome. He does not go into the details of rod making "from the wood," so to speak, but suggests that rod joints in the rough can be obtained and then pared down by the amateur rod maker to obtain the particular action he likes. He gives detailed instructions on how to fit the ferrules, winch fittings, and so forth, the best method of fastening off whippings, and everything for making the rod complete. His instructions on making split-cane rods seem to be rather too indefinite to be of much service to the would-be maker.

Rods, however, are only one of the angler's necessaries, and there is much useful information on making up spinning flights, bait tackles, dressing flies, making floats, and a dozen other items which should prove very useful. Most anglers like to devise "something different," and this book should put them in the way of it. H. D. T.

Who Has a Dog ? By REGINALD ST.-JOHNSTON. (Chapman & Hall ; 7/6.)

For all those who love dogs—and their name is legion—this book will have an instant appeal. I am, unfortunately, one of those city dwellers who, owing to lack of suitable accommodation and opportunity for exercise, am unable to keep a dog. But these stories by one who knows and understands them brought back to me many happy memories of the days when I, too, owned or was owned by a dog. There are twelve of these stories and each one has for its central figure a dog of one of the better-known breeds. What impresses me most about the whole book is that the yarns, admittedly fiction, are so very true to life. Call me sentimental if you will ; but after reading such a book I have an almost irresistible urge to visit the nearest kennels and once again to purchase some little ball of pink-tongued puppyhood—and to blazes with the drawing-room carpet ! V. R.

* * * *

A Sportsman Looks Back. By J. P. BEAVEN. (*Wiltshire Times*, Trowbridge ; 10/6 net.)

This book got me into considerable trouble. I started to review it after tea and had almost reached the end when the telephone bell rang and a distinctly chilly voice said, "So sorry you weren't able to come to my party." I wanted to go to that party very much. Mr. Beaven's book is the cause of my forgetfulness. Here, then, are the reminiscences of a sportsman for sportsmen, and an almost perfect dedication. Well done, Mr. Beaven. C. D.

Prisoner in the Forbidden Land. By GUSTAV KRIST. (Faber ; 10/6.)

When *Alone Through the Forbidden Land* was published last spring it was an instantaneous success. Its praises were sung then in the *Field*, and there is no need to repeat them. Gustav Krist did not live to know of his achievement, for he had already passed on to join the ranks in the unforbidden land, and his death is a great loss to literature. But he did write another book, and that has now been translated by E. O. Lorimer with the same perfect touch that distinguished the earlier work. This is the story of Gustav Krist's imprisonment in Russia during the Great War. The truth is vouched for, but that is not necessary : every page rings truth. It is a tale which will appal and yet enthrall ; the horrors of war, the horrors of a prisoner of war in a land where everything is hostile, are portrayed in simple forceful language. The loss of such a brilliant and yet completely unambitious writer cannot be estimated. Krist was a man who went through his afflictions and his years with a simple faith. Probably he never realised that, still less would he believe that, he has left this faith in tangible and beautiful form. He has done more than write a memorial, he has left a spirit to warm and cheer his fellow beings—whether allies or foes—who remember the years 1914–18. It is such a spirit which shows the complete and utter futility of war. C. N.

Canoe Country. By FLORENCE PAGE JAQUES, with illustrations by Francis Lee Jaques. (The University of Minnesota Press, $2.50, or Humphrey Milford ; 11/6.)

If you want to capture the sensation of "being along" on a canoe journey, then I recommend this book to you. Mrs. Jaques does not tell of hair-raising adventures, which so often seem a little too well painted to be real, but rather of simple things—a moose discovered at his bath, a young kingfisher pretending to be an austere and steady fisherman, tiny wood mice clearing the crumbs—things, indeed, which would thrill the ordinary townsman more than the veteran hunter.

The fact that Mr. and Mrs. Jaques started their trip at Winton and were always in the State of Minnesota need not make the English canoeist feel that this is not a book for him. He will find much in it of interest to him, and it may well be that he will discover some sound advice in *Canoe Country*. Contrasting the quietness of Crooked Lake with the noise of New York City, Mrs. Jaques writes : "No despairs are here. And no man-made dangers. The bright eyes of the beasts need only look for their natural enemies, and we ourselves can forget all the world's turmoils and antagonisms. . . ."

Forget all the world's turmoils and antagonisms ! Is not that so of any voyage on a quiet river ? Yet how many canoeists have realised it ?

This book, even for its splendid illustrations alone, would make a most pleasant Christmas present for anyone fond of river journeys. It is not big and it is not a classic, but there is a grand note of sincerity about both text and illustrations. W. G. L.

BOOKS IN BRIEF

Most children will love *Scrap*, by J. IVESTER LLOYD (John Murray ; 5/-). They will also learn much by doing so. "Scrap" is a terrier, a little dog who had some great adventures and a large variety of friends. Country ways, love of animals and what a true sportsman should really be, are some of the things this author shows so wisely, and never becoming "pi" in the transaction. A further charm is added to the book by Mr. Ivester Lloyd's pen-and-ink sketches.

India from the point of view of a district officer is the subject of *Impressions of an Indian Civil Servant*, by R. D. MACLEOD, I.C.S. (Witherby ; 10/6). "This book," the author writes, "is neither a collection of personal reminiscences nor a systematic treatise, but an attempt to convey to the reader the general impressions carried away by me from India and to interpret certain subsequent events in the light of those impressions." The author is well qualified to speak about India—he spent 23 years in the United Provinces of Agra and Oudh. He gives an unusually conscientious and detailed account of India to-day, and one which cannot fail to be of value to civil servants in whatever part of the land they are serving ; but even more useful will this book be to those who are about to start their work in India.

A very realistic sea story of the sailing days is *Maiden Voyage*, by R. L. DEARDEN (Herbert Jenkins ; 7/6). This is the tale of a record breaking maiden voyage from the Clyde to Sydney in 69½ days. Time enough for adventures on the High Seas ! Hurricanes, mutiny, blackmail—but also a honeymoon which likewise to the ship passed through storms to a safe and sunny port.

Salween, by RONALD KAULBACK.—We are authorised by Mr. Ronald Kaulback's solicitor to state that a regrettable printer's error has occurred in the last word of line 20, page 252, of Mr. Ronald Kaulback's book *Salween*. The word in question should read "colitis." All copies not already in circulation have had the necessary alteration made.

IN TOUCH

The First Harlequin Defeat

NOT only was the recent match between Richmond and the Harlequins exciting to watch, but it taught interesting lessons to those who cared to assimilate them.

There was bound to be plenty of spirit shown, for the fixture always draws a large crowd, while on the field there is a healthy rivalry between the two clubs. None the less, when I went to the match, I was doubtful as to whether there would be much more than the spirit, for I had already seen the Harlequins scramble to victory against a most indifferent Cambridge side, while Richmond were even more unconvincing when I saw them play Gloucester.

Pessimism was soon dispelled. Coming events cast their shadows before them, and although the first 20 minutes of play could not have been described as brilliant football, there were signs right from the kick-off of thrills to follow.

The results of undue carefulness and fear of the opponents' ability were obvious at once. For some time there were ample periods for conversation among the spectators, neither side daring to let go and drive hard for the enemy line. Stage fright is not confined to theatres. Sportsmen often have bad attacks, and it is this that sometimes makes the play of promising men so disappointing in important matches even though they may have given magnificent performances during minor fixtures.

So it was, at first, on this occasion. The clouds were gathering, however, and the desultory clapping and shouting round the touch-lines was as thunder giving warning of the storm to break. Break it did. It was started by R. G. Oxborrow, the Richmond stand-off half, who, playing a magnificent game, proved himself to be a coming man. His run took the ball almost to the gates of victory, but a reply was soon forthcoming for the 'Quins, for B. E. Nicholson, another excellent player, grabbed the ball and, boring his way through a rift in the Richmond defences, took the struggle back to the enemy half. Whether C. M. Squire, the Richmond full back, would have stopped the effort or not is a matter ever to go undecided, for a scrummage was ordered as the result of a forward pass to M. J. Daly.

Now, what had been done of a spectacular nature so far was very largely due to the men behind the pack. That obviously could not last, because the 'Quins have built up a name for forward play in recent years, while this season Richmond have put a pack into the field which needs due care and circumspect handling. Richmond had the best of the set scrummages for a while, though at times the tide turned to Harlequin advantage, but in the loose there was no question as to the superior forwards. Charles Laborde and his supporters were magnificent. I cannot refrain from putting it that way, not from any wish to minimise the praise for the pack in general, but more from a desire to render adequate homage to Laborde.

It may be personal sentiment, but I am certain that in the modern game an even greater measure of responsibility, either for victory or defeat, rests with the eight forwards than with those behind them. Certainly it appeared so on this occasion, and it was Laborde who brought the first figures on to the score board, in effect if not in name. There is something rather awe-inspiring about him when in action. His arms slightly bent, his head well down, and the ball bobbing and leaping at his feet, he appears to bear down on the opposition somewhat after the manner of a tank—straight and irresistible. The results are also similar, he reaches his destination leaving a trail of fallen opponents in his wake.

Laborde was not alone in his vigorous earnestness, and perhaps his most stalwart supporters were Cambridge and the Church. The latter, in the form of the Rev. D. M. Harper, seemed to be in a much overheated state for most of the game, but this appeared to have little effect on his enthusiasm. Harper is not new to the Richmond side, but the Cambridge player, L. E. Grose, is. I can only say that unless he has blossomed overnight, so to speak, I marvel at his long absence from the University side. Surely Cambridge did not consider their pack so good as to go without his services. Always where he was wanted he was, in an unostentatious way, one of the best forwards of the match, though when he played for his University the following week against Blackheath, he seemed to have lost much of his vigour and versatility.

After the first Laborde episode—and there were numerous others—the Harlequins replied by sending Nicholson over the line in the corner and the score stood at 3-all, neither try being converted. Shortly before half-time Cooke (Richmond's scrum half) broke clear and bolted diagonally for the corner at high speed, and, evading Napper, managed to run round and touch down under the posts—a final touch which brought an extra two points to the score.

The 'Quins, rallying fiercely, drove Richmond right back to their "25," and it was pitch and toss as to the final result, when a glorious piece of rugby smashed Harlequin hopes. Oxborrow broke away with the ball and streaked down field, later passing to his full back, Squire, who, remembering his three-quarter days, ran with remarkable speed for the line. He was caught and tackled before he reached it and despairingly threw a long pass as he fell to Warr, who took a difficult ball at his knees and went over to gain a well-deserved try. The score rose again when Butler made a blind pass near his own "25" line and paid the penalty in full, for Oxborrow intercepted it and was over in a trice.

The 'Quins stuck at it to the end, and were rewarded for their fidelity by an unconverted try, which emerged from the midst of a mob of players in the corner farthest away from my seat. Who scored it I am not certain, but Press Box opinion favoured M. J. Daly, and thus M. J. Daly it appeared in Monday's papers either by frank statement or by implication, according to the style of the paper concerned.

Thus it was that the Harlequins received their first beating this season—and a very good trouncing, too, for the score read 18—6 at the final whistle. It was a fine game played cleanly and intelligently, and the teams atoned for the dull afternoons they had provided for me earlier in the season.

But in their next match, which was against Oxford last Saturday, the Harlequins were as dull as could be, and their opponents no better. The 'Quins won—by penalty kicks—but they did not play any better football than Oxford, and Oxford played bad football.

SUSPENDED MOTION

A Richmond player at full stretch in an attempt to break away with the ball at his feet, during the Richmond v. Harlequins match

FROM TEE TO GREEN

IV.—The Powerful Irons

By E. R. TIPPLE

MANY golfers have been taught, and many more believe, that they should use a different swing for the iron clubs than that employed for the woods. Nowadays the experts are agreed that this is not necessary. The differences between iron and wooden club play are not as great as some imagine. What differences there are can be mastered by any player, and there is no need to alter the basic principles of the swing. Those who use different swings for the various clubs are only making the game more difficult for themselves.

Slight modifications are, of course, essential. With the irons the swing must be shorter and as compact as possible. With the wooden clubs the golfer endeavours to sweep the ball away, whilst with the irons it has to be punched, the stroke is more of a hit, but even so it can and must be rhythmical. The three-quarter swing seems to meet with general approval and is the one usually adopted. If you over-swing with the irons you not only lose control but power as well.

Mitchell maintains that over-swinging—certainly one of the commonest of faults—is caused by slack knees. "To play an iron well one must hang on fiercely with the knees. One of the great secrets of the game is to control the swing with the knees, for by so doing we keep the weight behind the ball, flowing naturally into the stroke and we avoid the fatal habit of 'going round the corner.' Your legs are your best ally in this game not your arms and wrists." To test this method he advises us to take up our stance and wind the knees towards the hole and hold them there as we take back the club. It will be found that the back swing is restricted, "that the club is tugging at the left shoulder and that the muscles under the left arm are at full stretch. The arms will, of course, go behind the body, but the left shoulder should take the strain firmly."

The first point, then, about iron play is to restrict the back swing. If at present the iron clubs are giving you trouble check your back swing and make certain that you are in control at the top of the swing. All the really outstanding exponents of iron play—R. T. Jones, J. D. Armour, Sarazen, Cotton, Duncan, Mitchell and Roger Wethered—take the club back a comparatively short way, they punch the ball but never snatch, and, throughout the entire stroke, preserve perfect balance.

The question of the correct stance for the irons arouses some controversy. Which shall it be—a square, shut or open stance? I know many of the finest players adopt a square stance, some professionals even use the shut, right foot behind the left, but the easiest and most dependable of the three is the open. Most of the experts I have asked advise this chiefly because it makes the follow through more easy. The position of the ball should naturally be further back, more towards the right foot. Some suggest a point opposite about the middle of the distance between the feet, others rather nearer the left heel. It must always be remembered that in an iron shot the ball must be hit a downward blow. Ball first, then turf. And as J. H. Taylor has said, "Be sure to let the arms go well through in the line of play and don't pull them through to the left."

For the wooden clubs we are told to have the weight balanced evenly between the feet. For the irons the weight must be left more on the left foot—as Mitchell puts it "Be heavy on the left foot throughout." If this is observed in the address when you start the back swing the weight is transferred to the right then back to the left as the club is swung down and the correct hitting position is achieved. Here is what Roger Wethered says: "In addition to placing the weight more forward at the beginning of the stroke, a slightly more upright swing will have to be adopted than was advised in driving. If the club is taken back too much round the legs and is brought down in the same plane the swing cannot be directed downwards when the time arrives to hit at the ball. Otherwise no appreciable change of style takes place."

No alteration in the grip is necessary except that the player should be sure that he is holding the club firmly, particularly with the last fingers of the left hand. If a firm grip is not maintained the club may turn as you strike the ball or even at the top of the swing, and the subsequent shot will be ruined. Cotton thinks that we should keep our hands closer to the body than when we are driving. "I find," he says, "that in playing an iron shot it helps considerably to keep the back of the left hand towards the hole, and the left wrist a little higher than usual. You do that by arching it; this should give the shot a feeling of firmness."

A feature of Cotton's iron play this year impressed me, and that was the way he hit the ball high into the air with his iron clubs. He played as if he wanted the ball to pitch almost beyond the hole. His shots would fly high up into the air and stop dead near their pitch marks. They carried the full distance, and he did not rely on any run of the ball as did most of his competitors. We should all learn this lesson and remember that even when we are playing a No. 2 iron the object should be for the ball to carry to the green and pitch on it. If we did this we would be more accurate and not so inclined to be short.

In the modern matched sets of irons a No. 1 is included. I agree entirely with Abe Mitchell in disliking this club. The average No. 1 iron is too difficult for the ordinary golfer to use properly. The blade is invariably deep, and there is very little left on the face, so that one can rarely be confident with it. It gives one a horrible feeling that the shot will be smothered. A club, with a more shallow face, is preferable. The manufacturer of my own set includes a "plus two" instead of a No. 1, and this club, with just that extra loft, is more suitable. The average golfer would be wise to discard his No. 1 and substitute such a club or even to be content with an ordinary No. 2.

BERBERIS PRATTI WITH EVERY STEM LOADED DOWN WITH BERRIES IS A PICTURESQUE SIGHT IN THE AUTUMN GARDEN

The Country House

BERRIED SHRUBS

The Importance of a Natural Setting

By ELEANOUR SINCLAIR ROHDE

ALTHOUGH the cult for berried shrubs, which figure so prominently at autumn shows, is a comparatively modern development, country folk have always been appreciative of their beauty. Our native berried trees and shrubs can hold their own with any foreign kinds cultivated in gardens, but the trouble with the former is that they need their natural setting to show off their beauty to perfection. The Rowan, for instance, never looks at home in a garden, for it needs a Highland glen; our native Guelder Rose (*Viburnum opulus*), with even more richly coloured berries than those of any Berberis, only looks its best when associated with Old Man's Beard (*Clematis vitalba*) and other hedgerow shrubs.

Certain native shrubs are admirably suited to cultivation, however, particularly the Sea Buckthorn, the Common Spindle and Sweetbriar. A hedge of Sea Buckthorn (*Hippophæ rhamnoides*) with masses of Montbretias in the foreground is an unforgettable sight, for the rich orange of the berries clustered like thick bracelets on the stems are perfectly enhanced by the touches of scarlet on the Montbretia flowers. Sea Buckthorn will flourish in any soil, and the berries are so acid that no bird will touch them. This shrub is unisexual, so both male and female have to be planted if berries are wanted, allowing one male to every six female plants. The common Spindle (*Euonymus europæus*) is as decorative in the garden as in the hedgerow. Sweetbriar if left unpruned is lovely all through the winter, for unlike most species Roses the berries are left untouched by the birds and uninjured by frosts. To the end of February their long arching growths, 14ft. to 20ft. long, are hung with scarlet berries looking like fairy lanterns.

To my thinking Sweetbriar makes the perfect hedge for a small "garden enclosed," for there is no season when this native shrub is not beautiful. All through spring, summer and autumn there is the delicious scent of the leaves; in June it is starred with its lovely flowers, and throughout winter its scarlet berries are a feast of colour. I am making a small square "garden enclosed" hedged with Sweetbriar, and am filling the bed all round with aromatic old-fashioned herbs such as Bergamot, Hyssop Balm, Catmint, &c., and the round bed in the centre with China Monthly Roses, and the paved path round this centre bed will have the various creeping Thymes in the interstices.

Many of the species Roses are strikingly beautiful in berry, particularly *R. pomifera*, *R. Wintonensis*, *R. Moyesii*, *R. Davidii* and *R. holodonta*. Unlike Sweetbriar, however, the fruits of these are quickly affected by frost, and the birds are all very appreciative of them.

A shrub that I wonder is not more commonly grown for its beauty in berry is *Symphoricarpus racemosus lævigatus*. The type *S. racemosus* is a poor weed and not worth the space it occupies, but *S. r. lævigatus*, with every stem loaded down with berries the size of large cherries, is an unforgettable sight. The berries are delightful for indoor decoration. This shrub flourishes on any soil, and in shade as well as full sun.

Amongst the best hybrid Roses for berried beauty are Cupid and Una. The former has clusters of very large bronze-green berries that polish as well as apples and are very effective mixed with autumn foliage for indoor decoration. Una has flaming orange berries that do not ripen till quite mid-December and remain lovely for weeks on end.

The Thorns are in the first rank of handsome berried shrubs, one of the best being *Crataegus cordata*, noted for the vivid scarlet of its autumn colouring and the vermilion of its berries. The taller and altogether larger "Red Haw" is an old favourite, for not only is it beautiful in autumn with its downy cherry-like fruits, but in spring it is equally lovely, its flowers measuring quite an inch across. Unfortunately, its fruits do not last much after mid-October. The Cockspur Thorn (*C. crus-galli*) is always decorative, for its autumn foliage, coral and red berries remain on till spring and its ferocious-looking thorns add to its appearance. The Scarlet Haw (*C. coccinea*) makes an attractive tree about 15ft. high, and keeps its berries well into winter, but not so long as *C. crus-galli*.

In southern parts the Pyracanthas are amongst the most popular berried shrubs, especially for growing against walls. *Pyracantha coccinea* has been cultivated in these islands for three centuries and is still unequalled for adorning house walls. The variety, Lalandii, is more upright in growth, and has rather larger berries. Of the Chinese species the most decorative perhaps is *P. Rogersiana*, which does equally well either against a wall or in a border. It has rich foliage and flowers and fruits profusely.

The Cotoneasters are even more popular on account of their hardiness, and they flourish in any soil. *C. microphylla* and *C. horizontalis* are wall shrubs. *C. bullata* has very large fruits and *C. Francheti* has beautiful silvery foliage. Amongst the newer introductions *C. salicifolia var floccosa* is worth noting. It makes a large bush, and should be placed where its drooping habit of growth can be seen to advantage.

In small and large gardens alike the stenophylla and Wilsonæ Berberis hybrids are indispensable, for they give the finest colour display in the minimum of space. The Pernettyas are amongst the most decorative small-berried shrubs, but they are far from being accommodating. They are natives of South America and belong to the Heath tribe. They need full sun, a lime-free soil, shelter from cutting winds and peat or leaf mould. The berries range in colour from a milky white to deep purple and hang on till spring.

SMOKY CHIMNEYS

HOW many charming houses are ruined by having a chimney in one of the principal rooms which is addicted to the vice of smoking? Cures for this are legion, but generally unsightly. The local builder will probably recommend a patent type of chimney pot. The owner may in all innocence agree, but may eventually prefer the original evil to the architectural ruination of the appearance of his house.

Another builder, attacking the problem from within, may recommend an iron, copper, brass or glass sheet to be fixed to the chimney breast, so as to decrease the distance between the grate and the crown of the arch from which the flue rises. Cheap and quite often effective, this method is ruination for the appearance of any fireplace with any pretentions to design and proportion.

Of the more costly remedies usually advocated by the trade must be mentioned raising the height of the chimney, so that it is level with and slightly above the nearest high building or tree, which is supposed to cause down draught. In very old fireplaces, with huge chimney recesses and an enormous steeple-like cavity merging eventually into the flue, a builder will explain the difficulty of heating so large a body of cold air.

In a recent bulletin the Building Research Station at Princes Risborough point out that it was in the late eighteenth century that Count Rumford published a comprehensive essay on fireplace and chimney design, which to-day remains the last word on the subject.

In his opinion the root of the trouble with most smoky chimneys lies in the design of the fireplace. The features which he considered desirable are:

1. A throat opening into the flue and set vertically over the centre of the fireplace.
2. The sides of the fireplace splayed so that the width of the back is one-third of the width of the opening.
3. Sufficient depth from the face of the brickwork to the flue throat for the smoke to be unaffected by cross draughts in the room.
4. The throat of the flue should be 4in. deep and about 9in. short each end of the width of the fireplace. Above it should have a horizontal smoke shelf, level with the top of the throat which should be a few inches higher than the top of the fireplace opening.
5. Smooth internal surfaces to all smoke passages, and a rounded internal angle to the top of the fireplace opening.
6. The back of the fireplace should slope forwards gradually for a distance of 8in. to 10in. vertically.

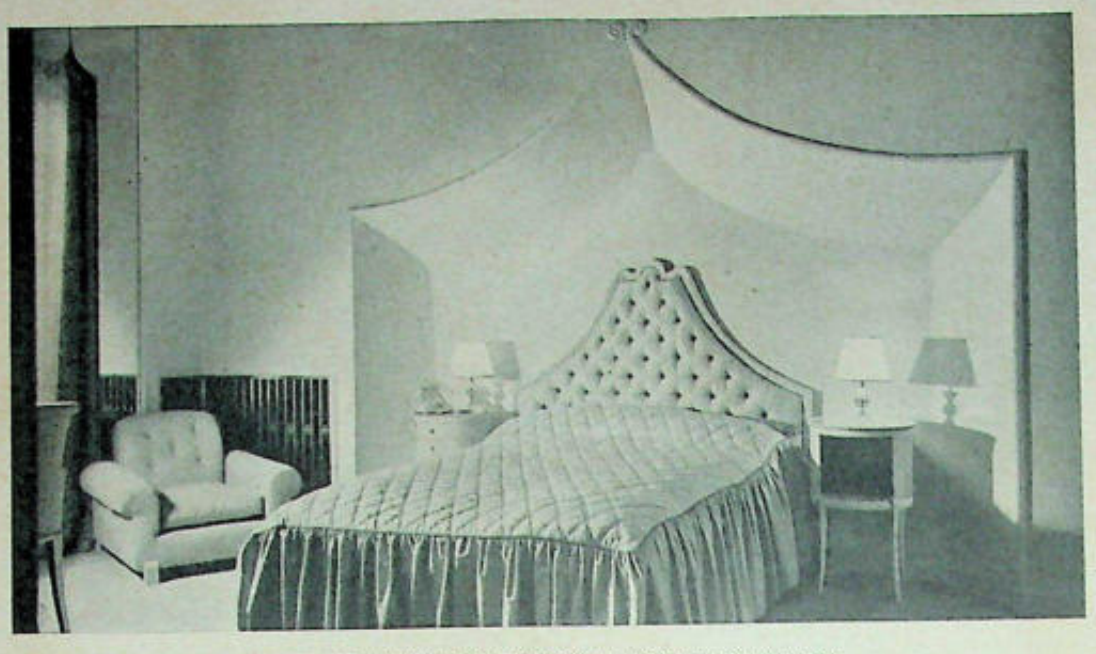
In one case a fireplace smoked at all times, but worst when the wind blew from certain quarters. The chimney was overshadowed by tall trees. Patent cowls and other alterations having failed, the fireplace was rebuilt in accordance with the above recommendations and a complete cure resulted. It is the fireplace design which most usually leads to smoking.

The case of a large open fireplace of sixteenth century design is interesting. Enjoying a local reputation for this vice, it had been the despair of the owner, because all he knew of remedies were revolving galvanised pots, unthinkable in his case, and equally unsightly draught treatment to the fireplace itself. Ultimately the fireplace was modified by the fitting of a concrete lintol with a 4in. throat over the fire, and the back was built out to the requisite forward slope. The result was a complete cure, and the appearance was unaltered.

But a well-designed fireplace will not function if the flue be too short. If less than 15ft. in length it should be added to, either in brickwork or, if out of sight, by a long pot. Tall trees if too near may be pollarded, an operation cheaper than reconstructing a fireplace or lengthening a chimney.

Inside the room a more adequate draught may remedy the trouble. If the smoke issues into the room in a continuous stream, and not in puffs, then it is the draught that is at fault. The opening of a door or window will cause a cure, but the room may then be too draughty. In this event an air brick should be inserted in an outside wall in a position decided with a view to avoiding a draught to persons sitting round the fire. If the fireplace is on an outside wall a good position for the air brick would be at ceiling level above the fireplace. It should not be fixed below the grate.

The method of procedure is, therefore, to see that the chimney is long enough and not overshadowed, that the fireplace has a sufficient supply of air to give a proper draught, and then, if these are satisfactory, to consider the design of the fireplace itself. This will usually prove a costly business, and before any expense at all is incurred it is worth while to try an old and generally effective remedy, that of raising the height of the fire in the hearth. Two or three bricks placed beneath the grate is all that is necessary. REGINALD DAVEY.



A BED IN A RECESS DEVELOPED AS ONE COMPLETE IDEA

The bedside lamps are not only useful, but make the whole of the shaped alcove luminous

LIGHTING OF CONTEMPORARY ROOMS

Useful Present-Day Equipment

By A. B. READ, A.R.C.A.

CONTEMPORARY rooms should be planned for convenience and use, and quite often considerable thought has been given to provision for appropriate lighting. However, lighting points and plugs are still sparsely provided, and it is only when installations are supervised and controlled from the very beginning that houses and flats have lighting points and plugs where they are really wanted.

Generally speaking, for all rooms, apart from any other form of lighting, there should be liberal provision of lighting plugs, so that there is always the possibility of supplementing or revising lighting schemes without the expense and difficulty of running new wiring with the inevitable damage to walls and the necessity for redecoration.

It is impossible in this article to go minutely into the lighting for every room, and the following should be a good guide for the small house or flat :

Porch.—One shallow bulkhead type fitting on the ceiling.
Hall.—Lighting from indirect brackets or a shallow, simple ceiling unit.
Living Room.—Three or four skirting plugs, and possibly two wall lights with additional lighting incorporated into recesses, or fitments.
Dining Room.—A ceiling point over dining table. Light over serving table.
Kitchen.—Ceiling light. Light over cooker. Lights in larder and pantry.
Bedroom.—Three skirting plugs for bedside lighting and dressing-table.
Bathroom.—Ceiling light and light over mirror.

It is impossible that these suggestions should be always suitable, but they should certainly be regarded as the essentials. The greatest boon of electric lighting nowadays is its amazing convenience and cleanliness. Where rooms are planned and designed coherently, lighting can be employed as an integral and indispensable part of the interior, giving new interest to interior form, texture and colouring.

For the sitting room, the quality of well-diffused light from indirect or suitably shielded light sources is most restful and soothing. It has produced a completely new standard of comfort, ease and charm, and has a most important influence on our state of mind.

One of the most useful pieces of lighting equipment in the present-day home is the floor standard which can provide direct or indirect light. This is made possible by means of a reflector inside the shade so that by switches on the standard itself, three alternatives are available. Firstly, totally indirect light thrown on to the ceiling. Secondly, direct light below and through the shade. Thirdly, both direct and indirect light used together for adequate general purpose lighting. Floor standards of this type can provide most charming, useful and adaptable lighting for normal living rooms. The standard can be stood near the wall out of the way, and when required moved further into the room behind easy-chairs or a settee, for additional light for reading or sewing.

The shade itself provides an opportunity for introducing pleasing colour to link up with the general decorative scheme, and there is available an incredible variety of celastoids, buckrams and other textured materials with infinite subtlety of shade and tint to suit every conceivable taste.

The use of this form of lighting also dispenses with the need for deciding on positions for ceiling or wall lights when rooms are planned, and leaves ceilings free of lighting points. The ideal form of lighting for the living rooms of the home is undoubtedly a combination of indirect lighting with small, interesting direct lighting features, and the floor standard just mentioned is an ingenious combination of these. In the same way that essential apparatus and useful equipment has been incorporated as an element in the design of the present-day kitchen, so a good proportion of lighting can be an integral part of the present-day room. The use of lighting for general and decorative purposes evolves naturally from the design and use of the room.

In the bedroom, for example, there is usually only one right position for the bed or beds, and it is logical, therefore, that provision for lighting should be made when the room is designed. In kitchens where the refrigerator, cupboards, sink and draining boards are all designed in an orderly way to fit together and form a coherent and complete working unit, then the lighting could again with advantage be formed as a part of this scheme, and be in the right places to give the best possible results, and to make working as simple and pleasant as possible.

In buying a motor car it would be absurd to provide one's own light fittings, as even in the most ordinary model a good deal of care and thought has been expended to see that these are where they are wanted, and as effective and unobtrusive as possible. We do not feel imposed to express our individuality by introducing into our car fittings which we happen to have, and there is a good deal to be said for rooms, even the other living rooms of the house or flat, having certain essential light built-in as a part of the room itself.

Fashion inevitably exerts a strong influence on contemporary design, but, ideally, there should always be a general undercurrent of sound design which eliminates from normal homes the merely fashionable and very passing mode of the moment. Interior decorations are not made for a lifetime, but are certainly made for years and not for weeks, and in so many of the rooms seen to-day there is the unmistakable stamp of the year of their origin. This applies even more so to lighting fittings themselves, and there seems every good reason for avoiding the use of lighting features that are merely new rather than good. Really well-designed contemporary fittings should be as good-looking and effective in ten years' time as they are now, but this is only possible if some discretion is used in the choice, not only of the design and type of fitting but also the material, whether it be glass or metal, of which they are made.

Modern materials afford new opportunities for colour, cleanliness and utility, and these can be modified for the lighting of our homes in ways which are not only good for to-day but for many years ahead.

A.R.P. FOR DOGS—I

DURING the recent crisis many owners of dogs and cats destroyed them in anticipation of air raids. It is distressing to relate, and in many cases such drastic methods need not have been taken ; but, on the other hand, it should be remembered that even to-day a large number of dog owners are more or less "in the dark" as to what precautionary measures need to be adopted for the protection of their pets. So many conflicting views have been foisted on the public as to what they should or should not do for their animals' protection, and so many fallacies are in existence (I have even been told that a dog will develop rabies if enclosed in a dark refuge), that the general dog owner has become not a little confused.

A.R.P. for dogs is actually no problem. For over eighteen months a body of experts has been studying the reaction of dogs to the various types of anti-gas masks and chambers, and now the net result is a guaranteed gas-proof shelter of very reasonable size in which one or more dogs can, with every safety, be housed during an air raid. This is the P.D.S.A. shelter which has been officially approved and is now in great demand. The People's Dispensary for Sick Animals of the Poor is to be congratulated upon introducing the first and only warranted gas-proof chamber. As the size is something like 3½ft. by 2ft. by 1¾ft. there is ample room therein for a large spaniel, two fox terriers or three pups.

Its floor cleverly controls an ingenious arrangement of bellows which, upon being deflated by pressure through the dog's movements, pump freshly filtered air into the shelter ; even the slight "tummy-undulations" of a sleeping dog will operate the life-saving apparatus. Cats require surprisingly little oxygen, so that there is no reason why an owner of, say, five or even six cats should not utilise one of these shelters—in fact, any small pet could be placed with safety in such a sanctuary. If you have only one dog, and he is not an outsize as dogs go, and you also happen to have a budgerigar or two in a cage which will fit into the interior of the chamber, then by all means put the whole lot in. Of course, the complete success of this operation depends more upon whether your dog is quiet and the bird-cage is covered with the usual "night-curtain" rather than on the actual supply of air.

Looking back on the long period of experimental work in A.R.P. for dogs I see now that the gas-proof shelter is, of course, the only practical solution, for the human answer to poison gases—the mask or respirator—is utterly hopeless where dogs are concerned. Three reasons contribute to their failure when worn by dogs. First, nine out of ten dogs attempt to paw them off in their indignation at being obliged to look like porkers sallying forth on a truffle-rooting expedition ; secondly, the wearing of such strange contraptions would frighten the dogs to an extent bordering upon hysteria (if nervy dogs) at the very time when complete control of one's dog is most essential. And, finally, as a result of the two preceding conditions the dogs would show symptoms of severe distress and cause them to eject saliva into the container part of the respirator, thus clogging the apertures and inducing asphyxiation. On top of all this, I seriously doubt whether toy dogs and small puppies would have enough lung power to inhale properly.

Secret experiments are being carried out by the War Office with a view to producing a perfect respirator for the dogs used in wartime as messengers, transport workers and other military assistants, but it should be appreciated that the exact nature of this research cannot yet be revealed.

Many anxious enquiries by dog owners as to what they should do for their pets during bombardments have been dismissed with the recommendation that all dogs be sent to boarding kennels well out in the country, but for obvious reasons this is not always suitable. Far better would it be for the dog owner of moderate resources to allocate a small room as a refuge for the dogs. Properly sealed, one 10ft. by 10ft. would suffice for ten medium dogs, or say a cellar of about 15ft. by 20ft. for 30 dogs, and other sanctuaries in proportion.

CANIS.

KENNEL CLUB SHOW.—Exhibitors at the forthcoming show of the Kennel Club at Olympia, on December 7th and 8th, will welcome the arrangements that have been made for popularising the event. Hitherto the interest has been dead soon after five o'clock, except for inspecting the dogs on their benches. This time a number of the most important features will be judged on the Wednesday evening, thus providing an attraction for those who cannot leave their work early. The Puppy Criterion, the Undergraduate Criterion, and five classes for the best brace in each of the leading sections, as well as the ever popular obedience tests, are all down for the evening of the first day. Mr. J. V. Rank, chairman of the Show Committee, is fully alive to the desirability of interesting the general public.

British Goat Society

A GOAT HOUSE MADE IN A DISUSED BARN

THE GOAT IN ENGLAND

Some Present-Day Difficulties

I FIRST became aware of the goat as a utility animal many years ago in Malta. For there I saw a goat proceeding down a side street and stopping with regular and apparently unassisted precision at various doors where, from the unquestioning response which she received, she was evidently expected. Having been duly milked, she walked on to her next call. And I was recently hearing about goats in North Queensland, where, in the small townships, they perform the useful office of scavenger, and also a means of racing for the children. Youngsters drive the chariots and the incalculable character of the goat provides the amusement. The goats are more or less common property, and anyone is entitled to appropriate any unowned goat he may meet.

It is a far cry from Malta and Queensland to England, and the distance is as great as the difference in attitude. For in England goat farming is just on the brink of being a fully-fledged industry. Yet there are certain considerations which will, I think, prevent it from acquiring that status for some years to come. There is the initial and obvious difficulty of disposing of large quantities of goats' milk, and the periodic problem of the disposal of male kids. The British Goat Society regularly publishes lists of persons who undertake to sell the milk, but this list could increase only in proportion to the number of producers and—even more—of consumers. It is easy for a farmer to supply his own family with goats' milk, but that brings him only a negative profit, and unless he can use the milk for feeding his pigs, or in some other way on his farm, the keeping of goats is likely to become a liability. Nor is the present unsettled condition of farming generally an inducement to take any avoidable risks. There seems, therefore, to be no prospect of goats becoming other than a very interesting sideline for those who are prepared to take the risk of loss.

The problems which are at present exercising the minds of all keepers of goats are related to the conception of the really useful animal. The British Goat Society set out, in 1879, to improve the stock of goats in this country, and so successful have they been that the importance of avoiding the mistakes which have been made in other stock cannot be sufficiently emphasised. The custom of breeding cattle for records and shows has done something to lessen the essential stamina of certain breeds, and it is to be hoped that goats may avoid a similar fate. As the milk yield of a goat increases, so the butter-fat percentage tends to fall, and it is being asked whether, in view of the fact that a useful breed is becoming a cream colour instead of the orthodox white, the cream should not be accepted and even encouraged at shows. After all, the aim in improving any stock should be to consider its utility possibilities first, and to combine as much faithfulness to the ideal form with it as may be possible.

Another point on which there seems to be agreement is that new animals, very carefully selected, should be introduced in order to maintain or improve the home stock. The Swiss breeds which have improved the British goats are the Saanen and the Toggenburg, and of the two the Saanen has probably been more useful. The Saanen is, strictly speaking, or in the "Swiss" sense of the word, pure white, and generally has the tassels or doddles, which are presumed to be a form of rudimentary ears. The Toggenburg is of a mouse colour and has white strips on the face and along the front of the legs. Though a very good milker, it cannot approach the records set up by the Saanen. Both these breeds are, however, ultimately responsible for the excellence of their British descendants, which preserve many of their characteristics.

The British breeds are the Anglo-Nubian, the English, the Irish and the native British. The Anglo-Nubian is a cross between the Nubian and the English. It may be of any colour, and is unusual in having a convex nose. The ears are long, and the goat is the tallest of the native breeds. The English goat may also be of any colour, and is remarkable as being the only goat on which horns appear yet which is allowed to be entered in the Herd Book. This applies, of course, only to the male. It is an advantage if the neck is without tassels.

British Goat Society

THE MALPAS HERD OF BRITISH ALPINE, BRITISH SAANEN AND ANGLO-NUBIAN GOATS AT HOME IN SUFFOLK

The British Alpine is generally held to be the most handsome of all goats. Its shining black coat marks it out at once, and in addition to its lovely appearance it is an extremely good milker. Yet there is not a single breed in this country which would not be improved by the immediate importation of fresh blood, and which would not be helped by a definite decision to regard the goat first and foremost as a utility purpose animal.

The housing of goats is a matter of some simplicity if certain essential features are remembered, although the present expense of some materials is causing present difficulty. Goats should be provided with loose boxes or stalls, and, where possible, these should be as large as those intended for a horse. The best roofs are those made of wood and covered with felt, and the floor should always be made of concrete. Those who have used concrete for their piggery flooring will be the first to praise it in spite of its comparative expense. It is essential that this floor should be at least 2in. above the surface of the ground, and advisable that it should slope away into a drain at the back. To provide for this drain, and at the same time to exclude the possibility of draughts is not always a simple matter. Some form of cheap bedding must be kept always on the concrete, as the cold surface otherwise has a disastrous effect on the goat. Another plan is to have a slatted board above the concrete, and in this case the bedding is placed between the concrete and the board. Much harm is caused by placing buckets with food and water on the floor of the box. It is a much better plan to put them on a shelf attached to the wall at a convenient height.

The importance of bringing goats under shelter for the night, whatever the weather, is sometimes forgotten. Nor should they be allowed to get wet during the daytime. For this reason it is a useful idea to have a compound near the house, in order that the goats may be, in doubtful weather, outside as much as possible, yet within easy reach.

Goats are among the easiest animals to feed—a fact which has done much to make them a popular sideline with many farmers. They will eat shoots on hedges of almost any kind, and much of the herbage which grows in grass. The accepted figures for milk production are 1lb. of concentrated food for 3lb. of milk. A rock salt lick and plenty of water should be easily available for goats at all times.

The breeding season lasts from September until February, and efforts are now being made to extend this period. The vast majority of goats produce twins. No goat should be mated until she is at least eighteen months old, and failure to observe this wisdom, combined with lack of condition, may produce unsatisfactory offspring and even a single kid. The milking life is about ten years, and one of the most valuable properties of goats' milk is that it is never infected with tubercle bacilli. Excellent cheese may be made from goats' milk, and about six varieties are commonly available, both hard and soft. Many people seem to be prejudiced against the milk of the goat, and they eat the cheese as they would taste some odd rarity. It is a thousand pities that this attitude should be so common, for it is quite unjustifiable, and is, at the same time, one of the chief reasons why goat farming does not develop into a profitable industry.

There is, however, no reason why the excellence of British goats should be allowed to deteriorate, and it is to be hoped that the introduction of fresh blood and the determination to preserve the goat as a utility animal may preserve it.

RESEARCH AND THE MODERN CAR

Improved Performance and What It Entails

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve* 300 *m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

THE modern car did not just "arrive"; rather is it the outcome of individual effort over many years. When I was pondering over this, it occurred to me that the average driver, with his "family" car, rarely appreciates the tremendous amount of preliminary work that goes to make his "value-for-money" bargain of which he is justly proud. More often, I believe, he is apt to regard his newest acquisition as last year's model with "trimmings." Actually, of course, it is more than that.

Possibly the improvements incorporated into many of this year's productions are the result of two or three years intensive study by a group of technicians based upon the theories of a designer who has spent, for the purpose of argument, the last twelve years of his life endeavouring to perfect his idea.

Improved performance, for example, is no accident. It is achieved by dint of unremitting experiment under many and varied conditions, the total cost of which must amount to a colossal figure. More economical running has been possible through modern developments in body construction, ignition and carburation, as well as a notable advance in forced feed lubrication and in the quality of the oils now used.

The owner requires these things, and it is the manufacturers' task to meet the demand, but it is doubtful whether the average driver realises the lengths to which large organisations will go in the effort to give satisfaction.

One of the leading makers recently opened a new research building which cost £175,000 to erect and equip. They employ nearly 350 experts in this department, including men of international reputation, and each is a specialist in his particular work. The annual expense of maintaining such a section for new equipment, experimental models and engines, together with the sum paid in salary, must inevitably assume amazing proportions.

The purchaser does not test the car for the maker, so that next year he can eradicate certain faults that have come to light. Many motorists imagine that this is the case, although nothing could be further from the truth.

Before a car goes near the roads it is subjected to a most vigorous and exhaustive series of tests aimed to strain the machine to breaking point. New engine types are started and left running night and day, for weeks on end on test benches. When they are taken down, every component is scrutinised for defects and excessive wear. Modifications are suggested, amendments made, and other engines embodying these improvements are set up, and the testing carried on once again, so that over a period of time, faults come to light and are eliminated and there is a constant trend towards perfection. It is because of such tests and the intelligent application of the lessons they teach, that manufacturers can guarantee a certain mileage before a rebore becomes necessary, and it is a guarantee not bounded by irksome restrictions and special clauses.

To overcome the difficulties experienced when starting from cold, some firms have specially constructed rooms wherein engines are left in a temperature far below that which we encounter in England, and where experts put their theories to the practical test. It is here that the modern motorist is divested of the worries which the pioneer was accustomed to bear upon his shoulders, and it is because of such research, which makes for carefree motoring, that recruits rally to the ranks of the drivers.

Coachwork design is not improved merely by pretty drawings upon blue paper; bodies, too, have to submit to prolonged testing where they are strained in every conceivable way. Weak spots have to be eradicated. Special drivers are employed by one organisation, and they commit all sorts of outrageous things, turning the car over at high speed, intentional head-on collisions, leaps from heights and driving through fire. It is only by such strenuous and thorough pre-manufacture examination that safety in the modern car has made such prodigious advances, and by money wisely spent that innumerable lives are saved every day.

Two years ago, a friend of mine, driving a popular type of car in the United States at a high touring speed, came into a head-on collision with a car which suddenly appeared from behind an oncoming lorry, and which was also travelling at a similar speed. The vision of the overtaking driver was impaired by a powerful sun and, consequently, the two vehicles met with a terrific impact, and my friend's car turned a complete somersault.

Because both cars were constructed sanely, and the coachwork on the all-metal principle, and equipped with unsplinterable glass, my friend emerged with a slightly cut head and a damaged knee. The occupants of the other car came out with only superficial injuries. One trembles to think of the outcome of such a collision had either of the models had different coachwork.

The small points which make so much difference to driving comfort are not merely included as an afterthought. They, too, are the result of evolutionary development through constant experiment. Scientists in all parts of the world are still striving to perfect a sound ventilation system, despite the fact that those at present in use are considered by many to be adequate. Similarly, no effort is being spared to isolate noises from the interior of the saloon car, while there is constant activity to exclude draughts and fumes.

Improved seating is achieved through the utilisation of the combined knowledge of experienced upholsterers and physiology specialists.

I have recounted here only a few aspects of the problems which our motor-car industry is daily tackling with such persistency and praiseworthy thoroughness, for there are many other considerations for the manufacturer before that neat and appealing car advertisement can read "Improved performance and economy . . . Absolute Comfort. . . . Dependability. . . . . Safety," and yet the price does not soar to prohibitive heights.

PETER SCOTT & CO. LTD. (Dept. 117) HAWICK. SCOTLAND

YOUTH AND THE AIR

An Important New Organisation

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

Chas. E. Brown

THE WINGS OF WAR
A Hawker-Osprey performing acrobatics over Alexandria, Egypt

A PROBLEM to which everyone concerned with the future of flying must have given serious thought at one time or another is how the immense interest of youth in aviation can be turned to practical account and lend its great potential strength to progress. There is no need to stress the extent of this interest; it is obvious to all. What is important is that it shall not be allowed to weaken through lack of opportunity for practical expression. The air has become a matter of fundamental significance to us all: our first line of defence, the binding link of Empire. The rising generation must become familiar with aviation in all its aspects; the more the voter of to-morrow is so informed, the greater the chances of our having a sound, constructive air policy.

Both from this larger aspect and from immediate needs, therefore, the establishment of the Air Defence Cadet Corps is deserving of a cordial welcome. This body, organised on national lines by the Air League of the British Empire, is a co-ordinated effort to bring air-minded youth within the orbit of aviation activities, and to create an informed nucleus on which, in later years, various branches of military and civil aviation can draw.

Members of the Corps will receive instruction in various important aspects of aviation, both theoretical and practical, and at the same time will enjoy all the advantages of a disciplined, corporate life to increase their value as citizens in the wider sense. In this way there will, it is hoped, be built up a really useful source of personnel eager and adapted to fulfil useful rôles in aviation.

The field covered by the instructional programme is wide. It includes, in addition to drill, classes in the administration of the Royal Air Force, airmanship, the theory of flight, the elementary principles of aircraft engineering and maintenance, radio operating, air navigation and meteorology. These subjects form the basis of the work, but they do not exhaust the range, for members will be taught how to make and fly model aeroplanes—an invaluable practical method of gaining an insight into the problems of flight and their solution—and will receive an instruction in A.R.P. work. Lectures and discussions on topics of general aviation interest will also play an important part in the work of the Corps.

This syllabus is, as will be seen, remarkably comprehensive, and those who go through it with enthusiasm and the co-operative spirit, should become unusually well informed on all matters of air interest. There can be no doubt that young men with such a background will provide valuable recruits for flying.

As regards actual flying instruction, the organisers of the Corps hope it may be possible to give this to senior cadets. No such instruction, however, would be given without the consent of parents or guardians.

Plans for this organisation were made some little time ago, and, when the Civil Air Guard was announced, it was felt in some quarters that the two bodies would conflict. There is, however, no danger of any such overlapping. The Air Defence Cadet Corps is a body exclusively for youth. The upper age limit coincides with the lower limit for the C.A.G. Thus, so far from being in any way competitive, the Corps should be a powerful feeder to the official organisation, since a large majority of Corps members cannot fail to desire to carry through their instruction to its logical conclusion by qualifying for a pilot's certificate. Obviously, cadets from the Corps should prove exceptionally valuable members of the C.A.G., since they should bring to actual flying a deeper knowledge of fundamentals than possessed by the average man.

The value of this scheme is twofold. On the one hand it provides constructively for future needs. It aims at taking advantage of what seems to be a universal interest of modern youth, nurturing it, and developing it so that it becomes not merely a paper hobby but a tangible asset of national importance. Ignorance of the air is a handicap that has done not a little to check progress as regards both air defence and commercial flying. In the future, such ignorance might well have disastrous consequences.

By attracting youth at a time when other interests have not had time to overlay the attractions of aviation, the Corps should do highly valuable work. It cannot, of course, educate the whole of the younger generation, but it can create a solid phalanx of opinion based on real knowledge of flying facts.

So much for the wider aspect. The other is no less important and concerns immediate affairs. That this country must be prepared for emergency is now undisputed in any quarter. The Corps aims at bringing youth as valuable allies into the larger schemes. Boys and youths, for example, trained in the principles of A.R.P. work are more likely to be reliable under stress than others.

Moreover, it is clear that more and more demands will be made by the R.A.F. and the industry for new entrants. By focusing interest in the earlier years, the Corps will undoubtedly turn the minds of many boys to an aviation career, who might otherwise have drifted through sheer inertia into some other calling.

This national scheme may, then, be regarded with great hopes. In saying that, however, no slight is intended on the excellent work carried out by other organisations that have and are helping to foster the interest of youth in the air, among them, for example, the air troops of the Boy Scout Movement and the Public Schools Aviation Camp. The field to be tilled is so large that there is room for all. It must be a matter of congratulation not merely that there is a connection between youth and organised aviation, but that the connection is being amplified and strengthened.

THE SHADOW OF PEACE ON THE WATERS
An Imperial Airways flying boat gliding down to the sparkling ripples of Southampton Water

MISCELLANEOUS ANNOUNCEMENTS

(Continued from page 1278)

FAMOUS ECONOMY DOG FOODS.—"JOHN PEEL" T/MK. PURE WHEATEN BISCUIT: nice thin pieces, 18/- cwt. "OWD BOB" T/Mk. ROASTED RUSK (small squares), 16/6.—Argyle Mills, Argyle Street, Liverpool.

The Case of Lady Nicotine

by

A. J. CRONIN

The celebrated author of "The Citadel" and of "The Stars Look Down"—Dr. A. J. Cronin—here diagnoses smoking in general and cigars in particular.

"Tell me, how much do you smoke?" your doctor asks. And your reply usually solicits a profound and often ominous "Ah!" If smoking is suggested as injurious to some people, it can hardly be said that the Havana cigar is harmful — it contains 0.064% of nicotine and what is more important no furfural, which is the really harmful element that may be found in some other tobaccos. So my advice is, smoke your Havana cigar with a quiet mind, and rejoice in the good it does you by inducing material relaxation and spiritual delight.

Issued by the Cuban Government to further the smoking of

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE KNAPPE CROSS HOTEL NEAR EXMOUTH

I ALWAYS look on November as a "sneezy month." Nearly everybody seems to have a cold, while persistent fogs normally make life rather trying and not a little unpleasant in London.

I was not surprised, therefore, when I met a friend of mine almost sneezing himself to pieces in the middle of Piccadilly a week ago. In between his convulsions he rattled out Walter Smith's verse about fog:

"A grey fog in the early prime,
A blue fog by the breakfast hour,
A saffron fog at luncheon time,
At dinner a persistent shower
Of smut, and then a dismal power
Of choking darkness and despair,
Thickening and soddening all the air."

Having got his little verse off his chest—one which I presumed was meant to show what was responsible for his condition—he implored me to recommend a good hotel where he could recover his health again.

"Somewhere," he said, "where the climate is good, the cuisine is good, the beds are good, and the terms not excessive."

Even as he was speaking my mind wandered from a cold, somewhat cheerless Piccadilly to the little byelanes of South Devon which only two months previously had been a mecca for me after a week of stern crisis in London. And I thought of the pleasant warmth and quiet friendliness of the Knappe Cross Hotel near Exmouth, which is just the place for winter (and summer, of course) holidays. I told my friend about it and he was delighted.

Situated between Budleigh Salterton and Exmouth the Knappe Cross Hotel gets all the sunshine possible at this time of the year, and sunshine *is* so essential to good health. The house was built by Sir Edwin Lutyens and is a fine country mansion. Inside are magnificently proportioned rooms and splendid furnishings; outside, a garden which, even at this season of the year, will prove a pleasure to guests. It may be that the countryside is undecorated, stripped of its finery, but in Devon it is never hard. Winter seems scarcely to exist down there; ere they have really said good-bye to autumn spring is moving in the air above and in the earth below in Devon lanes.

The outlook from the Knappe Cross Hotel would suit the most drastic critic. From one side you look down a long, gentle slope to the sea, and from the other over sweeping moorland country—a home of riding and hunting and golf and every other sport. If you have a car there are many delightful Devon villages within easy reach of the hotel. Go, for example, to Beer and you will see the coast at its best; or to Cullompton, where you can see a typical Devon village—quaint River Culme, almshouses and fifteenth-century church all complete. Farther afield is Bridport, a charming little seaside town where the harbour entrance is so narrow that it has to be cleared after every heavy sea, and Charmouth, where the tiny Char bubbles briskly into the sea and there is a grand stretch of hard sand ideal for a walk in the early afternoon sun.

And when one's ramble is over it is pleasant to return to the big yet cosy firesides at Knappe Cross. The joint managers, Mr. and Mrs. Dedman, have a thorough knowledge of what constitutes real comfort, while they have an obvious attachment to the hotel—only recently opened—which bodes well for its future.

"So you see," I said to my friend, "you cannot do better than go to the Knappe Cross." I am sure he agreed with me, but he was sneezing too violently for me to wait for his answer. I expect I'll meet him next week, fit and well, and able to thank me properly, though his real thanks will go to Knappe Cross.

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

INITIAL LEAD OF A TRUMP—II

When a Singleton is Effective

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*.)

I HAVE heard it stated and stated emphatically but on whose authority I do not know, that an initial lead of a singleton trump *never* should be made. Presumably the theory is that opener having only one trump, his partner may have several, and if the singleton is led it may "kill" his winner.

Of course this is possible. But as I pointed out last week, whether or not to lead a trump should depend upon the bidding. When conditions indicate the desirability of the lead the fact that you have only one trump should not deter you. In fact, on certain bidding and often against a slam contract, the singleton trump lead may prove the only game saver. Therefore I would advise you to rid your mind of prejudice and consider only circumstances after you have "listened in" carefully to the bidding

Study this example:

	♠ K, 8, 2 ♡ 7, 3 ◇ A, 9, 8, 4 ♣ 8, 6, 5, 4	
♠ J, 9 ♡ 8 ◇ K, Q, J, 7, 2 ♣ K, 10, 9, 3, 2	Y A B Z	♠ Q, 10, 6, 5 ♡ 9, 4 ◇ 10, 6, 3 ♣ A, Q, J, 7
	♠ A, 7, 4, 3 ♡ A, K, Q, J, 10, 6, 5, 2 ◇ 5 ♣ None	

Z is playing a contract of Six Hearts. A leads the King of Diamonds. At first sight it may appear easy. But it is not really so.

If Z wins with the Ace of Diamonds and draws trumps he must lose two tricks in Spades at the end and be one down. It is true that he can with this lead make his contract, but only by very cunning play, which savours of Double Dummy.

This is his procedure: Winning with the Ace of Diamonds, he leads a small Spade and ducks.

A wins with the 9.

If A now leads a trump Z can still make his contract as he can play out Spades and ruff the fourth round with Dummy's 7. If A does not lead a trump, but continues Diamonds or leads a Club, Z must himself lead one round of trumps, and when A's 8 falls, stop. Then he must try the Spades, hoping that A's 8 of Hearts was a singleton.

Note that this is an extremely tricky hand, and that Z has to play it with extreme care to avoid the loss of two tricks. While as I have stated it is possible for him to make it if a Diamond is opened, I assert that if A initially leads his singleton 8 of Hearts Z cannot possibly do it. He has then to play for the Spades being divided three and three and, as they are not, he must be one down.

Supposing after the Heart is opened Z leads a Spade and ducks the first round. B winning with the 10 plays a trump and thereby deprives Z of his ruff. Or if Z takes three rounds of Spades, B wins the third and leads a Heart, Z must lose two tricks in Spades. With a trump initial lead Z must be one down provided A and B discard correctly. Z may play out seven trumps in an effort to squeeze. But this will not avail provided B keeps all his Spades.

Against less than a slam contract the singleton may be just as effective.

	♠ Q, 10, 5 ♡ 7 ◇ 9, 7, 4, 2 ♣ J, 10, 7, 6, 3	
♠ J ♡ K, Q, J, 10, 5 ◇ K, Q, J, 8 ♣ K, Q, 4	Y A B Z	♠ 7, 6, 3, 2 ♡ 9, 4, 3 ◇ 10, 6, 5 ♣ 8, 5, 2
	♠ A, K, 9, 8, 4 ♡ A, 8, 6, 2 ◇ A, 3 ♣ A, 9	

Score Y Z game; A B nil. Z the Dealer. The bidding was:

Z	A	Y	B
One Spade	Two Hearts	Two Spades	No bid
Two No Trumps	Three Hearts	Three Spades	No bid
Five Spades	Double	No bid	No bid
Re-double	No bid	No bid	No bid

The bidding is interesting. Z's opening bid of One Spade is mild on his powerful hand. A's bid of Two Hearts is justifiable. He, too, had a strong hand, although lacking Aces, and he was prepared to try and save the rubber, even at risk of sacrifice. Y's bidding was right. With a singleton Heart he must give a raise in his partner's suit and his subsequent call of Three Spades was only a preference bid. Z, however, read it as showing greater strength and invited a slam declaration by bidding Five Spades.

A's double was fair. He might expect to make three tricks in his hand and Z's re-double was reasonable.

A made the normal lead of the King of Hearts and Z had no difficulty in making his contract as owing to his cards of entry he was able to ruff his three losing Hearts and confine his losses to a trick in Diamonds and in Clubs. If A opens his singleton Spades, however, Z cannot get more than two ruffs and should be one down, losing a trick in Hearts, in Diamonds and in Clubs.

The point here to notice is that A, having no possible chance of making his Knave of Spades, might and should have led it. In other situations you will find that a trump lead, even with a singleton, often proves to be the best.

CHESS

TOURNAMENT IN HOLLAND

A CLOSE finish to this contest seems very probable. After the 10th round the scores were as follows: Fine and Keres each 6 points, Dr. Alekhine, Botwinnik and Capablanca each 4½, Dr. Euwe 3½, Flohr and Reshevsky each 3. Reshevsky had three adjourned games, Botwinnik and Fine each two, Capablanca, Dr. Alekhine and Keres each one. Keres was the only undefeated player, while Flohr was the only one who had yet to win a game.

A very good game by Dr. Euwe.

(Indian Defence.)

8. Castles	Castles	24. P to B 5 (*i*)	P takes P
9. P to K 4	P to K 4	25. Kt to B 4 (*j*)	Q to Q sq (*k*)
10. P to Q 5	Kt to Kt sq	26. Kt takes P	Kt takes Kt P
11. P to Q Kt 4 (*c*)	B to Kt 5	27. P to Q 6 (*l*)	R takes R
12. Q to B 2	P to B 3 (*d*)	28. Q takes P, ch	K to R 2 (*m*)
13. Kt to R 4	P takes P (*e*)	29. R takes R	Q takes P
14. K P takes P	P to Q R 4	30. B to K 4, ch	K to R sq (*n*)
15. P to Q R 3	Kt to R 3	31. Kt to Kt 6, ch	K to R 2
16. Q to Kt 3	Q to Q 2	32. Kt to K 7, ch	Resigns (*o*)

(*a*) Bogoljubow's variation, not very much played nowadays.

(*b*) This move does not turn out well (see move 10). Black should, instead, play Castles, to be followed by B takes B, ch, P to Q 3 and P to K 4.

(*c*) White is ahead in development and starts an action on the Queen's side. His aim is to play P to Q B 5.

(*d*) An attempt to break up White's powerful centre. Unfortunately the move weakens Black's Q 3 and the subsequent exchange of pawns increases the scope of White's Bishop. B takes Kt, to be followed by Q Kt to Q 2, seems better.

(*e*) If, instead, 13. . . . Q Kt to Q 2, then 14. P to K R 3, B to R 4; 15. Kt to B 5 wins the Queen's pawn.

(*f*) Played so that next move he need not part with his Bishop, which is likely to be extremely useful later on when he has played P to Q B 5.

(*g*) Threatening Kt to K 3 followed by P to B 5.

(*h*) R takes R first is better, *e.g.* 23. . . . R takes R; 24. R takes R, Kt to R 3. If then 25. P to B 5, P takes P; 26. Kt to B 4, Black can play 26. . . . R to K sq, there being no danger from Kt to Kt 6 if Black has not got a Rook at Q R sq.

(*i*) This is very strong.

(*j*) Threatening to win the exchange by Kt to Kt 6.

(*k*) Not Kt takes Q P because then Kt takes P wins a piece. If, instead, (1) 25. . . . Kt takes Kt P, then 26. Kt to Kt 6, R takes R; 27. R takes R, Q to Q sq; 28. Kt takes R, Q takes Kt; 29. P to Q 6, to be followed by R to Q sq and B to R 3; or, if (2) 25. . . . Q to B 2, then 26. P to Q 6, to be followed by Kt takes P and B takes P.

(*l*) A very strong move. If now Q to K sq or B sq, then Q R to Q sq; or if, instead, Q takes P, then Q takes P, ch, followed by Q R to Q sq. In either case White gets a winning game.

(*m*) If, instead, 28. . . . K to R sq, then 29. R takes R, Q takes P; 30. Kt to Kt 6, ch, K to R 2; 31. Kt to K 7, R to Q sq; 32. B to R 3 with a winning game for White.

(*n*) If 30. . . . Kt takes B, then 31. Q to B 5, ch, K to Kt sq (if P to Kt 3, then Q to B 7, ch, followed by Kt takes P, ch and wins); 32. Q takes R, ch and wins.

(*o*) If 32. . . . Kt takes B, then 33. Q to B 5, ch, followed, if 33. . . . K to R sq, by 34. Q takes R, ch and mate in two more moves.

The following game shows a strong attack by Dr. Alekhine

(Queen's Gambit Declined.)

WHITE. Dr. Alekhine.	BLACK. Dr. Euwe.	WHITE. Dr. Alekhine.	BLACK. Dr. Euwe.
1. P to Q 4	P to Q 4	22. Q to B 5, ch	K to Kt sq
2. P to Q B 4	P to Q B 3	23. R to Kt sq	P to Q Kt 4 (*f*)
3. Kt to K B 3	Kt to B 3	24. P to R 6 (*k*)	P takes P (*l*)
4. P takes P	P takes P	25. B to K 5	K to Kt 2
5. Kt to B 3	Kt to B 3	26. P to Q R 4 (*m*)	P takes P
6. B to B 4	B to B 4 (*a*)	27. P to B 4	Kt to K 2 (*n*)
7. P to K 3 (*b*)	P to Q R 3 (*c*)	28. P takes P	Kt takes P
8. Kt to K 5 (*d*)	R to B sq	29. K to R sq (*o*)	R to Q B sq
9. P to K Kt 4 (*e*)	B to Q 2	30. R to Kt sq, ch	K to R 2
10. B to Kt 2	P to K 3	31. Q to R 3 (*p*)	R to K Kt sq
11. Castles	P to R 3	32. P to K 4	R takes R, ch
12. B to Kt 3	P to K R 4 (*f*)	33. K takes R	Q to Kt 4
13. Kt takes B	Kt takes Kt	34. P takes Kt	Q to Kt 8, ch
14. P takes P	Kt to B 3	35. K to Kt 2	Q to Kt 3, ch
15. B to B 3	B to Kt 5 (*g*)	36. K to B sq	Q to Q Kt 8, ch
16. R to B sq	K to B sq	37. K to Kt 2	Q to Kt 3, ch
17. P to Q R 3	B takes Kt	38. B to Kt 3	Kt takes P
18. R takes B	Kt to K 2	39. B takes Kt	P takes B
19. Q to Kt 3 (*h*)	R takes R	40. Q takes P	P to K R 4
20. P takes R	Q to Q 2	41. P to R 4	Resigns.
21. Q to Kt 6 (*i*)	Kt to B sq		

(*a*) Some masters prefer P to K 3 here.

(*b*) If 7. Q to Kt 3, then 7. . . . Kt to Q R 4; 8. Q to R 4, ch, B to Q 2; 8. Q to B 2, P to K 3.

(*c*) Best. If, instead, P to K 3, then Q to Kt 3, Black no longer having the resource of an eventual B to Q 2 as in note (*b*).

(*d*) The usual continuation is 8. R to B sq, R to B sq; 9. B to K 2, P to K 3; 10. Castles, B to K 2 with an even game.

(*e*) A surprising move which appears to be very good. If now 9. . . . Kt takes Kt; 10. P takes Kt, B takes P, then 11. P to B 3 wins a piece.

(*f*) If P to K Kt 4, then P to B 4 forces open the King's Bishop's file for White. The text-move, however, does not turn out well. Perhaps B to K 2 is the best move.

(*g*) B to Q 3 is, we think, to be preferred.

(*h*) Starting an attack on the Queen's side.

(*i*) White now threatens R to Kt sq.

(*j*) Played to prevent P to B 4.

(*k*) A good move which forces a weakening of the support of Black's King's Knight.

(*l*) If R takes P, then P to Q R 4, in reply to which Black cannot play P takes P because of R to Kt 8.

(*m*) A good move, as a result of which he succeeds in playing P to B 4.

(*n*) Not P takes P because of B takes Kt, ch, followed by Q to K 5, ch, winning the Rook.

(*o*) Threatening to win by 30. B takes Kt, P takes B (if Q takes B, then Q takes Q, followed by R to Kt 6); 31. R to Kt 6. If at once 29. B takes Kt, P takes B; 30. R to Kt 6, then 30. . . . Q to Kt 5, ch, forcing White to play B to Kt 3 to avoid perpetual check.

(*p*) White now threatens to win a piece by 32. P to K 4, and Black has no satisfactory move. If 31. . . . Kt to K sq, then 32. Q to B 8, Kt (Q 4) to B 3; 33. B takes Kt and mate next move. If, instead, 31. . . . Q to Q sq, then 32. Q to Q 3, ch, K to R sq; 33. Q to K 4 (threatening Q to R 4) with a winning game for White.

PROBLEM No. 3989

By M. SEGERS.*

WHITE (10 pieces): King at Q Kt 7, Queen at K 4, Rooks at K 2 and K 5, Bishops at K Kt 8 and K R 8, Knights at K B 4 and Q 6, Pawns at Q R 3 and Q B 5.

BLACK (11 pieces): King at Q B 6, Queen at K R 7, Rooks at Q Kt 5 and Q 7, Knights at Q Kt 6 and Q B 7, Pawns at K 2, Q R 4, Q Kt 4, K B 6 and Q Kt 7.

White to play and mate in two moves.

* First prize, *Munkásvárk*, 1934.

SOLUTION OF PROBLEM No. 3988

1. K to K 2, Any move; 2. Q, R, B, Kt or P mates.

CONGRESS AT HASTINGS.—This congress will be held from December 28th to January 6th. In the Premier Tournament there will be five British competitors: Sir George Thomas, Bt., H. Golombek, P. S. Milner-Barry, E. G. Sergeant and T. H. Tylor—and five foreigners: Dr. Euwe (Holland), V. Pirc (Jugoslavia), S. Landau (Holland), E. Klein (Austria), and L. Szábo (Hungary).

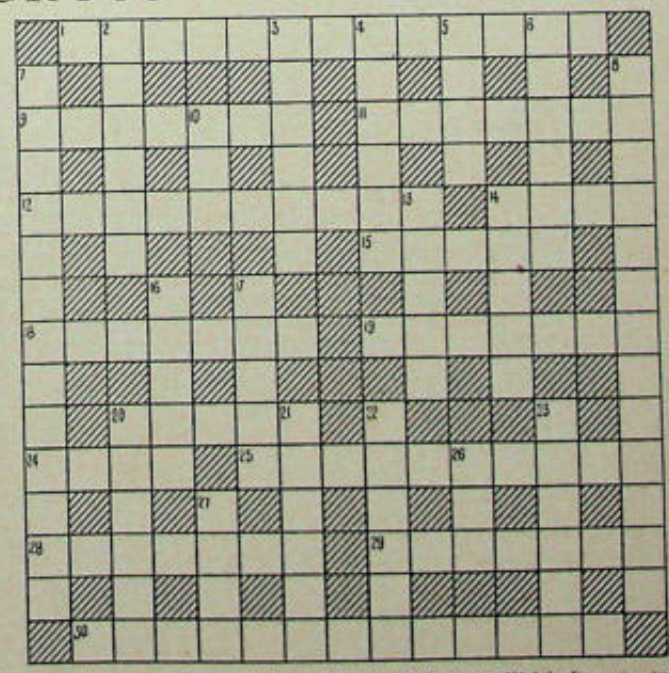
THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 492

ACROSS.—1, A running introduction to scouting (three words). 9, Oh! caper (anagram). 11, Is South uncultured? 12, Brisk baton bearing makes these. 14, A national drink in Devon. 15, A wanderer with a fiver. 18, Splits in the earth. 19, A shin rag does not. 20, Mistake in game. 24, The heart of good performance. 25, A guilty jump by a racehorse? 28, Chucker out. 29, A silent marker. 30, Two constituents of the English countryside.

DOWN.—2, The sons of Ham in the plough land. 3, Usual. 4, Add shelter for any old how. 5, Wild ox. 6, Coachman or club. 7, Sign off porter for a good chance (two words). 8, Harps and hooters are present, but not often used. 10, "Methinks, I have a great desire to a bottle of ——; good ——, sweet ——, hath no fellow" (*Midsummer Night's Dream*). 13, What a goose. 14, Great feast. 16, For light particles only. 17, Toper's ego. 20, "——, ——, thou bitter sky, Thou dost not bite so nigh As benefits forgot" (*As You Like It*). 21, Hesitate. 22, Cat's convenience. 23, Terrier perhaps. 26, The chief agent by which men are sent down the slippery slope. 27, An equine collar attachment.

A prize of one guinea is offered for any crossword puzzle, dealing mainly with sport or the countryside, that is accepted for publication.



SOLUTION TO No. 491

Published November 19th

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Bridge

Auction.—The Laws of Auction Bridge are published by De la Rue, and can be obtained from any bookseller, price 1/–, in paper cover, or 2/6 in cloth, or direct from De la Rue, 110, Bunhill Row, London, E.C. They are also given in full with comments in A. E. Manning Foster's book, *Auction Bridge for All* (Benn; 6/–). You are wrong in saying they have been altered. No alteration has taken place in the Auction Bridge laws since 1932. It was only the Contract Bridge laws which were revised in 1935. —*R. C. S., Christchurch.*

Forestry

Tree Surgery.—When a branch breaks away from a tree, if it is a simple break, that is to say, if the branch snaps off a foot or more from the trunk and does not injure the main stem, then the snag which is left should be cut back with a saw as close as possible to the trunk. The cut surface should then be treated with creosote, which will disinfect it and prevent the entry of fungi. In the case of beech the creosote is liable to damage the under bark and cambium, so that this portion should be painted with shellac varnish before the creosote is applied to the central area. When the stump has dried out completely, which will take twelve months, the surface may then be waterproofed by the application of a proprietary bitumastic compound called Rufmat. This material is applied in the form of a coat about ⅛in. thick. It adheres strongly to the wood, but remains plastic because, although it hardens on both its surfaces, the interior remains semi-liquid and responds to any growth of the tree or any shrinkage of the wood. The cambium, which in a vigorous tree will soon begin to heal over the wound, grows perfectly freely and satisfactorily over the Rufmat, and the whole operation gives a most excellent result. For a smaller branch on a vigorous tree, where healing may be expected to occur rapidly, a little tar brushed over the wound is all that is really necessary. Tar is superior to paint, which is neither antiseptic nor is it waterproof because it so rapidly cracks. When a branch breaks off close to the stem, it usually takes some of the stem with it and causes a most unsightly gash in the trunk. This gash should be trimmed with a small pruning axe or with a chisel and mallet to a smooth surface, with no places where water could lodge, all loosened bark removed and the clean surface creosoted, and twelve months later covered with Rufmat.

If there happens to be a hole or cavity in the trunk, it is advisable that it should be drained by an auger hole bored from the trunk in an upward direction in a position calculated to drain the lowest point of the cavity. If the entrance hole is left by the falling of a hollow branch, then it can be blocked with a wooden peg, sawn off level, and treated with creosote and Rufmat as before described. If a hole or cavity to which water gains access is in the fork between two large upward-directed branches, it is most difficult and, in some cases, impossible to exclude water, and the only method in that case is to ensure that the auger hole remains open and that the water is able to escape and does not accumulate in the heart-wood. The only use of concrete, which has no adhesive properties, in this connection is as a stabiliser for a tree which has a completely hollow trunk. These trees have been attacked by one of the heart-wood fungi and will live for years provided their stability is ensured by the replacement of heart-wood with concrete. The highest points in the trunk where water might gain admission and flowing down between the napwood and the concrete cause decay, should be waterproofed with Rufmat. To sum up, the essentials to the protection of a damaged tree are disinfection with creosote, waterproofing with Rufmat, and using concrete only as a stabiliser for hollow stemmed trees.—*G. M. A., Redmarley.*

Kennel

Cocker's Tail.—Usually about two-fifths of the tail is left on when docking a Cocker spaniel puppy. The man who performs the operation would be guided by the eye more than anything. As yours comes from an experienced breeder, he is not likely to have made a mistake. You could not get a more informative book than Mr. H. S. Lloyd's *The Popular Cocker Spaniel*, published by *Our Dogs*, Manchester. Price 5/3, post free. —*P. H., Cambridge.*

Miscellaneous

"Legs of a Horse."—Your quotation "Put not your faith in the legs of a horse" is incorrect, and we think you have muddled two other quotations, both of which come from the Psalms. In Psalm 146, verse 3, it says "Put not your trust in princes: nor in the son of man, in whom there is no help." And Psalm 33, verse 17, "The horse is a vain thing for safety: neither shall he deliver any by his great strength." You may also be thinking of Psalm 20, verse 7, "Some trust in chariots, and some in horses: but we will remember the name of the Lord our God," or Psalm 174, verse 10, "He delighteth not in the strength of the horse: he taketh not pleasure in the legs of a man."—*H. T., Somerset.*

Post-Mortem Examinations

Phosphorus Poisoning.—The cause of death of a hen pheasant and of an O.E. Game bantam cock was phosphorus poisoning. Both birds were in prime condition. The usual source of phosphorus is rat poison or "vermin-killer." The laying of poison in the vicinity of farms and coverts is very unwise. Rats appear quickly to learn how to avoid eating poisoned baits, and they will carry the bait, sometimes for a considerable distance, into poultry runs or pig pens. Poisoned bait carried in this manner is a not-infrequent cause of death of birds of all species, foxes and pigs. We deprecate the uncontrolled laying of vermin killers, both those containing chemical poisons such as phosphorus, strychnine and even squills, and those composed of disease-producing germs. We advise those who wish to destroy vermin on their property to consult U.L.A.W.S., or the R.S.P.C.A., for methods which can be kept under the user's control and do not endanger other animals and birds.—*J., Berks; J. H., Sussex.*

Yew Poisoning of Pheasants.—From five estates we received during October the bodies of pheasants which had died of yew poisoning through eating the leaves and berries of yew (*Taxus baccata*). The birds were of this season's rearing and were in prime condition at the time of their sudden death. The poisoning is a very rapid process, and its signs in the affected bird are very rarely observed. Seldom do we learn that more than a few individual pheasants have been picked up dead on the one estate. Almost invariably the poisoned birds have eaten the yew on empty crops, and frequently after eating the yew the birds have eaten corn. It would appear that the birds have eaten the yew while waiting the arrival of the keeper with his feed. Keepers are advised to avoid laying feed in the vicinity of yew, in which young birds tend to take cover.—*S. P., Suffolk; R. M. H., Salop; R. V. G., Dorset; J. P., Hants; F. H. B., Hants.*

Tuberculosis of a Pheasant.—A correspondent, having lost some of his pheasants, sent the body of a Reeves cock which his keeper had picked up. The bird was emaciated, its death being due to the contagious germ infection of the internal organs, tuberculosis. The disease is spread through the germs being excreted in the droppings of the infected bird. The germs of avian tuberculosis are capable of remaining alive on the ground for over twelve months. The germs are also capable of producing fatal tuberculosis, not only in all species of birds, but also in pigs, cattle and horses. Thus ground infected by tuberculous birds should not be grazed by farm animals. Should cattle be kept on property on which the disease has been prevalent among the poultry and pheasants, the owner should inform his veterinary surgeon so that the avian type of tuberculin can be used in addition to the bovine type of tuberculin at the testing of the stock. Whenever emaciated game birds or poultry are picked up dead, owners would be wise to send the bodies for expert examination.—*E. F. W., Sussex.*

Fowl Pox.—We received the body of a three weeks old chicken which had died of fowl pox. The owner reported having already lost several in the same brood from the disease, which was revealed as wart-like growths around the eyes and a cheesy matter within the mouth. Possibly the disease was contracted from the broody hen or other infected mature fowls on the property. The disease is rapidly contagious. The infected pen of birds should be strictly quarantined, or preferably they should be destroyed and their bodies should be burnt. The other fowls on the property should be vaccinated with fowl pox vaccine as a preventive measure. Fowl pox is communicable to wild and domesticated birds; so that the disease is not only endemic in this country and is frequently met with in poultry markets, and is not uncommon in pheasant coverts, but it is also introduced by infected immigrant birds, particularly woodpigeon. We are approaching the winter months when poxed woodpigeon from the Continent are likely to appear. Poultry farmers are advised to prevent the disease by vaccinating their stock at least once per annum as a routine procedure.—*J. G. G., Suffolk.*

Shooting

Size of Shot.—The business of John Rigby and Co. is still carried on at 43, Sackville Street, London, W., and no doubt could supply you with the same make of cartridges you found so successful in Burma. It is difficult, however, to understand how you found No. 8 shot more successful than No. 5 at a range up to 40yds, when so much depends upon density of pattern; the *maximum* effective range of No. 8 shot in cartridges of standard velocity being 36yds. As you mention duck, hare, partridge, pheasant and snipe we would advise you to have at least two sizes of shot. Should you, however, wish to adopt one size for all game, No. 6 might prove satisfactory. As, however, you are thinking of purchasing a new gun, you would be well advised to leave the matter of shot size in the hands of your gunmaker.—*A. P., Lydd.*

Travel

In the Cotswolds.—You would doubtless like the Mill Inn at Withington. It has only four letting bedrooms, two single and two double; but it is one of the grandest, cosiest little places of which I know. The exterior really belies the interior. You realise, of course, that the house must be fairly old to be so thoroughly covered with ivy—besides Cotswold houses have ever been solidly constructed to stand the test of time—but somehow the inside is more romantic than one would expect. You will be warm enough, for the inn is fitted with central heating, and the lounges have large open fireplaces which are a real delight to those who like that sort of thing. Everywhere you will find old beams, with furniture both in keeping with the characteristics of the inn and comfortable as well. Then there is the Old Swan at Minster Lovell. The 20th-century comfort of the Swan has behind it 500 years of tradition. Logs flame on the fires, old oak gleams brown and iron-hard, and you breathe the atmosphere of centuries of quiet ease and well-being. Oak, elm, chestnut and careful stonework, at one time covered by paint, paper and plaster, so that the very heart of the old Swan was hidden, now appear as their craftsmen saw them. The old house, with its neat arrangements and conveniences, seems to link up the ages of English history and relate us to forbears who loved a day in the English countryside and the hospitality of an inn to return to at eventide. In Burford—a charming Cotswold town—there are three very nice inns. These are the Cotswold Gateway, the Bull and the Baytree Hotels. The other hotels which we are sure you would like to visit when you are in the Cotswolds are: The Bull at Fairford, the Swan at Bibury, the Shaven Crown at Shipton-under-Wychwood, the White Hart at Chipping Norton.—*G. E. E., Manchester.*

Hotels in the Sahara.—There is an excellent hotel at Marrakesh, which is Southern Morocco, and although this is not the Sahara proper, it has an excellent winter climate, and is a fascinating place. The hotel is known as Hotel Mamounia. In the Sahara proper there is Laghouat, with the hotel Trans Atlantique. This, of course, is in Algeria. Finally there is Biskra, also in Algeria, which is a good winter resort with a hotel known, we believe, as the Trans Atlantique. We strongly recommend Marrakesh, but Biskra is probably much easier to get to owing to the Spanish war.—*A. A., Hants.*

Turf

The Derby.—The course at Epsom is now 1 mile 4 furlongs 5 yards. The first lady to win it was Lady James Douglas, when it was run at Newmarket in 1918. Here is the list of winners since 1921 which you required:

1921. Mr. J. B. Joel's Humorist.
1922. Lord Woolavington's Captain Cuttle.
1923. Mr. B. Irish's Papyrus.
1924. Lord Derby's Sansovino.
1925. Mr. H. E. Morriss's Manna.
1926. Lord Woolavington's Coronach.
1927. Mr. F. Curzon's Call Boy.
1928. Sir H. Cunliffe-Owen's Felstead.
1929. Mr. W. Barnett's Trigo.
1930. H.H. Aga Khan's Blenheim.
1931. Mr. J. A. Dewar's Cameronian.
1932. Mr. T. Walls's April the Fifth.
1933. Lord Derby's Hyperion.
1934. Maharajah of Rajpipla's Windsor Lad.
1935. H.H. Aga Khan's Bahram.
1936. H.H. Aga Khan's Mahmoud.
1937. Mrs. G. B. Miller's Mid-Day Sun.
1938. Mr. P. Beatty's Bois Roussel.

The Derby was run in 2min. 34sec. by Hyperion in 1933, and Windsor Lad in 1934; in 1936 Mahmoud ran it in 2min. 33½sec. —*D. B., Edinburgh.*

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

CHRISTMAS PRESENTS

NEARLY two thousand years ago the most wonderful present ever given was made to mankind. For nearly two thousand years men in their own poor way have followed that great example, and at Christmas give to their friends and relations such presents as they can afford.

No doubt, to begin with, their presents were very simple. And in those days it was the spirit that prompted the gift rather than the gift itself which earned the gratitude of the recipient. Times change, and with them men. We are more material. To-day, unfortunately, it is the gift, the value of the gift, rather than the spirit in which it is given that counts. The change occurred long ago—no man could say just when, but human nature being what it is it seems probable that it was nearly two thousand years ago—and has become progressively more obvious as the years passed. Man, a vain creature, has always been anxious to impress. Man, a lazy creature, has always chosen the easiest way in which to do so.

Some of the blame, perhaps a major portion, must lie with woman. For women have always been vainer than men, and much more acquisitive. Shakespeare touched the roots of the matter:

> "Win her with gifts, if she respects not words:
> Dumb jewels often, in their silent kind,
> More than quick words, do move a woman's mind."

And what woman respects words? Undoubtedly women cannot escape blame. But the real fault lies in man's desire to impress. It is very difficult to do so with words, very hard work with deeds, but so easy to impress with gifts—be it a mere acquaintance or a rich (and ailing) relative. Yet in the very easiness lies danger. John Boyle O'Reilly, with true Irish cynicism, summed it up: "Take gifts with a sigh: most men give to be paid." Most of us have found that to be true at some time or another. Those of us who qualify as rich (and ailing) relatives know it only too well.

In this number will be found details of many Christmas presents; presents for every conceivable sort of person; presents to suit almost every pocket: presents which prove beyond quibble the vast ingenuity and excellent craftsmanship of the British manufacturer. We will all give presents this Christmas, as we have done in the past, and as we will do in the future. It should not be otherwise. But let us remember the danger inherent in the practice. Let us give not to make a show but because we wish to give, for affection or friendship rather than for possible future gain. In the long run it is the man who does not set out to impress that gains in the worth-while things. The light set under a bushel may not be seen—but it burns more steadfastly than that set in a draught.

"In giving, a man receives more than he gives," said George MacDonald, "and the more is in proportion to the worth of the thing given." You can take that remark two ways. But surely it should be interpreted thus: that the spirit is the thing that matters, not the gift, but that in buying the best that you can afford, with no thought of self, you are helping many beyond the recipient. We live for each other and upon each other. If we do not help each other we fail. Generosity is the dynamic of help.

A.R.P. AND INCOME TAX

INCOME tax interests everyone who has to pay it, and for that reason there should be a good many members of the Income Tax Payers' Society. The minimum subscription is 10/- for private individuals and 1 guinea for firms, companies, &c. This sum entitles members to receive the monthly official journal which is devoted to all aspects of income tax legislation. The November issue points out that as far as expenditure on Air Raid Precautions is concerned, the new regulations are almost entirely confined to certain conditions which affect assessment under Schedule A.

These, it may not be surprising to learn, "will be negative, because so long as a building or a part of a building is used for purposes of air raid protection alone, and no rent or increased rent is payable therefor, the Revenue will not be entitled to tax the annual value or the increased annual value which may be attributable to Air Raid Precautions expenditure; and a taxpayer will not be entitled to any deduction or relief under that Schedule in respect of any such expenditure which he may have incurred on a building occupied or used either as a residence or as business premises."

"WORKING UP"

Truly speaking "working up" is a naval expression referring to the trials preparatory to a ship going into full commission, but it serves equally well in reference to the active preparations at present being pursued for the establishment of a regular transatlantic service by British landplanes and seaplanes. Importance of reliable weather forecasts has not been overlooked, and one school of thought, including in its ranks Captain F. Entwhistle, Head of the Overseas Division of the Air Ministry Meteorological Office, envisages the establishment of a weather reporting service additional to that obtained from existing ships in passage on the ocean. A stationary ship located in mid-Atlantic is considered to be a necessity to efficient weather organisation. Information is particularly required of upper air conditions, which passing ships are not always suitably equipped to observe and report upon. Aerological as well as meteorological information is needed for the safety of passengers and mails on transoceanic journeyings, and the authorities will not leave anything to chance.

END OF THE SALMON SEASON

St. Andrew's Day and its celebration of auld lang syne have been for a generation or more coincident with the end of the Tweed season; the last of the salmon rivers to go out. It is safe to say that this year there will be many anglers who consider that the sooner 1938 becomes verra auld lang syne the better. East-coast rods, taking the season through, have certainly done better than their unfortunate confrères of the west; but even Tweed has failed the back-end fisherman this year. The distressing feature has been not so much the lack of fishing water as the apparent lack of fish. Up to last year there had been signs of improvement in autumn fishing which at one time offered the best chance on most water for recording a catch that pulled the scale into the forties; but hopes of the big 'uns of auld lang syne have had a bitter setback this year.

A PERFECT KNOCK-OUT

On Monday night, at the N.S.C., Ernie Roderick, of Liverpool, a contender for the British Welter-weight Championship, knocked out Gustave Humery, of France, in ten rounds. That bare statement clothes what was a brilliant achievement. Humery is well-known in England as a strong, relentless fighter with no mean abilities as a boxer. Possibly he is a little past his best, but he had shown himself only a few weeks ago to be as tough as ever. Roderick completely out-boxed and out-fought him from the first gong. And the right-hand punch to the heart that ended the fight was perfectly executed and delivered with a force that few middle-weights could have withstood. In Liverpool they say Roderick is the best man at his weight in Britain, if not in the world. He has long sought a fight with Jake Kilrain, the champion, and is certainly more entitled to one than any other British boxer. Kilrain, himself, does not appear over-anxious to defend his title against so dangerous a contender, for which it is difficult to blame him. Dangerous, Roderick certainly is. A better combination of skilful boxing and punishing hitting has not been seen in England for many years.

THE FESTIVE SPIRIT

The extremely strong team which the M.C.C. have sent to South Africa threatens a swift revenge for our defeat in the second Test match at Lord's two years ago and the virtual loss of the rubber. Chiefly instrumental for their most decisive innings victory over the Orange Free State, at Bloemfontein, last week was some very fast scoring on the part of N. W. D. Yardley, of Yorkshire, and H. T. Bartlett, the famous Sussex hitter. The amateurs produced 227 runs in the astonishingly short space of two hours. This is certainly the festive spirit of cricket, a spirit not usually associated with the play of touring teams even at Christmas. It is a spirit which is both welcome and to be encouraged, as it should be one of the chief advantages of a cricket tour such as this, and an encouragement for more attractive play in the future. Let us hope that it is maintained.

AN OLD GATE

I like that weather-worn old four-barred gate
Which no one ever opens. The hedge is old
Each side of it; ash saplings grow behind it,
Their slender boles already ivy-covered
Though they are so much younger than the hedge.
And the gate is ancient, iron-clamped, crooked;
And leads nowhere. That is, leads nowhere now.
Set in an angle of the hedge, it awaits
Final destruction and oblivion.
Its green wood—green with age—will fall apart,
And then be taken to a house for burning,
Or else just left to rot into the ground.
Some more thorn will be planted, the gap closed.
One day bullfinches will be nesting there,
Conspicuous-inconspicuous furtive birds,
Who know the strength of intermatted thorn.
But if I pass alone I shall remember,
When that day comes, that once there was a gate.

N. L. B.

A COUNTRYMAN'S JOURNAL

WHETHER or no finality be attached to the theory of relativity in cosmic dynamics, it is without exception an æsthetic law of the first magnitude upon earth. It is in violating it, as for instance when we roof a house with Welsh blue slates in a stone country, that England has been uglified; in unconsciously obeying it that our ancestors made our land even more beautiful than nature's first hand upon it.

The other day I was crossing Cranborne Chase when I came upon something which owed its "sudden glory" entirely to this law. In the hedge stood a pair of yews and into them and over them the wild clematis, old Gerard's Traveller's Joy, had climbed until it had made a foliated Romanesque arch between them. Through the arch the eye traversed as wild and, in one sense, as forlorn a scene as any in England. Not a house, not a barn, was to be seen from corner to corner of the whole landscape.

Yet the signs of former habitation were everywhere abundant. To the south, the Bokerly Dyke which the Romano-Celts threw up as their last desperate defence against the West Saxons, serpentined across the plateau. To the north, Oakley Down was a vast cemetery of far older people than they. Symmetrical disc barrows, nobly formed bell barrows each with its circular fosse, bowl barrows and long barrows clustered together as thickly as on Normanton Down, where the Early Bronze Age dead slept within comforting sight of Stonehenge.

Through one of the disc barrows of this archaic churchyard, Ackling Dyke, the causewayed Roman highway on its way from Old Sarum to Badbury Rings, cut with that contemptuous indifference which we in our turn mete (and so shall it be meted unto us) to the villages, buildings and country crafts of our forefathers. Between the dark estranging sconce of Pentridge and where I stood, the land was a closely written manuscript of earthworks, Celtic arable fields and Romano-British villages.

Upon the crest of nearly every ridge there lay stretched a long barrow like a lion in sleep. To-day, nothing. The road alone knows the human face; on either side expands the wilderness. Old man's beard is always beautiful in autumn; it is the more so when it climbs a tree; yet more when the tree is a dusky yew that displays the misty silvery awns of the climber; lovelier still when it makes an arch between them. But loveliest of all when the wildness of its growth seems to symbolise and epitomise the wildness of a deserted land.

The next scene was under the heights west of Abbotsbury. In our day, the pampas grass has become as much an emblem of suburbanism as calceolaria and lobelia were of Victorian snobbery and stuffiness. If you see it in a garden, the name of the house is almost sure to be "Sunnymede" or "Mon Abri." What I could see before me was as unlike suburbia as it well could be. On the left, St. Catherine's Chapel, the former shepherd of the wandering mariner, stood on the crest of its conical green mount and looked out to the sea. The tawny Chesil Bank hemmed the ocean's rim, and on that still, vaporous day alone seemed to anchor the sea to the earth. In the sun, that sea was mother-of-pearl; when the sun's rays were diffused from a filmy cloud, it was of molten lead. It appeared as insubstantial as the sky, and even the solidity of earth was compromised by the soft autumnal light that played upon it. Directly in face of me, a large grove of ilexes fronted the baby waves and below the mound on which they stood ran a hedge planted all along with pampas grass.

The effect was entirely perfect; there was not a flaw in it. The tall, feathery tope, silky-white against the olive-green of the ilexes, was of just the right delicacy of substance to be in tone with the melting, dissolving day, the sea that was as evanescent as the clouds and the land suffused with tender light. The tops of the pampas languidly waved, and the semi-tropical vegetation of the warm, sheltered, southern bay, enfolded by the veils of sea and sky and air, conferred upon these plants a beauty and a distinction which are the very last things with which we commonly associate them.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a novel: "She settled herself in her chair with her white skirts gathered round her knees in the moonlight. The voices of the parties on the roof clustered unevenly in little nosegays of talk—English, French, Chinese, Japanese, Italian, German. While Ronnie called the boy and ordered fresh drinks in his commanding Public School manner she could hear the couple at the next table speaking about her, low and clearly in the night air."

THE DEMOCRACY OF HUNTING

But is it a Sport of the People?

ONE hears and reads so frequently that hunting is a democratic sport that the assertion is accepted as correct. But is it? I am not thinking so much of the pageantry of hunting, which does no harm to anyone, or to the fact that fashionable folk are as particular about their hunting toilet as they are when they attend a wedding. What I am thinking of are the facilities given for sport to the poorer brethren.

In the days of prosperous farming and big landlords, before the era of motor cars, barbed wire and large poultry farms, every farmer had a horse which he used for getting about the farm or seeing his neighbours on business. He may not have used it for regular hunting, but when there was a meet within reasonable distance he or his son turned out for an occasional day's sport. Now, in many hunts, not one man out of ten is a farmer. Often there are less.

At one of the last meets of the season there was not one farmer in a field of over thirty. This scarcity of hunting farmers is bad for sport, and in time will be worse. Hunting people cannot afford to lose intimate touch with those over whose land they hunt, and the intimacy can only be found in the field, where, needless to say, farmers are always received with the greatest of cordiality. Quite rightly, everything possible is done to keep on the right side of agriculture by the attendance of Masters and secretaries of Hunts at agricultural shows, farmers' dinners, &c., and by hospitality at the annual Hunt Point-to-Point meetings. But these occasions do not bring hunting folk into touch with all classes of farmers. The large man who breeds hunters, or, at any rate, has some for sale, can look after himself; the Hunt means a lot to him, providing not only sport but part of his business. It is the small man who counts in these times; the number of small holdings and of small owner-occupiers increasing every year. One man of this class who happens to be rubbed up the wrong way by a member of the Hunt can be a serious menace to sport by forbidding the entry of the Hunt on his land. Every county knows this trouble with a few rare exceptions. Flattery has done much in the past; butter has been laid on with a shovel by hunting folk whenever the word "farmer" is mentioned, and one must admit that farmers, as a whole, have been extremely tolerant of people who follow hounds over their land, breaking fences, riding over meadows recently rolled and chain-harrowed, and often, it must be admitted, leaving gates open for stock to stray. It seems a miracle that farmers should tolerate it, more particularly those who get no advantage from the Hunt.

A friend who lives in a district where at meetings among themselves farmers say hard things about those who take their pleasure in pursuit of the fox, tells me that at public dinners when, under the influence of good food and liquor, the toast of "fox-hunting coupled with the name of . . ." is proposed the enthusiasm is great: a man well known as an opponent to the chase rushes to the piano and bangs out "John Peel," the room, rising to its feet, sings the honours of the Hunt with an enthusiasm not accorded to other subjects. That, thank goodness, is a common experience. But will the spirit last? Surely it is worth the while of those whose business it is to direct the fortunes of the chase to keep this enthusiasm handed down from our fathers alive. Once dead it cannot be revived.

The real necessity seems to be to get farmers and their sons more directly interested in hunting. We want to see them out. Our flattery and their songful praises are well enough in their way, but they are words, mere words. Instead of their buying motor bicycles let them buy or breed horses and ride them. A man with a horse to ride about his farm sees that his gates are in good order; if he hunts he can be of the greatest value to the Hunt committee in giving his views to them on the petty grievances and needs of farmers, and to his fellow farmers on the advantages which the Hunt does or can bring to them if approached in the right way. I go so far as to say that one of the ways of ensuring the continuation of hunting is to get more farmers to come out. The need is urgent.

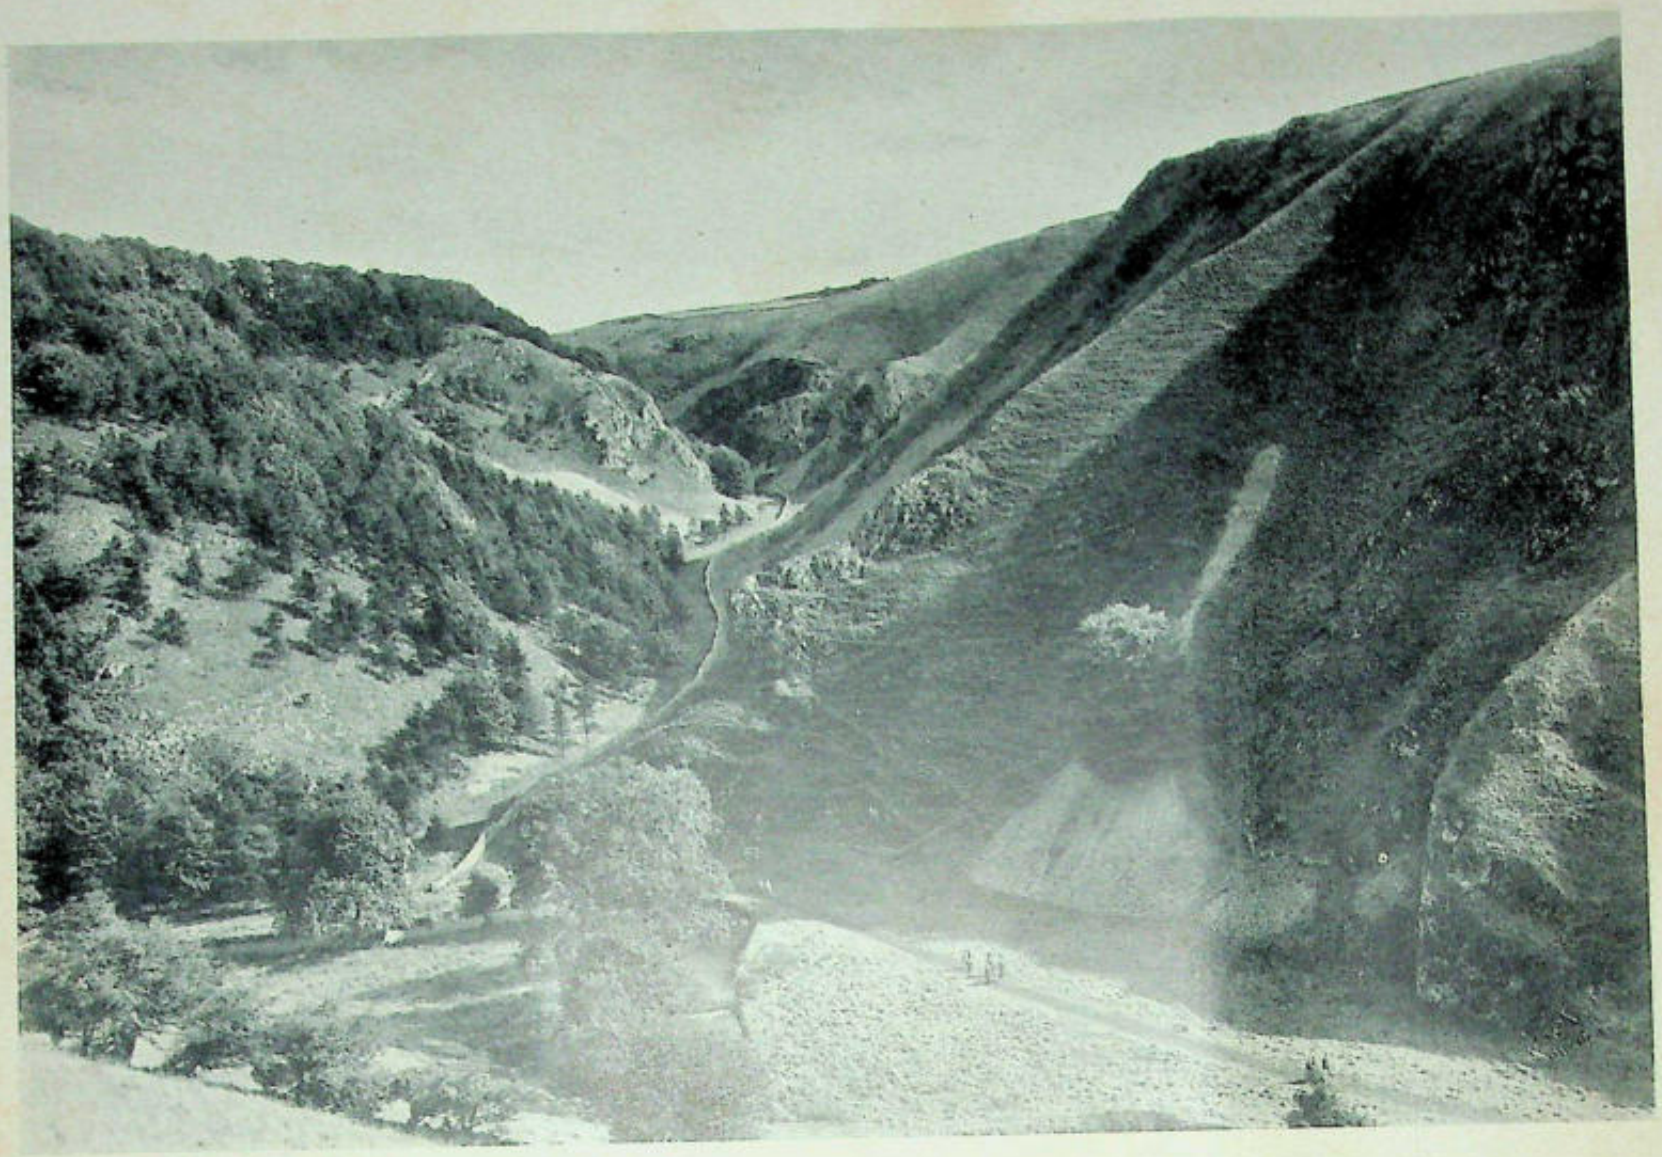
It is for this reason that I take pen in hand to discuss this matter. I myself hunt as a poor man in a mild way, and because I do not wish any particular Master to think that I am trying to make it difficult for him I prefer to keep my name obscure. But my case is typical of many others. I live in one hunting country within reach of the meets of another, but I cannot afford to subscribe to both. I have to rely on one hunt for my sport.

I farm a small grass farm where I preserve foxes and I keep one hunter, but have no horse-box for distant meets or groom to take my mount to and from them while I travel comfortably in a car. I must hack to and from meets, but before and after doing so I have my stock to see to. My carter looks to my horse while I do this. On Saturdays, when I have the best chance of a near meet, my men have their half-day off, consequently I have more to see to myself. My neighbour, who also likes his day of hunting in the week and is just as keen on fox preservation, is his own shepherd and has the sheep to see to before and after his day of sport.

There are many like my neighbour and myself not only in my own hunting country but, I imagine, in most others. To refer to the title of my story, one asks whether in arranging meets the Master is not thinking too much of those who can afford horse-boxes and grooms and too little of those who farm and who preserve foxes. With only one mount, quite apart from our work on the farms, we cannot hunt more than three days a fortnight, nor can we ride long distances to meets. Is it too much to ask the Master to give us one certain near meet in the week? We do not always get it.

Sometimes there are as many as three or four possible meets in the week, at others there is none within twelve miles of us and we get no hunt. There may be difficulties in the matter of stopping, and there may be urgent need for the hounds on certain occasions to be elsewhere. So far as I am concerned my hunting days are nearly over; my thought is for the future of hunting, and what may apply to one or two humble individuals in a small corner of England may apply elsewhere. Perhaps Masters will look into it.

KOTTON.



THE NATIONAL TRUST AND THE NATION

Public Opinion Should Be Crystallised Into Action

ABOUT a month ago, in this journal, I wrote an article advocating the formation of National Parks. The response—in the form of letters—has staggered me. I expected—I must confess—a number of letters for and against the idea. But I did not expect anything like the number I have received, and I did not expect them to be, as they were, almost unanimously in favour of such parks. That surprised me.

I was also surprised to find how many people were ignorant of the existence of the C.P.R.E., and how many were ignorant of the existence of any society or societies for the preservation of rural beauty in this country. I would expect those who did not mind whether the beauty of our countryside, whether the majesty of our old or historical buildings was destroyed or not, to be ignorant of the existence of societies formed for their preservation. But those that wrote obviously did care, and their ignorance is the more surprising for that reason. It reflects somewhat sharply upon the publicity methods of the bodies concerned, but that, happily, is no concern of mine.

It is, however, some concern of mine, as it is of every person who has in him (or her) a love of their country as it should be, to see that the aims for which these societies were formed—namely, the preservation of certain aspects of our civilisation from despoliation at the hands of the ultra-civilised—should be brought prominently before those members of the public still sufficiently cultured to care.

National Parks are, in my opinion, essential for the well-being of the race. But it would be a disastrous mistake to suppose that the movement for the preservation of rural England should end with their formation, or should be concerned only with their formation. There are many places throughout the length and breadth of Britain utterly unsuited for inclusion in any scheme for a National Park which are yet eminently suited for preservation from the hand of the builder or the road-maker. And preservation should not end with the countryside. An old building, whether of historical interest nationally or not, is of vast value culturally. You may have no great knowledge of architecture (my own is infinitesimal), you may have no interest in the architectural genius of the past (you may even prefer the modern concrete square which is so totally unsuited to the English background), but you cannot, having sensibility, look upon an old building and be the worse for so doing. The cultural life of a nation is of as great importance as its economic life—greater, indeed, for it is the cultural that conceives the economic. Kill the spirit—and you kill life. Remove culture and you have but an automaton, a queer soulless, lifeless thing—efficient, maybe, but without creative power.

There are many in this England of ours who would gladly do away with those things that have made us. There are, happily, those who would preserve—that word does not, by the way, imply a static condition blocking progress; if it did, I would have nothing to do with preservation—the land that made us, and the buildings that men built for the love of craftsmanship and not for the love of gain; that men built with care and pride, because they wished to create something of beauty.

STAINFORTH BRIDGE, ON THE LINE OF THE PACK-HORSE ROUTE FROM LANCASTER TO YORK

Pre-eminent among such societies is the National Trust, whose attentions are not confined solely to one aspect of English life. I had thought—and thinking again I do not know why—that everyone knew of the National Trust and its work. I was wrong: an astonishing number of people are apparently completely unaware of its existence—a fact which should interest the Council.

The National Trust was founded in 1895. Clause 4, sect. (1), of the National Trust Act, 1907, reads: "The National Trust shall be established for the purposes of promoting the permanent preservation for the benefit of the nation of lands and tenements (including buildings) of beauty or historic interest, and as regards lands for the preservation (so far as practicable) of their natural aspect features and animal and plant life." Nobody could quarrel with that: and I do not think anybody would wish to quarrel with the way in which that clause has been carried out. In 1895, no doubt, the movement was very small. Miss Octavia Hill, Sir Robert Hunter and Canon Rawnsley, who were the instigators of the movement, could not, for all their foresight, have visualised the movement as it is to-day. They could not have visualised the country as it is to-day. They would not have visualised an era in England in which vandalism passed for progress.

To-day we live in that era; and to-day the National Trust is a very large landowner. It has 305 properties scattered over the country from the Farne Islands to the Lizard Downs—covering an area of 45,262 acres. In addition, it holds seven properties, comprising 11,076 acres, on very long leases, and a further 16,489 acres are protected by covenant.

Now all that sounds very good—and very large. And it is very good. But large as the holdings of the Trust sound, in actual fact they amount to about two-thirds the size of our smallest county, Rutland. From a National point of view, I can only describe that as appalling. It is not the fault of the Trust. Though founded ore than 40 years ago, it is no

more than on the threshold of its life. Real public interest has only just been aroused—coincident with the growth of urbanisation and coincident, too, with the speeding up of modern transport—but only the outer skin of public interest (a very thick-skinned and phlegmatic animal) has been scratched. That the Trust holds so small an acreage is not the fault of the Trust but of the public in whose interests it was founded.

Our towns and our countryside are an expression—the expression, really, for all others spring from these two, just as the towns spring from the countryside—of the National life. They must change and develop as the National life changes and develops (if that is the correct word to use nowadays; I am not sure that enlarge is not better). But the change must not be unhealthy. We have planning schemes, to-day; but too frequently a scheme good enough, seemingly, on paper is bad in practice, and much of our countryside is being ruined every day (and for all time) by jerry-building and ill-conceived road-making. The change is morbid; the development warped. We have, here in England, some of the most beautiful scenery in the world—the beauty of copses upon downs, the beauty of hedgerows against chequered fields, the beauty of gentle streams in lush meadows, the beauty—well, the beauty of England; and year by year, week by week, day by day we lose it through lack of imagination, sheer lack of imagination, and neglect.

As a race we are not imaginative. As a race we are remarkably stolid (which is quite different from easy going). As a race we have muddled through so often in the past, that muddling through is part of us. We always believe—deep down in us—that "Everything will come out all right in the end" (which is just another way of saying that we are downright lazy). We explore every avenue; we hope for the best. But it is only the few, the very few, who do anything towards ensuring that the best shall come our way. That is true of every facet of English life. It is true of our attitude towards our countryside and our historic buildings. Most of us love our countryside, or some particular portion of it. We regard it with pleasure. We do not think anything will ever happen to it; to other parts of the country, yes, but not to our own. And then one day we see little pegs in the ground, and then the beginnings of another little red bungalow—and we are annoyed. But we did not do anything about it. We alone are to blame. We cannot, in these days of stress, blame the landlord for making his land pay in whatever way he can—almost certainly it will not pay if he farms it. We alone are to blame; we the public. We regard now with some distress the Sussex coast that was once glorious and is now a nightmare; but that nightmare is our fault. It is there because we, men of Sussex or men of anywhere else, had no imagination, hoped it would be all right, and were too idle to do anything about it.

And that is the trouble with the National Trust. The Trust can do the work *with* public support. It can do only a certain amount of work without public support. The Trust in fact does just as much as the public will allow it to do. It does more every year (which is as it should be) but it could do a great deal more every year.

The old tradition that public funds should not be spent on amenities is gradually being worn away. Government Departments and Local Authorities could be forced by the public into doing much more to help. English public opinion when roused is just as near invincible as makes no difference—and no class is more aware of that fact (and more fearful of it) than the Government Department and the Local Authority. But to do all or any of these things public opinion must be roused. That public interest in the National Trust—and other similar societies—has quickened, is beyond question. But it has not been crystallised; it lacks co-ordination; it must be marshalled and guided, made a force on a big scale.

That this could be done I have no doubt. Primarily the duty lies with the National Trust. Indeed, the only fault I can find with that estimable body is in the lack of force (punch as the Americans would say) that characterises their publicity. But a duty rests, too, upon the public. If you love your countryside, or any particular portion of it, if you love some particular building that has historic or cultural value, then it is up to you to do something towards its preservation, by expressing your opinions as forcefully as may be to those in authority and by helping financially. It is no good hoping everything will be all right; it is no good waiting for your neighbour to take some action (he is probably waiting for you). Apathy is the greatest enemy that our countryside and its ancient buildings has got to fight. For example, Londoners are supposed to be proud of their city. The National Trust during the past year have been unable to save several houses of architectural importance and irreplaceably historic interest in London. And I wonder how many Londoners even knew that the Trust was trying to preserve these houses? And how many cared? Apathy is the greatest enemy.

Apathy is the greatest enemy of modern English life, parochial or national. It is conquered in parochial and private life—apparently only when personal gain is the goal; in national life only in times of crisis. So far as the preservation of England's beauty and of the historic buildings of England are concerned this is—and has been for some time—a time of crisis. Many, many people realise this; many, many people would like to do something about it; many, many people really feel very strongly about it. But very, very few people do anything about it—for a variety of reasons (all of which can be defeated); because they are English and do not like making a fuss; because they are not well off, and what they could afford to give would not make any difference (a very common idea which is not always an excuse); because they do not know anything about it until it is too late; because they are lazy; because they do not know anyone personally who feels as they do. Public opinion when roused knows not apathy. Public opinion means the opinion, well directed and well expressed, of many people. A good cause will ultimately arouse public opinion.

The National Trust is doing a noble work. It can, given support, do very much more. But that support must come from the many—not the few.

SPAWNING BEDS IN WINTER

A Plea for More Investigation

By H. D. TURING

WITH the recent arrival of December, a change has taken place in the trout stream. Where a month ago the bed was hidden by an olive-green growth of mare's tail stirring gently in the current, with darker patches of buttercup making a shadowy background for bright green celery, now appears yellow gravel which has not been visible these three months past, and the contour of the river bed, its hollows, flats and mounds of gritty silt show clearly in the winter sunlight. What seemed to be a promontory on the bank, where loosestrife was so destructive to flies, until one was pulled gently off it into the water and destroyed something more worth while, now appears as an attractive hollow carved by some wayward current, fit habitation for the 2-pounder which knows it no more. Everywhere familiar landmarks of the fishing season seem to have disappeared. It is as if an old picture had been cleaned, and the line and colour of the master's brush showed up again as when the painting was new made.

Few anglers, apart from the occasional seeker for grayling, see the trout stream in its winter garb, most of us being, I suppose, occupied with our lawful occasions, and hoping, vaguely, that all will be well with the stream until we see it next year, when the pussy willows are already showering gold upon its surface. Possibly this is the reason why spawning beds are so often neglected. There is a tendency, perhaps, to think rather optimistically that "nature knows best," and to leave her the job of attending to her own affairs, with the sort of gentle hope that the trout will find suitable spawning grounds for themselves and are best left to their own devices.

This rather half-formed idea has probably been fostered by a very widely-held view, until recently, that natural spawning was an inefficient affair, decidedly a chuck-and-chance-it business in which most of the milt from the male fish was swept away down stream, and only some very small percentage of the thousands of eggs extruded by the female was ever fertilised. A recent investigation in New Zealand, of which an account was given in these columns earlier in the year, has shown very effectually that, on the contrary, a trout's spawning methods are highly efficient, just as efficient in fact as our most modern system of artificial spawning. The redd is so shaped that an eddying current carries the milt round just where the eggs are laid, and only some trifling 3 per cent. or so escapes fertilisation. Afterwards, they are covered with several inches of gravel and are practically safe until the little alevin has absorbed most of its yolk sac and struggles from its nest to take its chance in the stream. That this chance is not very good is shown by the low survival rate later on; but the original start is good enough for anyone.

It has been argued, and with some reason, that what is true of New Zealand streams is not necessarily true of those at home; that spawning streams at the antipodes are more nearly natural waters, running through comparatively uncultivated country, whereas our own best trout streams run through rich farm land and, at least in the south, have cultivated banks from source to mouth. In consequence, there is a great deal more fine silt carried down, which is one of the great dangers to eggs in their incubation period, for it fills up the interstices between the gravel in which the eggs are lying and stops the flow of water which carries the oxygen to the developing fish. Also, of course, that what is food for the fish is an enemy to the egg and alevin, so that the richer a trout stream in food the greater will be the loss in trout reproduction.

Mr. Derisley Hobbs, who was responsible for the New Zealand investigations, found very little evidence of loss through predatory insects up to the time when the alevins left the gravel for the bed of the stream, so it is possible our fears of damage from enemies in the redd itself are partly unfounded, but it would be useful for a careful investigation of redds to be made in a south-country stream to see whether caddis or the larvæ of large insects do work their way down into the redds. At present there is no really reliable information available in this country as to losses which occur at this stage.

What comes most clearly out of his investigations is that serious damage may be caused by the deposition of silt. It is true that no great loss occurs from this cause in New Zealand, but that is obviously because silt was seldom deposited. In this country silt is a perennial danger, as witness the damage which it caused two years ago (in the memorable winter flood which came down the chalk streams) to the experimental stews of the Hampshire Avon research scheme. What was the loss in natural spawning from this flood in the 1936-37 season? Judging by the damage it did to well-grown fish and the denudation of fly life from the river beds, it must have been appalling.

Present practice, with people who take care of their spawning beds, is to rake the gravel over with a fairly long-tined rake at the beginning of November, care being taken to root up all weed growing in the bed and stirring the gravel up well so as to get it as clean as possible. As far as it goes, this is probably very sound practice, but there are two points which may be worth consideration. One of them is whether November is the best time to do it. It is a rather curious thing that Mr. Hobbs noted in his investigations that fish did not seem to select, by choice, very loose gravel; they inclined to a bed which was partly cemented; easy to "work" apparently, but in itself fairly solid. It may be that there is some advantage in having the bed alongside a redd appreciably more solid than the redd itself, so that the water has a tendency to circulate in the loosely-filled redd surrounded by the partly-cemented undisturbed gravel. So an earlier rake over might give better results, leaving time for the gravel to settle down well again. Or what is, perhaps, more important, to rake only the surface of the gravel very lightly, so as to clean it well, leaving the immediate subsoil undisturbed.

The other point—and a much more urgent one—is how to prevent a deposit of silt occurring after the redd has been made and filled with fertilised ova. In trout streams nowadays, where great care is usually taken to keep as much weed in the water as possible, there are always heavy deposits of silt. All weeds collect silt at their base, though provided the stream is swift enough most of it will be of the gritty kind, composed of fairly large particles in which fly life is often abundant. In the autumn, when the weeds decay, a good deal of fine vegetable matter becomes mixed with it, unless weeds have been cleared sufficiently earlier in the season to keep a sufficient current running; the finer the material the less current it takes to carry it. But in any case, heavy water in winter is bound to carry off the finer particles of silt and as the high water subsides there is great danger that this may be deposited on the spawning bed.

One point to be watched is obviously that the spawning bed shall be as level and as free from any kind of obstruction as possible. Whenever an obstruction occurs a small eddy is formed behind it, and silt is inevitably deposited in the slower current. As the pile of debris increases its edges will be continually washed away and spread over the adjacent gravel since this lower layer of water is impeded by friction against the bed of the stream and will not carry the silt far.

ON THE SPAWNING BEDS: A REACH OF THE DIGSWELL FISHERY ON THE HERTFORDSHIRE MIMRAM

But something else is needed if silt from upstream is to be prevented from getting into the redds. It would seem that either the summer deposit of silt must be washed away early to the non-spawning parts of a stream, or that some method must be evolved of holding it *in situ* during the early months of the year when the danger of it is most apparent. In cases where the water is slow and the risk of deposit greatest, it may be possible to increase the stream by narrowing the river; but otherwise no very effective method of holding back the silt has yet been devised. Low single-log weirs might be worth trying. They have the effect of collecting silt on their upstream side, though the objection has been urged against them that a really heavy push of water will clear out the accumulated silt which increases the danger they were erected to avoid.

However, a push of water heavy enough to do this will also, as a rule, be heavy enough to carry the silt safely past the spawning gravel. It is while the flood is subsiding that the worst of the trouble occurs, and a log on the bed of the stream above the spawning bed may be expected to catch a good deal of the suspended matter which might otherwise get on to the gravel. Anyhow, it may be worth while for an owner to try it for a season and watch the effect. Exactly what constitutes good spawning gravel both in substance and position is a piece of knowledge well worth the trouble to acquire.

BEST DAYS WITH HOUNDS

Wet Conditions With the Duke of Beaufort's

THE wet state of the ground is conducive to first rate scenting conditions, but the wild and stormy weather has made it difficult to maintain the high average of sport that water lying in the furrows always betokens in this country. Those that have been out all day and every day have been well rewarded. Saturday at Fosse Lodge was a very bright morning after a rough night with a nip in the air for the first time this season, and there seemed little scent when hounds found at Dunley Gorse, and ran a circle to Cranhill Wood and back. However, when they got their fox away a second time they ran well, crossing the Fosse, and went on to Cranhill Gorse. Here again there was little scent in covert, and after marking two fresh foxes to ground, the Duke held them on over the land and recovered the line of the hunted fox going on by Goulters Gorse and Alderton Grove. Here the second whipper-in got a view, and then the bitches got on better terms and raced away up wind with much improved scent. Few people of the large Saturday crowd out were really well up with them after crossing the railway. They went very fast by Hebden, left both Centre Walk Brake and Allen Grove untouched, and continued as far as Sopworth Cross Roads, where a plough team probably turned this good fox, and he went back by Wick Farm to Allen Grove. Here, in spite of being "whistled away" on the line of a fresh fox, the Duke had the satisfaction of killing his beaten fox in the open in Badminton Park. This was a very good hunt, for the most part over a delightful line of country riding at its best.

On the following Monday the dog hounds with Holland had an excellent day in the Dauntsey Vale. At first there was little scent after a rough night, but there was a good hunt from Miles Gorse to Catcombe, followed by another over the cream of the Vale, also to Catcombe.

Tuesday was a busy wall day, after the meet at Sir Walter Preston's hospitable house. Wednesday a gale raged all day, but quite surprisingly hounds managed to run well when a fox obligingly left Worlocks Covert upwind for Siston. That is a particularly rough and awkward line of country, and several red coats were reported in the brook at the same time! Later from Bean Wood, after lightning and sleet, conditions for hunting became impossible, and hounds had to be stopped.

Friday also started unpleasantly, with the large crowd out getting soaked at the meet, which was the Kennels. A fox from Withmore ran by the Bath Verge, then from Maddon Plantation, a grand light-coloured fox went away in a heavy downpour of rain. He went through the Seven Mile Plantation, between Beech Copse and Grickston Farm, and continued on over the Bath main road, by Sodbury Camp to Little Sodbury Wood, where one expected this hunt to finish in the badger earths. But not a bit of it; this good fox went on—a most unusual line—past the church, back up the hill, over the road (quite clear of followers), straight towards the earths below Horton, but finding these closed he went on by Widden Hill, the Old Camp and Chalkley, to Broad Hill. Here it looked almost as if there were two lines, and a fresh fox jumped up by Hawkesbury Church, but hounds stuck to their hunted fox and went on to Lower Woods—thus far having come all the way upwind. The weather was now much better, and the going too wet to be holding. Hunting beautifully, hounds stuck to their fox for some time in Lower Woods till he turned down wind, and then on a failing scent they turned the line back to Horton Bushes, where, being out of their country, they were stopped. Less than a score of people saw this excellent hunt all through, but for those that could cope with the hillsides and the unexpected line, it was a rare delight to be able to watch hounds hunt so magnificently practically untouched all the way—and not once was the fox headed.

FIELDFARE.

COTTESMORE'S WONDERFUL WEEK

"PRAY for rain," said the Master to me last week. I duly did so, and a lot of others must have done so as well, as on Sunday we had a real downpour which has made the going just perfect now. And what a week's sport we have had. Four clinking good days, two of them red-letter ones.

Monday (21st).—Peckworth. A lovely day overhead and underfoot; a big field for this side of the country. And we had an excellent day's sport, hunting all day over a lovely country and plenty of room to ride each fence where you pleased. The hounds, the mixed pack, mostly dog hounds, work. Beginning with Turnpole, we found and ran very fast through Heath Wood, Newall Wood, into Holywell, where we were run out of scent.

A fox from a root field at Tolethorpe Oaks ran through the covert and very fast into Newall, and, turning back, worked its way back to Tolethorpe Oaks, where we marked to ground after a very nice hunt of 40 minutes. Finding again in Woodhead Wood we ran well in a left-hand circle over a nice line almost to Turnpole, where we turned right-handed and ran slap through Exeter's Gorse up to Tickencote, and, leaving Great Casterton on our right, eventually lost our fox near East Wood, after a really excellent hunt of 65 minutes.

Tilton Village was the venue on Tuesday (22nd); a lovely sunny day, a red-letter day's sport, and by far the best scenting day of the season so far. We began by drawing a small spinney on Mr. Button's farm adjacent to the village. Out of it came one of the biggest dog foxes I have seen for a long time. "Too fat to run far," said some of the knowing ones, and took things easy, and thus lost a very good hunt. Leaving the village on our right we crossed the Coplow Road, and hounds started to run fast down to the Loseby Banks before bearing left-handed and running very fast over this undulating country. They left Lord Merton's Covert on their left and Sludge Hall on their right, recrossed the Coplow Road, and continued on through Oak Spinney, straight through the Coplow into Botany Bay. Hounds sticking to their hunted fox forced him out of this without delay, and two miles farther on marked him to ground in a small spinney a field short of Ingarsby Old Hall, after a first-class hunt of 47 minutes—all in Quorn country.

From Owston Big Wood then came a really brilliant gallop, hounds running at a great pace over a most delectable line of country for 45 minutes. In the first 30 minutes hounds never checked, and then only momentarily. Going away almost at once on the west side of the covert, it was soon evident we were in for a good thing. We ran first towards Knossington. Leaving this on our right, we almost reached Somerby before bearing left-handed over the earths at Allom Banks (long life to the stopper), and crossing the big bottom fence we raced on to just below Owston Village. Here we bore right, and pointed for Marefield. Before reaching this we turned past Stone Lodge and on into Owston Wood, where fresh foxes were on foot and hounds were stopped after a really great hunt of 45 minutes.

Thursday (24th).—Cottesmore Aerodrome, by invitation of Wing-Commander Drew and officers of the R.A.F., who dispensed profuse hospitality to mounted and unmounted, an excellent day's sport was brought off. Beginning with Cottesmore Wood, a good fox went away at once, crossed the Greetham—Exton Road, Mr. Hall's farm, ran slap through Watkin's Gorse, and on across Chapel Farm into Kennel Spinney. Bustling their fox out of here, hounds killed him in the open a few fields farther on, after an excellent hunt of 45 minutes. Finding again on the old Canal Bank, hounds turned left-handed from the Ashwell Road, past Burley Village, and through part of Burley Wood, before getting into the open again, and ran to Catmose, where they swung into Burley Wood, again, and lost their fox, after a real good 67 minutes. A fox from Barrow Thorns ran through Cottesmore Gorse, and on to Market Overton, and then, taking a wide left-handed ring over a good line was killed at Market Overton after an excellent 35 minutes.

Saturday (26th).—Whissendine. We wound up the week with a red-letter day. A very large field out, including a lot of strangers, and after a wild night a lovely day. We started with Wymondham Roughs, which did not hold, but our most popular Chairman, Colonel John Gretton, had a great fox for us in Cottage Plantation. Going away at once, we ran straight through Laxtons, over the Whissendine Brook, and up almost to Whissendine Village, short of which we crossed the Melton—Whissendine Road, and with the Noel Arms on our right, ran straight and fast to Ranksboro Gorse. No delay here, this good fox going straight through the gorse and leaving Cold Overton on our right we ran on past Lady Wood and up to within a field of Cheseldyne, where we lost our fox, after a splendid hunt of 60 minutes, with a point of seven-and-a-half miles. Grief was abundant, as the pace was fast, and we had strongly fenced country to get over. Those who had second horses now went on to Little Owston, from where we had an excellent fox hunt of 67 minutes, though of a rather twisty nature, and so ended a really wonderful week's sport. A very hard one on huntsman, staff, horses and hounds.

FOXY.

USEFUL WEEK WITH THE PYTCHLEY

MONDAY (21st).—Moulton. Reference was made earlier in the season to the aptitude of these hounds for dealing with kale. On the day in question, with not too good a scent, they showed what may be accomplished by using their noses as opposed to their eyes, till, later in the day, they harried the foxes round and about the meeting-place, marking one to ground and killing a brace, in and out of kale continuously. In the afternoon a good hunt took place from more kale near Moulton Grange, which ended between Holcot and Hanmington by the fox being killed. A good day's work, with more resting on it than a somewhat brief description would infer.

On Wednesday, from Barby, the huntsman, hounds and their followers suffered, like all other packs which took the field on that day, from the stupendous gale. A guest who is a good judge of foxhunting replied to the query, "Well, you must have had a horrible day?" with "On the contrary, the day was certainly foul enough *qua* weather, but we had one really good hunt—fifteen minutes of it were as good as you want over a lovely country—and marked to ground. Another and regular member of the Hunt supported the above statement, and so this must be a matter of some congratulation to the executive and the pack.

It seems that after a fox of Mr. Darby's had been lost in Hill Morton another jumped up in a well-known rushy pit on Barby Hill. After a circle round the village the fox sunk into the vale and headed for Willoughby, thereby checking the wind. For fifteen glorious minutes hounds ran hard and over a notoriously fine country. As the fox turned back the pace was slower, but hunting marvellously well with a scent thoroughly diffused, hounds put him to ground short of Braunston Cleeve after 40 minutes in all.

Friday's doings from Harrington were influenced by geographical considerations and an unfavourable wind. The early foxes refused to take to the good country and resorted to the suburbs of Rothwell and Desborough, and Waterloo was blank.

A fox from Suderland Wood was caught just short of Scotland Wood, and another which jumped up in the same patch of thorns was marked to ground at Maidwell, when hounds were running really well. They were then close at him, having crossed Kelmarsh Tunnel and left Blue Covert almost on the fox's brush.

Saturday (26th), at West Haddon, provided a day which was nearly very good after a night of terrific wind and rain. A fox in Winwick Warren took a deal of finding, and was hunted nicely nearly to Elkington and killed. Hounds run hard to the Hemploe with a fox found in the aforementioned covert. He was run hard round these historic hills for 40 minutes but found an open hole when on the point of death.

Then came a great disappointment. The Field-side was the great hope of an attractive draw, but the fox to which the hounds were tied refused to leave and was killed after 20 minutes. The sun was setting, and there was a distinct nip in the air as the pack obtained a rare start with a fox found in some kale near Firetail. They settled to run hard at once and soon had arrived at Naseby Reservoir, where they may have changed foxes as there were two lines. After a momentary hesitation they were running as hard as ever past Naseby Hall, and pointing for Welford. Short of the earths at Sulby Abbey the pack swung sharp right. The Hunt staff and the leaders (and the company was select) were forced to make a detour. The pack raced on, pointing for Naseby Covert, turned back, and touch was regained near Georges Spinney. It seems that a fresh fox had intervened meanwhile, and so a gallop, which in some measure had made up for unavoidable disappointment, collapsed. It has been a useful week.

EMERITUS.

MORE GOOD BELVOIR SPORT

TWO excellent hunts in four days is fair treatment, particularly as the plums were evenly distributed between the two sides of the country, and only the adverse weather prevented further favours. The week started well on Tuesday from Sudbrook: the morning was balmy enough and possibly too bright for the more pessimistic prophets. However, the compact and amenable field which usually foregathers in the Lincolnshire country was soon to be given a treat. Sudbrook Gorse proved blank, but the kale field next door was immediately astir when hounds cast into it, and, almost at once, a fox went away. Going off at quite a stirring pace, the first lap over the jolly cock fences to Normanton put everyone into a splendid temper. This preliminary burst brought the concourse back to the starting place, of which the kale was so tall and well grown that the pack had difficulty in getting about. Individual hounds kept jumping high above the crop in a way which indicated that their fox was still in hiding. Soon he broke again on the Ancaster side and went off with decision; swinging up to the left, he then approached Sparrow Gorse, but did not attempt to go in; instead, carrying on over the flanking stone wall and the approaching lane, he set off as if for Byard's Leap. Root fields, light plough and occasional grass constitutes this region, but hounds

were not concerned with the nature of the ground; on everything they smelt fox, and that was enough. Without let or hindrance they carried on to the bluff above Caythorpe, then turned down the hill below the court. A holloa on brought them back to the high ground, and, after a short ring on the heath had given the scattered retinue a chance of getting up, they saw a brave fox bowled over in the open, with all honour, after a splendid hunt of over an hour.

That night the wind began to rise and welcome-though far from gentle, rain descended. Climatic metamorphosis from the day before was complete when a shivering field arrived at Thorp, Arnold, everyone vowing that it was madness to attempt hunting on such a day. The theory that foxes would be impossible to find in the gale was immediately exploded on arrival at Bouch's Plantation. They went off in all colours, sizes and directions like splinters from a bomb, and the only difficulty was to decide on which to follow. Up-wind was out of the question, and even the hounds nearly got blown over as they hurtled along, not so much on the line of the fox as on that of least resistance.

It was a miracle to have a hunt at all, so violent was the gale, and after drifting from Freeby Wood, through Waltham Thorns, Newman's Gorse and beyond for a few fields, a most attenuated party stuck to hounds when they subsequently had a small hunt on what was definitely the "blasted heath."

district of Gonerby Moor was traversed for the second time in a fortnight. After pointing for Barrowby Thorns, hounds swung round behind Sedgebrook, and, slowing down in the next ten minutes, were defeated after a really delightful hunt which must have measured a point of close on five miles, over country which carries a wonderful scent and is as enjoyable to ride across as any in the Belvoir region. A short dart from the Debdales put paid to the day, and finally banished the baleful memories of the morning. UNBRIDLED.

EXCELLENT SPORT WITH THE BADSWORTH

SYKEHOUSE is a charming and quite unspoilt village in the best of the Badsworth country; and conditions were good when hounds met there on November 22nd. The country had been much improved by the rain, though the going was rather heavy. Only a small field turned out, but they enjoyed excellent sport, and were on the grass all day, and everyone had as much galloping and jumping as they wanted. Oliver's Willows was blank, but a fox was viewed away from Kirkhouse Whin by the second whipper-in before hounds were put in cover. Getting a good start hounds ran hard to Kirkhouse Green nearly to the canal, and with Oliver's Willows on the left they crossed the Clay Drain and skirting Sykehouse Village crossed the line by the railway station for Balne Wood, but lost the fox by the banks of the Went after a very nice hunt of 22 minutes.

secretary, Major Cantrell Habbersty taking that nasty fall last Monday week, right at the commencement of the season, too. Everybody will join me in wishing the gallant major a speedy return to the pigskin.

Monday was a glorious day with a real nip in the air, and it was surprising scent was not better; hounds, after meeting at Wyneswold, having to work hard all day. Congratulations to whoever looks after Willoughby Gorse. Plenty of foxes this season in the beautiful little covert, lying so close to the village, it is apt to be hunted pretty regularly by stray curs and frequented as a happy playground for children—quite a difficult little spot to look after; and it was very pleasing when a burst of music heralded the rousing of the first fox of the day. He proved, however, to be a turning, twisting sort, and after taking hounds round by the Triangle Spinney, returned left-handed into the gorse, going away a second time at the bottom end, he hugged the brook and went on to the outskirts of Wysall Village before turning back left-handed into Thorpe-in-the-Glebe spinneys. Hounds and huntsman persevered through the chain of spinneys back to Willoughby Gorse, when they must have caught up with their fox—a hunted customer—being viewed away, this time over the Wysall—Widmerpool Road, hounds ran quite nicely at times and stuck to their fox, hunting him nearly up to Green Hill before he turned right-handed and made his way back to the outskirts of Willoughby Village, when what must have been a stone-cold

THE BICESTER AND WARDEN HILL AFTER MEETING AT KIRTLINGTON PARK

Saturday's meet was at Cotham, not a favourite appointment, placed as it is, close to the South Notts border, and with some very fruity ploughs and dykes in waiting on almost every side. As if drawn by a magnet, both foxes found in Cotham Thorns went straight across a slough of despond, and, to add to the indignity, a malevolent hail-storm struck us amidships, making visibility nil and discomfort acute. Better things were to come, and all the misery of the morning was forgotten when, with the sun, a fox emerged from the osiers alongside Staunton Hall. There is one route *par excellence* to be taken from here, and on this he kindly embarked. Top speed to Normanton Little Covert (not to be confused with the Normanton mentioned in Tuesday's hunt), a matter of ten or a dozen fields, all grass, and divided by fences one knows by heart but always welcomes. Hounds stormed into the covert, but were soon away again on the village side. Woe to the motorists who headed the fox from crossing the road at his appointed place; but he was not to be thwarted, and a holloa farther down the street announced that he was successfully over and on his way to Moss and Plumbs. This is also a lovely bit of riding country, and, pushing out without delay, the bitches were soon running on towards Allington. The line grew fainter as the Low Covert was approached, but, almost at once, they were again in full cry across the park; before long, the Foston Beck loomed ahead, if so deep and dank an obstacle can "loom." With infinite tact, the pilot chose to go by the ford, and the usually unfrequented

Finding an outlier in some rough grasses the pack ran very fast through Tune Wood nearly to Bramwith, crossing some biggish fences and dykes and drains, which were unpleasantly full, and, swinging right-handed, they ran on well over a very nice line past Hawkhouse Green, but short of Fenwick Wood hounds again bore right and checked on the railway line at Kirkhouse; a passing train caused a slight delay, but being put right they ran on more slowly, and marked their fox to ground in a breeding earth at Kirkhouse Green after a capital hunt of 50 minutes, hounds having run fast for 30 minutes to the railway. A good many followers now went home, but with a fox from Ell Wood, who incidentally only just evaded being chopped, hounds ran through the high bracken of Fenwick Wood, nearly to the church, the fox being headed on the Moss Road, hounds turned left-handed, and running on well across Mr. Duckett's Farm the fox unfortunately got to ground in a drain by Kirkhouse Green. This was a very nice fifteen minutes gallop. Horses had had quite enough by now, as the going was heavy, and they had been galloping and jumping nearly all day. This ended a capital day's sport, and the bitches showed to great advantage. B.

THE QUORN'S GOOD WEEK

SEVERAL nice hunts took place during last week. Scent was best, perhaps, first start off before the wind rose on Friday, the 25th, and again in the late afternoon after it had subsided somewhat. What bad luck for the popular Hunt fox beat his pursuers after two hours. Ella's Gorse then produced several foxes. Hounds going away with No. 1 at the top end hunted him over a few fields, and then lost him. It was during this short hunt the Hunt secretary came to grief.

Returning to Ella's hounds were quickly away again, and crossing the Willoughby—Six Hills Road, bore round left-handed, leaving Willoughby Village on the right and pointed for Wyneswold, where an enjoyable little hunt came to an end when scent failed on some plough.

Tuesday saw hounds at the Field Head on the forest side, a very enjoyable day following. Scent was very poor in covert in the morning; foxes roused in Hawksworth and Whittington Roughs being masters of the situation. It was a different tale, however, when a fox was holloaed away on the Desford side of Ratby Burrows, hounds hit the line off and ran nicely left-handed back over the lane under the Burrows through Whittington Roughs, crossed the Markfield Road and went down into the valley, pointing for Stanton-under-Bardon. A long way short of the village, however, he bore away to the left and after hunting him nearly down to Thornton Reservoir they lost him, after a nice 70 minutes.

Trotting back the Master gave orders for the Ulverscroft Coverts. Hounds quickly finding at the back of Mr. Lillingstone's house, hunted their fox through Lee Wood right-handed through the new covert and John Lee's nearly up to Covert Cloud, before turning back right-handed into

Stinking Wood. Crossing the road into Stoneywell, scent, although it had somewhat improved in covert, again became catchy, and it was some little time before hounds were able to force their fox away again into the open. Crossing the brook and Newtown Road he went on nearly up to Benscliffe before turning right-handed under Blake's Hayes, and going over the Newtown Road again he made his way back into John Lee's. It was now getting dark, and several fresh foxes being on the moor, hounds were stopped after 65 minutes.

A large field welcomed their Royal Highnesses the Duke and Duchess of Gloucester when hounds met at Barsby. Prince of Wales was drawn first, and no sooner had hounds been thrown in than one or two bitches spoke, a chorus followed immediately, and it was not long before they were streaming away for South Croxton. After running nicely down to the brook they "through up," and George, evidently thinking his fox had been headed, cast along the brook side to the right. His judgment was right, and they hit the line off again back into Prince of Wales. Going away the second time they ran through the New Covert, pointing for Barkby Holt, then right-handed down to the brook again and checked. Their fox had gone on up the hill to South Croxton village, where he was confronted by a dozen foot people, who proceeded to holloa in his face, turning him to the right.

George lifted hounds over a couple of fields, and putting them right the chase continued across the Baggrave Road back right-handed over the brook, and once again into Prince of Wales, where a tired fox was bowled over after 50 minutes. A fox then found in Barkby Holt made straight for an old turf drain one field short of the Queniborough Road, and made his escape. After chopping a fox in Sherrards, the "tit-bit" of the day took place with another from the same place; scent had improved, and they ran beautifully right-handed over the Queniborough Road, and leaving South Croxton on the left crossed the brook and went on under Prince of Wales, through Baggrave Park over the Cold Newton Road and into Quenby Park, when a topping good 45 minutes came to an end.

SCARLET RUNNER.

THE CATTISTOCK SEVEN-MILE POINT

HOW it did blow along the south coast on Friday night! Lying in my bed I wondered if any foxes were abroad, or if we should have a blank day on Saturday and break the record of "never a blank day" which has been true of the Cattistock country for the past 40 years. The Frome had overflowed its banks and three miles north of Dorchester the main road was 2ft. deep in water, and I picked up a stranded soldier from Bovington Camp, whose car had been put out of business. He was standing disconsolate by the roadside in his hunting kit, and was overjoyed at my suggestion that I take him on to the meet at Mosterton, where his horse was waiting for him. At the meet we found a goodly gathering, and, what was more important, hounds found a stout fox scarcely a quarter of a mile away, apparently waiting for them in a little coppice where he had been lying snugly protected from the storm. He was up and away over Mosterton Down, and with hounds close at him he sunk the vale and headed straight for the river. I could not believe that any fox would attempt to cross the flooded river, and waited on the hill above to see which way hounds would swing, but even as I watched I saw them away over the meadows beyond, and rode hard to get to the ford at Blue Button, which I deemed the only way to get across the swollen stream. How the Hunt staff managed to get across, I do not know, but they did, and they were followed by some of the more venturesome spirits; but they told me that the river was full of struggling horses, and I think that those of us who cut round by the ford and caught hounds as they came out of Potwell Covert had the best of it. From Potwell they crossed a nice bit of country, raced through Horn Park, and, coming out on the far side, swung sharp right-handed and ran almost into the village of Broadwindsor, turning back through Potwell again and retracing their line to Horn Park over the heavy going in the meadows. At Horn Park this time they swung left-handed, and, leaving Horn Park House on their right, they drove on over the Beaminster Road to Meerhay, turning left up Whitesheet Hill, and on past Fir Tree Gorse with never a check. Scent must have been very good, for the pace improved steadily, and we had to ride as hard as we could to keep the flying pack in sight, as they sank the valley below Corsecombe Village and drove on into Chelborough Park. Beyond Chelborough scent seemed to fail, and in the cattle-foiled fields that overlook the Benville meadows hounds were brought to their noses, and robbed of a well-merited victory, although they marked their fox to ground—with every hound at the earth—half-a-mile further on. It was just over two hours from the time hounds first spoke at Trott's Spinney to the top of Chelborough Hill, where the first serious check came, and during those two hours horses had been extended most of the time, so that, although the point was only seven miles, I feel sure that hounds covered more than twice that distance. It was a really brilliant hunt, the best of the season so far—and it has been an outstanding season to date, the best November I can remember.

The Cattistock have had very good days this week, two good hunts of 30 and 40 minutes respectively on Tuesday, and equally good sport from their meet at Up-Loders on Friday, when the bitches provided two very good hunts and added a leash to the tally. The last of these is perhaps worth mentioning, although it hardly ranks with the Saturday performance. Hounds found their fox in a little withy-bed below Askerswell Village, and, getting away close on his brush, they raced away over the hills past Stancombe and Brake's (where they had killed their morning fox) to Maltby's hanging, where they rolled over this stout customer after the fastest 40 minutes I have seen this season. Scent was breast high, hounds never checked, the country was all that could have been desired, and in fact it was one of those "quick things" which lives in one's memory for many a long day.

LINCOLN.

FERNIE'S BRILLIANT SPORT

THIS week has been a continuation of the excellent sport the Fernie Hounds have been showing this season. With the wetter state of the ground in contrast to last season, scenting conditions have been good, and the going perfect, two factors, when taken into account with a third, and no less important—the plentiful supply of foxes everywhere—augurs well.

After the gale conditions of Wednesday almost anything might be expected on Thursday. When the dog hounds met at Great Glen, however, bright sunshine and a cold nip in the air made it an ideal hunting day.

Glen Oaks was drawn blank, but Glen Gorse did not leave us long in suspense as hounds found at once, and going away in two lots on a brace of foxes in more or less the same direction made things appear somewhat complicated at the start.

However, joining up in a couple of fields they settled down and ran very nicely with Stackley on their left, pointing for Oadby. Swinging left-handed over the Glen—Stretton Road, they continued through Glen Oaks and turned left-handed along the brook, keeping Burton Overy on their right before crossing the Mere Lane. Here it would seem their fox meant to gain sanctuary in Mr. Williams' earths close by King's Norton, but finding these closed he bore left-handed over the brook and pointed for Norton Gorse. Doubtless he was headed at the road by motor cars and swinging right-handed traversed the length of the village to Bath Spinney. Continuing over that lovely piece of Fernie's Thursday country, hounds bore right-handed short of Ilston, and crossing the Ilston—Carlton Road checked owing to motor cars. However, Peaker's forward cast towards Ilston Grange righted matters. Continuing past Carlton Manor, they pointed for Shagton Holt, but leaving the covert one field on their left bore on over Gartree Lane as though Carlton Clump were the objective. At this point it was obvious their fox was tiring by the many short turns he put in, and it would seem he did not fancy the sharp climb up to Carlton Clump, and instead swung right-handed down into the valley towards Glen, where he tried Mr. Holman's earths. Being unlucky for the second time in that respect, he skirted Burton Overy Village and was rolled over on the outskirts after a brilliant hunt of an hour-and-a-half with a five-mile point and more than double the distance as hounds ran.

A noticeable and highly gratifying feature of this hunt was the way in which hounds ran up together throughout and were "all on" when Peaker handled his fox.

This is the second brilliant hunt this week with the Fernie, as on Monday the bitches excelled themselves after finding at Wistow, and killed in the open near by Walton Holt after 87 minutes. This was a six-and-a-half-mile point and fifteen as hounds ran.

C. D.

ZETLAND HOUNDS SHOW CAPITAL SPORT

THESE hounds met at Stragleton Gate on Thursday and found at once in Moulton Whin. They ran fast through Birch Carr to Halnaby Hall gardens where they checked, hitting off the line in Milbank they ran through Murky Hill and along the Howl Beck before bearing left-handed and running through 40 acres. Here there were several fresh foxes afoot, but sticking to their hunted fox they ran on fast with the Hall on their left, passed the reservoir and crossed the Croft Road. Through Bullmire and straight to Allan's Whin. They never hesitated here and ran on as if for Barton, short of which they turned left-handed, ran through the corner of Inkle straight to Middleton Lodge Whin. Disdaining this sanctuary, they were led over the park and over the Middleton Tyas Road to cross the North Road with Violet Grange on their left. They slowed up a bit here on the ploughs, but on reaching the grass they ran on fast with Merrybent Whim a field on their left and looked like going to Langdale. Short of Melsonby they bore right-handed and crossed the Piercebridge Road and came to a check by the Barton Quarries. The fox was viewed leaving the quarries, and hounds were soon set going again to run over the North Road, through Middleton Lodge Covert, over the park and come to a check short of Middleton Tyas. This was the end of this good hunt, although we learnt some short time after that two-and-a-half couple had run on with their fox only a field ahead into the Bedale country, it was most unfortunate that this information came too late for any use to be made of it. As hounds must have killed their fox and probably this small party did so. This was a great hunt of 1 hour and 45 minutes, with a five-mile point and fifteen as hounds ran, hounds only having to be cast twice.

Scent had deteriorated by the time they found their next fox in Church Whin, and they hunted past Halnaby Hall, through Black Wood, Clervaux, to the thorns where their fox turned back just in front of them, but they could only walk after him on the foiled ground as far as Walmire, where they were stopped after 45 minutes. The bungalow covert was drawn blank which ended the day.

H. A. JAFFEY.

A GOOD WEEK WITH THE CROOME

IT is many years since the Croome met at Upton-on-Severn, until last week when, owing to Lord Beauchamp's death, hounds kept to the east bank of the river (usually reserved for Saturdays), instead of hunting on the Madresfield side. It was on Tuesday, November 22nd, when we met there and, what with ferocious monsters of machinery at work on the new bridge belching forth fire and brimstone, and the incessant stream of main road traffic, we were not sorry when hounds moved off to their first draw. The Brickpits (which are not really brickpits at all, but pools of water surrounded by osiers, invariably providing one otter or more when the Wye Valley Otterhounds come there in the summer) were blank, and a fox from Ryall Bank was killed in covert, rolling down the slope into the river beneath. At mid-day precisely hounds found in Ripple Lakes and, doubling sharply, threw many of the field out as they turned for Towbury and Puckrup, where a fresh fox jumped up in some kale and was marked to ground. The hunted fox circled round to Towbury and was eventually lost there. An outlier from a rushy field below Towbury Hill provided the next hunt, and though he chose a bad line of country, hounds hunted him well, marking him to ground in Ryall Bank at one o'clock. Of three outliers on Mr. Surman's farm, one—a lame fox—was killed, whilst another provided the hunt of the day, with a four-and-a-half mile point, measuring some fifteen as hounds ran.

At first the hunt lay over very indifferent scenting country consisting of much plough and market-garden land, but hounds held to the line remarkably well. From Ryall Village they swung left above the river to Ripple, touching Brockeridge Common before crossing the main Worcester—Tewkesbury Road to the River Avon. They doubled back at Twyning Fleet and recrossed the road to Towbury and Ripple, after which their fox braved the main road traffic yet a third time, going over Brockeridge Common to Hill Croome and the Manor Farm.

They crossed Rough Banks to the Marsh Common, and now it was obvious that their fox was out of his country and did not know where to go, for he made no attempt to enter the Rhidings, but instead kept straight on towards the Salt Baths. Then, swinging round to the east, he made for Woodmancote Rough, beyond which, though hounds carried it for a field or two, scent, like the "old soldiers," simply faded away. Dusk was falling as hounds were called together for home at the end of this hunt of two-and-a-half hours.

The mixed pack had been out on the Tuesday. Two days later the bitches had their turn, and they, too, were on the go all day. The meet was at Bredon's Norton Cross Roads, at the foot of Bredon Hill, and the weather, after the great gale, had become calm and gloriously fine. A fox from Mr. Padfield's osiers made tracks for the hill and was lost behind Bredon's Norton Village, whilst a leash were disturbed from some kale on Clattsmore Farm, and one was killed, whilst another led hounds up the hill to Wellgate Larches. There was a stale line over the top to Fiddler's Nap, above Overbury, and hounds marked their fox to ground there. From Conderton Larches they ran to Ashton Wood and through the whole length of the well-named Long Plantation, to mark their fox at last in an earth in Ebnley Wood. And the day finished with a hunt from Merrell's Hangings, hounds running magnificently, though their fox

seemed inclined to play "Here we go round the mulberry bush." At last, at the end of an hour, he too got to ground between Elmley Wood and Batten's Wood, and daylight was on its last legs as hounds started on the long road back to kennels.

Saturday, the 26th, was a perfect autumn day, with a brilliantly blue, rain-washed sky, and just that "nip" in the air that made us glad to keep moving. There had been raging wind and rain during the night, and it was not surprising that foxes were hard to find, but at 12.45 a fox was away from Croome Perry, and a good hunt followed. There was a little "lepping," as hounds ran to the Park, where they jumped the high wall and ran through the Oaks nearly to Salt Baths, then back through the gardens of Croome Court to the Home Farm and Croome Perry again. Crossing the railway they hunted up to Deerfold and back once more to Croome Perry, from which, without dwelling, they drove their fox out for Defford Common. Halfway to Porter's Ashbed he suddenly lost his nerve, and evidently seeing in his mind's eye the comparative security of the Park, he swung sharply to the right for Salt Baths, and hounds overhauled him as he came back down the Oaks. The hunt had occupied 90 minutes. A tree fox from the top of the Park promptly got to ground in the Shrubberies, and a diminished field followed hounds to the Menagerie, which was, as usual, prompt in supplying a fox.

Hounds broke with him for Cubsmore, then came left-handed under Kinnersley and ran a ring from Pheasant Wood over the Standings and back. They were close behind him as he crossed the road to Red Deer Farm and Dunstall, going towards Earl's Croome, near where he was headed and doubled back short to a flooded drain beneath the road at Baughton. How he escaped drowning is little short of a miracle, but he was bolted apparently none the worse for his immersion, and proceeded to set a cracking pace, going by Old Ground Brake and Dunstall, then as if for Woodley's Brake, before he turned for his original quarters at Menagerie. Scent was breast high, with an oncoming frost, and hounds raced through the gathering darkness, their cry rising and falling eerily in the gloom, whilst the small remnant of the field followed by the light of the crescent moon. At Boat House Covert the line faded out abruptly, and as by now "it was so dark . . . that thou couldst not see thy hand," hounds were cheated of their due reward. Slowly they walked across the two intervening fields to the kennels, where their companions on the benches awakened the echoes with their welcoming clamour and the horn sounded its mournful call of "Home—home—home."

D. M. M.

SOUTH CHESHIRE'S VARIED LUCK

QUITE a large field met Mr. Clegg at Bickley Smithy on Tuesday. Finding at Barmere, hounds hunted well, and pointing for Maesfen, swung left-handed to Tusshingham, marking their fox to ground when pointing for Hinton Hall Farm after 30 minutes over a difficult country.

Having hunted Cholmondeley Mosses well and thoroughly, Neviles Wood was unfortunately drawn blank, but with a fox from the Mere hounds hunted slowly to the Coronation Covert, and pointing for Ridley, swung left-handed to lose their fox near Ridley Bache.

From Ridley Moss a fox went away towards Cholmondeley. Swinging right-handed, hounds crossed the Cholmondeley drain and ran to Bulkeley Hall, where hounds were stopped in the dusk short of the hills.

A small field met Mr. Barbour at Hankelow. Hounds, however, accounted for one, and with another hunted over a neglected line of country, pointing for Stick Covert, swung left-handed to cross the river, railway and canal, marking their fox to ground after 50 minutes.

Later, from Broomhall, a fox crossed the Whitchurch—Nantwich Road. Hounds, hunting slowly, crossed the railway and hunted to Dorfold, forcing their fox through Bulls Wood, the long Plantation, the Admiral and Tally-ho!

Scent by this time had vastly improved, and only after the utmost difficulty were hounds stopped in the dark.

Saturday, a big field met Mr. Barbour and Mr. Clegg at Tattenhall Road Station, and it will be a long time before the hospitality shown by Mr. Leslie Jones, of the Aldersey Arms, is forgotten.

Hounds quickly accounted for an outlier before going to Hoofield. Going away with a fox towards Huxley Village hounds crossed the road, swung left-handed to recross the road and pointed for Iddenshall. Swinging right-handed, hounds ran fast past Gardenhurst, marking their fox to ground at Tilstone Bank.

A fox from Crow's Nest was quickly killed, and with another hounds ran, keeping Tattenhall Road Station on the right, parallel with the canal, crossed the River Gowy, killing their fox below Beeston Castle after 25 minutes.

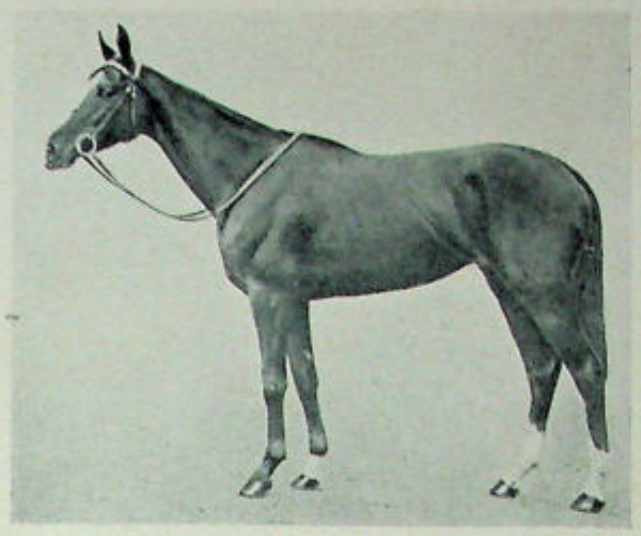
AFTER THE FLAT

Runners at Aintree



W. A. Rouch

ROCKFEL, THE BEST FILLY OF MODERN TIMES

THERE can be no doubt that Rockfel was not only the best three-year-old of the season, but that she is also one of the very best fillies of modern, and it may be of all, times. The manner in which she won the Aintree Derby of a mile and five furlongs was one of the most impressive things of the recent Jockey Season. She made all the running, and won by three lengths from Bombay Duck, another filly, with Challenge third, and Foxglove II fourth and last. After the race there were quite serious critics and good judges of racing who alleged that other riders in the race, apart from H. Wragg, who rode the winner, had ridden badly. Why, they asked, did not Challenge and Foxglove II go with Rockfel from the start and test her stamina?

The answer is she went too fast for them. Richards was continually trying to force Foxglove II up to the filly, but each time that he got anywhere near her she went away again without Wragg ever asking her to do so. In the end, Rockfel was going away again from the other three, and if the race had been two miles she would have won by many more lengths. She was received back in the paddock after the race with a reception which is generally reserved at Aintree for only Grand National winners. Rockfel looked many pounds better than she looked at Newmarket when she beat Pasch. Her coat then seemed to be breaking, but there was very little sign of that at Aintree. She will remain in training for another year, and if she keeps her action she will go through the season unbeaten. It is her wonderful action that counts, and I can see no reason why she should lose it, but such things have happened.

The only flat race horse that we need to write about who ran at the last Liverpool Autumn Meeting is Mr. Rank's Black Speck, a five-year-old gelding by Black Watch out of Little Mark. Until the beginning of this season it was thought that Black Speck was a sprinter pure and simple. Even when, in April of this year, he ran for a little mile race at Bogside, it was doubted by his owner and trainer whether he would really stay home. He won with ease, and then it was found that he was a genuine stayer who was still able to retain his original speed. It was hoped even then that he might win a Cesarewitch, and it will be remembered that only a few weeks ago he was one of the two favourites for that race. He started slowly, and then half jumped a path, so that he did well to finish fourth. It was at once stated that he did not, after all, stay the two miles and a quarter over which that race was run.

It was also considered by many, when they heard that he was to go for the Liverpool Cup, that the mile and a quarter of that race would be too short for a horse who had been prepared for the Cesarewitch, and that, after so severe a preparation, he could not possibly be back at his best. And that argument would have been successful in 99 cases out of 100, but this time it was wrong for, ridden by Weston, Black Speck won by a head from the bottom weight, Lone Mount, with Moody third. The truth is that when Carslake found out that only by riding the horse as hard as he could, and perhaps thereby ruining him, he eased him in the Cesarewitch, so that the horse really had a comparatively easy race. He was as fresh as he could be when he got back to Druid's Lodge after that long gallop, and was indeed so much above himself that what he needed before retiring for the winter was a race as soon as he could have one. He was on his toes at Liverpool, and will win more races next year.

So much for the horse, and now for a few words about the trainer, Noel Cannon. For a long time it seemed that this member of a famous racing family would never get a real break. Other Cannons were heard of as trainers, but hardly a word about Noel until he started to train at Newmarket for Mr. Clayton and some of his friends. He won a race early in his first season with a two-year-old owned by Mr. Rank, and it may have been that, and other things, which caused Mr. Rank, when he bought Druid's Lodge and divided his stable into two, to appoint him as his private trainer of the flat race horses. It was a brave thing to have done, for Cannon had never, so far as I know, had the highest class of horse to train before. He has shown that he has inherited to the full the ability of his ancestors. He has won the St. Leger, and he has been second in the Two Thousand Guineas and in the Derby, and he has placed Mr. Rank second in the list of winning owners for the season—no mean achievement. But even a greater achievement than that was his training of Black Speck. He has kept that horse fit and winning races almost since the season was begun, and here he is at the end of the year with the horse better than he has ever been before. He has earned his holiday in the South of France.

And now let us turn for a moment to the steeplechasers and hurdle race horses who ran at this meeting at Aintree, where the programmes are mixed with flat racing and steeplechasing. Airgead Sios was one of the most talked about National Hunt horses last season when he began the season by winning the Becher Steeplechase. He won that famous race again last week. He was always in front, and he jumped delightfully, literally flying over the water jump, while the famous chair fence had no horrors for him. Then when he reached the racecourse he did what he does when he feels that he will: he gave himself an easy without any permission from McNeil, who rides him to perfection by merely sitting still on him. At once it was thought by the riders on the stands that Airgead Sios had had enough and was beaten, but as soon as Savon and Royal Mail reached him he went away, sailing along in front. He took off much too soon at the last fence but one, and hit the top of it, but never faltered, and as soon as he landed was away again as if nothing had happened. Royal Mail did what other horses would have done; he took off at the same time as Airgead Sios, but he is not the cat-like jumper that Airgead Sios is, and although he did not fall he had all the stuffing knocked out of him and that was the end of him. For a moment, coming to the last fence, Savon threatened danger, but Airgead Sios went away from him on the flat.

Still, Savon put up a fine feat for a young horse. At the same time he has done himself no good from a National point of view, for he will have to be handicapped in that race with Royal Mail and Airgead Sios. He was receiving only 7lb. from Sir Francis Towle's horse. I had once come to the strong conclusion that Airgead Sios would never make a Grand National horse, but I am not certain about that now. He is so much heavier and stronger this season than he was even at the end of last. He would certainly be entered if he were mine, and he would also be started if all went right with him between now and March.

Rocquilla is another nice National horse. He won the Grand Sefton of almost three miles and seems to me to be a National type. Further, he is trained by Beeby, who, although still a very young man, is to be classed with the Anthonys and Hartigans as a trainer of Aintree horses. Rocquilla is owned by Lord Bicester, one of the greatest supporters of National Hunt racing that we have. Macmoffat, who was second in this steeplechase, is useful, but hardly the class of Rocquilla; but he suggested by this running that he will have to be considered next March. He comes from up on the Border, where many a good steeplechaser has come from.

The Valentine Steeplechase was won by War Vessel, owned by Mrs. Marion Scott, the owner of Battleship, who won the Grand National last spring. Both horses are by Man o' War, and I understand that their owner has sent Hobbs several more similarly bred. War Vessel is small, but likes the Aintree fences. He was ridden by yet another Morgan, Dick, who rode a fine Morgan race. What a family of born horsemen they all are. Bruce Hobbs, who would have ridden the horse, is, it is to be feared, in for a long illness. Everyone hopes that he will be able to ride, but even if he cannot go round Aintree again, he has already won the National. "How sad," said a sweet young thing last week at Liverpool, "to have such an accident so soon after you have ridden the winner of the Grand National." "How much sadder," said an experienced old man, "to have had the accident before you have done that." GNOSTIC.

E. A. Barton

"LIKE THE SENTINEL AT POMPEII, HAVING NO ORDERS TO MOVE, HE STANDS VIGILANT, A MENACE TO ALL THAT DO EVIL

ENEMIES OF THE TROUT

Some Suggestions for Protecting a Water

By E. A. BARTON

IN these days of intensive pisciculture, where every river and stream capable of holding trout is treated with respect, not only as a potential source of angling but also of income, every possible means is taken to ensure that the fish shall be molested as little as possible against the time when they meet their ultimate destiny. Hence it is that all streams and hatcheries are guarded by eagle-eyed keepers ever watchful for marauders—winged, finned or quadruped. And here I may say that I have always a qualmy anxiety when walking with a fishing keeper armed with a loaded gun. Shooting is not his job, and he generally carries his weapon full cock on his shoulder by the barrels as he gets over a wooded stile or pushes through a hedge. No, I do not like a fishing keeper carrying a gun.

Perhaps of all winged fish thieves the heron and the kingfisher head the list. The very early morning is the heron's hour, when the pale dawn is breaking and it is just light, when a thin night mist is yet on the water and all is still. Then it is that against the sky the grey thief grows larger and larger as with ominous silent wings he volplanes down to the bank, settles his wings comfortably, and then with deliberate steps—like "Tarquin's ravishing strides"—he enters the water. For no heron settles on the water even when it knows that it is shallow. No webby feet has it by which to break on water the impetus of its descent; and it hates getting its stomach wet, though, on urgent occasions, it has been known to swim. This I have never seen. But the small fish do not seem to mind a heron, for all that they see are its stiff motionless legs like growing water flags, above which is a silhouette rigid in immobility. Thus they swim in and out between them till the silhouette jerks forward its head a few inches and again remains motionless. After half a minute or so the head shoots forward again a few inches and remains rigid. The whole bird seems made of stone, till there is a flash downwards, too quick to follow, and up comes the head with a fish between the mandibles. It is a dirty trick, but pretty to watch.

However, there is no great difficulty in making shallow stews heron proof by stretching transverse wires across the water every few yards. A heron needs a few yards to take off from the water before rising, and the intervals between the wires are too short to do this, and the bird knows it. "Five bob for every heron" is a rule on many fisheries, but it is often hard-earned money when the keeper has to get up long before dawn for some days before he gets a chance of a shot. For in these days the heron has become a most timorous bird, and an efficient scarecrow, if nicely made, is often most effective in keeping herons away from shallows which may be difficult to protect. The bogey should be altered from time to time, a different cast-off hat placed on him and his position moved about lest the heron, becoming accustomed to him, looks on him as part and parcel of the landscape, and so neglects him.

I know one keeper who tells me that since he made a personable scarecrow he has not seen a heron where there was always one or two when he came along. Also our dummy keeper is ever on duty. He is no Trade Unionist and has no eight-hour day. He has not to go back to his dinner or for his matches. His belly is full of straw, and his pipe is always cold. But there he stands from dawn to dark, from dark to dawn, calm, resolute, inflexible. Like the sentinel at Pompeii, having no orders to move, he stands vigilant, a menace to all that do evil.

The kingfisher, however, takes no heed of such things, and is in consequence a far more serious problem. The wires which kept away the heron have no terror for it. Its stance is an overhead branch. I have known one settle on an angler's rod when quite still, legering for barbel. No overhanging branches, therefore, should depend over a hatchery or shallow where fry are put out. For the kingfisher likes to sit on a twig above the water it fishes, from which it can dive down on its quarry and to which it can return; where, after flogging its prey to death, it can throw it dexterously into the air, whence it falls head down into an open beak. Abroad, in places where the trees are few and far between, the kingfisher hovers in the air over its prey with fluttering wings, and then drops like a stone on to the fish. I have seen this only twice in my life, once on the Kennet and once on a tributary of the Test.

On the old Denham Fishery, on which Sir Humphry Davy wrote his classic *Salmonia*, I recall the ancient keeper telling me he had killed over 50 kingfishers in a year. Sentimentalists may grieve, but one can have either kingfishers or fish, one cannot have both in any quantity. As to moorhens and coots, I am far from certain that either of these birds really do any great damage to a fishery. The great crested grebe, of course, lives on nothing but fish, but they are rare on most waters.

Far more dangerous is the pike. Eternal war must be waged against this curse of a fishery. I believe that it is not so much the great pike—which are usually spotted by keepers or anglers and so killed straight away—as the small pikelets which escape the nets. These small vermin devour enormous quantities of fry and small fish, and grow with alarming rapidity; but they are not easy to catch till they have grown to such a size that they can be taken in the nets. I am sure that these small jack do much more harm than any bird, except perhaps the kingfisher.

Perhaps even more destructive to small trout than jack is the presence of eels in the water. Fry and small trout are eaten in great quantities by eels, and this can be shown by anyone sufficiently interested if he examines the contents of the stomach of an eel taken in water where there are trout fry. But to remove eels from a trout stream becomes almost impossible, and their number can only be lessened by sufficient number of eel traps placed at the hatches and in the deeper parts of the water.

The question as to the evil effects of grayling in a trout stream is an everlasting source of dispute. I think that much of the dislike to grayling arises from the annoyance and disappointment caused by them when angling for trout. I confess that after carefully stalking a trout and rising it, to find it a grayling becomes very irritating if it occurs often in a day. Therefore, I feel that much of the resentment against grayling in a trout stream is largely psychological and due to one never being sure that a rise is that of a trout. But when coldly considering any evil effects caused by the grayling, I am pretty firmly convinced that there are none, provided always that food is plentiful for all. And this generally is so unless the weed cutting is cruel.

The real cause for uneasiness arises when grayling grow large, for then, as they far outnumber the trout, they trench on the commissariat to a degree that may endanger the trout's food supply. But with careful netting out the bigger grayling every year this anxiety should not weigh.

The last and by far the worst enemy is pollution, and as the population increases and the land becomes utilised for factories with tarred roads leading thereto, so in a short time from now our lovely rivers must of necessity become poisoned unless drastic steps are taken to protect them.

A FINE MEMENTO OF THE SEASON

A salmon of 33½lb. caught from the Gare d'Oloron by Colonel W. Lawrence. He gaffed it himself

STRATEGY ON THE TROUT STREAM

BIG fish, which, when they are feeding, move up from the body of a hatch pool and ensconce themselves alongside the stonework in the middle of the actual hatchway, are always rather a problem. They are certainly wise in their generation, for, in the runway, a great deal of food passes through a small space, and a high percentage of it can be garnered in the passing with a minimum of effort on the fish's part.

How to put the fish in a less advantageous position is the core of this strategy. Its strength lies in possible invisibility, when the fisherman must strike by sound, by sight of change in the current, or by unusual movement or hesitation of the cast and line in their downward journey. Another source of strength in its position is the ease with which it can dive through the hatchway, and so on upstream, and, in any case, if the fisherman is at an angle from the lateral line of the hatchway and the fish merely splashes in it, his cast is likely to be frayed by the stonework, and perhaps broken.

My plan for circumventing these difficulties has worked several times, so that I feel it is worth relating.

Cast a big nymph or North Country wet fly, up to close behind the fish, but, if it turns, do not let it have it. After several casts you will, with luck, be able to entice it down into the top of the pool. As it turns to work its way back into the hatchway cast your fly into the hatchway mouth, to get it into the right current, and let it swim down to the fish. If the trout takes it, and is hooked, you will have turned disadvantage into advantage, by a very simple strategy.

WET WICKHAM.

The Gun Month by Month

PHEASANTS IN THE SNOW

DECEMBER—the month of Christmas cards and covert shoots, of crackers and snow and woolly scarves. We still preserve this grave superstition, though Christmas after Christmas goes by in lashing gales and rain and never a snowflake to cover the sodden nakedness of the fields. Only in the hills there is real snow falling silently day by day until the hill roads are blocked and the deer become as tame as sheep. In England it takes the synthetic snows and cardboard skies of Hollywood to show us what an English Christmas should be.

But real covert-shooting weather still happens occasionally, and when it does one thinks that, after all, there is no sport to compare with the shooting of the pheasant.

Overhead there is a pale sapphire sky and a low sun, and underfoot the snow is crisp and white. Outside the covert the guns are waiting. Breath steams in the cold air, every little sound is clear and brittle—the click of a gun breach, someone talking in a low voice to his loader, the impatient whimper of a young dog. Far back in the covert a whistle trills. Long before the first cock is in sight you may hear the rattle of his wings climbing up and up into the frosty skies. Over the high trees he sails on stiff wings, then sees the guns and begins to climb again. The sun lights multi-coloured jewels on his breast and neck. He is to be yours; no, Colonel Allweather's. But he does not like the look of the colonel, and high and curling he swings right over you. Somewhere behind you he splinters a sheet of ice with a tremendous crash and a puff of coloured feathers. Soon the whole line is shooting and barrels are hot. Major Herring, on the left, is busily counting his cartridges and his birds as he fires, so that there may be no mistake about his average when the stand is over. When he is off his day, which is more often than not, he maintains a continual covering fire on other people's birds. Any bird within 70yds. is fair game for him. With really perfect timing he will get off his gun at the exact moment that his neighbour kills the pheasant, and will be able to claim anything from a 50 per cent. to a 75 per cent. share in it when the drive is done. To-day he is a little out of form, and his gun is constantly going off when the pheasant has been dead for nearly a second, thus unavoidably reducing his share in it to a mere 25 per cent. or so. "Major Herring a bit late with his covering-fire to-day," chuckles the irreverent loader. Meanwhile pheasants stream unnoticed over the head of the major, who is vicariously engrossed in the sport of the neighbouring guns. On the flank the young host, who is a really good shot, is smoothly and accurately picking off birds that are apparently out of range of anybody. He has no need to count his cartridges, and has been known to reduce the major to frenzies of ill-concealed jealousy.

Right at the end of the drive, when the last beater is squeezing through the fence of the wood, a roving spaniel flushes a cock pheasant on the right flank. High, and a little wide of the guns, he flies straight down the covert side, receiving eight ineffectual barrels without so much as a bob of the tail in acknowledgment. Higher and higher he rises, heading straight for the major, who, to the amazement of the spectators, has withheld his covering-fire and now has the bird entirely to himself. He misses with the first barrel, but with the second the cock comes crashing into the high trees. There are incoherent cries of wonder and appreciation from the other guns, and the major, at some pains to conceal his own astonishment, waves his cap in a slightly dazed way. "The eye-wipe of a century," a voice inside him is quietly singing. Behind him, just round the corner of the covert, the young host is reloading his gun. He slips quickly out of sight before the keeper comes to pick up the miracle pheasant. The major's one perfect piece of covering-fire has been entirely innocent and unconscious.

As the guns move on to the next stand nailed shoes crackle on the frozen puddles and scrape on mud as hard as rock. There is a good deal of chatter and speculation about Major Herring's wonderful shot, but Major Herring is out of earshot. He is a solitary figure in a field of white snow and little scattered piles of red cartridge cases, making a last confirmatory count of his own pile. The first count showed fifteen pheasants killed with fourteen cartridges, and while not doubting the accuracy of the figures he is a little nervous of mockery when the story is retailed at lunch.

At the next stand old Mr. Strakes comes into his own. Never much good at a high pheasant overhead, give him birds rising from the edge of the covert and he is the original William Tell. The end gun on the right, his beady eye is fastened greedily upon the hen pheasants who scurry nervously about over the pine needles in the corner of the covert. At last, a flustered hen takes the plunge and flutters upward through the wire fence.

She ascends almost vertically, and is heading straight for Mr. Strakes's neighbour on the left, but she is unmercifully cut down before she is 12ft. off the ground. Strakes is in his element, and only misses six pheasants, all of which are killed some 80ft. up by No. 5 gun. Altogether, Strakes kills 22 pheasants at this stand. They lie in front of him, near the edge of the covert. He is delighted, and keeps up a quiet chatter of self-congratulation with his loader. Colonel Allweather approaches when the beaters are out of the wood. At length he controls his rage sufficiently to remark: "It seems rather stupid to have had four of us on this side of the covert when one could have done all the work, does not it?" But Strakes sees no insult, and beamingly agrees with him. The colonel snorts and turns away, almost swallowing his cigarette in his excitement. At the other end of the line a meek little gun is being towed about by a retriever on the end of a long string. Finally, he overhauls it hand over hand and there ensues a babel of beating noises.

After lunch Colonel Allweather vanishes heavily in the direction of the brake, where he can be seen routing about amongst a variety of strange packages. Presently he reappears dressed from head to foot in uncouth mackintosh garments, which caricature the rotundity of his figure. A sou'-wester is perched rakishly on the back of his head. "He's forgotten his moustache covers," says someone in a very audible voice.

In the afternoon there are more pigeons than pheasants. They swirl over the bare trees in huge droves, against a sky banking with snow-clouds. In endless streams they come, lifting and swaying on a rising breeze, clouds and clouds until the air seems full of them. The shooting is continuous, and several pheasants pass over almost unheeded, but very few pigeons fall. The major is at a loss with so many birds in the air at once, and has fallen back on discharging his gun more or less at random whenever his neighbours are shooting.

On the way back to the house there are yellow lights in the blue snow dusk and underfoot the snow is hard with a fresh frost. The beaters are dispersing—a voice strikes up a snatch of raucous song and is cut short by a loud guffaw. The voices and the chatter grow fainter and die away in the dusk.

After tea, in the dark and the grey slushy snow, there is the hum of motor engines and little clouds of exhaust smoke lit red by the tail lamps.

GAVIN MAXWELL.

MOVING OFF TO FRESH GROUND

". . . *in the hills there is real snow falling silently day by day* . . ."

WESTCHESTER CUP PRELIMINARIES

American Selections, Hurlingham Ponies, and Some Comparisons

THE announcement that the Defence Committee of the United States Polo Association has selected thirteen players from whom the defending four which will meet us for the Westchester Cup, in June, will eventually be chosen, has again directed interest to the American situation.

As I have stated, there seems no great likelihood of their team being other than Mr. M. R. Phipps (No. 1), Mr. Cecil Smith (No. 2), Mr. Stewart Iglehart (No. 3) and Mr. Tommy Hitchcock (back), who are all 10-goal players, Mr. Phipps having been very properly promoted; but in addition to these they have invited the following to prepare themselves and their ponies, possibly at Aiken, in South Carolina (where some of the Hurlingham ponies are wintering in the care of Mr. William Post), for intensive practice at Long Island, which is to be begun on May 1st, just over a month before the series is due to begin. The names of the remaining nine, with their handicaps in parentheses, are as follows: Eric Padley (7), Elmer Boeseke (7), Raymond Guest (8), Winston Guest (7), G. H. Bostwick (7), William Post, jun. (8), Elbridge Gerry (7), Robert Gerry (6) and C. V. Whitney (6).

What they need with so many I confess I do not know, but possibly this invitation is some sort of

Of these ponies 47 are now in America, and already several of them have been seen in action under Mr. Gerald Balding and Mr. Tyrrell-Martin, as has been narrated. It is hoped by the New Year that a few really outstanding ponies may be added to their number from India and, in addition, Lord Cowdray, our non-playing captain, is taking out sixteen for his own use and Mr. Lakin's during the practice, which he intends to bring home. The Duke of Roxburghe, too, is shipping his own string for his own use, one or two of which, notably Brocade and La Vétie, will probably be available for the internationals. All told, there are about 68 ponies available for the challenging squad (to whom I imagine will be added Captain "Pat" Roark, who is now in California, and whose American form clamours for admission) and that is no excessive number for practice and hard polo through a period of three months.

Moreover, some of these Hurlingham ponies, for some reason occult to the common mind, have not yet had the opportunity to show their quality, and it is only by severe test you may divide the real top-class pony from the merely good animal. As I have pointed out, the International Field at Meadow Brook is a peculiar test, owing chiefly

MEADOW BROOK CLUB HOUSE, HEADQUARTERS OF UNITED STATES POLO

The building, in the Colonial style, is of exceptional simplicity, and the atmosphere is that of a country house, with all its comfort. The building was originally a farmhouse, but from time to time has had additions made

a compliment to distinguished players, and the fact that all will be playing their best ponies at Meadow Brook will give the selectors a further opportunity to study the form of these ponies and decide which of them may be needed for the final test. And the fact that all of these gentlemen are "in the swim" may make it easier for them to obtain the loan of such ponies as they may desire.

The American player enjoys many advantages over his British counterpart, and when it comes to the matter of mounting an international team their lot is singularly happy. With two exceptions those named by the Defence Committee can more or less mount themselves, the other two, being of the greatest, have never any difficulty in obtaining what they require, and in any case there seems never to be much difficulty in borrowing ponies, especially at home, for these great events (the value of a pony is obviously raised by such a distinction), and so they in America are spared the Herculean task that confronts our Selection Committee for each succeeding challenge.

The Hurlingham Polo Association, by means of a fund contributed by "gates" at past International matches, and by private guarantors, has contrived to collect a string of ponies to mount their selected challenging "squad" of seven during practice, first in California, later at Aiken, and finally at Meadow Brook, and for the International series, and a number of these are equal to the best they have in America. Unfortunately, these official ponies will have to be sold at the conclusion of the series to liquidate some of the expense of this enormously costly venture, otherwise it would be impossible to undertake, considering, in addition, the cost of transportation and maintenance.

to its size, from which many a promising pony fails to emerge successfully. However, we rest satisfied that everything that could be done has been done conscientiously to give our team every chance that they can be given. After three months of hard practice and training—and the latter is especially important owing to the enervating atmosphere of Long Island—both men and the selected ponies should be fit for the task, and whatever the outcome, should give a good account of themselves. Though the American team is enormously strong, probably aggregating 40 goals, I do not believe they are invincible, and I look forward hopefully to a break in the run of American successes that, until 1936, threatened to remove all interest from the series. At all events, that is with the future.

There is no question of the present superiority of American polo over what we can produce in England or India especially, nor what they can show in the Argentine. To be sure, they have advantages climatically (though even we cannot produce such a hurricane as burst over Long Island during the Monty Waterbury Cup this summer), and to the American player his polo is his chief pastime in his leisure hours. Though he may hunt and shoot, race and play other games, he is all the time a polo player. He can, moreover, if he is rich and idle, play the game in his own country all the year round.

Though I doubt whether there are more really rich men in America than in England, they certainly do spend more on their ponies than we do, and some of the prices they have paid for outstanding ponies (mostly Argentines) are truly staggering, so that they have contrived to skim the cream off the produce of that country at least, and of course they do breed over there many magnificent ponies such as Bonny J., who delighted us in London last season. But that they "buy" their supremacy I hotly deny. Rather, recognising the advantage gained by playing the game well, they arrange to do so and undertake training and practice more rationally, and certainly more efficiently, than we do.

They bring on their young players, who, unlike our young ball-games players, are not immediately absorbed in such school games as cricket and the like, and so you find in the ranks of American polo players many young men who could (some of them do) gain distinction at many other games. The result is that at the age of 20, when most of us are just beginning our polo education, they are finished players and often of international class. The work of the late Mrs. Hitchcock at Aiken and with the "Meadow Larks" on Long Island, has been of inestimable value to American polo. Would that we in England could find a like benefactor, for, despite our short season and our unreliable climate, very much could be done to improve our standard. This is becoming a necessity since the Army is ceasing to be a prolific forcing ground for British talent.

It deserves mention, too, that in America they have far fewer tournaments than we see fit to inflict on our all-too-short season. Accordingly, the "star" players have the time to devote themselves to helping the young idea in "members' games," which are invariably played at absolutely top pace, and perhaps it is this fact that they play every single game they take part in at the full 16 annas more than any other that has sent them on ahead of us. Their grounds, though of inferior turf judged by our standards, are far truer, if slower, than ours, and there are so many of them, especially on Long Island, that you never suffer from that ghastly cutting-up that ruins our London grounds and our polo year after year. This, indeed, is an inestimable advantage and the thick sole of grass encourages long and accurate hitting.

Before going to America I was told that the umpiring over there would be an eye-opener for me, and I went there prepared to be impressed. I was not; and, indeed, I am prepared to affirm that the umpiring, especially at Roehampton these last two seasons, was distinctly superior in every way. The control of the games was often lax, the practice of disputing decisions and appealing for fouls, both of which are allowed, were not edifying, and they over there fully realise it.

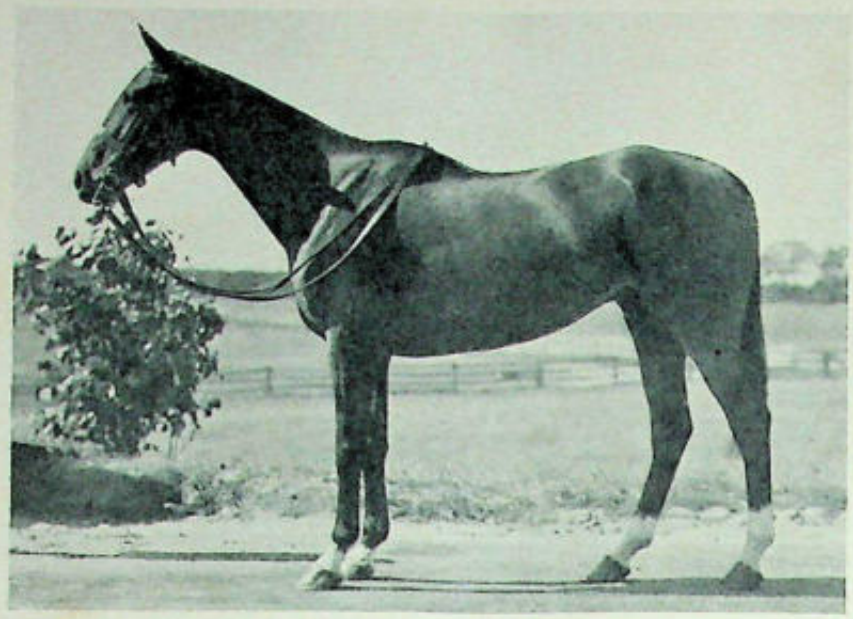
The suggestion to employ an umpire-in-chief available at any of the three London clubs during the season is an admirable one, and I hope it will be possible to carry out the scheme. Mr. S. V. Brady, a licensed indoor polo umpire, was the best I saw at Meadow Brook. For the rest they relied in the main on active players, and these seldom make the best umpires. JEMADAR.

MR. C. V. WHITNEY'S FAMOUS STRING

THE success of Mr. C. V. Whitney's Old Westbury team, for the second year in succession, in the American Open Championship at Meadow Brook this season was due at least as much to the splendid quality of the ponies played by the team as the magnificent polo played by his team. Apart from their obvious merit they were produced trained to a hair for the psychological moment by Mr. Ivor Balding, who is Mr. Whitney's "Master of Horse." Mr. Balding has inherited his family's gift of horse-mastership and to him no less than to Mr. Whitney and his team, is honour due for their very impressive victory. In the polo pony show held at Meadow Brook after the "Open" and Monty Waterbury Cup, Mr. Whitney's string not very surprisingly swept the board and his bay Estilista was adjudged the champion pony of the show, to which none could take exception.

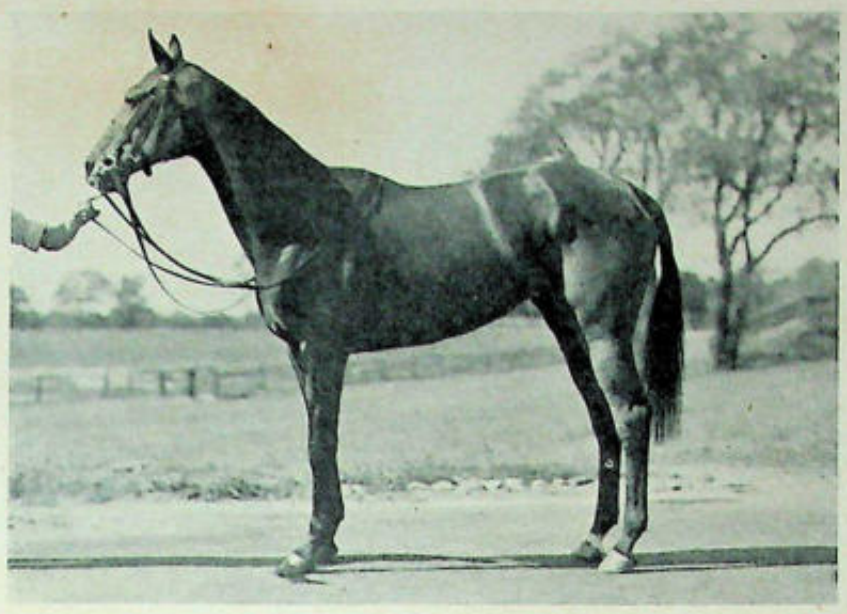
In view of the recent agitation in favour of American-bred ponies it is interesting to note that most of the successes were gained by Argentine-bred horses. A notable exception was that grand mare Fuss Budget, who won in the light-weight class, and was also awarded for the second year in succession the Prince Friar Stone Cup, awarded to the best playing mare, judged on her performances in the Meadow Brook tournaments, who is regarded as likely to produce a polo pony.

It is probable that five of the ponies at least whose portraits appear opposite will be playing against us for the Westchester Cup at Meadow Brook next June and from them we can judge the strength of the probable opposition. Mr. C. V. Whitney, on the strength of his personal performance this year, has, as already remarked, been included in the "squad" from which the defending team will be selected.



ESTILISTA, THE CHAMPION PONY, A SEVEN-YEAR-OLD ARGENTINE GELDING

Bred by Mr. Duggan, by that prolific and successful sire Morfeo (by Craganour) out of a mare by Monoculo. This pony was played by Mr. Cecil Smith two chukkers in the final of the American Open Championship this year. Estilista is a really outstanding performer in addition to being a real beauty to look at, and has furnished splendidly in the last year. Mr. Whitney paid £1,500 for him. He was also the winner in the Heavy-weight Class



A GREAT MARE: FUSS BUDGET, A BAY BY ST. GERMANS OUT OF QUARREL

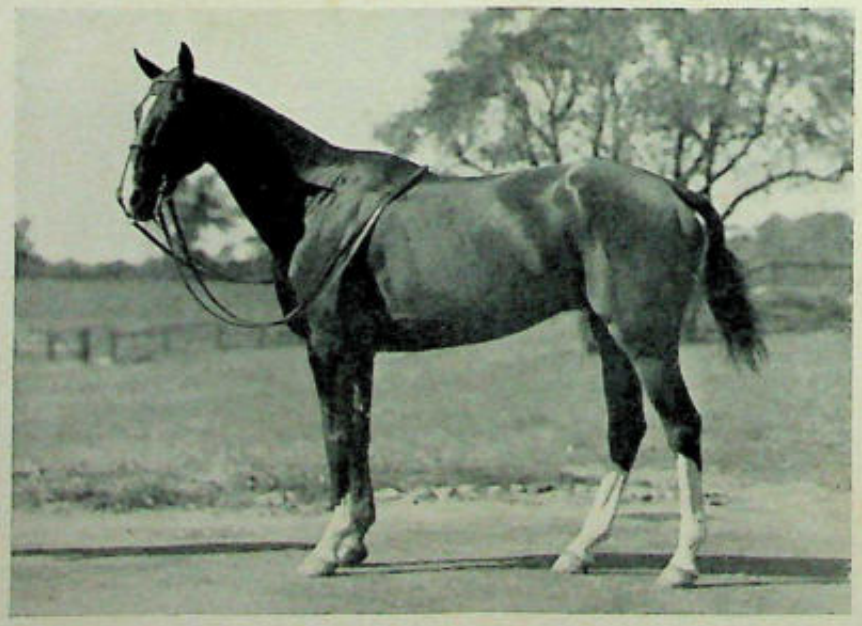
She won, for the second year in succession, the Prince Friar Stone Cup given for the best playing mare suitable to produce a polo pony, the judging being done during the Open Championship and Monty Waterbury Cup, on playing ability. She was a winner on the Flat before turning to polo, was bred at Lexington, and was played this year by Mr. Whitney. She was also the winner in the Light-weight Class

ANOTHER GRAND ARGENTINE: MR. WHITNEY'S BAY GELDING TORNASOL

Bred by Mr. Duggan in Argentina. He also is by Morfeo, out of Sweet Briar. He was played three chukkers in the final of the Open Championship in both 1937 and 1938. On sheer looks he is perhaps the best looking pony in this magnificent string and his action is the sheer poetry of motion. He was the winner of the Middle-weight Class in the Meadow Brook Polo Pony Show this year

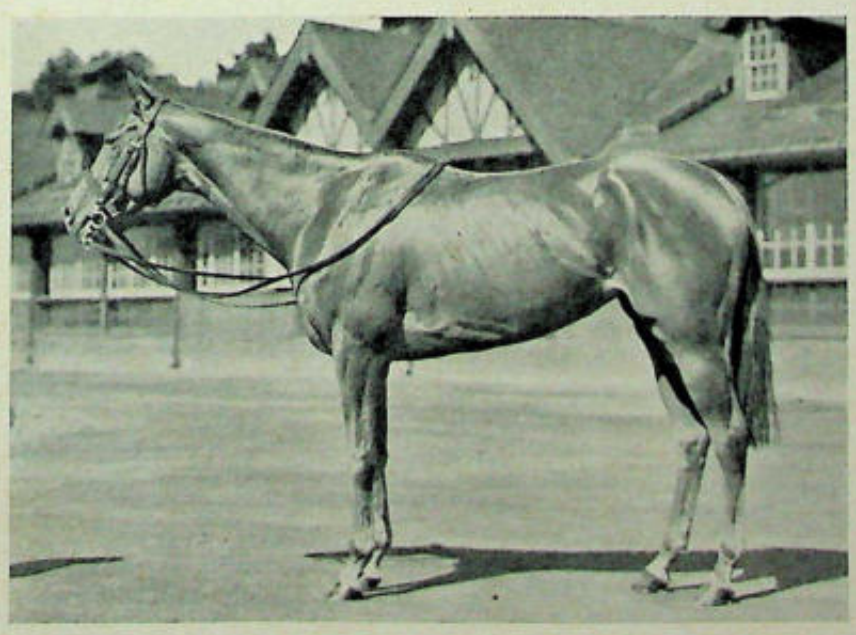
BAY MARE RUBISELA BY COLLAR STUD OUT OF ESTELLA

Bred by Mr. Nelson in Argentina, she was played throughout the Open Championship by Mr. Stewart Iglehart, and in the last two years she has played three chukkers in the final tie. Like all ponies played by Mr. Iglehart, she is amazingly handy and is as fast as the best, as is suggested by her enormously powerful quarters and well let-down hocks



CACIQUE, A CHESNUT ARGENTINE GELDING WITH A FINE RECORD

Also bred by Mr. Nelson. He is by Zaragatero out of Mumps (by Killrane) and won in the Heavy-weight Class at the Hurlingham (Buenos Aires) Show before he was purchased by his present owner. He also played three chukkers in the last two "Open" finals by Mr. Cecil Smith, and although he gave his rider a nasty fall in the fifth chukker, which resulted in a badly damaged elbow, he also gave him a glorious ride all through



HONU: A SEVEN-YEAR-OLD CHESNUT MARE OF DISTINGUISHED DESCENT

Honu is by Thunderer (sire of the Duke of Roxburghe's famous gelding La Vêtie) out of Belle of All, Mr. Louis E. Stoddard's Kentucky-bred mare (by Cunard out of a mare by Star Shoot), who was one of the greatest American polo playing mares that ever was foaled. Honu has not yet quite fulfilled the promise she gave, but she has "quality" written all over her. Her half-brother, Capsheaf, by Blondin, bred by Mr. Whitney himself, is also a member of Mr. Whitney's string

THE POLAR BEAR

Probably the best-known of all Arctic fauna on the familiar Mappin Terrace at Regent's Park Zoo

THE ORIGIN OF ARCTIC FAUNA—II

Discoveries of Russian Zoologists

By MALCOLM BURR, D.S.C., F.R.Ent.S.

PROBABLY the most interesting result of the recent study of Arctic life by Russian zoologists is the discovery that of all the thousands of kinds of animals, despite the most exacting conditions, there is no common feature. There is no "Arctic fauna" as such. There is no adaptational character that can be recognised as common to the Polar bear, daddy-long-legs and planarian worm. There is in fact no homogeneous, ecological unit to mark the extreme north, nothing that can be regarded as the result of Arctic conditions, nothing resembling the distinctive faunas of the desert or savannah forest.

We are, in fact, faced with a paradox. The only unity in the Arctic is disunity; the only homogeneous character the very fact that the fauna is highly heterogeneous. This complexity is evidence of descent from a heterogeneous original.

At the same time the very fact of their existence under such severe conditions points to adaptation of long standing. The common view that this adaptation is mainly due to low temperature is superficial. It is not the cold, but the food factor that matters, and Arctic animal life is ultimately based upon the plant life, and that is dependant mainly upon the illumination. This is the chief difference between the conditions governing the Arctic and the Alpine floras, which are so often confused. The second, which is not fully appreciated, is the difference in effect upon the organism of thawed water and fresh water respectively.

The Euarctics are regarded by Kuznetsov, in a remarkable article, as survivors of the pre-glacial and glacial faunas. He agrees with many biologists who feel that the severity of the glaciation has been exaggerated, that the ancient fauna and flora were never wiped out of existence, but that numerous relics survived in favoured spots. We have many such instances in England and Ireland, while in the Arctic the author quotes the endemics of the islands.

We do not generally realise how varied life may exist under the severest conditions. On the Northern Coast of Grant Land, at Lat. 82° 27′, there were collected no less than 75 species of vascular plants, two of bumble bees and five of butterflies. On *nunataks* protruding from the Greenland ice-sheet, 80 kilometres inland and 1,600 metres above the sea, Ilinsky records 27 species of flowering plants with a relatively rich insect fauna. The famous Arctic moth, *Dasychira rossi* Curt., has been taken in Greenland as far north as 82° 45′, where the larva feeds on a saxifrage protruding through the snow.

Such instances can be multiplied. The existence of so many species of insects and plants upon the scanty ground exposed in Greenland shows that an ice-sheet does not necessarily exterminate life, and is strong evidence in favour of the opinion that we have in Britain many survivors from our old Tertiary fauna and flora.

Still, there is no doubt that the greater part of the survivors were driven southwards by the advancing glaciers, and that on the recession of the ice they slowly followed it back to their original territory. The main region of this recovery is to-day covered by forest, especially by the *taigá* of Siberia, but it does not seem likely that the details of this recovery will ever be worked out.

These return movements must have taken place during each interglacial interval, and the last is no doubt still in process, for in Siberia we are separated from the retreat of the ice probably by not more than 6,000 years. In Britain it is usually considered that the Arctic tundra phase came to an end about 10,000 years ago, and that we were separated from the Continent some 6,000 years ago. If that view is correct, there was a very short interval for the re-population of our country.

In Siberia the ice-sheet reached as far south as Lat. 60° only in few places, for it had so much vaster an area over which to spread itself, and so the destructive influence of the glaciers was less. I have myself, in the Lena-Olekma plateau, about Lat. 60–61°, experienced a temperature of −72° F., which was certainly not fatal to life, and seen pieces of ice embedded in ancient gravels at a depth of some 150ft. Kuznetsov thinks that the boundaries and movements of these ice-sheets will eventually be marked out by the detailed study of the discontinuous distribution of the fauna and flora. He considers that the average temperature of Central Eurasia was lowered throughout the Pleistocene, in witness whereof he quotes the huge areas under loess in Europe and Asia, that desert and steppe conditions prevailed to the south of the ice-field, which barred the escape of many of the animals and plants. While the greater part of Central Asia passed directly from steppe to tundra the great belt of forest did not exist. Areas of refuge survived at the extremities, as proved by numerous instances of discontinuous distribution. He accepts the chief refuges for sylvan life in Europe south of the Alps, south-western Asia, Manchuria-China-Japan, and the Iranian-Turanian country, which offered a refuge for steppe life. These principal refuges and some more restricted faunistic islands he considers permitted the survival of animals and plants through all four glaciations. In the Far East the outstanding instance of Ussuria is of extraordinary interest, which is little realised in our country. There the "Arcto-Tertiary" life survives almost intact, and the tiger preys on elk and wapiti.

The original fauna of these refuges was enriched by the newcomers. The repeated changes of climate, affecting the refuges at least indirectly, the arrival of refugees and departure of the returning elements, all tended to stimulate evolution, with the formation of new species in the real sense of the word, and perhaps even new genera. One result is that the faunas of these islands now differ markedly from each other, so much so that many of them are now regarded as distinct "provinces." We find closely related species widely separated, cousins so to speak, which Semenov-Tian-Shansky calls vicarious species. Bey-Bienko has called attention to the existence of vicarious earwigs in Szechuan and Western Europe.

Like most biologists, Kuznetsov accepts the hypothesis of continental drift, with its corollary of the shifting of the poles, due to disturbance of equilibrium through the accumulation of ice-caps. He suggests also movement also at angles to the equator, and is prepared to assume a gradual progression of glaciation from west to east.

The problem is rendered especially difficult owing to the absence of proof of synchronisation of the glaciations. The author finds no help in the accepted glacial chronology of Europe, and that of Siberia he considers doubtful. It seems likely that the glaciation over a broad area was not simultaneous, but progressive, and that the advance and retreat of the ice-sheets took place, and is still taking place, not in a meridional direction, but from west to east.

This is an important deduction, because it implies that the glaciation of Asia was subsequent to that of Europe, and consequently also its recovery, with the result that we have in actual process a gradual invasion from the west towards the east. This explains the European element in the fauna of western Siberia, and the invisible frontier of the Yenisei. About a hundred miles to the east of that river and running north and south is the line of change of fauna and flora. Here the marten yields to the sable, the hooded crow to the black, and the change is marked in the molluscs, the beetles, the fish, the trees and ground flora. Yet I could detect no outward visible sign from the train, either in vegetation or scenery. This invisible frontier is the limit reached by the European life. To the east of it we find the Manchurian. Kuznetsov also suggests that the general eastward migration may explain the invasion of North America by the Palæarctic fauna and flora by the Behring Straits, which were till recently dry land.

He points out that many species of Arctic Lepidoptera extend their range not in a southerly direction, but towards the south-east, and from the far east towards the south-west, these lines converging to a common centre. This points eloquently to the connection of the Arctic fauna of all Europe and Asia, and even of North America, with that ancient horst called by Suess Angará Land, after that violent and crystal stream that dashes out of Lake Baikal, to-day marked upon our maps as Pri-Baikal, Mongolia and part of Tibet.

That is to say that all or the greater part of the whole Arctic fauna, including Euarctics, are representative, and to a great extent relicts of that ancient Angará fauna, which spread in remote times, possibly during the Miocene, throughout circumpolar lands, and was severely impoverished by later glaciation, the divisions of which in Asia did not coincide with those in Europe.

This view is confirmed by studies of the mammals beetles, caddis flies and flora.

He does not extend his Angará theory to the whole of the Palæarctic fauna, but the Angará element is greater even in our British fauna than is generally supposed. Our grasshoppers, for instance, must be regarded as the result of evolution on those grassy steppes, where they had time since the Palæozoic in which to adapt themselves to such conditions.

Kuznetsov, as we have seen, discards the view that the Arctic fauna is merely an impoverished fragment of the Palæarctic, or that it is an autonomous region in itself. He finds that it falls into four distinct portions—the European, the West Siberian, the East Siberian and, as a surprise, the Chukhot-Anadyr, for the entomological fauna of that remote north-east corner of Asia, though imperfectly known, shows marked peculiarities.

He proceeds to point out that the world can no longer be regarded as falling into clearly-marked regions and provinces. The statistical must yield to the historical and geological methods, and to the ecological consideration of biological facts. The old terminology does not satisfy contemporary philosophy and must be modernised. The first steps in this direction were made by Reinig (Holarktis, 1937), and attempts have been made in the U.S.S.R. by Martynov, working on caddis flies, and by Bartenev, upon dragonflies.

Finally, we may note that Kuznetsov quotes, in non-committal fashion, the extreme views of Kolbe (1928), that Central Asia is the cradle from which arose the parent stem of the entire animal world.

This England . . .

Over the Weald of Kent

ROMAN and Jutlander and Norman have passed this way upon their unconscious mission of making the English. So if the soft beauty of Kent and the gentle speech of the people charm you, do not be misled; beneath lies English character of the sturdiest sort. The Dauphin took Rochester and the Dutch sailed up the Medway—to their regret. And Wat Tyler, Jack Cade, and Thomas Wyatt expressed the will of Kent to the discomfort of authority. Now are the people become gardeners, famed for a flower that you rarely see—the hop, that flavours such great beer as Worthington. Indeed, this ancient brew has somewhat the qualities of these Englishmen—mellowed by much experience, strong, yet kindly in its way with you.

ISSUED BY WORTHINGTON AND CO. LTD., BURTON-ON-TRENT, ENGLAND

THE ART OF GOOD LIVING

By ANDRÉ SIMON

IN all matters of taste there are bound to be more exceptions than rules, and this is particularly true in the case of food and wine since we are all entitled to our own taste, in the first place, but we have also to consider the likes and dislikes of a number of inarticulate but highly sensitive friends of ours, meaning our organs, safely tucked away below the belt; it only too frequently happens that what we like best does not suit one or the other, and we are soon called to order.

Even after making full allowance for personal idiosyncrasies and liberty, we are bound to recognise that certain general rules do exist, and that they can be of assistance as a guide in the selection of the wines to choose with different kinds of food that they may help one another. Everywhere in nature there is harmony out of contrasts, be it land and sea, the hills and the valleys, the forest and the plain. And so it is in the case of the harmony of solids and liquids, food and wine.

One of the first general rules which the student of gastronomy has to learn is that white wines are best with fish or white meat and red wines are best with butcher's meat and cheese. The next is that the drier wines should be served before sweeter ones. The third is that lighter wines, that is, wines of lower alcoholic strength and less fragrant aroma should be served before wines of greater "body" and "bouquet." There are many who also claim that those should be served before older ones, but it is chiefly because older wines should be also better wines, with greater "bouquet" and "breed." Not that age is by any manner of means a virtue in itself. By far the greater quantity of all the wines made throughout the vinelands of the world are quite incapable of improving with age; they are drunk when very young, some before they are a year old and others before they have reached their third or fourth birthday.

But there is an élite among wines which gather charm and virtue as they grow older; they are an aristocracy among wines and they are aristocrats from birth, because of the soil of the vineyards from which they come; they take longer to mature, but when they have reached their full measure of excellence they are truly magnificent, and they must be served last.

Unfortunately, there are many wines which are kept much longer than they were ever meant to be; they are old and weak and poor; they may be still fit to drink, but they should not be kept to be served last, after younger and better wines which would simply add to their confusion.

The right age for a wine to be drunk differs with every vintage; the right age is the age when the wine gives pleasure. The Clarets of 1875, for instance, were delicious when they were five years old, and still delicious 50 years later; but the 'seventies were hardly fit to drink when 20 years old, and they did not reach their apogee much before their 50th birthday. Both, however, were exceptional vintages.

FIFTY YEARS AGO

From the *Field* of December 1st, 1888.

GAME Licences. "In the House of Commons Mr. Howard Vincent asked the Chancellor of the Exchequer if the Board of Inland Revenue had considered the desirability or otherwise of issuing short-time game licences—daily and weekly licences, in fact . . .

"At present a full game licence costs annually only £3; if it expires at the end of October, £2; when taken out on or after November 1st, £2; and, moreover, a licence can be had at any time for a fortnight at the moderate cost of £1. . . . If a man cannot pay £1 for the right to shoot game he is not in a pecuniary position which entitles him to indulge in the sport."

Blackmailing Foxhunters. "The name of Mr. E. C. Burton, of Daventry, will be familiar to hunting and racing readers. That gentleman is an owner of coverts, and a well-known rider to hounds in the Pytchley country. In the same town resides a surgeon, Mr. C. N. H. Johnson, who takes a philanthropic interest in the acquisition of a local recreation ground. Both Messrs. Burton and Johnson were members of a local committee for promoting such a recreation ground, but they were not of one opinion as to the choice of site. Mr. Johnson, in order to put pressure on the purses of hunting men for the benefit of their recreation scheme, adopted a course of proceeding which put him within the pale of criminal law. He threatened vulcipede unless £200 were paid in to the treasurer of the recreation scheme. He addressed letters on the subject to Mr. Burton, and enclosed therewith the brush of a fox, threatening that foxes should be destroyed unless the required sum were subscribed before November 1st. He also threatened to publish in the sporting papers his 'reasons' for this line of conduct, and that Mr. Burton's name should be 'coupled' with this publication. Mr. Burton took prompt steps in the matter, by instituting a prosecution for an attempt to extort money by menaces." There were two indictments and the defendant was sentenced to a month's imprisonment on each.

IN THE SALEROOM

MR. JOHN MORTIMER SCHIFF and his advisers have confirmed the now generally realised fact that London is the most important market for the sale of antiques and works of art by placing the whole of his father's famous library in Messrs. Sotheby's hands. The third and final portion is being offered in a four-day sale commencing December 6th. The catalogue contains 2,493 items, and is beautifully illustrated. It includes nine plates in colour, and 32 in monochrome, and will no doubt be cherished by bibliophiles and lovers of beautiful bindings. It is difficult to pick on any particular items in such a galaxy of book treasures, but, perhaps, the Elzevir Series, with its handsome old bindings, including as it does the finest copy in existence, the marvellous Pastissier François from the Carnarvon Library (uncut), is remarkable. There are actually over 200 of Voltaire's works, including the Œuvres of 1738 39, and of 1751 with eight of Eisen's drawings, also some of his autographed letters.

On December 8th, in the same rooms, will be sold Mr. Claude W. Heneage's Collection of English and Chinese pottery, porcelain and works of art. There are some very beautiful Meissen figures and groups of extraordinary interest and quality, better than any that have come on to the market for some time. A typical figure of this famous factory is "The Grape Picker," by Kaendler, a similar figure of which was illustrated in *Apollo*, in August 1934, in an article on "Early Dresden Figures, their Origin and Evolution," with illustrations from Lord Fisher's Collection. Amongst the English porcelain, a pair of Worcester plates by James Pennington must be mentioned. They are from a service made for the Duke of Clarence in 1792, and afterwards in the possession of the Earl of Munster.

A NATURALIST'S NOTEBOOK

LAST week—on Wednesday to be precise—I went to the Trocadero. I went to see Trocabaret (a horrible perversion that word, and one that makes me feel quite faint). I do not as a rule go to cabaret shows—for the matter of that I do not as a rule go to the better restaurants of an evening—and I was pleasantly excited, not because I was to see a cabaret show, but because I was to see one turn (if that is the right word—I'm not up in these matters) which is utterly different from the usual.

* * *

I went to see and hear Eric Hosking. Every reader of the *Field* probably knows Eric Hosking by name. If you do not, he is a bird photographer of outstanding ability and a more than competent ornithologist. And he was to talk about birds and show lantern slides of birds.

* * *

I think you must admit that that is an unusual item to find in a cabaret programme. To my mind a most refreshingly unusual item. And a most courageous one. It cannot be easy to talk about birds to a crowded room of diners who probably know nothing about birds; it must be very difficult to do so when that talk is limited to ten minutes and fitted in between a beautiful young lady singing love songs to rhythm and an oriental conjurer, who produces live chickens from nowhere. Mr. Hosking, I submit, is an extremely brave man.

* * *

Even more courageous, I think, is the management of the Trocadero. People go to such places to eat and be amused, rather than instructed. Few people, I imagine, would regard a talk on birds as amusing; most people would regard it as instructive even if they did not consider it boring. The Trocadero management must have known that, and knowing it, took with an initiative and courage and belief in their own judgment that is refreshing for any modern English business, the chance.

* * *

They and Mr. Hosking have been well repaid. The room on the night I went was full. I spent some time—in the intervals of eating an extremely good dinner—in regarding my fellow diners. They were with possibly two exceptions townsmen to all outward appearance. Next to me was a party of Frenchmen; not very far away an American with two Germans. The room was not, obviously, of an ornithological turn of mind. I feared rather that Mr. Hosking was going to spend an uncomfortable ten minutes.

* * *

Applause greeted his first picture. His talk was punctuated throughout by applause, which was pronounced when he showed kingfishers and which was enthusiastic when he finished. He was, beyond doubt, a success.

* * *

By the time this appears in print a new programme will be on. Trocabaret will be cabaret on the accepted lines. But I hope and believe that the Trocadero and Mr. Hosking have done something that will have repercussions throughout the cabaret world, that London will in future be amused and instructed over its dinner.

* * *

Birds are interesting things—even when you know little about them—and they do interest most people to some extent, even those whose normal round of business and pleasure is governed to a very large extent by hard pavements and bright lights. That was proved to my satisfaction on that Wednesday night. I hope Mr. Hosking will be given further opportunities of ramming the lesson home.

* * *

The lesson, of course, is that the general public are not nearly so unintelligent as those who endeavour to entertain them believe. Give a man a good dinner and you can do anything with him; but you cannot. If Mr. Hosking had bored, the room would have been silent—the room was not. A lecture on birds, sandwiched between song and conjuring, went well. The lantern slide of a barn owl was examined with just as much interest as the young lady who sang about her loves. The barn owl, of course, is also beautiful; but nevertheless I regard it as a heartening sign.

* * *

There is room for the pioneer even to-day, even in the after-hours life of London. There is room everywhere for a return to simple things. I congratulate the Trocadero on their dinner, on the courtesy of their staff, and particularly on their initiative and on possessing the courage of their convictions (in a world which seems now to have little of either) and of Mr. Hosking on his adventurous spirit. But I want more.

B. V-F.

LETTERS TO THE EDITOR

THE LITTLE OWL

SIR,—With regard to the diet of that worst of winged vermin, the little owl, I can speak from experience that it is not butterflies, moths and beetles that they principally live on, but our singing birds. About two years ago my son was riding round the land and saw a little owl tearing something to pieces on the ground. On going up to see, away flew one of these pests from eating a freshly-killed blackbird. Two summers ago we found a little owl's nest with the remains of six or eight young pheasants in it. The other day, when driving to the station, a little owl with a cock blackbird in his talons flew across the road. You could hardly see the owl for the blackbird's plumage. He flew just across the front of my car and it was with difficulty, owing to the weight of his prey, that he managed to clear the two high fences in and out of the road.

We always used to have a nice lot of nightingales about here. For some years they got less and less as the stock of little owls got up, and now we have not had one for several years and they have entirely disappeared. I have no doubt these owls are the cause of the entire disappearance of these delightful songsters.

The beak and the talons of the owl would show they were not meant for catching insects!

Yours faithfully,

Brent Pelham Hall, ED. E. BARCLAY.
Herts.

"FISH OF GREAT AGE"

SIR,—With reference to the above article by Mr. T. C. Bridges, in the *Field* of October 22nd, it is worthy of interest that the majority of modern ichthyologists appear to be of the opinion that "centenarian" carp are non-existent; that, in fact, they never have existed. According to the *Fishing Gazette* of May 25th, 1935, a German scientist, Professor Rochner, who has studied carp for many years, states that they "live twenty-five to thirty years only. The ancient carp of Fontainebleau are a legend . . . for the ponds there were emptied in 1789, in 1825, and again during the Commune. The monster carp there, 90 centimetres long and 60 in girth, is only twenty-five years old."

In his *History of Fishes* (pages 425–6), Mr. J. R. Norman quotes Dr. Regan's comment that the statements concerning most of the very old carp "rest on very unreliable evidence," and adds that, "although there is good reason for believing that under artificial conditions this fish may attain to a good old age, it is doubtful whether it exceeds fifteen years in a wild state." This, I think, aptly sums up the position in the case of carp, since these placid fish take very easily to a domestic life.

Both authors are equally sceptical about the alleged great age of certain pike, though Dr. Regan concedes "it is probable that fish of sixty or seventy pounds weight are at least as many years old." Mr. E. G. Boulenger (*Angling*, October–December, 1936, page 7) states that "no pike of over fifteen years is *definitely recorded*" (my italics). Ireland, as is well known, produces some superb pike; yet, so far as I am aware, scale readings, where practicable, have not revealed any evidence of notably long-lived individuals. One of the heaviest Scottish pike netted in recent years—a female fish weighing 35lb., and measuring 4ft. in length (Loch Ken, 1935), was estimated, from examination of scales, to be eighteen to twenty years old (*Fishing Gazette*, June 29th, 1935).

Unfortunately, numerous discrepancies are to be found between various authors' accounts of "long-lived" carp and pike. In some cases even the metal of which the marking ring was composed differs in different stories, some writers having that it was brass, others copper, and yet others insisting on gold! Gesner's marked pike, taken (*circa?*) 1497, was supposed to have been placed in a lake by the Emperor Frederick II in the year 1230, but, as Mr. Norman has pointed out, ". . . they (*i.e.*, other authors) cannot agree as to which of the Fredericks was responsible for marking the fish, or as to the exact locality at which it was finally captured. Its length has been stated to be 19ft., and its weight *five hundred and fifty pounds*" (my italics).

Incidentally, it would appear that the Teutonic sense of humour was more pronounced in those times than now; for we read (I really must apologise to Mr. Norman for quoting him so extensively!) that the actual skeleton of this monster pike is said to be preserved in the cathedral at Mannheim, but "a celebrated German anatomist" who studied it during the last century "found that the vertebræ in the backbone were too numerous to belong to a single individual—in other words, that the skeleton had been lengthened to fit the story!"

Yours faithfully,

"Davena," PETER MICHAEL.
56, Cranmore Lane,
Aldershot,
Hants.

ARTIFICIAL HUNTING

SIR,—As the writer of the article to which your correspondent refers in his letter in your issue of November 5th, may I seek once more the hospitality of your columns?

I must reluctantly admit Mr. Liversidge's implication that people do not ride to hounds in their thousands simply for the purpose of exterminating vermin! A Master of Hounds is something more than a glorified rat-catcher; nor can it be claimed that the sports of shooting and fishing are carried out solely for the purpose of augmenting the nation's food supply. To this extent, therefore, it may be said that all forms of sport have an element of artificiality, from the purely utilitarian standpoint. I feel, however, that to expound the ethics of field sports in the pages of the *Field* would be to preach to those who are presumably converted.

Foxhunting, however, may always claim to have been the least artificial and most democratic of sports. No "engines" are employed, beyond a pack of hounds, whose natural instinct is to hunt their quarry, while in support of its democratic character, I cannot do better than quote the late Captain Pennell-Elmhirst, possibly the finest hunting correspondent the *Field* has known.

"Foxhunting," he wrote, "is in truth the well-loved sport quite as much of the agricultural classes as it is of those mounted and scarlet clad. A day upon which the 'hoonters' are about to give vivid pleasure to a ten times larger number of working people . . . than of rich folk who ride a-horseback. Old men to little children all accept the pageant with gusto, and view its operations with keen delight, being never so happy as when they can share it by screaming at a fox, however distant!" My submission is that only when foxhunting ceases to be the natural sport of the whole countryside will it become artificial, and this was the purpose of my article.

As regards the "crime of preservation," this merely amounts to an effort at saving from extinction by trap, gun and poison bottle, an animal that, in reasonable numbers, performs a useful function in the destruction of vermin a good deal more harmful than himself; one, moreover, that plays a not unimportant part in our national life.

Yours faithfully,

Great Budds, RALPH GREAVES.
Shipbourne.

ENCOURAGING ATHLETICS

SIR,—The Scottish Athletic Federation wishes to encourage a more general participation in athletics of those who do not reach an exceptionally high standard, and especially of the youth of the country. One of the proposed methods is to give certificates or badges to all who attain a recognised standard in three or four events; another is to start inter-school and inter-club competitions on the basis of points to every competitor, or even of every member who attains a recognised standard; the winning club or school would then be the one with the best average performance, and not the one with one or two outstanding athletes.

A similar system is in force in some schools for inter-House competitions: the winning House is the one in which the greatest proportion of the boys or girls attain a given standard. But unfortunately it is found that at present there is no recognised standard either for boys and girls of any given age, or for adults. Standards vary from school to school, from club to club; sometimes only one standard is recognised, at other times two or more (such as high, medium and low). It is therefore impossible to compare the performance in one group with that in another group.

The S.A.F. is consequently anxious to collect as many as possible of the standards already recognised (and so proved to be of real use) and if possible to work out a set of standards which may be generally acceptable.

The standards will take into consideration the age of the competitors and their sex, the track used in races (grass or cinder, &c.), the height of hurdles, weight of shot or javelin, and other circumstances. According to some people, allowance must be made in the case of juveniles for the height and even for the weight of the competitors; but in many events this might introduce unnecessary complications.

If standards can be worked out which receive general acceptance, comparisons of performances in different areas or groups may provide very interesting data; one area may show greater ability than another, one group in an area may show greater ability than other groups in the same area. Not only will the average person be encouraged to improve his or her all-round ability by attaining the recognised standards in several events, but also attention may be drawn to groups who require special efforts (owing to lack of facilities, nutrition, hours of work, unemployment, &c.) to bring them up to the general average.

The S.A.F. would be greatly obliged if any of your readers who are interested would send us any relevant information and statistics in their possession.

Yours faithfully,

J. B. T. MACKAY
(Hon. Recorder).

Scottish Athletic Federation,
22, Stafford Street,
Edinburgh 3.

WEIGHT OF AFRICAN GAME

SIR,—Your correspondent's letter on the subject of weight of African game, in the *Field* of October 1st, has prompted me to submit the weights of a few species. Although the list is very meagre, it is forwarded in the hope that the figures may be of interest and will help to supplement existing information. My only regret is that I did not weigh more of the species which I obtained during a seven years' sojourn in Tanganyika Territory. The weights are as follows: Warthog, 178lb.; another of which measured 4ft. 1in. from the snout to the base of the tail, 140lb.; impalla, males 75lb. and 80lb., female 100lb.; waterbuck (height at shoulder 4ft.), 260lb.; spotted hyena (4ft. 11in. from nose to base of tail), 160lb.

Yours faithfully,

Department of Agriculture, N. C. E. MILLER.
Kuala Lumpur, F.M.S.

GAME OUTSIDE AFRICA

SIR,—With reference to the letter on "Weight of African Game" on p. 785 of your issue of October 1st, 1938, you have referred to African game only. Might I, however, refer to other game outside Africa, for, in my opinion, after the elephant there does not appear to me to be any animal in the world to beat, so far as weight is concerned, or even in height for that matter (leaving out the giraffe), the Indian or Burmese gaur, miscalled bison (*Bibos gaurus*). Old bulls sometimes run up to 21 hands at the shoulder and are, moreover, exceedingly bulky. I may be wrong, but I do not think either of the two rhinoceros of Africa approach anywhere near the gaur in weight, or even in height for that matter. The American bison and the African buffalo are puny animals compared to the Indian and Burmese gaur. The next largest land animal in the world, therefore, in my opinion to the elephant is *Bibos gaurus*, the so-called Indian bison or gaur.

I would say that the eight heaviest animals in the world are perhaps as follows: (1) Elephant; (2) gaur or bison (*Bibos gaurus*); (3) black rhinoceros; (4) white rhinoceros; (5) hippopotamus; (6) giraffe; (7) tsaien (*Bibos banteng birmanicus*), the true wild cattle of Burma; (8) the single-horned rhinoceros (*Rhinoceros sondaicus*) of Burma and the Malay States. I should say that a gaur standing at 21 hands at the shoulder was heavier than any Clydesdale horse.

Yours faithfully,

28, Rock Hill, W. S. THOM
Kalaw, (Imperial Police, retired).
Shan States, Upper Burma.

PONY VICTIMS IN THE NEW FOREST

SIR,—I have only just seen the letter from the Secretary of the R.S.P.C.A. on the above subject. May I crave space to explain that I in no way intended any reflection on the methods of the R.S.P.C.A. in this matter? Their inspector showed himself on the occasion mentioned keen and efficient under very difficult circumstances. It was impossible to approach the injured colt, though with a broken fetlock, near enough to destroy it without expert assistance, and this was difficult to obtain.

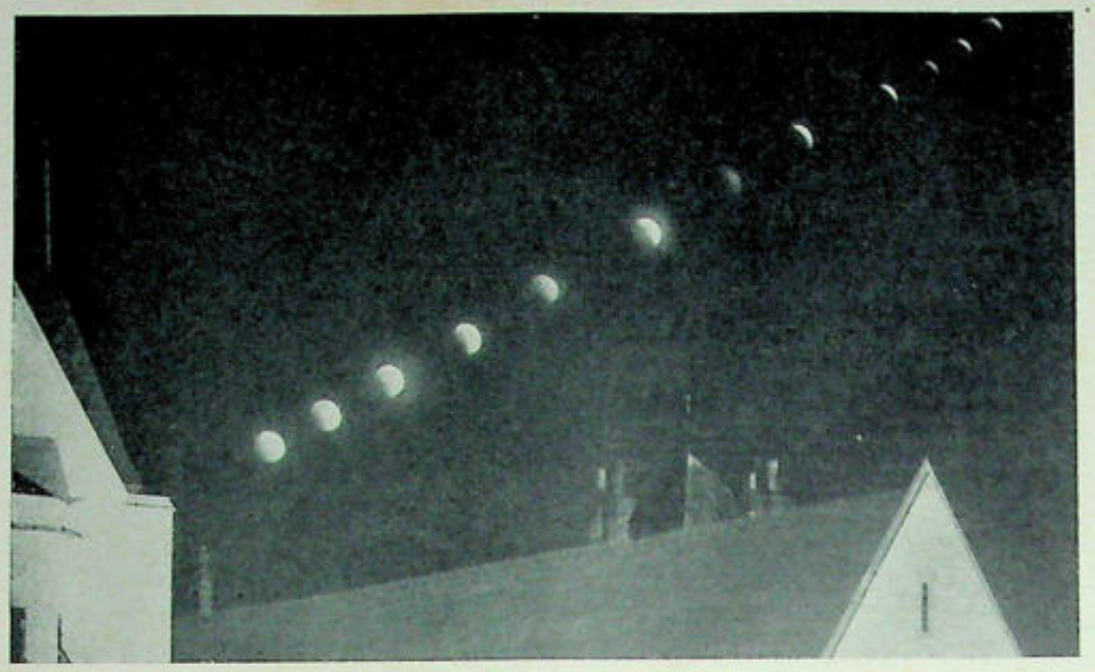
I fail, however, to appreciate Captain McCunn's argument against setting up a speed limit in the Forest. The same objections were raised when speed-limits in built-up areas were first suggested, and everyone knows that in these areas accidents have since decreased by nearly 50 per cent.

As long as motorists are allowed to drive madly along the unfenced Forest roads at 40 to 60 miles an hour—cutting in and overtaking—bad accidents will occur and these semi-wild ponies will continue to be killed and injured.

All over England—all over the world—animals have to pay the penalty for our mad lust for speed. Let us see to it that the toll of their suffering is not greater than we can reasonably prevent.

Yours faithfully,

Ashill House, EVA DUNBAR.
Ilminster.



A REMARKABLE PHOTOGRAPH OF THE RECENT ECLIPSE OBTAINED BY A SERIES OF EXPOSURES
(See letter "The Eclipse of the Moon")

THE ECLIPSE OF THE MOON

SIR,—I enclose a photograph of the recent eclipse. It was taken in the grounds of Howell's School, Denbigh, the buildings of which appear in the foreground. Exposures were made at approximate intervals of 7 minutes, between 8.35 p.m. and 10 p.m., on November 7th.

Yours faithfully,

Denbigh. RONALD THOMPSON.

"MOTHER CAREY'S CHICKEN"

SIR,—Not long ago in a wood near here I picked up a stormy petrel (*Procellaria pelagica*), otherwise known as "Mother Carey's Chicken." It was only a short time dead and had no marks of violence on it. I at once noticed a peculiar oily smell off the bird, and on looking it up in the book found this smell was one of its peculiarities. Its other markings, white upper tail coverts, web feet and sooty black feathers tinged with grey, helped me to identify it I have sent it to Messrs. Williams, 2, Dame Street Dublin, for preservation and setting up. This locality is over 90 miles as the crow flies from the nearest point of the Atlantic from which the bird could have come, and I believe the nearest known nesting places of the stormy petrel are on the islands off the west coast of Ireland some 100 miles from here. This place is situated practically in the exact (?) centre of Ireland. About October 8th or 9th there was a terrific gale blowing over here from the south-west. I have seen these birds many times topping the waves of the Atlantic, but never at close quarters before. Was it blown inland by the storm or was it migrating to other shores?

Yours faithfully,

Ettagh, EVAN LLOYD.
Brosna, S.O.,
King's County, Ireland.

HUNTERS AT GRASS

SIR,—This engraving arouses hunting thoughts every time you look at it, and the individuality of the three hunters recalls many memories of equine friends. It would be a great pleasure to have the opportunity to see the original painted by Landseer, and one often wonders where it now hangs and what is the size of the canvas? From the official record it appears Landseer painted the picture for Mr. W. Wigram in 1833, the price being 300 guineas, and it was exhibited in the Royal Academy.

All three hunters were bred by Mr. Wigram from a favourite mare, Elizabeth, by Waxy, by Pot8os. The first in the group, a chesnut by Osiris, is the youngest, foaled 1819, though he shows the most wear. The middle horse is a brown; and the last horse, Algiers, a bay by Salamanca, foaled 1816, is our pick for a day's hunting.

Yours faithfully,

Folkingham, CUTHBERT BRADLEY.
Lincolnshire.

A FOWL DIET

SIR,—In West Africa—at least, in the arid towns on the coast—the rearing of poultry is a chancy matter, and the amateur, particularly if he is otherwise engaged for the greater part of the day, finds the care of his birds quite a problem in the dry season. There is hardly a blade of grass to be seen, and it becomes necessary to scour the countryside to find green food for the birds.

When I was last in West Africa, some years ago, I kept a pen of Black Leghorns, which did very well for most of the year, but they had to be kept in a wired run to protect them from snakes—and not always of the crawling variety either—for the two-legged snake, who would lift one's poultry at night, was far from unknown.

During the dry season, there were frequent swarms of locust "hoppers" which settled everywhere, even in the fowl run, and they were greedily snapped up by the fowls, which throve on the unusual diet—and why not? Although there was precious little green food in the immediate vicinity, the locusts had, in the recent past, eaten and were gorged with, green vegetable matter. In any case, I can vouch for the excellent results derived from a diet of locust hoppers, for the egg yield very materially improved thereafter.

Yours faithfully,

Sonning Common, Oxon. H. BROOKS.

CYCLISTS AND ROAD ACCIDENTS

SIR,—A cause of road accidents which so far has received little attention is the inability of drivers to see what is *behind* them.

The mirrors used in over 90 per cent. of cars are of the internal pattern, that is, fitted above or below the windscreen and reflecting through the rear window.

Useful as this type may be, it is inefficient because it has a blind spot caused by the rear quarter of the saloon body. This blind spot does not obscure large vehicles, but it *does* obscure that most vulnerable and ubiquitous danger, the following cyclist, who, in traffic, is often in that very area where the motorist's mirror cannot reflect him.

This applies particularly when a car is stopped and the driver gets out. Dozens of cyclists are knocked off their machines every day by the sudden opening of off-side car doors.

In the interests of road safety I suggest the use of an additional mirror on the off-side wing, which shows the motorist that part of the road which is hidden from the internal mirror. The cost of a wing mirror is small, for Lucas's now make one for a few shillings, but its use may prevent accidents of a serious, if not fatal nature.

Yours faithfully,

Coxfolly, L. R. HANCOX.
Wood Lane, Earlswood,
Warwicks.

THE DEATH OF A KITTIWAKE GULL

SIR,—Recently I was walking along the road with fields on one side and fields and a rookery on the other side when I suddenly heard a great noise made by a flock of eight to ten rooks returning home.

In the centre of the flock was a kittiwake gull, also giving tongue very freely. I did not see that the gull was being pecked or struck at, but my attention being diverted for half a second I heard a thud about 25yds. away and I saw that the gull had dropped like a stone, evidently struck dead at once, as there was not even a flutter of a wing.

I went up to the bird and found it lying with the head bent underneath and its bill stuck into the ground "up to the hilt." The bird was in perfect condition, and not marked by any injury.

The rooks, after the gull had dropped, ceased their squawking and went home in silence.

Yours faithfully,

Filey, JOHN P. COLLIER.
East Yorks.

DUST IN THE NEST

SIR,—It is surprising to find that your correspondents "G. B. F." and C. Nicholson are unaware of the source of the fine bluish grey dust left in nests after the young have left. It is nothing whatever to do with the mud lining as suggested by Mr. Nicholson, but consists of the disintegrated fragments of the cases in which the quill feathers first appear on the young birds, and which breaks up rapidly as they develop and is trodden into dust by the nestlings.

Yours faithfully,

Whitekirk, F. C. R. JOURDAIN.
Southbourne, Bournemouth.

UNORTHODOX MANNA
(See letter "A Fowl Diet")

As Christmas approaches, your friends will say:

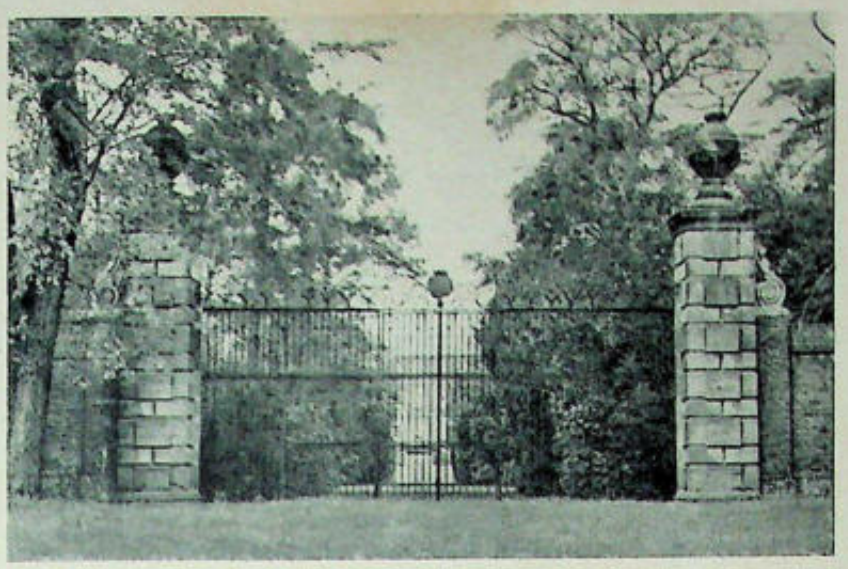
"I hope Mr. Walker will walk my way!"

Don't merely wish your friends a happy Christmas. Make sure they have a happy Christmas by sending presents of Johnnie Walker.

JOHNNIE WALKER
walks away with it!

BORN 1820—STILL GOING STRONG

AN HISTORIC BUILDING
(See letter "Ham House")



HAM HOUSE

SIR,—Three hundred years have passed since Charles I acquired Sheen Chase—giving in exchange compensation that was wholly inadequate—and, having added about 750 acres of land from Ham and Petersham, with smaller tracts from other parishes, enclosed what we now know as Richmond Park. It seems strange that the palace at Richmond was never a popular residence with the Stuart kings, despite its convenient situation for the favourite royal pastime of the day, seeing that the new park, well stocked with deer, became a famous hunting centre. There is little doubt that Ham House, Petersham, remembered chiefly to-day as the residence of John of Lauderdale, became of far greater account than its near neighbour, and if the park grew in importance, the palace became neglected and almost forgotten.

Ham House dates from 1610, and though possibly not the oldest, is certainly the finest Jacobean mansion in outer London. But little alteration has been made in house or grounds since the Cabal met here in secret conference, and some of the more ancient trees would appear to date from about that time. The stately avenues of elms with which the house is surrounded make their own contribution to the appearance of age which the mansion itself conveys.

The river front is seen in the first photograph. The oval niches seen in the brickwork contain lead busts of Roman Emperors, and on the lawn below may be seen a colossal figure of Father Thames, in stone.

The avenue gates, shown in the second photograph, are flanked by tall piers surmounted by urns, and date from the time of Charles II. Over the centre can be seen the Lauderdale Arms, surrounded by the Order of the Thistle with its pendant badge.

These gates bear a curious legend dating from the time of Charles. It is said that the fallen monarch spent his last night in the environs of London at Ham House, coming down by way of the river. When he continued his flight by road the following morning, the avenue gates were closed after him, never to be opened again, so the legend runs, until such time as the Stuart dynasty be restored. Though this restriction can scarcely have been put into effect, the gates have seldom been used since.

"THE CUP KILLS MORE THAN THE CANNON"
(See letter "Pot and Kettle")

Ham walks are as yet unspoiled—possessing a charm that is independent of season. They may be seen to advantage, as the writer saw them first, at haymaking, and again in late autumn, but better than either is the summer evening—with the drone of distant traffic hushed, and the lights dim above Petersham Hill—when one can enter into the spirit of Henley's beautiful lines:

"The dusk grows vast; in a purple haze,
While the West from a rapture of sunset rights,
Faint stars their exquisite lamps upraise—
Midsummer nights! O midsummer nights!

. . . . .

"In the stilly fields, in the stilly ways,
All secret shadows and mystic lights,
Late lovers murmur and linger and gaze—
Midsummer nights! O midsummer nights!"

Yours faithfully,

122, Kenilworth Court, Putney, S.W. 15. E. P. OLNEY.

POT AND KETTLE

SIR,—A curious inscription is to be seen on a stone on the outside wall of the vicarage at Kirdford, Sussex. It runs as follows:

"Degradation of Drunkenness."

"There is no sin which doth more deface God's image than drunkenness; it disguiseth a person and doth even unman him. Drunkenness makes him have the throat of a fish, the belly of a swine, and the head of an ass. Drunkenness is the shame of nature, the extinguisher of reason, the shipwreck of chastity, and the murderer of conscience. Drunkenness is hurtful to the body; the cup kills more than the cannon; it causes dropsies, catarrhs, apoplexies; it fills the eye with fire, and the legs with water, and turns the body into an hospital."

Tradition says it was put up as a warning to the village toper; tradition also says that the parishioners of the time said it should have been put on the other side of the wall!

Yours faithfully,

The Hill House, Lindfield, Haywards Heath, Sussex. G. PENNETHORNE.

MOVEMENTS OF PINK-FOOTED GEESE

SIR,—In a certain West Country goose haunt, "pink-foots" began to arrive this year on September 15th, and all of them, up to about 600, departed about November 7th. This, approximately, is what happens in this place, as regards this particular species of goose, every year. They stay in numbers sometimes up to 1,000 or more for some two months only. It would be very interesting to know where they go. There are probably not very many regular haunts of pink-footed geese in England, and if anyone noticed an influx into any of these about November 7th it might help to solve the problem.

Yours faithfully,

Dyrham Rectory, Chippenham. F. L. BLATHWAYT.

CAN DOGS COUNT?

SIR,—Recent articles in the *Field* on the subject "Do Dogs Reason?" have caused me to ask "Can Dogs Count?"

A few years ago I had two black cocker spaniel bitches. I lived six miles out of Durban, but went in almost daily. I never took the cockers with me except on Saturdays, when I used to take them sailing. They never attempted to get into my car on any day except Saturdays, but every Saturday morning, when the boys opened the garage to clean the car, they would immediately go in and sit on the running board and wait for me.

I can imagine they might have recognised white flannels and a yachting cap as a sign of the day, but I was very careful not to give any indication in that respect.

I now have a daughter of one of them which does precisely the same thing, although both her mother and aunt died before they could have taught her the trick.

How did the bitches recognise Saturday? There was nothing done about the place to distinguish it from any other day.

Yours faithfully,

Durban Club, Durban. R. G. P. WOOD.

PELHAM BITS

SIR,—The fashion of putting the curb chain through the ring of the Pelham seems to be coming to these parts.

I first noticed it a year or so ago in a frontispiece of the *Field* depicting a smart well-turned-out Lady Something. I imagine that is the kind of way fashions spread. I wrote to the man who, in my opinion, used to be the best saddler in London, and asked him what the idea was. His reply was that it might be a fad, or the outcome of groom-chauffeurs, but that it was certainly wrong, as it put the leverage all wrong.

I loathe a Pelham anyway. What "hands" with a plain snaffle or double bridle will not do is, to my mind, not worth doing.

Yours faithfully,

Hants. X. Y. Z.

Obtainable from all leading Hotels, Restaurants and Wine Merchants.

A PONY'S JOURNEY

SIR,—I send you a snapshot, which I hope may be of interest to your readers, of a small pony which made a rather remarkable journey last month. I bought it in Gulmarg, Kashmir, at the end of the summer for my small son, and as there is no railway to this part of the State, and it happened to be inconvenient to box it from Sealkot to Saugor, it was decided to march it down. The distance is 262 miles, and the pony stands about 13 hands, but the small Kashmiri syce said he would take sixteen days for the journey. He accordingly left Gulmarg on the morning of September 10th, and actually arrived in Sealkot on the evening of September 21st, having done the journey in twelve marches, and most probably riding the pony most of the way. The train journey from Sealkot to Saugor took the best part of three days, and the snapshot was taken when the pony arrived, in perfect condition, and not having turned a hair.

Yours faithfully,

Equitation School, Saugor, C.P., India. C. CALDECOTT.

UNUSUAL QUAILS' EGGS

SIR,—I enclose an extract from a letter I have received from my son, who is out on a tea garden in Upper Assam, which perhaps some of your readers can answer for him :

"This morning in a section of the tea, Y. came upon a quail's nest which had recently hatched. There were four chicks, minute little creatures not yet dry ; the old bird was there as well, and promptly got in an awful fluff, fluttering round and pretending that she had got a broken wing, whilst the chicks lay absolutely flat.

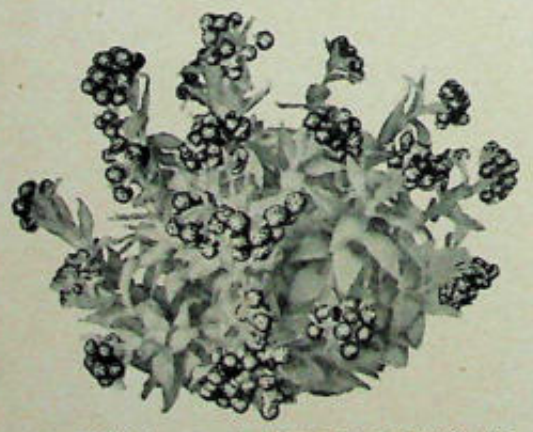
"This evening we went down there, and Y. showed me the nest, a few bits of grass, not even as much as a partridge makes. The eggs, one of which a plucking (tea) coolie woman had trodden on, were very interesting in that, instead of being broken in the irregular way that eggs that have been normally hatched usually are, all four of them have the blunt end neatly cut round, leaving a quarter as a hinge, the lid, if it can be termed as such, being pulled down inside.

"I am now wondering if this is always the rule or whether this clutch is the exception. All four eggs were the same, and three of them are on the table in front of me now. Maybe the *Field* could throw some light on this point ?"

Yours faithfully,

London C. J. TWIST.

The
CAPE COUNTRYSIDE
is *ablaze*
with WILD FLOWERS



THERE can be few more magnificent spectacles than the South African countryside when the wild flowers and shrubs are in bloom and the landscape is decked in a mantle of riotous colour.

The orchards and vineyards are now laden with fruit, and their sun-ripened crops add new significance to the pleasures of the table.

Visit South Africa and lay up a store of memories you will cherish throughout your life.

Consult your Travel Agent or the Travel Bureau, South Africa House, Trafalgar Square, London, W.C.2. Special steamer fares apply by certain sailings during Winter.

South Africa

A REMARKABLE RIDE
(See letter "A Pony's Journey")

FRENCH POODLES FOR SHOOTING

SIR,—Can any reader inform me how French poodles are used ; that is, whether as spaniels or retrievers ?

I have been given a French Poodle/Labrador cross puppy, and would be glad to know any reader's experience of this cross.

Yours faithfully,

Melrose. "LEX."

A GOOD PURGE

SIR,—The other day, walking along a lane in Hampshire, my curiosity was aroused by the sight of two men beating the hedgerow. They were collecting the berries from the purge buckthorn, which they told us they sent to the laboratories for use in an animal purge preparation. They assured us that two or three berries taken before a meal made a good human purge and that they were still used in the country for this purpose. It is peculiar that they should advise the dose before a meal.

Yours faithfully,

Sutton Scotney, Hants. PETER WHITE.

A STRANGE CASUALTY

SIR,—Some weeks ago we suffered a curious casualty while hunting. A bitch, still hunting keenly, was observed to be bleeding from the mouth and, when we managed to catch her, we found that her tongue was completely missing. No one witnessed the accident, nor did we find the tongue, which had been torn or bitten away at the roots. As she was quite unable to lap water or swallow food, we had to destroy her.

I should be interested to know whether such an accident is without precedent.

Yours faithfully,

Hon. Sec., Down House Beagles. C. L. GREENEP.

BIRDS IN LONDON

SIR,—Some of your readers might be interested in the following list of 48 species of birds observed within 300yds. of this house.

As this is but a bare ten miles from Charing Cross, I feel that it might be worth recording.

Mistle thrush,* song thrush,* blackbird,* redbreast,* chiffchaff,* willow wren, hedge sparrow,* long-tailed titmouse, great titmouse,* coal titmouse,* blue titmouse,* nuthatch,* wren,* pied wagtail,* spotted flycatcher,* swallow,* house martin,* tree creeper,* goldfinch, greenfinch, house sparrow,* chaffinch,* linnet, yellowhammer, starling,* jay,* jackdaw,* carrion crow, rook, skylark, swift,* lesser spotted woodpecker,* green woodpecker, kingfisher, cuckoo, barn owl,* little owl, tawny owl,* sparrow hawk, kestrel, heron, mallard, mandarin duck, woodpigeon,* moorhen, woodcock, black-headed gull, herring gull.

The mandarin duck established itself on the pond after the Crystal Palace fire.

Those birds marked with an asterisk have nested or fed in the garden.

Yours faithfully,

9, Edward Road, Bromley, Kent. E. JUSTICE.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, ask for your help for an invalid lady of 80 years, and her sister. Born and brought up in comfortable circumstances, they little thought they would have to throw themselves on the mercy of charity in their old age. Three years ago the elder lady underwent a very serious operation at Guy's Hospital, and the small guest house in Kensington, from which they had for several years derived a bare living, had to be given up as the invalid required constant nursing by her sister. At present one old-age pension (10/-) and 12/6 from a charity is their only income, which is wholly inadequate. Their struggle is gallant but pitiful, for the pride, which only too often prevents gentlefolk from asking for help until at starvation's door, has blinded their neighbours to the real extent of their misery. Please send us £13, that we may continue the 5/- weekly we have been giving these two sad sisters.

IN THE CITY

BY THE CITY EDITOR

MEMBERS of the London Stock Exchange have been experiencing a particularly lean time. Their year ends in March. Unless business expands a good deal over the next four months most firms, whether brokers or jobbers, will show losses instead of profits this year.

It is generally known that many firms, large and small, have been unable to cover their office rents for months past. Still members are accustomed to take the rough with the smooth. They naturally hope for better times. Now and again there is a gleam of hope.

More often than not this disappears under the clouds of adverse political conditions on the Continent of Europe. The recent news of the Anglo-American Trade Pact brought definite encouragement to markets, but it proved short-lived. It is highly probable, however, that as time goes on the friendly relationship between the English-speaking countries will have a material effect upon trade.

There has been speculative buying of various Lancashire textile shares. Many such issues are to-day standing at prices which may be described as "option money." Bleachers £1 ordinary are about 3/6 with Bradford Dyers around the same price. In fact, prices for the shares of textile companies, which some years ago were financially strong and paying good dividends, are now at rubbish prices.

It will naturally take a long time before shares holders in such concerns can again participate in dividends under the most favourable trade conditions. Many of the companies will probably have to reorganise before they are again financially strong. Better trade with America will help, but it must be remembered that we have lost very good trade with China. I am of the opinion that those buying textile shares will have to wait a long while for any substantial return.

I believe there is more scope in other directions. I have previously drawn attention to engineering shares. That section of markets has been tolerably good. Reports and dividend statements coming along indicate continued prosperity. Many companies are able to say that they have work on hand to keep them fully employed for at least two years.

A share which I regard as having very reasonable prospects is Burnell & Co. 5/- ordinary. This share can be bought around 11/6. The company is of old standing and has a good dividend record except for the world depression years. In the last three or four years, distinct progress has been made.

The company manufactures galvanised sheets, the demand for which is very keen. It paid a 10 per cent. and a 5 per cent. cash bonus for the year to December, 1936. Dividend for 1937 was 15 per cent. and a 5 per cent. cash bonus making 20 per cent. in all. Earnings were about 66 per cent. on the ordinary. Distributions in recent years have been most conservative.

The report for the current year will probably be available before the end of January. I find market dealers very confident that the total distribution will not be less than 20 per cent. Many are, indeed, looking for more. Even on a 20 per cent. basis the shares look to me as worth picking up.

Reverting to the Anglo-American trade pact, there is to be a reduction in the duty on the imports of bicycles into the United States from this country. That should naturally benefit cycle manufacturers. In this connection, Wright Saddle Company 2/- ordinary standing around 3/- each have possibilities.

This company manufactures cycle saddles and general leather goods. It is believed that very good contracts were secured quite recently from some of the most important cycle manufacturing firms of the country. The saddle company paid two dividends totalling 12½ per cent. for the year to August 31st last.

SNAKES FROM THE STATES

"They come not single spies, but in battalions," wrote Shakespeare, and although he can hardly have been referring to the arrival of snakes at a London menagerie at the time, the remark may very well apply to present circumstances. America believes in doing things in a big way, and as the result of a statement by the London Zoo that they were rather short of rattlesnakes the authorities of the Philadelphia Zoo dispatched well over 100 of these reptiles to the "Old Country." Their arrival has proved a trifle embarrassing, for although they are very welcome, reptilian accommodation hardly extends to adequate quarters for so many. It is probable that some will be sold, and any *Field* reader who feels able to give one of these little fellows a nice kind home might be able to obtain one at a sale price.

FROM TEE TO GREEN

V.—The Mashies

By E. R. TIPPLE

THE old adage, "The man who can putt is a match for anyone," is frequently heard, but miraculous putting is not the slightest use if too many shots are wasted before the greens are reached. I think most golfers will agree that the man who is an adept at laying his approaches consistently near the hole is the one to be feared.

For most approach shots the mashies should be used. As the incomparable Bobby Jones has said, whenever possible it is better to "play a straightforward stroke without attempting any difficult cut or backspin shots." The two mashies are friendly clubs, and so for the majority of golfers are the most popular in the bag. They can be used for many varied shots and are not difficult to handle.

As the ball must pitch within a confined area accuracy is essential. The player has to be able to gauge not only the flight of the ball but the subsequent run. This is acquired by practice, and by nothing else, for each individual has his own capabilities so far as hitting the ball is concerned.

The powerful mashie, the No. 5, is used a great deal by the average player. Short holes measuring up to 150yds. can be played with it, but, as one famous professional has repeatedly said, never attempt to force a shot with it. If you think you cannot reach the green, take a No. 4 instead. When you are positive you can obtain the necessary distance you can concentrate on accuracy. When you press anything can happen—and the worst usually does.

The grip and stance should be the same as used for the irons, and, as with those clubs, care should be taken not to overswing. Cotton believes in keeping the face of the club at a right angle to the line of flight, turned neither in nor out. He says the left arm should be kept straight and the club taken back to just beyond the vertical position without bending the left arm. "Thus," he says, "you will be able to control your swing and therefore your shots." To hit down and through when playing a mashie is, of course, imperative, just as one must not help the loft of the club to do its work. As Cotton puts it: "It is far better left to the clubhead than your arms; just carry the club through the ball."

For a full shot with the No. 6 the player will have to stand nearer the ball than he does when using the No. 5, because the shaft is shorter. Many professionals have told me that a common mistake their pupils make is to reach for the ball. That is to say, they stand too far away and bend down, arms outstretched, so that they can put the club behind the ball as they address it. There is no need for me to say that such a method is wrong. Adopting it the player cannot use his weight to advantage, and, what is more important, at least two loops will appear in his swing.

The two mashies can be used for the short approach shots, and personally I think they are easier to control than the mashie-niblick. Particularly is this the case during the winter months when fairways are soggy and full of worm-casts. A pitch-shot from a bad, muddy lie calls for great skill and few of us can play it with any degree of confidence. A mashie with less loft and a smaller face is the best club, and with it you are less liable to make a destructive stroke. Some mis-hits with a mashie look quite good shots, and the results are rarely as bad as a mis-hit pitch.

Many experts call the pitch-and-run the dullest of all golf shots. It may be, but it is both simple and effective, and results count. The open champion suggests, "The general rule-of-thumb idea is, whenever possible, to pitch just on the edge of the green and let the ball run the rest." That advice is sound and should always be remembered. The club should be held with a short grip, wrists firm and the feet fairly close together. It is generally agreed that the length of the back swing is determined by the length of the shot to be played.

Some experts say the ball should be at a point midway between the two feet, others believe that it should be nearer the right foot. The individual can choose for himself which method he adopts. I have noticed that the leading professionals all turn more towards the hole in the address, stance open, and there is little weight movement.

The pitch-and-run shot must be played firmly. Any slackness is fatal. Walter Hagen, the greatest exponent of the art of turning three shots into two, always made a habit of keeping the blade of his club pointing in the desired line; he never turned the head on the backswing. And he always gave the ball a decisive blow. Whatever else you forget, be firm—firm grip, firm wrists and a firm short swing.

When approaching a green it is essential to make up your mind what kind of shot you will play and where you want the ball to pitch. Remember that spot, and concentrate on it, forgetting where the flag is and what the green is like. Study the nature of the ground. A soft patch will prevent the ball running on as planned. A little care before the shot is played will save many of those approaches that finish well short of the objective. Always try to get a clear mental picture of the stroke you want to play.

R. A. Whitcombe suggests a helpful plan for approach shots. Imagine "the flag as being the centre of a circle and make up your mind to get the ball into the circle . . . and as your confidence grows with success so can you decrease the size of the circle." When playing a pitch-and-run he agrees with Hagen in believing that the club face "should be left-turned towards the target all the way on the backswing by the simple expedient of not letting the forearms turn outwards away from the line of flight . . . the club must not be snatched up towards the sky. It should be taken back quite slowly and kept as parallel with the ground as the natural bend of the right wrist allows."

Particularly in a wind is the pitch-and-run a useful shot. When winning the Open Championship in the gale at Sandwich Whitcombe, hole after hole, saved valuable strokes by laying his approaches close to the flag. It was an object-lesson to watch him. And all golfers can do likewise if they take the trouble to practise these shots and learn the correct method of playing them. I am convinced that we are apt to make matters more difficult for ourselves by attempting trick shots instead of playing a simple straightforward pitch-and-run. Always select the easiest shot and the easiest club with which to play it.

Furthermore, most golfers would be wise if they did not use such a variety of clubs for the short game. Whitcombe, whose views command respect, says, "Until you are much advanced and have very definite ideas of your own about clubs, I recommend you to play all your short game with a No. 6. I do myself, and am quite certain that by sticking to the one club I'm far better off than trying to employ a variety of clubs. There are some very good 'chippers' on the market, but they all mean more clubs in your bag and more clubs to learn to play with." That is sheer commonsense; no wonder he has called his new book, from which I have taken the quotation, *Golf's No Mystery!*

IN TOUCH

'Varsity Match Prospects

THREE days more and the stands of Twickenham will hold the largest crowd so far this season, for Tuesday brings with it the 'Varsity match. How a large proportion of the crowd manage to leave their offices on a mid-week-day I do not pretend to know, unless there is a mass slaughter of relatives over the previous week-end.

The 'Varsity match always brings a large crowd and great enthusiasm regardless of both the weather and the form of the contending teams. What sort of Rugby football we are going to see on Tuesday is open to question, though I fear that, in all probability, it will be bad.

A few weeks ago both Oxford and Cambridge were playing very indifferent football. Their packs were pitiful, and those behind them were very similar—the 'Varsity match was going to be a "flop." Players came and went, others were crocked, and everything appeared discouragingly embryonic. Indeed, the only really consistent players seemed to be the full backs. K. I. Geddes (Loretto and Caius) showed himself to be a ready-made back right from the start, and the Oxford captain, H. D. Freakes (Rhodes University College, S.A. and Magdalen), although out of the game at the time owing to an injury, was well tried in the past and known to be absolutely sound when the time came.

A fortnight ago Oxford played the Harlequins at Twickenham, and it proved a dismal match, though at times there were brilliant patches, notably R. M. Marshall's (Giggleswick and Trinity) grand dash down the field in all his old glory. Against such things as this, however, have to be set the painfully numerous occasions when the wing forwards, H. H. Pennington (Upholland G.S. and St. Edmund Hall) and I. W. Sutherland (Merchant Taylors and Magdalen), found their way off-side. To infringe as often as this suggests a lack of real shoving in the scrum as well as a contravention of the laws.

Freakes, of course, played as well as ever, and I. H. Watts (Sutton Valence and St. Peter's Hall) took some queer passes from the scrum-half remarkably well, but he was beaten by his opposite number more often than not as the game progressed, and, on the whole, the game was unintelligent, or to use a phrase I overheard, what was needed was "a bit more Balliol."

After it was over, a well-known authority remarked that, in his opinion, neither University deserved to play in the 'Varsity match. All the same, I should have chosen Oxford as the probable winners had a choice to be made. To my way of thinking, their forwards were better than those of their opponents, and in this, subsequent events appear to have proved me correct.

Last week Oxford played their match against Major Stanley's team and won handsomely by scoring two goals and two tries to one penalty goal and one try. Now Major Stanley's team was a nut of undoubted toughness, looking more like a united international side than anything else—Davies, Obolensky, Candler, Dick, Young were typical of the whole team.

Frankly, I thought Oxford were going to receive a terrible hiding, but they played a great game and quite deservedly won. It is significant that their forward play was of a very high standard, a standard which, if it comes forth on December 6th, will undoubtedly rout the enemy. In the tight they were generally out-pushed, and it was in the loose that they excelled. R. M. Marshall, probably the finest forward in the game to-day, was a tower of strength, and so, too, strangely enough, was H. H. Pennington, though he still does not understand the off-side rule it would seem.

Last Saturday Oxford again played well and beat the London Scottish by two tries to nothing; the Light Blues, however, played the United Services at Cambridge and lost by three penalty goals and a try to three goals and a try in a game which would have made an angel weep. Even the usually imperturbable Geddes was off form, while the backs fumbled their passes in a most disturbing manner. The tackling was bad too, and if it does not improve on the great day Cambridge will soon be in trouble with such persons as Marshall, Watts and Pennington.

If—and what a lot that little word implies—Oxford produce current form at the 'Varsity match, they are bound to win, but they are a mercurial team and to dogmatise is a risky business at best.

The game will be a high scoring one I think, and is likely to produce plenty of excitement even if science is somewhat lacking.

I will write no more. Time must now prove whether I be a prophet false or true. L. N. R.

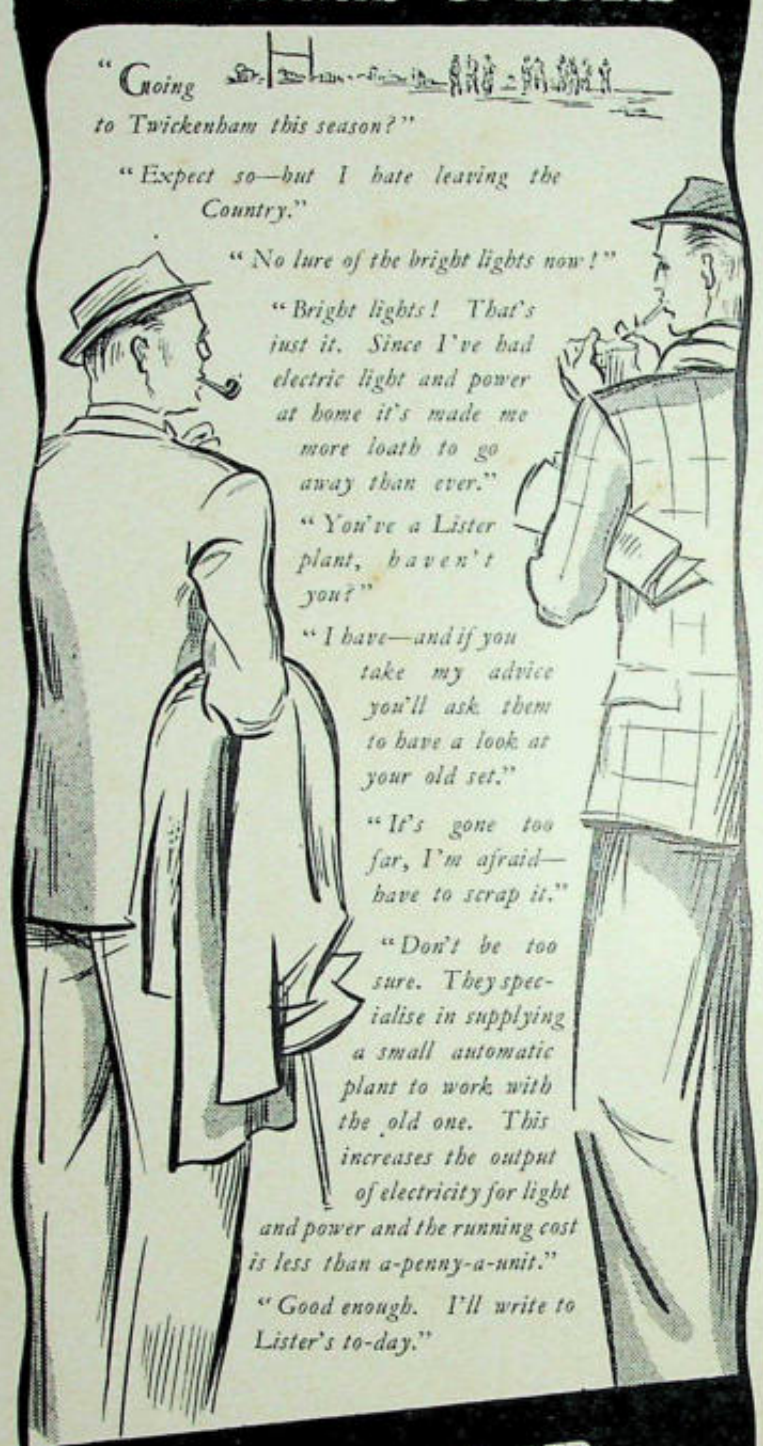
Water & Electricity
IN THE COUNTRY - BY LISTER'S



"Going to Twickenham this season?"

"Expect so—but I hate leaving the Country."

"No lure of the bright lights now!"

"Bright lights! That's just it. Since I've had electric light and power at home it's made me more loath to go away than ever."

"You've a Lister plant, haven't you?"

"I have—and if you take my advice you'll ask them to have a look at your old set."

"It's gone too far, I'm afraid—have to scrap it."

"Don't be too sure. They specialise in supplying a small automatic plant to work with the old one. This increases the output of electricity for light and power and the running cost is less than a-penny-a-unit."

"Good enough. I'll write to Lister's to-day."

THE TULIP GARDEN AT ABBEY CHASE

The Country House

TULIP PLANTING TIME

The Glory of the Spring Display

By ELEANOUR SINCLAIR ROHDE

TULIPS are amongst the few bulbs that should be planted as late as possible in autumn, and one well-known Tulip expert says that the ideal date is the last day of the year. In most gardens, however, May-flowering kinds are put in in late November or early December. The April-flowering kinds can be planted at this time also, but they are usually put in rather earlier. The drawback to the April-flowering kinds is that on very heavy or very poor soils they rarely do well after their first year.

The most charming effect I saw last season with the April-flowering kinds was in a small garden where they were massed in mixed colours with an edging of Polyanthus, also in mixed colours, and Forget-me-nots alternating with the Polyanthus. The effect was suggestive of a Kate Greenaway picture. The May-flowering kinds also look best in mixed colours, but I think that in a large spring garden the best effect is obtained by having a central bed with Tulips all of one colour, with a good carpeting and edging, and the surrounding beds with the Tulips in mixed colours. For the central bed the Tulips could be associated with Wallflowers in mixed colours and surrounded with an edging of *Dicentra formosa*. I cannot imagine why the last named is not more commonly used as an edging for spring, for it is in flower from April till well into July, and the pretty feathery foliage is then an effective edging for the bedding-out plants, such as Antirrhinums, that usually succeed Wallflowers.

This *Dicentra* is not suited to heavy soils nor very bleak parts. Pansies or Violas make a delightful edging for a Tulip bed, but they only look effective in a good broad edging, say 18in. broad. For instance, a bed of Pride of Harlem Tulips with a carpeting of a fine tall Forget-me-not such as Royal Blue, and an edging of Pansies or Violas in mixed colours, would be a lovely display of colour. Blue or mauve Violas always look well with cherry or rich pink Tulips, and one of the best blue Violas is Pickering Blue.

The addition of Pheasants Eye Narcissi to a bed of Tulips and Wallflowers is invariably good, because the Narcissi give just the necessary touch of white to lighten the effect. Without a little white the most gorgeous mixtures of colours are apt to look heavy. This year I am planting a large bed for spring effect with Pride of Harlem Tulips (to my thinking, the richest and loveliest of the cherry-coloured kinds), associated with Wallflowers in mixed colours, with Pheasants Eye Narcissi in small clumps at intervals of 3ft., and with an edging of Violas in mixed colours, Forget-me-nots and Double Daisies.

The modern demand to have everything in flower at the earliest possible date is responsible for a good deal of trouble with various Tulip diseases. Cottagers in old days planted their Tulips deeply and left them for years, with the result that the bulbs worked themselves down to about 2ft. The plants did not flower so early, but that worried no one in those placid times, and there was little or no disease. May-flowering Tulips ought to be planted quite 6in. deep. The best manure for them is bone meal, allowing 2oz. to every square yard. To secure first-rate Tulips it is of the utmost importance, as soon as the leaves show through, to keep the ground round them well hoed. The difference between a bed that has been kept aerated and one that has been neglected in this respect is remarkable. It is not easy to hoe between Tulips inter-planted with other flowers such as Forget-me-nots, but with care it can be done. I do the job with a small hand-fork. Laborious, perhaps, but it is worth the trouble.

The Darwin and Cottage Tulips are the glory of the spring display, and if it is possible to plant them with a background of Apple trees the effect is enchanting, especially with a thick border of Royal Blue Forget-me-nots in the foreground. The Dutch Tulips are grand, too, and some of them have the additional virtue of scent. Broken or Rembrandt Tulips are still a craze with some people simply because they figure so conspicuously in pictures by the old Dutch masters, but these Tulips are in reality diseased and never very strong growers. Parrot Tulips invariably attract considerable attention at shows, but they should be avoided for growing in the open. They are weak stemmed and can stand hardly any wind, and need a very sheltered spot. The right way to grow them is in hanging baskets. They droop perfectly over the sides, and their gorgeous colouring can then be seen to perfection. Unlike so many flowers grown in hanging baskets, they require no artificial heat, and make a delightful effect in the covered ways or verandahs that are so marked a feature of modern houses.

Tulips are accommodating plants, and succeed in almost any soil, but it is not sufficiently realised that they are greedy feeders. Here again we learn from the old-fashioned cottagers, who always enjoyed feeding their plants. They trenched deeply, put natural manure in the bottom spit, and then left well alone for perhaps 20 years. On no account must manure, even if well decayed, come in contact with the bulbs. It is not cold that affects the bulbs adversely, but cold and damp combined in the long bleak spells of early spring. This type of weather encourages the fungus of Tulip fire, and it is the plants that have been planted too early, and consequently appear too early above the surface soil, that suffer. From March onwards a careful watch has to be kept, and if the characteristic grey mould appears on any leaf the plant should be lifted and destroyed. Tulips should not be planted in infected soil for three years. As usual, it is a case of prevention being better than cure, and if the bulbs are put in at the right depth and not planted too early there should be no trouble.

TREE HOLE BLASTING

Some Safe Methods

MOST operations on fruit farms have been speeded up in order to save time and money, for although the farm worker still receives a comparatively poor wage in this country the labour bill on most farms is usually very heavy. The planting of new trees, however, still entails a great deal of expense for fruit growers. Apart from the cost of the young trees, a good deal of the initial outlay is accounted for by the labour bill, most of which is connected with the actual digging out of the planting holes.

On some soils this is, of course, more expensive than on others. On land which is very wet and heavy in fact it is not advisable to dig holes at all. The roots of the young trees should be spread on the surface of the soil and earth heaped up over them.

But on those soils overlying chalk it is impossible to dig deeply enough without the use of a crowbar, for although in some cases the young trees roots are not very long, the subsoil must be broken up to a sufficient depth to allow for the penetration of the roots later on.

On a deep light soil the cost of digging holes for one- or two-year-old bush trees is approximately 5/- per 100. These trees are usually planted 12ft. apart each way, so that the number required per acre would be 300, bringing the cost of hole digging to 15/- per acre. It is obvious that the same item on a soil with a rocky subsoil could hardly be less than £2 per acre, and would probably be much more.

Explosives have been used for some years to blow up the stumps and roots of old trees, and there seems no reason why this method should not be adopted more extensively for the opening up of holes for new trees.

There is bound to be a certain amount of prejudice against it, however, partly because it is new—and farmers are apt to be suspicious of new methods (although they are improving in this respect since they have been in touch with the research stations and the county advisory officers)—and partly because one or two deaths have occurred as the result of explosives being used carelessly by inexperienced people.

Several years ago a fruit grower was killed while blowing up an old tree stump, but it was proved that he had put his box of fuses, detonators and explosives too near the holes which he was charging. Also, he was using fuses with detonators already fixed, and probably some of the spray of the ignited gunpowder from the fuse blew into the box on to the detonators, and so caused the explosion.

There should be no danger so long as the detonators or capped fuses are kept away from the explosives in a separate closed box, and if the explosives are not anywhere near when the actual lighting is taking place.

When planting trees up to three years old a sufficiently large hole can be made as follows. Insert a crowbar 18in. into the soil, and into the hole thus made push 2oz. of gelignite. This is usually sold in 4oz. cartridges and can quite safely be cut in half with an ordinary knife.

The operation is quick, and once the men become accustomed to using the material their speed will increase. Those who have tried it say that it is possible to blast 30 holes per hour, and the cost of 2oz. of gelignite is only 1½d.

Apart from the saving in labour, this method of taking out the holes can easily make all the difference between a good and bad start for young trees. Often the soil and weather conditions are just right for a few days only and the trees are waiting to go in. If there are a large number to be planted it might take several weeks to get out the holes, and by the time this is finished the weather might have changed—the soil might be too wet or might have frozen hard. Thus, planting would have to be delayed still longer until conditions were suitable again.

If, however, the holes could be blasted out, they would be ready in a few days, and the young trees could all be planted during the spell of good weather. It seems, then, that even if this method were not cheaper, it would be worth considering because of being able to get the job done at the right time.

It may be that this new method of hole blasting will also be of value to those who are responsible for reafforestation. Very often young forest trees have to be planted up mountainous hillsides where there is little soil. The blasting method would come in very useful in such conditions.

Growers who have carried out tree hole blasting are delighted with the idea, and providing they never allow familiarity to breed contempt the scheme is quite safe, but the usual warning regarding special risks must be given concerning a workman's compensation policy. PEVERIL FARTHING.

DESIGNING A WILD GARDEN

The Best Types of Trees, Shrubs and Plants

DO not the very words "wild garden" seem to imply a garden that is easily made, easy to look after and cheap in upkeep? It certainly is by no means as expensive to care for as more formal parts of the garden, but it is not as easily made as it seems.

The plants selected should be those which are at their best when growing naturally, shrubs which need little or no pruning, and herbaceous plants which need no protection during the winter. The plants grown in wild gardens are not always those which grow wild naturally in England, and if left to themselves they may encroach or be encroached upon. Very often rampant growers such as nettles, thistles, brambles, docks, &c., cause havoc in the wild garden, and must be kept down in consequence. They are, unfortunately, easily introduced by seeds, and will increase rapidly if steps are not taken to control them.

The design of the garden will be largely influenced by the trees which are already there, and by any natural slopes or depressions. A river or stream running through the garden will greatly increase its possibilities, since a larger variety of plants can be used. More interest may be created by the use of overhanging trees to produce reflections in the water. It may, of course, be necessary to remove some of the trees already in existence, as well as some of the undergrowth, but this must be done with care, for it will affect the light and shade of the woodland. Some shrubs, too, may be required to act as screens or windbreaks.

The paths should wind easily in large curves, trees or clumps of bushes being on the insides of the curves. The sense of space and distance may be increased by the use of false perspective. For instance, part of the garden, or even of the surrounding countryside, may be viewed between an avenue of trees or bushes, and if these are planted nearer together at the far end of the avenue it will appear to be much longer than it really is.

In the moderate-sized wild garden it is not advisable to plant too many large trees, and certainly not many of those which cause such a dense shade that few plants can live beneath them—*e.g.*, beech, and many of the conifers, such as cedars.

The silver birch is one of the best, though it does not like chalky soils. The whole appearance of the tree is graceful, the leaves are small and change to a beautiful golden-yellow colour in the autumn, and the bark is streaked with patches of silvery-white. These trunks and the dark tracery of twigs seen against a dull wintery sky have a strange unreal effect. Maples, sycamores and oaks colour well in the autumn, the leaves of the oak often remaining on the trees until well after Christmas.

Trees with showy flowers should also be included, pink, white and red hawthorns, horse chestnuts, and mountain ash, as well as some of the decorative cherries, plums and apples. The hawthorns and mountain ash, having red berries in autumn and winter, are well worth introducing.

Some dark-leaved evergreens should be planted for contrasts with the golden-leaved and glaucous varieties, as they will give colour in winter. Holly, with yellow or red berries, may be obtained with green or variegated leaves, while there is a golden cupressus, the variety *Marcocarpa lutea*, and a golden Scots pine, *Pinus sylvestris aurea*. The latter has leaves of a dull green during the summer, but in autumn these begin to turn yellow until they are the colour of polished brass. Among trees with bluish-grey leaves are *Abies lowiana glauca*, *A. nobilis glauca* and *A. pinsapo glauca*. These are but a few: there are many others from which a selection may be made.

The selection of the kinds of shrubs to grow is difficult because there are so many. Gorse, broom and several berberis species are useful as screens or windbreaks, and are seen to best advantage if they are planted so that they get plenty of sun to show up their bright flowers.

Many rose species are at their best if allowed to grow naturally. *Rosa Moyesii* is undoubtedly the best, with its flowers of a peculiar shade of red, followed by large, red bottle-shaped fruits. *R. hispida*, *R. hugonis and R. xanthina* have yellow flowers.

Such shrubs as Rhododendrons, Azaleas and Ericas may be planted among other specimens, but if possible a special bank should be set aside for them, since they enjoy a soil rich in leaf mould and peat more perhaps than most of the other plants. Naturally it is easier to cater for their preferences if they are all planted together. This bank will be most effective if it can be so placed that it can be seen from a distance. The common *Rhododendron ponticum* is most effective when planted in a mass. Some of the coloured hybrids, however, need careful choosing and are better placed singly.

Some of the true climbers are at home in the wild garden and should be allowed to follow their natural habits. Nothing is more lovely than a mass of purple or white clematis blossoms seen against the dark background of a conifer. Honeysuckle, too, likes to scramble over other shrubs, and dead tree stumps may be clothed with one of these climbers.

No wild garden is complete without plenty of ferns, which give a very natural "woodland" effect and make a good background for flowers. If there is a stream, ferns which prefer damp conditions should be planted in drifts along the banks. There are, however, a number of species which will grow quite well in rather dry conditions, providing they get a certain amount of shade from the sun.

It is a good plan to plant some bulbs in clumps between drifts of ferns. Daffodils are best for this purpose, since they will be in flower just at the time when the fresh green fronds of the ferns are beginning to unfold. Other spring bulbs may be planted in large drifts. For instance, winter Aconites and

DRIFTS OF PRIMROSE AT THE STREAMSIDE IN THE WILD GARDEN AT TRENT PARK

Snowdrops are out about the same time, and may be planted together so as to have splashes of gold and white. Bluebells are effective when massed under trees, and arranged so that some are in shade and some in the sunlight. Scillas, Chionodoxas and Crocus may be grouped on banks or beneath trees, sometimes mixed with primroses and violets. Lilies-of-the-valley are quite easy to establish, and enjoy being left to themselves. Here and there Daffodil and Narcissus bulbs should be planted singly.

Spring is not the only time for bulbs. There are also the autumn Crocuses, Colchicums and Sternbergias, which flower in October. Some may object to the idea of Crocuses in autumn, and say that it is wrong for them to be in flower when "leaves are falling," but to the true gardener they are as much a part of the autumn as daffodils are of the spring. There are a number of species which may be grown. *Crocus speciosus* is violet and orange, *C. zonatus* is rosy-mauve, with a golden centre, and *C. pulchellus* is lilac-blue.

The Colchicums prefer rather damper conditions, and may be planted on the banks of a stream. *C. autumnale* has flowers of a soft shell pink, lilac white or pale wine colour; and *C. giganteum* is a rosy-pink. Some of the dwarf hardy Cyclamens are easy to grow on partially-shaded banks. *C. Neapolitanum* flowers in autumn, and is pink or white, while an easy spring flowering variety is *C. coum*, with pinkish-crimson flowers.

The best types of herbaceous flowers for the wild garden are those hardy perennials which do not object to partial shade or annuals and biennials which propagate themselves easily from seeds. These include the hardy Cranesbills, plants which will tolerate a semi-wild life with little or no attention, and there are several varieties—*e.g.*, *Geranium ibericum*, *G. pratense*, &c.

W. E. SHEWELL COOPER.

A.R.P. FOR DOGS—II.

IN the event of war, it is reasonably certain that the earlier types of poison gas as used in the war of 1914–18 will be replaced with new and more lethal gases. By this I do not suggest that vesicant or mustard gas, for instance, is now deemed out of date or inefficient. Far be it from that, for vesicant gas only appeared in 1917 as a result of much research, and is an extraordinarily persistent liquid agent. It is probable, however, that some of the first lung irritants used in the last war, such as chlorine, chloropicrine and a few others, will not be used again, as their persistency is slight, whilst their concentration needs to be heavy if they are to be at all efficient.

Of the innumerable chemical agents available it is more probable that those used will be diphenylchlorarsine, a very fine powder which can penetrate an ordinary charcoal respirator, causing acute irritation of the eyes, nose and chest; ethyl dichlorarsine and diphenyleyanarsine, two more gases of the sternutator—chest irritant—group which were used only by the Germans during the last year of the Great War; hydrocyanic acid, which in high pressure is a deadly paralysant; phosgene, an old favourite of chemical warfare better known as prussic acid and obviously lethal, and finally the persistent vesicant or mustard gas.

I cannot in such space treat other gases which may be used, but it may be mentioned that activated powdered charcoal as at present used in gas-masks and filters will, in any case, absorb almost all of the known poison gases. The filters of the P.D.S.A. shelter which I described last week are of this type and as each shelter has two such filters, it is clear that they are extremely efficient. In addition to charcoal there are numerous other antidotes, including solutions of sodium thiosulphate and sodium carbonate, chloride of lime, &c., but, as I said earlier, activated powdered charcoal is undoubtedly the best for general purposes.

In the event of a sternutator like diphenylchlorarsine being used on a wide scale for attacks on Great Britain it would be advisable to prepare well beforehand by obtaining a quantity of cellulose, as small pads of this will prevent the finely-powdered fragments of this harmful agent penetrating the common charcoal filter. Your chemist will be glad to advise you further on this point, no doubt, as it would be disastrous to "spoil the ship for a h'ap'orth of cellulose."

Another precaution I would advise taking well in advance is to purchase several tins of anti-gas ointment (No. 2) for use when a dog has been burnt from splashes of vesicant liquid gas. It is the capacity for causing really severe burns through the least contamination that makes this mustard gas so dangerous. Moreover, mustard gas is far more likely to be sprayed over here than on an actual front line of warfare, because being liquid it collects in puddles which may splash and burn pedestrians and their dogs, and if it becomes absorbed into the earth it will, in a favourable temperature, continue to give off a dangerous gas for weeks on end.

Last week, I recommended that in cases where too many dogs are maintained to find the P.D.S.A. medium or even large gas-proof shelter of sufficient size, that a separate room be allotted for the purpose of a gas-proof sanctuary. Since then, I have been asked why, in the event of the P.D.S.A. shelter not being convenient, dogs could not share the refuge room already set aside for the benefit of the occupiers? Frankly, I see no reason why dogs should not share a room with humans, as they would there be under one's eyes, so to speak, and therefore better behaved, but obviously their inclusion or exclusion is entirely dependent upon their number and the cubic area of the room.

If a refuge is theoretically sufficient to hold five humans with comfort, and you introduce during the warning time prior to an air attack, say, just two medium-sized dogs, then your theoretical sufficiency becomes an inadequacy instead, as two dogs of spaniel size will require as much breathing space as an adult human. Therefore, if you simply must bring your dogs with you into your communal refuge, count each two dogs as an extra full-grown person.

Three six-months or five two-months old puppies should be counted as one extra person. With cats it is almost a different matter as they need very little oxygen—these I would count as five cats, or ten or even a dozen small kittens to one human.

Remember, however, that whether your dogs are to be housed in a P.D.S.A. shelter, a refuge-room of their own, or to share your sanctuary, they should have a substantial bone or some of the larger biscuits to gnaw as a means towards quietude and contentment.

CANIS.

Performance and Comfort

In the new Armstrong Siddeley '16' the performance which has surprised the experts is combined with smoothness, silence and flexibility; while its well designed, spacious coachwork gives a new conception of restful motoring.

THE SMITHFIELD SHOW

"A Time to Build Up"

IT is impossible to avoid a comparison of the Smithfield Show, which opens at the Royal Agricultural Hall, Islington, on Monday with the Dairy Show, which was held at Earls Court some few weeks ago. For the Dairy Show was conducted under the threatening shadow of war, and it could not be maintained that the Smithfield Show will take place in circumstances of international tranquillity. How far these disturbing exterior elements affect these agricultural shows it is probably impossible to say, but it is certain that they have a very direct bearing on their nature, or rather, on their implications.

The Dairy Show was celebrating its Diamond Jubilee, and the Smithfield Club will, on the 17th of this month, celebrate its 140th anniversary. It is no less interesting to recall the many changes which have occurred since the first exhibition in 1799 than it is instructive to reflect on their meaning. For at the first show, which was held at Smithfield, there were four classes in all—two for steers and oxen and two for wether sheep. Some years later there were eleven classes for cattle, sheep and pigs. When the show was held in the Horse Bazaar in Baker Street, the numbers of classes had risen to fourteen, and in 1862, when the show was held in the Royal Agricultural Hall for the first time, there were 29 classes for cattle, seventeen for sheep and four for pigs. This year the classes reach the impressive figures of 58 for cattle, 35 for sheep, 34 for pigs and 15 carcass classes. It is satisfactory to see that a successful attempt to increase the pig entry has been made by the introduction of three classes for Essex pigs. The King will be the largest individual exhibitor, and is sending stock from Sandringham, Stoke Climsland and Windsor, and this show will, as in former years, be the final test for other contemporary fat-stock shows, including those at Norwich, Birmingham and Edinburgh.

This is a numerical record on which the Smithfield Club may well look back with a pardonable pride and satisfaction. Yet the real triumph lies elsewhere. In the early days of the show the age of the exhibited cattle was five or six years. Some ten years ago baby beeves of fifteen months were on view. How much money has been saved for the farmer, and incidentally for the consumer, by this growing insistence on early maturity, it is impossible to imagine. The evolution of a 6lb. joint is a commentary not only on the wholly peculiar week-end customs of the present age, but also on the laudable determination of farmers to humour them. If returning sanity, in the shape of peaceful habits, were ever to be restored, the position of farmers might be very awkward.

It is rightly held that one of the most valuable features of this show is the opportunity to see the cattle when they are alive and when they have been slaughtered. By this comparison it is possible to visualise what a satisfactory carcass should look like when it is alive—and more may be learnt from that comparison than might at first be supposed. The result cannot fail to impress on all buyers that home-bred is infinitely better than imported meat. Yet comparatively few buyers, taking into consideration the potential number, are present at this show, and a very large number of people will not have the advantage of this comparison. I cannot help but feel that sufficient steps are not taken to bring this truth home in a universal manner. Many buyers at present regard the appeal to purchase home-bred beef as a device simply to increase the prosperity of the home market, and, human like, assume that on that account imported meat is as good if not better. This is a problem on which fat stock producers would do well to ponder.

The beef industry as a whole is not to be classed among the many apparently hopeless aspects of modern agriculture. There are, it is true, difficulties in price and production, but they appear to be of a passing nature. It would be a good thing, from every point of view, if the number of beef cattle could be greatly increased, and not least from the international crisis aspect. An industry which is even moderately healthy can always be expanded with advantage, and it should never be forgotten that in the last war the supplies of home beef cattle ran out, and dairy cattle had to be slaughtered for food. It is certain that a food convoy would not be among the most difficult targets at which an enemy bomber might test its skill, and therefore every effort should be made to reduce imports to the minimum and to help the beef industry vastly to increase its output. So, an increased peaceful prosperity would have its advantages in time of war.

Agricultural machinery will occupy a large place in this year's show, and many improvements and new devices will be on exhibition. Yet one cannot but deplore, as at the Dairy Show, that so much of technical and industrial advantage should be quite beyond the reach of many farmers. The benefits to be gained, for example, from a tractor fitted with pneumatic tyres are incalculable, yet how many farmers have the capital to purchase one, or the confidence to risk it if they had? The innumerable machines which would do a great deal to increase the efficiency and to lessen the work of the fat-stock farmer must remain an ambition for the majority. This is a very serious position, as, in addition to these aspects of the question, the economy to be practised with these machines is not to be reckoned.

The increase in the beef industry which is so desirable is not to be brought about as an isolated section of farming, and it is on that account a thousand pities that the average farmer should be able to give the reply which the ancient cynic intended to his question: "What profit hath he that worketh in that wherein he laboureth?" The beef industry, and farming as a whole, can be expected to succeed only if sufficient men are on the farms to enable it to succeed. Yet no steps are being taken to stop the drift from the land, and not one farmer in ten would willingly allow his sons to work on his farm if they could possibly find any urban occupation. The machinery which has been devised, and which is on exhibition, is not to be understood in a moment, yet comparatively few steps have been taken to form instructional classes, and still fewer of these are compulsory. Nor is it possible to answer the new claim which is slowly, but inevitably, beginning to be made, that a farm labourer who is also a skilled engineer should receive a higher wage than his forerunner. It is true, of course, that his forerunner was equally skilled, but his knowledge was picked up in the school of actual experience and was in no way connected with the examination hall. Yet the question of increased rates of pay for such workers is far from being officially considered.

One of the most pleasant features of the Smithfield Show is the way in which the club realises the important duties of the stockmen. It has been recalled that even in 1840 oxen were brought to London by sea or by canal. Now, this transportation has become, like most other things, a question of time—a consideration which has done much to increase its efficiency. It is, however, a relief to know that these stockmen are more than excellent lorry drivers, for they have a competition of their own. Previous to the opening of the show they have an opportunity of judging the carcass class, and a comparison of their awards with those finally made by the judges does much to reassure those whose confidence in the modern farm labourer was waning.

I have before emphasised the importance of compelling a public interest in agriculture. The lessons of the crisis and the fears for the future have done much in this direction. One of the most valuable opportunities is provided by these agricultural shows, and the Smithfield Club is to be congratulated for realising that modern farming is beyond the grasp of all but those immediately concerned. They have, therefore, provided a competition in which competitors are to be invited to estimate the weight of a gigantic bullock, 6ft. high, 11ft. in girth and 12ft. long.

The importance of the Smithfield Show is twofold. It is a record of useful achievement in itself, but its wider implication consists in the fact that every effort should be made to take advantage of the measure of success which at present attends the industry to increase it to its fullest possible dimensions. It is, in fact, "a time to build up," and it is very much to be hoped that the show will be the occasion of an official realisation of this truth. CREAGHT.

The best Aberdeen Angus and best heifer in last year's show

"We intend to replace our iron-tyred carts with those of your make"

J. MASKELYNE. CHERRINGTON GRANGE, WELLINGTON, SHROPSHIRE.

TELEPHONE GREAT BOLAS 8.

Messrs. J.H. Jennings & Son Ltd.,

Dear Sirs,

I am writing to express my appreciation of the rubber-tyred cart you recently built for me.

The claims made for rubber, as opposed to iron tyres, we find to be fully justified. The rubber tyres, with ball-bearings, have made it possible for much larger loads to be hauled by one horse than could be attempted in the old-fashioned iron-tyred carts.

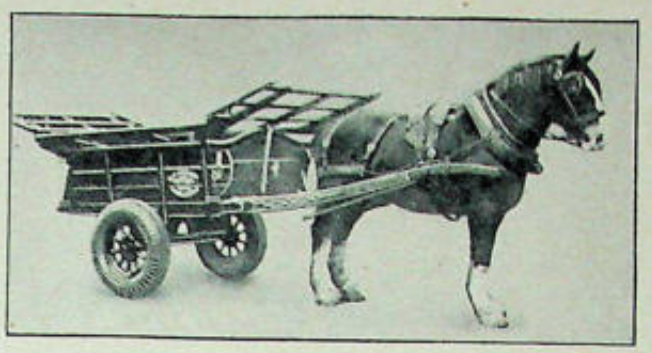
Neither on ploughed land nor grass do the tyres cut into the ground as do iron tyres. We are so pleased with the cart, that we intend to replace our other iron-tyred carts with those of your make.

Your cart-body is excellent, strong, capacious, and easily tipped. There is nothing about it to get out of order.

It has been much admired locally, and you will probably receive orders for several, from this district.

Yours faithfully,

J. Maskelyne



No claim was ever made by DUNLOP as to the greater economy and efficiency of DUNLOP Pneumatic Tyres and Wheels for horse-drawn vehicles, which has not been confirmed by users in all parts of the world.

Further endorsement—now a daily occurrence—is afforded by the accompanying letter from Mr. J. Maskelyne to Messrs. J. H. Jennings and Son Ltd., of Sandbach, Cheshire, who supplied him with his DUNLOP-equipped cart.

Effect these economies for yourself by following Mr. Maskelyne's example.

Full details and estimates on request.

DUNLOP are exhibiting at STAND No. 7 at the SMITHFIELD CLUB SHOW, December 5-9.

THE *Quality* TRACTOR THAT NEVER WEARS OUT!

AIR-COOLED ENGINES

Examples at the Smithfield Show

AIR-COOLED engines, ranging from 1 h.p. to 16 h.p., and offered at attractive prices, will be one of the exhibits of special interest at the Smithfield Show, which opens in the Agricultural Hall, Islington, on December 5th.

They are being shown by Messrs. R. A. Lister and Co., Ltd., of Dursley, Glos., who are exhibiting air-cooled engines at the show for the first time.

The value of the air-cooled engine has been conclusively proved by the experience of the United States, where the majority of small industrial engines in use to-day are air-cooled.

During recent years there has been a tendency in this country to replace radiator-cooled engines with air-cooled engines, but so far these have been available only in a very limited range.

The new Lister engines are produced in four sizes, three being single-cylinder engines varying in horse-power from one to seven, the fourth being a four-cylinder engine with a horse-power of from eight to sixteen.

Agricultural Items

Other new Lister lines of interest to the agriculturist at the show will include :

1. The Lister Grass Comb (self-cleaning harrow). A demonstration model will be working on the Lister stand, showing how well and effectively this tool can deal with grassland, and how well the tines clear themselves.

2. The Lister Market Garden Hoe, which was introduced for the first time at the summer shows, claims to be the only hoe which hoes between the plants in a row, as well as doing side hoeing and pull hoeing.

3. The Lister Tractor Trailer Mower, which has not yet made its appearance on the general market in this country. It has been tried out for two seasons under very strenuous conditions.

4. The Lister-Cockshutt Tractor Plough, which has earned for itself the title of "the plough that is a furrow lighter." This tractor plough has always had a name for lightness and strength. It is coming more and more to the fore as the use of light tractors tends to increase.

A display of Diesel and petrol engines, the former fitted with Listard cylinder blocks or liners ; cream-separators with stainless steel bowl plates ; pumps, and sheep-shearing and horse-clipping machinery will also be included on the stand.

SEED POTATOES

IT is a somewhat remarkable fact that about 90 per cent. of the potatoes acreage grown in Great Britain is still planted with varieties which have been on the market for 20 years or more.

Potato growers, who are considering the purchase of seed for next year's planting, will be well advised to take into account the possible advantage of growing some of the newer kinds. A number of the old varieties not only show faults such as poor shape, indifferent cooking quality and proneness to second growth, but are susceptible to wart disease.

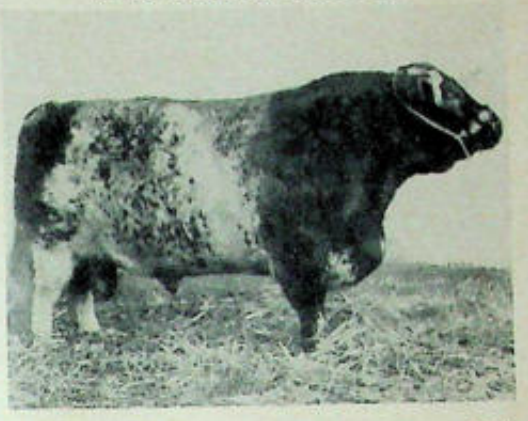
The National Institute of Agricultural Botany has, for the last eighteen years, been carrying out careful trials of all the new types as they have appeared during this period, full attention being paid to yield, cooking quality and other desirable characteristics. No new variety is recommended by them which is not immune from wart disease and satisfactory in other ways.

The institute issues a leaflet, revised from time to time, describing the best of these newer types and making recommendations as to which of the older varieties they might profitably replace. A new edition of this leaflet is expected to appear in a few weeks' time. As, however, some growers are requiring advance information at the present time for guidance in making their purchases of seed, the following notes on some of the newer varieties, based on the fuller information which will be contained in the leaflet, are given.

In the first early class Arran Pilot is confidently recommended as a substitute for Epicure, Ninety-fold, Duke of York and Sharpe's Express. The flesh and skin are white ; the tubers are of an excellent kidney shape and not prone to cracking or second growth ; the eyes are shallow and cooking quality good. It is a good cropper and early bulker. It is, however, somewhat susceptible to virus disease, and it is essential to obtain healthy seed. To maintain healthy seed in England, growers should obtain details of the work carried out by the National Institute of Agricultural Botany at Ormskirk on the production of reasonably virus-free seed in Lancashire.

Doon Early is recommended as a substitute for Epicure. It has a white skin and white flesh and is blunt oval in form. It bulks several days earlier than any other variety in commerce and is an eminently suitable variety to grow for the opening of the first-early trade. Dunbar Rover, a recent introduction suitable for lifting in mid-season, can be recommended to replace the old variety British Queen.

A BOVRIL CHAMPION



The magnificent bull illustrated above, "Esther Bletchley," is a typical example of the quality which is used to improve the herds of Shorthorns that range the vast Bovril pastures. For more than 50 years the Bovril Company has been improving the quality of its stock, and many show champions are imported into the herds.

The Bovril Estates comprise more than 10,000,000 acres, including those situated in Australia and the Argentine, and the paddocks range from 1,000 to 50,000 acres in area. There are many single enclosures in which it takes a day to round up the cattle.

New & Better Methods on the Land

may be learned from the Bulletins of the Ministry of Agriculture

British Breeds of Live Stock
The Ministry's Handbook gives a general account of the principal characteristics of British breeds of horses, cattle, sheep, pigs and goats, with a brief history of their origin, and some of the principal animals which have formed the foundation stock of the pedigree animals of the present day. Other valuable information is also included relating to Shows, Breed Societies, &c. No. 86, 6th Edition. 4s. 6d. (4s. 8d.)

Weeds
Three companion Bulletins deal comprehensively with an ever-present and often urgent agricultural problem
WEEDS OF GRASS LAND—No. 43 5s. (5s. 6d.)
WEEDS OF ARABLE LAND—No. 108 4s. (4s. 6d.)
POISONOUS PLANTS ON THE FARM—No. 75 2s. (2s. 2d.)

Pig Keeping
A complete guide to capital requirements, breeds, feeding, breeding and maintenance. No. 32 2s. (2s. 2d.)

Some Diseases of Farm Animals
Valuable live stock may often be saved if farmers are able to recognise the symptoms and are aware of methods of controlling common diseases, over 30 of which are described in Bulletin No. 1, 8th Edition. 2s. (2s. 3d.)

All prices are net. Those in brackets include postage.

Follow the progress of Research in Agriculture in the attractive monthly JOURNAL OF THE MINISTRY OF AGRICULTURE. Each Issue 96 pages, illustrated, with contributions from recognised authorities on the land. It will be sent to you each month throughout 1939 for six shillings post free.

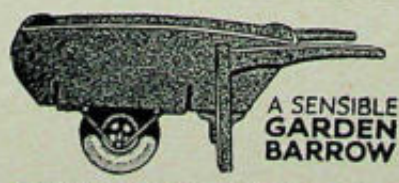
The WHUNDER



A SENSIBLE GARDEN BARROW

Don't waste energy and time by using a primitive type of garden barrow. Loads carried in the "WHUNDER" BARROW are so well balanced on the centred wheel that there is no strain at all on shoulders and back. The pneumatic tyred wheel ensures speed, silence and safety to lawns. Loads up to 2 cwt. can be handled with twice the speed of ordinary barrows, and with a fraction of the effort.

COMFORT IN WINTER MOTORING

Sensible Extras Which Are More Than Mere Luxuries

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve* 300 *m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

ABOUT this time last year I recall writing in these columns concerning preparations for winter motoring; but this, unfortunately, was not until after I had been forced to walk a couple of miles uphill, as a result of being caught on icy roads without wheel chains. After that unenviable experience I resolved not to be in such a predicament again if it could be prevented by a little foresight. Now my chains are ready in the car locker awaiting the first really bad spell.

If preparations are made I believe winter motoring can be divested quickly of its terrors now that so many really useful accessories are marketed at reasonable prices.

Many motorists never carry wheel chains perhaps on the score that they are too bulky or because business rarely takes them driving far out of town. Nevertheless, some sort of precautions should be taken on slippery roads for the safety of others, and to avoid inconvenience to fellow motorists. For occasional light use I notice that the John Bull concern manufacture emergency wheel grips of toughened rubber which can be strapped around the wheel at regular intervals. While not designed for prolonged wear like heavy chains, they will overcome immediate difficulties, prevent bogging and wheel spin. For the small car owner these grips should prove invaluable, since they are both light and portable.

For the motorist who must drive through the country during the winter, however, chains are still the thing, since they are made to withstand exceedingly rough usage in any conditions.

At this time of the year it is a good plan to have the brakes examined to see they are not operating unevenly, causing the car to pull up crabwise and probably to skid. On slippery surfaces badly adjusted brakes are a menace to drivers and pedestrians alike.

Interior comfort can be improved upon by the installation of one of the many car heaters now available. These are easily fitted to any car not specially constructed to take such equipment, and can be mounted either beneath the dashboard or in the rear compartment. The heater is in circuit with the water-cooling system (in the majority of cases) and a small electric fan is situated behind a small radiator which serves to circulate the warm air inside the car. As well as warming the atmosphere, these heaters also obviate the use of any de-frosting or de-misting apparatus, for the heated current of air can be deflected on to the windscreen thus preventing interior condensation and frost formation. Another commendable feature is that during the summer the water supply to the heater can be shut off and the fan used as a cool air circulator. Current consumed is remarkably low while warm air is available within a few minutes of starting up.

Prices are from about £5, and fitting is not an expensive undertaking, since all the connections are supplied, and it is only necessary to drill two holes in the bulkhead of the car. In a large saloon such heaters are particularly useful, because in cold weather the rear seat passengers do not look forward to long journeys in comparatively frigid atmosphere, no matter how well they are equipped with rugs and coats. Incidentally, the fact that heaters afford clear vision does, to my mind, take a great burden from the shoulders of the driver, relieving him from anxious moments and considerable eye strain.

I cannot stress too strongly the necessity for maintaining the batteries correctly throughout the winter. They are subjected to a vast amount of additional work, while the shortness of the day hardly gives an adequate chance of charging the batteries to meet new demands. Lights are used far more frequently, extra equipment means more work for the battery, while the starter makes the heaviest drain since starting is usually more difficult in cold weather. However, it is a simple matter to keep the batteries in good fettle if a home charging unit is employed—the trickle-charge type being particularly useful.

These work from the mains, are not expensive to purchase, while the current they consume is almost negligible. Most modern cars have the batteries in an accessible position, and connections are made in a matter of seconds and with complete safety. In the long run, these home-charging units save money, because batteries that are constantly run down deteriorate rapidly and replacements or repairs are apt to be quite expensive. Furthermore, anxiety about starting and leaving the lights on while waiting becomes non-existent.

Sump heaters, both electrical and oil types, are sufficiently well known, so that I need not refer to them here. Their advantages are manifold, and I regard a safe heater as an excellent investment.

A device marketed by the S.U. Carburettor people this year is an interesting development in the use of upper cylinder lubricant, the value of which is enhanced in the cold weather. When the engine is started this accessory—which is attached to the induction—provides an immediate supply of lubricant and ensures that during those first few critical minutes after starting when the cylinder walls lack oil and the necessary rich mixture further complicates things, excessive wear will not take place. When a certain temperature is reached the supply of lubricant is automatically shut off. This can easily be fitted to existing cars, although several manufacturers this year supply it as standard equipment.

The expenditure of a few pounds on various sensible "extras" puts winter motoring in a new light and makes a marked difference to the amount of enjoyment and satisfaction derived from a car.

Of the demands I make from my motoring, two in particular stand head and shoulders above the rest. They are safety and comfort—which, quite often, are interdependent. Sensible accessories increase both these factors immeasurably as well as saving time, trouble and mental strain. Considered in this light they become necessities instead of luxuries. Motor manufacturers realise this, and each year we see all sorts of fittings supplied with the car which, in other years, have only been supplied to de-luxe models or had to be obtained from various factors. There are innumerable examples of this such as dual windscreen wipers, easy jacking systems, passlights and fog lamps, and even radio.

Incidentally, car wireless is increasing in popularity every day. Sets with wide range, free from outside interference and rendering the fitting of suppressors on sparking plugs unnecessary, are being produced in ever-increasing numbers now that the pioneer stage has been passed and prices have dropped to more moderate levels. Progress in this direction should be encouraged because in times of national emergency, universal car radio has much to commend it.

CARAVAN REGULATIONS.—Owners of motor caravans and other trailers are reminded by the R.A.C. that new regulations affecting trailers came into force on October 1st of this year. Regulation 57 of the Motor Vehicles (Construction and Use) Regulations, 1937, provides that "As from October 1st, 1938, the owner of a trailer which . . . is fitted with over-run brakes, shall cause the unladen weight of the trailer to be painted or otherwise plainly marked upon some conspicuous place on the left or near side of it." Another important Regulation (No. 53) concerns mudguarding, and provides that "As from October 1st, 1938, the rear wheels of every trailer, except a trailer drawn by a locomotive, shall be provided with wings or other similar fittings to catch, so far as practicable, mud or water thrown up by the rotation of the wheels, unless adequate protection is afforded by the body of the trailer."

LICENSING THE AIRWAYS

The New Authority and Its Work

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

A NEW phase in the development of our internal airways has been entered by the recent inauguration of the Air Transport Licensing Authority, which began its work in the middle of September. The need for a system of licensing all internal routes was, it may be remembered, recommended by the Cadman Committee, and power to set up a licensing authority by Order in Council was, in fact, given by the Air Navigation Act, 1936. Actually the order establishing the present authority was made this year, and came into force on September 16th.

Broadly speaking, the function of the Authority is to license the internal airways on lines analogous to those which have become familiar in connection with road transport. The aim would seem to be to restrict unnecessary and wasteful competition and to ensure that those desirous of operating services should possess both the technical and financial resources to ensure their proper conduct.

The Authority is given power to control flights within the British Isles on which "passengers are carried for hire or reward at separate fares," or on which "goods are carried for hire and reward," and thus brings aircraft into line with motor omnibuses and lorries. No operator may now make flights of this kind unless he has been granted a licence by the Authority. In this way, the freedom hitherto existing as regards commercial air transport in this country is restricted and a measure of co-ordination promised without any scheme of compulsory amalgamation.

In most of its details, the procedure of the new Authority is similar to that which applies to road transport. Operators who wish to maintain services have to apply to the Authority on the prescribed form, giving full particulars of the services it is proposed to fly. The Authority then makes a public announcement to the effect that a licence has been applied for, and it is open to certain bodies and persons specified in the order to make objections if they desire. The right of objection is not, however, general; it is confined to local authorities, other operators of air transport, aerodrome owners, and public departments. If conditions justify it—as, for example, if objections are brought forward—the Authority has power to conduct a public inquiry at which evidence by both the applicant and the objectors may be brought forward and examined.

Apart from the hearing of objections and assessing their weight, the Authority has to take into consideration various other factors before granting a licence. Such questions as co-ordination and future development, the interests of the public generally, the existence of other services, and the financial backing of applicants, must be taken into account, and the Authority is empowered to impose at its discretion conditions in respect of licences granted. It is to be noted that the licences will not only regulate the actual routes flown and the number of flights made, but lay down rulings on the wages to be paid by the licensee to his employees.

While the foregoing are the main points of the scheme, they are by no means exhaustive, and much remains to be learnt from practical experience. It does appear, however, as though the Authority is given absolute power in regard to licensing; for while an applicant may demand reasons in writing from the Authority when a licence has been refused or is granted on different terms from those of the application, there is no right of appeal. The same conditions apply when a licence is subsequently revoked or suspended by the Authority for alleged breaches of its conditions. Moreover, there seems no course open to the licensee who wishes to have his original licence modified but to apply for it to be cancelled and then start the formalities for a new one all over again. Since licences may be granted for periods up to seven years, this would appear to make little allowance for the rapidly changing conditions of aviation.

As has been said, however, much depends on practical experience, and, in particular, the manner in which the regulations are interpreted by the Authority. The composition of the Authority, which includes both wide legal and aviation experience, suggests that everything possible will be done to ease the transition from freedom to control.

That some such scheme as this was needed was established by the Cadman inquiry, and, indeed, it has been obvious to most observers for a considerable period that aviation had little to gain by a continuance of unrestricted competition and mushroom services that collapsed after a short initial period of operation. The established concerns have, of course, largely recognised this fact and by a process of voluntary amalgamation and co-operation anticipated to some extent the ends for which the Authority has been established.

The work of the Authority will have to be closely studied by all concerned for the future of commercial aviation in this country. While there will be general agreement that some form of control is necessary in the interests of all—operator and travelling public alike—the fact remains that internal airways are still to some extent at least experimental in this country. Development must not be checked by the imposition of rigid rules adapted from other forms of transport, and it is essential that full freedom for expansion and for incorporating the lessons of experience in day-to-day working must be allowed. If these important aspects of the matter be satisfied—as there is no reason why they should not—the principle of licensing may well prove of the greatest benefit to our internal flying system and lead to the gradual extension of air facilities to the whole country. Co-ordinated development cannot but prove more stimulating than uncontrolled and wasteful competition over a few busy routes.

AFTER ADDAX AND BARBARY SHEEP

Sport in the French Niger Colony

A BARBARY SHEEP SHOT AT TERMITT. THE RAM CARRIED A 28½ INCH HEAD

THE French Niger Colony lies immediately to the north of Nigeria, between that territory and the Sahara. Across it, from east to west, there lies the thorn bush country, the pastoral zone, which separates the desert from more southern regions where regular rains permit of agriculture. These "fertile lands of the Western Sudan," as the latter were called in earlier days, furnished corn and slaves for the huge camel caravans which regularly crossed the Sahara northwards to the Mediterranean coast, a trade which has now been replaced by a steady southward flow of groundnuts, skins and hides to the seaports of Nigeria.

The desert itself cannot fail to exercise its fascination upon any traveller who can allow himself the leisure to enjoy it; the blue-veiled Tuareg on his camel, further south the leather-aproned Fulani watching the long-horned cattle whose requirements rule his wandering life, and south again the Hausa horsemen in flowing robes, their dusty fields and mud-walled cities, must interest the tourist. But it is the grey-green thornbush along the desert edge, where umbrella-shaped acacias are scattered sparsely over short, bleached grass, which will appeal to the sportsman, the country of white oryx and dama gazelle, with addax in the dunes to the north, and Barbary sheep on the Tiguiddi cliffs and amongst the Termitt hills.

No longer cut off from the world by the hardships of a Saharan caravan journey, this region is now easily accessible. Three days by 'plane, a regular service, will take the traveller from France to the capital, Niamey on the Upper Niger, or on to Zinder. For the greater part of the year, a "desert bus" service, operated by a French company, crosses from Algiers, through the Hoggar, to Agades and Zinder, and even on to Kano in Nigeria, from which the railway runs south to Lagos on "the West Coast."

In these days, too, it has become quite an ordinary matter to cross the Sahara by car. And granted the ordinary precautions enforced by the French authorities, a reliable car, and a reasonable knowledge of the eccentricities of cars, the journey should be accomplished without the slightest danger, if not, perhaps, without discomfort. At Agades there is a hotel and a mud-built fort of the "Beau Geste" type. The desert has been crossed, and the traveller passes into the northern fringes of West Africa; but this is still "the bush," and he must be equipped accordingly, and self-supporting.

From Tegida N'Tessoum, an ancient salt-making village, west of Agades and the Air Mountains, the hard clay flats extend, waterless and dead level, as far as the eye can see, the mirage, like some great marsh, all round at mid-day, and there is little game, beyond an occasional ostrich and the little dorcas gazelle. But the traveller will be astonished to learn that these flats are flooded knee deep for a couple of months each year, even if no rain falls locally, a freak of drainage from other areas, which is more common in low-lying desert country than is generally imagined.

Some 30 or 40 miles south of Agades, however, the bus route climbs the curiously worn grit cliffs of Tiguiddi, the northern edge of the low Tegama plateau, and on past the big pool of Aderbissinat. There are Barbary sheep along these cliffs, while dama gazelle, white oryx, and dorcas are common in the thorn bush of the Tegama. The addax are further east along the southern fringes of the Ténéré, a vast desert of sand dunes, across which lies the road from Agades to the famous Saharan oasis of Bilma. Eastwards along the southern edge of the Ténéré is the Termitt massif, reached in the writer's case by car from Nigeria on a shooting leave, through Kano and Zinder, and then branching off the sandy Zinder—Lake Chad road to Gouré, on northwards to the Taskeur Well and thence four days by camel. The low black plateau is much broken up by gullies and covered with a jumbled litter of ironstone blocks and scree. South of it the tufty sand steppe is dotted with the acacia bushes which mark the northern limit of the thorn parkland. To the north lie the Ténéré sands, with only the pale Saharan *had* in widely scattered grey-green clumps like moorland gorse, or tifts of spiky desert grass.

The great troughs of the ancient dunes run parallel, north-east south-west, and here and there, on the "live" crests, the sand is drifted like snow into sweeps and knife edges, or rippled like the seashore. The air is clean and utterly dry, a strong cool wind all day, a burning sun at noon, and bitter cold at night. Discomforts are easily forgotten in a climate so magnificently invigorating, and this cool season lasts from November to the end of February. There were several big herds of addax near Termitt, certainly not less than 70 beasts in each; and they were not really difficult to approach amongst the dunes; a head of 36in. at all events is sure. Luck had probably more than good judgment to do with the bagging of two Barbary sheep, rams of 32in. and 28½in., but time and careful work should be rewarded by a record.

The beautiful dama gazelle, like the dorcas, allow no liberties amongst the thorn scrub, and this adds to the pleasure of getting a pretty head of either. No more than two or three small parties of oryx were seen at Termitt, the herds having moved south, as the Tibu camelmen said they always do in February, although, of course, they never go beyond the sub-desert thornland. Like addax, sheep and gazelle, they are independent of water, and go without drinking for ten months of the year.

If personal experience is any guide, a most delightful holiday could be spent in the region by anyone who is prepared to cope with the difficulties which must always be encountered where the traveller is a rare bird and especially where the requirements of the sportsman are not understood by a sparse and inexperienced native population. The nomadic Azzur hunters may not understand the aims of the European sportsman, but they are capable of doing a great deal of damage amongst the game, and particularly the addax, by cleverly organised drives towards lines of nets.

BARBARY SHEEP MAKING FOR THE ROCKS AT TERMITT
The leading ram must have a head close on 32 inches. The sheep were caught out feeding late in a sandy korri, on a cool morning with a strong Harmattan haze

The French authorities have, fortunately, and without any question, established over these men's activities a great measure of control, the practical difficulties and successful results of which are far from being generally realised. The French officers whose work carries them into these *subdivisions nomades* are the most interesting of men, and without their unfailing help and friendly courtesy, the visitor would be lost indeed.

WHERE TO STAY

HOTELS AND APARTMENTS FOR THE SPORTSMAN AND SPORTSWOMAN AT HOME AND ABROAD

Grand Peace

In these abnormal times, when those who normally migrate abroad after Christmas are hesitant, we offer them a generous slice of our grand peace. A bedroom, with private bathroom if need be, overlooking the blue and tranquil waters of Tor Bay. A grandstand position *on the level*, a Sun Lounge to cheat the occasional wind and to capture the warmth of the sun. The comfort within of an even temperature and the feeling of wealth around you. A chef who practises to perfection the culinary arts of four continents, yet can, if need be, cater for the simplest taste. In short—an hotel where personal whims are studied and satisfied.

Above all, we offer a tempting all-in price with a sliding plan whereby the longer you stay the less you pay. For further information write to R. Paul, Manager

THE GRAND TORQUAY

Telephone: 2234

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

"THE SHIP HAS A FRIENDLY WHITEWASHED FRONT"

IT was only by sheer chance that I came upon the Ship Inn at Alveston, but it was not sheer chance that took me inside. It was curiosity, and, unlike the cat, I was not killed; rather enchanted. Standing just aside from the noisy traffic on the fairly new road joining Bristol and Birmingham, the Ship has a friendly whitewashed front which cannot fail to attract you as you approach.

Ten miles from Bristol, the inn was the first stage out of the town or, if you will, the last coming into it. The spirit and romance of those old coaching days was, to my mind, so admirably caught in *Tom Brown's Schooldays*. Do you remember how the young hero of that grand yarn made his first trip to Rugby by stage coach? After travelling all night they begin at last to see the countryside in the early morning light—"men in smock-frocks going to their work, pipe in mouth, a whiff of which is no bad smell this bright morning. The sun gets up, and the mist shines like silver gauze. They pass the hounds jogging along to a distant meet, at the heels of the huntsman's hack, whose face is about the colour of the tails of his old pink coat, as he exchanges greetings with coachman and guard.

"Now they pull up at a lodge and take on board a well muffled-up sportsman, with his gun-case and carpet-bag. An early up-coach meets them, and the coachmen gather up their horses, and pass one another with the accustomed lift of the elbow, each team doing eleven miles an hour, with a mile to spare behind if necessary. . . ."

Such was the England which our ancestors knew. While some of the romance of travelling has disappeared we still have our old-established inns, among which we number the Ship, to remind us of more spacious days. You can still see to-day, by the side of this 300-year-old inn, the fine coaching stables, and in the loft above are two ancient machines, an oat crusher and a bean kibbler, that were in use to prepare fodder for the steaming teams that came rattling down the road.

Since the first cock strutted out of the Ark and, letting fly his war-whoop, set an eternal fashion of defiance to humanity asleep, much has changed, of course. In those days, people really did sleep and there was no constant hum of traffic to keep them awake at night as in this twentieth century of ours. Some people, in fact, are lucky if they get to bed *before* the cock proclaims the dawn. They are known to their friends, I believe, as "night owls," yet it seems an odd way to spend one's life. However, each to his own desires; mine are with the folk who wish to go to a quiet country house hotel.

And in that category I would place the Ship. An attractive old house is this wayside inn with its whitewashed walls, old gables and bay windows. To see it at its best go there when the Berkeley Hounds—as they have done for years past—meet at the inn. Then you will see the place in its right setting with all the romance of a quieter past clustered thick about its sturdy walls, while only a mile or two away is the wide estuary of the Severn from which the smugglers came who once congregated at the Ship.

The writer will be pleased to answer any queries from readers concerning hotels.

WINE AND FOOD

A GASTRONOMICAL QUARTERLY

To all who wish to cultivate the art and enjoyment of good living this official journal of the Wine and Food Society will prove of inestimable value.

BRIDGE

SENSATIONAL HAND AT DUPLICATE

Points in Bidding and in Play

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

A READER in Barbados has written asking my advice. He says that he has been particularly interested in the articles in defensive play and "End" play, and he wants to know whether the examples given are manufactured to illustrate points or whether they actually occurred. "Do players," he writes, "make these brilliant coups or do you invent them?" And he continues: "Do experts never make mistakes or are they superhuman?"

Taking this second question first, I would give him the comforting answer that the experts are not by any means infallible. In fact they make frequent mistakes, and in these columns I have from time to time drawn attention to them. The perfect player does not exist, and the expert may be described, as Napoleon said of the best general in war, that he is the one who makes the fewest mistakes.

The hands I give are seldom concocted. They are taken from observed actual play or from records of Duplicate matches, which are generally the most valuable source of information. As an illustration of a battle between accomplished tournament players consider the following hand, which occurred at a recent Congress and which will probably be new to most of my readers.

	♠ J, 4, 3, 2 ♡ A, K, Q, J, 7 ◇ 10, 9 ♣ A, 6	
♠ Q, 9, 7, 6, 5 ♡ None ◇ A, 8, 5, 4 ♣ K, J, 9, 8	Y A B Z	♠ 8 ♡ 10, 8, 5, 4, 3, 2 ◇ 7, 3, 2 ♣ 7, 4, 2
	♠ A, K, 10 ♡ 9, 6 ◇ K, Q, J, 6 ♣ Q, 10, 5, 3	

Score love all. Z the dealer.

At seven of the eight tables the hand was played in contracts of Four Hearts by Y or Four No Trumps by Z.

At one table, however, the bidding was:

Z	A	Y	B
One No Trump	No bid	Two Clubs	No bid
Three Clubs	No bid	Four Hearts	No bid
Four No Trumps	No bid	Five No Trumps	No bid
Six Clubs	Double	Six Hearts	Double
Six No Trumps	Double	No bid	No bid
No bid			

The bidding is somewhat peculiar. Y's bid of Two Clubs was, we are told, of the "mark time" order. His next bid of Four Hearts suggested a slam, and Z's subsequent bid of Six Clubs was based on the belief that Y held the Club suit. It is suggested that A was wrong to double Six Clubs, but B was right to double Six Hearts and A to double Six No Trumps. You may not agree that a little slam should have been called on the joint holdings.

But mark now the play! A opened with the 6 of Spades—the fourth highest of his longest suit—a lead which the commentator on this hand considers wrong in the circumstances. He holds that his correct lead was the Ace of Diamonds. While the 6 of Spades made things easier for Z, the making of the little slam is by no means apparent. As the Hearts do not break, Z, it would seem, must lose a trick in Diamonds and one in Clubs. Yet he contrived to achieve his contract. This was how it was done.

Winning the first trick with the 10 of Spades, Z led a small Diamond, won by Dummy's 9. The 10 of Diamonds was returned, and Z's Knave was won by A's Ace. This, it is stated, was A's third mistake. If he refuses to win the second Diamond but takes the third the contract is defeated, as A then plays another Diamond to get rid of the lead. I think if you work this out you will find it is so.

As it was, after A had won the second Diamond trick, Z claimed the remainder on a squeeze. Whatever A led Z must make the rest. If he leads a Club at trick 4 a finesse produces the contract. If he leads a Diamond or a Spade Z makes four Hearts and the "End" play is:

	♠ J ♡ None ◇ None ♣ A, 6	
♠ Q ♡ None ◇ None ♣ K, J	Y A B Z	♠ None ♡ 10 ◇ None ♣ 7, 4
	♠ None ♡ None ◇ K ♣ Q, 10	

When at trick 11 Z leads the King of Diamonds A is squeezed and must part with the Queen of Spades or a Club. Very pretty and spectacular. And poor A got all the blame for his bidding and his play.

CHESS

TOURNAMENT IN HOLLAND

THIS important tournament has ended in a triumph for the younger generation, the first prize being shared by Fine, who is 24 years old, and Keres, who is 22. Each scored 8½ points out of 14. The other scores were Botwinnik 7½, Dr. Alekhine, Dr. Euwe and Reshevsky each 7, Capablanca 6, and Flohr 4½. We shall comment on the result in detail next week, when we shall publish a table showing the results of all the games played in the contest.

A very good game by Keres.

(French Defence.)

WHITE. Keres.	BLACK. Capablanca.	WHITE. Keres.	BLACK. Capablanca.
1. P to K 4	P to K 3	20. K R to Q sq(h)	Kt to Kt 3
2. P to Q 4	P to Q 4	21. Kt to Q 4	R to Kt 3 (i)
3. Kt to Q 2 (a)	P to Q B 4	22. Kt to K 6 (j)	Q to Kt sq
4. K P takes P	K P takes P (b)	23. Kt to Kt 5 (k)	R to Kt 2
5. K Kt to B 3	Kt to Q B 3	24. Q to K Kt 4 (l)	B to B 5
6. B to Kt 5	Q to K 2, ch (c)	25. R to B 4	R to Kt 4 (m)
7. B to K 2	P takes P	26. Kt takes BP(n)	R to K sq
8. Castles	Q to B 2	27. P to Kt 3	Q to B sq (o)
9. Kt to Kt 3	B to Q 3	28. R takes B	Q takes Q
10. Q Kt takes P	P to Q R 3 (d)	29. R takes Q	K takes Kt
11. P to Q Kt 3	K Kt to K 2	30. R to Q 7, ch	R to K 2
12. B to Kt 2	Castles	31. R takes R, ch	K takes R (p)
13. Kt takes Kt	P takes Kt	32. B takes P (q)	R to Q R 4
14. P to B 4 (e)	B to K 3	33. P to Q R 4	R to Q B 4
15. Q to B 2	P takes P	34. R to Kt 4	K to K 3
16. B takes B P	B takes B	35. K to Kt 2	P to K R 4
17. Q takes B	K R to Kt sq	36. R to Q B 4	R takes R
18. P to K R 3 (f)	R to Kt 4 (g)	37. P takes R	K to Q 3
19. Q R to B sq	R to Q B sq	38. P to B 4	Resigns (r)

(a) This move was introduced by Dr. Tarrasch nearly 50 years ago but abandoned by him after a short trial. In the last few years, however, it has made a reappearance in tournament play. The object of the move is to avoid the blocking of White's Queen's Bishop's pawn, and so allow P to Q B 3, if necessary. It has, however, the disadvantage that at Q 2 the Knight does not bear upon Black's Q 4.

(b) Until just recently this move was almost invariably played. However, in two games played in the Noordwyk tournament last June—Fine v. Eliskases and Keres v. Eliskases—it was shown that Q takes P, by which Black avoids getting an isolated Queen's pawn, can be played with quite a satisfactory game.

(c) This does not appear to us to be good. Black should, instead, make a developing move, *e.g.*, Kt to B 3.

(d) White is ahead in development and Black has an isolated Queen's pawn.

(e) A good move.

(f) Played to free his Knight from the task of defending the King's Rook's pawn.

(g) Here Black has, we think, a better move in P to Q R 4, threatening P to R 5.

(h) White has the superior position. He has the better pawn formation and his pieces are much better placed than his opponent's.

(i) If, instead, 21. . . . R to Q 4 (which Capablanca, perhaps, intended when he played 18. . . . R to Kt 4), then 22. Kt takes P with advantage to White, *e.g.*, 22. . . . R takes R, ch; 23. R takes R, Q takes Kt; 24. R takes B.

(j) A very good move. If now 22. . . . P takes Kt, then 23. Q takes P, ch followed by 24. Q takes B wins a pawn. If, instead, 22. . . . B to R 7, ch; 23. K to R sq, P takes Kt, then 24. Q takes P, ch, followed by 25. R to Q 7 and wins.

(k) Not 23. Kt takes P because of 23. . . . B to K 4 for after 24. B takes B, Q takes B the Knight has no escape.

(l) Threatening R takes B followed, if Q takes R, by Q takes R, ch.

(m) A mistake. Black should, instead, play B takes Kt, although he would still have the inferior position.

(n) A good move. If now 26. . . . K takes Kt, then 27. R to Q 7, ch, Kt to K 2; 28. Q takes P, ch and mate in two more moves.

(o) If 27. . . . K takes Kt, then 28. R takes B, ch, K to Kt sq (if Kt takes R, then Q takes P, ch, followed by Q to B 6, mate); 29. R to Q 7 and wins.

(p) If Kt takes R, then R takes P, ch.

(q) White has now a winning game.

(r) If 38. . . . K to B 4, then 39. P to R 5 and wins for, if 39. . . . Kt to K 2, then 40. B to B 8, K to Q 3; 41. P to B 6.

The following game was played in the second round.

(Queen's Gambit.)

WHITE. Reshevsky.	BLACK. Fine.	WHITE. Reshevsky.	BLACK. Fine.
1. P to Q 4	Kt to K B 3	20. R takes R, ch	B takes R
2. P to Q B 4	P to K 3	21. Q to Q 3	R to Q B 3
3. Kt to K B 3	P to Q 4	22. Kt to Kt 5	B takes Kt
4. P to K Kt 3	P takes P	23. Q B takes B	Q to Kt 2 (k)
5. Q to R 4, ch	Q Kt to Q 2 (a)	24. P to B 3 (l)	P to B 3
6. B to Kt 2	P to Q R 3	25. B to K 7	P to B 5
7. Kt to B 3	B to K 2	26. Q to B 3	Kt takes P
8. Kt to K 5 (b)	R to Q Kt sq	27. B to B 5	Kt to Q 2
9. Q takes B P (c)	P to Q Kt 4	28. B to Q 4	P to K 4 (m)
10. Q to Kt 3	Kt takes Kt	29. B takes P	P to Kt 5
11. P takes Kt	Kt to Q 2 (d)	30. Q to Q 4	Kt takes B
12. B to B 4 (e)	P to Q B 4 (f)	31. Q takes Kt	P to B 6
13. Castles (K R)	Q to B 2	32. P to Kt 3 (n)	Q to Kt 3, ch
14. P to Q R 4 (g)	Castles	33. K to B sq	P to R 7
15. P takes P	P takes P	34. Q to Kt 2	Q to B 4
16. Kt to K 4 (h)	B to Kt 2 (i)	35. Q to B sq	B to Q 4
17. R to R 7 (j)	Q to Kt 3	36. P to B 4	B takes B, ch
18. K R to R sq	R to R sq	37. K takes B	Q to Q 4, ch
19. R takes R	R takes R	Resigns (o)	

(a) A well-known position in the Queen's Gambit has been reached by transposition of moves.

(b) This is new. Either Castles (followed by Q takes R P) or Q takes B P at once is usually played.

(c) 9. Kt takes Kt, B takes Kt; 10. Q takes B P would avoid the weakening of White's pawn position which results from the exchange at his K 5 (see move 10).

(d) An interesting position. White's pawn at K 5 gives him chances of a King's side attack, while Black has a formidable majority of pawns on the Queen's side.

(e) P to B 4 is better. If, in reply, B to B 4, then Kt to K 4, followed by B to K 3.

(f) Not 12. . . . P to Kt 4; 13. B to K 3, Kt takes P because of 14. B to R 7.

(g) An ingenious move. If now (1) 14. . . . Kt takes P, then 15. P takes P, P takes P; 16. Kt takes P with advantage to White, or, if, instead, (2) 14. . . . P to Kt 5, then 15. Kt to Q 5, P takes Kt; 16. P to K 6, Kt to K 4; 17. P takes P, ch, K to B sq; 18. Q takes Q P, B to B 3 (if B to Q 3, then K R to Q sq); 19. K R to B sq and White has good attacking chances.

(h) Not Kt takes P because then Q to Kt 3 wins a piece.

(i) If 16. . . . Kt takes P, then 17. K R to B sq, P to B 5; 18. Q to K 3 with good attacking chances for White.

(j) This is decidedly not good. In view of Black's advantage on the Queen's side for the end-game White should avoid lines of play leading to simplification. Q to K 3 seems his best move.

(k) Not Kt takes P because of Q to Q 6.

(l) White is playing to keep his two Bishops, but after the text-move the one at Kt 2 has little freedom of action.

(m) A good move.

(n) If 32. P takes P, then 32. . . . P to Kt 6; 33. Q to K B 5, B to K 5 and wins.

(o) Q to Q 8 is decisive.

INSTRUCTIVE POSITIONS

WE have received for review a copy of a book containing 125 positions from master games, the subsequent play being annotated by the well-known veteran master, J. Mieses. The positions are all extremely interesting, and the author's comments are very instructive. He is to be congratulated on having produced a very entertaining little book. We heartily recommend it.

Instructive Positions from Master Chess. By J. Mieses (Published by G. Bell & Sons, Ltd., York House, Portugal Street, London, W.C. 2. Price 2/6 net.)

PROBLEM No. 3990

By R. RINDOIEN.*

WHITE (11 pieces): King at K R 7, Queen at K Kt 4, Rooks at Q Kt 5 and K 8, Bishop at K Kt 2, Knights at K 4 and Q B 5, Pawns at Q B 4, K Kt 5, K 6 and K B 6.

BLACK (8 pieces): King at K 4, Rook at Q R 2, Bishops at K B sq and Q Kt 8, Knight at K B 4, Pawns at K 2, Q 5 and K 6.

White to play and mate in two moves.

* First prize, *Arbejdermagasinet*, 1935.

SOLUTION OF PROBLEM No. 3989

1. Q to R 7, Any move; 2. Q, R, B or Kt mates.

THE LATE P. F. JOHNER.—We regret to hear of the recent death of the well-known Swiss master, Paul Johner, who during the last 30 years took part in a large number of international tournaments.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 493

ACROSS.—1, Wild fowl rising in a London street, 5, Add less to the harness. 9, Father is in the middle of an unlevel path. 10, Gave an entertainment to eat at the centre. 11, This marriage portion is but a speck. 12, Sheepdog's has judge but no jury. 13, I am in the middle of a maze. 14, Does the stock want to be red? 15, Do the Dutch fish from this stone? 18, These dogs may be planters. 20, The wagons age, perhaps. 23, Rained lolly upon Ted's eel! 26, Falls in flakes at present. 27, This part of the shoe is more than pate. 29, Motor begins the seasonable song. 30, All you need is here. 31, Greeted with a musical instrument. 32, Don't bark your shin on this log; it's somewhat extended. 33, Schemes arranged to place a manuscript last. 34, We are stern in this part of the globe.

DOWN.—1, A broken nut in fashion got on the horse. 2, Wing for a backward friend? 3, There is nothing in the smith's block. 4, A weed totters. 5, Let Tess compose herself on the benches. 6, "To sleep! perchance to . . .: ay, there's the rub." (*Hamlet.*) 7, Lace round a bird at the window. 8, Melancholy lairs. 14, Boasts of fashions. 15, Measures in the valleys. 17, This gorge gets you nearly to the gate. 19, Bit of the alphabet on the links. 20, So cures on the routes. 21, Waves, though not permanent ones. 22, Hastes, with reference to lands. 23, A sow goes round the wall. 24, Insect causes torn tie at the end of term. 25, Hold a pin for the Dorado. 28, The R.A. is early. 29, One at the centre of the fruits.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Country House

Fungus from Plaster Wall sent for Identification.—This is *Pezica tectoria* Cooke, a harmless fungus belonging to the group Ascomycetes, which is not uncommon on damp plaster. It has nothing whatever to do with wood-destroying fungi such as *Lentinus lepidus* or *Merulius lacrymans*.—"*Research*."

Construction of Swimming Pool.—It is difficult without knowing more details to advise you on the best size for your garden plunge pool. The length of the pool, however, should not be less than twice the width, assuming, of course, that the construction will be of the formal rectangular type. A good size, should you have the room, is 50ft. by 25ft. As you will realise, there are many considerations to think of when building a swimming pool. Such as cost, construction, orientation, water supply, adjacent surroundings and its relation to the landscape.—*E. W., Sherborne.*

Farm

Plague of Rats.—As you cannot use poison, the methods of getting rid of them are rather limited. One of the most effective preparations is Liverpool Virus—the makers of which are Messrs. Evans Sons, Lescher & Webb, of Liverpool. Although poison to rats, it has the advantage of being entirely harmless to domestic pets. You might, however, in the circumstances, prefer to use a trap, and one of the most effective is the "Mortis" Tunnel Trap which is manufactured by Messrs. Gilbertson & Page, Hertford, Herts. If you combine these two you will, we are sure, get rid of the rats in a comparatively short time.—*R. A. D., South Queensferry.*

Garden

Apples Sent for Identification.—King of the Pippins, but the specimens sent are poorly coloured.—*W. S., Penrith.*

Mushroom Sent for Identification.—*Psalliota villatica*. Yes, this is one of the edible fungi.—*G. F. C. F., Budleigh Salterton.*

Beech Coccus.—If the white powder appears on the trunk of the beeches and looks like driven snow, then the trees are being attacked by the beech coccus. So far as the trees themselves are concerned, this insect is perfectly harmless. Nor does it affect the value of the timber in any way. If the appearance is objected to, the best remedy is to scrub the trunks with paraffin, which treatment may have to be repeated if there is a fresh attack.—*E. P., Woodstock.*

Kennel

Treatment for Tapeworms.—The dose of areca nut in 2 grains per pound body weight, to that 28 grains would be that for a dog weighing 14lb. The glucose is added to disguise the taste and to prevent nausea, and is better than ordinary sugar.—*Mrs. B., Norfolk.*

Hysteria in Foxterrier.—Try the effect of giving him a 1 c.c. capsul of tetrachlorethylene (Nema P. D. & Co.), three times in one week, twice in the next, and once in the next or third week. During this time keep the dog as quiet and as free from excitement and fatigue as possible.—*G. E. T., Sussex.*

Excessive Salivation.—The excessive flow of saliva is due to some cause of irritation within the mouth, and the offensive smell is suggestive of a tooth being at fault, and possibly the jaw bone. The teeth most likely to be responsible are the last molar and the large carnassal tooth.—*J. C., Ceylon.*

Treatment for Eczema.—You could not do better than send him to the Royal Veterinary College Hospital, Great College Street, Camden Town, London, where there are ample facilities for the most modern treatment of this intractable skin disease.—*R. P. C. S., Cornwall.*

Basset Hounds.—Unfortunately, the number of breeders of basset hounds is few. Your client is in the United States would probably be able to get some from Mrs. Elms, Fyfield Grange, Andover, Hants; Viscount Chelmsford, Ash Platts, East Grinstead, Sussex; or Mrs. Grew, Tamarisk, Midanbury Lane, Southampton.—*F. H. R., Southwark.*

Treatment for Chorea.—There is no specific treatment for chorea, but some improvement may occur with the improvement of the general condition. To effect this a teaspoonful of codliver oil may be given with the food every day, and half a teaspoonful of Parrish's Food in a little water, every morning and night, for about a month.—*C. C. M., Bibury.*

Treatment for Worms.—There would be no objection to extending the period of treatment, unless it affects the appetite, when it should be discontinued for a few days. He might also be given a teaspoonful of cod liver oil twice daily with advantage. The heaviest meal of the day should be at night time, and the vegetables would be best omitted from the diet.—*K. D., Horrabridge.*

Dose for Dog.—Syrup of iodide of iron deteriorates slowly with keeping, and it is not desirable to give it for longer than ten to fifteen days at a time as it may impair the appetite. The dose ranges from 10 to 30 drops, according to the size of the dog, but, as it is its action on the worms that is required, half these doses is usually found to be sufficient. It may be given diluted with a little water, or milk, or mixed with the food, if the dog will take it.—*E. S. C., Kesh.*

Cleanliness in the House.—We can only advise you to have patience with regard to the training of your Cairn terrier puppy. When he misbehaves, scold him well, but do not whip him. If he is sensible he will soon come to understand the meaning of an emphatic "no" and a rating. If you whip him and then turn him out, the chances are that he will not do what you want, because he has not grasped the idea that what may be wrong in one place is right in another. There are few puppies that *cannot* be house-trained, but some take longer than others.—*Jumbo, Sherborne.*

Lawn Tennis

Davis Cup.—Of the 20 contests that have taken place for this cup since the War, America have won nine. We give the list below:

1919.	Australasia beat British Isles..	4—1
1920.	U.S.A. beat Australasia	5—0
1921.	U.S.A. beat Japan	5—0
1922.	U.S.A. beat Australasia	4—1
1923.	U.S.A. beat Australia	4—1
1924.	U.S.A. beat Australia	5—0
1925.	U.S.A. beat France	5—0
1926.	U.S.A. beat France	4—1
1927.	France beat U.S.A.	3—2
1928.	France beat U.S.A.	4—1
1929.	France beat U.S.A.	3—2
1930.	France beat U.S.A.	4—1
1931.	France beat Great Britain	3—2
1932.	France beat U.S.A.	3—2
1933.	Great Britain beat France	3—2
1934.	Great Britain beat U.S.A. ..	4—1
1935.	Great Britain beat U.S.A. ..	5—0
1936.	Great Britain beat Australia	3—2
1937.	U.S.A. beat Great Britain.....	4—1

While last year, of course, it went to U.S.A. as well.—*J. S. H., Lincoln.*

Miscellaneous

A Good Brand of Paint.—A brand of paint which we find entirely satisfactory is Nine Elms, although it is perhaps a little more expensive than other brands. The lasting properties of the paint depend very largely on the method of application. The old paint work should be sandpapered really thoroughly and the new paint applied in thin coats. If the paint is diluted too much with thinnings (linseed oil and turpentine), or if too many driers are added it will not last and will rub off in the manner to which you refer. The paint should be applied in quite a thick state, and the thinness of the coat obtained by hard brush work, a tiring occupation and one generally avoided by modern painters. With regard to fading the greens and the blues are the worst offenders, and we have not been able to find a brand which will keep its colour. Browns are much more reliable. Imperial Chemical Industries have been conducting extensive research into paints, and, if you require a fast blue or brown, it would be well worth while getting into touch with them.—*E. C., N. Wales.*

Shooting

Gun Barrels.—The particulars you ask for are as follows: (1) Damascus barrels are usually finished a rich brown colour. (2) Damascus barrels have a curly pattern, the size of curls depending upon the number of strips employed in welding the ribbon which is later welded into a tube (barrel in the rough state). (3) Osborne guns were made with all types of barrels, *i.e.*, steel, Damascus of all grades, iron twist, &c. (4) It is possible to purchase hammerless guns, both new and secondhand, with Damascus barrels. (5) Owing to various causes the Damascus barrel industry has practically ceased to exist; improvement made in the manufacture of special gun-barrel steel has resulted in it being adopted for all classes of guns from the plainest to the best. (6) In common with universal practice, Belgian gunmakers employ steel barrels in practically all guns. It is understood, however, that a limited number of damascus barrelled guns are still being made.—*J. F. W., Londonderry.*

Reblueing Barrels.—We regret being unable to advise you as to the best means of employing the solution you mention, which is unknown to us. The reblueing of barrels is certainly not an easy matter to be undertaken by an amateur, and we strongly recommend you to adopt one of the methods as adopted in the trade, and suggest the following: 1½ pints of water, 1oz. corrosive sublimate, 1oz. potassium chlorate. Mix these ingredients in an earthen bowl and heat by immersing bowl in hot water until the solution is hot. Before the solution is applied the barrel should be well heated, and the best way is to boil it in a sheet metal pan 3ft. long by 6in. wide by 6in. high. If this is not available the next best thing is to pour boiling water over the barrel until it becomes hot. Apply the hot solution by means of a sponge or several thicknesses of Canton flannel held in a split stick or clothes pin. The sponge should be squeezed out fairly dry so that no runs will be apparent when the solution is applied. Then place the barrel in boiling water for seven to ten minutes, withdraw, hold in vertical position and allow to dry quickly. As soon as dry, rub to gloss with a dry cloth. Repeat operation until colour is satisfactory and we should say that five to eight coats would produce a good colour. At last, when colour is acquired, wash the barrel very thoroughly with boiling water to remove all further rusting action. Do not be afraid to use plenty of boiling water. Then go over it evenly and gently with soft, dry cloths until the surface is bone dry. Now, while the metal is still hot and the surface dry, apply liberal quantities of linseed oil with woollen cloths, covering the barrel evenly with long, gentle strokes and light pressure. It is quite easy at this stage to remove the blueing in spots by hard rubbing. Note.—You would require to remove the present blueing with fine emery cloth, leaving the metal clean and bright. It is most essential that the ends of barrels should be tightly corked to prevent the solution getting inside the bore.—*W., Darlington.*

Cartridge Tests

Your 12-bore 2½in. cartridges contained 33.4 grains of Emerald powder and 1⅛oz. No. 7 shot. Velocity recorded averaged 1,072ft. per second with medium recoil. Patterns (30in. circle 40yds. choke barrel) were even and averaged 60 per cent.

Your 12-bore 3in. cartridges contained 35.5 grains of Emerald powder and 1¼oz. No. 2 shot. Velocity recorded averaged 975ft. with heavy recoil, which, however, would not be excessive in your 8¼lb. gun. Patterns were even and averaged 75 per cent. It is noted that the weight of powder charges do not quite agree with your stated loads.—*P., Walton-on-Naze.*

Your A cartridges contained 33½ grains of Empire powder and a full ounce of No. 6 shot. Velocity recorded averaged 1,068ft. per second with medium recoil. Patterns (30in. circle 40yds. choke barrel) were even and averaged 69 per cent.

Your B cartridges contained 33½ grains of Empire powder and 1oz. of No. 6 shot. Velocity recorded averaged 1,046ft. per second with medium recoil. Patterns were regular and averaged 73 per cent.

Your C cartridges contained 34 grains of Empire powder and a bare ounce of No. 6 shot. Velocity averaged 1,054ft. per second with medium recoil. Patterns were regular and averaged 70 per cent.

Your D cartridges contained 35 grains of E.C. powder and a bare ounce of No. 6 shot. Velocity recorded averaged 1,122ft. per second with rather irregular patterns varying from 46 per cent. to 68 per cent.

Above cartridges have apparently not deteriorated by keeping, all should prove effective against game, A, B, C being classed as most reliable.—*H. K., W.2.*

Stable

Children's Ponies.—The question as to how much hay two children's ponies will require during the winter if they are turned out into a rough grass field, is rather difficult to answer without knowing more about them. If they are moorland, forest or Shetland ponies, they will naturally require less hay than otherwise. The question whether they will be working also arises, and their size and weight must also be taken into consideration. We think that an average amount of hay necessary for each pony would be two trusses a week, but you must watch them carefully and increase this diet with corn and oats and possibly linseed cake, as you think fit.—*R. P., Piccadilly.*

Travel

Hotel in Madeira.—Although we have only stayed at Reid's Hotel in Madeira, we have some very exacting friends who have stayed at the Savoy and the Belmonte Hotels. The Savoy is exactly opposite to Reid's, and the Belmonte is at the head of the mountain railway. Undoubtedly it has a better view, except, of course, when the mountain tops are covered with mist when there is nothing to be seen at all. However, if you are going to Madeira again, especially for some time, we advise you to stay at the Belmonte, but whichever you choose, we are sure you will find it to be socially pleasant and in a good environment.—*S. P., Upton.*

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

RABBITS AND AGRICULTURE

FROM time to time in the past—and with increasing frequency of recent years—the *Field* has drawn attention to the very grave menace to agriculture from rabbits. We are, therefore, very pleased to see that a Bill has been brought before Parliament; that something is apparently going to be done at last.

The Bill—*Crops (Prevention of Damage)*—makes provision for the prevention of damage by rabbits; and also provision for the amendment of the law relating to the use of poison, the prohibition of night shooting, and the use of spring traps above ground for the purpose of killing hares or rabbits. It gives to local authorities power to require prevention of damage by rabbits; power to local authorities to assist occupiers of land to destroy rabbits; it imposes a duty upon rabbit breeders to fence warrens; and it prohibits night shooting and the use of spring traps above ground. That, very briefly, is the purport of the Bill at present before Parliament.

It is a Bill which deserves the widest support—not only from those whose livelihood is directly concerned with agriculture, but from all who have at heart the interests of the English countryside and who believe that agriculture is one of the mainsprings of English life.

That agriculture has suffered much from the rabbit is beyond question; that grass farming has suffered untold damage from rabbit farming is beyond dispute. That should, of course, be sufficient to ensure proper control of the rabbit. But this question of the rabbit cuts across many private interests, and it is, unfortunately, true that in all too many cases to-day private interest outweighs national interest.

The rabbit has some value—some considerable value in many cases—to shooting men. It has also some value—and again considerable value in many cases—to the rabbit producer. The latter lives, more or less without charge, on agriculture. That he should be controlled in the same way that certain aspects of agriculture are controlled should not be regarded as unjust.

The shooting man does not live upon agriculture to the cost of that industry. Furthermore, the majority of shooting men are good countrymen, and having a knowledge of the manifold difficulties and hardships involved in the pursuit of agriculture are more than willing to meet the farmer half-way. The majority: there is, however, a minority (a minority to be found in any form of sport) which has no hesitation in sacrificing the farmer to its own purely selfish interests.

Self should have no part in this—or any other national question. We are, all of us (though we forget too frequently that we are) dependent the one upon the other, and we are all (though few of us will acknowledge the fact) dependent, to some extent, upon the well-being of the agricultural industry. If that is true of the individual—and nobody will dispute its truth—it is true in far greater extent of the community as a whole.

The wild-rabbit industry, a misnomer, flourishes only because it has not got to pay the real cost of producing wild rabbits. The agricultural industry has to pay that. If the true cost had to be borne by those concerned in the industry, then there would be no wild-rabbit industry. There should be no need to say more.

We welcome this Bill. We welcome, since we have the interests of the countryside as a whole, rather than any particular section of it, at heart, any measure which will help to right the handicap under which agriculture is at present struggling.

NATIONAL SERVICE

THERE is a strong feeling in the country that voluntary measures will not meet modern war conditions. In the last war there were examples of "Untouchables" who profited by escaping service, so that it may not be surprising if the would-be volunteer to-day wants to know what the other fellow is going to do. We are told that a National Register will be compulsory if the country should become involved in war. Then why not save valuable weeks, days, hours and minutes and have it properly organised and ready to be put into operation in peace time? It would only be fair to everyone to know and be prepared for the service demanded of him or her. It looks at the moment as though the Register will go off half-cock, as did our recruiting campaign. In the latter it is not realised that youth's enthusiasm needs stimulating and encouraging. One of the troubles with the Army from a political point of view is that it suffers from being "military."

THE HEAVYWEIGHT CHAMPIONSHIP

Len Harvey, at the age of 31, regained the Heavy-weight Championship of Great Britain when he defeated Eddie Phillips, the latter being disqualified in the fourth round for a low blow. Harvey, by then, had the fight well won; he has never fought to greater purpose. Phillips had taken one long count and was obviously fighting in a dazed condition. There is, in the gymnasium, no better boxer than Phillips; in the ring he is at the start of every fight the victim of nervous strain. He defeats himself. And so it was in this fight. The result, while recognising to the full the magnificent qualities of Len Harvey, is something of a tragedy from the point of view of English heavy-weight boxing. Harvey is nearing the close of a long and honourable career. Phillips has shown clearly that the big occasion is altogether too big for him. The best British heavyweight has incurred the displeasure of the Board of Control and fights in America. It is altogether a sorry state of affairs.

ENNION OF THE MUDFLATS

The exhibition of bird paintings now being held at the Greatorex Galleries in Grafton Street is one quite out of the ordinary. Dr. Ennion is an extraordinary person. He is one of those rare beings a combination of technical knowledge and technical skill. It is one thing to know the exact colourings of a pheasant, and how ducks and geese fly, and quite another thing to know how to get that knowledge on to paper in pencil and paint. Dr. Ennion's technical skill is unquestionable, and the atmosphere of his pictures is convincing in the extreme. This latest exhibition of his proves that beyond all doubt. But there is something fresh creeping into these latest paintings of his, and that is that quality sought by all artists—originality. And it is a quality very difficult to achieve indeed when nature is the subject and herself the origin. Nothing can be invented and nothing left to chance. It is because Dr. Ennion has managed to introduce this quality into his painting that this is indeed an exceptional exhibition.

A COMPETITION FOR COUNTRYMEN

The British Field Sports Society—an altogether admirable institution—is running a competition for countrymen (and anyone else who is interested) and we feel that this one, which carries gratifying prizes with it, will appeal particularly to readers of the *Field*. It is not an easy competition. We do not imagine that any competitor will give the correct answers to every question. But it is a very fair competition designed to probe the knowledge of each entrant, and at the same time to give each a chance. Entry forms may be obtained from the secretary at 3, St. James's Square, S.W. 1. You will, by the way, want more than one entry form. Your family will certainly want to enter.

WINTER COARSE FISHING

It would seem that the official popularly known as the Clerk of the Weather views the drainage boards with no more favourable eye than the angler, and is determined to give them something to drain. For a month past high water has hampered the spinner for pike and perch, and high winds have rendered a good half of the efforts of the light-float caster, that most delicate of the arts of the coarse fisherman, abortive. The exhilaration of bright frosty weather, too, has been almost entirely lacking; altogether a disgruntling autumn. Last year, while the autumn was good enough for most men of robust constitution, the real winter, which sets in after Christmas, made something of an *amende déshonorable*. So perhaps this winter "the best is yet to come." There has been one palliative, perhaps: the boisterous weather has aroused pike to dash savagely at glittering seductions.

THE OLD SQUIRES

In the dining halls of the ancient manors
The horsemen look down from their gilded frames,
Their scarlet aglow like a challenge of banners
Blazing the pride of their sporting names.

There stands a Master, hounds around him,
Dappled beauties that wait his word;
Smiling just as the artist found him,
Ready to tackle it booted and spurred.

There sits a thruster, lean, hard-bitten,
Backed by a bank of purple cloud,
Over his features plainly written
Fine contempt for the slow-coach crowd.

Grandsire and great-great-grandsire fronting
The glittering room, keeping watch and ward,
Seeming to shout from their frames "Good hunting!"
When glasses clink at the festive board.

WILL H. OGILVIE.

A COUNTRYMAN'S JOURNAL

THE village was introduced by the normal post-War adjunct to all villages—a row of council houses like an ill-conditioned and incompetent set of prefatory verses to a book of poetry. Pay no heed; they will soon fall down.

What I was not prepared for was the village beyond them. With melancholy grace, in silent resignation, it was in the act of falling down. It was an old and, therefore, a soundly-built village, as I could see not only by the cottages and the seventeenth-century manor masked by a Georgian façade, but by a weatherboarded barn on staddle stones. It was roofed by corrugated iron, leprous in the sunlight. Next door was a stone outhouse roofed with moss-covered red tiling. It stood knee-deep in nettles. Two more barns succeeded; the roof of one was a skeleton of rafters; of the other the void, and even the brick walls were gashed with open wounds. Opposite it and flanked by two of the tallest ilexes I have ever seen, stood a thatched cottage of colour-washed brick, half-timbered, with a semi-detached brick chimney rising like a tree from wide shoulders of stone capped with red tiling.

This thatched cottage, with its materials all in loving partnership, rode like Noah's Ark amid a sea of wreckage. Its deeply recessed dormers were like sunken eyes looking over the flood of ruin for rescue. There was a trim box hedge round it, dense and compact as though to keep the wolf, decay, from the door. Box hedges enclosed other cottages in the village, but they had shot up such rank, dishevelled sprays that they concealed the gardens. Not that there was anything to conceal; like the arable fields in the neighbourhood they had been put down to grass. Grass also grew high up in the air, sprouting from the hayricks so badly protected from the rain that some had collapsed and lay sprawled like drunkards.

I walked through the dead, brittle stalks of some yellowish weed that covered a farmyard into a fine open barn that had once been a creditable achievement in early nineteenth century Gothic. It housed agricultural machines all red with rust, and the stone walls between it and the road were so laced with ivy in full flower that they were invisible. Even the posts of the fences were draped in ivy. Trees of great stature and lusty age gave the village a leafy seclusion dear to the contemplative mind, but their massive trunks, too, were coiled, clutched and enfolded with the life-sucking weed. Their foliage screening the village was like rags that half concealed the sores of decay.

A little way on, a large richly-timbered outhouse roofed a number of abandoned farmer's gigs, dung carts, governess carts, dog carts and disembowelled wagons. The dilapidation was the more distressful from the many signs of former pride and craftsmanship and solicitude the village revealed on every side. Here was a small outbuilding whose windows were all paned with bulls-eye glass, intact. The principals, trusses, struts and purlins of some of the barns stood as strongly against time as when they had stored good grain and lustrous fleeces instead of the litter that I saw.

I was surprised to see children playing in the street and housewives busy among the mouldering walls. It was a village that might have been deserted for a hundred years, its inhabitants all dead or scattered, its very name a memory. It was a place of ghosts, not of men.

Outside the village I met a labourer. He swept his arm round the empty fields. "I remember," he said, "when that was all golden corn and forty-three men worked on one farm. I'm the only one left." My heart was not less sore than his. If an army, a pestilence or a famine had swept through that village, the tragedy of it would have been comprehensible. But that England should thus devastate her own countryside and turn and rend the very stuff of her being, that I could not understand. The westering sun struck the autumn trees into a sudden glory; man only curses and smites himself in the name of progress.

H. J. MASSINGHAM.

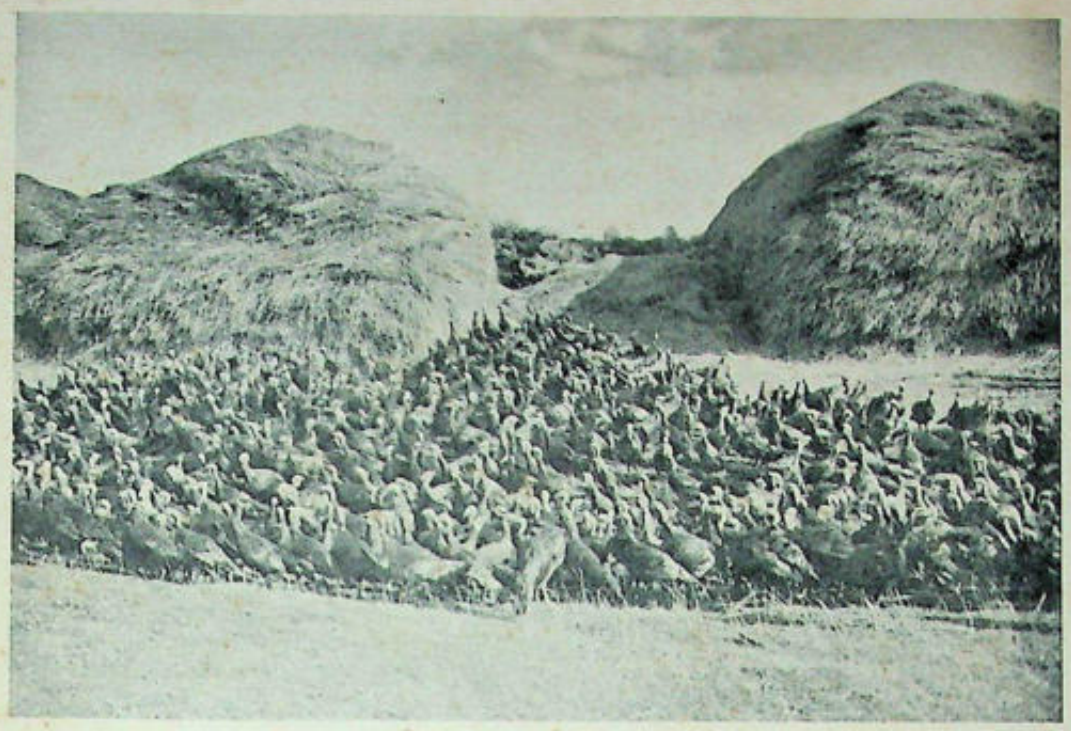
WITHOUT COMMENT

From a paragraph on an owner of field trial dogs: "Mr. —— goes in more for the shooting than the exhibiting of dogs."

Overheard in the hunting field:

A well-known thruster disappeared into a deep ditch the other day. As nothing could be seen of him, a fellow called out "Where are you? Are you all right?" And the reply came back in rather lurid language, "Must be in some local A.R.P. works."

From a daily newspaper: "His tiger skins—his record bag is 150—have been left behind to be made into a carpet and rugs for the Durbar Hall of his palace."



Rearing turkeys for Christmas *Photo: Horace Grant*

THE CHRISTMAS TURKEY

A Seasonal Industry

ABOUT the beginning of December a quietness falls on many districts in the country, for many thousands of turkeys, chickens, geese and ducks are killed to provide a traditional meal without ever having realised—possibly until that moment—the reasons for the kindness of the world towards them. Turkeys have now passed out of the hands of the producer, and, until Christmas, pass successively under the care of the packer, retailer and consumer.

The turkey industry has become a highly technical undertaking. The feeding problem is now a scientific one, and great emphasis is being laid on the importance of the correct time a bird should be starved before being killed and delivered. The time depends on the duration of the journey which the bird must make—either to a local buyer or to a poulterer in London. One of the most important duties of the producer is to take care, when killing a bird, that all the blood should be allowed to flow to the cavity, otherwise the colour of the turkey will be unsatisfactory. All birds which are going some distance are allowed to cool completely before being packed in their wooden boxes. The producing and packing aspects of the turkey industry have reached such a satisfactory condition that it cannot be regarded as other than a great pity that a certain amount of seemingly avoidable confusion should reign in the settling of prices.

The prices obtained for turkeys this Christmas will be less than last year. This is largely, but not, I think, wholly, due to the very large number of birds produced. The official figures give the number of turkeys on agricultural holdings in England and Wales of one acre or more this year as 948,000. This figure does not necessarily represent the actual state of affairs, as the September census, unlike the one in June, is not compulsory. It is difficult to see why it should not be made so, as several advantages would obviously follow. But it seems clear that this year will be satisfactory.

But the smaller prices obtained for turkeys cannot be attributed wholly to the increased number of birds being marketed. For there is a tendency on the part of retail buyers to pick the latest killed birds, and to base their offers, not on quality, but on the number of birds available. This is clearly not fair on the producer, and, although steps have lately been taken to prevent these practices, there can be no doubt whatever that the question of prices for turkeys should come under official consideration and should be placed on such a basis that last minute alterations of opinion should become impossible.

Much of this unsatisfactory condition dates annually from the end of the Attleborough Turkey Sale in October. For it is assumed, quite without reason, that the prices obtained at that sale will be approximately the prices for Christmas. There is no inductive line of reasoning for this supposition, but it is very unfortunate that such an assumption should be made, for it gives rise to all manner of unfounded rumour and unwarranted decision. It would be much better if some arrangement could be made whereby, early in November, the retailers could agree on a price with the producer. Nor is this all. At present the price is fixed largely on the number of the birds: it would be to everyone's advantage if quality were accepted as the standard. If this were to be done, and an unalterable decision made as to price, there would be an end of rumour and conjecture, and the financial aspect of the industry would be placed on a sound footing.

Nor is the attitude of some wholesalers conducive to the benefit of the industry. Naturally they wish to make a profit, and therefore they wish to handle turkeys all the year round. But this is not the best way to success, for turkeys must be regarded mainly as a seasonal industry. It is true that they appear at banquets and dinners well on into the new year, but no advantage is to be gained by trying to make them a permanent source of income.

And this consideration leads to a larger question—the place of the turkey in modern farming. No one would wish to deny any possible profit to anyone connected with farming to-day, but I cannot think of it as being otherwise than unfair that the intensive producer of turkeys should be in a position to oust the general farmer who raises turkeys as part of his farming scheme. It must be confessed that such a man is more than entitled to his profit, for he has made the subject his own, but it does not seem right to me that those whose financial resources allow them to produce numberless turkeys should profit at the expense of the general farmer. For he is, after all, the backbone of agriculture, and if he includes turkeys in his scheme of rotation, it should not be possible for him to suffer for it. No difficulty is experienced on the general farm till stubble time, and then the situation has been expected and prepared for. Many small farmers now follow turkeys with sugar beet, and reap excellent results from this practice, yet a financial gain is not to be numbered among their advantages. Probably this intensive attitude has gone too far to be checked, or rather to be incorporated into any scheme of rotation, and this may have the very undesirable effect of closing a possible annual means of profit to the average farmer.

If, however, means could be devised whereby the small farmer could continue to produce turkeys at a profit, or some method of balancing the intensive producers' and farmers' birds in the marketing could be thought out and accepted, it would be far easier to keep the industry as a seasonal one—and this is to be desired on every ground. If turkeys could find a place in the general scheme of agriculture, the producing and selling of the birds would become very much easier and would be to the advantage of the industry and the public alike.

There are, therefore, several aspects of the turkey industry which need attention. There can be nothing but praise for the thought with which the birds are reared, for the care which attends their killing and packing, and for the general excellence of the English turkey. But, undoubtedly, steps should be taken—and it should not prove very difficult—to regularise the price position and to see whether something cannot be done to retain the production of turkeys as a part of the farm rotation.

CREAGHT.

A FROSTY MORNING

THE CRAWLEY AND HORSHAM HOUNDS

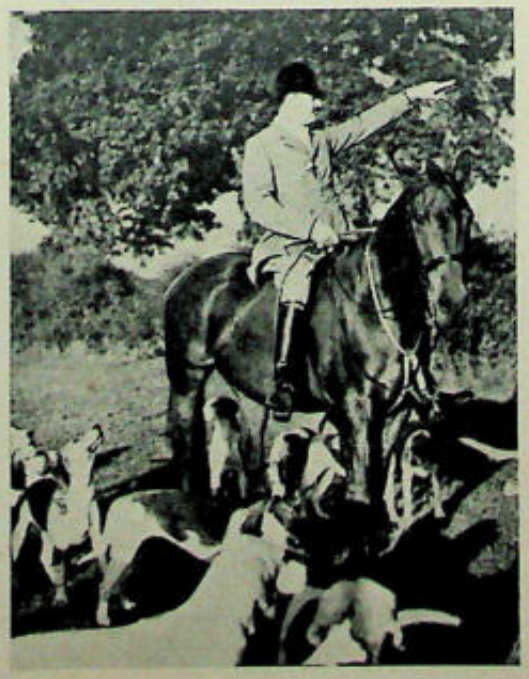
Hunting on the South Downs

THERE can be few hunts in Britain whose country is more close to industry and commerce yet which has been, since time immemorial, the scene of agricultural and country pursuits. For the South Downs, a great part of which is hunted by these hounds, are the most anciently inhabited district of England, and no one can see the dykes of Cissbury Ring or the heights of Chanctonbury without being impressed by their atmosphere. I must confess that in writing this article I confine myself entirely to hunting on "the Hill." My appetite has, as yet, merely been whetted by what I have heard of the difficulties of the Weald.

It is generally possible to point to a definite date as the year in which a hunt originated. But it has proved impossible to ascertain such a time with the Crawley and Horsham. Hunting has existed in this country since 1675, though the fox has not always been the quarry. Mr. Lee Steere took over the hounds in 1832, and hunted them—he owned three other packs—at his own expense. The name "Crawley and Horsham" emerges for the first time in 1840, and ten years later Mr. Edward Stanford, of Warninglid, was the first Master to appeal for a subscription from his followers. Some few years later the joint Masters were Sir Robert Loder and Colonel A. M. Calvert, whose son may be said to have saved the pack during the difficult days of the War. It is interesting to note in passing that the present Lady Loder is a most successful breeder and exhibitor of Red Poll cattle. Colonel C. B. Godman followed this joint Mastership, and he will long be remembered for his courage and originality in the breeding of the right type of hound. Later, Colonel McKergow was Acting Master under a committee, and in 1928 he was joined by the Hon. Guy Cubitt, who, in the season of 1933, became Acting Master.

The huntsman is C. Denton, who came from the Warwickshire in 1928. The first whipper-in is George Knight and the second R. Hiron, who came last season. Hiron must surely have one of the most melodious, far-carrying and unmistakable voices in the hunting field to-day. My horse has heard it only four times, yet, being a most knowledgeable animal, he is at once eager to be off as soon as he hears that lovely cry floating across the valleys to the hilltop. There are 50 couples of hounds, and the kennels have been moved successively from Warninglid (where they were in Mr. Stanford's day) to Staplefield, and finally to their present position at West Grinstead, where a great deal of money has been spent in making them a worthy home for so fine a pack.

The Crawley and Horsham country lies wholly within the boundaries of Sussex: The most northerly point is Ockley, and the most southerly the sea at Worthing. Often, during the extraordinary November heat this year, it has been most refreshing, if only in a negative kind of way, to look beyond the sweating horses to the coast, and to see the cold sea glittering under its golden mist. Yet nine out of ten of the men on the ships I could see long for work ashore! But I certainly envied them after the meet at Sullington Manor recently, when, after a brilliant gallop of some 47 minutes, we looked down from High Salvington.



THE HON. GUY CUBITT, M.F.H.

The most easterly point is Haywards Heath, where I imagine building activities must be having their usual effect, and the most westerly is the ancient village of Pulborough, a boundary which adjoins Lord Leconfield's country—a noted and experienced foxhunter and hound breeder to whom the excellence of the Crawley and Horsham hounds is in no small measure due.

The history of the hounds themselves is a long and interesting story, and those who would care to go into it thoroughly should consult the admirable Notes compiled by the present Master. As early as 1867 Colonel Calvert determined to breed hounds suited to the country, and he realised that he was really faced with two countries—the Hill and the Weald. He started a most successful line from Chieftain '77, and then when Colonel Godman was Master there was introduced fresh blood from the Warwickshire and Berkeley countries. During the War the pack suffered a great deal, and it was fortunate that Colonel McKergow consulted Lord Leconfield when peace was proclaimed. Lord Leconfield knew better than anyone the type of hound required for the country, and soon the Crawley and Horsham pack regained its old excellence. Later, fresh blood was again introduced from the late Lord Yarborough's hounds.

It is important to note that in the whole history of the breeding of these hounds, each Master has continued the work of his predecessor to this extent—the evolution of an essentially working pack. To this end many different parts of the country have been brought into service, and the remarkable results are obvious even to the stranger who watches these hounds working.

The nature of the Crawley and Horsham country is largely one of bank, ditch and timber, and no one could describe it as an easy country over which to ride straight. I believe that in the Weald the scent is apt to be catchy, though when it is good it provides many a brilliant day. On the Downs it is more consistently good, and a strong, well-bred and short-legged horse is necessary. He must also be sure-footed, for some of the slopes on the Downs remind one of those alarming pictures which invariably seem to bear the caption: "Italian officer going down a steep place." Last time I was out I was relieved to find my horse cantering down them with every evidence of enjoyment and

aplomb, yet there have been occasions when, on the top of a hill, I have mentally bade farewell to everything for which I cared.

Yet these steep hills provide one of the chief joys of hunting with these hounds, for often one may stand on a hilltop and watch them working out their line below in the valley. There is a strange fascination in watching them as they now cross a field, break through a hedge and circle a wood. And these heights are also the setting of some unforgettable pictures. I well remember one November afternoon on the very steep hills above Storrington. A grey mist lay in patches over the village, the three clumps of trees and half-way up the Downs. On a promontory stood the second whip, and as his voice came across to us the sun fell on him so that he seemed to be clothed in fire. Of course, he would not be thinking of that himself, but it is a picture I shall never forget.

The undulating Downs with their clumps of gorse and occasional woods are no less pleasant, and on a grey winter afternoon the Hunt takes on the appearance and atmosphere of an old sporting print. I well remember one such occasion when Arundel Castle stood out above a sea of mist, and three shafts of pale sunlight fell on its ancient battlements.

Wire must once have presented an almost insoluble problem on the Downs, for it is used very extensively by the local farmers. But this obstacle has been overcome by the energy and kindness of a member of the Hunt, who saw to it that wooden jumps were provided in the wire fences. The skill with which these jumps have been placed is a great tribute to his knowledge of the country, for whichever way hounds run it is always possible to be with them. Since the jumps are strongly made up one naturally clears them or takes a purler—and "a fall's a hawful thing." But these upsets are considerably lessened by the fact that the take-off is usually from firm ground. The only other kind of obstacle I have encountered on the Downs is the typical Sussex gate. These can be quite high, and the take-off is sometimes a sea of mud in wet weather. It is as well to accustom one's horse to the knowledge that he cannot brush through these jumps—a valuable piece of advice which was given to me some seasons ago both in theory and in practice.

Anyone who has any doubts as to the desirability of exterminating rabbits should most certainly spend a day hunting on the Downs. This is not the time or the place to enter into this controversy in an agricultural sense, though I believe one might be pardoned for such an intrusion at any time. I suppose one gets used to the sort of place where rabbit holes generally exist, but it is not always possible to judge. Only a few weeks ago a galloping horse put his foot into a well-concealed hole and the result was broken limbs for both horse and rider. It is a problem which can be met only by a determination on the part of every farmer in England to get rid of these costly and dangerous pests completely.

A MEET AT HOOKLANDS PLANTATION

While on the subject of farmers, it is most pleasing to note the friendly relations which exist between them and their local hunt. One farmer of 80—the oldest, I believe, in Sussex—is out regularly, and it is good to note the number of young farmers who still find it possible to hunt despite the general plight of agriculture. It was no idle rhetorical flourish on the part of the Master when he said: "Nothing can be finer than the fact that the local hunt races are looked upon by all living in the countryside as the greatest gathering of the year; somewhere where farmers, keepers, ploughmen and their wives will be sure to meet their friends, and something that each will remember as a subject for jolly conversation during the next twelve months."

Without doubt the atmosphere of hunting on these Downs is not to be assimilated in a day or even in several months. During the season proper hounds meet here only once a week, and it is possible to have a succession of stormy days. Such was the case two years ago when for six weeks or so at a stretch every Thursday was wretched. Gales blow the thick and icy mists in from the sea and only a love for the sport tempts one out at all. Nor is this the only difficulty, though here I speak entirely for myself. I yield to no one in my ability to become completely lost. I have been lost in the uninhabited forests of Finnish Lapland, in the dangerously inhabited regions of the Atlas Mountains and among the deceptive tors of Dartmoor. But I know of no feeling of helplessness comparable to the one which frequently descends on me when hounds have been taken home and no one is going my way. The prospect of a night on the Downs is not a pleasant one, yet always some familiar object comes into sight and home is just on the other side of the hill.

But there always remains the fascination of hunting on the South Downs. When hounds are running well there is the excitement of the chase which often develops into a kind of battle, and when, though rarely, covers are drawn blank, one is still surrounded by some of the most beautiful and pregnant scenery in England. I have hunted in many parts of the country, but never have I experienced more truly the essential joys of the sport than in those days spent with the Crawley and Horsham.

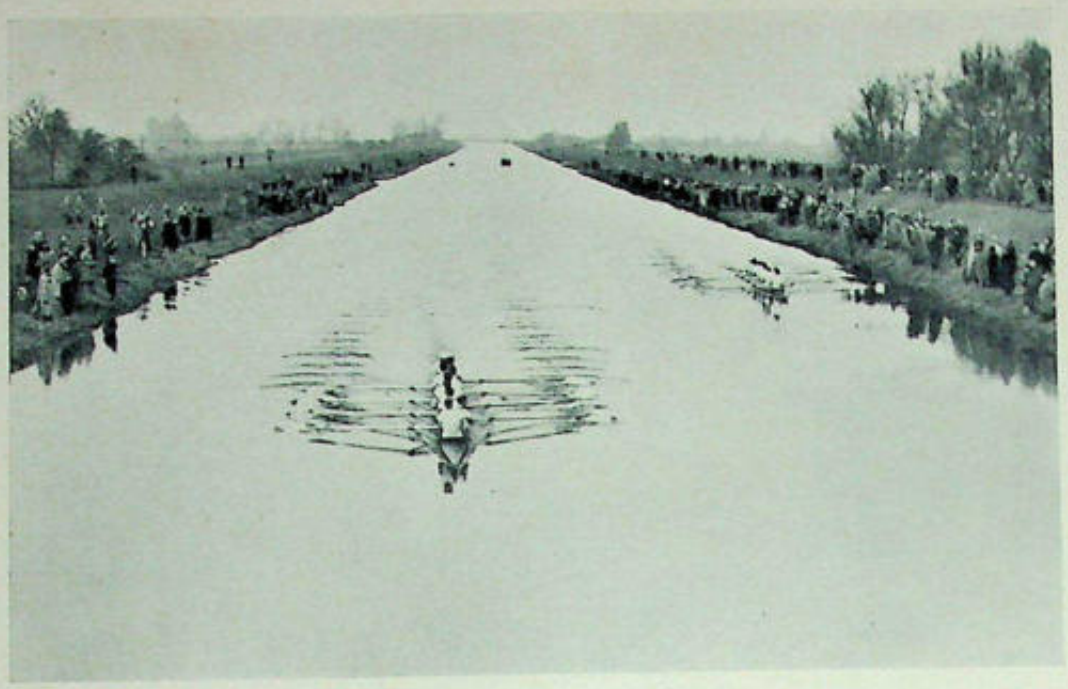
THE MASTER TAKES ADVICE BEFORE MOVING OFF ON A CUBBING MORNING



THE FINISH AT QUEEN ADELAIDE BRIDGE
"B" crew, stroked by E. B. N. Mitchell, gaining a somewhat surprising victory

AT HENLEY AND AT ELY

The Cambridge President Has the Harder Task

By E. E. D. TOMLIN

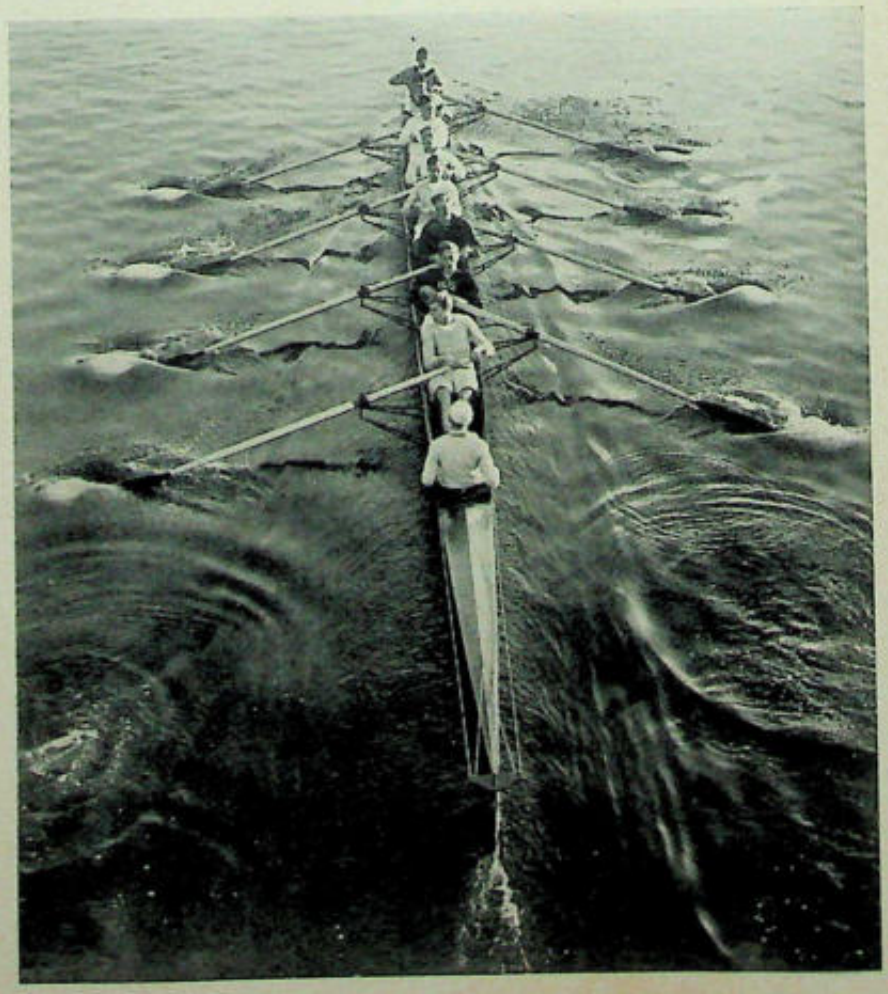
ABOUT this time of year I am always on the look out for the man who will tell me about next year's Boat Race. Yet even although I may never meet him, I know perfectly well what he has got to say. After all—he will point out—here are Oxford and Cambridge. They have their huge boat clubs, their various races on the Isis or Cam; their "Old Blues" whose ability is fairly well ascertained. And then come the trial eights; where you have sixteen picked men (to make things easier) racing against each other over a distance somewhat approaching that of the Boat Race course in length, and watched by as representative a selection of expert oarsmen and coaches as one would wish to find on any day of the week. And yet sometimes right up to a short time before the race the crew isn't decided. Good gracious! And this is his parting shot—when all is said and done, it should be the easiest thing in the world to choose a good crew for the race. Precisely. When all is said and done. And here we are, after Oxford and Cambridge have both rowed their trial eights races; with so little said, and still less done; and so if I do not attempt any serious forecast of either University crew I have my excuse ready to hand.

This year whereas J. L. Garton, the Oxford President, brought two very evenly matched crews to Henley for the lock-to-lock course, Burrough's crews at Ely exhibited certain differences in style which were obviously the result of design on his part, and it is interesting to see what effect the policies of the respective Presidents may have on the serious training early next year. Take Oxford first. It is clear right away that there is still no likelihood of the "Tideway" or "Jesus" style finding much of a place there yet. Garton has produced material trained on principles which are definitely orthodox, and his two crews showed a refreshing drive with body and legs in the strokes they rowed. Bourne's crew, which won a close race, gave one the impression of greater drive, particularly at the finish of the stroke, but on the other hand Esplin's eight was often the more lively combination. Clearly the immediate problem is to find a stroke. While Hodgson was available that sort of question did not seem to arise to any great extent. But there is quite a good choice of experienced men for the job. Garton himself has stroked many fine crews at Oxford and Henley, yet is almost too good an oar to risk loss of form as the result of the added responsibility of stroking a University eight. There are not many people who can touch him as a neat quick bow. Waldron, Forbes, and Stewart, the three available Old Blues, have all had experience, too, and Stewart in particular has made a fine reputation as a racer. But here again I feel that to put any one of these experienced men at stroke is to leave a serious gap in the rest of the crew. In the trial eights this year, Bourne, Esplin and Bingham all revealed possibilities. Bourne is very long in the water, quick off the stretcher, and, although seemingly of frail proportions, has astonishing stamina. He seems to follow closely the principles which made his father so famous as a stroke. Esplin is smoother and more collected, yet does not appear to exercise so much control over his crew, while Bingham, although light, has stroked many successful crews, very largely through his great dash and racing power.

Of the other trials men this year, Huse, Burnell, Nelson-Edwards, Slemeck and Stockton were outstandingly good. Of these, Huse, this year's secretary, is probably one of the most successful Oxford men who has, as yet, not got his Blue; while Burnell promises well as a heavy-weight despite a certain lack of control of his slide at the beginning of the stroke. He rows a really fine blade. Nelson-Edwards is likely to be a fine, orthodox oarsman, and his style is very reminiscent of that of Forbes, when he was a freshman last year. Both Slemeck and Stockton are men who use their bodies and legs together—something of which we see less and less in the rowing world as time goes on; more's the pity. There is plenty of good material at Oxford this year, although the loss of Cherry and Hodgson is likely to be keenly felt.

At Cambridge I think Burrough has a harder task than Garton has at Oxford. On the Cam the Jesus style is supreme, and justly so, because there has been nothing to touch it there for years. But somehow things have not proved so good on the Boat Race course, and after two defeats—albeit after magnificent races—Cambridge this year seems to be on the brink of important decisions. The position has not been made much easier by the fact that two of the finest freshman oarsmen either University has had for many years—Buxton and Magniac—both come from Eton, and thus do not take too readily to the "Jesus" style. Further, the crew which won the trial eights race at Ely, although stroked by Mitchell, a Jesus man of great experience, and containing all the other Jesus trial caps in Hamilton and Wooll, yet at the same time included Buxton, Sanford and Parker, whose hearts are surely still lost to the more orthodox style? So very little seems to have been determined about the mere question of rowing technique. On the other hand, it seems that the choice of stroke is less of a problem here than at Oxford. Turner, this year's secretary, might well have stroked last year's Cambridge eight, while Sanford was also in the running for a time; and of the two trial eights strokes, Mitchell has further enhanced his reputation after his convincing win at Ely last Saturday. What is a puzzle, however, is the fact that each one of the three men already named inherently favours a different style of rowing. What a task for Burrough!

The outstanding men at Burrough's disposal are undoubtedly Turnbull, Magniac, Wooll, Sanford, Buxton and Mitchell. Of these, Turnbull and Sanford are the most experienced—Turnbull, indeed, has rowed in the successful crew which London Rowing Club sent to Australia early this year, and also in the four which won the Stewards Cup, at Henley, this summer. Sanford's performance in winning the Colquhoun Sculls, in the fine Goldie crew early in the year, and in numerous others at Cambridge and Henley, should make his claim for a place very strong indeed. Neither Buxton nor Magniac seems quite at home with the new style yet, but should be able to adapt themselves a little more readily after further practice. On the other hand, Wooll, though a Jesus man, has many of the qualities one looks for in the orthodox oar—notably a good long finish. Mitchell's reputation as a stroke stands high even outside Cambridge.



OXFORD "A" CREW
The winners of the race shooting Henley Bridge on their way to the start

The Oxford order of rowing was:—

"A" Crew.

A. G. C. Whalley (Bishop's College, Canada, and Oriel), bow; J. R. Bingham (Bedford and Pembroke), R. C. Furlong (Wellington and Trinity), G. H. Nelson-Edwards (Shrewsbury and Brasenose), J. M. Blair Fish (Dauntsey's and New College), R. D. Burnell (Eton and Magdalen), G. Huse (Upper Latymer School and Oriel), R. M. A. Bourne (Eton and New College), stroke, and D. L. Smithers (Downside and Pembroke), cox.

"B" Crew.

W. S. Atkinson (Radley and Hertford), bow; R. H. Hillary (Shrewsbury and Trinity), J. Milburn (St. Paul's, Minnesota, and Lincoln), K. H. Robertson (Wellington and Corpus Christi), A. G. Slemeck (St. Edwards and St. Edmund Hall), D. W. Gieve (Shrewsbury and New College), J. S. Stockton (Shrewsbury and Trinity), I. G. Esplin (Sydney and University College), stroke, and H. P. V. Massey (Upper Canada College and Balliol), cox.

The Cambridge order of rowing was:—

S. M. King's Crew.

C. N. C. Addison (Roxborough and Pembroke), bow; I. R. Fraser (University College School and Lady Margaret), J. B. Massy Greene (Geelong and Clare), P. Bradley (Shrewsbury and Pembroke), A. C. O. Magniac (Eton and Trinity Hall), J. Turnbull (Geelong and Clare), J. J. Holden(Geelong and Clare), S. M. King (Marlborough and Pembroke), stroke, H. T. Smith (Eton and Magdalene), cox.

E. B. N. Mitchell's Crew.

G. I. Hamilton (Shrewsbury and Jesus), bow; A. E. Wooll (Monkton Combe and Jesus), H. Parker (Tabor Academy, U.S.A., and Trinity Hall), J. C. Gosse (St. Peter's, Adelaide, and Trinity Hall), E. G. P. Sherwood (Marlborough and Christ's), C. B. Sanford (Eton and Trinity Hall), M. Buxton (Eton and Third Trinity), E. B. N. Mitchell (Shrewsbury and Jesus), stroke, W. E. S. Bain (Loretto and Jesus), cox.

EARLY IRISH SALMON

A Chance for a Fish in January and February

By H. D. TURING

SALMON rods have one advantage over other anglers: they do not have to wait so long between seasons—provided, of course, that, like the wind, they can blow where they list. Indeed, it is quite possible for a salmon angler by fishing out the season on Tweed and starting a new one in Ireland, to leave his rods idle for no more than one month in the year, and that month December, part of which at least may be passed in Christmas festivities; little more than time to have the necessary repairs and replacements made to his tackle.

Ireland, or Éire, to give the Emerald Isle its official title, holds more attractions for the spring salmon fisher than it did some 20 years or more ago. In the first part of the century the bulk of its salmon came into the rivers in the summer months, from June onwards. They were, in technical language (and can there be any better sign of anglers' interest in the natural history of their sport than the growing tendency to adopt technical terms?), "grilse and small-summer fish," those fish which only spend a few months in the river before they spawn, in contradistinction to "springers," which arrive during the winter and spend practically a whole year in fresh water.

A recent report of Mr. A. E. J. Went of the Fisheries Department in Dublin shows that the average number of fish caught in February between 1930 and 1936 was more than double the average of 1900–1909; and in March for the same comparative periods more than two-and-a-half times as many. Those, of course, are market figures, taken from the net catches, but it shows very well how many more spring fish get into the Irish rivers nowadays.

What are the prospects for next year? Eire, like our own western seaboard, has been suffering from a shortage of salmon this year, and it has been freely mooted that "something has gone wrong in the sea." It is a safe kind of opinion to hold, since no one can prove it to be wrong, but the Scottish Fishery Board's marking experiments cast some doubts on its correctness. Most of the fish, even on the west coast, which have been caught and marked run back again to the north and east coasts; and some of the grilse went to Irish rivers. If they all come from the same sea-feeding grounds it would be inexplicable that some accident in the ocean should affect Atlantic coast rivers and not those which empty into the North Sea. So the idea that Atlantic rivers are necessarily a poor speculation for fishing is not really well founded.

Anyhow, most rivers ought to have seen the bottom of their slump, and without there being much real hope of a bumper year in 1939 there is at least a hope of something better than this year has provided in the west. For most anglers—apart from a few fortunate proprietors—Ireland certainly offers the best chance of making a beginning in the New Year. Actually, one of the free rivers opens on January 1st—the Lennan—though the best bit of it is privately owned, and another, the Bundrowes, which connects Lough Melvin with the sea, also opens with the New Year. Here the Hamilton Hotel at Bundoran has some fishing.

For the best chances of early salmon fishing, for rods who have not the entrée to strictly-preserved waters, one must wait until February. Then there are half a dozen among the early rivers from which a choice can be made. On the south coast there is the Suir, not so famous as it was in "the old days," but it has been fishing better lately. It has a run of large-spring fish, which come in early, and there is a ticket water at Clonmel. The famous Blackwater, a little further west, has also a good spring run, but there is little chance here for a man unless he is prepared to rent a beat. The Maigue, which runs into the Shannon estuary, opens on February 1st, and has fish in it from the opening day onwards. The Dunraven Arms, at Adare, has about a mile of water on one bank. Northwards up the west coast there is the Sligo, where the fish run very early, though they are mostly small fish, averaging about 9lb. The salmon fishing available to visitors at Sligo is, I believe, in Lough Gill, and is restricted to two days a week. It is obtainable by becoming a member of the Sligo Anglers' Association, but there are probably possibilities of getting more days fishing by local enquiry.

Those, of course, do not exhaust the possibilities for anglers who are prepared to rent a beat for themselves. The Lee has an early run. Particulars of lettings could be obtained from William Haynes and Sons, the well-known tackle firm in Cork. There is a record of a 45lb. fish from the Lee caught by Sam Haynes in 1902. Such a weight is quite exceptional, but there are occasional 30-pounders to be caught. Short-term tickets are not often available, but there are half a dozen fisheries between Cork and Macroom which are let by the month.

There is even free spring fishing to be had on the Nore, at Kilkenny, where the fish run early and are big, what there is of them. A 40-pounder from a free water is not an impossibility. Most of the fishing is spinning, but whether it would be worth anyone's while to go to Ireland for it is another matter.

SALMON IN THE SEA

OWING to the marking of salmon in the sea on the Scottish coast in recent years, much light has been shed on the migrations of the fish in salt water, but in addition to the long-range movements and the migrations of lesser extent when within range of their own river, salmon in the sea, wherever they be on the coasts, have certain characteristic movements in common.

The usual conception is that they approach the shore at some point on the way from the feeding grounds back to their own river, and then swim straight along the coast-line until they reach the river mouth. The very extensive series of nets situated all along the east coast of Scotland shows that this cannot be the case. The nets are so thick that fish moving from any point in one direction parallel with the shore would very quickly all be caught up; and at certain places there would not be room for such a movement even to start. Some bays are full of nets, some of these ranges of nets may be within 100yds. or 200yds. of each other, and may extend for half a mile beyond low-water mark. For such nets to fish well, and they commonly do fish well, it is essential for the salmon to adopt an on-and-off movement, first towards the shore and then away from it; with each on-shore move some at least will run the risk of capture.

Marked fish have been known to move between points from 5 to 50 miles apart along a thickly netted shore, and if they performed this migration in any but the erratic way indicated all would be caught up by the nearest nets.

An indubitable controlling factor which brings the fish close to, or takes them far off, shore is the wind. If it be blowing from the open sea then the fish come in to the lee shore, but if, on the other hand, it be blowing off the land then the fish move out into the deep. The reason for this is obscure. If the fish were feeding, then one might think that they were following small food organisms driven before the wind, but they have ceased to take food before they come into shallow water.

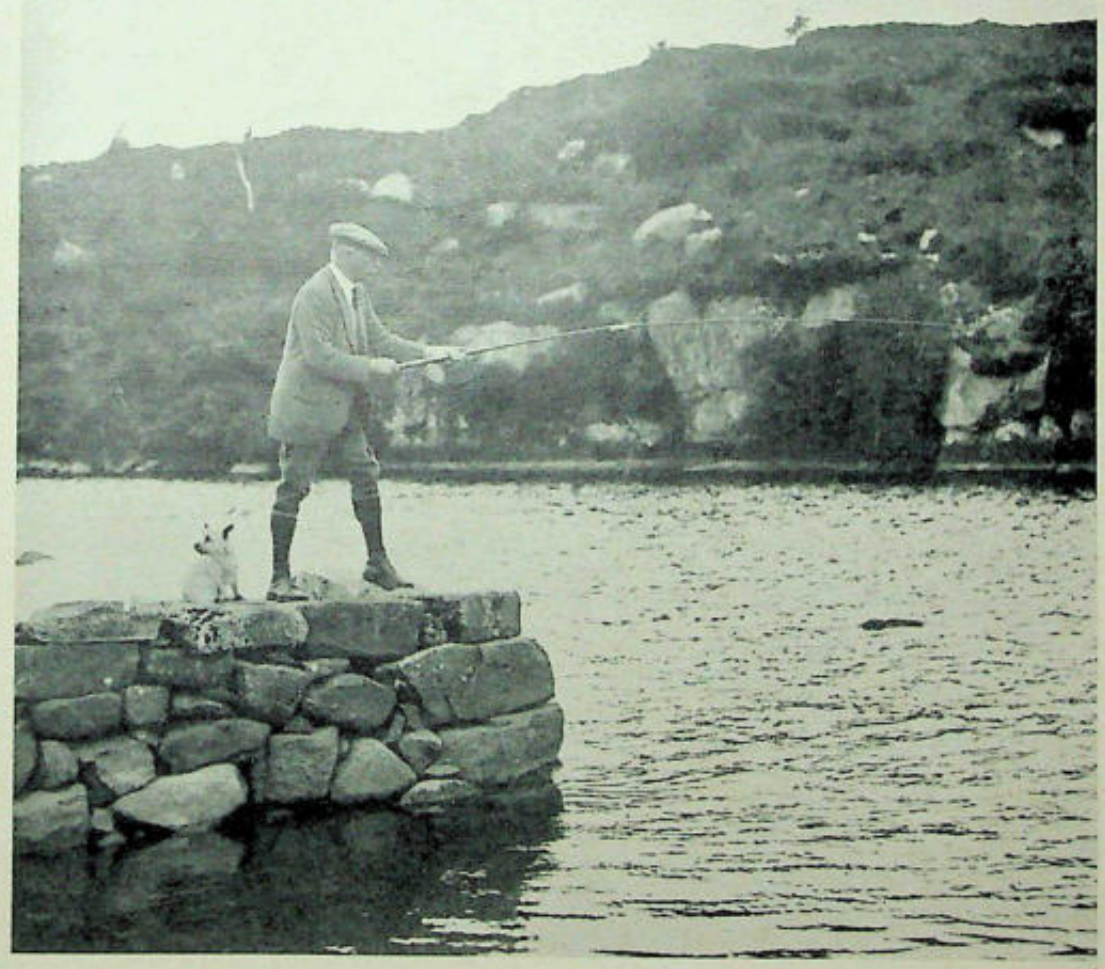
If they were seeking oxygen, one can also think of them as finding it in the breaking waves, but again sea water is normally fully aerated. The only thing that does keep them off a lee shore is a sufficient amount of wind and sea to bring a great deal of sand into suspension, and this, owing to the obvious chance of irritation of the gills, is understandable.

This on- and off-shore migration is of practical importance to those in charge of rivers down which there is a possibility of letting an artificial flood. Of such a flood the fish have no warning such as they seem to experience in the case of a natural flood, and if, when the water reaches the sea, they have been driven from the shore by a wind off the land, then they are not at all likely to feel the influence of the artificial flood water; such spates should be timed to arrive in the tidal waters, if at all possible, when the wind is blowing into the mouth of the river.

Salmon in the sea undoubtedly realise when there is, or is about to be, a natural flood in the rivers, and they then hasten from salt towards fresh water. In some situations they can undoubtedly realise the presence of fresh water, at least in the upper layers, if not at all depths, where they are. In other situations, far removed from the mouth of any river, it seems to be at least doubtful if they can possibly feel the influence of any fresh water, and that it must be some other factor which warns them of favourable conditions for the ascent of the river which they are seeking.

This characteristic is shown quite clearly throughout the season by reason of the fish which are known to ascend the rivers during flood conditions, and particularly during the time when the waters are falling, after the peak of the flood is past. In the earlier months this movement is to some extent masked in the sea by reason of the fact that fresh relays of fish are approaching the coast from the outer ocean, but it is more clearly demonstrated in July. By the middle of the month few fish remain to come in from the feeding grounds, except in one or two favoured districts, and a flood at any time after that practically denudes the whole coast of both salmon and grilse.

PISCATOR SENIOR.



A NEW YEAR'S DAY SALMON RIVER

On the Lackagh which shares with the Lennan the merit of opening the season

TWO BIRD ARCHITECTS

Their Private Lives and Types of Technique

A PENDULINE TIT PUTS SOME FINISHING TOUCHES TO THE NEST

THE wonder of the delicacy of construction to be found in birds' nests is a theme almost trite. Yet it would be difficult not to feel the fascination of this branch of bird behaviour. Dullard, indeed, is he who can pass unconcernedly by a long-tailed tit's remarkable globe nest. What, too, are we to say of him who can blasély ignore such marvels of bird architecture as the reed warbler's deep cup slung in the waving reed stems, or even the song thrush's mud-lined home? The theme may be trite, but the interest of the subject must always remain.

Nevertheless, for all that I enjoy as much as ever the beauty of British birds' nests, it was a very real delight to find during a visit to the Camargue two new (to me) bird architects of note—the fantail warbler (*Cisticola j. juncidis*) and the far-famed penduline tit (*Remiz p. pendulinus*).

Neither of these two species finds a place on the British list—not even as members of that great group of birds which by reason of isolated occurrences we are pleased to call our own. Nor, indeed, is their appearance to be expected, for the fantail warbler is a sedentary Mediterranean species, and a weak little mite. Remiz, too, is a resident, and does not move far from its native haunts. "Straggling on migration"—our usual method of adding these rarities—is therefore ruled out in the case of these two birds.

From the point of view of plumage, the fantail warbler is not at first sight a very striking bird. Light on the underparts, brown on the back streaked with darker brown—such it is, or little more. If it must be likened to any of our better known birds, it is in plumage reminiscent of a light coloured grasshopper warbler, but with the habits of a sedge warbler and with many of the mannerisms of a bearded tit—a strange mixture indeed! Yet those were the varying impressions I received as I watched it from a hide at a few feet away from its nest.

Along the Mediterranean littoral, where I have watched it in Andalucia and Provence, it is a bird of the marsh country, and here it chooses for itself a very typical habitat. It is not a bird of the big reed beds nor of the salt marsh. It prefers the rank marsh grass, and particularly where this begins to alternate with the true rushes and the boggy vegetation. Wet ditches seem by choice to be rarely far away from its nest. In such environments it is a common bird, yet one which by its very insignificance is easily overlooked, unless the ear is ready to pick up that incessant "seep-seep," which is the fantail's alarm note. Once this call is heard, the eye will not be long in finding the "songster," for these oft-repeated alarm notes are uttered in the air, as the bird flies in weak undulating circles round the intruder.

This call note denotes the presence of a nest and, difficult though it is to find, this is indeed well worth a prolonged search, for if the fantail is an insignificant little bird to look at, as a bird architect it is in the highest class. For building material it uses spiders' webs. These it skilfully weaves round the grass stems to form a nest of a type which we associate more with insect cocoons than with birds. In shape, when completed, it is like an electric light bulb or a Chianti bottle. The bottom half is a beautifully neat and symmetrical globe of growing grass amazingly woven together with the spiders' webs. This gives on to a long funnel similarly constructed at the top of which is a small entrance hole about the size of a florin. It is as much a marvel of camouflage as of construction, for it can readily be imagined that so natural a conglomeration of grass stems easily passes unnoticed. So inconspicuous, indeed, is it that it defies the eye of the camera even at the closest quarters. The illustration below shows the entrance hole clearly, but utterly fails to reveal the true nest that lies beneath it. This is no fault of my lens, but merely a high tribute to the fantail's sense of camouflage.

The nests vary quite a little in their shape, size and construction. In all I saw five, and all were different. Some were really quite large in the globe; others so small that it seemed impossible for six chicks to fledge successfully. In some the funnel was quite long; in others it was short and the entrance hole was almost on top of the globe. These nests were in all stages. In the one photographed the bird had chicks; in three others were eggs. Two I saw building. It appears that the globe is first woven together, the living grasses being lashed together with the web. This done, the birds concentrate on making the inside cup of solid webs, and then gradually extend their binding up the grass stems until the funnel is formed.

Naturally I was much intrigued to see how the fantails would contrive to get in and out of the tiny entrance hole. When it came to the point—as one would expect of course—it was achieved with perfect ease. Indeed, at the nest, the fantail did little of interest, but no bird I have ever watched, not even the bearded tit, has so frequently "done the splits" up and down the grass stems.

Remiz, the penduline tit, can only be coupled with the fantail warbler by virtue of its equally remarkable architectural ability. As its name implies, it is as a bird entirely different. It loves the trees as the fantail loves the true marshes; it is by no means drab of appearance. Yet it favours marsh country, and its nest, if lacking perhaps the superb camouflage of the other, is in no way wanting in delicacy of construction.

Like the fantail, the penduline tit must be hunted for, for tame though it is, it keeps to the tops of the trees and does not advertise its presence—save only, once again, by its note. How often, indeed, do ornithologists have cause to bless the calls of birds for their discoveries! In the case of remiz the call is a thin, double "tsee-tsee," very characteristic and easy to identify if the ear is ready to pick it up. It will usually be heard amongst the lines of tamarisks which line these southern marshland dykes as pollard willows do our own ditches. Remiz, indeed, does not confine itself to the tamarisk, and it may be found in almost any tree, so long as water is close by, and

". . . IT WAS ACHIEVED WITH PERFECT EASE"

preferably right underneath it. Hence the penduline is a marshland species.

At first sight it is not, perhaps, a very inspiring little bird, for, as it is watched at work in the tree tops, it appears a dull brown. But at close quarters it is possible to appreciate to the full the delicacy of its plumage—the lovely soft grey of the head and the rich brown back. And, to be sure, few birds can so easily be watched at a few feet range. Find a nest, and remiz will permit an approach of within 4ft. or 5ft. without taking fright. The bird, indeed, is absurdly confiding and almost contemptuous of man. My photographs were taken at 4ft. range, myself standing on a ladder and my head only covered with a sack. I do not really think the latter precaution was even necessary!

The nest is a very beautiful piece of construction. As the bird's name implies, it is pendent, neatly built into some downward hanging sprig of tamarisk or poplar. In shape it differs little from our own long-tailed tits, but in the penduline the entrance hole has sometimes a small funnel attached to it. The material used, however, is not lichen but the "down" of the fluffy reed tops. Here, again, I had the good fortune to watch the whole process of nest construction. The first stage is to build a complete hoop of reed down round the sprigs selected for the site. The top of this hoop is then strengthened, and the birds thereafter turn their attention to the lower half. This they gradually build up, equally on either side, until finally the whole globe, save the entrance hole, is blocked in. The photographs show a nest about half completed.

The building of this complex nest is done by both cock and hen in equal divisions, and the greater part of the construction is done from inside the cup. One of the photographs shows a bird in the normal building position. At times, however, adjustments to the outside are necessary and the birds then come out of the growing nest to add material where they think it is needed. I was greatly struck by the vigour used in the building. The down was pushed and rammed into place with the beak with great force and persistence. These nests, indeed, need to be strongly built, for in Provence they have to stand up to the blasts of the fierce Mistral—and many are the penduline victims.

FANTAIL WARBLER REMOVING EXCRETA

MINOR TACTICS FOR PIKE

Some Suggestions for Fishing on an Off-day

THERE are times when the capture of pike is little more than kindergarten play—when pike are really on the feed. It is by no means such a simple matter when pike are not feeding, but they can, even at such times, be induced to take a bait, on occasion, by adopting "minor tactics." In summer their coloration, blending so naturally with the surroundings, pike lie amid their weedy and reedy lairs, whence they dart out upon passing prey. In winter, however, the season which mainly concerns us, it is not so easy for pike to satisfy their "inner man." Their lairs, too, have mostly disappeared. Spurred by hunger, solitary fish, they now go out a-roving for food, under which conditions one might happen upon them anywhere.

PIKE FISHING AT SUTTON COURTENAY WITH A SHORT STEEL SPINNING ROD

The more likely spots, however, are known to be in deep, quiet water, holes, eddies, slacks, backwaters, off beds of reeds and rushes, in reedy bays, weirpools and millpools, near roach swims, and off the tails of weirs, islands and mouths of side streams; also in the still water formed in deep corners.

Towards the end of the season, about February, one may look for sport up the smaller side streams, drawns and drains where pike, now paired up, are getting ready for spawning, at which season, too, it is worth remembering that where one pike is caught one may reasonably expect to find the mate.

But though pike may be present in any or all of such places they may not be feeding, and one may have to play upon the outstanding physiological characteristic of the fish—its great voracity. True, if pike just are not "feeding," it would be useless to appeal to their real physical hunger. One can, however, appeal to their innate greed, their weakness to resist food, through their "hungry" eyes which are renowned for being bigger than their stomach. One can arouse their interest, their curiosity, with a view to arousing thereafter more active participation and connection.

I suggest that an attractively-spun artificial is as likely to arouse curiosity as anything. Indeed, given normal and equal conditions, I have yet to be convinced that live baiting will secure more pike than spinning. I have often picked up pike by spinning when live baiters have not had a single "run." Then again, as Partick R. Chalmers puts it in his *At the Tail of the Weir*: "Indeed it is no bad plan to spin first where you will presently swim a dace. I think that, even if *Esox* does not, without more ado, run at you, a spun spoon puts a potential taker on the *qui vive*, and that the live bait will do business with him anon."

And here are one or two other observations. One can put a spinner over a pike half-a-dozen times, yet tempt it at the seventh time of asking. In fishing for pike, there is always hope. Leave a live bait tethered on snap tackle in front of a pike, and it may completely ignore it, yet begin gently to draw it away and it is odds the fish will find it cannot bear to let it escape.

It is a not uncommon experience that pike, although not actually feeding, will be found "playing" with prey. Roach are often caught bearing fresh teeth marks of pike. Those roach, although seized by reason of a pike's natural instinct to seize, were not eaten. If one can arouse a pike's interest, curiosity, or "playfulness," there is always a chance that an angler may also be playing something very shortly.

WHEN PIKE ARE OFF THE FEED THEN IS THE TIME TO AROUSE THEIR INTEREST, CURIOSITY OR "PLAYFULNESS"

How, then, to arouse this interest further? I remember an occasion on which I was spinning in the Hampshire Avon and had tried all kinds of artificials. I had compromised with a nice dace on a natural dead-bait flight. Finally, still in exactly the same area of water, still with the dead bait, I resorted to "sink-and-draw." Fishing from behind what remained of a clump of reeds, I had in this manner drawn my bait to within some 3ft. of the bank when suddenly a pike appeared, enticed up seemingly from nowhere. Motionless, its quivering, stream-lined body remained poised, its eyes riveted upon the bait, apparently debating whether or not it really wanted it, or perhaps whether or not there was anything "fishy" about it. Slowly I began to draw the bait away, and in a moment its great jaws closed firmly across the bait's back.

Another most important point in pike fishing is the question of depth, the depth at which the bait is set or works, and this is, of course, linked up with the question of where pike habitually lie. The answer, surely, is near the bottom. There are, of course, exceptions. For instance, when pike are out a-roving for food, one may pick them up almost anywhere. Sometimes they bask near the surface on a sunny day. I well remember, too (for, alas! I had not my spinning tackle with me), one day last summer on a lake in Norfolk when a monster pike of upwards of 20lb. was swirling about on the top scooping up small surface-feeding rudd.

But when they are not feeding one will see them lying stiff, motionless on the edge of the stream, alongside or just under a patch of trailing weed, head upstream, or else across stream at an angle, head slightly lower than the tail, but always close to the bottom. Pike, then, being more habitually near the bottom, the bait ought likewise to be set or worked correspondingly deep, at least within easy range of vision of the quarry, particularly in cloudy water, but remembering that a pike's eyes are so placed in its head that its direction of vision is rather upwards than forwards. Personally, I am a great believer in spinning deep. Incidentally, too, I have also come to acquire a certain (or perhaps an uncertain!) reputation among one or two of my angling friends for the number of pike I have foul hooked. In one morning alone I achieved the "hat-trick," which at any rate should show that I really do get among the fish!

There remain two more points: One concerns spinning. A more interesting and attractive action can be given to a bait by what I will term a check-cum-sink-and-draw action, achieved by every now and again raising and lowering the rod tip during recovery, and a slightly different direction of travel can be given every now and again to the bait by pointing the rod tip to left or right like a natural fish, darting hither and thither in its efforts to escape. This, of course, is for use when spinning a dead bait, not an artificial, which must be kept constantly on the spin.

My remaining point concerns live baiting. Observation has, I am afraid, shown me that many live baiters will persist in confining their activities to one particular swim hour after hour, and I would suggest that their chances of success would be far greater if, instead of waiting for pike to find their bait, they themselves periodically set out a-roving to find the pike, now trying here, now there, and not just waiting for something to turn up.

NORMAN L. WEATHERALL.

BEST DAYS WITH HOUNDS

Sir Harold Nutting to Resign

ONE met with whole-hearted and widespread regret at the decision of the Master to resign at the end of the season. What an awful pity! What a calamity! Isn't it possible for the "powers that be" to persuade Sir Harold Nutting to carry on, if only for another season. Leicestershire Masters are hard to find; and everything running so smoothly, too. It is unthinkable that a Master of the type of Sir Harold with the true love of fox-hunting and real knowledge of the sport, shall be lost to the Quorn. How many young men are there that even show promise, with the necessary knowledge, &c., capable of taking on a pack of hounds in the shires? May heaven preserve the Quorn from the likes of a few I have seen.

Although scents have been indifferent up to the beginning of last week, foxes have been killed most days, great credit being due to both hounds and huntsman. On Monday when hounds met at Saxelby, a decided change had taken place, conditions improving, and hounds ran really hard the whole week through, some excellent sport being enjoyed. It was very bad luck when their first fox from Welby Osiers was headed by motor cars on the Wartnaby Lane after he had threaded his way through and braved a line of foot-people who, to a man, bellowed in his face. Bewildered, he turned short right and went on into Cant's Thorns, where hounds killed him.

The second fence from Welby Osiers towards the top road usually claims a victim or two, a week last Monday being no exception. One day last season I remember, a little higher up, there were no less than six down. It is not the sort of place you can jog up to and prick over. Wartnaby Fish Ponds, the next draw, held a brace. Settling down on a line pointing for the stone pits, hounds had barely crossed two fields when two or three wandering horsemen turned their fox to the right under Captain John Player's house. Crossing the gated road, hounds skirted Ab-Kettleby Village and ran on nearly up to the Melton main road before bearing right-handed back. Just touching the osiers they ran fast to Asfordby sand holes; whether the fox was again headed here I do not know, but, at any rate, hounds swung back right-handed along the ridge leaving the osiers on the right, went between Cant's Thorns and Taylor's Spinney to the outskirts of Kettleby Village, where the fox again went to the right down the valley to Hollwell Works, hounds marking him to ground close by the slag heap after a very nice hunt. There is no doubt he only just saved his tired old body, hounds having stuck well to him throughout the gallop.

Rain was falling in torrents when they found next. Hounds, slipping away, ran very fast with a fox below Saxelby Wood by Wartnaby Fish Ponds, over the Wartnaby Lane up to the sand holes on the left of Ab-Kettleby Village, where he got to ground. Going back to Saxelby Wood they found, and would have gone over the Six Hills Road had not cars headed him into the top end of Grimston Gorse. Going away on the other side, leaving Grimston Village on the left, he went back right-handed over the road into Dalby Old Wood, hounds being stopped at the top end of Old Dalby Village, thus bringing a topping good day to a close.

The next day they met at Copt Oak on the forest, and after two hours of good hound work and a fox killed in Bardon big Wood, hounds were taken on to Charlie Woods. Finding in Borough Wood, they broke away on the bottom side, the dog hounds hunting with a grand cry in the Charlie Vale left-handed back again into Cat Hill. Going away again scent was catchy, and George went on to a holloa over the Shepshed Road, hounds hitting the line off for Lub Cloud. Turning short to the right they went on by British Piece up to Charlie Knoll Farm, where they threw up. It turned out that a couple of sheepdogs met and coursed their fox at this point, putting an end to what looked like developing into a good hunt.

It was a great pity. We know the country is very wooded and a bit cramped on the forest side, but "By gad!" to those who really love hounds and their music, I know nothing better. Great Dalby is always a favourite meet, Friday being no exception, a large field enjoying a capital day's sport. Finding in Sir Francis Burdett's covert, the bitches were away in a flash, and running with every hound throwing her tongue up to and straight through Borough Wood. They then dipped down into the valley for Adam's Gorse, never checking until a small field of Mr. Burton's was reached and then only momentarily. Going on over a field of plough and up the hill into Adam's Gorse, it could not have been more than three or four minutes before they were away again, pointing for Twyford. Turning left-handed they crossed the Borough Road, and were running nicely towards Marfield, when for no visible reason the fox doubled sharp back and recrossed the Borough Road by the aerodrome. Scent was now failing with a beaten fox in front of them, and it was very bad luck when they were beaten altogether below Borough Wood. He had, however, given us a grand hunt and perhaps earned his freedom. A fox from Thorpe-Trussels, or very close to, took hounds over the railroad by Great Dalby Station nearly up to Eye Kettleby before turning right-handed over the Dalby Road, pointing for the Sandy Lane; from there they went to the right again, the hunt fizzling out at the back of Great Dalby Village. A fox from Ashby Pastures then provided a very fast hunt over the Kirby Lane by Sanham House, left-handed up to the railway nearly to Mr. Burton's kale field and then again left-handed back to below Sanham House, where he got into an old drain.

SCARLET RUNNER.

GOOD SPORT WITH THE PYTCHLEY

NOTHING of great moment happened from Orlingbury on November 28th, except that a brace of foxes were killed in a country which holds many more than even the most experienced foxhunter in this country can remember. Wednesday, 30th, North Kilworth, hounds were running all day, sometimes at a good pace, and in a country over which it is a delight to ride. They settled to run well in the wake of a fox found by Kilworth House. He was headed at South Kilworth Village, but with commendable speed Barker regained touch near where he was found. Then ensued a pleasant hunt at half-speed to near Walton, where he got to ground; time 45 minutes in all.

From Lord Cromwell's good little covert called Thornborough, the pack were away almost at once, and ran hard first in the direction of Gilmorton, then swinging right-handed with only one check to within a field of Kilworth Sticks. From here the pace left nothing to be desired into Walton Holt, thence more slowly, with an obviously tired and short-running fox, to ground in the same almost unstoppable quarry near Walton. A good hunt of just over an hour.

Hounds ran hard in the evening from Swinford Covert; but as the fox persisted in running the swamps beside the River Avon they were stopped near Cattorpe.

Friday (2nd).—Brockhall. Colonel Thornton and his family have been improving the lying in a good spinney near the meeting place. They were duly rewarded by the appearance of a leash of foxes directly hounds were put in. One was hunted at a good pace past Whilton Village, over the point-to-point course and in a circle over a big country past that village again, thence through Little Brington into Nobottle Wood. With no delay the fox was pushed through this big covert and hounds were hard at him in the adjacent village. A combination of some heavily-stocked fields and two lines saved this fox's life, and hounds were stopped while just turning a line near where he was found. It had been a good and an entertaining performance. A fox found in Nethorp was soon run off his legs and killed after a circle of the woodlands nearby. Scent became worse as the day wore on, and two short hunts ended by a brace of foxes being marked to ground.

From Naseby, on December 3rd, a fox was found in the local covert and raced into the village. His original intentions seemed good but, having been headed and viewed at a critical moment by the police-sergeant, was killed. Any illusions of a good scent that this little hunt had aroused were dispelled after a fox had been found in Scotland Wood. Thanks to the patience of the huntsman, the persistence and drive of the pack, a long and interesting hunt ensued, during which many miles of country were covered. Hounds stuck no doubt to their original fox past Clipston Haselbeach to Moss Hall. This fox twisted and turned as a fox will without the scent to drive him, when every stocked field causes a visitation at least.

After Moss Hall the pace did not quicken much as hounds feinted for Thonby, still hunting beautifully, thence up to some badger earths on the Vale Farm. All ground was not much good, but no line was touched, so the fox most likely got in. From Creaton Covert the pace was fast enough to the Spratton—Brixworth Road, and the fences big enough. Afterwards cattle-stained fields brought the pack to their toes and on a fading scent they hunted on nearby to Teeton, past Spratton Sands, where they were beaten. The latest and most reliable information is that the hunted fox from Scotland Wood was seen to emerge from the farm buildings of the Vale Farm after hounds had gone. Had luck been on Barker's side it would have been the true culmination of a fine hunting run.

EMERITUS.

SCENT ONLY FAIR WITH THE BEAUFORT

CHANGEABLE weather, rough nights, hoar frost and bright sun, alternating with sleet showers, have not conduced towards a holding scent during the past week. Late on Tuesday afternoon was the best hunt—most people who were there say—of the season, so far. The day started with dazzling sun and rime ghstening under the north side of every wall, as a large field assembled at Chavenage Green. Union Gorse was drawn first, and a fox was quickly away on the Beverstone side, but with little scent hounds soon checked in the castle grounds, where it was pretty to watch Holland hold them on over the main road, and see how they turned to his horn. They recovered the line and ran on rather slowly by Park Bottom and over the wall country, eventually marking to ground half an hour later in an old oak, in the hollow interior of which their fox had to be left. Next there was a short skurry from Tump Covert to Boxwell, followed by a long jog to Charlton Down, whence a fox went away by Nesley Farm, Park Bottom and on into the hills at Lasborough, where scent started to improve with the sun disappearing, and hounds, getting on terms, rattled their fox up and down and soon succeeded in catching him—always a triumph in that hill country. Returning to Hare Covert, which was blank, they found the last fox of the day in the garden of Mrs. Mitchell's house at Highgrove, an old customer who I was told had accounted for a dozen fowls the previous Monday, and "will never be caught!" Anyhow, he got the fright of his life, as there was now a grand scent when Tom viewed him away with a holloa that rang for a mile in the still, chilling air of the late afternoon. Hounds raced over a steeplechase course of walls and fences to the field adjoining the Beverstone Road, where the fox turned back and went past Hare Covert to Elmstee to near the Hare and Hounds Hotel, where there was the first check after 22 minutes of the very best, led by the Duke, Sir Peter Farquhar, Mr. Rollo Baker, the Duchess, Captain Spicer, and Mr. Tony Warre. Steaming horses and passing cars did not help matters while Holland tried to cast, but the Duke heard a hound speaking on in the Arboretum, and getting together hounds raced away again, continuing the length of Silk Wood and back before fresh foxes and darkness saved the life of Mrs. Mitchell's fox once again.

Wednesday was an enjoyable day marred by heavy showers following the meet at West Littleton. A fox from Dyrham was hunted to Corporation Clump, and on to Springs Farm, where he was lost. Another from Toll Down Quarry got in after a brief hunt, and heavy rain spoilt the next at Lapdown. Later there was a long hunt under much pleasanter conditions from West Kington, through Lowndes Covert, Faggot Pile, Burton, and Centre Walk.

Friday from Tresham was a busy hill day, winding up with a delightful hunt from Park Wood by Oldbury, Dunkirk into Swangrove—made so much the pleasanter by the smallness of the field. Saturday was the reverse; an enormous crowd and ringing foxes making hunting very difficult after the meet at Alderton. A fox from Cream Gorse went to Pinkney Park and turned back. There were two nice dashes from Widleys and a longer hunt from Mr. Smith's withybed at Norton, by Hullavington Station, West Park and Bradfield Wood—all over very enjoyable country—"as good as the Belvoir Vale," said one contented stranger, not realising that he had galloped in circles for most of what was a very pleasant day's hunting.

FIELDFARE.

CONTINUED GOOD SPORT AT CATTISTOCK

CAPTAIN WELLESLEY-WESLEY, of the South Dorset, and Mr. Higginson, of the Cattistock, spent most of last Sunday in kennels. In the morning Captain Wellesley-Wesley acted as host, and showed Mr. Higginson some fifteen couples of the South Dorset young entry that have already come in from walk, and in the afternoon the positions of host and guest were reversed and the afternoon was spent in the Cattistock kennels. Hounds were the topic of conversation; horses were not mentioned beyond Mr. Higginson's remark that the heavy going was playing havoc with his string. "Hardly one of mine could move on Sunday morning after that gruelling hunt Saturday night," he said; "and the weather clerk makes no mention of dry weather for the coming week. I don't know what we shall do." The weather in Dorset *has* been exceptionally wet, and the going is wicked. Scent, although catchy on Tuesday, when hounds met at Wraxall Dairy,

and provided only moderate sport, has been well above the average, and the scentometer which hangs outside my front door has registered above 75 the latter part of the week. I find it a fairly accurate prophet, though I must admit there is a certain disadvantage in knowing that one will not (in all probability) get a decent day. Still, while there's life there's hope, and one never knows what the day may bring forth.

Tuesday, as I say, wasn't much of a day, although hounds managed to kill a brace before they went home. Wednesday, however, the Hillfield meet brought out a good-sized field and an excellent day's sport was provided. Hillfield is on the border of the Blackmore Vale country, and we always have a scattering contingent from that field when we meet there. The dog hounds found their first fox in West Woods, and coming away close at his brush they gave the field a smart 20-minute gallop, past Twisting Alders, up the hill to Batcombe, and then down into the vale again by St. Francis's Home, to mark their quarry to ground near the covert in which he had been found. The second fox was built of sterner stuff, and breaking from Cochrane's he ran past Hillfield and up the steep slope to Batcombe Down, where he swung left through Upcerne Wood and on toward Sydling, only to be rolled over at the end of an excellent hunt which lasted an hour and 25 minutes. On Friday the bitches came to Longbredy Hunt, and they had hardly begun to draw Samways Gorse (not 100yds. from the meet) when a fox was halloaed away on the far side. Settling to the line, they streamed away over the Bridport Road, and swinging left-handed past Iron Railing Gorse and over the Longbredy Road, they ran hard past Kingston Russell to mark their fox to ground at Watcombe. It was a nice hunt, but not a patch on what was to follow. Fox-holes (what a grand name for a covert that has been famous since Squire Farquharson's day !) held a brace. Hounds killed one almost at once, and while Gosden was breaking him up his mate was halloaed away from the far end of the covert. Cheering hounds to the halloa, he jumped on his horse, and in less time than it takes to write this we were all riding hard on the tail of the flying bitches who were driving away over the hills at the best pace of the day. Past Little Bredy, right-handed to Gorwell, on toward Abbottsbury, leaving the Ashley Estate behind them on their left hounds ran, and then a sharp swing to the right brought us up on the edge of Puncknowle Wood with hounds screaming at their fox in the impenetrable covert. As we watched we heard them cross the gully, saw them come out into the open beyond, and drive on again over the downland. How we got over that gully in Puncknowle Wood I don't know, but we managed it somehow, and once out away we went again over the lovely old turf that hasn't seen a plough in many years. But luck was against us—that particular fox knew Puncknowle Wood too well, and knew, too, the safety that lay within its confines, for he didn't dare face the open for long: and the huntsman wisely stopped hounds before they entered the wood for a second time. Back again to Litton Cheney to draw—another fox was soon afoot and this time he didn't get far, for hounds killed not far from Longbredy Village. And then, when it was growing dusk, hounds went back to their kennels in Cattistock—that village where the church bells play "John Peel" every alternate hour of the day.

Saturday, at Closworth, saw the biggest turnout of the week—in fact, the biggest of the month, for Closworth is a very popular meet. Captain Gerald Digby, the one-time chairman of the Cattistock Hunt Committee, and Mr. Dampney, the doyen of Cattistock farmers, the two oldest members of the Hunt, whose memories go back to the days when Lord Poltimore hunted the country, were both out. Captain Digby will be 80 years old in a few days, and Mr. Dampney is not far behind him, and yet both of them still go in a manner that would do credit to any young thruster. When hounds moved away from the meet, Mr. Dampney was riding with the huntsman, for Closworth is his district, and it is he who knows the run of every fox in that part of the world. Hounds found their first fox in his withy-bed—not a quarter of a mile from the meet—and went away toward Netherton Cross hard at his brush. Luckily, they were on the far side of a deep gully from the field and got well settled to the line in the first ten minutes, so important a period in any hunt, and by the time we had managed to get near them they had crossed the river and the Halstock Road and were well on their way to Coker Wood. Scent was breast high, and they drove on through the covert and out on the Pendomer side, swinging left along the railway line and running along the ridge of Abbott's Hill to the end, when they swung back sharp left-handed through Bingham's Byre, recrossed the Halstock Road, and leaving Closworth Village on their left crossed the river at Holt Mill and ran on over the Yeovil Road. Skirting Briar's Wood, they turned left to Yetminster Quarries and there—with any sort of luck—they should have killed their fox, for he was dead beat as he neared Ryme. But "there's many a spill 'twixt find and the kill," and this fox persuaded a self-sacrificing friend to substitute for him, so out of the hedge where he lay beaten popped a fresh fox, and before hounds could be stopped they were away at *his* brush, through Caswell's, over the Yeovil Road again, and on past Holt Mill to Lewcombe, where they were finally stopped at the end of an hour and 50 minutes. The going was so heavy and hounds ran so fast that horses were hard put to it to keep pace with them, and there were many empty saddles, including the senior Master's, but the falling was soft, and no damage was done. The Hunt staff got their second horses at Clarkham Cross, and the order was given for Closworth Firs. Major Budden rarely fails to provide the "leading article"—nor did he on this occasion, and away we went after a good fox—at least, he looked like a good fox, but he was a twisting beggar, and although he kept the field galloping for an hour and 20 minutes he seemed not to want to go far from home, for he ran two great circles round his home covert, and then beat hounds in the end, when he was dead beat, by adopting the same tactics as his predecessor. Still, he chose a lovely line of country and the reduced field had a grand time riding over the beautifully-laid fences in Major Budden's district until darkness made it necessary to stop hounds and call it "a day"—and a very good one it was at that, for everyone, including the foxes.

LINCOLN.

OAKLEY'S NINE-AND-A-HALF-MILE POINT

THE Oakley Hunt scored a great hunt from their meet at Salford on Monday, November 28th. Salford Wood and Moulsoe young wood were blank. Finding in Moulsoe old wood, hounds at once started to run hard. Leaving on the Crawley side with the village on the left and Jacobs Wood on the right, by East End straight to Astwood Village, which they left on the right. Crossing the Newport Bedford Road, but came right and over the Dovecot Road. Leaving Grubs Wood on the left and Stagsden Village on the right, down to Wick End. Hounds were now running at a great pace. Crossing the Northampton—Bedford Road with Solomn Thrift on the left and Bromham Spinney on the right, across the railway into Oakley Park and down to the River Ouse, but came left to Sterington Osiers, where the fox crossed the river. This was in flood, and running very fast, so the Master stopped hounds. Time, 1 hour 50 minutes, with a nine-and-a-half-mile point. Hounds only touched one small covert throughout this excellent hunt. C. S.

THE FITZWILLIAM HOUNDS MOVING OFF FROM HINCHINGBROOKE HOUSE

CRAWLEY AND HORSHAM'S TWO BRILLIANT DAYS

ON November 24th and again on the 28th, the mixed pack were awarded good hunts, and comparison of the two is interesting. Scent was by no means good in the first instance, and yet the point was four miles, and the pace very fast; the "going" was well-nigh perfect, and the country easy to cross, with the opportunities for watching proceedings almost ideal. While standing on the lane at Lullington, Denton took hounds into some kale beside us. We saw the "find" perfectly—hounds drawing up the rows, coming together, one or two leap, a challenge, a scurry, the huntsman's cheer, and then a beautiful "view

holloa " from the south end, the "gone away," and away they went altogether. As we gallop up the hill, hounds hunt up the opposite bank, in full view, to Gibson's field. We are all over hounds now, because our pilot wishing no doubt to put up a substitute, doubles back through the thick briar and makes for the front hill. As hounds enter Biggenholt we halt above this hanging covert and survey the fields below. "There he goes," straight for Rowdell. Shall we go down or watch from the top? Half a minute—why is Denton still standing on top? Why does not the whipper-in holloa? Oh, the hounds! They are hunting up the hill again. How lucky we remembered the hounds. Once over the top, hounds hunt beautifully past Highden to Muntham, where they get on really good terms, and race over Church Hill, across the Horseshoe Valley, with a grand cry echoing in the larch trees, to the Old Mill at High Salvington, where they catch their fox.

On the 28th everything looks set fair for a scent. The meet at Northlands Cross Roads is attended by only a few, the usual few who love to see hounds hunt through the large woodlands, and whose ardour is not damped by the very heavy going, and numerous ghylls. A fox from Honeywood is quickly disposed of to the amusement of all who know this country. Another is roused out of the brambles, and hounds streak after him to Rowhook Ghyll. George Knight holds them over the road little thinking that he would be eight miles away when he next handles them; but so it proved. With tremendous drive hounds ran at top pace through Roman Woods to Bury St. Austens, and going away past Ellens were soon into Summersbury Wood. In this vast jungle hounds divided, six couple going to Baynards, but the main body, going continually forward, were soon taking a long lead on horses by Forest Green. Then came a large newly-hung five-bar gate in chestnut pale fence. Did it stop George or Reg? It did not. But it did stop everybody else. On, on they went, hounds five minutes, then ten minutes ahead, through Etherley, and then the long steep ascent up Leith Hill to the very top, and so at 3.30 p.m. hounds are at last at fault on Coldharbour Warren, eight miles from their starting point, and as was afterwards known, at fault by a well-known earth. It was a great hunt through very difficult country, and it is supposed that hounds never faltered but the once, on the road at Rowhook.

CRAWLER.

FIVE-AND-A-HALF-MILE POINT WITH THE WHADDON CHASE

ON the 29th at Stewkley Cross Roads, always a popular venue, a large field assembled. It was a gloriously sunny morning after a white frost—not exactly a huntsman's ideal of a hunting day. After Mr. and Mrs. Judd had dispensed hospitality, a trot down the Dean Lane brought us to High Havers. Every year this covert seems to get thicker, and it was some time before a hound spoke. Almost at once a fox, an unenterprising little vixen, went away, only to find safety in new earth at Littlecote. While drawing the big double of Mr. North's at Littlecote, a fox jumped up in front of the pack and could only get the length of the field before he was accounted for. An outlier picked up near the Smees provided a slow, twisting, ordinary sort of hunt. Running through High Havers, hounds went on to Littlecote and were run out of scent under Cublington. All the earmarks of a disappointing day were in evidence. The Hook Covert was blank. Perhaps Woodward thought the Jubilee Covert would be, too, as hounds were drawing before the whippers-in had got to their stations. In less time than it takes to write fox, hounds and followers were streaming across the Great ground for Whitchurch; but our pilot, having put the big double between himself and pursuers, ran down it, and recrossed it at the brook. Who knows why scent suddenly comes and as suddenly goes? Really going fast alongside the brook when they turned uphill with the Hook Covert on their right, the pack raced as though in view up the big pastures, with Hartwell Covert on their left to Dunton Great Ground, and from there almost to Hoggeston. Crossing the road they breasted the long hill to Blacklands. Only a good fox would have avoided High Havers, and missed Wendover Gorse, as this one did. Turning right-handed at the Smees, the pack went over Primrose Hill, and checked for the first time near the Richmond Nursing Home. It was momentary. Casting themselves, they hit off the line, and crossed the Mursley Road, ran on to Salden Windmill—here they were in the same field as their fox—only to lose him in the open earths at Salden. It is a very long time since hounds ran as fast over such a delightful line of country for 50 minutes and scored a five-and-a-half mile point. A curious coincidence occurred in the fact that from the bottom of Creslow to the first check at Mursley, hounds ran almost the exact line, field for field, that they did in the classic hunt from Evelyn's Patch on Christmas Eve, 1929. This was the prelude to a wonderful week's sport. On Thursday hounds found in Mr. Bigg's kale at Holborn Hill, and killed near Winslow Spinney, running fast throughout by way of Grandborough and Winslow, with only one check at the former village. This is a five-mile point. On Saturday, under more difficult conditions, they hunted a fox for two hours from Narbury to Murseley, to Swanbourne, and into Christmas Gorse. From here the pace improved considerably, as hounds ran round Grandborough to eventually lose their fox near the village. The point was five miles, but a great many more as they ran.

S. B. T.

DEVON AND SOMERSET STAGHOUNDS' SPLENDID GALLOP

SATURDAY, December 3rd, Cloutsham. Taking advantage of a gloriously fine morning, the Master had the tufters taken straight out to the open moor, where they were laid on to a herd on Wilmersham Common, just above the head of Thurley Combe. The dog hounds went off at a great pace across Exford Common and, crossing Almsworthy Common, turned into Hurdle Down. On Goddard's Allotment the deer divided, most of the tufters running a single hind back through Hurdle Down and across Almsworthy Common into Edgcott Allotment. Running the length of this, they crossed the eastern corner of Downscombe Bog and turned down towards Downscombe, but swung right-handed and crossed above Higher Pitsworthy on to Greenland's Allotment. Racing down over Wellshead Allotment, they crossed the Alcombe Water, and turned up to the Wellshead—Alderman's Barrow Road as if for Orchard Combe, but the hind turned sharp back into Wellshead Cleeve and, heading down the valley, ran right through the Pitsworthy Pond, before turning up through Pitsworthy Cleeve and running through the Hill Fields to water in the Exe just above Downscombe. Alfred held hounds on down the water to the Yealscombe Bridge, when a whistle came from the Luckesses Fields, and hounds were lifted to it and put the hind out of the water. Running up through the Edgcott Plantation, they crossed above Yealscombe Wood, and ran on across the Exford—Simonsbath Road just east of White Cross, and swung right-handed though Withycombe to the Pennycombe Water. Here the hind was close ahead of hounds, which raced her up Shutcombe, and left-handed almost to Brady-moor as if for the Barle, but her bolt was shot, and she turned back into Shutcombe, where hounds raced her down the valley and came up to her just above the Newland's Road, where she was accounted for at 12.15 after a splendid gallop over a most unusual and interesting line.

Going back to look for the other hounds, Alfred met with and laid on to a run hind, which hounds ran into Codsend, but here they got among fresh deer, and after an unsuccessful cast to Horner, hounds were ordered home. PINKERY POND.

THE COTSWOLD'S GREAT HUNT

WELCH was hunting the dog pack on Monday, November 28th, at Brimpsfield Park and a splendid hunt ensued.

Finding in King Edward's Covert a real straight-necked fox, hounds fairly streamed away across Highgate Farm to Cowley Wood.

Running through, they went by the Manor gardens and crossed the Cheltenham—Cirencester Road. Their pilot evidently had the Colesborne Coverts in his mind, and hounds ran hard over the big fields up to Pinswell, into Mercombe, then across to Hilcot. This large domain is always a stronghold for foxes, but hounds hunted in a body with great determination and a wonderful cry, which made the whole valley echo with their music.

Here Welch expressed high hopes of hounds getting up to their quarry, but this stout fox crossed over to Mercombe again and sank the valley down to the Centenary, where hounds were beaten with fresh foxes on foot, after a great hunt with nearly a five-mile point.

Up to now this season, though sport has been good, foxes have shown little inclination for pastures new. This fox to-day was a brilliant exception.

COTSWOLD.

BRILLIANT SPORT WITH THE CRAVEN

WHEN the Craven Hounds met on Saturday, November 19th, at Upper Lambourn, the weather was bright and cool, with a fresh wind blowing over the Downs from the south-west. The Master, Mr. S. D. Player, was hunting the bitch pack. The first draw was Lynch Wood, two or three foxes soon being on the move. Hounds settled to one, and an unpromising start, in the continual heading of the fox by foot persons at Black Bushes, was redeemed when at length they got clear away. Holding Maddle Farm on the left, the bitches brought their fox into Knighton Bushes, and, allowing him no quarter, pushed him through, screaming behind his brush. Swinging left-handed, they commenced to race across the Downs towards Ashdown. Crossing the celebrated gallops on Weathercock Hill, they turned right on the top, and ran parallel with the Lambourn—Shrivenham Road. A second right-handed turn brought them over Tower Hill, and on through Compton Bushes to Woolstone Down. With the Old Berkshire country close at hand hounds made another right-handed turn to the Lambourn—Kingston Lisle Road. Pointing for Hoe Acre, the first and only check of any consequence occurred. The Master held them on, and a clever cast saw the line regained by Seven Barrows Farm. Thereafter the pace was easier. Turning left-handed and with Knighton Bushes held on the left, hounds hunted well through Compton Bushes, and working back to Weathercock Hill, marked their fox to ground opposite to the Ashdown Woods. They had been running for 1 hour and 50 minutes, and had covered twelve miles of country, with a farthest point of four-and-a-half miles.

Only a small field went on with the Master to Lodge. A fox was found, and hounds ran very fast as if for Baydon, but turning sharp back left-handed, crossed the Stud Farm, and, swinging left again, held the starting place to one side. Hounds were running on well through Baydon Hole with a very tired fox not far in front when a cold rainstorm washed out practically all scent. Holding to the line, but hunting very slowly, they went on past Bailey Hill, and were stopped outside Botley Copse at the end of something over 60 minutes. It was a very disappointing finish to a good day. J. R.

THE DUKE OF RUTLAND'S USEFUL WEEK

A TUESDAY meet at Fulbeck is always well supported, and those who went there on the latest occasion were well rewarded. Leadenham Hilltop as first draw is always regarded as the "bread and butter before the cake" of the vale! However, there was nothing penitential about the hunt which soon resulted, though a fiasco was only just averted when hounds slipped away unheard. Conversationalists please note. Disquieting rumours began to circulate when no sound had been heard for some time, and panic set in on arrival at the top of this big covert when hearing that a fox had gone away towards Caythorpe Court. Setting off in despair, not knowing whether directions given were correct or not, it was with the utmost relief that, on approaching the High Dyke, a sharp eye detected the pack streaming along towards Byards Leap. The heath country was a blessing, not only on account of its extensive visibility, but because the pace was such that any larger obstacles might have been embarrassing. The Newark Road is often obstructed by sight-seeing motor cars, but the speed at which hounds had travelled stole a march on such traffic; they crossed to Fanes Gorse and hurried back to the hilltop, being officially timed to have run six miles in 35 minutes. So far and so fast, so good; some of the ploughs, though classed as "light," are hardly built for such *centre à terre* tactics, and it was quite a comfort that a substituted fox was not geared so high. He went over the border into the Biankney country, and was only given up on reaching Wellingore. The day would have scored high marks had nothing further occurred, but in the afternoon there was another most enjoyable hunt from below Leadenham House, which turned into a very sharp burst in the final stages up to Reeves Gorse.

That night it blew hard again, and there seemed a risk that the conditions of the previous Wednesday might be repeated. Luckily, all was well with the weather at Waltham, though foxes were subsequently hard to find in Goadby. There was no doubt about there being plenty in the neighbourhood, and a truant from the Bullamore was discovered lurking in some roots close by. Running out towards Scalford, he set some pretty problems for the field, but the country improved after returning to Goadby Gorse and continuing in the Melton Spinney direction. Nothing further happened until an outlier jumped up close to Thorpe Ashes; then things began to look better once the Melton Road was crossed. One began to hope for the good grass beyond Newman's Gorse, but instead Waltham became the pivot of a large circle and the fox was ultimately caught in a back garden behind the village.

On Friday, Sir George Whichcote's splendid Osbournby Hilltop rounded off a woodland morning with a delightful hunt. There is a specially nice strip of country by Swarby Gorse, which leads to Culverthorpe, and a race over this was just the thing to send the small field home well-contented with the day.

Plungar lies right in the middle of the Belvoir vale, so small wonder that one of the largest gatherings of the season met hounds there. Granby Gap foxes had evidently had warning of their visit, so were not at home, but the intervening fields which lead to Harby Covert were just what was

(*Continued on page* 1403)

BEST DAYS WITH HOUNDS (*Continued from page 1400*)

wanted for the many fresh horses. Within a few minutes a jaunty little fox departed right under our noses, but the bitches were interested in another one inside, and, before long, he, too, was away. After that there was hardly a pause in the galloping and jumping over this particularly "larkworthy" region. Almost every fence in the vale received attention, and the biggest gluttons for exercise must have been satisfied. It is a dizzy job trying to remember the ramifications of the various hunts which would probably have been less circular if the zeal of the followers, both cavalry and mechanised, had been more restrained. The patience of both Master and huntsman was remarkable, and Lord Daresbury's former technique often seemed to be indicated. It is too long since we heard malefactors recalled over a fence. After Kaye Wood had provided a tour, Hose Thorns was called on no less than three times, and at each visit foxes poured out to the tune of the pack hunting others within. The best hunt of this outstandingly busy day was the result of the last call; by then the tumult had substantially subsided and with the bright sun getting low, a hint of the frost to come, gave hounds a chance to settle down to an increasingly good scent; over the lovely line of grass from Hose Thorns to Clawson Village they hunted every yard of it beautifully, then, running up the hill to Scalford brickyard, they were unlucy not to give the *coup de grace* to a very tired fox, which presumably got into a well-won hole by the railway. UNBRIDLED.

I.O.W. HAVE A GOOD DAY

FROM Thorness Cross Roads on Friday the 25th these hounds had a particularly good day. Finding several foxes in Burnt Wood, they spent some two hours in covert until eventually they went away on one who set his mask for Porchfield. This line was over good galloping and jumping country. The field then made for Parkhurst Forest, which he completely encircled, almost entering Camp Hill, the Borstal Institution, but thinking better of it, left the forest and headed back for Burnt Wood, where hounds caught him in the open. Six to seven miles as hounds ran. Several empty saddles and dirty coats. These hounds are not to be denied this season, and may it continue, as I am sure it will. "SABREUR."

A SAD LOSS FOR THE BICESTER

BY the untimely death of Major George Edward Gosling at the early age of 49, this Hunt has lost a good sportsman and a real friend.

Edward Gosling served in the 10th Hussars, a regiment holding a record second to none in turning out the right type of sportsman, such as Edward Gosling was; one who not only enjoyed his sport, did his best on his estate at Stratton Audley Park to provide sport, but was always unostentatious and most generous in helping the Hunt in many ways known only to a few. In the War "Squeaker," as he was known affectionately to his friends, gained the Military Cross, and it was owing to a wound that, after the War, he was compelled to ride side saddle when following hounds, frequently surrounded by his children, whom he loved to initiate in the art of fox hunting.

It will not be until the present generation of fox-hunters has passed away that the name of Edward Gosling will not come to mind when the Bicester draw Stratton Copse.

To his widow everyone who hunts with the Bicester will spontaneously extend their deepest sympathy, and will hope that in some measure it will be a comfort to her to know how much everyone mourns the loss of Edward Gosling, and appreciates all he did for the Bicester and Warden Hill Hunt.

ORION.

NEXT YEAR'S BISLEY MEETING.—The 76th annual prize meeting of the National Rifle Association will be held at Bisley from Monday, July 10th, to Saturday, July 22nd, 1939. The Territorial Army Rifle Association Central Meeting starts on July 9th and ends with the completion of the N.R.A. Service Rifle Championship events on July 12th. Services Week, during which the Army, Royal Navy and Royal Marines shoot off their championship events, starts on July 3rd. There are, it is understood, to be considerable changes in the Army competitions, but their nature and extent have not yet been announced. In the National Rifle Association competitions there are few changes. Targets and weapons will be as for 1938. Additional accommodation is to be found for sporting and sniping rifle events, and there will be new competitions for the .22in. pistol and revolver. The most important change is that affecting the entry of members of the O.T.C. (Junior Division) for the King's Prize, whilst actually serving cadets will be permitted to enter for the King's Prize for 5/- as against the £1 entry for ordinary competitors. Another change affecting Public Schools competitors is that coaching is to be permitted in the Wellington and Iveagh matches. Colonel Lord Cottesloe has been re-elected chairman and Lieutenant-Colonel Sir Philip W. Richardson vice-chairman of the council.

THE NATIONAL HUNT SEASON

Some Bookmakers' Troubles

IT is very seldom that a season under National Hunt Rules does not meet at the very outset with adverse criticism. This season is no exception, for already quite important people are saying that it is time that the Stewards took action against owners and trainers who were running fat horses. In other plainer words they mean to convey the idea that a number of horses running over fences and hurdles at the present part of the National Hunt season are not trying. I cannot see that saying this either in the paddock, or the bar, or in one's club, or writing it in some important daily newspaper is doing anyone any good. Everybody knows that fat horses are run continually not only over fences or hurdles but also on the flat. How many times is a fashionably bred two-year-old expected to win the first time out? How many horses running on the flat last season were not even plated? Yet nothing is ever written or talked about that more luxurious and aristocratic game, racing under Jockey Club Rules. It is only when we come to the winter game that there is the yearly whine. No rule of racing or law of this land can make a man bet if he does not want to do so. A number of laws on the other hand do all that they can do to prevent him from gambling. It is therefore only reasonable that if an owner has a horse about whom he is not really hopeful that he should give him a run telling the rider to win if he can do so. It is done every day on the flat and no one complains. Yet it is done once over fences and hurdles and there is a row. Let us leave the game alone. It has begun well and is increasing in popularity every year. The Stewards of the National Hunt Committee are very wideawake men and they have done a lot for the sport. Just because the *Racing Calendar* does not say that they have had So-and-so up, it does not mean that they have not given him a quiet talking to and a little advice if he has done something which does not look too good.

Lord Harewood's speech at the Gimcrack dinner at York has attracted much attention. He was making a plea for the course bookmaker, whose numbers he stated were decreasing. Like all people really interested in racing he does not want to see him go altogether. Betting is necessary for racing if the sport is to continue and the two forms of betting, the bookmaker and the Tote, should both flourish for the good of the game. Lord Harewood put the decrease of the bookmakers' numbers on the course down to the fact that their expenses were too high. Newmarket, that is the Jockey Club, had tried to help them at the beginning of last season by reducing the charges at Newmarket, but the falling-off was not arrested. It would seem therefore that it is not so much a question of expense. Rather is it, in my opinion, the fact that the game is not as good as it used to be. Those are not my own words, but the words of one of the leading bookmakers of the day whose firm has been a household word on the racecourse for several generations.

What a bookmaker wants more than anything else is turnover, and there is no denying the fact that there is nothing like the amount of money betted to-day that there used to be. There is, for that matter, not the money about. I have heard in recent years leading bookmakers state that they have not taken enough money on a day's racing to give them any real chance of making a book as a book should be made: they have had to gamble. That is one reason why some of the firms have given up or go out only when they think that they will do so. There is also the talk of bad debts, but they have always existed, and when the turnover is large enough they are really allowed for in the odds betted by the bookmaker.

It is of course true that the Totalisator has taken a lot of money away from the Ring, but I doubt whether the figure is very big so far as the leading men on the rails are concerned. The big bettor who wants the odds does not go to the Tote except to have a tenner or a fiver on in case the odds are better. It is not the Tote nor Tote Investors that is causing a dwindling of the bigger bookmakers: it is the absence of turnover due to the fact that the betting figures of the punters have decreased out of all belief. The smaller man is being, without any doubt, frozen out by the Tote and Tote Investors. And, so far as I can see, nothing can be done to save him. At the same time it has to be admitted that he is not necessary to racing. It is the big bookmaker who is wanted and must be retained, but as no one can be made to bet I do not see how his turnover can be increased. What I would suggest, while dealing with this matter raised by none other than Lord Harewood, is to inquire why all the Tote servants and the Tote Investors servants should be allowed in for nothing at race meetings while the clerks and other servants of the bookmaker have to pay through their noses. I am not suggesting that the bookmakers and their staffs should be allowed in for nothing, but I do think that the Tote staffs should also be made to pay.

I have already dealt fully with the two-year-olds of the past season, so that there is no more to be written now even after the publication of the official Free Handicap. Everyone thought that he would place Foxbrough II at the top of the handicap for two-year-olds. He has given this very good American-bred colt 9st. 7lb. Foxbrough II has run only twice, so that in accordance with usual custom he should not have been handicapped, but the authorities gave permission for him to be included as well as Blue Peter, who also has been on a racecourse only twice. Blue Peter has been placed 4lb. below the American colt. I think that everyone who has seen the two-year-olds will agree with Mr. Fawcett's handicapping of these two colts, and also of Panorama and Portobello. Like me, they may think that Meadow has been given too much weight. Scenery is the top-weight among the fillies with 8st. 13lb., which seems to me rather too much. She also ran only twice, winning her second race. She is by Biribi out of Picture, and is owned and was bred by Lord Astor. I think that she may be all that Mr. Fawcett thinks, and I certainly hope that she is for Lord Astor's sake; but surely it would have been better if she had been left out of the handicap.

Mr. Fawcett places Rockfel and Bois Roussel at the top of the Free Handicap for three-year-olds, giving each 9st. 7lb. That, of course, means that he regards Rockfel as the best three-year-old of the season just concluded, for Rockfel being a filly is entitled to an allowance for sex of 3lb. at least. Bois Roussel ran only once in this country, when he won the Derby, so that Mr. Fawcett must be taking a chance about him. He ran only once, afterwards, this year when he was third in the Grand Prix. I hope that both the colt and the filly remain well and sound, and make normal progress during the winter, for when they meet next year together with Scottish Union, Chulmleigh, Challenge, Legend of France, Michoumy and the best of the French invaders in the race for the Gold Cup at Ascot, what a race it will be and what a crowd of visitors.

There was some good jumping, especially among the steeplechasers last week, at Newbury and Kempton Park. As a rule there is a shortage of good steeplechasers at this time of the season, but plenty of hurdlers. This season there are more promising steeplechasers than hurdlers, the latter being much better so far in quantity than quality. Mrs. J. V. Rank's Le Maestro has for several seasons been one of the best hurdlers in training, having won among other good races the Imperial Cup at Sandown Park. He made his first appearance over fences at Newbury in the Kingsclere Steeplechase of two miles. He gave a good, if not better, exhibition of fencing as I have ever seen from a novice and won with his ears pricked. He had been perfectly schooled by poor Gwyn Evans, who met his death the day after this success, when the motor car which he was driving home from Newbury skidded and hit a telegraph pole. He was a trainer of exceptional ability, a wonderful stableman and a most lovable character, with many friends and no enemies. Much more will be heard of Le Maestro as a steeplechaser.

Kempton Park, at the week-end, staged as good a steeplechase as we shall see this year, or, perhaps, have ever seen. This was the Middlesex Steeplechase of three miles. For the last mile, and it may be more, four horses were racing together and jumping together. They were Jovial Judge, Asterabad, Argental, who had won the race the year before, and Savon. Between the last two fences any of the four might have won, but in the end Savon prevailed, winning by half a length from Jovial Judge with Argental beaten for second place by only three-quarters of a length. Asterabad was beaten narrowly for third place. Savon is only a young horse, and had given Airgead Sios a great race over Aintree only a month ago. Somehow or other, he does not look to me like a National horse, being rather too much of the thoroughbred and not quite rough-and-ready enough for that severe test. He is by Schiavoni out of Saffron, and so is well enough bred for anything. He is a very nice horse. So also is the fourth, Asterabad, who, in my opinion, might well have won if he could have been ridden by T. F. Carey. As it was, he was ridden by a boy named Morris, who rode him very nicely and took him into his jumps like an old hand, but he lacked just the strength that Carey would have had in the last few hundred yards. It was a great race, and thrilled a large number of rather cold visitors. GNOSTIC.

STOCK BIRDS BEING GIVEN THEIR AFTERNOON FEED
". . . one satisfies oneself that the stock birds appear healthy and are kept in healthy surroundings and on fresh ground"

THE "FIELD" GAME FARM CERTIFICATE

What It Has Done and What It Can Do

"THIS is to certify that the Game Farm herein named, having been inspected by the *Field*, and having been found to be a genuine business carried on in healthy and suitable surroundings, and further the proprietors having given an undertaking not to deal in live grouse or English partridges, or their eggs, and not knowingly to deal with anyone else who does so, the firm of Mark Over, the Gabriel Game Farm, Colchicus, is hereby granted the *Field* Certificate."

These are the terms of reference of the *Field* Game Farm Certificate, and it is just as well to state them categorically at the beginning of this article. Because the *Field* Game Farm Certificate means everything that it says, but nothing more. When it was instituted some years ago the game farm world was still suffering from the inevitable collapse of the industry during the war. There was plenty of money to be spent on preserving, and the supply of pheasant eggs and pheasant poults was not equal to the demand. Naturally this offered an opportunity to those who did not carry on a legitimate business. Advertisements appeared offering eggs for sale that were almost certainly poached. Others calling themselves game-farmers were merely passing agencies. They bought eggs from A and sent them on to B with no more trouble to themselves than the collection of their profits. There was one authenticated case of a "game farm" conducted from Euston Station, a real stroke of genius as the individual in question, besides reaping the obvious advantages of easy money, had his "office" rent paid by the Midland Railway. Such business is, of course, within the law, but it undoubtedly did great harm to the proper game farms. Accordingly, the *Field* instituted an inspection of game farms.

There can be no doubt that this inspection served a most useful purpose at the time. It was by no means the only factor in setting the game farm world in order; the most important was the energy and technical skill of the game farmers themselves. But it served its purpose of helping to separate the sheep from the goats, and it was widely welcomed by game-farmers themselves.

A certificate such as this cannot naturally last for ever, and the farms holding it and others were re-inspected in 1931 and again this year. In this way the list keeps abreast with new businesses, changes in personnel, and other factors.

Having just completed the inspection of some 33 game farms in England and Scotland, I can say without hesitation that the game farm industry to-day is in an extremely healthy state. My impression is not that there is an amazing diversity of method, but all things considered a very general similarity. A few may favour big laying pens instead of the customary small ones; most have their own view of what constitutes the perfect coop; each have their own idea of the best way to deal with gapes. But in general they work on the same efficient lines, for the system of farming pheasants is by now well known. Nor is this surprising; for in a small industry where there is keen competition those who do not follow the methods that have proved their worth, especially as regards the constant change to fresh ground, will fairly soon go to the wall.

In visiting private estates and other game farms, one occasionally—very occasionally—hears it said: "So-and-so ought never to have the *Field* Certificate"—and a reason given. To this, in fairness to both parties, there is only one answer: "Did you write to the *Field* giving the reason for your complaint?" The answer is invariably, No. If, however, that was done the matter could be investigated, and in extreme cases the certificate withdrawn. Without such action the investigation would not be possible, and the complaint seems a little unfair to the *Field*. Rather more frequently one hears it said: "Oh! such-and-such a farm sent me infertile eggs." Such complaints are more difficult to investigate, because the fault may lie with either the game farm or the keeper concerned. It would not be unfair to suggest that though, of course, mistakes can be made anywhere, the game-farmer is almost certainly an expert on producing pheasant eggs, the keeper may not necessarily be an expert in handling them. The *Field* would do its best to investigate such complaints, and if they were constantly reiterated against a particular game farm it would investigate them most carefully. Though for six years at least this has never happened. But the point I wish to make is that the holding of the *Field* certificate does not carry

A REARING FIELD
"No rearing field should be used more than once in every four years, and its coops should be spread at distances of 25 yards or so apart"

with it a guarantee of 100 per cent. fertility. Bream's Buildings contains no magic wand of that sort—would that it did!

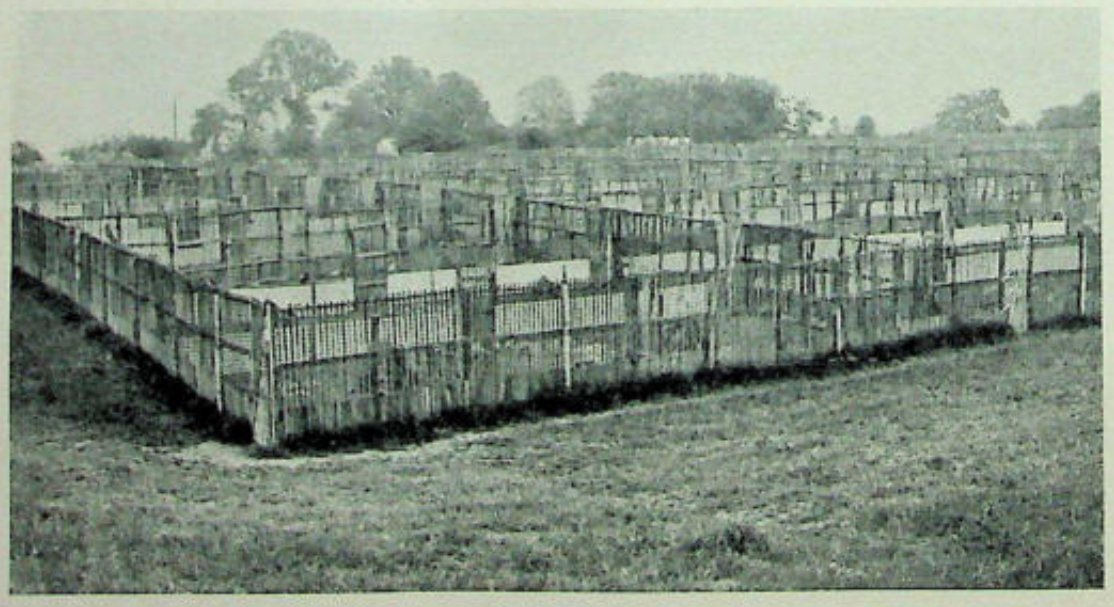
It means, this certificate, no more than it claims. It covers the points that an intelligent observer with a knowledge of game can expect to resolve in a single visit of inspection. Firstly, that the game farm *is* a game farm, and that it has on it the stock to produce the quota of eggs and poults it claims to sell. Of course, there will be occasions when a game farmer has to get eggs from another farm to meet the sudden wishes of an old client, but in general the holders of the certificate sell only their own eggs. Secondly, the methods used appear to be in conformity with modern practice and ideas, and allow for the raising of first-rate stock. In this connection, of course, a very considerable latitude must be allowed. Actually, as I have said, differences of method are much smaller than I had expected. In any circumstances it can hardly be the function of the Shooting Editor of the *Field* to tell an established game-farmer how to conduct his business. The third point is that in carrying out the inspection one must satisfy oneself that the farm has an adequate acreage. It is a first principle of game-farming. No rearing field should be used more than once in every four years, and its coops should be spread at distances of 25yds. or so apart. One naturally looks for a sheltered and sloping field facing south. Fourthly, one satisfies oneself that the stock birds appear healthy and are kept in healthy surroundings and on fresh ground. Naturally conditions vary. Some game-farms are situated so that their stock birds are penned in semi-wild conditions; others in more urban areas are less fortunate, but make up for the difference in locality by closer attention to method. Finally, the holders of the certificate guarantee not to trade in live grouse or English partridges, or their eggs. It has been found that this trade practically always entailed the selling of eggs or birds that had been poached.

It will be seen therefore what the certificate covers. It does not pretend to suggest a close inspection of each year's stock of eggs or birds. To do so would no doubt be considered an unwarrantable interference and would need a considerable number of inspectors treating the work as a whole-time job. In general the certificate is not given to farmers, however well-conducted, who sell less than 10,000 eggs.

In going round the farms one naturally forms opinions as to the respective merits of this or that system, but this is hardly the place to discuss them. There is, however, one complaint which was voiced by nearly every game-farmer, and that is about the modern broody hen. Good broodies are more and more difficult to find. Modern intensive hen farming is breeding all the broodiness out of them. It is a problem they share with the whole poultry world.

YOUNG PHEASANT CHICKS

". . . the Field *Certificate does not carry with it a guarantee of 100% fertility"*



LAYING PENS

The Field *Certificate is not given to farmers who sell less than 10,000 eggs*

It was also suggested to the *Field* that for the 1938 certificate the following additional condition should be added: ". . . . and having given an undertaking to make no presents to keepers except with the written consent of their masters. . . ." The whole game farm world and, indeed, a great many people in the shooting world, must know that there are keepers in not inconsiderable numbers who expect a commission on the money their employers spend on eggs. In the event of the commission not being forthcoming, it is not difficult for certain of these keepers to persuade the owners that for this reason or that the eggs were unsatisfactory, and they go where the commission is forthcoming. In some cases no commission is given; in some cases it is given at a fixed rate, and in a few to outvie the previous best. Such a state of things is not satisfactory. No game-farmer likes it; many will not countenance it without the owner's knowledge; all wish to stop it, but some are afraid that if they do so another firm will profit by their abstention. Naturally there are many cases where presents are given in the most harmless way, and it is acutely difficult to draw the line. Further, where presents are given at Christmas, or at other times, with the written consent of the owner, there can be no possible objection. The practice varies from giving half-a-crown to a man who has helped one to unload a lorry, to offering a bribe to a servant behind his master's back. I do not suggest for a moment that the last-named practice is a habit among game-farmers of repute, but clothed under the more respectable name of commission it exists, and nearly all game-farmers dislike it.

The point at issue seemed to the *Field* to be not so much whether such a stipulation on the certificate was desirable but whether it was possible to enforce it. That the certificate should mean no more than it says has been its object from inception. On mature consideration it was decided that it would be impossible to enforce such a stipulation, though it was in itself desirable, that it might even drive the present system more underground than ever, and that it would inevitably lead to tale-bearing and ill-will. Bream's Buildings is not the office of the King's Proctor.

This point of view was borne out in the letters we had from game farmers, all of whom had been written to on the subject. Of 33 approached 14 were in direct agreement with the suggestion, or prepared to fall in with any suggestion the *Field* made. Of the remainder, eight thought it was inadvisable merely because it was not certain that all concerned could be induced to stick to the stipulation, eight offered no definite opinion, and three were frankly and openly against it. This gives a fair idea of the situation and shows that game farmers share the views here put forward as strongly as the *Field*. The many letters we received were confidential and have been treated as such, but I have obtained permission to quote the following. This is from a small but very efficient game farmer: "It is a known fact that keepers will say So-and-so's eggs will hatch according to how they treat one. This season an estate had the same number of poults from me as from ——. The keeper told me he had so much from —— (very politely), and would expect the same from me." Here is another: "I have great compunction in tipping keepers. I think I have lost a good many orders through not doing so, and I know the firms they dealt with later did it very lavishly." Here is a letter from a game farm doing a very big trade: "This year a client of mine had taken over another shoot. He wanted to give me an order for eggs as usual, but the keeper would not listen to it. My client told me that the firm who this keeper had his eggs from tipped the keeper so well that no other eggs would have hatched." Here is another letter from a large concern: "All we have done is that, sometimes if a fellow has given us an order for 1,000 eggs or so, we have sent him at Christmas a present in kind. We are perfectly aware that in heaps of cases we have lost business solely through adopting this attitude." And here is another from a very well-known business: "I quite agree with your remarks regarding the menace of tipping, which has practically become a question of bribing, and I should be delighted to see this made a condition of the certificate, if I thought it would do any good. But, frankly, I feel that unless a careful watch was kept, and this would entail a great deal of work, the condition would not be observed."

I do not wish to appear to suggest that the "commission spirit" is rampant among game farmers. But it is fairly widespread, and we would be failing in our duty to the sporting public if we failed to make it clear. There must be many proprietors of shootings who would not acquiesce in such a state of things if they knew it was going on, and the healthy state of the game farm would depend on the healthy state of the shooting world as a whole.

In conclusion, I should like to thank all those game farmers whom I visited for their courtesy and hospitality, and for all that they showed me and taught me. I learnt more about pheasants in six months than I shall probably find out in the rest of my lifetime. I wish them all many bumper seasons to come.

M. T. S.

IN TOUCH

Thoughts on the 'Varsity Match

PROPHESY is a mug's game! Last week I was sufficiently dogmatic as to say that the 'Varsity match would be won by Oxford, that the scoring would be high, and that the game would probably be a bad one to watch. The game was won by Cambridge, the score was 8—6, and it was quite good from the spectators' point of view.

Twickenham stands, not quite so full this year as I have seen them, play queer tricks with the wind, and as I sat waiting for the teams to come on to the field I was amused to notice the flags marking the half-way line blowing in completely opposite directions. Small wonder is it that players unused to the ground at Twickenham sometimes produce unusual form—either for good or bad. The ball that should have made touch with ease unaccountably swerves into play again, or, if luck is good, an indifferent kick gains an incredible amount of ground for no apparent reason.

It was a perfect day for Rugby, with a wintry sun shining on to the unvarying green of the playing field, while a moderate breeze drifted the haze of pipe smoke lazily out of the stands.

The game started, as do all 'Varsity matches, in a do-or-die spirit, and at a killing pace. The game surged down to the Cambridge "25" line, and then back again almost immediately into Oxford territory, where someone managed to get offside to give the Light Blues an opportunity of first blood.

K. I. Geddes took a kick, but it went wide of the posts and after that the game settled down to work itself out in normal 'Varsity match tradition—getting harder and rougher, and more exciting as it progressed.

There was very little difference in the two sides, taken as a whole, and the score was a fair indication of how matters went. Quite the best feature was the tackling on both sides, the three-quarters virtually cancelling each other out. Behind the pack, for Cambridge, J. G. S. Forrest was outstanding. Early in the first half he saved his line by coming across hard, and carrying H. R. G. Percy, no mean runner himself, into touch like a sack of potatoes. This piece of work he repeated a few minutes later, to the downfall of Percy and of Oxford hopes for a try by the corner flag.

Of the Oxford three-quarters, G. Hollis played a very sound game, and as the only Freshman playing on his side, is to be congratulated. Twice he saved the Oxford position from becoming extremely awkward, while on one occasion he was involved in an amusing *contretemps* with Forrest. The Cambridge team were attacking when Forrest grabbed the ball from somewhere behind a loose scrum and made off across the field toward the opposite corner flag. Gadney, the referee, ordered a scrum, but by this time Forrest cared for nothing but a try, and was well away. Hollis went across to him and brought him crashing to the ground just short of the line, where the two of them were joined by two others, equally oblivious of the teams waiting patiently for their return; and amid loud cheers from excited spectators as unnoticing as themselves, and the laughter of the rest of us, they fought the matter out—a sort of quorum.

R. B. Bruce-Lockhart proved to be one of the most disappointing players on the field, and with one or two exceptions managed to do most things wrongly. He seemed unable to bring himself to pass out, and as a result the three-quarter movement suffered considerably. Once he might easily have dropped a goal, but when about to kick changed his mind and began to run with the ball, only to be bowled over with nothing accomplished but a run from the centre towards the wing.

To my mind, quite the most outstanding player on the field was Ian Watts at stand-off for Oxford, and had he had a better service from T. R. Thomas, the scrum-half, the score would have looked rather different. Watts has an extraordinary little body, rather reminiscent of a rubber ball—indeed, on one occasion I honestly believe he bounced on to his feet after being tackled. Added to resilience he has flexibility, and wriggles his way through the opposition in an extraordinary manner. He it was, too, who kicked both the penalty goals for his side.

Thomas was a mistaken choice, I feel, on the part of Freakes, who, incidentally, played as good and steady a game as ever; Bourne, the Harlequin scrum half, might have been a better substitute.

The forwards were good on both sides, and in the tight scrums there was little to choose between them, which says a good deal for W. O. Chadwick's captaincy and for his capacity as a hooker, for on paper Oxford were very much stronger. As for R. M. Marshall, he seemed to get little chance of doing one of his famous runs, but played as vigorously as ever, breathing out fire and slaughter wherever he went.

Thus, for another year, University Rugby has come and gone as far as Twickenham is concerned. There is no further need for prophecy. Readers may hold their own post-mortems.

L. N. R.

BRITAIN'S FINEST FORWARD

R. M. Marshall played as vigorously as ever in the University match, but had little chance of distinguishing himself

FROM TEE TO GREEN

VI.—The Pitch Shot

By E. R. TIPPLE

NO shot is more admired than the high pitch—the ball sailing up into the air and dropping dead on the green without any appreciable run, even when the ground is not soft. The stroke, as played by the professional, appears so very simple, yet the average golfer finds it extremely difficult to execute successfully. But there must be command of this stroke before any real progress can be made in the playing of the game.

Compston believes that the ordinary straightforward pitch with a mashie-niblick represents the easiest movement in the whole game. The movements themselves may be simple and easy, but I am convinced that most golfers have a very different opinion. They prefer to play the pitch and run because if that shot is mis-hit the result can still prove effective. With the pitch there is practically no margin for error, and this knowledge is very disturbing to say the least.

When using a lofted club the inexperienced golfer tends to "spoon" the ball into the air—that is to say, he tries to help the club elevate the ball instead of concentrating on his swing and allowing the club-head to do its own work. The greater the loft of the club the more this tendency becomes apparent. There must be no suspicion of digging at the ball, neither must the club be laid back and a glancing blow imparted. The shot should be a decisive one, the ball struck firmly even for the shortest of pitches. Indeed, I believe that the nearer you get to the green the firmer should the approach shot be played.

Undoubtedly many players make the pitch more difficult because they imagine the shot demands quite a different style from the one used for the other strokes, consequently they evolve all kinds of weird swings, none of which are at all suitable. All the experts are agreed on one point—there should be little weight movement. The left heel should be kept as near the ground as possible throughout the entire stroke. Naturally there must be a slight transference of weight, but this must never be allowed to get out of control. The player should stand nearer the ball because of the shorter shaft, and this closer stance will naturally produce the desired upright swing.

When the ball is addressed "Take up your stance as though you were going to hit the ball right away far left of the flag," R. A. Whitcombe says, "put the sole of the club on the ground and turn the shaft in your hands until the face is towards the target you are aiming at. Then swing the club parallel with your feet." Sounds quite easy, but few handicap golfers follow this correct method. They know they should use an open stance, but when they have placed their feet in position and put their mashie-niblick behind the ball they find that the club-head is pointing to the left also. To correct this they turn over their hands and this alteration of the grip brings the left wrist well over on top of the shaft. Such a grip is asking for a hook—the exact opposite of the shot intended and required. This question of the grip is of vital importance, and is the cause of most of the bad shots experienced.

It is therefore seen that the grip should be the orthodox one used for every other kind of stroke. Both the stance and the grip for the pitch should be the same as if you were playing a normal shot to the left of the objective; the open club-face is really incidental. The club is swung in the normal manner—care being taken not to over-swing and so lose control—but, because the club-face is open and pointing towards the target, the shot becomes a cut-up slice, the ball pitching slightly to the left of the hole and jumping a few feet to the right before coming to rest. Thus the stroke is a combination of back-spin and side-spin.

As the most natural tendency is to slice the ball, the average golfer should be an adept at this pitch shot. The reason he is not, according to Compston, is because of his weak left arm and lack of strength in the fingers and wrists. He says: "The trouble is to prevent the right hand throwing the club-head at the ball first. The chief weakness of the handicap man is that he cannot play with a straight left arm—that's a thing that can only be cultivated in childhood. But this shot is an exception. There is no excuse for the most portly business man golfer not to retain a straight left arm for this particular shot—for the simple reason that the backswing is not long enough for him to need to bend it." So it is essential to keep the left arm straight, particularly on the backswing. If you find you are bending it, the probability is you are taking back the club too far.

Stress has been laid on the question of the straight left arm, but the right elbow must not be allowed to wander away from the body. The familiar tip about placing a handkerchief under the right arm and keeping it there throughout the entire stroke is useful. If you can do this, then there is no danger of that dreaded disease—shanking. The right elbow should point downwards, not outwards.

Backspin is imparted by the face of the club coming into contact with the ball as it is moving downwards. The ball must be hit first, ground afterwards; not the turf first then the ball. You cannot hit the ball a downward blow if the club-head has reached the bottom of its arc and is being swung upwards for the follow through. To assist this downward hit, the ball in the address should be nearer the right foot than the left. The experts aim at hitting the ball just below the centre on the downward stroke, allowing the blade of the club to go on through, picking up turf on the other side of the ball. The ground is used to advantage; much the same principle as used when squeezing a grape with two fingers, in the words of the American, H. B. Martin. As he points out, the higher you strike on the back side of the ball the greater the spin obtained.

The pitch shot can be played with a variety of clubs according to the distance demanded. In most sets there is too great a difference between the No. 7, or mashie-niblick, and the No. 8. In my own I discovered the loft of the former to be 42 deg. and the latter 50 deg. So I had a club made with a loft of 46 deg., and this is most useful for short pitch shots. Because of a smaller head than an ordinary niblick I have found it better for shots from awkward lies. Confidence is a priceless asset, and to be able to pitch successfully you must be really confident. Select the club you prefer, and whatever the distance be definite and not slack. Flicking the ball is of no avail.

BOXING DAY RUGBY.—The Preston Grasshoppers Rugby Football Club will be holding their Annual Public Schoolboys' Trial game on Boxing Day morning, and from this match sides will be selected to take part in the following games:

January 2nd (morning): Preston *v.* Fylde Schoolboys at Preston.
January 5th: Preston and Fylde Schoolboys *v.* Waterloo Schoolboys, at Waterloo.
January 6th: Preston *v.* Blackburn Schoolboys at Blackburn.

Any boys residing, or who will be holidaying in this district and would like to take part in the trial, should send along their names, school, age and the position in which they usually play, to E. Thompson, Keppelstone, Kingsway, Penwortham, Preston, not later than Tuesday morning, December 20th, 1938.

HOMAGE TO ST. VINCENT

Fêtes of Burgundy

By PIERRE PONNELLE

WHO is it who, in the past, conferred upon wine its real titles of honour? Not the heathens, for they hardly ever spoke of wine, except to work themselves up at the orgies of Bacchus, and his priests and priestesses. For one thing, they never knew how to make real wine, no matter whether it was diluted, watered, boiled, smoked, tarred, spiced, aromatised or flavoured with pitch; their wine, generally speaking, was but a queer mixture, an awful hotch-potch of all sorts of ingredients.

THE ST. VINCENT OF NUITS ST. GEORGES

It was the Jews who, for the first time, appreciated wine at its true value. In fact, the Bible has been an invaluable advertisement for wine, for had it not the sanction of the Almighty? In 1924, when the prohibition campaign threatened to extinguish common sense amongst our friends overseas, a New York publisher hit upon the idea of publishing a Bible revised by Professors of Yale University from which the word "wine" had been deleted. This dishonest proceeding would have entailed some difficulty, inasmuch as in Holy writ, wine-growers, the vine, and wine are mentioned 441 times.

Such was the purport of a speech made on January 22nd in the low vaults of the little Church of Chambolle-Musigny, to an immense representative audience, who had been gathered from all parts of France to celebrate the Feast of St. Vincent, the Patron Saint of Wine-Growers. On this occasion the Abbé Krau, the spiritual guide of Burgundian wine-growers, and parish priest of Vosne-Romanée, from his sacred rostrum, bestowed a most impressive blessing on wine, the product of so much labour and patience.

The crowd assembled under the ægis of their venerable Patron—workers with faces bearing the mark of their daily toil, labourers of the vineyard and wine-makers, rich and poor, but all engaged in the same craft—saw on that day, in these religious celebrations, the justification of their many years of arduous labour and a recognition of their noble achievements. We are indebted to the Knights of the famous "Confrérie du Tastevin" for having revived these Burgundian rites which in observance extend from the annual thanksgiving offered in the church of a straggling village of the Côte d'Or to processions and revels bringing together an enthusiastic crowd of merry-makers.

From one end of the year to the other, all over the Burgundian vineyards, a succession of festivals takes place. Often their origin can be traced to local history, whilst in others they owe their birth to some pretext ingeniously suggested and gladly accepted.

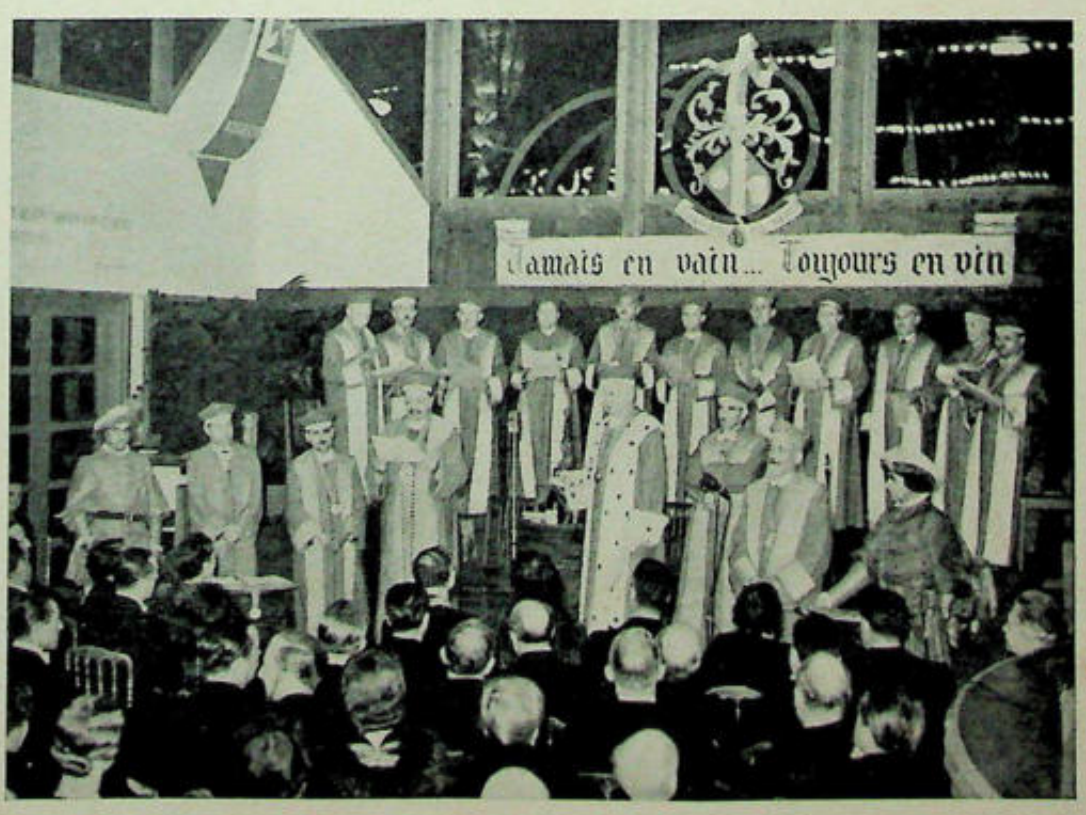
The villages, though unpretentious, all bear famous names, such as those of Gevrey-Chambertin, Morey St. Denis, Chambolle-Musigny, Vougeot, Vosne-Romanée, Corton, Savigny, Pommard, Volnay, Meursault, Monthelie, Chassagne, Santenay, and they draw from local folk-lore or tradition a stimulus to collective merriment resulting in sumptuous and picturesque feasts. These are typically Burgundian, when the culinary art, sublime without exaggeration, supports the local "great lords," namely, old bottles in which is stored up much love and sunshine. Those who practise, or at least it is to be hoped do, the cult of Burgundy wine, should also be anxious to visit the land of its birth. Behind these famous wines there lie hidden many fascinating treasures of historical, artistic and architectural interest.

As befits determined enthusiasts, the Knights of the "Confrérie du Tastevin" hold solemn meetings at Nuits St. Georges about ten times every year. The élite of the political and learned world, not only in France but abroad, belong to this body derived from the Middle Ages, and eminent Britons are amongst its members. Burgundian bards enliven the gatherings.

At Beaune, the wine festivals are of a special character; they take us to the Court of Burgundy Wine, where everything in this ancient city of the Burgundian trade is artistically set and fancy gives way to style. The mediæval aspect of the celebrated hospices imparts an impressive touch to the celebrations, where the most exquisite dishes are served and scintillating wines are selected to harmonise with them.

THE ST. VINCENT OF THE "CONFRÉRIE DU TASTEVIN."

At Meursault the famous "Paulée" is still celebrated—a great and merry village banquet to which each guest brings some of his best wine for himself and his neighbours at the table. During the banquet an annual prize is awarded for the best literary composition on the theme of wine. There are many other festivals of a similar nature, and visitors to Burgundy will find many things to admire and enjoy and ample reason for paying homage to and discovering the qualities of the great Burgundy wines and the exquisite Burgundian cooking.



A PROCESSION AT THE CHÂTEAU DE LA BERCHÈRE, NUITS ST. GEORGES, AND A CEREMONIAL GATHERING OF OFFICERS OF THE "CONFRÉRIE DU TASTEVIN"

Solemn meetings of this society are held about ten times a year, and the élite of the political and learned world in France and abroad belong to it

"GENTLEMEN, THE KING!"

A Loyal Toast Long Honoured with Port

IT was during the reign of Edward III that Portuguese wine was first introduced to the British Isles. Under his rule concessions were granted to the Portuguese fishermen to fish for cod off the coast of Cornwall. They brought over with them skins of wine from the Province of the Minho, in the North of Portugal, which they bartered for British commodities. The wines were more of the type of Burgundy than Port Wine, as it is known to-day, and to this introduction may be traced the origin of many of the old-established wine merchants of fame in the West of England.

At that time the wines from the Douro District were unknown in this country, but history relates that the two sons of a British wine merchant were sent to Portugal by their father in 1678 "to learn the wine business." One night they dined at the monastery in Oporto, and were given wine of a quality higher than they had previously seen, and which came from the Douro District. They bought all they could procure and shipped it to England. From then on the business in wines from the Douro District began to develop, being assisted largely by the Methuen Treaty made between Portugal and England in 1703. These wines were, however, also of the Burgundy type; they were known as "Wine of Oporto," being shipped from that great city; but between 1832 and 1847 it became the practice of Port Wine shippers to fortify their wines with Portugal grape brandy at the time of manufacture, thus providing Port Wine of the sort known to-day.

Through the middle of last century Port Wine built up for itself a reputation in the British Isles second to none, and became the popular wine which it remains to-day. Its success was largely attributable to the series of magnificent "Vintages" in the 'fifties, 'sixties and 'seventies, which were the produce of the national vine of Portugal, but during the late 'seventies and early 'eighties the Douro District was overrun by disease, the Phylloxera, which attacked the vines themselves, with the result that at one time it seemed probable that the Douro District would never again produce the fine wines which had brought it into prominence. The disease was, however, overcome, as elsewhere, by the introduction of the American stock, on to which the national vines of Portugal were grafted, this stock being resistant to the disease. The same practice is followed to-day.

The only place in the world where Port Wine can be produced is the Douro District of Portugal, which is a demarcated area along the banks of the River Douro, being of a hilly nature and of schistose soil. The special charms of the wine are attributable to the soil and climate of the region, and it is no more possible to produce Port Wine in, say, Australia than it would be to produce wines in the Douro District having the characteristics of Australian wines. The District has been demarcated by the Portuguese Government, which has taken extensive measures for the proper supervision of the industry and the wines themselves by the formation of Government Departments for the purpose. No Port Wine is allowed to leave Oporto until it has been passed by the expert Government tasters, and it is then shipped to Great Britain with a certificate of origin granted by the Portuguese Government. In this certificate lies a very proper guarantee for the public of the genuineness and quality of the wine.

The British Government recognises that Port Wine can be produced nowhere in the world outside the Douro District, and on more than one occasion, both by treaty and commercial agreement with Portugal, has confirmed its recognition. The name "Port" or "Port Wine" is therefore protected by law in this country, and a still further protection for the public is thus provided.

Port Wine to-day retains its popularity in Great Britain, where, for well over a century, it has been universally recognised as eminently suited to the climate by virtue of its special features. The ordinary Port Wine consumed has been matured for many years in cask in the Lodges at Oporto under the care of shipping firms having a galaxy of experience and knowledge behind them, many of whom are British and in which millions of British capital are invested.

If the best is to be obtained, the consumer would be well advised to patronise wine merchants of standing who understand the wines they sell and are competent to select for their customers those calculated to suit their individual tastes. In former times the wine merchant was just as much a "Family Adviser" as the doctor and solicitor, and the great majority of merchants to-day can be relied upon to select their wines wisely and to advise upon them. The pity is, however, that many consumers in these days of haste omit to give their purchases of Port Wine the study they merit, neglect to consult their wine merchants, and regard Port Wine as a commodity to be bought with little more attention than a box of matches.

Port is a pure wine, it being unnecessary to add any ingredient for the purposes of colouring or sweetening it, as the colour is obtained from the pigments in the skin of the grape, and the method of making the wine ensures the retention of the natural sugars of the grape, which are so beneficial to mankind. It is also interesting to observe that the bloom on the grape is the agent enabling fermentation in the first instance.

Port is surrounded by a glory of its own, which is probably unequalled by that of any other wine, and it may be significant that it is so consistently employed for drinking His Majesty's health. It merits respect and admiration for many reasons, but it would be unfair to omit from these the fact that it is produced in the country of the oldest ally possessed by Great Britain. There are types of Port Wine for all occasions, from the hunting field to the banquet—"Full," "Medium" or "Ruby," "Tawny," and White Port, the last named being made in exactly the same way as red but from white grapes. Perhaps, however, the King of Wines is "Vintage Port." This is a small selected quantity of none but the finest wines made in any one especially fine year, and it is matured in bottle as opposed to cask, which method gives it the full, round, luscious generosity upon which the reputation of Port Wine has through the years been built. It is a wine that breeds friendship and mutual confidence, just as much to-day as of yore, and the appreciation of which denotes the connoisseur. Fortunately the price of "Vintage Port," after the post-War years of high prices, is to-day well within the reach of most, which accounts for the greater interest now being taken in it by all classes.

Imitation is the sincerest form of flattery, and whilst Port Wine has many imitators, none of them have ever been able even to shake it on its pedestal. It is there because its worth has been proved for the last 250 years, and it is not surprising, therefore, that it should be found to-day to be the most popular dessert wine used throughout the British Isles.

A BUTT OF SHERRY AND THREE STALWARTS TO PUSH IT

Men whose fathers and grandfathers have worked in the Sherry bodegas at Jerez-de-la-Frontera

COMMON SENSE ABOUT SHERRY

How to Buy, What to Buy, and When to Serve

THE first thing for everyone to remember about Sherry is that there is no need to bother about dates of vintage years. There is not, nor ever has been, any such thing as vintage Sherry, because Sherry is always a blended wine. If, therefore, you see upon any Sherry label, or in any price-list, the words "Vintage 19—," or anything of that kind, it will not impress you—except unfavourably.

Sometimes there is found on Sherry labels the word "Solera," followed by a date, say, for example "Solera 18—." This requires explanation. Sherry is stored and matured in a unique way, that is in big casks in large airy over-ground cellars, called "bodegas." These casks are never moved, and are divided into various sets or "runs" of casks, called "soleras." Each solera has been started off in days gone by by putting an equal quantity of old wine into each cask. Thereafter there has been added to each cask equal quantities of rather younger but similar wine, which mixes with the older wine and takes on some of its mellowness and roundness.

Occasionally an equal quantity of wine is drawn off from each cask of a solera to be used as an ingredient of a Sherry being blended for shipment; and always, as soon as possible afterwards, some younger wine is added to the solera to take the place of that which has been drawn off. Soleras do not usually stand alone, but are fed from, and themselves feed, other soleras, so that wine often passes through four or five or more soleras before some of it finally emerges as an ingredient of a blend.

It follows from the above that the contents of his soleras, and the orderly sequence thereof, are a Sherry shipper's greatest assets and no shipper in his senses would ship even one cask of wine straight from a solera. The most, therefore, that the words "solera 18—" can mean on a label is that the Sherry in the bottle contains an appreciable quantity of wine from a solera which was started in 18— (but which, of course, has had many relays of younger wine through it since).

In this connection there is an interesting and instructive story. When Prohibition was repealed a few years ago, the U.S. Government with the praiseworthy idea of preventing the American people from being imposed on, passed a series of stringent regulations about the labelling of wines, one of which was that every label should bear the age of the wine contained therein. This regulation, had, however, to be abandoned in the case of Sherry, because, owing to the solera system, as will be obvious, it is mathematically quite impossible to give an exact age to any Sherry.

Occasionally a Sherry will be described simply as "Solera Sherry." This is really a misnomer altogether, for in that connection the word "solera" has simply been borrowed by the English and used inaccurately to mean what is more accurately described as a dark Oloroso Sherry.

These words—Solera, Bodega, Oloroso, &c.—are Spanish, and it should never be forgotten that Sherry is a wine of Spanish origin, and that all genuine Sherry comes from a small district in the South of Spain round about the town of Jerez-de-la-Frontera. Always, therefore, look for the words "Produce of Spain" on the label when you are buying Sherry.

The reader may now say: Yes, that is all very well. You have told me not to bother about vintage years, you have told me what the word "Solera," alone or with a date, means on a label, and you have warned me to watch out for the words "Produce of Spain," but am I really much further on? Tell me, please, how can I ensure that, when I buy Sherry, it is good Sherry?

The answer to that question is the same as it would be for any commodity other than Sherry. If you do not know enough yourself to distinguish between good and bad, or, rather, between better and worse, you must go to an absolutely reliable merchant, who is an expert, has nothing but good sound wine in his cellar, and will honestly advise you on your purchases. Very probably he will do more than advise you; he will teach you a lot about Sherry, so that in due course you will be able to rely on your own judgment. If you cannot find such a wine merchant, then you must proceed by trial and error to discover which of the shipper's brands of Sherry suits you best, and then stick steadily to that.

One further question suggests itself. There are a great many different sorts of Sherry. How is a prospective buyer to tell from the names what kind of wine he or she will find in the bottle? The following table will give the answer:

FINO.—Pale delicate dry aperitif Sherry, made in Jerez.

MONTILLA.—Very special and very dry pale aperitif Sherry, made in Montilla and matured in Jerez.

AMONTILLADO.—High-class, rather dry, fino Sherry, made in Jerez to resemble in style wines formerly made only in Montilla.

VINO DE PASTO.—Literally "wine of the repast"; less expensive, pale, rather dry Sherry.

MANZANILLA.—Distinctive, pale, very dry aperitif Sherry, with a "tang" of its own acquired from the fact that it is made and matured by the sea.

OLOROSO.—Darker, fuller and usually rather less dry wine. Can be drunk before, during or after meals.

GOLDEN.—A light Oloroso suitable for general purposes.

AMOROSO.—A rich golden wine, rather sweet, which is drunk before or at the beginning of meals by those who do not like their wines too dry.

SOLERA.—A dark golden wine with body which can be drunk before or after meals.

BROWN.—A rich, dark and rather sweet Sherry, to be drunk after meals, particularly with nuts and dessert.

EAST INDIA.—Now, usually, simply a not too full-bodied Brown Sherry, but formerly, and occasionally still, an Oloroso or Brown Sherry which had been shipped in cask in a sailing vessel across the world to the East Indies and back, before being bottled.

In conclusion, it should be stated that, although connoisseurs may insist on ultra dry Sherries, there is no sense in the average host or hostess forcing down his or her or their guests' throats Sherries which are so dry as to be unpalatable. The above list shows that there are Sherries of every type available for every occasion. Note, however, that although not an expensive wine, genuine Sherry can never be very cheap, because there is so little of it available. Good Sherry is a fine thing in itself and, in the long run, quite economical to serve. Bad Sherry is an abomination and expensive at any price.

CASKS AND AN OLD-FASHIONED CANDLE BOX FOR TESTING THE BRIGHTNESS OF SHERRY

A JEREZ VINEYARD IN AUTUMN

A MEMORY OF CHAMPAGNE

THE LUNCHEON AT THE ABBEY OF HAUTVILLERS, JUNE 28TH, 1932

NO member of the party who made the aerial journey to the shrine of Dom Pérignon to celebrate the 250th anniversary of "The Discovery of Sparkling Champagne" is ever likely to forget it. It took place on June 28th, 1932, and from start to finish the proceedings were worthy of a great occasion.

Guests from London set out in six air liners, carrying a dozen to fourteen passengers, and a squadron of private 'planes brought further reinforcements. The liners landed in a thunderstorm at Bethany Military Aerodrome, but the weather obligingly cleared up for the celebrations. From the moment of arrival it was champagne all the way; even at the aerodrome the military were pressed into service to regale each guest with sparkling refreshment. We were a mixed party, and it is nice to think that when we were assembled with those invited from other countries we were described as "l'élite des mondes politique, diplomatique, littéraire, scientifique, artistique, économique, medical et gastronomique."

There was much to do. Mr. Cochrane was called upon to assist the committee charged with the responsibility of electing the "Queen of Champagne"; there were songs and dances in national costume, and a "Ballet de la Mousse"; and receptions by the Mayors of Rheims and Epernay. But the main feature of the programme was the unveiling of a memorial to Dom Pérignon at the Abbaye d'Hautvillers, preceded by a banquet under the pleached avenue overlooking the valley of Epernay, and a great procession to the cloisters. The déjeuner provided for the guests was a triumph in gastronomic art. Here is the menu:

Truite Saumonée au Vin de Cumières
Paté de Pigeon Rémois
Jambonneau de Reims a la Gelée
Asperges d'Hermonville sauce Gribiche
Port du Salut de l'Abbaye d'Igny et Marolle
Fruits rafraîchis au Champagne
Sablés
Les beaux produits des Vergers de France
Biscuits et Masse pains de Reims
Les Dom Pérignon

And for wines—"Tous les Grands Vins de Champagne." This surpasses imagination. And the wines of Champagne flowed to such an extent that I considered it wise to call a halt. For this action I was duly reproved by a French banker opposite to me, who said, "No, no, you must drink it. A puff of air will blow it away!" In this he was right, for Champagne has the merit of cheering without inebriating, if not abused beyond all reason.

Following the lunch came the impressive procession of the Archbishop of Rheims, His Excellency Monseigneur Suhard, to the Abbey cloisters, escorted by a Guard of Honour of "Les Bâtons de St. Vincent," the patron saint of vignerons. It was rich with colour and the magnificence of ecclesiastical robes, and the Bishop of Guildford taking part in it struck quite a sombre note. One felt that he ought also to have been in robes to fit the occasion.

Then came the great event of the day—the unveiling of the memorial by Monseigneur Suhard, assisted by the auxiliary Bishop of Rheims and the Bishop of Chalons-sur-Marne and, incidentally, among many others, Lady Londonderry. Afterwards the guests were received at the Mairie of Epernay, passing through cheering crowds, and being heralded by a fanfare of trumpets from Dragoons and the playing of the "Marseillaise" and "God Save the King" by a regimental band. The Mayor, M. Paul Depuiset, put the final note on the proceedings in a speech in which he eulogised the virtues of champagne in a phrase it would be impossible to equal. It must be quoted in his own words, for translation would spoil it.

He said: "A ce vin vous rendez homage. Vous l'avez, j'en suis sûr, apprecié comme il convient pour sa legèreté, sa finesse exquise, sa mousse si parfumée, sa griserie légère qui donne à tous la joie de vivre, rend l'espoir aux désenchantés, provoque l'éclat de rire dans le danger, la chanson de la joie, la confiance dans le malheur." Can you have further reason than this for truly appreciating Champagne; that not only does it inspire song in rejoicing, but also hope in despair?

The guests assembled for their return by 'plane, filled with champagne and a "griserie légère."

They were seen off by their hosts. Someone called for a Monsieur Heidsieck; there were names bandied about that sounded like a galaxy of magnums, and it seemed fantastic that here in the flesh were the high priests of champagne. I also sped the parting guests, for I had determined that my wife should join me and also appreciate the products of Champagne. And I was fortunate to come under the care of M. Seydoux, of the firm of Krug, to whom I owe a debt of gratitude. It was M. Seydoux who found us that hotel, "not de luxe, perhaps, but very comfortable and reasonable," and who took us over his caves.

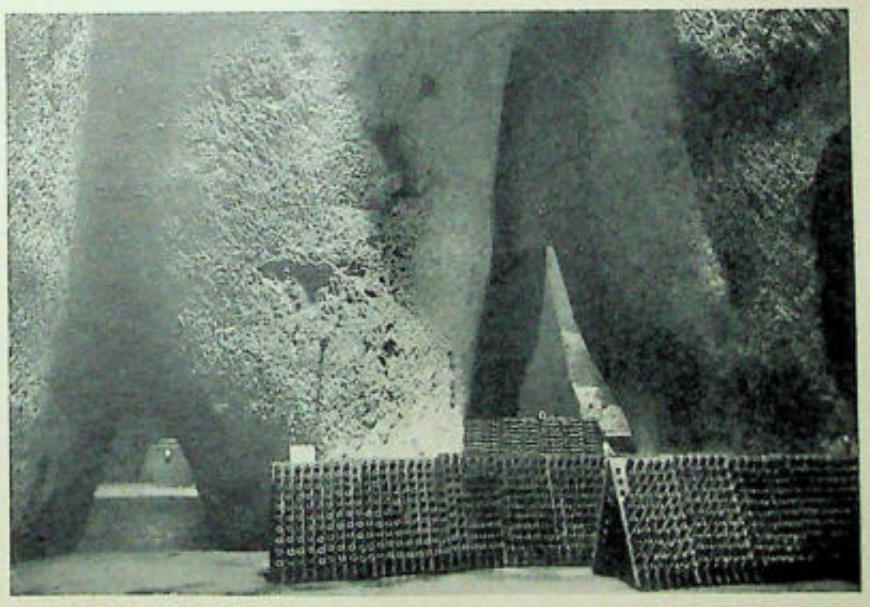
This was an experience not to be missed. Long-handled platter-like candlesticks were brought, the candles lit, and we descended into the depths of the earth. There the marvels and mysteries which go to the making of champagne were explained. We followed its progress from the storage of the new wine to the bottle. We saw the *pupitres* and the expert *remueurs* skilfully turning the inverted bottles until all sediment is gathered in the neck, witnessed the *dégorgement* of the frozen deposit (it is not always frozen for extraction), and the careful *dosage* with old wine sweetened with honey to suit the various tastes, and the final corking with huge corks under pressure, and the wiring. One picture remains fixed in my memory, that of an artist, whose sole occupation is to brand and smell the corks. Upon his nice sense of odour, which apparently runs in families, depends the success of all the scientific processes to which the wine is submitted.

The "cellars" of Champagne should be counted among the wonders of the world. These "cellars" stretch for miles below ground. Those of Epernay were made expressly for the storage of wine, big vaulted galleries; those of Rheims are an inheritance from the times of the Romans, great caverns with domed roofs, labyrinthine passages of inspiring grandeur. They have served their country well. For years of war they saved the precious fluid they contain from the destruction. It has been estimated that the total of bottles in these cellars of Champagne is some 150,000,000.

M. Seydoux took us by car round vineyards bearing celebrated names, and it seemed as though the sun itself shed a special champagne glow upon them.

We gazed upon many a noted *clos* and were told that the separation of one side of a road from the other might mean all the difference in the world between the growths.

THE GRAPE HARVEST AT AY
By courtesy of Messrs. Bollinger



IN THE TREASURE CAVES OF RHEIMS
By courtesy of Messrs. Charles Heidsieck

We had worshipped at the shrine of the greatest of wines, and if, as is averred, Dom Pérignon did not actually put the bubbles in champagne, or if he was not the first to cork a new wine, at any rate, the cellarer of Hautvillers, and director of its vineyards, did put the cork in and did place champagne upon the pinnacle it occupies. His name should be blessed by many an invalid who owes restoration to health to his endeavours.

When we returned to our hotel after visiting the caves I ordered a bottle of Krug in honour of our guide. I have the bill of my kindly host of the Hotel Foch in front of me. The franc was then 90 to the £ and the cost of the bottle was 15 francs! For a week we improved our knowledge of champagne.

One memory of Rheims is that of trying to telephone the Westminster Bank in London. It is a very difficult feat to spell out this name to a French telephone exchange girl. The assistant behind the counter came to my aid, but even he could not succeed until he had an inspiration. "Vesmanstaire," he cried. "The Palace where the King lives!" I secured my connection immediately.

My advice is, go to Rheims if you can. You may not become an expert on vintages, but you will have a very pleasant time in making contact with the growers of a wine which is the Pride of France.

QUALITY IN BRANDY

The Product of a Sound and Careful Upbringing

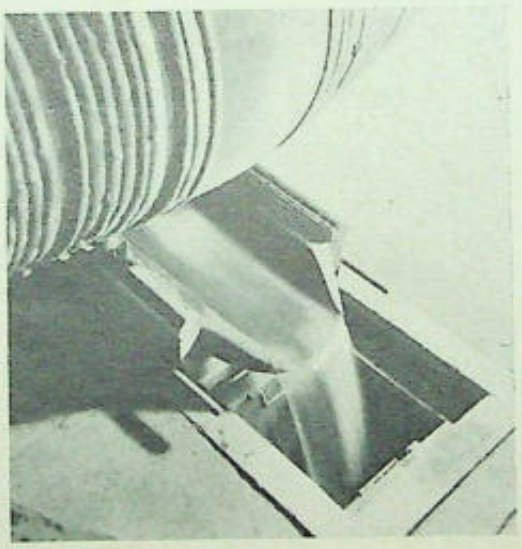
By FREDERICK HENNESSY

EVER since my early schooldays, when in an ill-advised attempt at sophistication I used—and misspelt—the word "liqueur" in an essay, thus exposing myself to the derision of the classroom, I have learned to mistrust this word, and I decided then and there that in any future connections with the brandy business I would, as it were, hitch my wagon to the stars.

In later years I have found more concrete reasons for my suspicion of the word "liqueur" in connection with brandy. For one thing, it conjures up in my mind the idea of something rather sugary and soft—a description which in no way fits a fine old brandy. And, more important, it implies a clear-cut dividing line between brandy and liqueur brandy, which certainly is not true of the way in which genuine Cognac is produced and offered to the public.

In the old days the brandy-lover would choose a cask of a good year for its quality alone and drink it only when it had reached an age to suit his palate.

Nowadays the great Cognac houses, who for generations have been accumulating vast stocks of carefully matured brandy, undertake this task themselves. In other words, they select the best brandies each year (some for their body, some for bouquet and still others for their finesse), blend them to a perfectly balanced standard, and mature them in casks for varying lengths of time before bottling. Therefore it is not their quality which varies but the length of time the brandy has been



FROM THE CASK TO THE VAT

in cask, so that it is difficult to say at what stage in its life it passes from an ordinary brandy to a liqueur brandy.

Everyone knows the feminine cult of the "little man round the corner" who runs up a dress better and cheaper than anyone else, thereby imparting a certain proprietary feeling in the person who has been clever enough to discover and patronise him. But the cult is not entirely feminine, and liqueur brandy gives the male his chance in the same field.

For some reason it has become a fetish to have discovered a few cobwebby bottles of some obscure brandy, long since forgotten in the cellars of a defunct relative, or to have purchased from some source a bottle whose eloquent label is nearly, but not quite, obliterated by cobwebs of a more synthetic nature. And this legend of the bottle is hard to kill.

Liqueur brandy might be likened to a man—a man is as old as he feels, and a genuine fine brandy is as old as it tastes. Both rely upon a good constitution at birth, upon sound and careful upbringing, which in time will replace the fire of their youthful vigour by a strong and well-developed character. Both will reach a peak when their natural vigour is perfectly balanced by their maturity, and both will have to face an age, sooner or later, according to their constitution, when natural exhaustion will overcome them.

For it is a fallacy that an old brandy is necessarily a good brandy. Character, or quality, is what counts, and even that will die if the brandy is too old. By this I do not mean that some old brandy has not certain advantages over its younger brother, but I contend that too much importance can be attached to age and particularly to age on the label.

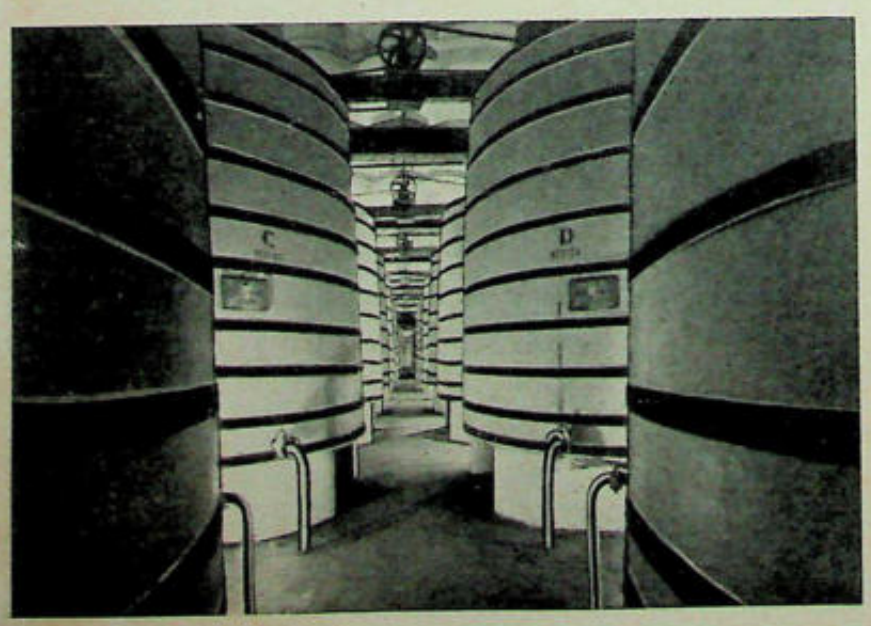
But how can one rely on one's palate, how detect this pure, honest quality? I will answer by quoting an expert whose knowledge of the subject has previously been demonstrated in these columns, and whose eloquence I cannot improve upon:

"A fine brandy should taste sweet, but with a natural richness that you will soon distinguish from the artificial, and a round, fruity flavour should pervade the mouth.

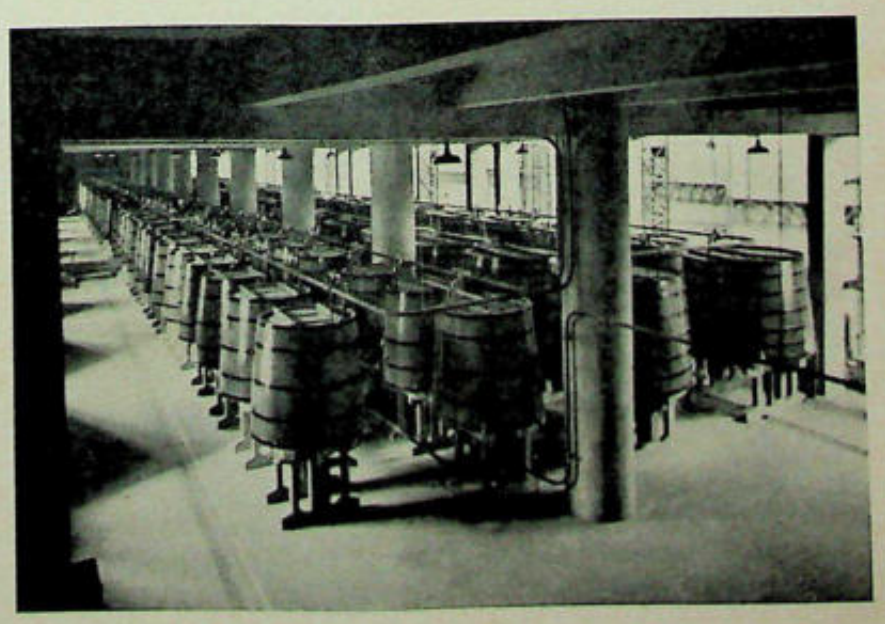
"If there has been any faking, the sweet will be thick and the flavour thin, and when swallowed it will be prickly, whereas a genuine old drop will slide down with a little kick certainly—all good spirit that has not been unduly watered should give that—but no prick. And afterwards! With a fake the flavour has gone, but with a fine brandy it lingers on the palate with a taste and smell faintly reminiscent of newly-baked household bread. It seems as though there had been solid and liquid combined in the spirit—meat and drink, and this is perceptible even in new brandy fresh from the still. It is inherent in the grape. And that is one of the surest methods of detecting a faked brandy, be it sweetened never so sweetly, or coloured never so craftily.

"Lastly, keep you hand round your empty glass, and as long as you do, it will be ready to delight you with its glorious aroma.

"Brandy in bottle is a talent hid in a napkin. It does not change its character. As it goes in—fine or inferior, old or young—so it comes out. All its development is in the cask, for, unlike wine, growth and change in a distilled spirit is dependent on access to the air, and is arrested by the cork. That fungus-covered brandy bottle that 'was laid down by my grandfather in the 'fifties' is taken up by his grandson just the same as when the old man binned it away, no younger, indeed, possibly a trifle softer, but no older. So it is to be hoped that grandfather was supplied in the first place with a fine brandy well matured in the wood. If not, no amount of keeping will mend it."



ROW UPON ROW OF HUGE VATS IN WHICH MATURED BRANDIES ARE BLENDED



THE LAST STAGE WHEN THE BRANDY IS READY FOR BOTTLING AND SHIPPING

"One can always trust it"

It may look impressive when liqueur brandy is poured from an old, old bottle covered with the cobwebs of centuries, but cobwebs on the bottle mean nothing. Their place is on the cask. Yet it is easy enough to find fine liqueur brandy; brandy that has aged over forty-five long years in the cask. Simply ask for Hennessy X.O.—old enough to be smooth as silk; but with age nicely balancing body and bouquet; and in that you have a rare and very lovely thing—a perfect liqueur brandy. Because, IT'S THE AGE IN THE CASK THAT COUNTS . . . .

HENNESSY

OVER 45 YEARS OLD

FINE LIQUEUR COGNAC BRANDY

"Shall we join the Gentlemen?"

MARY BORDEN

The famous woman author on an essentially male subject that closely affects all women

How happy they are, all those men, when we leave the dinner-table and they can settle down to the real pleasure of the evening, a good cigar! But why should we leave them? Why not break through the Edwardian convention and stay behind to enjoy the aroma of those delicious leaves from Havana and the talk they inspire. I do when I'm allowed to. I always shall. For I like the fragrance of fine Havana cigars and I particularly like the men who like cigars.

Men who smoke cigars are men of good taste, and good sense. They are men of worth and experience, interesting men. Indeed I've noticed that the more intelligent a man is and the more successful, the greater his appreciation of a choice Havana cigar.

And this applies by no means only to older men. Cigars are not the monopoly of old men wise in the ways of the world. All the young men I like best smoke cigars. I have a list to whom I always send a box of Havanas for Christmas. And I know when I do that these gifts will be those that are more appreciated than any others.

A subtle compliment to a man's taste; the boxes of Havana cigars I am sending to my friends will not bring them pleasure only—they will be a tonic, a stimulant to good talk, sound thinking, matured judgment. I can see a ring of contented faces smiling at me in the distance through the fragrant haze that has risen from far-off Havana.

IN THE VINEYARDS, CHÂTEAU D'YQUEM

WINES OF BORDEAUX

By ANDRÉ L. SIMON

BORDEAUX holds the pride of place among the vinelands of the world. Nowhere else is there so much fine wine produced as in the valleys of the Garonne and of the Dordogne, before they meet, below Bordeaux, and along both banks of the Gironde, the name under which the waters of those two rivers rush together towards the Bay of Biscay.

The vineyards of Bordeaux may be divided into six main categories :

The first is the Médoc, the strip of land on the left bank of the Gironde, which produces by far the greatest quantity of the best red wines, or Clarets, as well as a little white wine.

The second is the Graves district, to the south-east of the Médoc, on the left bank of the Garonne, from Bordeaux to the Sauternes country ; the Graves vineyards produce a considerable quantity of fine red wines, or Clarets, as well as a great deal of white wines, which are better known under the name of Graves than the red wines.

The third is the the district of St. Emilion and Pomerol, the hilly ground rising above Libourne, on the right bank of the river Dordogne ; both St. Emilion and Pomerol concentrate on the growing of black grapes and the making of red wine or Claret.

The fourth is the Sauternes district, which comprises Barsac, and there we find no black grapes but the finest white grapes from which they make the most luscious and delicious white wines in the world.

The fifth district is the V-shaped hilly ground between the Garonne and the Dordogne, before they meet ; it is called Entre-deux-Mers, that is " 'twixt two waters," and the vineyards of that district produce an abundance of both red and white wines, good, but not so fine, as the wines of the other four districts of the Bordeaux country.

The sixth includes the vineyards situated upon the right bank of the river Gironde, the Bourg and Blaye vinelands, as well as the vineyards planted in some islands in the broad waters of the Gironde ; they yield mostly red wines, less expensive and on that account most useful wines, but, of course, not of the same superlative quality as the best wines of the Médoc, Graves or St. Émilion.

CLARET

Claret is the most wholesome of all wine, because it is the most harmoniously balanced, the most natural ; it is neither blended nor fortified, nor tampered with in any other way. It is just the fresh juice of ripe grapes pressed and allowed to ferment and to find their own salvation in changing their unstable grape-sugar into the more stable form of ethyl alcohol. And besides being a most natural wine, Claret is also the most individual of all wines. In this age of mass-production and standardisation it is still putting up a brave fight to retain its own personality and not to reach a standardised wine-drinking public under the form of some well-advertised label or labels, brand or brands, but under the name of the individual château or estate where it was born and bred.

The cheaper descriptions of Claret, of course, must be blends of young wines so as to be within the means of a greater number of people. But most Clarets, and all of them with any claim to fine quality, are sold under the name of a particular vineyard and under the date of the vintage when the grapes were actually gathered and pressed. All possess a family likeness, but, at the same time, they are endowed with an individuality quite their own, which greatly adds to their other fine qualities.

The red wines of Graves and St. Emilion, from all the many good vineyards in both those districts, are *Premiers Grands Crus :* they call themselves first class, and they do their utmost to deserve being so called. In the Médoc, however, the 60 finest estates or châteaux have been graded, many, many years ago, by expert and independent judges, into five classes.

Châteaux Lafite, Latour and Margaux are the only three châteaux of the Médoc to be placed in the first class, together with Château Haut-Brion, the only Graves officially " classed " ; Château Mouton-Rothschild was placed at the head of the second class, followed by the two Rausans, three Léovilles and ten more ; then came thirteen third growths, eleven fourth and seventeen fifth growths, headed by Château Pontet-Canet.

In a good year, the 60 " classed " growths of the Médoc are responsible for the production of about a million gallons of fine Claret, whilst the rest of the Bordeaux vineyards would produce in the same year some nine million more gallons of Claret of less distinguished quality. Such figures show that the fine quality of the red wines of Bordeaux is backed by important quantities, making it possible for the merchants of Bordeaux to seek and supply markets for all the world over.

WHITE WINES

The vineyards of the Gironde Département, of which Bordeaux is the Metropolis, produce an abundance of white wines which may be divided into two main categories : the white wines of Sauternes and Barsac, in a class by themselves, and the others. The white wines of Sauternes and Barsac are the finest of all naturally sweet wines, being rich and delicious without being cloying.

The finest of them all is the wine of Château d'Yquem, but the wines of Suduiraud, Guiraud; La Tour Blanche and other estates of Sauternes, as well as those of Châteaux Climens and Coutet, in the Commune of Barsac, can be, when the vintage is a favourable one, exceedingly fine.

The other white wines of Bordeaux are drier and lighter wines, mostly from the vineyards of the Graves district. Here, again, there are some outstanding vineyards which are noted for the fine quality of their wines, although in the majority of cases the white wines of Graves are sold under the name of a shipper or of his registered label or brand, irrespective of the name or names of the vineyard or vineyards which originally produced the grapes from which the wine was made. Besides the Graves district, the Médoc and the Entre-deux-Mers also produce some white wines, mostly light table wines.

CHERRY BRANDY SNAPS

"MAY YOUR PURSE BE HEAVY — YOUR HEART LIGHT"

Your heart, at least, can be light, for you can pour out a glass of this glorious cherry brandy and drink to the joy of living. For two hundred years, De Kuyper Cherry Brandy has filled the toast on countless great occasions. To fete an honoured guest, to plight a troth, to seal a bargain, confirm a friendship. There is some toast you should drink to-night, phone your wine merchant, so that you can drink it in this precious drink.

WORKERS AT RIQUEWIHR

WINES OF ALSACE

ALSACE, with its back to the Vosges, faces east and to the Black Forest beyond the fast flowing, fateful waters of the Rhine. It is a land of contrasts, of sombre, pine-clad mountains and of colourful, sweet-scented meadows; of dreary plains and picturesque vineyards.

Alsace enjoyed during four-and-a-half consecutive centuries the *Pax Romana*. It was then that the fruitful vine replaced brambles, gorse and sloes upon the foothills of the Vosges. Then the Roman wall broke down, early in the fifth century, and wave upon wave of barbaric hordes swept over and laid waste the fair land of Alsace.

The vine returned to Alsace with the Gospel, and the monks of the West, during the seventh and eighth centuries, and the vineyards of Alsace have given wine to the civilised world during the last thousand years.

During the German occupation of Alsace from 1871 to 1918, Alsatian wines shared in the prosperity of the new German Empire. They were greatly sought after by the wine merchants of Coblenz, Mayence and Frankfort, who had established a world-wide trade in hocks. According to the Colmar Chamber of Commerce, there were from five-and-a-half to six million gallons of white wines of Alsace sent down the Rhine to German hock shippers, every year during the years of the German occupation.

These wines were sold by themselves or blended with the white wines of German vineyards, and always under a German label, never as Alsatian wines. Germany no longer buys any of the white wines of Alsace; and Alsace, no longer selling any of her wines to Germany, turns to the rest of the world and offers her wares under their own Alsatian names.

There are in Alsace over a hundred communes or parishes, where viticulture is of commercial importance; they are divided fairly equally between the Haut-Rhin (Colmar) and the Bas-Rhin (Strasbourg) and their average annual production is a little over fifteen million gallons of wine.

Among the best wine-producing communes of Alsace, with fairly easy names, are Ammerschwihr, Mittelwihr, Ribeauvillé and Riquewihr, in the Colmar district; and Andlau, Barr, Mittelbergheim and Obernai in the Strasbourg district. But there are a number of other communes where some excellent wines are made, unfortunately with names so difficult to pronounce and remember that the Alsatian wine trade has adopted the line of least resistance, and it offers its wines under the name of the species of grapes from which they are made, and not under the name of the village nearest to the vineyards where those grapes grew.

The species of grapes which are chiefly grown in Alsace are the Riesling, Gentil, Traminer, Pinot and Tokay, for the best table wines, that is wines possessed of bouquet, body, breed and balance; the Muscat, for dry wines, with a more distinctive or obvious bouquet; the Chasselas, Knipperlé, Sylvaner, Zwicker and Edelzwicker for the lighter sorts of beverage wines.

As a matter of fact, it is not only an easier question to ask: "Do you prefer Riesling or Muscat?" rather than: "Do you prefer Voegtlingshoffen to the Niedermorschwihr?" but it is also a fairer question, since the differences between the wines of Alsace are due much more to the *cépages*, or species of grapes, rather than to the growths.

Unfortunately, as elsewhere, there are wines made in bad years and of poor quality. But there are other white wines of Alsace made with care and in good years, which are excellent, and they have already gained a considerable measure of recognition and fame in all parts of the civilised world. Most of them are dry without being acid and ideal as wines to serve with oysters or hors d'œuvre, fish and white meat, whilst there are some possessing greater body and sweetness which are admirable as dessert wines.

ANDRÉ SIMON.

GRAPE GATHERING IN MARTINI AND ROSSI'S VINEYARDS NEAR PESSIONE, TURIN

VERMOUTH'S ORIGIN

THE ancient Britons recognised that the wormwood plant had excellent tonic and health-giving properties, and it is from the flower of this plant, one of its ingredients, that Vermouth derives its name. The health-giving properties of different herbs have always been known to mankind. Prehistoric man used to masticate herbs and roots when he felt his system needed toning up, and from the earliest ages the beneficial properties of different plants, barks and roots have been recognised all over the world. It may not be generally known that Cicero mentions that he used to offer his friends Vermouth, and during the Roman occupation of England much of it must have been consumed. Later on we find this wine in general use all over Europe.

The preparation of Vermouth since these early times has undergone considerable development, but its present-day popularity has unfortunately resulted in there being two different kinds available to the public—genuine Vermouth, which is an infusion of good wine with a combination of herbs and roots, such as gentian, wormwood, bitterwood, &c., and the other kind, which is a cheap wine flavoured artificially with synthetic substances.

A good Vermouth is known to medical science for its health-giving properties, and when taken plain is universally recommended for its highly digestive and stimulating effect, and is also very beneficial for disorders of the liver. Genuine Vermouth, being low in calories and alcoholic content, also prevents the formation of excess fat, so that anyone who is anxious to retain a youthful figure will find it beneficial.

WINES OF ITALY

The Heritage of the Romans

IT is perhaps not generally realised what an important place Italy takes in the wine production of the world. France is, of course, the largest producer, but Italy, with a normal annual production of from eight hundred to a thousand million gallons, is a very good second.

Viticulture in Italy goes back to time immemorial; when and where in the peninsula the vine was first planted it is impossible to say, fossil remains prove that it grew and flourished in the very early days of the world's history. Probably the first attempts at cultivation on proper lines were made by the Phœnicians and other adventurers from the near East, who in very early days founded small trading stations in the south, and eventually little colonies. To the Romans is due the credit of having fostered the cultivation of the vine and the making of wine, and they introduced it into the countries into which they penetrated.

The Germanic hordes who followed on the fall of the Roman Empire gave nothing; they destroyed, took all that was worth taking, and left only ruin and desolation. The Church followed the Empire; abbeys, monasteries and other ecclesiastical establishments were founded, and not only was religion taught but also husbandry. The old viticulture was resuscitated and improved, and so Italy may very rightly claim to be the mother of the art of growing grapes and making wine.

Italy to-day may be said to be one vast vineyard. Even in the most inaccessible spots where nothing else could be grown with profit there is the vine. On the lower slopes of the Alps, where even a goat would find it difficult to secure a foothold, let alone a living, terraces have been constructed in positions facing the sun, retaining walls built with difficulty, and suitable soil transported laboriously and often from a considerable distance. On these terraces grow grapes, which yield some of the finest wines.

It is not possible here to enter into a detailed account and description of the wines of Italy; though a short resumé of the principal and best known varieties cannot but be of interest.

In the north of Lombardy, in the province of Sondrio, which marches with the Swiss border, the Valtellina wines are produced. Here the country is very mountainous, and the vines are cultivated on the terraces described. They produce light dry wines of a Claret type, and although not widely known in this country, they are exported in considerable quantity to the Engadine, and are therefore familiar to many visitors who go there for the Winter Sports. The best known are the Sassella and Inferno, wines of character and charm.

Further to the west is Piedmont, on the borders of France, and bearing trace of French influence, not only in custom but in dialect. Here the famous Pinot grape, the backbone of Burgundy, is extensively cultivated. Fine wines of the Burgundy type are made—the best known is the Barolo described as "Il re dei vini ed il vino dei re" (The king of wines and the wines of kings)—perhaps an exaggeration, but still a very apt description for a fine wine. We have also the Barbera, the Nebbiolo and the Gattinara. In the Asti district is made a very pleasant and delicate little white sparkling wine. In this country it is known as Sparkling Asti, or sometimes as Asti Spumante (the same name only in Italian). It is prepared according to the Champagne method, preserves its brilliancy and freshness, and, while having no great pretensions, is an excellent little wine and attractive to those whose tastes and purses are modest.

Mention must be made of the Vermouth, made in Turin and the surrounding districts, and a very important member of the Italian Wine family. Those who know nothing and, therefore, know no better have described it as a vile concoction, a sort of dope. It is nothing of the kind; it is a pleasant healthful beverage, which will give appetite and act as a tonic. Good white wine, slightly sweetened and fortified, and with the addition of an infusion of wholesome herbs, aromatic plants from the Alps, quinine, gentian, &c., it is an ideal beverage, either by itself, as one would take a glass of Sherry, or with a dash of bitters and mineral water to make an ideal long drink and, of course, it is "par excellence" the heart of a good cocktail.

Tuscany, further south, birthplace of the Renaissance and famous for its picture galleries, &c., gives us Chianti, without doubt the best known of all Italian wines. In its picturesque wickered flask it is familiar all the world over, and very justly so, for it has a peculiar charm which is all its own. An Italian poet once called it "Vino che sa di mammole"—wine that is like violets, and that exactly describes it. It is a light dry wine of the Claret type with a particular flavour and "bouquet." The production of Chianti is strictly limited and defined to a particular area; it is not therefore and cannot ever be a cheap wine. To expect to be able to purchase a flask of genuine Chianti for two or three shillings is akin to expecting to buy a good Bordeaux or Burgundy at the same price—it simply cannot be done. There is also a certain amount of White Chianti, which is very good.

Not far distant are grown the Pomino and the Montepulciano, while on the Colli Orvietani, those picturesque Umbrian hills where is situated the famous old city of Orvieto, is produced the White Orvieto wine which, and very rightly, has a great vogue among those who have made its acquaintance. It is bottled in a flask, which is very similar in shape to the Chianti flask, and is a very pretty and pleasing wine.

ITALIAN WINE DISTRICTS

ITALIAN VIGNERONS EN FÊTE

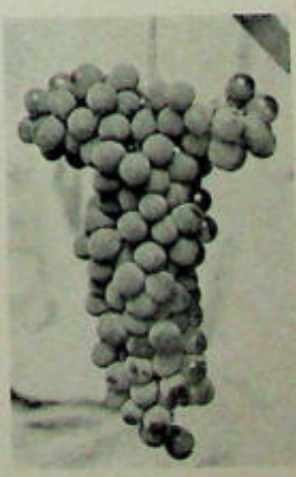
Near Naples the Lagrima Cristi is produced. Grown on what are practically the slopes of Vesuvius, this wine has a slight twang, derived from the volcanic soil on which it is grown. Capri, that island of romance and famous for its blue grotto, gives us Capri, dry and of a light golden colour and with the characteristics of a Chablis. Gaeta, on the mainland and north of Naples, produces Falerno. Amber in colour and similar to the Lagrima Cristi, it recalls memories of the poets of ancient Rome, who sang its praises.

Rome does not do a large export trade in wines. In the hills around the Eternal City is a district known as the Catelli Romani, where are produced the Frascati, Genzano, Albano and several other wines of very good repute.

Last but by no means least we come to Sicily, famous for Mount Etna and its wonderful Greek ruins. Here Marsala is made, a fine golden wine that reminds one of Sherry or Madeira, according to the type selected. It is made in a very similar way to that employed in making Sherry, and in addition to being a very pleasant wine it possesses very definite medicinal and tonic properties. It was very popular at one time in this country, especially in the Senior Service. Lord Nelson, when in command in the Mediterranean, made large purchases of it for the Fleet, and it is a great pity that it does not enjoy a larger demand.

In conclusion it is as well to stress the fact that the growing of grapes in Italy and the making of wine is no longer carried out on what might be described as picturesque methods. The vines are pruned, well-looked after and kept close to the ground. And in the making of wine mass production is not practised as it is not considered to be a sound principle. The grapes are gathered and pressed, the juice fermented and allowed to develop under the most approved conditions. Italian wines when exported are thoroughly matured and in every way reliable.

Time was when the wines of Italy were known but to a few, those who had travelled and the artistic. A trip into Soho to enjoy a cheap dinner and a bottle of Italian wine was looked on as an adventure; an excursion into Bohemia, enjoyable perhaps but distinctly an escapade. To-day all that has been changed. Italian wines are definitely standardised and classified. They are to be found at all good restaurants and hotels, and can be obtained at all the stores and reputable wine merchants.



While not aspiring to compete with the classic growths of Bordeaux and Burgundy, the wines of Italy have secured world-wide recognition.

The gay way to health

Of course you don't step into fashionable restaurants or bars for the sake of your health. *Medicine* bottles have no place in the haunts of pleasure! But all first-class restaurants and bars *do* serve plain Martini Vermouth for those who prefer to go gay in a *healthy* way.

You see, this fine matured wine possesses that "little something the others haven't got"—aromatic herbs that tone up stomach, heart, liver and kidneys—and keep the figure slim. So when next you're out for the evening ask for plain Martini Vermouth—next time friends drop in for the evening, serve it . . . before or with the meal.

WOMEN STALKING CHERRIES, A PRACTICE WHICH NO LONGER TAKES PLACE AT THE DISTILLERY

FROM HOUSEHOLD RECIPE TO WORLD FAME

A Cherry Brandy Centenary

FOR many centuries liqueurs have been produced in numerous—one might say innumerable—varieties and colours in accordance with secret formulas and methods, and there has always been something fascinating about the heavily flowing sugary drops and the odd and fancy bottles in which they are generally contained.

From generation to generation the special recipes have been carefully guarded and protected, and it is interesting to see how this trade more than most others, in these days of limited companies and public undertakings, has been kept in the hands of monastic orders or commercial families of old standing.

An example that in many ways is characteristic for the growth and life of a liqueur is that of the popular Cherry Brandy, which for four generations has been made by the Heering family in Copenhagen, the smiling capital of Denmark.

As so very often happens, a curious circumstance laid the foundation of a big commercial enterprise. The founder of the firm as a boy of seventeen served his apprenticeship in a grocer's shop, and his principal's wife made for herself and her friends a cherry liqueur, the wide possibilities of which were clearly seen by young Peter Heering, and the recipe of which he was allowed to take with him, when, in 1818, he started business on his own. The firm rapidly forged ahead owing to the energy and far-sightedness of its founder.

Within a score of years, in 1838, Peter F. Heering acquired the present site and premises of the business, and only a few days ago, on December 4th, the family celebrated the centenary of their acquisition of the buildings. A fleet of graceful sailing ships was added, and under the Danish and his own house flag, which was blue with a seven-pointed white star, Peter Heering's schooners and brigs sailed the seven seas and carried his Cherry Brandy to all parts of the globe.

The picturesque courtyard of the Heering establishment, with its ivy-clad walls and Latin inscriptions, carries a romantic atmosphere of the past, for recent additions and renovations have been effected with such skill that architectural beauty has been attained without loss of character.

The books of the firm, which are still preserved, demonstrate how the business grew from its small beginning into an organisation which, at Peter F. Heering's death in 1875, enjoyed a world-wide reputation and helped to make the name of his country better known in many distant markets. Many distinctions have been bestowed upon the firm, and foremost among these honours rank the Royal Warrants from the King of Denmark, the late King George V, and also the late Czar of Russia.

In the cellars and other parts of the distillery there are long rows of oak casks darkened through years of service, and some of them beautifully carved. For nearly a century many of these have witnessed the well-guarded process which changes the sunripe glistening cherries into the liqueur which to-day is so popular with all races and nationalities. These dumb witnesses have seen the production steadily increasing, and modern apparatus, such as electric pumps and powerful hydraulic presses, replacing the old-fashioned methods without altering the high standard of quality.

Decades have passed, and year by year fresh developments have taken place. The horse-drawn carts, which in early days transported the cherries to the distillery, have been replaced by modern motor lorries, but the cherries still come from the same orchards of the Danish islands. Improvements in the mechanical equipment now enable the distillery to receive and treat upwards of 70,000lb. of cherries a day during the season, and from their reception until the shipment of the finished product, the fruit and other raw materials are scientifically examined and tested in the firm's own laboratory.

Practically all the countries of the world are represented on the export floor, and destinations such as London and Shanghai, Buenos Aires and Sydney, Jamaica, Singapore, Cairo and many other names on the cases demonstrate the wide sphere of commerce which to-day is included in the firm's activities. After an interval of years New York and other cities of the United States again appear in the order books, and now Cherry Heering, as the old liqueur is called in the States, is rapidly regaining its popularity in that market.

The demands of changing conditions have now caused a many-sided business combining commerce, manufacture and shipping, to be replaced by one which to-day concentrates on the production and sale of a single product.

And so ends the story of a household recipe which came under the notice of a far-seeing and energetic young man.

OLD WOODEN WINE CASKS DATING FROM 1846 AND BEARING FAMILY ARMS

RHINE AND MOSELLE WINES

Their Growth and their Serving

By CHARLES HASSLACHER

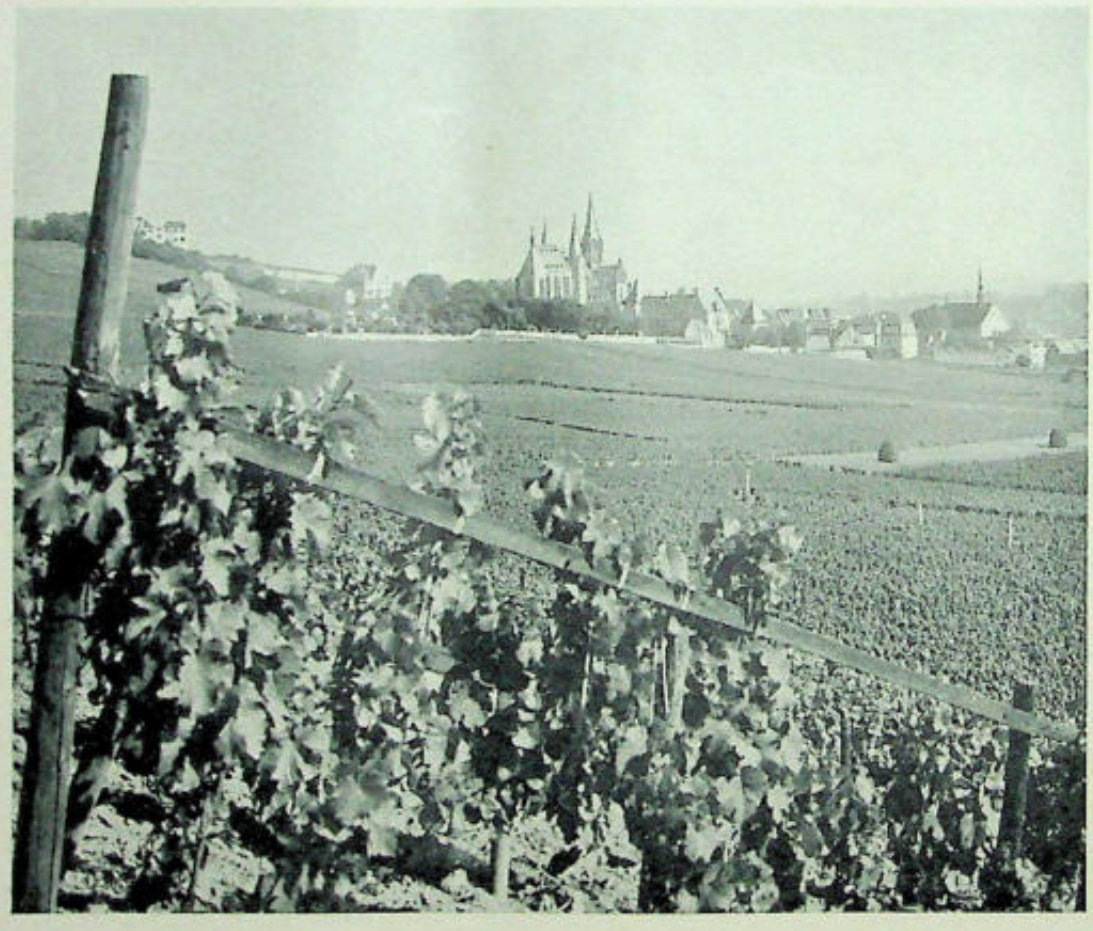
WHEN the general public, in England, order a Hock from their wine merchant, or in a hotel or restaurant, they expect to receive a wine from the vineyards bordering the river Rhine. These wines are known in the land of their production, and in most other countries of the world, under the name of Rhine Wines.

The word "Hock" (probably derived from "Hochheim") as a generic term for Rhine Wines, has been used in this country for a long time—replacing the older word "Rhenish," formerly affected by writers and poets. Unfortunately, the word "Hock" has, especially of late years, been used to make popular the white wines of some other countries, which would hardly be known under their own distinctive names.

Moselle (or Mosel) wines are the produce of the vineyards on the banks of the River Moselle and its tributaries, the vineyards commencing at a point not many miles above Trier (where the geological formation suddenly changes from a chalk subsoil to a slatey shale) to the point where the Moselle enters the Rhine at Coblenz. It is from the junction of the rivers that the town of Coblenz derives its name, being a corruption of the Roman "confluentia," meaning conflux. Even a passing view in most other countries. During the winter storms sweep the country, and it often happens that great quantities of soil are washed down to lower levels. If the vine roots on the upper slopes are not to be left uncovered, and, consequently, deprived of nourishment, this soil has to be loaded into baskets and carried up again.

The direct result of these conditions is that the expenses incurred in cultivating the vineyards in Germany are much higher in proportion to those of other countries—hence the somewhat higher prices of Rhine and Moselle wines as compared with the produce of other wine-growing districts. On almost all wine lists there is a large selection of German wines,

VINTAGE 1937 AT RUDESHEIM IN THE VINEYARDS OF MESSRS. DEINHARD, COBLENZ



LOOKING OVER THE VINEYARDS ON THE HILL-SLOPES AT RUDESHEIM

of the banks of the river, from a train, will show that the soil of the steep hills, bordering each bank of the Moselle, is very slatey and this, undoubtedly, is the cause of the characteristic Moselle flavour. These wines, on the whole, are lighter and more elegant, having less alcohol and fullness, than wines of a similar price from the neighbouring River Rhine. This difference in characteristics, no doubt, accounts for the poetic fancy which depicts the Moselle as a young girl and the Rhine as an old man.

By reference to an atlas, it will be seen that the wine-growing districts of Germany are the most northerly in Europe, if not in the world, and, as is only to be expected, Nature puts many difficulties in the way of making good wines. There are not only the many natural enemies, both insect and fungoid pests, to be fought, but the risk of night frosts (in the early spring when the first shoots of the vine appear and also in the autumn when the grapes are ripening) is very much higher than in more southerly climes.

Most of the vineyards on the Moselle, and, to a large extent, those on the Rhine, are cultivated on steep terraced slopes, which, of course, make the work of tending them very much more laborious than if they were on level or undulating ground, as but the ultimate choice is made all the more difficult when the name of the responsible shipper is not inserted against each wine. Imagine the difficulty in choosing a Champagne, should the names, under which all Champagnes are known, not be quoted on the list! After the final selection is made, however, even the best wine can be spoilt if not properly served, and the following remarks may be of interest to readers.

The correct temperature at which to serve Rhine and Moselle wines varies according to the season of the year, and should be from 47deg. to 54deg., but in the case of Rhine wines, and more especially in the case of the finer varieties (particularly in the cold season), it is advisable to serve the wine at the cellar temperature, unless that is unreasonably high.

With regard to the capsule, this can either be removed as far as the rim of the bottle, or be entirely removed and the top of the cork carefully wiped, so that no extraneous matter may find its way into the bottle and cause the wine to be condemned.

It is a good plan never to fill a wine glass more than about three-quarters full. In fact, it would be better to err on the other side, as no wine can show its beauty of bouquet if the glass be full to the brim. One should pay particular attention not to shake up the contents of the bottle when passing from glass to glass, as this is easily done by bringing the bottle up into the perpendicular position hurriedly each time.

In older vintages of German wines one sometimes finds small "floaters" (which are called "dry fliers" and are analogous to "bees wing" in port), but they do not affect the quality and soundness of the wine in any way.

Many of your readers have, no doubt, seen German wines quoted at what might appear ridiculously high prices. While such wines can, of course, never be a daily beverage, it is, on occasion, well worth while to hazard the extra expense of a really fine example of what a German wine *can* be when produced under exceptional conditions in a fine vintage year.

To my mind, the ideal occasion on which to drink such a wine is towards the end of dinner, as a dessert wine, and, undoubtedly, the acme of enjoyment would be to sip half a glass of such nectar to the accompaniment of a fine pear, apple or peach.

A DECORATIVE WINE CASK AND ITS LEGEND

So far it has not been possible to trace the exact history of this cask, but it is reputed to have been presented to Her late MAJESTY QUEEN VICTORIA, on the occasion of her 34th Birthday on the 24th of May 1853, which date appears on the enamel plaque surmounted by the English Royal Coat of Arms.

The monument depicted is erected on the HOCHHEIM VICTORIA BERG, a hill, with surrounding vineyards, which she graciously gave permission to be named after her as seen inscribed on the Monument Koenigin Victoria Berg (Queen Victoria Hill)

The cask came into the possession of the late Lord Kitchener and was subsequently purchased by Messrs Deinhard & Co

"THE SOFTEST CONSOLATION"

Furnishing the Perfect Finish to a Good Meal

CHOICE wines are an essential part of a good meal, but connoisseurs agree that a meal does not attain perfection unless it is rounded off by a fine Havana cigar. In no other part of the world has it been possible to grow a tobacco which equals in exquisite aroma and flavour that of Havana. Only the soil and sun of Cuba have been successful in producing it.

Rudyard Kipling wrote :

" And a woman is only a woman,
But a good cigar is a smoke."

And the praise of Havana cigars has been sung by poets, writers, artists and eminent men, who testify to the inspiration and solace they experience from smoking them.

The first smokers in Europe had their trials and tribulations. We are told that in Switzerland smoking ranked next to adultery as a crime, that in Russia they cut off the nose of anyone found smoking! The Greek Church forbade its use altogether by its members, but neither edicts of the Church nor decrees of Kings could stem the tide of its popularity, which continued to increase until to-day tobacco is regarded as a necessity of life.

The Havana cigar is a product which is as favoured among cigars as Champagne is among wines, although Cuba produces less than 3 per cent. of the output of leaf tobacco of the world. And but a very small proportion of this output is suitable for the manufacture of the leading brands of cigars of world-wide reputation, for the production of the right leaf is a specialised process.

From the moment the tobacco seed is sown in Cuba, it is tended as carefully as a child. The seedlings are protected by brush from heavy rainstorms and scorching sun, and as soon as they are strong enough to stand alone, they are thinned out and transplanted into hillocked rows, about 1,600 plants to the acre. Sowing takes place in November, and the plants are ready for harvesting in February.

The leaves, when gathered, are handled separately, being sewn together in pairs and strung over thin poles which are removed to barns, and the tobacco is then left to dry for four or five weeks. Then comes fermentation, for which operation the leaves are removed from the poles and placed in piles, which brings out the flavour and aroma of the tobacco. After many other processes, they are packed into bales covered with palm leaves, and the tobacco is then stored for maturing. Havana tobacco improves with age, and it is generally left in these bales for an average of three years before use.

When tobacco is required for manufacture, the centre stalk is stripped, and sometimes as many as 27 different grades of leaves are combined before a perfect blend of filler is obtained. Records of blends are most jealously guarded by the factories, and are their secret formulæ. First-class factories generally carry sufficient stocks of tobacco to take care of their requirements for three or four years, thus securing a continuity of blend.

The next process is the stripping of the wrappers. It should be mentioned here that all operations are by hand ; machinery takes no part in the manufacture of imported Havana cigars. The wrapper leaves are elastic and silken in texture, with a clear unblemished colour. In Havana only two wrappers are cut from each leaf ; that part of the leaf farthest away from the stem, which is most suited through its delicate texture. Wrapper leaves are very expensive, fine selected wrappers costing as much as $800 per bale, sufficient to wrap about 20,000 cigars.

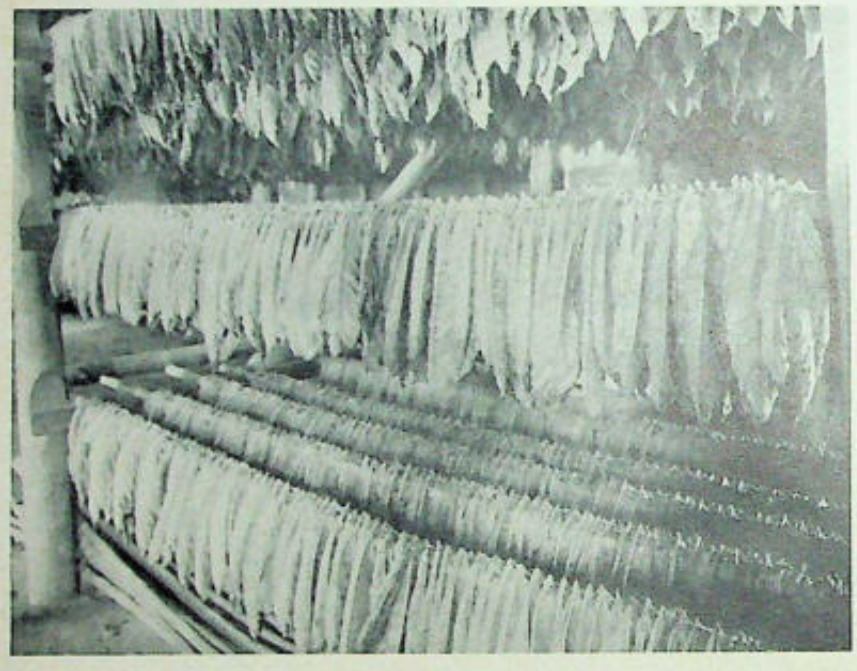
The final process is performed by Cuban workmen while listening to their reader, who sits aloft in a small pulpit reading aloud the day's news from the paper, or perhaps one of the classics or a Spanish novel. The readers are interesting characters. Often they are orators of some local note, and it is surprising how well informed the average cigar worker is in consequence of this custom. Of late years wireless has also been introduced. The average Havana workman will make about 100 medium-size cigars a day. Every cigar maker receives six cigars free per day ; the Havana manufacturers believing in the biblical teaching : " Do not muzzle the ox that treads the corn."

Visitors to a Havana cigar factory find the selecting room most interesting. Here the " escogidor," or selector, works. It is his duty to receive the cigars from the benches when finished and grade them in the various shades of colour. The cigars are laid out on a large table in a strong north light, and one sees how keen a sense of colour these men possess by the way they grade cigars in their many shades (usually about 32). It is difficult for an inexperienced person to see any difference between the parcels lying side by side. The average visitor can only detect differences of shade in piles separated by three or even more intermediate gradings. The reason for this intricate colour-scheme is to give a uniform appearance to all cigars in a box. Connoisseurs prefer the medium colour (*colorado claro*), which is mild in flavour and delicate in aroma, and stress must be placed upon the excellence of this light brown leaf. There are, unfortunately, a number of Havana cigars exported under little-known brands, which are in many cases of inferior quality, although not lower in price than the goods of the standard Havana brands which are of world-wide renown, and dependable.

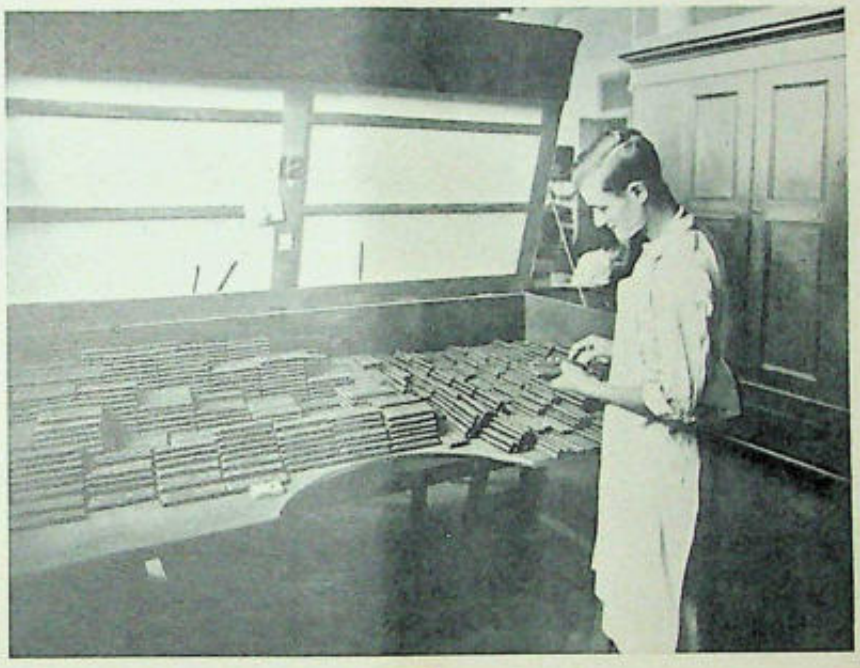
A few hints on storing cigars may be of interest. Artificial heat should be avoided at all cost. The best way to keep cigars is to store them in a cupboard in a living room, it being imperative, however, that this cupboard should be against an inside wall, not too near the fireplace. Havana cigars should be kept in a receptacle exclusively devoted to them, as tobacco absorbs any scent to which it is exposed. A cigar, generally speaking, is at its best two years after shipment, and it retains this perfect condition for two or three years, after which there is a tendency for flavour and aroma to deteriorate.

Fine cigars should be smoked slowly, otherwise combustion would be imperfect and the greater part of the delicate aroma lost. An important fact with regard to Cuban tobacco, from which Havana cigars are made, is that it contains less nicotine than any other known tobacco ; also the active poison, furfural, is entirely absent from these cigars. Unquestionably they are the most healthful form in which to enjoy tobacco. The Government of Cuba guarantees the genuineness of Havana cigars by means of an official label (green in colour) with which it is obligatory for manufacturers to seal each box before export.

" He who doth not smoke hath either known no great griefs, or refuseth himself the softest consolation, next to that which comes from Heaven," wrote Bulwer Lytton, and that " softest consolation " is provided by a gift of a box of fine Havanas in which each cigar is a reminder of the discrimination and good will of the donor.



LEAVES SEWN TOGETHER IN PAIRS AND STRUNG OVER THIN POLES



THE SELECTOR'S WORK IS TO GRADE THE CIGARS IN VARIOUS SHADES OF COLOUR

THE VINTAGE OF 1938

We are indebted to Messrs. Hedges & Butler, Ltd., for the following reports concerning this year's vintages :

CHAMPAGNE.—*Up to July prospects were favourable, but unfortunately August and September became cold and rather wet, so the ripening of the grapes was retarded. There is a heavy crop, but the wine will only be of average quality and will never make a " vintage wine."*

SHERRY.—*The reports from Spain regarding the* 1938 *sherry vintage state that the ripening of the grapes has been generally satisfactory and that the crop is heavier than last year. Grapes were gathered under excellent weather conditions.*

PORT.—*There is the prospect of good quality wines being made this year. Musts showed a high percentage of sugar, and good colour. The gathering of the grapes was carried out in perfect weather conditions. Prices will be about the same as last year.*

BURGUNDY.—*The grape crop is much below average in the Burgundy district. Scarcely any red, and very little white wine will be made this year.*

BORDEAUX WINES.—*Frost has affected the low-lying districts, but the vineyards on higher ground have suffered less. Although there is a definite shortage this year, it is hoped that the wines produced will prove to be fairly satisfactory in quality.*

MADEIRA.—*The result of the vintage this year is smaller in quantity than usual. The weather was dry in the flowering season, and the grapes matured well, so the quality of the wine is good.*

RHINE WINES.—*Reports are not very favourable; cool and wet weather prevailed in the latter half of August which spoilt the earlier hopes of a fine vintage. On the Moselle and Saar, prospects are brighter, and more favourable weather has prevailed during the vintage. Grapes here have developed well, though there will be no bumper crop.*

BRANDY.—*It is expected in Cognac that the vintage will be of good quality and of average quantity.*

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

THERE are wines, different in colour, age, strength, flavour and cost, to suit most if not actually all tastes and purses. Wine is a stimulating food and a source of inspiration, but it is usual, even indispensable, that we should partake of some more solid form of food besides wine.

The Art of Good Living teaches the harmony that should exist between solids and liquids. So, after looking round the world and taking stock of the principal vinelands scattered over the earth, we might very well continue our quest and take notice of what the world has to offer us to eat, be it fish, flesh or fowl; roots, shoots or fruits. Fish swam in the sea before any bird flew in the air and before any animal or man stood on solid ground; fish may rightly be called the world's oldest inhabitant, so that it is only right that we should begin with Fish.

The fish we eat may be divided into the following categories: (1) Fish which never leave the sea, such as herrings, soles, lobsters; (2) fish which leave the sea to spawn in fresh waters, such as salmon, shad, sturgeon; (3) fresh-water fish, such as pike, carp, grayling; (4) fish which we seldom, if ever, see but in olive oil, such an anchovies and sardines.

Taking the fish from the deep-blue sea first of all, we can subdivide them further into the travellers, the stay-at-homes, the sprawlers and the wrigglers. The travellers are the best of all from the food value point of view; they have more energy themselves and they are richer, more oily and more nutritious. Such are herring and mackerel and their many cousins, from the large tunny to the small sprat.

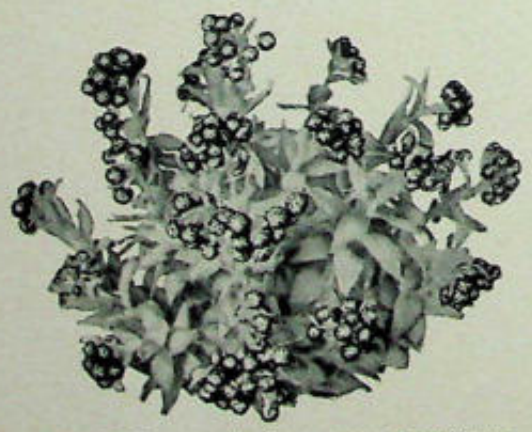
Among the stay-at-homes, the sole is the greatest favourite, gastronomically, and the cod the most important economically. There are ever so many kinds of similarly flat and lazy sorts, such as turbot and halibut, devoid of all sporting instinct but excellent in themselves and as a background for a really good sauce. The sprawlers are the armoured class comprising the crabs, lobsters and crayfish, whilst the wrigglers are the conger-eels and other snake-like creatures hiding in rocks or seaweed.

Of all fishes born in fresh water which make the sea their real home, the salmon is king and the shad queen, whilst smelts might very well be called good little pages.

As to the fish which never leave rivers or lakes, the trout has no equal among them and the grayling among denizens of river and lake. The pike and the carp both require a skilful cook to be of real gastronomic interest, just as the little fresh-water crayfish demands skilful *doigté* to be enjoyed at table. There are also the four more usual types of eels—the snig, the grig, the broad-nosed and the sharp-nosed, the last one being the brightest and best.

Last, but by no means least, are those always to be depended upon, little fishes in their tins and bottles, headless sardines and filleted anchovies and mackerel or herring. They are steeped in oil, hence their food value, and highly seasoned, hence their thirst-provoking merit.

The
CAPE COUNTRYSIDE
is *ablaze*
with WILD FLOWERS



THERE can be few more magnificent spectacles than the South African countryside when the wild flowers and shrubs are in bloom and the landscape is decked in a mantle of riotous colour.

The orchards and vineyards are now laden with fruit, and their sun-ripened crops add new significance to the pleasures of the table.

Visit South Africa and lay up a store of memories you will cherish throughout your life.

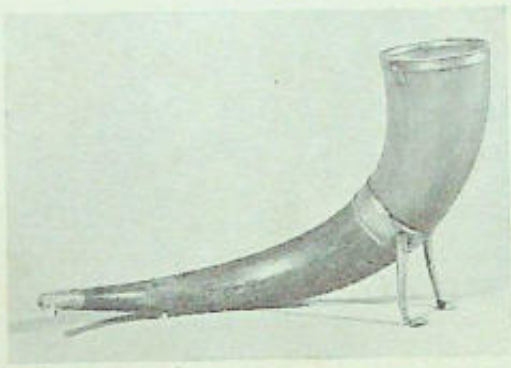
Consult your Travel Agent or the Travel Bureau, South Africa House, Trafalgar Square, London, W.C.2. Special steamer fares apply by certain sailings during Winter.

South Africa

FIFTY YEARS AGO

From the *Field* of December 8th, 1888.

SHOOTING Salmon. "Two persons named Harrison and Wren, have been fined £2 and £1 respectively for the novel offence of shooting salmon in the fence season. . . . From the evidence given at the North Riding Police Court it seemed that Harrison discharged a gun three times on to a spawning bed in the Stonegate Beck. One salmon was killed at the third shot and another fish was afterwards picked up with gun-shot wounds in it. Harrison and Wren's defence was that Harrison was out rabbit shooting and yielded to sudden temptation."



THE PUSEY HORN

IN THE SALEROOM

ON December 14th Christie's are selling the most important part of the William Randolph Hearst Collection of Old English and foreign silver, removed from St. Donat's Castle, Wales. Consisting of 146 lots, it includes some marvellous pieces.

Lot 47, the great mace and sword of the ancient Corporation of the City of Galway, it is to be hoped will be purchased and presented to its place of origin by some admirer of Eire. The mace was made by John Clifton, Dublin, 1709, and is 4ft. 9½in. high; the sword, *circa* 1660, is 4ft. 9in. high. Lot 118 is the famous Temple Newsam mazer, which was until 1935 in the collection of Lord Halifax. Of maplewood and silver-gilt, 6in. high by 6¾in. diameter, the bowl is *circa* 1470, and the stem and central plaque *circa* 1600. Lot 103 is an Elizabethan nautilus cup with silver-gilt mounts, 10¼in. high, *circa* 1580, and Lot 104 a parcel gilt tazza of the same period.

The most important piece of the sale is the renowned Pusey horn, which is one of the very few remaining specimens of objects held in connection with the tenure of "Cornage," and was the subject of an action brought for its recovery by Charles Pusey before the Lord Chancellor when it was produced in court and proved to be the identical horn by which, by a charter, Canute had conveyed the manor of Pusey 700 years before. Traditional history has it that Canute being in camp in the neighbourhood of Pusey and the Saxons a few miles distant, the King received intelligence from an officer of his army of an ambuscade formed by the Saxons to intercept him, and in consequence of escaping from this danger he gave this manor to the officer and his heirs to be held by tenure of the horn.

The foreign silver includes an interesting Inca gold sacrificial bowl, *circa* 1500 B.C., probably from the Pacorsinago region, Ecuador; a Gothic cup of mazer fashion, silver-gilt, 6¾in. high, German, early fifteenth century, bearing a rhyming inscription in the middle Bavarian dialect; a German silver-gilt tankard and cover, 5in. high, by Elias Lencher, Nuremberg, *circa* 1580; and a silver-gilt rosewater dish, 14¾in. diameter, sixteenth century, North Italian or South German.

A NATURALIST'S NOTEBOOK

DID you read *England Have My Bones*, by T. H. White? That was a grand book, a book that laid bare, but so gently, so lovingly, so wisely, the heart of England; a book that had in it something of all the old masters, those men who knew and loved England, and something of those few who of recent years have written truly of England's country, wrapped up in the personality of T. H. White. That was a book to keep and dip into whenever things seem a little awry. If you read it you will be interested to know that the author has written another (actually, of course, he has written a number of books—and all are good) and you will go and buy it. You need read no further. You have no need.

* * *

But if you do not know T. H. White, allow me to introduce you through his new book. This is called *Burke's Steerage*, and is published by Collins at 5/-. That is cheap, and when you have read it you will, I think, go out and buy several copies to give friends at Christmas; that is, if you know (and are friendly with) people who hunt and fish and shoot, or follow one of those pastimes—and, of course, you know such people.

* * *

Burke's Steerage is the Amateur Gentleman's Guide to Noble Sports and Pastimes. Some might call it a skit upon those sports and pastimes. But it is not that—skits are generally vulgar and always spring from jealousy or disappointment, and T. H. White is certainly neither jealous nor disappointed—it is, in very truth, a guide. And if a guide written primarily for the Amateur Gentleman (by the way those words contain no snobbish intention, cast no reflection upon birth and breeding) of small means, it should—I am absolutely convinced about this—be read by all who indulge in Noble Sports and Pastimes. It does no one any harm to see himself under a strong light, particularly a strong and kindly light.

* * *

The Noble Sports and Pastimes are Hunting, Shooting and Fishing—three aspects of English life upon which the *Field* can claim no small authority extending over a period of some 80 years. Can you wonder that I read *Burke's Steerage* with avidity? Mr. White divides each sport into four classes, and proceeds to consider each. He gives hints about dress, deportment, and expense; he describes an average day. He discusses the types of people to be met with in each class of each sport. He gives hints on what to do and what not to do—and all delightfully.

* * *

There are, he says, four main types of hunt—the *Leicestersheer*, *The Family Pack*, *The London Gentleman's or Good-Luck-to-All-where-none-are Known*, and the *God-Forsaken Hounds* (the last-named supported by farmers and other low people inspired by the unfashionable ideal that foxes exist to be caught). Well, we could all fit certain packs into those categories. But where would we put our own?

* * *

Four main types of fishing, too—*The Financier's*, *The Laird's of the Ilk*, *The Hotel*, and *The Worm Water*. And we all know them also—particularly *The Hotel*. Four main types of shooting—*The Certain Personage*, *The Family*, *The Syndicate*, and *The Farmer's Glory*. And again we all know them.

* * *

About each Mr. White is very funny—really funny and with no straining for effect. I do not know when I have laughed so much or so loud. Mr. White has an unerring eye for shams and no hesitation in ridiculing them, but he does it all so very kindly that no one—and not even a member of the *Leicestersheer*—could possibly take offence.

* * *

But this is much more than a funny book. It contains some gems of humour, as for example: "The upper classes are much more interested in doing the right thing than in doing the thing right." It contains, too, much wisdom. There are some pertinent remarks about Hunt Secretaries; pertinent remarks about buying fishing tackle; pertinent remarks about shooting in general, and three valuable and accurate appendices; pertinent remarks about almost everything. The Amateur Gentleman reading and digesting Mr. White will not go far wrong.

* * *

It is a grand book this—grand fun from beginning to end. And it ought to have a great success, because everybody will recognise somebody. Real humorists are rare! Plenty of people poke fun at the things they do not understand—and cease to be funny immediately. Mr. White loves and understands the things at which he pokes fun, understands the people at whom he pokes fun. He is a real humorist. He is more; he is a real and valuable addition to English letters. B. V-F.

LETTERS TO THE EDITOR

RABBITS AND AGRICULTURE

SIR,—There has been a great deal written recently referring either to rabbits as a pest to agriculture, or by persons connected with humane societies on the use or mis-use of steel traps. If the wild rabbit industry of this country is properly controlled, very little would be heard of either question.

I have recently sold some larch coverts on my land. These were planted 30 years or so ago without any protection against rabbits, except that, as was the custom then, a man dealt with any small colonies of rabbits that established themselves in the vicinity by ferreting, netting, snaring, &c. Such men did not catch rabbits with the idea of supplying the market but to keep them down, though the rabbits they caught were often acceptable in neighbouring houses or cottages or local shops.

To-day nothing can be grown in that area that will not be irreparably damaged by rabbits, including good quality grass. In the old days, rabbits were supplied to the markets of the Midlands in comparatively small numbers from a few recognised warrens, chiefly near the coast.

High prices during the War, the break-up of large estates, and to-day, motor vans which quickly collect catches for dispatch to the industrial centres by heavy motor lorry or by rail, supply a very large and highly organised industry.

The wild rabbit industry demands regular catches over a regular season. Local rabbit dealers, and their trappers meet this demand, by setting large numbers of steel traps, in the holes or the open, "moving them on" as soon as the catch begins to dwindle.

By this means they can virtually guarantee those they supply, with a definite number of rabbits per night. If it is a question of profitably supplying the market no other method can pay.

I have just prosecuted a dealer, and the trapper employed by him for setting 20 dozen in the open. Not one was near a hole. I could not have done so had not the sporting rights been retained in the tenancy agreement. The trapper refused to trap the farm if required to set traps in the holes.

The wild rabbit industry which lives "gratis" on the back of agriculture, should be controlled in exactly the same method as used by the successful potato marketing board.

Rabbit producers should be required to pay a "levy" plus the cost of the inspection of the land their stock is produced on. Recognised producers should only be allowed to market their stock through authorised merchants and *vice versa*.

A recognised rabbit producer would be required to keep his stock on his own land, by artificial or natural obstacles.

On all other land rabbits should be kept down to normal, as described at the beginning of this letter and not eligible for the market. On all land there should be a really heavy fine for setting traps "outside a horizontal hole."

If the "wild rabbit industry" had to pay the true cost of producing these pests there would very soon be few rabbits and no rabbit industry. The industry only flourishes because they can market a pest under the pretence or bluff of eradicating or controlling it.

Yours faithfully,
W. H. BUCKLEY.

127, Piccadilly, W. 1.

CANALISING THE AVON

SIR,—It seems that some of your correspondents who have written on this matter have not realised the very essential difference between a river which runs a natural course from source to mouth and a river like the Avon. The Avon (Hampshire), which flows a placid and nowhere a rapid course from Upavon, even Pewsey, to Christchurch has had its course diverted in numerous places, some not more than three-quarters of a mile apart, in order to create heads of water for mills. This makes long stretches of deep water in which the current is extremely sluggish and in which as well as in all natural pools the mud from upper reaches is deposited, and must be deposited. Even had the workers of the Catchment Board mudded these depths, which they did not in all instances, the mud was only sent a short way down stream to the next pocket.

The length of the river from Upavon to Christchurch is approximately between 50 and 60 miles, and in that distance falls only 309ft., so except in times of heavy and long-continued flood the river gets but little, if any, flushing, and this but for the effect of the mills and sluice gates would be effective, but is not now. If anyone should wish to have this borne in on his mind, let him do as I did on November 21st, and look over the bridges at Upavon, Netheravon and Bulford, and at the long reaches with but little movement in their tawny placid depths.

One of your correspondents alludes to this mud as "acid." Considering the fact that this is what one might term a bastard chalk stream, this seems unlikely, but the question of the reaction of the mud is of no moment.

There is, however, another matter which is of importance to the fisherman and that is the barbed wire erected sometimes less than 18in. from the bank and never over 3ft. under which the fisherman must roll. When in Shropshire recently I heard much of the Severn Catchment Board's work on the Vyrnwy, and nothing in its favour, the principal complaint is from those who have grazing adjacent to its banks and they are unable any longer to graze anything approaching the normal head of cattle.

On the Teme where I saw them at work the effect will be that reaches will for some time be fishable from the banks where they are not too steep, but it will mean that the trout will be decimated, as I think they will on the Avon, with no cover for the fish.

Yours faithfully,
Easterton, Wilts. RICHARD LAKE.

A ROEBUCK-SHEEP HYBRID

SIR,—Perhaps the following may be of interest to some of your readers:

When I was in Scotland this autumn, near my old home, I was told of a case of a roebuck having mated with a sheep. From what I was told, the roe have, for the last two or three years, come down out of the woods and fed with the sheep in the evening, with the result that they mated. I must confess I was doubtful about the story, but a day or two ago I was shown this hybrid, which was at that moment with the sheep. It is a curious looking animal, dark brown in colour, with the forequarters of a sheep and the unmistakable hindquarters of a deer. The head was darker than the rest of the body, but much narrower than an ordinary sheep. It was very shy, and it moved exactly like a deer. I believe there were three of them originally, and the one shown to me was a last year's lamb.

Yours faithfully,
House of Lords ESMÉ GORDON LENNOX.

SONGBIRDS AND THE LITTLE OWL

SIR,—It is good to note that you have opened your correspondence columns to those who have opinions to ventilate respecting the feeding habits of the little owl. I look forward to some interesting reading.

From the evidence to date there is no room for doubt that this bird preys to a certain extent on game bird and barndoor chicks; but I have been surprised to find only casual reference in the press to the fact that his diet also includes the nestlings of our song-birds, as well as the adult bird (see Mr. Brian Vesey FitzGerald's article in the *Field* of a few weeks ago in which he describes an attack on an adult blackbird in full flight).

There is unrefuted evidence that these birds feed their young on whole families of nestlings, and thus work enormous destruction during the nesting season.

I visited one such "devastated area" a few weeks ago, a lovely place which used to be alive with wild birds. It would be hard to find a thrush or blackbird there now. The little owl was there all right.

Britain cannot afford to lose her song-birds, and that she will lose them surely and none too slowly, is certain as long as the little owl is protected.

People who have always lived in England little realise the asset they possess in their song-birds, or the joy that these give to the real country lover, particularly to those who, like myself, have been compelled for a living to spend most of their days in some malaria-stricken outpost where the dreadful crescendo shriek of the brain-fever bird is a poor substitute for the lovely melody which greets one in an English garden on a fine morning in early June.

I would class the little owl with the grey squirrel and the worst sort of vermin, and exterminate him ruthlessly, root and branch.

Yours faithfully,
Singlestack, Catisfield, Fareham, Hants. C. L. STEVENSON.

BREWERS AND FARMERS

SIR,—While sympathising deeply with the serious, if not desperate, plight in which many farmers find themselves to-day, I feel impelled to express my disapproval of the methods adopted by some barley-growers in presenting their grievances during recent weeks.

The protests by these growers have hinged very largely on their suspicion that the heavy increases in imports of foreign barley were due to purchases from abroad by the brewing industry. Those who know that industry and who remember the downright admissions by the National Farmers' Union and by the Import Duties Advisory Committee that it had in the past honourably fulfilled its undertakings to buy as much home barley as possible, were, to say the least, puzzled by this suspicion. They were puzzled, but content to wait and see what official figures would show.

Now these figures, as given in the Trade and Navigation Accounts for the first ten months of this year, are available. And they show that imports of barley from Canada and the Soviet Union have risen from 3,179,309cwt. and 2,602,430cwt. in the first ten months of 1936 and 1937 respectively, to 7,452,462cwt. in the first ten months of this year. The increase over last year's imports is nearly 200 per cent. To appreciate fully what this means one should know that scarcely any malting barley for brewing purposes is commonly imported from Canada or Soviet Russia. The grain is not suited to that purpose.

The ineluctable conclusion, therefore, is that these hugely increased quantities were largely imported by farmers themselves, for stock-feeding purposes, thus inevitably depreciating the price of all lower-grade British barley.

Let us now examine the figures for imports of barley for all uses from other countries, some of which (notably the U.S.A.) are able to produce barley of malting quality, and others of which a certain amount is used for the same purpose. The totals for the barley imports from these countries were 8,857,699cwt. and 10,749,817cwt. during the first ten months of 1936 and 1937 respectively, and 9,163,113cwt. during the first ten months of this year. In other words, imports from countries generally regarded as capable of supplying malting barley are considerably lower this year than last, and very little greater than in 1936.

I should add, in passing, that I am obliged to omit the figures for Rumania. This year's imports from that country are not yet published, but there is no reason to suppose that they would falsify my conclusions in the slightest degree.

These figures for barley imports generally—the only evidence upon which we can base any reliable opinion until the brewers are able to collate information concerning their purchases of home barley—show beyond reasonable doubt that the farmers themselves are largely responsible for the heavy increases in barley imports, while the brewers, so unjustly criticised, have probably been importing even less than last year.

I feel sure, from my knowledge of farmers, that they will make amends for accusations which are groundless, more especially as goodwill between farmers and brewers is essential to the happy solution of the barley problem. From my own experience as a maltster I am sure that no one would be better pleased than the brewers if they could brew their beer without having recourse to foreign grain, but while the public demand for bright beers remains as it is to-day, many of them are forced to use barleys produced in sunnier climes than our own. Farmers can play their part in building up this goodwill by refraining from suggestions which are as damaging as they are unjust.

Yours faithfully,
House of Commons, London, S.W. 1. HENRY PAGE CROFT.

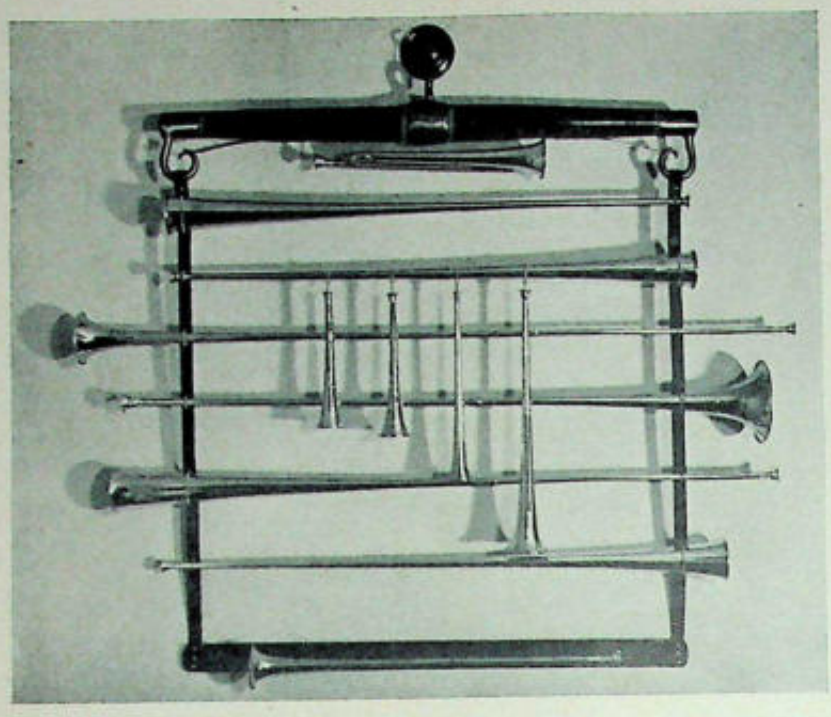
"GHOULIES AND GHOSTIES"

SIR,—Although the correspondence with reference to the above was closed on May 28th, perhaps the following may be of interest, and worth publishing.

At the beginning of July, I was clearing bushes from the side of the Little Glenelly River, Co. Tyrone, along with the owner of the fishing, a local farmer, Mr. Jacob Campbell, of Derborough, near Plumbridge. At the bottom of a furze bush which we had cut, there was a quantity of dead grass, and I said, "Jacob, that would be just the place for a hedgehog. Are there any about here?" He replied, "Not now, sir, but there used to be. I well remember, one moonlight night about 30 years ago. I was coming home over the fields from Plumbridge, when I heard the most blood-curdling shrieks coming from a grass field, over the brow of the hill. It sounded like a child being murdered, and fairly unnerved me, but I plucked up courage and went to find out what the trouble was. When I reached the place, I found five hedgehogs all close together. They continued to make these awful shrieks while I was standing watching them, and I realised that I was listening to a mating quarrel." Jacob told me he killed them all with the heel of his boot (as was the custom in those days) and found the bodies still there the following morning, and on examination, believed them to be four boars and one sow, adding that as long as he lives he will never forget their unearthly shrieks.

In view of the fact that Jacob Campbell knew nothing of the correspondence in the *Field*, it would appear that he has answered conclusively the riddle of "Ghoulies and Ghosties."

Yours faithfully,
Glenholme, Bladon Drive, Belfast. A. E. BLYTHE JACKSON.



AN ATTRACTIVE WALL PIECE
(See letter "A Wall Piece")

WHOOPER SWANS RETURN

SIR,—It may interest your readers to hear that the Whooper swans which were on the river here all last winter, and went away at the end of April, returned on November 7th at 8.30 in the morning. They were four in number, though there were only two last winter, and as two of them are slightly smaller than the others I suppose they are young birds. The four flew up the river and alighted on the water within a few yards of the house, close to where they were to be seen all last winter. Lots of motor and other traffic passes continually quite close to them, but they do not take any notice of it, nor of the mute swans, of whom there are four or five about the place.

Yours faithfully,

Old Ways, Beaulieu, Hants. THOMAS TROUBRIDGE.

Very Dark Blooze

"Kindly rest on your oars, Timothy. That contraption is getting you nowhere. And it squeaks. And the Eton Boating Song is *not* in the key of D."

"*What's up, Peter? Got a head?*"

"Like a gasometer. Very painful. And that noise you're making goes through it like a pneumatic drill."

"*Wasn't I on the warpath by your side? And look at me — no more hangover than an innocent little child.*"

"Well, it's not natural. It just proves that the Devil looks after his own."

"*I look after myself, old son. Last night I took a sizeable swig of Rose's Lime Juice before hitting the hay. That's how to kill off the aftermath of alcohol.*"

"You wouldn't lead me up the garden, Timothy?"

"*Peter, you wrong me. I've seen the light and I'm passing on the tip.*"

"Then, if you will kindly step ashore, we will seek out a vendor of Rose's. It's time I fell into good habits."

SHORT DRINK — 2 parts Roses, 3 parts Gin.
LONG DRINK — add soda.

A WALL PIECE

SIR,—I am afraid that for some years I have been a collector of out-of-the-ordinary, or, as I once heard them called, "funny things," and it occurred to me that some readers of the *Field* might be interested to see a photograph of a small collection of old coach and hunting horns I have diligently acquired, one by one, in various parts of the country. These are, as will be seen, suspended below an old stage-coach swingle-bar, and make, I think, an attractive wall-piece. I had my horns polished and then transparent lacquered, so they do not require cleaning. I have pleasure in giving a few particulars of them herewith.

Looking at the photograph downwards the horns are as follows:

1. 16-in. copper-coiled tandem horn, by Butler, London and Dublin.
2. 36-in. copper coach horn, "The Beaufort," by Köhler, London.
3. 36-in. copper "Telescope" coach horn, by Köhler, London.
4. 49½-in. brass coach horn, by Boosey, London.
5. 44½-in. brass coach horn, by Jerome Thibouville-Lamy, Paris.
6. 46½-in. brass coach horn, by Higham, Manchester.
7. 40-in. silver-plated-on-copper coach horn, by Hays, London.
8. 26-in. brass post or tandem horn, by Garden, London.

Looking across, from left to right:

9. 9½-in. copper hunting horn, by Köhler, London.
10. 10-in. copper hunting horn with German silver bands, by Martin & Martin, London, New York and Philadelphia.
11. 13½-in. copper miniature, "The Heavy Mail" coach horn, by Swaine & Adeney, London.
12. 18-in. copper hunting horn, by Rudale Rose Carte, London.

This last hunting horn is one of the straight pattern which superseded the old circular horn, and when introduced about the end of the seventeenth century measured some 18in. in length, as against the now usual length of about 10in.

It will be noted that all the horns have the makers' name and address on them. I have yet to find one of the 46-in. "Heavy Mail" coach horns, by Köhler, and one of Köhler's 52-in. "Four-in-Hand" coach horns; nor have I yet discovered one of the old circular horns which were once used, and which I believe are still in use in France, and were, I understand, last used over here by the Llangibby Hunt.

Yours faithfully,

London. C. R. ABBOTT.

WILD DUCK HATCHES

SIR,—I think it might interest your readers to know a wild duck has just brought off three young duckling in my plantation (November 23rd); there is another nest containing three eggs.

Yours faithfully,

Kenilworth, Brandon, Suffolk. J. A. WHITAKER.

A FOAL AT 20

SIR,—The enclosed photograph of my 20-year-old mare and her first foal may interest your readers. I wonder if this is a record. The foal was three hours old when I took the snap, and even at that age was so lively that it was hard to get a good one of it.

Yours faithfully,

(Miss) GARNET IRWIN.

Ross, Moyard, Co. Galway, Ireland.

APPEALS

SIR,—In the issue of the *Field*, dated November 12th, on page 1138, there appears a letter describing a fund opened for raising money for a memorial to the late Don Pablo Larios. It describes the presentation of a handsome silver salver to his widow. It also states that £300 has been received, and the fund is still open.

On page 1140 of the same issue a plea is put forward for help for a "plucky old lady of 81," in desperately sore straits—ill and practically penniless. "The Friends of the Poor" put forward the plea for this old lady—the daughter of a horse trainer. All that is asked is £13. In the name of common humanity and British sportsmanship let us help the needy living before we commemorate even the worthy dead.

I am sure such a sportsman as Don Pablo Larios would wish it so.

Yours faithfully,

Oxford. FOXHUNTER.

[Surely it is possible to do both—succour the needy and honour the dead?—ED.]

WOODCOCK IN CAIRO

SIR,—On Saturday evening, November 12th, at about 5.30, I saw a woodcock in a garden near the Gezira Sporting Club. There could be no doubt of the identification, as I saw the bird from a distance of about 5yds. as it was sitting on the lawn. It then rose and flew away and was unmistakably a woodcock. Nicoll, in his *Birds of Egypt*, says that the woodcock has been recorded in Egypt from late November to early March, but this would seem to be an unusually early record, especially as far south as Cairo.

Yours faithfully,

H.Q.B.T.E. Cairo. A. D. MACKENZIE.

PHOTOGRAPHS OF WADERS

SIR,—May I be permitted to pay tribute to Mr. Guy Farrar for his magnificent photographic studies of some of our waders which appeared in the *Field* of October 22nd. Although I am a keen amateur bird photographer, it does not need knowledge of this subject for one to praise such work. To picture birds in their breeding haunts needs lots of patience, but to obtain results such as those given us by Mr. Farrar calls for much greater effort. We shall hope for more.

Yours faithfully,

St. Margaret's-at-Cliffe. G. E. T.

A WHITE FOX

SIR,—I think it will be of interest to some of your readers to learn that on Tuesday, November 15th, the Morpeth foxhounds killed a pure white fox at Paxton Dene in the north part of their country. The eyes, although not the brightish pink one associates with pure albinism, were very pale brown and suggested lack of pigmentation. The tips of the ears were very slightly black. This was a well-grown fox in good condition. On finding, at first it appeared as if hounds could not make up their minds if he was their legitimate quarry or not.

Reports have been received of other white foxes in the district. Last season the Percy killed one at Brinkburn Priory. Is this outcrop of albinism just a freak of nature in the locality, or is it a strain of white being thrown by some individual dog fox?

Yours faithfully,

Northumberland. THE RUFFLE.

A PRECARIOUS NEST

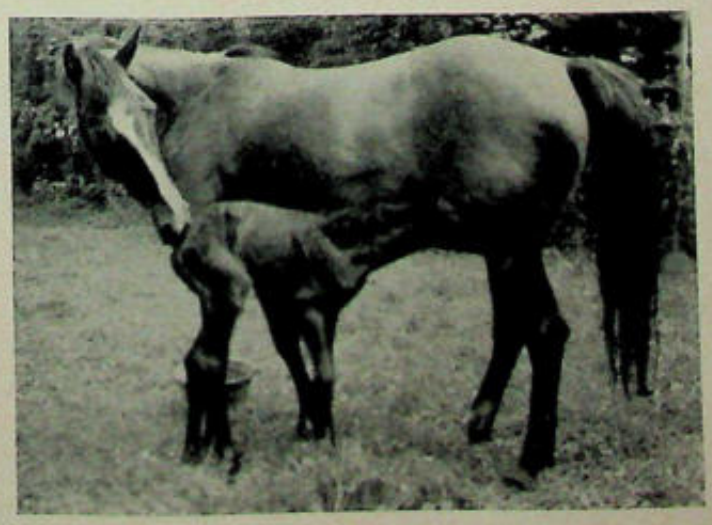
SIR,—On looking through an old album of photographs, I came across one unfortunately not clear enough for publication, taken in Brazil in the State of Matto Grosso. It shows a dove, sitting on its nest, which it had built on the spikes of a pineapple.

These birds are intelligent, and always build their nests as near to human habitations as possible, where presumably hawks are too afraid to approach.

I have seen nests built on the posts of corral fences, with cowboys yelling and cattle moving about.

Yours faithfully,

Hatch End. D. G. MACKENZIE.



THE FOAL IS THREE HOURS OLD
(See letter "A Foal at 20")

HUNTING BY HAND

SIR,—A shooting party which arrived recently at Lourenço Marques by Imperial Airways flying-boat, set off to shoot elephants near the village of Matuzi, about 30 miles north of Magude.

After five elephants had been bagged, a Mr. Selly, a member of the party, was walking through the bush when one of his native bearers warned him of the proximity of more elephants. Hardly had the bearer spoken when, tearing out of the jungle, came an irate young elephant which, although not more than 4ft. high, made up for its lack of inches by the fierceness of its onslaught.

Instead of using his gun, Mr. Selly handed it to the native, and as the elephant charged, stepped to one side and caught its trunk. Then ensued a tremendous rough-and-tumble; but although considerably bumped about, Mr. Selly did not relinquish his hold. Very soon the young elephant had had enough of the encounter, and its screams alarmed the other hunters, who dashed to the rescue. By that time, however, Mr. Selly had won the struggle, and after being stroked and made a fuss of, the youngster accompanied the party docilely back to camp.

Mr. Selly asked Imperial Airways officials to arrange for the elephant to be presented to the local zoo, which was done.

Incidentally, Mr. Selly has now a baby rhino, hippo and elephant to his credit, all caught with his hands and without assistance. There are probably few big game hunters who can claim such a record as this.

Yours faithfully,
London. E. A. R.

THE CAPTURE OF "AN IRATE YOUNG ELEPHANT"
(See letter "Hunting by Hand")

"BALANCE"

SIR,—I have just read with great pleasure the article entitled "Novices' Stable Lore (Terms and Their Meaning)" in the *Field* of November 12th, but there is a mistake in one of the definitions which I feel should be corrected, as to my mind it is of importance. I refer to balanced, equal distribution of the weight on all fours. The true definition of balanced is "When the horse's weight and that of his rider is distributed over each leg in such a proportion as to allow him to use himself with the maximum ease and efficiency at all paces." I do not think there is any time when the weight is equally distributed on all four legs.

Also in regard to the matter of hollow and roach backs, it is said in the article, and I have heard it said for as long as I can remember, that the roach back is a strong formation, and the hollow back a weak one, but personally I do not agree. Amongst the many horses I have trained there have been naturally some with hollow backs and a less number, I am glad to say, with roach backs. I have never found that the hollow back meant weakness if the loins were not slack, but I have found that there is weakness in the roach-backed horse. The backs of these horses were very rigid and required a tremendous amount of P.T. exercises to supple and strengthen them before it was possible to gain control of the hindquarters. Roach-backed horses are usually rough rides, and this may have given the idea that their backs are therefore particularly strong, whereas, in my opinion, they are only particularly rigid. I should much like to hear the experiences of other trainers of riding horses.

Yours faithfully,
Peterstow Court, Ross-on-Wye. R. E. PRITCHARD.

ODIHAM CASTLE AND PASSAGES

SIR,—I was interested to see in the issue of the *Field* dated November 12th, 1938, a letter concerning Odiham Castle. Your correspondent mentioned an underground passage joining the Palace Gate Dairy to Odiham Castle. It might be of interest to your readers to know that Odiham is undermined with tunnels, like the one your correspondent mentioned. For instance, there is a passage running from the church to the Palace Gate Dairy, which is situated next to the vicarage. Last year the church council considered throwing this passage open to the public in order to raise the much-needed funds by charging an entrance fee of a few pennies.

There is, according to tradition, a passage between our house and Odiham Castle (our house is called Redcourt; it was, however, previously called the Red House). The passage is supposed to start from a well. This well is in a small subterranean chamber. There is a brick wall in this chamber, and it is said that the brick wall covers the entrance to the passage. The whole chamber was blocked up about 20 years ago when a maid fell into it and hurt herself badly. So I suppose we shall never know whether there was a passage or not.

Yours faithfully,
Odiham, Hants. P. F. MORGAN.

THE LATERAL AND ANTERIOR VIEWS OF THE PHEASANT
(See letter "A 'Diving' Pheasant")

A "DIVING" PHEASANT

SIR,—In your issue of November 19th, under "The Towered Partridge," are some interesting examples from X-ray photographs, showing why birds towered. In case of interest I send you X-ray of a cock pheasant, fired at by a back gun standing in the valley as the bird sailed past high up, and beyond a slight check in flight, went on apparently unhurt, but after 120yds. suddenly dived straight down on to the ground and never moved again. On being picked up no sign of injury was visible, but the photograph shows that one pellet had perforated the femoral artery, which bled internally freely and blood to brain ceased, causing it to faint, and the shock of falling on to hard, frozen ground presumably killed it finally.

This appears to be a similar case to X-ray photograph No. 1 and/or No. 6 where "large"/"extensive" hæmorrhage occurred from a similar wound, but the partridge "towered." The pheasant did not do so; rather the reverse.

Yours faithfully,
Swanmore, Southampton. M. PORTAL.

"THE CHAIN OF AN OTTER"

SIR,—The theory on this is ingenious, but I would draw attention to the behaviour of an ordinary soda-water syphon. When the pressure is *released* the gas comes out of solution. It might, I suppose, be a possibility that the rapid passage of an otter through water might cause a *reduction* of pressure in his wake and so produce bubbles, although at slow speeds the reduction would be inappreciable. But it is quite impossible that bubbles should be caused by the pressure of his head and chest, both for the reason already given, and because water is well-nigh incompressible.

Yours faithfully,
Cobham, Surrey. A. E. HODGKIN.

PEOPLE do appreciate Craven 'A' quality, for they give more Craven 'A' than any other cork-tipped cigarette in the whole wide world at Christmas time. Craven 'A' are so fresh, so cool, so luxuriously smooth to the throat that they are always sure of a welcome.
You can buy Craven 'A' in their smart, colourful gift boxes everywhere—six convenient sizes to choose from, each with a card on the back for your personal greetings.
Give throat-smooth smoking this Christmas — give Craven 'A'.

C.A.5.X.

A FREAK LUPIN

SIR,—I made a sowing of Russell lupins during the early spring. Several of the plants flowered during the autumn. The enclosed photograph shows the flower spike of one, which was quite normal until the blossoms commenced to fade, when two smaller spikes were thrown up from the top of the first, as you will see. In addition to these spikes, shoots appeared from among the faded blooms and developed into miniature plants which are now throwing out root fibres. I am afraid I made the mistake of cutting the spike in order to take the picture, but even in water the small spikes are still developing, along with the five small "plants" growing from the original blossoms.

I have grown lupins for many years, but have never seen such a freak before. It would be interesting to know if other readers have found anything of the kind among their Russell seedlings.

Yours faithfully,

Northumberland. J. A. MILES.

FORMATION FLYING OF GULLS

SIR,—"A Naturalist's Notebook," in the *Field* of November 26th, interested me very much, as it is only within the last few years that I have noticed gulls flying in V-formation.

Some gulls spend the day very frequently on the Blackwater river, some 20 miles from the sea, and I have several times watched them flying over the high ground between this place, and presumably Cork Harbour, in groups of five or more, flying leisurely in a V in the dusk. At first I mistook them for other birds, because of this V-formation, but they were undoubtedly gulls.

Yours faithfully,

Wilton, C. ARTHUR WEBB.
Mallow, Co. Cork.

LATE ORNITHOLOGICAL RECORDS

SIR,—On November 15th, during the recent spell of very mild weather, I heard a cock greenfinch uttering a dissyllabic note which is heard only when courtship and nesting are taking place. This is evidently the canary-like "tsoocet" referred to in Mr. Witherby's new *Handbook of British Birds* and there stated to be "most used when uneasy or alarmed," though it certainly expresses other emotions. I should render it "pee-wee" or "tree-ree."

On November 24th, while looking at old nests in one of our hedges, I noticed one which appeared to be in exceptionally good condition. Examination

A STRANGE CONFORMATION
(*See letter "A Freak Lupin"*)

proved it to be a typical greenfinch's nest, newly built and finished, except that the lining was loose. There were no eggs. The nest was only a few yards from the place where I heard the "courtship" note little more than a week before. There can be little doubt that this nest was the natural result of the courtship, though I did not see it built.

Yours faithfully,

Holt Anstiss, E. W. HENDY.
Porlock, Somerset.

SIR,—It may be of interest to readers of the *Field* to report the presence of a house martin on November 27th. I watched it for a long time flying round my house, till it grew too dark to watch it longer. It seemed fully grown and flew strongly, but I should imagine its chance of wintering abroad is remote. I have never before heard of a martin in Essex delaying its departure so late.

Yours faithfully,

COLLINGWOOD HOPE.

Chelmsford, Essex.

SIR,—It may be of interest to your readers to hear that I saw, on November 25th, a wild duck with a strong brood of about fifteen ducklings, making their way across the park.

Is not this very unusual at this time of year?

Yours faithfully,

Maple Hayes, MURIEL WORTHINGTON.
Lichfield, Staffs.

SIR,—It might be of interest to report that I have a starling's nest with young in a chimney (Nov. 10th). The chimney is not used because the room is small and centrally heated.

Yours faithfully,

Field House, A. M. WALLACE.
Churt, Surrey.

SIR,—I do not know if it may be of any interest to record that I saw a single swallow flying about on the cliff front on the outskirts of the town here on November 14th. It was a very warm morning, and bright sunshine. It seems unusually late for a swallow to be here.

Yours faithfully,

Westthorpe, (Rev.) M. A. C. HORSFALL.
Whitby, Yorks.

SIR,—It may interest your readers to know that we have a brood of three swallows (November 22nd); they are able to fly, but are very weak on the wing. Is not this a record for Warwickshire?

Yours faithfully,

ADA BOUGHTON-LEIGH.

Brownsover Hall, Rugby.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, need gifts to help an elderly widower who has fallen on difficult days. At one time he had a small business on the outskirts of London, but he failed and lost all his capital. He has been in hospital for some weeks with heart trouble, and now he lives in lodgings. His only income is the Old Age Pension, added to which he receives 2/6 from an old friend. The poor man feels his position keenly, and he suffers from lack of comfort and proper food, so an extra few shillings weekly would be a godsend to him. Please let us have gifts.

In connection with the announcement of Black and White Whisky which appeared on page xi in our December 3rd issue, we are asked to announce that the prices quoted are not the retail prices.

IN THE CITY

By OUR CITY EDITOR

COMMENT is made on the lack of enthusiasm in the market for South African gold shares. The price of gold has been recently at a record of 150/- per fine ounce. The Rand producers valued their November production at a price of 147/- per fine ounce, which is a record for all time. Yet gold shares failed to attract the attention of the investor and speculator.

The producing companies on the Rand follow a policy of utilising more and more low grade ore in their monthly working as the price of the metal advances on the London market. Consequently profits month by month are not materially in excess of the previous year. At the same time it must be acknowledged that the lives of the properties are lengthened.

Should at any time the price of gold suffer a relapse the concerns are in a position to fall back on more payable ore to maintain a reasonable margin of profit. December dividend statements are coming along from the Rand companies. These are expected to be much on the basis of twelve months ago.

At current prices yields ranging up to 6½ per cent. can be obtained without much difficulty on the shares of companies calculated to have quite an extended life. It is possible that interest in gold shares is kept in check by German colonial demands in Africa.

There can be no question of German colonial demands in the Union of South Africa or in West Africa. There is, however, a feeling of reserve throughout the Union on this political problem, but it is believed that sooner or later a revival of interest in gold shares will materialise. Speculators will no doubt direct their activities largely to the shares of various companies developing new properties on the Rand.

There are several such concerns in existence. They have been formed since the Union went off the gold standard, and the price of gold has been at a high level. These companies are in the developing stages. Much additional finance will be necessary before they arrive at the production stage.

A concern which has been energetically developing a vast new territory on the Rand is West Witwatersrand Areas. The company was registered in November, 1932. It has already floated three subsidiaries to develop portions of the territory. The first was Venterspost Gold Mining. Then came Libanon Gold Mining and later Blyvooruitzicht Gold Mining. The latter was formed in June, 1937.

Yet another subsidiary is coming along. This is the West Driefontein. A lease on the property was recently granted the company by the Union Government. The Venterspost company is well advanced with developments. Funds have been raised sufficient to erect a treatment plant. Gold production on this property is expected to begin towards the end of next year.

Venterspost 10/- shares have a market price around 36/3. They are naturally speculative, like every other share in a developing mining property. Expert opinion concerning the future of the mine is most favourable. The suggestion is that those buying the shares around their present price, and are prepared to wait a few years for dividend, will find distinct capital appreciation.

Libanon 10/- shares are 16/6 and Blyvoor 10/- shares 12/3. Development work is being pushed ahead on both these properties. They have, however, a long way to go before they arrive at the producing stages. Here again money will probably be made by those buying to-day. Holders must, however, be prepared for occasional shocks and must certainly go without dividend return for some years.

Various other properties such as Marievale and Spaarwater Gold, the latter under the wing of the Sub Nigel Company, have definite possibilities, but only over a period. Marievale 10/- shares are now about 19/3 and Spaarwater 5/- shares about 6/9. All have great prospects, but it must be remembered that in mining there are many slips between the cup and the lip.

TRADITION TRANSGRESSED

AARD-VARKS are usually most unostentatious creatures, preferring to be buried in the privacy of a heap of straw than to pace the confines of their cages, the cynosure of wandering eyes. Nevertheless, Bogey, who arrived at the London Zoo about two and a half years ago in the company of his friend Bogey Bogey, is modern in outlook, and although at first he conformed steadfastly to the traditions of his fathers, he soon found the plaudits of the crowd to his liking, and from that moment on he has quite literally walked the path of destruction. First it was only the eating of bananas, but with this unheard-of transgression of aard-vark principles came a criminal desire for further self-expression, and as a result Bogey has begun to tear down large chunks of plaster and brickwork in his cage with his powerful claws. Housebreaking is good fun, he considers, even if it is aard-vark.

I am popular at all sherry parties

New Books

SHOOTING—FROM THE OTHER SIDE

Some Keepers Give Their Views

The Lonsdale Keeper's Book. Edited by ERIC PARKER. (Seeley Service; 15/-.)

THIS book is very much easier to read than to review. For though it contains a large amount of interesting matter and a great deal of shrewd observation and good sense, it has no connecting link, save that most of the contributions are from keepers and that they are all about shooting or fishing. There is no further plan or purpose that the reviewer can take to criticise the book as a whole, and the space at his disposal prevents him from criticising each essay separately. This, however, may be said: that though it is a book by keepers, it is a book that at the price of fifteen shillings the ordinary keeper can afford to buy, but that nobody who is interested in shooting can afford to dispense with, however much they know.

In this book moor management, pointers and setters, partridge feeding, pheasant rearing (by well-known game farmers and others), the rearing and management of wild duck, vermin, and the keeper as a naturalist, are all dealt with, together with admirable chapters on the stalker's duties and river keepering by Mr. Frank Wallace and Mr. Eric Taverner. But let the keepers speak for themselves.

Here, for instance, is a theory by no means universal among those closely connected with grouse interests. "I am in favour of sheep on a grouse moor and a good stock of them. They do no harm to the birds, nor are the birds afraid of them. They may do a little damage by cropping the young heather, but the amount of insects and grubs raised by their droppings repays for all that. Then they have roads and paths of their own, where the birds always get plenty of grit." This is D. McDiarmid, a Highland keeper, and I agree with him, with the proviso that where the abominable system of letting grazings by stints is in vogue the dogs of contending shepherds do a lot of harm.

Here is Mr. Dugald MacIntyre on trapping. "As the law stands the *tenant* farmer must not set gins 'except in rabbit holes,' but older Acts (which have not been repealed) allow open trapping to farmer owners and others." How many people are there who do not believe that open trapping is legal?

Here is Arthur Hipgrave, perhaps the best-known partridge keeper of his time. "There is one thing one need never be afraid of driving partridges away for good. One may drive them clean off the ground during a day's shooting, but they will be back again next day. Partridges cannot and will not be driven just where one would like them to go. I have seen them before now in a pack of anything up to 500, and have tried to get them into a field of roots, but they were not having any of it, and deliberately flew right across the field of cover and would not attempt to settle in it. I am speaking, of course, of driving well into October. No partridges should be driven before October."

This interesting book owes a great deal, I have no doubt, to the editing of Mr. Eric Parker. Only those who have grappled with symposia of this sort can realise how much unobtrusive presentation they require. The choice of photographs—though some of them are good—is not so uniformly successful. If the plate "Flankers" opposite page 30 were shown to the ordinary grouse keeper, he would break a blood vessel, and there are several others calculated to increase blood pressure. M. T. S.

Salmon! Experiences and Reflections of W. L. CALDERWOOD, I.S.O., F.R.S.E. (Edward Arnold & Co.; 6/- net.)

It is always a pleasure to see Mr. W. L. Calderwood's name on the binding of a book. His many friends—and there must be few salmon anglers to-day who are not at least vicariously his friends—will be more than usually pleased at seeing it on this volume, partly because it is some time since his last book appeared, but even more because in it he gives us a more intimate glance into his life as an angler and an investigator than in any previous book. As always, he writes with that simple charm which carries the reader along and intrigues his interest even when the subject of a chapter happens to be far removed from his own personal experiences.

He starts off with a happy reminiscence of Strathspey, and then goes on to tell us about his visit to Canada at the invitation of the Restigouche Club to investigate an apparent decline in the salmon rivers, and incidentally gives a vivid picture of fishing in the Canadian bush, where there are no roads to the "camps" and where transport, often enough, has to be by horse-drawn lighters up the swift river itself; and the salmon rise so much more readily than they do in home rivers. There is, of course, another side to the picture, for the season, from our point of view, is inordinately short, lasting only a couple of months or so. But there is no doubt that salmon take a fly much more readily than in our own streams; a matter which offers opportunities for speculative investigation.

Periodically he pauses in his narrative to give a summary of the mass of information about salmon and their habits, of which the present century has been so prolific; the wide range of salmon in the sea; their feeding habits; their homing instinct; the destruction of the old theory about the inefficiency of natural spawning—for which, to tell the truth, Mr. Calderwood himself has been so largely responsible, though you would never think so from his book.

Altogether this is a most attractive volume at an equally attractive price and will fill more than one enjoyable evening by the fireside this winter. H. T.

Golf's No Mystery. By R. A. WHITCOMBE. (J. M. Dent & Sons, Ltd.; 2/6.)

The playing of reasonably good golf is not so complicated as we have been led to believe. R. A. Whitcombe, the Open Champion, in his new book, attacks all theorists and contends that "golf is a natural game," free of mystery. He says it is as natural in its inception as throwing stones, and with this age-old pastime it has much in common.

"How does a child knock a stone with a walking-stick? Surely he takes a firm grip with the right hand and hits the stone forward? He does not stiffen every muscle in his body. The action is a flowing one, without tension or check, and that" says Whitcombe, "is my approach to golf." He does not believe in the familiar tips and hints; his methods are very simple and are explained equally simply. After reading his book I have realised for the first time just how simple the game really should be. Whitcombe has taught me, as he will teach any discerning reader, a great deal.

"Golf is a two-handed game with the right hand dominating. Get the right hand working properly and all the rest of you will follow naturally. . . . Relax and be mobile. Make it your unfailing custom that if for any reason whatever there is any definite check in your movements from the time you walk to take up your stance until you take that club back—start again. Keep moving." His contrast between the methods of the good and the indifferent players is both highly illuminating and instructional.

Strong hands and a good grip are of vital importance in Whitcombe's opinion. He sets out simple exercises for swinging the club one-handed and, with the aid of excellent photographs, demonstrates the ideal grip which will give both power and control. He is a firm believer in physical fitness as an aid to good golf. "Breathe your way to scratch" is one of his mottoes. Regular deep breathing will quieten the nerves and entails no hardship. This will overcome the nervous tension that spoils so many golfers' chances. "Right hand; breathe deep; keep moving." There is the foundation of his success. Whitcombe does prove that "Golf's no mystery," and this is one of the few instructional books that can be unreservedly recommended. It will appeal to, and satisfy, every type of player of any age. E. R. T.

Treks and Palavers. By CAPTAIN R. R. OAKLEY. (Seeley Service; 18/- net.)

In recent years, Africa has received so much attention from the pens of those who have helped to govern her, as well as from the casual visitor, that one feels a certain apprehension upon opening a new volume on the old subject. There need be no such apprehension on the part of those who buy Captain Oakley's contribution; for he gives us a well written, nicely balanced and thoroughly interesting description of his life as a political officer in Nigeria. Captain Oakley, it is very evident, was really interested in everything about which he now writes, and he succeeds admirably in conveying that interest to his readers. C. B.

* * * *

Guns or Butter. By R. H. BRUCE LOCKHART. (Putnam; 10/6.)

In spite of the crisis and its attendant stimulus to thought upon foreign countries, I think I should have been enthralled with this book. And that is saying a good deal, for I have had a surfeit of literature upon the state of Europe these last few months and "seasons," and opened Mr. Lockhart's work in a cynical state. But Mr. Lockhart became different, he inspired my confidence by his right conjectures, and also he has had such rare opportunities for acquiring his knowledge—his qualifications are too well known to need to be stated. And he writes really well.

He has revisited the Balkans after a period of years, which has enabled him to realise the changes which have taken place; he seems to have had interviews with nearly all the ruling Monarchs, Presidents or Premiers, and they appear to have spoken freely to him and this is enlightening.

But the author went to Czechoslovakia; he also visited Germany, and I suppose unwittingly this fact has become the crux of his writing.

This is not a book to be described, it should be read. Read for yourselves what the youth of Germany are allowed (and do) think of us; what Vienna was like on the night of the Germans' entry; what reception Hitler received as he passed through the streets of that city. Or go further from the centre of gravity and learn the hopes expressed all over Europe that Britain was strong, and *would be strong*. Rather uncomfortable reading for to-day perhaps, but all the more reason why we should digest it well.

This is excellent study for group reading; not merely the traveller, though he or she will enjoy Mr. Lockhart's descriptions of his travels. There is material here to form the axis of a winter's reading—an open door. C. N.

* * * *

The World was My Garden. By DAVID FAIRCHILD. (Scribners; 18/-.)

Primarily this is a book for botanists because that has been Mr. Fairchild's profession and hobby. But many besides botanists will be interested, for it possesses varying aspects, and especially will it appeal to the ever-increasing number of readers who enjoy a really good "travel book." Mr. Fairchild's search for plants took him all over the world: he has acquired a knowledge of all quarters of the globe which is rarely to be met with. There is another reason also why this author will be read and enjoyed, and that is for his sincerity and complete naturalness of style. There is no glorification of these travels, no ostentatious presentation of the local colour—it is plainly and simply a man's life. And that man a very clever and genuine one. We are given few personal details, but they creep out between the lines in a way which is refreshing in these days of modern egotistical autobiography.

Mr. Fairchild has done great service to the science of botany; he has combined this with an even greater service to his fellow men (especially his own country, America). We are indebted to him for the introduction of many well-known food plants, besides trees and flowers. Here we can trace romance in our daily diet by learning the history of the explorations which led to the discovery of the original plants. Few men can have such a life of value to record; and fewer still would relate it so modestly. C. N.

In our issue of November 26th we published a review of *Zoo*, by Louis McNeice (Michael Joseph; 10/6). This review infringed the copyright of *The Times Literary Supplement* in several respects. We desire to offer our sincere regrets and apologies to The Times Publishing Co. and to the author of the review.—ED.

We cannot tell a lie..

We hate to admit that Lillet possesses *tonic* value . . .

So many drinks claim to do you good that we hesitate to tell you that the pure juice of the grape and aromatic herbs from which Lillet is made are of real benefit to you.

You have only to savour the fresh flavour of Lillet to realise that those Frenchmen know the nicest way of taking Mother Nature's pick-me-ups, so, allons enfant de la patrie . . . demandez un gin and Lillet and . . . Cheerio!

COMPETITORS AND THEIR OWNERS IN THE PARK AT SULHAMSTEAD DURING THE KENNEL CLUB RETRIEVER TRIALS

FIELD TRIALS

Retrievers at Sulhamstead

THE All-Aged Stake of the Kennel Club Retriever Trials was held at Sulhamstead, in Berkshire, by the kind permission of Lady Watson and her son Sir Norman, on November 29th and 30th. As was shown two years ago, there can be no better ground in England, testing to the fullest extent courage and perseverance, both in very strong covert and in an admirable water test. The judges were: Lorna Countess Howe, Col. H. M. Wilson and Major J. I. Benson.

There was a strong entry of 20. Mr. Lonsdale's Jubilee Jane came out a very clear winner. She did everything she was asked, easy or difficult, and was under beautiful control. Haulstone Brock was second, not beaten by much, as he, both in drive, nose, and retrieving, is quite high class. He did a very spectacular retrieve at the end of the second day, where two other good dogs had utterly failed. Badgery Bridget came third, and did lots of good work, especially in a quarry; perhaps she did not get out on runners quite as well as those above her.

Equal fourth went to Avishays Brush and Champagne. It is not satisfactory placing equally, but the judges gave these two a particularly exhaustive trial and could do nothing else. These dogs may not have quite the style of Jane and Brock, but they have a wonderful knack, in an unassuming manner, of collecting the stuff, and I cannot imagine more pleasant companions to a one-dog man to have out by himself. Pettistree Dan was reserve and award of honour. At times this dog is quite brilliant, but now and again he gets a bit out of hand.

Dander, sound, steady, and under good control, and Pamela, were also given awards of honour; really good dogs, but on the day just beaten, we thought. Certificates of merit were given to Adderley Bee, Brisk of Yelme, Hiwood Mike, Jon of Beantown, Langbourne Midnight, and Heydown Grist. Take the stake all round, the quality and work was very high class, and the Champion Stake later on may very easily show different placing.

H. M. W.

OPEN STAKE (ALL AGED).—1st, Mr. L. Lonsdale's Labrador b., Jubilee Jane; 2nd, Mr. J. Eccles's Golden Retriever, F.T. Ch. Haulstone Brock; 3rd, Mr. A. B. Simpson's Labrador b., Badgery Bridget; equal 4th, Mrs. H. H. Hextall's Golden Retriever, F.T. Ch. Avishays Brush and the Hon. Lady Ward's Labrador b., Champagne; reserve and certificate of honour, Mr. C. H. Kennard's Labrador, Pettistree Dan. Certificate of honour, Major D. G. Astley's Labrador, Dander, and Hon. F. Baring's Labrador b., Northington Pamela. Certificates of merit: Mr. R. Corbet's Labrador b., F.T. Ch. Adderley Bee; Mr. H. Wentworth Smith's Golden Retriever Brisk of Yelme; the Hon. Mrs. Hill Wood's Labrador, Hiwood Mike; Mr. R. V. Garton's Labrador, Langbourne Midnight; the Hon. Mrs. D. Carnegie's Golden Retriever, Heydown Grist; Mr. A. V. Greer's Labrador, Jon of Beantown.

NORTH-WESTERN COUNTIES FIELD TRIAL ASSOCIATION

THIS Association held their retriever trials at Sawley Lodge, Sawley, near Clitheroe, on the estate of Mr. J. E. Fattorini, on November 24th and 25th. The judges were: The Hon. Mountjoy Fane, Mrs. E. G. Oliver and Colonel H. M. Wilson, and in the Open Stake they could not separate Haulstone Brock and Withington Nith for first place.

The ground was an excellent one for retriever trials, and provided a water test. There was an abundance of game, and the arrangements were excellently carried out under the supervision of Mr. R. Muir Wilson, who acted as steward of the beat. The weather was rather rough on both days, accompanied by a strong wind, but turned out fine after lunch on the first day. The meeting was on all sides voted a wonderful success, and a cordial vote of thanks was proposed by the president, Mr. E. A. Walker, to the donor of the ground, who kept open-house during both days of the trials.

BLACK GAME.

RETRIEVERS, OPEN STAKE.—Equal 1st, Mr. J. Eccles's Golden retriever F.T. Ch. Haulstone Brock and Mr. J. A. Rank's Labrador Withington Nith; 3rd, Mr. R. Muir Wilson's Flatcoat retriever Windle Don; reserve and certificate of honour, Mr. R. E. Birch's Flatcoat retriever Brynasaph Quickstep. Certificates of merit: Mr. C. Walker's Golden retriever Hazelgilt, Mr. E. Winter's Labrador b. Staindrop Priceless.

RETRIEVERS, NON-WINNERS' STAKE (for twelve dogs and bitches that have not won a first prize in any stake at a recognised field trial meeting prior to the closing date of nominations).—1st, Mr. R. E. Birch's Flatcoat retriever b. Brynasaph Fair Trade; 2nd, Mr. E. Winter's Labrador b. Staindrop Priceless; 3rd, Mr. J. C. Rogers-Coltman's Labrador Jestaphone; reserve, Mr. R. Muir Wilson's Flatcoat retriever Windle Don. Certificate of merit, Mr. R. Andertons Labrador Hawlmark Brave.

THE ARGYLLSHIRE FIELD TRIALS ASSOCIATION

THESE trials took place on November 22nd on the Castle Toward Estate, near Dunoon, by kind permission of Mrs. Andrew Coats. The judges were Sir James Wilson, Bart., and Mr. Thomas Tait. Unfortunately, owing to bad weather, the second day's heats had to be abandoned and only the Open Stake was decided. Result:

OPEN STAKE (for all ages).—1st, Mrs. M. K. Macpherson's Yellow Labrador b. Braeroy Peggoty; 2nd, Mrs. P. F. Morris's Black Labrador Donnybrook Banner; 3rd, Mrs. M. K. Macpherson's Yellow Labrador b. F.T. Ch. Braeroy Ruddy; reserve and certificate of honour, Mr. D. M'Donald's Labrador b. Lile Fast Lady. Certicates of merit: Mrs. Randal Finlay's Yellow Labrador Ladnor Robert, Mrs. Arthur Wormald's Yellow Labrador Knaith Boson, Mr. A. Wormald's Yellow Labrador Knaith Bolt, Miss. I. M. Macrae's Golden retriever b. Drumdaig Susi, Mr. J. Dinwoodie's Black Labrador Lochar Rob Roy, Mr. William Ponton's Black Labrador b. Lochan Nell.

WELSH SPRINGER SPANIEL CLUB

HELD at Neuadd Fawr, on November 25th and 26th, by kind permission of Mr. I. Campbell-Davys, the trials were judged by Lieutenant-Colonel C. D. Horsley and Mr. G. C. Williams. The results were as follows:

OPEN STAKE (for Cocker spaniels).—1st, Mr. R. Hill's b. Nip of the Links; 2nd, Mr. R. Macdonald's b. Rockstead Footspur; 3rd, Captain C. T. Traill's b. Sobenhal Binnie; reserve, Miss J. Wykeham-Musgrave's F.T. Ch. Poddle Cricket. Certificate of merit: His Honour Judge R. Roope-Reeve's b. Eardiston Susie.

OPEN STAKE (for any variety spaniel).—1st, Mr. S. C. Jones's English Springer b. F.T. Ch. Sally O'Vara; 2nd, Cadet D. J. Calvert's English Springer F.T. Ch. Bobble; 3rd, Captain O. P. Traherne's English Springer b. Bryngarw Fireside; reserve and certificate of honour, Mr. S. C. Jones's English Springer b. F.T. Ch. Style O'Vara. Certificate of merit: Mrs. J. Calvert's English Springer b. Eromtew Judy.

NOVICE STAKE (for any variety spaniel).—1st, Mr. H. S. Lloyd's English Springer b. Delia of Ware; 2nd, Captain P. O. Traherne's English Springer Noranby Flatcatcher; 3rd, Mrs. J. Calvert's English Springer Eromtew Pod; reserve, Captain N. W. Tredinnick's English Springer Newburie Sport. Certificates of merit: Mrs. J. Calvert's English Springer Staindrop Stopbright; Miss J. Featherstonhaugh's English Springer b. Rockstead Footflash.

OPEN STAKE (for Welsh Springers).—Certificate of merit, Captain N. W. Tredinnick's Ginger Lad.

CLUMBER SPANIEL CLUB

BY kind permission of Mr. J. Amphlett, the Clumber Spaniel Club held its trials at Clent on November 17th and 18th. The judges were Messrs. G. H. Turner and W. East. The results were as follows:

STAKE 1, CLUMBER SPANIEL—NOVICE.—1st, Mr. L. Evan-Thomas's Smart Rex; 2nd, Dr. E. B. Sunderland's b. Snow of Glen; 3rd, Mr. J. T. Flowers's b. Biggin Fancy; reserve, Mr. L. B. Hedley's b. Witley Jean. Certificates of merit: Mr. R. Cape and Commander E. Welman's Ch. Sandringham Sparkle; Baroness Burton's b. Doehfour May; Miss M. F. Reed's Oakerland Tinker.

STAKE 2, CLUMBER SPANIEL—OPEN.—1st, Mr. J. T. Flowers's b. Biggin Fancy; 2nd, Mr. L. Evan-Thomas's Smart Rex; 3rd, Dr. E. B. Sunderland's b. Snow of Glen.

STAKE 3, ALL VARIETIES—NOVICE.—1st, Captain O. P. Traherne's English springer, Noranby Flatcatcher; 2nd, Mrs. F. C. Hollingworth's English springer b. Dagnall Dimity; 3rd, Mr. M. H. Hopper's English springer Lytchmore Loyalty; reserve, Mrs. J. Calvert's English springer, Eromtew Pod.

STAKE 4, ALL VARIETIES SPANIEL—OPEN.—1st, Captain O. P. Traherne's English springer b. Bryngarw Fireside; 2nd, Cadet D. J. Calvert's English springer, F.T. Ch. Bobble; 3rd Mr. Lewes G. Beaumont's field spaniel b. Saxpence of Skerries; reserve, Mr. R. Hill's cocker b. Nip of the Links. Certificates of merit: Mrs. F. C. Hollingworth's English springer Dagnall Duncan; Miss J. Calvert's English springer b. Eromtew Judy; Mr. C. McNiel's English springer, Spanks Son; Mr. E. H. Wheatstone's English springer b. Roadhouse Chatter; Miss M. F. Reed's Sussex spaniel, Ch. Rummy of Oakerland; Mrs. Calvert's Staindrop Stopbright.

STAKE 5, COCKERS—OPEN.—1st, Mr. R. Hill's b. Nip of the Links; 2nd, Mr. R. Macdonald's b. Rockstead Footspur; 3rd, Miss Margaret Carnegie's b. Heydown Dinah; reserve, Captain C. T. Traill's b. Sobenhal Binnie. Qualifying certificate awarded, Mrs. E. Hemm's flatcoat retriever, Kala Rat of Adlington.

ENGLISH SPRINGER SPANIEL CLUB

HELD at West Woodhay, Newbury, these trials took place on November 15th and 16th, by kind permission of Mr. H. T. Winks and the members of the shooting syndicate. The judges were Messrs. F. M. Prime and J. Forbes. Results:

ALL-AGED STAKE (open to all English springer spaniels).—1st, Wing-Commander P. Kinnear Wise's Raithburn Prince; 2nd, Captain O. P. Traherne's Bryngarw Firearm; 3rd, Mr. Selwyn C. Jones's b. F.T. Ch. Style O'Vara; reserve and award of honour, Captain O. P. Traherne's b. Bryngarw Fireside; award of honour, Cadet J. D. Calvert's F.T. Ch. Bobble. Certificates of merit: Captain F. Holford's b. Whelford Flick; Mrs. W. R. Calvert's b. Eromtew Judy; Mrs. F. C. Hollingworth's Dagnall Duncan; Mrs. Phyllis Kennedy's b. Freck; Mr. Selwyn C. Jones's Shrimp O'Vara; Mr. Kenneth J. Malcolm's Flight of Glenmorag; Captain N. W. Tredinnick's Newburie Sport.

INTERMEDIATE STAKE.—1st, Mr. Selwyn C. Jones's Stingo O'Vara; 2nd, Mrs. W. R. Calvert's Staindrop Stopbright; 3rd, Captain O. P. Traherne's b. Noranby Pelican; reserve and award of honour, Mrs. W. R. Calvert's Eromtew Pod. Certificates of merit: Rev. E. J. Nelson's b. Blendworth Jocka; Mrs. F. C. Hollingworth's Dagnall Duncan; Miss J. Featherstonhaugh's b. Rockstead Footflash; Mr. E. S. G. Malin's Doljuss Brutus; Captain N. W. Tredinnick's Newburie Sport; Miss A. Mavrojani's b. Jura; Mr. H. C. Cumberbatch's b. Hamptworth Chippy; Mr. K. J. Malcolm's Flight of Glenmorag; Mr. H. S. Lloyd's b. Delia of Ware; Mr. E. H. Wheatstone's b. Roadhouse Chatter.

AMATEUR HANDLERS' STAKE.—1st, Mr. A. M. Horsburgh's Goldeneye Drake; 2nd, Mr. E. H. Wheatstone's b. Roadhouse Chatter; 3rd, Mrs. W. R. Calvert's Eromtew Pod; reserve and award of honour, Mr. Oswald Ellis's Burscombe Don. Certificates of merit: Mr. H. M. Hopper's Lytchmore Loyalty; Miss A. Mavrojani's b. Jura; Mr. F. A. Merry's Grouse of Thame.

BRACE STAKE.—1st, Mr. H. C. Cumberbatch's b. Blendworth Linda and Labes; 2nd, Captain O. P. Traherne's b. Bryngarw Fireside and Bryngarw Firearm; reserve, Rev. E. J. Nelson's b. Blendworth Jocka and Blendworth Dart.

TEAM STAKE.—1st, Rev. E. J. Nelson's b. Blendworth Jocka, b. Blendworth Dart and Blendworth Jest; reserve, Mr. H. C. Cumberbatch's b. Hamptworth Chippy, b. Blendworth Linda and Labes.

FIFTY YEARS A MASTER.—The presentation of a portrait painted by Lionel Edwards and given by supporters of the Henham Harriers to the Earl of Stradbroke to celebrate his 50th year as Master will take place at a meet at Henham Hall this Saturday (December 10th) at 11 a.m.

The Country House

A PLANT OF PICTURESQUE LEGENDS

The History of Elecampane

By ELEANOUR SINCLAIR ROHDE

ELECAMPANE, one of the stateliest of wild garden plants, comes high on the list of plants with interesting associations, for it carries us back in thought to the horse-loving tribes of Central Asia, the people who brought the horse to Europe, and with the horse the knowledge of how to use the herb which from time immemorial has been known as "Horse-heal."

Inula helenium, to give the plant its botanic name, is associated also with picturesque legends, for according to the old herbalists it owes its specific name to Helen of Troy. The radiant golden flowers are said to have sprung from her tears, and another version of the legend says that she had her hands full of the flowers when she was carried off by Paris. The plant also figures in fairy-lore, as its popular names, Elf-wort and Elf-dock, testify. Even in classical times it was valued as a remedy for all diseases of the chest, and as late as the last century Elecampane lozenges were commonly sold by chemists. In common with many other herbs of ancient fame, it has a musical name, and as such was mentioned by Kipling in "Excellent herbs had our fathers of old," wherein Elecampane was amongst those "almost singing themselves as they run."

Elecampane is a native of most parts of Europe and temperate parts of Asia, and is mentioned in John Josselyn's *New England's Rarities Discovered* (1672) list as being amongst the earliest plants introduced into the New World by the first settlers. It has now become thoroughly naturalised in the eastern United States. Elecampane is now a rare native in this country, and not only for its beauty but its historic associations deserves a place both in the herb and wild garden. It does best in rich moist soil, and in such soil frequently grows over 6ft. high. In flower it is a most noble plant with its handsome leaves, hairy on top and downy beneath, and its golden flowers usually about 3in. across. It is easily raised from seed sown in spring, or it can be increased by division in autumn. The roots are large and fleshy with a strong aromatic scent.

It is curious that a plant so highly valued through the centuries and proved by modern research to be a valuable remedy is now scarcely used except in the making of the Vin d'Aulnée, which in France is regarded as a specific for all chest complaints. Formerly, Elecampane was commonly grown in both large and small gardens for making Elecampane tonic and lozenges. The old herbalists insisted that the fresh root had far greater virtue than the dried, and certainly the taste is far stronger—a bitter, aromatic taste, but decidedly pleasing. Elecampane tonic is made by pouring 3 pints of boiling water on a ¼lb. of thinly sliced root, leaving the decoction to stand all night and after bringing to the boil next day it is strained when quite cold. It is important not to peel the roots before slicing them, as much of the goodness is in the skin. Three wineglassfuls a day can be taken. Elecampane lozenges were made by boiling the roots till tender, beating them to a paste and then adding sugar, allowing twice as much sugar as root. When thoroughly mixed with the sugar boil till the paste is so thick that when cold it sets and can be cut into lozenges. These recipes are to be found in most seventeenth- and eighteenth-century cookery books, and even in the last century, when Elecampane was a common wild plant, the tonic and lozenges were commonly made, even in small households.

Other members of Inulas that are natives of these islands—Ploughman's Spikenard (*I. conyza*) and Golden Samphire (*I. crithmoides*), formerly sold in the markets as a substitute for the true Samphire—are not decorative enough to deserve a place even in the wild garden, but certain foreign species are valuable both as border plants and for cut flowers for indoor decoration. The best is *I. glandulosa grandiflora*, a native of the Himalayas, and varieties such as *I. g. superba* and Golden Beauty. They grow about 2ft. high, and the flowers borne in July and August are about 4in. across and a vivid orange. *I. Royleana*, another Himalayan species, is somewhat similar. *I. macrophylla* is noteworthy chiefly for its handsome foliage. It grows about 5ft. high, and the spikes of yellow flowers are borne in August. *I. oculus Christi* grows about 2ft. high, and has pale yellow flowers. *I. Hookeri*, which grows about 2ft. high, is a native of the Sikkim Himalayas, and the flowers, which appear in late autumn, have a faint but sweet scent.

Then there are the Inulas that are suitable only for the rock garden. The rare *I. acaulis*, a native of Asia Minor, has big yellow flowers on 2-in. stems. The equally rare *I. rhizocephala* has bristly leaves and large yellow flowers. *I. ensifolia* is rather taller-growing and is one of the best late flowering rock plants. As a rule it flowers well into October. All these can easily be raised from seed sown in April in very sandy soil.

IN A MILD DECEMBER

Bulbs in Flower To-day

THROUGHOUT a mild December the loveliest of winter-flowering bulbs—*Iris unguicularis* (syn. *stylosa*)—produces its fragile-looking blooms in continuous profusion. Picked in bud they expand perfectly when brought into a warm room, and they look particularly well if associated with sprays of the winter-flowering Jasmine. *Iris stylosa*, as most folk still call it, is of the easiest culture, but the little it needs it must have—*i.e.*, perfect drainage, the protection of a wall (it does quite well in the open but flowers much later) and a soil that is very sandy. Planted in ordinary garden soil it makes a mass of foliage but produces few flowers.

"ELECAMPANE CARRIES US BACK IN THOUGHT TO THE HORSE-LOVING TRIBES OF CENTRAL ASIA"

It succeeds admirably if planted even in a path by the side of a sunny wall, for this Iris cannot be starved too much. It is advantageous to add lime rubble. Being a native of Algeria, it can do with any amount of sun-baking through the summer. Slugs have a great partiality for the buds, and a careful look-out has to be kept for them. Planting is best done in spring after the flowers are over, and in the event of a dry spell watering is necessary till the plants are established. The white variety flowers later than the type, and is not so attractive in mid-winter when all colour is precious. The finest form, *I. u. speciosa*, does not flower till toward the end of January.

Schisostylis coccinea Lady Byng needs a well-drained loam, a sheltered spot and must never be allowed to suffer for lack of moisture in the summer. This beautiful Caffre Lily does well in mild parts in the open, but in most parts it is better to give it the protection of a cold greenhouse. If to be grown in the open, the plants are best put in in April, about 6in. apart. Once planted, the Caffre Lilies should never be unnecessarily disturbed. For indoor cultivation pot up in a 5-in. pot in spring, using a compost of equal parts loam and leaf mould and a little sand. Place in a cold frame till May, after which month the pots should be plunged in ashes and brought in in November. After flowering, return to the cold frame and repot in fresh soil in spring.

R.

BLOODHOUNDS FOR SPORT AND SHOW

By A. CROXTON SMITH

THE MARQUESS OF AILESBURY'S intimation that he proposes to relinquish the chairmanship of the Association of Bloodhound Breeders will be received with great regret. Since its formation in 1898 the association has had only two chairmen, the first of which was my dear old friend, the late Mr. Edwin Brough, and when he retired he was succeeded by Lord Ailesbury.

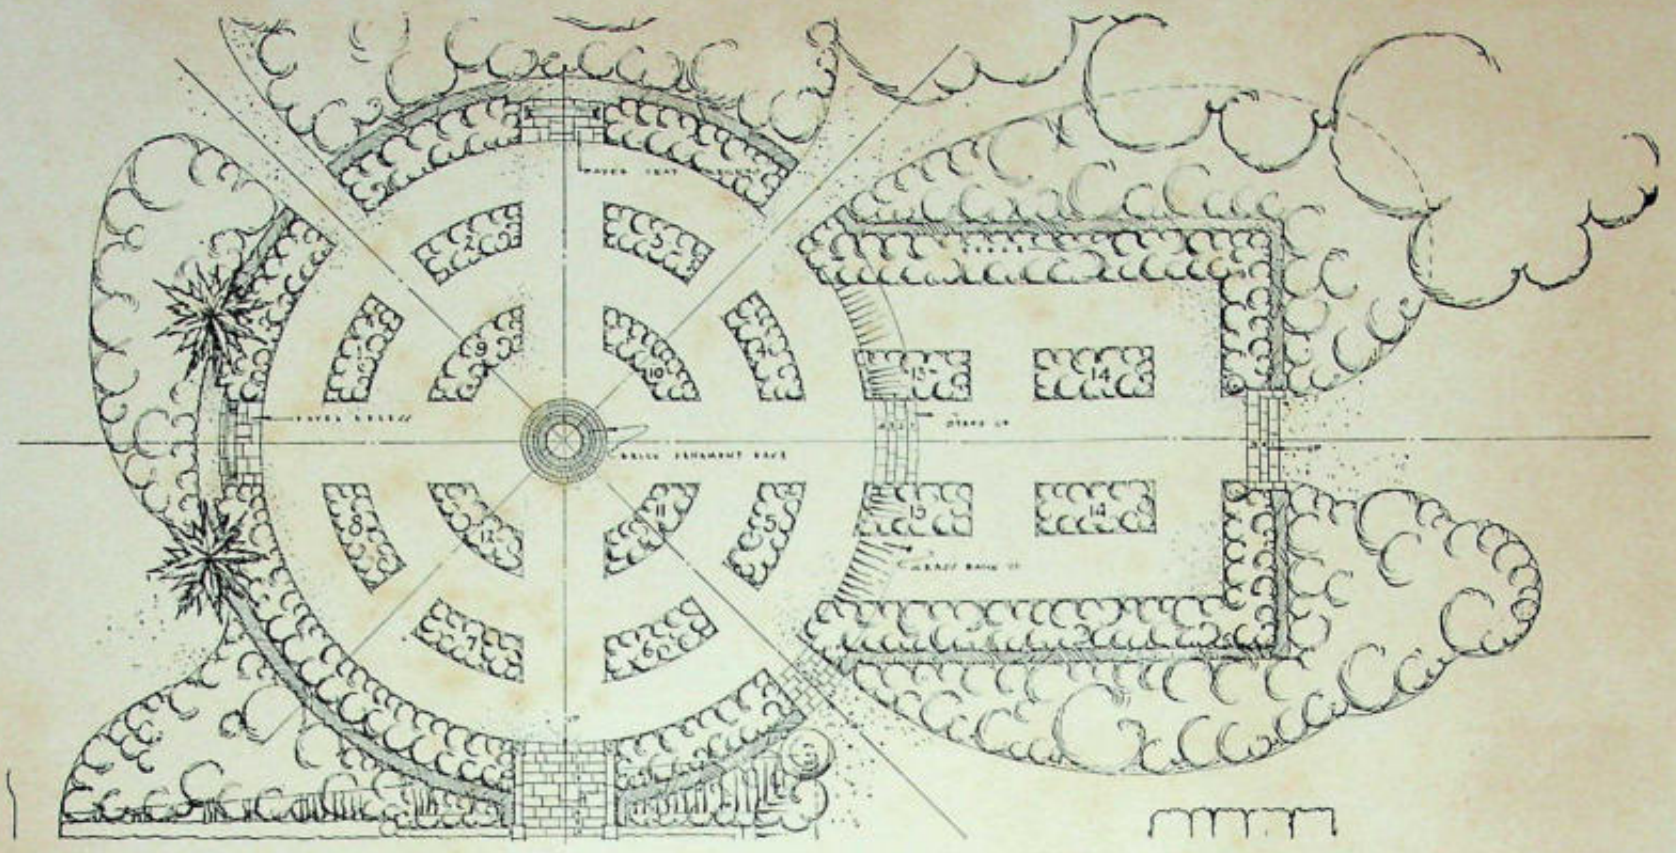
In conveying his intention, Lord Ailesbury has written to the members in the following terms: "It is now some forty-five years since I became interested in the bloodhound, and time has only increased my admiration for the breed. I would therefore beg members to do all in their power to further the interests of this hound, so good a companion and so intelligent in the field. Members of the association succeed to the inheritance left them by Mr. Brough and his contemporaries. It was largely owing to Mr. Brough that the breed was saved from extinction, and that the type has remained unaltered from the original standards. The main objects which Mr. Brough had in mind when he founded the association were the preservation of the type and the support of the interests of the breed equally in the field and on the bench. I hope and believe that members of the association will recognise that they are the trustees for the bloodhound and that they will work together for the ideals which inspired Mr. Brough."

This tribute to Mr. Brough's work is fully justified, for if it had not been for him bloodhounds would not have had the style and quality that they exhibit to-day, and it is quite possible that their wonderful working qualities would have fallen into desuetude. As a keen hunting man, Edwin Brough desired to have in his bloodhounds the legs and feet and strong loins that are to be found in the foxhound, and starting on this foundation he bred for a quality of head that had never before been attained, and managed to fix it permanently. He did not want a *chien de luxe*, however, and so it came about that he started training his hounds to hunt the clean boot, and immediately upon the foundation of the association he urged the desirability of promoting public working trials.

I attended the first of these, held on the moors at the back of Ravenscar in Yorkshire, in October of 1898. One has to admit that the tests were of an elementary character, suited to the amount of training that most hounds had then received. To the best of my recollection, the distance of each trial was not more than approximately a mile and hounds were laid on 20 minutes after the runner had started. None the less, they served their purpose by attracting a tremendous amount of public attention and acting as the forerunner of regular trials and matches ever since. The good work has progressed to such an extent that the association now promotes several trials a year, at which two stakes usually appear on the programme—one on a line an hour cold and the other with twice that interval. The winners at these trials are entitled to compete for the Brough Cup, which is on a six-hour cold line.

The ambition of all enthusiasts is to encourage the training of hounds on really cold lines, say, not less than six hours, but there are practical difficulties in the way as regards time that prevent anything more exacting being done. All the same, the effect has been to induce several owners to practise their hounds on lines twelve hours or more old, which means that they can be of actual use to the police. When I was hon. secretary of the Association of Bloodhound Breeders for 21 years we were able to persuade a few chief constables of counties to add bloodhounds to their force, and the success attending the work of some of them, no doubt, led to the Home Office authorities, at their experimental training school for police dogs at Newbury, giving consideration to two branches of police work—one tracking and the other the provision of dogs that will accompany constables on their nightly rounds. Various experiments were made with other hounds at this school, and finally they have decided in favour of bloodhounds, which are incomparable in their ability to hunt a very light scent on a really cold line.

It is quite easy to run a kennel of bloodhounds for show and sport since this is one of the breeds in which tracking hounds frequently come from the best show strains; indeed, it may be said that all the working hounds that have distinguished themselves are full of exhibition blood. As long as one has open country available it is possible to train hounds to track man, the great advantage of this kind of sport being that the runner can so select his line as to avoid disturbing farm stock or game. Bloodhounds are among the aristocrats of the dog world, having that air of breeding that is almost indefinable. There is plenty of scope for the enterprising, as breeders are not many and reinforcements to their ranks would be welcomed.



"IN DESIGNING A ROSE GARDEN, SUCH AS THE ONE ILLUSTRATED, THE IDEA IS TO INTRODUCE ROSE SPECIES TOGETHER WITH POLYANTHA AND BUSH FORMS"
The above plan is explained at the end of the accompanying article

DESIGNING A ROSE GARDEN

The Conversion of a Wild Garden

By RICHARD SUDELL, F.I.L.A.

NO plant lends itself so well for a solus display as the rose in its various forms: bush, standard or climbing. It has been improved by horticulturists through the centuries so that its season of flowering is prolonged, its habit is determined. For example, a bed of Else Poulsen is of uniform height, compact in mass and continuously colourful for several months.

In designing a rose garden, such as the one illustrated above, the idea is to introduce rose species together with polyantha and bush forms to create a garden which in itself is complete and separate from the rest of the garden.

Originally a large area at one side of the existing terrace was a wild garden. I thought, however, that a rose garden would be more in keeping with the very formal surroundings to the house. The general fall of the ground necessitated levelling, and so two plateaux connected by a bank and steps were formed.

Levelling was begun by driving in a series of wooden pegs marking the mean level of the finished lawns, using a 10-ft. straight edge of timber and a spirit level. To find the mean level the site was divided into equal parts and a central point found which could be assumed as the mean level of the new garden, and here a peg was securely driven in. An inverted bucket was placed over it to protect it against any possible movement by kicking or knocking with barrow wheels; alternatively a small pile of bricks or stones could have been used.

The next process was placing the second peg, and to do this we worked towards the lower end of the garden as this naturally required the minimum amount of excavation. One end of the straight edge was placed on the centre peg and another peg driven in at a distance not greater than 10ft. away, on the top of which the other end of the straight edge was placed with the spirit level resting in the centre. The second peg was then adjusted to centralise the bubble in the level. When the levels of the tops of the two pegs coincided the straight edge was moved on to fix another peg.

Progress towards the higher ground was carried out in a similar way, holes being excavated to allow for the passage of the pegs and straight edge. When the position of all the pegs had been fixed in the form of a 10ft. grid the ground was excavated from the higher end and wheeled and rammed at the lower until the soil was approximately 3in. above the tops of the pegs. This was necessary to allow for the consolidation of the ground after weathering and ramming.

Great care was taken over the formation of the dividing bank between the two plateaux and the retaining banks at the made-up end of the garden. I mention this because these banks were taking the pressure of many tons of soil, and any movement here would have resulted in a general sinkage over the whole area and would have necessitated considerable work and material in making good.

When the subsoil excavation was completed the ground was left for a period of two to three weeks; had the work been carried out in the summer it would have to have been left for longer. During this time a watch was kept for any movement in the ground.

Eventually the top soil was replaced and thoroughly consolidated by heavy hand ramming and frequent and copious applications of water. The hand ramming, I should explain, was carried out in 4in. layers of soil, while at the same time the extra depth of top soil required for the rose beds, &c. was placed and dug in position. Additional stone steps were then constructed leading from the terrace to the rose garden, and two flights of steps leading from each plateau were also built.

Bone flour was incorporated with the top soil at the rate of 4oz. per square yard to both rose beds and lawn areas. The turf was, fortunately, obtained in the locality and, owing to the small cost of cartage, the price was quite cheap. It was specified that this turf should be cut in 3ft. lengths not wider than 12in. nor less than 2in. thick. They were stacked in various positions on the site for ease in laying. This was done in the form of a bond, having straight joints longitudinally and broken lateral joints.

The beds, as will be observed on the plan, were laid out around two large vistas of cruciform shape. The long vista stretched from a seat recess beneath the two cedar trees, along which the eye was carried through the brilliant colour of the roses to a cool shady clearing in the surrounding woodlands. The shorter cross vista also had a seat recess at one end, and was terminated at the other by the flight of steps leading to the terrace which has already been described.

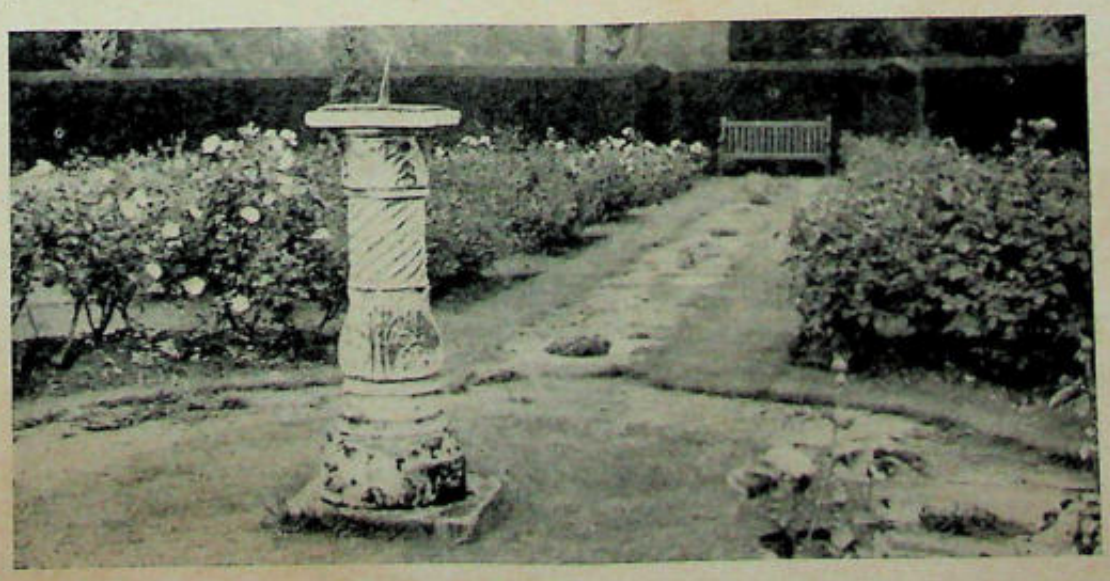
The varieties of roses were chosen with great care, special attention being paid to the colour. Near the seat red predominated, and as one walked down the garden one passed through shades of bright pink to orange. The centre was reserved for yellow, and the outer circular border was filled with alternate groups of polyantha and rose species. As a foil to this brilliant display a yew hedge was planted on the outer edge of the rose garden, and this also provided a pleasing link between the garden itself and the surrounding woodland trees.

The key given below will show the actual varieties used to create the desired effect:—

1. Etoile de Hollande—red
2. President Hoover—orange
3. Mme. Butterfly—apricot
4. Emma Wright—orange
5. Emma Wright—orange
6. Lady Forteviot—orange yellow
7. Mrs. G. A. van Rossem—apricot
8. C. P. Kilham—red
9. Julien Potin—yellow
10. Shot Silk—orange and yellow
11. Shot Silk—orange and yellow
12. Mrs. Wemyss Quin—yellow
13. Betty Uprichard—pink
14. Mrs. Sam McGredy—copper

The polyantha and species roses included:

Else Poulsen
Karen Poulsen
Kirsten Poulsen
Poulsen's Yellow
R. Davidii
R. Highdownensis
R. Hugonis
R. Moyesii
R. rubrifolia
R. spinosissima
R. Wilmottiæ



A SUNDIAL IS THE FOCAL POINT OF THIS CIRCULAR ROSE GARDEN

WHEAT FIELDS AND GRAIN ELEVATORS AT FORT SASKATCHEWAN

FARMING IN WESTERN CANADA

Some Agricultural Conditions

FROM the Red River valley to the foothills of the Rockies is still the ideal region for the production of high quality wheat which sells at a premium in the world's markets, together with similar annual crops. The low precipitation in harvest time, and the prevailing high temperatures at this period, combine to produce this excellence in man's most necessary food. Yet it must be remembered that the weather in the West is remarkable for its variation from year to year. The danger of summer frosts, once a bugbear throughout this region, has been overcome by the production of early maturing varieties, but in the Northern areas it still remains a hazard. The long winter period, with its attendant overhead expenses in cost of housing livestock and feeding them, is a handicap to mixed farming in times of strenuous world competition, and has forced the Western farmer to rely chiefly on cereal crops. The tendency has therefore been to exploit the natural fertility of the soil, without much regard either for suitability or for the future.

To illustrate the vagaries of the returns from the prairies, one may take the best crop on record, that of 1928, when 545,000,000 bushels of wheat were taken in by the elevator companies, as contrasted with last year's returns of 164,000,000, not much more than one-third. A still greater contrast is seen in the drought or "dust-bowl" area of South-Western Saskatchewan, whose total crop in the five years prior to 1930 was 644,000,000 bushels, but last year returned practically nothing. The outstanding reason for this seasonal variation is the uncertain supply of moisture. Half a ton of water is needed to produce a pound of wheat, and a shortage of moisture inevitably leads to a light grain crop.

The last half-dozen years may be classed as drought years for the West, because, except for parts of Manitoba where the rainfall has averaged from 20in. to 22in., much of the West has had from 10in. to 12in. only, up to 18in. or 20in. in the western or foothill section. From year to year there are tremendous variations in moisture amounts between local districts, so that it sometimes occurs that a territory which was dried out in one season may have a bountiful crop in the one which follows. An instance is seen in Southern Manitoba during the past season, which produced on the whole a paying crop, as contrasted with several years previous, when drought conditions were serious.

The Premier of Manitoba, Hon. John Bracken, was chosen some fifteen years ago to head a farmers' group which had gained the ascendancy in provincial politics. Mr. Bracken, born on an Ontario farm, had attended the Guelph Agricultural College, and by virtue of a capacity for hard work and good executive ability had risen to be president of the Manitoba Agricultural College. His choice by the farmers' group was natural, since many of them were in close touch with his work, and his policies have been, on the whole, favourable to rural districts, though hampered by lack of funds. In the last election the general political unrest due to the depression resulted in the return of a "Social Credit" group in the Provincial Legislature, which Bracken astutely induced to form a coalition, thus enabling him to command a majority. Under the stimulus of this group, Mr. Bracken has prepared a detailed statement of Manitoba's economic position, which he has had printed in nine volumes, for submission to the Rowell Commission appointed last year by the Federal Government, and which statement may be taken as describing the position of all the prairie provinces, since their problems bear a great similarity.

The effect of the statement is to demand a "new deal" for Western agriculture. Mr. Bracken charges that the Dominion Government policies have been of such a nature as to cripple the efforts of the provincial parliaments to raise sufficient money for their local needs. He quotes figures to show that while the cost of government *per capita* of the population increased very slightly in the past 50 years, the demands for education had risen six times as fast, and the call for public services had increased 30-fold. Unemployment relief has been a heavy factor in the budget of Manitoba, and the question of raising money by borrowing to meet this unprecedented demand is one of increasing difficulty. He also states that the policy of the Dominion Government regarding land settlement has been marked by lack of foresight, resulting in great hardship for settlers in unsuitable areas. His figures further state that the tariff policy of the Canadian Government, while presumably to the advantage of the nation as a whole, has worked to the disadvantage of the West. The cost of the tariff has been estimated as $100 annually to the average Manitoba farmer, while on the three prairie provinces, as a whole, it has imposed the staggering burden of $58,000,000 per year, in increased cost of the necessities of life. He contrasts the example of Australia, where the Federal Government, trying to assist the farmer, allowed their money to fall in value to give the agrarian class a bigger return for their products, but states that the Canadian Government, by pursuing the opposite course, have depressed the wealth of the West. Railway rates, being a fixed charge on the wheat crop, took an increasing percentage as the price of wheat declined. The burden of the heavy tax on land has checked, to any large extent, the needed repairs and rebuilding in towns and cities, being a major obstacle in the way of restoring employment in the building trades.

The prairie provinces have passed through, during the past six years, the worst crisis in their history, and the usual total income of the West has been more than cut in two. Dominion money has certainly been spent in Western Canada for unemployment relief, but as Mr. Bracken points out, more to keep unemployed people from starvation than to restore a fair economic balance. It is essential that the prairies should continue to sell wheat, and thus they are exposed to the competition of the world markets, so that their welfare depends on a vulnerable export trade.

As regards the debt situation of individuals, school districts, municipalities, and provincial governments, Mr. Bracken points out clearly to the Dominion Government that in order to avoid chaos and collapse of credit some definite step will have to be taken by the Federal authorities, since they alone have full control of the economic life of the country. The situation for 1938 presents some optimistic features in Western prospects. Agrarian unrest in Alberta, coupled with similar feeling in Manitoba and Saskatchewan, may force the hand of the Dominion Government and cause a bolder economic policy. Promises of an effort to stabilise employment by legislation have been made by the King Government, and indications are also noticed of an attempt to curb the monopolistic companies who control the prices of many commodities. Enough seed of the new rust-resistant types of wheat is in existence to provide for most of the area where rust is prevalent. The facilities for the handling and marketing of the grain crop are second to none in the world for their efficiency. Though temporarily weakened by low food prices, dry weather, and economic stress, Western Canada is still a land of tremendous possibilities in agricultural production, with cheap land, rich forests, mines, and fisheries, and a rural population, toughened by hardships, whose unfailing optimism makes a joke of difficulties, and, if given a reasonable chance by Nature and their fellow-men, are prepared to make good by industry and thrift.

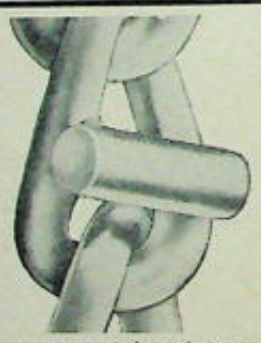
TRACTOR PLOUGHING IN WESTERN CANADA

The best grips BAR none! are BAR-REINFORCED



★ Bar-reinforced cross chains are an exclusive Parsons invention. In addition to giving surer grip they give double the mileage of any other type of chain.

The Double Wear invention—BAR-REINFORCED Cross Chains—is only one of the special features of PARSONS De Luxe Emergency Tyre Grips. Other features include: Lever-tensioning Foolproof Buckle, and heavily processed Fabric Strap with Metal Protector to obviate chafing on ventilated or easy-clean wheels. Stock and recommend Parsons.

FIT 3 OR 4 TO A WHEEL	PRICE PER GRIP

IRELAND

Where ANGLERS rejoice

Tyro and expert — one and all — acclaim Ireland the grandest Angling Country. On their first visit they are amazed at the enormous extent of Ireland's river, lake and sea fishing waters. They are astonished at the endless variety of sport and the abundance of fish. They are delighted with the good and reasonable accommodation in every fishing district. All over Ireland preparations are now being made for even better facilities in 1939, and the Irish Traffic Manager, Great Southern Railways, Kingsbridge Station, Dublin, and Irish Tourist Assn., O'Connell Street, Dublin, in inviting you to take an Irish Angling Holiday, offer a full and free Information Service. Write to-day for a copy of "Ireland for Sport" (free); "The Anglers' Guide" (2/10d post free); or send particulars which will enable them to suggest the ideal fishing centre for your 1939 holiday in Ireland.

You may travel by any of the following steamship routes:—

HOLYHEAD—KINGSTOWN
LIVERPOOL — DUBLIN
FISHGUARD — ROSSLARE
FISHGUARD—WATERFORD
FISHGUARD — CORK

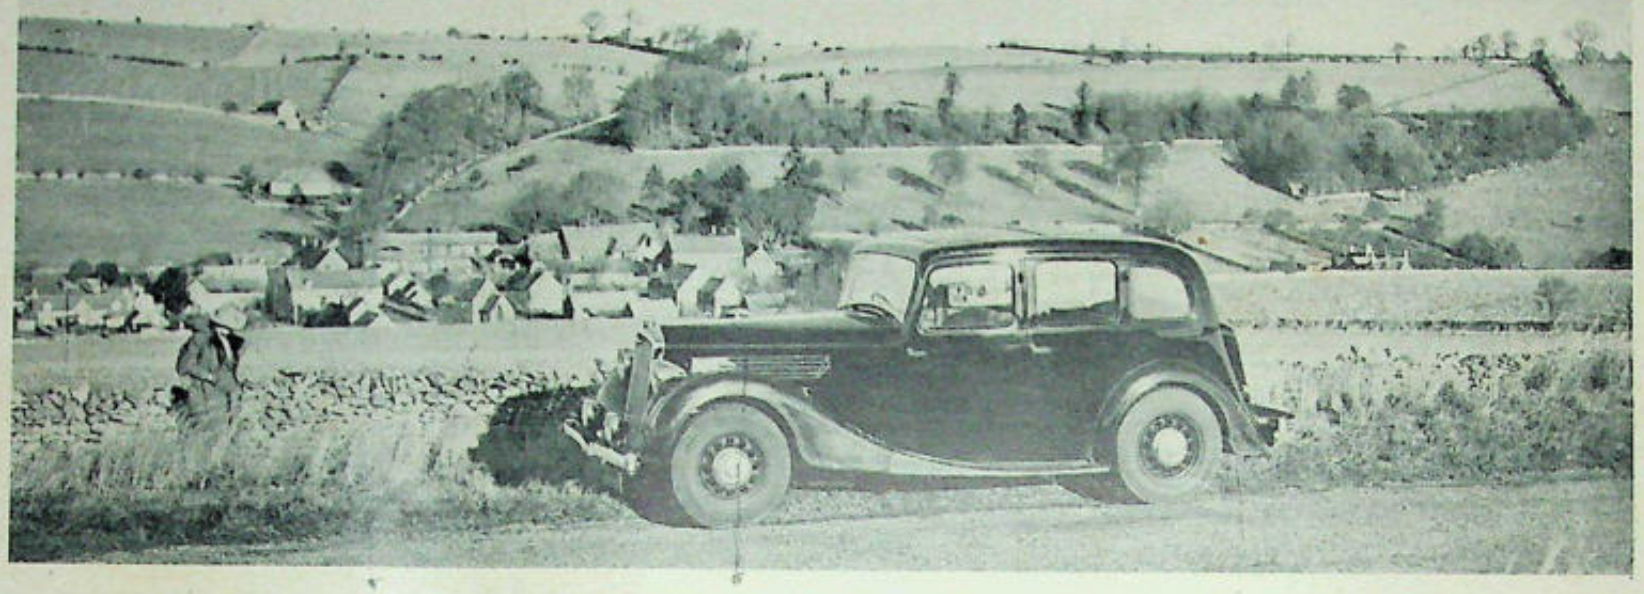
TRAVEL BY LAND, SEA AND AIR



WOLD WITHOUT END AN 18/80 WOLSELEY SALOON PARKED BY THE ROADSIDE OVERLOOKING THE VILLAGE OF NAUNTON IN THE COTSWOLDS

A ROLLS-ROYCE *PAR EXCELLENCE*

Magnificent Coachwork by Jack Barclay on a Phantom III Chassis

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

ONE of the finest examples of the coachbuilder's art I have ever seen was on view on Messrs. Jack Barclay's stand at the Earl's Court Motor Exhibition last October. It incorporated so many novel ideas, and the workmanship was so superb that it is really deserving of special mention.

The body I am referring to was a four/five-seater saloon coupé, designed by Mr. Barclay himself, and built by James Young, mounted on one of the latest 40/50 h.p. Phantom III twelve-cylinder Rolls-Royce chassis. First of all, the outward appearance of the car was most attractive, being painted dark navy blue, and relieved with a chromium moulding; it was dignified and unobtrusive, and the upholstery throughout was finished in dark pigskin.

The first novelty I noticed was the double sliding roof, having two panels of the same size, the first being orthodox, and the second and lower one being made of Perspex glass, so arranged that when the upper roof is opened, the glass panel can be brought forward. The obvious advantage of the double roof is that the occupants, during cold weather, can enjoy all the light and vision without in any way being inconvenienced by draughts; the glass itself is light and unbreakable, and, therefore, the risk of being cut if an accident occurs does not arise. This novel type of sliding roof must appeal to race-goers, and especially to those who attend point-to-point events during the winter months. Incidentally, the top panel is electrically operated; whilst the lower one can be pushed backwards or forwards with the very minimum of effort. I think we must all be agreed that coachwork, when fitted with two doors only, enables the bodybuilders to produce far more attractive lines than if four doors are employed. On the other hand, when orthodox methods of hanging the two large doors are used many disadvantages become apparent, and especially is this so when the door is opened wide to enable the occupants to get in or out of the car. In this particular instance, although only two doors are fitted, the usual disadvantages are eliminated, owing to the ingenious method adopted for opening the doors. Instead of the doors being hung on orthodox type of hinges and swinging outwards in the ordinary way, they have a parallel movement and when opened to their fullest extent do not project more than a few inches beyond the running boards; moreover, by this method, more space is available for entry or exit than is usual.

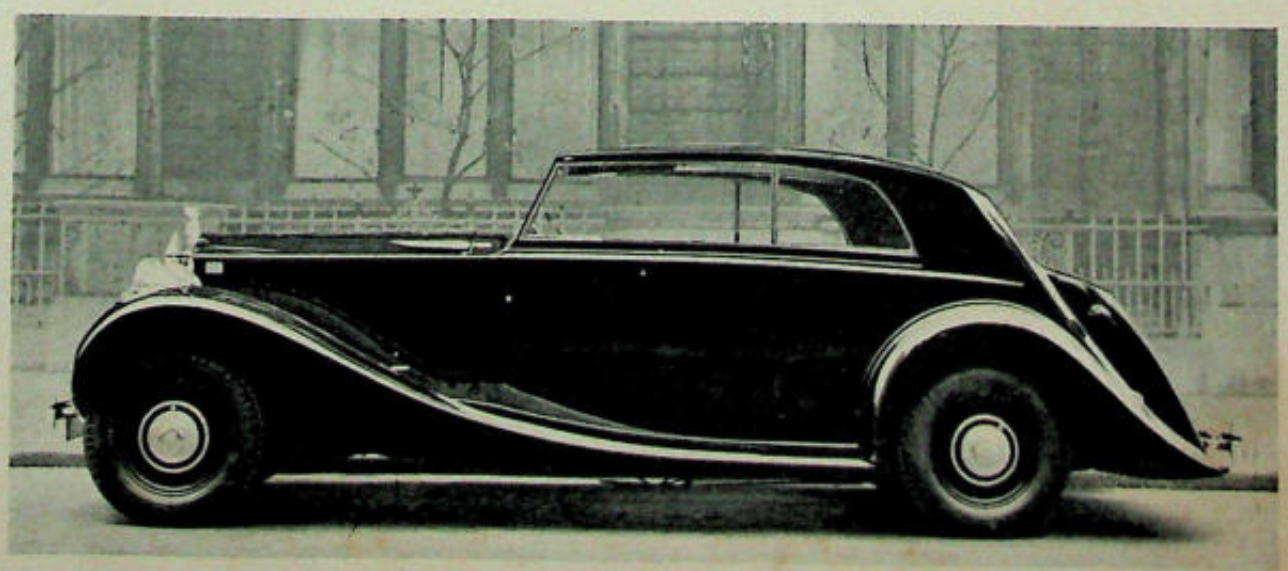
The interior of the car is equipped with no-draught ventilation and inside rear lights; sliding purdah glass panels are fitted to prevent sun glare. The windscreen is supported in exceptionally light metal pillars, and consequently the forward and side vision could not be improved. An electrically operated de-mister is also fitted.

Other features include a cocktail cabinet, ladies' vanity sets on either side of the back seats, a radio set with press-button tuning, and in the lid of the folding arm rest there is a cigarette box. Even the rear blind is electrically operated.

The luggage boot at the rear is very commodious and is fitted with large pigskin suitcases as well as a case containing a pair of Purdey guns, the luggage being protected by an inner lid; additional gear can also be carried by dropping the outer lid.

I must frankly admit I was most impressed when I looked over this car during the recent Motor Exhibition, and although there were many other fine examples of the coachbuilder's art to be seen on the other stands, this particular exhibit left a lasting impression on my mind. Everything about the car was practical, and every possible detail had been carefully thought out, and I should imagine that the lucky person who eventually owns this particular vehicle will become the envy of all his or her friends; it is certainly a credit, not only to the designer, but also to James Young & Co., the builders. The price complete, as described, is £3,173, or, without the pair of Purdey guns, £2,900.

CRISIS ACCIDENTS.—The National Safety First Association informs us that the October road accident figures spoiled a downward trend which has been in progress for some months, and the increases, both in killed and injured, were in speed limit areas, whilst in the de-restricted areas there were reductions. Mental and emotional strain always have a bad effect on concentration, and it is probable that the tension of the crisis and the reaction which followed influenced road behaviour. The tendency has not been confined to accidents on the road. Some organisations have found that cases of illness among their staffs were unusually numerous this autumn.



"EVERYTHING ABOUT THE CAR IS PRACTICAL, AND EVERY POSSIBLE DETAIL HAS BEEN CAREFULLY THOUGHT OUT"

REORGANISING THE AIRWAYS

Some Aspects of the New Merger Scheme

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

SIR KINGSLEY WOOD'S announcement in the House of Commons that Imperial Airways and British Airways, our two principal commercial-aviation companies, are to be merged into a single public corporation is probably the most important development of policy in civil flying since Imperial Airways itself was formed some fifteen years ago. In conjunction with other recent developments it provides very striking evidence of the Government's intention not merely to reorganise the airways on the lines of the Cadman Report, but even to go beyond the committee's recommendations when circumstances seem to warrant such a course.

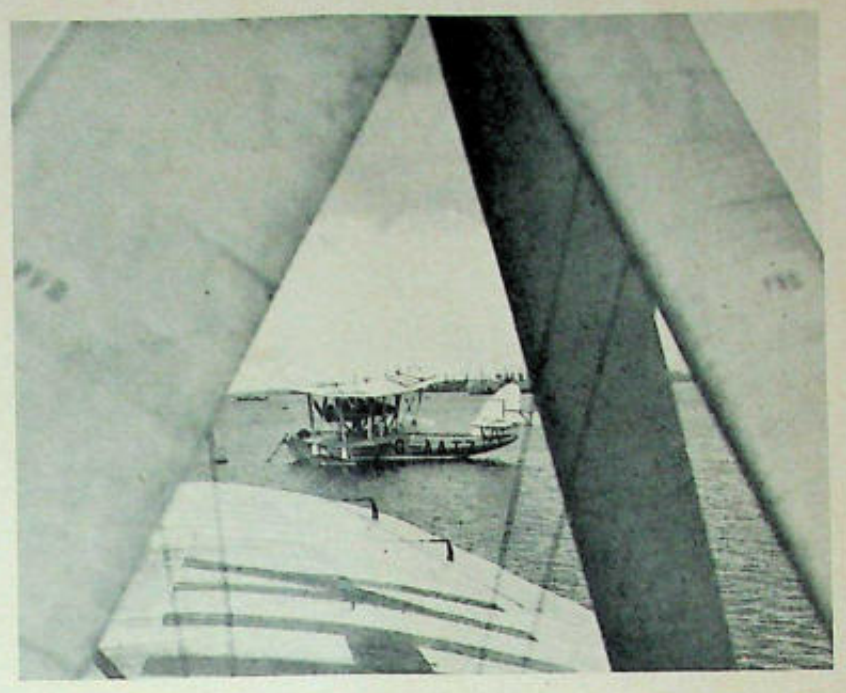
Precise details of the scheme will not, of course, be known until the Bill authorising the step is presented to Parliament. Broadly, however, the plan seems to envisage the creation of a non-commercial public-utility corporation, financed by the issue of fixed interest stocks guaranteed by the Government. That this undertaking may be more like the B.B.C. than, say, the London Passenger Transport Board, might be inferred from the remark made by Sir John Reith in his speech at the annual meeting of Imperial Airways, when he said that the airways would not be converted into a Government department, but that it might be like another public corporation with which he was until recently associated.

The point he also made that the present position of the company was neither commercially nor constitutionally satisfactory, and that relations with the State were not all they might be was fully recognised by the Cadman Committee. The idea of merging the companies receiving Government subsidy was not, however, considered—or at any rate not commented upon—by the committee. That body, it will be recalled, went no further than suggesting that Imperial Airways should be responsible for developments within the Empire and British Airways for other external services, while a joint company should be formed to conduct the London–Paris route.

Financial reasons seem to have been the principal ones in deciding the Government on the new course. Large additional capital is necessary for the expansion of services, and it is desirable that this should be raised as cheaply as possible. For this purpose some Government guarantee seems essential. The present position is that the State will not only carry the ultimate risk involved in the operation of the services, but pay large subsidies. It will, however, be generally admitted that it is better for subsidies to go directly to the assistance of development than to the maintenance of shareholders' dividends.

Apart from criticisms made on the financial aspects, with which this article cannot attempt to deal, and which, in any case, can be no more then speculations until the full provisions of the Bill are known, the chief point urged against the merger has been that it will eliminate competition and that British commercial aviation may, as a result, once again relapse into a position of inferiority just when it is re-establishing itself throughout the world.

This argument was foreseen by the Cadman Committee when recommending that the operation of external airways should be concentrated in a few hands. "Subsidised foreign lines," the committee observed, "will provide all the competition necessary to stimulate improvement in services and equipment." It is interesting to note that this view echoes the conclusion of the Hambling Committee of 1923—the committee whose report led to the establishment of Imperial Airways; that body remarked: "So far as efficiency of service is concerned, adequate incentive should be provided by the direct competition of foreign companies with large Government resources behind them."



THE OLD AND THE NEW

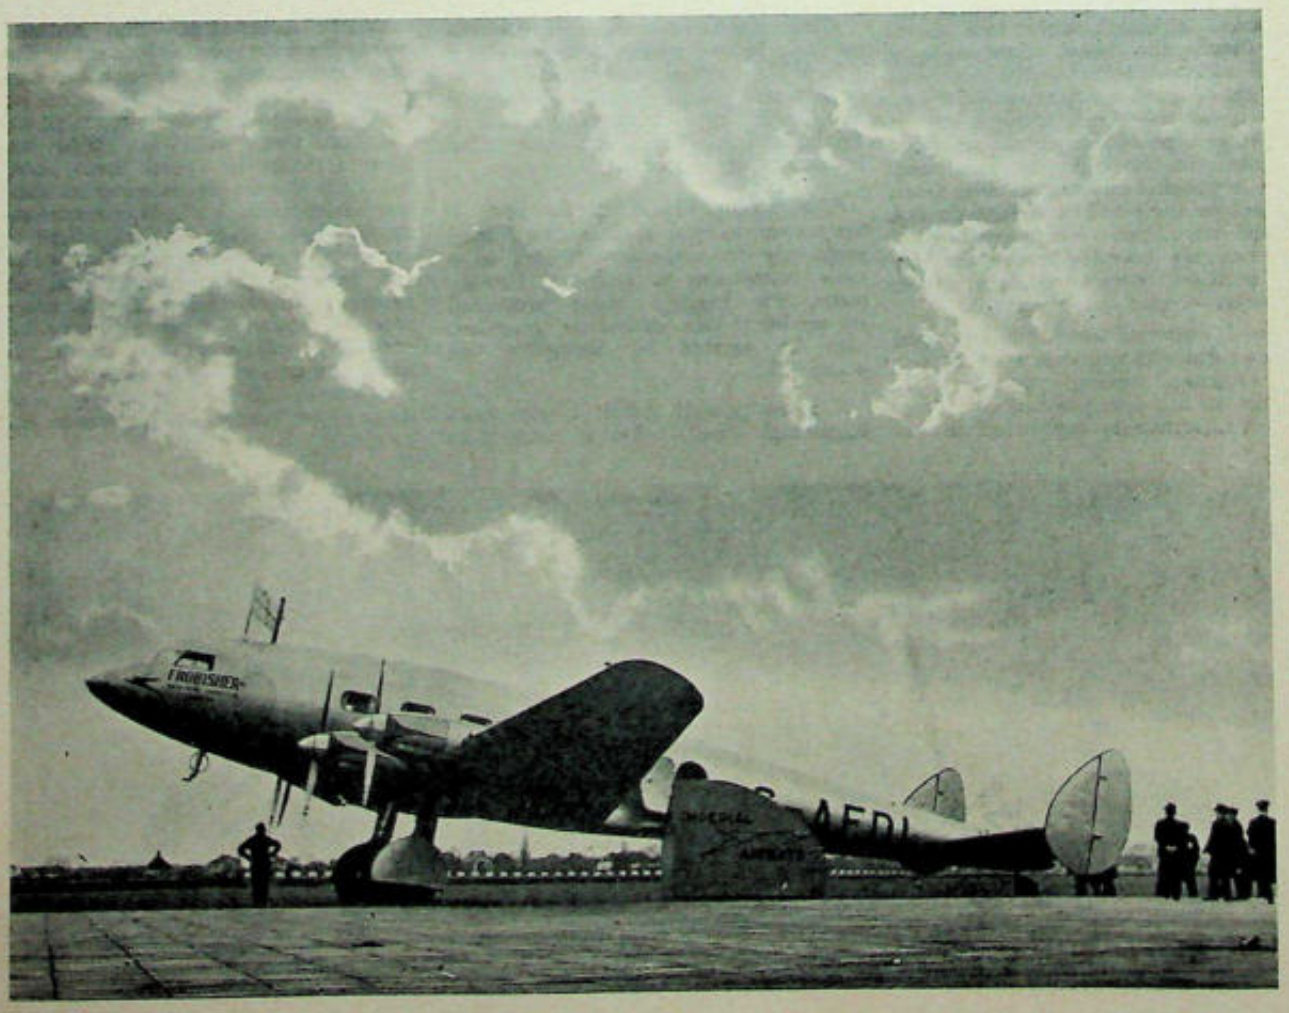
A view through the superstructure of the Maia showing one of the veteran flying boats in service on the Mediterranean as long ago as 1926

In some ways, the new scheme might be regarded as a return to the general policy recommended by the Hambling Committee. When this committee was set up, there were several British companies operating on different routes and each in receipt of Government subsidy. The conclusion drawn was that the system was wasteful and anomalous, and that the solution lay in forming a new organisation to take over the then existing services and to operate on a monopoly basis. The idea of a public corporation was, however, specifically rejected.

That policy was pursued until 1935, when the Warren Fisher Committee advised that more than one company should be subsidised. Imperial Airways' activities became almost entirely concentrated on the Empire routes, while British Airways received Government assistance for the maintenance of Continental services, with one or two exceptions, notably London–Paris. The official choice of British Airways to develop the West African and South American routes indicated, however, that the trend away from the monopoly policy was greater than had been thought.

In view of the handicaps (stressed by Sir John Reith in his speech at the Imperial Airways meeting) imposed on British aviation by the difficulty of securing deliveries of equipment, the creation of a single corporation with fuller Government backing than has hitherto been provided may very well lead to improvement in services, rather than the reverse. There is no reason to suppose that a concern of this kind must necessarily be less efficient than one in which commercial risks are greater; experience with other public-utility corporations does not suggest that the absence of internal competition inevitably produces stagnation. Moreover, the Government itself, as the ultimate sponsor of the new enterprise, should be more open to direct pressure in Parliament should circumstances calling for inquiry arise.

That the scheme has in it seeds of both good and possible bad no one can deny. Only practical experience can decide its ultimate merits. In the past monopoly rescued British commercial flying, and, later, competition revivified it. Perhaps in these early days the greatest significance of the plan is in the indication it gives of the new and welcome attitude to commercial flying: its being regarded as an absolutely essential service whose continuance must be ensured by the fullest backing the State can provide.



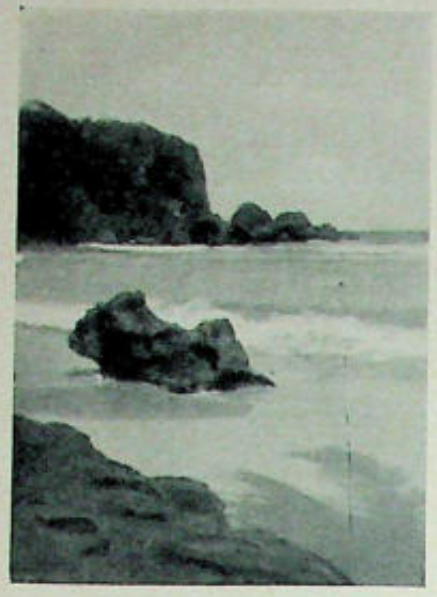
AN IMPRESSIVE ANGLE ON CROSS CHANNEL AIR SERVICES

The Frobisher, the first of three thirteen-ton, 240 h.p. air liners to be put into service on the European routes by Imperial Airways

COACHBUILDING.—With regard to the recent announcement in the Press concerning Barker & Co. (Coachbuilders), Ltd., they would like it to be generally known that the company is being reconstituted. Business will will be carried on at the well-known South Audley Street showrooms as before. The manufacture of new motor bodies is being carried out at a completely new and up-to-date factory at Elvedon Road, Willesden, where every possible modern facility, both for the men who now work under ideal conditions, and for the production of the highest possible excellence in coachwork, will be found. The repairs department has been transferred to a more central address at 77, King's Road, Chelsea.

"THE LOOK-BEHIND COUNTRY"

The Second Centenary of a Happy Jamaican Settlement



AN ATTRACTIVE COASTAL VIEW NEAR THE COCKPIT COUNTRY

A SMALL self-governing community of about 1,500 people, the Maroons offer a happy example to the other inhabitants of Jamaica so recently tormented by strife and riots.

Having fought for and obtained their freedom 200 years ago, the Maroons have proved themselves to be, since that time, a peaceful and law-abiding people.

The origin of this small independent State dates from the middle of the seventeenth century, when the English overpowered the Spaniards, who were then in possession of the island.

The slaves of the Spaniards having been released by their masters, in order to fight against the invaders, displayed such resource and courage that they remained unconquered. Being outnumbered they were forced to seek refuge in the nearby mountains.

They chose as their hiding-place a part of the island called "The Cockpit Country," owing to the curious formation of the hills. This particular district came to be known as "The Look-behind Country," owing to the fact that the Maroons, having established themselves there, became such a menace to the countryside, that any individual venturing near their lair had to look behind for fear of attack.

Long after the Spaniards had been driven from Jamaica, the Maroons remained a constant source of danger to the inhabitants of the island. Raiding parties destroyed the neighbouring properties. Lives were endangered. No one was immune from the cruel methods of these runaway slaves. All attempts by the military to dislodge them from their mountain refuge were unavailing. Although the British authorities took every means to safeguard their people, this intolerable situation persisted.

During the eighteenth century a Government official volunteered to go unaccompanied to this dangerous Cockpit Country in order to obtain an interview with the leader of the rebels. He hoped to succeed by negotiation where force had failed.

His courage so impressed the Maroons, that he was allowed to reach his destination unmolested. After much talk and bargaining a treaty was concluded and signed in the name of the British Government.

The signing of the treaty was carried out with great pomp and ceremony, in typical native fashion. A bowl was placed upon a rough hewn table, with the representative of the British and that of the Maroons standing side by side, their wrists loosely tied together. After a small incision had been made, the blood of both men was collected in the bowl, and mixed with a small measure of rum. With this mixture the treaty was signed. One copy was held by the Maroons, which to this day is one of their most treasured possessions, another was kept by the British, and is still to be seen in the Museum at Kingston. The signatures, now scarcely visible, still bear witness to the bravery of one man and the integrity of his opponents.

The conditions of the agreement granted to the Maroons full self-government. They were in future to make their own laws, and to be allowed complete freedom in their own domain, on the condition that they created no disturbance. So faithfully has this pledge been fulfilled that to this day the Maroons have never once broken faith with the Government of Jamaica. The only occasion on which an appeal could be made to the British Government was in the event of a death sentence having to be passed by the leader on one of his followers. This appeal has never been made. Investigations of the Maroon records prove that this community is practically free from crime. They show that the last "crime" to be tried was a charge of stealing brought against a youth. This case was dealt with in such a manner that during the intervening thirteen years no charge whatever has been made against any Maroon.

During the spring of 1938 the 200th anniversary of their freedom was commemorated, and many visitors were invited to join in the celebrations, which lasted for three days. Anyone undertaking the arduous and difficult journey, ending with an uncomfortable ride on a mule, was amply rewarded by the kindly hospitality of their hosts.

Long tables covered with spotless white cloths and laden with all manner of tempting dishes awaited the visitors. The fare consisted of differently cooked meats, including chickens and sucking pig, which were supplemented by a variety of luscious native fruits and vegetables.

After the first evening meal had been consumed, the leader rose to his feet and made a courteous and dignified speech, welcoming the visitors. He referred in touching terms to his people's unswerving loyalty to the British Empire. This loyalty, he pointed out, had already been proved by the sending of volunteers to fight in the World War. He also undertook in the future, if their aid should be required, they would be willing once again to offer their support. The terms in which he referred to the King Emperor resembled those which are generally used in connection with the Deity.

On being asked whether they would not welcome more easy methods of communication to the other parts of the island, the leader drew himself up proudly, and said: "Communication means contamination." The Maroons have jealously kept their origin free from any intermingling with other races. This is clearly seen by the purity of their dark colour (from whence their name is derived), and other characteristics of their African forbears.

The leader, who for his term of office has complete authority over his "subjects," is elected by them. On wishing to retire, he may nominate his successor, but the final decision rests with the electors. In point of fact, the leadership is frequently passed from father to son.

The houses inhabited by the Maroons, built of native materials, are of the simplest nature, airy and clean. The small gardens surrounding them are full of gay flowering shrubs. The natural resources of this fertile country are practically limitless, and climatic conditions make it easy for the inhabitants to live on their home-grown produce. All around there is evidence of content and well-being. A fact which is in strange contrast to the other parts of Jamaica, where the so-called benefits of civilisation have been introduced.

THE MAROONS HAVE KEPT THEIR AFRICAN CHARACTERISTICS

Cricket is one of their main recreations, the ground on which they play being about the size of an ordinary tennis court, and, surrounded by scrubby undergrowth. During a match, the women and children are posted at intervals round the pitch to prevent the disappearance of the ball. The rules of this curiously arranged game differ somewhat from those of the more orthodox cricket, but they certainly produce a hilarious and amusing entertainment.

On return from witnessing the strange anomaly of a self-governing, self-supporting state within the British Empire, the visitor would no doubt have been given much food for thought. He might have found it strange that the leader of the Maroons should have been so emphatic in wishing to keep his people from easier communication with the outside world.

On further reflection, however, he would probably be forced to admit that these simple-minded people have evolved for themselves a method of living whereby peace and happiness prevail.

EVELYN STEVENS.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE CROWN HOTEL AT AMERSHAM

EVERYWHERE the country is bare and entirely leafless. Yet there is something very attractive about a long walk in Bucks at this season of the year. If you are lucky you get a little glow of sunshine around noon and then there's that rather delightful hint of frost in the late afternoon which makes you bustle home eagerly to buttered toast and a cosy parlour fireside. It is a most pleasant thing to sit with slippered feet propped on the fender and go over in one's own mind the sights and sounds of a winter ramble.

I found myself doing this the other day in a cosy Ingle Nook room at the Crown Hotel at Amersham. And there can be few nicer places in Bucks for such a reverie. The Crown is a typical old coaching inn, built in the early part of the seventeenth century. Old beams and oak panelling predominate in most of the rooms, those in the coffee-room being particularly fine. You will notice a panel of painted plaster over the fireplace in this room, surrounded by an oak frame, the colour of which has faded away to a dull brown. It represents the Royal Arms with conventional Lion and Unicorn and motto while, very faintly, at the top you will see the words: "God save the Queene."

One writer said of the origin of this panel: "Whence came the panel, and who set it in its present position, no one seems to know for certain. The local legend—killed as all students of Heraldry will know by the Lion and Unicorn supporters—is that it was introduced into the Crown by some former lessee, and commemorates a visit paid by Queen Elizabeth to Shardeloes, the ancestral home of the Drake family, who have been Lords of the Manor of Amersham for many a long year. But the house of Shardeloes, a mile away on a tree-clad eminence overlooking the spacious lake by which you can wander at will, was built in Georgian days, near the site of the old house which it is quite probable Elizabeth visited."

Once the Crown was quite a busy posting house, as is obvious from the spacious courtyard and traces of stabling accommodation. To-day, of course, it has inherited a full trade by reason of the excellence of its cuisine and because of the ever-growing number of cars which pass through Amersham on their various ways to odd corners in Bucks. It is a much cosier inn than exterior appearances would have you think. Most of the bedrooms, for example, retain their ancient oak beams, and in one of them, number six, can be seen a relic of great interest in a piece of old wall-stencilling. These patternings used to be painted on the plastered walls of rooms, the paint being laid on before the plaster was dry to allow the colour to sink in.

But it was that Ingle Nook room which took my fancy so. I had walked through a countryside undecorated, hard, and stripped of its finery, and I came into a room where the firelight flickered and played over everything. Blazing beech logs winked at me and shadows danced across the time-worn ceiling beams and I gave myself up to the enjoyment of the fire, glad and contented that my wanderings had brought me to the Crown.

The writer will be pleased to answer any queries from readers concerning hotels.

BRIDGE

SIMPLE SYSTEM OF BIDDING

Readers' Opinions

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

RECENT articles in the *Field* and the fact that my book *Contract Without Conventions* (Seeley Service; 3/6) is now available in a cheap edition have produced a crop of correspondence as to the merits and demerits of the "Simple System" which I advocate.

So far as the opinions voiced are representative, candour compels me to admit that honours are almost easy. While there is a slight preponderance in my favour, I discount the percentage as a natural desire to be complimentary. Not because that counts for much. Bridge players on the whole are very outspoken. They are not inclined to bestow bouquets. When they express appreciation you can take it that they mean it, and you can also take it that they mean it when they hurl bricks.

As a recipient of both let me try to disentangle the controversy. My standpoint is this: that Bridge can be played just as efficiently, perhaps better, without a host of artificial and arbitrary conventions which involve tiresome preliminary catechisms at the card-table. Further I advocate: allow the cards to speak. Let us play cards not ciphers. Let us by intelligent deduction arrive at the best declaration without devices which savour of card-sharping and which are repugnant to the spirit of a game and destroy its pleasure.

That appears to me to be a reasonable proposition. What has the other side to say against it?

A very great deal.

First it is alleged that all card games are based upon artificiality. The scoring is arbitrary. Why should No Trumps be higher than a suit and why should there be major and minor suits?

Apart from conventions in bidding there are numerous conventions and signals in play which you admit and even advocate. Why, then, make this distinction? Are you merely catering for the lazy or impatient who will not be bothered to master or are incapable of learning the finer points of bidding? That, summarised, is a point of view which is not easy to answer briefly. It is quite true that all card games are in a sense artificial since you are to abide by rules which may not be logical. Certain rules are assigned and these you have to accept. But I see a distinction between conventions in bidding and in play. A convention in the laws is defined as "a call designed to convey an arbitrary or artificial meaning or used by a player with the assurance that his partner will not accept it in its natural sense."

Contract Bridge is the only card game where it is necessary to have a preliminary catechism. The abolition of that and of a number of code bids is what I am trying to bring about. I hold that in a game you should not be allowed to ask your partner or your opponents what they mean by their bids. Fundamentally, it is wrong. If you use the Simple System or natural bidding you have no such necessity.

The greatest tribute to the Simple System is given in two letters, both from well-known London players. One writes: "Your Simple System is all very well for *experts* who are good card players. But it is not precise enough for those who require a definite rule of thumb. . . . It leaves too much to the individual player." The second states: "The Simple System is good enough for '*rabbits*,' but you cannot expect that those who aspire to higher flights will ever adopt it."

These two opinions cancel. There cannot be much wrong with a system which is good enough for "experts" and "rabbits"!

In the December number of *Bridge Magazine* there is an excellent article by "Goulash" entitled "What is a Convention?" which I would commend to those of my readers who are interested in pursuing the subject. He stresses "the stupendous burden" laid upon the memory by certain complex and artificial systems. How is one individual to master and memorise them all? He considers that a "partly" arbitrary convention is pardonable if its significance is generally understood and if similar results cannot be obtained in other ways. This furnishes justification for the informatory double and for the over-call in the enemy's suit.

All artificialities are designed with an ultimate view to slam bidding. That is their *raison d'être*. Even so, proof is not forthcoming that, however cunning, elaborate and long-drawn-out your bidding, you will always arrive at the correct result. On the contrary the records of duplicate play show incontrovertibly that slam bidding is just as precarious on artificial systems as without. I claim that the Simple System will "get you there" just as often, and you will not have to be on tenter-hooks or rack your brains or memory in the process.

CHESS

TOURNAMENT IN HOLLAND

WE give this week a review of the result of this recently concluded tournament and the play of the competitors. Their scores and the results of all the games played in the contest will be found in the table below. There were four prizes.

The play in the tournament was refreshingly enterprising and a large number of highly interesting games were produced. There were very few of the short dull drawn games which unfortunately sometimes occur, games in which both players are "willing to wound, and yet afraid to strike." The percentage of draws, 57, was not high for a tournament in which there was so little difference in strength between the competitors.

Fine played with more enterprise than he has previously displayed. Contrary to his usual practice, he, when White, opened nearly all his games with 1. P to K 4. He scored the largest number of wins, six, and had the satisfaction of twice defeating Dr. Alekhine, the world's champion.

Keres is now playing much more steadily than he did at the start of his career two or three years ago. He won three games, drew eleven, and was the only competitor to go through the contest without defeat.

Botwinnik played steadily and his wins against Capablanca, Reshevsky and Dr. Alekhine were three of the best games in the tournament.

After adjourning a game against Botwinnik in a losing position Dr. Alekhine took risks in some of his remaining games. He lost two of them and in two or three others was in danger of defeat. He had the satisfaction of inflicting a crushing defeat on his great rival, Capablanca.

Dr. Euwe was not in his best form in the first half of the tournament but did much better in the second.

Reshevsky also started badly but improved later.

Capablanca, the oldest player in the tournament, does not play as much chess as any of the other competitors, and that undoubtedly handicaps him.

Flohr's form was far below normal and he was the only competitor who failed to win a game.

The result of the tournament will give rise to much discussion as to which player would stand most chance in a match against Dr. Alekhine for the World's Championship. Fine and Keres would each get a large number of votes, but, after an examination of the games, we are inclined to the opinion that a match against Botwinnik would give Dr. Alekhine the hardest task.

	Fine	Keres	Botwinnik	Alekhine	Euwe	Reshevsky	Capablanca	Flohr	Total
Fine	– –	0 ½	1 ½	1 1	1 0	1 0	½ ½	1 1	8
Keres	1 ½	– –	½ ½	½ ½	½ ½	1 ½	½ ½	1 1	8
Botwinnik ...	0 ½	½ ½	– –	½ ½	0 1	1 1	½ ½	1 1	7
Dr. Alekhine..	0 0	0 1	½ ½	– –	½ ½	1 ½	1 1	1 1	7
Dr. Euwe ...	0 1	½ ½	½ ½	½ ½	– –	0 1	1 1	1 1	7
Reshevsky ..	0 1	0 1	0 ½	0 ½	1 0	– –	½ ½	1 1	7
Capablanca ..	½ ½	0 ½	½ ½	½ ½	0 ½	½ ½	– –	½ 1	6
Flohr	0 ½	½ ½	½ ½	0 ½	0 ½	0 ½	½ 0	– –	4½

The following game shows a powerful attack by Fine.

(French Defence.)

WHITE. Fine.	BLACK. Flohr.	WHITE. Fine.	BLACK. Flohr.
1. P to K 4	P to K 3	15. R takes P	Q to Q sq
2. P to Q 4	P to Q 4	16. Q to R 5 (*m*)	Kt to K 2
3. Kt to Q B 3	B to Kt 5	17. R to Q 4	P to K Kt 3 (*n*)
4. P to K 5	P to Q B 4	18. Q to B 3 (*o*)	Q to B 2
5. B to Q 2 (*a*)	Kt to K 2 (*b*)	19. Kt to B 3 (*p*)	Kt to B 4
6. Kt to B 3 (*c*)	Kt to B 4 (*d*)	20. Kt to Kt 5 (*q*)	Q to Kt 3 (*r*)
7. P takes P	B takes P	21. R takes B (*s*)	K takes R
8. B to Q 3 (*e*)	Kt to R 5 (*f*)	22. P to K Kt 4	Kt to R 5 (*t*)
9. Castles	Kt to B 3 (*g*)	23. Q takes BP,ch	B to K 2
10. R to K sq	P to K R 3 (*h*)	24. B to Kt 4	Q R to K sq(*u*)
11. Kt to R 4	B to B sq (*i*)	25. B takes B	R takes B
12. R to Q B sq	B to Q 2 (*j*)	26. Q to B 6	P to R 3
13. Kt takes Kt	Q takes Kt	27. R to Q sq (*v*)	P takes Kt
14. P to Q B 4 (*k*)	P takes P (*l*)	28. B to K 4, ch	Resigns (*w*)

(*a*) Against Botwinnik in the first round Fine played P takes P (see *Field*, November 19th). The text-move is better.

(*b*) The best reply.

(*c*) The usual continuation is 6. Kt to Kt 5, B takes B, ch; 7. Q takes B, Castles.

(*d*) Not good, as White's eighth move shows. Either Castles, P takes P or Q Kt to B 3 is preferable.

(*e*) Threatening to spoil Black's pawn formation by playing B takes Kt. Black has now nothing better than moving the Knight, and White gets a big advantage in development.

(*f*) If Kt to K 2, then Kt to Q R 4, followed by Kt takes B.

(*g*) Threatening Kt takes Kt, ch followed by Kt takes P.

(*h*) If 10. . . . Castles, then 11. B takes P, ch, K takes B: 12. Kt to Kt 5, ch, K to Kt 3 (if 12. . . . K to Kt sq, then 13. Q to R 5, R to K sq; 14. Q takes P, ch, K to R sq; 15. Q to R 5, ch, K to Kt sq; 16. Q to R 7, ch and mate in two more moves): 13. Q to Kt 4 (threatening either Kt takes K P, ch or Q takes Kt) with a winning game for White. The text-move is played to prevent Kt to Kt 5. If, instead, B to K 2, then Kt takes Kt followed by Q to Kt 4.

(*i*) If 11. . . . B to K 2, then 12. Kt takes Kt, B takes Kt; 13. Q to Kt 4. If, instead, 11. . . . Kt takes Kt, ch; 12. Q takes Kt, B to K 2, then 13. Q to Kt 3. In either case White has an advantage.

(*j*) Threatening 13. . . . Kt takes Kt, ch; 14. Q takes Kt, Kt takes P; 15. R takes Kt, B takes Kt.

(*k*) A strong move, threatening 15. P takes P, followed, if 15. . . . Kt takes P, by 16. R to K 4, Q to B 3; 17. B to B 3.

(*l*) P to Q 5 would make the Queen's pawn very weak. If, instead, Kt to Kt 5, then B to Kt sq followed, if P takes P, by R to K 4.

(*m*) A very good move. If now (1) 16. . . . P to Q Kt 4, then 17. R to B 4, Black being unable to play 17. . . . P to Kt 3 because of 18. B takes K Kt P; if (2) 16. . . . P to K Kt 3, then 17. B takes Kt P, or, if (3) 16. . . . Kt takes P, then 17. R takes Kt, B takes Kt; 18. R takes P, ch, B to K 2; 19. R takes B, ch, Q takes R (if K takes R, then B to Kt 4, ch); 20. R to K 4 and wins.

(*n*) If 17. . . . Kt to Q 4, then 18. R takes Kt, P takes R; 19. P to K 6.

(*o*) White now threatens Kt to B 5. If now 18. . . . Kt to Q 4, then 19. R takes Kt, P takes R; 20. P to K 6 and wins. (If 20. . . . B takes P, then 21. B to Kt 5, ch. If, instead, 20. . . . P takes P, then 21. B takes P, ch).

(*p*) Threatening Kt to K 4 followed by Kt to Q 6, ch. If now 19. . . . B to B 3, then 20. Kt to Kt 5, B takes Kt (not B takes Q because of Kt takes Q, mate); 21. B takes B, ch, Kt to B 3; 22. R to Q B sq, R to B sq; 23. R (Q 4) to Q B 4, with advantage to White.

(*q*) A strong move. Black cannot reply with 20. . . . B takes Kt because of 21. B takes B, ch, K to K 2; 22. B to Kt 4, ch and wins for, if 22. . . . Kt to Q 3, then 23. Q to B 6, mate, or, if, instead, 22. . . . Q to Q 3, then 23. Q takes P, ch, K to Q sq; 24. B to R 5, mate.

(*r*) In reply to 20. . . . Q to B 3 Fine intended to play 21. Q takes Q, *e.g.*, 21. . . . P takes Q (not B takes Q because of Kt to B 7, ch); 22. Kt to B 7, ch, K to Q sq; 23. B takes Kt, K takes Kt; 24. B to R 5, ch, K to Q sq; 25. R (K sq) to Q sq and wins. If, instead, 20. . . . Q to B sq, then 21. R to Q B 4, B to B 3; 22. R (K sq) to Q B sq, P to Q R 3; 23. R takes B, P takes R; 24. R takes P, followed by 25. Kt to B 7, ch and wins.

(*s*) This sacrifice is decisive.

(*t*) If 22. . . . Kt to K 2, then either (1) 23. Q takes P or (2) 23. B to K 3, Q to B 3 or R 3; 24. Q takes P, with a winning game for White.

(*u*) If Kt to B 6, ch, then K to R sq. If, instead, K R to K sq, then R to Q sq.

(*v*) The strongest move.

(*w*) If 28. . . . K to K sq, then 29. Q takes K R, ch, K to B 2; 31. Q to B 6, ch (R to Q 8 also wins), K to K sq; 32. Q takes Kt and wins. If, instead, 28. . . . K to B 2, then 29. Q takes R (threatening Q to Q 8, mate), R to Q 2; 30. R to B sq, ch and wins.

A very good game by Botwinnik.

(Queen's Gambit Declined.)

WHITE. Botwinnik.	BLACK. Dr. Alekhine.	WHITE. Botwinnik.	BLACK. Dr. Alekhine.
1. Kt to K B 3	P to Q 4	27. P to K R 4	Kt to Q 2
2. P to Q 4	Kt to K B 3	28. R to B 7	R to B 2
3. P to B 4	P to K 3	29. Kt to B 3 (*h*)	P to Kt 5 (*i*)
4. Kt to B 3	P to B 4	30. Kt to K sq	P to B 4
5. B P takes P	Kt takes P	31. Kt to Q 3 (*j*)	P to B 5
6. P to K 3 (*a*)	Kt to Q B 3	32. P to B 3 (*k*)	P takes P
7. B to B 4	P takes P	33. P takes P	P to R 4
8. P takes P	B to K 2	34. P to R 4	K to B sq
9. Castles	Castles	35. R to B 6	K to K 2
10. R to K sq	P to Q Kt 3 (*b*)	36. K to B 2	R to B 4
11. Kt takes Kt	P takes Kt	37. P to Kt 3	K to Q sq
12. B to Q Kt 5	B to Q 2 (*c*)	38. K to K 2	Kt to Kt sq (*l*)
13. Q to R 4	Kt to Kt sq	39. R to Kt 6	K to B 2
14. B to K B 4 (*d*)	B takes B	40. Kt to K 5	Kt to R 3
15. Q takes B	P to Q R 3	41. R to Kt 7, ch (*m*)	K to B sq (*n*)
16. Q to R 4	B to Q 3	42. Kt to B 6	R to B 3
17. B takes B	Q takes B	43. Kt to K 7, ch	K to Kt sq
18. Q R to B sq	R to R 2	44. Kt takes P	R to Q 3
19. Q to B 2	R to K 2	45. R to Kt 5	Kt to Kt 5
20. K takes R	Q takes R	46. Kt takes Kt	P takes Kt
21. Q to B 7	Q takes Q	47. R takes P	R to Q B 3 (*o*)
22. R takes Q (*e*)	P to B 3	48. R to Q Kt 5	K to B 2
23. K to B sq (*f*)	R to B 2	49. R tks P (Kt 4)	R to R 3
24. R to B 8, ch	R to B sq	50. R to Kt 5	R takes P
25. R to B 3	P to K Kt 4	51. K to Q 3	Resigns (*p*)
26. Kt to K sq	P to K R 4 (*g*)		

(*a*) The usual continuation is 6. P to K 4, Kt takes Kt; 7. P takes Kt, P takes P; 8. P takes P, B to Kt 5, ch. An alternative is 6. P to K Kt 3 as played by Dr. Alekhine in the 24th and 30th games of his last match with Dr. Euwe. The text-move is very rarely played.

(*b*) After this move, which weakens the Queen's side, Black gets into difficulties. A better line of play is 10. . . . Kt to Kt 3; 11. B to Kt 3, B to B 3 with an attack on White's Queen's pawn.

(*c*) If 12. . . . B to Kt 2, then 13. Q to R 4 and Black is forced to move his Knight for, if, instead, (1) 13. . . . R to B sq, then 14. B takes Kt followed by 15. Q takes P, if (2) 13. . . . Q to Q 2, then 14. R takes B, or, if (3) 13. . . . Q to B 2, then 14. B takes Kt, B takes B; 15. R takes B.

(*d*) Not the strongest line. 14. B takes B, Kt takes B; 15. B to B 4 is better. After the text-move White's Queen is forced to Q Kt 5 and Black can play with gain of time P to Q R 3, which enables his Queen's Rook to be brought into play.

(*e*) White has the better game.

(*f*) The tempting move 23. R to Kt 7 is not good since it allows Black to command the open Queen's Bishop's file with his Rook and get excellent counter-chances, *e.g.*, 23. . . . R to B sq; 24. K to B sq, P to Q Kt 4 (threatening Kt to B 3 followed by Kt to Kt 5 and Kt to Q 6); 25. R to Kt 6, K to B 2; 26. R to Q 6, K to K 2; 27. R takes Q P, R to B 8, ch; 28. Kt to K sq, Kt to Q 2, threatening P to Kt 3 followed by K to K 3.

(*g*) A mistake. He should, instead, play P to R 3 (see note *h*).

(*h*) Threatening to win a pawn. This would not have been the case if Black had played 26. . . . P to R 3 instead of 26. . . . P to K R 4.

(*i*) This move, which frees Black's K B 5 for the hostile Knight, is, unfortunately, necessary for, if, instead, 29. . . . R to Kt 2, then 30. P takes P, P takes P; 31. Kt takes P wins a pawn.

(*j*) Threatening Kt to B 4.

(*k*) If 31. Kt takes P, then 31. . . . R takes Kt; 32. R takes Kt, R takes P.

(*l*) Dr. Alekhine is very resourceful in difficult situations. White can now win a pawn by R takes P, but after K to B 2 followed by Kt to B 3 Black regains the pawn and has counter-chances.

(*m*) R to Kt 5 is a good alternative.

(*n*) Not 41. . . . K to Kt sq (because of 42. Kt to B 6, ch, K to B sq; 43. Kt to K 7, ch) and not 41. . . . K to Q 3 (because of 42. R to Q 7, ch).

(*o*) If 47. . . . R takes P, then 48. R to Q Kt 5, K to B 2; 49. P to K R 5 with a winning position for White.

(*p*) If K to B 3, then K to K 4 with R to B 5 to follow, White thus winning another pawn.

In the game between Dr. Euwe and Reshevsky in the 6th round the following position was reached after White's 41st move:—White (Dr. Euwe): King at K R sq, Queen at Q R 4, Rook at Q sq, Pawns at K Kt 2, K R 3 and Q R 5; Black (Reshevsky): King at K Kt sq, Queen at Q B 6, Rook at Q Kt sq, Pawns at K B 2, K R 2, K Kt 3 and Q R 3.

The game was continued as follows:

WHITE. Dr. Euwe.	BLACK. Reshevsky.	WHITE. Dr. Euwe.	BLACK. Reshevsky.
41.	R to Kt 4	50. Q to R 2	P to Kt 5
42. R to R sq	K to Kt 2	51. P takes P	Q to K 4 (*d*)
43. Q to R 2	Q to Kt 7	52. P to Kt 3	R to K 5
44. Q to R 4 (*a*)	R to Kt 4	53. Q to Kt sq	R to K 7, ch
45. R to R 2 (*b*)	Q to B 6	54. K to R 3 (*e*)	P takes P, ch
46. R to R sq	P to R 4	55. K to R 4 (*f*)	R to R 7, ch
47. Q to R 2	R to K B 4	56. K takes P	Q to K 7, ch
48. K to R 2	P to Kt 4 (*c*)	Resigns (*g*)	
49. Q to R 4	R to B 5		

(*a*) After the exchange of Queens the Rook and pawns ending would be a win for Black.

(*b*) If R to K Kt sq, then Q to Q 7 wins the Queen's Rook's pawn.

(*c*) Threatening P to Kt 5.

(*d*) Now Black threatens R to B 7, ch or R to R 5, ch.

(*e*) If K to R sq, then Q to Q 4, ch, and mate in two more moves.

(*f*) If 55. K takes P, then 55. . . . R to K 6; 56. Q to Kt sq, K to Kt 3 and wins.

(*g*) If K to Kt 5, then P to B 3, ch, and mate next move. If, instead, K to B 4 or B 5, then R to B 7, ch, followed by P to B 3, ch, and mate next move. A very good ending by Reshevsky.

PROBLEM No. 3991

By Professor J. HALUMBIREK.*

WHITE (11 pieces): King at Q Kt sq, Queen at Q B 3, Rook at K 2, Knight at K R 3, Pawns at Q 2, Q B 2, Q 3, K Kt 3, Q B 4, Q R 4 and K B 5.

BLACK (3 pieces): King at K R 8, Rook at Q 4, Pawn at Q Kt 7.

White to play and mate in three moves.

* *Wiener Schachzeitung*, 1935.

SOLUTION OF PROBLEM No. 3990

1. Kt to Q 6, Any move; 2. Q, R or Kt mates.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Cards

Books on Bridge.—We should recommend you to read *Contract Without Conventions*, by A. E. Manning-Foster, published by Seeley Service & Co., Ltd., price 3/6. This book deals with most aspects of bidding and play. We also recommend *Book of Contract Bridge*, by Norman de V. Hart, published by the *Daily Telegraph and Morning Post*, price 2/6. With regard to systems, there are so many it is difficult to say which is most usually met with, but there is a growing tendency to dispense with the more artificial. We would recommend you to subscribe to the *Bridge Magazine* as this would keep you informed of all new systems, books and ideas on the game.—*S. P., Co. Cork.*

Country House

Improving an Open Fireplace. Inadequate radiation is always associated with the type of fireplace described, which, though picturesque, is fundamentally inefficient. Loss of radiation is due to two main causes: (1) Heat losses up the chimney; (2) Heat losses in the large gaps between the basket and the brick sides and backing. The first cannot be remedied without major reconstruction, although it is advisable to keep the chimney constantly swept to ensure maximum draught. There is a mistaken idea nowadays that large chimneys of this type need not be constantly swept. The second cause can best be remedied by using a larger basket to reduce the gaps, or by keeping the basket as full as possible, always remembering that the best grade coal need not necessarily be used. At the same time, it would be a good idea to cover the heat-absorbent brick backing of the fireplace with sheet iron, from which the heat is reflected and thrown into the room. This could be done easily and cheaply.—*C. C. G. S., Newport.*

Garden

Hedge of Flowering Shrubs for Moist Soil.—The soil you describe would be quite unsuitable for brooms. Diervillas should do well or for a higher hedge the Guelder rose (*Viburnum opulus*).—*H. N. D., Somerset.*

Quercus coccinea Leaves Brown instead of Red.—This is probably owing to the fact that the tree is now too deeply rooted. If possible, the tap roots should be found and pruned, but as the tree is old this is difficult. (2) Pruning Holly Hedge.—The right time for pruning is May or August. If cut back, however, as you suggest for the lower part, the stems will grow bare. The hedge should slope outwards all the way.—*F. H. L., Bow.*

Kennel

Incessantly Biting Grass.—He is probably suffering from hyper-acidity of the stomach, and takes the grass as a corrective instinctively. He might, with advantage, be given a teaspoonful of milk of magnesia three times daily, and be given very little or no fat with his food.—*S. W. B. S., Tenby.*

Treatment for Worms.—The syrup of iodide of iron would be quite suitable for your Cocker spaniel bitch, and she may be given five drops in a little water, or mixed with the food twice daily for a week to ten days. It is advisable to conclude the course of treatment with a dessertspoonful of medicinal paraffin.—*P. M. T., Bletchley.*

Treatment for Tapeworms.—The trouble may recur, either because the heads of the tapeworms are not expelled; or reinfestation occurs from time to time; but he would no doubt benefit by a course of syrup of iodide of iron, the dose of which would be ten drops in a little water, or mixed with the food, twice daily for ten days or so.—*E.B., Woodhouse.*

Breeding from a Labrador.—(1) We do not keep a Register of Stud Dogs. (2) It is a matter of arrangement, of course, but it is usual to send the bitch to the dog, and to leave her there until she has been mated. The duration of her stay will depend at which period of her heat she is sent to the dog, but the best time for mating is just before she is going off.—*J. D. B., Walkerburn.*

Pocket Beagles.—Hounds of the size about which one of your members enquires are known as pocket beagles, *i.e.*, those under 10in. at the shoulder. We have not heard of any for several years. It might be worth writing to Viscount Chelmsford, Ash Platts, East Grinstead, Sussex, hon. secretary of the Beagle Club, in case he knows of a breeder. It should be possible to get a 12in. hound, which is not very big.—*C. G. A., Letchworth.*

Skin Irritation.—It would be worth while trying the effect of giving him ten drops of the syrup of iodide of iron in a little water, or with the food twice daily for ten to fifteen days at a time, with an interval of at least a week between courses. The syrup acts not only as a worm deterrent, but as an alterative, so may have a beneficial action on the skin condition if the latter is not of parasitic origin.—*B. L., Norfolk.*

White Alsatians.—We have not heard of the strain of white Alsatian dogs that has been produced in California. If you were to write to the Secretary of the American Kennel Club, 221, Fourth Avenue, New York, he would probably be able to give you some information. White Alsatians are by no means a rarity. We have seen them in this country and they appear in Germany, but they are not liked, as this absence of pigmentation is regarded as a sign of degeneracy.—*A. E. H. C., Millerton.*

Miscellaneous

Aquarium Dealers.—In answer to your enquiry, some of the leading aquarium dealers are: Messrs. L. Curd & Sons, Baynes Court, Warner Street, Mount Pleasant, London, E.C. 1; The Artistic Aquaria Co., 76, Royal Hospital Road, Chelsea, London, S.W. 3; Messrs. Sessions, 331, Gray's Inn Road, London, W.C. 1; Captain R. Lane, West Bergholt, Colchester; Tropical and Cold Water Aquaria Co., 104, Tib Street, Manchester, 4; E. W. Coombs, 62, Canterbury Street, Gillingham, Kent; Kean and Sons, 15, Dalry Road, Edinburgh; Charles Harris, Esq., 92, West End Lane, West Hampstead, London, N.W. 6. You might also like to write to the Editor of *The Aquarist*, 20, St. Andrew Street, Holborn Circus, London, E.C. 4.—*M. S. P., Paris.*

Naturalist

Partridge Food.—In reply to your enquiries, we think that the best means of answering them adequately and comprehensively is to quote from the Report on the Progress of Game Research in the Bureau of Animal Production issued from Oxford University this year. In this connection it reads: "The first stage of this work, on which a report has already been circulated, was the analysis of a large number of crops of adult partridges throughout all seasons of the year. This analysis, which was carried out by Mrs. Helen Chitty and Mr. A. D. Middleton, with the assistance of some other experts, established several important points: the food at all seasons is predominantly vegetable, the character of this vegetable food changes in conformity with the seasonal cycle of agriculture, and there is a very high proportion of green food (probably undesirable) in the winter and early spring. The second stage of the investigation pushed the analysis back to the early life of the partridge chick. The analysis was done on the crops of 69 chicks sent in by 23 estates from eleven counties in England and two in Scotland, between 1934 and 1937. Thus the sample is fairly representative geographically, but, since it was only possible to obtain chicks killed during mowing operations, the items found in the diet are confined to those which occur in grass and clover fields. No doubt, if it had been possible to obtain chicks from growing corn crops, other species of insects might have been found, and unripe wheat and barley might have been the most widely occurring vegetable items, instead of the seeds of a common meadow grass, *Poa pratensis*. As it is, corn did not form a major part of the diet until the chicks were over three weeks old, when they were able to move about from field to field. The most striking fact shown by this investigation is the change from animal to vegetable diet, which takes place during the third week of the chick's life. During the first two weeks, over 90 per cent. of the food is composed of insects, the most important being the grub of a weevil (*Phytonomus*), which is a common pest on clover and trefoils; the caterpillars of butterflies; a small springtail (*Smindhurus viridis*), and aphids. During the third week the proportions of animal and vegetable food are almost equal, and ants and their cocoons are found to be the most important animal constituent. It appears that whenever a nest of ants is found and opened the partridge chick fills its crop at one meal, a habit it carries into adult life. After the partridge is 21 days' old its food consists almost entirely of vegetable matter (96 per cent.), chiefly seeds such as are found in the crops of adults during the summer months. Insects are relegated to the position in the diet which they occupy in the adult, and are now eaten sparingly and at random."—*A. E. W., Durweston.*

Post-Mortem Examinations

Enterohepatitis.—The contagious germ infection of the bowels and liver known as enterohepatitis, or blackhead, has been found in a peafowl, four turkey poults, a silver pheasant poult and three partridges. The disease is spread through contamination of the ground, food and drinking water by the germ-containing droppings of infected birds. Thus it is spread more rapidly when birds are closely congregated, as in aviaries or pens, when poults are newly turned to covert, or in a brood of young partridges. The disease is found among all the gallinaceous birds. In youngsters the disease usually takes a rapid and fatal course; mature birds progressively lose flesh, develop diarrhœa with dark green fluid droppings, and lose power of flight and finally "go-off" their legs. Penned birds should be housed on sawdust when the disease has been diagnosed among them, and each bird should be given a "Nicotine Compound Pill," followed by a second pill after an interval of seven days. A veterinary surgeon should be invited to treat each bird with the appropriate preparation of arsenic as early as possible. Each day during treatment the litter from the house should be burned, and the feeding and drinking utensils should be boiled in water. On the ninth day the treated birds can be removed to clean quarters. The ground of the infected pen should be dressed heavily with quicklime and kept free of birds for at least two years.—*G. L., Sussex; J., Berks; C. G. H., Essex; M. C., Hants; C. H. C., Berks; W. S., Bucks; A. P., Lancs.*

Shooting

Cartridge Tests

Your 12-bore metal cartridges contained an exact 33 grains of Rottweil powder and 1⅛oz. No. 6 shot. Velocity recorded averaged 1,068ft. per second with recoil on heavy side for a gun under 6¾lb. weight. Patterns were even and averaged 75 per cent. (choke barrel 30in., circle 40yds.). These cartridges should prove most effective against game.—*S., Shifnal.*

Travel

Inns near Dorking.—The White Horse Hotel at Shere is 600 years old, and there is every reason to believe that it was once used as a church guest-house. It is a remarkable building, and, except for the new wing which was added 34 years ago, the original structure remains. From the outside the inn belies its age. You can see at a glance that it is not modern, but there is little to make you expect such a splendid old interior. The house has no foundation, the mud walls being built round oak beams which run through the house from top to bottom. No nails or ridge-boards have been used in the construction, while many of the beams are of odd shapes. In all probability they were brought up from Shoreham by barges, for most of them are ships' timbers. The proprietor and his wife, Mr. and Mrs. Askew, take a real pride—as they may well do—in their old inn. Provided people call at a reasonable hour of the day, Mr. Askew told me that he was always willing to show them over the White Horse. You would also like the White Horse at Dorking. Here is a typical Dickens inn which has stood in Dorking High Street for at least 400 years. Americans often cross the Atlantic to see this old hostel, and they will tell you that it is the original Marquis of Granby, where Sam Weller met his mother-in-law in the bar parlour. It is strange to see the twentieth century sanitation rubbing shoulders with the sixteenth century oak, but it is one of the charms of the White Horse. Modern improvements have been made without in any way impairing the character of the queer old bedrooms, with their low ceilings and rough beams, while in the public rooms you will find some splendid furniture of the Georgian period. Not far away from Dorking, though a little difficult to reach unless you have a car, is the Abinger Hatch Hotel, near Abinger Common. Small enough to be friendly, big enough to be comfortable, the Abinger Hatch Hotel is a Mecca for walkers and motorists on Saturdays and Sundays. There are eight letting bedrooms and a suite, and they are all usually full in the summer months, which is, of course, the great compliment of all for the management, the cuisine, and the general attractiveness of the hotel. No local record has been kept concerning the foundation of the hotel, though inside the inn a solid oak beam here and there speaks of far off times. At all events, Abinger retains an atmosphere of peace and quietness which are too rarely come at in this modern world. Outside the church, which stands opposite the inn, the village stocks can still be seen, mouldering and repaired in places, but there they are.—*J. A. M., Chatham.*

Yachting

Building a Flat-Bottomed Boat.—There is no rule for determining the position of the mast or centre-plate of a flat-bottomed boat such as you describe, as both will depend upon the design of the hull and the location of the Centre of Effort of the canvas. It may be taken, however, that with the fore end of your centre-plate fixed at a point about one-third of the boat's length from forward, your mast will step—with standing lug rig—about midway between this point and the stem. It will be necessary to arrange your centre-plate so as to house snugly in its casing and it will probably need to be about 3ft. long and 1ft. wide. We think a standing lug will serve your purpose best, but we would advise you to get into touch with a Naval architect or boat builder and obtain construction and rigging plans in order to make sure of getting a satisfactory boat. Probably the Berthon Boat Company, of Lymington, Hants, would let you have these plans for a small fee.—*W. R. T., Dorset.*

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

DANGER ON THE ROADS

WOULD that one might head these remarks "Safety on the Roads." But the day lies far distant when safety in road travel may be considered an established fact.

An aeroplane crashes and ten lives are lost. The daily papers are full of the news and those who have no papers read it on the placards; yet cars crash all over the country every day, and no one except those directly concerned seems to take the slightest interest. In other words, the public have grown used to the whole matter. Road deaths no longer scare them or interest them. There is always the feeling that it will be the other man whose car, and perhaps whose life, will be wrecked, and so we go on in a hopeless spirit of *laissez-faire* which should not for one moment be tolerated.

A month or two ago we were on the verge of war, and quite rightly everything that could be done was done. Yet since the end of the Great War at least 96,000 people have been killed on the roads and multitudes more maimed and injured, and yet no one turns a hair.

The Road Fund, which should ever be in a most flourishing state considering the amount of money raised by taxation on motor transport, seems to be considered as an emergency hunting ground for every other Ministry under the British Constitution. We cry out that the birth rate is dropping, and yet nothing is done to keep alive those individuals already born.

Motor cars have evolved. They are safer to drive, more comfortable, and more effective than those of the last decade, yet the roads on which they travel are about twenty years out of date, and as a result the very qualities achieved in car production have become, through inadequate arrangements, a menace to all concerned.

Until we have new roads and modern lighting, we shall continue to produce terrible accident figures. It is the Biblical simile of new wine and old bottles all over again. We have the new wine without a doubt, but the bottles are bursting, and the wine is wasted.

While we wait for courageous action on the part of the Government, we must content ourselves with patching up the rents, and to this end it is satisfactory to hear that steps are being taken by the Ministry of Transport to survey all road signs, authorised and otherwise, with a view to making them more uniform, and to abolishing many of the superfluous ones. The driver of a car has an incredible number of things to watch, and to burden him with innumerable signs of varying sizes and shapes is a great mistake. All he need be told as a general rule is that there is danger of some sort ahead—one *illuminated* sign would cover the whole problem.

Then, too, something must be done about traffic lights. Owing to the prevalence of neon signs for advertising purposes, the stop light on a traffic indicator can quite easily be passed unseen in a large town. To those who do not drive this may sound absurd, but most motorists will acknowledge that they have, at some time in their lives, overrun the lights without seeing them. A solution to the problem is difficult—unless advertising signs are banned within a certain distance of the light. But surely there must be some way round the problem if sufficient thought be given to the matter.

Pedestrian crossings, too, are becoming a difficulty. They have not been rigorously enforced—on pedestrian or motorist—and as a result the motorist stops and so does the pedestrian; both wave one another on, and then, in desperation, they both move off together, with unfortunate results. If we are to have crossings, let them be clearly marked by reflectors in the studs, and by illuminated beacons, and let us also have a definite ruling on what has to be done by all parties at such a place, with adequate punishment—again for either party—if it is not fulfilled.

At best these, and similar arrangements, are only makeshifts. We need to open new systems and new roads, or we shall continue to open new graves.

CAUSE AND EFFECT

AT Lincoln last week some of the discontent rife among the agricultural community found expression, and Mr. Morrison, the Minister of Agriculture, who was present to hear it spent a somewhat uncomfortable two hours. The immediate cause of this outburst was the Government's barley policy, a policy which will, we hope, undergo yet further revision. The immediate cause: but Mr. Morrison will be making a great mistake if he imagines that at Lincoln he witnessed an isolated outburst, best forgotten. The agricultural community as a whole is worried and fearful—has been so ever since Mr. Chamberlain's speech at Kettering—and little that Mr. Morrison has done has helped to alleviate their apprehensions. Though traditionally silent and long-suffering, the agricultural community, having found its voice, and having realised that its voice—*ride* the fate of the Minister's Milk Policy—has power, will no doubt be heard again. The cause is poor, or bad, agricultural policy: the effect?

SUCCESSFUL SCULPTURE

A notable advance in the progress of portraiture in stone was revealed last week with the opening of an exhibition of sculpture by a young artist from Palestine named Zeev Ben-Zvi, at the Matthiesen Gallery. It is the technique of the artist that is most worthy of note. The portraits, which include studies of leading personalities, are executed in what might be indeed called a "happy medium" between impossible realism and what is generally known as impressionism. That is, their features and proportions are real and true to life, yet each portrait is a collection of interesting forms which have been simplified under the impression of the artist; the best example of this is the hair and general treatment of the study of James Maxton. The result is an effect of power through the subconscious realisation that the heads are merely stone and of beauty through their novel forms—and a most successful exhibition.

A NEW SQUASH CHAMPION

Any name but that of Amr Bey as the winner of the open or amateur squash rackets championship is something of a novelty, and it is a pity it cannot be added to the list when Amr Bey is there to defend his title. At any rate, his absence led to a really fine fight in the amateur championship final at the Bath Club before that versatile games player, K. C. Gandar Dower could become the new champion. D. I. Burnett, the Army champion, made him go all the way to win by a score of 2—9, 10—8, 9—6, 10—8 and Burnett might have saved the fourth game, in which his opponent had at one time led by 7—4, only that he had the misfortune to be hit with a return when leading at 8—7.

AMATEURS' EXPENSES

Despite the eloquence of its advocates the proposal to allow eight weeks' expenses for amateur lawn tennis players was defeated at the annual meeting of the Lawn Tennis Association. It is not likely, however, that the last has been heard of it, for the delegates present were fairly evenly divided in their opinions, and though there was no approach to the necessary two-thirds majority, the voting, with the proxy votes, was 439 in favour and 374 against. Whatever may be done abroad there is evidently a feeling here against anything which savours "openly" of professionalism or else a subsidising of a few leading players who are not necessarily likely to become first class, and also an idea that there are other ways of encouraging talent. Nevertheless the L.T.A. is placed in the anomalous position of denying to its own players practices indulged in by foreign competitors at its own tournaments, and it has been charged with being incapable of putting into force legislation directed against amateurs receiving "expenses."

MID-WINTER ON THE TROUT STREAM

From now to the New Year there will be stretches of the south-country trout streams alive with shadowy forms which take no more notice of the erstwhile angler on the bank than if he did not exist—as indeed for them he probably does not. Some slight rise in the water overnight, perhaps, and it seems that every trout in the reach has made up its mind that now is the time when a redd may profitably be made, and amid the confusing ripples of the bar little puffs of silt appear momentarily as the hen fish delves in the gravel, casting out the stones to make that grave-like nest in which next season's brood may lie secure, till the egg hatches some three months hence and its embryo is cast upon an unsympathetic world. To see the process may be reckoned as fortune's favour, for often the beds in daylight are quite deserted; only the morning shows the mounds which tell of a night of labour.

THE FIRST SNOW

Flakes fall, like silently struck-out notes
In a musical fantasy;
The ear is dull, but an inner sense
Is freed from the chains of an old offence
And lives its hour in glee.

Dreamily float they, dreamily fall,
Soft-soothing each lonely tree;
And only the bluebells' faerie ring,
Or moss a-glow in the lap of Spring,
Can give like ecstasy.

ARTHUR POWELL.

A COUNTRYMAN'S JOURNAL

HARDLY any of the archaic original heaths of England remain as God made them. I remember my stupefaction when, a few years ago, I revisited the heaths of Breckland, whose towns are Thetford and Brandon, where flint-knapping still goes on in the ancient manner. These heaths used to be more extensive than any other area of the same character in England, unless the New Forest heaths be included with Hardy's Egdon Heath, which would thus cover nearly the whole of the southern areas of East Dorset and West Hampshire. Breckland I knew well, but I revisited it only to lose my way. The Forestry Commission had peopled enormous tracts with coniferous forest, dark, impenetrable and lifeless, so that the very existence of the "Thick-Knee" or Norfolk plover, with his staring yellow eye, was threatened. The "Thick-Knee" loves the open heath, and nowadays there is very little open heath where the bird has room to nest. The peculiar character of these Norfolk-Suffolk heaths was for ever obliterated by these black seas of unnatural woodland, and what was left were little more than patches of commons.

In the days when Palæolithic Man roamed the great uncleared forests of ancient England, Rockingham, Yardley, Bernwood, the New Forest, Wychwood, Epping, Sherwood, the Weald of Sussex and Hampshire, and others, the scene was never sombre, sunless, oppressive and empty. His life must always have been full of interest, because he never knew what would appear on the other side of the next oak-trunk. But coniferous forest, unless it be of Scots pine or relieved by larch, is deserted alike by colour and animal life, and a horrible monotony, like that of a long illness in which there is no change in the patient's condition, weighs down the traveller's step. Light, life and change never penetrate it.

Egdon Heath has suffered very severely both from the military and development. North of Bournemouth the proper haunts in suggestion of King Lear and the Three Witches are now those of suburban householders with precarious lungs. Bovington Camp, near Wool, is like an erysipelas that has broken out over its clean white skin. Yet patches of the true heath survive as Hardy saw it. From the Purbeck heights, particularly above Worbarrow's big Roman nose at the edge of the sea, the heath appears to extend to the horizon, which is where the chalk midrib of Dorset between Hambledon and Beaminster walls in southern Dorset from the Somerset plain and the Vale of Blackmore or the White Hart. There is no spring nor autumn on this heathland. Its subtle shades of purple in summer and browns in winter, of a subdued but complex variety, are its only changes. It is broken by hollows full of trees, odd humps and mounts, the extensive woods round Lulworth Castle, white ribbons of roads, coppices, mysterious sheets of water like the Little Sea, occasional villages and the impressive mounds of the long dead. From Creech Barrow I once saw a double rainbow arched over Egdon, and where its feet bestrid the dark earth the ancient heath seemed to glow and pulsate as though roused from its primordial sleep.

The coppices have a singular beauty all their own. There is one called, I believe, Holme Wood, near Bindon Abbey, where most of the trees are fasciated. The branches rise at all angles from the soft floor of bracken, flushed by the rain, and lean this way and that, in places so low that it is impossible to pass under them without stooping double. None of the trees grow to a great size; they were beautiful rather in their variety, and their colours in late autumn—bronze, yellow, auburn, orange, old gold, cherry-red and crimson—had the magnificence of the borders of an illuminated manuscript. The miniature character of the wood was the real cause of its enchantment, that and its prodigality of forms within a circumscribed space, the tops, the roots and the middle distances of the trees making a wondrous intricacy of design. Birch, oak, maple, chestnut, beech, wild service, hazel and ash each had its own colour, shape and particular aspect. The wood was so small that Giant Tellus could have picked it up in the palm of one hand and presented it as a token of courtship to some reluctant Dryad.

In the harsh, estranging wastes of Egdon, friendly not to man but only to the tumuli of our forefathers who might be considered to have more of sympathy with the primordial than ourselves, these little woods are a revelation of what unsuspected treasures are locked up in the heart of Esau.

H. J. MASSINGHAM.

WITHOUT COMMENT

From an evening newspaper:

"But modern artists would revel in the streamlined sleekness of many of the other beasts, the clipped lambs, the Sussex cattle with their short, curly hair, and the hornless black Aberdeen Angus, with coats as luxuriously thick and shiny as seal-skin. They would make quite beautiful furs."

Marking at a tree

THE ART OF OTTER HUNTING

An Appreciation of a Most Scientific Sport

FOLLOWERS of the Kendal and the Dumfriesshire Otterhounds believe that there is no animal for doing a job like the one bred expressly for that purpose. For these two packs are composed almost entirely of pure otterhounds. The Hawkstone use Welsh hounds, while other hunts are of the opinion that good sport can be best obtained by a mixed pack of foxhounds, Welsh hounds and otterhounds, the best qualities of each breed being thus called into play. In fact, with some of these hunts, any hound which will work is eligible for service as an otterhound. In kennel, of course, such packs do not look level or "matchy," but neither did many of the packs of hounds who, in the old days, hunted fox or hare in the same manner in which the otter is hunted to-day—by hitting off the drag and slowly working up to their quarry. As with these older packs, too, pace is not an all-important consideration, for it is seldom that a line is strong enough to carry hounds so fast that they tail out.

It is on the otter's drag where the keen-nosed otterhounds and Welshmen score, for, like the bloodhound, these older breeds are able to speak to a line which more modern types could not own. As the drag becomes stronger, the foxhounds' drive carries the pack forward at a greater pace, and their quickness is very valuable after the otter has been put down.

In breeding true otterhounds, the difficulty appears to rest in the scarcity of fresh blood, and good results are often obtained by using a Welsh sire. The long-coated Welsh hounds such as are to be found in the Pantysgallog and other kennels have much in common with otterhounds. Another excellent outcross is the bloodhound, and this has shown considerable success. I know of a puppy, the offspring of a Dumfriesshire bitch and a Ledburn bloodhound, which shows all the good points of both breeds and none of their weaknesses. He has splendid bone and every appearance of making a grand hound, while his coat is long enough to be a useful protection against the ill effects of long periods in the water. Such an animal should prove excellent at the game, for I have known bloodhounds entered to otter with good results. But bloodhounds, although first-rate swimmers, have short coats which, for those packs who do most of their work in the "big water" of deep, sluggish rivers and lakes, must be a disadvantage. The question of length and thickness of coat would be less important when working swift, shallow moorland or hill streams. I believe another outcross which has been employed is an Airedale.

Otter hunting is less spectacular than other forms of the chase, particularly to those followers who are not keen enough observers of hound work to follow the drag closely. To the hound lover, however, this is quite the most interesting part of the hunt, when he can watch every inch of the line as it is worked through all its twists where the otter has played on the river bank, or about trees where he has rested. Then, perhaps, the pack will swim the stream and speak to the line on the far bank, their voices echoing in grand chorus through the summer air. Or they will race across a small isthmus on a path used by many generations of otters. For this conservative animal still uses the tracks which his ancestors trod several centuries ago.

One of the hazards of the sport is that a huntsman can never be sure whether or not hounds are hunting a heel drag until either the otter is put down or scent "fizzles out." For it is not unusual for an otter to travel on the bank for some distance and then take to the water and drop downstream again. The fastest I have ever seen otterhounds run was on a heel line. For nearly six miles we had difficulty in keeping hounds in sight, expecting every tree and holt to harbour our otter. Then, suddenly, their heads went up and they were unable to make any more of it. A foxhunter would be much annoyed at such an occurrence, but the M.O.H. only grinned, having expected this. Hounds were vanned back to the spot where the line had first been owned, and the stream was drawn in the opposite direction. Downstream the line was quite faint, and hounds could only work slowly. Nevertheless, a 22lb. dog otter was put down and killed after an exciting hunt of nearly two hours.

I have always been surprised that more beagling enthusiasts do not follow otterhounds in the summer months, and this I mentioned to a friend who hunts both otterhounds and beagles. "It is because," said he, "the average beagler considers otter-hunting slow, while the otterhunter holds the same view of beagling."

The fact is that the excitement of otter hunting only comes to the surface after the otter has been put down, when followers take up vantage points on tree roots or by bushes and watch for the chain or the swift passage of the otter below the surface. Even then, the inexperienced find it hard to recognise the chain or to detect the swimming otter.

My own single criticism of the sport is that it is so difficult to forget the motor car which must either be left behind at the meet, with consequent difficulties if hounds are vanned on to another stream, or it must be brought on. The latter course means either the employment of a chauffeur or self-sacrifice on the part of some non-hunting friend who is content to drive the car and see little of the sport. There are some otter hunters who do not leave the wheel until the otter has been found, but these can know little of the interest of watching hounds working a strong drag.

When it is remembered that an otter combines all the best qualities of stoat, cat and seal, it must be realised that hunting and catching him is very much a science requiring a great knowledge of his nature and habits, as well as of the character of British streams, a love of hounds, and the possession of all those other little points of character which are present in the make-up of a good huntsman.

J. IVESTER LLOYD.

TERRIERS AND YOUNG HOUNDS OF THE BLENCATHRA IN NEWLANDS VALLEY

HUNTING 2,000 FEET ABOVE SEA LEVEL

Good Sport and Good Company on the Cumbrian Fells

" He's strong and he's straight, lads, his tongue like a bell,
And the stout heart that's in him, lads, tongue cannot tell,
For to breast the steep hill-sides, where faint hearts must fail,
And to sweep the wide moors in the teeth of a gale."

WE are fast approaching the season which Leigh Hunt called " the glorious time of great Too-Much," and in a few days hunt followers will be assembling in various parts of the country for their Boxing Day meets. It is at this time that my thoughts go not to the gently undulating Quorn country or to the banks of the Waterford country, but to the fells of Cumberland and Westmorland.

On two successive Boxing Days I have enjoyed sport with the Blencathra, while many a splendid autumn holiday has been spent following these hounds over their rugged country. If you go there from the Shires you will no doubt be struck by the very different build of the hounds. The average height of the Blencathra hounds is between 22in.–25in.

Mr. Tatters, the Master, who recently showed me over the kennels, informed me that to run successfully on the fells hounds should not be too heavy in build. He added that a good deep chest is necessary, while hounds are usually hare-footed, as opposed to the round cat-foot of the standard type. I noted, too, of the Blencathra—and this is true of the other neighbouring Lakeland packs—the short back, good neck, shoulders and loin. Naturally these fell hounds must also have good noses and tongues and, last but not least, pace. Many of the hounds are bred black and white in colour so that they can be seen in snow or heather.

GEORGE BELL, THE HUNTSMAN, AND BLENCATHRA PACK COMING THROUGH THE VALE OF ST. JOHN'S

In the Blencathra country riding is, of course, quite out of the question, but a day's sport with these hounds does not necessarily mean that you spend all the time on foot. A motor car is often of the greatest help in getting to the meet—though I personally would advise the visitor to stay at some hotel or farmhouse in the vicinity—and is a very welcome comfort on your way home. Having reached your objective, it is usually the best plan to leave your car parked by the roadside and climb to some vantage point on the fell from which a good view can be obtained. I say " usually," because on some occasions hounds will disappear round a shoulder of the hill almost immediately, and that is all the work you will see for the day. If, however, you are on the road you can easily get round to the next valley.

Nevertheless, once you have attained a high altitude it is a fatal mistake to come down. Sometimes hounds will disappear entirely for a time, but often enough they return in your direction. You have only to watch the followers in the valley below to know which way hounds are running or feathering. Besides, hounds or no hounds, it is grand, bracing mountain air, and climbing 2,000ft. is a good day's sport in itself. As all work ceases in the locality of the meet it is easy enough to get details of the day's sport in the " local " in the evening. Many of the dalesmen are extraordinarily keen on foxhunting, and it has been recorded that one old man actually climbed to the top of Coniston Old Man on his 90th birthday. Surely James Pigg should have included mountain air to his statement that " brandy and bacey'll gar a man live for iver ! " ?

The fell fox, you will find, is no less cunning than his cousin in the Shires, and he has certainly altered in his ways since John Peel hunted the Blencathra pack over the Caldbeck hills. In those days you rarely found him near human habitations, which is far from the case to-day. Only a week from last Christmas Mr. Tatters found that " Charles James " had made a meal of his festive goose, despite the fact that hounds were kennelled not 400yds. away.

As I have said, fell foxes have their fair share of cunning. I have seen a fox take refuge on a small ledge in preference to going to ground. While hounds can wind him from above they cannot always see him, and occasionally a hound will jump down to the ledge and become what is locally termed " benked." Some of them have been lost in this way for two or three days, but the whippers-in of the Blencathra never give up a search until all hounds are accounted for. Once having located a stranded hound, ropes and willing helpers soon lower a rescuer down to the ledge, and

THE FAMOUS CUMBRIAN HUNTSMAN, JOHN PEEL

never goes home if he can enjoy some sport by staying out. He is a stout-hearted fellow, and grand company.

It would not be right to conclude this article without some reference to John Peel, more especially as the hounds in the present Blencathra kennels are all direct descendants from Peel's pack. Famed on the fells during his lifetime, Peel was unknown in the south until after his death, when the spirited verses about him received wider publicity. So many people still sing " . . . with his coat so gay . . . " instead of " . . . with his coat so gray." Remember, Peel never wore a scarlet coat, but one of home-spun Cumberland wool, and I am certain that he would have been the last person in the world to have expected his name to be sounded in all the corners of the Empire nearly one hundred years after his death (he died in 1854).

One writer said of him : " John was a very good shot, and used a single-barrel, with flint lock, to the last. Though he sometimes indulged too much, he was always up by four or five in the morning," while the late Sir Wilfred Lawson once recorded he heard John Peel say, when they had killed a fox : " Now ! this is the first fox we've killed this season, and it munna be a dry 'un—" whereupon the whole party would adjourn to the nearest inn.

Mention of Peel's coat reminds me that I have made no mention of the best type of kit for the follower on the Lakeland fells. Climbing 2,000ft. or 3,000ft. is, to the untrained, an arduous and difficult task, and it is of vital importance to one's pleasure to be clad in clothes which cause no hindrance to progress. Easy fitting tweed garments are best, such as plus fours, and for footwear a pair of strong boots—not shoes—will serve better than anything. During the day one will have to scramble across rocks, screes and crags, and boots give the necessary support to the ankles.

If I have tempted you to go North this coming Boxing Day, do please remember that hounds have a difficult task at a Bank Holiday meet, for many followers—one should, I suppose, call them spectators rather than followers—seem to think it is their duty to holloa every time they see the fox, whether it is the hunted one or not. Such people spoil the day's sport and make hounds rely too much upon someone shouting every time they check. After all, hounds are sent out to *hunt* not to go to frequent holloas.

About 3 o'clock in the afternoon the order is usually for " yame." " Yame " is home, and home is often a long way off, even when you have a car somewhere on the road which will help you over the last mile or two. But all has been worth while, and the joy of hot water is great as you plunge into your bath upon your return.

WILLIAM G. LUSCOMBE.

MR. TATTERS, THE MASTER OF THE BLENCATHRA, AND SOME OF THE HUNT FOLLOWERS RETURNING TO KENNELS WITH HOUNDS

To run successfully on the fells hounds must not be too heavy in build. Many of them are bred black and white in colour so that they can be seen in snow or heather

another hound returns to the kennels having learnt that it does not always pay to be too venturesome.

When a fox goes to ground in the fells, the Lakeland terrier comes into his own. He is a game little beggar, and nothing will induce him to leave without first of all evicting master Reynard. There has been many a fight to the death 'neath those Cumbrian crags. I remember once reading of a terrier being put in near Dod Bields, in the Coniston country, and after a stiff fight the fox was accounted for underground. Several hours' hard work failed to secure the carcass—always conveyed to and hung up at the nearest inn—so next day a party set out to dig it out. Eventually they came across not one fox but two, both jammed up against the end of a narrow tunnel.

As an indication of the type of sportsman you meet on the fells, let me quote from a recent experience I had when out with the Blencathra. Hounds met at a farmhouse in the Newlands Valley at 9 a.m. It did not take them long to put up a fox, and the whole pack went away on a screaming scent. Having climbed to a fair height, I could both see and hear hounds working the line. It was a splendid hunt, ending with a kill over on Catbells about 2.30 p.m., and the few of us who had kept going all day had covered a good number of miles. But just as we were making our way home the West Cumberland Beagles, fairly close to their quarry, came racing up the side of Catbells. Everyone was utterly tired out, yet off we went for an hour's beagling ; for the Cumbrian sportsman

GONE TO GROUND ON THE CUMBRIAN FELLS

GRAYLING AND THE SEDGE

Perfection in Days, Fish and Flies

By H. D. TURING

"THERE is one condition of water," wrote Rolt in his book on grayling fishing, "which will try not only the temper but the skill of the angler to the uttermost—I mean a low, dead-bright stream, as clear as if it was filtered," and, for most of us, I should think, there have been days this autumn when his specification has been more than fulfilled. It is extraordinary how low south-country steams have been in the fall of the year. While streams in the west have been rolling down in at least medium spate, the chalk waters of Hampshire and Berkshire have been idling along between browning sedges as if to show that whatever storms might be threatening Europe they at least could afford to s»unter seawards careless of the stir and bustle that had so suddenly invaded the downs from which they spring.

But after the rather grim turmoil of the crisis week no one could have wished it otherwise. Perhaps the low summer-like appearance of the stream enhanced the feeling of peaceful security, of a return to the normal life of the countryside. All the same, the lowness of the water came as a surprise. Normally chalk streams are little affected by a dry summer, and there had been enough rain in my own district during the winter months to keep the streams bank high in May. On my last visit in July, too, there had been ample water in the Hampshire streams.

But no lack of water could seriously impair the sense of well-being at finding myself by a chalk-stream again on a perfect grayling day with the mist gathering itself into white billowy clouds and a shaft of sunlight creeping down the hillside, revealing a vivid red patch of maple in the yellowing hedgerow bordering a brown fallow where plovers wheeled and voiced their thanks for some uncovered meal. The sense of well-being, and perhaps of some little complacency, was increased by a grayling which rose in midstream to a red tag at the first cast of the day and was duly landed. This, evidently, was one of those days when a skilful angler could do a good turn to the trout by removing a shoal or two of grayling from the water. Why did not more owners preserve grayling? They take the fly readily and their numbers could, if necessary, be kept within bounds without resort to more wholesale methods.

An hour later the perfection of the day had become a little tarnished. These grayling were uncommonly shy. My former indifference to the lowness of the water had evaporated and I was finding it, as Rolt says, a little trying to the temper. The early morning estimate of a shoal or two to stuff into the back of the car had assumed more modest proportions. As for their fly-taking propensities it is possible they may have had them if they could only be induced to "stay put" long enough to see a fly, but the most careful approach to a position from which a cast could be made was immediately followed by those long V-shaped waves zigzagging across the river like billiard balls and creating a *sauve qui peut* complex in every fish within reach.

A change to "across and down" methods was equally ineffective: a careful detour to a reach where rises could be seen; a cast from well back in the meadow, or from the shelter of a drainage ditch, produced no response whatever, and a subsequent visit to the bank showed a perfectly barren water without even the satisfaction, or dissatisfaction, of seeing fish retire to shelter. Evidently A.R.P. measures were better organised in water than on land. What was needed for these fish was not an artificial fly but a maggot floated to them from afar, a maggot dyed with whatever it is that is used to produce a roseate hue in the gentles of the Midlands.

There were, however, one or two runs where the water purled over a gravel bar, or was broken by the remains of a temporary weir in which fish were rising less suspiciously, and the next hour or so was passed experimenting with a shoal which rose persistently at something invisible. In one of them there were twelve fish on business intent, and siege was laid to them by a process of reduction—from a Wickham's fancy, through witch, red spinner, hare's ear, tup, to a smut; the hook sizes coming down collaterally from a No. 2 to 000. And at the end of the siege there were twelve grayling—or what purported to be grayling—rising in the run. These accursed fish ought to be removed with a net.

Lunch in the sunshine on the point of an island brought more charitable feelings, and my host. He culled from his memories (and they go back a long way) tales of fishermen of renown who had had completely blank days with grayling under just such conditions; soothing tales which went far to restore my early rejoicing in the day, for had I not at least one fish? He also produced from a pocket-book a fly of his own tying which, as he put it, had taken fish on occasion. Privately, it lowered my opinion of the fish which had taken it. It had a rough body made of claret-coloured wool, a very inadequate hackle, and a pair of phenomenally long wings, cut roughly from a pheasant's tail, laid on at a very acute angle with the body and quite twice the length of the hook. It looked rather as if the fly had borrowed an overcoat several sizes too large for it. Had I seen it lying on the bottom of the river I should have taken it for a caddis or a bit of stick. I thanked him with, I fear, the kind of forced enthusiasm one accords to a child's present of an outsize in bullseyes. He also called my attention to a couple of rises near the opposite bank.

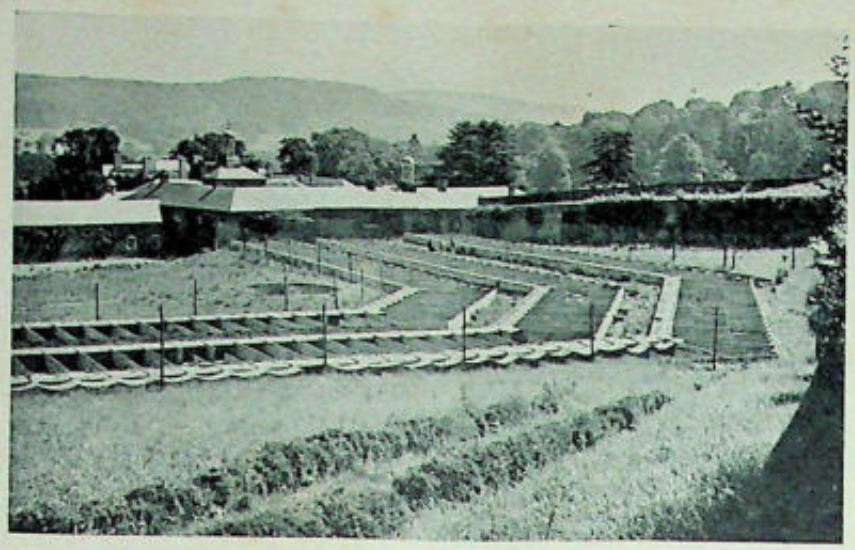
Had he not done so I should have left those fish alone. It is a matter of faith with trout-grayling fishermen that grayling occupy the centre of the stream, in the autumn particularly, the trout seeking the easy water under the bank. And the trout season was already past—several weeks past, in fact. However, that, as one might say, was his funeral, and the fly was duly despatched. It fell neatly within a few inches of the rushes and was promptly engulfed in the quiet ring a fish makes when it is taking something to which it is well accustomed, and which arouses no suspicion what-

CASTING FOR GRAYLING ON A HAMPSHIRE STREAM

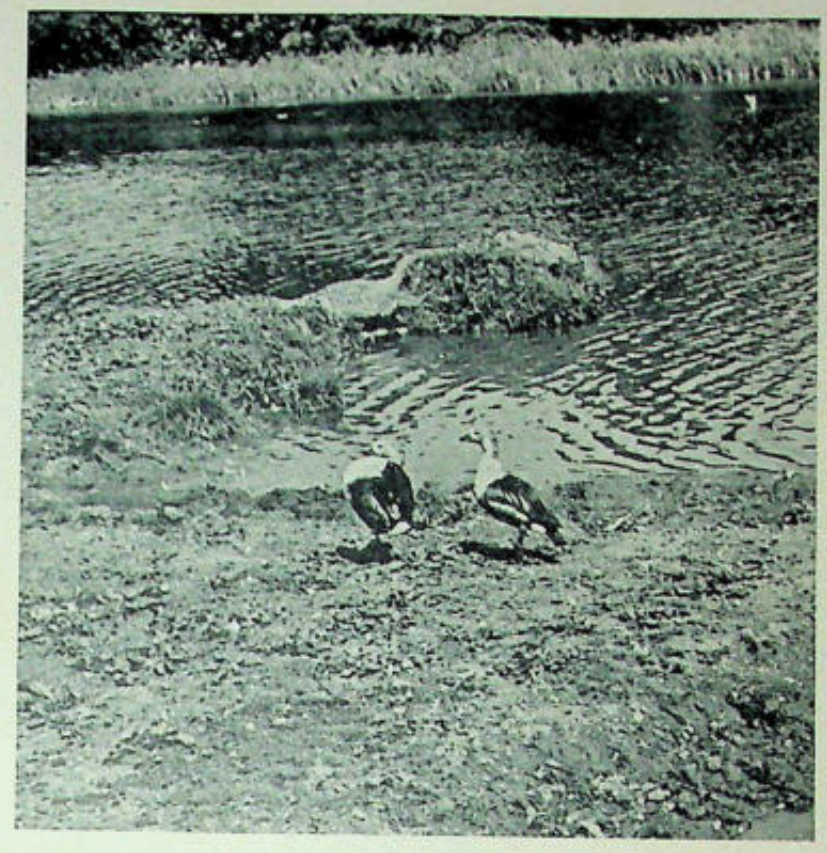
ever. In my surprise I struck in a manner which nearly upset me into the river, but the fish had taken a good hold and a minute later my host was netting for me as fat and lively a grayling as anyone could wish to see. Not long afterwards another, which might have been (and possibly was) own brother to the first, lay on the bank, also ensnared by this, apparently, disproportioned fly.

Later an autopsy on one of the fish produced a large red sedge, with its wings laid flat along its back and much longer than its body, in general outline certainly the counterpart of my host's fly. It is extraordinary how one may see a fly continually without its appearance impressing itself on one's memory. Though I have seen red sedges countless times perched on rush stems, yet it is always the fluttering moth-like insect which comes to mind from which, no doubt, the normal artificial has been copied a buzzy-looking object replete with hackle and with outspread wings.

Subsequent cogitation has made me wonder just how and when these sedges are taken. Research—rather cursory research perhaps—among available books in my library reveals no real life history of the Big Red Sedge. Does it climb down a reed stem to lay its eggs, and do fish pick it off the rushes? Does it swim up to the surface from its pupal stage so that fish grab it on the way? From the neat manner in which the wings in this specimen were folded over the back it was not spent, nor taken, presumably, while the wings were extended as in flight.



A GENERAL VIEW OF THE SANCTUARY SHOWING THE TWO HUNDRED REARING PENS SITUATED IN A WALLED-IN GARDEN AND (RIGHT) ORINOCO GEESE WITH THE MALE DISPLAYING



A SHROPSHIRE SANCTUARY

A Park for Waterfowl at Walcot

THE duck sanctuary at Walcot in Shropshire consists of a park containing a river-shaped lake a mile and a half long. The total area of the park, including the lake of 40 acres, is 200 acres, and this area is enclosed by a 6ft. high fox-proof fence.

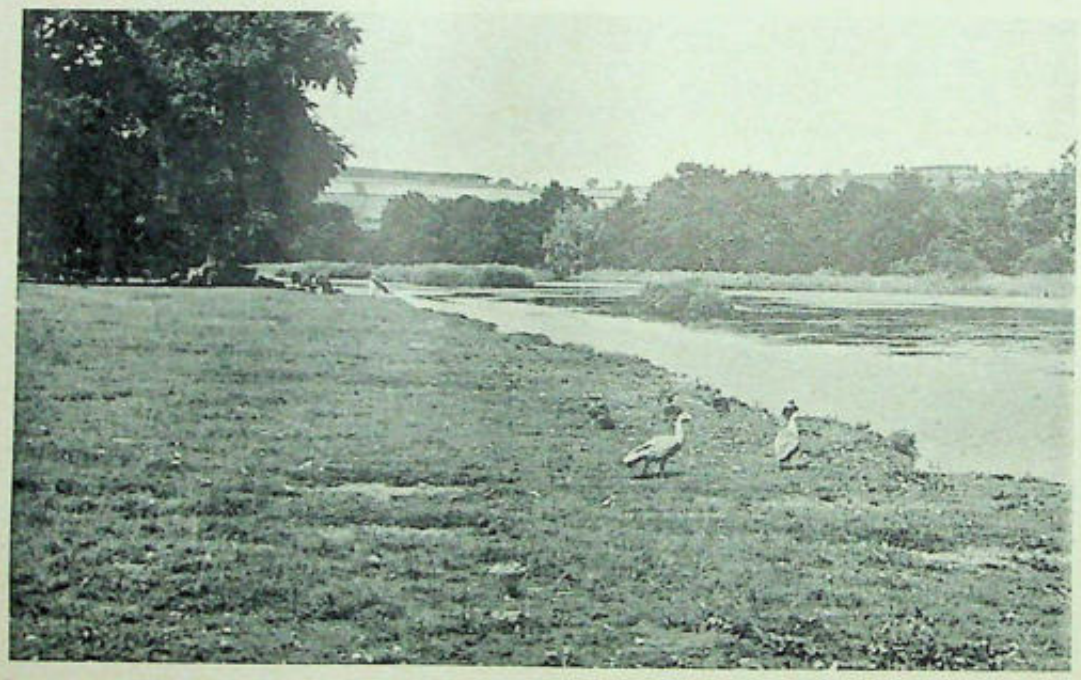
There are about 2,000 birds in the collection. This is composed of 82 varieties of duck, 33 varieties of geese and seven varieties of swans. Rare specimens, such as Hottentot teal, Eyton's tree-duck, North American ruddy duck, Cape wigeon and red-breasted geese (to name a few), may be observed at close quarters in a picturesque and natural setting.

Anyone who has seen duck or geese on the wing will agree that they are attractive birds in flight. At Walcot many foreign species are allowed the full use of their wings. Though a few fly away, or get shot when going too far from home, the majority make the sanctuary their permanent residence.

Mandarins and Carolinas are particularly interesting when left full-winged. In autumn they fly into oak trees to pick off acorns, fluttering like wood-pigeons from branch to branch. In spring they search trees to see whether they can find a suitable hole for nesting. Unfortunately, chimney-pots are considered the ideal home by those nesting for their first season. Consequently, all the cottage chimneys on the estate are visited, and sometimes the owner has a surprise when a Carolina or a Mandarin comes fluttering down the chimney.

The first warm day in March stirs the spirit of the waterfowl who, during the dull and cold days of winter, have been so quiet. Courtship begins; the drakes display to the ducks for hours on end. There are squabbles and sometimes fights, but no real harm is done. Across the water come sounds, some strange and beautiful in tone, which would remind the well-travelled sportsman of lakes and rivers in India, China, Iceland, Africa, and many other parts of the world.

By the middle of April the birds have paired off, and nesting commences and continues until August.



GEESE IN THE SANCTUARY

Showing the natural setting and how close it is possible to get to the birds

The months between are busy ones for those who look after the birds. No duck is allowed to bring off her own brood. Were she to do this only a very few ducklings would be reared, for pike, vermin and bad weather would account for most of her family. Therefore every nest has to be found and the eggs lifted and placed under sitting hens or bantams.

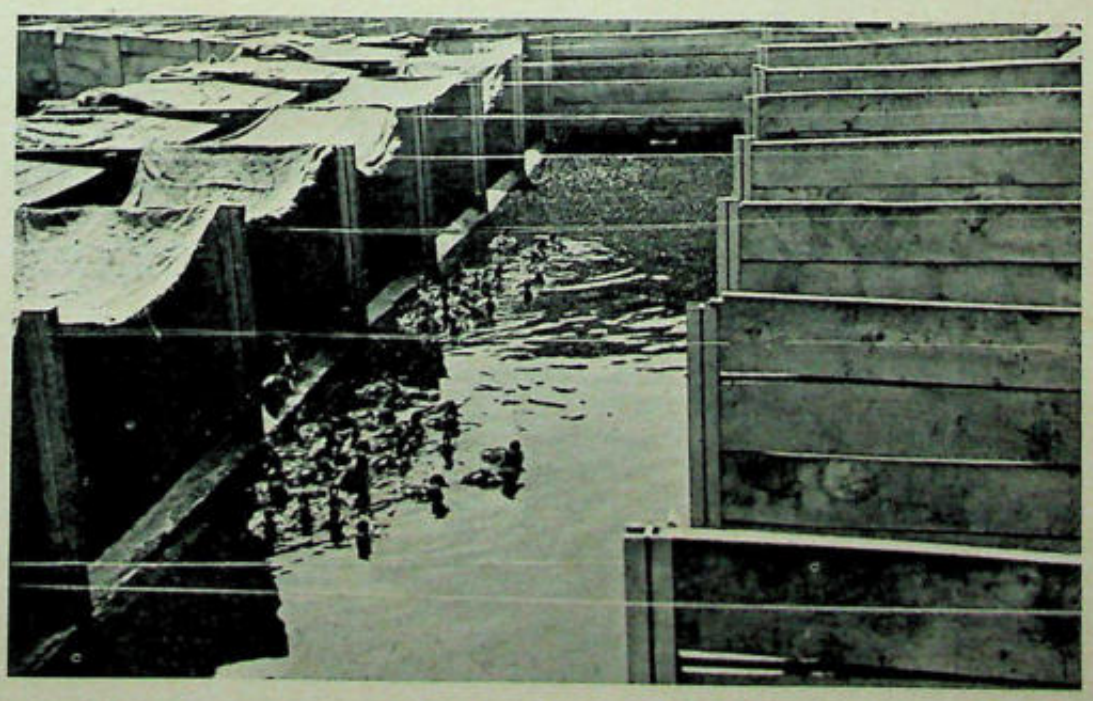
Finding nests is a difficult task and requires knowledge of the nesting habits of each species and a sharp eye, for duck are as cunning as any birds at concealing their eggs. The cover by the lake is extremely thick, so in order to help the nest-hunter a setter has been trained to mark nests.

A rare occurrence this year was the gathering of three clutches of Emperor goose eggs from one bird, a pair being worth about £45.

When the ducklings hatch they are placed in special pens with their foster-parents. Here they are kept until fully fledged, when they are removed to nursery ponds and gradually weaned off biscuit meal and fed on corn.

During July, August and September the adult birds are as quiet as they were in January. The drakes of the Northern Hemisphere species have assumed the sombre plumage of their ducks and lost their voice. They become shy, and prefer reed beds to open water. Early in October they assume their former brilliant plumage and on the sunny days of the declining year a courtship, with but a shadow of its springtime fervour, becomes vaguely evident.

A. P. T.



IN THE HATCHERY

"When the ducklings hatch they are placed in special pens with their foster-mothers"

BEST DAYS WITH HOUNDS

The Quorn's Great Gallop

MONDAY, December 5th, 1938. A great gallop with the Quorn. In the years that are to come the following hunt will be read and re-read. Another of those outstanding runs for ever carried in memory and will, when our hunting days have long passed, reflect back visions of green turf, flying underneath galloping hooves, fleeting glances of dark obstacles, as mighty leaps into space flung from perfect hocks landed one safely; yes, and crowning everything you will likely again hear those notes unequalled, as blown back by the breeze from throats of the Quorn bitches as, racing straight as a die and seeking no help, they cover nine-and-a-half miles of glorious country. This was no dream. It happened.

It was from Charlton Gorse on this memorable day this great hunt commenced. Ragdale Wood held hounds for a few brief moments, and then, settling down to run, away they flew on the topside of Shoby Scoles, over the Asfordby Road, through the top corner of Lord Aylesford's, and straight ahead again over the Six Hills—Little Belvoir Road. Then, dipping down into the vale, leaving Old Dalby Wood well on the left, they raced on in a direct line by Nether Broughton into Belvoir country. Sherbrooks was passed a few fields to the left, and Long Clawson well on the right as they ran on straight into Hose Thorns. What a performance; not a check and hardly a falter over nine-and-a-half miles of perfect country. Glance at your maps and see how straight it was.

In all probability the earths were open, and no doubt this game and stout fox saved his brush by just crawling in, as when viewed at Nether Broughton he was beginning to feel the strain, and it is very certain he could not have carried on. Foxhunting and falls go hand-in-hand, but what really bad luck George cracking his collarbone in a fast hunt from Shoby Cross Roads Spinney into the Hoby Vale in the late afternoon. Good news, however, of our brilliant huntsman is to hand, and it is hoped he will be able to resume in a week or so's time.

The beautiful little village of Newtown Linford on the Forest was the scene of Tuesday's meet. Sheet Hedges was drawn first. A brace of foxes were on the move, but, owing to deep old earths in the Quarries, hounds were beaten, and a move was made to Groby Old Wood. Contrary to the usual run of things in this particular covert, a fox was soon away pointing for Newtown Village, and hounds, getting away on good terms, hunted him nicely left-handed over the Field Head Road, under John Lee Wood. Swinging to the right, they went by Lester's Spinney over the Ulverscroft Road, up to Blake-Hayes. At this point the fox twisted and turned about, but eventually went straight through Benscliffe and over the Woodhouse Road. Hounds here, in my humble opinion, overran the line in going over the Shepshed Road, and I venture to think their huntsman would agree, as on certain information being received, Will held hounds back over the Shepshed Road and hit the line off by Blackhill Farm.

Settling down they began to run well into the Ulverscroft Valley, and when turning right-handed under Poulteney they fairly raced over the Markfield—Nanpanton Road, down by the New Covert to Charlie. At the Hall Farm hounds checked, enabling Will to get to them. The hunt was destined to finish here, however, and although casts were made, they could make nothing further of their fox. Possibly he got to ground. It had been a really interesting and good hunt, and as I have already said, at times fast. What remained of the afternoon was then spent in Poulteney and the surrounding coverts.

A bitterly cold wind was blowing when a large field assembled at Thimble Hall on Friday. Followers, however, had not long to wait before being "warmed up," as a first-class hunt took place with their first fox from John o' Gaunt. Going away over the railway by Mr. Crawford's Spinney, he then swung left-handed over the Tilton Loseby Lane, and holding Loseby Village went on nearly to Cold Newton before turning left-handed over the railway. Hounds now began to run very fast over what is known as a very trappy bit of country, and they were very soon leaving the field behind. Going over the hill, leaving Lord Morton's well on the right, they ran on left-handed to the Tilton Mill field and checked. Again I am venturing an opinion. There is no doubt they had a brace of foxes in front of them from the railway, and it is my belief the run fox went on over the Tilton and Coplow Road, and the fox they had changed on to hugged the bottom and went back into John o' Gaunt. At any rate, hounds, with the help of their huntsman, stuck now to the latter, and it was not long before they were again sailing away from the morning covert on the same side as before.

This time, however, the fox went to the right, and crossing the Twyford Brook, went on over the Twyford Road and railway into Cottesmore country. Along the ridge, leaving Marfield Village on the right, travelling fast, hounds hunted their fox, holding the railway always on their right, round to Rankins Lodge and then crossing the gated lane to Marfield from Tilton Station, they hunted slowly over Whadborough and the Owston Road to below Owston Wood, pointing for Withcott. A holloa back on the top side of the big wood brought hounds back, but with the certainty of fresh foxes on the move, hounds were stopped, or rather a line was not persevered with. Thus ended another enjoyable hunt, over a line of difficult country.

It was some time before second horses found their would-be riders, and as I should say it is quite six miles from where they lost their fox to Loseby Spinneys, the next draw, the afternoon began to draw in. Hounds killed one of a brace of foxes in Diamond's Spinney in quick time, and a fox from Car Brig took them through Prince of Wales Covert into the bottom below South Croxton, when hounds were stopped at dusk.

To finish the week on Saturday from Cotes Toll Bar a very enjoyable day's sport was spent in a part of the country strange to a Saturday. A nice hunt from Burton Spinney, over the Wolds and by Walton Thorns came to a close when the Master, finding he was penetrating rather deeply into his Monday country, had hounds stopped short of Mundy's Gorse; and then in the afternoon a four-mile point from Garners Gorse by the Aerodrome and Seagrave Village, leaving Sileby Orchard on the right, over the Cossington—Ratcliffe Road and the L.M.S. railway, ended by hounds being stopped at dusk when running into Wanlip Osiers. A clinking good hunt of 30 minutes.

SCARLET RUNNER.

TWO OUTSTANDING BELVOIR DAYS

THERE is frequently a difference of opinion as to the merits of a hunt; these are usually based on the success of individual exploits, the deportment of one's horse, the luck of a turn, &c.: this diversity of view is sometimes so marked that it is hardly possible to recognise the various reports as referring to the same expedition. But on two particular days of the past week there can be no shadow of doubt about the excellence of the sport provided. Those who had a good view will long have rosy memories of these hunts. The first on Tuesday from Wilsford and two during a subsequent very full Saturday: at risk of rubbing salt into the remorseful wounds of those who missed the fun, it is fair to say that these have probably been the most enjoyable outings of the season to date.

No one takes a very optimistic view of Wilsford's possibilities, and the morning's programme was no better than expected. So much so, that when second horses came up as hounds were drawing Rauceby Wood, few people elected to change, little thinking that they would not see the reserves again till after dark. The first burst away from the covert was spirited enough, as hounds ran parallel with the Rauceby Road towards the High Dyke: but scent was none too helpful, and as soon as the fox turned left, it required all George's genius to coax a line out of the light heath-land. The way he did this was a masterpiece; it would have been so easy to assume that the fox was aiming left for Willoughby or right-handed into Sparrow Gorse, but after taking precautions in these directions, he cast on towards Normanton. Just short of the belt of trees which rules off the heath from the sloping ground towards the village, he was amply rewarded by a sudden burst of enthusiasm from the pack.

Possibly the fox lay down for a breather, or tried some holes which line the bank; whatever the cause, the Hunt suddenly got a new lease of life, and anyone who wanted to participate had to hurtle down the hill and think about getting over the railway. A stretch of wiry impediments beyond may have been the cause of despair to some, but, at any rate, it gave hounds a free passage. From now on all was grass, and Bedlam was left to port as they streamed away to Hough, through a corner of the village as if for the covert. It seemed long odds on this fortress being the fox's objective, but not a bit of it. He turned away to cross a lovely bit of vale to Shield's Gorse, then on again at best pace almost to Willson's Osiers. A small but delighted field were mostly content to call a halt at Stragglethorpe after taking a turn across the road towards Fenton, but a handful of diehards still remained to enjoy another spurt over the Leadenham Lowfields, ultimately finishing by Reeve's Gorse, after covering a calculated distance of fifteen miles with a nine-mile point. This was as fine a performance on the Lincolnshire side as anyone could recall, and many may never see repeated or approached.

Wednesday and Friday both had their satisfactory features, but were small beer compared with both the foregoing and the feast which was in store for Saturday. Barkestone-in-the-Vale is an unusual rendezvous, as Plungar on the one side and Redmile and Granby on the others are inclined to elbow it out of the card. The Grantham Ball had been held the night before, so a good number of strangers came out for a combined chase of cobwebs and fox. Heavy rain had fallen overnight, to leave a well-washed morning glistening in the sunshine. After so much firm going it was quite a pleasure to see mud about as a squelching approach to Jericho was made down a cart-rutted lane. No one had time to wonder how brave or faint-hearted they felt, for a holloa on the far side caused a stampede to the corner bridle gate.

The first few obstacles of an "old-fashioned," rather unkempt nature with considerable ditches on the take-off side, served to distribute the field, and would also have given the pack the start they required if the motor brigade had not headed the fox at Granby. This was the trouble all the morning: every road was threaded with a ribbon of vehicles, considering which the ensuing hunt was a miracle. Mercifully for us, a considerable area in these parts has no proper highway, and within these limits the fox did his circular best. There is no knowing what point he might have made, given a proper chance, as he tried every outlet, first at Elton, then past Jericho along the canal almost within hail of Langar. By Barnstone Cement Works helpful news came to tell he was not far ahead and hounds caught him in Granby village, after a really good hunt of an hour with plenty of good ground covered.

Had this been the day's chief feature there could have been no complaints, but better was in store. Elton failed to provide anything but a breathing space, probably because the morning's pursuit had come so close. However, Rectory Covert now pruned and tidied up almost out of recognition, was soon to ring with the sound of the horn as the pack was cheered on to a fox which frisked off along the bridleway to Bottesford. Hounds were able to hunt up to the Bottesford—Elton Road quite happily, but the motor bogies were there before them and caused temporary difficulties, until the huntsman was able to hit off the line on the far side. A sweep round to the left and a holloa brought Elton into prospect again, but there was little in the covert to prove that the fox had passed that way.

A beautiful cast across the turnpike had an inspired result when an outburst of music pealed over the pastures below Elton Manor. The field was forced to go down the road for a few yards, and this absence of pressure gave the bitches the chance they required. It is difficult to believe that the distance they subsequently ran was after the original fox, as only the slightest technical hitches impeded their progress as they swept towards Sutton, then down the hill as if for Whatton.

This particular region used to be rather a snare, but the wire has happily been removed, and a lovely bit of riding country is thereby released. Running along the low ground, hounds turned over the road and railway by Barnstone, and crossed an area already explored in the morning. Granby Gap then appeared on the scene, but evidence proved the line to go beyond. Every yard of hunting was a delight, and instead of petering out as many a long run is inclined to do, the final stages were accelerated as, with tuneful accompaniment, the pack sped up to the Belvoir Woods. Apart from the fact that fresh foxes would have confused the issue, the ducal shooting party plus impending darkness robbed this delightful hunt of a suitably conclusive ending.

UNBRIDLED.

DUKE OF BEAUFORT'S GOOD WEEK

SPORT has been very good this week and with water lying in the furrows hounds have the sort of scenting conditions that enable them to run every day. In the Monday country the dog hounds had a seven-mile point from Great Wood, across the Bushton Vale to Clyffe Hangings, thence on to Upper Salthrop Farm, where they killed in the yard. The next day, too, scent was excellent, hounds running at pace all day in wide circles between Ashley, Larkhill, Newnton and Shipton Wood. Wednesday the weather changed, becoming much colder with a south wind touched with east. The meet was at Codrington, the best in the Sodbury Vale, but the early part of the day proved disappointing, with ringing foxes running the railway line and then getting to ground. Ham Wood proved blank, but finding quickly in Dodington Grove hounds ran very fast up wind by Lyde

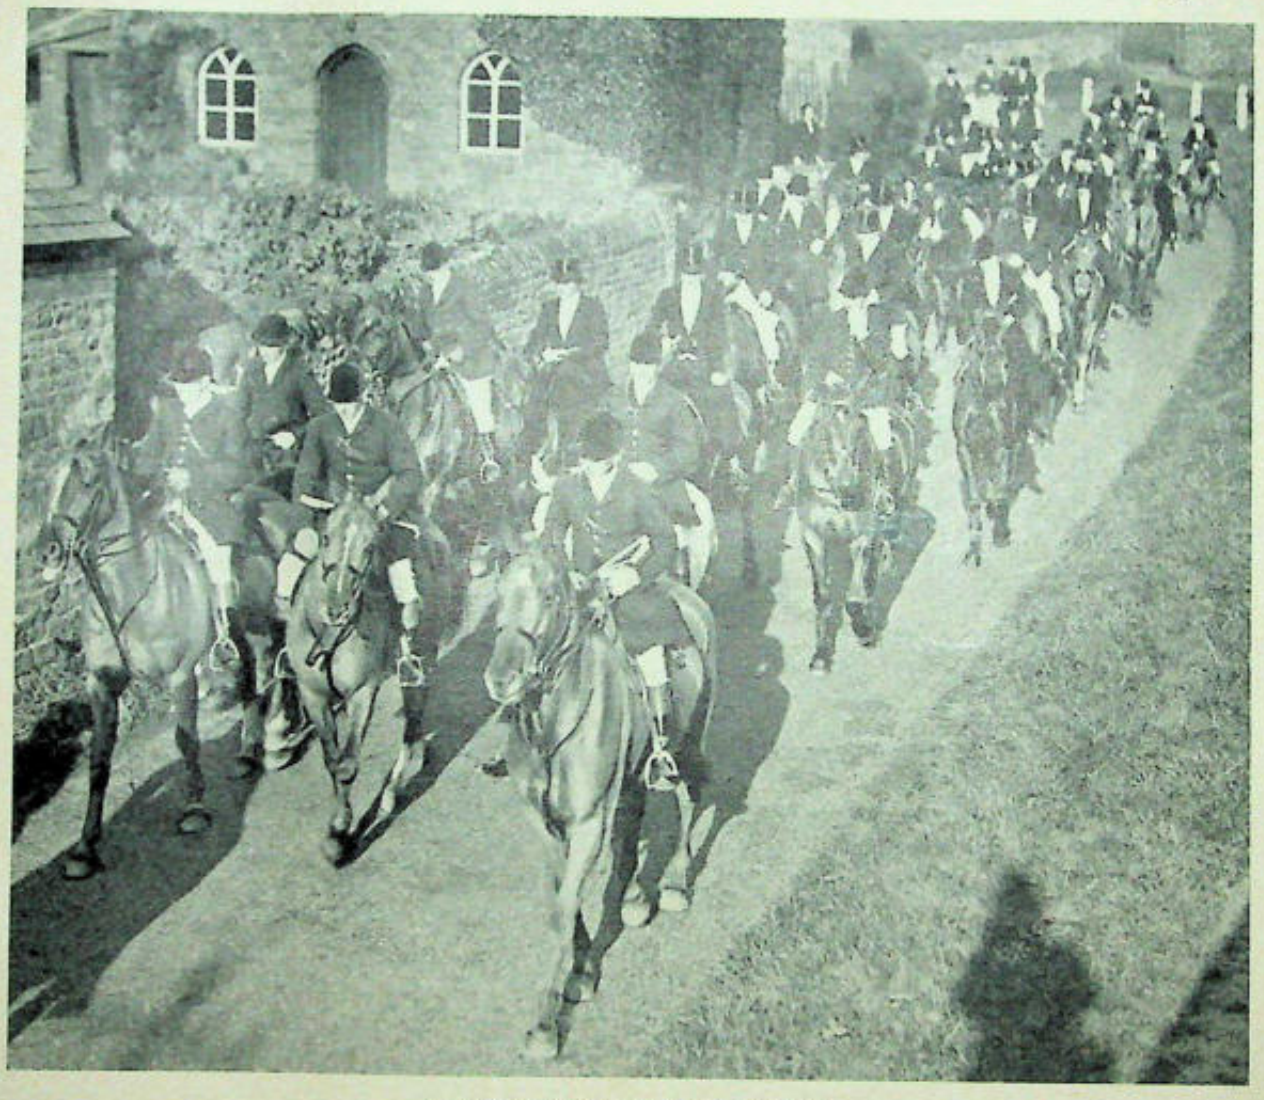
Farm and Mouswell to Codrington Gorse and on to just short of the Hinton Road, where the fox turned back down wind (I saw him hesitate and turn in an open field). He went to just beyond Tyning's Farm, where he was killed, to finish a first-rate half-hour over a delightful line of grass country, with the going good and the fences coming nicely for everyone.

Friday was also a busy and enjoyable day's hunting. Bull Park was the first draw after meeting at Didmarton. Hounds were soon away and ran very fast indeed through Hinnager to Swangrove, and without dwelling in this stronghold went straight through to Bodkin Wood, where a fresh fox made complications. Holding hounds on over the main road at Petty France, Holland recovered the line of his fox and hounds ran nicely over the wall country at the back of Hawkesbury Village towards Chalkley, where they were stopped. They found next in Beechbed, running from there to the Seven Mile and down the old track to Bodkin Wood, thence crossing the road into Bodkin Hazel. One fox went on, but hounds sticking to their hunted fox turned back to Bodkin Wood and Petty France kitchen-garden. Here he tried to get into the stud groom's coal-cellar and then climbed into thick ivy growing on the wall—his place of retreat being given away by an interfering goose who meanly gave tongue! There was much commotion and everyone ran, half of them yelling, so it was greatly to the credit of Holland that hounds caught their fox—incidentally the aforesaid goose getting bitten in three places while she, fox and hounds ran up and down the length of the wall! It all reminded me of Chaucer in the "Ploughman's Tale":

"Aha the fox: and after him they ran
And each with staves and many another man,
Ran Colle our dog, and Talbot and Gerlond
And Malkin with her distaff in her hand.
Ran cow and calf and eke the very hogs
So feared were for barking of the dogges
And shouting of the men and women eke
They ronnen so, hem thought her heartes breke."

Showing that the spirit of the English countryside has not changed down the centuries!

FIELDFARE.



THE COTTESMORE MEET AT TILTON

GRAFTON'S FOUR NINE-MILE POINTS

MUCH has been written of late about short-running foxes and the rarity of a hunt with a good point. The past week's sport has proved that with suitable scenting conditions a travelling fox will be forced to run straight, for at least four hunts have ended with a point of nine miles. Taking into consideration that the Grafton, to say the least, is very well foxed and that the season is still in its early youth, we, too, seem to have been very lucky this season to find straight-running foxes.

Colonel and Mrs. Hobson invited us to Cornhill on December 5th. There were at least a brace of foxes in Pattershall Osiers, in spite of the fact that no less than three brace of cubs had been killed in or near the tiny covert. The first fox away was hunted past the house and across the bottom to Bugbrooke Downs. Hounds checked at the top of the hill, and then with help carried on over the L.M.S.R. and also the canal. From there they ran quite nicely unattended past Rothersthorpe to Kislingbury Mill. Only with difficulty could the field keep touch across this very complicated and unrideable bit of country. Hounds crossed the river and had a faint line as far as the Northampton—Daventry Road, where they were finally beaten.

A long hack back to Grimscote Heath was unrewarded. However, there were at least two-and-a-half brace on foot to Grubb's Copse. Hounds finally went away with one through Bushey End to Field Burcote and on to Astcote Thorns. They gave him a rare dusting round the covert and then ran back at a good pace past Duncote and Potcote to Grimscote Heath. They took the line from the Grimscote end, straight through the covert and on over the road to Wait's Copse, then over the Bottom across to Seawell, just touching a corner of the covert. They ran on towards Maidford Village, then swung right-handed and pushed him straight through Maidford Wood. He then led them at a good pace along the valley back to Wait's Copse and past Foxley, on the right, to Caswell. Here there was the hollon of a fox which had passed ten minutes previously, but Pope, knowing his fox was not so far in front, and realising that the hollon would have turned him away, held them towards Blakesley and hit it off again. They crossed the Greens Norton Road and ran down to the brook and railway at Langford, just touched the corner of Ashey Copse and continued over the Bradden Road with Kingthorne on the left down to the Abthorpe brook, where they again checked. Hitting it off, they ran on with the Delft on their right across Handley Park and the Northampton—Brackley Road. The end came in almost complete darkness, when they marked their fox to ground in the Pits at Wood Burcote after a fine hunt of two-and-a-half hours; the farthest point was not more than seven miles, but hounds had covered at least sixteen miles. Only a few survivors saw the finish. It is difficult to say whether the same fox was in front of hounds all the way, but it seems certain that it must have been the fox which provided such a good hunt from Seawell to ground at the same spot last season.

The largest field of the season so far partook of Mr. and Mrs. Arthur Guinness's hospitality at Green's Norton Hall on December 9th. A straight-necked fox from Kingthorne did not dwell, but led hounds at a merry pace past Bradden over Kirby Grounds nearly to Woodend, where they checked. A holloa helped and they ran on across Cathanger and the Greenspark Bottom to the Wappenham Road. After a few seconds' respite they were away again past Lois Weedon, with Weedon Bushes on the left, nearly to Weston. From here he ran along the valley all the way to Allithorne. Hounds were out at the top end by the time the whipper-in was there, and ran on as far as the L.N.E.R. main line, which they crossed with Helmdon on their immediate left. They hunted on along the brook towards Stuchbury, and, from information received afterwards, possibly changed to a fresh fox along the brook. Running more slowly they hunted past Greatworth Hall nearly to Greatworth Village. They had a line down the hill towards Marston St. Lawrence and were able to carry it over the branch line into Cockley Brake in Bicester country, where they marked after a first-class hunt of 90 minutes with a point of nine miles. It was over a fine line of country all the way, and they had only touched one covert; there were an exceptional number of falls.

Second horses were forthcoming at Sulgrave which eased the long jog back to Plumpton. A fox was found in Adstone Copse, and again hounds ran with a rare cry past Moreton Pinkney to Gomerals Holt. They ran on as far as the Weston Road, where he had been headed; a forward cast hit it off and we were away again pointing for Oakley Bank, but they swung right-handed over the Wappenham Road down to Weedon Bushes. They went straight on through the covert and on past Weston to Allithorne on practically the line of the morning's hunt. From Allithorne the pace decreased, but they continued slowly past Colonel's Covert, across the Culworth Road to Gomerals, where they were stopped at dusk after a thoroughly enjoyable 50 minutes. The best day of the season to date.

U.

CATTISTOCK'S ANXIOUS WEEK

WITH the last outbreak of foot-and-mouth disease at Stalbridge increasing the restricted area, so that it now embraces pretty much the whole of the Blackmore Vale country, and a good bit of the South Dorset, it has been an anxious week for the Cattistock Masters; and though the new restrictions affect only a small portion of their country it must be an anxious time until they are finally removed. Dorset suffered severely last season, and they are naturally inclined to be worried by small incidents that ordinarily would have no effect on their otherwise amazing attitude of hospitality toward the hunting men. Tuesday's meet was changed from Charminster to Kingston Russell. Charminster was not in the restricted area, but it was very near it, and the Masters felt it best to take no chances in case a fox ran that way. There was a nice scent that morning and a good-sized field turned out, one or two visitors from the South Dorset among them. Hounds failed to find in Kingston Russell Gorses, but Mr. Williams had an old dog fox waiting for us in one of the Bridehead root fields. He was nearly caught in the first three minutes; but making good his escape, he ran through Well Bottom and over the main Bridehead drive into Captain Corbet's land, turning right-handed past Bridehead House, and then up the hill to Well Bottom again; after which he ran along very much the same line as in his first circle, but was killed just before he reached the main driveway again. A very fast 35 minutes without a check, hounds fairly bursting him.

A second fox, found in a thicket near Bridehead main gate, ran straight down the hill, parallel with the main road, past Winterbourne Steepleton, to Steepleton Water, where he crossed the Martinstown Road and continued on parallel with the main Bridport Road, leaving Martinstown on his right and Bradford Peverell on his left, to Hogg Hill, where hounds were at fault. Held forward, they hit off the line again through Maiden Castle, continuing beyond, a little right-handed, to mark their fox to ground in a drain at Winterbourne Monkton. A five-mile point, and about six as hounds ran.

On Wednesday, the meet was changed from Sydling, on the edge of the restricted area, to Steepleton Water; and with the good field which

turned out, it was too bad that hounds did not have a better day. The first fox came from Captain Corbet's laurels; and for the first mile or so it looked as if we were to have a good hunt; for hounds ran at a great pace down Bronkham Ridge, heading for South Dorset country. Above Friar Waddon, however, they turned back along the meadows below Bronkham, bearing right-handed over the Martinstown Road, and so back to the Laurels, where scent failed at the end of 35 minutes.

Foxes were very plentiful in the bracken below the Hardy Monument; several were found, one being killed near the meet at Steepleton Water, and another on Upper Bronkham; but scent got worse and worse, and it must have been a disappointing day for the huntsman, as well as for the field; although two foxes were killed.

Friday should have produced a good day's sport. The district around Rodden always holds foxes, and hounds have not been there over much this season. It is new to Gosden, being in fact almost the only remaining portion of the country which he has not been in before, the Master having hunted hounds himself when they met there in August. Lord Ilchester's New Covert near the village held a fox, and hounds went away with a good cry as if for Swyre; but the pilot got to ground in Wyke Wood just as we were settling down to ride, and cut short our gallop. There was another fox lurking near Colonel Bradley's stables; but this, too, failed to produce any point, and was promptly killed. The storm which had threatened all the morning broke about this time, and it was a difficult matter to keep in touch with hounds; but when they finally went away from Loscombe behind a straight-necked customer, who set his course across the Waddon Vale, everyone had a fair start, and the first 25 minutes left nothing to be desired, unless it were an abatement of the cutting rain and sleet which almost blinded us. Hounds ran very fast over the railway and past Corton and Friar Waddon; but on the wind-swept hills beyond the pace slackened a bit, and by the time Ashton Barn was reached hounds could barely speak to the line. Their pilot was viewed into the gorses beyond, and it may have been that he got to ground there, but the storm became so violent that at the end of 40 minutes hounds had to be stopped and were eventually sent home after a rather disappointing day.

When Captain Russell told me early in the season that he had a good litter of cubs at Langdon Manor I knew that we should sooner or later have a good gallop from his coverts, for he is one of those fox preservers who can be counted on with absolute certainty. Hounds met there on Saturday—a dark lowering sort of day with "storms in the h'air," as old huntsmen say—and after Captain and Mrs. Russell had looked after the field with their usual hospitality the fun began. There is a little patch of gorse lying in the gully below Shadcombe Farm that harboured the litter early in the year, and it was from there that our stout fox of Saturday afternoon came away. Running up the hill he topped the ridge and sank the valley on the far side, leaving the Langdon Dairy buildings on his left and going on over the Beaminster Road as if for Corscombe. At the Toller Down Road, however, he turned square left, and after running the road for a quarter of a mile he turned left across the fields through Banks's, which lies in the valley below. Beyond Banks's he swung right again, crossing the Cheddington Road into the village, where he nearly lost his brush in the churchyard; but having beaten hounds there he recrossed the road and again sank the valley towards Banks's. Just at this juncture a severe rainstorm washed away every vestige of scent, and hounds, which at one time had been able to run as if tied to their pilot's brush, were apparently beaten, as they could do nothing further. It was a nice hunt however—50 minutes—and over a very good line of country. I only wish that the gallop which followed had been over the same sort of going.

Near Banks's there is a rushy field which usually harbours a fox, and toward this Gosden jogged his pack. He had hardly begun to draw the rushes before our second pilot was away, and this time he ran back up the valley towards the Crewkerne Road. After about a mile he swung left across the Cheddington Road, and then setting his mask for Misterton he gave the Cattistock field as hard a 20 minutes as it has had this year, or for that matter in any other. Scent was apparently breast high and hounds could fairly fly over the rain-soaked pastures, but the going, which was terribly deep, spelled disaster for many of the field, and great exertion for all of them. There were many empty saddles, and I am afraid that at least one good horse will never hunt again, for when I passed him floundering in a ditch at which he had landed short he looked completely done up. Again a violent rainstorm came to save that fox's brush, and, try as they would, hounds could do nothing beyond the Misterton Road, where a gallant fox was known to have crossed only a few minutes before. Still, it was a grand day's sport, and one which was a good ending to an anxious week.

LINCOLN.

GREAT HUNT WITH THE ATHERSTONE (NORTH)

SO far this season this pack have been showing the most wonderfully consistent sport—the best that has been shown before Christmas for a number of years. Monday, December 5th, was no exception when hounds met at Cadeby. They found almost immediately in a small osier bed close to Botany Bay, and first made a big left-handed ring across the Newbold Gate Road, through Osbaston Gorse and the Rookery back to Botany Bay. Going on through Brascote, they ran to Kirkby Gorse, then swung left-handed with Brascote on the left over Newbold Hall Farm to Osbaston, where they marked to ground after an excellent hunt of one hour.

Finding again in Osbaston New Gorse, hounds were a long time in getting their fox away from the Osbaston Coverts, but eventually they pushed him away by Myra Heath over the Newbold—Bosworth Road to Botany Bay. Here they got on better terms and began to run well with Newbold Verden on the right, across the Desford Road to the Lindridge osier bed. They then ran at a great pace by the Great Fox covert over the Merrileas Lane and Bagworth Heath to within one field of Nailstone Wiggs over a grand line of country. Here the fox was headed, but hounds were glued to him and raced along the Bagworth Brook then over the rising ground to the outskirts of Bagworth, where they rolled him over in the open after a remarkable hunt of two hours five minutes. Though there was no greater point than four miles in this hunt, they covered at least twelve miles, and the last 50 minutes was at a great pace.

R. F. M.

NORTH WARWICKSHIRE HOUNDS' MEMORABLE RUN

TUESDAY has been the lucky day for these hounds so far this season, and the last five have all produced a good day's sport, while December 6th was probably the best. The meet was at Dunchurch, and after drawing Bilton Grange blank hounds were soon away from Bunkers Hill. They ran well to the London Road, swung left past Dunchurch Hall and Toft and then straight to Lesters Piece. Here, despite fresh foxes, they stuck to their hunted one, forced him away towards Thurlaston and soon killed after 35 minutes. Bunkers Hill was drawn again, and a straight-necked fox found, who gave us perhaps what may be the run of the season. Hounds went away towards Woolscott Toll Bar and bore right-handed over the Rainsbrook, which was brim full and caused considerable grief, though nothing serious. Before reaching the Woolscott Lane there was a check owing to sheep foil, and hounds had to be helped before hitting the line right-handed and increasing their pace past Sutton Spinney and over the River Leam into Warwickshire territory, where they checked again among sheep. Being held on they hit the line and ran very fast with Grandborough on the left across a lovely line of country to Flecknoe Station, which was on their right, over the railway and up to the Oxford Canal, where they checked.

A welcome hulloa proclaimed the fox on, and picking up the line hounds went on as fast as ever underneath Flecknoe Gorse and with Shuckburgh well on the right over the Daventry Road, straight to Catesby House and Dane Hole in the Bicester country, where they marked their fox to ground. This was a brilliant hunt of one hour with a seven-mile point over as good a line of country as could be wished for. It is interesting to note that as far as can be ascertained these hounds have not run to Shuckburgh since 1896. This season, on November 8th, they ran from Bunkers Hill to Shuckburgh, and lost among fresh foxes; on November 22nd they ran from Lesters Piece and marked to ground there; and now this hunt, which took them well beyond it.

G. J.

ZETLAND HOUNDS SHOW CAPITAL SPORT

THESE hounds showed capital sport to a large field after their meet at Melsonby on December 3rd.

Finding first at Merrybent Whin a fox which took some time to get to leave, they put him to ground in a few fields.

They then found in Langdale and ran fast through Twelve Acres to Sudels Farm, turned right-handed, and ran down the west strip at Stanwick, through Hurgill Plantation and Basingcroft, outside which they were at fault. Being held left-handed, they hit off the line, and ran past Garkin Fields to Three Nook Plantation, and to Sudels Farm again. From here they ran slowly on into Stanwick Park, where they were run out of scent after an enjoyable hunt of 50 minutes.

The best of the day was still to come when they found at Mr. Lax's covert at Carlton Grange. After nearly catching him in covert they ran by Carlton to Aldborough, right-handed over the beck to Dog Kennel Wood, which they left on their left, and returned to the starting place. Going away again they described a semi-circle with Carlton Grange on their right and ran to Aldborough and on to Park House. They ran outside the park wall and turned right, running the length of the west strip, and with Forcett Park just on their left they crossed the entrenchment and ran down to the beck. They turned right on reaching this, and ran past the starting point, leaving Carlton Grange on their left, they now crossed the railway at Rennison's Bridge, bore left-handed, and left Eppleby on their left, ran by Sough Hill to Cote Hill, where they were beaten after a most interesting, although twisty hunt of 1 hour and 25 minutes. Hounds hunted extremely well throughout the many turns this fox made

STUMPY.

THE CROOME FIND FOXES PLENTIFUL

EVERY Saturday since the regular season opened has been gloriously fine, usually after a rough and rainy night. Last Saturday (December 10th) was no exception, and the mixed pack met at The Boot, Flyford Flavell, under a cloudless sky, with the weather as mild as May. But scent was conspicuous by its absence in the unfathomable mud of Grafton Wood, and after spending an hour there hounds were called out to go to Naunton Bushes.

I suppose that the recent heavy rain has driven the foxes from the snug fences and drains where they have been lying during the warm weather; at all events the country seems alive with them. Foxes flew in all directions as soon as hounds put into the Bushes, around which they proceeded to conduct a circular tour (including plenty of jumping) before marking one to ground in an earth on the outskirts of the covert.

It was from Shutwell Bushes that the hunt of the day took place, and those of the field who had remained out were well rewarded. Finding quickly, hounds were as quickly away, and it was not until 80 minutes later that they concluded the hunt by running to ground at Wolverton Home Coppice. "Too many brooks spoil the sport"—both Bow Brook and Piddle Brook were heavy in flood, and for this reason the initial part of the hunt was distinctly circuitous, for the fox would face neither. Hounds circled back to the Bushes no fewer than three times altogether, but in the end, changing to a fresh fox, which perhaps was stouter-hearted than his predecessor, they drove him across the swollen stream near Churchill Mill. The field was obliged to make tracks for the nearest bridge, for the fords were too deep to negotiate except by swimming; meanwhile the pack was running on, past White Ladies, through Aston Hayes (where further fresh foxes got up), and then to Wolverton, where they marked their fox in the drain.

It had been fine and warm all day, but as hounds turned for home rain began to fall, and they must have had a damp and dismal journey back to kennels.

D. M. M.

SIX-MILE POINT WITH THE CHIDDINGFOLD

THESE hounds met at Knowle on Saturday, December 4th, where Mr. Berdoe-Wilkinson had several foxes for us in Bushey Copse. It was a brilliantly sunny morning, with a cold north-west wind blowing, and we spent rather a circular morning between Bushey, Wild Wood and Waterlands, scent never being good enough to get on terms with a fox.

At 1.50, however, the bitches found a leash of foxes in Mr. Roweliffe's withy bed by the canal, and settling down to the line of the best of them, as it turned out, drove him away to Mill Copse, which he barely entered before turning north for Nanhurst. He then skirted his home covert and ran out over Knowle, hounds not being able to run at any pace across the grass till they left Holdhurst and Bridge Farm behind them and got on to fresh ground at Hammer Farm. They ran through the Stews at Vachery and over Baynards Park to Oatridges. On Baynards the pace quickened, and here Goddard and his first whip, directed wrongly by a well-meaning farmer, got badly thrown out, not making contact again till nearly the end of the hunt. The Master took charge of the bitches at the snipe bog behind Oatridges, where there were two foxes afoot, and hounds hunted slowly across Tillhouse Farm.

A hulloa on the hill by Maybanks enlivened matters considerably, and the Master, lifting them

turned out, it was too bad that hounds did not have a better day. The first fox came from Captain Corbet's laurels; and for the first mile or so it looked as if we were to have a good hunt; for hounds ran at a great pace down Bronkham Ridge, heading for South Dorset country. Above Friar Waddon, however, they turned back along the meadows below Bronkham, bearing right-handed over the Martinstown Road, and so back to the Laurels, where scent failed at the end of 35 minutes.

Foxes were very plentiful in the bracken below the Hardy Monument; several were found, one being killed near the meet at Steepleton Water, and another on Upper Bronkham; but scent got worse and worse, and it must have been a disappointing day for the huntsman, as well as for the field; although two foxes were killed.

Friday should have produced a good day's sport. The district around Rodden always holds foxes, and hounds have not been there over much this season. It is new to Gosden, being in fact almost the only remaining portion of the country which he has not been in before, the Master having hunted hounds himself when they met there in August. Lord Ilchester's New Covert near the village held a fox, and hounds went away with a good cry as if for Swyre; but the pilot got to ground in Wyke Wood just as we were settling down to ride, and cut short our gallop. There was another fox lurking near Colonel Bradley's stables; but this, too, failed to produce any point, and was promptly killed. The storm which had threatened all the morning broke about this time, and it was a difficult matter to keep in touch with hounds; but when they finally went away from Loscombe behind a straight-necked customer, who set his course across the Waddon Vale, everyone had a fair start, and the first 25 minutes left nothing to be desired, unless it were an abatement of the cutting rain and sleet which almost blinded us. Hounds ran very fast over the railway and past Corton and Friar Waddon; but on the wind-swept hills beyond the pace slackened a bit, and by the time Ashton Barn was reached hounds could barely speak to the line. Their pilot was viewed into the gorses beyond, and it may have been that he got to ground there, but the storm became so violent that at the end of 40 minutes hounds had to be stopped and were eventually sent home after a rather disappointing day.

When Captain Russell told me early in the season that he had a good litter of cubs at Langdon Manor I knew that we should sooner or later have a good gallop from his coverts, for he is one of those fox preservers who can be counted on with absolute certainty. Hounds met there on Saturday—a dark lowering sort of day with "storms in the h'air," as old huntsmen say—and after Captain and Mrs. Russell had looked after the field with their usual hospitality the fun began. There is a little patch of gorse lying in the gully below Shadcombe Farm that harboured the litter early in the year, and it was from there that our stout fox of Saturday afternoon came away. Running up the hill he topped the ridge and sank the valley on the far side, leaving the Langdon Dairy buildings on his left and going on over the Beaminster Road as if for Corscombe. At the Toller Down Road, however, he turned square left, and after running the road for a quarter of a mile he turned left across the fields through Banks's, which lies in the valley below. Beyond Banks's he swung right again, crossing the Cheddington Road into the village, where he nearly lost his brush in the churchyard; but having beaten hounds there he recrossed the road and again sank the valley towards Banks's. Just at this juncture a severe rainstorm washed away every vestige of scent, and hounds, which at one time had been able to run as if tied to their pilot's brush, were apparently beaten, as they could do nothing further. It was a nice hunt however—50 minutes—and over a very good line of country. I only wish that the gallop which followed had been over the same sort of going.

Near Banks's there is a rushy field which usually harbours a fox, and toward this Gosden jogged his pack. He had hardly begun to draw the rushes before our second pilot was away, and this time he ran back up the valley towards the Crewkerne Road. After about a mile he swung left across the Cheddington Road, and then setting his mask for Misterton he gave the Cattistock field as hard a 20 minutes as it has had this year, or for that matter in any other. Scent was apparently breast high and hounds could fairly fly over the rain-soaked pastures, but the going, which was terribly deep, spelled disaster for many of the field, and great exertion for all of them. There were many empty saddles, and I am afraid that at least one good horse will never hunt again, for when I passed him floundering in a ditch at which he had landed short he looked completely done up. Again a violent rainstorm came to save that fox's brush, and, try as they would, hounds could do nothing beyond the Misterton Road, where a gallant fox was known to have crossed only a few minutes before. Still, it was a grand day's sport, and one which was a good ending to an anxious week.

LINCOLN.

GREAT HUNT WITH THE ATHERSTONE (NORTH)

SO far this season this pack have been showing the most wonderfully consistent sport—the best that has been shown before Christmas for a number of years. Monday, December 5th, was no exception when hounds met at Cadeby. They found almost immediately in a small osier bed close to Botany Bay, and first made a big left-handed ring across the Newbold Gate Road, through Osbaston Gorse and the Rookery back to Botany Bay. Going on through Brascote, they ran to Kirkby Gorse, then swung left-handed with Brascote on the left over Newbold Hall Farm to Osbaston, where they marked to ground after an excellent hunt of one hour.

Finding again in Osbaston New Gorse, hounds were a long time in getting their fox away from the Osbaston Coverts, but eventually they pushed him away by Myra Heath over the Newbold—Bosworth Road to Botany Bay. Here they got on better terms and began to run well with Newbold Verden on the right, across the Desford Road to the Lindridge osier bed. They then ran at a great pace by the Great Fox covert over the Merrileas Lane and Bagworth Heath to within one field of Nailstone Wiggs over a grand line of country. Here the fox was headed, but hounds were glued to him and raced along the Bagworth Brook then over the rising ground to the outskirts of Bagworth, where they rolled him over in the open after a remarkable hunt of two hours five minutes. Though there was no greater point than four miles in this hunt, they covered at least twelve miles, and the last 50 minutes was at a great pace.

NORTH WARWICKSHIRE HOUNDS' MEMORABLE RUN

TUESDAY has been the lucky day for these hounds so far this season, and the last five have all produced a good day's sport, while December 6th was probably the best. The meet was at Dunchurch, and after drawing Bilton Grange blank hounds were soon away from Bunkers Hill. They ran well to the London Road, swung left past Dunchurch Hall and Toft and then straight to Lesters Piece. Here, despite fresh foxes, they stuck to their hunted one, forced him away towards Thurlaston and soon killed after 35 minutes. Bunkers Hill was drawn again, and a straight-necked fox found, who gave us perhaps what may be the run of the season. Hounds went away towards Woolscott Toll Bar and bore right-handed over the Rainsbrook, which was brim full and caused considerable grief, though nothing serious. Before reaching the Woolscott Lane there was a check owing to sheep foil, and hounds had to be helped before hitting the line right-handed and increasing their pace past Sutton Spinney and over the River Leam into Warwickshire territory, where they checked again among sheep. Being held on they hit the line and ran very fast with Grandborough on the left across a lovely line of country to Flecknoe Station, which was on their right, over the railway and up to the Oxford Canal, where they checked.

A welcome hulloa proclaimed the fox on, and picking up the line hounds went on as fast as ever underneath Flecknoe Gorse and with Shuckburgh well on the right over the Daventry Road, straight to Catesby House and Dane Hole in the Bicester country, where they marked their fox to ground. This was a brilliant hunt of one hour with a seven-mile point over as good a line of country as could be wished for. It is interesting to note that as far as can be ascertained these hounds have not run to Shuckburgh since 1896. This season, on November 8th, they ran from Bunkers Hill to Shuckburgh, and lost among fresh foxes; on November 22nd they ran from Lesters Piece and marked to ground there; and now this hunt, which took them well beyond it.

G. J.

ZETLAND HOUNDS SHOW CAPITAL SPORT

THESE hounds showed capital sport to a large field after their meet at Melsonby on December 3rd.

Finding first at Merrybent Whin a fox which took some time to get to leave, they put him to ground in a few fields.

They then found in Langdale and ran fast through Twelve Acres to Sudels Farm, turned right-handed, and ran down the west strip at Stanwick, through Hurgill Plantation and Basingcroft, outside which they were at fault. Being held left-handed, they hit off the line, and ran past Garkin Fields to Three Nook Plantation, and to Sudels Farm again. From here they ran slowly on into Stanwick Park, where they were run out of scent after an enjoyable hunt of 50 minutes.

The best of the day was still to come when they found at Mr. Lax's covert at Carlton Grange. After nearly catching him in covert they ran by Carlton to Aldborough, right-handed over the beck to Dog Kennel Wood, which they left on their left, and returned to the starting place. Going away again they described a semi-circle with Carlton Grange on their right and ran to Aldborough and on to Park House. They ran outside the park wall and turned right, running the length of the west strip, and with Forcett Park just on their left they crossed the entrenchment and ran down to the beck. They turned right on reaching this, and ran past the starting point, leaving Carlton Grange on their left, they now crossed the railway at Rennison's Bridge, bore left-handed, and left Eppleby on their left, ran by Sough Hill to Cote Hill, where they were beaten after a most interesting, although twisty hunt of 1 hour and 25 minutes. Hounds hunted extremely well throughout the many turns this fox made

STUMPY.

THE CROOME FIND FOXES PLENTIFUL

EVERY Saturday since the regular season opened has been gloriously fine, usually after a rough and rainy night. Last Saturday (December 10th) was no exception, and the mixed pack met at The Boot, Flyford Flavell, under a cloudless sky, with the weather as mild as May. But scent was conspicuous by its absence in the unfathomable mud of Grafton Wood, and after spending an hour there hounds were called out to go to Naunton Bushes.

I suppose that the recent heavy rain has driven the foxes from the snug fences and drains where they have been lying during the warm weather; at all events the country seems alive with them. Foxes flew in all directions as soon as hounds put into the Bushes, around which they proceeded to conduct a circular tour (including plenty of jumping) before marking one to ground in an earth on the outskirts of the covert.

It was from Shutwell Bushes that the hunt of the day took place, and those of the field who had remained out were well rewarded. Finding quickly, hounds were as quickly away, and it was not until 80 minutes later that they concluded the hunt by running to ground at Wolverton Home Coppice. "Too many brooks spoil the sport"—both Bow Brook and Piddle Brook were heavy in flood, and for this reason the initial part of the hunt was distinctly circuitous, for the fox would face neither. Hounds circled back to the Bushes no fewer than three times altogether, but in the end, changing to a fresh fox, which perhaps was stouter-hearted than his predecessor, they drove him across the swollen stream near Churchill Mill. The field was obliged to make tracks for the nearest bridge, for the fords were too deep to negotiate except by swimming; meanwhile the pack was running on, past White Ladies, through Aston Hayes (where further fresh foxes got up), and then to Wolverton, where they marked their fox in the drain.

It had been fine and warm all day, but as hounds turned for home rain began to fall, and they must have had a damp and dismal journey back to kennels.

D. M. M.

SIX-MILE POINT WITH THE CHIDDINGFOLD

THESE hounds met at Knowle on Saturday, December 4th, where Mr. Berdoe-Wilkinson had several foxes for us in Bushey Copse. It was a brilliantly sunny morning, with a cold north-west wind blowing, and we spent rather a circular morning between Bushey, Wild Wood and Waterlands, scent never being good enough to get on terms with a fox.

At 1.50, however, the bitches found a leash of foxes in Mr. Rowcliffe's withy bed by the canal, and settling down to the line of the best of them, as it turned out, drove him away to Mill Copse, which he barely entered before turning north for Nanhurst. He then skirted his home covert and ran out over Knowle, hounds not being able to run at any pace across the grass till they left Holdhurst and Bridge Farm behind them and got on to fresh ground at Hammer Farm. They ran through the Stews at Vachery and over Baynards Park to Oatridges. On Baynards the pace quickened, and here Goddard and his first whip, directed wrongly by a well-meaning farmer, got badly thrown out, not making contact again till nearly the end of the hunt. The Master took charge of the bitches at the snipe bog behind Oatridges, where there were two foxes afoot, and hounds hunted slowly across Tillhouse Farm.

A hulloa on the hill by Maybanks enlivened matters considerably, and the Master, lifting them

to it, hounds hit the line close to Cox Green and crossed to Ellens. Here the pace began once more to quicken; the wind had dropped at about one o'clock, and a mild sunny afternoon was being succeeded by a rapidly cooling evening with a promise of frost. Not many of the morning's large field remained to negotiate some biggish fences on Ellens, when hounds swept across it to Ridge Farm. At Millfields the fox was obviously tiring and avoiding the rough coverts, kept to the open fields, lingering probably in some brambles where he was viewed by the Master. Shortly afterwards several belated members of the field arrived, followed by the Hunt servants. Scent had begun to fail again, and though Goddard cast on across some plough and hit the line, hounds carrying on over two more fields, they were approaching Park Pin Hanger in dangerous proximity to the Roman Woods where fresh foxes were bound to be at once afoot. In view of this and the rapidly approaching darkness, lightened by a brilliant moon, the Master decided to give the fox best this time and hounds were stopped at 4.10.

Never a fast hunt, except for one 20 minutes' burst, as shown by the fact of taking 2 hours and 20 minutes to do a six-mile point, this was definitely a feather in the cap of the bitches, who hunted well on a patchy scent both for Goddard and the Master.

SEMPSTRESS.

THE V.W.H. (CRICKLADE) HOUNDS' WONDERFUL HUNT

ALTHOUGH some more rain fell during the early hours of Monday, December 5th, the weather "took up," as the country people say, and it was fine and sunny soon after 10 o'clock. Only a small field met the Master with the doghounds for the bye day at Swillbrook Farm, but came in for a wonderful hunt; hounds, racing upwind for the first 55 minutes to make a seven-mile point, were running for three-and-a-quarter hours in all. Mr. and Mrs. R. C. L. Kennaway provided hospitality, and soon after 11 o'clock hounds moved off.

It was some long time before a fox was found, but such a stout customer was well worth the seeking. He was lying in a field of kale close to Somerford Keynes, and not far from the V.W.H. (Earl Bathurst's) boundary. The doghounds raced after him through Eight Acres and past Ashton Keynes. Turning into the south-westerly breeze they went on by High Bridge, and crossed the Cricklade—Malmesbury Road close to the Three Horse Shoes Inn—a favourite Thursday fixture. Carrying a great head they ran fast by Buryhill Gorse to Lower Farm. Swinging over the G.W.R. branch line, they ran into a corner of Red Lodge, and going straight through came into the open again across Battlelake Farm. Once over the Pavenhill Road, they ran by Braydon Green Farm and Parley Copse into Lydiard Plain. Carrying on into Flaxlands Wood, they pushed their fox through and over the road into the big stronghold of Webbs Wood. Holding to their fox well, hounds forced him away and made a big ring out to the Brinkworth—Swindon Road, and the turning point. Fifty-five minutes to date through heavy going and scarcely a breather.

Hunting back into Webbs Wood the presence of fresh foxes brought complications, but it was the hardest luck they brought their hunted one outside for the last time accompanied by a fresh fox; which hounds returned with inside, and their tired fox escaped into Midge Hall. Darkness had set in when the Master whipped off and "home" was the order.

J. R.

THE TYNEDALE DO WELL

AFTER meeting at Fenwick on Wednesday, December 7th, the morning was spent in drawing several good coverts blank, and it was past one o'clock when a fox was found at Standing Stone. After a few turns round the covert this fox was killed. Another was found at once in The Beeks, and, quickly away, hounds ran fast almost to Clarewood. Turning back they ran through the Mile Plantation, and, crossing the Matfen Road, arrived back at Standing Stone. The fox waited here and hounds got away close at him, and ran through the Brickyards up to Pead House. Swinging right-handed below Bog House, hounds turned southwards and ran up to High House, where they checked for the first time, after a brilliant 25 minutes over a very fine line of country. The line was soon hit off and hounds hunted nicely on down to the River Pont, where they checked again. Taken to a holloa northwards from the river, they ran through Marl Pit Plantation, crossed the Fenwick—Matfen Road, and went on with Mueckleridge on the left, past Ingoe Low Hall. The pace was slower now, but hounds were hunting beautifully as they crossed the Ingoe—Ryall Road, then ran due north with Kearsley on the right to Kirkheaton Fell. Just skirting the Fell on the west side, hounds ran on towards Bavington, but just short of Black Hill they swung right-handed back to Kirkheaton Whin, and were stopped at dark, just short of Memorial Whin, after a very fine hunt of 1 hour 50 minutes. The furthest point was six miles, and as it was over some of the best of the Tynedale country, the big field thoroughly enjoyed themselves.

J. M.

SOUTH CHESHIRE HOUNDS RUN WELL

SO far this season much the best sport has been on Saturdays; and on three occasions over the Calveley Oulton country.

A large field, after a disappointing morning from Tiverton Smithy, had two good hunts during the afternoon. Finding a fox in Oulton Lowe hounds ran pointing for Darnhall, but swung right-handed to kill their fox at Bank Side Wood after fifteen minutes; seldom have hounds run faster over this very wet but good scenting country. Picking up another fox, hounds hunted well towards Calveley Hall, swinging right-handed forced their fox through the new gorse, and again right-handed crossed the lane, ran through the Old Gorse pointing for Stoke.

MR. JOHN LAKIN, ONE OF THE JOINT MASTERS OF THE WARWICKSHIRE, TAKES A FENCE AND DITCH

With Hill's Gorse on their right they crossed the railway, the huntsman, whippers-in and field being considerably held up by a passing goods train. Hounds were next seen hunting along the canal bank. At this point the fox, being headed when pointing for Wardle by two farm workers carrying hay, changed his direction right-handed through Calveley Park, hounds losing their fox on Mr. Arthur Williamson's farm after 50 minutes.

Quite a large field met Mr. Barbour and Mr. Clegg at Church Minshull. Finding at Aston Gorse a fox went away in the wrong direction; motor cars, cyclists and pedestrians on the road in no way diverting his route, he ran down to the river, where, after a few fields, hounds marked him to ground. Mr. Winnery had the misfortune to break his horse's back during this hunt. Finding in the gorse at Poole Hall, a fox was quickly killed.

From Wettenhall Wood a most enjoyable hunt followed, a fox crossing the Boot and Slipper, Darnhall Lane; at times hounds running fast over a most difficult country to ride over, left Oulton Lowe on the left, just missed Philo, ran through Hunt's Hill, and lost their fox behind Eaton Village after a good hunt of 25 minutes.

It is with deep regret that we record that at the end of this hunt Mr. Pearson, who has hunted in Cheshire for many years, fell dead off his horse, an end that all foxhunters might well choose.

J. D. H. S-M.

POOR SCENT WITH THE PYTCHLEY

THE two days, from Old on December 5th and Wednesday, the 7th, from Badby, could hardly have been worse, owing to bad luck, which means force of circumstances upon which it can be of no interest to dilate. A brace of foxes were killed on Wednesday, but their efforts to supply sport were feeble to a degree.

Friday (9th), Welford. A thick fog and 5 degrees of frost at 8 a.m. did not seem to presage a good hunting day, and when hounds found in a kale field near Major Paget's house scent was very bad. He was marked to ground after some patient hunting not far from the Hothorpe Hills.

Another was away from Sulby Covert almost at once. He was hunted on what seemed a poor scent locally for some time till Barker, seizing a fleeting chance, got hounds on better terms and for ten minutes they raced as though for Naseby Hall into the wind. The fox, unable to stand this pressure, turned back, but the pack would not be denied, and rolled him over under the windows of Sulby Hall—a most creditable performance. The Marston Hills are not associated with good hunts as a rule, but on this evening the unexpected did happen. A fox jumped up at the Clipstone end of this big covert and with a rare start hounds were into and through Alford Thorns in no time. They skirted Twantry Gorse, passed East Farndon on the left, and raced over the big grazing fields and a strongly-fenced line towards Clipstone. The pack pushed their fox through Alford Thorns once more, hunted him through the Marston and Hothorpe Hills, where they were stopped in real darkness after an incursion to Fernie territory. This was a fine demonstration of what a good pack may make of poor scenting conditions, and the highest compliment which they may be paid.

The largest field of the season assembled at East Haddon on Saturday, the 10th. This seemed a nice hunting day despite the low level of the barometer. A fox was found in Ravensthorpe Gorse, and, considering the way in which he turned, was hunted at a fair pace locally till he found refuge in the village where hounds met. When Barker was still trying to locate him a fresh fox jumped up in the gardens of East Haddon Hall, and he was responsible for a gallop in the right sense of the word. It was unfortunate that many of the field got off badly owing to the lull which is often associated with village hunting. The pack had obtained a good start. The fox faced the wind; for some

time he ran straight enough and hounds ran hard. They passed Buckby Folly on the left, crossed the Rugby—Northampton main road, sunk the valley as though for Vanderplanks and close by Foxhill, owing to a difficult bottom and several couple of hounds hitting the line of another fox, some of the leaders were thrown out. The body, still running hard, crossed the West Haddon—Daventry Road with Watford Covert on the left, and checked on the road midway between Crick and West Haddon. Despite the fact that information was at hand describing exactly where the fox had been seen and all ground made good, the line was not touched again. So came an unsatisfactory end to a good gallop with some delightful country ahead, and in the ordinary course of events "catching time" not far distant. A fox found in an osier bed below Coton was hunted through that hamlet into the gardens of Guilsborough Hall and killed. At that moment another fox was viewed and hounds laid on. By now time pressed and the afternoon promised to end in a murky evening with rain spreading from the west, and so every fox by then must be treated as the "only" fox. Hounds seemed unable to settle, nor was it surprising that this fox was lost after a few fields, with what seemed a hopeless scent. It appears that when hounds have killed a badger or have been taken from a fox just killed they find difficulty in hunting another scent at once, which is not surprising when the problem is considered.

EMERITUS.

COTTESMORE'S FAST RUNS

MONDAY (5th).—Casewick Hall. Colonel and the Hon. Trollope-Bellew having entertained all as usual, also provided the material for two good hunts.

We found at once in the Park, an old dog fox, said by Colonel Trollope-Bellew to be eight years old, having been lucky to escape Mr. Hilton-Green so long. At a cracking pace he took us through Little Uffington, Big Uffington, Steddans, and, with Belmisthorpe on the right, turned into Uffington Springs; here our hero swam the Welland river and continued on into Burleigh Park, where we lost him after a first-rate hunt of 40 minutes. Finding again in a kale field outside Casewick Park we ran across the Park, over the railway, and, with Tallington on our right, reached West Delping, where we turned back along the river, and almost caught our fox at Tallington. Going on from there we recrossed Casewick Park, and hounds were finally run out of scent near Big Uffington. To finish Shillington Osiers and Covert were blank.

On Tuesday (6th) we met at Loddington Village in lovely weather. We found at once in the Redditch, and ran through Tugby Bushes, Priest Hill and Skeffington, and, leaving Tilton Wood on the right ran towards Tilton Village before turning back through Skeffington into the Redditch, hounds having run at a great pace for 40 minutes.

Going away with a fresh fox from the Redditch, we ran fast over the Leicester turnpike, through Keythorpe and further into Fernie country, where hounds were stopped. From Launde Park Wood, a great hunt started. Leaving Launde Abbey on our left, and Coles Lodge on the right, we cross the boggy bottom, ascend the hillside, and with Witheote on our left, cross the ridge and run hard across the summit of the Wisp Road, through Cheseldyne Spinney, and with Little Owston on the left, continue on almost to Knossington. Here we turn through Lady Wood and Orton Park Wood, pass by Betts Barn, and proceed down almost to the Langham—Cold Overton Road before bearing right-handed across the Langham—Oakham Road. Leaving Langham Lodge on our right, we sweep past Westfield Grange and through Ashwell Spinney, and finally lose our fox a few fields beyond at dusk, after a really great hunt of 90 minutes, and an eight-mile point.

FOXY.

ATTRACTING RACING VISITORS

A Good Meeting at Sandown Park

MUGGY weather, caused, so it is stated, by the Gulf Stream being warmer than it used to be, suits racing under National Hunt Rules, and the season under those rules continues on its successful way. It is true that there will be only two days next week, at Birmingham, but then the week before Christmas is generally open. After Christmas Day there will be racing all over the place with the Kempton Park Meeting the most important and popular. This meeting will be held on Boxing Day and the day after. The Kempton Park directors, or some of them, are always thinking of something new which may attract visitors. I am all in favour of pretty gardens and well-built and kept stands and lawns, and I am all in favour of increased prize money, and, if possible, reduced charges for admission, but I cannot honestly state that I am in favour of the new idea for the Boxing Day meeting. On that holiday, the day after Christmas festivities, when, from personal experience, I can vouch for the fact that children are often not feeling their best and when for a few hours parents would willingly let them rest, and also rest from them, parents who are members are asked to bring their children with them. It is even stated that there will be a Christmas tree on the Members' Lawn, no doubt all lit up with electric candles. It may even be that the chairman of the directors, Mr. John Hutton, will appear dressed up as Father Christmas and give away presents. Surely it would be much better if a place were prepared for the afternoon where one could leave one's offspring in the dry and comfort and pick them after the racing and after they had played a series of round games. And in any case, who is going to know whether the children brought are really the offspring of the member alleging that they are his. No, no, my dear friends, the directors of Kempton Park, this is not a good thing that you have done. Racing is a sport, but it is a very serious one, demanding all a man's, or a woman's, time. It is not a game for flippancy, and is not meant for the nursery, although some of us may first have heard of the sport when there. And now I suppose that the Kempton Park directors will call me "Old Scrooge."

A feature of the National Hunt season so far has been the paucity of good hurdlers of promise, and the number of steeplechasers of more than average ability. It always used to be the other way round. Even such a great patron of the game as Mr. James Rank has practically no young hurdlers of promise, and is trying to buy some. Naturally, any number of people are willing to sell, but they have not good enough horses for the races that that owner would like to win. On the other hand, Mr. Rank would seem to have a number of good young steeplechasers. Miss Paget, who is as interested in the winter racing as she is in the summer meetings, has been buying at the December Sales horses which she hopes will make hurdlers, and has also bought one or two from Ireland and from France. The horses bought at Newmarket included one or two who might make good hurdlers, notably Foxchase and Alarm Bell. They and others have gone to Epsom to be trained by Walter Nightingall, who must have now more than a hundred horses in his yard. Never probably before in the history of racing has one man had so many horses to train at Epsom. Mr. Whitelaw, another great patron of racing under National Hunt Rules, would also seem to be short of high-class hurdle racers. There was a time when quite high-class flat-race horses were put to hurdling, especially horses that could barely do a mile. They always then seemed to be able to stay two miles over hurdles. It may be that in those days hurdle races were not run as fast as they are now for horses to win over hurdles have to be more than milers on the flat. Indeed, a horse who can win good hurdle races has to be a really good stayer.

There was some good racing at the last meeting at Sandown Park, where the going was good on the first day and holding on the second afternoon. There is no better place from which to watch racing than the slopes of Sandown Park, and there are few, if any, worse members' stands. Surely it is time that it was pulled down or burned down. No better site for a really up-to-date stand exists on any racecourse that I have ever seen. The Blue Boy is now nine years old, and seems at last to have found something that he really likes doing, and that is to run in selling hurdle races. He has run for two of them, and won each of them, and what is more, this horse, whose reputation has not always been too good, has won them as if he thoroughly enjoyed doing it. He will win as many more as he is started for.

The betting market on a racecourse is often a most inexplicable thing. A hurdle racer named Tragedian met with a serious accident a year ago and cracked a pelvis. After making a wonderful recovery he was placed back in training, and made his first appearance again on a racecourse at Kempton Park a week before this Sandown meeting. He started with the others at 20 to 1, and ran really well until he was close home, when he shut up like a clasp knife. His clever trainer, C. Langlands, was more than pleased at the manner in which he ran, and he was more than surprised when he found him a very short-priced favourite for the Esher Hurdle, for he does not bet, and Mr. and Mrs. Nicholson, the owners of several horses with him, are also only in the five pounds line of betting business. I cannot see why the ring should have opened this horse at favourite's price, 5 to 2, for there is no doubt that he was doing his best at Kempton Park. However all was right, for the horse won nicely from Remeber II and Cocklaw Dene, who had come all the way from Scotland to run for this race. It is to be noted that he did not get much of a chance as his rider, not knowing the course, got well shut in on the rails in the straight. He will win more races for Major Anthony Marshall, who does so much for racing in Scotland by acting as a steward at many meetings. People who come all the way from Scotland to have a go against the Southerners always seem to come prepared, and they brought with them not only Cocklaw Dene but also Goldscleugh, who was to act as a retriever if the first attack failed. It did fail, as I have recorded, and so out Goldscleugh had to go and win the last race of the first day, the Amateur Riders' Steeplechase. Those visitors who went to get their shirts back must have felt half a mile from the finish that they were in for a naked week-end as coming round the long bend towards the pond fence Goldscleugh did not seem to have any chance. Mr. Black then sat down and rode him home as hard as he could and mowed the opposition down to win by a couple of lengths to most curious noises from the members, stands, undoubtedly made by visitors from over the Border.

Yet another fine steeplechase to watch this season, which has been rich already in such events, was the three miles Sandown Steeplechase. Rudolph IV had won so nicely at Kempton Park, when he had come from nowhere and sailed past the leader, that many visitors thought that he would win. On the other hand, the class that he was meeting seemed to be rather better to any that he had succeeded against before and class even at jumping does tell. Yet Rudolph IV won, and it is to be admitted that he is of much better class than was supposed. He was carrying a penalty of 7lb. for winning at Kempton Park. His owner, Mr. Bailey, rode the nine-year-old really well, always having him up with the second lot, the first lot was Rightun, which means that he was by himself. When half a mile from the finish Rudloph IV made a mistake, Mr. Bailey did not hurry him at all, but let him settle down again and get his confidence back. He was in front with Jovial Judge at the last fence, and then beat that nice steeplechaser of Mr. Rowleys Ranks by two lengths in the run in. Rudolph IV would have won the National Hunt Steeplechase last spring at Cheltenham if he had not had to carry a small penalty. Still, if he had won he would have been lucky, for there is no doubt at all that Young Mischief should have won that race, as he showed when he went on and won the Scottish Grand National. Still, Rudolph IV is a very nice horse, and was bought cheaply by Mr. Bailey his owner for he gave Mrs. Waddington only £500 for him. And that at the time seemed a good price for him for until he had won at Newbury he had been known only as a good hunter. I suppose that Mrs. Waddington had been hunting him herself. Rudolph IV will now be talked into being one of the favourites for the Grand National next March. Those people who would back him for that race might be well advised to look up the records of the National Hunt Steeplechase at Cheltenham, and those of the Grand National at Aintree, and compare them. Between winners at Cheltenham and winners at Aintree there is and always has been, a great gulf fixed.

And now although it is late, but that cannot be helped, a few words about a man whom many of us who love racing and go racing will miss very much, poor Colledge Leader, who died after an operation, and was buried in the middle of the week at Newmarket where he had lived and trained so successfully for so many years as had his father before him. We all knew that he was not well, and that he was to undergo a serious operation, but after it was over we heard at Sandown Park that he was dead, having first heard that it was successful. Colledge Leader was one of the five sons of old Leader of Wroughton, who trained George Frederick to win the Derby away back in the 'sixties. Some time after that he left Wroughton, and went to Newmarket, where the family have been ever since. Harvey and Tom still train there, while Stephen assists Harvey. Fred Leader, a successful trainer was killed in a motor car accident on his way back from Ascot several years ago. Mrs. Jack Jarvis is a sister of the brothers. For many years Colledge Leader was a public trainer and a very successful one, but some years ago he was asked by Lord Derby to be his private trainer and he handed over Machell Place to his nephew Ted Leader. Lord Derby has lost a most able trainer and a friend. Leader had placed his Lordship at the top of the winning owners' list this summer, and seemed in for a wonderful year again in 1939

Leader was a most quiet and charming man, against whom no one ever heard a word, for he did not understand how to do anything wrong. He was reserved and modest, but a fine friend, and no one's enemy. He leaves a wife and four children. He will be very much missed in the world of racing, and very hard to replace as a trainer.

GNOSTIC.

THE GROWTH OF TROUT

Some Reasons for Discrepancies in Size

IN these days of easy travel most trout anglers soon acquire enough experience to realise that the size of trout varies enormously in different waters. Bearing in mind the effects of overcrowding on plants, animals and human beings, the first temptation is merely to condemn the small as a population which has outgrown and outrun the available food supply and to congratulate the owner of the large as by Nature's kindness fortunate, or as wise in the regulation and management of his fishery.

But a little further experience soon makes the fact apparent that size is not necessarily connected with the abundance or scarcity of trout. It is true that often where trout are small they are also found in large numbers in a lake or stream, and larger fish are relatively much less plentiful in the waters which they frequent; but this is by no means always the case. Sometimes even small trout of four, five and six to the pound may be scarce in waters which are by no means hard fished, and sometimes larger trout may be quite plentiful in other waters where the angling is intensive. Many of us can call to mind pleasant holiday days spent in the Highlands on some lochs where a hard day's fishing produces a pathetic number of woefully small trout, and most of us have heard of the 58,000 trout averaging 13oz. which were caught in Loch Leven this season.

This sort of evidence soon induces one to abandon any preconceived notions about the absolute relationship of size to numbers of trout and to begin to search for some factor that will fit more closely to the observed facts. We first, then, have to think of where we have seen the small trout and the large trout, those five to the pound, and those which normally run to a pound or over, and where we catch what might be called the normal trout of ½lb. or ¾lb. For the smaller trout we have to think of our family summer holidays on Dartmoor and in Devon, in the higher Yorkshire streams and in the West and North of Scotland; it is in these waters that we get the little fish, many of them black and not particularly beautiful, or perhaps four or five to the pound, and among which a ½-pounder is a prize that falls to our lot on by no means every day.

Then at the other extreme are the larger trout which, when we are sufficiently lucky to get a day, we find in a southern chalk stream, in some of the lakes and fewer of the rivers of Eire, and in an occasional loch in the far north-west of Scotland. For the average trout we have to look to the ordinary waters: the lower parts of some of the English, Irish and Welsh rivers, the Tweed, Don and Deveron in Scotland, and a few of the Scottish lochs, such as Loch Leven in Kinross and Loch Watten in Caithness, which are away from the Highland area and influence.

When we come to think these facts over we begin to realise that numbers of fish in a given area of water may be less important than we first thought, and that in reality the three classes of trout which have been indicated can be connected sometimes with numbers but very much more frequently with the particular type of country in which the lake or river is situated. Those happy holiday days were spent among hills and heather: the hills may have been high or low, but they were in all probability of some igneous rock, granite, whinstone and so on; the heather may have been high and unkempt where grouse and deer were scarce, or it may have been burnt and tended for the benefit of birds, sheep and stags, but it certainly will have been on peat perhaps only a foot, or possibly six or more feet deep.

During those odd days when perhaps the family was forgotten, fishing was the sole object, and 4lb. or 5lb. trout were the hoped-for quarry; we may have felt more on business bent and less inclined to examine the country round about, but if we did so we must certainly have realised that we were in the chalk streams of the South, or that those rounded, weathered knobs of rock, and that luxuriant green grass betokened the presence of limestone which may even have been confirmed by the remains of that old lime kiln not so very far away.

Occasionally we may have an apparent anomaly. The big trout, the clear water, those abundant waving weeds may be in an area where we see high hills, heather and peat, but if we make further search we shall find nearer to the waterside the same evidence of lime that we noted in the more typical limestone areas. Then finally those ordinary trout waters, as I have called them, are more the everyday waters of those who live in the neighbourhood; they exist in, or flow through, agricultural land with just the ordinary soil and geology of the countryside, probably without peat for very many miles, and almost as certainly without any particularly noticeable rock formation of either the granite or limestone type. We are now, therefore, in a position to correlate the size of the trout with their surroundings and it becomes plain that small trout are found with the granite, peat and heather, large trout with chalk streams and limestone, and the intermediate trout with the intermediate, ordinary, agricultural land.

To some, part at least of this story has been known for a long time and, while no attempt was made to advance any definite reason for the variations, the statement became somewhat common that the small size of the Highland trout was due to the lack of food organisms in peat water. The late Rowland Southern was the first to dispute this theory and to point out that food animals might be found in plenty on and under the stones and in the mosses of the peat water, although these organisms were by no means the same as the shrimps and snails which form such an important item in the fauna of the chalk streams. Gnat and midge larvæ take the place of duns and so on, but the larger forms of crustacea and molluscs are absent.

We also now know that peat waters are acid waters and chalk streams are alkaline. Some of the former may be so strongly acid as to attack lead pipes possibly with danger to the consumer, and some of the latter may hold so much lime as to incrust boilers. We have further ascertained that acid waters may contain practically no calcium, and experience with cattle and human beings has shown how important this mineral may be in bone formation and in the general well-being and size of the creature concerned. The acidity or alkalinity of water is recorded chemically by what is known as the hydrogen ion concentration. This is usually called the pH value, and can be easily determined with approximate accuracy by a simple colorimetric test at the waterside.

So closely is the size of trout connected with the pH value that, given the one, it is possible to state with reasonable certainty the average value of the other. At least in waters that are acid or neutral, and possibly slightly alkaline also, the largest size which the trout normally attain is also in strict accordance with the pH value. In Loch Leven, for instance, of which the water is approximately neutral, only 25 of the 58,000 trout caught this year were 2lb. or heavier. It is possible that trout which develop strongly cannibalistic tendencies, may exceed the normal limit, but it would seem that one can do nothing by the introduction of weeds and natural food animals to increase the ordinary size of the trout in any water, though if the water can be rendered more alkaline by the introduction of lime or limestone, then a change for the better may perhaps be made. In some waters, however, certain types of limestone may quickly be inactivated by a deposit on the stone.

On the surface, therefore, we would appear to have discovered the secret of the size of trout to be in acid or alkaline water and more particularly in the absence or presence of calcium in the water, and that roughly the greater the quantity of calcium the larger will be the trout. There are, however, in nature some exceptions to this apparent rule; at least one or two lochs exist in peat areas without limestone where trout may grow to 3lb. or 5lb. in weight, but how they accumulate enough calcium for their bones and scales is as yet a mystery. To trout breeders and trout fishermen the whole subject of the factors controlling the rate, and total amount, of growth in trout is of great importance, but as yet little has been done to elucidate the problem, and a wide field for research remains open.

DEER-STALKING IN 1938

A Review of an Extraordinary Season

TWO factors in a stalking season impress it on the mind of the individual—the sport and the weather. To these, during the season of 1938, was added a third—the international situation. The two latter phenomena will be chiefly remembered this year, nor are either likely to provide very pleasant recollections.

The season promised to be a good one for the winter was very open and deer, generally speaking, suffered but little from the weather. These expectations were to a great extent realised, and the head stalker of one large forest told me that it was the best season for heads and weights that he ever remembered. On the other hand in many forests stags were late in going to the hinds, and, having done so, went out of condition very rapidly. Though I have not the facilities this year, as formerly, for giving a detailed account of the season, several owners have been good enough to send me particulars which seem to show that the average of weights was very high. For instance, at Strathconon the 46 stags killed by October 1st, including two small switches of 12st., had an average weight of 16st. At Affaric, 70 stags averaged over 16st. At Craig, 50 stags averaged 16st. At Ardverikie, 24 stags were killed, ranging from 21st. 7lb. to over 17st., 90 stags being killed in all. At Glenfeshie, six stags of over 19st. were killed, including one of over 23st. At Glenmazeran the Master of Elphinstone killed, in a day, three stags which averaged 19st. 3lb. At the Barracks, 58 stags averaged 14st. 7lb., clean.

At Corrour only bad heads were shot, and some very good heads have been left on the ground. Owing to the international crisis many people left Scotland before the close of the season and did not return. But for this and the horrible weather at the end of the season, I think, judging by the heads I have seen, that a good many more good heads would have been killed. In a howling gale, with showers of rain or snow, it is impossible to spy, and very often, if you have been lucky enough to see a good stag and get in, to shoot.

I have not had a chance, this year, of seeing the heads received by Mr. Spicer, of Leamington, for mounting, but he tells me that he considers it the best season for heads for many years.

Of the heads I have seen, three seem in the opinion of the majority of stalkers to stand out. Which is the best I should be very sorry to have to decide. One is a very fine royal from Strathvaich (35in., 5¼in., 29½in.). It was shot by Mr. R. Williams, who is, I believe, Captain of the Eton shooting eight. He will be very lucky if he kills as good a head in his future career as a stalker.

Another royal was shot by Lord Belper, at Glenkingie (35¼in., 5in., 27in.). The tops are magnificent, but the brows and beam are not as good as those of the Strathvaich head, though the latter suffers from a short point on the left horn.

The last of the trio was shot by Major J. Coombe, at Strathconon, and carries eleven points (6+5, 34½in., 6in., 27½in.). It is a very showy, wild-looking head, very thick horn throughout and with

11-POINTER BELONGING TO LORD WYFOLD

lovely tops, missing a point on the right. The coronets are practically non-existent. It is, of course, shorter than either of the other two, but is slightly thicker and about the same as the Kingie head for span. The Kingie head wins on tops and has a beautiful shape. I have heard some very interesting discussions as to which of these heads should be awarded that horrible myth, "the blue riband of the stalking season."

Lady Belper also killed a very good royal at Glenkingie (34⅞in., 4⅝in., 29½in.), with good shape and long points. The left bay is 13in long.

A good head was killed at Fasnakyle by Miss Weller Poley (6+6, 36⅜in., 4⅞in., 27⅜in.). The brows are weak and a point on the left top is missed.

There was a long, showy royal from Blackmount (36in., 4½in., 33⅛in.), which left one with the impression of being rather thin and not the best shape.

Lord Latymer killed a 15-pointer at Ledgowan (7+8, 33⅜in., 4⅜in. 23in.), with very good lower points and rough horn, but narrow.

Captain E. Merry killed a 13-pointer at Benula (7+6, 36¼in., 4⅞in., 24⅛in.) with good brows and thick horn. The head comes in at the top.

The best head killed by the Duke of Portland, at Longwell, was a royal with 12-in. brows (35in., 5¼in., 28⅛in.).

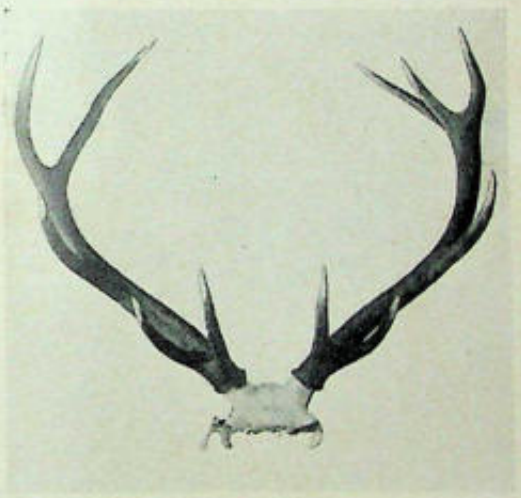
Mr. W. G. Gordon got a nice royal at Cougie, part of the old Guisachan Forest (32¾in., 4⅜in., 29½in.).

Captain Graeme Whitelaw had four good heads from Glenfeshie.

7+7	36in.	4⅞ in.	26⅛ in.	Good points on top. Thin brows. Nice shape. Good beam throughout.
6+6	35⅛ in.	5¼ in.	30⅛ in.	Two weak points on top. Otherwise good. Very good horn and shape.
6+7	33 in.	5 in.	25 in.	Good, but rather thin points (Mrs. Whitelaw).
5+6	32⅛ in.	—	32⅛ in.	Good lower points.

An attractive 8-pointer was killed at Borrobel (34in., 5½in., 31in.).

At Achintoul, Mr. R. Lamont got a 13-pointer (7+6, 35in., 5in., 34in.). One point on the right top



A ROYAL SHOT BY MAJOR A. H. WILKIE

is short, the brows are poor and the left bay long. At Wyvis, Captain Abbey killed a 10-pointer (6+4, 33⅜in., 5¼in., 32in.). It is not a well-balanced head and misses the right bay. At Achnacarry, Mr. Stewart killed a royal (35⅜in., 5¼in., 28in.) with good beam and ugly tops, and at Loch Choire Mr. M. W. Beaumont killed a very wild "wind-blown" 8-pointer (36⅜in., 4⅜in., 31⅛in.)—an attractive head.

The measurements Mr. Spicer has kindly sent me are as follows:

Points	*Locality*	*Length*	*Beam*	*Span*	*Owner*
6+5	Glenkinglas ...	37⅛ in.	4⅞ in.	35 in.	Lord Wyfold
7+7	Blackmount ...	36⅛ in.	4⅞ in.	30½ in.	Lord Wyfold
7+7	Invertrossachs.	36⅛ in.	5 in.	31⅛ in.	Sir James Wilson, Bt.
5+5	Ardverikie	35⅛ in.	4⅛ in.	32½ in.	Colonel J. N. Horlick
6+6	Corrie Lair ...	34½ in.	5⅛ in.	32⅛ in.	Major A. H. Wilkie
7+6	Jura	34⅛ in.	4⅛ in.	37⅛ in.	Mr. C. G. Campbell
7+6	Ardverikie	34⅛ in.	4⅛ in.	28½ in.	Colonel J. N. Horlick
6+6	Ardverikie	34⅛ in.	4⅜ in.	27⅛ in.	Colonel J. N. Horlick
6+6	Ardverikie	34 in.	4⅛ in.	35⅛ in.	Colonel J. N. Horlick

I saw several curious freak heads of a type which I have not encountered before. At Glenmazeran a stag was shot which, on one side, had no horn. In its place was hanging a loose bag of skin, from which grew a small forked piece of horn. This swung freely when its owner moved, and must have caused a good deal of inconvenience as it hung directly over the eye. A stag with a very similar type of malformation was also killed at Affaric. Yet a third carried two horns, but one grew straight from the bone of the skull, merging into it with no intervening pedicle. Part of the pedicle, again, hung loose from a sort of skin bag with a small piece of horn growing at its extremity. It is curious that three such abnormalities, which cannot be common, should occur in the course of one season.

The question of what stags should be shot is not an easy thing to decide though simple as compared to hinds. The head stalker of one very

10-POINTER SHOT BY COL. J. N. HORLICK

14-POINTER SHOT BY LORD WYFOLD

A ROYAL SHOT BY COL. J. N. HORLICK

well-known forest gave me an illustration of these difficulties without in any way simplifying them. He noticed a bad stag at the feed with a poor head and no brows at all. He shed on March 2. When the other deer started to shed their horns he already carried brows and bays, the former of which eventually measured 15in. This after having no brows at all! When killed he had a fine head of 11 points.

There is great prejudice in some quarters against what is known as "cube" feeding. It seems to me entirely unfounded. Such feeding is merely an attempt to supply deer with the qualities necessary to promote good horn growth, which are lacking in the only natural food they can get under present conditions. Why this is any more to be deplored than feeding with beans or maize I cannot see. Captain Graeme Whitelaw writes from Glenfeshie: "Weights and heads have improved tremendously, especially the latter. An interesting point is that all the heavy stags came from the 'cake' feed. The stags from the other feeds, maize, &c., did not show anything like the same improvement."

I did not stalk at all in Scotland last year, and I only had four or five days this season. The sport seemed to me just as good as ever, far superior to many forms of Continental sport, though without the spectacular prizes to be won there. That we in Scotland could expect red deer heads like those on the Continent would be unreasonable and impossible, but that they could be much better there is no doubt. A great many owners and some tenants are doing all they can to improve heads, but though it is pleasant to know that their care and forethought are at times rewarded by a really good trophy, not much impression is made on the bulk of the deer.

It is, no doubt, very important to shoot bad-headed stags, but I am convinced in my own mind that the real cause of bad heads lies in the hinds. If these were shot with the same care as are the stags, by the owner, the number of bad heads would diminish.

I stalked in a well-known forest which had not been let for many years. On the last day of my visit my host and I inspected together the 50 odd heads for the privilege of shooting which he had paid a large sum of money. He could have shot a very nice 11-pointer as well as several other heads which a good many people would not have spared. Being a sportsman such a course did not appeal to him, and he left them to attain, if they can, their full development. I have never, except once, seen such a collection of rubbish as the heads shot. There was scarcely one with the slightest attempt at a top, nearly every one being a switch, a 6-pointer or a freak.

My host looked at them rather wryly, and then remarked, "You know really one ought to be paid for doing this sort of thing!"

"There's the answer," I said, pointing at the rows of heads which adorned the larder, the gillies quarters, and the usual offices. They were in the main a very nice lot, royals, 10-pointers, and so on,

14-POINTER BELONGING TO SIR JAMES WILSON, BART.

many with nice cups. They date back to the early years of the century, in a good many cases. I suspect they ought to have been spared. Anyhow, if enough of such types are systematically killed year after year, it soon shows in the forest.

My host was the ideal type of tenant from the owners' point of view. He gave much and took little. But there are signs that this type of tenant is growing scarce, and in no very long space of time they are bound to be non-existent. They simply will not pay to shoot rubbish of this type. It is all very well to say that the sport is the same. It is. It is the sportsman who is changing. He knows more, at least the one who wishes to take the lease of a deer forest. I once suggested to a friend of mine, who owned a large forest, crawling with rubbish, that he should give orders to his stalkers to shoot the real identifiable bad stag about which there could be no question, at any time of the year when they could be killed. He immediately said: "What about the meat? It wouldn't be fit to eat in the winter?" The heads certainly were not those which one would desire to kill in the autumn, and to try to obtain good heads, I have always understood to be the chief object of a deer forest. Personally, I should like to see such a course adopted all over Scotland. Forests ought not to be run on the lines of a butcher's shop.

However great and systematic the efforts of individual owners and tenants, there is a continual stream of bad stock coming in from over the march that cannot be dealt with except by co-ordinated management, which is a long way off. Many more good heads are killed now in a year than was the case in our grandfathers' time. Unfortunately, the same remark applies to bad ones. I have said it many times, but there is no harm in repeating it: "So long as 40 bad stags are worth as much as four, or ten, or two good ones, so long will the numbers of bad deer increase." The saving grace is that the sport is the same, and always will be, but until large numbers of deer, especially hind, are systematically killed there is little hope of improving heads.

FRANK WALLACE.

ANOTHER SCENE FROM SCOTLAND

"The sport seemed to me just as good as ever, far superior to many forms of Continental sport . . ."

A SKEIN PASSING OVER THE FIRING LINE
The successful climax of the beater's part in the drive

DRIVING GEESE

Shooting from a New Angle

By GUY B. FARRAR

AT the instant this story opens, I was seated on the bank of a marsh dyke, my thigh boots knee deep in ice cold water, awaiting the moment when our beater was to put up the white-fronted geese feeding in a nearby pasture. Watches had been synchronised and each gun allowed seven minutes to reach his allotted position, mine being in the aforesaid dyke behind a screen of dead rushes. At least five of the seven minutes had been expended in a stealthy and circuitous approach to the dyke, so zero hour was due at any moment.

During the final seconds before the drive began I kept assuring myself that geese were the easiest of aiming marks, and that sitting in 2ft. of muddy water was an ideal position from which to shoot well; in fact there was no earthly reason why I should not get a right and left if the white fronts would only come within range.

Seconds passed, but still no sound came from behind the quickset hedge beyond which the geese were feeding. Had some hitch occurred? Had the beater's watch stopped? What on earth had happened?

Suddenly the silence was broken by a warning cackle, the staccato ack-ack-ack-ack, telling that every head is up, the gaggle ready for instant departure. A babel of shrill screams heralded their take off head to wind, and a moment later, a dozen white-fronts came streaming over the hedge top like so many partridges.

Although one could hardly see daylight between the tightly bunched skein my first barrel found an empty space. Cursing myself as every kind of fool for having fired into "the brown," I then swung well in front of the nearest bird and had the satisfaction of seeing my second shot cut him down dead as a door nail, his white stern and orange feet marking the clump of rushes into which he fell. Meanwhile the main body of geese had passed within range of the other two guns so a very successful drive ended with four white fronts in the bag.

This driving of geese on inland pastures is a most exciting sport demanding skilful team work between beaters and guns and a very considerable knowledge of the ways of wild geese. For three winters in succession I had the opportunity of driving geese, and during that time I learnt many things concerning this unusual form of shooting.

These geese, grey lags and white-fronts, on being put up always flew for a short distance in a westerly direction, then turned eastwards up the valley for, perhaps, a mile before finally heading westwards again for the sea shore some three or four miles away. As they naturally rose head to wind it was necessary to calculate what effect this take off would have on their line of flight before reaching the guns and therefore from what direction the beater should approach. I came to the conclusion that one man armed with a pair of field glasses could drive the geese with more certainty in the desired direction than three or four farm boys walking in line.

By observing the geese through glasses when beating one could tell by their movements on the ground the probable line of flight and so gauge the exact angle from which the drive should be made.

I often drove the birds myself and found it quite as exciting as shooting. Watching a big skein approaching a hedge behind which the guns are concealed, and knowing that the beater's part in the drive has been successfully accomplished brings no small measure of satisfaction.

I found that I could drive these geese quite successfully against the wind, but that they rarely crossed the corner of a field. This fact was a considerable help in posting the guns, especially when only three or four were available to cover a wide area.

Ample time should be allowed for them to reach their positions as on the secrecy of this manœuvre the success of a drive depends. The voluble gentleman, or the man who declines to creep to his post under cover of a hedge or bank, is quite out of place at a goose drive.

We generally shot the ground about once a month for three days in succession, driving in the early morning soon after the geese had arrived and again at mid-day when some at least had returned to feed on the pastures. On one occasion we had had our drive and were returning home to breakfast when we discovered to our amazement another gaggle feeding in a neighbouring field quite undisturbed by our shooting.

If, after taking into consideration the prevailing wind, the usual line of flight, and the direction in which the geese will jump, the guns are placed to cover the centre position of two adjacent sides of a field and the geese driven towards the intervening corner, they are almost certain to pass within range, and if they do, the drive has been a success from a tactical viewpoint.

The sensation at seeing two 7lb. grey lags with a wing spread of nearly 5ft. come hurtling downwards after a successful right and left must be experienced to be appreciated—believe me, few shooting moments can equal it.

"... *seated on the bank of a marsh dyke* ..."

HEADING IN THE RIGHT DIRECTION
It is almost possible to ensure that the geese always pass within range

This England . . .

Storm over the Cheviots

GREAT or small, the Englishman when troubled in his mind, seeks easement and reflection in the Countryside. For there is a peace about our land like that of ripe old age. All has been known it seems, all suffering, all joy, till laughter and tears alike take second place. To give ourselves awhile to her rough heart, to spend ourselves in play about her knees, is to be purged of self-made fears and face the world again clear-eyed and comforted. And if at the day's tired end, you raise a golden Worthington, here is one more communion 'twixt your land and you—for this, too, is of England's nurture, worked by your elders' cunning for your succour and your strength.

. . . by Worthington

THE ART OF GOOD LIVING

By ANDRÉ SIMON

STRICTLY following the order of development, we shall pass from the fishes of the sea to the birds of the air. There are still a number of birds born to the illusion that the air is free to all and is their own particular realm. Some of them are quite safe because they are scavengers not fit to eat ; such are owls, gulls and crows.

Others are fairly safe because they are protected by the law of the land, they and their eggs, such as the plovers. Others owe their uncertain safety to their wings and their own ability of making good their escape from their many enemies, as they migrate from one feeding ground to some breeding sanctuary. But all such birds are too little to be depended upon for our greed and needs, and we have long since made quite sure of our supplies of fowls by breeding chickens, geese, turkeys, ducks, guinea-fowls and others, to await our pleasure.

From the chick (*Poussin*) to the old cock or the boiling hen, only fit for the pot, there are ever so many grades and degrees of chickens. It is in the first place a matter of breed : there are good, better and best kinds of chickens as there are of horses from the cart-horse to the thoroughbred. Then there is the important question of feeding ; no aristocrat can be expected to remain dignified on a diet of fishmeal and mashed swedes, nor can a Bresse chicken grow a breast white and tender unless it is suitably and generously fed.

A well-bred and well-fed chicken cooked upon a spit in front of a wood fire is always acceptable and enjoyable, but there are ever so many more and more difficult ways of cooking a chicken, so that there is no need to fear monotony as long as we can make sure of a good chicken to play with.

Ducks, or rather ducklings, are delicious, but one soon gets tired of duck, because it is so much more assertive than chicken, nor does a duck lend itself to so many modes of preparation. The same may be said of the goose and turkey. They are excellent once in a way, for a change, but the thought of goose twice or more every week is enough to give one gooseflesh.

Quails, when fat, can be very good, and pigeons are cheaper, and should be fatter, than quails in London, considering the number of people who, at all times of the day, are to be seen in Trafalgar Square feeding the London pigeons.

But when August returns and we taste our first young grouse of the year all the pigeons in the world, the geese, and even the finest chickens have no chance left ; there is no finer bird in the whole world than a young grouse in September.

When October comes, young partridges are getting fatter ; they are still tender, and they challenge the grouse for first place, just as they will be challenged themselves in December by a plump hen pheasant. The long-billed birds, the snipe and the woodcock, can be very good also, but they certainly require greater professional skill to come to table at their best.

Kensington Gore

"Hawkins, the sticking plaster. I've cut my chin. My hand, for some reason, is somewhat unsteady."

"Very good, Sir."

"And while you're about it, Hawkins, you might get something to cure a headache. Enough to cure four men."

"I did not know we had guests, Sir. Where did the three other gentlemen sleep?"

"There are no other gentlemen. The hangover in question belongs to me. It is probably the fiercest specimen now in captivity."

"I'm sorry to hear it, Sir. I myself am largely to blame. Knowing you were to attend last night's re-union, I had intended to lay in some Rose's Lime Juice. The matter unfortunately slipped my memory."

"What on earth are you getting at?"

"I was explaining, Sir, the therapeutic action of Rose's. A stiff glass, taken after a convivial evening, has the property of banishing these distressing mornings after — apart from which, Sir — it slakes the thirst in no uncertain manner."

"Hawkins, you're not romancing?"

"SIR!"

"Of course not, Hawkins, of course not. Slip out and order a case of this Rose's. Never mind about the sticking plaster. I don't think I'll need it again."

SHORT DRINK—2 parts Rose's, 3 parts Gin.

LONG DRINK—add soda.

FIFTY YEARS AGO

From the *Field* of December 15th, 1888.

BARBED wire. "Bad times for agriculturists have naturally caused farmers to adopt a means of fencing both cheap and durable ; and, unluckily for foxhunting and foxhunters, wire answers to both these requirements. From a riding no less than from a scenic point of view, everyone would regret to see England's fields divided one from the other by four or five-strand wire fences, and all the hedgerows abolished ; yet this plan would, at any rate, not be a trap to the enthusiastic foxhunter ; he could either ride at the wire in full consciousness of the danger he was incurring, or he could go round by the gate, just as he would do were a navigable river or an 8ft. park paling to come in his path. It is not to the open and visible wire that anyone objects, either on principle or the score of self-preservation . . . but it is against the invisible strand running through a hedge that a perfectly well-grounded complaint is made."

Amateur Helmsmen. "Some anxiety was created, even among the most expert racing skippers, when a distinguished amateur helmsman undertook to sail a crack 40-tonner some years ago, but little notice, however, would have been taken even of that had it not been for the phenomenal success the amateur achieved in handling the yacht in the way dear to the yacht-master's heart. There was a jealous feeling created by this ; but we think that, as a rule, the yacht-masters look with pitying scorn upon the amateur sailor than with any jealous feeling, although they are cute enough to know that there is more than one amateur helmsman who could give most of the skippers a tack to windward and catch them. In America the certified amateur has lately been developing himself, and there is probably a substratum of unconscious vanity in the current notion that yacht-masters even regarded the amateur with fear."

IN THE SALEROOM

A SALE of valuable printed books, illuminated manuscripts, autograph letters and historical documents is being held by Messrs. Sotheby on December 19th and 20th. It comprises the property of some renowned collectors, and bibliophiles will do well to pay it a visit and obtain one of the catalogues, which contain five plates. The particulars of a few of the lots will give a small idea of the importance of the sale. It includes Robert Burton's *The Anatomy of Melancholy. What it is, with all the kinds, causes, symptoms, prognostickes, and several cures for it*, first edition, published at Oxford, 1621 ; a first edition Charles Dickens *The Posthumous Papers of the Pickwick Club*, 1836–37 ; a complete set of Sir Walter Scott's Waverley Novels, first edition, 1814–32 ; this is a very rare set, and nothing like it has come on to the market since 1924 ; and Robert Burns's sermons preached in the Kirk of Edinburgh, 1591 and 1615. Lots 247–259 deal with works of American interest of the period 1740 to 1783 and include the Earl of Abingdon's *Thoughts of the Letter of Edmund Burke, Esqr. on the Affairs of America* ; *Letters from a Farmer in Pennsylvania to the Inhabitants of the British Colonies* ; and a circular from George Washington to his Excellency William Greene, Governor of Rhode Island. There are a number of Horn-books, including one in silver, which is of considerable rarity, and which is similar in design to that illustrated in Tuer's catalogue 37, p. 103, which gives a list of five.

On December 20th, at the same rooms, will be sold a collection of medals and coins and Egyptian, Babylonian and Assyrian antiquities, Greek vases and papyri, and Peruvian pottery and native art, from various sources. One of the most striking lots is a bas-relief of the head of a divine winged human-headed figure, Assyrian (883–859 B.C.) ; also a quartzite head of a king, wearing the (blue) war helmet and uræus, which is a splendid piece of conventional royal portraiture of the nineteenth dynasty.

A NATURALIST'S NOTEBOOK

IT has always been one of my ambitions to travel. Not just travelling about the Continent (I have done a fairish amount of that) ; not just travelling about in a cruising liner (I have not done any of that as yet) ; but travelling in little-frequented spots among more or less unknown people by more or less unknown routes. It is an ambition which I have not been able to fulfil—and one I shall now be unable to fulfil. I would not say that I am heartbroken about that. I get a great deal of fun and much interest out of the English countryside, and I am, I confess, fond of comforts. What was once an ambition has become a mental relaxation. I do my travelling with other people. I am that abominable creature, an armchair traveller. I read books and look at maps. I enjoy the hardships of others, the while my feet rest upon the mantelpiece.

* * *

I read travel books. I read a great many, and I find that a great many other people—people like myself with whole-time jobs and increasing waists—do likewise. Doubtless we are looked upon with contempt by those who brave blizzards, perch perilously on precipices, and plod parched over deserts. We should earn their gratitude—for we buy their books. And where would the modern explorer be if he did not write books ?

* * *

I do not know into how many classes the modern explorer can be divided. Personally I divide them into a rather elastic three : those who explore with a more or less unselfish object (such as collecting for the British Museum), those who explore solely because they wish to write a best seller, and those who explore because they can't help it, lone hands with an itch to travel (these are as a rule real "tough guys"). I like the first and the third. I dislike the second, because I am always doubtful of its sincerity.

* * *

I have been reading some more travel books, and three I would like to recommend to anyone with the same tastes as myself. Two are primarily travel books, the third is a travel book only incidentally in that a journey was made and is primarily a natural history book. I am not going to put them in any order of merit (you probably would not agree with me, anyhow, and also I have met the authors of two of them and might meet the third one day).

* * *

Borneo Jungle, edited by Tom Harrison (Lindsay Drummond ; 15s.), is a collection of essays written by the members of the expedition to Sarawak under the auspices of the Oxford Exploration Club. The object was to make collections for the National Museum and Herbaria. All the members were young men—the average age was 23—and this book is a record of personal experience and in no way scientific.

* * *

It is a jolly good book, too, and very well illustrated. Each of the essays is well written, and each writer has much to say about his particular job. The youth of the contributors is apparent in the eager, virile prose. Quite outstanding in my opinion is that of the editor. It is outspoken, refreshingly so. It says, pointedly, many things that have been needed saying for a long time. As an example, Mr. Harrison describes modern Arctic exploration by young men in parties as a racket. I do not know how right he is in all he says. But I agree wholeheartedly in all he says about natural history collecting. Mr. Harrison has wit, force and courage. His writing is beautifully pungent.

* * *

A book of a different type is Ronald Kaulbach's *Saluween* (Hodder & Stoughton ; 21/–). If you read his *Tibetan Trek*—a remarkable book that—you will know what to expect. Ronald Kaulbach is a young man, rather a Wodehousian young man ; but a young man who likes to do things on his own. He also went to collect—perhaps more an excuse than a reason, though he did collect—for the British Museum. He went again to Tibet, and he definitely explored in the old sense of finding new places. The book is much more mature than *Tibetan Trek*, but the old humour is there, the same eagerness, the same delightful lack of sophistication *Saluween* is well illustrated, well indexed and well mapped. It is more than a good travel book, it is good literature.

* * *

The third book is *Zaca Venture*, by William Beebe (the Bodley Head ; 12/6). Dr. Beebe is a naturalist, a famous naturalist, with a gift for writing scientific natural history in the form of belles-lettres. This book is a crowning example of that very difficult combination successfully achieved. You can read all the book as a story, but at the end you will have learnt a great deal about American Pacific marine life. Dr. Beebe has humour and a belief in his reader's intelligence.

B. V-F.

LETTERS TO THE EDITOR

IS "HANDLEY CROSS" LEAMINGTON?

SIR,—The writer of the article in the *Field* of November 19th has revived this question.

I have not my copy of the *New Sporting Magazine* for 1838 before me, so cannot now refer to the exact words, but Surtees placed Handley Cross in the Vale of Sheepwash, in the western part of the county of Kent.

Surely it is not for anyone, years afterwards, to assert that Surtees meant other than what he wrote? If there is one thing clear in the writings of Surtees, with all its humour, its nonsense and its quaint characters, it is that he thoroughly understood hunting, and that is why it has continued to be so popular with hunting folk.

Surtees would not in any case have placed his kennels in one county and his country in another—100 miles or so apart. Had he done so we should have expected to have seen as entered in his books such an item as:

"To purchase of seven-leagued boots for 'ounds and 'osses both to meets and from where left off, £— —s. —d."

The article states: ". . . but I believe that as the book progressed both Handley Cross and with it the Vale of Sheepwash were moved, to meet their creator's needs, out of Kent into a county much farther from London."

Let us turn to Vol. 2, Chapter XL, in which, after the ladies had left the room at the celebrated dinner at Cockolorum Hall, Mr. Jorrocks tried to keep the conversation to hunting and in describing a run got as far as the plantations at Squerries when the Professor intervened and said it was the place he had been trying to think of. Surtees would have known all about Squerries and what it meant to a hunting man. As a boy I was taught that Squerries was in Kent.

It should not be forgotten that in Chapter XLV. Mr. Jorrocks was introduced by Tom Turveyland, alias Whisky Jim, to the Smugglers' Cave. Surely Warwickshire would not be a smugglers' county? Kent, on the other hand, would have a number of such, and here we cannot be far away from the sea.

We also get another reminder in Chapter XLIX, when, after the astonishment caused by the verdict which involved Mr. Jorrocks' removal to Hoxton Asylum, Captain Doleful called on Mr. Jorrocks in London, which Surtees deals with as follows: ". . . and accordingly he took a second-class fare by the early train of the Lily-White-Sand Railway and sought the 'lovely retirement' of Great Coram Street." Silverley, which supplied lily-white sand, is mentioned in the second chapter.

May I add that I have no connection with Kent. My chief interests are in that part of England around Warwickshire, but I feel I must protest against the continued attempts of various people to alter the meaning of those who have gone before and to make out that they meant other than what they wrote.

Yours faithfully,
Warwickshire. THE GREY CHAPE.

CANALISING THE AVON

SIR,—In the letters of some of those who have written on this subject there appears to be some unjustified pessimism. It seems that some would have us believe that the river which we admire so much is to become a stagnant canal with wreckage on all sides. This is nothing but exaggeration.

I think nobody can deny that, on occasions, the Catchment Board have allowed their statutory powers to get the better of their discretion; some trees have been needlessly cut down, in some places the banks have been widened too much, &c. For my part (though I may be committing some engineering "howler") I cannot understand why the Board does not attend to all the carriers as well as the main river, and why the work is being done in an up-stream direction, thereby depositing disturbed mud in places where they have only recently been digging it out down-stream.

But surely the advantages, which both fishermen and the rest of the community should ultimately enjoy owing to the Board's activities, outweigh the disadvantages which are, after all, only temporary. When the task is finished the whole valley will surely be better drained owing to the clearing out of silt and removal of obstructions, and conditions should be more favourable for the well-being of trout in the upper reaches, which are, in parts, badly overpopulated by grayling.

I am convinced that those who are responsible for the activities of the Catchment Board have no more desire to destroy the charms of the Avon than anyone else has, but the object of the Board is, I imagine, to prevent flooding and ensure adequate drainage in the Avon Valley, and I cannot see how this object is to be successfully achieved without some "barbarity," with very temporary effect on the scenery.

I think "fishing landlords" and riparian owners would find it to their advantage if they co-operated. The Board can be (and has been) persuaded not to remove all the weed, not to cut back the banks too far, not to cut down certain trees, and so on.

By co-operation the interests of all concerned can be benefited.

Yours faithfully,
The Red House, H. P. H. JOHNSON.
Devizes, Wilts.

THE CHAIN OF THE OTTER

SIR,—"Grey Owl" wrote in this connection that his beaver "Jelly Roll," when *suddenly* frightened, dived into the water, leaving behind a chain of bubbles which came from the long fur above the base of the tail, but the point was not fully established. This statement upholds the belief of some people that the chain of the otter comes from the fur on the shoulders.

Having made a special study of this phenomenon, and been convinced for many years that the chain from the otter came from the nostrils, except when the otter first enters the water after "lying dry," when bubbles do rise from the air in the coat, a statement of this description from "Grey Owl," who not only lived amongst the beavers but they lived with him, was very disconcerting.

The only conclusive method of investigation was to obtain under-water photographs of the process from the otter itself. The Zoological Society of London was written to, explaining the situation, asking them if they could supply a large glass tank and an otter to settle this controversial point. Unfortunately there were, at that time, no otters at the Zoo, although the authorities were prepared to help in the matter if one could be obtained, and suggested the name of a very well-known lady who usually kept tame otters who might be able to help.

A letter was sent to her, explaining the situation, and giving the writer's conviction that the chain was thrown from the nostrils in order to expel the air from the lungs to allow the otter to dive quickly and remain on the bed of the river in deep water. Anyone who has tried to lie on the bed of a river in deep water when bathing will find that under ordinary circumstances this cannot be done, as the heels only are on the bottom and the chest and body remain at a slope. Expel the air from the lungs and it becomes possible.

In reply to this letter the lady very kindly wrote that she was sorry she could not supply our wants as she "had not had a tame otter for some while, but with regard to the question how the otter's chain is produced, long observations of three otters I used to have left no doubt in my mind that the air was expelled from the lungs. I have watched them in clear water under ice, when the whole thing could be seen most distinctly. There is no shadow of doubt about it whatever."

This lady is one of our best known and most accurate recorders of natural history, and under these circumstances I am satisfied (like your contributor with his solution) that this is the correct solution to the phenomenon.

The reason for the idea that the air bubbles emanate from the fur at the shoulders of the otter and the base of the tail in the case of the beaver, is that, in the case of the otter, when the bubble hits against the shoulder it is forced upwards, and in the case of the beaver it travels along the regular surface of the body and rises at the base of the tail where there is no further resistance.

That the chain emanates entirely from the fur is obviously incorrect, as once the coat (the otter has two coats—one tight against the skin, which is waterproofed by the oil obtained from the eels that it eats—and the outer, or overcoat, of longer hairs) is saturated no more can be forthcoming, whereas the chain is frequently seen after the otter has been submerged for some considerable time.

These observations could be further studied with the beavers at Whipsnade, and it is understood with otters at the Zoological Gardens in London, where they have recently been re-introduced.

Yours faithfully,
Lechlade, H. L. ELWELL.
Glos.

SIR,—With respect, I venture to say that the views put forward as to the origin of the train of bubbles to be seen in the track of an otter swimming under water, read very like nonsense. Pressure applied to water does not ordinarily, if indeed ever, cause an emission of air or gas bubbles. Water when heated or under an exhausted receiver, emits minute bubbles. If highly charged with air or gas, as in a soda-water bottle, the air or gas is emitted when pressure is relieved by opening the bottle.

Air is contained in water not by solution but as a mechanical mixture, in minute particles. I have often seen otters swimming under water, and have never doubted that the chain of bubbles originates in the main in the otter's expelled breath.

No doubt an otter on entering the water carries air, entangled in his fur, with him. Most of this will probably escape and come to the surface, sooner or later, if he remains in the water long enough. That this can be the main origin of the chain of comparatively large bubbles I cannot believe.

Yours faithfully,
Bay View, W. F. TAYLOR.
Ballycastle, Co. Antrim.

DUTIES ON CRAWLER TRACTORS

SIR,—Those of your readers who are potential buyers of track-laying tractors will have noted with interest the clause in the trade agreement with the U.S.A. by which the duty on this class of tractor is reduced from 33⅓ per cent. to 25 per cent.

When the first application for a duty of 60 per cent. on these machines was made, it was actively opposed by this association, and the duty when applied was fixed at 33⅓ per cent. We have pursued the matter still further since then, and have made representations in all quarters concerned, in the effort to obtain a reduction on a duty which, we felt, was not in the interest of the farmer or of the nation. In view of the need for building up as big a reserve of crawler tractors as possible to be ready to meet any demands in a ploughing-up campaign, we contend that such machines should be available to the farmer at the lowest possible price.

One of our most recent approaches was to the Board of Trade, with special reference to the opportunity afforded by the trade agreement for a concession in this respect and although we had hoped for a bigger reduction, we must at least be grateful for this recognition of the justice of our case.

Yours faithfully,
D. N. M'HARDY,
Tractor Users' Association, Ltd. (Chairman.)
66, Victoria Street, S.W. 1.

A QUEER DEATH

SIR,—In an out-of-doors aviary here a small tortoise (*T. Graeca*) is kept. A young field mouse was found suffocated between the shell and the neck.

The mouse must have run into what it took for a hole. The tortoise would then have extended its neck, and pressed the mouse against the shell. With some interest in natural history I have never before heard of a mouse being killed this way. Have any of your readers?

Yours faithfully,
Kirkoswald, T. FETHERSTONHAUGH.
Penrith, Cumberland.

This is where Father Christmas comes in!

When you think of Father Christmas you think of Christmas presents—and that's where Johnnie Walker comes in! This famous blend of fine Scotch whiskies is specially packed for Christmas in decorated cases containing 2, 3, 6 or 12 bottles, and obtainable from your wine merchant or licensed dealer. No Christmas present could be more welcome.

JOHNNIE WALKER

walks away with it!

BORN 1820—STILL GOING STRONG

BEAR-BAITING AND PUTTING THE CART BEFORE THE HORSE
(See letter "Monastic Sidelights")

MONASTIC SIDELIGHTS

SIR,—I enclose two photographs which show some of the glorious carving on the misericordes at Beverley Minster. The bygone sport of bear-baiting is the subject of one carving; its dramatic effect is superb. The victim, chained to its ring in the ground, is being attacked by several hounds, who are spurred on by two sportsmen. One of these blows on a horn.

The second photograph shows an amusing representation of the old saying about putting the cart before the horse. Unfortunately, the horse-rider—along with many other figures in Beverley's misericordes—was decapitated by one of Cromwell's men.

Yours faithfully,
Leeds. G. B. WOOD.

TIGERS IN BARRACKS

SIR,—I was much interested to read of Mr. Sandeman's daring exploit with a tiger in barracks, and also the two letters which appeared in the *Field* dated October 22nd, 1938, giving such glowing reports of the prowess of this *burra shikari* (great hunter).

In Ochterlony's famous nineteenth century hunting book of the Punjab, *Blue Bull 'Mid Blas and Sutlej*, mention is made of Luke Sandeman of the Excise Department, and the intrepid bull hunter of the Punjab, who was reputed to have shot several of these beasts, and one particular enormous brute which had found its way into the Golden Temple at Amritzar. This animal defied all efforts of the Khalsa to evict it, goring several Akalies (temple guardians), whereupon the leading men implored the great "Ishandeman sahib" to leave his camp at Loodiana and to proceed post haste to Amritzar and despatch the defiant beast. This he did with all disregard of danger thereby earning undying renown.

It is believed that the head of this same animal is still preserved and adorns the entrance to a much-frequented caravanserai near Lahore.

It is a curious and interesting fact to note that these two great shikaries, one the tiger hunter, the other of blue bull fame, and both of the same name, and living 100 years of each other should rise to high fame in the hunting world of the great sporting province of the Punjab.

Yours faithfully,
Bahloh, Punjab. J. W. STRICKLAND.

SIR,—I have not the pleasure of knowing Mr. Sandeman, but have myself been on a number of hunting expeditions with Mr. Massey, and would like to recall one rather amusing incident.

Here hounds meet about five o'clock in the evening, as scent lies better at that hour, and we get better fields. We had accounted for a stout dog jack, who had taken us over a very good line, with plenty of jumping—mostly "karezes," which in these parts vary in depth from 10ft. to 40ft.

We were taking hounds home when suddenly old Verger spoke, and hounds flattened on the line for an instant, and then went away with a wonderful cry.

I sent Rissaldar Sewa Khan (our first whip) forward to get a view of our quarry, who seemed to be making Pathan Kot his point. Suddenly hounds swung left-handed—this was the first time. I got a view as my horse scrambled out of the nullah bed, and our quarry appeared to be a jack of unusually large proportions. He had been headed by a camel train, and was now making straight across the polo ground.

Sewa Khan tells me that he went down the Mall and over the mess garden wall.

Mr. Massey, convalescing from a bad bout of malaria, and unable to hunt, was practising some new shots on the wooden polo horse.

The hyena—as it turned out to be—dashed past him. Mr. Massey, not for a minute losing his presence of mind, but not hearing hounds, took a neat shot at the animal's head and killed him. It is interesting to note that hounds would not break him up.

Post-mortem examination carried out by the veterinary officer showed complete fracture of the lower maxilla and both temporal bones, thus demonstrating the striking force in the head of a polo stick.

Yours faithfully,
Loralai, Baluchistan. CAVALRYMAN.

LONG-TAILED TITS

SIR,—On the morning of December 1st I saw an occupation of long-tailed tits in the fig tree of a Chelsea garden adjoining the Royal Hospital grounds. They flitted off so quickly it was difficult to count them—perhaps there were ten.

Yours faithfully,
31A, Tite Street, S.W. 3. EDMOND L. WARRE.

21LB. EEL FROM THE ZAMBESI

SIR,—The eel shown in the snapshot, which is of a similar species to the conger, was caught by me in the Silent Pool, one of the well-known gorges in the Zambesi river, situated just below the Victoria Falls. The fish weighed just over 21lb., and was caught at night at a depth of 150ft. What with the strong subterranean currents coursing through these gorges, where the Zambesi in places narrows to 50yds. across, and the fact that the eels when hooked dive for the rocky floor, this particular fish provided great fun and took close on an hour to kill.

Ordinary meat bait was used. I have, during the dry season, caught these fish in the gorge below the Victoria Falls within 200yds. of the face of the Falls.

Yours faithfully,
Northern Rhodesia. J. M. H.

KENYA'S TROUT PROBLEM

SIR,—In reference to your article of November 12th, an experience in 1930 may be of interest. Whilst fishing in the Ngare Ndare, which runs into the Uasso Nyiro river, about three miles above the confluence of these rivers, I caught four fish which at first sight appeared to be of the perch variety. On examination they appeared to me to be undoubtedly trout. They were quite silvery, but had lost their markings and spots entirely. After eating them they were without doubt trout and in fairly good condition. I caught them on a large hook baited with raw meat.

Shortly after catching these fish I told a well-known fisherman in Kenya of my feat, but he laughed me to scorn. However, in 1937, I returned to Kenya Colony, and the self-same well-known fisherman informed me that a large rainbow trout had recently been caught in the Uasso Nyiro river, not far from the Ngare Ndare.

It seems, therefore, that the trout in Kenya will acclimatise themselves in the hot low country, for the four trout which I caught were in good condition and to my surprise (for I expected only mud fish) fought quite well.

Yours faithfully,
Fort George, Inverness-shire. WA RHUN.

A HERON'S PIKE

SIR,—Motoring back from Hampshire not long ago I passed a small sluggish stream near Hartley Wintney. I saw a heron on the bank struggling with its capture. I stopped the car and walked over, and the heron flew away leaving behind it a freshly killed 2lb. pike, which had been speared behind the gills.

Now three things strike me as being of interest. Firstly, I did not know that Heron would go for pike; secondly, is not a pike of 2lb. an unusually large fish for heron to tackle; and thirdly, if not too large, why did it leave it behind when it flew away? I shall be interested to hear readers' views.

Yours faithfully,
39, Hill Street, Mayfair, W. 1. P. Q. REISS.

HARRIER ON HAMPSTEAD HEATH

SIR,—On Thursday, November 17th, I saw over Hampstead Heath a bird I believe to have been a harrier. I noticed first what I thought was a big gull engaged in a fight with a carrion crow, but on getting closer saw it was a big hawk. I do not think it was a buzzard, as the wings were too pointed, and the form too slender. I had a pair of powerful field glasses, but the light was poor; however, the colour seemed lightish brown. It seems too late for the Montague. Could it have been a hen harrier, some specimens of which have lately been seen in the Chiltern Hills? Big hawk it undoubtedly was, and that seems to me a very interesting sight so close to London. I wonder if any other readers of the *Field* have seen a bird of this nature in the vicinity?

Yours faithfully,
Hampstead. KATHARINE DOUGLAS-SMITH.

IT TOOK CLOSE ON AN HOUR TO KILL
(See letter "21lb. Eel from the Zambesi")

At times such as Christmas when in the cause of good fellowship rules have to be relaxed, the little dash of ENO'S "FRUIT SALT" will persuade Nature to forgive and to forget little things which would otherwise vex her and put her out

Winter acidity, due to heavier foods, lack of fresh fruit, lack of sunshine, lack of exercise, is corrected by ENO, one teaspoonful of which is equal in alkalizing value to nearly a tumblerful of pure, fresh orange juice.

ENO'S "FRUIT SALT" for BALANCED HEALTH

The words 'Eno's' and 'Fruit Salt' are registered trade marks and indicate exclusively the preparation of J. C. Eno, Limited.

KILLER WHALES AS SALMON EATERS

SIR,—The letter of Mr. Lewis Smith in a recent issue alludes to the depredations of killer whales among the salmon of Campbell River in British Columbia, and from what I saw of the monsters in Scottish waters, I should say that the killers, which we also know as "blackfish," follow the salmon to our coasts.

It is within the recollection of all readers that a great school of "false" killer whales invaded the Dornoch Firth, and came to grief by grounding on the sandbanks near Bonar Bridge. That the whales were after the salmon when grounded is tolerably certain, but in the event of other whales coming to grief in the same way, it would be interesting to have a look into their stomachs.

I saw a small "killer" (or grampus) pursue a big salmon into shallow water on the Kintyre coast, and the salmon beat its enemy by getting under a rock. The grampus wallowed all round that rock with its head down and its tail churning the water, and failing to dislodge the salmon it sped to sea. Five minutes later I saw its form outlined over the sandy bottom as it came swiftly to the rock in the evident hope of surprising the salmon, but that salmon had not moved from its refuge, and the "killer" shot out into deep blue water, and there leaped out of the water like a salmon, showing itself as a mackerel-shaped animal of something under 20ft. in length.

It is not wise to trust to the idea that killer whales do not attack boats, for one did attack a boat which was returning from a seal-shooting expedition from St. Kilda the other year, and while the reason for the attack was the presence of dead seals in the boat, the scent of fish from a herring boat sometimes leads to danger from a hungry killer.

Yours faithfully,

Comrie. DUGALD MACINTYRE.

UNIDENTIFIED POLLARDS

SIR,—I have two lithographs, one "Blackwater Steeple Chase," and the other "Breaknock and Breakneck Steeple Chase." They have on them "Painted by J. Pollard and published by Dean & Co., Threadneedle Street."

Can any reader give me information about them, whether there are only one pair or if they belong to a set of four or more, and if they are rare or of any value at all? I have failed to find anyone who knows of these two lithographs or the steeplechases they represent. Yours faithfully,

Camrose, MARY G. PENN.
Camrose, R.S.O., Pembrokeshire.

THE RECORD TAKIN HEAD

SIR,—I enclose herewith a photograph of what I believe is the record takin head (*Budorcas taxicolor*).

This head was brought down from the Mishmi Hills in North-East Assam by a tribesman a few years ago and was given to me recently by a friend.

I have seen numerous heads brought in in this way, but was at once struck by the unusual size of this one.

The spread at the widest point is 1¾in. greater than anything recorded in *Burke's Indian Field Shikar Book* (the only book giving horn measurements I have available). It is known that the distance between the tips of the horns of this animal tends to decrease with age, and the short space between the tips in this specimen—8in. compared with the next shortest recorded by Burke of 10½in.—combined with the extremely gnarled and corrugated brow portion of the horns indicates the extreme age of the animal which bore them.

The full measurements, carefully made and checked by a friend, are as undernoted:

Length	Girth	Between Tips	Widest Spread
25¼in. (right) ..	15in.	8in.	17in.
25in. (left)	15in.		

THE HEAD BROUGHT DOWN FROM THE MISHMI HILLS
(See letter "The Record Takin Head")

Unless Rowland Ward's book of big game records contains anything bigger than this, I do not think there can be any doubt that this is the record head.

Yours faithfully,

Hoogrijan Tea Estate, F. WOOLLEY SMITH.
Hoogrijan P.O., Assam.

SNARED POLECAT

SIR,—The enclosed may interest your readers; it is of a polecat caught in a rabbit snare on Mr. Justice Stable's estate in Montgomeryshire.

It was very much alive, the wire not having tightened sufficiently to strangle it. It was taken alive and that night enjoyed a hearty meal of rabbit. Yours faithfully,

H. DENTON CLARK.

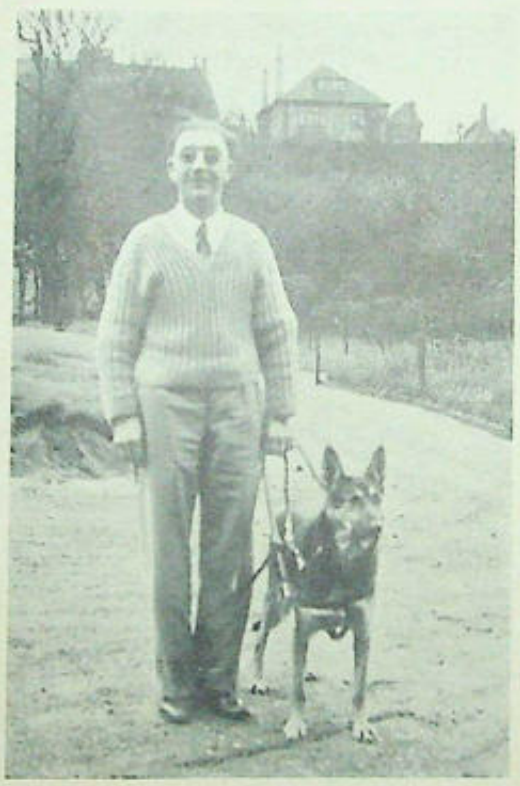
St. Peter's Churchyard,
The Cross,
Chester.

GUIDE DOGS FOR THE BLIND

SIR,—The recent controversy respecting the relative merits of the Border collie and the Alsatian has interested me, and although I yield to no one in my own enthusiasm for the Border collie and its intelligence, I do feel that Mr. Hardy has been less than kind to the Alsatian and its work.

These animals are now being trained in what is surely one of the most compassionate forms of all service, that of acting as guide dogs for the blind, and I recently visited the training centre of the Guide Dogs for the Blind Association at Wallasey, Cheshire, where I saw these animals being taught to act as "eyes" for blind people.

The dogs reveal a quick aptitude for their tasks



ONE OF THE MOST COMPASSIONATE FORMS OF ALL SERVICE
(See letter "Guide Dogs for the Blind")

and are taught to know the meaning of the commands "Right," "Left," "Forward." When the dog approaches the edge of a pavement it stops still and waits until its blind owner has located the road with his foot before moving forward. Even then, the dog will not budge an inch unless the road is clear of traffic.

With Captain Liakhoff, the trainer at the school, as my guide, I was taken on a motor run through the streets of New Brighton, and one of his assistants was out training a dog. We tried turning corners without warning and stopping right in front of the dog, but never once did the animal show any hesitation in bringing his charge to a standstill and refusing to move until we had left the way clear.

I enclose a photograph of one of these dogs with its blind master who was undergoing special instruction in the art of looking after his companion-to-be.

Yours faithfully,

Yorks. SYDNEY MOORHOUSE.

BIRDS OF PARKEND

SIR,—Mr. A. A. Jucker, in his letter under the heading "Birds of Central Germany" in your issue for October 15th last, asks "if any of your readers have ever seen such a great variety of birds in so small a circle."

Perhaps it would interest him to learn that here, within six miles of the city of Gloucester and on the main Gloucester—Bristol Road, one of the busiest in England, we have some hundred odd

"THAT NIGHT IT ENJOYED A HEARTY MEAL"
(See letter "Snared Polecat")

species, and of these over 80 breed with us regularly, in fact within the mile radius as named in his letter.

If space permitted I would have liked to have given the list, which must come near to being a record for such a small circle.

I have not included any of the autumn visitors which visit the Severn estuary, about two miles away, which with the geese, ducks, gulls, and waders would easily add another 20 to the list. In addition, we have a mammal list of over 20.

Yours faithfully,

Parkend, M. LEIGHTON RIDGWAY.
Moreton Valence.

EELS IN THE BATH

SIR,—My butler had a surprise recently when, on turning on a cold water tap, two eels came through it and proceeded to swim about.

The water is pumped by an engine through a Tangye centrifugal pump from a well supplied by roof water, and is connected by a drain of 200yds. to a pond, which, last week, was cleaned by a Ruston Hornsby engine scoop, and hundreds of eels have attracted herons to the grass fields; but how could they live through a pump? They cannot have fallen from the sky. Can any of your readers suggest a cure for eels in one's bath?

Yours faithfully,

Peterborough. (Canon) ST. JOHN WAYNE.

For FACE and HANDS

ICY winds and frequent changes of temperature are deadly enemies of the delicate skin tissues. That soft, smooth complexion and those immaculate hands so carefully tended during warmer days can easily be ruined by simply neglecting to use this famous skin tonic regularly. A little Larola massaged lightly into the skin each night and morning as well as before and after facing the elements is all that is necessary to guard against the rough, red skin so frequently encountered.

Larola 1/6 & 2/6 per bottle

From Chemists and Stores or Post Free in U.K. direct from:
M. BEETHAM AND SON, CHELTENHAM, ENGLAND
Write for the interesting Larola booklet "The Cult of Beauty"—post free

Larola Soap: Boxes of 3 tablets, 2/-; Single tablets, 8d.

A RELIC OF AN EARLY TRAMWAY

SIR,—One of the earliest tramways in England was the old Ashby and Ticknall Tramway, situated partly in Leicestershire and partly in Derbyshire. It was originally laid by Benjamin Outram in 1799, and officially closed in September, 1914. The purpose of the tramway was to convey coal, lime and other minerals for Ticknall and places in between. Its total length was 4 miles 35 chains, and the permanent way was the old type of flange rail. The track is now grass-grown and in parts obliterated, but two of the old tunnels still exist, one of which is illustrated here, and is still in a good state of preservation.

Yours faithfully,
Derby. A. B. L.

FORMATION FLYING OF GULLS

SIR,—When a boy at school, 20 years ago, I was particularly interested in the habits of gulls. As regards to formation flying of them, I do not think it is anything new.

In Aberdeenshire, where I hail from, it was a common sight on a very fine summer's day to see them very high up, usually in batches of seven, in V-formation.

Gulls usually fly like this on their way from the sea inland. My theory was that they used V-formation on long-distance flight. They return to the sea in batches without any particular formation, stopping here and there to feed.

Yours faithfully,
Croach House, GEORGE DUNCAN.
Rickmansworth.

[The gulls mentioned in "A Naturalist's Notebook" had reversed the process and used the V only when flying to the sea from their inland feeding grounds.—ED.]

COLONEL MARCUSWELL MAXWELL

SIR,—I note in your edition of the *Field* of September 3rd, 1938, that in the foreword to the article by Colonel Marcuswell Maxwell on rhino, together with his excellent photographs, you say that Colonel Marcuswell Maxwell was killed in a flying accident in Kenya early this year. This is not correct. Colonel Marcuswell Maxwell died in a Nairobi nursing home in Kenya on April 21st, 1938, following an operation.

Mr. Marius Maxwell, another distinguished big-game photographer and also a former resident in Kenya, was killed a year or more ago in a flying accident in the South of France. It is probably due to confusion of these names that the error to which I wish to draw your attention has arisen.

Yours faithfully,
ARTHUR W. SUTCLIFFE
Nairobi, Kenya. (District Commissioner).

LAID DOWN IN 1799
(*See letter "A Relic of an Early Tramway"*)

AN ALPINE SWIFT

SIR,—Whilst out shooting on November 29th with Dr. T. H. Ward, and a party of guns, on Weston about a mile from Totnes, we saw what we took to be an alpine swift hawking for flies.

We watched it for fully five minutes, and it once passed within 5yds. of Dr. Ward and myself. I was pretty certain at the time it was an alpine swift, having seen them many years ago in Crete, where they were fairly common.

On returning to Weston House we looked the bird up in a book by R. Lydekker, and came to the conclusion that it was undoubtedly an alpine swift.

Yours faithfully,
The Mount, F. J. C. HOLDSWORTH.
Totnes, S. Devon.

GAMEKEEPERS' NATIONAL ASSOCIATION

THESE trials for spaniels were held at Barlay, Balmaclellan, Castle-Douglas, on November 29th and 30th, by kind permission of Major H. S. Streatfeild. The judges were Messrs. H. L. May and Ronald MacDonald. Results:

OPEN STAKE (ALL-AGED).—1st, Mr. Selwyn C. Jones's Liver and White English Springer, Spar O'Vara; 2nd, Wing-Commander P. K. Wise's Liver and White English Springer, Raithburn Prince; 3rd, Miss D. Hardy's Liver and White English Springer b. F.T. Ch. Robinhood Bustle; 4th, Captain E. W. Brook's Lemon and White English Springer b. Kinmount Trixie. Reserve and certificate of honour, Mr. T. B. Laird's Liver and White English Springer b. Solo Event. Certificates of honour: Mr. C. A. Phillips's Liver and White English Springer b. Rivington Flight, Mr. Selwyn C. Jones's Liver and White English Springer Sprint O'Vara. Certificates of merit: Mr. A. Byrne's Liver and White English Springer Tedwyns Tango, Captain J. H. Rhodes's Lemon and White English Springer b. Harstonia Sally, Mrs. W. R. Calvert's Liver and White English Springer b. Eromtew Judy, Mr. G. Curle's Liver, White and Tan English Springer b. Breckonhill Bustle.

COCKER STAKE (OPEN, ALL-AGED).—1st, Mr. H. White's Jestering Micky; 2nd, Wing-Commander P. K. Wise's F.T. Ch. Raithburn Smut; 3rd, Mr. C. C. F. Addie's b. Yoredale Jen. Reserve and certificate of honour, Major Nelson Scott's Browster Bhoy. Certificate of honour, Dr. W. J. Dawson's Flush of Fews. Certificates of merit: Mr. C. A. Phillips's b. Rivington Spat, Mr. C. A. Phillips's b. Rivington May.

GAMEKEEPERS' STAKE (OPEN, ALL-AGED).—1st, Mr. G. Curle's English Springer b. Breckonhill Bustle; 2nd, Mr. H. White's English Springer Wild Rover; 3rd, Mr. T. Ellis's Cocker b. Solar Girl. Reserve and certificate of merit, Mr. T. B. Laird's English Springer b. Solo Event.

NOVICE STAKE (ALL-AGED).—1st, Captain J. H. Rhodes's English Springer b. Harstonia Sally; 2nd, Captain R. Joynson's English Springer, Altskeith Jock; 3rd, Mrs. W. R. Calvert's English Springer Eromtew Pod; 4th, Mr. A. Byrne's English Springer Tedwyns Tangle. Reserve and certificate of honour, Mr. J. Girdwood's English Springer b. Dalshangan Cheery. Certificate of honour, Mr. Selwyn C. Jones's English Springer Stingo O'Vara. Certificates of merit: Captain L. M. Kerr's English Springer Muick of Tullich, Mr. G. Curle's English Springer b. Breckonhill Brigadier, Mr. J. C. Dalton's English Springer Daily Sport, Mr. H. White's English Springer Wild Rover, Captain E. W. Brook's English Springer Kinmount Punch.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W.1.—An old lady of the working class, almost 90 years old, has only her Old Age Pension on which to live. Although she has all her faculties, she is now too feeble to clean her room and has to pay a girl a shilling a week, leaving only 9/- for rent, clothes, firing and food. To have to struggle against poverty at her great age is very pathetic. Do please send us gifts of money for this poor old soul, and relieve the anxieties of her few remaining years.

We print the following letter from a reader, who wishes to remain anonymous, which was sent in response to an appeal by "The Friends of the Poor."

SIR,—I saw in the December 3rd issue of the *Field* an appeal for £13 for the "Friends of the Poor" for an old lady of 80. I have to-day been told by a heart specialist that I can do a little shooting again. Please accept cheque for £13 as a thanksgiving. I killed my first grouse 52 years ago and my first salmon 50 years ago, and though I am now in a very different financial position compared with those days, the thought of being able to shoot a little after two years' abstinence makes me want to make someone a little happier.

IN THE CITY

BY OUR CITY EDITOR

MANY securities can be bought on the Stock Exchange to-day to show yields of 9 per cent. and more at current prices and based on latest dividends. Companies, the shares of which offer such good yields, are even now publishing most satisfactory annual reports showing increasing profits and dividends.

I have been asked on many occasions whether such shares are worth buying for capital appreciation purposes. Frankly, they are not. Most of the companies are small. The market in the shares is invariably restricted. It may be a simple matter to buy, but I am afraid it would be a different question altogether when it comes to selling in any lines.

These companies are mainly small engineering concerns. They are doing remarkably well just now. They secure an overflow of armament orders. These orders will be more difficult to get when the full flush of the rearmament programme is at an end. What will happen then may be imagined. Only a little contraction in profits will mean substantial reduction in dividends on a small capital.

Some are inclined to place aircraft manufacturing concerns in the same category as the smaller engineering concerns. This, in my opinion, is a short-sighted view. The aeroplane has come to stay, whether for military or civil aviation purposes. It is naturally readily granted that the aircraft manufacturers are experiencing abnormal conditions at present.

There must, however, be enormous replacements year after year. Besides this, the industry is still comparatively young. There is a great future ahead, and naturally the companies which have made a name for themselves will stand in a strong position when conditions in the manufacturing industry may be less hectic than at present.

I have in mind a company such as Bristol Aeroplane. It stands high in the order of merit. The company has just created additional capital. Many are asking whether it has been wise substantially to increase the capital at this juncture, having in view abnormal state of affairs in the industry. Opinion in responsible quarters is that the company can, and will, make very good use of new money.

The 10/- ordinary shares had a market price around 59/- just before the new issues were made. The price is now nearer 22/- a share. This certainly does not mean that capital has been lost. The fact is that those who bought 100 shares at, say, 59/- have since received 75 free bonus shares and have been given the right to take up a further 100 shares at their par value of 10/- a share.

Therefore, the 100 shares have become 275 shares for a further outlay of £50. That is, 10/- for each new share to which the holder was entitled. Quite naturally the market was rather unsettled following the substantial addition to the number of shares in issue. Conditions have now settled down, and I think that those buying the 10/- shares anywhere under 23/- will not be very far out in twelve months' time.

Other shares in this section which I regard as having very good future prospects include Blackburn Aircraft 10/- ordinary and Boulton Paul Aircraft 5/- shares. The Blackburn company is particularly well known. It paid 15 per cent. on a capital of £400,000 for the year to March 31st last. I think it is reasonable to expect larger dividends as time goes on.

Meanwhile, the shares around 24/6 should be worth putting away. The price went as high as 31/6 last year, when the position of the company could scarcely be as strong as it is to-day.

Boulton Paul Aircraft has not so far paid any dividends. There has been a definite change for the better in the fortunes of the company quite recently. It is now in receipt of direct and substantial contracts from the Air Ministry. Additional capital was recently raised. The 5/- shares standing around 7/- may be speculative but, in my opinion, are worth putting away.

Then there is Westland Aircraft 5/- ordinary standing around 9/6. This company, now under the control of John Brown, Ltd. and Associated Electrical Industries, is a concern likely to bring splendid results. Aircraft shares scarcely appeal to those unable to take some financial risk. Still, I regard various shares as undervalued at present prices.

A MASTER OF MUDSKIPPERS

INDIA has just supplied the Zoological Society with a large quantity of mudskippers. These fish have the valuable quality of adaptability, and to talk of "a fish out of water" to a mudskipper is to leave it in complete ignorance as to the meaning of the phrase, for the creature is amphibious and quite as happy on land as below the surface. Owing to food shortage in the water, the mudskipper, by means of its pectoral fins and tail, frolics over the mud flats and throughout the root forests of its little world in utmost abandon in search of an adequate diet. Owing to its tail being well supplied with oxygen gathering blood vessels it acts as an auxiliary breathing apparatus.

New Books

THE CALL OF THE WILD

Another Book by a Countryman in Exile

The Old Enchantment. By SIDNEY ROGERSON. (Nicholson & Watson ; 8/6.)

NOT long ago in these columns I reviewed a book by Mr. Sidney Rogerson on Propaganda. It was a good book ; it made one think, and it left one with a vague feeling of unquiet. In other words it fulfilled admirably the purpose of Mr. Rogerson, which was to draw attention to a weakness in our national system of defence ; and that, of course, is but another way of saying our national system of living.

I do not think that anyone reading that book and then reading this one would imagine that they were written by the same Mr. Rogerson. And that says a good deal for the power of the author's pen. The first book was obviously the work of Mr. Rogerson at work ; this is Mr. Rogerson off-duty so to speak.

Mr. Rogerson off-duty is very much more pleasant, very much more human, very much more tolerant. The old enchantment is the English countryside. Mr. Rogerson knew the country as a boy, and for a short while after the War. Then the pressure of living—the need to make a living—brought him to London, and hard pavements and bright lights ; and all the selfish, superficial, petty-minded, back-scratching people that walk those pavements and make those bright lights possible. The old enchantment lingered and with passing years grew stronger, until the time came when for short periods at any rate London could be left behind. Mr. Rogerson lives again in the country, though one presumes that the major portion of his life is still spent in London making living in the country possible.

The book he has written is a series of essays about varying aspects of country life. He touches on most of the more usual ones, and some that are most unusual. But in each his eye sees new angles, and his mind—a lively and inquiring mind—brings the angles sharply before one. It is a leisurely book, quiet and even-toned, but it has one property in common with that other book. It makes you think.

It made me think again of all the things we are throwing away in this, the peak, of our civilisation. One essay in particular—Stockbroker Country—gave me furiously to think. We all know Stockbroker country ; it is mainly composed of large houses with large gardens situated around golf courses. Is this to be the country of the future ? Are we in place of the old quiet wildness to have this synthetic orderly country ? Mr. Rogerson sees hope for the future of the countryside in the obvious desire of so many people, whose lives are spent in towns, to return to the soil—to own a little land and to make something grow on it. I, too, believe that in the not so far distant future we shall witness a return to the simple, truer things.

All Mr. Rogerson's essays have not got this undercurrent of seriousness. Some are light and not without humour, some merely sketches ; but all are most charmingly written. And the illustrations by woodcuts are as charming.

I would recommend this as a book to buy. Having bought it, do not lend it to anyone ; if you do you will not get it back. B. V-F.

* * * *

Lords of the Sunset. By MAURICE COLLIS. (Faber and Faber ; 15/-.)

Very few books have been written about the Shan States. After reading Mr. Maurice Collis's account of his visit to that country this appears strange, for he bears out all that has been heard of the charm and beauty of that land and its inhabitants. But, Mr. Collis is an artist to whom loveliness is not alarming ; he is able to portray it with no qualms about failure or betrayal.

Mr. Collis had the opportunity to see the States well and thoroughly ; throughout his visit he was the guest of Government officials, who took him about the country introducing him to the reigning princes in their districts, and in turn handing him on to their colleagues, who carried on the programme.

By this means Mr. Collis saw a great deal ; he is, though, one of the few "travel authors" I have met who admit that there was plenty left which he did not see and investigate—he even goes so far as to name some of these objections, and they sound sufficiently interesting to arouse the hope that the author will return to write again.

For this is a really delightful book : the author had already spent many years in Burma, and he speaks Burmese, which helped him considerably in his travels in the Shan. He knows the charm of the life, and also its fatal loneliness. But it is not, of course, of the European's conditions of which we read ; if any one subject is the main theme rather is it the aristocracy of the Shan—the ruling Princes and Princesses. These people are gifted with particular grace and charm ; their manners and exquisite tact and naturalness enable Europeans to mix with them with an ease and mutual understanding which in Mr. Collis's opinion is not found elsewhere in the East.

The descriptions of these men and women are fascinating. Modern conditions and Western education are having an influence upon them, but the picturesqueness is still supreme. Modern architecture is altering the style of the Haw, but the culture within is not spoilt, and cars are increasing the social amenities and opportunities. The visits which Mr. Collis paid to some of these princes and their wives sound happy occasions—the conversations ranging around his travels, their children and gardens, literature and amusements are such as most people enjoy taking part in.

But it is the Eastern elusiveness and charm which Mr. Collis has such skill in portraying ; this beauty, which cannot be appreciated by all, is to him apparent, and he draws it with a skill which is not far short of genius. If he dwells on the pleasant side (there is an absence of squalor and ugly poverty in his recountings) he cannot be charged as untruthful, for he is an artist who has chosen a lovely subject.

The practical side is by no means lacking ; it would be entirely false to give that impression. We hear of the tung oil and the future possibilities of that enterprise—the various opinions on the policy and chances for the States—the intense importance of that epoch-making road-to-be to China—and by no means least, the possibility of the Shan States becoming a very important frontier to our Empire as a result of the present China-Japanese War. C. N.

* * * *

This is Our World. By KURT LUBINSKI. (Hodder and Stoughton ; 15/-.)

The author's travels cover a vast area. He appears to have collected his journeys of a few years and described them in one collection. They include—amongst others—trips to Iceland, Abyssinia, Turkey, Siberia, Austria, Holland and the United States.

This is far too much for one book—at least it would be so for most authors, but not for Mr. Lubinski. He knows how to cover the ground with speed, relating only the most important and typical points ; and surprisingly, the result is most pleasant and soothing !

Mr. Lubinski had two great assets : a wife who enjoyed his travels as much as he did and had an equal sense of humour ; and a camera. This camera has produced the illustrations to the book, and they are exceptionally good.

Prominent personalities appear in these pages, for the Lubinskis are as successful with their interviews as their transport. Kemal Ataturk, Haile Selassie, Schuschnigg, Trotsky—and many another name of interest to-day figures in this way, and we learn in each case something of note. F.

The Danube Flows Through Fascism. By WILLIAM VAN TIL. (Scribners ; 10/6.)

Mr. Van Til, who is a young American, is Assistant Professor of Social Studies at Ohio State University. He and his wife became exasperated by the usual mode of touring Europe by rail, and so they decided to start afresh on new lines.

They acquired a folding boat and journeyed 900 miles down the Danube, starting from the source ; thus they passed through lands where Fascism holds sway, and also through Czechoslovakia. This was evidently a delightful holiday, taken lightheartedly and with unlimited scope on the banks of the great river for such ardent sightseers as Mr. and Mrs. Van Til.

But the book is marred by a definite cheapness of style ; true the author is young and very satisfied with himself, his race and his wife "Bee"—alias "the tiny lady" and "lovely blonde." Were they not Americans? They had a "status," they were not the hated English ; in fact, they made the pleasant discovery that they "belonged."

Although the Van Tils heartily despise the English, they appear very pleased to be able to state that English is their native tongue—though authorities on "English" will shudder at the form of literature this author has produced. American idioms, flowery sentiment and slangy jargons abound.

This is scarcely the time for reading high falutin' green advice on Europe from outsiders ; in fact, there is much here which will try most readers' patience—but if next summer you feel inclined to trust yourself to the Danube in a folding boat, here is excellent practical help with a guide book thrown in. C. N.

* * * *

Trout and Fly in Tasmania. By R. H. WIGRAM. (Angus & Robertson ; 3/6.)

Fishing conditions in Tasmania are probably nearer to those of the British Isles than any other part of the Empire, though Mr. Wigram's little volume leaves the impression that trout there are, on the whole, rather larger than here, and that the fly hatches are more abundant and their character perhaps more definite. Most of the fishing he describes savours of our chalk-stream fishing at home, and his tactics, for the most part, those of a South-Country angler. He notes, for example, what is so often true of a chalk stream that anything like a stiff breeze has rather a tendency to put Tasmanian fish down.

This is a book which would prove very acceptable as a practical handbook for anyone visiting Tasmania for its fishing ; but the sport it describes is also sufficiently "like home" to make it welcome on an English bookshelf. H. D. T.

* * * *

Water Gardening. By FRANCES PERRY. (*Country Life ;* 15/-.)

Fifty years' experience of water gardening compressed into one volume makes *Water Gardening*, by Frances Perry, a book that will be not only a delight, but a necessity to all enthusiasts on what is generally acknowledged to be one of the most fascinating branches of gardening. Mrs. Gerald Perry dedicates the book to her father-in-law, Mr. Amos Perry, an authority on this subject with a world-wide reputation, and in the preface states that for cultural methods she has been privileged to call upon his 50 years' experience. The book is so comprehensive and thorough that it will presumably remain the standard work on water gardening for many years. The author deals at length with pool construction and planting, designing both formal and informal water gardens, hardy and tender water lilies, Nelumbos and Nuphars, aquatics of all kinds, bog and water plants including the insectivorous kinds, the making of aquaria and diseases and pests, to mention but some of the chapter headings. The sections on the histories of certain water plants are particularly interesting. E. S. R.

RHINE AND MOSELLE WINES.—In the article under this heading, published last week, a picture was entitled "Vineyards at Rudesheim." The view shown was overlooking Oppenheim.

"PETER RABBIT" CHRISTMAS CARDS.—Greeting cards for children of this very popular character of the nursery are again being sold at 2d. each, and can be had from the Hon. Secretary of the "Peter Rabbits" Committee at Itchen Stoke Manor, Alresford, Hants. The profits go to endow beds for the Invalid Children's Aid Society.

EVERYTHING FOR THE YACHTSMAN.—There is no article of equipment for yachtsmen that Captain O. M. Watts, Ltd. (49, Albemarle Street, London, W. 1) cannot supply when nautical Christmas gifts are required. And the selection not only includes the strictly practical article, but also books and many ornamental novelties such as cigarette boxes from the teak of H.M.S. Iron Duke.

Obtainable from all leading Hotels, Restaurants and Wine Merchants.

IN TOUCH

The Importance of Coaching

AT the end of every term a huge crowd of Public School boys pass out of academic life into business and professional paths. They are boys who, during their school days, showed signs of genuine Rugby football ability. What becomes of them?

Naturally many have jobs or inclinations which preclude them from going on with the game, but nevertheless all too many seem to sink into obscurity instead of rising to first-class Rugby fame. Especially is this true in the South, where facilities would appear to be better in many ways than in other districts.

Natural talent, which was beginning to form into trained efficiency by the end of school days, no longer receives the skilled care and interest so necessary for its proper development, and, as far as football is concerned, the boy goes to seed.

Rugby, mercifully, is an amateur game, and for that reason the methods used in professional Association football cannot be operated here, but much more could be done, I feel, if first-class players who have passed from the game owing to their increasing age, &c., were to consider it their duty to hand on to the rising generation the wisdom gained through years of football experience by using their knowledge as coaches.

Coaching is not just anybody's job; it is as difficult to do properly as to play the game itself, but its importance is unquestioned. Natural talent is essential for a first-class player, but it is seldom 100 per cent. efficient unless rigorously trained. Diamonds are diamonds, whether in the rough or when cut and set, but no one can put them to any practical use while they are in an unpolished state.

Habitués of Rugby matches see too many glaring examples of ineffectual coaching. In the forwards it is often bad packing in the scrummages, or riotous fly-hacking instead of careful dribbling. The latter fault is especially noticeable in some clubs, yet it is only necessary to watch such a player as Charles Laborde to realise how tremendously valuable dribbling ability can be.

A common fault behind the pack is not so much fumbling hands as an inability to draw the opposing side before passing. It is the last three or four yards before the scrum half is tackled by the opposition which count for so much, and if, firstly, scrum-halves would learn to pass hard and long from the base of the scrum, and then the stand-offs would learn to run to the bitter end, regardless of a hard tackle, before they hand over the ball, I think we should hear a great deal less of the misdemeanours of over-efficient wing forwards.

Alternate praising and cursing from the captain during a match is of little use, but constant reminders and an effective example during practice games will often turn the mediocre into something really good, or at least improve the technique so as to change the team beyond recognition.

London may supply better facilities and a larger playing personnel than is to be found in the provinces, but at the same time there are increased counter-attractions from the spectators' point of view, and unless London teams in general can produce an improved technique in their matches they are likely to see ever-increasing drops in their gates. No one interested in Rugby will begrudge his 2/6 or his cold feet if he can know that he will be able to go away with memories of attractive football, but if he has to pay to see 30 young fellows mudlarking for 80 minutes, on his one free afternoon of the week, his seat will be empty, and he will be found in the pictures.

At its best, Rugby is a grand game to watch, as well as to play, and it is significant that many will follow it with the greatest zest even if they have but the haziest of ideas as to the meaning of the rules. To them off-side is an enigma and scrummages are a kind of necessary evil, but they, with the rest of us, can appreciate the unity and cohesion of a well-trained team; but take them to a bad match and they will certainly go away saying that Rugby is indescribably dull and is all whistle and scrummage.

The spectator is, quite rightly, a secondary consideration, I know—the game is the thing—but what is not worth the watching is often not worth the playing.

The solution, as I have already said, lies with present captains and with past players. Surely there are sufficient enthusiasts whose days on the field are over who can spare the time to take in hand the semi-raw material annually passing out of our schools and refining it into first-class playing members of the Rugby fraternity.

SCHOOL RUGBY PRACTICE

"Natural talent which was beginning to form into trained efficiency by the end of school days"

FROM TEE TO GREEN

VII.—Bunker Play

By E. R. TIPPLE

THERE is a great deal of truth in the remark that the golfer who knows how to play bunker shots has few to play, whilst the player who does not know much about these strokes finds himself faced with many. The former is not afraid of bunkers, and if the latter possessed similar freedom from fear undoubtedly he would experience less trouble.

Even during the finest of rounds mistakes occur, and even the experts expect to have to use their niblicks occasionally. They explode their balls out of the sand with amazing success, but the average golfer cannot do likewise. The most common mistake lies in attempting to do too much. In trying to bring off the super bunker shot, which will compensate for the previous mistake, the handicap player fails to remember the vital things that will produce the ordinary recovery, and so he fails to extricate his ball from the trap. It is just as bad to be over-optimistic as it is to be pessimistic. The first lesson that we must learn is that when we are in trouble the primary need is to get out of it. One mistake does not matter and should not make us worry. It is the repeated mistakes that ruin our cards and lose us matches. If the ball is lying badly in the sand play safely for the widest part of the green and be content with getting down in two putts.

Bunkers are often deceptive, so that when playing through the green it is wiser to take a more lofted club than we think is necessary. For example, if our drive is bunkered and the ball is lying nicely in the middle of the hazard, a mashie-niblick instead of a mashie is best, then we will be sure of making up some of the lost distance, and, moreover, will give ourselves a chance of reaching the green with the third stroke. If we think a mashie-niblick can be safely used then we should use it. In other words, safety-first tactics are more profitable.

There is naturally a great variety of sand. If it is firm and the bunker shallow, a straightforward pitch-and-run shot is the easiest of all. Generally speaking, the distance we strike the sand behind the ball depends entirely on the lie. If the ball is tucked up the explosion shot will be necessary. For this type of stroke we are advised to keep our eyes not on the ball but on the spot at which we want the club to enter the sand. The niblick is driven firmly into the sand one, two or perhaps more inches behind the ball, according to the type of sand and the distance to be covered, and the ball comes out with the "explosion" of the sand. Personal experiments and experience will give the necessary judgment of the shot. But, as Cotton says, "you must hit the sand harder than you think you have need." Explosion shots are rarely missed by being too strong. The common fault is timidity.

An 8-handicap golfer with whom I play regularly dislikes bunker shots and consequently rarely recovers at his first attempt. When he is bunkered near the green he is at a loss to know what to do. He tries to scoop up the ball and will not make up his mind to give it a firm, definite blow. He takes the club back no more than 3ft., and then his wrists collapse and the club-head sinks into the sand and stays there. I have watched many women players do the same thing. These short bunker shots are difficult to judge correctly, but at least it is easy to get the ball out somewhere. We cannot afford to be slack and we ourselves must not try to get the ball out; the club will do that for us if we swing it.

The club should, we are told, "be taken back rather abruptly so that the arc of the swing or path of the club-head will be decidedly up and down." Morrison further maintains that "the two most important things are swinging up and down and keeping the head in position until the swing is over. One takes care of the physical side of the job and the other covers the mental side. By swinging up and down we have the best chance of lofting the ball. It is just the opposite of what most players do. They figure that the ball can be raised only by taking the club-head back low to the ground and hitting upwards at the ball. The flat arc tends to keep the ball down whereas the up and down arc raises it." The reason why so many golfers tend to employ a flat arc is because of their natural anxiety to help get the ball out of the bunker. It is not so easy to make up the mind to drive the club into the sand and allow the club-head to do its own work. But that is the right method and the other absolutely wrong.

Wrist action is essential; and it has to be firm. At the end of the backward swing the wrists, says Morrison, "should have a full bend, for it is this added wrist action that puts a snap into the bottom of the swing which helps to flip the ball upwards." He thinks it is a sound idea to count one, two, three slowly before letting the head come up. That is not easy, but it will help to overcome natural curiosity as to the result of the shot.

The modern "blaster" or "sand iron" is a great improvement on the ordinary type of niblick. No golfer should be without one of these really helpful clubs. The ordinary niblick has a sharp edge, whereas the blaster has a broad, flat sole. Moreover, when resting on the ground, the front edge of the sole is slightly in the air. The result of this design is that it is impossible to dig deeply into the sand or ground. The club-head skids under the ball and does not delve deep down into the sand as an ordinary niblick does. Such a club will extricate the ball out of the most difficult of lies, but to obtain the best results with it the golfer must not force the shot; on the contrary, he must swing the club and allow it to come through. As Mitchell has said, "Aim to take the club-head through and not to bury it."

For bunker shots confidence is essential. Do not wait until you are standing in the bunker to plan the shot. Try and have a clear mental picture of the recovery beforehand. And practise two or three swings outside the limits of the hazard. By these means you will encourage yourself and in time acquire some degree of confidence. When that happens bunker play will lose most of its terrors.

CORRECT BUNKER PLAY

This photograph, reproduced from the American Golfer's Year Book, shows how the club should be raised rather abruptly in the back swing so that the arc is as near up and down as possible. This arc, as much as anything else, lifts the ball up into the air

IN MILD PARTS ROSEMARY IS ONE OF THE LOVELIEST WINTER-FLOWERING SHRUBS

The Country House

DECEMBER IN THE GARDEN

Decorative Shrubs at this Season

By ELEANOUR SINCLAIR ROHDE

THE colour and interest of the December garden depend chiefly on the few December-flowering shrubs, the shrubs that are valuable for their foliage at this season, shrubs with decorative barks, the last survivors of the herbaceous plants (notably the button Chrysanthemums) and the December-flowering bulbs, especially *Schizostylis coccinea*, Lady Byng and *Iris unguicularis*.

Certain December flowering shrubs are to be found in most gardens, particularly the winter-flowering Jasmine and Rosemary. The former is frequently neglected with the result that it soon makes a mass of dead wood and bears few flowers. Yet with a little attention this invaluable Chinese shrub, one of Fortune's best introductions, produces its golden star-like flowers in continuous profusion for weeks on end. They are invaluable not only for indoor decoration but also for sending away, for, picked in bud, even before any colour shows, every flower opens perfectly when the stems are put in water and the flowers associate so well with those of *Iris unguicularis*, which also travels well if picked in bud. *Jasminum nudiflorum* needs little, but that little it should have if it is to give of its best—*i.e.*, to be pruned immediately after flowering, cutting back each lateral to one bud and cutting out any dead wood. On light soils a mulch in spring is helpful.

Rosemary is frequently clipped and thereby ruined, for the beauty of this shrub depends on its spire-like branches. In every mild spell throughout the winter at least a few flowers are produced, and it continues flowering more and more till by early summer the branches are thickly wreathed with blooms. The only pruning Rosemary needs is to cut back rather bare growths to vigorous growths, and this should be done in spring after flowering. Except in the mildest parts, this shrub rarely does well in the open. It needs the protection of a sunny wall.

Viburnum fragrans is one of the most beautiful shrubs in flower at this season. Its pinkish cymes of flowers have a crystal-like appearance, and the scent is exquisite. Before the fall of the last Chinese dynasty *Viburnum fragrans* was grown only in the Imperial or Temple gardens. In spite of its beauty it is an accommodating shrub in regard to soil, but does best in a well-dug, moist soil. It should never be planted in a position where it is subjected to cold winds for the flowers are speedily "burnt." In mild parts it begins flowering in November, but not till several weeks later in most parts. *Berberis hyemalis* also flowers as early as November and December in mild parts, but not till as late as February in most parts. The scent of these flowers is almost indistinguishable from that of Lily of the Valley, and it is singularly decorative in growth with its huge pinnate leaves surrounding the central cluster of golden flowers.

Amongst the sub-shrubs the hardiest and most decorative is the invaluable *Erica darleyensis*. Rose-red flowers are scarce indeed in mid-winter, and few shrubs have such a cheery effect as this Erica in mass. It shows up well against a background of a tall growing Lavender such as Walhampton Giant. *Vinca difformis* is an unduly neglected shrub in mild parts. Blue flowers and rose-red flowers are scarce in winter, and this bush-like Periwinkle has flowers of the most charming shade of lavender blue. They are produced all through autumn and winter, and owing to the upright habit of growth of this Periwinkle they are useful for picking. The foliage, too, all through winter is a bright rather pale green. Except in the very mildest parts it is advisable to plant this native of Spain and North Africa against a wall to secure flowers in December.

Big bowls of evergreen foliage are a seasonable decoration at Christmas time, and amongst the best is the golden variegated form of *Elaeagnus pungens*. The leaves are bright gold and even on the dullest days they give the impression of reflecting radiant sunshine. The colouring, as with all variegated shrubs, is best on poor soils. This native of Japan is hardy in most parts of the South. Two New Zealand evergreens—*Leptospermum scoparium var Nicholsii* and *Cassinia fulvida* are amongst the invaluable foliage shrubs in the December garden. The former has dainty reddish-purple foliage in small slender sprays, is extremely quick growing, flourishes in any soil except chalk, and attains about 15ft. It is hardy, however, only in the South. *Cassinia fulvida* is heath-like in appearance, and the young shoots are a golden yellow all through winter, giving the shrub a springlike appearance. It succeeds best in a sandy soil, but does not resent chalk.

We are now once more appreciating the value of Laurustinus as a December-flowering shrub. Its masses of pink buds in their neat corymbs suggestive of a Victorian bouquet are always decorative and no matter how bleak the season the abundant foliage remains a rich green.

SPORTING BREEDS AT THE KENNEL CLUB SHOW

By A. CROXTON SMITH

ALTHOUGH field trials are numerous at the present time, there was a satisfactory entry in this section at the Kennel Club's show at Olympia last week.

Cocker spaniels, following recent precedent, made a bigger entry than any other breed, and it was to one of their number that the honour of being the best in show fell. That was Mr. H. S. Lloyd's incomparable little bitch, Exquisite Model of Ware, who, under three different judges, was similarly placed at Cruft's last February. The same owner's Sir Galahad of Ware was runner-up to the Scottish terrier, Heather Benefactor, owned by the Messrs. Chapman, of Glenboig, for Lord Lonsdale's challenge cup offered for the best dog.

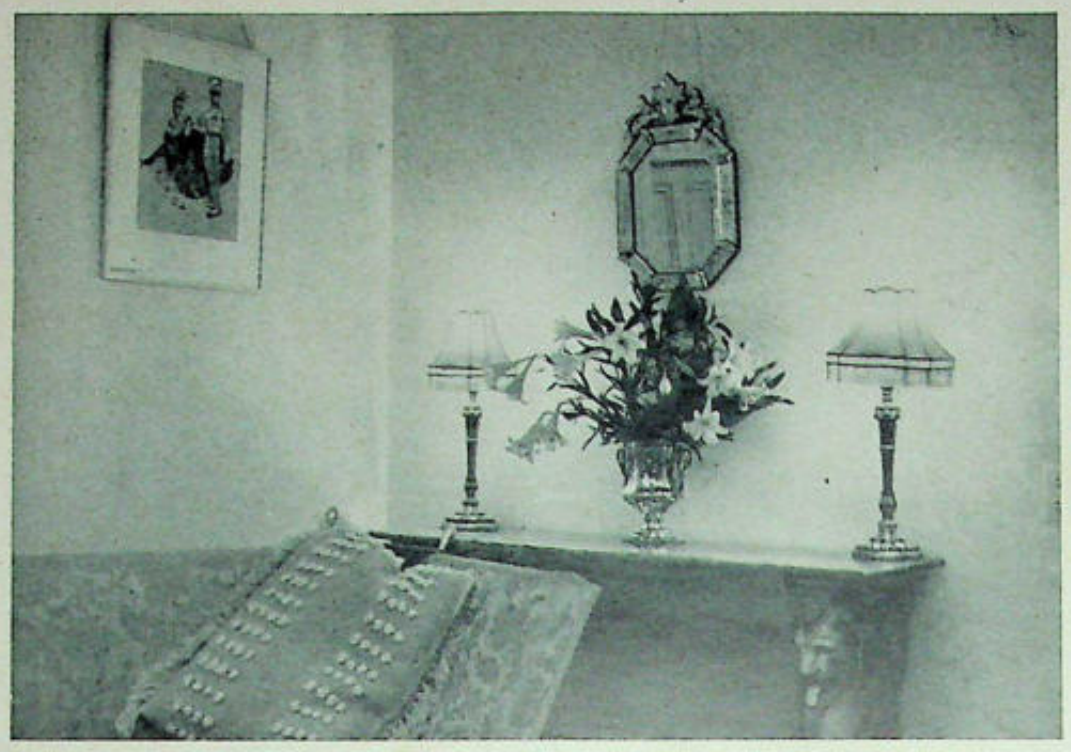
It will be seen that sporting dogs swept the pool and deserved to do so on the day. Several others of the same kind were also prominent. The Send Gold Vase for the best sporting other than gundogs or terriers went to Miss F. Joyce Esdaile's elkhound bitch, Fourwents Grinta, not long out of her puppyhood.

I should have mentioned that runner-up to Exquisite Model of Ware for the Lonsdale Cup for the best of the bitches was Colonel G. Woodwark's stylish wire foxterrier, Ch. Croyland Conquest, who is a little beauty. Now a word or two about the gundogs. In the Field Trial class for Labradors Lorna Countess Howe's celebrity, Ch. Bramshaw Bob, made a reappearance, and his nine years did not prevent him receiving one of the challenge certificates, the other going to the same owner's Banchory Julie. Mr. R. G. Heaton was the judge. In the golden retrievers, which made a good entry, the principal winners were Mrs. R. Lawrence Kirk's Ch. Abbots Trust and Mrs. I. M. Parson's Ch. Torrdale Betty. In the flat-coats, it was a pleasure to see Mr. H. Reginald Cooke doing a double with Woodlark of Riverside and Greta of Riverside.

The old curly coats are again taking their place among the workers, and both certificates went to working kennels, one of the recipients being Mrs. C. Breitmeyer's Snapehill Benjamin and the other Brigadier-General F. F. Lance's Sarona Juno. In the pointers, which made an excellent show, a brace exhibited by Isaac Sharpe, Ltd., did best, these being Bonny Prince Carlo and Ch. Stylish Myrrh. Lady Howe's Stylish Sunray and Mr. A. Eggleston's Pennine Pilot were the reserves. English setters, which are getting more numerous on the show bench, had their chief awards given to Mr. A. Eggleston's Maesydd Masher and Pennine Puregold. The revival of the handsome Gordons is welcome, though there is yet a long way to go before they achieve their deserts, either for work or looks. Miss M. K. Farne's Great Scot and Isaac Sharpe, Ltd.'s Stylish Stagestruck were the challenge winners. Irish setters again had the biggest entry of their kind, and there Mr. D. K. Steadman gave the honours to Mr. and Mrs. L. C. James's Ch. Portlairge Steady of Wendover and Mr. F. H. James's Beorcham Blameless. Clumbers are another variety that are staging a come-back. When the late King George V took them up he did them a great service, and it was fitting that Ch. Sandringham Sparkle, one of his breeding, now owned by Mr. R. Cape and Commander E. Welman, should have received the dog certificate, the other going to Mrs. A. M. Whittle's Maureen Maeve.

Mr. W. H. Gammon, jun.'s, Chg. Ribbenhall Waterwave and Miss A. Morgan's Llanbrynean Barney took the certificates in field spaniels, which are still not numerous. Nor are the Irish, in which the certificates were won by Mr. F. Trench O'Rorke's Breifny Brian and Mrs. E. I. Groves's Croome Bubbles. Welsh Springers were quite a fair lot, the leaders there being Messrs. H. Newman and E. R. Jones's Nellie's Choice and Mr. A. J. Dyke's Ch. Marglam Marquis. Miss M. F. Reed's Ch. Rummy of Oakerland and Miss L. M. Wrigg's Hornshill Meriel led in Sussex. Competition in English Springers is usually keen, and there Mr. E. E. Turner gave his certificates to one kennel, Mr. M. D. Withers's Ch. Showman of Shotton and Speculation of Shotton.

Mrs. J. V. Rank, who judged both Great Danes and Irish Wolfhounds, made the best wolfhounds to be Miss C. E. Ansell's Roland of Pentavalon and Mrs. F. Nagle's Ch. Sulhamstead Kirma. Mrs. Nagle had benched seven of these imposing hounds. Mr. Wilfred Unwin, who judged his old favourites, the bloodhounds, gave his dog certificate to Mrs. O. L. Payne's Barham of Stanton, a young hound with enormous bone, and to Miss B. E. Codd's quality bitch Ch. Tranquil of Wyema. In the beagles, Captain R. C. Hartland-Rowe's Ch. Mischief was the best of the dog hounds, and Mr. E. N. Crowder's Partney Watercress, a Peterborough winner, was first in bitches.



ORDINARY READING LAMPS, PREFERABLY WITH "SUNSHINE" SHADES, MAKE EFFECTIVE LIGHTING FOR WHITE FLOWERS

WATER, LIGHT AND FLOWERS

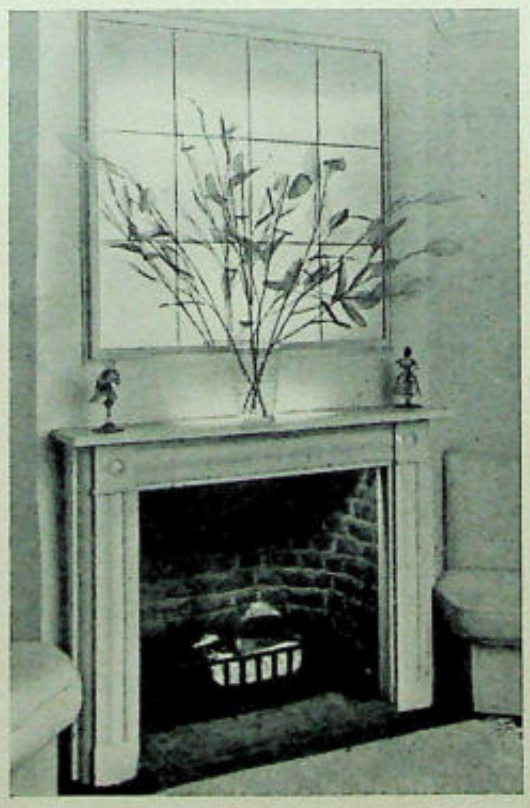
Make Your Floral Decorations Live

By MARGUERITE JAMES

INSTAL a fountain in a garden, and the eyes of every newcomer will turn to it. Floodlight a garden house and footsteps will gravitate towards it. Yet it cannot be seriously suggested that a fountain or a garden house is of greater interest than the flowers. Paradoxically, one may say that the reason the fountain and garden house attract is that they seem to have more life than the flowers and trees—which, of course, is just what they have not. Water has movement, however, and movement suggests life, while Light has drawn human attention even to the point of worship all down the ages. Then, too, light produces changing effects, movement again in another form. But whatever the reason, we are left with the conclusion that one way to draw attention to our flowers is to give them the added attractions of water and light.

Let us see what has already been done in this direction. We will take light first. The most obvious way to enhance the beauty of a floral arrangement is by placing it in a good light, natural or artificial. Colours generally are intensified when lights are set near to the vase, while some colours, such as light blues and mauves, are quite insipid at night unless a strong white light can be directed on them. Ordinary portable reading lamps are of some use for the purpose, but hidden flood-lighting as used in lighting alcoves, or a single spot light directed on to the flowers is still more effective.

When lights are portable, or when there are plenty of lamps installed and one can be selective in their use, almost any kind of floral arrangement can be lit up satisfactorily. If the light is a single one, or if architectural lamps are built in and can only be used in a certain way, the floral arrangement must be considered in relation to the lights. Overhead lighting is natural and easy to use, but not all flowers light well from one side, and a great many are unsuitable for light that comes from below.



WHERE HEAVINESS MUST BE AVOIDED

A light panel built in over an antique mantelpiece is an effective background for artificial or natural flower arrangements

I think a general rough guide to flower selection for unusual lighting effects is to keep to those flowers that display well as hand sprays (*i.e.* often upside down)—arum and longiflorum lilies, tulips, hyacinths and other hanging bells, narcissi, freesias—flowers which one is not afraid to look at from the back. Dahlias, with nearly always ragged outer petals, are better in natural or ordinary studio lighting.

ILLUMINATED FLOWER TANKS

These make useful decorations for a dull room

I have now in my study a firescreen (an adaptation of an antique metal screen) in which I keep a succession of small floral arrangements that are lit from below by hidden lamps. The vases or pots of flowers stand inside a kind of box, of which the front is an oak panel with a circular opening. Standing as it does on the darker side of the room, the tiny circle of light and flowers is cheering by day as well as by night. At different times I have used in it a single spray of roses, a begonia plant, and a group of cacti; I think the Cactus plants light up best of all.

Similar lighting effects have been used to illuminate a floral arrangement in a "false" picture frame: the illusion is of a floral group so extremely well painted that every visitor is drawn to it.

Among non-portable types of lighting for unusual effects are light panels built into furniture or house walls. A good example of this kind of lighting is seen in the illustration of an old hall fireplace modernised by a panel of light over the mantelpiece. A studio group of metal leaves in copper, brass or pewter, oxidised and burnished, might be better in association with such a panel than a natural flower arrangement, as they would be quite unaffected by the slight extra heat of the panel lamps. Or a very sparse arrangement of bare twigs, or of everlasting flowers or grasses might be used.

With flowers of certain colours, good effects are produced by light concealed actually inside the bowl or container. As a rule strong colours light best in this way, just as rather strong colours are best for use in a glass bowl over a table light panel. Also, restraint in the use of material is needed: it is generally better to use a single variety of flower or else to use boldly defined subjects and only a very few stems.

A favourite anecdote of the Chinese gardener who made up beds of bare soil and set just a single tumbler of water in the centre, saying that the sunlight on and in the water was sufficient beauty for a whole garden, occurs to me as I think of water and light and their joint connexion with floral art. Many beautiful modern vases are of transparent, plain colourless glass, through which the stems of decorations show as plainly as do the flowers and foliage. I like these specially where lighting effects are sought, as light through water, either from the side or the back, brings the picture to life in a remarkable way.

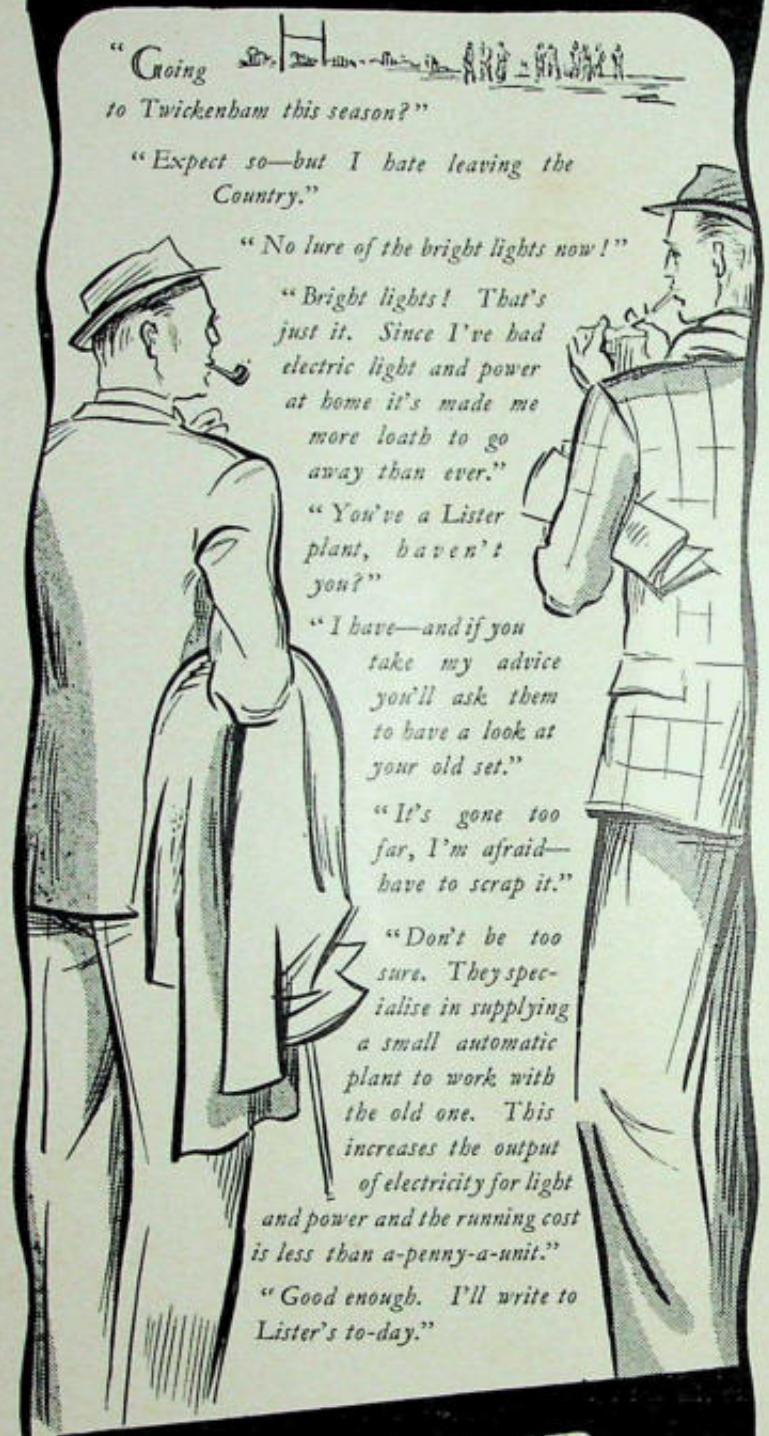
One modern studio produces illuminated rectangular tanks, in which the light is thrown up from a decorative base through the water. Here, too, the colours of the material and the general character of the stems make a great difference to the success of the arrangement. I am told that florists generally do not favour experiments on these lines. They suggest that the added warmth of the lamps makes flowers fade quickly, and that "customers would complain." It is known, however, that though flowers droop a little during a warm day, they rapidly revive if set in a cool place for a night's sleep. (Those who live with central heating might remember this fact.) So that if lighting effects are only used periodically, or if care is taken to use fresh cold water when the flowers are taken away for the night—with a cool spray overhead at the same time—I think the question of early fading need not cause trouble.

For my own part, I like the daily task of "doing the flowers," and I do not want my flowers to last too long without rearrangement! Do you?

LARKSPURS IN THE LIGHT

A single variety of flower is good when the light comes from below

Water & Electricity
IN THE COUNTRY – BY LISTER'S



"Going to Twickenham this season?"

"Expect so—but I hate leaving the Country."

"No lure of the bright lights now!"

"Bright lights! That's just it. Since I've had electric light and power at home it's made me more loath to go away than ever."

"You've a Lister plant, haven't you?"

"I have—and if you take my advice you'll ask them to have a look at your old set."

"It's gone too far, I'm afraid—have to scrap it."

"Don't be too sure. They specialise in supplying a small automatic plant to work with the old one. This increases the output of electricity for light and power and the running cost is less than a-penny-a-unit."

"Good enough. I'll write to Lister's to-day."

R. A. LISTER & CO. LTD.,
DURSLEY, GLOUCESTERSHIRE. PHONE DURSLEY 177

will send, without obligation an Advisory Engineer to report on an Independent Electric supply or water pumping.

R.S.V.P.

A PROVED WEAR RESISTING PROCESS

For some time all Lister Diesel Engines have been supplied fitted with Listard (Van der Horst Patents) cylinders. This process of chromium hardening increases resistance to wear by 400%.

Owners of Lister Diesel Engines not treated with this process can, when requiring a rebore or new cylinder liner, have existing cylinders Listard processed.

Christmas comes in Boxes

by

IAN HAY

The famous soldier-author of "Housemaster," "The First Hundred Thousand" and "The Middle Watch" points the moral for all exasperated present-hunters.

Christmas conjures up before me a vision of people scurrying round the shops, darting from counter to counter, getting more and more grubby and exasperated. Being an essentially lazy man, only too anxious at all times to be thoroughly selfish, I solve my Christmas problem in a simple, inexpensive yet princely way. I order Havana cigars for all my most deserving friends. Now, when Christmas comes, I sit calmly back in a deep armchair, drawing quietly and with intense enjoyment at a rich Havana cigar, knowing that on Christmas day my friends will be indulging themselves in the same blissful way; knowing, too, that each time they light a fresh cigar, fresh blessings will be heaped on my head. But apart from the joy of giving—and the greater joy of receiving—a box of Havana cigars, a cigar smoked quietly after moments of emotion or strain, brings with it a sense of security and complete and utter calm.

FERRETING OUT THE FARMERS' PEST

THE MENACE OF THE RABBIT

Some Problems of Extermination

FEW people, having any interest at all in British farming, will feel like quarrelling with those who, just lately, have again been deploring the vast amount of potential "arable" at present running to waste.

If only for the sake of seeing our countryside's rare loveliness no longer marred by such unsightly wastes, any effort at reclamation would be welcome.

"First things first," however, is always a good working rule. And all this current advocacy of a land survey, with a view of authority itself literally putting its hand to the plough, does appear to ignore an initial problem—that of rabbit infestation.

The fact that "rabbit land" has become the accepted name for so many of these derelict areas is highly significant of what the first step must be, if profitable reclamation is to come about.

Many of these abandoned tracts of sound land represent, tragically enough, the farmer's enforced retreat not so long ago in the face of an ever-increasing host quite beyond his individual suppression.

To-day, many men would gladly take in hand again much of this land that is now doing no good at all. Tractor-plough and the "payment" for wheat offer together a fine incentive; no need for the Government to take on the job. But, as a bit of private enterprise, the whole thing is stalled by the menace of the rabbit.

To be saved from ruinous depredation, any crop would have to be protected by a surround of wire-netting. And, unhappily, not only is wiring on any large scale a most costly business, it can very easily fail in its purpose.

The netting itself has to be of a kind that is the most expensive—of a good width and with a close mesh. To go in for a wide mesh, on grounds of economy, simply means that the baby rabbits get through. Growing as rapidly as they do, in a few days they are too big to get back. Thus rabbits in sufficient numbers to work havoc become actually "interned" on land under a crop at the very start of the growing season.

A good-width wire is demanded because there must still be a height of at least 3ft., after allowing for a turnover at the top and some bending outwards on the ground.

Done at its best, wiring against rabbits still entails a trying amount of subsequent vigilance. There is the constant risk of a yard or two of such a light fence as it is getting trampled down, here and there, or of pegs jumping out of the ground and thus letting up the wire. Only those who have had to protect growing crops or plantations from the ravages of the rabbit by means of a guard can know how wearing is the day-by-day anxiety.

Such is the case where individual enterprise is concerned, and it is not to be supposed that any national plan for land reclamation, which relied upon wiring as a means of combating the pest, would fare better. Indeed, one may well imagine a large-scale employment of labour lacking that cunning and thoroughness with which friend Hodge—knowing the rabbit as he does—goes about the job.

There is, of course, a possibility that in conjunction with any Government scheme for reclaiming the wastes, statutory powers would be sought for putting down the rabbit everywhere, almost to the point of extermination. But it is as difficult as ever to see how such a drastic measure could be made to harmonise with individual interests.

So many landed proprietors and tenant farmers, whilst heartily damning the rabbit for the mischief he does, are bound to say "No!" when it comes to the question of a nation-wide drive against the pest. That traditional 2 guineas is still on offer as a reward to the man who catches the last rabbit on the place; and yet . . .

It is not simply that all of us retain some of our childhood's affection for "Bunny." Quite apart from this, there is a good deal of wanting to have things both ways that would be amusing, if in part it did not explain why, up till now, there has been no concerted action.

The small farmer, moaning as loudly as anyone else over the damage to crops, really likes to see plenty of rabbits about at a time of the year when they can go into the pot or, better still, be marketed off by the score as a "help towards the rent."

Then there is the big landowner to whom an all-the-year-round campaign against the rabbit, waged intensively, would mean serious interference with his sporting interests. Every year, much killing-off of rabbits, in just those places where they most abound, has to be abandoned—and this, too, at a time when they are again coming on in full strength—for fear of disturbing the game.

Tackled one way or another the problem of the rabbit will certainly have to be, before ever any of the wastes that he has made his own can be brought back into profitable use; and it is imperative that this should be soberly realised in the right quarter. Otherwise we may anticipate a series of "supplementary grants," financing a departmental scheme that is failing to "deliver the goods"—or, as it would be better to say in this particular case, to reap where it has sown.

HORACE PHILLIPS.

AGRICULTURAL ENGINEERING SCIENCE

THE formation is announced of the Institution of British Agricultural Engineers. Its objects are briefly the advancement of agricultural engineering science and improvement of the status of those in the profession.

For some years now the formation of such an institution has been in the minds of those principally responsible for its inauguration to-day. The engineer is playing an increasingly important part in agriculture all over the world, but the most successful engineer in agriculture is the specialist, and in Great Britain there has been no special training for the work, no special qualifications, and no attempt among the members to act as a corporate body or profession. There has been a trade association of manufacturers, but nothing beyond that.

Meanwhile in many other countries the position of the agricultural engineer has been well established for many years, and special training courses and degrees are available in the universities.

In France, there are 6,000 certificated and trained agricultural engineers. There are colleges for training them at Grignon, Rennes and at Montpellier, and about 50 qualified engineers leave each annually. There is also the Institut National Agronomique, where the standard is very high, though more theoretical than practical. About 70 engineers leave that college each year.

In Germany the number is stated to be considerably greater than in France, and Russia leads the way. Even in Spain there is a considerable number of qualified agricultural engineers, and at Madrid University there is a Chair of Electro-Farming.

In the United States there is a Bureau of Agricultural Engineering within the Department of Agriculture and "Engineering (Agr.)" is a familiar degree at the universities. There is also a flourishing American Society of Agricultural Engineers with its own journal.

With the rapid mechanisation of agricultural operations there is an increasing demand in the British territories overseas for agricultural engineers, and owing to the lack of specially trained men in Great Britain these posts more often than not go to German or French engineers. One result is the diversion of orders for agricultural machinery to the countries from which the engineers come, and because of this the British agricultural implement manufacturing industry is taking a leading part in the launching of the new institution.

There was a recent case of a demand for six agricultural engineers to represent a firm of manufacturers in South Africa at a starting salary of £800 a year. No suitable Englishmen were found, and German engineers who were English-speaking secured the appointments.

Even at home a great change is sweeping over agriculture. Farming methods on a par with the use of the hand-loom in weaving a century ago are being supplanted by efficiently engineered equipments. "Time and motion studies" are being applied to the farm as to the modern factory. Already there are quite a number of farms that can tend, clean, feed and milk over 50 cows per worker as compared with the traditional ten cows per man. The care of about 30 breeding sows and their progeny of about 25 baconers is now the task of one man. Some poultrymen look upon 500 laying hens as the limit that they can look after.

Among the proper activities of the agricultural engineer are visualised the investigation into the mechanical needs of the farmer, liaison with the implement and equipment industry, technical representation of manufacturing firms, employment in agricultural machinery factories, appointment to county councils to work in conjunction with agricultural organisers, appointments in the forestry services, private consultative services, and so on. All branches of agriculture are concerned, from forestry abroad to poultry-breeding at home.

Among the objects of the institution officially set out are:

(*a*) The general advancement of agricultural engineering science and, more particularly, for promoting the acquisition of that species of knowledge which constitutes the profession of an agricultural engineer being the art of directing and applying the sources of energy in nature for the use and convenience of man in the adaption and application of materials and machinery and mechanical methods to the best development of agriculture and its allied purposes in the broadest sense of the term.

(*b*) To promote the consideration and discussion of all subjects affecting the agricultural engineering profession and to watch over and protect the interests of persons engaged therein, providing for them a standing they cannot obtain as individuals.

THE MOTORISTS' CHRISTMAS

Sensible Suggestions to Solve the Gift Problem

By CAPTAIN SIR MALCOLM CAMPBELL
(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)
(Motoring Editor of the "Field")

WITH Christmas so near at hand most of us are wondering what gifts we can buy for our relations and friends, and a considerable amount of time is often spent in an attempt to solve the question.

Above all, we are anxious to give a present that will not only be appreciated by the recipient, but one that will, at the same time, prove useful.

Since so many of us are now motorists, no better gift could be given than something to do with the car, as there is such a variety of articles from which to choose, all equally suitable for either sex. If ten or fifteen guineas can be spent a car radio is certain to be very acceptable, or if a lesser amount is contemplated, a pair of the latest Lucas Twin tuned horns, which cost from £3 12s. 6d., would prove most useful. A combined driving mirror and clock, made by S. Smith & Sons, would make an excellent present, and the price, 45/6, is moderate.

A set of maps in a case would be kept by the recipient indefinitely: while, now that the winter is in front of us, there are a variety of articles that would be greeted with open arms. For example, motor rugs are always useful: they are needed for the comfort of the passengers as well as for keeping the radiator warm when the car is stationary.

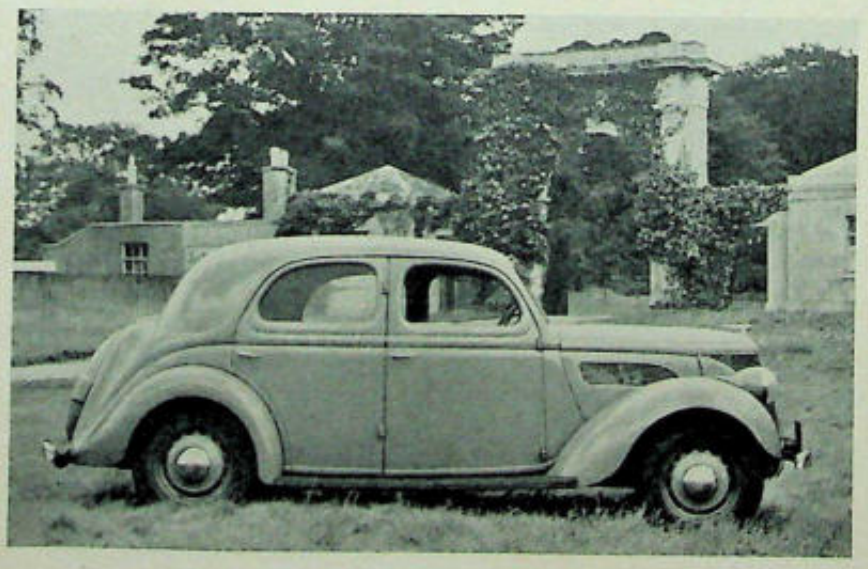
For the ladies, a foot muff is a good idea, or a vanity case and mirror with the usual accessories will be appreciated; one made by Gordon Equipments, Ltd., which can be illuminated for use after dark, costs only 17/6. Another useful gift is the Schroder Spark Plug Pump, price 14/6, which will pump up the tyres, and is driven off the engine. When needed, all that has to be done is to remove one of the sparking plugs and screw in its place the Schroder plug, and when the motor is started up it will pump the tyres to the required pressure. A gift of this kind would be most acceptable to any motorist, since it can always be carried as a stand-by and will last for years.

The eternal problem of being able to carry all the luggage when touring is solved by the Berkshire Carryall, which fits on top of the roof and does not necessitate the drilling of any holes. The cost is 47/6, and it can be fitted in a few moments and removed when not required.

Either two tins of anti-freeze mixture, or a radiator lamp heater, would make a most useful present; then Messrs. J. Lucas market a series of very fine fog lamps, the prices of which range from 30/- to £3 13s. 6d. If touring is contemplated, a luncheon or tea basket complete with Thermos bottles always comes in handy, or if your friends intend motoring on the Continent an interior aneroid or height indicator is an interesting accessory, and especially is this so when crossing over the Alps.

Then there are all kinds of useful presents for the garage that will always be appreciated: a kit of tools, or a trickle-charger for keeping the battery up to standard when the car is not in use, cannot fail to please the recipient. If none of the articles I have already mentioned will meet the case, then possibly an electric torch, radiator muff or a set of sparking plugs might be purchased; an electric cigar lighter, or an extra ash tray.

Then we come to a fire extinguisher, which in my opinion should form part of the equipment of every car. One of the pump action type, made by the Pyrene Co., costs 35/— a small outlay when it is possible that one day it may be the means of saving the vehicle from total destruction by fire.



THE IMPROVED FORD V-8 "22"
Enlarged luggage space is an added attraction of this smart looking eight cylinder car which provides a fine performance at a reasonable cost

In a week or two we may experience a very cold spell of frosty weather and, if the roads are frozen, a set of chains becomes a necessity. There is always a tremendous demand for these on the very first day of icy conditions, so that it is advisable to order them in advance, to avoid disappointment of non-delivery. A set, therefore, would make a most seasonable gift for those who do not already own them.

Another useful accessory is an Easiject oil can, made by Benton and Stone, which costs 7/6, or a set of lamp bulbs, a first-aid outfit, or a car polishing set. An interior heater, operated off the exhaust or water system, is another idea, or an electric defroster which fits on the windscreen, various types of which can be obtained from the Berkshire Windscreen Wiper Co., of Drayton Gardens.

It will be seen, therefore, that there is an abundance of gifts from which to choose, most of them costing comparatively little. There is also no shadow of doubt that they will always be acceptable to the recipient motorist, even if the article chosen costs only a few shillings.

RUGBY AT TWICKENHAM

THE official car parks at the Rugby Football Union Ground at Twickenham are, this season, once again under the control of the R.A.C.

For the assistance of spectators, the R.A.C. is issuing a folder containing a map showing the prescribed traffic routes to the official car parks which will be in operation on big match days and a map of the approach roads over a considerable area.

Within the last two or three years extensive alterations have taken place to certain roads in the vicinity, and, in order to avoid delay in reaching the ground, spectators intending to go to Twickenham by car are advised to secure a copy of this folder. A list of the principal fixtures on the Twickenham ground for the 1938-39 season is also given, together with times of kick-off.

These maps are issued under the authority of the Rugby Football Union and the Metropolitan Police, and copies of the folder can be obtained free of charge on application to the Secretary, R.A.C., Pall Mall, London, S.W.1, or to any R.A.C. branch office.

RE-MAKING BRITAIN'S COMMERCIAL AIR PRESTIGE

New Designs for New Needs

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

THE ascendancy of American commercial types on the world's airways has, for some time past, been a source of disquiet to those who rightly feel that this country could, and should, play as prominent a part in building the world's aircraft as, in the past, it has played in constructing the world's ships. The introduction of these imported machines on British lines roused, at the time, considerable controversy. But the facts could not be blinked. A commercial air line has a duty to offer its customers the fastest means of travel; and no British type generally available could compare with the Americans.

Yet, while this unpalatable truth had to be accepted, it was strongly felt that this country should take immediate steps to make good the deficiencies in its range of commercial aircraft. On the one hand, the British industry was producing large commercial flying boats that were setting new standards and acknowledged as superior in many ways by the Americans themselves. On the other, there were smaller British commercial types that, on the basis of economical operation, were practically in a class by themselves. When it came to the medium-sized, high-performance aircraft, however, British production had nothing ready, although this might have been far different if Government support had been forthcoming, as certain interesting machines were either designed or in the prototype stage. Given the market, therefore, British designers are quite capable of turning out machines bearing comparison with anything existing.

There are signs that both the natural stimulus of increasing demand and the new subsidy policy are encouraging British designers to give greater attention to the medium-sized commercial machine, as well as to larger types. In the New Year, if present production plans mature, some valuable additions to the range of British commercial aircraft will be made.

Considerable interest centres round the new D.H.95 Flamingo, which, according to present schedules, should be making its test flights early in 1939. This machine, which follows a formula which is becoming more popular in America, is an all-metal, twin-engined high-wing monoplane with an all-up weight of round about 15,000lb., giving passenger accommodation for up to 20 on short-distance work; carrying, of course, fewer when the range is extended. Performance figures must, naturally, await the actual flying tests, but the cruising speed is estimated as being in excess of 200 miles an hour, with a climb of 1,500ft. per minute.

These figures indicate that the machine should have a performance comparable to that which has given American types their great popularity with air lines the world over; and as it is understood that something like quantity production is in contemplation, it would seem as though here is a promise of a British product that should not only have a wide field of application on British airways at home and in the Empire, but stand good chances of success in the world market.

Somewhat detailed reference to this type has been made because it indicates that new needs are having the right effect in causing the British industry to design aircraft not only in keeping with local specialised requirements, but with the general requirements of air transport in other parts of the world.

It is not, however, by any means the only projected British design of interest. One of the most significant announcements in regard to civil aviation for a considerable time was that made by Captain Balfour, the Under-Secretary of State for Air, some little time ago, when he stated that three new large landplanes were to be developed.

These are being built by Messrs. Short Bros., responsible for the Empire flying boats, and may well be classed among the most ambitious machines of their kind yet projected. Each is to have a gross weight of some 71,000lb. —more than 31½ tons—and to have a power of about 5,500 h.p., which will give them cruising speeds of round about 250 m.p.h.

It is not so much in their large size, however, that this order arouses interest. The most significant point is that one of the trio is to be built for operation at great heights of the order of 20,000ft. to 25,000ft. This model will have a pressure cabin to ensure the comfort of the passengers. Its range is expected to be about 3,000 miles.

Here again is evidence of a serious attempt to meet new needs on the airways. The possibilities of commercial sub-stratosphere flight have been very actively explored in the United States, where the development of special machines with pressure cabins has been energetically pushed forward. On this side of the Atlantic little of practical nature has been done, at any rate in this country and in respect of commercial flying. Yet it might have been expected that the country which held the world's height record until a very short time ago would have taken the lead in this particular development.

Another projected civil machine of an interesting nature has been the subject of a more recent announcement. This is a four-engined low-wing monoplane designed by the Fairey Aviation Company to a specification based on operational experience. This machine will resemble the American D.C.4, and will incorporate a retractable undercarriage of the "tricycle" type. It is to have a maximum speed of 275 m.p.h., and will have a pressure cabin making it also suitable for high altitude flying.

Anxiety was felt until a little while ago that the world-wide effect produced by the Empire boats would not be followed up in a proper manner, and that here the leadership would also pass to America. In this field, too, there is welcome news of fresh construction. New flying boats, considerably larger than the Empire class, are being built, in addition to the enlarged and strengthened modifications of the Empire type now nearing completion. These new flying boats will have an all-up weight of no less than 33 tons.

There thus seems to be hope that in the next two or three years Britain's prestige in commercial aviation may be thoroughly re-established, and that the old policy of continuing to operate obsolescent machines long after their performance has fallen behind contemporary requirements is being reversed. In view of the preoccupation of the industry and the Air Ministry with military requirements, that is a most encouraging and stimulating sign.

A MODEL OF THE NEW LOW-WINGED MONOPLANE DESIGNED BY THE FAIREY AVIATION COMPANY, AS SHE WILL APPEAR WHEN IN FLIGHT

THE SHORT CHASSIS 2/4SEATER ASTON MARTIN TOURER SELLING AT £475

THE ASTON MARTIN

"A THING of beauty is a joy for ever," Keats tells us. A remark, I feel, which needs qualification. The thing of beauty I have in mind was a short chassis two-four seater Aston Martin Tourer, but to me it was a joy for a week-end alone, and that only through the kindness of the manufacturers, who handed it over to me one Friday night with a tank full of petrol—fourteen gallons—and their permission to drive as far as I liked, as fast as I liked, until the Monday morning.

The aim of the makers has been to combine the qualities of sports cars such as they have built in past years with their high power to weight ratios, resulting in tremendous acceleration and general mechanical efficiency, with the comfort and smoothness of a town carriage. They have been remarkably successful, and I found no difficulty in driving through heavy traffic at a crawl, yet there was that surge of power so reminiscent of the downright sports car available the moment it was required.

There is an up-to-date and valuable device on the dash for adjusting the shock absorbers, and this materially assists in maintaining comfortable and easy motion at all speeds. On bends there was none of that alarming roll, all too often experienced on the modern car, and in every way I found the road-holding abilities exceedingly good; indeed so good were they that on one occasion I drove for about half a mile at 70 m.p.h. holding the wheel with only two fingers. Once I had to brake hard at high speed owing to the proximity of a tight corner which, for some reason or other, I had not seen. The car stopped, although the road was wet, without any trace of a skid in an extraordinarily short distance.

A fast car is a menace to all concerned if the brakes are not in keeping with the speed, but in this car special provision has been made to take the braking torque, leaving other components free for their correct functions, thus making for exceptionally steady and powerful braking.

The makers claim a genuine 87 m.p.h. at 5,000 r.p.m. on top gear, 63 m.p.h. in third, 41 m.p.h. in second and 24 m.p.h. in first. Personally I found 84 m.p.h. well within my scope, and I have little doubt that had I really tried, the official top speed would have been reached without much difficulty.

The four-cylinder engine has an R.A.C. rating of 15.09 h.p., thus making the annual tax £11 5s., while the cost of the car itself is £475, and in my opinion it is well worth it.

The bodywork deserves a word of praise, for it has none of the rakish irresponsibility which was so common in cars of its type a few years ago, but is designed on most graceful lines and built with a care for detail and finish which is associated only with that which is best in coachbuilding. There is something about the whole production that is typically British. It is solid, comfortable and efficient.

When I returned the car after the week-end it was with a feeling of regret, born of the knowledge that I was parting with something of first-class workmanship—later to become someone else's "joy for ever."

W. R. J.

FROM A HUNTER IN THE WILDS OF N. AMERICA

"I have smoked Barneys Punchbowle in the deserts of Northern Mexico where the temperature was over 120°, hunting in Alaska, on the shores of Hudson's Bay and in the deserts of Arizona, and always have found it in perfect condition. It is the only Tobacco that I can smoke continuously and never become tired of."

TO the ends of all the Earth, Barneys travels—and arrives in all the fragrance of its original blending and the freshness of its packing day. And in return comes a stream of thanks and praise from the men who smoke it . . . The letter above, from Canada, pictures the type of men these are . . . big men of Outdoors and Achievement, smokers who appreciate *and need* something *outstandingly* good in the Tobacco *they* smoke.

. . . Barneys *is* good, uncommonly good . . . cool, sweet-smoking, never-failing in its friendly, *satisfying* charm . . . and you *cannot* buy Tobacco in finer condition. Try Barneys next time; it may please *you* better than any Tobacco you have yet encountered.

IRELAND

Where ANGLERS rejoice

Tyro and expert—one and all—acclaim Ireland the grandest Angling Country. On their first visit they are amazed at the enormous extent of Ireland's river, lake and sea fishing waters. They are astonished at the endless variety of sport and the abundance of fish. They are delighted with the good and reasonable accommodation in every fishing district. All over Ireland preparations are now being made for even better facilities in 1939, and the Irish Traffic Manager, Great Southern Railways, Kingsbridge Station, Dublin, and Irish Tourist Assn., O'Connell Street, Dublin, in inviting you to take an Irish Angling Holiday, offer a full and free Information Service. Write to-day for a copy of "Ireland for Sport" (free); "The Anglers' Guide" (2/10d post free); or send particulars which will enable them to suggest the ideal fishing centre for your 1939 holiday in Ireland.

THE YACHTSMAN'S PARADISE

Among the Islands of the Grecian Archipelago

GREECE is becoming more and more popular with the yachtsman, not only the owner of a large steam or motor yacht, but also with those people who, like the writer, cannot afford to run a boat of their own, but find it easily within their means to hire a sailing boat in Greece, and use it for weeks of happy sailing along the coast and among the islands of the Grecian Archipelagos.

The country possesses many advantages in the way of sheltered waters, ample harbourage and, above all, the opportunities for chartering boats of all sizes for very reasonable prices, much lower than one could possibly hope to find in England.

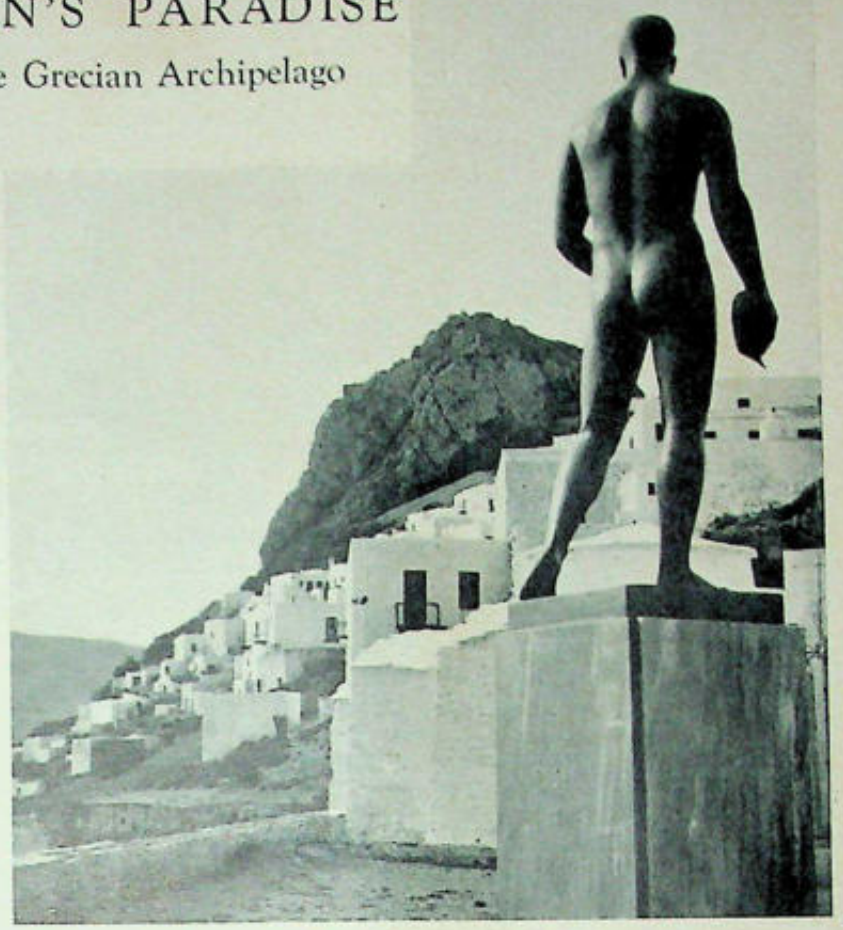
The majority of owners with craft for hire are to be found in Piræus, and their names can easily be obtained from any of the tourist agencies. The Athens Express in particular specialise in this type of charter, and as the firm is run by two Englishmen, one of whom is a yacht owner, I have found them very satisfactory people with whom to deal.

For the man who does not wish to charter his own boat there are ample opportunities for visiting the coast and islands of Greece by the many excellent steamers which operate frequent and regular schedules to the islands from the mainland. Many of these ships started their careers as British cross-Channel or North Sea packets, but others are very much more up-to-date and, indeed, are almost the last word in luxury. As an example of the two types, I recently made the journey from Piræus to the island of Corfu in the Frinton which, 35 years ago, began her life as a packet boat between Harwich and the Hook of Holland. I also travelled from Salonika to Piræus on the Sophia, a most beautifully equipped ship of up-to-date cabins (with proper bedsteads), all of them fitted with running hot and cold water, and many with private bathrooms, the public rooms also being extremely comfortable.

Fares on these ships are extraordinarily low. For example, my passage from Salonika to Piræus, calling at Volos, Ædipsos and Chalkis, cost me rather under £1 for a cabin de luxe with private bath which was occupied for two nights. Meals are, of course, extra, but feeding arrangements on the Greek boats are generally very good indeed.

One obvious and very interesting cruise which can be made either by the owner or charterer, or almost equally well by the regular steamers, is from Piræus to the islands of the Cyclades. This is probably one of the most beautiful and interesting cruising grounds in the world. The sea is generally calm and of an intense blue barely distinguishable from the blue of the sky. The islands themselves, with their olive or pine-clad hills and white houses, add to the beauty, and when one goes ashore the costumes and customs of the inhabitants are found to vary most interestingly from place to place.

Mykonos is a very great favourite with visitors and, indeed, many English people are now settling in the island, finding there a relief from the taxation and high cost of living at home. It is reached by steamer from Piræus in an overnight trip and, though it has no features of any great archæological interest, is beautiful and peaceful with a glorious climate and excellent bathing. Nearby, in fact, almost adjoining, is the island of Delos which, though now uninhabited, was at one time one of the most important religious and commercial centres of the Ægean Sea. The island was regarded as sacred, being the supposed birthplace of Apollo. Recently excavations have revealed the ancient town with its sanctuaries, temples, markets, clubs and many private houses with most beautiful mosaics, but the visitor will be particularly struck by the numbers of carved lions which are still to be seen scattered about the various sites.



THE STATUE OF RUPERT BROOKE ON THE ISLAND OF SKYROS

A QUIET LITTLE ROAD ON THE ISLAND OF MYKONOS

PEACE MIRRORED IN THE WATERS ROUND THE ISLAND OF HYDRA

Syra, Naxos with its associations with Ariadne; Andros, where some of the most beautiful women are found; and Milos, where the famous statue of Venus, now in the Louvre, was recovered, are other much-frequented islands, but perhaps the most curious and in some ways the most beautiful of all is the island of Santorini or Thera. This island is now crescent-shaped, the centre originally having been a volcano which, in prehistoric times, erupted to such good effect that it entirely blew itself out of the sea, the waters rushing into the hollow and leaving only half of the crater still showing above the surface. This has resulted in the formation along the inner side of the crescent of most enormous cliffs of fantastic shapes which are crowned by the white houses of the inhabitants. From the port, where there is a tiny, almost toy, harbour, one ascends on mule back to the top of the island.

On the western shores of Greece are, of course, the famous Ionian Isles. Corfu itself is, I think, almost the most beautiful part of all Greece.

Perhaps the most interesting building on Corfu is the famous Achilleon, built by the Empress Elizabeth of Austria, who was searching for an ideal spot to build a house to spend the last days of her life. After her tragic death it was bought by the Emperor Wilhelm II of Germany. Not only is it a lovely building in a glorious situation, but the statuary is the finest and most natural that I have seen anywhere.

On Sundays cricket is still played in the town square of Corfu. It is called cricket and bears some resemblance to the game as played on the village greens in England, but the numbers of people taking part are not necessarily limited to eleven a side; the pitch is of rough gravel, and the game exciting to a degree. This is a relic, of course, of the British occupation, and no sooner does a British warship anchor off Crete, than the local inhabitants at once send the crew a challenge to play cricket and shortly afterwards a battle royal ensues. It says much for the cricket of the Royal Navy that they are as frequently victorious in the test as they are vanquished.

Mr. Aspioti, the President of the local Board of Tourism, is himself a yacht owner and speaks perfect English. He is delighted to see English visitors and can always be relied upon to give information with regard to that part of the world.

W. T. BLAKE.

NILE VOYAGING.—The Nile voyage season opened on December 7th, when the first of Cook's steamers left Cairo for Aswan. There will be weekly sailings until March, with additional departures on February 3rd and 24th. The weekly service will be maintained by the Sudan, Egypt and Arabia, three-decked steamers, each 236ft. in length and 50ft. in width. The return journey occupies 20 days, two nights being spent at Luxor in each direction so that visitors may explore Thebes, the Valley of the Tombs of the Kings, and the temples of Karnak. There is also a break for two nights at Aswan. The arrangement introduced last season, of dividing the voyage so that those who cannot spare the 20 days may travel one way by train or air, will again operate.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE LION HOTEL AT BUCKDEN

ONE week until Christmas! It does seem rather impossible, but the years have the most wretched way of skipping along and before we realise the joys of summer we are in the middle of winter.

Admittedly no one likes time to fly past, yet why is it so many people waste the winter months? It seems absurd to crouch over home fires every week-end of the winter merely because it is "cold outside." You should know the countryside in December as well as in May, when song and shade and colour attract everyone to the field. You should face the mire and slippery path. How otherwise can you enjoy the full significance of meadows glowing with buttercups in spring, hedges touched with green and trees clothed with leaves? See a place bare of flowers and you will appreciate it so much better when it is a mass of gentle colours. Besides, beauty comes at intervals, unexpectedly; it cannot be fixed.

I realised this the other day when I wandered up the Great North Road and came upon Buckden in Huntingdonshire. Spelt "Bugden" in other times, some of the inhabitants still pronounce its name this way. As you come into the village you cannot help noticing the sturdy old red-brick walls that partially enclose the grounds whereon stand the ruins of Buckden Palace, while almost opposite the south-east angle of the grounds stands an inn, now known as the Lion.

Like a much-married lady, the Lion seems to have changed its name quite a number of times during its long history. Once it was known as the Lamb, later as the Lion and Lamb, and then by the sign you see to-day. But no matter how many times its name has changed the inn is a grand place to come by on a late winter's afternoon, for it is small enough to be cosy, large enough to be comfortable.

Years ago the celebrated Cartwright—of the "York Express"—himself an owner of a Buckden inn, drove every day to and from Buckden and Welwyn, a day's work of 70 miles. Whether he ever put down passengers at the Lion we do not know, but certain it is that other stages must have pulled in there during the busy coaching days which meant so much to the inns of the Great North Road.

I like to picture the passengers—especially as we are so near to Christmas—pushing eagerly into the warmth of the old kitchen at the Lion. In this room (now the tastefully furnished lounge of the hotel) you can still see the old beams in the ceiling. It is claimed, indeed, that there is one of the most remarkable specimens of the domestic architecture of the fifteenth century in its ceiling, the rafters all being concentrated on a round oaken boss in the centre—"like the Cords of a tent," as one writer has it—upon which, in relief, is the representation of the Lamb and Pennon, surrounded by the words *Ecce Agnus Dei* (Behold the Lamb of God).

Undoubtedly the coach passengers would have hugged the old log fire as the circulation came back to half-frozen limbs. And though travelling to-day is not nearly such a test of endurance, you will find yourself just as keen to gather round the old fireplace and raise your glasses with the fervent wish: "A merry Christmas!"

The writer will be pleased to answer any queries from readers concerning hotels.

APOLLO *Published Monthly 2/-*

THE ART JOURNAL FOR COLLECTORS AND CONNOISSEURS

Articles of absorbing interest to the collector, with beautiful illustrations (many in colour). Notes of the month. Art in the Sale Room. An invaluable aid to those interested in Pictures, Sculpture, Furniture, Glass and Pottery.

FIELD HOUSE, BREAM'S BUILDINGS, E.C. 4.

Welcome in Switzerland

ADELBODEN BERNESE OBERLAND, **PARC HOTEL, BELLEVUE**
The ideal Headquarters for Winter sports. Special arrangements. Apply for prospectus.
E. Richard, propr.

GSTAAD Bernese Oberland **Grand Hotel Bellevue**
English family Hotel in sunniest location. Every room with running water. Opposite skating and curling rinks. Close to famous ski-ing fields, ski lifts. All inclusive 7 days from Fr. 118.- Information through the Manager and the principal travelling agencies.

ZERMATT The Hotels Schweizerhof National and Bellevue
are offering to English visitors a real home. All comfort; exquisite cooking; moderate charges. Winter sports, Summer season.
H. ZIMMERMANN, Managing Director.

IRELAND

MILFORD, CO. DONEGAL.—MILFORD HOTEL. Salmon and Trout Fishing. Shooting. Golf. Garage.

RENVYLE HOUSE HOTEL, Connemara, Co. Galway. The most modern Hotel in Ireland, on a lake amid the Connemara Highlands, by the Atlantic Ocean. Central heating, electric light. Salmon and trout fishing in numerous lakes. 40,000 acres of rough shooting. Sea fishing. Strand bathing. Ponies for children. Most bracing climate.—Apply MANAGEMENT.

CONTINENTAL HOTELS

AROSA, SWITZERLAND. 7,000ft. BERGHOTEL PRATSCHLI. Hotel of high standard. Participant at Arosa-Ball in London. Full arrangement for seven days, all included, from £7.

AROSA, SWITZERLAND (6,000ft. above sea level).—EXCELSIOR, first class, 18/- to 26/- daily.—Man.-Prop.: SIEBER. Repr.: HANFORD, 12, Henrietta Street, W.C. 2.

HAUS ISLA, AROSA (SWITZERLAND). —Modern first-class FAMILY HOTEL in sunny and sheltered position among the pinewoods. Good cooking; fresh eggs, fruit and vegetables. Inclusive terms during summer from Frs.13.50, during winter from Frs.16.50.—M. HAERLIS.

ST. MORITZ (SWITZERLAND). HOTEL BELLEVUE AU LAC. Family Hotel on the lake. Pension terms from Swiss fr. 12.

ST. MORITZ-CAMPFER (Switzerland). BRISTOL HOTEL. Good family hotel, every comfort, near ski slopes Suvretta. Terms from Frs. 12.-.—Manager, J. STAUB.

PAYING GUESTS

EXPERIENCED SPORTSMAN, Rough SHOOTING, coarse FISHING FREE Proprietor's bag (one season): 1,100 snipe, besides duck, woodcock, plover, curlew, rabbits. Unsurpassed local knowledge. Golf (two links); horses available. British and Colonial recommendations. —TOM STUDDERT, Clifden, Corofin, Clare.

GENTLEFOLK, residing amidst the finest rough shooting, fishing, free; prepared TAKE GUESTS; terms 3½ gns. weekly; horses, golf, &c.; highly recommended.—EYRE STUDDERT, Cragmoher, Corofin, Clare.

GUESTS RECEIVED in comfortable Irish Country House. Very moderate terms, especially for parties or for long stays; three packs. Hiring easy and reasonable.—Apply Miss JOHNSON, Ballinapierce, Enniscorthy, Co. Wexford.

HUNTING IN IRELAND.—PAYING GUESTS welcomed in large country house near Dublin. Ward, Meath, Louth Hunts and Harriers; golf, Portmarnock; inexpensive, excellent stabling and hiring. Moderate terms.—LADY MARY CORBALLY, Rathbeale Hall, Swords, Co. Dublin.

WINES AND TOBACCOS

EXCELLENT SCOTCH WHISKY. Specially selected Standard strength. Enquiries invited.—DUNLOP, Wine Merchant, Greenock. Established 1840. Prices 61/- per gall. and 122/- per dozen cases or two-gallon bulk carriage paid.

CHRISTMAS AND NEW YEAR
PRINCE of WALES HOTEL, Harrogate
Programme of Festivities sent on request
Free Garage. Phone, 4676. 'Grams: "Elegance."

BRIDGE

POINTS OF LAW

Questions by Correspondents

By A. E. MANNING FOSTER

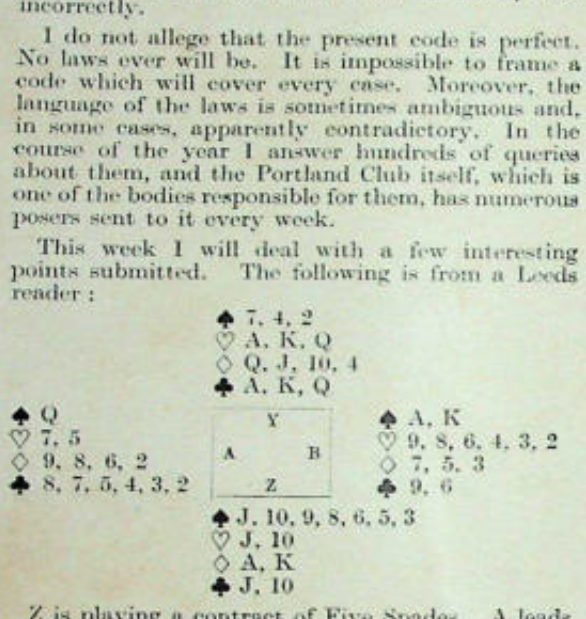
(Cards Editor of the *Field* and Editor of the *Bridge Magazine*.)

IT is astonishing how few players have more than a nodding acquaintance with the Laws of Contract Bridge. Mark that they are *laws* not rules, although they are often erroneously referred to as rules. Between laws and rules there is a distinction. I know many regular practitioners who acknowledge that they have never read the laws. They rely upon picking them up in a general sort of way or on there being always someone at the table or in the card-room who will give a decision on a knotty point.

This is a form of laziness or indifference which exists, I imagine, at no other game. Knowledge of the laws will not, of course, make you a good player; but it would save a lot of time and trouble, and probably, also, would save you points, as penalties are often exacted incorrectly. Wrong decisions are sometimes given or, when reference to the book is made, the law is interpreted incorrectly.

I do not allege that the present code is perfect. No laws ever will be. It is impossible to frame a code which will cover every case. Moreover, the language of the laws is sometimes ambiguous and, in some cases, apparently contradictory. In the course of the year I answer hundreds of queries about them, and the Portland Club itself, which is one of the bodies responsible for them, has numerous posers sent to it every week.

This week I will deal with a few interesting points submitted. The following is from a Leeds reader:



Z is playing a contract of Five Spades. A leads a Diamond and Z, winning the first trick, puts his hand face upwards on the table and gives his opponents three tricks in Spades. Who would score?

Now at first sight the answer seemed to me easy. Relying upon Law 29 (3): "If a side concedes a trick which it could not lose by any play of the cards such concession is void."

Here Z, in his hurry, obviously thought that he must lose three tricks in trumps. As you will see, owing to the crash, he need not lose more than two and can make his contract by any reasonable or likely play.

My first decision, therefore, was that Z has conceded a trick wrongly and that he was entitled to score his contract. But further consideration, and consultation with a member of the Card Committee of the Portland Club, caused me to revise my opinion.

The case is not so simple. The law refers to "*any* play of the cards."

If Z were foolish enough to play three rounds of Hearts before leading trumps, A would make a trump separately, and Z, in consequence, would be one down. On the strict letter of the law, therefore, Z having conceded three tricks, the opponents are entitled to score them. Even so, I have my doubts. I think the adversaries might have asked Z how he proposed to play, and if he said at once that he was going to lead trumps at trick 2 they should not have enforced their claim. But I am told that I am wrong, and that the opponents need not make any such inquiry and that Z must incur his penalty.

The second case is also interesting. Z bids One Heart and is raised to Four by Y. B, before deciding to make a bid, pass or double, says to A: "You lead partner?" meaning it in the form of an interrogation. But before he has time to qualify it as such, the Declarer claims that this closes the auction and denies him the right to make a declaration or to double which latter it was his intention to do, and also denies his partner the right to make a bid or a double. Was he justified?

Answer.—We are told that B's words were intended as an inquiry, equivalent to "was the first call in Hearts on my left?" The Declarer cannot claim that they are equivalent to "I pass, it is you to lead partner." First, because it is contrary to fact and, secondly, because he is bound to accept his opponent's statement in regard to his intention.

This I believe to be the right solution, although the words used by B might well have led A to suppose the auction was closed.

A player detaches two cards from his hand face upwards on the table. Has he the right to say which of the cards he is playing and which is the penalty card?

Answer.—The player names the card he intended to play, and if he is defender, the other card becomes a penalty card, but not in the case of the Declarer.

CHESS

TOURNAMENT IN HOLLAND

The following game shows some ingenious play by Keres.

(*Ruy Lopez.*)

WHITE. Fine.	BLACK. Keres.	WHITE. Fine.	BLACK. Keres.
1. P to K 4	P to K 4	30. Kt takes R	P takes P (*j*)
2. Kt to K B 3	Kt to Q B 3	31. Kt to Q 5	Kt to Q 6 (*k*)
3. B to Kt 5	P to Q R 3	32. R to Q 2	P to Kt 7
4. B to R 4	Kt to B 3	33. R to Q sq (*l*)	P to R 4
5. Castles	B to K 2	34. R to Q Kt sq	P to Q B 5
6. Q to K 2	P to Q Kt 4	35. K to B sq	B to B 4
7. B to Kt 3	P to Q 3	36. K to K 2	R takes P
8. P to Q R 4	B to Kt 5 (*a*)	37. Kt to K 3	P to B 6
9. P to B 3 (*b*)	Castles	38. Kt to B 2 (*m*)	Kt to K 8
10. P takes P	P takes P	39. Kt to R 3 (*n*)	R to B 4
11. R takes R	Q takes R	40. K takes Kt	B takes Kt
12. Q takes P (*c*)	Kt to R 2 (*d*)	41. K to Q sq	B to Q 3
13. Q to K 2	Q takes P	42. K to B 2 (*o*)	B takes P
14. Q takes Q	Kt takes Q	43. R to K R sq (*p*)	B to K 4
15. P to Q 4 (*e*)	B takes Kt	44. R takes P	K to B 2
16. P takes B	Kt to Kt 4	45. R to R sq	P to Kt 4
17. K to Kt 2	R to Kt sq	46. R to K sq	K to B 3
18. B to Q B 4	P takes P	47. R to K Kt sq	K to Kt 3
19. P takes P	Kt to K 3	48. R to K sq	B to B 3
20. P to Q 5	Kt to B 4	49. R to K Kt sq	P to Kt 5
21. Kt to B 3	Kt to B sq	50. P takes P	P to B 5
22. R to K sq	K to B sq	51. P to Kt 5	B to Q 5 (*q*)
23. R to K 2	P to B 4	52. R to Q sq	B to K 6
24. Kt to Kt 5	Kt to Kt 3	53. K takes P	B to B 8
25. P to Kt 3	Kt takes Q P	54. R to Q 6, ch	K takes P
26. Kt to Q 4 (*f*)	Kt to Kt 5 (*g*)	55. R to Kt 6	P to B 6
27. B to Q 2 (*h*)	P to Q 4 (*i*)	56. K to Q 3	K to B 5
28. B takes Kt	R takes B	57. R to Kt 8	K to Kt 6
29. Kt to B 6	P takes B	Resigns (*r*)	

(*a*) Not P to Kt 5 because of Q to B 4. The usual move is R to Q Kt sq.
(*b*) Not 9. P takes P because of 9. . . . Kt to Q 5.
(*c*) This position was reached in a game Book v. Alexander in the Margate tournament last Easter.
(*d*) Alexander played Kt to Q R 4. The text-move is much better.
(*e*) After this move White gets the inferior pawn formation. This he could avoid by playing B to Q sq.
(*f*) Apparently a strong move, but Kt takes Q P is better.
(*g*) Not 26. . . . Kt to B 3 because of 27. R takes B, K takes R; 28. Kt to B 6, ch.
(*h*) Threatening B takes Kt followed by Kt to B 6.
(*i*) A very good move.
(*j*) Black has two passed pawns for the exchange.
(*k*) Very good. If now R takes B, then P to Kt 7 and wins, or, if, instead, Kt takes B, then Kt to B 5, ch, and wins.
(*l*) Not Kt to B 3 because of B to Kt 5.
(*m*) Not 38. K takes Kt, B takes Kt; 39. K takes P because of 39. . . . B to B 8.
(*n*) Not 39. Kt takes Kt, B takes Kt; 40. K takes B because of 40. . . . P to B 7, and not 39. K takes B, Kt takes Kt; 40. K to K 2 because of 40. . . . Kt to R 6.
(*o*) If 42. P to R 3, then 42. . . . B to B 5; 43. K to B 2, B to B 8.
(*p*) After 43. K takes P, B to K 4, ch Black wins with his three pawns to one on the King's side.
(*q*) Not B takes P because of K takes P.
(*r*) If 58. K to B 2, then 58. . . . P to B 7; 59. R to Kt 8, ch (if R to K B 8, then B to B 5), K to B 6; 60. R to B 8, ch, B to B 5, and wins. If, instead, 58. R to Kt 8, ch, then 58. . . . K to R 6; 59. R to R 8, ch, K to Kt 7; 60. R to Kt 8, ch, K to B 8; 61. K to B 2, P to B 7; 62. R to K 8 (or 62. R to K Kt 8, K to K 7; 63. R to K 8, ch, K to B 6; 64. R to B 8, ch, B to B 5), K to Kt 7; 63. R to Kt 8, ch, K to B 6; 64. R to B 8, ch, B to B 5, and wins.

A game from the ninth round.

(*French Defence.*)

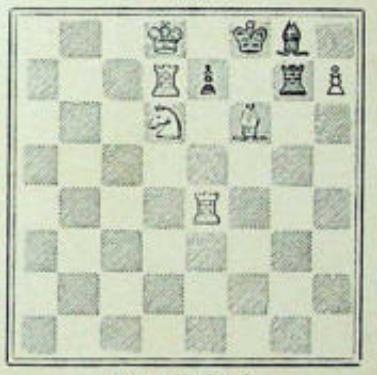
WHITE. Dr. Alekhine.	BLACK. Capablanca.	WHITE. Dr. Alekhine.	BLACK. Capablanca.
1. P to K 4	P to K 3	19. Q to Q 2 (*h*)	P to R 3
2. P to Q 4	P to Q 4	20. P to R 4	Kt to R 2
3. Kt to Q 2 (*a*)	Kt to K B 3 (*b*)	21. P to R 5	Kt(R2)toKt4(*i*)
4. P to K 5	K Kt to Q 2	22. Kt to R 4	Kt to K 5
5. B to Q 3	P to Q B 4	23. Q to Kt 2	K to B 2 (*j*)
6. P to Q B 3	Kt to Q B 3	24. P to B 3	Kt(K 5)to Kt4
7. Kt to K 2	Q to Kt 3	25. P to Kt 4 (*k*)	P takes P (*l*)
8. Kt to B 3	P takes P	26. B to Kt 6, ch	K to Kt sq
9. P takes P	B to Kt 5, ch	27. P to B 4	Kt to B 6 (*m*)
10. K to B sq (*c*)	B to K 2 (*d*)	28. B tks Kt, ch	R takes B (*n*)
11. P to Q R 3	Kt to B sq (*e*)	29. Kt to Kt 6	R to Q sq
12. P to Q Kt 4	B to Q 2	30. Q R to Q B sq (*o*)	B to K sq
13. B to K 3	Kt to Q sq	31. K to Kt 3	Q to K B 2
14. Kt to B 3	P to Q R 4 (*f*)	32. K takes P	Kt to R 5
15. Kt to Q R 4	Q to R 2 (*g*)	33. Kt takes Kt	Q tks R P, ch
16. P to Kt 5	P to Q Kt 3	34. K to Kt 3	Q to B 2
17. P to Kt 3	P to B 4	35. Kt to K B 3	P to R 4
18. K to Kt 2	Kt to B 2	White won (*p*)	

(*a*) Keres played this move (instead of the usual Kt to Q B 3) against Capablanca in an earlier round (see *Field*, December 3rd).
(*b*) Against Keres Capablanca played P to Q B 4, but failed to follow it up correctly. The text-move is not good since after 4. P to K 5, K Kt to Q 2 White, having his Queen's Knight at Q 2 instead of Q B 3, has not got to move it in order to be able to reply to Black's P to Q B 4 with P to Q B 3, but can, instead, make a developing move.
(*c*) This is stronger than 10. B to Q 2, which would allow Black to force exchanges by 10. . . . B takes B, ch; 11. Q takes B, Q to Kt 5.
(*d*) If, instead, he castles, White can start a strong attack by playing P to K Kt 4.
(*e*) It would still be dangerous to castle. Moreover, a move by this Knight is necessary before the Queen's Bishop can be brought into play.
(*f*) This turns out very badly, but Black has already the inferior game.
(*g*) If 15. . . . B takes Kt, then 16. Q takes B, ch, Kt to B 3; 17. B to Q Kt 5 with advantage in position to White.
(*h*) This move and his next two are played to prevent P to Kt 4.
(*i*) 21. . . . Castles (K R) is better, but after 22. Kt to R 4, K R to B sq; 23. Kt to Kt 6 White has much the better position.
(*j*) If B takes Kt, then P takes B followed by P to B 3 wins a piece.
(*k*) A good move.
(*l*) This is necessary to prevent the loss of a pawn.
(*m*) If Kt to K 5, then B takes Kt followed by Kt to Kt 6 wins the exchange. Kt to B 2 is, however, slightly better than the text-move.
(*n*) If 28. . . . K takes B, then 29. Q to B 2, ch, K to Kt sq; 30. Kt to Kt 6 wins the exchange.
(*o*) Threatening K to Kt 3 followed by K takes P and K takes Kt. If, instead, 30. K to Kt 3, R to B sq; 31. K takes P, then 31. . . . R to B 5 followed, if 32. Kt to B 3 or Q to Kt 3, by 32. . . . Kt takes Q P.
(*p*) In making his 35th move Black exceeded the time-limit. His game was, in any case, quite hopeless.

PROBLEM No. 3992

By T. K. WIGAN.

BLACK (4 pieces).



WHITE (6 pieces).

White to play and mate in two moves.

SOLUTION OF PROBLEM No. 3991

1. Q to Kt 7 (threatening 2. Q to Kt 7, ch), R to Q 2 (if 1. . . . R to Kt 4, then 2. Q to Q 4, &c.); 2. Q takes P, R to Q Kt 2; 3. Q takes R, mate.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO C.OSSWORD No. 495

ACROSS.—1, When you go abroad, of course, you invariably have a little pastime and sport. 4, "Sweet Vale of Avoca, how . . . could I rest" (Moore). 9, Although subverted, may still be made to serve. 11, Weapon cases. 12, Is it blistered feet that makes them shriek? 14, Shuffle the 'e and give us air! 15, Extracts from a neat simile. 16, A beastly piece of poor poetry! 18, He makes a vital organ of it. 20, "The sheltered cot, the . . . farm" (Goldsmith). 23, The members asked for the full details of the revolt and were promised more news before the House rose (hidden). 24, Even when you see the hunt go out of correct formation it may really mean nothing, after all. 26, Unprofessional appearance of a true M.A. 27, By secret methods, this clue might very well prove the last. 28, Band. 29, In common with 12, they are said to be looked upon with disfavour by irritable motorists.

DOWN.—1, It supports a negro in a seaside resort. 2, Particular places I knocked about. 3, This would appear rather above her. 5, The solution here is positively stated.

6, They may not be strictly described as tame animals, though, perhaps, nags must. 7, This is where you put in a request concerning horsemanship. 8, Things appear completely disorganised in these times. 10, When the teams become disorderly do they let it off? 13, Less fur now (anagram). 17, Would hunters and fowlers describe them as "plucky acts"? 19, Clannish patterns? 20, In no case can craft be found here. 21, Morning fixed on purpose to entertain. 22, Gives out. 25, Just so! 27, It follows the fashion in modesty.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI. Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Cricket

The West Indians.—As you suggest, it is the West Indians' turn to visit us this summer. The first fixture to be arranged between the two countries was in 1928, when they came over here and lost five of the six matches played, the remaining one being drawn. The year following, however, they had improved so much by the experience that they not only held the team we sent out there, but actually won the majority of the matches played. Since then, although they have as yet been unable to produce a team of true Test match standard, the fact that several brilliant individual players have come from the West Indies gives every indication that the day will come when they will do so. Amongst the greatest of these is George Headley. Hailed at one time as the "Black Bradman," he indeed proved a thorn in the flesh of the M.C.C. touring side of 1930. After making a brilliant 176 in his first Test match at Barbados, he proceeded to make a century in each innings of his third match, and concluded with 223 in his fourth. His total for the rubber was 703, and his average 87.87. Although he could not produce quite the same sensational results on English wickets when he came over in 1933, nevertheless his 169 not out at Manchester will long be remembered by all who saw it as a brilliant and technical piece of batting. Other well-known names in West Indian cricket are those of L. N. Constantine, I. Barrow, J. E. D. Scaley and C. A. Roach.—*K. D. C., Windsor.*

Garden

Walled-in Garden.—You are quite correct in your supposition that walls A and B will be the two shady ones. Though the walled-in garden will be on the small side, we think the advantages to be obtained from the wall will far outway any trouble that may arise through the shade. The border at A will be considered the north wall and can be planted up with Morello cherries, currants and gooseberries. Avoid draughts behind the trees by having the wire quite close to the wall. B is practically the east wall, and that will accommodate pears and plums. As to varieties, we can recommend the following pears: Doyenne du Comice with its pollinator Gleu Morceau, Souvenir du Congres, Beurre Superfin, Conference and Easter Beurre. With plums we would advise Victoria, Kirk's Blue, Jefferson's Gage, Laxton's Gage, Early Transparent Gage, and Dennison's Superb. It may be necessary to protect these during flowering with some ordinary fish netting. In the case of the red currants for the north wall, grow Laxton's Perfection and Fay's Prolific, and the gooseberries might be Lancashire Lad, a red, Careless, a white, Leveller, a yellow, and Berry's Early Kent, a green. You will be able to obtain these varieties from Messrs. Rivers, of Sawbridgeworth, Herts. Be sure and ask for the cherries, plums and pears on dwarfing stocks. We would like to recommend to your notice a new book, *Up-to-Date Fruit Growing*, by W. E. Shewell-Cooper, which we think will be of value to you.—*C. D. S., Whiteley Green.*

Miscellaneous

Answers to Questions.—We give below the answers to your series of questions. Unfortunately, we are unable to trace both the meaning and origin of the "Flick Wheel" and would welcome any suggestions on the part of readers: (1) Horn Book—This was a first book for children, which formerly consisted of a single leaf set in a frame with a thin plate of transparent horn in front to preserve it. (2) The first steamship to cross the Atlantic was the Rising Sun, built by Lord Cochrane in 1818. (3) Alpapa is a flower grown on the pampas of South America, and is used for the making of paper. (4) Zeugma—This is a figure of speech by which an adjective or verb, which agrees with the nearer word, is, by way of supplement, referred also to another more remote *e.g.*, "The girl arrived in a sedan chair, and a flood of tears." (5) Curari (also spelt curare, urari, woorali and woorari). Webster, in his Dictionary, describes this as, "Black resinoid extract prepared by the South American Indians from the bark of several species of strychnos (*S. toxifera, &c.*). It sometimes has little effect when taken internally, but it is quickly fatal when introduced into the blood, and is used by Indians as an arrow poison. (6) The 9° Channel runs through the Laccadive Islands in the Indian Ocean. (7) The Wreck Flag—The colour of this flag is green. (8) Shere Thursday—According to A. R. Wright, in the *British Calendar Customs*, Vol. I, it is the name for Maunday Thursday commonly used in olden times, and is written in the forms, Shere, Sheer and Clare Thursday. It has been suggested that this name follows, almost as a corollary, from the processes of shaving and cutting hair performed on Maunday Thursday as a preparation for Good Friday and Easter Day. (9) Gall on Oak Trees—Gall is an excrescence of any form produced on any part of the plant by insects or their larvæ. They are most commonly caused by small hymenoptera and diptera which puncture the bark and lay their eggs in the wounds. The larvæ live within the galls. Some galls are due to aphids, mites, &c. (10) The Horse that asked for Forgiveness—This is a Biblical quotation which comes from Job 39 v. 25, and reads: "He saith among the trumpets, Ha, ha; and he smelleth the battle afar off, the thunder of the captains, and the shouting." (11) The Golden Bough—There is a book by Sir James Frazer under this title dealing with customs. The book got its name from the story in the Æneid, Book 6, where Æneas cut a golden bough which he took to Hell with him, as a safeguard in danger. (12) Ferdinand Armine was one of the lovers of Harriet Temple in Disraeli's romance of that name. We have no knowledge of Nigel Armine. (13) Mme. de Chevreuse appears in the *Three Musketeers*. (14) Colonel Sapt appears in *The Prisoner of Zenda*. (15) Squire Western appears in *Tom Jones*. (16) Ben Gunn was the madman in *Treasure Island*. (17) The First Henley Regatta was held in 1839. (18) Nylghaie—A large species of antelope in Central India, the males of which are of a bluish colour. (19) Sheep Dog Trials—The first sheep dog trials in the British Isles were held at Ulverston.—*S. B., Whalton.*

Naturalist

Rat-Control.—This is the report on the subject, published by the Universities' Federation for Animal Welfare, which we consider answers your questions adequately: "Rats are highly sensitive and intelligent animals. Their destruction should be carried out humanely, though thoroughly. Any sense of vindictiveness should be avoided as being irrational. Rat-proofing.—Buildings should be so constructed and repaired that the entrance of rats is prevented, and access of these animals to food and water should be cut off. Fumigation.—Cyanide fumigants (cyanogas, cymag, calcid) are extremely effective and humane, and can safely be used in hedgerows and cornstacks; in buildings they are dangerous, however, in inexpert hands. The exhaust gas from a motor car (containing carbon monoxide) is humane, effective and safe. Sulphur fumigants and other irritant gases should not be used, since a non-fatal dose causes subsequent suffering. Ferrets and dogs and guns provide an effective and relatively humane method when well trained and handled. Bait Poisons.—Most of these are excessively inhumane, but red squill, which is effective and a specific poison for rats, is the least inhumane and has the advantage of not affecting domestic animals. Viruses are less inhumane than most bait poisons, but are open to other objections. Cats, though hardly humane, have the advantage of permanently keeping down the rat population if they are of a good ratting strain. In districts where gin traps are extensively used, cats cannot be kept because they are constantly caught in the traps. Traps. The best traps are either of the breakback type, such as the Nipper, Gripper, Veto, &c., which kill the rat outright, or of the double-door cage type, like the Brailsford. The gin trap (toothed steel trap) should never be used, on account of its cruelty; experiments carried out by the Zoological Society in 1919 showed that the much cheaper breakback trap is little less efficient, and that the double-door cage trap is substantially more efficient. Traps should be set in tunnels or drain pipes, or under slanting boards leaning against a wall."—*E. C., Caterham.*

Post-Mortem Examinations

Disease among Aviary Birds.—One of the common causes of death among aviary birds is chill, especially due to a night frost following a warm day, or a cold wind with an updraught on the perching birds. Of this trouble we have to report the deaths of two finches, a canary and a budgerigar. But a more serious cause of loss is contagious germ infection of which we report psittacosis in a collection of budgerigars' pasteurellosis, and coccidiosis in cordon bleus and budgerigars. The essential curative and preventive measures to be taken against these infectious diseases can be summed up in two words—regular sanitation. Aviaries, including all the fittings should be thoroughly cleaned out at least once per week, and by cleaning we mean scrubbing with hot soda water and soft soap, collecting and burning all the litter, and scouring the food and water utensils in boiling water. Labour-saving devices, such as spraying disinfectants through various gadgets, merely exploit the user's credulity. Public health measures in our towns for safeguarding human health are based upon the proper use of water in flushing drains and closets, scrubbing floors, tables and food larders, washing up dishes and cooking utensils, and washing our own clothes and bodies at least once per week. And yet people erect aviaries or other accommodation for birds without a thought of how water can be used with soft soap and soda as a necessary and effective cleansing agent. Water for drinking and possibly as a bird-bath may be part of the design; also the watering of the pretty foliage and flowering shrubs within the aviary may be intended. Aviaries designed as ornaments are not easily kept sanitary, and a sanitary aviary is necessary for the preservation of the birds' health.—*D. S., Salop; J. B. L., Devon; C. M. A., Perth; M. F., Devon; S. C., Jersey; M. M., Blairgowrie; S. M., Ross-shire; S. G., Skye.*

Travel

Where to Stay.—We are sure you would like the Montague Arms at Beaulieu, Hampshire, which is situated twelve miles from Southampton and seven miles from Lyndhurst. It is a fine example of a country house hotel. Then there is the East Close Hotel at Christchurch. You would be within easy reach of both the sea and the New Forest if you were to stay here. Also in the New Forest is the White Horse Inn at Romsey. The inn is long and narrow, as is so often the case with the old-world hostels which Trust Houses have acquired and preserved so admirably. The bedrooms lead off what were once galleries open to the courtyard beneath, but which are now protected from the weather by windows. In No. 2 bedroom, the Elizabethan oak panelling has an unusual cable moulding; while an adjoining room shows signs of a later age in eighteenth-century panelling, and boasts a graceful fireplace of the same period. But it is the cellars which will arouse the interest of the antiquarian. They are mostly in stone, patched and altered with Tudor brickwork. On one side, now beneath ground level, is the bottom part of a Gothic window with saddle-bars still in place. There are also queer niches in the wall, and, leading from the cellars, a brick-up passage which goes towards the Abbey. In this passage, now with an oblong bricked head, is a well or shaft giving access to fresh water. If walls have tongues as well as ears, what tales these cellar walls could tell! In the coaching days the White Horse shared with the now extinct Bell the posting trade of the district, for, though Romsey stands on no big main road, travellers from the West of England to the South pass through it, and a regular coach from London to Poole served the place a hundred years ago. Of a rather different style is the Langdown Lawn Hotel at Hythe. The main building of Langdown Lawn was built over 200 years ago, and new wings were added about 150 years ago respectively, work being carried out in the "soft-toned yellow Beaulieu brick" which, when partly covered with ivy, virginia creeper and climbing shrubs, settle amazingly well in the mild climate for which Hythe is renowned. Like some other country hotels of repute, Langdown Lawn has an authentic ghost, though the haunted room is not among those which are used by visitors to the hotel, it having been reserved for private use. The apparition, so the story goes, takes the form of a kindly old lady, who smiles on those who happen to be in the room when she cares to appear. In the grounds, some quarter of a mile away from the house, another ghost is supposed to appear, digging feverishly. Yet another ghost is said to patrol near one of the gates, and this one is firmly believed in by the local residents, though it is much more likely that the noises of footsteps which they hear are made by the Forest ponies. You might also consider the Beech House Hotel, which is situated on the southern fringe of the New Forest. So many people to-day seem scared of what, for want of a better term, they call "rural boredom," and, for this reason, they avoid the country. But at Beech House you cannot easily become bored. It does not rely solely on the beauty of the grounds; it provides equally for rest and recreation. You can, according to the dictates of your heart, play tennis or golf or wander through the 150 acres of woodlands which comprise the hotel grounds, where occasionally a New Forest pony grazes contentedly in a clearing. Being so near the sea, the air is always strong and bracing, which is just the tonic so many people need, either on holiday or for long week-ends away from the rush and worry of everyday life. In Wiltshire, we think you might like the Crown Hotel at East Everleigh, situated on the edge of Salisbury Plain. Its facilities for riding are unrivalled. There is also the Old Bell Hotel at Malmesbury, and the Old Ship at Mere. The Old Ship was first licensed as an inn at the beginning of the eighteenth century, and in due course it became a calling place for the coaches running between London and Exeter, being so built that passengers on the outside of the coach stepped out on to the first floor. The archway through which the coaches used to drive now leads to a spacious yard, beyond which there is a picturesque garden. We do not know whether you will have definitely decided to go to Hampshire or Yorkshire, but if you have not, may we recommend the Cotswolds as being the ideal Mecca for a country holiday at this season of the year? We have information concerning a great number of delightful old inns in that district, and we shall be only too pleased to pass it on to you, if you will let us know whether you will require it.—*T. B., S.W. 1.*

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

In view of the Christmas holidays, small classified advertisements should reach this office not later than the first post on Monday December 19th, to ensure inclusion in the December 24th issue, and not later than the first post on Friday, December 23rd for the issue of December 31st. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

HUNTING AND FARMING INTERESTS

THE relationship between hunting and farming has necessarily changed very much during the last twenty years. The plight of modern agriculture prevents many farmers, who still have hunting in their blood, from taking more than a conversational interest in the activities of their local hunt. Yet the fact that they are unable to hunt themselves must not be taken—as is so often the case—as evidence of their desire to see hunting abolished. For the majority of farmers have little of which to complain in their relations with the men and women who ride over their land. If damage has been done to their stock or property they are invariably compensated, so that they do not lose by it, and our experience, gathered from all parts of the country, goes to prove that the farming community as a whole would be unwilling to see the last of their local hunt. Frequently they take the utmost pride in the knowledge that a brilliant and unforgettable run took place over their own land.

Many hunts are themselves more concerned over this relationship than are the farmers. The merest glance at any hunt accounts shows how much of the hunt funds is expended in the satisfaction of poultry claims, the wire fund, and compensation to farmers in cash and in kind. We do not believe that in the whole history of hunting have the legitimate claims of farmers received more serious attention than at the present day.

Nor are such claims the most serious consideration of the modern hunt. For a considerable proportion of every field is made up of some men and women who, though they may be excellent fox-hunters and generous subscribers to the hunt funds, are yet by their nature ignorant of their proper conduct towards the farmers over whose land they ride. It is true that such persons are in the minority, yet it is for their faults that the hunt as a whole is compelled to answer.

It must never be forgotten that, while some claims—notably those of game farmers—would appear to merit more consideration than in fact they do, hunting is a source of income to farmers in many ways. Some horses are admittedly obtained from dealers, but sufficient are bought from farmers to warrant their breeding them. It is true that much forage comes from towns, yet many farmers find a profitable trade in supplying members of the hunt. It is more the fault of the Government than of the hunting community that farmers have not the facilities to combat the town forage merchant and to make it easier for owners of horses to patronise them. While the town trader has all day in which to convey the forage in adequate lorries, the farmer must frequently start to deliver it late in the evening after his day on the farm is over. It is by no means unusual to receive a visit from such a farmer in the region of midnight.

Yet undoubtedly hunting people should, at whatever cost and inconvenience to themselves, make every effort to secure the welfare of those farmers upon whose support their hunting ultimately depends. It should never be forgotten that while farming could continue without hunting, the existence of the sport is in the hands of those who own the land.

We believe that the future of agriculture and of hunting lies ultimately in the same hands—in the hands of those men who are countrymen before they are politicians. The political and sporting history of England, until the present chaos in agriculture and anxiety as to the future of hunting, is an argument for this view. It should therefore be the concern of every hunting man and woman to make every effort to weld together the two twin interests, for both are not only a feature of the great tradition of English life, but could also be an integral and valued part of English economic welfare.

PEACE ON EARTH

THIS issue of the *Field* is dated for Christmas Eve, and the occasion is not only one for wishing everybody the customary "Merry Christmas," but also for hoping they may enjoy the Peace and Goodwill of our sacred observances on Christmas Day. Signs of either have been sadly lacking. Every political speech at home or abroad has been charged with the fear or threat of war; two great wars are being waged; the Press is almost engendering the idea that war will have to be faced, and from a section of it we are provided with a daily scare based on dangerous rumours that have to be killed as soon as they are born. Without indulging in foolish optimism, and without neglecting very necessary preparations for national defence, an appropriate Christmas wish may be made that war will figure less in talk and print in the political and newspaper worlds, and that a more hopeful and characteristically British spirit will prevail, especially where the future of the Empire is involved. The public also might be given a respite from ominous warnings concerning eventualities the course of which the individual is powerless to influence. Our legislators are appointed to deal with these, and those who seek office have never been known to exhibit a lack of confidence to do so when appealing to the electorate.

BACK TO THE HORSE

Our old country inns are to resume their traditional connection with the horse through the medium of riding tourists. Five hundred of them with adequate stabling accommodation are to be registered as suitable centres by the Institute of the Horse and Pony Club, of 66, Sloane Street, London. After each inn has been approved by the institute as having stabling for at least three horses, the landlord will receive an illuminated certificate of official appointment by the Institute of the Horse. In most cases these certificates will be framed and hung in the lounge of each inn. The institute will also permit each registered inn to display its special stabling sign depicting a white "cut out" of George III. on horseback. These signs will be erected at the main entrance, as are the signs provided by the various motoring organisations. To facilitate the work of inspection of suitable inns, landlords, who can provide good stabling and who have not yet been registered, are invited to submit their names direct to the institute, which is stimulating public interest in riding by issuing itineraries and maps for riding tours of over 100 miles in many parts of the country.

WINTER SPORTS INDOORS

If we cannot go abroad for winter sports, the pleasures of ice and "snow" can be enjoyed under cover at home. The holding of the British Figure Skating Championships at Wembley recently provided the finest display that can be seen on any rink in the world, and those in search of novelty were introduced to lawn tennis on skates. But the most ambitious winter sports programme yet staged must be that at Earls Court, where, framed in Alpine scenery, a "mountain" 118ft. high soars up to the ceiling of the arena. There are ski runs on manufactured snow, ski hoists, and all the equipment of a winter sports centre, and an innovation was a series of slalom races for the "British Indoor Ski Championship." There is also an Indoor Ski Club with such experts as Bill Bracken and Audrey Sale Barker to instruct. For the production of the snow huge blocks of ice are placed in a machine which can crush 50 tons an hour, and then spray out the powder through a tube, and in this period it manufactures 150 cubic yards of snow.

CHRISTMAS AND THE ANGLER

Christmas Day, perhaps of all those marked upon the calendar, is the one on which the river banks are most deserted; even the sound of road-borne traffic has lost its dull insistence; the voice of the river seems suddenly to fill the silence as the whispering crunch of the foot among the frost-bound sedges approaches its softly-swirling current, and the plops which recall the sounds of a summer evening are seen to be caused only by the melting hoar frost falling from the overhanging bents, and floating off downstream till, spreading widely, the river adds them to its store. A moorhen moving jerkily along a reed-girt bay can still be traced by shaking stems long after she has made escape from her imagined danger. A sudden spirt of leaping fry shows where a pike, too, is keeping feast day, and regret for the rod reposing in its case at home may add itself to the emotions that the silent river bank provides. But better still, perhaps, is the thought of Christmas cheer towards which our home-bound steps will presently be turned.

THAT NEW GOLF RULE

The golfing world resignedly awaits
  Enforcement of the rule, arranged between
The R. and A. last year, which stipulates
  A set of clubs must not exceed fourteen.

The caddies will be pleased; there's little doubt
  They'll bless the kindly action of the men
Who'll make exacting golfers do without
  An extra driver, or a "number ten."

But for these players will it not provide
  A rather tricky problem? They must find
It will not be so easy to decide
  Which clubs to use and which to leave behind.

They'll hate to lose that "double" three or four,
  And yet that little "runner-up" is just
The thing for keeping down a mounting score,
  Despite its groggy shaft and coat of rust.

But if it is suggested that their game
  Will suffer, they'll deny it with a laugh—
Yet won't they feel a longing, all the same,
  To use that lovely "seven and a half"?

DOUGLAS HILL.

A COUNTRYMAN'S JOURNAL

SOME weeks ago I stayed the night in a noisy but faded little market town, and, while dressing in the morning, happened to glance at the yew-tree, whose branches darkened the window. It was full of crossbills. I called out to my wife: "Do you want to see a sight as rare as eating a good English cheese?"

The decline of the English cheese is one of the best examples of how commercial values have ruined good taste and discrimination. In 1850 it would have been difficult to find a single farmhouse in Britain which did not make its own cheeses, just as it cured its own hams, baked its own bread, and brewed its own beer. People at that date used to talk about "good cheese hands," as we to-day talk about "green fingers." In still earlier days most of the farmhouses possessed cheese presses, some with a great squared slab of stone, others with a square wooden box filled with stones in which the cheese was squeezed, on the same principle as cider in the cider press. Where the cheese press was absent the cheese was wrapped in a cloth and pressed down into the vat under a heavy stone. Weyhill cheeses—has England forgotten Weyhill Fair, where the cheeses of the west met the sheep flocks of the east? Seeing what Weyhill is to-day—a fringe of vulgar hoardings round a green—it is no wonder that this illustrious mart of English cheeses is forgotten.

How many out of this multitude of local cheeses survive in our day? English cheeses have vanished with English cooking, that once had none superior to it in Europe, even in France which, if first in some things—soups, for instance—was second to us in as many others. Now English cooking is derided as the worst in Europe, and we will not even call an English dish by an English name. We not only live on tinned importations but eat vamped-up messes under French or other foreign names in the fond delusion that we are being Continental. The menu has generated as bastard a brood of monstrosities in language as any spawned by scientific invention. And where are our cheeses? All, all are gone, the old familiar slices, except Cheddar and Stilton. I once bought a pound of Cheddar at Cheddar and left it at Cheddar (in the ditch), and the fact is that properly matured Cheddar is rare. It too often has that venomous bite to it, that rancid comeback that betrays how its makers have forgotten the cardinal desideratum of all good cheese (as of most other things)—"the ripeness is all." Besides, most people happily eat Canadian Cheddar; they do not know the difference, just as they do not recognise the difference between a good and an indifferent cheese. So, a genuinely ripened Stilton is as rare as a needle in a bottle of hay.

A handful of other English cheeses most precariously survives—Wensleydale, Cheshire, Dorset Blue Vinney, Leicester and Double Gloucester. Most people have never heard of them, and yet each is as fine a cheese as exists anywhere in the world. Personally speaking, I prefer Double Gloucester to any of your Bries and Camemberts; for richness and softness of flavour matching its beautiful colour of autumn beech leaves it is without a peer. There are, I believe, two shops in the whole of England where you can buy it—the proud Englishman prefers pieces of foreign stuff like soap wrapped up in tissue paper. It is not so strong as Wensleydale and Leicester, fine cheeses both, but it has a fullness and a tone that make it the perfect cheese with celery.

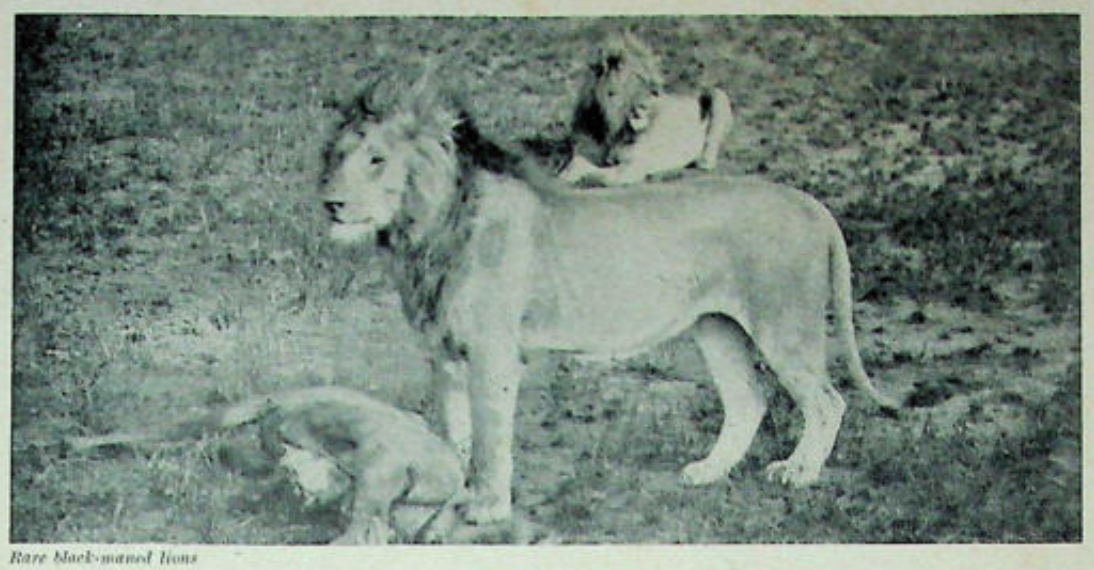
Quite recently an Oxford provisions dealer had a felicitous idea. He organised a cheese week, so that English people for the first time in their lives had the opportunity of choosing between more than two English cheeses. As a result of that week I learn that Double Gloucester is to be on the permanent list. By the shade of Cobbett, that is what I call good news. It will help to regenerate the decadent English taste in food. For half-a-dozen farmhouses overlooking the Vale of Berkeley it will keep the wolf from the door. Best of all, it will perhaps save an English rural industry from extinction. How remarkable it will be for English people to discover that the English countryside can produce good things; that it is something more than a series of sites for bungalows, aerodromes, garages and roadhouses!

H. J. MASSINGHAM.

WITHOUT COMMENT

From a novel:

"The following day there was a thrill in the wheat-field. The binder was vanquishing the army of stalks. . . . The farmer brought his gun from under the oak, and the men pulled sticks from the hedge. The binder kept at its steady clacking, devouring the last of the wheat. A whirr of wings and sudden shouts made the horses toss and jingle, and I saw a hen pheasant rocketing desperately. The driver pointed into the wheat where twelve olive eggs lay polished in the sun."



Rare black-maned lions

FLORA AND FAUNA OF THE WORLD

Next Year's Important Conference

IN the autumn of 1939 a Conference is to be held which will be of very great importance to the preservation of the flora and fauna over nearly half the earth's surface. All the Powers signatory to the African Convention are to meet again in London to discuss what further steps they can take to improve existing conditions, while at the same time a Conference is to be held of all the countries in South-Eastern Asia and Australasia. In our own case this will, of course, include India, Burma and Malaya. It is understood that these two Conferences will be convened together, dividing into committees as necessary. It will be the most comprehensive gathering of its sort ever held.

It is therefore of the utmost importance that the preliminary work of the Conference should be prepared with purpose and forethought, and it is highly important that the Indian Empire and the Colonial possessions should do all that they can to set their houses in order before the stock-taking takes place. Nobody—certainly not the Colonial Office—would desire that the nakedness of the land should be revealed as pitilessly as it was last year. Under the first heading of preparation the work will devolve on the Economic Advisory Council, the Colonial and India Offices, and the Governments they administer overseas, and as intermediaries on the Dominions and Foreign Offices. The Economic Advisory Council can be depended on to see that the technical machinery of the Conference runs smoothly, and it must be largely to their efforts that the necessary co-ordination will be achieved. Where good will is apparent they will find that such co-ordination is easy. Where opposition or conflict of interests is encountered they will no doubt, as in other cases, feel the lack of an administrative head actively interested in the work of the council, and having a seat in the Cabinet. But their handling of the last Conference leaves one with a feeling of competence, and in Mr. Hemming—soon let us hope to be intervening on non-intervening in more peaceful spheres—we have a Secretary-General who may be described without bathos as the Maurice Hankey of Game.

As regards the preparations which may be set in hand by the Colonial Office, these will, for the most part, concern Africa, and it seems to us that much useful work could be achieved by a preliminary conference of game wardens, to be held, say, in Nairobi fairly early next year. These acknowledged experts could then help to formulate some sort of an agreed policy (which, as far as the *Field* is aware, has never been laid down) for the British Colonies in Africa. It is interesting in this connection to note that that highly important document, the Hailey Report, contains practically no reference to the future of game on the Continent. This meeting of game wardens, provided the position is fully and frankly discussed, should have a most beneficial effect. It must, however, be remembered that the last word rarely lies with the game wardens. They are aware better than any of us where the dangers and difficulties are, but their efforts are all too often blocked by other departments, and by the eternal bugbear of finance. The future of game in any one colony or protectorate depends probably on one factor more than any other—the support that the Governor gives to the game warden's department. And, to use a homely metaphor, whenever father has turned we have all turned.

The need for such a preliminary conference is even more necessary in India than in Africa. That sub-continent contains a fauna more rich and varied than any part of the world, and it is decreasing in a most alarming manner. The non-enforcement of the Arms Act, and the lack of control outside forest areas, are denuding vast areas of game. The most hopeful portent in an otherwise unpromising situation is that Indian public opinion is showing an interest in the subject. It is at least a debatable point whether it would not be better to take game preservation away from the sphere of the forest department, and create, in most of the provinces at any rate, a game warden's branch. This suggestion was resisted for many years by the Indian Forest Service, whose work for game preservation was beyond praise, but the circumstances of the Service are much altered. Subjects such as these might be discussed at a general preliminary conference for India, to be held at Dehra Dun, or some similar centre. Even that is only half the problem, for there remains the question of the Indian States. Whether or not they can be represented at the London Conference is too complex a question to be dealt with here. It involves the whole question of their relationship with the Paramount Power.

It is of great importance that efforts should be made to ascertain the views of the Indian princes on the points at issue, and to get them to subscribe as far as is practicable to any arrangements made at the Conference on behalf of India. Under any circumstances the problems of game in India are on so grandiose and varied a scale as to demand most thorough preparation. It is not unfair to say that the extermination of wild life outside the forest areas has been a blot on our administration. Given the necessary fillip from High Places something can still be done.

There remain two considerations which are, apparently, like the poor, ever present with us. The first is the inevitable time lag. As regards fauna preservation, nothing is done until it is too late. When it is found that another rare beast has ceased to exist, or another once thickly populated area has been denuded of game, everybody says, "How dreadful!" But action has been postponed till it is too late. Nobody seems able to think ahead in this connection. Even when plans are agreed to in London it is generally a matter of years before they reach the state of effective action overseas and often effective action never follows.

There remains a second, but not unimportant, consideration. The whole trend of the various conferences held in recent years has been towards the creation of National Parks. As far as it goes, this is excellent. But at times this leads to a disregard of all other considerations. Having proclaimed a suitable National Park and seen that it is adequately policed, it is not enough to sit back and ignore game elsewhere. In all parts of the world there are huge areas which could not fairly be proclaimed as parks or reserves, but which will, or could, contain game, as far as one can see, for all time. Simply because we have proclaimed a park we cannot sit by and ignore the game question in these areas. We must remember that we are trustees for the nations. Not infrequently they require to kill animals for food. We must limit this killing to a quota which will allow the game to continue to exist in reasonable numbers, otherwise in a few years' time there will be no such source of food supply left. No good trustee allows the capital under his control to be squandered; he attempts to live on his interest, or, in this case, the breeding turnover. It should, therefore, be laid down as a maxim till that unfortunately far-distant date when the African can see these things for himself, that outside the parks and reserves, except in cases of emergency such as famine, the killing of animals by natives should be restricted to an agreed level.

THE ARTISTES GATHER AT THE ENTRANCE LONG BEFORE THEIR CUE COMES

Chas. E. Brown

SALUTE THE CIRCUS!

Ancient Customs, High Courage and—No Frontiers

ONCE, at the end of a performance, I stood with the late Bertram Mills watching six thousand people pour from the vast arena, eagerly discussing the thrills and spectacles of the show.

"And the pity is," commented Mr. Mills, "no matter how brilliant a programme we give them, when it's over, they have still had only a glimpse of the immense fascination of this business. I often wish I could take them all, one by one, and introduce them to the circus folk at home, in their wagons, at work in the practice ring, or journeying along the road. It would double their enjoyment."

Everyone who has even scratched the surface of circus life must agree with him. To explore the circus from the inside is not to meet disillusionment, but rather to increase one's sense of wonder and romance. They say that anyone who has ever worn out a pair of shoes in the ring will for ever have the circus in his blood.

And assuredly, all the "amateurs" who have made it their business to peep behind the scenes have remained the staunchest enthusiasts for the sawdust ring—people like Lord Lonsdale, who himself rode in a Continental circus as a young man; Lady Eleanor Smith, who has toured with various circuses, gathering first-rate literary material; Dame Laura Knight, who, when she toured with the Mills Circus, appeared on the pay-roll at a nominal wage of half-a-crown a week in order, as she insisted, that she should be regarded by the circus folk as a fellow-worker; Edward Seago; Miss Frances Doble; and scores of journalists, photographers and others whose work has taken them into the inner world of the circus.

It is a world like no other. A world of ancient customs, precise etiquette, high courage, simple philosophy and—a strange language of its own. Circus slang is the esperanto of the profession. The French clown, the German acrobat, the Cossack rider, the Cockney groom—all know that "tober" is the site or pitch of the show; that "munjari" is food; that the "spieler" or "barker" is the leather-lunged crier outside the side-shows; that horses are "prads"; and that usually the "starbacks" have the most "dinari" (meaning, the patrons in the best seats have the most money).

Technical terms abound. The circus tent, of course, is the Big Top, supported by main masts, known as the King Poles, with scores of "quarter poles" to support the huge weight of canvas and hundreds of side poles to stiffen the tent walls; the process of erection is called the "build-up," to be followed in due course by the "pull-down."

All feline acts—performing lions, tigers, panthers, pumas, cheetahs—are known as "cat" acts; horse acts are in three classes—*haute école*, or high school, in which the horse, carrying a rider, performs various high-stepping movements and dances, such as the "Spanish trot," polka, waltz, *passage*, and changing step at the gallop; Liberty horses, which may perform in troupes of up to sixteen animals without riders, and controlled only by word or gesture from the trainer; and rosin-backs, these latter being the broad-backed, even-trotting horses, used for bare-back riding, acrobatic and ballerina acts. They are so named because their backs are dusted with rosin to provide a grip for the artistes' shoes.

JOE CRASTON, DOYEN OF ENGLISH CLOWNS, WHO LEADS THE FUN-MAKERS AT OLYMPIA

Incidentally, the ballerina jumps through a "balloon," not a hoop. Similarly, circus folk speak of "perch" acts when they mean the acrobat who balances on top of a pole held by another. They never talk of coconut shies, tight-rope walkers or bare-back riders; instead they refer to coconut *sheets*, *wire* walkers, and jockey acts. Again, clowns are, technically, only those with chalk-whitened faces and traditional clown costumes; the funsters who sport outrageous attire—huge-striped vests, baggy trousers, patched coats, battered "toppers," or immense Eton collars—are not clowns, but Augustes.

Circus folk are true internationalists. For them, frontiers do not exist and international "tension" has not a chance in the friendly, workaday world beneath the Big Top. Czech and German, Austrian and Italian, Chinese and Japanese, all mingle in perfect harmony, united in a common loyalty to the show, for which they will work, fight, endure danger, hunger and fatigue without a murm[ur]. Every big circus is a League of Nations in min[i]—and one which works, for though the va[ri]nationals preserve their own customs, eat their special foods, cling to their religions, and obs[erve] their national feast days, they have seen too muc[h] of the world to believe in hating another because he does not speak the same language.

Language, as it happens, is seldom a difficulty. Circus folk are perforce good linguists, with usually enough English, French and German to get them round the world. Many of the children can speak three or four languages before they are in their teens.

Probably the most distinctive characteristic of the circus artiste is his all-absorbing passion for his work. To him, work and play are synonymous. No call-boy is ever required in a circus; the artistes gather at the entrance long before their cue comes,

eager to get into the ring. Their ambitions are almost wholly to do with their performance. Thus, I once asked Lilian Leitzel what was her highest ambition. She was the charming and brilliant girl who used to hang from a rope 50ft. or 60ft. above the ring and, suspended by one hand only, turned more than a hundred lightning somersaults without a pause. Her reply was: "To do 150 somersaults, of course." And she did. On her birthday, at Olympia some years ago, she achieved 167 revolutions, and there wasn't a happier girl in the world that day.

A profound sadness overcame the entire circus world when, soon afterwards, in Copenhagen, the rope broke and this talented child of the circus was killed.

For years, the supreme ambition of all flying trapeze artistes was to accomplish a double somersault while flying through the air. At last it was achieved. Then Codona, perhaps the greatest trapeze artiste of all time, made circus history by performing a two-and-a-half somersault. And later he accomplished a full triple somersault, which everyone had sworn was impossible. Others have followed him since. An American girl has "done a triple."

And the circus world now waits for the quadruple somersault. So far nobody has succeeded, though I believe, some years ago, an Italian attempted it in Dublin, with fatal results.

Rastelli, the incomparable juggler, achieved feats which nobody had dared attempt before—possibly because, on one trick alone, he spent eight years' practice before presenting it in public.

Similarly, Con Colleano, the Australian who dances the tango on the wire, practised in private for five years before he, too, created circus history by being the first man to perform a *forward* somersault on a tight wire. This, incidentally, is a good example of a feat of consummate skill and artistry which, through ignorance of the difficulties, is not wholly appreciated by the uninitiated. In a backward somersault, which many artistes had been able to do for years, the performer's eyes have a sight of the wire before his feet come round to it; in a split second he is able to adjust any error in his flight. But in the *forward* somersault, a vastly more difficult feat, his toes must find the wire "blind."

In a different sphere, Joe Barry, one of the Mills *haute école* riders, has lately broken fresh ground by training his horse, Black Diamond, to dance around the ring fence. This latter is the raised banking, only 16in. wide, surrounding the ring. A grown man would find some difficulty in running round it without losing his balance; for a horse to do so, changing step, and carrying a rider, is a superb achievement.

Black Diamond is a *natural* performer. Many horses are. Like certain dog breeds, they seem to have a quicker perception and imitative knack than their fellows. Many of them never see the circus ring, but remain the pets of their proud owners. Such was Merlin, one of Lord Lonsdale's shooting ponies—though Merlin did, one year, condescend to appear as an "amateur" in the Olympia Ring.

Some years previously, the King had presented Lord Lonsdale with a mare called Usury, one of a team of cream Hanoverians which formerly drew the royal coaches. Merlin was one of her foals. Very soon this pony displayed a remarkable intelligence, and Lord Lonsdale, who has always had a marvellous command over his horses and dogs, soon taught him all the circus tricks—dancing, jumping, begging like a dog, and picking up handkerchiefs at the order. Indeed, all Lord Lonsdale's ponies, more than 30 of them at that time, had been taught to lie down, roll over, and cross their legs at the command.

Every day spent "behind the scenes" of a circus yields its grain of knowledge. The layman learns, for instance, that dancing horses never dance to the band, but that the band keeps in time with their movements; that loud speakers, arc lamps, and troupes of stable boys waving papers are introduced to the practice ring to encourage new horses to be at ease for their first public appearance; that it takes about two years to train a Liberty horse troupe, at the end of which period the animals know their places so well that if one, by chance, goes astray, the others will cheerfully kick him back into position.

Did you know that all circus rings are precisely thirteen metres in diameter; that it costs a shilling a mile to transport an elephant; that elephants hate mice, fearing one may run up the inside of their trunk; that a good elephant team may be worth £10,000; that the safety net is disliked by most aerial artistes, who imagine it is a slur upon their skill; that an animal trainer, if clawed by a lion, never jerks his arm away, but, instead, thrusts it towards the animal and so unhooks himself; that "fat boys" in the freak booth are usually paid by weight—about £1 a stone a week for these "boys" of 25st. to 30st.; that a bearded lady may earn £20 to £25 a week?

The earnings of circus stars are among the chief surprises to the ordinary public. Circus talent of the highest class is one of the rarest commodities in the world. Even a circus like the Mills show, recognised among circus folk to be the pinnacle of ambition among the world's circuses, may have to wait from two to five years for a star attraction, so solidly booked are all the outstanding acts. The Bronetts, among the highest paid clowns, have been paid £300 a week. In America, Tom Mix was reputed to earn £1,000 a week, the circus providing him with his own private Pullman coach, his own valet, stenographer and chef!

Clowns are scarce. The humblest ring tumbler can nowadays earn £10 a week, while the inimitable Grock, who was a circus clown long before the music halls claimed him, has been known to refuse £600-a-week offers. The late Bertram Mills told me that the most he ever paid for a juggler was £400 a week to Rastelli.

His total wage bill for the five weeks' season at Olympia was in the region of £30,000, and the same policy of paying high prices for the cream of the world's talent is being maintained by his sons, Cyril and Bernard Mills, who this year knew that before a single person paid for his circus seat they had staked £80,000 on his doing so. He and many thousands more. Fourteen thousand a day, in fact.

"GRAVELLY RUNS . . . WHERE THESE SMALL PEAL LOVE TO LIE"

INCALCULABLE SEA-TROUT

What is it makes Good Fly or Minnow Water?

By "WEST COUNTRY"

BACK-END salmon fishing on Devon rivers is of very indifferent quality as a rule. It is rare for more than an odd fresh fish to come into the rivers after August, and those caught late in the season are, in nine cases out of ten, salmon which have been in the pools for months. Therefore, whenever conditions permit, I prefer to devote myself to sea-trout during September and October, for in the Tavy at this time of year there are, particularly in the lower reaches, big shoals of school peal, the herling stage of sea-trout, which average around 12oz. to 14oz. They come into the river from July onwards. Some, the early comers, push upstream, and a percentage spawn. But later arrivals, and I have caught them carrying sea lice well on into October, do not go far above the tide, and are mostly not breeding fish. They are, therefore, still in prime condition, and on light tackle afford excellent sport, for on a good day one may "meet" several score, although the number in the bag at the close will be vastly less than this.

Our West Country peal are wily creatures. One cannot go out by day with orthodox sea-trout tackle and make a basket as is done in Scottish and Irish waters. An odd one or two may be picked up by fishing dry with tiny trout flies and the finest gut. But for the most part they are killed after dark, or when the rivers are in fairly heavy spate. Good peal water has a definite meaning on the Tavy, and signifies that the water is pretty dirty. In such conditions, and in such conditions only, can one expect to catch sea trout by day in Devon streams.

That was one belief which has held good over more years than I care to remember when other, apparently well-founded theories, the fruit of considerable experience and observation, have crashed in ruins. And now, this autumn, every notion I have ever held about sea trout has been exploded, except that they are the most incalculable species inhabiting the waters of this country.

My disillusion began on a Monday. There had been a 5ft. flood the day before, but when I arrived on the river about 9.30 a.m. it was to find that the water, although a good height, was a clear amber-ale colour, instead of still being fairly dirty as I had hoped. The first words the keeper uttered when he saw my threadline spinning outfit, were: "Bit clear for minnow, sir. Better for fly?" I agreed, and in the first mile and a half I did not touch a fish. But as soon as I got down out of the big wood into the Lower Hams of the Buckland Abbey water, I began to have runs. Moreover, those which did notice the little 1¼in. devon meant business, not like one day I had on this same beat in August. Then I must have pricked fully 70 sea trout in catching half a dozen.

I have had this maddening experience before. Tug-tug-tug: sometimes I would run four or five fish without moving a yard; now and then one would take hold, kick and splutter for a few seconds, and then escape. Occasionally a bolder, or more foolish, fish would make a mistake and get well hooked, but the vast majority played the game of tip and run with consummate skill. How they can give the bait such a heavy pull without getting hooked is one of the wonders of the universe.

Presently I came up with another angler, a very skilful fly fisher, and, to my surprise, found that he only had one against my four. After lunch, it began to rain cats and dogs, and I started to work homewards, still behind the fly fisher. Four times I got a peal within a few minutes of his trying a run without a rise, and when we finished my total was ten and his four, although to all appearances the water had been far more suitable for fly than bait.

The rain continued; that night the river rose big again. Next morning the water was much thicker than it had been the previous day, and I wondered idly if I should be able to carry back to the car all the sea trout I proposed to catch. Such a thought was, of course, quite enough in itself to ruin any day, and may have been responsible for the fact that five hours' hard work only resulted in a bag of three peal out of seven runs.

On Thursday the water, although big, contained hardly any colour at all, and on the gravelly runs 3ft. to 4ft. in depth, where these small peal love to lie, one could see the bottom the whole way across. It looked pretty hopeless as I only had spinning tackle, but low down in the tidal reaches the "schoolers" were moving here and there, and by the time I finished at 3 o'clock I had nine, in spite of what should have been quite impossible conditions. To make it all the more astonishing another rod on my bank, and two fishing opposite, all using small flies, creeled one peal between them.

But this was not by any means all, and soon confusion was to be still further confounded. Torrents of rain late on Saturday caused another big flood. I arrived at the river about 10 a.m. on Sunday and found it a bright yellow colour and quite unfishable; but by 2 o'clock it had cleared into perfect "peal water." I chased down to the bottom end of the beat, as time was limited, and worked home. In three hours of ideal conditions I ran one sea trout and landed nothing. Next day I found nearly all the colour had gone, and the river was pretty much as it had been when I had killed the nine. Yet in six hours I had one good pull, which did not materialise into anything further.

And so I ended the season of 1938 completely bewildered, certain only of one thing: that I know a great deal less about the habits of sea trout than I thought I did.

ECONOMICAL TROUT STOCKING

DURING the passage of recent years popular opinion among trout preservers has completely boxed the compass of stocking methods. Stocking with ova, fry, yearlings, two-year-olds, and, to some extent, three-year-olds, have all had their enthusiastic devotees. All are good in circumstances favourable to their adoption, if, at the same time, you stock with discretion.

The cheapest way is to stock with ova, which consists in laying down the impregnated trout eggs in a stream under conditions that materially lessen the, say, hundred-to-one chances against the embryo fish ever achieving maturity. An effective way of doing this, if a well-equipped hatchery is out of the question, is by the employment of Kashmir boxes, which I have described in detail elsewhere *; but if something cheaper is required, an old tin trunk, such as grandma used for the transport of her frills and furbelows when she visited the seaside, will give good results.

Punch one end full of holes $\frac{3}{16}$in. in diameter, and the other end, bottom and sides with holes $\frac{1}{4}$in. diameter—not more. The holes should be punched from the inside, so that any jagged edges are on the outside. Fill the trunk to one-third its depth with clean gravel about the size of a pea. On this the impregnated ova are carefully spread, and gently covered with a thin layer of the gravel. The trunk is then anchored in the stream at sufficient depth to ensure a flow of water through it, the end with the larger holes facing upstream to admit the water which percolates through the gravel and emerges through the smaller apertures.

In this sanctuary the ova are hatched. In due course the resultant alevins wriggle their way through the interstices in the gravel, secure the dangers that beset the spawning beds, still enjoy the protection of the trunk until yolk sacs being absorbed, the spirit of adve combined with a craving for food, impels them outside exploration via the small holes in t lower end and sides.

Much more than this can be done to safeguard their infantile career if, some distance downstream, a grill can be placed across the stream to foil the piratical incursions of other fish, and the whole of the nursery carefully wire-netted to keep out such feathered enemies as kingfishers and dippers. A watercress bed in the nursery is a most valuable adjunct, as it provides both shelter and food for the infant fry.

WHERE SHALL WE GO THIS WINTER?

Some Topical Suggestions

AS soon as the fogs come, and the swallows have long since winged their way, I begin to have a twinge in my joints. It is then time to move. Just push across that atlas and let us have a look at Africa.

We might go tourist, of course, but if you are like me, you'll want an old bandook among your baggage. Take the East Coast, it sounds more familiar and must be the better climate.

Morocco, Algeria, Tripoli are no good to us, too "touristy," with an overlay of "sights" and expensive hotels dotted along super motor roads, quite inexpressive of the real heart of the land, where unrest still mutters and visitors are discouraged. Besides, there is very little left to shoot.

Let your finger pause at Egypt—you are getting warmer. If time is short and you have a youthful lust for camel trekking—just to see what it feels like—you might shoot a Nubian ibex not too far south of Suez. The heads are small unless you can tempt a beauty out of the once Royal Reserve, and of other game you will not see a sign; but the climate is good, you will hob-nob with the sun from dawn till eve, and camps, though waterless and treeless, yet spell the glamour of the desert.

More ambitious? Well, speed on then to Port Sudan. You are at the true gates of Africa now, with the key to three far different shooting grounds in your hand; mountains, desert and jungle. Choose one, for not the hardiest Nimrod can achieve them all in one mouthful.

If it is to be the mountains, you have chosen the easiest and, even if the game be scantier, yet to my mind, perhaps the most attractive of them all. Easiest, in that your hunting ground lies almost at your elbow, as you leave your ship. As the sun sinks or rises (for the mid-day haze fogs the interior) you can see the outline of your Red Sea Hills, and, in that 50 miles broad switchback of ridge and wadi, dwell your quarry of ibex, kudu, gazelle, dik-dik and klipspringer. A lorry to ..., a caravan of camels to meet you, and for ...ks you can call the world your own. It ...lthy shoot, too, with good stalking, trophies ...owning and much rugged scenery that charms ...art.

...r you can train to Khartoum and thus open ...e secrets of both Niles. But here, though your ...ag is quite different and ten times more varied, ...he glamour is wearing thin. The climate is less pleasant, the expense greater, the scenery north Central African thorn bush, the game humdrum, if plentiful; the camps still littered with last year's safaris' jam tins.

Or you can be ultra ambitious and aim for the finest shoot in Africa (or at least one of them) and steer for the Libyan Desert. This entails two clear months from Khartoum (best make it three) and more than the average preparation; but it will repay you. You have heard of the lure of the desert? There you will find it, that inexplicable something, which gets into your blood. You will learn the value of water, the joy and the curse of a camel steed, the charms of a bare rolling plain, teeming in mystery and shared with wild Nature alone. A place where all game animals are rare and even the smallest living thing, bird or beast, is somehow aloof from all the world. You will bag addax, white oryx and Barbary sheep, if your luck is good, besides half a dozen lesser beasts, and you might even bump into a lion. If you are keen on archæology you will be on almost virgin ground, and there is more than a little to tempt you.

The Sudan fails to lure you? Well, on, then, to the southward. You might disembark at Massawa, and climbing the escarpment by train to Asmara, beat northwards through the same Red Sea Hills you skipped at Port Sudan. A fine country this, with a narrow plateau top (Asgede) to follow, banked high with white clouds to the east, where lies the sea, 7,000ft. below and overlooking, westward, a maze of wadis and lesser mountain spines. Your transport will be mules and mountain ponies, and at first it will be an idler's life with little to shoot bar duiker, oribi, a rare bushbuck and klipspringer, giant francolin and guinea fowl, but as you near the Sudan frontier at Karora you will pass through the best kudu country in all Africa, and in the highest ranges along the border still lurk the best heads of all the Nubian ibex.

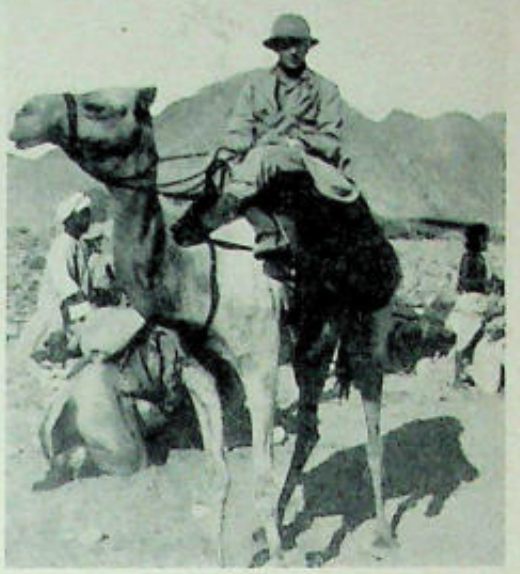
It is Italian country, of course, which may give you pause, and, if so, it is needless to mention Abyssinia, which even to the most reckless must sound Tom Tiddler's ground for the moment. But do not lock the idea too far away, lest one day the door should open and find you unawake. For there lie two shooting grounds, whose rivals can be found nowhere else on this hackneyed earth, save, perhaps, the far Thian Shan. The nearest gate is again Massawa and now, with new Italian roads, it may be less than a six months' journey to thrill at Semien's precipices after walia ibex or to revel in Arusi's wooded highlands after the kudu's half-brother, the mountain nyala.

Our ship ploughs south; you are at Berbera now, with a tranship at Aden for British Somaliland. Here is a trip for the simpler-minded, and the easiest of them all. A day or so's halt at Berbera (not too pleasant, perhaps) and a lorry or even the humble motor bus will carry you up the escarpment, that natural and ubiquitous rampart of all Africa, and dump you in the midst of your shooting grounds. You can use a private lorry all the way if you choose, or change at times to the less sophisticated camel and riding pony. In some ways it is a tame shooting country, and its game are not giants in size or rarity, but two of them—Dibatag and Beira antelope—are not found elsewhere, while Oryx Beisa, kudu and lesser kudu, besides gazelle, dik-dik and klipspringer are something better than common beasts, and lions are still not unknown.

It is a very cheap shoot with a moderate licence; the climate is good and so are the native servants, who not only speak English without being spoilt, but are trained in the ways of sahibs and are at their best on trek.

A DIBATAG FROM SOMALILAND

"This Somali shoot is the best of all beginners' shoots, where a man wishes to run his own show without great experience or paying through the nose"



"...THE JOY AND CURSE OF A CAMEL STEED..."

This Somali shoot is the best of all beginners' shoots, where a man wishes to run his own show without great experience or paying through the nose.

Let us skip Italian Somaliland, a replica in most ways of its British counterpart, with one gem alone on the Tana river, Hunter's hartebeest.

So we come to Kenya and Tanganyika. Since I should be loath to offer to play cicerone round Athens or the Pyramids, where trained guides are rife, let me leave them to my betters. Good sport is guaranteed, so is the beaten track. Fine countries in which to serve one's apprenticeship, but apt to be costly. If that is a light item, they are to be recommended. You need arrive with nothing but rifle and field glasses, and you have two score of game varieties to choose from.

If you are still treading the deck of our fancy steamer as Mombasa and Dar es Salaam drop astern, watch out for Port Amelia and Beira, the next likely stops, and the keys to Portuguese and British Nyasaland. But do not forget that you are now well south of the Equator, and that in November the rains will have broken in earnest, to continue intermittently for three months and, with them, comes the growing of the grass. It is the hot time of year, too, and the worst for fever. Like Rhodesia, June and July would be the best climatic months, although the grass will still be high. There are men who say that the beginning of the rains is the best time to hunt on the Nyasa highlands, when tracking is at its best and the rains have cooled the air.

If you are tempted to try this not overdone locality, Blantyre and Zomba by rail from Beira are your two best fitting-out places, and a lorry and porters will be your transport. You can bag a score or more of Central Africa's usual trophies in Nyasaland, but with patience and determination you may include a Nyala—one of the really worthwhile prizes—to say nothing of an outstanding kudu, eland and bushbuck.

As Portuguese Nyasaland is far less protected and not so attractive a country, besides containing no special game, it were better to skip Port Amelia for Beira.

South of Beira in our winter months there is little to tempt you. P.E.A. will be shrouded in rain clouds and riddled with fever, as well as being unattractive at the best of times. Northern and Southern Rhodesia in the rainy season are not to be recommended.

Zululand would be bearable and tempting for its one "star" turn, the Zulu Nyala, and the same applies to Cape Province for its few remaining little specialities, Vaal rhebok, Rooi rhebok and other smaller beasts, but in the Union it is their "close" season until May.

And so we turn the toe of Africa and work up the west coast. It is all Union territory until we reach Angola, the next "open" season country, and of that I will be able to tell you more in six months' time. Giant sable is now protected game, but there is a certain "Black-faced" impala, who needs further acquaintance, and my old friend the gemsbuck still calls for a joust with his grand horns topping a cunning brain.

So there are still places to go this winter!

H. C. MAYDON.

WILLIAM COBBETT'S BIRTHPLACE AT FARNHAM, SURREY

TWO CONTRASTING RURAL RIDERS

John Byng and William Cobbett

IT is scarcely to be expected that the Hon. John Byng, for the last fortnight of his life Viscount Torrington, formerly a lieutenant-colonel in the Foot Guards, would be likely to view rural England through the same glasses as William Cobbett, the son of a small farmer and a man who had been imprisoned and fined by the Government of the day for libel.

Certainly they would not have made good companions on any ride.

Byng started his rides in 1781, when he was 39; and Cobbett set out on his 40 years later, at the age of 59. When Cobbett completed his rides he was a man of 70, and when Byng finished his he was eight years younger than Cobbett had been when he started on his first ride. Yet of the two, Cobbett was immeasurably the younger man. Byng covered altogether some 6,000 miles, and Cobbett, probably, much the same. Many of their rides were over the same country.

Byng generally rode with a companion, and was nearly always accompanied by a servant. Cobbett rode along with his thoughts. Byng travelled for pleasure—Cobbett on his burning mission of exposing the wrongs of the labourers in rural England. Byng appeared to have no grievance against the Government of the day, nor was he worried about any political questions. Cobbett loathed the Government of the day and all its works—the "Thing," as he always called it. He abominated the Corn Laws, the Enclosure Acts, the Emigration Acts, the Borough system, plural livings and paper money—in fact, he abominated every single thing, without exception, that the Government of those times was responsible for. On some minor matters the two men shared common views. Both of them hated towns. Byng had, indeed, applied the name of the "Wen" to London before Cobbett started to use it himself as his favourite term of approbrium when speaking of any large city. Yet, strange to say, Byng set out on all his rides from the front door of his house in Duke Street, W.1; and Cobbett mounted his horse at his home in Kensington, S.W.! They both loved the old English trees, the oak, the elm, the beech and the ash, and detested larches and Scotch firs—mean, pitiful things they call them. They both deplored the passing and decay of the old English mansions, and the desertion from the country to London of the people who formerly occupied them. And, most illogically, both poured ridicule and contempt on the efforts of any "new" man to erect another one to take their place.

"Came through a place called a 'park' to-day," writes Cobbett, "belonging to a Mr. Montagu, who is now abroad. Of all the ridiculous things I ever saw in my life, this place is the most ridiculous. The house looks like a sort of church in somewhat of a gothic style of building, with crosses on the tops of different parts of the pile. There is a sort of swamp at the foot of a wood, at no great distance from the front of the house. The swamp has been dug out in the middle to show the water to the eye. . . . Here is a fountain, the basin of which is not 4 feet over and the water spout not exceeding the pour from a teapot. Here is a bridge over the river of which a child four years old would clear the banks at a jump. I could not have trusted myself on the bridge for fear of the consequences to Mr. Montagu: but I very conveniently stepped over the river in imitation of the Colossus. In another part there was a lion's mouth spouting out water into the lake which was so much like the vomiting of a dog that I could have almost pitied the poor lion. In short, such fooleries I never before beheld!" Byng, in his milder way, is no less scornful of every effort in the shape of a new country house that he sees. Neither of them liked the new fast roads and the influx of vice poured in upon every corner of the country by the quick and easy communication of travel—Byng took five hours to get from Slough to London in fine weather, in a coach, and he was in a hurry! He would like to have seen half the new turnpike roads, which had brought milkmaids on the roads with the dress and looks of Strand misses, ploughed up. In the days of bad roads the country could not be strip'd of its timber, or despoiled of its honesty, cheapness, ancient customs and civilities. Gentlemen, then, were bow'd to with reverence. Cobbett raved against the new fast road to Brighton—stock-jobbers, Jews, and even worse people, skipped backward and forward in coach from London to Brighton in the day. Hundreds of men and horses were at work on the road to make pleasure and quick travelling for those dreadful people. The land and the labourer paid for it all. After this there is not much to be found in common between the two men.

Byng's diaries are full of his reckonings at the numerous inns he stayed at, and also of the play-bills of the various dramatic performances he attended when he got the chance. The inn beds and their sheets are one of his principal subjects of comment; in fact, if you put together the number of times he uses the word "sheets" in these three volumes it would fill several pages. He detests inns, so he says, though it is difficult to believe him. "The imposition in travelling is abominable," he writes; "the innkeepers are insolent, the ostlers are sulky, the chambermaids are pert, and the waiters are impertinent; the meat is tough, the wine is foul, the bed is hard, the sheets are wet, the linen is dirty, and the knives are never clean'd! Every home is better than this." Cobbett tells us very little of the inns he stayed at and disdains altogether to talk about such domestic trifles as sheets. It was Byng's custom to send his servant, one Thomas Bush, ahead of him so that he could prepare for his master's arrival in advance. Bush had to take the precious sheets with him, but his master carried a great coat, night cap and a few other etceteras in a small cloak bag on his own horse. Elsewhere he tells us something about the horse he rode. "At two o'clock I bestrode my little nag, who is of pretty shape, with a well-fitted false tail covering a short dock." How Cobbett would have laughed. Byng gives us the expenses of one of these expeditions which he did with a friend. They amounted to £40, viz.: £20 each, "including every sixpence for ourselves and four horses, as expensive as ourselves, now considering we were out 25 days, had four meals each day, saw many places, and tipped genteely, this will not appear an extravagant business."

Byng was fond of riding. He thought it good for the preservation of health and for the conducement of old age. Most of the old men he knew had been great riders. He, also, appears to have been fond of hunting, but beyond some worthy reflections on the subject as he rides along he does not indulge in it on his travels. Cobbett, however, never misses a chance. He was as enthusiastic about the chase as Mr. Jorrocks, and he was devoted to dogs of every kind. Coursing, also, was a favourite sport of his. He gives us a fine description of a day's sport with the harriers in the course of one of his rides. "A whole day most delightfully passed in hare-hunting with a pretty pack of hounds kept here by Messrs. Palmer. They put me upon a horse that seemed to have been made on purpose for me, strong, tall, gentle and bold, and that carried me either over or through everything." It is difficult to imagine Byng's pretty little nag with the faked tail doing the same. Byng tells us nothing in his diaries of what is happening in the great world, and never mentions politics. The two topics of conversation he abhors are politics and children. He scarcely mentions the subject of agriculture, and says little about the condition he finds the labouring classes to be in.

On the subject of the countless women he must have met on his rides he is equally uninforming. They are either buxom or pert—neither of them very illuminating terms. At times, however, he becomes playful and recommends punch for ladies if you want them to become jovial and amusing. Cobbett does it better: "There were some very pretty girls here, but as ragged as colts, and as pale as ashes." A lovely sentence. Just enough and no more. He admires the grace of the English women and observes them wherever he goes. No woman who was alone with Cobbett would ever have needed punch. In one part of Hampshire he notes that the women are usually tall, straight, fair, round faced, excellent complexions and unusually gay. Somewhere in Sussex, he tells us, they have high cheek bones and are tall and dark. One day he meets a gypsy girl with beautiful features. He pulls up his horse and begs her to tell him his fortune. She declines to do so "but with a look as that seemed to say, it was too late; and that if I had been 30 years younger, she might have seen a little what she could do with me." Poor Cobbett, and not more than sixty! Towards all women Cobbett was as chivalrous as a Knight of the Round Table. Needless to say he was an ardent supporter of Queen Caroline in her troubles. In the whole of his two volumes teeming with abuse of countless men no woman of any degree falls under the lash of his whip. He is constantly referring to their courage and endurance, and to the help they give their men folk in the distressing times he depicts.

In their powers of general observation there is no comparison between the two men. Nothing escapes Cobbett's notice. He notes the difference of soils in all the counties he rides through almost down to each field. No tree, bush, flower, bird or weed, that is anything out of the ordinary, fails to draw a remark from him. His description of some of the scenery he passes through is very fine, and on occasions, such as when from a high hill he views the beautiful valley of the Avon river spread out before him, it rises to a high level. Cobbett loved his England with an intense love. As Trevelyan says, "Burke, though he sang Britain's praises, had not our island note. But Cobbett, though he abused all that Burke praised, was John Bull incarnate." But what is one to think of the mental balance of a man who, because he disliked the rotten borough system describes such peaceful little English towns and villages as Bletchingley, Marlborough, Calne, Cricklade, Wootton Bassett and many others, all situated in the heart of rural England, as vile, villainous holes and rascally places, and declares that he can even see villainy imprinted on the faces of their inhabitants! All this because, through no fault of their own, they return members to Parliament. But even this is eclipsed by the maddest of all his mad outbursts when he reaches the valley of Chilworth, where his hated bank notes and detested gunpowder were made. "Here in this tranquil spot," he says, "where the nightingales are to be heard early and later than in any other part of England; the first bursting of the bud is seen in spring; no rigour of seasons can ever be felt; where nothing seems formed for precluding the very thought of wickedness; here has the devil fixed on a spot of the seats of his grand manufactory."

Yet after all the weariness of reading these never-ending harangues against the Government and their doings it is impossible not to like and admire Cobbett. He feared no man, however rich or great. He was chivalrous to all women and to all the weak and oppressed. He was a great naturalist and a fine sportsman. As a companion on a rural ride most men and all women would have preferred his company to that of Byng's. It is impossible to think of Cobbett riding through rural England on a horse with a false tail.

CHARLES HIGGINS.

EXPERIMENTS WITH WEEDS

How Water Buttercups Solved the Fly Problem

By PETER CLARKE

So much has been written on the making and improvement of trout water that there can be little excuse for ignorance of the principles to be followed on the part of anyone sufficiently interested to make a study of them. It is in the practical application of these principles to any particular stretch of water where mistakes can easily be made with a consequent loss of time, labour and money. Generally speaking, writers confine themselves either to the fast-flowing rocky river or the true chalk stream, but there must be numerous rivers which, like ours in East Anglia, fall into neither category and on which the problems presented are more difficult to solve, so that it may be of interest to recount how an initial error in management has been subsequently rectified.

RANUNCULUS ONE MONTH AFTER PLANTING, RIVER WHITEWATER, MAY, 1938

The stream on which we have been working varies from a width of about 6yds. to 15yds.; it suffers from winter floods, which raise the level some 2ft., but even at these times, except in the narrow parts, the water never flows at any great speed. The bed is mostly gravel or clean silt, but except for three stretches of 100yds. or so where it is shallow and clean, it was covered with a deposit of mud varying from 1in. to 1ft.

The weeds natural to the river were mainly water dropwort, some small patches of water buttercup in the higher reaches, a little starwort, which never looked very healthy, some Canadian waterweed, a heavy growth of dense pondweed, which appeared in the middle of May and died away in the autumn, and banks of sedges along the sides and, in places, in the middle of the river.

One of the most unsatisfactory points was that in July; as the water level began to fall there appeared over the whole bed a vast growth of moss and algæ, due, I believe, to drainage from the manured agricultural land on the sides of the valley. This used to rise in hot weather and get hung up round the weeds making the water unfishable, until a storm washed it away and dumped it in great lumps in the still water at the bends of the river. We realised that if only we could get a faster flow we could prevent this mud deposit and probably the formation of the moss. The faster flow could be achieved either by narrowing the river or by cutting weed beds.

The narrowing of the river was a comparatively simple matter although it took time, nor could the whole length of some two-and-a-half miles be tackled all at once. Wherever we found a sedge bed beginning to form we placed boards set out at an angle from the bank in a down-stream direction. Each of these boards formed a backwater behind it, in which a great deal of the mud brought down by the winter floods was deposited. These mud banks were planted with sedge to consolidate them, and when they had reached well into the river the outermost edge was scooped up and deposited on the part near the bank, thus making a solid bank. These new banks were under water during flood times, but the stream was prevented from doing damage by the old banks behind them which confined it to its original channel.

It was when we came to the increasing of the weed beds that we struck trouble. As the main natural weed was water dropwort we, rather naturally, thought that this would be the best weed to encourage, especially as it appeared to hold a certain number of snails, shrimp and larvæ, and where it was established it grew profusely. Unfortunately, presumably because dropwort does not like being transplanted, we failed to get many beds established, and even in cases where the new beds appeared to be flourishing the growth of dense pondweed, together with the moss, soon made them unhealthy and they died out.

During all this time, there had been a sad lack of fly life on the river, and rising fish were few and far between, although we knew that we had a good stock.

When things were in this state I had the opportunity of inspecting an old-established fishery some miles farther down the main river into which ours empties. Here some water buttercup, which had been obtained from the Test, had been planted and had become thoroughly established on the gravel, where it was living side by side with dropwort. A look at these weeds soon established the superiority of the buttercup. From a handful of dropwort the nymph and shrimp could be counted in units, whereas in the buttercup they were present in tens and even hundreds. Further, the keeper, who had been there for many years, stated that he considered dropwort a thoroughly bad weed, it was not much good for trout food, it formed bad mud banks, and he was in the process of digging it out and replacing it with buttercup.

This opened up a new line of attack on our problem, so a search was made for our existing beds of buttercup. These were broken up and planted in other places. We learnt two lessons from this planting, the first that it is useless to plant this weed in mud, and the second that it is useless to plant it in anything except fast water, but where we had been lucky in choosing the correct place, the small plants of a foot in length put in in the autumn were long flowing weeds of 2yds. or 3yds. the following spring.

We now felt that we had some really valuable information on which to work, and it was a question as to how best to employ our knowledge. The essentials were a gravel bottom and a fast current, so we hoed out everything for a width of about 6ft. down the centre of the river. The hoe moved the weeds, and the mud and the resulting current cleaned the bed along the hoed strip. A reconnaissance of other rivers within 20 miles found plenty of buttercup, so, with the consent of the owners and the help of a Ford Utility van, many zinc bathfuls were collected. Incidentally in collecting the weed, hundreds of nymphs were transferred to our river.

Small bunches of weed were planted in the cleaned strip about 18in. to 2ft. apart, and a second and third row put in 1yd. or 2yds. downstream in the spaces so that the current deflected by the plants in the first row flowed directly on to those of the second and so on.

The plants very quickly began to grow, and as they became obstructions to the flow of the water, the current began to flow on either side cleaning new gravel. As this appeared more planting was done, usually encouraging one side of the river and leaving the old weeds on the other.

When the dense pondweed began to show it was ruthlessly hoed out, and where this was done it did not appear the following year.

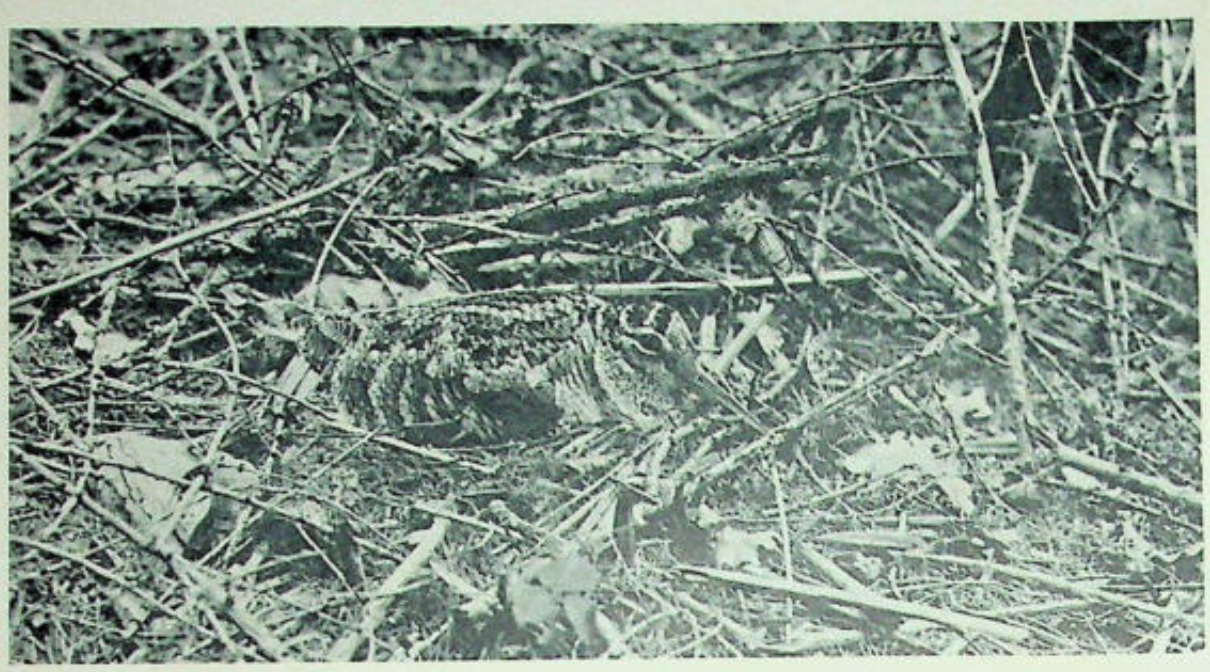
We continued planting till nearly three-quarters of the width of the river was covered with weed with narrow channels of water flowing between. Small bunches of starwort began to show now that the conditions were more to its liking and still more was planted.

The result of all this work was very apparent this season up till July. Before that date we enjoyed greatly improved fishing with plenty of fly, clean gravelly runs to which the trout came to feed and a freedom from moss. Unfortunately, after July we suffered a drought, the water level falling as low as it ever has since we have had the river, and, as a consequence, there was not sufficient flow of water in some parts to keep the weed healthy, and it died back, but the roots are still there and the young shoots are appearing again now.

Further, in one or two places, cattle got into the stream and undid in a few hours what had taken months to build up. This can and will be put right with fencing, and our outlook for the future is very optimistic.

RESTOCKING. ON THE LEFT A CONSOLIDATED MUD BANK PLANTED WITH SEDGE

THESE REMARKABLE PHOTOGRAPHS BY ERIC J. HOSKING WITH HER CHIC



The woodcock harmonises so well with its surroundings that when this brooding bird was first pointed out to Mr. Hosking among the undergrowth in the dull evening light he had great difficulty in seeing her at all as she sat crouched on the nest

The eyes of the woodcock are set very far ba

When the chicks were dry the hen walked very slowly from the nest, coaxing the chicks to follow her. She took them some yards away and then brooded them again. After 30 minutes she took them a little farther, and so on until they were out of sight

THE SOUTH AND WEST WILTS HUNT NEAR SHAFTESBURY, DORSET
The hunt enjoying a gallop over the grass in the vale country near Shaftesbury

BEST DAYS WITH HOUNDS

Pytchley's Brilliant Week

A WEEK of foxhunting at its best, is perhaps a fairly apt description of the four days under review.

Monday, 12th. Sywell Aerodrome. A fox found in some kale nearby was hunted for an hour without going far afield, was fresh found after some interference by motor cars, and killed near the Wellingborough Golf Course.

From Hardwick Wood another fox was hunted straight through the 200 acres of Sywell Wood, into and through the starting point, and marked to ground near Harrowden, all at a good pace. A fine, if circular, hunt started from Wilmer Park. Hounds had to compete with "sad" wheatfields and endless foil, but hanging to the line were close at this fox in Gib Wood; they hunted him in and out of Wilmer Park and only darkness prevented the fitting end to a fine hunting run.

Wednesday, 14th. Crick. A really fine day's foxhunting, and a long one to boot. A quick find in the famous covert and the pack were soon in Claycoton parish, where, during a check in some small and heavily stocked fields, a couple and a half got on. Forces were joined below the Hemploe, through which the pack took their fox without hesitation, thence ran well past Welford, as though for Sulby Hall. The fox had run the concrete dam of Sulby Lake, over which the pack hunted without a pause. Thereabouts the fox was viewed but only with Barker's help could hounds hunt on; and how often in this hunt was his help required? It is impossible to say. This fox of great experience tried some earths on the Naseby battlefield, turned back, was viewed near that village, hunted to the reservoir, where at least a brace of fresh foxes were on foot, and up to where the line was getting fainter. Colonel Lowther, as is his wont, sat still, made up his mind, then told Barker he had seen and heard some hounds running back along the bank. One bitch and almost the senior white collar got a view, and soon the fox was killed, after two hours and a point of near enough eight miles.

Not much of this great hunt was fast, for owing to a winter up to date milder than was ever known (would it had remained!) 90 per cent. of the many pastures crossed were fully stocked. From the Twenty-four Acres Covert, hounds ran fast, through the Hemploe once again, through Down Town Spinney and pointed for some pleasant riding country beyond. In a huge field covered in Welsh ewes hounds checked and for some moments all seemed lost. Barker held them left-handed over the railway, hit off his fox, and the pace was good and the cry a sheer delight, till Stanford Park was reached. After some difficult situations had been dealt with with success, and as the fox had run obviously into a covert of good repute, and as the sun had set, hounds were stopped perforce.

On Friday from Norton the mixed pack had a chance, of which they availed themselves, to show their mettle with just a useful scent. In moderate light they hunted well between the place of meeting, Daventry and Dodford Holt, killed one fox and lost another. Wilton Osier Bed provides good lying despite the rains which have made the going in this country perfect. Hounds had drawn only half when a whimper soon developed into a chorus shortly followed by a welcome holloa at the Buckby end.

This good fox and old friend set his mask up a valley where lies the Point-to-Point course, and up which hounds ran well without much pause till the walls of Althorp Park were sighted. Nobottle Wood, the prospect of a change, seemed certain, but pressure was too great and the fox decided to try the intricacies of Little Brington Village. After a long check and conflicting information the huntsman hit off a line beyond, then lifted the pack to Waydale Hill, wherein the hunted fox was viewed and from which a fresh one went away. After some covert work the pack, sticking to their hunted fox, ran past Brock Hall and almost to Floore Village, turning with a persistence ominous of the end. The end came not long after, for hounds were gaining ground, and in a small covert called Hobhill they killed a beaten fox in the gathering gloom. Time, two hours.

On Saturday (17th), a large field met hounds on the village green of Creaton. A rising glass and an atmosphere which became colder as the day wore on promised a scent, and yet throughout it the pack could never really run. From Creaton Covert hounds were soon away and hunted nicely over the Northampton Road, across the valley, then left-handed to the grounds of Teeton Hall. The fox was only just ahead from here, and turning past Teeton Mill hounds hunted on towards East Haddon, turned left-handed and killed in the open, one field from Holdenby House, in 50 minutes. From Moss Hall began a hunt which set the seal to a week such as the opening sentence of these notes attempts to summarise.

Hounds raced past Pursers Hills into the Privet without a check. The fox had been headed on the main road beyond, and so a gallop became a hunting run. Twice hounds ran into the Teeton Valley after running well through Cottesbrooke Village, and in the second visit may have changed foxes on the banks of the new reservoir which lies below Hollowell. A change took place of some sort, for no one fox could have withstood such constant pressure. Hounds recrossed the main Northampton Road, ran straight for Pursers Hills through Lady Milton's Gorse, past Halsbeach and Taliho.

All this with a lovely cry such as is heard with a holding scent, and many of a contented field, while on their homeward way, said that the cry would remind them of this good day's sport for weeks to come. 'The light was fading and most horses jumping short, as on the Kelmarsh—Clipston Road hounds marked their fox to ground in a deep drain. A six-mile point two hours of time and sixteen miles at least hounds must have run.

EMERITUS.

THE QUORN RUN FAST

IT is, I suppose, useless and quite hopeless wasting time and the space of this paper in appealing to those—the greatest of all nuisances—followers of hounds in motor cars. It is, however, impossible to restrain oneself from writing a few words after the disgusting exhibition of last week. Then, again, I suppose it is quite hopeless, as it is questionable if the disgust on the part of foxhunters expressed through any lines that might be written are even read by the guilty parties as I rather doubt the owners, or editors of any publication (the context of which is rather more likely to reach the offenders referred to) allowing the contribution of suitable admonition.

What on earth would our fathers or grandfathers have thought; and not for one moment dare one reflect the vocabulary that would most certainly have been brought into action regardless of the times we now live in. I often wonder if these people ever for one instant realise the harm rendered to hounds by these continued frustrations of natural instinct, and the enormous worry falling on the shoulders of a poor wretched huntsman who already troubled, perhaps, with a poor scenting day, has this new evil thrust on him when trying his utmost to show good sport to the 200 or 300 riders crowding and surging on him; and then, again, there is the distracted Master. If only the motorist would be satisfied to see hounds find, and then if they must follow, do so at a distance unlikely to interfere with fox or hounds and thereby not spoil the sport of people who pay huge sums of money in support of a pack of foxhounds, and who naturally look for some return as do most certainly those followers in cars in their own particular business or sphere in life. It is possible to see and hear hounds run from a car and it can be done with ordinary thought and decency in a way that does not interfere with the sport. For Heavens sake do not race away as soon as hounds find; this is fatal and will only end in spoiling not only riders' fun but your own. Cars doing this, of course, do not always go in the same direction, and one or other is bound to head a fox off, thus doing irreparable damage to a gallop. Much has been written before on this same subject, but perhaps, the editor will graciously allow of these lines in the hope that they may in some way or other come to the notice of those for whom they are intended.

The sport in the morning from Widmerpool was rather disappointing. Several foxes were housed in the plantations at the back of the hall, and after one had been hunted round by Guys, back by the Sandhills and killed, hounds went on

to draw Flint Hill blank. Curates, the next draw, has been, and is, so often associated with excellent sport, that it came as an unexpected, so to speak, disappointment when one of a brace of foxes, after being hunted over the two fields to the railway, dived into a drain at the top of the embankment under Folly Hall. The danger of trains at this particular spot, owing to bends in the line, is always upsetting, apart from the fox making his escape in the way he did, practically on the line, thereby adding to the danger. All anxiety past and the fox left, Ella's Gorse, a usual stronghold was then drawn blank; likewise Mundy's and Craddock Ashes; but on reaching Walton Thorns a good fox was found, a merry gallop being the result. Going over the Burton Road, hounds ran nicely by Harvey's Lodge nearly down to Wymeswold before bearing left-handed and pointing for Burton Village. Continuing to go to the left, the fox crossed the Burton Wolds and going over the Seagrave—Six Hills Road went on nearly up to the Old Fosse Road.

There is no doubt he was headed at this point and turned short to the left. It was a great pity, as hounds had been running at a great pace and would in all probability have killed him had he kept a straight course over the road; as it was, he went back through Craddock Ashes and was viewed in a sorry state over the Birton Road into Mundy's. It was now getting dusk, and although hounds had a line into the gorse scent was failing, and a first-class hunt came to an end.

Heading of foxes by cars is far too numerous to mention. Tuesday the 13th, was the day that prompted the writing of earlier lines in these notes, and the day on which I witnessed the spoiling, in the late afternoon, of a good hunt with a fox found in British Piece.

Going away at the top end they ran nicely over Charlie Knoll down over the Shepshed Road to Charlie, through Cat Hill on to the Roughs. Then leaving Gisborne Gorse on the right they ran back left-handed by Charlie Hall, and continuing to run beautifully up the plough, would most certainly have left the field at the pace; but, alas, on reaching the Shepshed Road up went their heads. Several motor cars standing on the road plumb in the line of a fox, were, of course, the main cause; but, to make matters worse, their occupants had holloaed in the face of the fox. Hounds were held to the right, and a good cast then made towards the road again put matters right, or rather improved things, the line being hit off when the fox, determined to get over, had crossed higher up nearer Charlie's Cross Roads. Although the particular incident already mentioned had gone a long way to spoil the hunt, there was more to come, as going back over Charlie Knoll, the fox then made his way up the road above Longeliffe, and would most certainly have crossed into Whittle Hill had he not again been confronted with cars that had rushed on from Charlie, and turning short back into Longeliffe, it was not long before he was master of the situation, and no wonder.

Now we come to Friday. Keyham. "By Jingo! hounds ran fast with their first fox from Scraptoft," were remarks one overhead. "The fastest thing I've seen!" "Never seen hounds run so fast in my life," &c. Away from the gorse like a flash, left-handed over the tunnel, still left-handed under Keyham Village, and left-handed again back by Scraptoft Hall; now down to and over the railway. What a pace! and never a check. Over the Leicester—Uppingham Turnpike up to the back of Thurnby Church in Fernie's country, and it was over. Thirty minutes as hard as they could go. There are a lot of old poultry-houses in some gardens close to the church, and no doubt the fox had taken refuge under one or other. The difficulty for hounds was the wire netting, and the fox, no doubt, well knowing his way, made his escape. Next a fox from the Oak's Spinney, or very close to, provided a nice hunt over a bit of country very often crossed by foxes from the Oaks or Bay. Going back to the left, they ran pointing down to Old Ingersby, then right-handed over the railway, and leaving Keyham Village and cemetery on the left went back right-handed nearly to Hungarton Fox Holes, where they ran out of scent. Hounds had a brace of foxes in front of them in the latter stages, and the holloa forrar'd on the top side of Hungarton Village proved to be a fresh fox, and the Master, after changing horses, gave orders to draw Billesdon Coplow.

Contrary to the general rule, Botany Bay was blank, hounds finding on the Knoll. Very possibly the foxes (as there were more than one) had been disturbed and crossed over; at any rate, hounds hunted one back over the road separating the two coverts through the Bay, and away on the Oak's Spinney side, and then back left-handed across the road back on to the Knoll, going over the road once more. This time leaving the Bay on the left they crossed the Ingersby Road into the gorse field, and going on between Cold Newton and Sludge Hall ran very fast up to and over the Tilton—Loseby Road. Checking in the bottom on the Tilton side of John O'Gaunt, they flung forward, and hitting the line off went on, now slowly, to within a field of the Red Lodge in Cottesmore country, when it is very probable he got into an old drain. This ended what had been a glorious day's sport.

In contrast, on the Saturday, from Belton, scent was not good first start off, and went from bad to worse as the day wore on. A fox found in the Asplin's was hunted through Breedon Cloud Wood, away at the bottom end, and running parallel with the railway towards Tonge bore to the left before reaching the village, and leaving Breedon on the right they ran out of scent on crossing the main road pointing for Spring Woods. Returning, they found a brace or more in Breedon Cloud Wood, and hunted in this thick covert for some time before going away with one for Barrow Hill, which, however, was lost after a short hunt. Tonge Gorse and Langley Priory were blank, and a fox from Langley New Wood was hunted slowly with scent now very bad by Langley Park to Woodhouse Farm, when hounds were stopped at dusk.

SCARLET RUNNER.

DUKE OF BEAUFORT'S GOOD WEEK

A GOOD week's sport concluded with a very good day's hunting on Saturday. The early part of the week had been unseasonable weather—Friday a day of glorious Riviera-like sunshine, Saturday changing to early morning fog and a north-east wind suggesting the icy conditions reported on the Continent. Hounds ran well all day, but were not helped the way things happened. They met at Foxley Green, a large field out and most people ready for a ride, wearing their oldest coats, knowing the state of the water-logged country! The going, however, proved quite good, and it was only the tail-end of the field that slipped and slithered about in greasy mud. The first covert drawn, Hyam, proved blank, but a fox lying out in a hedgerow went back through Hyam, crossing the Malmesbury Road near Twatley and pointing as if for Broken Borough crossed Fosse Farm and got to ground in a drain in the orchard of Boakley. This was disappointing, as hounds went off at racing pace with only a few really with them.

Returning to draw along the banks of the Avon, a fox was quickly found in Mr. Rich's small plantation. Again running fast, hounds this time went up wind, over the river to Cowage, where the fox turned back left-handed, running by the gorse to Thornhill Farm, where he again made a quick turn to go down wind at the back of Malmesbury, on by Hyam, Fosse Farm, over the Shipton-Moyne Road, and so to Shipton Wood. Here he was viewed very tired, and hounds killed him in the garden plantation near Estcourt House. Going back to draw Easton Grey another fox was soon found by the river, and he went by Brawsdown Bottom and on over that nice bit of grass country towards Rushmore. Here, after running the foil of cattle, the fox turned away, crossed the road and went on by Tug Wells Gorse and Hill Court as if for Doughton. Here there was a check, where he had run through a field of kale, but recovering the line hounds ran on very fast for Westonbirt Park, and swung into the garden of the school just as their fox left via the tennis court on the other side. Running on, they stuck to him in the Arboretum, and hunted beautifully, forcing him again to take

A MEET OF THE HURSLEY HOUNDS AT CHILWORTH MANOR

to the open by Down Farm and Elmstree Farm, but turning back on to foiled ground in the Arboretum they were unlucky to lose him in the thick brambles behind Mr. Middleton's house, a fresh fox taking away half the pack and darkness coming on to finish a hard day. FIELDFARE.

CATTISTOCK'S CONTINUED GOOD SPORT

I MET the Cattistock Hunt Secretary, Captain A. Douglas Pass, at the meet when hounds met at Ridge on Wednesday, and in the course of the conversation he said to me: "I wish when you write your article for the *Field* you would make some mention of the fact that, although this influx of visitors which we are getting from neighbouring Hunts is very flattering, we must request those who do not hunt with us regularly to refrain from coming out now, when their own hounds are stopped by foot-and-mouth restrictions. I know it seems inhospitable," he went on, "but I do not think it quite fair to the farmers under the existing conditions, although ordinarily we like to see them." Now, since I was asked to, I preface my report this week with these remarks.

On Tuesday, hounds met at Chilfrome, and there, Wednesday; for the bracken, which usually holds must have been exposed to the fury of the storm all night, and I see no reason why any self-respecting fox should have been there. However, hounds found a good fox—a brace in fact—in Pipsford, and going away behind one of them, they gave the Field as good a 50 minutes' hunt as I have seen this season. I saw it all on my feet. The fox whose line hounds hit off ran straight away toward Westcombe, turned back right-handed from the covert, and setting his mask for Mapperton, came back across the lower end of Pipsford Farm; skirted Hooke Park and went on toward Beaminster. They all came very near to where I was standing—the fox, the hounds, the huntsman, and the Field, and I followed them with my eyes down the valley until they disappeared behind Mapperton Hill. It was a lovely clear day, and what little wind there was brought the sound of hounds' cry clearly to me, as they swung right-handed and drove on for Cox's Gorse. I think that fox must have known that he had a "gallery"; for he skirted the gorse and came back toward Westcombe over a mile of open country, where one could watch every move, and see easily through a pair of field glasses the entire Field as they swept across the

THE OLD BERKS MOVING OFF FROM THE MEET AT SPARSHOLT

in the house so long occupied by the Rev. E. A. Milne, Mr. and Mrs. Mitchell, who now occupy it, entertained the Field before hounds moved off. Maiden Newton Withy-bed does not often fail us, but it did that day, and it was a small thicket near Lower Wraxall which harboured the first pilot of the day. He went away toward Daws Hill, swung right-handed for Wraxall, thought better of it, and setting his mask for Toller, took us over the hills, past the Rookery, and over the Crewkerne Road to the Punchbowl. Here hounds dwelt for a moment, but quickly hitting off the line, they raced down the ridge above the Toller Valley toward Maiden Newton, re-crossing the road and forcing their fox back to the thick covert of the Rookery. It took some time to dislodge him from here, but he was eventually holloaed away, and this time he ran nearly to Chilfrome before turning back to Kingcombe Wood, where he was presently lost. It was a twisting hunt, but there were a good many fences in it, and the "riding" division of the Field had a good deal of fun; in fact one lady told me that she considered it an excellent hunt.

I did not; but then, I like to see hounds account for their fox. We had another gallop in the afternoon from Daws Hill; another twisting fox, that was finally killed near Rampisham; but the day, as a whole, I should term an unsatisfactory one.

It rained on Tuesday night, and I was not really surprised that hounds failed to find at Ridge on cut-and-laid fences which, in that part of the country, divide the grass fields; and, as if to cap the climax, the fox turned at Westcombe and brought the Field straight for us, getting to ground in the valley below, near Toller Whelme, not more than half a mile away. It sounds a twisting hunt, but I can only say that the circle was a very large one, and that those of the Field who were lucky enough to get to the end told me it was one of the best and fastest gallops they had had this year.

Winterbourne Abbas can always be relied upon to provide hospitality for the Field and a good fox afterward. Last Friday it was Captain and Mrs. Simonds to whom we were indebted for the former, which was very much appreciated by everyone. A root field hardly a quarter of a mile away produced a good fox, which, running over the Downs, crossed the Roman Road, and leaving Town Hill Farm on his right, led hounds to a covert about half a mile beyond. Scent was very good, and hounds could go at top pace. There were two foxes in the little covert, one of them running across the hills toward Compton Valence; but hounds stuck well to their hunted one, who brought them back over the Bridport Road, and was killed above Winterbourne Steepleton after a very fast 30 minutes' burst. The second hunt, and the best one of the day, came with a pilot from Winterbourne Gorses, who after running very much the same line of country as that travelled by the morning fox, sank the valley and turning right-handed toward Muckleford looked at one time as if he meant going to Bradford Peverell.

I think he must have been headed, however, for he swung sharp left-handed and running parallel with the Frome River, traversed the coverts above Frampton Court and went on to the end of Cruxton Gorse, taking the Field over a nice line of country, but one which in the heavy going, took a lot out of their horses. When he turned back at Cruxton Farm hardly any of the Field were with hounds, but some stragglers coming from behind were able to nick in, and watched hounds mark their fox to ground in a covert back of Frampton Court, at the end of 55 minutes. We were galloping all the time, and in the heavy hilly going it was all that a horse could do. At the end of this hunt so many people went home that the Master decided to call it a day, and hounds were in their kennels early in the afternoon.

The week, which up to then was really a brilliant one, ended with one of the worst day's sport we have had this year. There was a big field out when hounds met at South Perrott on Saturday, but Fate was against them; for after having drawn Picket's blank when they finally found a fox in the same rushy field that produced such a good hunt the week before, he refused to run, and went to ground less than a mile on. Hounds were jogged back toward North Perrott, found another pilot in a thick double hedge just across the Crewkerne Road and went away as if for Misterton, but scent was very catchy, and hounds losing repeatedly were soon run out of scent. It was most disappointing and the Master in desperation drew the Somersetshire Holts, but here again the result hardly justified staying out longer, and hounds were ordered home as light began to fail. This week, however, has been a very good one, and certainly no one can grumble at one poor day—as an old huntsman once said to me: "It's the glorious uncertainty of foxhunting." "LINCOLN."

BEDALE'S GOOD SPORT

ON Monday (12th), the Bedale Hounds met at the Mess of the Royal Corps of Signals in Catterick Camp, where the officers kindly entertained the field. The first fox was found in Tunstall Whin and gave a nice 20 minutes gallop over a nice line to Brough beyond which the fox was marked to ground. After hunting several foxes in Brough without getting away any distance hounds were called off and taken to the Kennel Whin, where a short running fox was marked to ground in Sandholes after some hunting of a local nature. Gasshouse Plantation near Hornby Castle provided the next fox. Going away by Milky Hill hounds pointed for Tunstall bending left-handed by West Appleton and Hornby Castle, where they entered Spring Wood; crossing the Park with Winterfield on the right the pack again entered Milky Hill, then bending eastwards they ran down to the New Covert. Here a very tired fox was viewed, and going away over the Park as far as the Hornby Castle Drive, hounds got a view and rolled him over just entering Chain Pond cover after a capital hunting run of 50 minutes.

The meet was at Azerley Chase on the 14th, the weather promising, and all looked well for sport after a succession of foggy days, but unfortunately foxes were difficult to find; nearly all the Mowbray House and Azerley coverts were drawn blank, and it was past 1.30 before a fox was found in Juniper Wood. He attempted to go away on the north side, but was headed back, and finally got a good start. Going away on the Azerley side hounds hunted nicely, leaving Thunder Wood just on the right, then, swinging left-handed nearly to Azerley Tower they crossed the Kex Beck. Bending southward by Nether Close they entered and ran the length of Hollin Head Wood, crossed over the Ripon and Azerley Road with Sutton Grange on the left, entered Fisher Wood and checked beyond it. Kilbourne, who was hunting hounds, cast them over the Ripon Road and hit his fox off on the east side; now hunting at a slower pace over Ripon Parks hounds reached the flooded River Yore, which was past all idea of fording and over which some workers on the far bank had seen the fox swim. Fortunately hounds were not running fast, and it was possible to stop them. It was just past three o'clock and hounds were sent home after a nice hunting run of 70 minutes.

OLD SURREY AND BURSTOW HUNT WELL

THE Old Surrey and Burstow had one of the best days of the season from Scarletts Cowden, on December 14th. Scent was good, and in spite of very heavy going and woodland country hounds hunted all day with a wonderful cry, finally accounting for their fox in a brilliant hound hunt of one hour 35 minutes in the afternoon.

They found first in Shernden, and after a circle through Cobhambury back to covert ran back through Cobhambury almost to Edenhall. Swinging

right-handed, they hunted through Minepit and the Old Furzefield and raced over Upper Stonehurst to Lullenden. Taking a line through the kale field, their fox pointed for Hammerwood Church, but turning short ran parallel to the brook, and crossing the lane at Scarletts ran hounds out of scent beyond Drew's Rough.

A fox from Jules Wood gave hounds a capital hunt in the afternoon. They found immediately, and with the pack close behind him the fox crossed a ride between the horses' legs of the field, and went away towards Shernden. Turning back short of it, he ran through the Willow Bed to the Old Furzefield. Hunting with a great cry, hounds drove him right-handed over Dry Hill into the Plantation and ran on almost to Greybury Farm. Here they swung left to the Marsh Green Road, where the fox was headed and took a line back to Greybury Farm. Hounds were beautiful to watch as they picked up the line over the plough into Greybury Wood, and without checking pushed their fox straight through the covert to the Plantation and back into Jules. Pressing him hard, they hunted through Greybury Ghyll, where it looked as though he was making for Shernden. But their tired fox would not face the open, and hounds steadily gained on him as he twisted and turned in the Ghyll, and finally bowled him over after a hunt of exceptionally good hound work in difficult country.

SPORT WITH THE LEDBURY

FRIDAY, December 16th, these hounds met at Cold Elm in glorious weather, very different from to-day, when there is a bitter north-east wind blowing and prospects of hunting to-morrow seem negligible. Finding in the Blacksmith's Coppice, a fox ran into the Dene, where a brace were on foot. Fastening on to one, hounds ran to the Mitre, then on nearly to Swinley Court, where they turned right-handed over Nashend and Hardwick Hay nearly to Berta Hill, where there was a check at the Pigeon House—30 minutes to here. The line was then carried to Hog's Pitch, where the fox probably lay down, as he was next seen retracing his steps to the Pigeon House. John soon had hounds on, and they ran back to Nashend, where the fox was marked to ground in a hedgerow. This was a nice hunt of some 90 minutes over a good line of country. The next fox was found at the Thistles, but soon went to ground in a hedgerow by Throat Cut Lane. Another fox found in Downend seemed one of the right sort as he crossed the main Tewkesbury—Ledbury Road through a line of cars and numerous people, who holloaed in his face. Subsequently he proved less enterprising, as turning short of Blacklands he circled back to Long Green and the line was finally carried to Downend, where he was lost. This ended a very busy day.

GIN AND TONIC.

MORPETH FOXHOUNDS

THE going all this season has been very heavy, rain and still more rain, with no frosts to harden the ground. What this means to the farmers perhaps only too few appreciate; the Morpeth, however, is lucky in having a very sporting lot.

On Tuesday, December 6th, hounds met at Linden Hall. Two foxes were quickly found in the shrubberies, one of them set his mask north-east, running by Bywell and East Moor. There was a brief check at the Brocks. This country is very heavily wired, and Mr. Cookson did well to hunt his hounds dismounted till they picked up the line again across the Stobswood—Felton Road.

Leaving Cheeveley on the south, they ran to Acklington Wood; here several fresh foxes held up proceedings, but hounds stuck gamely to the hunted fox, and forced him across the flooded Coquet. The fords were impassable, and although the fox was viewed across the river, hounds had to be called off. This was a five-mile point.

On Saturday, after a very heavy mist in the early morning, hounds met at Saltwick. Creighton's Whin was drawn blank, but the Gubeon as usual was alive with foxes; scent in cover was fair but very patchy in the open. Later in the morning a fox found in Cockhill took hounds by the Gubeon North to Springhill, where he laid up in the allotments. He was roused again and finally beat hounds to a badger earth by West High House.

Edington Whin proved a sure find, and the evening gave a sporting hunt by Molesden and Meldon Village back by Penny Hill to the Whin.

THE RUFFLE.

SOUTH CHESHIRE'S SPORT

MAJOR AND MRS. TOMKINSON entertained a small field, which met Mr. Barbour at Willington Hall on Monday.

Sunday night having been unthinkably rough, one wondered if any self-respecting fox would be anywhere except underground; and only the best and keenest earthstopper out on such a night.

Hounds quickly killed a fox found in the long Plantation. Ox-Pastures, Ash Wood, and the Waterless were drawn blank. From Waverton a good hunt of 75 minutes followed. A fox going away in the direction of Golden Nook Bridge, swung left-handed, hounds running nicely over good country before circling back towards Waverton, and without touching the covert ran in the direction of Cotton Edmunds. Running through Tofts Covert, they pointed for Stapleford Mill, the field crossing the River Gowie by the bridge on the Eggbridge—Duddon Heath Road.

Hunting slowly, hounds ran keeping Stapleford Hall on the right, swung left-handed over Mr. Shaw's farm to Hockenhull Hall, killed their fox on the main Tarvin—Chester Road by Holme St. Hall.

The Tuesday field which met Mr. Clegg at Wilkesley were compensated for a bad morning by a good afternoon hunt, having quickly killed a fox found in Hopetown. A slow hunt from Courts Gorse to Sound Heath, over a bad country followed.

Finding in the Rookery, which lies in the centre of the Broomhall country, so admirably managed by Major Ashton, a good hunt followed over a nice country via Broomhall. Hounds crossing the main Nantwich—Whitchurch Road and the railway, ran to within a field of Starkeys Gorse, where hounds were stopped in the dusk, with only the Hunt staff, the Master and one member of the field in attendance. The week concluded with the best day of the season to date, from Tattenhall Village, where a large field met Mr. Barbour and Mr. Clegg. From the coach drives hounds went away over some of the best Bolesworth country, through Hanley, over the brook by the old hunter trial course, crossing the main Chester—Whitchurch Road, lost their fox on Mr. Jackson's Farm.

J. D. H. S.-M.

Owing to Christmas press arrangements, no accounts of hunting runs will be published in next week's issue.

THE LINCOLNSHIRE HANDICAP

Some Promising Entries

THERE has been no racing worthy of mention during the past few days, but there were two quite good meetings earlier, the one at Windsor and the other at Hurst Park. At Windsor the weather was warm enough to do without an overcoat, but at Hurst Park on the second afternoon the cold was intense. On the first day at Hurst Park rain fell as heavily as it did on the unforgettable afternoon at Aintree when Troytown, one of the greatest of all jumpers, won the Grand National, and a number of well-known racegoers later died of pneumonia!

There was a time not so long ago when horses who could get barely a mile on the flat could win hurdle races run over two miles, but those times seem to have passed away. Yet at Hurst Park a horse named Petoford, by Stratford, whose best distance was six furlongs at the outside, won the Osterley Hurdle of two miles, and what is more he won it with ease. There was no suggestion that this four-year-old, who had never been seen over hurdles, was much expected to win, and he started at 20 to 1 in the ring and at more than 120 to 1 on the totalisator. Yet he was not unbacked, and one lady racegoer, who is well known, had him in the daily double. She thought that she knew the second half and went to Tote Investors and placed Too Dear in the office as the second half of the double. She then met a gentleman, who is not altogether uninterested in Tabor's stable, in which Too Dear is trained, and asked him what chance the horse had. She was told that it had none at all, and so she went back to the Tote Investors and changed her horse. The tragedy of it was that Too Dear won on a tight rein. He was not fancied in the least and went in the market from favourite to 10 to 1 offered, while in running one of the leading bookmakers offered as much as 33 to 1 against him. The tote double paid more than £430 to 10/-.

And yet there are many people who state that the trainers of horses always know when one of their horses will win and when it has no chance at all. On this showing Too Dear is about the best three-year-old hurdler yet seen out and a really good one, for he won this race, the Surrey Hurdle, with a stone in hand. On the second day of the meeting at Hurst Park another three-year-old hurdler, Main Mast, won the Marble Hill Hurdle against older horses with many lengths to spare. He had beaten Iceberg II, another three-year-old, earlier in the season, and Iceberg II had won twice since. Main Mast is trained by that great master of training, Tom Leader, who won the Grand National with Sprig. Ever since then Leader has been regarded as a National Hunt trainer, only much to his detriment, but he can train flat-race horses just as well if he is given the chance, as he showed last summer when he won a number of races with a very few horses.

The Lincolnshire Handicap is a long way off, for it will not be run until March 22nd. Yet the entries were made known a short time ago in the *Racing Calendar*. Sixty-seven horses have been entered against 68 last autumn. As a class they are much the same as they have been for many years, the days when classic horses such as Sir Galahad III and Tapin seeming to have passed. Yet such a wonderful filly as Sceptre was entered for the race, and was beaten by only St. Maclou, who afterwards won a number of handicaps and finished up the year by winning the Manchester November Handicap. It has always been thought that Sceptre should have won that Lincolnshire Handicap, and she afterwards won all of the five classic races except the Derby.

The best-class horses in this next Lincolnshire Handicap would seem to be Agincourt, The Hour, Thankerton and, it may be, Domaha. The first two, like Zoltan, are trained by Jack Jarvis, who saddled the winner last spring in Phakos. A few years ago he sent out Flamenco to win the same race, and if he makes up his mind to go for the race this year he should not be opposed. I like Agincourt, a colt by Bosworth out of Valescure, owned and bred by Lord Rosebery, the best of his three entries. This colt showed much promise as a two-year-old, but was then regarded at first as a three-year-old as a sprinter, and that in spite of his breeding. He was then found to be able to stay a mile, and after running away with a mile race at Doncaster was much expected to win the Cambridgeshire. He ran rather indifferently in that race, and later failed in another race. Still, he seems to be of rather better class than most of his possible opponents. Jarvis has private ground of his own at Newmarket, and can get his horses ready for the race with greater ease on that account than many other Newmarket or provincial trainers. At the same time, The Hour was a very good three-year-old, and if he can recover that form would also have a very good chance.

I am tired of Thankerton, who has done little for a long time, and would seem to have trained off. He is now owned by Mr. Westhead and trained by Tabor. He is being run over hurdles this winter, and that may give him back his courage and will keep him fit. Still, the last hurdler to win this race was Clarence Hatry's Furious, just after the War, and hurdling does not keep horses fit any more now than good work at home if the winter is open. Domaha is an interesting entry, for on his best form he is as good a miler as there is in the country. The manner in which he won at Doncaster last September proves that, and further, he ran very well in the Cambridgeshire last autumn. The distance there may have been just too far for him, and he will certainly like the Lincoln mile much better.

Harry Peacock has won the race twice in recent years. He won it in his first year as a trainer with Jerome Fandow and he won the race the year before last with Marmaduke Jinks, who is now running over hurdles and might win one soon in the colours of his new owner, Miss Dorothy Paget. Harry Peacock has entered three horses for the race, the most interesting of them being Mrs. Robinson's Lode Star, a winner last back-end and a horse bred to win this race. His dam won the Cambridgeshire for Mrs. Robinson, who also bred her and this horse. Zaimis, who was second in the race last year, and then was much expected to win the Cambridgeshire, in which he was far from disgraced, is another interesting entry. If I had to make a suggestion now as to the probable winner of a race for which the weights do not come out until February 2nd, I would choose from J. Jarvis's selected and Zaimis, for horses who have run well once in this race over this somewhat peculiar course have been known to do so again. Zaimis has done so, and, further, is a horse who runs best when he comes out fresh and unraced for some time.

There will be a lot of good racing this coming week with meetings especially well worth a visit, at Kempton Park on Boxing Day and the following day, and at Newbury at the week-end on Friday and Saturday. It is to be noted by members that they can take their children to both days of Kempton Park so long as they, the children, are under eighteen years of age, free passes being obtainable for them from the office on the course. There should be some really good racing on both days if the frost, which is prevalent as these notes are being written, has by then passed away, as, like all other racing men, I hope that it will have done. It is not so much a hardship for some of us as it is for the men who rely on it for a living, such as the ring-keepers and gate-keepers, the riders, who at the best for the most part get a bare living, and the many people attached to the catering and bookmakers' business, such as waiters, waitresses and runners and clerks.

GNOSTIC.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

CONSIDERING the large number of four-footed beasts which roam the world, there are but few which we honour with our gastronomic patronage. To millions of men and women in the East, the ox is sacred, and all flesh is repugnant; to many more, not merely in the East, the pig is a disgusting scavenger, and pork is untouchable. But to the great majority of broad-minded and broad-waistcoated Englishmen, roast beef and Yorkshire ham are among the very best things on earth. In Belgium and in some parts of France, horse-flesh is recognised as butcher's meat, whilst in most mountainous districts of Europe, the goat—and preferably the kid—are greatly appreciated. In the Balkans, both venison and bear abound, and are consumed upon a considerable scale. In England, however, bears are safe and so are park deer, the ox, the lamb and the pig supplying practically the whole of the demand for our daily meat.

There is no better beef in the world than English beef, except Scotch beef. The reasons for such superiority are, first, that bulls serve but do not work in Britain as they do on the Continent; second, that the grazing is more plentiful and more suitable than in other lands, where the heat of the summer and the cold of the winter are so much more extreme than they are either in England or in Scotland, where God's good green grass has such a lovely time. Truly tender and white veal, such as one gets in France from milk-fed calves, is vastly superior to the immature beef known in England as veal.

English lamb is admirable, but there is no more any English mutton deserving the name; Welsh mutton is still praised as the finest there is, so that it is probably still to be obtained, presumably in Wales. Queen Victoria always kept sheep in Windsor Great Park which were not brought to the royal table before they had attained the age of discretion, even if not the age of consent, which for sheep is three years. The sheep that has lived peacefully and been properly grazed from three to four years has had a chance to cushion its saddle with close grain meat of truly excellent flavour and quality. The trouble is that wool from Australia, South Africa and the Argentine reaches England in such large quantities and at such low prices that the English farmer cannot sell the fleece of his sheep at a price that will pay for the sheep's keep from year to year; hence the slaughter of the innocent lambs, and the fact that butchers who offer us home-killed meat in England deal very rarely in more than two sorts of lamb, new lamb and old lamb, which they call mutton.

Pigs, of course, are the more human of all quadrupeds; they do not vote, but they are omnivorous, eating meat, fish, and everything that they can get, without ever showing any signs of gratitude, but, on the contrary, never ceasing to grunt and to want more. Yet, when the end comes, as come it must, they amply repay, to the last drop of their blood, all favours received.

IN THE SALEROOM

AT the Notaries' Sale Room, 7, Marché aux Grains, Louvain, Belgium, the magnificent Van Dyck portrait of Sieur Vinck is to be sold on January 21st. Listed by Smith, Vol. III, No. 487, it comes from the Vanden Schrieck Collection, and will be sold without reserve. The companion picture, the portrait of Madame Vinck, is now in a private collection in England.

The disposal by Sotheby's of the final portion of the Schiff Library was not quite so well supported as the previous sales, but the total of nearly £13,000 brought the amount realised for the complete library to over £50,000. The following are some of the prices obtained: *The Gessner* (*Salomon*) *Œuvres* (three volumes, Paris, 1786-93) fetched £155; Voltaire's *La Pucelle D'Orléans* in contemporary French red morocco, possibly by A. M. Padeloup, extra-illustrated with an original water-colour title and 29 drawings, was sold for £110; *Xenophontis Opera* (in Latin), Grolier's copy, with his name and motto on the covers (Basle, 1534) secured £150; Diego Lopez De Zuniga's *Annotationes Jacobi Lopidis Stunicae*, Grolier's copy (Alcalà, 1520), fetched £235; and *Les Sainctes Prières de l'âme Chrestienne*, "escrites, gravées après le natural de la plume par P. Moreau," and bound in very fine contemporary Parisian red morocco, possibly by the mysterious Le Gascon (Paris, 1649), brought £130.

Claud W. Heneage's fine collection of English and Continental porcelain and pottery and Chinese porcelain and works of art was, apparently, affected by world affairs at the sale at Sotheby's on December 8th, and the prices realised were moderate, and doubtless many collectors were able to obtain genuine, fine pieces at prices much less than they anticipated.

FIFTY YEARS AGO

From the *Field* of December 22nd, 1888.

TRAVELLING at Christmas. "Imagine what was the lot of your ancestor at a time when railroads were not. The interior of even a third-class carriage is a warmer berth than the top of a coach, and what may be slow for a train would, nevertheless, be quick travelling on the road. Moreover, in case of a block in the snow, or a thick fog, those under cover have the best of it; they are neither choked by the one nor are they called upon to get down and lend a hand in whatever direction the guard might suggest. It is said that a former Dean of Rochester was once asked to ride one of the leaders of a snow-bound coach to summon assistance. . . . Anyone who happened to be in the vicinity of the Edgware Road on Wednesday morning last might have had his mind carried back to the olden time of stage coaches as upwards of a dozen were to be seen near the Marble Arch. They were engaged, however, on no merry Christmas errand. . . . They had come together to follow to their last resting place in Highgate Cemetery the remains of James Selby, the proprietor of the Old Times coach."

Sand Grouse Protection Bill. "The Bill as it stands provides that, for three years from February 1st next, anyone who shall knowingly or with intent kill, wound, or take any sand grouse, or shall expose, or offer for sale a sand grouse killed or taken in the United Kingdom, shall be subject to a penalty of 20/- for each offence . . . Sydney Buxton."

"'I regret to say that I am still of the opinion that the birds will all die out or disappear before long, though perhaps a few stragglers may linger longer than I at first thought, whatever may be done to protect them from persecution.—E. Delmé Radcliffe.'"

Magazine Rifles. "On Thursday, in the House of Commons, Colonel Eyre rose to ask the Secretary of State for War whether his attention had been called to the *Field* newspaper of Saturday last, December 15th, as to the penetration attained by a bullet, the invention of Mr. Farini, and to the machinery by which rifles can, without alteration, be converted into machine guns."

RETRIEVERS AT IDSWORTH

THE Southern Counties Gun Dog League held their retriever trials at Idsworth on December 9th and 10th by kind permission of their president, Lady Howe, who judged them with Mr. W. East and Mr. G. T. Woodger. Results:

STAKE 1 (limit fourteen nominations and winner eligible for the Retriever Championship trials).—Equal 1st, Mr. J. A. Rank's Labrador Withington Nith and Mr. A. B. Simpson's Labrador Bill of Upperlodge; 3rd, Mr. R. V. Garton's Labrador Langbourne Midnight; reserve, Miss Newton-Deakin's golden retriever b. Silence of Tone. Certificates of merit: Major B. M. Bebb's Labrador Hiwood Shimey, Mrs. W. M. Charlesworth's golden retriever Noranby Ranter, Major F. E. Davies's golden retriever Rakelands Copper, Mr. J. A. Rank's Labrador Withington Sam, Mr. K. J. Malcolm's Labrador b. Gem of Glenmorag.

STAKE 2 (for retrievers not having won first, second or third prize in any stake up to November 26th).—1st, Mr. R. G. Heaton's Labrador b. Cheverells Amber; 2nd, Mrs. E. M. Harvey's Labrador Nero of Harpotts; 3rd, Mr. Henry S. Loebl's Labrador Hesloe Flash; reserve and certificate of merit, Major F. E. Davies's Labrador b. Braeroy Fay; certificate of merit, Mr. J. A. Rank's Labrador Withington Sam.

BLIND GARDENERS—The blind competed at the National Rose Show this year, and they have won prizes for their exhibits in past years. Growing plants seems an extraordinary procedure for the blind, but here is evidence of what they can achieve. They sow the seeds and do all their work by touch, tending with care flowers and vegetables they can never see. But they enjoy the work, and that they can follow such an occupation is due to the inception of The Garden Club for the Blind, Tressillian Lodge, St. John's, London, S.E. 4. Many people have helped with plants, seeds, implements, &c., and assistance will bring pleasure to many blind gardeners.

THE ELEVENTH COMMANDMENT.—If you not do know what this commandment stands for, it is "Thou shalt not be found out." A trial performance of a play by Edward Hyde Kent bearing this title was given at the Twentieth Century Theatre. The theme is a good one and deals with the difficulties of an aspirant to Cabinet rank when threatened with the revelation of a divorce which took place in his youth. The last acts were spirited, and, with some adjustment of dialogue in the early acts, and some additions and polishing, the play would have distinct promise in the hands of a West End caste, as was revealed by the acting of Deirdre Doyle and Aithna Gover.

THE GLAMOUR OF CHRISTMAS

CHRISTMAS EVE. We have put holly above the pictures, and along the picture rails. We have hung mistletoe up in the hall, not because anyone will make use of it this year (we are all far too old) but because we always have hung mistletoe up in the hall. We have examined the Christmas cards on the mantelpiece, on the top of the piano, on the overflow tables; we note that So-and-so has not remembered us this year and glow inwardly when we think of him looking at our card; we try to forget that we shall have to buy several cards when the shops open again, and hope that the recipients will put down their late arrival to the vagaries of the Christmas post and not have the *nous* to look at the post-mark. And now it is time to go to bed.

* * *

Christmas is still a time of excitement even in middle age. To-morrow morning we shall receive presents; not so many as we did years ago, of course, but still presents. One or two, in the nature of things, will be rather unsuitable. They will call forth expressions of deep gratitude—sincerely meant, if not for the gift for the spirit that prompted it—and be placed in a drawer against the future. And then, of course, there are the presents which we are not supposed to know anything about; the presents we saw being smuggled into the house during the last week (just as we were seen smuggling in our own); the presents we were asked about so casually during the past month or so. And, of course, one or two that we do not know anything about. And it is all very exciting. It is nice to get presents: it is nice to give presents. It is nice to know that some people still retain an affection for us: it is nice to be able to show affection occasionally. It is nice to recapture one's childhood once a year.

* * *

Do you remember your early Christmases? I do, for I loved them more than anything. When I was a very small boy I used to sleep at the top of a very large house. I went to bed early normally and slept soundly (except on those occasions when I had my one nightmare—that of being chased, generally up the side of a house, by a large stallion of the cart variety) and woke early. On Christmas Eve I went to bed early, but I did not sleep. I would lie awake waiting for the visit of Father Christmas. Father Christmas, in that household, never wore red, and had no long white beard beneath red cowl. A beard, yes, and white, but short; and the clothes well-worn tweeds. Father Christmas tip-toed to the end of the bed and filled the bolster-case that hung in place of a stocking. When he looked my way my eyes were shut. But he knew I knew and I knew he knew. Christmas was Christmas. One kept up appearances.

* * *

In those days I opened my Christmas presents about midnight by the light of a candle: teddy-bears, and tin soldiers, and railway trains. Christmas and nothing to worry about. And then, later—the first presents of adolescence. And the first Christmas when one smoked in public, and drank in public. And all the Christmases since. The Christmases that brought, each one of them, happiness; that brought, each of them, additional responsibility; that brought, each of them, added weight and thinning hair; the Christmases that retained, each of them, some measure of the thrill of those early Christmases.

* * *

To-day I hang up no stocking; to-day I sleep soundly and wake late. But yet I am excited. The lighted shops, the hurrying crowds, the general atmosphere of festivity, the balloons and teddy-bears and dolls, the vendors on the pavements with their somersaulting toys, buoy me up. I only wish that toys were not now beyond my reach.

* * *

It is fitting that we should every now and again return to childhood, even though our hair be thi and our breath short. That we do so but once year is unfortunate in a great many ways. Fortuna for our purses, fortunate for our digestions—bu unfortunate for our natures. In this hurrying mechanised world, in this mad struggle to live (which really means no more than keeping up appearances beyond our means), in this vast pantomime that is modern life, the things that matter—really matter—are forgotten; are so frequently forgotten that they may one day cease to exist.

* * *

Christmas brings back good-will. It is the children's festival. So let us all be childish, and wear paper hats, and eat too much, and pull crackers, and blow paper squirters—and be happy.

B. V-F.

LETTERS TO THE EDITOR

ENCOURAGING ATHLETICS

SIR,—The method of encouraging those athletes who do not reach the standard of the champion in their own class as advocated by the Hon. Recorder of the Scottish Athletic Federation, is a most admirable one. There is no doubt that both the raw novice and the keen athlete of only second-class ability will be enormously encouraged if only they have some means of comparing what they can do with what others in a similar position to themselves are achieving. Likewise, a class, a house or a whole school, will be able to compare its average standard with that of other classes, houses or schools.

As it happens, the means for this comparison is in existence. It is the Finnish Scoring Table, adopted by the International Amateur Athletic Federation for scoring in the Decathlon competitions in international matches at the European Championships and at the Olympic Games. In this table—actually a small book—marks are awarded for almost any performance at every event on a comparative basis. Off-hand I am sorry to say that I cannot give the exact method of computing the tables, but, roughly, it is as follows: 1,000 marks was given in each event for the standard of a world champion, this standard being an average of the performances recorded by several world or Olympic champions. A curve was then drawn for each event showing marks against performance, the curve being very carefully worked out so that 500 marks, shall we say, for the high jump was of equivalent value to 500 marks for the 100 metres or 1,500 metres. (The running events are all worked out for metric distances, as are used in the Olympic Games.)

In this way a direct comparison may be made between a mile run in 4min. 53sec., a 33ft. put with the weight and a long jump of 20ft. 1in., simply by looking up in the book how much each is worth in points. Adjustment for metric distances, of course, has to be made.

The hon. secretary of the Amateur Athletic Association, 118, Chancery Lane, London, W.C. 2, will, I am sure, be glad to forward all particulars as to where the booklet can be purchased. It is the scoring table used by the A.A.A. for their own Decathlon championship.

As Mr. J. B. T. Mackay pointed out, there are other considerations besides the actual performance which are needed for an accurate comparison of standards, and I suggest the following points for guidance in the matter:

1. Children should be grouped by ages, boys and girls always being kept entirely separated. Sometimes a child who has developed quicker than usual will be outstanding in a certain age group, but the difficulties of deciding how much should be allowed for extra height or weight seem to be so great as to preclude any variation of this rule being adopted.
2. The same size of weight, discus or javelin should be used on every occasion by any particular age group. Those used in the A.A.A. Junior Championships, give a guide for the older boys.
3. No difference should be made for grass or cinder tracks. Contrary to usual belief, a firm, springy grass track is faster than many cinder tracks; in fact, the English native 880yds record was lowered less than three years ago on a grass track.
4. All distances should be measured with a steel tape. A linen tape stretches with age, and with the strength of the manipulator.
5. All times should be taken with at least two stop-watches. In championships at least three watches are used, but in schools and clubs this number may not be available; none the less, two should always be used, for obvious reasons.
6. The A.A.A. rules for competitions should always be enforced. This may seem an unnecessary point to bring up, but unless it is constantly in the minds of those responsible for the competitions under consideration there is always the chance that some small rule may be neglected, usually with the intention of making things go better, and later on much bitterness may result.

Yours faithfully,

R.N. College, F. W. COLLINS.
Greenwich.

THE LITTLE OWL

SIR,—With regard to the assertion of the British Field Sports Society that it was not invited to take part in the Little Owl Food Inquiry, I have before me as I write three cuttings from *The Times* of 1936, dated May 23rd, May 29th and June 3rd respectively.

1. An account of the activities of the British Trust for Ornithology, with an appeal for help with its investigations, including that of the little owl.
2. A letter from Mr. J. W. Fitzwilliam, secretary of the B.F.S.S., in which he expressed his opinion that the inquiry should not be confined to the examination of pellets.
3. A letter from myself, in which I wrote: "It is the truth about the bird that is being sought by the Trust, and for this end it is necessary that every possible source of direct information should be tapped."

Could any clearer invitation have been given? Moreover, the B.B.C. broadcast, in April, 1936, by Mr. Tom Harrisson, stressed the point that the appeal for help was made very specially to those interested in game.

The contents of all the gizzards examined during the special game chick investigation were prepared for me at the British Museum by the head of the bird department.

The evidence of the whole inquiry was presented in the Report for everybody to read, and the conclusions drawn from it were endorsed by the four distinguished members of my advisory committee. A suggestion of bias under the circumstances is preposterous.

Yours faithfully,

Hilary, ALICE HIBBERT-WARE.
Girton,
Cambridge.

HATCHING PHEASANTS

SIR,—I run a poultry farm of about 600 to 700 head of stock, and a friend of mine, Major Passy, of Blackford, Cornwood, Devon, has for several seasons asked me to make an experiment hatching pheasants' eggs. The object of the experiment was to see how far pheasant chicks could be raised on ordinary poultry chick foods and under ordinary chick conditions. This year I carried out the experiment, and at Major Passy's request I am sending you a few details in case it might be interesting to other people.

On May 11th 52 pheasants' eggs were put in a 100-size Gleoum incubator, run at 103° and treated just as hen eggs.

On June 5th 27 chicks were removed and placed in a 100-size Visi-chick hover run at 90° to 95° as for chicks, in a room in an old Army hut with special windows and chick verandah, room bedded down with peat moss.

Of the 25 eggs that failed to hatch, twelve were clear, twelve failed soon after starting, and one died later.

The chicks required careful handling out of the incubator, as they were wild and very quick; three jumped out of the incubator and were damaged by the fall.

The chicks were started on Silcock No. 1 baby chick mash, but were rather slow taking to it, so were given about two feeds a day of Spratt's Chiko. Once they took to the mash they appeared to like it as much as the grain.

Some chicks refused to leave the hover and had to be removed by hand and shown the food.

Eventually fifteen good chicken were raised, the casualties being mainly those which refused to feed properly at the start.

They were kept intensively till August 20th, when they suddenly started a bad attack of feather-pulling; the verandah was opened and they were allowed to go free. From the first day they roosted out, but remained in and about the garden and near-by fields, returning once or twice daily to their own house, where a feed of plain wheat was left on the verandah for them to help themselves. This continued for some time until they eventually split up into twos and threes and only returned once in a way. There is plenty of cover handy, and as there were no wild pheasants about I have requested farmers around to do their best to preserve them this year in the hope they will increase naturally next year.

Yours faithfully,

Coombe, G. T. B. HEXT.
Hessenford,
Torpoint, Cornwall.

DRAINING GROUSE MOORS

SIR,—Mr. Laming's letter, in your issue of November 18th, on what might be termed the depopulation of grouse on Scottish moors, cannot be allowed to pass unchallenged.

Mr. Laming does not apparently realise that the majority of moors are sheep grazings first and foremost, and that the drains he complains of are put there in order to improve the land for sheep.

In the old days estate owners and their gamekeepers were always at loggerheads with the tenants and shepherds of sheep farms on the question of drainage, heather burning, &c. It is now pretty generally recognised that grouse are more numerous on moors which are well farmed for sheep, and I could show Mr. Laming numerous moors in various parts of Scotland which are very badly drained, and on which, I am sure, he would very soon tire of tramping miles through bogs, and only see a few brace of birds.

Mr. Laming is wrong in his assumption that a wide-bottomed drain is a deathtrap to young birds. During the spring and early summer I have many times seen "cheepers" get in *and out* of these wide drains, which, even after heavy rain and thawing snow, only carry a shallow flow of water. On the other hand, the deep, narrow drain or ditch has caused the loss of dozens of birds, and many sheep.

May I humbly suggest that the cause of poor bags is not due to the causes he mentions, but to the fact that the standard of the "shots" in the majority of shooting parties is very much poorer than of old?

Having had a varied experience of sheep farming I know the keen interest the shepherds take in grouse generally, and any old shepherd will tell you that.

The Scottish moors are, on the average, in better condition for both purposes to which they are put than they were 20 years ago, but unfortunately for the shooting tenant his guns are not so accurate.

Yours faithfully,

Glasgow. IAN P. CHRYSTAL.

SIR,—I have read with interest the letter in your issue of November 19th on the above subject.

While it is true that there has not been a bumper year throughout Scotland for some time, one cannot help doubting if it is quite correct to say that there has been a very appreciable decline in the head of Scottish grouse. One can recall some very big bags made since the War.

It so happened that I heard some time ago of Mr. Laming's idea concerning draining, and coming from such an authority it has occasioned much thought. It is, of course, quite true that a wide, deep, straight-sided drain, as so often made by sheep farmers, is disastrous to any young grouse that may fall into them, but I cannot think that there are enough of these to cause a general decline in the numbers of grouse throughout Scotland.

It would be very interesting if Mr. Laming would give his reasons for supposing that these drains are detrimental to heather. My experience has been exactly the reverse. When one comes across these drains in low ground it is usually found that the only good heather grows alongside them. I am not, of course, defending drains of this type—they are an abomination—but I am quite sure that a well-drained moor is more likely to carry a good stock of birds than one that is ill-drained or not drained at all.

I am equally sure that all moorland drains are a curse to fishermen as the water runs off so quickly that the river is down almost as soon as the rain stops.

I quite agree that a full discussion on the subject would be very beneficial.

Yours faithfully,

The Bath Club, BERNARD CAZENOVE.
34, Dover Street, W. 1.

SIR,—Mr. Laming's letter in your issue of November 18th *re* the draining of grouse moors will, I hope, start a very interesting discussion.

There is one point, however, which he does not mention and that is the effect that extensive hill draining has on the salmon rivers. In the old days after heavy rain the river took a day or two to rise, but when it did it came gradually, stayed big for some days, and then went back gradually, and the water was clean, having filtered through the ground. Nowadays heavy rain just rushes down the drains, the river rises at once, and is the colour of black coffee. Fish will not take in this black water, even if they come into it from the sea.

The Spey in the last two years demonstrates this well. I refer to one of the lower beats. 1937 was a dry year, no black water and a record season, though the water was low. In 1938 the season was good till May, but from then on the river was high and black, and there were no more fish.

Yours faithfully,

Blairs House, A. P. GORDON CUMMING.
Altyre, Forres, N.B.

BIRDS AND THE GRID

SIR,—It is a matter of common knowledge that large numbers of game birds are killed by flying against telegraph wires, and the grid cable is now an additional danger.

On a shoot in the county of Devon there have been found this year killed against an electric wire crossing over a small field of less than two acres in extent the following numbers: Five landrail, two snipe, three woodcock and one ringed plover.

It is remarkable that so many landrail, which are now seldom seen or heard of in this county, should have met their death in one small spot. The five landrail were all picked up in the early part of September, the two snipe in October, and the three woodcock and the ringed plover in the early November moon.

Yours faithfully,

Bicton, CLINTON.
East Budleigh,
E. Devon.

COMFORTABLE BEDS

SIR,—It is often said, and truly, that the Swiss hotel proprietor prides himself on the great comfort of his beds.

To-day in England in the better-class hotel, I consider the beds compare favourably with those in Switzerland or any other country. Unfortunately, however, there are still a host of smaller hotels, country inns, and seaside boarding-houses where, to judge by the feel, the mattresses are stuffed mainly with brickbats and iron filings.

Recently I made a very comprehensive tour of Switzerland, staying only at the most modest village inns. In every case my bed was a direct inducement to over-sleeping.

This delightful state of affairs was explained when I discovered that in almost every village there is a professional mattress cleaner. I took this picture of one of the younger generation at work in the village street with his funny old-fashioned machine. Once a year everyone sends a mattress to be opened up. The stuffing is passed through the machine and emerges clean and resilient as when new.

THE PROFESSIONAL MATTRESS CLEANER AT WORK
(See letter "Comfortable Beds")

Since such complete comfort is obtained by merely opening up and cleaning the mattress once a year, it seems a great pity that the proprietors of our smaller but otherwise most comfortable hostelries should ignore this most important detail.

On my return from Switzerland I spent a weary and sleepless night at a moderate price hotel in one of our main ports of entry for foreign tourists. Next morning the comments on the beds by a party of Continental tourists, who had also spent the night there, were anything but flattering to British hotel keepers.

Yours faithfully,

Cheshire. M. HUNTER.

A HEN SITTING IN A TREE

SIR,—A year-old hen of mine, a cross between an Indian game cock and a Barnevelder hen, took to flying up into an elm tree quite early in her career. Some time ago I noticed that she flew down with much cackling every afternoon to join the other hens at feeding time. I suspected nothing, but in a day or two it became obvious that she was a sitting hen. My gardener, with the help of a ladder, explored two elms. In the first he found a jackdaw's nest, with three fledglings nearly ready to fly. Quite close by, in the second, he discovered the hen sitting on fifteen eggs in a hollow quite twenty feet from the ground. One day, my cook and I were feeding the hens—the expectant mother busy picking up food with the rest—when we heard cheeping, to the accompaniment of much excitement among the birds in the surrounding trees. I fetched the gardener, who ascended and brought down five lively chicks, one chick slightly and another fatally wounded in the neck by some bird of prey (owl or hawk which had swooped suddenly while the hen was out of the nest), and four eggs; while below the mother was walking about cackling loudly, accompanied by two lusty chicks which somehow or other she had in the meantime conveyed to the ground. One chick had fallen down and was dead, and one had been carried off by the robber bird. Of the four eggs one was addled, one contained a dead chick, and the other two we hatched out on the top of our hot-water tank, thus adding two more to our brood, which now numbers ten.

Yours faithfully,

Lavington Rectory, (Rev.) F. H. A. WILLIAMS.
Graffham, Petworth.

FIVE GIANT PANDAS

SIR,—Looking over things I think life out here must make one adaptable. It sounds a formidable task to house five giant pandas, two blue sheep, a musk deer, a marmot, a golden-haired monkey, and three attendants in a well-filled dogs' home, built for about 50 dogs. But in fact it was not! Within two hours of the first enquiry, the collection and attendants had been unloaded, housed and settled down, and my staff were carrying on with their routine work.

The condition of the animals after a three weeks' journey across China, skirting the war area, ending with two days on an overloaded tramp in heavy seas, had best be left to the imagination. But I would like to add an opinion that, if the zoos of the world must encourage this trade in wild animals, they should, at least, supervise the trade, and not leave it to private enterprise. However, I thought you might like to get the impression of a cargo of giant pandas from a European who has had them in her supervision for nearly twelve days.

The giant pandas ranged in age from three years to ten months, and their weights from about 300lb. to 50lb. The fur reminds one of sheep's wool, and appears to be 2in. thick or more in places. Their disposition seems to be that of the Himalayan bear, now in the Liverpool Zoo, which I had for six months, and of the other bears of which I have read. They seemed perfectly content in the open grass run, fastened with a leather collar and chained to an iron stake, but one rainy night I had to bring them into the kennels; after this, they were always restless out of doors, demanding permission to go inside, so much so that one pulled the stake out of the ground and marched straight up to the kennels, demanding admission.

For food, the Chinese keepers cooked a sort of biscuit, made from oatmeal, water and sugar; while for liquid they were given a very much watered milk. They refused water alone.

At first they were suspicious of condensed milk when I offered them a tin with the usual small holes. However, after a few minutes, each one realised that it was something really worth having. The "baby" quickly learned to pick up the tin and roll on her back, in which position she would remain until the tin was taken away. A tin of milk was the only thing which would arouse the oldest, whom we called "Grandma." The tin would last her for three hours, a greater part of which was spent in licking the milk from her hair, on to which it had spouted when she gave the tin a crunch.

It must be remembered, however, that the giant pandas are nocturnal animals, and I did not see them at night. The keepers told me that they were much more active in the dark. However, they do not seem to have made any strenuous efforts to escape from their chain or the kennels.

I was rather astonished at the size of the canine teeth, in view of the fact that they are purely vegetarians and their natural food is the bamboo.

It was also strange that only one of the five would take to sugar cane.

Two other features which struck me most were the shape of the ears which are small and curiously rounded, reminding one of nothing so much as a pompom, and the thick mat of hair on each foot, so useful to give a grip on ice and rock and, possibly, on snow. I do not know sufficient of bears to know whether this is common to the family.

The facility with which they used their joint between the paw and the forearm for holding their biscuits, and anything they want to pick up, reminded me of my previous bear.

Due to my ignorance of zoology, I was not able to appreciate the blue sheep or the musk deer, except that it was a great joy to give them the freedom of a large run and to get supplies of fresh grass for them.

The whole collection was absolutely fearless of human beings, or even the dogs, with which the blue sheep rubbed noses through the wire within half an hour of arrival.

The musk deer had a broken bone just above the hock. I was able to clean and disinfect the wound but, after consultation with a local surgeon, came to the conclusion that the risk of attempting to set the bone was greater than leaving it alone, particularly so as she seemed more timid than anything I have ever handled.

There was nothing to be done for the birds as I had no aviary.

I enclose a photograph which may interest you as I think it is unique. The panda on the right is in her favourite position—she used her iron stake as a back rest and usually had her nose right in the air.

I think it is proper to add that (on behalf of the local S.P.C.A.) I took charge of the animals for their benefit and for no other reason. There cannot be the slightest doubt that, during the twelve days they were with me, the animals all made remarkable improvement in condition. They were just beginning to show their joy of life and to assert their independence when they were recrated for the journey to the Zoo.

I hope the *Field* will make its influence felt to improve the conditions under which this traffic is carried on, if it must be carried on; but it is only fair to add that the animals showed that their owner, Mr. Smith, had a remarkable knowledge of animals and their needs, but this does not alter the fact that a wealthy public body, like the Zoo, could afford to spend much more on their animals than a private trader, and should do so, or not encourage the trade.

Yours faithfully,

H.K.S.P.C.A. Dogs Home, ROSA LOSEBY.
Tam Kung Road, (Hon. Sec., Dogs Home)
Kowloon City, Hongkong.

THE CHILDREN'S CHRISTMAS DREAM COMES TRUE
(See letter "Five Giant Pandas")

WHITE ALSATIANS

SIR,—In your issue of December 10th you answer an enquirer about white Alsatians, and end by saying that the "depigmentation" is considered a sign of degeneracy. At the risk of seeming tedious I would like to explain several points about this fallacy of "degeneration." I am in a position to do so because I have bred, trained and worked white Alsatians for over five years.

As far back as 1606 the ancestor of the present-day Alsatian was white by preference. "They must be white as the sheep, so that the latter should not be afraid of them, and that they should be easily distinguished from the wolf, so that they should not be shot by mistake." This was written in 1606 by P. C. Gessens, and in 1701 Hohberg mentions the same point again.

The first Alsatian ever exhibited was a dog called Kirass, a grey and white; the second (Greif) was white. These were shown in 1882. In 1888 another white (Greifa) was shown at Hamburg, and a white and yellow (Greif) at Berlin in the same year. In 1889 at Cassel Show were exhibited Stummel (yellow) and Greif II (white). These details are quoted from George Horowitz's standard work.

So undoubtedly the majority of Alsatian ancestors were white, and it is, not surprisingly, those ancestors who are responsible for the present-day white Alsatian, a simple case of atavism, or throw-back. The fallacy of degeneration arises (as far as I can see) from a total confusion between albinism and atavism. The former is, of course, an undesirable abnormality, and I have never come across an albino Alsatian, though I have seen a very great many whites. This understandable atavism has also frequently been confused by those who should know better with depigmentation. Breeders apparently imagine that if their stock becomes gradually paler in colour, the eventual result will be white, whereas in reality white puppies come quite spontaneously from dark parents. There have been black-and-white puppies in the same litter, white puppies from a black sire, and so on.

I should like to point out that "depigmentation," as far as whites are concerned, is an erroneous expression. Except for the colour of the coat, the ideal white Alsatian should have (and always has) dark eyes, a black nose, black lips and black pads, exactly the same as required in Samoyeds or white Pekingese.

As for "degeneration," my own dogs work hard all through the shooting season, have not suffered from hysteria for many years, and are natural workers from the time they are weaned. Could one ever train successfully a degenerate animal?

Yours faithfully,
HULDINE V. BEAMISH.

Yarcombe,
Devon.

A STRANGE CASUALTY

SIR,—I was very interested to read your letter in the *Field* of December 3rd entitled "A Strange Casualty."

The only possible, and I should imagine quite probable, solution to the mystery is that the bitch got her tongue caught in the teeth of a rabbit gin; and naturally being frantic, exerted all her strength to get away and thus tore it out by the roots.

I once heard of this happening to a Labrador dog, which also had to be destroyed.

Of course, in a case of this kind if one had the time to persevere for a few weeks in pouring nourishment down the dog's throat it would in all probability learn to eat, and instead of lapping liquid would suck it down; taking as example, a very good hound in the pack of the Carmarthen and Pembrokeshire Otter Hounds, which was born tongueless and does not appear at all inconvenienced by this hard deal from nature.

Yours faithfully,
LORNA G. LEWIS
(Hon. Sec., Down House Beagles).

Pontardawe,
Glamorgan.

SIR,—With reference to a letter in your number of December 3rd under this heading, a very similar incident happened to a pointer belonging to a friend of mine. The dog was working on a hill in Scotland when it suddenly returned to its master, bleeding profusely at the mouth. On examination, it was found that the entire tongue was missing. This, we imagined, had been bitten off when the dog galloped into a hidden hole, and in consequence bringing its bottom jaw a bang on to the ground. After bathing it as best we could, it was taken back and shut in its kennel. Next morning, to everyone's amazement, the stump had stopped bleeding and looked a healthy clean cut. The dog soon learnt to eat its food and to drink its water. So I do not think it was actually necessary for the beagle bitch to be destroyed, but, on the other hand, she would never again throw her tongue!

Yours faithfully,
H. N. C.

Essex.

SIR,—The strange casualty to a hound recorded in your issue of December 3rd reminds me of a similar accident, in which the victim was a bullock. No one could imagine how the bullock had lost its tongue until the severed organ was found beside a closed-up rabbit snare.

The bullock had put its tongue within the loop of the snare while grazing, or when about to chew the wire of the snare, which is a frequent habit of cattle.

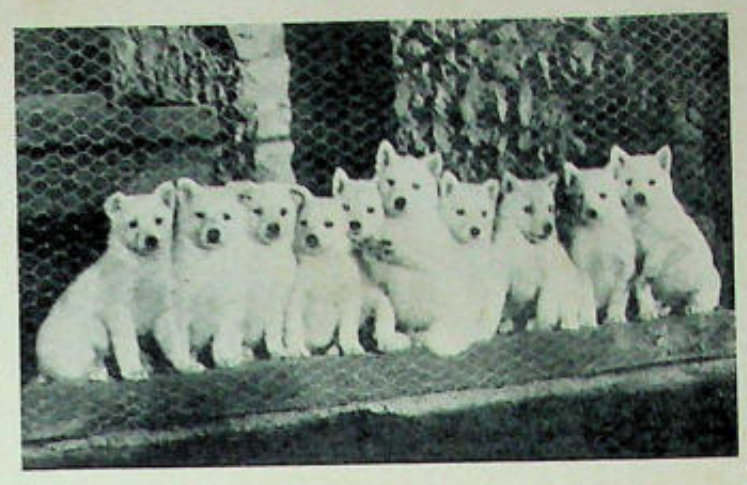
It is probable that the hound which lost its tongue was running with its head to ground and mouth open when it got its tongue caught in a snare, when the animal's own weight would sever the organ as by a knife.

No doubt the man who set the snare found the dog's tongue beside it, and, equally without doubt, he hid it.

Such accidents to cattle or dogs are rare, but snares should not be left standing open in daytime where cattle graze, or where hounds may be running.

Yours faithfully,
DUGALD MACINTYRE.

Comrie.



NO SIGN OF DEGENERACY HERE
(See letter "White Alsatians")

MOVEMENTS OF CAMELS

SIR,—I have just seen the correspondence in the *Field* of November 26th, where Muybridge's work in recording the movements of animals is referred to, and although you indicate that the correspondence is now closed, it occurs to me that you might like to inform your readers of the following.

Muybridge left all his lantern slides, made in the '80's, a large selection of his plates from the various books he published, and his "Zoopraxiscope" to the Kingston-upon-Thames Museum. The "Zoopraxiscope" was a forerunner of the modern cinematograph. By printing transparencies of successive movements of an animal round the outer edge of a glass disc, and revolving this in a specially constructed type of magic lantern, a moving picture was projected on to the screen. Muybridge first demonstrated the machine on May 4th, 1880, at San Francisco. Muybridge was born in Kingston-upon-Thames in 1830, but all his work was accomplished in America. He died at Kingston-upon-Thames in 1904.

Yours faithfully,
H. CROSS.
(Borough Librarian).

Public Library, Museum and Art Gallery,
Fairfield, Kingston-upon-Thames.

BELLE OF ALL PHOTOGRAPHED IN 1924
(See letter "The Greatest American Polo Mare")

THE GREATEST AMERICAN POLO MARE

SIR,—I have been looking at the photographs of U.S.A. polo ponies you reproduced in your issue of December 3rd. The best photograph is that of Tornasol, and you may like to use the enclosed of Belle of All (the dam of Honu), as you describe her as "the greatest American polo mare ever foaled." I photographed her with 23 other ponies played by the American team in 1924, at Mr. H. P. Whitney's stables on Long Island, New York. Mr. Louis Stoddard, who owned the mare, had a large photograph from me to hang up in the Meadow Brook Club at Westbury, L.I.

Yours faithfully,
W. A. ROUCH.

London, W.C. 2.

Yes, my darling daughter?

So that explains the decline and fall in Father's stock of Gold Flake. Of course, she's only one of many these days. Women have developed a liking for a man's cigarette. And a Wills's Gold Flake—*the* man's cigarette—certainly *is* something worth smoking. It has the distinctive flavour of really fine Virginia tobaccos. Look how men have been loyal to Gold Flake for years and years and years.

WILLS'S
GOLD FLAKE
is the man's cigarette that women like

N.B. You can get Wills's Gold Flake Cork-tipped as well as Plain. Ten for 6d. Twenty for 1/-

G.F.B. 592

A PRECARIOUS RESTING PLACE FOR AN EGG
(See letter "Fairy Terns at Rodriguez")

KILLING GAME

SIR,—I was interested in the question asked, "How to kill a wounded pheasant," and notice so far only one suggestion in reply.

I have been one of shooting parties for many years, and have witnessed some sickening methods used both by gamekeepers and guns.

I consider one of the cleanest, quickest and effective is to carefully place gun on ground, raise the bird by both legs in one hand (avoid gripping tail and other long feathers), and with the other open hand cut twice, knifewise, across the neck just back of head (similar to correct way of killing a rabbit).

There is usually no later movement or flapping by this means. I shall watch for other suggestions in your columns. Yours faithfully,

64, Hamilton Road, Felixstowe. E. E. BURT.

GREY SQUIRRELS

SIR,—I have shot down these pests here for many years, and now the leaves are off and the gales have destroyed their nests I have just bagged a dozen or more in a few days. There are plenty more to get later. I understand it is now a legal offence to "harbour" grey squirrels, and that a government official could be sent to kill them, but this law is futile and ignored, and few seem to pay any attention to it. My records show grey squirrels are more numerous this autumn than for several years. They have now got well established north of here, between Wrexham and Chester.

A posse of small birds, chattering and flitting

about in a tree, almost always indicates a squirrel or more. Two shots are generally needed, as they instinctively cling to the tree before eventually falling. Yours faithfully,

Bryn-y-Grog Hall, Marchwiel. R. STEWART-BROWN.

FAIRY TERNS AT RODRIGUEZ

SIR,—Rodriguez, a small island of 42 square miles, is one of the Mascarenhas Group, and is situated about 300 miles east of Mauritius.

It is surrounded by a coral reef which, on the eastern side is very close to the land, but which on the west and south goes out to a distance of nearly ten miles. There are several small islands inside the reef, and one, named Cocos Island, is the breeding ground of large numbers of sooty and fairy terns. This island is half a mile long by 100yds. wide.

The sooty tern builds its nest, roughly constructed of twigs, in the casaurina trees which flourish here, and hatches out its young in a normal manner, but the fairy tern, which in most parts of the world lays its egg on the ground, here lays it on a bough without any nest to hold it in place. It is often precariously balanced, and it is amazing that the bird is able to get up suddenly when frightened without knocking the egg off. In due course the chick is hatched off and remains on the same bough until it can fly. There are a lot of rabbits on this island, and it has been suggested that they eat any eggs found on the ground, thus driving the birds to nest on the boughs. At a neighbouring island, less than a quarter of a mile away, which has similar facilities in the line of suitable boughs, but no rabbits, nearly all the eggs are laid on the ground. Yours faithfully,

6, Cleveland Gardens, Hyde Park, W. 2. C. P. BARTLETT.

THE BRAMSHILL HUNT

SIR,—I have in my possession a set of four old coloured hunting prints, by F. Pollard E. Gill of the Bramshill Hunt.

These prints have never had any margin, and the above information is taken from a cutting with two illustrations of the prints taken from a paper which is stuck on the back of one of the prints, and gives the information that the two illustrations are taken from prints in the possession of Kenyon Fuller, Esq.

Can anyone give the history of this pack?

Yours faithfully,

Kingsthorpe, Northampton. A. G. SEWARD.

HOOKED THROUGH THE GILLS

SIR,—With reference to Mr. D. J. Reid's inquiry, I have often, when using a greased line and very small flies, caught a salmon with the fly through the gills, and I was under the impression that it was quite a usual occurrence. May I refer Mr. Reid to the late Mr. A. H. E. Wood's chapter on greased line fishing in the Lonsdale Library's *Salmon Fishing* (1931)? Here, on page 250, Mr. Wood says:

"I have often landed a fish and found the cast through the mouth and gills, and the hook in the side of the fish. The chewed fly had been ejected through its gills; a clear proof that my line had no drag and was slack. This fish takes somewhere down-stream of me."

Yours faithfully,

Uxmore, Checkendon, Oxfordshire. F. P. LANDON.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, are in urgent need of funds to help one of their old pensioners. Mrs. C. is aged 86 and has been a widow for some years; she lived with a sister who died suddenly whilst they were having tea together, and it was many months before the old lady recovered from the shock. Her only income is the Old Age Pension of 10/- weekly, out of which she pays 7/6 a week for rent and 2/6 a week to her landlady who cleans her room and does her shopping. The Friends of the Poor have been sending her an allowance of 7/6 weekly, which just covers food and warmth, and this help must be continued, for the poor old soul's one dread is the Institution. Please send gifts towards her fund.

IN THE CITY

By OUR CITY EDITOR

INVESTORS have found excellent investments in the securities of electric power distributing companies. Development of the industry in this country lagged behind other countries until the coming of the Central Electricity Board. The "grid" system brought about a distinct change. Expansion in the industry since the War years has been material.

During 1928, or ten years after the end of the War, the total amount of electricity generated in this country was 9,073 millions of units. By the end of 1937, the latest figures available, production had increased to 22,905 millions of units. There is every probability that expansion will continue for years to come.

Distribution of electricity both for domestic and industrial purposes is carried out by numerous public companies and municipalities. In most instances the undertakings owned by public companies are purchasable by their respective municipalities at various dates. These usually give the companies a life of 42 years.

As times goes on, the tendency will be for the whole of the business of supply to be owned by local authorities, many of them with very small areas. Various boards have been set up for the purpose of amalgamating lighting undertakings of adjacent municipalities.

There is, for instance, the London and Home Counties Joint Electricity Authorities, as well as the West Midlands, North-West Midlands and North Wales and South Cheshire. The London and Home Counties is interested in an area of nearly 1,800 square miles. This comprises the whole of the counties of London and Middlesex and parts of Herts, Essex, Kent, Surrey, Bucks and Berks. Every method possible is adopted to develop the use of electricity.

Some of the distributing companies are of fairly old standing. County of London Electric Supply began supplying London with electricity in 1895. This concern may be regarded as one of the most important in the land. It has an excellent record, which has satisfied many investors.

Quite recently the company issued new ordinary capital in £1 shares at a price of 43/6. The money is required for the further development of the company's activities. For seven years now the ordinary dividend has been 10½ per cent. The new shares will not rank for dividend for 1938, but the £1 shares which are entitled to a 1938 distribution stand around 44/-. They certainly look cheap.

In comparatively recent years investors in electric power undertakings have benefited very substantially from new capital issues. New money was usually raised by the issue of shares to shareholders on bonus terms. That policy is not so much in evidence nowadays. Shareholders rely more on regular dividends on their investments and less on scrip bonuses.

There is the case of Scottish Power Company, which for many years has paid a regular 8 per cent. ordinary dividend. In 1927 the ordinary capital was £750,000. To-day it totals £3,800,000. Most of the increase has come in the way of new issue on bonus terms. All this time the dividend h been a regular 8 per cent. The £1 shares have market price of 35/3. The yield is not much ove 4½ per cent., but this return is regarded as safe.

There is quite a selection among the electric power issues. Clyde Valley Electric £1 ordinary are usually very popular. This company serves the industrial districts around Glasgow. Recent dividends have been 8 per cent., with the shares standing around 35s. 9d.

Edmundson's Electricity Corporation £1 ordinary units are an interesting proposition. This concern controls, or is financially interested in, about 100 electricity supply undertakings. These are dotted all over the country. The concern can point to a good record.

The capital at the end of the year to March, 193[9] was increased by a 50 per cent. scrip bonus. D dend on the old capital for 1938 was 9 per Interim for this year on the larger capital has 2½ per cent. against 4 per cent. The units are va around 35/6.

THE LIGHT THAT FAILED

LAST week there was a fire at the Kingston-on-Thames power station, and as a result candles were at a premium. It must have been annoying once more to eat dinner by the light of "starry lamps and blazing cressets," but even more embarrassing for the inmates of the Chessington Zoo, who supped in outer darkness. The large carnivora, usually fed in the publicity of flood lighting, viewed their rations by hurricane lamps, while the less dignified chimpanzees grabbed their keeper's torch to assist them in their celebrations. The penguin's keeper, being without a light, slipped into the pool to join his wards—presumably on the principle that you cannot help a person in difficulty until you see things from their point of view.

New Books

THE SPIRIT OF THE SALTINGS

Life Through the Binoculars of an Ornithologist

At the Turn of the Tide. By R. PERRY. (Lindsay Drummond; 12/6.)

MR. PERRY needs no introduction to readers of the *Field*, for he has contributed to its columns on matters ornithological for the past two years. Mr. Perry is a student of bird life. By that I mean that he is a great deal more than just an observer of birds, and a very great deal more than a mere lover of birds, but that he has not as yet—and I do not think ever will—acquired that rather dusty outlook which is so prevalent amongst those who call themselves ornithologists. He has lived most of his life in wild places and he has developed that acute observation, the ability to notice and register small details, which comes to anybody whose life is spent close to wild creatures. You can feel this on every page of his book. He knows his birds and understands his birds; he knows what their calls mean; he knows, I think, what they think and what they feel. He knows and understands his birds, as I have said, but he has no desire to dissect them.

It is an attitude for which I have, indeed, much admiration. One can (there can be no doubt about it) learn a tremendous lot about birds in museums. But one can learn a very good deal more about birds in their natural surroundings. Birds are animate creatures with feelings and thoughts, and it is their feelings and their thoughts that make them the interesting creatures that they are, no less than it is the feelings and thoughts in man that make man so interesting. The skeleton in a museum, the mounted specimen in a glass case, the skin in a drawer, all are instructive; it is only in the open that one can approach the individuality that is a bird, and it is only in the open that one can really learn of birds.

It is perhaps, if you are good that way, not so very difficult to learn. It is very much more difficult to put that learning down on paper in a way that will hold the reader and at the same time instruct. Mr. Perry, as most of the people who read this review will know, possesses a fluent and descriptive pen. His pictures of bird life around our coasts are living and vital. I myself—until the last three years—spent my life in wild places and had for my daily companionship the cries of gulls and terns and the piping of all the many small waders that visit us on their way north or south. I did not realise until I read Mr. Perry's book how much I missed them, how great a portion of my being had been cut off. This book (I cannot pretend that I agree with all the author's ideas, and with some I am in definite disagreement) has produced in me a great longing for the saltings and mudflats of our coasts. It gave me a nostalgia for the good earth, and in doing so did me much good. I do not know if that is a big side of a great book—great is a horrible word, anyway, for things can be great only in comparison with things less great—but it is definitely the criterion of a good book, and I am convinced that that will not be my opinion only. You may have your own ideas about such things as the eclipse of drakes; I have. You may have your own ideas about this and that and the other thing, about migration and breeding behaviour—fostering and so forth. They may not agree with Mr. Perry's. But if you love birds I defy you to read this book without feeling the great urge to go as quickly as you can to some lovely coast line, and the illustrations, whether they be in colour or from photographs, will but increase that urge.

The Film of Memory. By SHANE LESLIE (Michael Joseph: 15/-).

Once again the Book Society have made a wise choice. Mr. Leslie has written his memories, and they are both charming and interesting. Born into a wealthy and cultured family, he has passed his days in pleasant circumstances in company of renown, culture and wit. But, above all, Mr. Leslie has watched the play of Time and epoch-making scenes: the last years of a century of magnificent pageantry and the commencement of another—none the less dramatic—changing from a sparkling social peak to the horrors of war, and that hectic recovery which has brought us to a precipice to-day.

Mr. Leslie attributes the clearness of his earliest recollections to his recent accident and subsequent concussion; certainly his telling of his youthful memories are some of the most fascinating in his story. The first home was in Ireland with the Leslie grandparents (Sir John and Lady Leslie) at their Castle Glaslough: here was a boy's Paradise, ruled over by a Master and Mistress, who were typical of a type now gone and sadly missed: feudal but loving, surrounded by servants who were friends, and holding sway in their village or over the society which poured up the great staircase of Stratford House, their London home.

It was in that setting that the little Leslies grew up to recognise their first sounds—the rooks in the tall trees and the cuckoo clock; their best friends were the servants, the gamekeeper and the welcoming villagers. Here are Irish characters in plenty. The old woman who danced at her third wedding when she was 103; the little girl who, when asked at the village school religious examination, what food St. John the Baptist had, replied: "Was it midges he was ateing?" Or the witty Derry Possmore; the Beresford cousins (who deserve a volume to themselves), and nearly every Irish name of wit and culture of those days.

Later came inevitable changes: the Fraulein had to be exchanged for schools, and in turn Ludgrove, Eton and Cambridge fill the pages: each brought new friends and experiences and a ceaseless flow of "personages."

> "Links with the past give the restless mind a halting place. Can a generation pass so quickly? Has one only to live to eighty, or even fifty, to become a mark by which others can measure the passage of historical time?"

But not only the pleasanter side of life has been experienced. He spent some little time living and working in London slums, meeting many pioneers of the missions and clubs.

> "Perhaps the most important tendency of our time for the social historians to unravel will be to show how the whole Labour movement has passed into secular hands towards Communism, in spite of the many Christian sources by which it was fed in this country."

Mr. Leslie looks at the changes to-day, the large departmental stores standing where he dined and danced with illustrious company in mansions of dignity and grace; he sees our ribbon development scarring a countryside which he loves; he despises motor cars for removing man's leg muscles, and he marvels at the levelling of all class distinctions by the modern dress.

Whether or not you regret "the good old days," you will enjoy re-living them in such good company.

Your House and Mine. By GEOFFREY BUMPHREY. (Allen & Unwin: 15/-.)

The origin of this book was in a series of broadcasts for children. Mr. Bumphrey found that they were appreciated and not only by those for whom they were intended. (I was, myself, one of those who listened as regularly as I could and always with enjoyment.) And so he has remodelled his talks and formed a book which he hopes will appeal to all readers. A modest hope: Mr. Bumphrey has written a book destined to rank as a classic. It is no good trying to criticise it—I can't: and I certainly can't review it (whatever that may mean)—I should only quote large portions of it. I can only tell you that it contains the history of homes from the cave dwelling to the flat; from the rush on the floor to steel furniture. I can only tell you that it is magnificently illustrated and charmingly written; I can only beg you to buy it.

Alone. By REAR-ADMIRAL E. BYRD. (Putnam; 7/6).

Admiral Byrd has flown over both the North and South poles, and he was the leader of two expeditions which established the Antarctic base, Little America. Obviously he knows the polar regions as well as anyone else in the world—probably he knows them better. But he is not so good at setting down what he knows, on paper in popular form. I believe he took four years to make up his mind to write this book, which is the account of his five months' stay alone at Advance Base on the Antaretic ice barrier, 123 miles south of Little America. Alone, yes: but not absolutely isolated. There was wireless—and if there had not been wireless there would not be this book. As a record of an astonishing and courageous vigil it is magnificent: as popular reading (and presumably the book is meant to appeal to a wide public) I do not think it more than fair. The fact is that we are all of us dependent upon our surroundings and our contacts with other people. Without them we would be lost. Admiral Byrd's surroundings were snow and ice, just snow and ice, and his contacts were vocal over miles and miles of space. An imaginative novelist could make something of that. This is real life.

B. V-F.

* * * *

Cecil Beaton's New York. Illustrated from drawing by the author and from photographs by the author and others. (Batsford; 10/6.)

This is really a collection of photographs with rather unimportant but very readable text alongside. The photographs are most original, and vary from lines of tenement washing, reflections in puddles, ghettoes, to cabarets, skyscrapers and a corpse in a coffin. The angles at which Mr. Beaton has seen these objects is perhaps unusual, even a little askew, but perfectly sound. They all hold attention. There is no other "guide book" to New York like this one. Sordidness is shown, wealth shines out—only drab respectability and suburbia is left out. The sketches suffer from their close proximity to the photographs, but they are alive and amusing. Mr. Beaton has produced a work in keeping with his renown, and his publishers have excelled their own excellence.

C. N.

Punter's Pie. By WILLIAM FAWCETT. (Duckworth; 5/-.)

In *Punter's Pie* Mr. Fawcett has collected for the first time in one volume many of the racy racing stories which have been bandied about club and paddock, stable and saddle-room, during recent years. Some you may not have heard before, but old or new, careful selection of subject-matter has made this a readable and amusing book.

It is not uninteresting to see how some of the new stories came to light. Following upon the idea of the book an appeal was made in the sporting press, and this brought a huge mail to the author's doorstep. From its contents we get some of the hitherto unpublished jokes in *Punter's Pie*, many of which are illustrated by Patrick Bellew. There is, too, a foreword by Tom Walls, and it is natural to find that such a team, given free rein, have run a good race.

W. G. L.

* * * *

Beware of the Dog. By MARY DUNN. (Collins; 5/-.)

Of late it has been my lot to review a number of serious books about dogs. This volume is far from serious, but in spite of, or because of, this it is eminently readable. We English are essentially a dog-loving people, and Mary Dunn makes use of this characteristic to write an exceedingly witty and amusing satire on the peculiarities and absurdities of dog owners in general.

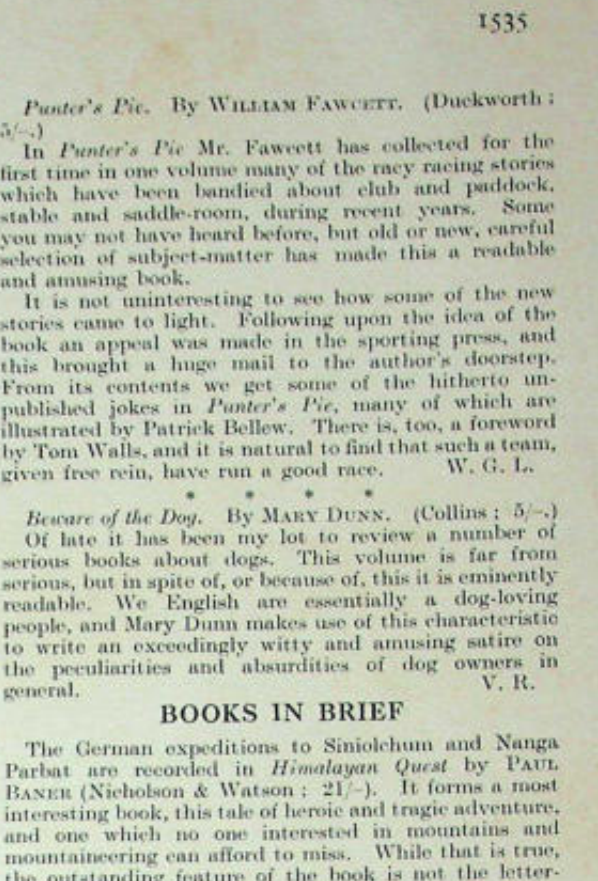
V. R.

BOOKS IN BRIEF

The German expeditions to Siniolchum and Nanga Parbat are recorded in *Himalayan Quest* by PAUL BAUER (Nicholson & Watson; 21/-). It forms a most interesting book, this tale of heroic and tragic adventure, and one which no one interested in mountains and mountaineering can afford to miss. While that is true, the outstanding feature of the book is not the letterpress (which is indeed only ordinary), but the photographs, which are amazingly beautiful and produced in a way that does infinite credit to the publishers.

A most beautifully illustrated book—the letterpress is almost non-existent, and is largely in the form of long captions—is *Sand and Sea in Arabia*, by NORMAN LEWIS (Routledge; 15/-). The photographs are really exceptional, the work of an artist who is not afraid of angles, and the book is one which you can keep and look at again and again without any fear of satiation.

Miss Frances Pitt's latest book, *Wild Animals in Britain* (Batsford; 8/6), is an excellent all-round introduction to the wild mammals which live in our woods, by our rivers and around our shores. It is necessarily short, but nothing of real value is omitted, and the photographs are excellent. A very good present for any young naturalist.



PEOPLE do appreciate Craven 'A' quality, for they give more Craven 'A' than any other cork-tipped cigarette in the whole wide world at Christmas time. Craven 'A' are so fresh, so cool, so luxuriously smooth to the throat that they are always sure of a welcome.
You can buy Craven 'A' in their smart, colourful gift boxes everywhere—six convenient sizes to choose from, each with a card on the back for your personal greetings.
Give throat-smooth smoking this Christmas — give Craven 'A'.

IN TOUCH

The Second English Trial

I HAVE often wished that I did not write about football—it is so easy to make statements and so galling to have them proved incorrect a day or two later. But better far to write and make mistakes than to be a member of a Selection Committee and have others pointing out one's errors, unforeseen at the time.

I motored down to Bridgwater full of hopes, and determined to choose my English team from those playing as if I, too, were a selector. I motored home again almost as undecided as when I went there, and with doubts as to the potential greatness of this season's English team—I do not think it will prove a vintage year.

To watch, the game was quite good fun, even if not good Rugby. There is that quality of irresponsibility about a trial which belies its name—the changes of shirts and sides at the whim of the committee, the good tempered grins of the players (so different from the actual international matches), and, on this occasion, the pardonable levity of the touch judges who, whenever the occasion warranted it, raced each other to the posts in an effort to keep warm.

So much for the game—what of the play? The score is more or less immaterial (Probables 15 points, Possibles 19 points), apart from the lesson it teaches as to the defensive qualities of the two sides. The real interest lies in the type of play produced.

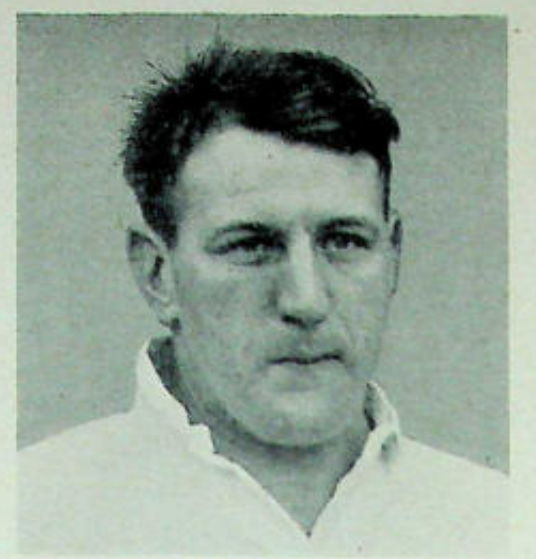
Perhaps the key to the position was in the hands of the scrum half-backs, and a good deal of food for thought was forthcoming from the play of these two individuals. R. T. Campbell (St. Mary's Hospital) who, as a new man, had taken the place of P. Cooke, was not a success. Although he was playing with T. A. Kemp (his club partner) at stand-off half, he seemed very ill at ease and his passing terribly erratic.

At half time Campbell and J. Ellis (Wakefield), his opposite number, changed shirts. It was a wise move on the part of the committee, and immediately the play began to improve. Ellis seemed to be everywhere, and played a first-rate game. Kemp's play improved with the change also, and he showed a great deal more dash than at the beginning. Neither he nor H. J. Kenyon (Coventry), however, pleased me overmuch on the form of this match, and here is a situation vacant for anyone with genuine talent.

In the three-quarter line C. B. Holmes (Manchester) put up a stout performance, and a good turn of speed, coupled with a sturdy frame, appeared quite convincing. G. E. Hancock (Birkenhead Park) played solidly, but he hardly showed signs of latent greatness. Heaton (Waterloo) I found a little unconvincing at right centre and, as a result, Obolensky (Rosslyn Park) saw less of the ball that he deserved. Heaton's kicking, too, was poor, and it was manifestly obvious that the team needed someone like Freakes, who was not playing on this occasion, to show them how to kick. Obolensky himself looked as if he wanted to run with the ball, but when it did get out to him he seemed to be well held in check and did little that was spectacular.

R. L. S. Carr (Old Cranleighans and Manchester), Obolensky's *vis-à-vis*, played a good game and provided that individual with plenty to think about, twice giving him the slip. On the other wing was R. H. Guest (Liverpool University), a player with dash and quite a flair for side-stepping. Inside him played Kemble (Harlequins), but on the whole little was seen of him, and it is possible that he may play at stand-off half in the final team.

ONE OF THE FAMOUS BROTHERS
H. F. Wheatley who packed in the front row for the Probables



A WELL-TRIED COVENTRY PLAYER
A. Wheatley who played as a second row forward for the Possibles

Harrison, who began in the match as left centre for the Possibles, pulled a muscle within the first five minutes, and his place was taken by Edwards (Birkenhead Park), who played a steady, if undistinguished, game.

The packs I thought to be rather scrappy, and all the players that should have shined seemed lost in the general rampage. R. N. Marshall (Oxford University), H. F. and A. Wheatley (Coventry) and R. J. Longland were not their usual outstanding selves, but Toft (Waterloo), who hooked very proficiently, Mycock (Harlequins), A. A. Brown (Exeter) and D. E. Teden showed plenty of brains and harnessed them with good effect.

The full back play was a little disappointing. Of the two players, G. A. Hosking (Birkenhead Park), for the Possibles, was the better man, but this was not surprising, for R. A. Gerrard (Bath), a veteran if ever there was one, had come in at the last moment to take the place of G. W. Parker, who was unfortunately involved in an accident on the eve of the match. Gerrard was gallant but slow.

By the time this is read the teams for the final trial will have been announced, and then will begin that last—I was almost going to say despairing—separation of the sheep from the goats which will culminate on January 21st in the first international match of the season, England versus Wales at Twickenham.

FROM TEE TO GREEN

VIII.—Recovery Shots

By E. R. TIPPLE

ALL golfers have to play recovery shots, because everyone makes mistakes—some more frequently than others. Watch the professionals in any tournament, and you will discover many of them attempting to hack their balls out of awkward lies. Such a sight is very comforting to the struggling player who seems to experience the oddest difficulties every time he goes on to a golf course. We all appreciate and understand that it is very easy to get into trouble during a round, but few of us find it so easy to recover satisfactorily. That is quite a different matter!

There are many players whose game is upset by the least mistake. They may accomplish several holes according to their normal standard, then one bad shot is hit, they become worried, frequently attempt the impossible, and, for the completion of the round, are in a hopeless plight. That one mistake has caused as much trouble as the throwing of a spanner into the midst of delicate machinery.

To those who suffer in this way Morrison's advice should prove very helpful. Start the game with an allowance of mistakes. Permit yourself to many errors per round according to your average performance. "When you do find yourself slipping a bit just check off one or two errors against the number you make ordinarily. By this method you should very often find yourself well ahead of the game in the matter of mistakes, all of which should encourage you to be more optimistic about the rest of the round."

There is much to be said for this idea, for it should help to preserve the individual's peace of mind and alleviate annoyance. If you set yourself, say, ten mistakes for a game and only make six, you have kept well inside your estimate and will be satisfied, perhaps to such an extent as to forget being angry over the mistakes that did occur!

When faced with a difficult recovery shot the golfer should remember that his primary task is to get out of the particular trouble. Walter Hagen proved himself an adept at extricating himself from seemingly impossible situations. He put into practice his own advice, "Do not try to do too much; there are always other shots to follow." That was one reason why he was so successful.

If the ball is lying badly in the rough it is better to use a mashie and be certain of getting back to the fairway than to use a more powerful club which might not extricate the ball at all. For such a stroke the feet should be fairly close together, and the club held shorter than usual. This will give more control. The narrow stance will help you to take the club back with an upright swing then the ball will be hit a descending blow and the club will do the rest. Although from some really bad lies a follow-through will be impossible, this should be attempted. A shot is liable to be ruined if you plan to stop the swing as the club meets the ball.

Obstacles such as trees and bushes have a demoralising effect on some players. Even if they have plenty of room to clear the top of these trees they try to help the club get the ball up sharply, and only hit it straight into the middle of the wood. Again, the upright swing is essential using a mashie niblick or even a No. 6. But if the height of the trees makes you dubious and causes you to worry whether your ball will clear them, even if hit perfectly, employ safety first tactics and play to one side. That is better than wasting more strokes.

Awkward stances give the average golfer a great deal of trouble. He dislikes hanging or up-hill lies. These strokes are more simple than many imagine. If you are standing below the level of the ball the natural tendency will be to pull the shot. Mitchell thinks that the safest way to cope with such a situation is "to take a straight-faced club—that is, a slicing club: for example, a driver instead of a brassie; a No. 2 instead of a No. 4, &c.—a quicker shot will be required." If you are standing above the level of the ball—a slicing position—you will be tempted to use a "long-handled club." This we are advised is fatal because to counteract the slice one must have loft. Therefore a spoon is better than a brassie, and so on. In this case the player should stand nearer the ball than for the other stroke, weight back on the heels. And for both it is essential to maintain your poise.

When playing downhill, that is, from a hanging lie, the tendency is to knock the ball down. As the slope will nullify the loft of the club a more lofted one than would be necessary for the required distance from a level stance is necessary. The stance should be open with the ball rather nearer the right foot than usual. Mitchell believes that one should keep the swing, particularly on the follow through, following the slope.

The left leg must remain firm throughout, and a free formed movement of the body should sustain the blow. The conditions for playing uphill are the reverse of the above. Because of the stance the weight will be forced back to the right foot, so that whatever the club used the ball will be sent high into the air. Bearing this in mind, the player should use a straight-faced club. The shifting of the weight to the right disturbs many swings in these circumstances, so the stance must be slightly in the rear "to enable the club to be swung freely up the slope." Mitchell continues: "This is a case where you should over-club somewhat and stiffen up your grip." It is worth while remembering that you will need a more powerful club to cover the distance with a slice and, conversely, not such a strong club to cover the same distance with a draw.

Sometimes we put ourselves in such peculiar places that trick shots are necessary. I remember watching Hagen playing at Porthcawl, and during the round his ball lay against a shelter. He faced the wall, hit the ball at it instead of away from it, and the ricochet stroke was a complete success. That demanded courage and confidence to a great degree. Then there was the case of the enthusiastic golfer who, playing the last hole in an important match, hit his ball on to the roof of the club-house. Obeying the old rules of playing a ball from where it lay, he fetched a ladder, climbed up, and to everyone's astonishment hacked the ball out of the gutter back to the course! Such bravery warranted victory, which I hope he achieved.

These shots, and indeed all recovery strokes, demand confidence. Confidence is a priceless asset, and care should be taken not to lose it by attempting some daring stroke when the occasion does not warrant it. You must decide when a risk is worth while. If a perfect shot with, say, a brassie, will reach the green, and the state of the match is serious, it is worth a chance, but if you could never get the distance required with the club then leave it alone and make sure of recovering with an iron or mashie following up with the subsequent stroke and a possible single putt. Lack of strategy is the cause of many disappointments that could so easily be avoided.

MISTLETOE, COMPARATIVELY EASY TO GROW, HAS LONG ASSOCIATION WITH CHRISTMAS DECORATIONS

The Country House

MISTLETOE AND THE YULE LOG

Old Customs and Christmas Rites

By ELEANOUR SINCLAIR ROHDE

FROM time immemorial Mistletoe has been associated with Holly and the Yule log for Christmas festivities. This traditional use carries us back in thought to pre-Christian times, for Mistletoe figures conspicuously in Norse mythology in the well-known legend of Baldur, and was regarded as sacred by the Druids, and the Yule log is also believed to be of Norse origin.

Mistletoe is the only parasitic shrub that is a native of this country, and possibly this accounts for the attention it attracted even in the remote past. On account of its connection with Druid rites it has always been banned by the Church for church decoration. There was formerly, however, a remarkable exception to this rule, for in York Minster it was the custom for a branch of Mistletoe to be laid on the altar. The origin of this custom is unknown.

The Druids regarded Mistletoe as so sacred that it was never allowed to fall to the ground when cut, and, even in Elizabethan times, it was never allowed to touch the ground when cut for medicinal purposes. For this we have the authority of both Gerard and William Langham. The berries in past centuries were worn enclosed in small silver boxes as amulets, and they were regarded as a valuable medicine for many ills. Sir George Colbatch, one of the most distinguished eighteenth century physicians, wrote a treatise, entitled *A Dissertation Concerning Mistletoe*, on the medicinal uses of the shrub.

Mistletoe has several curious characteristics. Unlike most plant parasites it is green and gets some of its food from the air. It is also one of the very few parasites that can both live and produce fruit when growing on another parasite, that is, on another Mistletoe. Further, it is most capricious, at least in this country, in regard to the localities in which it grows. It grows abundantly in the West Country, but not in Cornwall. It is not a native of Ireland, but was probably introduced there in very early times. It does not grow in the Isle of Man. The range of hosts on which it thrives is remarkable, at least 80 trees and shrubs, the tree on which it is rarest being the oak, with which it is most closely associated in popular imagination. It grows very commonly on the Apple, Mountain Ash, Black Italian Poplar, both the English and Wych Elm, Sycamore and common Spruce.

The origin of the custom of kissing under the Mistletoe has never been satisfactorily explained, but the custom is peculiar to this country. In the North of England, where Mistletoe is a rare native, it was formerly the custom to make a substitute for Mistletoe in the shape of two hoops covered with evergreens called the "kissing bunch."

Growing Mistletoe is comparatively easy, but it is best to sow the seed on the same host as that of the plant from which the seed was taken. Also the seed should be fully ripe, and this is usually not till early spring. Before sowing the skin should be removed, for the whole berry attracts birds, especially thrushes and blackbirds. When birds attack the seeds they pierce through the gummy substance within, and it is in the act of wiping their beaks to and fro to get rid of it that they "sow" the seed. Crush the seed on to the bark of the tree chosen, a cleft in the tree being a suitable position. It is best to choose a smooth young bark, and there is no need to make a cut in it for the gummy substance keeps the seed in position. This substance is rainproof, and consequently protects the seed until it has germinated.

Mistletoe is extremely slow growing. Sown in spring, the first tiny leaves do not appear till the following spring, in the second season each leaf stalk of the old leaves produces a pair of leaves and so on from year to year. Consequently it is possible to tell the age of any plant of Mistletoe by counting the number of joints.

There are altogether 30 species of Mistletoe, but only one, besides our native species, is a native of Europe. This is the golden-berried Mistletoe of Southern Europe, *Viscum cruciatum*. The golden berries, though lovely, lack the mysterious attraction of the milky white berries of *Viscum album*, and, unlike those of our native species, the berries of *Viscum cruciatum* fall off at the beginning of winter.

The Mistletoe is unisexual, but the male kind, having no berries, is seldom used in decorations. We still adhere to the rule laid down by King Alfred that the festival of Christmas should be kept for twelve days, and decorations are usually removed on Twelfth Night. It has always been customary to burn them. In 1719, the hall of Christ Church College, Oxford, was set on fire when the Christmas decorations were being burnt.

Nowadays we speak of the Yule log, but formerly at least two trees formed the "log." They were the Ash and the Hazel, the two sacred trees of Norse mythology. A large log of Ash was bound with Hazel and lit on Christmas Eve with due ceremony with a brand from last year's log. The log was kept burning throughout the twelve days of the festival.

SOIL TESTING—I

CAN I plant roses in this soil? Will rhododendrons grow here? Should I plant European or Japanese larch? These and other questions can only be answered after an examination of the soil, but they are questions to which many landowners will require a reply, though they may relate to no more than a small area of garden.

Those who wish can always obtain the advice of the local agricultural (for farms) or horticultural (for gardens) organiser, whose address can readily be gleaned from the clerk of the local council. For the majority surely half the joy of landownership lies in seeking to understand nature and get into tune with the countryside. What a welcome relief from city activities. What a perfect corrective for jangled nerves and sorely tried judgments. To these persons an understanding of the why and the wherefore adds greatly to the enjoyment of the countryside and the benefit obtained therefrom.

It is fortunate that with little pains the layman is able to form sound judgments on soil questions, without calling in experts or having elaborate soil analyses. He must first grasp the essential soil differences and understand their bearing on plant and tree life.

Chalk makes an excellent and porous subsoil, but a very poor top soil. If within 4in. or so of the surface then the soil is very poor and will grow little but beech and barley. Where there is a loamy soil 12in. or so deep overlying chalk, most plants and trees will not only grow but thrive.

Clay, another extreme type, is, of course, impervious to moisture and air. When broken up by cultivation and frost it is highly fertile, though always difficult to manage. Oak grows well in it, but conifers are unsuitable, with the exception of Douglas fir and one or two rarer species, which may be planted if the rainfall is over 30in. per annum.

On the other extreme is light sand, recognised by the large size of the grains and the lack of adhesion. Soil of this type, if of dark colour, is fertile, though hungry, requiring frequent and heavy manuring. In the woods oaks grow well and fast with a high proportion of heartwood, but an unfortunate tendency to shake. Sweet chestnut grows to perfection, and most conifers will also grow well.

It is the intermediate soils which present the greatest difficulty in classification. Chalk and clay are generally clearly defined and do not occur in intermediate forms, though clay is sometimes rendered less intractible by the presence of stones. Stones form the basis of some of the gravels, most of which are dry and poor and characterised by Scots pine and birch. They are easily identified.

The sandy soils vary greatly in the size of the particles, in colour, in subsoil and in condition. They are in places by streams modified by a rich, dark-coloured alluvial deposit of great fertility.

Sandy soils are acid in character, as distinct from the alkaline chalk soils and the neutral clays, and this acidity varies from the extreme of the bog to the neutrality of areas fertile and subject to past agricultural influence.

The ruling factor is usually the subsoil. If this is impervious to moisture then the water-table will be high and the soil less desirable from a plant's point of view. A high water-table is indicated by flecks of iron rust in the soil. Another type of wet soil is formed on the finely divided sands, which are really silts suffering from all the defects of the clays, but lacking their basic fertility. They are usually light in colour, very fine and clay-like in texture, but not staining the hand when rubbed.

The coarser-grained sandy loams are subject to a common tendency to leaching. That is, the loss of the colouring and food material in the surface layers, which is washed downwards and forms a hard pan a foot or so below the surface. These leached soils are grey in colour and poor in fertility, of no use save for growing Scots pine and birch.

The principal soils apart from the chalks and the clays are sand derivatives. Those influenced by alluvial deposits are very fertile and suitable for fruit growing. The deep, dark-coloured and coarse-grained sands are fertile, though hungry, but early and easy to manage. Sandy loams of finer texture, lighter colour, and overlying an impervious subsoil at 9in. deep are not very desirable owing to low initial fertility and high water-table. They are improved by the formation of a humus on the surface. Silts are poor, and the leached grey sands are very poor.

REGINALD DAVEY.

LIGHTING AND COLOUR

Reflective Properties of Wall Surfaces

By A. B. READ, A.R.C.A.

As a reaction from the confusion and fussiness of late Victorian times and its influence on furnishing in the early years of this century, there has been a fairly prolonged fashion in off-white interior decoration. There were, and still are, many good reasons for the use of simple backgrounds for normal rooms, but in London and other cities, there is perhaps not the desire or good sense in having quite so much of the furnishing fabrics and wall coverings in similar colourless materials.

Colour in fabrics and interior decoration has always been more effective when used sparingly or in contrast with neutral backgrounds and surroundings. This applies not only to colour, but to intricacy of detail in items of furnishing, and there has been a general realisation of the fact that objects of great intricacy, not only of form but of colour, look at their best in simple interiors. It has been found that highly decorated and ornate things like Venetian mirrors have a jewel-like quality against plain walls and look better in these surroundings than they did even in their original settings.

In off-white rooms good lighting is perhaps more simply and easily achieved than under any other conditions. By their general reflective qualities, light ceilings and walls acquire a luminous quality even from mediocre lighting, while rooms with coloured walls and intricacy of detail require particularly appropriate lighting if their character and appeal is not to be completely lost.

There are two main aspects of lighting and colour—first the effect of lighting from normal lamps. Second, the effect of coloured light, either from coloured lamps or through tinted glass.

In the first instance, colour under artificial lighting conditions is approximately, but not, of course exactly, the same as under normal daylight. Colour is, therefore, a part of the furnishing and decorative scheme, and not a part of the lighting. Of course, pure colours in fabrics lose considerably under even the whitest and most direct forms of electric lighting in ordinary use. The composition of the light is not that of daylight, and although corrective lamps have been invented and used for remedying this, the results are not entirely desirable.

Dealing with the second consideration—that of lighting with colour, this practice is in its infancy. On the stage and in the theatre colour lighting has played a very important and a very thrilling and exciting part. In fact, the developments of stage lighting have made possible effects and beauty which are quite impossible by any other means and have, in fact, produced quite a new theatre technique. In the home, however, theatrical methods are not easily adaptable and are not, in fact, particularly appropriate, but there must be great opportunities for the use of the simple underlying principles for the use of colour change adapted for domestic use. This does not mean that colour will be changing all the time, but it would be used to create a totally different, or a subtly different atmosphere, either for different times of the year or for particular occasions.

It is quite surprising how even with the simplest possible means, unusual and often very pleasing results can be produced. For example, in an indirect floor standard supplying general lighting for a small room, if in the top reflector a flame lamp replaces the usual pearl lamp, a room can be bathed in a warm comfortable light. When this is supplemented by other lighting fittings or floor lamps and table lamps, the warm effect of the light is not immediately apparent, and the source of it is invisible. The effect of the lighted room, however, even with this slight warmth, is very much more attractive than with the usual white light, and it is on these lines that there may be greater opportunities for introducing quiet, but nevertheless effective colour changes into home decoration. The use of coloured light does, however, introduce big problems if developed further. In the streets and on the big roads we know the disturbing effects on people's faces and on the colour of their clothes, from the use of gaseous discharge lamps of either mercury vapour or sodium, giving everything a blue or a yellow bath. If all our faces and clothes and buildings were given a coat of whitewash, the effect of this coloured light would be very beautiful, but unfortunately, owing to the varying colours on to which the light falls, many unhappy and ugly colours are produced. Under a bluey light our faces look a death-like peculiarly greeny colour, and it is almost impossible to distinguish between the colours of postage stamps or money.

Obviously, violent colour effects are quite impossible indoors, and in any case in the streets and also in the factories, these gaseous discharge lamps are having their colour corrected by the introduction of other normal lamps. However, the fact remains that even with the slightest colour in home lighting, we must be prepared for surprises in its effect on the colour of carpets furnishing fabrics, and even clothes. The effects cannot be described in detail, but obviously, blues lose their freshness and are turned more green as a result of the red and yellow in electric light. Almost all lighting is also transmitted through some intervening medium of glass or shade material, so that this effects the colour that falls on the walls, ceiling surfaces and the furniture of the room. The result of this tinting of the light is comparable to the effect that would be produced if a water-colour sketch when completely finished, were to be washed over with a tint of pale yellow or pale pink. The freshness of the original colour would disappear, although there would be a blending of the whole sketch with less harshness and contrast.

It is a curious thing that there is now a realisation that electric lighting has produced a new sense of decoration and colour when daylight has gone. The shops have begun to realise that the choosing of dress materials for wearing under these conditions, must be made under similar artificial conditions, and in many designs for large stores and dress shops daylight is being excluded at any rate for all those sections dealing with clothes for evening wear. This applies not only to clothes but to make-up, and there is no need to emphasize the special reasons for relating the use of these to the conditions under which their effect will be seen. Different colours have widely different capacities for reflecting light. Objects and colours are visible to the eye only as a result of the light that they reflect, and are less visible the more they absorb and fail to reflect light. This means that when lighting our rooms, either direct or indirectly we must be very careful to take into consideration the varying reflective properties of rough or smooth textures, light or dark tints and varying shades of colour.

To take an extreme example, if the whole of the ceiling and walls of a room could be white, including white curtains over windows, and white doors, possibly as much as 80 per cent. of the light from the lamp would be reflected and not absorbed, with the result that the room would be brilliantly lighted and very little light from the light source lost. If on the other hand, the ceiling and walls and curtains were black, then only 2 per cent. or 3 per cent. of the light would be reflected from these surfaces, so that the room would be badly lighted, and we should be losing almost all the reflected light from the light source. In between these extremes there are an infinite number of colours and tints that reflect or absorb in varying degrees and while it is not essential that wall and ceiling surfaces and fabrics, should be light, there is a great incentive to keep them so, if we regard economy of lamp wattages, and therefore of lighting costs as a reasonably important factor.

Very little is known about the psychological effects of colour. Blues and bluey greens are commonly referred to as "cold," red as exciting, green as restful and so on, but there is no information available to link this scientifically with interior decoration and lighting. Attempts have been made to link colour with music, and in the Paris Exhibition last year there was a fountain which was synchronised to change its shape and colour with music. The effect was very wonderful, but there is no formula which would enable us to introduce coloured light or coloured surfaces to suit our temperament or moods. The idea, however, of developing along these lines is not impossible, and in the same way that rooms have an atmosphere due possibly to their shape and other associations, so other atmospheres particularly suited to their purpose, may one day be produced by subtle effects of colour through the medium of electric light.

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, games, country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, January 31st. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Bream's Buildings, Chancery Lane, London, E.C. 4. 2. Only amateur photographers are eligible to compete. 3. Photographs should be sent unmounted, and no prints will be returned. 4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final. 5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6. 6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.

Entries from abroad not arriving in time will be placed in the next of the series. Do *not* send negatives.

SHOOTING TESTS FOR GUNDOGS

A Field Trial Departure

An interesting field trial meeting was held by kind permission of Sir John Leigh, Bart., M.P., at Witley Park, Godalming, on December 10th. The object of the trial was to show that it is perfectly possible to test the abilities of retrievers under normal shooting conditions.

In view of this object it is interesting to note that the course of the day's shooting was not altered in any way for the purposes of the trials, and that the final result was that the seven drives were completed in the usual time, the pick-up for the day was as good as on any other day this season, and the judges, Mr. S. Ruffett and Mr. E. Crosswell, were able to come to a final decision at the end of the sixth drive.

The shoot, which was so kindly placed at the disposal of the promoters of the meeting, was ideal in every way and afforded, among other things, a most excellent water test. Throughout the day birds flew well, and great credit must go to the head keeper, Curtis, for the way in which they were shown. The guns were Sir John Leigh, Bart., M.P., Mr. John Leigh, Mr. Eric Leigh, Captain Crispin, Colonel Rushbrooke and Mr. George Evans, M.F.H. In addition to the host, Sir John Leigh, Sir Walter Windham and Colonel H. C. Elwes kindly consented to be patrons of the meeting, and took an active part in the making of the necessary arrangements.

The system that was followed throughout the day was that which would have been employed had the dogs been the property of the guns. Three dogs were put into the line at each stand, one being allotted to two guns, and at the end of the drive each dog and handler had to gather the game which had been shot by the guns to which it was posted; when the guns moved on to the next stand the dogs went with them, and any picking-up that remained to be done was attended to by the keepering staff, though, in actual fact, the amount of work which they were called upon to do in this respect was very small. As is the usual practice, the work of the dogs and their handlers consisted of picking up the game in reasonably short time, and handlers picked up that which was lying close at hand while the dogs were sent for birds which were further afield or more difficult to reach. The judges did not specify which birds were to be retrieved, but allowed the competitors to carry out their duties in the ordinary way, and left it to their initiative and that of their dogs to decide upon a course of action.'

The rules for the trials, which were framed strictly in accordance with shooting principles, proved a strong attraction, and many owners of working gundogs were numbered among the competitors and the spectators, who included Admiral Sir Sydney and Lady Fremantle, Sir Egerton and Lady Hammond-Graeme, Vice-Admiral and Mrs. Crofton, Lady Windham and Lady Leigh. The stake was won by Mr. F. Andrews's black and white Springer spaniel dog, Dash of Chilgrove, which distinguished itself early in the day by collecting two runners in quick time at the first stand, and subsequently put up a good performance at the water, which it entered smartly and from which it retrieved well. This dog was a very good gamefinder, under perfect command, and should have a good future.

Second place was taken by Miss A. M. Bickerton's crossbred retriever, Shelsley Niky, which ran the first dog very close indeed. This dog did all that was asked of him, marked his birds well throughout the day, and was very well handled. He is a good dog with a nice delivery, and distinguished himself at the sixth drive when he was sent for a bird which had fallen at a considerable distance and on the far side of a roadway and a wire fence; he went well out to a good distance, found well, and made a good retrieve.

Third prize and the special prize for the best puppy in the stake were awarded to Sir Walter Windham's liver and white Springer spaniel bitch, Flo. Though only nine months old, Flo is shaping exceptionally well, and although leaving a little to be desired in the water test, showed herself keen and a quick mover with plenty of brains and a good delivery. Mr. F. Andrews, the owner of the winning dog, also featured again on the award card as the owner of the reserve with his golden Labrador, Dawn.

The enthusiastic reception which has been accorded to this type of trials by a large circle of supporters has led those responsible to make arrangements for another meeting of a similar nature to be held in January, and it is hoped that such meetings will now become a regular feature.

R. A. W.

"THE GREAT NEED OF THE COUNTRY TO-DAY IS A MUCH LARGER SUPPLY OF REALLY GOOD, SOUND, COMMERCIAL DAIRY COWS"

COMMERCIAL DAIRY COWS

Replenishing Attested Herds

DAIRY farmers have been telling me recently that there is quite a shortage of really good dairy cows, and that it has been very difficult to replenish herds in the ordinary commercial way, while it has been especially difficult to find cows and heifers that are deep milkers and are qualified for entry to attested herds.

I think this difficulty of replenishing attested herds could plainly be seen by most people interested in dairying, for it was obvious that with a scheme so recently started there could be no great supply of spare attested cattle in the country.

This is a matter that will right itself, given time, but it is during that time the difficulties occur.

Naturally, the effect of this has been to raise prices at such sales of attested cattle as have been held, and where cows and heifers of this classification and possessed of heavy milk yields or are bred from animals with such heavy yields in their pedigrees come under the hammer, the competition for them has been keen.

We are no longer content with medium yields; we ask for heavy yields and a clean bill of health, and that is just another difficulty at the present time. Some are beginning to question whether we have paid sufficient attention to constitution and stamina ere we developed abnormal yields, but against that opinion are those who maintain that these heavy yields are by no means abnormal, but are simply latent possibilities developed now by the science and skill of man.

Figures and records are so scanty that we are unable to tell with sufficient accuracy as to make it perfectly certain whether, in the days of our ancestors, the health of the dairy cattle was better than it is to-day.

One thing seems to be tolerably certain, and that is a cow lasted longer in the herd than she does to-day. Possibly that may have been owing to the reason that not so much was expected of her in the way of milk production, and also because cows were then fed on more or less natural foods grown on the farms themselves.

Of course, we did not hear so much about tuberculosis in cattle, nor did we know so much regarding mastitis, contagious abortion, and the like, and yet, without doubt, they must have been present in our herds.

Yet, given all these factors, the truth is driven home that our cattle lasted longer, even though they gave what to our modern eyes would seem to be but a mediocre yield. As with poultry, so with cows; we seem to make an effort to get all we can from them in the shortest possible time, and thus we are inclined to adopt a policy which one might term "milk and scrap."

I am convinced that the "clean up" of our herds will do a great deal towards lengthening the useful life of the cow in the herd, because if only tuberculosis can be eradicated many of the other ills, which now follow in the wake of that dread disease, may well be eliminated, or drastically reduced. It follows, therefore, that the future of our cattle industry, so far as the dairying branch of the industry is concerned, rests largely on the success of the attested herd scheme, and already the success of this scheme is assured as witness the fact that there are now 2,680 attested herds in Great Britain, while at the recent London Dairy Show only T.T. cattle were allowed to enter.

I can visualise the time when our great autumn sales of dairy cattle will be practically confined to animals from attested herds, or that are eligible for qualification for such herds, and although there are not yet sufficient of them in being to supply a great reserve of these cattle from which ordinary herds could be replenished, that time is steadily drawing nearer.

The great need of the country to-day is a much larger supply of really good, sound commercial dairy cows, for although no one will deny that the type and quality of the cattle on offer at the best-known markets has been greatly improved of late years, yet there is a long way to go before one can feel perfectly secure in purchasing cows in the open market that such cattle are fitted to enter the herd direct.

There are thousands of cows and heifers of the very best type and quality on offer to-day, but how many of them come from attested herds or are eligible to enter such herds? Very few, and naturally that detracts from their value to-day in the open market, although they will find their home at a price in such herds as are not attested.

Going back to what I must call the "normal" side of the business of dairying, just the commercial man who is not attested but possesses a herd of deep milking cattle of a good type, autumn is the time of year he seeks to replenish his herd at the big sales of down-calvers, or of heifers with a calf at their side. It has ever been the time for such sales, and many a farmer has made a very useful living by producing heifers of good working type, not too much got up for the occasion, but whose bags and general appearance show them to be the type the ordinary farmer needs. To-day many a man has made an extra £1 or so per head by producing and selling these heifers backed by their ancestors' milk records, and this brings us to the factor which I hold to be the start and foundation stone in all schemes of improvement in our dairy breeds, namely, Recording. All progress dates from the interest aroused by recording, for that has plainly shown us how easy it is to be deceived by appearances and hasty judgment, on the old saying: "She gives a bucket of milk each milking," and that the only means of knowing with accuracy how much milk a cow or heifer gives, and for how long she continues in milk is through recording, and again *not* by privately recording, but through the official channels.

Just a word, too, on the subject of preparing down-calving heifers for sale. While every effort should be made by correct feeding, and handling, and even massaging to produce a good udder, it is very inadvisable to "doll" a heifer up for sale. By that expression I mean to resort to such artificial aids to beauty as polishing the horns, curling the coat, or brushing it up to such an extent as to make it look as though the cattle had to be so got up to sell them, that there was probably something not quite genuine about them.

A long experience of agriculture and farmers in general has taught me that the average farmer has a great fear and hatred of anything that seems to be in the least way "artificial," or produced for his especial benefit.

DAIRY COWS ON THE EDGE OF THE CHILTERNS

So those who wish to make the most of their heifers at these autumn sales should sell them in as natural condition as possible. One more thing which is worth remembering; and that is most men like to see cattle carrying some condition. This is all very well, but I know, full well, that many a really excellent cow or heifer has not made all the money she should have fetched because it was suspected that she had been well fed up for the sale, and was thus too far forward in condition to be a really commercial proposition.

E. WALFORD LLOYD.

TRAVEL BY LAND, SEA AND AIR

PONIES ARE A GREAT PROBLEM IN THE NEW FOREST, AND, AS IS WELL ILLUSTRATED HERE, CONSTITUTE AN EVER-PRESENT DANGER BOTH TO THE MOTORIST AND TO THEMSELVES

THE AMERICAN AUTOMOBILE EXHIBITION

A Large Improvement in Body Refinements

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

LARGER crowds than ever attended the New York Motor Exhibition this year, which, as usual, was staged under the auspices of the Automobile Manufacturers' Association of America. The exhibition, as on previous occasions, was held in the Grand Central Palace of New York, and was the 39th of this series.

Other similar exhibitions, on a smaller scale, are, however, held in some of the principal cities of America during the same period for the convenience of those who are unable to travel across the continent of the United States for this purpose. The 1939 models have undoubtedly been greatly improved in a variety of ways, even though I could find no really radical alterations in design for the coming season.

Manufacturers appear to have concentrated their energies for the most part to body refinements; the interior of the coachwork is roomier and more elegant, whilst the exterior lines are even more pleasing to the eye than before. The principal exterior changes are to the front ends, most of the new models being equipped with much lower radiator grilles, which give a very neat appearance. In the case of the Ford products, the radiator itself and the opening of the bonnet has been considerably lowered, which is a great improvement, since it gives easy access to the motor. It is interesting to note that the Lincoln Zephyr was the first car to appear on the market with the low radiator grille, and, since its advent, most of the other leading American manufacturers have now followed this example.

Another point well worthy of mention is that 60 per cent. of the latest models are being fitted with the gear lever situated immediately below the steering wheel, instead of having it placed in the central position as formerly. The primary object for this change is to leave the floor boards clear, so that the driver can use either door when entering or leaving his car, and to enable three passengers to be accommodated on the front seat with comfort.

Hydraulic brakes have certainly come into their own for the 1939 season, and 94 per cent. of the cars which were on view are so equipped.

I was very interested to see that over 50 per cent. of the latest models are now fitted with some form of independent front wheel suspension, and although I think that the methods at present employed for springing the wheels independently have by no means reached perfection, yet the fact that this system of springing has become so popular signifies that considerable progress will be made in this direction in the near future. Many of the new cars are fitted with vacuum-controlled ignition, and, with the object of reducing petrol consumption, upwards of three-quarters of the models on view were equipped with a thermostatically controlled hot spot in the induction system.

For 1939 most of the windscreens are wider than they have formerly been, and the width of the screen pillars has been reduced, thus affording better vision and consequently contributing to safer driving. Interior heaters and defrosters are now being almost universally employed, some systems favouring the exhaust gases, while others use the engine cooling water for this purpose. Radio in the car is becoming very popular, and, although it is charged as an extra, the public demand is so great that over 33⅓ per cent. of new cars now being sold are so equipped; the latest sets are fitted with push-button tuning.

All Chrysler cars for 1939 are being turned out with a new safety speedometer, a jewel in the dial displaying a green light up to 30 m.p.h., an amber light from 30 to 50 m.p.h., and a red light appears on the face of the instrument from 50 m.p.h. upwards. This innovation should appeal to British motorists in particular, since it would assist them considerably when travelling in built-up areas.

Several entirely new chassis have been introduced for 1939, the most interesting example of which is the Mercury, a product of the Ford Motor Co. It has a V8 engine which gives off 95 b.h.p. with an R.A.C. rating of 32.5 h.p., and the wheelbase of the car is 116in., *i.e.*, 4in. longer than the popular 30 h.p. V8 Ford. I have often wondered why American manufacturers have not adopted the sunshine roof which has proved so popular in Great Britain over a long period of years, but at last it is being taken up and is now fitted as optional equipment to Cadillac and La Salle cars. I venture to predict that it will not be long before the demand for the sliding roof will become as great in the States as it is in our own country.

Controlled overdrive is another new feature which has been introduced by Chrysler, De Soto, Packard and Studebaker as an extra for 1939, and, although the overdrive itself is not a new idea, yet its method of control certainly is. It is now possible when using the overdrive to return to direct top at any speed desired by merely depressing the accelerator pedal further down to the floorboard and beyond the open throttle position. Previously the unit changed over automatically at whatever road speed to which it had previously been adjusted—usually in the region of 40 m.p.h.

This device, which is made by Warner Gears, is now fitted with an electrical control which closes a circuit when the accelerator pedal is fully depressed and thus brings into operation a solenoid which changes the overdrive to direct. This overdrive unit, as heretofore, provides free-wheeling when in direct top gear, but this and the overdrive can be put out of action at will by a lock which is fitted on the instrument panel.

Many steering wheels on the new cars are now fitted with three spokes instead of four, and in the case of the Mercury it only has two; the reason for this innovation is to give the driver an unrestricted view of his instruments, which in the past has so often been impeded by the fourth spoke, which is, in any case, superfluous.

I noticed that in some instances the orthodox ammeter has been replaced by an entirely new instrument which is called a battery condition indicator. This device is, to all intents and purposes, a special voltmeter with a dial marked H. N. and L. (high, normal and low), and when this is fitted the driver can tell at a glance the condition of his battery, which is more important than knowing the amount of current that is actually being generated by the dynamo.

Although on the whole prices are lower than they were last year, yet manufacturers are offering greater value for money than ever before. It is obvious they have gone to great pains in adding refinements to their new vehicles, in affording greater riding comfort, and in giving considerably more seating and luggage accommodation than in previous years, and these facts, combined with the revival of trade in America, lead one to believe that the 1939 season will be a busy one for the American motor car manufacturer.

MOTORING IN FOG

Not always does fog give warning of its approach. Sooner or later the time must come when there is nothing for it but to drive on and hope for the best. The many excellent fog lamps now on the market have made driving in fog considerably easier than it used to be.

Not all cars, unfortunately, are equipped with these lamps; and to their drivers the R.A.C. fog discs are a very welcome help. These discs, which are made of amber paper of a special type, and fitted to the headlamps, have been proved to be of great assistance in driving in fog. Since the inauguration of the scheme, the R.A.C. has supplied over half a million sets of discs free to its members. Supplies are obtainable from the R.A.C., Pall Mall, London, S.W. 1, from R.A.C. Branch Offices, or from any R.A.C. roadside telephone box.

THE FLYING POST

Practical Results of the Empire Air-Mail Scheme

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field")

THOUGH it has grown commonplace to talk of the growth of the air mail and to point to its immense significance in the world to-day, it is perhaps only during the past few weeks that the facts have presented themselves in such a form as to be readily grasped by all. This year it has devolved upon air transport to carry the whole of the Christmas first-class mail to the greater part of the Empire; and steps taken to meet this need have demonstrated clearly not only the volume of the mail now borne by air, but the large resources of men, machines and organisation it demands.

Perhaps the first indication to the general public of the new state of affairs was the announcement that this year Christmas mails, if bearing the full letter postage, need not be sent until later than in former years. In this way, the great saving of time effected by the Empire services was strikingly brought out, especially to those many people whose only correspondence overseas takes place at Christmas. Figures now available bear witness to the great volume of the traffic to be handled.

Though exact quantities cannot, of course, be known until the full statistics have been worked out, it is estimated that the total weight of mail carried by air this Christmas will amount to some 350 tons. This is by far the largest quantity ever consigned by air in the normal course of events. Of this, some 200 tons is represented by outgoing mail from Southampton, the balance being composed of incoming and intermediate consignments. These figures become, perhaps, more immediately impressive when it is said that this 200 tons represents roughly 11,000,000 letters.

Such figures are not easy to visualise, but it may serve to stress them if it is said that every machine in the Imperial Airways fleet has had to be pressed into service, including on the one hand, the older, obsolescent aircraft, such as the Heracles class, and, on the other, newcomers such as the Mercury, the upper component of the Short-Mayo composite machine. The latter, by flying non-stop with a ton of mail to Egypt in the course of a single night, proved what has been urged before in these articles: that the use of non-stop special machines for mails can prove of the utmost advantage. To facilitate this service several of the regular Empire boats were scheduled to fly without passengers, and with a minimum crew.

These glimpses of what is being done at the busiest season of the year for mails are far more impressive than any mere comparison of statistics could be in illustrating the remarkable practical progress of the Empire air-mail scheme. In view of the great activity, it is, in fact, somewhat difficult to realise that it is barely three years since the policy of consigning first-class mail by air without surcharge was decided upon.

This scheme has, indeed, brought about a complete change in the business of the air mail. The air carriage of letters dates from 1919, when the first London–Paris service was inaugurated, if one sets aside experimental services before the War, and the communications work carried out by the R.A.F. immediately following the Armistice in 1918.

In those days a heavy surcharge was made for air carriage, and, while the list of countries served by air mail was continually added to as commercial flying developed in the ensuing years, the basic policy remained the same. Surcharges gradually fell and times of transit were reduced; but the air mail itself was a separate service, which correspondents could use or ignore at their pleasure.

The Empire scheme was inaugurated in 1936 and is practically in full operation, the obvious gap being the lack of a transatlantic service to Canada. But though this was the first large-scale plan for carrying air mail without surcharge, it was not absolutely the first of its kind under British auspices. Internal air mails with the Orkneys were carried by air in 1934, and according to a statement recently made by the Assistant Secretary of the General Post Office, some 600 tons of mail are now carried regularly every year on our internal air lines.

How great has been the increase in air mail as a result of the Empire scheme is seen by figures given by the same authority. Taking the year 1935 for comparison—the last full year in which the "surcharge" system was in force universally—European destinations provided the greater proportion of the air-mail traffic to and from this country. The total weight carried, however, in the year was less than 100 tons. Australian traffic was less than half, Asiatic slightly less than European, and African less than Asiatic.

The figures for the present year show an enormous increase. Europe is again first—the "no-surcharge" system having been largely adopted on the European services—but the total has grown from less than 100 tons to a total that, at the end of the year, is expected to approximate to 1,000 tons. Australian mail has advanced to about 300 tons, Asiatic to about 450 tons, and African to about the same figure.

These developments may be regarded as the first stage of the Empire scheme—the transference of all first-class mail to the air. The second, and no less important, must be acceleration, and the official goals in view are two-and-a-half days to India, four days to South Africa, and seven days to Australia. The third stage must be the establishment of the transatlantic service. Great though the advance has been, the Empire scheme cannot be considered complete until Canada enjoys the same easy communications with the rest of the British Commonwealth as the other dominions and colonies.

TROGLODYTES OF TUNISIA

One of the Most Extravagantly Fantastic Places in Africa

THE TUNNEL WHICH LEADS TO THE SURFACE FROM A TROGLODYTE HOME

DOWN in Southern Tunisia, close to the Tripolitanian border, live some of the strangest people that inhabit the earth. They are Arab troglodytes.

We were on our way to Cairo and Jerusalem by car when we first heard about them at a small coastal town called Gabes. The mountains of Matmata, where these people lived, was only 40 miles away, and we determined to visit them, even if it took us all day.

As the car pushed upwards in the heat, the ground became steadily more stony and broken, the countryside more grim and forbidding. At one moment the tyres were gashed by beds of sharp knife-like flints; the next they swung into patches of yellow sand. The way was not only steep and rough, but very narrow—so narrow in places that there was scarcely room between the outer wheel and the edges of sheer precipices for a starved cat to pass. No people, no houses, no animals except perhaps a few stray goats were to be seen. Solitude and desolation reigned supreme.

The noise of the car's exhaust seemed to reverberate in the mountains. Still the interminable trail led on, dropping down into the beds of dried-up rivers, crossing by narrow bridges the creeks cut in the soil by smaller torrents, crawling cautiously around the rocky shoulders and skirting the brinks of chasms whose walls dropped away from our wheels thousands of feet below as we scaled the face of towering cliffs by a series of narrow shelves hewn from the solid rock.

At long last we topped a rise to find ourselves on a lofty tableland sprinkled with palms and sparsely covered with grass, with great peaks of high mountains rising in a rocky rampart all around.

It was hard to realise that underground were houses accommodating 12,000 people, who have dug their habitations out of the hillsides. These subterranean dwellings were built primarily because they were an efficient protection against marauding bands—and here live these people like moles beneath the surface of the earth.

A shaft about 30ft. square and about 30ft. deep is sunk in the soft earth. The bottom of this shaft is levelled and forms a courtyard. From this yard six or seven normal-sized rooms are excavated, some on the same level as the floor, others higher up which are reached by ropes. Finally, a tunnel is driven up from the courtyard to the surface several hundred feet in length to end amongst small hillocks, and is secured against intruders by a stout timbered door with enormous hinges of wrought iron.

SOME OF MÉDININE'S TROGLODYTE DWELLINGS

Some of these doors are said to be more than 1,000 years old.

The rooms, which have vaulted ceilings, are neat and clean and are decorated with primitive designs in vivid colours. They are warm in winter and cool in summer. The beds and furniture are cut out from the earth itself. The open courtyard serves as a stable for camels, donkeys, sheep, goats, chickens and dogs.

Midway between the eastern slopes of the Matmata plateau and the coast—close to the Tripolitanian border—is a small town called Médinine. It is one of the most extraordinary places in the world. Here, too, the inhabitants are troglodytes, if by troglodytes is meant those who creep into holes, which is the classical definition. But whereas the troglodytes of Matmata might almost be called "rabbit-men" because they live in holes under the ground, the inhabitants of Médinine might be called "bird-men" since they live in tiny mud buildings, sometimes five stories high, which are entered by a very small hole from the outside.

Médinine lies in a shallow depression in the desert, and we came upon it suddenly as we topped a rise in the yellow plain. The town consists of some 2,000 dwellings, which rise from the ground as abruptly as the chimney of a factory. The dwellings are packed together in rows and squares and lean drunkenly against each other. Seen from a distance they look like enormous sewer pipes of greyish concrete, about 10ft. in diameter, ranged in rows on the ground or stocked in tiers sometimes rising to a height of 50ft.

IN THE NARROW SOUK OF MÉDININE

The walls of enormously thick rubble and mud are windowless, each apartment only obtaining light through its tiny doorway, which is not much larger than that of a dog-kennel. The doors are of wood, very stoutly secured by an enormous sliding wooden bolt from the inside. To reach the doors of these dwellings is a very hazardous performance, for the stairs are on the outside and must be scaled on hands and knees. These rude stone steps are extremely steep and narrow, and perilously slippery in wet weather. In most cases the inhabitants have to climb up and down on small stones, hardly large enough to afford a foothold, which project from the surface of the house.

AT THE ENTRANCE OF ONE OF THE TROGLODYTE HOUSES ON THE MATMATA PLATEAU

How a troglodyte who has imbibed over freely of palm wine manages to get home at all is a mystery, for, having reached his home, he must still unbolt the door.

A locksmith would howl with laughter if he could see the "door keys" of the Médinine houses. These consist of a strip of wood about 2ft. in length, on the end of which is a flat knob, studded with four or five wooden pegs. The key is inserted through a hole in the wall close to the door, which is just large enough to admit a man's hand. It is then swung around in the region of the wooden bolt of the door until the pegs fit into corresponding holes, allowing it to be pushed back. The key has to be carried constantly by its owner who takes extravagant precautions to lock up every time he leaves his house. Presumably its weight and bulk are compensated by its handiness as a weapon.

Médinine is one of the most extravagantly fantastic places in Africa. It is like a disconnected dream, curious, exciting, incredible. A good rain might wash it away, but then good rain in this part of the world is very scarce.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

CHRISTMAS DAY IN THE LAKE DISTRICT

CAROLS, somehow, seem to demand certain accompaniments—snow and frost, starlight and lantern-light, a mingling of church bells, and above all their own simple, haunting music. That is how I feel about it, but then as a romanticist I am one of those people who believe footprints in the snow to have been unfailing provokers of sentiment ever since snow was first a white wonder in this drab-coloured world of ours. A Christmas without snow fails to excite us half as much, though your foxhunter will bless you for wishing for a heavy fall.

I look back with high pleasure to Christmas Day spent in many odd corners of England. Once I was in Keswick—a grand spot at this time of the year—and I shall never forget the way the snow-capped mountains were reflected in Derwentwater. On another occasion I tucked myself away in a little inn in the Cotswolds. I remember it snowed quite heavily that year, and here and there great branches had been torn away by the sheer weight of the snow. Robins perched and hopped on them in their perky way, and they followed me down the lane as I walked and thought of all the other ways of spending Christmas Day which people might find more pleasant—for them. But I enjoyed that holiday. Chestnuts spitting and roasting on a superb log fire, a good book and some old wine are surely the best welcome a man could want after a walk in a snow-covered countryside?

Many people, I know, have always spent their Christmas at home, but if you do decide at the last moment that you would like to go to an inn for the final holiday of the year I would advise you to make for a country hotel. That is, of course, if you are not set on gay evenings in a ballroom and crowds of people to accompany you wherever you go. If you like that sort of holiday—and many do—then you would have to go to a larger hotel.

But if you are like me, you will make for a small country inn where log fires predominate and the proprietor knows that one hot water bottle in the bed is worth six brass warming pans on the wall. It is great fun to return to the cosiness and contentment of an old lounge as the wintry sun hangs red and low on the horizon. As I write this, press arrangements being what they are with the approach of a bank holiday, we are still some days off Christmas, but I recall that little verse of Kenneth Grahame's:

> "The Time is drawing nigh when Trees
> Shall rustle in the parlour breeze;
> And pines and firs shall wave indoors,
> Scattering their needles on the floors.
> Then we shall wander neath the boughs
> That whisper in the scented house
> And, looking up for Stars, shall see
> Pink candles twinkle bashfully."

Whether you decorate a Christmas tree in your own house; whether you go down into some small country inn; or whether you go to a big hotel, I take this opportunity of wishing all readers of this column a very happy holiday.

During the past year a great many of you have written to me, and I have valued your letters. I hope during 1939 many more readers will ask me for advice if they require it. What little help I can give will be given willingly, for I do think we are getting a far greater understanding between hotel-keeper and travelling public. There is still a lot to be done if our hotels are to be brought up to date, but there is no doubt that there has been a tremendous improvement all over the country during the last few years.

Yet this evening my wish can best be summed up in a quotation from *The Joys of Christmas*:

> "Be merry all, be merry all,
> With holly dress the festive hall;
> Prepare the song, the feast, the ball,
> To welcome merry Christmas."

The writer will be pleased to answer any queries from readers concerning hotels.

English family Hotel in smallest location. Every room with running water. Opposite skating and curling rinks. Close to famous ski-ing fields, ski lifts. All inclusive 7 days from Fr. 118.— Information through the Manager and the principal travelling agencies.

MÜRREN Hotel Jungfrau
Bernese Oberland
The good Family Hotel in the centre of all Sports. Moderate Prices. Schad — Knöri.

PAYING GUESTS

EXPERIENCED SPORTSMAN.—Rough SHOOTING, coarse FISHING FREE. Proprietor's bag (one season): 1,100 snipe, besides duck, woodcock, plover, curlew, rabbits. Unsurpassed local knowledge. Golf (two links); horses available. British and Colonial recommendations. —TOM STUDDERT, Clifden, Corofin, Clare.

GENTLEFOLK, residing amidst the finest rough shooting, fishing, free; prepared TAKE GUESTS; terms 3½ gns. weekly; horses, golf, &c.; highly recommended.—EYRE STUDDERT, Cragmoher, Corofin, Clare.

GUESTS RECEIVED in comfortable Irish Country House. Very moderate terms, especially for parties or for long stays; three packs. Hiring easy and reasonable.—Apply Miss JOHNSON, Ballinapierce, Enniscorthy, Co. Wexford.

HUNTING IN IRELAND.—PAYING GUESTS welcomed in large country house near Dublin. Ward, Meath, Louth Hunts and Harriers; golf, Portmarnock; inexpensive, excellent stabling and hiring. Moderate terms.—LADY MARY CORBALLY, Rathbeale Hall, Swords, Co. Dublin.

ONE OR TWO PAYING GUESTS TAKEN; gentleman's country house, charming position Quantock Hills, Taunton five miles. Good hunting, stag and fox; stabling if desired. References required and given.—Box 3444, FIELD Newspaper, Bream's Buildings, E.C. 4

PUPILS AND SCHOOLS

BRANKSOME-HILDERS, Haslemere, Surrey. BOYS' PREPARATORY SCHOOL. Health, happiness and efficiency in perfect surroundings.—Prospectus Y.

HOME TUITION (postal)—Economic scientific Mixed Farming. Pig, Poultry, Fruit. Colonial Farming, Estate Management.—FIELDING, D.S.O., N.D.A., P.A.S.I., Agricultural Correspondence College (Sec. K), Bath.

THE ROYAL AGRICULTURAL COLLEGE, in consequence of considerable extension, has VACANCIES for October, 1939. Courses of instruction are held for future FARMERS and FARM MANAGERS, LAND OWNERS and AGENTS, ADMINISTRATORS and ADVISERS IN AGRICULTURE. There are THREE FARMS and over 3,000 ACRES OF WOODLAND for PRACTICAL INSTRUCTION. Write for Prospectus.—BURSAR, The Royal Agricultural College, Cirencester.

VACANCY FOR FARM PUPIL on large mixed FARM, all crops grown, all descriptions of stock kept, including dairy and pedigree flock Oxford Down sheep; good hunting and shooting.—HUGH STILGOE, Adderbury, Banbury, Oxon.

VACANCY FOR PUPIL.—Thousand-acre mixed FARM; world-renowned pedigree Dairy Shorthorn cattle and Oxford Down sheep; clean milk dairy, good hunting, shooting, fishing. —HOBBS & DAVIS, Kelmscott, Lechlade, Glos.

STAMPS

EARLY BRITISH COLONIALS.—Advertiser is dispersing Choice Collection, selections of picked copies on approval at one-third catalogue. Also superb used and mint modern at over half catalogue.—"F.," 6, West Hill Road, London, S.W. 18.

CHRISTMAS AND NEW YEAR
PRINCE of WALES HOTEL, Harrogate
Programme of Festivities sent on request
Free Garage. Phone, 4676. 'Grams: "Elegance."

BRIDGE

GOULASHES

Amusing Variation of Bridge

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

DO you play Goulash ? If not, at this Christmas season I recommend you to give it a trial. It is great fun and a pleasant relaxation from strict Bridge. Introduced some years ago, I think from America, it practically died out for some time, but has been revived and is, in fact, played at the Portland Club, which recently promulgated the following regulations :

(1) Goulashes can be played only when all four players have so agreed.

(2) In such cases they shall be played whenever (*a*) all four players have passed on the first round of the auction, or (*b*) a bid of " One " which has not been doubled and which does not give game is left in. Here, before the Goulash is played, the Declarer scores his contract as made, and any player entitled to claim an honour premium may do so.

(3) The player who dealt the hands then places his cards arranged in suits face downwards on the table, and the other players in rotation to the right (*i.e.*, not in the rotation of the game) do likewise, stacking them as a pack.

(4) The same player, after cutting this unshuffled pack to the player on his right hand, and after the latter has cut it back to him, deals in three rounds, five at a time in the first round, five at a time in the second round and three at a time in the third round. He then opens the new auction.

(5) In Goulashes the slam premiums are 400 and 800 when not vulnerable and 500 and 1,000 when vulnerable.

To make rule 3 quite clear Z is the dealer of the hand which has been passed. Having arranged his hand in suits he places his hand face downwards on the table, B puts his hand on top of it, followed by Y and A. The built-up pack is not shuffled, but there is a double cut as described in rule 4.

Bidding and play are as at Contract, except that the bidding suffers a " sea change." It is topsy-turvy Bridge.

Freaks abound. Singletons and voids in a suit are usual. If you have six cards of a suit you may find the other seven in one opponent's hand. Amazing things happen. You cannot, or should not, bid on the same principles as in serious Bridge.

Indeed, pre-emptive bids are not to be recommended. Contracts in No Trumps are preferable when every suit is securely guarded, because there is always a probability in a suit declaration of cross-ruffing by the opponents. Here is a hand from play :

♠ A, Q, 10, 8, 4, 3
♡ None
◇ A, K, J, 9, 6, 3, 2
♣ None

♠ None ♡ Q, J, 10, 9, 7, 6, 3 ◇ None ♣ Q, J, 9, 6, 3, 2	Y A B Z	♠ K, J, 9, 7, 6, 5 ♡ None ◇ Q, 10, 8, 7, 5, 4 ♣ 5

♠ 2
♡ A, K, 8, 5, 4, 2
◇ None
♣ A, K, 10, 8, 7, 4

Score, love all. Z opened with One Heart ; Y replied with One Spade. Z now bid Two Clubs ; Y, fairly certain that there was a game in something, bid Three Diamonds. Z, still bidding his own hand, went Three Hearts ; Y Three Spades ; and Z called Three No Trumps. This Y willingly left alone.

A led the Queen of Hearts, which Z took with the King and led the Ace and King of Clubs. He thus discovered that B was left with nothing but Spades and Diamonds. Z, therefore, made his Ace of Hearts and led his Spade, giving B the lead.

This hand illustrates how fatal it is to pre-empt in a Goulash unless your suit is long and solid. The only bid at which Y-Z can get game is No Trumps. But a good deal of conversation is necessary between them in order to arrive at it. Sometimes you will find yourself with a good hand, but with no suit long enough or solid enough to bid. In that case, in a Goulash, say One No Trump.

There is an understanding among good players, amounting almost to a convention, that if your partner has anything worth showing he will then bid his longest suit.

Many players have a prejudice against playing a Goulash hand in No Trumps. Certainly the final bid should not be No Trumps unless you know that every suit is securely guarded, otherwise a long suit may be led out against you. But often, as in the example given, the best bid is No Trumps. In a suit bid, the adverse trumps may be massed on your left, or the opponents may set up a cross ruff.

CHESS

TOURNAMENT IN HOLLAND

The following game was played in the fourth round.

(*Queen's Gambit Declined.*)

WHITE. Dr. Euwe.	BLACK. Fine.	WHITE. Dr. Euwe.	BLACK. Fine.
1. P to Q 4	P to K 3	24. B takes Q	B to Kt 5 (*s*)
2. P to Q B 4	Kt to K B 3	25. R to Q 2 (*t*)	R to K sq
3. Kt to K B 3	P to Q 4	26. B to Q 3	R to Q sq
4. B to Kt 5	P to K R 3 (*a*)	27. P to Q Kt 3	B takes Kt
5. B takes Kt (*b*)	Q takes B (*c*)	28. P takes B	B takes P (*u*)
6. Q to Kt 3 (*d*)	P to B 3	29. K to Kt 2 (*v*)	B to Kt 4
7. Q Kt to Q 2	Kt to Q 2	30. R to Q sq	B to B 5
8. P to K 4	P takes K P	31. K to B sq	P to R 5
9. Kt takes P	Q to B 5 (*e*)	32. K to Kt 2	P to K B 4
10. B to Q 3	P to K 4 (*f*)	33. K to R 3	K to B 3
11. Castles (*g*)	B to K 2	34. K to Kt 2 (*w*)	R to Q 5
12. K R to K sq	P takes P	35. K to R 3	P to K Kt 4
13. Kt takes P (*h*)	Castles	36. B to B 2	R takes R
14. B to B 2 (*i*)	Kt to B 3	37. B takes R	B to Q 3 (*x*)
15. Q R to Q sq (*j*)	P to K Kt 3	38. B to B 2	K to K 4
16. Kt tks Kt, ch (*k*)	B takes Kt	39. K to Kt 2	B to B 4
17. R to K 4	Q to B 2	40. B to Q 3	P to R 4
18. Q to K 3	K to Kt 2	41. B to B 2	P to B 5
19. P to K R 4	P to K R 4	42. B to Kt 6	K to Q 5
20. R to B 4 (*l*)	R to K sq (*m*)	43. B to B 5	K to B 6
21. Q takes R (*n*)	Q takes R (*o*)	44. B to B 8	K to Kt 7
22. Kt to B 3 (*p*)	R to Kt sq (*q*)	Resigns (*y*)	
23. Q to K 4 (*r*)	Q takes Q		

(*a*) A move of doubtful value. Either B to K 2 or Q Kt to Q 2 is, we think, to be preferred.

(*b*) 5. B to R 4 is not good because of 5. . . . B to Kt 5, ch ; 6. Kt to B 3, P takes P with a good game for Black.

(*c*) Playing to keep two Bishops, but in our opinion 5. . . . B to Kt 5, ch is preferable, *e.g.*, (1) 6. Kt to B 3, B takes Kt, ch, followed by Q takes B ; or (2) 6. Q Kt to Q 2, Q takes B, to be followed by B takes Kt, ch.

(*d*) Preventing B to Kt 5, ch, and threatening to win a pawn.

(*e*) If Q to Kt 3, then B to Q 3 followed, if Q takes P, by K to K 2.

(*f*) A novelty. In two well-known games in which this variation was played—Baerger v. Sir George Thomas (Hastings tournament, 1926) and Dr. Alekhine v. Dr. Asztalos (Keckemet tournament, 1927)—Black played B to K 2 at once.

(*g*) Offering the sacrifice of a piece, *e.g.*, 11. . . . P to K B 4 ; 12. Kt to Kt 3, P to K 5 ; 13. K R to K sq, K to Q sq (not 13. . . . B to K 2 because of 14. Kt takes K P, P takes Kt ; 15. R takes P followed by 16. Q R to K sq, and not 13. . . . Kt to B 3 because of 14. Kt to K 5) ; 14. Kt takes K P, P takes Kt ; 15. R takes P with fine attacking chances for White.

(*h*) White now threatens Kt to K B 5, in reply to which Black cannot play Q takes Kt (B 4) because of Kt to Q 6, ch.

(*i*) Played (1) to allow him to move the Knight at K 4 without having to part with the Bishop after Black's Kt to B 4 and (2) to make a way for the Queen to move along the third rank, if necessary.

(*j*) White has a very good game. In some variations he can play Kt to Kt 3 followed by Kt (Kt 3) to B 5.

(*k*) Not good. White should, instead, play 16. Q to Q B 3, threatening 17. P to K Kt 3, Q to B 2 (if Q to Kt 5, then P to B 3. If, instead, Q to Kt sq, then Kt takes P followed, if P takes Kt, by Kt takes Kt, ch, or, if Kt takes Kt, by Kt takes B, ch) ; 18. Kt to Q Kt 5 followed, if 18. . . . P takes Kt, by 19. Kt takes Kt, ch, or, if 18. . . . Kt takes Kt, by 19. Kt takes Q, Kt takes Q ; 20. P takes Kt. If (in reply to 16. Q to Q B 3) 16. . . . Kt takes Kt, then 17. R takes Kt, Q to B 2 ; 18. Q to K 3, B to Kt 4 ; 19. P to B 4, B to B 3 ; 20. P to K B 5, B to Kt 4 ; 21. Q to B 2 or, if, instead, 16. . . . R to Q sq, then 17. P to K Kt 3, Q to B 2 ; 18. Kt takes Kt, ch, B takes Kt ; 19. Kt to Kt 5. In either case White has a fine game.

(*l*) Threatening 21. R takes B, K takes R ; 22. Q to B 3 with a strong attack, Black being forced to play 22. . . . K to K 2.

(*m*) A very good move.

(*n*) If R to K 4, then B to Q 2 followed by an exchange of Rooks.

(*o*) If now White plays 22. Kt to K 6, ch, then not 22. . . . P takes Kt (because of 23. Q takes P, ch) but 22. . . . B takes Kt ; 23. Q takes R, B to Kt 5 with advantage for Black, for if (1) 24. P to B 3, then 24. . . . B takes B P, if (2) 24. R to Kt sq, then 24. . . . B to Q 5, if (3) 24. R to K B sq, then 24. . . . B to K 7, or, if (4) 24. Q takes Kt P, then 24. . . . B takes R ; 25. B takes B, Q to Q 7 ; 26. Q to Kt 3, Q to K 8, ch ; 27. K to R 2, B to K 4, ch.

(*p*) A mistake. He should play P to K Kt 3.

(*q*) A strong move, threatening to win the Queen by B to K 3.

(*r*) If, instead, 23. Kt to Kt 5 (in order to reply to R to K 3 with Kt takes B, ch), then 23. . . . R takes Kt ; 24. P takes R, R to Kt 5 ; 25. R to Q 8, R takes R ; 26. Q takes R, Q to B 8, ch ; 27. K to R 2, Q takes B ; 28. Q to B 6, ch, K to Kt sq ; 29. Q to Q 8, ch, K to R 2 and wins.

(*s*) Not R takes Kt P because of R to Kt sq followed by B takes B P.

(*t*) If P to Q Kt 3, then B takes R P. As White plays, Black can win a pawn only by parting with one of his Bishops and allowing Bishops on opposite colours.

(*u*) In spite of the Bishops being on different colours, Black has a winning game.

(*v*) Preparatory to P to B 4 followed by K to B 3. If at once 29. P to B 4, then 29. . . . R to Q 5 ; 30. P to K B 5, P to K Kt 4.

(*w*) Not K takes P because of R to R sq, mate.

(*x*) Practically immobilising all White's Queen's side pawns.

(*y*) If 45. B takes P, then 45. . . . K takes P ; 46. B takes P, K takes P followed by the advance of the Queen's Rook's pawn.

A STRONG ATTACK

The following game, from the Norwegian Championship Tournament, shows a strong attack by White.

(*Ruy Lopez.*)

WHITE. Gulbrandsen.	BLACK. Rojahn.	WHITE. Gulbrandsen.	BLACK. Rojahn.
1. P to K 4	P to K 4	14. P to B 4	Castles (K R)
2. Kt to K B 3	Kt to Q B 3	15. P to B 5 (*d*)	K R to Q sq
3. B to Kt 5	P to Q R 3	16. Q R to Q sq	B to B sq
4. B to R 4	Kt to B 3	17. B to Q 4	Q R to Kt sq
5. Castles	P to Q 3	18. Q to K Kt 3	R to K sq (*e*)
6. B tks Kt, ch (*a*)	P takes B	19. P to K 6	P takes P
7. P to Q 4	B to Kt 5 (*b*)	20. P to B 6	K R to B sq (*f*)
8. P takes P	Kt takes P	21. P to B 7, ch	K to R sq
9. P to K R 3	B takes Kt	22. R to B 4	Q to Q 3
10. Q takes B	P to Q 4	23. Q to Kt 5	R to Kt 5
11. Kt to B 3	Kt takes Kt	24. R to R 4 (*g*)	P to K 4
12. Q takes Kt	Q to Q 2 (*c*)	25. Q to B 5	Resigns (*h*)
13. B to K 3	B to K 2		

(*a*) There are several alternatives here, among them 6. P to B 3 and 6. P to Q 4. The latter move involves after 6. . . . P to Q Kt 4 ; 7. B to Kt 3, Kt takes Q P ; 8. Kt takes Kt, P takes Kt the pawn-sacrifice 9. P to Q B 3 since 9. Q takes P leads to the loss of a piece after 9. . . . P to B 4 and 10. . . . P to B 5. In a game Yates v. Rubinstein (Carlsbad tournament, 1923) the continuation after 9. P to Q B 3 was 9. . . . P takes P ; 10. Kt takes P, B to K 2 ; 11. Q to R 3, B to Kt 2 ; 12. Q to Kt 3, Castles ; 13. B to R 6, R to K sq ; 14. P to B 4 with a strong attack for White.

(*b*) A better move here is 7. . . . Kt takes P, to be followed after 8. Q to K 2 or 8. R to K sq by 8. . . . P to K B 4.

(*c*) A bad move. He should, instead, play P to Q B 4.

(*d*) White has a very promising position.

(*e*) 18. . . . P to B 4, which looks as if it would seriously inconvenience White, is refuted as follows : 19. P to K 6, P takes P (if Q to K sq or K 2, then B takes Kt P) ; 20. P takes P, Q takes P (if Q to Q 3, then B to K 5 ; or, if, instead, Q to K sq or K 2, then R to B 7) ; 21. R takes B, K takes R ; 22. B takes P, ch, K to Kt sq (if K to K sq, then R to K sq) ; 23. B to B 6, ch, K to B sq or B 2 ; 24. B to R 4 (threatening R to K sq) and wins for, if 24. . . . Q to K 6, ch, then 25. B to B 2, or, if 24. . . . R to Q 2, then 25. Q to R 8, ch.

(*f*) If 20. . . . K to R sq ; 21. P to B 7, R to K 2, then 22. Q takes P, ch and mate in two more moves. 21. . . . K R to B sq (instead of 21. . . . R to K 2) leads to the position which actually occurred after Black's 21st move.

(*g*) Threatening R takes P, ch followed by Q to R 5, mate. Black has no satisfactory reply.

(*h*) If P to Kt 3, then B takes P, ch followed, if B to Kt 2, by Q takes R, ch and Q takes Q, mate, or, if Q takes B, by Q takes Q, ch, Q to K 8, ch and R takes R. If (instead of P to Kt 3) P to R 3, then B takes P followed, after Q to B 4, ch, by Q R to Q 4, the threat of R takes P, mate then being decisive.

PROBLEM No. 3993

By V. FÜHRER.*

WHITE (9 pieces) : King at Q R 7, Queen at K Kt 3, Rooks at Q R 2 and Q B 5, Bishops at Q Kt sq and K Kt 5, Knights at K B sq and Q Kt 2, Pawn at Q R 3.

BLACK (8 pieces) : King at Q Kt 6, Queen at K B 6, Rook at K R 4, Bishop at K 8, Knights at K R 5 and K B 7, Pawns at K R 2 and K 4.

White to play and mate in two moves.

* *El Ajedrez Espanol*, 1935.

SOLUTION OF PROBLEM No. 3992

1. K to B 7, any move ; 2. R or B mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 496

ACROSS.—1, Bomb-proof shelters for fellow defendants ? 5, The explorer who kept the seaman in bed. 8, Giant strides towards mutual protection. 10, The dimensions of the schoolboy's headgear ? 11, Safe way of confusing an employer. 12, A peach of a songstress. 13, Such a record is cheerless when on so late ! 16, Does the hounder intend an empty sort of victory ? 17, The object of a Scandinavian legislative body. 18, He has his destiny as a slave. 20, One-third of a rosary. 22, 45-inch letters. 23, Periodical producer of music. 24, His wife gave Osiris no alternative. 28, Mohammedan confession to being a ship's officer. 29, Tender hue. 30, Another letter and this knotty point would be without particles of dirt. 31, An Irish competitor for Nell Gwynn ?

DOWN.—1, When these horses go off it may be with a bang. 2, Boxed. 3, She was invited into the garden. 4, This instrument is only at the bottom of the bag. 5, A headland extremely important in 10. 6, Putting water on the safer side of the boat. 7, Biting insect known to Tommy Atkins ? 9, Forbidding feature of the sailor's life. 14, Somerset town, Kentish author. 15, Where a fellow about 19 lives in Italy. 16, Colne rain produces this small tree. 18, Where they talk 50 per cent. double-Dutch. 19, Explosive feature of foot or pedometer. 20, " Blow, winds, and —— your cheeks ! rage ! blow ! " (*King Lear*). 21, A period of five years. 25, The seat of a French surrender. 26, Trees with unusually prominent barks ? 27, The South African antelopes have been made comfortable.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division 1. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Athletics

The Next Olympiad.—Although Finland was only recently awarded the next Olympiad, building operations on the Helsinki Stadium, where the athletic contests take place, were commenced as long ago as 1934. The first athletic contests were held there in June this year. At the present time the Stadium holds only 30,000 people, but work in connection with its enlargement has already commenced, and, by August, 1939, it will hold 63,000 people. The oval running track is of red powdered brick, and has a length of 400 metres to the lap. Its breadth, which is 8.5 metres, permits of seven runners participating in the shorter distance races at one and the same time. The straight sides of the track are each 96 metres long. The arena faces north and south, the grand stand being on the western side.—*L. C., Birmingham.*

Canoeing

Danish Canoe Association.—The first kayak club in Denmark was founded in 1917 at Klampenborg, near Copenhagen, but it was not until six years later that the Danish Kayak and Canoe Association was founded. The association was dissolved in 1925 and reorganised later in the same year under the title of "Dansk Forening for Kajaksport," this title being changed to "Dansk Kajak-Forbund" on April 18th, 1929.—*P. T., Exmouth.*

Cricket

Alan Melville.—Your suggestion that Alan Melville is well versed in the art of captaincy and will be a most capable leader in the approaching Tests in South Africa is well founded. He captained Oxford University for the seasons 1931 and 1932, and, of course, has often led Sussex in the County Championship. As to further details of his earlier cricketing career up to the time he qualified for Sussex, we hope the following summary will prove adequate. He was born on May 19th, 1910, in South Africa, and went to Michaelhouse. He obtained his "Blue" at Oxford in 1930 as a promising batsman and a useful bowler, and finished the season with an average of 32.83 with a top score of 118 against Yorkshire. The following year found him second in the 'Varsity averages with 35.05 per innings and a top score of 87, while the year after that his average was 32.30 with highest innings, 113, against the Free Foresters. It was in this season that he gained some success with the ball, taking 24 wickets at a cost of 19.25 each and first place in the 'Varsity bowling averages. In his fourth and last year at Oxford we remember him making a glorious 127 against Surrey, and finished that season with an average of 28.99 and second in the bowling averages. Melville never had much luck or success in any of the 'Varsity matches in which he took part, and the highest score he managed to obtain was 47. After qualifying for Sussex, by residence, in 1934, he has continued to represent the county on and off ever since. As can be seen from his record, none of these mammoth scores can be expected of him, but we speak from experience when we say that when Melville really starts to see the ball, he ranks amongst our most attractive players.—*R. E. C., Beverley.*

Garden

Fruits Sent for Identification.—Black fruits are those of black nightshade (*Solanum nigrum*); red fruits are those of black bryony (*Tamus communis*).—*H. B., Norley.*

Kennel

Inoculation Against Distemper.—The few cases that go wrong are no argument against the desirability of inoculating dogs against distemper, so it would be well to have this dog inoculated before he becomes exposed to infection.—*G. M., Ambleside.*

Salukis.—We know of no monograph upon this breed, though the standard works contain chapters about its appearance and history. In *Sporting Dogs* (by A. Croxton Smith; *Country Life*; 12/6) there is a fairly comprehensive description of the breed.—*B. A. F., Newcastle-on-Tyne.*

Hard Mouths.—The question of how to deal with a dog that has a hard mouth has always been the great concern of trainers, and it is not easy to advise you how to combat the evil. One authority wrote that the only cure of which he knew was an ounce of shot well placed. In his opinion, mouths were more in the hands of the breeder than the breaker, although if one wanted to keep dog's mouths at their best they should practise the quick return and give them less time to play with the game, and should never allow a dog to carry game that had been badly smashed. When you are teaching the dog to retrieve an object, never snatch it from him and incite a tug-of-war, but open the mouth gently.—*G. F. W., Canterbury.*

Miscellaneous

Game Research Bureau.—The Bureau, which is a University institution, carries out investigations on various animal population problems of scientific and economic interest, amongst which (thanks to the continued support and co-operation of shooting men and estate owners) game research occupies an important place. The Bureau also maintains a special library and acts as a world clearing-house for information on these problems. Up to the end of 1937 the Bureau's game research was largely supported by the ammunition branch of the Imperial Chemical Industries. When Mr. A. D. Middleton left the staff of the Bureau to join the Game research unit of I.C.I., a division of work on game research problems was mutually arranged. He continues his special partridge census studies on certain estates, while the Bureau is doing the Game Survey and the Rabbit Research. The work of the two organisations, although independently run, is being co-ordinated in this way to avoid overlapping.—*D. C., Wimbledon.*

John Peel.—Your supposition that the most famous of all hunting songs was written in the 18th century is not well founded, as it is generally recognised as having been written *circa* 1825 by John Woodcock Graves. The exact words of the chorus run as follows:

"'Twas the sound of his horn called me
from my bed,
And the cry of his hounds has me oft-
times led,
For Peel's view-hollo would awaken the
dead
Or a fox from his lair in the morning."

The last verse is:

"Then here's to John Peel with my heart
and soul,
Come fill—fill to him another strong bowl:
And we'll follow John Peel through fair
and through foul
While we're waked by his horn in the
morning."—*L. G. W., Cumberland.*

Naturalist

Flies Identified.—The flies are blue-bottles or blow-flies. The larvæ (gentles) feed on decaying or fresh animal matter. Unless the pots of chrysanthemums contain much manure in the soil, the appearance of so many is unaccountable. It is an outdoor species, but enters buildings for shelter or in search of matter to lay its eggs upon.—*R. S. K. E., Crowborough.*

Coccidiosis of Rodents.—The death of a red squirrel was due to the contagious germ infection of the bowels known as coccidiosis. This animal was a frequent visitor of our correspondent's bird table, and, for a few days before its death, it had been lame. Loss of power in the limbs was reported by an owner of a hutch rabbit as the most noticeable symptom. We also received a wild rabbit which had died of the disease. The affected animals rapidly lose flesh, despite the retention of their appetites, and frequently diarrhœa is observed in the advanced stages of the disease. Regular readers of this column will have noted the frequency of our reports on this disease among wild and penned or aviary birds. Among the animals the disease is very prevalent in rabbits and wild rodents; and it is a frequent cause of loss to breeders of fur-bearing animals, sheep, cattle and dogs. Young stock go down with the disease more rapidly; the mature animal is more resistant, and, provided it can feed, it will maintain its strength for a long time. Some of the infected old stock persist as "carriers," *i.e.*, they continue to excrete the germs in their dung, though showing no evidence of ill-health. These "carriers" keep the disease going and convey the germ to the susceptible youngsters during the summer and autumn. Another reason for the persistence of the disease on an infected premises is the power of the germs of keeping alive on the ground for long periods up to 12 to 24 months.—*D. E. E., Surrey; H., Lisliithgow; H. S. D., Staffs.*

Shooting

Gun Licence.—The answer to the question which you ask is covered by the Gun Licence Act of 1870. By virtue of that Act, a gun is defined to include a firearm of any description and air-gun or any other kind of gun from which any shot, bullet or any missile can be discharged. By section 8 of the same Act, where two or more persons carry a gun in parts, each person is considered to carry a gun; however, if you simply take a gun barrel to a gunmaker to be repaired, we do not think you fall under any provision of the Act, and therefore you do not need a gun licence in these circumstances.—*J. S., Newhall.*

Ground Game Act.—The answers to the questions you ask are as follows: Game Licences Act, 1860, imposes a penalty of £20 on every person who shall take, kill or pursue, or assist in so doing (or uses any dog, gun, net, &c.) any game, or any woodcock, . . . or any coney . . . without a proper licence. (1) Among the *exceptions* . . . taking or destroying conies by the proprietor of a warren on enclosed ground or by tenant of land or by his direction or permission. (2) Among the *exemptions* . . . any person assisting in taking or killing any game . . . coney . . . in the country or preserves and for the use of another person who shall have obtained in his own right a Licence to kill game and who shall then and there use his own dog, gun, net, &c. . . . The unlicensed person must not use his own or any borrowed dog. (3) The want of a Game Licence is an offence against the revenue and not against the Game Laws, and each is punishable separately. (4) Under section 10 of the Act, a person discovered doing any act which requires a Game Licence who shall refuse to give his name to the owner, landlord, lessee, or occupier of the land, or to any person who shall have taken out a Game Licence shall commit an offence. A selected officer of the County Council has the power formerly exercised by officers of the Inland Revenue, to demand production of Game Licences, &c. (The transfer took place on January 1st, 1909, under the Finance Act, 1908.) (5) The offence would consist in the sending in of a dog. Sending in a dog is not an entry under some Acts—*e.g.*, under the Game Act, 1831. (6) A stray dog can be destroyed if there is a real belief that the destruction was necessary for the protection of property. (7) When a person is found by day or by night on land in pursuit of game, and shall have in his possession any game which shall appear to have been recently killed, any person having the right to kill game on such land, occupier or gamekeeper may demand the game, if not given up may seize it. (Game Act, 1831, sect. 36.) A constable may search a person (or conveyance) if he has good cause to suspect him of having game in his possession and of coming from any land where he shall have been in search of game.—*W. A. S., Kensington.*

Cartridge Tests

.22 Rifles. There is a mistake in the figures you refer to. Evidently owing to a misunderstanding both bullets have been quoted as 40 grains, whereas the ballistics of the high velocity cartridge refer to a 30 grain bullet. The figures for a 40 grain bullet should read: 1,400 F.S. Velocity and 174 F. lbs. Energy. A rifle chambered for the .22 Long rifle cartridge cannot possibly be used for a .22 Hornet, the former being a rim fire non-taper case .620in. long and the latter a central fire bottle-necked case 1.43in. long.—*T.R.W., Crewe.*

Although we should not classify your cartridges as the "best in the world," the results obtained from test prove they are reliable and that you need have no fear of injuring your gun. We, however, on account of their short length, recommend you to well clean and oil the front of the chambers after firing. Velocity averaged 1,020ft. per second with recoil which would be considered heavy in a gun under 6¼lb. weight, patterns were even and averaged 73 per cent. (30in. circle 40yds. choke barred).—*A., London.*

Travel

Ski Schools in the Lauterbrunnen Valley.—We should strongly advise you to go either to Wengen or Scheidegg. The ski school at Wengen is one of the best in all Switzerland, and the slopes are reached in about 20 minutes from Wengen by mountain railway. There are some seven successive classes, all presided over by an expert. The Palace Hotel is one of the international class, and of the smaller ones we should recommend the Metropole. The school at Scheidegg, too, is excellent, and the hotel is the "des Alpes." There are many fairly easy runs in the district, and for experts there is the prospect of ski-ing on the Jungfraujoch and staying in the highest hotel in Europe. It is not absolutely necessary to buy boots, ski and sticks, but we should strongly advise you to buy the boots as uncomfortable boots can completely ruin your ski-ing.—*N.R., Bristol.*

Travel in Morocco.—You will get an excellent idea of Morocco if you start in Tangier, and stay either at the El Minza or the Villa de France. The Cecil is good, but is down by the sea and has neither such good air or such an extensive view. Next you might go to Ouezzane, the most sacred place in Morocco, where the hotel is the Grand. You should stay for some time in Fez, possibly at the Grand, and then go on to Meknes. The only hotel we know there is the Excelsior, which is good but suffers from the irritating custom of having the restaurant some way up the street. If you do not wish actually to cross the Atlas you should stay at the Hotel du Panorama, in Azrou, where you will get an idea of Atlas scenery. You could return to Tangier via Casablanca and Rabat. The best way to travel is by bus. There are several grades, but the best—the C.T.M.—is absolutely necessary.—*C. N., Hastings.*

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage, Home and Abroad.

	Inland. £ s. d.	*Canada.* £ s. d.	*Elsewhere abroad.* £ s. d.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

SOUTH AFRICA'S CAPTAIN

Alan Melville is well known to cricketers in this country as the captain of Oxford University for 1931 and 1932 and as a brilliant first-wicket batsman for Sussex. His selection to captain the South African cricket team in all five Test matches against England was a popular one. Besides having considerable experience in the art of leadership, through frequent captaincy of Sussex in the County Championship and also of the Transvaal side, he is usually a run-scorer.

NEW YEAR

IT was formerly the custom to make plans and resolutions on New Year's Day. People resolved, in a comfortable and composed frame of mind, that in the coming year they would do this, see that, and achieve the other. Yet how many people, as they look into the coming year, have the strength of mind necessary to plan anything? There seem to be two alternatives—either to disregard the state of the world entirely and resolve to carry on happily until something happens to end it all, or sensibly to adjust one's way of life to the situation. We believe the latter to be the course which we should take.

An acute philosopher once observed that though there was really no such thing as progress it was necessary to believe in it if we were to remain, at all events, stationary. It is, perhaps, unsatisfactory to found one's attitude to the coming year on a piece of cynicism, and, indeed, it is not necessary wholly to do so. Our civilisation is an improvement on its forerunners only in its treatment of women and animals, and there are people who maintain that having presented to world history such figures as Bach and Shakespeare, Spinoza and Michelangelo, our civilisation has achieved its purpose and must sink gradually to rest.

We ourselves refuse to believe in this statement viewed as a natural law. It is true that many features of our times—the rise of demagogues, the condition of art and music, the decay of civic virtue—have preceded the end of every previous civilisation. Yet we have the advantage of being acquainted with the world's history, and it is our belief that this sad record of human stupidity will prevent its recurrence. Was it not Dr. Inge who observed that if European civilisation could not preserve itself it thoroughly deserved to crash?

Since it is by no means certain and irrevocable that the end is in sight, that wars are ahead and that there is really no hope for anything, it is a great pity that so many people should, by their attitude and conversation, make it considerably easier for disaster to occur. It has become the custom for a vast number of men and women to act and talk as though they awaited an imminent end, and to find an excuse in this behaviour for ceasing to be of any service to the few forces that are making for peace and order.

The curious thing is that they do not really believe the end is coming at all. Theirs is a pose directed by the wish to appear to have the latest news, and in the light of the last twenty years that is considered to be necessarily bad news. It is possibly too much to hope that this attitude will be universally given up in 1939, yet if there is to be any improvement at all it is quite necessary that this apparent acceptance of defeat should be abandoned. Such people should take the words of Dr. Johnson as their motto: "You may *talk* in this manner; it is a mode of talking in society: but don't *think* foolishly."

It is difficult to see what positive assistance to better things may be made by those who hold no public office and sway no wide opinion. Agriculture, for example, has been steadily refused its place in those defences considered necessary to peace; allotment holders have been deprived of their land, and with it their opportunity to make their own contribution. But we think that the most useful attitude to adopt in the year that is just beginning is to pursue what work or occupation we have and to respond quietly to such demands as may be made for national defence. Above all, we must never believe that "we are here as on a darkling plain," for it is not in England's tradition to submit before the occasion.

THE WOUNDED HOUND

THE case which was recently brought by the R.S.P.C.A. against a poultry farmer who had wounded a hound belonging to the Axe Vale Harriers, brings into prominence a question which is always latent. Both parties felt aggrieved. The farmer had expressed his unwillingness for hounds to cross his land, and the harriers say they had done their best to avoid doing so. Yet, on this occasion, a fox headed for the poultry farm, it was impossible for hounds to be stopped in time, and the farmer took the extreme step of shooting at the hound, which he hit in the right hind leg. Although the ethics of the matter may be called into question, this kind of thing does no good to farmers or to hunting. The two can be, and usually are, of mutual benefit, and it is a thousand pities when an incident of this kind disturbs the harmony. We would reinforce most earnestly the appeal which we made last week to hunting people and to farmers to let no opportunity pass of consolidating their undoubted mutual interests, and to avoid by every means incidents upon which the general public are unable to form a proper opinion.

A KINDLY NOTE

Appreciation is a rare thing; blame is more often dealt out as an incentive to better effort. It is therefore an encouraging finish to the year to be able to quote from a very kindly passage in Daphne du Maurier's novel *Rebecca*. She writes: "Sometimes old copies of the *Field* come my way, and I am transported from this indifferent island to the realities of an English spring. I read of chalk streams, of the mayfly, of sorrel growing in green meadows, of rooks circling above the woods as they used to do at Manderley. The smell of wet earth comes to me from those thumbed and tattered pages, the sour tang of moorland peat, the feel of soggy moss spattered white in places by a heron's droppings." We wish the author the success with a novel displaying a love of the countryside that she has had as a biographer.

THE SIGN OF THE GARLAND

"Good wine needs no bush," we know, but an ale garland may be taken as a sign of good ale. A bunch of flowers or foliage on an ale pole, wrote an old author, "doth but signify there is good ale in the house." Stakes and garlands disappeared from inns, one reason being that people had learned to read. They were subject to legislation, being restricted by law to 7 feet in 1375. They impeded riders, and in 1669 their excessive length and cumbrous signs, making the thoroughfares close in daytime and preventing the light from lamps spreading properly at night, again brought the law to bear on them. A catastrophe spelled their doom when, in 1765, an enormous sign in Fleet Street pulled down the front of an inn and was responsible for the death of two girls, the King's jeweller and a cobbler. Now less lethal ale garlands have been revived, and 500 inns, mostly in midland and eastern counties, sport them at Christmas time, bank holidays, and local festive occasions. Messrs. Flower, tenants of the old galleried George Inn, Borough High Street, London, last year displayed the first garland seen in this country for many a day, and four Ale Conners of the City of London and a number of guests recently celebrated the reintroduction of the custom and made acquaintance with some fine old possets.

UNNECESSARY EVILS

December has given us some good specimens of the English climate; warmth, rain, cold winds, hard frost and snow. It has also provided the catastrophe of burst water pipes for many householders. And it may again be asked why we have to suffer this evil without adequate reason. Architects plan and builders build, but do not seem to bother much about the plumber, electrician or the gasfitter. Water tanks are put in the most exposed places, and pipes placed in inaccessible positions, often without wrapping or any protection against frost. Unless builders and plumbers are in league with the weather it is quite easy, when designing a house, to ensure that pipes shall be adequately safeguarded. Some genius, too, is required to invent a removable wainscoting or floorboard so that a room has not to be ripped to pieces when a new electric point is desired or a gas stove has to be fitted. Intelligent co-operation between the builder and these allied trades is badly needed.

FISHING IN THE NEW YEAR

Less than a fortnight and the earliest Scottish rivers open their rod-fishing season—indeed, if an angler crosses to Ireland he can begin on New Year's Day. But, after all, who wants to begin on the first day of a New Year? Even the ten days or so which Scottish by-laws allow their very earliest rodsmen is none too much to get one's liver in order after the Christmas festivities, and to collect wits, tackle and information before going North. Information in particular will be eagerly sought this year, and will be difficult to get after the turbulent autumn when few reliable observations of winter arrivals can have been made. For some years past salmon have sadly neglected to burn the candle at both ends. The very early-running fish have loitered in the sea; and the late runners have come in before their time, or have not come at all, as you like to consider it. Salmon runs show more tendency to swing than to jump, but at least one may legitimately hope that 1938 marked the very bottom position of the pendulum.

HUNTSMAN TIME

Already the season is halfway through;
It's "ring out the old and ring in the new,"
For Time is a Hunt-sman who waits for none,
He's off and away on his non-stop run,
And holding his hounds to a forward cast,
With never a thought for the pounded Past;
No "tally-ho back" to the years gone by,
No check for the old, as the seasons fly.
It's cram down your hat and away like hell,
And deaden your ears to the tolling bell
That rings out the old, for the new is here.
So "ring in the new." It's another Year.

EDRIC ROBERTS.

A COUNTRYMAN'S JOURNAL

FROM the wild, bleak, scarred plateau, fissured with narrow gullies, of Purbeck limestone near Worth Matravers, I could see a series of "linces" or "lynchets," or cultivation terraces on the steep flanks of more than one of the sea-pounded promontories between St. Aldhelm's Head and Peveril Point. Nobody takes any notice of them, and yet they are significant enough to upset an archæological theory which has held the field since the eighteenth century. The man whose name is chiefly associated with this theory is Henry Seebohm (*The English Village Community*, 1883), but it has been supported in our day by Mr. O. G. S. Crawford with an amount of dogmatic self-assurance and high-handed contempt for anybody who ventured to disagree with him only possible in the scientific world. Years ago I was one of those heretics who had the temerity to question this great canon of orthodoxy, and I was in consequence reviled as a shallow ignorant amateur, a cheap publicist, who had had the impertinence to trespass upon holy ground. A Bull was launched against me and I was excommunicated.

And now what is this theory? In very numerous areas on the chalk downs, but also among the oolite ranges of Gloucestershire, in Wales, Yorkshire, the Lake District, and on yet other rock-formations not covered by these regions, the hillsides are terraced into broad level baulks and almost perpendicular (often quite) sides, making giants' stairways whose enigma has exercised many a curious mind. Seebohm's idea was that these lynchets were made by the ploughs of the Anglo-Saxon villagers under the old open-field system. When the co-operative plough-teams of the village community reached the foot of a hill, they went on ploughing across the hill-slope itself, travelling only one way, and the terraces were formed by the natural tendency of the soil to fall downhill. Thus the hillside terrace was an adaptation of the strips with baulks between of the pre-Conquest villagers of the plains. The earlier theorists said: "It may be so"; the later dogmatists swore, "It must be so."

Yet, as I stood and looked at those mighty terraces that bit into the stormy thighs of the Purbeck headlands, I had the audacity to be as certain as a man may be without sacrificing all modesty that it could not be so. What a task for the ploughs! In *The Open Fields* (1938), Professor C. S. Orwin shows that even on the chalk, the depths of the terraces being sometimes 20ft., the plough-teams would have had to have ploughed 10ft. in order to form the terrace, 10ft. through "clunch" (chalk blocks) for ploughs that even on the most yielding soils only drove their shares to the depth of a few inches. Since there was no land shortage, what purpose could have been served in engaging the wooden ploughs upon such superfluously Herculean labour? But the argument applies far more shatteringly to the Purbeck limestone. It is some of the hardest rock in all England, incomparably harder than the toughest chalk, and the top-spit of soil is never anywhere deeper—as the mining works reveal—than a very few inches.

Conceive ploughing up several feet of solid rock with a wooden turn-furrow! Not 80 oxen could have done it, much less eight. The coulter would have been turned in a yard and the beam would have split in less than 5yds. Professor Orwin gives several other conclusive reasons (there were no baulks among the valley strips, for instance, to be imitated on the hillside) for disposing of the connection between Saxon farming and terrace cultivation. But I confess I should like to bring a party of archæologists, headed by Mr. Crawford, to have a look at those terraces by Worth Matravers. Science has many virtues, but humility is not one of them, and Humility Point would not be a bad name for the headland of the Purbeck terraces.

Who did build these wonderful terraces? There can be only two hypotheses. Either the Bronze Age people, who so thickly populated Southern Dorset, hacked them out with bronze celts or deer-horn picks or the Romano-British—King Arthur's men—dug them to feed themselves when beleaguered on the hills by the Saxons. The walled *Polis* was reoccupied in King Arthur's day and the cultivation system of the pre-Roman Celts—little parallelograms of banked fields—is quite different either from that of the Saxons or of the terrace-makers. One thing is certain—until this profound mystery is approached with an open and a humble mind, it will never be solved.

H. J. MASSINGHAM.

WITHOUT COMMENT

Sent by a reader from a provincial paper's account of a day's hunting:

"The reassuring note of hounds, followed by the view-holloa and a trill on the trumpet, preceded the break away . . . it was there among the cabbages that the huntsman upheld and declared the unanimous verdict of hounds gone to ground."

"Handling" a bloodhound in field trials

SPORT WITH BLOODHOUNDS

"A Bloodhound Line Has Many Advantages Over the Drag Hunt"

A BLOODHOUND owner may show his hounds, "handle" them in field trials, or hunt them as a pack. If he wishes, there is another form of activity open to him; he may enter them to game, although, once he has done this, they will never again be steady on their legitimate quarry—man.

With the showing I am not greatly concerned, although bloodhound classes are included in the "big breeds" of most leading dog shows. Personally, I should like to see a class for *working* bloodhounds at Peterborough, each entry to be the possessor of a field trial certificate. Neither is there space here to discuss field trials. In pre-War days the Bloodhound Hunt Club held regular meetings on Salisbury Plain, when three different packs were ridden to by large fields. This hunt club has ceased to exist, but there are still a few packs of bloodhounds in existence.

To the true lover of hound-work, a bloodhound line has many advantages over the draghunt in which the artificial scent is often so strong that any cur dog could follow it. At the same time, the bloodhound line has the one quality which recommends a drag hunt in that the quarry, being human, can be instructed where to go and so keep off ground which it is desirable to avoid. The quarry should have no "gingering" whatever, but be followed "clean boot." Given 40 minutes' "law" on an average scenting day, this results in a hunt which should delight even some of the hardest riders and which will surprise those who have had no previous experience of bloodhounds' pace. So many people think of these hounds as slow, lumbering great brutes who tie to the line and may be followed at a walk. They certainly possess "lumber," which, together with "wrinkle," is encouraged by the shows. Several bloodhound huntsmen are agreed that these things invariably go with a "cold nose" (ability to hunt a very cold line) as well as "staunchness" (freedom from change).

Were I breeding a pack solely to provide sport for mounted followers I would aim at lighter bone and less wrinkle. I have seen examples of this type which were fast and keen on a hot line, but unreliable on a cold one. While this put them out of field trials, it could have few disadvantages when the hound was being used for fast pack work.

Bloodhounds, when running, are inclined to string out, each hound making sure of the line for itself, unless early work with a pack has taught it to go to cry. The drive of a good bloodhound is surprising when it is remembered that he never gets blood, as is the way he flings himself in wide casts when at fault.

The pace of a hunt may, to a certain extent, be regulated by the amount of "law" given, and anything from 90 minutes to two hours will provide a very useful outing for the foot-follower, although, under good scenting conditions, any but the best runners would be well advised to make discreet inquiries about the quarry's route.

Lieutenant-Colonel Roberts, the present Master of the Trethill Harriers, also owns a pack of bloodhounds, hunted by his daughter. These hounds work over the wild Cornish moors where outcrops of rock and stone-faced banks require a horse accustomed to the country. Mr. R. A. Edmunds' Ledburn Bloodhounds hunt throughout the winter in Buckinghamshire, usually being followed on foot until the end of the season, when a few mounted days are arranged in connection with pony clubs. Since this pack has been reduced in numbers, lines often are hunted in conjunction with hounds belonging to Mr. Peter How, M.R.C.V.S. In the case of each of these three kennels, the Trethill, Ledburn and Mr. How's, there is a long list of field trial winners to show that pack work does not spoil a hound for working solo. At the same time, it is very necessary that prospective entries for trials should be given plenty of work on their own.

Another foot pack which has recently come into being is the Peak Bloodhounds, owned by Mr. Furness and hunting, as the name implies, in Derbyshire.

A bitch from the Ledburn Kennel, Ledburn Blessing, laid the foundation of a pack now showing excellent sport in Poland under the Mastership of Major Pfann. These hounds often have mounted fields of about fifty followers, most of them being Army officers on active service. Runs, during the regular season, are from six to fifteen kilometres in length, over a country full of game, yet Major Pfann's hounds are perfectly steady. Owing to conditions which he does not explain, he finds it necessary to be able to stop his pack at any moment, and he has it so handy that hounds will sit in a field while he and his whippers-in ride out of sight. There they will remain until called by horn. This Polish pack hunts short lines throughout the summer months, from April onwards, to keep hounds in condition, and starts the real season on October 1st, going out twice a week until frost stops operations in December.

Bloodhounds *can* be entered to game, and the late Lord Wolverton had a very fine pack, the Ranston, with which he hunted deer in Savernake Forest. But once allowed to stoop to game, the bloodhound is never again reliable in a man hunt as, quite naturally, the huntsman cannot be sure when hounds will change to a more exciting quarry.

Bloodhounds have been known to hunt the line of a man 48 hours or more "cold." It would be hard to imagine a foxhound sticking to a fox even half an hour ahead of him when its line had been crossed by many others. Neither would it be desirable for a hound to do so. This is one reason for the inclusion of foxhounds in most otter-hunting packs, for the true otterhound, being part bloodhound, also has a "cold nose" and will carefully work the drag of an otter which may be many, many miles away.

Another point which the bloodhound has in common with the otterhound, as well as with the basset, is voice. Although I have heard nearly all forms of English hound music, I think the grandest of them all was the cry of five couples of Ledburn bloodhounds as they hunted "clean boot" through the Ashridge woodlands.

THE COWDRAY HUNT LEAVING ELSTED WAYPOST (WHERE THEY HAD PREVIOUSLY MET) AFTER DRAWING A SMALL COVERT BLANK

A VISIT TO THE COWDRAY

A Good Pack of Hounds and a Pleasant Atmosphere

HISTORY and tradition, from which any hunt gathers much of its strength, goes back with the Cowdray country to 1729, and to the names of Mr. Roper, the Duke of Richmond, the Earl of Tankerville and the glories of the Charlton Hunt. It will have to suffice, in dealing with those days, to tell of "the grand chase" of Friday, January 26th, 1739. Hounds found in East Dean Wood at a quarter to eight in the morning, and the fox was killed at "the wall of the Arundell river" at ten minutes to six in the evening, an "old bitch fox." It was computed that "the glorious twenty-three hounds" had run 57 miles 2 furlongs 15 rods. What a hunt! It makes our longest and most famous modern runs look like Saturday afternoon coursing matches.

The Cowdray Hunt, as such, dates from 1922, when Major the Hon. Harold Pearson (second Viscount Cowdray) and the Hon. Clive Pearson formed a private pack. In 1933 the Hon. Clive Pearson became sole Master until 1935, when subscriptions were taken, and Lieutenant-Colonel F. H. Sutton, M.C., took over the Mastership, and is the present Master. As will be seen, those who enjoy sport with the Cowdray owe a great deal to the Pearson family. A fact which speaks well for the popularity of the Hunt is the way in which local landowners and residents contributed to a guarantee fund, when the Pearson family gave up the hounds as a private pack. At present there is a maintained deposit account of £1,000, a remarkable sum for a provincial country.

Before describing my very pleasant visit to these hounds, something of the country and its characteristics may interest you. These hounds hunt two days a week, Monday on the eastern side and Friday on the western side, their lateral neighbours being Lord Leconfield's and the Hambledon. In the north of the country is a small grass vale, between the River Rother, which is the northern boundary, and the downs. Foxes when found in the vale nearly always run for the hill. The downs here are not like the bare, grassy hills of the Southdown country, but are a mass of big beechwoods, such as Charlton Forest and West Dean Woods, intersected by little ridges and valleys of grass.

There are also now some Government plantations; but in the beechwoods proper you can keep with hounds without keeping to the rides, and for this reason a real "forest" woodland hunt is a great deal more enjoyable than the uninitiated might suppose, since there is no undergrowth, and when the leaf is off you can really see what is going on. Scent on top is very seldom as good as scent below, and though the general opinion is that owing to the fallen leaf, a lot of rain is necessary before hounds can really run in the beechwoods, they have been known to go after a dry spell.

The foxes in the country are notoriously strong and are of the "toddling sort," rarely being so accommodating as to wait in covert or hedgerow, and allow hounds to get a "fresh entapis" at them. It is, as well, a country where foxes can get about without being seen, and you seldom get a second look at your fox once he is found. A galloping whipper-in is as much out of place here as pork in a mosque. In the cubhunting there are, practically speaking, no "easy places" where cubs can be held up, and this year's tally of seven-and-a-half brace killed on top is above the average.

There is a tremendous lot of riot in this country, which does not make the huntsman's task any easier, as in these big woodlands it is really impossible to see what the unentered hounds are hunting, and, if necessary, to correct the error of their ways; nevertheless, they all seem to come to it in the end, though perhaps not so quickly as in easier countries. Deer, a most tempting form of riot to all hounds, owing to their sweet scent, are rapidly increasing. The presence of attested herds in the vale country constitutes another little difficulty, as, owing to the Ministry of Agriculture's regulations, such herds, when adjacent to non-attested cattle, have to be double-fenced; but it shows that the farmers are an enterprising lot of men, and, like all West Sussex stock, they are great sportsmen.

This country must be unique in one way; it lies within 50 miles of London, and yet is traversed by only one main road; the electric railway, by the grace of Diana, only affects two meets and very little country. Being so near London, there are several big shoots in the country, and though the terms with shooting interests are of the best, it is a little difficult to find sufficient country before the end of November. From the foxhunting point of view it is not a wealthy country, and one sees very few second horses out; but this does not seem to affect the enjoyment of a remarkably young and pleasant provincial field in the genuine sport shown by Colonel Sutton, who hunts hounds and is a real "hound man." To my mind, a useful innovation is that a subscription of from £2 2s. to 10/- or even less is accepted from *everyone* who comes out on foot, bicycle or car, so that all feel themselves to be part of the Hunt.

I spent two very pleasant days in this country, and on the Thursday afternoon we went over to look at hounds in quite one of the best built and handy kennels I have ever seen. Colonel Sutton was at one time, as no doubt you know, Master of the South Dorset, and he has continued his plan of breeding here. Pytchley Hetty ('25), by Croome Dashwood, is a headstone and corner in the pedigrees, and the general procedure has been to introduce Buccleuch and Berkeley blood into the original stock of the kennel, and at the same time to cross with hounds brought from South Dorset, mostly Belvoir bred, with a little Oakley. The result is a very workmanlike, strong-looking pack of hounds. I will just put down notes made at the time upon some of those that I personally liked best. First the young hounds.

Dexter, by Galway ('33) ex South Dorset Heroine ('34). "A very nice short-coupled little dog." Heroine is a South Dorset Dalesman, a hound used with tremendous success in the Pytchley kennel.

Countless, by Carlow Coiner ('33) ex South Dorset Helpful ('34). "I liked this bitch very much indeed."

Cosy, by Carlow Coiner ('33) ex South Dorset Helpful. "A nice fronted bitch."

Spinaway, Spinster and Sportive, all by Galway ('33) ex South Dorset Special ('34). "Three useful bitches; but Spinaway stands out."

Now the old hounds.

Heroine ('34), by South Dorset Goodwood ('32) ex Their Helena ('28). "Typical Belvoir—Buccleuch; a very nice quality bitch and a clinker to hunt."

Ladybird ('35), by S. and W. Wilts Templar ('33) ex South Dorset Lively ('32). "A star in her work, as I saw later; excellent nose allied to great drive; no beauty; one of the few Welsh-blooded ones that has been a tremendous success; a deep note like a doghound."

Happy ('36), by South Dorset Herald ('30) ex Parody ('32). "About the nicest bitch seen;

beautiful shoulder, good spring of rib and quality: a very fast bitch."

Helena's ('36) dam, South Dorset Helena, did a remarkable thing in her own country. She was suspected of being a little riotous, and in an eight-mile point led the pack through miles of hares, throwing her tongue beautifully. Colonel Sutton "sat and suffered," but his trust was rewarded, as Helena was right, and hounds killed their fox handsomely after a great hunt.

Lincoln ('36), by Berkeley Licton ('32) ex South Dorset Wanton ('31). "A very good hound; nice back, length to hock and good bone."

Spiteful ('37), by South Dorset Splasher ('31) ex Darling ('34). "Colonel Sutton is aiming at backs and ribs to cope with these hills, and he is getting them."

Gadabout ('37), by South Dorset Splasher ('31) ex South Dorset Garlic ('30). "A really beautiful free shoulder."

On my second day hounds met at Elsted Waypost, and we had the opportunity of seeing some of the heath country which sometimes provides such interesting hunts. This country is remarkable for its variety, the only type lacking being ploughland, which can well be spared, one imagines. It was a fine, soft, rather "muggy" day, and after observing the Two Minutes' Silence, hounds moved off to draw Bushey, followed by a field which included the local Salvation Army luminary on his trusty velocipede.

An extraordinary thing happened here, for while hounds were drawing the covert a fox came into it from *down wind* straight into them. They hustled him out again pretty quick, but within two fields he had gone to ground, so that the brave young ladies who took on some timber wasted their efforts; but no doubt courage is its own reward: I, myself, went through the gate. After some delay, a fox was found in Elsted Roughs, the starting point of many good hunts. He was a great big red devil, and he knew what he was at, going as straight as a die for the hill, hounds streaming along in his wake, a beautiful sight. They eventually lost him in the beech woods on top.

This hill really is a hill, and so steep that a stranger can scarcely keep his footing, and I almost suffered from an attack of vertigo. The view riding down to the vale again was superb, green fields, hedgerows, woods and farmhouses laid out in a homely but beautiful panorama.

Hounds found again in Park Copse; and now started the best hunt of the day. Those of us standing by the railway line viewed him slipping away, and the Master quickly had hounds out, and away over the road, where a mighty shouting showed that the foot people had also viewed him.

LT.-COL. F. H. SUTTON, M.C., THE MASTER OF THE COWDRAY, AND MR. A. LANGDALE, HUNT SECRETARY

At first hounds could not settle, but when they did some really beautiful hound work was seen. In the first circuit of the vale we were never out of a trot, and again and again Ladybird's hoarse note put them right; they had to beagle every inch of it.

Coming back again into Elsted Waypost, hounds seemed to get closer to their fox, though they could still only run slowly; but on being inclined in Park Copse they really started to go, and for 40 minutes we had great fun, having really to gallop to keep with them. These hounds have a beautiful cry, and proceeded to show us that they could chase as well as hunt; but they are very steady, and will not go a yard without the scent; just the difference between "flash" and drive.

On we went, through Julians and the Waypost, and so, looking as if they might catch him at any moment, hounds were away to the hill. A check on the only ploughed field encountered during the day settled matters in the fox's favour, and though they hit it off, it was obvious that at such a late hour, with foxes already on the move, hounds stood little chance of catching on the hill, so Colonel Sutton had them stopped just short of it after a most enjoyable hunt of 1 hour and 20 minutes.

Before finishing, a word must be said of Mr. Arthur Langdale, the hon. secretary, who does so much for the Hunt, and of Tom Pember, the first whipper-in and kennel huntsman. Pember has been with Colonel Sutton for eleven years, and seemed to me to be of the best sort. I should also like to say something of my good horse, who seemed to possess a bottomless well of stamina, and a great, if eccentric, liking for carrying large weights across country.

May I thank all my hosts for two most enjoyable days in a friendly country where foxhunting is properly carried out.

A. H. V. L.

MEMBERS OF THE COWDRAY HUNT FOLLOWING HOUNDS ON THEIR WAY TO AN AFTERNOON DRAW

TWEED'S IMPOTENCE

Are Its Autumn Fish Disappearing for Good ?

TWEED has for long been noted for its back-end salmon, and it has maintained its reputation for this run many years after the back-end fish have disappeared from almost all the rivers where they were formerly plentiful. One often wonders what chance of nature it is that has allowed Tweed to outstay practically all her competitors in this respect and yet, at the same time, to have developed into a spring river as famous now as any in all Scotland or England. It may be that some of us have also speculated as to whether Tweed will continue to maintain this fortunate position or whether, in course of time, she, too, will be added to that long list of districts where autumn salmon in reasonable numbers are no longer found.

Experience this year may be exceptional, but if it is not, then the slide has commenced which, in such a short time, reduced other outstanding rivers to the ranks of those that are of little importance so far as the autumn fishing is concerned. The Tweed autumn season that has recently closed has not been poor—it has been really bad. For this the weather has undoubtedly been partly responsible. From October 4th to November 30th the river was never in good fishing order ; only very occasionally was it even fishable, and on those few scattered days the water was always too high to be in good order. On all the other days—and they form the great majority—conditions have varied from merely useless to perfectly absurd. On the left bank just above Kelso Bridge a gauge exists which forms the first thought of many anglers when they wake in the morning, and the last hope before they turn in at night. When that gauge registers 2ft. 6in. the river is fishable, and when it is 2ft. it is in good order. This back-end that gauge has usually been between 3ft. and 5ft. ; on occasions it has been up to 6ft. or 8ft., and on one memorable Sunday in the middle of November it registered at 15ft. the largest purely rain-water spate since probably 1881.

Conditions have therefore been all against good fishing, even if the river had been full of fish, which was certainly not the case. They were not seen running up the sides of the river as is their habit in the Tweed ; they were not seen passing over the caulds ; and, what is equally significant, the poachers in the lower part of the river had so few that they even ceased to worry the bailiffs by trying for them. Normally the best of the autumn fishing, as indeed of the spring fishing also, is concentrated between the Floors water, just above Kelso, and Coldstream, but in the long-prevailing floods this year the few available fish were scattered all over the river right up to Peebles. Instead of a concentration in the favoured fifteen miles, with a fair sprinkling of fish for ten miles or so farther upstream, there has been only a few odd fish in all the pools.

Many people affect to despise the Tweed autumn fish, and, as with all autumn fishing, any of the fish which have been in fresh water for many months are to be despised, as indeed is the fisher who takes them. But the real autumn fish are not of this sort. They are as bright and silvery as the average spring fish, some have sea lice attached, and all are only a reasonable time away from salt water. It is true that in most of them the milt or ova are well formed, but while developing the fish have continued to feed, and their flesh is consequently in at least moderately good condition. In this last respect they vary considerably more than do earlier fish ; the females are not so good as the males, but many of the latter have curd in the muscle.

When it comes down to actual figures, during the autumn season that has just closed the best day's catch does not run to half-a-dozen fish, and the totals for some, or indeed all, of the beats are absolutely ludicrous. Four fish in a day seems to be the best that one hears of, and it is by no means certain that they all fell to one rod, and on at least one beat, where the previous record bad year showed about fifty fish, this year's total is no more than a dozen. With the general scarcity there is also a marked scarcity of the big fish for which the Tweed back-end is famous. Hardly a fish above 30lb. has been landed, and not one within sight of 40lb. has been reported.

Amid such a tale of woe it is difficult to find a day that is worth writing about, for the days spent in idling away the time or in fruitless journeys to the gauge at Kelso Bridge are of no particular interest. But here and there one has been able to get out and cast a fly into slightly less turbid waters. One of the great drawbacks of the season has been the uniformly bad colour of the river which, without exaggeration, on many days has resembled that of a ploughed field. Tweed itself in its upper reaches has not been so bad, but in the mid-reaches Leader and Gala bring in much agricultural drainage, and Teviot is always a bugbear to those who fish at, or below, the junction water at Kelso.

But after many days of waiting and a very little fishing one morning dawned in the third week of November when Kelso gauge was down to 2ft. 6in., Tweed was clear and Teviot was no more than slightly brown. What a morning it was, though, when we went afloat at about ten o'clock. Half a gale of wind, cold and raw as only a south-east wind can be in the Border and Edinburgh country, and occasional heavy showers of sleet that promised well for neither fishing nor the river. With the water rather high but not a bad colour, a pull or two seemed to be at least reasonably certain, so that, after crossing the main current and starting in at the other side of the stream at the mill I was not surprised to find that the fly was taken within the first ten minutes. But it was a poor creature that came straight to the stern of the boat, and within a minute or two it proved to be a small kelt hooked right in the point of the nose that was remarkable only for being so silvery at this early date. Practically every trace of the spawning livery had left it, and it was as bright as most of the kelts taken in March. There was nothing else in that stream, and nothing in the pool above, which was at least 6in. above its real fishing level ; nor did we fare any better in a little bit of slack water, fished off the bank, where a running fish might be expected to lie, before tackling the rather faster water up over the little cauld into the next pool.

By this time the weather was really foul, the wind, after coming from all quarters, had settled in the north, and the showers were fierce and bitter. But the other side of the stream cheered me up with a fish which took the fly with a rush, and came straight out of the water. It was only a little fellow, but it had one enterprising run before, in the net, it was seen to be another kelt smaller than, but almost as silvery as, the last. These fish must have been springers that had spawned in the upper reaches of Teviot, Ettrick or Tweed about the end of October, and which, encouraged by the high level and high water temperature (until after the middle of November it was running between 50 deg. and 55 deg. F.), had descended early and far. But why they should have become bright so very quickly is not so apparent.

This same bit of the mill stream also produced another fish, which was not a kelt but was not by any means a typical Tweed autumn salmon. First of all it was only about half the usual weight and must have been nearer 10lb. than 20lb. ; secondly, it was not really fresh run, and had begun to acquire the fresh water tints ; thirdly, it was a female, and not a male. In view of all these circumstances I was not at all sorry to see the hook come out just before the fish reached the net, for the Tweed boatmen, like all other professional fishermen, are out for blood and are not at all willing to put back any fish, other than a kelt, whatever its condition.

Lunch under the bank was not a great pleasure, nor was the sight of leaves and little pieces of stick beginning to come down on the surface, for it meant that the river was beginning to rise. By the time we got to the mill pool it had risen several inches, so that a head and tail rise to a 5/0 Wilkinson was more than a surprise, but the fish, of better quality and better size than the last, soon parted company and since the river was now up nearly a foot there was nothing for it but to go ashore blank but with at least a day's fishing to one's credit. It was only Wednesday, but it was the last fishing day in that week, and, as it proved, the last fishing day of the 1938 season, for the middle reaches of the river were never again in order.

PISCATOR SENIOR.

A COLD DAY ON THE TWEED AT HENDERSYDE

WHAT LUCK ?

THIS greeting, so commonly heard by the riverside, is, I contend, a reflection upon the skill of the angler. It almost savours of impertinence. But the modest angler should accept the gentle implication, even though he is pleased with his performance ; for well he knows that Nemesis may be waiting round the next corner to break him in his best fish, or has already, though he knows it not, caused him to leave his pipe at home.

"And how have you sped ?" was the greeting of Piscator to Viator, and this has an old-fashioned flavour, suggesting neither flattery nor luck. The angler, indeed, should endeavour to observe the mean between confidence and caution. Too much confidence is apt to degenerate into carelessness ; too much caution leaves the initiative with the fish.

Beginner's luck we all recognise, I suppose ; but we cannot all be beginners, all the while. I know that on the days when I first went salmon fishing, I caught four fish. That night at dinner two salmon were placed upon the table, one cooked and the other not cooked, one hot and the other cold, and the maid asked me, would I have hot or cold ; but then she was Irish.

Generally speaking, luck is fairly equally divided between the angler and the fish. If the angler draws one beyond his hopes out of a weedbed, he loses another round a concealed snag. It is all in the game.

So boast not, honest angler ; for we all have our off days, when nothing will go right, and the fish appear to bear charmed lives. To-morrow the luck will change, whatever the fortune of to-day.

And if you will, remember ;
And if you will, forget.

CHELIDON.

"STUDY ANY CRUSH AT A GATEWAY . . . . THOSE WHO ARE CUNNING IN ALL ITS PHASES WILL PUSH THEIR WAY THROUGH ALMOST ANY CROWD WITH A REMARKABLY SMALL QUOTA OF FUSS AND BOTHER"

EACH MAN FOR HIMSELF

The Principle of Being Unprincipled

APART from the average skill needed to propel both your horse and yourself over varying obstacles when following hounds, there is an additional "art," quite distinct in nature, in keeping close to hounds when riding a slower horse than those of your fellows.

The "art" is dependent, of course, upon a diversity of circumstances. Upon the pace of the hounds in question and upon the comparative pace of your horse. Upon your knowledge of the country. Upon your age and sex. Different relationships of these factors will either diminish or increase the extent to which you practise the "art."

But assuming that you are comparatively virile and that your foremost wish is to keep close to hounds, and assuming, of course, that you are riding a slow horse, it is safe to generalise. And the first generalisation is that you should be unprincipled. Impolite though this sounds, you need not be impolite if you cover your unprincipled behaviour with a cloak of apparent good manners, remembering that manners are not so important in conception as in effect. Thus you are privately self-assertive whilst apparently submissive, and thus only will you keep close to the faster horses ridden by the majority of the field.

More specifically, there are many "tricks of the trade." In woodland rides, for instance, it is essential to keep edging your way to the front of the queue so that you may be able to get away quickly when hounds break covert. This is quite simply effected by pretending either that you wish to talk to a friend further ahead or that your horse is ill-mannered and that you wish to take him to the front, alone and unbothered by surrounding horses. The latter is easily achieved by "niggling" your horse quietly with your heels when in the thick of the crowd, so that he will throw his head about and by leaving him alone when you reach the front. In gateways you can retrieve much lost ground with similar tactics. Often a successful plan is to gallop up from the rear of a crush in a gateway, apparently out of control. Then, should you appear too pushing, you apologise to your immediate neighbours, saying that your horse has a "mouth like iron" and throwing a word or two of gentlemanly abuse at your mount. A good plan, also, is frequently to place your hand behind your back so that people will steer clear of your horse's quarters, thus leaving you additional space for your manœuvres.

In open country there is less scope for the practice of low cunning. Out here, where men are men, you must take your chance with the rest, relying largely upon your horsemanship and your knowledge of the country to maintain your position, though remembering always that hounds may soon check, when once again you can make up lost ground. There are, however, a few facts worth bearing in mind. One of these is that it is unwise to be in a hurry when hounds start to run; too frequently, if you dash away in a burst of enthusiasm, you will find that you have completed a neat circle, with hounds back at their starting-point. Wait, rather, until you are certain that they have a line. Then, with half the field careering madly on the wrong side of the covert, you will make a clear, staid "getaway." Should you be in a strange country, it is wise to pick out a likely-looking farmer mounted on a stout cob, watch his tactics and make full use of them.

But the real test of your abilities in these respects presents itself at crowded fences. With hounds running fast ahead and with a seething mass of eager, fidgeting horses around you, your skill as an exponent of this "art" is then tried to the utmost. The first essential is to rid your mind of all prejudices and conventions. Becoming pushful, forceful, determined, even brutal in your aspect of the situation, remaining superficially suave and well-mannered. Then, if you wish to see hounds again, adopt every tactic you have at your command, the more rigorous in practice when you realise that you are by no means the only person with such dishonourable intentions. Every inch that presents itself should be filled immediately. Every horse which edges alongside should be assiduously blocked. Touch your horse with your spurs so that he pushes forward, apologising in unctuous tones to your victim; then touch him again and push alongside. Lastly, and this is extremely important, ride at the fence as soon as is possible without cheating too blatantly.

A few will curse you, perhaps, but this does not matter provided that you have not actually harmed anyone or pushed aside any vitriolic women, defenceless children or important old gentlemen. Those who curse you will be those you have outwitted in the aforesaid "art."

All this may sound hardly in the best traditions of the hunting field, yet it is an "art" which is practised daily by the most respectable patrons of the sport, and indeed must be practised if you are to see anything of a fast pack of hounds on a slow horse. Study any crush at a fence or gateway dispassionately and you will see approximately three-quarters of the entire company indulging in it to a lesser or greater extent. Those who are cunning in all its phases will push their way through almost any crowd with a remarkably small quota of fuss and bother; particularly, in this respect, women. For women, apart from their advantage in being the weaker sex, and therefore given more ground, are particularly adept at being basically unprincipled whilst outwardly weak and helpless. (The context is here strictly confined to the hunting field.) In consequence of this—more power to their elbow! Who would condemn them when hounds are running and when it is undoubtedly a case of every man and woman for his and herself?

In general, a hunt on a slow horse can be just as exciting and interesting as that on a faster, for when riding the latter any proficient horseman finds it easy to keep with hounds. Yet the former requires that you be a cad in the guise of a gentleman—a rôle which adds considerably to the amusement of a day's sport. You do not always want to drive a Rolls-Royce. It is fun, sometimes, to slip through the traffic with an old Austin Seven.

JASPER SAYER.

"IT IS ESSENTIAL TO KEEP EDGING YOUR WAY TO THE FRONT OF THE QUEUE SO THAT YOU MAY BE ABLE TO GET AWAY QUICKLY WHEN HOUNDS BREAK COVERT"

Should you be in a strange country, it is wise to pick out a likely-looking farmer mounted on a stout cob, watch his tactics and make full use of them.

But the real test of your abilities in these respects presents itself at crowded fences. With hounds running fast ahead and with a seething mass of eager, fidgeting horses around you, your skill as an exponent of this "art" is then tried to the utmost. The first essential is to rid your mind of all prejudices and conventions. Becoming pushful, forceful, determined, even brutal in your aspect of the situation, remaining superficially suave and well-mannered. Then, if you wish to see hounds again, adopt every tactic you have at your command, the more rigorous in practice when you realise that you are by no means the only person with such dishonourable intentions. Every inch that presents itself should be filled immediately. Every horse which edges alongside should be assiduously blocked. Touch your horse with your spurs so that he pushes forward, apologising in unctuous tones to your victim; then touch him again and push alongside. Lastly, and this is extremely important, ride at the fence as soon as is possible without cheating too blatantly.

A few will curse you, perhaps, but this does not matter provided that you have not actually harmed anyone or pushed aside any vitriolic women, defenceless children or important old gentlemen. Those who curse you will be those you have outwitted in the aforesaid "art."

All this may sound hardly in the best traditions of the hunting field, yet it is an "art" which is practised daily by the most respectable patrons of the sport, and indeed must be practised if you are to see anything of a fast pack of hounds on a slow horse. Study any crush at a fence or gateway dispassionately and you will see approximately three-quarters of the entire company indulging in it to a lesser or greater extent. Those who are cunning in all its phases will push their way through almost any crowd with a remarkably small quota of fuss and bother; particularly, in this respect, women. For women, apart from their advantage in being the weaker sex, and therefore given more ground, are particularly adept at being basically unprincipled whilst outwardly weak and helpless. (The context is here strictly confined to the hunting field.) In consequence of this—more power to their elbow! Who would condemn them when hounds are running and when it is undoubtedly a case of every man and woman for his and herself?

In general, a hunt on a slow horse can be just as exciting and interesting as that on a faster, for when riding the latter any proficient horseman finds it easy to keep with hounds. Yet the former requires that you be a cad in the guise of a gentleman—a rôle which adds considerably to the amusement of a day's sport. You do not always want to drive a Rolls-Royce. It is fun, sometimes, to slip through the traffic with an old Austin Seven.

JASPER SAYER.

"IT IS ESSENTIAL TO KEEP EDGING YOUR WAY TO THE FRONT OF THE QUEUE SO THAT YOU MAY BE ABLE TO GET AWAY QUICKLY WHEN HOUNDS BREAK COVERT"

STOWE SCHOOL OVERSHADOWS ITS TEAM DURING THEIR MATCH AGAINST OUNDLE WHOM THEY BEAT FOR THE FIRST TIME IN THEIR HISTORY

IN TOUCH

The Public Schools

At least one may be thankful that the public schools managed to get through their fixtures before the cold spell, and now that school clothes have been laid aside for a while, and Christmas has been digested and forgotten, perhaps a brief review of school form may be of interest.

On the whole, school Rugby has been very good this season. Stowe, for instance, consider it to be the best on record, and out of the fourteen matches they played, only two were lost—to London Scottish and Cambridge Sixty sides. Among their scalps hangs that of Oundle, who they beat for the first time in Stowe history, thus breaking the Oundle record of having won all their inter-school matches since 1935. They are fortunate in having an excellent half and a splendid captain in Hastings, who is hailed as being second in Stowe history to B. C. Gadney alone.

Although Oundle thus lost a school match, they have had a good season, and managed to keep their flag flying against Haileybury, Uppingham, Rugby and Bedford, the last of whom they defeated 43—3, though it must be admitted in fairness to Bedford that it was their first school match of the season.

It is cheering to hear that Rugby have managed to produce one of their best sides for some years, and, apart from the Oundle match already mentioned, they broke up for the holidays unscathed. They compiled a very awe-inspiring total score—279 points for, and 60 against, but figures are hardly a fair indication, since Harrow, who have had a very bad season, were beaten 46—0, Wellington 34—0, and the R.A.F., Cosford, 69—3, thus accounting for 149 points of the grand total.

Bedford, despite their bad start against Oundle, improved greatly, finishing in "trailing clouds of glory," and although in their last match Stowe won 13—3, they were being led 3—0 by Bedford until the last quarter of an hour—not bad going, considering the Stowe record.

Another season of success was that of Christ's Hospital who, refusing to carry on in the rut of defeat dug by their first two matches against Epsom College and King's College School, Wimbledon, proceeded to win seven school matches in a line, though Brighton gave them a run for their money, only capitulating at 19—18.

Another unbroken record has been that of King's College School, who have taken quite a good fixture list in their stride, and appear to be building up a reputation for themselves for Rugby, as well as for a unique shooting record. King's (Canterbury) Rutlish, Cranbrook and Taunton have also played some good matches and have returned from the field of battle waving a palm of victory.

In these days, when "nothing is as good as it was when I was a boy," it bodes well for the game of Rugby that such excellent football has been played, and I feel that there must be material in these school teams to produce fine international sides during the next decade.

However, I would heartily endorse the words of a correspondent in one of our leading newspapers who wrote: "School matches should be refereed with the utmost severity, even ruthlessness, if need be."

There is an attitude in very many public school first XV's that, provided the eleventh commandment is obeyed, "Thou shalt not be found out," it is a matter for congratulation to skate on thin ice (if the figure of speech may be permitted). To put it bluntly, if you can foul and get away with it, then foul.

That is an attitude which must not, for one instant, be condoned. School Rugby is the fountain head. Once let that become corrupt, and the whole course of Rugby life will be irreparably damaged.

FROM TEE TO GREEN

IX.—Putting

By E. R. TIPPLE

It has been said that professional golfers drive for pleasure, but putt for money. This is undoubtedly true for, in almost every tournament, one will notice little difference between their shots through the fairways; it is on the greens that the winner is decided. We are allowed 36 putts per round, two on each green, but the expert putter will average 32 or 33 strokes during the eighteen holes. Putting has been called a game within a game and, in this department, the longest handicap golfer can prove a match for the best professional.

What makes a great putter? An obvious question which is difficult to answer. The first essential is the ability to have complete control of the nerves. Confidence is of paramount importance. We can hole all kinds of putts when nothing depends on our doing so, but even a 4-foot putt becomes difficult when we must hole it to win a match or a monthly competition. The knowledge that putting is such a final business, that one has practically no margin for mistakes as we have off the tee, for example, accounts for many poor exhibitions on the greens. If we become disturbed mentally we will never hole those awkward length putts.

Concentration on the task is another essential; concentration on the line of the putt, the green itself and the swing required. One big fault is to be uncertain of the line you wish the ball to take. You will obtain better results by choosing a definite line—even if it does not happen to be exactly the correct one—than by trusting blindly to luck and the way you put the club down behind the ball. The good putter always makes a definite decision which, once taken, is never changed.

Which is the best and most fault-proof style? It is difficult to be dogmatic for others on this subject. There are many good putters, each using different styles. Mr. Eustace Storey evolved a peculiar, almost stork-like style, as he appears to be standing on one leg, manipulating his feet into such a position that they make a right angle, the right pointing at the ball, the left towards the intended direction. His putter is very light, with an exceptionally small face. Bobby Jones stands upright, feet close together, Leo Diegel squats low on his feet, knees bent, elbows well out, hands close to his body. Percy Alliss holds the club at the top of the shaft; Lacey, bending low, holds it almost at the bottom end of the grip. Hagen has his feet fairly wide apart, weight on the left leg. Padgham has his hands well away from his body, and with a free, easy action uses a stroke that resembles an approach in miniature. And so one could continue giving contrasts of styles and methods. The question must be answered by the individual, the type of stance and its width depending on his own ideas. But they must give him a sense of comfort and balance.

It is generally agreed that the stance should be a natural one. Most experts prefer to have their feet close together. Any trace of tension should be avoided. Tension—locked legs and stiffened body—will ruin putts. Good putting demands ease, relaxation. Then smoothness of stroking will follow. But if you are all tense you are apt to jab at the ball and hurry the stroke, which is fatal.

Most golfers are not deliberate enough, and all of us are inclined at some time or other to hurry the stroke—"I'll never hole this one; let's get it over quickly." As Lady Heathcoat-Amory has advised, "The object that should be aimed at in striking the ball is to hit it in such a way that it runs towards the hole on a vertical axis, and is free from any sideway spin . . . both wrists and arms should take part in the stroke . . . the whole action should be a happy medium between too much wrist work and too stiff a movement of the arms. The stroke is made slowly and deliberately in order to give full time for the completion of the shot." That last sentence in particular contains wise advice. Do not be over-anxious, and look up before the ball has hardly started on its journey to the hole. Rather is it better to wait and *listen* for the result—you'll know quite soon enough!

The Americans are wonderful putters, as we should learn from their experience and methods. During the last Ryder Cup match, I was very interested to observe that practically each member of the U.S. team employed a short back swing, even for long putts. They took the club back along the line and kept it as low as possible—not lifting it high into the air as some golfers do—and the blade was kept at a right angle to the line. They gave the ball a determined, firm hit, following through as if they wanted to hit it a second time, and the club, on the follow through, was kept low, almost grazing the ground, the face still square to the hole. This method, I believe, would repay anyone and is the most fault-proof of any. It can be followed no matter what stance you choose.

Most experts to-day use the reverse overlapping grip when putting. The forefinger of the left hand rests on top of the little finger of the right, and this grip puts the desired emphasis on the right hand. This is needed for we are told that putting is to a great extent a right-handed stroke. If you have not tried this grip the experiment is worth while. Furthermore, hold the club in the fingers, not in the palms of the hands. Putting requires a delicate touch.

How hard shall I hit the ball? The old maxim "never up, never in" is very familiar with all players, consequently we attempt to go for the back of the hole, giving the ball a firm rap. This demands absolute accuracy, for if the ball does not strike the dead centre, it will rim the edge and stay on the lip. With the more gentle stroke—the ball going up lazily to the hole—there are four ways for it to drop—front and back and the two sides—the "tradesmen's entrance." But with this latter method greater care regarding the line has to be exercised. Incidentally, if you cannot see the line to the hole—and we often experience such a difficulty, particularly on strange greens—it is useful to look at the general contour of the surrounding land. That will give you some indication as to the fall of the green.

A light or a heavy club? The former is, perhaps, best on fast greens; the latter for the heavy inland courses, where the grass is thick. But the player will be well advised not to go to the extremes, a medium-weight putter is the most suitable. The lie of the club is of the utmost importance. All the sole should rest on the ground, the nose should not be up in the air. As the eyes should be over the ball and the intended line, an upright lie is desired.

Practice makes perfect. That may be an exaggeration, but the golfer who wants to improve his putting must practise. When doing so, do not try to hole putts. I have watched many experts practising and they all try to get the correct feel of the stroke; they practise to regain the rhythm of the swing, the smoothness in the striking of the ball so they do not bother about the results of their practice shots. If you lose your putting touch during a round, ask yourself the question employed by the late Freddie Tate—one of the world's greatest putters: "Am I moving my body, am I taking the club back straight?" These questions contain the two fundamental laws of putting and most of our mistakes can be traced to neglecting or disobeying these vital rules.

A HOLIDAY IN THE IMATONGS

On Safari in the Southern Sudan

FROM north to south in the Sudan, the traveller crosses a territory of great variety and contrast both in fauna, flora, and in the various Sudanese tribes. The greatest difference lies in the change of scenery between the arid deserts of Khartoum and the north, and the fresh, green trees and tall grasses of the south. This striking contrast is reflected in the complete dissimilarity of the inhabitants. The tribes of the north are of Arab and Nubian stock, generally light-skinned in colour and clothed in white, flowing robes, while those of the south are of the real negroid type, primitive and barely clothed.

From Khartoum we travelled 1,000 miles up the White Nile by paddle-steamer to Juba, and we found ourselves virtually in a new land. This sudden change of environment, after such a short distance comparative with the vast size of Africa, was distinctly invigorating. A complete book could be written about the Nile journey alone, so interesting is the trip.

Big-game shooting in the Southern Sudan is plentiful, and either east or west of Juba sport is good. The exact locality chosen depends on the requirements of the hunter. For our own part we desired a good general shoot, and with this in mind went 100 miles east of Juba to Torit, headquarters of the Equatorial Corps, Sudan Defence Force, to whom we owe a debt of gratitude for their hospitality and help given to us during our stay there, and for our subsequent trip to Tereteinia.

Tereteinia is 50 miles south-east of Torit, almost on the Sudan-Uganda border; a country of rolling plains, covered with thorn or sugar bush, and occasional jebels (hills) to relieve the monotony. A most suitable country for stalking and shooting or photographing big game, of which there is a wonderful variety. From elephant and lion, lesser kudu, roan and common eland, rhinoceros, buffalo, giraffe and ostrich, and also various gazelle and buck, down to the lowly wart-hog. It is an inspiring sight to see so many wild animals in their natural habitat within such a short time. Surely the sportsman in search of a general shoot could wish no more?

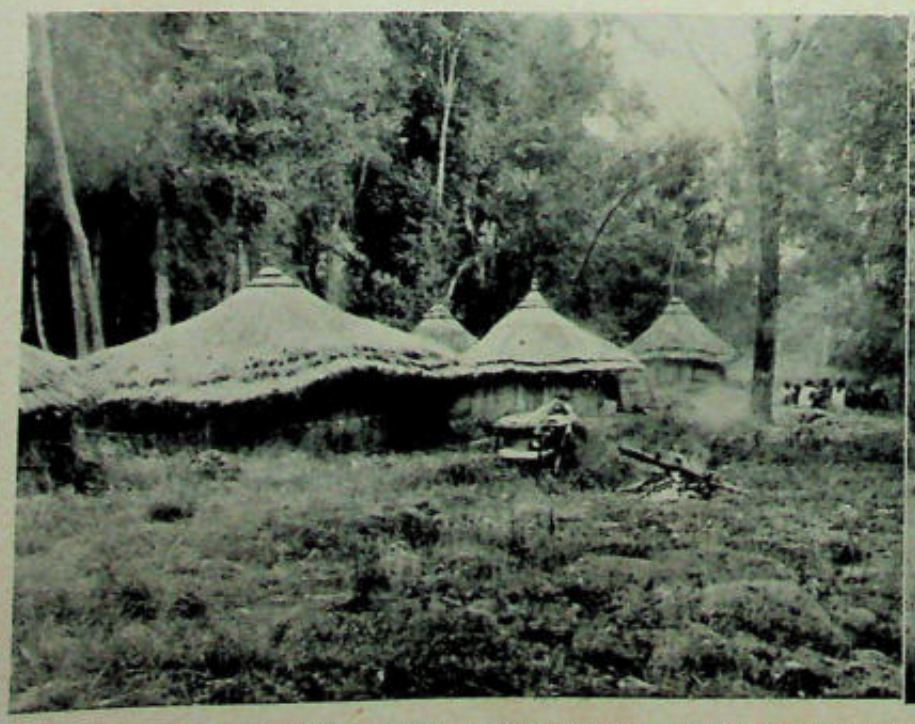
The plains at that time of year (April-May) are extremely hot, and were even more so this year, since the March rains were long overdue; in consequence all rivers and most water-holes were dried up. Accordingly, after much exertion during our shooting on the plains, we decided to make for the Imatong Mountains, whose slopes loomed up so temptingly and cool some 30 miles away. So we struck camp, to trek for one-and-a-half days to the village of Logoforok, on the eastern foothills of the Imatongs. Here we paid off our 30-odd porters, whose places were now taken by men of the Lango tribe, natives of the hills, well used to climbing the steep slopes and rocks with heavy loads on their heads.

Logoforok is an "Eden" after the hot and dusty plains; everything is green, with fresh milk from grazing cattle, refreshing bathes in the streams running down from the hills, and it is no longer necessary to boil or filter the water.

The ascent up the mountains from Logoforok begins at dawn, a few porters and the cook being sent ahead to prepare breakfast at the first rest-house, 4,000ft. up, reached after three hours' climbing. From this spot a wonderful panorama of the plains lies spread, like a giant map, before you. The contrast is impressive. Around the rest-house everything is fresh and green, water trickles down the hillsides, strawberry plants and blackberries grow in wild profusion, roses and carnations bloom in the garden, while below you lie the plains, a vast stretch of yellow earth, shimmering under the heat of the rising sun. Scrub and stunted trees are dotted everywhere, with occasional jebels protruding from the surface like giant ant-hills. Everything gives the impression of scorching heat, from which there is no shade.

To continue with the climb. This is now full of interest. The ascent is not difficult if the narrow, winding tracks are used, and one passes through a diversity of country, over rocks and loose moraine, across slopes of grass covered with pink and blue irises, wild orchids and foxgloves. Sometimes over streams, bridged by tree-trunks felled by the natives or, more frequently, with no bridge at all; through thick forests of lofty trees and brutal thorns overgrowing the tracks, forcing the leading men to hack a way through with their spearheads. Constantly one hears the dog-like bark of the baboons, which swarm in troops in these forests, or occasionally one catches a glimpse of a black and white colobus monkey swinging in the trees above. Here is a paradise for the ornithologist, birds of tropical plumage and variegated colouring always to be seen and some still to be classified, for many are not yet known by the Natural History Museum to exist in the Sudan. Butterflies, too, of all descriptions breed and abound in these hills, and it was our one regret that we had no net with us.

A few words about the porters would not be amiss here. All of them were Langos, and a better type of man would be hard to find. Good-humoured, willing, unsophisticated and hard-working, these men carried loads for us up to 60lb. over most difficult ground, never once faltering in their steady



(LEFT) LOMULENG, A QUIET SHELTERED SPOT, 7,500 FEET UP AND (RIGHT) THE SAFARI APPROACHING THE IMATONGS NEAR LOGOFOROK

stride. The water-girls, too, carry, for women, amazing loads, generally consisting of the porters' own kit and food. Each Lango carries a horn slung round his neck by a chain or a piece of leather, and at frequent intervals, especially at the start or end of a safari, blows his instrument. Each man has his own sign-call, and it is astonishing how far the sound of these horns carries through the mountains. These sign-calls are used by the natives in their normal daily life to warn others of their whereabouts when needing help in herding up cattle or straying goats, and are also used by hunting parties returning to the village with a kill.

Many of the men also carry small snuff-boxes of hollowed-out ebony wood, with a leather covering, and inside is either powdered snuff or tobacco rolled into the shape of a ball and chewed. The men rarely appear to smoke; the women, on the other hand, are keen smokers, and it is a common sight during the various halts to see the water-girls lighting up their massive pipes.

In early afternoon, Lomuleng is reached. The large rest-house is blown down, but there are six or seven circular thatched huts, grouped in a clearing of trees at the edge of a forest, affording warm shelter. A quiet, sheltered spot, 7,500ft. up, and cold enough in the evening for fires and blankets.

Good shooting may be had on the neighbouring slopes, for here abound the mountain bushbuck and also the bush-pig; but both animals are cunning and difficult to spot in this close country, unless caught early in the morning, feeding in the open at the edge of the woods, or while descending to the streams in the evening. High up in these mountains is also the reputed home of the giant forest hog, a mythical animal to most sportsmen, for few have been seen or shot.

From Lomuleng the rest-house at Kipia is reached after an easy safari of four hours across several ridges. At Kipia the rest-houses are again separate and consist of the circular huts. The view from the front is a fine one, with Mount Kinete (10,500ft.), highest mountain in the Sudan, looming in the background.

To climb Kinete from Kipia is fairly simple, starting early in the morning the summit may be reached at midday, and camp regained before dusk. Before our ascent the guides had informed us that there were no bushbuck in the region at this altitude (10,500ft.), but we shattered their theory by shooting a fine buck only 100yds. below the summit.

The movements of any party from Kipia depends upon the amount of time on hand. Those hard pressed for time move south across the mountains to Katire rest-house, while those not in a hurry may climb round the western slopes of Kinete, and move on a long safari to Itabol, probably the best situated rest-house in the whole of this range, and from here descend the northern slopes to Lomo, whence the road leads back to Torit, or runs south to Uganda.

As regards the costs of shooting in this area A full licence, class A, available for the whole Sudan, which enables a person to shoot all animals save, of course, protected species, costs £60, or reduced to £6 in the case of Government officials, serving officers in the Sudan, residents, &c. A permit to enter the closed districts must also be obtained from the Gamewarden.

All transport is by porter or by motor, as there are no camels, donkeys or horses in this part of the country. Motor transport to the shooting ground generally consists of 2-ton V.8 Fords or 6-cylinder Chevrolets, and costs 2–3 piastres per mile (1 piastre = 2½d.) when loaded, and unloaded from 2–2½ piastres per mile. If the lorry is to wait, it will cost 50–100 piastres per day. Cooks and guides can usually be obtained locally. A boy will cook for about 150 piastres (30/–) a month, and a guide may be procured for the same amount. Some people bring a cook with them from Northern Sudan. With this arrangement the cooking will probably be better, but the Northerner may not agree very well with the southern native, as the former considers himself vastly superior. This cook will also cost about £7 a month, and the price of his return fare. Porters are collected locally by the village chief and are paid 2 piastres a day or 1 piastre when retained for the day and not carrying a load. When paying out these porters, that type of piastre with a hole in its centre is most acceptable, since the natives like to string the coins together and adorn neck or waists with their accumulated wealth.

Prospective visitors may obtain any further information from the Gamewarden of the Sudan, Major W. R. Barker, O.B.E., to whom we are greatly indebted for his assistance and arrangements which alone made our trip feasible.

ANTHONY GATES.

"ARMA VIRUMQUE . . ."

Six Guns at Lochearn Castle

IT was August 13th, and as I passed the servants' kitchen Private Henderson was reading the following extract from the daily paper to my batman, Private Scott:

> "The crack of the sportsman's rifle was heard all over the moors, and good bags were obtained yesterday in many districts."

To which Scott, with a fine disregard for the niceties of shooting replied: "Aye, and that's just what we'll be doing in two months' time!" He then whistled, "Little Old Lady," which was his own peculiar method of scoring a point, covering defeat or ending an unprofitable discussion.

He was referring to the fact that I was to be posted to the regimental depot in October, a future to which I myself was frankly looking forward, while Scott, for his part, considered it would be "all right." The non-committal nature of this reply did not indicate whether he thought that life at the depot would be preferable to life at Dover (*i.e.* the present), or Delhi (the past); but then he was a very self-satisfied Glaswegian, so I did not expect any enthusiasm from him.

In appearance he was short, square-shouldered, and possessed of a kindly but stupid cast of countenance. In reality he was rather quick-witted and self-confident, for which reasons I had selected him as my servant. Although described in his conduct sheet as a "carman" I knew this to be a misleading euphemism for one who pushed a fish-cart, and I had not, therefore, allowed him to drive my car. Nevertheless, his other qualities made him a useful servant, and I was glad to be permitted to take him North with me.

From a sporting point of view, Lochearn Castle is probably the best depot in Scotland, though it is certain that it was originally selected by the War Office for more utilitarian reasons. Situated at a junction of main roads and railways, it is within easy range of good shooting, stalking, fishing and hunting; while its immediate locality is one of the few where Scottish cricket—that alien flower—still flourishes. If you add to these amenities the presence of innumerable hospitable neighbours, you will realise that I had better say no more lest this article should catch the eye of the energetic Secretary of State for War, whose measures for promoting the efficiency of the Army are so delightfully unexpected.

I went there in October, and early in November I received a letter from Colonel MacDonald, an old brother officer of my father's, asking me to shoot his coverts with him on the 21st, and to bring a loader. This was definitely a good invitation, and though I hesitated a moment over the loader problem I felt tolerably certain that Scott would "oblige" in that capacity, and therefore gladly accepted it. So next day my henchman and I began rehearsals for our "double act."

He had never seen a pheasant except outside a fishmonger's shop, but he took quite kindly to the idea of assisting me to kill them. In fact, like any soldier, he showed unusual enthusiasm for doing something which was not really his job, and I could see, after we had been practising for one or two periods, that he greatly fancied himself in the rôle of loader.

It was perhaps unfortunate that there was no opportunity for clay-pigeon shooting, so that we never had any practice with "ball ammunition" (as he called it), but by the eve of the great day I considered him sufficiently well versed in the elementary safety precautions to ensure that the risk of casualties among the guns would be reduced to the minimum. Only one point remained to be settled, and it was one to which I had given no thought until Scott suddenly asked me: "Will I wear the kilt or 'clean fatigue' for shooting, sir?" And then, although I realised that this matter of "dressing the part" was one which was very near his heart, I answered inadvisedly, "No—you'll wear plain clothes."

I ought not, therefore, to have been unduly surprised when he called me the next morning dressed *pour le sport* in his Gent's Navy Blue D.B. Reefer Suit, and elegantly pointed black shoes By that time it was much too late to effect any sort of transformation, and so we departed looking rather like a French Cabinet Minister attended by his detective.

* * *

We were a party of six guns, and after we had drawn for places I found that my neighbours would be Colonel MacDonald and Joe Gordon of my regiment, who was adjutant of the local Territorials. Good company, good weather, and (I felt reasonably sure) good sport were to be the ingredients of a perfect day, and my pleasant anticipations were only slightly disturbed by the sound clashing my gun barrels together as we n to the first stand. Here, being drawn had to walk in line with the beaters an any "backsliders," an occupation which give our untried combination a blessed opport of settling down, for which I was duly grateful

The beat began and events took their intended course, the birds being brought well forward to the four guns in line. Scott, as I had expected, was extremely alert and much concerned that I would not shoot at birds going forward. He was actually urging me to slaughter one such bird when a cock pheasant sailed out above me and turned for home. I killed him neatly; but the perfection was somewhat marred by my forgetting to change guns.

As I opened the breech, the empty case took Scott in the eye just as he was exclaiming "Correct!" in the true tradition of a musketry instructor. This infringement of the rules clearly demanded the apology which I made, though it hardly deserved the revenge which Private Scott took a few moments later when a cock and a hen broke out rather wide on my right.

I knocked the cock down with my first barrel and was just swinging on to the hen when a voice behind me said: "Noo for the double event" and all at once the air was full of tail feathers. We changed guns in silence, and then he began to whistle "Little Old Lady" very quietly.

At the next stand I was right in the shop window, so Scott was warned that there would be a lot of shooting, and that speed and accuracy would be essential for both of us. I particularly warned him that he was on no account to follow the fortunes of the guns to right and left, but to concentrate all his attention on myself. This advice was dutifully received, and duly disregarded.

Birds began to come over my host on my right and Gordon on my left, but I kept my eyes on my front until a hen pheasant appeared flying extremely fast and high towards me. As it proved, she was too high and too fast, and my harmless salute only increased her height and speed. Quickly I turned for my second gun, to find Scott gazing with rapt admiration at Colonel MacDonald who was dealing out death and destruction in no uncertain manner.

Recalled to his duty, he gave me the other gun, observing at the same time that "the colonel was great altogether"; during which interlude two remarkably easy birds had sailed unmarked over my hat. This was hardly an auspicious beginning to what I had hoped was going to be a very good stand; nor did matters improve much, for I might have known that Scott's eccentricities would adversely affect my own performance. However, there was a deal of firing done, and when once he had warmed to it, my loader played his part with precision. But I must confess to a feeling of unworthiness at the pick-up when I found that my neighbours had each killed about 50 per cent. more than I had, and I was glad to note that Scott's face was also registering shame. At least, that was what I thought it was until I detected him handing over money to Gordon's loader.

After this rather shaky start we steadily improved as a team, and by the time we stopped for luncheon I felt I could face my host with a clear conscience; and it was not until later in the afternoon that the sudden salvo which greeted the appearance of a woodcock caused a momentary lapse of attention on the part of my loader. The woodcock, *more suo*, escaped the barrage, but was observed by the watchful Scott to alight in a young covert about half a mile away, whereupon I was respectfully informed: "Yon bird that you aimed at has come down over there, sir."

And so we came to the last and best item—a walk in line over a boggy bit of moorland which held (as a friend of mine once said) "everything bar a tiger." It was a most exhilarating end to the day, and I believe my prestige would have stood high with Scott if only I had not shot that snipe. The scorn with which he picked it up and held it (by the beak) made it obvious that I had let the side down by shooting anything so insignificant.

Actually, my host insisted on adding it to the quota of pheasants which he put in my car, and so I instructed the mess cook that I would have it cold for my breakfast next day.

As it was not on the sideboard the following morning, I rang for Scott. "Isn't there anything else for my breakfast?" I asked. "No sir," said Scott, and added as he produced my snipe from behind the screen, "Except yon wee bird." *De minimis non curat lex*, and as the door closed behind him, I heard "Little Old Lady" fading away down the passage.

"SANS PEUR."

THE HUNT IN PROGRESS

Considerable skill is needed to net the duck as they fly up without "poaching" on neighbouring ground

DUCK HUNTING

An Extraordinary Form of Sport Practised in Japan

DUCK hunting has nothing in common with duck shooting, except that the quarry is the same in each case. Although it has been practised as a sport in Japan for centuries, it can scarcely be called more sporting than netting for salmon.

The duck are found in lakes a few miles outside Tokyo. These lakes are fenced in by wooden enclosures so that the duck never see a human being, and it is only possible to view the duck through peepholes in the barricades. The most famous duck preserve belongs to the Imperial household, and once yearly an invitation is extended to the Diplomatic Corps to participate in the hunting. The list of guests is exclusive, being limited to the heads of missions, the senior attachés and counsellors and their wives. In earlier days top hat and morning coat were obligatory, but the fashion now is to wear sports clothes.

Extending radially from the lakes are waterways, and the duck can only enter these by negotiating two right-angled bends which screen the hunters from the lake. These waterways are some 20yds. long by 4ft. wide, and terminate each in a wooden barrier flanked by grass banks.

The hunters are provided with nets and take up positions facing one another behind the barrier at the end of a waterway. The strictest silence must be observed while a boy creeps along the bank edge towards the lake to throw in food. This attracts inside tame duck, which are used as decoys, and the boy returns to behind the barrier, where he watches progress through a small hole in the boarding. In order to bring the duck close in, he drops more food through a box in the barrier and knocks on the wall. This sound is a call to the duck outside to enter.

The hunters meanwhile wait expectantly with their nets lowered, and the boy signals the number of wild duck which has entered; the little finger signifies a small duck and the middle finger a larger one. When the duck have approached the near end, the signal to attack is given and the hunters rush in line along each bank. There is a sweeping motion of nets to trap the duck as they leave the water and once a duck is imprisoned in a net the open end must be turned over quickly to prevent the duck escaping.

Having finished a hunt at one waterway, the hunters are led in silence to another one, and the same procedure starts over again. At the end of the day, the bag is divided up amongst the hunters. In the diplomatic hunts, the shares are divided according to protocol, the more senior the diplomat, the more duck he receives.

There is naturally a certain etiquette to be observed. Although poaching is considered bad form, one usually finds that when the hunters are composed of mixed nationalities a member of a state noted for the excitable temperament of its people will run along the bank netting any duck he can find. Novices sometimes plunge their nets in the water trying to trap the tame duck.

Incidents sometimes occur on the diplomatic hunts. There was a case of an ambassador's wife who wore a large feathered hat and who found herself netted by the ambassador of a country which was not on friendly terms with the country represented by her distinguished husband. The incident required much explaining, as the captor could not confess that, owing to shortsightedness, he had mistaken the lady's head for a duck.

A RED-LETTER DAY OFF COVERACK

A Catch of 296lb. with Fourteen "Specimens"

TIDES were short, nearly full neaps, and after ten days fishing light for pollack and bass round the Manacles, we decided to try one of the deep marks off Coverack for ground fish. This is not a pastime to be contemplated lightly, for it involves hauling big fish up nearly 30 fathoms against a tide that is light only by comparison with its usual fierceness. Under favourable conditions, using the lightest gear practicable, a pound of lead is necessary.

We had been out after mackerel for bait soon after dawn and had two dozen, all well over 1lb. in weight, but we knew we should have none too many for this style of fishing. A large one only cuts up into four good baits. For the first quarter of an hour a few bites were felt, but we could not connect. Then the fish started to feed in earnest. The first was a pouting, then up came another, and another, until we had a dozen, none under 2lb. and several round the 3lb. mark. Soon something heftier was felt and a 20lb. conger was given the *coup de grâce*. The next fish was a 14lb. ling, and then to add to the variety, a whiting was landed; not a south coast half-pounder, but a good one—3lb. exactly.

There were now half a score of "specimen" fish in the boat, and we began to realise we were in for one of those red-letter days one often hears of, but seldom experiences.

While these thoughts were passing through my mind the pollack expert showed he was no specialist by connecting with something really big. His powerful split-cane rod bent to danger point, but after a few fathoms of line had been regained more by far was run out. Some fierce "pumping"; a few more fathoms recovered; and once again the fish took charge. Evidently it was not a conger and the angler hazarded a guess that it was a ling.

WITH ROD BENT TO DANGER POINT

as quickly as they had come on. None too soon, as it happened, for we had been hard at work and lunch-time was long past.

Something less strenuous seemed indicated, so up came the anchor, out came the trout spinning rods and off we went to the pollack grounds.

LEFT: A LING WHICH WEIGHED 35LB. FIVE HOURS AFTER BEING CAUGHT. CENTRE "WHACKING THE GAFF INTO HIM." RIGHT: A 28LB. CONGER ADDED TO THE LING

Ten minutes elapsed, hard work all the time, and frequently we expected to see the rod snap. The fish was now close to the surface and we could see it was a good one, but it was still full of fight, and not until the boatman (to use his own words) "whacked the gaff into him" was it beaten.

A ling it was, and our 28lb. steelyard was not big enough. Weighed five hours later it went 35lb. The gaff had done a good deal of damage and the fish had lost a lot of blood. Had it been weighed at the time of gaffing it would have registered several pounds more.

No sooner had the hook been removed than it was noticed that the rod the boatman had put over was bumping the deck, so, for a change, its owner took a hand and was soon busy playing a good conger. However, a good rod and a heap of muscle soon told on the fish and within a few minutes it was gaffed—28lb. exactly. Several more ling from 7lb. to 14lb., and a few more pouting were secured, and then the fish went off the feed

October days are short and it was not long before the Silver Cloud was on her way back to harbour. Not a bad day; 296lb. of fish, including fourteen "specimens," and 2cwt. of them caught in one-and-a-half hours.

HANDCRAFT.

L'ENVOI

So he goes out, 1938; and not many fishermen, perhaps, will wish him God-speed, for there must be few who have found him a merry companion, bringing gifts which carry fragrance or one whose sojourn has left an aroma of pleasant company. Salmon fishers, of all rodsmen, have had reason to complain of the inequality of this year's gifts. Spey, it is true, had some notable fishing in the spring which carried on until high water in August brought the inevitable "black out" from the peat drains at its source; and neither Dee nor Tweed, nor Tay had anything to complain of, seriously, save that the spring was too fine for good fishing. Of autumn, least said the better.

But the west coast streams, most of them been faced with something very like stark tra a catch on the Wye scarce running into four and further west, in Devonshire, the river almost as well have had a close season this su all the sport they gave. The year in fact more prolific of wordy warfare among f than of fights with fish. But if it fosters of inquiry into why some streams shou plenty while others go short, instead of a t to "put the blame on the sea," it may p service in the long run.

Trout fishermen will part with the year, not h willingly, perhaps, than the salmon fishermen, but at least with less rancour. In the south there will be recollections worth retaining, and worth refurbishing, too, over the winter fireside; for during all that spring drought the chalk streams ran full and plenteous like granaries after a bumper harvest, though dusty and sparsely-cropped fields gave a burnt-up look to the countryside within the length of a meadow from their banks. One of the London area streams, the Mimram, gave good fishing the season through, and save, perhaps, in Berkshire, which has suffered woefully in recent years from some mysterious depletion of its springs, most of them were little affected till September brought a sluggish current and their trout reflected its mood.

Here, again, the difference in sport on one or another stream of the same type invites investigation. Why should the little Mimram in particular record so good a season? There have been individual record catches to a rod elsewhere, but, if one may take club waters as a fair sample of the season, there has been little "to write home about."

This stream has been "renovated" recently, its intrusive rush beds removed, its too-abundant silt washed clear. Is it that nowadays we allow too much weed to clothe the bed of the river, and that a lesser crop and more clear gravel would give better hatches of fly? Or is it simply that a clearance which removes some of the underwater feed makes trout perforce take more notice of the surface fly which requires more energy to catch?

Drainage authorities which do not yet seem to have got beyond the stage of regarding water as some kind of dead matter which only requires mechanical handling, have caused more heart-burning among fishermen than perhaps any former authority on our rivers. But are not anglers themselves rather to blame in the matter? If the warnings which were given at the time the Drainage Bill was passed had been taken to heart, sufficient opposition would have been forthcoming to insist on an effective control of these bodies. Even now there is apathy, hopeless apathy, over the suggestion to establish central watershed authorities which will have power to override any one authority on a river whose activities are carried on without regard to other interests. If the present resentment of the high-handed action of Catchment Boards this year results in a combined effort to get this reform enacted, 1938, though unwept and unsung, may yet have played a worthy part in the improvement of fishing.

"OF ALL THE ORDERED ACTIVITIES OF THE NATION, THAT OF AGRICULTURE STILL REMAINS THE MOST FUNDAMENTAL"

AGRICULTURE AND ECONOMY

The Place of Farming in National Prosperity

OF all the ordered activities of the nation, that of agriculture still remains the most fundamental, though its importance in the national economy has been seriously overlooked during the past eighty years. The tremendous growth of our mercantile and industrial interests has overshadowed its claims to attention, and the result is that if to-morrow we were cut off from our overseas supplies of food starvation would be near. Our general outlook on the relative importance to national life and well-being of industry, commerce, finance and agriculture stands in urgent need of revision; and the time is now over-ripe for the framing and execution of a bold, consistent, but not inflexible, policy that will raise agriculture from its present slough of despond and enable it to make a better contribution to the health, wealth and security of the nation.

We must guard against such nebulous phrases as "Ensuring the agricultural industry its *rightful* place in the national economy." That phrase means exactly nothing unless we know or can agree upon what is the rightful place of agriculture; partisans of every differing policy naturally think that their policy is the "rightful" one.

Also, that agriculture must be allowed to develop along its "natural lines." If this means that we are to adopt a policy of *laissez-faire* and that agriculture should be allowed to reach its own level, it will be a very "dead" level in an over-urbanised economy like our own. Moreover, the word "natural" seems entirely out of place, for, as Liebig pointed out a hundred years ago, all agriculture is essentially artificial.

No, the only way out of the present *impasse* is to think and talk concretely, and to evolve a policy based upon facts and with a definite objective or objectives in view, for unfortunately we cannot speak of one objective, because a peace-time policy must, to a considerable extent, run counter to a war-time policy, and in a peace-time policy we have to choose between one that will result either in maximum food-production or in maximum employment of labour. In view of the very disturbed international situation, I suggest that the paramount consideration at present is to improve our position in regard to the production of home-grown food.

But before entering on this thorny controversial path, let us review some of the facts regarding land utilisation, food production, agricultural labour and international trade.

Of the total surface area of the United Kingdom, some 60,000,000 acres, just over half is under crops and grass. In addition there are over 18,000,000 acres classified as rough grazings, which are at present practically useless for agricultural purposes. Seventy per cent. of these 18,000,000 acres is in Scotland, but even in England and Wales to-day there are 5,500,000 acres. A fair proportion of this acreage could be made productive by draining, liming, cultivating, and the use of fertilisers; and much of our permanent grassland, which has been so neglected, could be improved and rendered more fertile by similar means. Professor Stapledon says we have about 16,500,000 acres (equal to 43 per cent. of the land surface of England and Wales) in a more or less neglected condition, much of it absolutely derelict, but every single acre of it capable of radical improvement. There is therefore plenty of land available for increasing food production if we wished to do so.

Of the present cultivated area in the United Kingdom, 58 per cent., or 17,500,000 acres, is under permanent grass and 42 per cent. (12,500,000 acres) under the plough. The decline of the cultivated area, which has been especially marked in recent years, has been brought about not only through agricultural land becoming abandoned and derelict, but also owing to the encroachments of the builder, the road-maker, and of Government and local authorities for aerodromes, open spaces and recreation grounds. In the last ten years the latter causes have accounted for a loss of 810,000 acres of cultivated land, which is equivalent to a loss of 222 acres a day.

The most significant change in land utilisation during the past 80 years has been the shift from arable production to grassland production. Taking England and Wales only, the arable acreage has declined from over 14,500,000 acres in 1866–73 (the first period for which official statistics were collected) to 8.9 million acres in 1938—a decline of 40 per cent. During the same period the area under permanent grass has risen by 39 per cent.—from 11.4 million acres in 1871 to 15.8 million acres in 1938. The largest decline in arable land has been in the areas under wheat, barley and swedes. In the 1850's over 4,000,000 acres were under wheat; in the 'seventies about 3,500,000; in 1931 (the lowest ever) 1.2 million, and in 1938, 1.8 million. Since 1868, the decline in wheat acreage has been 75 per cent. in the "grazing" counties and 55 per cent. in the "corn" counties; to the whole cultivated land it contributed 10 per cent.; it now contributes 3 per cent.; and its value is only 2 per cent. of the annual value of all farm produce.

The story is much the same for barley. In 1876–80 we had 2,250,000 acres of it, to-day we have only 0.9 million (886,000 acres). Between 1914 and 1938 the barley acreage decreased by 41 per cent., that of oats by 32 per cent., that under turnips, swedes and mangolds by 57 per cent. The areas under wheat and potatoes have not changed substantially since 1914, but that of sugar-beet has risen from 4,000 to 328,500 acres. In sum, since 1914 the land under the plough has declined by 2,000,000 acres, one-quarter of which—500,000 acres—has been lost since 1932.

Compared with 70–80 years ago, the chief changes in the livestock population of England and Wales have been a great decline in sheep numbers, a good increase in the cattle population, and of late years a great increase in the numbers of pigs and poultry.

In comparison with 1868 the cattle population of England has risen by 44 per cent., mainly owing to a remarkable expansion of the dairy in[dustry] in comparison with 1914, the dairy herd [in 1938] was nearly 19 per cent. larger and a[bout] 12 per cent.

The sheep population of England and [Wales] decreased by more than 25 per cent., [but the] decrease has been accompanied by a shift [from the] "corn" counties to the "grazing" coun[ties], numbers in the latter having risen from 51 [per] cent. of the total. Since 1914 total sheep [numbers] have remained practically stationary at 17,2[00,000] to 17,500,000, but breeding ewes have increas[ed by] 22 per cent.

The pig numbers in England and Wales were 2,319,000 in 1871–75, 2,430,000 in 1911–15, but 3,348,700 in 1938—a gain of about 40 per cent. Poultry supplies before the War were estimated at 38,800 tons (57 per cent. of total supply), and after the War at 45,900 tons (63 per cent. of total supply). Between 1921 and 1938 the fowl population has increased from 25 to 52 millions, approximately.

From the standpoint of natural food supply, the increases in livestock production do not compensate for the loss of home-grown cereal food, because when man eats animal food he obtains only a fraction of the energy that is present in the growing plant upon which the animal feeds. Moreover, a considerable proportion of the meat and other animal products we now produce at home is derived from imported feeding-stuffs; and the population has just about doubled during the past 100 years.

Concomitantly with the shift from arable to grassland farming, there has been a marked decline in the number of agricultural workers. It should, however, be remembered that the *proportion* of the population working on the land has been diminishing with the growth of wealth from the earliest times. Sir Daniel Hall has told us that "the whole history of English land reflects the continuous withdrawal of the countryman to the opportunities of employment in business or manufacture, because there he hoped to obtain a better living or better chances of rising. The motive has always been economic."

Since 1871 the number of farmers and their relatives has remained practically constant, but the number of employees has fallen to about one-half. In England and Wales in 1871 there were 1,073,120 men and women engaged in agriculture, other than occupiers; in 1938 there are 589,500.

A particularly disturbing feature of recent returns has been the great decline in males under 21 years old—from 182,548 in 1921 to 95,800 in 1938. Although, in the main, this drift from the land has been due to economic pressure, the attraction of the town being more potent than the necessity for leaving the land, much agricultural labour has been lost by the conversion of arable land into grass, by the increasing use of machinery, and by the lack of financial resources of many owner-occupiers and tenant farmers. The incentive to use as little hired labour as possible has been intensified of late by the fixing of agricultural wages, irrespective of the income derived from the land.

There is a large and growing opinion among all who have the welfare of our country at heart that the intensified drift from the land must be stopped, that we as a people are much too urban-minded, and that national health and national fertility and national security all demand an adjustment of the balance between the rural and the urban population. And if it is not possible greatly to increase the number of those who work on the land (to-day it is 6 per cent. of the employed workers) something could be done to bring the town to the country, to decentralise some of our great national industries, and to spread the population over the land.

In a rational world a country would grow the kinds of food it was best fitted by nature to produce, export any balance, and import those foods that were more economically produced elsewhere. But not even Dr. Pangloss could maintain that the world is ruled by reason to-day; primitive instincts, *e.g.*, self-assertion, accretion, &c., dominate national activities, with the result that autarchy, or national self-sufficiency, is the ruling policy of many—and particularly of the aggressive, nations.

With war and fear of war in the ascendant, we are bound to make provision for a possible future entanglement, and as a nation now marches on its stomach quite as much as an army so walked in Napoleonic times, we must consider our sources of essential foodstuffs and devise a policy that will reduce the fear of starvation to a low point, and as far as possible make it fit in with our peace-time requirements. The possibility of war accentuates the importance of agriculture in our national economy.

In the United Kingdom we now produce at home 23 per cent. of the wheat and flour we consume, 48 per cent. of the meat, 21 per cent of the sugar, 7 per cent. of the butter, 21 per cent. of the cheese, 23 per cent. of the raw fruit, and over 50 per cent. of the eggs in shell. In milk, as well as in potatoes and oats, we are practically self-supporting. The

f's we import come from all parts of the d a considerable proportion of them from ountries, which provide us with almost f the wheat and one-quarter of the meat ne.

l we produce at home about 40 per cent. od requirements, and in time of war this t suffice. We could increase production taking more land into cultivation and by ng the fertility of land already cultivated. uld be physically possible to double this e of 40 per cent., especially if we altered our taries, but from the point of view of present-day conomics it might well prove disastrous.

The wealth of this country has been largely built up by exporting manufactured goods, by lending money, and by performing such services as shipping, banking and insurance ("invisible exports"). Nowadays, many nations are producing at home what they formerly imported, and they are competing with us in the world markets. Their standard of living and, therefore, their costs of production are in many cases lower than our own, so that to compete with them we must reduce our costs to the bone; and this implies keeping wages as low as possible. To the wage-earner the cost of food is the most important item in his family budget (though rent often runs it close); therefore, say the industrialists, the cost of food must be kept down at all costs; we must import it from countries where it can be grown or produced more cheaply than in Britain; and we are bound to import it to pay for our exports and services.

This is by far the most important economic problem that faces us to-day. It is true that our export trade, our income from foreign investments and loan services have seriously declined, but we want to save what is left of them, otherwise our standard of living will decline.

Therefore, under present conditions a limit must be set to the production of home-grown food, at least in peace-time. But war-time requirements must also be considered. Expert agricultural opinion in this country is pretty well unanimous that we could increase our proportion of home-grown food from 40 per cent. at any rate to 50 per cent. and perhaps to 60 per cent., without causing a revolution; and the question then arises, what crops should we grow and how much of them. We cannot wait until war is declared, for increasing agricultural production is a slow business. Nor can we leave it to the farmers themselves to make the choice. They are not as a class *au fait* with economic facts in spheres other than their own (any more than the townsman is *au fait* with agricultural economics), and as they receive much assistance from the public purse (something like £40 millions per annum in one way or another) it is only right that the State should to some extent call the tune.

The need of a policy is, therefore, urgently necessary so that this line of demarcation between the food we are to grow and the food we are to import, say in the next ten years, may be decided upon without delay as the first step in a consistent long-term agricultural policy; and the matter should be decided by the Government after taking the advice of the very best men available. The facts of the present situation are known; no long inquiry by a Government Commission or tribunal is necessary.

The Government itself should decide, but only after having considered the views of expert authorities. Such authorities should be selected from any walks of life, including, of course, agriculture and commerce, for their intelligence, knowledge, and detachment, but above all for their foresight and good judgment. Naturally the views of such men would vary, *e.g.* on the time-honoured, but still very important, problem of Horn *versus* Corn, *i.e.* of the relative importance of livestock and cereal cultivation, but with good will, detachment from party politics, and our vaunted genius for compromise, the conclusions they arrive at should not be too contradictory to enable the Government, aided by representatives of the Dominions, Colonial and Foreign Offices, to reach a decision and formulate a practical, fairly long-term policy, rigid in its few fundamental principles but flexible in details, before the winged chariots of war descend upon us.

Home agriculture has been too long neglected to justify any further delay; the problems of peace are nearly as urgent as the prospective demands of war, and those who fail to meet or solve them should be dismissed from the exalted positions they occupy.

This article gives an idea of some of the fundamental issues at stake, of our neglect of agriculture in the past 80 years, of its vital importance to national life, and of the urgent necessity for the provision of a reasoned, coherent, national agricultural policy. It is surely time to segregate such fundamental problems from the pettifogging pucrilities of party politics and to consider them from the standpoint of national and imperial welfare.

AGRARIAN.

WATCHING THE RETRIEVERS WORKING THE MARSHES AT MARGAM CASTLE

FIELD TRIALS

The Retriever Championship

MANY have been the acts of kindness shown to field trial societies by Captain Talbot Fletcher in the past, but nothing could quite equal his generous action when refusing to allow this fixture to be put off. Though laid up in Scotland by illness and unable to come South, he insisted upon the meeting being carried through at Margam Castle, Port Talbot, on the same successful lines as in 1936, and that hospitality should be given to everyone as before. His absence was a great disappointment and another absentee was the president of the society, Lorna Countess Howe, who was unfortunately prevented from coming by her doctor's orders.

The meeting took place on the 14th and 15th, and after all the continuous rain that had fallen in the district it was a relief to experience a perfect day when a start was made for the marshes where the trials were held. The tests here were severe enough, especially the retrieving of duck from the reedy swamps where no dog lacking in courage and perseverance could hope to succeed. Handlers themselves required some of the former at times!

Taken all through, the work on the first day was not quite up to championship standard. It improved on the second when rain fell heavily, though this failed to damp the ardour of either owners or handlers, many of them, including several ladies, being over their knees in water a good part of the day.

There were fifteen entries, but fourteen starters, all of which were given further trial on the second day, at the end of which the judges considered their verdict, and came to the conclusion that they could not separate Mr. R. G. Heaton's yellow Labrador bitch Cheverells Amber and Mr. Leopold Lonsdale's Labrador Greatford Shy. They were of the opinion that it would be unfair to either, if one was put over the other. Neither had made any mistake, and both deserved the honour. Cheverells Amber was handled by R. G. Leach and Greatford Shy by Mr. Hugh Peacock, who are the quietest and best of handlers. The winners were more stylish workers than the rest in the award list, all of which made mistakes of one kind or another. F.T. Ch. Braewy Ruddy, belonging to Mrs. Macpherson, who had come all the way from Aberdeen, was third, another yellow Labrador who had won that club's open stake at Bedale Hall on her way South. Two golden retrievers filled the fourth and reserve positions, Mr. Walker's Hazelgilt and Mrs. Hextall's F.T. Ch. Avishay's Brush.

ERNEST TURNER.

The final awards were:

THE RETRIEVER CHAMPIONSHIP, 1938.—Equal 1st, Mr. Leopold Lonsdale's Labrador b. Greatford Shy and Mr. R. G. Heaton's yellow Labrador b. Cheverells Amber; 3rd, Mrs. May K. Macpherson's yellow Labrador b. F.T. Ch. Braeroy Ruddy; 4th, Mr. Cyril Walker's golden retriever Hazelgilt; reserve and diploma of merit, Mrs. H. H. Hextall's golden retriever Avishays Brush. Diplomas of merit: Mr. Leopold Lonsdale's Labrador b. F.T. Ch. Jubilee Jane, Mr. H. Wentworth-Smith's golden retriever b. Quick of Yelme, the Hon. Mrs. Hill-Wood's Labrador Hiwood Mike, Lieutenant-Colonel C. Heseltine's Labrador b. Walhampton Judy, Major R. G. Sharp's Labrador Punch of Clava.

UTILITY GUN DOG SOCIETY

By kind permission of Sir Merrik Burrell these trials were held on December 16th and 17th at Knepp Castle, Horsham, Sussex. The judges were Messrs. H. A. Saunders, C. Campbell and G. Woodger.

ORDINARY MEMBERS' STAKE.—1st, Mr. E. G. Crosswell's Labrador Rough Beech Bran; 2nd, Mr. G. Hallett's Labrador Oakwood Jock; 3rd, Mr. John Cady's Labrador b. Belle of Airlour; reserve and award of honour, Mr. S. J. Ling's Beeding Maxim. Certificates of merit: Mr. A. E. Butterfield's Labrador Donald Duck, Mr. M. G. Carter's Labrador b. Plover.

HONORARY MEMBERS' STAKE.—1st, Miss A. M. Bickerton's Shelsley Niky; 2nd, Mr. Lewis G. Beaumont's field spaniel b. Saxpence of Skerries; 3rd, Sir Clive Baillieu's golden Labrador b. Golden Wattle; reserve and certificate of merit, Mr. F. J. Nettlefold's Mystic of Uckfield; certificate of merit, Major F. Erichsen Davies's Rakelands Copper.

YELLOW LABRADOR CLUB

THE Yellow Labrador Club's All-aged Stake was competed for at Bedale Hall, Yorks, on the 9th and 10th inst. The judges were Captain Medlicott, Captain J. Steel and Dr. Stanton. First prize went to Mrs. Macpherson's F.T. Ch. Braeroy Ruddy and second to Mrs. E. W. Brook's Kinmount Polar, whose handler, D. Johnstone, took the handler's first prize. Mr. A. Wormald's Knaith Bolt won the Pavenham Challenge Cup, being bred and handled by owner. The thanks of the club are due to Mr. and Mrs. Oliver, who so kindly helped them by providing a ground, the original meeting having been cancelled. Weather conditions were good and the arrangements excellent. No outstanding work was done, but all the dogs in the awards put up sterling performances, there being some good water tests.

A. W.

ALL-AGED STAKE.—1st, Mrs. M. K. Macpherson's b. F.T. Ch. Braeroy Ruddy; 2nd, Mrs. E. W. Brook's Kinmount Polar; 3rd, Mr. A. Wormald's Knaith Bolt; 4th, Mr. R. Hunter's b. Braeroy Fairy; reserve and certificate of merit, Lord Middleton's b. Birdsall Anna. Certificates of merit: Mrs. A. Wormald's b. Knaith Brill, Captain W. G. Heymann's Rockstead Footprint, Mr. L. Harvey's b. Race.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

VEGETABLES and grasses—such as herbs and salads—provide us with a wonderful range of foods quite sufficient to keep us in health without ever tasting either meat or fish. They are really the only form of food that is absolutely indispensable to our lives, because they are the only means that we have to get in their proper form the different salts from the earth which are not food in themselves and yet are quite as important to our organism as the electric switch that must let the current in before we can hope to get any light or power.

The more usual vegetables upon which we rely for our daily meals may be divided into three groups, according to whether we eat their roots, tubers or bulbs; their shoots, stems or leaves; or else their seeds or fruit. The first are mostly in season during the winter or early spring, the second during the spring and early summer, and the third during the late summer or early autumn.

Among the vegetables of which we eat the roots or tubers, the potato has pride of place: it is a most admirable vegetable, not only because it has in and within its skin so much nutriment, but because it lends itself to so many culinary adaptations, all different and most of them ever so good. There is no friend in the kitchen like the potato, new and not so new, large or small, to be relied upon all the year round, unless it be the onion, which is not a root nor a tuber, but a bulb which grows on the surface, closely attached to the soil, but in sight of the sun. The onion is the family name of a very large tribe, all possessed of a strong nasal family likeness.

Among the roots proper there are the two very great favourites, the carrot and the turnip; there is also the parsnip, the only vegetable which I dislike; and there is the salsify, one of the best and one that deserves to be better known. There is also the Jerusalem artichoke, which all know, and there is the celeriac, or turnip-rooted celery, which is not nearly so well known.

The next group is a much larger one, since it includes the immense cabbage family, which could fill a large book with the names and description of their many varieties, just as they are capable of filling a large house with the last expression of their personality when they are boiled. Then there is the noble asparagus, the more homely and admirable leek, and there are all the salads, the different sorts of spinach, sorrel, and other leafy vegetables.

Among the last group, that of vegetables of which we eat the fruit or seeds, there is a battle royal for the first place between the beans and the peas: the beans have numbers—and strings to pull—on their side; but the peas can claim to be so much sweeter. There is also a comparatively speaking newcomer that has blushed its way to the front—the tomato. There are also the large number of cucumbers, marrows or squashes, melons and pumpkins, and now a variety of maize, or sweet corn, which is capable of maturing its seeds in some parts of England.

Six and Eightpence

"Meredith, I want to make my will. My fox-head scarf-pin to my Uncle Philip, unless he remarries. My collection of film stars' portraits, autographed, I leave to the Mess. To my faithful butler, Albert Hawkins, the contents of my cellar . . ."

"But, Lord Henry, isn't this rather sudden? It was only last night that I chanced to catch sight of you in Regent Street on the roof of a taxi-cab, sounding a fanfare on what appeared to be a hunting-horn."

"Don't remind me of it, Meredith. If you only knew how I feel. Not a morsel of food has passed my lips since a brace of devilled bones at three a.m."

"I am indeed sorry to hear that, Lord Henry, but in all my long experience I have seldom known a hangover prove fatal. Are you not cognisant of Rose's Lime Juice?"

"I think so, Why?"

"Because the said Rose's, whether taken as 'Gin and Lime' or consumed before bed, does, by virtue of its therapeutic properties, neutralise the after-effects of alcohol and render hangovers null and void."

"Is this true, Meredith?"

"I am speaking, Lord Henry, as your solicitor."

"Thank you, Meredith, from the bottom of my heart. You have given me fresh hope. Believe me, when I *do* come to make my will you shall not be forgotten."

SHORT DRINK—2 parts Rose's, 3 parts Gin.

LONG DRINK—add soda.

FIFTY YEARS AGO

From the *Field* of December 29th, 1888.

STINGINESS in Sport. "Hunting is a sport which, to a skintint, admits of stinginess on the face of it. The stingy man will give little or nothing—certainly nothing proportionate to his means—as a subscription to the Hunt. Then there are frequently little calls made upon a gentleman's purse, tips to men opening gates, catching or holding horses, and the like. The stingy man either nods sulkily and rides off, or he smiles pleasantly and leaves someone else to pay. . . . If a man will insist on giving three-halfpence for flies when he may have the best in existence for twopence each, or in purchasing doubtful gut because it is a trifle cheaper than the best, he deserves to lose the best fish of the season because his fly-dressing draws off the hook, and to see fish after fish break away on the best day of the year, since his gut was half-rotten when he fastened it on."

Hunt Steeplechasing. "A great number of hunting men share Assheton Smith's dislike to steeplechasing; while many more who are in happy possession of a good hunter, do not care to run the risk of making him fidgety, too eager in the field, or too quick at his fences; and altogether it may be doubted whether any great proportion of hunting men care one way or the other about steeplechases (except, perhaps, Point-to-Point ones) beyond attending them as pleasant *réunions*. Then with regard to devising any plan whereby the bold and *bona fide* hunter should be put on an equality with a regular trained steeplechase horse, we do not see, as we have contended before, that it is possible. Make the courses as stiff as you please, and the steeplechase horse can be made as good a jumper as the horse used for hunting. He will jump as high and as wide: in fact, the open ditch, as at present constituted, taxes the jumping powers of a horse very considerably as, by reason of its height and its width, it can only be properly cleared in having some pace on: in fact, it would stop a great many men were it encountered in the hunting field, not being an obstacle to be jumped 'in turn' with three or four yards run."

IN THE SALEROOM

A NUMBER of interesting Old Masters were sold at Christie's on November 25th, the property of the Rt. Hon. the Viscount Hampden, the late Mrs. S. L. Barnard, and others. "A Young Warrior," by Rembrandt, fetched £252; a fine Dan De Cappelle, "The Mouth of a River," £1,050; a Cuyp, "A View of Veere-on-the-Scheldt," £525; "A View on the Guidecca, Venice," by Guardi, £682 10s.; and the outstanding price for a typical river scene by Salomon Van Ruisdael, a master whose works appear to be at last properly appreciated, fetched £2,520.

The William Randolph Hearst collection of silver from St. Donat's Castle, sold at these rooms on December 14th, fetched good prices, considering what the market has had to absorb lately, and, fortunately, the museum authorities were able to obtain three of the most important pieces. The Boston Oar, the well-known silver-gilt mace in the form of an oar, by Benjamin Pyne (1725), was purchased for £1,100, with donations from the National Art Collections Fund, and the Boston Trust, for presentation to the Boston Museum, Lincs.; the Commonwealth peg tankard and cover, by John Plummer (York, 1657) was purchased for the Victoria and Albert Museum, and the famous Pusey Horn, illustrated three weeks ago, was also given to this museum, having been purchased for £1,900 by an anonymous donor. The great mace and sword of the ancient corporation of the City of Galway, made by John Clifton (Dublin, 1709) although reaching £1,950, did not realise the reserve, and so was withdrawn. It must have cost the owner a big figure. The total amount realised, £41,882, proves at any rate the value attached to fine, genuine, old silver.

A NATURALIST NOTEBOOK

I LIKE seeing the New Year in. N accustomed manner with dancing a ment, but silently and by myself. stand in the quiet dark and listen to th bells. It is a solemn occasion this passin this birth of a new year with all possibilities for happiness, for tragedy.

* * *

Once I lived in a village that had but one and that rather tinny—so we had no peal. Th I would stand at the garden gate, and borne ove marsh and estuary, borne over meadow and stream, I would hear the peals from two villages. Simple peals, but the distance added dignity; and in the still darkness with no soul moving and the quiet of miles broken only—and then rarely—by the mewing of a gull or the soul-reft cry of curlew, those peals were thrilling and intimate as no man-made sound can be in the clear light of day.

* * *

Now I listen to peals that are peals, and all around are men making merry and the mechanised throbbing of modern life; But I listen in my heart to the old tune peals, and I think—as I used to do—of the year that is passing, the sorrows and the joys and the fears that were in it, the opportunities missed and the opportunities seized; of new friends made and of old friends gone—as surely as the year is going.

* * *

And each year in the darkness I make resolutions, most of us do, I imagine. All of us should. And I think sometimes of the resolutions I made last year and how soon they were broken. Each year I make certain resolutions that are nobody's business but my own—small domestic resolutions that I try very hard to keep; and each year I make others. Some probably are very similar to your own. I wonder how our records would compare?

* * *

Each year I resolve to keep a diary. I first made the resolve when I was thirteen and in my first term at my public school. I keep the diary all right, but I have yet to complete a full year of entries. My first diary lasted a fortnight, and then life became too complicated. In my first year at the university, fired with ambition and the absolute certainty that I was on the threshold of a great career and that posterity would be glad of my earlier thoughts, I bought a diary with a whole page to each day; a fine great tome, an ornament to any bookshelf; it has three completed days, a telephone number or two, the address of a girl whose name means nothing to me now—and then life became too complicated.

* * *

Last year I had a diary with but four lines to the day. More or less I kept it going until the beginning of October, and then life became much too complicated, and much too full. But this year I am going to keep a diary. I am going to fill in every one of the 365 days—I hope. So good for one's strength of will.

* * *

Another resolution which I make each year and break in the first week of January, is to smoke less. And, of course, there are many more. Indeed, writing in December, I wonder why I trouble to make them, and even as I wonder, know that I shall make at least two more (to keep a diary and cut down my smoking) as 1938 joins its resolutions and 1939 dawns.

* * *

It seems a foolish business, this making of good resolutions. But I do not know that it is. I think it is a good thing to resolve—it would, I admit, be better to keep the resolve—because it shows that just for a moment we realise that we are not perfect. I am not at all sure that I would be perfect if I kept a diary and if I gave up smoking altogether. I fear my resolutions would have to go much deeper, and I should have to keep them all. And that would be horribly dull. There would be no good resolutions to make.

* * *

This year, again, I shall listen to the bells, bidding farewell and welcoming, and maybe in the stillness I shall hear the movement of small birds turning in their sleep, and the cry of curlew. I shall sense again that utter loneliness which belongs to man alone in the small hours. I shall think again of the chances and the trials, the joys and the fears, that have been my lot in the past twelve months. I shall look forward.

* * *

And as the bells cease, and their echoes die away in the solitude of the marsh, I shall turn and go indoors, and to my study, and open the first page, boldly lettered January 1st, of my diary, and look regretfully at the tobacco jar and the empty pipe (for it is already January 1st), and climb to bed.

B. V-F.

ETTERS TO THE EDITOR

BBITS AND AGRICULTURE

I have read with some interest and some ent your correspondent's letter, "Rabbits riculture," and I can see that although he es indubitably an abundant local knowledge he rabbit question "from his end," here parently his knowledge ceases, and as so very ten happens in such cases, he allows his own personal knowledge to be sufficient for him virtually to lay down the law and to state facts which, although they may apply to his particular case, do not in fact cover the general circumstances of this "trade" at all.

To write about "the cost of producing pests" is to suggest that rabbits are deliberately encouraged to breed in order that they may be trapped and sold at a profit; which to anyone with the slightest practical knowledge of the subject is farcical. I believe I am right in my contention that the true position may be stated as follows:

All persons owning, farming or, in fact, possessing such rights over any land where there may be a quantity of rabbits realises that he has, perforce, to destroy them, and to do so costs him a varying amount according to the quantities which have to be killed. Against this cost he endeavours to sell them to the best of his ability, using such means as may seem to him best. His trapping may start in October or November when, owing to the vicissitudes of this unfortunate climate, he is lucky indeed if 50 per cent. of his marketed rabbits pay him the cost of killing. During cold or frosty weather his returns may improve, but this frosty weather and possible snow is all against his being able to trap at all and his marketable quantities decrease. Shot rabbits, from the point of view of a food item, are practically valueless, and he is, therefore, not in a position to take advantage of any increased prices. He is, therefore, extremely lucky if he can pay his expenses during the season, let alone make a profit.

The rabbit does, without doubt, meet a demand in the poorer districts of large cities for a cheap food, as well as a good food variety from meat and fish, and as such should be encouraged.

One cannot reckon upon the prices of rabbits obtained by shopholders in suburban or good-class districts where overhead expenses, delivery, &c., are an extremely costly item. One must judge by the hundreds of thousands sold daily from costers' stalls and barrows in places comparable with the Commercial Road—the East End of London—or such districts as Woolwich, &c.

I have been in the "trade" many years—at the very heart of the "industry"—and I have never before heard of "rabbit producers." There are very many rabbit dealers in the country, but not one that I have ever heard of who can earn more than a few pounds a week out of some thousands of rabbits which he may buy from farms, &c., or from the estates where he may contract to supply trappers.

The suggested "organised rabbit industry" does not, to my knowledge, exist. Nor does any "rabbit producer" exist, other than the gentleman who does so from a hat. And there is very little likelihood of the rabbit increasing in value unless some better demand is created for rabbit skins. However, if your correspondent imagines that he can "produce" and market the rabbit as a profitable business proposition he will soon be overwhelmed with enquiries, but he will find few, if any, financial backers. Too many fingers have already been burned in this "fire." The "rabbit producer" is at present making the best of a bad job, and a very poor best at that.

Yours faithfully,

Smithfield, E.C. 1. ERIC H. BROOME.

CLOSE SEASON FOR WILD DUCK AND GEESE

SIR,—There is in existence a Bill, sponsored by my Lords Mersey and Ilchester, which seeks to extend the close season for wild duck and geese of all species.

Amongst other entirely laudable objects, the Bill aims to prohibit the importation of dead wild duck and geese throughout the close season—a provision which will be welcomed by all fowlers, amateur and professional alike.

With regard, however, to the close season, which it is proposed to extend to August 15th and from February 15th, no distinction is made between migratory, unpaired wigeon and geese, and duck such as mallard, pintail and teal, which are paired by the end of January at the latest.

As any wildfowler knows, it is often only in the second fortnight of February that we, in this country, get a cold snap that gives the punt-gunner and shore shooter his real chance of getting a good bag of wigeon. The unfortunate fowler is rapidly being driven from the best marshes in the country by the increasing, and presumably necessary, demands of the R.A.F., and is now prevented from shooting at the very time of the year when he may hope to make up for the innumerable blank days during the rest of the season.

As soon as I heard about this Bill, I wrote to Lord Mersey suggesting that the close season for mallard, pintail and teal might well start on February 1st instead of 15th, but that it was unnecessary and undesirable that wigeon and geese, which did not breed in this country, should be included.

In a reply received at the time, his lordship states that "it is hoped to be able to pass the Bill into law by the end of the session, and in the circumstances, I am afraid that I cannot be a party to introducing amendments to it at this stage."

I would suggest that this Bill, which has received but little publicity, is being smuggled through Parliament without the knowledge of most wildfowlers, whose interests, as usual, have been entirely neglected. I feel it possible that if more shooting men were aware of the proposed alterations some opposition might be organised, and an amendment exempting non-breeding species tabled when the Bill comes before the House of Commons.

Yours faithfully,

Greylag Farm, Upchurch, Kent. JAMES JUSTICE.

A.R.P. FOR DOGS

SIR,—The article by "Canis" has much interested my Society, as for nearly three years we have maintained that to equip dogs with gas masks is little short of criminal, unless the animals, as in the case of war messenger dogs, are specially trained for the purpose. Furthermore, such masks, costing as they do several pounds, are beyond the purse of the average dog owner.

It has always seemed ridiculous to this Society to attempt to protect dogs' lungs when their feet and bodies might be exposed to contamination by mustard gas. A number of box devices have been submitted to us, but we are against their employment as some dogs are liable to excitement which may lead to hysteria, if they are put in a confined space. Further, there is the grave risk of the owners becoming casualties and the dogs being left to starve and unable to escape. Undoubtedly a properly designed box would be of considerable assistance in certain circumstances, but it must not be forgotten that the Government has not only issued gas masks to the public, but it has also urged the use of public shelters, wholesale evacuation, household gasproof rooms, &c., from which one can safely assume that we have not only to fear gas, but what is worse—the high explosive and incendiary bomb. It would therefore be foolish to stress the importance of protecting animals from gas only; in fact, it would be analagous to the action of the ostrich in putting his head in the sand.

This Society's policy has been directed towards advising owners of dogs to take their pets with them into their gasproof room or, better still, into the household bombproof shelter. We are quite aware that many people are unable to have bombproof shelters in their gardens for the simple reason that they live in flats, and for cases of this kind we have in hand the formation of a scheme for the transportation of dogs from urban areas to rural districts or to special shelters in the country. During the recent crisis, we had made arrangements for one shelter alone in the West Country to take 1,000 animals. We are, moreover, collecting the names and addresses of people who are willing to take dogs and, what is of almost equal importance, to assist in their transport.

It will be understood that much of a scheme of this kind must be dovetailed with local Air Raid Precautions, otherwise means of transport stand a fair chance of being commandeered when a moment of emergency arises.

The R.S.P.C.A. cannot be blind to the experience gained in different parts of the world where conditions of emergency have arisen. For example, within three days of the earthquake at Quetta, highly respectable and civilised dogs so lost their nerves that they formed themselves into a band headed by a courageous leader and became a serious menace in the town, so much so that these dogs would not hesitate to attack a man, and it is against incidents of this kind that the R.S.P.C.A. is endeavouring to make provision. Such work can only be accomplished in conjunction with the Home Office Air Raid Precautions Department, with which we have been in touch since March, 1936, as well as the veterinary profession and local authorities.

This Society is represented on the Committee formed by the N.V.M.A. for the purpose of dealing with the question of animals and air raids.

Some months before the crisis, the R.S.P.C.A. published a pamphlet entitled "Animals and Air Raids"—during the crisis we disposed of 12,000 copies throughout the country—and I shall be pleased to supply copies to any of your readers who may be interested.

Yours faithfully,

R.S.P.C.A., 105, Jermyn Street, London, S.W. 1. FERGUS MACCUNN (Chief Secretary).

DUCK IN EGYPT

SIR,—The compiling of intentional records of shooting is a matter for no pride to anyone, and as a practice it fortunately died a natural death after the war. Shooting men, I think, however, will be interested in the details which I have just received from Egypt of a bag of duck, made on the Ambassador's shoot at Ekyad, on the 4th of this month. The British Ambassador, Sir Miles Lampson, and nine other guns, shot the astonishing total of 1,658 ducks in a morning. There was no intention to set up a record. It merely happened that the Ambassador decided this year to shoot these famous lakes and marshes a month earlier than usual, and his visit coincided with the migrational rush of duck from Eastern Europe.

The outstanding personal bags were: Sir Miles Lampson, 405 ducks; Saleh Enan Pasha, 230; Admiral Sir Dudley Pound, 208; another gun, 213; Lieutenant-General Sir Robert Gordon Finlayson, 140; Sir T. W. Russell Pasha, 102; Kamel Bey Eloui, 117; and Major John Bowen, about 90 ducks.

Sir Miles Lampson's bag almost constitutes a world record. Mr. M. T. Kennard, however, shot 509 duck to his own gun in Kashmir on February 24th, 1912, whilst the Maharajah, Sir Hari Singh, shot 513 wildfowl to his own gun at Hygam on November 18th, 1922. This total, however, included 43 greylag geese.

It may be of interest to those who contemplate visiting Egypt this year to know that the State Tourist Bureau has made extensive plans for both duck and quail shooting to be placed at the disposal of visitors on different properties throughout the country.

This follows my visit to Egypt early this year when I had the honour of being invited to inspect and report upon the sporting possibilities of the country, which are indeed remarkable and, so far as wildfowl are concerned, equal to anywhere in the world. British sportsmen, I suggest, might do better service to themselves and the friendly relations between Egypt and England by spending their time and money there rather than in the unsettled countries of Central Europe.

Those who are interested should write to His Excellency Achmed Seddik Bey, Director-General of the State Tourist Bureau, 1, Rue Baehler, Cairo, who will make the necessary arrangements.

I shall be glad to supply anyone in London with prior information, if they care to write to me.

Yours faithfully,

London. J. WENTWORTH DAY.

A STRANGE CASUALTY

SIR,—The strange casualty of a hound's tongue being torn out, which was reported in the *Field* of December 3rd by your correspondent, is almost certain to have been caused by a gin trap set in the open.

In West Wales there have been many instances of cattle being found with gin traps on their lips, picked up whilst grazing, and in a few cases even on their tongues, which have had to be amputated.

Gin traps were never intended to be set in this way; and if the law could be amended to prohibit under all circumstances their being set in the open, it would gain the support of every sportsman and sporting paper.

Yours faithfully,

Wappenham, Towcester. C. VAN DER BYL.

SIR,—In answer to the letter under the above heading in the *Field* of December 3rd, I think it more than likely that the unfortunate bitch got her tongue caught by a rabbit snare.

We had an old spaniel caught like this, and were, fortunately, able to release her tongue, but it was a horrid job. My husband says he has known of other cases.

Yours faithfully,

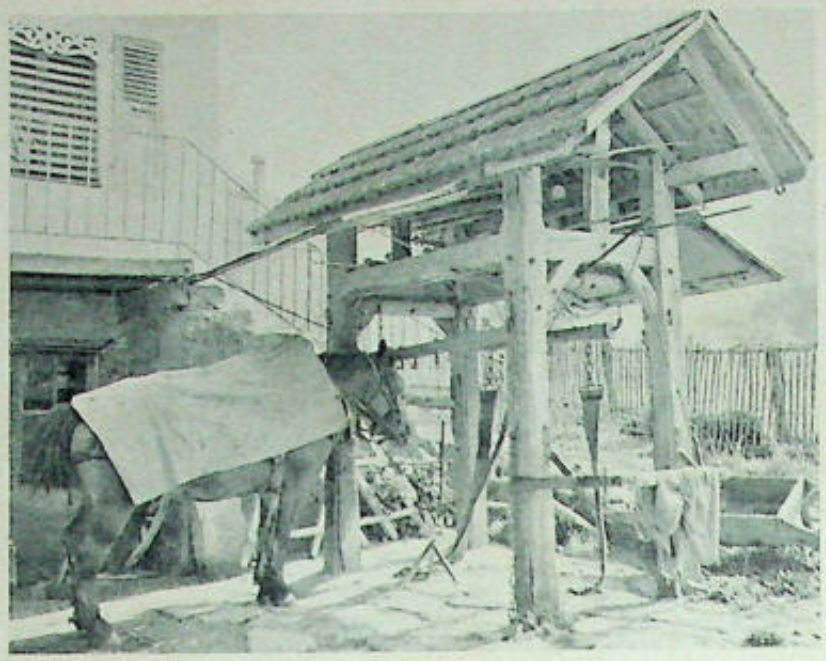
Clunes, Kirkhill, Inverness-shire. M. D. CAMERON.

SIR,—I called the attention of Mr. Greenep's letter, "A Strange Casualty," to a M.F.H. friend, who, having known of two similar cases, was at once ready with the solution.

In my friend's first case, the hound's tongue, badly cut with a rabbit snare, was providentially saved. In the second, a calf which caught its tongue, similarly in a snare, had to be destroyed.

Yours faithfully,

Waterloo, Mallow, Co. Cork. L. LONGFIELD.



WAITING TO BE SHOD
(*See letter "A Horse Shelter"*)

GREEN HECKHAM PECKHAM

SIR,—I shall be grateful if any of your readers can and will give me the correct dressing of a salmon fly called "Green Heckham Peckham." This fly is mentioned on page 37 of Mr. A. H. Chaytor's book *Letters to a Salmon Fisher's Sons* (1910), and also on page 311 of the Lonsdale Library's *Salmon Fishing* (1931), where it is stated that the wing is made of the "blue metallic feather with a white tip from the middle or speculum of a mallard wing covert." But I am unable to find, anywhere, directions for the rest of the dressing.

Yours faithfully,
F. P. LANDON.

Uxmore,
Checkendon, Oxfordshire.

[Mr. J. Bernard's *Fly Dressing* gives the Heckham green as: Body—bright green wood ribbed with fine gold wire. Wings—the white-tipped feather from a wild duck's wing. Hackle—natural light-red cock's. Tail—three or four fibres of the golden pheasant tippet feathers.—ED.]

A HORSE SHELTER

SIR,—The enclosed photograph of a shelter for horses was taken outside a smithy near the village of Dingy, some miles from Annecy, Savoy, France. As the hanging halters show, there is space for several horses, which have shelter not only from rain, but also from the fierce sun, while waiting their turn for shoeing. The roof carries two flaps which can be raised sideways to give added protection.

Yours faithfully,
EDWARD RICHARDSON.

Villiers House,
Villiers Road,
West Bradford,
Nottingham.

SPEED OF SWANS IN FLIGHT

SIR,—It is so seldom that the opportunity occurs of "clocking" the speed of birds in flight, that the following observation might be of interest. Travelling towards London recently on the 10.10 a.m. from Leeds, we picked up five swans near Biggleswade. When first sighted they were some 300yds. to the west of the line and at right-angles to my compartment. Their general direction was the same as that of the train with the line of flight tending to converge on it. To all outward appearances the air was still although smoke from sundry chimneys indicated it might be three to five miles per hour and at right-angles to the line of flight. The birds were in sight for some four minutes and appeared to cross the track at about some 200yds. to the rear of the train. The speed of the train was estimated four times by the expedient of counting the rail joints (indicated by bumps) during a period of 21sec. The speed of the train appeared to be 41 miles per hour, which indicated that the cruising speed of swans in still air is in the region of 37 miles per hour.

Yours faithfully,
A. V. CAMPBELL.

The Farmers Club,
2, Whitehall Court, S.W. 1.

"COBDEN'S MATCH"

SIR,—I have only just seen Mr. Stuart Edwards's letter in the *Field* of October 29th, on the subject of "Cobden's Match," but as to there being any "unsolved mystery" about the last over, I can only say that I was present at the match, and it is all just as clear to me as when I saw it.

Fred Hill, who was at Oriel with me, was batting at the *Pavilion wicket*, and from the first ball of the over he made a very fine *cover drive*, which A. A. Bourne just managed to stop from crossing the boundary, and *one* run was made. I myself was standing within a very few yards of the spot and saw it quite plainly. I am not quite certain who was batting at the other end to Hill, but anyway Cobden "yorked" him with the next ball, and with the following one treated Stewart, the Oxford wicket-keeper (who also was at Oriel with me), in the same way, Cambridge thus winning by two runs.

Yours faithfully,
A. TUNNARD.

Newport,
Berkeley, Glos.

[This correspondence is now closed.—ED.]

AN ANCIENT CIDER PRESS

SIR,—I think your readers may be interested in the accompanying illustration of an ancient cider press that is lying in the grounds of Southam Priory, near Cheltenham.

On first appearance it looks like a small grindstone, but closer examination reveals a stone trough below, into which the juice pressed out of the apples would fall.

Yours faithfully,
ERASMUS E. ELCOMBE.

Sherwood,
Nottingham.

TALKING BULLFINCHES

SIR,—I was interested in the letter in the Christmas number of the *Field* in regard to talking bullfinches. I have one who has a small vocabulary consisting of "Naughty Toby," "Toby Boy" and "Where's Jack?" He also pipes a few n simple tune, though I believe this is quite He was purchased at a local bird shop reared" and I understand was brought chauffeur on an estate in Norfolk. The thing about his talking is that he w "Naughty Toby" and "Toby Boy" after I had him. The word "naughty occurred to me when talking to him. I conclude that the chauffeur had a dog name which was sometimes scolded, as the bullfinch times comes out with a noise which sounds "A-a-ah you!" as one would say to a dog disgrace. I did teach him to say "Where's Jack? choosing these rather unlikely words to prove that he could learn. He is inclined now to run all these words and the tune into one long sentence, if one can call it that. A curious thing is that he will only talk for me and not for my mother and sisters. If he is left alone he calls for us, using two notes, not his natural call, or goes through his "recital" in a quiet, small voice. He bows gracefully during the performance and beats his tail sideways towards one, whichever way he happens to be sitting on the perch.

Unlike the bullfinch mentioned, he dislikes hands intensely, unless one has an apple pip between finger and thumb—a delicacy he cannot resist. Hair fascinates him, and when sitting on one's head he will tug at the hair or eyebrows—rather a painful process. Unfortunately he has sobered down a good deal now; perhaps old age is creeping on (five or six years old).

I would be interested to hear of other cases of this kind should you hear of them.

Yours faithfully,
J. G. F. MOOR.

1, Chepstow Villas, W. 11.

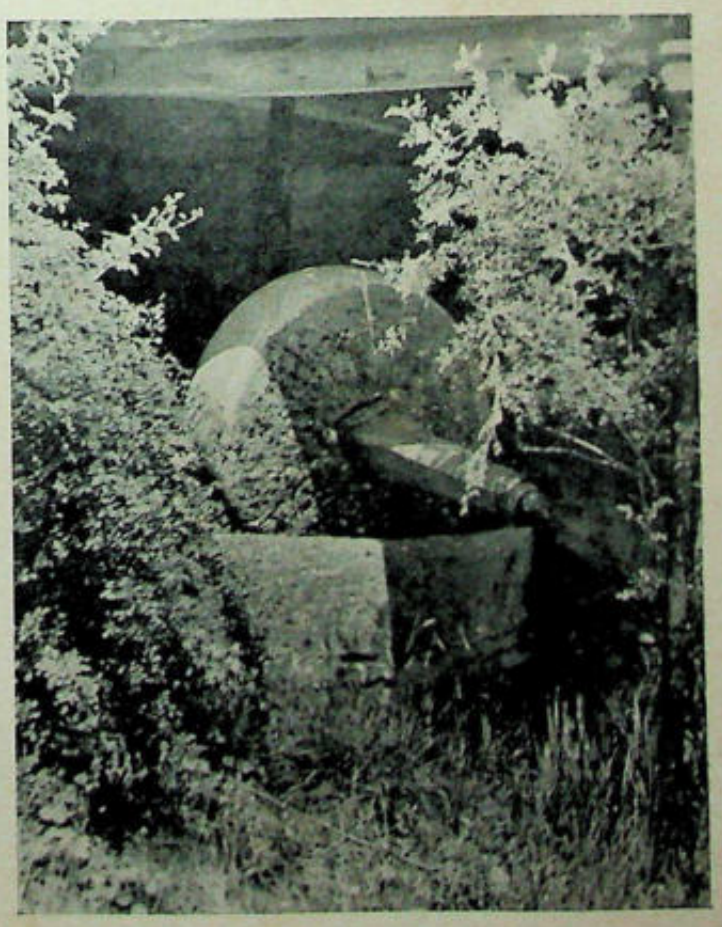
IRISH LOUGHS

SIR,—Though not yet sixteen years old, I have fished for seven years of my life, during the summer holidays in the big lakes of the West of Ireland, chiefly in Lough Conn and Lough Mask. In recent years the trout fishing in the former has grown steadily worse, though I do not think this is due to over-fishing or any resultant decrease in the number of trout. A few years ago when eel-fishing on this lake was a profitable occupation, lines were set extensively, and soon there was not an eel to be caught. Any trout that I have seen caught lately, has disgorged, on landing, a quantity of shellfish and grubs, and at times their sides have been bulging with these grubs. Can it be that the trout are now feeding on what were formerly the eels' preserves, and hence their aversion to flies, natural and artificial?

Another interesting fact is that it is not only the Gillaroo trout which eat these shellfish, but the ordinary brown trout as well, an occurrence which I have never yet come across in any lake, and one would think that these trout would suffer from indigestion.

Yours faithfully,
IUVENIS PISCATOR.

Gloucestershire.



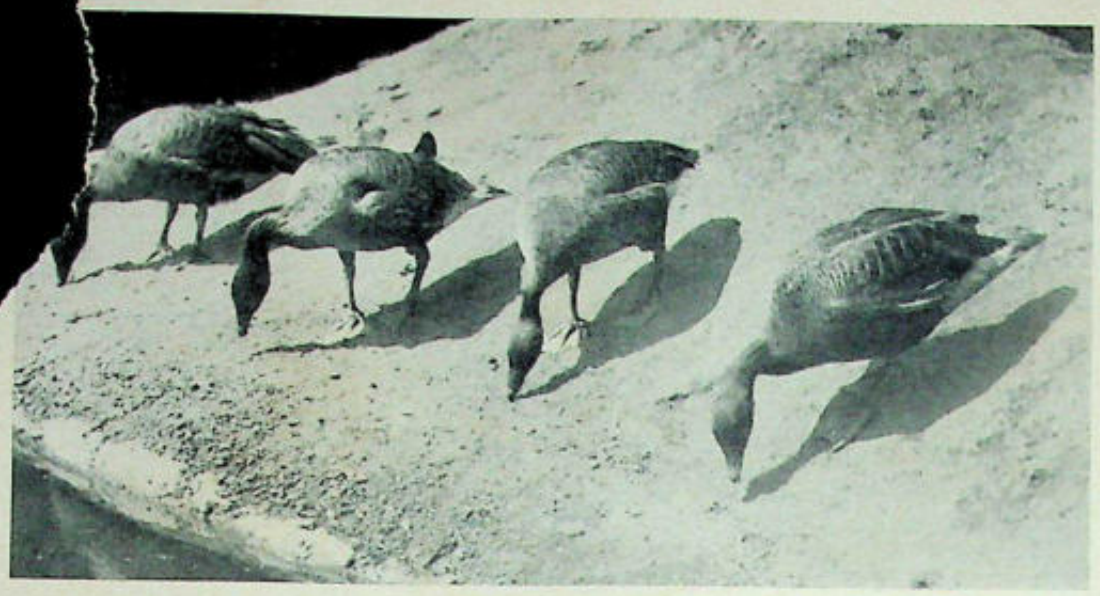
LYING IN THE GROUNDS OF SOUTHAM PRIORY
(*See letter "An Ancient Cider Press"*)

At "First Footing"—

—and other festive occasions, Johnnie Walker is always appreciated for its distinctive flavour and smoothness. Each of the whiskies in the blend is specially chosen and fully matured before blending. That is why, at New Year and throughout the year, you will find that Johnnie Walker is Scotch whisky at its very best.

JOHNNIE WALKER
walks away with it!

BORN 1820—STILL GOING STRONG



PINK-FOOTED GEESE FEEDING
(See letter "A Census of the Pink-Footed Goose in Britain")

"A CENSUS OF THE PINK-FOOTED GOOSE IN BRITAIN"

SIR,—Elaborate preparations have been set out by ornithologists and wildfowlers to calculate the numbers of Britain's commonest wild geese. *A. brachyrhynchus* is an autumn and winter visitor. The object of this desire is coupled with a national fear of a decline. Some of the most careful observers have found themselves beset with distracting circumstances just when conclusions seemed apparent. At a point on the Humber, for instance, a fair estimate of many thousands of geese gathered together was diligently compiled for that day by three observers, and declared to be 15,000. But at the same hour, on the same date, a wildfowler recorded the presence of 10,000 "pink-feet" not more than 20 miles away—from which, throughout the afternoon, his bag was 36. This is an instance of how uncertain is the business of estimating wild creatures.

Bold and decisive calculators have stated that the world's total population of the pink-footed goose is 60,000, and the presence (more or less) here and there is dependent on food and weather. To an extent this is correct, but calculations of this sort are mainly based in such cases upon hearsay, not practical investigations, and by the fact that not long ago it used to be declared "not more than 50,000," this is proof that such estimates are purely guesswork. At the same time, on the most sanguine lines, a nearer calculation than 10,000 of the actual total will always remain contentional, for the all-sufficient reason that species of grey geese intermix at certain places—much as the "pink-foot" holds to itself, and the fact that birds of this species from the continent cause influxes in Britain beyond conception. When the latter condition occurs, however, it has repeatedly been recorded that white-fronted geese, chiefly adults, occur on the east coast of Britain unexpectedly and a few bean geese with them, the latter the rarer.

Names of observers have been withheld; nevertheless tabulations are based on access to almost daily reports from Ross-shire, Aberdeenshire, Perthshire, Firth of Forth, Northumberland coast, Humber district, Wash, Norfolk coast, Essex marshes, all the South coast, the Severn, South Wales, the Dee, Lancashire coast, Solway and Western coasts and islands of Scotland, so that it need be no surprise after 30 years of close acquaintance with this subject, the writer is in a position to pass an opinion. What is noticed in all estimations of numbers is that the individual observer so often decides for himself what his neighbour may readily frustrate. Consequently, unless a reliable collaborated estimate is forthcoming the true value of such a matter is lost.

So far as notes compare, and without giving dates and place names in minute detail, the total census determined and maintained over the last five years is 120,000—just twice that of those figures several authorities on the subject have given. A feature seemingly overlooked is that with this species abundant on the Danish coast and Schleswig-Holstein as well as other Western European shores an influx is at any time possible, though the pink-footed goose practically never goes to Ireland (only four examples authenticated to date); and on this assumption it is believed to be more defined in its winter range than it really is. A reverse condition can take place, and actually does in hard winters, for it is in mild winters in Britain that we have most grey geese within our seaboard.

What comparison of the present census of this bird can be made with that of 40 years ago is a problem beyond solution, because at that time numbers were not collaboratively registered. It is the opinion of those remembering numbers brought to notice at that time (my own recollections included) probably half the numbers to-day known of and witnessed then existed. History reveals that geese in Britain during winter suffered much greater mortality before the days of steamships, railroads, aeroplanes, motor boats and cars, which collectively cause much disturbance, yet at the same time engender but comparatively little destruction. But the mortality of the pink-footed goose in its breeding retreats is almost certainly greater than in days gone by by reason of facilitated communication with and better human conditions in the far north. It is these same conditions which have facilitated the work of the observer and led to ocular manifestations of increase at many of the goose haunts within our kingdom.

Hull. STANLEY DUNCAN.

A NEW USE FOR A BARREL
(See letter "Homes for Owls")

HOMES FOR OWLS

SIR,—A great deal can be done to encourage owls to thrive and multiply by providing suitable nesting accommodation in the form of boxes or barrels. Both tawny owls and barn owls take as readily to these as tits do to nesting-boxes, and are particularly glad of them in these days when the tendency is to cut down old and hollow trees to make room for younger and sounder timber.

The tawny owl is one of our earliest nesting birds. Now, therefore, is the time to rig up barrels or boxes in suitable trees, that the birds may have ample opportunity to find them and grow accustomed to them, and that the barrels and boxes themselves may have plenty of time to weather. The main essentials are that the boxes should be fixed firmly in position, so that they do not move or rock under the weight of the alighting birds, and that a liberal soft bedding of decayed wood, sawdust, peat-moss or other material be provided for the safe reception of the eggs. Owls never supply any nesting material of their own beyond castings.

When the young owlets hatch in due course they may frequently be seen at dusk sitting about the entrance and are entertaining creatures to watch. Barn owls in particular seldom show any fear of human habitations, and it is, perhaps, the barn owl that is most in need of help and protection—since modern farm buildings are relatively inhospitable—and that is responsible for the greatest amount of unmitigated good work.

Yours faithfully,

Westminster, S.W. 1. R. A.

SWIMMING POOL

SIR,—These notes may be of interest if not too late; they are taken from a pool made in this garden in the spring. Length 50ft., width 20ft., depth 3ft. 6in. at each end, sloping to 7ft. in the middle. There is a flat portion at one end, 3ft. 6in. deep, so that children can learn to swim across the bath. Bottom and sides are of 6in. concrete, reinforced on both faces, and rendered inside with ½in. cement finished with pink water paint. (This is wasteful, as it does not show pink beneath the water.)

The pool is set in a lawn, with paths and margins of Noelite paving. There is a grab-rail made of ½in. tube, painted aluminium, at water level on three sides, and a scum channel, with outlets, on the leeward side. There is a diving board and two teak steps. The inner edge of the paved surround is bullnosed. The bath holds 32,000 gallons and fills through a ½in. pipe from the house tanks, which are on the mains supply; it takes 144 hours to fill. It empties through a 4in. pipe and valve, controlled by a long key, at the bottom of a manhole, into the ground, which is of rock with many fissures.

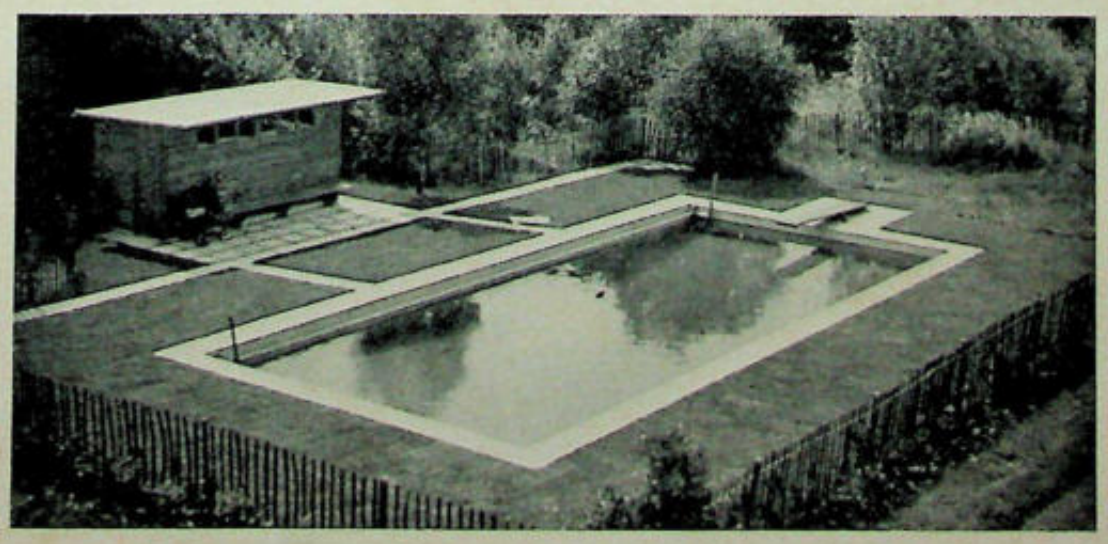
The changing hut, 16ft. by 8ft. by 8ft., is of western red cedar on deal framing, with a flat roof finished with Ruberoid.

The total cost was £450, including excavation, concrete tank, rendering and painting, turf and paving, hut, fence and gates, diving board and steps, water pipe and outlet.

Small quantities of water were let in to replace water overflowing into the scum channel, but the bulk remained unchanged throughout the season: it was dosed twice a week with small quantities of "Chloros."

The photo was taken from the flat roof of the house. Yours faithfully,

Crockham Hill, near Edenbridge, Kent. H. G. C. SPENCELY.



A SWIMMING POOL COMPLETE WITH ALL EQUIPMENT FOR £450
(See letter "Swimming Pool")

RETRIEVER TRAINING

SIR,—Perhaps the enclosed snapshot will interest some of your young readers, who may wish to train their own retrievers. This method of elementary training prevents much annoyance to the trainer, and saves the dog from many of the harsh methods which are liable to become necessary to prevent fur chasing when advanced training and field experience starts.

The system adopted at an impressionable age of the dog adds an advantage often overlooked, as to break from fur chasing by a harsh chastisement method, at the advanced training and field experience stage often destroys the full educational value of what may have been a nice display of working to signals, &c. just previously. It also has a tendency to delay, and in some cases destroy, that mutual confidence which works up in many cases to a wonderful telepathic influence between handler and dog. The rabbit in the snapshot has become so accustomed to puppy training that he often goes to the fall of a dummy and sits by it until a puppy retrieves it, and very often he will sit "stop" when a whistle order has been given to a puppy.

Yours faithfully,

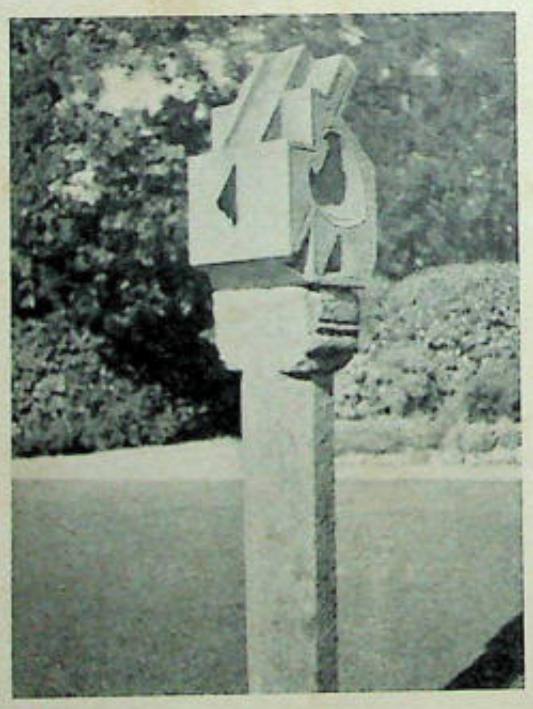
Wherstead, Cannon Lane, Maidenhead. ROBT. E. CHAMBERLAIN.

KINGFISHER TACTICS

SIR,—In our small garden, about 15ft. from the dining room window, there is a trough 2ft. 6in. deep, 2ft. wide, and about 16ft. long, full of water plants and goldfish. This pond has to be artificially filled, but the fish like it, and breed in it. For some time we have noticed that the small fish have been vanishing, although there have been no dead ones coming to the surface. A little while ago we caught the culprit at his work. A kingfisher comes and sits on the stone in the middle, and after, I suppose, choosing his fish, he flies into a very high bay tree a few yards away, from where he swoops through the trough, picking out his fish. I am afraid I prefer him to the fish. As we are on a hill near the main road, with no stream or river for miles, I am wondering if this is not very unusual.

Yours faithfully,

Steadings, Alveston, Near Bristol, Glos. GLADYS I. MOREL.



ONE OF THE THREE BEST IN SCOTLAND
(See letter "An Old Sundial")

AN OLD SUNDIAL

SIR,—I enclose you a photograph of an old Scottish sundial. I believe one of the three best examples in Scotland.

I am anxious to know what the diagrams on the faces mean.

Yours faithfully,

Olives Manor, Wadhurst, Sussex. ANDREW HAYDON.

THE OTTER'S CHAIN

SIR,—In reference to the article on the otter's chain in the *Field* of October 29th and in subsequent letters, there is one fact which the writers appear to have overlooked. An otter uses only his hind legs and feet when swimming. The front feet are tucked under the chin, and are only used in conjunction with the rudder for turning.

During this last summer I went to the London Zoo to watch the otter which was in one of the ponds. In the clear water her movement could easily be seen. I noticed that when the otter first submerged a large bubble appeared between the shoulder blades, which gradually dispersed

AN AMUSING ELEMENTARY TRAINING
(See letter "Retriever Training")

in a thin stream of bubbles. At the same time a stream of smaller bubbles ran back over the head reaching the surface slightly in front of the bubbles coming from the coat. After a short while the air from the coat was exhausted and only a thin stream from the head showed. I should say that I could not actually see the air being expelled from the nostrils, it appeared to come through the hollow between the eyes. This I think would be in accordance with the shape and position of an otter's nostrils.

I believe the reason why the chain is sometimes visible and at others non-existent, is that the otter, when hunted, swims as near the bottom as possible.

In deep, cloudy water, the tiny bubbles never reach the surface but are absorbed by the water.

I have had some experience of otter hunting, and can state definitely that every time I have actually seen an otter beneath the surface I have also seen his chain. On many occasions when hunting deep, thick water, the otter has passed without a sign.

Yours faithfully,

Burcombe, Hangersley, Ringwood. BRYAN L. DAY.

THE PRESERVATION OF RURAL BEAUTY

SIR,—I was most interested by the sincere and valid article in a recent issue of the *Field* on the preservation of the English countryside. All the points you made rang with perception and honesty. However, I would like to criticise one point made, namely, that on public apathy.

In a stolid country like ours any idea, to achieve fulfilment, must be "boosted" strongly, with all the possible weapons of propaganda. I am afraid that the preservation authorities have not done this enough. You cannot, therefore, accuse the public for the decay of the countryside entirely. I am confident that a more concentrated advertising policy would repay itself doubly. For example, the question in its basic ideas is non-party; interest, therefore, the newspaper proprietors of all papers, left or right. The working man is not acquainted fully with the facts. Given this enterprise, then you will achieve results.

I hope this letter does not strike you as being too pompous. I have an immense enthusiasm for the crusade you are fighting, and would love to help in any way I can. I shall be glad if anyone will kindly furnish me with information towards that end? I am sure that a victory in this problem would assure a better England and a better mentality amongst all classes.

Yours faithfully,

Union Society, Oxford. A. F. MACDONALD.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1. A very respectable old couple need a helping hand during the autumn of their lives. Mr. W. was a nickel-plating supervisor working with one firm for 24 years. He is now nearly blind, though not eligible for a Blind Pension. The wife of 64 is a delicate woman with nerves strained by the effort of making both ends meet. They have no children. Their home is a little house in North London, for which they pay 13/5 weekly, and they let one room for 7/6 weekly. Apart from this sum, they have only the husband's old age pension on which to live, so that their balance is 4/1 for all necessities. Please send us donations towards the 5/- weekly we want to collect for these old people. £13 needed.

FELL HUNTING IN LAKELAND.—The copyright of the photograph of the Blencathra Hounds in Newlands Valley, which appeared in our issue of December 17th, belongs to Messrs. Maysons, Photographic Artists, Keswick. We regret that the name of the photographer was not printed underneath the block.

IN THE CITY

BY OUR CITY EDITOR

A DEFINITE improvement in the steel trades is confidently expecte 1939. This results very largely decision on the part of steel manufacti reduce prices somewhat drastically from Jan

The use of steel during 1938 has been on a scale, but manufacturers more than twelve mo ago entered upon very substantial forward co tracts owing to a belief that supplies would be shor as a result of rearmament requirements. There has been no shortage of iron and steel products.

Manufacturers, however, have been living on their stocks. There has been no need to re-enter the market for additional supplies. Prices for iron and steel products had been fixed for the whole of 1938. There was, therefore, no inducement to buy ahead, especially as there was every possibility of lower prices for steel products.

Stocks in the hands of manufacturers are now believed to be comparatively small. New buying is to be expected. In fact prominent members of the industry have predicted steel production in this country comparatively soon on a level equal to the peak reached in 1937.

Iron and steel shares, like many other securities dealt in on the Stock Exchange, have been definitely reactionary. It is possible to buy shares in this section to-day to give yields well over 6 per cent. on the last dividend basis. Several dealers I know in this particular section are distinctly hopeful concerning their market for the New Year.

Shipbuilding companies should benefit considerably from the reduction of 7/6 per ton in the price of steel plates. It must be admitted, however, that there is distinct slackness in the shipbuilding industry. Foreign competition, in many instances subsidised by foreign Governments, is particularly keen. There are certain companies, however, in this country which can look forward to reasonable business for some years to come.

One such firm is Swan Hunter & Wigham Richardson. It has contracts on hand for the Admiralty and has been successful in securing important orders for merchant vessels from the Turkish Government. The company paid in all 9 per cent. for 1937.

Interim for 1938 has been raised from 3 per cent. to 4 per cent. This need not necessarily mean a dividend for the whole year in excess of 9 per cent. It does, however, indicate that the company is working successfully. The £1 shares are valued around 27/3. This means a yield of £6 12s. per cent. I consider a higher price warranted.

Another important shipbuilding firm is John Brown & Co. This concern has made very material progress in recent years. Total dividend to March 31st, 1938, was 17½ per cent., free of tax. Interim for the current year has been maintained at 5 per cent., tax free. The 10/- ordinary stand around 30/6, which compares with a top in 1937 of 41/3. Yield on the last dividend basis is as much as £5 15s. per cent., free of tax.

Hadfelds 10/- ordinary shares appear to me as offering good prospects at the present price of 28/6. It is true that this Sheffield firm is very largely engaged on rearmament work. This point must naturally receive consideration. There are prospects, however, of substantial earnings for several years to come.

The company paid two dividends totalling 22½ per cent. for 1937. Interim for the current year has been repeated at 7½ per cent. At the end of 1936 the company distributed a special bonus of 10 per cent. That came from reserves. Reserves are still large, and there is just the possibility of a further scrip bonus later on.

Taking the shares on dividend alone, the yield at the present price is as much as £7 18s. per cent. Such a high return naturally indicates the speculative character of the shares, but I think that a few put away for a time will bring good income and possible price appreciation.

CONDOR CONTENTMENT

In 1925 Dr. Burgess Barnett presented a male condor to the Regent's Park Zoo, and through thirteen years it has played the bachelor; for whereas most other birds were able to enter into nuptial bliss owing to the plurality of their kind, the condor remained alone—unwept, unloved, unsung. Fate decided that in a Peruvian cave a nestling should be found, and that it should be sent to the London menagerie. Thus it is that bachelordom is to cease in the condor cage for the new arrival is an eligible young female. Although these birds are carnivorous and have the enormous wing span of about 10ft., they are of a peaceful nature, and it is probable that the thirteenth year may be marked by contentment for the old condor, and not ill-fortune.

Books

INSULAR INFECTION

The Wanderings of a Modern Robinson Crusoe

ow an Island. By R. M. LOCKLEY. ; 10/6.)

N years ago Mr. Lockley went to live on the uninhabited island of Skokholm, off the coast of Pembrokeshire. He rebuilt the ruined ouses and produced some sort of order out of the more immediate chaos: and then paid a brief visit to the mainland to get married. He and his wife—a lady of great courage and commendable initiative—settled down to a life of farming and bird-watching.

Either you like islands or you don't. Most Englishmen have some liking for the sea, but the love of small islands implies far more than that. It means that you must have a liking for solitude—and more and more people in these days like crowds—that you must have a love for wild creatures, that you have no dislike for hard work, that you have the spirit of adventure so strongly developed that what would mean boredom for the ordinary run of civilised man means excitement for you, that in fact you have a fondness for the Robinson Crusoe type of existence. Mr. Lockley has all these things, and so, obviously, has his wife.

He tells here the story of his settlement on Skokholm—of the joys and hardships of the early days to the comparative luxury (certainly comfort) of the present. But he was not content with one island. (Islands get into your blood, and Mr. Lockley was soon thoroughly infected.) He started exploring other islands; and this book is the result of these explorations.

First Grassholm and its gannetry, which he and Dr. Julian Huxley made famous with their film "The Private Life of the Gannets," and then Ramsey, separated from the mainland by the fiercest of fierce tide-rips; and then Bardsey which is, as you know (or may not know: I did not), the resting place of 20,000 saints.

And soon he was going further afield—to the Blaskets, of course, where he arrived in time to see Peg Sayers, the third of its Irish authors, crowned with laurel for writing the best island book of the year. And after the Blaskets to Heligoland, to study bird-ringing as carried out by Dr. Doost.

And then up North—to Fair Isle and Ronaldshay, and Hestur and Koltur (which are in the Faroe Isles) and to Heimaey (which is in the Westmann Islands off the coast of Iceland). A noble pilgrimage.

All these islands are inhabited by nice people, pleasant and easy and simple, living so close to Nature that they have time and thought only for the essentials of life. And by birds. Mr. Lockley knows birds and knows how to write about them accurately, yet simply (which is not so easy or so simple as it sounds) and charmingly.

This is a very good book. It holds the attention from the very first word, and it is well illustrated with photographs and fifteen extremely good maps (I liked the maps as well as anything). I hope we shall have another island book from Mr. Lockley. He might visit Tory Island, for example, and work down the west coast of Ireland. B. V-F.

Varieties of British Butterflies. By F. W. FROHAWK. (Ward, Lock & Co., Ltd.; £2 2s.)

The vogue of collecting aberrations or "freaks of Nature" by entomologists is comparatively new. Less than half a century ago naturalists were content to fill their cabinets with rows of typical butterflies and moths, either by breeding them in captivity or catching them on the wing. Now all this is changed. Entomologists specialise in certain families of butterflies, getting as many different local forms as possible from various parts of the British Isles, and examining thousands daily during their period of emergence for variation in the markings.

In Mr. F. W. Frohawk's new book, *Varieties of British Butterflies*, a galaxy of some of the finest and rarest aberrations in lepidoptera have been presented in the most perfect way possible. Each insect has been hand painted with infinite care by Mr. Frohawk, and, without exception, they have been reproduced in absolutely natural colours. Where an albino butterfly has been figured Mr. Frohawk has adopted the method of "framing" the insect in a delicate mist of sky blue, intensifying the variety in an extraordinary way.

Many of the butterflies figured have quite a history attached to them already, and in the brief notes he writes on each species many interesting and sometimes amusing "stories" are recorded. It will be noticed with satisfaction that quite a good percentage of the finest varieties reproduced in these pages are now in the Lord Rothschild collection, which as many people will know has recently become the property of the nation.

The book is published at 2 guineas, and to anyone who has taken more than a passing interest in our butterflies this is not too high a price to pay for such a unique book. To the serious collector it will be invaluable, as it will help him classify his varieties and guide him as to the various forms which can be found in each species. L. H. N.

* * * *

The Armoured Cruiser, by FRANZ SCHAUWECKER. (Massie Publishing Co., Ltd.; 7/6.)

Naval experts will criticise this book. It starts with a reference to the battle of the Bight of Heligoland, and ends with an imaginative action in which the latest German "armoured cruiser" is sunk, an incident said to be based on Jutland, but more like the sinking of the Blücher. Gruesome details of blood, death and devastation are generously supplied, and the story is mainly devoted to that morbid introspection to which we are led to believe the German warrior is prone, as possibly the result of being told that it is a far, far better thing to die for the Fatherland than to live for it. R. N. R.

* * * *

Horses and Ponies. By LIONEL EDWARDS. (Country Life; 21/-.)

I suppose every reader knows Mr. Edwards's work: it would be waste of time attempting to re-introduce him. But this book is rather different. It is, to begin with, really a sketch book—some of the drawings are very rough indeed, and the range of subject is such as to show that the artist sketched what came before him rather than what he went to see. The book has, therefore, a freshness which I, personally, was afraid Mr. Edwards was beginning to lack. This book is fresh and stimulating. I can imagine no better present for any young artist who desires to make horses his main theme, for here you can see the economy of detail that is so hard to notice in the painting; here you can see how a line or two is all that Mr. Edwards needs to express mobility; here you can see how great an impression the spirit makes upon the artist. And that, surely, is the hallmark of a great artist. B. V-F.

* * * *

Messing About in Boats. By Surgeon Rear-Admiral JOHN R. MUIR. (Blackie; 7/6.)

Most boys dream; quite a number of them dream of adventure and going to sea. The two things are often connecting links in the chain of ideas which, to a young man's mind, constitute real life. One admires the spirit of such dreamers. In their way they are quite right, though the sea labourer must never be confounded with the seaman.

Surgeon Rear-Admiral John R. Muir was more fortunate than some of us. At the age of thirteen his father presented him with a 13ft. sailing boat. In this he learnt that "who hath desired the sea and her excellent loneliness" will never until the day of his death be content with aught else. At nineteen the author became possessed of his first real decked, sea-going yacht. Only determination and personal sacrifice enabled him to raise the cash for her, but looking back I do not doubt he considers it—as he did then—well worth while.

You have only to read *Messing About in Boats* (how I hate that much abused title) to realise that there is more in sailing than simply getting from here to there in the least possible time and with the minimum of exertion. There is, you will be made to see, such a thing as the art of sailing, and the scope of this art is so wide that it is unlikely that the average amateur will ever attain perfection in it.

The problems presented in managing a boat (the author has owned many) are constantly varying and of absorbing interest. And that is why this is such a readable little book. Each chapter gives some new, valuable tip, while the whole shows a grand love for boats and the sea. W. G. L.

* * * *

Bird Sketches. By PHILIP RICKMAN. (Eyre and Spottiswoode; 15/-.)

The first thing I noticed about this book was the absence of a publisher's "puff." And how very wise. Mr. Rickman needs no introduction anyway, and "puffs" so rarely tell you anything worth while and are usually horribly blatant. The publishers have shown a wise restraint. And they have taken trouble over the book, which is most tastefully produced. With one exception the illustrations are in black and white. I like them: they live and were so obviously drawn on the spot. Particularly do I like those of gulls, and geese, and warblers. They have charm and originality, whereas the woodcock—as an example—is orthodox. A book worthy of a place on every naturalist's bookshelf; and on the shelves of those who like fine books. B. V-F.

* * * *

The Flight of Birds. By C. HORTON-SMITH. (H. F. and G. Witherby; 7/6.)

The author modestly claims that his book is "intended to serve as an introduction" to his subject "rather than a comprehensive survey." He contrives, however, to impart an immense amount of information without indulging in technicalities. Types of flight are almost as varied as types of bird, and the successful study of flight in birds demands not only a technical knowledge of zoology but also a technical knowledge of aerodynamics: a further essential is, surely, the opportunity for studying birds in the open. Mr. Horton-Smith has all the necessary qualifications, and combines with them a fluent and not uncharming style which makes his book as pleasant as it is instructive. A good book, well illustrated, and with a useful glossary and a full index. B. V-F.

* * * *

Danger is My Business. By JOHN D. CRAIG. (Arthur Barker; 12/6.)

Few young men have such adventures to record as Mr. Craig. He is a camera man whose favourite haunt is the ocean bed. Dangers are common there, but one of the greatest is fear, and one to be overcome at all costs. The thoughts and technique of a diver are fully described; this is not exaggerated boasting told in high colours, but it is the story of a young man self-trained, mentally and physically, to face dangers in a practical manner. May he live to the ripe old age which he senses in his bones. C. N.

* * * *

BOOKS IN BRIEF

PATRICK TURNBULL'S *Black Barbary* (Hurst and Blackett; 15/-) is no ordinary traveller's account of Morocco. He journeyed off the beaten tracks and visited towns and villages of which we hear little elsewhere. In doing so he became well acquainted with the Berbers, a race whom the author likes and describes well. He also has had first-hand experience of the Foreign Legion. These wanderings are intermixed with history told in a style which interests and informs. There is more in this book than descriptions, and it is well worth studying.

It is always instructive to see ourselves as others see us, but it is not always pleasant. However, with kind Mr. CHIANG YEE that is not the case; he has been charming, and very polite, in his latest book, *The Silent Traveller* (Country Life; 10/6). Having lived in London for the last five years, it is chiefly of London and the Londoner of which Mr. Chiang Yee writes. His pictures are always delightful, but the illustrations chosen for this work are particularly exquisite. Here is an admirer who can see beauty even in our local fog and grime; so delicate is the touch that we are even persuaded to believe that we live in fairyland! So enchanting a book deserves a warm welcome.

A FAMOUS PLAYER OF BALL GAMES

THE death of Reymond Hervey de Montmorency, or rather "Monty" as he was known to generations of ball-games players and Etonians, has robbed the world of sport of an outstanding and most attractive personality such as is becoming more and more rare in these days of specialisation and standardisation in the games we love. The words "ball-games player" are nowadays too often loosely used to describe an expert in some particular form of endeavour, but Monty was that thing *in excelsis*.

As a rackets player he made his mark when he went up to Oxford, at a rather advanced age, after being at Cheltenham and St. Paul's, and he played in the four-handed match with the late "Tip" Foster in 1897 and with R. A. Williams two years later. Though an admirable cricketer he only got his Blue in his last year, on the urgent representation of Dr. Grace, but was an outstanding success in the University match.

Most of his active life was spent as modern language master and later as a house-master at Eton, and to him Eton rackets owed much from 1900 till 1927, the year of his retirement. He had been Captain of Golf at Oxford, and as time went on he became increasingly devoted to golf and for years he was as near unbeatable, especially at Rye, that holiday haunt of schoolmasters, and at Stoke Poges, as could be. Unfortunately, until he retired he was never able to take part in the Amateur Championship as this fell in term time; otherwise there is no doubt whatever that he would have won it more than once. However, he did play against America in 1921 at Hoylake and also for England against Scotland, Wales and Ireland, and for Great Britain in South Africa. Outside the Championship he gained innumerable honours.

With his short swing, that thrust of the forearm and his really glorious footwork he bore the stamp of what Arthur Croome of beloved memory used to call the "reformed cricketer," and his play, round after round, had about it such an inevitability that he was a heartbreaking opponent.

To any of kindred tastes Monty was the most delightful and interesting companion, a perfect host, and his little amiable weaknesses and vanities did nothing but endear him to his friends. Perhaps he was the best foursome player of his time (though he invariably protested that "he did not care for that form of golf"), and that cannot be achieved by a self-centred player. On the death of Horace Hutchinson in 1932 he was elected president of the Oxford and Cambridge Golfing Society, one of the most distinguished positions in the world of golf.

He had been in bad health for some years—he was, in fact, never the same man after the death of his wife—but recently he had seemed to improve and had again been able to play a little golf. Only a month ago I met him at Sunningdale, full of heart and good cheer and looking better than for years past. Now he is gone and his countless friends mourn him, but he had a good life, enjoyed it to the full and he lived it as a straightforward sportsman.

Reymond Hervey de Montmorency was born in India in 1871, the son of Major R. H. de Montmorency, and was he always insisted of Roman descent. He married in 1905 Gwynned, daughter of Lieutenant-Colonel G. T. Thomas and leaves a son and two daughters. J. A. B.

ROSES AND *CLEMATIS MONTANA RUBRA* IN MASS OVER A GARDEN HOUSE

The Country House

ROSES FOR WALLS

Saving the Beauty of the Countryside

By ELEANOUR SINCLAIR ROHDE

ROSES still hold pride of place as wall shrubs, especially those with a long flowering period. The gloriously rampant Mermaid stands in a class by itself, and though commonly listed as suitable for walls with any aspect there is no doubt that this rose is amongst the few that can stand real sun baking and is pre-eminently suitable for a south aspect. Probably this is due to the fact that Mermaid is a hybrid of the semi-tender *R. bracteata*, the Macartney rose. If owners of bungalows would plant it more frequently there would, I am sure, be far less heard of the beauty of the countryside being ruined with these little buildings, which are, after all, not much uglier than the suburban type of house now, unfortunately, as commonly put up in the heart of the country as in urban districts. Mermaid associates delightfully with *Clematis montana rubra* if the latter is allowed to scramble through the rose. This Clematis, like all of the tribe, however, needs shade at the roots, and this can usually be effected by putting some bushy plant in front.

Those grand old favourites, William Allen Richardson and Gloire de Dijon, are still reckoned amongst the best roses for walls, but are far too seldom planted against those of the new houses springing up all over the country. Gloire de Dijon was Dean Hole's favourite rose, and he mentions in his *Book about Roses* that he had one on the chancel wall of his church on which there were 200 flowers in full bloom simultaneously. This rose does best if trained out horizontally as much as possible. William Allen Richardson does best against a west wall, and is most picturesque with the rays of the setting sun tinting its orange petals. Madame Alfred Carrière is another first-class old-fashioned rose that does well against a wall, and it is practically free from mildew. The fragrance of the flowers is exquisite, but the colour is not sufficiently vivid for modern taste.

Many still regard Cramoisie Superieure as the finest of all climbing roses for walls. An old specimen in flower makes an unforgettable picture, but this rose is a slow and rather weak grower. No modern rambler can compare with its deep blood red colour and the remarkable way it lights up in the horizontal rays of late afternoon sunlight. Its foliage is almost evergreen, and it never seems to be afflicted with any disease.

Climbing Caroline Testout is most reliable and very decorative with its masses of silvery pink roses, but its lack of scent is probably the cause of its lessening popularity. It has the merit of being very vigorous, and its abundant foliage is handsome.

Then there are the first-rate roses for walls which bloom only in summer, but nevertheless deserve a place where there is sufficient room for many instead of only a few roses. Apart from the exquisite Banksians, the following are amongst the pick: Paul's Scarlet, Albertine, Paul's Lemon Pillar, Emily Gray and Madame Gregoire Staechlin. Paul's Scarlet is the fiery colour now so much admired; unlike the vast majority of Wichurianas it is rarely affected with mildew when grown against a wall; the foliage and blooms cover the plant almost to the base. Unfortunately it is scentless. Albertine, also a Wichuriana, is amongst the most popular of modern Roses for its early blooming, the beauty of its warm chamois colouring, and its rich abundant foliage. It is, however, rather subject to mildew against a wall.

To many, Emily Gray is the pick of yellow ramblers, for it is a most vigorous grower, the foliage is almost evergreen, and the clusters of blooms are a rich gold. Further, it has a most graceful habit of growth. Against this are the drawbacks that Emily Gray is sometimes not very floriferous, has only one season of bloom, and it is essential if grown against a wall to see that the roots never suffer for lack of moisture in spells of drought. Paul's Lemon Pillar is noted for the size of its blooms, and if pruning is confined to shortening back the lateral shoots and cutting out dead wood this rose is very floriferous. If pruned too much it makes abundant growth but produces comparatively few blooms. The foliage is an attractive pale green of a colour now much in demand for associating with cut roses for indoor decoration. Madame Gregoire Staechlin is, I think, a particularly good modern rose for a wall. It is of Spanish origin, it is deliciously scented, and its bright pink blooms, splashed with carmine, have a charming gaiety. It is vigorous and healthy, and being a H.T. does particularly well against a warm wall.

Certain climbing sorts of various dwarf roses are suitable to grow against a wall, notably Ophelia, Madame Abel Chatenay, Etoile de Hollande and Lady Waterlow. Lady Waterlow is one of the very best for a west wall. Etoile de Hollande is the choice of those who demand a beautiful red rose that does not fade, no matter how fierce the sun that beats on it. The climbing variety has, if anything, even more richly coloured flowers than the bush. It is a vigorous grower, and unlike many climbing sports never reverts to type.

SOIL TESTING—I

HOW is a layman to recognise the diff types? By "different" is meant as regards suitability for plant life week's *Field* I discussed the different explained shortly the characteristics Recognition in the field is a different matt

We are helped by visual examination colour, size of particles and consistency. A case containing a solution of litmus, a small spoon and a pestle will rapidly tell the degree acidity or alkalinity. The type of vegetatio growing naturally will confirm the results.

For obtaining samples of soil at different depths, down to 3ft., a ¾in. auger with a lengthened shaft is most suitable. When bored into the ground it produces successive soil samples every 6in. or so, the soil adhering to the grooves.

In use, the top layer of soil will be seen to be darkened by the humus from decayed vegetable matter for a depth of an inch or more. This vegetable layer is an indication of the state of the soil. A depth of 2in. or 3in. in grassland is the best. Less means that the stored fertility of the soil is becoming exhausted by exposure and consequent decomposition of the humus. A greater depth up to 6in. or more generally means insufficient decay and very acid soil conditions.

In arable land the humus darkening will extend down to the full ploughed depth, owing to the mechanical disturbance. Below will be found the true soil, be it sand, loam, clay or chalk. Its feel to the hand will show the difference between a sandy soil, a silt and a clay. The colour will at once indicate chalk. The more fertile soils are usually dark in colour, and a complete range will be found from a highly fertile alluvial deposit to a light blow-away sand. Depth is important. The soil may gradually merge into a rocky subsoil of the same type, or it may overlay a different type of strata. In either case the question is whether the subsoil is porous.

A soil with a high water-table is indicated by a definite unpleasant smell, a sense of which has to be cultivated. In ironstone districts the height of the water is clearly marked by flecks of iron rust in the soil. In the winter the pushing in of a walking stick causes a squelching and a resistance to withdrawal that is not found in a well drained soil.

Wet soils are usually acid. The soil testing equipment, very small and cheap, and of which particulars can be supplied, is a great help in telling the degree of acidity or alkalinity of the soil. The scientist describes this degree as the Ph value, but the layman will be content with very acid (red), acid (orange), slightly acid (yellow), neutral (green), alkaline (greeny-blue), highly alkaline (blue). The litmus test alone tells very little, but combined with visual examination and a study of the vegetation it is very illuminating, particularly if a question of liming is being considered.

Of all vegetation the growth of bracken is possibly the most indicative of good conditions. Bracken will only grow in a well-aerated soil, which means a soil with a low water-table and of coarse and open texture. It is confined to sands and sandy loams, and where it grows the forester knows he has good planting conditions, with a wide range of species to choose from, including the rather particular European larch. A slight admixture of weak brambles with the bracken indicates a higher water-table, a less well-aerated soil, and for the forester a preference for Japanese rather than European larch. A stronger admixture of brambles indicates a heavier soil with a still higher water-table, until the soil is reached which carries only strong brambles. Here is a heavy soil of clay or silty character and very poor aeration; a soil that will grow good oak, but poor conifers, unless the rainfall be high.

On the other hand, the lighter sandy loams, with their tendency to leach, favour heather rather than bracken, and when an admixture of the two is found, the soil, though well aerated, is light and dry and very hungry. Japanese larch will grow well, but when heather entirely replaces the bracken, then only Scots pine and birch will be planted.

Broom also indicates dry sand or gravel, whilst Dyers greenweed grows on heavy clay, and false brome grass on chalk. Tufted hair grass grows on the heavy loams, whilst acid peats and bogs, though they scarcely need an indicator, possess many, including ling, bell heather, cross leaved heather, bilberry, whortleberry, purple melick grass and cotton sedge. Bog myrtle indicates much water, but not stagnant water.

Highly fertile land of a heavy or medium type grows the common stinging nettle, whilst gorse grows on the heavier, poorer and less well-aerated soil, including clay. The names of woods themselves are frequently indicative of soil conditions. Withy wood is usually heavy and rather wet, sedge wood a bog, bramble wood heavy, furze wood, a clay soil.

REGINALD DAVEY.

This England . . .

The Roman Wall near Housteads

THIS country is not unlike some great brewhouse—into it there go elements of different kinds and out there comes something different—something exclusively our own, made and mellowed in our special way. There was Rome, direct, forceful, making its boundaries with the spade and not the pen. There were the wild Northerners and Jutland farmers with new laws, new customs and new seamanship. Lastly, the solid Norman, building and ordering. Dominants all, yet what they have produced is—England. None of these made England of themselves, any more than barley and hops and yeast make Worthington—it is the craft of brewing, the art of balance and of discard, of slow maturing to a mellow strength, that makes of this very English thing a mirror of the whole.

Brick Pergola

PERGOLAS AND SCREENS

Important Points in Their Construction

By RICHARD SUDELL, F.I.L.A.

WHEN one hears of a pergola it always brings to mind a long shady walk made colourful with the blooms of climbing roses and fragrant with the scent of honeysuckle, but these cool tunnels can also serve a strictly utilitarian purpose. In mild districts they can be used, as they were frequently in the old days, for training vines, while in the more distant parts of the garden, where a formal garden meets outlying woodland, it would be difficult to find a more satisfactory method of linking the two than by a well-constructed timber pergola.

Let us now consider the construction of such a pergola, and first I would point out that timber, however well treated, will eventually rot at its junction with the ground. Moreover, wooden pergolas, especially those of the rustic larch type, soon begin to look untidy, and may harbour injurious insects in the bark. The best advice I can give to those contemplating the erection of a cheap timber pergola, is that the main uprights be of stout 5in. or 6in. diameter poles, the bases of which should be set in concrete in an earthenware socketed pipe. Place the pole in the pipe and then fill with rough concrete, making a sloping weathering around the top. For an even more satisfactory finish it would be better to make a small cut about half-an-inch deep around the pole at the top of this weathering and pack some concrete into it. This will prevent water seeping in between the concrete and the timber and causing rot.

Where the pergola is near the house it should be of a more formal design and construction, and should be in keeping with the architectural style of the building. For example, if the house is built of stone, the pergola pillars should also be of stone, and if of brick the pillars should be the same.

The important point to remember when erecting a pergola of this type is to make the columns well proportioned; avoid the common tendency of making the supports too thin in comparison with the height, thus giving the whole a spidery and unsatisfactory effect.

In dealing with the details of construction, let us consider one of the simple brick forms and analyse the structure of the pillar.

The materials required are about one-fifth of a cubic yard of concrete (a good mixture can be made from sandy river ballast and Portland cement in the proportions of four to one); one-eighth of a cubic yard of cement mortar, made of a mixture of sharp clean sand and cement in the proportions of four to one; about 100 bricks, if possible matching those used in the house; two ½in. diameter mild steel rods, for reinforcing; and a square piece of stone, preferably York stone, to form the cap of the pillar.

A start is made by excavating the ground for the concrete which will form a footing. A hole is dug 2ft. square and about 1ft. 3in. deep, a certain amount of the top soil being retained to replace round the base of the pillar when the work is complete. Mix the concrete well, taking care not to let any dirt get into it, and put it into the hole, and at the same time insert the two steel rods. These, by the way, should be L-shaped, and it is the short arm which is fixed in the concrete. Using a plumb line, adjust the rods until they are absolutely vertical, and fix them with a strut or tie ropes.

Now we come to the part that will try your patience. Assuming that the pillar is to be 13½in. to 14in. square, the bricks will have to be laid in a bond. This is formed by laying the alternate courses of bricks in such a way that the vertical joint between two bricks in one course does not coincide with the vertical joints of the bricks in the adjacent courses. Each course consists of four bricks, and it is important to lay the bricks in this way as a straight joint down the pillar would be weak. This method of brick laying will form a hollow square through which the reinforcing rods project; as the work proceeds this hollow shaft should be filled with concrete to make a solid whole.

I would not recommend making the joints in the brickwork any thicker than ⅜in.; joints larger than this look clumsy and out of proportion to the depth of the courses. Remember, too, that it will give a better finish if the joints are lightly raked out to a depth of half an inch.

The plain brick shaft can be slightly ornamented by introducing three tile or stone courses, say, about 1ft. 9in. apart and 3ft. thick. These should be laid to a bond similar to the brick work and should not project more than ⅜in. from the pillar. This is especially effective in the case of thin pillars of only 9in. square and 7ft. high, as it thickens the shaft and makes the whole pillar more proportionate.

Two of the best materials for the overhead timber work are oak and teak, neither of which require any preservative other than a coat of linseed oil. Both, however, are rather expensive, and a satisfactory result can be obtained by using a cheaper wood, such as deal, provided it is treated with two coats of creosote when it should last several years without attention.

The arrangement and size of the timber work depends largely on personal taste; some people prefer an open framework, and for this I would recommend wood of 6in. by 3in. section. If, however, more wood work is preferred it would be advisable to reduce the dimensions of the main bearers to 5in. by 2in. to avoid a top-heavy appearance. The cross-beams between the main bearers should not be less than 4in. by 1½in., and should be halved into the main bearers to prevent any possible movement.

The end of the timber work can be moulded in various designs, the most common being the "cyma recta," which is formed by joining two opposed arcs, and the "ovalo," formed from a quadrant.

To the owner of a new house with a garden as yet undeveloped the problem of adequate screening is of major importance. For instance, there may be an ugly building or view to block out, and on many new estates greater privacy can be assured by judicious screening.

Even where trees and shrubs are used for the purpose, some temporary structure will be necessary until they reach the required height, and, in this case, a plain deal trellis can be fixed to the top of the existing fence. The materials for this should be creosoted timbers of about 3in. by 2in. section, some 1in. by 1in. battens, nailed to the main framework to support the intersecting laths; and some plain builders' laths, such as are used for plaster work or tile hanging. These should be nailed together to form a 4in. square mesh, treated with creosote, and nailed or screwed to the battens. This type of trellis will last until the living screen is fully grown, and, until that time, quick growing climbers such as *Polygonum Baldschuanicum*, *Ampelopsis Veitchii*, or rambler roses, will add to the beauty and effectiveness of it.

For enclosing some particular part of the garden, such as the kitchen garden, a more permanent and stronger screen can be made by fixing a similar square mesh trellis between brick or stone pillars built in the same way as for the pergola.

THAT TIMID DOG

By A. CROXTON SMITH

EVER since I can remember the nerv has been a bit of a problem to its ow is a source of constant anxiety, espe one wishes to work or show it, and it is eq nuisance in domestic life. Some com observers consider that nervousness is on increase, attributing all the trouble to the st and strain of modern life, which, they argue, affec dogs as much as human beings. Personally, should hesitate to subscribe to these views, not being able to remember the time in which some dogs were not afflicted with nerves.

What we call canine hysteria is a manifestation of recent years in its widespread nature and peculiar form, although disorders of the brain, such as epilepsy, have always been with us, convulsions in puppies have been common for generations, and from time to time dogs have been known to suffer from fits. These attacks, however, were sporadic rather then general, and never had anything like the prevalence that has been attained by hysteria. Those who blame inbreeding or breeding for this overlook the fact that all classes of dogs are subject to attack.

One wonders if this is an old disease that has merely increased in intensity. In an edition of *Diseases of the Dog*, published before much had been heard of hysteria, Muller and Glass described hyperæmia of the brain as characterised by a sudden development of excitable symptoms. "These consist in great restlessness, running around, making frequent changes of position, irritability, a tendency to biting, and attacks of delirium, partial or general convulsions, and an increased activity of the action of the heart. The pulse is quick and irregular, the respirations are short." In fact, they were very much what we should expect to see in a typical case of hysteria.

Apart from this extreme form of nervous excitability, there is no doubt that many dogs do suffer from what may be called nerves, being shy and timid, easily upset by anything strange, afraid of strangers, and distressed by loud and unexpected noises. Fifty years ago we had the same trouble, and one wonders if it is any worse to-day than it used to be.

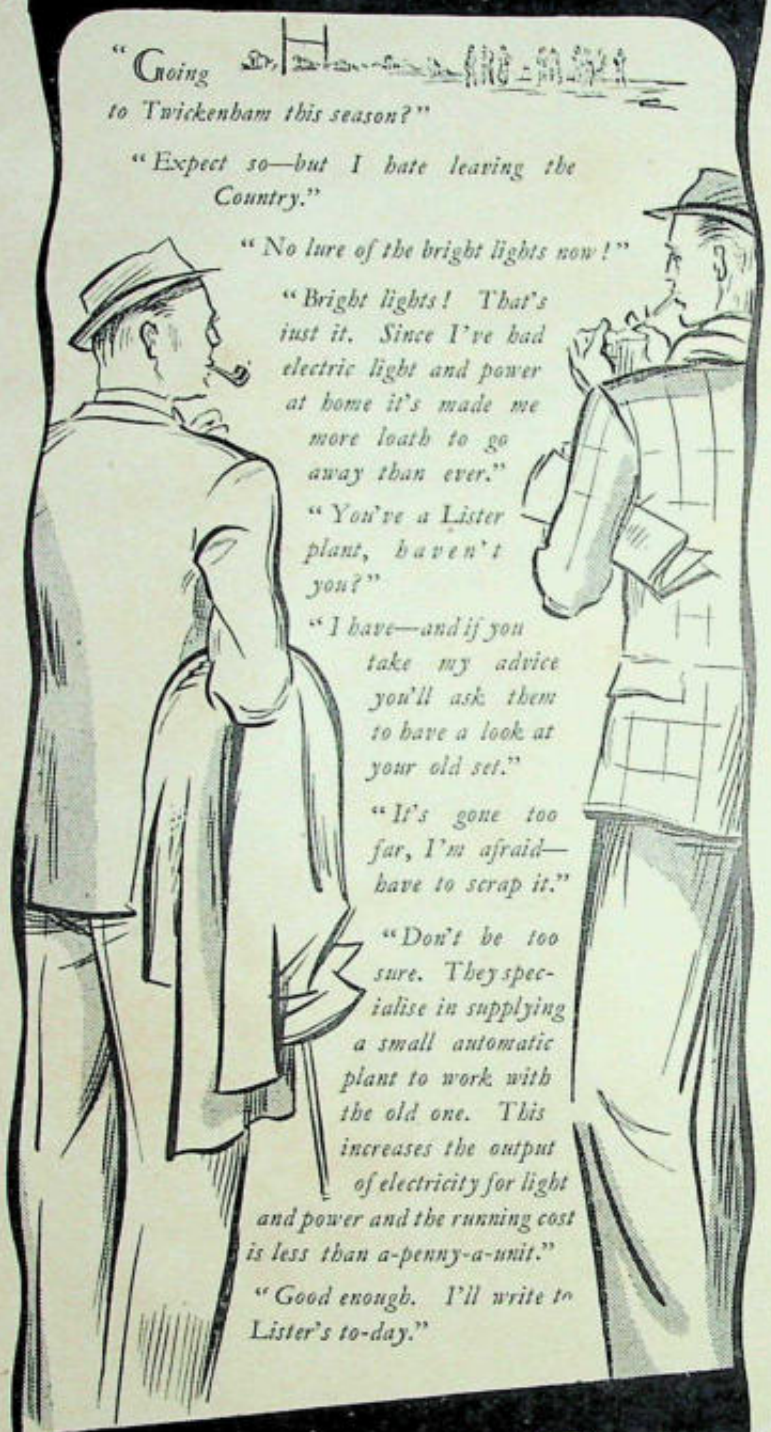
Old readers of the *Field* must have experienced gun-shy dogs long before the younger generation was born, and many dogs display abject terror during a thunderstorm. It is difficult to take them into public places, since there is no knowing how they may behave. They may endanger their lives by bolting on the slightest provocation, or, if on a lead, will make a nuisance of themselves by pulling. In the show ring they are almost hopeless, as it is impossible for any judge to ascertain their good points, notwithstanding the contention of some that a judge should invariably pick out a good dog no matter how it is presented to him. My advice to such critics is that they should have a turn at judging themselves.

In some cases it is possible for a dog to overcome this excessive timidity if he is handled judiciously, but it means the expenditure of time and patience, and exercise of much self-restraint. A blustering manner, rating and scolding, merely make matters worse, and the use of a whip would accentuate the dog's sensitiveness. He should be taken out in public as much as possible and reassured in the language that seems appropriate at such times. Pat him and tell him that there is nothing of which to be afraid, lead him up to any object that makes him shrink, and altogether try to make a "dog" of him.

By these methods I have recently watched an enormous improvement in a dog that for a while was almost hopeless. He was nearly given away on several occasions; now his owners would not part with him for anything. His nervousness, however, may perhaps have been better described as diffidence than inherent. Never having been away before from his home kennels, having no knowledge whatever of the outside world, and not having had his intelligence developed by instruction, it is not surprising that he was stupid and shy. It would have been easy by harshness to have made him incurable, but sensible treatment has got him through a difficult period, and he has steadied down in a remarkable manner.

A YACHT CLUB HONOUR.—His Majesty the King has been graciously pleased to command that the Lymington Yacht Club shall henceforth be known as "The Royal Lymington Yacht Club." The club was founded in 1922, has 500 members, and has been a keen supporter of yacht racing in the West Solent for some considerable time. The commodore is the Hon. Mrs. Cecil Brownlow, the only lady commodore in the world.

Water & Electricity
IN THE COUNTRY - BY LISTER'S



"Going to Twickenham this season?"

"Expect so—but I hate leaving the Country."

"No lure of the bright lights now!"

"Bright lights! That's just it. Since I've had electric light and power at home it's made me more loath to go away than ever."

"You've a Lister plant, haven't you?"

"I have—and if you take my advice you'll ask them to have a look at your old set."

"It's gone too far, I'm afraid—have to scrap it."

"Don't be too sure. They specialise in supplying a small automatic plant to work with the old one. This increases the output of electricity for light and power and the running cost is less than a-penny-a-unit."

"Good enough. I'll write to Lister's to-day."

R. A. LISTER & CO. LTD.,

will send, without obligation an Advisory Engineer to report on an Independent Electric supply or water pumping.

Largest manufacturers of small Diesel Engines in the World

R.S.V.P.

A PROVED WEAR RESISTING PROCESS

For some time all Lister Diesel Engines have been supplied fitted with Listard (Van der Horst Patents) cylinders. This process of chromium hardening increases resistance to wear by 400%.

Owners of Lister Diesel Engines not treated with this process can, when requiring a rebore or new cylinder liner, have existing cylinders Listard processed.

"One can always trust it"

It may look impressive when liqueur brandy is poured from an old, old bottle covered with the cobwebs of centuries, but cobwebs on the bottle mean nothing. Their place is on the cask. Yet it is easy enough to find fine liqueur brandy; brandy that has aged over forty-five long years in the cask. Simply ask for Hennessy X.O.—old enough to be smooth as silk; but with age nicely balancing body and bouquet; and in that you have a rare and very lovely thing—a perfect liqueur brandy. Because, IT'S THE AGE IN THE CASK THAT COUNTS . . . .

PNEUMATIC TYRES ON THE FARM

The Importance of the Right Pressure

JUST as the introduction of power farming methods has altered the whole outlook of many people in the matter of their farm management, so the development of specialised pneumatic tyres for land work is causing a secondary revolution in our methods of power farming itself.

The most fundamental difficulty in producing machines for work on the land is the almost infinite variety of conditions which a single unit is called upon to face, and which upsets all the calculations of the designer, who may have only one set of circumstances in mind when laying his plans. Hence it is that any factor which increases the adaptability of any farm machine is bound to have a practical influence upon its success. It is from this aspect that the advent of rubber into the make-up of farm equipment is of so much significance.

The introduction of the land tyre for the horsed farm cart first demonstrated, as far as agriculture was concerned, some of the advantages of elastic tyres over solid, especially in the matter of draught reduction. The conversion of old carts and the building of new on rubber tyres has proceeded apace. The land tyre for carts has proved durable and thoroughly practical, and has contributed to the reduction of costs by allowing the haulage of larger loads with less effort.

The extension of rubber to the tyreing of tractors, however, has marked a step forward of much greater significance. Not only has it made a very big impression on tractor design, but it has started the move towards rubber-tyred implements.

To deal first with some details of the pneumatic tyred tractor, one must again refer to the importance of general adaptability. One has only to remember the unsatisfactory means which have to be adopted when it is required to move the machine over a hard road. The fitting of road bands over the strakes or lugs is commonly something of a struggle, especially after wear has taken place. The pneumatic-tyred machine, on the other hand, can be driven straight off the land and along public roads without any waiting.

Then there are other matters to consider. The reduction in the draught of hauled vehicles on pneumatics is easily understood by most people. It must also be realised that the same principles are involved in the case of a self-propelled tractor, inasmuch as the pneumatic tyre has a lower rolling resistance than a steel wheel equipped with lugs. To some extent, the reduced fuel consumption which may be looked for in respect of this point has been masked in practice by the fitting of wheels giving a smaller effective diameter than the steel wheels they replaced, but with the 9-in. by 36-in. tyre, as fitted to many rowcrop tractors, good fuel economy is obtained.

When one operates a pneumatic-tyred tractor on hard baked ground in the summer, as on harvest work, one attains a full appreciation of the reduction of vibration as compared with a machine on steel wheels with strakes or lugs. Remembering that it is vibration which is responsible for the start of many metallic fractures, one cannot stay long on the machine without appreciating what the rubber tyre is doing to relieve the strain on the structure.

The traction obtained with rubber tyres is of course the most vital point in considering their performance, and the fact must at once be faced that there are conditions under which such tyres are quite unable, without auxiliary help, to gain any adhesion at all. In extreme conditions one may even find a rubber-tyred tractor unloaded, getting out of control and unable to move itself. On the other hand, it must also be remembered that under equally extreme conditions a steel-tyred machine may become immobile and even track-layers may encounter their Waterloo.

The lesson is that we must interpret our requirements in a reasonable manner, and not ask for equipment which will work under every possible condition. To obtain such would cost more than is justified. And we must also remember that such extreme conditions usually mean that the land is unfit for work in any case. At the same time it must be conceded that there is every probability that rubber tyres will not become universal until the supply of suitable auxiliary adhesion devices has been perfected. There is no doubt that with such a device it is possible to secure the whole available power output of a normal wheeled tractor even under wet conditions. Many people are now exploring the most suitable form for such equipment.

Very large numbers of pneumatic-tyred tractors are now being made and sold, and a recent inquiry rendered it evident that most people who have more than one tractor have at least the second machine on pneumatics. In the United States nearly half the total of wheeled machines produced are so equipped. In this country the practice of having two sets of wheels and changing over for the winter and summer seasons is found convenient in some cases.

It is in the more ready application of rubber-tyred machines for farm haulage that they are of such importance on many of our farms where so much of our labour cost is concerned with the transport of crops and manure. Such costs with horses are apt to be so heavy as to constitute an unbearable burden on the farm, although they are often obscured by other considerations and are not fully realised.

The rubber-tyred tractor is able to handle heavy haulage about the farm at a greatly increased speed and with very great reduction of cost, but to get the best results it is usually necessary to change the method of labour organisation from what was approved when the prime mover was a horse. It is frequently best to let the loaders, who have put perhaps 4 or 5 tons of muck on a big trailer, travel with it and unload in the field, rather than keep them inside awaiting the return of the outfit.

The pneumatic, although more than repaying its higher cost as compared with steel wheels, is not cheap and should not be neglected. In general, durability has proved remarkably good, and I have kept observation on sets which showed but little change in appearance of tread from one year's end to another. While one cannot give any figures on length of life which would be of the slightest value as a general guide, it should be appreciated that life depends very much upon proper care.

The driver should not be unduly rough upon his tyres and can do much to save them from unnecessary wear by avoiding stony places, and so forth, as much as possible. It is in maintaining proper pressures, however, that he can usually do most to preserve the tyre from undue wear. In order to enable the tyre to make a large arc of contact with the ground and so gain the best tractive adhesion it is designed to operate at a much lower pressure than car or truck tyres which are to run on the road. Although this low pressure is allowed for in the make-up of the tyre, it should be evident that too low a pressure which causes exceptional wear on the walls must be avoided. Most makers recommend a pressure of about 12lb. for ordinary land conditions, and this should be maintained and gauge checked at regular intervals. Certainly not less than once a week.

We know that if the land is difficult, owing to looseness of the soil—as in cultivating—or damp after rain, we can improve adhesion by running at a reduced pressure, and it is permissible to lower the pressure to 9lb. or even to 8lb. if the tractor is not a very heavy or powerful one. Below this one should never go, and when bleeding the air out of the tyre to this pressure it should be most carefully checked. Moreover, the tyre gauge itself should be checked against another from time to time. As soon as the abnormal conditions have passed the tyres should be pumped up again to normal pressure.

A device which is likely to become univ
adopted for the work of inflating tyres on
and other farm equipment is a spark plu
known as the Schrader, which takes all the
work out of the job and is therefore l
encourage the driver to attend to it
This simple device, which costs a matter
lings, is a little pump which is screwed
into the orifice from which one of the sparki
has been removed. It is coupled by a le
tube to the tyre to be inflated, and on runnin
engine slowly the driver is able to blow up the
with little trouble to himself.

It is a special feature of the device that the ai
which goes to the tyre is quite distinct from that
in the cylinder. The pump is worked by cylinder
pressure, but there is no mixing of the air sent to
the tyre with that inside the engine. Naturally,
the same pump can be used to inflate tyres on any
other vehicle or implement brought near the
tractor, and it can be employed just as well on a
car or lorry. With the need, however, for frequent
changes of pressure in tractors, the pump should
be carried regularly in the equipment. For road
work, for example, the tractor tyres should be put
up to 15lb. or 16lb. pressure.

The ability to run rubber-tyred tractors satisfactorily at faster speeds than steel-wheeled machines has no doubt led to the development of rubber tyres for the implements hauled. It is now standard practice to build such machines as the smaller reaper threshers on pneumatics, without any alternative. The saving in vibration is a matter of the greatest importance where these complex outfits are concerned, and for the same reason we should benefit by a considerable extension of the practice to our binders.

A POTATO DIGGER HAULED BY A FORDSON TRACTOR. BOTH ARE SHOD WITH DUNLOP TYRES

It is no uncommon thing to see in a dry year the steel bull wheel of binders absolutely knocked to pieces, especially where the land has been left uneven and there is no doubt that such hammering leads to a large proportion of binder breakdowns. The cost of fitting a power binder with a set of pneumatics is not excessive, and would save many costly delays in the field.

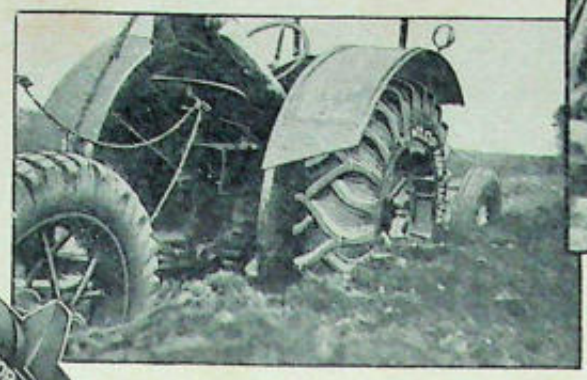
Although the same remarks apply in particular to mowers, which are also being rubber fitted, they do not invariably hold good on all implements of cultivation, yet there is a general tendency apparent, to develop the changeover. It must be remembered that all rubber-tyred implements pull more easily and that on the occasions when they are being moved along farm or public roads, they are subjected to worse jolting than the binder in summer. Hence it is that we may expect to see a big reduction in those casual breakages which too often occur at these times as a result of the coming of the pneumatic. On ploughs, it is found that the rubber tyres have all the advantages mentioned, and, in addition, have less tendency to collect soil on the depth regulating wheels. Consequently it is easier to maintain regular depth without the need for constant readjustment.

There remains, of course, much to be done in this connection, for we are only just starting the change-over, and the movement will receive support which depends a good deal on the standardisation of tyre and wheel sizes, so that these can be interchanged from one machine to another, and so keep them in use for the greater part of the year.

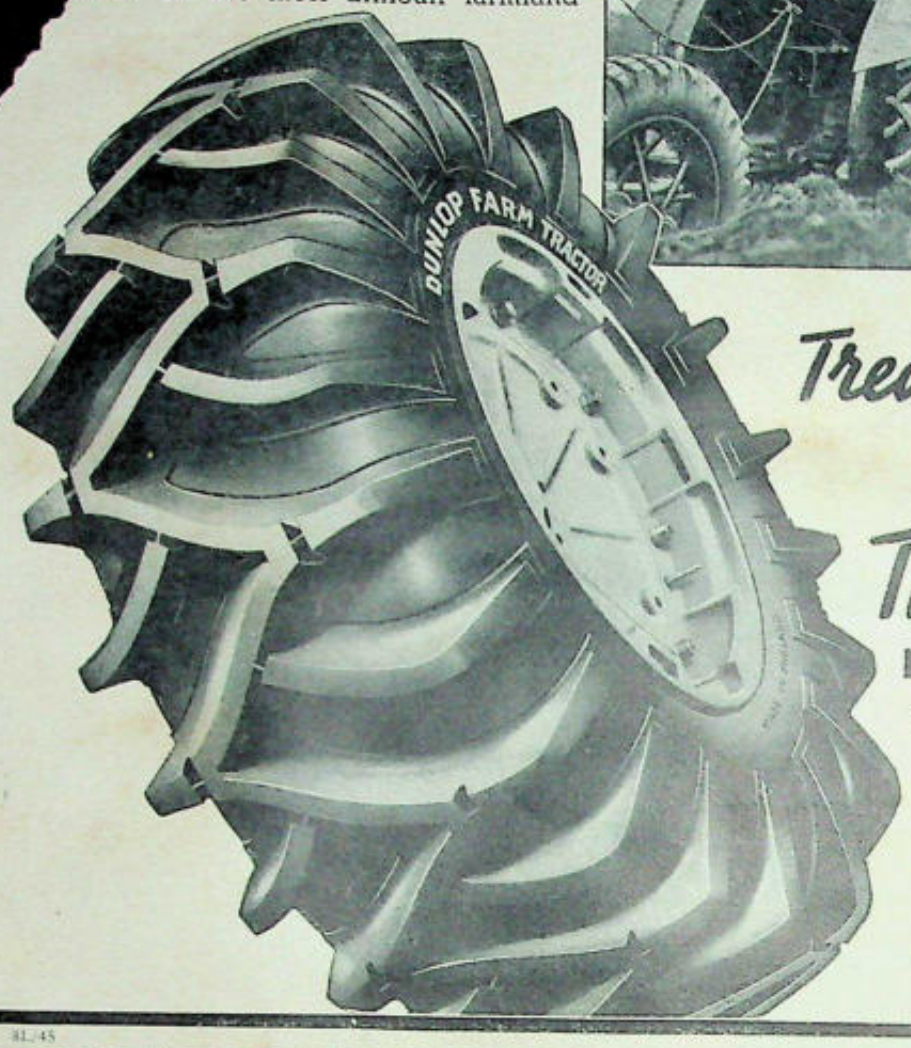
D. N. McHARDY.

The Greatest Grip on Earth...

The new Dunlop Tractor Tyre grips even on the most difficult farmland



These two photographs show the new Dunlop Tractor Tyre on a Fordson Tractor pulling a pneumatic-tyred Mollette Plough.



The Toughest Tread on Hard Surfaces

A special anti-wear feature in the tread gives this tyre exceptional durability on hard surfaces.

The New DUNLOP TRACTOR TYRE

Here is the ideal tyre for **your** tractor. It combines unfailing grip with amazingly hard wear and yet it costs no more. The secret of its grip lies in its exceptional flexibility which allows a larger tread area to make contact with the ground and also prevents the tread from clogging. Its durability on hard surfaces is due to a new scientific method of linking the lug bars which prevents excessive wear. For efficiency and economy specify the new Dunlop Tractor Tyre—it has no equal.

DE KUYPER *CHERRY BRANDY*

TRAVEL BY LAND, SEA AND AIR

THE SEVERN SEEN FROM LITTLEDEAN AS IT WINDS ITS WAY DOWN TO THE SEA. THE CAR IS A 2½-LITRE S.S. JAGUAR

THE 16-H.P. ARMSTRONG-SIDDELEY

Upholding the Reputation of a Famous Factory

By CAPTAIN SIR MALCOLM CAMPBELL

• (*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

THE Armstrong-Siddeley programme for 1939 consists of five different models, three of which are practically the same as they were during last season, namely, the 14 h.p., 17 h.p. and the 25 h.p. cars, whilst two entirely new models have been introduced, the Sixteen and the Twenty. Prices range from £335 for the Fourteen Saloon to £745 for the Twenty-five Limousine.

I have not yet driven the new 25 h.p. car, but the very latest Sixteen was loaned to me by the works recently with the object of giving it a thorough road test.

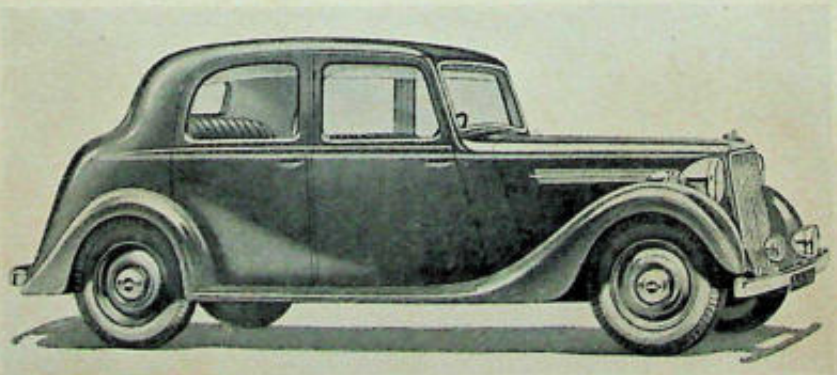
I always regard Armstrong-Siddeley cars as coming within a special category, for I consider they undoubtedly possess features in their construction which entitle them to this distinction. They are neither cheap to buy nor are they expensive, when their high qualities are taken into consideration, and when it is realised that in America they would be termed "Custom built." In other words, they are not mass produced, each individual car receiving far more personal attention than is usual with modern methods of construction, and consequently they have a character all of their own.

The new Sixteen will undoubtedly continue to uphold the reputation of this well-known factory, since it looks well, handles with very little effort, and it runs smoothly and silently. The engine is a six-cylinder, with a bore and stroke of 65 mm. by 100 mm. The R.A.C. rating is 15.7 h.p., the tax £12 per annum, and the capacity of the motor 1991 c.c.—just under two litres.

The engine is of very clean design and both the distributor and the carburetter are readily accessible; the fan and the dynamo are driven by a belt, which can easily be adjusted for wear. The Zenith down-draught carburetter is fitted with a large air cleaner and silencer, and ignition is by a 12-volt battery and coil.

In these days, when so many cars all look alike, it is refreshing to see that the Armstrong-Siddeley is one of the few that still retains its individual design of radiator, which gives the front end of the car such a pleasing appearance.

Cooling of the engine is effected by means of a pump and fan, and an even temperature is maintained by a thermostatic control. The radiator on this new model can be replenished without lifting the bonnet since the Sphinx mascot hinges back, and when open, discloses the filler cap beneath. This is an excellent idea, and the way it has been carried out is most ingenious. I only hope that other manufacturers will follow this example, since if the filler cap is under the bonnet, there is always the possibility of water being upset all over the engine when filling up.



THE ARMSTRONG SIDDELEY 16-H.P. TOURING SALOON WHICH IS PRICED AT £380

Overhead valves are employed, operated by push rods, the crankshaft is dynamically counterbalanced, and is carried on four bearings, and forced feed lubrication to all bearings, camshaft and valve rockers is effected by means of a roller-type of pump, which is driven from the front end of the camshaft.

The rocker cover is unusual in that it merely consists of a metal framework which, being covered with fabric, is completely non-resonant, and thus contributes towards silence. The gearbox, which is built in unit with the engine, is, of course, of the preselective type and the balanced drive is employed, which was first introduced by Armstrong-Siddeley's at the Motor Exhibition last year.

The centrifugal clutch, which is enclosed in a housing, takes up its drive at 600 engine revolutions, and therefore the car can be brought to a standstill when in gear by merely using the brakes, it not being necessary to depress the clutch pedal in the usual manner.

There are four speeds, the ratios being 5.1 to 1 on top, 7.24 to 1 on third, 10.67 to 1 on second and low is 18.4 to 1. On full throttle it is possible to obtain a road speed up to 40 m.p.h. on second, 60 m.p.h. on third and approximately 75 m.p.h. on top gear. The suspension is carried out on orthodox lines both fore and aft, by semi-elliptic springs with silent bloc bearings.

The brakes are of the Girling self-compensating type and are fitted with oil-less bearings, while the steering is by Burman Douglas worm and nut. The wheelbase of the car of 9ft. 3 in., track front 4ft. 6in., rear 4ft. 6in., and the weight of the complete vehicle unladen, 27 cwt.

The petrol tank holds eleven gallons of fuel, which includes a reserve of one-and-a-half gallons, and as the consumption works out at approximately 25 miles per gallon, the car has a cruising radius of 275 miles without replenishing.

Armstrong-Siddeleys have always been noted for their high-class coachwork, and the coach saloon fitted to the car that was loaned to me was a really excellent example of their fine work. The exterior lines are dignified, there is ample head and leg room, and both front and rear seats are very comfortable, there being plenty of room for three adults on the back seat. The general finish is good, the upholstery is luxurious, and the head lining, made of washable material, a good point.

The instruments are neatly grouped in the centre of the board, on the left of which is a glove locker. The spare wheel is carried on the inside of the door of the luggage boot and there is accommodation for several suitcases.

The performance of the car on the road is good, the engine has plenty of power and runs extremely smoothly and quietly, the absence of noise being very noticeable. Although suspension is very comfortable, the car is inclined to roll somewhat if driven really fast round corners, but this defect on the car I drove may have been due either to the tyre pressures being too low, or else to the fact that the shock absorbers may not have been properly adjusted. With the exception of this criticism, I formed a very good opinion of the new 16 h.p. Armstrong-Siddeley, which is undoubtedly an extremely fine car, and eminently suitable for a lady, since it requires little effort to drive.

With a petrol consumption of 25 miles per gallon, and an annual tax of only £12, it is extremely economical to run—a big consideration.

The equipment too, is generous, since included in the price are such items as Biflex head lamps, fog lamp, and a Jackall hydraulic inbuilt jacking system.

The list price of the car complete with either the coach or touring saloon, is £380, both types of body have four doors, but the former has six lights, whilst the latter only has four.

ATLANTIC STOCKTAKING

A Review of To-day's Position

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of the "Field")

THE great activity on the Atlantic airway that marked 1937 has been followed this year by a period of comparative calm. Apart from Mercury's flight in July, made, it may be assumed, primarily for testing out the composite aircraft, there have been no actual crossings by British or American machines. The sanguine hopes expressed in so many quarters last year that an experimental mail service might be operating in the summer of 1938 have, therefore, not been realised.

To some extent, this lack of activity is inevitable, since a period of review and analysis is always necessary after making a large-scale practical experiment. At the same time, a season of complete inactivity had not been expected, and, apparently, was not visualised by those responsible.

Originally, a schedule of some fifteen flights across the Atlantic was drawn up, of which Mercury's was to be the first; she was intended to make two further round trips. Several flights by the first of the new strengthened Short Empire boats, the Cabot, were planned; and the land plane Albatross and another of her class were also to undertake trans-atlantic flights.

That this programme was not realised was, in the main, due to no specific lack of interest in the Atlantic airway. Mercury's second crossing was replaced by her flight to the Cape, in which she won the world's seaplane distance record for Britain. Cabot was not ready for her initial test flights until the first week in December, and the unlucky mishap to the Albatross naturally put back the programme. Thus, what might have been a year as remarkable for Atlantic crossings as its predecessor has provided very little actual achievement, and public interest has, as a result, undoubtedly waned.

The failure of the Albatross to fulfil the schedule is particularly disappointing. The intention had been that she should make the crossing in the late autumn and spend the winter testing out conditions on the other side of the Atlantic. It now appears that nothing will be done until the early spring, when winter conditions will be passing. Nearly a year, therefore, will have to pass before these vital experiments are carried out.

Much regarding the future operation of an Atlantic service will depend upon what is learnt from such flights as the Albatross was to make. All the crossings so far have been made by flying-boats, and the success attained suggests that, with larger machines, regular operation should be possible during the summer months. Flying-boats are, however, greatly handicapped on the northern route during the winter, since the bases likely to be used are all subject to ice conditions; even New York is not free from the ice danger. Thus, it appears that, if northern crossings are to be made during the winter months, land planes will be necessary. The practicability of using land planes large enough for the Atlantic crossing on snow-covered aerodromes has yet to be fully explored, though small machines have, of course, been operated successfully under such conditions, using skis on the undercarriage when necessary, for several years.

In spite of the postponement of actual flights, the Atlantic problem has not been permitted to fall into the background. A useful breathing space has been provided for analysing the data obtained last year, and this may well prove advantageous when actual operation is resumed in the coming spring.

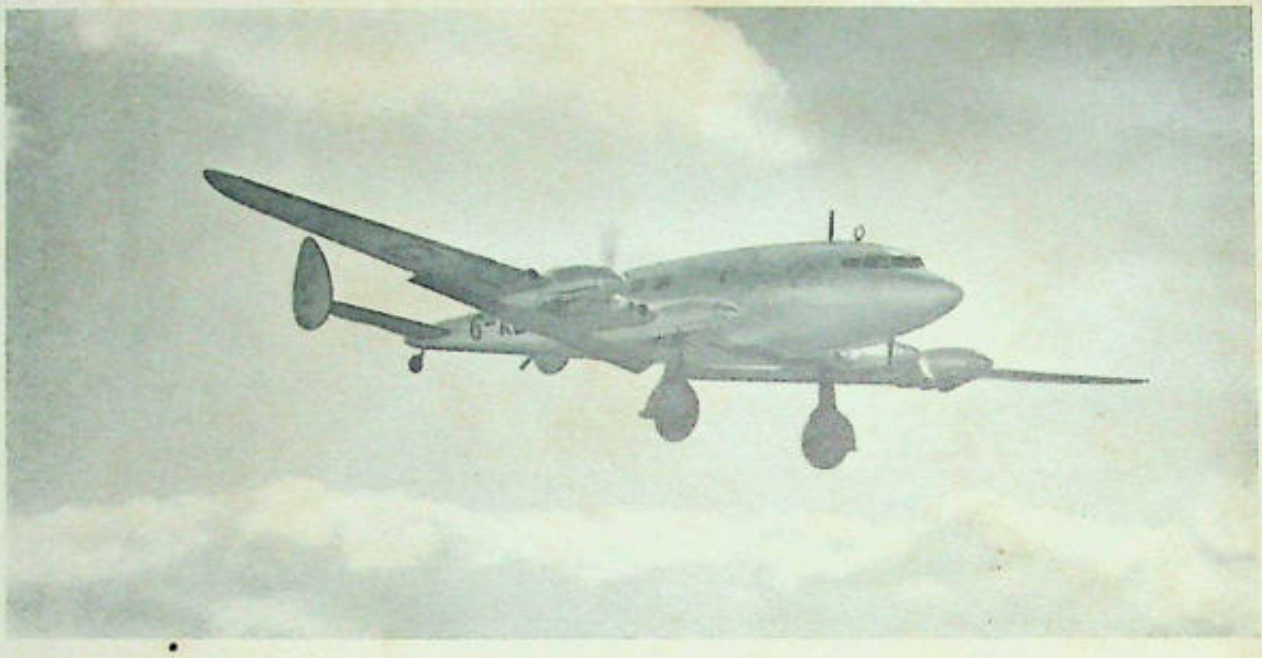
It has been generally admitted that the most important problem associated with an Atlantic service on a regular scheduled basis is a meteorological rather than an aeronautical one. It has been amply demonstrated that given suitable circumstances these long non-stop flights can be successfully made with existing equipment. Scheduled commercial flying depends, however, on the provision of co... weather reports to enable p... choose that line of crossing w... afford the best existing condit...

How much remains to ... before this end can be attai... shown not long ago in a pa... before the Royal Aeronautical... a short time ago by Capt... Entwistle, M.Sc., head of the o... division of the Meteorological O... who had a very great deal to do w... the successful organisation that help... the 1937 flights.

He pointed out that with the organisation at present available a complete weather chart for the North Atlantic could be prepared only twice daily, while for the Continent of Europe a chart could be drawn up every three hours. For regular services, North-Atlantic charts would have to be available at six-hour intervals. A pre-requisite of schedule transatlantic flying was, therefore, the establishment of an organisation that would make this possible.

One of the essential needs for collecting data was a mid-ocean observation station, which might be provided by a stationary ship. The advantages of such a station have been accepted by many with practical experience, not merely for its meteorological function, but as a fixed point from which direction-finding bearings could be obtained.

It is thus seen that a great deal of work remains to be done before the much-discussed Atlantic service is an all-the-year-round reality. The problems involved have, indeed, been condensed to those of organisation in its broadest sense; and while further flights this year would undoubtedly have been valuable, it is clear that real progress cannot be made until adequate steps for the establishment of the necessary surface services are made. An experimental mail service is, indeed, promised for next spring and summer (the characteristics of new aircraft may make the weather problem of smaller moment) but the fact remains that, on the Atlantic airway as elsewhere, the basic requirement of commercial operation is efficient meteorological and ground organisation; and it may be that this period of stocktaking may bring this vital fact into prominence.



THE ALBATROSS IN FLIGHT AT HATFIELD

This plane, which was to have crossed the Atlantic during the autumn, was prevented from doing so owing to an unfortunate accident which resulted in a broken back

UNDEVELOPED PAPUA

A Paradise for the Bird Lover

UA is about two days' sea urney from the north-east coast Australia. In the days when ew it there were no aeroplanes ng between Papua and the main- d. and no fast steamers. We epended upon a small boat, which called once a month at Port Moresby, the capital of the Territory. Apart from the wireless station, this was our only link with the outside world. We were a lonely little community, and the arrival of the monthly mail steamer was an event to which we looked forward, a welcome break in the monotony of life in the sweltering heat of New Guinea.

It is always hot in Papua, although in the uplands you may find coolth at night. You will also find mosquitoes or, rather, they will find you and, having found you, will sooner or later send you to bed with a dose of malaria.

Port Moresby itself is an unprepossessing little town, a collection of iron-roofed bungalows and offices with a few warehouses clustered round the jetty, which juts out into the harbour. Palm trees, frangipanni and hibiscus grow in haphazard fashion around the buildings, giving place on the outskirts of the town to a form of scrub like that to be found in the Australian Bush. As one leaves Port Moresby by the only road that can be used by motor vehicles, the scenery improves. The road winds upwards, twisting and turning through wooded hills and masses of rock which seem to be ever on the verge of breaking up and engulfing all in a gigantic landslide.

As you progress inland the woods become jungle pure and simple, with great tall trees whose trunks are covered with twisted, rope-like creeper. Ferns and undergrowth grow thickly between the trees, and everywhere there is the smell of rotting vegetation. Everything is still, dark and hushed, and apart from the interminable hum of mosquitoes the silence is broken only by the occasional call of a bird as it flits through the dense foliage above your head. Suddenly you may come to a break in the jungle, and you will see before you a wide expanse of prairie-like country with acres of the long coarse grass known as kurra-kurra waving like a sea of green corn in the breeze. And from this point of vantage you will now get a view of the surrounding mountains, blue in the distance, with here and there the silvery streak of a stream as it tumbles down the slope on its way to the sea.

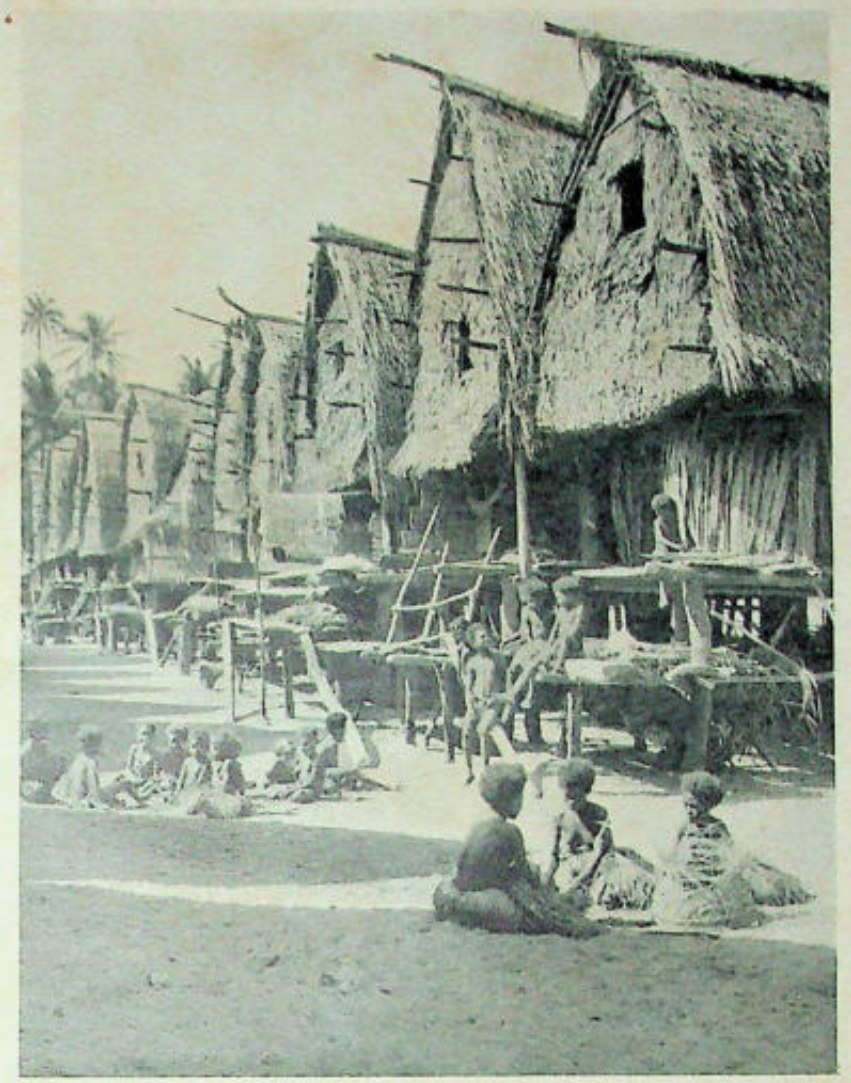
Papua is a paradise for the bird-lover, though I do not imagine that this is how the Bird of Paradise got its name. I am glad to say, incidentally, that there is now a law prohibiting the export of the beautiful Bird of Paradise and gowrah pigeon plumage; otherwise it is probable that the species would soon become extinct.

There is no big game in the usually accepted sense of the term. The largest animal I ever encountered in Papua was a mammoth pig, which was expecting any moment to become a mother. Crocodiles abound in the rivers and there are also numerous maganies or wallabies to be found, principally in the open grassland. These wallabies, incidentally, make excellent eating when they are young and tender, and I shall always remember with gratitude a dog, a cross between an Airedale and a foxterrier, with a remarkable turn of speed, that I trained to hunt and catch them.

Sport in Papua is really incidental to the everyday business of obtaining food and consists mainly of hunting for pig, wallaby or pigeon, and fishing, either in the rivers or the sea. Fishing is probably the more exciting, as there is always the chance of a crocodile upsetting your canoe if you are on the river, while at sea a sudden squall may result in a capsize, with subsequent unpleasantness with the ever-attendant shark.

The fish to be found around the New Guinea coast are frequently of the most beautiful colour and are quite often poisonous. This, by the way, will not deter the native fisherman from trying to sell them to you. A fairly sound rule to abide by is that the more beautiful the fish the more poisonous it is.

Papua has one sport which is, I believe, unique. This is canoe racing, and for excitement and thrills there is no form of sailing to compare with it. The native canoes are hollowed out of the trunks of trees and have an outrigger of spars on one side. Sails are usually of canvas and in comparison with the hull are of enormous size. In a stiff breeze it is necessary for two or more of the crew to balance themselves on the outrigger, as this is frequently lifted clean out of the water by a sudden squall, and without the application of extra weight the whole crazy craft will turn turtle. This is really grand fun, and I recommend it to all lovers of sailing who may be tired of the stately processions from buoy to buoy too often to be seen, under the name of yacht racing, around our English coasts.



THE VILLAGE STREET ON MAILU ISLAND.
The windows seen in the houses are interesting in that they are not voluntary but are insisted upon by the Government

The canoe is one of the principal methods of transport in Papua. At the time of which I write there were practically no roads; produce, stores and labour were all carried by small coasting steamers or sailing ships to the nearest point on the coast to their destination, and the remainder of the journey was done on foot over the jungle tracks, or by river canoes.

The Papuan native varies tremendously in physique and mentality according to the district in which he lives. Cannibalism still exists in the remoter parts of the Territory and "Puri-puri," or witchcraft, is still practised, in spite of the Administration's efforts to stamp it out. The Papuan, a simple soul, is not overfond of work and has to be constantly supervised. There are numerous tribes, and almost as many dialects, and it is quite a common occurrence to find an estate labour force divided into several sections, each entirely different in language and customs. Motu is the key-language of Papua and this can generally be used with a reasonable degree of success in most parts of the Territory.

It is, of course, impossible in the compass of a short article to give more than a very brief outline of Papua and its inhabitants; but it is true to say that here is a country almost completely undeveloped, its vast resources untapped, and who knows what hidden wealth waiting to be discovered.

A. B. G. Dickinson.

WHERE TO STAY

HOTELS AND APARTMENTS FOR THE SPORTSMAN AND SPORTSWOMAN AT HOME AND ABROAD

Grand Peace

In these abnormal times, when those who normally migrate abroad after Christmas are hesitant, we offer them a generous slice of our grand peace. A bedroom, with private bathroom if need be, overlooking the blue and tranquil waters of Tor Bay. A grandstand position *on the level*, a Sun Lounge to cheat the occasional wind and to capture the warmth of the sun. The comfort within of an even temperature and the feeling of wealth around you. A chef who practises to perfection the culinary arts of four continents, yet can, if need be, cater for the simplest taste. In short—an hotel where personal whims are studied and satisfied.

Above all, we offer a tempting all-in price with a sliding plan whereby the longer you stay the less you pay. For further information write to R. Paul, Manager

THE GRAND TORQUAY

Telephone: 2234

5-star hotel. A.A. and R.A.C. 200 bedrooms and suites. Under the same direction: The Headland Hotel, Torquay.

"MINE EASE AT MINE INN"

By WILLIAM G. LUSCOMBE

THE PRIDE OF THE VALLEY INN AT CHURT

WITH the last issue of 1938 it is perhaps not too dull to recall those hotels which have appeared in this series during the last twelve months. The many letters which I have received have shown the interest which readers take in these articles, and as I am constantly being asked, some months after publication, for the name of an hotel which I have recommended, it will not, I feel, be wasted space to list the more recent ones again.

You may remember that we spent New Year's Day at the Rose at Wokingham, haunt of literary men, and visited the White Hart at Chipping Norton, the Star at Yarmouth, the County at Taunton, and the George at Southwark, ere the first month of the year gave way to February. On the 5th of that month I was in Norfolk, mecca of many budding yachtsmen, where the dignified old Swan Hotel at Harleston sheltered me. Then on to the Royal Fountain—centuries old—at Canterbury, before making a splendid tour of some Surrey inns.

Now Surrey is a grand county, and when you find really comfortable inns for a week-end your visit is complete. Successively I visited the Abinger Hatch near Abinger Common, the Pride of the Valley (which stands opposite Mr. Lloyd George's farm) at Churt, the White Horse at Dorking, the Angel at Guildford, the Cricketers at Bagshot, and the Lake Hotel at Godalming, where the proprietor, Mr. A. W. Rudd, makes guests feel that it is "their hotel."

With spring in the air again Devon lanes called me, and I was away to the George at Hatherleigh and the Fisherman's Cot at Bickleigh Bridge, before once more going on an excursion into Surrey. On this second visit to "London's county"—I always think of Surrey like that—I discovered the George at Haslemere, the Hurtwood at Peaslake, and the fascinating old White Horse at Shere.

During May we noted in this column the George at Cranbrook, the Black Swan at Helmsley, the Bull-aven Farm Hotel at Harford, and the Red Lion at Colchester. Then on to the lonely but cosy Kirkstone Pass Inn in Cumberland, and south again to the Old Mill at West Harnham and the White Hart at Braintree—built when beer was a man's drink.

Another White Hart, this time on the Thames at Sonning, occupied my attention the following week before I went up the Great North Road to the George at Stamford. It was an easy stage from here to the comfortable Granby at Harrogate, but a longer hop down to the Royal at Llangollen. Boiling hot weather called for a visit to the Grand at Torquay in the following week, and then once again the Surrey magnet worked and I was in the Talbot at Ripley and the Bush at Farnham.

In the autumn I told you of the Fountain at Sheerness, the Mansion House at Evesham, the Mill Inn at Withington, the Manor House at Budock Vean, the Blakeney at Blakeney, the White Hart at Newmarket, the Red Lion at Henley, the Fox at North Aston, Ye Olde Bell at Barnby Moor, the Three Salmons at Usk, and the Ballachulish in Argyll.

Then with the real approach to winter attention was called to the George at Crawley, Hatchett's in Piccadilly, Knappe Cross near Exmouth, the Ship at Alveston, the Crown at Amersham, and the Lion at Buckden.

And, finally, may I add that if, during 1939, you call at any of the hotels I have mentioned you are certain of a cordial welcome and a comfortable stay.

The writer will be pleased to answer any queries from readers concerning hotels.

WINE AND FOOD

A GASTRONOMICAL QUARTERLY

To all who wish to cultivate the art and enjoyment of good living this official journal of the Wine and Food Society will prove of inestimable value.

BRIDGE

INTERESTING HANDS

By A. E. MANNING FOSTER

(Cards Editor of the *Field* and Editor of the *Bridge Magazine*)

THE following hands from tournament and private play have been selected to demonstrate various points.

	♠ K, Q, 9, 8, 6, 2 ♡ Q, 10 ◇ K ♣ A, Q, J, 8	
♠ 7, 4 ♡ 8, 7 ◇ Q, J, 10, 8, 7, 3, 2 ♣ K, 9	Y A B Z	♠ A, J, 5, 3 ♡ 9, 5 ◇ A, 5 ♣ 10, 7, 4, 3, 2
	♠ 10 ♡ A, K, J, 6, 4, 3, 2 ◇ 9, 6, 4 ♣ 6, 5	

Score Y-Z game; A-B nil. Y the Dealer. The bidding was:

Y	B	Z	A
One Spade	Double	Three Hearts	Four Diamonds
Four Hearts	Double	No bid	No bid
Re-double	No bid	No bid	No bid

B's double of One Spade was wrong. Not only had he not the necessary material, but he might be defeating his own interest, since against a Spade declaration he might hope to make three tricks. Actually, however, the game would not have been played in Spades in any case. But after Z's bid of Three Hearts the double undoubtedly encouraged A to call Four Diamonds. When then Y bid Four Hearts B's double was as bad as, or worse than, his first double. The re-double by Y was punishing, as Z made his contract and an overtrick.

The moral of this hand is the folly of precarious doubles. B had no right to depend upon A for a single trick, and even if he had held one trick the Four Hearts contract could not be defeated.

In the second hand the bidding was spirited.

	♠ J, 9, 8, 5, 2 ♡ 9, 7, 4 ◇ None ♣ 8, 7, 6, 5, 4	
♠ 7, 6, 3 ♡ None ◇ A, Q, J, 9, 6, 4, 3, 2 ♣ Q, J	Y A B Z	♠ 10 ♡ Q, J, 10, 8, 6 ◇ K, 10, 8, 5 ♣ A, K, 10
	♠ A, K, Q, 4 ♡ A, K, 5, 3, 2 ◇ 7 ♣ 9, 3, 2	

Score Y-Z game; A-B nil. B the Dealer. The actual bidding was:

B	Z	A	Y
One Heart	One Spade	Three Diamonds	Three Spades
Four Diamonds	Four Spades	Five Diamonds	Five Spades
Double	No bid	No bid	No bid

A led the Ace of Diamonds, and Z was two down on his contract, losing 500 points. It was not a bad result, since A-B can make Six Diamonds against any defence, which would have yielded them 620 points and the game, worth 300 points.

The question arose, however, whether A-B would have reached the little slam in bidding, as B admitted that he would not have gone on if Y had left Five Diamonds. Y-Z escaped lightly. At Double Dummy A-B can do better. If A opens with the Queen of Clubs, B overtakes and leads a Heart. A ruffs and returns a Club, which B again overtakes, makes his third Club and then gives A a second ruff of Hearts.

The third hand is a matter of the opening lead.

	♠ K, Q ♡ Q, 8, 7, 2 ◇ A, Q, J, 4 ♣ K, J, 5	
♠ 9, 5, 3 ♡ K, 9, 6, 4, 3 ◇ K, 10, 3, 2 ♣ 8	Y A B Z	♠ 7, 4, 2 ♡ 10, 5 ◇ 9, 8, 6 ♣ Q, 10, 7, 6, 2
	♠ A, J, 10, 8, 6 ♡ A, J ◇ 7, 5 ♣ A, 9, 4, 3	

Score game all. Y the Dealer. The bidding, A and B silent, was:

Y	Z
One No Trump	Three Spades
Four Spades	Four No Trumps
Five No Trumps	Six Spades

A led his singleton 8 of Clubs. Z won with the Ace over B's 10, finessed a Diamond, drew trumps and finessed Diamonds again, thus getting rid of his Knave of Hearts and making his contract with the loss of one trick in Clubs.

While A had a difficult lead, I consider the singleton Club was wrong. It certainly made things easier for Z. A's opening is a trump, which is better than a lead from either of his King-high suits. In this case Z has to guess and although, as the cards lie, he can still make his contract, he might miss it if he manipulates the Club suit wrongly.

CHESS

TOURNAMENT IN HOLLAND

The following game was played in the tenth round.

(Indian Defence.)

WHITE. Reshevsky.	BLACK. Botwinnik.	WHITE. Reshevsky.	BLACK. Botwinnik.
1. P to Q 4	Kt to K B 3	27. Q takes K P	R to Q 6
2. P to Q B 4	P to K 3	28. Q R to B sq (g)	R takes B (h)
3. Kt to Q B 3	B to Kt 5	29. R takes R	B to B 2
4. P to K 3	Castles	30. R to Q 3	Q to Kt sq (i)
5. Kt to K 2 (a)	P to Q 4	31. K R to Q sq	R takes Q
6. P to Q R 3	B to K 2	32. B takes R (j)	Q to K B sq (k)
7. P takes P	Kt takes P (b)	33. R to Q 8	B to K sq
8. Kt tks Kt (c)	P takes Kt	34. R to K sq (l)	K to B 2
9. P to K Kt 3	Kt to Q 2	35. B tks R P (m)	Kt to K 4 (n)
10. B to Kt 2	Kt to B 3	36. P takes Kt	Q to B sq
11. Castles	B to Q 3	37. B to B 2 (o)	K to K 2
12. Kt to B 3	P to B 3	38. R to B 8 (p)	P to B 4
13. P to Q Kt 4	P to Q R 3	39. B takes P	Q to R 4
14. R to K sq	R to K sq	40. P to Kt 4	Q to Kt 4
15. B to Kt 2	B to B sq	41. R to B 7, ch (q)	K to Q sq
16. Q to Q 3	B to K 3	42. R to B 8, ch	K to K 2
17. P to B 3 (d)	Kt to Q 2	43. P to K 6	P to Kt 3
18. Kt to R 4	P to Q Kt 3 (e)	44. R to B 7, ch	K to Q sq (r)
19. Q R to B sq	P to Q Kt 4	45. R to Q 7, ch	K to B sq (s)
20. Kt to B 5	Kt to Kt 3	46. P to K 7 (t)	P takes B
21. B to B 3	R to R 2	47. R to Q 8, ch	K to B 2
22. P to K 4	Kt to B 5	48. R takes B	Q tks P, ch (u)
23. R to R sq	B takes Kt	49. K to R sq (v)	Q to B 6, ch
24. Q P takes B	R to Q 2 (f)	50. K to Kt sq	Q to Kt 5, ch
25. Q to Q 4	P to B 5	Drawn.	
26. P to B 4	P takes P		

(a) This move, introduced by Rubinstein, is considered by Dr. Alekhine to be inferior to R to Q 3.

(b) In the 25th game of the last World's Championship Match Dr. Alekhine played P takes P.

(c) P to K 4 is a good—and, perhaps, preferable—alternative. The text-move enables Black to open a diagonal for his Queen's Bishop.

(d) White is preparing to play P to K 4.

(e) As Black plays P to Q Kt 4 next move, it would appear that he might have saved a tempo by doing so at once. Actually, however, as the continuation shows, Black does not lose a tempo but gains one by playing as he does. He takes two moves, instead of one, to play P to Q Kt 4, but White loses two moves in playing his Queen's Rook to B sq and then back again to R sq.

(f) Black has the better game.

(g) If 28. K R to Q B sq, then 28. . . . R to B 2; 29. Q takes P, R takes B; 30. R takes R, Q to Q 5, ch, followed by 31. . . . Q takes R. If, after the text-move, Black plays 28. . . . B to B 2, then 29. Q takes P and Black cannot play 29. . . . R takes B because of 30. R takes R, ch, B takes R; 31. Q to Q 5, ch.

(h) This move should have been decisive.

(i) Here, however, Black makes an unfortunate mistake. He should, instead, as the continuation of the game shows, play 30. . . . Q to B sq, *e.g.*, 31. Q takes P, R takes R, ch; 32. K to B 2, Q to K sq or R to K sq with a winning game.

(j) Black has no good place for his Queen. (If, however, he had played 30. . . . Q to B sq, he could now have played 32. . . . Q to K 3.)

(k) If, instead, 32. . . . B to Q 4, then 33. B takes B, ch, P takes B; 34. R takes P, K to B 2; 35. R to Q 8 and wins. If, instead, 32. . . . Q to B 2, then 33. R to Q 7 and wins.

(l) Not B takes P because of B takes B.

(m) Threatening 36. R (K sq) takes B, Q takes R; 37. B to Kt 6, ch.

(n) Black is forced to lose a piece. If Q to R sq, then B to B 5 followed, if Q to R 4, by P to Kt 4.

(o) 37. P takes P, Q takes R; 38. P takes P is very strong and probably stronger than the text-move which should, however, have led to a win.

(p) Here, however, White, under extreme time-pressure, misses his way. He should, instead, play R to R 8 or Kt 8 (see note q).

(q) If White had played 38. R to R 8 or Kt 8, then now R to R 7 or Kt 7 ch would have been decisive, for, if K to Q sq, then R to Q sq, ch and mate in three more moves, while, if K to B sq, then B to K 6, threatening R to B sq, ch.

(r) 44. . . . K to B 3 is an alternative, *e.g.*, 45. B to K 4 (not R to K B sq because of Q to K 6, ch), Q takes P, ch; 46. B to Kt 2. The text-move is better.

(s) Not 45. . . . R takes R because of 46. P to K 7, ch, Q takes P (if K to B 2, then R takes B); 47. R takes Q, K takes R; 48. B takes B, K takes B; 49. P to K R 4 with a winning game for White.

(t) Not 46. R to K Kt 7 because of 46. . . . Q to Q 7; 47. K to B sq or R to K 4 (to prevent Q to Q 5, ch), P takes B.

(u) Black now forces a draw by perpetual check.

(v) If 49. K to B 2, then 49. . . . Q to R 5, ch; 50. K to B sq (not K to K 2 because of Q to R 4, ch), Q to R 6, ch.

A POWERFUL ATTACK

IN a game played in this year's Russian Championship Tournament the following position was reached after White's fourteenth move:—White (Osilow): King at K Kt sq, Queen at Q 2, Rooks at K B sq and Q R sq, Bishops at K 2 and K 3, Knights at Q B 3 and K B 4, Pawns at K R 2, K Kt 2, Q R 2, K B 3, Q Kt 3, K 4 and Q B 4; Black (Konstantinopolski): King at K Kt sq, Queen at K 2, Rooks at K sq and Q sq, Bishops at K Kt 2 and K 3, Knights at K B 3 and Q Kt 5, Pawns at K R 2, K B 2, Q B 2, Q Kt 2, Q R 2, Q 3 and K Kt 3.

The game was continued as follows:

WHITE. Osilow.	BLACK. Konstantinopolski.	WHITE. Osilow.	BLACK. Konstantinopolski.
14.	P to Q 4 (a)	20. Q takes R	Q takes B
15. B P takes P	B takes P	21. Q R to B sq	R to Q sq
16. Kt (B 3) tks B	Kt (B 3) tks Kt	22. Q to B 4	R to Q 7
17. Kt takes Kt	Kt takes Kt (b)	23. P to Kt 3	Kt to K 7, ch
18. B to K Kt 5	Kt to B 6 (c)	Resigns (d)	
19. B to Q 3	R takes B		

(a) White's Queen is on the same file as Black's Queen's Rook, and his Queen's Rook on the same diagonal as Black's King's Bishop. Moreover, his two Bishops leave no pawn protection. Black takes advantage of these facts in the combination initiated with the text-move.

(b) Threatening either (1) Kt takes B followed, if Q takes Kt, by B to Q 5 or (2) B takes R. If now Q R to Q sq, then Kt to B 6 and wins.

(c) A powerful move. If now (1) 19. B takes Q, then 19. . . . R takes Q wins a piece; if (2) 19. Q takes Kt, then 19. . . . Q takes B; 20. Q to B sq, R to Q 7; 21. R to Kt sq, Q to K 6, ch; or, if (3) 19. Q takes R, then 19. . . . Q to B 4, ch; 20. K to R sq, R takes Q; 21. B takes R, Kt takes B. In each case Black has a winning game.

(d) If K to R sq, then Kt takes P, ch, followed, if P takes Kt, by Q to R 4, ch and Q to R 7, mate, or; if K to Kt sq, by Q to K 6, ch and Q takes R, mate.

KERES' GAMES

ONE of the most remarkable features of international chess in the last four years has been the rapid advance made by the young Estonian master, Paul Keres, who recently tied for the first place in the very strong international tournament in Holland. About a year ago we reviewed a book by Mr. F. Reinfeld, of New York, which contained about 50 games played by Keres during the period 1932–1936. A second book, by the same author, is now to hand. It contains 53 games played by Keres during 1937. The games are all extremely interesting and are thoroughly and lucidly annotated by various experts, among them being Mr. Reinfeld, Dr. Euwe, Keres and Professor Becker. The book, which is well bound, appears in a limited type-duplicated edition. We heartily recommend it.

Keres' Best Games, 1937. By F. Reinfeld. (Published by F. Reinfeld, 505, Fifth Avenue, New York. To be obtained from Frank Hollings, 7, Great Turnstile, High Holborn, London, W.C. 1. Price (post free), with cloth cover 7/5, with flexible cover 5/5.)

PROBLEM No. 3994

By J. ŠMUTNÝ*

WHITE (4 pieces): King at K B 2, Queen at Q R 8, Rook at K Kt 6, Knight at K Kt 5.

BLACK (8 pieces): King at K R sq, Bishop at K Kt sq, Pawns at Q 2, Q B 2, K Kt 2, K R 3, K B 4 and Q R 7.

White to play and mate in three moves.

* *Prager Presse*, 1935.

SOLUTION OF PROBLEM No. 3993

1. B to Q 2, Any move; 2. Q, R or Kt mates.

OXFORD PAST v. CAMBRIDGE PAST.—This match, played recently at the City of London Chess Club, resulted in a win for Cambridge by 7½ points to 4½.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 497

ACROSS.—1, Where there's a will there's sometimes a this. 4, Treason (anag.). 8, The cause of all the trouble. 9, Looks as if it might mean you sing. 11, "Full of wise —— and modern instances" (*As You Like It*). 13, An opera. 14, It is suggested that the educational authorities should do this to the summer holidays. 16, Literary attempts. 17, Obviously the editor was upset when he did this. 18, "A lot of holes tied together by string." 20, This musical instrument sounds like American slang. 21, 2 to 1, 3 to 1, 5 to 2. 24, Pale. 28, The outcome of disorder in Ulster. 30, Use in the end what was read to begin with in Peru. 31, Subjects of travellers' tales. 32, She begins to cast off. 34, Fat is adequate on a short Tuesday. 35, It follows November 5th. 36, Paste can be made from this. 37, "For that deep —— may be called an Hell, Where more is felt, than one hath power to tell" (*Burton*). 38, Mrs. Grundy is associated with this.

DOWN.—1, C. possesses half a score. 2, Little devils. 3, Tinsel (anag.). 5, Some people would like this fixed. 6, A lady well known in India. 7, Kind ones are sent in letters. 8, The messenger said he saw a ship sink soon after seven o'clock (hidden). 10, This can be made right. 12, The giant collapses in his own gore. 14, Marks or characters taken as conventional signs. 15, These get one guessing. 18, The world is on the other side of the Atlantic. 19, This is not to be considered backwards. 22, Repents (anag.). 23, Australia holds these but can't show them. 25, Mountains with laps. 26, Q. 27, You should never worry on this score. 29, Two sailors make an unpleasant catch. 30, K N perhaps. 33, Die first and then they give tea to revive you. 34, Often rolls in dust.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division 1. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Fish with Frayed Tails.—The fish you sent had very frayed tails, and in some cases the tail had almost disappeared. No parasite could be found to account for the trouble, but it is probable that when the weeds were pulled up some disturbance of a muddy bed resulted in the liberation of gases, such as sulphuretted hydrogen, carbon-dioxide and the like, so that the fish were in a gas-polluted water. A careful renewal of the water from a fairly good source would probably put things right, but until the products of decay have all been removed, trouble is likely to occur among the weaker fish.—*E. M., Somerset.*

Farm

Control of Nettles.—There are two varieties of nettle, the great stinging nettle and the small stinging nettle. *Bulletin No.* 108, published by the Ministry of Agriculture, gives admirable advice as to control. As regards the first: "In arable land it may best be destroyed by removing the root stocks as thoroughly as possible, by forking out if the patches are small, and by thorough and continued cultivation if the infestation is extensive. In either event, the collected root-stocks should be burnt. Repeated hoeing when the shoots are 3in. high will gradually exhaust the root-stocks . . ." As regards the latter: "This nettle needs only regular and thorough hoeing to prevent seeding for a year or two; and it may be expected to become gradually less prevalent. This species is one that is a sure indication that the land is in need of lime; hence, where it is plentiful, a dressing of lime should be given." The Bulletin, entitled *Weeds of Arable Land*, may be obtained from H.M. Stationery Office.—*L. G. D., Taunton.*

Hedge Plants.—This month's Journal of the Ministry of Agriculture has a small section on hedge plants in general which substantiates your suggestion that there is nothing like hawthorn for hedges. The hawthorn, it says, is most favoured for hedging purposes as, if correctly treated, it forms the most effective barrier. It thrives best on heavy soils, but will grow on almost any well-drained soil. It will withstand considerable ill-treatment, but grows with vigour after clean cutting, laying and cleaning. Many distinct varieties of varying habits are found in the hedgerow. There seems little knowledge available to indicate whether soil condition or the variety of thorn is responsible for the more vigorous types found on the clays. Farmers often consider the land responsible, while hedgers sometimes claim that their particular style of work is the cause of the excellent growth. The writer, however, is led to believe that the variety of thorn is the most important factor. When planting new, quick hedges, it is an advantage to select a quick-growing variety, which is not only more vigorous, but much more satisfactory for the hedger to work. The more vigorous types of thorn appear to have larger leaves and fewer spines and make considerably more growth from stools after cutting. In the actual work of cutting it will be found that they split and cut with ease, while the slower-growing varieties are dry, brittle and more difficult to manipulate. The old native species has a broad leaf and a habit of throwing out many growths at the base, often eight or more from a single stool and has rather slender stems which are inclined to entangle. Hedges of elm, privet, ash, holly, blackthorn, maple, myrobella plum and hazel are common, but all inferior to the hawthorn.—*K. G. W., Bolton.*

Golf

International Meeting.—The first series of international matches commenced in 1902 when England and Scotland played the first of their annual matches. After being discontinued however in 1912, it was revived in 1922, and has been played ever since. England then played a match against a combined side of Irish and Welsh golfers, and in 1928 there was instituted an annual contest between England and Ireland. A year before Scotland and Ireland had also arranged to play each other annually, so that when both Scotland and Wales started an annual match against Ireland the quadrilateral was almost complete. There was a general feeling that it would be a great help to all concerned if there could be some sort of arrangement by which all these matches could be played on the same course on succeeding days. The result was that in 1931 England, Scotland and Ireland met at Haylake, each playing a full day's match by foursomes and singles against the other two countries. This meeting was such a success that the officials decided to inaugurate an annual International Meeting, with England, Scotland, Ireland and Wales playing each other on succeeding days. The first meeting was held at Troon in August 1932, and Scotland won the day in most convincing style by winning all their matches. The control of the meeting is undertaken by the British Golf Unions Joint Advisory Council on behalf of the four National Unions.—*R. M., Maida Vale.*

Kennel

Eating Manure.—This may be simply a bad habit, but it is quite frequently associated with a deficiency of potassium salts in the diet, so it might be well to try the effect of giving her one to two teaspoonfuls of black treacle every day.—*E. L. C. P., Notts.*

Cure for Mange.—For ordinary sarcoptic mange, clipping close all over, and rubbing in sulphur ointment twice a week for about three weeks, is usually sufficient to effect a cure, but for the follicular type of mange the services of a veterinary surgeon are needed. The diet, so long as it is nourishing and ample, is of no importance, as mange, unlike eczema, is a parasitic and not a constitutional disease.—*H. C. H., Dorset.*

Cure of Skin Complaint.—The rapid change for the better of the skin condition suggests that it was an allergic one, and that beef in this particular case acts as a systemic poison. It is on a par with the urticaria and erythema which follows the taking of shell fish, strawberries, &c., in some human individuals, and with the asthma excited by the use of feather pillows, by pollens, and by certain foods. An exceedingly interesting case.—*Veritas.*

Miscellaneous

Decay of Timber.—There was a report on the subject you mention issued two weeks ago by the Department of Scientific and Industrial Research and, in our opinion, deals with the questions you put forward very adequately indeed. Wood, it is stated, never decays solely on account of age alone. Timber thousands of years old has been discovered in a state of perfect preservation in the tombs of Egypt or in the foundations of pre-historic lake dwellings. In this country decay is brought about mainly by attack by fungi, but in the tropics white ants are an equally important enemy of timber. In general, so little timber is lost through wear as compared with the amount which is allowed solely to decay, that the term "durability" has come to mean almost the same as resistance to decay. Among the common timbers used commercially in this country, teak, iroko, jarrah, oak, yew and western red cedar are remarkable for their resistance to decay. "The decay of woodwork," the report states, "should never be accepted as inevitable. If woodwork has decayed while the structure of which it is part is still in use, it is evident that the wood has not been adequately protected. The extensive substitution for wood of other materials resistant to decay has occurred principally because it has not been realised that wood can economically be made completely resistant to the destructive agencies. Wood pit props have now been replaced largely by steel props for supporting the roofs of the more permanent roadways in coal mines, principally because the untreated wood props decayed so rapidly. It has now been shown that the life of wood props can be extended at least five to ten times by a simple inexpensive open tank treatment with a solution of sodium fluoride or zinc chloride. Where timber is exceedingly cheap, as in some timber-producing countries, it may possibly be more economical to renew it frequently than to protect it against rot, but in Great Britain, where timber is not particularly cheap and where labour costs for replacement work are high, calculation will nearly always show that protection by wood preservative treatment of all timber liable to fungal decay is most definitely a paying proposition." Fungal decay of wood is in reality a chemical decomposition which is brought about by the ferments and acids secreted by the fungi. The wood is, as it were, digested by the fungus, and part of it is transformed into liquids which are absorbed by the fungi as nutriment. For instance, certain substances in the wood are converted into sugars which are then utilised by the fungi. Wood in an advanced stage of decay represents the residue which is of no use to the fungus, or which has not yet been utilised. The report gives much valuable information on the diagnosis of decay. At its early stages, even before there are any obvious signs of disintegration, there may be quite a serious falling-off in the strength of timber. The report makes recommendations for the prevention of attack in standing timber, felled logs, sawn timber in storage, and in timber during shipment and in use. The more important of these recommendations can be briefly summarised as follows: Felled logs should be converted as soon as possible, and sawn timber should be stacked so that the surface at least can dry off quickly. Timber yards should be kept clean and free from decaying wood waste, from which fungi will spread. Timber in service which cannot be kept permanently dry should be thoroughly treated, preferably by impregnation, with a wood preservative. Valuable woodwork infected with decay may be sterilised by a short heat treatment at a high humidity in a drying kiln.—*D. A. C. R., Bridgwater.*

Post-Mortem Examinations

Avian Tuberculosis.—A hen pheasant and a domestic duck have revealed advanced loss of flesh and the lesions of avian tuberculosis. This contagious germ infection is met with in many species of domesticated and wild birds, usually as a slowly progressive and fatal disease. When the internal organs are infected the germs of tuberculosis are excreted in the droppings of the diseased bird. On the ground the germs are capable of remaining alive for between 12 to 24 months, and during this period will infect another bird or susceptible animal whose food is contaminated. Among farm animals pigs are more susceptible to the avian tuberculosis germs, but cattle and horses also contract the disease. Thus whenever poultry or game are picked up in an advanced state of emaciation their bodies should be examined by an expert. If the disease is diagnosed among domesticated birds the remainder of the flock should be tested by a veterinary surgeon; all reactors to the test should be destroyed, since there is no known curative. The litter and droppings from the house and pen should be burned, and the interior of the house should be thoroughly scrubbed out with hot soda water and soft soap. The ground of the infected pen should be dressed heavily with quicklime and should be kept free of birds and farm animals for at least two years. The bodies of tuberculous birds should be incinerated at once. We have known of avian tuberculosis being conveyed to pigs on a poultry farm because the farmer threw his tuberculous carcases on to the manure heap, where they were found and eaten by some of his pigs. If the avian disease has been diagnosed upon a general farm the cattle and pigs should be tested with avian tuberculin by a veterinary surgeon. Occasionally correspondents to whom we have reported avian tuberculosis have asked us to describe the tuberculin test so that they might apply it themselves. It is a delicate test requiring the experienced professional for its application and interpretation; there are too many dangers involved in its misuse by unskilled laymen.—*C. H., Lincs; J. O. H., Surrey.*

Shooting

Shooting in Portugal.—There is excellent duck shooting in the south of Portugal, and we should advise you to go to one of the two following places: The first is Caldas da Rainha, which is about 55 miles north of Lisbon. A good place to stay there is the Pensao Extremadhera, where the charge is from 4/- to 6/- a day. A short way from this town is the walled city of Obidos, where you may stay at the Hotel Fuas Ronpinho for 3/- a day, including wine. There is a large lagoon just outside where the shooting is excellent, and there are also opportunities for sport on the nearby islands. These hotels are not, of course, palatial, but they are very comfortable. The Spanish War has tightened up the regulations about taking guns into Portugal, but we think if you declare them in the customs and buy a Portuguese gun licence immediately on arrival, there should not be much trouble.—*A. E., Abington.*

Stable

Pony's Bedding.—You will find it is most necessary to provide some sort of bedding for your pony in his stall. There are a good many reasons for your doing so. The most obvious is that it makes for cleanliness, not only in the stall, but on the pony's skin. As one of the most important causes of capped elbows is the lack of bedding, it will help to obviate this. Also the provision of bedding helps as a non-conductor of heat, and this minimises the risk of chills. But it is most essential to see that the pony has good bedding material, as, in the case of it being insufficient, contact with the cold cement of the flooring will bring on chills, just the same. In the case of the pony being sick, of course, the advantages are obvious. Another reason in favour is that it encourages him to lie down, and so saves his legs.—*B. R. D., Moffat.*

Travel

Winter Sports in Finnish Lapland.—The centre of winter sports in Finnish Lapland is Rovaniemi, which is some two miles south of the Arctic Circle. There is an excellent and very modern hotel there, and a school run from the hotel. Reindeer may be obtained for reindeer-joring. Although there are no slopes in the Alpine sense of the word, there are several appreciable hills and two excellent ski jumps, one of which is the highest in Scandinavia. The attraction is really the long ski journeys which are conducted by expert guides. You will obtain all information from the Finnish Travel Bureau at Helsinki, or at 7, Victoria Street, S.W.1.—*P. D. L., Otley.*

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage, Home and Abroad.

	Inland. £ s. d.	*Canada.* £ s. d.	*Elsewhere abroad.* £ s. d.
12 months	3 3 0	3 0 0	3 10 0
6 months	1 11 6	1 10 0	1 15 0
3 months	0 15 9	0 15 0	0 17 6

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

Printed in Great Britain by Bungay & Kearns, Ltd., Maiden Ln., Stamford Street, S.E.1, and Published by The Field Press (1936), Ltd., The Field House, Bream's Buildings, London, E.C.4, in the County of Middlesex. Dec. 31, 1938
