ROSE SPECTACLES

THIS year the Royal Agricultural Society of England hold their centenary show. The show will be held at a time of acute depression in British agriculture. There will be no signs of that depression on the show ground at Windsor. There is never a sign of depression in the shop window; the first sign for the man in the street is the closing of the shop. But the depression is there all the same. Make no mistake about that.

It is not the fault of the farmer. British farmers can farm their land as well as any men in the world. It is not the fault of those who supply goods to the farmer. It is not the fault of the present Minister of Agriculture, who is doing a very difficult job as well as his Cabinet colleagues will allow, and who might do a great deal better had he more power. It is indeed difficult to say just whose fault it is—though the fault obviously lies somewhere, and is, equally obviously, closely related to the question of overseas trade.

Sir Reginald Dorman-Smith has started a ploughing scheme. He is trying to do something for the sheep farmer and something for the barley grower. And all (though we do not believe in the subsidy system) this is to the good in so far as it is better than nothing. But you cannot work the land without men. And what is being done to bring men back to the land? Many thousands have left the land recently: and if there is unemployment in the towns (and there is still plenty) there is a great shortage of agricultural labourers, a very great shortage if our farming is going to be put back into its rightful position.

Something could be done, if the Government set about doing it. But the Government appears at the moment to be somewhat at sixes and sevens. "Czech gold" has not pleased the man in the street, and the man in the street is shortly going to be asked to vote. The Japanese fish deal, temporarily pushed into the background, and the stripping of British men and women at Japanese command has not pleased the man in the street. But, then, the man in the street has given up trying to understand (the politicians call his attitude "apathetic"; "disgusted" would be a better word) the workings of the political mind. It would be a very great pity if that disgust robbed us of the most promising Minister of Agriculture we have had for many years.

For Sir Reginald Dorman-Smith is, we believe, much more an agriculturist than a politician. We do not believe that he has one eye cocked on Downing Street; we do believe that he has the best interests of the British farmer at heart. We believe, too, that he has a chance such as is given to few men—the chance of rejuvenating a countryside. And, though we cannot know all the difficulties and the obstructions he has to face, we can guess at some of them. We do not believe them to be insuperable—though we do think that to combat them he will have to show a spirit of independence and a will to fight altogether foreign to the general run of Ministers of Agriculture.

Men could be brought back to the land: farming could be made to pay. The countryside could be as prosperous as towns that make armaments. But only with real leadership, which is leadership with knowledge and courage and a belief in the rightness of a cause. The days when one could believe the popular political sop "a little turn of the wheel and everything will come right" are long past, though a number of politicians apparently still believe it. The wheel has got to be turned. And only a strong man can do that.

THE "FIELD" TROPHY

ONCE again the motor yacht contest for the *Field* Gold Trophy, under the auspices of the Royal Scottish Motor Yacht Club, is assured of success. There are no fewer than sixteen boats entered for the Endurance Test which is to be decided this week, June 30th and July 1st, over the 160 miles course in the Firth of Clyde. Two of them enter from Ireland, Dr. A. C. Seymour's Cruiser and Mr. W. H. Roberts's Kathleen, which raced last year, when Mr. E. Arrol Hunter's Maureen II was the winner. Lord Inverclyde's big and speedy Beryl is again taking part, and, on the last occasion, was given the task of overtaking the rest of the fleet which had a long start of her. She did the fastest time and this year the first boat off has nearly six hours lead. Mr. Harry Turley, who took the trophy to the Clyde in 1935, will be competing with Golden Gleam, and others of last year's participants are Mr. Nigel Laird's Melosa (placed 3rd), Mr. John C. Sloan's Clarinda (placed 4th), and Mr. J. M. Tolmie's Zephyrus. There will be a keen contest between yachts big and small under the well-adjusted handicaps. The rest of the entry comprises Mr. Ninian B. Stewart's Rosemary, Mr. T. R. Patterson's Metopa, Mr. John Ure Wright's Senora, Mr. E. D. Kennedy's Westward, Mr. James F. Ross's Tunnag, Mr. J. A. Wotherspoon's Fessonia, Mr. Thomas Angus's Eun Mara, and Mr. J. Russell Murdoch's Macabeth. It is to be hoped the weather will be as kind as in 1938, for the test in past years has been one of endurance for the yachtsmen as well as the yachts.

DUCKS UNLIMITED

Wildfowlers on the other side of the Atlantic mean to go on wildfowling, judging by the amount of "hustle" which now characterises their efforts to stem the decline of ducks. Since the days of the Great War, when many of the finest breeding grounds were drained to make room for more tillage, fowl have decreased. It is estimated that over 17,000,000 acres of water areas in the north central states alone were affected in this way. The extra tillage attracted crows, which, on account of their egg-eating proclivities, have become an additional menace. Drought, too, has accentuated the situation. Curtailment of shooting seasons and reduced bag limits have failed to arrest matters, and so America's first national organisation of wildfowlers has come into being with headquarters in New York City and a similar organisation in Canada. Many local committees have been formed, and subscriptions amounting to over $300,000 on a five-year pledge basis have been enlisted, as well as public and governmental co-operation. So far about 100,000 crows have been destroyed, dams have been built, and 140,000 acres of marshes have been restored in the Prairie Provinces of Canada, which are, or were, the great breeding grounds. These efforts certainly deserve success.

WHERE ARE THE GRILSE?

Midsummer, unworthy of its name this year, has already passed, and still there is no sign of a satisfactory grilse run. It may be that rain and heavy water at June's decline has hidden the arrival of these summer migrants and that there are more of them in the rivers than pessimists believe; but market reports do not support that view, and it is to be feared that holiday salmon fishers will again be left lamenting. There seems to be an, as yet, unexplained connection between plenitude of springers and paucity of summer fish, but this year only a few streams have had the satisfaction of heavy runs in the early part of the season. From now till September grilse are the only fish which can be relied upon to give sport to salmon rods. A failure in the run for the second year in succession will be a sad blow for the many rods to whom the summer holiday alone gives the chance to enjoy their favourite sport.

WEEDS, COMFORTING AND OTHERWISE

One of the bright spots in Parliamentary debate centred round the increased duty on tobacco. Lady Astor said she had not great sympathy with anybody who was comforted by a pipe. She had never found that a comfort herself. Smoking was almost one of the crimes of the age. Mr. Bracken characterised this as strange language from a daughter of Virginia, and Mr. Naylor, when assuring the noble lady that smoking did add to one's power of thinking, was ungallant enough to recommend her to try a cigarette or two. The opposition were not so much concerned with Kipling's dictum that

"There is peace in a Larranaga,
There is calm in a Henry Clay,"

but with the burden thrown upon poor people. Yet the humblest of smokers would doubtless spare the odd halfpenny willingly rather than share the fate of the German who is said to be threatened with the fragrance imparted to tobacco by the addition of lemon peel, thyme, lavender, violet root powder, cherry leaves, or rose leaves. When, instead of this adulteration, dried stinging nettles or dried grass is added, the term "weed" becomes no longer a misnomer, though the usual adjectives may need revision. Lady Astor might well protest at the smoking of this "mixture."

THE HUNTER'S DREAMS

Out of the mists of ages past,
Out of the future, too,
Comes a cavalry charge to the trumpets blast
And a hunt that gallops through.

These are the glorious dreams of men
These are the visions bright
While Reynard sits watching in his den
Waiting to hunt till night.

These are dreams that fade away
Visions that melt at dawn.
Keep your thoughts on the mounts of to-day,
And the twanging note of the horn.

LAVENDER BEAUMAN (aged 12).

A COUNTRYMAN'S JOURNAL

IT seems as though the manless, elm-bordered pastures of mid-Bucks must be linked on to one another all across England, so uniform are their expanses as they stretch themselves athwart the vale or straddle the low hills. But suddenly the big sad fields of Bucks look over the dark Midland plain through the stark portals of the stacks of the brick kilns. The Bedfordshire border is in sight, and on this side of it stands what is perhaps the largest village in the county, larger than Cowper's Olney in the north. This is Stewkley, whose age is warranted by the squat bulk of its massive late Norman church, more richly ornamented with chevron work both within and without than is any other Norman church known to me.

Yet the traveller's first thought is to wonder what Stewkley Church is doing at Stewkley. It is as though a piece of antique statuary were set in the midst of the figures of mass-produced zoos or fairy lore in which the suburban gardener delights, or a St. Bernard dog were surrounded by yapping mongrel curs. The village itself no longer looks English at all; it might easily be mistaken for an Australian mining colony of shacks, saloons and little Bethels planted on a goldfield. Attentive search reveals a score or more of traditional cottages of local brick, stone, half-timbering and thatch. One cottage has a diminutive oriel with latticed windows; one or two others have their brick set in herringbone courses, a happy mannerism that extends or extended to other villages in Bucks and Oxon, while a few possess old oak doors with local ironwork. But they are as lost along that mean and squalid street as the bole of an old tree is hidden by the ivy that "mantles" it and sucks its life-blood. No casual pilgrim through Stewkley would be aware that such cottages existed, and the only reason for my discovering them was that I was on the look-out for the older folk who lived in them, and I was on the look-out for them because Stewkley used to be one of the headquarters of the immemorial cottage industry of straw-plait.

Fifty years ago, every cottager made straw-plait for the hat and bonnet factories at Luton and Dunstable, mostly the woman; but the men also when they came home from work in the cornfields, and the children, too, they were taught the craft in the mixed plaiting schools. When they were closed, as the lace schools were, by the Education Act of the '70's, the trade hung grimly on for a score of years or less; but even in its decadence and desperate self-defence against the plaiting machines and their glib inferior products in the mass, the children were still taught by their mothers. Then, some time in the '90's, the village fingers fell idle by the force of what one of the old men called "the cut-throat world," the fields whose corn had served the double purpose of food and craft reverted to grass and Stewkley became what it is now.

No technical record of straw-plait exists except for half-a-dozen pages in Thomas Hennell and Henry Warren, and the counties of Bucks, Beds, Essex and Herts were those in which it lingered the longest. I hoped, therefore, that I might be able to recover the memory of this ancient craft from the cottagers of Stewkley, especially in view of the fact that the wheat fields of this region grew the best straw for the purpose, being almost white and taking a fine polish after steaming and pressing. Herein, no doubt, lies one of the reasons, apart from machine-made plait, why the industry perished. When wheat was cut by scythe or reaping-hook, the whitest and most flexible part of the straw was severed from the ears before they were threshed, tied up in bundles or "links," each with its sheaf-knot and sold in the village for 6d. a link. But with the coming of the reaping machines, the villagers could only obtain the coarser stubble, and this meant that it was not far enough removed in quality from machine-plait to compete with it.

In the days of hand-reaped corn many villagers owned plots of land in which they grew their own corn for the plaiting, and what they sold to the collector who went the round once a week was all profit. The most dexterous hands could braid a "score" (20yds.) of plait a day, for which they were paid 8d., while the rougher kind fetched about 5d. Since field-wages on the big farms of those days were sometimes as low as 10– a week, a large family of straw-plaiters (and I talked to a man whose parents had a quiverful of eleven) was able to make substantial increment to the father's pittance. I shall conclude what I found out about straw-plait next week.

H. J. MASSINGHAM.

WITHOUT COMMENT

An account of the Sind Steeplechase: "In the Sind Steeplechase, only two horses finished the course. Wanconner fell at the second fence, while Hadagain shied at a fence in the second chukker and failed to complete the course."

The Birdbrae Grove on the way to Goodwood Racecourse

ROADSIDE TREES AND SHRUBS

Beautifying Our Modern Highways

TRUNK roads are appearing all over England to-day. Some of these main arteries are attractive, some ugly scars which need careful attention if they are ever to be healed. To certain motorists the invalid can be left in its present state, for to them the only object of any road is to get from one place to another in the quickest possible time. The scenery through which they pass means nothing to them; they do not understand "the gift of country life" which Mr. John Masefield has so often praised. This minority, therefore, give little thought to trees and flowering shrubs and how their judicious employment could enhance the beauty of our highways.

But there is, I am glad to say, a majority in favour of the careful planning of our new highways. At the moment the Ministry of Transport want to bring all our main roads up to a given standard, which includes, among other things, dual carriageways with a gap between them. Now that gap can be transformed into exactly what we wish. It can be merely a space, a patch of stunted shrubs, a magnificent standing block of trees, a combination, a border, or a lot of other things.

Little of value can be said in a general way as regards selection of species from the purely ornamental point of view. Each situation requires an individual scheme suited to local conditions. That is a very important point. The beautification of roads is an aspect of landscape design which is too strictly limited at the present moment. The Roads Beautifying Association is doing a noble work, but their sphere is limited by lack of funds.

I should like to see a landscape designer employed when a road is first made, for in this way we should keep the road as an integral feature in the landscape. This might not agree with the modern idea that all new roads should be thought of only from the point of view of the motorist and that they should thus be treated as a thing apart from the landscape. Naturally, safety is of first importance, but surely by planting the partition between the dual carriageways with shrubs we should be successfully combating the anti-dazzle menace; no little achievement.

Trees and shrubs, of course, would have to vary according to the type of country through which the road passed. We do not want to dragoon the countryside into a sort of "avenue landscape," so popular with the French some years ago. Certain trees, after all, fit towns; others, the country. We must therefore make them fit naturally into the landscape. In any case trees placed close together or too near the roadside are not beautiful. They really put a new angle on the term trunk road.

I personally would like to see the central strips on dual carriageways look like a mixed hedgerow, preferably wild shrubs. It would thus be pleasing to the eye, while no one could call it monotonous.

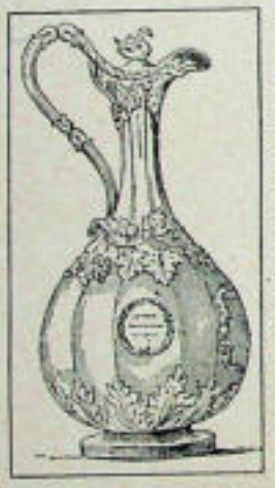
As I have already said, the Roads Beautifying Association is doing a lot of useful work. We may not all agree with some of their ideas, but then do we all agree with modern art, modern music? You cannot stop progress. You cannot stop these trunk roads from appearing. Country scenery will always change, but it is our duty to make the heritage of the next generation as beautiful as we can. Trees take a long time to grow; how can one criticise the work of a society before it is finished? It will take at least twenty years for some of the trees planted by the R.B.A. to come to maturity. The problem to-day is to provide efficiency with beauty.

A few days ago I was fortunate in attending a joint meeting of the Roads Beautifying Association and the Council for the Preservation of Rural England at which there was a discussion on planting the highway of to-day. I am sure *Field* readers will agree that both these societies are doing a grand work and one which will receive the blessing of future generations. That these two societies do not quite agree about the necessary treatment of our roads is not a matter for regret. Only by serious and thorough discussions will we get the very best rural effects and the most lasting beauty.

It is interesting to study where the views of the R.B.A. and the C.P.R.E. diverge. One of the main points concerns the type of tree and shrub to be planted. If, as Mr. Barnes said at the meeting I attended, the English countryside was of little beauty, and of a monotonous, uniform character, one might be tempted to favour the introduction of the flowering shrubs which we associate with parks and private gardens. But the English countryside is, as everyone knows, a thing of rare and precious beauty, varying in character from one county to the next. It is this striking variety of scenery which makes England so attractive to the foreigner accustomed to one type of scenery over an extensive area.

It is necessary, therefore, to give careful thought to the planting of roadside trees and shrubs. There are not, after all, so many flowering shrubs which will flourish in such an exposed situation as the central strip of these highways, especially in the north, and if we accept the principle that shrubs like berberis, cotoneaster, olearia and rhododendron, are suitable for country as well as suburban roads, is there not the danger that they will appear on all the main roads of the future? One must remember that people travelling through the country often form their conception of the local landscape by the immediate surroundings of the road they use. If the same design is made all over England, the effect will be to give our main roads a sophisticated character whereas in the country we look for unsophisticated charm.

The problem which now faces the various societies looking after our countryside seems to be to find a common line of thought. Are the roads to be lined with flowering shrubs or the common native shrubs—the thorns, hollies, broom, gorse—which have helped to make the English country lane so well known? Are we to grow "exotic" trees, like the lime, chestnut and walnut, or should we keep chiefly to the ash, oak, beech, sycamore, elm and willow for boundary planting on open roads?



In my opinion, these are questions which no one society should decide alone. A pooling of ideas is the only way of making our roads look at their best. In making these new roads we are on the threshold of tremendous new scope for landscape architecture, and it would be a mistake for any policy to be too hurried.

WILLIAM LUSCOMBE.

HENLEY REGATTA OF 1845. A PICTURE FROM "THE PICTORIAL TIMES" WHICH WAS ALSO USED TO ILLUSTRATE THE REGATTA OF 1856

A HUNDRED YEARS OF HENLEY

The New Challenge "Cup," forerunner of the Ladies' Plate

WHEN the landed gentry and principal townspeople of Henley decided to hold the first regatta in 1839 they had in mind that it would be capable "of producing most beneficial results to the town" and also be "a source of amusement and gratification to the neighbourhood, and the public in general." Mr. H. T. Steward tells the story of the early days of the regatta in his carefully compiled records, and no one can say that it has failed in its object.

It was on June 14th, 1839, that the first Henley took place, and to-day when entries soar into the hundreds, when there are nine events for competition and the heats for the Thames Cup and the Ladies' Plate exceed a score, the first programme makes strange reading. There were three Oxford crews for the Grand Challenge Cup ("Brasen Nose," Etonian Club and Wadham) and one from Cambridge (Trinity B.C.). The only other event was the race for the Town Cup, in which the crews rowed in boats named The Wave, The Albion and The Dreadnought. The starting-point is given from just above Temple Island and the finish was apparently under the bridge.

The weather did not behave very well for the regatta, as a storm arose on the Thursday night and continued until Friday morning, the rain pouring in torrents "amidst the most terrific thunder and lightning." The Leander crew arrived from London drenched with rain and rowed the distance, each heat, with the racing boats in good style. Some of the spectators had a bad time, for the Shell steam-barge ran aground and took twelve-and-a-half hours for the journey from Oxford, arriving at 4.30 p.m. Her passengers missed the first heat of the Grand, which was arranged for four o'clock, but were in time for the final, rowed at seven o'clock, and that of the Town Cup at six o'clock. First Trinity were the first to put their names on the list of winners of the Grand and added it again in 1860 and 1861. Next year saw a Leander win, the herald of 22 up to the present regatta.

The second year saw increased interest and signs of growth, for the eight-oared wherry of the Guards was present, an eight-oared gig of the Travellers' Club, the Magdalen Hall cutter, the four of Guy's Hospital, another with Lord Kilmorey and his crew, and several members of the London Scullers' Club, whose light constructed wager-boats were much admired. A District Challenge Cup made its appearance in the programme, but both this and the Town Cup were not very successful in attracting entries. The Stewards' Challenge Cup was instituted in 1841.

Apparently the heads of Oxford Colleges frowned upon rowing at Henley in those days, for we find Trinity College being entered as "The Pope" and Brasenose as "The Child of Hale Club." Tradition, therefore, seems to have been established for Oxford handicaps at Henley. It seems quite a pity that one bright spot of the early proceedings could not be revived, as for example when winners of the Grand were preceded by a band with the crew waving flags over their coxswain's head!

In these early days the O.U.B.C. and C.U.B.C. entered crews at Henley, and in 1842 Oxford withdrew from the Grand owing to the proposal that if they beat Cambridge in the challenger's heat, in which they were drawn together, some of the C.U.B.C. eight would be used to strengthen the Cambridge Subscription Rooms crew. This led to a ruling that no member of a club should be substituted for another who has already rowed a heat, or any member of a club be allowed to row with more than one crew in any of the races for the same cup. In 1843—the year that rule came into operation—Oxford had occasion, after having beaten the Etonian Club in the Grand, to ask permission from the Cambridge Subscription Rooms to row a substitute for their stroke, Fletcher Menzies, in the final heat, as he was laid low with fever.

The request had to be refused, and so the famous seven-oar race came about after the Subscription Rooms' crew had protested without avail at being compelled to row against an incomplete eight. Their crew is described as not having been properly got together, but they were a hot lot on paper and determined to repeat their successes in the Grand of the two previous years. The Rooms had the right to call upon members of each college club while in residence at Cambridge, and this gave them a strong pick.

The late Sir Theodore Cook, in *Rowing at Henley*, says their bow had been in the 1839 crew which won for Cambridge from Westminster to Putney. No. 2 was in the winning boat from Westminster to Putney in 1840. No. 3 was afterwards in the winning Putney crew of 1845. No. 4 was in the winning eight from Westminster to Putney in 1841. No. 5 had won in 1841 and lost in 1842 over the same course. No. 6 had won the same race in 1836. No. 7 was in the 1841 and 1842 crews. Stroke had won in the 1840 and 1841 races. All represented their University at one time and another if not before this race, but they were not officially a University crew.

Menzies, according to the account of Arthur Shadwell, the cox, fainted when stepping into the Oxford boat for the final heat, and the request to row a substitute was then made which it was not in the power of the Cambridge Rooms to allow had they been willing. A delay was granted and Oxford rearranged their crew, shifting "seven" to stroke and bow to "seven." There is some conflicting evidence about this, but it seems clear how's seat was vacant. To make a long story short, the "Seven" held their opponents from the start, gradually drew ahead, crossed to the Berks bank and won by two lengths.

Tom Hughes, brother of the seven-oar's stroke, wrote a poem on the race, one verse of which reads:

> Within a darkened chamber,
> Wrapped in his tartan plaid,
> Fevered in mind and body,
> Our captain brave is laid.
> To keep him from the river
> They've ranged stout waiters four,
> And they've barred the windows firmly,
> And firmly locked the door.

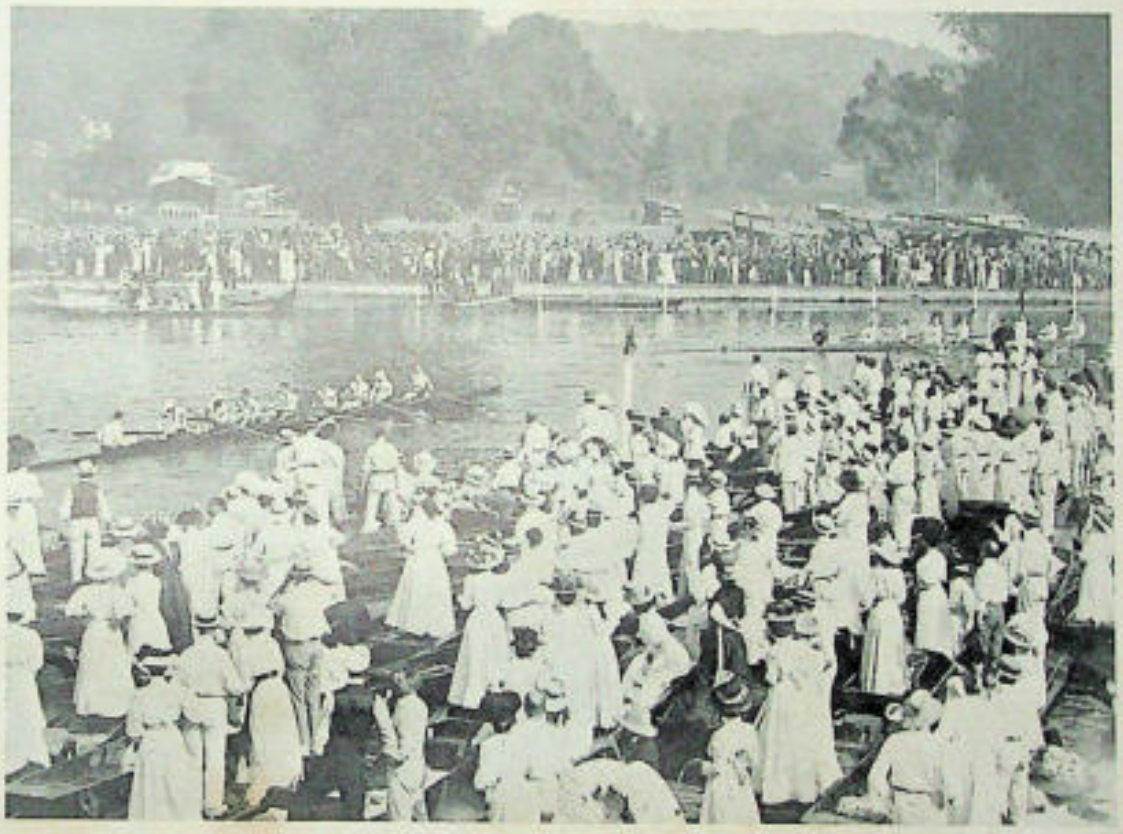
The scenes following this race provided one of the riotous affairs which were not unusual in the past. The crowd went temporarily mad and uprooted a tollgate and hurled it into the stream. Young men full of spirits used to indulge in practical jokes and feats which brought them to the notice of authority. A story has been told of one prominent oar, and a much-respected member of society in his later years, to whom the police credited all ill-doing. When a cart loaded with hay was shot over the bridge, which seems to have been a magnet for roysterers, he was miles away and had a perfect alibi. They fined him all the same. When the houseboats were such a feature of the river it was considered good fun to go round them at night and transfer the floral decorations from one boat to another. High-spirited oarsmen stopped short, however, at "setting the Thames on fire," which was done once with petrol (not at the regatta), to the detriment of the lovely roses on Phyllis Court wall.

Houseboats and the mass of skiffs which used to line the course were a matter of much perturbation among rowing men 50 years or so ago. A race for the Grand has been spoilt by the behaviour of the spectators. It is hard to imagine such a thing happening in these days of booms and meticulously ordered proceedings. After the War a decline set in as regards pleasure boating, and it is said that Henley to-day is not the attraction it was. I wonder if this is really the case, for although there are less boats and punts, the stands that have been erected must have compensated for the absence of floating spectators. In pre-War days you could walk across the river dry-shod at regattas, and some of the skiff handlers were not too skilful. I have seen a sculler catch a spectator in another boat a terrific crash across the head with his blade while attempting

TEMPLE ISLAND IN THE 1850's

The scene has not changed, but it is not on record that the races were rowed in wines or this direction

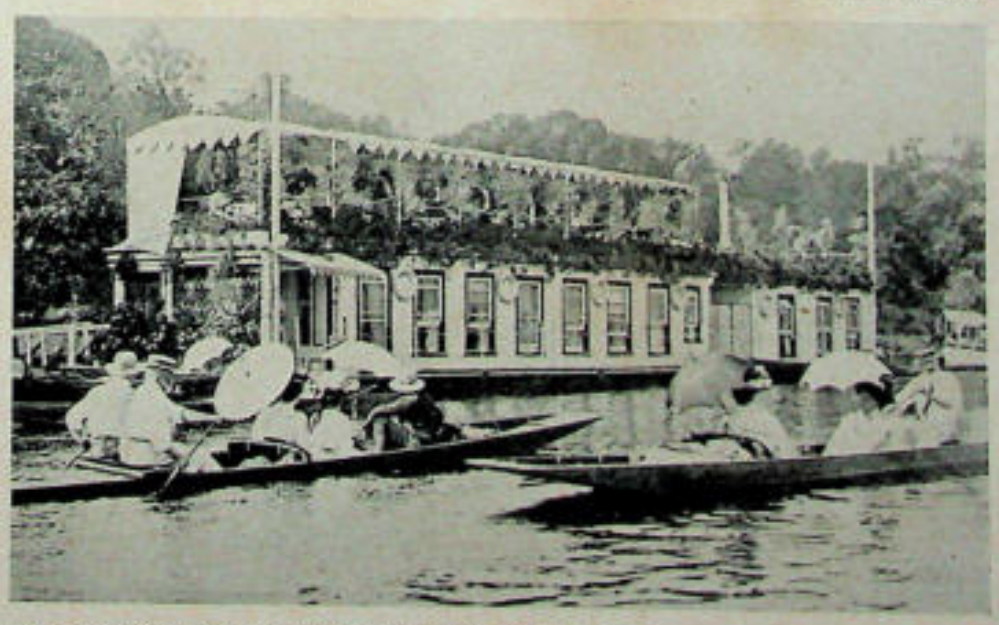
to move ahead and then, while making apologies, hit another one with a backward sweep of the other blade. Tempers at times were strained.



The course at Henley has undergone various transformations. The original course, of about 1 mile 550yds., was from the top of Temple Island round the Point to Henley Bridge. From 1886 to 1922 it was from below the Bucks side of the island to the top of Phyllis Court wall, and the booms made their appearance in 1899. In 1923 an experimental straight course was tried out, but its length was about 1 mile 440yds. and no records on it could be counted. The present course finishes at the same point as that of 1886. Actually, with the exception of 1923, all the courses are the same distance from starting post to finish, namely, 1 mile 570yds., but distances can only be given approximately for a race, as boats are sent off with their sterns to the starting pile and the longer one is pulled back to bring their bows level. As boats win by their bows an eight of 60ft. long rows 1 mile 550yds., but a sculling boat would go some 34ft. farther.

On the programme as we know it to-day the Ladies' Challenge Plate arrived in 1845, the Thames Challenge Cup in 1868, the Visitors' in 1847, the Wyfold in 1855, the Goblets in 1845, and the Diamonds in 1844. The Grand and the Stewards', as mentioned, had been established in 1839 and 1841 respectively. The Wyfold Cup, given by Mr. Donkin of Wyfold Court, was originally awarded to the challengers for the Grand Challenge Cup; the District Cup, without entries for two years, became the Visitors; the Goblets was first known as the Silver Wherries; and the Thames Cup was instituted for amateur clubs, with the proviso that no University crews or amalgamation of college crews or boat-club crews should enter or member of a crew take part who had rowed for the Grand or Stewards' or was in a Head of the River boat at either Universities in the current year.

Various modifications in the conditions of the races have been made. The Ladies', which started off as the New Challenge Cup, was originally open to colleges and other amateur clubs established a year, with the exception of University clubs, Subscription Rooms or clubs similarly constituted and so we find Thames R.C. entered for it in 1846. In 1857 the rules were amended to clubs and colleges of Oxford and Cambridge Universities and the schools of Eton and Westminster. This seems exclusive as regards the schools when one considers the number now entered, a case of "Westminster we row." The greatest revolution took place recently when the schools were given a fairer chance of meeting one another before going down to a college, and many people still support the idea of a school v. college final by arranging the draw in respective sections.



A great rumpus was caused in the Stewards' in 1857 by the action of Brasenose, who advertised their intention of rowing in this race and the Visitors' minus a coxswain. To conform with the letter of the law they started with one, but made him jump overboard. They were promptly disqualified and withdrew from the Visitors'. The unfortunate coxswain was the late F. E. Weatherley, K.C., the famous song writer, and I have heard the tale from him of how he received precise instructions from W. B. Woodgate to slide off the stern without disturbing the boat and of how he went down into the green depths with some perturbation as he could not swim! This incident led to racing in coxswainless fours at the premier regatta.

If an attempt were made to deal with the great oars and crews of the past 100 years, how would one know where to start and where to end? Think of the '50's, '60's and '70's, with Tinné, Darbishire, Yarborough, Arkell, Casamajor, the J. H. D. and C. J. D. Goldies, E. Warre, Willan, J. E. and T. C. Edward-Moss, Schlotel, Eyre, Gurdon, Gulston, Woodgate, Michell, Hockin, Brickwood, Champneys, H. H. Playford, Le Blanc Smith—just a valiant few at random! Then proceed to the '80's and '90's, and there the array of those we are conversant with

AT THE FINISH IN THE HEYDAY OF THE PLEASURE BOATING PARTIES

LEFT: A MEMORY OF THE OLYMPIC REGATTA OF 1908. LADY DESBOROUGH AND LORD DESBOROUGH AT THE PRESENTATION OF MEDALS. RIGHT: A DECORATED HOUSEBOAT IN PRE-WAR DAYS

becomes formidable: the great Guy Nickalls and Vivian Nickalls, Muttlebury, Lord Ampthill, W. A. L. Fletcher, F. W. Warre, C. M. and F. I. Pitman, Burnell, Kent, Harcourt Gold, Rowe, F. S. Lowe, Etherington Smith, Hastie, W. E. Crum, F. L. Playford, Wauchope—the list could be prolonged and many a worthy name would be missing, for there are giants galore.

Some of them in the earlier days possessed dominant characters. Possibly they were days when independence could be carried to greater lengths than in this age of uncertainty. W. B. Woodgate was a striking example. He looked like our conception of John Bull, with his side-whiskers, square hat and strange cape with ventilators at the shoulders. I have travelled with him on occasion, and his voice and manner commanded respect. He seemed to have an antipathy to railways and railway officials, and held the view that a railway ticket once purchased became the property of the purchaser.

A story is told of the celebrated oarsman being involved in difficulties with a railway official. Tickets on the South-Western Railway used to be collected at Vauxhall Station. Once when the ticket collector opened the carriage door Woodgate was asleep, or pretending to be asleep. The collector tapped him on the knee. "Take your hands off me!" roared Woodgate, and promptly hit the collector on the nose, knocking him out of the carriage. But the man was game, hung on, and got in again as the train started. It cost Brickwood, who was with Woodgate, a sovereign to soothe ruffled feelings and hush the matter up.

We have now got accustomed to foreign invasions of Henley and the prospect of trophies going abroad, but it was a shock to British rowing when the Grand Challenge Cup went to Belgium in 1906 and 1907. The Belgians' short stroke and broad blades evoked much discussion. In Sir Theodore Cook's opinion it was not their style but their better uniformity, resulting from long rows together, that produced their pace. He deprecated imitation, and argued that it was a dangerous thing to advise anything below the highest amateur standard when a general improvement was desired. Sydney R.C., Harvard Athletic Association B.C., Zurich R.C. and Rudergesellschaft Wiking, Germany, have won the Grand since then. As for the Thames Cup, the America Schools' attack on it has succeeded five times since 1929; while the Diamonds can only list one English win since 1927. Perhaps one day we shall revive the idea of the London Scullers' Club of 1839 and do something about it.

It is only to be expected that rowing should not be a British prerogative when other nations have learnt from us. And defeat is all to the good in livening things up. Nobody enjoys being beaten, and the object of entering for a race is to win it. This does not mean to say we do not appreciate the victor's success. Very far from it! There is some consolation for defeats at home in that the Tideway and the Universities have shown we can go abroad and return the compliment.

One great reform at Henley has opened the Royal Regatta to clubs besides those affiliated to the A.R.A. Democratic rowing legislation, in keeping with the times, has removed the bar which was erected against those who "had been by trade or employment for wages a mechanic, artisan or labourer, or engaged in any menial duty." Time marches on!

If the ghosts of great oarsmen can look down upon the hundredth Henley and pass judgment upon the rowing of to-day they cannot but feel proud of their successors. Orthodox or unorthodox and questions of style apart, the spectacle of 120 crews rowing the Championship course must exceed their wildest dreams, and that is not all by any means, for there are the Head of the River races in the Provinces to consider, and oarsmen up and down the country who row for rowing's sake. The prowess of the past is always held up as a model for the present, but in days to come, lugubrious but comforting thought, it will be "Ah, but you should have seen Jack Beresford or Cherry. Those were men who knew how to row!"

Times and records we are always told are no criterion of performance, nevertheless they are lovingly preserved. And if they are to be built upon what about last year with records in the Goblets, the Visitors' and the Diamonds eclipsed, and a 6.52 in the Grand, a 7.3 in the Thames Cup and the fastest time (6.56) ever made by a school in the Ladies'? This latter was Radley's first win. Sir Theodore Cook, had he been alive, would not have been the best selection for the post of official timekeeper on that occasion. I remember him filling that office one year when Radley, his old school, were beating a college crew. After Fawley the race absorbed his whole interest, and when the launch passed the Press box and there was a cry of "Time! Time!" he turned to the rest of us and asked if anyone had taken it. No one had. "Seven twenty-seven," he called out without the slightest hesitation.

For the centenary there are crews and scullers from America, Canada, Australia, Norway, Uruguay, the Argentine, Switzerland, Italy, Belgium and Poland, and a new event appears on the programme, the Centenary Double Sculls.

The entry of Montevideo R.C. for the Wyfold furnishes an example of how our chickens come home to roost, for the club was founded in 1874 by an Englishman. Now it is an entirely Uruguayan institution and has achieved distinction by winning for the last two years the American Cup presented by the President of the Argentine Republic and competed for annually at the regatta on the Tigre near Buenos Aires. The club holds the record of having won the race eight years consecutively, and No. 3 of the visiting four, Julio Flebbe, has been five times in the winning crew; the stroke, Francisco Simara, four times; bow, Baldomero Benquet and No. 2, Cesar Seaglia, twice. Stroke and No. 3 competed at the Olympic Regatta in Berlin. They are to be congratulated on their venture, especially as they are strange to coxswainless rowing. Their departure was arranged with the help of a grant from the Regatta Hospitality Fund for overseas crews and the assistance of the British Minister, Mr. E. Millington-Drake, an old Oxford Blue, who has rowed six years at Henley and who was in the Eton crew that won the Ladies' Plate in 1905, and the Magdalen crew that won the Grand Challenge Cup in 1910.

And so to the contestants at this great centenary the words of Tom Hughes may be applied:

The backs that bend together,
The steady stroke and long.
Now lively on the feather,
Now through the water strong;
The wind that lasts for ever,
The pluck that never dies,
Will last them through the struggle
And bear away the prize.

R. N. Rose.

SEA-TROUT FISHING ON SUMMER NIGHTS

FOR the angler who must take his holiday at the height of summer, say from mid-July until mid-September, the sea trout is without doubt the fish which offers most opportunities of sport. Salmon fishing in many rivers is at its very worst during this period. For one thing it is a sort of interlude between the summer and the autumn fishing. Summer salmon begin to appear in May, and the runs continue through June and then usually tail off fairly abruptly in July, so that by the end of this month most of the fish in the pools have been there long enough to have become dour.

Autumn salmon, in those rivers which nowadays have a real run, and the number is far smaller than it was a generation ago, do not begin to put in an appearance until the end of September or October, and so there are few fresh fish about unless one happens to strike it lucky in a good grilse year. These immature salmon, which come back to the river after only one year in salt water, usually start running in July, and may continue to ascend, if there is water to bring them up, well on into August. But in many years there is no water, and this is another reason why salmon fishing is often so bad in August, the rivers are low in level and the water temperature is high, and so the dice are heavily loaded against the holiday angler who, for business or family reasons, must make this his main angling occasion. Then it is that the real value of the sea trout becomes so evident.

While individual rivers vary to a certain extent, it may be said that in the majority the earliest fish begin to appear about mid-April, and many of these first comers are real big 'uns, weighing in some cases up to 10lb., and in a few rivers even larger, with 4 and 5-pounders relatively common. In May and June there are runs of medium-size fish of 2lb. to 3lb., and then, towards the end of July, come the great shoals of small fish, which go under various names, herling being the one most widely used. These, which correspond more or less to the grilse stage of the salmon, average about 12oz., and in some years enter rivers in such numbers that certain favourite pools may appear to be paved with a carpet of living silver, a sight to rejoice the heart, and make the pulses tingle.

Sea trout differ from salmon in two ways which are of the utmost importance to the angler. First they will come into rivers at the height of a drought, pushing up over stickles at night where their backs must be out of water at times, whereas salmon will not go above tidal pools when once the river gets low until there is a spate. Second, the best sport with *trutta* is in conditions that are hopeless for *salar*—hot weather and low water, although it must be admitted that to catch them in any numbers one must turn the clock about—fish by night and sleep during the day. Yet there are many worse places—indeed I can think of few better—than the bank of some lovely stream in the West Country, Wales, the North of England or Scotland on a hot August evening. The tawny owls are hooting in the oak woods, and from the bracken-covered hillside comes the curious "jar-r-r-r" note of the nightjar hawking the big crepuscular moths, and the cockchafers which pass with droning hum, like miniature aeroplanes.

On the mirror-like surface of the pool, which reflects the moon or stars, are the dimpled rises of brown trout, and now and then a great commotion as a big sea trout or salmon comes up to wallow just below the surface. Then, maybe, almost at one's feet as one stands motionless like a heron in the shallows near the tail of the pool, a silver shape leaves the water for brief aerial flight. One can hear the curious whirring noise made by its fins, which sounds like the pinions of some vast bird hovering overhead, and then the night is shattered by a resounding crash as the sea trout falls back into the pool.

Not infrequently when night fishing one will have the luck to see an otter hunting for its supper. Some people object to *Lutra* fishing the same pool as themselves. But, personally, I would always willingly watch the other fish catcher at work if there was light enough to see what it was doing. An otter passing through a pool does not alarm sea trout at all; but if it elects to hunt there it will certainly put a stop to sport. However, it is always amenable to a little "peaceful persuasion" in the shape of a well-placed stone or two if its absence is desired. There have been a number of instances of an otter actually taking a sea trout which was being played by an angler at night.

Sea trout are more particular than salmon in their choice of water. They do not seem to mind a certain amount of pollution; but they do not like very slow-running streams as a rule, and most of all do they dislike muddy rivers. Fast, clear, rocky streams are their favourite habitat, and in the West Country the Tavy, Dart and Teign in Devon, and the Fowey in Cornwall are all good.

Most of the Welsh rivers hold good store of sea trout. In the last few years they have increased enormously in the Towy. In 1937 the rod catch jumped from a previous average of about 3,000 to nearly 8,000, and to 9,326 in 1938. The Teifi is also good, while the Dovey is famous for its heavy fish, which run up to 16lb. and over. Conway is excellent sea-trout water, and so on up the west coast, Ribble, Lune, Eden, Border Esk, and almost without exception the western Scottish rivers and lochs provide good sea-trout fishing.

West Country.

OBITUARY

SIR FREDERICK HOBDAY

With the death of Professor Sir Frederick Hobday, F.R.C.V.S., F.R.S.E., the veterinary profession in this country has lost one who for many years has been its outstanding personality. Sir Frederick was honorary veterinary surgeon to the King and late Principal and Dean of the Royal Veterinary College. It was largely due to him that the college was rebuilt and transformed into one of the most scientifically equipped institutions of its kind in the whole world. And it was largely due to him that the veterinary profession holds the position it now does in England. But he will be remembered by many people for his marvellous operation on Robin-a-Tiptoe, winner of the National Hunt Steeplechase at Cheltenham, for but for that operation Robin-a-Tiptoe would never have raced. Sir Frederick, who was 69, had been undergoing treatment at Droitwich, where he died, for some time. He had not been well for a long time, and those who knew could not have been surprised at the news of his passing. Though he suffered at times great pain he was ever cheerful and his spirit quite indomitable. His death will be a great blow to all with whom he came in contact in the course of his work and to the many friends he made in all walks of life outside that work.

LETTERS TO YOUNG FLY FISHERS

II.—How To Cast a Fly

MY DEAR BOB,—I am glad you decided on the longer 9½ft. rod. All that your friends say about the convenience of those little rods of 8ft. or even 7½ft. is quite true, but it is not the whole story. You may remember I said in my former letter that a complete trout fisherman's outfit would cost ten times the £5 you had to spend; and I might have said even a complete trout *fly fisherman's* outfit would cost that sum. If you had £50 to spend instead of five I should recommend the purchase of several rods, and among them a short, light rod for use under trees and encumbered waters; but for your purpose we have to consider which type of rod will be most generally useful for fly fishing here, there and everywhere. And you will find that, while the short rod can be very useful in awkward places, there are many waters on which a long rod will catch fish for you when a short rod will not. It is always as well to remember that the main object of going fishing is to catch fish. Comfort and convenience are important, but they are secondary considerations.

You say that the rod is "more bendy" than the shorter ones. That is as it should be. There are many men who do not like what is called a "slow"—or sometimes an "easy"—action; but for a first rod it is, I think, distinctly to be preferred. A stiff rod will throw a longer line, and will cast better against a wind, but at first neither of these things will be of much use to you, because your muscles—the muscles used in fly casting—are probably quite undeveloped, and until they are, you could not get any advantage from a stiff rod, while on the other hand it would take you much longer to learn to cast with it. Casting is almost entirely a question of practised muscles. That is why I cannot, despite your faith in my ability, teach you to cast a fly by writing to you about it. The best I can do is to explain the general principles of the thing, and leave you to put it into practice. An hour with an experienced fly fisherman would teach you more than I can hope to do on paper. But here is the gist of it.

You have no doubt already discovered how to put the tackle together. See that the rod rings of the two joints are in line and the ferrules pushed well home. By the way, if the ferrules are stiff, as they generally are in a new rod, put a smear of grease on the male ferrule before putting the rod together, otherwise you may have difficulty in pulling the joints apart again. Put on the reel with the handle to the right. There are people who will tell you to put the handle to the left and learn to wind in with your left hand, thus saving time. But there is no advantage in this split-second saving. It takes only the merest fraction of a second to change the rod from one hand to the other when a fish is hooked, and it is less tiring to play a fish partly with one hand and partly with the other, so what is gained on the swings is lost on the roundabouts.

Before threading the line through the rings, take the rod and make the rod top "play" in the air so as to get the hang of it. The whole trick in casting is to *make the rod bend*. That is a point you should bear always in mind when you are learning—and for a long while afterwards—until casting has become second nature to you. The hand holding the rod must make only a very small movement, while the tip of the rod must sweep out, comparatively speaking, a long arc in the air. The hand, in fact, only moves about 3in., while the tip of the rod moves 3ft. or 4ft. This is where the practised muscles come in. At first you will have to make a conscious effort to get the rod to bend; in a month or two you will be able to do so without any conscious effort at all. I want to impress this upon you. If someone had emphasised it for me some 35 years ago I should certainly have caught a trout much sooner than I did. Do not be afraid of it. You will not break the rod, however flimsy it may seem to you. Put some beef into it, and make it bend backwards and forwards; but move your hand very little.

When you are satisfied you can make the rod bend, thread the line through the rings, tie a small knot at its end (to prevent fraying); lay the rod down on the grass (a lawn is much better than water for learning the ropes) and pull off 9yds. or 10yds. of the line (no more), laying it out straight on the ground in line with the rod. Then pick up the rod, holding it parallel with the ground. Your object is now to make the rod do with the line exactly what it did without it: the tip must switch back, making an arc in the air which will throw the line back over, and to the side of, your right shoulder. The best stance for your body is facing 45 degrees to the right of the line as it lies out on the grass. In this position you will find that you can watch the path of the line through the air both backwards and forwards by simply turning your head; and it is of the first importance, in learning, to see what is happening to the back cast.

When you are in this position raise the rod point a little (to about 45 degrees), and then with a quick movement make the tip bend backwards, thus picking up the line and throwing it behind and to the side of your right shoulder: allow the line to extend behind you, and then make the same movement forward and throw the line out on the grass again as before. The rod during the cast should be pointing to your right side at an angle of 45 degrees with the ground—not vertical or horizontal; it must be gripped firmly and the movement of the hand must be very short and quick. The hand movement is made parallel with the ground. It is not made by bending the wrist or the forearm from the elbow, but by the whole arm from the shoulder; hence it is commonly called the "shoulder cast." There must always be a short pause between the backward and the forward part of the cast to allow the line to straighten out behind, otherwise you will hear a crack, and if you had a fly on it would most certainly part company with the gut. Cracking off flies can be a most expensive pastime. So do not forget the pause between the backward and forward cast.

The process of casting may be thus divided into five parts: lift the rod a little (which starts the line moving); make the back cast; pause; make the forward cast; drop the rod point as the line falls.

What you should try to do is to get the line at the end of the cast to lie out straight on the grass. By "straight" I do not mean a geometrical line like the side line of a tennis court. Some waggles of a few inches do not matter at all, but there must not be big loops to right and left, and the end of the line where the fly will be in fishing must be farther away than any other part. At first you will probably find that after a few yards the rest of the line lies in a tangled coil, or that the last yard or two is turned back towards you. This generally means either (1) that you have not made the rod bend enough in making the forward cast, or (2) that you have not allowed a long enough pause between the backward and forward casts.

A point you will have to watch is that you make the back cast properly. It must be just as much a genuine cast, made by the rod bending, as the forward cast. The tendency for a long time, even after you have got the hang of it, is to lift the line off the water and try to throw it behind you with a big movement of the arm, the rod remaining comparatively straight. This will not do. The backward throw must be just as much a genuine "cast" as the forward throw. The rod must bend.

HERE IS AN EXAMPLE OF AN ANGLER USING THE SHOULDER CAST. NOTE THE ANGLE AT WHICH THE ROD IS HELD

There are many other ways of making a cast, all of which you will learn in time. It can be made with the forearm, the rod being brought up vertically over the right shoulder. It can be made with the wrist in the same way. It can be made over the left shoulder (backhand cast) or parallel with the ground (underhand cast) from the right or the left. Then there are various forms of continuous-motion casts in which the line is thrown back in one plane, the rod point swept in a semi-circle, and the delivery made in another. But at first, stick to the shoulder cast and make yourself proficient in that. The others will come comparatively easily. After you have gained some little facility put on a cast and a fly—an old fly with the point of the hook broken off—and try to make the fly drop on a sheet of newspaper as a target.

But the main thing, as I have said before, is to train your muscles to make the rod bend. Once you have acquired the trick of that, the other mysteries of casting will present little difficulty.

Your affectionate uncle
HARVEY.

ADDER WOOD, ANOTHER HAUNT OF THE STAGS

WALKING ON THE QUANTOCK HILLS

By S. P. B. MAIS

BY far the strangest thing about the Quantock Hills, or, as the officer in charge of the Information Bureau in Taunton kept on trying to make me say, the Quantocks, is that no bookshop in Taunton keeps any guide to them, and that even the local publishers who in their time have published two books on the subject, have allowed them to go out of print, and are not going to re-issue them.

Indeed, Creswell's book has become so rare that one of the most generous men I know, who hitherto has denied me nothing, draws the line at lending me his copy of that book.

The obvious deduction to be drawn is that the Quantock Hills are unknown, and that the local people desire that they should remain unknown, an understandable point of view when you think of the havoc wrought by popularity at Land's End.

But when you consider the popularity of Exmoor, and the fact that the Quantock Hills are just a piece of Exmoor pushed further east, it does seem strange that the Quantocks should remain unknown.

Every lover of poetry knows the profound effect wrought upon Wordsworth and Coleridge during their all-too-brief stay at Alfoxden and Nether Stowey, and most sportsmen know that the red deer as well as foxes are hunted over these moors and down these combes, but even the tourist who claims to know the West Country well is content to take the Quantocks as seen from what he gleans from the carriage window between Taunton and Minehead or the coast road between Bridgwater and Williton.

It may be that their very smallness has saved them, for what walker in the West is going to turn aside for a moor twelve miles long and four miles broad, and never more than 1,260ft. high?

And yet to miss the Quantock Hills is to miss one of the sweetest experiences in England.

Their great virtue, beyond that of being still unspoilt, is that they are easily accessible and yet completely wild.

Running parallel with their western, steepest foot, there is a chain of villages and a railway line. On the eastern, further edge, which is rich with stream-fed combes, there are farms everywhere, and little hamlets tucked away in every wooded bottom and on every knoll.

You get your isolation on the whortleberry and heather-clad uplands of Will's Neck, Black Hill, Bicknoller Post and Robin Upright Hill, where there is nothing but moorland whichever way you look, but you know all the time that just over the brow there is cultivated land and transport. And from almost every high point there is a view not only of distant green isles, but of the waters of the Bristol Channel and the high hills of South Wales.

Quantock walking is therefore more in the nature of a stroll than of a serious exercise, and you will be wise to let yourself be diverted by every bypath that looks tempting.

My first walk over the Quantocks was easily my least satisfactory.

I wanted to conquer them in a single day, a ludicrous ambition, almost as silly as the game played in the Lakes of climbing the greatest possible number of peaks in 24 hours. I chose to walk from north to south from West Quantoxhead, along the track that runs more or less undeviatingly along the top to Taunton. This gave me a good sense of the open moorland, but gave me no idea at all of the wealth hidden in the deep country away to the east.

What I remember best of this walk was one writhen gnarled ancient thorn standing up all alone near Bicknoller Post, and a magnificent avenue of beech trees that bordered a very wide track capable of taking four coaches abreast that came into the main way from Dead Woman's Ditch at Crowcombe Park Gate.

I kept a weather eye open for deer, but saw nothing more startling than horned sheep with fleece dirty with contact with the heather and a few moor ponies.

On my second excursion, I attempted much less and saw much more. I climbed the hills from Crowcombe, where the pink sandstone church tower stands nobly up among the elms and beeches at the foot of the drive of the great four-square brick manor house of the Carews. Just over the top of the hill I came to the only farm on the top of the Quantock, standing just above the beginning of Quantock Combe.

I succumbed then and there to the lure of the combes, and spent the rest of the day going down one and up another of these densely wooded ravines, where the paths are overhung with rhododendrons, the streams musical, but as often as not invisible, and the hillsides fresh with larch and fir planted by the Forestry Commissioners.

I thought that here if anywhere I should find the red deer. There were plenty of traces of them, slots everywhere on the soft turf, but no sight or sound of the animals until evening, when the farm bailiff took me down Crockercombe to the enchanting hamlet of Aisholt, for so long the home of Sir Henry Newbolt. Here in this steep sided valley I saw field upon field of arable, almost geranium-red, thatched cosy cottages nestling under the shadow of the red stone church tower set half-way up the hill, and some exceptionally neat and well-kept farms.

We walked up a lane that was more like the bed of a river, and suddenly in the bracken almost indistinguishable from it in colour and curve, I saw no fewer than thirteen hinds with three massive stags. They first stood as silent and still as the bracken, and then moved just as silently over the hill. The light was fading fast, and by the time that we had panted up the steep slope it was quite dark, and all that we could see were twinkling lights at sea and the lights of new factories on the flats.

My third visit was easily my most successful from every point of view.

This time I started at Cothelstone on the south-western corner and tacked a zig-zag course towards Kilve on the north-east. I had no set plan, and it didn't matter where I got to at what time, so I spent a very pleasant hour before climbing the hill in exploring the church and manor house of Cothelstone, where Judge Jeffreys hanged two of Monmouth's followers from the gatehouse simply because Lord Stawell, the owner, protested against his cruelty.

The church contains one of the most perfect fourteenth-century painted altar tombs in the country and some good bench ends, and the manor house, even in a country full of fine Tudor manor houses, stands right out, partly by virtue of its arched gateway and long avenue leading to the second arched gatehouse, beneath which you pass into a grassy quadrangle to face the three-sided gabled house, the chief glory of which lies in the very tall and slender cylindrical stone mullions in the windows.

The east wing was completely demolished by a well-aimed shell from Blake in the Civil War, but it has been so well restored that if you didn't know the story you would never guess it. I found the tall woods above the park known as Twenty-Acre Plantation carpeted with bluebells, and then a sandy lane led me out on to the open moor at Lydeard Hill, where there is an immediate view of

the combes falling away to Aisholt in the east, showing how thin in places is the width of the range.

Turnuli on the left led me up to Will's Neck, where I ran into one of those wetting sea-frets that in a moment of time sweep over and completely obliterate the view.

Before, however, I had descended to the famous hunting rendezvous of Triscombe Stone the mist had passed and only the grey clouds remained.

It was at this moment that I sensed a certain Bronte-ish atmosphere about the moor. Up till then it had been almost as gentle and genial as the South Downs. Now it suddenly assumed something of the harshness of the Haworth Moors. There was grandeur in the blackness. A storm broke.

The beech trees in the avenue shone with running water and I ran for shelter to the farm and ate my sandwiches in a log cabin overlooking the Steart Flats and the islands of Steep Holm and Flat Holm, of Weston, and listening to stories from the bailiff about the chances of finding stags' antlers.

He told me that there were men out scouring the moor from dawn to sundown in May looking for good antlers. He showed me a pair, "brow, bay and tray and two on top," that he himself had found in the farm paddock that very morning. "And if you find one that is very heavy, the odds are that you ought to find the other, for the stag hates to feel lopsided, and he'll crash into trees or anything to lose the second. Sudden fright'll make 'em drop them, anyway." He told me of a friend of his who had dreamt that a pair of antlers lay under a certain tree at a little distance each from the other, and the dream was so vivid that he went out of his way the next day to see, and there were the two antlers precisely where he had seen them in his dream, and he got eleven guineas for them.

I am not given to such profitable dreaming, nor were my efforts to find antlers for myself at all successful. I spent the afternoon scouring the heather, and being constantly misled by bracken fronds and bits of old stick.

A stag's antlers are exactly the colour of an adder's skin, so after crossing Ramscombe and Robin Upright Hill I went down into Adder Wood, a noted haunt of the stags.

I found here, right at the top of the combe, a tall, lonely pine with a hermit's log-cabin built high up among the branches with a roof of dead bracken and tin and a floor of logs. At the foot of the tree lay a worn out wooden ladder made of logs tied together with string.

I followed the new-born stream down its fern-fringed bed and suddenly looking up the green sides of the combe among the little ones I saw three stags standing watching me. As soon as I looked up they disappeared through the trees, and I lumbered up over the boulders and whortleberries towards them, only to find when I got to the top that a mounted farmer in a cap was cracking a whip and giving vent to hunting noises.

As it was a Sunday in May the noises seemed misplaced, and I failed to understand their purpose until I remembered what the bailiff had said about frightening the antlers off a stag. So he had sighted the stags and was now chasing them up and down in an effort to get them to shed their horns.

THE MILL AT DUNSTER

All the rest of my walk down Adder Wood, Lady's Edge and Hodders Combe was made melodious by the cries of the farmer and the cracking of his whip as he rode up and down on the hillside above.

CROWCOMBE CHURCH, AT THE FOOT OF THE QUANTOCK HILLS

At the foot of the combe I turned aside to visit Alfoxden because of its Wordsworth and Coleridge associations.

I think nothing of the cottage at Nether Stowey where Coleridge lived and I knew nothing of Alfoxden beyond the fact that it had been turned into a country house hotel, the sort of place I avoid in ordinary circumstances.

In this case I nearly turned back because the park seemed never ending, and I feared lest I should find a score or so of motoring tourists condescending to the spirit of Wordsworth or else cheerfully oblivious of his existence. I was pleasantly surprised.

Alfoxden is very Quantock in atmosphere. It is white, four square, dignified, quiet, spacious and altogether lovely. A visitor was indulging in solitary archery on the lawn. I had tea in Wordsworth's study—a quiet, high-ceilinged panelled room with good square windows.

I passed over pleasant smelling stone-flagged passages, up a wide staircase to rooms that had been occupied by William and Dorothy, Charles Lamb, Coleridge and that astonishing nineteen-year-old enthusiast Hazlitt, who had walked all the way from Wem in Shropshire to hear and see more of the Unitarian minister who had so fired his imagination.

Somehow Alfoxden has managed to keep the atmosphere of 1797, and I shouldn't have been at all surprised to see young Wordsworth come straight and the capricious Coleridge come capering waywardly down through the bracken from the top of the hill. It is all too little realised how large a part those Quantock walks played in the composition of "The Ancient Mariner" or Wordsworth's lyrics in the Lyrical Ballads.

I finished my walk that day three miles further on at East Quantoxhead, where the little grey shale cliffs meet the sea on a sandy deserted shore. And if there is a lovelier hamlet in all England than East Quantoxhead I'd like to hear of it.

It is a rising crescendo of delight. First, those little tranquil cottages each with its slab or bridge over the rivulet, then the pond barring the way to all further car traffic. Then the little footpath leading past the dovecote and the old farmbuildings, culminating in the smooth grass path overhung with honeysuckle and clematis that leads to the little grey stone church clinging to the wall of the old court-house where Luttrells have lived and flourished over a thousand years. In this house the reigning Luttrell showed me seven superb Flemish overmantels in plaster, carvings of seven scenes from the New Testament, but the loveliest things, to my mind, in this stately and hardly altered manor were the slightly raised polished oak dais in the dining room—last relic of the Middle Ages—the little cobbled court where the cockfighting took place, the oak staircase and the haunted oratory.

And my walk really ended as I stood on the flat lead roof at sunset and looked back over the black moorland and frowned over the silver sea to the dim, misty mountains of Carmarthen and listened to the church bells at my side ringing the villagers into evensong.

"The holy time," as Wordsworth said, "is quiet as a Nun Breathless with adoration."

ON ROBIN UPRIGHT HILL

"THE KING, HIMSELF, FARMS AND EXHIBITS, THUS FOLLOWING IN THE STEPS OF HIS ANCESTORS"
Some of the King's Shorthorns grazing on the Royal Farm at Windsor

THE CENTENARY OF THE ROYAL SHOW AT WINDSOR

THE Royal Agricultural Society's Centenary Show! And . . . held in Windsor Great Park under the presidency of H.M. the King!

These words must thrill the hearts of all those engaged in agriculture, not only in the United Kingdom, but throughout the Dominions and all places of the world where the kindly fruits of the earth are cultivated and livestock of superior merit are bred.

"Practice with Science," such was the motto chosen by the society when it was established on May 9th, 1838, incorporation following on March 26th, 1840, and with what consistency and tenacity of purpose has that motto been carried out through the long years of a century that has seen more changes in agricultural methods than any preceding hundred years!

Few, and comparatively rude, were the implements employed by farmers in those days, if we judge them by modern standards, and no small part in the encouragement given to manufacturers of agricultural machinery has come from the Royal Agricultural Society of England.

There is, in fact, no section of the great agricultural industry that has not benefited by the influence and help of the Royal.

Many are inclined to think of the Royal Agricultural Society as being primarily connected with organising and running the largest show in the country. While undoubtedly a considerable part of the energies of the society are so occupied, yet it must be remembered that the Royal is responsible for the experimental station at Rothamsted, near Woburn, and it is partially responsible for examinations for the National Diploma in agriculture and the National Diploma in dairying.

The Chemical Department carries out analysis of fertilisers and feedingstuffs on behalf of members, while problems associated with the diseases of farm, market garden and fruit crops are dealt with by the Botanical Department, the Zoological Department dealing with injurious insect pests.

There are research, veterinary and machinery committees, composed of practical agriculturists, while it has always been the aim of the council to possess at 16, Bedford Square the best, most comprehensive and largest library of standard books on agricultural subjects. Thus it will be recognised at once how great and valuable a part has been played in British agriculture by the R.A.S.E. for a century.

The first president of the Royal Agricultural Society was the third Earl Spencer of Althorp Park, that great breeder of Shorthorns and supporter of all things connected with rural life, and he was supported by the best blood in England, whether of the peerage or not, but all were united in the common bonds of agriculture.

It is an interesting source of conjecture as to what this great nobleman would have thought could he have seen the gigantic progress and power achieved by the society in after years, remembering the limited scope of its activities at its commencement.

Following Earl Spencer came many noted presidents, including members of the Royal Family, commencing in 1862 with H.R.H. the Prince Consort (when the show was held at Battersea); while in 1869 the Prince of Wales (afterwards Edward VII) took office, a post he afterwards occupied in the years 1879, 1886 and 1900. In 1889, the last occasion upon which the show was held at Windsor, Queen Victoria (always an enthusiastic supporter of agriculture) was the revered president, having just completed 52 years of her glorious reign. The late King George V was president in 1879 (as Duke of York), in 1903 (as Prince of Wales), and in 1911 as the King.

Other monarchs to hold this, the highest honour in agriculture, were the Duke of Windsor in 1920 (as Prince of Wales) and King George VI, in 1922 as Duke of York and again this year, when, as King, he will welcome the society to Windsor Great Park once more.

Both the Dukes of Gloucester and Kent have occupied this high office, as did the Earl of Harewood when the show was at Harrogate in 1929.

The show started its migratory career with the first exhibition, held at Oxford, on July 16th, &c., 1839, and a truly wonderful exhibition this must have been, although the classification followed seems strange in our eyes to-day.

For instance, the cattle section was divided into classes for Shorthorns, Devons, Herefords and cattle of any other breed or cross. Horses were, roughly, carthorses or hunters; sheep were divided into Leicesters, Long-woolled sheep, Southdowns or other Short-woolled sheep; pigs were just pigs of no distinct breed classification.

How different is the position to-day when at this latest Windsor Royal there is classification provided for 22 breeds of cattle, 26 breeds of sheep and 11 breeds of pigs.

There will be four breeds of heavy horses present, while hunters, hacks, hackneys, ponies (of all kinds) and jumpers are liberally catered for.

According to the *Farmers' Magazine* for 1839: "Although the exhibition of stock was not as numerous as had been expected, yet the quality of some was very superior."

Great praise was given to Mr. T. Bates, of Kirklevington, Yorkshire, for his magnificent Shorthorns, while the Devon cattle that were exhibited by Mr. M. Paull, of Compton Pauncefort, Somerset, were highly spoken of.

In the sheep section the leading awards for Southdowns fell to Mr. S. Grantham and Mr. T. Crisp, while Mr. S. Bennett and Mr. J. Inskip were to the fore for Leicesters. Pigs were shown to advantage by Messrs. Lefevre and Carrington. Carthorses found Messrs. T. Freeman and J. Osborne successful.

The entry of livestock numbered 247 and that of implements 54.

The loss to the society on this show came to £1,162.

Such, then, was the first Royal Show ever to be held, the forerunner of all those brilliant events which have set the crown on the summer show season of this country. Few could see, then, that in the not far distant future entries of livestock would exceed the 3,000 mark, and stands alone would be almost 500 in number.

So the show continued to migrate all over the country with varying success, at one town making a very useful profit, at others a substantial loss.

Thus we come to the Jubilee Show of the society, which, by permission of Queen Victoria, was held in Windsor Great Park in 1889, the Queen herself very graciously assuming the presidency. At this show, one of the best organised and most magnificent held up to that date, there were 7,446 implements entered, 3,976 head of livestock, 155,707 people attended the show, and the result was a loss of £4,966!

Contemporary writers have described how Queen Victoria, taking her office as president very seriously, visited the show four times, while Her Majesty gave a State banquet at St. James's Palace to commemorate the Jubilee of the society.

From the Royal box on the show yard Her Majesty, wearing the president's badge of office, was able to respond to the applause of the huge crowd that had assembled, and which, according to the pen of one who had witnessed the scene, were able to enjoy a sight of the very cream of British pedigree livestock, and the best agricultural machinery in the world, amidst a setting of ancient trees that themselves made history, and under blue skies that did justice to the scene.

Unfortunately, good fortune did not always attend the efforts of this great society.

Up to 1902 the society continued to hold its shows at various centres in the provinces, and

then it was decided to acquire a permanent site near London, in the hope of attracting a large crowd of visitors from the metropolis. Park Royal was the site acquired, and the show yard was fitted up for permanent use.

However keen Londoners may be on spectacular displays and shows, they certainly displayed no love for agriculture as exhibited at Park Royal, and each of the three years 1903-5 (during which the show was held there) money was lost freely, and not only that, but from an attendance of 65,013 at the first of these shows it had shrunk to 23,978 in 1905.

Even the well-filled coffers of the society could not face this progressive decline, and so Park Royal was sold, as well as the headquarters of the Society at Harewood House, a move being made to Bedford Square. There was a reorganisation of the society upon more democratic lines, and it was decided to tour the provinces once more, while an hon. director of the show was appointed.

The hon. director, whose business it was to supervise and advise upon the general organisation and management of the show, was that well-known and greatly respected figure in the world of agriculture and sport, the late Sir Gilbert Greenall, Bart., afterwards to become Lord Daresbury.

Lord Daresbury had always been a devoted admirer of dairy shorthorns, hackneys and large white pigs, and had been a successful exhibitor of these three classes of stock; while he had for some years been Master of the Belvoir Hounds.

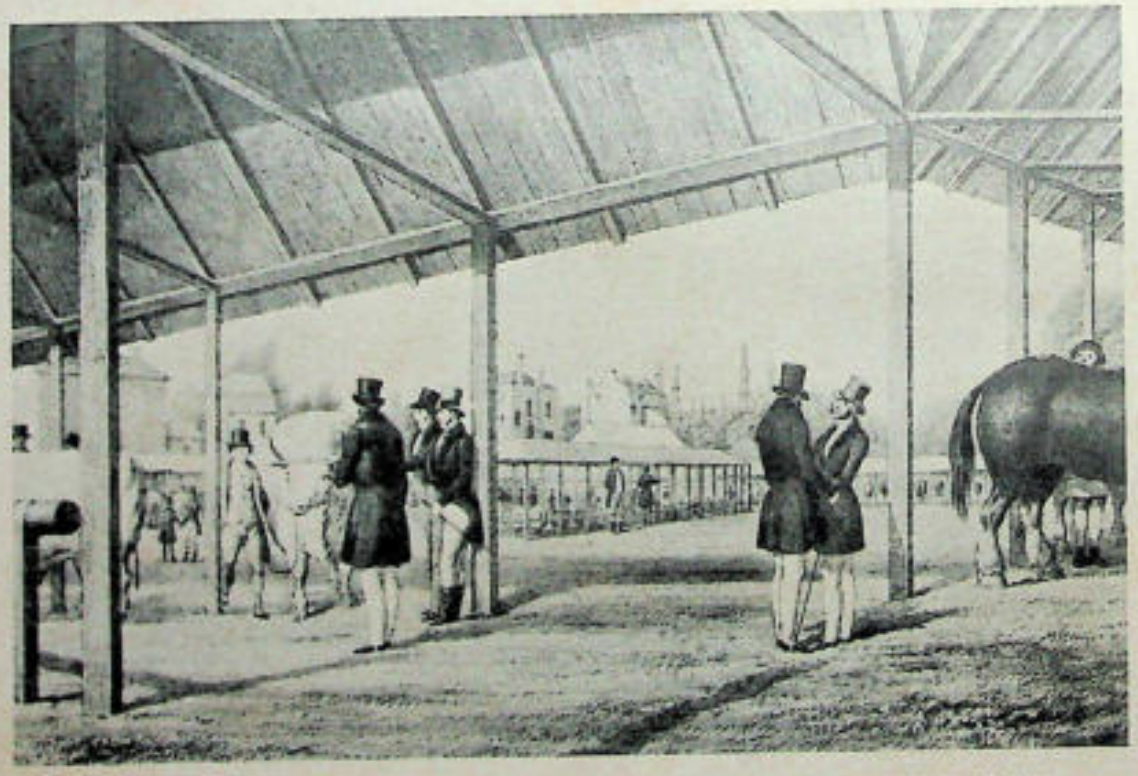
To the great task of restoring confidence in the Royal Show and bringing it back to success Lord Daresbury brought infinite tact, great business ability, a cheery manner and tremendous gifts of patience and determination. Soon he was to become the most familiar figure on Royal Show grounds, as, mounted on his white cob, he would ride round the ground keeping a vigilant eye on everything.

Here it may not be out of place to say that Lord Daresbury, in his time, occupied the president's chair of the Dairy Shorthorn Society thrice, was twice president of the Shorthorn Society, and had occupied the presidential chair of other breed societies, including the N.P.B.A. Moreover, so highly respected was he by all types of agriculturalists, that on two occasions, 1910 at Liverpool, and 1925 at Chester, he was elected president of the R.A.S.E., as well as acting as hon. director. A great honour.

Lord Daresbury continued as hon. director for over a quarter of a century, when he was succeeded by the present hon. director, Mr. U. Roland Burke, who also attained the presidential chair in 1937.

In 1906 Lord Daresbury had the extreme pleasure of seeing the results of his first year's work as hon. director turning the losses of the previous years into substantial profits; for, at Derby, under the presidency of the late Lord Cornwallis, and with King Edward VII paying a visit to the show, the result was that a profit of £2,028 was realised. This success was followed by the Newcastle Royal of 1908, when 213,867 people attended the show, and a profit of over £10,000 was made.

PERSONALITIES AT THE FIRST ROYAL SHOW AT OXFORD IN 1839
1. *Earl Spencer*; 2. *The Duke of Richmond*; 3. *Mr. H. Handley, and* 4. *The Duke of Rutland*



So the tide of success had set in once more for the society, with occasional fluctuations, until 1914, when with the Royal held at Shrewsbury, a loss of over £3,000 was made. War followed in August, but in 1915 (Nottingham) another loss was made, which in 1916 (Manchester) was turned into a quite surprising profit. In 1917 and 1918 (War years) no shows were held; and, looking back, how very surprising it seems that even two Royals should have been held with war raging!

It was feared, on many sides, that after the War agriculture, and especially that part of it devoted to pedigree stock, and showing, would never recover from the shocks it had sustained. Far from this being the case, the boom in prices was in full swing, new breeders of pedigree stock had joined the ranks of the breed societies, and a large number of these were keenly anxious to exhibit at the leading shows, and . . . of course, at the Royal.

Thus in 1919 at Cardiff, the Royal once again recommenced its round of shows, and an entry of 2,502 in the livestock section, with an attendance of some 191,694, and with a profit of over £12,000, was surely a good enough omen for the resumed programme of Royals.

It was left to Newcastle again in 1923 to provide the largest profit so far made at a Royal Show, this being £19,102, with an attendance of 186,510, and since that show, from a variety of causes, the attendances have not approached the 200,000 mark.

Harrogate, Ipswich and Newcastle again in 1935 all have been successful events and admirably supported.

THE SHOWYARD ON THE OCCASION OF THE SECOND MEETING HELD AT CAMBRIDGE IN 1840

Now we are on the very threshold of the Centenary Royal in Windsor Park, and surely here is a grand opportunity for the agricultural community to enjoy an historic event held in historic surroundings, and almost beneath the shadow of Windsor Castle walls.

Moreover, the King and Queen will both attend the show, and this will give an opportunity for the agricultural public to give their Majesties a warm welcome after their trip to Canada and the United States.

Both the King and Queen have ever shown their interest in agricultural matters, and, when they were the Duke and Duchess of York, were ever ready to attend agricultural shows all over the country where their presence might be helpful.

The King, himself, farms and exhibits, thus following in the steps of his ancestors from George III onwards, and it is worthy of note that both the King and Queen are giving special trophies to commemorate the centenary of the show, and the fact that it is being held in Windsor Park.

The society, too, are marking the event by giving a centenary silver-gilt medal to the first prize-winners in each class, but no exhibitor will take more than one of these medals in any section in which he exhibits.

The Royal Agricultural Society has ever been happy in the selection of its secretaries, and able and tactful indeed are those gentlemen who have held this honourable post.

The first secretary of all was Sir Brandreth Gibbs, and we believe him to be the only one—so far—to attain presidential honours, for in 1884 he became president. Later on came Sir Ernest Clarke, another great organiser and secretary, and one who did an immense amount of work for the society.

So then we come to Mr. Thomas McCrow, who served the society loyally and well as assistant-secretary and then as secretary, ill-health cutting short his period of office. Mr. McCrow was succeeded by the present secretary, Mr. T. B. Turner, who had made a name by his successful handling of another show society, and who has been eminently successful with the Royal. Practical, tactful, alert, and keeping a watchful eye on every section of the show, besides being a rare organiser in the office at 16, Bedford Square, Mr. Turner has made himself deservedly popular with all who have anything to do with the R.A.S.E. He has been the right-hand man of many presidents and two hon. directors, and all who have had any dealings with him wish him good fortune with the Royal for many years to come.

There will be a vast difference in the types of livestock and the various breeds seen at Windsor this year as compared with the first Royal at Oxford in 1839, and the Windsor Royal of 1889. Gone has all coarseness and excess of fat. Smaller animals are now the vogue, for, while the Royal is a breed show, yet the ultimate fate of all animals, and their test of merit must always be the butcher's block.

Is not the housewife the supreme judge of the stock breeders' art?

E. WALFORD LLOYD.

A YACHTING ARMADA AT COWES

All Classes in the Round the Island Race

By K. ADLARD COLES and TERENCE STOCKEN

WITH nearly 80 entries and over 70 yachts crossing the line, the Island Sailing Club's Round the Island Race, on June 24th, created a record for any "full-size" yacht race yet held in this country.

It was raced in two divisions, the main fleet being the under 25-tonners, who were racing for the I.S.C. Gold Roman Challenge Bowl. The big class (not eligible for the bowl) had four entries (Erivale, Astrape, The Blue Peter and Rose); and the start for these was 7.30 a.m. The rest of the fleet, however, started half an hour earlier, many of them got under way as early as six, and by the time it was getting near the gun, Cowes Harbour was alive with yachts of all colours, shapes and sizes getting under sail, circling and jockeying around.

The morning was fine but dull; it was obviously going to rain later on, and one could but hope that the rain would bring wind, as, by the five-minute gun, there was just about sufficient weight in the variable N.E. air to carry the boats over the west-going tide which was then prevailing.

The line was from the Island Sailing Club, past the Fairway Buoy, and thence straight on as far as necessary—a virtually unlimited starting line. It soon became apparent that there were two schools of thought in the matter of the start; the majority seemed to prefer an off-shore position, well out into the Solent. "Local knowledge" is fairly unanimous that the wind always comes off the opposite shore in the early morning, and spreads across; and to start far out certainly gave more sea room.

A few boats, however—amongst them Triune of Troy, Josephine II, Britt (a "Teal" class O.D.), Neon and some others—took the shore berth. As soon as the gun went they began to reap the advantage, were all across shortly after the gun, and picking up a strong tide off No. 3 buoy were swept ahead, though actually to leeward of the rest.

Farther out the start was a very ragged one. As in so many cruiser races, many of the boats evidently reasoned that a few minutes would not make much difference in a long race and preferred not to risk a recall. Certainly with the strong westerly stream and the fickle breeze there was every reason for caution, but many must have been a quarter of an hour late or more, and no doubt regretted it later on in the race.

The fleet drew closer together off Egypt Point, those starting from the weather end reaching down on to those who had taken the shorter, leeward course. Theoretically this part of the race was a broad reach, but the wind was very light and fitful, dying away altogether for minutes at a time, and to keep spinnakers drawing required constant attention. Many yachts, in fact, preferred Genoas or Yankees, and undoubtedly the use of really big and very light reaching headsails was the best bet.

The bigger boats and some of the ocean-racing types of craft had drawn away by now, and the fleet was roughly in three sections: Major Harston's yawl Amokura appeared to be in the van, with the grey hull of Mystico well up; Evenlode, which had started in the big class half-an-hour later, was pressing them close, and the red hull of little Mindy could be seen hard on their heels.

Next came the "inshore mob," keeping roughly together, though changing their relative positions a little from time to time; and then there was an almost complete "lane" through the fleet—a gap of clear water of perhaps 200yds., followed by the "front line" of the late and extreme-windward starters; in fact, at one time, there were about half-a-dozen boats with their bows on the same thread, as it were; amongst these, the varnished hull of Mr. Rohan's Ragan was noticeable, and a little behind her the blue hull of Major Henderson's graceful Hetreshoff 21-tonner.

To mention every boat is impossible, and would be tedious; but the enormous variety of hull, size and rig, with the gleam of sun that was now penetrating the rather threatening-looking sky, together with the leisurely progression of the boats, their spinnakers fluctuating lazily, made a wonderful picture. Away out to windward the big topsail of the gaff-rigged Iolaire was noticeable among an almost exclusively Bermudian fleet.

The semi-drifting conditions lasted right down to the Needles. Round the Bridge Buoy the first four were Moby Dick, Evenlode, Cynthia and Shamakid. It must have been a fine view from the Needles Lighthouse, with such an unprecedented collection of yachts converging on the buoy; the last of the ebb was still running, and at times there was a considerable cluster with hardly an inch between boats.

After rounding the buoy, the problem was whether to luff up under the land and get a breeze off the cliffs, or keep out and lay a straight course for St. Catherines. Mr. May, in Lollypoppet, had no doubts and stood right under the shore; several others, the Teal class Content, Heather, Josephine II and Guiding Light amongst them, followed. Content, who took second prize, proved the wisdom of this course, and soon began to draw gradually ahead. Close inshore there was no foul tide, in fact the east-going stream started about an hour early.

The wind now freshened considerably, and rain began to fall from time to time; St. Catherine's Race was the only bit of broken water so far met with, and but a ghost of its real self in the generally easy conditions. The fleet was now widely spread, and through the rather thick visibility, the leaders, now about 30min. ahead, could just be seen, surprisingly plainly, until a second look showed that they were making a board out to sea.

So the wind was heading, and many of the boats, now well off-shore and down to leeward, found their chances lessened. From Dunnose it was a general tacking match, opinions divided as ever on the relative merits of short boards and several or long boards and few. Here the advantage probably went to the latter school, as at the end of their last tack they could lay the forts, whereas the others had to put in an extra tack between Bembridge and the "gate"—the gap in the recently laid boom between the Horse and No Mans Forts.

SOME OF THE FLEET CROSSING THE STARTING LINE IN THE ROUND THE ISLAND RACE

There was a record entry for any race in the British Isles

MR. BONNER'S CONTENT, WHICH TOOK SECOND PLACE

An extra point of interest in a varied and interesting race was the appearance off Bembridge of a four-masted barque, presumably one of the grain fleet, under all plain sail; as the fleet passed she clewed up her top-gallants, to wait for the tide before continuing her beat up-Channel.

Once through the "gate," the fleet reached back to Cowes at great speed with a freshening wind; here the harder-weather boats came into their own, or what was left of it, for up to then the reaching had been largely a matter of jogging with light canvas. The order over the finishing line was: Evenlode, Teal, Cinque, Allure, Cynthia, Amokura.

So ended a splendid day's race. Conditions were fluky, but that provides consolation for many; almost every one can say, "If it hadn't been for that drift to the Needles we might have pulled it off"—and so they might! The popularity of this race shows plainly the preference of owners for short off-shore events rather than handicap racing. In the latter, the issue must too often narrow itself down to two or three, quite early on; whereas in an event like the Round the Island no one knows to the last who stands a chance in the final placings—it is "anybody's race" almost to the last.

It is a matter of great congratulation for the Island Sailing Club to have promoted such a popular and interesting race, with an almost incredible variation of craft—30 sq. metres, Gauntlets, Teal One-Designs, fast cruisers, "ordinary" cruisers, ocean racers—all the fun of the fair, yet handicapped into a very harmonious whole, with most creditable fairness and skill.

R.O.R.C. rating and time scale was followed, and once again proved its worth under conditions which tested it to the utmost.

In addition to the Golden Bowl to the winner, there were money prizes for the next five yachts placed, and an inscribed pewter tankard presented to each finisher; altogether a very handsome prize table.

The first six placings are as follows, corrected times are in parentheses:

1st.	Kallista	Major R. C. Windeler	5.50.37	(6.41.22)
2nd.	Content	C. E. Bonner	5.13.21	(6.45.07)
3rd.	Fore	J. F. Tilney	5.11.59	(6.45.49)
4th.	Wanda	R. G. A. Scott	5.30.43	(6.49.08)
5th.	Grey Seal	O. Rusk	5.12.07	(6.49.38)
6th.	Olina	J. S. Truscott	5.29.09	(6.50.50)

There is not space to give the placing of every boat, but the above and the following make up the first half of the list, in order of placing, reading down:

Guiding Light	Lord Normanton	Lollypoppet	H. G. May
Britt	Dr. L. H. Tuckett	Trimer of Troy	A. Buxton
Mindy	J. W. Kidsdale & F. R. B. Brown	Jenny Spinner	K. A. E. Moore
		Chrisando	Col. A. C. Robinson
Greengage	F. A. Pitcl	Monica	R. Preston
Motihari III	A. C. S. Irwin	Invertiel	Ian Henderson
Hinerangi	B. Clarke	Dina	M. Hackforth Jones
Eole	Col. O. C. Niven	Eventide	T. C. Ratsey
Josephine II.	C. Smallpeice	Kallistra	H. C. Devitt and Orr
Red Gauntlet	J. Blake		
Mystico	D. H. E. McCowen	John Dory	L. H. Ryan
Epenta	L. A. Riddle	Neon	R. Spurrier, Jun.
Donna	A. G. Pridcaux & N. C. Rowlston	Brambling	G. D. Lock
		Amokura	Maj. E. S. Harston

Placings in the big class were:

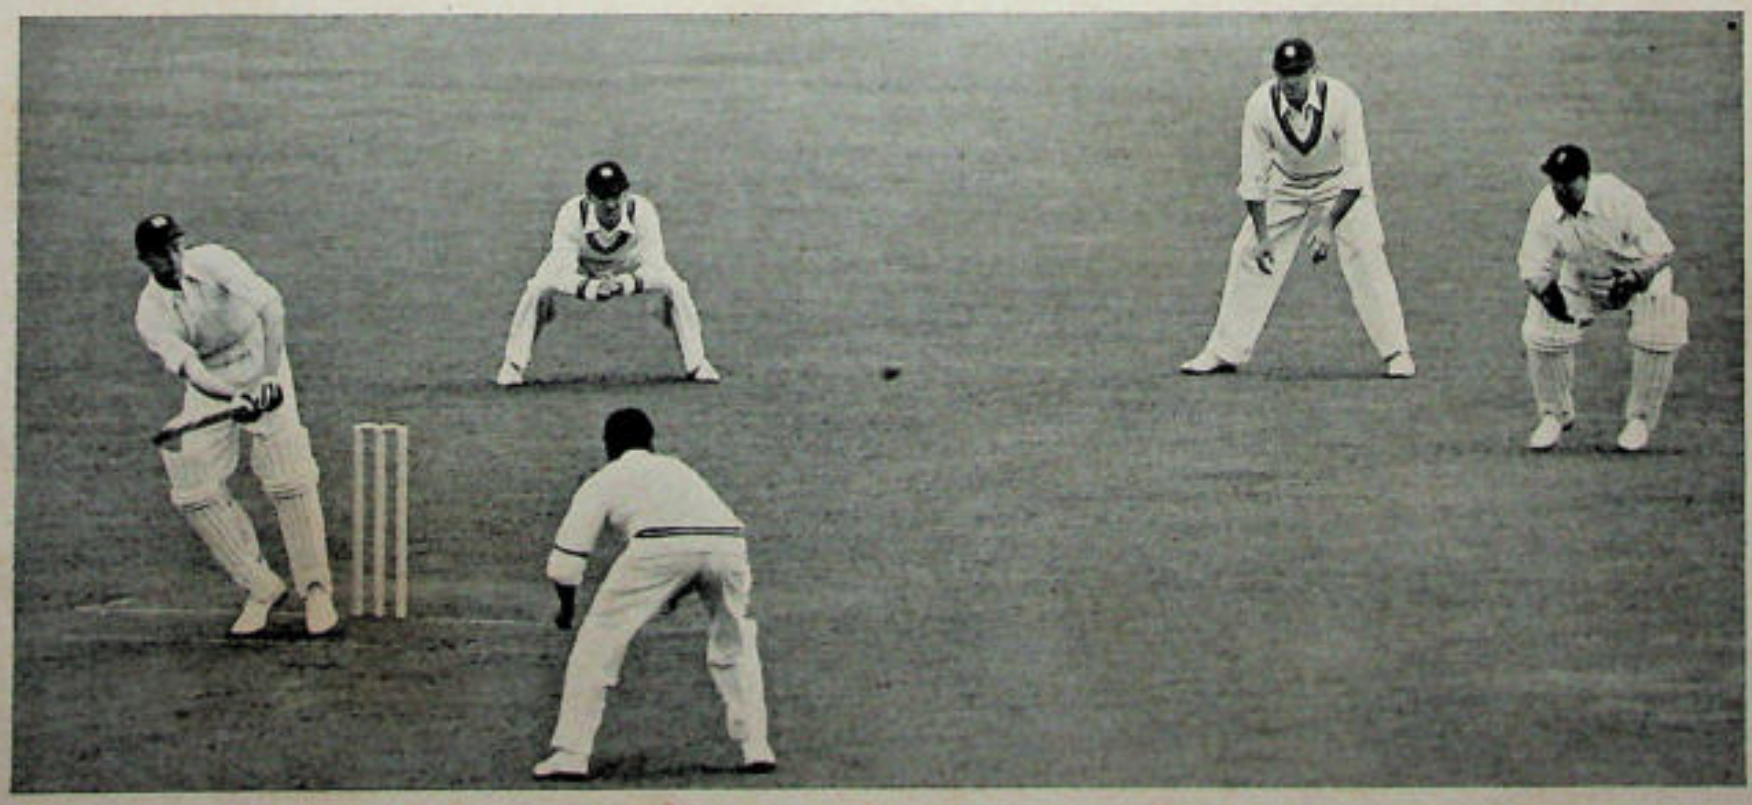
1st.	Erivale	J. H. Rawlings
2nd.	Astrape	F. B. Richards

THE TEST MATCH

By NEVILLE CARDUS

FATE OF THE MIGHTY
George Headley slips in sweeping Wright round to leg

THERE was a period at Lord's last Saturday when the English bowling against the West Indies seemed short of ideas and technical resource, especially in the eyes of those of us who were looking as far ahead as next year, and the next visit of an English team to Australia. The West Indies reached 200 with only three wickets down—to the open and unashamed satisfaction of a crowd of 20,000, most of whom seemed to wish that the West Indies would score 500. Before the advent of the 200 and the new ball, and during a stand by Headley and Stollmeyer, the English attack had to be content with steadiness on a slow, easy turf. Bowes and Copson both depend considerably on a new ball—and both have already found Australian grounds and Australian atmosphere unfriendly to their methods. We can scarcely regard either of them as assets for future operations in Australia. Verity lacks flight problems, and that is why he is not a Wilfred Rhodes; give him a sensitive turf and he becomes almost unplayable. On Saturday he apparently was bowling with much intellectual application; unfortunately, there was somewhere a hiatus—the conceptions of mind were obscured by the workings of matter: in other words, Verity could not keep a good length and bowled badly.



Wright troubled Headley once or twice, which was proof of superb spin; for Headley, though not always at his best, was plainly one of the three great contemporary masters of batsmanship. The suggestion has been made that Wright bowls too fast and should moderate his speed and cultivate a tempting flight. If he diminishes his pace in the least I am sure Bradman will be delighted. The rare fact and quality about Wright's leg-spin is that it *is* quick, so quick, and bowled with such a low flight, that even a Bradman cannot get to it on his feet.

The weather was so cold that we all felt sorry for the West Indians, and for ourselves. And now and again the day grew dark. Once the West Indies appealed against the light, but without success. The English bowlers could as reasonably have appealed, for it must have been difficult for them to see Headley against the background of the Pavilion, and he is a batsman who needs to be carefully watched. He was not, as I say, altogether at his best on this occasion in a technical sense; he frequently lost touch and miss-hit or nearly edged. But it is on those responsible occasions when a great player is a little out of form that he proves he *is* a great player; he conquers then by character, concentration. Headley made many strokes of extraordinary skill; strong hits to the on from the back foot; quick turns to leg. At moments he recalled Bradman vividly. He used his legs perfectly to Bowes while the ball was swinging. I wish some student of the game of greater age and experience than mine would tell us how defensive technique has come to take its present form, with the back foot moved across the stumps to the off. I am aware that the development of new-ball tactics has contributed its share, but what I would like Mr. C. B. Fry (for example) to tell us is precisely how the back-play of a Bradman or a Headley differs from that of Arthur Shrewsbury.

The young West Indian, Stollmeyer, played a charming innings. Grant went in first with him, and 29 were scored before Grant was caught at forward short-leg off a ball from Copson which "lifted" abruptly. Then came the partnership of Stollmeyer and Headley, which added 118. Stollmeyer made 59, and his style won general admiration because of his elegant forward action, left foot well to the ball, the body inclined over it effortlessly. But this is a method requiring trustworthy turf; Stollmeyer will have to modify it for pitches that allow spin bowlers to spit and "pop." After Bowes had bowled Stollmeyer at 147, Sealey helped Headley to push the total to 180. Sealey, to employ an expression I have used before, is a sort of Donald Duck of cricket; he wears his cap with the front near his right ear. But Sealey could not settle down; a leg-break from Wright sought out the edge of his bat, and he was caught by Wood, who all day was an agile and very Yorkshire wicket-keeper. Weekes, a left-hander, stayed in long enough to get a sight of the ball, then indulged a reckless slash against Copson and a new ball, and was brilliantly caught by Gimblett, who ran from extra-cover at a terrific pace and overtook one-handed a dizzily whirling missile. The West Indies innings wavered now, and when Headley fell to another catch by Wood at 250 the bastion was gone. The promise of 200 for three was mocked—277 all out. The crowd did not try to conceal their disappointment—think of that, Dr. Goebbels! But the innings of Headley made the day distinguished enough: he scored 106 in four hours, but never gave any impression of inactivity or negation. Copson, who took five for 85, struck much of vitality out of the apathetic turf.

On Monday the wicket was faster and better suited to stroke play, but the changeful light handicapped England's batsmen for a long time. Moreover, the West Indies bowled admirably, and a keen field pounced on the ball everywhere. Ironically enough, chances were missed just when the match was at the critical point. England lost the wickets of Gimblett, Paynter and Hammond for 147. Then Compton sent a sharp, difficult chance off Martindale to the slips; fortunately, the fieldsman was not Constantine. Compton proceeded to play an innings of Trumperian splendour; in the encircling gloom his strokes were brilliant—one of them, a hook off Martindale, was like forked lightning out of the threatening sky. He and Hutton smashed the West Indies attack, but could not rout it, so gallant was the spirit of Constantine, Martindale, Hylton and Cameron. Nothing in the day's play was more artistic or clever than Cameron's slow leg-spin. He bowled Gimblett when Gimblett was promising a fine innings; he enticed Paynter, when Paynter was set, into sending a catch at the wicket; he tempted Hammond and saw him (without show of emotion) caught on the offside. Cameron seldom dropped his slows short; always he had to be played with the shrewdest forward push.

Hutton went his Yorkshire way, building the foundation. Then, when Compton attacked, he, too, revealed his batteries. But he should have been caught in the slips when he was 67, off Cameron. For long the crowd of 23,000 waited to see England forge ahead. For long they suffered the delays caused by the ghostly veils of the heavens. But they were rewarded by the crashing and crackling brilliance of Compton and Hutton in the day's closing period. This stand was not only grand in itself, but a rare promise of greatness to come from the same players in more onerous matches of the near future. Compton's hundred was composed, inspired or improvised in two hours. Hutton held watch and ward for four hours, then, with his hundred behind him and the moment ripe for the English counter-attack, he was ready with a violent enough stroke for all manner of balls.

YOUTH WILL BE SERVED
J. Stollmeyer, the youngest player in Test history, makes one of his typical shots to force Copson away past the leg side fielders

ROUND THE WICKETS

An impression of Paynter cutting a rising ball

IT was so cold at Lord's for the first day of the Test match that it might have been snow on the seats instead of white paint. The wind blew bitterly, in icy stabs. The sky was a wash of grey, cloudless, dreary, as smooth and as cold as a slab of stone. The elders in the Pavilion enclosure crouched huddled together in groups, vague reminders of partridges in coveys. The only warm spot on the whole ground was The Tavern. It glowed in that windy waste like a fire in a Victorian drawing room. People crowded round it, they drank in its warmth. Their faces beamed red with it. From the shelter of its comfort they looked out on a game played by men burly and bulging with sweaters, watched by people immersed in the top-coats of winter. It was a terrible day for cricket. There was nothing of the sunny south about this, and nothing of the bright happy-go-lucky cricket which the sun of the south brings. It was dour, grim, vigorous cricket. The wind cut like a knife. It frayed tempers. Batsmen hit hard, bowlers bowled fast. It was the cricket of the north. And it was two north-countrymen who held its stage.

* * * *

They opened the attack, both bowling extremely fast indeed. But there was something more than sheer speed in the bowling of Bowes and Copson. It seemed to have something vicious, something awe-inspiring about it. It was something entirely different from the genial thunderings of Jim Smith or the boyish energy of Gover; maybe it was just that they both had red-coloured hair and suggested sting. But their bowling was hostile—it had spirit behind it.

To look at, Bowes is anything but terrifying. Caricaturists have put him behind a desk with a mortar-board on his head with great effect. But his cane has always seemed out of place. His glasses, his complexion, his almost chubby face all give it the lie. But a friend of mine once batted against Bowes. He was a good bat, brilliant for a schoolboy. Apparently Bowes hit him many more times than he hit Bowes; the ball seemed to be made of rubber, it kicked all over the place; but his hands proved that it was cork and leather all right—they were bruised blue.

But Bowes does not depend entirely on his height and making the ball "bump." He does not depend on anything, except his own ability; to him, the wicket is only an accomplice. He can swerve the ball so much and so accurately that he can beat a batsman before it has even touched the turf. That is why he is the best bowler on all wickets in the country, and, possibly, in the world.

Copson, at the other end, was a complete contrast. Small and thin, almost frail-looking, he is in the line of Larwood. Also, like Larwood, he is incredibly wiry. The ball leaves his hand rather like a stone from a catapult. His whole body whips behind it. He, too, can make the ball fly at times; but his counterpart to Bowes's bumping is a terrific break back. It must rival any of Kortright's.

The wicket which Bowes and Copson had to bowl on was about as stubborn as Russia's policy towards the Peace Front. It was sodden with rain—almost drunk with it. It was insensible, lifeless; but it could not frustrate them. For over after over they pounded at it; occasionally a spark of life would make the ball lift; more than often they managed to make it turn quickly, and while the shine was on it they swung it for all their worth. Between them they captured eight wickets. It would be interesting to watch the combination of Bowes and Copson on something else than a a feather-bed wicket—on a fast Oval wicket, for instance. It is ripe time that England found another pair of fast bowlers. Since the days of Larwood and Voce, fast bowling has not been too popular. We have seen very little of it. It is suspected of being unsporting, dangerous. It is supposed to be unfair. It has gone out of fashion. But it must come in again. We cannot do without it. No game can be a great game without that element of risk, that test of courage. We want fast bowlers. Bowes and Copson may be the men we are looking for.

* * * *

Away from the dust and din of the main conquest, news kept coming through of the minor skirmish going on at Sheffield. Yorkshire were falling—they were 22 for 3, they were 32 for 5, they were 62 for 6. Yorkshire were down. They were all out for 83. The Pope brothers of Derbyshire had bowled out Yorkshire for 83. Well, well, we thought, it had to come sooner or later. We were still thinking, when the next news came through. Derbyshire were all out for 20. Not one of them had reached double figures. Five of them had made nothing at all. Not one out of that great army of run-scorers had been able to raise a bat to stop the onslaught. The relentless machine, with four of its driving wheels missing, had swept them back into the pavilion in 40 minutes, in 67 deliveries. Then we looked for the name of the man of the moment, the hero who had so nobly filled the breach. Smurthwaite, we read. Smurthwaite? A misprint for Smailes, someone suggested. A railway porter, perhaps, picked up on the journey and put in to make up the team.

And then a picture from the past sprang into view in my mind. A picture of a stocky little man with a red face and small blue eyes close-set. He looked like a general who had lost his monocle and forgotten to grow a white moustache. And that is just about what George Hirst is to Yorkshire—General-in-Chief of all their forces. Year in, year out, he picks them out. He trains them. He puts them into the field cricketers, as perfect as Yorkshire can boast. Everywhere he has nets, looks out for the cricketers of the future. And George Hirst standing in front of a group of boys with a net in the background has become as familiar to the pages of Yorkshire papers as any pictures of royalty.

It was at one of these nets of his that I remembered him. So vast was his organisation, so thorough and painstaking, that even my moderate ability was to be considered. I put on my pads. I went in to the net, faced the bowling. Presently Hirst himself took the ball; two steps and the great man had bowled it. Down it came slightly outside the off-stump. Just as I was congratulating myself on having hit a ball from George Hirst, it disappeared. It reappeared behind me somewhere to lay back the leg stump. It must have swerved not only very much but very late. Two more steps and the ball, apparently the very same one, was on its way again. I waited for the swerve, played for it. It did swerve—uncannily; but it also spun, just enough to curl round the bat and send the off-stump shooting out of the back of the net. I was desperate, and in my exasperation, rather angry. So that when Hirst's next ball came down I went to meet it, struck at it, caught it (*mirabile dictu*), sent it skimming out of the mouth of the net. "That's better, lad," said Hirst; "now you've got your back up. That's much more like a Yorkshireman."

At the end of the practice he talked to us. He showed us how to hold the ball, how to make it swerve and spin. He took a bat and demonstrated strokes. The usual pictures were taken for the Press. (Most of us spent many a penny before finding the paper it adorned.) He then called out the names of the lads he wanted to see again. We listened for those names, because we knew that one day they might be talked of wherever cricket is played. I believe Smurthwaite was one of them.

HUMPHREY DANIEL.

Captain J. W. A. Stephenson, the Essex all-rounder, fielding at cover-point

MOOSE KILLED BY MRS. CURTIS IN BRITISH COLUMBIA. SPREAD 58 INCHES, POINTS 26. (SINGLE SHOT FROM .300

HIGH VELOCITY AND KILLING POWER

By CAPTAIN PAUL CURTIS

UNDER the caption "Bullets and Brushwood" which appeared in some of the November issues, I concluded my observations on the superior accuracy of the small bore high-velocity bullets to that of the slower and heavier type in thick cover, with some comments on their superior killing power when used against thin-skinned game, under similar conditions. These comments were not conclusive, however, and the editor has suggested that I should go deeper into the matter.

The time-worn argument of the large bore adherents that one can throw a feather and it will not do any damage, but that a brickbat heaved with the same force is demoralising, no longer holds good, at least not under all conditions. Time was when we looked upon a bullet travelling through space at a speed of 2,200ft. per second as an amazing advance in ballistics, and when these small projectiles happened to hit in the spinal column, or the brain pan, or the heart, they made astounding kills at hitherto unthought of ranges. The pity of it was that they did not always hit those vital areas and kill cleanly.

That condition in relation to the light, high velocity bullet has undergone a vast change in the past few years, a change, strange as it may seem, entirely due to the very things that we condemned in the loads which we formerly called high velocity, but are now in the medium velocity class, a change entirely due to their becoming even lighter and faster.

We began to suspect this manifestation of the higher velocity at short range when the now justly famous .30-06 and .276 cartridges became so popular in Canada and on the plains of Central Africa, which was that when a large soft-skinned animal was struck at short range the small bullet created a terrific wound, and the animal went down completely paralysed by shock. I was one of the early users of the .30-06, and I witnessed this demonstration time after time. Yet people still continue to think of the high velocity rifle simply in terms of greater range. Of course, it increases the range, largely because its flatter trajectory eliminates a great deal of the mistakes made in guessing the range, but actually its greatest advantage is at short range, where it hits like the hammer of Thor.

As muzzle velocities increased from 2,700ft. per second to 3,000ft., and began creeping up into the higher brackets, we began to learn that actually they appeared to kill best when the deadly areas were missed, such as the detestable stomach shot, or one through the lungs that missed the shoulder blade, slammed the victim off its feet never to rise again. The answer to this demonstration of their destructive energy is that the contents of the body of any animal is largely fluid, and these two cavities contain the larger proportion of it. But fluid is non-compressible, hence the terrific internal disturbance. If you want to see what it is like, shoot a super-velocity bullet into a petrol tin filled with water, even shoot at an orange; they are torn to pieces because that non-compressible fluid struck with such high kinetic energy becomes part of the destructive force; it blows itself apart.

This is not demonstrated by slow-moving bullets regardless of their size, in fact we do not notice it from rifles of the .30-06 class except at the shortest ranges; but when a small, soft nose bullet is driven into the lung cavity at 3,500ft. per second the victim simply collapses; it is the same as if an explosion had taken place, the lungs are demolished.

I once shot a large grizzly at 15ft., which is too close for fooling; the .30-06 hollow point went through both shoulders, of course, traversing the lungs; the beast simply rolled over on its head and never kicked—it was finished. On another occasion I stalked a large Rocky Mountain goat that was lying down, using a telescopic-sighted rifle (the one which the guide is holding in the illustration) and fired a careful shot at it. The goat never moved and the guide said that I had missed, that he had

A GOAT SHOT BY THE AUTHOR

seen the bullet strike the shale behind it, sending up a shower of dust. I was confident that I had not pulled off and fired at the same spot, the goat did not get to its feet, which it should have done; but the guide insisted that I was still aiming high. In all I fired four shots with the same result, and then said: "That goat is dead, whether I killed it or not." We went to it, and the four holes could have been covered by the palm of a hand, the first one had killed it in its form, so to speak, like a hare. Yet the goat is conceded to be one of the toughest animals to keep down in the North-West, tougher than the wapiti and almost as tough as the grizzly. I have taken five with the .30-06 with a single shot apiece.

One swallow does not make a summer, nor are five goats conclusive proof. They might have been five perfect shots and the next 20 might have been imperfect, but the same thing has happened over and over again on other game at short range. Not, be it noted, when using the 220-grain bullet which reduces the velocity to 2,400ft. at the muzzle, but when using the 180-grain at 2,700ft. or the 150 at 3,000ft.

The North American white tail deer are noted for their vitality. When struck with the average rifle of moderate power used for deer they will dash off at a terrific pace for a couple of hundred yards; even when hit hard and knocked down they will generally spring up and go off. When hit with the .30-06 at 150yds. or 200yds. they will do the same thing, but if struck at short range, where its maximum energy is in evidence, they go down as if some great weight had fallen upon them, as if crushed to the earth.

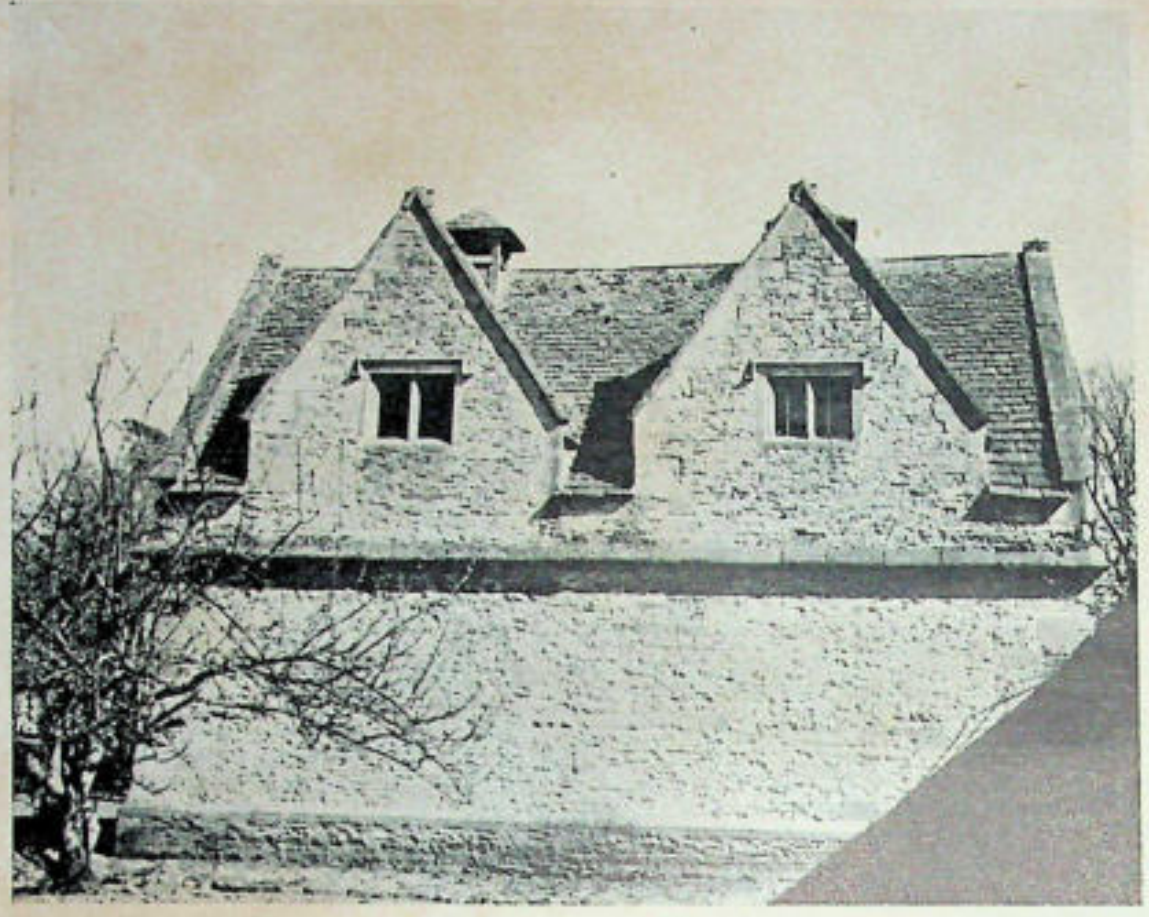
The moose is not a difficult animal to stop, in my opinion, despite its great size and impressive strength, though I know that many will disagree with me. To date I have taken fourteen of them, using the .30-06, and seen two others brought down by my wife. They were taken at ranges from 60ft. up to 400yds., and with one exception were brought down with a single shot. Frequently they required another to finish them, but they could not regain their feet. The notable exception was paralysed by the first shot and dying on its feet. With the moose, as well as the smaller species, if the shot was at short range they seemed to be knocked off their feet. Undoubtedly it was the velocity, or rather, the resultant explosive energy, which shattered the nervous system that did it.

I know well the A.D.C. of a Maharajah in Central India who told me that His Highness had to date killed 137 tigers with a .280 Mauser, and taken most of them on foot. Surely he has confidence in the explosive force of high kinetic energy over a large slug, at short range.

There never was an improvement in any line of endeavour that did not suffer from the efforts of the radicals to go one better and progress is retarded for a time. I do not endorse the new super high-velocity cartridges stepping up to around the 4,000ft. velocity class; I am simply stating the facts that when used against small and medium-sized game their effect is actually devastating. Used against deer and antelope there are actually fewer wounded to escape, when these super high-velocity bullets, weighing about 100 grains, are used, than with the large-bore slugs of a generation ago with velocities of 1,800ft. to 2,000ft. per second, but there is less meat to carry home.

On the other hand, normal high velocity rifles have the same effect to the required degree at short range, and are far better for average conditions. I have in mind the .270 with 150-grain bullet, the .30-06 with 150-grain bullet, the .300 Magnum with 180, and the .375 Magnum with 270, using short exposed, soft-point bullets with tough jackets and all having muzzle velocities of from 2,700ft. to 3,000ft. I know how they will demoralise a charge at short range.

For that reason I would prefer one of them in a tight corner to any of the old order smaller than a .500. The thick-skinned game of Africa and Asia is, however, another story, in which one might well include buffalo and bison.



Radical as the super H.V. loads are, we are moving in the right direction; modern powders are producing higher energy with relatively lower chamber

A MOOSE SHOT BY THE AUTHOR

pressure; tougher cases are also permitting the safe use of higher pressure in properly-chambered rifles. This means that relatively heavier and more reliable bullets can be used at the higher velocities than was true ten years ago—bullets that, while not too heavy, are tougher and therefore penetrate deeper and with less disintegration than formerly.

The old order of sporting rifle is rapidly reaching the end of its sphere of usefulness.

THE DOUBLE HOUSE AT LOWER SLAUGHTER
". . . the purpose of this house is not readily guessed, for it looks exactly like a small Cotswold dwelling. Only the two little stone-slated cupolas . . . indicate its purpose clearly to the dovecote hunter"

SOME COTSWOLD DOVECOTES

By MARGARET WESTERLING

GLOUCESTERSHIRE has many dovecotes, and of these not the least distinctive are built on the Cotswolds, of the weathered, colourful oolite, with the pleasant detail that gives charm to the local masonry. Until the introduction of root-crops, when, as Chancellor Fergusson said, "mangel-wurzels killed them," the necessity for keeping pigeons to provide fresh meat in winter was a very real one.

The inhabitants of the dovecotes, columbaria, culverhouses, culverhays or the country "Dovvus," to give some of their names, were descendants of the wild rock-doves, such as inhabited —and perhaps still do —that curious culver-hole built in the interstices of the rocky Gower cliffs at Port Eynon.

The massive circular dovecote at Garway in Herefordshire is one of the oldest and finest still extant, but at Daglingworth, near Cirencester, is another, that may not unworthily be compared with it. Here is no dated inscription, like that of Garway, establishing its construction in 1326, but in spite of some reconstruction it is definitely of early date. It stands on the orchard slopes of the court-house of Daglingworth, where there was formerly a religious house under the nuns of Godstowe. The building is in excellent repair, the modern weathercock surmounting it probably replacing an earlier cupola, such as is more usual.

The stone-slated roof still keeps the steep pitch, flattening at its base on to the wall-plate, indicating an ancient building. About two-thirds up the height of the wall is a square-moulded string-course. There is no sign in this house that the roof was ever corbelled and carried over to close in the top with overlapping stones like that of Garway, whose walls of 3ft. 10in. thick would suffice to date it earlier than fifteenth-century Daglingworth, with walls of 2ft. 9in.

The door is small, less than 4ft. in height, another indication of early origin, and the modern padlock secures an old iron chain. Two dormer windows in the roof give access to the nest-holes. These are L-shaped, widening out in the inner arm of the L, to give the birds ample nesting-space, turning left and right in alternate rows, with an alighting-ledge formed by a projecting stone slate to every hole. In some dovecotes the nest-holes are beautifully shaped and rounded to give the maximum of space and ease to the nesting-birds.

To make the nests more readily accessible, a potence, or revolving ladder, is used. The ladder is hung upon horizontal arms extending from an upright revolving pillar, socketed to the base and the roof-timbering. Occasionally there are two ladders. At Daglingworth the potence still remains: the cross-beams in the roof to which it was fixed have been renewed. Obviously a potence was of greater use in a round dovecote than in any other, though there is a rare instance of a potence being placed in a square house at Hanley Castle, Worcs. I have yet to find an instance of a potence in any of the numerous square dovecotes of the Cotswolds.

THE ATTRACTIVE DOVECOTE IN DAGLINGWORTH, GLOUCESTER

At Cold Aston, near Bourton-on-the-Water, the sides and end of a big gabled cart-porch in a massive stone-built barn is closely set with external nest-holes, and there are more in a smaller shed nearby, though these, earlier in appearance, are partially destroyed. In another barn, hidden away on the western slopes of Cleeve Cloud, at Prestcott, the whole length of the southern side is filled with nine rows of well-spaced nests. On the northern side a circular stone, cut somewhat like a mill-stone, is

THE GABLED CART-PORCH AT COLD ASTON

set above the porch, bearing the inscription, "Thomas Peacey, 1807." The barn appears to be considerably earlier in date. There are a few nest-holes in the walls of the farmhouse itself.

At Bourton-on-the-Water is an old house, now used as cottages, with many widely-spaced pigeon holes in and below the steeply pitched gable-ends, the best example I have seen of the nest-holes in the house itself. The close rows of nest-holes in two of the gables of a beautiful old house at Lower Througham, near Stroud, though now part of the house, stand in what was once the dairy.

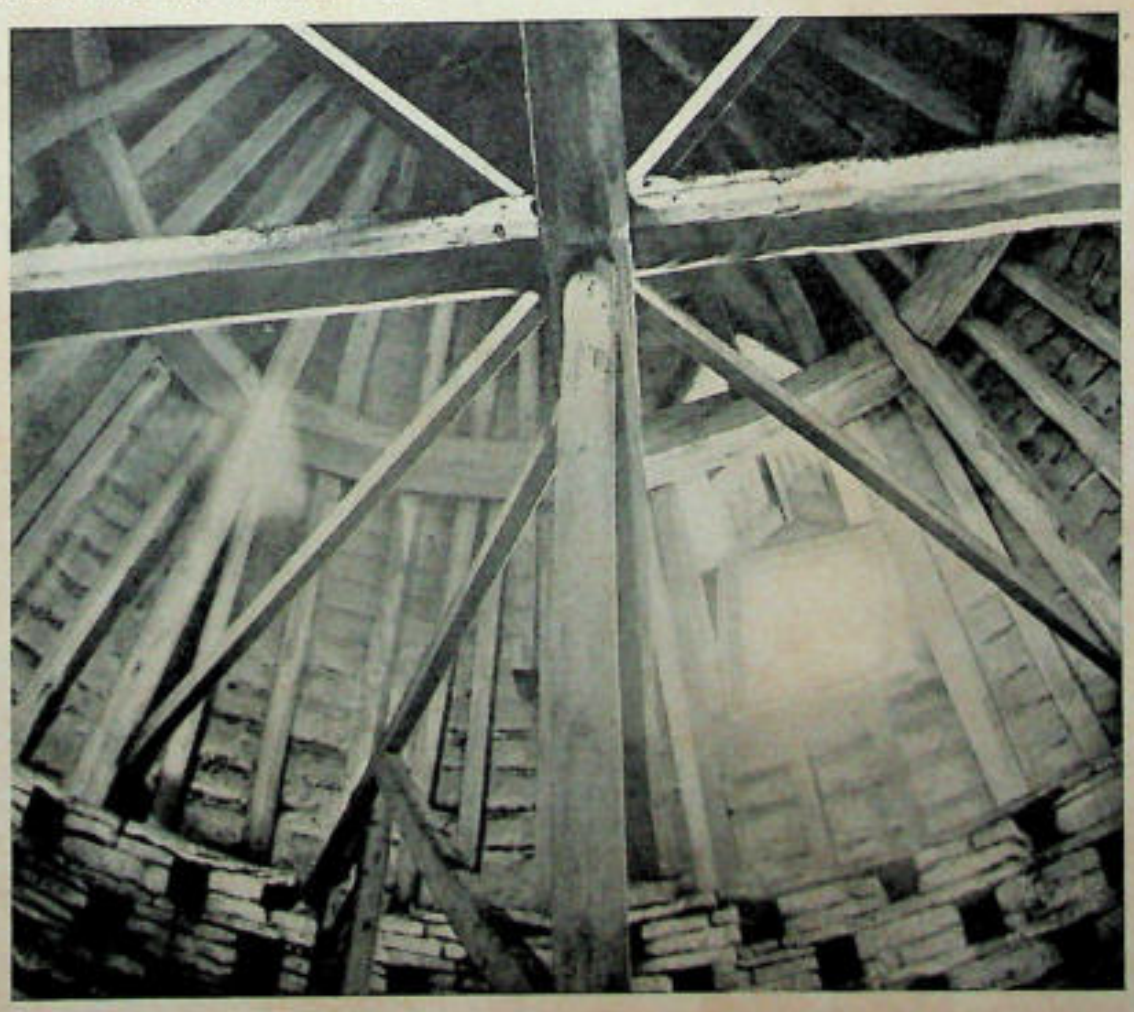
A great rectangular double pigeon-house lies in the grounds of the Manor House at Lower Slaughter, a few miles from Bourton. Its external measurements are 37ft. in length by 29ft. 6in. Double houses are not very common, though Northamptonshire can show a few examples, but this one has a very unusual feature. The internal dividing wall between the twin gables is carried up only to the point from which they spring, with nest-holes on both its sides, widely spaced and roomy. In the Northants examples this wall is more often carried up above the roof. At Lower Slaughter, as seen from the adjoining churchyard, the purpose of this house is not readily guessed, for it looks exactly like a small Cotswold dwelling. Only the two little square gabled cupolas, with their hipped, stone-slated roofs carried on wooden pillars indicate its purpose clearly to the dovecote hunter. There is a sharply undercut string-course a few feet below the base of the gables.

One of the most delightful of Cotswold dovecotes is that hidden away behind a Georgian-fronted farmhouse at Westington, near Chipping Campden. It is of the square Cotswold type, stone-built and stone-

AT LOWER THROUGHAM
This beautiful old house clearly shows its rows of nest-holes

AT WESTINGTON
"The roof is formed of intersecting gables, so that each side has its steeply-pointed gable end . . ."

THE FIFTEENTH-CENTURY DOVECOTE AT NAUNTON



slated. The roof is formed of intersecting gables, so that each side has its steeply-pointed gable end, and probably each had formerly its own stone-mullioned window, though two of these have now disappeared. On the south side, where the entrance stands, a stone slab is fixed above the window. It was formerly a sun-dial with an iron pointer, and bore a date. From the ground it is now illegible, save for the figures "17—." The central opening or cupola on the roof fell in about 20 years ago, and the opening is now closed by the original ball-finial from its top. About 12ft. from the ground there are massive stone angle-plates projecting from each corner, as a safeguard against rats.

The walls are 2ft. 6in. thick, and the 600 odd nest-holes are placed directly above one another, not staggered or, as an old book has it, "In quincunx order," giving an appearance of great regularity. There is no trace of a potence, but there is a circular dais in the centre, on which the birds were fed. It was probably at one time stone-slabbed as was formerly a similar table in the fine octagonal dovecote at Milcote, near Banbury. The nest-holes, with their L-shaped ends turning left and right in alternate rows, have alighting-ledges for every third row, 3ft. apart. Every 4ft. or so there are beams placed across the corners, providing an excellent method of climbing to search the nests.

Another impressive early dovecote of the square type is the fifteenth-century one at Naunton, now in sad need of repair. It is said to have 1,175 nest-holes, though they cannot now be counted, owing to the insertion of timbered flooring about 6ft. from the ground. The holes are staggered and well constructed of single blocks of stone, closely spaced, with thin slabs of stone between each row, only occasionally projecting to form alighting-ledges. They turn left and right in alternate tiers.

The four gables are very steeply pitched, with a small stone-mullioned window in each face. There is a string-course around it, and, below the gables, a heavy, projecting moulding, sharply undercut, to keep rats from climbing up to rob the nests. Rats were very destructive to young pigeons, and many attempts were made to defeat them. An old book advocates placing an iron spike at the base of the walls to spear them if they fell. It is a striking and conspicuous object, standing free of other buildings, in Pigeon House Close, by the banks of the Windrush, where it faces the flat Naunton meadows with its loops and twists. Nor was the stream without its use here, for a shed was built on to the lower side of the dovecote to house an iron mill-wheel. That too, like the dovecote, stands idle, save for occasional use as a chaff-cutter.

Now that pigeons are once more in the news as war-time messengers, is it too much to hope for a revival of interest in the buildings erected to house them?

NEST HOLES IN THE DOVECOTE AT DAGLINGWORTH
"To make the nests more readily accessible, a potence, or revolving ladder, is used. The ladder is hung upon horizontal arms extending from an upright revolving pillar . . ."

ENGLISH CHEESES

By H. J. MASSINGHAM

THE story of English cheese is in process of becoming as antiquarian a research as most other English things the English used to make.

Loudon's *Encyclopædia of Agriculture* (1825) gives a list of fifteen cheeses, only seven of which have escaped the massacre of local industries begun by the Industrial Revolution and continued into our own age, even more pitiless against its own interests. Of the hard-pressed cheeses, these are Cheshire (once made in cylinders of 40lb. to 80lb. over the Mersey Plain); Gloucester Single and Double (now made at Cam, Cooley and the Vale of Berkeley of new milk and cheese, rich in flavour and like the turning leaf in colour); Lancashire (Leigh), a mild, loose-textured, creamy-yellow cheese made from curds of different ages; and Cheddar, then made as a spongy cheese filled in with sweet oil. Of the lightly-pressed cheeses, Stilton, whose former period of seven years' maturing (like that of Parmesan) was reduced to two by wine being added to the curd; Cottenham, a blue-veined cheese rather similar to Stilton but creamier, and made near Cambridge; and Blue Vinny, made in conjunction with butter from hand-skimmed milk naturally souring and nowadays only on two farms near Bridport—are the only survivors. To these we can only add Leicester, a hard-pressed cheese made at Melton Mowbray and rather coarser and more tart than Gloucester, which it a little resembles; Caerphilly, a lightly-pressed cheese, mild, moisture-laden and eaten fresh from South Wales and Somerset; Wensleydale, a lightly-pressed cheese made in Swaledale, the Clevelands and Pennines, and similar to, though more solid than, Stilton; Cambridge, a soft cheese only made in summer and sold fresh; and Colwick, another soft cheese made near Nottingham.

At the opening of the nineteenth century, 200 tons of Leicester cheeses were sent up in October to the Leicester Fair, which is not one of the ten Cheese Fairs (seven for Cheshire, two for Lancashire, one for Caerphilly) which survived up to 1930. The closing of Weyhill Fair in Hampshire, the centre of the South, where the ponies and cheeses from the West met the hops and sheep from the East, is one of the taller milestones in the decline of our native agriculture. Hither, carried in great waggons tossed along the roads behind six or eight horses from the south-eastern slopes of the Mendips and the downlands of Mere in Wiltshire came load after load of Cheddar cheeses. Cheddar, now a flashy pleasure-station at the foot of the towering gorge, has usurped the name of this most renowned of all cheeses. Cheeses were made there much later than at John Billingsley's first mention of them in 1795, and of a very inferior brand. The name was affixed only because the waggons stopped there from the uplands to get their way-bills.

Hence we gather that cheeses were not of old made from the milk of the rich valley pastures, as they invariably are to-day. The truth is that the best cheese and milk-producing soil in England is limestone. In the Journal of the British Dairy Farmers' Association, Professor J. P. Sheldon said that he had "eaten no finer cheese" than that made in the Peak District, though the land there is poor and thin-skinned. The best cheese, he added, comes from the poorest land. Old turf makes the finest cheese and all pernicious bacilli are absent from it except the indispensable germ that makes the lactic acid.

Cheddar was once made by a series of comparatively simple processes—renneting, draining, warming, vatting, scalding, pressing, turning, salting, and wrapping in cloths—complicated by their intervals and repetitions and the methods of adjusting them to the varying condition of the cheese. But from 1860 onwards, an array of mechanical devices produced the following effects. The traditional technique was broken, the trained skill and hereditary experience of the cheese-maker were displaced, the era of mass-produced cheeses in factories rose on the horizon, foreign imports crippled the home market, and the process of ripening was most deleteriously speeded up. What the consequences were to Cheddar Cheese may be weighed by referring to Lloyd's estimate of its quality in 1896. A good Cheddar, he said, is soft and fat, with the aroma and flavour of nuts, it melts in the mouth and has an agreeable after-taste. That kind of Cheddar has passed out of taste as the cheeses that once travelled down the river from Lechlade to London have passed out of mind. It was that kind of Cheddar of which Martin Rishton wrote to Coke of Norfolk in 1815: "I beg you will do me the honour of accepting a real Cheddar Cheese, old England's fame in days of yore when every poor cottager could enjoy his home-brewed beer and sit under his own Fig-Tree."

The changes in utensils between traditional and modern cheeses need only take a few lines. The round wooden tub or vat gave way through transitional forms to the rectangular jacketed vat with steam and water connections. The wooden "cheese" or mould in which hard cheese was pressed is now made of metal. The old "curd breaker" is now a contraption of knives of metal strips long ways and up and down for cutting the curd into cubes. Rennet now is a commercialised product, much questioned by some cheese-makers The "starter," substituting a prepared sour milk for natural souring, still further relieves the maker from thinking, while colouring cheese is an entirely novel departure from tradition. Further aids to mechanising cheese-making, of rendering its processes automatic and so independent of human ability and craftsmanship, are the acidimeter, the butyrimeter and the lactoscope.

This brings me immediately to inquiring the causes of the decline in English cheeses. A few people are at last waking up to the fact that "scientific agriculture," by "forcing" the land to bear more than it is naturally capable of doing, by the use of artificial fertilisers and by standardisation, is largely responsible for plant diseases and soil exhaustion. In one of the scientific reports on the modernisation of cheese-making occurs this naive remark, expressed in the customary jargonese: "The manufacture of a large number of varieties is an obstacle to standardisation of quality on a national scale and is calculated to perpetuate individualistic and uneconomic (viz., not in accord with our financial system) marketing methods." Precisely, science murders variety, just as it murders the English language, and the variety of English cheeses in the past was the criterion of health in this particular rural craft. Re-made or pasteurised or "processed" cheeses are vastly on the increase. What more evidence is needed for the degradation of taste, of sound methods, of true workmanship and of quality? There is no more wisdom in desiring the standardisation of cheeses than there would be in attempting to standardise sheep whose different breeds reflect the varieties in soil, climate and environment. Differentiation is vitality and the heavy reduction in the varieties of our cheeses, the shifting of the responsibility from human to mechanical power, the starvation of the homestead in favour of the artificial factory system, the treatment of nature (cheese comes from milk, milk from cows, cows eat grass and grass grows from soil) as though it were merely a raw material to be exploited—all these are signs of degeneration, not, as science loudly proclaims, of progress.

PACKING CHEDDAR CHEESE INTO THE MOULDS PRIOR TO PRESSING

MAKING CHEDDAR CHEESE

Cheddar cheeses are pressed for three days and great care is taken to ensure that a good firm skin forms on the cheese

Another cause for the decline speaks for itself. Of the total number of cheeses consumed in Great Britain less than a quarter is made at home, and three-quarters bear no comparison in quality with the home cheeses. Competition from factory-made imports, that Victorian idolatry, made its worshippers rich but has reduced their descendants to beggary. A third cause is the expansion of the liquid milk market for supplying the towns to such a degree that there is not enough milk left over for country cheese-making. Lastly, lack of labour, that ulcer of the whole countryside, poisons each and all of its once flourishing activities, and cheese-making by no means the least of them. What it all amounts to is that science will never rehabilitate cheese-making. The only thing that can do that is the revival of agriculture, and agriculture will never reawaken until the land is repopulated with a peasantry and a yeomanry.

Cheese-making is indeed like bringing up a child. The development of the lactic acid must be watched; the coagulation of the milk by rennet judiciously carried out; the separation of the whey from the curd undertaken as a parent discourages one impulse and forwards another; the ripening fostered by knowledge and a kind of insight. How temperamental cheeses are! Their flavours may be acid, fishy, weedy, tallowy, sour, rancid, sweet or nutty; their texture close, open, porous, flaky or crumbly—"merly," as they call it in Yorkshire; their body plastic, soft, pasty, firm, smooth, weak or spongy; their colour mottled, scanty, spotty or puffy, with red patches or black spots due to various bacteria, uneven salting or drainage or curding in advance of acidity; their rind has all sorts of tricks in cracks, whey stains or mould-growth. They take their virtue from the living cow and are choicest in late summer (they are made from April to September), because the butter-fat content is highest when the milk-yield from the cow is lowest. Is it automatism in factories that can bring up this delicate thing from the milk pail to the ripening shelf? Husbandry alone can accomplish it.

For this reason, in the interests of good eating and for the sake of our starved and prostituted countryside, I wish the makers of existing English cheeses in the country luck in their struggle for existence against a phase of declining civilisation which does its damnedest to destroy the foods that best nourish its people.

Gentlemen!

your **Johnnie Walker—**

That's what we call service! However many racquets a champion may need, for real refreshment he need only order a Johnnie Walker. Why is Johnnie Walker so refreshing? Because every whisky in the blend—and that includes all Scotland's finest whiskies—is chosen for some special individual quality, which is actually enhanced by the blending. If it's a matter of men's doubles—make them Johnnie Walker.

TERNS ON THE MARRAMS

MIDSUMMER DUSK TO DAWN

By E. A. R. ENNION

THE wind, tired of hustling day-long through the grasses, had relaxed. The gorse, hot-scented still, no longer cracked its seed-pods at the bidding of a baking sun. Clay Bank, dividing the salt marshes from the fresh, led down to where, beyond wide shingle stretches, there thrummed a far pulsation of the sea.

Starlings, 20 and 30 in a bunch, crossed over; they were gathering in the reeds to roost, and most of them were brown birds of the year. To-day, they had been scattered over the salt marshes, probing the ooze for food as those inland probed the matted grasslands. Some had ventured the water's edge with sanderling and dunlin, but starlings are not true children of the tideway. Not for them the excursions of a wader-flock heading low across the flats and flickering above the waves; the swerves to sky to be lost against the clouds and then seen against the blue; the settling of the flock by common inspiration and the return to individual fancy, preening, feeding, sleeping fitfully with bill and one leg tucked away.

Halfway to sea low islands rose from the saltings by the bank. They held big nesting colonies of gulls and terns. Skirmishers came screaming overhead and a taint of sea refuse soured the air. The numbers multiplied until the air quivered with the tumult of their wings.

Black-headed gulls, many with bonnets already turning white, found the calm air difficult to navigate—they flew heavily and with more continuous beat than when with a wind to buoy them. The terns, livelier at any time, seemed doubly lithe by contrast.

Common terns winnowed, scolded and wheeled, and the big sandwich terns raked round the outskirts of the swarm on their narrow, angled wings. Often a lesser tern, bobtailed as a bat, with a white blaze on its forehead and a sharper cry, came from the shingle ridge to join the company.

I lay on the bank to wait their settling down.

Except for one lone gull brooding a late clutch, the nearer island was reserved by common terns. Most of them were resting: some asleep with red bills tucked in grey mantles, others still nodding black skull-caps as they preened.

The grey plumage of the fledged young was coffee-stained and nicked by dark crescent bars margined in buff. Their caps, defined so sharply in adults, were invaded by white at forehead, nape and cheek. There was a touch of lavender on the coverts of the folded wing. This patch enlarged when the wing was stretched. Gulls and terns often extend a wing fully, but more often only the long front border up to the angle is stretched and the primaries remain closed and crossed upon the opposite wing point. Whenever this happened a little grey triangle appeared suddenly against the dull background to fade out as the wing shut again.

A few were still in the motley of earlier days with feathers sprouting through the down. There were even a few mere nursery toddlers about—plaguing their mothers with small petulant cries.

One last, wild chase was seen when a late forager skimmed home dangling a silver-slip of sand eel from the tip of his bill.

The sandwich terns, like the gulls, worked longer hours. The pilgrimage for food went on until dusk had gone to dark, and they were ready to be off again an hour before the dawn. One flew in high and laden from the sea, the leverage of its lank wings tossing the frail, awn-shaped body up and down at every stroke. They were nesting on an island farther away and there was barely light enough to see the stir among the neighbours when it lit—an outburst of upstretched necks and bristling black top-knots, chattering bills and wings akimbo.

Flights of dark arrows threaded the reed-tops—young swallows taking toll of the insect swarms before these, too, took cover for the night. Sand martins stayed up after the swallows had gone to bed, and swifts pierced the upper air until the big bats were out and the duck passed whimpering overhead.

The bank turned left, and still the sea was out of sight below the ridge. White stars of sea-campion, yellow flares of sea-poppy beset with its rakish seed-pods, gleamed from the darkening shingle. There was a large grey stone on the crown of the ridge.

I went to it and sat there watching the sea sweep to an horizon veiled in smears of cloud. One bright streak was the only sign left of the sun. Out of the dusk swung a short-eared owl. Twice, with gruff chokes of enquiry, it circled round the intruder on the stone. After each dozen or so leisured beats it sailed a little way with the wings held at a rigid angle forward above the body—more often than not with a list to starboard or port. And then the shoulders heaved again with a powerful down stroke, displaying light patches at the base of the chequered primaries. Its legs were white and slim as a woman's arm wearing a long kid glove, but the clenched claws at the business end looked a lot less gentle than fingers.

"Out of the dusk swung a short-eared owl. Twice, with gruff chokes of enquiry, it circled round the intruder on the stone"

"A wren, quite close, jerked out a trill of vigorous song"

It came so close that I could see the yellow eyes staring: they shone in the dark pattern which broke the oval of its face. Away it went in buoyant vacillation on its hungry quest along the shore.

On my return stars glinted in the pools below the bank. Duck, dimly seen and swiftly vanishing, rose from the marsh, protesting. Reed warblers woke to scold me softly, and phantom snipe fled with their weak complaint. For a little while I had to follow the hard road, uneasy with homing traffic's noise and glare, and then a wide grass track led off through shimmering cornfields.

The track narrowed to a lane hemmed in by brambles, bracken and gorse. An occasional blackbird challenged sleepily. Elm and oak mingled in a canopy overhead. At last a fretted half-circle of night sky brought the end of the lane. The bordering trees gave way to open heath.

A tawny owl lit gently on a withered arm of gorse ahead of me. It floated away, a swaying shadow. The body seemed too flimsy and misshapen to keep even keel under the sway of those slow vanes of wing.

A nightjar glided across the path; a male, since I caught a glimpse of the white twin-spots which plot the chin, the wingspan, and the boundaries of the tail as boldly as the stars prick out Orion and his dagger. The female lacks these ornaments. He was intent on the ghost-swift moths whirling their crazy energy away. The bracken petered out, and I walked over lichens and short grass between great mounds of heather. One of these mounds was chosen for a mattress. It sprung perfectly and there was the night sky for a ceiling.

A stone curlew whistled from the wastes beyond the fringe of bracken. The notes had lost their courtship purity. They never had the rippling ecstasy of the true curlews of the moors, but the warrens would miss that clear, repeated call to echo down their enclosing belts of pine. A second answered; others, from more distant heaths, took up the cry and the dark rang with their melody.

When it ceased I lay listening to the night's undercurrent sound: the wail of peewits; the mew of short-eared owlets telling their whereabouts in the heather to guide parents bringing food, and, most present sound of all, alternate loud and soft, the reel of nightjars.

A pair must have been hawking close by. It was too dark to see, but now and then the faint snap was heard as their beaks enclosed—or was it missed?—some passing moth. I heard, too, an occasional clap of primaries together over back: much the same noise that woodpigeons make when they smack their wings at the apex of the curves traced in joy flight.

A nightjar flickered for a moment against the afterglow before it settled on the bough of a naked, solitary oak—sideways, like a knot in silhouette—to twirl away its prayer-wheel through the night.

After a few hours sleep I woke to find low clouds moving across an opalescence in the East. The immediate clouds above my head stayed shadowy dark, but others, high above them through the gaps, began to lighten. The stars faded and a warmer colour overspread the sky. Presently the highest clouds of all flushed pink against an ever-strengthening blue. Pale strands of mist cut the blurred forms of trees from their connection with the ground. A pheasant crowed and beat his wings. He was challenged by a distant farmyard cock. A jay screeched, and a skylark slipped aloft to meet the sun. A wren, quite close, jerked out a trill of vigorous song.

The new day had begun.

NEXT WEEK'S GOLF OPEN

The Stern Test of St. Andrews

By E. R. TIPPLE

ON Monday the first of the two qualifying rounds for the British Open Championship will be played over the Royal and Ancient Golf Club's links at St. Andrews. As has been the case in every tournament this year, the entry is much smaller than usual. With the exception of A. H. Padgham, winner in 1936, who forgot to send in his name before the closing date, every British professional of note will attempt to win the coveted title.

Once again the challenge from abroad is not as formidable as had been anticipated. The American championship has just been held, and most of the leading players are staying at home to take part in their match play tournament. The former amateur champion, Lawson Little, has arrived in this country, and it seems probable at the time of writing that he will be the most dangerous contender from the United States. Since turning professional he has improved his play and must be regarded as one of the most powerful golfers in the world to-day. Whether he will be able to adapt his methods to suit the peculiar conditions at St. Andrews remains to be seen. If he does learn the way to play the links he will need watching.

After an interval of many years the Argentine has sent over a team of professionals. They did well at Leeds, but Leeds is very different from what they will have to face next week. Jurado, a small, jovial type of golfer, has had experience of British conditions, and in fact might have won the championship at Carnoustie in 1931, but for a bad finish. The winding burn and safety-first tactics ruined his chances. Now he has the handicap of *anno domini*.

This year new conditions will be in force. A maximum number of 130 players will qualify for the actual championship, and the number eligible for the final two rounds will be 44 instead of 40. If there are ties for the last places all those who tie will be eliminated. These new arrangements will meet with general approval and will prevent any congestion in the closing stages. In the past several competitors have been hindered by those who were out of the running.

The question everyone is asking is: "Will Locke beat Henry Cotton?" Despite every effort on the South African's part, Cotton has refused him the chance of a challenge match. Personally, I agree with Cotton's attitude, but if Locke wins the title next week then there will be a meeting between them. Bobby Locke has been established favourite in the betting list, and both his record and recent performances justify that position. No one at his age has had such an impressive list of successes. Last winter he won three championships—including the Transvaal title—with the record aggregate of 265, each of the four rounds being below 71. He has beaten the present British champion, and has won the Dutch title as well.

Since last year Locke has put on length and his short game play is positively deadly. With a slightly pigeon-toed stance he hits the ball with his putter crisply for the back of the hole, dragging it in from the right as Willie Park used to do. I have never seen anyone quite so consistently accurate from 6yds. as this young South African.

Henry Cotton seems to have struck his best form as well. So far he has had a very successful season, and at Little Aston his improved putting was a feature of his performances. This will give him that needed confidence when he comes to the difficult St. Andrews' greens. Nowhere else are the greens so large and treacherous, and putting will play an even greater part than usual in the deciding of the championship. At St. Andrews it is the long approach putts that are the problem. It is very difficult to gauge the slopes of the undulations so that you are left within holing distance for the next putt. If you are not careful and accurate you get many of these long putts, because the huge greens tempt the unwary to play safely when approaching, instead of going for the play.

The Old Course is not liked by everyone; indeed, many of the professionals hate it because they do not—and will not try to—understand its subtleties. It is not straightforward and is never the same day by day. It cannot be treated lightly. The wonderful terrain—the "'umps" and "'ollows" round about and in front of the green—provide a variety of ways in which each hole can be attacked. There is no obvious way to play them and each approach is always in the nature of an adventure.

Some complain that the element of luck plays too great a part in the play at St. Andrews. But they forgot that this very uncertainty is the essential charm of the game and that, in the long run, luck balances out and the best player wins. A good shot may be penalised sometimes because of the formation of the plateau greens. They are not built up to assist the player, but slope away from him so that if he is too bold the return pitch is a teaser. If the greens are soft much of the character of the links is lost because ordinary pitch shots can be employed. When the ground is hard—and judging by recent reports it will be—the pitch and run must be played and then the undulations, the folds in the ground have to be considered.

Small, almost insignificant bunkers dominate the play at most of the holes. These have to be circumvented rather than carried, and if a shot is not placed in just the right place the next will be found to be almost impossible. The long hole in the fourteenth—which in 1933 proved the undoing of Hagen, Sarazen, Diegel and Easterbrook—has been lengthened, so that the dreaded bunkers, "Kitchen" and "Hell," will come more into play than they have done for some time. The wind governs the method of play at this hole, as indeed it does at most of the others, and there are at least four routes to the green depending on the capabilities of the player concerned. With a following wind the route is to the left; with the wind against, "Hell" has to be considered.

Although most of the holes are nerve-racking, the ninth and tenth can be termed fairly easy. And because they are simple golfers often drop strokes at them. No one can afford to relax at St. Andrews. It makes you think and keep on thinking—if you don't, your score will be in the high 80's. The last time the Open was held there Craig Wood won after a tie with Shute at 292. Unless the conditions are easy the winning total next week will not be very much lower than that. Who will be the next champion? Cotton or Locke? Whoever beats these two will be near the top of the list.

Despite his poor exhibitions so far, R. A. Whitcombe should not be overlooked and C. A. Whitcombe, Adams and Rees are quite capable of springing a surprise. One thing is certain, however; the ultimate winner will have to play good golf. St. Andrews will see to that.

AN AERIAL VIEW OVER THE LINKS (OLD COURSE) TOWARDS THE ROYAL AND ANCIENT CLUBHOUSE

From the 17th tee the route for the long driver lies over the railway sheds seen in the bottom right-hand corner of the photograph. The green is off the picture with the dreaded road behind it. The famous twisting Swilcan Burn is clearly seen and the first two holes. The aerial view brings out the undulating nature of the terrain which is so puzzling to all visitors to the headquarters of the game

PENNINGTON

This is a pleasant parish,
Without the smoke of town,
Where fields are green in summer
And winter hedges brown.
It slopes from heathery moorland,
And sinks to rolling plain,
Where mangels grow, and turnips,
And oats and barley grain.
The red men in their cages
Went down in days of old,
Like Pawnees or Ojibways,
For haematite from mould.
By gins walk'd round the horses,
And streams flow'd down like blood,
And beer ran in beer-houses;
But then the times were good!

EDMUND CASSON.

This England . . .

Withypool, Somerset.

THOUGH its name be clumsy yet is there risen a good and subtle thing in this England. "Rural bias" it is called—a device whereby some worthy educational authorities are seeking to broaden the minds of their charges. For if England's cities are become important, she cannot live by them alone. And is not the little motor car beneficent in the same degree, in that it frees the people to go about their lovely heritage, to learn again an understanding of the country life? For in such measure as we become farm and country conscious is our contact with the past maintained and the strength of England renewed. And if this gentle schooling weary you, is there not Worthington at your halt—old-fashioned, English and itself devised for the renewing of England's strength.

ISSUED BY WORTHINGTON AND CO. LTD., BURTON-ON-TRENT, ENGLAND

"Of late, a new terror has been added in the shape of the pony club. In the young days of our old friend Louis Muttlebury Miltown there were no such things . . . But to-day things are different"

THE YOUNG IDEA

By MARTIN STEPHENS

RECRUITS to English life are very soon made conscious of the extraordinary lack of suitable cogs in the machinery of the community. The cricket club, the women's institute, the British Legion, the parish hall, would each of them take on a new lease of life if only a live wire could be found to run them. Old Colonel Dobbin was *quite* splendid, but since he became blind as well as deaf, his faculty for conducting the public affairs had waned somewhat. But what we want, the vicar's wife repeats with an ogle, is a *live wire*. The recruit to rural life at once realises that he is the prospective electrolyte, and begins to struggle. It is of no avail. He will probably only get the Boy Scouts thrown in as well.

Of late, a new terror has been added in the shape of the pony club. In the young days of our old friend Louis Muttlebury Miltown there were no such things. You were taught to ride by the coachman, unless your father was a family sort of man, in which case he took you in hand himself. But to-day things are different. The grooms who taught Louis's generation in their neat saddle rooms are in the local livery stables now, and the pony clubs really represent the efforts of an impoverished class to let their children have the things which they had enjoyed in other days.

Not long after Louis acquired a country mansion, the local Colonel Dobbin became blind (or deaf), and nobody hesitated for a moment as to who the live wire was to be. Louis, good-natured, well-to-do, a bachelor, was just the man. Moreover, he might be able to keep those little fiends, the children of Commander Dashwood, of Conkswell, in order; children who stood in awe of neither man nor beast, and scarcely trembled even when the voice of Sir Harkaway Gorse thundered at them, "Boy, get off those seeds."

The pony club year is, fortunately, confined to the school holidays. During the remainder of the year the district commissioner may *recueiller pour mieux sauter*. Christmas is spent arranging children's meets and engaging oneself with the Shetland pony which refuses either to go on or go home, and in keeping back the young fiends aforementioned from the seeds. At Easter, most of the time seemed to go in segregating those few who had not been in contact at their schools with an infectious disease from those many who had, while the summer offered the apotheosis of the whole business. First, there was the annual camp, and then came the cubbing, which will always be the best apprenticeship to foxhunting, if only because even a three-year-old child on a donkey is able to see the fox. And, after all, that is the illustrious vermin about whom all this pother is.

So for his summer camp Louis had ambitious schemes and he borrowed a disused mansion and created therein a male dormitory, a female dormitory, and a refectory. Every child was to send his own crockery; every child was to ride over on his or her own pony; and every child was to "do" his or her own mount. There was to be a morning inspection after stables, and a prize for the best-groomed pony and the best-kept hack. There remained, however, only one point. Who was to feed the children? Obviously, it would be against the spirit of the enterprise to hire a staff of servants. Obviously, if they had to cook for themselves, they would either cut themselves to ribbons with tin-openers and/or die of malnutrition. And here it was that Janet Pearson stepped in.

Janet Pearson was a definite rural type. She was the spinster of the Hunt. Kindly, gruff, prejudiced, handsome, masculine, efficient, sympathetic, poor, pitiably poor, her position had grown upon her by degrees. Always admired, often courted, it was generally conceded a great pity that she had not married. She fulfilled all manner of public works, and in the winter she made her three-days-a-fortnight with clockwork regularity, with as many extras as her friends provided. She administered her wire district with extraordinary efficiency; she was renowned as the most economical settler of poultry claims in all Barsetshire; her voice was uplifted alike in the parish council, the local theatricals, the women's institute, and on the hunt ball committee. She was commonsense in a habit, and to her Louis turned at once. Without further palaver Janet accepted. Ribald members of the Hunt referred to them from that day as the "happy couple." But what of it?

Meanwhile, another nightmare was beginning to loom. One of the great events of Barsetshire was the Pendlebury Show. Now the Pendlebury Show is the most important of all summer reunions in Barsetshire. Sir Harkaway Gorse himself attends and distributes the prizes with Jove-like affability. The young ladies and gentlemen of the neighbourhood take part in the musical chairs, for which the music is supplied by the band of the Barsetshire Yeomanry. And every yeoman farmer turns up with his family as a matter of course, to criticise the entries, their riders, and the judges. Last year a real live cavalry regiment, whose commanding officer had connections with the district, had sent a troop which carried out a musical ride. This year they had been mechanised. And nobody made so bold as to suggest throwing Sir Harkaway into an apoplexy by an armoured car demonstration at the Pendlebury Horse Show. So Louis and Janet were called on to organise a display by the pony club. "On top of leg of mutton for fourteen, I call it hard," said Janet.

Leg of mutton for fourteen it was, for no fewer than fourteen children turned up for the annual camp—three male Dashwoods, including Tony, the arch-fiend of the family of fiends, three female Tarrants, shy little John de Courcy, tall, lanky, timid George Kirkup, two new children called Boyer, a boy and a girl, the babes of the party, aged eleven and ten, and Camilla Hawksworth, a fine young lady whose mamma was letting her out of her sight for the first time. The party was completed by Jim and Alice Brown, the children of a biggish farmer, and Flower Donald, the Scottish doctor's stolid daughter from Barchester. "How in the name of the Almighty anybody could have called his child 'Flower' defeats me," said Janet. "Vegetable would have been nearer the mark." Janet was busy counting the stores; something of everything to the power of fourteen.

On the first day they began rehearsing for the Pendlebury Show. It was agreed that the children should be dressed as devils on horseback. ("Very appropriate," said Janet), and that the keynote to the display should be diabolic. Suitable clothing was hired—red and green devils. "Will I have a tail," was the cry of every child. When they were assured that they would the enthusiasm waxed intense. Even John de Courcy became a little less timid than usual, and the Flower positively floral. There was a slight wrangle the next day as to who was to be a red devil and who a green, but in the excitement of a tail such minor disappointments were overcome. It is curious how even sophisticated sixteen shows a preference for being a devil of real red.

The programme for the pony club display was to be as simple as possible. First the children were to gallop through the arena *vestre-à-terre* and shrieking like the devils they were. ("That won't be difficult," said Janet, as, flushed in the face, she basted leg of mutton for fourteen). Then there was to be a display of jumping, and, finally, some trick riding by the more advanced devils. In this, the young Dashwoods excelled. Tony had a pony, a thirteen-hand grey, with some sort of connection with Arabia, which surely began life in a circus. They could, if the spirit moved them, give an inspired performance. But the pony, like his master, was also a limb of Satan. If the spirit did not move him his toes stuck in, and that was that. Their show piece was jumping through a vast paper hoop, a trick they'd learned from an ex-cavalry riding instructor. When it came off it was highly impressive; when it didn't it reduced the unfortunate producer to a state of apoplexy.

The day of the show was fine and sunny. Louis's last hope of salvation, torrential rain, seemed lost to them. Janet (scrambled eggs for fourteen) remained strangely calm at breakfast; so did the children. Louis could not understand it, for at yesterday's rehearsal everything had gone wrong and even the performers—human and equine—had been listless and uninspired. The rehearsal of saddling up in the morning went all right. Perhaps, after all, everything might pass off well enough. The morning dragged on: the children were made free of the raspberry canes, the ponies having been burnished to the point of reflection. Louis had nothing to do but sit and wait. Janet occupied herself with beefsteak pudding for fourteen. The anticipatory agonies of a Point-to-Point were as nothing to this.

Let us draw a veil over the next few hours. It is 3 p.m.; the Barsetshire Yeomanry Band have finished playing the beautiful "Blue Danube." The best light-weight hunter owned by a *bona fide* farmer has cantered from the ring, white rosette and all. Two small tents are pitched in the middle

of the arena. Louis, standing nervously near the side, heard a ribald voice say: "The big one is for the pony club; the smaller one for Louis and Janet." He glanced round; the rows of faces over on the other side resolved themselves into parents varying from the anxious to the proud. There sat Sir Harkaway Gorse, Jove-like as usual, on a farm wagon. Louis had given his final instructions; there was nothing more to do. He nervously blew his whistle.

Suddenly there was a sound of advancing cavalry. "For the honour of the Household Troops," "Death or Glory," and all the rest of them, and before he knew where he was the screen of paper had been rent asunder. Tony Dashwood had come through it, yelling like a soul in torment, and the pony club had galloped madly across the ring, fourteen red and green Chingangtooks, and disappeared through the other end of the arena. Nobody had expected it. Everybody was delighted. The applause was more than perfunctory, more than purely parental. The cavalcade returned at a trot, demurely. It is true that one or two were still all canter and curb chain, but you could hardly expect their steeds to realise that the honour of the Household Troops was no longer involved. The ponies were duly picketed. The devils feigned extreme languor and departed for the tents. The ponies nuzzled into empty nosebags. (This was play-acting with a vengeance!) "Night," as the programme read, "may be taken to have fallen." Louis edged nervously towards the centre of the ground, feeling much too like Royalty in the paddock at Ascot, and blew his whistle. There was a convulsive heave in the tents and, as they belched forth devils, the clear tones of Tony were heard enquiring, fortissimo, "Have you cleaned your teeth, Satan?" and the audience were again in high good humour. One, two, three; he saw saddles and bridles go on. Taffy, the little Welsh pony which young Kirkup had brought, was playing up, but two fellow-players made strenuous devilry, and the girths met somehow. Now they were all done except the Boyer girl. They were fiddling with a bridle. Were they going to be all day? And then it was done and they were out of the arena amid loud applause. Sir Harkaway was heard to thunder a stentorian "Bravo!" The practical had an immense appeal to his solid British common sense. Devils were all right, but saddling up, that really was to the point.

The next item was the turnip and pipe episode. The turnip, artistically decorated by the children to look like a face, was supported on a pole. Each face held a clay pipe, the idea being that as one rode past at a gallop one had to smash the pipe (but not the face) with a wooden sword. This in itself was not difficult once the ponies were used to the turnips, but they had an annoying habit of shying off just at the critical moment. The display was not faultless, but nobody took a voluntary, and if only six pipes out of fourteen were broken—well, so much more difficult did it make it appear.

The bending, too, went well enough, for by now the audience was getting worked up to it, and there remained only the jumping. The first round was a sort of grand scurry over the bush fences and an in-and-out. This was done *ventre-à-terre*, and excitement could be counted on carrying the whole fourteen along. Then the six elder children were to give a display round the course. The first out was Camilla Hawksworth. She was not a popular child locally. She was smug. So, though everybody was pleased for the success of the turn when she got round to the water without mishap, nobody minded much on her own account when she had a refusal thereat. Jim Boyer came next. He removed the top layer from the stone wall and had a bit of difficulty extricating himself from the "in-and-out," but his performance must surely have gratified the fondest of parents. Jim Brown had trouble with one of the bush fences, and the younger Dashwood rode three spirited refusals at the water and then withdrew amid applause. Then Tony appeared on his grey pony. He took his fences *ventre-à-terre* in the Continental manner. His blood was up. He was playing his part to perfection. Seven times the arena held its breath, and the breath of Louis and Janet held a second longer than anybody else's; and then, amid deafening applause, he cleared the water by 3ft., and cantered out of the ring, waving his tail above his head. After that the equally faultless round of the eldest Tarrant seemed insipid to all except the Tarrant relations, and it was with a light heart that Louis and Janet received the congratulations of half Barsetshire.

"And where are you off to now?" inquired Sir Harkaway Gorse of Janet—one of his special favourites. "Fish pie for fourteen," she replied grimly.

"The grooms who taught Louis's generation in their neat saddle rooms are in the local livery stables now, and the pony clubs really represent the efforts of an impoverished class to let their children have the things which they had enjoyed in other days"

". . . and the pony club had galloped madly across the ring, fourteen red and green Chingangtooks, and disappeared through the other end of the arena . . ."

A PARTY, INCLUDING LORD LASCELLES, ON BLUBBERHOUSES MOOR LAST SEASON
It was here that Lord Walsingham made the individual record bag of 1,070 grouse, on 30th August, 1888

The Gun Month by Month

SHOOTING—YESTERDAY AND TO-DAY

FROM the educational standpoint I always look forward to July. For then my favourite commentators, dabbling in research, usually discover startlingly original reasons why grouse are "exceptionally plentiful and strong on the wing." Of late years the heather beetle and the sheep tick have had a lot to do with it, though which insect is the more to be commended is a moot point. For each, I have gathered, is a "form of food of which grouse are particularly fond." As fond, in fact, as pre-War pheasants were of mangel-wurzels if I do not misquote an elder statesman. But then one could believe anything of birds which (again my mentor speaks) "are curious fowl, as tame as auntie's lap-dogs, being penned and given brucs to wear lest they should escape."

Still, without these unconscious humorists the daily news-sheet would often be unconscionably dull. Even that historic rifle (resurrected from the 'eighties if my memory serves) was once more "cracking" on the moors last year. In the hands, presumably, of one of those rich parvenus one never meets in over-ripe plus fours and gaily feathered Homburg hats, who, in view of all the champagne and brandy they consume at lunch, seem to make remarkably good practice. Although, possibly, it is not so surprising that they should on grouse which "tame and terrified, have even been known to perch directly on the butts."

As antidotes to the proverbial gloom of breakfast tables these vignettes of the moors are doubtless welcome. Yet we should not take them too lightheartedly in that they are usually flavoured with an anti-blood sport sauce. The uninitiated not unnaturally conclude that shooting is the pastime of the rich. In point of fact this has never been less true than it is to-day. One might almost suggest without exaggeration that within the recollection of the elder sportsmen of the present era the shooting wheel has turned full circle. If we drive birds nowadays instead of walking up it is because we cannot shoot them otherwise on land devoid of holding cover. But that is not to say that we shoot in the aggregate more game than did our forbears.

Our modern shoots take place, for the most part, at not less than fortnightly intervals. Moreover, due mainly to the changing conditions of land tenure since the War, more than 75 per cent. of all the shootings in this country are of the small or medium-sized variety. It may be said without qualification that the *acreage* expectancy per season on any shoot of 1,200 acres or thereabouts with intensive hand rearing would be no more than 400 or 500 pheasants and 100 brace of partridges. And on a vast number of rough shoots one-fifth of such a bag would be considered as quite a satisfactory yield in an ordinary year.

Nothing is "news" nowadays unless it contains something of the sensational. And that is why the public is apt to take the exception for the rule. An outsize bag is reported from somewhere, and people immediately assume that *all* bags are outsize. It may happen, and of course it does, that in exceptionally good game years thousands more birds are killed than in an average season. When one considers that ground, which, say for argument's sake, holds 100 partridge nests, will yield at least 700 more young birds in a good year than a bad one it is patent why this must be so. For if too big a stock is left, disease will ravage it. But only once, or at most twice, in every ten-year cycle do we get these bumper years. The plain truth is that "records" are unfashionable nowadays. The average sportsman likes to spread his shooting over the season. He does not want to kill a thousand pheasants and five hundred brace of partridges in two days and have little left to work on for the rest of the year. And he knows—for modern research has taught him—that he cannot eat his cake and have it. If he decimates his breeding stocks, it is not only going to cost him dearly for restocking, but also his future prospects will be seriously prejudiced.

Some shoots, of course, yield big bags with unfailing regularity, but were their acreage to be taken into account it would be found that *proportionately* they are not greater than those obtained on less extensive properties. More pheasants may be reared, but that, again, is usually because the coverts on big, well-keepered properties are in all respects more suited to their harbourage. Definitely, I think, the craze for big bags is a thing of the past. Nor is the change of outlook due to financial stringency. Individually we may have less money for sport than our grandsires, but the system of syndicate shooting redresses the balance. Men who can put down anything from £100 to £300 a year for a share in a syndicate can get, if they want them, bags every whit as large as did the big landowners of pre-War days.

But no one nowadays is interested in outpointing a neighbour. There is little doubt that the urge for big bags reached its zenith when breech-loaders were substituted for the old muzzle-loading weapons. The new invention came out in 1858, just at the time when intensive preservation was beginning to be better understood, and the coincidence of these circumstances, no doubt, gave sportsmen rosy dreams of what they might accomplish with improved weapons and abundant game. For more than ten times as many pheasants were shot on such well-known properties as Holkham, Rendlesham and Chevely in the 'sixties as in the previous decade, the average annual bag being 7,000 to 8,000 birds.

The 3,937 birds shot at Hall Barn in 1913 still holds the pheasant record; and although Sir Ian Walker's party on the Wemmergill moors killed 2,697 grouse in a day in 1935, this bag was exceeded at Abbeystead when 2,929 were shot in 1915. The year 1872 was the *annus mirabilis* of grouse, when Wemmergill yielded 17,064 birds in the season, 1,035 brace being killed in a single day, of which 364 brace fell to Sir Frederick Millbank's own gun. At Broomhead, in the West Riding, 1,313 brace were shot in a day by eleven guns; and at High Force eight guns, shooting for nineteen days between August and October, bagged 15, 484 grouse. And in the same year Lord Walsingham set up an individual record on Blubberhouses Moor of 421 brace of grouse (using alternately two muzzle-loading guns and two breech-loaders), which sixteen years later he eclipsed by killing 1,070 grouse to his own gun on the same moor in fourteen hours' shooting. Another remarkable bag was made in 1882 on Lord Ripon's moors at Studley Royal, when seven guns accounted for 2,240 grouse on the 12th and 1,800 on the following day.

In the latter part of last century, on Lord Ashburton's property at Alresford, 93,000 partridges were killed in 33 years, 3,536 birds falling to six guns in three days in 1897, the biggest day being 1,461. In 1885, at Elveden, in Suffolk, three guns shot 6,504 birds in fifteen days, an average of 72 brace each a day, and the Maharajah Duleep Singh, then the quickest shot in England, established an individual record, which still holds, of 780 partridges to his own gun. At Holkham, in the same year, Mr. Coke and seven guns bagged 3,393 partridges in four days, and exactly 20 years later 1,671 birds were shot in a day on the same property. To come to recent years, one of the biggest, if not the record bag of partridges, was got in Hampshire in October, 1929, when 9,360 birds were shot in 21 consecutive days. Curiously enough, this works out at almost identically the same average per day as the Elveden shoot of 40 years before, but whereas the latter bag was compiled by three guns, ten contributed to the Hampshire total. Which is in itself sufficient argument to justify the contention that the average sportsmen of the present day are content to shoot a lesser head of game than were their forbears.

J. B. DROUGHT.

THE LAST WEEK OF THE HORSE SHOW

IN this, the second article on the International Horse Show, which ended on Saturday, June 17th, the show can be reviewed as a whole in the light of the final championship awards, the majority of which were made on the Friday and Saturday.

The classes for novice hunters have already been reviewed, and it is interesting to note that the good opinions which were formed upon Mr. John Drage's bay gelding, John Peel, were fully justified when he was later awarded the *Horse and Hound* Champion Cup for the best novice hunter.

This is a medium-weight horse and the class in which he appeared was undoubtedly the strongest of the novice classes, the majority of entries showing a great deal of quality. Reserve for the cup was awarded to Messrs. W. Young & Sons for their bay gelding Westward, the winner of the heavy-weight class for novices.

Major N. H. Kindersley on Maguire, Major C. H. Brooker on Cuck Clever Virgo, and Captain W. F. Butler on Big Sweep

LEFT: THE HEYTHROP HUNT TEAM

Miss E. Keith on Yetminster, Mrs. Mackinnon on Windrush, and Mrs. Stennett on Merrimouth

The open classes for hunters had produced a surprise among the heavy-weights, as a result of which the judging in the other classes was awaited with keen anticipation which was, as always, considerably enhanced by the desire to see how the novices would bear comparison. A very large entry of light-weights included many good horses, but was rather uneven towards the bottom of the list, and was notable for an apparent complete loss of form on the part of one or two hitherto successful animals. First prize went to Mr. Bernard A. Selby's very showy brown gelding, Percy III, who thereby repeated his success of last year; while Mr. A. H. Asheroft's Right Away was second; and Mr. John Darby's winner of the novice light-weight class, Edgehill, was third. The novices showed up well in the open medium-weight class, Mr. John Drage's John Peel winning it from Mr. J. R. Hindley's short-legged, nice quality Islington winner, Bradbury; with another novice, Messrs. W. Young & Sons' Wings, third. Wings is a particularly attractive dark grey gelding with a light mane and tail, who moves as well as his excellent shoulder would lead one to expect. In a rather weak class for *bona fide* hunters he stood out on his own to win first prize from Miss Josephine Colebrook's Jake, second, and Captain H. M. Allfrey's John Peel IV third.

With two winners in these hunter classes which were real show horses, the award of the Tattersall Champion Cup to Miss E. M. Pitt's Mount Royal seemed to show that the judges were more impressed by the strength and good-wearing qualities of this weight-carrier than they were by the more refined attributes of the lighter-built quality animals; Percy III was reserve. These two horses occupied the same relative positions for the Sir Julien Cahn Champion Cup for the best hunter in the show.

In the ladies' hunter classes, Mr. A. H. Asheroft's Right Away came out again to take first place in that for light-weights, and also the Askew Champion Cup and the Schweppes Challenge Cup. The St. George's Stables' Seifton was second in the light-weight class, and also reserve for the Askew Cup; while Mr. John Darby's Wall Street, which won the medium-weight class from Mr. B. A. Selby's Montrose and Miss Betty Rank's Guildsborough, was reserve for the Schweppes Challenge Cup.

The two classes for weight-carrying cobs strengthened the opinion, originally formed at Richmond, that Messrs. W. Young & Sons' grey gelding, Just Wait, is the finest animal of his type, and the best mover that has been seen for some years. He deservedly won both classes from Mrs. A. R. Kent's Popeye. Mrs. H. K. Snell's Nicholas, third in the novice class, took fourth place in the open class below Mrs. Thomson's David. The remaining hack classes were a triumph for Mrs. A. R. Kent's Thor, which had already won at his height among the novices and had also taken the Novice Champion Cup presented by Mr. F. C. Minoprio. In addition to these awards he received the J. Lyons & Co. Champion Bowl, first prize at his height for ladies' hacks, the Sir Ian Walker Champion Cup, the Moscow Challenge Cup and the Champion Prize. The winner of the class for ladies' hacks over 14.2 hands and not exceeding 15 hands was Mr. A. H. Asheroft's Gentleman John, which was also reserve to Thor for the three last-named championship awards.

Another exhibitor at the show who met with a large measure of well-deserved success was Mrs.

MISS E. M. PITT'S MOUNT ROYAL

Champion hunter at Olympia. Ridden by Captain V. Francis

W. A. Rouch

LIEUTENANT-COLONEL A. BETTONI ON ADIGRAT

Winner of the King George V. Gold Challenge Cup

K. V. Coates, whose very well-known child's pony, Kavora Roulette, an elegant brown mare of 14 hands, won the class for novice ponies of its height and the Champion Cup, and also took second place to Mrs. Joan Nelson's Love Knot in the class for ponies between 13.2 and 14.2 hands. Mrs. Coates's other awards were a second prize in the class for ponies not exceeding 12 hands for Kavora Tom Thumb, and a first prize among ponies of from 12.2 to 13.2 hands from Kavora Kismet, which also won the Lancaster Champion Cup from Love Knot and the Rawnsley Challenge Cup from the same pony. The other winner in the later classes for children's ponies was Miss Jean Legerton's Paint Box in those for ponies under 12 hands and under 12.2 hands.

The championships in the large number of harness classes were well divided between four owners. Mr. F. C. Minoprio's very popular and unbeaten pair, Mickey Mouse and King of the Lawn, were adjudged the best pair of horses or ponies in the show, and also received Mrs. Bernard A. Selby's Champion Cup for the best tandem in the show for the fifth year in succession. Reserve for both these awards was the same owner's big pair, Broompark Merry Girl and A.I's Becky. Mr. Nigel C. Colman's very high-class bay stallion, Nork Monoplane, won the James Buchanan & Co. Champion Cup for the best horse in single harness from his possibly more spectacular Nork Spotlight, after making rather a bad start, in which he did not seem to settle to his work. The same owner gained reserve for the Champion Cup for the best pony in single harness, with Cassilis High and Mighty, the winner being Mrs. Claud Goddard's Barcroft Belle, which the judges, Mr. Henry Hinrichsen and Mr. Robert H. McColl, preferred to Nork Monoplane when these two were seen together in competition for the Noel B. Ducker Challenge Cup for the best single harness horse or pony in the show.

The international aspect of the show was well maintained by the presence in the jumping events of military competitors from Italy, France, Belgium and Ireland, as well as the British officers. The competition in all the events was very keen, and the final results were by no means one-sided, the successes being well spread between the competing nations. The final competition for the King George V Gold Challenge Cup resulted in a clean round for Lieutenant-Colonel Alessandro Bettoni on Adigrat (Italy) and Captain X. Bizard on Honduras (France). In the jump-off Honduras, probably the most consistent jumper in the show, made one mistake, slipping right into a fence, and Adigrat scored a second clean round and a win. Italy also won the Touch and Out competition, Major Lombardo di Cumia putting up the quickest clean round on Rodano with a time of 19sec.; Captain X. Bizard, on Honduras, and Captain J. Chevallier, on D'Huis, both of the French Army, tied for second place with clean rounds and a time of 11sec.; no other competitor had a clean round. France, represented by Captain Bizard, again on Honduras, won the Scurry Stakes with a clean round, and also gained second place with D'Huis, ridden by Captain J. Chevallier; while Lieutenant J. t'Serstevens (Belgium) was third on Bilboquet.

It is to be hoped that the considerable measure of success which attended the British competitors will afford ample justification for a more sympathetic outlook upon this form of activity in official circles. Their performance in winning the Edward Prince of Wales Cup was exceptionally good, and the small total of but twelve faults in six rounds was very creditable. Big Sweep, ridden by Captain W. F. Butler, distinguished himself in this competition with two clean rounds, and subsequently won the Connaught Challenge Trophy. Great Britain was again to the fore in the Irish Army Challenge Cup event, which was won by Major C. H. M. Brunker on Cark Clever Vixen, another very reliable jumper; riders from Italy, France, Eire and Belgium tied for second place. Lieutenant-Colonel Bettoni, on Adigrat, won the *Daily Mail* Cup for Italy; and Belgium scored a win when Lieutenant E. Delelienne, on Gulden Vlies, was the only competitor in the Military High Jump to clear 7ft. 4in. The Civilian High Jump was won by Mr. A. H. Ashcroft's Speculation at the same height.

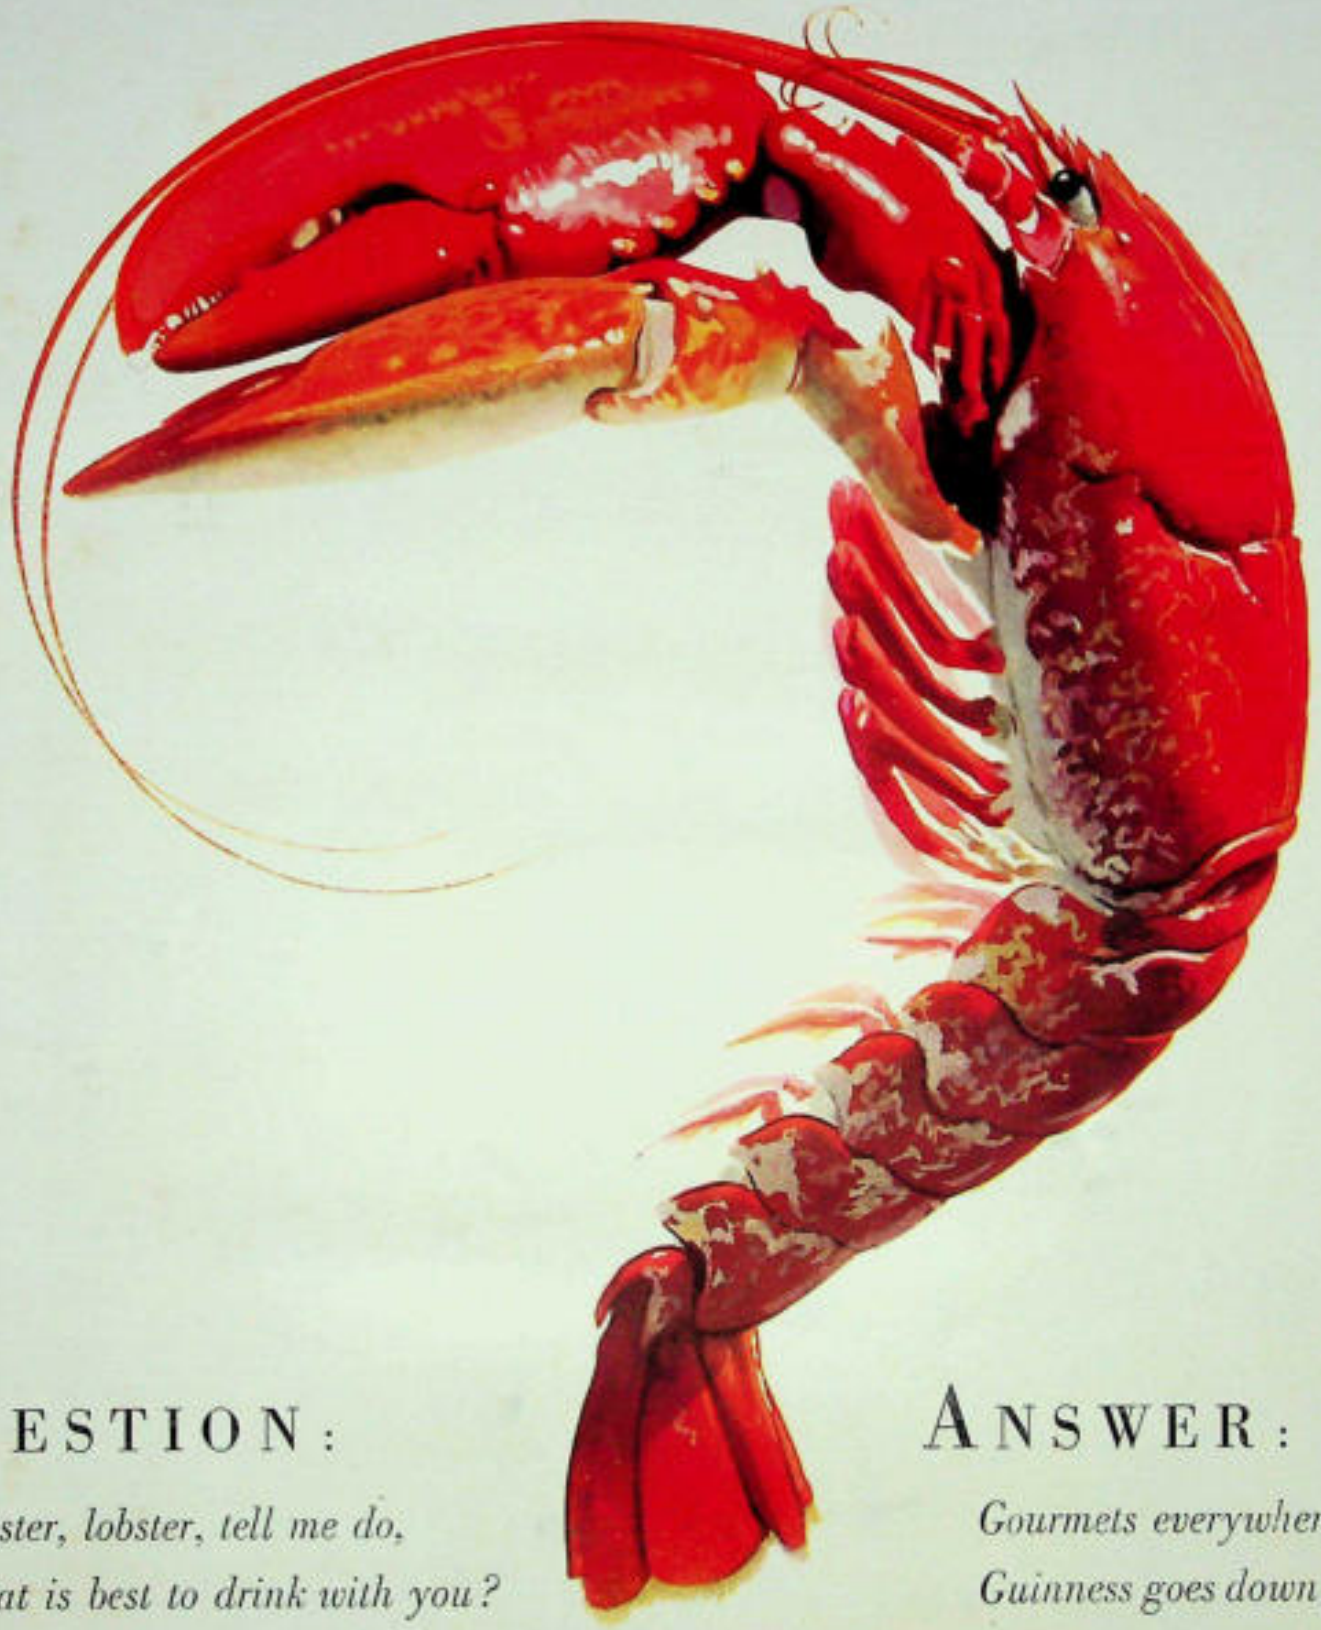
PHAKIS WINS THE GRAND PRIX

Some Reflections on the St. Leger

PHAKIS, owned by M. Boussac and trained by Swann, won the Grand Prix at Longchamp during the week-end with the greatest of ease from Tricameron. The winner, who was ridden by Elliott who, strangely enough had never ridden the winner of this race before, is by Pharos out of Carissima, and had previously won the French Derby. After his second success many people who saw him win at once formed the opinion that he was an outstanding colt and better than Blue Peter. Such is not my humble opinion, although there is no doubt that he is very useful. He was badly placed for a long time in the race, and once almost brought down. When, however, Elliot asked him for a final effort it was forthcoming at once. I have, indeed, never seen the Grand Prix won so easily.

The winner is to be trained for the St. Leger and no doubt many people will take him to beat Blue Peter and the others. I do not think for one moment that he will beat Lord Rosebery's colt. He is rather small and full of quality, and it may seem absurd to doubt his stamina after he has won this long race in France. My opinion, however, is that he is not a genuine stayer, and he is not bred to be one, for most of the children of Pharos have been at the most only middle-distance horses. Tricameron has run twice in this country, and won twice only once to be disqualified. On his Chester form he is no better than Bold Devil, and not much in front of Fairfax, and there is no doubt at all that Blue Peter can give Bold Devil any amount of weight and beat him with ease. I only hope that when the St. Leger comes along the French visitors to Doncaster bet on their own colt, thus making a better market for Blue Peter.



I am not altogether certain that Blue Peter will have an easy race with Heliopolis, who is a much improved and still improving colt. He seems now to have sobered down, and he stays. There was nothing more impressive at Ascot than his win. Unfortunately Heliopolis is not engaged in the Eclipse Stakes, to be run at Sandown in a fortnight's time. Blue Peter runs for that event for which he has been kept since winning the Derby. I understand that after all Scottish Union may be started. He failed at Ascot in the race for the Gold Cup, but he will be much better suited by the mile-and-a-quarter over which the Sandown Park race is run. A year ago he failed, but it should be borne in mind that he had then had a very hard season and had been in training as well as racing ever since the season had begun. He came to Sandown Park looking far from his best, and never once took hold of his bit. Still, it is not often that a horse who has been trained for and run in the Gold Cup comes back so soon so that it is probable that Blue Peter will have an easy race.

One hears a lot about the comfort of racing in France and indeed anywhere except in this country. I am quite certain that English racegoers would not put up with lots of things that happen elsewhere.

The only English runner at Longchamp was Hypnotist, who was ridden in the Grand Prix by Sibbritt. He had every chance but did not stay more than a mile-and-a-half. He was always in the first four for more than a mile, and when the turn into the straight was reached he seemed to have as good a chance of winning as anything in the race. He was six or more lengths in front of Pharis. That, however, was the end of him, for he stopped almost to a walk.

One of the most interesting little books published during the flat race season is always Sam Long's *Two-year-old Handicap*. The first edition of this year's series is just out, published by *Sporting Life* at a pound. Captain Long places the Rose of England colt at the top of the handicap 4lb. above the other Ascot winner, Turkhan. He is probably right, but I think that the time will come when Turkhan will be the better. There is more scope about him. And yet when he was a yearling he was so disappointing that the Aga Khan, who bred him, wished to send him up for sale. The Aly Khan persuaded him not to do that and in the end bought him from his father, or rather he bought half and the other half was given to him as a birthday present. The curious thing about the colt as a yearling was that he had no action at all. Then this season he found his action. He was the best mover at Ascot going down to the start, and more than one visitor backed the colt because of his action. I am rather surprised that Sam Long should have placed Stardust as high as he has done, only 3lb. below Turkhan and on the same mark as Tant Mieux. The Buchanette filly, who has not been out for some time, is placed at the top of the fillies, 8st. 3lb. This little book is well worth buying.

ALL FROM A CIGARETTE

SCARCELY a week-end at this time of year passes without news of some big forest or heath fire. Some of these fires are undoubtedly the result of deliberate acts of incendiarism, but the majority are caused by a cigarette or a lighted match carelessly cast aside. The bill for such carelessness is enormous. In the past eight years, *in forests belonging to the Forestry Commission alone*, there have been 2,650 separate fires; 7,800 acres of trees have been destroyed; and the bill has totalled £100,000. That is a heavy bill for carelessness. And, remember, it is the bill only for fires on Forestry Commission land. And much damage is done for which no bill can ever be made out. Each year many of the wild creatures—birds, mammals and reptiles—that live on our commons and in our woods die the most hideous death imaginable. And all because some thoughtless person throws aside a lighted cigarette.

A cigarette may...

...the...

...of all the trouble.

Very soon the fire is well alight, its...

...of big trees and...

...up little...

HAVOC WELL UNDER WAY

In these four lower pictures the progress of the fire is vividly shown. The flames lick the lower branches of the trees—an inferno rages. Only the larger and stronger trees avoid destruction in a fire such as this; everything small, including birds and beasts, is swallowed up. And, frequently, troops have to be called out; and inevitably some of the taxpayers' money is wasted, since it might have been spent more profitably. So great things spring from small beginnings. These pictures — with, of course, the exception of the first one!—are actual colour photographs of a heath fire, and were taken by Frank Ziegler.

BURBERRY FISHING KIT

Healthfully warm on cold days, cool on warm days — and almost untearable

BURBERRY GABARDINE SUIT

A two-piece suit of Burberry Gabardine ideal for this form of sport. Light in weight, warmth-retaining on chilly days, yet paradoxically cool on warm days. Proofed by Burberry special process to resist anything from the heaviest rains to blizzards. Because of the fine close weave, hooks cannot penetrate. The coat is easy fitting and Burberry "pivot" sleeves ensure perfect casting. The wariest fish finds great difficulty in spotting, because it tones so naturally with the surroundings as to be almost invisible. There are capacious pockets—an important consideration—to accommodate necessary tackle; *in toto* a most practicable and indispensable angling suit.

FEATHERWEIGHT WELLINGTONS

have crepe rubber goloshes to prevent thorn and shingle scratches, designed by Burberrys at the special request of the Vice-President of the Fly-fishers' Club. The weight is only **1 lb. 10 ozs.** **37/6**

THIGH WADERS

Made on similar lines, weigh **2 lb. 10 ozs.** only, and both these styles can be supplied with or without reinforced metal studded soles. **55/-**

THE BURBERRY

Burberry-proofed—antagonistic to every form of moisture or rain; downpour or drizzle falls off it like water from a duck's back. Made from closely-woven fabrics—cloths so dense in texture that *even fish-hooks cannot penetrate them*—it keeps out the keenest wind and generates a healthy glow of natural warmth on chilly days.

Although unrivalled as a safeguard against bad weather, The Burberry, airylight and airfree, is yet the coolest overcoat for warm days.

Spun, woven, proofed, dyed and tailored by Burberrys, all this is done with the set purpose of producing the weatherproof topcoat that fulfils each and every need. In wet or cold, mild or warm weather, it excels as a protective, healthful all-purpose weatherproof overcoat . . .

THE WORLD'S BEST WEATHERPROOF

WARNING

No garment or material, unless it is the manufacture or merchandise of Burberrys Limited, may be described as "BURBERRY," a Registered Trade Mark protected all over the world.
N.B.—Proceedings will be taken against offenders using the word "Burberry" wrongfully whether with or without knowledge.

Illustrations, patterns and prices of the season's latest models sent on request. Please mention "The Field."

BURBERRYS LTD. HAYMARKET, LONDON, S.W.1

BEST DAYS WITH OTTERHOUNDS

The Joint Meet of the Carlisle and Dumfries

EASTERN COUNTIES HUNT WELL

MEETING at Hadleigh on the 17th to draw up the Brett, hounds soon owned to a drag which started just above the meet, by Sun Court. This was a catchy line, but they took it on up-stream by Kersey to the Semer Coverts, and hunting on nearly to Semer Mere they ultimately came up to their otter and put him off from some bushes on the bank. He proved to be a very sticky otter with little scent, and for half-an-hour he stuck to some very heavy cover, where hounds hunted him as best they could until they finally forced him out and swam him right down-stream with a great cry for a mile until just before reaching the Semer Coverts, when they came up to him, and during a period of sharp work they nearly caught him on two occasions. Having been subjected to this somewhat unpleasant experience, however, their otter then tucked himself away for a spell and they lost touch with him, but Mr. Russell cast them up and down stream with his customary determination, and after an interval of half an hour hounds refound their otter in an ash root. He came away down river, but scent was very poor and they had to work hard to keep him moving; but, nevertheless, they hunted him down to the Semer osiers again, where he landed and ran the covert for a time until they worked up to him and once again nearly caught him. He managed to slip away, however, and, using the very thick cover to advantage, continued to lead them round the covert for a good hour. After an interesting hound hunt of three-and-three-quarter hours, however, hounds had had enough of it and had to give their otter best. This is not the first time that a Semer otter has been too much for them. Scent was indifferent all day.

Next Saturday hounds went out to the tidal water at Snape Bridge by the Suffolk coast, meeting at the Plough and Sail at eight o'clock, to get right with the tide. DRIFTER.

THE CARLISLE IN THE EDEN

SATURDAY, June 10th, saw us have our first hunt in the Eden, which had fallen to summer level. The meet was from kennels situated in the merry Border city and only a field from the river. Starting at Caldew Foot hounds had a good drag on the Islands, but there was no tenant in the usual haunt behind the weiring. Carrying on downstream they were keen to the big willows in the Ghylls, but again the usual holt did not hold; however, near the end of the pool they roared at the old weiring and we knew he was there. Terriers soon had him on the move, and with any amount of cover he did not move far at a time. First Cracker, then Sultan put him away and he came right to the top ford, only to double and come back to the Willows and cover. Hounds hunted really well and swam him up and down the pool many times, but owing to the low state of the river it churned up and scent vanished, so after about three hours Master decided to leave him and try on down. Nothing turned up below and they were called out at Cargo Wood.

Monday we started at Armthwaite (scene of many long and splendid hunts) to try down. There was a fair drag down to Low House Island, where it petered out, and we expect he was in the big pool above the Bridge. Trying on to the famous Ton's Pool, long, deep, with high rocky banks on the left, quite unwadable, we gasped when hounds got to the end without a whimper. We all said, Fishgarth for sure, but no, not a sign. Well, Brocklewath must hold at least a brace; wrong again, and for the first time I remember in 40 years we drew a grand length without finding.

Thursday saw us at Warwick Bridge to hunt upstream through beautiful Wetheral and Corby Castle Woods. A big field turned out. Distressing to say we had another blank day; two of our most certain meets failed us; we all had a great shock.

Hearing the Dumfries Hounds were so short of water, they were only having one meet, a joint meet was arranged in a hurry for Saturday the 17th. We had a great turn out, having visitors from Hawkstone, Courtney Tracey, West Cumberland, Kendal and District, and of course a good following from the Dumfries, including our keen friends from Ayr. Major Bell-Irving brought twelve couple, and our Master took out nine-and-a-half, which together made a splendid picture as they left kennels for another go at our friend of last Saturday. As so often happens, a wet Thursday and Friday put 15in. of fresh water in just when we wanted it right, but, although heavy and coloured, we started off full of hope. Again a grand drag on the Islands, but the river was so strong hounds could not face the fast stream at the weiring, and I think we left him there. Trying on down we found the Ghylls blank, but some good touches at the bottom end kept up our spirits. Just below Grinsdale, hounds swam over to the big tree and left no doubt an otter was in residence. Rock and Pincher were both in, and after a round or two he was off and viewed going fast downstream. A more beautiful setting could not be found; a wide strong river with the village just above and the old church right on the water's edge, twenty couple of hounds swimming their otter, the music something to remember. She put up a great show, and, after moving up and down for three hours, tired and set off downstream. Scent must have been very good, and we saw hounds at their best in a long swim of half-a-mile, when she landed and was accounted for—a 17lb. bitch. Congratulations were showered on Huntsman Scott and Hind for a performance to be remembered for many a long day. TINKER.

THE HAWKSTONE'S EXCELLENT HUNT

ON Monday (12th) hounds met at Caer Bevis, the beautiful home of Lady Swansea. People have been known to come to this meet on purpose to see the lovely garden, through which the River Irfon flows, and Lady Swansea most generously allows the field to walk through. There was a drag immediately and hounds spoke on the rocks. The river was very low, so it was not surprising when the drag led up a small side-stream into a lake. Hounds were soon speaking to an otter in the reeds at the far end, and they swam him backwards and forwards for some time before he showed in the middle. The lake was about five acres and about a quarter of it covered in reeds. It was soon suspected that more than one otter was afoot and this was proved when hounds killed one on the far bank, while almost at the same time another was viewed by the boat-house. This first hunt took one-and-a-quarter hours. On putting hounds back to the lake they took a drag up a ditch leading out of the lake, and marked at a holt. After about ten minutes a second otter was bolted and given about ten minutes' grace to make for the lake. This otter gave a hunt of about an hour before being accounted for. A third otter was then suspected, but as it had turned wet and cold, and most of the field unprepared after the warm, dry days, it was decided to leave the other one. After lunch Mr. Stanier drew up the river, but there was not a touch, and he blew off at four o'clock.

On Wednesday the meet was at the Boat, Whitney-on-Wye, and Mr. Wallace carried the horn. Drawing upstream they hit off a drag almost at once, which carried on right through the "Muck" Pool and petered out at Hay. After lunch they drew on in silence for a while, until just below Clyro Court they opened, and marked at a holt on the left bank. They swam the otter downstream, and then he turned and was viewed above, and a stickle was formed on the lower ford. Presently he broke through the stickle and gave the field a good view of himself before he dived and swam down. They hunted him for an hour-and-a-half up and down, before he landed and was caught by Guardsman and given a good shaking. But the others were too slow in coming to his assistance and the otter got away. The theory that an otter loses his scent after he has been shaken proved correct once more, for this one was not seen again, nor could hounds make anything of him. Mr. Wallace persevered until about 6.30, and it was most disappointing to have to leave this otter after such a good hunt, and after he had been so nearly caught.

It was a most disappointing day from the meet at Pont-an-Ithon on Saturday. Mr. Stanier drew up the Ithon to the bridge by Llandrindod without a touch. He then lifted back to the meet and drew down the Wye from Newbridge, through the famous Goitrey Pool to Builth Road, but there was not a sign of an otter. S. W.

THE WYE VALLEY FAIL TO KILL

TUESDAY, June 13th, commenced the first of our visits to the River Usk. There was evidence of a very big otter under the bridge and when hounds were put on they at once hit the drag and took it downstream to the tidal water and muddy banks; we eventually returned upstream, leaving the otter somewhere in the vicinity of Newport. After this outburst we had no drag at all and continued to Usk itself, where hounds were much keener, but the town's drains held this otter quite securely, and we finished for the day.

I had heard rumours of otters being trapped and shot on the lower part of the Usk, and this no doubt accounted for us drawing over some beautiful water on the Llangibby and Llanbadoc fishing without finding.

I wonder if it is asking too much of those people who do this sort of thing to be sportsmen and let some of these otters live, and go through the lower part of the river to the upper parts. We are quite willing to meet them in any way, and I do this in a most friendly spirit. Now what about you fellows?

On Friday we met at Usk to continue upstream, and at the islands at Monkswood hounds absolutely raced across the pebbles and withy beds on a glorious drag, and we looked like finding any minute, but hounds drew all the holding very carefully, but could not locate their otter. On now to the big pool at Chain Bridge; this proved blank, and it was not until we came to the Trostry Lodge water that hounds picked up a drag again and spoke to the line all under the gardens of the Clytha Arms; on getting to that hopeless garrotting old Granby soon marked his otter, and all the pack were roaring at this very big place. All they could do, however, was to move the otter from one place to another, and sometimes they marked at the top of the pool, and in a few minutes were marking quite 300yds. below. We tried and tried to get the otter to the river, and everyone worked for all they were worth, but the tons of timber used in this place prevented us from getting behind the otter.

We did have just one swim downstream with hounds throwing their tongues on getting the wash, but it was soon all over and the otter was soon back in this very safe refuge. We left soon after this and hope that by next week he or she will have moved; this I doubt very much, for it is the most impregnable place on the river and an otter is as safe as a rock here. M. L.

GOOD SPORT WITH THE DARTMOOR

ON Tuesday (13th) our meet was at Aveton Gifford for the lower reaches of the Avon. Hounds hit off a drag at once in the Salt Marshes, and, drawing on, a few hounds marked on the left bank, about half-way between the Weir Pool and Hatch Bridge. This was a very hollow place and the terriers soon proved it to be vacant. The drag continued to below Loddiswell Station, after which hounds became less interested, the otter evidently having gone down on the tide. The Master called off at Topsham, as the river was very low and the water above was best left for another day after some rain.

Thursday of that week we met at Greystone Bridge on the Tamar, by invitation of the Tetcott Otter Hounds. The river was in perfect condition and soon after the draw commenced it was evident hounds knew there was an otter ahead. They found in Gatterly Pool. Bolting at once, hounds drove their otter upstream, nearly to Rockpool, where he turned and dropped down to the Island. They hunted him up and down many times in this pool before he passed over the lower stickle into Judge's Pool. They continued to keep him on the move, hunting extremely well on this rather difficult stretch of the water, till eventually they cornered and killed him at 1.40 p.m. after a hunt of 1 hour 40 minutes. The largest otter killed by this pack for many seasons, 24lb., and a very creditable performance by both hounds and their huntsman. Drawing on to Polson's Bridge, they did not find again.

The following Saturday was Flete Mill on the Erme. Hounds spoke in the marshes below the footbridge and were keen at the old holding in the Island, which was thoroughly tried before moving on. They had a line up the Goutsford Brook, which proved to be a double. Drawing on up the river, they hung at an old tree below the Weir, but again nothing came of it. From now on it was obvious the otter had gone down with the tide, as hounds became less interested, and between Sexton's Corner and Ivybridge, where they called off, there was no line.

At Buckfast Bridge on Saturday, June 24th, they dropped down to Kilberry Pool before drawing the Dart up. Opposite the Abbey, hounds feathered on the rocks and pressing on, drew very keenly, showing us they were sure there was an otter ahead. On the lower end of the island, below Black Pool, they put him off lying rough, a very pretty find, and hunted up into the pool. After dwelling here for a quarter of an hour, hounds swam to the top of the pool and raced over the higher stickle. He must have had a good start, as they hunted up past Queen of the Dart, and on till about 200yds. below the bridge on Holne Park, before being turned by hounds. He dropped right down again into Black Pool. Here he put into the old tree in the right bank, where we have had trouble before, and again it proved impossible to move him, and he was left. Hounds spoke exceptionally well during the hunt above Black Pool, their cry echoing beautifully in the valley. The draw continued to Holne Bridge, where they called off. D. C.

FROM the first tee to the last green foot comfort is one of the first essentials of good golf. That is why experienced and discerning golfers wear shoes with uppers of Zug Scotch Grain, which is remarkable for its suppleness.

But Zug has other qualities that golfers appreciate. It is fully water-resisting and keeps you dry shod. It has remarkable toughness and gives exceptional service. It does not crack and keeps its appearance. Zug is the perfect leather for the Golfer.

★ *Obtainable at most good shoe stores, but in case of difficulty apply to us for name of nearest stockist.*

In various styles for men and women

Look for the OVAL LABEL

AQUATITE

For those who prefer a smooth grain shoe of lighter weight, "Aquatite" is recommended. It has all the famous Zug qualities.

THE ART OF GOOD LIVING

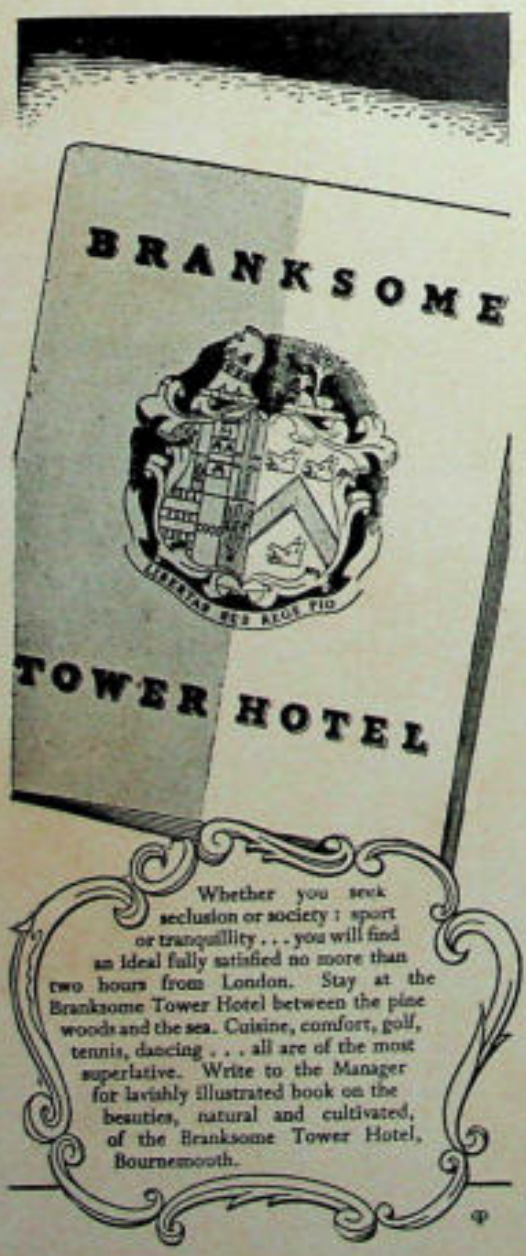
By ANDRÉ L. SIMON

A JULY DINNER MENU WITHOUT FISH

The Fare : Bortsch Polonais
Petits Filets de Bœuf Clamart
Poulet rôti à l'Anglaise
Laitues à la Crème
Pommes de terre gratinées
Aubergines sautées aux fines herbes
Glaces aux jus de Fruits frais
Dessert

The Wines : Clos Fourtet 1929
Château Giscours 1920
Château Suduiraut 1914

THE Bortsch soup is both refreshing and sustaining. It is a *Consommé* made with beef and veal and bacon, plus a duck or a hen, and plenty of vegetables, with cabbage as the informing flavour and beetroot the all-pervading colour. Most cookery books give recipes for Bortsch soups, but the best still is that given by Carême, over a hundred years ago, and reproduced in the *Larousse Gastronomique*, published in 1938.



The *Petits Filets* are small pieces cut off the fillet, plainly grilled and served with new garden peas, known in culinary French as *Clamart*.

The chicken is roasted *à l'Anglaise* when served with thin rashers of bacon and some bread sauce. Lettuce is most wholesome and we cannot eat too much of it, especially if we have a garden and find that, in July, lettuce have a habit of running to seed. Put the lettuces into boiling water and leave them in from three to four minutes only. Drain them dry. Cut them in halves, longways, and fold in halves. Arrange these half lettuces, folded in half, in a baking dish well buttered. Add a little *Bouillon*, cover the dish and stew on a gentle heat during 40 minutes. Then add pepper and salt and some thick cream ; leave on the fire for a few moments longer for the cream to soak in and be warm ; then serve.

The *Aubergines* or Egg-plant are peeled, cut up in round slices, floured, *sautés* in butter or olive oil ; then add pepper and salt and lots of finely-chopped parsley and serve as a separate course.

We have plenty of small fruit in July and now is the time to make all sorts of water ices flavoured with strawberry juice and the juice of other berries, raspberries, black currants, and so on. Crush the fruit and 1½lb. of sugar to 2½lb. of fruit ; pass through a fine sieve ; add the juice of a lemon and a pint of water and fill up little tin moulds or the well of the rotating freezing machine, whichever happens to be your way of making ices.

As regards the wines, a generous St. Emilion will be excellent after the fairly solid foundation Bortsch and with the tender little fillets that follow. With the chicken, a lighter and more mature Claret, such as the Giscours 1920 is sure of a warm welcome, whilst a chilled Sauternes served with the ices and fruit will be most gracious and gratefully received.

FIFTY YEARS AGO

From the *Field* of June 29th, 1889.

POLO Ground Boundaries. "At Hurlingham the ball is kept in play by the device of fixing a run of boards about a foot high along each side, thus constituting a boundary round the greater part of the ground, the remainder being defined by the goal lines, which extend on each side of the two goals. That this method of checking the ball has its drawbacks is apparent to anyone who has watched the progress of the game there. To those players and ponies who are unused to them, the boards are a source of trouble and anxiety, so much so that for the military matches which take place in July they are removed and a crease substituted. The presence of these boards has introduced a new element into the Hurlingham game, which consists of playing at the boards for a rebound, or for such deflection of the ball as will favour the player or his side. This affects the game prejudicially, as, instead of the play being concentrated in the centre and the boundaries avoided for fear of the ball going out, the greater part of the play is contested along the sides of the ground. Every game or match played at Hurlingham suffers considerably from this cause."

Farming Changes. "A Midsummer day's dream realised ! A Winter's Tale to be recounted whenever, round the hearth, the Wives of Windsor are disposed to be merry ! The incidents during the week (which is now closing) revive the memories of an older date, when another great queen put herself at the head of her subjects to consolidate an inevitable reform. That agriculture, in its old shape, has become an impossibility in England, must now be admitted. Yet it does not follow that English fields will not be tilled ; nor that the occupation of land will cease to be a pursuit to which Englishmen's minds are irresistibly attracted. In plain truth, the country now, as once before, is shaking off views which were honestly conceived at first, and made compulsory by general consent, with all the sanction of law.

"Circumstances, however, both then and now, have shown established views to be incompatible with our national condition. We will let the earlier renewal of thought fall out of this story, and say that it is, at the present minute, felt that agriculture cannot any longer live by the four-course system ; nor can agriculture make it a primary aim that English acres do give the English people bread. And so it follows that a great revision of practice is imminent, and that we must revert to earlier methods still ; must return to the notion that studs and herds and flocks are the safest of all means of wealth for this people ; and in this way, by catering for quadrupeds first of all, we may make the farms—which feed and shelter them—to become once more pleasant and profitable to ourselves."

IN THE SALEROOM

HARRODS are holding a very interesting sale on July 10th and 11th at Alford House, Princes Gate, S.W., of prehistoric and ethnological specimens formerly forming part of the celebrated Rosehill collection, and also savage implements and weapons which were part of the collection of the late Sir John Evans. In this sale, ordered by the trustees of the late Sir Henry Wellcome, is the remainder of his collection which was not required for the Wellcome Historical Medical Museum.

As memories are short readers are reminded that the Rosehill collection, though fairly known to those particularly interested, was not familiar to the public, being hidden at Longwood during its formation until removed to Winchester 50 years ago. Baron Rosehill, ninth Earl of Northesk, undertook long journeys throughout Europe and expended large sums of money in making the collection complete. Comprising over 500 lots, it includes bronzes, horn, bone, wood and pottery objects from the Swiss Lake dwellings ; Neolithic implements from practically all Europe, savage weapons, jade weapons from New Zealand, and jade tikis from North America. The last named, very rare and much sought after, are charms which were worn around the neck to arrest disease, and were accounted valued heirlooms in the family.

A TRAVELLER'S NOTEBOOK

IF you remember, I referred in one notebook to the fact that I had seen a tomb reputed to be that of Hannibal outside Gebze, and so I found it particularly interesting during my last journey in North Africa to reach Carthage, birthplace of the Punic hero. But, I must confess, it surprised me to find nothing remained of the Carthaginian city but a heap of crumbled ruins. Hundreds of years before the younger Cato had cried in the Roman Senate "Delenda est Carthago," and his suggestion had been carried out to the letter.

Indeed, not only are there but few remains of the Punic city, but also of its Roman successor, which suffered a similar fate at the hands of Hassan Ben Noman and his Arab followers.

* * *

So it was with a feeling of disappointment that I left Carthage and turned to Tunis, a place about which we have all been hearing a great deal lately. My first impression was that the city had a very Turkish air about it, and so reminded me very much of Constantinople after the Great War. Tunis, of course, though semi-independent, was, before the French occupation, closely connected with the Ottoman Empire. Many of the leading families are of Turkish origin ; the houses are similar to those in the old Turkish capital, and the celebrated covered bazaar would appear to be modelled on the old Grand Bazaar of the Byzantine Emperors.

* * *

The Tunisians struck me as having a rather languid, gentle air. They have in the past shown a certain tendency towards political intrigue, but now, owing to the errors committed by the enemies of France, are firmly supporting the Republic. Perhaps the most interesting part of the city is the Avenue de France, the favourite promenade of the Tunisians. No matter their race, no matter their occupation, both rich and poor come out to stroll up and down the long shady avenue so that the scene becomes an extraordinarily animated one. Tunisian Arabs, with a flower stuck coyly behind one ear, Frenchmen, Italians, Jews and Maltese all combine in cosmopolitan cavalcade.

* * *

It is a pity that Tunisia is rather difficult to reach from England because, in addition to the capital city, there is much of interest to be seen. Kairwan, for instance, is a sacred city renowned throughout Islam which has the great advantage that Christians are now allowed to visit the great mosque. This mosque is notable, for the pillars with their carved capitols came either from Carthage or one of the Roman settlements, while the minaret served as a model for all those subsequently erected in Andalusia and Morocco.

* * *

But what I like best of all in Tunisia are the Roman ruins. I always think, and I am sure you will agree with me, that temples and theatres are so often ruined when they happen to be in a town where trams and motors pass by. One is spared this in Tunisia. Dougga, for instance, occupies an olive-clad hill in so remote a situation that comparatively few people ever visit it, and thus one can really recapture something of the original atmosphere. The French, whose good work in preserving monuments of historic interest is in North Africa remarkable, have done much excellent excavation work, revealing mosaic floors of very great beauty. One floor impressed me particularly, for it depicted a number of boys fishing with rod and line, and it had never occurred to me that rods were actually in use so very long ago.

* * *

Another thing pleased me. It was this. One had only to search with a certain degree of diligence as one walked along, and one's efforts were rewarded by finding pieces of Roman pottery. No doubt, some day, when excavation has been carried out on a greater scale than at present, many most remarkable finds will be made. Already excavators have reaped a rich harvest, notably in finding some exquisite bronze statues and mosaic pavements which, in beauty and variety of design, surpass anything I have seen elsewhere.

* * *

Tunisia is ruled by a Bey under the ægis of the French, and he is assisted by a Minister of the Pen and a Minister of the Seal. There are beylical guards and numerous beylical generals who present brilliant figures enough. But I was rather amused recently when the Chinoush attached to a legation came and complained bitterly about an alteration in a new badge he had been given to wear in his fez. Now, so he said, people kept on mistaking him for a beylical general.

* * *

This Chinoush looks most impressive in a brightly coloured uniform which seems to be a passport to the most solemn functions. At the last review he established himself in the front row with the French and beylical generals, while his master was delegated to an inferior position. F. H. M.

LETTERS TO THE EDITOR

KASHMIR PONIES

SIR,—Once more I am taking courage to appeal to animal lovers in England to lend their pity and their help to the unfortunate ponies in Kashmir. The kind response to my appeal last year enabled us to ensure our patients having warm and comfortable quarters through the bitter cold of the winter months. Our original stables were most unfortunately burnt out and had it not been for the sympathy and assistance of lovers of animals in England the plight of our poor little ponies would have been terribly hard.

Few people who have not visited Kashmir realise the enormous number of transport animals employed in that country. In our small and struggling clinic we average over 7,000 dressings a year, and hundreds of ponies pass through our hands. The condition of the majority of our patients is pitiful beyond expression. These animals spend their entire lives, commencing work far too young as a rule, in carrying merchandise to far away places—Ladak, Baltisan, Astor, and many others—goaded on their way by men who have little regard for the sufferings of those who are lame or ill, or for the torture inflicted by the loading of heavy, swaying burdens on open sores on their backs and withers.

I am happy to say we have to a great extent gained the confidence of the pony owners, and realising that their ponies are treated absolutely free, and are well fed while they stay under our care, they bring them of their own accord. They are encouraged to watch the dressings and shoeing, and so learn that kindness and patience constitutes a far better method of dealing with nervous animals when a painful dressing is being done than their usual procedure of jabbing it in the mouth or hitting it across the face with a stick. They are often so astonished how quickly a pony becomes quiet and docile under our care.

Animals that are so old or hopelessly crippled that they can never be worked without pain are given a few days rest in a nice shady paddock, plenty to eat and drink, and then put painlessly to sleep with a humane killer. Our veterinary surgeon issues a certificate that these animals are unworkable; although our great aim is "to cure" rather than "to kill," in such cases humane destruction is the only possible procedure.

Our work is well established now, and provided we can obtain the means to insure its continuance we see before us many years of usefulness and great possibilities of achieving enduring good.

Our urgent need is for sufficient funds with which to erect a small but thoroughly efficient hospital, and also we are extremely anxious for the wherewithal to purchase a small motor with a horse box trailer. The Kashmir Government have presented us with sufficient land on which to build our hospital, and grateful though we are for this measure of assistance, the site is situated five miles from the city. It is impossible to walk a seriously injured animal that distance, hence our urgent need for some form of conveyance, which would be the greatest blessing to us and also enable us to fetch cases from far distant villages, which at present we cannot deal with at all.

The cost of the hospital and motor ambulance would amount to about £2,000. Should there be any surplus, in the event of our being happy enough to obtain this sum, it will be devoted towards the running expenses, towards which help is, as always, very thankfully received.

I am not good at begging, but these poor little suffering animals cannot speak for themselves, and I, who realise only too well what they so patiently endure, feel that I must plead with you to help them. No subscription is too small, and will be very gratefully acknowledged if sent to me at the Berystede Hotel, Ascot, Berks, or to the General Secretary, Srinagar, Kashmir.

Mrs. Geoffrey Brooke, whose name is well known to all animal lovers, has visited our dressing stations, and has become a member of our executive committee, is kindly adding a P.S. to my appeal.

Yours faithfully,

Ascot. EVE MACCULLOCH
(Organiser of K.A.W.A. Hospital for Animals).

SIR,—May I add a few words in support of Mrs. MacCulloch's appeal for assistance for the animals in Kashmir?

All animal lovers, could they but see for themselves the admirable work she has done, and is doing, would be filled with admiration for her unstinted and selfless efforts on behalf of the suffering little Tonga ponies, the bullocks and dogs that she personally attends to and cares for every day of the many months that she is in residence in that country each year.

It is not intentional cruelty that Mrs. MacCulloch is striving so heroically to mitigate, but the ignorance and, in many cases, callous ignorance, of the very poor men who own the animals. The greater part of the cruelty thus involved is engendered by the poverty of these owners, the poverty we cannot hope to alleviate, but the ignorance that accompanies it we very definitely can. The example of the value of kindness and good treatment Mrs. MacCulloch sets before these people is a lesson that they readily learn, provided a sufficient number of patients can be admitted, to spread the tidings of the immense benefit treatment and care in the hospital produces. At present only a limited number can be retained in her clinic, although no really suffering animal is ever turned from the doors.

The need of a well-equipped veterinary hospital is very great, and may I beg all who read Mrs. MacCulloch's appeal to bear in their minds that although the animals she asks for help to assist are very far away from England's shores they suffer as few horses in England ever suffer, and this, without arousing feelings of indignant compassion that even one example of such pain would arouse in the British Isles. Such suffering becomes an accepted fact in countries where no organised effort is made to alleviate animal pain, but is none the less tragic to behold and terrible to hear. Horses have no nationality; all belong to the one great-hearted family who strive all their lives for the benefit of mankind, and who are unable to make a sound or the smallest cry for help when treated with heartbreaking lack of consideration.

Mrs. MacCulloch's instituting not only a campaign of mercy, but an incalculably valuable campaign of education of the owners of the countless dumb and suffering animals, that she so urgently wishes to insure will, in future, continue to be treated and cared for with skilled kindness and genuine sympathy.

May I beg a generous response to her appeal from all who not only care for the horses they own or see every day on the roads and in the green fields of England, but for horses that toil all their poor lives in a far country where their poverty-stricken owners ask nothing of them but their incessant greatest effort, no matter how weary, how suffering they may be.

Yours faithfully,

London. DOROTHY BROOKE.

BIRD PROTECTION

SIR,—Mr. Ralph Chislett, in the *Field* of May 27th, speaks of "upsetting" nesting birds by photography. By this I suppose he means that a pair of birds deserted their nest. I should like to suggest that it is not necessary for a pair of birds to desert the nest for them to be "upset." The mere fact of being driven off the nest and "hides" erected and being constantly visited, will, I think, stop that pair of birds from nesting in that place again.

We all enjoyed the excellent photographs of the stone curlews in a recent number of the *Field*. But I cannot imagine those curlews nesting in that field again the next year. If birds are not disturbed they will often nest year after year in the same quarters. Because a brood hatches off successfully after being photographed I do not think that you can always say that the birds have not been disturbed.

Our best bird photographers doubtless know their art now. But they were once amateurs, and we all have to learn by our mistakes. I think that in their way the photographers do more harm than they perhaps realise. But at the same time they learn a great deal about birds.

Yours faithfully,

Deanes Barn, FRED S. TRITTON.
Alfriston, Sussex.

THE LITTLE OWL

SIR,—Whilst staying in Somerset lately I found a dead mole with the skull neatly extracted and the head skin turned back. Apparently this had been done through the mouth, as there appeared to be no outward damage to the head itself. It puzzled me as to what animal could have done this, but a few days later I found another mole similarly treated in the nest of a little owl.

That the little owl would merely eat the brains of small mammals, leaving the rest, seemed to me unusual, so I visited the nest again next day and found the mole had vanished, proving, I conclude, that the bird had made a complete meal of it.

A few years ago I found a dead hedgehog treated in exactly the same way as this mole, the skull completely gone but the jaws remaining. This would seem highly improbable to have been the work of the little owl unless the bird is a carrion-feeder and had found the hedgehog dead.

In addition to the mole, the nest of the little owl cited above contained feathers of young blackbird, chaffinch and greenfinch.

So much controversy has been expressed concerning the harmfulness or reverse of the little owl that I will not add to these opinions, but my own experience during my stay in Somerset was that, despite the evidence I encountered, the little owl there has in no way diminished the song-bird population.

The owner of the property on which I was staying likes the little owl and will not have it shot; moreover, as there is no game-preserving in the neighbourhood, no one else destroys it.

I can only say that during the short time—a little over a week—I stayed in Somerset I have seldom enjoyed such a wealth of bird-song as I heard there. Small song-birds of all kinds nest freely in the garden and surrounding neighbourhood.

Yours faithfully,

Horsham, Sussex. J. GORDON DALGLEISH.

SLAUGHTER OF BADGERS

SIR,—In your issue of April 29th under "Slaughter of Badgers," your correspondent understands that badgers are not carnivora. I most emphatically state from sad experience that badgers are carnivorous—raid poultry-houses, doing far more damage than the ill-famed fox, as they will not only kill in the open, but also tear down almost any doors or fastenings in order to secure their prey—*i.e.*, poultry and rabbits. As for your correspondent's objection to the method of killing with a spade, instead of the humane killer, with the latter it would be necessary to hold the badger steady; trying to do so much more cruelty would be needed. From experience, a blow from the flat of a spade well directed on the head will kill any badger instantly provided sufficient force is used. It is not necessary to exterminate "those most interesting of all English mammals," but it is necessary to keep their numbers within reasonable limits, and this is worth while even at the risk of further atrocities of the kind described (by accident), as the badgers do not spare rabbits or poultry. I had a pen of R.I.R. pedigree fowl three months old all killed, torn into wings, head and limbs, after wire, iron door fastenings had all been eaten through. I heard it was done by a fox; traps were set, bait was eaten; it came again, and a badger was caught and killed in the trap with a spade. My near-by neighbour had the same experience. In my youth we hunted badgers, running after them with our dogs, and they were most ferocious; the dogs soon learned to keep a safe distance away.

Yours faithfully,

"MORE THAN FORTY YEARS A FOXHUNTER."

SIR,—The late J. G. Millais in his *British Mammals* clearly states that the food of the badger is like that of the bear—omniverous—and gives a long list of its diet, including fruit, vegetables, with a marked preference for roots, nuts, eggs, small mammals, young rabbits, frogs, worms, slugs, snails, acorns, wasps and grubs, vipers. From personal knowledge of badgers for 50 years I would add hedgehogs and potatoes stored in a clamp in the field, and an occasional old hen from a hen house in a far corner of a field.

Only once have I found a lamb at a sett and that was a newly-born one, probably dead. I have found older lambs at fox dens in the hill country. Let it be remembered, as Mr. Eric Parker points out in his *English Wild Life*, that the badger and hedgehog are *our* oldest type of living wild mammals existing and were *here* "before man begun to be man in Asia" and deserve their place in Great Britain. These two will continue to exist here long after any other mammal, excluding rats, mice, &c.

If a badger must be killed it deserves a quick and painless end and a sharp blow across the bridge of the nose, just below the eyes, puts it out at once.

Yours faithfully,

Southampton. X. Y. Z.

AN ELEPHANT'S UNTIMELY END

SIR,—I think you may possibly find the following letter of sufficient interest for publication. It is dated Bangkok, June 3rd, and referred to an incident which took place in one of the Borneo Company's teak forests in the north of Siam. The letter reads:

"You will be interested in learning of a very unusual incident which took place in the forest at the end of last month.

"An elephant and party had just arrived at their destination and the mahout jumped off his elephant at almost identically the same moment as a serious flash of lightning occurred.

"The chains of the elephant were, as usual, round the feet and up over the head and formed a perfect medium for the lightning.

"The elephant was killed instantaneously, and the mahout and party were also struck but not seriously injured.

"Had this incident occurred, say, five minutes sooner then the mahout and the elephant would, I think, have shrivelled up together."

Yours faithfully,

The Borneo Co., Ltd. A. MALCOLM.
143-149, Fenchurch St., London.

DEFYING CONVENTION
(See letter "Scaup on Fresh Water")

SCAUP ON FRESH WATER

SIR,—I thought you would like to use this photograph I took of a pair of scaup amongst a very interesting local freshwater collection of waterfowl, visited recently by the Merseyside branch of the British Empire Naturalists' Association. Although these sea-duck are said not to last long on fresh water, this pair has been on the particular water since last autumn, only that the duck spends most of her time accompanying a tufted drake. They came through the winter well and are in fine condition.

Yours faithfully,
47, Woodsorrel Road, ERIC HARDY.
Wavertree, Liverpool, 15.

FLY MIGRATION

SIR,—In the Angling Number of the *Field* of April 1st there is a short article entitled "Fly and Weed," which deals with the migration of nymphs. Some six years ago a rock dam, about 9ft. 6in. high, was built across the Liki river. This dam passed little water over the crest, when the river was low, but the water filtered through the interstices of the rocks which constituted the dam. During a period when underwater examples were being taken observations soon pointed to the fact that there was a strong upstream movement of nymphs, principally of the genera *Baetis*, *Teloxythus*, *Ephemerellina*, *Euthraulus* and *Afronurus*.

Since that date observations have been made in a number of rough rock dams, and in every case the concentration of such forms is most marked on the downstream toe and face of the dam. The concentration is greatest during February and March (low water and high temperature), lesser during August and September (higher water and lower temperature), and smallest during the rest of the months when we have high water and low temperatures. No attempt has been made to find out the rate of the migration or density, but this migration is a fact with which we are familiar and now take as a matter of course.

One of the reasons why the migration takes place may be a search for aerated water and oxygen, coupled with the fact that the smaller life on which the nymphs feed also have to migrate into more oxygenated water. The evidence we have of the greater density of migration in the low water and high temperature periods seems to point to this.

Yours faithfully,
Box 241. HUGH COPLEY.
Nairobi, Kenya Colony.

LAMPING

SIR,—May I be permitted, through the medium of your journal, to bring to the notice of all sportsmen the ever-growing menace of the practice of "lamping," now so largely indulged in all over the country.

Bands of men, armed with high-power lamps and nets and accompanied by long dogs, roam the fields at night, ostensibly for rabbits, but frequently also in pursuit of game in general and partridges in particular. These birds, roosting as they do on the ground, are easy prey for the lampers and their nets, and are quite helpless in the rays of the powerful lighting sets now used.

To my knowledge whole coveys have been destroyed in this manner, and even the close season is no deterrent, and many pairs are caught.

The loss to the shooting tenant is heavy, especially with shoots which cannot afford the luxury of a keeper, and, in addition, the farmers, over whose land the lampers appear to roam at will, suffer heavily from disturbance of stock at night, and the fact that gates are frequently left open, allowing cattle and sheep and horses to stray on the highway, in some cases actually entailing a fine. Eventually the farmer, who is often the landlord letting the game, finds it difficult to demand a decent rent for his shooting owing to scarcity of birds.

Surely, sir, the time has come when this abominable practice should be suppressed, by law if necessary, if we are to save the remnants of our already dwindling stock of partridges, and safeguard the hard-hit farmer and his stock from these night marauders.

Yours faithfully,
Cornwall. SUFFERER.

ROEDEER IN SURREY

SIR,—I was hoping that someone would comment on Major Garrick's most interesting experience in finding roedeer near Dorking.

At almost the same date as he saw his buck, I identified a doe on one of the more inaccessible slopes of Boxhill. I have not seen her since, so it may not be too much to hope that the two have got together.

I may be wrong, but it struck me that the colour of my doe was a shade lighter than those I used to stalk in Sutherland many years ago with a .22. I do not know whether this was Major Garrick's impression.

Yours faithfully,
Dunmore, SAMUEL MICKLETHWAITE.
Esher.

A LIZARD EPISODE

SIR,—I read with interest in your issue of April 8th a letter in which your correspondent, Henry G. Morris, of Florida, U.S.A., describes how when wading up a stream fly fishing in Wales, a red squirrel jumped off the bank on to his leg, and when he moved, it jumped into the water and swam across. He asks if anyone else has had a similar experience.

Two seasons ago whilst I was walking from one jungle fowl-beat to another, a particularly spiny and active lizard—I did not then know what it was—leapt on to my bare knee, ran up my leg under my shorts, described a circle round my middle and jumped out of the neck of my open shirt. I am sorry that there was no water into which the lizard might have jumped, as I feel sure—and who should know better?—that it was too bony to have floated long.

I hope you will agree that I am lucky to have survived the shock of having been raked from stern to stem by a lizard.

Yours faithfully,
Gangaw, C. P. H. WILSON.
Pakokku District, Burma.

GREAT SPOTTED WOODPECKERS IN SUTHERLAND

SIR,—A pair of great spotted woodpeckers are at present nesting in a wood near here. My first information regarding woodpeckers nesting in this vicinity was last autumn, when a gamekeeper showed me where a pair of these birds nested during the 1938 season near the site presently occupied. Visiting the wood during May I soon traced the woodpeckers by their loud call notes and characteristic drumming, and later the nest was easily found by the querulous din made by the young birds. I have only once before seen the great spotted woodpecker in Sutherland, and this is the first instance I have heard of it nesting in the county.

Yours faithfully,
Dornoch, D. MACDONALD.
Sutherland.

BASKING SHARKS OFF HANDA

SIR,—I wonder if it would be of any interest to readers of the *Field* to see this photograph of basking sharks, which I took recently off the Island of Handa on the West Coast of Sutherland?

There were a great many to be seen, and doubtless far more unseen, because at one moment we saw six pass together under our little boat! The sharks showing above water were cruising very slowly round and round, with their enormous mouths wide open. They did not seem in the least afraid of the boat, indeed they followed it several times.

I only had an ordinary Kodak and, alas! my photographs do not show the submerged bodies of the sharks at all, although these were clearly visible to us—indeed, we could see every detail of them, as their bodies were only just under the water, and with the strong sunlight behind us it was a marvellous opportunity for seeing them in the wonderfully clear, still water. Much to the consternation of my boatman, we urged him to go nearer, and we got to within about 10ft., but from my miserable photograph you would never think we were so close, and unfortunately, just as I took this one which only shows the tail and back fin, the shark submerged his head end!

Another photograph showing three "fins" was taken about 40ft. away, and gave a good idea of the immense length of the shark, which the boatmen say averages 30ft.

There is great distress amongst the fishermen in this locality, because so many of these sharks have recently taken to coming, and staying, close inshore where the men fish; and, of course, when one of these monsters gets into the nets the damage is appalling. Also, the possibility of having their boats capsized is unpleasant!

Yours faithfully,
Dudbrook, JESSIE TYSER.
Near Brentwood, Essex.

THE NEEDED EVIDENCE
(*See letter "Moorhen's Breeding Habits"*)

ELECTRICAL WADERS

SIR,—I read with interest a letter on "Electrical Waders" in your issue of May 6th, 1939, as one evening last summer when I was prawning on the rocks at Sandgate, I had a similar experience.

While walking in shallow water my waders appeared to stir up some luminous substance, and if I kicked about in the water, the resultant splashes were highly luminous, and gave one the impression of liquid fire.

My waders were rubber, but I found that if I moved my prawning pole in the water, this had the same effect.

I put this "firework display" down to the presence in the water of some minute form of phosphorescent marine life, but it would be interesting to learn if any of your readers can give a more accurate explanation.

Yours faithfully,
Hythe, Kent. K. K. BROWN.

DEER FEEDING

SIR,—With reference to the letter in your number dated April 22nd on feeding the deer in a large forest on Deeside, accompanied by two photographs, saying that the first photograph was taken in the first week of March before the antlers were shed, and the second photograph in the first week of April when the new antlers were forming, I think Mr. A. E. Stewart's remarks and photographs may be rather misleading to many deer forest owners and deer forest tenants, who spend hundreds of pounds on the best deer feeding.

They will be disappointed if they come North in the first week of June and find their stags are not further advanced in antler growth than they actually turn out to be.

Yours faithfully,
Glenfeshire Lodge. DONALD MACDOUGALL.
(Head Stalker).

A TOWN PARTRIDGE

SIR,—A few evenings ago when it was practically dark I was strolling along one of the principal streets of Exeter when I saw a bird running and fluttering towards me chased by a cat. I drove the cat off, and the bird ran into a doorway which was closed. Upon picking it up I was surprised to find it was a partridge. I took it home with me and let it go in my garden in the country. I have not seen it since, and I am hoping it is living and well. I did not examine it to see if it was hurt.

Yours faithfully,
Devon. EUSTACE M. FORD.

A "HOLD-UP" ON THE HOG'S BACK

SIR,—Driving along the Hog's Back about 5 p.m. recently between Guildford and Farnham, we were held up by a hen pheasant and a large brood of chicks crossing the road. The mother bird seemed to be quite aware of the danger, but carefully moderated her speed to that of the chicks, obviously urging them to hurry up.

This road, as most people who live in these parts know, is usually fairly full of traffic. Probably it was not the first time the hen pheasant and chicks had crossed it, but she had discovered that she was able to hold up the traffic.

Yours faithfully,
Hants. A. STEWART BUCKLE.

MOORHEN'S BREEDING HABITS

SIR,—With regard to the moorhen in *A Practical Handbook of British Birds*, I note under "Breeding Habits.—Incubation—Probably by both sexes, but more evidence desirable." I apologise for the poor photograph I send herewith, due to a sudden thundercloud obscuring the sun, but think it may be worth publishing as it shows both male and female moorhen at the nest, and thus provides the evidence needed. Twice while I was in a hiding tent the two birds changed places on the nest, which contained eight eggs, three of which were chipping. A good deal of excited "conversation" took place each time, starting while the oncoming bird was about 15yds. upstream and only ceasing when the one departing had slipped away over the back of the nest. The white under-feathers of the tail of the sitting bird can be seen in the photograph as she flicked it up and down, bobbing her head the while and bowing to the approaching mate.

Yours faithfully,
CATHERINE M. CLARK.
Fayrer Holme,
Windermere.

LENGTH OF SLIDE IN RACING BOATS

SIR,—Last year you were good enough to insert some remarks of mine in the *Field* on the subject of the length of the slide in racing boats and the value of different parts of the stroke. My remarks were confirmed by the easy victory of Mr. Burk in the Diamonds, and, as he will probably be a competitor again this year, may I suggest that his style should be very seriously studied in the interests of rowing.

It would be of very great advantage if someone would take a cinematograph photo of his stroke, with, of course, his permission.

Yours faithfully,
240, Iffley Road, A. G. SHORTT
Oxford.

A UNIQUE FLY RECOVERY

SIR,—The following experience may interest some of your readers. On Thursday, June 8th, I was fishing for trout at the lower end of Loch Langabhlat, Isle of Lewis, and during the afternoon I rose and hooked two fish of about 10oz. each. They gave me some trouble, and I thought that I was weeded. I slacked the line in the hope that they would come out, which they did, and I landed both. To my surprise I found my middle fly missing, which I supposed had been torn off in the weeds.

I was fishing three flies. On Saturday, June 10th, I was fishing in the same spot, and hooked a trout of about the same size as the two I had caught on the 8th. When I had landed it I found my middle fly in its jaw. I must, therefore, have hooked three trout at the same time. The extraordinary thing is that I should have caught the fish, which broke off the middle fly, two days afterwards, and got back my lost fly.

Yours faithfully,
Grimersta Lodge, CECIL BRAITHWAITE.
Stornoway.

WATERMILL WITH TWO WHEELS

SIR,—The interesting point about the accompanying photograph is that the old mill has two water wheels, a most uncommon fact, though there is another in this part of Somerset. It is situated at Dunster at the foot of the castle hill, where it used to utilise the water of the little River Avill, flowing down the lovely valley of that name from the heights of Exmoor.

The particulars of the mill are given in Domesday Book, but tradition says it probably existed long before then.

Originally there was only one wheel, the smaller one on the right, but the larger one on the left was added later. The mill belonged to Dunster Priory, and the monks used to grind corn there for the priory farm and for the farmers of the countryside. It continued to work until modern times and only fell finally into disuse in 1916, because farmers gradually gave up bringing their corn here to be ground.

Dunster is one of the prettiest show villages of the West, with its broad picturesque street, its quaint octagonal Yarn Market built about 1600 by George Luttrell, and the ancient castle of the Luttrells overlooking the village from its sharp conical hill. It is visited by thousands of tourists in the summer, but the old mill with the two water wheels, being in the castle grounds, can be seen only on Sunday afternoons when the grounds are open to the public.

Yours faithfully,
Exmouth. E. M. BOOTY.

THE CUCKOO AND THE NEST

SIR,—I have always understood that a cuckoo is supposed to lay its egg on the ground, and then carries it to the nest in which it intends that it shall be hatched out. But recently I had the opportunity of watching the whole performance from the start.

I noticed a hen cuckoo being mobbed by two blackbirds and a hen hedge-sparrow, near the hedge on the lawn here. The cuckoo repeatedly flew into the hedge at the same place, where I knew there was a hedge-sparrow's nest containing four eggs.

Realising the cuckoo was probably going to lay her egg, I watched her carefully through a pair of field glasses, noticing that while on the ground she squatted with her wings slightly open like a bird cooling itself, hopping about driving away the blackbirds, who were very annoyed at her presence.

The cuckoo visited the nest six times, remaining the last time for seven minutes, then she flew away and began calling in some trees close by.

I visited the hedge-sparrow's nest at once to find one egg had been thrown out on the ground and the cuckoo's egg substituted.

As all this happened within 30yds. of where I was sitting, and I was using a pair of very good glasses, I can state that the cuckoo did not lay her egg on the ground but direct in the nest. The hen hedge-sparrow went back to the nest and continued her interrupted incubation as soon as the cuckoo had left, the whole incident lasting about half an hour.

Yours faithfully,
Woodchester, PHILIP C. SPICER.
Nettlebed, Henley-on-Thames.

SIR,—Quite recently I sheltered under a tree from a shower of rain in the New Forest and noticed a wren putting the finishing touches to its nest which was practically completed. Ten days afterwards I visited this nest which, approached very cautiously, showed no signs of life. I found it contained nothing but a cuckoo's egg, stone cold, and the nest obviously deserted; in fact it could not have been tenanted at all and seems to point to the cuckoo's great lack of intelligence. However, the fact of a cuckoo's egg being in a wren's nest seems to prove that the cuckoo does not lay its egg direct in a nest, but is placed in by the bill.

Yours faithfully,
"Oaklands," ERNEST E. JOHNSON.
Brockenhurst, Hants.

[Most authorities agree in stating that the cuckoo does—as did the bird in the first letter—lay direct into the nest.—ED.]

A MILL MENTIONED IN THE DOMESDAY BOOK
(*See letter "Watermill With Two Wheels"*)

SCHELLY

SIR,—I enclose a photograph of a schelly, caught on worm in the Red Tarn, Helvellyn. On several occasions I have caught schelly by bottom fishing. The last time I was at the tarn, spinning for trout, I found the dried body of a schelly lying amongst the stones at the water's edge. It had evidently been dead for some time. At Bala Lake, and other places gwyniad and schelly have from time to time been washed up in this way. The question as to what causes their death is difficult to answer. Cases recorded from Haweswater by Francis Day had the air-bladder expanded. It may be that spawning has something to do with it, the fish changing rapidly from deep to shallow water.

There is no sport in fishing for schelly, but anyone who has never seen a specimen of whitefish may find some interest in trying for one with worm. I have had many a good day's fly-fishing for trout in Red Tarn, as well as spinning with a natural minnow in scarab tackle. The last time I was there I held several *post mortems* on trout brought to net, and found they had been feeding greedily on black gnats and stonefly nymphs.

Yours faithfully,

Lane House, RICHARD CLAPHAM.
Troutbeck, Windermere.

A THRICE USED NEST

SIR,—During the spring of 1936 a song thrush built a nest in a flowering currant hedge in a garden here. In the following spring (1937) a blackbird utilised the thrush's old nest as a foundation by superimposing a nest of its own upon the old structure. Now, after an interval of two years, a blackbird has repaired the nest once more and is sitting upon a clutch of four eggs. In both previous cases the broods were successfully reared.

Yours faithfully,

Dornoch, D. MACDONALD.
Sutherland.

TAMING A RAVEN

SIR,—I should be very grateful if any of your readers would give me some hints with regard to bringing up and taming a raven.

I have a young bird, about two months old and pinioned, but though he eats well and seems quite happy running about the garden, he is still very wild and shy.

Yours faithfully,

Greylag Farm, JAMES JUSTICE.
Upchurch, Kent.

A match for each other

Romance to-day has none of the handicaps of past generations. Young men and women can share the same interests, play the same games, smoke the same cigarettes. The latter was inevitable once women learned to appreciate the man's cigarette—Wills's Gold Flake. The flavour of really fine Virginia tobaccos appeals to modern women. They've got Wills of their own, you see, in every sense of the word.

WILLS'S GOLD FLAKE
is the man's cigarette that women like

N.B. You can get Wills's Gold Flake CORK-TIPPED as well as Plain.

G.F.8. 752

WHITEFISH FROM THE RED TARN, HELVELLYN
(*See letter "Schelly"*)

A GULL AT PLAY?

SIR,—Can any of your readers explain this incident, or have they seen a similar?

I live on the coast of Vancouver Island. Recently my sister, my brother-in-law and I were seated on the porch of our home. Directly opposite is a group of tall firs. We saw a seagull hover over these, then descend and tug a fir-cone from a top branch. This it tossed away. It returned four times at intervals of a few minutes and did the same thing. Why? Gulls do not eat cones, nor did it attempt to do so. Was it a game, and has anyone else seen a gull play it?

Yours faithfully,

Cherry Point, MARY HOLDEN.
Cobble Hill, Vancouver Island, B.C.

A LONELY BONE

SIR,—Reference letters on "A Lonely Bone" appearing in your issues of May 27th and June 17th, I have taken these floating bones from lion, tiger, leopard and even cheetah.

They are considered as lucky charms in India, and the native name is "Suntok."

I still have in my possession one from a lion measuring 3¼in. straight, and 4¼in. on the curve; and one from a cheetah, 1¾in. straight.

I was once told that these bones were presumed to be the remains of wing bones, when the prehistoric felines might have flown.

What a sporting shot a rocketing lion or tiger would have made!

Old Mill House, S. H. CHARRINGTON.
Rockfield,
Monmouth.

THE GOLDFINCH IN HAMPSHIRE

SIR,—Your readers may be interested to learn of the great increase in the goldfinch population in this part of Hampshire during the last two summers. Last year a goldfinch was quite a common sight in the hedgerows round about here, but this year one can hardly go for a walk along any of the by-ways without seeing at least one pair. Indeed, I saw a party of at least a dozen (evidently migrants just arrived from the Continent) on the evening of May 6th, and we had two pairs nesting within a few minutes' walk of the house, and this in a fairly populated neighbourhood.

So far from being one of our rarest species (as they were said to be not so many years ago) from where I write they bid fair to outnumber the chaffinch.

Yours faithfully,

Romsey, Hants. LANCE DAVL.

MOLE CRICKET

SIR,—Your correspondent should have no difficulty in finding mole crickets in the boggy districts of the New Forest. It has been recorded from most counties in England, from Cornwall to Lincoln, and from Kent to Lancashire. They are regarded as a garden pest at Mudeford, near Christchurch, in Hants, where 82 mole crickets were taken from a wet patch of ground about 70yds. square, that had not been dug for two years. They were in the wettest ground, that had been under water during the preceding winter.

Isolated records from Ireland and Scotland are accepted only with reserve, and verification is much desired. Mole crickets live in wet, boggy ground, and betray their presence by their churring note on warm evenings, resembling the noise of the nightjar.

Your correspondent's record from Nailsworth is an addition to the Gloucestershire list.

Yours faithfully,

South Rest, MALCOLM BURR.
Foxley Lane, Worthing.

FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, appeal for help for an aged couple of the middle class. They lost all their capital through a dishonest solicitor, for which cruel fraud the solicitor was sent to prison, but in the meantime these poor souls are suffering many deprivations, anxiety and ill-health. Do please help.

IN THE CITY

By OUR CITY EDITOR

A RAPID and remarkable growth has been seen in the electricity supply industry of this country during the past few years. There is a very general belief that still further progress will be experienced in coming years. Striking figures have been published on behalf of the Electricity Commissioners showing the growth in output of electricity by electric power companies and railways in Great Britain.

During 1930 the amount of electricity generated in the country was 10,914,000 units. There has been steady expansion year after year until 24,375,000 units were generated in the year to December, 1938. This means an increase of 123.33% over 1930.

Stocks and shares in electric power companies have always provided the investor with excellent investments. During the world-wide slump period of a few years ago investors in electric power shares fared far better than those who had put their money in other securities. For many years, in addition to regular dividends, shareholders received free share bonuses or were offered shares on very attractive bonus terms.

The industry is to-day firmly established, and I consider that preference as well as ordinary stocks and shares in electric power companies constitute ideal investments. A share which I favour is Midland Counties Electric. It supplies power for a large district in the industrial area of the Midlands. For some years up to the end of 1934 the ordinary dividend was a regular 7 per cent. For 1935 dividend was increased to 7½ per cent., while 8 per cent. has been paid for the past three years. An interim of 2½ per cent. is usually paid in October and a final when the accounts are available in March.

There is a point in connection with this company of considerable interest to the shareholders. Besides its principal business of electricity supply, it has considerable interest in road transport. Its traction properties operate services over 541 route miles, with a fleet of 289 vehicles, of which 256 are diesel or petrol driven and 33 are electric trolley.

The transport business is now on a strong commercial foundation, and the time is drawing near when the question of separating this business from the electric power side will be considered. That may at some future date mean a windfall for shareholders in the company. The shares standing around 37/– are a sound proposition.

As an indication of the popularity of this type of security the immediate success of an offer of 500,000 new 4½ per cent. preference shares of £1 each at 20/6 by West Kent Electric may be cited. The issue was oversubscribed and the shares in their partly paid form are changing hands at a small premium. Investors immediately recognised the merits of the shares.

I consider that shares in some of the smaller electric companies are worth investment attention. They are concerns which can show much development in future years. A concern I have in mind is Lincolnshire & Central Electric Supply Company.

The company was registered in 1930. Ordinary dividends are steadily increasing. The first distribution was 6 per cent. for 1936, followed by 8½ per cent. for 1937 and 9 per cent. for 1938. The ordinary capital is privately held, but the company has in issue 4½ per cent. £1 preference shares which can be bought around 21s. 6d. each.

They make an ideal industrial investment with a yield of £4 3s. 9d. per cent. As seen by the increasing dividend on the ordinary, cover for the preference capital is steadily increasing. In fact, the last published accounts showed £51,500 available for dividend, while only £11,250 is required to meet the preference dividend.

Another somewhat similar issue is Mid-Cheshire Electric Supply 4 per cent. £1 preference which can be bought around 19/9. Here again cover for the preference dividend is handsome.

OMNIVOROUS OSTRICHES

The latest arrival at the Scottish Zoological Park is a large male ostrich. It is very welcome, for the Zoo has not had an ostrich for some time. The last one died over three years ago, the cause of its death being half a plate which someone had thrown into its paddock and which it promptly swallowed. The ostrich is a bird who sadly lacks discretion in such matters. Such things as pennies, knives, nails, sticks, wire, lengths of string and, on one occasion, half a lemonade bottle, have in the past contributed to the deaths of a number of the Zoo's ostriches. The new ostrich came from Nigeria via Hamburg. Other birds of this group at present represented in the Park are the rheas of South America, the cassowaries of the East Indies and the emus of Australia.

New Books

GAY NEW WORLD

I Like America. By GEOFFREY HARMSWORTH. (Hutchinson; 10/6.)

I DO not know if you read *Abyssinian Adventure?* If you did there is no need to recommend Mr. Harmsworth's new book. If you did not, then I strongly advise you to go out and get a copy immediately you have read this review, and while you are about it get a copy of *I Like America*. It is 10/6 well spent.

The publishers call Mr. Harmsworth a star reporter. A reporter is a gentleman that reports—that and no more. Mr. Harmsworth not only reports that that he sees, but tells you what he feels about it, and what, in his opinion, it means. He is very much more than a star reporter. He has a very observant eye and a very retentive memory. There is little or nothing he misses, and he has the ability (a very rare gift in these days of shoddy reporting) of making his reader—an ordinarily dull human being—see the things he sees. He is a star *observer*.

This is the story of a 15,000-mile trip through the United States. That trip took six weeks. Obviously it was pretty hurried—2,000 miles a week is good going even to-day; and obviously you cannot get to know the United States in six weeks. (I know a man who maintains that it takes a lifetime to know Rutland.) Mr. Harmsworth does not pretend that he knows the United States. He just puts down what he saw and thought about it. Moreover, he did not travel in the "old school tie" manner, made fashionable by recent explorers in less accessible parts of the globe. His attitude is very much the attitude of any other young Englishman on a voyage of exploration, seeing new things with a quick eye and an alert mind. It is an attitude unclouded by snobbishness, pretentiousness and all that fantastic mess that is covered by the old school tie. And that is most refreshing.

This is not a political book—again most refreshing—but a cross-section of general American life. He witnesses a trial in the High Court (I found this about the most interesting thing in the whole book); he went to a service at Aimee Macpherson's temple (which is just incredible), and to an all-in wrestling match and to a convict prison. He met John D. Rockfeller, jun., and Mr. William Randolph Hearst and Walt Disney and Miss Anita Loos, who wrote a classic—at least what will be recognised as such one day. And he met a lot of those people I pay a shilling to see about once a fortnight—including Charlie Chaplin and Shirley Temple and Maureen O'Sullivan. And about it all he writes gaily and easily—so easily that one can too easily forget that this is a book that should be read seriously and carefully.

It should be read thus because it is a picture of a country we ought to know a great deal better, and with whom—not only for our own sakes—we should be in much closer touch. Three thousand miles away it may be (but did not Mr. Harmsworth cover five times that distance in six weeks?), but it is actually next door. It speaks our language, thinks and acts to-day as we do next year, and is youthful and energetic. We may not think too much of America; we should think a lot more.

Mr. Harmsworth liked America. He is, indeed, enthusiastic, and his enthusiasm is infectious. It is jolly good reading this book—and you can't fail to like America, too. The photographs are excellent. Many more might have been produced full-page size—no, not might, should. BRIAN VESEY-FITZGERALD.

Les Mouches du Pêcheur de Truites. By L. de Boisset. (Librairie des Champs-Elysées, 2 bis, rue de Marignan, Paris.)

Anglers who are conversant with French will find this book decidedly intriguing. M. de Boisset has now done for French streams very much what Halford did for English chalk streams, but unlike Halford—to whom, by the way, he pays honourable tribute—he has not confined himself to any one type of water, but has provided a lucid account of all the flies likely to be encountered by an angler in any part of France.

In the main he is concerned with their identification and on how to distinguish between the different species, which, as a rule, is beyond the ordinary angler's powers; but he is able to point out some simple distinctions between various species of olive, for example. For the purpose of catching trout with a fly this, perhaps, is of no great consequence, since the difference—a matter of the veining on the wings—can hardly be observable to the trout. But it is probable that, with so widely distributed an insect, the species which are suitable for one type of water are not suitable for another, and a more careful study by anglers who fish streams other than chalk streams may be of great help in improving stocks of fly in those waters.

The author has also many suggestions to make about better fly imitation. Though he approves in general Halford's dressings, he considers that they might be improved in many cases. He is, perhaps, a little too much inclined to attach importance to the exactness of an imitation, disregarding the useful maxim that what looks alike to the angler does not necessarily look alike to the trout. But an entomologist is naturally jealous of the good fame of his subject. He will have nothing to do with impressionist studies and even "strafes" that excellent fish-taker the gold-ribbed hare's ear.

But M. de Boisset is to be heartily congratulated on producing so readable and interesting a book on the fly life of streams in France. It could be studied with advantage by English anglers both for its information about natural insects and for its many suggestions for their more accurate imitation. H. D. TURING.

End Plays. (The Ad. Press, Ltd.; $2.50.)

This is the third edition of George S. Coffin's classic work on end plays. It is definitely not a book for the happy-go-lucky player who wants a few hints for improving his game. As stated in the foreword, it should "be taken in small doses, as much of the analysis is too deep for casual reading." Of necessity the writer has been compelled to invent his own nomenclatures for the various basic plays, and in his endeavour to cover thoroughly each variation he has invented many weird titles, such as entry cross ruff fork strip, and force avoiding entry throw in, which are apt to prove rather disconcerting.

However, the reader should not allow himself to be put off by the titles of the various plays, since the book will very well repay a close study. To the average player many of the situations described would be sufficiently difficult for double dummy problems, let alone rubber play. The various hands are very clearly illustrated and in many cases most amusingly described.

Not many players would be able to reproduce often the actual play followed by the many experts who have contributed hands to this book, and in fact most players would be proud to have just one or two of them to their credit. I can definitely recommend this book not only to problem lovers, but to the many who wish to improve the finer points of their game. G. E. SMITH.

Rudiments of Riding. By Captain F. C. HITCHCOCK. (Hurst & Blackett; 2/6.)

Captain Hitchcock has set out in this little book advice which the beginner will find invaluable. He discusses the general behaviour towards the horse, gives excellent hints as to saddling and bridling, describes the correct application of the aids and the general care of the horse. If there is nothing fresh in his pages, it can at least be said that no one ought to mount a horse who is not in possession of the degree of information represented by this book.

Regent of Hungary. By OWEN RUTTER. (Rich and Cowan; 18/-.)

Europe to-day is governed by many personalities and not the least of them is Admiral Nicholas Horthy, Regent of Hungary. For two decades he has controlled the destiny of his country, and it seems extraordinary that this should be the first account to appear in English of this man and his work.

Mr. Rutter's account is very complete. He has had the free use of the facts of the Regent's life hitherto unpublished, while many famous men have given him assistance in the compilation of his book. It is a valuable historical record. ROBERT COLVILLE.

Rock Gardens: Their Construction, Planting and Maintenance. By W. E. SHEWELL COOPER. (The Epworth Press; 2/6.)

Mr. Shewell Cooper, as a regular contributor to our columns, needs no introduction to *Field* readers. His practical advice has already made many gardens brighter, and it is pleasing to find that his latest book on the construction of rock gardens is full of the same sound knowledge and love of his subject. It deals with every problem which might beset the beginner, from the correct placing of rocks to the many and varied plants which can clothe their nakedness.

I do not feel that I can compliment the author in any better way than by saying that I am glad to have his book in my library. WILLIAM LUSCOMBE.

* * * *

An Outline of Forestry. By THOMAS THOMSON, M.Sc., and M. R. K. JERRAM, M.C. (Thomas Murby & Co.; 7/6.)

To set as an effective introduction to a subject, a book should paint the picture as whole, with broad sweeps of the brush, omitting detail the study of which would confuse the issue if undertaken at too early a stage. Messrs. Thomson and Jerram have produced just such a book, in which will be found a masterly, comprehensive and accurate analysis of the principles of forestry from a silvicultural and financial point of view. Rather more than an outline, its greatest appeal will be to anyone contemplating a serious study of forestry, but the welcome absence of technical terms makes it suitable for the general reader, whose mind will not be bemused by routine problems, nor by considerations of amenity or sport, two factors of great importance for estate woodlands, but regarded by the authors as matter for later study. R. D.

* * * *

Celluloid Safari. By STIRLING GILLESPIE, F.R.G.S. (Blackie & Son, Ltd.; 12/6.)

The author and Mr. J. Blake Dalrymple, F.R.G.S. travelled 25,000 miles for the purpose of filming and photographing big game in Africa. The book begins with their landing at Cape Town and ends with their arrival at Cairo three days ahead of schedule, having made the journey by car. What happens in between and the results of their photography, form the contents of a most attractive volume. Written in a light-hearted, pleasant style, it is essentially readable, and the 70-odd photographs can only be described as first-rate. As can be expected, there are both thrills and trials, all of which seem to have been met in the happy spirit of an adventurous disposition. The mumbo-jumbo of a witch-doctor, the cheetah which tried to steal the food from the car and got "snapped" in the act, the monkeys which raided the larder at the camp on the Zambezi are a few of the sort of things which crowd the book. One of the most thrilling photographs is of an elephant at 20yds. range, and another remarkable one shows a puff-adder crawling over the head of Kumbemba, a witch-doctor. Those of the eland, black rhino, and buffalo are among other particularly attractive ones. But it is hard to pick and choose when the standard is so high.

Perhaps if the author had refrained from making comparisons with big-game shooting, tempting though this may be, it would have been better. But whatever his views, the book will be greatly enjoyed by the reader. W. H. T. LOXO.

BOOKS IN BRIEF

There have been a number of stories about cricket going about for some time now. The best of them, and some new ones as well, have been collected in *Silly Point*, by ARTHUR CLIFTERBOK (Duckworth; 5/-). With a note from Patsy Hendren it is well worth reading.

Another indication of the rapid development of every sport is Pitman's 4/- publication *Fencing*. In it the art of the three methods of fencing—foil, epée and sabre—are brought up to date. Its author, G. V. Hett, is well qualified to write it, as he is himself an active fencer and looks on the sport with the modern point of view.

From Land's End to John o' Groats (Blackie; 8/6) is obviously a large field for any book to cover. Mr. Colin Howard covers it in some 300 pages, in fourteen days. It is all praise to his knowledge of the country, his appreciation of atmosphere, his good writing that he makes this book what it is.

All in the Day's Work, by Commander C. L. KERR (Rich & Cowan; 15/-), is a book of some variety. It is a memory of youth, of the sea, of years as a young officer, of cruisers and torpedo craft and submarines. It is a cross-section of the War, the activities of naval batteries on different shores, and the control of convoys in Egypt. And it gives an account of later life, of shark hunting in Australia and life in the City. A colourful book of a varied life, told in a straightforward, slightly graphic, more than slightly humorous style which is so unmistakably the voice of the man of the sea.

TRACTORS FOR ALL PURPOSES

Some Problems of Choice

IT is becoming generally appreciated that the success or otherwise of a tractor outfit depends very much upon the judgment which is exercised in making a choice at the outset. This is not merely a question of makes but of models, since the majority of firms can offer several different machines and the total number from which one can choose is now well over fifty.

As regards types as distinct from makes, one has first to decide on the tasks to which the machine will be put and the class of ground on which it will have to work, before getting down to a consideration of models. One may very broadly classify the types as wheeled and crawler machines and further sub-divide on the basis of capacity in both types to haul one, two, three, four, or more furrows in medium land. In both crawler and wheeled types there are standard and row-crop type machines, the latter being capable of doing practically all jobs as well as the standard patterns in addition to their specialised advantages in row-crop work.

In choosing between the two classes, one generally prefers a wheeled machine to a crawler, if wheels can do all that is wanted, on the score of simplicity and cheapness allied to the greatest measure of adaptability if mounted on pneumatic tyres. For difficult conditions, as on hilly or heavy land and for the higher powers, the supremacy of the crawler is undeniable and much land is being successfully and cheaply worked with their aid, which could not be tackled with horses or with wheeled-tractors.

A machine which has done more to popularise power-farming than any other is the well-known Fordson, which has occupied a favoured position for many years as a general utility tractor, capable of being economically put to most jobs on the majority of farms and with power enough to-day to handle three furrows on heavy land. On pneumatic tyres it is suitable for general haulage as well as the tillage work and stationary driving. In addition to the standard pattern a row-crop type is available.

The Case is a great favourite in several districts, and the better-known models—the small C and the large L—have recently been joined by a lighter type known as the RC. This is suitable for a variety of the jobs requiring less power than is afforded by the model C, and is specially laid out with a view to row-crop work and has a power lift for tool-bar frames. The row-crop version of the C, namely, the CC4, is very popular for inter-cultivations and general work on heavy land.

Several of the Massey-Harris models have been the subject of recent improvements and the Pacemaker is a good example of the standard type four-wheeler allying power with economy. The Challenger, the companion row-crop machine, may be had in the tricycle fashion layout or as a four-wheeler with a special high clearance front axle. They have also a larger machine giving over 25 h.p. on the drawbar which is capable of turning out a great deal of work at plough and handling big combines or threshing machines. On a set of 12.75in. by 32in. pneumatic tyres this machine will handle a four-furrow plough comfortably on heavy land and represents an excellent type of machine for the larger farm.

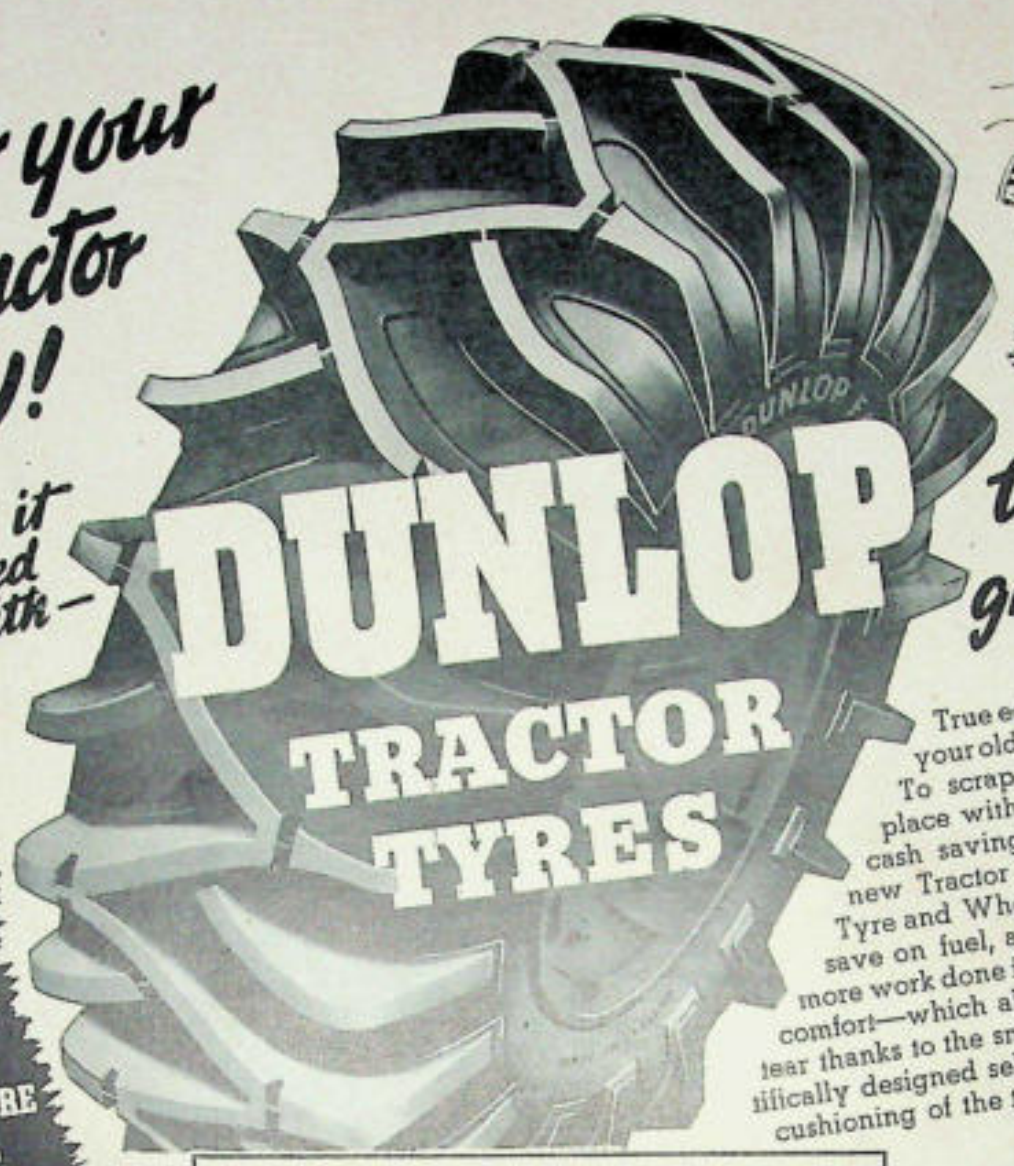
There is such an extensive range of International Harvester models that it is difficult to single out any particular individuals for mention. It includes crawler machines with both paraffin and Diesel motors as well as a number of standard and row-crop wheeled patterns. Among the latter, the Farmall 14 and the Farmall 20 are very popular representatives. The former is described by some farmers as a first-rate substitute for a three-horse team and is a most economical unit for harrowing, drilling, mowing and the like, while the latter will handle a three-furrow plough almost anywhere and is also an economical runner.

A MEDIUM-SIZED STANDARD TRACTOR ON PNEUMATICS, THE ALLIS-CHALMERS W.F., PLOUGHING THREE FURROWS IN DORSET

Allis-Chalmers machines are becoming every year more popular and since their introduction about five years ago they have spread to all parts of the country. Here again there is a comprehensive range from which to choose. It starts with the model B, one of the smallest general farming tractors made, but one which will haul a two-furrow plough on heavy land and can also do all the other tillage jobs, haulage and belt work. It is designed for pneumatic tyre equipment, which is the only form of wheel obtainable. The machine is also a row-crop type and can be bought with tool-bar frame. Other models include a selection of well-tried wheeled machines and several different crawlers.

A machine which has been creating a very favourable reputation on row-crop work is the Oliver 70, one of the few six-cylinder motored jobs in use. It has exceptional ground clearance and with a forward mounted tool-bar frame is capable of turning out very good work. The smooth-running engine assists the operator very materially in his job.

When thinking of track-laying tractors most people also think of Caterpillar, a line in which there have recently been introduced two new models. These are the D.2 and the R.2. These replace the well-known model Twenty Two and the former is of special interest in having a Diesel-type motor. Whether the extra cost of this type as against the paraffin-burning R.2 will be justified is a matter for the individual user, but either machine can be relied upon for handling four-furrow ploughs in most soils and for coping with the most difficult conditions in hillside work. For those who need high-powered machines there is a range of Caterpillar models, including the largest tractors built for farming purposes.



The Cletrac range is another incorporating a series of crawler models of varying power. Among these are to be found models suitable for most purposes, including high-clearance types for row-crop work.

THE SECRET
of keeping up with harvest work

. . . is to use the tractor which will never let you down. Pulling a binder takes more out of horses than any other job, but a Case is tireless and will work from daylight to dark six days a week, with never an involuntary stop. And when harvest is over you can break your stubbles at once and so keep your land clean. For fuel consumption Case takes the lead in all trials.

A MASSEY-HARRIS FOUR-FURROW PLOUGH AND A TRACTOR OF THE SAME MAKE

CULTIVATING WITH A STANHAY TOOL BAR ON A FORDSON

PLOUGH AND TILLAGE IMPLEMENTS

Choice Dependent on a Variety of Duties

THERE is every reason to convince one that ploughing and other tillage operations have been carried out for years out of number largely on a rule of thumb basis, and with very little consideration of the underlying principles of cultivation. In days when horseflesh was cheap, the number of horse and man hours expended in the production of a crop was not a matter for concern—indeed, many took a pride in the numerous ploughings given in preparation for roots, for example. To-day, the usage of tractors and other up-to-date machines in the effort to counter high labour costs has led people to study ways and means of economising in the conduct of tillage operations, and the advisability of every style of cultivation is subjected to more critical examination.

In equipping the farm with ploughs and other tillage implements for tractor haulage one can select a group of machines which will each give service in several directions, and this will lead to economy in first cost and in operation. A good plough which will be suitable for a variety of jobs is the foundation of a tractor outfit, and the British farmer is extremely well served in this section. In the range put out by Ransomes, Sims, and Jefferies there may be found something suitable for almost any condition that comes to mind, since for abnormal conditions one may draw on the export types that are not commonly sold in this country. Several models carrying normal bodies are convertible as to the number of furrows ploughed, as from three to two, or four to three. This is a help where land on one holding is both light and heavy, and by reducing the load by a furrow on the heavy going it is usually possible to keep the tractor on ploughing gear instead of having to drop to bottom speed.

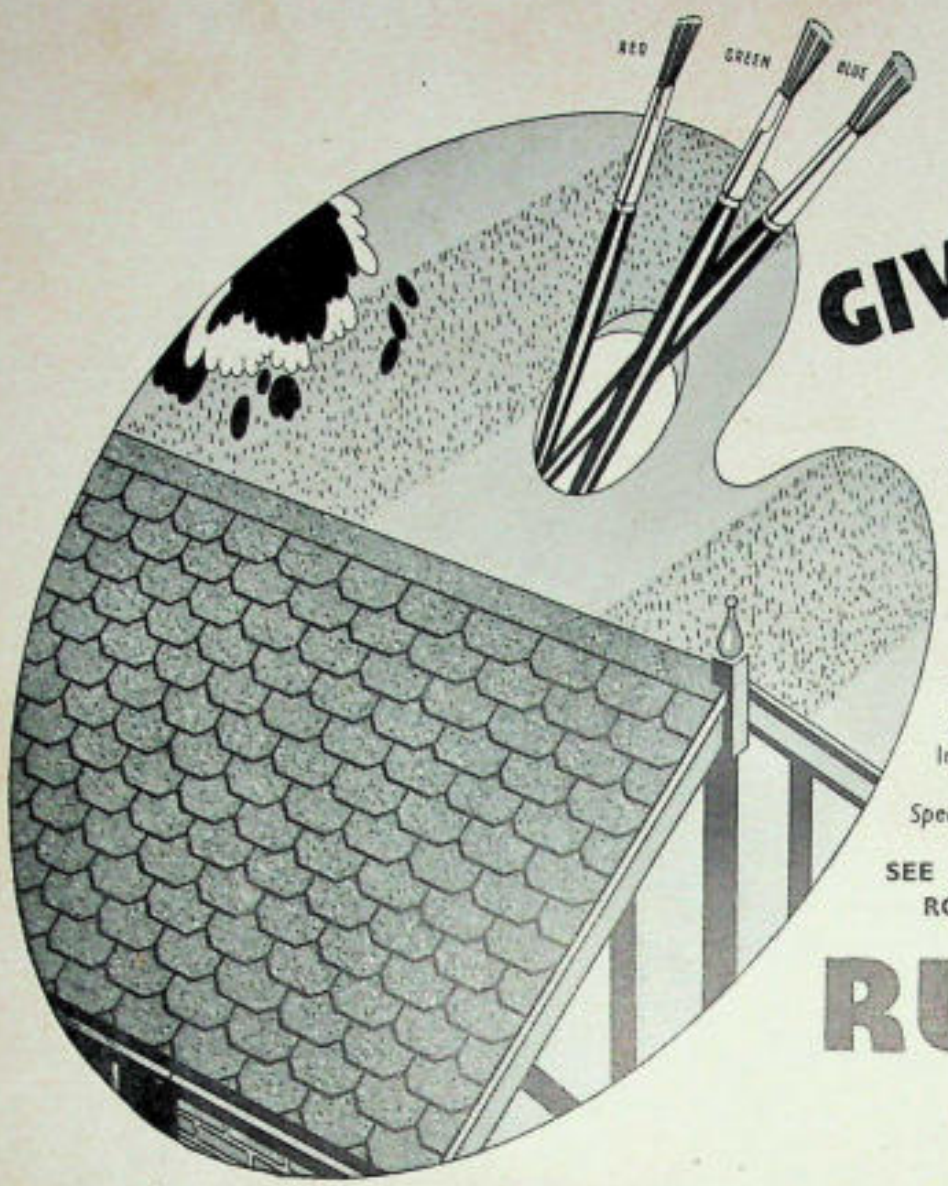
Then it is well to remember when buying a plough that more than conventional ploughing may be necessary at times. One may want to undertake subsoiling, for instance. Many of the Ransomes models are capable of taking subsoiling tines in place of a plough body, and there are some specially designed for the job of combined ploughing and subsoiling with a powerful tractor, such as the Junotrac. This is a first-class implement for increasing the depth of workable soil at a low cost.

A series of standard ploughs noted for light draught is the Cockshutt, marketed by Listers.

Several of the general agricultural engineering firms who make tractors also build ploughs and other tools for use with them. This applies among others to Massey-Harris, International Harvester and Oliver, and many buyers like to obtain a complete outfit from the one manufacturer. For special deep work as in Fen land the Melotte one-way tractor ploughs have become very popular in appropriate districts. They can handle a 16in. deep furrow quite easily and leave no dead furrows.

The cost of seed-bed preparation or cleaning operations is largely dependent on the efficiency of the implements employed. The greater speed of travel of the tractor is nearly always an advantage in this connection, as the tined varieties, at any rate, are more effective at fast speeds. Tractor cultivators are produced by many firms in various types. For deep heavy grubbing on stiff land many prefer the rigid tined type, and these may be obtained in sizes to suit most machines. For breaking up hard clay land for a half fallow, if sufficient power is available, from one of the largest crawlers, one looks to the big export cultivators made by Ransomes, which will turn out work not inferior to the steam cultivator. Another substantial model for medium tractors is produced by Nicholsons. In addition, it may be remembered that for all normal cultivations one may employ the toolbar frame of a row-crop tractor and save the cost of a separate implement.

THE MURRAY ROTARY CULTIVATOR AT WORK BEHIND AN INTERNATIONAL 10-20



On the mixed farm in particular, the advantages of cultivating tools that are equally useful on grass and arable must not be overlooked. The Wilder Pitchpole harrow, for instance, was developed as an arable tool for surface cultivation and the extraction of rubbish. It was then found equally effective with a different tine for slitting old turf, and has become widely known for this work. The tandem disc harrow, which is one of the finest arable tools in the right hands, has also its uses on grass, for breaking up mole heaps and ant hills, and for aerating. Good examples are made by Ransomes, International, Massey-Harris, Bentalls and Oliver.

In districts where the rate of share wear is rapid on mouldboard ploughs, such as on the Wolds, it has been found that the disc type harrow plough or one-way disc has enabled the mouldboard plough to be very largely displaced with a consequent saving in operating cost. The disc plough proper has had few advocates in this country, but properly handled it can turn out good work, and more will probably come into use.

In loading a tractor to accommodate the power to the implements drawn, one may increase the load on the lighter jobs, either by a wider tool or by hitching several, such as cultivators, harrows or rollers in tandem. The system to follow depends in part on the type of country and partly on the tools already available, the tandem system being a way to use up old horse implements economically. It is also the favourite method where fields and gates are small.

The expanding roller, however, is capable of going through ordinary gates and yet of opening out to 18ft. or more in action. These are made by such firms as Wilders of Crowmarsh, Listers, Blackstones and a number of others.

Rotary tillage attachments for the standard tractors continue to attract an increasing amount of interest. The models available include the rotary hoe for attachment to the Fordson, the Murray Helical Rotary Cultivator, which is a trailer-unit for power drive from the take-off of any suitable tractor, and the Fishleigh which is also hauled behind the tractor and power driven. These have uses on both arable and grass land. B. J.

GIVE COLOUR TO YOUR ROOFS

Ruberoid Slates in warm, mellow colours always look neat and give permanent service at moderate cost on all types of estate and farm buildings, bungalows, garages, summerhouses and garden shelters. No experience is required for fixing. Ruberoid Slates are supplied in Twin Butt form or in neat Octagonal strips, complete with all accessories for fixing. Three colours: Venetian Red, Westmorland Slate Green and Steel Blue. Stocked by leading Builders' Merchants and Ironmongers.

Specimen Slates and explanatory booklet sent on request.

WHITE CAP, OVERALL, RUBBER BOOTS, MAKE UP A CLEAN MILKER'S OUTFIT IN THIS COWSHED, WHERE ALUMINIUM STOOLS ARE ALSO IN USE

AIDS TO CLEAN MILK PRODUCTION

The Necessity for the Exclusion of all Dirt

THE rising consumption of milk cannot be altogether unconnected with the increasingly high standards of quality enforced, and the study of equipment and technique has led to the manufacture of many devices to aid in the production of a first-class sample. In laying out a dairy plant with this end in view the first essential is to plan for the exclusion of dirt or contaminating matter from the milk.

Some old buildings may be successfully modernised for the housing and milking of cows, but the present tendency is to separate the milking and housing problems. Cows may very well lie in an old-fashioned byre, if taken to a modern shed in batches for milking, and this reduces the outlay. In such circumstances one may well decide on the provision of a set of washing stalls erected at the rear of the milking stalls, where one batch may be cleaned while another is milked. Such stalls are now equipped with water brushes and sponges and can be connected up to a steam-pipe to warm the washing water, so that the job can be most efficiently done.

In such milking-houses there is a concrete floor, kept wet when milking is in progress and therefore dust does not arise. The milk is delivered to the cooler without exposure to the atmosphere. To prevent contamination at the source, the foremilk may be drawn into a cup made for the purpose, which also enables a thick quarter to be at once located; and teat cups will be disinfected between cows.

In such installations, arrangements are made for easy dismantling and also for coupling up pipelines for steaming through and for rinsing with cold water. The controls are similarly designed for dismantling for cleaning.

Design of coolers has been directed very much towards the production of articles which present no angular crevices in which dirt or milk can lodge and which afford cover from the air while in use. The quantity of water employed is much reduced where the refrigerant system is adopted, and such has made dairying possible on farms where the water supply must be conserved. The provision of a mechanically operated cooler in conjunction with a small cold room has other advantages. It permits churns of milk to be held at a low temperature pending dispatch, and thereby reduces any souring tendency in hot weather, and it has also enabled a number of dairy farmers to develop a useful trade in ice-cream as a sideline.

The sterilisation of utensils employed in milk production has brought into being a very large range of equipment which was almost unknown to the general run of farmers a few years back. It is generally accepted that a steaming plant is a *sine qua non*, and numerous firms have set out to supply a set including a boiler and a steam chest which will enable all the utensils to be sterilised. The boiler commonly operates on pressures from 15lb. per sq. in. upwards and models fired with coal, oil or gas are obtainable. In addition, a number of electrically heated outfits are available for those who have a supply of cheap current.

In selecting a plant one has to look for capacity in the chest sufficient for all items which have to be "cooked" after each milking. It is handy also to be able to draw off water for washing and to have an attachment for steaming churns on a block if a number of churns is normally in use. Most makers also turn out a jet to which can be attached the tubes of the milking machines for steaming through. One should look for a chest with simple but effective locking device on the door, and, if space is limited, select one of those with a slide-over type door, which does not take up any room when open.

Dairying invariably makes a big call upon water supplies, and if any defect occurs in the water used for washing cows or appliances, trouble may easily arise. Bacterial contamination can readily be introduced in this way. If available supplies are poor it usually pays to sink a deep well in the absence of a company's supply. The water may be lifted from this well at a negligible cost by an engine common to the milking machine and the pump. In this way one can employ a medium-sized power unit for the dual purpose and no extra labour is involved for attention when pumping.

In some districts a good supply can be obtained from springs, and if located near running water, the spring supply can be lifted to the buildings even more cheaply by installing a hydraulic ram. The steel windmill is another economical source of power for the purpose.

Attention to the coat of the cow itself is another direction in which one can make for cleanliness. It is now general among more advanced producers to clip the flanks, hindquarters and udder, and for this purpose some of the milking machine makers have introduced a very neat vacuum operated clipper. One may also make use of the electric clippers, which are also quiet and efficient.

P. B. S.

MR. D. N. MCHARDY has written a most useful pamphlet entitled *Rubber Equipment in Modern Farm Management*, which appears as Bulletin No. 11 of the Rubber and Agricultural Series, published by the British Rubber Publicity Association. Mr. McHardy deals with such subjects as specialised potato machinery, poultry and pig folding, the saving of farm roads by the use of pneumatic tyres, and spraying with tractors.

MODERN METHODS OF MILKING AT MR. KING'S FARM NEAR PRISTON

"The total sales of milk in this country have risen steadily until, in the 1938-39 period, the figure reached the enormous total of 1,080,000,000 gallons"

PROGRESS IN MILKING BY MACHINES

Developments in Outdoor Milking

RECENT statistics issued by the Milk Marketing Board show that since the year 1934–35 the total sales of milk in this country have risen steadily until, in the 1938-39 period, the figure reached the enormous total of 1,080,000,000 gallons. There is every indication that the upward trend will be continued, and it is beyond dispute that such a productive movement could not have been sustained without the aid of the milking machine.

It is well known that over the same period the numbers of regular workers have steadily declined,

ASSEMBLING THE UNITS OF A MANUS PLANT

and the supply of casual workers for milking only, on whom producers in old-established dairying districts formerly relied, is now extremely small. In the circumstances the spread of the machine has been inevitable. In many districts, however, the prejudice against mechanical milking has held out against the evidence of large numbers of successful users and one may find patches of country with hardly any outfits, surrounded by areas where the majority of cows have never been hand-milked.

Like all other machines, the mechanical milker is successful or otherwise in proportion to the aptness of the operator. If a motor car is kept in a filthy condition its passengers will invariably have their clothes spoiled. Yet we know that millions of fastidious people travel in cars without complaint. Just in the same way, a well-kept milking plant can turn out clean milk with a phenomenally low bacterial count. Careless workers will produce dirty milk just as readily without a machine as with it.

One also hears alarming stories about the transmission of disease from one bag to another through the medium of the teat cups. The careful operator, who dips them in a disinfectant and rinses them after each cow does not experience such trouble, which is just as common where hand milkers do not take precautions. As to relative yields, there are plenty of cup-winning herds to vouch for the high outputs that can be attained with a machine. Progress has been such that one has not much difficulty to-day in finding a good milking outfit. The various makers have each some speciality in construction on which they base their individual successes. Materials used in construction are being constantly improved, and there is generally very little trouble nowadays with teat cup liners or other rubber parts. Stainless steel is very widely employed in bucket construction and assists in easy maintenance.

The essential components of the machine—the vacuum pump, controls, pulsator, teat cup claw, and so on, may be applied in any one of several ways. There is the bucket plant which is a permanent fitting in a cowshed of the type in which cows are tied and are milked. This is the oldest standard application.

More recently, in order to meet the situation where cowstalls are not up to modern standards for milking, but are good enough for sleeping quarters, the releaser plant has been introduced, for installation in a special milking building, to which the cows are driven in batches. No buckets are employed, the milk being drawn through tubes and delivered into the dairy section. This system has much to recommend it. It allows of complete handling of the milk without exposure to the air, it economises in capital outlay, and in labour, while milking is done in a perfectly clean atmosphere.

Such plants may be fitted with a device for recording individual yields at will, so that they suit the breeder of milk-recorded cattle.

The system of outdoor milking in movable bails, as introduced by Mr. A. J. Hosier some years ago, has spread into a number of districts since and has been responsible for some very interesting developments in practice. The system incorporates a standard milking machine plant in the bail and, as the outfit is moved frequently to fresh ground, the risks of contamination of the milk are minimised. In some cases the herd is kept out on the open ground all the year round, but if conditions are such as to render this impracticable, one can still make use of the bail in winter.

A DAIRY SHORTHORN HERD IN THE CENTRE OF SALISBURY PLAIN NEAR IMBER

In such cases it is usual to locate the bail close to the buildings where the cows are lying in, and drive them to be milked in batches. This again overcomes at low cost the problem of those whose buildings are not suitable for milking by modern standards.

AN 8-FOOT CUT MASSEY-HARRIS POWER BINDER IN A HEAVY WHEAT CROP

NEW MACHINERY FOR THE HARVEST

The Tractor-Drawn Power Binder

WHILE plans for the coming harvest will in general have been made somewhat earlier than this, many people will defer ordering new machines until they have had the opportunity of looking around the latest types at the bigger shows. It is not wise to delay any later than the beginning of July since a rush of late orders may easily absorb all the available machines.

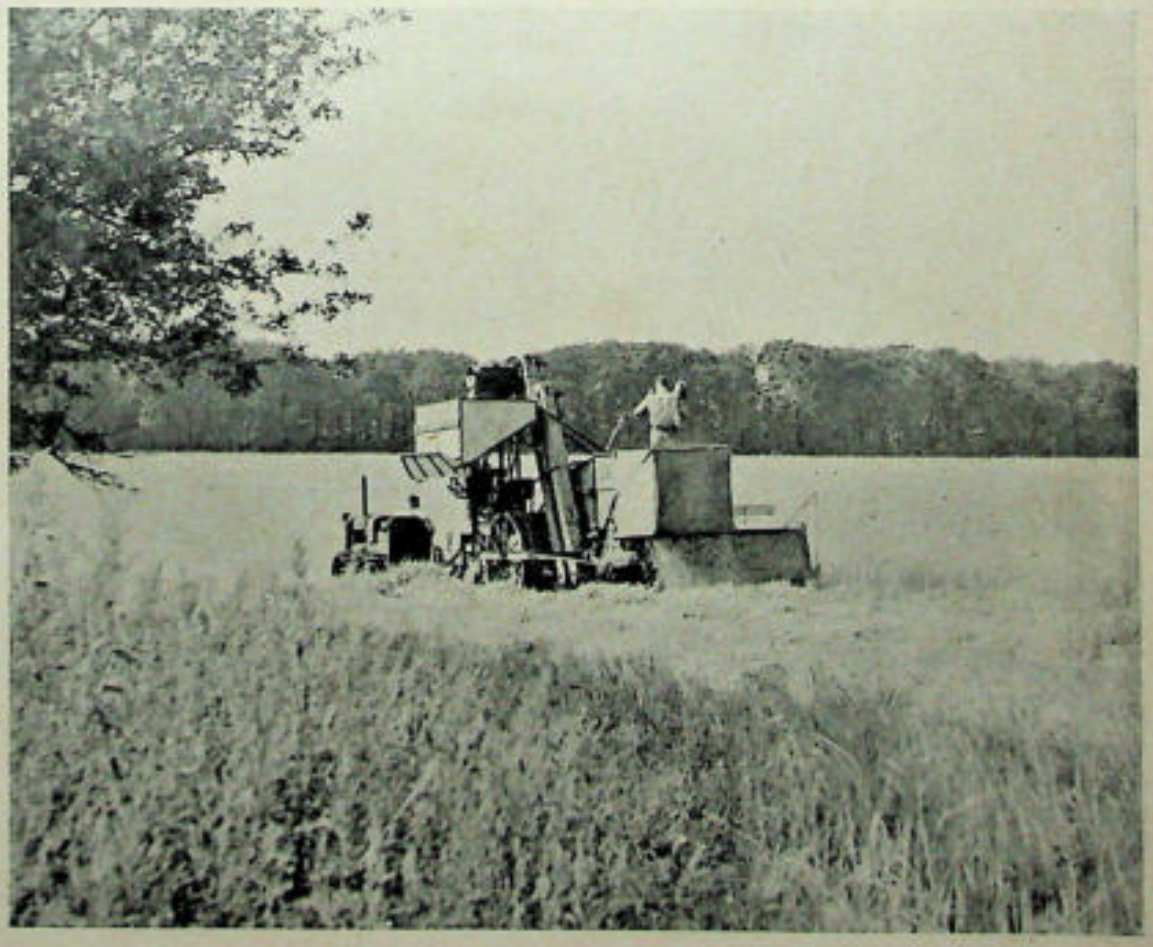
Ideas on the harvesting of the cereal crops have undergone considerable changes during the last few years. The difficulty of obtaining casual labour for seasonal operations and the impossibility of carrying a large staff on the majority of farms has led to a general search for means to get in the crops with the least requirements for man power.

There are some who have yet to acquire practical experience of the tractor-drawn power binder, but when they have once seen the advantages as compared with the older pattern deriving its power from contact with the ground, they will soon appreciate the difference. The power-drive type can be had with cuts of up to 10ft. and an 8ft. cut is common. Even in these large sizes the binding mechanism is capable of handling heavy English crops, much, indeed, to the surprise of the sceptics. What is more, such machines will operate regardless of the state of the land and can be put to work as soon as rain has dried off the corn. The ground below may be still much too wet for a horse-drawn binder to operate. The best-known makes now on the market include the International Harvester Company's McCormick Deering, the Massey-Harris and the Albion, while the recently introduced Lanz has found a number of friends. This was the first pattern to employ rubberised canvases and this innovation is likely to spread to all machines of this type wherever found.

It is a frequent source of trouble in ordinary canvases that failure to slacken them at night and when they are likely to become damp, causes shrinkage and the over-straining of buckles and stitching. The rubberised type is impervious to weather conditions and requires no attention in respect of tensioning devices.

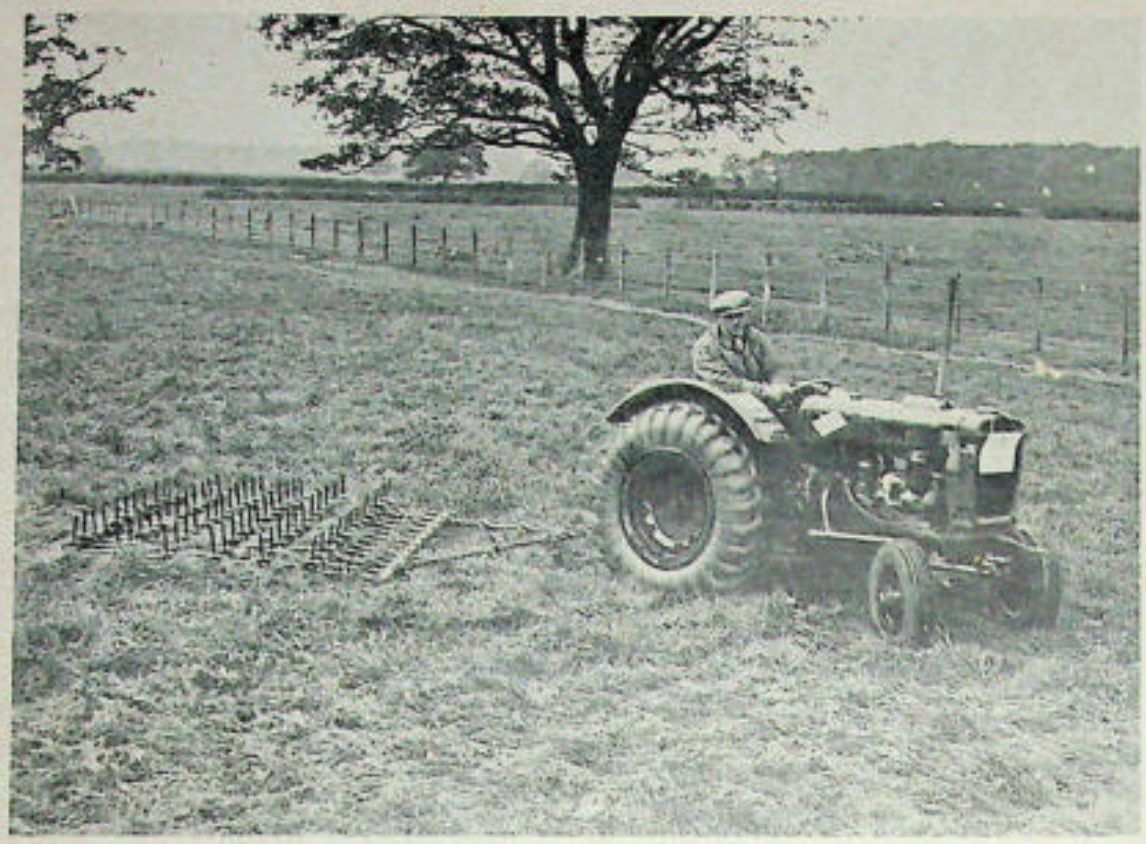
In view of the complex nature of the mechanism of the binder, this is one of the machines in which the advantage of pneumatic tyres is more than usually obvious. If one operates a binder on steel wheels over the hard-baked ground often encountered in harvest time, one can easily see that many breakdowns are directly traceable to vibration. By mounting the machine on rubber tyres this trouble is cut out and the saving in time, losses and cost of spares may easily be recouped in the first season. There is also a substantial reduction in the draft of a machine mounted on pneumatics and quite a small tractor will easily haul and operate an 8ft. cut machine so equipped.

The reaper-thresher has now become accepted as a standard machine in this country, many of the suppposed difficulties having been found to be non-existent. The range of sizes is now such that the question of high cost does not loom so large as at first. In any case it must be remembered that one is getting two machines in one and that the threshing unit is comparable in its output with that of a standard threshing machine drum, for which one would pay as much as or more than the cost of a reaper-thresher. The latter machine can be used in winter for stationary threshing and used in conjunction with binders, will save the cost of hired threshing outfits.



The leading American harvesters are available on this market and are selected as to models by their markers with a view to their suitability for this country. The makes include the Massey-Harris, the Case, the International and the Allis-Chalmers, the last-named having out the first of the 5ft. cut machines built. This model is suitable for many of the medium-sized farms in this country, having a sufficient capacity to deal with something like 200 acres a year and costing not much over £200. This firm has produced an even smaller machine with 3ft. cut which has already become popular in America on the family farm.

With 12ft. cut machines such as built by the firms mentioned above, many of our farmers have been handling over 400 acres of grain in recent seasons. These machines are driven by their own motors (another big item to set against the cost of a standard thresher) and are merely dependent on a tractor for haulage. It is necessary to provide one of adequate size, for the reaper-thresher of big dimensions is correspondingly weighty and calls for at least 25 h.p. on the drawbar to keep it going comfortably.



Some of the 8ft. cut machines are made available with or without a motor for their operation; the power take-off shaft of the tractor being utilised for driving if a motor is not provided. The individual circumstances of the farm must rule the decision in such cases. If a really powerful tractor is available for operation, it may be possible to cut and thresh an 8ft. swath satisfactorily without an auxiliary motor, even in heavy crops, but where there is any doubt about the capacity of the tractor and crops or going is likely to be heavy, it is better to spend a little more and make certain of successful operation.

The conditions under which most people farm in this country render it generally necessary to put in a drying plant along with the combine, although many have got through several seasons quite happily without one. The drying plant is too apt to be used as a means of getting rid of moisture from grain which has been cut too soon, whereas it should be left for combining until dead ripe and dry enough to mill without artificial treatment. The drier should be looked upon only as something to get rid of superficial water and for this reason there is much to be said for placing reliance on a cold blast from an ordinary winnowing-machine. This is all the drying plant that has been used by a number of good practical men in the drier districts of this country.

A COMBINE HARVESTING MACHINE WITH AN INTERNATIONAL SET ON A CAMBRIDGESHIRE FARM

"A NUMBER OF MOST EFFECTIVE TOOLS HAVE BEEN DEVISED"

GOOD EQUIPMENT FOR GRASSLAND

Many New Effective Tools

THE neglect of old pastures and the tumbling down of arable to so-called grass during the post-War years has resulted in millions of acres of land becoming of little or no value for any purpose whatsoever. The recent announcement of a State subsidy for the ploughing-up and cleaning of such land for re-seeding is an attempt to meet the problem.

While the policy may be successful from the national point of view inasmuch as the anticipated acreage may be dealt with by farmers who are in a position to do so, it will, nevertheless, be true that huge areas will still remain because of lack of tackle or other facilities. In most cases it is possible to bring round grassland to an improved condition without breaking it up completely.

A number of most effective tools have been devised, chiefly for tractor operation, by means of which it is possible to open up an old turf, allow aeration to take place and so to eliminate the moss and foggy growth which has frequently taken charge. Furthermore, such treatment will break through the impervious layer at the surface which frequently causes water-logging and will allow the water falling on the land to penetrate. It has been demonstrated that in addition to this surface work, valuable results may accrue from straightforward subsoiling with the same tool as used on arable land.

Drainage is, of course, a matter which often calls for first attention and if the methods for opening up the surface in conjunction with subsoiling do not improve matters one may achieve the desired end by mole draining. It is, of course, assumed that everything possible will have been done to clear any existing drains. Mole ploughs may be drawn direct by a sufficiently powerful tractor which should be a crawler, or by a light tractor equipped with a winch. Such winches may be built on to the tractor; but one, the Fishleigh, is a very convenient pattern, self-contained for drawing behind the tractor, coupled up to the power take-off shaft. The Heudon winch and mole plough is a popular type for the Fordson; while for general use several mole ploughs are made by Messrs. Ransomes, Sims & Jefferies.

One of the earliest to devote attention to cleaning and aerating grassland was the firm of Wilders of Reading, whose Pitch Pole harrow is now a standard tool for the job. This is self-cleaning and with forward pitching tines, can be given any desired degree of penetration. It cuts into the turf and breaks the surface hide at the same time tearing out coarse grasses and moss and cutting through the grass stools. Such a tool worked across and across, will break up even the worst fields and one cannot black them over too much. Subsequent growth will be much finer, and if controlled and encouraged by proper liming and manuring will develop on nearly every occasion into a decent herbage.

The self-cleaning grass harrow made by Bamfords of Uttoxeter is another machine which has given satisfaction in this class of work. It incorporates vertical tines with a rising and falling action on the tine bars which enables them to be constantly cleaned while in action as they are raised alternately against a stripper which removes any rubbish adhering. They are more closely set than the tines of some other implements and are capable of very thorough work.

Messrs. Listers have also produced fairly recently their Grass Comb harrow, which is built up in sections, several of which may be coupled together, so that the width covered may be varied to suit the power of the haulage unit, whether horse or tractor. Each section has its own cleaning device, in which a cam type lift brings the tines out from time to time, giving them a movement which throws off the matter adhering.

A great deal of the work at the well-known Cahn Hill experimental station in North Wales has been done with the help of a tractor-driven Fishleigh cultivator, which is a rotary-type machine, equipped for this purpose with straight knives. As this is drawn over the land it will cut through any rough material on the surface and at the same time create, as it were, a surface tilth on which may be sown any renovating seeds mixture considered desirable. In this way an effective result may be achieved in one traverse of the land.

For lighter work following the types of machine mentioned and for conditions where less drastic action is sufficient from the outset there is a good range of flexible harrows of different patterns. Among the firms that have specialised in this field for a very long time may be mentioned Parmiters, who produce a good selection of chain harrows for the grass farm and include very wide models for tractor haulage. Then the Lancashire firm of Aitkenhead has become well known for its Ripper harrows, in connection with grassland improvement. The chief feature of these harrows is the inclusion of renewable sharp tines located at the junctions of the links. Another well-known pattern is the Ransomes Dagger harrow.

Much of the land that has gone wrong has done so very largely because of understocking; and there is often a need for compression after the rubbish has been removed. One may secure a variety of tractor- or horse-rollers for this work; the advantage of the tractor types being their increased width which may be equal to three of the single horse-rollers. The units are coupled together in such a way that they run behind one another for travelling along roads and open out to the full width for work.

As compared with ploughing out and re-seeding, the methods outlined above have the advantage that all over the ground one retains alive innumerable plants or portions of grass plants which, when rolled in and consolidated, will give a certain sward of the finer varieties. If one ploughs and destroys all the grass, the production of a fresh sward is entirely dependent on the expenditure of a considerable sum on seeds and the success of their take.

AN EARLY THRESHING SCENE ON A FARM NEAR ALTON IN HAMPSHIRE

STATIONARY POWER ON THE FARM

A Very Wide Range From Which to Choose

THE stationary power requirements of the estate and farm are so multifarious that it is not surprising to find a very complex range of prime movers has been evolved to meet the demand. The would-be buyer has to-day a choice among petrol, paraffin and heavy oil internal combustion engines, as well as electric motors, and the size can be accommodated to an almost unlimited range of needs.

In tackling the problem of powering the farm, it is well to consider at the outset what use can be made of the tractors that may be on the place for belt work. A pulley either is, or can be, installed on most, and there is every reason to make use of this whenever possible. That is to say, for work which can be done at times when the tractor is not much needed for haulage purposes and for jobs on which it will be economical. Most tractor motors are capable of giving off something not much less than 20 h.p. at the belt, and while many modern machines are very economical at low loads, it would obviously be extravagant, for example, to put the tractor to drive a cream separator. On the other hand, it would generally be poor policy to buy a 20 h.p. stationary engine to drive a thresher on a farm where a tractor was in use.

The various classes of prime mover have certain characteristic advantages which fit them more particularly for one class of work or another, and these should be borne in mind when buying. For fractional horse-powers there is no question as to the superiority of electric power, and to this must be added the advantages of silence and cleanliness, two very important factors in dairy work. As such call for motors to handle light loads like cream separating, churning and operating milking machines, it is not surprising to find electric power popular with many dairy farmers.

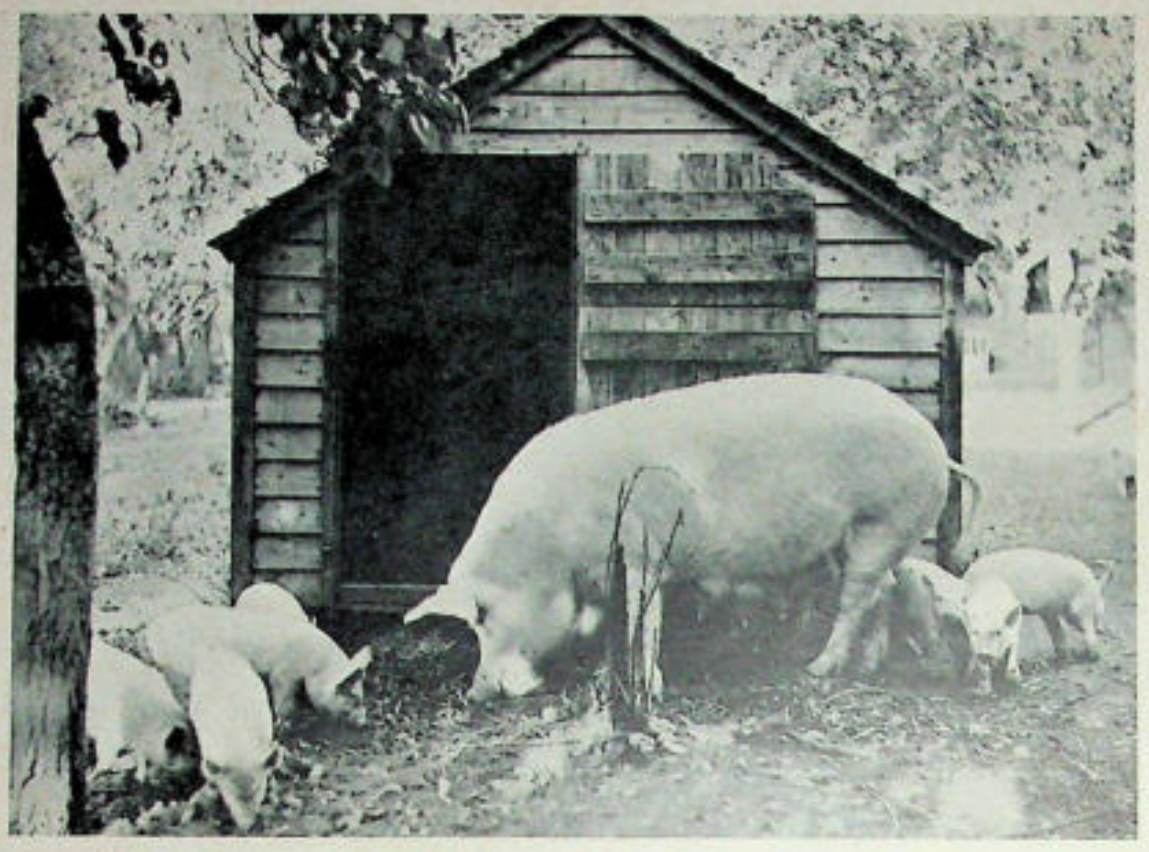
Although electricity can claim these points, along with simplicity, convenience and low first cost, the electric power unit is tied to a source of current supply, whereas the internal combustion engine is fully portable or may be self-propelling. Hence its general popularity. Quite small sizes, such as the 1½ h.p. types used for operating elevators, are efficient and in common usage, so that an economical plant can be found for most purposes. The cooling problem has also been tackled by several makers, and satisfactory air-cooled patterns in the small sizes have been produced, such as a recent range from the Petter factory. In the small sizes, petrol or paraffin may be the standard fuel.

When one reaches a power output of 4 or 5 h.p. and upwards it becomes worth while studying to economise on fuel costs, especially if the engine is in regular daily use, and as a result the makers have given much attention during the last few years to the production of Diesel type stationary farm engines of 5 h.p. and upwards. As is generally known, these employ higher compression than other internal combustion engines, and fuel is injected instead of being drawn in under atmospheric pressure. Although the starting of a large Diesel motor may present some difficulty, this is not true of these smaller types which are distinguished for easy starting and regular running.

One of the first of these to become generally popular was the Lister, of which large numbers are now operating. They have been further improved by the introduction of the Listard process for hardening the cylinder walls to promote long wear, and this system is now shared by the Blackstone range of engines, which are also noted for their reliability and trouble-free running. A series of Diesel-type stationary farm engines which has attracted quite a lot of attention is that built by Fowlers, of Leeds, to meet the requirements of most farm loads, from 3½ h.p. upwards.

The name of Ruston & Hornsby is another standing for an old-established reputation in farm power. This firm has for many years specialised in making cold starting heavy oil engines, and many of their units are driving both large and small installations. A unit such as their 20 b.h.p. horizontal engine is a favourite for heavy duty work where a fixed engine is required.

When one has occasion for a large power output to be utilised in a number of different ways, the question of putting in an electricity generating plant is often worth considering, for one can sometimes produce current at a lower cost than is charged by public supply companies, and the power can be distributed from the main plant for use through electric motors where direct application is not feasible.



Such an installation might consist of a heavy duty engine, employed for some large power job directly, *e.g.*, grass drying or milling, and at other times driving a dynamo for charging a battery. From this would be drawn current for lighting and for operating such items as a milking machine, pumps, and shearing or clipping machines. On such an installation the power uses by small motors should not be excessive, but they do represent a convenient way of breaking down the output of the prime mover to smaller proportions.

The small compass of the electric motor is a reason why it is frequently built in as a part of the machine which it is to drive, but apart from this application one can buy motors which are designed to be fixed to a ground base for belt driving, or fastened in any suitable position which may be convenient, such as to an overhead beam. Others, again, may be portable, and for this usage may be mounted on skids or on a wheeled barrow. The General Electric Company, some time ago, brought out a portable known as the Drumotor, in which the motor forms the centre of a drum which can be rolled about from place to place, with the cable wound around the motor—a neat and practical arrangement.

Electric motors are simple to operate, call for little attention, and if of good manufacture are very reliable. If anything goes wrong with this class of apparatus there is little that can be done by the farm staff to remedy matters, and from all points of view it is most desirable to see that installation is in the hands of a first-rate firm since this part of the work has a great influence on subsequent safety and trouble-free operation. W. S.

THRESHING WITH AN ALLIS-CHALMERS ROW-CROP TRACTOR

A SOW AND HER LITTER HOUSED IN A GROOM GENERAL-PURPOSE HUT UNDER ORCHARD TREES

PIG HUTS AND POULTRY FOLD UNITS

Advantages of the Open-Air System

FOR the purposes of pig and poultry farmers who intend to pursue their operations over a considerable period on a comparatively large scale there is much to be said for the construction of large and permanent buildings. Among these the Scandinavian type pig-fattening house is an outstanding example of the way in which a specialised building may effect economy in the use of labour. In such a building one man is able to look after as many as 500 pigs single-handed, or with slight occasional help.

There are many, however, who for various reasons, do not wish to depend too much on such permanent buildings, and there are very many and sound reasons in favour of portable or mobile structures for the housing of both pigs and poultry.

It is recognised that while most arable land is in need of animal manure for the maintenance of its fertility, the cost of transporting it from the farmstead and spreading it on the land, renders such applications uneconomic for many. The solution of putting the animals on the land to spread the manure by natural dropping is worth pursuing in every possible direction. Its advantages are greater than the simple matter of manure distribution.

As regards the conservation of manurial value the system has no equal, since the volatile ingredients are immediately absorbed without the loss which is inevitable where manure is removed from buildings. Then, the action of the animals or birds on the land itself is beneficial in destroying many weeds and insect pests, and on light land the consolidating effect itself is of considerable assistance to succeeding crops. So much for the land. What of the animals themselves ?

The supreme advantage of the open-air system is the fact that the stock is brought away from old buildings which may be infected with disease organisms which have accumulated through years of intensive stocking, and with frequent moving spend their time on clean land in the healthiest possible conditions. The growing of crops for their support and the subsequent production of cash crops which have been manured largely by the folding, is a modern version of an old-established practice, for which we have still to find a better substitute.

Modern methods of construction are very largely responsible for the equipment which renders it practicable to house thousands of birds in folding units and move them daily at very small cost for labour. Similarly, the pig hut as constructed to-day is extremely handy.

Timber huts for use in the open are made by a number of firms. Many are on skids and suitable for shifting with a pony or behind a car or tractor.

In other cases they are provided with pneumatic-tyred shifting trucks. These have lengthy handles attached and can be slipped in place under a hut or run very readily. The operator, then using the leverage of the handles can raise the pen and move it without difficulty. Such a system avoids strain on the hut and cutting up of the ground, should the plant be used in a grass field.

The majority of these huts are of a general purpose character which is all to the good, since they may be used for stock of any age and for all purposes. Some pig farmers will keep their breeding sows in the open, move them to a special farrowing house for the birth of a litter and then take them out again. Others prefer to let the sows farrow in the open-air hut, and contend they get better results from this practice.

Some, again, run out their weaners for a time and then bring them into a Scandinavian type house for fattening. Others fatten in the open, and allow the pigs to inhabit the hut throughout their whole life.

In conjunction with the hut, some means of keeping the pigs within bounds is commonly considered desirable. For open field work a set of easily movable hurdles may be employed, although some makers combine a hut and run in one unit and move the whole on wheels. This latter system certainly saves much time in shifting. The enclosure is smaller, and shifting must be done every day or two. With a larger hurdled enclosure, one may make the move at weekly intervals.

For the brood sow, the tethering system has gained considerable favour, and operated in conjunction with the hut it renders unnecessary the erection of a fence for the sow with a litter, since the youngsters usually keep within a fair distance of the mother.

The practice of poultry-folding has extended very rapidly in certain districts. On the Cotswolds, for instance, one may find numerous examples of flocks running into many thousands, which are assisting in building up the fertility of the thin soils locally encountered. There are many other districts where the fold has not yet been adopted, and which would benefit rapidly from such a system.

A very large range of different patterns exist for house-laying hens, in which are incorporated all the necessary fittings, such as nest boxes, food and water troughs, broody coop and slatted floor.

In a number of examples the units are supplied with transport wheels fixed permanently in place. Others are provided with shifting gear which can be applied to a series of the units one after the other. The nature of the land will determine the most suitable type.

The cost of housing in this way is moderate, since a house and run for, say, 20 birds can be bought for little more than £4 or about 2s. per bird. The cost of feeding in the case of both pigs and poultry can undoubtedly be reduced to a minimum under this system if they are folded on clover leys, lucerne and similar crops. After harvest, both types of stock may be put out on stubbles and glean a considerable portion of their food which would otherwise be wasted.

A TYPICAL BEDFORD DROP-SIDE LORRY ON MARKET GARDEN HAULAGE

TRANSPORT FOR CROPS AND STOCK

The Wide Influence of the Land Tyre

QUITE a cursory examination into the tonnage of our crops produced per acre, and the distances which many of them have to be transported, either to the yards or to market, will reveal the immensity of the agricultural transport problem. The difficulties are aggravated by the fact that all this material, running into many millions of tons over the whole country, has to be carried over land which is often soft at the time, and over farm roads which are far from smooth. All these factors add to the cost of transport, and, one, the ground condition, may be bad enough to cause cessation of haulage in wet weather unless modern types of equipment are in use.

The coming of the land tyre has made a great difference to the problem of internal farm haulage in a very short time. The H.D.V. tyre has meant the production of lower loading carts and wagons which, with a lighter effort by the horse, will permit the haulage of heavier loads over soft ground.

The saving of damage to the land surface is also a matter of the greatest consequence, and the general popularity of these tyres is now such that in all parts of the country one can find firms producing new vehicles which depend for their construction on the H.D.V. wheel.

Similarly, the production of trailers for tractor haulage has become generally practicable since the development of the land tyre. Many firms are specialising, and one may note the range of trailers, tipping and otherwise, put out by Whitlock Bros. of Great Yeldham and by Wilders of Reading, to mention only two. In each case, good loading space is allied with a weight-carrying capacity sufficient for most general purpose tractors, 3-tonners being an average. The rapidity with which one can handle large tonnages of crops or manure effects a substantial reduction in the cost of harvesting or manure carrying.

When one comes to consider the problems of farm haulage on the roads many factors must be considered. It is not generally the desire of farmers to employ their tractors for long-distance work on the road. For one thing the speed is too low, and for another, the machine may not always be available. What is generally desired is to use a tractor for moving harvest loads on the road from field to farm and sometimes to fetch or carry to the nearest station. On rubber tyres the tractor can do this work with advantage to the owner and effect a reduction in wear and tear on the roads as compared with horses.

With a farm truck, however, the agriculturist can go any distance he desires at speeds up to 30 m.p.h. and at a reduced taxation rate, if the machine is used solely for his own farming purposes. Thus it is practicable, and often very advantageous, to carry cattle to butchers in distant towns and deliver them on contract at regular intervals, in place of driving them to the local market. The pedigree breeder finds the livestock lorry invaluable in show work and in delivering stock to purchasers. Arable work may involve taking potatoes or beet to factory or town, while the uses to a big producer of milk are obvious. One must always include, too, the fetching home of fertilisers and feeding stuffs, jobs which fall to the lot of most farm trucks.

The type of vehicle to buy is a matter which must invariably depend to a large extent upon individual needs, but it must be remembered that construction and use enter into the taxation and speed regulations. A vehicle unladen must not exceed 5cwt. if it is to qualify for a permitted speed up to 30 m.p.h. and a tax of £30. Hence makers have studied to reduce unladen weight to the minimum. In spite of this, it is possible to obtain trucks which will carry 4 to 5 tons on such a chassis. A very favourite capacity for general farm purposes is the 3-tonner, and the most commonly used style of body is the drop-side open lorry type.

Such trucks are standard models of all the leading manufacturers, including such well-known firms as Morris-Commercial, Commer, Bedford, Austin and Ford. Others who specialise in this class of vehicle are Dodge, Reo Motors, International and Chevrolet. In most cases, it is possible to obtain from the makers, trucks carrying cattle and general livestock bodies; but where such are not standardised one can always draw on the services of one of the specialist body builders catering for this market.

The possession of a truck with a livestock body enables one to do a much larger variety of jobs, since many such trucks may be converted to open lorry style without any difficulty. In that guise they may be extremely helpful in harvest or similar work for bringing in bulky loads.

It is worth while inspecting the products of several of the cattle truck specialists, since a variety of bodies have been evolved. For the carriage of cattle only one-deck loading is practicable, but if and when one desires to transport calves, sheep and pigs, the smaller units enable the builder to offer double-deck loading and consequently provide a bigger capacity. Considerable ingenuity is shown in the provision of detachable floors and of loading ramps up and down which the stock can be driven. In some formations, a mixed load may be carried, utilising a half-deck. There are strict regulations about the construction and use of these vehicles, and expert knowledge is desirable.

On the farm itself, the truck can offer very useful service as a means of helping out in rush periods, not only on haulage, but also for operating such implements as harrows, rollers, &c. During haying, it is naturally an excellent vehicle for carrying when worked in conjunction with a hay-loader and, in addition, it is frequently called into service for use with a hay-sweep. The attaching of one of these car-sweeps is a very quick process, and as it can be equally quickly detached, one need not interfere with the use of the truck on the road, except for such time as it may actually be required on the field. It is noteworthy that loads of hay or corn, ride much more steadily on a truck than on an old-fashioned, solid-wheeled wagon, and can be loaded more quickly in consequence.

HAULING IN PEAS WITH A FORDSON AND TRAILER

EXTRA SPACE FOR CRATES HAS BEEN PROVIDED ON THE ROOF OF THIS MORRIS

RETAILING FARM PRODUCE BY VAN

An Increasing Use for a Variety of Products

THE growth of the producer-retailer movement has been one of the leading features of post-War farming development, and it is safe to assign the chief credit for its success to the up-to-date light motor-van. Its cheapness, speed and load-carrying capacity, have brought thousands of farms within easy reach of one or more sizeable towns and made it possible to retail direct from holdings which were formerly considered to be isolated.

The chief product handled in this way is, of course, milk, but other perishable articles are being sold to an increasing extent on similar lines. There are many estates on which milk production is practised which are operating considerable fleets of light vans and carrying on very extensive businesses. The principal supply of some provincial towns is to-day often derived from such sources.

There is an ample choice of vehicles for those who intend to pursue this form of marketing. The selection must be finally determined by individual circumstances. One factor is the distance to be travelled on each round. Where one has all the customers within a radius of, say, five miles, the job can usually be done effectively with one or more vans of a capacity of 5cwt., since if necessary the distance from home is not too great for the van to come back and reload when its first consignment has been deposited.

There is another condition where one has to run a fair distance to town before delivery commences, and here, for reasons of convenience, it is commonly desirable to select a van capable of holding all that is needed for one delivery. A good margin of power and strength is also more desirable in such a case because the van will daily run a fair distance at its top speed with a full load. It not infrequently happens that the chief difficulties attendant upon selecting a van for this work are due to the changing needs of the business as it grows. The case just mentioned is typical of a partly developed farmer's retail milk business. All going well, the time will come when he can no longer carry everything for delivery in one van.

The next stage is to establish a sufficient number of small vehicles in the town area, giving to each a round of convenient dimensions and to feed these small vans with supplies of bottle crates carried by a large vehicle.

Practically all of the makers of the popular passenger cars are able to supply commercial light vans based on their normal chassis. Such vans are usually of a capacity of from 5cwt. to 15cwt. Thus we find in the Morris range a 5cwt. and a 10cwt. van, while a 15cwt. vehicle is made by Morris-Commercial. Austin do three small vans with pay load capacities of 5cwt., 6–8cwt. and 8–10cwt. Other well-known types are Commer, Bedford, Ford and Singer. Most of these are standardised with rear opening doors and access to the interior from the driver's seat, while ventilation is usually well studied.

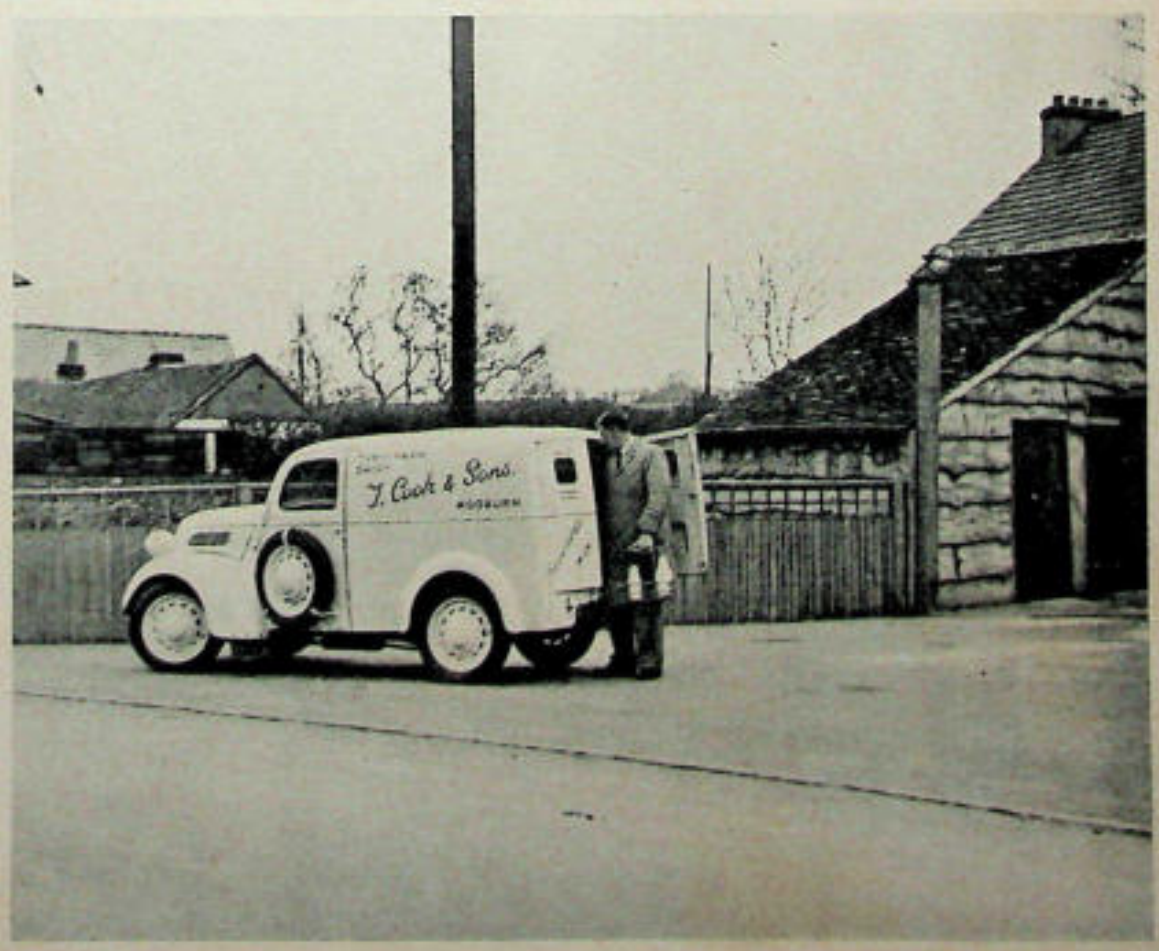
For use entirely in towns it is sometimes worth while to examine the advantages of electric vans, particularly where local facilities for battery charging are good. Among these are the following well-known makes: Electrican (5cwt. and 10cwt.), Victor Electric (6cwt. and 8cwt.) and Morrison Sewt. The general air of cleanliness and the silence of electrics are always an asset in the dairy trade.

It must be remembered that in working up a retail milk round one is up against very strong competition, and that every art of salesmanship must be employed—and that without spending extravagant sums. The van which carries on delivery is not only a valuable advertising medium if used as such, but occupies such a key position that if it is unsatisfactory in character it will quickly nullify efforts made in other directions. Therefore, it must be well finished and carry a suitable sales message, to be seen by thousands daily; it must be kept perfectly clean, and it must be well maintained mechanically. Delays in delivery are fatal and the driver should never have to dirty himself by carrying out repairs on the road.

While the retailing of milk has been stressed—since it is of the most exacting nature—there are several other items of produce in which good retail rounds can be worked by van. These include eggs and dressed poultry, vegetables and fruit; and in every such case, the fact that the roundsman brings the atmosphere of the farm to the customer's door, has a selling value that must never be overlooked. This, coupled with the freshness which should be the major advantage of such produce, is what is mainly responsible for the business being able to compete with the shops in any district.

R. L. S.

BREAKING UP GRASSLAND



Tractor Users' Panel

Under the scheme recently announced for encouraging farmers to break up and clean old worn-out pastures, the practical difficulty arises that many who have a good deal of such land have not the necessary power to undertake the additional work of ploughing and cultivation involved.

In order to meet this situation, the Tractor Users' Association has formed a panel of its members who are able and willing to undertake such operations for others, at an agreed charge. By this means it should be possible to utilise many tractors and implements which might otherwise be standing idle for a period when the work on the owner's land is finished.

The association will be pleased to receive the names of other tractor owners who are in a position to offer assistance in the campaign, and to receive inquiries from farmers who wish assistance with the work of breaking up their grassland. Wherever possible they will be put in touch with the nearest member of the Tractor Users' Association who has the necessary tackle.

Inquiries should be addressed to the Secretary, The Tractor Users' Association, 2, Chesham Place, London, S.W. 1.

A FORD 5CWT. VAN OPERATING ON A FARMER'S MILK ROUND

WELL CUT YEW HEDGES IN A BUCKINGHAMSHIRE GARDEN

The Country House

THE JULY KITCHEN GARDEN

By ELEANOUR SINCLAIR ROHDE

IF July is the month when most of the choicer vegetables are at their best it is also the month when we have to provide for choice vegetables in autumn.

Carrots, Turnips and Beet have to be sown for a supply of young roots in October, saladings for autumn use and various catch crops. In this household we are very appreciative of garden Swede sown this month for use in November. These Swedes are commonly sown in May, and they are at their best when least wanted. Tough, stored Swedes are not very palatable, but sown now they are delicious either as a vegetable or for Swede soup in November. Laing's Garden Swede is one of the best. As with Turnips, it is essential to thin out as early as possible, otherwise the crop will be worthless. Thinnings, chopped up finely, are quite a good addition to salads. Nearly every seed germinates, so it is as well to sow thinly. The drills should be 18in. apart.

The best recipe for Swede soup that I know is to boil the required amount till soft, rub it through a sieve and to every eight parts of Swede allow one part raw grated Onion. Add milk to reduce the mixture to the consistency of soup, and when almost but not quite boiling add the yolk of an egg and a little butter, also finely chopped Parsley or any herbs seasoning, such as Chervil. Strongly flavoured herbs, such as Sweet Marjoram or Sage, have to be used with discretion or they dominate instead of improving the flavour. If the egg yolk is added to the soup when boiling it will certainly curdle.

The most important saladings to sow are Endive Radishes, Parsley, Lettuce and Pe-tsai. We are still curiously unappreciative of Endive in this country, whereas in France it is in universal request. I think this is due to the fact that the blanching involves labour. Further, once blanched, Endive has to be used quickly, otherwise it soon decays. I have recently been sent from France seed of a self-folding Endive and am keenly anxious to see if this comes up to its reputation.

Endive requires a rich but very well-drained soil, and on heavy ground it is advisable to have a raised bed. But, on the other hand, through the growing season this vegetable must never suffer for lack of moisture. Full sun is essential. Sow in drills 6in. apart and barely cover the seed with soil. Prick out the seedlings when large enough at least a foot apart, or the plants may be thinned out. Blanching should begin three months after sowing, the simplest way being to cover each plant with a flower-pot, putting tiles over the holes to exclude all light. In winter the best way is to lift the required number in succession, plant them closely in boxes of soil, cover with boxes of the same size and keep in a cellar till blanched.

In regard to Radishes, why are we so conservative? I think I have before mentioned the black Spanish Radishes which make roots the size of Potatoes. They can be stored in sand like Carrots. Few people seem aware of the fact that Radish pods, while the seeds are still green, together with a suspicion of mayonnaise sauce, make an excellent and unusual filling for salads. Far more pleasing, I think, than the flavour of the root. All Radishes have to be quickly grown, and either very heavy or very light soils need the addition of plenty of humus. It is interesting to note that Radishes are now becoming rather fashionable, whereas formerly it was only cottagers who appreciated them. Curried Radishes are excellent.

Pe-tsai, one of the Chinese Cabbages, is a valuable salading for use in late winter. Last winter we were picking the leaves up to the end of December from plants growing in a very exposed part. Although a true Cabbage, Pe-tsai, when cooked, is anything but attractive. Pe-tsai can be sown successfully only this month. Sown in spring it invariably runs to seed when only an inch or so high.

In regard to Lettuces everyone has their special fancy in regard to the varieties that are best to stand one winter. In my opinion the old brown Bath Cos still takes a lot of beating, and for sheer hardiness commend me to Stansted Park. In the severe cold of last winter Stansted Park was the only one in our garden that came through in perfect condition in the open. These Lettuces should not be sown till the end of the month to stand the winter, and even a little later in mild parts. Success with these Lettuces depends in no small measure in keeping the soil round them well aerated through winter, but this has to be carefully done not to disturb the roots. Left in caked soil, the plants naturally suffer badly.

Every scrap of vacant ground should be planted up with Broccoli, Leeks, Collards, &c. It is a very short-sighted policy to leave beds under Spinach, &c., merely to secure a few more pickings when the space could be much more profitably used. Leeks are invaluable, for they take the minimum of space, require little attention and stand up to the worst weather. I am, of course, not referring to those grown for exhibition, which require as much attention as Celery, but those merely dropped into holes made with a dibber and left to earth up themselves. For all practical purposes they are excellent.

PHEASANT COVERTS

HOW to improve woods from a shooting point of view is a question that perplexes many a landowner. He can secure any amount of advice on the best shape for coverts and their relation to flush points. His keeper will speak of keeping woods open so that the sunlight can penetrate, of not allowing the woods to be so open that they are draughty, of having ground cover.

Further enquiry will bring to light the names of perhaps six or eight plants which can be planted in woods to give cover, and at the same time food for the birds. When a wood has become so dense that ground cover must be introduced, none of the usual prescriptions will grow to a serviceable size, and one cannot do better than plant beech. Of the fruit-bearing species usually suggested, only *Berberis vulgaris, Cotoneaster Simonsii* and common privet are evergreen. These will not grow under dense foliage.

These temporary expedients do not go to the root of the trouble, and what is required is a woodland policy based on game requirements. The forestry of the past generation, which gave us a legacy of timber with underwood beneath, provided conditions very suitable for pheasants. The size of the woods and poor arrangement of coverts usually detracted from the success of the shoots, but the system of wide spaced trees with regularly cut underwood has much to recommend it.

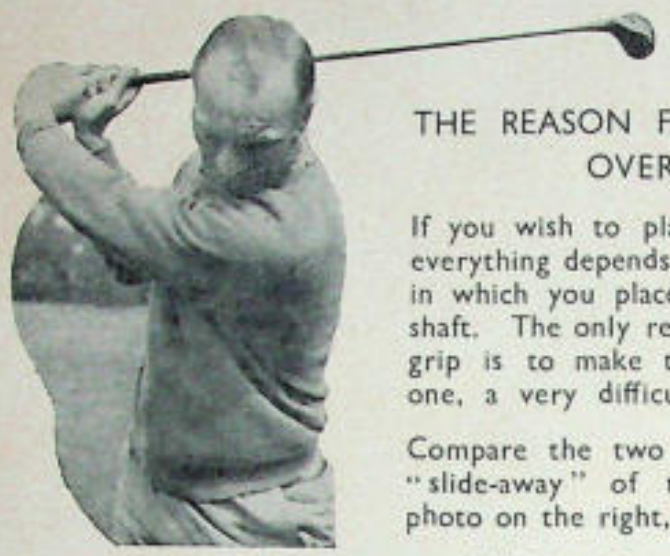
Inability to find persons willing to cut the underwood every twelve years has signed the death knell of a system which, though attractive for shooting, was economically unsound. There is a limit to the area of underwood which an owner can have cut each year for estate use. The resulting overmature coppice has killed the ground cover and given rise to the anxiety of many woodland owners.

The solution is to institute a programme of clear felling and replanting with light-demanding species that will retain their covert value for the maximum possible period. The Forestry Commission grants, coupled with the reclaim of income tax and surtax on the costs of planting and after care, make the operation a profitable one for the owner. In every case it has been found that commencement of a policy of felling and planting has immediately benefited the owner's pocket, as well as improved his shooting amenities.

Suitable species to plant are, on heavy soils, oak, or where the soil is of brick earth, ash, which will also succeed on a fertile medium loam, a soil capable of supporting almost any species. On the lighter bracken type soils, larch, and on the lightest soils of all, Japanese larch and Scots pine. In every case an admixture of 10 per cent of beech is advisable, and ash should never be grown alone. It will succeed alternated with larch, but with a row of beech between each.

A young plantation of one of these species will make first-class nesting during the first three years of its life. After this it will become excellent covert until in its twentieth year the covert value will begin seriously to deteriorate.

For size an average of seven acres, with a minimum of four or five, and a maximum of ten or twelve, will be suitable, provided they are the right shape. A square covert is a nuisance, and oblong is better, with wedge-shape as optimum. Their arrangement in relation to flush points is decided by the fact that each is effective only for 20 years. A conifer is planted to fell at 60 years, a hardwood at 120 years. A light demanding hardwood such as oak or ash requires underplanting at the fortieth year, an operation which will revive the covert value.



It is therefore clear that each flush point should be served by three separate coverts, each planted 20 years later than its predecessor. The clear felling and planting programme in the case of 300 acres of woodlands might involve dealing with five acres each year, thus completing the cycle in 60 years, when the first conifer plantation will be mature. If the woodlands cover 150 acres it is best to plant five acres every other year, rather than two-and-a-half acres each year. This does not mean that until one covert is planted for each flush point the shoot will be useless. Far from it.

Almost of equal importance to planting is the division of the woods by 60ft. wide rides into covert areas of suitable size and shape for serving the flush points. These rides may take two years to cut, but when completed the shoot will be vastly improved. Rabbits will be more easily dealt with, and a reduced number of beaters will be able to drive a higher percentage of birds over the guns. If the owner is lucky enough to possess a central valley, a further improvement will result from clearing this for a width of 200ft. or more, partly as a stand for the guns and partly as a sheltered and sunny place for the birds.

REGINALD DAVEY.

SKILLED ADVICE BY

Archie Compston

THE REASON FOR THE OVERLAPPING GRIP

If you wish to play successful golf, everything depends upon the manner in which you place your hands upon the shaft. The only reason for the overlapping grip is to make the two hands work as one, a very difficult thing to accomplish.

Compare the two photos and notice the "slide-away" of the right-hand in the photo on the right, a common fault in golf.

GERANIUMS, FAVOURITES OF VICTORIAN DAYS, ARE AGAIN POPULAR INDOORS
Here blooms of crimson, pink, orange and white are arranged in a bowl of dark marble

JULY INDOOR FLORAL DECORATIONS

By MARGUERITE JAMES

A MILLION different perfumes fill the July air—jasmines and roses, lilies and carnations, pot-pourri drying in the garden room and currants and raspberries ripening in the kitchen garden. They give us our cue for the house vases; this month we can have both colour and fragrance.

Fragrance can be too assertive, it is true, but with warm days and open windows there is not so much danger in this respect. It is wise not to mix perfumes too freely, and specially wise to be careful over gleanings from the shrubbery. Jasmine, *Osmanthus fragrans*, and myrtle, for instance, are easily tolerated indoors, but mock orange is generally overpowering, except in a very small quantity in a very large room.

July is generous in her offerings of cut flowers, and perhaps because she provides so much good material we can the more easily make mistakes. She offers us giant delphiniums, for instance, and, though we long to use them, there are really only a few places where they seem right indoors. I have seen them massed pleasantly in a huge stone urn immediately under a domed skylight, and also in a copper bucket by a staircase window, but the most delightful and unexpected arrangement of delphiniums that I remember was a boat-shaped decoration on a dinner table. It was mainly of the smaller Belladonna delphiniums, but the low long line of the decoration allowed some quite tall stems to be used in a nearly horizontal position. Side stems from the larger types, and even individual "pips," helped to form the pointed ends of the arrangement, while red maple foliage was the background to the picture.

Delphiniums, by the way, should be cut the evening before they are needed, and set immediately into warm water that comes well up the stems. A slanting cut at the bottom is good, as with most thick-stemmed flowers; it allows water to be absorbed more freely. Another point for delphinium lovers is that when plants are grown in the kitchen garden specially for cutting, the gardener might be asked to take out, early, the central flower spike from some of the plants. This practice results in the development of large, very easy to arrange side-stems, and it also prolongs the season of bloom, as these side growths naturally develop late.

Strangely enough, though delphiniums and Madonna lilies associate well in the garden, they are not so happy together indoors. I prefer white lilies used as the focal point in a green and white decoration, or set alone in crystal vases, unattended even by extraneous foliage. In this way they are lovely for console tables backed by mirrors.

Where blue flowers are valueless but height is needed I find nothing better than the taller antirrhinums. They are surprisingly beautiful with roses of similar tone, particularly apricot shades in antirrhinums with such roses as Mrs. G. A. Van Rossem. White antirrhinums with Frau Karl Druschki roses are delightful in a setting of silver foliage, too. Foxgloves (for loggias, but not in rooms with closed windows, where they are actually poisonous), verbascums, gladiolas, sidalceas and campanulas (*C. persicifolia*) are other flowers useful where height is demanded.

The most popular flower of the month for general purposes is the sweet pea, and the three most popular varieties are perhaps Powerscourt, Patricia Unwin and Excelsior—the last named because it is a good orange colour that lights up well at night. I am inclined to think that sweet peas are never better arranged than on the exhibition bench. They are not good mixers, and the practice of staging one variety in each container, with the stems radiating from one point and the flowers held well apart so that their individual beauty of form is evident, and the use of no more foliage than a few "outsize" leaves from the peas themselves, definitely suits them.

Good mixers are to be found in plenty, however, for those who desire them, and nothing is more delightful than to experiment with Shirley, Iceland and other poppies, scabious, pentstemons, spiræas, love in a mist, phlox, cornflowers, coreopsis, gypsophila, gaillardias, white moon daisies and all the other hundred and one inhabitants of the mixed borders. It is not an easy matter to formulate rules for decorations of this kind, so much depends on an inborn sense of fitness, which some people have more than others. The golden rule is that the mixed decoration must be harmonious, and that, I think, means that the material selected should have some similarity either in tone, in colour, or in form. For instance, a mixed arrangement of all colours should be either of all decided, strong colours, or of all pale, delicate shades. A vase in which one colour is outstanding can have every shade of this colour. Usually it gains in effect if the deepest flowers are the central or focal point of the decoration. A vase in which the flowers are all identical in form—mixed poppies, for example—can have every colour and every shade of colour in it.

Now for some July suggestions to those who seek "something different." First, try a decoration of grasses, alone, or with flowers that are small and incidental like those of *Tradescantia virginiana* which nestle in the grass-like foliage. Grasses make a particularly cool and restful decoration for hot days.

Next, use a few out-of-the-common containers and very few flowers. You can do this in July without giving the impression that you are short of material! A simple trail of clematis or convolvulus in a shallow Lalique bowl, or just three fat round heads of Paul Crampel geraniums in a beer mug, or some variegated ivy trailing from an old soup tureen are small touches that memory will cherish.

And my third suggestion is to rob the fruit patch! Last summer I gathered some large glistening red currants (Laxton's Perfection), taking several whole stems, and added them to a decoration in which red pentstemons, red bouchera, red and pink plumes of spiræa, red antirrhinums and two different varieties of fuchsia were all included, and the effect was very much admired, particularly when the whole decoration was enlivened by hidden architectural lamps.

HORTICULTURAL ADVICE

Daffodil Buying Time

By CARTHEW ALLERDYCE

THERE is nothing that gives me greater delight in April and early May than to see the magnificent show of narcissi and daffodils in my own garden. It is not that the garden is a big one, or that many of the bulbs have been purchased at great expense. It is not that they take a great deal of looking after. They do not, for I plant them around the fruit trees, along the edges of one of the lawns, in a north border, and so on.

Every year I wish that I had planted more. Every year the ones that were put in in the past come up with greater and increased vigour, and so nothing is lost. That is the great advantage of planting daffodils. They are a regular investment.

I think the reason why I never buy enough bulbs is that I am apt to leave the business of ordering until late. Bulbs, of course, should be ordered at this time of the year, and not a week before planting! I am resolved, this year, to place my order right away, and so I have been busily consulting catalogues.

I have before me, as I write, the catalogues of the following firms: Barr & Sons, of King Street, Covent Garden; Clibrans, of Altrincham, Cheshire; A. Dawkins, Ltd., of Kings Road, London, S.W. 10; C. H. Furness, of Burnham-on-Sea, Somerset; The Hocker Edge Gardens, Cranbrook, Kent (who list all kinds of unusual bulbs); Pearson & Sons, Ltd., of Loudam, Notts; Peed & Sons, of West Norwood, S.E. 27; J. Lionel Richardson, of Waterford, Ireland; Guy Wilson, of Brough Shane, Co. Antrim; the Donard Nursery Co., Newcastle, Ireland, and Cross & Co., Wisbech, Cambs.

If you would like catalogues from any of these firms I shall be happy to see that they are sent off to you. It does not matter whether you are getting thousands for naturalising or some very special kinds for forcing. Think about the bulbs for Christmas and the New Year. Think about those for indoors as well as out—those that are to be planted in the garden or naturalised in the grass.

I often get letters from readers who peruse my articles in the sanctum of some club, and who suggest that this column should contain notes and suggestions from time to time as to what can be done in a town garden. The narcissi and daffodil are ideal for this purpose, and do equally well when planted in window-boxes and in tubs on the verandah or roof garden as they do in the open ground.

There is something very British about the daffodil. You can ensure buying bulbs that have been grown in this country and that will, therefore, give employment to the men in Lincolnshire, Cornwall or Devon, or wherever the bulbs have been raised. Those who are thinking of planting large quantities in woodlands or shrubberies can buy mixtures at very cheap rates. Special mixtures are made up of the short cup varieties, of the poeticus types, of the all Barri kinds, and so on, and where they are required by the ten thousand or so, the price may easily be round about 17/- per 1,000.

For those who are going to grow bulbs under glass the following varieties of narcissus (and I am including the daffodils in this group) are particularly easy to force: Paper white, Soleil d'Or among the Polyanthus; Cheerfulness, Helios, Laurens Koster among the Poetaz; Emperor, King Alfred, Princeps and Spring Glory among the trumpets; and the following, Barri, Bath's Flame, Charles; Lady Moore and Sunrise. There are also Cassandra and Ornatus among the fragrant Poeticus.

I feel that I can recommend the following, though choosing varieties is a matter of opinion!

Aileen, comes into bloom long before Golden Spur. It is pure yellow throughout, and its beautifully flanged trumpet has a broad perianth in proportion. White Conqueror is a large bold flowerer. The trumpet is faintly tinged with lemon, and the perianth is massive and of the purest white. Solid Gold will be too dear for some, for the bulbs sell at about £1 each. It is said to be the finest yellow trumpet ever raised. Golden Harvest is another yellow trumpet variety, the perianth being over 6in. across. It is a pure yellow, and a free bloomer. It is by no means coarse or rough. Fire Tail is a very vigorous kind which increases rapidly. The eye of the flower is solid, deep rich red with the surrounding petals primrose and ivory-white. I know of no Barri which keeps its colour better. Copper Bowl is an incomparable which has a clear yellow perianth, the crown being of a glowing coppery-orange red.

For ever and a day . . .

There are many Boulton & Paul glasshouses in regular use to-day that were erected over 50 years ago. In the words of one owner: "These are in every way as good as when they were put up." The reason is that there is practically no limit to the life of good material and sound workmanship. Add to these the practical experience of over one hundred years and you will realise the unfailing wisdom of investing in a greenhouse or conservatory by Boulton & Paul.

We shall be pleased to send you Catalogue 585 giving you full details.

Royal Show, Windsor, July 4-8

B. & P. are experts in the construction of farm and estate buildings of every description—stock-houses, stables, kennels, barns, storehouses, etc. The B. & P. exhibit at the Royal Show (Stand 338, Avenue L) will contain many actual examples, and full information will be available on the whole range of B. & P. farming and horticultural products.

COLD CHON

The Perfect Surface

Bicycle Path in Holland

Large quantities of COLD CHON are used in Holland to obtain the finest road surfaces.

COLD CHON YOUR DRIVES and PATHS and SEE THE DIFFERENCE! It gives a beautiful surface, entirely weed free, and the original colour of the gravel is retained. It is firm, durable, and lasts for years. No skilled labour is necessary to lay it.

The £ s. d. of Drive and Path Upkeep

High maintenance costs can be saved by treating gravel drives and paths with COLDCOAT. It firmly binds and waterproofs the surface, keeps it neat and clean in all weathers and preserves a natural appearance. Ash and clinker surfaces may be treated similarly and no skill or special apparatus is needed.

"THE MODERN METHOD OF DRIVE & PATH MAINTENANCE"

is the title of an interesting booklet on the subject. May we send you a free copy? Ask for publication K154.

CONSTRUCTIVE CRITICISM OF THE H.P. TAX

How May the Blow to the Motor Industry Be Spread?

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

THE proposed horse-power tax increase has called forth a deluge of hard words from the motoring community. This is hardly a surprising development when the lack of justification for this blow at the motorist, the distress it will cause in the car industry, the other fields for revenue open to the Chancellor of the Exchequer, and the fact that the tax will hardly achieve its object, are so obvious. Severe criticism has emanated from a variety of quarters, since the imposition will exercise unwarranted hardship upon so many people, and upon such a widespread and diverse number of commercial and industrial interests.

I wholeheartedly endorse the efforts of the critics, not merely because the polemic is endeavouring to vindicate himself and his arguments, but because the majority of those seeking amendment of the assessment have put forward constructive suggestions. Criticism, to be effective, must be constructive, and, therefore, it is to the credit of those who seek redress on this issue that they have submitted workable alternatives. Some of the readers of the *Field* who have written to me have made proposals which, if implemented, seem likely to bring the necessary finance to the Government, and would—to quote Sir John Simon's phrase—"spread the burden evenly."

Acting on behalf of the industry which stands to suffer so much, the Society of Motor Manufacturers and Traders have pleaded that the tax should be reduced to £1 per horse power, that some consideration might be given to a special reduction for used cars, and that it should be permissible to take out monthly licences. Similarly the Motor Traders Association urged that some form of rebate should be made for cars more than two years old. Whether these representations will bear fruit or not is problematical, but I do feel that the motorists own organisations—the A.A. and the R.A.C.—should make stronger protest, an action which their members would welcome. Success in ameliorating the blow can only be attained by concerted and united action.

It is reasonable to assume that the Chancellor of the Exchequer would consent to some modification of the 25/- per horse power rating only if such alteration could produce additional revenue. This, therefore, is the fundamental basis upon which proposals must be based.

Personally, I adhere to the view that an equitable solution might be found by reducing the tax to £1 per horse power, and by levying a tax on new cars at the time of purchase. I would suggest that a sum, say, from 1 to 5 per cent. of the purchase price, should be added before the car leaves the hands of the manufacturers. I imagine that a motorist contemplating the acquisition of a vehicle costing £200 would not be inclined to postpone or cancel the purchase because the car will cost him £210, particularly if the transaction is on the hire-purchase system. I am confident that new car sales would not be adversely affected, neither would the used car market be impaired.

Further, fuel purchases—and the revenue they produce—would not tend to diminish while, above all, the British car industry would not experience the severe setback which appears inevitable when the new tax is enforced. If our governmental financiers fear that the yield thus forthcoming would be insufficient, then I recommend that they should consider a tax on betting and on cosmetics.

The majority of the proposals brought to my notice suggest a tax upon bicycles which would serve the dual purpose of keeping the very young and therefore undesirable cyclist from the roads, and also bring in considerable revenue. The main argument against this project is the initial cost of establishing an organisation and the necessary machinery to collect such a tax. Nevertheless, there is a large section of opinion believing that the cyclist, as a user of the roads and as a citizen, should be willing to make some contribution, and not leave the entire burden to the motorist.

The champions of a higher levy upon petrol to replace the road-tax system are numerous. But their chances of success are slim, particularly at a time when the State is in urgent need of adequate funds, and during the first year of such revolutionary legislation there is always the possibility that the receipts forthcoming from such a switch might easily fall below the estimated revenue. I know there is a host of excellent arguments in support of an all-embracing fuel tax, but my personal opinion is that it would be impolitic to make such a drastic change in the present stage of international affairs. In addition, the public transport vehicles and heavy commercial traffic would have to face yet another burden.

Many people would say that any Britisher realising why the money must be gleaned immediately from taxation and yet stands in opposition to the proposed tax is being unpatriotic. As a patriot and as an opponent of the tax, I cannot accept this argument.

In the first place, I believe that the method by which it is proposed to obtain the funds is incorrect, and when in practice, its effect upon the motorist and the motor-car industry will be such as to prove there has been serious miscalculation. The revenue may easily fail to reach the level required. Yet, if taxation is applied more fairly and more sanely so that the demand from one community is not so manifestly unfair—and, after all, a 66⅔ per cent. increase is out of all reasonable proportion—the revenue ultimately forthcoming will exceed that which may now be collected.

I have recalled to some of my correspondents the slogan which Sir Archibald Sinclair adopted in the House of Commons recently, *i.e.*, "Make the rich man pay," when discussing the Budget. This sounds well at first glance, but the fact has probably been overlooked that there are thousands of family motorists with large cars which were purchased with the tax at 15/-, and which they will—owing solely to the increased tax—be unable to run next year. More serious than this, perhaps, from the personal standpoint, is the obvious *sequitur* that the capital previously represented by a car investment dwindles practically to nothing, because already high-powered cars cannot be disposed of for any reasonable sum regardless of condition and age.

The second-hand markets have been grievously wounded, and to offset the decline in trade many organisations now undertake to pay the additional tax for a period of years. This gallant gesture illustrates the gravity of the position for them, but even if every dealer were able to adopt this practice I doubt whether big car prices could be stabilised now at any kind of fair level.

Whitehall also appears to have forgotten that there are many car owners whose income is such that they have only a narrow financial margin on which to run a car. The majority of them are now running small cars which may have been acquired second-hand, but it is doubtful whether they will be able to keep their vehicles in the coming year.

Judging by the speech of the Financial Secretary to the Treasury, Captain Crookshank, during the second reading of the Finance Bill, there appears to be little hope of any real concession to the motorist. He pointed out that 58 per cent. of the cars in Britain did not exceed 10 h.p., and the additional weekly contribution would be in the region of 2/-, while half a million motorists with baby cars will be obliged to pay another 1/6 each week. In the 11 h.p. to 15 h.p. class, 500,000 motorists would need to find another 3/- weekly. Captain Crookshank said that he found it difficult to believe that the impost ranging between 1/6 and 6/- each week would stop motorists using their cars as they are doing now!

From the Opposition it was pointed out that even before a penny of the new tax has been paid, the estimated loss by motor agents and individual car owners is already £6,250,000 owing to the fall in values. The tragedy of a decreasing export trade and its effect upon industry was also dealt with, but it aroused little sympathy from the Government.

This brandy, m'sieu', will never disappoint with the displays of raw youth. Nor yet, though old, bore with the dullness of age. It is always mannered, m'sieu',—for to grow old gracefully is the creed of

MAKE MOTOR SPORT HUMAN

A Plea for More Soul in Speed Events

HAVING attended in quick succession two rallies, two major hill-climbs, two important race meetings and one gymkhana I was struck by the comparatively limited appeal most of these events made to the public imagination. The spectators were mostly fans, while the average motorist was only present in small numbers. And yet most of these events had received some advance publicity in the Press, and the progress of some of them was reported daily in the national papers.

Take the English and Scottish Rallies as an example. It might have been thought that the eliminating hill climbing, acceleration, braking, turning and kerb tests would have attracted a goodly crowd of onlookers, when as a matter of fact most of the spectators as far as I observed were either the competitors themselves or others directly or indirectly associated with them.

Then one might have imagined that at any rate a handful of enthusiasts would have assembled to watch the cars climb any notable hill included in the route and to compare their style and performance with their own. Instead, the tit-bits of the course were deserted, and the controls were not much better. What a contrast is this lack of interest when compared with the crowds that assemble annually to watch the Motor Cycling Club's mass attack on famous West Country hills. In the London—Land's End run a hill like Beggar's Roost, near Lynton, will be black with spectators by six o'clock in the morning; and I suppose that the equally famous Park Rash near Kettlewell in Yorkshire is just as popular a venue in the London—Edinburgh run at Whitsuntide.

The race meetings I watched were at Donington and Brooklands. At the former one can walk right round the circuit and study form in the most lovely parkland from many different angles. One can see cornering, fast, very fast, and slow. One can watch cars at top speed; and one can, from the other side of the track, gain some idea of what is happening at the pits. By keeping one's wits alert and studying the score board or paying attention to the loud speakers one can also follow the fortunes of the drivers with tolerable accuracy.

At Brooklands things have bucked up enormously, and by running the races on the outer circuit, the mountain circuit and the Campbell road circuit variety is added to the programme and interest is sustained. Also as one can follow almost the whole of a race from certain vantage points Brooklands scores over other circuits where only fleeting glimpses of cars and conductors are obtainable.

The same fleeting glimpses characterise the entertainment afforded by the lightning ascents of competitors at Shelsley Walsh in Worcestershire, and Prescott, near Cheltenham. Each climb in itself is a really big thrill, but there is no variety, and to the casual onlooker one climb seems very much like another. True, in order to keep the public apprised of what is happening expert broadcasters are stationed at strategic points and put over any notable incidents, while big notice boards register the competitors' times.

Now the point that might be made in cases where the event is run as a business is that with a bit more showmanship and a bit more variety in the proceedings more of the public might be induced to patronise the meetings. It would be interesting, for instance, to see how C. B. Cochran or the late Bertram Mills would put over a big hill-climb or race meeting. One of the directions in which something might be done is to make much more out of the human element. Spectators hear that Raymond Mays is on the line, and that his great rival A. F. P. Fane is all ready with a supreme attempt to capture the Shelsley record, and then see a flashing car and the announcement of the time concludes the thrill as far as they are concerned. But how much more interesting would it be were it possible to get a close-up of these famous drivers. Not by a gigantic television set erected on the course, though this may come in the future, but by admitting the public into the paddock at a reasonable charge. Pressmen, photographers, friends and officials are admitted into this holy of holies, and if the public could come, too, they would mightily appreciate the favour. One might go so far as to have the competitors numbered like their cars, and as they are in the big American football matches. After all, this motor racing is a modern business and should make use of modern methods of publicity.

RAYMOND MAYS TAKING THE "S" BEND DURING HIS RECORD-BREAKING RUN UP SHELSLEY WALSH LAST MONTH. HIS E.R.A. TOOK 37.37 SECS. FOR THE WHOLE RUN

Still pursuing the theme of capitalising the human element, one would like to hear more on the loud-speaker from the racing men. At present they are too modest about their achievements when asked to say a few words. Anyone who had watched their meteoric ascents would brim over with questions if he or she had the chance. They would want to know the maximum speed attained at various points, how the driver manages to brake, change down, and accelerate almost simultaneously while steering his skidding car round an acute one-in-six bend. How many revolutions his engine gives, what the road looks like at such a speed, whether he was nervous or what he thinks about at the start and on the run, and so on.

Then, instead of a succession of climbs, let some variety be introduced into the proceedings. The ascent of the monsters of 1907–1912 with engines of 7,000 to 21,000 c.c. is a welcome change. Could not other events be worked into the programme? A stop and re-start, for instance, or a class for standard cars of a certain capacity. It would be most interesting to the public to know, for instance, which of the many excellent Tens referred to last week could climb Prescott or Shelsley in the shortest time. All kinds of difficulties would occur. It would be difficult, as it has been in the past, to ensure that the cars were standard. It would be said that the gradients favoured one set of gear ratios as used on one make more than another and so on. But in the old hill-climbs, all these snags were eventually overcome.

It would also be instructive to make the six fastest racing drivers take the same standard car up the hill and see who handled it the best. A reversing test in a suitably widened part of the course would provide an unusual competition. In this competitors would make a complete 360 deg. turn in the course of their climb, their time being taken from start to finish.

To many people's minds the most interesting point from which to watch a race is the pits. Here, again, the human interest boils up to fever pitch. Yet it is practically impossible for the public to approach the very focus point of the event from which the race is controlled and where the drama of the struggle can best be watched. The commentator with his batteries of loud-speakers, does his best to keep the crowd *au fait* with what is happening, but even this is not the same as seeing these things for oneself.

Brooklands is lacking in having a paddock where the public for a suitable charge can mingle with the great ones before and after the races. Where paddock accommodation is not available a slow drive past, instead of a scamper to the starting-line, would give the non-paddock onlookers a chance of familiarising themselves with the race drivers they know so well by name but have only seen at long distance. And writing of Brooklands reminds me of a human touch that prefaced the celebrated duel between the great green 90 h.p. gas-pipe radiatored Napier and Nazarro's 120 h.p. flaming red Fiat. While the Napier people, headed by Newton, who was to drive the monster, were all hot and bothered, taping up the bits and making last-minute adjustments, one discovered the great Nazarro peacefully asleep waiting for zero hour. Perhaps it was not surprising that he won the match.

One of the reasons why motor sport has not the same appeal as horse-racing, football or other forms of human sport is that it lacks the element of super-effort or the spurt. To compensate for this it offers the reverse in the form of the breakdown! But were it possible for cars to spurt, a new element of surprise and thrill would instantly be introduced. In the early days at Brooklands, about 1908–1910, when Napiers, Metallurgiques and Fiats were the big shots, some drivers were popularly supposed to admit oxygen into their engines as a last endeavour to snatch victory from their rivals. But this practice was barred eventually and the spurt was buried with it.

W. G. McMINNIES.

JUST AFTER THE START OF LAST YEAR'S 200 MILES INTERNATIONAL TROPHY RACE AT BROOKLANDS, SHOWING A PART OF THE NEW CAMPBELL CIRCUIT

WILD REINDEER IN NORWAY

By AIR COMMODORE R. PEEL ROSS, D.S.O., A.F.C.

IT is seldom that one can find an unspoiled country, unspoiled people and unspoiled sport, within reasonable distance of England, and at a reasonable cost. This I was lucky to find last August in the Solen Mountains, about 200 miles north of Oslo to the east of the Österdal Valley. There used to be a large stock of wild reindeer in the Solen Mountains, but they had been so poached and shot down owing to there being no restrictions, that 25 years ago there was no game left there. At that time, Herr Bjontegaard, of Ovre Rendal, and other sportsmen introduced some 30 bucks and 60 does. They saw that the ground was protected from poachers and no shooting was allowed. The reindeer increased enormously, and two years ago they reckoned there were 3,000 head in the district. In 1937 the district was opened for reindeer shooting from August 1st to February 1st, except from September 10th to 20th, when the ground is reserved for ryper shooting.

The farmers are allowed to shoot on their own land from four to ten reindeer, according to the extent of their property, other local Norwegians can obtain a permit to shoot by paying 60 kroner, and foreigners pay 100 kroner per reindeer. This district, being about 300 square miles, could accommodate many sportsmen, but the number of permits is limited and land allocated so that they do not interfere with each other. Alternately, one could rent the sole rights of shooting over one or more farms.

I found accommodation in the village of Ovre Rendal in a small hotel, which, although somewhat primitive, was spotlessly clean. The people were particularly hospitable, and the food was excellent. The roads up from Ovre Rendal were awful, but after climbing for one hour with great care through pines and birch trees, we came out on to an open undulating plateau, extending for miles at a height of about 3,500ft. To the south are the Solen Mountains, and all around range after range of hills. The views were wonderful and the air fresh and invigorating. The plateau, except for occasional rocky patches and some bogs, was covered with reindeer moss. It was delightful to walk on and much less strenuous than the average Scottish deer forest. I spent several days there at the end of August and had glorious hot sunny weather all the time, but that cannot be relied on. Heavy storms and snow may be expected even at that time of the year.

Reindeer were in abundance, and I had a variety of interesting stalks. On one day I saw close on 500 head, including a herd of about 40 bucks, amongst them some grand heads. This herd was on the move. I tried to cut them off, but they were travelling too fast, and I never saw them again. I found that the sight of man did not alarm the reindeer so much as it does the Scottish red deer, and, consequently, one could take more liberties, which was fortunate in view of the open country. On the other

"IT WAS A MAGNIFICENT PAIR OF HORNS"

hand, the slightest taint of our wind and they would bunch together and set off up-wind, and perhaps travel for ten miles before settling down again. After a shot was fired they would run round and stop and gaze, thus giving time for another shot if I had wanted it. I was successful in shooting a buck each day I was out, and had three really nice representative heads.

On the last day, my luck was right in. We took the most southerly road, close under the Solen Mountains which, I think, was the most beautiful part of the ground. Apart from the mountains, which were about three miles to the north-east of us, it was pretty flat ground with a good deal of bog.

We had been trekking for three hours; it was heavy going and very hot. I had been spying continuously, but had seen no sign of reindeer. This was disappointing, as the wind was correct, and this ground had not been touched. Then, about two miles to the north on the shoulder of a hill, I saw a solitary reindeer, and where there was one, there might be more. I decided to investigate, and we made for the hill.

I had only gone a short distance up the hill when I unexpectedly saw a small stag grazing about 80yds. ahead. Until then he had been hidden by a dip in the ground which I had not noticed. It occurred to me he might be a "fag," and I searched very carefully for some signs of his master. After a time I saw something, but could not be sure if it was a dead branch or the top of horns. Soon, however, it moved, and then there was no doubt at all. It was a magnificent pair of horns.

It was then one o'clock, and I knew he might not rise for two hours, so I showed myself to the small stag; he gazed at me for a moment then gave a short whistle, which brought the big

THE AUTHOR WITH A PAIR OF HORNS

"There are more like him in the Solen Mountains . . . The country is lovely, the people charming and the sport good, and not too strenuous"

THE AUTHOR'S COMPANION MAKES COFFEE

stag slowly to his feet. He looked splendid as he stood broadside on, and took the bullet through the heart.

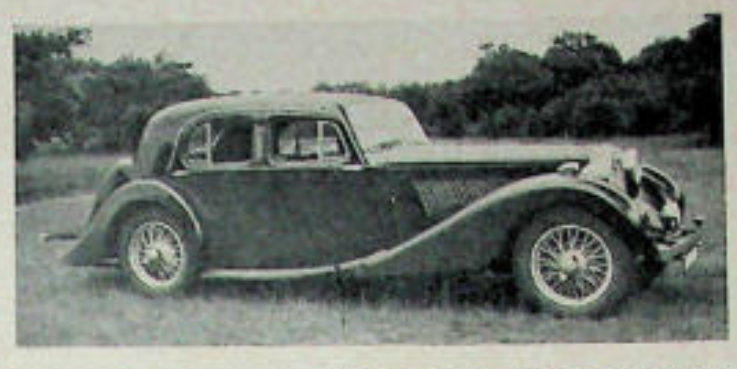
The little stag cocked his head, had one look at his late master and trotted away full of joy, as if glad to be rid of a tyrant. The photograph gives a good idea of what a fine trophy he made. There are more like him and better in the Solen Mountains.

Herr Bjontegaard is to be congratulated on the success he has made of it all. He is anxious to welcome British sportsmen to the Solen Mountains, and I can assure them they will not be disappointed. The country is lovely, the people charming, and the sport good and not too strenuous. I shall be very happy to give further information to anyone who may consider doing the trip.

VIEW OF THE SOLEN MOUNTAINS

". . . We came out on to an undulating plateau extending for miles at a height of about 3,500 ft. To the south are the Solen Mountains . . ."

EVOLVING THE PERFECT AIR-LINER



By LORD SEMPILL, A.F.C., F.R.Ae.S.

(Aviation Editor of "The Field")

IN the early days of commercial flying, there was very little difference between the air-liner (then so called only by courtesy) and the military machine; and, indeed, the pioneer London—Paris services were operated with aeroplanes that were but crude modifications of War-time types, such as the D.H.4 and the Handley-Page O.400. It has taken a long time for the truth that efficiency in air-liner design can be achieved only by specialisation, as in other spheres; there is, in fact, still a very common tendency to confuse military and service types, as, for example, when the Short Sunderland flying-boat used by the service is described as the "military version" of the Empire class.

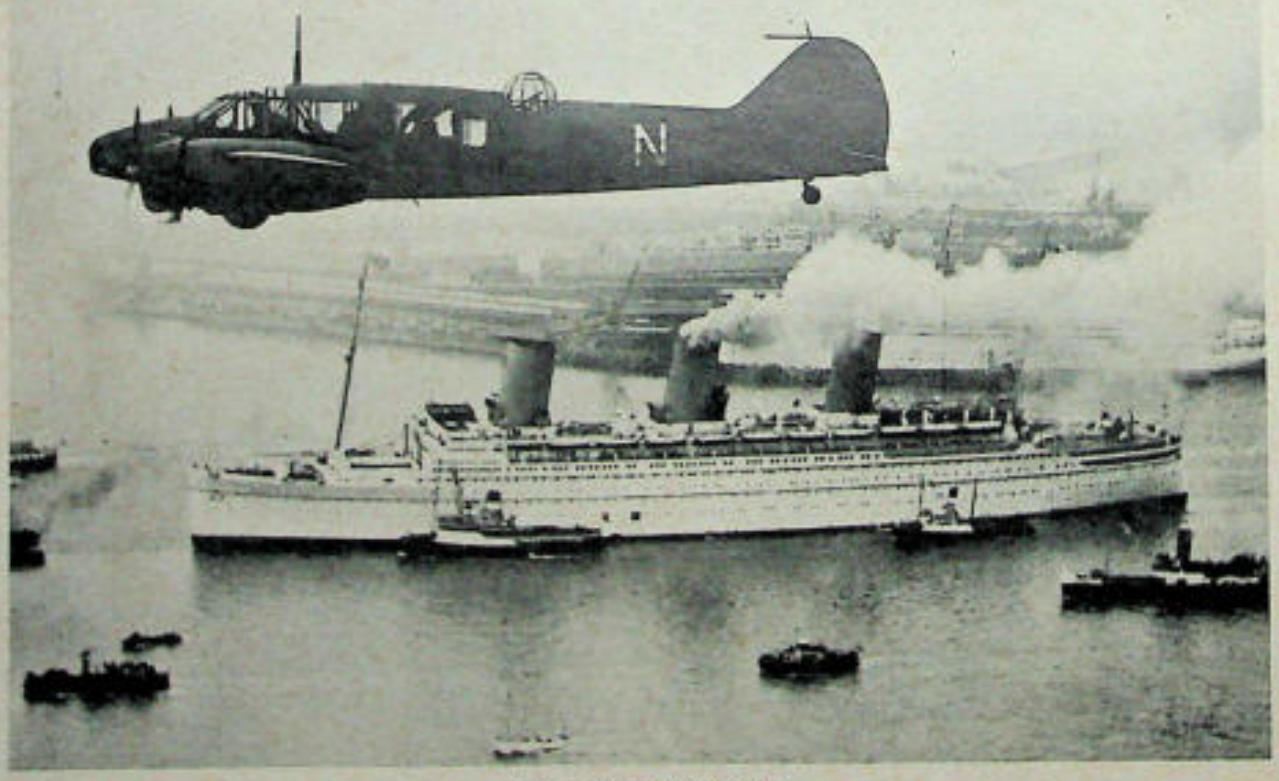
This tendency to regard all aircraft as basically the same is perhaps explicable, and was especially so some years ago. For then, flying was a somewhat exotic form of transport; the designer's problems were predominantly those concerned with flying qualities; and when refinement was not essential it was natural to regard a certain aeroplane as a means of carrying a certain load over a certain distance at a certain speed, irrespective of whether that load was bombs or guns or passengers.

But when flying became accepted as a normal means of transport, conditions changed. A new element entered into design—that of passenger comfort. Regular travellers by land and sea naturally expected in the aeroplane standards comparable to those they found elsewhere; and this account it later became a target of not altogether justified criticism. To-day, the air-liner designer has to combine luxury for his passengers with high performance. It is a tribute to the world's industry that so much success has been achieved.

A STRIKINGLY DESIGNED CAR WITH A HIGH PERFORMANCE

No one would be prepared to assert that anything like finality has been reached. There are still outstanding technical problems, while data on passengers' and operators' requirements are incomplete and, to some extent, conflicting. Moreover, despite its comparatively short history, commercial aviation has developed a number of conventions based on early experience that are not necessarily valid under to-day's conditions.

With so many new ideas and new requirements claiming attention, the time is a very fitting one for an examination of the whole problem. This has been attempted in a very praiseworthy way by the General Aircraft Company in a recent special issue of *General Aircraft News*. Though this publication has been produced primarily for the information of operators and to secure their views on various questions, it has a wider interest to all students of the air in that it indicates the manifold aspects of design that have to be considered by manufacturers.



The problems of passenger comfort are of considerable complexity. Cabin conditions are naturally of primary importance; and these, when analysed, fall into a surprisingly varied number of items. They include such obvious items as range, cabin temperature, noise, and ventilation, and less obvious ones like quantity of carbon dioxide present in the air, fore-and-aft angle, and the effect of acceleration.

The pressure cabin has been much discussed lately, and it is usually assumed that its principal recommendation is that it enables aircraft to be operated at considerable heights where more stable meteorological conditions are to be found. Investigation shows, however, that its advantages are not entirely operational. A case is put forward that the pressure cabin is necessary for practically all commercial aircraft in order that accustomed sea-level conditions may be maintained at all times. Among the points made in favour are that when normal atmospheric states are maintained, the leakage of bottles and fountain pens is eliminated, that sparkling drinks such as bottled beer and champagne can be served at all heights; and that hot beverages can also be provided, since the boiling point of water remains normal and is not reduced as the machine climbs higher. Incidental advantages are reduction of noise, better sleeping conditions, elimination of draughts, and—a safety point—better flotational qualities in the event of forced descent over the sea, provided, of course, the cabin is undamaged.

In addition to these internal arrangements, there are, of course, many technical points of importance, such as the relative advantages of two and four engines, high or low position for the monoplane wing, cabin position, and so on; but these do not come within the scope of this article.

What it has been sought to stress here is that modern air-liner design is a highly complicated business and flying could not hope to compete with surface transport if passengers were expected to endure major hardships, such as extremes of cold, and minor inconveniences, such as leaking fountain pens.

The Handley-Page Hercules class was, perhaps, the first commercial design to provide the air-passenger with Pullman-car standards of comfort; it earned a high reputation. But its performance was low, and on that details that received scant attention only comparatively few years ago are now of first importance. Air travel must no longer rely on speed alone to compete with surface transport; it must offer complete normality of conditions to the passenger—and to-day normality in transport is virtually synonymous with luxury. If necessary, it must evolve its own specialised methods of attaining the desired end.

THE ROYAL HOME-COMING

The King and Queen return to Southampton on the Empress of Britain with their air escort. One of the planes is seen flying above the ship

THE M.G. TWO-LITRE

I HAVE driven more expensive cars than the M.G. Two-Litre; I have driven faster cars, more comfortable cars, and, possibly finer looking cars; but, taking all these things into consideration together, I doubt if I have enjoyed any car more, for without hyperbolism, I should say that this model has as high an aggregate of good points as any car lying in its price class.

The four-door Saloon sells at £398 (chassis only £265), while there is also a folding head Foursome, priced at £425. Considering its capabilities, and its "hand-built" production, the cost is by no means exorbitant.

It has been a long established policy of the company not, as with most cars, to make annual changes, but to market a type for an indefinite period, making only minor improvements and modifications brought about in the course of normal development. As a result, we have, in the Two-Litre, a tried and tested veteran, free from the weaknesses often located in first-year models. It must not be implied by this that the car is a year or so behind its contemporaries—that is an idea immediately dispelled when the car is driven.

It has a six-cylinder O.H.V. engine of 2,322 c.c. capacity, with a bore and stroke of 69.5 mm. by 102 mm. This unit has been made to do its job efficiently and without fuss and, on the model I drove—one that had already done 21,000 miles—the speedometer clocked 80 m.p.h. without much trouble, and at that speed the car was rock steady, which says a good deal for the suspension. This is carried out with semi-elliptic springs, which are specially mounted to give a low centre of gravity. The slogan "Safety Fast—Drive an M.G." is well known, and is more or less justified, for the car really does give the driver a feeling of security and balance experienced in few cars, even in these days. Braking seemed to me adequate—Lockheed hydraulic foot-operated brakes, with the hand lever controlling the rear shoes through cables.

There is a four-speed gearbox with remote control, the gear ratios being: Top 4.75, third 6.55, second 10.1, first 17.85 and reverse 22.6. Top and third are synchromesh, and changing gear is a simple operation, although it still leaves room for skill by those to whom driving is more than just a means to an end. That is one of the great attractions of the car in its entirety. It gives the impression of being something more than a machine in which to move from one spot to another—it has individuality or character, call it what you will.

The exterior lines of the car are most attractive, suggesting subtle compromise between a thorough-going sports car and a luxury saloon, which, in fact, it is. My only criticism of the interior of the car is a certain lack of space on the driver's right side, making steering more troublesome than necessary, and a narrowness at the bottom of the rear doors, making entrance and exit a little awkward for the corpulent. Once in, however, the car is very comfortable and adequate for the longest journey, while an excellent boot gives room for 11 cubic feet of luggage.

Lack of space forbids me to say more about this model but, like the Queen of Sheba, I can only say "the half has never been told." W. R. J.

BRIDGE

PAR CONTRACT

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

IN my next two articles I propose to include hands from the fourth Par contest organised by John Waddington, Ltd. These hands have been designed to illustrate certain principles of play in defence and attack.

Points are allotted for bidding, play and leads, and, irrespective of the actual bidding, each hand is played in a directed contract with a directed lead to ensure that the particular problem is met for which the hand was constructed. In the first three contests, no competitor managed to obtain 90 per cent. or more, but it is believed that one or two players will obtain this score this time.

In the first hand below, the defence have to find an unusual discard to defeat a contract of Three No Trumps. In the second hand, the declarer is given an opportunity to shine and make a contract of Four Hearts.

♠ A, 6
♡ J, 7, 3
◇ A, 5
♣ K, 10, 8, 5, 3, 2

♠ Q, J, 4
♡ A, 10, 9, 5
◇ 9, 8, 4
♣ A, J, 6

Y / A B / Z

♠ 8, 3
♡ K, Q, 8
◇ K, J, 10, 7, 6, 2
♣ Q, 9

♠ K, 10, 9, 7, 5, 2
♡ 6, 4, 2
◇ Q, 3
♣ 7, 4

Y	B	Z	A
One Club	One Diamond	One Spade	Two No Trumps
No bid	Three No Trumps	All pass	

The bidding is on marginal values and equal credit is allowed to A-B for a part-score bid in Diamonds; but the chance for game is worth taking, though few players will get there because the majority, after the opening bid and response, will bid their opponents' cards instead of their own.

Credit is given for a Club lead, but the Ace of Spades is directed. Z can see no prospects in the other suits, so he should encourage Spades and play a third round, hoping that his Queen of Diamonds will be an entry. When he has to discard on the third Spade, Y must give careful thought to the future defence. The problem is to find an entry for partner's Spades; A must have both the Aces on the bidding, so the only chance is that Z has the Queen of Diamonds; but if it is doubleton, declarer can succeed by going up with the King on the first round and knocking the honours together on the second. Unless . . . But by the time Y has reached this point in his analysis the Ace of Diamonds will be scorching his fingers and he will drop it like a hot brick.

♠ K, J, 4
♡ 4
◇ A, K, J, 5, 3
♣ Q, J, 10, 8

♠ A, Q, 3
♡ A, Q, 10, 8, 7, 6, 5
◇ Q
♣ 6, 5

Y / A B / Z

♠ 6, 5, 2
♡ K, J, 9
◇ 10, 9, 8, 4
♣ A, 4, 2

♠ 10, 9, 8, 7
♡ 3, 2
◇ 7, 6, 2
♣ K, 9, 7, 3

Y	B	Z	A
One Diamond	No bid	No bid	Two Hearts
No bid	Three Hearts	No bid	Four Hearts
All pass			

Z may find a response for tactical reasons, but this should not keep A-B out of a game bid.

The King of Diamonds is the directed lead, but there is equal credit for the Queen of Clubs. Y will surely switch to this card at the second trick, and declarer should win at once, for his contract is in sight. The 10, 9, 8 are equals against the A, J, and on these three cards three losers can be thrown, but one trick is guaranteed. The first discard must be a Club, and it is followed by the two Spades. If A makes the mistake of passing the Queen of Clubs, Z should overtake and lead a Spade, giving declarer no chance to recover.

THIS WEEK'S PROBLEM

The following problem is also taken from the fourth Par contract contest, and although it is not a difficult problem when all four hands are seen, readers may not find it so easy when the Z hand is not seen.

♠ A, 9, 6
♡ Q, J, 10, 9
◇ 8, 4, 2
♣ J, 5, 3

♠ 3
♡ 8, 7, 6
◇ K, J, 6, 5, 3
♣ K, 9, 4, 2

Y / A B / Z

♠ Q, 8, 4
♡ K, 5, 4, 3, 2
◇ Q, 9
♣ Q, 10, 8

♠ K, J, 10, 7, 5, 2
♡ A
◇ A, 10, 7
♣ A, 7, 6

A leads Eight of Hearts against Four Spades by Z. A-B to make four tricks against any play by Z.

LAST WEEK'S PROBLEM

♠ 8, 4, 2
♡ A, 10, 8, 6
◇ 8, 4
♣ A, K, 3, 2

♠ K, Q, J, 7, 3
♡ K, 7, 5, 3
◇ 7
♣ Q, 8, 7

Y / A B / Z

♠ 10, 9, 5
♡ J, 9, 4, 2
◇ 5, 3, 2
♣ 10, 5, 4

♠ A, 6
♡ Q
◇ A, K, Q, J, 10, 9, 6
♣ J, 9, 6

A leads the King of Spades. Y-Z to make Six No Trumps against any defence by A-B.

SOLUTION

Z takes the trick with the Ace of Spades and leads the Queen of Hearts, which A must cover. Y takes the trick with the Ace of Hearts, leads a Diamond, and Z runs off all his Diamonds, leaving the following situation:

♠ None
♡ 10
◇ None
♣ A, K, 3, 2

♠ Q, J
♡ None
◇ None
♣ Q, 8, 7

Y / A B / Z

♠ 10
♡ J
◇ None
♣ 10, 5, 4

♠ 6
♡ None
◇ 6
♣ J, 9, 6

On the lead of the 6 of Diamonds A is squeezed. If he throws a Spade he will be thrown in with the Spade to lead away from the Queen of Clubs. If he throws a Club, Y-Z's three Clubs will be good. It will be noted that if he manages to unblock his Spades earlier in the game the 10 of Hearts will act as a menace to B's Jack.

CHESS

A POWERFUL ATTACK

The following game, played in the tournament at Kemeri and Riga last March, shows a powerful attack by the young Hungarian master, L. Szabo.

(*French Defence.*)

WHITE. Szabo.	BLACK. Book.	WHITE. Szabo.	BLACK. Book.
1. P to K 4	P to K 3	18. P to B 5	Kt (Kt 5)to K 2
2. P to Q 4	P to Q 4	19. P to R 6	P to B 3 (k)
3. Kt to Q B 3	B to Kt 5	20. R P takes P	P takes P
4. B to Q 2	Kt to K 2 (a)	21. R takes P	P takes P
5. P to K 5	P to Q B 4 (b)	22. Q to B 6	P takes P
6. P to Q B 3 (c)	B takes Kt	23. B to Kt 5	Q R to K sq
7. P takes B	Q to B 2	24. B to K 2	P to K 4
8. B to Q 3	P to B 5 (d)	25. Kt to B 5	Kt takes Kt
9. B to K B sq	B to Q 2	26. P takes Kt	Kt to Q 5
10. Q to Kt 4	Kt to B 4	27. B to R 5 (l)	B takes P
11. Kt to K 2	Kt to B 3	28. B takes R	B takes B
12. Kt to Kt 3	Q Kt to K 2	29. B to B 7	Kt takes P, ch
13. Kt to R 5	Castles (Q R)	30. K to B sq	R to Q sq (m)
14. Q to B 2 (e)	K R to Kt sq (f)	31. B to K 6, ch	K to Kt sq
15. P to K R 3 (g)	Kt to Kt 3 (h)	32. Q to R 8 (n)	R to B sq
16. P to Kt 4	K (Kt 3) to K 2 (i)	33. B to K 7 (o)	Resigns.
17. Kt to Kt 5 (j)	Kt to B 1		

(a) Best. It threatens P takes P followed by Q takes P. If at once 4. . . . P takes P, then 5. Q to Kt 4 followed, if 5. . . . Q takes P, by 6. Kt to B 3, Q to B 3; 7. Q takes K P and 8. Castles, or if 5. . . . Kt to K B 3, by 6. Q takes Kt P, R to Kt sq; 7. Q to R 6, Q takes P; 8. Castles, and in either case White has attacking chances.

(b) This position is generally reached by 4. P to K 5, P to Q B 4; 5. B to Q 2, Kt to K 2.

(c) The usual continuation is 6. Kt to Kt 5, B takes B, ch; 7. Q takes B, Castles.

(d) A risky move. It lessens Black's chances of counter-attack on the Queen's side.

(e) Not Kt takes P because of Q R to Kt sq. The text-move threatens P to Kt 4.

(f) Not a good move. Black should not allow his Knight at K B 4 to be dislodged by P to Kt 4 and should, therefore, play 14. . . . P to K Kt 3 and after 15. Kt to B 6) 15. . . . P to K R 4, even though he would then have a weakness on the black squares of the King's side.

(g) Not 15. P to Kt 4, Kt to R 5; 16. Q takes B P because of 16. . . . Kt (K 2) to Kt 3 (threatening Q R to B sq) and wins.

(h) Now P to Kt 3 is not good because Kt to B 6 attacks the Rook and White gains time to play P to Kt 4.

(i) Not Kt (B 4) takes B P because of Q to Kt 3, threatening either R takes Kt or B to Kt 5.

(j) Not Q takes B P because of Q R to B sq.

(k) If 19. . . . P to K Kt 3, then not 20. Q takes B P (because of 20. . . . Q R to B sq; 21. Q takes K P, R to K sq; 22. Q to Kt 7, K R to Kt sq, drawing by repetition of moves) but 20. B to Kt 5, after which Black has a very cramped position with a weakness on the black squares of the King's side. The text-move, however, is also unsatisfactory.

(l) A good move. If now 27. . . . Kt takes P, ch; 28. K to B sq, Kt takes R, then 29. B takes R, R takes B (if B takes B, then Q to K 6, ch); 30. R to R 8 and wins. If, instead, 27. . . . R to Q sq, then 28. Q takes R, ch and wins.

(m) If 30. . . . R takes P; 31. Q takes R, Kt takes R, then 32. B to K 6, ch and mate in two more moves.

(n) Not 32. Q takes R, ch because of 32. . . . Q takes Q; 33. B takes Q, Kt takes R; 34. P to Kt 8 - Q, B takes Q; 35. B takes B, P to R 7; 36. B to Kt 5, Kt to Kt 6; 37. B takes P, P to Kt 4 with a winning game for Black.

(o) Threatening either (1) R to Q 6 or (2) B takes R, to be followed, if Q takes R, by B to Q 6, ch. Black has no satisfactory reply.

TOURNAMENT IN RUSSIA

An interesting game from the tournament at Leningrad and Moscow last February.

(*Indian Defence.*)

WHITE. Keres.	BLACK. Lilienthal.	WHITE. Keres.	BLACK. Lilienthal.
1. P to Q 4	Kt to K B 3	18. R to Q 2	R takes R
2. P to Q B 4	P to K Kt 3	19. Q takes R	R to Q sq
3. Kt to Q B 3	P to Q 4	20. Q to Q B 2	P to Q Kt 4
4. B to B 4	B to Kt 2	21. B to Kt 5 (g)	R to Q 6 (h)
5. P to K 3	Castles (a)	22. R to Q B sq (i)	P to K R 3
6. P takes P	Kt takes P	23. B to R 4	P to Kt 4 (j)
7. Kt takes Kt	Q takes Kt	24. B to Kt 3	R takes P
8. B takes P	Kt to B 3 (b)	25. Q to B 5 (k)	R to K sq
9. Kt to K 2 (c)	B to Kt 5	26. B to B 2	Q to R 3 (l)
10. P to B 3 (d)	Q R to B sq	27. Q to Q 7	Q to K 3
11. R to B 4	Q to R 4, ch	28. Q takes Q	R takes Q
12. Kt to B 3 (e)	P to K 4	29. P to Q Kt 3	R to Q 6
13. P takes P	B to K 3	30. R to Q sq	B takes Kt
14. B to K 2	Kt takes P	31. R takes B	R to B 3
15. Castles	Kt to B 5	32. B takes P	R to R 3
16. B takes Kt (f)	B takes B	Drawn (m)	
17. R to B 2	K R to Q sq		

(a) Offering the sacrifice of a pawn for a strong attack.

(b) In a game Flohr v. Botvinnik in the "Ayro" tournament last year Kt to R 3 was played. The text-move is better.

(c) The Knight is to be played to Q B 3.

(d) If 10. Kt to B 3, then 10. . . . Q to Q 2; 11. P to B 3, B takes P. If, instead, 10. Q to Kt 3, then 10. . . . Q takes Q; 11. P takes Q, K R to B sq; 12. B to Kt 3, Kt to Kt 5 followed, if 13. K to Q sq, by 13. . . . P to K 4; 14. P to B 3, B to K 3 with advantage to Black.

(e) If 12. Q to Q 2, then 12. . . . Kt to Kt 5; 13. Kt to B 3 (if 13. P takes B, then 13. . . . Kt to B 7, ch; 14. K to Q sq, Q takes Q, ch; 15. K takes Q, Kt takes R; 16. Kt to B 3, P to K 4), P to K 4 with a strong attack. If, instead, 12. K to B 2, then 12. . . . P to K 4.

(f) Not Q to B sq because of Kt takes Kt P.

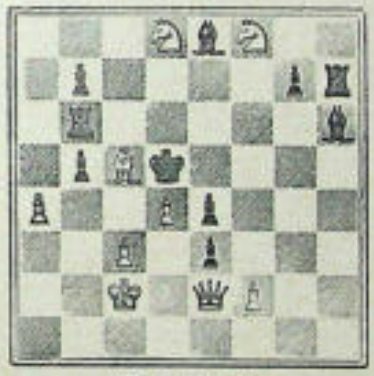
(g) If Kt to K 4, then B to Q 6.

(h) P to B 3 would close the line of action of the King's Bishop.

(i) If Kt to K 4, then P to K R 3.

(j) 21. . . . B takes Kt; 22. P takes B, Q takes K P would leave Bishops on different colours. The text-move leads to the gain of a pawn but weakens Black's King's side.

(k) White takes advantage of the weakening of Black's King's side. He threatens 26. Q to B 8, ch, K to K 2 (not B to B sq because of B to Q 6); 27. Q to B 5, ch, with a draw by perpetual check.



(l) If 26. . . . B takes Kt; 27. P takes B, Q takes R P, then 28. B to Q 4 with good attacking chances for White. (If 28. . . . K to K 3, then 29. P to R 4.)

(m) A well-played game on both sides.

PROBLEM No. 4020

By Y. S. NILSSON.*

BLACK (10 pieces).

WHITE (9 pieces).

White to play and mate in three moves.

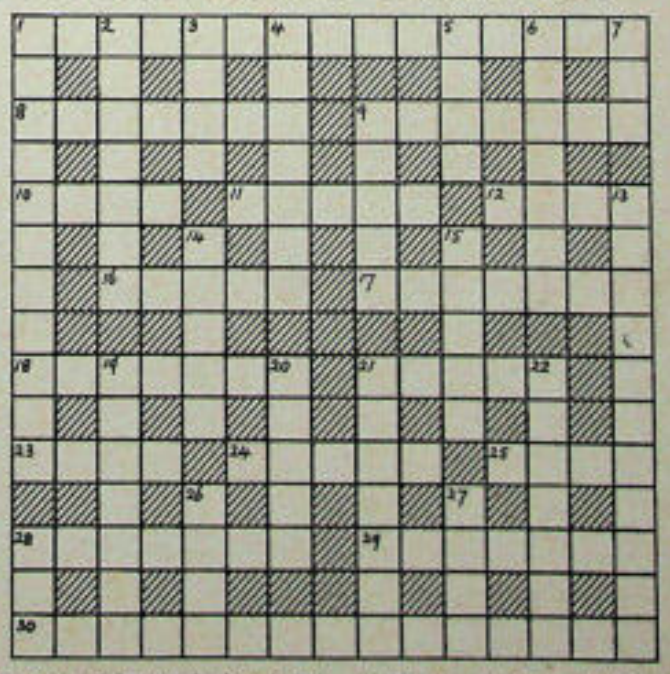
* Hon. Men., *Ajon Sass*, 1931.

SOLUTION OF PROBLEM No. 4019

1. P to Q 4, Any move; 2. Q or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 523



ACROSS.—1, Overheated hikers? (7, 8). 8, Confused tirades (7). 9, Ralph Rackstraw might have been of this nationality if he had yielded to 13 (7). 10, The Dean is upset (4). 11, King Hal was (5). 12, Good in human beings; bad in machines (4). 16, This might be a snare (5). 17, To call back a miracle (7). 18, One very much behind schedule probably has infection (7). 21, The great trunk of the arterial system (5). 23, "I would applaud thee to the very ——, That should applaud again" (*Macbeth*) (4). 24, Pool or plain payment (5). 25, The printer prefers this correction (4). 28, This will give poise (7). 29, The name of a wind (7). 30, Communists in one of the United States? (5, 6, 4).

DOWN.—1, Cleaned tins in secret (11). 2, A see-saw displays this change (7). 3, "Things are seldom what they seem: —— milk masquerades as cream" (*H.M.S. Pinafore*) (4). 4, A clue here is almost unnecessary (7). 5, This stops men from going straight (4). 6, A rare tie for an Italian colony (7). 7, A part of Abyssinia is terribly wicked (3). 9, You may deduce something finer here (5). 13, Not the same as 7, but not far from it (11). 14, "To die,—to sleep;—To sleep! perchance to ——" (*Hamlet*) (5). 15, Disdain corns (5). 19, He said, "I have done the state some service, and they know't" (7). 20, A happening in the seventies (5). 21, I am sane, perhaps, but my trouble is loss of memory (7). 22, This must be very small; it's less than a particle (7). 26, Race or worry (4). 27, Parched (4). 28, Where counsel get their refreshers? (5).

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division 1. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Aviation

Golden Hind.—The largest commercial flying-boat built so far in this country, Golden Hind, has an overall span of 134ft. 4in., and an overall length of 103ft. 2in. Its power plant consists of four Hercules engines, capable of developing a total of 5,500 h.p. for the take-off. Golden Hind's all-up weight will be approximately 31½ tons, and its cruising speed from 180 to 190 miles an hour, with a maximum of over 200 miles an hour.—*P. E. D., Rye.*

Cards

Right Call ?—A correspondent asks us whether, after an opening forcing bid of Two Diamonds has been made by Y and a pass by B, Z is justified in calling Two Hearts on ♠ 10, 2; ♡ Q, J, 10, 8, 7; ◇ J, 2; ♣ J, 10, 9, 2. According to Culbertson and most approach forcing systems, the responder should hold at least one-and-a-half honour tricks for a suit response to a forcing two bid. Thus the correct response is Two No Trumps, although the Hearts may be shown later.—*H. E. V., Wallasey.*

Bidding Criticised.—A correspondent asks us to criticise the following bidding: North—♠ K, J, x, x; ♡ —; ◇ K, J, 10, x; ♣ K, J, 10, 8, 6. South—♠ x, x, x, x; ♡ Q, 10, 9, 8, x; ◇ x, x, x; ♣ Q. Bidding was as below:

W.	N.	E.	S.
1 Heart	Double	3 Hearts	No bid
4 Hearts	5 Clubs	Double	No bid
No bid	No bid	No bid	

North's cards in the first place, although strong distributionally, do not really justify a double. His subsequent Five Clubs bid is a shot in the dark and is deservedly punished. South cannot be blamed for not doubling Three Hearts, which may quite easily be a make, *e.g.*:

East—♠ A, x, x; ◇ A, K, J, x; ◇ x, x, x, x; ♣ x, x. West—♠ Q, x; ♡ x, x, x, x; ◇ A, Q; ♣ A, x, x, x, x.

On a Spade lead, East—West can make Four Hearts, and on a Club lead by correct play they can make nine tricks.—*M. W., Hong Kong.*

Garden

To Get Rid of Long-rooted Weeds.—Apart from injecting with poisons, the only method of getting rid of long-rooted weeds, such as dandelions, is to dig them out.—*F. C., Tadcaster.*

When sending plants to be named, send as many parts as possible—basal leaves, stem, flowers and fruit. Pack in moss, moistened paper, or damp leaves, in a stiff cardboard, tin or wooden box.

Golf

The Field Marshal at Royal Blackheath.—The Field Marshal at the Royal Blackheath Golf Club—the oldest golf club in the world—is the next official in importance to the captain. Usually an ex-captain is given this title and occupies the position for life. Since the club's inception there have been only thirteen field marshals. To-day he has no particular duties to perform, but, when golf was played over the heath, he was the official responsible for marshalling the field—hence the title. At the famous functions of the club, which include unique ceremonies, he is entitled to wear two epaulettes, one on each shoulder, whilst the captain of the club wears only one. Regalia and red coats are worn at the traditional dinners, but golfers at Blackheath have long since discarded red coats for actual play.—*J. B. T., Braefarick, New South Wales.*

Kennel

Chorea in Golden Retriever.—There is nothing mysterious about the treatment for chorea, which is a common after-effect of distemper. In severe cases a cure is seldom to be expected, but in mild attacks there is hope. Dogs seem to respond differently, some being amenable to arsenic and others to Easton's Syrup. It would be safer to consult a competent veterinary surgeon, for these medicines need to be given with care.—*R. H. A., Tiverton.*

Sheepdogs.—We assume it is a working sheepdog that you want for Rhodesia and not one of the show Old English sheepdogs. You could not do better than write to Mr. James A. Reid, 28, Anderson Street, Airdrie, Scotland, who until recently had been hon. secretary of the International Sheep Dog Society that promotes working trials. Mr. Reid knows all the best strains, and would be able to help you.—*E. W. T., S. Rhodesia.*

Labrador Trainer.—Some trainers that can be recommended for retrievers are Mr. Bishop, Sutton Wood, Ropley Station, Hants; Mr. R. McDonald, Caledonian Kennels, Broomfield, Ludlow, Salop; Mr. J. Kent, Chrishall, Royston, Herts. Your Labrador is too young at present. Probably you would be advised to send him when he is about nine months old.—*C. J., B., Coventry.*

Motoring

Motor Vehicles on Tow.—A car or motor cycle being towed on a public highway, and in such a condition that it could not be used under its own power, need not be licensed. There was a case on this subject at the Derbyshire Quarter Sessions, in an appeal brought by the R.A.C. on behalf of a motor cyclist associate-member. The facts of the case were briefly as follows: The motor cyclist member, at the time of the alleged offence (that of using a motor cycle on a road without having a Road Fund licence in force), was being towed behind a car and was on his way to compete in a motor cycle competition on private ground. The machine he proposed to use was a borrowed one and was unlicensed, and the member had no immediate intention of using it on a public highway. He made an arrangement with a friend that the latter should tow the machine to the place of the competition behind his car. The primary chain of the motor cycle was disconnected, the silencer removed and the petrol tank drained of fuel. After the competition, the motor cyclist was again being towed home behind the car, when he was stopped by a police constable and his attention was drawn to the fact that the motor cycle was not carrying a Road Fund licence. The member was subsequently summoned and, after a lengthy hearing before the magistrates at which he was represented by solicitors instructed by the R.A.C., the Bench decided to convict and a fine of £1 was imposed. As, however, a very important point of principle was involved, the R.A.C. decided to appeal on the member's behalf to quarter sessions. At the hearing, after argument by counsel for both sides, the result was as stated, the appeal being allowed with costs against the police.—*D. H. K. L., S.W.1.*

Post-Mortem Examinations

Egg-Binding and Egg-Peritonitis.—Obstruction of the egg-duct during the process of egg laying is a common disease of birds. We have to report three cases in fowls and one each in a guinea-fowl, bantam, wild partridge, canary and Chinese quail, the latter being an aviary bird. A common form of the disease is brought about by the laying hen being exposed to a chill from a draught or cold wind, which results in a cramp of the egg-duct. This is particularly prevalent among aviary or caged birds which have been unable to choose the site of their nest, or have been disturbed during the early stages of laying. The same thing happens when wild birds are disturbed in the process, so that they leave the nest for a time to roost in an exposed situation, where they get chilled. Aviary birds so affected will stand on the edge of the nest box, with their tails depressed, their breathing is laboured and at intervals they will strain as if defecating. Usually the bird can be relieved, provided it has not been straining to a stage of exhaustion, by holding it over a jug of hot water so that the heat impinges on its abdomen. The bird should not be exposed to the heat beyond about ten minutes. If after this period the egg is not passed, the bird should be placed near the fire in a cage or basket, and after about an hour's rest the treatment can be repeated. Under no circumstances should an instrument be inserted up the vent in order to release the obstruction, as almost invariably the egg-duct or lower end of the bowel is perforated, with fatal results. Operative treatment by an experienced veterinary surgeon is necessary for obstructions which do not yield to the heat treatment at home. Another cause of egg-binding is the fat condition of the hen. Laying hens should be athletically fit, but some birds under confinement become indolent and lay on far too much fat, particularly within the body cavity; also the liver becomes fatty. When such fat birds begin laying, they lack the muscle tone required to eject the egg, and, after severe straining, their egg-duct ruptures or their fatty liver ruptures, resulting in death. Thus feeding and general management plays an important part in preventing egg-binding among poultry. Many people keep a few fowls for the supply of eggs to the house, and where these fowls are confined to a small wired enclosure, their exercise is as important as their feeding. Not only should the amount and quality of the food be correct, but the morning feed of grain should be scattered among a thick layer of chaff-litter or straw so that the birds have to scratch actively in search of their food. Suspending a cabbage from the roof of the pen so that the fowls must jump to get the green-food is another means of keeping their muscles in training. The prevalence of egg-binding among caged birds, such as canaries, is a condemnation of the practice of confining small active birds so that they have no opportunity of freely using their wings and breast muscles in flight. There is but one humane use for a bird-cage, namely, as a hospital bed for the resting of a sick bird under skilled treatment. Healthy birds should no more be confined to a cage than healthy human beings should be forced to pass their life in a hospital bed.—*F. M., Anglesey; M. H., Suffolk; C. C., Argyll; G. C. C., Worcester; D. D., Essex; J. D. C., Northumberland; W. O., Sussex; P. D. M., Perth.*

Shooting

Magnum 16-bore Cartridges.—Magnum cartridges are made in 16-bore, and their standard loads are as follows: 2¾in., 31 grains (of a 33 grain powder) and 1oz. of shot; 3in., 33 grains (of a 33 grain powder) and 1oz. of shot. If 42 grain powders are used, the shot charges are 1⅛oz. and 1¼oz. respectively.—*T. G. S., Corofin.*

Travel

Hotels at Douglas.—We think possibly the Castle Mona Hotel might suit you very well. It is situated in the centre of the promenade within half a mile of the bathing pier. There are 60 bedrooms, all with hot and cold running water, while some of the rooms have private bathrooms. The *en pension* weekly terms are from 5 guineas, though this tariff is reduced during the off-season. There is also the Derker's Trevelynn Hotel, which has accommodation for 160 guests; the *en pension* terms are from 12/6 to 14/6 per day.—*J. H. P., Folkestone.*

Where to Stay.—We think you would like the Carbis Bay Hotel (St. Ives), situated on the water's edge and with its own private steps to the beach. There are all modern amenities, while there is a putting green and tennis courts in the hotel grounds. Terms in July and September are from 5 guineas to 7 guineas, and in August from 6 guineas to 8 guineas per week. Or you might like the Tregenna Castle Hotel at St. Ives. Its situation is high and lovely, and it stands amid its own 100 acres of park and woodland, stretching down almost to the yellow sands of Porthminster and up to the gorse-covered moorland. The gardens are full of sub-tropical flowering shrubs, with an occasional fountain and "other delights." To stroll among the Tregenna woods is to obtain many a lovely glimpse of land and sea, while the windows of the house itself, long turreted and machicolated, frame delicious pictures. At Tregenna Castle one may fare sumptuously within and enjoy all the country pleasures without. The hotel's own garden supply the vegetables, from its farm come eggs, poultry and salads, and Cornish cream is served with every meal. Out of doors at Tregenna, to say nothing of hard and grass tennis courts, the castle provides its own golf. A nine-hole approaching and putting course was made some years ago, occupying about 4 acres. The length of the hole ranges from 80yds. to 135yds., with a total distance of about 1,000 yds.—*A. S. J., W. S.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, JULY 8th

OTTERHOUNDS—ENGLAND

BORDER COUNTIES.—Saturday (July 1st), Llansantffraid (Vyrnwy); M., Cook's Bridge, Rosett; W., Glanhafren, above Newtown; S., Ryley Bridge, near Middlewich—10.30.

BUCKS.—Saturday (July 1st), Lealholm (R. Esk)—10.

BURE VALLEY.—All meets cancelled until further notice.

CARLISLE.—Monday (July 3rd), Rose Bridge, Caldew (up); Th., Kershopefoot, Liddel (down)—9.30.

CHERITON.—Saturday (July 1st), Eggesford Station; W., Black Torrington; S., Umberleigh—10.30.

COURTENAY TRACY.—Saturday (July 1st), The Vine, Over, near Romsey—10.30; M., Bowbridge, Godshill, Isle of Wight—11.30; Th., Old Mill, Hamham, Salisbury (Nadder); S., White Swan Hotel, Swaffling—10.30.

CROWHURST.—Saturday (July 1st), The Lamb Inn, Sewers Bridge, Pevensey—10.30.

CULMSTOCK.—Saturday (July 1st), Cannington—10.30.

DARTMOOR.—Saturday (July 1st), Denham Bridge (Tavy); Tu., Sowden Bridge (W. Looe); Th., Poison Bridge (Tamar); S., Dartmeet (W. Dart)—10.30.

EASTERN COUNTIES.—Saturday (July 1st), White Bridge, Stoke Ferry; M., Easton County Bridge; Tu., Dullington Mill (for lake); W., Dullington Mill; Th., Thetford Bridge Station; F., Narborough Ship; S., Anrior Hotel, Thetford—10.30.

HAWKSTONE.—Saturday (July 1st), Sennybridge—10.30.

KENDAL AND DISTRICT.—Owing to foot-and-mouth disease all meets in Yorkshire are cancelled until further notice.

WYE VALLEY.—Saturday (July 1st), Sennybridge; Tu., Clytha Arms; F., Hostelrie, Goodrich—10.30.

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage, Home and Abroad.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

FITNESS BY FLOODLIGHT

TURNING night into day is more easily associated with riotous living than with physical fitness, but, for all that, the hours of darkness may easily be turned to good account in these days of advanced illumination, if clubs, municipal authorities, and other bodies responsible for recreation amenities would realise how easily, and how comparatively inexpensively arrangements can be made to light such things as tennis courts, swimming pools and football pitches in an adequate manner. Still, as Moore assures us:

"'Tis never too late for delight, my dear,
And the best of all ways
To lengthen our days
Is to steal a few hours from the night, my dear."

It is improbable that the poet had the same point of view in mind as ourselves when he wrote the lines—probably the exact opposite, but for all that his words hold true in our sphere equally well.

Already the longest day of this year is a thing of the past, and the evenings are slowly beginning to draw in once more. Three months, and we shall be back in our overcoats praying for the sun and warmth, and all the time the opportunities for open-air recreation become more and more curtailed. Let us, then, lengthen our days by stealing a few hours from the night.

About three months ago the National Fitness Council for England and Wales published a very useful report (H.M. Stationery Office; 2d.), carefully illustrated, giving the results of many months' inquiry into the practicability and costs of floodlighting playing fields and sports grounds, and, if the pun is excusable, their findings are very illuminating.

Of the effectiveness of floodlighting there can be no doubt, but, unfortunately, a feeling seems to prevail that the initial and running costs are such as to prohibit the installation of the equipment. In fact this is a false premiss, though, naturally, costs vary considerably according to the conditions prevailing. For instance, the cost of equipping two netball courts in Tottenham amounted to £100 each, the lighting being provided by four standards in each court. The cost of permanent installation in a school playground of 7,605 sq. ft. was only £57, while equipment for three other school playgrounds in the London area cost £115, £75 and £46 respectively.

The most surprising thing, however, is the low running cost. The Saracens Football Club use four 12-light gas floodlamps for scrummage practice, players being able to work between the 25 lines over the full width of the pitch, and the cost per hour for the gas amounts to about 4d.

There is one possible snag in this "night into day" idea, and that is the effect of the blazing lights on the eyes. However, no evidence has as yet been found to justify any fears, and at one school mentioned in the report floodlighting has been in use for some time and the medical officer reports no ill effects. Whether the lights really do do harm can only be decided, with any certainty, after further experience.

Floodlighting has made great headway in some countries, notably in Germany and Australia, but in Great Britain the experiment is in its extreme infancy. Its desirability will hardly be contested, for a large part of any urban population work late in the evenings, thus making it impossible for games to be played except at week-ends, when, as a result, playing fields and courts become hopelessly congested and overworked.

Among many others, this very useful report has been sent to 1,641 local authorities throughout England and Wales, and it is to be hoped that, as a result, far-sighted town councils will realise the value of implementing its suggestions. Not only would the public benefit, but the municipal coffers might show a gratifying profit also.

A SQUASH RACKETS CHANGE

LAST year the Executive Committee of the Squash Rackets Association proposed that the standard height of the play line in a court should be lowered to 17in. and a slightly faster ball adopted. Members desired further time to consider the proposal, and on Wednesday next an extraordinary general meeting is to be held at which the question will come up for decision. D. G. Butcher is all in favour of the change. He considers, among other things, that the rallies, in so far as the first-class player is concerned, will be considerably shortened, because a drop shot will be more difficult to return and the passing shot will be brought back into the game with telling effect. Angles, too, will be of greater value, as they will score more aces than they do now. The angle shot at the present time is mostly used for positional play; if it can be turned into a scoring shot so much the better. In the case of the poorer and average players, who have not the shots at their command, they will enjoy the game more as the ball will come back to them and be kept in play longer. As it is now, if one man is able to play a drop or angle a little better than his opponent, the rallies are too short for either one to get the exercise they want in half an hour.

The Women's Squash Rackets Association approves and also favours the faster ball, which eliminates difficulties encountered by the use of two different types of ball, while it would enable manufacturers to acquire better standardisation.

ENGLAND MAKES A RECORD SHOOT

This country is becoming still better at smashing clay pigeons. At the International Tournament held at Bray, Dublin, the English team, which easily proved victorious, scored the highest total ever recorded at this event with 1,878 points, the previous best being 1,814 at Gleneagles in 1937. Scotland came second, but was 57 points behind; Wales was next, beating Australia, which competed by cable, by 8 points; and Ireland brought up the rear. Mr. E. Fear (England) won the cup presented by the Maharajah of Jhalawar, after a shoot-off, with 49 out of a possible 50. The latter also won the British Open title, in which 98 shooters took part, with 98 out of 100, but only after two tie shoots with P. Catterall (England) and A. Thomson (Scotland). He also won the High Gun of the meeting with a score of 292 out of a possible 300. This represents a very high standard of marksmanship, and congratulations are certainly deserved. It is evident that skill at this form of sport is increasing.

THE LATE F. W. JONES

It is with very great regret that we learn of the death of Mr. F. W. Jones, O.B.E. Mr. Jones had throughout his life been consulted on almost every problem concerning guns, rifles, ammunition, powder and caps; and for many years did ballistic work for the *Field*. In 1889 he was appointed chemist to the Smokeless Powder Company, and six months later became manager. When, in 1902, he joined the research staff of Eley Bros., a special laboratory was built for him. He was a keen supporter of the Gunmakers' Company, and in conjunction with the late R. L. S. Griffiths he revised the rules of proof of firearms as regards test pressures and charges for the London and Birmingham Proof Houses. He was also interested in match rifles, and had a most distinguished record at Bisley. His death will be deeply felt by all his many friends and by all the branches of the gun trade.

JULY IN THE SOUTH COUNTRY

July's opening days give some hope that the severest part of the summer is now over, and suggest the possibility of being able to fish for trout without being garbed like a spring salmon fisher at the opening of his season. At last the weed is beginning to grow, and one hopes to be able soon to step into the stream without every trout in the reach making a bee-line for safety. Warm and moist weather now should at least encourage a reasonable hatch of fly and put trout fishing in the South on its legs again. There are quite a number of streams which, on the average, fish well in July, though it must be admitted that the last hour of daylight is apt to be the time which has most to do with their reputation for summer fishing: and the last hour of daylight at this time of year is almost, if not quite, the last hour of the twenty-four. Let us hope that the law of compensation will give us something in exchange for our near-frosts at midsummer. If rain in June puts all in tune, there should be a lively lilt about the trout fisher's July sport.

THE SOURCE

I see a little winding path that pleads
For me to tramp through the golden leaves
And find perchance the cool dark source that feeds
The silver stream, where the lime-worn rock cleaves
Asunder, and where the rich soft moss weaves
Intricate patterns in the stony bed;
And the water murmurs like one who grieves
With gentle sorrow for a loved one dead.

Tall beeches interlace their branches green
In arches spanned like some cathedral aisle,
Where songs of praise are sung by birds unseen.
Long vistas through the trees show many a mile
Of pastureland, and sunlight rests awhile
On Dunkery's height, and gilds the Beacon's head.
Here is a hidden path, a dark defile
That opens on a joyous sunset red.

FRANCES D. WATSON.

A COUNTRYMAN'S JOURNAL

ACTUALLY I learned very little about straw-plait from the older villagers of Stewkley. The folk were willing to talk, but perhaps the dislocation between our own times and those of a thriving straw-plait was so violent that the latter might as well have been not forty or fifty but a thousand years ago; their interest was apathetic and their memories were dulled. Not one of them could give me a concise and intelligible account of the various processes. I had to piece together a threadbare narrative from hints and fragments of hints dropped at one cottage and another. The straw was first cut into lengths (called "strippings" in Essex, but Stewkley had lost its own name for them), the best grades were dyed a number of colours of which "plum-pudding" was a favourite, and the straws split into three, five, seven or, more rarely, ten parts by a bladed cutter with a sharp prong, wetted with spittle, clipped to shorten the "wings," steamed, bleached, milled and then braided. The "mills" were like miniature mangles for flattening the straw, but none of the cottagers I spoke to had preserved any of them. Nor could any of them tell me which patterns they had preferred—"beady head ladies' wear," "three waves," "eleven straw," "porcupine," "long and short" and "Rustic No. 1" in Hertfordshire, "wisp," "whip-cord," "brilliant" and "goose's neck" in Essex. Names once as familiar to them as their children's had faded into limbo, a bottomless gulf into which the whole past in an indiscriminate heap of periods, particulars and distinctions seemed to have been irrevocably emptied. What anchorage had these old people now that their last years had launched into an age that might have been the wilds of New Guinea for all its resemblance to that of their warm, active youth? Or was it that their years of rest were like the billows of an angry sea with no port of memory for which to set sail when they threatened to swallow the whole world? They had seen two Stewkleys, the one as different from the other as the moon from green cheese. But perhaps it gave them pain to remember the old Stewkley of their young days, and so they had forgotten.

Those days saw the early summer of industrialism when the landworker was sweated to the bone for a starveling wage, and the satellite crafts of the land were being picked off one by one by the industrial towns as the green woodpecker does a colony of ants. But this worker was still a son of the land, though nearly all of it had been already stolen from him, while the land was still the nurse and nourishment of the people, though manufactures and free trade or the hunt for wealth in foreign countries against as acquisitive rivals had begun to depopulate our own countryside. The tradition of tillage and craftsmanship was hard beset, but not yet had it been utterly broken. The country was being sucked up into the town, but not yet had the town begun to move out into the country. Therefore the division between those days and ours is absolute, since now the tendency and process and development, first of the enclosures and then of the industrial age, are complete.

The old tag "For England, Home and Beauty" held meaning when the plait-makers were young. What an Alps, then, has memory to scale before it can return to the country tradition it has left behind! Among the old folk of Stewkley that memory has decayed like the village itself in which they live, the same name in the same neighbourhood but no longer the same place. Nothing could have given me a more poignant sense of how a country craft can be totally blotted out, never to be recovered except, granted the will to recover it, by fumbling fingers moving like those of a child, a child who has nobody to teach him. This is what Rivers meant by "the loss of useful arts," but he need not have gone to Melanesia for his examples.

As I left, what Sir Walter Ralegh called "the futile panorama of industrial progress" passed across my mind. What has it brought us when it fails to bring even the object of its existence, material wealth, for which it has sacrificed the permanent desirables of human life? I asked the last old "hwoy chap" of over 70 if he remembered a time when there was something else to be seen but plurality of pasture round his village. He pointed to a low hill. In my young days, he said, there was nothing to be seen from up top there but miles and miles of corn. "And now look at it! It's got the green sickness. It's lonely, all that land. It never sees nothing but cows."

H. J. MASSINGHAM.

WITHOUT COMMENT

From an illustrated weekly:

"It is a little like the starter's pistol on the race-course, which releases not only the horses from the tape but from the accumulated, waiting crowd, the gasp 'They're off!'"

A grouse shoot on the Milden Lodge Moors

GROUSE MOVEMENTS IN SCOTLAND

Some Causes of Periodic Migration

OBSERVATION of grouse movements within Scottish limits suggests that there is most restlessness among the birds when they are most numerous. Number is one factor which makes for movement, and a failure of the heather crop is another. When grouse are numerous and the heather is bad the conditions for a periodical disappearance from certain moors are present, and the grouse of those moors, roaming far from their homes in what might be termed the "oat" season, may fail to return home to breed.

It is a mistake to suppose that grouse disease comes on suddenly. Birds which died from it in the past spring may have been ailing in the previous one, and if the age and sex of the first victims of grouse disease is noted it appears that old hen birds are the first to die.

Sometimes old hen grouse are so thin in October that they must be thrown out of the bags as unsaleable. They are quite unfit for food then, and numbers of the old cocks are not much better in condition, while the young birds are lighter of weight than they are when in perfect health.

Sending grouse per parcel post teaches the keeper a lot about the health of his grouse, and if he finds his one- and two-brace parcels grow lighter as the season advances, he knows that all is not well with them.

The keeper of a low ground Moss, such as Laggan Moss of Kintyre, which I knew so well for 40 years, knows just when to expect strange packs of grouse on his Moss, which may be separated from the nearest hill moor by a couple of miles. The stranger grouse will, in normal years, appear in numbers on the Moss when the oats are cut, and the longer the oat-stooks are out the more grouse will gather to them.

Most of the grouse which reach such a Moss as the Laggan one are hen birds, but they are not all young hens, the old ones are with the young in due proportion, and act as guides. Otherwise the packs might easily pass the Moss, which is only about 600 acres in extent, and has miles of agricultural country round it.

The migratory packs of hen grouse which come to the Moss towards the end of harvest form themselves naturally in the hill country. Several broods of grouse come morning and evening to the same small oat-stubble, and the hens of the broods fraternise. The cocks do the same, so there are hen packs and grouse packs on the same hill stubble field. Such small fields soon have the last grain of oats picked up, and one fine October morning the hen pack which formed itself on that particular stubble is gone to a Moss, or to a fertile low ground moor at some mile's distance.

The cock packs still remain on the hill-ground when the hen packs have left, and if the hill moors are driven at that season bags will be small, and chiefly made up of cock grouse. It is at this season that a moor-owner sometimes makes the discovery that most of his grouse are males. He is all unaware that his hen grouse are away on their travels, and that they will come back, provided they are not shot, and do not die from disease contracted at home, while on migration.

The cock grouse which remain on the hill moors when their mates have gone frequent the hill stubbles up to November, and may form packs. In company with another, I once "browned" such a pack, and our combined effort brought down eight grouse cocks.

The cock grouse of the milder districts of Scotland have no sooner finished their stubble gleaning than they take up crowing stances, which they hold against all comers. Individuals have their mates before the end of the grouse-shooting season, and those early-mated birds appear to be old ones.

In South Scotland, and particularly in Kintyre, what might be called the stubble migration of grouse is at an end by mid-November, and a return migration to the hills, on the part of the hen packs, is in evidence. Those packs alight by the way, and their individuals find mates at every halt, so that a pack of 40 quickly becomes one of 20, and then of ten. At this season four and even six hen grouse may be seen with one cock, but while a cock grouse sometimes has two wives, I only once saw one who had three and kept them.

Grouse cocks which one can recognise from year to year are rare, but one such bird which had its primary wing feathers of both wings pure white nested for four years at the same spot. That bird could be flushed from a particular knoll near his chosen nesting place up to the end of November, when his old mate came back to him, or he found a new one.

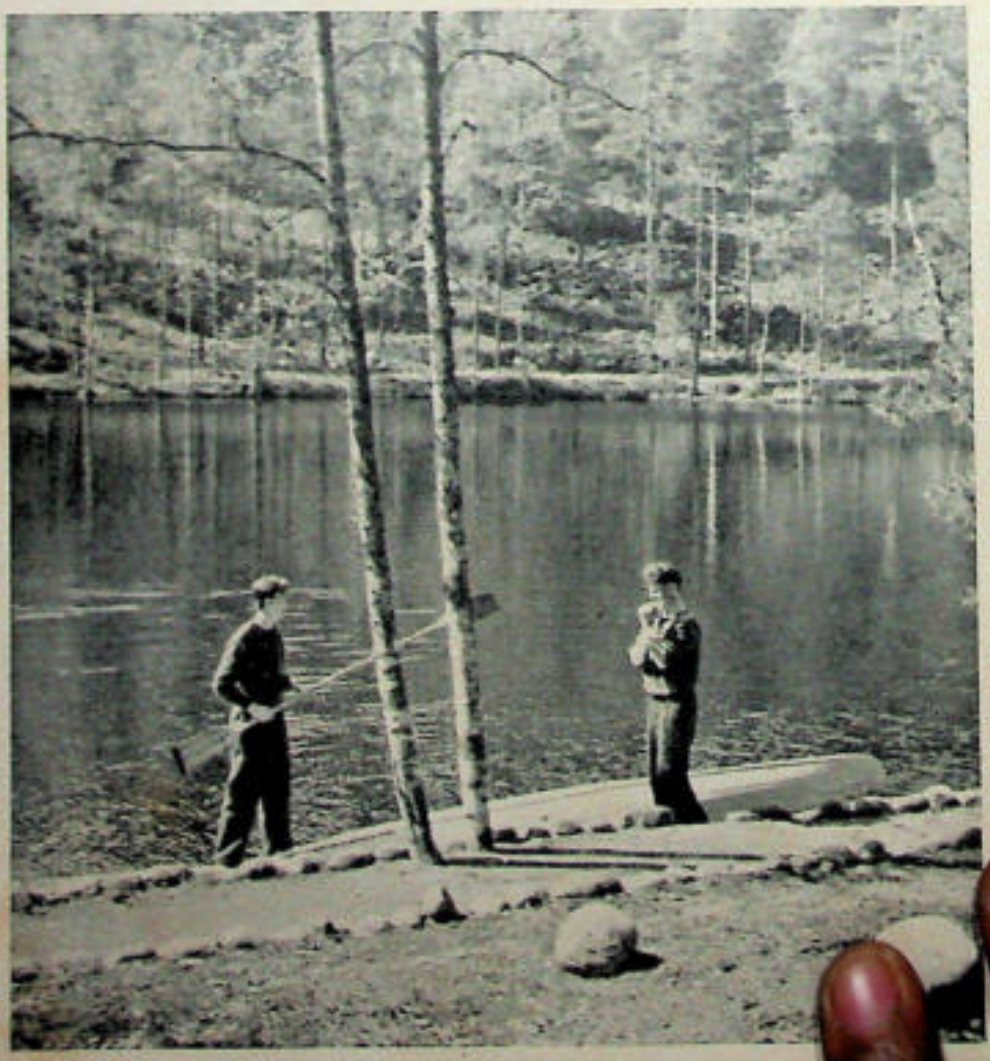
There are two mating seasons for grouse, and for a great many other birds, no doubt. One is the early date when old couples come together again, and the other that of the young birds of the season. The old couples are together in mid-November in mild years, but it is March before the last young couple has joined up.

Besides the ordinary movements of grouse which I have mentioned, and which are, or may be, more or less local, there are sustained ones, such as in 1911, when drought forced the grouse of higher and drier Kintyre to reach the Moss in August in unprecedented numbers. We had to stop shooting the birds after two drives that season, for fear of having our limit, but the hordes of grouse would have been better killed, as thousands of them died in late autumn and winter. Want of water is not the worst evil of drought, for the birds have wings, but heather becomes dry and brittle in a long drought, and is no use for food for grouse, or for sheep.

Drifting snow also sends the grouse flying in more or less number, and, in a snow migration, both sexes travel together. The birds evicted from their native moors by snow travel until they find black patches denoting uncovered heather under them, and the trek may be continued daily for some days until the birds are far from home. It is sure that the general direction of a snow migration is southward, and if the birds survive they come back in reduced numbers, and as small packs or in couples.

DUGALD MACINTYRE.

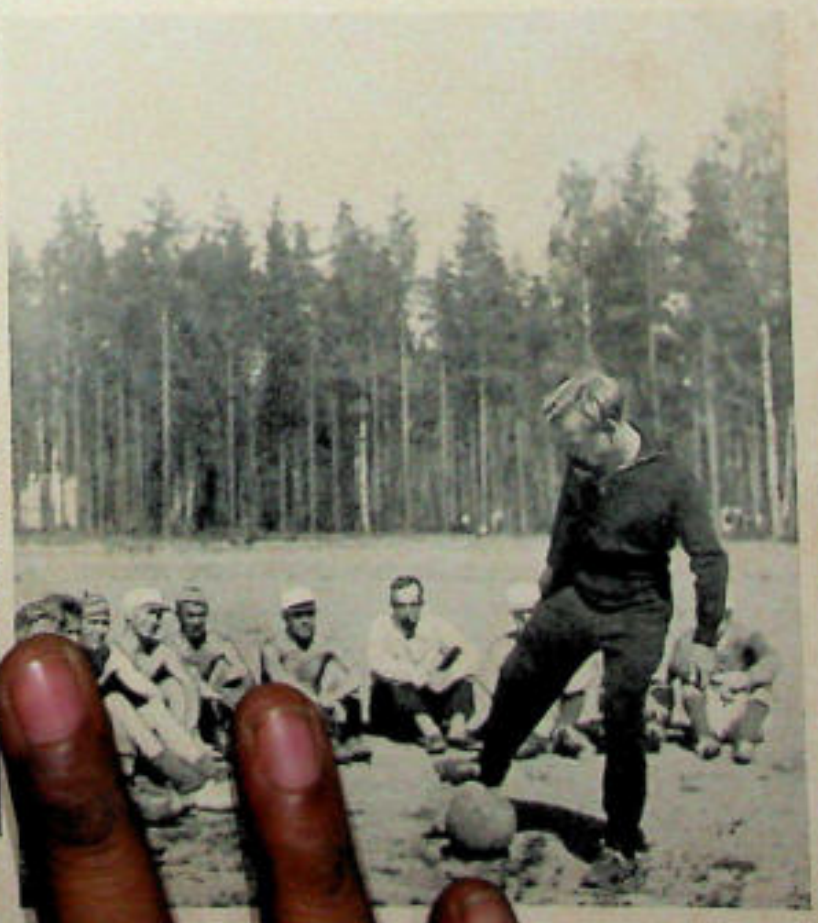
AN AERIAL VIEW OF VIERUMÄKI, THE PHYSICAL TRAINING COLLEGE OF FINLAND, WHICH WAS OFFICIALLY OPENED ON JUNE 13TH, 1932



FINLAND'S WHITE

PARTLY owing to the historical vicissitudes of the country, physical training in the modern sense is comparatively young in Finland, though sport and athletics have been popular with the people from ancient times. It may be said that the lakes, the great forests, fishing, wood pulp and matches make up the vision of Finland, but not these things brought her fame.

Fame came to this land of the north through her incomparable athletes: Lethinen, Malki, Iso Hollo, Teuberi, Helms, Jalkenen, Hockert, Reingoldt, Kotkas and, greatest of all, Paavo Nurmi. The success of the Finnish teams at the Antwerp and Paris Olympiads of 1920 and 1924 undoubtedly increased the self-confidence of the Finnish people. The later successes at Amsterdam, Los Angeles and Berlin have certainly enhanced the reputation of this nation, and in 1940, when the Olympic Games are staged in Finland at Helsinki, many will be delighted by the running of the natives of this friendly and hospitable country. These athletes have a style which is exclusively their own. Where do they learn the finer arts of athletics? The answer is: at Vierumäki, known as the White House of Finnish sport, which, if not so well known in this country, is famous throughout the Continent. It is a pattern of what such a school for the athletic development of youthful champions should be. It lies in an artist's paradise of lakes and woods, and combines beauty of setting with the needs of a sporting centre.



We can trace the idea of Vierumäki to the Finnish successes in the 1920 Olympiad, though nothing definite was done until 1925. It was the old story of doubt and prejudice. People argued that it was just as good to watch a handful of super-athletes as it was to take part themselves. In other words, Finland remained a nation of spectators in preference to active participation in sport. It is true, of course, that sport claimed an increasing number of disciples, but the growth in these did not nearly correspond to the rise in fame of Finland. And the fundamental ideals of sport were still absent. "Playing the game" was of secondary importance to winning, and it was with a view to sowing the seeds of real sportsmanship that a company was formed in 1925 to maintain an institute to be known as "The Physical Training College of Finland."

Here, indeed, is proof that it is better to be slow and sure. Before any college or large building was erected as headquarters, the public pulse was well tested. Special summer courses of instruction were organised in addition to the short courses arranged

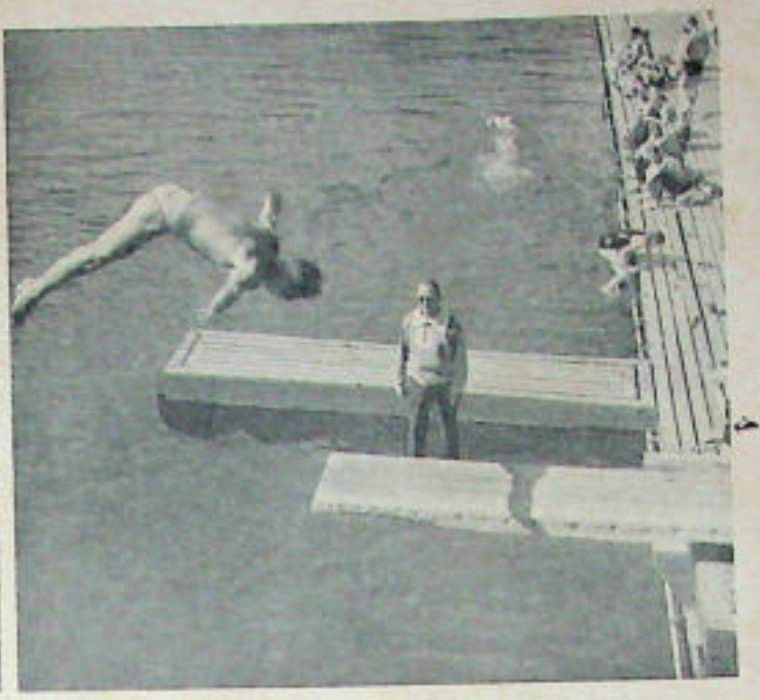
HOUSE OF SPORT

for many years by various sports organisations throughout Finland. Once there were obvious signs of general keenness, those planning the College looked for a suitable site.

It was no easy task. Firstly, the site chosen had to prove attractive, for most of the pupils who were to fill the college were to be pure amateurs, willing to sacrifice their summer holidays for the advantages of physical culture. (Pause for a moment and consider how many people would do the same thing in this country.) For sound training it is my contention that athletes need the quiet of rural surroundings. To get well away from cities is essential for real peace of mind. But the Finns had to do more than just that. They had to find a site where it was possible to construct level sports grounds and also convert the surrounding slopes for ski-ing purposes. Thus the southern coast of Finland was at once ruled out owing to the uncertainty of its climate. After several plans had been submitted and rejected, Vierumäki, a spot situated more or less in the wilderness, was decided upon in 1928. It had once been a military summer camp during Russian times and was thus an ideal site.

Next came the design of the proposed college. A competition was held in 1930 and was won by the well-known architect Elis Bryggman. He was then entrusted with the design of the new college. Building, however, proceeded slowly owing to lack of funds, and it was not until June 13th, 1937, that President Kallio officially opened Vierumäki.

Before that date, nevertheless, the college had become famous not only as an instructional centre for athletes and scouts, but also as a show place for tourists. You will get some idea of the good work it does when I tell you that during the past few years the college has organised more than 150 courses and entertained something like 5,000 pupils. Remember, too, that in its early stages lack of accommodation and building work still in progress kept quite a number of athletes away, and you will understand better the great possibilities of the college.



One of these days they intend to have their own aerodrome at Vierumäki. That will be progress; but I am not at all sure that I do not prefer the drive by car from Vierumäki station—about five kilometres. Imagine the change from the noise and bustle of a city. Your car passes along a gravel road, sometimes over open heathland, sometimes between stately pine trees. At first there is no sign of life other than vegetation; not even a small cottage breaks into the landscape. But as you approach nearer to the college a sports ground, with running track, or a shelter under which physical exercises are being taught, give the first hints that you are near Vierumäki. Then at last the handsome, modern six-storey home of Finnish sport comes into view.

A tour of the building reveals lecture rooms, dining rooms, a gymnasium, laboratory, bedrooms and dormitories, all as spacious as they are practical. I believe I am right in saying that nearly 100 pupils can be accommodated in double-bedded rooms, while the dormitories hold something like

A CLASS ON CORRECT MUSCLE MASSAGE BEING GIVEN TO STUDENTS AT VIERUMÄKI BY DR. SAVOLAINEN, WORLD CHAMPION IN GYMNASTICS, 1931

LEFT: RETURNING TO THE COLLEGE AFTER MORNING EXERCISES. RIGHT: SWIMMERS AND DIVERS EXERCISING UNDER THE DIRECTION OF INSTRUCTORS

60 athletes. All the pupils can eat together in the large dining room, and it is interesting to record that food is carefully regulated to the needs of the student and his or her work.

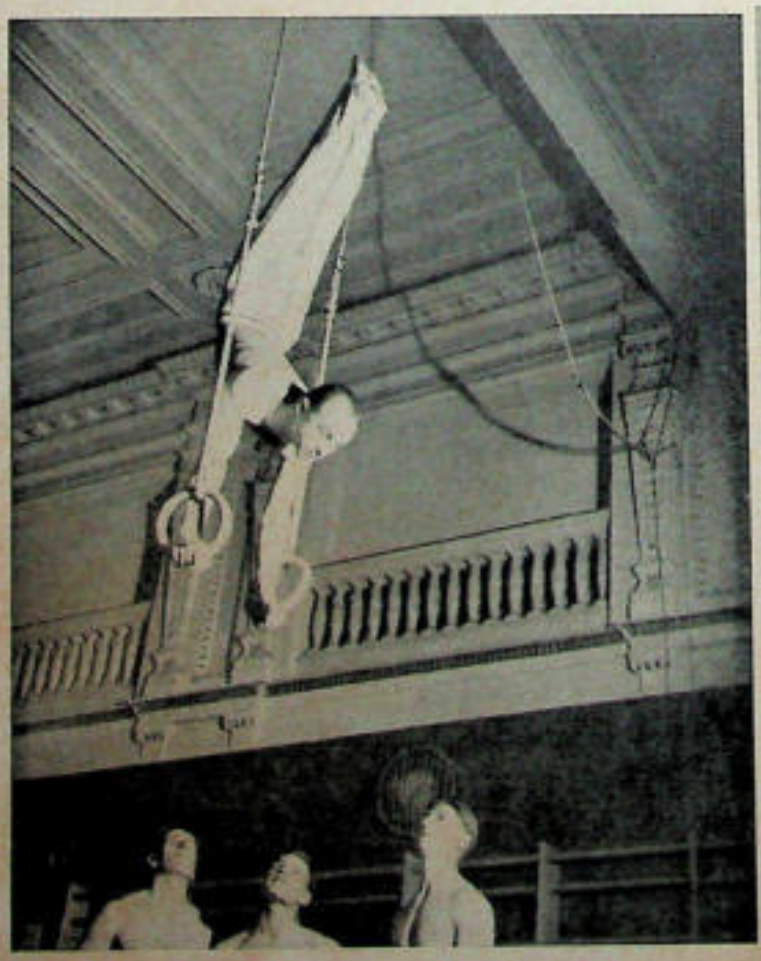
Is it any wonder that Vierumäki has become the centre to which sport-loving men and women from all parts of Finland go for instruction in physical culture? The college not only contains everything the young athlete desires, but is situated amid lovely scenery. In such surroundings it is obvious that one must find inspiration. There is freshness here and peace, and it is worth noting that a well-known sportsman, upon visiting the college, said: "One has to become good in such a place." Besides, among the many famous instructors at Vierumäki is Paavo Nurmi, that grand long-distance athlete.

In this country we have our Loughborough College, America has its Springfield College, Germany its Wunsdorf, France its Joinville, and Denmark its Ollerup, but nowhere are surroundings as ideal as those to be found at Vierumäki. The underlying principle is, however, everywhere the same. Nations have realised that people gain real happiness from physical fitness. Much has been done all over the world to satisfy the requirements of physical culture. By building the splendid college at Vierumäki, Finland has done her share towards greater fitness, and thus, I believe, greater happiness among the nations. Sport, after all, knows no frontiers.

And if you should be among the thousands who will flock to Helsinki for the 1940 Olympiad spare a couple of days to visit Vierumäki. You will regret it if you do not. There is much to see and admire at the college. In contrast to the level nature of the country traversed on your way from the railway station to the college, that to the north of Vierumäki (Boulder Hill) is entirely different, while at the foot of the hill lies a small lake fringed with graceful birch trees. To visit the college is an education and a holiday in one.

If you are fortunate you may hear the students at a sing-song. If any country might boast of a native heritage of song, it is Finland. The very foundation of the national culture is a poem in praise of song. The *Kalevala* stands off from all other folk epics in its insistence upon music and poetry as pastimes far more worthy of a hero than picking fights with dragons and foreigners.

Faithful to the creed of their forefathers, whose legacy of song made possible the survival of their posterity as a distinct people, the Finns have always fostered the arts as their most cherished birthright. Testimony to this national peculiarity is the remarkable fact that practically the only Finns—outside of the champion athletes—to have earned world-wide fame have been, not warriors, not politicians, nor money-makers, but artists and scholars.



Who are the Finns known more or less widely in all lands? Sibelius, Pahngren, Järnefelt, Sillanpää, Kivi, Lönnrot, Runberg, Topelius, Westermarck—not to mention the athletes. All of these men are dedicated to the spirit of song; to the spirit of the ageless Kalevala, whose heroes veritably sang their people to freedom.

And when you have listened to the students singing in one of the common rooms at Vierumäki you may wander down to the lake-side and watch an athlete idling away sunny hours in a canoe. Canoeing as a sport is already about 50 years old in Finland. Up to the end of the last century, however, its practice was confined to excursions and pleasure trips, and it was not until 1925 that the first canoe club was founded in Helsinki. This was followed by a second in 1930, and the next year saw the advent of the present controlling body of the sport in Finland, the Finnish Canoeing Association.

To-day Finnish canoeists and runners are getting into first-class condition for the 1940 Olympiad. Much hard and serious training goes on at Vierumäki.

The organisers of the Twelfth Olympiad are preparing in a spirit of harmony and friendship. In Finland it is fully realised that sport can develop that fellowship which alone will save the nations from disaster. In these times of unrest an effort must be made to dissipate the antagonisms which the conditions of modern life seem to promote. Finland is making that effort.

WIMBLEDON'S UNEXPECTEDS

By J. E. COLLETT

DECADENT or dull, or even deadly dull, are descriptions which have been applied to the Wimbledon Championships of 1939. A transition period may have been indicated by the first week's play, but any suggestion of dullness may be ruled out.

The theory that there must be an outstanding star to make a Wimbledon what it should be arises from a misconception of the nearby eras of F. J. Perry and D. Budge, or the further gone times of

MISS JEAN NICOLL WITH MISS D. A. BUNYRACH
Faced with a first match on the centre court the 16-year-old player was beaten 6/8, 6/4, 6/2

Mlle. Lenglen. The public have disproved it time after time by their attendance, but sections of the Press have pruned lawn tennis publicity to personalities. It is a policy which has always annoyed those who see the game as itself and has faintly irritated newspaper readers, who for one thing are getting to know that some "stars" do not write the articles attributed to them.

Thus, indirectly if not directly, this Wimbledon has been more refreshing than for years past. Players whom no newspaper has yet considered as journalists have done very well or have provided pleasurable entertainment. That gorgeous giant E. Smith served, volleyed and smashed his way surprisingly through the first week to the last eight. He is no "tournamenteer" in his own country, the United States, just a schoolmaster here on summer holiday. G. L. Patterson came over from Australia in 1919 in some such fashion, and won the championship. He had only an imitation of a backhand, Smith has a solid one; Smith, moreover, is the better player.

Smith was not seeded, which meant, officially speaking, there were at all events eight players reckoned better than he was. He beat one of them, R. Menzel, himself a giant and a hitter withal, in the second round. Ghaus Mohammed, of most un-Indian strength of build, beat his particular seed, I. Tloczynski, in the third round in straight sets. F. Kukuljevic, of Jugoslavia, again a mighty hitter, also eliminated his seed, H. McNeill, the champion of France, in straight sets, having met him in the second round.

How long is it since as many as three out of the eight seeded players have failed to survive to the predestined fifth round? Without reference, I believe that it is a record. It was not due to inefficiency of the committee but to the closeness of qualification among the competitors. The seeding is usually fairly easy, the last place alone being in much doubt.

Surely it is arguable that a tournament in which there are many claimants for pre-selection as the best eight out of 128 competitors in the men's singles, is likely to provide more entertainment than one in which there are only nine or ten.

The last eight in the men's singles were H. W. Austin (Great Britain), E. T. Cooke (U.S.A.), F. Kukuljevic (Jugoslavia), H. Henkel (Germany), E. Smith (U.S.A.), F. Puncec (Jugoslavia), Ghaus Mohammed (India) and R. L. Riggs (U.S.A.). These will be found, when they become history, to compare favourably with the last eights of the past. For level quality they have rarely been bettered. It would be interesting to analyse their chances as a team against their predecessors. This might be an entertaining post-Wimbledon exercise for a wet week-end, indulged in by a house-bound party, presided over, say, by Mr. Hamilton Price, the Wimbledon referee, or by Mr. F. H. Grisewood, whose B.B.C. experience, particularly of spelling bees, might come in useful.

McNeill went out on a damp day on a slippery surface which did not suit his attacking game. He would probably have beaten Kukuljevic under suitable conditions. He pairs up well with Smith in a double; at times their back-hand returns of service are a joy to watch. Talking of the back-hand, though R. A. Shayes was beaten by Riggs he brought off some marvellous takes of the American's extra high-kicking second services. Shayes got well in and under them, and hit them somewhere about the height of his ear.

Riggs is a bit of a riddle. He wanders about the court with feet turned out like a ballet dancer's, as we were taught to walk in the Victorian era, and his tempo is generally moderate. This robs him of modernity, and his opponents of self confidence. His own self-confidence is his chief asset. In order to beat him you have to break it—no simple job against the strokes he has got and the artful way he uses them.

Most people beforehand said it was going to be a ladies' year. At the back of their minds was probably the personality and playing ability of Miss J. Nicoll, a girl of sixteen. Unfortunately, she was put to play on the centre court at her first essay and was beaten unexpectedly. It was an ordeal she should have been spared.

Apart from Miss Nicoll, there ought to have been glamour enough to go round and overshadow the men; there was, but it did not go round. Neither Miss A. Marble nor Miss H. H. Jacobs appeared in a single on the centre court. Miss Jacobs was not seen even in a double; her presence seemed forgotten. Miss Stammers and Miss Hardwick gladdened the eyes of the centre-courters by hitting the ball with their accustomed ardour and elegance, but the most entertaining performance was given by Miss C. Somogyi, from Hungary, while being beaten by Mme. R. Mathieu, 6/0, 6/8, 6/3.

Miss Somogyi does everything a classical exponent does not do. For example, she always slices her backhand excessively, and takes it often when it has nearly gone past her; she drop-shots service returns; she has little mobility, but much anticipation.

After seeing for so many years so many ladies driving so many balls with such correct style, Miss Somogyi was a refreshing experience.

GHAUS MOHAMMED GETS DOWN TO IT—BUT JUST TOO LATE

THE DINING ROOM AT WHITE'S
Originating from White's Chocolate House, White's is older than the Bank of England

GREAT SOCIAL CLUBS—I. WHITE'S

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

WHITE'S is older than the Bank of England. Several generations of its members had come and gone before ever the first race for the Derby Stakes had been run at Epsom. Its history from 1736 down to 1892 has been written in two volumes, taking up over 600 pages and weighing 12lb. It is now my task to try to compress this into a single sheet. I ask straightaway for the forgiveness of the members of White's.

It has been stated that the whole modern system of club life owes its existence to the introduction of coffee into England. This would appear to be true as the first clubs, as we understand clubs now, owe their origin to the gatherings of men who used to meet at the different coffee houses in the late part of the seventeenth century. These coffee houses were frequented then for the discussion of news and for the propagation of political opinions. The Government of the day, frightened of their power, tried to suppress them but failed. During this period the various coffee and chocolate houses were each patronised by a distinct coterie of men in the same profession or trade, or possessed of the same tastes and inclinations. White's Chocolate House, for example, was the rendezvous of men of fashion. But at this time none of these clubs could refuse the entry to other people not belonging to their own set. As time went on, they naturally wished to change this, and eventually the public were excluded and White's Chocolate House was transformed into the private and exclusive society known as White's.

The original position of White's Chocolate House has frequently been wrongly placed. The truth is that it was opened by a Francis White in 1693 at a house on the site now occupied by Boodle's Club. After four years here White crossed the street and moved to where Arthur's Club stands now. Here White died in 1711 and Elizabeth, his wife, assumed the management. Mrs. White prospered and continued to manage the house until somewhere about 1730, when it was taken over by John Arthur, a former assistant of her late husband. Arthur also did well and joined up more houses to the Chocolate House, until one day in the early hours of an April morning of 1733 the whole place was destroyed by fire. A fire so near St. James's Palace naturally caused much excitement and His Majesty George II and the Prince of Wales left their beds and encouraged the firemen in their work. After this fire Mr. Arthur moved three doors up the street on the same side and continued here for three years while he was rebuilding his old house lower down. John Arthur now ceased to manage the house and his son Robert took over from him.

In the fire all the early records of the Club had been lost and these were not started again until 1736. In consequence, the first Club rules in existence now at White's are dated 1736. They are entitled "Rules of the Old Club at White's," and were probably made out from memory of the original ones destroyed in the fire. A list of the 82 members of the Club follows the rules. It will be seen, on looking at these names, that the members were not all idle young men of fashion. The great Walpole was one of them; William Pulteney, Earl of Bath, his rival, was another; the Duke of Newcastle and his brother, Henry Pelham, both of them subsequently Prime Ministers of England, are also to be found on the roll of members. In 1743, there being many more candidates for the Club than the members were prepared to admit, "The Young Club at White's" was formed and they shared the same house. It would seem that there was no hostility shown to this new Club by the members of the old one and their rules were exactly the same.

The new Club became, in fact, a place of probation where one waited, with what patience one could muster, for admittance to the Holy of Holies. And on the extent of your personal popularity and the amount of influence you could exert depended the length of your probation. Fox had only to wait a few months; other distinguished people waited for years and some waited for ever. This division of White's into two Clubs lasted until 1781, when they were merged into one. By 1755, the number of members of both Clubs having increased to 350, their Manager, Mr. Arthur, removed to the "Great House" in St. James's Street, where they have been ever since. Arthur, out of his profits, had purchased the freehold of this house from its owner, Sir Whistler Webster. It had been a house of note for a considerable period. Having done this, Arthur transferred the management of the business to his assistant, "Bob" Mackreth. This man only stayed a few years, eventually becoming member of Parliament for Castle Rising, one of the pocket boroughs. This borough was in the patronage of a noble earl who had borrowed money from Mackreth, when he was a waiter at White's, and had not repaid it. One need not explain the story any further.

During all this time under review the gambling and betting at White's had been terrific. It was a constant subject of comment in the Press, and in the private letters of those times—Pope satirised the Club in verse, Swift in prose and Hogarth in paint. The betting book of White's comprises nearly 250 pages of bets. They betted on everything that could, or might, happen under the sun and no subject was too intimate to bet on. The probable duration of various men's lives and the possible increase in the families of certain ladies who happened to interest the members were amongst the most favourite subjects. £240, besides sweepstakes, were staked on bets as to which of the two Miss Gunnings, the famous beauties, would first have a child after marriage. General Scott, the father-in-law of the Duke of Portland and George Canning, whose wife brought with her £100,000, was stated with authority to have won £200,000 at White's, thanks to his notorious sobriety and knowledge of the game of whist. He always came to the table with a clear head. Thousands of broad acres of England's fairest hereditary estates were pawned or lost for ever on the gaming tables of White's. High-minded and intellectually gifted young men like the youthful Lord Carlisle seemed no more able to resist their pernicious influence

THE BILLIARD LOUNGE AND, IN THE BACKGROUND, THE BACKGAMMON ROOM

than hardened old roués old enough to be their fathers. But as has been pointed out earlier, they were not all mere gamesters in White's. Besides the idlers were many eminent statesmen, distinguished sailors and soldiers and the great administrator Robert Clive.

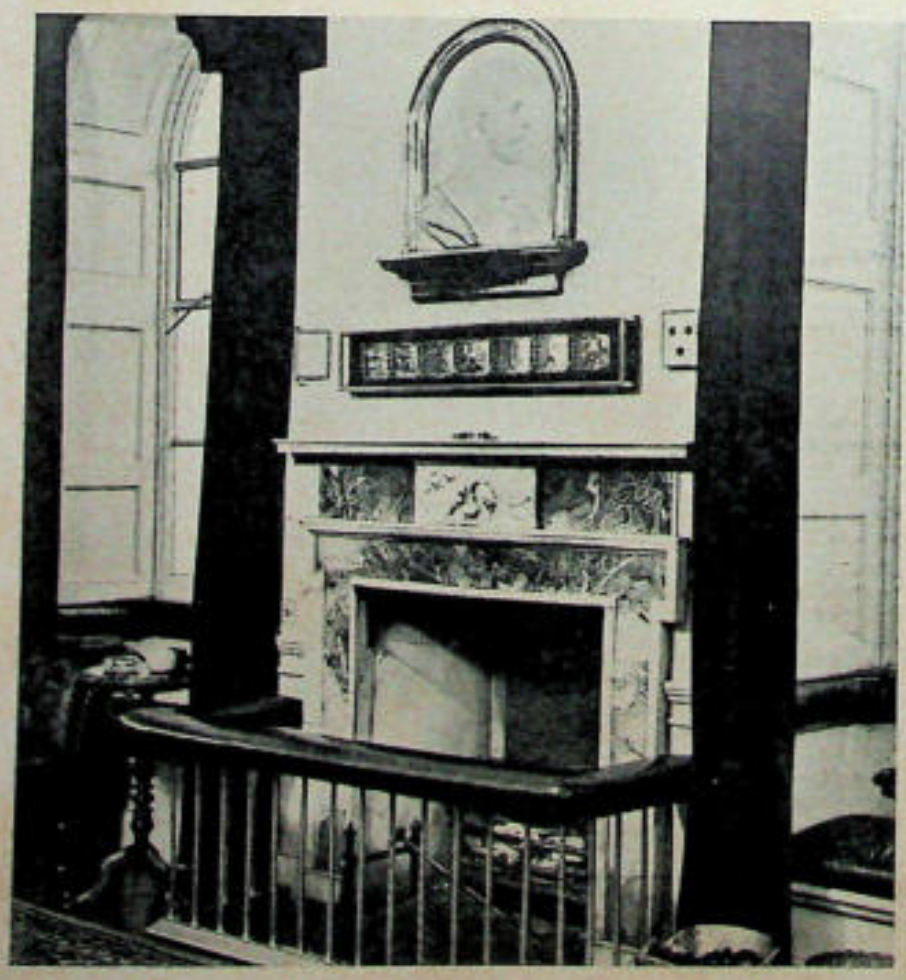
In 1764, the formation of a club known as Almack's, for the purpose of gambling only, took away some of the heaviest gamesters from White's. Up till the year 1781, the date the two clubs amalgamated, White's had been neutral as regards politics, having amongst its members adherents of both parties. But when William Pitt joined the Club (1783) and started to use it as a place of meeting for his supporters, the Club then identified itself with the King's Party. Charles Fox, his great

rival, thereupon removed himself and many of his friends to Brooks's, which became the headquarters of the Opposition party.

In 1798 the odious Beau Brummell joined White's. It is certainly most surprising how this man ever led "London Society" or, as far as that goes, White's, which all said and done had some very intelligent and intellectual men amongst its members. Neither by birth, intellect nor means was he qualified to lead the people who followed him. He appears, in fact, to have had nothing at all to recommend him except a vast conceit and a most colossal impudence. One instance here of his conceit is sufficient. A creditor of his, not moving in the same brilliant circles, pressed him for the repayment of £500 owing to him. "I paid you," said Beau Brummell. "Paid me, when?" "Why, when I was standing at the window at White's, and called out as you passed, 'How d'you do, Jemmy?'" In 1811 the Club carried out some building operations and altered the position of their front door, and at the same time put in their famous bow window. Here Beau Brummell ensconced himself with his cronies and woe betide any uninvited member who dared to join them there.

When Brummell's reign was over, Lord Alvanley succeeded him on the throne. Alvanley was at least a gentleman and a wit, neither of which terms could rightly be applied to Brummell. The great Duke of Wellington had joined the Club in 1812, and two years later, in June, peace having been proclaimed and Napoleon placed, as people fondly imagined, safe at Elba, White's gave a ball to celebrate it all. The ball was held at Burlington House, lent by the Duke of Devonshire, one of their members. Two thousand four hundred people were present and it cost the Club £9,848 odd. The subscription to the ball was limited to 20 guineas, and as there were at this time 500 members, apparently everyone paid up. Shortly afterwards, they spent another £2,500 on a dinner in honour of the Duke of Wellington, one of their members. Carefully preserved in the Club can still be seen one of the beautifully woven tablecloths used at this dinner-party.

When, in 1813, the Club had started its first candidates' book, this had proved to be the signal for a most extensive blackballing campaign to set in. It seems that the Club was now becoming jealous of the growing social status of Arthur's, Boodle's, &c., and that its members were determined to keep themselves even more exclusive than they had been before. Noble lords such as Castlereagh, Duncannon and Dufferin were all blackballed, and the great Sir Robert Peel was twice turned down in the same year. So bitter was the disappointment of the proposers and seconders of these unsuccessful candidates that we find their names not only painted out of the book in black ink, but even bodily cut from the pages. Things reached such a pitch that the numbers of members



A CORNER OF THE CARD ROOM

At one time the gambling and betting which went on at White's was terrific

became seriously depleted and so, in 1833, steps had to be taken to fill up the vacancies and nearly 100 new members were elected. Matters now went on more calmly for a number of years until 1866 was reached, when once again the vexed question of allowing smoking in the drawing-room boiled over. A general meeting of the Club was summoned, every member of the Club receiving a personal whip to attend. So determined were the smokers to win the day that they actually obtained special leave from the headmaster of Eton for the young Marquis of Huntly, lately elected to White's, to be present. Seeing that smoking at Eton was an offence punishable by flogging at that time, one may, indeed, congratulate the smokers on the thoroughness of their preparations. Nevertheless, they lost the day by 23 votes and it was not until 1870 that they were allowed to use the drawing-room for the purpose. The victory of the non-smokers on this occasion is said to have given rise to the formation of the Marlborough Club, the Prince of Wales not being prepared to put up with these restrictions on smoking at White's.

In 1871, the Club house came up for auction and was bought by Mr. Eaton, M.P., afterwards Lord Cheylesmore, for £46,000. Mr. Eaton was not a member of White's. However, Mr. Percival, who at this time was the manager and held the existing lease of the house, was subsequently able to obtain a 30-year renewal of his lease from 1881 at £3,000 a year. In July, 1888, the long management of the Club by the Percival family came to an end and it was taken over by Mr. Algernon Bourke, a member of White's and the author of its history, to which I am largely indebted in the writing of this article. Extensive alterations were then carried out and the interior thoroughly modernised, without in any way impairing the beautiful style of the old building.

In 1928, the members subscribed to a fund to purchase the freehold of their premises, so the house is now their own property. Was this due to financial acumen or mere luck? Whichever it was, they are to be congratulated. Only a short time afterwards the great slump burst with a crash, and before it had spent itself clubs built on frailer foundations were whirled away in its icy blast like leaves before a storm. During the last five years, the members have spent several thousands on repairs and improvements to their house; over the same period, the membership has increased each year, there have been remarkably few resignations and it is now up to the prescribed limits.

THE FIREPLACE IN THE LOUNGE

A GLIMPSE OF THE COFFEE ROOM

"It has been stated that the whole modern system of club life owes its existence to the introduction of coffee into England"

W. A. Rouch

HELIOPOLIS, WINNER OF THE PRINCESS OF WALES'S STAKES AT NEWMARKET

JULY MEETINGS AT NEWMARKET

Some Comparisons of Form

THE First July Meeting at Newmarket is over, but the second one will be held there next week, and anyone who had to miss the first should make a point of going to the second, for no more delightful meetings are held during the season under Jockey Club Rules. It is indeed a mystery and a pity that more than two meetings are not held over the course which could surely stand it. There are still some of us who preferred the old stands and old course. The old stands are still there but cannot be used as they are on the opposite side of the course. The new stands are modern in every way and very comfortable.

We racing people are always inclined to think that the last that we saw is the best. A number of visitors to Paris for the Grand Prix came back from the race quite convinced that they had seen in Pharis the horse of the century. I was under no such delusions, for I had heard the same thing after Blue Peter won the Derby. I heard something very like it at Newmarket last week after Heliopolis had won the Princess of Wales's Stakes of a mile and a half. Once again Blue Peter was forgotten, and this time also Pharis had receded into the background. Blue Peter is to run at the end of next week in the Eclipse Stakes, and if he wins that race as he certainly should do, he will be placed back on the pedestal which he occupied after the Derby. I cannot for the life of me see why he was ever removed from it. I am not stating that he will win the St. Leger as he won the Derby, for I am of the opinion that, but for a little bad luck in the race, Heliopolis would have been nearer to the winner and certainly in front of Fox Cub.

Writing in *Horse and Hound*, the best of all the writers on racing in France, Mr. Clement Hobson, places Pharis very high, but he does not admit that he is a St. Simon or anything like it. He beat Tricameron by two-and-a-half lengths, and, using that colt and Flyon, Pharis is not so good as Heliopolis. It has to be admitted that Heliopolis won this race at Newmarket in fine style and in very good time, several seconds faster than the time taken by Maranta to win over the same course and distance earlier in the meeting. The conditions as regards going and atmosphere were much the same. I am certain that Heliopolis is a very good Hyperion colt, and it is to be noted with interest that his trainer, Earl, has got him sobered down a lot since the spring. He is still rather highly strung and was inclined to play up a little when he came back to be unsaddled. He nearly knocked his delighted owner, Lord Derby, over.

When Colombo was a two-year-old and a three-year-old there were always rumours that he was a mad beast and a man-eater. His trainer, Captain Hogg, used to be worried out of his life by newspapers ringing him up day and night asking him for the true story about the colt. Each of the stories was at least a terrible exaggeration or wholly untrue. The colt had a tender top to his head and resented at times his bridle being placed on him. On another occasion a wasp or bee buzzed round his head as he was leaving the paddock at Newmarket and he behaved a trifle wildly. His son, the Rose of England colt, is of the same playful manner. A few days ago he got rid of his boy when out on the Heath, a thing which Colombo was always trying to do in a playful way. Colombo, however, never did anything wrong in a race, and his son out of Rose of England is exactly the same. He showed how wonderful a mover he was when he won the July Stakes cantering from Claudius. He has the same action as his sire and is very like him to look at except that he has his white sock on the off fore and Colombo had it on his near fore, and a white sock there was, in the opinion of Ettie de Mestre and old Jim Bell, the sign of a sure winner. There can, I think, be no doubt at all that this colt by Colombo out of Rose of England is the best yet seen out and more than that is a colt of the greatest promise. Yet he was beaten in his first race at Newmarket, where he ran very greenly. Sam Long in his invaluable Two-year-old Handicap places him 4lb. above Turkham, who has not run since Ascot.

The Ascot form is not working out badly as regards the two-year-olds even if it has to be admitted that the King's filly, Great Truth, by Bahram out of Frankly, failed in the Queen Mary Stakes there. After all, fillies at this time of the year are not easy to understand. She had previously won running away at Manchester. As she had not beaten much there and had then failed at Ascot it was assumed by many people that she was not as good as everyone had hoped would be the case. She showed that she was very useful indeed when she won the Fulbourne Stakes last week in admirable style by three lengths from East Bee with Clarion III. who will win races, just beaten for second place. For the time being the King's filly is inclined to be a little excitable, but she will grow out of that, and at last it may well be that His Majesty has bred a classic winner.

A proposed new rule relating to the weights to be carried by horses running under National Hunt Rules was announced in all of the newspapers last week, but the importance of it seems to have been missed owing no doubt to the Flat racing season being on. The proposed rule is to the effect that in handicap steeplechases of four miles and upwards the top weight need not be more than 12st. It is also proposed that the rule that the lowest weight in a handicap shall not be less than 10st. (except in handicap steeplechases of three-and-a-half miles and upwards when the lowest weight may be 9st. 7lb.), shall be retained.

Now these two proposed rules look quite innocuous, but they are of the greatest importance, and I hope that they will be carried. As they are proposed by the Stewards, I expect that they will be. The changes mean that the top weight in the Grand National next year need not be more than 12st., and that it is no longer necessary to have the top weight at 12st. 7lb. I had heard rumours some time ago that this was to be done, and this is the way in which it is to be done. As to whether the bottom weight will now be 9st. 7lb. I do not know, but that is a possibility. I am not in favour of that weight and would like to see the top weight 12st. and the bottom weight 10st. Every great Grand National rider has held strongly to the opinion that 12st. 7lb. was 7lb. too much for any horse, each 1lb. over the 12st. being nearly a ton in the last half-mile. More than one horse in my time would have won the National if the top-weight had been 12st. instead of 12st. 7lb.

GNOSTIC.

LOOKING BACK ON MEADOW BROOK

THE last game of the international series on the International Field at Meadow Brook was, in many ways, the most interesting of them all. For one thing, America decided to play their "dream team," the 40-goal outfit. Cecil Smith was fit again, and that meant a possibly stronger team than that which had just won the Westchester Cup from us again. With an eye on the "gate," I suspect, it was decided to play England on handicap, which meant that America, on American rating, would have to give us a start of ten goals, which sounds fantastic. In fact, they very nearly brought it off, and did equalise at 14—14 in the sixth chukker.

It is very easy to be wise after the event, but, having seen that game in which John Lakin took the place of the disappointing Aidan Roark at No. 2, I am inclined to believe that had he been playing in all the series we might have had a better chance. Certainly he put up a grand show, going "wiciously wenomous" from the first bell, and giving Tommy Hitchcock a very rough ride all through. Towards the end England began to open out, and then they looked like a winning team. The expected thousands again failed to materialise, though there were about 20,000 present, we were told, and I fear the trip has been a desperate financial flop, which is not likely to be much improved by the sale of the ponies.

England should, I protest, have played as "Hurlingham" in the last game, for it is a little *infra dig.* for an international team to receive a start of ten goals. We were short of several of the best ponies owing to various causes and had out a number of ponies who if good tournament mounts are certainly not internationals. It certainly looked as if we should be hopelessly outpointed. After the first two chukkers it seemed as though we were in for a terrible hiding. Again America got a flying start, and had three goals up in the first chukker, and at the end of the second had scored six against our solitary goal, hit by Lakin from an opening made by Balding.

It really was beginning to look like a farcical affair, and at the end of the first half the score read 10—13. At that rate the result looked probable of an overwhelming rout to the tune of 20 or so goals against 15 or 50. But although the fourth chukker had been pretty disastrous with three goals hit against us without reply, the team was beginning to go better. After the interval the Americans were within a goal of us. In the next each side scored once, and then all of a sudden the spirit that had all along seemed lacking entered the whole English team and they began to go like men possessed. From that point they dominated the play, all of them playing splendidly, and in those last two chukkers had definitely the better of that team of all the talents. What was even more remarkable was that although the Americans had out their best four ponies in the seventh chukker, they could not get away from us.

That was a chukker! There were four terrific runs the length of the ground by both sides; never have I seen eight men play so furiously, and at the bell both they and their ponies looked fit to drop.

The point of this story is this. Up till then England had tried to keep the game close, fearing the advantage of the Americans' length of hitting. In a close game the superiority of the Americans' stick-work was, I think, even more apparent. Once England began to play them at their own game, and give their ponies the chance to run, they no longer looked like an inferior combination. Perhaps had they hardened their hearts and dropped Roark from the first game and substituted Lakin, had they played an open game from the start, they might well have won the first match, penalties apart. The defenders looked by no means unconquerable that afternoon, and to lose the first match would have unsettled them even more. But, as I said, it is easy to be wise after the event. Heaven knows the captains Lord Cowdray and Balding had a terrible problem to solve, but in view of the lack of form of Roark, due I hasten to add through ill-health (he is now having his appendix removed in California), and the appalling difficulty in pleasing him with any pony that was up to the job, I believe they would have done better to play Lakin. I did not think so at the time, for he had not proved his quality then on a big occasion.

I have an idea that, sooner or later, Skene will gravitate to No. 3, that is provided he can get the ponies to play in that position. He did not shine in the Internationals as he had done on the Pacific Coast, well though he played. But it is very hard to shine at No. 1 when the ball is not coming up as it should. Tyrrell-Martin was brilliant in the first and third games and vindicated the opinion that he is the best back in the world. I still think Cecil Smith the best player in America to-day, and, on his showing, Iglehart must be very close behind him.

JEMADAR.

THE AMATEUR'S PLACE IN CRICKET

By NEVILLE CARDUS

R. B. PROUD FAILS TO CONNECT WITH A. C. SHERRETT

HALF-WAY through the season is a time convenient for stocktaking. In spite of poor weather, we have enjoyed much splendid, and occasionally surprising, cricket. The vagaries of the game have seldom gone so contrary to logic as during the two matches in which Gloucestershire inflicted defeats on Yorkshire, and the one in which Derbyshire lost seven wickets for one run against Sussex, when they needed less than 30 for victory. So often are we told that the game is not what it was, that it is losing the spirit of adventure. If you believe that, reader, you will believe anything—as the Duke of Wellington replied to the man who came up to him and said: "Mr. Jones, I believe?"

Seldom has first-class cricket been played with as much enterprise and gusto as at the present moment. A leading professional batsman of the North put the "new" situation to me the other day in terms of unconscious humour: "It's a rum 'un now; if we get out there ['there' denoting the wicket] and we doan't score for ten minutes, we begin to worrit and wonder what's best to do now. In t' old days we could just go on puttin' bat down t' line and waitin' for t' fower 'underd to go up."

I am not statistically-minded, and cannot say whether the rate of scoring is faster this season than in recent summers. But there has undoubtedly been a quickening of the general tempo of the pulse of the game at large. Most matches are being finished; skill has escaped from routined procedure; it is again governed by sport and the caprice of man. Such a change was necessary. We live in times too serious for dullness on our fields of play. The crowd wishes to see good and stylish cricket, but insists (deep down in its heart) also on gallant cricket. There is the memory yet of the dreadful bore of last year's "timeless" Test match. The splendid game at Lords with the West Indies revived the heart of the true and proper Test match. (It would have been pointless, of course, without a time limit.) The West Indies were no doubt disappointed to lose a Test match in which their one great batsman scored a century in each innings. They can scarcely hope that Headley will repeat that remarkable performance for a long time to come.

But the West Indies will be well advised to disregard the defeat at Lord's, and indeed, to disregard any subsequent defeat in this country by England. Already they have won a victory well worth while—they have won the approval and esteem of the crowd. The way they played during the closing hour at Lord's was exhilarating and fine—England were forced to fight hard for every one of the 99 runs they needed. When only 9 from the goal, Hammond pulled with enormous power a loose ball—obviously he was aiming at a six to put an end to the proceedings. And Headley, fielding at short square leg, tried to catch Hammond at the risk of life or limb. It was a brave attempt, but I fancy that if I had been Grant I should have complimented Headley, extolled his courageous sportsmanship, then kicked him hard in full view of the rest of the team. Headley might easily have stopped Hammond's blow at the cost of fingers or wrist: he might have impoverished his team for weeks to come. It was not as though Headley could have won the match by his bold effort; it was a noble deed and a foolhardy deed, one which made us like the little man more than ever. The contribution which the West Indies are making to our cricket is not to be reckoned in results and scores.

They are helping the game here to recapture something of the original impulse; they are showing us the way back to youth and fun. We have rather needed a touch of eagerness in cricket these last few years. Any game suffers if skill in it grows in excess of ambition. A player should always be not *too* clever; desire for glory and the powers of execution should be nicely mated. The West Indies gave the best of England a good game at Lord's; they will do even better than that later on. I decline to believe that any team is suspect of weakness if it possesses or contains a Headley, a Hylton, a Cameron, a Stollmeyer, a Martindale, a Constantine, a Scaley. The serious need of the West Indies is one or two additional batsmen of organised technique. Their bowling is excellent—and we have not seen Martindale in form yet; he bowled well with atrocious luck at Lord's. Put O'Reilly into the West Indies side and it would possess better all-round bowling than Bradman commanded last summer.

The disturbing fact in a mainly satisfactory scene is the poor quality of our amateur cricket. There was not one player in the University match who by any stretch of the imagination could be made to look like a Test match man. Yet, not so long ago, the University match boasted a Chapman, a Gilligan, a Jardine, a Duleepsinhji, a Pataudi, a G. O. Allen, a "Father" Marriott, an F. R. Brown. In the leading names of the batting and bowling averages this week only those of three English cricketers appear—W. R. Hammond, G. F. H. Heane and S. Pether. I cannot be happy when I see a Middlesex team with only one amateur in it coming to Old Trafford for the benefit match of a Lancashire professional. Once on a time the blazers and colours of the Middlesex amateurs made the Old Trafford pavilion balcony look like a flower show—remember the two Douglases, J. and R. N.; L. J. Moon, P. F. Warner, C. M. Wells, B. J. T. Bosanquet, G. McGregor, J. H. Hunt. If I remember well, the three "pros" had to be *squeezed* into the side. And they were Trott, Rawlin and J. T. Hearne! In Kent, Fairservice used to disappear in late July, no matter how helpful he had been. Probably his bowling analysis was 60 wickets at 19.80 each. None the less, August saw him no more. The school holidays meant the eclipse of many a good professional by a better amateur. Those days, I suppose, are beyond recall. For that reason, I cherish the appearance in the Somerset team of a new name to me, F. M. McRae, who scored 107 last week against Hampshire. Also I cherish the news that C. H. Palmer of Worcestershire is an amateur batsman of exceptional promise. I would give much to see once again at Lord's a Gentlemen's team strong enough to tackle any possible Players' team of the moment. Can any reader remember such a Gentlemen's team?

THE OXFORD CAPTAIN BATTING

E. J. H. Dixon fails to drive Webster. He played a subdued but extremely useful first innings

CONSTANTINE SWEEPS THE BALL TO THE LEG BOUNDARY WITH TYPICAL VIGOUR

ROUND THE WICKETS

WHEN Oxford and Cambridge came to play at Lord's last week they came like newcomers to some extremely exclusive club in Pall Mall. The members looked them over. They wondered what youth was coming to. They sighed for the days of yore. They thought of F. S. Jackson and C. B. Fry and the time when Cambridge beat Yorkshire. Cricket was not what it was. The batting was bad—rank bad; the fielding, true, was passable, but then any young man should be able to field. The bowling was only fit for one end—the Nursery end. But if cricket is not what it was, to quote the words of Mr. Punch, "It never was." It is only human to idealise the glory of the past and realise the faults of the present; and this respect of the past, this hallowing its deeds and garlanding its victors is as much part of the 'Varsity match as the play itself.

* * * *

But, good or bad, past or present, there is one thing about the 'Varsity match which always remains—and always will remain—the same. It is the spirit in which it is played. It is not merely the raucous shouts from the tweed-coated partisans clustered round the Tavern. Not merely the undertone of rivalry which pervades the voice of crowd and everyone watching. But the very nature of the game itself. The men who are playing it out there are men—of flesh and blood. They are not the infallible heroes of county cricket who play a game so exclusive to themselves, so shut off from the crowd that it might not be the same cricket at all. The opening batsmen are nervous, and we feel it.

The young leg-break bowler is anxious about his length. First slip is hoping he will hold the catch which must come to him some time. The fielding captain is wondering about changing the bowling. When the bat of the side plays forward we can almost hear the advice of the school coach, almost see the net. We appreciate the 'Varsity match. It is a game; and a game after our own hearts, a game we all play.

Perhaps that is why it is so widely, and consequently so often unjustly, criticised. But it would be no injustice to say that the batting we saw was weak. It was weak; and it was stereotyped in its weakness, its lack of imagination. Only one batsman caught the eye, and he was only on view for a short time. But in that time he had made 31 very quick runs, and had shown us almost every shot known to technique, from an exquisite leg-glance to the latest of late cuts. And when E. D. R. Eagar swung his bat at a fast rising ball on the off-stump and rocketed it into the air to a towering height, not even the highest, most piercing discord in the flow of a Beethoven sonata could have shocked us more.

The bowling was no better. It was almost rotten. It was not an attack at all. It lacked initiative. It also wanted length, and leg-spin, and variation. The best of the bowlers was Webster. He bowled fast, very fast for a young amateur. He swung the ball, when it shone, literally feet—once or twice enough to beat his own wicket-keeper. He cut the old ball viciously, brought it back from outside the off-stump beautifully. He was extremely accurate. Webster comes from the north. He learnt his cricket at Bradford Grammar School. That, I think, significant. The North is where the real bowling is—the bowling that is hostile, that attacks, that gets the wickets. A look at the averages, and then a look at the Championship table, will tell you that.

But the fielding—— The fielding we saw from Cambridge would, I swear, have rivalled the Australians themselves. It was absolutely brilliant. It held Oxford in a grip of iron. When the ball was hit along the ground it was snapped up cleanly, returned to the wicket accurately. Anything that went up—and to a fielder—was almost gobbled up. The Cambridge captain at silly mid-off took a full-blooded off-drive in his huge hands with as much relish as picking a red apple off a tree. Cover-point stood under Eagar's mis-hit and held it safe after an interval as long and as nerve-racking as anything an international player has had to face. Square-leg took a hit which skimmed hard and low against a kaleidoscopic background of spectators' faces. Not a catch was dropped, not a chance missed all day long. Even the most persistent diehard, even the most ardent follower of the shades of the cricketers of the past, even the oldest Blue present must have found it difficult to decry the fielding we saw from Cambridge.

And yet the youth of to-day cannot bat, does not know how to bowl. They cannot propel the ball, they cannot hit it; and yet they can outstrip the best cricketers in the world and their illustrious forefathers themselves when it comes to running after it, fielding it, catching it. This is obviously extraordinary. But it is significant. The art of fielding is entirely different from the art of batting or bowling. Its demands are different. It requires not so much excellence of technique as a sense of anticipation, a highly-developed "ball-sense." It also requires a certain amount of courage, physical fitness and a great amount of determination. Anyone can learn to field, they say. It is the art of collecting the ball in the quickest, and therefore the most natural, way. Fielding is natural, which is the whole point.

Batting and bowling at schools and universities to-day are too minutely studied. There is too much coaching. A boy "with cricket in him" is pounced upon at once. He is stuck in a net. It cramps the freedom of his shots like the wings of a butterfly. He is told he must not do this, he must not do that. He must not play across this ball, he must play straight at that. He must not bowl the ball too fast. He must not try to do too much with it. He is pampered. He develops into one of Mr. Cardus's "suède-shoe cricketers." Cricket is a game of art, of beauty, of culture—sometimes. It should always be a game of character and natural personality.

* * * *

Copson continues to take wickets. He is still at the top of the bowling averages. He persists in his claim to be the best fast bowler there is playing. And yet there were quite a number of people at the Test match the other day who asked who the small, frail, red-haired man opening the bowling from the pavilion end was. Very few people, too, could tell them much more than his name, and his county, and his position in the averages. They might have remembered vaguely that he had gone to Australia sometime, and, perhaps that his stamina had been unequal to the strain of the tour and the severity of the wickets. Or they might have realised that no one with red hair played in any of the Tests against Australia last year—the result of that tour. That is about everything we know about Copson, the bowler of the year. Copson, in fact, is rather a mystery. Because he comes from rather a mysterious county. Derbyshire have always been an unknown quantity. It is their position on the map. So much is written, and so much is heard of the thunderings of their mighty neighbours in the North that we forget all about Derbyshire. But three years ago they eclipsed even the might of Yorkshire. They won the Championship. With someone else to bat as well as Copson can bowl they would win it again. HUMPHREY DANIEL.

IN THE FORESTS OF THE HARZ MOUNTAINS
"Broken by openings in which grew beech and oak, with, at intervals, glades"

IN PURSUIT OF THE HARZ MOUFLON

By FRANK WALLACE

With illustrations by the Author

HAVING reached an age when I am uncertain about a great deal in life, having done many things that I ought not to have done and a few that I ought, it is pleasant to look back on something about which there is no uncertainty.

I had always wanted to shoot a mouflon. Why, I am not quite sure, except that he is such a handsome little beast with his white saddle, rich chestnut and black colouring and smartly marked legs. That, and the fact that wild sheep of any species have always held a great attraction for me. No sporting trophy is equal to theirs, and the big sheep of the great mountain ranges of Central Asia provide the blue riband of the stalking world. Never, alas, now am I likely to see one of these in the flesh, but I was more than delighted during a visit to Germany when I was told that I had been given permission to stalk mouflon in the Harz Mountains.

These sheep, as everyone knows, came originally from Corsica and Sardinia. They were introduced into Germany by a business man called Tessdorf about 30 years ago. Small herds have now been established in many parts, and, being very strictly preserved, are doing well. They were imported into Austria in 1841, again into Upper Austria in 1868, fresh blood being brought in in 1890 and 1910.

The best German heads come from Pless, and the four best in the International Hunting Exhibition in Berlin in 1937 were from Czecho-Slovakia. The best head from here, on formula, had 225.8 marks. The best German head gained 221.8 marks on formula and came from the Harz. The best from this district, of which I have measurements by our own system, was 33¼ long by 10¼ in circumference.

To be successful in an international exhibition measurements of, roughly, 32 long with a girth of over 10 would be necessary (something over 180 marks by formula). Heads with a wide tip to tip measurement are more highly prized than those with ingrowing horns.

The number of rams allowed to be shot in the district in the eastern end of the Harz which I visited, was from three to five out of a total number of shootable rams of fifteen. The whole herd numbered about 50.

The pleasure I anticipated from the trip was enhanced by the fact that the diplomat with whom I had made friends in Berlin said that he would accompany me. Not only was it very much pleasanter to have a companion, but the fact that he spoke German fluently smoothed away many difficulties.

We set out one morning from Berlin in the diplomat's car and drove westward for mile after mile down the wide double-tracked *autobahn*, through country which, flat though it was, had for me the charm of novelty. Towards midday, after we had left the *autobahn* at Magdeburg, a low range of hills rising above the plain told me that we were nearing our destination, and soon we were climbing the foothills. The Harz Mountains average about 1,300ft. for most of their length, which is about 50 miles. The highest point is the famous Brocken (3,700ft.), and they cover about 20 miles from north to south. At the eastern end there are two State and several private forests.

At Magdesprung, the Virgin's Leap, we were met by the Forstmeister who had charge of the district. Dressed in a smart green hunting uniform with a flat-topped peaked cap, he engaged the diplomat in conversation, whilst I, feeling rather a fool as one always does on such occasions, even though the latter gave me the translation of their talk, stood by catching a word or two occasionally and reflecting how much more interesting life would be had I realised years ago what I should miss by not being able to talk French and German. Cold lunch occupied but a short time and we were ready to start. A few minutes' drive in the car took us to a path which branched off into the wood. Here stood a familiar object, a "machine," as such conveyances were always known in Scotland in my youth.

At once I knew what was to take place. We were going to do a "pirschfahrt," to which I had grown accustomed in Schorfheide. This consists in driving round the rides and open spaces of a wood until your quarry is sighted. You then descend from your machine, take the nearest cover, and, unless you make a mess of it, secure your beast. At Schorfheide I did make a mess of it! I missed my stag, the only one of the whole party who had done so, and returned in the evening feeling an outcast and a pariah. Next day, it is true, I retrieved my mistake with the aid of a borrowed rifle and a telescopic sight, though my performance still rankled.

I had anticipated driven game, and for this reason had armed myself with a D.B. .275, which is an ideal weapon for such sport, but unsuitable for the kind of shooting on which I was engaged. However, all this had happened a month before, and now the diplomat had added to my indebtedness to him by giving me the loan of his Mannlicher fitted with a telescopic sight. This, under his

directions, I now proceeded to try. The first shot was high, the second at the right elevation, and the third in the bull. Up to my knees in undergrowth, propped against the stem of a tree, very cold and not too happy, this seemed good enough to go on with, so on we went.

I always feel rather guilty when I am allowed to "pirschfahren"! At the back of my mind I am conscious of the feeling that I ought to be doing more to earn my shot. It was the customary method of hunting, so there was nothing to do but acquiesce, though very different to my imaginings. I had had visions of snowclad rocks, wintry, windy heights, and wide open spaces with a few stunted pines. Here I had pictured myself climbing precariously, a spy-glass on my back through which, if I were lucky, I hoped presently to spy a herd of mouflon.

Instead were sombre woods of fir, broken by openings in which grew beech and oak, with, at intervals, glades and narrow rides which bent and twisted round corners and undulations. The woods were bounded by meadows, now dull and grey, gloomy, and I was not feeling too happy about my shooting. I found it, as I always do in a bad light, shut in as we were by trees, extraordinarily difficult to see. In a sneaking subconscious sort of way I had the sensation that this driving about in a carriage-and-pair was not quite fair on the "muffles."

I felt that to be on equal terms with them the entourage by which I was accompanied ought to be rather more piratical in appearance, and that there should be the prospect of rather more hard work. Bronzed mountaineers with long moustaches, rope sandals, dirty but picturesque clothes and belts bristling with weapons, who would not be above taking a pot shot at others similarly attired on the neighbouring hill tops, would, I felt, be more in keeping with the atmosphere which my imaginings had built up about a "muffle." Instead, my glance showed me the diplomat, a very smart fur collar buttoned on to a heavy overcoat, a jaunty green hat cocked rakishly over one eye, and the spruce and severe Forstmeister. Even the driver had a better overcoat than mine! However, make up my mind, one, whether he carried a head which I, subsequently, should be pleased to possess; and, two, whether I should hit him if I fired. Such a state of mind is, as every stalker knows, hopeless.

My doubts were settled without action on my part by a low drone, of which I had been conscious for some time suddenly developing into a shattering roar. An aeroplane shot over the tree tops, and the "muffles," to my secret relief, vanished. Rejoining my companions I made unconvincing explanations which were duly translated and we continued our drive. Beyond the edge of a bank across the ride, before we had been driving for ten minutes, I saw something move and gave an exclamation. We stopped. More "muffles." I thought at first, so close were we to the scene of our late adventure, that they must be the ones we had just left, or rather which had just left us. The driver, however, who seemed to be a bit of an expert, maintained that they were a different lot and contained a ram with a head far superior to any that we had seen. They moved slowly on and we followed. Crossing

MOUFLON IN THE SNOW-COVERED RIDES

Coming originally from Corsica and Sardinia, mouflon were introduced into Germany thirty years ago, in many parts and, being very strictly preserved, are doing well. Small herds have now been established

but which in summer must be lovely to look at. It is true that in among the trees were occasional rocky knolls on which I was told mouflon were often found, but the differences between my imaginings and the reality were great.

Through aisle-like rides we did our "pirschfahrt" for some time without incident, and I thanked my stars that I had brought a heavy overcoat. It was cold and inclined to drizzle, and in the back seat of the machine I cowered beside the diplomat, endeavouring to keep warm. Then the driver, a lad of parts, pointed with his whip and exclaimed, "Schaf!" In the gloom of the trees I could see nothing, but the diplomat, after a look through his glasses, said, "ordinary sheep, not 'muffles'." The latter is the term by which mouflon are always called in Germany, and very catching it is. I do not to this day know whether he was right or not, but by degrees I made out several pale ghost-like faces peering out from behind the tree trunks. Almost at once they vanished. We drove on.

The next excitement was the sight of a stag, an eleven-pointer with good brows but in no other way remarkable, who gazed at us from the edge of a ride and then disappeared into the wood. The deer in the Harz are not particularly good, though they are improving both in heads and bodies. Half an hour later we came across more "muffles." There was no doubt about them this time, though according to the Forstmeister they were all ewes. They watched us, when a roe suddenly dashing out of the thicket put them off.

I began to feel a little depressed. The day was turning to a wet misty afternoon. The wood was there we were and it was no use cavilling. I only hoped that if I did get a shot I should not repeat my Schorfheide performance.

About three o'clock the next "muffles" appeared, this time with a ram. The Forstmeister anxiously scanned them with his Zeiss. Yes, the ram was a good one. A muttered colloquy in German with the diplomat. Did I think, he inquired, that the ram was good enough? Never previously having seen a mouflon ram in the flesh, I modestly replied that he was a better judge than I. There were, perhaps, three better rams in the Harz. This was a good representative head. It was getting dark and I very cold. I agreed to pursue it. We drove on, turned down a bisecting ride at right angles, saw the ram walk over a knoll and disappear. The ewes followed. They were not frightened. If, said the Forstmeister, I thought it good enough to shoot, would I kindly descend, walk up to the knoll and do my stuff. This reliance on my, *my* judgment was beginning to influence me. Was the ram so good, after all? I debated this as I walked up to the knoll.

Some of the ewes were to be seen walking into the wood on my right. The ram was not with them. Then I saw him. He stood, 30yds. off, watching me, then moved slowly away stern on. Certainly he looked pretty big, but back views, we all know, are very deceptive. I made a mental note to aim low and, not knowing much about telescopic sights, wondered if he was too close. He pottered on while I dodged from tree to tree, occasionally, when I had a chance, trying to get a clear view of him through the sight. I could not the ride in front of us they strung slowly out among the trees. Said the diplomat: "The Forstmeister will tell you where you get off!"

Pondering the familiarity of this phrase I got off without waiting to be told, and lumbered, half-numbed, behind a tree, which, at any rate, gave some cover. I saw no ram and scrambled to the next tree. I had no doubts this time as to whether I ought to shoot or not. Even without a glass I had seen that he carried a much better head than that which I had formerly pursued. "Stalked" would be too flattering a term. Then I saw him as he stopped to look back. The cross lines with the little pointer between were on his shoulder, and I set the hair trigger with which all continental rifles are fitted. Then he moved forward, and as he did so the cartridge exploded!

I should be very sorry to have to say on oath that I meant it to at that exact moment. I was quite certain I had missed, and, as he kept on, made a gesture of impotent rage. Following, I heard a cry and looked back. My smart companions, gesticulating wildly, were scrambling out of the cart. The diplomat yelled, "He's down!" The Forstmeister waved. Turning, I saw a dim form beneath a tree. When we got up to him he was quite dead, and I pretended that my gesture had been one of joy! I was not quite sure from the look in the diplomat's eye whether he was convinced. The bullet had raked right forward, passing through the heart, but, pleased though I was to have a good head of this splendid little sheep, I could not honestly feel that I had fairly earned it.

WITH THE MITUMBA MOUNTAINS IN THE BACKGROUND
Aquatic bird life on the shores of Lake Edward, one of the richest in fish in the world

BIRD-BANDING IN THE CONGO

By LEON LIPPENS

DURING a year's stay as assistant game-warden of the Parc National Albert, in the Eastern Congo, in 1935-36, I often spent some time on the shores of Lake Edward.

This lake is one of the richest in fish in the world. It also has a big variety of aquatic birds, which seek out an easy living in its shallow waters, its sandy or muddy beaches and its sheltered sandbanks.

The African birds themselves are very numerous; but are joined up in wintertime by a crowd of European migrants. They come from every point of the Northern Hemisphere to gather there: Stilts, sandpipers, snipe, garganeys, terns, ruffs, greenshanks and many other little waders.

It is a fascinating thing to observe the life and behaviour of these birds in their African surroundings. Watching them, one is often led to wonder: "But where do they come from? Where will they be in a few days' time—in a few months' time?"

These are difficult problems to solve, and yet there exists a way of solving them, if only partially. This way is the scientific process of banding birds.

In Europe, banding has been especially confined to young birds, in their nests, or as chicks. In Africa, it would be necessary to band adult birds in their winter haunts.

The first difficulty to surmount is catching them. This makes excellent sport, much more difficult than shooting them with a gun.

Before going to the Congo, I had had plenty of experience in this kind of thing, ratching and banding storks, for instance, and all sorts of more little waders in our meadows. I may say, without undue exaggeration, that catching one single snipe with a net, and leaving it loose with a ring on its leg, is much more exciting than shooting ten. This sport I highly recommend to all those in search of a thrill!

Seeing all those birds running about on the shores of Lake Edward, I felt I must try to catch them—to band them, too.

Nothing was easier for me than to place a small net (30ft. by 12ft.) on the edge of a little sandy beach which I always observed to be frequented by numerous birds.

My net was rolled up on the very edge of the water and shot out over the birds to be caught with a sort of spring.

The natives could not understand anything about all this; catching birds in order to let them loose a few minutes later seemed sheer madness to them, or, most likely, pure imbecility. Or, perhaps, it was just another of the "white man's tricks."

Up to this date, of all the birds I caught near Lake Edward none have been recaptured in Europe. However, banding them has made me able to ascertain a fact. One might think that our northern birds, spending the winter months under the Equator, roam about from one marsh to another, from one lake or river to another, until springtime.

I believe this idea is false. These birds, which come from so far away, and have passed through so many lands, come to winter at a given spot, which seems to be very localised, and from which they do not depart during several months.

I found this opinion to be correct with stilts and the common sandpipers (*Himantopus himantopus* and *Actitis hypoleucos*).

I banded some of these birds at Kamande, on Lake Edward, in October, 1935. In November, January and February I was able—with field glasses—to discern the same birds on the same spots.

In April, 1936, to make sure, I laid my net there again, and among the birds I caught that day were two stilts and one common sandpiper which I had banded during the previous October.

PORTRAIT OF A STILT
An occasional visitor to our shores

A few days later all those birds had left the lake to fly back to their breeding places, north.

I feel ready to believe that the following year these same birds would have come back to the same spot, but unfortunately I was not there to observe it, and so my experiment remains unfinished.

As a conclusion, I venture to suggest, would it not be interesting to establish a bird-banding station of palæarctic birds in their hibernating grounds in Central Africa?

Capturing these birds is not difficult if one has some experience and plenty of time at one's disposal. It would be possible, too, to train natives to catch and band them under European supervision.

In this way one could get interesting information concerning the origin and habits of palæarctic birds hibernating on the Equator, about which so little is known up to now.

AFTER BROADBILLS OFF CHILE

By W. E. S. TUKER

WHY is it that the first sight of a broadbill swordfish finning on the surface causes all other fighters of the ocean at once to step into second place? It happens every year. I start the season with the firm intention of pitting my skill against the striped marlin whilst it is in these waters up to the end of May and to let "old man Broadbill" sun himself to his heart's content. On May 1st my good intentions were shattered as soon as my look-out man shouted "albucora," which is the local name for swordfish. Everyone moved at high speed aboard the launch getting in the "teaser," putting away the marlin rod and tackle in the cabin, rigging up the rod for broadbill and fixing on the skipjack for bait. This was all accomplished in a short space of time and, when the launch had been manœuvred into position for working the fish, the bait was thrown out over the stern.

This was the first broadbill of the season and the crew were as keen as possible to get on terms with it. It certainly is a grand sight to see one of these huge fish swimming along at a leisurely pace with dorsal fin and tail cutting the surface of the water. Our first visitor soon showed that it was in no two minds about being interested in the bait, for, as soon as the launch had worked the bait into its line of vision the water boiled as the fish, with a swish of its tail, went down to get a better look at the skipjack.

The launch keeps moving ahead slowly while the fisherman, whose nerves are at tension point, waits with the drag brake very lightly on the reel for the first strike as the fish slashes the bait with its sword. The look-out man, who is standing high in the bow of the launch, keeps his eyes fixed on the bait which can be seen flashing through the water about 40yds. astern; he can also see the swordfish as it turns to slash the bait and shouts "alli viene," then whack! and the line is jerked off the reel with the strike.

At that exciting point the launch must be stopped as soon as possible and the fisherman must leave his line absolutely slack; if he does not do so and the bait is jerked by the line, the fish will return and hit once more with its sword probably tearing the bait off the hook. So, with everything slack, the fish returns and grabs the bait across the body with its mouth. The fisherman must keep cool and do nothing except let the line run absolutely freely off the reel; if he puts bait into its throat; the skipjack is about 20in. long and is swallowed head first, which is quite a mouthful for a big fish which is not in the habit of bolting its food.

As soon as the swordfish has the bait in its throat it will move off slowly at first; then, as it feels the drag of the line in the water it will speed up. Now the fisherman must come into quick action to take up the slack in his line and strike hard three or four times to pull the wire leader through the fish's mouth and bury the hook deep.

I succeeded in carrying out the operation successfully and had my fish well hooked, much to the joy of my crew and to the satisfaction of myself. The swordfish very seldom goes in for jumping when hooked; it may come out once to splash back heavily, but will not tire itself out with jumps all over the ocean like the marlin. This fellow acted up to form and made some fine runs, keeping under the surface all the time, then settled down to steady pulling with vicious shakes of the head, which nearly lifted me out of the chair each time and definitely shook my head in none too comfortable a manner.

Time passes and the tug-of-war goes on. After three hours of give and take I can feel that the fish is feeling the strain and I am able steadily to pump its head up and recover line on to the reel. I also have my troubles, for every time I bend forward to pump the fish and wind the reel my back, arms and hands are just one block of pain. Finally, I succeed in getting the fish close enough to the launch for my boatman to have a look at it; he decides that the fish is still much too full of fight to be brought alongside, so I let it take line and then start working on it again. This has to be done several times, until at last after three-and-a-half hours the fish begins to turn a grey colour under water, which is the sign that it is practically played-out. The final effort can now be made to pump in line and get the wire leader to the surface so that the boatman can grab hold of it. Gradually, foot by foot, the leader nears the surface, but with only a few more feet to go the gear inside my reel snaps off and the reel is useless. I grab the line with both hands, lean back in the harness to keep the rod up and manage to keep the fish from sinking and dragging out line. The boatman looks over the side at the fish and to me it seems ages before he makes up his mind that it is dead. With my reel out of action there is nothing left to do but hand-line the fish up alongside the launch. That ends a four-hour battle and a very unsatisfactory ending too, because no hand but that of the fisherman is permitted to touch the rod or line and the boatman can only catch hold of the wire leader when the fisherman gets it within his reach. That fish weighed 593lb. If it had been a record fish I could not have claimed it according to our rules over here. Serve me right for not keeping to my resolution to hunt marlin and leave swordfish alone.

F. W. UTZ, WITH BROADBILLS TAKEN OFF TOCOPILLA, CHILE
The fish on the left weighed 615 lbs., and was captured after 4 hours 15 minutes; that on the right weighed 487lbs., and the one on the planks, 482 lbs.

IT TAKES FOUR MEN TO DO IT
An eight-hundred pounder being hauled aboard

THE COPIHUE IN ACTION AND THE AUTHOR WORKING ON A BROADBILL

tension on the line then the fish will clamp its jaws on the bait and swim off—the harder the fisherman pulls the harder will the fish pull and shake its head like a dog with a rat until it gets tired of the game or pulls the bait off the hook. With everything slack the fish will turn the bait in its mouth to swallow, during which operation the actions of the fish can be felt on the line. The fisherman must still keep cool and do nothing, because it will take several seconds before the fish gets the

What is without doubt a unique incident happened when I was out with a friend after "Old man Broadbill." We were out in two launches, he in the Quinchihue and I in the Copihue. Early in the day we found a swordfish and the Quinchihue went into action at once and the fish was hooked soon after. While my friend Hope Norton was fighting his fish I was hunting the ocean in the vicinity of the battle to find another surfacing fish. It was not long before we spotted one about 400yds. to the north and 150yds. to the west of the Quinchihue.

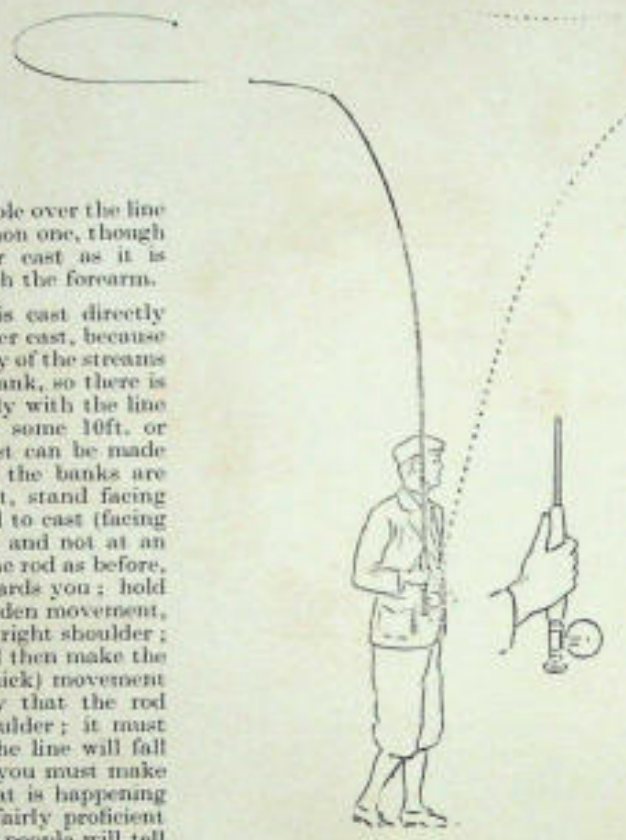
I got the bait to the fish and the strike was not long in following. The fish was well hooked and went away on a fine hard run. What was my disgust to see that the line the fish had taken was going to pass dangerously near the Quinchihue and my fish would pass under or over Hope Norton's line. I did everything I could to stop or turn that fish, slacking off the drag to see whether the easing

up of the pull would persuade it to stop, then clamping on the drag to try to turn it, but all to no avail. The fish kept on its course.

Soon came the awful moment when I felt the other line rub on mine. I hoped the other boat would realise the critical situation that had arisen and immediately get under way and swing round ahead of my fish in the direction in which their fish was travelling, so I clamped on all the drag I could and held on to the fish which was towing the Copihue astern at a good pace. The rub of the two lines became more pronounced as my launch was being dragged along, until Hope Norton's line appeared above water running up my line. That left no other way out of the jam but to break my line, which I did, and, fortunately, his line sank at once allowing the launch to pass over it without cutting it. He killed his fish, a 53½-pounder, in 3hrs. 40min.

LETTERS TO YOUNG FLY FISHERS

III.—On Playing and Landing Fish



MY DEAR BOB,—I sympathise with your difficulties. Casting is a most irritating thing to learn; but you will find, I think, that quite suddenly the knack is acquired. You will probably be very pleasantly surprised, after a few more trials, to find your line going out beautifully and wonder how you did it. After which you will be back again for a while at the old coils and tangles; and then suddenly you will put in another good cast; after that things will become easier. The trouble over the line catching in the rod is a very common one, though not so common with the shoulder cast as it is with the "overhead" cast made with the forearm.

By the way, you must learn this cast directly you have got the hang of the shoulder cast, because you will want it in Devonshire. Many of the streams there are small, with trees on the bank, so there is not always room to cast comfortably with the line travelling backwards and forwards some 10ft. or more to the side. An overhead cast can be made in quite a narrow stream, even if the banks are bushed on both sides. To make it, stand facing in the direction in which you intend to cast (facing the line as it lies out on the grass, and not at an angle of 45 deg.); lift the point of the rod as before, so that the line begins to move towards you; hold the rod firmly, and then, with a sudden movement, bring the rod up vertically over the right shoulder; pause to allow it to straighten; and then make the forward drive with a *small* (but quick) movement of the forearm. Note particularly that the rod must not point back over your shoulder; it must never go beyond the vertical (or the line will fall behind you); and, as before, that you must make the rod bend. You cannot see what is happening behind you with this cast, so get fairly proficient with the shoulder cast first. Some people will tell you to keep the upper arm from the shoulder to the elbow pressed close to your body while you make the overhead cast; and if you find any difficulty in making it with a free arm, try it. You may find it a help.

But to return for a moment to your difficulty. The reason the line catches in the rod is that it is not high enough in the air—not out beyond the point of the rod as it ought to be, and that means either that you are not making the rod bend enough, or that you are allowing too long a pause between the backward and the forward cast, in which case the line falls towards the ground behind you. But I will make a moderate wager that the former is the explanation: you are not putting enough beef into your back cast. It is generally with a following wind that one's line adopts this maddening trick of curling itself round the rod. It is, of course, that the wind checks the back cast, and the line does not straighten out properly behind. The result is that when the forward cast is made the end of the line (which is not yet straight behind you) comes round with a swish, checks its pace in doing so, and falls a foot or two towards the ground, thus coming into the area of the rod instead of travelling over its point. Whenever you find this happening, put more energy into the back cast and less into the forward drive. It is really the back cast that matters. If you can make a good and well-timed cast in the air behind you, you will find that the forward cast follows almost automatically.

Now to try to answer the very wide question which you put so briefly in your postscript: "What happens next?" You mean, after you have made a cast on the water, I suppose? I am almost tempted to answer, "Nothing. Lift your line and make another cast"; which is what happens nine times out of ten (to put it optimistically). But should you have the good fortune to get a "rise" out of a fish, then you will, I hope, hook it, play it, and land it—and I expect you want a dissertation on this part of the art of angling. To you, at the moment, it is probably the most important part. To an old hand it is secondary—inducing the fish to rise being the more important and enjoyable feature of his pastime.

On the best method of hooking a fish anglers will wrangle, I expect, till kingdom come. The wrangling is caused by the term which is used to describe it. This, in fisherman's English, is "strike." Disputants claim that the term is too belligerent; that it implies violence and that violence leads to disaster and is the last thing to be desired. They suggest all kinds of modified terms to smooth over its vicious character. But, after all, it does not seem to matter much what it is called, as long as the term is understood. The object is to drive the hook home.

BACK CAST AND FORWARD CAST (DOTTED), IN MAKING THE OVERHEAD CAST WITH THE FOREARM.

The line should always be above the tip of the rod so that it does not catch in it. (Only a very short line is shown.)

If too much vigour is used the gut will break and fish and man will part company; if too little, the hook will not penetrate beyond the barb, and again, sooner or later, man and fish will part company. So here is another case of the happy mean, which can only be acquired by experience. What is wanted is to raise the rod point quickly but firmly. It is no use just "pulling at it." If the fish is a heavy one that may possibly get the hook home, but with a half or three-quarter pounder, let us say, it will simply pull the fish towards you. Fish are very light in the water. So the strike must be reasonably vigorous—but do not go to work as if you intended to pitch the fish on to the bank with one sweep of the arm.

At first you will be well advised not to hold the line against the rod with your finger while you are fishing. Let the line come directly from the reel. In this case you have a sort of safety device in the "check" which prevents the drum turning on its own account, though line can be pulled off very easily. Consequently, a little too much energy in the strike will cause the reel to turn and save the gut.

Actually, the best way of avoiding a break is to keep a nearly taut line between the rod and the fish. It is a great length of slack line which is the danger. This has to straighten before the strike is effective, and the jar as it comes taut suddenly is what does the damage. So, for a start, strike "from the reel," as it is called.

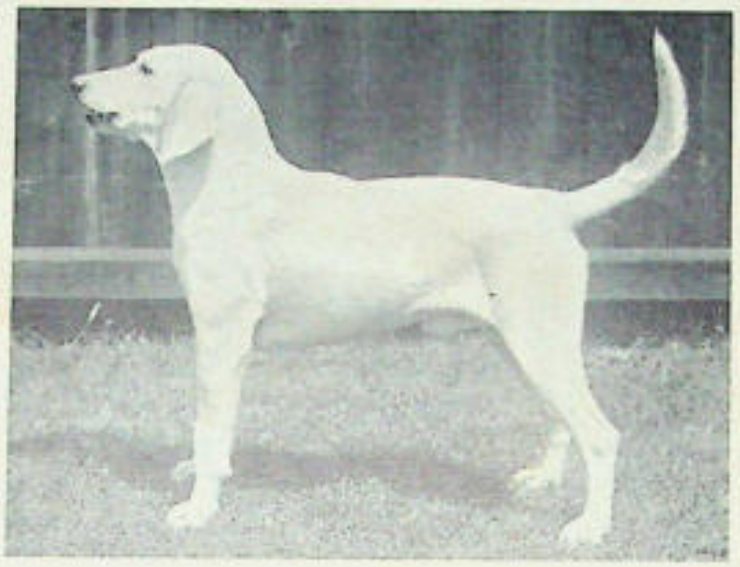
When playing a fish always remember to keep the rod upright. Do not let it slope away towards the fish. The rod should be well bent. There is no need to fear the tackle will break. Gut will stand as much strain as the rod is capable of putting on it provided it is a steady strain and not a sudden jolt. Try to get the fish in as soon as possible, but do not "grasp the rod and hold on." Let it have line if it must, but do not be weak about it. A steady strain with the rod held well up will soon tire any fish up to a pound. If a fish gets into the weed it generally grabs hold of it with its mouth, and the rod will not be strong enough to move it. Walk downstream (if necessary) and get below your fish. Pull in line gently through the rings (or wind it in on the reel) letting the rod point down slowly as you do so, until rod and line are in a straight line. Then grasp the rod and line together (so that you are pulling directly on the line) and pull gently. This will bring a fish out of a weed bed in nine cases out of ten.

If by the time you go fishing you have not been able to acquire a landing net, play the fish till it turns on its side at the top of the water; then point the rod back over your shoulder till you can get hold of the gut and pull the fish gently out on to a shingle bank. If no such landing place is possible, one can generally get a fish (up to ¾lb., which means a fish up to 12in. long) on to the bank by taking hold of the gut and lifting it gently in one movement from the water to the bank. Do not try to do this by the rod, of course; take hold of the gut. But be sure the fish is played out, so that it does not wriggle on its aerial journey, or it may fall off the hook.

If you have a net, let it bide where it is until the fish shows signs of exhaustion. Then take the net in your *left* hand; hold it under the water; keep it quite still, and guide the fish over it with the rod held in the right hand. When it is over the net, lift the net gently, letting your line go slack at the same time. Never try to scoop a fish out with a net. It should be guided over it by the rod while the net is held still. Kill your fish as soon as possible by hitting it on the head with something. The best thing is a short stick with a lump of lead at the end known as a "priest"—but you can easily devise something for yourself.

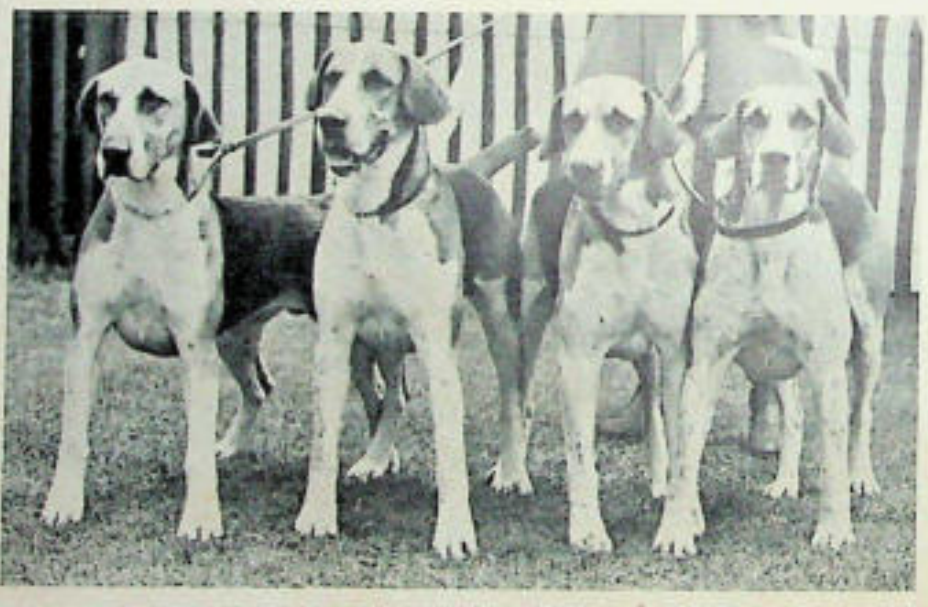
Your affectionate uncle,

HARVEY.



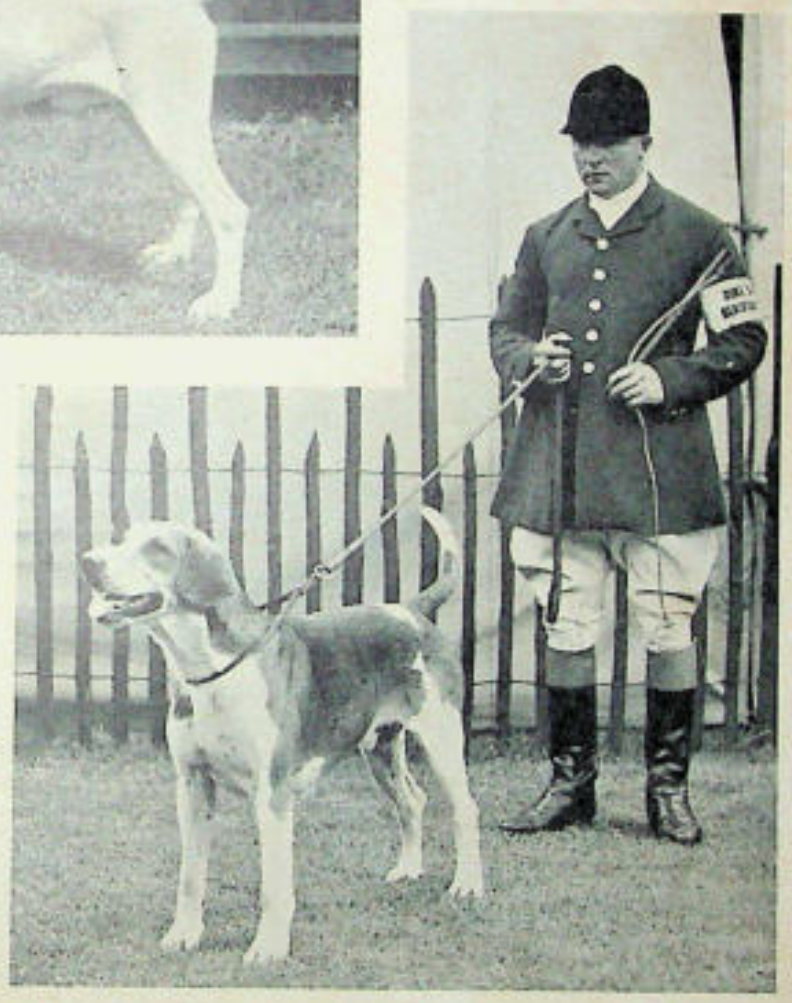
If you have no net put your rod back over your shoulder till you can get hold of the gut and draw the fish up gently on to the shingle.

FOXHOUNDS, HARRIERS AND BEAGLES AT PETERBOROUGH



"PETERBOROUGH" is always a summer landmark in the hunting calendar, and once more Masters of Hounds have had an opportunity of taking stock and seeing what "the other fellow" is doing. The day is now past when the foxhound stamp was dominated by the influence of one or two ancestral kennels, and the modern hound-breeder, taking as his motto "Hounds for Countries," selects his type according to his individual requirements, going for the blood he wants wherever he can get it. The consequent latitude adds piquancy to a foxhound show, while increasing the judges' difficulties. After a period of transition a more or less definite prototype seems to be emerging, which, with slight modifications, combines sufficient scope and substance to avoid degeneration into shelliness with that lightness and activity which is now more than ever in demand.

Last year's "Peterborough" was described as "the best for years"; this time most people seemed to agree that in the foxhound section the general level, though good, was not particularly outstanding, though in the beagle classes the standard was higher than ever throughout the enormous list of entries. Judging began with the foxhounds on the Wednesday, 21 packs being represented as follows: Albrighton, Albrighton Woodland, South Atherstone, Duke of Beaufort's, Blackmore Vale, Braes of Derwent, South Cheshire, Croome, South Durham, Fitzwilliam, Middleton, South Oxfordshire, Percy, Puckeridge, Rufford, Seavington, Sinnington, North Staffordshire, Old Surrey and Burstow, Tynedale and South and West Wilts. Captain T. Wickham Boynton, M.F.H., and the Hon. C. G. Cubitt judged the Doghound Classes in the morning, and the Rev. E. A. Milne and Lord Grimthorpe, M.F.H., officiated over the Bitch Classes after lunch. The North Staffordshire were conspicuous winners on the day with three firsts, a Champion Cup and a Special Prize.



DART VALE REGENT, CHAMPION HARRIER DOG

It was a well-deserved triumph for the West Country to carry off the honours. Regent, '36, is by Jester, '34—Random, '30, by Mr. Spooner's Raylan, '27

THE NORTH STAFFORDSHIRE TWO COUPLES OF ENTERED HOUNDS

Left to right: Warrior, Warden, Prodigal and Harbinger

ANOTHER TRIUMPH FOR THE BADMINTON KENNELS

The Duke of Beaufort's Champion Doghound Darnley

The first class, for novice unentered single hounds, was rather disappointing, being hardly up to standard. Croome Sailor (Vanguard, '34 out of Satin, '36, by S. and W. Wilts Lumberer), who was placed at the top, was a light, active sort who looked like galloping on, but still a bit puppyish. Sinnington Hereford, who was second to him, was a nice-looking, dark-coloured hound, more stuffy than the winner, but without the same liberty.

The next class, for unentered couples, was a big one but of rather mixed quality—in more than one case a good hound being let down by his companion. The winners, North Staffs Rider and Rifleman (litter brothers by Belvoir Rifleman out of Charity, by Linlithgow and Stirlingshire Chimer) were a very taking couple, and shown in beautiful condition. The Middleton Gaoler and Savage, who were second, were well matched, with plenty of substance and timber, so once more the verdict went to the lighter, more active type, though the Middleton moved well in the ring. The entrants for the Special Prize were eventually whittled down to the North Staffs Rifleman, the Puckeridge Colonist, a real stuffy sort, and the Duke of Beaufort's Douglas, who were finally placed in that order.

In the next class, for two entered couples, one

CHRIST CHURCH PRUDENCE

Champion Beagle Bitch by Major Birkbeck's Pansy, '34—out of Finder, '31

more quality than the dogs, which seems usually the case, and they were more difficult to judge.

The first class, for unentered hounds, was an exception to both rules, however, and the judges had little trouble in placing Seavington Amorous above the S. Atherstone Laura, who looked rather light of bone, but improved on acquaintance.

The next class, for unentered couples, was much better. The Rufford Cobweb and Countess looked outstanding as a couple, and were placed first. The Puckeridge Bargain and Wonder, who were second, had substance and well-sprung ribs (so difficult to get), and the Duke of Beaufort's Vision and Brenda, of whom I liked Vision the best, were third. The Seavington Agnes joined her sister Amorous to make a good couple, who were kept in the ring till the last. For the Special Prize, the process of elimination left us with Puckeridge Bargain, Rufford Cobweb, the Duke of Beaufort's Vision and S. Cheshire Drastic. Cobweb deservedly got the verdict. She shows real quality and has beautiful neck and shoulders. Vision was second.

The class for two couple of entered hounds was a good one, well up to "Peterborough" standard. The eleven entries took a deal of sorting out, and, watching the 22 couple in the ring, I fell to wondering what account they would give of themselves as a

"pack" in a woodland country when they got to know each other! Here are some of the notes I made at the time: "Albrighton, very nice; Trusty and Truthful, well-matched litter sisters: the old bitch Dutiful ('35), bigger than the others. Duke of Beaufort's: Dulcet, Feasible, Damsel, Vernal. Quality here. Tiverton Actor blood. Well shown by Holland, who has a knack with hounds; they're fond of him, and follow him whenever he moves. Braes of Derwent: Long and scopey, but look rather flat-sided from here; like Laudable best. S. Cheshire: Ready, a beautiful bitch (dam's sire Rifleman, used by N. Staffs). S. Durham: All same litter (by Pieman—Placid—Brecon Brusher). Shy and won't show themselves. Fitzwilliam: Light, active quartet, a bit up in the air. Puckeridge: A contrast to the last lot; plenty of substance. Scavington: All by Heythrop Seaman; good type of brood bitches, stuffy, substance. North Staffs: Good, scopey sort; look as though they'd last. (Cheshire Rifleman doing the kennel a lot of good.) Tynedale: Very nice, medium-sized, short-backed—the classic 'square box with four pegs.'" The last four in were the Albrighton, Puckeridge, Tynedale and Duke of Beaufort's, and the final placings were in this order.

The brood bitch class was won by N. Staffs Problem ('35, by Warrior—Prudence out of Dandy). Puckeridge Columbine, who won the championship when unentered in 1937, was placed second. Problem, a smart and roomy bitch, went on to win the championship this time, with S. Cheshire Ready in reserve; Rufford Comfort (unentered) was in the last three, and put up a good show against older hounds.

Harriers and beagles were judged on the following day, the judges being: Harriers: Lieutenant-Colonel D. C. Part, M.F.H., and Sir Francis Brook, Bart.; Beagles: Mr. E. N. Crowder, M.H., and Mr. J. Dimsdale, doghounds; Major H. A. Birkbeck, M.H., and Mr. C. Fitzherbert, bitch hounds. Harrier classes were not too well filled in the doghounds, but there was some beautiful quality throughout. I was particularly taken by the pure West Country Harriers shown by the Dart Vale, beautiful examples of their type. Their Regent in particular, who deservedly won the Doghound Championship, was a very nice, short-backed, compact sort, who showed great activity in the ring, and looked as though he could give a good account of himself with a fox! One would like to see a class confined to the West Country, as they are difficult to judge against the "Foxhound" type of other kennels.

In the Beagles the Christ Church, bringing nine couple, which fully demonstrated the excellence of their kennel, carried off most of the honours against very strong opposition, winning eight firsts and a championship, which latter they clinched by filling reserve and third in the same class. I was glad to see included this year a class for "not exceeding 13½in.," which was well filled. Rewards were as follows:

HARRIERS.—Class 1. Single unentered hound: Lartington Prowler, by Arle Court Garland out of Ranger. Class 2. Couple of entered hounds: Lartington Hotspur, by Weston Hannibal out of Gaudy. Class 3. Silver Cup for single hound not less than a second-season hunter: Lartington Hotspur. Class 4. Single unentered hound, between 18in and 21in.: 1st, Rockwood Scamper, by Sinbad out of Spitfire; 2nd, Lartington Pilot, by Arle Court Pilgrim out of Garland. Class 5. Couple of entered hounds: Rockwood Spider and Batchelor. Class 6. Two couple of entered hounds: Rockwood Batchelor, Spider, Sporty and Scamper. Champion Cup: Dart Vale Regent (Jester out of Random).

BEAGLES.—Class 8. Single unentered hound not exceeding 19in.: Rockwood Heather (Lartington Hannibal—Rattle); 2nd, Lartington Sportive. Class 9. Couple of entered hounds: Lartington Heedful and Garnet. Class 10. Single unentered hound between 18in. and 21in.: High Peak Rally (Lartington Random—Handmaid); 2nd, Rockwood Saucy. Class 11. Couple of entered hounds: High Peak Nightshade and Nosegay. Silver Cup for two couple, any age: High Peak Nightshade, Nosegay, Rally and Rein. Champion Cup: High Peak Rally. Class 13. Single hound: High Peak Rally. Class 14. Silver Cup for brood bitch: Rockwood Bridget (Windermere Benedict—Special A.).

BEAGLES.—Doghounds. Class 1. Couple of unentered hounds: 1st, Major Birkbeck's Justin and Juniper; 2nd, Christ Church Dabbler and Justice. Class 2. Single unentered hound: 1st, Ampleforth Gaylad; 2nd, Major Birkbeck's Juniper. Class 3. Couple of entered hounds: 1st, Christ Church Pagan and Foreman; 2nd, their Minor and Marvel. Champion Cup: Ampleforth Ringwood. Class 5. Stallion hounds: 1st, Christ Church Foreman; 2nd, Old Berkeley Rector. Class 6. Two couple: Christ Church Pagan, Foreman, Dabbler and Justice. Class 7. Couple not exceeding 13½in.: 1st, Thorpe Satchville Angler and Airman; 2nd, Pipewell Buster and Bluecap.

BEAGLES.—Class 8. Couple of unentered hounds: 1st, Christ Church Famous and Fallacy; 2nd, their Fairmaid and Fabric. Class 9. Single unentered hound: 1st, Christ Church Fallacy; 2nd, their Fabric. Class 10. Couple of entered hounds: 1st, Christ Church Patience and Prudence; 2nd, Trinity Foot Stately and Damsel. Champion Cup: Christ Church Prudence. Class 12. Brood bitches: 1st, W. Surrey and Horsell Midnight; 2nd, Bolebroke Croney. Class 13. Two couple: 1st, Christ Church Fabric, Fairmaid, Honesty and Pansy; 2nd, Bolebroke Crocus, Craven, Croney and Crockery. Class 14. Couple not over 13½in.: 1st, Pipewell Foot, Witchcraft and Dainty; 2nd, their Playful and Glimmer. Class 15. Novice couples, either sex: 1st, Storrington Playful and Pastime; 2nd, Miss Massick's Barbara and Sunlight.

HOPLEAF.

BEST DAYS WITH OTTERHOUNDS

THE HAWKSTONE-WYE VALLEY JOINT WEEK

THE joint week of the above hounds commenced at Crickhowell on Monday, June 26th, when the River Usk was at its best, and when the Hawkstone pack arrived there was a very big field, which included members of nearly every otter hunt in England and Wales.

The Hawkstone met on Wednesday at Llanhamlach, and then it was our turn to meet at the Castle Hotel, Brecon. Hounds were vanned above the Newton pool to continue upstream. Unfortunately, the river had risen during the night, and we found about a foot of extra water which, tumbling over the rocks, made the currents very fast. Hounds soon hit a drag, and spoke to it up a small stream, but it soon petered out, and back to the river, where an intermittent drag took us up to the Clinker Pit Pool. Here hounds went full cry on a very fresh drag, and soon we saw the pack swimming upstream with Benedict leading them. Increasing their pace, they raced to a big holt under the bank, and then away they came with a great cry, following their otter from his bed, who, to show his disregard for the pack, came up to the surface, had a good look round, and then gracefully dived down again. Now began the most exciting and brilliant hunt most of us have ever seen. Upstream first, ploughing through the swiftest currents, past islands with hounds in close attendance, throwing their tongues in unison as they got the wash full in their noses. Getting into a hollow tree he tried to rest, but Harbinger saw his rudder, and soon had him into the river again. Down now for the first time, and back into the pool, where hounds gave him no rest, he tried to turn upstream. The currents were too strong for him, although he tried to imitate a porpoise in his endeavour to get back into the pool. Failing to do this, he turned downstream, and then began a great hunt through pools and rough water cascading over the rocks in a great roar. Hounds were soon after him, and he showed himself time after time as he continued this swim. Deep down in the ravine the river took its course, and as hounds raised their voices the whole woods and hills above re-echoed their music. Continuing this hunt through most glorious scenery, our otter came to some islands. Still he did not land, but found refuge in a fallen tree. Mr. Stannier poked him out of here, and we now had to keep to a steady trot to see anything of the hunt. Hounds had by now been swimming for nearly two hours, and as far as we could see the otter was as strong as ever, and the water was all in his favour.

Mr. Thompson quite rightly let the otter go where he liked, and this made the hunt outstanding, for with nobody to impede his progress, he kept floating with the water, and hounds were getting the full benefit of his wash. His objective was the big Newton Pool above Brecon, and we were now within a short distance of it. Hounds increased their pace, and were getting quite a few views of their otter, but could never get within striking distance of him. Past the small river on his left, and on downstream, he eventually reached the big Newton Pool, but hounds swam him about 250yds. down this before he reached a safe refuge, and we all took our hats off to a very stout otter, who had given us a magnificent hunt of 2 hours 50 minutes, and a three mile swim. Hounds hunted beautifully, and deserved their otter. Friday we hunted again, meeting at the Tanners Arms, Devynock. This proved to be a blank day, although hounds had quite a nice drag on the River Senny.

I cannot finish without expressing to the Joint Masters of the Hawkstone Otter Hounds our sincere thanks for a most enjoyable week, and for three hunts that will remain in our memories for many years.

M. L.

DARTMOOR HUNT WELL FROM DUNMERE BRIDGE

FROM New Bridge on June 26th, after dropping down to the island above Spitchwick Lodge, hounds hit off a drag just above the meet and spoke freely on the right bank, across to an old dry ditch. Drawing on, they again opened on the right bank, a few hundred yards above, and continued to draw very keenly till they marked solid in the right bank at the top of Widdecombe Island. The terrier soon had him away, and hounds hunted nearly to the bottom of the island; before turning and crossing over they went up the left side and marked in a bend, again near the top of the island. It was a difficult place to get a terrier away, but after some time he was viewed down; and now came the best of the hunt. Hounds drove him on down, never dwelling anywhere for long. It was a very pretty sight seeing hounds hunting so well on this lovely bit of the Dart. When about 30yds. above the island at the bend under Holne Gott the otter landed on the right bank, and running a right-handed semi-circle came back to ground in a drain by an old disused pond in the wood. This proved to be a small place, and he bolted at once and was killed just before making the river again. A big otter (20lb.) and a really good hunt.

D. C.

On Thursday we had another nice hunt from Dunmere Bridge on the Camel, by invitation of the Tetcott Otter Hounds. Drawing up hounds hit off a line at the head of Dunmere Weir Pool. On reaching the Clerken Water hounds raced up this in full cry for over a mile before turning back to complete the double. Continuing the draw up the river, hounds found their otter barely a quarter-of-a-mile above in the right bank. Bolting at once he was hunted down to the weir pool, where he was viewed going over the dam. Hounds hunted on down, turning beautifully up a little runnel which went across to the leat where he was marked. After some holing he must have left unseen in this coloured water as hounds marked him a little farther down; he shifted at once and returned to the river by a small overflow. Hunting up and down for some time, the field next viewed him beautifully as he landed and ran across the meadow to the leat where he again put into a drain. The terrier soon got busy and moved him; hounds hunted him well in the leat, driving him on down over the end of it to the river and into the pool below Dunmere Bridge. Here he must have got in somewhere out of mark from where hounds had the wash. In spite of every effort of our huntsman and his hounds he had to be left after a grand hunt of 2 hours 20 minutes.

R.

THE EASTERN COUNTIES AT STOKE FERRY

MEETING at Needham Market Station for the Gipping, on June 29th, hounds drew Bosmere blank, and it was not until they had got right down river by Great Blakenham and Claydon that they discovered any trace of an otter; but on getting into Bramford Osiers they opened up on a rare drag which they hunted well down to Sproughton, where, as it was now 4.30 and their otter was apparently in Ipswich, they were taken out.

On July 1st hounds went up to Norfolk, as a prelude to the Norfolk week, and met at White Bridge, on Boughton Fen, near Stoke Ferry. Having tried down the Oxborough Stream, with but a stale touch or two, Master had them back and drew up. There was a little work in the fen, and no line up the brook to Barton Bendish Fen, but on reaching Oxborough Wood—a rare place for otters and very thick cover—they spoke well to several fresh touches, and driving on through the big covert, which is over a mile in length, they put their otter up in the bog near the top end. She ran the covert for a time until she got into the Oxborough Stream, near the top of the wood, and was viewed coming down. There was little scent on the water, but this otter, as is customary with Norfolk otters, soon pulled out and ran a big circuit of the wood, with hounds simply screaming along in her wake. They gradually worked up to her, however, and she took to water again, only to draw out almost at once, when she was viewed by many of the field. Down through the wood she went again, with the great cry of hounds thrilling us all as it echoed through the covert with the whole pack, which included several of the Bure Valley hounds, crashing their way through thick undergrowth. It is really amazing how these Norfolk otters stand up to it all during a land hunt, but it seems that they can slip through the cover just a little quicker than hounds.

This rare otter was soon leading them back again at the back of the wood, and having taken them for a couple of circuits she got into the water again and once more, after several narrow escapes, she drew out and hounds hunted her right down the whole length of the carr at a rare pace. They then lost her for a few minutes, but picking up the line again they came up to her and forced her into the stream, where, after a short period of exciting work, she drew out for the last time with hounds just behind her, and ran up the covert until reaching a spot near to the bog in which she had been found. Here they pulled her down after a grand hound hunt of 65 minutes, during which hounds had hardly been touched. She was a good bitch of 17lb., who had put up a brave show, and given us a fast hunt, nearly all on land.

Having drawn up as far as the Old Carr, above the Oxborough—Stoke Ferry Road without drag, hounds were taken back to the meet to draw down to Stoke Ferry, but, as there was no line at all downstream, hounds were vanned up on the bridge soon after four o'clock, to end a capital day.

DRIFTER.

GOLF WITHOUT THE RULES

Lack of Knowledge a Handicap

By E. R. TIPPLE

IN no other game do so many problems and awkward incidents occur as in golf. This is largely due to the fact that few players are really acquainted with the rules and how they should be applied when troublesome points arise. The 35 general rules, together with the special rules for stroke play, and the hundreds of decisions given by the Rules of Golf Committee are as comprehensive as possible; yet experienced golfers participate in tournaments without possessing even a working knowledge of rules.

True, it may be said that there are far too many rules; that some of them are so phrased that they are difficult to interpret clearly, but these arguments do not excuse sheer ignorance.

Unfortunately, when an incident regarding the rules occurs the person concerned is not the only one affected, but his innocent opponent as well. The delay and the discussions frequently prove so disturbing, that for the rest of the round he may play indifferently, and so lose a match that might have been won. No golfer likes to be dogmatic, nor does anyone wish to take advantage of a rule in order to gain an easy win at any hole. But if one's opponent is guilty of a breach of any rule, attention must be drawn to the fact at once, otherwise you will suffer a penalty yourself. This is when trouble starts, and it often happens that the person who has pointed out the error subsequently suffers more than the one who committed the fault.

Not long ago I was playing a friendly round on a course where an inter-club match was being decided. After driving off at one hole, one of the competing pairs came over to ask for an outside opinion on a point that had just arisen in their match. The visitor had attempted a long carry off the tee and had failed to make it. They and their caddies searched for the ball for some time, but without success, so the player called for another ball and walked back to the tee to drive again. He drove, played his approach shot, but on reaching the green he was handed the first ball, that had been found in the meantime. Thereupon he said that he could have played the ball himself, and that his opponent had no right to pick it up. The latter was so upset by the incident, that he failed to concentrate on his game and ultimately lost the match.

The player whose ball was lost was quite wrong. The fact that he retraced his steps to play another ball suggests that he had given up the first as lost. He is not allowed to go back to play a provisional ball. Rule 22 clearly states that "a provisional ball may only be played *before* the player or his partner goes forward to search for the ball which has been played with the previous stroke." Therefore, if a golfer drives off, walks up to the place where he thinks his shot finished, but cannot find the ball he can only go back to play another under penalty of one stroke.

Questions concerning lost and provisional balls arouse more controversy than almost anything else, and secretaries are constantly being bothered with these cases. Confusion would be eliminated if players understood that the provisional ball must be played before leaving the place from where the first shot was hit. Five minutes—and five minutes only—are allowed for the search for a ball, but it can be declared lost before then if the player wishes.

After giving my opinion on this problem I finished the hole I was playing, but before the next tee was reached another couple came over with yet another query! Apparently the player A had hit his opponent's ball when putting and knocked it further away from the hole. B putted from the new position, missed and lost the hole.

No comment was made until they had played the following hole, when B remarked that he thought he could have replaced his ball in its original position. Rule 32 (2) gives this clear definition: "If the player's ball move the opponent's ball, the opponent, if he choose, may replace it, but this must be done before another stroke is played by either side." So B could have replaced his ball without penalty but having not exercised this right the result of that hole must stand. Rule 35 states "If a dispute arise on any point a claim must be made before the players strike off from the next teeing ground or, in the case of the last hole of the round, before they leave the putting green."

As in the first case, A was naturally upset by the incident, and could not help feeling he had benefited when he should not have done so. His subsequent play suffered, and he also lost his match.

These two incidents may appear simple yet similar cases occur all too frequently. Even the obvious rules are not understood by some golfers, and occasionally this ignorance gives them an unfair advantage if they but realised it.

Other rules that are commonly violated include those dealing with a ball driven out of bounds and the grounding of a club in a hazard. You cannot select another spot, say on the tee, for your second drive when you have hit the first out of bounds. Yet how often does one hear a golfer say: "That place was no good; tee the ball up over there, caddie."

Rule 23 provides that "If a ball lie out of bounds the player shall play his next stroke as nearly as possible at the spot from which the ball which is out of bounds was played." In a hazard the club must not be grounded. Even on the backswing if the sand is touched by the club head the player has broken Rule 25 just as much as if he had deliberately placed the club in the sand at the address.

AN INTERESTING MATCH

Next Saturday, July 15th, Henry Cotton will play the best ball of Miss Pam Barton, Miss Jessie Anderson and Miss Wanda Morgan, present and former winners of the British championship, over the Maylands Club's course, near Romford. Last year he beat Lady Heathcoat Amory, Mme. Lacoste and Miss Enid Wilson mainly due to a wonderful display of accurate putting, but these new opponents should provide him with sterner opposition. It should be worth going miles to see.

The match is due to begin at 3 o'clock and admission to the course will be 2/6. All proceeds will be devoted to Mr. Robert Middleman's "Fairplay" children's outings scheme. Since he inaugurated this work four years ago his fleet of old buses have provided thousands of poor children with opportunities of days in the country—some of them had never left the streets of London before.

DRAGONS, THE STRONGEST ONE-DESIGN GROUP ON THE CLYDE, RACING AT HUNTER'S QUAY. THEY ARE BOATS OF 20 SQUARE METRES, 29.2 FEET OVERALL, 18.7 FEET ON THE WATERLINE, WITH A BEAM OF 6.5 FEET AND DEPTH OF 4.9 FEET

BOATS OF THE HANDICAP CLASSES

By K. ADLARD COLES and TERENCE STOCKEN

THE amount of limelight shed one way and another in the course of a yachting season on the International Metre classes, the Ocean Racing "out-and-outers," and, to a lesser extent, the various One-design class racing boats, tends inevitably to push into the background—so far as the "public eye" is concerned—a very large number of interesting boats which do not happen to come into any of those categories.

They may well be described as "the backbone of sailing"; from them are drawn the ranks of the handicap classes—big, small or medium—which, with some infiltration from the ocean racing ranks, infuse such interest and variety into the coastal regattas. Extremely varied in rig and design, and ranging in size from something under 5 tons to nearly 100, they make a very absorbing study.

The main home of the really big chaps is, of course, the Clyde. Fleets are a trifle depleted there this year, compared to last; but there is nevertheless a better showing than at one time seemed likely.

The Over 50 tons class came out for the first time this season when Clyde Fortnight began on June 30th; notable among them is Thelma IV, a fine old-timer built in 1906 at Fairlie. A Bermudian yawl of 80 tons, she is owned by Mr. E. Lynton Viears, long prominent in Clyde racing. Colonel Wordie's Fiumara also made a welcome reappearance; like many of the Clyde boats, she retains her gaff rig, and is a Mylne ketch of 77 tons, in her fifth season.

Last year Golden Hind, owned by Captain Kitson, D.S.O., R.N., was much to the fore; also a Mylne boat, she is a graceful schooner of 144 tons, but her absence from the Clyde racers this year, so far, is greatly regretted. Mr. Robert French's 82-ton ketch Albyn was another that it was not intended to fit out, but news now comes that she is being got ready after all, and will be welcomed; she won the Clyde Points contest last year. Eilean (59 tons, owned by J. V. and R. W. Fulton), a Bermudian ketch by Wm. Fife, has been out this year, winning the Inglis Memorial Prize on the first day of Clyde Fortnight.

Among the slightly smaller vessels, which usually race in the Over 20 and Under 50 tons class, Mr. Ian Fraser-Marshall's 34-ton yawl Zigeuner is notable. Last year, in her second full season, she won eighteen flags, some of them in southern waters.

Her percentage of firsts over others increased when she came south, perhaps implying that the Scottish craft encounter less serious opposition when they leave their home waters! So far Zigeuner has been unlucky with firsts this year, but she has gained several seconds and a third or two. Designed and built by Robertsons, of Sandbank, she is a graceful boat, recognisable by her rather prominent wheelhouse amidships.

Eileen (not to be confused with Eilean, in the bigger class), owned by Mr. A. W. Stephen, beat Zigeuner in the matter of flags last year, and has half-a-dozen firsts to her credit this season; a 33-ton cutter, she is another Fife boat, and looks like keeping her position at the head of her class. Sonas, another beautiful cutter, designed by Mylne and built by Fife, spent most of last year cruising, under the ownership of Mr. J. G. Allan, D.S.O. She was bought this year by Mr. J. C. Guthrie, and is being raced by him; she has the respectable sail area for her size (25 tons) of 1,229 sq. ft.

Other notable boats in the Over 20 tons class are Mr. R. J. Dunlop's ex-12 metre Veronica, and Noreine, a 25-ton Bermudian sloop owned by Mr. R. G. Perry, but somewhat under-canvased compared to some of her compeers; while, owing to the fact that this season there does not seem to be much support forthcoming for the Under 20 tons class, Panther (14 tons) has at times been pressed into service with the bigger boats.

Panther is a most graceful boat, born 1895 (and still going strong) with a flaring "swan" bow, low freeboard and flat overhanging counter, and together with her long boom and gaff and tall, fidded topmast, she has all the marks of the old-time racer, discarded one and all by modern boats. Yet last year she was top of the under 20 tonners, with eight flags (four of them firsts) out of eleven starts. Built at Sandbank and designed by Watson, she is owned by Dr. J. P. Leckie; the doctor prescribes hard sailing and takes his own medicine, and, though a bit outclassed, even on handicap, when compelled to sail against the 20-50 tonners, if the Under 20 tons class gets going again this year, Panther will no doubt come into her own once more.

Last year there was an Under 7 tons class, in which Sunbeam, owned by Mr. G. B. McKean, was the most frequent starter, and topped the class; but the Clyde season is buzzing merrily now, after a rather shaky start earlier in the year.

Turning to southern waters, handicap racing cannot be said to have got into its proper stride, even yet. August, of course, is the best month for this branch of the sport, but even so, the season does not promise to attain such a high standard of entries as last year. On the East Coast and Thames estuary, three staunch supporters have been The Blue Peter, Noreen and Diadem.

Noreen, owned by Mr. Hugh M. Crankshaw, is an ex-12 metre, and has been the subject of much interesting experiment by her owner in the matter of rig. Her mast is stepped 3ft. abaft the centre of the over-all length, and because of the fact that the eye tends to discount the last 2ft. or 3ft. of the counter when viewing broadside on, it seems to be even further aft than it actually is.

This gives Noreen a very distinctive and instantly recognisable appearance, and—from the point of view of a non-class racing boat, as she now is (in the International class sense)—makes her handier close-hauled and needing only a small crew.

The Blue Peter, owned by Mr. D. W. Molins, is a well-known and very strikingly good-looking teak planked sloop of 34 tons, built by King & Sons to a Mylne design. She has recently undergone a "surgical operation," having another 8ft. added to her bow.

Diadem, Mr. G. Glynn Terrell's 41-ton cutter, is one of the best-known boats in Solent and East Coast waters; built by White Bros., to designs by Shepherd, she dates from 1907, but her years have impaired neither her trimness nor her sailing qualities. She was sailing at Harwich this year and also at Ramsgate, at which latter Cariba, another Shepherd design belonging to Mr. Arthur Moy, lost her topmast in the heavy weather.

Last year Colonel Cleaver's If, a 12-ton sloop hailing from Fredrikstad, won many prizes in the coastal regattas; but she has been sold, and has gone to Ireland. So far we have seen neither Colonel Robinson's 12-ton cutter Chrisando nor Squadron-Leader Reid's 15-ton sloop Ingeborg afloat, two vessels which did much to keep the handicap classes on their toes last year.

In the West Country, where the Plymouth and Torquay regattas have recently concluded, Mr. I. D. Spooner's 10-ton cutter Naiande is a notable boat. She won four firsts, two seconds and two thirds in the Under 25 tons handicap last year, but was beaten in the race for the Kathleen Cup at Plymouth this year by Morva, belonging to Mr. P. M. Holman. Morva was launched in the latter half of last season at Port Mellon, Cornwall; designed by Mylne, she was built at the same yard as Colonel Ionides's Wind Star, another stout handicap and off-shore racer. Morva competed in the Cowes—St. Malo race last year, but though rating well under the R.O.R.C. rule, she is not primarily an ocean racer.

Echo, Mr. F. Morgan Giles's new boat, was also out at Plymouth (in the under 10 tons), and got two third places.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

A JULY DINNER MENU WITHOUT MEAT

The Fare: Bouillon aux Herbes
Mitan de Saumon Henri IV
Courgettes frites
Croûtes aux Laitances gratinées
Cerises étuvées
Dessert

The Wines: Pouilly-Fuissé 1935
Chassagne 1926

THE *Bouillon aux Herbes* is the simplest and one of the most refreshing of summer soups; it is made by boiling together some sorrel, lettuce and chervil (twice as much sorrel as lettuce and twice as much lettuce as chervil) in three times the amount of water required. Let it boil until a third of the water has steamed itself away, and by that time the herbs will be thoroughly cooked and the soup ready to be served after you have added the usual salt and pepper and more butter than usual.

The *Mitan de Saumon* is the middle cut of a large salmon; it should be cooked rather slowly in the oven in a baking dish with lots of butter and, of course, the usual pepper and salt. The *Henri IV* are the garnishings, and they consist of new potatoes and artichoke bottoms, the first being *rissolées* and the second poached in water first then finished in butter. At the time of serving, the artichoke bottoms are filled with a *Sauce Béarnaise* (Henri IV was Béarnais) and more *Sauce Béarnaise* is served with the salmon. It is an excellent and different way of serving salmon, but it is more suitable for a meatless meal than when one's appetite must be saved for the joint that is to come.

Courgettes frites are vegetable marrows peeled and cut up in little sticks of about the same length and thickness as the ordinary *Pommes de terre frites*. Dip them into some cold boiled milk, flour them and drop them in *boiling* olive oil, for choice, or else in some very hot fat, and cook them as if they were fried potatoes.

The *Laitances gratinées* are soft herring roes poached in white wine and lemon juice, then placed upon a thick piece of buttered toast, sprinkled with finely chopped shallots first of all, and some grated cheese after. Pour some melted butter over them and brown under a very hot grill just before serving.

The *Cerises étuvées* are a new way of serving stewed cherries at a time of the year when cherries are cheap and ripe. Stone the cherries and put them in a deep baking dish; give them a free dusting of caster sugar; put in the centre of the dish, in a small muslin bag, a dozen or so cherry stones which you will have crushed so that the bitter almonds may add their flavour. Cook in a slow oven, the dish being left uncovered, and when sufficiently cooked, serve in their own juice with or without a little kirsch added at the last moment, according to taste.

As regards the wines, a young white Burgundy from Pouilly should provide a pleasant and modest opening, leading the way to a more highly-bred and more satisfying white Burgundy from Chassagne and from an older vintage.

FIFTY YEARS AGO

From the *Field* of July 6th, 1889.

HENLEY'S Jubilee. "From a single race, interesting to, and attended by, some few scores of undergraduates, has arisen the enormous programme of 30 races, for its three eight-oared and three four-oared Challenge Cups, its Diamond Sculls, and its pair-oared Goblets, into which it has now developed. Its more modern and less desirable features of a lavish and sensuous picnic, with its wine, its music, its flowers, its houseboats, its steam launches, its gaily-dressed company, and its utterly selfish disregard of the rights and claims of the rowing men who have made it what it now is, it is unnecessary to dwell upon. But those who have not failed to be present since 1857, or the still more memorable year of 1859, when, for the first and only time on record, a Metropolitan boating club gained a brilliant victory over the representative crews of both Oxford and Cambridge Universities . . . . cannot help drawing comparisons between the past and the present—by no means to the advantage of the latter."

IN THE SALEROOM

ON July 11th and 12th, Sotheby's are selling further properties of Mr. Hearst, comprising prehistoric, Babylonian and Egyptian, Greek, Roman, Etruscan, Irish Celtic, Merovingian and South American antiquities. Habitués of the British and the Victoria and Albert Museums will no doubt be drawn to this sale, which includes some very wonderful antiquities.

The Babylonian and Egyptian antiquities include rare inscribed Stele, Ushabti figures and rare granite, basalt and limestone sculptures. There are Greek vases, marble figures, ancient glass and wonderful Greek, Roman and Etruscan bronzes; a most valuable collection of gold, jewellery and Irish Celtic gold treasure, and South American ornaments in gold and stone. It is impossible to particularise any items, there are so many that merit special mention, but the head of a granite statue of Rameses III, King of Egypt, about 1200 B.C., and two fine Ushabti figures in limestone, painted, of the eighteenth–nineteenth Dynasty, are alone worth a special pilgrimage to Bond Street.

A WELL-TIMED TRIBUTE

There is no work that requires more painstaking application than the compiling of records; there is none that gets less recognition or is subject to more criticism; and yet it is upon records that history depends. So it is a good thing for rowing that among its devotees there have been a few (comparatively very few) who have been willing to sacrifice their time, without thought of reward, in monotonous labour for the glory of the cause. Mr. Clifford Thomas Steward is entitled to the gratitude of all who take any interest in Henley, for the crown he has placed upon its centenary in bringing the records right up to date.

Mr. H. T. Steward, the author's father, compiled the volume dealing with the early history and Henley racing from 1839 to 1902. Sir Theodore Cook has carried it on to 1914, and now comes the final touch. The book is in the same style as the first volume, and it would have been pleasant to have had the interim period of Sir Theodore's in the same handsome style.

From the Peace Regatta until last year, the accounts of each year are recorded with a note of any exceptional occurrences, while at the end are the tables of fast times and close finishes, and an analysis of records which gives times to the Barrier.

Mr. Steward acknowledges the great help he received from Mr. George Drinkwater, who annually since 1929 cut up programmes and pasted them in books, together with cuttings from newspapers concerning each heat; but for the existence of these, the work might not have been completed. Anyhow, it is a great task well done, and of immense value. R. N. ROSE.

Henley Records, 1919–1938. By CLIFFORD THOMAS STEWARD. (Hamish Hamilton, Ltd.; 21/-.)

Craven 'A'

quality is always dependable . . . . they never vary

Craven 'A' appeal to me in so many ways!

I like their flavour, their mildness and the way they maintain such fine quality. And I must say that whether I buy my Craven 'A' here in England, on the Continent or in America, they never disappoint — they are always just as smooth to the throat.

A TRAVELLER'S NOTEBOOK

I HAVE previously written of the Swiss Guard and the Janissaries, now perhaps you will be interested to hear something of the French Foreign Legion, a corps which has had so much to do with the pacification of North Africa and one as ready as ever to give a good account of itself. Much has been written on this subject, but so many writers seem to think it a suitable one on which to indulge in airy flights of fancy that it becomes exceedingly difficult to disentangle fact from fiction.

* * *

The Legion was founded on March 9th, 1831, by King Louis Philippe of France, and played a prominent part in the war waged against that great warrior Abd-el-Kader and in the pacification of Algeria. The Legion fought at Alma, Inkerman and Sebastopol, in Mexico, Dahomey, the Soudan and Madagascar; in fact they fought everywhere, though their most notable feat of arms was at the Camerone, where 60 men put up a heroic defence against a force of 2,000 Mexicans. This action is commemorated each year by a fête held at Sidi bel Abbes and Meknes.

* * *

During the Great War the Legion dispatched a column to France, which became known as Le Regiment de Marche de la Légion Etrangère; and a battalion fought with distinction in the Dardanelles. But perhaps the name of the Legion is better known in regard to Morocco than anywhere else, for it took part in the initial pacification, held the country during the Great War, repelled the attacks of Abd-el-Krim, and later formed the core of the army that pacified Berberland and the Riff. This was very aptly put by the great Marshal Lyautey in the following words: "La Légion a été, dans tout mon commandement oranais et marocain, ma troupe, ma plus chère troupe, et, pendant la guerre, de 1914 à 1919, elle a constitué ma première force, ma suprême réserve."

* * *

The Foreign Legion to-day is said to be about 20,000 strong and is stationed in Algeria, Indo-China, Morocco, Syria and, as one may well imagine with the world as it is, in Tunisia. The depot and the headquarters of the 1st Regiment are at Sidi bel Abbes, where the men are quartered in excellent barracks—built by the legionnaires themselves—and made comfortable in every way. "You may see everything, monsieur; we have nothing to hide," the Colonel said to me proudly, and told off an officer to show me round the barracks and the training ground.

* * *

Of course, the Legion is at its best when there is fighting to be done, for at other times the men, the large majority of whom have joined owing to the unfortunate outcome of a love affair, are apt to brood. Then twice a week pay day comes, and they are liable to smash things up and cause a great deal of trouble to their officers.

* * *

It is a disgraceful thing that the gallant officers of the Legion should ever be accused of ill-treating the men. In actual fact they look after them very well indeed and are on the best of terms with them. Of course, on active service the men do have to endure real and terrible hardships, since one day they campaign in the desert and the next in the Atlas snows; but the fact that they fight so well and follow their officers so well testifies to the sound foundation of mutual trust and even affection on which the Legion has been based. At all times life in the outpost forts is dull and uncomfortable, but no worse than that our soldiers lead on the North-West frontier of India.

* * *

Legionnaires are, it is true, like the French poilus paid very little, but an intelligent, well-behaved man has no difficulty in rising to the rank of sergeant, when he will become a member of a comfortable mess and receive very greatly increased rates of pay. Having less expenses, he is as well or even better off than the officers. There are many Germans and few Englishmen in the Legion. The Englishmen do not seem to like it; they find it difficult to learn the language, and the food, though good, is different from that to which they are accustomed. But they are treated with the greatest kindness. Prince Aage of Denmark, a Commandant in the 3rd Regiment—whose great-grandfather, Louis Philippe, founded the Legion—has an Englishman as his orderly, and so has a lieutenant whom I know.

* * *

The following anecdote concerning an Englishman of good family will illustrate how well the officers handle their men. This man had been punished several times for small offences and at last, having done something really dishonourable, was brought before the squadron-leader. "Allez," shouted that officer, a noble of France, "You no gentleman, allez!" And these few words, about all the officer knew in English, shamed the man so much as to alter his career. H. F. M.

LETTERS TO THE EDITOR

THE LITTLE OWL

SIR,—There have been many complaints that gamekeepers, as a class, do not do enough to state their case to the world. In the main, their case has to state itself. "The truth will out," they say, and with that they remain silent.

Such was about my own attitude to the inquiry that was given to the little owl in 1936-37. But I welcomed that inquiry, and did my utmost to help on my naturalist friend who was working with "might and main" towards the desired end in that particular part of the country. Then came the report which, among many other interesting factors, stated: "The little owl's good qualities far exceeded his bad ones." That may be true, but my complaint against the report is this: So many of the bad qualities of the little owl were not mentioned at all.

Then the question was put: "Does the little owl kill chicks to such a degree as to cancel his undoubted usefulness in destroying rodent and insect pests?" The answer, judging from the records of two seasons, is "No." For only one game chick was found in pellets representing over 2,000 meals of little owls. None were found in 78 nests and holes. None were found in gizzards, though most of the birds were shot on game estates, some of them actually sitting on their nests.

How is this conclusion to be reconciled with the contention of many keepers? Take a recent experience of my own.

On the morning of June 17th, 1939, about 7 a.m., I opened out and fed a coop of pheasant chicks, numbering seventeen. At 10 a.m., when moving the coop to fresh ground, only ten birds were on view, so I sat down to watch what was happening. I had not been watching ten minutes when along skimmed a little owl, grabbed a chick and made for a Rundle oak tree in the corner of the rearing field. (I could have shot it as it went away, but wished to know where it was nesting.) I got my boy to climb up the tree. He found ten pheasant chicks, all with blood on their heads. I think the chicks were killed with the owl's talons. The birds were stuck in crevices in the hollow of the tree. No young owls were visible, but we had reason to believe they were far down in the hollow of the tree and out of reach. Needless to say the old ones "received their due" after that evidence. The point is this, when a little owl starts on a brood of chicks (wild or on a rearing field) it will clear the lot if not stopped. But think of the damage several pairs will do on an estate. It tends to make a keeper uneasy when you get first-hand information like that regardless of the Little Owl Inquiry, 1936-37.

But I can still say, and will say, much in favour of the little owl. He has many excellent attributes. The great point is: If in similar inquiries that will take place in the future we are to arrive at a truthful conclusion, we must have proper representation. By this I mean representation of sporting men, on the one hand, and bird-preservers, on the other hand. The idea of a conference between the two classes is more than appealing, but the keeper must play his part also.

Yours faithfully,

FRANK H. BLAKELEY (Head Keeper).

Leominster.

BIRD PROTECTION

SIR,—Though a life-long interest in birds has made me a keen bird's-nester, I have never had an egg in my possession or done any bird photography, but have confined myself to making rough sketches and taking notes. A collection of eggs is to me a most unsatisfactory possession. The egg is such a small, though important item in a bird's life history that a collection of eggs alone, though most attractive to look at, does not appeal to everybody. The eggs of some different species of birds are so much alike that in many cases an expert may look at an egg and be unable to say for certain, without some data to go upon, what bird laid it. Birds whose eggs are subject to great variation are, indeed, unlucky, for the collector will take clutch after clutch to acquire varieties.

I have seen a collection of 33 clutches of tree pipits' eggs, and read an account of another collection which comprised literally hundreds of red-backed shrike's eggs. I once found what I thought was a ring ousel's nest in Hampshire. I saw the cock bird several times with a white patch on the throat, and eventually found the nest with four eggs, but it was deserted and the eggs cold. I showed the eggs to several experts, but they could give no definite opinion as to whether they were blackbirds' or ring ousels' eggs.

I have personal knowledge of several nests containing eggs being deserted through too much disturbance by photographers. The ordinary observer is content to look at the nest and go away. The photographer may stay by the nest for days till he gets a picture. Though the photographer may in some cases cause the desertion of some nests, the collector makes a clean job of it and takes the lot.

A healthy common near home with scattered trees about it was a favourite woodlark ground, and I have known as many as four pairs to frequent it. An artist of my acquaintance found a woodlark's nest with a full clutch of eggs and prepared to come next day with his apparatus to photograph it. An egg collector from a neighbouring town had been watching him, and when the artist returned next day the eggs were gone; and with the aid of a gipsy lad this man collected three other clutches of woodlark's eggs.

At my home in the New Forest extensive fires have done far more harm to birds who nest on or close to the ground than either collectors or photographers. One fire alone destroyed several hundred acres of lovely good-conditioned gorse and heather in one swoop.

Yours faithfully,

CHARLES C. DALLAS.

Eastley Wootton, New Milton, Hants.

SIR,—The great majority of egg collectors now refuse to be drawn into this or similar correspondence for the reason that they are at once marked down for attention by the so-called bird watchers and wardens, apart from the knowledge that letters to the Press seldom lead to any satisfactory conclusion.

This "nest adoption" scheme stimulates the sporting or adventurous spirit of the younger generation to outwit the "adopter," with the result that nests get taken which might otherwise be undisturbed. In Surrey this year an "adopted" great crested grebe's nest was taken whilst the "adopter" slept in his tent which was advertising the whereabouts of the nest nearby.

The results to be obtained by "adopting" individual nests or tracking down egg collectors are infinitesimal in comparison with the same enthusiastic effort which might be more sincerely exerted to catch and bring to court those who carelessly and too often deliberately set fire to heaths, commons and woodlands. These acts of incendiarism, both accidental and intentional, are becoming almost regular week-end tragedies in the Home Counties. In almost every instance the whole of the immediate local bird-life is exterminated for years to come.

Or, again, let these bird watchers and wardens and protectionist societies combine intelligently and concentrate their influence and energies to the extermination of the plagues of grey squirrels, magpies, jays, rabbits, &c. These search the woodlands and gardens, and overrun the undergrowth day and night throughout the nesting season and destroy all but a small percentage of the constantly repeated nests of nearly every species, with deplorable results to the bird population.

In the two seasons during which I have been living in Surrey I have been appalled by the damage to bird-life by vermin, and the apathetic attitude of many who consider themselves to be bird-lovers is most disappointing.

I should like to shake hands with everyone who can honestly say that he is doing as much as I am trying to do to increase the non-vermin bird life in his immediate neighbourhood.

Yours faithfully,

EDGAR P. CHANCE.

Gurdons, Witley, Surrey.

HORSE-DRAWN CARRIAGES

SIR,—May I, as you suggest, come to the help of your correspondent, Mr. J. V. Taylor, in connection with his letter in your issue of June 17th on the subject of his travelling chariot of 1840.

The Science Museum in South Kensington, as the national museum of science and industry, is charged with the preservation of the history of road vehicles from early times down to modern usage.

So far it possesses 37 examples of horse-drawn carriages of various types. The nineteenth century is well represented, though a few gaps remain to be filled, but vehicles of the eighteenth century and earlier are so scarce as to be almost non-existent. It is intended to represent these in due course by small scale-models constructed from such data as is procurable.

Gifts of contemporary prints or drawings or designs are welcome to achieve this object, as also are the various appanages of road travel.

Owing to certain delays in rebuilding exhibition space is restricted for the time being, and only thirteen vehicles are on view (these are changed at intervals), but there is a present need of preserving examples of all types before they perish away or, as Mr. Taylor hints, become hen houses.

Yours faithfully,

G. E. B. MACKINTOSH (Director, Science Museum).

South Kensington, London, S.W. 7.

[Will Mr. J. V. Taylor, Dunmore, whose letter is referred to above, kindly communicate with the Editor.]

SERVICE TO READERS

Each week the *Field* contains a page devoted to Answers to Correspondents. This feature has been running for just on eighty years now, and like every well-established feature in every walk of life now causes little or no comment. But it is the feature of which the *Field* itself is most proud, and we feel that readers may like to know something of a service of whose scope they can have little or no conception.

Every question that comes into this office is answered by the Editorial Staff through the post. Only a selection of the answers is published week by week. Many of these questions are answered by return of post, but some take days and a few take weeks to answer. They come from all over the world; in 1938 from all the Dominions, from every British colony, protectorate and mandate; from every European country; from the United States; from Brazil, Uruguay, Argentina, Chile, Peru, Ecuador and Mexico; from Cuba; from Siberia, China, Japan, Siam, and Borneo; from Iraq and Syria; from Egypt, Algeria, Morocco, Belgian Congo and Portuguese East Africa; from Madagascar, the Philippines and Hawaii. And they are on every conceivable subject. During the year 1938, for example, we planned three honeymoons, and a shooting trip in Africa; we dealt with Toby jugs and stage coaches; with illnesses of pet cats and a baby bear; with the fertility of soil and of mares; with parrot disease and coccidiosis; with the choice of cameras, field-glasses, guns, rifles, clothes, hotels, pets, hunters, yachts and country houses; with rivers to fish and moors to shoot; with every sort of gardening query from the most obscure to the most simple; we identified birds uncommon and common, mammals and reptiles and insects; we diagnosed the cause of death in game birds and aviary birds and goldfish; and we answered a question about tombstones.

Year by year the number of questions increases.

From January 1st to December 31st we answered, excluding cartridge tests (which themselves make a good total), 2,698 questions, made up roughly as follows:

Angling	Hunting	Shooting	Farming	Gardening
91	303	300	601	354

Naturalist	Travel	Dogs	Miscellaneous (including post-mortems)
301	201	100	358

We are proud of this service. It costs the reader nothing at all. And we think it compares favourably with any similar service provided by a newspaper anywhere in the world.

A FINE BIRD WITH A WING SPAN OF 40 INCHES
(See letter "Carrion Crow")

CARRION CROW

SIR,—I am interested to know if any reader has ever seen a finer specimen of a carrion crow than the one shown in this photo. It has a wing span of 40in. and was killed by me on the Brockhampton Court Estate.

I have killed some fine specimens from time to time, but never one to equal this, nor have I heard of such a fine bird.

Yours faithfully,
Stone House, J. F. ASPLEY.
Brockhampton, Hereford.

HOOPOE IN DORSET

SIR,—On the morning of April 12th I had the good fortune to meet with a hoopoe quite close to the town of Dorchester.

On my return in the evening it was near the same spot feeding on the ground as before.

On the following day, and again on April 14th, I watched it for a long time, but on my next visit, April 19th, it had gone, and I am glad to say it went away unmolested.

Yours faithfully,
Blandford, W. J. ASHFORD.
Dorset.

THE BEST DEFENCE—ATTACK

SIR,—The following incident seems worthy of notice.

On the 22nd instant a young thrush, fledged but unable to fly, occupied our front garden. The parent came to feed it at intervals. On the following day my mother was in the garden with her French bulldog, which was routing about in the ferns, apparently in the vicinity of the young bird. Suddenly the parent appeared and, alighting on the dog's back, proceeded to peck the animal with some violence. The dog, taken by surprise, made off.

Yours faithfully,
31, Hillcroft Crescent, E. S. WALLS.
Ealing, W. 5.

EARLY PARTRIDGES

SIR,—On May 17th, while going my rounds on the boundary of Hetton House Estate, I found a partridge nest containing ten eggs. I could see by the nest and eggs that the bird had been sitting some time. I did not get back to the nest until May 27th, when everyone had hatched. By the condition of the shells I could see she had hatched out at least a week. This is very early, especially so far north.

The following may interest some of your readers. On the same estate, on April 27th, I shot a male hybrid, a cross between a corbie crow and a hoodie (the latter a native of Norway). The bird was slightly larger and had a much longer tail than either a corbie crow or hoodie. As far as is known, it is the only one that has been killed in Northumberland. It is preserved in Hancock's Museum, Newcastle-on-Tyne.

Yours faithfully,
Mealkiln Knowe, R. SIMPSON
Chatton, (Head keeper).
Northumberland.

MOLE CRICKET

SIR,—May I through the medium of your paper thank the many who have written me in reply to my letter *re* the above, which appeared in your issue for May 27th.

THE INSECT IN QUESTION
(See letter "Mole Cricket")

All have been from abroad, or relate to it there, and no one seems to have any first-hand knowledge of it in this country.

It is certainly strange that this curious insect is so little known, and one can only conclude that so far as this country is concerned it must be counted extremely rare.

Its appearance is so strikingly unusual that if it were in any degree common it would most assuredly have been remarked upon more frequently. The only other authentic record besides my own for this county is one preserved by Mr. Alfred Thomas, taxidermist, late of Gloucester, but this, too, dates back 30 years or more.

I enclose a plate which gives quite a good illustration of the insect, and if space allows of its publication it might assist those who do not know the name mole cricket to identify it.

Yours faithfully,
Parkend, M. LEIGHTON RIDGWAY.
Moreton Valence,
near Gloucester.

CANADA GEESE

SIR,—You may think it worth placing on record that I have had a similar experience here to that which Mr. Eric Hardy relates of the Knowsley flock. A hatching of nine took up their quarters in my waters of 40 acres. They increased to a flock upwards of 200 and, like the Knowsley flock, became a nuisance to the farmers. They proved so clever in escaping the guns that the only way of reducing the flock was to collect the eggs from the nests, of which there were many. These intelligent birds defeated our intentions, for after pairing they went off and nested elsewhere, returning later with their broods, so that now, as in the case of the Knowsley flock, we only have a nest or two. The flock which makes its headquarters here takes an annual holiday of from 14 to 21 days in the autumn to some unknown destination. I wonder whether the Knowsley flock do the same.

Yours faithfully,
Gatton Park, JEREMIAH COLMAN.
Reigate, Surrey.

A GIANT SHARK

SIR,—I think the enclosed photograph may interest your readers. It shows a huge shark caught off Mousehold recently by Mr. Harold E. Dennis. The creature, which was harpooned twice, fought for an hour and 50 minutes before it could be brought alongside, and was later found to measure between 27ft. and 30ft., though its exact weight—somewhere between 5 and 6½ tons—could not be ascertained accurately, owing to lack of adequate tackle to raise the fish out of the water. Eight men on the Mousehold crane could not raise it and the task was given up as a bad job lest the crane should crash.

Yours faithfully,
Penzance. H. L. PENRAUL.

RINGING OAKS

SIR,—From the photograph published in your issue of June 3rd it is fairly clear that the object of the high ring-barking of the New Forest oak trees is to secure a good crop of acorns so that the ground may be carpeted with young oaks to replace the mature trees.

As Mr. Sketch points out, ring-barking is well known to the fruit grower who applies it to trees that are growing too strongly and failing to fruit satisfactorily. Its effect is to stop all wood growth below the ring, and to administer a shock that causes the tree to take stock of the need for ensuring reproduction.

It could not possibly have the reverse effect suggested by your correspondent—namely, to improve the circumference of the tree and check top growth. It does not hinder the upward flow of water, but does prevent the food materials passing below the ring. This food is therefore retained in the crown and available for fruiting purposes.

Yours faithfully,
East Grinstead, REGINALD DAVEY.
Sussex.

GAME POLICY COMMITTEE

SIR,—There are, I have no doubt, among your readers many who will be interested to know that a committee has been appointed by the Government in Kenya to consider and report on certain matters of vital importance in conserving the rich indigenous fauna and flora of the colony.

The committee, known as the "Game Policy Committee," has as its two chief terms of reference:

"(1) To consider and make recommendations as to the policy to be adopted in regard to the preservation and control of game with special regard to the necessity for preventing game coming into serious conflict with the economic development of the country.

"(2) To consider and make recommendations concerning the institution in the Colony of a National Park or Parks, including their location extent, constitution, control and management."

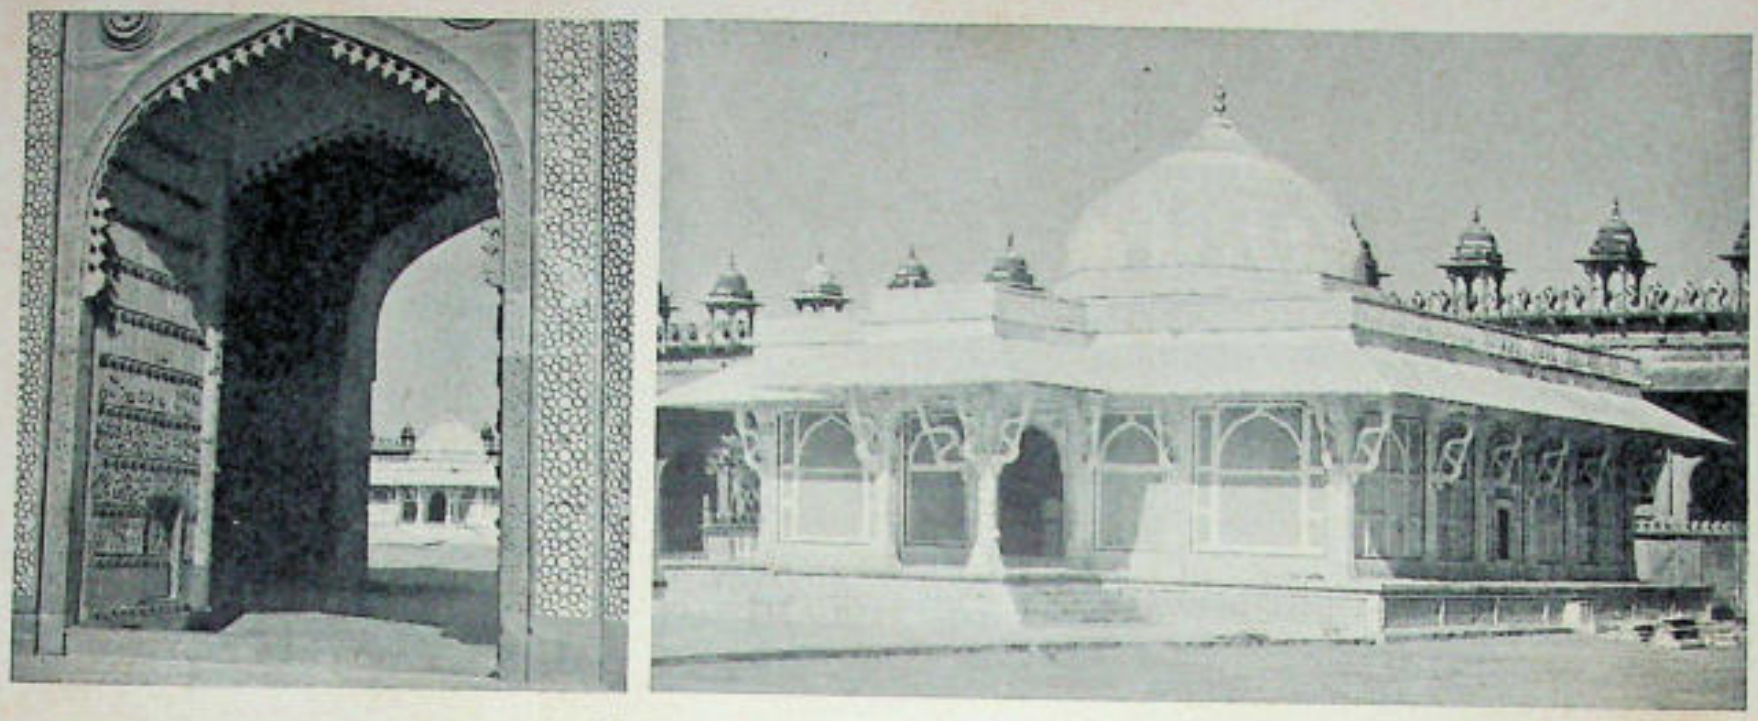
The committee is inviting anyone who wishes to do so, to submit evidence on matters falling within its terms of reference, and it is probable that some of your readers have views on National Parks or on Game Policy, either generally or with special reference to Kenya conditions, which they would wish to place before the committee. Memoranda setting out such views will be welcomed by the committee, and should be in the hands of the secretary (care of The Secretariat, Nairobi) by the end of July or as soon thereafter as possible.

The committee will be most grateful if you can find it possible to take an early opportunity of bringing this matter to the notice of your readers.

Yours faithfully,
A. T. A. RITCHIE, Captain
(Game Warden).

Game Department,
P.O. Box 241, Nairobi.

SEVEN FEET SEVEN INCHES ACROSS THE TAIL
(See letter "A Giant Shark")



Gentlemen!
your
Johnnie Walker—

However many racquets a champion may need, for real refreshment he need only order a Johnnie Walker. Every whisky in the Johnnie Walker blend — which includes all Scotland's finest whiskies—is chosen for some special quality, which is enhanced by the blending. If it's men's doubles —make them Johnnie Walker.

BORN 1820—STILL GOING STRONG

THE HORSE-SHOE GATE AND THE TOMB OF SHAIKH SALIM CHISTI
(See letter "A Deserted City")

A DESERTED CITY

SIR,—Twenty-three miles from Agra lies the deserted Mogul city of Fatehpur Sikri, Akbar's "City of Victory," the building of which was begun in 1570. The city is built of red sandstone, all very finely carved, and is said to be entirely the work of one man. Two outstanding features in it are the Horse-shoe Gate and the tomb of Shaikh Salim Chisti, a noted Mohammedan saint.

The tomb of the saint is of white marble, carved with possibly unrivalled skill and delicacy. The windows, which can be seen in the second photograph, form a transparent marble lattice, and contain no glass. It is said that the shaikh advised Akbar, who at the time had no son, to send his wife to Fatehpur Sikri and tie a strip of coloured cotton to one of the windows. This apparently did the trick, as a son was born within the year! The custom is still observed by Hindu and Mohammedan women who desire children.

Regarding the Horse-shoe Gate, legend has it that sick horses are cured by nailing one of their shoes to the doors; these doors are studded with shoes dating back to the sixteenth century, and can be seen in the first photograph.

By an inscription over the doors, Akbar warns those who leave by this gate that ". . . The world is a bridge; pass over it, but build no house on it. The world endures but an hour; spend it in devotion."

Yours faithfully,
India. E. WATSON.

THE BAOBAB TREE

SIR,—I have just read "W. H.'s" letter headed "Baobab Tree" in the *Field* for June 17th. I have no doubt that the interesting statements about the

THE BOX AS IT NOW APPEARS
(See letter "Nuthatch Nesting")

growth of this weird tree are correct, for the part of Africa to which "W. H." refers, but I am sure they also grow like any other tree in West Africa.

I have seen plenty of young baobabs; they always marked the site of deserted villages in the bush.

In 1918–19, as everyone knows, the world was in parts decimated by influenza. All over the bush of the hinterland of West Africa there were deserted villages which I was told had been left during the influenza scourge; they looked to me older than this, but in every one there were two or three baobabs from 7ft. or 8ft. to 20ft. high. I do not think these young trees could have engulfed any other tree, as for one thing their limbs were only about 9in. in diameter; for another thing they were growing on the village midden heap, where there never are any trees. I have myself fired through the biggest with a .303 rifle, which does not suggest there was the trunk of any other large tree inside, or does "W. H." consider that the trunk of the victim tree would be rolled away or assimilated by the aggressor?

The seed-pods of the baobab contain a white substance much like the cuttle fish one keeps for birds to peck at, but it is very sweet, and quite pleasant to eat.

Yours faithfully,
Higher Holditch, South Chard, Chard. C. ST. B. SHIELDS.

DOMESTIC OVERCROWDING

SIR,—Last year I had a pair of moorhens nesting on a nearby pond, which brought off an early brood. When these were not more than three-parts grown, a second hatch was on the water.

Now happened what to me appeared most unusual: the parents turned over these youngsters when only about a week old to the first brood, and went off to another pond in an adjacent field to raise yet a third family. The birds of the first brood tended those of the second with great care and devotion, and in every way acted as ideal foster parents. After many years of nature study I have seen nothing like it before.

Yours faithfully,
Gloucester. M. L. R.

YOUNG BIRDS BRICKED UP

SIR,—Your bird-loving readers may be interested in the following: A little fully-fledged blue tit was flying about in a ventilator above a window—the mother feeding it from outside. The inner side of the ventilator was removed, which necessitated a considerable amount of hammering (and mess!), the bird was released and flew off quite happily. Later in the morning two more birds were in other ventilators on the same side of the house; they were also freed in like manner. The following morning all three were happily flapping about in No. 1 ventilator—waited quite unconcernedly while they were being unscrewed and sent flying away. The nest apparently is high up in the cavity walls and the young birds had fallen or crawled to the first available, to them, opening. The question arises: How many poor little birds get bricked up in cases where there are no ventilators other than those below floor level, which is to my own knowledge sometimes the case?

Yours faithfully,
Croswick, Burnham-on-Sea. E. E. VIGNE (Mrs.)

NUTHATCH NESTING

SIR,—This year we decided that separate bird boxes were an unnecessary luxury, so we made community boxes with several distinct compartments. The one in the photograph had four chambers. Two pairs of nuthatches immediately took possession and at once proceeded to close up the alternate openings with clay. It took them some considerable time, but the work is so well carried out that the fillings are almost invisible. Both pairs successfully reared families and the last of the young birds flew away on June 5th.

Yours faithfully,
Greenlands, Keymer Road, Burgess Hill, Sussex. J. G. WILSON.

ELEPHANT'S DOUBLE HEART

SIR,—In my letter on the above in your issue of June 17th I notice two errors which I shall be glad to see corrected.

The measurements given as "13 by 14 in." should read "13 to 14 in," and the word "lober" is a printer's error for "lobes."

Yours faithfully,
Belmont, Moffat. DENIS D. LYELL.

TURNING THE OTHER CHEEK

SIR,—On visiting his coops one morning lately my keeper found all the young pheasants at one coop dead. Inside the coop the murderer, in the shape of a young stoat, was fast asleep and the old hen was brooding him most affectionately. I do not know whether anybody has ever heard of such a queer case before.

Yours faithfully,
Addington House, nr. Croydon. W. H. HILL.

A LONELY BONE

SIR,—I was surprised to read in your issue of May 27th that the "Lonely Bone" was unknown to all to whom your correspondent had spoken on the subject.

These bones are common to all the cat tribe.

I have shot tiger or panther in India in the U.P., C.P., Behar, Orissa, Bengal, Kashmir and in the Kanarese jungles, and have always found that the local shikari or "skinner" knew where these bones were to be found.

I have always been under the impression they are the survival of a prehistoric collar bone.

Yours faithfully,

Ministry of Defence, Baghdad. D. O. W. LAMB.

[This correspondence is now closed.—ED.]

THE CUCKOO AND ITS EGGS

SIR,—During 26 years of interest in ornithology I have examined many nests containing the egg of the cuckoo (*Cuculus canorus*), but never had I seen this bird give her secret away. I had never even seen a cuckoo visit a nest. Therefore, little did I think that the whole scene would be enacted before me on the evening of May 29th, and less possible did I imagine that Mr. Edgar Chance, the eminent authority on the cuckoo, would be with me when I was privileged to see what so few of us have seen.

On the evening in question I was walking in a garden with Mr. Chance, who suspected that an active pair of hedge sparrows had their nest in this garden, and if so, this evening was a suitable opportunity to watch the cuckoo of this vicinity visit the nest. The nest was found containing three eggs. Suddenly at 7.10 p.m., as if at the command of Mr. Chance, a cuckoo appeared, flying from a row of trees, across the garden to the fence by which was the nest of the hedge-sparrow. The flight was heavy and careful, as if the weight of an egg, ready for deposition, was being carried.

From the fence the hen cuckoo flew to a pear-tree near the nest, and for a few moments remained stationary, all the while surveying the area, and seeing all was clear for the visit to the nest. Then at 7.16 the bird returned to the fence and entered the bush from behind. At 7.19 I saw the cuckoo fly from the nest carrying the blue egg of the hedge sparrow in its bill, seemingly as near the tip of the bill as possible. The bird flew from the nest to the trees from which it had originally flown at the opening of the episode, and the distance was sufficient to enable me to see the egg in the beak of the cuckoo with the naked eye and also with glasses. The lack of trees or any obstruction in front of us gave us a perfect view of this remarkable enactment.

One thing which stood out in my mind when watching the bird in flight was the great difference in its flight before and after laying the egg. On the one hand, heavy and careful, and on the other, light and free, proving that the egg had been carried in the body of the bird and the flight lightened after the laying of the egg.

Yours faithfully,

Kestrels, St. Margaret's-at-Cliffe, near Dover. G. E. TOOR.

SIR,—To your correspondents who see cuckoos with eggs on their beaks, might I suggest that in every case it is the egg which they always abstract before they lay their own in the nest. These they either swallow (as the best means of getting rid of them) or drop. The cuckoo is not an egg eater otherwise, as is so often supposed.

The one seen by your correspondent Kismet (if it were an egg) had probably been dropped by accident, and the bird regained possession of it.

Until recently only one man, and he a monk and no ornithologist, had actually seen the egg emerge from the cloaca and drop into the nest. Quite recently a friend of mine has actually got this performance in a film.

Yours faithfully,

Lancaster. H. W. ROBINSON.

SIR,—I was interested to read Mr. Chance's letter in your issue of June 24th in reply to "Kismet." May we now have his comments on the problems raised on "Two Cuckoos" in the letter from Mill Hill? Is not the hissing noise made by the young cuckoos, and not by the fosterer? and is not the bare patch on the fosterer's head caused by the act of thrusting her head into the young birds' beaks when feeding them, and not by the thick foliage? But why two cuckoos? Why did not one (or each) eject the other? Did they hatch simultaneously, and are they mutually tolerant of each other?

Yours faithfully,

Brockhurst, Chiddingfold, Surrey. H. M. BRICE-SMITH.

SHETLAND PONIES

SIR,—Being at present engaged upon some research in connection with pony breeds I should be greatly interested to hear the opinions of your readers upon the following statement which I have read in connection with Shetland ponies:

"It has been suggested that the ponies became so small by reason of the severity of the conditions under which they lived, but this is refuted by the fact that ponies reared in southern climates and on rich pasture show no tendency to increase in size."

The author does not put forward any alternative theory.

Yours faithfully,

Fenstanton Manor, Huntingdonshire. R. ASSELL WELLS.

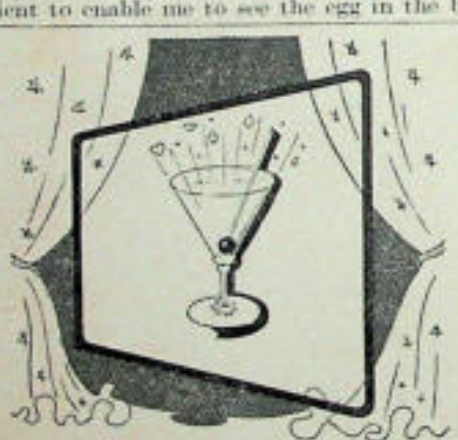
CONGREGATING RAVENS

SIR,—Referring to your request for information regarding ravens congregating together. Two or three years ago I had the same experience as your correspondent. On my hill, where there are a few grouse, there appeared a gang of between 30 and 40 ravens in the month of August. They remained there for some weeks in about the same place. They were a nuisance when out shooting, as they kept mobbing my old setter and just kept out of gun-shot. When a shot was fired they cleared away, but very soon returned and again annoyed the setter by flying close over her. I shot one of them who ventured too close. Since then I have not seen them.

Yours faithfully,

Plâs Penhelig, Aberdovey, Merioneth. J. M. HOWELL.

ROEBUCK ANTLERS



SIR,—When visiting "Skansen," i.e. Stockholm's Zoo, on May 29th, I observed a roebuck with full-grown antlers. Surely at this time of the year all roebucks have shed their antlers, and the new ones are not yet full grown?

Could any *Field* reader suggest an explanation?

Yours faithfully,

Djurs-holm, Sweden. G. RAUSING.

THE FRIENDS OF THE POOR, 42, EMERY STREET, S.W. 1, appeal for 4/- weekly for a poor old lady of nearly 80, living in North London. For many years she was helped by her family, but unhappily she has now lost them all, her fourth and only surviving son dying of cancer in 1931. She is now old, alone and frail, with fast failing sight and she has only her Old Age Pension. Please send us something for this pathetic old lady.

CINÉ COCKTAIL

Baby's first steps . . . Doris diving, in slow motion . . . a procession filmed from your office-windows with telephoto lens . . . You can take all these with a Magazine Ciné-'Kodak' as simply as ordinary snaps. Yet this handy camera, that slips into your pocket, can be loaded with a magazine of 16mm. film in three seconds . . . that's all!

PLAIN OR IN COLOURS

When you want colour shots, just substitute 'Kodachrome' for black-and-white film. (You can do it in the middle of a reel without wasting any film.) The results are incredibly lovely.

Examine the Magazine Ciné-'Kodak' at your Ciné-Kodak Dealer's and ask for a booklet on Ciné-'Kodaks.' Or write to Mr. F. Taylor, Dept. 57, Kodak House, Kingsway, London, W.C.2, for *your free copy*.

P.S.—You can now take pictures indoors on fine days, or you can even film at night in good lighting conditions, by using Ciné-Kodak Super-XX Film.

Ultra-fast f1.9 Anastigmat lens; seven lens-focus and wide-angle lenses available (extra); 3 speeds (16, 32 and 64 per sec.). Capacity 50 ft. magazine of 16mm. film. Price (with carrying case), £40.

The MAGAZINE CINÉ-'KODAK'

IN THE CITY

By OUR CITY EDITOR

PROFIT figures now being published by brick-manufacturing companies and other concerns associated with the building trades show contraction as compared with recent experience. I must point out that companies in this industry have enjoyed several years of great prosperity.

There has of late been a severe falling-off in the building of houses for private occupation. The building industry as a whole is reasonably well employed, even now, but most companies are engaged on constructional work of an industrial nature and on Government contracts.

It is generally accepted that the falling-off in the construction of homes for the people results from a lack of definite Government plans for insurance against damage from the air. Few, therefore, can be tempted to put their money into bricks and mortar while the international situation is bristling with difficulties.

Some move by the Government to give insurance protection may result from pressure now being brought to bear on behalf of the building industry and insurance companies. When such a step is taken there will undoubtedly be a revival in private building which would, I might add, have a marked effect upon the activities of the building societies.

It is observable on the Stock Exchange that the popularity of the securities of property companies has dwindled a good deal. Some such securities to-day offer most satisfactory returns and, in my opinion, they are really worth consideration on the part of those with money to invest. One concern in particular, whose ordinary shares are, in my opinion, really attractive is in Slough Estates Ltd.

This company owns factory estates at Slough, in Bucks, and also at King's Norton, Birmingham. In addition it owns a controlling interest in Slough Motor Supplies, Ltd. It provides tenants on the Slough estates with electricity, water and gas. Revenue has been steadily increasing since 1933. In that year the issued capital was £588,000 in £1 shares receiving a 10 per cent. dividend.

The existing capital of £735,000, and for the last two years dividend has totalled 15 per cent. Development of estates in other parts of London is constantly before the directors. The concern is regarded as having a distinct future. The £1 shares at 63/3 give a return of roughly £4 15s. per cent.

There are many selections among the securities of property companies nearer London. London County Freehold & Leasehold Properties has a most satisfactory record. Its properties are situated in almost every district of Greater London.

It has been the policy of the directors for many years to pay three interim dividends a year. These have been a regular 2 per cent. with a final of 4 per cent. and a bonus of 1 per cent. to follow when the accounts are available. That means 11 per cent. in all.

The 10/- shares have a market price around 15/- to yield as much as £7 6s. 6d. per cent. I consider the shares quite a good investment.

Covent Garden Properties Company has particularly steady revenue-producing capacity. Its freehold estates include Covent Garden market and Royal Opera House, London, but there are other freehold and leasehold properties in the Metropolitan area. For years the ordinary dividend has been a regular 7½ per cent. The £1 ordinary are valued in the market around 15/9, which means a high return of £9 10s. 6d. per cent.

The first indication of any improvement in the European political situation would undoubtedly have immediate effect on prices for securities such as I have mentioned. There is probably a risk in buying, but risks have to be accepted in order to get yields such as offered on these securities.

SNAKE SUBTERFUGE

An interesting consignment of snakes has recently arrived at the Scottish Zoological Park, from Texas. The most interesting amongst them is the hog-nosed snake or "spreading adder," as it is called in the States. It is not an adder; it is not even poisonous, but it carries through a huge bluff. When disturbed, it inflates its lungs with air causing the body to spread out with a bloated appearance which carries a strong suggestion of the body of a rattlesnake; that is probably sufficient to warn off most intruders. If that bluff fails a more interesting one is tried. The hog-nosed snake rears up the fore part of its body, with its neck flattened and broadened and its head pointing forward in a manner strongly resembling the pose of a cobra about to strike. If still the intruder is either blind to these warnings or "calls the bluff," it will turn over on its back and remain rigid as though it had been dead for a week.

LORD INVERCLYDE'S BERYL CROSSING THE FINISHING LINE TO WIN THE "FIELD" TROPHY OVER A COURSE OF ABOUT 156 MILES

A GREAT "FIELD" TROPHY DUEL

Lord Inverclyde's Fine Win in the Motor Yacht Endurance Test

By K. MARILLIER MILLER of the "Yachting World"

FOR the fourth time the contest for the *Field* Gold Challenge Trophy has been held on the Clyde. For the fourth time it has been a really great success. So much so, in fact, that it is fast becoming the most important event of the year for British motor yachts and cruisers.

Since the Trophy was brought to the Clyde by Mr. Harry Turley in 1935, the Royal Scottish Motor Yacht Club have had the organisation in their hands, and they have shown most conclusively that they are supremely competent.

Of the sixteen entries this year only three failed to present themselves at the starting line. One of these was an Irish entry, and we were all sorry to miss him, but the little Kathleen had, of course, come over from Northern Ireland, and no more welcome or popular ship and crew could be found.

The limit boat, Mr. Ninian Stewart's Rosemary, put all the others on their mettle by crossing the line only 8sec. after her gun was fired on the Commodore's steam yacht Minona. All did their best to beat that start, but none of us could quite manage it. So she set off all by herself, just after lunch and then there was an interval of more than two hours before the little Kathleen, with her cheery bearded owner at the wheel, started after her.

At this stage, in spite of the most optimistic weather forecasts, the breeze from about N.N.W. began to pick up. It seemed that there was every likelihood of a fairly tough patch once clear of Garroch Head, although in the Firth itself the Clyde was in smiling mood. The puffs of white clouds were travelling much faster and showing firm edges. Down the Holy Loch the wind now whistled through Minona's rigging, but the fleet set off in good order, anticipating plenty of sea off the Craig, but, in that bright sunshine, positively looking forward to the 156 mile trip.

By the time the big 'uns at the tail end of the list were due to start the limit boat must have been close to the Craig, 45 miles from Hunter's Quay. She practically carried the ebb for the whole distance, and when she turned the mark she took the flood up Kilbrennan Sound—right into the teeth of the breeze which had now hardened considerably. Every ship in the test took a pretty heavy beating on that open water between Pladda Light and the Craig. We did not know until much later that Metopa and Morna sought shelter in Lamlash and Brodick.

Between individual ships there were many keen duels. As one of Clarinda's crew, I watched Lord Inverclyde's Beryl round every possible mark, checking each gain and calculating our chances. Lord Inverclyde was doing much the same from the time he crossed the line nine minutes astern of us, right until he finally passed us on the leg from Garroch Head to Tarbert.

It was most interesting. His Beryl is a light displacement Nicholson 93-footer, while Clarinda is just over 60ft. on the waterline and is of quite different type—a hefty, heavy ship from Silver's yard. Beryl sleeks her way through or over the water, looking almost slow for her size. Clarinda is about as purposeful a ship as I know. She stamps

THE ENDURANCE TEST COURSE

TEN YEARS OF PERFECT SHAVES WITH ONE BLADE!

In ten years, Segrave's record of 231 m.p.h. has been raised to 377. But through these fast-changing years Mr. C., of Welling, Kent, has never changed the blade in his Rolls Razor. He says: *"I was given a Rolls in March 1929. I am still using the original blade, and have not had to renew any part, or even adjust anything since I have had it. Above all this I can get a* **perfect** *shave with it, not just a good one."*

21/-. 27/6 presentation Sets up to 20 gns.

ROLLS RAZOR

SELF-STROPPING · SELF-HONING SELF-CONTAINED

Shaving Bowls 1/6. Shaving Sticks 2/6 (Refills for either 1/6). Shaving Brushes 5/- to 15/-.

Write for illustrated catalogue. Our Service Department exists for your enquiries and convenience.

along at ten knots through almost anything, throwing spray high, wide and handsome, and making a fine mark for Beryl to follow through the night and morning.

Once outside the narrows, by the light of the big full moon we could see the seas running down Bute Sound as wind met tide. We rolled, pretty fiercely at times, until we felt a lee from Arran. But never for a moment did Clarinda lose a fraction of her speed.

Then from Pladda to the Craig the seas were more quartering, keeping helmsmen hard at it to hold a true course when a big one caught the stern. A moment of lee under the Craig, a quick look back for Beryl, and then out into it again, head seas now and hard ones all the way up to Kilbrennan Sound. This was where Clarinda's weight and great power should tell against any others in the fleet. She was given no mercy, nor did she ask for it as she was slammed into it remorselessly, dead on her course by a little hawk-eyed man at her wheel. Beryl gained nothing on us on this leg, but we were both closing up on Golden Gleam, Eun Mara and Melora.

Dawn saw us in quiet water off the measured mile posts on Arran's north-east shore. Sure enough we could just see some other competitors out in the Firth rolling their way over to the Cumbraes almost hull down away on our beam. "How much had Beryl gained on us?" was the next question.

I timed her to be just over 4½ minutes astern round Holy Island. She had picked up only half our lead in about two-thirds of the total distance. We were delighted, but we forgot about the comparative quiet of the water ahead. From now onwards she began to close steadily on us.

Half-way to the Cumbraes we passed first Senora and then the gallant Irish Kathleen. Melora and Golden Gleam were added to our bag off Inch Marnock, and then without seeming effort Beryl slid past us.

Considering the bad weather out at the Craig it was not surprising that the bigger boats came right through the fleet. They naturally could keep their speed easier in a lumpy sea which had given the smaller craft a tough time. And so between Ardlamont Point and Tarbert we picked up Marabeth, Rosemary, Tunnag and Eun Mara, all going well, and set off after Beryl, now a minute or so ahead of us. Barring accidents we were bound to finish first and second.

As always we found peace, quietness and beauty in the Kyles. In lovely warm sunshine and smooth water Beryl slowly increased her lead, getting her gun, a most popular winner, nearly 8 minutes ahead of Clarinda. It had been a great race. Then Golden Gleam and Eun Mara had a mere 2 minutes or so between them, followed by Tunnag and Melora only 5 seconds apart. Clearly the handicappers had done their duty admirably, as always, and the weather had sorted the fleet in a most interesting way into approximately comparable ships, in pairs.

Of the dinner, held on Saturday evening at the Queen's Hotel, Kirn, one need hardly say more than that the Commodore, Mr. George Urie Scott, was in the chair, as usual. That is a certain guarantee of a friendly, cheerful meeting. Good seamen are not usually the wittiest of speakers, but Lord Inverclyde proved himself the exception. Commander Gibson, a pillar of the club, was brief and to the point in his speech, and Major Tom McGill found no more hardship in announcing the results and times than we did in listening to him.

"FIELD" TROPHY RESULTS

Racing No.	Name of Boat.		Friday. Start at P.M. H. M. S.		Saturday. Finish at P.M. H. M. S.
1.	Mr. Ninian B. Stewart's Rosemary	Prize Best Start	2 5 0	..	1 3 47
*2.	Mr. Ernest D. Kennedy's Westward		2 43 16	..	—
*3.	Mr. James M. Tolmie's Zephyrus		3 42 20	..	—

Hon. Official Handicapper and Timekeeper .. Major Thos. McGill

BOAT RACE TRAINING

By DENIS GUYE

I SUPPOSE no athlete is in such constant training as the modern rowing Blue. No sooner will Henley Regatta be over when, according to a recent announcement, Messrs. C. B. Sanford, A. Burrough, M. Buxton and J. L. L. Savill, representing the C.U.B.C., will be leaving Croydon Aerport to fly to South Africa to compete in various races.

Not only will they have to borrow a boat and oars, but also that unknown quantity, a coxswain, because, just as here in the provinces and generally abroad, the coxswainless craft has not yet established its popularity, which is surprising, as it is a vastly more pleasant form of rowing.

Excursions abroad are rapidly becoming popular with the universities. Two years ago the Boat Race crews raced in Paris against picked crews from the Seine and Marne clubs, whilst last year and this they flew to the Riviera to try their hand at sea rowing in the bay at Cannes against the leading coast clubs. Despite a form of training, which I do not think would be condoned by the strict disciplinarians, the late W. B. Woodgate and Dr. Bourne, they had no difficulty in winning these races and, at the same time, giving a first-class exhibition of Fairbairn and orthodox rowing, which was much appreciated by French clubs, who are endeavouring to raise the standard of their rowing.

The Cambridge Boat Race crew of 1932, as the Granta, represented this country at the Olympic Games held at Los Angeles and other excursions abroad included racing in Germany and on the Danube, where the crew received tremendous ovations.

When one considers that quite apart from the Boat Race, which, excluding the trial eights and experimental work in the Christmas term, is a three months' concentrated job, there are such events as the summer eights, college representation at Henley, light fours, pairs and sculls in the "Blue's" calendar, it will be readily seen that he has little time in which to get fat. In view of his continued activity, one cannot help concurring with the popular view that Boat Race crews would benefit from a less gruelling form of training. The fact that it cannot be necessary to train solidly for three months for a 20 minutes' contest, is rather proved by the Head of the River race, when any number of the 140 crews taking part, on the most scanty preparation, are able to strike just as fast, if not faster, over the whole of the course, than the losing Oxford crew of this year; and, furthermore, that men like Len Harvey, the Empire Boxing Champion, requires little more than three weeks in which to get fighting fit for contests which nearly always last at least 30 minutes, also emphasises the same point.

Again, it might be less severe on the nerves if only two instead of four weeks were spent at Putney, where the "hero worship" and incessant battery of cameras would make even a film star a little weary. No doubt it is largely taut nerves which influence those last-minute changes in the personnel of the crew that completely nullify the cohesion and meticulous time-keeping which are the chief assets of a long training.

Whether or no the University Boat Race training is right, and which, after all, is a matter for the universities themselves to decide, there can be no doubt that our past policy in choosing and training our representatives for Olympic events was altogether wrong and did not give our competitors a chance against the strong foreign opposition. The fact that we have failed to win the eight-oared event since 1912 can be ascribed to the faulty policy of either picking the winning Grand crew of the previous year or a representative crew a fortnight before the event, rather in the manner of making up scratch eights at an end-of-season club regatta.

The latter policy was adopted with the English eight at Berlin in 1936, and despite a miraculous piece of coaching by Kenneth Payne, the effort was a débâcle. There was no excuse for an English eight to be lying second at 1,500 metres and to finish fourth of five at 2,000 metres, except that they were not together. It is, therefore, exceedingly pleasing to learn that plans for the 1940 Olympic games to be held at Finland have already been made. A representative committee, has been formed with no less a personage than Jack Beresford, jun., who must know more about Olympic Games than any other living man, as its chairman.

The present idea is that our intended crews should be thoroughly representative of English rowing regardless of the calls of club or college, and should practise throughout the winter at week-ends.

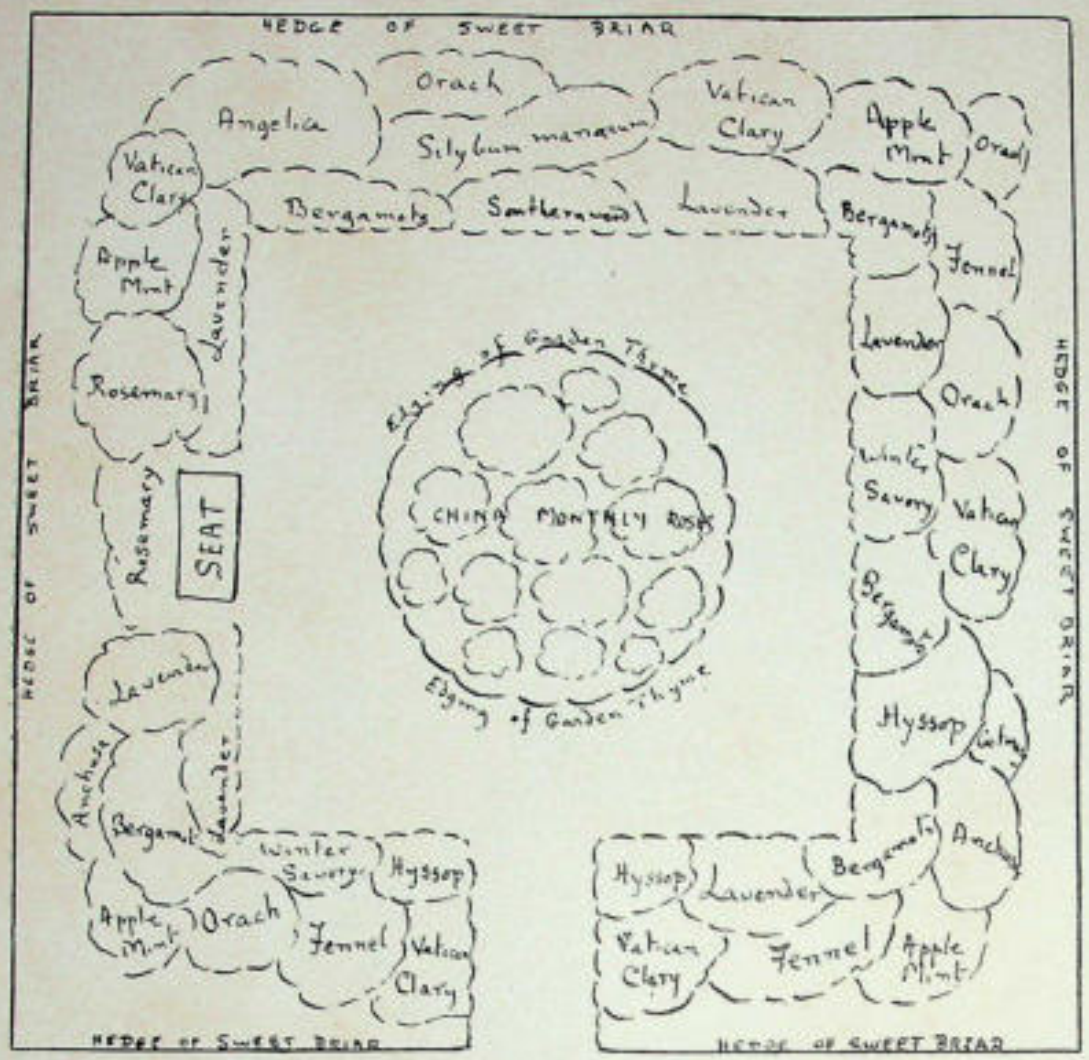
Despite the strong American Olympic invasion which has been invincible in the eights since 1920, I am quite sanguine of our success next year. English oarsmanship has never at any time been inferior, but, alas, our method of selection and preparation has been totally inadequate for English crews to justify themselves against foreigners who have been specially trained for the events.

THE BISLEY MEETING

By CAPTAIN ERNEST H. ROBINSON

DESPITE all difficulties there will this year again be three full weeks of competitions at Bisley. They started on Monday, July 3rd, and will end on July 22nd.

This week the Royal Navy and Royal Marines have held their rifle and revolver championships as usual. The cancellation of the Army Rifle Association meeting has allowed the senior service and the "Jollies" to shoot in considerably more comfortable conditions than in normal years.



The difficulties which beset the National Rifle Association are primarily concerned with tent accommodation. The Territorial Army is now attending camp at double strength, and the instructional staffs and recruits at every regimental depot are now going into camp under canvas to make way for the Militia which will occupy the depots from July 15th. The shortage of tents has made impossible the housing at Bisley of the two full infantry battalions which are usually detailed by the War Office for butt and range duties. A sufficiency of tents to accommodate competitors and a maximum of 250 markers from the Royal Navy, Royal Marines and Royal Air Force have been obtained.

The N.R.A. has managed to crowd the whole of the important competitions into one week, July 10th to the 15th. There have, of course, been considerable alterations in the programme, but the King's Prize starts as usual on the Wednesday, the Ashburton Shield match and the Public Schools Veterans match will be held on Thursday, the 13th, and the King's Prize Final and prize distribution will take place on Saturday, the 15th. The Clay Bird meeting will be held as usual, and the new sporting range will be in full operation.

The Match Rifle events have been crowded out, but will be held on the first three days of the next week, ending with the Elcho match on the afternoon and evening of Wednesday, July 19th.

For the benefit of those who want a full fortnight of service rifle shooting, or, because of holiday arrangements, will not be able to shoot in the grand aggregate events, the N.R.A., in collaboration with a committee from the Bisley clubs, has arranged a series of auxiliary competitions, starting on Monday, July 17th, and finishing on Saturday, July 22nd. There will be a separate competition each day for which the final prize will be a cup and £5. There will also be a grand aggregate of the full series. Entries for these competitions are coming in well, and it is expected that at least 300 competitors from all over the country will attend.

To enable the N.R.A. competitions to be held at all, many interesting innovations have been made. As a result of these experiments it is possible that there will be many changes in future Imperial meetings.

The Country House

A GARDEN ENCLOSED

By ELEANOUR SINCLAIR ROHDE

THERE is a great charm about enclosed gardens, especially small enclosed gardens. I have many mental pictures of different examples, and it is extraordinary the variety that is possible. I recall one comparatively small one enclosed with a lofty yew hedge (the hedge is double on one side and tunnelled to form a shady walk), and the centre of the garden is laid out in a simple design taken from the embroidered crown of a baby's cap two centuries old. The design is laid out in box, and the interstices were filled, when I saw the garden, with marigolds which looked like a pool of gold with the sombre background of the yews. I recall another little "garden enclosed," also surrounded by a yew hedge, and in it there is only a tiny lawn and a trough-garden containing a few Viola species and a seat. It is a pleasant restful spot.

Yet another comes to mind, which consists of four gardens enclosed, each about 20ft. by 20ft., all within an encircling hedge. Each enclosure is a different type of spring garden.

The plan depicted above is for an enclosed small garden, which is designed specially for its restful atmosphere. A pleasant place in which to sit and read, or, still better in these restless days, to sit and do just nothing at all. There is no formal arrangement, the old-fashioned and mostly aromatic plants in the outer bed being in irregular clumps. They are mostly plants beloved by bees, for what pleasanter than to sit and listen to bee-music?

This garden is enclosed with a Sweet Briar hedge, which should not be kept mercilessly clipped, for this ruins the beauty of this shrub in flower. It is kept about 8ft. high, and all through summer there is the delicious scent of the leaves (at their best after a shower of rain), in June the lovely flowers, and all through autumn and winter it is hung with scarlet berries like fairy lanterns. They hang on till March, for birds never touch them.

In the outer bed and round the edge of the centre bed are a few Crocuses and other early-flowering bulbs. The centre is planted with pink China Monthly roses and thickly edged with garden Thyme, for these two associate perfectly in flower, and these roses flower from June till well into December. I far prefer their exquisite colouring and age-old dignity to the modern Poulsens. For spring the roses are interplanted with the cherry-red Pride of Haarlem Tulips, which are enhanced by the rose foliage. The path is flagged, and the interstices are planted with creeping Thymes and tiny Thrifts, &c.

The level of the outer bed is broken by a bush of Rosemary on one side of the seat and Lavender Walhampton Giant on the other, and at irregular intervals are clumps of the Vatican Clary (taller growing and far more attractive than the type), Fennel, Angelica and the thistle known throughout Southern Europe as Our Lady's Thistle (*Silybum marianum*), which is so curiously decorative in flower. Amongst the less stately plants are clumps of Lavenders—one or two of the tall kinds, several of the lovely white-flowered form, and some of the early-flowering richly-coloured dwarf kinds.

Winter Savory, one of the most attractive August flowering sub-shrubs, is placed here and there. Bergamots in mixed colours associate delightfully with Lavenders and Winter Savory, and with the Hyssops. The pink-flowered Hyssop is particularly attractive. There are also generous clumps of Southernwood, kept bushy and a mass of green throughout summer and autumn by being kept well clipped to within 15in. of the ground every spring.

I think it is pleasant, in a small garden such as this, to have any out-of-the-way plants for which one may happen to have a special liking. They should, however, be of a kind that do not mar the restful atmosphere of such a garden. The blood-red Orach, with its slender 5ft. stems, makes an occasional colourful break—and small clumps are effective. Every part of this plant is blood red, and in seed it is particularly attractive, for the seed hang in crimson tassels. It is so slender that it can be fitted in anywhere. Anything in the nature of half-hardy plants would be out of place in this garden.

The placing of such a garden needs careful consideration. It requires sufficient sun, and if in such a position that from the seat there is either a pleasant distant view or a vista of another part of the garden such as a herbaceous border, so much the better. There is little space in the garden depicted for any ornament in the way of a sun-dial or a bird-bath, except for very diminutive ones.

Old sun-dials are costly treasures, and a modern pedestal frequently strikes a jarring note. I think the best solution where cost is a consideration is to use an old tree stump about 3ft. high as a pedestal.

DESIGN OF FLUSH POINTS

THE success or otherwise of the coverts described in last week's *Field* will depend upon the siting and design of the flush points. It is well known that the ideal is to drive a bird over the guns back into the covert from which he has just come. This is not always practicable, and very largely depends upon the lie of the land.

If the woods are disposed on both sides of a central valley, flush points set on prominences on each side of the valley will enable the birds to be driven in a zig-zag course from covert to covert down the valley and finally with the last drive back up the valley again. On a flat or slightly undulating country advantage is taken of every small rise to secure high birds, but the principal method is to rely upon high trees to secure this end. The disposition of the drives is designed to cause the birds to fly towards the centre of the estate.

The more difficult problem is the woodland which crowns a hill or ridge, with no other wood on the estate to aim the birds at. In the case of a wooded hill the birds will be driven round the hill, the flush points being directed slightly downhill, so that advantage is taken of the slope of the ground to secure high birds.

The wooded ridge invariably has subsidiary prominences projecting down the slopes like the legs of a centipede. If the flush points are placed on these and directed along the slope, the birds can be made to fly swinging backwards towards the ridge over guns standing well below on the lower ground between the prominences.

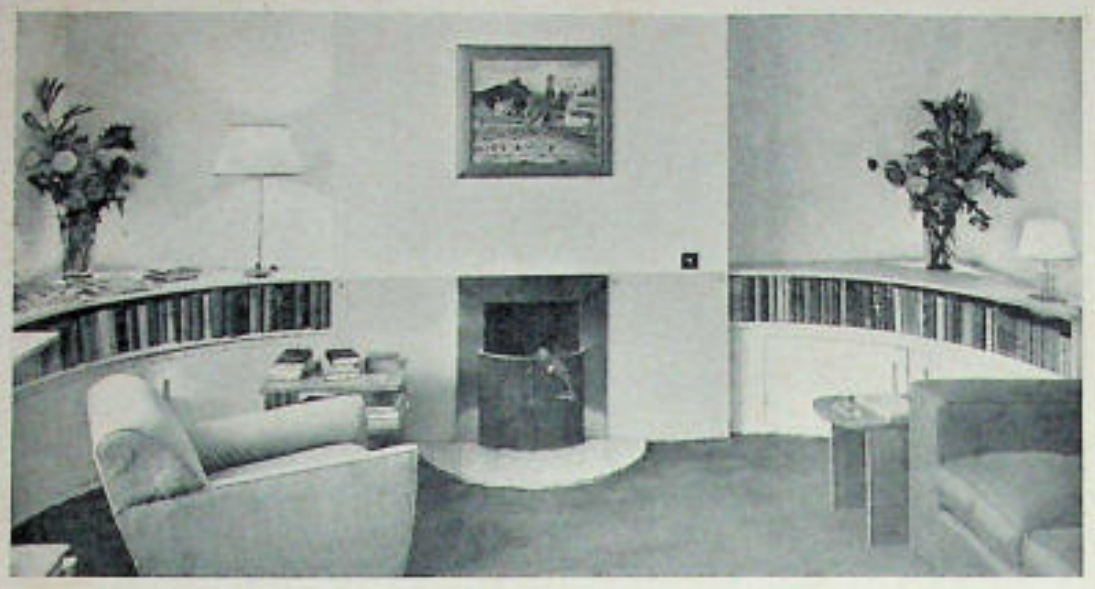
Most guns prefer high birds and, to secure these, dense rises are placed in front of the flush points so that the pheasants leave the wood at a high elevation. The rise is semi-circular in shape consisting of three rows of evergreen conifers. On heavy soils douglas fir, on medium soils with plenty of moisture Norway spruce, and on the dry sandy soils a central row of Corsican pine with two rows of Scots pine, on chalk Austrian pine.

The flush point is set at the apices of the three wedge shaped coverts, and is itself triangular in shape with slightly convex sides, the flushing face being more deeply convex so that the birds tend towards the middle. Its aim is to give a steady stream of birds, rather than the all-too-frequent rising of the birds in a bunch. To this end it should not be too small. A flushing face of 100yds. and a depth of 150yds. to 175yds. is about right.

The usual keeper's flush point, consisting of odd shrubs dotted about and much artificial covert and hedge brushings is not to be recommended. Seldom is it really efficient. Either the ground is bare, or the shrubs have outgrown their usefulness.

A flush point should not be too dense at its commencement, or the birds may rise too soon and swing to one side or back over the beaters. It should be thicker as the flushing face is approached, and the swelling should be set about 60ft. from the rise, so that the birds have plenty of room to gain height and top the trees in the rise.

If the flush point and rise is set a little way inside a wood, the guns will see none of it, and have the impression of a more or less continuous stream of pheasants flying from somewhere in the wood.



The condition of a flush point is exactly similar to that required for nesting. It is the state of a young plantation during its first three years of life. This means the lightest of shade, no trees and plenty of weed growth and stool shoots.

A reproduction of these conditions can be secured by planting ash as coppice and cutting it every six years. On lighter soil birch will be satisfactory, and on a heavy clay hazel. All these enable weed growth to thrive, giving the desired cover and impeding the free movement of pheasants on the ground and causing them to take to the wing. To prevent this occurring too soon lanes may be cut in the brambles and weeds to allow the birds to reach the centre of the flush point before rising. They should be of different lengths.

Bracken is the only weed that is quite useless for the purpose, and where it grows it should be killed by cutting when the leaves are just beginning to expand. On this lighter type of soil quite the best flush point is heather cut over every six years, and it is well to plant heather in preference to birch coppice.

To avoid the one year of hareness following from the six-yearly cutting, it is advisable to cut in alternate 20ft. strips running parallel with the flushing face, thus visiting the flush point every three years.

REGINALD DAVEY.

IN THIS ROOM THE SPACE BEHIND THE CURVED BOOKCASES HAS BEEN USED TO FORM LIGHTED PANELS THAT GIVE AN ADDED EFFECTIVENESS TO FLOWERS

BUILT-IN LIGHTING

By A. B. READ, A.R.C.A.

ONE of the most expensive luxuries of the present day is space. Living in towns and cities has produced a state of affairs when site values have risen to phenomenal levels and practically every square inch has to be used to the greatest possible advantage. Architects have struggled with the problem of designing flats with the best possible accommodation for certain rentals, with the result that, although in some cases contemporary flats have a reasonable spaciousness, all furnishing and equipment has to be chosen to take up the least possible room.

In common with every other piece of household equipment, lighting has inevitably become more and more a part of the interior of rooms, to be as inconspicuous as possible and to take up little space. A few years ago it was immaterial whether half-a-dozen wall lights or portable lamps were used to light a room, but nowadays restrictions on space have made it absolutely necessary to reduce the number of lighting fittings to a minimum.

Electricity has supplied a clean, safe and efficient means of providing light without elaborate precautions being necessary for ventilation or prevention of danger from over-heating. Lighting can be introduced behind ceilings, in walls and above cornices, and, in fact, in innumerable ways that make the lighting fitting an integral part of the room itself.

Perhaps the only disadvantage of built-in lighting is that to make an installation worth while it should be reasonably permanent. If houses or flats are taken on short leases then it is uneconomic to make elaborate alterations to rooms, but in most instances it seems well worth while to provide ourselves with pleasant surroundings, even if this involves some expenditure.

The practice of building in light has been developed to an extraordinary degree in the cinema, the theatre, the modern hotel, and in many restaurants. We are all of us aware of the extremely pleasing and often soothing lighting effects produced by many forms of indirect lighting, and there is no reason why simple and easily installed ideas on these lines should not be adapted for our homes.

Each house or flat has individual characteristics arising from its plan and its relation to the structure, and quite often the placing of beams or breaks in ceiling levels provide ready-made opportunities for wonderful lighting effects. As a simple example in thousands of interiors a break in the ceiling occurs where bay windows project from bedrooms or sitting rooms, and strip-lighting or a simple architectural lighting fitting screened behind this would light up curtains and perhaps the dressing-table too. In spite of this opportunity, it is common to find a pendant fitting hanging in this position, and almost invariably this makes no contribution to the pleasantness of the room, and is not a satisfactory means of lighting.

There is always a certain amount of fixed furniture, such as bookshelves, cupboards, wardrobes, and so on, that are made up to fit particular positions and to make the most use of recesses. While these are being made and erected it is a simple matter to extend existing wiring or run new points so that lighting becomes a definite part of the design, adding to its effectiveness and its efficiency, and at the same time making it unnecessary to use lighting fittings or portable lamps as an afterthought. All wardrobes could have tiny built-in tubular lamps housed in the thickness of shelves or other suitable positions, using switches that were operated by the opening or closing of the doors. Corner cupboards with glass tops lighted from below are simple to construct and give a new beauty to flowers or leaves that stand on them.

If lighting is to form a definite part of the interior, then the greatest possible care must be given to its position, and the placing of lighting points. Although it seems obvious advice, it is surprising how many houses, and expensive houses and flats, have lighting points put in impossible positions. For example, there are a number of instances where a door opening would cut any lighting fitting on the ceiling, or smash any lighting fitting on the wall behind it. Invariably, in bedrooms, a lighting point is put near the window, irrespective of the shape of the room, and the probable arrangement of furniture. Lights in kitchens in such a position that one cannot avoid working in one's own shadow. Most living rooms, and certainly all bedrooms, have nothing like enough skirting plug points, so that lighting on a dressing-table is only possible by means of a trailing flex going halfway round the room. Bathrooms are given one point only, in the middle of the ceiling, and yet it is so obvious that there should always be another available point for a light over a mirror for shaving, or a self-illuminating mirror of a type which most of us know. How many men have lacerated their chins morning after morning for the want of a light in the right place? This lack of thought on the part of the builder or the architect often prevents us from lighting our homes as we would wish, and we hesitate to have walls cut away and decorations spoiled to run lighting points to the right positions, and often put up with inconvenience for years and years as a consequence.

The building of the future will have all its general lighting provided with it, and forming an essential part of it, in the same way that a motor car is bought complete with all its equipment. After all, no one nowadays buys a motor car and puts in his own lighting fittings, and it seems quite possible that in a very few years' time kitchens will be built up of standard electrical and other equipment, working on the unit principle, so that the room will not be made and the equipment put into it, but the equipment decided on and the room assembled to take it. The time has come when, quite apart from the actual electrical installation, the ultimate lighting of every part of a building must result after every consideration of its position and purpose has been reviewed in the early stages of the setting out.

Lighting should be either a part of the architectural form, or, if fittings are used, their positions should be carefully decided upon in relation to their type and their place and importance in the general scheme. Points must be provided, not for "a light of some sort," but for the right fitting in the right place.

The development of many types of lamps has made it possible to introduce lighting into very small spaces. Not so very many years ago it was necessary to use ordinary lamp bulbs, or rather inefficient flame-shaped lamps, but to-day there are many quite efficient and durable tubular lamps of varying lengths that do not exceed 1¼in. in diameter. These lamps make it possible to use lighting behind narrow mouldings or beams by the side of bedheads, in bookcases, in china cupboards, in decorative niches and recesses of all kinds, and they have opened up new possibilities for useful and decorative lighting.

HORTICULTURAL ADVICE

Carnations for All

By CARTHEW ALLERDYCE

THERE are carnations to suit almost every part of the garden, both under glass and in the open. The oldest type is, perhaps, the border carnation which flowers during the summer out of doors.

The cottage carnation, on the other hand, is quite a new race. It is hardy, flowers abundantly, and has a dwarf habit of growth. The Malmaison blooms under glass the entire year, but should not be grown in a cold greenhouse or out in the open. The Perpetual Flowering carnation does best in a heated greenhouse, where it will flower quite happily for twelve months of the year. It does not do well in a cold greenhouse, but I have used it as a summer bedding plant.

This should not be confused with the Perpetual Border Carnation, which is, perhaps, the ideal race of hardy outdoor carnations and which flowers in the open from May till October. It is quite a good cold greenhouse plant also. The Room Carnation is the type that grows with a short bushy habit, and is used much in the country as a pot plant. It flourishes on a table or shelf near the window.

Closely connected to the carnation, and yet coming from quite a distinct origin, is the Pink, which blooms early in the summer. The *Allwoodii* may be said to be of mongrel origin, as they are a cross between the carnation and the pink. They are very hardy and robust, and if they are protected with a glass cloche in the autumn, they can be kept flowering right up till Christmas. The *Allwoodii Alpinus* is a hybrid race which do well not only in the rock garden, but in a stone wall or growing between crazy-paving. And so one could go on describing the dianthus family.

Whether for outside or under glass, carnations may be obtained from various firms—Messrs. Allwood Brothers, of Haywards Heath, Sussex, have specialised in the dianthus family for years. Mr. Montagu Allwood is a very well-known horticultural character, and the man who has written two books in the subject.

Stuart Lowe & Co., of Enfield, Middlesex, are also carnation experts, and so are C. Englemann Ltd., of Saffron Walden, Essex. Other firms that offer carnation plants for sale are, for instance, Blackmore & Langdons, of Bath, the Farnham Royal Nurseries, Farnham Road, Slough, Keith Luxford & Co., Sawbridgeworth; and for Scottish readers there is, of course, John Forbes, of Hawick, Scotland.

Border carnations are quite easy to grow, providing they are planted where they can have direct light and are not overshadowed by trees. They do not like acid soils or badly drained land.

In the ordinary way it is best to plant in the autumn, though March and April plantings may be necessary if the soil is heavy and cold. The best results are obtained from planting young carnations from 3-inch pots rather than direct from rooted layers. The roots should be buried, but never the plant stem; 12in. apart is necessary, though if it is known that the plants are to be left down for two or three years, a distance of 18in. should be given.

The Hardy Carnation should never be protected in the winter time. It is much better to leave it exposed. Frosts may loosen young plants, and when the thaw comes the soil may need firming again.

During the summer the soil will have to be hoed regularly and slow-acting organic foods should be given once a month throughout the spring and summer. Cornish Fish Manure has proved excellent for the purpose, and so have some of the specially compounded carnation manures.

Disbudding should be carried out regularly—the side buds around the centre end bud being removed. Some prefer to allow all the flowers to develop and the lower buds will produce quite good blooms later, if they are left on.

Reference has already been made to the Cottage carnations which are really an improved type of the common old red variety, called Rifleman. They are nicely perfumed, and do not need to be layered so frequently because of their ideal habit of growth.

The *Allwoodii* will grow almost anywhere. As Montague Allwood says in his book: "It is a plant for the million, as well as for the millionaire." Like other carnations, it must have direct light, and hates shade. No special cultivation or manuring is necessary, and all that need be done after planting is to keep the ground hoed regularly.

The sayings of Henri . .

A brandy such as this, m'sieu', does not boast. You must nurse it in the warmth of the hand to realise its true flavour, to learn what lineage of nobility retires behind the label of

MORE MOBILE PATROLS NEEDED

A Successful Lancashire Experiment Which Must Become Routine

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

THE unprecedented success of experimental mobile police patrols in certain areas provides sufficient justification for immediate action by the Government in establishing a system of such patrols of "courtesy cops" throughout the country. Results from an experiment in Lancashire reveal a 46 per cent. decline in road casualties, while extension of the tests applied in Cheshire, Manchester, Liverpool, Salford, Essex and the Metropolitan Police area have produced figures which are equally encouraging.

But the Government do not yet propose to go any further with the scheme, despite its proven worth, merely on the count that the annual financial demand upon the State (estimated at £2,500,000) is too great. They are prepared to meet half the cost, sharing the burden with local authorities, providing they are assured of the co-operation of these local bodies. But it has been clearly stated that they will only do so with great reluctance.

Evidence has never been lacking that Whitehall is invariably and stupidly short-sighted where the national roads and the safety of the people using our highways are concerned. Normally the critics of the lack-lustre transport policy of the Government have been confined to the ranks of the motorist and cyclist. Even now, with a matter of vital, country-wide importance concerning the personal safety of every man, woman and child in Great Britain held in abeyance, the mass of the public is slow to condemn. The frequency of transport fatalities and the appalling annual road casualty statistics apparently fail to illustrate the proportions of the problem which the Government is refusing to face.

The monotonous repetition of the monthly deaths and injuries figures fail to register in the public mind, yet every year there are approximately a quarter of a million casualties of all kinds and between 6,000 and 7,000 people are killed on British roads. To drive home the enormity of the losses, I need only point out that the number of deaths on public highways in this country total more per year than the number of men killed in the Italian Army during the Abyssinian and Spanish wars.

We know we can do something about reducing this pathetic toll. It has been proved by a practical test that the death rate comes tumbling down when mobile police patrols are at work in any one area. The Lancashire experiment offers the finest example. During the year before the "courtesy cops" were on the road there were 393 deaths on the road in the county Palatine, persons receiving serious injuries amounted to 1,839, while slight injuries numbered 5,200, giving a full total of 7,342. In the months of the patrols' activity deaths number 248, serious injuries 1,050 and slightly injured 2,807—an aggregate of 4,105. Between the two years, therefore, there is a difference of 3,237. Expressed in percentages, the differences are, perhaps, even more striking. Deaths declined by 18 per cent. and the total number of accidents by 44 per cent. Throughout the remainder of the country the reduction has been only 5 per cent. Surely these results need no further recommendation, and most certainly they merit the expenditure of two-and-a-half million pounds, to extend the system to other parts of Great Britain.

The case against new expenditure is that at the moment the Government is facing enormous outlay necessitated by the international situation and are unwilling to undertake new commitments. I realise, and moreover am one of the most ardent supporters of, the need for national defence; but, at the same time, I maintain that it is futile to plan for safety of lives which may be in peril in the future, yet simultaneously neglect now the lives of citizens who are already endangered and who are being needlessly sacrificed. This has been brought to the notice of the Government by Lord Sandhurst speaking in the House of Lords. He said:

"I cannot see that there is any value in making this land safe from air raids if we are going to kill the inhabitants of it before the air raids come. To my mind we have to keep an even balance before us and distribute our money so as to secure the greatest benefit for all the people. I cannot see how the man who is killed in a road accident to-day can benefit by the air-raid precautions of to-morrow."

It is argued by the Government that if they made the whole grant for these patrols, without invoking the assistance of local authorities, the precedent thus created would "upset the whole series of arrangements with regard not only to roads but also with regard to such services as health services." This is a feeble pretence. It merely signifies that the Government realise that the money should be disbursed, but are opposed to the methods by which it should be spent. In other words, a trivial technical difficulty stands in the way. The money must come from somewhere, and it must be spent. The people will pay, in either case, whether the Government—as the central authority—make the expenditure or whether the local government organisations are required to meet a portion of the bill. This vital question is, therefore, reduced to the status of a petty departmental argument causing a delay during which slaughter on the roads continues unabated because the mode of spending the people's money involves certain accounting adjustments.

Haggling, now that a means of improving road safety has been evolved, means that the death-rate mounts while the powers-that-be are in possession of a weapon which can effectively combat it and diminish the toll.

I have long been a consistent advocate for new and better roads, but I have been an even more persistent agitator for improving the safety factor on all existing highways. I would willingly see work on new roads suspended temporarily—if the Government is so short of finance—and the money thus saved utilised in instituting an efficient corps of "life guards" in the form of mobile police patrols. The advantages—including the strategic values—of a new trunk road are undeniably great, but they are completely overshadowed by the importance of establishing and extending a proved method of curbing the march of death upon our highways.

It has been suggested that money to meet this project should be obtained from the Road Fund. Motorists receive little direct benefit from the sums they contribute to the fund, and obviously some charge should be made upon it to meet this contingency which affects all motorists. When this suggestion was mooted in the House of Lords, the Government spokesman said that he had no control over the administration of the Road Fund, but he promised to recommend its consideration to the appropriate quarter.

The other proposal was that the Government should make 75 per cent. of the grant and the local authorities, who would still be responsible for the spending, should contribute the remaining 25 per cent. The supporters of this proposal aver that if the local bodies were obliged to find a quarter of the total expenditure, this would not unduly overburden them, and would, at the same time, ensure that the Government would not be saddled with unnecessary expense.

Either of these suggestions might be put into effect by Whitehall, but they must do so without loss of time. Delay is manifestly dangerous, but present indications are that no further action will be taken yet, and, in any case, the Lancashire experiment will be concluded in September. The danger is that the Government will be satisfied with the results of the test, and will then quietly shelve it.

To my mind the Government has no case upon which to base its "reluctance" to face the costs of extending the mobile patrol system. Even if the annual demand was greatly in excess of the present estimate, they have an obligation to fulfil when the question of human lives is at stake and when there is a known means of protecting it.

M.G. 1½ litre open tourer

IN MY OPINION . . .

The Problems of Car Tests and Criticisms

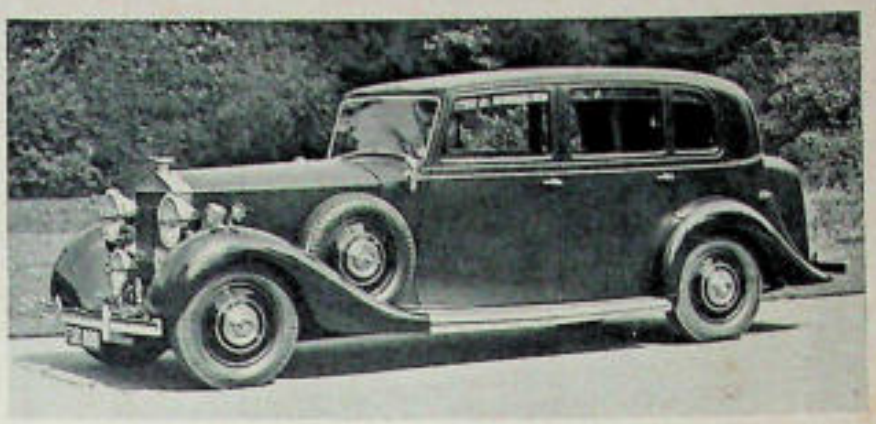
ONE of the duties of a motoring journalist is the testing, appreciation and description of new models. In the course of a year he may try 40 or 50 cars of widely different appeal and price, and in his writing attempt to convey an impression of their qualities, performance and atmosphere.

Obviously, as a few hundred miles are the limits of his tests, there are several important aspects with which he cannot deal. He cannot hazard an opinion on the durability or all-round accessibility of the car. Nor can he delve deeply into the service facilities that an owner may expect. He does not know how long the tyres will last or at what intervals the engine will require decarbonising. And unless he is unlucky he will not discover any unsuspected weakness in the design, for to-day it is almost impossible to find a bad car. Some, it is true, are better than others, but none is wholly to be condemned.

It was very different in the old days, when a man with a wide experience of many different makes of car could often be of help to a manufacturer or designer whose experience might not have been as wide as his own. It was different, too, because serious failures on these journalistic tests were not unknown, partly because the critic's views on what a car should do were then often in advance of the manufacturer's notions on the subject. The critic's tests, therefore, often discovered such elementary weaknesses as too high a bottom gear for restarting on steep hills, overheating and so on.

So to-day the motoring writer has to content himself with stating the facts and letting the reader, who may be a potential buyer of the car under review, judge for himself. By the facts, I mean, first and most important, the capabilities of the car, how fast it will go on various gears, its acceleration and cruising speed, braking, petrol consumption, turning circle, controllability, suspension, smoothness, and so on.

Coachwork details are equally important, for potential owners pay much attention to such factors as visibility in a forward and backward direction, comfort and accessibility of seats, luggage accommodation, weatherproofing, interior and exterior lighting and, last but not least, "gadgetry."



As far as is possible the honest critic will suppress his personal likes and dislikes, because a feature which does not appeal to him may be considered of value to another owner. He will consider, first of all, in writing his appreciation, the price of the car, the type of owner it is intended for, and what the car is supposed to be. Having made up his mind on these points, he can then compare the car with others in the same class and write enthusiastically or guardedly on its various qualities and capabilities.

I am often asked what attitude one takes when a car does not come up to reasonable expectations. It is a very natural question, especially as most car descriptions are supposed to be write-ups and not write-downs. The answer is that if a car puts up an indifferent performance, a very rare thing to-day, one returns it to the makers with regrets that owing to such and such a failing, which may be a piece of bad luck, one would prefer to omit this test. The maker then investigates the defect and, having cured it, may re-submit his product to the critic.

There is also another side to the question. In very rare cases the maker may consider that the critic's views or tests are not fair to the car. In that case he may withdraw the car from the test before it is completed. Actually, when working for a large and successful manufacturer some years ago, I did that myself, as I considered that one of the tests imposed on the car was ridiculous in view of a certain peculiar feature in its design. In this case no sane owner of this make of car would have attempted to do something which the critic wanted the car to do. And as a manufacturer does not submit his product to these tests with the idea of having it publicly pulled to pieces, the test concluded abruptly.

The accurate testing of a car's capabilities needs the greatest care, concentration and conscientiousness. To do the job efficiently one should use a place like Brooklands track, where quarter miles are marked out, there are special places for carrying out braking tests, a test hill of known gradient and plenty of space for measuring turning circles. Brooklands, too, provides the same sort of conditions for all cars, the only variable factor being the wind and weather. Thus if all tests are made on the track the keen and careful reader can draw far more accurate comparisons than when one test is made on one bit of road and another on another. To show in what detail some car tests are conducted it may be noted that certain critics even state in their reports the height of the barometer, for the reason that this has a certain influence on the power output of the engine and is regularly given in all Air Ministry aero engine tests.

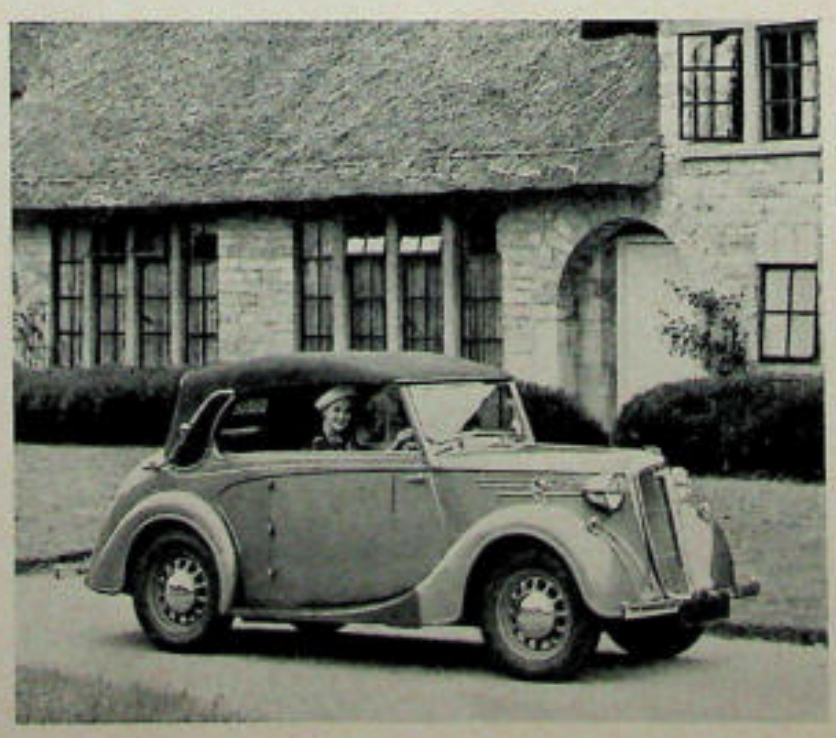
Having selected the testing ground like Brooklands, the next thing is to arm oneself with a stop-watch. With its aid one can determine accurately the car's speed over any distance from a quarter of a mile upwards. In circling Brooklands track all out it will be found that the speeds over various quarter-miles vary considerably, generally owing to wind. The more conscientious critics make a large number of timed runs and give the average as well as the best. With the stop-watch and measured distance it is also possible to check the accuracy of the speedometer at various speeds. Sometimes it may be found accurate at, say, 30 or 40 m.p.h., and optimistic at the top end of the scale. Brooklands has this advantage, that this degree of accuracy can be discovered as easily at 80 m.p.h. as at 30 m.p.h., whereas on the road it will be very difficult to test the speedometer at all at the higher rates owing to the exigency of traffic.

A ROLLS-ROYCE WRAITH, WITH BODYWORK BY MESSRS. THRUPP & MABERLY, WHICH HAS BEEN RECENTLY SUPPLIED TO H.R.H. THE DUKE OF GLOUCESTER

Braking and acceleration tests are to-day often conducted with the aid of a Tapley instrument which gives a percentage reading of efficiency. If this is translated into ordinary figures, such as a stop from 30 m.p.h. in 30ft., or an acceleration from 10 to 30, 40, 50 or 60 m.p.h. in so many seconds, the public can gauge the car's capabilities quite easily. In the old days the braking tests, especially at the highest speeds, were not very reliable because of the difficulty of gauging exactly where the pedal had been applied. Also, as can well be imagined, the full power application of the brakes at a speed of 60 or 70 m.p.h. was quite a thrilling experience.

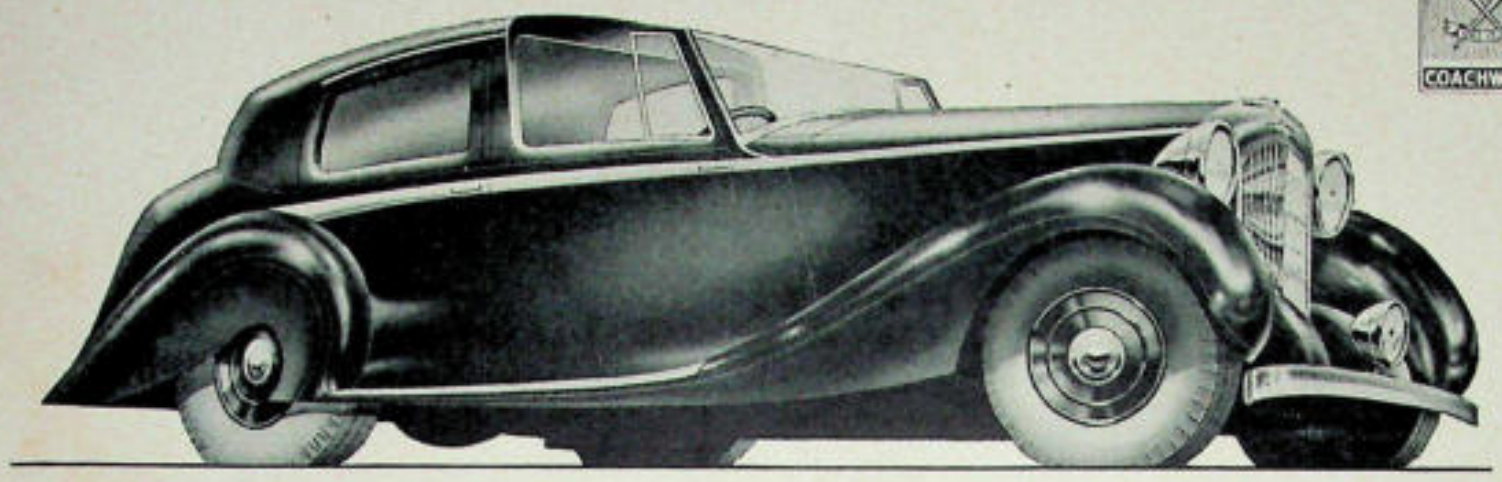
Brooklands also has the advantage of possessing a weighbridge, and, having used it on many occasions in the past, I can say that the catalogued weight of a car does not always coincide with the reading on the scales. This may be due to the fact that factory cars are often weighed dry—*i.e.*, without water, petrol or oil, or that since the original weight was taken it has been found necessary to add new accessories or to strengthen up certain parts.

The measuring of petrol consumption, as pointed out in a recent article in the *Field*, requires a true understanding and a full statement of the prevailing conditions. The identical car running under conditions that may vary enormously as regards load, speed, weather conditions and even tyre pressure and fuel used, will give equally widely varying results. To provide the reader with really useful data, therefore, it would be wise to quote the worst and best consumption figures that could be obtained. And, in fact, that is what some manufacturers do to-day in their book of words.



Now let us turn to the more indefinable qualities of a car, such as controllability, comfort, smoothness, silence and roadworthiness. The appreciation of these qualities is fraught with difficulty. You, for instance, touring at not more than 40 or 50 m.p.h., may consider a certain car ideal in all these respects. Another driver may want to proceed faster, and may find that the soft suspension that suits you makes him sway on corners or bump his axle on rough roads. Silence and smoothness are matters of personal opinion—at any rate, at the moment—for the ordinary tester cannot measure them and give a figure as he does for speed, braking or petrol consumption. And the same is true of appearance. A line, colour, contour, shape or style of furnishing and appointment that appeals to you may horrify your friend just as his or her ideas on dress, decoration, food and wine may be at variance with yours.

Comfort, too, is equally difficult to assess. The angle, suspension and size for a certain type of seat may suit you. You feel instantly that this layout fits you like a glove. But your wife, perhaps shorter and slimmer, may feel lost and ill at ease. And while on the subject of seats, I should point out the importance of testing a car from the back seat. Personally, whenever possible, I make a point of this, for I want to know, if I feel sick, whether I have a tolerable view of the road ahead, whether I can stretch out my legs and do not get stiff after a longish run, if I can wear a hat and whether I am likely to be brained when going over a moderate bump. Back-seat comfort is a vital consideration on any type of car, but it is of most importance on the larger, more expensive types, where the owner usually sits behind and employs a chauffeur.



An unusual way of assessing the qualities of a family car is to test it with the family on board, letting them change places during a day's journey and asking them to award marks out of a possible hundred under various headings. By this means a more general view of a car's appeal can be obtained.

But when all is said and done the acid test of a car is its performance over long distances in the hands of the public. What does the critic's paltry week-end trip avail against even a 20,000 miles a year motorist's experience? That is the man who can tell you whether his car is good, bad or indifferent. True, he has not the all-round experience of the professional critic who drives many different cars. But on his one and only car he is a real and reliable authority. And, after all, it is the public that decides in the long run as to the merits of a car, and any car which sells and continues to sell freely must be worth the money asked in the opinion of large numbers of people. In time, of course, a better car will make its appearance in the natural way of progress, and when this comes along one of the useful functions of the motoring journalist is to explain and assess its appeal and quality to the best of his ability.

THE YELLOW ANTHEMIS GROWING BY THE MILLION, CAUSING A BRIGHT PATCH VISIBLE FOR MILES

LIGURIA—LAND OF FLOWERS

ON the terraced slopes of Liguria—that province of Italy forming a narrow strip of mountains and coast between Spezia and the French frontier—facing the deep blue of the Mediterranean, stretches acre upon acre of ground dedicated to the cultivation of flowers. Every inch of the available land in the growing districts is occupied either by flowers, shrubs, plants and greenhouses or colour-washed dwelling houses, with an occasional round water tank of concrete.

The flower-growing industry of Liguria is one of the few industries in the world which does not suffer by competition from other sources of supply. During the summer, when the rest of Europe is producing its crop, the workers in Liguria are preparing for the next season. Their busy period begins in November and finishes in April, and during those six months miles of countryside are scented by millions of blooms of every conceivable colour.

The richness of the soil, the mildness of the climate and above all the extraordinary clarity and purity of the atmosphere, which allows the sun to exert its full beneficence, are such that plants thrive in the open air during the winter. In consequence they have a stamina and reserve of strength which gives to the cut flowers the advantage of great durability.

Some plants need protection against frost and wind, and this is provided mainly by matting; certain others must be started or grown entirely under glass.

Liguria produces about a million pounds worth of flowers a year; of this over £810,000's worth are flowers for cutting. Carnations and roses form the foundation of the industry: at the last exhibition at San Remo the catalogue printed the names of 90 specimens of carnations and admitted that over 400 others were shown. The variations in size, shape and especially in hue are incredible, entrancing and beautiful beyond description. Twenty-three varieties of roses appeared by name at the same exhibition. Nearly every other flower for which such an exceptionally good climate is suitable is also grown, and a number of specialities has been evolved.

The work of rearing the flowers occupies about 5,500 people over at least 5,000 acres of land. About another 160 persons are employed in distribution, without taking into account the many buyers who peddle their wares throughout the neighbouring regions.

Imperia is the centre of production, but San Remo the most important centre of distribution; about 800 baskets of flowers change hands there daily during the winter, compared with about 450 baskets at Ventimiglia.

The market itself is at present held in a temporary building until such time as a fine projected construction can be erected. It opens daily at 6 a.m. for an hour's sale of roses; from 7 a.m. carnations and other flowers are dealt with until 9. The sellers are mostly women, and the business is carried out in a quiet and orderly manner, each seller having baskets arranged according to name, quality and shade, while the buyers wander round purchasing their requirements.

In spite of an appearance of calm and ease, however, the flower market of San Remo is one of the most sensitive exchanges in the world. Outside influences, often unpredictable, can send prices up or down by 50 per cent. or more, generally without any warning. A severe storm, the death of a well-known person, a society wedding, or some special anniversary can alter the finely balanced relation between supply and demand to such an extent as to cause enormous movements in price.

Roses vary in price from about 1/3 to 10/- per dozen. The price of carnations ranges from 1/3 per hundred to as much as 12/- a dozen. On a day when the market is quiet narcissus are on sale at 2d. a dozen and daffodils and hyacinths at 1d. A few of the commoner flowers are even sold by weight.

Owing to their remarkable powers of keeping fresh, large quantities of cut flowers are packed into straw boxes and exported. In fact about 45 per cent. of Italy's production is sent abroad, the principal buyers in order of importance being Germany, Great Britain, Jugoslavia, Switzerland and France. The weight of these boxes is over 3,000 tons a year for a total value of about £550,000; in good years, such as 1929, 1930 and 1931, the value exceeded £1,000,000.

It is easy to imagine that the Ligurian flower-grower lives the ideal life in perfect surroundings, but production figures help to modify this view by giving some indication of the long hours of back-breaking work, beginning before dawn and ending after sunset; remember, too, the disappointment at a sharp fall in the market just when one's finest blooms are ready for cutting.

Nevertheless they will tell you that it is a fascinating and satisfying industry . . . for the industrious.

S. V. THORMAN.

GO-ANYWHERE AIRCRAFT

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field")

IT is one of the paradoxes of flying that, though aircraft use a universal medium—the air—and are limited in their journeys by no such barriers as apply to surface transport, they are yet very dependent upon ground organisation. While the increasing reliability of engines has practically eliminated the need for emergency landing grounds—at any rate on the regular airways—other trends in design have served, in some measure, to increase the dependence of aircraft on properly prepared aerodromes. Generally speaking, the heavily-loaded machine of to-day demands a large aerodrome from which to take-off, while their high landing speeds mean that, for safety, the alighting surface shall be reasonably smooth and well prepared.

That this is one of the chief handicaps to aviation progress has been recognised for many years—and, as a result, the ease for ever more airports and aerodromes has been pressed almost *ad nauseam*. But when all is said and done, there is much to be said for attacking the problem from the other end, and for seeking means whereby the aircraft themselves can be rendered less exacting in their requirements and more capable of going anywhere.

Before indicating briefly some recent advances in this desirable direction, it may be worth while to show how great a hindrance this ground-dependence is. In commercial flying it has the grave disadvantages that aerodromes cannot be placed near the centres of towns served and the cost of construction is high.

The preparation of the trans-Canada airway, recently mentioned in these articles, provides an example of how much time and money must be spent to make virgin country suitable for regular flying. Admittedly not all of this expense is for landing grounds as such; radio control and so on are necessary under modern conditions. But there can be no doubt that cost could be considerably reduced if aircraft were more versatile, and could be, in the popular phrase, "put down anywhere."

From the military point of view, these limitations are even more serious. An aerodrome is necessarily a vulnerable target, and it is to be noted that, even if no machines were destroyed in an enemy raid, serious scarring of the aerodrome surface might well immobilise the squadrons using the station—at any rate, for a time. Furthermore, the position of units serving the Army would be difficult. Even admitting that the higher speed of modern types would enable aerodromes to be located even farther from the lines than in the last war, the task of preparing sites suitable for use by modern high-performance designs would impose great burdens on the work of the field engineers.

A recent demonstration of the latest autogiro shows that these problems are not being entirely neglected—and that, in fact, some notable progress is being made. This machine showed its ability both to land and to take off from ground of a roughness that would probably have proved insurmountable to an ordinary aeroplane.

It is, of course, of the "jump-start" type—that is to say, the rotor is run up to speed by being connected through a clutch to the engine, so that the aircraft is enabled to make an almost vertical take-off. The height gained by this initial impetus is not very great, it amounts to 10ft. or so, but it is sufficient for the machine to get out of small fields bounded by hedges, since the normal climb commences immediately.

These advantages are gained at present at some expense of top-speed performance; but it is easy to visualise circumstances, particularly in Army co-operation, in which ability to land and take-off in bad country would more than offset the loss of speed.

For general touring, too, the special abilities of this new type would seem to be specially attractive, since the present necessity of planning a flight so as always to have an aerodrome for refuelling within the range of the machine would be largely obviated.

While progress is being made on the development of slots and flaps and tricycle under-carriages—all of which tend, however, to be of more assistance for landing than taking off—there can be little doubt that the rotating-wing type of machine seems in the light of present knowledge to offer the greatest promise for making the aircraft free to go anywhere. A machine that needs no special surface or large space for taxi-ing is obviously inherently more adaptable than one that does demand such facilities.

Nor is the gyroplane the only type that is receiving close attention at the present time. There is revived interest in the helicopter, both here and abroad, and some encouraging success has been gained, more especially in Germany. Present types of direct-lift machine are, it must be admitted, somewhat crude; they do little more than demonstrate that the helicopter is not impracticable. Even so, the mere fact that the helicopter principle has been vindicated sufficiently to justify further research and experiment serves to indicate clearly that there is no reason why the conventional aeroplane of to-day, with its obvious limitations, should be accepted as the final solution for the problem of flight.

It has always been urged that the great advantage of air transport is its ability to make point-to-point journeys without changes or transhipment. As things are to-day, that advantage is to some extent obscured. The growing use of the flying-boat for long flights means that bases are located on the coast, and passengers and goods for the interior must continue by other forms of travel or by feeder airways, which are themselves limited in their scope by the availability of aerodromes. The go-anywhere aircraft must be the ideal ever to be kept in mind, and it is reassuring to know that sufficient knowledge now exists for us to say definitely that it is within the realms not merely of possibility, but of probability.

IN COMFORT OVER THE DESERT
The Imperial Airways liner Caledonia flying over the Mogattam Hills shortly after leaving Cairo en route for Basrah

THE 3-LITRE SUNBEAM TALBOT—A CAR WHICH PROVIDES AMAZING COMFORT

THE 3-LITRE SUNBEAM-TALBOT

FIRST reactions are very often good criteria of the worth of a car, and I was not surprised when a friend of mine who had travelled in a good many new models, and therefore had reason to be somewhat *blasé* about them, seeing the vehicle under review remarked, "What a lovely car!" Perhaps the word "magnificent" would be more suitable.

Is is very easy to over-state the value of a car when space is limited to a column, and everything must needs be said succinctly, but the 3-litre certainly deserves the praise I would accord it. Here is a car which, with a standard saloon body, costs £415, and provides a happy combination of most qualities sought in the large car.

If one word had to be given as the focal point of the Sunbeam-Talbot's design I think it would quite definitely be the word "comfort." Here are seats which support your back in just the right place, and window handles which do not irk your thigh when you drive—a small but important point—while the suspension neither gives those sickening undulations noticeable on some vehicles which have squashy springing, nor makes the occupant wobble like a jelly in a high wind through springing which has been taken to the other extreme.

The engine is a six-cylinder unit with a bore and stroke of 75 mm. and 120 mm., having a cubic capacity of 3,181 c.c. Since the R.A.C. rating is 20.9 h.p. the annual tax in Great Britain becomes £15 15s. Transmission is through a silent four-speed gearbox with synchromesh on third and top, making the task of changing gear a very simple one. The gear ratios are as follows: Top, 4.30 to 1; third, 6.30 to 1; second, 10.62 to 1; and first and reverse, 15.90 to 1.

I should not call the car particularly fast, but it will cruise very easily at about 65 m.p.h. with a top speed about 15 m.p.h. higher, and unless speed is the be-all and end-all of your motoring this is a very practical performance. In traffic the car handles well and will crawl through a jam at 10 m.p.h. on top gear without stalling, if necessary; while on the open highway it holds the road well.

The view forward is good, the screen being raked to give the best visibility, and blind spots are reduced to a minimum, though, like its young brother, the Sunbeam-Talbot "Ten," the rear view, via the driving mirror, is not as good as I should like.

Suspension I have already mentioned as being first class, and it is achieved by means of independent front wheel springing and long semi-elliptic springs in the rear, while double-action hydraulic shock absorbers with adjustable ride control give further comfort. The brakes—Lockheed hydraulic—are exceptionally effective.

The lines and lay-out of the car are good except for the front doors, which open forwards—a dangerous practice, as I know from experience on another car—and luxurious leather seat upholstery adds to the general impression of ease and well-being. Altogether the car is refreshingly British and what better recommendation could I give it than that?

W. R. J.

BRIDGE

FURTHER NOTES ON PAR CONTRACT

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

SINCE I wrote my last article, the scores of the fourth Waddington Par Contest have been published. At last one pair has managed to get over 90 per cent., Dr. J. Whitby and Mr. L. Ellison, of London, obtaining 91 per cent. London regained first place amongst the leading towns with an average of 86 per cent. on the best four scores, which were as follows:

	Per cent.
Dr. J. Whitby and L. Ellison	91
Harrison Gray and J. C. Marx	88
L. Tarlo and N. Novello	83
R. Swingler and S. Bendix	82

The hands played were devised by S. J. Simon and Terence Reese to illustrate various points of play. Points were awarded for play bidding and initial lead, and irrespective of the actual bidding and initial lead each hand was played at a given contract and opening lead. Thus each declarer started with the same problem, and the hands were so interesting that I make no apology for reproducing two more from the official hand analyses bulletin published by Messrs. Waddington. The second hand illustrates a fairly simple play by the declarer, and the first a rather more difficult squeeze play.

	♠ 2 ♡ K, 10, 9, 7 ◇ A, J ♣ A, K, Q, J, 2, 2	
♠ 10, 7, 6, 5, 4 ♡ 2 ◇ 5, 4 ♣ 10, 9, 8, 7, 6	Y A B Z	♠ 9 ♡ A, Q, 6, 5, 4, 2 ◇ 9, 8, 7, 6, 3, 2 ♣ None
	♠ A, K, Q, J, 8, 3 ♡ J, 8 ◇ K, Q, 10 ♣ 5, 4	

Z	A	Y	B
One Spade	No bid	Three Clubs	Three Hearts
Four Spades	No bid	Four No Trumps	No bid
Five Spades	No bid	Six No Trumps	All pass

The "Four Spade" bid by Z, a jump bid when a forcing situation is in being, is an effective way of showing a solid suit with no losers. As Y also has a suit which looks solid, and as he wants the lead up to his King of Hearts, the final bid of "Six No Trumps" is clearly marked. "Six Clubs" is not too bad a bid, but "Six Spades" should never be allowed to stand. Although B is not vulnerable, he should certainly not attempt a sacrifice above the level of Five, for it is sure to cost a million, and there is a very fair chance that partner has some defence in the black suits.

When B leads a Diamond to "Six No Trumps" prospects look good, but any attempt to claim balance will be stopped by a roar of rage from A. The first Diamond should be taken with the Ace and the Clubs tested. B shows out, so Y tries Spades; the nine drops and then B again shows out. This marks A with five of each black suit, including a minor tenace in Spades. So it is clear that a position is about to be reached. Two more rounds of Diamonds are played, and A has to discard a Heart; if a black suit is unguarded declarer makes thirteen tricks. Then three rounds of Clubs are taken and A is put on play with the fifth Club to lead into dummy's Spades.

	♠ Q, 10, 6 ♡ Q ◇ 9, 6, 3 ♣ Q, J, 10, 8, 5, 2	
♠ A, 5 ♡ J, 7, 6, 3 ◇ A, 8, 4, 2 ♣ 9, 6, 4	Y A B Z	♠ J, 9, 7, 4, 3 ♡ 10, 8, 5 ◇ 10, 7, 5 ♣ A, K
	♠ K, 8, 2 ♡ A, K, 9, 4, 2 ◇ K, Q, J ♣ 7, 3	

Z	A	Y	B
One Heart	No bid	Two Clubs	No bid
Two No Trumps	No bid	Three Clubs	All pass

Z is worth the constructive rebid of "Two No Trumps" over "Two Clubs," but he must respect Y's sign-off on the next round.

B has no better lead than the fourth best Spade, and A, having won with the Ace, will naturally return a Spade in the hope of a ruff. Y's play is clearly marked: he must play out Ace and King of Hearts and discard the third Spade from his hand, thus confining his losers to two trumps, a Diamond and a Spade; failure to make this play will result in defeat, for the defence will make a fifth trick through a Spade ruff.

THIS WEEK'S PROBLEM

A, 10, 6, 5, 2

Y
A B
Z

K, 7, 4

What is Z's best way to play this distribution to avoid using more than one trick?

LAST WEEK'S PROBLEM

	♠ A, 9, 6 ♡ Q, J, 10, 9 ◇ 8, 4, 2 ♣ J, 5, 3	
♠ 3 ♡ 8, 7, 6 ◇ K, J, 6, 5, 3 ♣ K, 9, 4, 2	Y A B Z	♠ Q, 8, 4 ♡ K, 5, 4, 3, 2 ◇ Q, 9 ♣ Q, 10, 8
	♠ K, J, 10, 7, 5, 2 ♡ A ◇ A, 10, 7 ♣ A, 7, 6	

A leads Eight of Hearts against Four Spades by Z. A-B to make four tricks against any play by Z.

SOLUTION

After A's opening Heart lead is taken with the Ace, Z can see that he requires two entries to Dummy in order to discard losing Diamonds and Clubs on Y's Hearts. His correct play, therefore, is to lead the Jack of Spades and if this is taken by B's Queen of Spades he has two re-entries in Dummy for the Hearts. A clever defender can still beat the contract by refusing to play the Queen of Spades. This difficult defence was made by very few people in the recent Par contests.

CHESS

A STRONG ATTACK

The following game, the 17th of the match between these two German masters early this year, shows a strong attack by Eliskases.

(Queen's Gambit Declined.)

WHITE. Eliskases.	BLACK. Bogoljubow.	WHITE. Eliskases.	BLACK. Bogoljubow.
1. P to Q 4	Kt to K B 3	27. P to K 6	Kt to B sq
2. P to Q B 4	P to B 3	28. P to R 5	B takes Kt (*f*)
3. Kt to K B 3	P to Q 4	29. R takes B	B to K 5
4. P to K 3 (*a*)	P to K 3 (*b*)	30. P to R 6 (*g*)	Kt takes P
5. B to Q 3	Q Kt to Q 2	31. B takes Kt, ch	R takes B
6. Castles (*c*)	Kt to K 5	32. P takes P	R to Kt 3
7. Q Kt to Q 2	P to K B 4 (*d*)	33. R to R sq	P to R 5
8. Kt to K 5 (*e*)	Q Kt takes Kt	34. Q to R 3 (*i*)	K to B 2
9. P takes Kt	B to K 2	35. R to B 8	R takes P (*j*)
10. Q to B 2	Castles	36. B takes R	K takes B
11. P to Q Kt 3	B to Q 2	37. Q to Kt 3, ch (*k*)	R to Kt 3
12. R to Q sq (*f*)	P to Q B 4 (*g*)	38. R takes R	Q takes R
13. P to Q B 2	Kt to B 4	39. Q to K 5, ch	K to Kt sq
14. B to K 2	B to K sq	40. R to Kt 2	Q to R 2
15. B to Kt 2	P to R 5 (*h*)	41. R to Kt 8, ch	K to B 2
16. B to Q 4	B to Kt 3	42. Q to B 4, ch	K to K 3
17. Q to B 3 (*i*)	Kt to Q 2 (*j*)	43. Q to Q 6, ch	K to B 4 (*g*)
18. P to B 5 (*k*)	P takes P	44. P to Kt 4, ch	K to Kt 4
19. P takes P (*l*)	P to Kt 3 (*m*)	45. R to Kt 8	Q to K B 2
20. P to Q Kt 4	Kt P takes P	46. R to K B 8	Q to K Kt 2
21. P takes B P (*n*)	R to R 2 (*o*)	47. Q to B 5, ch	K to R 5
22. P to K 4 (*p*)	Q to R 2 (*q*)	48. R to B 6 (*z*)	P to R 5 (*aa*)
23. Q R to B sq	B to Kt 4	49. K to R 2	P to Q 5
24. B to Kt 4	K R to K sq	50. Q to B 2, ch	K to Kt 4 (*bb*)
25. P takes P	K P takes P	51. R to B 5, ch	Resigns (*cc*)
26. P to K B 4 (*r*)	B to R 3 (*s*)		

(*a*) Kt to B 3 is more aggressive.
(*b*) B to B 4 is a good move here, but Bogoljubow, being behind in the score, had to play for complications.
(*c*) Q Kt to Q 2 (to prevent Kt to K 5) is better.
(*d*) Black has now got the Stonewall formation (pawns at K 3, Q B 3, Q 4 and K B 4).
(*e*) This seems of doubtful value, since after the exchange of Knights the pawn at White's K 5 blocks the only possible line of action of his Queen's Bishop. Q to B 2, to be followed by P to Q Kt 3 and B to Kt 2, seems preferable.
(*f*) Played to prevent 12. . . . B to K sq, to which the reply would be 13. Kt takes Kt, B P takes Kt; 14. B takes P.
(*g*) Threatening P to R 5, to be followed, if Kt P takes P, by Kt to B 4.
(*h*) A good move. If now P to K 4, then B to Kt 3.
(*i*) White now threatens B P takes P.
(*j*) Threatening to win a piece by P to B 4.
(*k*) 18. B P takes P seems better. If, in reply, 18. . . . P to B 4, then 19. Q P takes P, P takes B; 20. P takes Q P and White has three pawns for the piece and a good game. After the text-move Black has the preferable position.
(*l*) He plays this move instead of Q takes K P as he wants to open up the game by playing P to K 4.
(*m*) A good move. White cannot play P takes P because of P to B 4.
(*n*) White has a bad pawn-formation.
(*o*) P to R 5, threatening R to R 4, is better.
(*p*) A good move. We understand that in reply to 22. . . . P takes P, Eliskases intended to play 23. B to B 4 followed, if 23 . . . Kt takes B P, by 24. B to B 2 (not B takes Kt since Black would recapture with check).
(*q*) Not good. He should play P to R 5, to be followed by R to R 4 and Q to R 2.
(*r*) A good move. Black cannot play B takes P because then Q to R 3 wins a piece.
(*s*) This loses valuable time (see his 28th move). He should play B takes Kt and then Kt to B sq.
(*t*) If 28. . . . B to K 5, then 29. Kt takes B, B takes R; 30. Kt to Q 6 with advantage in position to White.
(*u*) A strong move. If now 30. . . . P takes P, then 31. Q to R 3, or, if 30. . . . P to Kt 3, then 31. R to K B 2, Kt takes P; 32. Q R to B sq, Kt takes B; 33. Q takes Kt, threatening R to B 8, ch followed by B to K 6, ch and Q to Kt 7, mate.
(*v*) Threatening 35. R to B 8, ch. B takes R; 36. P takes R = Q, ch. K takes Q; 37. Q to B 8, ch, K to K 2; 38. R to K B 2 and wins.
(*w*) Black has nothing better.
(*x*) Very good. If now 37. . . . K takes R, then 38. R to B 2, ch and wins. Black having nothing better than 38. . . . Q to B 2, after which there follows 39. R takes Q, ch, K takes R; 40. Q to B 7, ch and 41. Q takes B P.
(*y*) If K to B 2, then R to B 8, ch followed by Q to B 6, ch and R to R 8, mate.
(*z*) Played to prevent any checks after his next move. 48. P to Kt 5, ch also wins, *e.g.* (1) 48. . . . K to R 6; 49. Q to R 2, ch followed by 50. R to B 8, ch and 51. Q to R 4, mate; or (2) 48 . . . K to R 4; 49. Q to R 2, ch, K takes P; 50. Q to Kt 3, ch, K to R 4; 51. R to B 5, ch, B takes R; 52. Q takes Q.
(*aa*) Black has no good move.
(*bb*) If K takes P, then R to B 4, ch and mate next move.
(*cc*) White mates in two more moves.

A CRUSHING DEFEAT

A game from the tournament at Kemeri and Riga last March. Bogoljubow suffers a crushing defeat.

(Dutch Defence.)

WHITE. Bogoljubow.	BLACK. Dr. Hasenfuss.	WHITE. Bogoljubow.	BLACK. Dr. Hasenfuss.
1. P to Q 4	P to K 3	12. P to Kt 3	B to K 2
2. Kt to K B 3	P to K B 4	13. K to Kt 2	Castles (K R Kt)
3. P to K Kt 4 (*a*)	P takes P	14. R to B sq	R takes B (*d*)
4. Kt to K 5	Q to R 5	15. Q takes R	R to K B sq
5. P to K 4 (*b*)	P to Kt 6 (*c*)	16. Q to Q 3	Q to Kt 5, ch
6. B to Kt 2	P takes P, ch	17. K to R sq	Kt to Kt 5
7. K to B sq	Kt to Q B 3	18. Q to Kt 3 (*j*)	Q takes P
8. Kt (Kt 5) to Kt (*d*)	Kt P takes Kt (*e*)	19. Kt to B 3	B to R 5
9. P to B 4	Kt to B 3	20. Q to K 3	P to B 4 (*k*)
10. P to K 5 (*f*)	Kt to Q 4 (*g*)	21. Q takes Q	P takes Q
11. B to B 3	B to R 3	Resigns.	

(*a*) Not a good move.
(*b*) A mistake. He should, instead, play P to K 3.
(*c*) Taking immediate advantage of White's mistake. If, now, B P takes P, then Q takes K P, ch.
(*d*) If he leaves his Knight to be captured, his pawn-position is weakened still further. The text-move, however, opens an important diagonal for Black's Queen's Bishop. Probably Kt to K B 3 followed, after Q takes K P, by K takes P is best.
(*e*) Threatening the deadly B to R 3, ch.
(*f*) Development by Kt to B 3 is better.
(*g*) A good move. If P takes Kt, then B to R 3, ch and wins.
(*h*) Another good move. If now 14. P takes Kt, then 14. . . . P to B 8 = Q, ch; 15. R takes Q, B takes R, ch; 16. Q takes B (if K takes B, then R takes B) Q takes P.
(*i*) After this the attack soon proves overwhelming.
(*j*) If Q to Q B 3, then Q to K 5, ch and mate next move.
(*k*) Threatening B to Kt 2, ch. White is helpless.

A BOOK ON THE OPENINGS

The large number of tournaments and matches played in the last few years has resulted in numerous important innovations in the openings, and it is becoming increasingly difficult for the average player to keep up to date his knowledge of that part of the game. All chess-players will, therefore, welcome the appearance of a sixth edition of that well-known work *Modern Chess Openings*. This edition, which shows an increase of 32 pages and 155 columns on the fifth, has been prepared by the American master Reuben Fine, under the editorship of R. C. Griffith and P. W. Sergeant. Mr. Fine has obviously performed his arduous task with very great care and he has produced a really valuable book, indispensable to all match-players. We heartily recommend it.

Modern Chess Openings. (Published by Whitehead and Miller, Elmwood Lane, Leeds, 7. Price for ordinary copies 7/9, for interleaved ones 10/4, in each case post free.)

PROBLEM No. 4021

By C. MANSFIELD.*

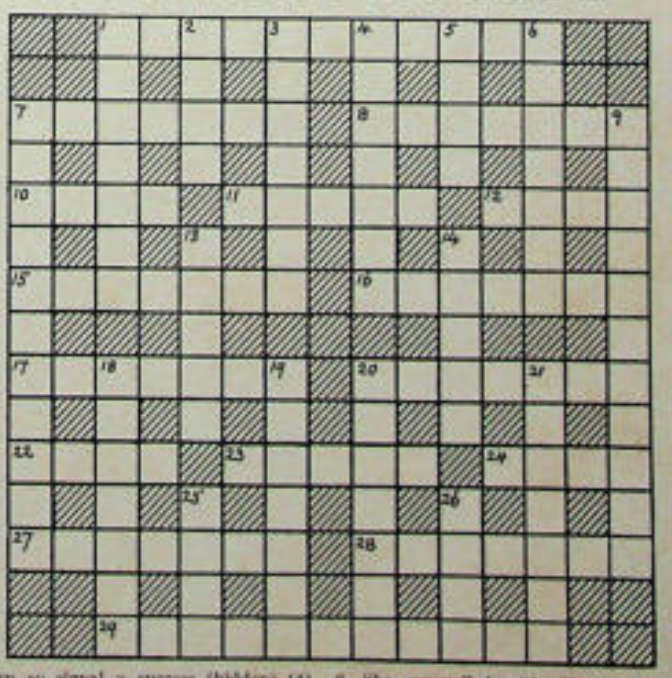
WHITE (8 pieces): King at Q B 5, Queen at K Kt 8, Rook at K R 3, Bishops at K R sq and Q R 7, Knights at Q B 3 and K Kt 4, Pawn at Q B 2.

BLACK (5 pieces): King at Q B 5, Rooks at K sq and Q sq, Knights at Q 4 and K 5.

White to play and mate in two moves.

* Second prize, *Magyar Sakkvilág*, 1937.

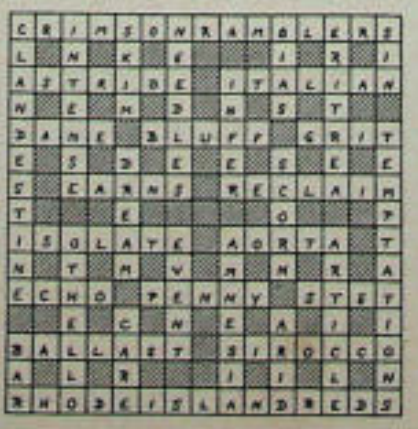
SOLUTION OF PROBLEM No. 4020



1. Kt (B 8) to K 6. If 1. . . . R takes Kt, then 2. K to Kt sq, &c. If 1. . . . P to Kt 3, then 2. K to Q sq, &c. If 1. . . . P to Kt 4, then 2. K to B sq, &c. If 1. . . . R to Q B 3, then 2. Q takes Kt P, &c. If 1. . . . R to B 5, then 2. Kt takes B, mate.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 524



ACROSS.—1, Obviously this person has no need of spectacles (11). 7, Acting strongly (7). 8, Ill cast—being flexible (7). 10, We trust there will be no rift here (4). 11, 101 – 6 – 50 (5). 12, Presently to be found on a subscription list (4). 15, Anger at the refreshment counter (7). 16, Clothing becomes useless with age (7). 17, A red rose in church (7). 20, This entertainment centres around the bar (7). 22, A sweet idea for a schoolboy (4). 23, Sudden fall of plums (5). 24, Hallo! Fifty gone? (4). 27, Strangely enough, cutlets may be got from this (7). 28, "What dire offence from —— causes springs" (Pope) (7). 29, For Ralph Rackstraw there concerned his nationality (11).

DOWN.—1, Undoubtedly a batter in a hundred (7). 2, Examples for the lazy man (4). 3, Ere vice you take into possession (7). 4, The Queen's Gambit is a popular one with three masters (7). 5, The manager said he had never known so signal a success (hidden) (4). 6, She quarrelled with Oberon (7). 7, "The woman that —— is lost" (Addison) (11). 9, There are none between this chic and the next (11). 13, And Pa? At the Zoo! (5). 14, Beds for boys who don't like translating (5). 18, Concerning a noble (7). 19, Entails (anag.) (7). 20, A closely-packed agreement (7). 21, "If —— were as plentiful as blackberries, I would give no man a —— upon compulsion (*Henry IV*, pt. 1) (7). 25, Essential to every system (4). 26, It's not quite so hot (4).

SOLUTION TO No. 523

Published July 1st

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Trout Fishing in October.—There are several places in England where the trout fishing season extends into October. For example, at Blagdon, the famous Somerset lake, the season goes on to mid-October. On the Welsh Dee the trout season closes on October 13th, and on the Towy, in Wales, the season closes on October 14th.—*R. F. E. C., Cheshire.*

Scales from a Lough Erne Trout.—All the scales proved to have re-grown centres, which means that at some time the scale has been rubbed off and a new one grown. The result of this is that the new scale has no lines on its centre part, and it is impossible, therefore, to read the age correctly. There were five years after the scale had been renewed, and, since the first spawning mark occurs in the first winter after renewing, it can, perhaps, be assumed that this spawning mark represents the end of the third year in the fish's life, or possibly the fourth year. We should put the age of this fish, therefore, as being eight years.—*W. D., Northern Ireland.*

Country House

Harm to Hedge.—There can be absolutely no risk of harming the foliage of the cupressus hedge by chlorinated water splashed from the swimming pool. Even if the hedge were watered with swimming bath water containing these small quantities of chlorine, no harm could result. Nor can there be any risk of harm to the hedge by absorption of chlorinated water through the roots. Such minute quantities of chlorine would most certainly be absorbed in the passage of the water through the soil. Assuming that sodium hypochlorite disinfectant was used, all that would remain after a very short time would be a trace of common salt. Incidentally, the only risk to be guarded against is the dirtying of the pool by debris blown in from the hedge, and the sterilisation measures outlined should be regulated to allow for this.—*C. G. D., Dunmurry.*

Nettle Destruction.—Nettles can easily be destroyed by spraying them with a solution of 50lb. of sodium chlorate in 100 gallons of water per acre. Grass is resistant to this chemical and although the surrounding turf may be scorched it soon recovers. More effective results can be obtained, but damage to the grass is increased, by using a solution of double this strength. Although a powerful weedkiller, sodium chlorate is non-poisonous to animals or birds, and there is no danger of it harming livestock except when administered in large quantities. It decomposes slowly in the soil and several months should be allowed to elapse before planting crops on treated land. The great disadvantage of sodium chlorate is that materials sprinkled with its solution are liable to burst into fire by spontaneous combustion after the water has evaporated. Care should, therefore, be taken not to allow solutions to come into contact with wooden floors, sacking, clothing, boots, &c. Clothing that has been accidentally splashed should be washed afterwards with clean water. If the area to be treated is not very large it would be more convenient and safer to use a proprietary preparation of sodium chlorate called "Atlacide," in which fire hazard has been eliminated. This is made in powder form and is applied simply by dusting the powder on the weeds by means of the sprinkler-top tin. It can be obtained from seedsmen and ironmongers everywhere.—*G. E. T., Salop.*

Farm

Technical Advice.—There is a bureau where you can obtain advice on how to deal with your various problems. Farmers, market gardeners, fruit growers and allotment holders can all obtain advice on their cultural problems from the County Agricultural Organiser and his staff, whose offices are in the county town, or elsewhere, the address of which is given in the leaflet on "Technical Advice for Farmers" issued by the Ministry of Agriculture. For the further purpose of this service, England and Wales is divided into fourteen divisions, called provinces, each served by an advisory centre, which may be either a university (or university college), a department of agriculture or agricultural college. The Agricultural Organiser and his staff give the agriculturist advice in the first instance. Problems needing specialist advice are referred to the provincial centres. The specialist advisers include entomologists and mycologists, who advise on insects and fungi pests, and the damage done by other micro-organisms; chemists, who specialise in soils, manures, feeding and feeding-stuffs; economists, who deal with such matters as farm management and farm accounts; veterinarians, who advise on questions of animal disease of general public interest, e.g., epidemics or cases of high and long-continued mortality in flocks or herds; dairy bacteriologists, and some others. The whole service is explained in detail in a special leaflet issued by the Ministry, and obtainable free on application to its offices at 10, Whitehall Place, S.W. 1.—*M. W., Ipswich.*

Spraying for Potato Blight.—The disease is most to be feared when the weather is continuously damp or humid, and a spell of such weather in summer before the tubers have reached any size may result in the haulm being so badly damaged by blight that a negligible crop is obtained. Spraying is an insurance against such a contingency, and even if no weather favourable to blight is experienced during the summer, sprayed plants usually last longer into autumn and give a heavier yield. To be really effective, spraying should be begun before blight appears, and repeated two or three times so that new growth is also protected. Bordeaux and Burgundy mixtures are the most satisfactory fungicides, but under certain conditions dusting with copper-containing dusts is cheaper and easier and provides a sufficient measure of protection if applied often enough. Besides the loss in yield arising from early destruction of the foliage by the disease, the tubers may become infected by spores washed into the soil or, at digging time, by spores falling from partially blighted haulms. As a result the tubers may rot in storage. Losses from infection at digging-time may be reduced by spraying the haulm with sulphuric acid about three weeks before digging. When sulphuric acid has not been sprayed, care should be taken not to dig the crop while the haulm is still living and affected by blight. Particular care should be taken that no haulm is placed on boxes or bags of freshly dug tubers. If tubers must be dug when blight is prevalent on the haulm, dipping the tubers in formalin will prevent much of the decay which might otherwise develop in storage. If you require further information on the subject, we advise you to obtain the Ministry's Advisory Leaflet No. 271, from H.M. Stationery Office, York House, Kingsway, London, W.C. 2.—*J. B., Portsmouth.*

Garden

Destroying Tree Stumps.—Soak the tree stumps in dry weather with a solution of sodium chlorate or saltpetre. When thoroughly saturated and dry, set alight and they will gradually smoulder until consumed.—*G. P., Glasgow.*

Raising Paeonies from Seed.—The writer has often raised paeonies from seed, both the tree and herbaceous kinds. They are slow in germinating, the seed should be sown as soon as ripe, not over dried, if at all. Some plants may emerge the following spring, and again others from the same sowing for one or two years afterwards. Keep the pots in a cold frame and the soil in a healthy condition.—*G. P., Glasgow.*

Disease of Blackcurrant Bushes.—From your description there is little doubt that your blackcurrant bushes are suffering from "reversion," a silly name given to a condition brought about by a virus disease. As far as is at present known, this disease is only communicable by the conveyance of the sap of a diseased plant to that of a healthy one, by the pruning knife, but more often by a sucking insect such as green fly. Once affected, there is no known cure, though good cultivation may help the plant to resist it for many years. The Currant Gall Mite (*Eriophyes ribis*) "Big Bud" is often present, and, besides causing mechanical injury to the buds, may be responsible for the conveyance of the virus. Destroy the bushes as soon as the fruit is gathered. Plant clean stock as far as possible from the site of the previous bed. In spring, when the leaves are about the size of a shilling, spray with lime sulphur, 1 gallon to 60 or 70 gallons of water, to control Currant Gall Mite. If any one plant is affected by virus, generally noticeable by the more pointed and sharply divided leaf, it should be destroyed before the disease is communicated to the neighbouring bushes. Virus diseases have been with us for ages, but it is only of late years that they have been scientifically examined and reported on. Hence the absence of any reference to them in your gardening books.—*G. P., Glasgow.*

Miscellaneous

Matter Identified.—We thank you for your letter, together with the matter sent for inspection. This is glass and from its curious shape it probably resulted from the melting of a portion of a beer bottle. The crack may have been formed by the hot glass falling into the water. Then on cooling the water would have entered via the crack owing to contraction of air inside. The water will probably, in course of time, evaporate through the crack.—*Anonymous.*

Post-Mortem Examinations

Asphyxia of a Greenfinch.—A hen greenfinch (*Chloris chloris*) died of asphyxia or suffocation due to blockage of the windpipe by some regurgitated food. The condition of her crop proved that she was feeding young. The presence of three hairs from cattle and a piece of vegetable fibre in her mouth suggested that the onset of the choking had occurred when she was on her nest, possibly feeding her young, and that in her struggles she seized the side of her nest with her bill. She was picked up about 10yds. from a clump of rhododendrons.—*H. K. P., Moat.*

Partridge Losses.—From casual reading of our reports in this column it might be assumed that all specimens sent for post-mortem examination had been suffering from infectious disease. We have to report shot as the cause of death in a cock and hen partridge, each from different estates. They were in prime condition for the breeding season and had been picked up by the keeper. One of these keepers about a month later sent us another partridge, a cock, which lay dead on its back and was warm when picked up. The keeper noticed that bleeding from the mouth had occurred; he also recorded that he had observed two cocks with the one hen, and surmised that the one cock had killed the other. The bird was in prime condition there was a wound on the neck near its junction with the skull, and several bruises on the breast. The bird had died from rupture of the right auricle of the heart, probably the result of fighting as the keeper had suggested. From another estate we received a hen partridge which had died of a crush fracture of its backbone and ribs; it also was in prime condition. No evidence of any germ or parasitic infection was found in any of the four birds.—*F. B., Salop; T. A., Golspie; J. C., Hants.*

Fatal Wounds of Birds.—We received a female clucking teal which had died of a deep and extensive wound over the back and sides of the pelvic region. The probable cause of the injury was a rat. Rats are a common cause of loss of sitting waterfowl by springing on to the bird's back and worrying its neck or backbone until it dies of loss of blood or a broken spine. Another fatal injury was a compression fracture of the skull of a hen chaffinch, the broken bone having lacerated the brain; a blow was the probable cause. When birds are killed as a result of a head-on collision, the cause of death is almost invariably a broken or dislocated spine, not a fracture of the skull. A hen greater spotted woodpecker (*Dryobates major*) had died from loss of blood from numerous deep or tearing wounds all along its back. The owner of the estate on which the bird was nesting suggested probably correctly, that the woodpecker had been mobbed by starlings. The fourth accident was that of a cock grouse whose ribs on the left side had been broken and driven into the lungs. She was in prime condition, although mildly infected with bowel tapeworms. No evidence of trichostrongylosis was found. Her injury was probably the result of colliding in flight against a post or fencing.—*J. V. F., London; N. B., Yorks; T. O. D., Northumberland; L. P. H., London.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, JULY 15th

OTTERHOUNDS—ENGLAND

BORDER COUNTIES.—Saturday (July 8th), Byley Bridge, near Middlewich; M., Montgomery Bridge on Severn; W., Carrawa Bridge on Severn; S., Bala Bridge on Tryweryn (down)—10.30.

BURE VALLEY.—All meets cancelled until further notice.

CHERITON.—Saturday (July 8th), Umberleigh—10.30.

COURTENAY TRACY.—Saturday (July 8th), White Swan Hotel, Swathling; M., Where leave off; W., Charlton All Saints, Salisbury (Avon)—10.30.

DARTMOOR.—Saturday (July 8th), Dartmeet (W. Dart); Tu., Rills Mill (Lyner); Th., Bow Bridge (Harbourne); S., Holne Bridge (Dart)—10.30.

EASTERN COUNTIES.—Saturday (July 8th), Anchor Hotel, Thetford (B.V.O.H.)—10.30.

HAWKSTONE.—Saturday (July 8th), Leintwardine—10.30.

KENDAL AND DISTRICT.—Owing to foot-and-mouth disease all meets in Yorkshire are cancelled until further notice.

WYE VALLEY.—Tuesday (July 11th), Mordiford, near Hereford (by invitation); F., Wilton Bridge, Ross-on-Wye—10.30.

OTTERHOUNDS—SCOTLAND

DUMFRIESSHIRE.—Saturday (July 8th), Williamwath Bridge (Annan); M., Canonbie Bridge (Esk); W., Khock Bridge (Nith)—9.30.

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage, Home and Abroad.

	Inland.	Canada.	Elsewhere abroad.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

Printed in Great Britain by Hudson & Kearns, Ltd., Hatfield, Hamilton Road, S.E. 1, and Published by The Field Press (1936) Ltd., The Field House, Bream's Buildings, London, E.C. 4, in the County of Middlesex, Saturday, July 8, 1939

OTHER PEOPLE'S PLEASURES

SOMEBODY once remarked that one half of the world had no idea how the other half lives. If that is true of the other half's worries and hardships, it is no less true of their pleasures and luxuries. The former are ignored whenever possible because they are rather unpleasant and rather disturbing. Why the latter are ignored is rather more difficult.

Darts, for example, is distinctly fashionable nowadays. A few years ago the game was quite unknown socially. Association Football remains the social inferior of Rugby Football so far as the crowds that watch the game are concerned: in another way Association Football is most fashionable. Almost everyone "does" the pools. And there is another sport—almost as huge an industry as Association Football—and that is greyhound racing. Horse racing is ultra-fashionable: it always has been, and, we hope and believe, always will be. Greyhound racing remains, it would seem, socially "not quite."

Yet somewhere around 24,000,000 people pay to watch greyhound racing during the course of the year. That, in proportion to the population of Great Britain, is an enormous figure. There must be something about the sport. Yet one wonders how many *Field* readers know anything about it; how many, indeed, have ever been to watch it? We who are not without opportunity, know nothing about it—and have never watched it—a fact of which we are rather ashamed. But we are certainly not alone in our ignorance.

Greyhound racing has been called every name under the sun, and few of them complimentary. It has been described as crooked; it has been said that the winner of each race is known beforehand; it attracts, we have been told, the worst element in our population; the race gangs, we have been assured, have left the racecourse for the stadium. But we do not believe that 24,000,000 people would pay to see a sport that was run on those lines. They could not all be mentally deficient. And we do not believe that 24,000,000 people would pay to see a sport that was not attractive; would not come again and again if that sport did not give them something they earnestly desired, which they could not get elsewhere.

Obviously, then, greyhound racing is a factor of some importance in our national existence. The baby among our popular sports it is now an enormous industry employing a great many people, caring for a great many dogs, handling an enormous amount of the nation's money and amusing a very large proportion of the population. As such it surely deserves some consideration from "the other half."

In this issue of the *Field* there appears the first of a series of ten articles on greyhound racing as it is run by the Greyhound Racing Association. The articles will deal with every aspect of the sport from its inception: its constitution, the legislation that controls the racing and the betting: its kennels and the management and training of the dogs boarded therein: and so forth. The articles are in no way propaganda, but rather a plain statement of fact. The reader can make up his own mind afterwards. But we feel that, no matter what that reader's opinion of the sport may be when he has read the completed series, he cannot as a lover of animals be anything but interested in one aspect at least—the feeding and training of many hundreds of highly-bred animals. That is, in itself, a science and is quite apart from the sport.

And it is worth while noticing that certain diseases that are causing concern to dog-lovers are more or less unknown in these greyhound kennels.

A VETERAN'S CHAMPIONSHIP

LEN HARVEY, at the age of 32, has earned the right to call himself light-heavyweight champion of the world—in Great Britain, at any rate. It really was a magnificent performance on the part of a man who, in the boxing sense, is truly a veteran. He was opposed to a fit and very powerful man, one some years his junior (McAvoy is a good boxer, too), but, while he looked drawn, and rather haggard, and very, very tired, his skill was such that at the end of fifteen strenuous rounds he was a clear winner on points. A magnificent victory, but a doubtful commentary on the standard of British boxing, when an "old man" remains at the top of the tree and his only challenger is a middle-weight, himself of long ring service. It is to be hoped that before Harvey retires—that event cannot be postponed for long—he will have the opportunity of fighting America's No. 1 and so prove himself beyond any doubt champion of the world. On the same evening Jack Doyle lived up to his reputation as One-Round Doyle.

FISHING IN THE DOG-DAYS

With the arrival of the dog-days, the usual summer lassitude on the trout streams may be predicted with reasonable certainty. Even if the sun is thwarted of its authoritarian intent, trout will accept the will for the deed and retire into the cool glades of the weed during what ought to be the hottest part of the day, only to be roused to activity for a spell before the creeping mist damps their belated ardour. But where a good coarse-fishing stream is available, many pleasant mid-day hours may be spent stalking chub as they also enjoy a siesta under the arching willows which fringe the bank. If it were not for the inherent, though largely unconscious, value anglers in England attach to the table qualities of their fish, Chavender would not so often be left to snooze away a July day in idleness. The excitement of watching an aldermanic form roll lazily up to engulf a well-placed palmer, apparently fallen from the tree above, and the mad tussle afterwards, is worth more than a long, if pleasant, wait for belated activity on a trout stream.

OUR GREAT WEEK OF SPORT!

Tom Webster has suggested a memorial to Richard Burton for having saved us from complete extinction in a week of sporting depression. Had Bulla won the Open at St. Andrews the United States triumphs this year would have been complete; their representatives have drawn rings round us at Meadow Brook, at Wimbledon, and at Henley. Oarsmen will smart the most at the figure they have cut at the Centenary Regatta, for if there is one thing this country prides itself upon it is the ability to turn out a crew capable of putting up a show against the world's best. No amount of explaining away defeat can evade the fact that we have been hopelessly outclassed; no amount of discussion on styles or training can avoid the conclusion that a rot has set in somewhere, for one refuses to believe the material is inferior to that of our opponents. Old watermen at Henley were talking of the days of Dr. Bourne, and it remained for Beresford and Southwood to show what sort of a fight can be put up by perfect combination, racing ability and watermanship.

ATHLETIC HOPES

Some relief from the outlook in other quarters was supplied by the A.A.A. Championships at the White City. Many of the races were noteworthy for close and exciting finishes. Sydney Wooderson received a great ovation after his mile victory in the new championship best time of 4min. 11.8sec., while D. B. Pell, who was second, ran the race of his life in pushing Wooderson so hard. Another fine performance was that of C. A. J. Emery, who beat P. D. Ward by 5yds. in the three miles, setting up a new British record time of 14min. 8sec. The race was reminiscent of duels we have seen between the great Finnish runners. The championship meeting was the herald of to-day's match between Oxford and Cambridge and Harvard and Yale. Let us hope the 'Varsities will be able to uphold our prestige on the track.

STRIKING OIL

It is with mixed feelings that we contemplate the Anglo-American Oil Company's efforts to find oil in commercial quantities in Great Britain. There can be no doubt that such a discovery would bring an added prosperity to this country and would do much to alleviate the fears felt for our petrol and oil supply during a period of war. At the same time, such a discovery would at once turn that area into a danger zone from enemy aircraft, while those of us who still trust for peace, fear, too, for the natural beauties of the countryside which would suffer over a great area were production to be carried out on a large scale. We realise that national needs must come first and that it is better to have damaged scenery than none at all, as might be the case if we could not cope with enemy incursions. Let us hope that they may strike oil—but not in the Trossachs!

SHOWER

Raindrops simper
On the soft tresses of the sleeping grass,
Slowly the minutes pass
And the quiet leaves whimper
In the languid breeze.

I have heard the anger of great storms, the thrills
Of cannonading thunder;
Have seen the earth tremble and wonder
Before the sombre frown of black-browed hills,
The apprehensive silence of old trees.

But the raindrops lisp
Among the quiet leaves,
The air quivers and grows cool,
The spider weaves
An airy web of silver,
The sparrows twitter by a wayside pool.

A COUNTRYMAN'S JOURNAL

MANY years ago I collected an anthology of poems about birds. When it came to examining nightingale literature through a period of some fifteen hundred years, I discovered a mere handful of poems (mostly indifferent) out of innumerable references in four languages which did not describe the song as a feminine lament for the vanished nestlings. Nearly every account, whether in poetic prose or often enough prosy poetry, committed no fewer than four *gaffes*, that it is the hen-bird which sings, that the song is sung after the young are hatched, that it is exclusively night-music and that its tone is sorrowful. The writers, that is to say, were not writing about the nightingale at all, but a mythical bird of metempsychosis that actually was not a real bird. Well and good; but the character of the imaginary bird, as the myth grew dimmer, was transferred to the living one and took its own poetic reality away from it.

Such has been the power of a single Greek legend, handed on by Vergil, Shakespeare and Milton, and from which even Izaak Walton, who wrote words supreme in beauty about the nightingale, did not altogether free himself: "But the nightingale, another of my airy creatures, breathes such sweet loud music out of *her* little instrumental throat, that it might make mankind to think that miracles are not ceased. He that at midnight, when the very labourer sleeps securely, should hear, as I have very often, the clear airs, the sweet descants, the natural rising and falling, the doubling and redoubling of her voice, might well be lifted above earth, and cry, Lord, what music hast thou provided for the saints in heaven, when thou affordest bad men such music on earth." Yet to the best of my knowledge only two naturalists, Hudson and that excellent observer Oliver Pike, have pointed out this singular truth about the nightingale, that a bird in full rich passionate song, when it easily surpasses in range and power the songs of all other birds, is a rarity. Perhaps I have heard a hundred nightingales in song during my life, but there have certainly not been above half-a-dozen among them, and they were most definitely not any of those that have been broadcasted, that were master-craftsmen. A nightingale will often sing best against a thunderstorm or a chorus of other birds at dawn, at eve or during the day, but the majority of the birds that I have heard were day-singers among a host of others, and still they failed of that plenary inspiration and enchantment of which some nightingales are capable.

Nightingales cease to sing soon after the middle of June, and the last one I heard (of course in an oak-coppice) was what an Oxford don would call in his or her horrible jargon "beta-minded." He was, that is to say, a good average warbler, but his repetition of that high, pure, long-drawn-out and rapturous call, so translunary that it seems to pierce the skies, the call that preludes the "jugging" and shows a virtuosity that no other bird can achieve—that was more frequently uttered than among all except the most brilliant singers. Otherwise, the rest of his song was definitely inferior to blackcap, garden warbler, woodlark or marsh warbler, and I should like to say to the second or muted song of the lesser whitethroat, except that I have never succeeded in hearing the latter except in snatches.

But the crescendo of the nightingale—the very heart of the upsurging life of the nature spring seems to pass into that fiery note that is yet just touched with unearthliness. And the proper time to hear it is, I am convinced, either at dawn, when it salutes the first flowering of the day, or at dusk, when it lifts like a clear tongue of flame above the ebbing, fading, lulling chorus of the singers all about it. It disentangles itself from them and acquires a mystery from the thickening of the light and the primrose-coloured afterglow in the west. The drowsy earth sinks into sleep, but that gleaming hail penetrates the languor and the twilight like a sword and wings its way into space. It might be the cry of a soul on its release from the heaviness of the world, from fear and disappointment and all the pettiness of things, into a purer element.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a nature note:

"You have had much to say as to the beauty of our woods and hills at the present time with their profusion of dogwood and May flowers.

"Last week I was admiring these when in a moist and shaded spot I came across a bed of wild conubines that while not great or showy, were certainly worthy of note in their red and yellow dress.—Millburn & Short Hills (N.J.) Item. . . . Noted."

From an evening newspaper: "The King and the Princesses had a ten-mile gallop in ideal weather."

A GREAT CENTENARY ROYAL SHOW

The Implications of the Past and the Present

THE Centenary Show of the Royal Agricultural Society of England has been anticipated and has passed. Held amidst international tension and domestic agricultural discontent, it was an event which provoked a good deal of reflection in one way and another.

It is, perhaps, unfortunate that centenary shows tend to make the onlooker cast his mind backwards rather than forwards, yet in the present state of agriculture this attitude is inevitable even without provocation. It is interesting to recall the figures of this year's show, to compare them with those of past years and to draw certain inferences and conclusions. The number of horses, exclusive of double entries and those entered in riding and driving classes, has varied very much during the last 50 years. In the present year's show there were 673 entries. The cattle entry, exclusive of double entries, amounts to 1,819—which was a record. Goats showed an increase of 51 over last year's show at Cardiff, and the entry for sheep had gone up from 662 to 728. Pigs showed an increase of nearly 300 as compared with last year, the highest figure between 1889 and 1938 being 841 at Ipswich in 1934.

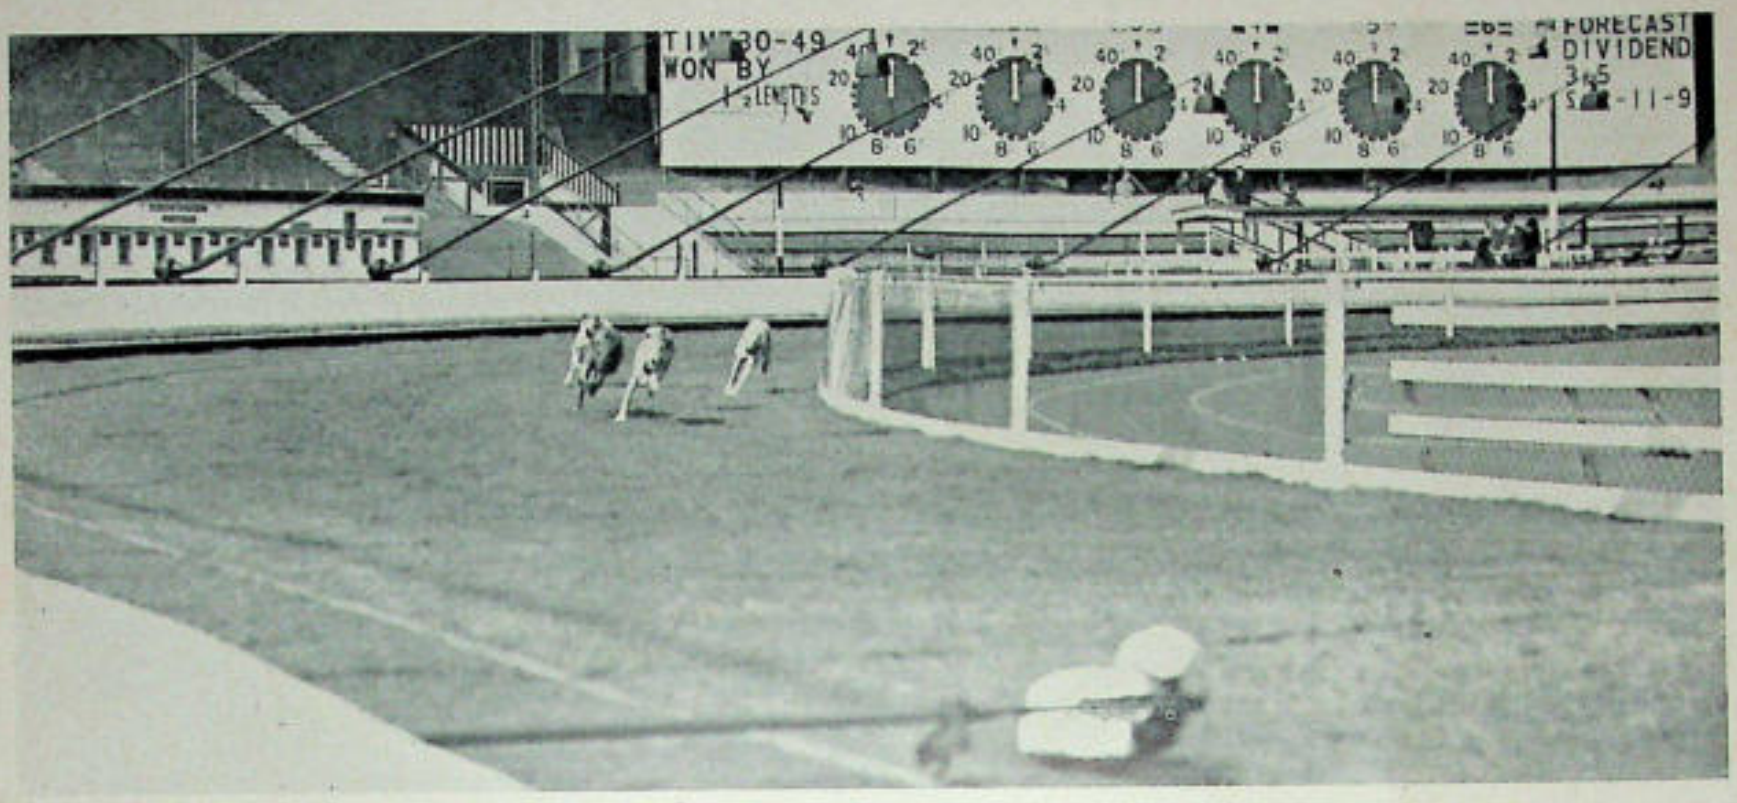
The general total for livestock this year was the magnificent figure of 4,245, which was a record in the Society's history. It is good to note that cattle and sheep were well represented, having regard to their importance should a war break out, and this reflection applies more, perhaps, to the pig entry. Pigs would be invaluable in a multitude of ways. But even more important is the fact that these figures reflect a very great determination on the part of the British farmer to overcome his difficulties.

The poultry and produce entries were also satisfactory, being 522 and 383 respectively, and the total length of shedding in the show was 9,294 ft., which was a record since 1889, when the figure was 15,602. One of the most encouraging features of the show was the machinery section, which was an assembly of every conceivable kind of implement which can be of assistance to farming. But I could not help feeling what a tragedy it was that these implements—for they are costly and require a certain amount of initial capital outlay—should be far beyond the reach of so many farmers to whose prosperity and success they would contribute so much.

Among the cattle the shorthorns drew a general admiration, though it is really invidious to pick out any breed for special praise out of entries of such general excellence. It is impossible not to remark on the King's success with his wonderful entry of Devons from the Stoke Climsland herd, or to forget what a magnificent lead the first farmer in the country gives to the rest of the agricultural community by his genuine interest and work.

The arrivals of the King and Queen, in all the pageantry of the Ascot tradition, and of Queen Mary and the Duke and Duchess of Gloucester, were greeted with great enthusiasm and set the seal on what was, from every point of view, a Royal Show.

It may seem to savour something of a carping spirit to utter any complaints where there was so much that no one could do anything but praise. Yet I could form no general opinion of hunters and ring horses, as the director found it "impossible" for me to be in the grand stand—where one must be if one is to see the horses properly—on every day. And even more difficult to understand were the motives which led to Major Faudel-Phillips being asked to leave the ring as soon as the parade of ancient vehicles began—an event to which he had given at least six months' physical work and probably a great deal more in thinking the parade out.



No doubt these were unavoidable incidents, and in any case it is impossible to allow them to do anything to spoil the recollection of the show as a whole. For it was in every sense a show worthy of its occasion. The general layout was beyond reproach, and one could not but regret that so much that had all the air of permanence was there for only a few short days.

Yet if the actual show has passed, the spirit which produced it remains. No one could walk around the stands, examine the machinery and let the eye wander over the magnificent and satisfying lines of the finest products which the stud farmers of the world can show without being impressed by the show's wealth of purpose and potential prosperity. There was no sign of depression anywhere, and everyone was determined to take a cheerful view of things.

Yet no one could but remember that this was farming at its most successful, or forget the hundreds of farmers, small and big, scattered up and down the English countryside to whom everything that the show stood for—except, perhaps, determination and the will to carry on—must, as things are, remain a dream.

At this show was collected everything which could possibly make for a successful agricultural community. The soil and pastureland of this country could be improved out of all recognition and might easily become the finest in the world. One has only to remember what has been done in this way in Italy and in Germany, where hardly an acre is wasted, to see just what can be achieved. Yet a journey through almost any part of this country cannot but fill the observer with despair at the enormous waste of land and man power.

Perhaps the main significance of the Royal Show was that it proved our ability to restore farming to a suitable and deserved prosperity. Our engineering and scientific brains are second to none, and there is no branch of farming in which experts are not immediately ready to give assistance. Hundreds of men who drifted away from what they quite excusably regarded as financial suicide on their farms have been disillusioned in the towns, and would return to the land to-morrow if they could hope for any possibility of improvement. It is very much to be hoped that this show will convince the Government of the ability of manufacturers, engineers, scientists and farmers to make agriculture pay and to restore to its fitting place in the economy of our country. If this were to be the result, the Centenary Show of the Royal Agricultural Society would indeed go down in history as having justified all the work and efforts of the great Society which produced it. CREAGHT.

TRIALS AT THE WHITE CITY

It is here that the "Greyhound Derby" is run, and 90,000 people pay to see six dogs race for the Blue Riband of Greyhound Racing

THE STORY OF GREYHOUND RACING

I—Origin of the Sport

By DALE BOURN

IT is a well-known fact that greyhound coursing is one of the oldest sports in this country, about which we have authentic details as far back as the reign of Queen Elizabeth. Had there been no such thing as "coursing," it is obvious that greyhound racing as known to millions of people to-day would never have come into being.

Greyhound racing, as opposed to greyhound coursing, is not the comparative new sport that so many people imagine it is, although, as we will see, the true birthday of modern greyhound racecourses was as recent as 1926.

Attempts to race greyhounds after the "artificial hare" were made as far back as 1876. In that year, at the Welsh Harp, Hendon, a small band of sportsmen laid out a racecourse in a field. Quoting from an article in *The Times* of September 11th, 1876, headed "Coursing by Proxy": "For a distance of 400yds. in a straight line, a rail has been laid down in the grass. It is traversed through its whole length by a groove, in which runs an apparatus like a skate on wheels. On this sort of shuttle is mounted the 'artificial hare.' It is made to travel along the ground at any required pace and so naturally to resemble the living animal that it is eagerly pursued by greyhounds. On Saturday afternoon, at half-past three o'clock, a trial was made of the new mechanical arrangement. A considerable number of persons were present . . . the whole scene was that presented by a racecourse . . . when the hour came all that was seen was the 'artificial hare' bounding out, quite naturally, like the real animal, from its bag, and followed at once by the hounds, like so many kittens after a cork. It was amusing to watch the eager greyhounds in their headlong race, striving in vain with all their might to overtake the phantom hare, which a touch of the windlass could send spinning like a shadow away out of their reach. The new sport is undoubtedly an exciting and interesting one. It is perhaps entitled to the commendation bestowed upon it by its promoters. 'It is,' they say, 'well worthy of the attention of the opponents of sports involving cruelty to animals, as it will afford an innocent recreation to all.'"

History does not relate how many greyhounds took part in the race, nor whether wagering was permitted. However, it does relate that the effort soon died a natural death as the public were not attracted. The reasons for this may have been that in those days the greyhound was known purely as a coursing dog, and its speed was not recognised nearly as much as its intelligence and cleverness in *coursing* the hare.

Again, the fact that the course was straight would make it unpopular with the coursing fraternity.

As far back as 1780, there were attempts to course the hare artificially. At Ashdown Park Coursing Club a hare was caught and put into a sunken trap. The dogs were held in traps and released at the same time as the hare. In this case the first dog to reach the hare was declared the winner. Incidentally, the dogs at this meeting each wore a distinguishing ribbon, this method of marking obviously being the ancestor of the present system of marking by various coloured coats and numbers. This system of racing was also the obvious forerunner of the "enclosed" coursing meetings in Ireland which became so popular.

In 1890, an enterprising sportsman patented the idea of a *circular* greyhound racecourse, but it never came into actual being owing to lack of financial support. Whippet racing has, of course, been practised for years, and this form of racing, though popular in Southern England in the 'nineties, is now mostly carried on in the manufacturing districts of the North and Midlands. It is interesting to note that in 1895, starting boxes were used for whippets at the Beckenham meetings in order to try and defeat the somewhat dubious methods of some of the competitors when hand-slipping their dogs. Here, again, we have the forerunner of one of the devices that go to make up the equipment of modern greyhound racing.

The true birth, weaning and upbringing of the modern sport reads more like a romantic novel than modern history. It is, in fact, the greatest romance of modern sport. No sport has ever captured the imagination of the public to such an enormous extent in such a short space of time. Not only is it a "poor man's" sport patronised by millions of the public, but it is a vast industry, commanding millions of capital, employing thousands of men, and benefiting, the Treasury, local governments and charities to the tune of many thousands of pounds each year.

For the first successful beginning of greyhound racing we must primarily go to America. In 1925, Mr. Charles Munn, a well-known American sportsman, happened to be motoring through Oklahoma City. He noticed a crowd gathered round a certain space, and, being of an inquisitive and enquiring nature, he stopped to investigate. He discovered that a farmer, one O. P. Smith, had been in the habit of entertaining friends and guests to enclosed coursing meetings on Sunday afternoons. These meetings had become so popular and noisy that the neighbours had complained to the State authorities, who had immediately raided one of them and fined Mr. Smith for "coursing live rabbits in an enclosed space!" Not to be outdone, however, Mr. Smith, realising the entertainment that this sport had given, and its growing popularity, was struck with the idea of coursing a *dummy* hare in a *circular* track. Having looked into all the patents then existing concerning this form of racing, he patented his own idea, and eventually established a series of circular tracks in various States. It was this spectacle, then, that greeted Mr. Munn's eyes. The hare was drawn on a cable attached to the back wheel of a jacked-up car, and was chased by straining dogs to the yells of delight of a crowd, most of whom had a financial interest in the result of the race.

Being an astute judge and realising the commercial possibilities of this game, Mr. Munn had moving pictures taken of the sport actually in action—a sport that had taken Florida, Cincinnati and Chicago by storm. He found, however, that coursing people were not interested, and others were sceptical.

On coming over to England he happened to be asked to a country house party, at which his friend Brigadier-General A. C. Critchley, the well-known Canadian soldier and sportsman, was also staying. He showed the films to the General, who was immediately impressed with the possibilities of the sport for the man in the street, if organised on a commercial basis.

He, later, sought out Munn for more details as to track lengths, equipment, statistics and, more important still, the amount of cash needed. Here we have, then, Munn and General Critchley as the small acorn that was destined to grow into one of the tallest oaks ever.

They formed the Greyhound Racing Association, Ltd., as a private company, and looked around for shareholders. Many were they who scoffed and scorned; some ridiculed; some politely refused; some laughed and said they would take a gamble and mentally waved good-bye to their money.

The General approached big men in finance—men in the industrial world, the sport world; but there were few who could be impressed. The few have lived to bless the day they "parted"—the others must be metaphorically kicking themselves. I, personally, know several of the latter.

£14,000 was raised for the G.R.A., Ltd., after strenuous and unceasing effort upon the parts of Munn and the General. A site was looked for, and eventually, with the generous help of Sir William Gentle, chairman of Belle Vue Gardens, Manchester, a racecourse was begun at the Belle Vue Stadium, Manchester was chosen as a location, as it was thought that the popularity of whippet racing and coursing in this district would influence the interest of the public towards this new sport.

It was all a colossal gamble. Experts in coursing were sceptical, avowing that greyhounds would not take to chasing the "tin rabbit" as they contemptuously called it.

Mr. L. O. Browne, now racing manager of the New Cross Stadium, managed to collect together, from all over the place, about 160 dogs by bargaining and persuasion, the prices ranging from £10 to £25 a dog.

The racecourse itself had to be built, kennels erected, rules drawn up, and a system of identification of the dogs devised; the electric hare had to be constructed and made to work. It was made to work all right—round and round it would go but no one could stop or control it. Eventually it

was arranged that it should be switched off its track into a heap of sandbags. It stopped all right then!

The main driving force behind all this planning, scheming and organising was General Critchley, who threw all his well-known energy into the work. He even called into service his father, the late Mr. O. A. Critchley, who helped to devise the method of identification of the dogs by noting their measurements, markings and scars, and the set of their toes and toenails—a system still used to this day. Mr. Critchley was also to act as a steward and judge with Browne.

He acted as chief steward to the G.R.A., Ltd., until his regretful death, at the age of 72, in 1935.

THE START OF IT ALL

The first mechanical hare chase. An impression of the historic event held at Hendon, in 1876, from E. G. Ash's "Book of the Greyhound"

As matters progressed at forced speed and difficulties were surmounted (and they were many and various), it was found that more money was required. Nothing daunted, this band of pioneers raised another £10,000 on their own bond, and eventually all was ready for the opening night.

Word had gone forth, advertised all round the district, that on the night of July 24th, 1926, the public would be able to see, for the first time in England, organised greyhound racing on a circular track. By sheer driving, slaving and rush, on that night all was ready. No one knew what to expect. How many people would turn up? Would they laugh? Would they jeer? Or would they just look on, go home and not come back?

What a flop! Only about 1,700 turned up, and they appeared none too enthusiastic.

Everyone in the organisation was disconsolate except the General. He refused to be downcast, and never once did he waver from his confirmed opinion that it would be one of the greatest sports of all. "I know it is good," were his averred words. How right was he eventually proved to be!

The first race was begun. The dogs in their distinguishing coats and numbers were brought out from their kennels and paraded by their kennelmen. Even then the uniform of the kennelmen was the same as to-day. Bowler hats, white coats with the number of their dog on the left sleeve, black leggings and boots. The dogs were put into their respective traps, which had previously been drawn for—round went the derided "tin rabbit," up went the doors of the traps (thank heavens they worked!) and out flashed the dogs. Round they went hell-bent and all out after their quarry. What would happen? Would they fight as they ran? What were the stewards to do if the dogs ended up in a battle? But everything went smoothly—Mistley, a dog bought for about £15 and boasting only half a tail, flashed over the finishing line 500yds. from the start, the first winner. Mistley made history that night.

Being summer-time the first few races were run in daylight, but as it got darker the lights were switched on, throwing into relief the stands and the green ribbon of the racecourse. As the hare was started in one of these dark races, it was found that the current was not sufficient to drive the hare and keep on the stand lights! These were turned out, and so was born another custom that has continued to this day.

That first night there were six races, five dogs to each race, the third race being over hurdles. The last race was run and the evening ended. What a disappointment! The public were apathetic; the personnel of the company were crestfallen; they had expected a bigger and better response and a bigger reward for all the work, thought, care and money that had been put into the project. The General and his father alone persisted in optimism, but worse was to come. On the third night only 500 turned up. Black despair prevailed. Still the General persisted that success was just around the corner, and there sure enough it was. The very next week the attendances jumped to 21,000. Greyhound racing had "arrived," and it never looked back.

A close season was suggested and adopted. It was rightly said "it would be good for the sport and good for the dogs." Belle Vue closed down on October 9th. More planning and scheming were put into operation, and it was resolved to bring the sport to London.

The G.R.A., Ltd., endeavoured to get hold of the White City, but it was at first refused them. However, General Critchley spotted a site at Harringay where the North London tube had dumped earth from their excavations. They began to build a racecourse there—a colossal undertaking, as 40,000 tons of earth had to be shifted. It was done—nothing was going to stop the General's grim determination. Then a lease of the White City was obtained, and in 1927 the G.R.A., Ltd., opened up four more courses, two in London at the White City and Harringay, one at Powderhall, Edinburgh, and one at Hall Green, Birmingham. The White City opened its doors to 25,000 people on June 20th and Harringay followed on September 13th. Wembley Stadium, Ltd., followed suit with an opening on December 10th to 35,000.

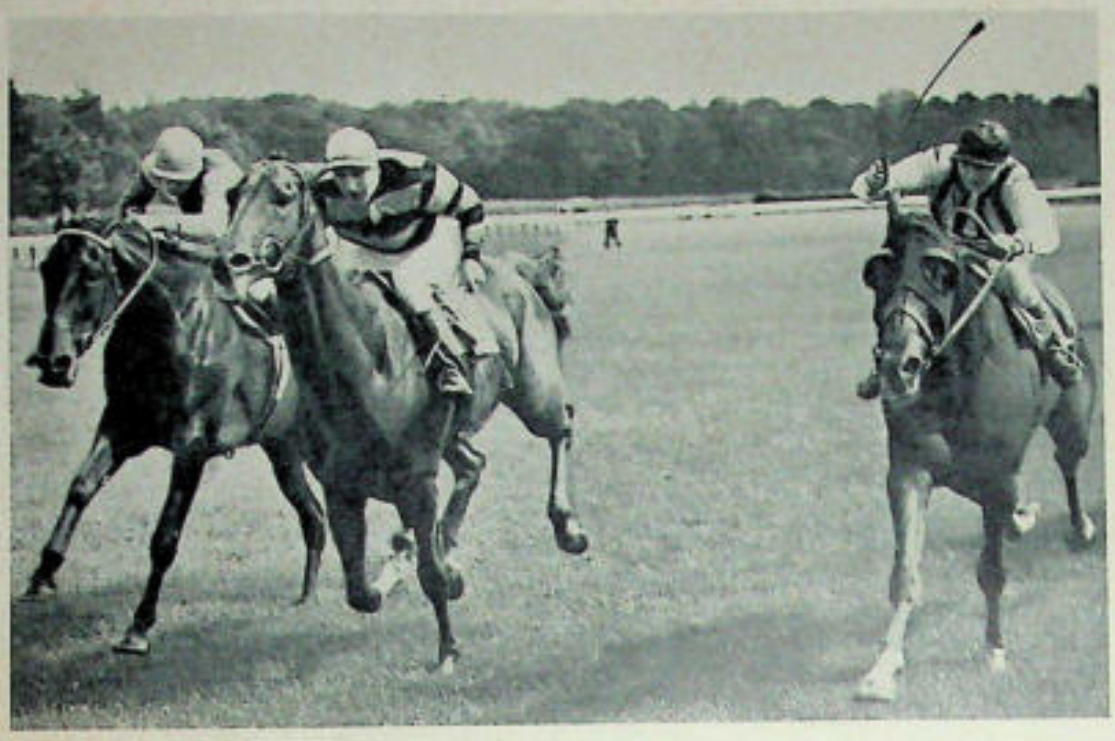
Thereupon racecourses sprang up all over the country—Clapton, Wimbledon and West Ham, in London, each under different promotion, started up, followed by others in the provinces. Truly, "going to the dogs" had taken on a new and significant meaning.

In 1927, greyhound racing at the White City alone produced an average attendance of 50,000 per night for 40 nights racing. In 1932 it had increased to over 20 million, in 1935 over 22 million, and now over 23 million pay through the turnstiles each year in this country alone.

Greyhounds were at a premium—breeding was booming, quick money was made, shares in the various concerns rocketed. In one company alone, after a year of working, the 1/- shares were changing hands at £12 10s. As an example, when the G.R.A., Ltd., issued their shares to the public in 1927, the original 1/- shares later sold to the company for £7 10s. per share—an approximate increase of 14,900 per cent. on the original investment.

Besides the financial aspect, great armies of men were employed—men from all stations of life. Men were needed to build courses and stands, men were required to run them; breeders, trainers, veterinary surgeons and kennelmen all found a new outlet for their activities. Ex-officers and others found employment as stipendiary stewards, directors found new boards on which to sit; in a word, a vast new industry had sprung up, a lucrative business combining the two great attributes of giving employment as well as a sporting spectacle to the "man in the street." Even a new school of bookmakers opened a fresh field of operation.

Of the original band of pioneers, the name of General Critchley, now managing director of the 1½ million pound company, the Greyhound Racing Association, Ltd., alone stands out to the public as epitomising greyhound racing, although Charles Munn is still a director and L. O. Browne still a racing manager of the same organisation. Critchley's "chrysalis" has grown into a great butterfly whose wings stretch far and wide.



It was only too obvious that such a money-maker would attract thousands of "gentlemen" of the get-rich-quick type who would operate at the expense of the public. Just as there is a "gold rush" or a "diamond rush" so there was a "greyhound rush." This had to be controlled. Various methods suggested, but in 1928 the National Greyhound Racing Club was formed to control the sport even as the Jockey Club controls horse racing. Legislation was introduced, legal battles were fought, but it is an almost incredible truth that in the small space of ten years an entirely new sport was introduced, commanding the attention of over 23 million people each year and turning over millions of pounds, stabilised and controlled to a pitch of as near perfection as possible. But of the nature and details of this control more anon.

It must appeal to the romantic nature of every sportsman when he harks back to that birthday night at Belle Vue and compares it to the present-day "Greyhound Derby" night in June at the White City, when over 90,000 people turn up to see six dogs race for the Blue Riband of greyhound racing—when over £120,000 goes through the totalisator alone, and the people shout and yell from the start to the finish of a race that takes less than 30 seconds to run. Truly, wonders never cease.

THE "SNOWBALL" ROLLS ON

Only a section of the enormous ground which the Greyhound Derby attracts. Over £120,000 goes through the totalisator alone

MENDICANT FRIAR (CENTRE) WINNING THE SUMMER HANDICAP AT LINGFIELD FROM FLYING SPRAY (RIGHT) AND KNOLE STAR (LEFT)

AMATEUR RIDERS AT SALISBURY

Some Promising Sprinters for Goodwood

THE Southdown Club, which holds its meetings at Lewes, and the Bibury Club, are almost the only two clubs which foster and try to encourage amateur riders under Jockey Club Rules. Now that most of the cavalry regiments have been mechanised there is a shortage of amateur riders from the cavalry, most of the gentlemen riders of to-day being either business men or rich young men with time to spare. It was pleasant to see young Mr. Jack Astor, the third son of Lord Astor and a nephew and godson of Major John Astor, ride his first winner on the flat when he won the Amateurs' Welter Handicap of a mile and six furlongs on his father's horse Bookseller.

This six-year-old gelding by Buchan out of Pennycomequick—a Derby second and an Oaks winner—had not won a race for a long time, so that it was a feather in the cap of this very young rider to win on him. He rode him well and won by half a length from Prince Charlie III. Mr. Astor is attached to the Life Guards, who are in camp near Pirbright. His uncle was a very good man across a country before the War and also a polo player of the greatest promise. Unfortunately he lost a leg when commanding a battery in the War. He himself had been in the Life Guards, but finding things rather too dull was seconded to the Gunners. But for this unfortunate loss he no doubt would have played polo for England and taken a great interest in racing under National Hunt Rules. It is to be hoped that his nephew will continue to do so.

The Aly Khan has been winning races at this meeting and at Lewes for several years. He generally buys a horse in France to run in such events and they are nearly always successful. He has made himself a very efficient rider on the flat, and rode two winners at the meeting. His first winning ride was on Tramail in the Dundridge Welter, and then he won the George Thursby Plate on Moonray. This latter event was named after Sir George Thursby, who is now a steward of the meeting. When he was young he was the leading amateur rider of his day, and able to hold his own with the leading professionals. Amateurs and professionals no longer are allowed to ride against each other under Jockey Club Rules. Sir George twice finished second in the Derby, first in 1904 on John o' Gaunt, who was beaten by St. Amant, the race being run in a thunderstorm, and then in 1906 on Picton, who was beaten by only a length-and-a-half by Spearmint. None of the amateur riders of to-day could have held their own with him, but then he had a great advantage that they do not have. He was able to ride with the great professionals of his time, and that must have taught him a lot, as many of us know from being allowed to play other games with the great professionals of the time.

All of which must not be taken to mean that the amateurs of to-day cannot ride, for many of them are very good. Captain Cundell, Mr. Hislop, Captain Peter Herbert, Mr. "Bobby" Petre and Mr. Teddy Underdown are all capable men, as is the Aly Khan, to whom I have already referred. Mr. Underdown rode a really well-judged race and a strong finish when he won the Waliop Selling Handicap on Black Witch. He, like many other amateur riders that I have mentioned, rides early, and go and ride work with any trainer who will give them work to ride, and then hurry off back to military duties or work in the City, or, as in the case of Mr. Underdown, on the stage or on the screen.

Liverpool and Hurst Park are next week, and then comes Goodwood, for which let us hope most seriously that the weather is better than it is as these notes are being written. Goodwood, when the weather is wet or there is a sea fret, is an abominable place. When it is fine, it is one of the show places of the world. There was a time when there was much ante-post betting on the Stewards' Cup, a six furlongs handicap, but those days seem to have gone for all time. Yet the race which will be run on the first day of the meeting, July 25th, is still one of the most popular sprint races of the year, and one of the most delightful to watch. The field line up for the start just over a hill, and it is some seconds before they appear charging over that brow and begin to gallop down the hill to the flat run in. The winner seldom comes from the stand side of the course, and yet there is no reason why they should not do so, for the course appears to be quite fair. Yet there is an idea that the far side is the better, and the riders flock to it, thus creating much unnecessary scrimmaging. There are some really good sprinters in the race this year, and naturally they are at the top of the handicap. The top weight is old Reliance, followed by Caerloptic and America, whose easy win at his second attempt at Ascot this year showed that he was a high-class sprinter.

He has, however, been given quite enough to do this time. Still, good sprinters can carry weight and give it away. I like his chance best of the top weights. The middle weight to appeal most to me is Knight's Caprice, a four-year-old colt by Knight of the Garter out of Caprice. He is trained by Dawson at Whatcombe and has had only two races this season. In his first, at Newbury, he won from Real Estate and Tallboy, with the consistent Shalfleet just out of a place. Shalfleet then gave Knight's Caprice 18lb. The difference in the Stewards' Cup is 12lb. Knight's Caprice's other race was at Ascot, when he just missed a place in the Wokingham, won by America with Shalfleet third. Knight's Caprice is handicapped with those two horses on that running. He then seemed just unable to stay the six furlongs, but the going was very holding, and this six furlongs at Goodwood is easier than the six at Ascot. Of the lighter weights I like best the chance of the ex selling plater, Ethland, who, through Lovely Woman, is surely kindly handicapped. The winner of this race generally comes from the middle weights, and is a four-year-old. If, therefore, I had to make a selection to-day for the race, it would be Knight's Caprice.

GNOSTIC.

THE SERVICES AT BISLEY

By CAPTAIN E. H. ROBINSON

THE triumph of the Royal Air Force in the historic Methuen Cup match was the outstanding event of a "Services Week" made rather colourless by the unnecessary and "panic" cancellation of the Army Rifle Association's Central competitions.

For some years the Royal Air Force has been nibbling at prizes which the Navy and Army have regarded as the guerdon of their own private fights. The nibbles are now giving place to very decided bites. Last year the R.A.F. captured the Inter-Services XX trophy at the Imperial Meeting. Now the Methuen Cup is in their possession. Their eyes are hungrily fixed on the United Services cup and "they won't be happy till they get it."

Three men chiefly are responsible for the steady rise in the quality of the match shooting of Royal Air Force teams. They are Air Vice-Marshal F. C. Halahan, chairman of the R.A.F. Small Arms Association; Squadron-Leader "Joe" Pearce, hon. secretary of the association; and that indomitable enthusiast Squadron-Leader J. C. Stevens, of Eastchurch. After something like eighteen years of constant drive their labours are being rewarded with outstanding achievement outside their own service.

The conditions for the Methuen Cup match are difficult enough on an ordinary day, with their close simulation of shooting in war. This year there was the added difficulty of a very high wind which made steady holding almost impossible. As a consequence scoring was on the low side of "bogey," which is usually taken to be in the neighbourhood of 1,280 points for the team of eight.

Royal Air Force (Training Command) won with 1,249. Next was a team new to the competition—Small Arms Experimental Establishment, Hythe. The success of this team somewhat compensated Hythe for the fact that its old and trusted regular entrant, the Small Arms School, suffered almost complete eclipse, ending seventh in a field of twelve. The only other Army teams to enter were the Greenjackets, Brigade of Guards and the Royal Engineers. These entered more as a matter of sentiment than with any hope of winning in a year in which the Army has seemed to consider that the expert in the use of small arms is to be discouraged in every possible way—so far as ordinary regimental shooting is concerned.

H.M.S. Excellent took third place, followed by Royal Marines (Eastern Command), H.M.S. Drake and Royal Marines (Southern Command).

The Aldershot Cup, which is a yearly bone of contention between teams of the Navy and Marines, was this year won back for the "Royals" by Royal Marines (Portsmouth Division). Last year H.M.S. Drake had it, and in 1937 it was held by R.M. Depot, Deal.

The new rifle champion of the Royal Navy is Petty-Officer Records of H.M.S. Pembroke, and the revolver champion Petty-Officer Bird of H.M.S. Drake. The rifle champion of the Royal Marines is Company-Sergeant-Major Baker of the Portsmouth Division.

RACING ENGLAND

MR. CHALMERS has never written a dull word about racing, but he has never done anything better than in his last book, *Racing England*, published by Batsford at 12/6. Enlivened with a wealth of reminiscence and anecdote is a great deal of valuable information on the history of racing in this country, reflections on some of our racecourses and an unusually interesting account of the surprising origins of the Jockey Club.

There is about this book all the atmosphere of racing in the past, and it is impossible to avoid a comparison of the days of Admiral Rous and Mr. George Payne with our own days, when one never knows whether another Derby will ever be run or not. They were great days, and if there was much trickery, there was also much character about them.

There was then, I think, a very much more widely spread enthusiasm about the great races of the Turf, and I am quite certain that there was very much more knowledge among what might be called the racing public as opposed to the racing experts. Possibly this is the result of the general movement to enable people to go through life without thinking of anything for themselves. Nowadays the number of townsmen who have the least idea of the form or appearance of the horses which they so happily back is very small.

Mr. Chalmers has written a book which the most knowledgeable racing man will enjoy, while the illustrations are varied and extremely well chosen. In a second edition, perhaps, one shock might be removed—the attribution of certain immortal words of the Swan of Avon (incidentally quoted incorrectly) to the Stricken Deer.

THE "ALL-AMERICAN" WIMBLEDON

By J. E. COLLETT

IT has been a weird Wimbledon! The tournament began as the most open affair for years, and ended with such a triumph for the United States that it might almost have been a close championship.

The only event not American owned was the Ladies' Plate, which Mrs. R. D. McKelvie, once Ireland's No. 1 as Miss A. E. L. McOstrich, managed to rescue for Scotland. R. L. Riggs won the men's singles, the men's doubles with E. T. Cooke, and the mixed doubles with Miss A. Marble. In addition to the mixed doubles, Miss Marble won the ladies' singles, and the ladies' doubles with Mrs. S. P. Fabyan.

Records for "triple triumphs" only run since 1913, when the mixed doubles event was added to the programme. In 1937–38, J. D. Budge won three titles (the doubles in each year with G. Mako and Miss Marble), a feat not previously accomplished. In 1922 and 1925, Mlle. Lenglen did the triple, her doubles partners being Miss E. Ryan (U.S.A.), P. O'Hara Wood (Australia), and J. Borotra. Thus America has always had a racket in this record.

Miss Marble was the high light of the finals. Her score of 6/2, 6/0, against Miss K. E. Stammers, who was, nevertheless, playing well up to form, was equalled in 1925 by Mlle. Lenglen, when her opponent was Miss J. Fry. Miss Stammers probably could have beaten Miss Fry with a similar score. Miss Marble's earlier round scores—Mrs. J. S. Kirk, 6/3, 6/2; Miss B. G. Beazley, 6/4, 6/3; Mme. A. Halff, 6/1, 6/1; and Panna J. Jedrzejowska, 6/1, 6/4—had not the inevitable quality or queenly power of Suzanne's, but the 6/0, 6/0 defeat of Fru. S. Sperling, and the score in the final certainly had.

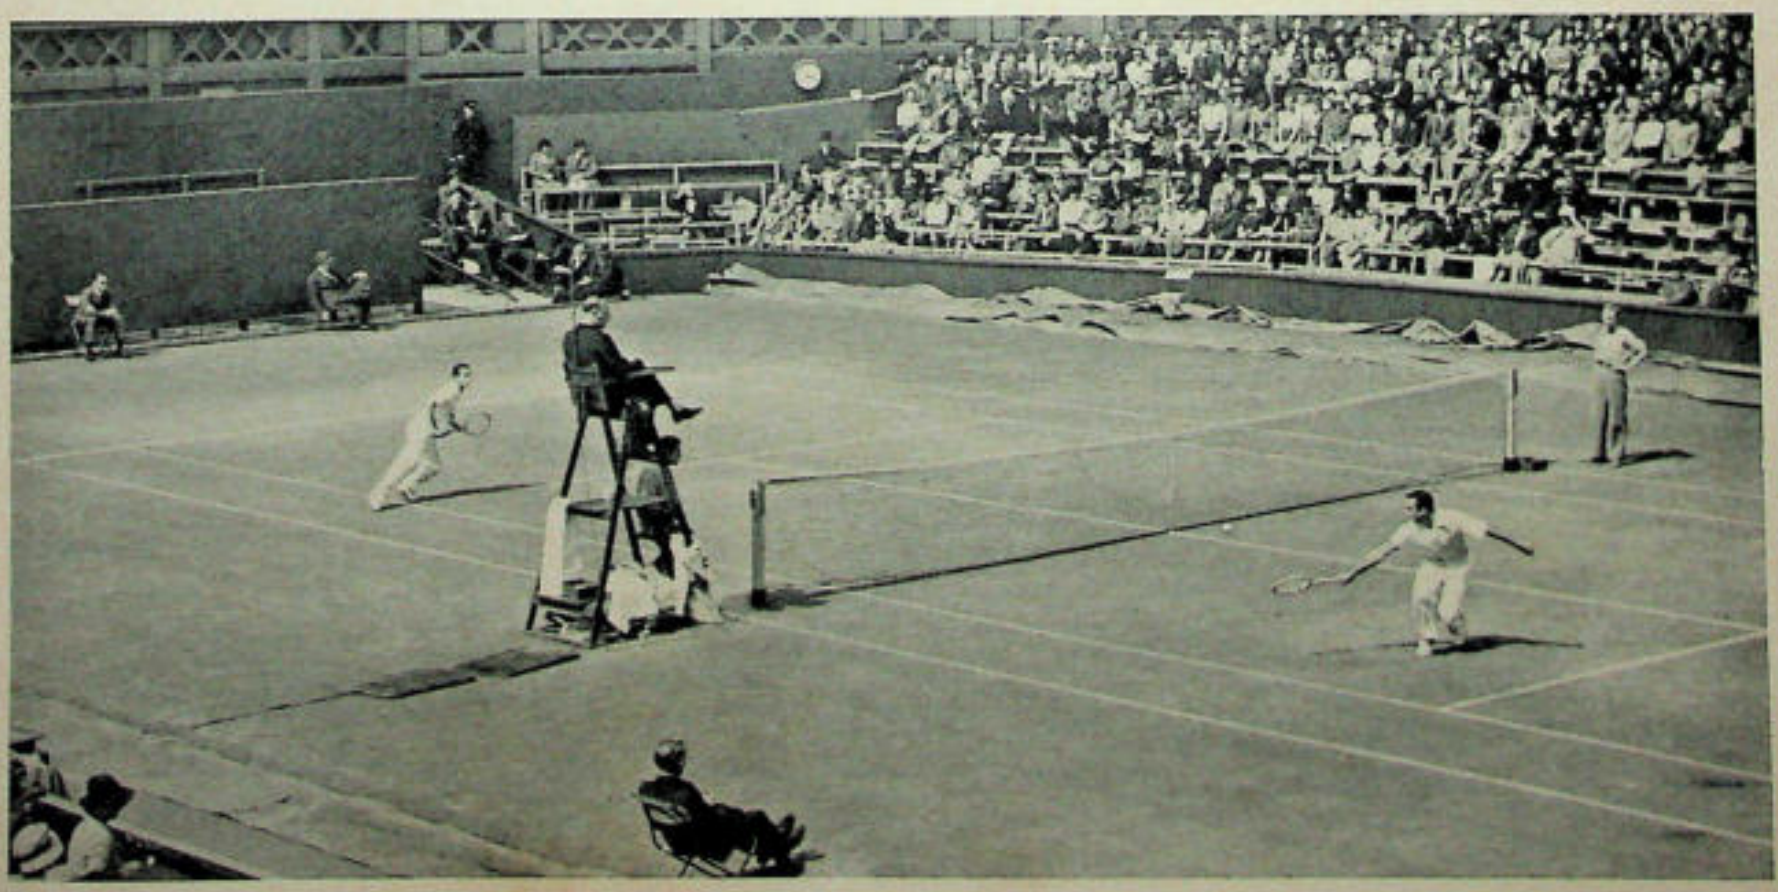
Against Fru. Sperling we saw complete moral and technical supremacy, the best existing lady baseliner was never allowed even to begin establishing a base, and throughout the twelve games only made one shot of any importance, a backhand pass.

In the final, Miss Stammers made a continuous stream of strokes of importance enough to upset any ordinary aspirant for the championship; Miss Marble merely made use of them. Every lady champion since the list of honour was started by Miss Maud Watson in 1884, has played an essentially feminine game. Miss L. Dod (1887–88 and 1891–93) is not admissible as an exception; she was a volleyer and smasher of merit at contemporary standards, but Miss Marble's overhead work is equal to, if not better than, that of most of the men of Miss Dod's time.

It is almost permissible to say that Miss Marble is the first lady champion who at reasonable odds might give the current man champion a good game. Her methods are non-feminine, and for the modern woman, however athletic, to try to imitate them would be hopeless. In the sense that she may create a leaning towards a style too strenuous for young girls to attempt, she is not the pattern

SAFE OVERHEAD!
Miss Alice Marble in her final against Miss Stammers

champion Mlle. Lenglen was. For the same reason, the most magnificent woman's match I can imagine would have been one between Alice Marble, and the great Suzanne. The probable outcome of this ideal clash is highly debatable, but would be argued along the lines of Suzanne's impatience of equality. Alice rejoices in and improves on it.



I feel surer of Riggs than when I was writing about him last week, having seen him dispose both of Ghaus Mohammed and F. Puncec in straight sets without overt extra exertion, and then in the final wear the sturdy Cooke right down to a first-aid case, after five sets of stuff almost as wearying to watch as to bear up against. A spectator for several decades said to me during the opening stages of the final that the play reminded him of the first championship final he had seen which was won by E. Renshaw. Certainly here were the aforetime academic exchanges from the baseline, and the copy-book advances to the net, but certainly not the air of adventure which Renshaw imparted. The Renshaws, E. and W., invented the mixture. If, after the lapse of some 60 years, it was not being served up so as to appear a much superior article, the game cannot have advanced as tremendously as some would have us suppose. The fact is that the advance has been superficial and spectacular. Riggs, being a shrewd person, perhaps soon noted this, and living in the land of the spectacular, was able thoroughly to exploit a theory of beating the heavos by technique.

As he proved against Puncec, a better player than Cooke, Riggs is a superb technician, expert enough to be perfect or imperfect at will without ultimate detriment. The procession of his strokes can be appreciated as theoretically spectacular by a student lover of the grammar of the game, but for a sensation seeker he provides only occasional satisfaction when circumstance calls for exceptional hazard. He has no bogey stroke like the backhand of Budge, and no personal mark like the bustle of F. J. Perry, the forceful forehand of E. Vines, or the careless rapture of J. H. Crawford.

These were his immediate predecessors in Wimbledon championships. He may either go farther forward than they went, or farther back, because, regarded classically, he has a completer equipment than any of them.

In general, the play in the doubles finals was disappointing. We had the efficient opportunism of Riggs in the men's double which turned the scale against the raggedness of C. E. Hare and F. H. D. Wilde. The compensation for the decisive elimination of Miss H. H. Jacobs and Miss A. M. Yorke at 6/1, 6/0, by Miss Marble and Mrs. Fabyan, was the utter efficiency of the process.

The feature of both the semi-final and final of the mixed doubles was the marked improvement of Miss N. B. Brown, whose graceful presence and darting cross-volleys enlivened her defeat with Wilde of Cooke and Mrs. Fabyan at 6/3, 7/5; and also the final English defeat by Riggs and Miss Marble at 9/7, 6/1. Both in the men's and mixed doubles, the English pairs owed a large measure of their losses to an inability to clinch chances. This deficiency is, in my opinion, directly traceable to the easy-going nature of most matches our ranking players meet with in their weekly round of ordinary tournaments.

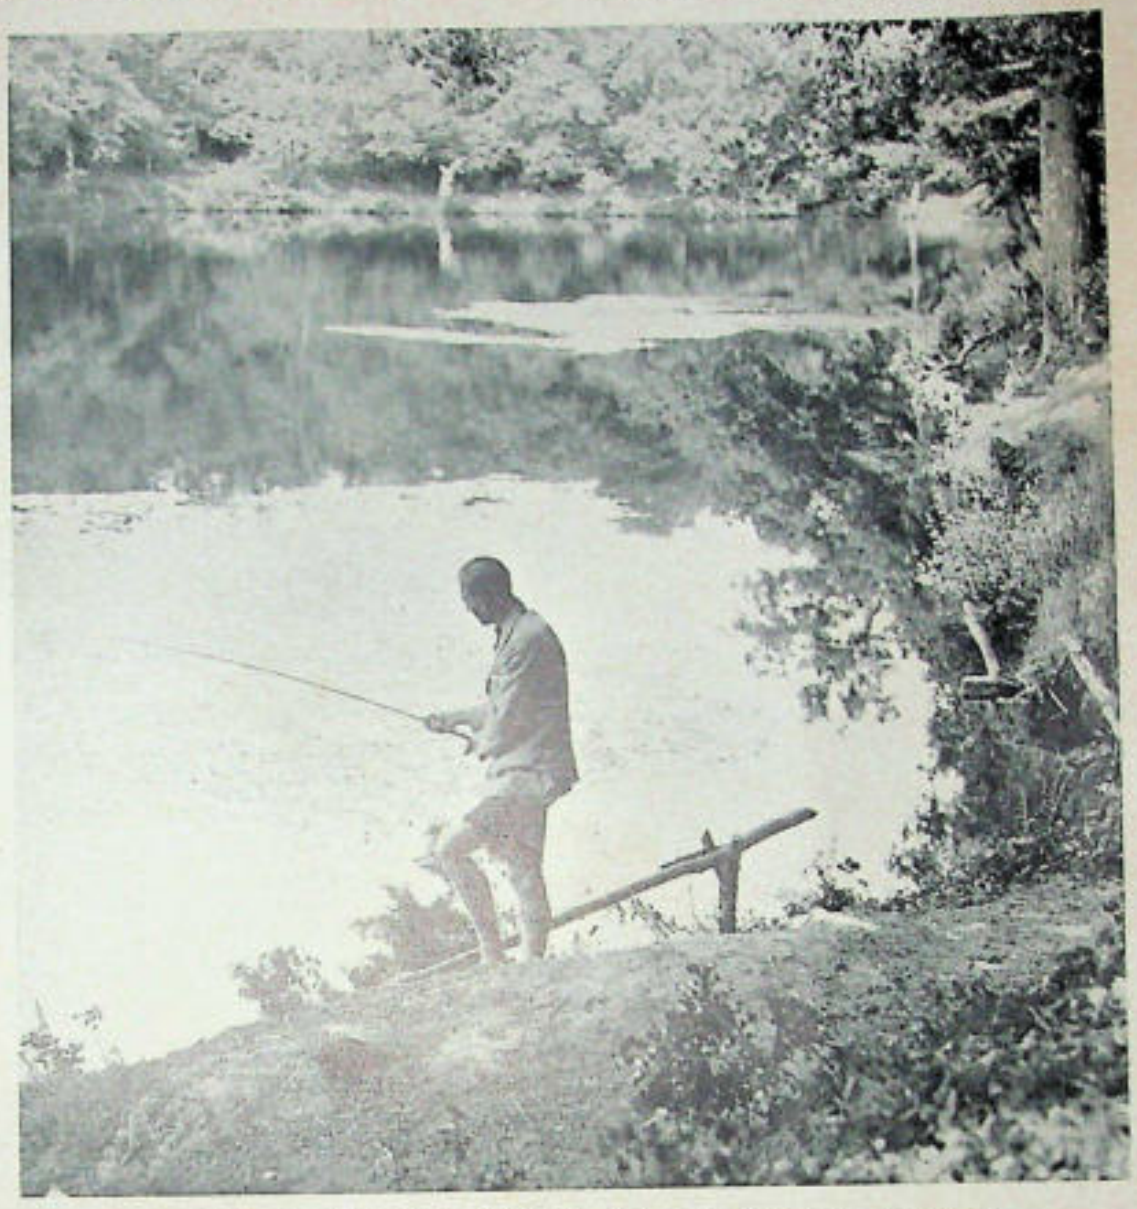
Riggs, up at the net, with an open court at his disposal

LETTERS TO YOUNG FLY FISHERS

IV.—Why Artificial Flies Are Such Oddities



MY DEAR BOB,—To answer, first, your question about buying flies. No, it is not necessary to wait for your holiday in order to get flies for Devonshire. You can get them during the few days you will be in London, or when you get to Devonshire just as you like. The majority of them will be the same flies tied, in all probability, by a wholesale house. Formerly the patterns most in use were tied locally, and, as a rule, there are still local fly-dressers who make a speciality of certain patterns which have a reputation as fish catchers on this or that stream, but whether they are really any more attractive to trout than other patterns of the same fly is open to doubt. It is always the fly which is most used that catches the most fish; but whether any given fly catches most fish because it is used oftenest, or whether it is used oftenest because it catches most fish, is a conundrum I must leave you to guess for yourself.

But local flies are always worth studying for their size and general appearance. The fly with a local reputation is pretty sure to be sound practice in its size, so when you purchase you can get yours tied on the same size of hook. As to general appearance, I mean that a fly will either be heavily dressed, *i.e.*, it has a rather "buzzy" appearance with plenty of hackle on it, or very skimpily dressed with little hackle and a rather attenuated body—a spidery appearance, in fact. It is useful to know roughly what the local dressings look like—even if you do not invest in any—for this will give you the cue for the type of dressing you should select, and also (this is a tip worth bearing in mind) what the exact opposite of the local fly looks like. This last point is to be remembered when things are going badly, when, for example, your flies are ignored by the trout altogether. Then is the time to try something entirely different from the local favourite. If this is rather a buzzy-looking object, try a very thinly-dressed fly of the same pattern; this quite often proves successful.

You have probably been rather puzzled over these remarks about different dressings of the same pattern; and on consideration I am perhaps using the term "pattern" in a rather unusual sense: I am referring to different artificial flies which are all supposed to represent more or less the same natural insect. To understand it better, turn up the colour page (Plate V) in your copy of *Where to Fish*. The lower half of the page, as you will see, gives a dozen flies selected from those in common use on west-country streams. You will see there four flies—olive quill, blue dun, olive dun and blue upright. All those flies, although so different in appearance, are used to represent the same insect—the olive. How this apparent curiosity comes about I will try to explain.

Flies on which trout feed are water-bred insects. Land flies are occasionally blown, or fall, on to the water, and are often greedily taken by trout, but they are few and far between compared with those which spend practically all their lives in the water. When you get down to Devonshire, take an early opportunity to pick up some good-sized stones from the bottom of the stream and look at their under sides. You will find they are covered with small insects which look rather like thin flies without any wings. Most of these are water-bred flies in their early or larval stages. They are safe enough under the stones, though trout will eat them readily if they are dislodged or when they swim from stone to stone. If you pull up pieces of weed and examine them, you will find that they also contain a considerable number of insects.

These water-bred flies have much the same kind of existence as butterflies, which spend most of their lives as caterpillars, form themselves into a chrysalis, and then break out into a winged insect. A little later in the year (some of them next spring) these water-bred insects form themselves into the counterpart of a chrysalis, known as the pupal stage, then they float or swim up to the surface, where they break their shuck, shake out their wings and fly away to the bank. In this stage they are known to the scientist as "subimagines," and to the angler as "duns," probably from their rather drab appearance, though they are certainly not drab if examined closely. After a day or so some of them undergo a further change, shedding another skin and become what the scientist calls an "imago" and the angler a "spinner." In this stage they mate, lay their eggs on or in the water, and finally drop on the water dead, where they are known to the angler as "spent" flies. The term "spinner" has come from their peculiar flight over the water during the mating time, when they look rather like little spinning tops. You will see them in the evening, particularly on a warm, still day. Not quite all of them have both a dun and spinner stage—some of them hatch out direct into the perfect insect—but most of the ones particularly interesting to the angler have both.

A YOUNG ANGLER FISHING BRADMERE POOL, NEAR CHAGFORD, DARTMOOR

It now, I think, becomes clear why quite different dressings represent the same fly. When the fly first comes to the surface it is still inside its shuck, and it takes quite a little while for the insect to struggle free. The trout get an uncommonly good chance of a meal during this period, which some scientists believe to be as long as 20 minutes. This is calculated from the time the insect takes to free itself from its shuck in an aquarium. It may be less in running water. I do not know. But anyhow, it is a matter of many minutes which means a long journey downstream in fast water, and accounts no doubt for the number of "nymphs," as the angler calls them, found in trouts' stomachs.

In this stage, when it is still encumbered with its shuck, the fly must have a "generally buzzy appearance"; hence dressings with a fur or wool body are a fair imitation of it when floating down on, or near, the top of the water. When it has got clear of its shuck, it stands for a moment or two on the surface drying its wings, and then its body has the delicate ring-marked appearance which is well represented by a strand of quill from a large feather wound round and round the shank of the hook. This explains, I think, why both fur and feathers are equally successful at times in deceiving a trout, though they both represent the same natural fly.

You may be wondering also why the colour appears so different; why, quite apart from its general appearance, *blue* dun and *blue* upright should be used indifferently with *olive* dun and *olive* upright. I am afraid this is more difficult to explain than the other. I was brought up in the belief that blue duns and blue uprights represented another, and smaller, fly called the "iron blue," which is of that colour. But later consideration has altered that belief. I cannot remember to have seen any hatch of iron blues on Exmoor such as one gets in the south country, and a resident fisherman has told me that it is a rare fly in the west. The blue dun is a very old dressing. Nearly all old writers on fly fishing give some form of it, blue dun or whirling blue dun, or something of that kind—a fly the size of an olive (which the iron blue is not), but of a different colour. All olives which I have examined seem to merit their name, though some in the early spring in particular are very dark in the body and have, perhaps, a slightly blue tinge to the wing. Nowadays, anglers are gradually coming to believe that these olives, which come up all the year round, are really several different species, and it is quite possible that the colour of the different species varies, or that the colour varies with the type of water in a stream. Anyhow, these blue olives have shown their ability to deceive trout for several centuries, so if they do not look much like the natural insect to us, they evidently do so to the trout.

SOME TYPES OF OLIVES

Top row: Blue quill, left; blue dun, right. Bottom row: Red spinner and olive quill. A spent pattern is shown in the middle

In its final (spinner) stage, the fly has a distinctly reddish appearance; hence the "red spinner" in artificial flies, the red quill, red upright and pheasant tail, all of which are often taken when spinners are on the water.

I had intended to answer your question about what flies to buy for your Devonshire holiday, but must now leave this till next week. In the meantime I will try to think out what I, myself, should take with me if I were going there in August with only a few shillings to invest in these attractive but (what with bushes and one thing or another) too often ephemeral creations.

Your affectionate uncle,

HARVEY.

CRICKET AND THE SPECTATOR

By NEVILLE CARDUS

I HAVE often wondered why somebody does not write a short book for the average spectator at a cricket match showing him how to watch the play, what to look for, and why. Even in the pavilion at Lord's I have heard strange questions concerning some obvious procedure in the field.

"Why doesn't he take the new ball?"—a criticism directed at a captain who preferred to use the old ball because at the moment his best spin-bowler was doing well.

Such a question would not, of course, have been unintelligent once on a time, when slow spin-bowlers cheerfully opened the attack with a fast bowler at the beginning of a match; recollect the famous "opening" combinations of Mold and Briggs, Hirst and Rhodes, Wass and Hallam, to name a few. Not many seasons ago I saw one bowler polishing the new ball on his trousers, and at the other end of the pitch the slow bowler rubbing the same ball on the ground, a procedure which probably puzzled even the most expert observer in the crowd. It should always be remembered that cricketers, like most human beings, are subject to fashions and to spell-binding phrases. And what is the custom in one period becomes obsolete in the next, not necessarily because of a development in the technique of cricket, but simply as a result of a shibboleth or craze.

No doubt all of cricket's procedure and ritual has had some practical origin, but in many cases the outward form of it has survived the first useful purpose. I have actually seen an English batsman patting a cast-iron Australian wicket between overs—a clear case of the habit of a lifetime. When I was a boy I never saw a wicket-keeper returning the ball to the bowler via point or short square-leg.

Nowadays the ball is seldom sent directly back to the bowler, especially if he is a quick bowler; indeed, I am expecting any fine morning to see, say, Wood "take" a ball from Bowes and then to see it tossed from backward point to third-man, and so on, all round the field. I suppose the modern idea is to return the ball from the wicket-keeper in a way that will safely get it back to the bowler without risk of the seam suffering damage by contact with the ground; the bowler might miss holding a direct return! Besides, we must protect our bowlers' fingers at all costs.

The "average" spectator varies in knowledge considerably in different parts of the country. My primer on watching would have a special edition for Yorkshire, where they know most of the tricks of the trade. Yet it was in Yorkshire that a dear old writer on the game achieved a precious gem of innocence. Shortly after the War, Yorkshire on a soft pitch would begin attack with Robinson and Waddington. Then, as the new ball waned, Macaulay would come on, over the wicket, just to get the "feel" of the turf. But as soon as his off-spin started to "bite," he went round the wicket. And then our beloved scribe sent off his message: "Macaulay, obviously experiencing some difficulty in obtaining a foothold, was compelled to go round the wicket."

The "average" spectator at Gloucester still wonders why Goddard bowls "round" rather than "over"—at least, I recently heard puzzled remarks at Gloucester on this subject. And under the "new" l.b.w. rule, is it as advantageous for an off-spin bowler to exploit his spin from *round* the wicket as it was under the old rule? Have we not here another case of necessary procedure changing into mere custom?

A few years ago it was a familiar thing to see a slow left-handed bowler on a hard pitch choosing over the wicket as his point of attack, against all "classical" precedence. Did Rhodes or Blythe, not to mention Peel, ever bowl over the wicket in all their lives? I recollect that Sir Pelham Warner once deplored in print that so naturally gifted a slow left-handed bowler as Roy Kilner frequently bowled over the wicket. No doubt it was a "trade secret."

In Lancashire, during the great Makepeace regime, the left-hand over the wicket tactics were employed whenever on a hot day the spear-head of McDonald had been blunted. A widespread on-side field supported good length bowling aimed at the leg-stump, and thus the batting side's merry-making (and that of the crowd if the batting side was playing at home) was spoiled. A favourite complaint against Lancashire in those days was: "You won't score quickly yourself and then you bowl tight and make it impossible for batsmen who *have* got strokes to make them!"

Oh, the lovely summer afternoons I have seen ruined for patriots at Hove by those "dour" Lancashire clods of the bad old times! I have heard retired colonels fuming; I have seen them helpless with mortification as Lancashire put into effect the two match-saving specifics—the "dead" bat one day, and "Hopwood over t' wicket" the next. But I am not sure that Rhodes was not as much the prophet of the "dead bat" (on bowlers' pitches) as Makepeace himself, though no batsman has played "dead bat" more skilfully than Makepeace. The "dead bat" meant a passive stroke to the abrupt spinner, so passive that the ball fell harmlessly off the bat to the ground almost at the batsman's feet. Thus was the expectant close-up "leg-trap" thwarted. The "dead bat" prevented the ball from spinning, or ricochetting, from any part of the bat to the fieldsmen.

The close-up leg-trap is a post-War "gadget." (I do not refer to the packed leg-side field for the so-called "body line" stuff; I mean the legitimate supports for off-spinners on a "sticky" wicket, or for Root's inswingers, which never threatened anything except a batsman's innings.) Who was the first off-break bowler to employ a short-leg field?

Hugh Trumble once told me he used such a field at Manchester in the 1902 Test match which Australia won by three runs. My memory cannot confirm this point. Did Spofforth ever bowl off-breaks from round the wicket? By going round the wicket, post-War bowlers of Parkin's or Macaulay's order hoped to thwart the batsman's defensive pads; by going round the wicket, the angle of the spin was, as the saying had it, got at the bowler's end. As I have already asked in this article, is it any longer necessary to bowl off-breaks from round the wicket? I should have thought that the new rule would favour the angle of spin occurring at its abruptest at the batsman's end.

The spectator's guide should certainly be written. And one of the first things it must explain is the general absence of a fieldsman in the straight deep nowadays when a slow bowler is on. A few years ago, old Bill Howell, the Australian, visited a cricket match at Sydney, the first he had seen for many years.

He watched in silence, then after half an hour he spoke: "When did this new rule come in?" "What new rule, Bill?" "Why, the one which stops the batsman from hitting a four in front of the wicket!"

A TYPICAL PAYNTER SHOT DURING THE GENTLEMEN v. PLAYERS MATCH
A sporting declaration by W. R. Hammond resurrected the game from a watery grave

ROUND THE WICKETS

The Derbyshire Mitchell bowling his leg-break

ON the third day it looked as though there would be a fitting finish to what is always the greatest family feud of the season. And a fighting one. After two days of cricket in fits and starts, the Gentlemen had to make 315 runs to beat the Players. They had an extremely playful wicket to make them on, and the most varied and probably the best attack in the country to make them against. They had three-and-a-quarter hours to do it in.

Chalk and Wyatt came down the pavilion steps to take first tilt. They were an odd pair. Chalk's cap of red and yellow quarters is so brilliant that it almost scintillated in the sun. It reflected his batting, too. It made him look vaguely like a Jester. And the cricket of Chalk is, above all, full of the fun of all Kent cricket. At the other end Wyatt might have been a substitute from the Players' eleven. His batting was reserved, orthodox, correct. It seemed somehow a freak in the game that this man, so tanned by the sun of every land where cricket is played, his face and hands almost black against the brilliant white of his shirt, should be able to bat so entirely without colour.

They began cautiously, like boxers sparring for an opening, expecting some notorious right hook. And the punch was there, too. Copson had found a place in the wicket to make the ball kick like a mule. One outside the off-stump rose swiftly. Chalk, aiming at a safe single to third man, slipped it up with the bat's edge into point's hands. A moment later Copson finds the opening again. Wyatt retires from the field and the game, one of his hands battered numb. The Gentlemen hesitate, distrust the wicket. And Hammond strides in to stop all the nonsense. A lovely shot off the back foot, a hefty straight drive, a horrifying whack at a short-of-a-length from Copson and he is walking back again, well caught at point. He is followed by a surge of turning heads and inquiring looks in the crowd. And by most of the Gentlemen's hopes of beating the Players.

The ball is flying all over the place. Once or twice it goes clean over the batsman's head. The next pair on the programme were left-handed, swarthy Heane, faint reminder of dour Nottinghamshire, Larwood and coal-pits—and fair-haired Valentine of the county of Kent. But to-day was no day for hitters, no time for happy-go-lucky batting. This was business. And so Valentine flicked at a ball from Bowes which rose almost breast high and was caught miles behind the wicket. A dainty, shy sort of shot; almost in keeping with the name of one of the most vigorous batsmen playing.

With the score at 53 for three, time was slipping on. The game was swinging to one side. But the Gentlemen made one last noble effort to win it. Hugh Bartlett came to view, and the crowd chattered in anticipation.

The Players accepted the challenge. Wright took the ball. The field spread out. His first delivery sailed smoothly through the air, pitched, and whipped towards the leg stump like a top. Two were then over-pitched, and he settled down to his length. There were only seven wickets left to fall, but Wright bowled as if he wanted all of them. A beautiful googly beat batsman, bat, stumps and wicket-keeper. Another one was edged into—and out of—first slips hands. A third was banged in desperation at cover point—and ricocheted off the end of his fingers. Cruel fortune—for fielder and bowler alike. But Wright was irresistible. His art was lasting. He clean-bowled Heane with a lovely piece of guile. The batsman played at a ball on the off, expecting, or hoping, it was going towards slips. It scuttled in between bat and pad to lay back the leg-stump, like a ferret seeking its prey.

Meanwhile William Bowes had disappeared into his sweater like some gigantic Jove vanishing into the clouds. He had bowled well, but not his best. Things were too easy. The wicket was on his side. The batsman had not a chance. Bowes was bored. There was nothing to play for. He comes from Yorkshire.

His place was taken by a familiar apparition. He looked like the ghost of O'Reilly. He was tall, lanky, long-legged. He was bald-headed. He waved his arms wildly, shot out his considerable feet. He bowled well, very well. And there are some who say that George Pope rivals in more ways than the physical the greatest bowler in the world.

Freddie Brown came in. His face swelled with an enormous smile. It belied his intentions. He set about the bowling hip and thigh. A colossal straight drive, a crack past cover, and sundry heaves at the Clock Tower, sent his score galloping along dizzily. He thrived on Wright. The wretched bowler is like the prophet in his own country. Brown treated his spin disgracefully. He knew too much about it. But this could not go on. He was intoxicated with runs, and he had hit one over the eight. The Gentlemen had not a chance then of winning.

Hugh Bartlett was laying about him with lusty vigour. His batting was almost boyish in its simplicity, its directness of method and object. A mighty slash over cover and we were applauding a gallant 50. But it was minutes not runs that the Gentlemen needed.

Then came the time for Bowes to miss his catch. Bowes never fails to miss a catch if he can possibly help it. Like some popular variety artist and his even more popular joke, he never lets his audience down. Shrieks of derision mingle freely with shouts of applause in the crowd's acceptance of Bowes. It seems almost grotesque that anyone could bowl so beautifully and at the same time bat so badly and field so disastrously.

Bowes later missed another catch. He was rooted on his usual site, mid-on—the dunces' corner of the cricket field (the on-drive is quite the most difficult of shots). The ball came at him high. He pawed the air hopefully, missed it hopelessly. But I believe he actually got a touch. And I can quite imagine him going home and telling his friends, not that he had clean bowled so-and-so or had taken so many wickets, but that he got that touch.

Bowes went after another catch, this time at mid-wicket. His technique was not uninteresting. Seeing the ball coming in his direction, his first reaction was to look about him to see if anyone could possibly take it for him. Finding himself alone, he resigned himself to his fate, shrugged his shoulders as if to say, "Well, if you will send them at me——" and vaguely put up his hands. This time he held the ball while the bowler looked as if he had bowled Bradman. The batsman was so dumbfounded that he forgot to walk out. Completely oblivious of the thunderous applause, Bowes flung his massive length on the ground to rest. "I do it every day when I want, you know."

And then Bartlett went, bowled all ends up. The game was over. The Players had won.

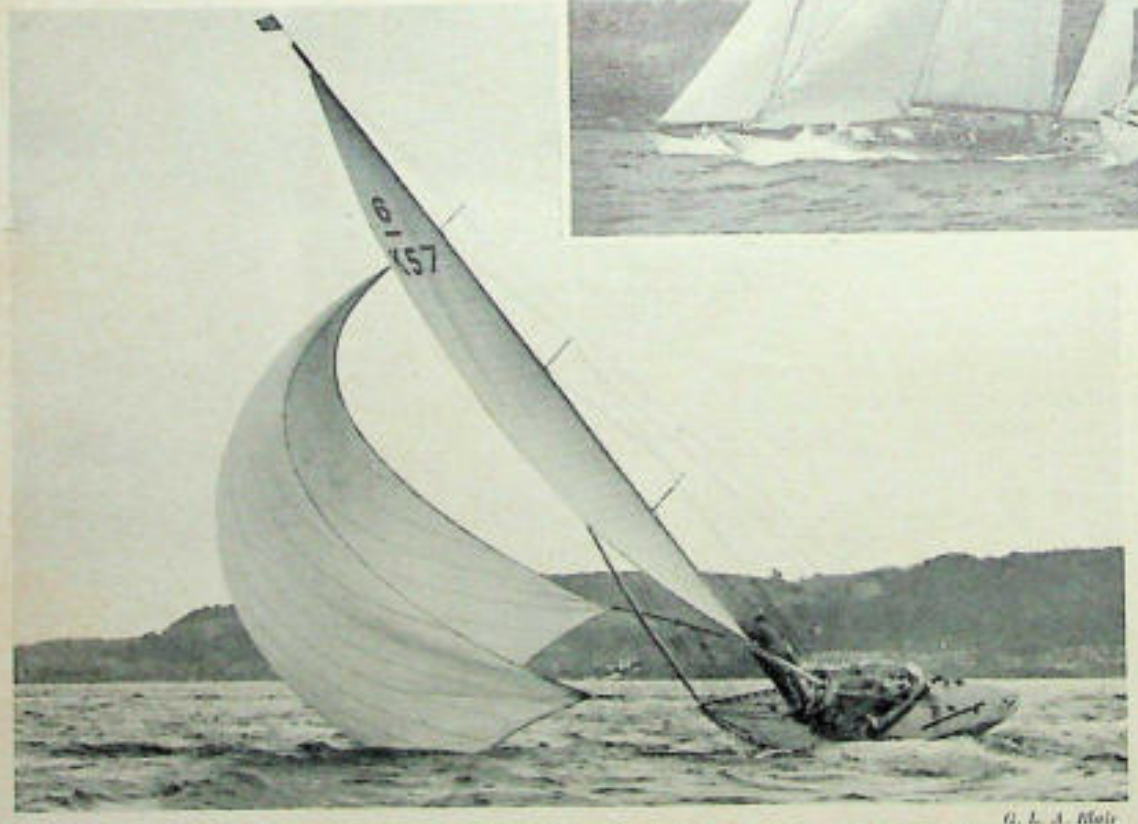
HUMPHREY DANIEL.

ENTENTE CORDIALE.—On July 28th, 29th and 30th a novel lawn tennis tournament takes place at Deauville. Instead of famous amateurs and professionals, the competing teams will be made up of tennis-playing members of the House of Commons and the French Chambre des Députés. To foster the spirit of friendly rivalry between the two great nations, President Lebrun will offer a cup to the team which will have won three consecutive sets or a total of four non-consecutive sets. The team for the House of Commons includes Mr. Kenneth Lindsay, Sir Samuel Hoare, Mr. Hamilton Kerr, Mr. Cazalet and Miss Thelma Cazalet, and for the Chambre des Députés: MM. Pierre Etienne Flandin, du Fretay, de Beaumont, de Clermont-Tonnerre, Tixier-Vignancour, Crouan, P. Peugeot, B. Béranger, E. Quinson. The British team will be accompanied by Mr. Anthony Eden.

Ames takes off the bails and appeals to the square-leg umpire

A FINE CLYDE FORTNIGHT

By K. ADLARD COLES and TERENCE STOCKEN



CLYDE FORTNIGHT—thrown on its own resources this year, as it were, by the absence of the international flavour imparted to it last season by the great Exhibition, and without any visiting yachts from the south, except the big handicapper, Thelma IV—has produced some fine sailing, and has shown clearly that the Clyde can more than hold its own with other yachting centres in the organisation of a series of yachting events, such as the "Fortnight," which hold the interest unflaggingly to the end.

Apart from a lamentable lack of sun on most days, the weather really did all it could to help things, with breezes sometimes hard and sometimes soft, from north-west through south-west and southerly to east, giving a variety of windward work and plenty of incident—not excluding a dismasting or two!

The Fortnight opened with the Mudhook Yacht Club's day on Friday, June 30th, with a large attendance, and a westerly breeze which rather tended to tail off just when it was needed most. If anything can be said to be a Clyde "speciality," it is the 6-metre class, of which there is a particularly good fleet this year. The most successful of the new Sixes is Johan, owned by the brothers W. B. and N. P. Donaldson, and built by McGruer's at Clynder to the designs of James McGruer.

Johan took a little while to find her form at the start of the season, but two firsts, three seconds and a third up to the Saturday showed she has "got it in her." The present Seawanhaka Cup holder—Circe, owned by Mr. J. Herbert Thom—has been showing such consistent good form that it is perhaps doubtful if anyone will be able to wrest from her the privilege of defending that Cup in the contests beginning on August 14th; but it would be rash to prophesy.

The other new boat, Maida, also built by McGruer's but designed by her owner, Mr. John G. Stephen, attracted a lot of attention with her abnormally

G. L. A. Main

ERICA IN DIFFICULTIES WITH HER SPINNAKER DURING THE SIX-METRE RACING

short boom and her curious truncated sail-head, with its abbreviated horizontal "gaff"; but her record so far has not been too good. Her appearance during the Fortnight was disappointingly brief; after getting a third flag in the second day's racing on July 1st, she was dismasted while returning to her moorings. Maida has also a somewhat unusual underwater form; her rudder only comes half-way down the sternpost, that portion of the keel lying below the heel of the rudder having a large semi-circular "bite" taken out of it.

The premier racing class on the Clyde is, of course, the 8-metre; and those waters are fortunate in possessing the only amateur designer of International Metre boats in Great Britain, in the person of Sir Thomas Glen Coats. There are three of Sir Thomas's designs in the Clyde 8-metre fleet: Pandora, his own boat; Helen, owned by Mrs. Peter Simpson; and Sappho, owned by Mr. F. P. Rankin, and he had the gratification of seeing all three in the prize list together on July 3rd, the second day of the Royal Clyde Yacht Club's fixture at Hunter's Quay.

After several days of generally light and sometimes variable weather, the Royal Western Yacht Club's day—the last of the Hunter's Quay race-days—produced a hard, business-like southerly blow, hardening as the day wore on, and putting up a stiff sea—conditions which put everyone through their paces. The second dismasting of the Fortnight occurred on this day, to the 6-metre Senoia, owned by Mr. C. A. Allen.

This was handicap-class weather *par excellence*, though only two boats were out in the over 50 tons event—Colonel Wordie's big ketch Fiumara, and Mr. E. Lynton Vicar's yawl Thelma IV; the latter though first home, had to give away just under 12min., however, and Fiumara took the flag with half her time allowance in hand.

Owing to the depletion of the Clyde ketch fleet this year, most of the over 50 tons events consisted of duels between these two; Thelma turned the tables at Rothesay on the 8th, the Royal Northern Yacht Club's day, in a light south-westerly that failed towards the finish, when, reaching grandly from Ardine Point to the line, Thelma saved her time to win.

In the 8-metre class, Helen got her third win on this day; as far as one can judge, half-way through the season, the three winners on this day—Helen, Fulmar and Pandora, in that order, comprise the "short list" from which will emerge the leader of the class for this year.

There must have been well over 100 yachts actively engaged in the course of the Fortnight; and with some close racing—occasionally very close indeed—over varied courses, and with only a very few isolated spots of the well-known "Clyde calms" which on less fortunate years have marred whole days together, this year's Clyde Fortnight can certainly be regarded as an unqualified success.

But why do not more boats go up there from "down South"?

There is now a pause in the 12-metre racing—a pause punctuated in some cases by the licking of wounds, or, to be more explicit, the stepping of new masts—and although it is possible that some of the class will visit Deauville Regatta on July 17th, the next event scheduled in home waters is Lymington on the 22nd. Mr. Vanderbilt's yacht has the enviable record of eleven firsts out of fifteen starts; and if one examines the four occasions when Vim has failed to bring home first flag, this record will be found to be even more creditable than it looks.

The first defeat was sheer hard luck, when the visiting yacht (together with Jenetta) went round the wrong side of the buoy at Harwich and incurred disqualification; since she gave herself slightly longer to sail, yet got home first, this can hardly be regarded as being vanquished in the field. The second occasion was after the famous luffing match

ZIGEUNER, VERONICA AND EILEEN BOWLING ALONG IN THE OVER 20 AND UNDER 50 TONS RACE

A photograph taken at the Royal Western Regatta on the best day's sailing of the Fortnight

at Ramsgate, when Mr. Sopwith, tackling the visitor with dogged persistence, converted the race into a private duel between Tomahawk and Vim, leaving Evaine to steal up and get first flag. Vim got third place that day, but even so, Tomahawk only saw her off by a matter of 11sec.

On the first day of the Royal Cinque Ports Yacht Club regatta at Dover, Vim again failed to win; but then, no one else won either, as after a weary drifting and kedging match, the race was abandoned. However, it has to count when computing the number of starts.

The fourth occasion was in Torbay, when, after winning the "Channel race" round from Plymouth the day before, Vim, in the honourable company of Jenetta, Tomahawk and Blue Marlin (the last named recently bought by Mr. W. Westhead), lay totally becalmed off the Thatcher, watching helplessly while Evaine, steered by Mr. Fairey himself for the first time this season, together with Ornsay, took a nice little breeze with them around the second triangle. Vim and Blue Marlin stuck it out, and getting in two-and-a-half hours after the winner (Evaine) Vim managed to get a third flag.

This again was largely a matter of luck, rather than a defeat-at-arms, and but the kind of thing all racing yachts expect on occasion when the dice goes against them; and with only these paltry exceptions to set against a series of slashing victories, Vim has shown herself a conqueror indeed. There is no doubt that Vim's super-excellence in the matter of rigging arrangement and adjustment, together with faultless sail-handling and a skipper who knows every move of the game, sets a standard which, when it is consistently maintained—as Vim certainly does maintain it—leaves almost no opening for an opponent to get the better of. However, some of the British Twelves have shown that if there is a chance going anywhere they are ready to snap it up, and we may look forward to some "needle" matches before the last race of the season is sailed.

A VIEW OF THE LIBRARY

"The rooms throughout the house convey a sense of dignity and repose. The Duke might still be lying dead upstairs"

GREAT SOCIAL CLUBS—II. BROOKS'S

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

FOR very many generations, Brooks's was the great Whig fortress. It is indelibly associated with the name of Charles James Fox. But in its origin, like White's, it was not political. It owed its rise from the same cause—the inclination of men, moving in the same social circle, to mix together in a place where they could do so more freely and comfortably than in one of the coffee houses of those times, which legally were open to all.

The establishment was first formed and started by a man called Almack, whose name, according to one authority, was really Macall. The first mention of "Almack's" appears in a letter dated July, 1765, and the first reference to Brooks's or Brookes's in a letter of August, 1774. The original site of the Club was in Pall Mall on or near where the present Marlborough Club now stands, and it cannot be said positively when it moved into St. James's Street, but it is certain that the existing house was built by Brooks, who had succeeded Almack as manager in 1774. By the name of Brooks's, the Club has ever since been known.

Brooks employed Holland as his architect for the new house in 1778. This year Townshend, afterwards Lord Sydney, referred to Brooks's new house "fitted up with great magnificence, which is to be opened in a few days." He quoted it as an instance of the growing opulence of the country. Other fashionable writers had done the same about Brooks's.

But why this professed astonishment at the magnificence of these small St. James's Street clubs, in those more than spacious times? One might well ask. The eighteenth century saw the height of the power and riches of the great landowning class, and in particular, of the Whigs. Throughout the length and breadth of England their stately mansions stood, packed with treasures, serenely surveying the broad acres of their smiling parkland. The clubs which now caused so much astonishment were scarcely larger than the lodges they built to guard the entrances to their numerous long carriage drives. The cause of the astonishment can surely only have been the contrast between these new club buildings and the old coffee houses. In its early days the Club had consisted of 150 members at an annual subscription of 4 guineas. In 1778, in order to pay for the new building, it was increased to 8 guineas, and in 1779 raised another 2 guineas. For the first 40 years of its existence the Club was famous, or notorious, for the unlimited gambling that went on within its walls. As Trevelyan says, society was at this time one vast casino, and Brooks's exceeded all others in this respect. Anyone who was short of money borrowed from Mr. Brooks, who appears to have been a most accommodating person. In a copy of verses addressed to Sheridan, he is described as:

> .....
> .....
> Liberal Brooks, whose speculative skill
> Is hasty credit and a distant bill,
> Who nursed in clubs, disdains a vulgar trade,
> Exults to trust, and blushes to be paid.

It seems hardly necessary to say that when he died in 1782, he was a very poor man with many creditors. His body was interred in a small vault, said to be still existing, under the pavement of St. James's Street. Though there were very strict rules in force on the subject of arrears by members, Griffin, who had succeeded Brooks as the manager, reported the arrears to be £6,000 in May, 1806 and by 1809, they had risen to £10,000. In 1789, both White's and Brooks's gave balls. These events were the cause of much ill-feeling between the court party and the Prince of Wales's party, and at the time little else seems to have been talked of. Pitt was a member of both clubs, having been elected to Brooks's in 1781, with Fox as his proposer. He had, however, made White's his headquarters, and this club had then become identified with the King's party. The Prince detested White's for this reason, and as soon as their dance was announced, he forbade friends to go and sent his own ticket, and it is said, that of the Duke of York, to be sold at a public library. In consequence of this when, three weeks later, Brooks's followed suit with a grand ball, all the ladies of the court refused to attend it. Another incident to depict the feeling that existed between the two clubs, when party passions were running very high, happened when Pitt was being dragged up St. James's Street in a coach after having been given the freedom of the City. When opposite Brooks's, it was attacked by men armed with bludgeons, amongst whom, it was said, were certain members of Brooks's. Some of the rioters forced open the doors and aimed blows at the Prime Minister. At length Pitt and his companions made their way into White's in an exhausted condition.

A SECTION OF THE SUBSCRIPTION ROOM

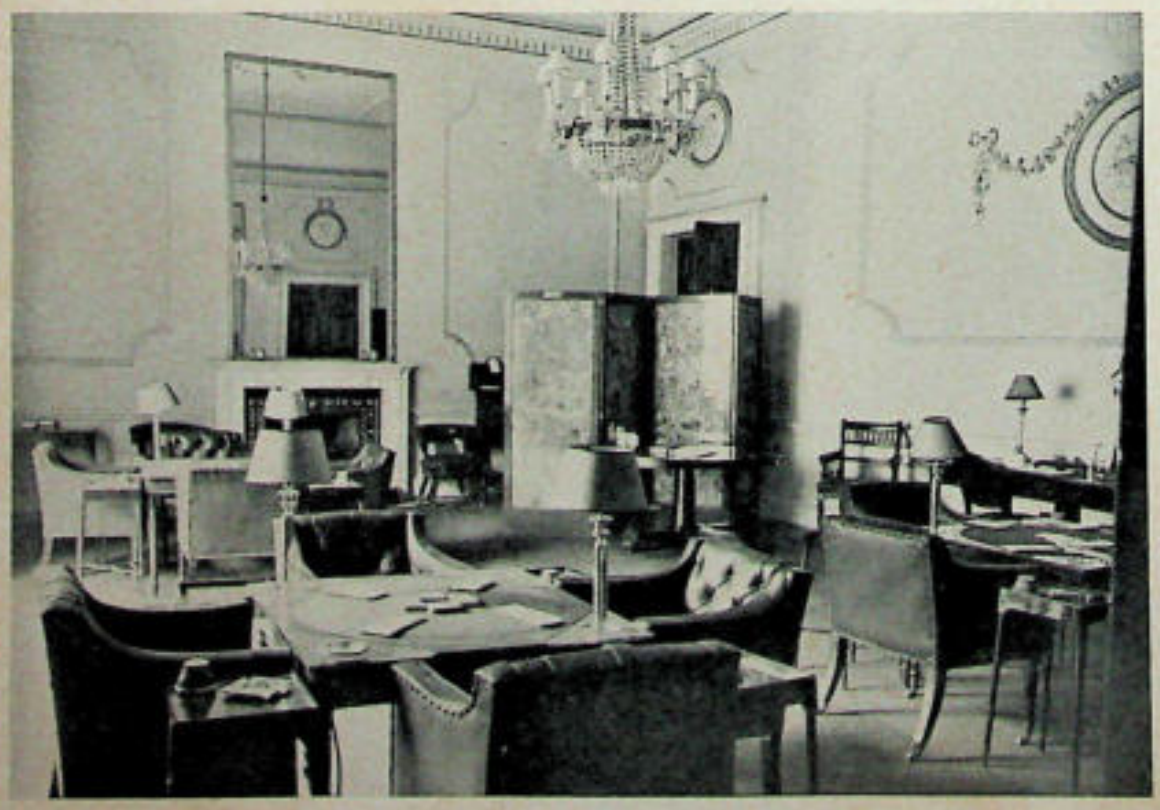
The stories relating to Fox's gambling in Brooks's would fill a volume, and one can only quote a few here. Not only did he lose a very large fortune himself, but he half ruined many of his friends in annuities given by them as securities for him to the Jews. Walpole wondered what Fox would do when he had sold the estates of all his friends. He was a very good whist player, and had he contented himself with this game, it is said that he could have made a very good income out of it, but unfortunately he could not keep away from faro and other games of chance. On one occasion, Fox played hazard from Tuesday evening, February 4th, until 5 p.m. the following evening. An hour before he stopped he had won back £12,000, but by dinner time at 5 p.m. he had ended up a loser of £11,000. The following day, Thursday, February 6th, 1772, he made a speech on the Thirty Nine Articles. That night he had supper at White's at 11.30 p.m., when he drank until seven the next morning; from here he went on to Almack's, where he won £6,000, and between 3 and 4 p.m. he set off for Newmarket. In 1774, his father left him £154,000 to pay his debts. It was all pledged, and a short time afterwards he had not the wherewithal to pay the chairmen who carried him from his lodgings to Brooks's. A friend of his who called on him at his lodgings in the early hours of the morning, after he had lost practically his last penny the night before, found him stretched on a sofa calmly reading one

of the Greek classics. Once he became involved in a duel. He had spoken disparagingly after dinner of the gunpowder issued by the Government, and a man, Adams, who was in some degree responsible for it, took exception to his remark and sent him a challenge. Fox went out and took up his station, giving a full front. Adams said: "You must stand sideways," and Fox replied, "I am as thick one way as the other." The order to fire was given. Adams fired. Fox did not. When they said he must, he replied, "I'll be d——d if I do. I have no quarrel." They then advanced to shake hands, and Fox said, "Adams, you'd have killed me if it had not been Government powder."

Whenever he won money, he was anxious to pay his debts and on one occasion wrote to a certain baronet saying that he was prepared to discharge his debt if he would come and state the amount. Seeing his creditor making certain calculations on paper, Fox asked him what he was doing and he replied: "Working out the interest on it." "I thought it was a debt of honour," said Fox and walked out of the room, remarking: "As I make it an invariable rule to pay my Jew creditors last, you must wait a little longer."

Sir Philip Francis, said to be the author of the *Letters of Junius*, and the lifelong and implacable enemy of Warren Hastings, was a very successful whist player at Brooks's. Another who won a lot of money there was Major-General Smith, who had made a fortune in India. He went by the name of Hyder Ali in London, and his son, who was also reputed to be a very good player, was called Tippoo. Even Samuel Wilberforce, the great philanthropist, was seen to be seated at the gaming table in Brooks's. In the old betting book, like at White's, are to be seen the entries of bets on every conceivable subject. There is a bet of 500 guineas to 10 that none of the Cabinet was beheaded by that day three years to come. Against the name of Mr. Thynne is written, "won only £12,000 during the last 2 months, retired in disgust, March 21st, 1772; and that he may never return is the ardent wish of members." A complete set of the old gaming-counters is still to be seen, and the old gaming-table, with a semi-circular cut in it to accommodate Fox's figure.

The early election ballots at Brooks's used to take place between 11 p.m. and 1 a.m. A single black ball excluded, and a member who joined any other club, except White's, was at once struck off the books. Needless to say, the amusement of black-balling candidates was indulged in freely at Brooks's. Fox tried to get Sheridan in, but he was repeatedly black-balled. Two of his enemies, George Selwyn and the Earl of Bessborough, made a compact never to miss an election, so as to ensure that he would not get in. Eventually, by marking the balls, it was discovered who put in the black balls. By a trick, Selwyn was kept away at one election and Sheridan got elected at last.



George Selwyn, who is said to have had a kind heart, had also a morbid love of horrors, and never missed attending an execution if he could help it. One day he called on the first Lord Holland, who was on his death bed. Lord Holland said: "The next time he calls, show him up—if I am alive, I shall be delighted to see him; and if I am dead, he will be glad to see me."

THE ENTRANCE HALL AND MAIN STAIRCASE
It is pleasant to think that this Club and White's with their great histories, founded so long before the majority of existing clubs, are still to-day in such a flourishing state

As late as 1886, owing to the high passions excited by Mr. Gladstone's Home Rule Bill between Mr. Gladstone's supporters and his opponents, the black-balling reached such a pitch that it became nearly impossible for anyone to get elected to the Club.

Lord Granville then made a soothing speech in the Club imploring the members to calm their passions, with good effect. In 1846, Henry Bandaret assumed the management. Like their original manager, Bandaret was a kind and generous man and allowed extraordinary credit to the members. He once reported a member to the committee as being £800 in debt to him, and said that although he would be ready to trust him to any amount, he hardly considered it necessary that this gentleman should insist on having ortolans for dinner every night. He is said to have only left the Club once for a few hours in the course of his management lasting 34 years. Bandaret looked after the comfort of the members so well and generally provided such a dignified style of luxury, that to dine at Brooks's was described by someone as like dining in a Duke's house with the Duke lying dead upstairs. In 1823, some enlargement of the house was carried out, and when Bandaret took over in 1846, a smoking room and dressing room were provided, and a room in the adjoining house in Park Place was adapted to form a small library. In 1854 the Club purchased the freehold of their house from a Mr. Haldimand for £25,000. Eventually the complete sum was paid, in 1878. Earlier than this, in 1857, the Club had bought No. 2, Park Place, for £5,673 odd. Little, however, was done to it at the time, and it was not until 1889 that it was incorporated in the Club house. Great alterations were carried out, the present coffee rooms and library being built, and the hall and staircase entirely reconstructed.

THE CARD ROOM
Like other clubs Brooks's was at one time notorious for its gambling. Fox's gambling at the club would fill a volume

There are some fine examples of the engraver's art to be seen in the Club, and Rowlandson's celebrated drawing of the old Subscription Room at Brooks's, where the gaming took place, is of great interest, as nothing of any importance has been altered in the room since the drawing was made. There are also some beautiful pieces of silver in daily use in the coffee room. Reference has already been made to the old gaming counters—starting at a modest sum, they rise in value until one finds a single counter marked "500 Guineas." *O tempora! O mores!* surely one may exclaim here! To place this counter now in the hands of a modern club member and suggest that he should stake it on the turn of a card or the throw of a dice box, would convert him, I feel sure, into an urgent ambulance case for the nearest mental house.

The rooms throughout the house convey a sense of dignity and repose. The Duke might still be lying dead upstairs. Brooks's rejoice in a full membership and a long waiting list. It is pleasant to think that this Club and White's, with their great histories, founded so long before the majority of existing clubs, are still to-day in such a flourishing state. In the midst of all the heavy gambling and deep drinking that went on within their walls in the past, someone amongst them must have always kept his head and watched over their destinies. Neither of them is likely to lack such a man in the future.

A FOREST SANCTUARY IN ASSAM

IT is said that the average Londoner does not know his Tower, yet he lives "next door" to it, and on a parallel scale so it is with most of us, and we were determined that living, as we have done for some years, within a few miles of a Game Reserve, it would be a pity to waste such a wonderful chance of seeing the animals that live in this sanctuary.

And so it was that at 4.30 one morning we met the forest guide at a point near the reserve, and while it was still dark we hauled ourselves up by the ropes on to the silent, massive shapes that were our hired elephants, and without which a journey into these rhino-inhabited parts would be precarious indeed. Soon we were on our way over the paddy fields and into the long 12-foot grass, and gradually we got accustomed to the curious heave and roll of our conveyances. The stars had gone and the sky began to tinge with the first pinky streaks of morning as we approached a stream with the silence so curious to such an unwieldy creature as an elephant. The two cow elephants ahead stopped, and our tusker took up the van as we came upon a rhino half submerged by the cool water. There was a battle of wits, and the small piggy eyes looked baleful; then with a snort of challenge from our elephant the armour-plated beast turned and thundered away through the water. Our first glimpse of one of these prehistoric, horned monsters!

On again through the high thatch grass and reeds, through dried-up riverbeds, stalking the rhino and photographing them from 30ft. and less distances, we came across hog deer with little white tufted tails, looking so like large rabbits in the distance and from our elevation. They proved very shy and, even though our mahout's soft whistle, so like their own cry, delayed the smaller deer, they were off with a bound at our further approach.

Water buffalo were near the big bhil (lake), placidly grazing. One large male well out in the middle of the water swam hastily and with surprising speed to the edge and crashed away through the grass. They were shy, and we were unable to get close enough for photography.

On the water were hundreds of birds—Brahmini duck, that "golden goose" that has taken in would-be shikaris until a taste of its fishy flesh has belied its looks; the snake-bird (Manuri), so very like its name when swimming, all its body submerged and only an elongated neck and bill gliding through the water; herons and peewits, the latter continually calling "Did you do it, did you do it," and towering over them all the neatly dressed Secretary bird, slowly picking its way in search of breakfast. In the season the water is packed with duck, our guide told us.

"STALKING THE RHINO AND PHOTOGRAPHING THEM FROM 30 FT. AND LESS"

The wild boar, too, were shy, and we only glimpsed two. Their size enabled them to hide in the long grass, but as with the buffalo, we felt we had not "missed much," for their cousin the common domestic Indian pig, so alike in looks if not in manners, is a daily sight in the villages round the tea gardens in Assam. We turned and were making our way back—we had been out three hours—when in a clearing we sighted a rhino, back turned, quietly feeding. Slowly we approached to the leeward; he had not seen nor heard us. Our tusker in the front, we entered the surrounding grass 100ft. from him, and like a flash at the sound of the trampled grass and reeds he had turned. For perhaps a minute he stared at us and we at him, then with a rush he charged and we clutched the ropes wondering what was going to happen next.

Our elephant stood firmly although the two cows stampeded, and then, perplexed at such bravery, the rhino stopped dead within 15ft., turned, and was gone. We breathed again, disappointed that we had been too occupied keeping our seats and had missed a picture record of this exciting moment.

And so we made our way out of this sanctuary, stopping once more to view a young rhino with its parents—a jungle family group—after what might be called a "bag" of 25 rhino to remember, and left them in peace. We had been out six hours when we finally reached the P.W.D. Rest House and slid off our huge, whimsical, though graceful "steeds."

J. BULLEN-CASE.

SNIPE DRIVING IN MANDALAY

By COLONEL W. F. BRAYNE

FOR a number of seasons in Mandalay a regular system of driving snipe has been adopted, instead of the more usual method of shooting these birds by walking them up. In view of the very fine sport obtained, it seems worth while to publish a few notes on the subject in order that others may try it.

The main reason for starting the driving was the undoubted fact that in this country a large bag of snipe killed by walking-up is merely a test of endurance, and not of shooting, as most of the birds in the middle of the day are so sluggish that they are as easy to kill as waterhens. On the other hand, if properly driven, the snipe is certainly as hard to hit as any driven grouse or partridge at home. The reason for this is the extreme variety of the shots obtained with regard to height and pace, combined with the fact that the frightened snipe, who has been driven before, puts on a most baffling swerve when it sees the guns.

On the other hand, driven snipe can be so easy as to be hardly worth shooting. In order to get the really difficult birds described above, a start should be made as soon as it is light enough to see, as good shots are not obtainable in the heat of the day. The best birds are always got during the first two hours after daylight when there is a cold nip in the air. In the afternoon, if the sun is not too hot, good shots may be obtained, though never so difficult as those got during the first two hours of daylight. In the evening the lower the sun sinks the lower the snipe fly, until just before sunset they are skimming along the ground.

Another essential for the obtaining of difficult shots is the education of the birds. Snipe which have never been driven will sometimes give good sporting shots, but a number of the birds come over low and give easy shots.

Further, better sport is obtained on ground where snipe are regularly shot by walking them up, as the wilder the snipe are the fewer the beaters required to put them up and the more snipe will come to the guns, as if they are lying close a number will get up between the beaters and fly back.

So the ideal ground for driving is a ground which is regularly shot by guns walking up snipe, and on which drives are held regularly.

On such a ground the snipe rise 50yds. ahead of the beaters, and as soon as they are up and hear the firing they realise that they are in a trap and rise as fast as they can and exercise all their wiles in the way of swerving to escape.

A number will, of course, try to get out on the flanks, and to prevent this the flank men of the beaters must be well in advance of the line, and must be provided with large white flags to turn the birds. The flank guns also should be at least 60yds. in advance of the line of the guns.

The beaters require special training for this sport. At first we used to put several trained sepoys in the line to keep the beaters right. Now we have trained the male population of a small village to such a point of perfection that, under their head man, they can do a drive as well as any beaters in England. If snipe start breaking out to a flank the line automatically halts, while the men on the threatened flank advance right up to the flank gun.

When the beaters come on to a patch of ground where the snipe are thick they halt as soon as the first snipe rise, and do not advance again till shooting stops. A few steps forward put up some more birds and again the men halt. If this is not done a swarm of snipe will come over, and only a few shots can be fired, instead of a steady stream of birds which the guns can deal with.

The beaters are all provided with small white pieces of cloth which they tie on to sticks, while the flank men have large white flags.

The beat is run by the head man who is in the centre of the line, and his two assistants, who are the flank men.

Snipe must always be driven in the direction they naturally take when leaving any patch of ground. It is useless to try and force them to go in any other direction.

After ground has been once driven this is easy; on new ground it pays to walk over the ground and shoot a few birds some days before the drive in order to note the direction of flight from the patches which hold snipe in any numbers.

As regards the length of the beat, 400yds. is a good average length. Short beats do not give the birds time to get sufficient height and pace.

For a 400-yard beat, five or six guns are necessary, as otherwise too many birds escape on the flanks. With fewer guns the beats have to be shorter, and the class of shots obtained is not so good.

Each gun is provided with a hurdle 6ft. long and 3ft. 6in. high, which is carried by his man. These hurdles have sharpened ends some 18in. long, which are stuck into the ground. The hurdle is dressed with green rushes or grass. Behind these the gun sits on a bamboo stool some 12in. high, so that he is entirely concealed from the birds on the ground in front of him.

The guns are placed some 70yds. apart, so that each gun can take every bird which comes to him without having to consider whether it is his neighbour's bird or his.

All hawks coming into the beat are shot at, whether they are in range or not. This is necessary because if there is a hawk about snipe tend to fly low along the ground instead of rising high.

A hawk behind the line of guns will prevent any birds from coming over the guns, and they will all break back or out to the flanks.

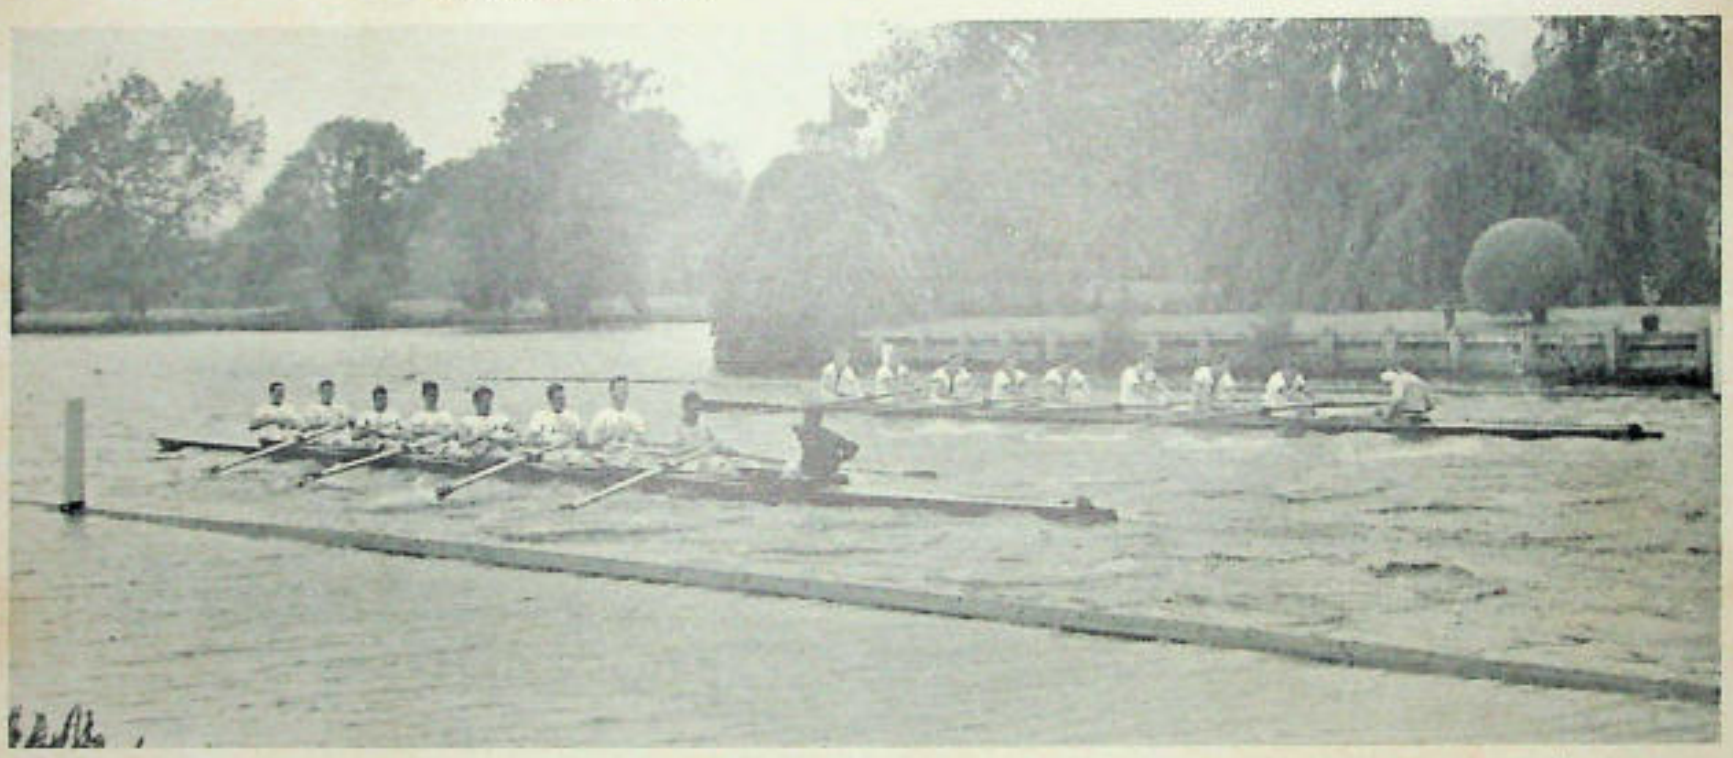
Many a beat has been entirely spoilt by hawks before we made this rule of shooting at them. On one occasion, at least, 500 snipe came over the guns so low that no one could shoot at them in front without danger to the beaters or behind for fear of hitting men working in the fields.

We do not allow a rising snipe to be shot, nor do we allow any shooting, except at hawks, between the drives.

As regards picking up birds, we find that it pays to send men back at once to pick up birds falling behind the line, but no man is allowed to go in front of the guns till the drive is over.

It is true that the men picking up birds prevent shooting at low birds behind, but it is so much easier to pick up a bird if a man is sent as soon as it falls, that we find that the saving of time is worth the low birds which escape.

Two guns and a loader are a distinct advantage and hand guards are a necessity.



The total bag for a season has been 1,020 couple, the best day being 118 couple.

JACK BERESFORD AND L. F. SOUTHWOOD IN THE CENTENARY DOUBLE SCULLS
They led by three-quarters of a length against the Italian pair, G. Sciorli & E. Bruschi, near the half-mile, but the latter came up at Fawley and a gruelling race resulted in a dead-heat

AN ECLIPSE FOR ENGLISH ROWING

By E. E. D. TOMLIN

HARVARD UNIVERSITY (NEAR SIDE) AND THE ARGONAUTS AT THE TOP OF TEMPLE ISLAND IN THE FINAL OF THE GRAND CHALLENGE CUP

AFTER four days of fine racing in the Henley Centenary Regatta, which finished last Saturday, many of us must be wondering what is happening to English rowing when we see the final of the Grand fought out between American and Canadian crews, the final of the Stewards won by the Swiss, the Diamonds go to America, and the Thames Cup an all-American final, too.

Although England did record a win over Tigre Argentina in the Wyfolds, the "foreigners" were, after all, our own countrymen, and so the only redeeming feature was the superb race put up by Beresford and Southwood, when they rowed their memorable dead-heat in the final of the Double Sculls on Saturday. And even then the English pair can hardly be classed among the modern band of oarsmen, because they could probably give away anything up to 20 years to the average competitor at Henley to-day.

What is the explanation of it all? And how are we to put matters right, for unless we do—and very soon—English rowing prestige will suffer eclipse.

It is surely idle to argue that in more favourable conditions our crews would have shown up with greater success. If we are going to be "fine weather crews" only, then the sooner we hang our oars up for good the better. No. The explanation clearly does not lie there, but it does lie in the style at present adopted by the majority of English oarsmen, and although I believe the so-called unorthodox, or Tideway methods, are most of all at fault, English orthodox rowing to-day cannot altogether escape the blame. Naturally, the obvious answer to such a statement as this is the fact that Jesus, a college crew from Cambridge (and first-rate exponents of the unorthodox style), were able to defeat the Leander eight which this year included an exceptionally good array of orthodox talent. To which I reply, "Did even Leander row as the Swiss row, or did they achieve the magnificent style of the Harvard eight, which won the Grand so convincingly in the head wind on Saturday? With the single exception of the fine Jesus crew, what unorthodox crew could cope with the conditions we had during the Regatta this year?"

Four years ago, when the Swiss Four romped away with the Stewards Cup, a strong plea was put forward for a return to a controlled combination of swing and slide, so that body swing and slide movement might be combined to finish together in the way we saw the Zurich crews demonstrate. Four years have gone by, and again Zurich take the Stewards against our best fours, and again the long, hard, accelerated finish of Harvard and the Argonauts, of Tabor and Kent, took them to the finals with little difficulty. And in that time one can think of no single crew which has even seriously attempted to copy the Swiss methods—odd, no doubt, but surely not so odd as the Fairbairnism-run-riot which has graced so many of our regattas in the past few years?

I cannot help feeling that this long-neglected art of combining leg drive with accelerated swing has, by its gradual disappearance from our rowing clubs, been one of the chief reasons why English sculling has never been able to compete with a Buhtz, a Ruffli, or a Burk. Yet one glance at Beresford as he came past the enclosures in the final of the Double Sculls should have told us what we are in danger of losing, and one look at the efforts of those who take exercise sculling up and down our rivers should show us what we have already lost.

R. VEREY (FAR SIDE) WELL AWAY AT THE START OF THE DIAMONDS FINAL AGAINST J. W. BURK

Burk, who took the record in the Diamonds last year, did not find the head wind at Henley so easy to manage, and Verey, who came from Poland,

ran him to 1¼ lengths in a very gallant race. Burk's style is enigmatic, and I am inclined to believe that he himself is more responsible for his undoubted pace than the style which, with its short strokes, seems hard to parallel with the work of the fine German, Buhtz. Burk has unlimited energy, and that is a great asset for a sculler. Burnell, the Oxford Blue, showed unexpected pace against Verey, who only beat him by a narrow margin. I think we shall see more of Burnell in the Diamonds.

The double sculling event was well fought and the final provided the high spot of the whole regatta. It was clear that Scherli and Broschi, the Italians, were the only pair capable of dealing with our Olympic veterans, Beresford and Southwood; and so it proved. Their dead-heat brought the spectators to their feet cheering, shouting, waving their arms madly, in a way I have rarely seen at Henley, though we witnessed a similar scene when Radley won the Ladies' Plate last year. This was racing indeed.

This year school crews were good, and Eton, who survived longest, achieved a magnificent win over Lady Margaret on the Thursday. They were beaten by Clare, the ultimate winners, in the semi-final. Westminster had a very fine crew, too, and their win over Radley on the first day brought them into the limelight at once. But I doubt whether any school crew this year would have beaten Clare even under favourable conditions. By their win over Corpus on Saturday they proved their undoubted pace, and the speed they revealed at Cambridge in the Mays was amply rewarded at Henley.

Tabor and Kent provided an all-American final for the Thames Cup, King's College, London, being the only English crew to reach even the semi-final, where, with the Fana Roklut from Norway, they fell to the American challenge. Fana were deceptively fast, and a welcome entry for this event, but Tabor, who went on to win the final, proved quite devastating. To me the sight of these American crews—Harvard, Tabor and Kent—all rowing into the wind with such fine precision, was at once a challenge, and an example which we would do well to take seriously to heart.

Harvard, indeed, won the supreme eight-oared event—the Grand Challenge Cup—with consummate ease. It is true that Leander had, I think, the greatest potential racing capacity of any English crew in for the event, but they proved a disappointment, and the way in which Harvard disposed of Jesus was a revelation. On that same day the Argonaut Boat Club of Canada defeated Sydney. The Australians were remarkably neat and had beautifully smooth wristwork, but they rowed as if their blades were wrapped in cotton wool to prevent them being damaged. In the final, against a strong head wind, both crews fought out a great race, though after Fawley, where Harvard had gained a length, the race was over, for the United States crew pushed their boat into the wind with a smoothness that was worth watching. They do not swing nearly so much at the back-stop as one would expect, yet despite the fact that their slides are almost vertical under their bodies at the beginning, they succeed in getting into just that very strong position over the stretcher that some of our crews exceed by swinging too far forward. The Argonauts were well beaten by three lengths in 7min. 40sec., but they kept their form right over the course.

I have already spoken of the Swiss victory in the Stewards. Oriel, who reached the final, were not as clever as last year, for their boat did not seem to run so straight, none the less, they could scarcely have had stronger opposition in the shape of a crew which was stroked by a man like Schmid, and which included Ruffli, the former Diamonds winner, at "two." Their almost lazy recovery, and the way they leant against their finish, was something that made racing in a Four look what it is—the most enjoyable form rowing can take.

Sanford and Parker, who won a popular victory in the Goblets, were also members of the fine Trinity Hall Four which beat New College in the final of the Visitor's Cup, and thus were the only two men to win two finals at Henley this year. But the most unfortunate crew in this event was Durham School, who were leading Pembroke 50yds. from home, broke part of a rigger, and had to stop. It was cruel luck for this fast schoolboy crew.

Bourne stroked New College well in the final, and was well backed up by Robinson at "three," but Trinity Hall had the spurting power they lacked, and won in the extraordinary fast time of 8min. 9sec.—over 1min. faster than the Wyfolds, though, admittedly, that event was rowed into the teeth of a moderate gale, with which Maidenhead seemed better able to cope than Tigre, the Argentine crew. Lion stroked Maidenhead with great determination on Saturday.

The Centenary Royal Regatta will be remembered on account of the fine standard of the rowing from all the foreign countries entered, and also because of the poor conditions of wind and weather throughout most of the days' racing. But if it does nothing else, it should have stimulated our oarsmen to even greater efforts to improve the style, and so the pace, of the crews we produce at the present time.

A ST. ANDREWS SURPRISE

By E. R. TIPPLE

The New Open Champion

AFTER one of the most exciting week's golf in the history of the Open Championship, Richard Burton sprang a surprise on all the favourites and won the title with an aggregate of 290 for the four rounds over the classic Old Course. This is the first victory for a professional attached to a northern club since Alex Herd took the cup to Huddersfield in 1902.

Although only 31, Burton has been in the front rank of golfers for several years. A Ryder Cup player, his former victories include the Dunlop Southport event and, earlier this season, he tied with Padgham at Moor Park, but lost the replay. Tall and powerfully built, he is one of the longest hitters in the game to-day. With his upright swing he gets the club-head moving at a terrific speed, lashing it through with his strong wrists. His hands are held high, both at the top of the backswing and at the finish. The way his left hand guides the club is an object-lesson to anyone. To make sure of a firm grip with the left he wears a leather glove—a habit that is becoming increasingly popular.

The new champion scorns safety-first tactics and enjoys nothing better than having a "bang" at the ball. Even in a tense situation he will swing with gay abandon, and if the shot goes deep into the rough he remains unperturbed. He is an adept at recovery shots and a bold putter, so he frequently saves a stroke when others expect him to lose several. His length may be of great advantage, but his fine equable temperament—he treats golf in a happy-go-lucky attitude—is an even greater asset. A typical North Countryman with a great sense of humour Burton does not train for golf, neither does he allow himself to take it too seriously.

His gallant display in the final round proved beyond doubt that his technique is shock-proof. Before this was played the position was very open. His own hopes had suffered a setback due to an indifferent third round of 77—that vital stage in the championship in which so many potential winners have crashed.

Young Fallon had taken the lead with 215, Shankland was one stroke more, Perry 218, Posse, Bulla and Burton 219, then a bunch of others, including the holder, King, Rees and Locke, all within striking distance. Fallon, who during the winter months had done a course of physical training so as to prepare himself for a gruelling season, had the luck of the draw to start first. Short and lacking in physique, he failed to seize his opportunities, and a 79 was not nearly good enough. Nevertheless he finished well up the list for the second year in succession.

Posse, one of the Argentine team, whose easy, graceful style had impressed the keenest critics, found the strokes slipping away under the pressure of the struggle and so failed to take the lead. Perry and Shankland, a hard-hitting type of golfer who had never been prominent before, also failed on the last few holes; but the big American, Bulla, finished strongly with a 73 to total 292. The championship of 1933 came back to memory; would a repetition of those events occur once again and an American win, whilst the British "hopes" wilted? Bulla had got his blow in first—a tremendous advantage.

Burton, starting late, knew what he had to do, and was also aware that he was the only one with any possible chance of catching the American. Playing with admirable consistency and calmness he reached the turn in 35. That meant 37 home to win; difficult enough on a calm day, but against a strong wind and in a championship—well! Two characteristically wild shots at the tenth and fifteenth gave the spectators shocks, but he recovered from both, and at the latter hole sank a long putt with utter nonchalance. A five and a four to win, with the dreaded road to avoid at the seventeenth. Wisely he played short of the narrow green, chipped up safely and got his five.

A gigantic tee shot to the home hole, hit straight towards the flag—always the bold line—left him within 40yds. of the green. Burton did not then play a safe scuffle along the ground, but pitched boldly for the flag, played it perfectly, and holed the putt for a three almost without looking at the line!

Unlike so many modern golfers, he wastes little time over his shots, not anticipating difficulties where there are none, and his bold attacking plan received its just reward. If he had tried to play safely, to steer the ball down the course, he would have failed like the others. Happily he did not, and so brought off a gallant victory, fulfilling the prophecy he made weeks ago at Little Aston that he was confident he would beat the field. This performance will rank among the most memorable in the game.

As Lawson Little failed through indifferent putting to figure among the thirty-four players eligible for the final day's play, the smallest number on record, Bulla was the solitary American challenger. To finish second at his first attempt was a truly great performance, particularly as he had to experiment with a variety of putters, for his centre-shafted club is banned in this country. Over 6ft. in height, he hits the ball a long way, keeping his left arm straight. After an indifferent first round his game was steadiness personified, and he was one of the few who avoided making any really fatal blunders.

The fourteenth and seventeenth holes were the graves of many of the favourites. Bobby Locke in his first two rounds took an 8, and a 7 at the fourteenth. Lengthened by over 50yds., this hole provided a severe problem. Locke drove into a bunker on the left, then tried to get too far with his recovery shot, and failed to extricate the ball. After he did get out he cut his brassie into "Hell" bunker. In the second round he tried the right-hand line off the tee and sliced out of bounds, and that was a 7. He found the Road Hole nearly as expensive, and so did not figure among the first eight.

Cotton on at least one day had the worst of the weather, but, like Locke, he played far too many loose shots. His seconds were far from accurate, and his chances disappeared when his ball bounced over the road out of bounds just as he seemed set for a 69 at the half-way stage. Throughout the week the huge greens made putting awkward. R. A. Whitcombe finished equal third with four others at 294—a praiseworthy attempt to retain his title. He made few really destructive shots, but his approach putting, as it so often is, was timid. From 3yds. he would not give the hole a chance, and you have to be bold with those putts if you are going to win.

No less than five amateurs completed the four rounds—in contrast to last year—and J. Bruen was one to enhance his reputation. For a youth of nineteen to lead the qualifiers with two 69's was remarkable. Bobby Jones is the only other amateur who has achieved such distinction. Despite the fact that he took a wretched nine at the sixth in the final round he finished only eight strokes behind the winner, and is obviously a golfer of the highest class, having all the necessary shots in his bag plus an ideal temperament.

It is certainly a long time since a British amateur can be regarded as a potential Open Champion, skilful enough to match most professionals.

The playing conditions were difficult throughout the meeting and the Old Course proved to be as great a test as ever. Despite the fact that the greens were rather slow and soft, quite unlike the real St. Andrews in July, no player was able to beat 70 in the championship proper. And in the qualifying rounds just three 69's were returned—by Bruen, Little and Cotton. The several parallel fairways made the control of the vast crowds difficult, so that not a few of the players were disturbed by the long waits. But the most astonishing of all the incidents was the case of the scorer who could not score. This would seem quite incredible anywhere, but particularly so at St. Andrews. The players concerned discovered the incompetency of this official at the ninth as one of them was told he was out in 58 when his total was actually 38! As if a championship was not sufficiently nerve-racking without such an unprecedented disturbance! Fortunately, this scoring had no bearing on the actual result, but such an unfortunate incident should never have taken place.

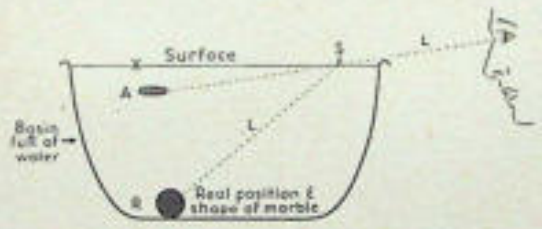
C. Metcalfe

"GIVEN THAT A FISH CAN SEE AS WELL AS A MAN, THEN IF WE, WADING, CAN SEE THE FISH, THE FISH CAN SEE US"

WHAT CAN A FISH SEE?

By J. L. DICKIE

MOST of us have been puzzled, at one time or another, to estimate the size of a trout, more particularly a trout cruising around in an eddy. One sees, sideways on, a long, thin fish, then one loses sight of it, and, a few minutes later a short fish, in much better condition, appears end on. Are there *two* fish? As we watch, the short, fat trout continues its inspection of the eddy; as it turns, it lengthens and visibly loses condition—the eel-like fish and the short fat trout are one and the same.



Actually, the maximum sizes are the right ones: what looks, end on, like a fat ¾-pounder often pleasantly surprises one by going ½lb. better when caught and weighed, and the "thin" pounder, seen sideways on, does the same.

Two factors have caused confusion about this business: confusion between reflection and refraction, and the protective colouring of fish. I have heard it said, and even seen it in print, that if a fisherman is wading and below a certain level, the fish cannot see him at all. It has even been suggested that, at a certain level and distance, the fish sees only the angler's head; that, in fact, below a certain angle, there is an area of *total invisibility* to the fish. This is not so. Given that a fish can see as well as a man, then if we, wading, can see the fish, the fish can see us.

I first began to doubt the "total invisibility" theory when I discovered that I could see a pale green weed patch, in quite 2ft. of water, from over a hundred yards away. It was in shadow, in mid-stream, on a bend of the Test, and looked, from far upstream, like a narrow green streak, right on the surface, under the far bank. Had a big trout been a sufficiently conspicuous colour it would have been visible also as an extremely narrow streak. My line of vision was certainly not more than 5deg. from the horizontal, yet, though the underwater world was out of position and distorted in shape it was not invisible.

The same applies to the overwater world as viewed by the trout. Had I been in tennis flannels it could have seen me as a white streak. This can be explained quite simply. We all know that if we push a straight stick into water it seems to be bent where it goes through the surface; it is this bending, or "refraction," which causes optical delusions for the benefit (or otherwise) of fishermen. The *maximum* angle of refraction of fresh water is a constant—the same in a basin as in Lough Neagh; but it gradually increases from 0deg., straight overhead, to about 40deg. as one squints almost along the surface.

Before arguing further about angles, I ask my readers to try a very simple experiment, which will explode a lot of theories and may, I hope, help them to catch more trout: Take a basin and fill it to the brim with water; put a marble (not glass) on the bottom of the basin, on the far side; now look at it from above. It looks round, exactly like a marble, but it does not look as deep down as it is—it only seems to be at three-quarters of its real depth. Stoop, and you will still be able to see it, though the side of the basin would block your view if it were not for refraction; but as you stoop

AN EXPERIMENT WITH A MARBLE

the marble ceases to be a sphere and gets flatter and flatter. Finally, when you are squinting almost dead along the surface, your marble becomes merely a narrow strip of the same colour as the original, which gets narrower and narrower until it finally disappears into the surface as you look directly along it.

Seeing Round a Corner

In the diagram:

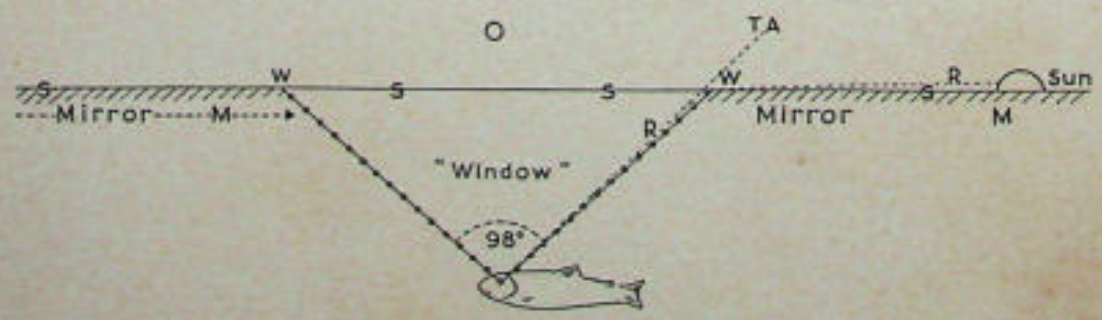
A shows apparent position and shape of marble.
R shows real position and shape of marble.
L shows light travelling from marble to eye, refracted or bent at point S, on surface.
Note that under-water angle RSX (about 37°) is apparently contracted to angle ASX (about 8°).

Now as to what is known as the trout's "window." Take a glass of water and look through the side of it at the underside of the surface. You cannot see through the surface obliquely—it looks like a mirror—it is a mirror. Push a match, head first, through the surface and you will see the head of it and the reflection of its head—you will not be able to see the shank of the match or your finger through the surface if the angle is more than 48deg. from the vertical. This phenomenon is familiar to everyone who has kept an aquarium. Yet, as has been shown, one can see in from almost any angle. The point is that all objects, visible through the trout's "window," are seen in an angle of 98 deg., not 180 deg.

Instead of calling it a "window" one might clarify the situation by calling it a "funnel" which collects or compresses the whole overwater world (180 deg.) into 98 deg. Naturally, things look narrow.

In the second diagram:

——————— *SSS = Surface.*
..... *RR shows path of rays of light from setting sun, bent about 40° where they meet the surface.*
TA shows apparent direction of the sun as seen by fish.
WW = Limits of fish's "window": surface beyond "window."
MM is a mirror, as viewed by a fish in calm water. Only objects overhead at O are seen undistorted and in their real positions.
Note that the sun has become flattened as viewed by the fish.



This "compression" is not regular. From nearly overhead objects appear a normal shape, but in the area of maximum refraction—i.e., nearly along the surface—the "compression" gets more and more pronounced, as we saw in the case of our marble. Thus there is no area of total invisibility, only an area of extreme distortion, everything under the surface to the man, or over the surface to the trout, finally merging into one line—the surface to the man or the edge of the "window" to the trout. Beyond that edge the underside of the surface becomes a mirror to the trout, like the underside of the water in the glass was to us.

Thus the trout sees things in the upper air distorted and changing their shapes—a man walking towards him seems to grow taller as he approaches, and the angle of vision becomes less oblique. In his under-water world the fish frequently sees the same thing twice over—directly and in its mirror.

One final knock at the total invisibility theory commonly expounded, i.e., that if one keeps fairly low and far away the trout cannot see one at all. Try sinking a white jam pot a foot or so under water in your local river. Choose a shady spot (otherwise the reflection of the sky will interfere, the sky being brighter than the jam pot). Now try from how far away you can see the pot and from what angles.

When you have finished, imagine that the pot is a trout in position and do not forget that there is no one-way traffic in light—if the light can reach you from the fish it can reach the fish from you. Therefore keep low and far away—try to melt yourself and your rod into as narrow a strip as you can in the area of maximum distortion.

One other point: some trout not only see more than one thinks they do, but know what is dangerous and what is not. For instance, at Heytesbury-on-the-Wylye, there is a path beside the river; the trout take no notice of people walking along this path—they still feed at their very feet—but show them a rod and it is a very different story.

THE FISH'S ANGLE OF VIEW

GOOD POINTER WORK

By DUGALD MACINTYRE

HEAD gamekeepers of grouse moors where point shooting is still practised do not always approve of pointers which have been trained with a view to winning heats at field trials. The dogs run too fast and range too widely to be really useful in grouse shooting. Grouse are not such fools as to sit on while a shooting party is coming up to a long-range point, and it is certain that a pointer which ranges within reasonable bounds, and leads swiftly into the centre of the broods without need for coaxing, is the best pointer.

The practice of setting pointing dogs, which are to run a beat against each other, off in opposite directions at the command "Go" is spectacular, but has nothing else to commend it. The best pointers for shooting over which I knew would walk to heel (without leads) like retrievers, and ordered to "Go!" first made good the ground in front of them by two or three short cross-beats, reaching gradually further on alternate ranges until going all out; when their widest range on either side was somewhere about 150yds. The dogs ranged closer in thick cover than on naked grass country, where, realising that broods were few and far between and that the going was good, they showed their paces to advantage, but found little game. Field trial teams of pointers which were brought into competition with teams trained by keepers for actual work on the moors, ranged and pointed so fast and "well" that the ordinary beat to keep a party of two guns going for a day was finished before lunch. And not only that: the bag from the beat which should have lasted out the day was less than half-a-day's bag. That was because wide ranging and spectacularly pointing dogs miss the scents of a great many single birds, and single birds are what make up the bag.

Say that a perfect grouse team is wanted. The first dog of the team, to be called No. 1, is used for the preliminary gathering of grouse from naked wilds into better cover. No. 1 ought to be fast, and to range widely on naked ground and close on heather. He ought to carry his head high, and it is no matter if he is a better pointer at broods than of single birds, for grouse are in broods at their first rises of the day, and quite a different stamp of pointer is best for scattered single birds in thick heather and where there is little wind in the hollows.

Here is our bag-maker No. 2. He is a large heavy dog, but with bone and muscle to carry his weight, and his speciality is detecting faint scents, and leading carefully to them without pointing. See him draw out to a faint scent, and at a closer approach recognise the doubtful odour as that of a "stink-lark," from which he turns with a toss of the head. There he is again! But this time he recognises the scent as that of a single running grouse and stiffens to attention.

Now he has a rabbit in its scent, but assured that it *is* a rabbit he leaves it sitting and ranges on, for he is absolutely off pointing fur, and can be worked for pheasants and woodcock, in the glens, where rabbits abound, and if he points it is at a bird. No one ever saw him point fur in cover, or on the moor.

Here is the bag-maker at an actual point, and five dead grouse lie in front of him after the brood has been shot at. Ordinarily he displays a faint interest in dead grouse, and a more lively one in winged birds, on which he places one of his massive paws, if master is hard pushed to catch it. None of that at this point. The dog moves through the dead birds, at a steady point all the time, to a fresh brood 100yds. upwind from the first. Four birds from that brood, then back to pick up our five from the first point, when the keeper and his dog get the best compliment of their lives from about the best dog judge in England, "I thought I knew something about pointer work, but evidently I did not."

No. 3 and No. 4 of the team ought to be young dogs, and no pointer can work better than a well-trained young one. There are no tricks in a young one, and it is delightful to see it enter into the spirit of the game by dropping without a word spoken and without even looking back. Its education is only complete when, in an afternoon's outing of a full hour, it has pointed steadily, gone up to its birds fast and truly, and dropped to shot without orders. Perhaps it has pointed a rabbit or hare, and been rated for even looking at such a detestable creature. Unlike the field-trial dog, the out-and-out worker was, and I think should be, used to find out such dead grouse as cannot be found by the keeper.

Generally speaking, a retriever is out of place at point shooting, and in a year's work a winged grouse was seldom lost by us. The nose of a pointer is a very fine instrument indeed, and grouse rarely run fast or far. If a young pointer failed to find a winged grouse, No. 2 of the team would quickly show him how to do it.

A SHOOTING PARTY ON RANNOCH MOOR

THE WILD BIRDS (DUCK AND GEESE) PROTECTION ACT, 1939

THERE has been much controversy upon this Act, and now that the matter is settled and the measure is about to come into force—it does so on August 1st—it may be well to state exactly the changes in the law without discussing the ultimate objects of the Act, or whether those objects will be achieved.

It is impossible to understand this year's Act without going back to the various other Wild Birds Protection Acts, which were passed between 1880 and 1908. These Acts had fixed the close season for various birds from March 2nd to July 31st. The Act of this year changes the dates for wild duck and geese to the period February 1st to August 11th.

During that period—February 1st to August 11th—it is unlawful "to shoot or attempt to shoot or use a boat for the purpose of shooting or causing to be shot, any wild duck or wild goose; or to use any lime, trap, snare, net or other instrument for the purpose of taking any wild duck or wild goose."

Altering the date of the beginning of duck shooting has also meant altering the date after which it is illegal to have or expose for sale any wild duck or goose recently killed or taken. This may not now be done after February 28th, instead of March 15th as formerly.

These prohibitions are not, however, absolute. To understand the position we must go back to the Act of 1880. Under that Act orders could be made, on the application of the county council, to vary the dates of the close season in the county concerned. And orders might also be made exempting from the Act any county, or parts of it, as far as any sort of bird was concerned. Several of such orders were, in fact, made in different districts. Obviously, if such orders could still be made, the whole object of the 1939 Act might be defeated. It is therefore provided that, as far as wild duck or geese are concerned, no more orders of that nature are to be made (with the exception to be noted in the next paragraph), and any now in force are to be valid no longer.

The exception is as follows. It was realised that though it was desirable that inland shooting should end on February 1st, yet that was thought to work hardly on the man on the sea shore, and that the shooting he could do there would be permissible up to a later date. So that an order may still be made on the application of the county council that such gunners may continue, *but not after February* 21st. Further, such an order can only permit shooting up to that date on "parts contiguous to the low-water mark of ordinary tides." These words must be construed strictly, however difficult it may be to do so. It is suggested that the area between high and low-water mark may be "contiguous to the low-water mark of ordinary tides," but not land above high-water mark. If this is so it would have been simpler to say so.

The main section of the Act of 1880 contained a scheduled list of wild birds. It is declared by the 1939 Act that wild geese shall be added to the Schedule. (Wild duck were already on it.) The reason for this amendment is that unless a bird is on the scheduled list it is not an offence under the Act for the owner or occupier of any land, or any person authorised by them, to kill or take it on his land. As wild geese are now on the Schedule they are protected, even from the owner or occupier, during the close period. But here is another exception made by the 1939 Act. An order may be made in respect of any county, or part of it, that wild geese shall not be on the Schedule. So that if such an order is made, the owners or occupiers of land, or those authorised by them, may kill wild geese on their land which is covered by the order at any time without offending against the Act.

There is a minor amendment in the law to the effect that it is unlawful to import into the country any dead wild duck or goose from February 1st to August 11th. This is the only part of the Act which applies to Northern Ireland. There is also a minor amendment as to the possession or sale of birds killed in or imported from a place not covered by the Act, but that need not bother us. "Wild duck" are, for the purposes of the Act, defined as eider duck, mallard, pochard, shelduck, shoveller, smew, teal, wigeon, and wild duck of any other species whatsoever, except merganser and goosander. "Wild goose" means a wild goose of any species whatsoever.

To sum up. After August 1st the close season for wild duck and geese will begin on February 1st and end on August 11th. *But*, orders may be made extending the open season for shore gunners not later than February 21st. Again, if, and only if, an order is made in their district, owners or occupiers, or those authorised by them, may shoot wild geese (but not wild duck) without bothering about the Act. Fines may be imposed up to £1 a bird killed or shot at in contravention of the Act.

A word may be added as to orders. The expense of these is defrayed by the county council. Any order in their district must be published in the three weeks before the year of the order begins, in two local newspapers, and also affixed in conspicuous spots near the district where the order operates.

W. J. BROWN.

FIVE HUNGRY MOUTHS TO FILL

A FAMILY OF TREE PIPITS

By GUY B. FARRAR

SPRING is a very pleasant time in the water-meadows when irises fill the ditches with a golden glory and violets blossom at the foot of the hedgerows. Then one can expect to hear the song of the tree pipit but newly arrived from Africa, a strong vibrant song, having in it something of the joy of the coming season, of a new beginning, an awakening from winter's sleep.

Later one may discover the nest itself hidden in thick rushes, or the lush grass growing on the steep bank of a lane, containing four or five eggs of extraordinarily varied colouring. Blue, grey, brown, and a pinkish red, may form their ground colouring, superimposed with blotches, streaks, or uniform speckling. The only certain thing to say about clutches of tree pipits' eggs is that they are scarcely ever alike.

The nest at which these photographs were taken was situated at the foot of a large clump of rushes in a water-meadow much frequented by cattle. For this reason I was unable to erect my hide the previous evening and had to put it in position on the morning I intended to begin photography. Fortunately the tree pipits took not the least notice of its presence.

The most striking characteristic of these pipits was their stealthy approach to and departure from the nest. Never once during the whole day did they alight nearer than 20yds., the remainder of the journey being made on foot. When leaving the nest, often with droppings in their beak, the same procedure was enacted, the same stealthy walk through the long grass before taking wing.

If you can imagine a rather attenuated, elegant, and aristocratic-looking lark, you will have some idea of the outward appearance of a tree pipit. Both birds carried themselves very gracefully, walking daintily, each having a separate route to the nest, the cock always appearing from the rushes on the left-hand side and the hen from a grassy tunnel on the right.

It was impossible to distinguish between the sexes until one bird, presumably the hen, tried to brood the half-fledged youngsters. Her efforts were not very successful, as her growing family completely filled the nest.

As far as my observations went, the food brought to the young consisted entirely of insects—grasshoppers, craneflies, and, in one case, what looked like a spider. Meal times were extraordinarily erratic, a succession of rapid visits being often followed by an absence of over half an hour. Once I thought some tragedy must have happened, so long were the youngsters left without food, but at last a movement in the herbage heralded the return of the hen on her regular route to the nest.

An unusual and exciting incident occurred when taking these photographs. After being in the tent for a couple of hours, I thought I heard a trampling noise outside and peeping through a slit in the side wall was horrified to discover a semicircle of cattle closing in on the hide in most menacing attitudes.

A bold counter attack seemed the best means of defence, so leaping out of the tent I rushed at the intruders, sending them galloping madly to the far end of the field.

This bull-fighting act seemed to have no effect whatever on the pipits, who continued their methodical walks to and from the nest as if nothing unusual had happened. Placid is, perhaps, the word that best describes these dainty little birds, whose one concern was to visit and leave their nest as unobtrusively as possible.

Their shorter hind toe and distinctly yellower plumage distinguishes them from meadow pipits, while their rather harsh call note, an oft-repeated *tees*, is another identification mark.

"HER EFFORTS AT BROODING WERE NOT VERY SUCCESSFUL, AS HER GROWING FAMILY COMPLETELY FILLED THE NEST"

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

A JULY DINNER MENU WITH BOTH FISH AND MEAT

The Fare: Potage Purée St. Germain
Filets de Sole Chauchat
Selle de Pré-Salé Jardinière
Mousse de Canetón
Beignets de Framboises
Dessert

The Wines: Gewurztraminer
Château Pape Clément 1929
Coteaux du Layon 1926

THE *Purée St. Germain* is a soup made with mashed garden peas and served with a sprinkling of garden peas whole; a simple and delicious beginning.

The *Sole Chauchat* is equally delicious but not nearly so simple. The fillets of sole are placed in a baking dish and seasoned with pepper and salt and a squeeze of lemon juice; they are placed in a hot oven and left some six or seven minutes only. They are taken out of the dish, which is then thickly coated with a sauce *Mornay, i.e.*, a *Béchamel* with cheese. The fillets of sole are then put back into the dish upon a soft cushion of *Mornay* sauce, and they are surrounded with a beading of small round pieces of potatoes, already cooked in water. A thinnish coverlet of *Mornay* sauce is spread over the fillets of sole and the potatoes, and then a fair sprinkling of grated Gruyère or Parmesan cheese; lastly, a little melted butter is poured on top and the dish is browned in a very hot oven.

The Selle de Pré-Salé is a saddle of Southdown lamb roasted and served with a number of fresh vegetables, the more the better.

The Mousse de Canetón is a cold confection of duck meat and foie gras pounded together; rich and tasty withal. A salad of bitter oranges served at the same time helps the duck but not the wine.

The *Beignets de Framboises* are raspberry fritters, not the best of all ways to enjoy raspberries, but a change when raspberries are plentiful. The fruit is lightly sugared and soaked in Eau-de-Vie de Framboise, an Alsatian speciality; failing this, kirsch will do. They must then be left to dry before being dipped in batter and dropped in very hot fat, not too many at once, so that all of them may be equally caught up in the boiling fat. When taken out of the pan, the raspberries are drained dry, dressed on a folded napkin and sprinkled with castor sugar before being served.

As regards the wines for such a meal, a white Alsatian wine would be acceptable as an opening wine. The wines of Alsace are not marketed under the name of the village nearest to the vineyards where the grapes grew from which the wine was made, but under the name of the species of grapes used, irrespective of its vineyard of origin. Among the best grapes grown in Alsace, that is the grapes responsible for some of the best white wines of Alsace, are the Traminer and the Gewurztraminer. With the saddle of lamb and the duck, a good red wine from the Graves district of Bordeaux, such as the 1929 Pape-Clément, will prove most acceptable, whilst a little known but charming white wine from Anjou should bring the meal to a happy end upon a distinctly sweet note.

FIFTY YEARS AGO

From the *Field* of July 13th, 1889.

ROYALTY at Kempton. "As the Shah has been once again among us to see our institutions, it was only in the fitness of things that he should be conducted to a race-course, in order to witness the British public take a holiday after its own fashion.

"At the bidding of Mr. Hyde a royal pavilion sprung up like the handiwork of a fairy; and it needed but the announcement that our guest would be present to bring together an assemblage that Ascot itself could scarcely excel. A late Emperor of China, it is said, was sorely puzzled, on receiving a present of a state coach, to know where he ought to sit; but after much deliberation came to the conclusion that the loftiest seat was the seat of honour, and so, on his next appearance in public, took up his position on the hammer cloth, while his coachman sat inside, and drove with the reins through the front windows. Now it is just possible that the Shah, on his visit to Kempton, may have been slightly uncertain as to who were the persons most to be honoured—the people in tall hats and black coats, or the mannikins in their gaudy colours. His Majesty, however, is not of an ecstatic temperament; he made no sign; but, after handing his race card to his Grand Vizier, composed himself to see all that was to be seen, and is reported to have vastly enjoyed the brilliant scene before him. In the paddock he is reported to have shown himself a good judge of horseflesh."

More Henley Complaints. "The curse of Henley regatta is the picnicking—we care not a straw whether it is afloat, on houseboats, steam-launches, or row boats, or ashore on the meadows on either side of the river by the occupants of these boats. This picnicking, this ostentatious display of female finery, of flower, of fruit, of wine, of viands, is a modern innovation, and a sign of the luxurious selfishness of the times—a selfishness which is exemplified in a total disregard of the competitors, and in the *bon mot* uttered on a houseboat, that 'the regatta would be perfect were it not for those horrid rowing men.' These rowing men, however, have first claim on the protection of the regatta authorities, and 'they should see that they get it,' as they do when they buy Reckitt's blue, or else stop away from the meeting. . . . A novel nuisance was the dust which rose from the foot traffic along the bank, the dresses of the ladies being mainly responsible for the cloud of powdered gravel which hung like a pall over the towpath during the afternoons."

IN THE SALEROOM

SOME of the finest arms and armour will be sold at Christies on July 27th. The property of the late Clarence H. Mackay, it vies in rarity with the finest to be found in public museums in this country. The late owner scoured the whole of Europe for all that was outstanding of the armourer's craft. Many of the items now included have come from such well-known collections as Sir Guy Laking's, from Brassey and the Earl of Pembroke, and from Continental armouries.

To make a choice from the hundred lots or so is difficult, but the following may deserve particular mention: A pair of English double-barrel flint-lock pistols by Barbar, in perfect state with a crest surrounded by a garter, Montagu with Churchill in pretence; a wheel-lock sporting rifle, English, dated 1650; a bastard sword, English, *circa* 1450, found in the Zion House reach of the Thames; a court dress sword, English, *circa* 1745; a suit of armour for the tilt, German, 1580, from the Royal Armoury, Dresden; a demi-suit of armour, French, *circa* 1560, from the collection of Hollingworth Magniac; a cabasse Morion, Italian (Milanese), 1550, from Prince George Fuggers's collection; a sixteenth-century locking gauntlet, German (Augsburg), *circa* 1550; and a fourteenth-century Bascinet with visor "Hundsgugel," Italian (Tyrol).

A TRAVELLER'S NOTEBOOK

THE Janissaries, who for centuries served the Sultan of Turkey, made up what was without doubt one of the most formidable corps of fighting men the world has ever known. The corps was instituted in this fashion. Each year, by the command of the Sultan Amurath, or, as some Turkish historians say, by Sultan Orkhan, 1,000 Christian boys were taken away from their homes and initiated into the Moslem religion with the customary rites. In the first instance this was done by a holy man named Haji Bektash who, with his sleeve touching the head of the novices pronounced the following words: "Let these youths be called the Yeni Cheri; let their countenances be ever bright, their hands victorious and their swords clean, and wherever they go may they return always with a white face." Thus they became Janissaries—Yeni Cheri, or new soldiers.

* * *

Training was severe in the extreme. First of all the recruits were divided up, the more beautiful and intelligent among them being reserved for employment about the Court, while the remainder were all designed for service in the army or some menial occupation. But even life at the Court was no bed of roses for these houseboys, who lived a most Spartan life and who, unless exceptionally talented and well-behaved, never attained those favoured positions about the Sultan all so much desired. They were more likely either to be transferred to the fighting Janissaries or else given some subordinate post in the administration. The soldier apprentices endured an even harder lot. Rigorously trained in the use of weapons, everything possible was done to toughen them.

* * *

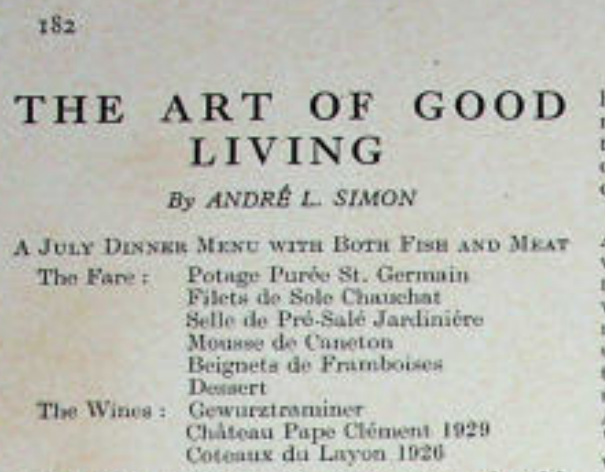
On leaving school—a merciful relief, no doubt—they were posted to an Orta, or company, remaining in it for the rest of their life. They were forbidden to marry, so that they might devote themselves to the Sultan and the regiment only. The uniform seems to have been quite simple; but the felt head-dress, with its gilt sheath at the front and white sleeve at the back was a magnificent affair, especially in the case of veteran soldiers who placed in the sheath a bird of paradise plume so that it fell down the back. During a campaign, it is true, their appearance must have been somewhat ludicrous, as the Turks did not issue armour, and the pieces worn by the Janissaries were either looted from Christian dead, or taken from Christian captives.

* * *

The Agha commanding the corps had under him regimental and company commanders, and was by merit of his appointment one of the great officers of the Empire. Curiously enough, the captains were known as Tchorbadjy, or ladle-bearers, and the cooking pots, carried at the head of the troops, even when marching into battle, were held in greater veneration by the men than their standards. If a company lost one cooking pot it was disgraced; if both it was disbanded.

* * *

Later in the history of the Empire the rule as regards marriage became relaxed, and recruits for the corps were usually obtained from among the children of the Janissaries. By degrees their power increased, and even the Sultan trembled when they turned their stewpots upside down as the signal of revolt. Some rulers were deposed, others murdered by these fierce soldiers, so that it was not surprising they were in the end disbanded. This was done at the command of the strong Sultan Mahmud II, by the simple method of a general massacre. There were supposed to be some 40,000 Janissaries, and few escaped, for the Turkish rulers used to do these things thoroughly.



* * *

The institution of the Janissaries was without doubt a very clever move on the part of an Empire continually engaged in war, as otherwise the male population might almost have been wiped out. But like the Slavonic Guard in Cordova and the Mamelukes in Egypt, they were allowed to become too powerful and thus provided a source of weakness rather than of strength. Their military achievements were unrivalled, however, and it is curious to think that these men of Christian origin formed the spear-head of the attack when Suleiman the Magnificent thundered at the gates of Vienna, and it seemed as if all Christendom would be overrun by the Moslem hordes.

* * *

Every now and then one still comes across something that reminds one of these famous fighting men. It may be a sword, an old book illustrating their uniforms, or their drums and cooking pots in some museum. I, myself, saw only the other day a remarkable brass tray made by a Janissary. On it were engraved the names of the countries he had visited and the battles in which he had taken part, and it was decorated with pictures of his uniform and his very varied selection of weapons.

F. H. M.

Gentlemen!
your
Johnnie Walker—

However many racquets a champion may need, for real refreshment he need only order a Johnnie Walker. Every whisky in the Johnnie Walker blend — which includes all Scotland's finest whiskies—is chosen for some special quality, which is enhanced by the blending. If it's men's doubles —make them Johnnie Walker.

BORN 1820—STILL GOING STRONG

LETTERS TO THE EDITOR

BIRD PROTECTION

SIR,—I was very glad to read Mr. Vincent's letter in your issue of June 24th. On the whole he apportions his criticisms of those with an interest in birds who have visited Hickling fairly impartially. The tendency to appear to view Norfolk as a small village in Hicklingshire (!) is perhaps no bad trait in one concerned primarily with the birds of the Hickling area and their preservation. I had an instance of this a few days ago. "Jim Vincent told me that long-eared owls always nest on the ground in Norfolk," remarked a total stranger. My reply was to the effect that I had seen the species sitting on nests in trees in Norfolk, where taking the county as a whole, the proportions of long-eared owls using the two types of site is probably similar to those obtaining in other counties—Yorkshire, for example.

It is true that the bittern, harriers and bearded tits I photographed in Norfolk had already been well and truly tamed to a hide by Major Buxton and Mr. George Cree before I began. But again Hickling and Horsey are not Norfolk. Nor have I had any "trail of disaster" with the bittern elsewhere, or with the hen harrier, or with other birds to the number of some 500 pairs, covering over 150 species; and I must protest against Mr. Vincent's calm and unwarranted assumption that I should have met with such near Hickling had I gone there "with a free hand." I could name other photographers of birds who also can work without a "trail of disasters," and who would never have allowed Mr. Vincent to cut and lower a tree to bring a nest into range of their cameras, as I believe has been done near Hickling!

Any photographer may have an odd accident; but those who cause a series are either callously careless, or do not know their job, and have no right to learn it with rarities. Inexperience, carelessness of method, haste due to lack of time without which no one should attempt a difficult species, insufficient gradualness in the erection of hides, the choice of too early a time—with many birds the operation is best left until after the eggs have hatched—over-keenness to obtain portraits clear of surroundings of the "close-up" type giving the kind of striking (and often unnatural) effect so often apparently desired by sections of the Press, do cause risks which no photographer would run who places the preservation of birds as of greater importance than his photographs—as we all should. I know photographers who suffer from none of these defects, and who would not work under conditions that would make possible other than the odd accident due to the exceptionally nervous temperament of a particular bird, and who would guard against even that by the abandonment of the attempt as soon as the fact became apparent.

I can still count my own disasters on my fingers; none of them concern rarities; a "trail" of such I have never had, even in my early days more than 30 years ago. The shy and nervous marsh harrier is the only Broadland species of which I should have any doubts of my ability to photograph without disaster, if the site was favourable, given a free hand and no outside interference.

Yours faithfully,
Larkspur, RALPH CHISLETT.
42, Broom Crescent,
Rotherham.

HENLEY AND AFTER

SIR,—The Grand, Thames, Stewards' and Diamonds, all gone to foreign parts. Not only this, but out of the eight boats in the finals only one was English. It is seriously to be hoped that this will open the eyes of rowing men to the state of rowing here. It is as well, therefore, to deal frankly with the question: Where does the fault lie? Is it in men, or material, or coaching?

As regards men, there is no doubt that they are as good as in the past, but not better. At the same time they often do not do themselves justice. Except for Putney, weight does not matter much. I myself have been in a crew which won the Visitors' with an average weight of 10st. 5lb., and I do not think it was anything out of the way. But it is unwise to overdo rowing, at least for University men. There is a full programme here for the year, and to add to it by the Thames Head of the River race, Monte Carlo and other foreign races is fatal. I know that the Fours, Trials, 'Varsity Eights, Pairs and Henley finished me. Rowing is hard work, and flesh and blood will not stand an overdose.

There is much to be said about material. The ideal shape of a boat is not known. The well-known Bedford School boat was copied exactly without equalling its speed. Professor Bourne's model, tested at Teddington against one which he asked me to design, was not a success in practice. More investigation is needed. And there are solid arguments against the present practice of central seating, long slides and swivel rowlocks. Long oars seem to be less popular, which is all to the good for mechanical reasons.

But it is the coaching which requires most examination. I know coaches are difficult to get, but judging by results and the output of Rowing Correspondents in the Press, I think it is clear that the principles of rowing are not properly understood. There is no accepted style, which means that there is no accepted view of the necessary ways of using strength to propel the boat to best advantage. But if there is one thing necessary in coaching, it is that the coach should make sure that the pupil understands fully the why and wherefore of every instruction given, and unless the principles of rowing are understood this cannot be done.

Good coaching, at the Universities at least, is not merely for the instruction of the particular crew coached. It is absolutely necessary, in that the members of the crew are the potential instructors of other later crews. And the absence of this careful instruction means the dearth of capable coaches in the future. Men will not heed instruction which merely tells them to do such and such without reason given.

What, then, is the remedy? There is only one. If coaches will get together and try to understand the principles of rowing, which, while complicated in fact, are comparatively easy to understand, English rowing in two or three years' time can be lifted to a respectable level and, later, to superiority over all comers. If we are not prepared to make the effort we can write Ichabod over it.

Yours faithfully,
A. G. SMART

Oxford.

SCARCITY OF LANDRAIL

SIR,—It would be interesting to hear whether the landrail is as numerous in the Kintyre district of Argyll as it was some twenty years ago when I knew that district well.

It is no exaggeration to write that walking in the low ground of Kintyre on nights of early summer the ground seemed absolutely to vibrate to the craking of the cornerakes, which was continuous.

The landrails arrive in Kintyre on April 15th at the earliest, yet I saw their black young running among the cut hay on June 20th. When the hay fields are mown the birds go into the oat fields, where they rear second broods, the young of which are sometimes quite small when the oats are cut.

When the oats are cut the birds are compelled to seek the fields of rushes, and in certain mountain straths, at a good elevation above sea-level, landrails were often seen when snipe shooting in September.

Once a few years ago the field behind my cottage was cropped with hay, and I could see the landrails meet in the hay after long calling and answering. Two males arrived to the calling of a female on one occasion, and the scuffle which ensued was of short duration, as one male was much the stronger.

Many landrails used to kill themselves on the telegraph and telephone wires on their first arrival, and in Kintyre, and nowhere else in Scotland, did I see the birds flying across country on their first arrival, to alight in the clover fields, which, at that season, are the only adequate cover.

Stoats, and more particularly weasels, hunt out the young landrails in the corn, and may be seen emerging from their cover with limp landrail chicks in their mouths. While a good many landrail's nests are cut out of the hay, the birds nest again in the oats, and I should say that a hay-field of 20 acres held ten nests of landrail in my time in Kintyre, and may do so still.

Here in Perthshire I would put the landrail population at about two couples to the ten acres, and the population seems neither to increase or decrease.

Yours faithfully,
Woodview. DUGALD MACINTYRE.
Comrie.

A "DEGENERATE" MOOSE

SIR,—Never having visited Poland, I know that beautiful and hospitable country only from pictures and the descriptions of a few Polish gentlemen, possibly and naturally biased in its favour. So, of course, I have never hunted there; but it was a complete and stunning surprise to find the statement in the *Field* that there the elk was considered a "degenerate moose."

To an American rifleman familiar with both animals in the United States and the tremendous wilds of Canada, the thesis is wholly untenable, so much so that it is impossible to conceive any reasonable basis for it. The two animals differ in every way possible; habitat, habits, size, appearance, disposition, horn formation, skin hoofs and general character.

It is true that the books assign both to the *cervidæ*, but many hunters do not think the moose a deer at all. The only one I ever cleaned had only three stomachs, while the deer has four and has no appendix. They do not interbreed, either in the wild or in the zoos, and avoid each other as far as possible in the few places where they live near together.

I have seen a New Brunswick moose which weighed 1,460lbs. on the railroad scales after cleaning and bleeding, and in life weighed 1,600lbs. at least. Another in Maine weighed 1,200lbs.; we trailed him over frozen snow for three hours, when the wind shifted and he ran; the guide got him next day. The big fellow in New Brunswick had antlers 5ft. broad with palms 30in. by 24in. I have never seen the big moose of Alaska, which run to 2,000lbs. or 2,300lbs., except mounted, and that one had horns 6ft. broad with palms 38in. by 24in., or so.

On the other hand, the elk runs to about 400lbs. and odd; a 500lbs. one is very large. The moose is ungainly and ugly; the elk is an enlarged Scottish red deer, slim and graceful; except for the white seat of his trousers he might come from Sutherland or Argyll; the antlers are the same.

The moose likes the low country, with hills and lakes and lives much in the water. The elk lives in the hills and on the plains of the Rockies in Montana, Idaho and Colorado, where it is dry. The moose is a great swimmer; I have seen him start to cross a lake five miles over. Also on the Allegnash in northern Maine I have seen the moose stand neck-deep in the white water to get lily-pads, which he loves; and our canoe went past him at 10ft. or so; he knew as well as we did that it was closed season; though I am sorry to say that there are "sportsmen" who fear not God, neither regard man, who would have shot him anyhow.

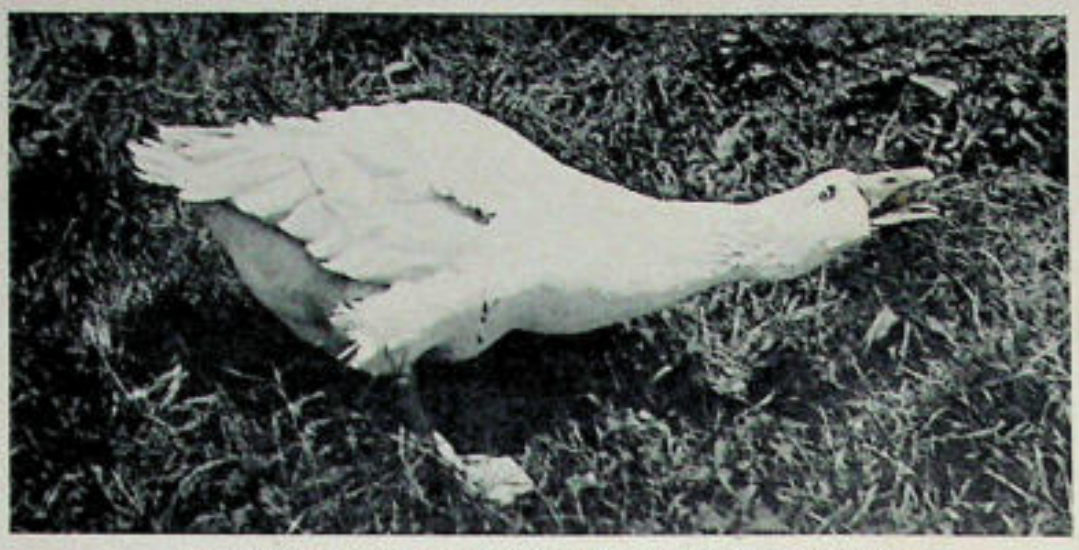
Surely the great Irish elk dug up in the Erse bogs are proof enough to the contrary; standing 10ft. high, they are about as degenerate as G. Lyttleton Rogers, for example.

Come again, Poland, with a new theory; this one does not wash.

Yours sincerely,
51, Hamilton Place, THOMAS J. JOHNSTONE.
New York City.

[The above letter was forwarded to the author of the article mentioned, and below is appended his reply.—ED.]

Mr. Johnstone's "complete and stunning surprise" is due to the fundamental error that American riflemen will persist in miscalling wapiti "elk," which they resemble superficially no more than does the American bison the buffalo, by which term this animal is almost universally known in the United States. Both moose or elk and wapiti are members of the *cervidæ*, the horns of the former attaining their greatest development in Alaska, a development which can never be equalled by the European variety, despite its close relationship.



A good wapiti will weigh about 700lbs. to 800lbs., which is very roughly the weight of a good Polish elk. The former may resemble superficially a red deer, though more closely allied to certain Asiatic members of the deer family. There is, however, a marked difference both in colouration, antler formation and the call.

A typical wapiti head can be readily distinguished from that of a red deer by the formation of the tops. The fourth tine is always the largest and, with the fifth and sixth, develops on the same plane without lateral divergence. Mr. Johnstone's last paragraph is rather absurd in meaning. The "great Irish elk" is another common misnomer. This giant fallow deer which stood from 6½ft. to 7ft. high at the withers, was not an elk. Mr. Johnstone says: "Surely the great Irish elk dug up in the Erse bogs are proof enough to the contrary." Proof of what? In my ignorance I am afraid Mr. G. Lyttleton Rogers is only a name to me.

CANINE SAGACITY

SIR,—The wonderful intelligence and sagacity of a dog prompts me to send you the following account of a friend's accident not long ago. Mrs. F. Brock, of Fawcett Street, S.W. 10, was in her kitchen when the ceiling fell upon her and knocked her unconscious. Rose, her six-year-old spaniel bitch of Devon breed, dashed into the kitchen, removed the debris from her mistress's face, and then licked away the plaster from her nose and mouth, thus bringing her mistress back to consciousness. Rose then dashed upstairs and called assistance. The Canine Defence League have granted their medal to Rose for saving life.

Yours faithfully,
228, Tufnell Park Road, FRED CHERRY.
N. 19.

A 45-YEAR-OLD GANDER WHICH DOES NOT APPRECIATE PHOTOGRAPHY
(*See letter "Gander"*)

A RABBIT IN A TREE

SIR,—For some weeks I have been searching for a rabbit in my garden as it was doing a lot of damage, and recently I discovered its hiding place, which to my utmost astonishment was about 5ft. up in a Cypress tree, where it had made a nest. It jumped out when I was poking about underneath the tree, which is a fairly tall one. It is quite easy to see the way by which it reached its "nest." The garden has wire netting all round, so the rabbit must have got in somehow and been unable to get out.

Yours faithfully,

Bursted Manor, W. H. BRADFORD.
Upper Hardres,
near Canterbury.

GANDER

SIR,—"Gander" is 45 years of age, his wife a mere child of 42. For years he has established himself as protector of a large poultry run, allows no one, except his mistress, near the fowls, and rules them with a rod or, rather, a beak of iron.

For years when the last fowl has gone to roost, he taps with his beak on the back door of his mistress's cottage, letting her know it is time to lock up, and if she does not walk as fast as he wishes, he pulls her by the skirt or from behind has a nip at her legs with his beak.

Some time ago, his owner discovered that hens which had been ailing for a day or two were drowned in the pond. She could not account for this epidemic of suicides amongst sick hens. One day, however, the mystery was solved, for she saw old "Gander" dragging a sick hen by the wing down to the pond, where he deliberately drowned it, keeping it under water by standing on it till it was dead. He evidently disapproves of sick hens amongst a flock of fine birds. Now, however, every ailing hen is removed out of his reach.

Though murderously inclined himself, he is a strong supporter of law and order amongst the fowls, and should he see any birds fighting he immediately rushes in, stops the fight, and woe betide the bird he thinks was the aggressor.

Yours faithfully,

London. P. C. SAUNDERS.

WERE THE FISH CHOKED?

SIR,—The following may be of interest. In September, 1937, five trout of approximately 3in. each were taken from a very small moorland trickle about 1,000ft. above sea level, and placed in my garden pond. This is only about 50ft. above sea level, and is an entirely artificial structure of concrete, fed by rainwater from the roof gutterings. The approximate length and width are 50ft. by 7ft.; the depth slopes to an average of 18in. in the centre. It is well stocked with gold fish and golden rudd and well planted with weed.

A week ago, on consecutive days, I found two of the trout dead. The first was a very plump healthy-looking fish of 8¼in. with a bulging tummy. I opened this, to find inside a full-grown female common newt, dead but undigested. The trout's mouth was widely distended, as though it had choked.

The second was also healthy and plump but had a very flat tummy and widely gaping mouth. On opening, I found its stomach exceptionally empty. Had it also swallowed a newt and had the newt escaped after the spasms of choking and vomiting had proved too much for its captor?

Yours faithfully,

The Pyghtel, J. WALLER COVERNTON.
Cliff Park Lane,
Goodrington,
Paignton.

YOUTH AND THE SPEY

SIR,—I was very interested seeing in your issue of June 10th a photograph of a young angler and his first fish caught on the Bray water of the Spey.

I do not think that this can be quoted as a record, and I should like to say that I well remember two similar cases—both of which occurred in the Quarry pool of the Spey—in 1915 and 1919, when two Gordon-Lennox brothers aged seven and eight, caught their first fish.

Incidentally, since then, these two—G. Gordon-Lennox and A. Gordon-Lennox—have become two of the finest rod fishermen in Scotland.

Yours faithfully,

Fochabers, JOCK SCOTT.
Morayshire.

"DON'T GO DOWN THE MINE, DADDY"

SIR,—Possibly you might be interested in the enclosed photograph. A great tit built its nest in one of the hollow tennis posts on my court, and the photograph shows the parent bird about to enter the post for the purpose of feeding its young with a worm.

This happened on several occasions whilst we were actually playing tennis, and I had no difficulty in securing this snap (which is, of course, enlarged considerably) from a distance of some 25ft.

The nest was so far down the post that it was quite impossible to see anything of it. Therefore it is a matter of conjecture as to whether, and if so how, the young birds managed to leave it.

At any rate there is no longer any sound to be heard, and so I hope they are not all dead at the bottom of the post.

Yours faithfully,

Ashton House, G. O. HERBERT.
Steeple Ashton,
Trowbridge.

CAT'S CRADLE

SIR,—I have a rearing field close to the main road, and between the road and the wire-netting there is a spinney. Recently my son heard the alarm cry of blackbirds, &c., and went to the spot. In a blackthorn tree about 12ft. from the ground there was an old nest, and he saw a cat's head appear over the side. On closer investigation he found the bottom of the nest was an old wood-pigeon's, but this was covered with another nest of hay and feathers, a sparrow's, and in this flattened nest were three kittens a few days old.

Yours faithfully,

Lyons Game Farm, DOUGLAS F. JOHNSON.
Slinfold, Horsham.

ARMY HORSEMANSHIP

SIR,—Much that is depressing has been written about the mechanisation of the Army, therefore the following statistics about the International Horse Show may be of some comfort to your readers:

(1) In the "First Jumping Competition" there were 85 entries, of which 37 were British, 26 of which were entered by individual officers of mechanised units.

(2) Thirty-two horses qualified for the *Daily Mail* Cup, of which twelve were British.

(3) Big Sweep (Butler) and Cark Clever Vixen (Brunker) together jumped more clear rounds than any other two horses, and individually more than any except Honduras (Bizard).

(4) Seventeen horses qualified for the final of the King's Cup, of which eight were British.

(5) More British horses jumped one or more clear rounds than those of any other country. There being seven horses in all.

(6) Great Britain won the Prince of Wales Cup by a fairly wide margin.

Statistics may be made to prove anything, it is said, but I feel that the above may be of some comfort to those who fear that the interest of the British officer in horses is dead.

On Wednesday, Captain Butler jumped two clear rounds in the Prince of Wales Cup and then went on to Hurlingham and played in the winning team of the semi-final of the Champion Cup.

Yours faithfully,

London, "STICK HEAP."
S.W. 3.

GREAT DANES

SIR,—In regard to Great Danes, I can remember those belonging to the Comte de Lalaine on the Avenue Louise in Brussels some 60 years ago! They were huge beasts, not at all coarse, and very fierce looking.

Mostly blues or harlequins, the latter marvellous to look upon, they wore collars of silver about 4in. wide and had, of course, cropped ears, which makes a different dog of a Dane.

They used to always accompany the Comte's young sons, who wore their hair "en Mérovingien," no hats and dark brown surcoats with belts. The whole effect was unique, so I have not forgotten it.

Yours faithfully,

Home Farm, MARGARET HEINEMAN.
Old Sodbury, Glos.

SERVICE!
(*See letter "Don't Go Down the Mine, Daddy"*)

A match for each other

Romance to-day has none of the handicaps of past generations. Young men and women can share the same interests, play the same games, smoke the same cigarettes. The latter was inevitable once women learned to appreciate the man's cigarette—Wills's Gold Flake. The flavour of really fine Virginia tobaccos appeals to modern women. They've got Wills of their own, you see, in every sense of the word.

WILLS'S GOLD FLAKE
is the man's cigarette that women like

N.B. You can get Wills's Gold Flake CORK-TIPPED as well as Plain.

G.F.8. 752

A MOORHEN 40FT. UP

SIR,—While shooting vermin on a neighbouring chicken farm to-day, I noticed a fairly large black bird fly from a large nest at the top of a high tree and disappear into a nearby wood, evidently disturbed by my shots. I was 400yds. away at the time and could not see the bird very easily. However, I informed my host of this, and later in the day we went to inspect the nest, as he suspected it was a crow.

Standing underneath the tree he said he could see the bird's head, and, on firing, down fell 40ft. fell—a moorhen!

One has heard of these birds building in low trees, but has any reader ever heard of a moorhen's nest built at such a height?

A problem which would eventually have presented itself to the mother-bird is—how was she to convey the young to the ground safely?

Yours faithfully,

Tuckness, J. B. WILSON.
Hawkhurst, Kent.

STRANGE BEHAVIOUR OF A GREENFINCH

SIR,—Some weeks ago I took this bungalow. Adjacent one of the windows stands my dog-house. The whole day long a greenfinch spends his time flying from the dog-house up the window or tapping at it. If I open the window he will venture on to the ledge but no further. Sometimes he brings a mate to look on. He takes no notice of my Basset hound and two puppies. Hemp seed is refused, and he eats little bread. I have wondered if minute flies on the window attract him, or could it be his reflection—or what?

Yours faithfully,

IANTHE ST. AUBYN FORT.

Jubilee Bungalow,
Haldon Moor, South Devon.

A.R.P. IN PARIS

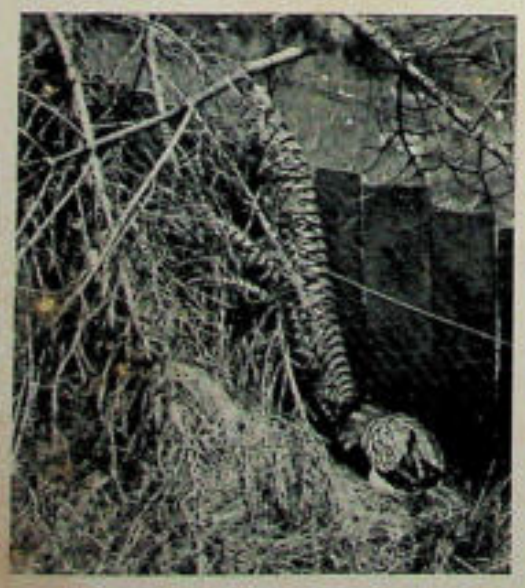
SIR,—Visitors to the Luxembourg Gardens in Paris have been rather shocked to notice that trenches have been dug in some of the few fine old lawns of that city.

However—as usual in Paris—art triumphs over all difficulties, and the trenches have been carefully planned not to disturb the statues, however much the grass is disturbed. In my photograph we see (paradoxically enough) the well-known group, "Peaceful Night," rising from a neat square of surrounding concrete trench!

Yours faithfully,

56, Oakwood Avenue, C. A. HARRISON.
Beckenham.

A COCK PHEASANT SITTING



SIR,—I took the accompanying photograph recently at my home in Sutherland; it is of my three-year-old cock Amhurst pheasant sitting on a nest of his own hen's eggs. His six wives were all sitting hard when apparently he got bored and thought he would "take a hand" himself. So he turned one hen off her nest and has sat on those eggs himself for the last seventeen days! Meanwhile the hen he turned off spends most of her time sitting on the bare ground about 2ft. away from him! She would not allow me to get near enough to include her in the photograph.

He is very fierce if one goes too near, pecks one's hand hard and nothing will dislodge him. It will be interesting to see if he hatches the eggs and if he will rear the chicks.

I would be interested to hear if any of your readers know of a similar case.

Yours faithfully,

Balnacoil, Brora. JESSIE TYSER.

HERE HE HAS SAT FOR SEVENTEEN DAYS
(See letter "A Cock Pheasant sitting")

DECLINING DONKEYS

SIR,—Though donkeys are still to be seen in considerable numbers on the sands of the larger seaside resorts, these animals are rapidly disappearing from the roads—largely because costers find them too slow. At the annual donkey show organised in London by Our Dumb Friends League, over 150 donkeys were exhibited in the year 1909; in recent years, fewer than 30 have appeared.

A clipped or partially clipped donkey is now such an uncommon sight that the enclosed snapshot may be interesting. It was taken in West Cornwall, which probably boasts a bigger donkey population than any other part of England. Some donkeys are still bred locally as well as in the New Forest and the Gower Peninsula.

Yours faithfully,

73, Iffley Road, J. D. U. WARD.
Oxford.

A SMARTLY CLIPPED DONKEY
(See letter "Declining Donkeys")

MR. TATCHELL'S SCULLING BOAT

SIR,—Rowing men who have seen the photographs of the flat-sterned sculling boat published in the *Field* may be interested to hear what has happened to her.

She was sent down to Putney at the time of the Boat Race, and there tried by several leading scullers, most of whom, however, were considerably over the 12st. for which she was designed. Owing to an over-estimation of the floating power of her flat stern the seat had been placed too far aft, and she was down by the stern. Since then she has been sent back to Kingston, her seat and outriggers moved 6in. further forward, and now floats to her right waterline.

ART TRIUMPHS OVER ALL
(See letter "A.R.P. in Paris")

The following is an account of her behaviour when sculled by Mr. G. D. Mackway, of the Twickenham Rowing Club, who is 11st. and of medium height.

"When moving ahead her stern remains practically steady at the designed level just above the water. As the stroke is pulled the bow rises considerably: in other words, she planes up, thus markedly reducing her displacement. As long as this happens, *i.e.*, so long as the sculler is fresh and sculling at a lively rate, she seems to be distinctly fast. At the end of the stroke the bow does not sink below the normal flotation level. There is not the least semblance of a following wave."

Whether the design is fast is hard to tell, as she has not yet been raced; but in practice she certainly appears to be no slower than the usual type of racing boat, while the flat stern does in some degree exert the steadying effect originally aimed at.

The boat is now at Turk's, Kingston-on-Thames, where she is at the disposal of any sculler who will be kind enough to try her. Possibly a tall oarsman of about 11st. 8lb. would get the best result. Why tall? Because the bow does not sink at the end of the stroke, and, therefore, the boat would stand a long swing.

Yours faithfully,

London, PERCY TATCHELL.

ELEPHANT LYING DOWN

SIR,—While shooting shamba-raiding elephants for the Game Department of Kenya, my boys and I were following up the spoor of a bull, which had been raiding native shambas.

After following his tracks for a couple of hours, we suddenly came on him in thick bush lying down on his side, enjoying a siesta after a good feed of maize. As it was impossible to get in a vital shot, we retreated, and he must have heard us, for he was up in a flash and moved off among the thick bush. After carefully stalking him, I eventually got in a brain shot.

The same evening the boys brought in the tusks, and on cutting him up found that his stomach was full of maize. There was much rejoicing over his death.

Yours faithfully,

Limoru, J. PITCAIRN HOLMES.
Kenya Colony.

CORACLES

SIR,—I must ask Lord Dorchester to accept my apologies for having left his letter, which appeared in the *Field* of June 3rd, so long unanswered. The address of a skilful coracle maker is Mr. Parry, Head River Keeper, Chirk Castle Estate, Pentre, near Ruabon.

In this part of the county he is the only man I know of who makes coracles, and from personal experience I know he makes them well.

Yours faithfully,

Llangollen-Fechan, R. J. HUGHES PARRY.
Llangollen, Denbighshire.

TAKE all that holiday-time offers and leave your skin and complexion in the safe-keeping of Larola. The beautifying and protective qualities of Larola on the face, hands and arms never fail throughout the seasons. Use it regularly. Revel in its refreshing, soothing properties. LONGEVITY OF A PARROT

SIR,—Stories of longevity in animals are not infrequent, but many of these are unsubstantiated, so that it may be of interest to record the following authenticated instance in the case of a parrot belonging to Colonel Langlois, of Alderney, C.I.

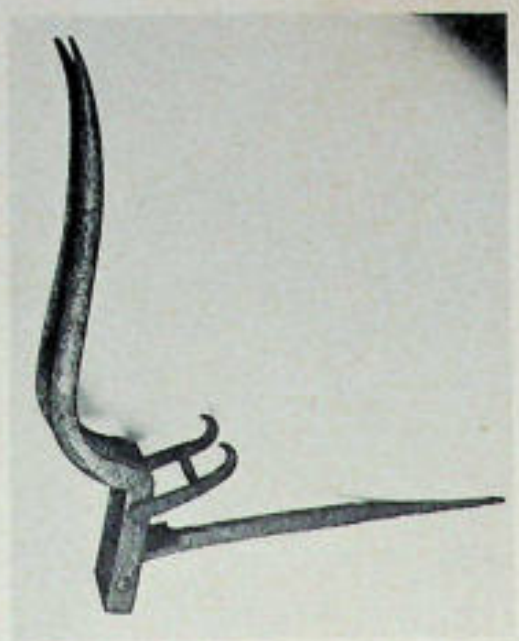
In February, 1889, the ss. City de Barri, an Italian vessel from South America, with a cargo of maize and 46 green Amazon parrots on board, was wrecked on the coast of Alderney. Nearly all the parrots died, but two lived on, one to the age of about 20 years and the other (Colonel Langlois's bird) to February 24th, 1939, or to well over 50 years. Its age on landing in Alderney is not known, but it was full grown at the time. He was a really wonderful bird, and I have not seldom held conversations with him. In the words of Colonel Langlois, he "called the dogs and cats, crowed, barked, sang songs, asked for all he wanted, called us by name, and would answer correctly numerous questions."

Yours faithfully,
W. R. THOMPSON.

Clements,
West Moon Road, Ferndown,
Dorset.

FOR WHAT WAS THE IMPLEMENT USED?

SIR,—I send you a photograph of a curious implement which was found a short time ago in a barn in this county. Up to the present I have been quite unable to discover for what purpose the implement was used, and venture to ask if any of your readers can name it. When extended to its full length it measures 22in., and apparently the pointed end fitted into a handle. A shoulder can be seen in the photograph. I do not think the handle could have been very long as the iron is not thick enough to stand a great strain.



Yours faithfully,
F. C. MORGAN
(Curator).

The Museum,
Hereford.

KENNEL PROBLEM

SIR,—In the June 10th issue of the *Field*, a correspondent raises the point of the treatment of hysteria in dogs with his experience of treatment with halibut oil. As prevention is usually better than cure, the following may interest some of your readers.

I know a breeder and trainer of Labradors and other sporting dogs who, over a number of years, does not know what hysteria is. He puts this down to his method of feeding his puppies.

WHEN EXTENDED IT MEASURES 22 INCHES
(*See letter "For What Was the Implement Used"*)

When the puppies are ready to leave the mother, his method of feeding consists of throwing into the run a "lump" of raw horse-flesh on which the puppies can feed as often as and as much as they please. This is replenished as each "lump" gets reduced. This and nothing else except water.

Yours faithfully,
J. C. CLAYTON, M.R.C.S., L.R.C.P.

Fairford, Glos.

EARLY PARTRIDGES

SIR,—In reply to Mr. F. H. Blakeley's letter in the *Field* of June 17th, regarding young partridges on Whit-Monday, which was without doubt early for the district, I wish to say that a covey of eleven was seen by me on this estate, Brockhampton Court, on Whit-Sunday, May 28th, and a further five coveys on Whit-Monday, May 29th. This is the earliest I have ever seen young partridges, although in Kent on one occasion I saw two coveys on May 30th, this being in 1935.

Yours faithfully,
J. F. ASPLEY.

Stone House,
Brockhampton,
Hereford.

CROW CATCHES TROUT

SIR,—A friend has drawn my attention to Mr. Tower's letter entitled "Crow Catches Trout," in your issue of June 10th last. I have seen this happen on a fishing I have on the Iton River (which runs into the Risle) three times last year. On one occasion it was also seen by two friends of mine who were fishing with me, the Hon. Reggie Fellowes and Lord Dundonald.

The crow very clumsily flops into the water or on the water, then rises with a small fish, say 4in. or 5in. long, flies on to a post or tree nearby and quietly eats it.

We all thought, perhaps, it might be a small chub and not a trout.

Yours faithfully,
A. C. M. ANDERSON.

Chalet de Buzenval,
Careles (S. & O.).

A CRICKET CRISIS

SIR,—The following extract from a letter received quite recently from the Lawrence Royal Military School at Sanawar in the Simla Hills, is sent, as I think you may like to publish an account of so unusual a cricketing incident:

"One of the first storms accompanied by tremendous wind created an amazing and rather amusing diversion down on the boys' cricket ground. The pitch matting suddenly blew up, lifting the batsman with it and hurling him down, knocked him senseless. Then the matting proceeded to roll itself up, lifting two or three of the fielders right off their feet and pitching them bodily several yards across the ground."

Yours faithfully,
J. K. TOD.

IN THE CITY

By OUR CITY EDITOR

THERE has been a good deal of discussion in City circles recently concerning support given various new capital issues. It is well known that there are several important syndicates in existence which make a speciality of new issues. Applications are sent in by the syndicates for new loans if they are considered attractive, simply for the purpose of being able to sell the allotments at a profit when dealings begin on the Stock Exchange.

Naturally, general conditions are weighed up to a nicety before applications are sent in. Even after the lists have been opened and closed the position is most carefully watched. Should certain lists be kept open for a longer time than had been expected, there is usually a wholesale withdrawal of applications.

It is well known that withdrawals can be effected up to the time allotment letters are actually placed in the post. Just recently, Hertfordshire County Council invited subscriptions for a loan of £3,000,000. This was in a 3½ per cent. stock at a price of 96½ per cent. The redemption dates were 1954–59. Some £2,000,000 of this money was required to repay an outstanding 6 per cent. loan. Only a little over £1,000,000 was, therefore, new money.

It is on record that applications for this loan to an amount of £45,000,000 were sent in. Allotments were naturally drastically scaled down. Application money for amounts up to £600 was returned, while those for larger amounts received only a very small portion of their alleged requirements.

There is no possible doubt that a very substantial portion of the £45,000,000 was sent in by those who did not require the stock for investment, but believed that a small profit could be made on an allotment. That view turned out correct as the scrip promptly opened in the market around 12/6 premium.

Immediately afterwards the London County Council came along with a loan for £7,500,000 on exactly the same terms as Hertfordshire. This was all new money required by the L.C.C. for various purposes, such as Slum Clearance, expenditure on hospitals and schools, contributions towards establishment of the Green Belt around London, and A.R.P.

It is admitted on all sides that the credit of the L.C.C. is even superior to that of Hertfordshire. It was noticed that the two loans were on identical terms, but from the very moment underwriting of the L.C.C. loan began it was described as an issue which stood no chance of success. In the first place the amount was large, and in recent years the L.C.C. has been a hardy annual borrower.

In the case of this loan investors applied for less than £500,000. Over £7,000,000 of the loan was, therefore, left on the hands of the underwriters. Other securities had to be sold in order to provide money to carry the new loan, with the result that there was wholesale collapse in prices of all new issues.

Instead of being 12/6 premium, the scrip of the Hertfordshire loan went to 10/- discount. It means that the loan can now be bought at 96. The L.C.C. loan went to 2 discount, but has since recovered to the neighbourhood of 1 discount. These loans are worth more than their price of issue on present monetary conditions. Corporation stocks of older standing command a higher market price. It is highly probable that the scrips of the new issues will improve as overhanging supplies go into the hands of permanent investors.

I believe there is an opportunity here for the investor to acquire really cheap lines of stock. The L.C.C. loan, for instance, is a particularly sound security. Its present low price is due to market disorganisation caused, it must be stated, by the ill-advised offer of such a large line of stock on a market which has been particularly tender for some time owing to political tension.

Several comparatively small industrial companies have successfully raised new capital. In fact, June proved the best month for new capital issues since May of last year. There are ample resources in the country to provide capital for industry. All that is necessary is more settled politics which will give investors courage.

MOINA DIES

After a starvation strike which lasted for ten days Moina, the London Zoo's giant gorilla, has quitted this world of iron bars, and has gone to rejoin Mok, her former companion, in the pleasant forests of Nirvana. When she arrived at the Zoo in 1932 Moina weighed a mere 112lb., but when she was last weighed it was found that she had grown to be a sturdy young female of 20st. Her friend Mok, whose death occurred a year and a half ago, was even larger, and turned the scale at 25st.

New Books

CRICKET—WITH ITS CAP OFF

Background of Cricket. By Sir Home Gordon, Bart. (Published by Arthur Barker at 12/6 net.)

The world which lies behind the familiar setting of county cricket, the world which the players enter when they disappear into the Pavilion, is almost as interesting, as colourful, as the actual play itself. But it is a world which the "man-in-the-seat" never enters. To him the game is always dressed up, decorative, a mere echo of what it really is out there in the middle. To him its players are always so many masks made famous by the daily Press, like statues on a pedestal. This book goes behind all that, behind the conventional setting and the masks. It looks behind the scenes. It sees the famous for the men they are, learns their feelings, their exploits, their views on the game. It is about the background of cricket.

It would be hard to find a better man to write it. Everyone in the cricket world knows Sir Home Gordon. And Sir Home knows almost everyone, and certainly everyone that matters, in cricket. He has probably seen more of it played than any one man living. He can remember the first Australians. He saw G. F. Grace make his catch under the gasworks at the Oval to dismiss Bonnor and make cricket history. He has watched cricket at Princes'. He has sat at a Lord's flourishing with trees and resembling a village green. He has followed every 'Varsity match but one for 60 years. He was the first real writer on the game.

But it is not as a journalist that we know Sir Home. It is as a statistician. His collections of records, and runs, and wickets have amazed us. He has brought the tabulation of the facts of cricket to a fine art. And this book of his is more the book of the statistician than the journalist or the novelist. It is a collection of facts; of amusing stories, interesting incidents, intimate character studies. There are stories about Yorkshire and, of course, Tom Emmett; stories about every county, and especially Sussex. One of the incidents described is typical. It is about Duleep. He had challenged Lord Harris. And so Sussex had met Kent at Maidstone. At the time there was a prolonged drought. There was also, however, a considerable amount of water on the wicket—to help Freeman's spin. Sussex lost. Duleep was furious. He vowed vengeance. Lord Harris was told he would see Duleep score a century in each innings of the return match. He did; and one of them was a double century. There are thumb-nail sketches of Bradman and Hammond, Thornton and Jackson, and a whole host of cricketers.

It is a plain tale. Sir Home rarely gives theories, only occasionally gives opinions, never ascends to the clouds of idealism. There is nothing here of the summer game as Neville Cardus sees it, with its green fields, white figures, yellow sun. Nothing of the brilliant insight and vast knowledge of all its technicalities which are in the writing of C. B. Fry. But simply as the record, the photograph of one man's view of the game, for the ground it covers and for the details it absorbs, it may never be surpassed. Humphrey Daniel.

* * * *

Cruising with a Camera. Phototips for Sea and Shore. By F. W. Frerk and Oswald Blakeston. (The Focal Press; 6/–.)

Writing in rather a racy style, the authors of this book give some very sound ideas on photography for the vast army of camera-users that have come into being and want some real records of their cruises and holidays. Amateur photographers are ambitious these days and wish to show their friends something more than the small fuzzy snapshot which needs a terrific amount of explanation to describe what it represents. To the purchaser of a new camera the writers say: "Buy it well in advance. Read the instructions and practise the methods of handling it before you expose a picture. Learn the snags before they happen, and find out how to make yourself foolproof." "It is a mistake to buy a new camera which you have never used when you start the adventure of a cruise." And with this sound initial advice the differences in cameras, the art of composition and the mysteries of film speeds, filters, exposures, &c., are then explained in simple language. There are excellent illustrations to show what pictorial excellence can be achieved on the cruise. A point on which the critic might differ is in regard to the table of shutter speeds for motion. This seems to err on the slow side in several instances with respect to its rather wide definitions. *Cruising with a Camera* should prove a great help towards better pictures. R. N. Rose.

* * * *

Trailing through Siberia. By Joseph Crad. (John Gifford; 10/6.)

This is a book teeming with adventures, written by a man who has lived in some of the most out-of-the-way places in the world. Mr. Crad knows Siberia and Alaska as few writers can, for he has spent years among the Eskimos, prospectors, sealers and others who live or travel to these northern regions. And from beginning to end there is not a dull page. The habits and customs of the natives are described in that vivid style which is the outcome of an intimate knowledge and a ready understanding. This will intrigue all and sundry, as the accounts of big game shooting will interest the sportsman. But to get a good idea of this book it is but necessary to hear a very few of its contents. A dog-team race in Alaska—fur trading—Eskimos of Port Clarence—a lecturer on women, their uses, how to treat them—journey in a blizzard—a walrus hunt—my first visits to the Tchuck-Chis of Siberia—polyandry.

Speaking of the family life of the Eskimos from the Mackenzie River in Canada right away to Arctic Siberia, Mr. Crad says that their treatment of children was splendid. Brutality, such as is known in the slums of large cities or elsewhere, was absolutely unknown. To show the differing types of humanity to be found, he mentions meeting the owner of a trading post near Kuknipto Island who was of mixed Gakut, Bariut and Russian blood. This man was not more than 4ft. 6in. in height, with the torso of a gorilla. His chest measurement next his skin was 58in., and his huge muscular arms, thick as the average man's thigh, were so long that his hands reached below his knees. This will give an impression of what to expect—but read the book and find out all about it.

* * * *

Unknown River. By J. M. Scott. (Hodder and Stoughton; 7/6.)

Peter Sherwood by a stroke of chance meets Lucky Long, who has knocked about the world and who fires his imagination with a desire to break away from humdrum life and to go to North East America, where the latter has an old score to settle with an ex-partner who let him down. He offers to pay all expenses, and the two set off. Many adventures follow in the backwoods of this wild region, where the search for gold, trapping and shooting, the rough and tumble of prospecting life, queer characters and unexpected thrills and shocks make the book an entertaining companion. But if you want to know how the two eventually come safely out of a series of tough situations you must read the book. It will certainly hold you to the last page, which comes all too quickly.

* * * *

The Death Treasure of the Khmeres. By Lance Colam. (Stanley Paul; 12/6.)

This is a most exciting story about an adventure which starts in Macao, the Portuguese colony in China. Here Lance Colam meets a half-caste French-Cambodian who, under the influence of opium, tells him of his finding the hidden treasure house of the Khmeres, a vanished race that flourished 800 years ago. The secret had been kept by priests, who would have killed the half-caste had he not made good his escape.

The account of how the author, after journeying to Angkor, makes his way into the densest jungle and locates the treasure is very thrilling, especially when he sees a death ceremony and the daughter of the half-caste, whom he had hoped to save from captivity, stab herself. He does, however, succeed eventually in rescuing her sister. By masquerading as a butterfly collector and thus being allowed to remain in the district, though regarded with suspicion, he actually gets to the treasure in an underground chamber, but fails to secure any reward for his daring, as, at the critical moment, a 20ft. python is released.

The story is exceedingly well told, the accounts of native life and ceremonies being as interesting as the adventures of the writer are hair-raising; there are some good half-tone illustrations, and it is unlikely that the book will be put down until the last chapter is read.

W. H. T. Long.

* * * *

Sailing on the South Coast. By K. Adlard Coles, with charts and drawings by T. L. Stocken. (Faber and Faber; 5/–.)

This is an extraordinarily valuable little book which every cruising yachtsman should have aboard. They will know too well the difficulty encountered when making a landfall in thick weather, but Mr. Adlard Coles, with Mr. Stocken's valuable help, has simplified their task for the future.

Sailing on the South Coast includes photographs of most of the harbours and a sufficient number of prominent headlands to form, as it were, stepping stones of identification at intervals from the South Foreland to the Longships. Then, too, there are Mr. Stocken's excellent charts, so that no yachtsman should fail to get a copy of this book.

The information crammed into its 144 pages is truly amazing. I thought I knew most of the South Coast harbours, but I learnt something new about nearly every one of them from Mr. Coles's notes.

William Lusombe.

* * * *

The Compleat Goggler. By Guy Gilpatric. (The Bodley Head; 10/6.)

One may admire a book for many reasons. One may like the subject, its presentation, the style or the author, but it is rare to enjoy a book which one realises one does not fully understand. Mr. Gilpatric has an unusual subject, and he deals with it in so delightful and witty a manner that anyone innocent of goggling is never quite sure whether his leg is being pulled. Nor is a feeling of confidence restored by the author's candid admission that he has included "a rather superior lie or two." Yet what Mr. Peter Fleming has done for travel, Mr. Gilpatric has achieved for goggling.

Quite simply, goggling consists in the art of killing fish beneath the surface, protected only by goggles and armed with a minimum of weapons, such as a spear. In the course of this sport, Mr. Gilpatric has seen undersea landscapes of incredible beauty, has encountered remarkable fish—and fought them—on their own ground, and has seen many things which no one would believe possible. Merou the Bonehead was an old friend and remained sublimely indifferent—like Moby Dick, with whom he is compared—to all attacks by spear. The idea of attacking a large octopus under the water is one to which I myself should feel bound to give some consideration—yet to Mr. Gilpatric it is a daily delight. Nor is the account of the weapons and the way in which they were evolved any less interesting than that of their ultimate destination. As a final and convincing plea for the sport, Mr. Gilpatric includes some suggestions as to the cooking of the trophies.

Goggling is, of course, a sport which may be abused, and the author rightly has a horror of the crowded beaches of the Mediterranean generally and of those sections in particular where the occupants have lowered themselves to goggle in 3ft. of water. But it is quite clear that if goggling is properly carried out it is a sport of the first order and attraction. Robert Colville.

BOOKS IN BRIEF

We recommend to our readers *Citizen Service*, the monthly journal of the Citizen Service League, which is dedicated to the cause of national security. The May issue contains articles from eminent authorities on Conscription, German Colonial Demands, the Auxiliary Fire Service, and Army Training this Summer.

The photographs in *Phototips on Cats and Dogs* (Focal Press; 6/–), as might be expected from studies of two such domesticated animals, are, almost without exception, very good indeed. Their action is good, their setting good and their effect on the eye through contrasts of light and shade good. The tips which accompany them, although couched in a language frequently exploded with a series of interjections and question marks, give some useful technical advice.

We have received a copy of the *Anglo-Argentine Review* for May. This is of particular interest in its survey of trade between Britain and the Argentine and the effect of the lowering of minimum freight rates. Following the death of Colonel Charles Morley-Knight, almost the entire herd of Aberdeen-Angus cattle owned by Messrs. Knight & Porteous has been bought by Dr. Enrique Larreta. The herd was the largest of red Aberdeen-Angus in the world, and the bulls were in great demand for crossing purposes. It has descended principally from stock reared by the late Mr. W. K. Macdonald, of Ballintuim, Perthshire, and the sale put through covers a total of 808 head. Mr. Harold J. Hardy writes of sport in Argentine waters.

BEST DAYS WITH OTTERHOUNDS

The Wye Valley Returns to the River Usk

AFTER our joint week, we resumed operations in our own country with a meet at Clytha Arms on the River Usk. Included in the field were Mr. D. Prothero and Captain Howell, of Pembroke and Carmarthen Otter Hounds.

Hounds tried the drain at Pantygoystre, but nothing resulted, and it was not until we came to Llanellen Bridge that hounds were at all interested, and here old Granby marked his otter in the river bank; terriers had a great to-do with the otter, who left its teeth marks in one of them before bolting.

Upstream was the first move, and hounds hunted with plenty of vim and threw their tongues on what seemed to be a good scent, up through the rapids they went, hunting every yard of water. Soon, however, they became silent, and were casting about for the resting place of the otter. Looking up the bank, I saw what looked like an otter running through the rocks and undergrowth above us. Slipping up the bank, this is what I saw. Running a small path was the otter, and in its wake was a stoat, who every few yards would attack the otter's side without making the least impression on the otter. Getting in front and turning the otter back down the path caused a collision between these two, and the last I saw of the stoat he was flying through the air like the trapeze man.

Hounds were running the line of the otter full cry and were soon back in the river swimming downstream, with the two new Dumfries hounds in the van, on this their first day in the Wye Valley. This swim took us down nearly to Penpergum Bridge, where hounds turned and came back upstream, to lose their otter in this pool.

Mr. Thompson kept them at this pool for some time, and then Charlie came with the news that he had just seen a cub of 7lb. or 8lb. on the bank below us. This, of course, decided the issue, and hounds were called off, and we finished for the day.

On Friday we met at Hostelrie Goodrich, when our usual luck on the Wye, in the extra water coming down, made it too dangerous for hounds, and we had, in consequence, a poor day. M. L.

EASTERN COUNTIES' NORFOLK WEEK

OWING to serious illness in his family, Dr. Samuel Shepheard, the Master of the Bure Valley O.H., was unable to hunt his hounds during the period that the E.C.O.H.-B.V.O.H. joint week had been fixed. Dr. Shepheard, however, kindly loaned eight-and-a-half couple of his hounds to us, and Mr. Jack Russell, the E.C.O.H. Master, took on the strenuous task of hunting hounds for six consecutive days, a mixed pack being taken out each day.

The first meet was on July 3rd at Euston County Bridge on the Duke of Grafton's estate, and hounds drew up the Little Ouse, through Rushford Carr, without drag, and it was not until they reached Rushford Heath that they opened, and came up to an otter in the big carr. They hunted him well in a big right-handed circuit of the covert before he got into the back ditch, down which they roared at him until he pulled out and ran another circuit of the carr. He then crossed the main river to the island, where they were close at him, hunting with a terrific cry, and soon forced him into the river. He came away at the bottom end and was viewed going down, but he soon doubled back to the island, around which he led the pack until he again took to water and swam down to the footbridge, where he was viewed. Hounds swam on down for half a mile, but presumably flashed over him, for he was never seen or winded again. This had been 70 minutes' of fast work, and another hour was spent trying to fresh find him, but he was safely tucked away somewhere, and at five o'clock he was given best.

The venue on the 4th was Didlington Mill, and a very representative field assembled. Hounds had a line over from the Wissey to the lake, and soon put up a brace of otters on the middle island at 11.25. Having taken the dog round the island, they crossed the channel to the reed bed, throwing their tongues in a rare chorus and soon had their pilot back on the big island again, where they hunted him for a spell until he got into the lake. Now commenced a long period of swimming, with a brace of otters in front of hounds, and during which they, no doubt, changed pilots at times. After swimming round the big island, they hunted across it to the top end, where the dog otter was caught on the sand spit, but managed to escape again before they could close in on him.

The pack next roared away down the channel and across to the sluice, where they changed on to the bitch and went back with her to the island, which they crossed to get into the channel and over to the far lakeside. Another rare swim now followed as, with the brace in front again, they went right up to the top of the lake, by the Lily Pond, where both otters were viewed, the dog being a very big otter indeed, just about a 30-pounder. At the reed beds by the Lily Pond the otters separated, the dog going back up the lake side and the bitch, with hounds swimming her well, across to the big island. It was now 2.30, and the going was as good as ever, and having been viewed across the island, the bitch got into the channel, where they lost touch with her until they hit her off again, and after a further spell of hunting in the reeds, she took them right down to the Lily Pond end of the lake, where they were hard at her under the overhanging trees, until she crossed back to the island, and then over to the reeds by the sluice gates, where they lost her, and this magnificent hound hunt of four and-a-half hours concluded. Hounds were now all in, and so, one imagines, were the otters. Hounds had been swimming practically throughout this long hunt, and had received little assistance in their tussle against a brace of strong otters.

We were at Didlington again on the following day and hounds drew round the lake, speaking only by the Lily Pond, into which forbidden territory it was presumed that the otters hunted overnight had gone. They were, therefore, left, and having tried up the Wissey to the cattle bridge, hounds were taken back to try below the lake. As they discovered only stale work here, they were next lifted to Foulden, where Borough Fen was drawn. There was stale work in the fen, but no otter, and having tried the Cockley Cley stream to My Lord's Wood without event, the closure was applied.

From Thetford Bridge Station on the 6th we drew up the Little Ouse, across Barnham Common to the railway with a stale line before lifting the pack to Fakenham to try up the Ixworth stream. Hounds got on to a fair drag by Honington, and hunted it up by the Grange to Thorpe Carr, where foxes caused a halt. The drag went on to the mill near Bardwell, but hounds had not come up to their otter when we finished.

We met at the Narborough Ship on the 7th, and having tried down the Nar towards Pentney, we vanned up and took hounds to Baulk Bridge to draw up, but it was not until they got above the West Acre Road Bridge that they found really fresh work, and from here they had a rare drag hunt across the water meadows to West Acre Mill, where they got into the carr and put up a brace by the dyke. The selected pilot swam down the dyke before pulling out and ran a circuit of the carr with hounds screaming away in her wake. After a short spell in the river, she crossed the carr again and got into the Nar at the top end, where they swam her up well and, pushing her out on the far bank, killed her after 40 minutes' fast hunting, a 13lb. bitch.

At three o'clock they put the other otter down above the carr. She went hard upstream, and with a good scent on the water, hounds were able to hunt her well, some exciting work going on as she took them up and down river, occasionally hanging up in the rushes. She was viewed many times, and hounds were never far away from her; at times, in fact, she was forced to draw out and run the covert, but after an hour's hunting she swam right down and, crossing the shallows, drew out and was killed after 70 minutes, a big bitch of 19lb. This was a good day's sport.

The concluding day of the week saw hounds at the Thetford Anchor, to draw up the Little Ouse, where they had a stale line across Abbey Heath to the Stanch by Warren Wood. Here they got on to roebuck, and some time was spent collecting them, but in due course the draw continued, the drag running out by the Vitriol Works, the otter being presumably back in Thetford town. Master drew on to Santon Downham without drag before finishing the day; not a good day to finish with, especially as a wheel came off the hound trailer! However, we were very grateful for the loan of the Norwich Staghounds' trailer which enabled hounds to get back to kennels, where, having been fed, they climbed up on the benches for a well-earned rest, after seven days' hard work, during which they had found six otters and caught three of them. It is true that this could not be termed a joint week in the accepted sense of the term, but hounds of both packs hunted together and put up a very creditable performance in difficult country.

Our thanks are due to Mr. Michael Dill and Mr. C. A. Hopkinson for assisting our regular whippers-in during the week. DRIFTER.

MIXED SPORT WITH THE HAWKSTONE

THERE is not much to write about the first two days of this week. On Monday Mr. Stanier hunted hounds and met at Hope-under-Dinmore at the bottom end of the Lugg. He drew down to Eaton almost without a touch.

On Wednesday hounds met at Croome Court, the home of Lord Coventry. Mr. Wallace carried the horn, and he drew the artificial river first, where there was a drag on one side. He then tried the lake, but with no result, and the Croome otters again triumphed.

Pirton was tried without a whimper, and then after lunch hounds were vanned to Leigh Station and drew down to the Teme and then up the Teme as far as Broadwas. So ended a blank day.

On Saturday the meet was at the old rendezvous, Leintwardine. Mr. Wallace put hounds to water, and they immediately spoke to a drag which took them away from the Clun and across country. They eventually returned to the river, where the drag continued up to the Tay pool and on to Broadwood. After lunch Sir Henry Ripley's decoy pool was blank—for the first time—and a very intermittent drag went on as far as Coston. They came up to their otter at Oaker and put him down from the thick undergrowth between the back-water and the River Kemp. He went down to the Mill Stream, which was very deep owing to the torrential downpour which continued all day. After a sticky period, the otter was hunted well, with a good cry up the River Kemp to a mark under an oak tree. He then slipped back and landed in the undergrowth and into the back brook, which was in flood by this time. Hounds pushed him out into a big holt in the mill leat, and there—at 7.30—he was left. S. W.

THE DARTMOOR'S LIVELY HUNT

ON Tuesday, July 4th, the meet was at Sowden Bridge on the West Looe. A pouring wet morning unexpectedly provided us with a really exciting hunt. Raymond took the pack down below Shallow Pool to start the draw in tidal water. Hounds spoke immediately, indicating a strong line, which, however, weakened as we approached Sowden Bridge. Drawing on upstream, hounds suddenly marked solid in the right bank at 11.50. Five minutes later a large otter was seen taking the water and swimming downstream. He was given a good long start, after which hounds were laid on, and went away with a great cry. They over-ran him about 300yds. down; here he had landed, running upstream. He took the water once more near the silver fox farm some way above the original find. Putting into the right bank, he was very soon on the move again, and dashed downstream, hounds following with tremendous music. A few short checks during a really fast run brought us nearly back to Sowden Bridge. Here he landed once more, and was pulled down after this lively hunt of 45 minutes. A fine young dog otter of 24lb. A great chance had been given to the 4½ couple of puppies, brought out that day, and every one of them made full use of it.

Continuous heavy rain has not improved our sport. In spite of this we had a long and interesting walk up the beautiful Tamar Valley by the kind invitation of the Tetcott Otter Hounds on Thursday, July 6th. Hounds spoke at frequent intervals to a drag, which finally brought us to the end of our draw, rather late and very wet indeed. C. R.

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, games, country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, August 1st. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Bream's Buildings, Chancery Lane, London, E.C. 4.

2. Only amateur photographers are eligible to compete.

3. Photographs should be sent unmounted, and no prints will be returned.

4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final.

5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6.

6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.

Entries from abroad not arriving in time will be placed in the next of the series. Do not send negatives.

A FIELD OF SPRING CABBAGES IN KENT
"It much depends on the district and the county as to when the seed should be sown"

JULY SOWING—THE SPRING CABBAGE

A Profitable Large-Scale Crop

THERE is probably no more profitable brassica crop than the spring cabbage. It comes in at a time when greenstuff is scarce, and so is welcomed on the market. Under farming conditions this cabbage may follow early potatoes, beans or peas, or even a corn crop.

The spring cabbage trade may be divided into two groups : (*a*) spring greens, and (*b*) hearted cabbages. The spring green types are grown where the seed is sown but plants of the hearted cabbage types are raised in seed beds and are planted out in the open field two months later. When the seed is drilled in the field for greens, 5lb. of seed should be used per acre. When the plants are raised in the seed bed, only ¼lb. of seed is required for the same area.

In some districts it is possible to market a good crop of well-hearted cabbages by the end of April and have the ground cleared for another crop. If this is done, the spring cabbage can be regarded as an excellent catch crop. Naturally, early maturing varieties have to be chosen, for this particular purpose, and fortunately one or two firms have specialised in producing such types.

It much depends on the district and the county as to when the seed should be sown, but it should be between the second week of July and the end of July. In the north, the earlier time of sowing is preferred, and in the south the later—but successful sowings have even been made in August.

To obtain a succession—*i.e.*, for those who find a ready sale for cabbages up to the end of May—the first sowing may be definitely followed by another in August, while sowings for greens are often delayed until September in the south—one sowing say the first week, and another the third week.

When raising plants, the usual precautions should be taken against the club root disease, though it must be said that the autumn sowings are never so severely affected as those in the spring. The seed bed should be watered with a corrosive sublimate (mercuric chloride), using 1oz. of the chemical to 12 gallons of water. As mercuric chloride is somewhat difficult to dissolve in cold water, it is advisable to use half a gallon of hot water first of all, and then add the remainder of the water to make up the correct solution.

The seed bed should be soaked two or three days before seed sowing and again a fortnight later. Plants are thus raised which can be guaranteed to be free from the disease. If the land is known to be badly infected, one-eighth of a pint of a similar solution may be poured into every hole at planting time. This, when done on a commercial scale, need not cost more than 2/6 per 1,000 plants.

Corrosive sublimate is poisonous, and should be used with care. Further, it will eat away metal vessels if the liquid is left in them long.

Brassisan—a non-poisonous powder—may be used as an alternative "control." The seed bed should be treated with this material at 2oz. to the square yard before seed-sowing—a good raking-in being given. In order to obtain even distribution, it is as well to mix the required amount of the product with four times its bulk of nearly dry sifted soil.

Brassisan should also be applied to the dibble holes before planting the cabbage and for this purpose one part by volume of the powder should be mixed thoroughly with five parts of sifted soil. A dessertspoonful of the mixture is then applied to each hole.

As soon as the previous crop has been cleared, the land should be ploughed, this being followed by a good harrowing and one rolling. Some market gardeners do not roll, for they say that cabbages on land that is slightly rough face the winter better. After potatoes, it is hardly necessary to plough, and the soil can be got down into a fine tilth with a disc harrow or similar implement.

During the cultivations—on light land, 1cwt. of sulphate of potash with 2cwt. of hoof and horn should be used, and on heavy land perhaps 2cwt. of sulphate of ammonia with 5cwt. of meat and bone meal. The spring cabbage responds well to a top dressing of nitrogen, but this should not be applied until the early spring; 2cwt. of Chilean potash nitrate is advisable, for the available potash helps to impart a dark green colour to the hearts and the nitrogen "pushes on" the growth. One dressing may be given about February and another a month later. On land which tends to be deficient in lime, nitro-chalk is sometimes applied instead.

When the crop is to be cut as "greens," the rows may be 1ft. apart, and the plants set out 9in. apart in the rows. By this method over 44,000 plants can be put out per acre. If intended for hearting, the rows should be 2ft. apart, and the plants put out 1¼ft. apart in the rows. In this case only 14,000 plants are necessary. The planting takes place some time in September, when the previous crop has been cleared and when the plants are sufficiently large.

Naturally, cabbage that is drilled in direct is not transplanted, and if the seed drill is set correctly, the plants may grow without being thinned. Such greens, however, do not fetch as high a price on the market as hearted cabbages.

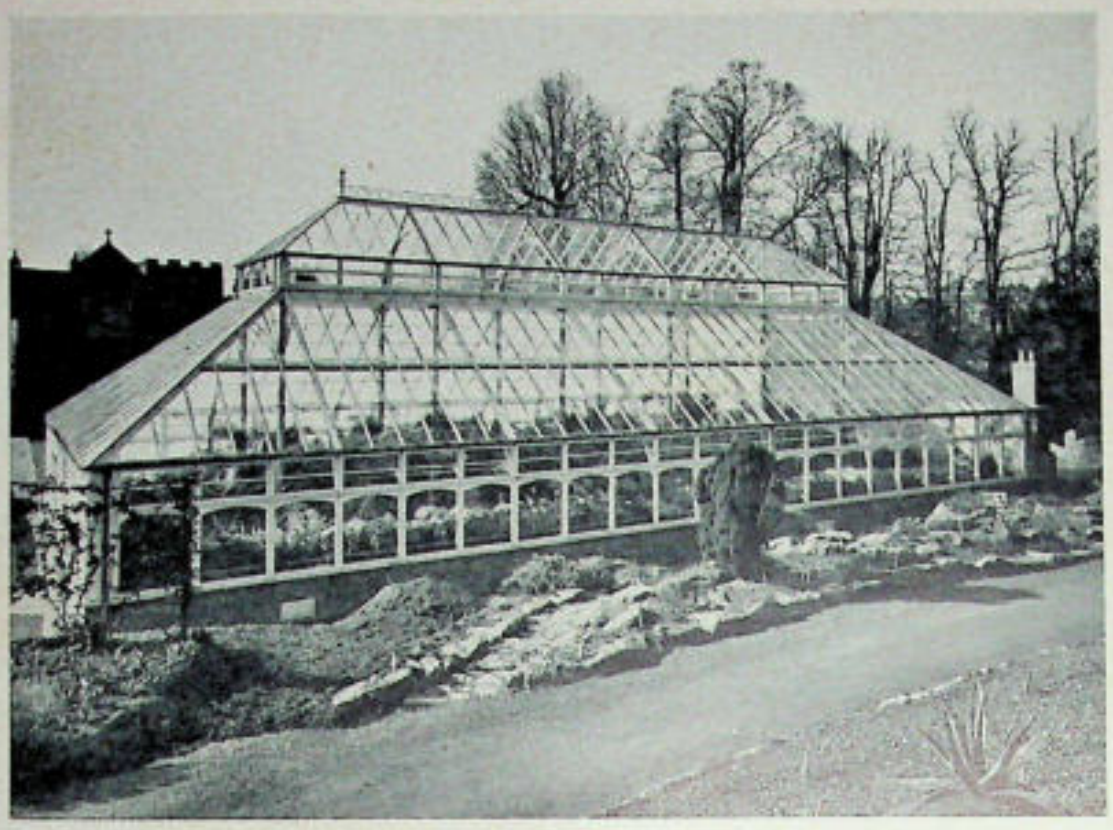
Transplanting machines such as the Robot are most useful at this time of the year, for they will plant up to 12,000 plants per hour, automatic watering of the plant roots being done at the same time. The machine may be drawn by tractor or horse, and there is no need to have skilled labour, except for driving the tractor or horse in a straight line.

At Wye College it was found that there was a greater mortality among the hand-dibbled plants than among the machine-set plants, and that one machine could do the work of nine or ten first-class dibblers. A transplanting machine of this kind has considerable cash value in that it is able to plant up a large area at a time when a favourable planting condition may be short-lived.

After planting, not more than two good hoeings should be necessary before the winter sets in. One is often sufficient. It is advisable, in addition, towards the end of October, to run a double-sided plough in between the rows to form a shallow furrow. This helps to drain away the excess of water and the ridges thus formed give some protection to the plants.

In the early spring, as soon as the land is fit to work, cultivation should commence again, and the necessary artificial manures are given after hoeing, care being taken not to allow the chemicals to scorch the leaves.

When cut as greens, no grading is done. The cabbages are sold in half-bags or nets, by weight.



HOEING THROUGH A PLOT OF CABBAGES GROWING IN BETWEEN FRUIT TREES—A CUSTOM IN SOME PARTS OF THE WEST

The hearted cabbage should be cut at least twice a week, as soon as it starts to turn in and may be packed in bags or deep baskets. When prices are good it pays to grade and market packed in light crates similar to those used for broccoli.

Probably the earliest variety to turn in with a large firm heart is Cluces's First Early Market, No. 218. This is a one-plant selection and received an Award of Merit of the Royal Horticultural Society. The cabbage is really dark green. Durham Early is fourteen days earlier, but is not quite so hardy as No. 218. Ellams Early has a small conical head while Harbinger produces small hearts with bright leaves. Flower of Spring is considered a second early, and is a large conical-headed type. The seed of this variety is usually sown in August.

W. SHEWELL-COOPER.

THE NEW PALM COURT IN TORQUAY'S EDUCATIONAL GARDENS CONSTRUCTED BY MESSRS. BOULTON & PAUL, LTD.

Among the palms and ferns kept here perhaps the most interesting is Encephalartos Villosus, *which was brought from South Africa and is over one hundred years old*

The Country House

THE JULY HERBACEOUS BORDER

By ELEANOUR SINCLAIR ROHDE

IN the rich beauty of the border this month the more delicate colourings which characterise the early summer border give place to those that are a foretaste of the opulence of autumn. For, apart from the late-flowering Delphiniums and Irises (and in both cases the late kinds are usually the most richly coloured), Phloxes, *Lychnis chalcedonica*, Spiræas, *Thalictrum dipterocarpum* and *T. flavum*, Verbascums, Gaillardias, the common Monkshood, early Anemones such as *A. Hupehense*, *Aster Thomsonii*, *Centaurea macrocephala*, Valerian, *Centranthus coccineus*, *Heliopsis incomparabilis*, Hemerocallis, early Kniphofias, *Lythrum virgatum*, *Liatris pycnostachya*, the various Houndstongues are amongst the outstanding features of the July border.

Amongst the less commonly grown border plants in flower at this season those that appeal to me especially are *Clematis erecta*, *Hedysarum coronarium*, the belladonna Delphiniums, *Phlomis Leonorus* and *P. samia*, various Salvias and Nepetas, and the double form of *Geranium pratense*.

Clematis erecta, with its graceful habit of growth, its glistening foliage and almond-scented white flowers on slender yet strong upright stems invariably attracts the attention of those who do not know it. It grows well over 3ft. and deserves a place in every border. Established plants in good soil attain nearly 5ft. It can easily be raised from seed.

Hedysarum coronarium, though best treated as a biennial, makes such abundant bushy growth that, unlike most annuals and biennials, it does not look out of place in a border. The flowers are a deep crimson and show off to perfection against the rich foliage. This Hedysarum, a native of Southern Europe and sometimes called French Honeysuckle, grows over 3ft. high and in full sun sows itself. *Phlomis Leonorus* (syn. *Leonotis leonorus*) and *P. samia* are amongst the most striking orange-yellow flowered plants in bloom this month. The former is a native of South Africa and in mild parts grows from 3ft. to 6ft. high. With its woolly branches and leaves and vivid orange-red flowers it is most decorative, but in most parts it is too tender to be left out of doors during the winter. It likes a good sandy loam. The best method of increase is to take cuttings of the young shoots and strike them in gentle bottom heat in spring. In my part of Surrey on sandy soils this Phlomis came safely through the last exceptionally cold winter. *Phlomis samia*, the woolly sage, is hardier and very free flowering.

The belladonna Delphiniums are, to my thinking, amongst the indispensable border plants, and I have frequently lauded their virtues in these articles. I think the reason they are not more popular is because their first season they usually grow only 15in. or so high and look insignificant. But each year they increase in beauty, and clumps over 3ft. high and 2ft. across are amongst the loveliest blue flowers in the border. I never can have enough of them. The tall hybrids are surpassingly handsome and indispensable in the summer border, but consider the staking they involve! Unless every one of those towering top-heavy stems are separately staked they are sure to break in the first high wind. Further, when their flowering period is over they leave large unsightly "holes" in the border and their foliage in late summer is anything but attractive. But the graceful belladonna hybrids only need two stakes to each clump, and when the clumps are in flower the stakes are quite inconspicuous and even gales leave them unharmed. Their outstanding virtue, however, is their long flowering period. After a brief pause in August they begin again in September, and all through autumn when sky blue is a scarce colour in the border they are flowering merrily.

These belladonna hybrids are easily raised from seed. It is always advisable to sow Delphiniums in boxes as slugs find the young growths irresistible. If sown now the seedlings should be wintered in a cold frame kept open except in very severe weather.

Then there are the less common Salvias. The pick of these is indisputably *Salvia sclarea Vaticanus*. This true Vatican strain is far finer than the type, for it attains nearly 5ft. With its large pink bracts and pale mauve flowers and handsome foliage it associates perfectly with the taller Delphiniums. It has a long flowering period—from late June till cut by frosts. Strictly speaking, the actual flowering period is not so long, but the pink bracts that remain to the end of the season look just as decorative as flowers.

S. argentea is another charming Sage with its woolly silvery foliage. It does not begin flowering as a rule till its second season. *S. dichroa magnifica* is another decorative species, and in common with most Sages very easily raised from seed. The flowers are violet blue enhanced by white mid-lobes. These Sages both grow about 3ft. high.

Amongst the Nepetas my favourite is *N. grandiflora*. Established clumps of this well over 3ft. high, and as much across, look like blue clouds in the border, and they are continually haunted by bees and butterflies. This Nepeta is a Persian species, introduced over a hundred years ago, and for a time almost lost to cultivation. It is perfectly hardy even in bleak parts. It is propagated either by division of the roots or by cuttings taken now and struck in sandy soil in a cold frame till rooted, which takes about a month; the frame should be kept closed and shaded.

DUCK COVERT

OPINION is divided as to the practicability of planting aquatic plants that will encourage natural food and give cover for duck. I.C.I., whose excellent game leaflets are such a help to all shooting men and keepers, do not think it worth while, and in this opinion they are by no means alone.

Their experience, which coincides with that of many landowners, is that any considerable number of duck coming to a pond would demolish two years' growth in a night. On the other hand, American experience, notably with rice grass, tells another tale. Their conditions are not quite the same as in this country, for their waterways are extensive and the number of duck per acre of water is certainly greatly below ours.

If duck are to be encouraged something must be done, for they will not resort in numbers and regularly to a pond or lake which is bare of cover and therefore of natural food. We are all too accustomed to the lake which is entirely artificially fed, and from which the duck can scarcely be persuaded to rise, and when they do they circle it at a low elevation. Shooting in these circumstances is a sickening business, and gives rise to the longing to tackle really wild birds that have to be stalked, and then a swish and they are away out of gunshot. This is sport, and well worth the trouble of securing.

Part of the difficulty is that some owners wish to combine duck and trout in the same water. This can never be achieved satisfactorily. The duck make the water too muddy for the fish. The fish require weed growing tidily in the shallows, and these the duck will punish and kill. Weed that grows in deep water will survive attack, but makes the lake unfishable.

There are no two opinions as to the advisability of keeping duck and trout apart. Their needs are too opposed to be reconcilable.

Duck require snails and shrimps and other water denizens, whose multiplication depends largely upon food supplies, principally algæ and other minute forms of life. These in turn appear to multiply most rapidly when there is plenty of weed about. Apart from food, the duck, which are shy birds, like to feel safe, and prefer to feed among high growing weeds which give cover and a sense of security.

The common reed-covered pond is excellent, and the introduction of bullrushes or Norfolk reeds can always be successfully undertaken. The trouble is that they are certain to get out of hand and take possession of the whole pond. This can be prevented by yearly attention with a boat and chain. The eventual silting up which they hasten is a matter that must be thought of and can be dealt with by partial draining and digging out the mud, or else by heightening the dam which forms the lake or pond

Other weeds that will withstand the attention of duck are the American Pond Weed, the Broad-leaved Pond Weed, and the rather useless Water Milfoil, which grows in peaty lakes.

Two plants of local occurrence and which grow well if there be a strong gravelly bottom, are Water Lakewort and Water Lobelia. They should only be tried as an experiment, for if conditions do not suit they will grow only weakly and suffer at the bills of the duck. On a suitable site they will grow strongly and spread into the deeper water, but are not likely to get out of control.

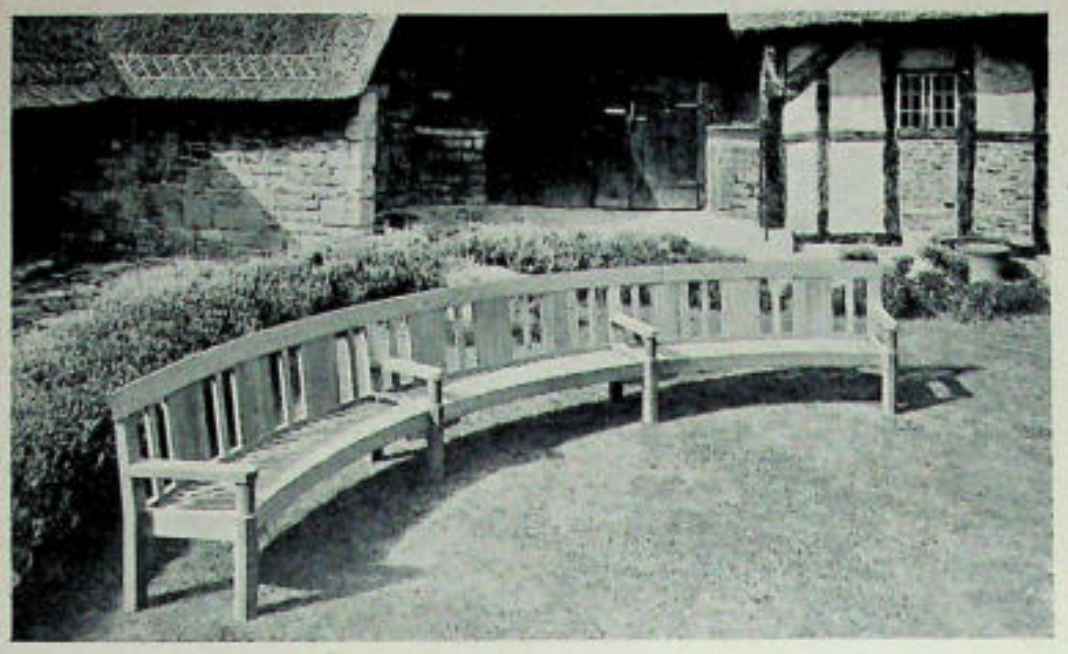
I.C.I. recommend two ponds for duck. The morning flight pond, where duck can sit, sun themselves and preen during the day; and the evening flight pond, where they feed at night and where all artificial feeding is carried out.

It is not always practicable to use two ponds, and where an owner has only one available it can be made to serve. It is best that it be surrounded by trees for shelter, but not overshadowed, so that the duck can look about and are not hindered by branches when arriving or leaving. Except on the north side the trees should be far enough away to let the sun in. No sepulchral woodland pond will attract or hold duck.

It is best if the banks are shallow and slope but slightly so that the birds can leave the water and sun themselves on the banks.

With but one pond it must be made to do double duty, and duck can be kept there for long periods if the water is attractive with plenty of cover and food, both natural and artificial. A few clipped or pinioned birds will help to keep the others about and encourage them to return. It will be necessary in this case to surround the pond, 20ft. or so from the water's edge, by 6ft. wire netting to prevent the duck from walking away, and to act as a barrier for foxes. Within this enclosure nesting will take place, provided there is a suitable reed-covered shallow end.

REGINALD DAVEY.



This England . . .

Newton Flotman—Norfolk

SPEED the plough . . . once more the cry is heard in our land; yet are we so sure now what it means? More corn, says the townsman. Perhaps—in good time. But when grassland has been ploughed (and mayhap cross-ploughed) and harrowed and made clean, some soil will prove poor and some over-rich. First crops, then, must be chosen to suit the soil—not us; linseed perhaps, or cabbages, or roots. For we are ploughing up not to grow more "corn" but to put more land in good heart against our need. Slow—yet so do we come by the truest riches, in patient labour and ancient skill. This way alone will you have the perfect seed-bed for the golden barley, the richest malt for the brewery, and the re-captured sunshine of our Worthington—to put Englishmen in good heart.

. . . by Worthington

A CHARMING GARDEN SEAT IN OAK DESIGNED BY MESSRS. GORDON RUSSELL, LTD.

A GOOD GARDEN ALWAYS

The Part of Furniture and Ornaments

By RICHARD SUDELL, F.I.L.A.

IN the course of many visits up and down the country I notice that a great many people who spare no pains to furnish their houses with good taste, to make them comfortable and good to look at, entirely neglect this part of garden making. Very often, too, the good gardeners are the worst offenders. It is as if they found so much pleasure themselves in wandering round borders and browsing over rock gardens, that they never felt the need for seats.

As a matter of fact, a garden in which there is good grass, a proportion of shade, and comfortable furnishings in the way of seats and tables is always a good garden, even if it lacks any special horticultural merit.

Furniture divides itself naturally into two groups—the permanent furniture that remains in the garden all the year round, and may be quite unmovable, and the temporary furniture that is stored indoors in bad weather. Most gardens require a proportion of both types.

I think the right way to choose and use permanent furniture is to select the site first, and design the garden accordingly. Then the type of furniture is more easily chosen. For instance, if you have a formal water garden with flat stone copings to the pools, stone flower boxes at the corners, stone-flagged paths, and a stone fountain, you would naturally need a stone seat to harmonise with the general layout. On the other hand, if your water garden is only a little less formal, and if there are oak or teak tubs of flowers, you might prefer a semi-formal seat in oak or teak, while in the truly informal water garden, where stepping stones and a rustic bridge are a part of the picture, you might place a rustic seat or furniture of the plain monastic type.

Something depends, too, on your feelings about upkeep. Oak and teak furniture is almost everlasting, and needs no regular attention apart from cleaning over with an oily rag. I am afraid there is no way to avoid cleaning: all garden furnishings get dirty if they remain out in all weathers, and even stone seats must be watched.

Painted furniture, of which there are to-day a good many different styles, some very good indeed, needs an annual overhaul, but rarely anything more. Painted furnishings last well if they are rightly treated, but not otherwise.

A good many modern types of lounge chair suitable for the garden are made on the principle of letting the rain fall through instead of remaining on the surface. The comfort of these new lounges is indisputable: the appearance is a matter of personal taste, but a great many people, when they once get over the shock of seeing what they take at first for a partly upholstered chair, find that the style improves on acquaintance.

These furnishings are not permanent inhabitants of the garden, and their place during a large part of the year is in the loggia or garden room.

Rain, and the vagaries of the weather generally, are catered for rather more than they were at one time. Seats that tip up so that they do not get very wet, seats that fold over in the middle so that they protect themselves, tables and folding tops, easily adjusted waterproof covers for tables and chairs—these are some of the devices that make for garden comfort to-day.

Among the truly portable furniture—the sort of things that a guest can carry for himself to any odd corner that suits his fancy—there are also two types. The one is the lightweight cane or reed furniture, which again finds its general home in the loggia or the garden house. The other is just a variation of our old friend the deck-chair, but the modern deck-chair does not pinch the fingers. It can often be set up by hand, and it may be adjustable to any position—merely by the sitter leaning back or raising himself to a vertical position.

In all these varied styles of furnishing, colour plays a large part, and an all-green garden, or old-fashioned topiary garden takes on quite a festive air at times when these furnishings are in use.

I said that the site should be chosen first, and I think this is generally true. There should also be some definite planning of the surroundings. A garden seat should be provided with dry foot-rests. Either the foot-rests should be portable like the seats, or a portion of the ground by the seats should be specially paved. Stepping stones let into a lawn flush with the grass are useful under trees, where seats are often set in high summer.

Permanent seats should generally be in full sunshine. They are mostly used for a few minutes rest during a tour of the garden, and sunshine is not troublesome during a short rest. On the other hand, seats in complete shade are cold and unattractive in early spring and late autumn, and at all times when there is a keen nip in the air—at all times, it seems, except in the hottest weather, when there will probably be plenty of portable furniture available.

So set your permanent seats in full sunshine, provide a foot-rest, and, then, as an extra touch, make sure you have some scented flowers near enough to be appreciated.

Now just a word on garden ornaments. I think mass production has ruined a great many gardens, and this not because the ornaments produced lack quality. Quite often they are full of good lines and would, alone, grace many a situation. But because they are produced in quantities, and are, therefore, reasonably cheap, there is a tendency to crowd several pieces into a garden that should take only one.

The remedy is obvious. If you can do so, avoid the mass-produced article. There are good artists who specialise in garden statuary, and who will consider each site separately and design something of real merit, and something that intrinsically "belongs" to the garden. In the old days they had to rely on artists of this kind for garden statuary, and I think they did better than a great many of our contemporaries. In short, I advise garden makers to limit the use of ornaments, and rather to have made one statue of exceptional merit, which will really be a feature of the layout, than to buy numerous "pretty" pieces and dot them here and there in meaningless fashion.

HORTICULTURAL ADVICE

Pests of All Kinds!

By CARTHEW ALLERDYCE

I GET a very large number of letters from *Field* readers every week, and if I were not a gardener I should be very depressed! It would seem that the gardens of this country are being decimated by pests and diseases and that there is little chance of any garden succeeding! Of course, I know that this is not true really, but it is the sort of impression one gets from being a Garden Doctor.

It is curious the way that slugs are causing a great deal of trouble this year (despite dryness in May), and I think this may be because some people have not been careful enough in destroying plant remains. Garden refuse provides a harbour for slugs, and it is often on old heaps that they hide and breed. A compost heap rotted down with Calcium Cyanamide is quite all right, but heaps, as heaps, are a danger. Badly drained heavy soil seems to encourage slugs and so do soils that are acid. I, therefore, always advise a good application of lime plus draining.

The use of Meta Fuel and Bran has been much recommended for slug control, but I use, most successfully, the formula consisting of Bran and Paris Green. I damp the Bran, stir in the Paris Green and mix well. I use 5lb. of Bran and ¼lb. of Paris Green to a quarter of an acre of ground. This mixture should be scattered thinly on the ground, *not* on the plants. Paris Green is a poison and must be handled carefully. Should it rain in the night, apply again the next day.

In slug-infested gardens, powdered copper sulphate and ground lime (note, not ground limestone) may be used for digging in, in the autumn. Be careful to use the finely crystallised form of copper sulphate, and having mixed this with the ground lime in equal proportions, apply it at the rate of from ½oz. to 1oz. per square yard. When trenching, sprinkle lightly in the bottom of the trench.

A similar mixture may be worked into the ground fifteen days before sowing seeds or setting out plants, while to prevent the passage of slugs from another garden, into one's own garden, some of the mixture may be used sprinkled along the edges. This acts as a kind of surface barrier.

One must be careful not to overdo the copper sulphate business, for heavier dressings might lead to ground poisoning. The slightest speck of copper sulphate is death to a slug and seems to finish him off by burning him.

A garden "pest" that can cause a great deal of trouble is the rabbit, though a hare can be even worse! It is not always convenient to surround the garden with wire netting, nor is this particularly beautiful; anyway, wire netting has to be buried in the ground to be of any use.

Renardine has, however, solved the problem in many gardens. It is said to smell of fox, and if string or binder twine is soaked in it and this is stretched from bamboo to bamboo, say, at a height of 1ft. from the ground, no rabbit or hare will ever pass. Renardine can be used in other ways, of course, but it is an effective rabbit-scarer. It may be obtained from Messrs. Gilbertson & Page, Ltd., of Hertford, or from any local horticultural sundriesman.

In the greenhouse at this time of the year the white fly may be causing a good deal of anxiety. Some gardeners like to introduce the chalcid wasp, which will, of course, eventually parasitise the white flies and so keep them down. If chalcids are used, no fumigation can be carried out to control other pests, and so it is often more convenient to use a white fly fumigant regularly.

Messrs. Corry & Co., Ltd., of Shad Thames, London, S.E. 1, sell a fumigant known as "White Fly Death"; Messrs. Murphy, of Wheathampstead, offer a product known as "Cleandie"; and Messrs. George Monro, of Waltham Cross, Herts, market a product which I have used for years now, called "Cyanogas." All are quite simple to use, particularly the latter, which merely has to be sprinkled on the path at the rate of about ½oz. per 1,000 cubic ft. of house (it naturally depends a little on the crops which are in the house, but the makers will give all particulars). Messrs. G. H. Richards, of 234, Borough High Street, S.E. 1, supply a control for white fly also.

One of the objections to Bordeaux Mixture has always been the difficulty of preparing it. Wooden utensils had to be used and there was a good deal of time lag. Messrs. Bayer Products, of Africa House, Kingsway, London, have, however, brought out an excellent dust or powder which mixes with water in an amazing manner. It is seemingly a powdered Bordeaux, but it dissolves in water in what might be called a miraculous manner. I can recommend it for spraying potatoes as a control to Potato Blight, and no doubt it will be equally useful against Celery Blight. It is called Soltosan.

TRAVEL BY LAND, SEA AND AIR

A SUNBEAM-TALBOT TEN ON THE PLEASANTLY WOODED INVERARAY ROAD

A FANTASTIC STATE OF AFFAIRS

Revision of the Road Laws and Other Necessities

By CAPTAIN SIR MALCOLM CAMPBELL
(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)
(Motoring Editor of the "Field")

IT is significant that the major portion of my correspondence with readers of the *Field* and with those generally interested in motoring is devoted to the peculiarities of the law where the driver is concerned, and to the question of road safety. While it is gratifying to see that the public is becoming increasingly conscious of the paramount importance of road safety and how legislation may affect it, the trend of these letters reveals that a deep dissatisfaction exists because the authorities do not appear to possess an over-abundance of energy or initiative, neither do they appear willing to lend a sympathetic ear to the opinions or proposals of experts who are unconnected with the bodies controlling motor traffic and the highways.

There are many who feel it their duty, in the public interest, to make an objective study of salient modern problems and to place their findings before the people. Many of these persons are experts possessing sound and original ideas, but unfortunately only a meagre proportion of their projects finds a place in the columns of the press of this country. Only rarely, too, is prominence given to the more obscure, but, nevertheless, serious, inequalities within the scope of the law.

A solicitor correspondent has described to me some of the controversial cases which have arisen during the course of his practice, which indicate that both adjustment and amendment are definitely needed. In the first place, a motorist can be guilty of committing no less than 105 separate and distinct offences. A pedestrian, however, apparently enjoys comparative immunity since his sole transgression punishable by law is to loiter on a traffic crossing! Every one of us knows how frequently pedestrians can and do cause accidents through gross carelessness; yet in the majority of cases the only punishment meted out is a verbal reprimand—and this only occasionally. The momentarily careless driver, on the other hand, may stand to be convicted. Surely this state of affairs calls for drastic alteration.

Traffic lights give rise to a variety of dangers and a motley collection of uncertainties. Here is an interesting instance. A traffic light fails to function correctly and a policeman assumes control of the crossing but fails to veil the light. A pedestrian not seeing the policeman and relying upon the light crosses the road, and in so doing is knocked down and injured by a vehicle which has been expressly beckoned on by the constable. Now against whom, if anybody, has the pedestrian a legal remedy?

There are cases when a driver will be guilty of committing an offence whatever he may do in certain circumstances, yet there is no ruling to safeguard him. A driver may begin to negotiate a crossing with the light in his favour, yet half-way across it is possible that a policeman may signal him to stop. Which signal has he to regard, the policeman's or the light? He has the option of disobeying the light or the constable, but whichever he elects to do he has definitely, if theoretically, committed a breach of the law. Most of us would unquestionably say that the policeman's authority demands priority, but if an accident and the matter were taken to a court of law there is no recognised precedent upon which an arbiter could give a clear decision. Surely such ambiguity should not be permitted to remain.

These two cases provide excellent argument for a real revision of the law relating to road users and the adaptation of a system which will not militate unfairly in one direction. There are innumerable intricacies which demand clarification and straightforward ruling, and there is ample room for entirely new legislation. For instance, the fact that a pedestrian is at liberty to disregard the lights—whether green or red—while within the confines of a Belisha beacon area is from the common-sense point of view a highly dangerous right and manifestly unfair to the motorist. Those who draft our laws should make some provision to meet this contingency, but they display no desire to do so.

Road safety is inextricably bound up with highway regulations, and there are many experts with a thorough practical knowledge of both legal procedure and the factors governing safer motoring, but it would be unusual to see that knowledge utilised to the best possible advantage by our Ministry of Transport, who seem content to "educate" each successive new Minister, lose him, and begin work upon his successor.

No sensible expert on road safety would condone the apparently indiscriminate erection of "Keep Left" signs on the new by-passes, yet we see them cropping up everywhere and providing a most dangerous obstruction. At night they are difficult to see on unlit roads, and by day or by night they cause embarrassment to drivers who pull out, prior to overtaking, and find themselves uncompromisingly faced with an unnecessary centre-of-the-road obstacle in the shape of a solid concrete island with equally solid pillars at either extremity.

In fog the dangers of driving rise tremendously, for the chances of running into these "Keep Left" signals naturally increase the ordinary hazards of driving. I have already described how many of these islands with their posts have been razed to the ground on some sections of our roads, and feel that this alone provides sufficient justification for their immediate removal.

It is difficult to see what functions some of these islands are intended to fulfil, because in some places the normal white line would suffice or, better still, when the road was being laid the authorities concerned could have made dual carriageways divided by a grass strip upon which bushes should eventually be planted to provide an effective screen counteracting the dazzle from the lights of vehicles proceeding in the opposite direction.

On numerous occasions safety experts have advised the construction of roadside bays, and although these would be inexpensive and prove a boon to all classes of drivers, the Ministry do not seem inclined to carry the suggestion further. Personally, I cannot see any argument against the provision of such pull-ins, which would have a host of advantages, but apparently both the local councils and the central authority prefer, except in isolated cases, to turn a blind eye and continue to neglect such obvious methods of increasing the highways safety standard.

On far-sighted, sweeping but expensive projects designed for the future—as all road plans should be—one has grown to expect complacency and inaction with the consequent pigeon-holing of admirable schemes in the dungeons of Whitehall, but with smaller and inexpensive suggestions possessing excellent grounds for their execution, it is reasonable to assume that experimental action might be taken. I doubt, however, whether work—even in a minor way—will commence in the near future on the construction of bays despite the emphatic recommendations which accompany the proposal.

Condemnation of the wood block type of surface has been severe by all road users—particularly from the motor cycling community—and the menace of this costly form of roadway must be obvious even to the Ministry of Transport; yet it continues to be laid with unabated frequency, and accidents through skids on its treacherous surface persistently recur. Amateur experts are unanimous in demanding its banishment from our cities, but feel they are fighting vested interests and that we shall see this insidious type of roadway for many a long day yet. If the authorities know anything at all about the highways they are controlling, they must admit the deficiencies of wood blocks. But they do not admit anything and blocks are still being used, therefore one must believe that they are appallingly ignorant of practical conditions and obstinately refuse to be led in the right path indicated by those who do know and who are endeavouring to do something about safety on the road. It is a fantastic state of affairs.

"Ethyl . . . has done much to make possible the amazing performance of the small car of to-day"

SIR MALCOLM CAMPBELL

"...and this is an amazing little car"

said the School of Motoring Instructor

Horse-power basis of taxation in Great Britain makes for small engines of high-compression. Esso Ethyl is a vital necessity for *all high performance engines.* British small cars lead all over the world for value and have a performance which is little short of miraculous.

MAINLY THE MAURETANIA

The Junior Car Club's Visit to America

I AM writing this on the promenade deck of the Mauretania. Glancing to the left I see the great sweep of the Atlantic, as serene as the proverbial mill pond. And did I not know that we are nearing New York at a speed of twenty something knots there is nothing in the way of sound, vibration, smell or sensation to warn us that we are not living at ease in a first-class luxury hotel or club.

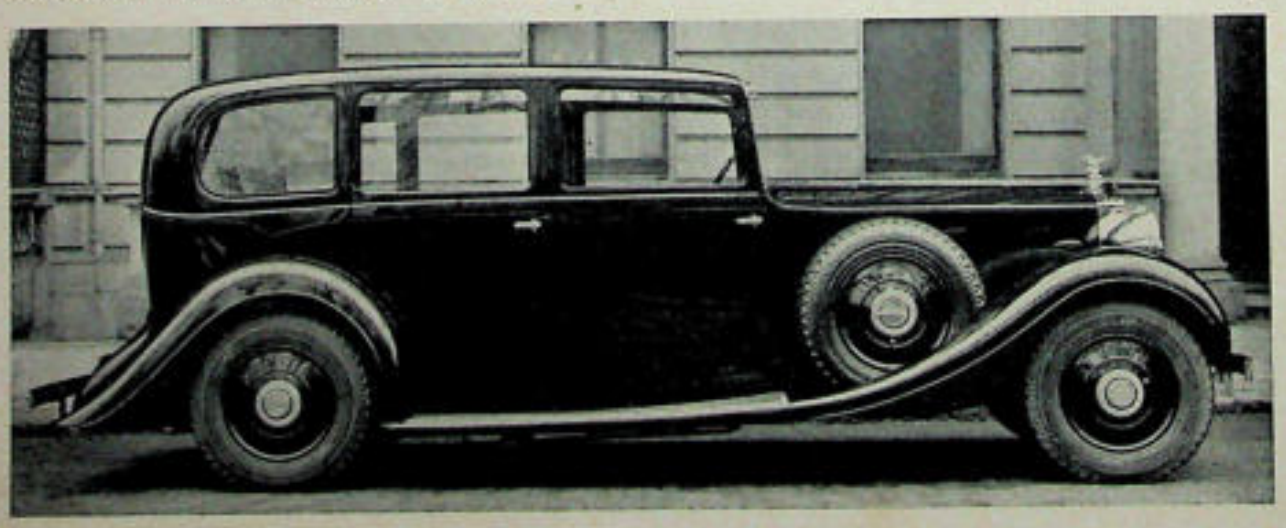
Somewhere in the hold of this noble ship are 20 or 30 motor cars belonging to the members of the Junior Car Club, that alert and enterprising body which belies its name by travelling in Phantom III's, Bentleys and other fine motor cars, staying at world-famous hotels like the Waldorf Astoria in New York and organising amusing tours of the high spots of Europe and America.

The idea of touring in America, pioneered by Autocheques as an alternative to France, Italy or Switzerland, is not as fantastic as it might appear. And if you like to sandwich the road part of a month's holiday between two Atlantic crossings you add a new and different angle to your adventures. This is the better fun if you have never before crossed the ocean in a great liner. It is rather like reading an exciting book or watching a new film in which you and your friends play various parts. In our party there are between 40 and 50 players. A few days ago the curtain went up at the Adelphi Hotel in Liverpool, and the cast, their parts unrehearsed, commenced Act One, entitled "Mauretania Maiden Voyage."

It took some days—the stage, its properties and effects being so spacious and varied, for us to learn our exits and entrances: in other words the way about the ship. Certainly she is the last word in luxury, equipment and ease, and as she is not quite so fast as the greyhounds like the Queen Mary, fares cost less. But that does not mean that there is less comfort or fewer facilities for the passengers' enjoyment. The lower charges are only made possible by the lower speed, and not by any reduction in food, fittings or convenience. It is rather like the question of fuel consumption on a car. If you want to average a high speed the consumption increases enormously, and so do the running costs. But if you are content to tour along comfortably and enjoy the scenery you save money in all directions.

Perhaps the thing that has impressed our party most is the extraordinarily pleasant atmosphere on board. Our fellow passengers are a jolly lot, and as we get to know them better by meeting them in the ballroom, swimming pool, observation cocktail bar or sports courts we appreciate them more and more. Behind this feeling of bonhomie and contentment produced by lotus living is a service which in a wide experience of hotels in England and abroad, is unequalled. Silent, courteous and efficient stewards, waiters and officers anticipate your smallest whim. Perhaps at a meal you express your like for a special wine or dish. It is quite on the cards that it will appear automatically on your table. And this perfected service is allied with equipment and facilities which seem equally efficient and perfect in detail.

I happen to have a very extensive experience of touring hotels, both in this country and abroad. I study details and their effects on my comfort and well-being with more than average interest. And this interest has taught me to notice such trifles as the placing and arrangement of lights, the condition of stationery, the comfort of chairs, the slickness of doors and drawers, the placing of mirrors, the efficiency of the plumbing and ventilation systems, the preparation and presentation of food, and so on. Well, I can truthfully say that out of the hundreds of touring hotels I have stayed in when motoring on land I have never found more perfect detail work than in this Cunard White Star liner Mauretania. That this perfection on the mechanical side is allied with the most delightful effects in decor, furnishing and creature comfort makes the general impression all the more delightful.



There is another point, too. The same sort of effect prevails throughout the ship, and experienced travellers have been amazed at the charming effects and wealth of pleasant facilities provided in the tourist and third-class accommodation. While most of the Junior Car Club party is travelling cabin, some are using the tourist class, which in their opinion is every bit as good as the cabin class on most other ships. In one most important respect it is practically the same, for the same kitchen—a model in sparkling cleanliness, airiness and efficiency, serves both classes with the same food, the only difference being that the tourist class has a slightly smaller selection.

Life on board seems to centre on doing nothing in the most elegant manner. What a contrast it will be to the hectic days on the road ahead of us when we have to cram nearly 2,000 miles, not to mention much sightseeing and many entertainments, into a strictly limited schedule of time. This gentle art of doing nothing elegantly has as its mainstays the matter of eating and drinking. Immense and varied menus of English, American, French, Italian and Scandinavian food face us every few hours. The more adventurous taste dish after dish, whose names mean nothing whatever to them. It is exciting work. Between these stern exercises of the digestive organs come parties in the great observation cocktail bar, tiered up to afford a sea view forward. To fill in odd corners I note snacks and hot and cold drinks at eleven in the forenoon, at afternoon tea, and again after dancing in the evenings.

Previously I had no idea that the human body was capable of so much. But to offset this constant fortification there are other attractions. The immense promenade decks encourage pedestrian traffic, where people with fixed jaws and determined expressions step out boldly in an effort to prepare for the next meal. Meanwhile youth and beauty in all three classes disports itself on the decks. Here deck tennis, table tennis, shuffle board and a miniature form of hockey are popular amusements. But perhaps the high spot of the sporting facilities is the pool, where the slightest motion of the ship manufactures interesting undulations of the naturally warm and briny water. Then, of course, there are several gymnasiums, complete with machinery on which you can bicycle, horse and camel ride, box, fence, massage and row. Each gymnasium has its own instructor. There are several rooms in the various classes set aside for children, and equipped with toys and apparatus dear to the heart. But, alas, I have only found three children on board, and they were being entertained by the company to a glorious spread of brightly coloured cakes, jellies and delicacies most suitable to their juvenile digestions.

A 2½-LITRE M.G. NEGOTIATING A TRACK NEAR BALA, NORTH WALES

A SMART 12-CYLINDER 40/50 H.P. PHANTOM III ROLLS ROYCE FITTED WITH SPECIAL SEVEN PASSENGER LIMOUSINE COACH-WORK BY HOOPER, WHICH HAS BEEN SUPPLIED TO MR. CECIL L. FOX BY JACK BARCLAY LTD., OF HANOVER SQUARE

Of more sophisticated entertainment for the grown-ups there is an abundance. Excellent and luxurious libraries, writing rooms, several dance floors, a trio of cinemas and a first-class band, which plays not only snappy dance rhythm but also orchestral music. The films, often in colour, and on one or two occasions so new as not yet to have been seen in London, always attract a full house, which begins to assemble at least an hour before the programme starts at 4.45 p.m. The evening's fun is divided into two parts. The first consists in some simple games of chance, such as Keno or horse-racing, where one fills up numbers on a card as they are called out or backs a wooden horse whose progress is controlled by the throw of the dice. As one can enter these competitions for the modest sum of one shilling and may win a fiver, the thrill is well worth the outlay.

The second half of the evening is spent in dancing in one or other of the beautifully decorated lounges. There is a welcome informality about these proceedings with just the right amount of decorum thrown in. These evening dances, which for all one knows might be taking place at the Café de Paris or the Berkeley, are an amusing conclusion to the day. We watch friendships and perhaps romances, who knows, flower and sometimes wilt. We see the grimmer melt under the influence of music, laughter and liqueur. We pick out personalities and paint in our minds pictures of who they are and what they do. We criticise and comment on the women's dresses, make-up, jewellery, and on the men's motives, manners and mentality, which reminds me of a sentence we heard on a film the other afternoon which proclaimed, most appropriately, that all the best things in life were either illegal, immoral or fattening. And sometimes we join the throng in the Chestnut Tree, Palais Glide, Veleta or Viennese Waltz, a whirl of colour and rhythm.

To-morrow all this will be but a happy memory. We shall be early awake to see the great sights of New York, the Statue of Liberty, and the famous skyline of skyscrapers. Hundreds of feet of film will bear witness to these events, and then we shall have to get on with the real object of the trip which is to see America. And so Mauretania, dear lady, we bid you good-bye and God-speed on your great adventure.

W. G. McMINNIES.

STORA LE, SEEN FROM ED

A SWEDISH SUMMER HOLIDAY

I HAVE a friend who works very hard and owns a collapsible canoe. I like to think that I, too, work very hard. We both needed a proper holiday, something really restful and refreshing, with as little journeying, as few stuffy trains as possible. At the same time somewhere well away from home, and far from the alarms and excursions of the Continent. We had both already "done" most of the rivers and lakes of France. We had no wish to risk the anxiety of a holiday in Germany. What more pleasant, what more suitable for our purpose, than the lakes of Sweden with our collapsible canoe?

We were worried at first about the weather. Was it really hot enough in Sweden? Did it often rain in August? Would the country be flooded with tourists? Proper enquiries in the right quarters put our qualms at rest. We were assured that the interior of Sweden was as hot as the South of France; that it seldom rained in August; that very few tourists penetrated as far inland as the Dalsland lakes. The language problem was not difficult, we were told; all educated Swedes spoke English or German, and everywhere the country people understood signs. We packed up the canoe, reserved berths on a comfortable Swedish-Lloyd steamer, and, at the beginning of August, set off.

This two days' voyage across the North Sea is a very restful way of starting a holiday. I always think that the scramble and discomfort of crossing the Channel mars the pleasure of any trip abroad; but this peaceful cruising in comfort—sitting in deck-chairs in the sun all day—was an excellent beginning and put us both in a very good temper—essential for our particular sort of holiday. At Göteborg, too, we avoided the universal rush for seats in the Stockholm express; we waited until the crowd had gone, then took a slower, emptier train to Ed. There was no fussing at the customs over our canoe, as there always is in France; no unsewing of the canvas bags, no brutal examination of the contents. On the contrary, all the officials were most considerate and helpful.

Ed, about a hundred miles north of Göteborg, is a tiny town of wooden houses and gardens full of flowers, scattered about on a raised strip of wooded, fertile land, an isthmus between two lovely lakes. From Ed's Turisthotell you can see on one side the Lilla Le, the Little Lake, with the white tower of Ed's church rising above the trees and the woods coming right down to the water's edge all round. On the other side the Stora Le, or Great Lake, stretches away in a series of magnificent headlands and bays and beaches to the horizon. Stora Le is 50 miles long, and even then is connected at the other end to more lakes by canals, so that if you have a mind to it you may travel by water for weeks on end through all the lakes in Dalsland. You may even paddle over the border into Norway. Ed is only twelve miles from the frontier; Eddites go to Oslo rather than to Stockholm for their week-end fun.

The Turisthotell, with its splendid views over the two lakes, was a perfect resting-place for such a holiday as ours. Excellent meals, consisting of good, simple, Swedish food; enormous Swedish ladies sat about in the garden afterwards digesting them. The worthy middle-aged waitresses, equally vast, dressed in white satin blouses and black satin skirts, especially tickled our fancy.

It was a healthy life. We got up early and bathed before breakfast in the Lilla Le; the water was already warmer at eight o'clock than in any English lake or river in the afternoon. After breakfast, laden with large picnic lunches, we went down to the Stora Le, where we kept the canoe. All day long we paddled about or sailed if the wind was kind; first to one bank to be in the sun before lunch for a bathe; then to the other to catch it again in the afternoon before tea. Wherever we landed there were little beaches and grassy banks, utterly secluded; we were absolutely alone. We might have been somewhere in the backwoods of Canada; tall firs and larches all round us, the long lake stretching away on either side, and great white clouds which perfected the picture but never seemed to get between us and the sun. It was extremely hot, our bodies became really brown, and it never rained all the time that we were there.

In the evening, the sunsets over the lake beat anything I have seen in the way of sky effects. Every night visitors stood and watched them from the hotel windows. The ever-changing purple lights and shadows, and the stereoscopic appearance of the many headlands, which seemed to rise up, tier on tier, into the sky, were certainly a sight worth seeing.

After supper, which was early, about half-past six, we would walk into the town, or round the Lilla Le, or through the woods. It was then that the gardens were at their best; the flowers filled the whole night with their scent. We usually went to bed early, after a pint or so of Swedish ale.

We spent ten days at Ed. We could have spent ten weeks, ten months. But we wanted to see something of the rest of Sweden. We went north to another excellent hotel at Hälland, near Are, before ending up our holiday at Stockholm to see the sights of the city.

JOHN EVELYN PEPYS.

SAILING ON THE STORA LE

SPECIALISATION IN AIR DEFENCE

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field")

TWO reasons make the present moment particularly opportune for a review of the development of our defence system, not with regard to the ever-publicised expansion but in the light of certain basic trends. Of these reasons, one is the coming-of-age of the Royal Air Force; the other is the transfer of the complete control of the Fleet Air Arm to the Admiralty.

The coincidence of the two events certainly arouses some interesting reflections. In 1918, when the Royal Air Force was formed as a union of the Royal Naval Air Service and the Royal Flying Corps, military aviation was given a new and independent status. Up till then, the flying services had been neither more nor less than auxiliaries of the forces on land and sea. The operations of the Independent Air Force, in bombarding strategic centres in enemy countries, and owing no direct responsibility to the military command in France, seemed to signalise the arrival of a new method of making war.

To-day, 21 years after, we are witnessing what seems a return to earlier conditions and the definite subordination of the air arm to one of the older services. On the face of it, that looks like a retrograde step. Yet the impression is purely superficial, and actually it is the outcome of the remarkable progress in air defence, a strengthening of it rather than a weakening, and a purely logical development.

The division of duties within the flying service has, indeed, always been implicit. In 1918, when the Royal Air Force came into being, the bulk of its duties lay with the Army and the Fleet; and the change was more an administrative and titular one than a revolution. Aircraft had still a comparatively small range, and their primary functions were reconnaissance and the bombing of military targets close behind enemy lines. Command of the air through fighters was necessary to enable their operations to be carried on.

Development since the War has, as we have all become only too well aware, altered these conditions. In a war to-day aerial bombardment could be systematically carried on by an enemy actually in the heart of this country, and by our own machines in the heart of his. Hence has arisen, slowly but surely, the new conception of air defence.

The duties of the Royal Air Force to-day are to make direct attacks on significant objectives in enemy territory and to prevent comparable air attacks on this country. The operations of armies and fleets are, in this conception, of no direct importance to the flying service. It works in its own element in its own way. That is not to say that co-ordination is either impossible or unnecessary. It merely means that the R.A.F. has a special sphere of activity, just as, in the past, the Navy and the Army have.

FORMATION FLYING AT LEE-ON-SOLENT, NOW H.M.S. DAEDALUS
The Navy's latest aircraft, Blackburn Skuas, flying over other machines assembled on the aerodrome of the Headquarters of the Naval Air Arm

But while a new strategy and new tactics have been evolved and become, under the general title of air defence, the *raison d'etre* of the Royal Air Force, the growing power and potentialities of aircraft have become of increasing importance as auxiliaries for the older services.

Work of this kind demands specialisation in operations differing in many and essential respects from the duties of air defence. The Admiralty contended, from the first, that effective reconnaissance and similar operations for the Fleet could only be satisfactorily performed by naval men with a specifically naval outlook and training. To meet these views, which logic certainly upheld, the Fleet Air Arm was formed, in which control was shared between the Admiralty and the Air Ministry, and in which a large proportion of the personnel consisted of naval officers and other ratings. Training and maintenance were carried by the Air Force, but other duties tended more and more to become exclusively the province of men of the Royal Navy.

There are, on the R.A.F. strength, a number of squadrons whose duties are Army co-operation. The system seems to work well, but there would surely seem to be a sound case for the re-creation of an Army Flying Corps, trained, manned and maintained by the War Office on the lines of the Fleet Air Arm. This case is not solely concerned with the Army point of view. It is arguable that the Royal Air Force itself would gain by its acceptance. As it is, the Army co-operation squadrons cannot legitimately be considered as part of the air-defence strength of the R.A.F. In the event of war these units would be needed by the Army, and the Air Ministry would be responsible for seeing that their strength was maintained and that arrangements for expansion were made as necessary.

The fundamental fact appears to be that the Air Ministry's first duty is air defence; and as that duty becomes more and more onerous, secondary duties, such as providing the Army with air strength, should be placed in the hands of those primarily concerned. The future may well see this problem of army co-operation become of greater importance in practical politics, and it is essential, therefore, that the main issues should be grasped now.

Twenty years ago believers in the future of air strength had to fight hard to prevent the dissociation of the newly formed R.A.F. into army and naval corps. They feared that the conservatism of the older services might retard the proper development of the air arm. To-day there is no need so strongly to uphold the belief that all air units should be under one control. Specialisation would seem to demand otherwise, and provided that the vital question of supply is not complicated by the evil effects of competition between services, the ultimate ideal would seem to be that the Royal Air Force should be left free to concentrate its entire energies on the immense problem of air defence of the Empire, at home and abroad.

THE LANCHESTER ROADRIDER DE LUXE WHICH IS PRICED AT £375

THE LANCHESTER ROADRIDER

LANCHESTER is a long-established name in the motor industry for they were the first to build a four-wheeled British petrol-driven car. That was in 1896; since then the industry has suffered many vicissitudes, but Lanchesters are still with us, though numbers of their contemporaries have their place in memory only.

For those who desire a smart town carriage which is easy to drive and comfortable to travel in, the Roadrider de Luxe should have a special attraction, for it possesses all these advantages in a marked degree. The engine is a six-cylinder unit with a bore and stroke of 61.47 mm. by 101.6 mm., and the R.A.C. rating is 14.06, making the annual tax £10 10s. The engine is rubber mounted at four points, and has been carefully designed to exclude noise and vibration. Transmission is by means of the well-known and well-tried Daimler fluid flywheel and pre-selector gearbox, and this is one of the reasons why the car handles so well in congested traffic. Those whose experience has been limited to the orthodox gearbox will be surprised at the simplification of the whole gear-changing problem. The engine cannot be stalled, or the gears crashed, and it is possible to be stationary with the car in gear. The price of the car with the fluid flywheel is £375, but for those who still cling to the traditional type of transmission the same car may be obtained with a normal clutch and synchromesh gearbox for £350.

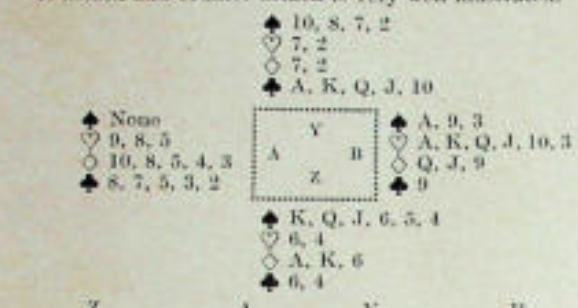
The car's suspension is particularly praiseworthy, consisting of semi-elliptic springs in the rear and independent springing in the front, while anti-roll stabilising bars are fitted front and rear to cope with side sway. Translated into practice, this suspension provides a quite remarkable stability on the road and, frankly, I was most impressed by its effectiveness. It gave a feeling of security on corners, and did not turn the rear seat passengers into human shuttles when negotiating them—a fault of so many cars.

The brakes are Bendix self-energising, and seemed to me quite capable for their task, giving smooth, straight line stops without danger even on wet surfaces.

The coachwork on these Roadriders is extremely smart, and I think most people would be agreed that the lines are far more attractive on these 1939 models than those supplied a year or two ago. The comfort of the interior is in keeping with the body-work. There are two bucket seats in the front, well sprung and well built, and since the gear pre-selector lever is on the steering wheel and there is a pistol grip hand-brake, the floor is left clear of obstacles. At the rear, the seat is deep and comfortable, while there is plenty of foot room for passengers with long legs.

The Roadrider is quite a fast car, and cruises particularly comfortably at about 50 m.p.h. with a most satisfying lack of noise, while its acceleration is rapid. On the open highway the Roadrider puts up a good performance, and as a town car it excels.

W. R. J.



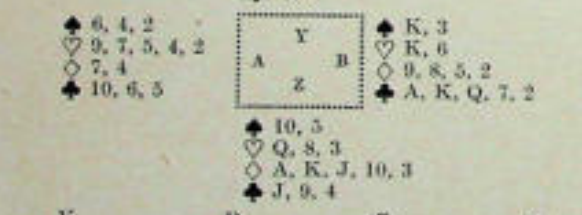
BRIDGE

ATTACK AND COUNTER-ATTACK

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

ALTHOUGH in some hands the declarer may be able to make his contract irrespective of the opponents' defence, in most cases he has to readjust his play according to the play of the opponents. The opponents in their turn may produce a second line of attack, and the declarer must again endeavour to meet their play.

It is most interesting to analyse the hands played by two well-matched pairs of players, and in the following hand taken from G. Coffin's *End Plays*, this sequence of attack and counter attack is very well illustrated.



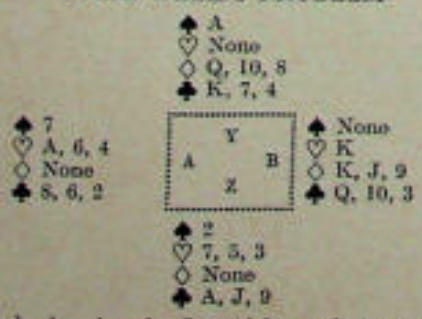
Z	A	Y	B
One Spade	No bid	Two Clubs	Four Hearts
Four Spades	No bid	No bid	Double
No bid	No bid	No bid	

B takes A's opening lead of the 9 of Hearts with the 10, and decides that his only chance of defeating the contract is to obtain a Club ruff as well as the two Heart tricks and the Ace of Spades. He therefore returns the 9 of Clubs which is taken by Y. It is now Z's turn to think; he realises the significance of B's Club lead. Obviously, B will get in with a trump, put his partner in with a Heart, and obtain a Club ruff. To circumvent this, Z tries to discard Y's losing Heart on the third round of Diamonds, at the same time throwing B in the lead. Z therefore leads a Diamond from the Dummy.

It is now B's turn to shine: he exits by playing the Jack of Diamonds. Z takes the trick with the Ace of Diamonds and leads the King of Diamonds, on which B throws the Queen. On the third lead of Diamonds, it is A's turn to be brilliant. He plays the 10 of Diamonds (if he played a small Diamond Y discards a Heart, and B is on play, and cannot get into A's hand). Y trumps this and leads a Spade. B plays the Ace of Spades and *underleads his Four Honours* in Hearts to give the lead to A with the 8 of Hearts. A Club return, and the contract is defeated.

The composing and solving of problems introduces many difficulties, since it is always necessary to be on the look-out for the various lines of defence, and it is by no means easy to compose a foolproof hand.

In the recent Waddington Par Contests the hands were so devised that very few justifiable appeals could be made, but in the following hand, the composers overlooked a line of play by the declarer by means of which the contract could even be made against the recommended defence.



Y	B	Z	A
One Spade	Two Clubs	Two Diamonds	No bid
Three Spades	No bid	Four Spades	All pass

In this hand, B leads the King and Ace of Clubs, and then obtains a par by switching to Diamonds, and again leading Diamonds when he gets in with the King of Spades. This play should kill the Diamond suit in Dummy, and eventually Y must lose a Heart trick.

However, if one examines the hand closely, it will be seen that Y can still make his contract by finessing the Queen of Spades after the first Diamond lead. B takes the Queen with the King of Spades and returns the Diamond, and the Diamonds are led from Dummy. If A ruffs, Y over-ruffs and enters Dummy with the 10 of Spades, *et voila!* Alternatively, if A refuses to ruff, Y discards his losing Hearts.

THIS WEEK'S PROBLEM

Z to lead and make five tricks against any defence by A-B.

LAST WEEK'S PROBLEM

A, 10, 6, 5, 2

K, 7, 4

What is Z's best way to play this distribution to avoid losing more than one trick?

SOLUTION

First the King should be led, and then a small card towards the Ace and 10. If A follows the 10 should be finessed. This guards against cases in which A holds Queen, Jack and two others. If B holds these cards, two tricks must be lost, however the cards are played.

CHESS

TOURNAMENT AT AMSTERDAM

The following game was played in a recent tournament in Amsterdam in which four Dutch players—Dr. Euwe, Dr. Landau, N. Cortlever and J. H. C. Fonteijn—took part together with S. Flohr (Czecho-Slovakia) and L. Szabo (Hungary). The final scores were: Dr. Euwe, Flohr and Szabo each 3½ points out of 5, Cortlever, Fonteijn and Dr. Landau each 1½.

(Queen's Gambit Declined.)

WHITE. Dr. Euwe.	BLACK. Flohr.	WHITE. Dr. Euwe.	BLACK. Flohr.
1. P to Q 4	P to Q 4	21. B to B 6	Q to R 4 (i)
2. P to Q B 4	P to Q B 3	22. R to B 5 (j)	Q takes P
3. Kt to K B 3	Kt to B 3	23. R to K R 5 (k)	P to K 4 (l)
4. Kt to B 3	P to K Kt 3 (a)	24. P takes P	B to K 2 (m)
5. B to B 4	B to Kt 2 (b)	25. Q to R 4	Q takes P
6. P to K 3	Castles	26. B to B sq (n)	B to K 2 (o)
7. Q to Kt 3	P takes P (c)	27. Q to R 4 (p)	B to Q B 4
8. B takes P	Q Kt to Q 2	28. R to R 6 (q)	P to R 4
9. Kt to K 5 (d)	Q to K sq (e)	29. R to Q 3 (r)	B takes P, ch (s)
10. B to K 2 (f)	Kt takes Kt	30. Q takes B	Q takes Q, ch
11. B takes Kt	Q to Q sq	31. K takes Q	P to R 5
12. Castles (K R)	Q to Kt 3	32. B to K 2 (t)	R to B 4
13. Q to R 3	R to K sq	33. P to Kt 4	R takes P
14. Q R to B sq	B to B sq (g)	34. B takes R	B to B 5
15. Kt to B 4	Q to Q sq	35. R(Q5)to K R3	B takes B
16. K R to Q sq	Kt to Q 4	36. B to B 6	R to K 3 (u)
17. P to K 4	P to K 3 (h)	37. P to K 5	B takes P
18. Q to K B 2	Kt to Kt 3	38. B takes P	K takes B, ch
19. Kt to B 5	Kt to Q 2	39. P takes R	Resigns (v)
20. Kt takes Kt	B takes Kt		

(a) This move, which can well be played if White has shut in his Queen's Bishop by P to K 3, is not good here. The game is now turned into a variation of Grünfeld's Defence (1. P to Q 4, Kt to K B 3; 2. P to Q B 4, P to K Kt 3; 3. Kt to Q B 3, P to Q 4) with White playing B to B 4, to which move Black has to reply with P to Q B 4 as soon as possible. Having already played P to Q B 3, he can play P to Q B 4 only with the loss of a move.

(b) The variation 5. . . . P takes P; 6. P to K 5, P to Q Kt 4; 7. P to Q R 4, Kt to Q 4; 8. P takes P, Kt takes Kt; 9. P takes Kt, P takes P; 10. Q to Kt sq, Q to Q 4; 11. B to K 2 is advantageous to White.

(c) A necessary preliminary to Q Kt to Q 2, which move, if played at once, would result in the loss of a pawn.

(d) If 9. Castles (K R), then 9. . . . Kt to Kt 3; 10. B to K 2, B to K 3.

(e) Loss of time. He should, instead, play Kt takes Kt.

(f) Best. If, instead, Castles (K R), then Kt to R 4.

(g) Not a good move. He should play P to Q R 4, to be followed by Q to Kt 5. If, instead, B to K 3, then Kt to R 4 followed by Kt to B 5.

(h) This weakens his K B 3, but, if, instead, Kt to Kt 3 at once, then P to Q 5.

(i) If, instead, B to K 2, then P to K 5.

(j) A very good move. If now 22. . . . B takes R, then 23. P takes B, Q R to Q sq or Q to B 2; 24. Q to K 3 (threatening Q to R 6) with a winning game for White.

(k) Threatening Q to K R 3. If now P takes R, then Q to Kt 3, ch, and mate next move.

(l) If 23. . . . B to Kt 2, then 24. B takes B, K takes B; 25. R takes P, ch, K takes R; 26. Q takes P, ch, K to B sq or R 2; 27. R to Q 3, Q to Kt 8, ch; 28. B to B sq, P to K 4; 29. Q takes B and wins. If, instead, 23. . . . Q takes P, then 24. B to B sq with transposition into the line actually played.

(m) If Q to K 3, then Q to B 4, threatening Q to R 4.

(n) B to B 3 is better (see note q).

(o) Not B to Kt 2 because of the winning reply R takes B.

(p) Not 27. Q to R 6 (because of 27. . . . B takes B; 28. Q takes K P, ch, K to B sq; 29. P takes B, Q takes P) and not 27. R takes P (because of 27. . . . B takes B).

(q) Not 28. R takes P because of 28. . . . Q takes P, ch, White being forced to play 29. Q takes Q, for if, instead, 29. K to R sq, then 29. . . . Q to Kt 8, mate. (This would, however, not have been the case if White had played 26. B to B 3).

(r) Threatening R to K B 3 (to guard the Bishop's pawn) followed by R takes P.

(s) There is nothing else to be done. If 29. . . . R to Kt 5, then 30. P to K R 3 or, if, instead, 29. . . . R to B 5, then 30. R takes P, Q takes P, ch; 31. Q takes Q, B takes Q, ch; 32. K takes B, K takes R; 33. R to R 3, ch, and mate next move.

(t) A strong move, to which Black has no adequate reply. If now 32. . . . P to R 6, then 33. P to Kt 4 (threatening 34. R takes K R P, K takes R; 35. K to R 3, ch, and mate next move), B takes P; 34. R takes B, P to R 7; 35. R takes P and mate in two more moves.

(u) If 36. . . . R takes P, then 37. R takes P, R to B 5, ch; 38. K takes R, R takes B; 39. R to K 8, ch and mate next move.

(v) After 39. . . . B takes R; 40. R takes B, P to Q Kt 4; 41. R to K 3 White wins easily.

INGENIOUS PLAY

A game from an inter-club match at Philadelphia. It shows some ingenious play by Black.

(Queen's Gambit Declined.)

WHITE. A. di Camillo.	BLACK. G. Shalimowit.	WHITE. A. di Camillo.	BLACK. G. Shalimowit.
1. P to Q 4	P to Q 4	13. Q to B 3 (c)	R to R 4
2. P to Q B 4	P to Q B 3	14. Q to Kt 5 (d)	R to Kt 2
3. Kt to K B 3	Kt to B 3	15. Castles	Q to Q 4 (e)
4. P to K 3 (a)	P to K 3	16. Kt to B 3	B to Q 3
5. Kt to B 3	Q Kt to Q 2	17. Q takes P (f)	R to Kt sq
6. B to Q 3	P takes P (b)	18. Q takes Kt	B to K 4 (g)
7. B takes B P	P to Q Kt 4	19. Q takes B	R takes P, ch
8. B to Q 3	P to Q R 3	20. K to R sq	Q takes Kt
9. P to K 4	P to B 4	21. B takes P, ch (h)	R takes B
10. P to K 5	P takes P	22. Q takes R, ch	K to B sq
11. Kt tks Kt P	Kt takes P	23. Q to Kt 4, ch	K to Kt sq
12. Kt takes Kt	P takes Kt		Resigns (i)

(a) Kt to B 3 gives more chances. In reply to the text-move Black can play B to B 4 and has then little difficulty in getting an even game.

(b) The Meran variation. It has been under a cloud since the introduction in 1935 of Stahlberg's move 13. Q to B 3, as played in this game.

(c) This position has been analysed a great deal and no completely satisfactory line has found for Black. Probably the best is 13. . . . B to Kt 5, ch; 14. K to K 2, R to Q Kt sq, *e.g.*, 15. Q to Kt 3 (first suggested by Reshevsky. If 15. Kt to B 6, B to Kt 2; 16. B takes P, then 16. . . . Q to Kt 3 with advantage to Black), Q to Q 2; 16. Kt to B 3 (that 16. Kt to B 6, Q takes Kt; 17. Q takes R, Castles; 18. P to B 5, B to Kt 2 is very dangerous for White was shown in a game Reshevsky v. Petrow in the Kemeri tournament, 1937). P to K 4 (better than Q takes Q); 17. Q takes P, ch (not Q takes P, because of P to K 5), Q takes Q; 18. Kt takes Q, R to Kt 5; 19. B to Q 2, B takes B; 20. K takes B, B to Kt 2 with advantage to White.

(d) If Kt to B 6, then B to Kt 2. The text-move, however, is not good. White should, instead, play 14. Castles. In a game Capablanca v. Löwenfisch (Moscow tournament, 1935) the continuation was 14. . . . P to Kt 5; 15. B to K B 4, B to K 2; 16. K R to B sq, Castles; 17. Q to R 3 with the better game for White.

(e) Threatening 16. . . . Kt to R 4; 17. Q to B 3 (if Q to Kt 5, then P to K 3 and wins), Q takes Q; 17. Kt takes Q (if P takes Q, then B to Q 3), B takes Kt; 18. P takes B, B to Q 3 with a good game for Black.

(f) Not B to K B 4 because of Kt to R 4. The text-move, however, is finely refuted by Black. White should, instead, play Q to R 4, although in any case he would have the inferior game.

(g) Very neat. Now the Queen can no longer guard the Knight.

(h) If Q to R 8, ch, then R to Kt sq, mate. If, instead, Q to Kt 8, ch, then K to Q 2 and wins.

(i) After 24. Q takes B (the only move), Q takes Q; 25. P to B 3, R to Kt 3 Black threatens P to K 4 followed by P to K 5. White can play on for a while but his game is hopeless.

PROBLEM No. 4022

By S. KRELENBAUM.*

WHITE (10 pieces): King at Q R 2, Queen at Q 2, Rooks at K R 5 and K Kt 7, Bishops at K Kt 2 and Q 8, Knight at K Kt 6, Pawns at Q Kt 4, Q R 4 and Q R 6.

BLACK (7 pieces): King at Q B 3, Queen at Q Kt sq, Rook at K R 6, Bishop at K B sq, Knight at Q B sq, Pawns at Q 2 and Q 6.

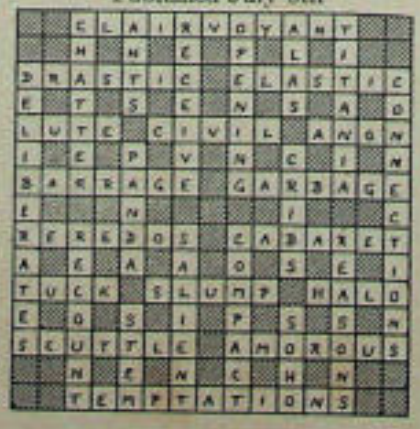
White to play and mate in two moves.

* First prize, *Tijdschrift van den Koninklijken Nederlandschen Schaakbond*, 1937.

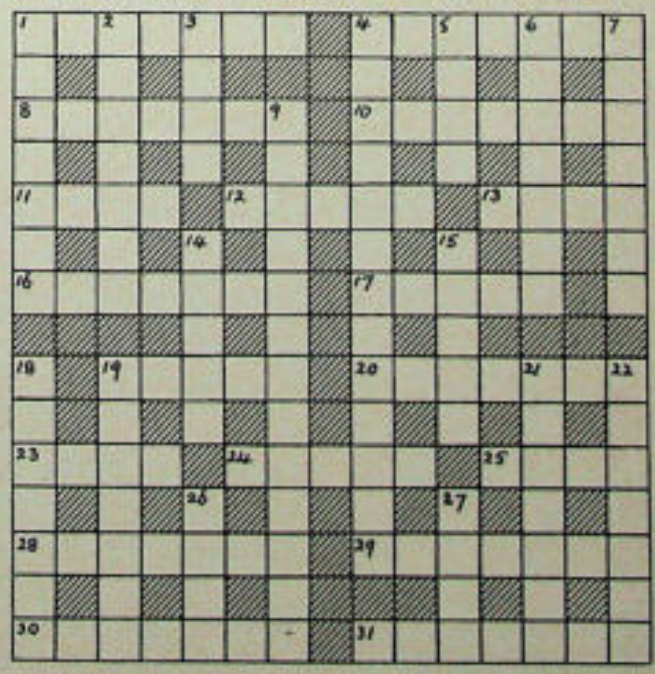
SOLUTION OF PROBLEM No. 4021

1. Q to B 8, Any move; 2. Q, B or Kt mates.

THE "FIELD" CROSSWORD PUZZLE



CLUES TO CROSSWORD No. 525



ACROSS.—1. Day and Martin's B——. What should be there is this (7). 4. Laconic and pointed (7). 8, Retains a more unpleasant aspect (7). 10, 1 to 10 (7). 11. This may tire you (4). 12. A rare flower in the midst of the bird (5). 13. I'll sound just like it (4). 16, "A man must serve his time to every trade Save —— —— critics all are ready made" (Byron). 17. You can start with the sweets (4). 19. The wise men of the East begin conjuring (5). 20. To be in these circumstances is a come-down (7). 23. Here's a job for you! (4). 24. Compass (5). 25. This is absolutely true (4). 28. One of the races to which Ralph Rackstraw might have belonged (7). 29. Longed in the deanery (7). 30. Infers and is seduced (7). 31. Late in bed (7).

DOWN.—1. "The ——, the lover and the poet, Are of imagination all compact" (*A Midsummer Night's Dream*) (7). 2. Cretins make a tank (7). 3. I's twice for a goddess (4). 4. Tea is at the heart of brotherhood (13). 5. "He left the ——, at which the world grew pale, To point a moral, or adorn a tale" (Dr. Johnson) (4). 6. Do they roll the pitch to remove these? (7). 7. Not so much freedom from hardship? (7). 9. When this happens the overdraft grows (13). 14. Associated with 15 in our history books (5). 15, "The Devil did grin, for his darling sin Is—— that apes humility" (Coleridge) (5). 18. Intrude (anag.). 19. A star in the mail probably accounts for the colour and form (7). 21. Less than a kind heart, if we are to believe Tennyson (7). 22. Greatly feared and red dead (7). 26. A billygoat's stomach lining (4). 27. A chilly greeting (4).

SOLUTION TO No. 524

Published July 8th

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Cards

Playing a Hand.—A correspondent sends us the following question: Z is playing a hand in Three No Trumps and A leads his fourth highest Diamond. Dummy has a singleton Ace of Spades. I, as B, have Spades Q, 10, 8, 5, 2, and the Ace of Diamonds. How should the Spades be played to indicate to partner that I have four or more? With Spades 10, 8, 5, 2, or Q, 10, 8, 5, on the first Spade lead the 10 should be played, and when B gets in with the Ace of Diamonds, the 5 of Spades should be returned. With similar holdings an encouraging high card should first be played and then the fourth highest returned.—*E. L., Moillet, British Columbia.*

Farm

Clean Milk Production.—A series of demonstrations on this matter is being organised for the farmers of Scotland. If you could manage to attend one of them we think that the visit would answer your questions adequately, as they are of a practical nature. Arrangements are being made for each area. The demonstration will be conducted by the county agricultural organisers and the dairy instructresses of the agricultural colleges, who will be assisted by the dairy workers at the selected farms. It is hoped that it will be possible to arrange demonstrations at one or more farms in each county in order that every producer may have the opportunity of attending without being unduly inconvenienced. During the demonstrations every detail in the methods of production will be fully explained, and the pitfalls which the producer should avoid will be emphasised. To assist those producers who contemplate making alterations to their premises the essential features to be observed in the construction of a byre and dairy will be discussed. After the demonstrations there will be ample opportunity for those attending to ask questions and to bring forward their own particular difficulties. Producers will be able to obtain details of the schemes organised by the agricultural colleges under which samples of the milk are tested monthly with a view to assisting producers to control the quality of their milk and improve its hygienic condition.—*D. A. P., Dumfries.*

Treatment for Sick Goat.—Here is part of the British Goat Society's advice on how to treat a sick goat which will help you. It is quoted from their Year Book. "A sick goat must *never* be left tied up. She must always have her freedom in a dry, airy, warm, loose box. Keep her bodily warm by clothing her with thick, light, well-aired rugs, of which she may require one, two, or even three and feel the comfort of them. If she cannot get up, a large carriage rug may be put right over her, feet and all. She must not be allowed to be flat on one side. Prop her up against a wall, with sacks half filled with straw, and turn her every two hours from one side on to the other. This can be done by keeping a sacking under her and raising her on it. For feeding, try to tempt her to eat by offering anything and everything, but never the same bit twice over, and if she will not touch it, be quite sure that she can swallow before you attempt to drench. Do this slowly and carefully, making sure that the liquid does not 'go the wrong way,' as that may cause pneumonia. For this reason it is sometimes well to flavour the medicine with brown sugar, which is also an excellent heart tonic, or treacle, or give it in milk, which will induce the patient to suck it down with satisfaction. Any food or medicine that is taken with relish does much more good than what is forced down. Never fuss your patient when nursing her. Do not let her realise that you are nervous and worried, but be quiet, calm and cheerful, for it is wonderful how animals respond to the tone of their attendants. If the poor goat is lying down, do not get her up to see whether she can stand (leave that for the vet. when he comes) and do not neglect her at night. If she is really ill she should be visited at least once between 10 p.m. and 7 a.m. If about 1 a.m. you find she is comfortable, she may then be left till about 6, but remember the early morning hours are when vitality is at its lowest, so a possibility of collapse must not be overlooked. The best stimulant for a goat seems to be a teaspoonful of strong black coffee, which may in serious cases be administered every four hours. Spirits such as brandy, whisky or sal volatile are not advised except in cases of very acute illness when up to a dessertspoonful of one or other may be given, well diluted with warm water, but they should never be employed where there is a high temperature nor if there is any risk of hemorrhage."—*E. M., Taunton.*

Garden

American Blight on Gooseberries.—At this season remove all affected fruit and prune the infected tips of the shoots and burn them. Spray with Bordeaux or Burgundy Mixture, winter strength, early in the year, before the buds open and again at summer strength three weeks later. Repeat again in three or four weeks.—*G. M., Isle of Mull.*

Getting Rid of Tree Stumps.—Prepare a strong solution of sodium chlorate, obtainable from any horticultural sundriesman, 1lb. to 1 gallon of water. Soak the stump thoroughly with repeated applications, and, when quite dry, set fire to it and it will gradually smoulder away; it may need a second soaking to finish the lower part.—*H. M., Perthe.*

Disease on Beech Leaves.—The R.H.S. entomologist to whom your query was referred reports "that the beech leaves are attached by a very small weevil, namely *Orchestes fagi*. This pest is not one to worry about unduly, owing to the fact that it is only every few years that it becomes epidemic, and spraying or dusting large trees is not practicable. This weevil attacks the common beech, although the copper varieties are occasionally attacked. It is found that the trees attacked suffer slightly, but it is not known to destroy the trees owing principally to the heavy parasitism that occurs in this species of weevil."—*G. M., Windsor.*

When sending plants to be named, send as many parts as possible—basal leaves, stem, flowers and fruit. Pack in moss, moistened paper, or damp leaves, in a stiff cardboard, tin or wooden box.

Eradicating Horse Radish.—Horse radish is often a difficult weed to eradicate as the roots penetrate to a depth of 2ft. or more. Close mowing and weeding usually kills it out on a lawn, though it may take some time. Try cutting the stem at ground level and placing a pinch of lawn sand on the cut. Other parts of the garden are more easily dealt with. Mix a solution of sodium chlorate, 2½lb. to 25 gallons of water. Use a fine rose can and spray the foliage thoroughly. This will gradually penetrate to the roots and kill them. You must leave the ground fallow; no crop will grow on it for six months. Do not use it too close to hedges or shrubs.—*H. W., Heathmere.*

Asparagus Growing.—There is no doubt that "male" plants of asparagus bear a greater number of heads than "female" plants which exhaust themselves by seed-bearing. For this reason some growers plant only selected "males" or clear out the "females" when they can be detected. The stems of both "male" and "female" plants should be left until they turn yellow, usually in October or November, for the well-being of the plant depends on matured stems and leaves. Asparagus plants continue in bearing for a great number of years, but there is no doubt that old beds are often replenished by seedlings from fallen berries. It is wiser to plant new beds than depend on this.—*de C. V., Cheltenham.*

Kennel

Catarrh in the Nose.—We should be inclined to consult a veterinary practitioner about the springer spaniel. When catarrh is chronic, the nasal cavities sometimes become affected, and that, of course, would interfere with the dog's scenting powers. They may require syringing with one part of listerine to two parts of warm water.—*A. P. B., Colinton.*

Miscellaneous

Handmill.—After extensive enquiries, we have been able to find where you can obtain the handmill for grinding down household bones. These machines can be obtained from Messrs. Geo. Munro, Ltd., Sundries Dept., Hertford Road, Waltham Cross, Herts. We understand that the price is 37/3 each, carriage forward. Various forms of ground bone, such as bone meal and steamed bone flour, can be obtained from any fertiliser merchant at very low cost, and these would certainly be more suitable as a source of plant food than the product of a handmill. Mineral fertilisers containing phosphates and lime—the main constituents of bone—are still cheaper, the best known of these being basic slag, which is subsidised by the Government under the Land Fertility Scheme. For the garden, however, it would be better to use a soluble complete fertiliser containing potash and nitrogen as well as phosphates, and various proprietary preparations with a guaranteed content of these plant foods can be obtained from seedsmen and ironmongers everywhere.—*J. M. H., Hazel Grove.*

Shooting

·22 Pistols.—There are two weapons which we think would suit your purpose, and both are obtainable from Messrs. Parker-Hale Ltd., Bisley Works, Whittall Street, Birmingham 4. They are: (1) The Colt Woodsman Automatic Pistol; capacity of magazine: 10 cartridges .22 Long Rifle; length of barrel, 6¾in.; length over-all, 10¼in.; weight, 29oz.; will handle high-speed ammunition; is fitted with slide safety lock; price £9. (2) The Webley Single Shot .22 Pistol; barrel, 10¼in.; weight, 37oz.; fires .22 Long Rifle ammunition; price £3 15s. Both of the above have adjustable sights, great accuracy, are fitted with excellent grips and give splendid handling.—*J. B., Punjab.*

Travel

Hotels in South Cornwall.—If you do not think South Cornwall is too enervating, we would recommend the Manor House Hotel at Budock Vean, near Falmouth. You can get away from asphalt pavements and promenades yet you have all the attractions normally to be found at a seaside holiday, and it is not one of those places where it is necessary to stake your claim to a square yard of beach early in the morning. The hotel, itself, is open all the year round, and is completely modernised without being "gawdy." The grounds overlooking the famous Helford River and Falmouth Bay are extremely beautiful. There is plenty to do there. Two hard courts for lawn tennis players, and the hotel has its own private nine-hole golf course, planned by James Braid, in the grounds. A golf professional is always at the service of residents who may become temporary members of the club on payment of 10/6 weekly. Excellent sea fishing is available for those who prefer the feel of a rod to that of a putter, and then the small boatman can enjoy himself to his heart's content in the local creeks. Probably, however, you would prefer North Cornwall to North Devon in August. Why not try the Dormy House at Rock, Wadebridge? We have had very good reports of this place, and the spirit of the place seems to be to make one comfortable and at home. The fact that you can get golf, hard and lawn tennis, squash, badminton, rough shooting and fishing will give you some idea of the type of company you can expect. We think you would like this place. If you do not mind being slightly inland, we would recommend the Bullaven Farm Hotel at Harford, two-and-a-half miles from Ivybridge. At one time Bullaven was a farmhouse, as its name suggests, and its conversion to a hotel has been made possible by adding to the original building. The core, therefore, is the old farmhouse, with its thick walls and attractive fireplaces. You cannot help admiring the large open hearth in the entrance hall leading to the lounges or the splendid views obtainable from the dining-room. In the evenings dancing is sometimes arranged, though always so that it does not interfere with the pleasure of the non-dancers. Indeed, everything is done for the consideration and comfort of guests, which makes it a happy centre for a holiday. Leave the hotel in the morning, complete with luncheon basket—for which there is no extra charge—and wander over the Devon moors, and you will return tired and contented.—*G. M., East Sheen.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, JULY 22nd

OTTERHOUNDS—ENGLAND

BORDER COUNTIES.—Saturday (July 15th), Bala Bridge on Tryweryn (down)—10.30.

BUCKS.—Saturday (July 15th), Wheatley Bridge, Oxon; Tu., St. Ives, Hunts (down) (Doh); W., St. Ives, Hunts (up) (Ecol); Th., Bubbenhall, Warwick; S., Compton Verney, Warwick—10.30.

BURE VALLEY.—All meets cancelled until further notice.

CHERITON.—Saturday (July 15th), South Molton Road; W., Weare Giffard; S., Eggesford Station (up)—10.30.

COURTENAY TRACY.—Saturday (July 15th), Ring up Grasley 206; M., Julian's Bridge, Wimborne (Moor); W., In district; S., Darweston Bridge, near Blandford—10.30.

CULMSTOCK.—Monday (July 17th), Axe Bridge, Culyfort (Crowhurst); Tu., Yarty Bridge, near Axminster (Culmstock); W., East Budleigh Station (Crowhurst); Th., Feiny Bridges, near Honiton (Culmstock); F., George Hotel, Axminster (Crowhurst); S., Hawbridge Mill, Curry Rivel (Culmstock)—10.30.

DARTMOOR.—Saturday (July 15th), Holne Bridge (Dart); Tu., Postbach Bridge (Yealm); F., Staverton Station (Dart)—10.30.

EASTERN COUNTIES.—Saturday (July 15th), Navland Bridge; M., Judes Ferry, near Mildenhall; W., St. Ives Hunts (by invitation); S., Hillborough Swan—10.30.

HAWKSTONE.—Saturday (July 15th), Llanfyther—10.30.

KENDAL AND DISTRICT.—Owing to foot-and-mouth disease all meets in Yorkshire are cancelled until further notice.

WYE VALLEY.—Tuesday (July 18th), Monmouth Troy, Monmouth; F., Westbury-on-Severn, Glos—10.30.

OTTERHOUNDS—SCOTLAND

DUMFRIESSHIRE AND ROXBURGHSHIRE.—Saturday (July 15th), Kelso Bridge (Tweed); M., Where leave off 15th (Tweed); W., Jedfoot Station (Teviot)—9.30; F., See Seedsman, of 20th.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

100 YEARS OF PHOTOGRAPHY

IT is just 100 years ago this summer that two men, working independently of each other, evolved the first practical processes of photography. There had, of course, been "imitations" of photography before 1839, but it was not until that year that the great difficulty of permanence was surmounted.

To the Frenchman, Daguerre, we owe those metallic, mirror-like and infinitely faithful portraits of our grandparents, known as daguerreotypes, while at the same period an Englishman, Fox Talbot, evolved the process of the negative, which, unlike Daguerre's invention, had the great advantage of making it possible to produce an unlimited number of positive copies. Fox Talbot's process, known as "Calotype" or "Talbotype," is the foundation of modern methods, and he can therefore be looked upon as the father of photography as we know it.

It is possible to see the works of both these pioneers at an exhibition, "100 Years of Photography," which opens at the Science Museum in South Kensington to-day, July 22nd. Divided into three sections, the exhibition illustrates not only the labours of these pioneers but also the development of pictorial photography and the varied applications of the camera to everyday life.

These applications are perhaps more important than most people realise even in this "camera-carrying age." To many photography means little more than a family album filled with snapshots, the illustrated pages of a newspaper or the cinema. They do not realise what a dull world we should live in without the great art of the camera; they do not realise the power of photography. No one will deny that it is a great art. Proof of this, if proof were needed, can be seen any week in the pages of this paper, and, for that matter, at the exhibition at South Kensington, in which is shown some fine examples taken from the collection of the Royal Photographic Society. In these pictures will be seen the ultimate æsthetic heights of which photography is capable.

To return to the part played by photography in our everyday life. The clothes we wear, the food we eat, the water we drink, all rely upon photography as a recording device for research and control of the product. Take, as another example, the unbounded good done by X-ray photography from the medical point of view. Think how many lives have been saved and how much pain alleviated by this art, just as it is possible for the safety of airmen to be ensured by the examination by X-ray of hidden parts of his machine during construction. Undoubtedly science and industry possess one of their most valuable weapons in the rapid advance in photography, as the exhibition at the Science Museum ably illustrates.

It is to-day not uncommon for an exhibition to be staged at a museum. The idea is a good one, for it has broken down the conception that museums are dull and interesting only to the antiquary. Nothing is further from the truth. People visiting the Science Museum during the next five weeks, the duration of the exhibition, may be tempted to visit for the first time other rooms besides those in which the photographs and apparatus are displayed. In this way the museum will receive ample reward for their collaboration with the Royal Photographic Society.

Admission to the exhibition is free, on weekdays from 10 a.m. to 6 p.m. and on Sundays from 2.30 p.m. to 6 p.m. The public are therefore offered a great chance of seeing famous objects in photographic history. It is an opportunity which should not be missed.

EYES TURNED TO FINLAND

WHILE cricketers all over the country are discussing possible players to send to Australia next year, keen followers of athletics are just as anxious about those who will represent this country at the next Olympiad in Finland. Their cup was filled to the brim last week-end when, following our 'Varsities sensational defeat of Harvard and Yale, we learnt that Great Britain had won the Challenge Cup at the International meeting in Brussels. Looking dispassionately at the results of the two meetings, one singles out the half-mile of G. E. Wethered at the White City meeting as the outstanding performance of the week-end. In setting up a new time of 1min. 52.4sec. he beat a record held by D. G. A. Lowe since 1925, the year after he won his first Olympic title. Does Wethered mean to reverse the order of events? Individual performances apart, there was a decided improvement in the standard of our field events men. Against Harvard and Yale we won the long and high jumps, while J. L. Newman won the latter event in Brussels with 6ft. 2¾in.

THE NATIONAL TRUST

It was good to hear from the Marquess of Zetland, at the annual meeting of the National Trust, that there is hope of saving about 160 acres on the west side of Birling Gap. This will be a notable addition to the stretch of cliff and downland which stretches westward from Beachy Head and which is already preserved for public enjoyment. And it will save from building development a place which has not altered very much during the past 200 years. Other gains were also mentioned, notably the last bit of Rosemullion Head in Cornwall. In all, 80,000 acres scattered all over the country are now controlled by the National Trust. We hope that the public will realise to the full the magnificent work being done by the Trust, and by their support enable it to acquire many thousands more acres. The countryside of England is being swallowed up at an incredible pace—not only by the builder, but also by the War Office and Air Ministry and these, with the attendant considerations of transport, electricity and water supplies and housing, while unhappily essential, must not be allowed to ruin altogether the scenic amenities which have always meant so much to us as a nation. The modern idea, for example, of building large factories on excellent agricultural land is a form of insanity much to be deplored.

SUMMER SEA TROUT

Mid-July spates arrived just in time for the spring tides early this week, and West Coast streams by now should be well peopled with those lively little sea trout of a pound or less which go by so many different names in different neighbourhoods and provide the cream of the sport for holiday anglers. They are erratic visitors, these youthful sea trout. One day the tidal pools will be empty of life save for a shimmering shoal of fry, perhaps, which wander like lost souls seeking who can say what; the next, its sandy bottom will be covered by shadows from which an occasional flash is heliographed as a fish turns in changing its position; and the observing angler departs hurriedly in search of his tackle. Despite its disagreeable features, this season has worn a benevolent aspect on many West Coast streams, for though spates have been few, they have been timed with apparent solicitude for trout-fishers' needs.

AN UNREWARDED EFFORT

When Miss Marjorie Foster won the King's Prize at Bisley in 1930, her success came as a shock to some military marksmen, who felt that such things should not be. Under the conditions, however, she could not be barred, though possibly she was not expected to go so far. Since then, Miss Foster has become a part of Bisley, and last week she nearly added her name to the roll of prizewinners for the second time. It was decided this year, owing to the Territorial Army Rifle Association's meeting having to be abandoned, to make the King's Medal for the best Territorial shot dependant on the King's Prize scoring. Miss Foster had the second highest score, and, as an assistant company leader in the Woman's Transport Section of the Auxiliary Territorial Service, not unnaturally, considered she had a claim to the King's Medal. The War Office has decided otherwise. Therefore, we have the anomalous position that whereas she can head the Forces in shooting she cannot claim a place in her own particular branch. She, at least, has compensation in the fact that her scoring was six points higher and sixteen places above the actual winner, and that her performance, among the expert shots of the Services, evokes admiration, as also the section she represents.

THE FISHER

Under the bridge by the salmon-pool
(Dark as velvet, still and cool)
Where the leaning rowan-tree looks down,
Brave in her green and scarlet gown,
I saw a fisher stand,
Motionless as the old grey stone
He rested on—a fisher lone
Upon a lonely strand.

Nothing to him the lissome grace
Of the greenheart over the water's face,
Nor the tearing screech of the spinning reel,
Nor the glistening catch in the fisher's creel—
These are not for him;
Yet greatest of all the fishing clan
Is that grey, motionless old man
Beside the river's brim.

I moved. As by a sudden blow
The spell was shattered there below;
The lovely rowan, leaning down,
Brave in her green and scarlet gown,
Claimed him for hers no more,
As, with ungainly, laboured flight,
Jack Heron vanished from my sight
Along the dreaming shore.

NONA HERMON-WORSLEY.

A COUNTRYMAN'S JOURNAL

I FANCY that no obituary notice of old "Tal," the dry-waller of Winchcombe, just dead at the age of 83, will appear in *The Times*, and so I shall give him one. He lived rough to the end, stepping outside a civilisation he did not approve and making his home with the woods and the fields. He altered not when he alteration found; there was no bringing Tal up to date. But he was no philosophising Thoreau; cheerfulness, content and the things of the passing day were his writings in the book of fate. They and his dry-walling at which he was a master. When he fell ill he was taken from his open air in a car to Cheltenham and passed through his birthplace, Winchcombe, on his way to the Poor Law Infirmary. Two or three of the older natives were standing on the pavement as he went by. He called on the driver to stop, and said to them: "I shan't be coming back. I'm going to Heaven." A week later he was dead.

He was a Gothic craftsman: there was no difference at all between him and the corbel-heads to be seen on the churches through the length and breadth of the land. Progress meant nothing to Tal; it was just a piece of bad luck that he was living in 1930 instead of 1330 or 1430, dates in which he would have been thoroughly at home. For some time past he had been unable to get any work, not because he was too old for it, but simply because he was a highly-skilled craftsman and the age has no use for such men. They must either starve or become slaves of the machine, and neither way suited Tal. He was so stubbornly and organically Gothic—the jovial sardonic figures on Winchcombe Church looking out over the hills were his born folk-fellows—that he had as it were walked out on the period in which his body but not his spirit found itself. Material anxieties did not press heavily upon him; just as the foxes had their holes and the birds of the air their roosting places, so for Tal there was always the side of a hedge or a stack or the inside of a barn.

In more abundant days he would amuse himself with a little poaching, tickling for trout and then going to the police station to ask: "Did you get him?" When he was in work he always insisted on being paid every evening, because, as he said, "I might be dead to-morrow," but his real reason was his wariness not to lose his liberty. Like a labourer I know in my own village, who has built his own round hut of corrugated iron and straw (there is just room enough for him to sit but not to lie down in it) and whose wife (he has often told me) was a mermaid, he was the happiest of men. To see him come swinging down the road in his patched homespun, his face beaming under its white thatch, to hear his high voice shrilling the brightest and loudest of welcomes was enough to make a man wonder whether Tal had not chosen the better part. He literally had not a care in the world: he had no more troubles than coin to make them for him. Such men do not receive obituary notices in *The Times*, not because they are too common, but too rare. They are so rare nowadays that nobody notices it when they die.

Like his Gothic kin, he was a born craftsman, and had built, as he said himself, "hundreds and hundreds of yards" of mortarless wall for a period of 60 years. There are hardly any dry-wallers left now, but even those that survive would not have understood the terms that Tal used, the immemorial terms, the Gothic terms, such as "parpin" for the the big bonding stone that stretches across the whole breadth of the wall and "quoining up the gateway" for building up the corner-stones of the wall. He lived to see his fellow-craftsmen die out one by one, to see miles of walls falling in ruin about him and masses of scree lying beside them for want not only of the hands to build them up again, but want of the interest, not to mention the means, in standing walls that under the hands of men like Tal would last a century without repair. In Tal's young days men cared about the earth, its fields, its hedges and its walls, whereas nowadays all they care about are the roads, not the thing in itself but the way through it. So, since nobody bothered about the walls any more, Tal retired from business.

He lived in his memories, and they were an odd mixture of mild vagabondage and that passion for his work which Shakespeare, Rembrandt and Mozart shared with him. He was grave when he talked about building a wall and would assume the natural superiority of inward knowledge explaining itself to children. I hope he is building the battlements of Heaven: they seem in sad want of repair these days.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a London daily:

"The King will shoot over the wide grouse moors around the Castle and stalk deer in the thickly wooded forests."

At Six Mile Bottom, where shooting history has been made

WHAT CONSTITUTES GOOD SHOOTING?

THE bare principles which underlie sound performance with a gun have recently been discussed and in due course their application in respect of the various types of shots will be set out in detail. The tyro will then, it is hoped, appreciate the full force of the conclusion that upon good judgment and footwork depends success. In the meantime the question as to what really is meant by good shooting may be asked. What should a man be capable of doing before he can be considered a good shot? What is the standard by which he can be judged?

As in many other spheres, the epithet "good" is often loosely applied. It may in actual fact mean a great deal or very little. So when it is said that Mr. So-and-so is a good shot, one may be not much the wiser. It is only when one experienced man hears this said by another experienced man that there can be no doubt as to what is meant. Under any other set of circumstances the statement is practically valueless as regards the conveying of a precise definition. A man may be described as a good shot merely because he can, with fair regularity, roll over five rabbits out of seven out in the open. Or, again, because he can kill three out of seven in covert. Or it may be because he can bag his bird each time at walked-up partridges in September with an occasional right and left. In the other direction he may only be considered good when in addition to killing 70 per cent. or more of ground game and walked-up birds, he can average 30 to 40 per cent. at all driven game. This latter standard is, of course, much nearer the real qualification. But except between people who are in a position to pass judgment, the use of the prefix is of little account.

In view of all the circumstances, it may be best to treat the matter in both a limited and a general way. Since it is given to few to enjoy every kind of shooting, more especially so in these days of high pressure and an accelerated rate of living, it is generally the case that the experience of any single individual is limited either to driven game or to walked-up game with a sprinkling of the former or else to genuine rough shooting and wild-fowling. Now all these kinds provide difficult birds, though it will probably be agreed that driven game provides the highest percentage. That being so, it may be argued that a man who can account for, say, 40 per cent. of driven birds, is a better shot than his fellow who can do likewise at the other kinds of shooting. Yet they may all be considered good performers. Again each may think that his own kind of shooting requires a special sort of skill and, further, that anyone who has not had experience of it would fail to show up to advantage. In this they will probably be right up to a point, but only up to a point. For if a man has a certain degree of shooting skill, there is reason to suppose that he can, with practice, extend this skill to whatever kind of sport comes his way. It is, as stated, simply a matter of practice. In other words, there is no reason why the sportsman who has attained a degree of success at mixed shooting should not attain a similar degree at rough shooting and all that it can entail, provided of course that he first has sufficient practice to accustom himself to the different circumstances. Of course there are always the exceptions which prove the rule. I used to know a first-rate snipe-shot who literally was no good at other forms of shooting. Out on the bogs he was a marvel. Almost as soon as a bird was flushed and had done its first twist, it was snapped down. And his success was due as much as anything to the fact that he knew how to walk a bog! He never seemed to get into difficulties with his feet or be caught on the wrong balance when a bird rose. Certainly this is a great part of the art. He appeared to know instinctively what ground was safe and what should be avoided. But put that man in a grouse butt—he got plenty of chances at grouse—and watch the result. He just could not hit the birds, and the more time he had for his shot the more he "poked." Those even well-timed movements, which are so necessary with driven game, were beyond him. His footwork, while a marvel for purposes of bog-trotting, was not that of the game shot.

What sort of conclusions can be drawn from this preamble? It is not easy to reduce the whole question, with all its manifold implications, to one of precise and categorical definitions. But this is how it appears to me. There are among those whose shooting is confined to limited kinds many potential good shots; that is to say, among those who are good at what they do are a number who would be good all-round, had they the chance to prove their worth. And so, if they had, they would really qualify for the title of good shot. At the same time there are those who would never become good except at the kind of shooting which they do, which happens to suit them. As, generally speaking, driven game shooting requires the highest skill, it is likely that the good shot here would sooner prove himself in an all-round capacity than other kinds of performers. Of course it must be remembered that strength and staying power play their part in rough shooting and the man who can stand all day outside a covert and pull down high pheasants may not be equal to some gruelling test on a wild Irish mountain. Short of wind and inactive of limb, he may early become so physically played out as to be unable to deal with the simplest of birds. And as shooting is essentially a field sport, these things must be taken into consideration.

There are men who kill their 60 per cent. of driven game and more throughout the season. This is first-class shooting, entailing exceptional abilities. If they are sound of wind and limb, they should be fine all-round performers, able to acquit themselves with outstanding credit at any kind of shooting; though it must be said that they might need practice before they became accustomed to the different conditions of, say, wild-fowling. While I consider, then, that a good driven game-shot can be a good shot at anything, I do not feel so sure that a good shot at walked-up game can necessarily be good at driven game. As has been said, there are potentially good all-round shots to be found anywhere, but they are most likely to be found among those who are adept at the driven bird.

Good shooting, in its fullest sense, should mean the ability to deal with any kind of quarry under any kind of conditions. This entails practice where there can be no question of picking shots at the angles which suit. Yet the picking of shots can be taken to mean either of two things—the picking of the easier ones or the more difficult ones. And there is a sufficient number of first-class shots who by picking the more difficult ones justify the contention that they could show a fine average under the varied conditions that sport can give.

"SCOLOPAX."

THE CHERITON OTTERHOUNDS JUST BELOW UMBERLEIGH, ONE OF THE BEST MEETS ON THE RIVER TAW

A FINE OTTER HUNT ON THE TAW

IT would, I think, be difficult to find a more sporting neighbourhood than that which lies in North Devonshire. There is excellent pheasant shooting, and, not far away, is the River Exe with its fishing. To the east lies the country of the Tiverton Staghounds, and there are many packs of foxhounds which, in a difficult country, show the most excellent sport.

I do not know whether these smaller packs are not mentioned more frequently by accident or design. For there is a certain charm in hunting with a dozen people out, and such packs are unquestionably the haven of the lover of hound-work. Not that very good hound-work is not to be discovered and enjoyed elsewhere, but the whole atmosphere in the smaller country is more intimate. And yet it must not be forgotten that were it not for the help of the residents in the small country and the visitors to the larger packs, hunting would have been well on the way to disappearing some time ago.

These reflections, which may possibly meet with disapproval, were prompted by the very great kindness of Mr. and Mrs. A. O. Thurston, who entertained me for a night at Leigh House, where the kennels of the North Eggesford, of which Mr. Thurston is Master, are situated. It was most exhilarating to hear, in place of the aeroplanes which nightly drone over London and whose sound, however protective it may really be, always appears most alarming, the sounds from the kennels during the night. And in the morning I had the privilege of seeing hounds fed, and formed a very high opinion of their standard. Certainly they show consistent sport in a country in which it is only too easy to be left behind. I wondered again, as I have wondered before, whether the nature of the country produces its own type of sport and inhabitants or whether it is the other way about.

My object in visiting North Devon was to have the pleasure and interest of a day's hunting with the Cheriton otter hounds, among the oldest packs of otter hounds in the country. Before coming to the present pack and my own experiences, a few words as to the history of the Hunt may be interesting, for it is, I think, always fascinating to look back, however briefly, over past records and hound breeding.

The Cheriton otterhounds were first formed by Mr. William Cheriton, who was born in 1828, and lived at Ellicombe in the parish of Down St. Mary. He was Master for 56 years, and was a farmer of the type which has meant so much to every type of hunting in the country. Would that agricultural conditions at the present day had not made their number fewer—they have certainly not lessened their spirit.

Mr. Cheriton owned the land which he farmed, and gave up all his spare time to hunting and to the furtherance of the sport which he loved. The original Cheriton pack was made up, in equal halves, of pure-bred otterhounds and of the old-fashioned type of harrier.

It is impossible to recall in detail the achievements of the various Masters over so long a period of years, or to estimate the effect which their different views on the right type of hound had on the sport which they showed. Mention of two Masters must suffice, and I have, with diffidence, selected Mr. Arthur B. Heinemann and Mr. W. Littleworth.

Mr. Heinemann lived at Porlock, and at the time when he was invited to become Master of the Cheriton was Master of the Essex otter hounds. For some time he combined both offices, but then gave up the Essex in favour of the Cheriton hounds. His Mastership lasted from 1902 till 1904, and during that time he showed himself as a most wonderful breeder of hounds. Mr. Cheriton had favoured the rough-coated hound, and Mr. Heinemann had the wisdom to retain this strain while mixing in with it the smooth hounds from his Essex pack and Staghounds from Mr. Peter Ormrod's country. It would, I believe, be fair to say that a finer pack has never hunted the Cheriton waters, though it must be remembered in looking back over the records that conditions have changed.

Mr. Littleworth, of the Fox and Hounds Hotel, was a marvellous all-round sportsman, and was Master from 1907–14. The only hound retained from the previous Master's time was one called Banker, and Mr. Littleworth built up a new pack with which he showed sport well worthy of the Cheriton traditions.

The present Master is Mr. C. R. Tritton, who took office last year, and, as I hope to show later on in this article, is admirably maintaining the traditions of breeding and sport which have characterised the Cheriton pack for almost 100 years. The secretary is Mr. F. H. Leake, who gets through an enormous amount of work, and I think it would be reasonable to say that the success of the Cheriton otter hounds is in no small measure due to his untiring efforts.

The Hunt uniform consists of a white bowler hat with a dark blue coat and waistcoat. A white tie and white breeches are worn with dark blue

A GROUP OF CHERITON PERSONALITIES

In the centre is the Huntsman, Mr. C. R. Tritton, the Master, is third to the right of him, and Mr. F. H. Leake, the Secretary, second to the left

HOUNDS BEING UNLOADED AT UMBERLEIGH

SCENT IMPROVED DURING THE LATTER PART OF THE DAY

stockings. A peculiarity of the costume is that only the Master wears a yellow waistcoat, and this custom was first introduced by Mr. Loraine Bell, who was at one time Master of the East Galway Foxhounds.

A great deal of uninformed prattle is heard from time to time about the cruelty of otter-hunting. It may be freely admitted that the old custom of using a spear gave a decided advantage to the field, and it is interesting to note that the spear was used for the last time in the Cheriton country in 1874.

The waters hunted by the Cheriton hounds are all in Devonshire. The principal rivers are the Taw, the Teign, the Torridge, the Creedy, the Kenn and the Lyn. All the tributaries of the Taw and Teign are hunted, but only those of the Torridge which are on the left bank.

I was glad to have the opportunity on the day after hunting of seeing hounds in kennels. Long before I ever saw a hound I knew what standard the Cheriton huntsman maintains by the perfect order in which he keeps the buildings. The dogs' and bitches' sections are spotless, and there is a most ingenious and successful method of ventilation achieved by a skilful combination of door and ventilator. In this way a constant inflow of fresh air is maintained. There is a good yard and also a useful wired-off enclosure. The huntsman has a most attractive cottage, which had every appearance of comfort.

Two dogs I particularly admired, both hunting and in kennels, were Dolphin and Pedlar. Dolphin came from the South Tetcott and Pedlar from the Dulverton.

Wasteful is a fresh-entered and light-coloured bitch also from Lord Poltimore's pack; and Fancy, who distinguished herself as usual when hunting, is one of the Cheriton's own breeding. One of the best drawers is Racer, who never leaves the water. Altogether there are fifteen couple of otterhounds and foxhounds in kennel.

Hounds meet twice a week, and on the day on which I hunted with them the meet was at Umberleigh on the River Taw. There were several past and present Masters of otter hounds out, and among them was Mrs. F. M. Beaumont who, with Mr. A. J. Heaman, was joint-Master of the Cheriton from 1929–1933. In 1933 she became Master, and retired at the end of the 1938 season in which she had been joined by Mr. C. R. Tritton, the present Master. Another ex-Master of the Cheriton out was Mr. W. H. Rogers, who was joint-Master with Major the Hon. T. R. Graham-Murray from 1928–29, before which he had been sole Master for some years. Mr. Rogers has done a great deal of work regarding the history of the hounds and country, and I, as everyone who writes on this subject must be, am greatly indebted to him. Mrs. Beaumont must be one of the few lady Masters to have been in charge of foxhounds and otter-hounds at the same time, and almost certainly the only one to have killed a fox with otter hounds and an otter with foxhounds.

Mr. Geoffrey Pring, who has been Master of the Culmstock otter hounds since 1935, was also out, and did a great deal by his enthusiasm and admiration to counteract the effects of the continual and drenching downpour. A grand old sportsman whom I met on another day was Mr. John Tripe, who began hunting with the Eggesford Hounds on a donkey when he was five years old and continued to hunt with them for 60 years.

Hounds moved off from Umberleigh at 10.30, and made good to Hawkridge. There were no otters in this part of the river, but, at all events, we had the consolation of seeing much very beautiful scenery, which is one of the greatest charms and delights of otter hunting.

Hounds were accordingly taken back to Umberleigh to try up, but for a long way nothing happened. Then we arrived at Four Acres, and here it seemed for a time that something might happen. Undoubtedly there was an otter there, but so soon as he got into the water and became wet the scent failed completely, and it was decided to try on. I was told that this not infrequently happens in this difficult pool, yet I could not but admire Fancy, who was perfectly certain that there was an otter about, and who went so far as to give a faint whimper, which she never does without a very good reason.

HOUNDS MADE GOOD TO HAWKRIDGE FROM UMBERLEIGH THEN WERE VANNED BACK

However, there was nothing to be done but to try on, and hounds were at last rewarded about a mile below South Molton Road, where they marked. It was still pouring, if anything harder than ever; but, fortunately, the rain was quite warm.

Hounds soon had the otter away, and with a cry which it did everyone all the good in the world to hear, started on a long swim up. After some minutes, scent appeared to be getting a little patchy, but hounds kept him on the move splendidly. Several times everyone expected to see him go down, but he decided to go up, and then came the best part of the hunt. With an exhilarating cry hounds raced up for about 200yds.—it was a cry that made everyone forget even the weather. Then he got back without anyone seeing him to the pool, but the dependable Fancy knew he had returned. On landing hounds soon had him killed. He was a splendid 21lb. otter, and not one inch of his skin had been punctured.

It was a 60-minute hunt such as anyone would give a great deal to take part in, and no hounds could possibly have put up a finer performance. Tom Moran, who hunted the Dumfriesshire otter hounds and also fell hounds before coming south, is to be congratulated on the way he handled his hounds, as are the past and present Masters for breeding and assembling a pack of such exceptional ability with which to hunt.

The huntsman cut up the otter in a way that I had never seen before—just like a fox—and I am greatly indebted to the Master for kindly presenting me with the mask, which will be a permanent reminder of a grand day's hunting among a very sporting number of people.

This is the first occasion on which a special article dealing with otterhounds has appeared in the *Field* for many years, and I must express my great thanks to all those in North Devon who made this occasion so pleasant and interesting.

ROBERT COLVILLE.

BLUE PETER'S FORM DURING THE SEASON

LORD ROSEBERY'S colt, Blue Peter, duly won the Eclipse Stakes at Sandown Park last week. He beat Glen Loan, a four-year-old whom he was meeting at 12lb., weight for age, by a length-and-a-half with his stable companion, another four-year-old, Challenge, beaten for second place by three lengths. Just after the race there were many regular followers of racing who wondered whether the winner was, after all, as good as had been thought after he had won the Derby. I admit that I was one of them. My attention was called to the previous race of Glen Loan. This very good colt had won at Ascot over seven furlongs from Wansfell, to whom he was giving 24lb. He had beaten that three-year-old by half-a-length, so that allowing for a possible improvement later in Wansfell, the two races, that at Ascot and that at Sandown Park, mean that Blue Peter is about a stone in front of Wansfell. At first glance that looks rather silly, but in spite of more than one failure this year, he is a very good three-year-old when willing to give of his best. Further, it is to be remembered that the Ascot race and the Sandown Park race were run the one over a severe seven furlongs and the other over a comparatively easy mile and a quarter. The distance of the Eclipse was, in my opinion, not nearly far enough for Lord Rosebery's colt, who did not win the Derby until the last quarter of a mile. There should be no doubt that he will appreciate much more the mile and six furlongs over which the St. Leger will be run early in September. It appears now, after thinking it all over, that Blue Peter did all that could be expected of him at Sandown Park, and that if the race had been a mile and-a-half, or even more, then he would have won by a much larger margin than was actually the case.

The St. Leger, if all goes well with Blue Peter, Pharis and Heliopolis, is going to be a most intriguing affair. The French racing people consider that Pharis is a colt of quite exceptional ability, and that he will win at Doncaster. I saw him win at Longchamps, and it has to be stated that he sailed past Tricameron, who was in front close home and won in quite sensational style. I am, however, not one of those people who saw him win who have since gone into ecstasies about him. Tricameron had twice been on a visit to this country, and he was going very slowly at the end of the race at Longchamps. Indeed, when Pharis sailed past him he was doing little more than a walk, and whatever happens neither Blue Peter nor Heliopolis will be doing that at Doncaster. The fact that Allegory was fourth in the Grand Prix in my opinion discounts the value of that form.

I consider that the danger to Blue Peter, if any danger there should be, is Heliopolis. Yet these two colts met in the Derby when Lord Rosebery's colt slammed Heliopolis. Since then they have not met, but Heliopolis has won two races. In the second of them he finished three lengths and a short head in front of Challenge, who was giving him 16lb. At Sandown Park last week Blue Peter beat Challenge by four-and-a-half lengths, and was receiving 12lb. from him. On form, therefore, as it stands, it would seem that Blue Peter has the better of the argument, but there is not as much in it as there had seemed to be after the Derby. Still, as I pointed out at the time, Heliopolis did not get too clear a run at a very important part of the race, but for which he would have finished closer to the winner without beating him. All things, then, being taken into consideration, there is little, if anything, wrong with the form of Blue Peter, Heliopolis and others using races at Epsom, Ascot, Newmarket and, last of all, Sandown Park. Blue Peter is fully entitled to be considered the best colt of his age, and in addition to that a very high class three-year-old, probably well above the average standard of recent years.

Lord Glanely's colt, by Colombo out of Rose of England, had won in such good style at Ascot and at Newmarket that he was generally considered to be the best of his age and a colt of great possibilities. He started at 5 to 2 on for the National Breeders' Produce Stakes at Sandown Park and won by three-quarters of a length from the Aga Khan's Stardust, with Piping Rock third, and the King's good filly, Great Truth fourth. The five furlongs races at Sandown Park are run down, or up, the middle of the park, some distance from and broadside on, to the stands. It was, however, certain that Stardust had met with serious interference from the winner when making his challenge inside the distance. Smirke had to check Stardust and then was beaten by only three-quarters of a length. He was certain that if he had not been interfered with he would have won, and such is my opinion.

He was running on very strongly when he caught up with Lord Glanely's colt. The Stewards very soon sustained the objection. One of the Stewards, at least, and a very able one too, was down the course, and saw for himself all that happened. The fact that the Rose of England colt was beaten does not mean that he is not a good colt in the making, but it means that Stardust is just as good, if not better. Stardust is a chestnut colt by Hyperion out of Sister Stella, and is really good-looking. He had just failed at Ascot when beaten by Tant Mieux, but he had then gone on to the First July Meeting at Newmarket and won cleverly from Illuminate, who has won since, at the Second July Meeting at Newmarket. Incidentally, when they first ran in public, Illuminate met the Rose of England colt, at Newmarket, and beat him so that there is probably not much wrong with the form. The Rose of England colt won at Ascot, but the later running of Engaged and Congratulations who were second and third to him has not been of much account. Racegoers had begun to think that the Aga Khan at last had got no two-year-olds of outstanding promise. This success of Stardust proves them to be wrong. Smirke has the highest opinion of this good-looking and beautifully bred colt.

The great feature of next week's racing is the Goodwood Meeting, which will be held in the Duke of Richmond's lovely park on Tuesday, Wednesday, Thursday and Friday of next week, a week which will be ended with a one-day meeting at dear old "Ally Pally." If only the weather will be fine Goodwood will be delightful. There is no more lovely racecourse in the world, so far as I know. The going is never too hard.

Rain, however, or that awful sea fret which sometimes covers the course, spoils everything, and on such days Goodwood is the most melancholy racecourse anywhere to be found. The class of the racing will be of the highest, with the race for the Stewards' Cup on the first afternoon the most popular event. There are, as ever, many tips for the race, but the best handicapped horses seem to be Davy Dolittle, Scotland for Ever, Neuvy, and Knight's Caprice. Davy Dolittle was third in this race last year, beaten by Harmachis and Old Reliance. He is better handicapped with them by many pounds than he was last year, the reason being that his form this season was much below that which he had shown twelve months ago. Since the weights were made known he has shown that he is back in his old form, for he was beaten by only inches at the last meeting at Newmarket. A repetition of that form makes him about the best-handicapped horse in the race. Knight's Caprice has run only twice this season, winning the first time, and failing in the mud at Ascot. He is nicely in on his Newbury form. Scotland for Ever ran very well at Ascot and is about the best-handicapped horse in the race. Neuvy, who looks likely to be favourite for the race, is also well handicapped on his best form. As only one horse can win my selection is Davy Dolittle. GNOSTIC.

W. A. Rouch

BLUE PETER (E. SMITH UP) BEING LED IN AFTER THE ECLIPSE STAKES.
His trainer, Mr. J. L. Jarvis, is on the right

SALES AT DUBLIN

At Messrs. Robert J. Goff's sale, held in conjunction with the Dublin Horse Show next month from the 8th–11th, 713 thoroughbred yearlings will be offered for sale. A glance through the distinguished sires is an indication of the importance of this event. On the 12th, 176 lots of hunters, show horses, &c., will conclude the sale. Catalogues may be obtained now from the auctioneers at 60–61, Lower Mount Street, Dublin.

TYPICAL STAR BOATS RACING IN KIEL HARBOUR. GERMANY HAS A FLEET OF ABOUT TWO HUNDRED

A NAVAL STAR TURN AT KIEL

By K. ADLARD COLES and TERENCE STOCKEN

FOLLOWING on "Kiel Woche," the International Navy Cup contest, in which teams of naval officers from nine different countries took part, resolved itself into a most exciting event, in which the favourite, Germany, built up a lead in the initial stages, only to have it reduced and then surpassed by the English team, it being anybody's cup until the last of the five races which formed the series.

The races were held in Star class boats, a type of boat which has a world-wide distribution; the Royal Naval Sailing Association has raced in this class for several seasons at Burnham, but this is the first time they have pulled it off at Kiel.

Last year Sam Woodcock, the star helmsman of the British team—Sub-Lieutenant Woodcock he was then, but is now a "two-striper"—put up a good fight, but finished third in the final placings, nearly 29 points behind Germany, the winners. This year the tables were turned; perhaps that second stripe put just the extra edge on his helmsmanship that was needed, or, maybe, it was just hard luck last time—whichever the way, he has pulled it off, ably seconded by Lieutenant Grattan.

This victory was really more than we had dared hoped for, because the Star boat sailers have always been at a disadvantage in this country, owing to the few boats available, compared with the quite enormous fleets abroad. There are about 1,600 boats of this class actively racing in various parts of the world, all over it, in fact. There must be getting on for a thousand of them in the United States by now—the monthly list of new numbers which the I.S.C.Y.R.A. publishes always shows at least a dozen new ones each time—while Germany has something like 200; further, Germany has always made the Star class her particular pet, and—the rules of the class allowing considerable play in the matter of price—the German-built boats are the recognised Rolls-Royces of the class, costing about £260; not bad for a 15½ft. waterline.

German masts have always been the envy of other Star boat owners; laminated and streamlined, and of super workmanship, they have played a big part in the supremacy of that country, hitherto; and many have been the tall yarns told about the "flexible" German masts, juggling with which was alleged to be the secret of the Germans success.

The point is that, owing to the elasticity of the rules, much variation can be played with the rigging; although the dimensions, scantlings, weights and proportions are very strictly laid down and must be adhered to, it is permissible to move most of the salient fittings of the boat a limited distance in either direction; thus, the heel of the mast may be moved forward or aft about six centimetres; the placing of the shrouds, runners, height of the boom, jib-tack, and so forth may likewise be varied within fixed limits, so that individual ingenuity has plenty of scope, and, in the United States particularly, following rumours of German mast jugglery, has been given full play. It is even possible to alter the raking of the mast at will while racing; in fact to "trim" the mast, as ordinarily one trims the boom.

However, the Americans' skill was of no avail in the World Championships last year, held at San Diego; the crack German pair, von Hutschler and Weise, sailing that wonderful little boat Pinun, carried off the prize, and the betting odds must certainly have been on Germany when the Navy Cup races began at Kiel.

The main Star fleet in England is at Burnham-on-Crouch; but there are only nine boats there all told, an average racing day bringing six to the line, so that although Woodcock has some pretty good metal to race against—such capable helmsmen as Gumprecht, Roy Mitchell and Fitz. Carse—prospective international challengers must always be at a disadvantage as compared with countries where the picked helmsmen of a dozen or more fleets, in boats equally picked, are perpetually contending for pride of place. It probably helped this year when the R.N.S.A. invested in a second boat of its own (Glitter, the first one being Twinkle), so that Woodcock and Grattan raced against one another, and could compare notes as one skipper to another.

The Kiel races opened with good omen, Woodcock winning the first day's event. (The boats used were all, of course, local German ones lent to the competitors, an advantage one way, in that they were all crack, selected boats; a disadvantage in another, as it meant the competitor was not sailing the boat he knew.) Seven points down on this race, the Germans made a great come-back and won the next two days. Racing was suspended for one day by a great storm, which rather broke up the weather; but the Stars seem to love it when it's tough, and though the day after the storm the German team had pouched 47 points, the English pair were on their heels with 37 points.

The fourth day the weather was mild again, and the German team came out right down the list; the English pair coming in first, found themselves ahead on total scoring with 55 points to Germany's 50 points. The nearest rival was Sweden, with 35 points.

Sweden now came into the limelight; her only hope was to win this event and hope that neither England nor Germany would succeed in getting second place. Eighteen points were given for a win, and eleven points for second, so that by winning, Sweden would convert her 35 points into 53 points, and with both her rivals unplaced would gain second place.

Well, she won, after a tough struggle; but Great Britain was close behind, and sailed through into second place to win the series and the cup.

This has really been a splendid effort on the part of Woodcock and Grattan, and shows that not even countries far outnumbering ours in the matter of Star boats, and which go in for intensive training and selection undreamed of over here, can keep a good helmsman down.

A fine feather for the R.N.S.A. cap!

Final placings of the first three were: Great Britain, 67 points; Sweden, 53 points; Germany, 50 points.

As has been shown, the Star class is one of great individuality; and in different hands the same boat can change her racing personality according to that of her owner. Nevertheless, the exact dimensions and specifications have to be followed very rigorously, like any ordinary one-design class.

Stars are "hard-chine" boats, with a flat bottom and a fin keel, with bulb. The rudder is detached from the keel, on a fin or skeg of its own. The cockpit is comparatively small (it needs to be, as Star boats mostly travel on one ear, with the crew lying full length on the upturned side of the boat), and the mainsheet can be carried either on a horse on the counter or on a bar across the after end of the cockpit, according to the sheeting arrangements preferred. The rig is ordinary Bermudian sloop, with four battens in the leach; the sail plan is laid down, and is the only one permissible. They were designed in 1911 by William Gardner, and it is interesting to note that—as related in the *Star Bulletin* a few months ago—Stars Nos. 1, 2 and 3 (the numbers are perpetual, are not transferred but die with the boat) still race regularly on Long Island Sound; new sail numbers are now approaching 1,800! The dimensions of the class are as follows: Length O.A., 22ft. 9in.; L.W.L., 15ft. 6in.; beam, 5ft. 9in.; draft, 3ft. 4in.; sail area, 281 sq. ft.

BONTEBOK IN SOUTH AFRICA

By MAJOR H. C. MAYDON

UP to two years ago I was under the impression that bontebok were practically extinct, and most other men keen on game seemed to think likewise. I therefore made it one of my principal objectives, whilst at the Cape during the last two winters, to make close inquiries.

Bredasdorp—an old-time Dutch township—is some 100 miles S.E. of Capetown and fifteen miles from Cape Agulhas. Half way between the town and the sea, in a district of sour veld, scrub and dried vleis, lies the farm of Mr. Albertyn, and it is on this farm that the last of the bontebok exist.

All praise is due to Mr. Albertyn and his forebears for preserving this two-mile square of sour veld as a game sanctuary and religiously protecting the few herds of bontebok, which have been hunted to death elsewhere. This portion of Mr. Albertyn's farm has now been taken over by the Government to keep as a game reserve. Unfortunately, Mr. Albertyn has now resigned his interest in the reserve, and on my second visit last March I found no white man in charge, although the precinct is closely fenced and has a native warden. A permit is necessary to visit from Bredasdorp.

Last year there were 100 bontebok alive and doing well, divided roughly into seven or eight herds. Visitors are frequent and there is a fair motor road encircling and crossing the park. The herds are so tame that they can be approached to within 150yds. without difficulty in one's car, although they grow restless at once if one gets out of it. I spent a few hours trying to stalk them for photography and closed one fine buck to 60yds.

Bontebok closely resemble blesbok, save for the prominent white patch on the rump, more white on the legs and very brilliantly marked puce coloured coats. It is very difficult to distinguish a male from a female, as both carry horns of very much the same shape and size. Herds ran to as many as a dozen beasts. Like all the hartebeest family, they seemed to live and graze in the open, were very conspicuous and rather stupid in habit, as all their tribe. An easy prey to the hunter in the old days and very different to the various steinbok, duiker, and at least one large herd of Vaal rhebok in the same reserve. The Vaal rhebok, a herd of fifteen, were the most timid of all, and although seen on both my visits could never be approached nearer than 500yds.

Although nothing much as a trophy and probably indistinguishable from a blesbok as a mounted head, it is good to know that bontebok are apparently safe so far from extinction. Mr. Albertyn assured me that the stock of 100 has been maintained for the last few years, although the area of the feeding grounds does not seem able to carry any more.

Old bulls have to be shot off from year to year, but the young cows breed freely. From his experience, bontebok would be difficult to introduce elsewhere, as they are so timid that they usually die if man-handled.

It is reported that there is one more small herd of bontebok preserved on a farmer's private land near Swellendam.

It seems a great pity to me that the Cape authorities do not attempt to establish a herd at Cape Point, a six-by-two-mile stretch of sour veld, useless for farming, and already possessed of 100 or more (at a guess) Vaal rhebok. This is one of the favourite motor drives of visitors—being so close to Simonstown—and an excellent picnic resort. The country and hills are wild, reminiscent of Scotland, and it would make an ideal game reserve for the survivors of old Cape game.

Since the Cape is proving more and more popular for overseas visitors each year, let me assure them that there is still plenty of small game left as a lure for naturalists. A visit to the Cedarsberg Mountains, beyond Piquetburg and 150 miles north of Cape Town by an excellent road, is well worth doing.

It is a Government forest reserve of many square miles, and contains the Cedarsberg spine of mountains up to about 4,000ft. Here are several mountain huts for mountaineers and visitors, where good climbing may be found in wonderful and wild mountain scenery and where many large herds of Vaal rhebok still exist. They and klipspringer are strictly preserved, but a permit to shoot one or two

"CLOSED ONE FINE BUCK TO 60 YARDS"

specimens for authentic collections may be had and the most meticulous shikari could not demand a more sporting beast in more wild and natural surroundings. Blaine and I located some six herds of rhebok in ten days wandering, but it took Blaine every minute of it, and many failures, to bag the head he wanted.

Rooi rhebok have apparently disappeared from the Cape Province from lack of protection. But grysbok, steinbok and duiker are fairly common, although by no means easy to bag in thick scrub. The small game shooting (birds) in certain districts from April 1st is excellent.

BONTEBOK ON MR. ALBERTYN'S FARM NEAR BREDASDORP WHERE THERE ARE A HUNDRED ALIVE AND DOING WELL

THE REST CURE

By MAJOR C. S. JARVIS

"WAKE up! Wake up! And drink your early morning tea. Quickly now—everybody else has finished theirs a quarter of an hour ago."

I rub my eyes sleepily and wonder where I am. Through the big windows in front of my bed the cold light of dawn shows with a background of red sky. It cannot be more than 6.30 a.m., but all around me is the hum of busy, feminine life. It is like nothing I have ever experienced before.

Then I remember the words of the regimental M.O.: "You're badly run down, my boy, and this bout of malaria has left you very shaky. I'm sending you down to the base hospital for a complete rest. There you will be able to lie on your back and do nothing."

Down the ward again comes the rapid tap-tap of Sister's shoes, and the tempo quickens. Orderlies in list slippers hurry past with piles of sheets, junior nurses flit along with an even more rapid tap-tap than Sister, popping thermometer from mouth to Lysol basin and from basin to mouth. Charts are written up, bed baths administered, blankets stripped off; and the whole ward is a hum of feverish activity suggesting a rush order in the assembly shed of a mass production car factory. Those who say old England is sunk in lethargy and inertia and losing her grip of the Empire in consequence should see a military hospital ward in the morning hours.

Breakfast comes and goes with a clatter of plates and gulping of scalding tea, and now the staff really get down to it. Orderlies scrub the floor with flying brushes; patients are brushed and combed; spare blankets are folded neatly at the foot of the beds; and the sheets are turned back neatly and smoothed, and on no account must they be disturbed afterwards.

If having a complete rest consists of watching others work like a hive of bees on a warm June day, I am having the laziest time of my life. The question is, however, whether I should lie in bed when others—better men and women than myself—are working themselves to death for some great cause. I do not know what that cause is, but I feel instinctively that it is one the whole nation should have at heart, and the urge is to spring up, grab a broom or brush, and join the toilers.

The hands steal round the clock's face, and one feels that the climax is near at hand. The great moment for which we have been striving and straining is imminent. Sister stands by the door to sound the fall-in, and bustling orderlies dress the folded blankets and sheets, and even the beds, by the right. Then comes a sudden hush, and we dare not breathe for even our heads and upturned feet are part of the general scheme of "By your right: Dress."

When the tension has reached breaking point steps are heard outside, and a sigh of awe and foreboding goes through the room. The door flies back on its hinges, a hoarse sergeant-major's voice roars, "Shun," and in all his military, medical majesty an R.A.M.C. captain walks in.

THE SPIRIT OF CRICKET

By NEVILLE CARDUS

IT is good to get away from the main tracks of county cricket now and again, and to journey, as I did last week, to some remote place in Somersetshire, where the sight of a famous player has not become common. Familiarity does not necessarily breed contempt, but it tames the spirit of hero-worship, even amongst the young.

At Yeovil last Saturday Lancashire were down to play Somersetshire, but the morning was stormy. The Yeovil cricket field is approached along a narrow lane; there were puddles in this lane on Saturday morning, and when the weather momentarily cleared, they reflected the blue of the sky like magic mirrors. Outside the ground a small crowd waited patiently, although they knew that cricket was not likely to occur until late in the afternoon. From time to time a scudding cloud sent out a blinding shower and everybody huddled under the nearest shelter. But few people went home—as the man in Phil May's drawing put it: "Anything in reason, but I will *not* go home."

I heard these humble anonymous lovers of the game speak of Wellard and Gimblett in affectionate accents. Yeovil gets few chances of watching these heroes. But not only Wellard and Gimblett were extolled; after all, we all know Wellard and Gimblett; their prowess has gone beyond the local boundaries. The little throng in the rain on Saturday spoke of Luckes, Buse, Hazell, Lee, Andrews in much the same admiring tone that they spoke of Gimblett and Wellard. I imagine that Yeovil folk are like Yorkshire folk—they would pick an England team in terms of Somersetshire. And rightly so—every village or little town worth its salt is convinced that "our lads" are the best in the world.

An old Scot once said to his son, before sending him out into the greater world, "If ye ever become a great man it'll be in a small toon." The boys and girls at Yeovil elevated Buse to the ranks of the immortals. And why not?

Wellard, of course, is one of the game's great possessions. I think that he should have been put into the England eleven years ago and left there. He may not be a great player in the technical sense but contemporary cricket is not so rich in all-round players that a Wellard can be counted as only a "county performer" of unusual personality. He is a hitter of potentiality; he is a good fieldsman. Also he is two bowlers in one—he can use a new ball at a decent pace, and then on a soft wicket he is capable of spinning an off-break. In the absence of really distinguished specialists, the useful all-rounder is not to be despised, especially in long-series Australian Test matches. This time next year we shall be picking the England team for Australia.

I cannot at the moment point to a single match-winning bowler of the Barnes or Spofforth order. And if we take a glance over history of Australian Test matches, we find that few bowlers have achieved averages of under 25 a wicket—that is to say, there have been few match-winning bowlers in Australian Test matches. Rubbers in Australia are won by enduring batsmanship, backed up by all-round utility in the field. Wellard is now beyond the age when a cricketer makes his first visit to Australia—I am simply using him in this article as an example of the kind of player the Selection Committee should look for in an age when the land is terribly naked of great specialist bowlers.

I was struck by a fact at Yeovil which has been forced on me at Lord's, Old Trafford and other places. The hero-worship of the spectators was directed entirely at contemporary players; even the elders on the pavilion seldom referred to the "giants" of the past. When I was a boy, even young folk had a sense of the past, a background. They knew what Spofforth meant, and Hornby, and Bonnor. When first I visited Old Trafford I was thrilled to think that on this sacred turf Hornby and Barlow stole their runs long ago, and Crossland bowled out the parson, saying as he did so, "Down goes his —— pulpit!" To-day the young people not only know little of cricket's old masters; they even belittle them. This is a sign of the general inferiority-complex shared by the age we live in. Before the War the crowds that hailed the coming of Hobbs to greatness never dreamed of using him as a means of "debunking" Trumper. No period is likely to produce great men, in any walk of life, if it is a "debunking" age, and one not inspired by tradition and ready to reap where the best forerunners have sown.

But these may be pompous thoughts to bring any from Yeovil. Better far to reflect on the new spirit which has come into the game this season. There is no lack of sportsmanship amongst the county teams; indeed, the irresponsibility of the country club is apparently being cultivated in certain high places. Teams aspiring to championship honours are acting on the "win or lose" principle. Declarations are fashionable—declarations which give the batting side a more than reasonable chance. Then, when the batting side is beating the clock, *and are not losing many wickets*, the bowling side does little or nothing to close up the game, to change from match-winning to run-saving tactics.

Surely the "bright" cricket enthusiasm can be overdone. A match should be saved if, after the right gesture, it cannot be won. Bowlers have their tricks, their artful ways of withdrawing from an offensive to a defensive policy ("Over t' wicket and t' leg policemen!" as they used to say in the North). If the secret of protective bowling dies out, if the art of playing back-to-the-wall for a draw becomes obsolete, we shall certainly get into trouble in the long-lengthed Test matches of Australia. By all means, let teams play for victory for all they are worth. But, having failed in their advance, it is then their job to try to frustrate the other fellows. The rigour of the game!

AFTER THIRTY-ONE YEARS

A. O. L. Lithgow, the Harrow Captain, being carried shoulder high to the pavilion after Harrow had defeated Eton for the first time since 1908

THE SILVER-LINING

FOR 31 years there has been a cloud over the Hill. On Saturday the sun broke through. There have been better sides than this Harrow eleven during the past 30 years, very much better sides, that have been beaten or had to be content with a draw. But no Etonian can complain about Harrow's victory. It was most decisive. It left no possible room for doubt as to the respective merits of the two sides. It was—from every point of view—a thoroughly good thing. Thirty-one years is a long time.

This year's Harrow side is young. Though not a good side it was well drilled (the ground fielding was on occasions slovenly) and it looked all through to have a fighting spirit, notably absent among the Etonians. Perhaps the names Crutchley, Anson, Cowley—names associated with former Harrow victories—had something to do with it. And then, of course, D. F. Walker and Patsy Hendren, great fighters both, are in charge of cricket on the Hill. Anyway, it was the will to win rather than any outstanding skill that brought victory.

Eton were not a good side. They looked passable when batting on Friday. They looked passable during the first half of Harrow's first innings. Thereafter they were very ordinary. And in their second innings they produced strokes not in the book at all, strokes more in keeping with preparatory school cricket. It seemed then as though they did not expect to win.

Eton batted in this second innings without concentration. Personally, I have thought, for a number of years now, that there has been a sight too much concentration about this game. Too frequently has it been forgotten that this—cutting out all the glamour (and glamour, anyway, is largely false)—is a game between two sets of *boys*. It should be a cheerful, youthful, virile game. How many times in the past few years have we seen grim cricket, grim concentration, dour batsmanship, the atmosphere without the skill of an Australian Test Match? We might have had all this again this year—there were signs of it in Eton's first innings—but for the Harrow batting, joyful attacking stuff, full of mistakes and full of fire. And for that we may thank Patsy Hendren.

Of the Eton side Fiennes was the best bat, and looked as good a bat as any on the side. And Pearson was unafraid of reputations or results, a man who would be useful higher up in the batting order of a school side. For Harrow Crutchley added glory to the family name, and hit a good century, and Anson did the same without the century. In the second innings it was Paul and Lithgow. Paul has the strokes of a racket player, Lithgow the strokes of a good batsman. And Lithgow played a captain's part in every way, even down to hitting the winning run.

Byam was by far the best bowler. He bowls more like a good professional from the north than a public schoolboy, and his three for 30 was a poor return for excellent work. Henley took three for 14, but that was due to good catching rather than good bowling. The Eton bowling, once the shine was off the ball, was made to look moderate. Some school sides of this year would not have noticed the shine. Both wicketkeepers were good, with Fiennes rather more stylish. Harrow's catching was remarkable—their ground fielding mediocre. Eton's fielding was consistently good, despite a dropped catch or two.

The crowd, a good one, though not so smart as usual, was delighted—at least the Harrow portion of it; and quite a number who watched, owing allegiance to neither side, had acquired Harrovian nationality by the end! They swarmed round the pavilion and wanted vociferously to see the heroes. They cheered and cheered and then sang "Forty years on" (not very well). Then they started on the top hats. Some top hats were dribbled, some were bashed, and some just tapped. But few, I think, were left alone. There was some good single-stick play, some rather crude fencing with umbrellas, and some all-in wrestling. Harrow was very pleased with itself. Thirty-one years had begun to make "Forty years" look a bit sorry. And the old gentlemen in the pavilion looked down benignly and with pride. "England" you could almost hear them thinking, "stands yet where she did."

Well, Harrow will have pretty well the same side again next year. They may well make it two. And, personally, I hope they never take their victories so decorously—and Foreign-Officey—as Eton used to do.

B. V-F.

Townsend, of Derbyshire, about to bring off a late cut through the slips

ROUND THE WICKETS

WICKETS fell all day long at Maidstone the other day when Kent were playing Gloucester. The small boys in front of us got a lot of fun out of filling in their score cards. So, apparently, did the man in the bowler hat sitting next to me. He put down everything so neatly and correctly on his card that he might have been filling a ledger. And at the end of the day he asked his friend—a red-faced man in a cap—whether it was a record for the lowest aggregate in a day. The man in the cap could not tell him. No wonder. He had sat all day, his arms folded, his score card in his pocket. The score did not mean a thing to him. Just as the game did not really mean a thing to his friend.

A game is pretty obviously whatever its followers make it. If, for instance, England played Australia, not at the Oval, not at Sydney, but away out in the country somewhere before a handful of villagers, it would, I think, be a very different affair indeed. There would be no doped wickets, no body-line bowling nonsense, no trouble about fast bowling or slow batting, no record mania. In all probability it would be a very peaceful affair. So that any unpleasantness can, to a great extent, be suspected from the spectators. And I do not think there is much doubt which of the two types of spectator is the most suspect—the man who loves the game and what it stands for, or the man who loves its figures, its scores, its records, its sensationalism—the man in the cap or the man in the bowler hat. When the first two Tests had been drawn the bowler-hatted one thought he was not getting his money's worth. In no uncertain terms he demanded results at all costs. Timeless Tests became his watchword, his banner with a strange device. And so eventually we went to Kennington Oval to witness his invention. Those who survived went abroad to recuperate—and ran head-first into the biggest farce which the game of cricket ever conceived—the ten-day Test at Durban.

But then the man in the cap intervened. He had been ready to put up with people who had evidently never heard of Hirst, who stormed that something called "body-line" would assuredly wreck the game. He had been ready, too, to look on both sides of the "barracking" controversy. But he was not going to stand by and watch the game made into something like a Six-day Cycle Test. He demanded that cricket should be governed by time, because if it were not its pace would come to a standstill; that cricket should be played on English turf and not some product of science; and that it should be played with a spirit worthy of the game, its players and its followers. And people listened to him. So long as they continue to do so, cricket will always be a game worth watching.

* * *

We were watching Townsend bat. Rain had made the wicket a mat of black rubber and the ball was leaping about all over the place on it. Every now and then one would rear up and smack him on the hand. And every time the little man sitting next to me on the seat would stir uneasily. He had come a long way apparently to see Derbyshire play and Townsend bat. So that when a particularly vicious ball suddenly flared up at Townsend, rapped him on the gloves and then settled down again, nestling quietly in the hands of first slip, he was moved to a degree. But not beyond words. As the white form of his idol, banished to the obscurity of the pavilion, grew smaller and smaller he grew more and more heated. It was, it seemed, all about gloves.

Townsend had been wearing the wrong sort of gloves. They were, I had noticed, somewhat out of the ordinary. Instead of horse-hair padding wrapped in leather or spikes of rubber for protection, they had what looked like strips of solid rubber. The little man was claiming that Townsend would never have been out, would still be on view if he had been wearing the right sort of gloves. It was ridiculous to wear such things — the ball bounded off them higher than it did the bat. Horse-hair gloves were no better. What was wanted was something which would check the ball, put the break on it, put it on the ground. Rubber spikes were the things. The ball had not half the chance of going up and being caught if it hit rubber spikes.

I thought a lot about the little man's theory during the next few days. I kept an eye on all the cricket pictures in the papers. I noticed what kind of glove the batsmen were wearing. Almost to a man they wore gloves with rubber spikes on them. I was just thinking that there might have been some sense in the fury of the little man's exaggeration when I came across three pictures — one of Hammond, another of Bradman and another of Hobbs. They were all wearing gloves backed with horse-hair padding, great things which looked like bolsters. But then, I realised, the three greatest batsmen which we have seen since the War were so rarely hit on the hands that they might never have worn gloves at all except for their peace of mind and confidence. Besides, if a bowler hits Bradman on the hand he must almost be tempted to appeal for l.b.w.

* * *

Wilkinson was toiling in the blazing sun of a July afternoon. The Old Trafford wicket was as hard as iron, the batsmen in their element. He had been bowling for over two hours. And he had taken but a single wicket for well over 100 runs. Not a very imposing feat—from the figures. But in point of fact Wilkinson was bowling very well indeed, well enough to be kept on in spite of all the runs he was costing his side. The fast bowlers were finished. He was holding the fort until the new ball came along. It was a thankless task. The dice was heavily loaded against him. Almost his only hope was his googly, in trying to trick the batsman to think the ball was going one way when it was really going the other. The wicket hardly helped. It was as shiny, as unresponsive, to the bite of a ball as a sheet of glass; and just about as icy in its relentlessness.

Wilkinson had beaten his man more than once, had deserved more than one wicket. Four times he had lured him out, spun the ball round his bat, watched it go on—and hit his pads. And four times he had plotted in vain. The ball had not pitched on the wicket. And because it had pitched on the leg the batsman had not been given out. That is the law. Don Bradman has suggested that the words "that part which is between wicket and wicket" should be cut out of the new l.b.w. rule. I will be extremely rash. I will go further than he. When that is a rule,—as I think it will be soon, and when it has proved insufficient, as I think it may quite possibly prove to be, then, I suggest, make anything which is going to hit the wicket count as if it had hit it. Make a ball good enough to beat a batsman, but simply not good enough to pass clean through his pads to hit his wicket good enough to count him out. Do let us give the bowler a fair chance.

HUMPHREY DANIEL.

Arthur Wood anticipates the decision to an l.b.w. appeal

LETTERS TO YOUNG FLY FISHERS

V.—Flies and How to Tie Them

BROUGHT TO THE NET

MY DEAR BOB,—During the week I have been meditating, whiles, on your problem. When you have bought your casts and points I think I reckoned you would only have 6/6 left for flies, and to speak frankly that is not very much for an original stock, as it were. It seems to be a question of whether you should get three kinds of fly only—say a dozen of two of them and half a dozen of the third, or whether you should buy half a dozen of each and get five different flies. As you will find later, there are, quite literally, hundreds of different dressings of flies, and they go by all kinds of curious names. A few years ago a book on fly tying gave details of 515 different patterns. A great many of those would not interest you at the moment, for they are meant for sea trout or lake trout, and are not really intended to represent "flies" at all; they are more in the nature of lures, brightly-coloured affairs which attract fish from afar by their showy appearance and the way they are fished.

But even among genuine trout flies—flies which are taken by trout in mistake for their natural food—there is hopeless confusion for the beginner. Some of them are named after the natural fly they are intended to imitate—olive dun, olive quill, rough olive, red spinner, and so forth. Others, particularly flies used in Yorkshire and the North, are named after the materials used in their construction: waterhen bloa (hackle from the underwing of a waterhen and a blue—*i.e.*, slate-coloured—body of mole's fur); pheasant tail. Others, again, are called after their designer, or some famous angler: Greenwell's glory; Gilbey's upright. One could, no doubt, easily select a dozen or two more examples of this curious nomenclature, but I have selected these because they are all taken by trout for one and the same natural fly in one or another of its stages—our old friend the olive, which I mentioned in my last letter. You will, I think, gather from this what a prominent place olives hold both in the trout's diet and in the angler's estimation.

So when you have to tie yourself down to one or two patterns, you, too, had better specialise on the olive. There have been anglers who have gone through a whole season using nothing at all but a red spinner, which, as I mentioned before, is the name of the olive after it has made its final change into its mating and egg-laying existence. It is rather odd, perhaps, that this particular fly should be taken so readily, since a trout gets much less chance of feeding on it in this stage than it does when it first hatches out as a dun, except when it falls dead on the water. However, the difference between spinner and dun is very little more than the colour—one being olive, the other a rusty red—and it is quite likely that the dun appears redder to the trout than it does to us; so, for the first choice, I should suggest an imitation of the red spinner and the particular fly had better be an orange quill. This is a compromise. It is of a sufficiently red colour to represent the spinner of several flies, and its quill body has the rather noticeable segmental markings of the fly in its dun stage. The size for summer fishing had better be No. 0, say half-a-dozen flies.

Next you must have a fly which represents the insect when it is hatching out at the top of the water, as it is in this stage that it is taken most frequently by the trout. For this there is nothing better than a gold-ribbed hare's ear, made from the fur of a hare's ear with a thin gold wire ribbing down the body. But see that you get the right dressing. The hackle should not be made from a feather, as has become the reprehensible practice of some professional dressers. It should be made of longer strands of hare's fur. Get two sizes, No. 1 and No. 00, as this fly is a good one for a sort of general pattern; it is probable that many flies have much the same appearance when struggling from their shucks, but their size differs. If you get half-a-dozen of each size you will then have two other patterns of half-a-dozen each to select.

One of these had better be a fly of a different type altogether—say, a black spider. "Spider," in fisherman's English, does not mean an imitation of the insect which spins its web in the grass or vexes the soul of the careful housewife. It is simply a fly tied with a long and sparse hackle which has rather the general appearance of a spider. The reason I suggest a pattern of this kind is that in summer there are often days when trout do not seem to feed in the ordinary way at all, but when a fish here and there will be found lying in shady and comparatively still water, lazily rising from time to time, to suck in some inconsiderable trifle that happens to float slowly over its nose. It is then that some small black fly will often get a rise when the more usual patterns will be ignored. So get half-a-dozen black spiders on No. 00 hooks.

For the final half dozen I am torn between Devonshire practice, which almost invariably includes a March brown on the cast, and my secret conviction that a tup stands more chance of attracting a fish in summer. If one could rely on getting genuine tups I, personally, should invest my last eighteen pence in half a dozen. They should be made from soft fur from the underside of a ram, and I suspect that the real attraction of this sometimes remarkable fly lies in the natural oil in the wool, but I am very doubtful about the shop-tied article. Too often it looks to me as if "any old wool" had been used. So perhaps you had better lay out your last pennies on March browns. One fly of this name comes up periodically through the summer, and the imitation will also be taken occasionally for one of the sedges. No. 0 is perhaps the best bid for size at this time of year.

All these flies are best tied as hackle flies—flies without wings—and should be on eyed hooks, and not whipped on to lengths of gut. As to putting them on, there is a multitude of knots which have been devised for making up tackle, but for all practical purposes three, or four at most, are all you need to learn: one for tying two lengths of gut together; one for making a loop; one for tying on the dropper links when two or more flies are being used; one for tying on flies. Here are some which are easy to learn:

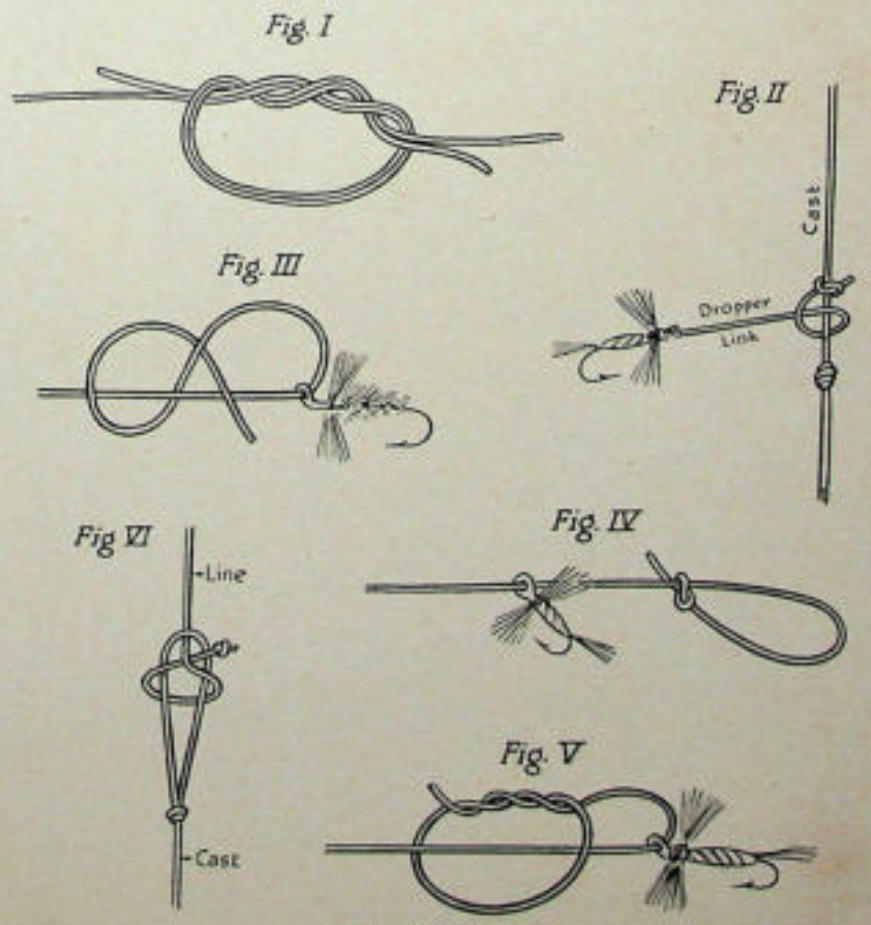
For tying two lengths of gut, putting on points, for example: Lay the two pieces of gut alongside each other; make an overhand knot, pulling the short end through; put the short end through again and pull tight (Fig. 1).

To make a loop turn back about 3in. of the gut so as to form a loop (do not stint yourself, as you will find short lengths on a gut cast difficult to tie), then proceed exactly as if you were joining two lengths of gut together. Put the loop through the overhand knot twice and pull tight.

In tying on the dropper link your object is to make it stand out at right angles to the cast. Select a point in the main cast just above a knot, so that a fish pulling on the link will pull it down against the knot. Then with the link make a simple overhand knot round the main cast, pull tight; now make a half-hitch between the overhand knot you have just made and the knot on the main cast, pull tight and pull the completed knot against the knot on the cast (Fig. 2).

For tying on a fly, the simplest knot is the "figure of eight" (Fig. 3), but for wet-fly fishing I think a fastening which goes round the neck of the hook is more secure, and as, for this type of fishing, the fly does not need to "swing free," I suggest that you adopt this type of knot. There are two ways of tying it: one is the Turle, in which the gut is passed through the eye and the fly pushed up the gut out of the way. Then a loop is made, not by the method described above but by a simple overhand knot which you can see in the sketch.

The fly is then slipped down the cast and passed through the loop, which is pulled tight round the neck of the fly just behind the eye (Fig. 4). The other method can be seen from the sketch (Fig. 5).



The loop is slipped back over the eye and a pull on the cast settles it in behind the eye as before; but be careful in making the overhand knot to pass the gut through *twice*. In turning back over the eye it looses one turn, so to speak, and if you only put the end through once you will find you have only a half-hitch round the neck of the fly and this is liable to pull out.

For attaching your cast to the line you can either use the "figure of eight" or what is simpler and just as effective—tie a knot in the end of the line, put it through the loop at the end of the cast, then pass it round the outside of the loop and slip the knot under the main line—a half-hitch, in fact, secured by the knot, which will not allow it to pull through (Fig. 6).

You had better get some string and practise these knots till you can tie them quickly, and without having to refer to a diagram to do so.

Borrow a kitchen skewer for the fly. The loop on the end will serve for the eye of a fly, especially if you bend it up at about 45 deg. angle. This will save you a lot of time in Devonshire when you will want to get to the water without waiting for anything. By the way, when do you go, and where?

Your affectionate uncle,
HARVEY.

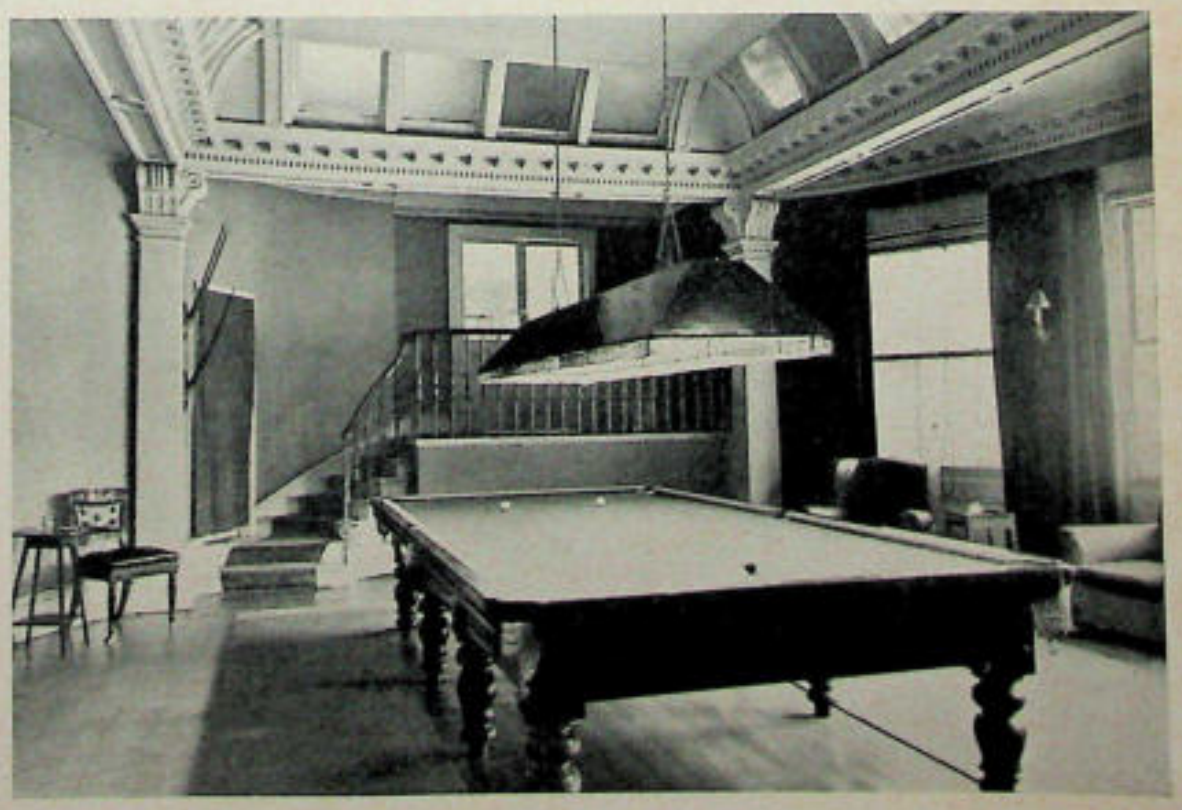
THE DINING ROOM AT BOODLE'S CLUB
Sporting prints and Adam candelabra give this room an atmosphere of its own

GREAT SOCIAL CLUBS—III. BOODLE'S



By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

THERE are, I am sure, very few foxhunters, and certainly no foxhunters of the Victorian era, to whom Boodle's is not a household name. For many generations it was the great club of foxhunters, and there are very few famous Masters of past times who were not members of Boodle's. It has never been political. Founded in the year 1762, it therefore ranks next in seniority to White's in the list of the famous small social clubs under review.

Mr. Boodle, who founded it, appears to have been a genial and hospitable man of the type likely to make a good club proprietor in the times he lived in. His first club house was in Pall Mall, and was probably built by Robert Mylne, and here they remained for 20 years before removing to their present premises in St. James's Street, in 1782. In this house they have remained undisturbed for 157 years. The house had been built for a certain Mr. Nicholas Kenney in 1775. Kenney had been for several years previous the owner of a house on the west side of St. James's Street. It had been one of the usual fashionable gambling clubs, and Kenney, doing well out of it, decided to embark on an increased membership and larger premises.

For this purpose he bought three very old houses on the east side of St. James's Street, and on this site he built the existing house. Having done this, he moved into it in 1775 with his Savoir Vivre members. The magnificence of the house for club purposes attracted much attention at the time, and Horace Walpole wrote, in March, 1776: "A new club is opened in St. James's Street that piques itself in surpassing all its predecessors. But this is almost commonplace." In a monograph written and published by Mr. Richard Miles, a well-known club proprietor of those times, he wrote on the subject of Kenney's new house: "The house when built was furnished in a style beyond any preceding club: classical pictures, sofas and chairs covered with satin. And when opened I will venture to affirm that no club ever did, or ever will flourish as this club did for some years." To find the additional members to enjoy and pay for this magnificence, about 200 members were combed out of White's and Almack's. The betting now in these new premises was very heavy. Colonel Crawford of the Guards (Equerry to the Queen) won 100,000 guineas in a season. A Kentish baronet, Sir Edward Dering, lost in one night 11,000 guineas, and brought the money to the house the next day. On the night of this same day he lost 19,500 guineas, the house giving credit to the winners for their respective shares. This sum was all repaid in a fortnight. This mad rage for gambling in these St. James's Street clubs had now been going on for years. There is little wonder, therefore, that it was a constant theme for comment in the Press and private letters of those days. Lord Lyttleton had written a few years earlier: "The Dryads of Hagley are at present pretty secure, but I tremble to think that the rattle of a dice box at White's may one day or other (if my son should be a member of that noble academy) shake down all our fine oaks. It is dreadful to see, not only there, but almost in every house in town, what devastations are made by that destructive fury, the spirit of play."

In 1782, Nicholas Kenney sold out of his club the Savoir Vivre, and the premises were then bought by a Mr. Harding, who had succeeded Boodle in 1772 in the management of the club which bore his name. Harding then moved his members from their original home in Pall Mall into Kenney's house in St. James's Street. For a short time after moving into the Savoir Vivre old premises it appears that Boodle's was known by their name, but very soon reverted to their original title. There is evidence that about this time the gambling fever somewhat abated for the very good reason that money was not now so plentiful throughout the country, and Boodle's, in a chastened mood, even went in for passing rules apparently devised for reforming Society. Rule 14 read: "Every member of the Society must promise upon his word and honour not to give money to the servants of a private house in London where he dines or sups. Any member who has a house must likewise promise upon his word and honour not to allow his servants to take money in London." Other rules were:

THE PLAYGROUND OF EVERY CLUB
The billiard room at Boodle's, with its excellent lighting and pleasant decoration

"There cannot be more than 250 members in the Society," and "The dinner is always to be on the table, if there is only one member in the house exactly at half an hour after four, uncalled for. The bill, uncalled for, is to be at seven: supper at 10.45 and the bill at 12.30. Any person in the room is to pay his share of the bill. The dinner is 8/–, supper 6/–, the fire in the room is not to be paid for. Port is 2/6 and claret 5/6 a bottle."

In later years, the system of the wine bill being pooled and everyone having to pay for it, whether he drank it or not, did not suit some of the younger and more temperate members and they appealed to the proprietor, Mr. Gayner, against this rule. Gayner agreed with them and tried to enlist the Duke of Beaufort on his side. The Duke, however, backed up the Old Brigade, who were naturally all for the pool system, and as Gayner would not yield, the Duke walked out of the Club, taking his friends with him. This was a very serious blow to Boodle's. In fact, at the time, many prophesied that it would be a knock-out blow to them.

Indeed, for one of the great Dukes of Beaufort, the hereditary owner of the most famous family pack of foxhounds in England, and the recognised arbiter on all matters concerning the noble sport, to leave such a Club, taking with him his numerous followers, could only be considered in the Club life of those days to be a major disaster of the first magnitude. It was long before the Club recovered from such a shock.

Gayner was a very generous man, and allowed his members the most extraordinary credit. They were allowed to cash cheques for any amount, for Gayner always kept two or three thousand pounds in notes in his safe. At his death, it was said that he was owed over £10,000 by certain members of the Club. He seems to have anticipated this, for he left a special clause in his will to the effect that no member of Boodle's was to be asked to repay any money.

In its early days in its new house, Boodle's had been noted for the expensive masquerades and ridottos given by its members. Gibbon speaks of one that cost 2,000 guineas. But as White's thought nothing of spending £10,000 on a ball, one is surprised that it should have been considered worthy of recording. The epicurean taste of its members, which were well-known to the satirists of the times, brought forth the following ode on this subject:

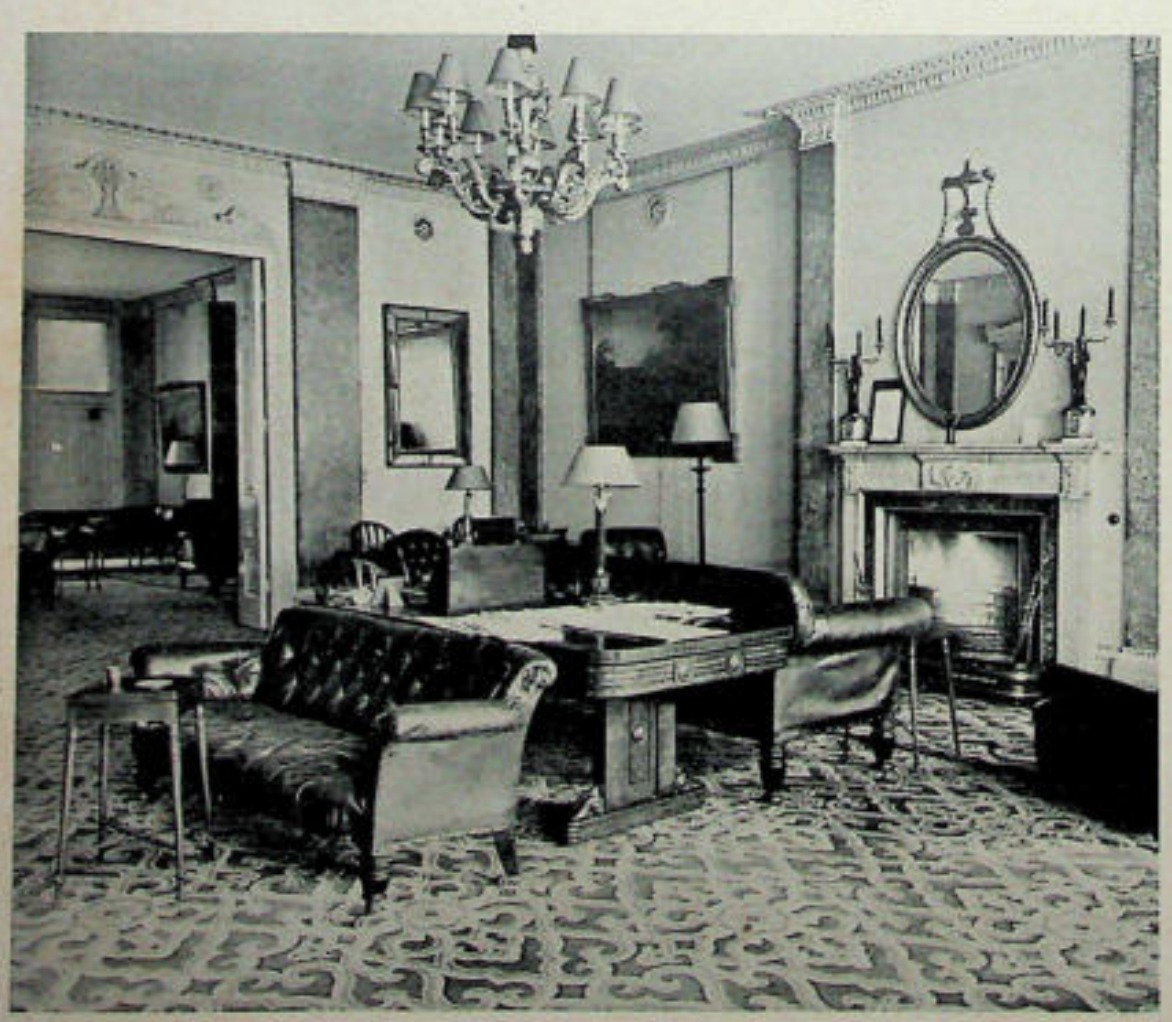
"For what is nature? Ring her changes round,
Her three flat notes are water, plant and ground.
Prolong the peal, yet, 'spite of all your clatter
The tedious chime is still ground, plants and water;
So when some John his dull invention racks
To rival Boodle's dinners or Almack's,
Three uncouth legs of mutton shock our eyes,
Three roasted geese, three buttered apple-pies."

For many years the Club was managed not by the usual committee, but by a species of secret tribunal, the members of which were supposed to be unknown, though their duties corresponded to those of an ordinary club committee. Little was known of their work by the other members and only very occasionally did they issue anything in writing—and when they did, it was generally on the subject of dogs or strangers, both of which seem to have been equally disliked by them.

Another peculiarity was the method adopted at their elections. Gayner, the proprietor, used to sit near the ballot box in a back room while the members assembled in another room, and when a candidate's name was proposed, they walked across, deposited their white or black balls, and then retired again. After a short pause, Gayner would then shout out "Elected" or "Not elected." It was said that Gayner in reality never counted the balls, but took upon himself to elect all candidates he considered suitable and to reject the others. Another subject for the humorists of the day was the very large number of baronets who belonged to Boodle's. It was said that when a waiter opened a door and announced that "Sir John's carriage was waiting," half the members in the room rose to go.

There must be very few people who have ever walked down St. James's Street, who have not commented at some time or other on the charming exterior the front of this Club presents to the street. A well-known authority on architecture writing not long ago, said: "The modest and domesticated front of Boodle's Club is justly regarded as a masterpiece of the later eighteenth century architecture." For many years, it had been regarded by most people as a fine example of the work of Robert Adam. It must, therefore have come as a shock to many when about 20 years ago, Mr. Arthur Bolton, the famous architect and one of the most reliable critics of all time of the Adam period, definitely ruled out that it was the work of Robert Adam. From reliable contemporary evidence, it appears to be safe to assume that the builder was John Crunden. In Mr. T. Malton's book *Picturesque Tour through the Cities of London and Westminster*, published in 1792, we find on page 107, a plate 94, which gives us a view of St. James's Street. Malton describes it as "Brooks's Subscription House on the right-hand of the view, designed by Mr. Holland, and another called the Savoir Vivre, nearly opposite on the left, designed by Mr. Crunden, are the most prominent objects, and have great claims to praise." The latter is, of course, the Savoir Vivre erected by Kenney's orders in 1775, and now Boodle's.

And here we have reliable data. Mr. Malton speaks almost as a contemporary of Robert Adam, who died in 1792, and we are therefore justified in assuming that Boodle's was built by Crunden. Whoever the architect was, he gave us a most satisfying house and one which remains one of the chief ornaments in one of the very few London streets still retaining much of their former charm and dignity.



The grand salon on the first floor presents a noble interior, very characteristic of the Adamitic period. The ceiling here is very fine with a carved medallion in the centre consisting of figures in the Grecian style. Below the frieze ornamented with carved urns and swags, are a number of rectangular panels in which are enclosed paintings. A magnificent candelabra hangs from this ceiling. On a table in this room are to be seen the old gaming counters and the betting books with complete details of all the bets made. There is also the original auction sale notice advertising the house belonging to Mr. Nicholas Kenney, called the Savoir Vivre Club, to be sold by Mr. Christie at his Great Room, Pall Mall, on November 18th, 1802.

The membership of Boodle's to-day continues to reflect strongly the countryside atmosphere which has prevailed since the Club's inception.

THE PROS AND CONS OF THE TELESCOPIC SIGHT

By CAPTAIN PAUL CURTIS

SEVERAL years ago, when I suggested to the Shooting Editor of the *Field* an article on my experiences with the sporting telescopic sight, it was turned down. He felt, and I admit with some justification, that the scope took unfair advantage of the game, that its use was akin to hitting below the belt. Under some conditions this is undoubtedly true, but the reverse is equally true. The use of the scope has its time and place, and while it can detract from the thrill of the stalk it is also far more humane to game under certain conditions when due to uncertain light one could not be sure of properly placing a shot without it.

THE AUTHOR WITH A 2½x SCOPE ON A SPRINGFIELD RIFLE

Sporting traditions are worth as much to me as to any man, but much as we may regret the changes we cannot prevent progress; we can, and do, defer it at times for sentimental reasons, but in the end the world moves on. Sporting rifle shooting is, and always has been, influenced by military advancement. It was the Army that first used the magazine rifle; it was the Army that first used smokeless powder; it was the Army that first used small-bore high velocity cartridges with their jacketed bullets; and as the Army is now equipping specially trained marksmen in every infantry unit with precision-rifles fitted with telescopic sights, it is certain that many more sportsmen will be using them in the course of time. In fact, the handwriting is already on the wall in the form of advertisements of a wide variety of rifles mounted with scopes which are recommended for rook and rabbit shooting, while many sportsmen of unassailable reputation are using them for stalking in the Highlands. So there can be no good in ignoring the subject any longer—the scope is gaining ground. It is far better to admit its virtues and expose its vices and thus guide its usage in the right direction.

The slow advance of the telescopic sight in popularity is not due so much to the discrimination of sportsmen on ethical grounds as to the fact that early models were utterly unsuited to withstand the hardships of stalking conditions. In most instances they were too long and too heavy; the flimsy spring mounts in which the tubes were held were for ever getting out of adjustment; they were never dust- or water-proof, the field of view was too narrow for running shots, and the luminosity insufficient in a poor light, and the lenses frequently came loose under the shock of recoil.

With the advent of small bore high velocity sporting rifles came the demand for sighting equipment that afforded the sportsman the full advantage of their additional range and accuracy. The coarse open sights, so satisfactory for quick shots and short range, rapidly gave place to the more accurate aperture sight and advanced sportsmen acknowledged that from a practical point of view a reliable telescopic sight would be better. It was but natural that the Austrians were the first to solve the problem. They had a splendid rifle for the purpose in their Mannlicher, using the .256 cartridge. They also produced the finest optical instruments in the world; furthermore the Tyrolian chamois-shooters had a very small target with which to contend, with which no amount of stalking skill would permit getting on intimate terms, so the need was father to the thought, but they had not learned all there was to be known about it.

While their glasses were excellent in most instances they were too powerful. The mounts, while sturdy, were very difficult to adjust; furthermore, they were mounted on top of the barrel instead of being attached to the side of the receiver, so the mounts had to be channelled to permit the use of the iron sights without removing the scope. This was responsible for a very high mount, which was bad in itself, but made worse by simply attaching the scope to a standard rifle with a very low comb to the stock instead of accommodating the rifle and scope to each other. Accuracy was not assisted, because to aim through the glass one had to stretch one's neck with only the tip of one's chin resting on the stock when shooting from the prone position. This easily corrected feature was responsible for many people being disappointed. They did not get the additional accuracy which they expected, and why use a scope for any other reason?

While looking over the Zeiss exhibit in New York City in the spring of 1924, my attention was attracted to a unique telescopic sight. It was compact, being only 10in. in length by about 1in. in diameter, and weighed only 8oz. Yet it had an internal elevation drum, a magnification of 2½ power, and a field of vision of 34½ft. at 100yds. The manager of the branch waved it aside, remarking that it was only for little .22 rifles for rook shooting; but I was interested. Providing that it would stand the recoil of a heavy rifle, I knew that on a mount which I had seen it was exactly what I had wanted for years, so he gave me one to test that I had fitted to a Noske mount with micrometer windage adjustment and fitted to a .30-06 sporting Springfield.

That combination made sporting history in the Canadian Rockies. The following autumn I did all of my shooting with it, accounting for eleven head of big game on a 29-day trip, at ranges from 50ft. to 400yds., and did not fail to stop anything at which I shot. Quite naturally I wrote enthusiastically about it when I got home. Sportsmen became interested, the Zeiss Company sold 150 of the little scopes in three months and the telescopic sight vogue was under way. As usual with the Yankees, when they adopt anything they went mad about it. In the open season some idiots are now still hunting deer in the thick forests of Pennsylvania and similar places, where they cannot see 50yds. ahead, with telescopic sights which they need no more than a third leg.

One does not want high power. Because a scope magnifies the target, it does not make it any easier to hold on it. Actually it appears to make it more difficult because it magnifies the tremors of the shooter in exact proportion to the magnification of the target. High power also means a narrower field of view, lower illumination and increased eye strain. What we need in a sporting glass is the reverse—not magnification which is detrimental but definition—the purpose of the glass is to let us see where we are holding.

In the order of their importance we should demand the following qualities. A readily detachable mount so that the glass can be carried in the pocket and quickly snapped on when required. Obviously it must be a reliable mount that will not change its zero in the operation if detached and replaced 20 times a day. It should be a side mount that does not interfere with the rapid loading of the magazine and in no way obstructs a clear view through the iron sights. This is important. A scope may receive a knock which will put it out of adjustment and the shooter not be aware of it until he has fired and missed. After falling down with my rifle this once happened to me, but, thanks to the side mount, I was able to retrieve the situation by dropping my eye to the iron sights and stopped a fine bighorn that was rapidly getting away.

The field of vision should not be less than 35ft. at 100yds., so that running game can be quickly picked up. The luminosity or light gathering power should be high, to increase its usefulness in the early morning and evening when one is most likely to get a shot as game comes out to feed. It should be as light and compact as possible, for it is at best a cumbersome appendage to a rifle. It should never be more than 4x in power, or the magnification of vibration will be too high when one is breathing unsteadily after a stiff climb; 3x is better and 2½x better still.

The attendant advantages of the scope of this type are rapidity of fire, as one does not have two sights to line up (one simply looks through the optic lens and places the aiming post on the mark and the ability to use the aiming post which usually covers 4in. at 100yds., as a range-finder and to see exactly where one is holding, irrespective of whether one is shooting into the light or away from it.

While its greatest value is at long range, and certainly I would not recommend its habitual use at medium or short range, by an odd paradox there are occasions in jungle or forest conditions when it can be of great service. When a partly concealed beast is standing in deep shadow it often happens that after spotting it with the binoculars it is impossible to pick it up again through iron sights. With the telescopic sight the two actions become one. Spotting the game through the scope sight, the rifle is already on it when seen and the shooter can immediately distinguish the sex and species; it springs into relief when seen through the light-gathering telescope, and one can even avoid hitting a small intervening branch which might be in the line of aim. I do not advise its use on dangerous game, though I have stopped a grizzly with a scope-sighted rifle at under 20yds.; but there are times in forest shooting when it is worth its weight in gold.

On the other side of the fence are its handicaps. To begin with the most compact telescopic sight is a clumsy, awkward appendage to tie on to a rifle, and adds a pound or more to its weight.

It cannot be used to advantage when it is snowing, or raining heavily, or in a thick mist which it magnifies like everything else.

Though often of value in thick cover it is always a bother and constantly getting caught on brush and vines, unless the rifle is carried so that the projection is tucked under the armpit.

Lastly, it cannot make a good shot out of a bad one; it cannot stop him wobbling or jerking the trigger. It simply permits a good shot who can hold steadily to see where he is holding and therefore hit more consistently than he would without it. Consequently I would not recommend it to the average indifferent shot who cannot hit consistently at over 150yds. with a peep sight.

So much for the practical side of the argument. For the sportsman I believe that the ethical side of the matter is of equal importance. There was a time when I did not; I had brought it into

A MULE-DEER IN VELVET SHOT AT 500 YARDS

popularity, and naturally I was proud of the offspring. Also I was a rifle enthusiast and took a pardonable pride in bringing off a long shot. I was also collecting specimens, and that scope was responsible for one world's record and several other fine trophies that I would not have secured without it.

All that is changed now. I am not shooting as a collector, or for necessity, but simply for recreation.

It was the Duke of Montrose, who several years ago made me see the light while I was visiting him on the Isle of Arran. "When you return next year," he said, "leave your telescope at home, you are doing a lot of good shooting, but you are missing a lot of good stalking." He was right, and my scope has taken a back seat ever since. I never used it again in Scotland, where I consider it out of place, and when I returned to the Canadian Rockies a few years ago I left it at home because I had everything to be taken out there on previous trips and being more anxious to see my wife fill her bag, I contented myself with taking a good bear and a fine caribou stag with iron sights.

LONDON POLO IN RETROSPECT

CAPTAIN R. P. GUINNESS ON THE GIANT PANDAS ON JOHN

ONE of the disadvantages of attending the international matches at Meadow Brook is that, unable to be in two places at the same time, one has seen very little of polo in London. But from all accounts there is no doubt that everyone has thoroughly enjoyed himself. The polo, if not quite up to the standard of normal years, has been extremely interesting. Games have been almost invariably very even, and this season, so short alas, so far from being desultory and dull, has indeed been one of the pleasantest of recent years.

In view of the distinctly uncertain situation, there have been fewer players than usual, but in spite of expansion and the need for intensive training, the soldiers seem to have managed to play quite a lot of polo in London (though we were told that this would be frowned on by the big brass hats at Whitehall), and altogether everything has been as pleasant as could be.

The Jaguars, who, for the most part, exchanged their spots for the distinctive markings of the Panda, Giant, Baby and just plain, ordinary Pandas, won at last the Champion Cup with Keith Rous and Humphrey Guinness the two survivors of the team that reached the final in the last two seasons, only to lose to Goulburn and the Texas Rangers respectively. Guinness is just about a class above any other player that has been seen in London this season and, with all respect to the Maharaja of Jaipur and Raj Kumar Prithi Singh, it might have made a lot of difference to our international team had he been able to join the squad in America, even as late as May 1st, when they came to Long Island. He certainly is a happy warrior, capable of devastating brilliance, and he might have brought to our team some of the "drive" that they so conspicuously lacked in their practice matches before June 4th. Rous has improved enormously in these last three seasons, and on his showing in London this year is full value for his five goals.

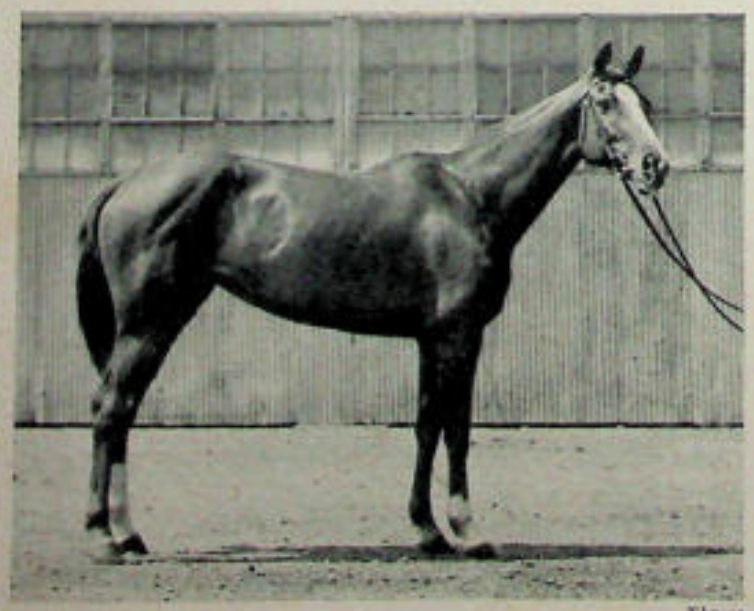
The Optimists, led and, for the most part, mounted by Mr. W. L. Horbury, have not had much of the success expected of them. They have, of course, those two great Indian players, the Maharaja of Jaipur and Prithi Singh, but to them their polo this year has not been a *raison d'être*, as it would have been had Jaipur, as a team, come over in quest of the Champion Cup; rather they have been out to enjoy themselves as they, and everybody else, have done. They have had the choice of Mr. Horbury's excellent ponies, but there is a difference, and the Indian polo player is, perhaps, a shade less adaptable than are the westerns. What I should really be interested to see would be an entry of the Jaipur team in full force, for the American Open Championship, although I do not believe that they would win it, even if the championship is to be restricted, so far as America is concerned, to 28-goal teams. The only player since the War—and since the Americans introduced, or developed, the modern long-hitting, up-and-down-the-middle game—who could "get away" with an Indian-type of game, was Pat Roark. However, it would be interesting to see what a great Indian team would make of American polo and American grounds.

H.R.H. THE DUKE OF GLOUCESTER PLAYING FOR THE ROYAL AIR FORCE V. THE ROYAL NAVY

The Navy won the Duke of York's Cup by 4 goals to 3

The future is naturally uncertain until some kind of *modus vivendi* can be found for Europe in general, and it has become increasingly difficult to manage to play polo at all, let alone running a side for a season. Last week a number of Colonel Sir Harold Wernher's ponies were put up for auction, which rather suggests that there will be no Someries House team next year, which would be very sad. He has, however, retained some of his best for his own use and that of his son, who put up a promising performance last week in the Villavieja Cup. Moreover, Captain Lord Louis Mountbatten will be going to sea shortly, which will presumably deprive us of the Adsdean team until he returns to "the beach." They won the Whitney Cup again at the start of the season and ended up with a well-deserved and thrilling victory in the final of the Ashton Cup, when they beat by half a goal that excellently mounted and well-balanced Edmundsbury team after a memorable battle.

It is an unpalatable truth that there is far more interest in America in the matches played between the States and Argentina than in those against England, and that has been intensified since recent happenings at Meadow Brook. This autumn Charlie Wrightsman intends to take down to Buenos Aires a team to challenge again for the Cup of the Americas which the Argentines won so splendidly in 1936. His team, according to my latest information, will consist of Eric Pedley, No. 1; Cecil Smith, No. 2; Winston Guest, No. 3; and Raymond Guest, back. That is a team which would give any American combination a tremendous game and would most likely beat them. Wrightsman has an ample sufficiency of first-class ponies to mount Pedley and Smith, such as Bonny J, Past Master, and so forth, and he has added Cop, an outstanding member of the British team, by Spion Kop, who played superbly for Eric Tyrrell-Martin in the internationals.

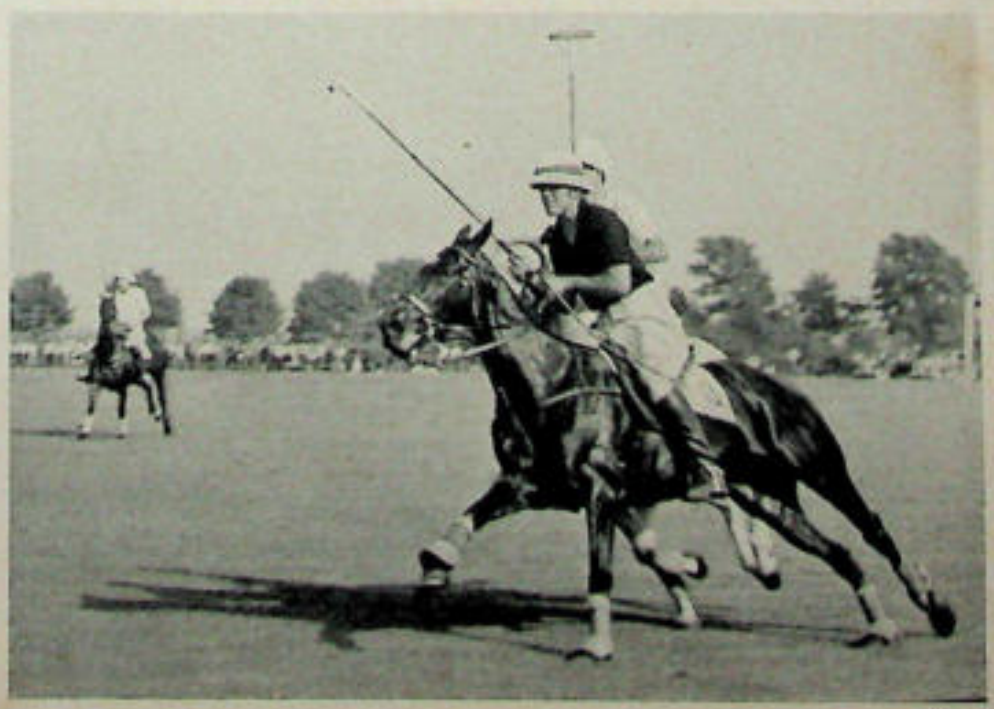


For the Argentine Championship Raymond Guest will drop out and Wrightsman come in at No. 1, Pedley going back to No. 3, and Winston Guest to back. Raymond Guest is giving up polo this year, and will dispose of his string, presumably to Wrightsman.

The sale of the Hurlingham ponies at East Williston that followed the international series must have been most disappointing, but had been expected. For the most part they sold poorly, especially the Argentines that formed the nucleus of the string.

Guinda, to be sure, fetched $2,000, which in these times is not so bad, and that showy pony Atalanta, by Dhoti, brought $1,600. Of the Wales, Sea Foam sold reasonably well at, I believe, $2,200, and Brown Sherry attracted the highest bid, $3,300. The top price of the sale was paid for Brujola, of the Nawab of Bhopal's string, who realised $5,500, and Blue Socks $4,000. I think these will find their way into the stables of the Maharaja of Kashmir, who is making a great challenge for the I.P.A. Championship this winter. Cop was bought by Charlie Wightsman for $3,500.

The sale brought in £6,000, or thereabouts, as against the estimated £15,000. The gates were miserably poor, and it looks as though the guarantors who made this challenge possible will have to provide a quite substantial amount.



JEMADAR.

GREYHOUND RACING LEGISLATION

By DALE BOURN

THE new sport of greyhound racing, once established, grew apace. The public demand for courses was clamorous. By the end of 1927, there were over 30 courses either operating or in course of promotion, and the sport had been proved an unqualified success in almost every district it had been presented.

From its inception the sport was bitterly attacked by the many anti-gambling and moral bodies in the country, who prophesied all sorts of dire consequences as a result of its popularity.

As early as 1928 a Bill for the control of greyhound racing was introduced into Parliament heavily supported by the Church, Nonconformists, heads of free churches, municipal representatives, the National Emergency Committee of Christian Citizens, and other religious and moral bodies. However, it was dropped through lack of interest, and as time went on their attacks lost their sting, and by 1931 it was obvious to all that greyhound racing was here to stay.

In that year, however, a new attack developed from an entirely different quarter, this time from the bookmakers. By the Racecourse Betting Act of 1928, for the first time in English history, gambling was legalised by the legal establishment of the totalisators on horse-racing courses. Greyhound racing was not mentioned.

On August 31st, 1929, the first tote on a greyhound racecourse appeared at Stanley, in Liverpool. No one appeared to know whether this was legal or not. Court proceedings were taken in England and Scotland, the results of which seemed to indicate its legality. The net result was that greyhound racecourses with totes and tote clubs sprang up like mushrooms, the latter presumed to be legal as well as the totes themselves.

The whole sport appeared to get out of hand. By 1931 there were more than 300 courses operating throughout the country of which only 50, those controlled by the National Greyhound Racing Club, appeared to be giving the public a square deal. In other cases, the scandalous misuse of the tote by "unlicensed" racecourses and clubs, the uncontrolled percentages derived therefrom, and the unlimited number of meetings on weekdays and Sundays, were the source of enormous profits. Naturally, the bookmakers regarded this unwarranted competitor with hostility, as it constituted a serious menace to their trade.

Eventually, the Northern Bookmakers and Backers Protection Association brought a case against the Leeds Greyhound Association, claiming that the use of the tote was a breach of the Gaming Act, 1853. The National Greyhound Racing Society took up the challenge on behalf of greyhound racing, and won the case before the local stipendiary magistrates. The bookmakers appealed against the decision, and on December 16th, 1932, the Lord Chief Justice, Lord Hewart, sitting with Mr. Justice Avory and Mr. Justice Horridge in the Divisional Court, unanimously upheld the appeal. Later a similar judgment was given in a test case in Scotland.

Consternation prevailed in the greyhound racing world. The effect was colossal. When it is considered that this decision affected about 20,000,000 public followers of the sport; 20,000 either directly or indirectly employed in the game, and that about £5,000,000 capital invested producing an annual turnover of somewhere near £10,000,000 yielding a quarter of a million to the Government in revenue; and that 2,000 or so "tote" clubs were put out of business, it is not to be wondered at that greyhound racing shares slumped and became a drug on the market, and that there was a general outcry for the Government to take immediate steps to deal with the position.

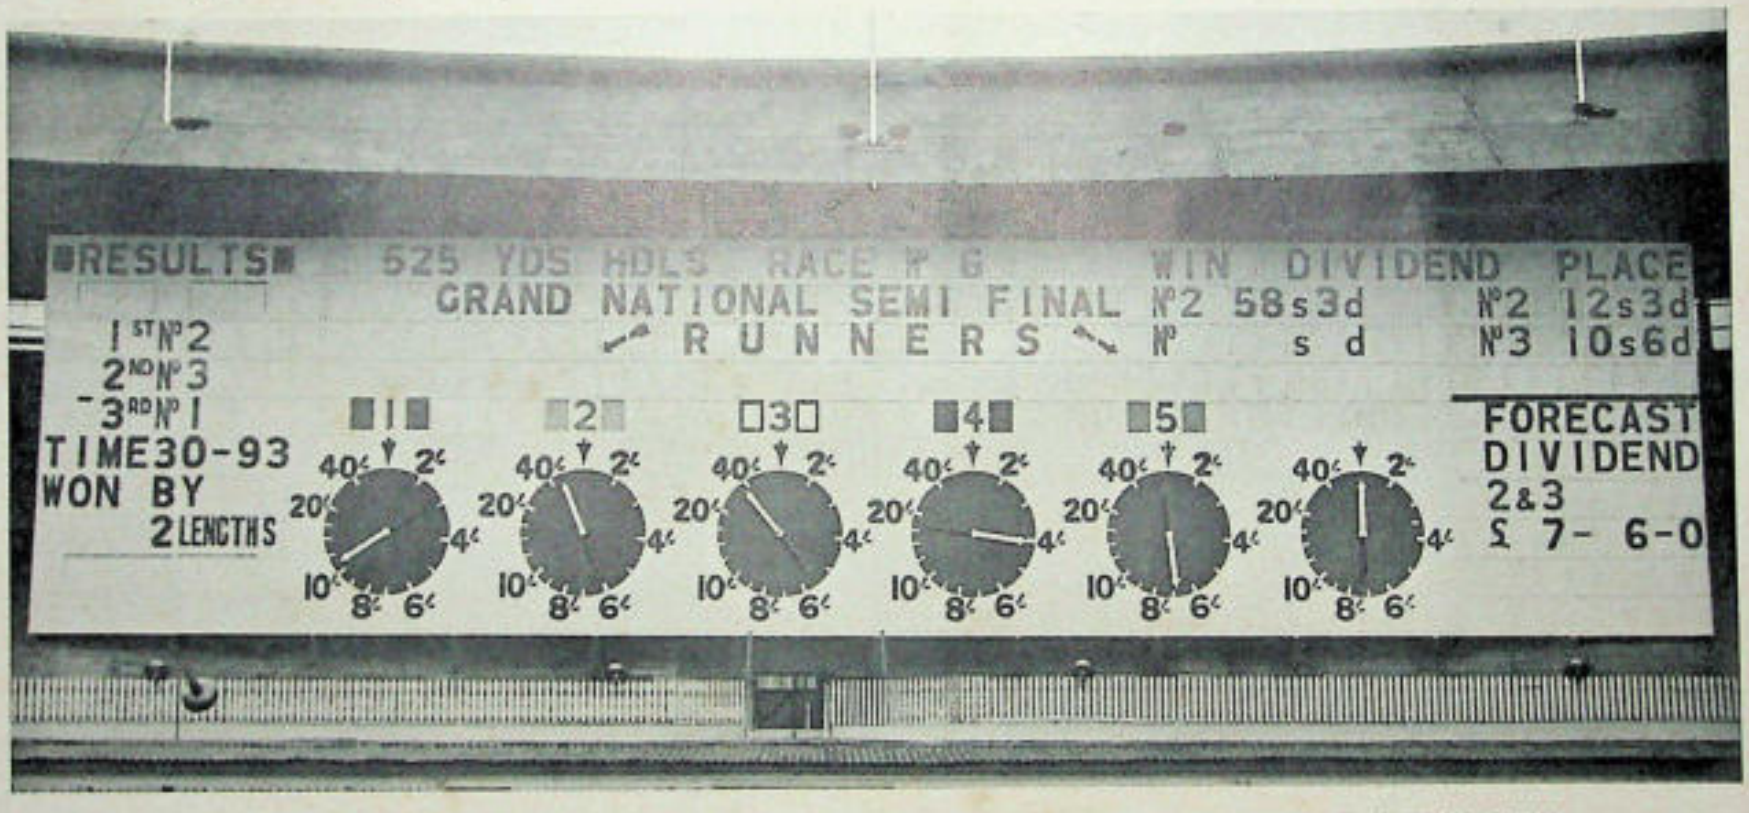
By early January, 1933, tote clubs had disappeared, and the totes had gone from the racecourses. Some courses continued without the tote, and, in some cases, they were running two meetings a day including Sundays. Nobody appeared to worry about the death of the tote clubs, but the public protest against the shutting down of the racecourse totes was strong. It was, they claimed, the old story of "one law for the rich and another for the poor." The Royal Commission on Betting and Lotteries was then sitting, and the Government promised legislation to deal with the question of totes on greyhound racecourses and other matters as soon as the Commission made their report. This report, a monumental affair, was finally produced, and it recommended the banning or limitation of most of those pleasures in which the public can take a speculative interest, such as sweeps, lotteries or football pools. The report recommended that greyhound racing be limited to 104 days in a year, and that the tote should not be extended to include greyhound racecourses, but reserved for horse racecourses. This was so manifestly unfair that the Government ignored this recommendation when it produced the Betting and Lotteries Bill of 1934.

With the passage of this Bill into law at the end of 1934, that part of the Act dealing with greyhound racing put the seal upon the sport and gave it a charter no other entertainment possesses. In a word, greyhound racing became legally established and recognised.

The main provisions of the Act provided that the tote is legal upon greyhound racecourses, but the amount to be deducted from the pools, sufficient to cover costs and working expenses, is limited to 6 per cent.

The tote must be electrically operated and supervised by a mechanism appointed by the local authority, and the dividends must be calculated by an accountant appointed by the local authority. All courses must be licensed by their local authority, which licence is in force for seven years from the date of issue, and costs up to £50 each year and is renewable.

Racing is permitted on 104 days in a year, commencing always on July 1st. The days are appointed by the local authority after consultation with the racecourse owners. On four of the days appointed two meetings can be held, thus working 108 meetings in 104 days. The "days" are appointed before the end of May each year, but all courses in an area defined by the local authority charged with the duty of licensing these tracks have to race on the same 104 days.



A meeting is to consist of eight races which must be run within a period of four hours. Generally speaking, the Act was satisfactorily received so far as greyhound racing was concerned, and it has worked well. Racecourse managements and local licensing authorities have co-operated to make for smooth running, and in very few cases have local authorities abused the powers given to them in the Act. The courses are now integral parts of the civic life of the communities they serve. They pay hundreds of thousands of pounds each year to the local rates. The stadiums are at the disposal of local authorities for big celebrations and functions, and in these days for A.R.P. work.

Perhaps the least happy people who go greyhound racing are the bookmakers, whose action made possible the legalisation of the tote. They now have to face greater competition than ever. It is to be hoped, however, that they will not disappear entirely from greyhound racecourses, for they give the sport that touch of colourful vivacity which no electrical robot, however legal, expensive or efficient, can provide.

The largest tote in the world is operated by the Greyhound Racing Association at the White City in London. It is calculated that throughout the country something in the region of £44,000,000 passes through the greyhound racing totes per annum. Thus yielding, indirectly, a nice sum to the Treasury. This colossal amount of turnover easily puts in the shade that amount which passes through horseracing totes each year.

The better class courses welcomed the Act for various reasons—one being that the fact that calculation of the dividends must be approved by the official accountant gave official verification to the declaration of the odds. They also welcomed the limitation of racing days. On the other hand, the public objected to the fact that all courses in the same licensing area have to race on the same days.

This dictation to racegoers as to when they could go racing meant considerable limitation upon their activities, but protests were unavailing, and that is how matters stand to-day. On the other hand, it was felt that the Act did not go far enough in many respects in protecting the public. It legalised the sport and the tote, but it gave no control over the actual racing. This has to be undertaken by those operating the racecourses, and it is to their great credit that through the medium of the National Greyhound Racing Club and the National Greyhound Racing Society, supplemented by the Greyhound Racing Board of Control and the Greyhound Racing Totalisator Control Board, they have brought the control of the sport to such a high state of proficiency and efficiency in such a short space of time. It is through their efforts and theirs alone that the confidence and respect of all greyhound racegoers has been so soundly commanded.

TOTE BOARD AT THE WHITE CITY SHOWING THE HUGE DIVIDENDS PAID ON THE SEMI-FINAL OF THE GRAND NATIONAL OF 1938

WINNERS *at the* BISLEY MEETING

By CAPTAIN ERNEST ROBINSON

CHAIRING THE KING'S PRIZE WINNER, CAPTAIN T. S. SMITH, LATE 5TH BN. THE SOUTH STAFFORDSHIRE REGIMENT

WIND judgment of a very high order won the King's Prize for Captain T. S. Smith, late the 5th Battalion South Staffordshire Regiment, and added the Gold Medal to the several high honours he has won during many years devoted to the cultivation of marksmanship for himself and in others.

Disregarding the howling gale of 1936, which hurled targets from their frames and blew down the huge umbrella tent, it is many years since the final has been shot in so tricky a wind. At 900yds. it was a "rear fishtail," but was changing angle so slowly that most competitors were able to follow it easily. There were many scores of 70 or over out of 75.

When shooting started at 1,000yds., the wind was freshening and coming away from the left. Changes in velocity were both quick and considerable. At times at least half the competitors were caught for magpies or outers on the 10ft. wide targets. The 30in. bullseye was difficult to hold at all times.

The story of Captain Smith's triumph can best be read in his fight with Acting Company-Leader (Miss) M. E. Foster, A.T.S., during the last five shots. It was an exciting affair as I saw it from the top of the broadcasting van, even though neither competitor could have known they were the only ones left with a chance of winning.

All others were out of the picture by the time the first of the last five shots were fired. Smith and Miss Foster had each an aggregate of 260 made up of their scores in the second stage, at 900yds., and for the ten shots they had sent away at 1,000yds. Miss Foster added an outer and Smith an inner when the wind was in its most deceptive mood. Both had bullseyes with their twelfth shots. Smith added two more bullseyes, but Miss Foster could only respond with inners. Both finished with shots in the magpie ring, but Smith's aggregate was 282 and Miss Foster's 278. Miss Foster won in 1930, the only woman yet to achieve the highest rifle shooting honour.

There was no doubt at all about the popularity of Captain Smith's win. The enthusiasm in the camp as he was carried round in the historic chair was great. He deserves his triumph.

It was good to have the Lords versus Commons match revived after a lapse of ten years, and it is to be hoped that it will be continued with something like the novel conditions that were introduced this year. The match was at 200yds. with the Service rifle and on the new Hog Lees Sporting range with the sporting rifle fitted with telescopic sight. Each man fired seven shots at 200yds. and here Lord Cottesloe and Colonel R. Ropner were "high gun" with 29 out of 35. The teams left the range to move over to Hog Lees with the Lords leading by seventeen points.

At the running bear the Commons took back four points, chiefly owing to the good shooting of Colonel Ropner, who scored 15 out of 25. The best score for the House of Lords was Lord Brocket, who had 10. At the disappearing pirate Lord Brocket found his true form, took 22 out of 25 points —three more than the whole House of Commons team—and won the Viziansgram trophy for his side.

The totals were: House of Lords—Lord Brocket 56, Lord Cottesloe 40, Lord Waleran 34, and Lord Dorchester 31. Total 161. House of Commons—Colonel R. Ropner, M.C., 50, Major the Hon. Oscar Guest 30, Colonel Sir George Courthope 30, and Sir Edmund Frindlay 19. Total 129. The last time the trophy went to the House of Lords was in 1920.

A feature of the meeting has been the long list of successes of the Royal Air Force, both in team and individual events. Amongst their most successful individuals were Warrant-Officer C. J. Collins, who won the Grand Aggregate, and Pilot-Officer A. W. Easton, who won the Stock Exchange. The Air Force had eight in the King's Final. Its teams won the Inter-Services XX match for the second year in succession and, for the first-time, the Whitehead (Revolver) match.

The Mother Country won the Kolapore match without much trouble at 600yds. after a rather weak start. Canada was second. The Mackinnon and National matches both went to England. Burma scored a fine win in the Junior Mackinnon, and Singapore put on a remarkable score to beat Kenya by 10 points in the Junior Kolapore. Cranbrook School, one of the smaller organisations, with only one O.T.C. company and who were 48th in the list last year, won the Ashburton Shield after 20 years of endeavour. They beat King's College School, Wimbledon, who have held the shield three times since 1932, and were the winners last year, by 1 point. Cranbrook's score was 482.

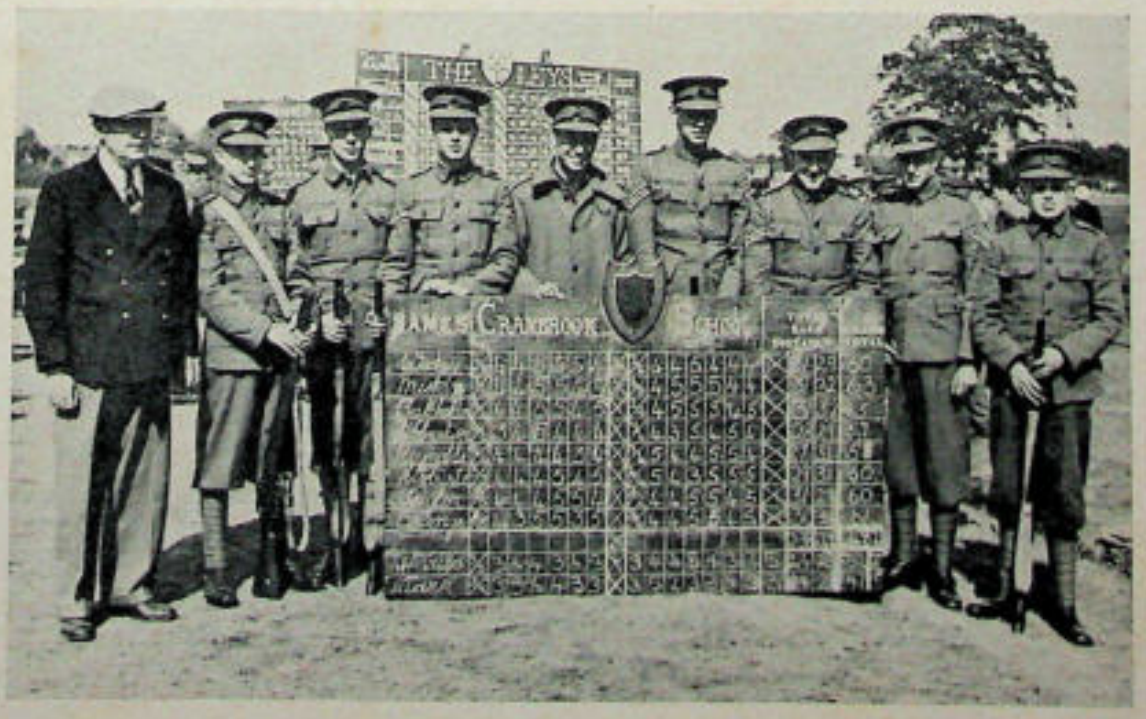
At the 200yds. range Edinburgh Academy led with 241, Glenalmond and King's College School scored 239, and Cranbrook 238. Glenalmond came third. It is remarkable that in a year of great difficulties, when there was no sleeping accommodation for school teams in the camp, 76 schools shot in the match, only four less than last year.

The leaders' scores were as follows:

Cranbrook School.—200/500 total: Sgt. R. F. Miskin, 31, 32—63; Pte. M. C. Batchelder, 31, 32—63; Pte. D. Grange, 30, 31—61; L./Cpl. E. C. Hibbart, 29, 31—60; Cpl. P. F. Weekey, 31, 29—60; Cpl. R. B. Taylor, 31, 29—60; L./Cpl. A. J. Reynolds, 27, 31—58; Pte. F. L. Hibbart, 28, 29—57. 238, 244—482.

King's College School, Wimbledon.—200/500 total: Sgt. Hughes, 32, 33—65; Cdt. Baker, 30, 33—63; Cdt. Rapson, 27, 33—60; Cdt. Stone, 30, 30—60; L./Cpl. Wallace, 28, 31—59; Sgt. Newton, 32, 27—59; Cdt. Jennings, 31, 28—59; L./Cpl. Roberts, 28, 27—56. 239, 242—481.

Next in order came: Glenalmond, 473; Tonbridge School, 473; Winchester, 472; Eton College, 469; Charterhouse, 469; Glasgow Academy, 468; City of London School, 467.



The Cottesloe Vase went to St. John's, Leatherhead, the next highest small school, who were seventeenth in the main list. The *Country Life* trophy for the best score at 200yds. went to Cranbrook, and the Kinder Memorial Trophy for the best at 500yds. to Glasgow Academy.

Charterhouse, always a useful team, took the Public Schools Veterans Trophy for "A" teams and Alleyn's School that for "B" teams. Alleyn's won the Aggregate Cup.

There can be no doubt at all about the success of the strenuous endeavours of Major-General Sir Alan Hunter and the Bisley staff to run a meeting, despite the fact that the N.R.A. could get very few tents and only 350 markers instead of the usual 1,000 officers and men from the Army, Navy and Air Force to act as register keepers and markers. The competitors kept the registers in all squadded events and "played the game" very well indeed. Except for Friday morning the weather was fine.

MISS M. G. FOSTER WINNER OF THE KING'S PRIZE IN 1930 AND CAPTAIN SMITH'S MOST DANGEROUS RIVAL

CRANBROOK SCHOOL'S ASHBURTON TEAM

They are seen with Major H. F. Saunders, who for 20 years has been working to put them at the top of the list

THE EYESIGHT OF BIRDS

By T. C. S. MORRISON-SCOTT

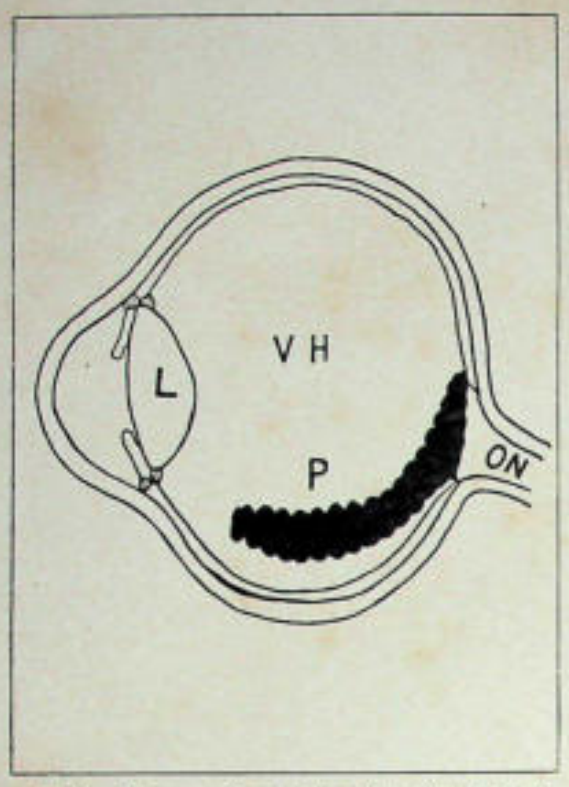


Fig. 2.—Diagrammatic vertical section (after Wood) of the eye of a herring gull to show the pecten, P; VH, vitreous humour; L, lens; ON, optic nerve

THE eyes of birds, especially birds of prey, are very efficient instruments; this is recognised by such phrases as "he has an eye like a hawk," meaning that someone has very acute sight. Every countryman is familiar with the sight of a kestrel quartering the ground in wide circles and stooping from a great height to a field mouse which would have been quite invisible to a man at such a distance.

Keenness of sight is also shown by the following experiment on some tame pigeons. These were in the habit of sitting on the roof of a certain three-storied house, and their owner would scatter crushed maize on the lawn for them. Occasionally he scattered sand of the same size and colour as the maize. Then, instead of flying down as was their custom, the pigeons remained unmoved.

This acute vision is due not merely to good sight as we understand the term, but to a more finely constructed retina, or back wall, to the eye. A retina is composed of many cells, and at a spot (the yellow spot, or fovea) near the centre of the retina the cells are more highly concentrated than elsewhere. Here most of the cells have a separate fibre going to the brain along the optic nerve, and if we want to see something clearly we must swivel our eyes or turn our head so that the image of the object falls on the fovea. Now it is obvious that the greater the number of cells per given area of the fovea, the greater the distance will be at which we can distinguish a small object. This principal can be seen by comparing photographs in daily newspapers with those in weekly papers. In both, the pictures are made up of innumerable small dots, but in the latter the dots are placed closer together, and this gives the pictures better definition. To revert to the kestrel's field mouse: at 100yds. the latter's image on a man's retina would only cover, say, one visual cell (a dot in the press photograph) and would be indistinguishable, but the kestrel has approximately five times as many visual cells in the same area and the mouse's image would therefore cover more than one cell.

Birds' eyes have, however, one disadvantage as compared with the eyes of man: they are more or less fixed in the orbits; that is to say, that birds cannot roll their eyes, and since the eyes are placed on the sides of the head it follows that a bird such as a hen cannot see things directly ahead of her, at least no more clearly than we can see things on each side of us when our eyes are directed straight ahead. That is why a hen cocks her head on one side to examine an object on the ground, and why a hawk, when quartering the ground, either twists his head so that one side is turned to the ground or else banks round in a spiral.

Owls' eyes differ from those of other birds in being set on the front of the face and are completely rigid, but owls have extremely moveable necks to compensate for this: if you walk past an owl's cage at the Zoo you may see him following you round with his eyes and turning his head so that it is always directed straight at you.

If birds of prey had no special adaptation objects straight ahead would appear blurred, as seen out of the corner of a man's eye, but they have an extra fovea in each eye, placed at the after-end of the retina. These "pursuit" fovea do not give such acute vision as the main, or "search," fovea, but they give binocular vision (Fig. 1), and although the eyes cannot be rotated in the orbits to any great extent they can be moved just enough to enable the bird to focus its prey when the latter is dead ahead. In this way a hawk is enabled not only to see clearly the prey he is pursuing but also to judge the distance.

This binocular vision is present not only in birds of prey, but also in swallows, martins, terns and kingfishers, and may prove to be present in some other birds as well. Swifts and owls have the binocular vision fovea, but lack the lateral view ones.

Owls, however, do not appear to enjoy binocular vision as we know it because, though the optic nerves cross on the way to the brain, there is no fusion between the nerve from one eye and that from the other (*i.e.*, there is no optic chiasma). This brings one to the question: what is the mental impression of a bird which has two pairs of fovea? A hawk's brain will be receiving three distinct fields of view: one each side and one ahead. To which is he going to pay attention, and can he suppress the fields in which he is not interested in the same way that a man with a cast eye does not bother about the ceiling at which the cast eye may be looking?

Another peculiarity of birds' eyes is that the cells of the retinæ of diurnal birds contain oil globules. Some of these are colourless, but most are yellow, orange or red, with a few pale green. The purpose of these is not yet clearly understood, but in birds, where the percentage of colourless globules is low, the effect will be to pass most of the light falling on the retina through a poly-chromatic filter which cuts out blues and violets—*i.e.*, the short-wave end of the spectrum. This gives a clue to the purpose of the globules: skiers and alpine climbers know that yellow glasses are a help when low cloud makes it difficult to see undulations in the snow, the reason being that under these conditions the short-wave light still gets through and by wearing yellow glasses we cut out this blue light and make blue shadows appear darker.

Another suggestion is that the globules do away with chromatic aberration. When a human eye is focused on a piece of red paper it is out of focus for a piece of violet paper at the same distance; hence human vision is made more distinct (so far as multicoloured objects are concerned) by being passed through a monochromatic filter. But this explanation holds good only so long as the bird concentrates on the impressions coming through one colour of globule only. A third suggestion is that the bird, as he moves his head, passes the image of an object through the various globules and that his experience tells him something about the object as he notes what becomes of it when seen through different filters.

Nocturnal birds have a special adaptation in their retina which enables them to see in poor light. The receptive elements of the retina (which have been referred to up to now merely as cells) are of two kinds, known as "cones" and "rods." The cones perceive form and colour, the rods light. The fovea in man, apes and day birds contains only cones, the rest of the retina has cones and rods mixed.

The fact that rods are better for perceiving light is shown by the fact that a faint star is seen better by not looking directly at it, but by looking just to one side of it—*i.e.*, by letting its image fall not on the fovea, but on that part of the retina which has rods. The fovea of nocturnal birds have a large percentage of rods; moreover, the oil globules (which are confined to cones) are colourless, or very pale yellow, so a nocturnal bird's vision is not complicated by these. It is not known why owls prefer the dark—they can take strong light without blinking.

Owls appear to be able to see light of a much longer wave-length than human beings. The human range is between 4,000 and 8,000 angstroms, but the probable range for an owl is from 6,000 to 15,000 angstroms. Experiments have been conducted in which an owl was able to see a dead mouse in a "light" of a wave-length of 9,000 angstroms. Further, a live mouse may be photographed in the dark by using a plate which is sensitive to the infra-red rays which its body emits.

There is a very interesting adaptation in the eyes of cormorants and gannets. The cornea has approximately the same refractive index as water, and so under water the refraction of the cornea is annulled; the loss of refraction corresponds approximately to that produced by a cataract operation in man. This is counteracted by strongly increasing the curvature of the anterior surface of the lens by means of the circular strands which these birds have in the ciliary muscles in addition to the normal radial strands of other birds.

Lastly, there is in birds' eyes a very peculiar structure known as the pecten (Fig. 2). It is a feathery structure arising from the retina near the optic nerve and sticks out into the cavity of the eyeball. It is really an extension of the blood supply to the optic nerve and probably fulfils a nutritive role for the "vitreous humour" with which the eyeball is filled and also for the retina which in birds seems to be devoid of blood vessels.

Since these objects could be attained without the sometimes very complicated structure of the pecten, other functions have been suggested. The pecten may protect the retina from glare, it may serve (by expanding and contracting) as a pressure compensator to maintain an even pressure within the eyeball no matter how rapidly the bird changes its altitude, or it may act as a heater for the eyeball during flight at high altitudes, though these last two seem rather fanciful theories.

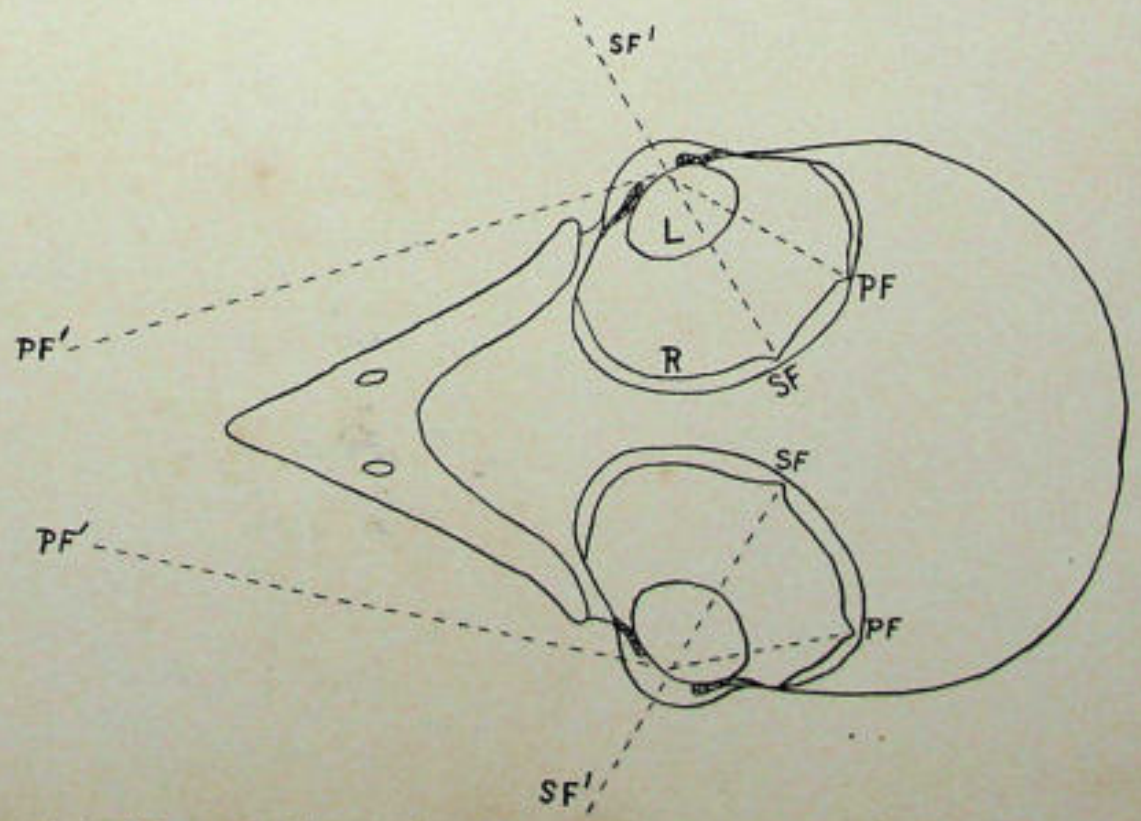

Fig. 1.—Diagrammatic horizontal section (modified from Wood) through the head of a bird of prey to show the three fields of view, the binocular and two lateral fields. SF, search fovea; PF, pursuit fovea; SF', line of acutest vision of search fovea; PF', line of acutest vision of pursuit fovea; R, retina; L, lens

SOME LOW WATER TACTICS

Lessons Learnt from Past Experiences

NOW the season is in full swing, it is occasionally profitable to look back on the last—memories of successes and failures—lessons one thinks one has learnt, but will not be sure until the occasion presents itself anew; and as fishing is a thing of infinite variety it is not by any means certain that the occasion when it comes will meet with recognition.

I have long kept my diary in such a form as to show the following particulars: Place, date and time; wind (indicated by an arrow to record strength and direction), state of water, natural fly seen, artificials found successful, general remarks and any interesting particulars of the fish caught, numbers and weight. This record is very little trouble to keep if columns be ruled in a small account book, and suitable abbreviations made use of.

Possessing such a diary, it is not difficult to reconstruct a day's sport, and to a certain extent enjoy its after taste! What strikes one most is the dissimilarity of each year from the point of view of the flies on the water and the successful artificials employed, and in addition the method of feeding employed by the trout varies greatly. Some years the "Purist" will do well, at other times fish seem to do nothing but feed under water, and a follower of Mr. Skues will come into his own; generally however each year will provide ample scope for both methods; in fact one might say each day.

Last season on the Upper Avon was remarkable for low water. The river was very low at the beginning of the season, and was never properly replenished during the summer, and at times fish would not look at any floating flies though hatches of small fly were well up to the average. As wading is not allowed, the fish in the shallows soon became almost entirely unapproachable, and in the still, deep, reaches, the film on the surface rendered fishing very difficult as it crept over line, cast and fly, making it almost impossible to float any of these things.

To the ordinary fisherman, who loves to roam the bank looking for rises and then to crawl into action, this state of affairs became most disconcerting, and when at length fish were seen scudding away for a distance of 60yds. and more it was evident that a radical change in tactics was obligatory. Where it existed a suitable background of course provided great advantages to the angler, and at times, and in certain places, this could be reached without alarming the fish, and with care a fly could be presented; though this was often none too easy, as the angler dared not venture on any movement beyond the necessary action of casting, and felt very much imprisoned in the coign of vantage that he had selected; not daring to stir out from the cover it afforded. Under such circumstances casting becomes a bit of a fine art, and to get the line out in the various necessary directions every method, including underhand, both fore and back-handed, switching, drifting and half drifting, and even left-handed fishing is called for.

There are certain reaches of this river which hold good fish, but where the banks on the angler's side of the river are destitute of all cover, while a good proportion of the fish may be found lying under the far bank or beyond the centre of the stream. Any movement along the bank is fatal to success, so, with the certain knowledge that there were fish to be got if only one could circumvent them, I would often crawl up on all fours behind the cover of sedge, rush, or willow-herb, and then sit on a piece of rubber sheeting (which I find the cheapest and most convenient sort of seat) with my gum boots dangling in the water, and there confidently await the opening move in the game from the fish!

It is curious how little the waving of the rod appears to alarm the fish as long as one has allowed a sufficient interval to elapse before starting to cast, and by casting up, across, and "drifting" down, a good deal of water can be covered without moving from one's position at all; even when playing a fish it is better to risk losing it rather than to struggle to one's feet and scare all the others away.

Another point is that these "sedentary" tactics are eminently suitable for a hot day, and the water running over one's gum boots keeps them pleasantly cool. My most successful effort last season with these tactics was three takeable trout without moving at all, and one more by crawling 5yds. downstream. The fly was a gold-ribbed Hare's ear.

Of all the physical qualities that are necessary for successful fishing none can be more important than good eyesight and the knowledge of how to use it. Any beginner can "spot" the old black trout that lies out in the open or behind a weed bar, but the recognition of a fish of normal colouring against weed, or lying deep against a gravelly bottom, calls for experience; while a shoal of grayling on gravel in bright sunlight would often be invisible except that their shadows give them away. It is especially necessary to users of the nymph that they should be able to "spot" fish quickly—not only does this faculty enable the angler to approach without scaring the quarry, but it also enables him to study the way in which the fish is feeding.

The best way to learn to spot fish is to go for a walk with a good keeper, or experienced fisherman, who is known to be an expert at this sort of thing; also, if the learner is the least bit short-sighted, let him use spectacles. Nymph fishing is extraordinarily fascinating, and also extraordinarily difficult.

As one begins to understand something of this art one undoubtedly has to develop another "sense." The indications of a "take" by a fish are often so difficult to define that it is not always easy to say exactly why one did strike at all. Fish take the nymph time after time without the beginner being in the least bit aware that this has happened. For a fish upstream pitch the nymph above it and to one side or the other; not directly above. If it is visible and turns out, strike as it turns back; if it is not visible strike at any indication. For a trout in midstream or across, pitch the nymph well above it and beyond, allow a little slack in the gut cast. Fish nymphing usually lie in a good current, so if the cast has been properly made the current should play the nymph across the fish's nose with the gut cast just about straightening as the nymph comes to it—when striking, strike quick and hard. Mr. Skues's well-known books are the books of reference and almost the last word has been said in them on this subject, but I should like to submit these methods of presentation which I have found most effective.

THERE ARE CERTAIN REACHES OF THIS RIVER WHERE THE BANKS ON THE ANGLER'S SIDE ARE DESTITUTE OF ALL COVER

Under our rules only upstream nymphing is allowed, so this method of letting the quick-running stream play upon the gut cast seems the best way of getting a proper presentation. Nymphs when about to hatch rise swiftly and on the slant to the surface; the artificial, if fished in the above way, will very often reproduce much the same movement.

I have found that with grayling a little twitch given to the nymph just as it comes to the fish appears very provoking and alluring, but that it is best to avoid this entirely when fishing for trout. As to patterns, I have always found it best and most interesting to catch nymphs and try to copy them.

One last word as regards fishing during this last season of low water. There were, as often is the case, days when fish rose apparently at nothing. When this happens, I always say to myself, it must be nymphs or smuts or spent fly. If no duns are seen to rise from the water nymphs are improbable; if no smuts are visible, the same reasoning applies to them. In this case it is best to fish a spent-spinner pattern, just awash, and of all the many patterns I know, I have most confidence in "pheasant tail," provided it is of suitable size and suitably lightly hackled. H. E. C.

BEST DAYS WITH OTTERHOUNDS

Heavy Floods Spoil Sport in Many Districts

ON Monday, 10th, owing to the Teify being in flood, meets had to be changed, so the Hawkstone fixture was made for Rossers Bridge on the Lugg. Mr. Wallace hunted hounds. Casting downstream, they at once hit off the overnight drag which carried on past the mouth of the Hindwell, and hounds came up to their otter about a mile above Kinsham. Rifleman proclaimed he was there, but it took a little time to bolt him, and he was refound on the opposite bank 100yds. below, after Mr. Wallace had made good the bog. Then for 7 hours and 40 minutes the otter was kept on the move, going down stream all the time. He landed twice in the thick bracken, and cleverly dodging hounds each time, got back into the river. This very game otter was given up at 8 o'clock, after hounds had hunted him down stream for two miles.

On Wednesday the fixture was Stoke-on-Tern in Shropshire. Mr. Stanier hunted hounds, and they hit off a drag almost at once, going upstream. The grand old hound, Duplex, put down his otter in a small reed bed on the estate of A. H. Heber Percy, Esq. There turned out to be two, and a 14lb. bitch was soon accounted for. Hounds drove the other upstream very fast to the artificial holt, a distance of about half a mile, where, as usual here, he beat hounds.

They were then vanned to Sandford Hall, where they found in the boggy wood above the pool. Hounds raced him round with a grand cry for half an hour, and then lost him. It was a most difficult place to get about in, so it was hats off to another North Shropshire otter.

On Friday hounds journeyed down to Llandyssul in South Wales to put up at their old haunt, the Porth Hotel; but it rained again, and the Tiefy was again unhuntable on Saturday. So Mr. Stanier drew Falcondale Lake on the estate of Sir Arthur Harford, Bart., near Lampeter. Unfortunately, this was blank, so they drew the Grammel, where they at once hit off a drag which continued and gradually increased for about three miles, till they came up to their otter at a flannel factory. Hounds hunted him through the dense undergrowth round the mill leat. At this point a terrific thunderstorm broke, and it poured for the rest of the day, spoiling scent and raising the river. After pursuing for about three hours Mr. Stanier reluctantly gave him up. We are hoping for better things in South Wales, but the Tiefy is still in flood.

S. W.

THE WYE VALLEY'S SPORT INTERFERED WITH BY FLOODS

TUESDAY last we were at Mordiford to hunt the Lug on the lower stretch by invitation of the Hawkstone O.H.

The river had been up during the week-end, and on this day it was not much lower, and coming down very swiftly.

Hounds went down towards the Wye first, and Minstral hit the drag almost at once and the pack were soon speaking on what must have been a fairly fresh one. Primate then crossed the river and led the pack on the drag on the opposite bank. Coming back hounds pushed through the water to the withy bed by the main road, and all at once were roaring away through this very thick place. Coming to the back water they swam all round the withy bed and then overland to the bridge. Hounds swam under this and were off upstream, throwing their tongues on quite a good scent, they then turned and came downstream with the very fast water to the withy bed. The otter, however, had not landed and hounds tried the many water courses but could not locate their otter. Regaining the river they swam under the bridge again and upstream in the slack water, meeting the faster water above they could hardly move against it and had to turn again. This kept on for nearly two hours, and then Mr. Thompson tried hounds down nearly to the Wye and then back again; the otter had not moved and was evidently keeping to the more deep water and defying hounds to move it. Mr. Thompson had one more try, but the otter won, and we left it and went on upstream and had the drag right up to Tidnor Mill, where the otter had no doubt commenced its journey down to the Wye during the night.

Friday was to be Wilton Bridge, Ross, but the river was once more in half flood, and in consequence we could not hunt it. Still, this flush will benefit the salmon anglers, who, I believe, have been having quite good sport on the Wye. I hope they will not forget us poor fellows if they catch too many and do not know what to do with them. We have had to change our days next week to Monday and Thursday owing to the by-election in Monmouthshire, and to a most important function, which is the wedding of Mr. Thompson's eldest son at Burton-on-Trent. May I, therefore, conclude by wishing these two young people on behalf of all the members of the Wye Valley the very best of happiness and success in their married life.

M. L.

A REVIEW OF KENDAL AND DISTRICT

AFTER our very successful visit to the West Cumberland country the Master, as usual at this time of the year, laid hounds off on account of the hay grass, expecting afterwards to pay his annual visit to the Nydd and Wharfe in Yorkshire. But owing to the outbreak of foot and mouth he was unable to do so, and other arrangements rather difficult to make had to be made. While hounds were laid off we took the opportunity to pay a visit to the Carlisle, and had two most enjoyable days, one a joint meet with the Dumfriesshire, finding two otters on each day and accounting for three of them with some very good hunting, particularly the day of the joint meet. What a grand river the Eden is to fish or to hunt.

On June 28th we met at Churchtown to hunt the Wyre up, the Master hunting hounds. We had a long hike up through Garstang and past Scorton, and it was getting towards three o'clock before hounds marked in the old weir. It was impossible to get a terrier in, and we, no doubt, left an otter there, but following the drag upstream to the runner, which feeds the late Peter Ormrod's old fish ponds and the mill, we put the otter off, the crush of their music telling us he was away, and then followed the best hunt we have had so far this season—down the runner around the fish ponds under the road bridge, where the hounds could not get and he had a good rest, into the mill dam across the road up into the wood, a mile along, where thistles and nettles are 6ft. high and the bottom so thick that hounds could barely get through, the huntsman and whips not at all; down into the main river back across the meadow alongside the hedge into the runner again through the fish ponds and dam again, and so it went on for three hours, of which about two hours was on land, until 6.30 p.m., and as we had a long way to go home the Master blew off after the best hunt this season. Scent was very good, but the briars in the wood prevented hounds getting on terms. They could only get through with the greatest difficulty, but the music was wonderful. This is the second good hunt we have had there this season. Kitchener, who was whipping to-day, stood out on the top side of the wood as it was impossible for anyone to get to them inside, and they kept very well together and hunted in a pack.

July 1st.—We met at Elterwater. Sir Maurice Bromley Wilson, the Master, again hunting hounds. We were met by a good number of the Fell fox-hunters, local people dead keen, male and female, old and young, who never miss a meet of any sort. Same faces always there; and what a charming place to go hunting, one of the most beautiful places in the whole of the lake district. The Master put hounds into the river and we proceeded upstream. Hounds soon were feathering but could not speak to it. They then flashed across to the quarry dump, where there are always otters but where it is also impossible to do anything, too dangerous to try to put a terrier in, and we followed the drag upstream to mark in a root near Harry Place. Hounds put the otter off, and he was viewed twice, but he got under this very long root higher up and was never seen again. Hounds marked in one or two places, but it was impossible to get a terrier in, though we tried for a long time. We followed the drag heel for a little way and it gave out, and we hunted on up to Dungeon Ghyll, where we had lunch. And what matters, to walk upstream getting closer and closer to the Langdales is enough if you never find an otter.

After lunch Master took hounds across to the new duck pond, where the keeper says he has been much bothered with otters taking his young ducks. They took 40 out of one pen last year he told us. But there were no signs of any otters about to-day, though he showed us visible signs that they had been there in his trap the night before, so we proceeded downstream and hounds were sent home.

REDFORDE.

THE DARTMOOR STOPPED BY HEAVY FLOODS

ON Tuesday we met at Rilla Mill on the Lyneer. Dropping down a short distance, hounds started to draw very keenly, and continued to carry the line up to Trebartha, where they spoke up a side-stream, but threw up when this became covered in, and took no more interest, neither did the terriers think it worth further investigations. On returning to the river, hounds drew up the Cascade before calling off. There certainly had been an otter in this water, and was either below the meet or perhaps up the side-stream at Trebartha out of mark in a drain.

The following Thursday we met at Bow Bridge on the Harbourne. Hounds showed little interest till after Sandwell, when they feathered above the main road by the pond, and carried a line from this, across to the stream. A couple of hounds hung here in the bank and marked, but the terrier proved it vacant. Drawing on they spoke several times in the marshes and almost marked once or twice. Raymond tried every possible place with the terriers, but we were unfortunate again in not finding, and the draw ended at Rattery Mill.

On Saturday we were stopped hunting by the heavy floods, the river still rising as we watched it at the meet.

D. C.

CATCHY SCENT WITH THE CARLISLE

ALTHOUGH both coloured and on the high side, we started at Rack Bridge to hunt the Ottery River Lyne. A small field turned out, owing probably to the wet week-end. Mr. Glaister was in charge, and Hind turned out nine-and-a-half couple, looking like business. As expected, scent was catchy after the heavy showers, but we had touches right up to the Island, where it petered out evidently heel with our otter lying below. Nothing much was doing until we reached the junction of the Black and White Lyne just above Luckens, when hounds became very keen and raced on to the big clitter of rock above Breakings Bridge, where they all stopped, and we knew the game was there.

This is a big place, and about 30ft. high. Nearly all the pack were in out of sight, and terriers were busy, but could not corner her. She moved first down to the water, then right up a height. After some time Pip got her on the move, and followed her up. Nabob roared at her as she passed him at the top end, and she left right on the highest point. We heard Victor off into the woods, where the bracken was shoulder high, and soon all the pack was with him. She came to water at the top of the bend and swam right up the pool into a strong holt on the far side. Terriers were soon in and she was viewed making for her first harbour, but was turned away and went halfway up the pool again and took to the wood. She was a very fast traveller, and got safely into the river again, but soon left and came back on the other side. Right past the island she went, and came in just in front of hounds above the bridge in full view of the field, which was now swelled by several workers from the field who, hearing hounds, downed tools and joined in. Down stream she went where there was plenty of cover and just disappeared. We spent a long time trying both up and down stream, but were beaten by a really clever otter. Being four o'clock we called it a day.

TINKER.

EASTERN COUNTIES SHOW GOOD SPORT

ON July 13th these hounds were hunting on the Suffolk coast, meeting at East Bridge, near Leiston. Having drawn up the Minsmere river with a fair drag, which petered out, and then tried the marshes without avail, hounds ultimately put an otter down in the big reed bed below the sea wall and with a capital serving scent, both on land and in the water, they pushed their pilot hard with a beautiful cry through the reeds, and a grand hound hunt took place. After three hours of exciting hunting the otter came away through the sluice and down into the big reed bed below it, hounds nearly catching him on several occasions, but at this stage, unfortunately for them, a fresh otter joined up in the chase and hounds changed on to him, swimming him at a great pace for one-and-a-half miles towards the meeting-place before reaching which, however, they checked. The pack had now been hunting hard and well for four-and-a-half hours, and what with reed and a brace of otters, they had experienced just about enough of it, and came out on to the sea wall whacked to the wide; so concluded a magnificent hunt—one of the best of the season so far.

We were at Nayland Bridge on the Stour on the 15th, and having tried down river for a mile without discovering a line, hounds next tried upstream, and it was not until they came to Wiston Mill that they first opened to some old work. Some three-quarters of a mile above the mill, however, hounds found an otter lying rough and put him away, hunting him upstream for a distance until he turned and swam right down for nearly a mile to Wiston Mill, with hounds swimming him grandly. Right into the mill they went, and the otter was viewed by the old bridge just above the mill; but having got into the mill itself, this otter refused to budge, all efforts to shift him being unsuccessful and he had to be left. Hounds then drew on up to Smallbridge, but did not find again. Two good days.

THE ONCE BURIED CHURCH OF ST. ENODOC.
In the background the far end of the links can be seen with the short eleventh green prominent

A HOLIDAY LURE FOR GOLFERS

By E. R. TIPPLE

THERE must be many people who enjoy their holiday golf, who have not visited Cornwall. Probably, despite its wonderful scenery, the Duchy seems too remote for links they may deem not worth the journey. But those who have found Cornwall's links go back to them year after year. They enthuse over them, and there are regular visitors to St. Enodoc whose praise rises to such heights that strangers are lured there through sheer curiosity. I was one of them, and I have just spent one of the most enjoyable golfing week-ends imaginable.

With a friend I left Paddington by the midnight train on the Friday and, after a comfortable night's sleep, was on the first tee before 10.30 next morning. Two-and-a-half rounds were played that day, two on Sunday, and we were back in London by 7.30 on Monday morning. Five hundred miles were covered, and four-and-a-half rounds enjoyed in that short week-end, thanks to the admirable service of the Great Western Railway. Cornwall is not so inaccessible after all!

The first impression one gets at St. Enodoc is that the land provides a ready-made natural setting for golf. There is an abundance of fine, open, rolling country, much of which has yet to be explored by even the most wayward player; there are the huge hills, the sandy wastes, streams—difficulties designed by Nature herself. Such magnificent terrain is a gift which golf course architects dream of but rarely receive. It is not surprising, therefore, that only 36 bunkers were constructed by man. Five of the eighteen holes have no artificial hazards of any kind. This fact tells better than any words just how grand the country is.

Measuring under 6,100yds., the links, according to modern standards, would be called short. Actually it plays longer than one would suppose, and scores below par are few and far between. The winds influence the game in no small measure. They are constantly changing, so that the conditions may be quite different in the afternoon from what they were in the morning. This, of course, adds to the enjoyment and variety.

An alteration in the site of the clubhouse and the building of a new one meant a change in the rotation of the holes. The first is now over 500yds.—the longest on the links—played over typical rolling land, with a narrow gap between the hills on the right and a deep hollow on the left, through which the second must be hit. If this is achieved—and the shot is not easy, for you can get very amusing stances, one foot above or below the other—the plateau green will be visible for the pitch, or pitch and run. The latter type of shot will be the wiser, for the undulations will ruin any but the most perfectly judged pitch. At the second, also, the player needs to plan his approach with care, for the green, perched upon a hill at the end of the long and narrow valley, is guarded by cunning slopes in the ground that deflect to one side or the other all the "nearly good" strokes.

The third and fourth holes are excellent examples of what two-shot holes should be, yet they are quite different in appearance. The third is dog-leg to the left, with a hill to punish the crooked tee-shot. If the drive is placed properly a view of the green beyond the road and stone wall can be had. But the second has to be held up into the cross-wind, and this is made more difficult by a sandy hill just on the left of the green.

Holes measuring under 280yds. are usually dull and featureless, but the fourth is an exception. Indeed, Sir Ernest Holderness includes it in his "eclectic" course—a well-deserved honour. The tee-shot has to be played over an out-of-bounds field and you can take off as much as you like, the more the better, for then you will have just a run up with the land gathering towards the hole. A cautious drive will have to be followed by an awkward pitch over a deep, grassy hollow with the narrow green sloping away from you. This will make even the big hitter think twice—then he will probably miss his expected three!

At the sixth the golfer is confronted with as big a bunker as any pictured in the worst nightmare. The green, as illustrated, lies in a sheltered valley with huge hills on all sides, and the Himalaya bunker makes the pitch a blind one if the drive is hit out to the right—the safe line. Those who want to see where they are playing to can risk a drive to the left, but the mounds and winding road are more than likely to trap the ball. This is a thoroughly provocative hole calling for boldness and ingenuity and appealing to handicap and scratch golfers alike.

In my opinion, one of the best holes on the course is the tenth, 449yds. long without a single artificial hazard. But what difficulties have to be overcome! There is a marsh on the left, and if the drive is pushed out for safety the ball will finish halfway up the range of hills and then the second, taken from a goat-like stance, is alarming. The plateau green is on a ridge near the quaint old church that was buried for years by the sand. After a drive down the valley the next shot calls for much skill, as the contour of the land is deceptive. A weakly-hit second will kick off into the stream. The ordinary mortal will play it as a five and be well satisfied. Here is a hole full of adventure.

At present the eleventh is a short hole, not particularly impressive. However, a site for a new green closer to the sea has been chosen, and when this comes into use the hole will become a testing two-shotter. The change will be a wise improvement and make the round better balanced. Four short holes are quite enough for any course.

Playing round the historic church you climb gradually to the top of the hills and obtain a magnificent view of the Camel estuary and the open Atlantic beyond. The long, rolling breakers, the deep blues of the sea tempt one to lose concentration on the game and gaze on the scenery.

The drive-and-pitch thirteenth looks ordinary enough. The green is just beyond a ridge running diagonally across the line of play. Yet it is astonishing how many fives are recorded by those who treat it lightly. After the short fifteenth played across a valley, like the fifth, comes a testing long hole over undulating ground. Again the stances can be awkward and the hollow just short of the green seems to attract the ball more than the green itself! The new finishing holes call for high, carrying shots over rather terrifying country, particularly so as the end of the game is within sight.

Whatever happens, you go in for lunch with a huge appetite that is amply satisfied by a tempting array of dishes from which you are allowed to help yourself.

In addition to the eighteen holes the club has a separate nine-hole course, which, for the most part, is over as fine golf terrain as the rest. The fifth and sixth, in particular, are so interesting as to warrant inclusion in the major layout. But other equally good holes could be constructed, if required, in the expanse of virgin land bordering the present links—possibilities are endless with such magnificent country.

St. Enodoc caters for every type of golfer. Handicap players will find it intriguing without being too overwhelming. The lordly "tigers," expecting it to be simple because it is not stretched to the absurd modern length of over 7,000yds., will discover that 70 is a rare score because of the strategic design. In short, the golf is great fun under ideal conditions, providing a welcome change from everyday routine.

THE FAMOUS HIMALAYA BUNKER
Probably one of the largest in the world. The sixth green lies ahead and if the drive is placed correctly the second has to be hit high over this fearsome hazard

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

A Supper Menu for a July Evening

The Fare: Consommé Glacé Madrilène
Turbot froid, Sauce Verte
Poularde à la Néva
Selle de Veau froide, Sauce Cervelles
Fruits rafraîchis
Glaces et Patisserie

The Wine: Champagne

A COLD *Consommé* is a gastronomic heresy, but like other heresies it can, and it does, attract. However, since it has not got the saving grace of stimulating the flow of our gastric juices, which is the primary function of a hot *Consommé*, it must have the greatest possible sapidity; this is only obtained by a more generous allowance of meat in the pot and longer concentration in the cooking. The *Madrilène* means that some tomatoes and tomato *purée* have been added to the broth. Let it be quite cold, of course, but not stiff cold, jelly-like, which is tasteless and more indigestible.

A cold Turbot is an excellent supper fish dish, being easy to carve and a very good background for a well-seasoned *Sauce Verte*, that is a *Mayonnaise* with plenty of green herbs, chives, chervil and the like, as well as capers.

The *Poularde à la Néva* is a cold fowl, poached in a rich white broth, filled with a foie gras and truffle stuffing, glazed with a white meat glaze, when cold, and garnished with a *Salade Russe*, that is a salad of a number of different vegetables, such as peas, beans, carrots, &c., cooked and allowed to get quite cold, and dressed with a little *Mayonnaise*.

The *Selle de Veau* is suitable only when there is to be a large company for supper; it looks handsome upon the sideboard, and it provides a variety of different cuts to suit all tastes. But when the number of guests does not justify a saddle, let a cold loin of veal, plainly roasted, take the place of the cold roast saddle. With either saddle or loin, a *Salade de Cervelles* will be a novelty, in spite of the fact that the recipe is one of Carême's, and over 100 years old. You boil the calf's brains in water with plenty of salt and the juice of a lemon; when cold, cut the brains in thin slices which you dress in a salad bowl filled with crisp lettuce leaves; add some quarters of hard boiled eggs and pour over the lot a *Vinaigrette* (olive oil, wine vinegar or lemon juice, a little mustard, pepper and salt dressing).

Bowls of fruit salads and a choice of ice cream and water ices as well as a number of different small pastries, *petits fours* and cakes are always popular on a hot July night.

Champagne, the best of all wines first thing in the morning, that is round about 11 o'clock, is also the lightest wine last thing at night, and the most suitable wine to serve for supper, but it must not be too sweet nor of the acid sort which too often passes off as "dry" Champagne. The real Dry Champagne is made of ripe grapes and unsweetened; the other sort is made of unripe grapes, that is, made in a sunless year when the grapes did not mature completely, and it is sweetened to be made drinkable, retaining all the same an unwholesome "apple-y" acidity; to the untutored taste such a wine may give satisfaction, but to the more sensitive organs below the belt it is bound to be a source of burning irritation.

Craven 'A'

will not affect your throat—and they never vary!

Craven 'A' are in a class apart

Craven 'A' are cool—your throat will notice the difference at once—and for smoothness they are in a class apart. Yes! Craven 'A' quality makes the last cigarette at night as good to smoke as the first you light in the morning—even if you are a heavy smoker.

Cravens Ltd.—110 years' Reputation for Quality

C.A. 633

FIFTY YEARS AGO

From the *Field* of July 20th, 1889.

UNITED States Cricket Amateurs. "Since their arrival in the British Isles, the team of American amateurs, coming from the chief centre of cricket in the United States, have got through a good deal of travelling, and have played some very good cricket. They began their tour in Ireland, where they played drawn matches against Dublin University and the Gentlemen of Ireland. At Edinburgh they did better, defeating the Gentlemen of Scotland by ten wickets, and this they followed up by a one-innings victory over the Gentlemen of Liverpool. At the beginning of this week they played, and were defeated by, the Gentlemen of Gloucestershire, but still they showed good form.

"On Thursday they made their first appearance in London, and were opposed at the Oval by a strong eleven of Surrey Gentlemen, among whom were three of the regular county team. A good number of spectators assembled to watch the visitors, who on the whole acquitted themselves well."

American Yachting Cups. "A correspondent this week makes a suggestion that a challenge cup of the value of £1,000 should be provided in the country for international yacht racing. We believe the council of the Y.R.A. had a similar suggestion under consideration two years ago; but although the proposal was favourably discussed, no action was taken in the matter. The fact is, it is by no means certain, if such a cup were started, that any American yachts would compete for it under the ordinary rules which govern match sailing in this country. But even if they could compete for the trophy under their own conditions, it is by no means certain that an American would challenge for the cup. Two American challenge cups—the Cape May Cup and the Brenton Reef Cup—have been on this side of the water for four years, one held by the owner of Genesta, and the other by the owner of the Irex. The conditions under which the cups are held were made by Americans, and they also selected the courses; and yet no American, as yet, has been spirited enough to challenge for the cups. The conditions are distinctly favourable to the challenger, as he can obtain an exact knowledge of the capabilities of the yacht he will have to compete against, and can deliver the challenge under such short notice that it would be impossible to make any alterations to the challenged yacht before the match was sailed."

IN THE SALEROOM

SOTHEBY'S are selling the interesting and valuable contents of Cam House, the property of the late Mrs. Evelyn St. George, on July 24th and following days, but the pictures, which include important works by El Greco, Goya, and Cranach, are to be sold at their Rooms on July 26th.

Mrs. St. George was the daughter of Mr. George Fisher Baker, of New York, which accounts for the contents of the house including so many beautiful things. The fine French furniture in the drawing room, with its magnificent Boucher-Beauvais tapestry, illustrated in the *Encyclopædia Britannica*, was originally in Mr. Baker's collection, as well as a very important sixteenth-century Ispahan carpet. There are sixteenth-century leather panels from Walsingham Abbey, painted with the story of Esther and Ahasuerus; a wonderful eighteenth-century Chinese lacquer screen, a marvellous Mortlake tapestry with Indo-Chinese designs, a rare Chelsea tapestry panel, and fine Italian and Spanish needlework. The furniture includes a bureau plate of Louis XV design in kingwood; a small commode of the same period and wood, stamped D. F., with the mounts struck with the "Poincon" mark, which was only used between 1745–1749; a Louis XVI writing table in kingwood and tulipwood, 3ft. 1in. wide; and some delightful Spanish highback chairs of about 1700.

A TRAVELLER'S NOTEBOOK

EVERY country has its own code of manners which it is very necessary for you to learn if you want to enjoy yourself. Generally speaking, English people and Arabs become on excellent terms, for the customs of the two races are very similar in many ways. Both possess grave, quiet manners, keep their hands still, do not speak too loudly, and know when silence is golden. Si Mohammed Madani El Glaoui told me that when a boy he only saw his father once a week, and was obliged, whenever he wanted anything, to ask for it through a third person. Parents treat their children with much kindness, and yet young men are brought up in a very strict way. They must not speak except in reply to a question; they must not smoke in front of their father, or even their elder brother; they should sit with hands and feet hidden by the jellaba, keeping their eyes downcast.

* * *

It is very difficult to know when the Moors really mean what they say. Such remarks as: "We will go to Marrakesh to-morrow and stay with my friends," or "You must come and live with me for a month," are merely airy flights of fancy, trial balloons or indications of general regard. And yet it is not easy to know where one stands. I once received an invitation from a friend to stay with him whenever I might be in Fez, and thinking this mere politeness I put up at a hotel on my next visit. In the evening I met him, and he was furious. "Is not my house good enough for you?" he asked, and made me leave the hotel at once.

* * *

Appointments are infuriating, for Arabs have no idea of time and arrive, if they come at all, anything up to two hours late. They cover themselves by saying "inshalla," or God willing, though they often really mean, "It depends on how I feel about it when the time comes." You can never be certain. Sometimes your friend will start out from his house with the best of intentions and then meet Ali, who delays him half an hour, and then Mustapha and then Abdullah—as a result he never arrives at all. Very few have watches, and when they do it does not help much. I once asked a young man if his watch kept Arab or French time. "I really can't remember, but anyway, it's half an hour wrong," was the complicated answer.

* * *

Even when you are asked out to dinner you never quite know in whose house you may find yourself. Mohammed gives the invitation, and you not unnaturally think you are his guest; but, oh, no, not at all; he merely takes you along to the house of someone you may never have seen before, but who none the less shows the greatest possible kindness and hospitality. Their hospitality is, indeed, boundless, and if Mohammed really does give a dinner, and I am invited I, too, can always take a friend along with me. Once, when I was staying with Mohammed, he announced he would give a great dinner party; there would be flowers and music. On the morning of the great day he bustled out very early to buy, so he said, masses of roses; evening came, and we sat down to a very fine dinner, but not a single flower could be seen, and the nearest approach to music was a recitation by a young cousin.

* * *

Conversation is difficult as unpleasant subjects must be avoided at all costs. If asked about your health you must not even admit illness, and merely reply: "I have been rather tired." Compliments should be produced in an endless stream: "Fez has seemed empty without you; something in my heart told me I should see you; I am joyful because you are with me; you are in my heart and in my head always."

* * *

Djinns and devils complicate life considerably, and so does the evil eye. Precautions have to be taken. The word "Bismillah" (in the name of God) is said before every meal to scare away the djinns, who otherwise would come and eat. The evil eye one can guard against by holding up the open hand to spell "Allah." Persons, words, and things (such as a camera) may all have the evil eye, and so protective decoration is used, such as a hand painted on door or window, or a counter eye on ring or dagger. Only the other day I heard of a workman being dismissed because he had the evil eye and everything he touched went wrong.

* * *

You never thank a friend, because God alone is the source of all benefits, and also friends should share and share alike. I once lost a watch under very dubious circumstances, but Mohammed only laughed and said: "My house is your house, your watch is my watch."

H. F. M.

LETTERS TO THE EDITOR

BIRD PROTECTION

SIR,—Since I last wrote on this subject, I have been visiting different parts of the British Isles, and have had the pleasure of seeing many hundreds of eggs *in situ*. Out of these I have only taken one clutch. This is not "marvellous," as Mr. D. H. M. Bahr expresses it, but is the normal result of reasonable and selective collecting. I find that half-a-dozen opponents of all egg-collecting have voiced their opinions in the meantime, and should be glad of the opportunity to reply to them.

Mr. W. W. Nicholas writes from Yorkshire and identifies the sea-bird colony from which 40,000 eggs are taken as Bempton. This is, of course, incorrect, and his argument consequently falls to the ground. There has been a decrease in the number of guillemots on the Yorkshire cliffs of late years, but this is obviously due to the enormous increase in the number of kittiwakes, which have to some extent taken their places. The fulmar, too, will probably be a serious menace in the future. Living in Yorkshire, Mr. Nicholas can scarcely be unaware of these facts.

Miss C. M. Clark, writing from Windermere, expresses astonishment that a collection of eggs may comprise 10 to 15,000 eggs. Yet in Mr. Nicholas's letter printed above hers, he mentions that 130,000 eggs of guillemot were estimated to have been taken *in one year* from one colony, mainly for food.

This process had been carried on for generations without injury to the species, until the increase of rival forms began to drive them from their ancient haunts. As to the kite, protection of this species dates back to the time when Dr. J. A. Salter and I drafted a letter, which was read to the British Ornithologists' Club, when £40 was collected in the room, mainly from egg-collectors, to save the bird. Miss Clark goes on to say that it can hardly be regarded as a virtue in egg-collectors not to have taken eggs of the honey-buzzard for 20 years past, since the last breeding record was in 1899. May I point out that she is quoting from a paragraph which was published in 1921, eighteen years ago, to prove her case! In the new edition (1939) it is shown that nests were found and spared in order to give the birds a chance to re-establish themselves, from 1928 to 1932, and in other localities in 1923 and 1932. That "little knowledge" has indeed much to answer for.

As to the absurd fable about the destruction of eggs and nest by a collector of a bird which laid abnormally coloured eggs, I have the best authority for stating that no eggs of this bird have ever been destroyed, and that all the nests built by it are still intact. Either Miss Clark was misinformed or misunderstood her informant. As it has been freely stated that the buzzard and raven in Lakeland are in danger of serious diminution or even extinction, I may add that in the present season (1939) ten nests of buzzard and five of raven, all containing young were seen by a friend of mine in one county alone. This represents about 40 birds added to the population in one season in less than half the district. The peregrine, however, does need protection, for it is shot or trapped on one of the largest estates, and is hated by the pigeon fancier, as well as by the gamekeeper.

I should have thought that any intelligent person would see that if the British Museum collection contains good, bad and indifferent material, our aim should be to add to it and improve it, eliminating the rubbish. There is, of course, much that is of great value, and I have spent months in it, correcting errors, but I fail to see the object of keeping odd eggs without data of common species, often blown with two holes, and over half a century old.

Mr. D. H. Manson-Bahr's letter is so childish that it hardly requires an answer. He admits that he is a very bad ornithologist and "young in years," but adds that this has nothing to do with the question, and does not weaken his case. If this reasoning were correct, why consult experts at all? What is the use of 50 or 60 years of intensive field work and study in three continents, if a young man without a scrap of evidence can flatly contradict what he is apparently incapable of understanding? "Thug chauffeurs" must be unpleasant people (if they exist); almost as bad as *agents provocateurs*, or public-house spies.

Now we come to Dr. Manson-Bahr, whose letter contains many truisms. Certain species have disappeared: "Some blame the gamekeeper, others the egg collector, and probably both have played their part. They have vanished within the memory of man—the sea-eagle, the osprey, the avocet, spoonbill and ruff." Sea-eagles were shot and poisoned by sheep farmers and keepers, and ospreys were treated in the same way during the great massacre in Scotland. The final blow to the osprey was the slaughter of twelve birds on migration in Ireland between 1892 and 1912. Since that date only one bird has been recorded from Ireland.

As to the avocet and spoonbill, the former died out nearly 100 years ago through reckless shooting and wholesale egg-taking for food; while no spoonbill has bred for about 260 years, surely too long for any man to remember. Neither keeper nor egg-collector had any hand in the matter, for they did not exist. Ruffs were exterminated by wholesale netting in spring for eating, though a few pairs have bred or attempted to do so since from time to time. As to the Kentish plover, marsh-harrier, Montagu's harrier, hobby and dotterel, the hobby is still not rare in many places in South England, harriers are mercilessly shot by game-preservers, while the Kentish plover was always very local, and its one haunt has been ruined by "development"; the dotterel only breeds in the mountains of the north at over 3,000ft., and may exist there for centuries to come if not shot on passage. The insincerity of the present agitation is shown by Dr. Manson-Bahr's next sentence: "It is quite obvious that there is insufficient authority to prevent indiscriminate egg-collecting. The law must be strengthened," and possession of egg or skin made an indictable offence.

What really is quite obvious is that if we are in earnest in wishing to protect our rare birds, there must be stiffening of the law all round. The Pole Trap Act must not be allowed to be a dead letter; some control must be exercised over keepers, and those who break the law must be deprived of their licences. Vindictive fines on egg-collectors do not read well when contrasted with reports of "case dismissed" for open breaches of the Pole Trap Act.

Dr. Manson-Bahr's Wardens Association ignores the most important agency for the destruction of rare birds and concentrates its attacks solely on the collectors of eggs, the effect of whose work is in most cases trifling. What is really needed is the education of the landowner and the keeper as to the true value of the various hawks and owls and their importance in keeping down rabbits, rats and voles. The pole trap law should be rigidly enforced, and we should not have the farcical situation of heavy fines inflicted on all present when a peregrine's or a raven's egg is taken, while perhaps in the next parish, the keeper is nailing up specimens of both birds on his gallows and even claiming a reward for so doing. These birds are "vermin" over two-thirds of Great Britain, and ravens are so numerous in Lakeland that many are unable to find nesting places and do not breed.

Mr. Chislett writes brightly on his experiences in photographing Temminck's stint. In his first letter he queried the correctness of my quotation from Jim Vincent's letter; now the subject is dropped. He omits to state that his friends had already caused the desertion of the nest in 1934, so that he was unable to photograph it; in 1936 only one bird faced the camera, and the eggs proved infertile. Would not a few words from Mr. Chislett in 1934 have saved the situation in 1936? In Cornwall and Cumberland the magistrates fine not only those who take protected eggs, but any others present at the time; surely Mr. Chislett was guilty at least as an accessory after the act. As to Mr. Nathaniel Tracy's letter, I need only say that eyries of the golden eagle are few and far between in Strathspey, because it consists largely of grouse moors on which eagles are not allowed to breed. In some cases they are tolerated on condition that the eggs are taken, as in that case the birds generally move away. With regard to his accusations against two unnamed collectors in the district, I can state that the only detailed account of the incubation and fledging of the dotterel and snow bunting ever recorded in the British Isles (made, of course, by allowing the birds to rear their young) were carried out by a well-known ornithologist who has lived for some years past in the district. Is it to him that these accusations are applied?

I am glad to hear that so many as twelve clergy are collectors out of the 30,000 (or is it 20,000?) in the Church of England, but fear the number is exaggerated. The intellectual professions are well represented, as might be expected. The qualification to be included in Mr. Tracy's list must be a very low one, though, and I personally do not think that the possession of an ostrich's egg should entitle the holder to inclusion. I am informed that with his usual modesty Mr. Tracy has not included his own name in the famous "black book," and trust that the omission will be remedied.

No work on the breeding-biology of birds approaches completeness; but a comparison between the paragraphs in the *Practical Handbook* and those in the new *Handbook* will show the great advance which has been made during the half-century in which I have been accumulating data on this subject. To the collectors, past and present, who have contributed to this result, I can only tender my best thanks. To the landowner and game-preserver, I would say, look into your methods and, where necessary, reform them—and do not drive the true ornithologists and oologists into the ranks of those whose aim is to abolish all kinds of field sport.

Yours faithfully,

Southbourne, Hampshire. F. C. R. JOURDAIN.

SIR,—Mr. N. Tracy's graphic account of the exploits of egg collectors in the Spey Valley greatly interests me, as it so vividly recalls one of Mr. Eric Parker's delightful articles on the same subject. "Three fruitless months were spent this year in trying to catch a notorious collector. He was after greenshanks, crested tits, and dotterels. All the keepers in the Cairngorms were after him, but in the present state of the law, when only the police may search, the pursuit was hopeless. He cleaned the district of eggs." This indictment, furnished by one of the correspondents of whose *bona fides* Mr. Parker "had not any reason to doubt," was published in the *Field* on October 27th, 1934.

Let me come straight to the point. I believe that the "notorious" collector to whom Messrs. Parker and Tracy refer is myself, and I now feel that after this long interval ornithologists generally should have the opportunity of forming their own judgment. My primary object in coming to live is Strathspey five years ago was to fulfil, if I possibly could, a long-cherished project. I wished to be the first man to watch, study and record every phase in the breeding cycle of the sub-alpine birds of Scotland. And I believed then, as I do now, that if a collector is prepared to sacrifice a little he is capable of doing work on breeding biology that will compare, not unfavourably, with that done by anyone. In 1934, the year it was alleged I "cleaned the district of eggs," my wife and I spent 70 successive days and nights in camp on the high ground in order to observe for the first time in this country the entire breeding biology of snow bunting, dotterel and ptarmigan. That year we also secured, *inter alia*, incubation and fledging data about greenshank and crested tit which had then never been previously recorded.

Was it likely that I should have done anything to harm the breeding stock which I proposed to spend five further years in watching? Thenceforward, our work on these birds has been greatly amplified, and in addition, the Scottish crossbill, siskin, golden plover, red grouse and capercaillie have likewise been intensively studied. But I felt very strongly that until our story was complete, there was nothing to be gained by replying to, or even defending ourselves from, the grossest distortions of truth. We have had not only to contend with what is probably the most difficult group of birds in Britain, but to face an unparalleled campaign of persecution and misrepresentation. I have been hounded from camping-place to camping-place, faced and defeated the sanctions programme of a Highland lairdling, been made the butt of every malicious gossip, and even branded as "Public Enemy No. 1" by enraged ornithologists who should have known better. The cream of my own collection was sold in 1934 to help to defray the costs of my work. Since then I have not taken a single egg for myself, though I certainly have helped a few friends. I declare now that in spite of what we have suffered, we have never taken any reprisals, and I defy Mr. Tracy or any other to prove that we have diminished by one single pair any of the birds I have named.

Meanwhile, I recommend our critics to read the outlines in the new *Handbook of British Birds* on Scottish crossbill, crested tit, siskin, golden eagle, peregrine, &c. (all of which have already appeared), and greenshank, dotterel, golden plover and others (which are shortly due to appear) to see whether our work has or has not contributed anything new to ornithology.

In his letter, Mr. Tracy mentions three of our birds—greenshank, dotterel and golden eagle—all of which, it is implied, we are exterminating. What are the facts? I begin by asking Mr. Tracy whether I am the arch-villain who is alleged to have made the bag of eagles this year. If so, I can only say that it is as false as are the fantastic figures he adduces as to prices for clutches, &c. I do admit, however, that the status of the golden eagle is disquieting, but it must be remembered that this is a heavily preserved district, and that few gamekeepers (whether their masters approve or not) allow an eagle to rear young on their beats. In the last five years I myself have known of 50 eagles (old and young) to be destroyed by trap, gun and poison. To illustrate my argument, let me add that the one eyrie I saw in Strathspey this year was tenanted by the fourth different female in four years. Unfortunately, the best way to help the golden eagle at present is to rob them of their eggs as soon as possible after they are laid, and one will thus avoid the experience of an

acquaintance of mine who, in this county two years ago, had to lift the dead eagle off her two eggs.

Which, then, has contributed most to the decline of the golden eagle—the possible taking of a few eggs, from which in any case young would never have been reared, or the slaughter of dozens of birds, old and young?

Of the greenshank, as its Strathspey breeding-grounds are to-day, it can be truly said that it is possibly the most difficult quarry in Britain, and one which the flower of British field ornithology has vainly tried to master unless, of course, Mr. Tracy is the solitary exception. Its status here, and in its headquarters in Sutherland, is 100 per cent. sound.

The dotterel is another story. This attractive plover suffers not a little on migration from the gunner, and in the Grampians it is admitted that egg collecting has also been overdone, but without going into detail, I can prove that the Spey Valley breeding stock is not unsatisfactory. The crested tit, about which we also too often read the most alarming reports, is actually in some areas the most plentiful of our titmice.

Significant as are these facts, all of which I will gladly prove to an impartial tribunal, there is one further point which will emphasise them. Last March I was approached by an agent of Mr. Tracy's to see whether I would be willing to participate in his famous "nest adoption" scheme, but despite an affirmative reply by me, my gesture was declined. This, however, did not surprise me, because had my offer been accepted the rewards paid to me for showing successful hatches of alleged vanishing birds would, in my opinion, have resulted in the bankruptcy of Mr. Tracy's society.

But, sir, I am still unwilling to allow this controversy to distort my vision, and I confess that I am worried about the future of egg collecting. Let me make this clear, however, if it comes, as well it may, to guerilla warfare between Mr. Tracy and the police, on one side, and reactionary collectors, on the other, I have not the slightest doubt that the conflict will result in overwhelming victory for the latter, but ornithology has much to lose and nothing to gain in such a grotesque struggle.

For a century or more, collectors from Montagu onwards, both at home and abroad, have by their enthusiasm built up the fabric of modern field ornithology. To-day, having reached the end of that pioneering period, we live in the dawn of a new and richer ornithology. Our greatest living student of life-history is still an egg collector, but Eliot Howard, Huxley, Ryves, Hugh Thompson and others have shown what wonderful work can be done in the field of breeding biology. Their work, and all that it implies, appears to me to be an infinitely stronger argument in favour of reform in oology than do a thousand bitter attacks and whispering campaigns. And the plain truth is that, thanks largely to the polemics of fanatics, collectors working in this country, with few very honourable exceptions, are not now making that contribution to field ornithology I know them to be capable of. The amassing of long series of beautiful varieties, though harmless enough, is rarely of value unless each series is backed by a life-history study as full and complete as that made by the best of contemporary observers. As a field sport, egg collecting at its best is second to none, and the nest-finding technique of the ace oologist is still incomparable, but this must become a means to an end rather than the end itself. And, with this last sentence, Mr. Tracy, not so long since himself an egg collector of no little experience, must surely agree.

Finally, I would stress a point which is apt to be overlooked. Many of the problems connected with bird-protection are so complex that the sympathy and knowledge of all observers, whatever their creed, are essential to their solution. Mutual recriminations settle nothing, and I, for one, would always be pleased to meet the other side for friendly discussion of our common problems.

Yours faithfully,
DESMOND NETHERSOLE-THOMPSON.
Nethy Bridge, Inverness-shire.

SIR,—Mr. E. P. Chance is wrong when he says, that the "nest-adoption" scheme stimulates the sporting or adventurous spirit of the younger generation to outwit the "adopter." Fortunately, the members of the younger generation are gentlemen as well as sportsmen, and we have no trouble with them. It is the older generation that is doing all the harm, but time itself will remedy this.

So far we are adopting the nests of only five species of birds, and the great crested grebe is certainly not one of these. The so-called "adopter" who slept in a tent near a great crested grebe's nest was most probably some keen young naturalist who was intent on studying its habits, so another of Mr. Chance's squibs has missed fire.

The mention of fires reminds me of a true story which I heard a month or two ago. This concerned some collectors who were warned off an estate in Scotland and who, in revenge, set fire to the forest.

It is really humorous to read of Mr. Chance complaining about the harm done to birds by vermin. He does not seem to realise that these creatures whom he styles vermin are only performing the tasks allotted to them in the scheme of things, which the egg collector is certainly not doing. Or can it be that Mr. Chance is already feeling their competition? Anyhow, when he robbed the red-backed shrikes' nests as recorded in Mr. Eric Parker's book *The Ethics of Egg Collecting*, he appears to have been one too many for the vermin.

Yours faithfully,
N. TRACY
Hon. Sec., The Association of Bird Watchers and Wardens.

SIR,—In reply to Mr. F. S. Tritton, from much experience I should say that the proportion of birds returning to their haunts of the previous year for breeding purposes is exactly the same whether they were photographed or not. They will even do so when the hide is of a permanent nature and still remains to remind them. Herons have repaired the previous year's nest in front of the same tree-hide from which they were photographed in the previous year, and have been photographed from it again—surely an extreme case. The stone curlews to which Mr. Tritton refers may or may not have nested on the same ground in the year following the one in which they were photographed (Mr. Hosking may be able to say); but if not I am sure that the photography was not the cause. Mr. Tritton magnifies the slight inconvenience to which the birds were put; and credits them with longer memories than they possess.

Yours faithfully,
42, Broom Crescent, Rotherham. RALPH CHISLETT.

SIR,—The Bird Watchers and Wardens is a society for enforcing the laws of wild bird protection on shooters and egg collectors, and Mr. Edgar P. Chance, in his letter to the *Field* of July 8th, thinks that it ought to be changed to a society for protecting heaths and commons from incendiarism. Such a society is as urgently required as the Bird Watchers and Wardens, and if he could promote it he would be doing a national service without interfering with the excellent work being done for wild bird protection in more pressing directions. Mr. Chance's other suggestion, that the Bird Watchers and Wardens should also make it their business to exterminate "grey squirrels, magpies, jays and rabbits," is undesirable. The future of the rabbit, which Mr. Chance includes among the enemies of wild birds, is at present being considered by Parliament, but on quite different grounds. On the other hand, it is generally agreed that the grey squirrel must go, though the harm it does to the rarer migrant birds is as nothing compared to that done by the shooting collector and field systematist. There remain the magpie and jay: The large public opinion which the Bird Watchers and Wardens represent does not want to interfere too much with nature, and still less to exterminate any species if it can be avoided. It is the nature of birds and animals to prey upon one another, and none should be exterminated on that account, though in some places it may become necessary to decimate them by taking their eggs, or by shooting the adults out of the nesting season. The magpie and jay do no harm among the rarer bird which are the almost exclusive prey of the collector and his satellites.

Yours faithfully,
London. D. A. MACALISTER.

SCHOOL AND COLLEGE IN THE LADIES' PLATE

SIR,—Before Henley passes out of the news may I revive the plea made a few years ago for revising the regulations for the Ladies' Plate? The change by which schools are now drawn against each other in the early heats, welcome for many reasons in itself, does nothing to remedy the real trouble. Is it not obvious that school and college are unequally matched? The average age of a college crew cannot fail to be at least two years more than a school's; and it is precisely these two years that add most to strength and staying-power. No one would dream of pitting a team of schoolboy runners against a University.

To take weight first, a college crew will usually weigh 1st. a man heavier than a school crew. In almost every way the dice are loaded against the school. A college at Oxford has 150 to 200 to pick from—at Cambridge often more; a school of 400 boys (and no school should be more—before long most seem likely to be less!) has only a few dozen of the right age and weight to draw from. Then training: the college eight have ended their term a fortnight before Henley Week, they can give their whole time to training and stay at Henley as long as they like; the schoolboy, on the contrary, is in the ninth or tenth week of the most tiring term of the school year, often with an important examination ahead of him, and the school eight can put in only a few days at Henley. That, in spite of these odds, the schools make so good a showing, and have often won, is nothing to the point. It says much indeed for sound conditions at our schools. All honour to the crews, and to their coaches—schoolmasters, most of them working full time in school—for the keenness, the patience and the pluck which enable them to overcome their heavy handicap.

Let me illustrate from this year. Westminster, a very light crew, showed exceptional promise, and were picked out by rowing critics as one of the three crews—Radley, last year's winners, and Clare College, Cambridge, this year's, being the other two—out of the 28 entrants likely to figure in the final. What happened? On the first morning Westminster beat the powerful Radley crew by a canvas, after what Mr. Nickalls described (if I heard him rightly) as the pluckiest school race he had ever seen: in the afternoon they beat Bedford by the same margin. Next morning they had to meet Trinity Hall, who averaged a stone a man heavier, and had won their two heats on the previous day with comparative ease. After their two neck-and-neck races of the day before, made far more of a strain by the strong head wind, the light schoolboy crew could not possibly be at its best, and Westminster, after a gallant fight, were beaten. In less than 24 hours they had had to row three exceptionally close races, each of them in the teeth of a wind of unusual force for the time of year.

No one will grudge the college crews their well-won victory, least of all the Westminsters, who are certainly as good sportsmen as ever manned a boat. But all who are proud of Henley as the Mecca of the rowing world, and whose only wish is to see the best crew win, cannot but be distressed to find conditions prevailing which bring in a large element of chance. I speak as a dry-bob, perhaps even, like St. Paul, "as a fool"; but I speak also as an old schoolmaster whose whole life has been spent among boys in school and out, and I am absolutely certain that it is both unwise and unfair to subject boys of seventeen and eighteen to so severe a strain, and that if we want, as we all do, conditions that give the schools a fair deal, we should make a clean cut between college and school by having a separate "Ladies' Plate" for the schools.

Yours faithfully,
Moyses, Five Ashes, Sussex. LIONEL JAMES.

Gentlemen!
your
Johnnie Walker—

However many racquets a champion may need, for real refreshment he need only order a Johnnie Walker. Every whisky in the Johnnie Walker blend — which includes all Scotland's finest whiskies—is chosen for some special quality, which is enhanced by the blending. If it's men's doubles —make them Johnnie Walker.

BORN 1820—STILL GOING STRONG

RIDING SIDE SADDLE

SIR,—I have read the article on side saddle in your issue of June 10th. I fear me that such an article will only lead to muddling people more than ever about this seat.

First of all, the writer gives us a diagram of the lower pummel right above the rider's left knee. This with a person with an ordinary length of thigh is practically an impossible feat, and, at any rate, tends to throw the weight back on to the horse's loins, which is one of the things that the side-saddle rider must surely try to avoid.

Another thing I note, the writer infers that the side-saddle rider should grip the whole time—again one of the things that we try to avoid as much as possible; in fact, the less the side-saddle rider grips, the easier and less fatiguing the seat.

I, of course, totally disagree that the left leg should be used as the main grip. A person strapped into the side saddle as per diagram in the article I am referring to, will undoubtedly get tired, and it is going back to the days of our grandmothers, or at least I should say, the grandmothers of the present generation.

If a rider distributes her weight evenly on the seat bones, letting the left leg hang in a perfectly normal and comfortable position, as in a good astride seat, allowing room for the flat of the hand between the thigh and lower pummel and allowing the right leg to steady her, I fancy she will not get tired.

One always hears people talking of a side-saddle rider sitting square to the front—this, of course, is a physical impossibility. Owing to the position of the pummels, the right thigh is further forward than the left thigh and the right seat bone is also further forward than the left, thus the body is turned quarter left; so to counteract this and sit apparently square to the front, the rider must turn quarter right from the waist.

The maintenance of the balance depends, I think, on what I call the "platform," that is to say, from the right knee to the seat bone, and if the right toe is not dropped this "platform" is maintained firm. It especially prevents the body swinging round to the left when jumping.

I am, of course, in agreement with your correspondent who does not advocate the straight left leg. There is practically nothing we can do with two main joints stiff. At the same time, as far as I understand the article and the diagram, your correspondent has gone from one extreme to the other.

Personally, I think that the side-saddle seat is far the easiest thing that we have to cope with, and anybody who rides well astride and has never ridden side saddle, should, if properly started, be able to go hunting after a very few lessons—at any rate, such has been my experience.

Yours faithfully,
H. F. FAUDEL-PHILLIPS.

Theobalds Park, Herts.

AN UNUSUAL NESTING SITE

SIR,—While walking through our camp at Buddon, Angus, some weeks ago, a small bird suddenly appeared as if from the bowels of the earth. On going to the spot I discovered a fire hydrant in which was a nest containing five eggs. These turned out to be a meadow pipit's.

The extraordinary part of the nesting site was that the hydrant was right in the middle of the camp with people continually walking past, and in addition was only about 10yds. in front of the garage for the new Bren carriers, whose trucks must have crossed and recrossed the nest many times a day.

The hydrant was left open half-way to allow easy access for the bird, and at the same time give her some protection from the carriers.

WATER LAID ON
(See letter "An Unusual Nesting Site")

In spite of all difficulties and the many sightseers who photographed her, she hatched out all five eggs.

I enclose a photograph which shows the nest. The necessary lighting was obtained by reflecting the sun into the hydrant with a shaving mirror.

Yours faithfully,
JOHN DE PREE.

Maryhill Barracks, Glasgow.

ELECTRICAL WADERS

SIR,—The cause of the phosphorescence, not electrical, was possibly due to drifting life called planktons (πλαγκτός = wandering). There are thousands of varieties, mostly of microscopic size. What your correspondent saw was possibly a variety called *Euphausiids*, or "krill" as called by the Norwegians. They are about 1¼in. in length, but are so abundant that they form a large part of the food of many northern fishes, and are the chief food of nearly all the whalebone whales. Their bodies are quite transparent except for the presence of minute red spots, and they possess enormous black eyes, and on this account the fishermen of the west coasts of Scotland call them "suil dhu," or black eye.

But they are most remarkable because along the sides of their bodies are numerous little organs that can blaze up into brilliant phosphorescence at will. It is on record that six of these little animals in a jar of water, flashing on their lights, made it just possible to read newspaper print.

Although many land animals, such as the glow-worm and firefly, are able to produce light so that they glow at night, this power of phosphorescence, or "bio-luminescence" as it is better called to distinguish it from light produced by the element phosphorous, is much more widespread amongst marine animals.

Yours faithfully,
G. PERCY ASHMORE.

11, Kings Gardens, Hove.

A FREAK TULIP
(See letter "One Stem, Five Blooms")

ONE STEM, FIVE BLOOMS

SIR,—I believe that tulips carrying two blooms on a single stem are fairly common, and I recently saw an illustration of one having three on one stem in a contemporary publication.

The enclosed photograph shows five distinct blooms, each on a separate stem, all proceeding from a single main stem a few inches above the bulb. You will notice that one bloom has already faded and that the lower one in the centre of the group has not developed in the normal way.

A further freak exists just below the large bloom, for a single petal, coloured as the flower, juts out from the stem itself. This freak tulip is growing in the garden of Mrs. Marshall, Anstead Cottage, Beadnell, Northumberland, a very old reader of the *Field*.

Yours faithfully,
J. A. MILES.

19, Lindisfarne Road, Alnwick, Northumberland.

WOODCOCK NESTING

SIR,—It may be of interest to some of your readers interested in birds to hear that on July 5th I saw a woodcock and three young ones on our tennis court quite near the house. They seemed to be sunning themselves in front of some low-growing shrubs.

We know woodcock nest here in our woods, but at a considerably higher level.

Yours faithfully,
RACHEL CHRISTIE.

Jervaulx Abbey, Ripon, Yorks.

A LANDRAIL'S NEST

SIR,—It may be of interest to record the finding of a landrail's nest this year at the end of May by a Westmorland farmer. It contained ten eggs, and his horse-drawn mowing machine picked it up on the knives and carried it intact for 6yds., only one egg being damaged. From this he ascertained that the bird had been sitting only a few days, possibly three or four. He replaced the nest as carefully as he could, but the surrounding grass having been mown down, it was without cover and the landrail deserted the eggs, much to his sorrow; he remarked that he would rather have lost a sheep!

An odd feature was that no calling had been heard on the farm this year, although the nest was in a field adjoining the yard and main buildings. Neither was a landrail heard there last year, yet I actually saw one standing in the gateway of a field next to the farmyard, on the opposite side from the site of this year's nest. It stood still for about a minute, then crept into some nettles under a hedge. This took place on April 30th, and as no landrails were heard calling subsequently, we concluded that it was a bird of passage. I wonder now whether it did nest without making its presence heard, and if this habit has been noted before.

Last year I heard seven different birds, but no nest was recorded in this particular area of about ten square miles, and this year at the time of writing, July 8th, I have neither seen nor heard a single landrail there.

I send herewith a photograph of a landrail's nest containing eleven eggs which may be of interest in view of the scarcity of this bird at the present time. It was taken at Silverdale in 1931.

Yours faithfully,
CATHERINE M. CLARK.

Fayre Holme, Windermere.

GHOSTS OF AUSTRALIAN CRICKETERS

SIR,—A friend sends me the enclosed print of a snapshot he took on an Orient liner on the voyage from Australia. The subject is an inspection door, which is secured by wing bolts.

By a freak of the sun the shadows on the top and right-hand side represent a lively cricketing scene. On the top you see the bowler taking off his sweater, then two stages in his run to the wicket until finally his left leg comes down as his arm comes over.

On the side we have a left-handed batsman playing the bowling, and apparently slamming it to the boundary on the leg-side.

Yours faithfully,

38, South Eaton Place, London, S.W. 1. T. AINSLIE ROBERTSON.

THE CUCKOO AND ITS EGG

SIR,—I can verify that the cuckoo does lay its egg in the grass, having studied birds all my life, and that is a long time, as I am over 80. I made a study of this eight years ago, when there were quite a lot of cuckoos in this vicinity.

I rose early, between three and four in the morning, and took my position under an elm tree in the middle of a field, covered myself with a grey army blanket, had my glasses, and imitated its call. I attracted cuckoos; one bird settled just over my head, then flew down about 15yds. from me, laid still for about three minutes (I could only see its head at the time), then rose up, turned round, picked the egg up in its feet, then flew away. I distinctly saw this with my naked eyes. If you examine the feet of the cuckoo, you will find the feet are zygodactylous, having its toes disposed in pairs, made purposely to pick things up. The bird is not a tree-crawler, nor does it belong to that class.

I might further state I found a cuckoo's egg in a reed warbler's nest built on five pieces of water-grass stalks by the river, close to my house. The bird must have hovered over the nest to drop the egg in, for it would topple over if it rested on the nest. The egg was hatched out, but the fledgling's weight was too great. I found it dead five days after its birth.

Yours faithfully,

The Red Cottage, Enford, Wilts. ARTHUR NEWHAM.

SIR,—While examining a reed bed in the fens of Lincolnshire, I found a reed warbler's nest, in which was deposited a cuckoo's egg. From the shape of the nest, which was very narrow and deep, and from the position of the nest, which was built on

SHADOW BOWLING
(*See letter "Ghosts of Australian Cricketers"*)

slender reeds, on the outer edge of the bed, it was impossible that the egg could have been laid, as in the first place, the nest was far too small for so large a bird as the cuckoo to sit in; and in the second, the weight of the bird would have inevitably swamped the nest. Does not this fact go far, at any rate, to confirm the theory held by many ornithologists to be the correct one, that the female cuckoo drops her eggs into nests by means of her bill? She is provided with an enlargement in the throat, in which the egg could be carried in safety during her flight in search of a suitable place in which to deposit it. I have also found a cuckoo's egg in a titlark's nest situated in a hole in a bank of a loch in Benbecula, which was far too small for a cuckoo to lay an egg in.

Yours faithfully,

Cardigan Road, Bridlington, East Yorks. W. AUDAS.

THE CUCKOO'S NOTE

SIR,—In this district the cuckoo does not seem to have developed its usual double note this year. It would be interesting to know if the same peculiarity has been noticed elsewhere. They are, however, remaining here later this season than last.

Yours faithfully,

Ferndown, Dorset. W. R. THOMPSON.

WATERMILL WITH TWO WHEELS

SIR,—Your correspondent, Mrs. E. M. Booty, may be interested to know that a water mill on the Arrow river about one mile above the town of Kington, Herefordshire, has two wheels set in line similar to those in her photograph. This mill is not now working.

Yours faithfully,

South Brent. A. T. MITCHELL.

LADIES' POLO

SIR,—With reference to the letter in your issue of June 24th, 1939, "Ladies' Polo in Burma," your correspondent, who feels that "this polo match is unique," is quite wrong.

My battalion went to Burma in 1936, and several of the wives of the polo-playing officers took up polo at once. By April, 1938, they had raised a team which consisted of the Hon. Mrs. P. Hotham, then, as now, the backbone of the side, Mrs. Vallance, Mrs. Roberts and Mrs. Ridout. The team played again at Mandalay at Christmas, 1938, when they were so much better than their opponents that a pick-up match had to be arranged.

Before the K.O.Y.L.I. went to Burma, a ladies' polo challenge cup had been in existence for some years, and had been competed for on several occasions.

Yours faithfully,

Ascot. T. B. BUTT.

THE FRIENDS OF THE POOR, 42, ENDRY STREET, S.W. 1. A gentlewoman, no longer strong enough to work, whose husband died eighteen years ago of diabetes, has applied to us for help till she receives her old age pension in three years time. She lives in a bed-sitting room with her daughter, and the case is very pitiful, for as gentlefolk they are existing in great poverty, both dependent on the daughter's little earnings. Please send us £13 that we may give them 5/- a week to relieve their struggle.

IN THE CITY

By OUR CITY EDITOR

FROM time to time I have made references here to the iron and steel and engineering trades of the country which are to-day enjoying enormous prosperity. Many of the engineering firms, particularly those in the machine tool trades, have order books which will keep their factories fully employed for several years to come.

A Machine Tool Trades Exhibition which was to have been held at Olympia in April next year has been postponed simply because firms are far too busy to be able to give the necessary time in making arrangements for the exhibition. Exhibitions are held in order to attract new business. Most of the machine tool companies are not in a position to-day to accept additional orders except for very distant delivery.

It must be realised that to a large extent the activity now enjoyed is due to rearmament. How the companies will fare under the new Armaments Profits Duty remains to be seen. It is admitted, however, that in recent years most of the concerns have paid very handsome dividends, and in practically every instance actual disbursements have been on a conservative basis.

In addition, many of the firms conduct a substantial export business which is, of course, entirely unconnected with rearmament. One of the best-known machine tool companies is Craven Brothers (Manchester). The business was founded in 1853, but the shares of the company have only been available to the public for the last three or four years. This concern finds no contraction in the volume of inquiries coming in from home and overseas sources.

The capital of the company is £300,000, all in ordinary shares of 5/- each. Dividend for the year to December, 1938, was 22½ per cent. with earnings of over 37 per cent., against 15 per cent. for 1937 with earnings of 28 per cent., and 12½ per cent. with earnings of over 30 per cent. in 1936. The shares at a market price around 13/3 yield about £8 10s. per cent.

Churchill Machine Tool Company, also of Manchester, specialises in the manufacture of precision grinding machinery. This company has been highly successful. The directors have consistently refused to expand the plant and buildings sufficiently to deal with anything like all the orders coming in. Despite this cautious attitude the company owns a factory whose potential output is in excess of normal requirements.

Dividend in 1936 was 45½ per cent. That was on a capital of £65,040. At the end of that year capitalised bonuses raised the capital to £197,820. On this larger capital the dividend for two years has been 40 per cent. paid in two equal instalments. Recently there has been a further scrip bonus raising the issued ordinary capital to £263,760.

The 5/- ordinary now stand around 19/-. This security can be quite useful over a period of a few years as it still has a good deal of work on hand, and substantial dividends are likely to accrue.

I hear that the firm of Arnott & Harrison is extremely busy. Its productions include precision tools, pressed tools, dyes, jigs and gauges. There are other activities. Its customers include Government departments, transport companies, aircraft manufacturers, and commercial undertakings. The issued capital is £105,000 on which there was a 12½ per cent. dividend for the year to June 30th, 1938. Earnings that year were over 28 per cent. on the issued capital.

The next report is due about the end of September. I know that dealers in the shares are looking for a rather larger distribution. The 4/- shares have a market price of 5/9. They may be regarded as quite a good speculative investment.

It must be recognised that shares such as I have mentioned, and there are many others available in the market, are attractive only from a speculative angle. Work will be more difficult to secure when the rearmament plan has been completed.

THYROID TRANSFORMATION

Not long ago, in their efforts at banting, it was fashionable for women to take doses of thyroid in various shapes and forms. The London Zoo have found another use for it in the Regent's Park Aquarium. Their patient has been the Axolotl, a Mexican salamander about 8in. long with a tadpole-like body with lengthy gills. The creature has no eyelids, and possesses fins on both body and tail. After a few meals of gland the Axolotl began to alter, and now, after three weeks, this aquatic creature has become a land dweller and has produced eyelids, while its fins and gills have disappeared and the tail, once flat like that of a tadpole, has grown round. The effect of thyroid on fishes, it would appear, is more noticeable than its effect on humanity. How trying if we had to take to our baths for the rest of our lives.

New Books

ROYAL YACHT SQUADRON YARNS

Further Memorials of the Royal Yacht Squadron (1901–1938). By J. B. Atkins. (Geoffrey Bles; 50/-.)

MR. J. B. ATKINS'S sequel to the *Memorials of the Royal Yacht Squadron*, by Montague Guest and W. B. Boulton, is no cut-and-dried story. The author reviews the squadron yachts and racing from year to year, and important decisions in its history, but his text is enlivened throughout by anecdotes and notes concerning the members, and it is astonishing how he has managed to collect so much material together; every odd page brings forth a chuckle. Assistance has been given by the Hon. George Colville and other members of the R.Y.S.

There is much about Kiel and an amusing incident of the International Regatta held there in 1912, when Captain Hennessy was deputed to receive prizes from the German Emperor on behalf of absent winners. When he went up for the third time to shake hands and receive his own award for the 19-metre Corona, the Emperor burst out laughing and exclaimed that "Dis young man was taking all the prizes." That was the occasion when Herr Ballin, in an after-dinner speech, said he looked forward to Der Tag "when Neptune's trident will be wrested from the hands of the present owners." *Plus ça change, plus c'est la même chose!* When Captain Hennessy met Mr. Milburn, of Noruda, to hand over the loot he swapped the label of his own second prize with the latter's first. "It's very strange," said the puzzled Mr. Milburn, "that the first prize is much smaller than the second." "Well, you see," was the reply, "they do things differently here. This happens to be an old Teutonic custom."

Sir Reginald Graham, the owner of Resolute, a heavy and very slow cutter of 80 tons, entered for the first Heligoland race in 1898. As he left, his son, in wishing him good luck, added: "I'm sorry you're going; we've always had such happy Christmases together." Mr. Hechert Weld, owner of Lulworth, while anxious to carry on family yachting traditions, knew very little of seamanship. He would go down below with *The Times* under his arm and often not appear on deck until a race was well in progress. "Hullo!" he would say, casually looking round, "We've started!"

There is a story of Mr. Gerard Lambert, of Yankee fame, being bidden on board the Victoria and Albert in 1935 and placed between the Queen and Lady Gore. He was apprehensive that he might be engaged in conversation with her and not be aware when the Queen desired to speak to him. So he communicated his fears to Lady Gore, who promised that whenever she observed such an inclination she would say: "Lee, oh!"

But the book is not all yarns, though these constitute such a delightful part of it. There pass in review those magnificent schooners, cutters and yawls of the pre-War period—Satanita, Valdora, Brynhild, Modwena, Evelyn, Glory and many others which took part on those great occasions when Meteor and Germania raced at Cowes. And from them we pass to the days of the Endeavours and the modern ocean racers. Britannia, very appropriately, has a chapter to herself. Sir Philip Hunloke supplies his recollections, the America Cup races of 1934 and 1937 are discussed, there is a chapter on ocean racing, and Sir Fisher Dilke writes on Tides and Tactics.

One of the most important sections is the War history of the R.Y.S. and its yachts, together with a table of the duties, and in a number of cases the fate, which was their lot in the years from 1914 to 1918. Then, in the words of Captain Lecky, yachtsmen proved themselves "a real nautical asset for emergency," and the C.-in-C. Grand Fleet said that "without the auxiliary patrol the Grand Fleet often could not have gone to sea."

Of the Squadron there are many interesting particulars, with notes on the library by Sir Charles Biron and notes on the pictures by Mr. Cyril Drummond. Illustrations are given of many fine ships, and there are a number of most amusing cartoons of prominent members drawn by the Earl of Albemarle. R. N. Rose.

The Island of Zeus. By Ralph Brewster. (Duckworth; 15/-.)

Minos and Rhadamanthys (mythologically the sons of Zeus, but for the purposes of this book, two donkeys), Freddy and the author are the four moving spirits in *The Island of Zeus*, which is, of course, the island of Crete.

The story we are given is an account of three months spent wandering about day after day among the hills and towns of this historic spot. The publishers claim the book to be "the only comprehensive book on Crete—in fact, *the* standard up-to-date work for anyone who is not a professional archæologist," which remark, like so many publishers' "puffs," is somewhat highly coloured. The book is altogether too discursive to fall into the catalogue of standard works, but, for all that, it makes excellent reading, and has that intimate feeling about it which makes the reader desire to go to the island himself—a desire enhanced by the author's very fine photographs.

In the Odyssey we read: "There is a land called Crete, in the midst of the wine-dark sea, a fair, rich land, begirt with water, and therein are many men past counting, and 90 cities!" Thanks to Mr. Brewster we are able to see this fair, rich land and to meet quite intimately some of the men past counting and to wander among the fallen stones of the 90 cities.

Leslie N. Radcliffe.

Angling at Loch Boisdale. By Major R. A. Chrystal. (H. F. & G. Witherby; 6/- net.)

C-Trout's new book is of a very different character from his speculative volume on angling theories and methods which appeared more than ten years ago, and intrigued the angling world with its suggested explanations of more than one fishing problem. This book deals with a little corner of South Uist, on the West coast of Scotland, and in it he describes the lochs fished by anglers staying at the Lochboisdale hotel of which a sportsmen's record has been kept for many years.

One of the advantages of the lochs is that they cannot be overfished, since only six rods are allowed, one to a loch; and there is no evening fishing; so here we have an account of fishing under what are virtually "natural" conditions. The main part of the volume is devoted to a study of the journal which has been kept, recording the bags made, and other items, from 1882 to the present time, though there are gaps in the earlier records.

Major Chrystal extracts items, and quotes from the journal, commenting shrewdly on the items as he goes along. It ought to be said, perhaps, that this is hardly a book for the general angler, since it consists almost entirely of the season-to-season fishing history of a group of lochs. But there must be many rods who have fished at Loch Boisdale, and others who may be interested in comparing this record of sport with their own lochs or other waters in the west of Scotland.

H. D. Tebbs.

* * * *

Suffolk Scene. By Julian Tennyson. (Blackie; 8/6.)

Mr. Julian Tennyson, a great-grandson of the poet, is a great lover of the English countryside, and particularly of Suffolk, his own county. He is both poet and sportsman—a combination by no means so unusual as it sounds—and he writes his book as a sportsman with a poet's eye and a poet's feeling. I do not know Suffolk very well, but having read this book, which is beautifully written in the most natural of ways, I want to know it very well. That is a tribute to Mr. Tennyson, but I do not think he wrote the book for those who do not know Suffolk, but only for those who do. He writes a good deal about Constable and the Constable country, and he praises the Suffolk Punches. But—perhaps my memory is at fault—Constable himself did not paint Suffolk Punches—he preferred white horses. Mr. Tennyson does not mention this weakness (to my mind) of Constable's work. Another case of love is blind? But enough of criticism. There is stuff in this book that may be read again and again: a storm on Breckland and an adventure in a dinghy, both examples of really fine writing; and a chapter on ducks and dogs and marshes and marshmen, which must rank very high in East Anglian literature. This is a lovely sensitive book. It will have a warm welcome from Suffolk lovers, and from those who know not Suffolk but love fine literature.

Brian Vesey-FitzGerald.

* * * *

Red Strangers. By Elspeth Huxley. (Chatto and Windus; 8/6 net.)

If ever there was a book worth writing, worth reading, worth publishing, it is this one. It not only has a very interesting story to tell, but a definite purpose in writing it. It tells this story with such imagination, such colour, that it would be worth reading for its description alone. And for these reasons it is obviously a good book from the publishing point of view. The setting for it is Africa; in the beginning the land of untamed nature and uncivilised tribes; towards the end the country civilised and mechanised by the white men—the Red Strangers. A tribe of Africans, the Kikuyu, are the main characters. And it is in her description of them, their way of living, their habits, their beliefs, that Mrs. Huxley is at her best. For she is not merely content to put it all down with great accuracy and great detail. With her brilliant imagination and beautiful writing she uses this plain fact as a canvas on which to paint a picture of vivid colour. As a combination of harsh realism and artistic idealism her book could not possibly have more variety, more interest. As a statement of fact and at the same time a beautiful piece of writing it will be read by people almost as varied as itself. Humphrey Daniel.

* * * *

Thorne's Complete Contract Bridge. Revised and enlarged by "Petronius." (Eyre & Spottiswoode; 5/-)

This is the fourth edition of Harold Thorne's well-known book. This enlarged edition includes a description of the Acol System and the Kempson Direct System. The former uses Two Clubs as the opening forcing bid, but is essentially Approach Forcing in character and embodies many features evolved by prominent London players. The latter is Ewart Kempson's crystallisation of the broad principles advocated by the late Colonel Walter Buller.

About 160 pages are devoted to a discussion of the better known systems of bidding and 60 well-written pages to the play of the cards. The essential points of the Two Club and Culbertson systems are thoroughly covered, and I can definitely recommend this book to the club player who wishes to have a working knowledge of the various systems. For a more detailed description of each system the reader is referred to the excellently chosen bibliography at the beginning of the book.

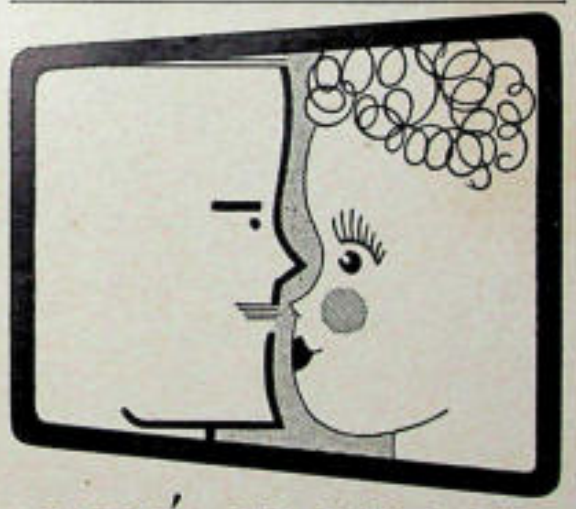
* * * *

Simplified Contract Standards. By Frank W. Perkins. (Fitzwilliam; 4/-.)

In 63 pages the author summarises the basic features of the Culbertson system, the "Four Aces" system, and the standardised code, omitting all highly conventional bids.

An ideal book for the beginner or the family player, it briefly gives the essential points of bidding. Each chapter is followed by a series of hands illustrating the type of bid to which reference has been made. The chapter on slam bidding refers to the Four-Five No Trump convention and the Blackwood convention, but does not include asking bids. A well-produced little book, although rather expensive, for its size.

Ralph Swingler.



* * * *

Lord Kitchener. By Lieutenant-Colonel H. de Watteville, C.B.E. (Blackie & Son, Ltd.; 5/-.)

It is safe to say that this is a book which will be read by all. Where an outstanding figure is concerned there are bound to be differing opinions, but there can be few who do not admire the qualities which made Lord Kitchener famous and which have assured him a lasting place in history.

Colonel de Watteville's book is of particular value in that he has avoided the mistake of allowing hero-worship to obscure his pen-picture of this great man. This at once places his work in the forefront. Perhaps his remark that of Kitchener, in a way, it might truly be said that he was in the Army yet not of it, may be a good epitome of the reason for his success as a soldier. From this too it may not be difficult to understand why he made mistakes as a politician.

The author traces his life from that of a subaltern of Royal Engineers to the tragic ending in H.M.S. Hampshire. The Sudan, Egypt, South Africa, India, the Great War, all the phases of this brilliant, if enigmatic, career are described in graphic style. Naturally, the part dealing with the Great War receives due prominence, and also a good deal is said about the Kitchener—Curzon controversy. As touching his personal life, it is recorded that while he knew nothing of pheasant or grouse shooting, he was very keen on tiger shooting. There are eight illustrations, including the famous recruiting poster of 1914. W. H. T. Long.

CINÉ CLOSE-UP

Have you ever handled a Magazine Ciné-'Kodak'? It's thrilling. So ingenious, so versatile—yet it's easier to load than a cigarette case. Slide in a magazine of 16mm. film—3 seconds' work—and it's ready to film sport, home, holidays, etc.

PRESS NOTICE

Press a button and you're taking pictures. If you want to take shots in glorious colour you can change to 'Kodachrome' film instantly. Have you seen 'Kodachrome' colour movies yet? They're *sensational!*

Telephoto shots (with long-focus lens) and fascinating slow-motion pictures are simple with a Magazine Ciné-'Kodak.' For night-filming ordinary home electric light is often bright enough with Ciné-Kodak Super-XX Film.

FREE Why not pop into a good camera-shop and examine this modern marvel yourself? Ask for a book on Ciné-'Kodaks,' or write to Mr. F. Taylor, Dept. 87, Kodak House, Kingsway, London, W.C.2.

Ultra-fast f1.9 Anastigmat lens; seven long-focus and wide-angle lenses available (extra); 3 speeds (16, 32 and 64 per sec.). Capacity 50 ft. magazine of 16mm. film. Price (with carrying case), £40.

The MAGAZINE CINÉ-'KODAK'

HEALTHIER MOTORING

Enjoy health-giving fresh air by motoring in Tickford Coachwork. The pleasure of touring is doubled. The Tickford Drop-Head Coupes and Four-Door Cabriolets are built up in electrically welded steel framework, giving lightness and great strength, and the ease with which these are opened and closed is not found in any other Coachwork of this type. The hoods are fully lined as in a Saloon, no framework being visible. Tickford bodies are the result of over 20 years' specialisation in Open-Closed Coachwork in which are incorporated patents giving the maximum ease of opening and closing, with complete protection from wind and rain in rough weather. No other Coachwork of this type can give you the same advantages. Thousands are in daily use giving absolute satisfaction. Tickford Coachwork is included in the Models of the Armstrong-Siddeley, Daimler, M.G., and Rover Cars. Descriptive specification with pleasure from the Patentees:

"COLCHICUMS HAVE THE MERIT OF FLOWERING WITHIN TWO MONTHS OF BEING PLANTED"

The Country House

AUTUMN FLOWERING BULBS

The Popularity of Colchicums

By ELEANOUR SINCLAIR ROHDE

FASHION is as fickle in the garden world as elsewhere, and for years the autumn-flowering bulbs have been rather neglected, but now they are very much to the fore, notably the Colchicums. They have the merit of flowering within two months of being planted (though they are only seen at their best when well established), and the colourings of the best kinds are striking. The only drawback is that in spring they produce masses of large leaves, and consequently they cannot be planted indiscriminately to fill up gaps in the rock garden.

Colchicums should be planted as early in July as possible, and even so the bulbs usually arrive already sprouting. These plants are ideal for rough grass banks, for in such a position the blooms are not ruined by mud splashes as in beds. If planted in such a position, however, the grass cannot be cut the following season till the foliage has faded completely. Sometimes a suitable spot can be found for Colchicums along a hedgerow enclosing an orchard. I recall one where the short grassy banks by the hedges were planted with Colchicums, and the effect of the pink and wine-coloured flowers with the trees loaded with fruits made an unusual and delightful feast of colour.

The earliest Colchicums to flower are the new hybrids, Autumn Queen and The Giant. The latter with its slightly tessellated mauve-pink flowers is particularly fine. *C. Bornmulleri* is also early flowering and has blooms rather similar to the varieties named above.

The pick of the Colchicums, however, are perhaps the later flowering hybrids of *C. speciosum*, notably Ruby Queen, Lilac Wonder and Conquest. The flowers and stems of Ruby Queen are a rich wine colour and the centres white. Conquest is very free flowering, and the petals have a ruby tinge. The white form of *C. speciosum* is remarkably fine. Another outstanding variety is *illyricum*, which has white-centred pinkish flowers with prominent golden anthers.

The varieties of *C. autumnale* are late-flowering and, being free-flowering, are useful for picking at a time when choice flowers in the open are scarce. Unlike most double flowers, the double forms of *C. autumnale* are charming, notably the white varieties.

Colchicums belong to the Lily tribe and consequently need perfect drainage. Heavy soils have to be well lightened with sand or hop manure, &c. They do equally well in full sun or part shade. Once planted, the bulbs should never be disturbed till the flowers show signs of deterioration, when they should be lifted and divided. The best time to do this is directly after the foliage has faded. The ideal soil is a well-drained loam, but Colchicums are accommodating provided the soil is well drained. The bulbs should be planted with the tips 1in. below the surface soil.

The autumn-flowering Crocuses are not so showy, but they are eminently suitable for the rock garden. They also do well in fine turf, but cannot be planted in rough grass. One of the most beautiful is *C. speciosus*. This type has large-veined rich lavender flowers with orange stigmata, and there are several varieties, but the type is the most attractive. *C. odorus* syn. *longiflorus* has mauve flowers with vivid scarlet stigmata and is faintly scented. *C. zonatus* and *C. Salzmanni* both have mauve flowers, and the petals of the latter are streaked on the outside. *C. ochroleucus* invariably attracts attention, for whereas most autumn-flowering Crocuses range in colour from lavender to violet blue, this species has creamy flowers touched orange at the base.

The most interesting of the autumn-flowering Crocus is indisputably *C. sativus*, the Saffron Crocus listed in the Song of Solomon among such valuable spices as myrrh frankincense, calamus, aloes and spikenard. The Romans valued the Saffron Crocus for its medicinal and culinary uses, and they may have introduced it into these islands. Traditionally it was first grown at Saffron Walden, and the arms of this town commemorate the legend that the bulbs were brought by a pilgrim who hid them in a hollow staff. Saffron Hill commemorates, possibly, the Saffron grown there when this ground was part of the famous garden of Ely House. Nowadays this Crocus is not easy, but formerly it was commonly grown. Saffron is not a flavour to everyone's like. It is skilfully used by Italian cooks, notably in risotto, and in this country it is still popular in Cornwall. But whereas risotto flavoured with saffron is excellent, Cornish saffron cakes always strike me as an acquired taste.

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, games, country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, August 1st. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Bream's Buildings, Chancery Lane, London, E.C. 4. 2. Only amateur photographers are eligible to compete. 3. Photographs should be sent unmounted, and no prints will be returned. 4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final. 5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6. 6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.

Entries from abroad not arriving in time will be placed in the next of the series. Do not send negatives.

DIVERTING A FOOTPATH

"ONCE a highway, always a highway," is the saying that causes so much misgiving to the landowner with an unwanted path on his estate. Like many of its kind, this saying is very nearly true, but not quite. For a highway may be legally closed or diverted, or it may have been abandoned. Abandonment is very troublesome to prove, for there is no precedent for the number of years which must elapse since it was last used. The onus of proof is upon the landowner, in itself no mean task.

It is now quite clear that a footpath is created if it is used by the public openly, not by written consent, and not secretly when no one is looking, for a period of 20 years, or if the landowner be a tenant for life, then for 40 years immediately preceding the action. The Rights of Way Act, 1935, made this clear, and also provided that proof of public user could be negatived by notice-boards maintained on the land, and by a plan and statement deposited with the County and District Council and reaffirmed by statutory declaration every six years.

The creation of a footpath is clearly defined, but its abandonment is not, and it is necessary to rely upon legal closing or diversion. The procedure is very clumsy. It may cost £100 and take from six months to a year to carry through. Great care is taken to ensure that the limelight of publicity shall shine brightly on the footpath in question, and opposition may render the proceeding abortive. A fortunate provision that an unsuccessful opposer may be saddled with a share of the costs is a deterrent to busy-bodies.

In order to divert a footpath, if it cannot be closed as unnecessary, it is required that the substituted way shall be nearer or more convenient for the public. The landowner is forced by the fiction of law to pose as a public benefactor. However absurd this arrangement may seem, it does ensure the continuance of footpaths, each of which was first created for some definite purpose.

The first application is to the rural district council, and must be repeated to the parish council. Large-scale plans showing the path to be closed and the line of the substituted way are required. The council, if they approve, will then apply to two justices to view the paths. Notices are exhibited at each end of the path, also inserted in the local paper for four successive weeks, and affixed on the church door for four successive Sundays. The justice's certificate and the plan is lodged with the Clerk of the Peace for inspection during this time.

Application may then be made to Quarter Sessions, and interested persons can object to the closing or diversion. If the court grants the application, the new way is made up by the landowner with all necessary swing gates, stiles, footbridges, and other things necessary. Some levelling may be required, but not metalling unless the original path was paved.

When all has been carried out, the justices again view and certify that the work is satisfactory and that the new way is substituted for the old, which is closed. The liability for future repairs is not affected. The cost of making the change rests upon the divertor, but the repairs to the new path are dealt with in exactly the same manner as of the old. The most general custom will be for the landowner to be responsible for gates and stiles, and sometimes bridges, and the council for any metalling.

One can sympathise with the landowner who refuses to be drawn into so complicated a proceeding, and who takes the law into his own hands, avoiding publicity, and quietly closes up the unwanted path and makes up the substitute. Simple as it may seem, this course is open to serious objection. The owner has dedicated the new way to the public, without legally closing the old way. If someone wished to be unpleasant, the landowner could be made to open the original path and suffer the inconvenience of two public footpaths instead of one. This eventuality is not so remote as it may at first sight appear, for the Rights of Way Act has caused activity among landowners, who are preparing plans and statements, and councils are drawing up their ideas of the public rights of way, with which to check the owners' plans.

Organised bands of hikers are becoming more common, and various public societies actively seek to keep footpaths alive and investigate complaints. It is by no means safe to take the law into one's own hands in these matters. Far better is it to take advantage of the powers in the Town and Country Planning Act, 1932, and secure the co-operation of the planning officer. Diversion under this Act is no more than the crossing out of one way and the marking of the substituted way on the draft scheme map. It is open to public objection, but this is not so likely at a time when so much else in the draft scheme calls for attention.

REGINALD DAVEY.

A HARD LAWN TENNIS COURT AND SQUASH COURT CONSTRUCTED BY THE "EN TOUT CAS" COMPANY OF SYSTON

SQUASH RACKETS COURTS

Planning and Cost of Construction

By RICHARD SUDELL, F.I.L.A.

IT is interesting to recall that the game of squash, which is so popular to-day, was originally played in Arabia, and was a ball game played with one hand against one wall. This game has been developed and is now played with a racket instead of the hand. From Dickens's account in *Pickwick* one would gather the game came into vogue in this country as a *pis aller* of insolvent debtors in the Fleet over 100 years ago.

To-day it is played in most of the Public Schools, and in many of the big clubs and holiday centres. It is one of the fastest games in the world, and the building of the court needs the services of an architect conversant with this type of building and specialised construction.

The modern court measures 32ft. by 21ft. on inside wall-faces, the front and side walls being 15ft. high and the back wall 7ft. high. These dimensions were fixed by the Tennis Rackets Association in 1911, and are the standard for single courts laid down by the Squash Rackets Association.

In the modern courts artificial lighting is necessary, and this must be so arranged that no shadow is thrown at any one point, so care must be taken when arranging the position of the lights, which are usually suspended from the roof and carefully guarded by wire cages.

Squash courts require the most accurate planning, and the construction of the walls must ensure that they are absolutely smooth and non-sweating, and too much care cannot be given to these points.

The foundation of the floor is as important as the walls themselves, and it is difficult to-day to say what is the best and most modern construction; such points are best left in the hands of the architect designing the court. In brief, the best material is white maple, and this is laid on joists bedded in concrete, the maple boards being laid with tongued and grooved edges and ends secretly nailed to the joists. The whole surface is then smoothed and polished off, to make a perfectly even floor.

As much light is required as possible, and it is best to leave the interior of the court in a light colour, dull cream being the best. The floor is left its natural colouring. Markings of the court are painted in with a bright red, and the small hard black ball shows up clearly in contrast with cream and red.

In the olden days the squash courts were made with four walls only, the roof being left open, and the material used was ordinary cement, no skill being used in the construction. Nowadays, however, skill is used and special material is employed in the making of squash courts; and in order that they shall not deteriorate under the weather, the modern courts are covered in with a roof, part of which is glazed over to ensure the maximum amount of light.

The doors should be so arranged that when closed they form part of the playing area inside the court. It is important that they are absolutely flush with the surrounding walls. They should be made of teak, and fitted with flush butts and sliding handles, with special catches and checking-straps or springs.

It is usual to place a balcony at the near end of the court for spectators. This balcony must be built above the 7ft. line and run the whole width of the court, thus giving plenty of room for the spectators. The floors are covered usually with deal tongued and grooved flooring. This balcony is reached by means of a flight of stairs from the ground.

In cases where squash courts are used in clubs or public buildings, it is necessary that dressing rooms and showers should be provided, and thus it is essential that this should be taken into consideration when planning the courts in the first instance, in order that the required extra space is allotted.

The cost of constructing squash courts varies from £635 to £800 for one court and gallery, and from £1,200 to £1,500 for two courts. The more expensive kinds have dressing-rooms, baths and showers.

In the case of constructing a squash court to tone in with the characteristics of any particular building, the cost may be put down at approximately £150 to £200 extra for the "special feature" work.

In a converted barn or outbuilding a single court, without shower or dressing room, could be made for about £350.

In conclusion, it might be well to bear in mind the value of squash courts in clubs, as these will often be the means of producing a good source of revenue, especially during the winter months when it is not always possible to play outdoor games. By having a few squash courts, a club can not only retain its revenue but often retain the membership.

The last point to bear in mind, but by no means the least, is that the construction of squash courts should be carried out under the supervision of an expert in order that a really satisfactory job is made of it. This is especially the case where it is intended to hold championship matches.

HORTICULTURAL ADVICE

Cyclamen for Winter and Spring

By CARTHEW ALLERDYCE

THERE is perhaps nothing nicer than a well-grown batch of cyclamen plants, both for the winter and spring. Actually they can be got into flower if desired in the autumn. They can be at their best at Christmas, or can be grown for the spring display. As a matter of fact, I find they are usually treated in the latter way by amateurs.

A well-grown cyclamen should have the marked and marbled foliage growing close to the pot and covering the soil completely, while the blooms should stand up well, be of good size and bright of colour. It is possible—in the modern kinds—to have flowers in various shades of pink, bright crimson, salmon scarlet, cerise, pink and white, and pure white.

There are several ways of starting cyclamen. Dried bulbs or corms can be obtained, young seedlings can be purchased, or seed may be sown. It is at this time of the year that plants can be purchased for potting up into their flowering receptacles.

The following firms are particularly interested in cyclamen and have done them well for years. They should be written to on the subject and catalogues and prices obtained. Messrs. Blackmore and Langdon, of Bath; Messrs. Clibrans, Ltd., of Altrincham; Messrs. Stuart Lowe & Co., of Enfield, Middlesex; and Messrs. Stewart & Sons, Ltd., of Ferndown Nurseries, near Wimborne, Dorset.

Plants obtained at this time of the year should be potted up into 4½in. or 5in. pots. The compost should consist of seven parts by bulk of medium loam, three parts good moss-peat and two parts coarse sand, adding to each bushel of this mixture 1½oz. hoof and horn meal, 1½oz. superphosphate of lime and ½oz. of sulphate of potash.

The pots should be well crocked, for good drainage is essential. The corm should not be buried too deeply, for if it is potted low it will not live. Burying the corm about half-way in the soil seems to be the right depth. After potting and a good watering, the plants may be placed in a cool house with perhaps some slight shade for a fortnight or three weeks and then may be stood out in frames until the end of September.

If they are stood on a base of moist ashes, they are very little trouble. The plants will need shading from the brightest sunshine, and the roots should never be allowed to suffer from drought.

Cyclamen are apt to be attacked by red spider, and regular syringings should be given with clean water; the underneath sides of the leaves should be sprayed with as much force as possible. This can be done until the flowers appear without doing any damage. If regular syringings are given there should be no need to use a white oil insecticide.

When the plants are brought into the greenhouse at the beginning of October they should be stood on a staging covered with fine gravel or coke breeze. The pots should not be crowded together, but 2in. or 3in. space should be allowed between them.

When the buds appear, weekly waterings may be given with a weak solution of liquid manure. A good feed consists of 1oz. of C.C.F. No. 1, plus 1oz. of ammonium nitrate to eight gallons of water. C.C.F. is made by the Imperial Chemical Industries and can be obtained from any horticultural sundriesman and from most seedsmen. There is no danger that this liquid manure will scorch the foliage of the plants as long as they are not wetted and then exposed to strong sunlight immediately.

The house should be given plenty of air, but draughts should be avoided at all costs. When a leaf or flower stem turns yellow, becomes covered with a grey furry mould, or looks sick for some reason or other, it should be cut down as close to the corm as possible, and removed to be burned.

Aphides can sometimes be a serious pest of cyclamen. It is the flowers that are attacked. The black fern aphis is the cause of the trouble, and the best way of controlling them is to fumigate the glasshouse with some commercial calcium cyanide, distributing this along the paths of the house at the rate of ½oz. per 1,000 cub. ft. This should be done in the evening, after making sure that the foliage of the plants is quite dry. The temperature throughout the night should be maintained at from 65 to 70 degrees Fahr.

It is possible to raise cyclamen from seeds sown in August or September.

THE MOTOR CYCLE'S PLACE IN TRANSPORT

Its Value in Civil Life and for Military Purposes

By CAPTAIN SIR MALCOLM CAMPBELL

(*First to achieve* 300 *m.p.h. on land, and holder of the Water Speed Record*)

(Motoring Editor of the "Field")

IF an exhaustive survey of public opinion were conducted in an effort to classify the general popularity of the various vehicles on our roads to-day, I imagine that in the category described as "Least Desirable" we should find the motor cycle heading the list. It is unfortunate that this machine is so frequently maligned, since it possesses undeniable assets with which no other vehicle can hope to compete.

The modern motor cycle is a highly efficient piece of machinery. Its reliability is beyond reproach, and it stands alone for sheer performance and economy in running. The initial purchase price is not high, while maintenance and garage expenses are correspondingly small. The uninitiated would be astonished at the degree of comfort which is obtained nowadays, and although the motor cycle demands greater skill than the handling of a car, ease of control is surprisingly good. Above all (and this is important these days) it does not present a particularly satisfactory target to the Chancellor of the Exchequer.

Public criticism seems to be based upon two primary considerations; the first being the speeds which motor cycles can attain and the second the amount of noise they can create. It seems, therefore, that one of the major assets of the motor cycle provides the very foundation for public resentment because the happy alliance of speed with economy means that these machines often find their way into the hands of irresponsible young men who delight in roaring over the countryside and through the cities to the chagrin of the car owner and the apprehension of the pedestrian.

The fact that such riders form the small minority of those owning motor cycles is apparently overlooked by all but the most tolerant, so that it is regrettable that this small section of the motor cycling community should give the remainder a poor reputation and a lowly standing in the public conception.

There is no denying the ever-present element of danger, but wherever there is speed and wherever there is sport one inevitably has to contend with this factor. Properly handled, the motor cycle is no more dangerous than any other road machine—indeed, it is often safer. Motor cyclists themselves ascribe by far the larger proportion of mishaps to road conditions and more particularly to the hazards which wood-block surfacing provides.

I have been a keen motor cyclist for many years. I have raced them, used them for pleasure purposes and for getting from one place to another in the shortest possible time. I have several in my garage which are in regular use, and my son is an ardent motor cyclist. To any man who revels in fresh air, feels the urge of speed and enjoys controlling a machine which calls for sound judgment and the exercise of a little "nerve" there is no better or cleaner sport.

As a utility vehicle the motor cycle is possibly at its best. It can be used over any sort of road and even across rough country. Boulders, steep hills and water splashes do not bar its progress, while in traffic the motor cycle has no competitor. Mechanically, the excellence of the product is cause for congratulation. British manufacturers lead the world and have set a hot pace. Fierce competition—both on the race tracks and in the world's markets—has evolved trouble-free power units, good steering and springing, efficient brakes and lighting equipment with first-class road holding.

Perhaps one of the finest recommendations the motor cycle could have is the extent to which the War Office intends using this vehicle in the event of war. Military experts are agreed that the advantages of mobility, speed, general utility and independence of action—all of which the motor cycle can provide under all conditions—are essential in modern warfare. Used in conjunction with almost any type of force, it is a most effective weapon. Indeed, now that mechanisation is the order of the day, the motor cycle forms a truly vital co-ordinating link in the offensive and defensive systems of the nation. During the Great War the despatch rider proved the worth of his "mount," but now there is a vastly bigger job for the motor cycle to do. The scope of the military machine is exceedingly wide and, realising this, we are now training corps of motor cyclists to be specialists in their particular tasks.

There are armed reconnaissance squads mounted on motor cycles, observers, signallers, men who watch and maintain communications, others who control the movements of military traffic, and there is still the indispensable despatch rider.

I am, at the moment, commanding the London Divisional Provost Company (T.A.), which is a motor cycle mounted unit. My men, who have been recruited from motor cycle experts, racing and trials drivers, are now learning the part they may be called upon to play. Upon them rests the responsibility of maintaining the even flow of traffic upon the strategic roads to and from the front lines; directing and controlling the astounding number and variety of motor vehicles which are necessary now to move, arm and feed the modern fighting battalions. This task, the real importance of which is obvious, can only be done on motor cycles. Their's is the task of preventing the immobilisation of the entire network in the immediate rear of the lines, and the clustering of transports in groups vulnerable to low-flying aircraft attacks.

Naturally, the motor cycle is the only vehicle capable of the speed necessary to get from one centre to another irrespective of conditions, congested traffic and other obstacles which may be present in war time. Certainly no temperamental engine, nor any fragile frame, could stand up to the work, but the British motor cycle is ideal for this strenuous work.

This unit of mine is merely one of many now in training and in the course of formation. Hundreds of enthusiasts have enlisted in the Territorial Army and it is my experience of them which leads me to expect they will make fine soldiers.

Among motor cyclists there still exists a notable spirit of camaraderie which unhappily seems to have disappeared from among the car owners since motoring has become so commonplace. Something of the friendly spirit which existed among the pioneers of motoring still flourishes among the "boys on 'bikes," and it is a virtue deserving of admiration.

I believe that we shall see motor cycling becoming more popular now that the increased horse-power tax will deprive so many motorists of their small cars. Although the motor cycle is not immune from the 66⅔ per cent. increase, their lower engine capacity means a relatively small impost. Further, I imagine that the performance and the extraordinarily low fuel consumption of motor cycle combination outfits will attract the family man in larger numbers. The sidecar outfit is one of the safest means of transport on the road, insurance costs are not high, and from a 500 c.c. machine petrol figures range between 65 and 70 miles per gallon. A really good model costs about £75 new, and the annual tax for a 500 c.c. motor is now only £3, although it will rise to £5 next year. The solo machine, of course, is much cheaper both to buy and to run, although insurance premiums are somewhat more expensive. A first-class general purpose machine of either 250 or 350 c.c. need not cost more than £50, and petrol consumption is near the 100 miles per gallon mark.

The choice available is wide, and with any modern machine the buyer is assured of reliability, speed and utility, together with that indefinable "something" which comes from the incorporation into the design of improvements and the valuable lessons learned from international racing and competition trials.

MORRIS PRODUCTION.—The directors of Morris Motors Ltd. announced recently that for the six months January 1st to June 30th nearly 60,000 Morris models have been delivered to distributors and dealers, a figure which constitutes a record for the company, and is believed to be a record for the British motor industry. It is interesting to note in connection with this record output figure that, in order to achieve it, one complete car has left the factory, on an average, every minute of each working day during the past six months.

SCOTLAND!

NIGHT TRAINS FOR "THE TWELFTH"

The day of the Glorious Twelfth may be a strenuous one this year—but you can still get sound sleep the night before. This year, as always, a fleet of comfortable sleeping car trains will be running through the night, so that you can wake refreshed in the morning for the first familiar glimpse of moorland and heatherclad hills.

This year's programme of trains (all with first and third class sleeping accommodation) is given below and on trains leaving before 8 p.m. you may dine in comfort. Times of day trains will be supplied on request at any L·N·E·R or L M S station, office or agency.

AN ENGLISH MOTORIST IN AMERICA

The World's Fair and its Motoring Exhibits

I AM writing this from a balcony in the 1,000-roomed Shoreham Hotel in Washington, U.S.A., the Junior Car Club's temporary headquarters. We arrived 40-50 strong last night, having covered over 200 miles of the Lincoln Highway, America's equivalent to our Great North Road, with the difference that it goes south-west. Much of this route is twin-carriage-way, and we frequently encountered sections being widened to this style. Large numbers of men are employed, but the machinery and plant used did not seem to us as elaborate or efficient as those we saw in Germany last year. In fact the methods employed seemed more like our own, but on a larger scale and with more common sense and push and go behind them.

As No. 1 Highway led through flat and easy country, the construction of wide, straight and level road presented few difficulties. Thus we soon found ourselves aboard the Rolls-Royce Phantom III, cruising in supreme comfort and silence at 70-80 m.p.h. On the last section of the run down a five-lane road choked with traffic averaging 50-60 m.p.h., we accelerated to 90, a thrilling traffic drive if ever there was one. But so well are the lanes laid out and so good are the visibility, curving and surfacing that this speed felt perfectly safe. Then, too, the standard of the Americans' driving is meticulously precise and intelligent. They do not suddenly swerve out of one lane into the next without giving ample warning. They do not overlap the central white line, and though they travel quickly their speed and the speed of the general flow of traffic is uniform. We saw few motor-buses or coaches, no pedestrians, cyclists or odd pieces of transport on this trunk road. But instead a constant stream of big black saloons filled the road, proceeding fast but accurately according to plan. It was a striking contrast to the heterogeneous, wayward scramble on our own highways.

In New York itself we noticed the same well-ordered movements. To start with pedestrians concentrate at signal-controlled crossings and move with the rest of the traffic. At the intersection of streets, which are numbered instead of being named, the signals change simultaneously all down the road as far as the eye can see, and the traffic, held up at each crossing, moves forward simultaneously in blocks of cars. We had been warned that the speed would scare us, but the routine is so easily learned that we soon got into it. We had also been told that the streets would be dirty and the noise terrific. But in the area round about the Waldorf Astoria, where we stayed a few days after completing the Mauretania's maiden voyage, the streets were perfectly clean and the traffic note subdued. Nor did we meet the expected bluffness of officials or police. Instead we were treated with every kindness and consideration, even when part of our convoy on the first day was held up by a traffic cop for speeding. Next day one of the Washington dailies came out with headlines, "British motorists bring good will at 90 m.p.h." and went on to say that the police caught up all but the first three of the cavalcade headed by the Phantom III and a Rolls-Bentley, which appeared to be too fast even for the 90 m.p.h. motor bicycles.

Incidentally, we were given the honour of a motor police escort on several occasions. Their cars and motor cycles blast a clear way with the shrieking of sirens and the waving of hands to the traffic to get over to extreme right of the road. The cars are fitted with radio and machine guns, and the motor cyclists carry revolvers and can shoot a tyre flat while travelling at top speed. After these adventures and realising that we were not supposed to do more than about 50 on the open road, we modulated our speed and kept a better look-out for the smallish signs indicating the various limits.

In and around New York we found ample evidence of new and advanced road construction. Elaborate clover leaf formations are springing up all over the place. There is a magnificent overhead road, sometimes built out in the river on pylons and confined to fast moving traffic.

Roads of tremendous width are already in being, and others are being planned. One-way traffic schemes are highly developed. For in the words of a General Motors commentator at World's Fair, it is expected that in 50 or 60 years' time the present 28 million cars will have increased to 35 millions, and the roads to accommodate them must be planned now.

There are no small cars in America at the moment. Even the latest taxis seat five in comfort. They are de Sotos and have a sliding or transparent roof over the main compartment from which one obtains fine views of the skyscrapers, and at night of their most beautiful illuminations and floodlighting effects. I talked with one of these drivers who gave me some astonishing figures. His car had covered 78,000 miles without rebore, and would cover another 75,000 before it retired from business. In one year it had covered over 50,000 miles. The periods for tyre renewal and decarbonising on something like 30,000 miles, while brakes are relined every 15,000 miles.

The tremendous similarity in the appearance and performance of the American cars was most noticeable. Black seems to be the almost universal colour. One can tell the new cars by their yellow registration plates, designed to advertise the World's Fair. Here I inspected the new Crosley bantam two-seater which appears to resemble in size the Austin "Seven" of sixteen years ago. It is made by a concern famous for radio and cold storage machines, and is fitted with a horizontally opposed twin cylinder air-cooled engine. I do not think that despite a projected output of 200 a day, and an American price of about £65 it can be regarded at the moment as a menace to our own home market. On the other hand, if it succeeds in the States it may point the way for other formidable rivals.

The high spot of the first part of our tour was a visit to the World's Fair. One could literally spend months at this amazing, beautiful and varied exposition. In the British section, where the regally installed Magna Carta attracts a reverent stream of visitors, are staged Captain Eyston's land speed record breaker Thunderbolt, a Rolls-Royce Phantom III, a Rolls-Royce aero engine, a Bristol air-cooled sleeve valve aero engine and some motor bicycles. The exhibit looks bald and cold, lacking the dynamic presentation of other shows.

Most spectacular are some of the American exhibits which have cost hundreds of thousands of pounds to install. In some cases queues numbering, 5,000, 6,000 or 7,000 people wait all day to gain admittance. General Motors, for instance, feature an attraction they call the Futurama or Horizons and Highways of to-morrow.

This remarkable exhibit consists in a miniature model of an immense expanse of country which embraces farmlands, cities, great lakes and mountain ranges, all arranged as they may be 50 or 60 years from now. Running across this Continent in miniature are the grand trunk highways of to-morrow. They cross by means of four tier bridges, great rivers. Along their multi-traffic lanes speed tiny cars as futuristic in design as are the buildings and lay-out of the great new cities wherever they come and whither they go. Mighty dams, imposing canyons, rugged mountain peaks are crossed by this amazing highway. At times the brilliant sunlight effects, which add life and reality to the model panorama, fade to give place to night scenes. Then the cities, roads and airports light up and the effect is even more beautiful than before.

Around this magic land visitors are transported in chair-settees slowly moving on a conveyor. Sometimes the track leads aloft and they view the scene as if from an aeroplane 12,000ft. above the earth. Sometimes it dips to give a closer, more intimate view of some specially interesting feature such as a house or factory of the future, a great hydro-electric plant, a mighty dam or mountain precipice. As the visitors proceed on this 20 minutes' trans-continental tour a voice on a sound track speaks softly into their ears and draws attention to the features in front of them, their meaning and effect on human existence in the years to come. The whole effect is so staggering in its conception and construction that I almost thought it was no longer worth while to continue with our lifesize tour of America. In the space of less than half an hour I had seen more country than I could explore in a year, and seen it as it might be long after I was dead, and in greater silence and comfort than was possible by any other form of transport.

The Ford exhibit, another many acred affair, displays a more technical aspect of the world of to-morrow. Chief attraction is the road of the future up which Ford cars, laden with visitors, circle until they attain the full height of the building, from which overhead views of the rest of the Fair are obtainable. Ford also shows how intimately the farm and country life is linked up with industry by reason of their products and activities, and follows up this idea by an entirely new method of tracing the sequence that converts raw materials of many different kinds into the various parts of a motor-car. An immense conical turntable revolving slowly carries at its lower circumference animated model men engaged in extracting from the earth the raw materials. Above them in a vertical plane other animators carry out the next process in the manufacture of this particular material. And above them are others until one sees near the top of the tunnels the finished article, and above it the car itself. Other Ford high spots are an extraordinary ingenious working mural showing a V-8 engine in action, a wind and weather tunnel in miniature and a mighty press for stamping out hub caps.

The Chrysler interpretation of the Future is fantastic, ingenious and amazingly interesting. In one room one sees the first full-size three-dimensional film in action. Its theme is the building of a Plymouth car. This is so realistic owing to the stereoscopic effect of the plan that visitors frequently cry out or raise their arms instinctively in anticipation of being struck by some of the pieces in motion. Near by is the frozen forest composed of specially built metal palm trees covered with a thick coating of boar frost. This is an interpretation of the effects of man-made weather, the effects of which in a more everyday life are found in the common or garden refrigerator. Another Chrysler novelty is the talking-thought-reading car, while in the next chamber one is shown the transport of the future in the form of a rocket car with scenery and effects that portray one's departure for the moon or some far distant corner of the earth.

Verily, it is a staggering affair; more wonderful, thrilling, varied and lovely than anything most of us have even dreamed of, let alone seen in our lives.

W. G. McMINNIES.

A MIRROR OF SWITZERLAND

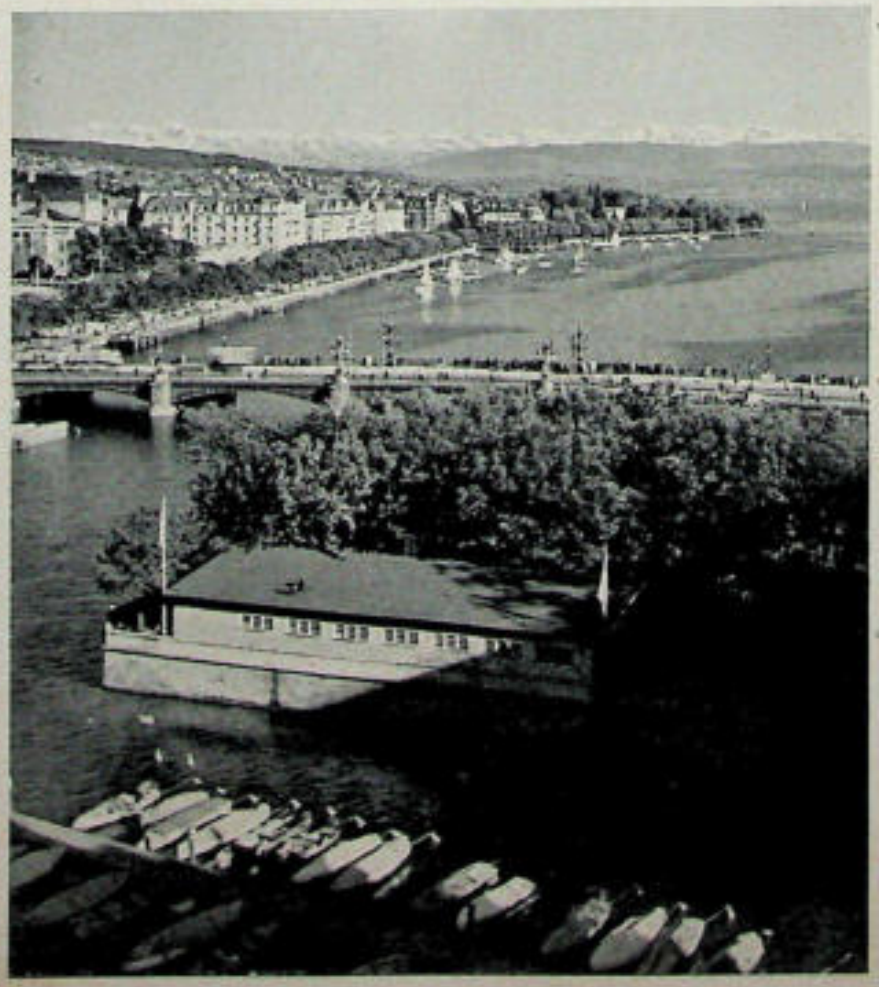
The Country's Life Seen at the National Exhibition

THE SUSPENSION RAILWAY WHICH CONNECTS BOTH SHORES OF THE EXHIBITION

PAVILIONS AT THE SWISS NATIONAL EXHIBITION WHICH HOUSE TEXTILE, FASHION, AND WATCH EXHIBITS

WE live in an age of exhibitions. Sometimes they are national, sometimes international, but whatever form they take they attract foreign visitors. The number of such visitors has greatly increased with the present economical travelling facilities, and it is hardly surprising, therefore, to learn that the Swiss National Exhibition at Zurich, opened on May 29th, has already proved itself a great attraction. As the exhibition will remain open until October it is probable that many summer visitors to Switzerland will halt a day or two at Zurich when on their way to some other destination in the mountains. It will not be wasted time, for there is much to see and much to learn from a tour of the exhibition grounds.

There are, of course, always a certain number of "exhibition migrants" who never fail to go to any exhibition wherever it is staged. They go for many reasons—on business, to see people, to learn about the country—but the ordinary traveller will go to Zurich to enjoy himself and nothing else. That is the spirit of holiday and the spirit, too, which animates the Swiss National Exhibition. It is here that the native has given himself over to showing visitors the excellent products of Switzerland. He has done the job cheerfully and well.



It is not easy for one to take a visitor round the exhibition in mere print and give him a real impression of what it is like. It is only possible to give him or her details of some of the exhibits and hope that the accompanying photographs and their own personal knowledge of the friendliness of the Swiss people will do the rest.

Perhaps one of the most interesting sections for the visitor from abroad is the one which gives an insight into the life and history of the people. This section lies along the so-called "Hohenweg," on the left shore of the lake. The first pavilion is dedicated to the the very soil of Switzerland. Under its vault, the eyes of the visitor first come to rest on the great painting in which Bodmer, one of the foremost living Swiss artists, has given expression to the nature of the Swiss people. In the foreground a number of women stand singing in a meadow, in the background the homely gables of a village are seen among trees, while the male strength of the country is symbolised by a male figure, shirt-sleeved, singing among the women. Not many countries could confide to figures so unsophisticated the symbolisation of the profoundest aspects of the national mentality. But for Switzerland that is right. It is from such roots that Swiss life springs, and is nourished in the best sense.

I was interested in the gallery leading out of this pavilion, for here one can see the models of a number of Swiss villages. It was not merely single models that held my attention, but a comparison of one with the other. As I have travelled through Switzerland I have always been struck by the difference of temperament and individuality of the people. Here in the models at Zurich you see something of this portrayed. There is no such thing as a typical Swiss village. They are fiercely independent entities, varying in speech, in mentality, in aspect. You will find among the models that there are some of towns, but they by no means occupy the place of honour.

To my mind the towns of Switzerland, pleasant though many of them may be, are a means to an end. The "Swissness" of Switzerland cannot find so marked an expression in her cities, where a certain adaptation to internationalism is bound to happen, and I would therefore always encourage foreign visitors to sample both towns and villages during their visit to Switzerland. Only thus will they grasp the true loveliness of this grand country and the real character of its inhabitants. But I am wandering from the point of this article.

You must not think that the Swiss National Exhibition is merely a show or a fair; it is something much more lively and interesting, presenting a picture of all branches of production with their mutual relations and dependencies. The exhibits are not displayed in tiring series, but are to be seen where they belong with regard to their functions in daily life. For instance, furniture is to be found in the section "House and Home," and not in a furniture section, while office furniture may be inspected in a modern office. The electricity section, too, is not only confined to a display of the various applications of "white coal." In short, the individual manufacturer has given way in the foreground to the productive capacity of the closed economic group. Everyone has done his best to sacrifice his personal ambition to the community. This thematic arrangement makes the exhibition a world *in petto*, active and energetic and really productive.

A GENERAL VIEW OF ZURICH, SHOWING THE LAKE AND THE ALPS

Part of the charm of the Swiss National Exhibition is the natural beauty of its surroundings. Situated on the lakeside, one shore has been utilised for the showing of agricultural produce and the other is devoted to the creations of Swiss industry. Those keen on engineering may prefer the latter, but I found great pleasure in the farming and livestock shown on the right shore of the lake. In order to present a complete picture of rural life—however it may vary in different parts of Switzerland—a little village was constructed, and it is here, among these rural buildings, that the peasantry celebrate their own special festivals, display their own special costumes, sing their folk songs and dance their folk dances.

You can see at this exhibition all the strength of Switzerland which lies, surely, in her diversity. She is diverse in her scenery, in the occupations and life conditions of her inhabitants. She speaks many languages and has many varied customs and manners within her frontiers. But one spirit governs this little nation—freedom of thought for the individual and the independence of the State. You can find it here at Zurich, you can find it in all the odd villages among the hills.

Have I led you far enough, reader?

Admittedly, I have taken you over very little of the exhibition grounds, but I hope that I have led you far enough. For the Swiss National Exhibition at Zurich portrays before you all Switzerland, and it may be a long time ere such an opportunity presents itself again. It puts truth into the phrase which slips so lightly from our lips on some occasions: "The chance of a lifetime!"

Switzerland, believe me, has given of her best.

WILLIAM LUSCOMBE.

THE NEW AIRWAYS CORPORATION

By LORD SEMPILL, A.F.C., F.R.Ae.S.

(Aviation Editor of "The Field")

THE Bill formulating the terms for the creation of the new public corporation that is to absorb Imperial Airways and British Airways, follows the lines generally expected. The new undertaking, which is to be known as "British Overseas Airways Corporation," will take over the two existing companies in the autumn—probably in October—and thenceforth the operation of our external air services, whether to the Empire or to foreign countries, will be entirely unified.

On the general aspects of the scheme something was said at the time of its announcement: there is, therefore, no need to go over the ground again, except to say that it is an almost inevitable outcome of the present state of affairs. It does not destroy that competition which so many regard as essential for development. Not only will the Corporation's services be exposed to the rivalry of the heavily subsidised airways of other nations: the monopoly granted to it applies only to subsidy. There is no absolute ban on the conduct of unsubsidised external air services by private concerns, though it is clear that very abnormal circumstances would have to obtain for such competition to be either possible or desirable.

Two main ends have obviously been in mind in drawing up the details of the scheme. One is the need for continuous technical progress; the other is the creation of financial conditions that permit that progress to be ensured and also provide long-term stability for the Corporation.

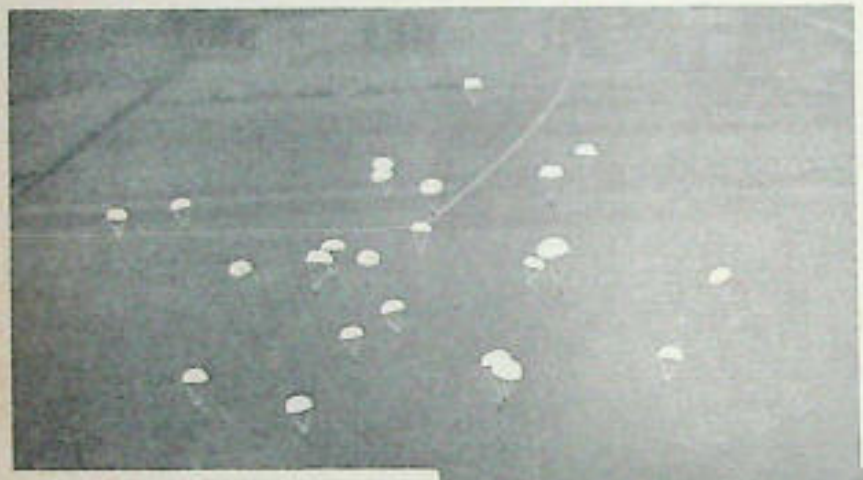
As to the former, the report of a small committee set up last February to investigate the problem is now available. This recommends the establishment of a permanent Civil Aviation Development Committee, whose principal function would be to examine current needs for aircraft, and advise the Air Ministry on requirements in order that construction may be confined to a small number of types, for each of which a definite market exists. This Committee, it is suggested, should consist of three members, apart from an independent salaried chairman; and of these, one should represent the Corporation and the others the Air Registration Board and the Society of British Aircraft Constructors. Power to co-opt representatives of British and colonial airways should exist.

On the financial side, the main provision is that the existing maximum rate of subsidy shall be raised from £3,000,000 to £4,000,000 per annum, and that the Corporation shall have power to borrow up to £10,000,000. Moreover, to stimulate efficient organisation, the Corporation will be able to retain in a reserve fund sums representing excess revenue or economies. The £4,000,000 subsidy, it may be mentioned, includes the £100,000 set aside for internal airlines, and will not, therefore, be available to the Corporation.

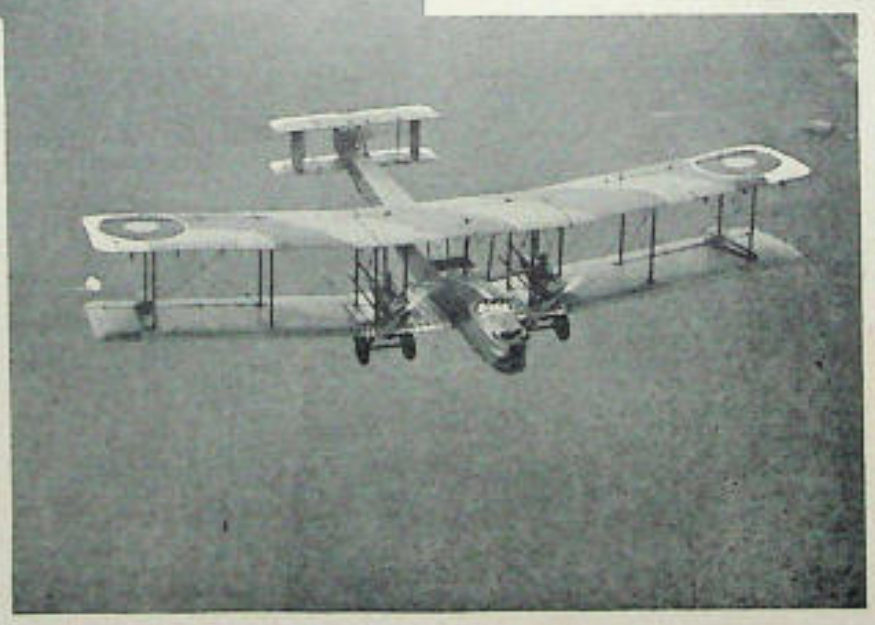
It will be recalled that the chain of events leading up to this scheme had its origin in a widespread dissatisfaction, expressed in Parliament, with the technical position of our external airways. This led to the Cadman Committee, whose report, though it did not actually recommend any scheme so far-reaching as this, certainly stressed the need for greater co-ordination and for improved types of British commercial aircraft.

How far, then, may the new scheme be considered to go in meeting the very desirable—indeed, imperative—condition of British commercial air leadership in all phases?

On the technical side, the new Committee may be a great help, and should, if wisely administered, do much to ensure co-operation between operator and constructor. The increased subsidy and the borrowing powers should also go far towards putting the Corporation in a position of being able to keep its fleet right up to date.



Moreover, the fact that, while the Corporation is to be a self-managing body, administered by a Board appointed by the Secretary of State for Air, it will be obliged to submit an annual report to Parliament; and this should provide an opportunity for criticisms to be freely ventilated.



As always, practical experience alone can decide whether all the results hoped for from the scheme can be achieved, but in view of the lively and informed interest Parliament has recently shown in air matters, it may be taken that any weaknesses will be exposed during the discussion of the Bill.

Apart from the details, the Bill itself provides a very striking commentary on the most remarkable change that has come over British air policy in the 20 years since commercial aviation came into being. Though the subsidisation of airlines was adopted abroad at the outset, the British Government did not fall into line until 1921. Even then, however, the assistance granted was but small, and even when, in 1924, Imperial Airways was formed, Mr. Churchill's famous dictum of 1920—"civil aviation must fly by itself"—was still held to be the ultimate goal.

Pressure of events has caused a growing retreat from that viewpoint. Since the inauguration of the Empire Air Mail scheme, subsidies have been steadily increased, and the formation of the new Corporation marks a further stage in this process.

Nor is it only in the field of inter-imperial and international air transport that this trend is to be discerned. There is to-day hardly a branch of aviation that is not supported, directly or indirectly, by State subsidy. The flying clubs have become virtually a vast State-aided system of flying schools, and the decision of the Government, several times expressed, and endorsed by the Cadman Committee as recently as last year, that internal lines should not receive assistance, has been reversed.

A VICKERS VIRGINIA PARACHUTE TESTING OVER HENLOW

The original conception of aviation as something that must develop on strictly commercial lines has, in fact, given place to a conception of it as a vital public service, which must be maintained under all circumstances, as is the Post Office in this country and the railways in many parts of the Empire. Whether commercial aviation can ever, in the famous phrase, "fly by itself" cannot be decided at the present stage. This much may be said, however: aviation is vital to the Empire—never more so than to-day—and the price we pay for its development is by no means exorbitant. Our main concern lies in seeing that good value is given for the money paid, and that assertions of backwardness, whether justified or not, cannot again be made. On the face of it, the new scheme gives ground for the hope that those aims may be achieved.

THE RILEY TWELVE IS A THOROUGHBRED CAR FOR THE UNDERSTANDING MOTORIST

THE RILEY TWELVE

FEW cars caused so much enthusiasm in informed motoring circles as the old Rileys of the past decade—they were "class" cars built for those who took an interest in their motoring. When the firm was on the edge of financial collapse last year, Viscount Nuffield did a magnificent piece of rescue work, and as a result, this old-established firm are still with us, and have produced a 12 h.p. model which is essentially Riley, but has the added support of Lord Nuffield's enormous organisation behind it.

The model I had the pleasure of driving the other day was the drop-head touring saloon seen at the top of this column, and it is priced at £335, or with a "Sprite" engine, at £360. It may be argued that this is not a cheap price for a 12 h.p. car. It is not; but neither is the car "cheap." There has always been a comparatively small body of the public who have motoring culture, and it is for these that the Riley has been built. Lord Nuffield, in a conversation with Mr. Victor Riley, said, "The Riley car has been in the past a British thoroughbred; try to make it even more so," and that command has been faithfully obeyed.

The car I drove was not new, and had done some hard work before I took it over, but I was gratified to find that the head had developed no rattles or squeaks, nor had the doors sagged—common faults among drop-heads. When closed, the car has been so designed as to give ample view from the rear seats instead of the usual blind quarter—a window takes the place of the fabric here. The seats are well sprung and of sensible dimensions, while the woodwork is polished walnut, giving the car a neat and sumptuous appearance.

Space does not permit me to say more concerning the interior, except that it is a very sensible and comfortable lay out. It is mechanically that the Riley reaches its peak. The engine is a four-cylinder 12 h.p. unit (tax £9), with a bore and stroke of 69 by 100 mm., and is so laid out as to be easily accessible for adjustments, &c. The gears, with remote control, have ratios: First 19.4, second 11.2, third 7.25, and fourth 4.88 to 1, and are synchromesh on second, third and top.

Top speed is just over 70 m.p.h., and with a lower gear ratio than used formerly, the car will cruise without strain at about 60 m.p.h. It holds the road magnificently, and will corner at high speed without lateral sway, owing to its low centre of gravity and the anti-roll torsion bar that connects the rear shock absorbers. Springing—half ellipties—is improved, and gives comfortable riding, while the Girling brakes bring the confidence one would expect in a car of its type. Petrol consumption is about 30 m.p.g., a good figure for a car with a snappy engine, and fuel is stored in a 10-gallon tank with a filler on either side at the rear. Although a high performance car, the engine is perfectly docile in traffic and shows no tendency to flutter at low speeds.

On hills it seems to thrive, and with a judicious use of the gears will show its back wheels to most cars in its class.

Altogether, the Riley Twelve is worthy of the most exacting owner of a luxury light car. W. R. J.

BRIDGE

THE ECHO

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

SINCE Bridge is a partnership game there must of necessity be certain conventional plays as regards leads and discards. Many of these are survivals from Whist, but in many cases their significance has been considerably increased.

In this article, and the next, I propose to deal with the "echo," "high low" or "peter" signal, the last being its Whist name.

The "high low" signal, as its name implies, consists in discarding on two consecutive tricks first a high card and then a low card. It may be used both in discarding to partner's leads or to the opponents', and as with many so-called "conventional" plays has quite a logical origin. The normal way to discard to two consecutive leads would be first one's lowest card and then one's next lowest. Obviously, if a player reverses this normal order he does it for some particular purpose. The most common use is to show that the person who signals has no more of the suit and can ruff the third round. This week we shall consider its use in a trump contract. In this case it shows:

1. Important honour strength in the suit led.

2. An original holding of two cards in the suit led, or

3. That the signaller wishes his partner to continue the suit.

	♠ J, 3, 2 ♡ K, 7, 4, 3 ◇ A, K, 7 ♣ Q, 4, 3	
♠ A, K, 7, 4 ♡ Q, 10, 6 ◇ J, 10, 8, 5 ♣ 10, 7	Y A B Z	♠ Q, 10, 5 ♡ 2 ◇ Q, 9, 4, 3, 2 ♣ 9, 8, 5, 2
	♠ 9, 8, 6 ♡ A, J, 9, 8, 5 ◇ 6 ♣ A, K, J, 6	

Z is playing the above hand in Four Hearts, and A leads the King of Spades, on which B discards the 10 of Spades. A now leads the Ace of Spades, and B thereupon completes the echo by the 5 of Spades. A, thus encouraged, leads a third Spade, which B takes with the Queen. A must make a Heart trick to defeat the contract. It will be noted that if A does not lead the third Spade Y—Z make four Hearts by discarding a Spade on the second Diamond.

	♠ 7, 2 ♡ Q, 4 ◇ A, Q, J, 10, 3 ♣ K, 8, 4, 3	
♠ A, K, Q, 3 ♡ 3, 2 ◇ 9, 8, 5, 4 ♣ J, 10, 7	Y A B Z	♠ J, 10, 5, 4 ♡ K, 10, 6 ◇ K, 2 ♣ Q, 9, 6, 2
	♠ 9, 8, 6 ♡ A, J, 9, 8, 7, 5 ◇ 7, 6 ♣ A, 5	

Z, not vulnerable, bids a rather weak Three Hearts against vulnerable opponents, and is raised to four by Y.

On the opening lead of the King of Spades B plays the 5, and when A follows with the Queen of Spades B plays the 4, since if Z is forced to ruff a third Spade in Dummy B must make a Heart trick. The King of Diamonds will then beat the contract. In this case we have an example where the echo is used as a means of encouraging partner to lead the suit again.

The trump echo is not quite so well known. When a defender plays high and then low on two trump leads he signals to his partner that he has one more trump. When ruffing, if he has only two small trumps he should ruff with the lower. When holding three or more he should ruff with a trump which is not his lowest. This information may be invaluable to partner when he has to choose between trying for another ruff or changing the suit.

(To be continued)

THIS WEEK'S PROBLEM

	♠ K, 4 ♡ K, 3 ◇ 8, 6, 2 ♣ K, J	
♠ Q, 6, 2 ♡ 8, 6 ◇ 5, 3 ♣ Q, 6	Y A B Z	♠ 8 ♡ 7, 5, 4, 2 ◇ 10, 9 ♣ 7, 3
	♠ J, 10, 9 ♡ A, 9 ◇ Q, 7 ♣ 9, 8	

Z to lead and make eight tricks against any defence by A—B.

LAST WEEK'S PROBLEM

	♠ A ♡ None ◇ Q, 10, 8 ♣ K, 7, 4	
♠ 7 ♡ A, 6, 4 ◇ None ♣ 8, 6, 2	Y A B Z	♠ None ♡ K ◇ K, J, 9 ♣ Q, 10, 3
	♠ 2 ♡ 7, 5, 3 ◇ None ♣ A, J, 9	

Z to lead and make five tricks against any defence by A—B.

SOLUTION

Z leads the 9 of Clubs taken by Y's King, a Club is returned and the Jack finessed and the Ace taken. A small Heart is led and if A plays the Ace the Ace of Spades discarded from Dummy. A then makes the 7 of Spades and has to give Z two Heart tricks. Alternatively, if A plays a small Heart, Y discards the 8 of Diamonds and eventually makes the Ace of Spades and a Diamond trick.

CHESS

BOTWINNIK'S PLAY

The following game, played in this year's Russian Championship Tournament, is a good example of the enterprising style of play of the well-known master, M. M. Botwinnik. It is also of theoretical interest.

18. Kt to B 3	B takes Kt	37. P to Kt 3	Q to Kt 4 (n)
19. P takes B	R takes P	Resigns.	

(a) The Grünfeld defence. It has recently returned to favour.

(b) 4. Kt to B 3, B to Kt 2; 5. Q to Kt 3 is probably better.

(c) Offering the sacrifice of a pawn. If now 6. P takes P, Kt takes P; 7. Kt takes Kt, Q takes Kt; 8. B takes P, then 8. . . . Kt to B 3 and Black gets a strong attack. (See game Ketres v. Lilienthal in the *Field* of July 1st.)

(d) In a game, Capablanca v. Flohr, in the "Avro" tournament last year the continuation was 6. Q to Kt 3, P to B 4; 7. Q P takes P (very risky), Kt to K 5; 8. P takes P, Q to R 4; 9. Kt to K 2, Kt takes Q B P with advantage to Black. Against Reshevsky a few rounds later Capablanca tried the text-move, which is probably better.

(e) A strong move.

(f) Capablanca played 9. Q to R 4, the continuation being 9. . . . Q takes Q; 10. Kt takes Q, Kt takes P (threatening B to Q 2); 11. B to Q Kt 5, Kt takes B; 12. P takes Kt, B to K 3; 13. P to Q Kt 5, B to Q 4; 14. Kt to K B 3 (there is no time for P to B 3. White must complete his development), B takes Kt; 15. P takes B and the game eventually ended in a draw. With the text-move White starts a combination which leads to a gain of material but allows Black to get a very strong attack.

(g) If 10. . . . B takes Kt, then 11. B takes Q, B takes Q, ch; 12. B takes B and Black has no compensation for the pawn.

(h) The only alternative is Q to Q 2, for, if the Rook is left unguarded, White plays Kt to B 6, ch. The text-move is very much better.

(i) Threatening 14. . . . R to Q sq.

(j) Threatening 14. . . . R to Q sq.

(k) Much stronger than regaining the pawn at once by R takes R.

(l) If 17. Kt to B 3, then 17. . . . R takes P; 18. Q to Kt sq (if Q to Q sq, then B takes Kt P; or if, instead, Q to R sq, then Kt to Kt 5), B takes R P; 19. Q to R sq, Kt to Kt 5 or R to B 7 with a winning game for Black.

(m) Black has a winning game.

(n) Preventing R to Kt 8 and threatening P to Kt 6.

TOURNAMENT AT AMSTERDAM

Shortly after the tournament at Amsterdam mentioned in the *Field* of July 15th a second tournament was arranged there with the same six players. The final scores were Dr. Euwe (Holland) and Dr. Landau (Holland) each 3½ points out of 5, N. Coetlever (Holland), and S. Flohr (Czecho-Slovakia) each 3, L. Szabó (Hungary) 2, and J. H. C. Fonteín (Holland) 0.

The following game was finely played by Dr. Landau.

(Indian Defence.)

WHITE. Dr. Landau.	BLACK. Flohr.	WHITE. Dr. Landau.	BLACK. Flohr.
1. P to Q 4	Kt to K B 3	18. B takes B	K takes B
2. P to Q B 4	P to K Kt 3	19. Kt to K sq	Kt takes Kt
3. Kt to Q B 3	B to Kt 2	20. Q to Q 4, ch	K to Kt sq (e)
4. P to K 4	P to Q 3	21. Q R takes Kt	P to K 5
5. P to K Kt 3	Q Kt to Q 2 (a)	22. P to B 5	R P takes P
6. B to Kt 2	P to K 4	23. R P takes P	Q to B 2 (f)
7. K Kt to K 2	Castles	24. P to Q Kt 4	Kt to R 3
8. Castles	R to K sq	25. P to B 6	P to K 4 (g)
9. P to Kt 3	P takes P (b)	26. Q to Q 2	K to R 2
10. Kt takes P	Kt to B 4	27. Kt to Q 4 (h)	R to K Kt sq
11. P to B 3	K Kt to Q 2	28. Q to Kt 5 (i)	Kt takes P
12. B to Kt 2	Kt to K 4 (c)	29. Kt to B 5	B takes Kt
13. Q Kt to K 2	P to Q B 3	30. P takes B	K R to K sq (j)
14. B to B 3	Q to Kt 3	31. B to K 4	R to K 4 (k)
15. K to R sq (d)	P to Q B 4	32. P takes P, ch	P takes P
16. Kt to B 2	R to Q sq	33. Q tks Kt P, ch	K to R sq
17. P to B 4	Kt (Kt) to Q 6	34. P to B 7	Resigns.

(a) P to K 4, to be followed by Kt to B 3, is preferable. After the text-move Black has difficulty with his development.

(b) Black plays this in order to free his Q B 4 and K 4 for his Knights, but by giving up the centre he increases the mobility of White's pieces. Perhaps P to B 3, to be followed by Q to B 2, is preferable, although the problem of the development of the Queen's side pieces would still remain to be solved.

(c) Threatening to win a piece by playing Kt (K 4) to Q 6.

(d) A necessary precautionary measure. If Kt to B 2 at once, then Kt takes Kt P, ch.

(e) Black should, instead, play P to B 3. After the text-move the "hole" at his K B 3 becomes a source of great embarrassment to him.

(f) Q takes P would be very dangerous, White having a strong reply in Q to B 6, to be followed by P takes P and Kt to B 4.

(g) Not Kt takes P because of Q to Q 2, threatening either Q to R 6 or Q takes Kt and so winning a piece. The text-move, however, is not good. Black should, instead, play 25. . . . Q to Q 2, *e.g.*, 26. Q to Q 2, Q to K sq; 27. Kt to Q 4, P to B 4; 28. Kt to B 5, Q to B sq (best) and he has some chance of making a defence.

(h) Threatening 28. Kt to B 5, B takes Kt (not P takes Kt because of Q to Kt 5 and mate next move); 29. P takes B (threatening R to K 7), R to Q 2 (if R to K sq, then Q to Kt 5); 30. Q to Kt 5, R to K Kt sq; 31. B to K 4 with a winning attack.

(i) Threatening Kt to B 5. Black has no satisfactory move.

(j) If 30. . . . Q R to K sq, then 31. P takes P, ch followed, if (1) 31. . . . P takes P, by 32. P to B 7 and wins, or, if (2) 31. . . . R takes P, by 32. R takes R (threatening Q takes P, ch followed by B to K 4, mate), R takes Q (if P to Q 4, then Q takes P, ch followed by R to R 8, ch and mate in two more moves); 33. B to K 4, ch, R to B 4; 34. B takes R, ch, K to R 3; 35. P to R 4 and wins.

(k) If R takes B, then R takes R (threatening R to K 7) and wins.

PROBLEM No. 4023

By CAPTAIN W. BYAS.*

WHITE (11 pieces): King at Q B sq, Queen at Q B 7, Rook at Q Kt 5, Bishops at Q 3 and K B 8, Knights at K 4 and K B 4, Pawns at K Kt 3, Q B 4, K Kt 5 and K R 5.

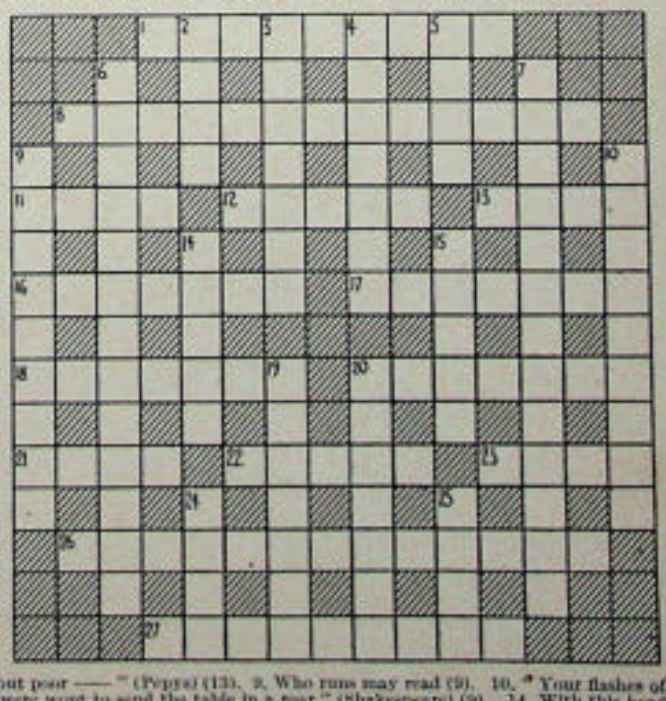
BLACK (11 pieces): King at K B 4, Queen at Q B 4, Rooks at Q 3 and Q R 4, Bishops at K B 2 and K R 5, Knight at Q sq, Pawns at Q B 3, Q 5, K Kt 5 and Q R 6.

White to play and mate in two moves.

* *Observer*, 1937.

SOLUTION OF PROBLEM No. 4022

1. Q to R 6, Any move; 2. Q, R, B, Kt or P mates.



THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 526

ACROSS.—1, "Alone in London seemed in itself an ——" (Brontë) (9). 8, This occupation in the field sounds rather like a warden's job (13). 11, There should be at least one in a 4 down (4). 12, "A deer —— out of a copse," Possibly just for a game (5). 13, Many a Saint has one (4). 16, Take a chance here (7). 17, Your member depends on him (7). 18, Hangers-on in the furnishing business (7). 20, This metal should be useful if white-washing (7). 21, A cox with this might look foolish in the boat (4). 22, A new one is often very annoying (5). 23, May be good, or bad (4). 26, A never mounted, but obviously tried to (13). 27, Something for the budding motorist to show (9).

DOWN.—2, This ship belongs to the nobility (5). 3, Not a weapon —— just an arm of the sea (7). 4, You may play here (7). 5, This in to enlist (4). 6, Drive ten times, and you are sure to be amusing (13). 7, "A great deal of company, but poor ——" (Pepys) (13). 9, Who runs may read (9). 10, "Your flashes of ——, that were wont to send the table in a roar" (Shakespeare) (9). 14, With this head one should be well balanced (5). 15, Five hundred Romans open a jumble sale (5). 19, You begin by receiving absolution and then wither up (7). 20, If grown-ups want to play with hoops, they might try this game (7). 24, An obsolete claw (4). 25, Seem to be widgeon (4).

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division 1. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Garden

Orchis for Naming.—The large specimen is *Orchis latifolia* (marsh orchis), common in marshes and moist meadows. The small specimen sent is probably Orchis Morio, but the flower was so decayed as to be difficult to identify.—*V. C., Mudeford.*

Making a Screen.—To the owner of a new house with a garden as yet undeveloped, the problem of adequate screening is of major importance. For instance, there may be an ugly building or view to block out, and on many new estates greater privacy can be assured by judicious screening. Even where trees and shrubs are used for the purpose, some temporary structure will be necessary until they reach the required height, and, in this case, a plain deal trellis can be fixed to the top of the existing fence. The materials

When sending plants to be named, send as many parts as possible—basal leaves, stem, flowers and fruit. Pack in moss, moistened paper, or damp leaves, in a stiff cardboard, tin or wooden box.

for this should be creosoted timbers of about 3in. by 2in. section, some 1in. by 1in. battens, nailed to the main framework to support the intersecting laths; and some plain builders' laths, such as are used for plaster work or tile hanging. These should be nailed together to form a 4in. square mesh, treated with creosote, and nailed or screwed to the battens. This type of trellis will last until the living screen is fully grown, and, until that time, quick-growing climbers such as *Polygonum Baldschuanicum*, *Ampelopsis Veitchii*, or rambler roses, will add to the beauty and effectiveness of it. For enclosing some particular part of the garden, such as the kitchen garden, a more permanent and stronger screen can be made by fixing a similar square mesh trellis between brick or stone pillars built in the same way as for the pergola.—*S. D., London.*

Kennel

Hard Mouth.—We do not know of any contrivance such as you mention as a cure for a hard mouth. We have heard of a stuffed rabbit skin being used in which a few short knitting needles had been fixed, but we cannot say if it was efficacious. Many men consider that a hard mouth is incurable. The bad habit may often be prevented if the dog, when learning, is persuaded to deliver smartly.—*R. J. P., Wakefield.*

House Training.—We have heard of several Labradors taken indoors straight out of large kennels and they have been models of cleanliness, never once misconducting themselves. Probably Mrs. Stoubouse Williams, Langford, Norton Fitzwarren, Taunton, would take the bitch for you and keep her in the house. If not, Mr. H. Scott, Meriden, Manor Road, Taunton, would be able to give you the address of someone not far away.—*G. S., Wimborne.*

Breeder of Lurchers.—We do not know of anyone who breeds lurchers. In all probability an advertisement in these columns would bring you plenty of offers. A whippet-greyhound cross is so unusual that we think you would have a difficulty in finding one. Would not a large whippet suit your purpose? They can usually be had cheaply. We have seen some so big that they could almost be mistaken for small greyhounds. We have no addresses in your immediate neighbourhood, but two close to London are Mrs. Floyd, 51, Aragon Road, Kingston-on-Thames, and Mr. B. H. Evans, 26, Ingleborough Drive, Purley, Surrey.—*R. L. N., Knightsbridge.*

Clumber with Bad Eyes.—As there are several ailments of the eyes, and you do not say which it is from which your Clumber suffers, we cannot be of much help to you. Feeding has nothing whatever to do with the trouble. For weeping eyes or such as show a discharge in the morning, bathing with boracic lotion will often effect a cure. Inflamed eyelids may be anointed with golden ointment.—*E. J., C., Devonshire.*

B.H.S. Infection of Dogs.—The letters B.H.S. have been widely adopted by veterinary surgeons for the very prevalent infection in dogs due to the betahæmolytic streptococcus. This disease, which some breeders have termed "kennel flu," attacks dogs of any age and of either sex, causing a variety of syndromes or combinations of symptoms. The form of the disease causing the greatest loss to the breeder is that in the bitch, resulting in sterility, abortion, or if she whelps she probably goes down with puerperal fever or whelping fever. Almost invariably her whelps die within the first three days of life, though one or two may survive into the second week. The death rate among infected bitches is low, not higher than 10 per cent.; but the loss of whelps or the sterility of the breeding bitches are the serious factors about this streptococcal infection.

Yet another form the disease takes is frequently confused with distemper; the infected puppy or adult goes down with fever, discharge at the eyes and nose, tonsilitis, swollen glands, and commonly diarrhœa develops with a brown discoloration of the mouth. This has led many dog owners to suspect the very reliable method of immunising against distemper by means of the virus vaccine, when, after their puppies have been protected against distemper, they go down with the distemper-like symptoms due to the streptococcal disease. Yet another common form of the disease causes rash and intense itching of the skin, which after some weeks leads to eczema-like patches on the back and quarters, or to a form of dermatitis which closely resembles mange.

A more intense form of the skin syndrome leads to bleeding spots or minute ulcers, which continually weep blood from almost every part of the skin surface, gums, lips, eyelids, penis or vulva; it is the so-called purpura hæmorrhagica form. When dogs, which are already suffering from inflamed bowels due to worms or coccidiosis, contract the streptococcal infection, many or all of them are likely to exhibit hysteria. Several recent outbreaks of so-called canine hysteria have been investigated and traced to this complication of the streptococcus germs and bowel worms. Incidentally, canine hysteria is a combination of symptoms, which may be due to different causes, e.g., the one mentioned already, poisoning from certain vegetable poisons which have been found in some meals and biscuits, inflammatory conditions of the brain, etc. It appears that the streptococcal infection is not commonly a fatal disease, but as in the human being it results in a large amount of chronic ill-health or disability. In other words, though its mortality rate is low, its morbidity rate is very high, unless the patient is diagnosed and appropriately treated in the earlier stages of the disease. This disease, probably the most prevalent infection among dogs, was unravelled by the veterinary profession of this country, who in the past two or three years have made steady progress in both curative and preventive measures. The disease is also under investigation now in other countries.

This rather long note has been prompted by our finding the disease in two new-born whelps, which had been sent to us for post-mortem examination. We have advised our correspondent to invite his veterinary surgeon to examine the bitch as she is the probable source of the infection in the whelps. Accurate diagnosis of the disease requires the assistance of laboratory workers, since the isolation of the beta hæmolytic streptococcus from swabs and other preparations from the bitch is necessary.—*F. D., Hants.*

Post-Mortem Examinations

Coccidiosis of Pheasant Chicks.—This contagious germ infection of the bowels appears on the rearing field usually in chicks of two to three weeks of age; occasional younger chicks die of the disease without showing any previous sign of ill-health. The more common symptoms of the disease in chicks are ruffled plumage, watery eyes, drooping wing, lameness and diarrhœa; the appetite is usually maintained until the chick is too weakened to search for its food. Chicks showing the above signs of disease should be destroyed, since they are not likely to benefit from treatment; moreover, they are a means of spreading the infection to adjacent coops.

The remaining chicks should be fed on a mash of which 20 per cent. is composed of powdered milk, or as an alternative 2 per cent. of molasses can be used. This treatment should be continued for three weeks; if the chicks scour badly the mash should be left off for a day or two. Also as a tonic to each gallon of drinking water 2oz. of sulphate of iron should be added.

Where a good supply of fresh milk is available an alternative treatment consists of replacing the drinking water by fresh whole milk given twice daily in cleaned drinking fountains, which should be placed on the shaded side of the coop. Since the disease is spread through contamination of the ground and food by the germ-containing droppings of infected birds the coops should be moved on to clean ground as often as possible, every day if practicable. The droppings and litter on the used patches of contaminated ground should be burned; a ready method of doing this is to burn twitch or straw over the used patch. At the close of the rearing season the field should be dressed with 2 tons of quicklime and 56lb. of copper sulphate per acre, and it should not be used again for rearing or for poultry for at least two years. The reason for this long period of rest from birds is that the germs of coccidiosis are capable of remaining alive on the ground for at least twelve to eighteen months. This season, as in former years, we have received reports of heavy losses on rearing fields from which specimens have been diagnosed as cases of coccidiosis, and we expect again to receive evidence of the disease being carried into coverts with poults. There is no doubting that coccidiosis is the greatest scourge of the rearing field, and we doubt if there will be much improvement so long as diseased broodies are used. The usual origin of the coccidiosis outbreak on the rearing field is one or more coccidiosis-infected broodies.

The trouble to the keeper is that his fowls may appear outwardly to be in good health, they may handle well, and yet they may be "carriers" of coccidiosis. By the term "carrier" is meant a bird showing no visible signs of ill-health though containing the germs within its bowels and excreting them in its droppings. In order to detect broodies infected with coccidiosis it is necessary to have samples of their droppings examined microscopically by an expert. Since the routine examination of broodies by an expert is not a practicable proposition for most rearers, we advocate the rearing of pheasant chicks in movable artificial brooders; there are very satisfactory models especially adapted for pheasant chicks on the market, and we have personal experience of their many advantages over the broody hen of doubtful origin and health. Other sources of the infection on the rearing field are diseased poultry in adjacent fields, and contaminated coops and utensils from the previous season's use. At the end of a season coops should be thoroughly scrubbed out with hot soda water and soft soap before storage.—*J. G. W., Carnarvon; J., Berks; R. S. T., Berks; H. T. C., Suffolk; J. A., Yorks; C. E., Berks; A. W., Hants; A. W. W., Berks; J. S., Fife.*

Shooting

Caps for French Brass Cases.—The ignition system you describe is known as the Gevelot or Amorce-ferme system, and is used extensively on the Continent, but mostly in France. From your description we should imagine that reference is made to the Gevelot cap with the open end, and the same cap the end of which is sealed with a celluloid disc. The celluloid disc usually denotes a rust-free cap which is very sensitive, and in all probability the celluloid is fitted to intercept in some way direct communication, and thereby avoid the great danger of explosion in bulk.—*R. A. H. C., Carnforth.*

Cartridge Test

Your 12-bore 3in. cartridges contained 35 grains of emerald powder, felt and card wads and 1¼oz. No. 6 shot. Velocity averaged 1,080ft. per second with recoil which would be heavy in a gun under 7¼lb. weight. Pressure was normal and patterns even, averaging 66% in a 30in. circle at 40yds. (choke barrel). These cartridges should prove fully effective at all normal ranges.—*J. P., Walton-on-Naze.*

Stable

Grass Disease.—The cause of grass disease is not known, and so far no treatment has been discovered, nor any means of prevention, save keeping horses off the pastures during the summer months.—*S. W. B. S., Pembrokeshire.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, JULY 29th

OTTERHOUNDS—ENGLAND

BORDER COUNTIES.—Saturday (July 22nd), Berwyn Station on Dee; M., Tyndrel Bridge on Tryweryn; W., Shiregrove Bridge on Camlad; S., Montgomery Bridge on Severn—10.30.

BUCKS.—Saturday (July 22nd), Compton Verney, Warwick—10.30.

CHERITON.—Saturday (July 22nd), Eggesford Station (up); DARTMOOR and CHERITON Joint Week: M., Teign Bridge, Kingsteignton (C); Tu., Granite Lodge, Stover (D.); W., Jews Bridge (for Bovey) (C.); Th., Chudleigh Bridge (D.); F., Christow (C.); S., Fingle Bridge (D.)—10.30.

COURTENAY TRACY.—Saturday (July 22nd), Durweston Bridge, near Blandford; Tu., In district; Th., King's Mill, Marnhull (Upper Stour)—10.30.

CROWHURST.—Wednesday (July 26th), Robertsbridge Flour Mills; S., Etchingham Village—10.30.

CULMSTOCK.—Saturday (July 22nd), Hambridge Mill, Curry Rivel (Culmstock); Tu., Roughmoor (River Tone); S., Birkleigh (R. Exe)—10.30.

DARTMOOR.—Cheriton-Dartmoor Joint Week (see Cheriton).

EASTERN COUNTIES.—Saturday (July 22nd), Hillborough Swan; Th., Braidon; S., Nacton Post Office, near Ipswich—10.30.

HAWKSTONE.—Saturday (July 22nd), Teify (water permitting).

WYE VALLEY.—Monday (July 24th), Stretton Grandison, near Ledbury; Th., British Lion, Fawley—10.30.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale), English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C. 4.

FARM WAGES

THE establishment of a minimum wage of £2 a week for farm labourers has been turned down by the Government. A number of Government supporters representing agricultural constituencies voted in favour of the motion (which came before the House in a curiously limited form), but it was rejected without difficulty.

A determined effort is being made to put agriculture in this country on its feet. Subsidies galore have appeared. Two pounds an acre is being paid for land ploughed up before October 31st, and this, at any rate, is a large stride in the right direction. But land cannot be farmed without men, no matter how "scientific" the methods used. And men continue to leave the land. Three hundred thousand have already done so, and the movement shows no signs of coming to a halt.

Men leave for two primary reasons—poor housing conditions and poor wages. The average wage of a farm labourer in this country is 34/9. Having paid the rent, this is reduced to an average of 28/- for a man and his family. It may be true—and in certain districts it is true—that the farm labourer's scale of living compares very favourably with that of the lower-paid urban worker. But money, hard cash, speaks louder than any intangible benefit. Twenty-eight shillings a week is not much for a man and his family. He can get a good deal more elsewhere, and he goes to get it.

One Government argument was that the increased rate would lead to unemployment. But there is already a shortage of farm labourers. It would seem, therefore, that the Government argument is, in fact, an admission—an admission that agriculture cannot afford to pay its labourers more; that, if the minimum wage were passed, farmers being unable to pay, would not employ; that not only men, but land would go out of work. If that is so, then indeed those Ministers of Agriculture now occupying easier posts can look back upon their tenure of office with shame. The hard things said about them were not, it would appear, unmerited.

In the meanwhile, the drift from the land will merely gather momentum as the months pass.

Land cannot be farmed without labour. If our land is to be brought back to its proper state of fertility, then men must be kept on the farms. And as fertility increases more men will be needed. As crisis mounts upon crisis, the value of British agriculture to the nation is more fully realised by the urban dweller, which is all to the good since agriculture is utterly dependent upon the urban vote. But surely we should not need crises to drive home the fact that our land—a heritage handed down to us on trust, a heritage for which men have died in thousands in the past—is of value to us?

At the moment increased pay for the agricultural worker is, we are told, impossible. The men will not stay at the wage given them, and they certainly will not come back for that wage. One day—perhaps one day soon—increased pay will be utterly essential. It may then be found that it is not easy to bring men back once they have found employment elsewhere.

OPEN AIR ART

IT is a remarkable thing that the people of this country, reputedly among the most air-loving in the world, refuse to do anything in the open air except pursue the acquirement of health. They are perfectly happy to be soaked to the skin and frozen to the marrow as long as exercise is the occasion of their discomfort. But social entertainment must be celebrated in artificial light and behind closed doors. Should a restaurant possess a natural window opening on to the open air and possibly a view of some gardens, heavy curtains are hung, so that one might just as well be eating in France. And should we seek to sip an apéritif in one of the few restaurants which have a pavement table in London, we are always apt to be the prey of some photographer with a "nose for news." Not that we lack outdoor entertainments completely. Glück's "The Pilgrims of Mecca" was recently performed in a charming garden in Essex, and if Mozart is presented indoors at Glyndebourne, we can, at all events, reflect, with Mr. Herbert Farjeon, that outside "the best-bred sheep are grazing." There is the Greek play at Bradfield, and the open-air theatre—with its emergency building—in Regent's Park. Yet these departures from custom always appear to remain just that, and have none of the natural atmosphere of open-air opera, which is presented in every important town in Italy. Perhaps our attitude is due to the ability of our fathers and grandfathers to enjoy day after day of uninterrupted sport, so that fresh air and sport became naturally associated. But the old tradition is lingering on with surprising strength in a new world.

GAMEFARMING BY RADIO

We expect almost anything of our radio and we are not disappointed. But it will come as a welcome surprise to know that we are going to hear something about how game is farmed. To urban dwellers to whom farming means just farming, this may seem something of an enigma; to shooting men it will provide an interesting tea-time item. Nobody knows more on this subject than Mr. J. Carlton Hunting, of the Gaybird Pheasant Farm, and nobody is better able to compress into a few words the story of this industry. At a time when there are not a few mistaken ideas on field sport, it is hoped that such a talk may also help to dissipate lurking prejudice. At all events, our readers will be well advised to listen in to Radio Normandy in the "Country Home Hour," at five o'clock on Monday, July 31st.

ROAD REPAIRS

A letter appeared recently in the *Daily Telegraph* drawing attention to the removal of tramlines on a portion of A1, the arterial road to the north. The operations are causing acute congestion and are likely to take a further four months before the normal flow of traffic can be restored. The writer cites another case of a bad block in North London, and then voices the hope that there is nothing similar to the east, south and west of the Metropolis, since, as he points out, at a time of crisis the flow of evacuation traffic would be very seriously impeded by these constrictions. His hopes, one fears, are ill-founded, for these badly-timed repairs are to be found week after week in all directions. We do not question the necessity for road repairs, indeed, it is high time they were carried out in a thorough manner everywhere; but why this lethargy? If those responsible felt the importance of the work, what now takes months could be accomplished in weeks. There is no lack of man-power to do the work—we still have over a million of unemployed—the materials are to hand, and with the rates and taxes we pay, there should be the necessary money. Roads are absolutely vital in emergency. Let us consider Germany's magnificent highway system, blush, and mobilise our resources.

GOLF AND STAMINA

James Bruen led the field in the opening qualifying rounds of the Open Championship at St. Andrews. He led again at the commencement of the Irish Open Championship. In each case he played superlative golf, better golf than any of the professionals, only to "crack" in the later stages. In each case he finished as first amateur and ahead of many famous professionals. At the top of his game he is the best amateur golfer in the world. On occasions he plays golf better than any man, amateur or professional, in the world. But he is not yet a Bobby Jones, for that wonderful player could produce superlative golf throughout a championship meeting. Sustained effort is one of the essentials of modern golf, and comes, it would seem, with age. It is the one factor lacking in James Bruen's make up. But he is yet very young, and time will prove him to be as good in every way as Bobby Jones, which means better than anyone else.

ANGLERS AND TOURNAMENTS

In the fisherman's world, nowadays, July has become the established month in which to hold those trials of prowess with rod and line which reflect the competitive spirit in an otherwise uncompetitive sport. Though fishermen will always differ on their true value to angling, there is no doubt that they have had the major share in producing the extraordinarily efficient rods and lines which have added so much, not only to the pleasure of a day's fishing, but ultimately to the size of the bag. But of recent years these gatherings have attracted even more attention from the artistry displayed by competition in the "accuracy" events. Though the enormous lengths cast may be useless for the capture of fish, the ability to drop fly or bait within a foot of a given point must be accounted of as great practical value on the river bank as it is on the ornamental water of a casting tournament.

POLO

Dusty dry earth bound by a cactus fence,
Eight horses foam-flecked in the strident sun
Thudding and racing, all their recompense
The antique joy of horse and rider, one.

The ball lies placid in its verdant bed,
The word unspoken or the note unsung;
Expressionless, till ball and stick are wed
And life exultant to the goal is flung.

The rotting flesh of horse and man are gone,
Through wind and sky by night their spirits chase;
But there's a sweet remembrance lingers on,
An afternoon of sport and lively grace.

K. E. HESLEY.

A COUNTRYMAN'S JOURNAL

NOTHING was left of the old village, but from its suburbanised site run a lane, a long one, leading to a farm, an undemonstrative lane leading from one century to another, to another dimension of existence. In the end it ran among the farmbuildings, shut off as completely from the pseudo-village as though I had turned some lucky corner in time, and had found myself in a new world, which was the comfortable, spacious, leisurely old world of real life. This was what I saw: a thatched and weather-boarded barn, a pond with willows looking into it like old dames dreaming before the open fireplace, a thatched cart-house sheltering muck-cart, governess cart and two waggons, a long low white millhouse with a litter of pigs asleep in the sun by the gate that led into the back premises, and through the gate the mill-stream narrowing from its broad meads and heavy-foliaged trees towards the house which straddled it, and on this side was a ripe black.

The farmer was the biggest surprise of all. He was spare, tall, well-knit, in breeches and leggings ("immaculate lounge suits," Mr. Street tells us, is the modern farmer's dress off his fields), and with a finely-cut, intellectual face. His ease of manner was not at all after the style of "Varmer Giles," that good-natured Caliban of urban dream, and his courtesy was what is called "old-world," presumably because none exists in the new. But the most remarkable thing about him was his merriment. He was a joyous man, his smile was warm, his laughter infectious, his whole air one of sovereign content. This was indeed the final touch of old-fashionedness. How could a farmer smile when he was without a combine-harvester, a cut-lift mower, a grass-dryer, and a mile of poultry forcibly fed from machines? Since he never smiles when he has them, smiles are necessarily obsolete. They are altogether Gothic. We moved off to inspect the old wooden wheel-less plough that was like a younger brother of my Gloucestershire long plough. But when I heard the farmer remark quite casually that he had another and similar plough which he kept for use, not show, my attention wandered from the plough to its owner.

Here was a farmer living nearby one of the tentacles of the Great Wen, already curled round his village, keeping a plough constructed on the mediæval model for potential use in his fields—surely one of the wonders of Britain. "Do you mean to tell me," I said, "that your arable fields are not all grassed?" The relic of Merrie England laughed his merry laugh. "Certainly not," said he. "My brother urged me to some years ago, the same as he did himself, but I would not. I said that I'd give up farming rather than I'd ever use a tractor, but when I found that I had to use the thing because I couldn't get any men, I didn't give up farming, but I kept the old plough by me for winter corn. In a wet November, the tractor makes the ground like a pavement, and it doesn't know how to treat it like the old plough. But I had to get the tractor, for I don't hold with turning England into a milk factory, and I've found it just as profitable to grow corn, only it's more trouble and you have to be a real farmer to grow it."

We went back towards the house, whose cobbled whitewashed flints looked as friendly and wise as the master. The "dillin" pig, the last of the litter, came running towards us, half the size of its sleeping brethren. How symbolic was that little pig! What is called business efficiency does not bother about the dillin pig. It is harnessed to the modern ideal of miles of mouths that open by reflex at the sound of the feeder, of a mechanical cow, and of pressing a button in an office for setting in motion an apparatus that will gather the fruits of the earth in half a day. But at Mill Farm the tradition of the husbandman tilling the living earth still survived like a loose end of the past. Cultivation was still a mode of life there, content and cheerfulness were still human desirables, and the unchanged country scene was still their natural setting. The men were gone, since it is no longer considered necessary for men to work in order that men may eat. A thoroughly old-fashioned notion, a putting the clock back. But when the mainspring breaks, if it has not broken already without business efficiency being a penny the wiser, there will be men again on Mill Farm, and the old plough will break the furrow once more.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a letter in a London daily:

"It may interest your readers to know that several years ago while at Bourke, N.S.W., I heard that sometimes it rains fishes. The spawn is said to be drawn up from lakes and rivers in waterspouts by a *willie willie* (the name given to small whirlwinds). The spawn germinates in the clouds and when full grown the fish fall to the ground."

Mr. Vanderbilt at the helm of Vim

MASTER OF HIS CRAFT

By A. M. KINNERSLEY SAUL

WHEN we heard that Mr. Harold Vanderbilt was bringing over his new 12-metre yacht Vim to compete in our 1939 regattas, we knew we were to see some unusually keen racing. What we did *not* know was that, with a new, untried craft racing in—to him—unknown waters, he would in a few weeks establish so complete a mastery over our finest yachts and our most skilful helmsmen.

We have become more or less resigned to our long list of failures to regain the cup which the schooner America carried off 88 years ago. Having won only five out of the 50 races which have since been sailed during the various challenges, another reverse does not cause surprise, although "hope springs eternal," and there is always the prospect of "bringing it off." But we have had no previous experience of this kind in our own waters, and it is proving a surprise.

What is the secret of Mr. Vanderbilt's astonishing success, not only in decisively defeating our last three challengers for the America's Cup—Shamrock V, Endeavour and Endeavour II; but in now repeating the performance over here against our crack "Twelves"—a class which has always been considered essentially British and one in which he has not previously raced?

It may, perhaps, be summed up in one word—Efficiency; efficiency in the design, rigging, canvassing, equipping and manning of his craft and efficiency in every aspect of racing her.

We have good reason to know that Mr. Vanderbilt's knowledge of yachts and yacht-racing is complete, and that it can hardly have been equalled anywhere; but we were quite unprepared to find that, on his first visit as a yachtsman, his knowledge of our winds and our peculiar tides is equally expert.

It is known that when Mr. Gerard Lambert was planning his season over here with Yankee in 1935, he arranged for careful observations, covering several months, to be made, and recorded of the weather and tidal conditions on our courses. Either Mr. Vanderbilt has followed the same procedure or he is making use of the same survey. Only once so far have local conditions appeared to bother him—at Torbay, when the precise weather which was referred to by the writer in the *Field* of June 3rd, was much in evidence.

Our American visitor has also a hearty dislike of any ambiguity or any argument about the result of a race. An example of this occurred during the first race of the season at Harwich, where history appeared to be about to repeat itself in a truly remarkable fashion. Vim, precisely as her famous flag-mate had done in the historic race round the Isle of Wight in 1851, sailed on the wrong side of a mark in the course.

It will, perhaps, be of interest to recall those earlier events before making any comparison. Two sets of official sailing directions were issued to the fifteen competing yachts, but while the first described the course as being "Round the Isle of Wight," the second had the additional note "outside the Nab" (then marked by a lightship). The result was that five British yachts kept on towards the Nab after passing Nomans, while America and the nine others hauled up immediately for Bembridge, thus shortening their course by some four miles. In spite of this and America's speed, she was headed by Volante (which had rounded the Nab), and but for the latter colliding with Freak there might have been no America's Cup.

America was first home, and in spite of one protest from a craft which had sailed the longer course, was awarded the Queen's Cup. The fact that she had, besides sailing the wrong course, broken a racing rule then in force by booming out her sails, was waived aside by the committee. There was no argument; that was to come later, and to increase in volume and intensity with each succeeding challenge. But it must never be forgotten that the American Cup Committee made an equally "bean geste" when they postponed the start of the race to allow Endeavour's mainsail to be properly set.

All this, and much beside, may have been in Mr. Vanderbilt's mind when he found himself on the wrong side of one of the marks at Harwich. The course he had taken, followed by Sir William Burton, would entail a longer distance being sailed, and it is doubtful whether any protest would have been made because of this and because it was his first race in strange surroundings and in what was at that time still a strange vessel. To put the matter beyond all doubt and to settle all arguments before they had a chance to arise, he sailed Vim wide of the finishing line.

But since then he has won race after race in masterly fashion. At Ramsgate Vim suffered her first real defeat after winning five races in succession. In boisterous weather, during which Ornsay was dismasted and Jenetta withdrew to tow her into port, Mr. Sopwith succeeded in luffing Vim wide of the course. In doing so, however, he was obliged to sacrifice his own chances of winning as Mr. Fairey's Evaine was able to reach straight through their lee for the mark, winning by 1min. 4sec. over Tomahawk, Vim taking third place 11sec. later. At Lymington he shared the fate of Trivia and Jenetta in running aground, but after losing three minutes almost triumphed, being beaten by only 20 seconds by Tomahawk.

Observers are agreed that the American vessel is not appreciably faster than ours, except in her uncanny ability in going to windward. It is her superb handling and the amazing smartness of her crew in shifting sail and carrying out the various evolutions which racing entails that the precious seconds which decide the result, are gained.

Mr. Vanderbilt makes no secret of his methods. On the contrary, in his engrossing *On the Wind's Highway*, he describes them with the same thoroughness and the same wealth of detail as he approaches the job itself.

There will no doubt be some who will say that this is making too much of a business of it. If so, there will be others and amongst them the writer, who will point out that the form of a ship, *any* ship, and however propelled, must be of far greater significance to a nation which owes its very existence to the efficiency of the vessels which fly its flag on the seven seas. The line which separates sport from commercial and warlike efficiency at sea is hardly perceptible.

One of our new "Twelves," Flica II, which has been evolved after similar tank tests to those which determined the lines of Vim and, by the courtesy of the Stephens Institute, in the same tank, has yet to find her form. At the time of writing she has been unfortunate. It is possible that Mr. Hugh Goodson (like Mr. Peter Scott of small boat fame, he is also an accomplished artist with a paint brush), will yet get the measure of our visitor from whom we have learnt and are still learning so much about yacht racing.

Whatever the result of the present season may be, it is certain that we shall recognise that Mr. Vanderbilt has put plenty of "Vim" into it, and that he himself is, in the widest possible sense, Master of His Craft.

COWES WEEK FAR FROM BEING OVERSHADOWED BY THE BIG YACHTS IS ALSO THE GREATEST OCCASION FOR NUMEROUS SMALL CLASSES

THE CHANGING FACE OF COWES

By K. ADLARD COLES and TERENCE STOKEN

IT is customary to regard Cowes not only as the epitome of the yachting season, but as the one place where, *par excellence*, the old regime holds out longest and strongest: the last bulwark, still stoutly standing, of conservative tradition in an intrinsically conservative sport—yachting.

Head-shakings there may be, amongst the surviving stalwarts, and laments that Cowes is "not what it was," so that if one listens without mental reservations one gets an impression that in those far-away days, two or three decades ago, sails shone whiter in the sun, yachts were driven harder, and the terrific tussles of tremendous craft vied with the inspiring splendour kept by "The Squadron" and its glittering fleet to make Royal Cowes a spectacle that, to have lived, one must have seen.

But although pre-War Cowes, as the picture of it remains in the fading memories of elder yachtsmen, may dim by comparison the lustre of Cowes to-day, we still tend to think of Cowes as carrying on the old tradition; handicapped by changing times and altered values, and the competitive claims of other, newer sports, no doubt—but with its roots far down in Time.

Yet Cowes—calm, conservative, perpetual Cowes—has played a trick on us, a trick, that is, on those of us who yearn after the vanished glories of the past, and would see them revived if they could. Unnoticed, because we have conditioned ourselves to regard it as unchanging, at least, as less changing than any other institution in the yachting season, Cowes has been renewing itself. Bit by bit, it has cast off almost every link with the past, until to-day, how much of that past remains? Almost nothing, yet when Cowes Week begins on July 29th—behold, it is a record year! In round figures, over 400 yachts will be actively engaged—that is, actively taking part in organised racing. What the total number of craft present on the Solent station during Cowes Week will be it is impossible to compute.

Let us look a little closer at the constitution of present-day Cowes, and see how that almost unbelievable figure comes to pass. First, we will glance back, to get a point of departure and a basis from which to reckon; back to the days when the King's cutter was the premier yacht on the station, and the century was a few years old. There were giants in those days: the schooner Meteor, owned by the German Emperor, her main-mast near amidships and her colossal main boom, longer than a 12-metre's mast, and thicker than a man. Shamrock III, too, preparing to challenge for "The Cup," with her towering canvas, over 15,000 sq. ft. of it. Satanita, a yawl of 112 tons, was hardly past her prime; and Rainbow, another great schooner of 270 tons, 116ft. waterline, and 110 tons of lead on her keel.

Spectator craft at Cowes were impressive in those days, too. Sunbeam, of course, was there, Lord Brassey's lovely topsail schooner; and the 1,490-ton ship-rigged Valhalla of the Earl of Crawford. Those two raced it across the Atlantic, in 1905, Sunbeam's best day's run being 299 miles under sail.

It was craft like that which made Cowes a name to conjure with—if we may coin a phrase. And because they are no longer with us—and their like has not been seen again—it is natural to suppose that the present has little with which to compare the past, and to overlook that comparison with the past is really beside the point.

One thing in which modern Cowes is incomparably rich is in the One-design classes which cluster so thickly in the Solent; all along the Island shore, from Bembridge, in the far east, to Yarmouth in the west, is a long succession of sailing and yacht clubs,

SIR RICHARD WILLIAMS-BULKELEY, BART.
Commodore of the Royal Yacht Squadron, of which he has been a member since 1884

while on the opposite side, Portsmouth and Southsea, the Hamble and Southampton Water, Beaulieu and Lymington contribute their quota. Most of these classes are centralised under the head of the Solent Classes Racing Association; few of them are more than ten or fifteen years old, as classes; some of them very much younger. Each has its own especial character, and is actively building up a tradition for itself, and they alone would make one visiting the locality after an absence of, say, 25 years, conscious of a profound change.

The doyens of the Solent classes are the Redwings. They date from 1896 as a class, but they were redesigned (by Mr. C. E. Nicholson, their original designer) from truck to keelson for the 1938 season, so that, except for their characteristic "turkey-red" sails, they bear little resemblance to the old class. The only other pre-War class belonging to the S.C.R.A. is the Yarmouth One-Design, a 21ft. over-all boat dating from 1911, and coming, as its name implies, from the other extreme of the island.

The other members of the Association are as follows:

The "X" Class.—These are popular little boats, 17ft. 9in. water-line, and have a wide following. Beside the Solent division, which have their headquarters at the Royal Motor Yacht Club, at Hythe, on Southampton Water, there are three other divisions, one at Itchenor, on Chichester Harbour; another at Parkstone, Poole; and a third on the Hamble.

The Seaview Mermaid Class.—There are a dozen boats all built by the neighbouring firm of Woodnutt and carrying 257 sq. ft. of sail on a 24½ft. over-all length. They were begun soon after the War, in 1922.

The Solent Sunbeams.—These are, justly, a very favourite class, with very graceful hulls, and very fast, with a sail area of 300 sq. ft. There is a second division of Sunbeams, at Itchenor, with 27 boats all told. Soon after they were first started, in 1923, several boats were transported as far afield as Falmouth, where the newcomer is surprised to find Solent Sunbeams racing as keenly as in their home waters.

The West Solent Restricted.—These are somewhat bigger boats, with full accommodation, and 34ft. 5in. in over-all length, with a sail area of 570 sq. ft. They hail from Lymington, where there is a fleet of a dozen; there is also another division at Burnham, and one at Torbay.

The "Q" Class.—This class, hailing from the Hamble, are all old 6-metres, very popular both as a racing class *per se* and as a training ground for helmsmen for the more exacting 6-metre racing.

The Teal Class.—This is a very new class, now in its third season, and the boats, though out-and-out racers in appearance, are also good seagoing cruisers. They frequently enter in such events as the Round-the-Island Race, in which Content, one of the class was second this year.

Besides these classes there are numerous small classes of the dinghy type, or analogous thereto: The Island dinghies, the Victory class, the Centre-board Racing Club dinghies, the Lymington Scows, and so on.

In the days of "bygone Cowes" there was far less opportunity for the not-too-ambitious racing man to express himself in the variety of choices which these classes offer; all distinct and clearly defined. In pre-War days the Cowes classes were a rather heterogeneous collection of 2½-raters, 2-raters, 5-raters, 36-footers, 24-footers, 1-raters, and the like, with a few classified-by-tonnage classes; hulls and rigs differed widely, and there was little resembling a One-design class as we know it to-day.

We must not overlook the 30 Square Metres, which arrived on the Solent only last year, and at once took a firm hold. The skerry cruisers, as they are also called, are boats of Swedish origin, fast and modern in rig, rivalling in fact the 6-metres in speed; besides which they are well able to take care of themselves "off-shore."

The premier class in the British Isles, and therefore in the Solent, is of course the 12-metre. Though smaller than "the big yachts," as people used to call the "J" class when they held sway, they are really quite big enough for a single-mast

LEFT: SEA WIND, A NEW BOAT DESIGNED BY HER OWNER, MR. DUCKER. *RIGHT*: A SPOT OF TROUBLE FOR MAID OF KENT IN THE COBB AND SUNK RACE FOR THE HOUGHTON CUP INTERESTS THE CREWS OF ROYAL BURNHAM ONE-DESIGNS. MR. S. HERRING'S LORA WAS THE WINNER

Bermudian boat that does not stay on her moorings when the breeze begins to pipe. This year, with four new British boats and the American visitor Vim, the class makes an impressive enough showing, and with the enormous genoas and spinnakers in use, there is quite enough "swelling sail" about a 12-metre race with the boats on a reach or running before it, to satisfy those who like to see—and who doesn't?—the muslin on display.

The Solent has always shared with the Clyde the honour of being the home of a grand fleet of 8- and 6-metres, and this year both classes are very well represented. There are fourteen 6-metres in commission, more than there have ever been; while with two new Eights from Sweden (Christina and Iskareen) and Wye brought from the Clyde, they too are at full strength.

We have not yet mentioned the handicap classes. Last year the Y.R.A. handicap vessels were out in a strength unknown since the War, but those who thought that in the handicappers the "pre-War splendours" were destined to be revived, have been disappointed this year. Still there are newcomers in this field, such as Cowes in the past never knew: the ocean racing fleet.

The typical ocean racer is an entirely new entity, evolved in the last few years; and she it is who, in the future, will become one of the most characteristic features of Cowes Week, sharing the honours and the limelight with the International Metre classes. This year, most of the out-and-outers in the ocean racing fleet, will be tuning up for the Fastnet when Cowes Week is under way, the off-shore classic being due to start on August 5th; but, as it starts from Spithead, they will all assemble there, and as this year the ocean racing programme has been so constructed that two other off-shore races will finish at Cowes on August 2nd, almost every R.O.R.C. vessel of note will be seen there at one time and another during the Week. These, with the Twelves, are the modern giants; not giants so much in size, compared to those of past days, but of full stature in deeds.

The Fastnet entries this season make a most interesting field, with several nationalities represented, and no doubt many of them will be seen out, having a final "limber up" before the great race, in the special race to the Poole Bar buoy and back to Cowes, which takes place on August 1st and is to be run under full Fastnet conditions. They make an interesting fleet: Latifa, the fine yawl belonging to the R.O.R.C. Commodore; Tai-mo-Shan, the British Admiralty yacht; the two "soldiers' boats," Ilex and Rose, belonging to the Royal Engineer and Royal Artillery Yacht Clubs respectively; Golden Dragon, from Hong-Kong; Zeerand, from Holland, already a Fastnet victor two years ago; and newcomers, too, amongst them, it is hoped, Lara, a big new yawl built at Lowestoft, and hastening to complete in time.

With the 350 yachts which belong to the Solent Classes Racing Association, together with the International Metre fleets, the ocean racers and the Y.R.A. handicap boats, we begin to see how that round figure of 400 is arrived at; it is a conservative estimate, if anything!

And we must not forget the International dinghies. For the first time in history a six-day programme of racing in the 14ft. International dinghy class has just been concluded at Cowes—over, it is true, before the Week itself begins, but organised by the Island Sailing Club of Cowes, and culminating in one of the dinghy classics of the year, the Prince of Wales's Cup. No such ambitious programme for the 14-footers has ever been organised in Solent waters before, and it, too, is a sign of the times; Cowes has changed, changed profoundly and is still changing—but it is adding to itself, adding interest, variety and splendour, of a different sort but none the less real. Cowes no longer reflects the past, save in her stones and quaysides; she is very much of the present—and of the future.

CONTROL OF GREYHOUND RACING

By DALE BOURN

IT has been already shown how greyhound racing through the Betting and Lotteries Act of 1934 became legalised by Parliament and the laws laid down for its management. The internal or domestic management of the sport, however, was not catered for by the Act, and the control of the actual racing and the regularisation of that control was left to those interested in the sport.

It was realised at the outset that some national body, independent of any financial interest in the sport, should be formed to protect the interests of the public by drawing up a code of rules and given authority to enforce these rules. In other words, even as there is a Jockey Club in horse racing, so there should be some such club acting in like capacity in greyhound racing.

As early as August, 1927, that pioneer of greyhound racing, the managing director of the Greyhound Racing Association, General A. C. Critchley, C.M.G., D.S.O., invited a number of prominent gentlemen, well known in the sporting world, to serve on a racing committee. At the White City a meeting was held presided over by Sir William Gentle, then chairman of the G.R.A., Ltd., and at which the Earl of Westmoreland, Lord Chesham and Captain Sir Humphrey de Trafford consented to act. This was the first step in the right direction, but their control was, by the nature of the committee's creation, limited only to those courses owned by the G.R.A., although numerous other courses outside their control were springing up all over the country.

Lord Askwith, in his memorandum, submitted to the Royal Commission on Betting and Lotteries, stated that the more responsible among the promoters of greyhound racing and the managements of the leading courses realised that neither its growth nor its operations should be allowed to continue uncontrolled, and that, in the public interest, a national governing body was a necessity. Accordingly, on December 10th, 1927, a meeting was called at Wembley Stadium, presided over by Lord Mottistone, of the directors of greyhound racing enterprises all over the country. That meeting appointed a committee under the chairmanship of the Earl of Kilmorey, whose purpose was to form a National Greyhound Racing Club composed of sportsmen of good position who had no financial interest in any greyhound racing promotion. The club actually came into being on January 1st, 1928, the day of its first meeting of members. So another landmark appeared in the history of greyhound racing. Through the efforts of the various managements and the prompt support of the press, a number of prominent men were got together as the first members of the club. Amongst these, Captain E. A. V. Stanley gave untiring and unselfish energy and time to the club's formation and became secretary and one of the original stewards. The earliest membership of the club included such well-known names as those of Professor Sir Frederick Hobday, C.M.G. (whose recent death was a great blow to the veterinary profession), Sir Harry Brittain, K.B.E., C.M.G., M.P., Sir Woodman Burbidge and Lord Inverclyde. The various managements of the courses concerned immediately recognised the club's authority over them and have loyally supported it ever since.

The first business of the club was to draw up a code of rules for racing—not an easy task and one to which unlimited time and energy had to be given. Also it was one of their primary functions to issue licences for approved racecourses. The difference between "licensed" and "unlicensed" racecourses has to be explained. "Licensed" in the greyhound sense does not carry the same meaning as "licensed" when referring to an hotel, motor-car, dog or gun. In the latter cases, the licences are issued by the State operating through its various systems of magistrates and local county or borough councils. In these cases, the licences are of Government origin and have definite legal status. The licence of a "licensed" greyhound track is not granted by the State, but by the N.G.R.C., which is not part of the machinery of government. It was established by the voluntary action on the part of those engaged in greyhound racing promotion and its authority recognised.

These N.G.R.C. licences may well be compared to those issued by the British Board of Film Censors—in fact, they are issued as a safeguard from *within* the industry and not from *without* by force of law. In granting these licences, the N.G.R.C. take into account many factors, such as the financial stability and integrity of the promoters, whether the course is needed in the district it is proposed to erect it or whether that district is already well-enough fed, transport facilities, &c. Many licences are refused on various grounds, but the promoters carry on in some cases and run the courses just the same, thus becoming "unlicensed" courses. These "unlicensed" courses are perfectly legal and are governed by the Act of 1934 in the same way as a licensed track. However, the rules and regulations of the N.G.R.C. are very strict, and the stewards have always had very firm views on the subject of courses not approved by the N.G.R.C. The rules of racing lay down penalties that may be imposed on persons who, while being registered with the N.G.R.C., race their greyhounds on such courses or in any way support them.

Thus it is that the running of certain "unlicensed" courses may not bear too close a scrutiny. It is a fact that in any cases of frauds or malpractices that are reported in the newspapers, it is pointed out by the court that the course was "unlicensed."

The N.G.R.C., in fact, acts as trustee for the public, and the good name of greyhound racing, and through their stewards they guard against any form of malpractice and any perpetrator or attempted perpetration of such is promptly and severely dealt with by instant "warning off." In the case of "unlicensed" tracks, there is no such independent national body to supervise or guard the public interest.

As the functions of the N.G.R.C. are to administer matters of racing, so another body, the National Greyhound Racing Society was formed to deal with administrative matters. As the purpose of the club is to safeguard the public in matters of racing, so the society has the protection of the public against unscrupulous or inexperienced promoters as well as the regularisation and control of the administrative side of greyhound racing as its aim.

Whereas the members and stewards of the club by reason of their duties have no financial interest in any racing concern (except in the case of certain stipendiary stewards), the membership of the society on the other hand is composed of owners and directors of racecourses as representing the financial interests in the sport. So we have the club and the society, although each is operating in a different sphere, having the mutual object of safeguarding the public and maintaining its confidence by the enforcement of rigid rules both in racing and administration.

The club has many and diverse duties. As well as the drawing up of rules and regulations (132 of which are contained in its issued book) and the enforcement by their stewards of same, they also register all greyhounds racing on approved courses and take all steps possible for checking the correct identity of such greyhounds. To this end, the club has established a very elaborate and thorough record of all their registered greyhounds. Every greyhound has to possess a certificate of the National Coursing Club or the Irish Coursing Club. Before it is allowed to race it must be registered with the club. For each greyhound the club issue an identity book. This "passport" contains the fullest possible details of the animal as to its measurements, markings, colour of coat, eyes, toe nails, toes, &c., as well as a full record of all its performances in trials and races, and of all owners through whose hands it passes.

The club also investigates all reports of improper practices and breaches of the rules by owners, trainers, officials and others, and takes disciplinary action against those found guilty, either by "warning off" or fining. Licences for all courses and all officials engaged on courses as well as trainers are issued by the club.

In 1938, a Greyhound Racing Board of Control was formed consisting of six members of the club and six of the society, to consider all applications for licences for courses and also to consider the passing of new rules.

Each week, on Friday, the club publishes its official journal or record, the *National Greyhound Racing Calendar*, which contains the official announcements of the stewards and a list of every greyhound and every official registered or licensed. This journal also contains all "warning-off" notices, and such other details as the changes of greyhounds' names, forfeit list, appointed days of racing, deaths and all other information useful to director, owner, trainer and veterinary surgeon.

All technical problems in connection with track equipment and operation, health and veterinary problems and questions of policy are dealt with at each fortnightly meeting of the stewards, who also act as a court of inquiry into all breaches of the rules and allegations of improper practices.

There are 50 members of the club who appoint their stewards and whose work is entirely voluntary except for stipendiary stewards who are allotted areas in England, Scotland and Wales, and whose job it is to inspect from time to time the various tracks in their respective areas, reporting to the club all irregularities or complaints as well as giving help and advice to racing managers and trainers.

There are approximately 68,000 greyhounds and 35,000 owners registered with the club to-day and 63 racecourses are now licensed and controlled by them.

The Greyhound Racing Totalisator Control Board deals with all questions appertaining to the tote.

The fact that the public confidence and interest in greyhound racing has reached such immense proportions and that the industry has become so well established and stabilised, is mainly due to this club whose task is so invidious and which, in only thirteen years, has attained such sound results, as well as to the integrity, the sportsmanship and the loyalty of the managements of all courses that race under its rules.

"THE HEN PERCHED ON A SIMILAR BRANCH NOT FAR AWAY"

"A LOVELY LITTLE LADY, CLOTHED IN BUFF AND BROWN, STILL BROODED THE YOUNGSTERS"

WATCHING WHINCHATS

By GUY B. FARRAR

ON a lovely day at the beginning of June, I was walking through a strip of marshland in an unfrequented Herefordshire valley. Cattle browsing in the rushy pasture or standing knee-deep in a sluggish stream that wended its sinuous course through the water meadows, cast unfriendly glances at intruders in this haunt of ancient peace. The hedges, white with May blossom, scented the still air, snipe drummed overhead, a thin grey wisp of smoke rose from a distant farmhouse chimney, rows of pollard willows intersected the marshland, giving character to the landscape. Here, indeed, was an unspoilt corner of England, a rural backwater untroubled by the industrial stream of modern progress that turns to hideousness everything it touches.

I was engaged in examining the pollard willows, hoping to discover the nest of a little owl, when suddenly I heard a familiar call—*uttic-uttic-uttic*—and there, clinging to a dwarf willow spray within a few yards of where I stood, was a cock whinchat, his scolding cry echoed by the hen perched on a similar branch not far away.

Field glasses and patience at last revealed the nest cunningly concealed at the foot of a dwarf willow bush, its five blue-green eggs just chipping in their shallow grass cup lined with a little horsehair. A week later I returned armed with all the impedimenta of bird photography to spend a long summer day watching the domestic life of these joyous little birds.

Joyous is the right word to describe them, for they seemed so proud and happy in the possession of their newly hatched family, and so ready to tend their every want.

The hen, a lovely little lady clothed in buff and brown, still brooded the youngsters when she was not engaged in bringing food for those five hungry mouths. Meal times occurred at intervals of a few minutes throughout the day, punctuated by rest periods lasting as long as a quarter-of-an-hour. Between 10 a.m. and noon the young were fed 23 times, mostly on larvæ of various sorts.

Taking this period as being typical of the rest of the day one can realise the enormous amount of food consumed by five young whinchats.

In the late afternoon insects formed the staple diet. On one occasion the hen appeared with a large brown moth in her beak. Its capture evidently afforded her the greatest satisfaction, because she showed the trophy to the cock before taking it to the nest where it was dismembered and given to the young.

Twice I saw the cock feeding the hen on the nest and a very pretty sight it was to see him offering her a crane fly, which she, on her part, accepted with such obvious gratitude. On the second occasion she drew aside to allow him to feed the chicks, but he disregarded the gesture, holding out his offering for her acceptance.

The call of the whinchat is a softer, less metallic echo of that of the stonechat, the ticking being repeated continuously as long as either bird was alarmed. They loved to perch on the branches of the dwarf willow bush that sheltered their home and always returned to this vantage point before and after feeding the young.

THE WHITE PATCH ON THE PRIMARIES IS THE SIGN OF MATURITY IN MALE WHINCHATS

During the whole of my period of observation I never once saw a sign of anger or quarrelling, which is more than one can say for many feathered families. When evening came I left the whinchats with great regret; no bird-lover could fail to be charmed by such beautiful and happy little birds.

"CLINGING TO A DWARF WILLOW SPRAY WITHIN A FEW YARDS OF WHERE I STOOD WAS A COCK WHINCHAT"

THE COCK WHINCHAT AT THE NEST. TWICE I SAW HIM FEEDING THE HEN

LETTERS TO YOUNG FLY FISHERS

VI.—Fishing the Stream

MY DEAR BOB,—I do not know B——, though I think I must have passed through the village. My impression is that it was some little distance from the water, but if the house your people have taken for August has fishing close by it is probably half-a-mile or so from the village. Anyhow, the river must be the Bray. You are in luck, for the Bray is a most attractive stream. It is a tributary of the Taw, and has a run of sea trout. Should you get a spate you may get a chance of sea trout as well as brown trout. Whether they run as high as B—— I do not know, but one of the hotels at South Molton, which is not very far away, has some water on the Mole—the Bray's principal tributary—and you could get a day or two on that for a few shillings, I expect.

I am afraid you will find the three-quarters of a mile attached to the house is not quite as much as it sounds. If it were a chalk stream you could fish it every day without exhausting its possibilities, but it is surprising how little time it takes to fish up three-quarters of a mile of a Devonshire stream. However, you are quite well placed for other possibilities. The hotel at North Molton has a good stretch of water. Then if you can get the use of the car periodically, you can run across the moor to Withypool, say, where you can get a day ticket for the Royal Oak water. This takes you over the watershed of the Exe on to the tributary Barle. A little lower towards Dulverton there is an attractive piece of water, particularly, I think, for anyone learning to fish, at Tarr Steps, for which tickets used to be obtainable at Tarr Farm.

The time when the Exmoor hotels are full is generally the stag-hunting season, which begins on August 12th, so it is quite possible there may be few fishing guests in which case it is often possible for non-residents to obtain a day permit. It is always worth enquiring. In all these streams you will need to wade, except when a spate is coming down, and the water too deep, but I do not advise you to invest in regular waders; you will have grown out of them before they are worn out, and that makes them costly. A pair of wading trousers, with brogues and socks will leave very little change out of £3. Get a pair of rubber thigh boots, which can be had for a pound or thereabouts; not knee boots, or you will be forever getting them full of water although you believe yourself to be keeping most carefully to shallow places. The objection to rubber boots is that they are very buoyant in the water, so you must be careful not to go into water more than just up to your knees; otherwise you will slip and get a ducking. Stones on the bottom are always covered with green slime (alga, the scientists call it—flies feed on it), and are uncommonly slippery. If tactfully approached, your father may be willing to regard rubber boots not as fishing equipment, but as clothes, to be paid for from the family exchequer.

Now as to the fishing itself. You cast your flies *upstream*. You will probably be tempted to cast them downstream because the stream itself will then straighten out your line and make things easier. Resist the temptation. You can, it is true, catch fish in this way on occasion, but for every fish you rise you will scare a dozen others, and in the long run it does not pay. You will simply spoil the water for other people as well as for yourself. Fish lie with their heads upstream, so in casting upstream you are behind them, and they are much less likely to see you. It is this question of keeping out of sight which is the really important one in fly fishing. Fish can see very clearly in water, but not very clearly out of it. This is due to the refraction of light. You have probably noticed that if you push an oar into the water it appears to be bent suddenly at the point where the surface comes. This is because a ray of light going into or being refracted out of the water is bent at the point where it passes through the surface. Hence a trout in the water can see things very well over its head, on a high bank, let us say, where the light is bent very little; but close down to the water, where the light is bent a great deal, its vision is very much foreshortened and blurred. When you are wading there is much less of you showing above the surface than there would be on the bank, so it helps you very materially to keep out of sight of the fish.

The second point to note is to cast as short a line as possible, so that only the flies and the gut close to them are on the water. This is really also closely connected with a fish's eyesight. The trout is feeding on flies which are drifting down on the surface, and if you look at the stream carefully, you will see that the surface consists of all kinds of cross currents, little whorls and eddies here, a sudden wave there where there is some obstruction on the bottom. There is scarcely a length of two yards anywhere with the current running smoothly, in one direction and at one speed. Consequently, if you have 6yds. or 7yds. of line floating on the water, the current at one end will be pulling it in one direction and in a different direction at the other: so the flies will be pulled out of their natural floating course and as natural flies do not behave like this, the deception will be revealed.

I want to urge you most particularly to study this attitude of a fish towards an artificial fly, because I believe that more than half the battle consists in not rousing the trout's suspicion. A bad cast or a fly that drags may not actually scare a fish away from its feeding ground, but it makes it suspicious, and your chance of catching it is reduced by about 90 per cent. right away. And this, if you come to think of it, is not surprising, for a fish can always see your gut if it looks closely. I suppose you are asking yourself why, in this case, it ever takes an artificial fly at all. But it is quite possible to be able to see something, and still take no notice of it. Have you not, on occasion, been walking down a country lane in the evening and looking vaguely at a field bordering a wood: you have been looking at it, in fact, for the last quarter-of-a-mile, and the strip of field is quite empty. Then a movement catches your eye, and you see there is a rabbit there: you look closer and see another and another: now you can count twenty. They have been there all the time, though if one had not moved you would have passed by, believing the field to be empty. It is much the same with a trout. As long as it is looking out for flies to eat, your own will pass muster as long as they behave naturally: but the moment they behave suspiciously the trout is on the look out, and examines every fly carefully to see that it is what it purports to be. So cast a short line, and do not let your flies float too far on the water; let them travel a couple of yards, then pick them off and cast again.

Fish do not lie just anywhere in a water. They take up positions where they can get food without too much exertion. A trout's problem is this: the swifter the current, the more food passes a given point in a minute, and the more flies it can catch. But it cannot lie actually in a swift current, for that would be too exhausting—you cannot eat a satisfactory meal while you are running to catch a bus. So it generally picks out a place on the bottom where there is a small depression so that the current passes over its head, but the water in which it is lying is comparatively still. A stone on the bottom has much the same effect: there is a small eddy both in front of it and behind it. Then, of course, there are places in a stream where food drifts more readily than in others. When you get into the water, look at the stream. You may see a run under a bank or alongside a pad of floating weed, perhaps, and you will notice that leaves and other small debris seem to drift along there in a stream much more than they do elsewhere. Where leaves float, flies will float.

Another very favourite place for trout is at the downstream end of a deep pool, just on the lip where the water shallows. Here they have a good view of food floating across the pool, and are also in a good position to dash for safety into its depths if anything disturbs them. Any kind of little runnel that will bring food in from a land drain is worth exploiting, and any place where grasses or bushes overhang the water and grubs are liable to fall in.

As a sort of standard cast, use the orange quill as a dropper, and a gold-ribbed hare's ear as a "stretcher" (tail fly). March brown can be exchanged for the orange quill on occasion or used in the evening by itself (taking off the dropper) to represent a small sedge. The black spider is best used by itself, for still reaches where spasmodic rises can be seen.

Whenever you rise or catch a fish note carefully the place where it rose. Later, when you move forward, examine the spot carefully. You will learn more about likely places for trout in this way than you will in any other; and try to memorise what the place looked like from afar. Do not try to cast and move at the same time. Pull a yard or so of line in through the rings; let your cast drift behind you; then step forward a few yards very carefully, and study the water before you start casting again.

Your affectionate Uncle,
HARVEY.

A. A. A.—Trout in feeding position. B.—Trout in resting position. This stone is too big for the fish to see food coming down properly. It rests behind it and goes in front for feeding; both immediately in front and immediately behind stones is easy water. Note that the wave on the surface shows a foot or two downstream of the true position of the stone

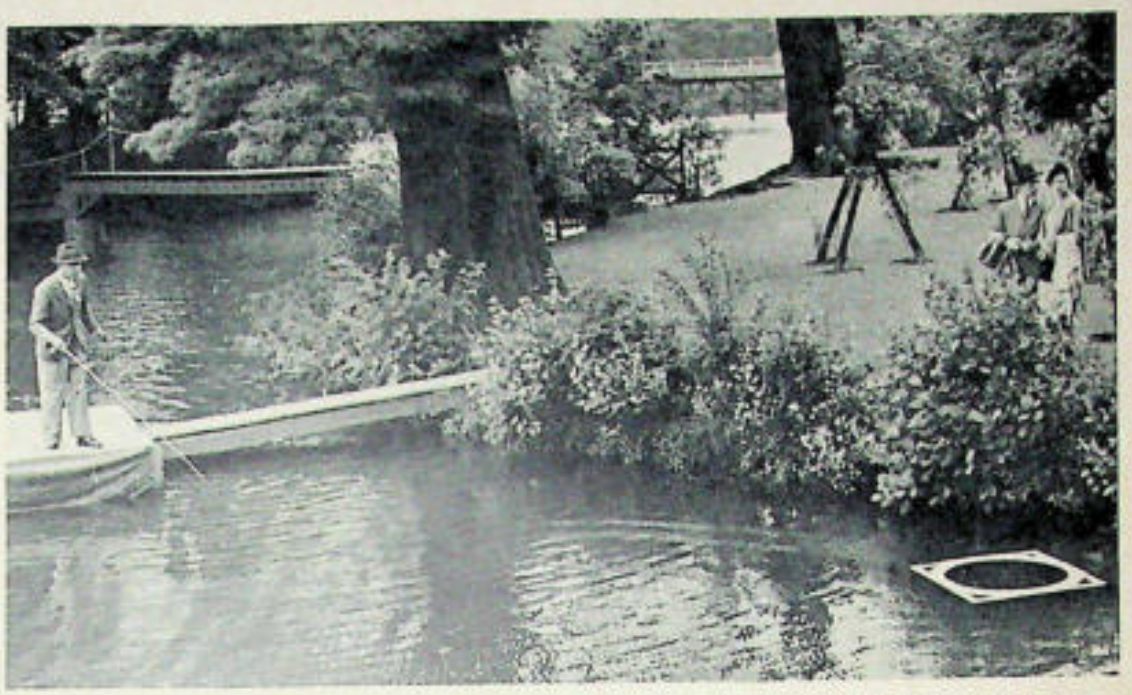
CASTING AS A FINE ART

WEATHER conditions were not very kind to competitors at the British Casting Association's Tournament at Ranelagh, last Saturday. Our irritating climate was in its most depressing mood, and though early in the day the wind was not too bad, it became decidedly troublesome in the afternoon.

Interest in the meeting was enhanced by the presence of the champion French lady caster, Mlle. A. M. Jeanteur, who incidentally created a new British Ladies' Record for salmon fly distance with a cast of 47yds. 2ft. It was made, however, in the open salmon-fly distance event, and did not secure her a place in the result, since the competition was won by Captain T. L. Edwards with a cast of 54yds. 2ft., thus creating a new British record for the event. Mr. L. T. Sweet, was second with a cast of 50yds. 1ft.

Several other new casting records were created. Captain T. L. Edwards cast, 106yds. 2ft. 9in., in the ½oz. bait-casting distance event is a remarkable cast for so light a bait. Mr. P. E. Creusevaut broke his existing record in the 1oz. bait-casting distance competition with 125yds. 5in.

Two other records were created in the bait-casting section: Mr. A. J. Provis reached 6yds. 1ft. 7in. for the amateurs with a ½oz. bait; and Mr. W. G. Greenaway cast a couple of yards farther for professionals in the same event, winning it with a cast of 62yds. 1ft. 9in.



Trout-fly casting was less dramatic this year than the salmon-fly event, probably because the platform was more exposed to the wind, and left-hand casters, such as Mlle. Janteur, were rather bothered by the tree which overhung the approach to the platform. Herr Arne J. Schultz made a British record cast of 44yds. in the distance event, though he failed to win the competition, which went to Mr. J. E. May.

The accuracy events, which give a real chance to fishermen to show their skill, always attract the spectators. This year the rings into which dry-fly fishermen had to place their fly were arranged to test the judgment of the most experienced, for three of them faced the wind and two were disposed under a tree. Wet-fly fishermen found rather better conditions.

Among professional casters, Mr. T. L. Edwards scored 44 points, with Mr. A. Godart second with 39. Rather surprisingly, perhaps, amateur casters did not score nearly so heavily as the professionals, Mr. N. V. Keeble doing best with 31 points; Mr. Schultz was only one point behind him, Mr. Provis, in the novice amateurs' class, did better, comparatively speaking, since he scored the same number of points as Mr. Keeble, Mr. A. P. Field being second with 28. Ladies did not do so well. Mrs. A. I. Macdougall won with 20 points, and Mlle. A. M. Jeanteur, who was second, only scored 16. However, she won the Ladies' Trout-Fly distance event for the Bennion Challenge Cup—this is competed for with rods not exceeding 5oz.—Miss J. Barry being only 1ft. behind her on the aggregate of three casts. Both of them made the same "longest cast"—26yds. 1ft. The best cast in this competition was made by Mr. J. E. May—38yds.—who won the Keith Rollo Challenge Cup. Miss J. Barry won the Palethorpe Challenge Cup for trout distance (ladies) with rod up to 8oz. The Victor Ludorum Cup for the competitor scoring the greatest number of points was won by Mr. N. V. Keeble.

COLONEL J. G. LOWTHER, D.S.O., M.C., FROM THE PAINTING BY MISS DORIS ZINKEISEN

This fine picture showing Colonel Lowther with some of the Pytchley Hounds, of which he is Joint Master with Colonel Borwick, is one of the few works in which an artist has succeeded in reproducing the correct Pytchley colour with its suggestion of rose. Miss Zinkeisen has painted a great many horses but few have been exhibited to the public, her portraits in the Royal Academy Exhibition being more widely known. She has been awarded the Gold Medal in addition to the Silver and Bronze medals from the Salon.

THE ENGLISH BASSET HOUND

By J. IVESTER LLOYD

Keeping Up Working Strains of a Fine Breed

WHEN considering British hounds, one might roughly divide them into two sections. In one of these, I would place those breeds which are distinctly modern in looks as well as in methods of working. This would mean grouping together the foxhounds and the modern harrier and beagle; in other words, those breeds which have been strongly influenced by Peterborough standards. In the second section, I would place hounds of older characteristics, the "cold-nosed" breeds. First the bloodhound, because his method of hunting is typical of this group, then the true otterhound who, at his best, is very like a rough bloodhound. The few remaining old English harriers, which are practically old southern hounds, would be among these, as would also a certain type of beagle of the stocky, coarse stamp still to be found in some districts. And the bassets would certainly be included among these "cold-nosed" hounds, for their methods of working are very similar to bloodhounds.

In this system of classification, Fell and Welsh foxhounds would fall into the second group, if only because they are accustomed to working the drag of their quarry after several hours. Each of these breeds combines pace with a cold nose, and both are used to working without assistance. In the field, the only help which they ask of men is that someone shall arrive on the spot with a terrier and a spade when required.

The spirit of independence is, perhaps, more than anything else, typical of the older breeds. I have seen a good bloodhound throw up his head at the first attempt to cast him, throw it up with an air of, "If you know so much about it, then work it out for yourself," and refuse to make any further attempt to hunt that line.

These older breeds of hounds were not intended to be cast by a huntsman and, if they can in time be accustomed to the idea, then it is often at the expense of one of their greatest virtues—staunchness, or freedom from change. I am sure that nearly every case of hounds changing from a beaten to a fresh fox or hare is the fault of some human being who is too anxious to help. It may be the huntsman whose keenness to bring the quarry to book outruns his judgment but, more often, it is some amateur whipper-in or a member of the field who has not paused to count twenty before holloaing.

The desire for pace in the hunting field brought about the Peterborough influence in hound breeding and produced a foxhound which, on the ground over which it has been bred to hunt, knows no equal. A present-day field in a grass country has neither the time nor the desire to watch hounds puzzling out the line of a fox that may be an hour ahead of them. They, not unnaturally, want to get on with it and include a certain amount of galloping in the day's fun. A similar wish to "get a move on" with the sport is one reason for the inclusion of foxhounds in most otter-hunting packs.

The same influence has been felt in hare hunting, and the aim of most harrier and beagle breeders is to combine, in their smaller hounds, the best qualities of a foxhound. This means that pace has increased since the earlier days of hare hunting. There may be another reason for having faster hounds in that they are able to keep clear of large fields of active followers!

Although essentially a "cold-nosed" hound, the English basset has yet considerable drive and, although he does not welcome interference, in a pack he will respond to help at the right time. Considering the weight of the basset's body and the shortness of his legs, his pace is surprising. He may take longer to tire his hare than will a 15-inch beagle, but his method is interesting to watch, and anyone who enjoys hound music will revel in his note, which closely resembles that of a bloodhound. Many successful amateur huntsman served an early apprenticeship with a pack, or perhaps it was only a cry, of bassets, and this experience of cold-nosed hounds often made their later hunting problems easier as well as more interesting.

Each July, the recognised packs of basset hounds put up an excellent show of their own at the White Lion Hotel, Banbury, where I always find the collections of pewter and old sporting prints alone worth a journey to see. Hounds are kennelled in loose boxes, while judging takes place in the hotel yard. What Peterborough is to the M.F.H.A. and the Masters of Harriers and Beagles Association, so is Banbury to the Masters of Basset Hounds Association.

While a few of the more important dog shows include classes for bassets, there is no stipulation that the entries must be workers or, for that matter, even bred to hunt, but the Banbury show, being run by Masters of Hounds, is for working strains.

In recent years, the honours at Banbury have been divided between the Westerby and the Eastington Park. The first of these hunt a wide country on the Leicestershire—Northamptonshire borders, adjoining the Pipewell Foot Beagles, while the second are kennelled at Stroud, in Gloucestershire, and have the Royal Agricultural College Beagles for neighbours.

Banbury is a most suitable location for a basset hound show. For one thing, it is placed within reach of most of those who are interested in the breed and, for another, the town was closely connected with the late Lord North, who bred and hunted these hounds for so many years. It was he, together with the late Major Godfrey Heseltine, who laid the foundations of most of the working strains of to-day.

OLD TRAFFORD TEST MATCH

By NEVILLE CARDUS

OLD TRAFFORD on Saturday was unusually dry; there was no actual rain until afternoon. People who woke early in the dawn saw the green of their gardens; the summer's waters had temporarily subsided. On hopeful feet a large number of optimists journeyed to the ground in time for half-past eleven. They were admitted through the turnstiles to the accompaniment of a loud-speaker which informed them, in good honest Lancashire, that they were entering at their own risk. A cloudburst the day before had drenched the field of play, and now the Old Trafford ground staff was giving another of its celebrated nautical performances. Experienced dredging located the wicket, and it was brought to the surface and revived by skilled hands. At a quarter past two the match was actually begun—a considerable improvement on Old Trafford's experience last summer, when the four-day Test match against Australia was abandoned without the bowling of a single ball.

On Saturday, no fewer than 60 balls were bowled at this same Old Trafford. Even more remarkable was the fact that they were bowled by the West Indies. For Grant won the toss and boldly sent England to the wicket. Whatever the results of this action, much logic, deductive and inductive, was needed to rationalise it at the time—before the event, so to say (if any). The pitch had been covered and was slow. England, by batting first, would almost certainly "knock the top off." A fine week-end would dry the rough places and favour the spin of Goddard. A faster wicket on Monday would suit Copson and Bowes much more than they would be suited by Saturday's sodden earth. W. G. Grace used to argue that no captain, in *any* circumstances, should send in the other side. But the "Old Man" was prejudiced on the matter; he always wanted to bat first, whatever the weather, whatever the bowling. Grant took a strange liberty with the might of English cricket in a Test match; I cannot recollect that any Australian captain, after winning the toss, has asked England to go in first.

From the 60 balls bowled on Saturday by Martindale and Hylton, only eleven runs, including three extras, were scored. Fagg played uncomfortably, and even Hutton's slowness was imposed on him, and not of his own choice. A crowd of 10,000 defied the lowering sky. They cheered every incident with a pathetic ardour. And when a policeman interrupted play by walking in front of a sight screen, many unambiguous voices told him to move on. The Old Trafford crowd, by the way, is one of the most impartial in the country; the Lancashire team, in fact, declare that Old Trafford distributes its applause more lavishly on the visiting team than on Lancashire. There were many expressions of regret on Saturday that Ginnblett had been left out of the England eleven. He would certainly not have allowed Hylton and Martindale to bowl 60 balls on a slow pitch for only eleven runs. I doubt the wisdom of sending in first *two* batsmen of more or less defensive methods. Hutton and Fagg both command strokes, as we all know. But both of them concentrate to begin with on laying a sort of Maginot line. Ginnblett has natural attacking powers; why should he not be given at least half the chances in Test cricket that were granted to Edrich?

After half-an-hour's slushy endeavour on Saturday, the rain changed from a non-committal drizzle to spiteful interference. Then, to aggravate the long-suffering spectators, it ceased until the players returned gingerly to the field. Then, when everybody was exposed and umbrellas had been closed up in the pavilion, torrents descended without mercy. The rush for cover was general and unashamed. Only the Old Trafford groundsmen remained visible at four o'clock; but, of course, they are amphibian, either by nature or practice. No further play being possible, the players had a restful Saturday.

On Monday Old Trafford received poetic justice, for play was possible, apart from one or two short, if sinister, interruptions. On most other grounds in the land rain reigned supreme—which is not intended as a pun, my only pun in a lifetime having been *il faut cultiver notre Jardine*. The Old Trafford wicket grew sticky after lunch, and before then, following a late start at ten minutes past twelve, Hutton and Fagg dallied more or less strokeless while the turf brewed its mischief. Fagg was diffident, disappointing, apologetic; he played a Mr. Toots kind of innings, which all the time told us it was "of no consequence." There is a vast difference between good county form and Test match form.

Paynter failed for once in a way, then Grant bowled offspin round the wicket, and Clarke bowled leg-spin. Hutton was caught from a lame pull to backward-leg off a pretty breakback by Grant. Compton lost his wicket unluckily; he played out

MARTINDALE IN ACTION AT OLD TRAFFORD

at Clarke and disturbed his stumps by slipping on his right foot—the game had just been resumed after a shower. Two or three magnificent drives by Hammond put blood and muscle at last into England's innings; but he was stumped brilliantly after making 22—stumped on the leg-side by Sealey, from a ball by Clarke which beat Hammond in the air. Five wickets were down for England for only 62—and Wood's arrival heralded the "tail-end."

It was here that Grant committed, as I think, a mistake. He was bowling his offspin well enough on a pitch hungry for spin. He surprisingly took himself off, which was another proof that a bowler-captain is often prone to errors of self-abnegation. Clarke tired, and no other West Indies bowler could exploit the conditions. Hardstaff played a grand innings; he used his feet and drove with poise and uncommon masculinity. Wood, in his Yorkshire way, held up his wicket, and occasionally he thumped a loose ball like a man beating a carpet on a clothes-line. The sixth wicket added 88 precious runs, and Hardstaff achieved a most puissant 74 in as many minutes. Hammond was able to declare at 164 for seven at five o'clock. Up to a point, Grant's action of putting England in had obtained some of the justification which comes from "results." But Monday afternoon's evidence only proved the risk he took on Saturday when naturally he assumed a day's play. Easily might his team have been trapped on Monday when the wicket was at its worst, with Goddard and not Grant bowling offspin from round the wicket.

J. E. D. SEALEY, THE WEST INDIES WICKET-KEEPER, FALLS AS HE MOVES ACROSS TO TAKE A BALL ON THE LEG SIDE DURING THE BRIEF PERIOD OF PLAY ON THE FIRST DAY OF THE SECOND TEST MATCH

Goddard turned the ball unpleasantly enough when the West Indies batted. And Grant played one of the heroic innings of the season. Thrice he drove Goddard for noble sixes, to the on, or straight. He nearly lamed Compton in the "leg-trap." Many times have I seen Goddard bowling his slow offspinners with no fieldsman behind him, and with the leg-side packed with clutching hands near a tremulous bat. Grant compelled Goddard to use or deploy a deep square-leg, a deep mid-on, and a deep long-on, almost straight. Grant's hitting was not wild but cultured; he produced the cut for the ball short of driving length. Out of 56 he scored 47 in half-an-hour before he went down gallantly fighting to a catch from another good drive. Stollmeyer played Goddard according to English county etiquette, and was quickly caught and bowled.

At close of play the West Indies had retaliated with 85 for three wickets; but on the third day they were all out for 133. England then replied with 128 for 6 wickets declared. The West Indies made 43 for 4 before stumps were drawn.

THE BILLIARDS AND CARD ROOM

"Although the members of Arthur's have never had quite such a notorious reputation as gamblers as those of White's and Brooks's had, card playing was undoubtedly one of the chief attractions of the Club in its early days."

GREAT SOCIAL CLUBS—IV. ARTHUR'S

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

ARTHUR'S, starting much later than the other three famous small clubs of this series, has, naturally, not so much history behind it as the others. Nevertheless, ever since it came into being, it has lived up to the exclusive social standard set by its three predecessors.

The Club appears to owe its name to Robert Arthur, for some years the proprietor of White's. Robert was the son of John Arthur, a former assistant of Francis White, who had been the original proprietor of White's Chocolate House. When Francis White died in 1711, his wife, Elizabeth, assumed the management and retained it until about 1730, when she handed it over to John Arthur. According to the rate book, John Arthur appears from the year 1702 to have been the occupant of 69, St. James's Street, so it would seem that Francis White must have sub-let the premises to him from that date, possibly without vesting him with the management of the Chocolate House. John Arthur died in 1734, and was succeeded by his son, Robert, who is shown in the rate book as the occupier of No. 69, St. James's Street from 1734 to 1756. Various books of reference have stated that Arthur's Club was founded in 1765, that was the year after Robert Arthur's death, but so far as the managers of the Club are aware, no mention of Arthur's can be found from the time of Robert Arthur's death until the year 1811—and this year, therefore, must be accepted as the date of the Club's foundation. This was nearly 50 years after Robert Arthur had died; none of the original members of Arthur's Club, founded in 1811, could have known him, and it would, therefore, seem that the only reason the Club was named after him was owing to the fact that he had once rented the house they proposed to take for their club house.

For some cause, difficult to understand, there appear to be no contemporary letters in existence giving the reasons for the formation of Arthur's Club, or why they elected to be called by that title, beyond the incidence of Robert Arthur having at one time been the proprietor of 69, St. James's Street. It is true that there had been on this same site, 69/70, St. James's Street, another club since the time when White's moved from here. This Club had been run by two men named Miles and Evans since the year 1781, and had been known by the name of Miles' Club, and it is mentioned by Hoyle in 1790 as one of the fashionable houses where cards were played. In 1809 Miles had to close his house for lack of support, and two years later the premises were acquired by Arthur's Club. In May of that year a meeting of the members of Arthur's was held at 16, St. James's Street, the present site of Lloyds Bank, when it was resolved "That a new club be forthwith established to consist of 300 members." It was further resolved that the subscription should be 15 guineas and subsequently 10 guineas. It was also decided that any candidate proposed by a member of the committee should be eligible for election, no seconder being required, and that one black ball should exclude. The first ballot was held on Sunday, May 12th, 1811, when the first 87 members of Arthur's were duly elected. A month later the membership was raised to 350, and by 1828 it had reached 600.

THE LIBRARY

The doors throughout the house are of fine mahogany

While the elections were taking place in the summer of 1811 the present Club house underwent structural improvements from the design prepared by Thomas Hopper, the well-known architect, who had been responsible for Penrhyn Castle. The existing stone front with the Corinthian columns was then erected and Arthur's had the distinction of being one of the very few buildings of its kind in London to be erected in whole or in part for club house purposes. The house opened its doors to members on November 1st, 1811, so the work of reconstruction must have proceeded very quickly. On the evening of that day the first house dinner

was held. Sherry then cost 6/- per bottle, Madeira 9/-, port 5/-, claret 10/-, champagne 14/- and vin de Graves 10/-. It is evident that members of clubs did not drink for nothing in those days any more than they do now, though one is always apt to imagine that these things were very much cheaper in those times.

That month a new candidates' book was started, a seconder being required for each candidate, though the stringent rule of one black ball to exclude was retained. The result was that with only four exceptions, the whole of the first 50 candidates found themselves rejected! After this wholesale slaughter it was decided to raise the number of black balls necessary to exclude to two. Certainly the fate of many of those who aspired to revolve in the eclectic circle of the small St. James's Street clubs of those times was not altogether an enviable one. Snubbed when they dared to enter their names in the candidates' book, and more often than not given the cold shoulder if they happened to be successful at the election, they must, indeed, have set great store on being able to say that they belonged to one of these exclusive assemblies. Who is there now who would be prepared to take the same risks to enter any social paradise?

Nevertheless, some strange people in those times achieved rapid and great social advancement. "Bob" Mackreth, who had been a waiter at White's under Robert Arthur, and who had afterwards married his daughter, became Member of Parliament for Castle Rising, and later was actually knighted. Another former waiter at White's, a man called Rumbold, got an appointment in India, and suddenly rose to be Sir Thomas and Governor of Madras. It was said that he had come by his wealth dishonestly, and a bill of pains and penalties was brought into the House with a view to depriving him of his ill-gotten gains. The bill was suddenly dropped, owing, it is said, to the corrupt assistance of Rigby, one of the *bon-viveurs* of White's in those days. This sort of thing was fair game for the satirists of the times, and one of them composed the following epigram on the subject of "Bob" Mackreth and Rumbold:

When Mackreth served in Arthur's crew,
He said to Rumbold "Black my shoe."
To which he answered "Ay, Bob,"
But when returned from India's land,
And grown too proud to brook command,
He sternly answered, "Nay, Bob."

In 1825, after long negotiations, a 99 years' lease of the present premises was granted by the Crown to the trustees of Arthur's in consideration of an expenditure of £12,000 in structural improvements. When this was completed in 1828 the membership was raised to 600. Although the members of Arthur's have never had quite such a notorious reputation as gamblers as those of White's and Brooks's had, card playing was undoubtedly one of the chief attractions of the Club in its early days. In 1828 the notice of the committee was called to the fact that on several occasions members remained

THE COFFEE ROOM

"Arthur's was probably one of the last clubs to sanction visitors being entertained at dinner in their house. . . ."

all through the night and until after 10 a.m. the following morning at their favourite amusement. In Captain Gronow's notes on gambling in London clubs, he relates about Arthur's that in 1836 a nobleman of the highest position and influence in Society was detected cheating at cards, and after a trial, which did not go in his favour, died of a broken heart. In 1846 a smoking room for the use of members was provided for the first time. Arthur's was probably one of the last clubs to sanction visitors being entertained at dinner in their house, and it was only a year or two before the War that this privilege was open to them: a small room on the ground floor, said to be the old gaming room in the time of White's, was then set aside for this purpose. Another old custom which lasted longer at Arthur's than anywhere else was that of giving change in washed silver. The money was first plunged into hot water and cleaned, after which it was placed in a wash leather bag and whirled round in the air until it was dry.

Nearly every club has its Egeria, and the sweet creation of Arthur's heart is the beautiful Kitty Fischer, seven times painted by Sir Joshua Reynolds. This lady was the daughter of a German stay-maker, and married in 1766 Mr. Norris, son of the Member for Rye. She was reputed to be as witty as she was beautiful, and like most ladies of her kind, appeared to have had somewhat extravagant tastes, as she is recorded to have got through £12,000 in nine months. At this time she was about 20 and was living under the protection of Captain Keppel, which probably accounts for her first sitting to Reynolds. Lord Ligonier was also another of her many admirers. There is a beautiful portrait of her as Cleopatra dissolving her pearl, now at Ken Wood. A wit once wrote under it: "To her famed character how just thy right, Thy mind as wanton, and thy form as bright." A writer in the *Town and Country Magazine* extols

"NEARLY EVERY CLUB HAS ITS EGERIA, AND THE SWEET CREATION OF ARTHUR'S HEART IS THE BEAUTIFUL KITTY FISCHER"

her as the "essence of small talk and the magazine of contemporary anecdote," and adds the note that she was for some time "kept by subscription of the whole club at Arthur's." Kitty Fischer died before September, 1771, "a victim of cosmetics." Two engravings of the lady are to be seen in the Club. The best one, after Reynolds, depicts her as a very charming and intelligent-looking young woman, with a figure slightly more under control than those of the majority of her contemporaries.

THE SMOKING ROOM

"In 1846 a smoking room for the use of members was provided for the first time"

As in so many other club houses of this period, the main feature of the interior is the grand staircase which divides into two, and is lighted by a cupola-shaped and highly-ornamented domed window. The ceilings throughout the house are very good, the best of them being found in the large billiard room on the top floor. Another feature is the fine mahogany doors leading into all rooms. A general aspect of calm and dignity pervades the whole house. The silver at Arthur's has always been noted, and some of the pieces shown in the dining room are certainly very fine examples of their period. They are marked, rather unusually, not only with the name of the Club, but also with its address.

BEST DAYS WITH OTTERHOUNDS

The Wye Valley's Magnificent Performance

ON Tuesday of last week the meet was at Monmouth Troy to hunt the River Trothy. This river feels the effect of heavy rain more quickly than most, and when we arrived at the meet we found that the water had risen quite a lot, and, as usual, was coming down very discoloured. This, however, did not prevent us from hunting it, although rain was falling in a steady downpour all day long.

Hounds drew over the first part of the river in silence, but by the Somerset Arms we found tracks of quite a big otter going up the smaller stream under the Monmouth Road. Hounds tried up here and had a stale drag. Returning to the Trothy, and just under Dingestow church, the pack were very keen and tried the big tree without finding. On we went, and on getting to Lower Hendre they went off full cry on a drag across the meadow. Taking this on, and hounds trying every holt, we got nearer to Abbey Bridge. Before this was reached the drag improved, and first Minstrel and then Galway would lead hounds on the line, and so we came to the bridge. Here quite a number of our field decided to leave as it was getting late and still raining. As it turned out, they made a great mistake, for if they had stopped a little longer they would have witnessed a remarkable incident. As hounds were drawing on and getting the drag, which was now quite fresh, Mr. Thompson stopped, and turning to Major Wolley and Rudge Humphreys asked them if they could see what looked like a sheepdog coming down off the hill half a mile in front of them. They were undecided what it was until the animal came into the meadow in which they stood, then with astonishment they saw it was a big otter making his way to the river. Fortunately, hounds did not see him, as they were running the drag where he had gone up during the night. With a great halloa hounds were brought back and laid on, and were soon on his line and into the river, where they hit his wash and were away downstream at a great pace. Hounds checked below, and then Mr. Thompson tried them upstream, but could not hit him off. Back he came with the pack, but all to no avail, and everything was at a standstill. Back upstream for quite half a mile, and then the fun began, for hounds eventually found him and started a great hunt up and down this very heavy water. They never lost touch with him, and hunted with a great cry as they swam from place to place, pushing their otter with the water and then coming back up stream. I need not mention the old hounds, as they know their jobs, but it was a pleasure to see all the young ones working like Trojans and the new additions, such as Linkboy, Lightfoot and Lounger joining in and hunting wonderfully well. I don't think I have ever heard such music, and the pace was tremendous. Once our otter got into a big oak tree, but the roar of the pack as they marked him was too much even for the otter, who soon left and had another swim upstream against the currents. This was the last time he tried to battle against the water and turned down with the flood water to commence a great swim with all the hounds going like blazes after him. All we had to do was to keep up with them and watch them hunt their otter without the least assistance and without a single halloa from the field. This was hunting at its best—no interference and no stickles.

Once the otter landed and proceeded to run through Mr. Thompson's legs, only to be helped back into the water by him just in time. Hounds were now getting the best of the deal, and after one more spurt came up to their otter, to kill him in the middle of the river. Now the fun began, for we had to get him to dry land, and after two or three duckings we managed it, and I don't think Mr. Thompson, Charlie or myself had one dry article of clothing left on us. To hunt and kill on the Trothy in the condition it was to-day was a magnificent feat, for few huntsmen would have tackled it. Hounds had hunted for over two hours, and their otter weighed 23lb. M. L.

EASTERN COUNTIES ON THE GREAT OUSE

FROM their meet at Judes Ferry, Mildenhall, on July 17th, these hounds had a long ten-mile draw up the Lark, across Turf Fen, and Tuddenham Fen to Lackford, without once speaking. A most desolate blank day it was; but we cannot grumble, because on their next outing, hounds put down a leash during the day. The meet was at St. Ives Bridge, in Huntingdonshire, to try our luck on the Great Ouse, at the kind invitation of our neighbours, the Bucks O.H., who had drawn down river from the same meeting place on the previous day. Mr. Russell hunted hounds from a boat on the 19th, for the river here is somewhat vast. After getting on to the big reed-covered island just above the bridge, hounds hunted a line round for some time before they put up an otter at the bottom end of the island. He came away at the town end, and they swam him well for a short distance until he got into some drain near the bridge and had to be left, as they could not mark him anywhere. Drawing on up stream, however, they soon put down their second otter from the reeds and swam him up stream with the current, with a rare cry and at considerable pace. After half a mile all out, he crossed over to the Hemingford Grey bank and got into a tree by the mill pool, but was soon away from it, and they then pushed him across the pool and away up the river for a good distance, until he was viewed coming down again. They were not on such good terms with him now, however, and it was not until they hit him abroad again, that things warmed up once more, and they swam him up river until he turned in at the Houghton Brook, up which they hunted him until he turned back and, evading them cleverly, set off back to the main river. In the interim, a couple had flashed on with a drag, and had put down another otter, some three-quarters of a mile up the brook. They were stopped in due course, however, and the reunited pack, having got back to the main water, fresh found their hunted otter, who was viewed coming away from the reeds, and they then swam him right down towards St. Ives for nearly half a mile before he gave them the slip. They could not touch him again, and at four o'clock, after three hours' interesting hunting, we took off our caps to him. Scent had not been good after the first hour.

We are very grateful to the Bucks O.H. for this pleasant day on their water, and equally thankful to Mr. and Mrs. Walter Atter, who entertained the field most lavishly, at Needingworth, after hunting. The ideal finish to a good day.

On the 22nd we were up in West Norfolk once more, when a big field turned out at the Hilborough Swan. Hounds were put in to draw down the Wissey, but having reached Bodney Bridge without speaking, they were lifted on to Langford Bridge, and getting out on to Furze Heath, they spoke well in Toft Carr, hunting a fresh drag round the covert and down the back ditch. Some time was spent at Buckenham Tofts as there was drag all over the place, but hounds could not find their otter, and trying on, they finished with this drag at Buckenham Mill, for the line below here was old, and ran out before Mundford Bridge was reached. The otter may have been up on the lake at Buckenham, or in Stanford Water, although they had no line to the Park. We drew on to Didlington Mill without drag, where a long day finished. Somewhere in this nine-mile draw (or just off it) was an otter; but his precise location remains a mystery!

DRIFTER.

THE KENDAL AND DISTRICT'S SPORT

JULY 10th.—We met at Kendal Station, a small field only to meet us, which included visitors from the Eastern Counties and Border Counties, and we were glad to see our popular hon. secretary recovered and again out. Kitchener, the kennel huntsman, was hunting hounds and proceeded to draw the Kent from Kendal Town up to the Mint without any result. As soon as we reached the Mint hounds began to feather and picked up a drag which got stronger as we went up and they were able to speak to it occasionally, and just about a quarter of a mile above the pipe-line bridge, with a burst of music, they put it off, and it was viewed going down stream. Hounds hunted it down for about 500yds. and then lost it. Various roots were tried without result, and some considerable time was spent trying to find the outlet of a big drain from the corner of the wood on the other side of the Tebay Road, but we were unable to do so, and it was decided to run a terrier through a large dry flag drain. Lunesdale Foxhound Trixey, otter hunting for the first time, was put in in the pasture on the other side of the high road and soon out came the otter with Trixey close behind. Hounds jumped in with another burst of music and had not proceeded very far when they were again at fault. While Kitchener was trying down an otter was viewed travelling over the field to where the drain had been opened, only to find it stopped; it then galloped back, climbed the wall, crossed the road and ran under the hedge and across the meadow between some of the field into the river, turned upstream first and then down again. Opinions varied as to this being our original otter, for it had to cross a piece of meadow and the road before arriving at the field where the drain had been opened, and, although the followers were lining the river banks, no one saw it go. However, hounds hunted it down for a short distance, when it again disappeared, and hounds marked at a fissure in the rock which was partially under water. Nigger, out perforce for another day, was put in and soon told us the otter was there, but he was unable (gallant old fellow as he is) to get to it, but after some considerable time we managed to bolt it. And the hunt was on again downstream. Soon hounds were at fault again: the river was high and the very numerous roots were under water, and this went on for six hours. The Master had given orders not to go any farther up the Mint than the drag took us, owing to hay grass, and so Kitchener proceeded with considerable patience to hunt this otter, which eventually we gave best to, and we went home—rather a disappointing day, the otter having spent most of his time in the various holts.

July 12th.—We were at Abbystead with quite a fair field, including visitors from the Eastern Counties, Border Counties and an amateur whip to foxhounds from India, and some of our Yorkshire members. The Master was hunting hounds, and he put them into the Wyre above the lake, tried the marshy ground and the island without result, and then tried down the far side of the lake, where hounds seemed interested but could make nothing of it. We continued to hunt downstream, and before very long picked up a drag that they were able to speak to, and cheered us up with a grand burst of music as they flashed across the field and back down the hedge bottom into the river. Scent was none too good later on, but we continued to touch here and there down to Dolphinholme, where we were, as usual, hospitably welcomed by Mr. Wilson.

July 15th.—The meet was at Tunstall for the River Greta, Sir Maurice Bromley-Wilson, the Master, hunting hounds. There was a moderate field with a good contingent from Yorkshire, the heavy thunderclouds no doubt keeping many people away. Master first tried the small stream running into the Greta, a very likely spot, without result, and we then proceeded upstream. The well-known drain just above Greta Bridge proved blank, but hounds picked up a drag near the island which they could own here and there, and which eventually took them up into the very steep wood, where it was foiled by fresh tracks of red deer. The Master hunted very carefully upstream and came to the conclusion after some time that we were probably going best when we were enlivened by a real burst of music at the old power-house weir. Hounds swam the wash downstream, and we felt sure that an otter had gone away. Master tried the various roots and rock holes below, then went up and terriers were put into a cave which went underground for 150yds. with water in the bottom of it, but no result. We then hunted up another mile to Burton-in-Lonsdale (Black Burton), where we had lunch. The field had increased by now, and after hounds had been put in above the bridge they went off with a scream and at such a pace that it was impossible for any of the hunt staff to keep up with them. Kitchener, the kennel huntsman, got to them after about one and a half miles, when they had then arrived at a farm on the river bank—and it was Muscovy Ducks!

The Master continued to hunt upstream without any result, and so ended the last day before hounds proceed on their annual visit to the Nydd and Wharfe in Yorkshire. REDROUDE.

THE HAWKSTONE IN SOUTH WALES

THE weather in South Wales continues to be deplorable, and hounds have had to resort to the smaller streams. On Monday they hunted the Aeron, which is a good little river—and not so very little that day, after the heavy rain. It had not been hunted by the Hawkstone since 1923, when Lord Davies was Master. Numerous otters were reported, and they actually materialised. Mr. Wallace drew up from Cilian Aeron Station, and they hit off a drag after about two miles, which gradually increased for some miles until at about 3.20 p.m. hounds put down otters in a bog. A small otter was viewed and hunted into the river. This otter was hunted well for about an hour and a half. Then Mr. Mainwaring and Miss Jones holloaed a big otter over the bottom ford and hounds screamed after him downstream. He gave a really magnificent hunt for 2½ hours. It was not so easy-going for hounds, as the river was rising and scent was poor, but they stuck to him well and finally caught him when he landed in a rabbit burrow at 7.45 p.m. He was a 22lb. dog.

On Thursday the P.C.O.H. kindly helped by lending the Gwilli from Conwill Station up. Mr. Wallace hunted hounds. There was a drag, and hounds later became keen on the banks and finally put an otter down about two miles up. But the river was too high, and though they hunted him up and down for a bit very well nothing more could be done with him. The rest of the draw was blank.

On Saturday it rained again, and the Cleddau had risen in the night, but there was nothing for it but to draw as arranged. The field were rewarded by a most interesting drag, which petered out at Portshaen. So ends a very disappointing Tiefy fortnight and better things are hoped for in August. Hounds have been out 51 days, found 51 otters, and killed 23. S. W.

A GOOD "BART"

AFTER CHAMOIS IN AUSTRIA

By FRANK WALLACE

I WAS very disappointed. I had seen the document myself in the Diplomat's case, an enormous envelope, heavily sealed and inscribed in large and clear writing, "Very secret," "By safe hand." It had thrilled me to the core! Now, thought I, if ever, they will appear. The lovely lady with violet eyes whose svelte figure and slinky walk would at once give her away, even without the alluring perfume which would first render me aware of her presence. I felt quite capable of being able to deal with the sinister and bearded men who, I felt sure, would be hovering unobtrusively in the background. Of my willingness to sit up and watch the corridor whilst he retired to his bunk I had assured the Diplomat. To my secret chagrin he had vetoed such a course as unnecessary. He, however, had been proved right, for here we were in Munich, white under a sprinkling of snow, after a night's journey from Berlin completely without adventure. Still it was all an adventure to me.

I had first met the Diplomat at a lunch party. It had been a very smart party. Ambassadors had jostled excellencies; princesses had, metaphorically, rubbed shoulders with countesses. Ladies being in a majority, I had found myself stranded with the male sediment at the far end of the table and could only gaze at these exciting creatures from a distance. The Diplomat enlightened me as to their identities. Of one old gentleman, rather the worse for wear, he disclaimed all knowledge, but added: "If he'd been a stag he'd have been shot long ago!" This led to talk of sport, and he inquired what particular kind of stalking I preferred. I expressed a liking for small mountain game with heads large in proportion to their bodies such as some of the smaller sheep and goats.

"So do I," said he. "I hate felling great lumps of meat!" His eyes had a hint of laughter and his easy, quizzical glance bespoke a sense of humour.

"Have you done any chamois shooting?" he went on.

I told him I had only shot one.

"You'd better come and have another go at them next month," said he, so here we were en route for Karvendal.

After seeing the Brown House and as much of Munich as we could fit in in the morning we took train after lunch for Garmisch and Scharnitz. Late in the afternoon the sight of roe standing in the blue snow-shadows by the side of the line delighted me.

At Scharnitz, known to the Romans as Porta Claudia, we were met by Wragg, the jaeger, picturesque with long brown beard and moustache, big stag horn buttons on the inevitable green coat, and a weather worn chamois "bart" in his battered hat. Both he and "young Albert, his son," had the perfect, natural manners of unspoiled mountaineers. A couple of hours' drive through woods, ghostly in the darkness with their snow-laden branches, brought us to the hut at Karvendal Thal. The estate is still owned by the Duke of Saxe-Coburg under whose care the game, both deer and chamois, has improved. Chamois stalking in my experience is the finest form of continental sport. The pursuit of a mountain animal is superior to that of any which can be found in the low country, and when he is so small a beast as a chamois and one so supremely able to look after himself, all one's powers are called into play in the effort to circumvent him. I had only stalked in September, which

WRAGG PREPARES TO SPY

is a very different thing from doing so in the winter in deep snow, which now lay to a depth of 18in. on the lower slopes and was up to one's thighs on the high ground. The hut itself was about 4,000ft. above sea level. Progress was slow, and once as we ploughed through deep drifts the Diplomat, who was in front, turned to me and said: "Ski-ing is about eight times worse hell than this!" It put me off any desire to ski.

In the fir scrub which grows up to 6,500ft. or so chamois are found, but usually females and young ones, the best bucks keeping to the high ground which in Karvendal rose to 9,000ft. On the other side of the southern ridge lies Innsbruck. There is much limestone in these hills, and the heads of the chamois here are consequently as good as any in Austria. (My visit was three months before the "Anschluss.") It is a golden rule when contemplating the pursuit of any horned quarry to search for it on limestone formation.

When after a beast which one does not know it is always a difficult matter to judge heads correctly. The smaller the head the more difficult does such a task become, and in the case of chamois it is particularly hard as an inch or less may make all the difference in the status of a trophy. Never making any pretence at being able to estimate a head, I left it entirely to Wragg. From him I picked up one or two useful pieces of information. The horns of a young buck thicken irregularly and the points are thin. The horns of an old buck are thick for a third of their length and then become thin. The hair on the stomach is also an indication of age, becoming in the case of an old buck darker, as it does also on the chest, while that on a young buck is lighter.

It is important to kill the old barren does which have never had a kid, for they remain in season late and keep the bucks in a state of excitement after the regular rut is over, giving them no time

REMOVING THE "BART"

to recover their strength before the hard weather sets in. I think chamois live to about the same age as deer. Wragg told me he had once killed a doe of twenty. They breed at the age of three and continue to have young up to ten years of age; a buck is at his best from eight to eleven years of age. The proportion of bucks to does at Karvendal was about one to five, which is approximately correct.

The usual charge for shooting an old doe is roughly 30s.; a buck will cost £10.

Apart from the head, the chamois carries another trophy of a kind carried by no other animal that I can recollect, which is prized equally by continental sportsmen. This is the beard or "bart." A really good one fetches a big price. It consists of the hairs which grow along the top of the rump and withers which, to be first class, should be white tipped. These hairs are carefully removed and wrapped in paper, which is then laid between two flat pieces of wood to keep their shape. They are then graded and tied in small bunches. From these the finished article, worn in the back of the hat, is made. The best are grown when the buck is from six to eight years old, after which they become shorter.

Chamois vary considerably in weight, the average good buck being about 60lb., the weight of a very good Scottish roebuck ungralloched. The heaviest recorded at Karvendal, weighed clean, without the head, was 74lb., which is very unusual.

Much the most amusing time to stalk chamois is during the rut, from mid-November to mid-December. The bucks at this time do all sorts of unexpected things. They will cross from the tops of one ridge down into the valley and up 9,000 ft. on the opposite side in search of does, and old jaegers say that until they have done this the rut has not really started. It is most amusing to watch bucks charging each other, just as stags do, but with more apparent vigour. After a shot, too, it was most entertaining to see little black dots, bearing for some unexplained reason an extraordinary resemblance to the black caterpillars one finds on a Scottish moor, scurrying for the tops. Every beast in sight would vanish and then suddenly on each sharp-pointed peak would appear a little black head with pointed ears surveying the hillside below them. It always made me laugh, for the chamois is a most engaging little animal, of whom I grew very fond.

Owing to weather bad for stalking the chamois on our arrival were very scattered, and many were still in the scrub at the bottom of the valley, when they should normally have all been collected in the corries at the tops of the hills. The big bucks do not wander much at this season when they have collected some does, though travellers move for great distances. Wragg, who had been the jaeger at Karvendal for 24 years, said he had never seen them so sluggish in search of does. The Diplomat killed a fair buck on our first day's stalking, and I missed one on the following morning. Having reached the top of the timber line we were confronted by a series of rocky tops which might have been a part of some remote Scottish glen.

After an amount of marching and counter-marching from below a steep face of rock high above us, flecked with ridges of snow, appeared a small black speck. Wragg declared it to be the head of a good chamois. Dutifully balancing the rifle on two crossed alpine stocks as he directed, I did indeed see an occasional flash of a chamois as my telescopic sight swayed backwards and forwards. Steadying it to the best of my ability, I felt no surprise when the bullet struck the rock, 300yds. away, immediately below the buck. It was a pity as he was a good beast, and we never saw him again. However, it had been a pleasant day, warm out of the wind, with blinks of sunshine and wonderful cobalts and madders in the far distance of Vorarlberg where, eight years before, I had killed my only chamois.

It was on December 2nd that I retrieved my miss. We left the hut at 7.15, and toiled through the snow to the head of the valley. Before reaching it we saw some beasts across the river which flowed below. Then, as we started to climb the hill which led to a house, only occupied during the summer months, perched on the edge of the cliff, Wragg spotted a buck at the very top of the ridge on the south side. We stopped at a bend in the road and for a long time Wragg watched him, dragging out a ridiculous-looking little telescope with about nine pulls, which he kept secreted for emergencies in the depths of his clothing. In addition he carried binoculars, but the appearance of the telescope meant that something serious was on foot. I got a bit bored after about ten minutes, and said to the Diplomat: "It's extraordinary how all stalkers love watching beasts and wasting time! There isn't a hope of getting at that buck, even if he's any good!" "Wait a bit," said he; "I think he's got some scheme."

We accordingly waited, I curbing my impatience, and Wragg peering through his telescope. Then to my amazement the buck started to descend the hillside. Remember he was at least 2,500ft. above us. It was no casual descent with a stop for a nibble or a loiter on a ledge. It was a purposeful odyssey. He came steadily on, occasionally disappearing from sight, but always getting nearer. From 8,000ft. he came to 7,000ft., and from 7,000ft. to 6,000ft. Wragg motioned me to fix the telescopic sight. From 6,000ft. he came to 5,000ft., where he was opposite us, across a wide gorge, on the edge of some scattered bushes and trees, a wall of rock behind him. "Two hundred!" said Wragg, but I remembered yesterday's miss, and determined to rely on my own judgment. I thought it was nearer three. A bundle of coats gave some support, and a St. Andrew's cross of alpine stocks steadied the rifle. At the shot he took a step or two forward, then stood, head down, and I knew he was hit. Then he lay down. He looked very small, and I tried several more shots without any effect, for it was impossible to tell in the snow where they had gone. But he lay still.

It took us nearly an hour to work round the top of the glen, make our way along a precipitous slope above the river with some very nasty corners, where a slip would have meant a 50ft. drop into icy water and reach the spot where he lay, quite dead.

His head was far better than I had expected, just in the gold medal class in an international show. The "bart" was moderate, but it was something to have one at all, and I felt very contented and satisfied as I watched Wragg carefully removing it bit by bit.

"This," I said to the Diplomat, "is better than doing a '*pirschfahrt*'"!

"That," replied he sententiously, "is more suited to the appearance lent you by your white hairs, than to your hidden supplies of energy!"

I felt still more contented.

WINTER FEEDING OF PARTRIDGES

A large number of entries were received for this competition, and we print below the prize-winning essays. No attention was paid to literary merit, and these essays are published in the form in which they were received

First Prize of £10 - 10 - 0 to:

F. J. ASPLEY, Stone House, Brockhampton, Hereford.

PERSONALLY I find that clover and grass leys are ideal natural food for partridges during the winter months. This I find due to the fact that these birds are found regularly on them. I find two reasons why partridges choose this form of food:

(*a*) They would prefer this to any other.

(*b*) There is very little or nothing else really suitable.

During the winter months partridges find a deal on these seed leys, but without doubt they like to make their total rations with seeds.

Now I will mention some of these valuable foods—for instance, knot grass, which is a seed-bearing plant which I find from time to time they are very fond of; again I point out some more valuable foods, meadow grass, sprouting wheat and sugar beet.

It is without doubt some of these foods I mention vary in various parts of the country. But again as I mention sugar beet, they feed only on the tops, which bear great nutrition.

It is of great importance that the winter green food this little brown bird obtains is of great necessity.

It is essential that regular feeding should be carried out, and to place the food where the birds can make the best use of it, and the most suitable kind, which I will now give in due course.

After one month to six weeks all birds should know their feeding spots.

Now I give the right kind of food which I consider: 40 per cent. wheat, 25 per cent. hemp, 15 per cent. split maize, 10 per cent. dari, 10 per cent. millet.

Winter feeding should commence about second week in October, and should be carried out regularly daily at about the same hour.

This should be about two to two-and-a-half hours before sunset and carried through until the end of March; of course this depends much on the local conditions. Starting feeding early ensures the coveys to know their feeding places before they get broken up.

Now I will point out a very cheap food, tail end wheat, which is mainly very easily obtainable from one's local farmers.

As regards making an ideal feeding place, and to draw the birds quickly together, get some old rubbish or chaff from threshing, which I can assure is most ideal.

As regards quantity of feed to be given to the birds, much depends on one's own judgment, but in most severe weather ¾oz. should be quite enough for one bird.

As to places where to feed, much depends on the farming in the district.

I consider most suitable places in a belt of trees, a dry wide open dyke, or even an old gravel pit, or a rough grassy field, or even a south side of a good high fence, where you would probably find a deal of rubbish in the bottom. Such places I mention should hold the feed concealed from vermin, such as rooks, &c.

Again, it is essential that all birds should be able to reach their feeding places by their normal flights.

Olive oil is of great value mixed with the food; this helps to keep the birds warm and their jackets waterproof.

Cod liver oil, again, which is very helpful added to the food from time to time and which without doubt greatly increases the birds' stamina, is to my idea a good preventive of disease. Quantity to be given, say, four tablespoonfuls of these oils added combined to 28lb. of seeds.

It is of great importance that these oils should be mixed freshly; one is quite sure then that there is no valuable vitamin lost.

Second Prize of £5 - 5 - 0 to:

E. H. GARNER, Stanley Wood Kennels, Lockeridge, Marlborough, Wiltshire.

THE winter feeding of partridges should be one of the duties of the first importance connected with a partridge shoot, more especially so in such winters as the last one was, when snow lay deep two or three weeks at a stretch, and not a particle of Mother Earth to be seen anywhere. Partridges had a very hard time to find food of any description, and unless fed by the human hand, were bound to suffer in consequence. Even in mild winters where there is a large stock of partridges on the shoot, natural food becomes scarce during the month of November, and it is from then until the end of February that the partridge should receive special attention as far as food is concerned. Birds that are fed during these winter months will not only give better results during the breeding season to follow, but will be in first-rate condition for the nesting period. Especially important is winter feeding in some of the more heavily-stocked districts, such as parts of Hampshire, Norfolk and Suffolk, where the birds have to rely on clover leaf as their chief source of food. It is reasonable then to presume that partridges that have access to a good sound grain mixture will be more likely to ward off any tendencies of "scour," which does occur with excess eating of the frosted leaf of young clover.

Winter feeding will also help check migration at pairing time. More pairs will be induced to stay on the shoot to breed, which will mean more coveys when September and October arrive. The period of the year when natural food becomes acute is during December, January and February, but on some shoots a little food scattered for them in November would be welcome. It all depends on the nature of the farming done on each shoot, as this varies so from one district to another. If there is much arable, corn-growing, roots, &c., or where there is a big proportion of grassland, feeding must be governed by what quantity of birds the shoot carries. Therefore it must be for the keeper in charge to decide when to commence winter feeding. But mid-November would be an appropriate time in some districts, and continue until February ends. A good grain mixture that I find answers well is one part tail wheat, one part tail barley, one part finely crushed maize, with a few handfuls of dari seed mixed in with it. This is all that is required to keep the birds in excellent condition. Of course, there are numerous seed mixtures on the market, but where expense has to be kept in mind, the above mixture answers well, which I have proved over a number of years. Why I recommend tail corn, is that you then get

(*Continued on page 282*)

This England . . .

Ullswater and Gleuridding from Place Fell

WHEN in late Tudor days, pewter and silver drinking mugs gave place to glass—Venetian goblets for the wealthy and "rough Surrey glass" for the would-be fashionable—not everyone approved. Andrew Boorde found glasses wasteful, complaining of breakages, "besides that they breed much strife toward such as have the charge of them." The glasses won; but it should be recorded in fairness to the worthy physician that in 1542 he did speak well of ale as being a wholesome beverage "for an Englysshe man." For here, indeed, did he speak for the generality of men—even to posterity—if we may judge by the popularity to-day of a brew well thought on in Tudor times . . . your Worthington, noble in tankard or glass.

ISSUED BY WORTHINGTON AND CO. LTD., BURTON-ON-TRENT, ENGLAND

all the small grain which is what you require for the partridge. There is only one satisfactory method of getting the food to the birds that I know. It is for the keeper, or whoever looks after the partridges, to go round and scatter the food by hand, two or three times a week. Where a large area of ground has to be covered, do one part one day, the other part another, and keep it fed alternately. One must always bear in mind that, unless under very severe weather conditions, the partridge will always be able to find a certain amount of natural food, and will search for a certain amount of it, even where fed by hand. Sow the grain sparingly at first along sections of the hedgerows. Choose those parts where possible that are free of rabbit or rat burrows, alongside stone walls or belts, whatever is on the shoot. Birds soon find the food placed there, as they always resort there for shelter. I find the above places best to feed partridges in mid-winter for several reasons. Pigeons are less liable to feed under hedges, as are also rooks and jackdaws, who prefer to feed out more in the open, where they can discover any danger more quickly. Roots are excellent places to feed in where available, but where pigeons are numerous, it is not advisable to feed in them, as the pigeons usually attack roots, and would quickly find and eat all the grain put there for partridge. Any patches of rough grass that have not been eaten by cattle are excellent places to scatter a little grain. Partridges always resort to these places for shelter, as well as in search of food. Avoid roadside hedges or footpaths, where birds feeding would be a temptation for anyone to poach them. The keeper or individual who is looking after his partridges will know and avoid any danger of this sort. Feed very sparingly at first until your partridges have got accustomed to the places where you are feeding; then increase to what the birds will readily consume, but on no account more than is necessary, otherwise rats may be attracted to it and, unless destroyed, would become a pest at your feeding places.

This winter feeding may mean extra work on some shoots, but the extra will be well repaid when the shooting season arrives. What can be more pleasing to the sportsman or keeper than plenty of good coveys going over the guns in September and October? This is one way that will help to do it.

Third Prize of £3 - 3 - 0 to:

J. FLEGG, Flixton Hall, Bungay, Suffolk.

MUCH could be written about the different methods of feeding one's partridges during the hard winter months. It greatly depends on the birds' environments whether there is a good supply of natural food or not; different surroundings require different methods, but the keeper should, on his beat, know which of the fields the partridges favour most, and there he should feed. I prefer to start feeding as soon as the harvest is over, as not much food is left on the stubbles these days; and, again, if one starts feeding before the winter months, the birds will know the better where to expect food, and one can keep his birds at home. I prefer to feed on maiden-hair, stubbles, old leys, pit and dell holes, if any, or by the sunny side of kale, which partridges favour much during the winter months. I would avoid feeding by thick fences, as sparrowhawks would soon harass the birds feeding under the fence, and also avoid near highways and footpaths, owing to the man out for a "family shot."

I usually feed about noontime, scattering the seeds and corn about and by taking the same route next day one can soon see if the birds are taking it. I also place water for the birds, as ponds get frozen over, and they have to go a great distance for it if not supplied. Old tyres cut in half make good vessels to hold water, and are light to carry about.

Food I use is wheat, barley, a few small seeds mixed in, and use some oils on the feed and one will find the little brown bird will take no harm during the coldest spell.

NEW CONDITIONS FOR THE GRAND NATIONAL

THE race for the Grand National is a long way off, but the new conditions governing the race have to be made now. In future, the top weight need not be 12st. 7lb., as has been the case for many years. It may be as low as 12st. On the other hand the handicapper can, if he thinks fit, make the top weight 12st. 9lb. It is also proposed that in future the bottom weight shall be 10st. 3lb. and not 10st. as now. I am sure that everyone will agree with this change. I also think that they should agree with a new condition that Mr. Balteel, the Clerk of the Course at Aintree, wishes to make. It is to the effect that no man shall ride in the Grand National unless he has ridden the winners of five steeplechases under the rules of steeplechasing in any country. This new condition is, in my opinion, absolutely essential. Idiotic men, led on by their equally idiotic friends, have recently sought rides in this famous race when they actually were hardly qualified to ride on a merry-go-round. Side bets have been made that they would win; that they would get round; that they would get round once; that they get over the first fence. The last man to try and do all those things did not get safely over the first fence. Such men do not think what they are doing, and they are backed by certain sections of the Press always looking out for stunt news. Such riders are not only a menace to themselves, but also to the professional rider, and there is no finer body of men. I hope that this new condition will be approved.

The Liverpool summer meeting is never the same to me, at any rate, as the other two meetings held over the Aintree course. I think that the reason is that the summer meeting alone is held under only the Rules of Racing, while the two other meetings are held under both sets of rules, and one has come to think of Aintree as a course for mixed meetings. Nevertheless, last week's racing at Liverpool was interesting and enjoyable.

Lord Astor's colt, Quick Ray, was a very easy winner of the St. George of a mile and five furlongs. He was, however, receiving more than a stone from Sierra Nevada, and the same from Wheatland, who whipped round at the start and took no part in the race. Quick Ray won with ease by five lengths from Sierra Nevada, and at once people began to talk about his chance in the St. Leger. I wonder how far Blue Peter or Heliopolis would beat Sierra Nevada at level weights, let alone at the weights at which Quick Ray met Lord Derby's representative. Quick Ray, on the other hand, is a colt of promise. He is by Hyperion out of Pennycomequick, both classic winners, so that he could not be better bred. Pennycomequick was by Hurry On out of Plymstock, who was by Polymelus out of Winkipop, by William the Third out of that wonderful mare Conjure, the beginning of the Cliveden Stud, one of the historical studs of this country. Pennycomequick's previous foals have been useful, but not outstanding. The first of them, Adept, also won this St. George's Stakes, but nothing else. Bookseller is still in training, but is not of much account. Pound Foolish won two rich stakes, and so more than paid his way, but he was not in the top class. Quick Ray may be the best of them. There is also a full brother, a two-year-old, at Manton, named Golden Penny, who has yet to run.

Fair Test, who won the rich Lancashire Breeders' Produce Stakes, is a two-year-old of the greatest promise. He is by Fairway out of Surbine, and I recall how much I liked him when he came into the sale ring at Doncaster last autumn. He was bought by Captain Boyd-Rochfort, I think on his own. He no doubt had many offers for him afterwards, and sold him to Lord Portal. Fair Test ran first at Ascot, when he looked to be still a baby. Still, he ran very well, and finished third in the New Stakes, behind Tant Mieux and Stardust. It is true that he was several lengths behind them, but he ran greenly, and was not hard ridden when his rider saw that he could not beat the two in front of him. He had to be ridden fairly hard at Liverpool to win by a length from Bashir, a bay colt by Bahram out of Mah Mahal, the dam of Mahmoud, who was by Blenheim. Bashir is described as bay, but he is really a grey, as was Mahmoud. I think that there is a great future for the first and second in this race. Surbine was also the dam of Superbe, who won the Irish Oaks a few days ago, and also of Buckleigh, one of the best horses ever owned by Lord Glanely, but a very difficult one to train. Poor Buckleigh was found a few days ago in his paddock with a broken leg, and had to be destroyed.

A TRIO AT PARK LODGE
Blue Peter with his trainer, J. L. Jarvis, and jockey, E. Smith

Lord Glanely's luck, a thing in which he does not believe, is not too good these days.

There was much rejoicing in the North, and especially at Newcastle, over the success of Sansalvo in the race for the Liverpool Summer Cup, whose owner is a Newcastle man. The horse is trained by Mather at Richmond in Yorkshire, and Mather is himself connected with Newcastle. As Weston, who rode the horse, is Northern born and bred, and began to ride there, everything was as it should be. Sansalvo is by Jacopo out of La Rambla, and was trained until this year by Captain Boyd-Rochfort. He was bought by his present owner at the December Sales last year. He will win again.

While looking up the breeding of Quick Ray, I used a very valuable little book sent to me by Lord Astor. It is connected with his stud, Cliveden, and contains a list of his horses in training, the yearlings and foals of 1939, the brood mares, the stallions, the stud and racing record, the trainers and jockeys, and foreign sires used. It is an amazing record. The stud was started in 1900, when Lord Astor was at Oxford. He then bought Conjure for a hundred guineas to win Point-to-Points. She went into his stud in 1903. Since then Lord Astor has bought only thirteen other mares, but only three of them are still represented in the stud. They are Popinjay, Maid of the Mist, and Shining Cloud. The last-named was bought in 1935. Every great race has been won, some of them several times, but never the Derby, in which Lord Astor's colours have been carried into second place no fewer than five times. In all those 33 years that Lord Astor has been owning horses, he has had only three trainers. He first trained with Willie Waugh at Kingsclere.

In 1913 the horses went to Manton, where they are now, trained first of all by Alec Taylor, and then, when he retired in 1927, by Joe Lawson. Mr. Taylor still taking a great interest in them, which he does to this day. Lord Astor has been just as faithful to his jockeys, outside criticism having no effect on him. Brennan has been with him since 1918, 20 years retained by one owner. And Brennan still rides a winner or two. Frank Bullock was his first jockey for many years, while Bobby Dick rode first for him for seven consecutive seasons, and could have gone on doing so if he had not wished to retire and set up as a trainer. G. Richards and Bobby Jones now ride mostly for him.

I cannot add up the money won in stakes by horses bred at Cliveden, but it is enormous. The first two years nothing was won at all, but ever since then there has never been a blank year. Some of them have not been as good as others, but on the whole the stud must have been self-supporting for many years, for in addition to the brood mares and winners there have been some very successful sires standing at Cliveden, most notably Buchan, who was full for years and years at a big fee. GNOSTIC.

ALL horsemen will have heard with regret of the motoring accident with which Major and Mrs. J. C. Friedberger met last Sunday. Major Friedberger broke his right thigh and his wife sustained serious concussion. We wish a very speedy recovery to this gallant horseman and his wife.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

FEW of us have either the time or the inclination to walk every day to work or play, and the many hours spent on office stools or railway seats cannot but aggravate the fate of so many sufferers of headaches, biliousness, sleepiness during the day or sleeplessness at night, minor ills in themselves yet quite sufficient to make all the difference between joy and misery, a sweet or a sour temper.

In the great majority of cases, so doctors tell us, the cause of most of those ills is "intestinal stasis," the learned and polite name of constipation: hence the considerable number of remedies sold by all chemists to cure it. But we all know that prevention is better than cure, and we all have every day and twice a day the means of preventing constipation by a judicious choice of foods which, whilst pleasing to the sense of taste, are unaffected by the gastric juices and are therefore expelled without delay. By including a proportion of such foods every day in our diet we can make sure of keeping off all evils due to constipation without having recourse to any purgatives.

We all know that milk, sugar and eggs are excellent foods, but we do not always realise that they can be too good, that is they are so completely used up that our bowels are not given any chance; hence the inevitable constipated state of people who are not as moderate as they should be in their consumption of milk, sugar or eggs. On the other hand, quite apart from their blessed vitamins, vegetables contain a more or less considerable proportion of cellulose, a fibrous substance which has no food value whatsoever, but one that is invaluable on account of the roughage that it supplies, the most natural, hence the best, means of "sweeping the flues" and avoiding constipation. Coming to concrete examples of meals which are a safe and pleasant form of insurance against constipation, here are two suitable summer menus, one for lunch and the other for dinner:

A SUMMER LUNCHEON
Melon Cantaloup
Artichauts à la Grecque
Colin aux Aubergines
Courgettes marinées à l'Orientale
Salade de Laitue
Fromage
Fraises et framboises
Wine
Sylvaner d'Alsace

A SUMMER DINNER
Potage Marie Stuart
Sardines fraiches aux tomates
Fricassée de Poulet Vallée d'Auge
Epinards à l'Anglaise
Salade de Romaine
Water Ices
Figues et raisins
Wines
Muscadet to begin with and a Pouilly-Fumé to follow

FIFTY YEARS AGO

From the *Field* of July 27th, 1889.

CROWN Rights in Scotland. "The Select Committee of the House of Commons, inquiring into the Woods and Forests Department, took evidence on Tuesday, relating to Crown rights in Scotland. Mr. Culley, one of the commissioners, stated that the Crown rights were transferred to the Woods Department by Act of Parliament in 1833. The revenues, which were then £16,000, had risen to nearly £24,000.

In 1856 the revenues of the Crown from the salmon fisheries in Scotland was £54. The revenue last year was £6,500. After the decision in the Gammie case in the House of Lords in 1859 the revenue rose. The effect of that decision was to show that the Crown had the right of salmon fishing around the coast of Scotland, as part of the hereditary revenue. Fishings which in 1856 let for £20 now let for £700. A total of £30,665 had been received by the sale of salmon fisheries; but the department preferred to keep them until they became valuable. . . . A great many proprietors had salmon fishing in their titles. The Duke of Richmond was a larger proprietor than the Crown."

The New Minister of Agriculture. "We certainly believe that the new Minister of Agriculture for Great Britain will have a great deal to do besides supervising the management of the numerous voluntary agricultural associations which levy subscriptions on the public, on the pretext of advancing the interests of the occupiers of land; but we are quite positive that this supervision will have to be no unimportant part of the duties of a Minister of Agriculture. . . . Agriculture has been wounded in the house of its friends;* and this, too, in the interest of, if not under prompting by, the council of a voluntary association,† of whose career of fifty years nothing can be affirmed with the same certainty as this—that it synchronises with a period which has witnessed the greatest and the most widely diffused suffering of the class for whose benefits it professed to be steward; whilst it has apparently neither the power to foresee impending misfortunes, nor the ability, when they have come, of pointing out any consistent line of conduct by which such extraneous troubles may be minimised."

IN THE SALEROOM

ONE of the last sales to take place at Sotheby's for this season is to be held on July 31st and following day. The properties of the Baroness d'Erlanger, the late Lady H. S. Dalziel, Mr. Horace Beck, Princess Ducas and H.E. the Baron von Wachendorff (former German Minister in Cairo) are to be sold, and include some Assyrian, Egyptian, Greek, Roman, Indian and Persian antiquities of more than ordinary interest. There are a seated sandstone figure, 11in. high, with inscriptions, which is ascribed to the New Kingdom; a finely modelled bronze horse, 6in. long, apparently once part of a chariot group, Cypriot work of the seventh century B.C.; three life-size heads of two bearded men and a woman, marble, Attic, fourth century B.C., all three in their original state, absolutely unrestored; and an exceptionally fine fourth century B.C. votive relief, 15½in. by 21½in., of eight figures, found near Sunnim.

The gold jewellery includes a necklace, of links of double-loop form, with heads of bulls, third to fourth century B.C.; a pendant, Macedonia, fifth to sixth century B.C.; and an Etruscan gold swivel ring, with a scarab. In the Persian antiquities are a lacquer eighteenth-century pen box, a mirror case painted with figures, a lacquered chamberlain's staff (50in.), with engraved silver knob, and a miniature of the sixteenth to seventeenth centuries painted with two figures. The Indian work includes a number of figures in granulite and sandstone of the tenth and eleventh centuries.

A TRAVELLER'S NOTEBOOK

ORIENTAL rugs are very attractive, don't you think? It may be they look better in the East than here, but all the same I have been in English houses which are definitely adorned by a few well-chosen specimens. Nowadays one can buy very fine ones in London at a reasonable price—indeed, one will probably pay far less than if one were to engage in interminable bargaining with some Eastern merchant whose Oriental wiles would certainly be too much for a simple European. There is, of course, a very wide range of varieties and qualities from which to choose, and, whether you are a millionaire or, as is more probable to-day, a man with an overdraft, you can buy something that will please your taste and suit your pocket.

* * *

Those beautiful Bokhara rugs are among the most sought after, for the colours of strawberry red and black go with almost anything. Also they are very soft with a thin pile and—two marks of a good rug—lie quite flat on the floor and show a clear pattern on the back as well as the front. There are two main designs, the Elephant's Foot and the Princess. Concerning the former there is a picturesque story, which runs as follows: "An elephant cut itself and so left blood-stained footprints as it walked along in the snow. Soon after a caravan happened to come along and the tribesmen of the caravan struck by the effect decided to use the elephant's foot as the chief motif in their rugs." The Princess Bokhara decorated with large cross and branched candlesticks is interesting also, particularly as the design is that of a prayer rug with a place for the head and hands. You may remember in Flecker's play Hassan, Ishak the musician says in reference to a carpet Hassan longs for, but dare not seek: "I will bring it to you. You shall stretch it out upon the desert when you say your evening prayer, and it shall be a little meadow in the waste of sand."

* * *

The Baluch rugs with rust red as the chief colour are popular, and, unlike the Bokhara, quite cheap. They are often made with a pleasing flower design, and the more unusual ones, which I like best, have in them a good deal of blue. Persian carpets are rightly admired on account of their beauty. Some of the more valuable are most elaborate creations showing the tree of life or hunting scenes with lions and tigers. Unfortunately many of the more modern rugs are now spoilt by the use of analine dyes, which cause the quick fading of too brilliant colours. This growing evil it is difficult to counteract, as the Persians, so a friend of mine tells me, like faded rugs as they find them less distracting to meditation.

* * *

Good Turkish rugs are also becoming difficult to obtain, though Istanbul is still a happy hunting ground for those in search of specimens. Many rugs come in from the Caucasus, notably the thick piled Kosak variety which wear very well and are most suitable for a hall or dining room. They are frequently decorated with crosses and grotesque figures of animals some of which have as many as six legs.

* * *

Once I was quartered in the hunting lodge of the Sultan of Turkey at Hereke, and nearby was the Imperial carpet factory, where little girls copied on to large looms an elaborate pattern from a small specimen. It was amazing the dexterity and speed with which they worked, and the results were most pleasant, though, alas, the small rug with which I was presented on departure has long ago lost most of its colour.

* * *

North African rugs are somewhat crude. The general admiration for the brown-tinted Kairwan rugs I do not share, but I do like the red Berber kilims—they have no pile—which are to be found in Tunisia, Algeria and the Moroccan Middle Atlas. Often there is a protective decotation. The Glaoua rugs from Marrakesh display an eye in order to ward off the evil eye, and the thick pile rugs in brilliant orange and yellow from Karia Ba Mohammed are decorated with numerous crosses. This is due to the fact that the Berber Moslems who made them were once Christians.

* * *

Moslems of course always take off their shoes before entering a house, and so their rugs have a very long life. Naturally we cannot do this in England, but I think people might look after valuable rugs with a little more care. Sometimes Bokharas and Persians are treated in the most cavalier fashion and suffer in consequence. Surely they could either be used as a covering for a couch or else be hung upon the wall, for not only are such rugs as these unsuited for hard wear, but also they are not seen to full advantage. There are plenty of strong and, for that matter, beautiful, varieties suitable for the floor.

F. H. M.

LETTERS TO THE EDITOR

BIRD PROTECTION

SIR,—Earlier in this correspondence, I wrote that I approved your proposal that egg-collectors should be included in the suggested conference on this subject, because when they come into the open they inevitably give their case away. The letters from your collector apologists have shown clearly enough the correctness of my prognostication. The old red herrings about additional damage done by game-keepers, photographers, fires, natural causes and vermin, and about birds laying again when robbed, have been tediously dragged across the trail. Your protectionist correspondents' replies have once again confuted these tiresome irrelevancies, and have quoted details of more recent acts of collectors' vandalism. If red herrings form an essential part of collectors' defensive armament, may we ask for some fresh fish? The old ones have long been malodorous.

All collectors protest that they collect for some (usually unspecified) scientific purpose. But egg-collecting does not smell more sweet when it is dubbed "oology." Psycho-analysts have recorded some unpleasant facts about the collecting mania and its concomitants. Its real source is often merely the possessive instinct. And the fact that most collecting means law-breaking is significantly ignored.

Under present conditions it is impossible to record the appearance or nesting of rarer species. I recently had to refuse information of this nature to a scientific publication because my own experience has proved that it would put collectors on the scent. And so genuinely scientific ornithology suffers.

One correspondent naively proposes that because he finds it "exciting" to try to pick out and shoot a variety from among stray migrants the shooting of all birds (except a few rare ones) should be allowed from August to February! Others may question whether any useful purpose, scientific or otherwise, is served by shooting some unfortunate migrant which has lost its way and wandered to our shores. True, it will be "added to the British List," but whether a casual and probably unpremeditated visit really entitles the victim to inclusion is a matter upon which opinions differ. Many will rather agree with your other correspondent, who prefers to watch the live bird rather than to handle its unhappy corpse. For myself, I can only say that the sight of longshore gunmen blazing away at little birds on the chance that one may prove to be a rarity fills me with disgust.

The mental attitude of the defenders of private collecting revealed by this correspondence augurs ill for the success of any conference. There does, however, seem to be some measure of agreement that to-day the collecting of eggs and skins is necessary and useful only when authorised for the formation or completion of museum collections. I agree with your correspondents who advocate the formation of representative collections of eggs and skins for this purpose. But such collecting should only be allowed under such licences as were recommended in paragraph 87 of the Report of the Committee on the Protection of Wild Birds, issued in July, 1919. The Committee advised that these licences should be granted only to suitable persons, for a specified time, and for definite areas and species, and that the licencees should enter into a bond, with sureties, to guard against abuse.

Except for such purposes and under such licence the collecting of eggs or skins should be abolished by law. If all sections of opinion could agree to advocate and accept this solution it would put an end to a controversy which has already lasted too long, and has in many quarters earned ornithologists the reputation of being hopelessly quarrelsome. If, Sir, your suggested conference could bring about such an "appeasement" you would earn the gratitude of all real bird-lovers.

To many of us the most ugly aspect of collecting is its wanton destruction of beauty. Birds, as one correspondent truly says, are a national asset. A countryside without birds would lose half its charm. It is useless to make an appeal for their protection because of their beauty to those who prefer eggs in a cabinet or stuffed birds in a glass case. To them we are "sentimental fanatics." But public opinion will not much longer allow a small and selfish minority to continue their work of destruction.

Yours faithfully,

Holt Anstiss, E. W. HENDY.
Porlock, Somerset.

SIR,—Mr. E. P. Chance does not appear to realise that if jays and magpies were exterminated it would mean an enormous increase in destructive grubs, insects and rodents which those birds destroy. The Advisory Leaflet No. 242 of the Ministry of Agriculture pronounce these birds "*beneficial species*." Is it possible with the slightest regard for the truth to call them "vermin"? Since when has "vermin" been considered a "*beneficial species*"? The mischief that *some* of these birds do is too short-lived to demand the forfeiture of life when procuring food for their family and fulfilling the law of their being. Killing them in the nesting season means leaving their young ones to die by the agony of starvation. These birds play a great part in the balance of nature, and are just as important to the universal scheme of things as are we ourselves. They are not infected by the deadly virus of brutality *for its own sake*, they do not take life for a hobby, they take it for food. Could Mr. Chance explain why the cuckoo should be allowed to eject and kill beautiful and useful nestlings with impunity, if he wishes jays and magpies exterminated if *some* of their members take a few eggs or nestlings? Could anything be more unfair? Jays and magpies are two of our most beautiful, useful and intelligent birds. Long may they live.

Yours faithfully,

Berks. T. S. HAWKINS.

SIR,—I have read the correspondence in your columns on the subject of Bird Protection with great interest. Some reference has been made therein to the Nest Adoption Scheme sponsored by the Association of Bird Watchers and Wardens. As some of your correspondents appear to be labouring under a misapprehension as to its objects, may I, as the author of the scheme, be allowed space to correct them.

The scheme is not aimed, as they appear to think, primarily at egg collectors. It is an attempt to induce gamekeepers to spare those raptorial birds, whose status as breeders is in danger, by a system of rewards for broods safely reared on their beats. I need hardly say that the employers consent is first obtained. It naturally follows that the keeper will do his best to prevent the eggs from being taken by collectors, as he would then lose his reward. The foxhunter has found, that, if he wants an adequate supply of foxes, he must pay "litter" and "find" money to keepers. The system is almost universal and achieves its object. It occurred to me that if ornithologists want birds of prey preserved they must take a leaf out of the foxhunter's book and give the keeper some similar monetary inducement. The scheme has now been in operation for two years, and has so far only been applied, as I originally intended it should be, to certain rare raptorial species. There is, of course, no reason why it should not be modified in the future to include other birds, not regarded as enemies of game. No one, I imagine, will deny that game preservation has been mainly responsible for the extermination of birds of prey. But that hardly seems to me a good reason why egg collectors should assist in and hasten that extermination, as they are undoubtedly doing. Two blacks do not make a white.

In the case of such a bird as the dottered, the gamekeeper cannot be held responsible for any decrease in numbers. The suggestion that they are shot on migration may have been true 60 years ago, but is certainly not so to-day. They pass through England during the close season, and would be most unlikely to be shot. I am afraid the egg-collector must take the blame for any decrease that has occurred during the last 25 years in this case. I am personally acquainted with a large number of keepers in England and Scotland, and I know that practically all of them quite openly break the law with absolute impunity many times a year by killing birds of prey on the protected list.

Mr. Jourdain has stated in your columns that his and other collections may contain from ten to 15,000 eggs. Presumably a very large proportion, perhaps 75 per cent., of those eggs have been illegally taken, rendering the takers liable, had they been detected, to fines totaling many thousands of pounds.

No further testimony is required in either case as to the utter inadequacy of our present Wild Birds Protection Act to achieve the objects for which it was framed. I understand that the Home Office contemplates the introduction of a new bill. But the wheels of democracy turn exceeding slow. In the meanwhile for certain species the sands are fast running out. If they are to be saved from extermination as breeders in this country something must be done at once. Is it not time that ornithologists, oologists, protectionists, all the other "ists" and even ordinary bird lovers like myself, dropped mutual vituperation, and got together to devise some means of saving those birds which are in danger? May I suggest, sir, that you add to the already great achievements of the *Field*, and now take the initiative in a practical form, by inviting representatives of the various bird protection societies, prominent egg-collectors and bird photographers to meet round the table under an impartial chairman such as yourself? Let them agree to a list of birds, however small, that are admitted by all to be in some danger of early extermination in this country. All have professed a desire to see them saved. Having agreed to such a list, would not the oologists undertake to spare those eggs for a term of years, and to use their influence to get their fellow-collectors to do likewise? At the same time, photographers should be asked to refrain from taking pictures of such birds at the nest. A joint letter might be signed by all the representatives, and sent to all known collectors and photographers asking them to co-operate by giving a similar undertaking. Letters could also be sent to the owners, or lessees, of land, where such species breed, or are likely to do so, pointing out their rarity and asking them to afford them all the protection in their power.

We all profess to have the same object at heart; surely with a little good will it is possible to do something before it is too late. It is no good waiting until a species has reached the pitiful state of the kite, before we try to save it. Let us tackle the others in time before the breeding stock is reduced so low that there is little hope of their recovery.

Yours faithfully,

Passnores, Harlow, Essex. G. DENT.

SIR,—Last week Mr. N. Tracy wrote as though he does not know the truth about my investigation 20 years and more ago into the breeding habits of the red-backed shrike.

He has surely read my statement of the facts in "An egg collector replies to his critics"; therefore his reference to me as having robbed the red-backed shrikes' nests *as recorded* in Mr. Eric Parker's book, *The Ethics of Egg Collecting*, is misleading.

Mr. Tracy should by now be well aware that the statement given in that book is untrue, and having that knowledge should surely therefore refrain from repeating it.

Yours faithfully,

Gurdons, EDGAR P. CHANCE.
Witley, Surrey.

Mr. N. Tracy, hon. secretary of the Association of Bird Watchers and Wardens, has asked us to say that there is no truth whatever in Mr. Nethersole-Thompson's statement that he was approached by an agent of the association with a view to enlisting his aid. Someone who is not a member suggested that this should be done, but Mr. Tracy replied that he could not entertain the suggestion for one moment.

[This correspondence is now closed.—ED.]

GROUSE AND DISEASE

SIR,—Grouse disease is with us once again, and it only remains to be found out which moors of England and Scotland have suffered most from it. Some moors and districts may have an actual clean bill of health in 1939, for that is so in every outbreak.

Grouse must be still rather scarce in the extreme north of Scotland, and in the district of Kintyre were scarce enough in 1938, so that one would expect those outlying districts, and others like them, to escape disease at this season, if overcrowding, and not a failure of the heather crop, is the principal factor of grouse disease production.

It is known to most of us that the infection for grouse disease is bred in grouse droppings, and that the more insanitary a moor is, the worse for the grouse, which, as adults, become doubly or trebly infected with that worm named by scientists *Trichostrongylus* and, as chicks, with coccidiosis.

Experience of many grouse disease visitations teaches that more than an excessive number of grouse is needed to produce grouse disease. Number is but one factor for disease production, the decisive one being a failure of food supply.

Heather has not the same food value in all seasons, and in years when the heather is at its best regarding nutritive powers, there is enough of it on every moor to feed more grouse than are there.

One year in which drought was the decisive factor of disease was 1911, and that drought began in spring and lasted up to the end of August. The heather became brittle and sapless, the grouse were thin in September, and the old hens had to be withdrawn from the bags because of their emaciation in October.

Some old hens died in winter, and the old cocks began to go in January and February. Nesting grouse had fewer eggs than usual, and numbers died while sitting. The heather, which had been weakened by the drought in 1911, was blasted again by blighting east winds and drought in the nesting season of 1912, and the result was a big drop in the grouse bags of that year.

The present outbreak of grouse disease is no doubt due to failure in nutrition of grouse owing to excessive worm infestation and non-nutritive heather. There was drought in the spring of 1938 to weaken the heather, and there was much snow last winter to spoil the heather under the drifts and to starve the grouse.

Deer are fed now, and so are partridges, so why not feed grouse? Yours faithfully,

Perthshire. DUGALD MACINTYRE.

"MADE UP INTO HUGE PARCELS WITH GALVANISED FENCING WIRE"
(See letter "Croys in New Zealand")

CROYS IN NEW ZEALAND

SIR,—I send a photograph which may be of interest to owners of rivers or fishing in Britain. This method of strengthening banks is used everywhere in the South Island of New Zealand, where the rivers are nearly all glacial torrents.

As the photograph shows, river boulders are made up into huge "parcels" with galvanised fencing wire, and the result is not at all unsightly and seems to be very satisfactory. It seems to me that this method could be employed on our mountain rivers and might make good dams on smaller streams, always supposing there is a suitable stone on the spot.

Yours faithfully,
C/o 2nd Bn. The Loyal Regt., Gillman Barracks, Singapore, S.S. E. F. WATKINS.

[The system for use in dams is already well known in Scotland where such wire sacks filled with boulders are known as "croys."—ED.]

CARRION CROW

SIR,—The interesting letter and photograph of a very large carrion crow in your issue of July 8th made me wonder whether the bird was actually a crow or a raven.

In my measurements of birds' wing-spans I found that a raven's wing-span is round about 42in., and the wing-span of a large female peregrine falcon measured against an old raven's, was almost exactly the same.

The photograph produced in the *Field* appears that of a raven, but it would be interesting to have the bird examined by an expert.

Yours faithfully,
Perthshire. D. M.

PRESENTING THE FLY

SIR,—I was particularly interested to read the letter from the Rev. George Dean, which appeared in your issue of June 10th, regarding his encounter with an otter, while fishing the Clywedog, as I have just returned from fishing the same river. So far this year I have spent about three weeks there, while the water was rather low, and have not seen any otters. Of course, I do not doubt the veracity of the esteemed writer's story, but it intrigues me to know where this encounter took place, as the stream seems too small in most places to form a comfortable habitation for these animals.

However, there are plenty of big fish in some of the pools, and it may amuse your readers to hear how I discovered that excellent sport could be had with the larger trout by rather a curious method of presenting the fly. During the day I noticed that only small fish would take the usual dry fly fished in the ordinary way; but at night, when it became too dark to see my dry fly distinctly, then the big fish could be induced to rise by the following tactics.

I substituted a large, dark fly with a silver body, tied on a No. 3 or 4 hook. This fly, which embodies many killing characteristics possessed by some of the best-known sea trout flies, I have christened the "Connaught Killer." I cast upstream beyond known fish and *dragged* the fly towards me sufficiently fast for me to be able to see the wake it made; this also had the advantage of keeping the line straight, ready for a strike.

The fish did not seem at all worried by the strange progress of the fly nor of its unusual appearance. Instead, they attacked it hungrily until eventually they were hooked. In fact, standing on one rock, in a very short time I was able to secure seven fish, five of which were about ¼lb. a-piece, and most of them were hooked a few feet from me, presumably after following the fly for some distance. I also missed many other fish and succeeded in rising one very large one of several pounds, which was most exciting, as one does not expect to find large fish in such a small stream. But for this method of fishing I doubt whether I should have had much success.

Incidentally, a very skilful angler I once knew never used to oil his dry fly nor grease his line; instead, he always relied on putting sufficient drag on his tackle to keep it afloat—and this on the River Dart, which is badly over-fished, with the result that the fish are extremely shy. Yet I never knew my friend return with an empty bag! A complete heretic by modern standards, he used a very whippy greenheart rod and level line, but he kept to very fine gut, often 5x, and flies size 00 or 000.

It would be interesting if fishermen would experiment with this style of fishing on other waters, particularly lakes and small streams, and let their experiences be known. Of course it would not be wise to practise this strategy on chalk stream fish!

Yours faithfully,
279, Goldhawk Road, London, W. 12. J. G. LYNDE.

SCAUP ON FRESH WATER

SIR,—Regarding scaup on fresh water in your issue of July 1st, it may be of interest to state that during November, 1935, I watched a solitary scaup drake on one of the Hammer ponds, near Thursley, Surrey.

This bird was consorting with tufted ducks and was not at all shy, and I was able with the aid of field glasses to obtain a good sight of it, and also to sketch it.

Yours faithfully,
Horsham, Sussex. J. GORDON DALGLIESH.

FREAK NARCISSUS

SIR,—The "freak narcissus" which your correspondent, J. A. Miles, describes in your issue of June 24th is not so very unusual.

I have found them here now for several years, and in fact I picked 24 from one bed one year, in order to have a bowl which was "a little out of the ordinary."

Yours faithfully,
Parkanaur, Castle Caulfeild, Co. Tyrone, N. Ireland. Y. A. BURGES.

HIGH JUMP AND HORSE SHOW

SIR,—The presence of Captain Antonio Grutierrez in the Italian team for the Prince of Wales's Cup at Olympia has reminded me of the enclosed photograph which he gave me in Rome last autumn.

Possibly comparatively few of the crowd who applauded Captain Grutierrez at Olympia realised that they were watching the holder of the world's record for the high jump.

I happened to be in Rome last October when Captain Grutierrez had won the Italian Army high jump, an important annual event at the horse show in Rome. He was riding an Irish-bred, thirteen-year-old gelding called Osoppo, and had attained the height of 2 metres 30 centimetres, within a few centimetres of the previous record set up in Paris in 1936. Captain Grutierrez finally rode Osoppo over the astonishing height of 2 metres 44 centimetres, or within a fraction of an inch of 8ft. This photograph shows him in the act of doing this, and I hope that you will find space in your columns for its publication as a tribute to the good sportsmanship and friendliness of the Italian officers.

Yours faithfully,
The Cameron Highlanders, Aldershot. ALEXANDER MONRO.

ROEDEER IN SURREY

SIR,—I was interested to see Mr. Michelthwaite's letter in a recent issue. The more inaccessible parts of Boxhill, now National Trust property, should provide an ideal habitat for roe. I know the ground well, having rented the shooting of it some years ago.

The buck I saw was heading north, and let us hope he found his way to the dense woods on Boxhill.

The lightness of colour remarked upon by Mr. Michelthwaite was probably due to the change of coat which usually takes place at this time of year.

The buck I saw was in that process. I also have done a considerable amount of roebuck stalking with a small-bore rifle on the borders of Ross and Sutherland.

Yours faithfully,
Little Denshott, Leigh, near Reigate. G. C. GARRICK.

REDUCING ROOKS AND RABBITS

SIR,—The letter signed "J. R. W. G.," in your issue of June 3rd, seems to regard rooks and rabbits as equally harmful to farming. Recent investigations of the University of London Animal Welfare Society (now incorporated in the Universities Federation for Animal Welfare) have proved that rabbits are a real source of loss in agriculture and should be exterminated. It has been shown that this can be done most effectively by cyanide dust blown into the burrows. The dust remains until it is moistened by natural means, when it evolves hydrocyanic gas, which kills instantly by paralysing the heart. The dust can be obtained in the form of calcium cyanide, which is sold under the name of Cymag. Full particulars are given in *Man versus Rabbit*, by Dr. Kirkman (U F A W., Gordon House, 29, Gordon Square, W.C. 1). It has been proved over and over again that the common steel trap, an instrument of torture, is quite useless for eradicating rabbits from the land. If the Bill now being considered by Parliament passes into law, there will be no more ferreting as a sport, for there will be no rabbits left to shoot.

On the other hand, rooks are beneficial to agriculture during the nesting season and at times of ploughing, while at other times they are omnivorous. They have got a bad name among farmers, who only notice them when attacking ripening corn. If rooks become too numerous in a district they must be reduced, but it is sheer cruelty to do so by shooting the young at the nest. When rookeries increase in a farming district to the extent of constituting so-called "black spots," they can be reduced by Dr. Collinge's method (*The Food of Some British Birds*, York) of destroying the eggs before the chicks have hatched, or by pursuing a policy of "systematic destruction of nests."

It has been said that rooks will desert a rookery if the young birds are not shot, but this is quite untrue. Nature has her means of carrying on. When a rookery grows too large it becomes difficult to obtain food for its population, and the younger rooks are driven out to seek fresh sites.

Yours faithfully,
10, St. Albans Grove, W. 8. D. A. MACALISTER.

A FRACTION SHORT OF EIGHT FEET
(See letter "High Jump and Horse Show")

CHESAPEAKE VERSUS LABRADOR

SIR,—In some recent issues of your paper I have read with much interest remarks and views expressed about the Chesapeake. Perhaps my own experiences with this breed, and also the opinions of some of my American friends, may prove of interest to you. Many years ago I owned and also shot over several Chesapeakes. Their work, especially in the water, was, as a rule, excellent; they were big, bold, fearless dogs with lots of courage and endurance, and splendid for winter work under the most trying conditions.

At land work, when the game birds I mostly shot were blue, ruffed and sharp-tailed grouse or prairie chicken, the Chesapeakes were not so good. Sometimes they were hard-mouthed and often difficult to control, and their noses were not so keen. One advantage they had, which was of considerable help under certain conditions. In the big, bare stubble fields where our duck and geese used to feed, if the birds had been much shot at and disturbed, they became very wild and very hard to get within range of, so that even the black Labrador lying at heel often sent the overhead flocks away out of range, whereas owing to the dead-grass colour of the Chesapeake the birds overlooked the dogs and the gunner got in his shots at passing flocks. Apart from these few good and useful traits in the Chesapeake I do not consider him nearly as good an all-round gundog as the Labrador.

The Labrador is more reliable all round, certainly on upland game, and a better hunting dog than the Chesapeake. He has more brains, which one might gather from the formation of his skull. I might point out here that I believe the Chesapeake still is, taken all round, the more popular of the two breeds, but this, I think, is to a very great extent accounted for by the fact that the Labrador has only come into his own in the States within the past ten or twelve years. He is still (although making steady strides in general favour) comparatively little known, and the price of good Labradors is much higher than that of the Chesapeake.

When it comes to the question of field trials, and these days the American trials are very exacting, the Chesapeake is almost completely off the map. The Labradors win, I should say, about 90 per cent. of the awards, or even more. A few good Chesapeakes can still be seen at these trials, but their percentage is very small indeed.

There are now many lady owners of Labradors, and some of these handle their own dogs with great excellence and success at the various American trials. I might here mention that Labradors are now being trained and used to a certain extent to work as spaniels. Perhaps I myself have had something to do with this. For more than a decade now I have trained, and had trained for me, many of my Labradors to work in this way, and I have advertised the fact pretty frequently in various magazines, &c. Just why they are not more used to hunt and find as well as retrieve I do not know, but it adds 100 per cent. to their value, efficiency and help to the ordinary sportsman. I am glad to see that a few prominent American Labrador

THE TWO CONTESTANTS
(See letter "Chesapeake versus Labrador")

enthusiasts are now training their dogs to work in this manner.

Mr. Chas. L. Lawrence, now President of the American Labrador Club, staged a field trial last fall, the first of its kind, on his estate in New Jersey, for retrievers used as spaniels. There were some twenty entries, and the trial was a great success. The winner, Banchory Varnish of Wingan, put up a first-class performance in the dual capacity. No doubt this trial will prove the forerunner of many others, as several of the best trainers in America are taking the matter in hand.

One word of warning, however, I may give from my own experience. If Labradors are to be trained to do spaniel work I would not allow them to be handled or trained in this way during their first season at field work, and especially so if these young dogs are from highly strung field trial strains. Unless the trainer has taught his pupil the most important lesson of his life, absolute obedience under all conditions, disaster at any spaniel work field trial is almost sure to follow. No brilliant pupil and game-finding Labrador is *at heart* really steady and to be relied upon during his first season when out with the gun, and often it takes longer than one season before he can be trusted.

In conclusion, I do not wish for one moment to belittle the merits of this fine American dog, the Chesapeake, but from my own experiences, dating over many more years than I care to look back upon, I have not the least hesitation in placing the black Labrador far ahead in every way as an all-round gundog, and also as a house dog and companion. I have had a considerable amount of correspondence with many well-known sportsmen and field trial trainers in the U.S.A., who have had wide experience with both breeds, and they one and all agree with my opinion, which is that in general merit, both as a sportsman's dog and as a field trial one, the black Labrador far exceeds the Chesapeake. This assertion, I think, is proved by the fact that in most of these big American kennels the Labrador has almost entirely superseded the Chesapeake, and as I already mentioned, nearly all the field trial awards are won by the Labrador.

Yours faithfully,
Ewing's Landing, Okanagan Lake, B.C., Canada. R. LECKIE-EWING.

LYING IN THE GALWAY FISHERIES
(See letter "Salmon from the Air")

ON LANDING A TROUT

SIR,—In the third interesting and useful letter to young fly-fishers by "Uncle Harvey," he says: "Never try to scoop a fish out with a net. It should be guided over it by the rod while the net is held still."

But we are not told to avoid getting the head in first. I hardly realised the importance of this until on July 5th, 1937, when fishing from the bank of a Somerset reservoir, I lost a fine brown trout of quite 4lb. through twice trying to get it into my knuckle-joint net head first. The second time I got it up to the net it rubbed the gut cast against the wooden frame of the net, and got away with the fly (Watson's Fancy) in its jaw. Unknown to me at first, the keeper of the reservoir was near me, and he had seen the fish jump after my first failure to get it into the net, and agreed that it was "a good four-pounder."

Yours faithfully,
Clifton. H. STUART THOMPSON.

BLUE TITS' BEHAVIOUR

SIR,—On April 9th (Easter) a pair of blue tits commenced nesting in a box on my house, but quickly deserted, probably owing to the presence of cats. I had the box removed at once farther out of harm's way, and on June 9th the birds, presumably the same pair, returned. The hen commenced carrying material and was fed immediately by the male bird, and the bird appears to be sitting close at this date (July 7th). The box is fixed next to my window from which I can observe the birds uninterruptedly. From an experience of 30 years, I can say I have never known tits nest so late as set out above. In the box last year, a pair commenced operations on February 27th. The birds show great affection, and the hen frequently takes food from the beak of the male, who calls to her to come out for it.

From observation I believe three weeks are usually occupied in rearing the young.

Yours faithfully,
Newcastle-upon-Tyne. J. F. STEWART.

SALMON FROM THE AIR

SIR,—Some of your readers may be interested in the enclosed photograph showing salmon waiting to go up and lying in the Galway Fisheries. I took it from the bridge above.

Yours faithfully,
Crowborough. ESME K. RITCHIE (Mrs.).

WOODCOCK SITTING IN JULY

SIR,—On July 6th this year one of my men, while trimming a ride in one of my coverts, found a woodcock sitting on three eggs.

Is not this late for the bird to sit? I should be interested to know if any other reader has found a similar case.

Yours faithfully,
Monmouth. A. H.

Ninety pipe smokers

in every hundred will find in Chairman the mixture that answers every desire. A fragrant, pleasant, cool tobacco that gives six joyous hours of smoking to each ounce.

Chairman Tobacco

In 3 strengths. CHAIRMAN (medium), BOARDMAN'S (mild) RECORDER (full).

1/3½ per oz., in ½ oz., 2 oz., and 4 oz. vacuum tins. Made by the successors to R. J. Lea, Ltd., and sold by tobacconists everywhere.

P 484

HUNTED HARE CAUGHT BY EAGLE

SIR,—Previous to the outbreak of the Great War we had a pack of harriers at a place called Zsuk near Kolozsvar (now Cluj). The hunting season opened in October and closed when snow and hard frost made riding impossible—usually in December. We hunted regularly every day in the week, Sundays excepted. The country over which we hunted is rolling, hilly grassland, without trees and with some very steep slopes, making downhill riding by no means easy. There were no fences, only some drainage ditches to jump.

It was, as far as I can remember, in 1911, on a fine November day. We were hunting a very strong hare, which gave us a long and straight run up and down hill. During the whole of this run we were followed closely by a pair of golden eagles, flying low over the ground and alighting from time to time on prominent hillocks, where they watched the pack as they followed the trail. When the hare began to slacken pace and the pack drew close to their quarry, as it began to cross over a ridge, one of the eagles made a headlong dive down the far side of the same and struck the hare when it was about 20yds. in front of the hounds. However, the hare was a heavy one, and the eagle could not get away with it quickly enough, and it was only about 12ft. from the ground as one of the hunt followers rode just below it and tried, fruitlessly, to hit it with his hunting crop. His effort made the eagle drop the hare, which was already dead, and it flew slowly away and disappeared over the next hill-top. I wonder if anybody has had a similar experience?

Yours faithfully,
Capalnas, Romania. EUGENE, COUNT TELEKI.

GIN TRAPS

SIR,—I have had to deal with three victims of gin traps recently—a fox, otter and cat. The fox and otter were in such a shocking condition that I had to shoot them; they had evidently been in the traps some time. The cat had managed to free the peg and limped up to the house, dragging the trap along the ground. She is receiving treatment, but her paw is badly mangled and septic.

Rules regulating the use of these instruments of torture are of little use, as these are seldom observed. No one with any feeling for animals would allow such relics of barbarity to be used on their property.

Yours faithfully,
Suirmount, J. W. SEIGNE.
Kilmanahan, Clonmel.

AWKWARD DEFORMITY
(See letter "A Pug-nosed Salmon")

A PUG-NOSED SALMON

SIR,—I enclose photographs of a small salmon I caught on the Holne Chase water of the Dart a few days ago. The higher jaw was turned inwards and down its throat, and as it could not have caught herrings, &c., one wonders how it lived. It was not in very good condition, but when cooked its flesh was exceptionally red. It came at the fly twice, and the second time foul-hooked itself.

Yours faithfully,
D. M. W.
South Devon.

[This deformity is well known among many species of fresh-water fish, and does not seem to prevent the fish feeding as most of the specimens are in good condition when caught.—ED.]

THE MOLE CRICKET

SIR,—Your correspondent, Mr. Leighton Ridgway, states that the mole-cricket must be extremely rare in England. On the contrary, in some parts, especially in the southern counties and in damp meadows or in the vicinity of water, it is fairly common. Like the mole, it leads a subterranean existence and is therefore seldom seen. If a patch of ground is watered overnight and a board laid over it, one or two of these creatures may often be found underneath.

Although mainly carnivorous it does much harm to the roots of plants. The front legs are beautifully adapted for burrowing, the tibiæ and tarsi also acting as shears for cutting roots.

Yours faithfully,
Eastbourne. P. G. TILLARD

SIR,—In the summer of 1887 mole crickets were by no means uncommon in the New Forest district, and a friend who lived in Lyndhurst told me his gardener frequently turned them up.

A few days later this man brought me four mole crickets alive. I killed them and preserved them, and they are still in my possession in good condition.

Since then, though I have made frequent enquiries, I have never been able to secure any more.

Yours faithfully,
Hants. CHARLES C. DALLAS.

SALTED BEEF

SIR,—During many yachting expeditions to remote districts I used to carry casks of salted beef and pork that remained in good condition for several months. The meat was salted and prepared by my dairy man, but I have lost the receipt. Could any of your readers give me the method of preparing meat for storage in casks to last for several months?

Yours faithfully,
Norfolk. HARKEN CASH.

SCARCITY OF CORNCRAKES

SIR,—There has been some correspondence lately regarding the supposed scarcity of corncrakes. I was glad to hear the note of a corncrake in a field of hay close to this house on June 27th. They are always uncommon in this neighbourhood, and I cannot recollect when last I heard one.

Yours faithfully,
St. Andrews, Fife. R. W. PURVIS.

A LARGE NUMBER OF SWIFTS

SIR,—On June 12th last, swifts in many hundreds were flying over a wheat field near Grantham, Lincoln. These birds were wheeling round and low down over the growing crop.

On June 15th swifts in some hundreds were flying round Hill Head in Hampshire, where the River Meon enters the sea.

On June 17th several hundred swifts were some eight to ten miles up the Meon Valley, flying around, and feeding all day, but none, or only the normal number, were to be seen there next day. It would be interesting to know if very large numbers were observed elsewhere.

Yours faithfully,
Swanmore, Southampton. M. PORTAL.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—We urgently ask your help for a poor paralysed woman, who has been completely bedridden since the age of five. She is 52, and has managed to earn a little throughout her life by needlework, but now she has reached the stage when she can no longer sit up in bed. Until recently she was cared for by her old mother, but she, too, has now become practically bedridden. Do, please, send us something for these two brave and pathetic women. £13 is needed.

IN THE CITY

By OUR CITY EDITOR

BRITISH industry as a whole has received great impetus from the rearmament programme. Boom conditions are enjoyed in several industries. Unemployment has been very substantially reduced, and in some trades there is acute shortage of skilled labour.

It is encouraging to find some industries which are not directly benefiting from rearmaments making distinct progress. One is the rayon trade. The outlook for this industry is brighter than it has been for some time, partly due to general trade conditions, but also to a better understanding regarding selling prices within the trade.

Courtaulds, Ltd., and British Celanese, Ltd., which are two of the most important rayon producers in this country, are operating their respective businesses with better understanding. That has certainly brought material benefits to the trade as a whole.

Exports of artificial silk during the month of June increased. The home trade is also said to be much better, while there is distinct improvement in the rayon industry of the United States. This is partly due to a higher price for raw silk, which has given the rayon companies competitive advantage.

It is reported from New York that some of the leading rayon manufacturers of America anticipate net profits this year better than at any time in the history of the industry. Reflection is seen in the market for rayon shares on the Stock Exchange.

An increase in Courtaulds, Ltd., interim dividend for the current year from 1½ per cent. to 2 per cent. had a stimulating effect not only on rayon shares, but on the industrial sections of the Stock Exchange as a whole. The increase in the dividend is small, but the fact that the very conservative board of the Courtaulds company has taken the step of increasing the dividend, even by a half of one per cent., is regarded as a definite "bull" point for the industry.

Courtaulds' ordinary units have moved up to about 29/–. This price may be regarded as high on the previous year's dividend. Courtaulds' units have invariably stood in the market at a price showing a comparatively slight yield. It may prove that the market takes an unduly optimistic view of the future. At the same time improvement in the industry has brought encouragement.

Those prepared for a reasonable speculation among equities might, in my opinion, consider Courtaulds ordinary around the present price. In the case of Celanese there is still much leeway to make good. The company has, however, recently announced a half-year's dividend on the 7 per cent. first preference shares. This brings dividends on this class up to April 30th, 1938.

No dividend has been paid on the second preference shares of the company since October 31st, 1930. There has been no dividend on the ordinary capital at any time. In my opinion, the first preference shares of British Celanese standing around 18/3 ex dividend have prospects, but the second preference and ordinary shares are simply a gamble.

A company which seems to be improving its position is Lansil Limited. This concern was formerly known as Celluloso Acetate Silk Co. The concern is now working on a more remunerative basis. It has certain Government contracts on hand and the directors look forward with some confidence to the future.

The company has paid a 5 per cent. ordinary dividend for each of the past three years. The ordinary £1 shares are valued around 14/6 to give a yield of about £6 17s. 6d. per cent. on the last dividend basis. This high yield naturally suggests the somewhat speculative character of the security.

Kirklees, Ltd., manufactures artificial fibres and artificial silk by the viscose process. It had rather a lean time during the year to June 30th last, when the dividend was 2½ per cent. against 6 per cent. previously. Improvement in the trade has come since the end of this company's financial year. Prospects this year may be brighter. The 5s. shares stand around 3/6. The yield on a 2½ per cent. dividend basis is small, but more normal working in the industry may easily bring a larger dividend for the current year.

SALLY ARRIVES

Sally, the baby elephant which has been long expected at the Scottish National Zoological Park, has at last arrived. She made the short journey from Germany in a large travelling box, and the box was transferred from the boat to a waiting lorry and very soon reached the park. Her tameness and gentleness ensure her being a great favourite with visitors, in particular of the children, whose special playmate it is intended she shall be.

New Books

THE BACKGROUND TO MOTOR RACING

Motor Racing. (Lonsdale Library XXVII). (Seeley, Service; 15/-.)

A NEW volume added to the Lonsdale Library is something of an event for those who like to study their sport intelligently. An event, not because of any lack of new volumes, but because of the undoubted authority which lies behind each fresh publication in the series.

Our fathers, and in the case of some of us, we ourselves, went to the Badminton Library as our friend and guide in matters sporting, but times change, and here is a subject being dealt with unknown to the pages of the Badminton—Motor Racing.

Like all sport, motor racing has a subtle romance, if that well-worn word may be used, only appreciated fully by those who understand it, and the problems which confront its participants. Those who are tempted to dismiss the subject out of hand, and to consider the internal combustion engine as being only a means to an end, and an unfortunate end at that, should remember that their own saloons, apparently so remote from the roaring belching monsters of the racing track, owe a heavy debt to these mechanical pioneers. Motor racing is a sport which has done more of a constructive nature than most.

Edited by the Earl Howe, *Motor Racing* upholds the tradition of the Library, and the names of those contributing to the work represent the cream of authorities on their own particular section of a vast subject.

Reid Railton, one of the greatest designers in the world, writes an extremely interesting and lucid chapter on the designing of specialised cars, while George Eyston tells of the problems of driving these record-breakers when they have been built. It is an irony of fate that the chapter on Grand Prix Racing should have been contributed by R. J. B. Seaman who, so soon after its publication, met his death when racing.

Like all the books in the series this volume is not merely light reading for the motor-minded, and such chapters as Captain J. B. Irving's on automobile braking will tickle the intelligence of the expert as well as the tyro. The illustrations throughout are first class, and do more than brighten up the pages—they are in themselves instructive. Leslie N. Radcliffe.

* * * *

One Pair of Hands. By Monica Dickens. (Michael Joseph; 10/6.)

Miss Dickens has written a most amusing account of her time spent "below stairs." She took domestic situations of all kinds, from cook-general in London flats to cook in a west country mansion. She was bored with the social round of an ex-débutante—and, also, she wanted to write a book. This she has done with a sense of humour worthy of her famous ancestor.

The employers varied. Few sound really nice—and one or two really nasty. We hear continually of the shortage of domestic servants, and there is much in these pages to explain that shortage. Mistresses (and masters) will undoubtedly learn much of which they could have no knowledge, and some things will undoubtedly annoy them. They will also understand, dimly perhaps, something of the stigma that attaches to the words "domestic servant."

But this book is not a fair commentary upon the conditions under which our domestic servants live and work (there is, for example, no mention of those many happy associations between mistress and maid in which both are partners to an agreement mutually beneficent), and it is certainly no fair commentary upon the domestic problem as a whole.

Miss Dickens could return home at any time (she usually did so to be revived with warm milk and a comfortable bed, and the attentions of her own family's servants) and she could depart for a holiday abroad whenever she felt the urge. Furthermore, she had not got to live on the money she earned.

There are plenty of young women (plenty of young women of Miss Dickens's class, though perhaps few of them could fairly be called ex-débutantes) who work under the conditions which Miss Dickens sampled. Very often they are termed "helps"—and they are frequently worse paid and more imposed upon than those who don cap and apron. They do not write books. They cannot go for holidays abroad. They cannot even return home of an evening to comforts provided by rich parents and administered by servants. They know the value of a job—and how slender their chances are of improving upon it, how easily they may become destitute.

There is, indeed, a very wide gap between Miss Dickens and those she tried to copy.

Brian Vesey-Fitzgerald.

Happy Countryman. By C. Henry Warren. (Geoffrey Bles; 7/6.)

In these days of touring and travel when thousands of people flock into the country from the big urban centres every week-end and public holiday, there is naturally a demand for literature that will help them in the search for picturesque villages and pretty places. But admirable though much of this may be, it can scarcely be expected to differentiate between what is beautiful and what is essentially rural. And there is a very big difference. Attractive scenery is to be found almost at London's door, as everyone who visits the home counties knows. But how much of this can truly be called rural in the real meaning of the word? Yet there are those who yearn for the atmosphere of the remoter parts of England wherein lies that life and outlook that has been untouched by the changes of a fast-changing world. They long for the sense of peace and continuity which only true rusticity can bring.

The hero of *Happy Countryman* is Mark Thurston, a true son of the soil, and much of the book is about his village set in the corn-lands of East Anglia. Mark has been an active worker for seventy years, and his philosophy is as refreshing as the charm of the land which is his home. The great days of harvest, of scythe and flail, gleaning and hackling, dibbling and plaiting, and similar features of agricultural life, are well told and make attractive reading. Yet the book is not entirely confined to this bit of England, for Mark tells of his war experiences, and gives his views on army life. And here his attitude to the military regime, when he was, by the way, in his 54th year, will be read with relish, as also the account of some time which he spent in London and even in America. For a countryman his adaptability is remarkable. But it will be the descriptions of the inner life of East Anglia that will make the strongest appeal to those who know or wish to know something of its secrets. W. H. T. Long.

* * * *

The High Seas. By Edgar B. Schieldrop. (Hutchinson; 5/-.)

This is the third volume in Messrs. Hutchinson's "Conquest of Space" series. To this nation it is of particular interest, for the building, ownership, and management of ships is a British speciality.

Do you remember what John Ruskin—an artist rather than a practical man—said in praise of ships? "Take it all in all," he wrote, "a Ship of the Line is the most honourable thing that man, as a gregarious animal, has ever produced."

But Dr. Schieldrop does not deal with "the ship of the line" which moved Ruskin to admiration. He tells us of leviathans which dwarf into insignificance the vessels of his day. In the main Dr. Schieldrop deals with the big liners, and in particular those which are engaged on the North Atlantic route. The comfort and safety of passengers, and the many devices of the sea, are most interestingly illustrated.

I discovered in this book some new facts concerning man's battle with the sea.

* * * *

Adventures on the High Seas. By Captain H. G. Kendall, R.D., R.N.R. (Hurst & Blackett; 12/6.)

If, as Sydney Smith once said, a man is the happier for life for having once made an agreeable tour, then Captain Kendall must be a very happy man indeed. I admit that all his tours can hardly be called "agreeable," but many were, and the others were adventurous enough to make them well worth while.

I never wonder why men go to sea. I understand the reason; it is something in the blood. For Captain Kendall it was "a natural desire to roam, encouraged by an unhappy period at school. He started his life on the ocean waves in a windjammer, so that now—something like 50 years after his first voyage—he can tell of many changes in a sailor's life.

He tells of battering round Cape Horn, of South African fever ports, of San Francisco in the "bad old days," of the apprehension of Dr. Crippen, and of shipwrecks. His autobiography is vividly written, and makes a most entertaining book.

William Luscombe.

* * * *

Water Music. By Sir John Squire. (Heinemann; 10/6.)

Sir John Squire made, more or less in the company of Mr. Arthur Bliss, a canoe trip starting at Oxford and proceeding by way of the Cherwell (whose philological derivation might have saved the learned author's musings on its course) and the Oxford canal to Warwick and the Avon, and so to a telephone conveniently near Salter's. The actual journey serves as a skeleton on which to hang reminiscences of Sir John's experiences over a wider period.

These reminiscences include reflections on Gosse, Kipling and other literary figures, on Zazel, the Human Cannon Ball, whom he met in retirement in the inevitable South of France, and the habits of wool manufacturers while on holiday in Blackpool. If reflections add no great value to the sum of human wisdom, it can at least be said that they are amusing and pass an extremely pleasant hour or so. Mr. Bliss, it may be remarked, appears as a most inconvenient travelling companion, and Sir John Squire as the only man in my experience who would stand it.

Sir John will arouse annoyance (though not fear) among big game shooters when he expresses his willingness to shoot all bongo-hunters, a baffled feeling among those who have to kill badgers, and will move all Methodists to write to *The Times* about the Central Hall. It was not, as he says, a Million Shillings Fund which built this pile, and it was left uncompleted not because of any lack of Methodist money, but because a neighbouring building claimed the privilege of ancient lights. Robert Colville.

When I Was a Boy. By General Sir Ian Hamilton. (Faber & Faber; 18/-.)

Sir Ian has written an amusing account of his youthful experiences from his first adventures of the 'sixties until he left Sandhurst and joined the 12th (Suffolk) Regiment at Athlone. One of his early efforts at marksmanship was to emulate William Tell with his brother Vereker to bear the apple. He missed the target and the arrow struck the victim fair and square in the left eyebrow.

There are tales of troublous days at a school at Cheam and later at Wellington, with adventures on the Continent, but one of the best stories concerns Sandhurst. Here Hamilton had been guilty of boasting of his riding to earn the caustic comment, "Your trumpeter must surely be dead."

He had been forewarned that those who fancied they could ride would have to unlearn everything, and that the first thing anyone who had ridden to hounds had better do would be to forget it. The first day in the riding school they were not going to ride but learn how to go up to a horse, make much of him, mount, assume the correct position and dismount. What happened is told as follows:

"When I was introduced to No. 8 I approached him as if he were a Bengal tigor. When I had to make much of him I patted him at the wrong end, nearly producing disaster of the first order. Having once begun the play-acting I found it good fun. When I tried to mount the dangerous animal I swung my leg over with so much force that I fell on the other side, and even the horse was surprised, for it had not so much as cocked its ears or whisked its tail. Gradually, however, I seemed to gain some notion of balance, and the sergeant-major began to get interested and to regard me as an object lesson on his favourite theme that it is best to start military equitation from the basis of blank ignorance. Our lot were half angry, half amused, but they never gave me away." He became the sergeant-major's favourite pupil.

The old pictures are amusing, especially one of the present Chief of the General Staff, Lord Gort, as a veritable Little Lord Fauntleroy. R. N. Rose.

* * * *

Accentual Symmetry in Vergil. By W. F. Jackson Knight. (Basil Blackwell; 6/-.)

In spite of its somewhat forbidding title, this book is not for the scholar alone: it will deepen and enrich the appreciation of all lovers of Vergil.

The author sets out to shed further light on the peculiar power of Vergil's rhythm—a power which has fascinated the world since the publication of the Aeneid. There is nothing new in showing, as the author does, that this power owes its source partly to a skilful interplay between the natural word-stress and the ictus, or beat of the foot; but Mr. Knight goes far beyond this and, succeeds in showing beyond all dispute that this interrelation between ictus and accent is based upon certain clear principles. Thus their coincidence lends impetus to a verse, and is reserved mainly to stress swift action or strong emotion, while when these accents are in conflict, the effect is one of rest and tranquillity.

By a skilful analysis of such coincidence and conflict particularly in the fourth foot, Mr. Knight has succeeded in proving that Vergil's verse periods are based upon recurring patterns, and that passages of stress and tranquility alternate in such a way that each is heightened by the proximity of the other. By penetrating some of Vergil's secrets Mr. Knight has indeed done scholarship a service.

Though no lover of Vergil can afford to miss this book, I would particularly recommend it to all classical teachers; its careful perusal would soon convince the most hardened offenders of how much their pupils lost by being allowed to stress the first syllable of every foot. F. W. Lockwood.

* * * *

The Trail of Opium. By Margaret Goldsmith. (Robert Hale; 12/6.)

To the masses, opium is fortunately merely a word—something which is inserted into the more imaginative of novels to announce that the setting is the East and that the actors have long knives and dubious characters. To the few, however, it means the easiest and quickest way of escaping the harder side of life—or a menace to civilisation. Which is the way this book looks at it. It follows its trail through the centuries—from as far back as the days of the first Egyptians, the time of Homer, the Middle Ages, to the present day. It brands it "the eleventh plague." It watches it spreading its tentacles across the world like rays from the land of the setting sun. The East is riddled with the pest. And with its growing demand new sources for production are being built, new methods of smuggling devised, new dens springing up. It is a growth which must be checked. Already there have been international meetings to try to stop it. This book is written in the same vein, with the same noble object in view. It is to be wished every success. Humphrey Daniel.

Ernst Toller dedicated his play, *Pastor Hall* (Bodley Head; 5/-), "to the Day when this Play may be performed in Germany." The words reflect the whole spirit of the book. It is about the martyrdom of a Protestant pastor in modern Germany; about all the horror which he (and the author) went through. But it does not condemn. It regrets. Its author loved Germany to the last.

STRENGTH ON THE LINKS

GOLFERS are continually reminded to swing slowly and let their clubs do the work, so that the part physical strength plays is often forgotten. The expert, with his rhythmic grooved swing, seems to obtain terrific length without apparent effort. Yet he does hit the ball, using all the power at his command.

The art lies in harnessing that power, applying one's strength at the crucial moment; the secret is correct timing. The club head has to be moving at its greatest speed just as it comes into contact with the ball if length is to be obtained. This must be achieved without loss of rhythm or balance, without disturbing the groove of the swing itself.

This is difficult enough for a man, but infinitely more so for a woman. Women golfers suffer a severe handicap in the matter of physique. Some of them may appear to be veritable Amazons but, with few exceptions, they do not possess strength in the wrists, hands and fingers. This is a vital disadvantage. Much of the power that the expert professional applies to his shots comes from his powerful wrists and hands. They whip the club through and enable him to get it moving at the greatest possible speed. Consequently, even the best of feminine golfers suffer from lack of length in the long game.

This failing also affects their iron shots and the awkward pitch and run strokes. They may hit the ball a reasonable distance, but when it pitches it runs on and does not bite the ground and stop quickly. Strong wrists are needed to impart back spin. The same thing happens with the shots from just off the green. Most women golfers play these strokes too delicately. Lacking strength they do not give the ball a firm, decisive blow, neither do they restrict the back swing. The swing is inclined to be slack.

One great advantage the strong golfer has over his weaker opponent is that when he hits a bad shot it usually goes so far off the line as to escape just punishment. If he is in a bad lie his strength enables him to extricate the ball so satisfactorily that he saves a stroke he might have lost—and no doubt deserved to lose! The woman golfer when she mishits a shot finds herself in trouble, and her lack of length prevents her recovering so well. She has little margin for safety, and consequently has to keep aiming at perfection.

Matches between the sexes are always interesting and illustrate the vital difference in physique. A year ago Henry Cotton had no difficulty in beating the best ball of Lady Heathcoat-Amory, Miss Enid Wilson and Mme René Lacoste. Length then was not so much the decisive factor as was the putting. However revenge for this defeat was gained by Miss Pam Barton, Miss Jessie Anderson and Miss Wanda Morgan when they won on the home green, Cotton missing a 5ft. putt for a half.

These three brilliant young players did not begin at all well. Indeed, four down at the fourth, seemed to indicate that the match would develop into a dull procession: but the women thought otherwise. Although constantly outdriven, they made few really destructive shots. When one did make a mistake, one of the other two took command of the situation, as Cotton did not win another hole. Even these lady champions betrayed their lack of strength in the wrists and hands when they were chipping. But on the greens they gave little away, and took full advantage of the odds in their favour.

Miss Jessie Anderson, slightly built, overcomes her lack of power by expert timing and by keeping the ball low with the wooden clubs. Her brassie to the 200yds. eighteenth, uphill with a narrow green, was a superb stroke, particularly as her partners had sliced their tee-shots. Cotton, with a No. 2 iron, could not match it.

E. R. TIPPLE.

THE MATCH RIFLE AT BISLEY

THAT the Elcho Shield would be won this year by England for the seventh successive time was a foregone conclusion. Barring an almost impossible series of accidents the result was inevitable.

The interesting point about the match was whether Ireland would at last be rewarded for many years of plucky endeavour by beating Scotland for second place. Her team now includes two very good men at present at Cambridge, and if they can continue shooting when they come down, A. L. Figgis and H. J. Russell may yet see Ireland back in the position she occupied previously to her last win in 1907. Before 1900 she was always a dangerous competitor.

Had this year's match been for teams of five instead of the customary eight, Ireland would have taken first place, beating England by five points.

The teams and scores for the three eights were:

ENGLAND (Team Captain: Lord Cottesloe)	900 yds.	1,000 yds.	1,100 yds.	Total
Major the Hon. J. W. H. Fremantle	74	72	68	214
Pilot Officer J. J. Lowe	71	72	69	212
Mr. C. L. Hall	73	69	67	209
Dr. C. H. Vernon	70	72	66	208
Wing Commander A. T. Whitelock	62	70	62	195
Mr. A. H. Vicars	72	69	63	204
Mr. O. Western	73	64	64	201
Captain M. W. Parr	68	65	65	198
	574	553	524	1,651
SCOTLAND (Team Captain: Major T. Ranken)				
Mr. John Notman	69	70	69	208
Mr. A. E. Martin	70	72	64	206
Major T. Ranken	72	69	66	207
Lieut.-Colonel Duncan Campbell	69	68	69	206
Mr. J. A. Crawford	68	73	63	204
Captain T. Macleod	69	65	66	200
Mr. E. St. G. Maxwell	72	67	59	198
Captain H. St. G. Maxwell	70	65	63	198
	561	549	519	1,629
IRELAND (Team Captain: Dr. J. A. Sellers)				
Mr. S. A. Parke	72	72	69	213
Mr. J. J. O'Leary	70	71	71	212
Mr. A. L. Figgis	74	69	66	209
Major C. R. McGowan	69	70	68	207
Mr. H. J. Russell	67	72	65	204
Squadron Leader J. L. K. Pearce	68	65	63	196
Colonel G. Gould	69	66	57	192
Dr. J. A. Sellers	69	64	57	190
	558	549	516	1,623

The weather throughout the match was about as bad as it well could be. Indeed, the whole four days of the match rifle meeting displayed the worst vagaries of an English summer. There was occasional sunshine, but mostly the events were shot in pouring rain, with occasional thunderstorms. The wind was mostly blowing from the left rear and was very changeable in force and sometimes in direction.

Unlike the Elcho, the Humphry match did not run true to form. On paper Cambridge had much the stronger team and should have repeated its success of last year, but things went wrong and Oxford won by three points after a very good match. Teams and scores:

OXFORD:	900 yds	1,000 yds.	1,100 yds.	Total
E. H. Seward	73	71	72	216
E. S. M. Wade	70	71	68	209
G. C. Matthews	70	72	63	205
F. T. W. Blatchley-Hennah	69	66	64	199
	282	280	267	829
CAMBRIDGE:				
R. St. G. Maxwell	72	66	70	208
H. J. Russell	70	70	68	208
A. L. Figgis	71	71	64	206
K. B. Glosg	70	66	68	204
	283	273	270	826

The Hopton Aggregate and Match Rifle Championship provided a newcomer to the list of those who have held the handsome trophy presented by the late Colonel John Hopton in 1900. Dr. C. H. Vernon, King's Prize winner in 1927, took up the match rifle some years ago and has always been somewhere near the top in the championship list. To win the cup he made 690 out of a highest possible 725, taking first place in the Halford Memorial competition, third in the Albert, fourth in the Whitehead Memorial and fifth in the Eandeo and Wimbledon Cup competitions. Mr. S. A. Parke was second for the Hopton Cup with 687 and Mr. J. J. O'Leary third with 679. Mr. O'Leary is still shooting well in the prone position with his sporting pattern telescopic sight. This year six "true" telescopes—as opposed to the usual Galilean type—were in use. Most of those who favour them prefer to follow the useful experimental work done by Mr. A. H. Vicars last year and have them fitted for shooting in the back position. Mr. Vicars took eighth place in the Hopton Aggregate this year.

Of the other individual events, the Whitehead Memorial Cup (900yds. and 1,000yds. H. P. S. 150) was won by Major the Hon. J. W. H. Fremantle with 146. Two Irishmen, Messrs. J. J. O'Leary (145) and S. A. Parke (144) took second and third places. The "Eandeo," at 1,000yds., was won in fine style by the Scottish veteran, Major T. Ranken, with 99 out of 100. Mr. E. S. M. Wade, of Oxford University, was second with 98 and Mr. O. Western third with 97. Mr. S. A. Parke won the Wimbledon Cup at 1,100yds. with 96 out of 100. Mr. O. Western and Lieutenant-Colonel Sir P. W. Richardson each made 95.

Mr. Parke also won the Albert Challenge Cup after an exciting tie with Mr. A. E. Martin. Each had 218 out of 225 shooting at 900yds., 1,000yds and 1,100yds., and with three tie shots each added 23. They then proceeded to fire single shots, and each found the bullseye. Martin then made an inner and Parke a bullseye to win. Mr. A. H. Vicars won the Match Rifle Association Cup with 49 out of 50 at 1,100yds.

E. H. ROBINSON.

FENCING AT KINGSGATE

GRAVÉ'S, the second oldest Salle d'Armes in the British Empire, have just concluded their second international summer fencing tournament. This was at the historic Kingsgate Castle, and was the most brilliant and successful fencing meeting this country has seen.

When at Hassocks last year Gravé's inaugurated the first summer fencing tournament we have ever had, they took a tremendous risk. Success meant opening a new era for British fencing: failure would reflect not only on Gravé's themselves but on the sport as a whole.

By enterprise, sportsmanship and efficiency, particularly on the part of their hon. secretary, Janet Tomblin, this old but virile Salle made Hassocks a roaring success, and thus put British fencing on an entirely new basis. The second meeting, this year, remained as the final test, and it was a severe one. International affairs held up foreign entries, and kept many from making the journey, while Militia, Territorial and A.R.P. duties called away a number of British blades of both sexes. Despite this there were 185 entries, 96 actual individuals, including the holders of all five events. Counting England, Scotland, Ireland, and Wales, as one, there were fencers of seven nationalities, namely, French, Belgian, Italian, German, Austrian, Dutch and British. Of the British units there were, apart from London and district (fourteen salles and clubs), fencers from Birmingham, Barnt Green, Cardiff, Falmouth, Kent, Oxford, Lincolnshire and Sheffield.

This representative entry, which included the holders of ten of London's major contests, the ideal venue, and an organisation that was a triumph even for Gravé's, combined to make Kingsgate an historic event.

Both team events went to Britain, the Ladies' Cercle d'Escrime London (holders) winning the women's foil when they beat the Salle Bertrand I. by 5—4 in the final, and the men's épée went to the Salle Paul when they defeated the London Fencing Club 5—0 in their final. The holders of the latter, the Polytechnic, were eliminated 5—0 by the L.F.C. in the semi-finals, and in the same lap Paul's beat Bertrand's 5—2. The French team from Le Mans, fencing in Britain for the first time, were beaten out by Paul's in the second round. Ten sides competed.

The individual events went one each to a Belgian, a German, and a French fencer, while for all five competitions the entries were, in both quality and numbers, equal to or better than for the British championships.

The final six in the women's foil individual (41 entries) were all from different salles. The holder, Mlle. Jenny Addams (Bruxelles), ex-European Champion, and holder also of our Hutton International title, won again undefeated, five wins, and was run to the last hit only by Pauline Etheridge and Betty Puddefoot. P. Etheridge (Bertrand's) was clearly second with three wins, her other loss being to Lyn Teesdale. Next were B. Puddefoot (Lansdowne), E. Carnegy Arbuthnott (Gauthier), the British Champion, and L. Teesdale (Gravé's), all two wins, and separated on the hits aggregates, while Holland's star, T. Van der Klaauw, was sixth with one victory.

The men's foil individual, 32 entries, included men of six nationalities, of which five were still represented in the final. The German holder, Fritz Stark (Bertrand's), won again, unbeaten, six victories, with the 1934 British champion, C. R. Hammersley (L.F.C.) next with four. Three men, an Austrian, K. R. Schwitzer (L.F.C.), Pierre Turquet (London Hospital), current British runner-up, and R. Paul (Paul's) were all three up and separated on hits. E. B. Christie (Oxford) had two wins, and an Italian, C. Delzi (L.F.C.) none. The reigning British foil champion, H. Cooke (Paul's) reached the final but scratched.

There were French, Austrian, German, Belgian and British stars among the 40 épéeistes. This produced an extraordinarily close final of ten in which there was a difference of only two wins and of three hits between the top eight. A Frenchman, J. Hardyau (Le Mans), topped the list with six wins, twelve hits. Next came four men, each five wins and ten, eleven, twelve and thirteen hits, namely F. Stark (Bertrand's); the Belgian épée champion, H. Van der Beken (Bruxelles), the holder; R. Paul (Paul's), and P. M. Turquet (London Hospital). The next three duellists had four wins each, and eleven, twelve and thirteen hits, K. R. Schwitzer (L.F.C.), S.C.M. W. Green (R.H.G.), and N. G. Winton (Bertrand's). G. F. D. Winstanley (Gravé's) had three wins, and H. Forcan (Le Mans) two.

M. POLLOCK SMITH.

A LANDOWNER'S WORK IN WALES

I.—The Improvement of Grassland on a Derelict Farm

FOR one reason or another, there are few landlords in West Wales who are able, or have the inclination, to live at home and devote their time and energy to setting an example by farming themselves and making available modern methods to their tenants. The once well-farmed home farm of Castell Gorfod, the property of Captain W. H. Buckley, M.F.H., consists of approximately 220 acres, which includes woodlands and hillsides. Three meadows lie at a low elevation near the mansion, and the rest of the farmland consists of hillsides with about 80 acres of workable land situated at an elevation of about 400ft. above sea level. Nearly all the typical features of small Welsh hill farms can be found at Castell Gorfod. In 1931, when Captain Buckley returned to live there, the farmland had become almost derelict owing to the introduction of commercial rabbit trapping during the Great War. The chief products from the land were about 3,000 rabbits annually, some poor grazing, and about 10 tons of inferior hay. The soil had become very acid and low in fertility, and all the land which was down to grass carried a third-rate herbage, principally bent, fescues and Yorkshire fog.

The sight of this land in such a derelict condition worried Captain Buckley a great deal, and the thought always uppermost in his mind was, "Could the land be reclaimed to produce good grass or arable crops; and would the reclamation prove profitable." In 1934 a start was made to improve the grassland by the use of spiked harrows and the application of basic slag. It was soon discovered that high mechanical power was needed to perform the necessary cultivations under such difficult conditions. After trial it was found that a crawler-type tractor was the only type of tractor which could work under all the natural obstacles existing at Castell Gorfod. Consequently, in 1935, a caterpillar tractor was purchased, and this has made it possible to undertake the cultivation of the high lands and makes the transport of manures, &c., economic.

Ten acres of the poorest land was then ploughed and planted to oats, and another man was employed on the farm. At this point Captain Buckley called in the assistance of Imperial Chemical Industries, and since then constant collaboration has been maintained with I.C.I. In 1936 all the land was severely harrowed with the latest types of self-cleaning grass harrows in an endeavour to remove as much as possible of the unpalatable mat of poor grasses and weeds covering the land. Another ten acres of poor grassland was ploughed and planted with oats. A fair crop was harvested after dressing the seed with Agrosan G and applying a dressing of 1½cwt. per acre of I.C.I. No. 6. Twenty-four acres of grassland were manured with a complete artificial manure or F.Y.M., and was cut for hay.

This marked the first definite stage in increased production. It became quite evident from these initial experiments in increasing the output of the land that there would be no permanent improvement unless the rabbits were exterminated, or else reduced to pre-War reasonable limits. As a result of a "gassing" experiment in 1935, using "Cymag" (a product of I.C.I., which liberates hydrocyanic gas on contact with moist soil), Captain Buckley decided to attempt to clear his whole farm of rabbits by this method. By means of a hand rotary blower the Cymag powder was blown into all the rabbit holes which were then immediately sealed with a sod of turf or soil. It took two men fourteen days to complete the work on the farm, and the total cost of materials and labour was £15. All the rabbits living in the soil at Castell Gorfod were effectively killed, but still the grassland and crops around the boundaries did not improve as well as was expected. This was because, as soon as the grass began to improve, it attracted new rabbits from heavily-infested neighbouring land. Some of these eventually re-inhabited the "gassed" areas. The land at Castell Gorfod is now kept free from breeding rabbits by giving the rabbits free to the farmhands who catch them in winter by means of ferrets, snares, nets, dogs and lamps. In spring and summer a regular look-out is kept for any newly-opened holes, and these are immediately given a puff of "Cymag" and the hole sealed up. The only problem now is that of the marauding rabbit which comes in by night from neighbouring infested land, and eats anything good in reach from the boundaries and then travels back in the daytime.

In 1937 a much more comprehensive scheme of reclamation was embarked upon. This included the improvement of grassland by means of the plough, after a rotation of crops, or immediately re-seeding on the back of a newly-ploughed furrow, and mechanical cultivation and manuring of the grassland without the use of the plough. The depredation of rabbits from neighbouring land was still serious, and it was decided, whenever possible, in ploughing land near the boundary to plant a crop not palatable to rabbits. The only crop of this character with a commercial value was potatoes. The soil and climate proved to be well suited to the growing of certified seed potatoes, and as there is a good market in Pembrokeshire for early seed potatoes the variety principally grown is Arran Pilot.

The yield of the seed potatoes (1¼ by 2¼) without farmyard manure, and receiving 8cwt. per acre I.C.I. No. 2, is about 5 tons per acre. Wherever grassland is ploughable the general system is to apply if possible a light dressing of F.Y.M. in the autumn and to plough the sward deep. It is then ploughed again in spring if necessary, or disc-harrowed and suitably dressed until it can be

GASSING THE TOP OF A QUARRY TO PROTECT AN OAT FIELD ABOVE

ridged up for potatoes. A dressing of I.C.I. No. 2 at about 8cwt. per acre is broadcast over ridge and furrow before planting the pedigree seed potato setts. The ridges are split back and the usual cultivations for an ordinary potato crop follow. In early autumn, as soon as the potatoes are ripe, they are lifted and allowed to green and harden slightly on the headland previous to riddling and selling as seed. The next crop to follow is oats, and this year, and in future, it is intended to grow a crop of pedigree seed oats from Aberystwyth Plant Breeding Station for sale locally to improve the local yields. All corn crops are undersown with either Italian ryegrass as a catch crop for winter feeding or grass drying, or else sown out to a long ley mixture. Where ryegrass alone is sown, the amount is about 20lb. per acre, and a standard type of long ley mixture is as follows:

10	Italian ryegrass.
6	perennial ryegrass (commercial).
3	" " (Aberystwyth S23).
4	cocksfoot (commercial).
4	" (Aberystwyth S26).
1½	crested dogstail.
1½	rough-stalked meadow grass.
1	wild white clover.

Where the land is too steep to make rotational cropping possible a test has been made this year in sowing the above seeds mixture in late spring straight on the newly-turned sod, which has been pressed and harrowed to make a nice seed bed. The nurse crop used in this case has been 12lb. of Italian ryegrass. At the time of writing, despite the drought, this field promises to be entirely successful.

No field is ever sown down to a long ley without correcting the soil acidity by an appropriate dressing of lime. The standard practice is one ton of carbonate of lime with the seed mixture and subsequent applications in following years until the deficiency has been corrected. Owing to the poverty of the soil a complete dressing of artificial fertilisers is given to each crop, and a straight dressing of nitrogen in the form of nitro chalk at the rate of 1 to 2 cwts. per acre is given whenever an increased flush of grass is required, and to extend the growing season in spring and autumn.

The system of sound mixed farming in Wales has rapidly gone out of fashion, and with the advent of intensive milk production the sole criterion of a good farmer is being judged by the record-breaking yields of his cows or by the magnitude of the cheques he pays for imported feeding stuffs. This change has been no minor cause for the low standard of soil farming in many of the milk districts. It was with a view to seeing whether he could not do something to improve this position and grow more foodstuffs on the farm for the purpose of maintaining the stock in winter, without resort to excessive purchases of imported foodstuffs, that Captain Buckley installed a tray-type grass dryer in 1937.

He has already found that this machine can be made to fit in admirably with the economy of a farm such as his situated in a district of high rainfall and uncertain weather. He has not used his grass dryer simply as a factory to turn out a commercial product for sale and planned his farm accordingly to supply material for drying. He has rather experimented in using the dryer to improve his land, to prevent the inevitable waste in harvesting crops in this climate, as well as turning out super-dried grass which will replace concentrated cakes. For example, he is convinced that it is highly economic to make super hay in the dryer; that is, allowing the grass to get to nearly the hay stage, then cutting, and, when the weather is suitable, making it partly in the field, and finally passing it rapidly through the dryer. The cost is very little, but the product is a great improvement over the best-made ordinary hay. Again, the dryer is put to good use in a difficult corn harvest.

The sheaves are dried in the dryer, and if necessary for the sale of seed, the seed corn can be super-dried again on the trays. In a very wet autumn the potato crop has been successfully dried in the dryer before bagging for sale. Captain Buckley is convinced that there is great scope for grass drying on all farms situated in a district of high rainfall and moderate climate. The dryer has turned out a first-class dried grass product for under £6 per ton and is likely to prove an even greater commercial success in the future when economies in the field work operations can be effected. About 40 tons of dried grass were produced last year. The hunters at the kennels did particularly well last season on the medium protein quality dried grass, and it is intended to make a much larger quantity of this product this year.

It will be seen that a typical rotation adopted in reclaiming the worn-out grassland is as follows:

First year of ploughing	...	Pedigree seed potatoes.
Second "	" ...	Pedigree seed oats.
Third "	" ...	Re-seeding to a long ley under corn or Italian ryegrass as a nurse crop.

The first two cash crops on the rotation pay the expenses of getting the land back into good grassland again.

Where conditions are not suitable for an arable rotation, then the land is re-seeded to a good grass mixture on the back of a newly-turned furrow.

A properly balanced I.C.I. fertiliser is given to every crop, including the grassland, and a little more is given than will be required by the crop so that fertility will be gradually built up to a much higher level.

Enough has been written to illustrate the fact that a lot of valuable pioneer work has been undertaken by Captain Buckley, and some remarkable practical results have been achieved. The change in appearance of the land in the last five years has to be seen to be appreciated. In place of the dried, matted, rabbit-infested fields with boundaries consisting of tumbled-down banks undermined by rabbits, the land is now carrying excellent crops of potatoes, corn and grass, with clean, well-kept boundaries.

It is yet too early to be able to make an exact balance sheet of the cost of improvement and value of the results, but it has every prospect of proving a financial success. The crops produced have opened wide the eyes of local farmers, and have shown them what possibilities there are by the adoption of modern scientific methods of production. When the work which is being done here gets wider known I am sure that Captain Buckley will be hailed as a pioneer of modern methods and will earn the gratitude and thanks of the future generation of agriculturists in this district.

T. F. L.

THE BORDER AT CHARLTON PARK, MALMESBURY

The Country House

PATHS AND EDGING PLANTS

By ELEANOUR SINCLAIR ROHDE

THE effect of a herbaceous border can be made or marred by a path of the right sort and well-planned edgings. Formerly grass paths were popular, but, though delightful when perfectly kept, they involve considerable labour, and during our long cold springs are frequently far too wet to walk on with any pleasure. I have never been an admirer of crazy paving for, during at least seven months in the year, it looks chilly and, in any case, is not a good foil for dwarf plants. Old bricks are ideal, for the rich soft warm colour enhances the spring flowers, whereas crazy paving makes for a cold picture on bleak days. If old bricks are not available even new bricks can be used, for though the colour is unpleasing at first, they mellow much more quickly when used for paving than when used for walls.

Straight edgings are almost essential in the case of grass paths to reduce labour, but if either crazy paving or bricks are used an uneven edging is most attractive. The accompanying illustration shows a lovely border at Charlton Park, where the uneven edging adds greatly to the picturesque effect. Sometimes herbaceous borders are on a raised bit of ground with a drop of a foot to the path. In mild parts, and on the sand or chalk soils in which they revel, there is nothing to equal rock roses in mixed colours for an edging such as this. Interspersed with Aubrietias, Alyssums, &c., for spring, the colour interest is maintained throughout the season. When the Aubrietias and Alyssums are out of flower their evergreen foliage makes a good foil for the rock roses, for the foliage of the latter is not their best feature.

Box, in spite of the labour it involves, is still used in many gardens, but it does not seem to be commonly known that *Lonicera nitida* kept clipped to a height of a foot makes an excellent substitute. I saw this first in the Dahlia garden at Hatfield, and was much impressed by the effect. It was certainly neater than the best-kept box edgings I have ever seen, and the gardener told me he considered it better than Box in every way. The colour is a better green than Box, this *Lonicera* is impervious to drought, and, again, unlike Box, it does not harbour pests. Box is generally regarded as the oldest type of edging, but of this we have no historical proof. The Romans very likely introduced it, but it was unknown in mediæval times, and Parkinson, in his *Paradisus*, describes it as a novelty and "only received into the gardens of those that are curious."

The height of edgings is an important consideration. In the case of short borders, especially if they are double, an edging that errs on the tall side, *i.e.*, about 15in. high, makes the border look shorter. My preference is for a mixed edging, *i.e.*, mixed not only in regard to plants, but also height, as this makes for varied interest. In a long border made for this season, we had Violas, double Daisies, Forget-me-nots, Arabis, Alyssum, London Pride, Pinks, *Veronica ratticans*, *Iberis sempervirens*, *Cerastium tomentosum*, *Dicentra formosa* (far too seldom used, although so effective and for such a long time), *Sedum spectabile*, dwarf Lavenders, *Achillea rupestris*, Golden Thyme, dwarf Thrifts, *Ajuga multicolour*, *A. reptans variegata*, *A. metallica crispa* (all the Ajugas do best in part shade but are accommodating), and mossy Saxifrages. In early spring this was effective with double Tulips, Wallflowers, and various Narcissi behind, and is still a picturesque edging for the summer effect.

Herbaceous borders with a formal background such as a yew hedge need a formal edging, otherwise the effect is that of a framed picture with part of the frame missing. I had the planning of one herbaceous border about 12ft. wide which surrounds a largish lawn, and the background on three sides is yew. We decided to have not a uniform edging, but a mixture of dwarf sub-shrubs. *Santolina incana* is used at the corners, and for 3ft. each way from the corners there are about 5ft. of pink Hyssop, then an equal extent of Lavender, then blue Hyssop. Arranged in equal breadths on the three sides the effect is uniform, but not monotonous.

If prostrate edgings are used they should be broad, otherwise the effect is niggling. *Omphalodes verna* (Blue-eyed Mary) is one of the most charming spring edgings, but should be quite 15in. broad. A real sky blue is a rare colour in early spring and, to my thinking, it is the perfect foil for cherry red Tulips, Wallflowers, Narcissi, &c. And, being evergreen, Blue-eyed Mary is pleasing, even in spring. But on account of the space they take, I do not think these very prostrate edgings are practical, except in fairly small patches.

Kitchen garden edgings, if well done, fascinate me. Some people like to make their edgings a sort of picking garden. I think amongst the best edgings grown with this object in view are Pyrethrums in mixed colours or English Irises (*I. xiphioides* hybrids). They not only make decorative edgings, but they are so useful for picking at a season when picking flowers in the border are far from numerous. They flower at the same time as early Delphiniums, Campanulas, Oriental Poppies, Irises, &c., and these are certainly not picking flowers. The English Irises, unlike the Spanish Hybrids, are perennial and increase well. The pick of the hybrids is, I think, King of the Blues. For a mixed herb edging, I like Golden and other Thymes, Chives, Pot Marjoram, variegated Balm (it grows neither so tall nor so rampantly as the type), Chervil, Marigolds, and some of the Mints, notably the richly-coloured Eau-de-Cologne Mint.

CHARCOAL BURNING

DURING the Great War a certain officer in our Forest Service was supplied with some prisoners and ordered to burn charcoal. He had never before attempted the task, and to many the poser would have proved insuperable. It was a poser. On estates the charcoal-burner is rightly regarded as highly skilled. The trade runs in families, and the "secrets" are jealously guarded. To speak to a burner is to enter the presence of a high priest, for the veil will be lifted but slightly to impress the inquirer with the wealth of knowledge possessed by the burner and the abysmal ignorance and foolishness displayed by the questions asked.

Quite apart from the needless window dressing, the calling is highly skilled, as anyone will admit who has employed a bad burner following a good one. The amount of charcoal yielded per cord of wood and the quality so largely depend upon the maintenance of an even and not excessive temperature.

Charcoal has many uses, explosives, chemicals, silk goods, fertilisers and paints, to name but a few. The market is expanding rapidly, and now is an excellent time for disposing of much useless materials for this purpose. Hardwood cordwood and underwood are suitable, so that a market is offered for usually unsaleable produce.

Imperial Chemical Industries use 4,000 to 5,000 tons of charcoal a year in normal times, and much more at present, and the price will ensure a return of 8/- to 12/- per cord for wood or £1 to £2 per acre for mixed underwood according to the quantity of poles growing per acre. This price applies to the poorer types of hardwood, beech, birch, alder, hazel, elm and other species regarded as useless.

Originally the chief use of charcoal was for drying hops. The smokeless flame with which it burnt was particularly suited to the old type of kiln in which the fire had direct contact with the hops. Nowadays anthracite has taken its place, and charcoal is used only for lighting the anthracite. In the most modern kilns the smoke from the fire passes through tubes which heat air, the latter being circulated by fans to dry the hops. In this type of fire the production of smoke is not objected to, so that charcoal now meets a decreasing demand in this quarter. A fact that it more than made up for the increasing number of uses to which chemical research has enabled charcoal to be put.

To-day the market is more promising than it has ever been for this product, an important minor one for the woodland owner. It is the successful marketing of the minor produce that spells the difference between profit and loss when an owner is busy replanting devastated areas.

The process of burning, until the advent of the new portable kilns, was on a level place in the woods, called an "hearth." These can be seen, not infrequently, as level circular places with slightly banked circumference and a sod blackened by the ashes.

Cordwood is usually used, cut into 3ft. or 4ft. lengths and stacked in cords of 8ft. x 4ft. x 4ft. or 14ft. x 3ft. x 3ft.

The wood is then stacked in the hearth in a cone-shaped manner with a vent up the centre to enable the wood to be set alight. The stack of cordwood is now called a "pit" and varies in size, but usually seven cords of wood are used. With the aid of some kindling wood a fire is started in the centre, and were it not controlled would soon produce an enormous blaze and no charcoal.

The method of securing the desired slow controlled combustion is to cover the pit with charcoal dust, if available, or, if not, with a mixture of earth and sand. The covering is kept continually damp during the process of burning, and the burner has a long rake with which he regulates the thickness of the covering. If it is too thick the air will not penetrate and the fire will go out. If it is too thin combustion will be too rapid, and the quality of the charcoal poor and the quantity reduced.

The reason for the preference for charcoal dust is that it has the right consistency for the purpose and never packs too tight; so that it can be laid on thicker than sand, and thus is easier to regulate. A burner will always use an old hearth if he can find one, for the reason that charcoal dust is available.

A pit that is burning must never be left, night and day for 60 hours, when it is uncovered and the charcoal put in sacks. During this period the burner will be seen rake in hand watching the smoke, which is his thermometer. It issues generally from all over the pit, but in places it will start to come too fast. A little more dust raked over will correct this, and so the process goes on.

REGINALD DAVEY.

INDOOR FLORAL DECORATIONS

Material for August

By MARGUERITE JAMES

AM I mistaken, or is there just a soupçon of that tired feeling in the cut-flower patch this month? There is still plenty of material, I know. There are dahlias, if you dare risk the earwigs, and purple buddleia, if you dare risk the overpowering fragrance. A delightful and unusual decoration can be made by associating purple buddleia with a few trails of pale mauve Nellie Moser clematis. Soft, silver-green ripening grasses with the geums Mrs. Bradshaw and Lady Stratheden are another August decoration that I love to use. These two varieties seem to me to last longer than the newer hybrids, but none of the geums is much good after the second day.

I think it is usually true that flowers from the late summer garden are short-lived in vases. To be sure, some Japanese chrysanthemums of the earliest varieties have arrived, but they are the writing on the wall that tells the passing of summer, and we postpone their use as long as possible.

Perhaps it is not only the garden flowers that are tired. We ourselves have sated our appetites with the flowers from the borders. Suppose we ring the changes and use pot plants from the glasshouses. Fuchsias, with their lovely drooping bells, are wonderfully decorative indoors, particularly tall standard fuchsias that can take the centre of the display in place of the usual palms. *Fuchsia*

GEUMS—ORANGE OR RED—WITH COOL SILVER GRASSES ARRANGED IN A METAL WALL BRACKET

corymbiflora is a handsome species: its long, brilliant red flowers hang from the ends of the stems, and make the whole plant particularly decorative. With these some purple and white heliotropes, which have the added grace of fragrance, and begonias of all colours and in varying forms, double, single and crested, make up an interesting group.

Cannas, which have fine and varied foliage in addition to their vivid flowers, streptocarpus and gloxinias are other brilliant pot plants that even a cool greenhouse can supply.

There are numerous common annuals, too, that should be more widely grown in pots for use now. They last fully a week, often longer, indoors, and not many cut flowers will do this in August. Petunias, schizanthus, torenia and impatiens, all easily raised from seed, are good for the purpose, as well as such garden annuals as Golden Gleam nasturtiums and clarkia. A few trails of tall nasturtiums, by the way, are of very great merit for half-dark corners. You merely let them hang down from a pedestal, looking ragged and untidy at first, and an hour later you find every bloom and leaf is holding itself up at just the angle you would have wished to arrange it!

I once used as a table decoration a few flat pans of the South African violet, *Saintpaulia Ionantha*. This has soft velvety foliage, over which appear masses of small purple flowers. Alternated with these pans were small crystal glasses that held scented blooms of the Madagascar jasmine, *Stephanotis floribunda*. These flowers last a very long time in water, as they do on the plants.

Coleus, which most gardeners raise in quantity for bedding and for greenhouse decoration, is a fine pot subject for indoor use. You can build up really exotic-looking groups with these if you add a caladium here and there, and also include a few pots of such grasses as eulalia, carex and cyperus.

If you grow orchids, and you want something rather striking for a lunch table, take from the

DOUBLE CHINA ASTERS IN MIXED COLOURS ARE TYPICAL OF THE AUGUST GARDEN

shelves an odontoglossum hybrid or a cattleya in full bloom, and set the whole plant into a silver bowl (I saw one in a silver entrée dish), and you will have a complete decoration, one also that will last well. Damp sphagnum moss packed carefully round it inside the silver container will keep the plant happy. Almost any inhabitant of the odontoglossum house can be treated in this way, and most of them will endure the spell indoors without any harm. If you can find such a flower as the *Loddigesii cattleya*, a vivid rose-purple, you will, I am sure, like it amongst the silver of the table.

Coming back to cut flowers, I have just seen a consignment of new vases delivered to a well-known furnishing firm. Almost all of them were of off-white pottery, and the prevailing form seemed to be broad or fan-shaped, a style of container that is useful on narrow tables. For these and other off-white vases in August, white and cream flowers with green or variegated green and white foliage would be my choice. Such an arrangement is cool, restful and clean in contrast with the dusty hedgerows and scorched meadows and downs of the countryside.

White and cream sweet peas are still with us and white and cream dahlias are good in off-white containers. More decorative than either, and more unusual, are 2ft. long sprays of bridal wreath, *Francoa ramosa*, in my opinion one of the most useful of all cool greenhouse subjects for late summer. I like it alone with silver foliage, or almost equally well in association with the Barberton daisies that are also among the month's gifts. These (*Gerbera Jamesoni* hybrids) are lovely for wall brackets and tables against a light background.

The colours are strong, clear tones of orange, rose, cream and scarlet, and the petals are so delicate and finely pointed that the flowers, which in another form might be called harsh, have all the subtle delicacy of a pastel drawing.

PURPLE BUDDLEIA IS DECORATIVE, BUT IT MUST BE USED WITH CARE AS ITS STRONG FRAGRANCE IS NOT ALWAYS ACCEPTABLE

HORTICULTURAL ADVICE

Power in the Garden

By GARTHEW ALLERDYCE

AS I start to write about "power in the garden," I can hear again an old head gardener's voice saying, "Motor-mower, never while I'm head gardener here. The pony mower has been good enough for me all these years and I won't have any petrol fumes in my garden." When he retired two years later the new head introduced a motor mower and the pony was pensioned off, and grass cutting proceeded apace and was completed each week in record time.

I often visit large gardens all over the country, and I find again and again that where there were 30 or 40 gardeners there are now 18 or 20, and where 8 or 9 gardeners used to do the work similar results are expected from 3 or 4 men. These are the facts, for since the War and the subsequent slump large garden owners have had to economise.

I am too much of a gardener myself to agree with those who claim that machines can entirely take the place of hand labour.

Take, however, the Tarpen portable generating set which is made by the Tarpen Engineering Company, of Ixworth House, London, S.W. 2. This machine enables electric power to be available anywhere in the garden without mains or wiring. The set costs £35. It can be used for watering the garden, coupled with a pumping set. It is first-class when used with the hedge-trimming machine. As a matter of fact it produces sufficient power for three trimmers to work along hedges simultaneously. Two men have done a complicated job of hedge trimming as quickly as twelve when using one of these machines. Those who have topiary work will enjoy using a Tarpen Hedge Trimmer.

It has a giant capacity for work—is very powerfully constructed and yet it can be wheeled from place to place with ease by one person. As a spraying machine it is very useful indeed; while its many other activities include the cutting of grass close up to curbs, walls and trees, the sawing of wood, the spraying of fruit trees, and even the clipping of horses!

A self-contained electric hedge-cutter and trimmer is manufactured by Mr. C. I. Wilson, of 2, King Edward Street, Liverpool, 3. It will cut the roughest hedge, leaving the surface even and smooth. It is easily operated at a very low cost, either from the mains supply or from a portable generating plant.

Those who have fairly large orchards should consider purchasing a power spraying outfit such as is made by Messrs. Cooper, Pegler & Co., of 31, Clifton Street, Finsbury Square, London, E.C. 2, price £66 10s. This machine enables the spray to be applied at 400lb. or 500lb pressure, the maximum output being about 5 gallons or 6 gallons a minute.

In conjunction with the machine is built a large brass alloyed tank, which can be filled by suction at the rate of 22 gallons per minute. So often one has to get a large block of trees sprayed in a day or two (because a particular pest or disease is only vulnerable at that time), and a power sprayer like this enables the job to be done in comfort.

Quite a revolutionary type of motor mower is the Roto-Scythe made by Power Specialities, Ltd., of Maidenhead, Berks. The grass is severed by circular cutters which are attached to tips of an impeller. They are circular, and when dulled by use can instantly be rotated and fresh cutting edges brought into action. When the entire cutting edges are worn they can be replaced at a cost of 1/-. The blades are set fan-wise, and the rotation induces a strong current of air which lifts the grass cuttings into the box at the back. Because of this suction, twigs, fine needles, little stones, &c., are collected. It even cuts a new lawn without bruising, and no stalks or bents are ever left behind.

The small model costs only 15 guineas. It is very light and handy, economical in upkeep, and the engine has adequate power.

Land that needs cultivating between rows of vegetables and fruit trees can be kept in surprisingly good order by the use of a mechanical cultivator. Take the Auto Culto Junior, for instance, which costs just over £36. It is only 11in. wide, and the amount of work this little machine can get through in a short time is remarkable. It is used in closely planted rows, where it would be impossible to take a horse or a larger cultivating machine. It is made by Allen & Simmonds, Ltd., of Reading.

Another small tractor is the Atco, made by Messrs. Charles Pugh, of Whitworth Works, Birmingham 9. I can get catalogues of these machines or any others sent to *Field* readers if they so desire.

ANYONE confronted with this luxurious limousine for the first time is apt to ask that question. The answer is, of course, that the "Ranelagh" is a comparatively new car. People are just beginning to realise that so much luxury exists for as little as £595.

As you ride in the deeply cushioned comfort of the "Ranelagh" you will like the spaciousness of the car. You will appreciate the wide doors and windows, the draught-free ventilation, the lavish equipment.

If you sometimes take over from your chauffeur and drive yourself, you will enjoy the experience. No noise, no heat—just silent speed under your foot. This car is *your* car. Smooth power, quiet luxury—sensibly planned.

MOTORIST'S VALUE IN THE TERRITORIAL ARMY

A Need Which Can Be Met by Those Who Enjoy Their Driving

By CAPTAIN SIR MALCOLM CAMPBELL
(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)
(Motoring Editor of the "Field")

IN these columns last week I referred to the important rôle of motor-cycle mounted forces in the modern army which is now so dependent upon mechanised transport. I mentioned also the motor-cycle unit I have the honour to command in the Territorial Army and made a brief survey of the work it will do. My detachment comprises 106 officers and men, and I am proud of the fact that they were recruited within ten days.

On a number of occasions I have been asked why the response was so rapid. The answer is that each and every one of these men is an enthusiast who realises that if he is called upon to serve King and country, his efforts will be most effective if they are directed towards a task which he enjoys doing and, moreover, a job for which he has, through civilian experience, natural leanings and adaptability. These men delight in handling their machines, and are confident because they are sure of their skill and the knowledge that they will definitely be fulfilling a useful purpose. Finally, they appreciate that if and when the time comes they will be engaged in a sphere of action to which they are accustomed and to which they are attracted more than anything else.

I cannot but feel that there are many motorists harbouring similar sentiments and who, if the worst comes to the worst, would prefer to be driving. The popular tendency, I believe, is to regard the army driver as a necessary but not highly important adjunct to the fighting forces. This is an erroneous impression, which must be corrected because it is keeping skilled and, therefore, valuable men from attaching themselves to the units sorely in need of transport experts and skilful drivers.

In time of war considerable responsibility devolves upon the individual drivers, who are invariably chosen for their ability to exercise initiative and act upon quick decisions. They are expected to take their charges over all sorts of country in safety and with speed. Upon them hinges the success of the operation in which the fighting troops may be engaged, and thus it is upon the driver's sound handling of his vehicle that so much depends. It is not surprising, therefore, to find that the authorities are keen to enlist experienced drivers, who can begin their special training without grinding through driving instruction and without having to be grounded in the essentials of independent action.

To-day there is scarcely a section of the British Army which does not rely to a great extent upon its drivers, while throughout the country there are units in urgent need of good motorists who regard their driving more as a sport and an accomplishment rather than merely a means of getting from one place to another in the minimum of time and with the minimum of bother.

I cannot imagine any British driver not enjoying his association with the Territorials, for apart from the moral satisfaction of knowing that you, as an individual, are contributing to the nation's preparedness and safety, there is good sport to be had and friendships waiting to be made.

It is amazing to see how speedily the recruit becomes imbued with the spirit of his "crowd," particularly when they are men of like calibre and similar tastes. My own company, for instance, were recruited from motor-cycling experts, men with racing honours, technical qualifications and others who are just good plain motor-cyclists. They came from all over London, and from far outside. After the first parade they began to know each other because they found common ground in their love for motor cycling.

A driver's training in the Territorial Army is a specialised process and an enjoyable one. Hours of routine and squad drill are not so important, and after the essential "licking into shape" period is completed the really interesting work begins.

Duties vary largely in the different sections, but so far as my own particular company is concerned those in it must first become versed in the art of accurate map reading. This is essential because the task of these motor-cyclists is to control military traffic moving up and down from the line, devise the best routes and, when a particular section of the road becomes impassable for one reason or another, provide, without loss of time, an alternative detour which will prevent obstruction and the consequent immobilisation of a large section of the troops.

It is not difficult to conjure up a picture of the confusion which would require unravelling if numerous convoys of heavy lorries were endeavouring to travel on a road continually harassed by shell-fire and perhaps strewn with transport units put out of action. Clearly, any such obstacles can improve the chances of the enemy and form a grave source of weakness to those holding the forward positions. Therefore, the man on the spot must be in a position to decide without hesitation the best available road for the transports, and must be able to make that decision from the map of the sector he is controlling.

He has to divert the stream of traffic, but at the same time regulate its even flow and to see that the drivers are acting in accordance with the pre-arranged procedure. On paper this may appear to be a simple enough task, but in practice and in rough country with poor highways and badly served by secondary roads, the job assumes a greater magnitude. Its importance needs no emphasis.

Tuition is being given to my company now on the marking of routes, the picketing of control men, and the manner in which a general scheme of operations is conducted. Naturally, to undertake this type of work they must possess some authority; therefore their parent corps is that of the Military Police, and each man is a non-commissioned officer.

They have various other duties assigned to them in times of peace and occupy a similar position to that of our own civilian police. The men of my unit have been described as "a cross between an A.A. scout and a traffic 'cop'."

Obviously, the standard of their riding must be high when the nature of the work involved and the conditions which may be encountered are borne in mind.

They are mounted on Norton motor-cycles and armed with revolvers, while to complete the complement of the company's transport there are six 15-cwt. lorries and one 30-cwt. vehicle. These carry the men's special equipment and the necessary road signs apparatus as well as the headquarters paraphernalia, which must necessarily be moved from place to place with dispatch.

Taking the less serious aspect of the thing, these men may conceivably have the task of ushering troops into cinemas, or looking after car-parking arrangements. In garrison towns they assume normal policing duties and, of course, have to deal with any road accidents which may occur. In the meantime they retain their essentially sporting character, compete against one another in various motor-cycle events which may be organised and still endeavour to achieve perfection in the technique of riding their mounts.

I have described the activities of my particular unit here in some detail, but the motorist who intends to attach himself to any other body of men in the capacity of a driver with a specialised job to tackle will find conditions similar in most regiments. Naturally, varying duties require different training, but the prospective recruit can look forward to an instructive and interesting time, which will provide him with action and perhaps some thrills. In any case he can enter the ranks of the Territorial Army or other voluntary services confident in the knowledge that when his period of training is completed he will have become a more competent driver, a more useful member of the community, and will be able to play more adequately the rôle of citizenship which is the heritage of all Britons.

I know this article has been rather out of the line of my normal contributions to the *Field*, but we are living in exceptional times and exceptional things have to be done.

"BARNEYS

AT SEA

is the only tobacco which completely compares with those obtainable in England."

"At Sea: Haifa, towards Paullac.

"Gentlemen,

"Oil-tankers visit such out-of-the-way places that even some brands of internationally-known goods are not readily obtainable at short notice, and it was this state of affairs which separated me from Barneys 'Punchbowle' for about five months—a separation I did not appreciate, having smoked that satisfying weed for over seven years.

"However, I was able to lay in a good stock when we arrived in Pulo Sambac, Singapore, and I want you to know that it is the only tobacco which, in my experience of exported tobaccos, completely compares with that obtainable in England, both with regard to freshness and quality."

This letter is a striking confirmation of what we know to be the case; that *wherever* you buy Barneys . . . in Singapore or Seattle, Mombasa or Martinique, *anywhere* on the face of this old Earth . . . it is in perfect condition—the same as if you were buying it from our Factory on Tyneside.

About Barneys there *must* be something *unusually* good to bring such letters *continually* from every corner of the Globe . . . Barneys, in one of its three strengths, may bring you a deeper realisation of pipe-joy.

Barneys

Three strengths: Barneys (*medium*), Parsons Pleasure (*mild*), Punchbowle (*full strength*). In "EVERFRESH" Tins, 2 oz. 2/3d. "READY-FILLS" in Cartons of 12, 2/3d.

THIS HANDSOME HUMBER PULLMAN LIMOUSINE WITH COACHWORK BY THRUPP & MABERLY HAS BEEN SUPPLIED RECENTLY TO THE EARL OF ATHLONE BY MESSRS. ROOTES

ENGLISH CARS ON AMERICAN HIGHWAYS

IN a whirlwind tour of America you collect so many impressions, see so many things, and talk to so many people that the whole episode is liable to concertina itself into one fantastic memory. Even if, being methodical, you jot down in your notebook things that strike you, you hardly do justice to the wealth of impressions that envelop you every moment of the day and for a good deal of the night. For the 40 or 50 members of the Junior Car Club have probably only averaged three or four hours' sleep per night since they left England on this marvellous adventure.

By now they have got used to the traffic, road conditions, and as their task in entering or leaving large cities such as New York, Indianapolis or Chicago has been lightened by an escort of speed cops and cars, they have had little to worry about.

It appears that each State controls its own road system, car licence scheme and so on. Thus the speed limits are constantly varying, as also the style of the road. The signposting of the roads relies on numbers, plus the name of the town, which is sometimes given at its boundary. As the country is so young and comparatively undeveloped a townlet may consist of a few houses only. Under these circumstances and especially if you are travelling fast, it is not surprising that you are often past a village before you realise it.

Speed limit signs are stepped down on entering and up on leaving a town. Thus you come upon warnings stating the speed limit as 45, 30 and 20, successively, and *vice versa* when leaving the place. The signs not only give the name, but also the population of the town, and sometimes in addition a small silhouette map of the State. The signposting by road numbers through a big city is excellent, and might be adopted in our country. There are few reflector lights, and the general impression is that the negotiation of the roads is simpler than in England. This is probably due to the fact that the American traffic is more homogeneous as to its units and therefore in its speed.

The roads are often narrower than ours, but they are not filled up with cyclists, motorbuses, vans and pedestrians all travelling at different speeds. The American motorist jogs along at anything from 40–60 m.p.h., and keeps religiously to his own traffic lane, the only sign to matter being to extend his left arm when he intends to swing out and overtake another car. This routine is universally observed.

While the roads are full of this fast-moving traffic, and we have probably passed or met hundreds of thousands of cars, we ourselves have only seen three minor accidents, two being cases of one car bumping into the back of another, and one being a ditched car.

Traffic lights on the English plan are in evidence in some cities, while in others a four-way signal is suspended from wires above the crossing, a simpler and cheaper arrangement than the array of standards required by the other method. Many of the level crossings are unguarded, and some of them appear extremely dangerous, being approached blind, and with only a road sign to give warning.

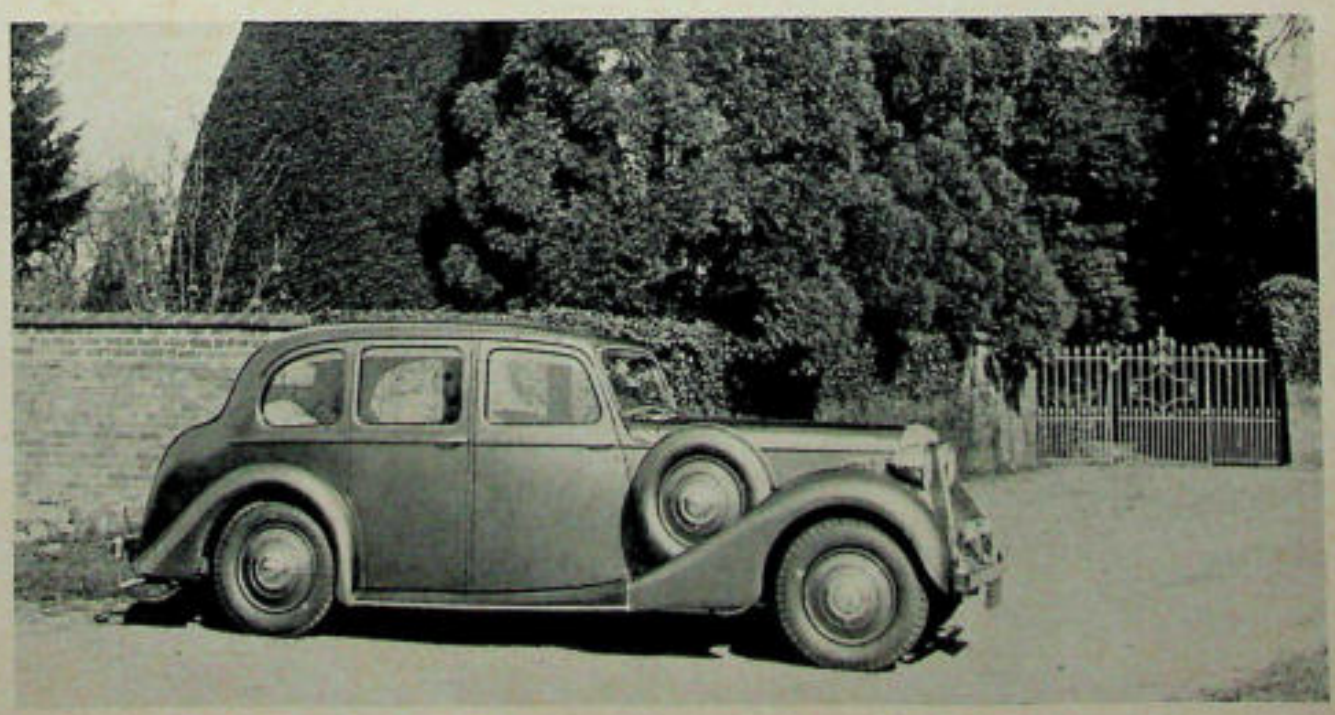
Apart from one 100 miles of really high speed road, where our Rolls-Royce Phantom III averaged 60 for most of the way, and about 95 for the last ten miles, the conditions we met did not permit any higher averages than are possible in England. This is due to the narrowness of long stretches of road which, if widened, would permit the highest possible speeds. Our average has also been reduced by the care necessary when pulling out to the left to overtake another vehicle with a car with right-hand drive. This feature always interested the crowds that gathered at our stopping places, when people always enquired whether we found this at all awkward. Another thing that tickled their fancy was the trafficators, a gadget unknown in the States, where they rely on hand signals only. The Americans also commented favourably on the appearance of our cars, which include such widely varying types as Rolls, Bentley, Humber, Lanchester, Rover, S.S. Renault, Wolseley, and Frazer Nash-B.M.W. In contrast to this motley array the American cars we have been encountering all day long seem strictly standardised, not only in colour—black—but also in appearance.

The continuous and genuine hospitality and expressions of friendliness has made a tremendous impression on all our members. At one wayside lunch stop the proprietor refused to receive payment from one car's crew because he was proud to meet them. At another the driver was invited on the spot to contribute to a local broadcast. And the free entertainment we have received all along the line has been positively embarrassing. In this respect the service of the Amoco and Standard oil companies afforded a remarkable example. Their representatives were always at hand to advise, direct, suggest or shepherd. Their kindness and efficiency was typical of the help and hospitality we received everywhere. And everywhere men and women of all ages came up to us and told of how they or their ancestors had been born in England and what an honour they deemed it to converse with a traveller from the old country.

In one case a good-looking young woman expressed the same opinion, but applied the honour to being allowed to sit in the Phantom III and work the twin horn. And this recalls another aspect of the same thing. As we speed along the roads or stop for a meal or drink we constantly hear people, even children, exclaim "That's a Rolls." And this tribute to a great name so far away from home fills our hearts with pride, which the irreproachable behaviour of our great grey lady has thoroughly justified.

One of the angles of our American adventure that has never failed to intrigue us is the food. To our way of eating and drinking the arrangement and timing, especially of the evening meal, seems quaint. It can start from 6 o'clock and continue to 9 or 10 p.m. It may include, served at the same time, such diversities as chicken, salads, all sorts of vegetables, hot scones, coffee and iced water. Though it is all very muddling, our interiors have battled nobly with the mix-up.

Prices, we thought, were a good deal more expensive than in England. Thus I have just consumed two sardine sandwiches, one lemon squash and bought an evening paper, for which I paid 4/2, including a tip. Petrol or "gas" costs 1/2 per gallon, the American gallon being four-fifths of the English. Weekly garaging appears about the same as with us. The hotels are expensive, £2 a day being an ordinary charge in the best places. Motor cars and tobacco are much cheaper than in England. Literature is more expensive. The tobacco and coffee are universally excellent, and the latter is always served with cream.



An interesting development from the tourist's point of view is the number of miniature one-room and one-bed bungalows centred round a central house and restaurant. A night's lodging at some of these places, which are often picturesquely placed in the country or woodland, costs 8/– without meals. Though we have passed hundreds of these little dolls' houses or log cabins we have hardly seen any cars outside them. Possibly those who use them had not arrived at the time we passed.

Another sideline which amused us was a new form of roadside advertisement in the form of a series of small brightly coloured notices each bearing a line or part of a line of doggerel verse ending up with the name of the product. Here is an example: "Wedding bells, blushing bride, scratchy whiskers, homicide." On the fifth and last notice board is the name of a well-known shaving cream.

The American people, men and women, who we have met and made friends with, have impressed us with their immense vitality and joy of living. Out of the office the American man is just a great big schoolboy, full of fun and jokes, invariably hearty and good-tempered. The women are essentially feminine. They look healthy and happy, their eyes sparkle and they are not afraid to enjoy life. They seem to get married much earlier than our women do, and it is no uncommon thing to meet a pretty girl who looks like seventeen and find that she is the mother of a family. At one place the locals staged a special dance for the Rallyers and, as one of them said, he had never seen so many pretty girls in one party before. We found both them and their menfolk natural, bright and brimful of "la vie." They wore their clothes with unaffected and informal grace and one and all danced admirably. The net result was that several members of the party wished that the tour dallied longer in the town of Huntingdon, which they were informed was founded by an Englishman.

So you can well imagine what a roaring success this Autocheque expedition is proving. As one who has travelled much by car, I think this rally idea of touring *en masse* and yet independently has much to recommend it. If you want to make friends there are many opportunities for so doing. If you prefer to keep to your own party and not be organised you can do so. You meet all together at breakfast for the start and at dinner after the day's run. You lunch or take tea where and when you will. You drive fast or slow as the mood takes you. And all the worry of making reservations and carrying the luggage is taken off your hands. For which services, so efficiently executed, we have to thank the organiser, Grahame Lyon. Next year, D.V., there will be many of us who will return to renew the contacts thus so pleasantly inaugurated.

W. G. McMINNIES.

"MOUNTAINS SKIP LIKE RAMS"

A Walking Holiday in the Six Counties

LET it be said without more ado that my knowledge of Ireland is limited. That is my qualification for writing about it, for those who are Irish born and bred, or who know the country intimately, do not need to read articles to convince them of its beauty; they know it a land pleasant to the eyes, and already they have "gone up to possess it."

For those less fortunate than they, to whom Ireland is as remote as the foothills of the Himalayas, simply because they have never been there, the impressions of one so recently their companion in ignorance may stir in their hearts a desire to see what, for so long, they have missed.

The crossing from England is a simple and comfortable business by the Ulster Imperial Line from Liverpool to Belfast. The ships on the service are officially described as luxury motor vessels, and that is not an over-statement. They are equipped with pleasant and restful public rooms, while as for the berths, for myself, I found hot tea and toast were the first things that loomed on my horizon when I awoke in the morning. Since the same thing happened on the return journey I came to the conclusion that an Irish crossing in any reasonable weather should cause discomfort, internal or external, to none.

Personally I walked round Ulster, there on Nature seems to better herself at every mile. The first place of note is Glengariff, the loveliest of the celebrated Glens of Antrim. Like most people I have looked at a good number of glens, chines and waterfalls at one time or another, and, again like most others, I have gone away disappointed; but at Glengariff I was enchanted. Evening had come, the attendant had gone home to his supper, and I was alone. I can still see the water heaving and tossing its way over Ess-na-Larach Fall as it dashed upon its carefree way to the sea.

From Glengariff a climb up to the cairn upon the summit of Crockalough (1,304ft.) brings its own reward. The foreground to the north-west is the inspiring face of Trostan, the highest mountain in Antrim, and behind it the mountains skip like rams—everywhere there are mountains, big mountains such as Orra More, and smaller mountains with intriguing names like Tievebulliagh, and in between are the little hills doing their best to imitate young sheep. Looking northwards, and to the sea, the eye can trace the path of the roads and the rivers as, in close company, they wind their way through fertile valleys to the sea at Cushendall and charming Cushendean with its whitewashed cottages and pleasant coastal scenery.

TYPICAL OF THE ROCKY SOLITUDE OF THE NORTH ANTRIM COAST. THE SEASHORE AT BALLINTOY WITH SHEEP ISLAND IN THE MIDDLE DISTANCE, AND BEYOND IT RATHLIN ISLAND

LOOKING ACROSS LOUGH FOYLE TO MAGILLIGAN STRAND FROM THE FREE STATE AT GREENCASTLE (ABOVE)

and if circumstances allow the reader to do likewise he will not be sorry he chose this method of searching out the land. Motor cars are all very well, and they can be taken over both cheaply and easily, but they cannot go along cliff tops, climb mountains or explore the subtle twistings of each sandy bay. If he drives, the visitor will see the beauty of a great area, but if he walks, though he may view far less, he will find that the spirit of the place is his, and it will leave an ineffaceable mark upon his memory.

As a magnificent highway the Antrim coast road can hardly be beaten anywhere in the British Isles for its combination of natural charm and technical excellence, and here the motorist will have the advantage, for though it is pretty enough at times, it becomes dull to walk upon for any length of time, and feet begin to yearn for the grass and the heather.

It is not until Garron Point is reached that the views are more than the shape of things to come, but from

At Cushendall the coast road ends and the best of the country begins. It is possible to walk to Ballycastle within a few hundred yards of the sea, and all the way to Fair Head the cliffs become grander and more rugged, starting from the gentle hillsides that flow down to the sea at Port-aleen Bay to the almost sheer face of Fair Head itself, which rises 636ft. above the water that washes to and fro at its foot.

Behind Ballycastle rise the easy, though steep slopes of Knocklayd. Nearly 1,700ft. high, it offers a magnificent view in every direction, and to the west the mountains of Co. Donegal are clearly visible, beckoning the traveller on towards Eire. For all its fine panorama, I have always regretted climbing it, for in so doing I missed the massive coast line from Ballycastle to Ballintoy, and if it is as fine as the scenery after that point, I made a bad error.

Ballintoy is, I think, the most charming spot I have ever visited, and irresistibly made me think of fairies, a thing, I may say, not usual in my daily round! Here, and in White Park Bay, which joins it, national and personal problems simply disappear into their holes like the rabbits that scuttle before the visitor's feet. Everywhere are wild flowers in such profusion that it is impossible not to tread upon them. Here life stops still and at peace before the admiration of those who behold it. If anyone wants a spot for a honeymoon, try Ballintoy.

There is little which need be said about the Giant's Causeway, it is too well known. For myself, I would exchange fifty Causeways for one Ballintoy. The latter is natural beauty, the former a commercialised freak.

After the Causeway, scenically, the coast line peters out, and I made my way to Magilligan, that huge tongue of sand which pokes out across Lough Foyle to within a mile of the Free State, providing conchologists with a very happy hunting ground on its seven-mile stretch of firm, silvery sand.

Greencastle lies just opposite Magilligan Point, and taking the row-boat ferry over the water I spent two days lounging amid the rocks

PORT-ALEEN BAY WITH TORR HEAD BEYOND, AND THE SCOTTISH COAST IN THE DISTANCE (BELOW)

before turning my back on Ulster to explore Donegal. Beautiful, Donegal undoubtedly is, but in a different way. I missed the friendly atmosphere of the land I had left, with its mellow cliffs and the glorious golden whins like gigantic scrambled eggs poured out upon the mountains.

L. N. RADCLIFFE.

AIR STRENGTH AND THE EMPIRE

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field")

IT has become a commonplace that the coming of air power has basically altered the whole of Britain's traditional strategy of defence. The old protection of insularity has been swept away, and we are now faced with problems and dangers of which the past year or so has made us all only too well aware.

There is no need to refer in detail to that aspect. But it is certainly not so widely known that the development of air power is bringing, too, an entirely new conception of Empire defence. This fact was underlined in a recent speech by Sir Kingsley Wood, the Secretary of State for Air. The Air Minister pointed out that the increasing range and speed of aircraft might revolutionise Empire defence radically. "The possibility," he said, "of reinforcing any part of the Empire in the air within a matter of hours is rapidly becoming definite." Thus, it was pointed out, the invention of the aeroplane, which had entailed disadvantages to Empire defence, might turn out to be an asset.

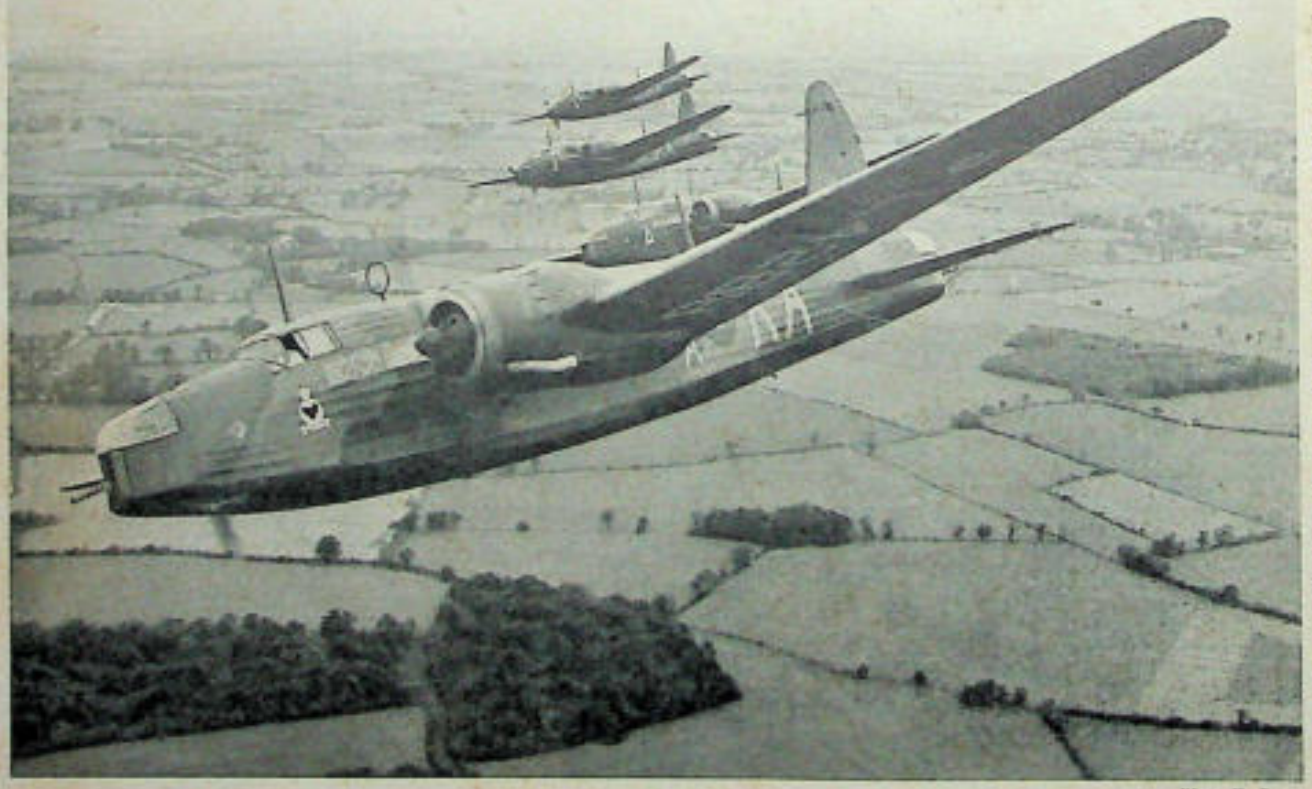
In a phrase, the new conception appears to regard air strength as an integrating factor in a problem, the solution of which hitherto has had to be considered mainly in local and isolated terms. Through the speed and range of the aeroplane, the garrison of the exposed outpost may have the moral and material strength of readily available reserves behind it. The weakness of positions to which relief could not be brought, in emergency, for some considerable time—perhaps too long to be of any immediate value—may be abolished.

Here, then, is a facet of air power that seems destined to add strength to the Empire; and the fact that it has been given such wide publicity by the Air Minister as was afforded by a London gathering of Empire journalists should do something, at least, to dispel the belief some held that air power is nothing but a curse to the British peoples. It has often been stressed that commercial aviation can play an all-important role in strengthening the Empire by binding its citizens more closely together. Such bonds are, of course, mainly intangible. Now there is a further advance in that the air is visualised as adding to the actual security of the most remote parts.

Nor should it be forgotten that this gain in strength is mutual. Just as the scattered parts of the Empire are brought within the main orbit of defence measures by the aeroplane, so the central point can be reinforced by resources far afield.

This point is, perhaps, a little more familiar. The arrangements for aircraft construction in Canada were made, as was stated at the time, not only because the Dominion is away from the main danger area of attack, but because machines could, if necessary, be sent by air.

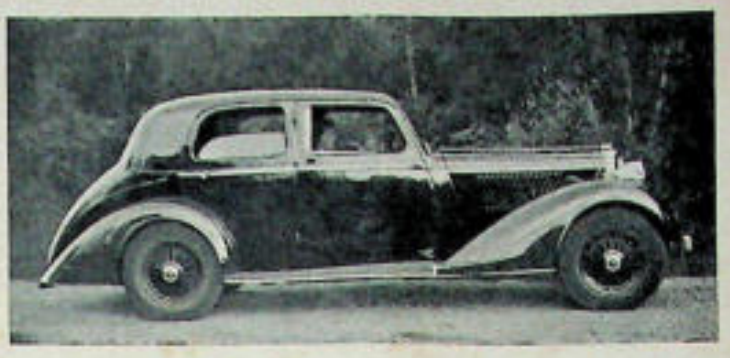
Similar plans for construction of military types in Australia are under way, but here the prospect of rapid air delivery seems more remote. Yet it is not really so. The flight of the Vickers machines that broke the world's distance record showed that the stage Egypt-Australia could be flown in one hop; and those machines differed little from standard long-range bombers employed by the Royal Air Force. By the Imperial commercial route, Australia is reached from Southampton in just over seven days; and in the stress of emergency and in condition unhampered by considerations of passenger comfort and the like, that schedule could be very much reduced—as has been demonstrated in "record" flights and in other ways.



Successful defence of any community consisting of scattered groups, like the Empire, must depend upon mobility; and that aircraft provide in a very remarkable degree. There is no suggestion that the Royal Air Force could undertake the complete defence of the Empire; that would clearly be an exaggerated and untenable proposition. But as a means of introducing unity and mutual support for the individual measures of the various communities, air power has, as Sir Kingsley Wood said, a great and growing part to play.

In this connection, it is of interest and importance to note that the principle of unity in Empire air defence has long been a cardinal point in its development. Primary responsibility for defence of their various territories rests, of course, in the hands of the self-governing Dominions, which are, technically at least, at liberty to remain neutral in any war in which Great Britain herself may be involved. Nevertheless, there has been no independent development. The closest liaison with the Mother Country has been preserved. Something much more than a skeletal framework of a unified air-defence system has been created.

Each of the four great Dominions—Canada, Australia, South Africa, and New Zealand—has its own air force, manned and maintained from its own resources. Yet there is the closest connection between these and the Royal Air Force. There is identity of equipment, as regards both flying stock and other items, and interchange of personnel ensures still further unification.



Moreover, training for the Royal Air Force is now being undertaken in the Dominions, and, in the same speech as that already mentioned, Sir Kingsley Wood mentioned that further facilities for training in overseas British territory would be afforded by establishing R.A.F. Volunteer Reserve units at R.A.F. stations in the Colonial Empire.

There is ample evidence here of a growing strength in the air that cannot fail to be an immense access of security for the Empire as a whole. To-day, our immediate problems seem nearer at hand than the outer territories of the British Commonwealth, and excuses might be made if attention were focused exclusively on those matters. But the larger whole is ultimately the most important. The strength of the Empire in the air must be considered not piecemeal, but in its entirety; and if such a comprehensive view is being taken, there is every reason for satisfaction.

VICKERS-WELLINGTON LONG-RANGE BOMBERS GETTING INTO FORMATION AFTER THEIR TAKE-OFF. THE WELLINGTON HAS A MAXIMUM SPEED OF 265 M.P.H. AND A RANGE 3,200 MILES

SPEED WITHOUT FUSS, DIGNITY WITHOUT OSTENTATION

THE 20 H.P. ALVIS

I HAVE a friend who owned one of the old Alvis tourers until about four years ago. It was, I remember, painted a particularly revolting shade of green—a legacy from a previous owner—and went off with much noise and a certain amount of rattle from the coachwork. Since those days he has owned two or three new cars of other well-known makes, and although he is full of praise for his present vehicle, he always speaks affectionately of the old Alvis. To him it represented performance above its peers in price, both in character and reliability.

Those qualities, so admired by my friend, are typical of the Alvis cars of to-day, for the Alvis has built into it the experience and technical excellence which lie behind the name. It has never been a cheap car, and is hardly likely ever to become one for the simple reason that it is "tailor made," and cars such as that cannot become cheap—the labour and materials involved prohibit it. But even in these days there are still many of us who will willingly pay a little more to obtain first-class craftsmanship.

The particular member of the Alvis "family" I drove recently was the Silver Crest six-light saloon, a 20 h.p. car selling at £595; although the car may also be obtained with a 17 h.p. at the same price.

The performance of the car is most attractive. It has a top speed of just over 80 m.p.h., and reaches it without fuss and bother, while a high cruising speed may be maintained more or less indefinitely. The engine is quiet-running especially at speeds under 60 m.p.h., and transmits little vibration.

The four-speed gearbox deserves special mention, for it is almost unbelievably smooth. It is, of course, synchromesh, and to do anything wrong is almost impossible. The lever may be flicked from one gear to another absolutely soundlessly without any hesitation. I think it is the simplest orthodox gearbox I have ever met.

As might be expected from a car with a sporting ancestry, its road behaviour is good, and cornering produces no tendency to imitate a yacht and heel over all the way round the bend, though some might consider the steering a trifle heavy. Brakes, too, are efficient, and on the one occasion when I had good reason to stop quickly, thanks to a cyclist, I did so in a remarkably short distance. Jackall hydraulic jacks are a further refinement.

The coachwork is distinguished without being ostentatious, and provides one of the best boots I have ever seen, which is all the more remarkable since there is very little overhang at the rear. Clever designing has been responsible, and by means of cutting away every unnecessary obstruction there is room for a golf bag and enough luggage to satisfy a film star.

The interior arrangements and upholstery are of excellent quality and provide plenty of room and good comfort for the occupants. I can personally vouch for the comfort of the driving seat, and those who travelled in the rear assured me of a similar state of affairs there.

During an eventful week-end the car gave me both pleasure and amusement—it will be a car I shall remember after many another is forgotten.

W. R. J.

BRIDGE

THE ECHO—II

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

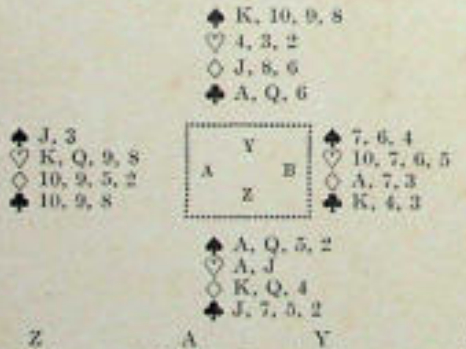
LAST week we dealt with the echo with a trump suit. This week we will consider it when the contract is played in No Trumps.

In No Trumps the echo shows:

1. An important honour in the suit led.
2. Four or more cards of the suit led, or
3. Occasionally an original holding of two in the suit led.

The first two uses are fairly well known and correspond to the parallel cases in trump play in that they both encourage partner to continue his suit.

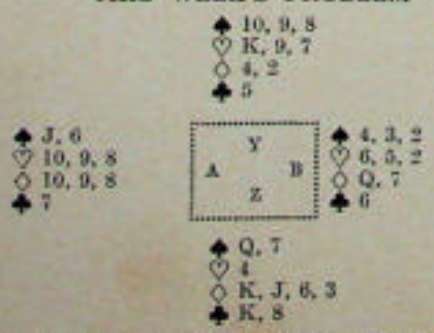
The third example is not so well known, but is extremely useful since when dummy has a long suit without an entry and the opponents have a certain trick in the suit, generally the Ace, it is essential that the holder of the Ace knows how many rounds he must hold it up.



Against Three No Trumps by Z A leads the 5 of Hearts. Z takes the trick with the Queen of Hearts and leads the Jack of Clubs on which A discards the 2 of Clubs. When Z plays the 4 of Clubs A plays the 3, and B knows that A has a third Club since he did not echo. B must therefore take the trick with the Ace of Clubs and correct defence will then beat the contract since A-B should make two Heart tricks and one trick in each of the other suits. Of course if A echoes in Clubs B holds off the Ace of Clubs till the third round to shut out the Club suit.

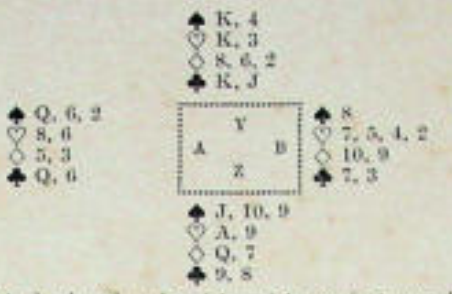
In all cases of echoing the defender must be ruled by the dictates of common sense. Occasions may arise in a suit contract where, although holding a doubleton in the suit led by a partner, he will not echo if he does not wish the suit continued.

With regard to the case where one has four or more cards of the led suit, one of my readers raises the query as to what card should be returned. Whether in a No Trump or in a trump contract the defender should endeavour whenever feasible to return his *original* fourth highest.



Occasionally this lead may be of too much assistance to the declarer, but in general it will help the defenders more in obtaining an accurate count of their hands.

Z	A	Y	B
One Spade	No bid	Two Spades	No bid
Two No Trumps	No bid	Three No Trumps	No bid
No bid	No bid		



Z is playing the hand in Three No Trumps and A leads the King of Hearts, upon which B plays the 7 or 6 as an encouraging card and Z takes it with the Ace. When B gets in with the Ace of Diamonds he returns the 5 of Hearts, *i.e.*, his original fourth best, and A then knew that B and not Z holds the 10 of Hearts. A returns the 9 of Hearts, taken by B's 10, the 8 of Hearts is made and A leads a Club to defeat the Contract.

THIS WEEK'S PROBLEM

Z to lead and take all the tricks against any defence by A-B.

LAST WEEK'S PROBLEM

Z to lead and make eight tricks against any defence by A—B.

SOLUTION

Z leads the Knave of Spades, which A does not cover. The Jack of Clubs is finessed, and the King of Clubs, the King of Hearts and the Ace of Hearts taken in that order. Z now leads Queen and 7 of Diamonds and when B returns a Heart which Z ruffs with the 9 of Spades, Y-Z must make the last two tricks.

CHESS

WORLD'S CHAMPION'S PLAY

Dr. Alekhine, who is on tour in South America, took part in a small double-round tournament at Caracas in March and won all his games. The following one, against the runner-up, is a good example of the World's Champion's attacking style of play.

(Ruy Lopez.)

WHITE. Dr. Alekhine.	BLACK. Benitez.	WHITE. Dr. Alekhine.	BLACK. Benitez.
1. P to K 4	P to K 4	19. P to K Kt 4	Kt to B 2
2. Kt to K B 3	Kt to Q B 3	20. Q to B 4	Kt to K sq
3. B to Kt 5	P to Q 3 (a)	21. Kt to Q 5	Q to R 5 (i)
4. P to Q 4	B to Q 2	22. Kt to K B 3	Q to Q sq
5. Kt to B 3	Kt to B 3	23. Q to Kt 4 (j)	P to K Kt 3
6. B takes Kt	B takes B	24. Q to K B 4 (k)	P to K B 3
7. Q to Q 3	P takes P (b)	25. Q to R 6	K to B 2
8. Kt takes P	B to Q 2 (c)	26. K R to K sq	P to B 3
9. B to Kt 5	B to K 2	27. Kt takes P, ch	Kt takes Kt
10. Castles (Q R)	Kt to Kt 5 (d)	28. P takes Kt	Q takes P (l)
11. B takes B	Q takes B	29. Kt to K 5	B to K 2
12. Kt to Q 5	Q to Kt 4, ch(e)	30. Kt takes R	Q takes Kt
13. P to B 4	Q to Q sq	31. R to B sq	Q to B 2
14. P to K B 3 (f)	Kt to B 3	32. Q to B 4	Q takes Q, ch
15. Kt to Q B 2	Q to K 2	33. R takes Q	K to Kt 2
16. P to K 5	P takes P	34. R to K sq	R to Q 4
17. P takes P	Kt to R 4	35. R to K 7, ch	K to B 3
18. Q to K 3 (g)	Castles (K R) (h)	36. P to K R 4 (m)	Resigns.

(a) The Steinitz defence. 3. . . . Kt to B 3 followed after 4. Castles by 4. . . . P to Q 3 is better, Black thus avoiding the line of play adopted by White in this game—6. B takes Kt, 7. Q to Q 3 and later Castles (Q R)—which is very strong.

(b) If, instead, Black defends his King's pawn by playing 7. . . . Kt to Q 2, then 8. B to K 3 (threatening to win a piece by P to Q 5 which, if played at once, would be answered by Kt to B 4) and now, since 8. . . . P to Q Kt 3 is not good on account of 9. Q to B 4. P takes P (if B to Kt 2, then Kt to K Kt 5); 10. B takes P, Kt to Kt sq; 11. Castles (Q R) with a big advantage in position for White. Black has, therefore, to play 8. . . . P takes P, but after 9. B takes P he has difficulty in completing his development. A game Nimzowitsch *v.* L. Steiner (Nicolsdorf tournament, 1927) was continued as follows: 9. . . . P to B 3; 10. Kt to K 4, Kt to B 4; 11. Q to K 2, Q to Q 2; 12. Kt to B 5 with advantage in position for White.

(c) If 8. . . . P to K Kt 3, then 9. B to Kt 5, B to Kt 2; 10. Castles (Q R) with the better game for White. Black cannot continue with 10. . . . Castles because of 11. Kt takes B, P takes Kt; 12. P to K 5, P takes P; 13. Q takes Q, Q R takes Q; 14. R takes R, R takes R; 15. Kt to K 4.

(d) In a game Spielmann *v.* Maróczy (Gothenburg tournament, 1920) the continuation was 10. . . . Castles; 11. P to B 4, Kt to K sq; 12. B takes B, Q takes B; 13. Kt to Q 5, Q to Q sq; 14. P to K Kt 4 with advantage to White.

(e) A weak move.

(f) Very fine. If now 14. . . . Kt to B 7, then 15. Q to K Kt 3, Kt takes K R; 16. Q takes P, R to K B sq; 17. Kt to B 6, ch, K to K 2; 18. R to K sq with a winning attack, *e.g.* (1) 18. . . . Kt to B 7; 19. P to K 5, P to Q 4; 20. Kt takes P, ch, K to K sq; 21. P to K 6, B takes P (if P takes P, then Kt takes P); 22. Kt to B 6, ch, Q takes Kt; 23. Q takes Q and wins; (2) 18. . . . P to Q 4; 19. P takes P, ch, K to Q 3; 20. Kt to K 4, ch, K to K 2 (if K takes P, then Q to K 5, ch and mate next move); 21. Q to B 6, ch, K to K sq; 22. Kt to Q 6, ch and mate next move; or (3) 18. . . . R to K Kt sq; 19. Kt to Q 5, ch, K to K sq; 20. Q takes R, mate.

(g) Preventing Kt to B 5 as a reply to P to K Kt 4.

(h) If 18. . . . Castles (Q R), then 19. K Kt to Kt 5, B takes Kt; 20. Kt takes B, P to Q B 3 (not P to Q R 3 because of Q to R 7); 21. Kt to Q 6, ch.

(i) If 21. . . . Q to B 4, then 22. Kt to Kt 3, Q to Kt 4; 23. P to B 4, Q to R 5; 24. Kt to B 5, Q takes R P; 25. Kt to K 7, ch, K to R sq; 26. Kt takes B and wins.

(j) Threatening 24. Kt to K 7, ch, K to R sq; 25. Kt to Kt 6, ch, R P takes Kt; 26. Q takes R, ch, K to R 2; 27. P to K R 4, P to K Kt 4 (if 27. . . . P to K B 3, then 28. Kt to Kt 5, ch, P takes Kt; 29. P takes P, mate); 28. Kt takes P, ch and wins.

(k) Now White threatens 24. Q to R 6, P to K B 3; 25. P to Kt 5.

(l) Black has no good move. If 28. . . . R takes P, then 29. Kt to Kt 5, or, if, instead, 28. . . . Q to K B sq, then 29. Q takes Q, ch, K takes Q; 30. Kt to K 5.

(m) Threatening P to Kt 5, ch followed by R takes P, mate. Black can parry the threat, but in any case his game is hopeless.

A POWERFUL ATTACK

The following game, from a tournament for the championship of Moscow, shows a powerful attack by White.

(Caro-Kann Defence.)

WHITE. Smyslow.	BLACK. Reksech.	WHITE. Smyslow.	BLACK. Reksech.
1. P to K 4	P to Q B 3	13. P to B 4	P to R 4
2. Kt to Q B 3	P to Q 4	14. Castles (K R)	P to K 3 (g)
3. Kt to B 3	P takes P (a)	15. P to Q Kt 4 (h)	Q takes B P
4. Kt takes P	Kt to B 3 (b)	16. K R to B sq (i)	Q to Q 4
5. Kt tks Kt, ch	Kt P tks Kt (c)	17. Q to K 2	Q to Q 3 (j)
6. P to Q 4	Q to B 2	18. P to Kt 5	Kt to Kt sq
7. P to K Kt 3	B to Kt 5	19. P takes P	P takes P (k)
8. P to K R 3 (d)	B takes Kt (e)	20. B to B 4	P to K 4 (l)
9. Q takes B	Kt to Q 2	21. P takes P	P takes P
10. B to Kt 2	Q to R 4, ch (f)	22. B takes K P	R to K sq
11. B to Q 2	Q to R 3	23. R takes P, ch	Resigns (m)
12. P to Kt 5	Castles		

(a) 3. . . . P to Q 5 is inferior. After 4. Kt to K 2, P to Q B 4; 5. P to B 3 Black cannot play 5. . . . Kt to Q B 3 (because of 6. P takes P, P takes P; 7. Q to R 4) and is, therefore, forced to play 5. . . . P takes P, which gives White the superiority in the centre.

(b) Good alternatives here are Kt to Q 2 and B to Kt 5. 4. . . . B to B 4 is not good, *e.g.*, 5. Kt to Kt 5, B to Kt 3 (B to Kt 5, although losing time, is better); 6. P to K R 4, P to K R 3; 7. Kt to K 5, B to R 2; 8. Q to R 5, P to K Kt 3; 9. Q to R 3 (B to Q B 4 is also good), Kt to B 3; 10. Q to Kt 3 or 10. B to Q B 4 with much the better game for White.

(c) K P takes Kt, to be followed by B to Q 3 and Castles, is, we think, to be preferred.

(d) If B to K B 4, then P to K 4.

(e) Black should play B to R 4.

(f) This move does not improve his game.

(g) If 14. . . . B to R 3, then 15. B takes B, R takes B; 16. Q to K 2 wins a pawn.

(h) Threatening P to Kt 5.

(i) A good move. If now 16. . . . Q takes Q P, then 17. R takes P, ch, K to Kt sq; 18. R to B 8, ch and mate next move.

(j) If 17. . . . Q takes Q P, then 18. B to K 3, Q takes P (if 18. . . . Q to K 4, then 19. R takes P, ch followed, if 19. . . . P takes R, by 20. Q to R 6, ch and mate in two more moves, or, if 19. . . . K to Kt sq, by 20. B to B 4 with a winning game for White); 19. B takes R P with advantage to White.

(k) If 19. . . . Kt takes P, then either 20. B to B 4 or 20. B takes Kt, P takes B; 21. Q to R 6, ch.

(l) If 20. . . . Q takes P, then 21. B takes Kt, K takes B; 22. Q R to Kt sq, ch with a winning game for White.

(m) If Kt takes R, then Q to R 6, ch followed by B takes Q.

PROBLEM No. 4024

By H. ERDENBRECHER.*

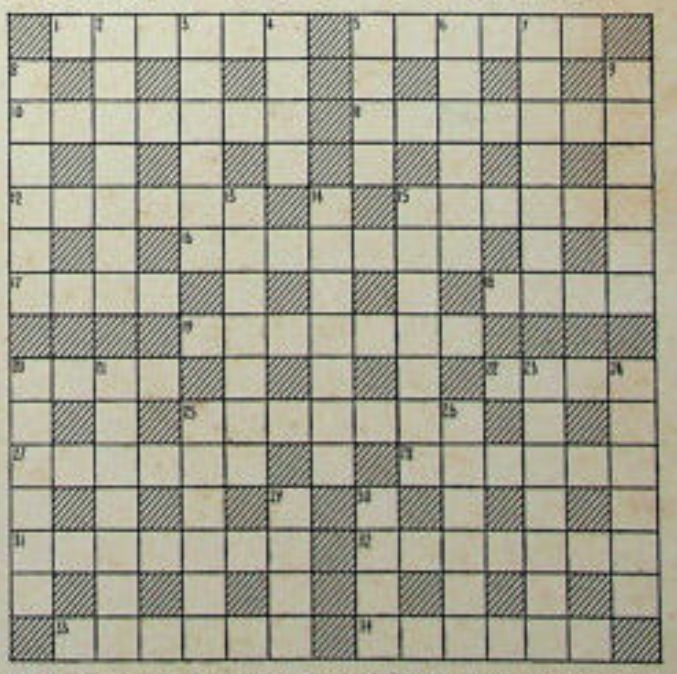
WHITE (9 pieces): King at K B 7, Queen at K B 8; Rooks at K B 2 and K Kt 8, Bishops at K R sq and K R 8, Knight at K B 4, Pawns at Q 3 and K R 4.

BLACK (13 pieces): King at K B 4, Queen at Q R 5, Rooks at K 4 and K 5, Bishops at Q R sq and Q Kt 5, Knights at K 6 and Q 8, Pawns at K 2, K R 2, K 3, K R 3 and Q R 4.

White to play and mate in two moves.

**Die Schwalbe*, 1937.

SOLUTION OF PROBLEM No. 4023



1. Kt to K 6, Any move; 2. Q, R, B or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 527

ACROSS.—(1) There should be more than one beast here anyhow, about 50 in fact (6). 5. He might have bowled a few balls to W. G. Grace perhaps (6). 10. The piper's son chases the painter inside with a red hot poker (7). 11. As you may gather, it's often read in church (7). 12. Dependent on the family tree of Grimalkin and her relatives perhaps (6). 15. Oddly enough, there isn't a bee in it! (6). 16. They may provide your wage, Sir (7). 17. It has always needed runners, so Bob was well to the fore (4). 18. Hardly a palatable way to cook fish (4). 19. Not being in the cockpit in rock fighting days, he is now above all that (7). 20. A current event? (4). 22. What are the chances? Twopence to the shilling there is no start (4). 25. Being cut off with a penny is apt to give one a serious start (7). 27. In them you might see the likenesses of your equine friends (6). 28. The inside of the bivalve should be taken at tea-time (6). 31. Would a farmer, as a matter of course, allow the club to be of use in his loft? (7). 32. A plant often seen on mountains (7). 33. An air familiar to the gasworks' band? (6). 34. The youngman's guide to navigation? (6).

DOWN.—2. This'll almost sound emblematical (7). 3. A man, of course, is likely to have a better clientele (6). 4. A test mostly taken two hours before noon (4). 5. Did Drake address his wife thus? (4). 6. The parts of a bullock's mouth you might rightly describe as blooming (6). 7. A Midland river doubtless in use before the laundry was here perhaps (7). 8. Financial markets don't benefit when gardeners lift them (6). 9. Yes, art is an indispensable necessity to one who can last the course (6). 13. They can often pick where they wish to work (7). 14. Jersey, for its own ends, alters its rents and we get taken in (7). 15. No fellows will back a horse with such a name (7). 20. A caravan dweller who will eventually make quite a good host (6). 21. You will see much useless stuff in the museum, as your spaniel might know (7). 23. The ex-soccer player batsman doesn't do it when he plays forward (7). 24. Cook may be unfamiliar with this range which is returned with a faulty bark (6). 25. A way to walk or a way to go on horseback (6). 26. Shylock said one had come to judgment (6). 29. Very behindhand anyway in whiskey manufacture, there is so much water around (4). 30. A short tail because the end is curtailed (4).

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division 1. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Cards

Mistake in Bidding.—Question: My partner bid One No Trump, and since I thought he bid One Club, I bid One Spade. When attention was drawn to the under bid I immediately bid Two Spades. Was my partner entitled to bid over the Two Spade call? Answer: Partner must pass for one round. See Law 22.—*McC., Glasgow.*

Comment on Bidding.—Question: Please comment on the following bidding:—Y, Three Spades; Z, Five Diamonds; Y, Six Spades.

Y—	Z—
♠ A, Q, J, 10, 9, 8	♠ None
♡ A, K, x	♡ Q, x, x
◇ None	◇ A, K, x, x, x, x, x
♣ A, 10, 9, x	♣ Q, x, x

Answer: In our opinion Z should realise that there is a misfit and only call Four Diamonds. Although Y might also realise this fact, he can hardly be blamed for bidding the small slam after Z's jump bid.—*T., South Africa.*

Drawing Attention to a Revoke.—Question: Can dummy draw his partner's attention to a revoke by the defenders? Answer: Yes, so long as he has not seen any cards other than his own. See Rule 30, 2 (d).—*N. B. B., Rude.*

Country House

Norfolk Reeds.—You would be able to obtain Norfolk reeds for the purpose you mention from the Norfolk Rush and Reed Industries, Ltd., Reckland St. Mary, near Norwich, or R. J. Farman, Aylesham Road, North Walsham.—*H., Taunton.*

Disposal of Dredged Mud.—The best way to deal with mud dredged from a lake is to spread it evenly over surrounding pastures. It will soon break down and disappear, and, being very fertile, will very greatly improve the condition of the sward. Spreading should be done if possible before the mud has dried out, otherwise it will be more difficult to distribute. Where labour is available it is advisable to take the material direct from the pond and scatter it straight away.—*J. E., Oswestry.*

Control of Silverfish.—Silverfish are common household pests, living in chinks and crevices in walls and surrounds, and under linoleum, especially in warm parts of the house. They are attracted by starchy materials, such as wallpaper paste and picture backs, and hence can be controlled by the use of a suitable poison bait containing starch or flour. A safe and efficient bait for household use can easily be made up by mixing one part of sodium silico-fluoride (obtainable from any chemist) with six parts of flour. The powder should be scattered along shelves, inside bookcases, along surrounds and under linoleum. Another method is to visit each infested room at dark, switch on the light suddenly, and spray any pests seen with a pyrethrum-kerosene preparation. Since the pests must be hit to be destroyed, however, it is rarely possible to wipe out the insect population by this means, though numbers can be considerably reduced. Use of a poison bait is generally more satisfactory.—*L. E., Hoxton.*

Farming

No. 22 (J. S. S.).—It is quite unusual for a cow or heifer to come into milk at this stage of pregnancy, and it may mean that she will slip her calf at seven to eight months; but, on the other hand, it may only be a case of precocity, as there is no fixed rule about it.—*C. G. S.*

Jacob's Sheep.—There is not much recent information as to the activities of owners of flocks of Jacob's sheep, but we think your best plan would be to write to the Earl of Bradford, at Weston Park, Shifnal, Salop. In 1936, the Earl said that he had a list of seventeen owners of these sheep. Another owner who might be able to help you is Sir Merrik Burrell, of Floodgates, Horsham, Sussex.—*C. S. A., Ringwood.*

Herd and Stud Books.—Three of the books to which you refer have recently been issued. Volume LXII of *Dury's Devon Herd Book*, with a supplemental register and dairy section, for 1938, is published by the Devon Cattle Breeders' Society and printed in Taunton by H. G. Mounter & Co. The *Clydesdale Stud Book*, volume 61 of which has just appeared, is printed in Perth by the Munro Press and contains the pedigrees of mares which had produce before September 30th last year and of stallions foaled before January 1st. The *Shorthorn Breeders' Review* is published by the Shorthorn Society at Victoria House, Southampton Row, W.C.1. The British Goat Society publish a Herd Book which is to be obtained from the Secretary, The Cottage, Roydon, Diss, Norfolk.—*J. B., Crediton.*

Barley Growing.—The point you raise is dealt with in the Advisory Leaflet No. 220, just issued by the Ministry of Agriculture and Fisheries. It says: "Barley is largely grown for malting, and for this purpose quality is of the first importance. The price of good malting samples is frequently 50 per cent. higher than that of feeding barley, and this may represent a difference of £4 to £5 per acre in value. Good malting points in barley grain are: (1) good maturation, as indicated by a ripe, dry, mealy grain; (2) plump kernel, of bright colour and even size, with finely wrinkled skin; (3) absence of mould and mustiness, and (4) germination practically 100 per cent. Grain possessing these characteristics usually has a nitrogen content not exceeding 1.6 per cent. Apart from the more obvious causes of inferior quality, such as weathering in the field and heating in the stack, close threshing is a common fault that results in a high proportion of broken and tipped grains. Judicious cultivation, the choice of suitable varieties and correct manuring all tend to the maintenance of high quality. Soil and season exert the greatest influence."—*P. T., Sheffield.*

Kennel

Retrievers and Setters.—You may find a difficulty in getting a young retriever or Irish setter house trained from well-known breeders. Probably you would be more likely to hear of one through an advertisement in this paper. The nearest breeders to you of whom we know are: Irish Setters—Mrs. M. Holt, Menaifron, Dwyran, Anglesey; and Miss B. Praddah, The Acres, Heswall Hills, Cheshire. Golden Retrievers—Mr. H. L. Jenner, Abbots Morton, Worcester; Mrs. A. Kirk, Pant Canol, Merionethshire; and Mr. F. Thomas, Dyfri Kennels, Ammanford, S. Wales. Labradors—Major J. I. Benson, Aston Hall, Craven Arms, Salop; Mr. G. J. Johnson-Houghton, Croughton Cottage, near Chester; and Sir Edmund Spriggs, Ruthin Castle, N. Wales.—*E. C. K. B., Barmouth.*

Naturalist

Mange in Squirrels.—Mange is a fairly prevalent and common disease among squirrels, and is usually of the sarcoptic variety.—*D. M. B. I., Lochcrbie.*

Shooting

Boring of Guns.—As regards the question of the boring of guns, provided wadding is able to perform its work of gas-check, extra internal width may help to improve shooting by lowering pressure and shortening the shot column. It is this system which enables ¾oz. of shot to be handled successfully by a 2in. chambered 12-bore of, say, 5lb. 2oz. This, too, is no doubt the reason why some guns that were originally bored for brass perfect cases give good shooting with the smaller loads from paper cases.—*J. A. L., Co. Down.*

Travel

Where to Stay.—The Marine Hotel at Salcombe offer accommodation from 3½ to 8 guineas a week according to room and season. There is also the Tides Reach Hotel, situated near the harbour bar at the foot of Bolt Head. Their terms are from 4½ to 5 guineas weekly. Regarding Dorset, there is little doubt that you would like the Knoll House Hotel at Studland Bay. Weekly terms inclusive of baths, early and afternoon tea, beach hut and garage are from 4 to 8 guineas. There is also a bungalow wing in the woods in which the charges are less. Then there is the charmingly placed Grand Hotel at Swanage, where terms are from 4 to 8 guineas per week.—*H. B. A., Penn.*

The South Devon Coast.—The Knappe Cross Hotel, near Exmouth, is very pleasant. The outlook from the Knappe Cross Hotel would suit the most drastic critic. From one side you look down a long, gentle slope to the sea, and from the other over sweeping moorland country—a home of riding and hunting and golf and every other sport. If you have a car there are many delightful Devon villages within easy reach of the hotel. Go, for example, to Beer and you will see the coast at its best; or to Cullompton where you can see a typical Devon village—quaint River Culme, almshouses and fifteenth-century church all complete. Further afield is Bridport, a charming little seaside town where the harbour entrance is so narrow that it has to be cleared after every heavy sea, and Charmouth, where the tiny Char bubbles briskly into the sea and there is a grand stretch of hard sand ideal for a walk in the early afternoon sun.—*E. S. P., Aldershot.*

Hotels around Burford.—The Cotswold Gateway Hotel is an ideal place for short or long holidays. If "good company, good wine and good welcome can make good people," the Cotswold Gateway Hotel does its job very good indeed. You would also like the Bull at Burford. Such famous coaches as the Magnet, the Berkeley Hunt, the Regulator, the Retaliator and the Paul Fry bound for Aberystwyth, Hereford, Gloucester or Salop, were wont to call at the Old Bull. You will find at this Cotswold Inn to-day all the big and little comforts of your own home, and all of those old courtesies which made the coach travellers of another age so glad to arrive at the hostel. Then there is the Brimpton Grange Hotel near Oxford. Brimpton Grange is the result of the adaptation and modernisation of some beautiful old farmbuildings. Nothing apparently has been lost during the conversion, much has been gained. The hotel has assumed the atmosphere of a large country house where peace and quiet and comfort are the prevailing features.—*H. B. A., Penn.*

Staying in Cornwall.—The hotel about which you enquire is the Manor House at Budock Vean. Budock Vean has rightly been called a little bit of heaven. You can get away from asphalt pavements and promenades yet you have all the attractions normally to be found at a seaside hotel, and it is not one of those places where it is necessary to stake your claims to a square yard of beach early in the morning. The hotel itself is open all the year round, and is completely modernised without being "gawdy." The grounds overlooking the famous Helford River and Falmouth Bay are extremely beautiful. There is plenty to do there: two hard courts for lawn tennis players, and the hotel has its own private nine-hole golf course, planned by James Braid, in the grounds. A golf professional is always at the service of residents, who may become temporary members of the club on payment of a subscription of 10/6 weekly. Excellent sea fishing is available for those who prefer the feel of a rod to that of a putter, and then the small boatman can enjoy himself or herself to their hearts' content in the local creeks. There is also the Ferry Boat Inn at Helford Passage near Falmouth. Being practical first, there is electric light throughout the hotel, electric radiators in every bedroom as well as hot and cold water, while the lounge and dining room are both large enough to be comfortable and small enough to be cosy. There are ten double and nine single bedrooms, all with a superb view of the river; and although there is none of the pomp and ceremony met with in a large hotel, you are yet assured of a warm and cheery welcome from the proprietor and his wife, which, together with their personal care, makes your stay at the Ferry Boat Inn really pleasant and memorable. If you would consider the North Cornwall coast I would strongly recommend the Dormy House Hotel at Rock, Wadebridge. To golfers the Dormy House is a veritable paradise. There are two courses, eighteen holes and nine—not necessary to be a golfer before you can enjoy a visit to Rock. Guests at the Dormy House Hotel pay a minimum weekly subscription of 5/-, and this enables them to play, free of charge, lawn tennis, squash, badminton, billiards, table tennis, while there is shooting over 1,200 acres and fishing in the little River Allen for over two miles. There is, too, an excellent dance room at the Dormy House. On some Saturday evenings a small orchestra plays, but on most days the dancing is informal to a gramophone or wireless. Let it be noted that there is no danger of any noise disturbing other guests, as the position of the dance room has been carefully chosen at the end of the entrance hall well away from the bedrooms.—*E. G. W., Towcester.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, AUGUST 5th

OTTERHOUNDS—ENGLAND AND WALES

BORDER COUNTIES.—Saturday (July 29th), Montgomery Bridge on Severn; M., Llong Station on Alyn; W., Dinas Mawddwy on Dovey; S., Rhydmeredith Bridge on Tanat—10.30.

BUCKS.—Saturday (July 29th), Castlethorpe Bridge, Bucks; M., Scrooby Bridge; Tu., Staunton Bridge, near Newark; Th., Fiskerton Mill, near Newark; S., Markham Moor—10.30.

CHESTON.—Dartmoor and Cheriton Joint Week: Saturday (July 29th), Fingle Bridge (D.O.H.)—10.30.

CROWHURST.—Saturday (July 29th), Etchinghams Village; W., Hartfield Station; S., Goudhurst Station—10.30.

CULMSTOCK.—Saturday (July 29th), Bickleigh, R. Exe; Tu., Cullompton Station, R. Culm; S., Bolham, near Tiverton, R. Exe—10.30.

DARTMOOR.—Tuesday (Aug. 1st), Dart Bridge (near Buckfast); Th., Gweek (Helford); F., Trosillian Bridge—10.30.

EASTERN COUNTIES.—Saturday (July 29th), Xacton Post Office, near Ipswich—10.30.

HAWKSTONE.—Saturday (July 29th), Radnorshire Arms, Presteigne.

PEMBROKESHIRE AND CARMARTHENSHIRE.—Monday (July 31), Scotchwells, Haverfordwest; Th., Black Bridge on Cowen—10.30.

WYE VALLEY.—Tuesday (Aug. 1st), Bourton-on-Water; W., Bourton Bridge; F., Cricklade, Wilts (by invitation Bucks O.H.)—10.30.

OTTERHOUNDS—SCOTLAND

DUMFRIESSHIRE.—Saturday (July 29th), Dalgonar Bridge (Cairn); M., Kennels (Annan)—9.30.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only recieved and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale) English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

GOING NORTH

WE English have often been accused of indifference and phlegm, by friends and foes alike. And, since old ideas die hard, it is unlikely that this opinion of our national character has been altered in every quarter whence it originated. Indeed, it may be there are reasons why it will not be changed at the present time. However it is, it matters little when a mistaken interpretation is unwittingly placed upon a trait which, if it exists at all, is only skin deep We may, too, seem to take our pleasures sadly. The point is that we keep on taking them in spite of any unsettling clouds which may gather on the horizon. This in no way should be taken to mean that we are negligent of duty, but rather it shows that we have fully appreciated the value to be gained from a sane mixture of work and play.

The fact that the opening of the shooting season coincides with the height of the holiday season and some of the pleasantest weather is no doubt a reason for the popularity of the Twelfth; but it is not the chief reason. For the latter lies deeper than the desire to visit pretty places and recuperate from the stresses and strains of business life. Sport which is dependent upon beast and bird must be closely related to the soil, and it is the latter which is the real magnet. Once let a man come under the influence of this invisible force and he will never wish nor try to break away. Other forces may—indeed will—exert their influence, but the call of the earth will in the end prevail.

In this spirit and for these reasons we shall again go North. Nor will our going bring any less thrill because we have so often gone before. For this is a new season, pregnant with possibilities, teeming with adventure, into whose promised land we are about to enter. Here lies escape from a thousand and one petty cares and troubles—not that we mean to avoid what may be our due. Here for the first time for many months we can taste again the joys of the shooting field and under ideal conditions. The uncertainty of the sport—of general or individual results—will intrigue, as some urge of the wild will find its answer.

The northern termini have always played a happy part in this exodus and have become definitely associated with shooters and shooting. In spite of road competition, they continue to be the gateway from which a kind of pilgrimage sets out. And though the scenes at these stations—King's Cross, Euston, St. Pancras—have been so often described as to have become almost hackneyed subjects of journalism, they still retain much of the atmosphere which has inspired writers in the past. What is chiefly missed are the pointers and setters, though of course many dogs go by car. There is something about a brace of pointers, a gun case and a bag of cartridges that is redolent of an era which at times seems to be slipping away into the limbo of the past. They represent the more leisured and contented existence of our forebears, who had time to drink in each shooting scene and extract therefrom the acme of all it offered.

But does anything basic really go? Are the peace and charm of the eternal hills things that can be lost, never to be retrieved? The answer is not far to seek. They are always there for him who can learn to understand their value, and they will remain there as long as the universe remains. This, indeed, is a comforting thought, for on the truth of it is hinged the whole case of field sport.

So with a light heart and a composed mind we may set our course towards those Elysian fields and wake to find the purple moors and misty mountain tops stretching away to unknown distances and still more unknown secrets. And if it proves to be the first occasion for many months upon which we do more than justice to the enticing plenitude of a north-country breakfast, we need have no reason to search our conscience or to entertain doubts as to the wisdom of any gastronomical licence.

OUR COLOURED COVER

The picture on our cover this week is reproduced from the painting by Mr. Richard Harrison, one of our younger and most promising bird artists. The original may be seen at Messrs. Fores, Ltd., 123, New Bond Street, and Mr. Harrison has also a limited number of signed prints for sale.

"A BAD ONE TO BEAT"

NO sooner had we published an article extolling the merits of Vim and her owner, than British yachtsmen began to show they were getting the measure of the famous 12-metre challenger at Cowes. In the Royal Thames Y.C. regatta Mr. MacAndrew sailed Trivia to beat the American yacht in light airs by 2min. 25sec. The following day Vim beat Tomahawk by 8min. 8sec. and on the Friday by 2min. 29sec., but at the Royal Southampton Y.C. regatta Mr. Sopwith proceeded to show that the crew of Tomahawk could also work smartly, and, in a most exciting finish to a race of 26 miles, twice round the Brambles, won by a margin of 30sec. It was a pity after this that the next race on Monday should have been marred by an incident at the start, when Mr. Sopwith was moved to protest at an action on the part of his rival which might have led to a collision. Needle racing brings its penalties and the rights and wrongs of this start gave the Sailing Committee of the Royal London Y.C. food for thought for two sittings.

DOGGETT'S COAT AND BADGE

The oldest trophy which has been competed for year after year without intermission is to be found in the domain of aquatic sport. This is the Doggett's Coat and Badge, which was instituted by Thomas Doggett, an actor, in the year 1714. The "Coat" is, in fact, a complete uniform of the style in vogue among watermen in Doggett's day, and the "badge" is of silver, and is worn on the arm. This year's race, the 225th of the series, was won by D. E. Thomas from W. A. Healey, and provided one of the best finishes on record, only one length separating first and second after 4½ miles. The watermen had plenty of opportunities to show their watermanship, for though the race was started on the young tide and there was not much traffic, there were plenty of moored craft and bridge building operations to be negotiated. The wind, too, was at times a "dead-noser," making stretches of lumpy water which were a real test of skill.

A FINE LIFE

Anyone who visits the Territorial camps cannot fail to be impressed by the excellent spirit shown, which even rain cannot damp. The work is taken as really good fun, and a company of one battalion entered thoroughly into the task of rounding up three desperate gangsters, the price on their heads, a pint of beer, being duly earned. When one sees the prevailing cheeriness and enjoyment it is hard to understand the attitude of those who ban Cadet Corps in London schools. They inflict quite unnecessary hardship on youths who will have to join the Militia, for once a boy is initiated into military routine the Army possesses no terrors for him. Many a Territorial who took part in the War faced his service with as much equanimity as he would put on an old coat, while the raw recruit discovered hardships where they did not exist. The present Militia training will undoubtedly prove one of the finest roads to national physical fitness that could be conceived, outweighing any amount of voluntary schemes propounded by well-intentioned committees.

CHALK WATERS AND THE DEARTH OF FLY

The Southerner's adage that a high-water year means poor fishing has been illustrated once again in the present season; in spite of prolific hatches of iron blues which ushered in the month of May, hopes of a really good season have been dashed by July's leaky waterworks; weed, and the fly which finds sustenance upon it, has been sparse, and trout for the most part have been inclined to use what there was of it for a refuge instead of a dining room. What will be the result of these impoverished hatches next year? Fortunately (this time) life in the water seems largely indifferent to seasons of good and bad reproduction. Nature, it appears, has allowed too ample a margin for her plans to be seriously upset by weather conditions.

STORM

The trees and fields lie parched and bare of rain
The murmuring thunder rumbles in the hills around
The birds are still and hushed is every voice
Save for that faintly ominous and dully threatening sound.
Heavy with storm and dark foreboding care
The sky hangs low—a vast gigantic shroud
Where but an hour ago was joyous sun and dancing light
And birds sang loud.
The suffocating tension stretches on
Like some strange purpose unfulfilled
But over and above the close suspense
The impenetrable darkness and the eternal "Why"
There shines the promised radiance of God's bow
Arching the sky.

I. FOULIS.

A COUNTRYMAN'S JOURNAL

WHEN I close the door of the "Hermitage," where I keep my relics of country life before the shadow of it had replaced the substance, who is to say that walls a prison make, dimness excludes the light or confinement of space the vitality and variety of my landscape? Ahead of me a shepherd in a white smock, stumping along with his crook in his right hand, directs his sheep-dog to drive the flock into the shearing-pen over the shoulder of the down. The men are already busy there, and the murmur of voices, the click of the shears and the peal of the many-toned bells from the advancing flock blend into a country tune. Further down the slope is a saw-pit whose roof is being thatched by a man and his two apprentices. The last two are twisting hay-bonds with the wimble, while the man on the roof is threading his iron needle with twine. The slopes echo with the whine of the pit-saw, and in the barn close by men are mortising planks with shell-augers, adzing the ends and gouging out mouldings with the tomahawk. Towards the village, at the foot of the downs, a timber-waggon is crunching over the loose stones of the trackway, drawn by six horses. The latten bells fixed on the wooden hames send out their resonant chime a mile away to warn all who use that road, while the brasses of the martingales passing between the horses' forelegs, of the side-pieces and the face-pieces, flash in the sun. The carter touches up the thiller horse with his many-ferruled whip.

The first house in the village is the saddler's; he is sitting in front of his door mending harness with his oaken stitching clamp held between his knees. Through the open door of a workshop a few cottages further on, basket-makers can be seen sitting with their lap-boards between their legs. One of them has stopped working while a bodger from his cabin in the beechwood on the further ridge of the down beyond the village shows him the points of the wheel-back armchair he has made for him. The stone-slatters are on the roof of the farmhouse that lies at the back of the winding street fitting slats, holed by the pittaway or slat-pick, on to the oaken pegs in the laths, while through the door into the kitchen I can see the bulk of the iron kettle on its ratchet-hook hanging by the sway or chimney-crane black against the burning logs of the open fireplace. By the dresser, whose shelves are covered with pewter and blue ware, the farmer's wife is mixing something in a grooved dough-bowl. By a corner of the fireplace a glow comes from the open door of the bread-oven and another woman calls to a boy to rake out the embers of the furze as she moves towards the tall bread-peal leaning against the wall. The long table is laid for the harvest home, and I can see a lead tobacco-jar and a clay-pipe with a wide bowl and a face on it like that of Silenus. The daughter of the house sits by the pillow-horse weaving her lace-bobbins in and out, each one turned differently from its neighbour and hung with gay-coloured jingles.

The clatter of pattens comes from the yard where another girl is carrying the oak, copper-ringed meal-bucket, made by the cooper whose wattle-and-daub cottage can be seen from the kitchen window behind its screen of white poplars, to the pigs. A flight of sickle-men is just coming off the barley-field beyond the yard for 'levenses, and the "lord" has gone ahead to pour cider out of the eostrel into the cider-horn. In the next field a party is turning up the stubble with their breast-ploughs, while a sower paces up the new furrows broadcasting grain from his kidney-shaped seedlip. A shout from the lane beside the field makes him turn his head, and it comes from Simon Tark, who is bringing home the share, just repointed by the blacksmith, to be socketed into the throck of the wooden plough, itself attached to the beam by a key. At the gable-end of the stack close by the hedge a man is fixing a straw-bird to a pole, while from the great tithe-barn lying back in its grove of limes on the other side of the lane sounds the muffled thud of the barley-hummeller striking off the ears of barley from the straw and bruising the awns to prevent the beard from catching in the throats of the pigs. A woman with a pleated and chequered sun-bonnet, on her way to the farm-house dairy with a pair of butter-balancers in her hand, lifts up her head to listen to the nearing sheep-bells as the sheep float down the slope of the down like a drifting cloud.

The images pass before my vision one by one, and for the moment it is impossible for me to believe that, were I to go outside this crowded hut and look over the fields, I should, across mile after mile, see not a single fellow-man.

H. J. MASSINGHAM.

WITHOUT COMMENT

From an article on archery:

"Bows for men are 6ft. long and weigh anything from 36lb. to 80lb., while those for women run between 5ft. and 5ft. 6in., the average weight being 25lb."

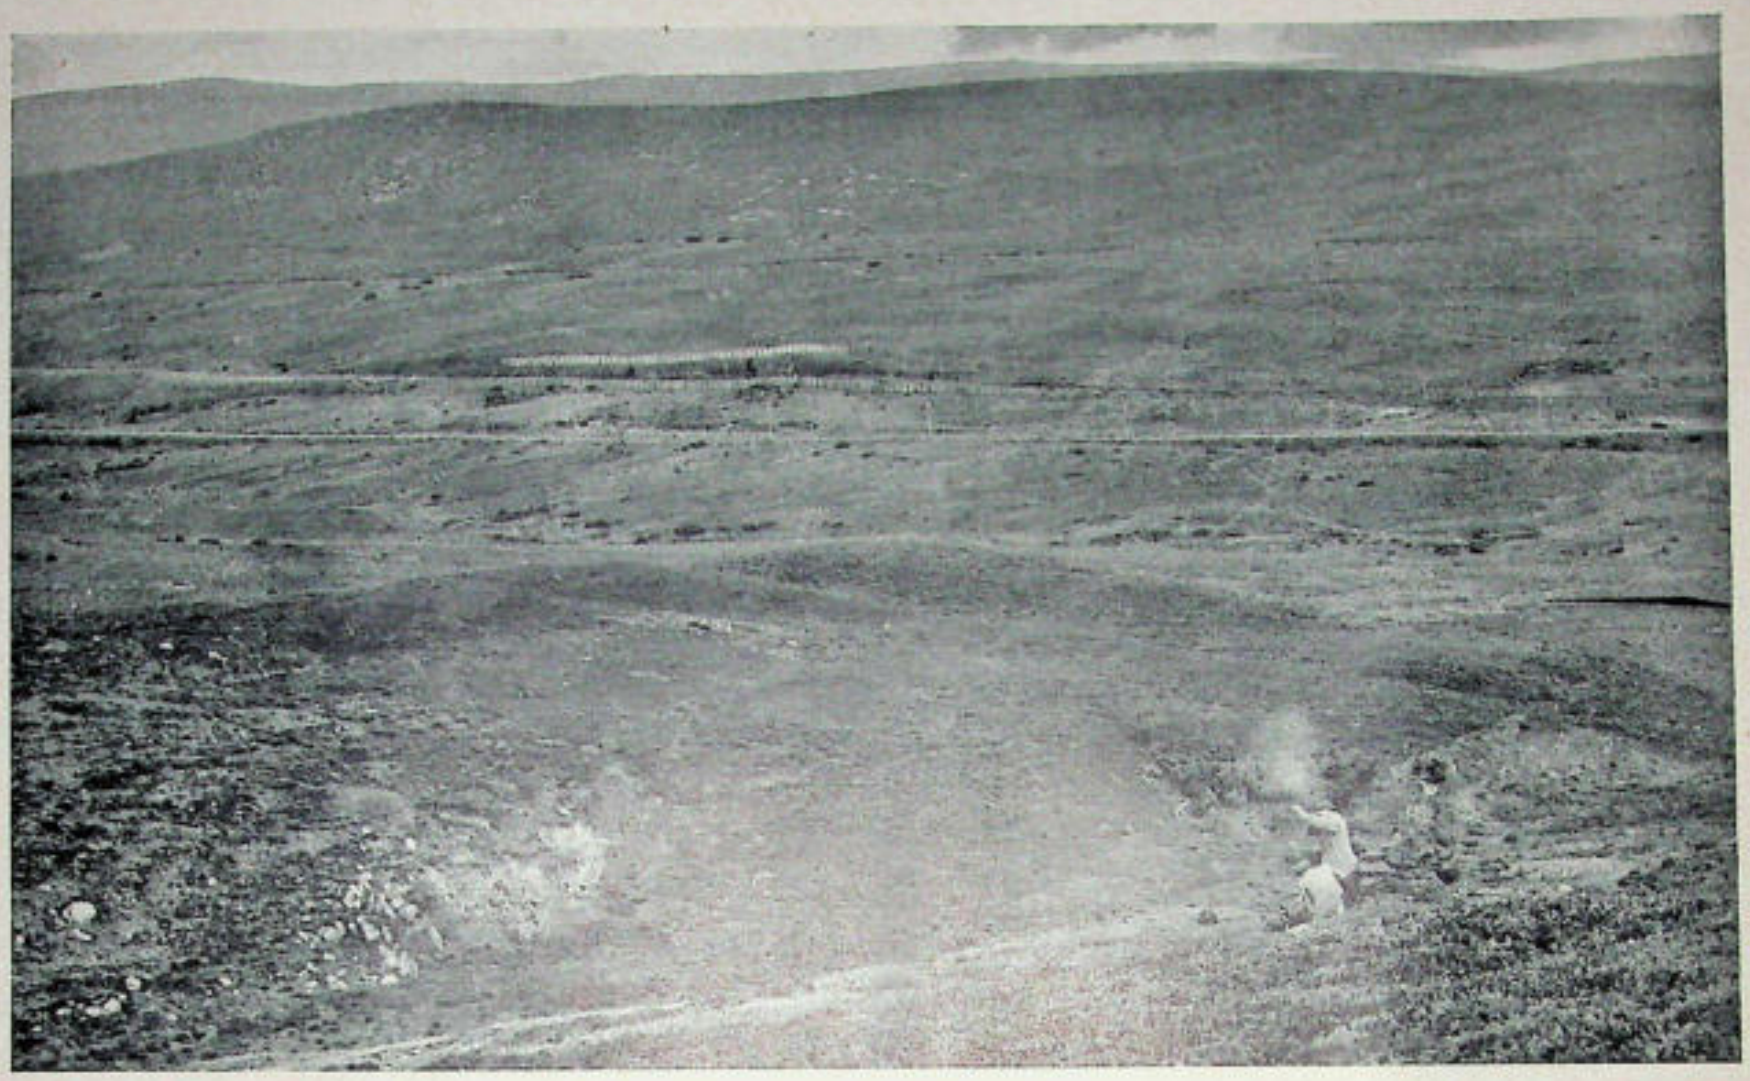
Lord Mountt in action

SHOOTING THE ONCOMING BIRD

DURING the next few months a great many chances at birds flying low and straight towards the shooter will be presented. In grouse shooting, especially, there will be thousands of such birds coming towards the butts in the many drives that will be organised from, say, the middle of this month to the end of September. There is probably no other kind of shooting in which so many chances at this angle are afforded, though in all driving the more birds that can be dealt with in front the better. For, unless birds can be killed in front, there will be very little time—in fact, insufficient time—to get off more than two barrels: indeed a poor performer may only get off one. And not only is it necessary to take birds in front; they should be taken as far in front as possible, so as to make the most of every available fraction of a second during which they are within range.

The man who knows his business will, where the lie of the land permits, kill his first bird 40yds. out, thus allowing himself the maximum time for bringing into action his remaining barrels. Apart, too, from these considerations, there are the additional advantages that birds flying towards the shooter expose their most vulnerable parts, and as they are meeting the pellets, the latter are made to exert the greatest shocking power. Thus there is far more likelihood that those that are hit will be killed cleanly than is the case with those that are flying away, which expose for the most part only their less vital parts. Another point is that oncoming birds, when shot even at close quarters, are seldom smashed or rendered unfit for table purposes. When, as particularly is the case with grouse, birds are to be sent away through the post as presents, it is most desirable that they should be as little knocked about as possible. They both keep and look better when in this condition.

It is not really difficult to kill a bird coming at you, so long as it is flying more or less straight. Indeed, it is the curling bird that alone can baffle first-class shots. Grouse can and do offer very difficult shooting when they come with the wind in their tails and with a bank, curling round the shoulder of a slope. Or again when they decide to follow the uneven contours of some wild mountain-side. But at present I am only dealing with the kind of straightforward chance that is frequently presented in the usual day's driving. The thing to remember is that it is fatal to stop the movement of the gun when the trigger is being pressed. This is what the beginner is very apt to do, and what nearly everyone does occasionally. Some men are particularly prone to do this when they have seen their bird a long way off. They may actually shoot much better when they have to fire quickly, as will be necessary when, say, placed in a narrow gulley or just behind a rise. I have known men who were good at snapping rabbits in cover or when jumping from one hole to another in a large bury that was being ferreted, but who more often than not missed them out in the open. Obviously the fact that there was plenty of time robbed them of the urge to maintain their gun swing, at least to a proper degree, just as the absence of trees or bushes robbed them of guides as to distance and angle.



Some birds may be killed by firing at a fixed spot ahead of them, but it is impossible to maintain any semblance of consistency by such methods. If it were possible to judge the point at which bird and charge would meet in every case, and then fire at that point, birds could be killed regularly in this way. But no explanation is needed to show the utter impossibility of such a task. Ranges are never quite the same, speeds vary, and anyway it is beyond the human eye to estimate so many feet and so many inches at such and such a range. Therefore the gun must be kept moving in front of the bird.

At the same time there is less obvious movement or gun swing in the shooting of an oncoming bird than in the shooting of a crossing bird. And for this reason it is often said that gun swing is not required when oncoming birds are being shot. This is as incorrect as it is misleading. Some sort of swing or movement is always necessary for the reasons given above; and the moment one stops that movement and fires at a fixed spot, clean misses will result. It has been stated that one of the quickest shots in England owed his dexterity to the fact that he fired straight at the point where he knew charge and bird would connect. This is entirely misleading, since it implies that he stopped his gun while in the act of pulling the trigger. Actually he would be moving his gun until after it was fired. This man, it may be added, was particularly fond of shooting birds coming low towards him, and as this kind of shot needs less movement and gun action than others, it was no doubt a reason for the great reputation he gained.

Just how should a shot at a low, or comparatively low, on-coming bird be made? By such is meant any bird flying towards the shooter up to an angle of about 45° or so. Here there will be a minimum of footwork, especially if, as in a grouse butt, the shooter is ready facing in the right direction. The left foot will, of course, be forward and the body evenly balanced. The action will be comparatively short, and will consist of bringing up the gun smartly to the shoulder so that the muzzle end blots out the bird, and of pressing the trigger as the stock goes home. It is all one movement, and an essentially brief one. Should there be the minutest tendency to dwell on the aim, the charge will be placed too low. It is a matter of throwing up the gun so that the bird is blotted out, and firing it as it comes well into the shoulder. Be conscious of the head only of the bird at the beginning of the action, and align the gun so that it is covered. Once mastered it is a relatively easy shot, as no great powers of judgment are called into play.

It is not meant to be inferred, however, that because this action is accomplished in one movement, actions in respect of shots at other birds are performed in more than one movement. For no matter what kind of shots are concerned, there should be no semblance of different and distinct actions in any sort of shooting at moving objects. From the time the gun is first moved from the ready position to the time of pressing the trigger, movement should be continuous. But in this particular case the action is notably short and sharp.

Naturally these remarks are intended to apply only to the shooting of birds coming at or above the level of the gunner. "SCOLOPAX."

A CENTURY OF DRIVEN GROUSE

By MARTIN STEPHENS

GROUSE shooting nowadays is an affair of the purple in more senses than one, and the grouse is in danger of becoming a bit of a snob; but really there is no reason why he should be so. In point of fact, he is the *parvenu* among game birds, but like others of the class, he is now more royalist than the king. The pheasant was a rare and exotic if seldom encountered prize before the "moor fowl" was even accounted of; while the despised partridge has a pedigree of far more imposing length.

There are lots of reasons for this, but one of them is that the grouse runs his publicity very well. He makes his debut in the "silly season," when there are columns yawning to receive him, and blank pages of the illustrated weeklies pining to mirror the Strathbaggis party all sandwich and shooting stick. The Twelfth of August, unlike the first of September or the first of October, is an opening day in fact as well as in name, and the "crack of the rifle" is heard on the moors with an unfaltering precision.

The grouse came into the picture rather late because the North of England and Scotland became settled in the pastoral sense far later than the South. As everybody knows it was a rare occurrence for the laird to kill game for his table till the nineteenth century; he would as soon have butchered his own mutton. He left it to his retainers to do it for him. The sight-seeing Englishman did not exist. The visiting Englishman of the mid-eighteenth century was the Duke of Cumberland. It is true that he was followed by the beneficent General Wade, but it was to be a long, long day before General Wade's roads rattled to the carriage wheels of hopeful sportsmen. One has only to read the *Tour in the Hebrides* to see the frame of mind in which these holiday places were regarded even by the Scottish Boswell. To Johnson, of course, they were as Patagonia!

Nevertheless, mad old Colonel Thornton was making his eccentric way northward fairly early in the last century, and Peter Hawker himself had a day on Bowes Moor, in 1812. St. John shot the Muckle Hart within a year or two of Queen Victoria's accession. The shooting of the moor fowl, which had become the grouse by now, was pretty general by that time, and a minority had practised it since before the Napoleonic wars. Yet we have remarkably few records of it. Just as the muniment rooms of north country families often seem far less well-furnished than those of the south, so also are their game books. I often wonder why that particularly distinguished team who wrote for the old Badminton "Moor and Marsh" volume delved so little into history which was then comparatively recent, and which is now a page to which we can never turn back. Evidently the tritons of the breech-loader thought that muzzle-loading minnows were beneath contempt. Personally I would sacrifice all the hard print they expended on the placing of "batteries" for a gramophone record of the old Colonel discussing his day's sport with his lady of an evening.

Grouse shooting in those days meant dogging and the sportsman might have out two guns and a loader. On occasion they shot from a quiet pony. Dogging does not and presumably did not offer a large variety of difficult shots, but even to-day some of the bags recorded are remarkable. Even allowing for the fact that the shots were probably picked, which of us would not be pleased with 48 grouse to 50 shots? Which indeed? Driving in a rough and ready form has existed since 1803, when it was carried out on the moors of the Bishop of Durham, then a Prince of the Palatinate. Times change. The number of bishops who are likely to inaugurate new methods of grouse shooting this season will be limited. I doubt if a single shovel-hat will be seen in a grouse butt!

By the time that Queen Victoria had married Prince Albert the grouse was on the map as a sporting bird. Most people who owned grouse moors shot grouse. The stage was set for the second act. It was the beginning of the commercialism of the moor. At the time it was called—I wasn't there, but I feel it in my bones—"the thin edge of the wedge" and "the beginning of the end." But the end has not come yet. The most potent factor in the letting of moors was the railway, creeping, creeping forward to Inverness.

It enabled not only Mr. Briggs's heart to be in the Highlands, but also his body. And Mr. Briggs was only John Leech's synonym for the new middle class which the industrial revolution had created. They wanted to enjoy the same privileges as the privileged classes of those days. And why not? Rents of course were remarkably low, and over vast areas shooting could be had for the asking. The Lord Malmesbury of those days had the sporting rights over the Island of Lewis for £25 a year. Yet a good many important landowners still thought it was very unbecoming to let sporting rights. I read in Lord George Scott's admirable little book that the fifth Duke of Buccleuch, who died in 1884, never let a moor.

But the real reason for the commercialism of the moor was the decline in sheep farming. It gradually became more profitable to run a moor as a home for grouse than as a home for sheep. By the early 'seventies letting was common, though north of the Dee Valley there was still plenty of those who would not do it, just as there were still in England noblemen who would not take a subscription from those who hunted with their hounds. This change of opinion coincided with two other important events, and was no doubt influenced by them. The first was the invention of the breech loader in 1854, which appropriately enough was the year that Hawker died. The second was the terrific epidemic of grouse disease in '72 and '73. From those years spring the efforts to regard grouse disease as something more than the chastening hand of providence which must be borne in suitable submissiveness. These efforts culminated in the report of Lord Lovat's Commission on Grouse in 1911, which is a great landmark in the history of grouse. Both breech loaders and disease assisted in the general introduction of driving, for, as everybody knows, driving increases bags enormously.

Driving was customary at Bolton Abbey in the 'fifties; it was pretty general in Yorkshire and Durham in the 'seventies; it was practised as regards blackgame in the Lowlands before 1886, and presumably some grouse came along with the blackgame. When Sir Frederick Milbanke made his great bag at Wemmergill in the 'seventies his kinsman the Duke of Cleveland spoke of it in terms that may have been ducal but were certainly not cousinly. Driving was rare in Scotland except on half-a-dozen moors, of which, I believe, Cawdor was one of the first, before the 'eighties. Yet driving to-day is the absolute rule except where stocks are patently small or beaters clearly unobtainable.

From then on grouse shooting assumed its present form. There have been improvements, but they are in the nature of elegant refinements rather than sweeping alterations. Principally, I think, one would suggest the improvement in comforts in the ordinary lodge, and the superiority as a means of rapid transit of the motor over the "machine." The days are past when the bathroom was an appendage as exotic as a winter garden.

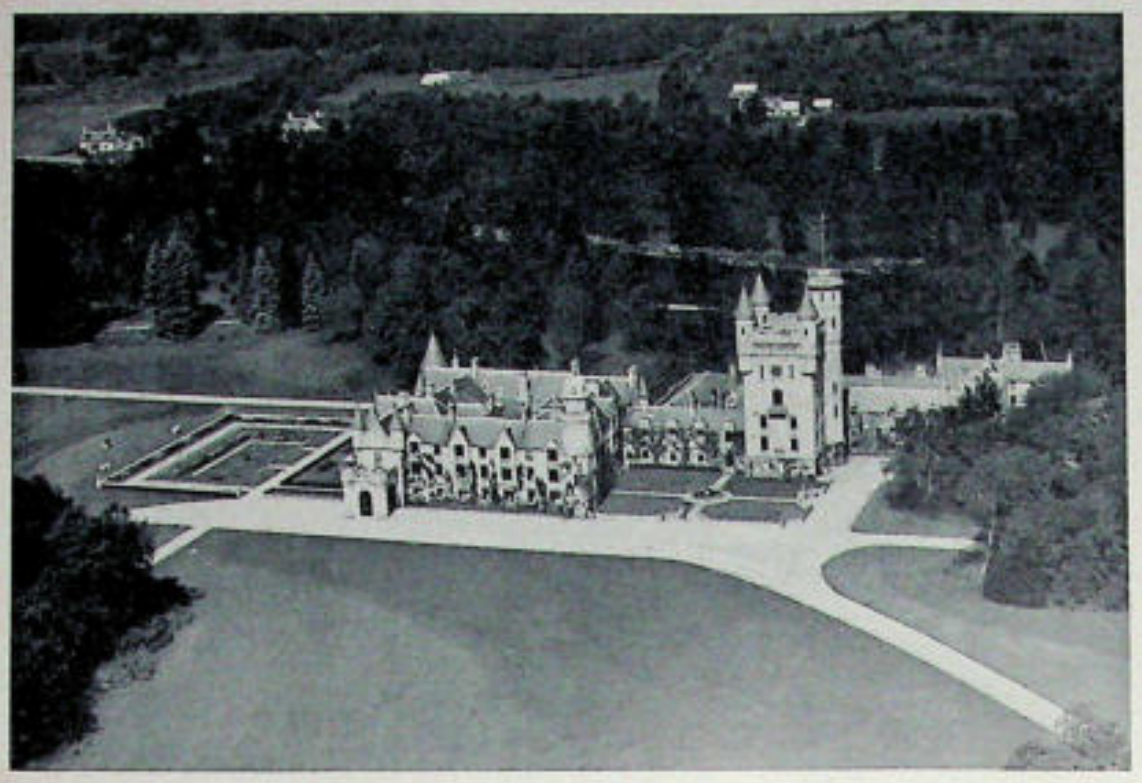
The War, of course, altered grouse shooting as everything else. Vast areas changed hands in 1919, notably the sale of a very big acreage by the Duke of Sutherland. Prices remained high till 1929, and to-day they are still above the pre-War level. The syndicate came to stay. Far more syndicate parties—in one form or another—are to be found in Scottish lodges to-day than were ever found in the past, though the earliest reference to a grouse syndicate goes back to 1838, 100 odd years ago. Here is No. 21 of the elaborate rules drawn up for its guidance: "No subscriber or keeper shall at any time be allowed to drive birds, with dogs, or by any other means, from a distant part of the moor to the intended shooting ground, for the purpose of more easily obtaining a great number of shots." I fear most of us would be blackballed. (Incidentally an old grey hen cost a guinea, a "poult" half-a-guinea.)

I suppose this year will be one of the worst in the history of grouse shooting. Apart from the fact that I hear Ichabods from Yorkshire and lamentations from Angus, the international situation has made it the worst letting year in history. The word Danzig has been even more damping than strongylosis. One of the most famous letting agents in the country assured me that he had only let one moor without a war clause. Not since 1915 has the outlook for proprietors been so bleak, and 1915 was the *annus mirabilis* of grouse which would never have been forgotten had not Twelfth of August coincided with the preparations for the battle of Loos. Those who think the old quota of £1 a brace a high price to pay for their summer holiday may well pause and recall how much of that £1 goes into the sinking fund for years like these.

There is one fault of post-War shooting in Scotland which I personally deplore, and that is the decline of deer-stalking. Once upon a time it was the *ne plus ultra* of sport, the ambition of every right-minded young man. To-day it is not so. The ancients say that modern youth cares only for aeroplanes and motor cars, and cannot walk: though I myself feel there are many who would be glad to take part in this grand sport if circumstances offered. Nevertheless one must admit that stalking has lost something of its popularity.

I often wonder what the history of grouse shooting is going to be. Will somebody invent a new shotgun, some change as revolutionary as the introduction of the breech-loader, which will make all shooting quite different? After all, that is not impossible. Will the development of the Highlands be forced through as a first-class political issue? We are all old enough to remember the Caledonian Power Bill, and some of us are old enough to remember the pheasant that ate the wurzels. If industry could be made to flourish in the Highlands, grouse shooting will become far less pleasant than it is. Will there be, as I think possible, a strong reversion to dogging?

MOVING TO A FRESH LINE OF BUTTS AFTER THE PICK-UP



The most marked improvement in the shooting world of my time has been the noteworthy advance made in the quality and training of gundogs. Field trial enthusiasts are increasing every year. So are those who care for the wilder forms of sport, particularly the wildfowlers. Surely these two instincts could be canalised in the form of dogging.

Then, too, there comes the question of feeding. England and Scotland have not always been covered with vast areas of heather, nor will they necessarily always be so covered. Perhaps great stretches of heather may sour or become sour, perhaps huge areas may become bracken infested, or under sheep tick. If these things happen the grouse will go, and may not return. If I were the owner of extensive moorlands, and was busy tying them up for my children's children (on the pleasing supposition that life in 2039 will be on much the same sort of lines as 1939, except that the aeroplane services will be better, and television perfected), I would put a clause in any entail to the effect that a third of all grouse rents should always be funded. The majority of people in these islands—thank heaven!—still want field sports to be continued, but let nobody delude themselves into thinking there is not a possibility of a Bill largely interfering with the practice of sport being wangled through the Houses of Parliament some day.

When any of these evil days come it will be a sad time for many of us. Grouse shooting is an absolutely unique institution. You can have a first-class copy of a first-class English covert shoot on Long Island. (I believe Mr. Winston Guest, the polo player, is busy putting one ship-shape just now.) You can kill hundreds of brace of partridges as easily, indeed more easily, in Central Europe, than in Norfolk. Flighting geese and flighting ducks you may follow across half the world; but the red grouse is unique to our islands, the atmosphere of his shooting so typically and pleasantly British. At the risk of bathos I dare to suggest that it is an institution which brings out that which is both pleasant and practical in us, although I have known grouse drives which were neither pleasant nor practical. Grouse shooting is so very much a holiday, it takes place, as a rule, so far from the unpleasant things of cities; it takes place in such grand surroundings. We have no really wild sport left in these islands, but the red grouse is at least the hem of the wild. It is a garment whose hem I would fain touch; for virtue goes out of it.

THE START OF THE DAY. A PARTY ON THE GLENARTNEY MOORS, PERTHSHIRE

AN AERIAL STUDY OF BALMORAL, FROM WHICH H.M. THE KING WILL SHOOT

THE GLORIOUS TWELFTH

By LORD DORCHESTER

I IMAGINE that those of us who have been accustomed to celebrate regularly a certain anniversary must find it difficult, as the years roll by, to distinguish one such occasion from another. For example, the man who has attended fifty, or even twenty, Derbys, while remembering the winner of each year, probably will quite be unable to recall his own movements on any particular Derby day. Yet he will always retain a vivid mental impression of Epsom Downs, its crowds, the roar of "They're off!" and the semi-silence while the race is in progress, to be followed by the shouting home of the winner; also many and various incidental happenings will pass through his mind without his being able to place them in their chronological sequence.

Even so is it with me, who have been privileged to take part in many a Glorious Twelfth. As in the case of the Derby devotee, my difficulty is to see the wood for the trees; in other words, to differentiate in retrospect between one Twelfth and another. Thus, instead of a succession of separate mental pictures, my recollections form a mosaic of many incidents, grouped together anyhow, and without reference to date or place. . . .

The party outside the lodge awaiting the order to move off, the walk or ride to the moor, the climb to the butts, luncheon by burn or knowe, snapshots of the guns posed so as to include everybody's dog. . . . Visions of drives in progress, a solitary flanker high up on the skyline, grouse coming on, sheep moving ahead of the beaters, a suspicious blue hare erect and *regardant*, myself at full length in hot heather, dozing digestively, or alternatively crouched in the lee of a wall, sheltering against the rain. I find that one picture melts into another, the two merging kaleidoscopically to form a third, until a shake-up of my grey matter produces yet a fourth. It would be quite impossible for me, even with the assistance of a shooting diary, supplemented by snapshot photographs, to single out and reconstruct any particular Twelfth with a view to tracing its happenings from start to finish, yet numerous incidents are as clear in my memory as though they had happened but yesterday.

For instance, it was a bad year, and birds were few and far between, and I had not fired a shot in two drives, when presently a single grouse came into view, flying high and very fast down wind. Eight pairs of eager eyes marked his advent, for he was the only bird in the drive. At a quarter of a mile from the butts he was anybody's bird; at 200yds. he developed a bias in my direction; at 100yds. he was mine . . . if I could hit him. I can still feel myself losing sight of him as I let go the first barrel when he was right overhead, only to see him again a little to my left rear, and perceptibly higher and untouched, and still in full career. I swung despairingly with the gun turned right over, and held anyhow, yet somehow I connected. Back went his head, his clear-cut silhouette losing its firm outline for a moment, until, control temporarily regained, with rapid wing beats he towered to an immense height, to collapse and fall among some peat hags half a mile behind the butts. And to-day I can still see Eva retrieving that very grouse some twenty years ago, although I have no recollection of any other individual performance on her part. Eva, naturally a good marker, even when a lot of birds were down, had on this occasion nothing to distract her attention, and on being sent out, she galloped in a bee-line for the hags, went well beyond them before turning back into the wind, and was on to her quarry in a flash, without the slightest semblance of check or cast; indeed, I never saw a bird so quickly retrieved from such a distance.

Kipling urges us when we meet "with triumph or disaster to treat those two impostors just the same," a counsel of perfection that after the lapse of years I find hard to follow when reviewing what I regard respectively as the greatest heights and the deepest depths which I ever achieved or plumbed on a grouse moor.

The triumph fell on a day when everything went right. I was in the lucky butt in each drive, it was a bumper year, and a strange loader loaded as never loader has served me before or since, and to cap it all, I seemed unable to miss. No wonder that a certain rosy smugness pervades my whole being whenever, as is not infrequently the case, I re-read in my shooting diary the very detailed records of that never-to-be-forgotten day. But, alas! there is a reverse to this coin from memory's currency; in fact, the tail of the penny is even darker than its head is bright. It was a very fair year and fortune once more was kind to me in the draw for places, but that was the limit of her favours. For although every bird seemed attracted to me as is the needle to the magnet, my shooting was vile beyond all words, for not only was I desperately slow in getting on to a bird, but I also seemed to have lost all sense of swing and follow-through. I began by missing so many in front that I gave up shooting at any but easy crossing birds, or waited to take them behind, poking and consciously aiming above, below and in front, even shooting where I hoped that they would go, with what success may be imagined! Birds being plentiful, and coveys big, I next tried browning them, and did on one occasion kill two with one cartridge, and these two, plus a few unfortunates who somehow "managed to fly into it," brought my total to eleven, on a day when, seeing the chances that came my way, I certainly ought to have had sixty and might have killed a hundred—regardless of Kipling. I still writhe whenever I recall that *dies iræ*.

In one respect there is this to be said for the opening of the grouse shooting, that its prospects, whether of a good or bad season, can usually be forecasted in advance, and while anticipation is, admittedly, usually so much better than any realisation, it is a pleasant change to be able to make one's arrangements accordingly. While on the subject of prospects, and without in any way depreciating the magnificent grouse moors of Yorkshire, Lancashire and the North of England generally, it has always seemed to me that a bad year hits these moors very much harder than it does the Highlands. In a bumper year their totals are far bigger than any that are likely to be achieved farther north, always excepting at Langholme, and, *ipso facto*, in a bad year they may fail altogether.

This, lacking another explanation, I am led to attribute to the general uniformity of their height above sea-level compared with many Scottish moors which latter may rise from sea-level to 2,500 feet, and also to their rolling character as opposed to the more rugged outlines of the Highlands. On a big rolling moor, if anything goes wrong with the weather at critical times, such as during the nesting season, or when the heather is frosted or disease breaks out, all the ground seems to suffer equally. On the other hand it often happens, on a rugged moor, that when the low ground is bad the high ground may be good, or *vice versa*.

And again, without depreciating English moors, I have a preference for Scotland because it offers such a variety of alternatives to the holiday-maker (and in these days most of us can shoot only during our holidays and not, as our fathers did, all the season through) in a bad season, that he must be hard to please if he cannot amuse himself even when there is little to shoot; golf, fishing—though not too good in August as a rule, rough shooting of sorts in bog or bracken, excursions into the hills—all these make for happy days even when birds are scarce.

So far I have said very little about the actual opening day, or the wealth of pleasurable preparation which precedes the ecstatic moment when, from your bedroom window in the lodge, you hear the old cock grouse announcing to the glen at large that the Sassenachs have "Come back! Come back!"

Such preparations are part, and quite a large part, of the fun and embrace the ordering of cartridges, the purchase of various items of equipment, visits to gunmakers and tackle shops, possibly, too, the selection and fitting of a new suit of tweeds, even a refresher course at a shooting school.

If you have but a single visit in view or are pressed for time, it probably simplifies matters to go by train, but if you are the lucky possessor of several invitations then a car is a great convenience, almost a necessity, indeed. Especially is this the case when your shoots are distant from each other, or when the termination of one visit does not coincide with the commencement of the next.

Without a car you are tied to the railways, and probably to railway hotels between visits; with a car you not only avoid the bugbear of cross-country train journeys which are notoriously tiresome in Scotland, but can also fill in your time by touring the country at your leisure, and often are able to accept one or two extra invitations which would otherwise be inaccessible to you.

Not the least pleasurable of my own preparations for the 12th is the conditioning of my dog, and so, while the mayflies are still dancing above the glassy southern waters, Gyp accompanies me daily down a

"Mile of elms and Alderneys
and surpassing greenness,"

as I wend my way to the river. Here, when I am not actually fishing, she is encouraged to gallop and swim to her heart's content; and while I watch, the summer fat seems positively to melt from off her flanks, and the muscles harden on her back and quarters.

Condition, I would remark in parenthesis, is just as important to man as to beast, and so I see to it that when Gyp and I take the heather we are, if not absolutely fit, at any rate, not butter-fat after our summer run. I emphasise the importance of condition because the unfit man tires quickly, and his shooting suffers correspondingly, while an unfit dog soon becomes too blown to find birds.

To-day, with the war clouds hanging low above us, it is impossible to contemplate the coming 12th with our usual joyful anticipation; indeed, by the time these lines are printed the cyclone may have burst, but there is still hope that the clouds may lift without discharging their lightnings. If this, happily, be the case, I do not know who is most to be envied at the commencement of the coming season, the old hand who knows and often dreams of the pleasures that await him, or the beginner to whom everything is new and wonderful.

I, undoubtedly, am an old hand, yet annually I thrill at the first glimpse of a grouse moor on my journey north, and thrill again when I cross the Border, and, further on, with Abington, Stirling and Crieff behind me, I thank my lucky stars that once more I have reached that "Land of known desires and tried delights"—the Highlands of Scotland.

If an old hand can feel like this about the 12th and grouse shooting after some 40 seasons, it might seem that I have little reason to envy a beginner in his first year; but envy him I do, nevertheless, because, in all probability, he will still be going north for the 12th long after I have bidden a last farewell to the high hills and the heather.

SHOOTING PIGEONS FROM A RIDE OF SHEAVES

AUGUST ON THE ROUGH SHOOT

AUGUST is the shooting man's month of awakening, and this is as true of the rough shooter as it is of him whose acres are broader and perhaps more plentifully stocked. Since February, when the gun was cleaned with extra special care and put back into its case, he will have had little use for it except possibly when occasion demanded the shooting of vermin or when in the days of March or April, pigeons provided a welcome opportunity of a day's sport. And as spring advances into summer his thoughts, when they turn to shooting matters, will surely centre round the successes and failures of the past season—the morning, for instance, when he tried to shoot pigeons in a westerly gale, and returned home with two birds after having fired a quite unmentionable quantity of cartridges and, above all, perhaps, the unforgettable duck shooting during the frost at Christmas. But after mid-summer he will cease to dwell on the past to the same extent, and by the beginning of July, he will find that he is looking forward eagerly to August and a new season of sport.

The rough shooter who can count on being able to shoot a few grouse during August is indeed a happy man, but for most of us August is, above all things, the month for pigeons, rabbits and, perhaps, a few duck (but not until August 12th please, now that the wildfowl protection bill is law) if it should happen that our shoot is near a river, when we may also hope for some snipe. If it contains a reedy pond beloved of the mallard and his kind, or, best of all, if duck come at dusk to glean our stubbles, we are indeed fortunate.

A rough shoot without a fair stock of rabbits is generally a very poor proposition. They are always a useful standby, and in August and September, they offer a greater variety of sport than at almost any other time of year. On sunny days and sometimes, rather surprisingly, on dull days too, they delight to lie out in grass fields, where these are undisturbed by cattle, or in hedgerows and fields of roots. To walk them up from these situations with the aid of a dog and to shoot them when they bolt is a pastime that lacks neither pleasure nor variation. A rabbit in the open affords or should afford an easy shot, but one that is running through roots or dodging in and out among the undergrowth of a hedge can offer a very difficult target as I have proved to my own dissatisfaction on more than one occasion.

Although it is true that rabbits lie out to a greater or lesser extent at most times of the year, there is no doubt that they do so more frequently in August and September than at other seasons and, therefore, they may be more profitably walked up during these months.

Then one must not forget that in the evening when they are feeding, they can be stalked and shot with a rifle, a procedure demanding quite a large proportion of stealth and skilful marksmanship. For this purpose a .22 is undoubtedly the best weapon, and as it makes comparatively little noise when fired, it is less disturbing to other rabbits in the vicinity than a shotgun would be when used under similar circumstances.

No account of August rabbit shooting would be complete without mention of the time of corn cutting when, if the field that is being reaped contains a goodly quantity of rabbits, the sport waxes fast and furious and is often highly dangerous to those who participate in it. In this connection I shall never forget an occasion when four of us arrived at a shoot of this type and discovered to our horror that there were already five guns round the remaining area of uncut corn. When the rabbits began to bolt several of us had very narrow escapes. I know that at one time while I was watching a rabbit running straight towards me, a neighbouring gun fired at it and bowled it over within 6ft. of me. The total bag when all was finished consisted of more than 40 rabbits, and it was mere chance that it did not include several human beings as well. All the same, under less alarming circumstances, the harvest field does provide one with some excellent shooting; indeed, there are times when it is difficult to load fast enough.

As I have already remarked, I associate August as much with pigeon as with rabbit shooting, and, although it is often possible to have very good sport with pigeons in the early part of the month, I often think that the best time is towards the end of it when, in the south of England at any rate, most of the corn will have been cut and the birds are feeding on the stubbles.

Throughout the month in districts where pigeons are numerous, first-rate shooting can be obtained if you hide in a convenient place along the flight lines to and from their various feeding grounds, or in the woods where they fly to roost each evening. But after the corn has been cut, many places become accessible that were formerly impossible to approach, and thus you have a far wider scope for your activities. At this time of year I prefer to shoot pigeons in this way rather than over decoys, but success is only assured when a good wind is blowing.

On such occasions the birds seem to move about much more freely and at a lower altitude. If they are plentiful you can, by choosing a favourable place, have all the shooting you desire and still miss considerably more than you bring down.

In still weather, decoying is likely to be more profitable, and for this purpose you may use either recently shot pigeons or model decoys. I like to have the decoys not more than 25yds. from me, and if I am using freshly shot birds, I support their heads with a small forked stick or a piece of stout wire, one end of which may be pushed up the neck into the base of the skull and the other stuck into the ground. Decoys should, of course, be placed head to wind as all birds tend to face that direction when feeding.

At this time of year a stubble field is probably the most suitable place for practising the art of decoying, and if the stooks are still standing, some of them can be utilised to make a hide provided the farmer does not mind and provided that the sheaves are arranged in their original positions after your decoying is finished, for they dry more readily thus than when a dozen or more are stacked together.

If the field has been cleared it becomes necessary either to conceal yourself in a hedge or, in lieu of sheaves borrowed from elsewhere, to construct a hide of some other material such as sacking. I myself once made a very effective one out of hurdles, and it should not be difficult to discover other suitable materials.

Decoying is an exciting sport, and among its more pleasurable moments must be included that of seeing a high bird pause in its flight, descend in a wide circle and come right down to the decoys. I do not think I shall ever tire of watching pigeons act in this fashion. They hurtle earthwards with such speed and have such control over their wings that it is ever a marvel to see them from the moment when they first catch sight of your decoys until the time when they pause a few feet from them.

R. N. WINNALL.

A REEDY POOL BELOVED OF MALLARD

VARIETIES OF WILD GEESE

Described and illustrated by J. C. M. NICHOLS

I IMAGINE that most sportsmen and naturalists will be familiar with the general appearance of our British wild geese, and, given an adult bird "in the hand," should find little difficulty in naming him correctly. But in the case of immature birds, or in the field under varying conditions of light and background, the task of identification is not so easy.

In classifying the various species of grey geese, our text books, without exception, lay great stress on the colouring of the naked parts—beak and legs (orange-yellow in the bean goose, pink in the grey lag, and so on). But, as some of these "colour points" are found to vary considerably in individuals and according to age and season, while seen at some little distance they are hardly noticeable, we must look for further points of difference.

I will start by describing these colour points and some variations from them which I have observed.

In the grey lag goose the beak is orange-yellow shading down to bright pink against the nail, which is always white or greyish-white, legs from white to dull pink. The orange eyelids, too, are a feature.

In the adult white-front again the beak-nail is white, the beak is often described as orange colour, but I have never handled a white-front (old or young) which had not a pink beak, except for a tiny spot of lemon-yellow at the base (culmen), and also on the sides of the lower mandible. An immature white-front (a bird of the year) will show neither the white forehead nor the dark breast-bars so noticeable in old birds; the nail is brown instead of white, legs and feet pale yellow. Such birds can be very puzzling to a casual gunner, and are often called young bean geese or what not.

Both bean geese and pink-foot have a black beak-nail, and at all ages show a varying amount of black about the nostrils and base of beak.

The pink-foot has comparatively the shortest beak of all the grey geese.

I have, myself, shot one pink-foot that had yellow legs, and have heard of similar birds, but this is, I fancy, a very unusual variation. In a typical bird the legs and feet may vary from greyish white, in a young bird, to bright rosy pink when fully adult.

Now for points of identification in the field. The grey lag is a big "burly" goose, very grey looking about the head and neck, and, when lifting from the ground, the light pearly-grey shoulders (in contrast to the dark flight-feathers) are very noticeable.

White-fronted geese look slimmer and browner, and, in a clear light, the black breast-bars of the old ganders can be seen at some distance. Pink-feet again, apart from their dark heads, are very grey-looking geese, and, on stubble or marsh, look sometimes as "blue" as pigeons. The bean goose is a big dark-looking bird with rather an upright carriage.

After a little practice it is quite easy to distinguish the various grey geese by their voices alone. The grey lag, with its long-drawn, sonorous gabble of "gar gar gar gar" (like a farm-yard goose); the sharp "gag gag" of the pink-foot and the similar note of the white-front, but pitched in a high falsetto; and, lastly, the deep grunting voice of the bean goose, almost resembling those of a little pig!

On flight, both pink-foot and white-front look (as they are) very long in the wing, and comparatively short in the neck.

Though outnumbered by the white-front in the Western Counties, in point of numbers and general distribution the pink-foot is, without doubt, our commonest wild goose; at all events in England and Scotland; in Ireland it is rarely met with.

The grey lag is distinctly local in its occurrence, and to be considered rather a scarce bird in most parts of England, but becoming more numerous as we approach the border country. In recent years these geese have made a notable little settlement at Leighton Moss, near Carnforth. Here I have seen five or six hundred geese on flight together—all of them grey lags. About a hundred geese are shot at Leighton in most seasons and never a pink-foot among them. Whatever may have been the case 50 or 60 years ago, the bean goose is nowadays to be reckoned a very rare goose, and whether it was at any time really numerous in this country is open to doubt. I fancy that the statements of earlier writers as to the thousands of bean geese to be found in Norfolk (or elsewhere) bear obvious reference to the pink-foot which at that time had hardly obtained recognition as a separate species.

Generally alike in their habits of feeding by day (except for occasional foraging expeditions by moonlight) and of spending the hours of darkness resting on some extensive lake, estuary or sand-bar, the different grey geese show some variation in their own particular choice of bed and board. The preference of the grey lag for fresh water is well known, and I suggest that the term "lag," as applied to this species, is merely a corruption of the word lake or lough, *i.e.* the grey lough goose that sticks to the north country tarns, &c. A small party of grey lags which frequented the Holkham marshes in 1922, during the winter of 1922 were often observed to flight "in" to Holkham lake at nightfall instead of "out" to sea.

Pink-footed geese (and white-fronts also) show a decided partiality for salt water, and Loch Leven is the only fresh water that I know of which is used by them in any considerable numbers. The pink-foot again is the only goose which is to be found feeding on the barley stubbles in autumn, and not until these are gleaned bare or ploughed in, will he resort regularly to the marshes. The bean and white-front geese are almost exclusively marsh feeders. At all events I have never heard of either being shot on an "upland" farm.

In the matter of local distribution we must remark some notable changes during the last ten to fifteen years. To take as an example the county of Norfolk only. In pre-War years the entire grey goose population could be found centred in a very small part of West Norfolk comprising the coastal marsh-land from Blakeney to Burnham Overy, and inland as far as Fakenham and Docking. Elsewhere in the whole county grey geese were (comparatively) rarely seen, and, of course, still more rarely shot.

Nowadays, Holkham, the pre-War "Mecca" of East Anglian goose-shooters, has, indeed, lost its "pride of place" and geese can be found wintering in goodly numbers in almost all parts of the county which are suited to their habits, from the Suffolk border to the extreme bight of the Wash.

It was during the winter of 1913 that a few dozen grey geese began to frequent the Halvergate fresh marshes near Breydon water. During the following ten years their numbers had increased to perhaps two or three thousand, while more recently still they have spread themselves as far up the Yare valley as the Buckenham and Acle marshes.

I was lately told of some good bags of geese made at morning flight in this neighbourhood. My informant, a local marshman and wildfowler of some repute (but now in his eighties), told me also that he himself had never shot a grey goose of any sort! It was about the same time as the Halvergate settlement that the geese (pink-foot and white-fronted) began to use the Snettisham and Dersingham marshes in greatly increased numbers, and the same can be said of the country near Holbeach (South Lines), where heavy bags have been recorded.

Of these perhaps the most notable was one of no fewer than 72 geese to five guns (in a few hours), which was made in December of 1932. The geese were shot by moonlight flighting in to feed on fields which had been wheat-sown after a potato crop.

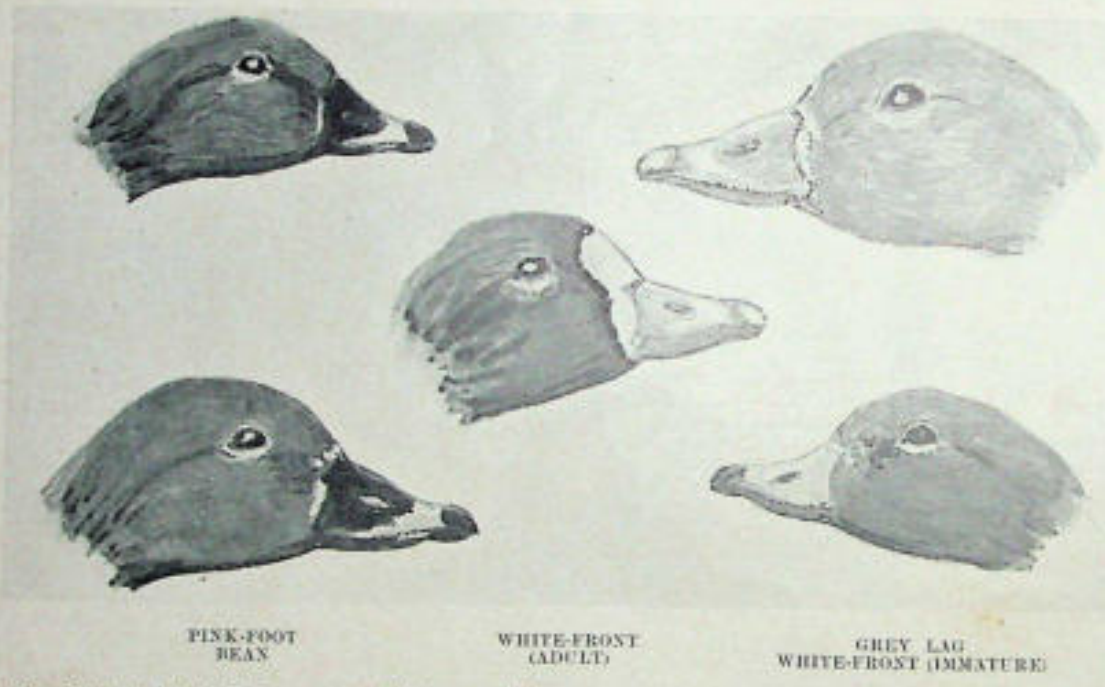
On the West coast of England we find similar local changes for better or worse. The Dee marshes near Burton Point, formerly second to no place in England for geese, are now practically deserted by them, but possibly the Ribble Estuary and other goose resorts have benefited in proportion.

Our black geese, the brent and bernicle, are easy to distinguish—the brent with his sooty black foreparts and white "stern," the bernicle with white cheeks and variegated back. There are two distinct races or sub-species of brent geese, the dark-bellied and the light. The first is an Eastern form nesting in Siberia, and the second the pale-bellied Western form, in Spitzbergen and Arctic America. Both are said to occur on the Norfolk coast in about equal numbers, but I have never handled any but those of the darker variety.

The bernicle is a very "local" goose, and its occurrence in any numbers is confined to certain favourite localities on the West coast of Scotland, and Ireland. In England the only regular haunt of the bernicle is on the Solway shore. The brent, on the other hand, is widely distributed. The bitter February weather of 1929 was heralded by unusual numbers of them on the East and South coasts.

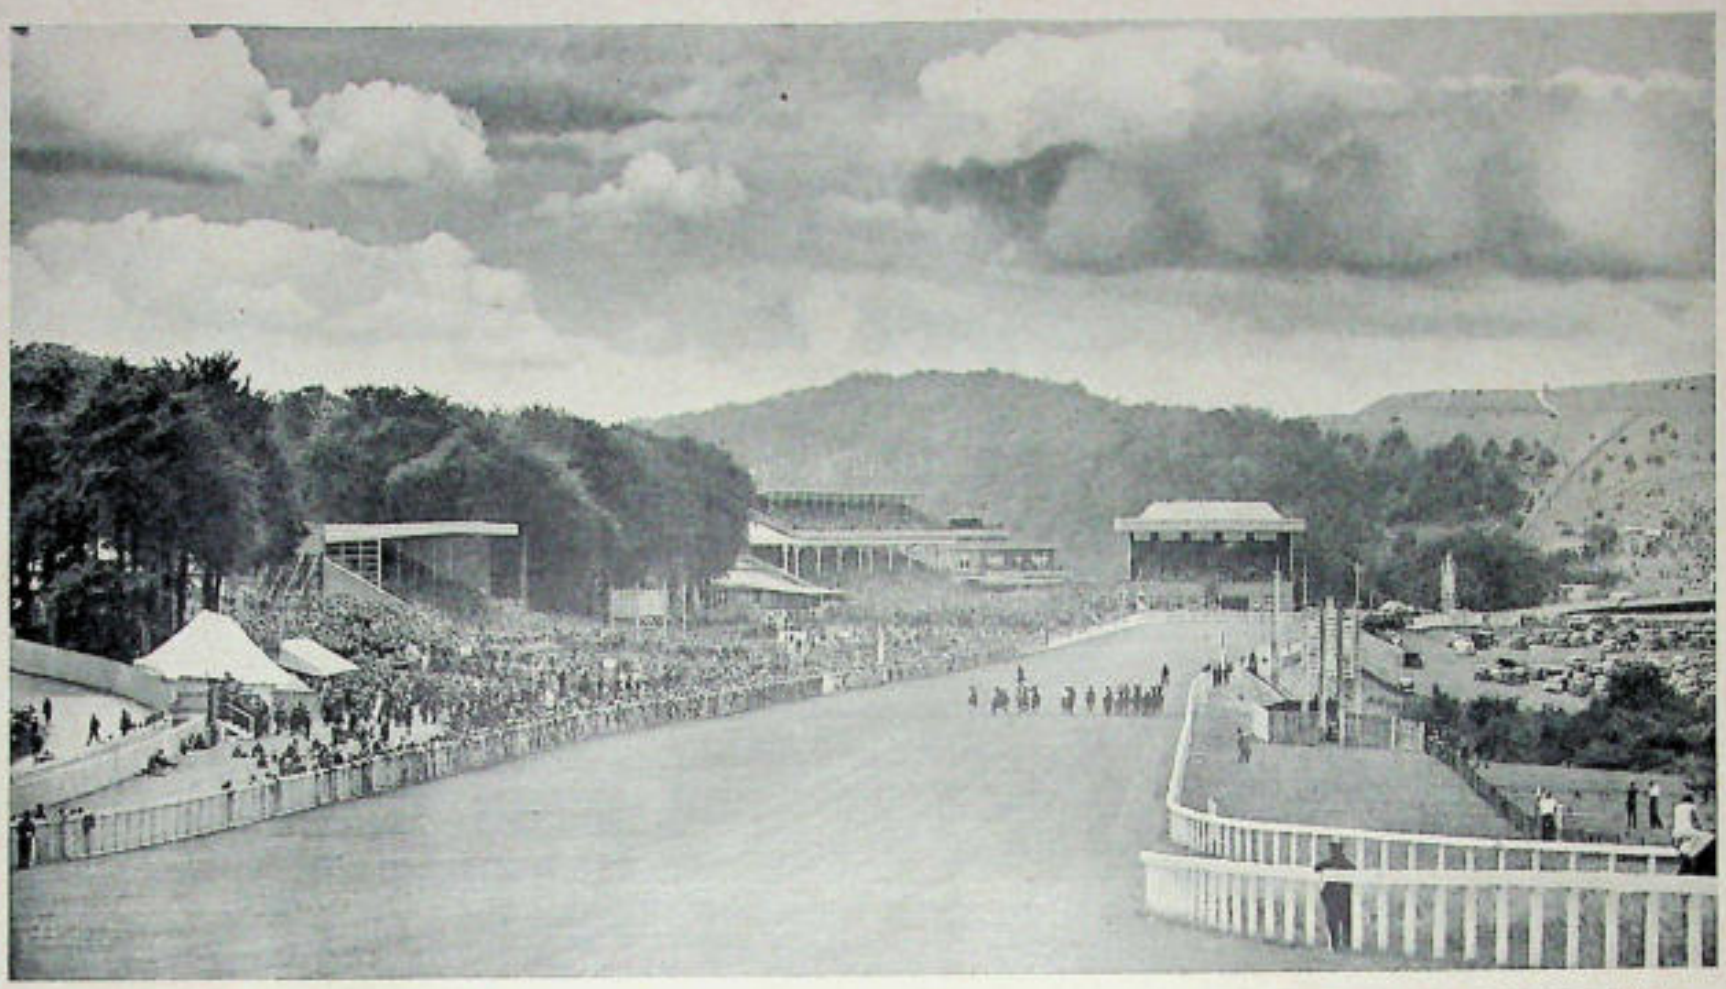
Towards the end of January, 1937, a remarkable account of wild geese on the South coast was published in a Sussex newspaper. Commencing with the words, "Shooting amounting to wanton slaughter," the writer proceeded to state that wild geese by the hundred were being shot from the beach at Winchelsea, Pett and Pevensey; that they were of all sorts (quoting every species on the British list), and concluding with the amazing statement that "wild geese . . . fall easy victims to the modern breech-loader," &c.

The story, on the face of it, was greatly exaggerated, and I was curious to know how far it had any foundation in fact. After some inquiry I learnt from various reliable informants that there had been a wonderful visitation, of brent geese at any rate, along the south-east coast, including the Kentish fowling grounds, at Pegwell Bay, Sheppey, &c., and that quite a sprinkling of geese had been shot. I could hear nothing authentic about grey geese, though it is possible that a few were obtained. A similar influx of brent occurred on the Norfolk coast at the same time; and I was assured by fowlers of long experience at Blakeney and Wells that never (not even during the record hard winter of 1923-4 and 1928-9) had they seen so many brent geese. Curiously enough, in January, 1937, we had no hard weather at all, only a bitter north-east wind lasting for several days.



I have now dealt faithfully with our typical wild geese. The British list includes a few others, such as the Canadian and Egyptian geese, the snow geese and also the red breasted and lesser white-fronted. Of these, the first two must be written-off as half-tame introductions, and the others too rare for consideration here. The lesser white-front finds admission to the British list on the strength of two well-recorded specimens only. I might mention also certain eastern forms or sub-species of the bean goose, such as Middendorf's and Sushkin's geese, individuals of which *may* possibly have wandered *nigro-que simillima cygno* as far as our coasts.

Middendorf's goose, larger and deeper-beaked than *our* bean goose, is a magnificent bird; and a good gander might well weigh 10lb.



Sushkin's goose (*anser neglectus*) is typical "bean" in size, shape and length of head, &c., but has rosy-pink legs and beak, like an old pink-foot. To anyone who is interested in these and kindred varieties of the geese, I would commend M. Serge Apheraky's monumental treatise, *The Geese of Europe and Asia*.

In conclusion, we may ask ourselves: "Have our visiting wild geese increased or decreased within living memory?" The question is a hard one to answer, and I for one shall not attempt it. Owing to the nomadic habits of geese the difficulties of compiling an accurate census of their numbers would be enormous, and even if reliable figures were obtainable we have no similar accounts of past years with which to compare them.

But if the well-recorded "bags" of the last few years are any criterion at all, there would seem to be no *present* decrease in their numbers.

PINK-FOOT BEAN — WHITE-FRONT (ADULT) — GREY LAG WHITE-FRONT (IMMATURE)

A GENERAL VIEW OF THE COURSE FROM THE FIVE FURLONG GATE, SHOWING THE FIELD GETTING AWAY FROM THE START OF THE GOODWOOD STAKES. THE RACE WAS WON BY MR. J. H. WHITNEY'S VALEDICTORY

A SUCCESSFUL GOODWOOD MEETING

THOSE people who were connected with the Goodwood meeting in any official capacity, or had a financial interest in it, must have been very depressed and anxious on Monday evening, for rain had fallen all the afternoon and there had been thunder and lightning, while the weather prophets had nothing but bad news. Goodwood depends very much on fine weather, and that seemed most improbable. Nevertheless, everything was a great success, for no rain fell while racing was on, and what rain fell at night did nothing but good. The weather for all four days was the best that we have had this year. The result was one of the most successful Goodwoods for many years, and it was certainly one of the most enjoyable. Further, the racing was of the highest class, and most of the finishes almost too exciting. Mr. Hancock, the judge, earned fully every penny of his pay.

When Turkhan was a yearling he was such a bad mover that his breeder, the Aga Khan, suggested sending him for sale. His son, the Aly Khan, however, suggested that that might be a bad advertisement for Bahram, and bought him himself from his father. Whatever Turkhan may be at home, he is useful on the course, as he showed by winning at Ascot. He seemed on that form to have a good chance of winning the Ham Produce Stakes on the first day at Goodwood, and when he had overcome Boccaccio the race seemed to be his until E. Smith brought Hippius with a great run and got up and beat Turkhan in the last stride by a short head. Hippius is owned by Lord Rosebery, who bred him from Hyperion and Edgelaw, the dam of winners among them Edgehill. Hippius is a gallant colt, and, if small, is no smaller than was his famous sire. Many visitors consider that Turkhan should have won, but many people think that when a short-priced favourite is narrowly beaten.

Turkhan was not the only two-year-old favourite to be beaten during the meeting. The Aga Khan's Moradabad, however, won the Richmond Stakes at slight odds on, as did Rose of England colt the Lavant Stakes of five furlongs. Nizani, who had failed at odds on a few days before at Hurst Park, was well backed to beat Lord Glanely's colt. He ran in a hood, but ran no better than he had done at Hurst Park, and must be much better at home than he is on a racecourse. The Rose of England colt made almost all of the running, and was not all out to win. I think now that he was unlucky to have been disqualified at Sandown Park, and, so long as the distance is not too far for him, will go on winning. On the other hand, his breeder and trainer consider that he will stay. I think that he is the best two-year-old yet seen out, although that is not the universal opinion.

FIVE FURLONGS FROM THE FINISH OF THE SUSSEX STAKES, WHICH WAS WON BY LORD GLANELY'S OLEIN WITH T. LOWREY UP. OLEIN WON FROM MOON RAY BY A NECK AND ORLEANS WAS THIRD

Rose of England colt is out of Rose of England, who was by Teddy out of Perce Neige, who must be a very old mare. She is surely over 20. Gainsborough must be even older, yet the two of them had a winner during the second day at Goodwood. This was the Aga Khan's Winterhalter, who stayed on most gamely to win the Selsey Stakes of six furlongs. It is not often that the son of such old parents is of much account, but this seems to me to be a very useful horse in the making. To judge by the odds at which he started, a hundred to eight, he was not much expected to win, yet strangely enough he had been a good tip all the morning of the race.

Illuminate, who won the six furlongs Foxhall Stakes, owed much of his success to the riding of Carslake, who nursed this doubtful stayer in masterly fashion. Illuminate was well backed, and then people who back two-year-olds—and they are the wisest of people who bet—laid 7 to 2 on the Aga Khan's Bashir, who had shown such promise at Liverpool the previous week when beaten by only Fair Test. They lost their money, for after starting slowly, and then making up the lost ground very quickly, and taking the lead, Bashir failed to stay home as well as Northern Lights, who won for Lord Derby. Bashir is by Bahram out of Mah Mahal, the dam of Mahmoud, who was by Blenheim, so that Bashir is bred on almost exactly the same lines as the Derby winner, Mahmoud. He also is a grey, although described on the programme as a brown. Northern Lights is by Solario out of Lady of the Snows, by Manna, and is the dam's second winner. Credentia and Allure, the two two-year-olds to win on the last day of the meeting, are useful but hardly top class.

So much for the two-year-olds of the meeting, which I leave still considering that the Rose of England colt is the best of the lot yet seen on a racecourse. Heliopolis, one of the most fancied of the St. Leger candidates, won the Gratwicke Stakes of a mile and a half—a rich stake. He won by only a neck from Silksworth, to whom he was giving 17lb.

Time may well show that this was a very good performance, but in addition to that it is to be noted that Heliopolis won easily and had the race won a long way from the winning post. Olein, a three-year-old filly by Colombo, the sire also of the Rose of England colt, won two races at the meeting and so avenged her defeat at the Second July Meeting. Her first success was gained in the Sussex Stakes over the old mile. She gave Fulham weight and beat him with ease, being chased home by Moon Ray, to whom she was giving some 10lb., including sex allowance. It was thought after this success that she would not race again during the meeting, but she seemed so fit and well the next day that her owner decided that she should be started for the Nassau Stakes of a mile and a quarter. I have always liked this filly, but I have always doubted whether she got any further than a mile. Yet she stayed this mile and a quarter, cleverly catching the leaders in the last few yards and winning narrowly from Flyolley and Foxcraft. Olein was carrying 9st. 8lb. and must be a really high-class three-year-old.

The most spectacular event of the whole meeting was the win of Knight's Caprice in the Stewards' Cup. He was drawn number three, on the stands side, which is generally considered to be a severe handicap. Ridden by Canty, who came over from Ireland for the sole purpose of riding him, Knight's Caprice was out of the gate like a flash, and was soon leading the field. He was quite early in the race so far in front that he could edge over to the far rails without any danger of interfering with any other horse. He then sailed home unchallenged, winning with the greatest of ease and elegance by three lengths from Faststep, who beat the three-year-old Linklater by a head for second place. Knight's Caprice is a four-year-old by Knight of the Garter, and was trained for the race by R. C. Dawson, who I have reason to believe was not surprised by the colt's success. He should now win the Portland Plate, at Doncaster, if he can get that much more severe six furlongs.

The night before the race for the Goodwood Cup Basil Jarvis, the trainer of Dubonnet, told me that his candidate was not certain to run, as he had knocked a knee. However, he had him sent from Newmarket to the meeting, and finding that the knee seemed all right decided to start him. At the weights he had an outstanding chance, and the only question was whether the knee would stand the long gallop of two miles and five furlongs. There was a moment at the top of the hill when Dubonnet suddenly lost ground, when it seemed that he might have broken down, but such was not the case. Coming on to the flat, Senor, who had never been out of the first two, took up the running, chased by Dubonnet, who, with an advantage in the weights of 10lb., went on to win in the end by a length. Contrevent was third, Sierra Nevada fourth and Challenge, who seems to have lost his stamina, fifth and last. GNOSTIC.

A TORRIDGE RETREAT

By JOHN KENNET

"TORRIDGE. Rises near the Cornish border of Devonshire, and joins the Taw Estuary at Appledore, falling into the Atlantic at Barnstaple Bay. Salmon and trout." That description comes from the *Field's* publication *Where to Fish*, but in its necessary brevity it can convey nothing of the charm, beauty and sporting possibilities of this little gem of a river, which, incidentally, must have one of the most curious courses of any river in England. Curious, in that its mouth, in Barnstaple Bay, is only about a dozen miles in a straight line from its source, for the Torridge runs in a great horseshoe. And somewhere about halfway along this horseshoe is the tiny village of Sheepwash.

A writer once described Sheepwash as the "remotest village in Devonshire." It is. It lies on a road leading nowhere. It is miles from the nearest railway. Indeed, there seems very little reason for the existence of Sheepwash at all. But as a peaceful, quiet, wholly delightful fishing centre, I have found few places to equal it. The Torridge here is an attractive stream, and is well stocked with trout. In an average season (unlike the 1938 disappointment) there is a good run of salmon, and, after a summer flood, of peal. But it is with the brown trout fishing that this article is chiefly concerned.

The Half Moon Hotel at Sheepwash (proprietor, T. W. Alcock) has my fullest recommendation. It is comfortable, the food is excellent, and nothing is too much trouble. Mr. and Mrs. Alcock look after their guests in a truly hospitable and thorough manner. The Half Moon has four miles of fishing in the Torridge, all easily accessible to anglers staying at the hotel, and in these four miles there is every type of water—deep pools, shallows, stickles, glides and fast runs. Trout are plentiful, and do not seem especially gut shy.

There is little to choose between one beat and another (the four miles are divided into six beats), though probably the best from the trout angler's point of view are the two beats above Sheepwash Bridge and the bottom beat above the Iron Bridge. These are rather easier to fish than the rest of the water, which, in places, is inclined to be wooded, and in some places too deep to wade. But on the whole there is good trout water throughout the four miles, and no matter how many anglers there are at the hotel you are never likely to be crowded.

At the top end of the water (*i.e.*, above Sheepwash Bridge) the water is quite open, and is generally fishable from the bank, though wading is everywhere more desirable. This stretch also includes several of the best salmon pools, notably the Peninsular Pool, at the top end of which is said to be an excellent place for sea trout.

As in most West Country rivers, the trout do not run large, but the Torridge is no moorland river, and half-pounders are by no means uncommon. Though the average is probably four or five to the pound, there are considerably larger trout in the water, and pounders may be expected anywhere. A fish of 1¼lb. was taken from the Bridge Pool this summer, and I personally had a nice pounder to a dry Wickham's Fancy in the top stretch.

As regards flies, the Torridge trout seem very catholic in taste, and it is hard to recommend any one pattern in particular. But here are one or two which I, and others, have found successful on this water: Blue upright, pheasant tail, Greenwell's glory, Wickham's Fancy, coachman, red spinner, any form of olive, and Tup's indispensable. I have taken trout on all of these.

Dry-fly fishing I have generally found to produce better sport than wet fly, but there is suitable water for both. With a dry fly it often pays to fish the *unlikely* spots, especially in the small bays and back eddies at the sides of the salmon pools. A fly flicked under the overhanging trees will often produce a good fish. Owing to the wooded nature of the stream a long rod is not advisable, but if you are not wading, a long-handled landing net is an absolute necessity, as in many places the banks are high and steep. Incidentally, it is often under these high gravel banks, and in deep water, that the best trout lie.

Although the Torridge does not run off Dartmoor, it is quickly affected by rain, and after a few hours' steady downpour comes down thick and coloured. It fines down, however, as quickly as it rises, and even after a bank-high spate is generally in reasonably fishable condition in a couple of days or so. But just as a warning—if the water *is* coloured, do not wade at all unless you have made sure beforehand of the nature of the stream bed. In some places the bed of the Torridge is made up of rocky ledges, and it is quite easy to slip or step off these into deep water. I made this mistake once when fishing just below Sheepwash Bridge—and received a very uncomfortable ducking in about 6ft. of water. I was always exceedingly wary after that!

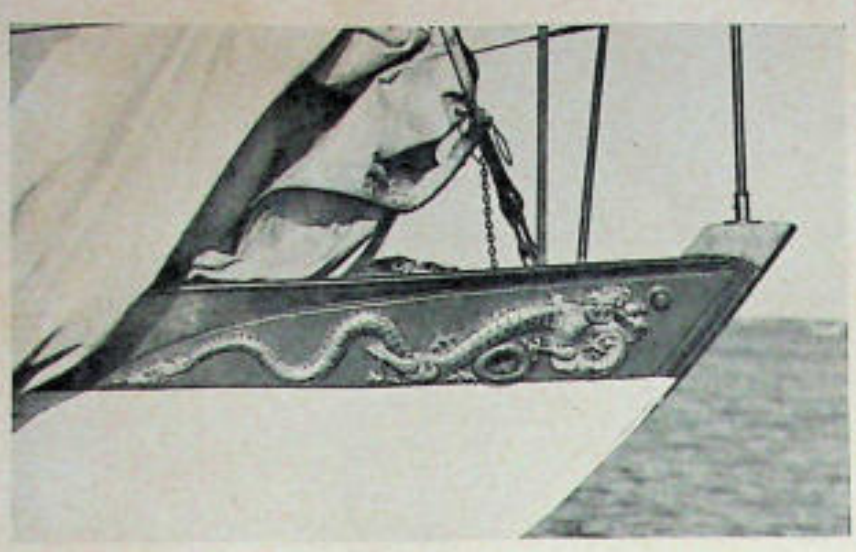
Yes, the Torridge at Sheepwash is certainly worth a visit. If you want a quiet, comfortable holiday in really beautiful surroundings, you will find it hard to beat. And once you have fished the Torridge at Sheepwash, the next visit is only a matter of time.

SUMMER FEEDERS

By NORMAN L. WEATHERALL

ALTHOUGH all coarse fish can now be angled for, and although, too, we can still go for salmon and trout, four fish which I suggest anglers should not forget when planning their calendars are tench and carp—the hibernators; rudd, which seem to revel in the hot mid-day hours of the summer months; and bream, the proverbial great big "bags" of which are likewise made in summer, though, for some reason, October is a good month for them, too.

And I suggest there is further justification for considering these four members of the carp family *en bloc*. They all often inhabit the same water—pond, lake, broad, canal or sluggish-flowing river. Upon occasion they will all take similar baits. The methods of capture (except that rudd are surface or near-the-surface feeders), as also the tackle, are much about the same, with the bait lying well on the bottom. Rudd, though, with their lovely golden-bronze flanks and brilliant lower fins, are, I think it will be agreed, the handsomest of all.



In fighting power, however, carp — leather-mouthed, barbuled wiseacres—put up the best and most cunning resistance, with, when hooked, that initial headlong streak off towards the centre, any premature attempt to "brake" this merry little scamper being apt to result in quite a different sort of "break"; while if there be any obstruction in the water, such as a submerged tree trunk, a fallen branch, a post, or reeds, these fish with the biggest brain will intentionally, so I verily believe, connive to get the line encircled around it. Tench, too, another good fighter, will likewise, unless resolutely given the butt, assuredly seek escape amid the dense mass of weed and other aquatic growth usually characteristic of their habitat.

The trouble with bream, I have found, is that, gregarious of nature, and presumably under some leadership, they are great rovers. Finding ground-bait, they may be tempted to tarry awhile—let us hope—till their numbers are thinned a bit. Alternatively, their whereabouts is disclosed by discoloured muddy water, evidencing that they are rooting and grubbing about on the bottom. Sometimes, too, one sees them basking or disporting on the surface, or when rising, which they do in a deliberate manner, jutting their dorsal fin out of the water and rolling over with a lazy flop. Bubbles are another sign, but likewise of tench and carp.

The easiest way to locate rudd, however, is to surface bait for them by throwing pieces of dry bread on to the water, and then bide quietly until these are seen being nosed about.

As regards ground-bait constituents, one cannot, I think, beat the good old general favourite of bread, bran and middlings. But I ken an angler who claimed that slaughter-house remnants brought tench and perch on feed quicker than anything. The late R. B. Marston advocated mixing in a few drops of oil of tar. But what should be added is some of the hook bait—such as chopped-up worms or a few maggots. For carp, I usually add some mashed boiled potatoes. For bream—which, of course, still abound in the Norfolk broads and rivers—I usually add some stewed wheat and/or barley.

As regards hook baits, worms, gentles and bread-paste may be equally successful. Carp, of course, like honey, either mixed in the bread paste or as a coating outside the new parboiled potato. In one old monks' stewpond I sometimes fish, however, I have found that a paste made from grated Cheddar cheese is best. For rudd, fishing at Slapton Ley (Devon), famous for its wealth of big rudd, I have found breadpaste most killing. Tench will also take boiled wheat or a piece of stiff ground bait.

OCEAN RACERS OF TO-DAY

An International Entry for This Year's Fastnet

By K. ADLARD COLES and TERENCE STOCKEN

ON the eve of the Fastnet, let us take a quick glance at some of the entrants, for when, on Saturday, August 5th, the gun goes at noon or thereabouts, there will be over 30 boats jockeying for the line—the flower of the ocean racing fleet.

One or two of them are brand new, so new that except for the "shake-down" race organised by the Island Sailing Club around Poole Bar Buoy for the previous Tuesday, the dust of the fitting-out yard has hardly left them; the majority are seasoned warriors with one or more full seasons behind them, while a few are veterans of several Fastnets—and just one that has carried off the Fastnet Cup before.

To take the British entries first:

Latifa belongs to Michael Mason, Commodore of the Royal Ocean Racing Club. She is a big bermudian yawl, of 53 tons, a Fife boat from the Clyde. This is her second Fastnet; it is a biennial event, of course, so last year Latifa went to the United States to take part in their Bermuda Race, but carried away her bowsprit and had to retire.

Another boat whose owner belongs to the Royal Yacht Squadron is Bloodhound, the fine Nicholson boat, also a bermudian yawl, but smaller than Latifa, being 45ft. on the waterline; she is owned by Mr. Isaac Bell, and is the same hull design as his previous ship, Foxhound. She won the Morgan Cup and Channel races in her first season (1937), but was not raced at all last year.

A third sister ship of the two "Hounds" is Stiarna, cutter rigged and owned by Mr. J. B. F. Gage. At the time of writing she is a "probable" only for the Fastnet, as her entry is not confirmed. She was second in the last contest, and in 1938 took second prize in the Dover-Christiansand race.

The biggest sloop in the race is Benbow, a Robert Clark design, built at Cumper & Nicholsons, and owned by Mr. E. Gore-Lloyd. She is very new—her mast was stepped for the first time scarcely a fortnight before the start of the race—and though she is an obvious thruster, she has hardly had time to find herself before being put at the stiffest fence of the offshore season. She is 50ft. on the waterline, with a centre-board and 2,000 sq. ft. Y.R.A. sail area—a truly enormous size for a sloop.

Another "pierhead jump" (if she makes it in time) will be Lara, also designed by Robert Clark, but built at Brookes's, Lowestoft. She is a yawl of 42ft. waterline and, again, belongs to the growing school of centre-boarders which is the result of some outstanding successes with the c.b. by American designers in the past few years. Lara is a "firm entry" for the Fastnet, but as we write there is some doubt if she will manage to start, as she was only ready to sail from Lowestoft the previous week-end, which is certainly cutting it fine. However, if she gets there after all she is likely to put up a fine performance.

Maid of Malham is another well-known boat, designed by Laurent Giles and owned by Mr. Norman Jones. She and Ortac rivalled each other in renown for a couple of seasons, though the latter has, alas! dropped out of things this year. The Maid was third in the last Fastnet, and last year won the Trenchemer Cup for the most points in the open class. She is a cutter, 35ft. on waterline.

Mr. T. C. Ratsey's Evenlode, a Fife boat, also 35ft. waterline like the Maid, but sloop rigged, is another entry. She was second to the Maid in last year's Channel race, and also took second prize this year in the Morgan Cup. This is her first Fastnet.

Ilex, owned by the Royal Engineer Yacht Club, earns the title of "old timer": with many changes of rig, from gaff cutter (when she first saw the light in 1899) to gaff yawl and back to cutter again, this time bermudian, she has been in almost every Fastnet that ever was—and most other off-shore events of any note. She won in 1926, was third in 1929 and 1930 and again in 1935, winning the inter-regimental cup in 1937.

Another "military" boat is Rose, owned by the Royal Artillery Yacht Club. Of the same vintage as Ilex, she raced her first Fastnet in 1935 under the ownership of Colonel King (of subsequent Ortac renown), and under her present ownership was second in the cruiser class in 1937.

A third old 'un is Zoraida: with her dark hull and dark sails, straight stem and gaff rig, she is a familiar sight on the Solent. Owned by Captain Franklin Ratsey, R.N., this is her 51st year afloat, and her second Fastnet. Another boat sailing her maiden Fastnet, but otherwise no chicken, is Griffin, a straight-stemmer built down west, and owned by Lieutenant-Commander Martin, Admiral of the R.O.R.C.

A newcomer from the Far East is Golden Dragon, from Hong Kong, designed and owned by Mr. H. S. Rouse, who designed Tai-mo-Shan. The latter will not be sailing in the Fastnet, as she has been scratched.

Two more well-known Clark-designed boats are entered: Erivale and Mary Bower. The former, owned by Mr. J. H. Rawlings, created considerable interest when she appeared last season, full of the latest gadgets. She won the Dover-Christiansand race, but did not appear much during the rest of the season, though she won two of the smaller events on the French coast. This year she won the Round the Island race (big class). Mary Bower is a new ship, owned by Major Bryson; she is a cutter, of 35ft. waterline and this year won the Southsea-Brixham (via le Havre light vessel) race in convincing manner.

The remaining "certain entries" among the British yachts are: Macnab, Mr. J. J. Joass's 35ft. waterline cutter, built by the Berthon Boat Co.; she won the Kingstown-Clyde race last year; and Morva, a new last year Mylne-designed cutter belonging to Mr. P. Holman. Amongst older boats are Thalassa, Forban, Joyrena and Phryna.

Besides the above, there is also a short list of "possibles": Stiarna has already been mentioned, but it is also hoped that Ragna R, a Swedish-designed boat (by Knud Reimers), owned by Mr. H. Wrohan, will turn up; also Neith, Major Henderson's handsome Herreshoff cutter, and perhaps Trenchemer, the Olin Stephens designed cutter belonging to Mr. Walter Bell, brother of Bloodhound's owner.

Amongst foreign boats there is quite a good showing: Zecarand, also designed by Stephens, and winner of the last Fastnet, and Olivier Van Noort, both from Holland, the latter a new boat, second this year in the Weser race.

Five entries come from Germany, amongst them Nordwind, a Gruber-designed ship owned by the German Admiralty, and the biggest vessel in the race—built to the limit, with a 60ft. waterline. The other four German boats are: Roland von Bremen, Walkure, Ettsi IV, and Hamburg.

There are two French entries: Aile Noire is one, a graceful yawl, designed by her owner, M. Baldenweck, and presenting an attractive picture with her tanned sails and blue hull. The second is an ex Havre pilot cutter, Saint Maâl, resembling that first-of-all Fastnet winners, Jolie Brise, but not likely to emulate her achievements in these fierce modern times.

With 29 firm entries and several possibles, there will be a biggish fleet on the line for this off-shore classic; the biggest the race has even seen, if not the most international; for somehow, the Fastnet does not seem like the Fastnet without an entry or two from across the Atlantic. There was talk of one American entry turning up, but at the time of writing it has not materialised; maybe at the last minute—who knows?

MR. J. H. RAWLINGS'S ERIVALE
Designed by Robert Clark and built by the Sussex Yacht Works, Shoreham

THE SLACKNESS OF ALASTAIR

By FRANK WALLACE

"A NICE head," said Mr. B., in the big downstairs room in Piccadilly. "A very nice head."

It was a nice head, but even Mr. B., who knew pretty nearly everything, did not know how much human thought and energy, what hopes and fears besides Alastair's had centred round it a few days earlier before it had finally come to rest on the floor beside him.

Four days earlier it had been Sunday, Sunday in the stalking season, which meant that though during the preceding six days it had poured relentlessly, and would probably pour for the following six, the swollen waters of the river which ran in front of the lodge danced and sparkled in bright sunshine. They caught reflections from a sky which turned them in mid-stream from gold and amber to silver and blue. The whole scene was full of colour, such colour as can only be seen in Scotland in October, the memory of which, once seen, can never be effaced.

In front of the lodge was sitting a boy of about seventeen. His long rather narrow face was of a deep brown from which a pair of blue eyes shone with suppressed energy. His name was Alastair, and of him at a later stage in his career I have written before.

Whatever faults he had, he could never have been accused of slackness. Occasionally his outbursts of energy were punctuated by spasms of silent brooding, the invariable precursor of a super outburst. He was broody now. He was brooding on the Baron who had been to lunch.

Lord Runton, short, stout, with a Hitler moustache, was one of those unfortunate people who, everyone agreed, would have been very much nicer had he been kicked hard when young. As it was, pink, petted and prosperous, he exuded an aura of self-satisfied opulence which less favoured mortals found intensely irritating. So long as it was generally conceded that he was the best shot, his wife the best-looking woman, his pheasants the highest, and his stags the most superior in any company, all was well. At other times the cloven hoof was apt to appear.

He had patronised Alastair at lunch, and we all hate to be patronised. He had called him "old chap," and Alastair hated to be called "old chap" by people he did not like. He had talked about stags, his stags in particular, and he had enlarged on a certain 13-pointer which he had pursued without success the previous season. He had announced that, this animal having been seen near the march, he was going to make a supreme effort to circumvent it in the middle of the week, on his return from London, whither he had been summoned for an important business conference.

It was on these facts that Alastair brooded.

A quiet voice broke in on his musings.

"What are you thinking about, Alastair?" it said.

Alastair woke up with a start.

"Oh, just thinking," said he. Then suddenly as he collected himself, "May I stalk to-morrow, Uncle?"

"You can go out with Rory if you like," was the answer. "I want Duncan. And you'd better not bump off the Baron's 13-pointer if you see it," added the speaker.

"No, Uncle Henry," dutifully replied his nephew.

The following morning was dull and cloudy with a strong S.W. wind, which was good for the ground not really forest, though deer were always about. Heavy mist swayed and eddied sullenly about the higher tops, and swirled sluggishly round the birches which covered the lower slopes.

Rory was an ally of Alastair's, but what he had planned he wished to do entirely alone, and to carry out his plan it was essential that he should kill a stag.

Fate seemed against him from the start. Spying was difficult, for as the morning drew on, the wind lessened and a slight drizzle started. A small, ugly 5-pointer had possession of some hinds in the middle of a peat hag and him they stalked. Fate still pursued them, and it was not until late in the afternoon that their third stalk ended successfully.

"I'll have to drag him down to the path and get the gillie up from the loch side," said Rory. "You'd best cut straight home by you burn, Mr. Alastair."

Alastair pondered a moment. "Right," said he. Then he added casually, "I'll just have a look over the edge of Corrie Beith on the way, in case there's anything there."

Just over the ridge lay the Baron's domain, and as he watched Rory dragging the dead stag over the peat Alastair's hopes grew. The wind was right. He knew that the best chance of a poach was on this identical bit of ground, and though such chances seldom materialise, there *was* a chance, and thoughts of the 13-pointer filled his mind. He was very wet, but he was very happy, as one always is at his age, having just brought off a successful shot.

It was not far to the march, and though the rain had stopped, a thin mist hindered his view as he reached the ridge. Crawling the last few yards, he peered over. Scattered on the slope of the hill in Naboth's vineyard were some hinds. They were within a few hundred yards, but no stag was visible, and Alastair's hopes sank. The mist curled and eddied. At one moment the whole stretch of hill-side was blotted out, the next capriciously revealed.

As Alastair watched, a roar came out of the mist. The hinds moved uneasily, bunched and lifting their heads stared intently in the direction of the sound. There came another roar. One of the hinds started to feed. The others remained motionless, watching.

Through a swirl in the mist a form dimly showed, was blotted out and again grew visible. The eyes of the watcher, blazing fiercely, were glued on the spot. There came a movement in the mist and another roar. Presently a stag stepped slowly into view, palely silhouetted against what should have been the skyline. He turned his head, looking at the hinds, and gave a grunt. With shaking hands Alastair focused his glass, for he knew that he had never seen a stag like this before. To say that he was excited would be a liberal understatement of the truth. He literally shook all

"A GREAT FORM HURLED ITSELF TOWARDS THEM DOWN THE SLOPE"

over, lying there with his head buried on his arm, until the spasm had passed. Then as he grew more composed he slowly raised himself. The mist had drifted aside and the stag stood with lifted head, his horns showing clearly. The glass was far from steady, but the watcher made out good double brows and, above the strong thick horns curving backwards in a grand double sweep, three on each top. The stag put down his head and nosed the ground. As he did so his right top was turned and a fourth point showed.

Alastair tried hard to collect his thoughts. The stag was just out of shot, but if he joined the hinds, as there was every reason to suppose he would do, he would be within range. He was over, but not very far over, the march, and what the boy was trying to get clear was, first, if he dared to take the risk of shooting could he kill the stag dead. He had no wish to pursue a wounded stag into the heart of the Baron's territory. Secondly, what his course of action should be with the stag lying dead before him.

He had practically decided the first point in his own favour when the stag roared again. It sounded nearer. Breathing heavily, Alastair grabbed hold of his rifle and pulled it up beside him. Then he raised his head and peered over the ridge on which he lay.

The mist, under the influence of a slight breeze, swept along the hillside, forming an unending procession of grey ghosts. Sometimes thicker, sometimes thinner, it was impossible to make out anything distinctly. He could see the group of hinds. Several of them were feeding, two or three had their heads raised. They had lost their attitude of watchfulness. The stag was not visible.

Then came another roar. This time it seemed further away up the hill, and the heart of the watcher sank. So, it seemed to him for hours, he waited.

A hind suddenly came into view. She moved quickly, trotting towards the others. The stag roared, and as he did so the mist lifted like a theatre curtain and revealed him, black and stark, his head and neck outstretched, broadside on 180yds. away.

Doubts and hesitations swept aside, Alastair turned the safety catch and cuddled the stock of the rifle to his cheek. As though the crack was a signal, down came the curtain of mist, but not before he had had time to see the hinds break and scatter as a great form hurled itself towards them down the slope. Then the grey procession swept everything from view save the immediate foreground, and he was left to wonder whether he had made a mess of the chance of a lifetime and what he was to do next. Slowly extracting the empty cartridge, he slipped it into his pocket and rose to his feet. Trembling all over, he took a few cautious steps forward and, bending almost double, slowly advanced. Beyond a few yards he could see nothing. The hinds had completely vanished and there was no sound save that of his own footsteps. The grey rocks and the yellow grass seemed unending. The mist swept past him, vague and intangible. Then for a second the curtain parted.

Thirty yards in front of him down the hillside were two rocks. Between them lay something dark, and above it, stark and black, a big withered branch. But there were no branches up here.

It was a horn! Caution laid aside, Alastair sprang forward. The brown object never moved, for the stag was quite dead. Alastair viewed it from every angle. He had triumphed after all. He had done in the Baron, and he had got an absolutely first-class Scottish head for his very own.

It was undeniable that the immediate future presented serious difficulties and a great deal of hard work, but with the enthusiasm of youth Alastair felt quite capable of surmounting them.

It took him three-quarters of an hour to drag his prize over the march, which was pretty good going, as anyone who has essayed a similar task will admit, and it was a very tired boy who stumbled upstairs in the lodge a couple of hours later. However, he felt better after a bath, and received his uncle's congratulations on the death of the 5-pointer with equanimity.

"Well out of the way," said the former. "I suppose you didn't see anything on the way back?"

For a moment Alastair boggled. Then, "Not much," he answered. After all, a few hinds and one stag were not much!

"Well, you'd better get off to bed," said his uncle. "I expect you're tired."

"Good night, Uncle Henry, and thank you for a lovely day!" said his nephew.

An hour later he heard his uncle come up to bed. He waited an hour longer to make sure that he was quite safe, though his eyes would hardly keep open.

Then quietly slipping from his room he cautiously opened the front door and stole into the quiet of the night. He found the path which led up into the hills and stumbled through the wood, barking his shins against roots and tree stumps, driven ever onward by the thought of what he had to do before the dawn. Presently he stood over the dark form which he had left, it seemed, so many hours ago.

How he managed in the dark to sever the head from the body, dispose of the latter in a large peat hag, and remove the more immediate traces of his crime, he never afterwards could recollect. Nor how, tired and sore, he succeeded, just as it was getting light, in depositing his trophy in a disused shed. It was Rory who found him there and who delightedly listened to the story of his Odyssey with many reproaches that he had not himself been called in to help.

"I wanted to do it all myself, Rory. You must help me to get the head away. My uncle mustn't know in case the Baron ever finds out," said Alastair soothingly.

It was Rory who enlisted the aid of the carrier and who despatched the head in an old crate to London.

These details attended to, Alastair crept wearily up to his room, flung off his clothes and crept into the luxurious softness of his bed. Three hours' dreamless sleep was his reward.

"Are you all right, Alastair?" said his uncle at breakfast.

"I'm all right, thanks," said Alastair, raising a couple of red-rimmed eyes to his host. "Why?"

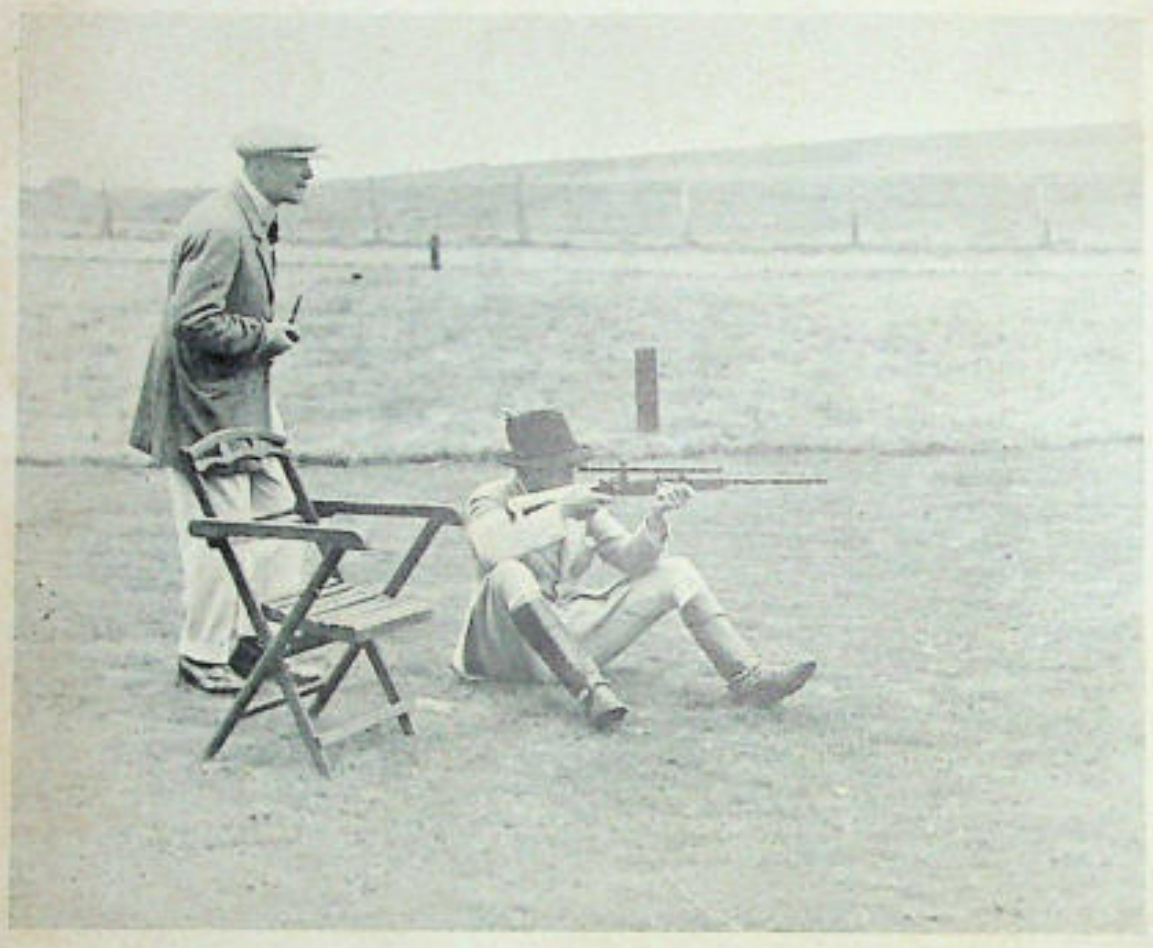
"You look a bit fagged," said his uncle. "You'd better have a slack day."

For once, Alastair slacked.

USING THE TELESCOPIC SIGHT

By CAPTAIN PAUL CURTIS

APROPOS my recent article on the modern type of sporting telescopic sight, I trust that a few hints on its proper use will be in order, particularly as the beginner will usually experience some difficulty in getting the most out of one until he has had considerable practice with it.



Obviously the main purpose of the magnifying sight is to increase one's ability to hit exactly where one desires; but as the glass has no inherent ability to steady the aim, or mystically guide the bullet on its course, this is entirely up to the shooter. So that while it is possible with the modern low-powered, wide-field telescopic sight to hit running game—in fact it is easier to do so than with iron sights once one has learned—it is nevertheless advisable to shoot from a rest when possible.

Naturally, when shooting at increased ranges on the open veldt, or in the mountains, one will adopt the prone position most of the time. Next to that the sitting position with the elbows supported by the knees is the most desirable. Often it is possible to shoot from the support of a boulder or when steadying the rifle against the trunk of a tree, and whenever these assistances are available they should be used. The more we increase the range the more we should guard against inexcusable wounding. When solid supports are resorted to the shooter should not rest the rifle barrel or the fore-stock directly on them, as this is ruinous to accuracy; the left forearm (speaking of right-handed shooters) or elbow should be rested on the support and in a like manner one can place his supporting left hand on the trunk of a tree. However, the barrel must not be held against the trunk but simply rested across the wrist, or in the crotch of the thumb, depending upon the side of the tree from which one is shooting. When the barrel is in direct contact with a solid support, it will shoot in the opposite direction, as the natural vibration of the barrel is retarded. When shooting off the top of a rock, if the barrel is bearing upon it, the shot will go high, sufficiently so with a perfect aim and let off to miss a large stag at 200yds., and if held against the right side of a tree the shot will go to the right.

As all telescopic sights magnify the vibrations of breathing and the tremors of the body, they appear to be less steady to the beginner, but actually they are only indicating the wobbles which the shooter is unconscious of when using iron sights, so that when one becomes used to it and does not become demoralised by their disconcerting effect, they are of real advantage.

Often when climbing at high altitude, which makes one gasp for breath and causes the heart to pound like a hammer, I have crawled out on a ridge to find game within fair range and as soon as I placed my telescopic sight upon it realised that I was in no condition to hazard a shot until I had quieted down. With iron sights I would not have been aware of it, or at least would have minimised the amount of the tremors and that is quite often the answer to what we consider an inexcusable miss.

Anyone who adopts a telescope should learn to use a strap hold; it is particularly advantageous when shooting from the standing position at running game. This simply consists of having an adjustable sling-strap on the rifle with a loop through which the left arm is thrust up to the biceps, the forearm then being twisted about the forward part of the strap before the hand grasps the fore-stock. Shooting thus I have frequently stopped running game from the off-hand position with a single shot at 200yds.

MR. W. V. C. BUXTON SHOOTING FROM SITTING POSITION

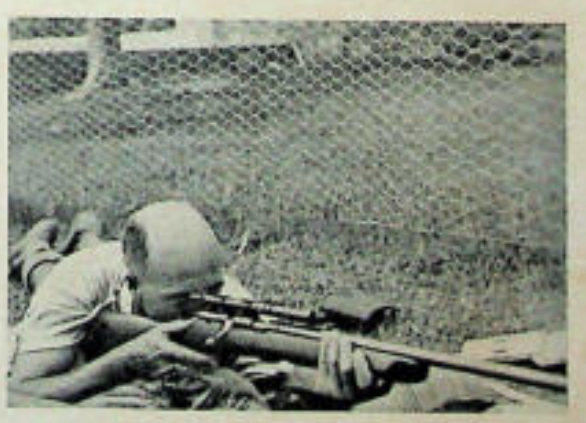
in conjunction with a glass sight, and once won the American running deer event at the Campfire Club with a perfect score plus three additional tens in the target before scoring less than a possible. I believe that score has not been equalled to date, in the States.

In using the sporting scope, I believe that the average range should be considered and the scope set for that distance and left alone thereafter for all time. While some of the good ones have micrometer adjustment in the mounts, or internal adjustment for both elevation and windage in the scope tube, they should only be used to correct the sights when a new batch of ammunition, shooting to a different point of impact, is purchased. Such a change might be made necessary by a variation in the weight of the bullet, an increase in velocity, or even a change in the type of powder.

This range, with a modern sporting cartridge having a velocity of between 2,600 and 3,000 feet per second at the muzzle, should be 200yds., and once established I would advise tightening the adjustment screws, which should be of the lock type, so that some curious friend or gun-bearer, without the aid of a pair of pliers, could not alter them. It is amazing the interest some fools show in altering other people's sight adjustment.

Such cartridges as those in the category specified will then have a point-blank range from the muzzle to about 275yds., in which the bullet will not rise or fall out of the killing shoulder area, if the aim is good.

Having established this zero, the shooter should then concentrate on the estimation of range, using the aiming post in the scope as a Mills scale. I do not recommend a cross-hair reticule, as it is too slow, very easily broken by the recoil of a heavy charge, covers too much of the exact spot which one desires to hit and has no value as a range finder. So by all means specify an aiming post, either a pointed picket, or one with a narrowing flat top. Learn by trial just how much the width of the post subtends at 100yds. and at 200. If it is 6in. at 100 it will equal 12in. at 200. Most of them subtend about 6in. at 100. Knowing this, if you held on the head of a Rocky Mountain goat, an animal that has a very narrow head for its size, being about 5in. across the eyes (a wild Highland goat is about the same, though smaller), and your aiming post subtended 6in. at 100yds., and if it appeared twice as wide as the goat's head, you would know with certainty that your quarry was something near 250yds. away. Incidentally, you can make a very canny guess as to the span of the horns or antlers of a beast by knowing the measurements of the head and the area covered by your aiming post.



At the longer ranges, the shooter using a telescopic sight under favourable conditions, with good light, absence of wind, a steady rest and standing or walking game to contend with, can make very good practice.

There is no reason why one who has any claim to calling himself a marksman should not expect, with the super-accurate rifles of to-day and their attendant flat trajectory and when using a telescope and a strap hold, to make as good practice on game up to 350yds. as his father did at 200 with the equipment in use 30 years ago. To do so such a man has only to judge his ranges intelligently and know the fall of his bullet at them.

For instance, when the .30–06 cartridge with the 180 grain bullet at a velocity of 2,750ft. per second is fired from a rifle with the sights set for 200yds., the bullet will rise, above the line of sight, 3in. at 100yds., be zero at 200, fall 9in. low at 300 and 32in. low at 400.

These figures are substantially correct for any of the other popular cartridges in the same class, such as the .30 Holland & Holland with the 220 grain bullet at 2,750ft. per second, the .375 Holland and Holland with the 270 grain bullet at 2,720, or the .270 Winchester with the 150 grain bullet at 2,770ft. per second. At least they are so close that by relying upon them the shooter cannot go wrong, as he could not hold close enough to notice the slight variations in trajectory.

Most of the sporting telescopic sights of the type suggested have an eye relief of about 3¼in. In attaching one care should be exercised to make sure that this eye relief is maintained by the length of the stock when shooting from the prone position, as thus the glass will be most frequently used. In that position the head is thrust forward closer to the sights than when in the standing position; in

MAJOR BROOKS USING A SMALL SCOPE FROM PRONE POSITION

consequence, if the rifle has a heavy recoil the shooter is liable to have a biscuit cut out of his forehead by the rim of the scope tube. There is little chance of the optic being injured, however, with a scope, even if it is too close to the eye, as the projecting brow will painfully but nevertheless efficiently take the blow. But there is nothing that I know of which is so conducive to flinching as a smash like that at the moment of discharge, so it should be avoided.

Lastly, in learning to use a scope guard against dwelling too long on the aim, and shoot as quickly as you would with iron sights; despite the vibration which is shown through the glass it is possible to shoot even quicker, but the tendency is to become slow.

THE GROUSE SHOOTING OUTLOOK

THERE are several factors which influence grouse welfare and which accordingly have to be considered in making any forecast. Of these none is more important than the weather, and since the latter can be more extreme in Scotland than farther South, it is natural to pay special attention to what has happened beyond the Border.

On the whole the winter in Scotland was comparatively mild, as it was in most parts of the British Isles, with the exception of such cold spells as those at Christmas and the end of January. This, however, was followed by a wet spring and then a period of drought, which did not help heather growth. Where there has been disease—and this unfortunately broke out in districts of Scotland and very seriously in Yorkshire—this weather has been largely responsible. Birds lost their powers of resistance, while their enemies flourished. A contributory factor in some cases has been a too large stock from last season, though, of course, the effects of this are more local. While there are prospects of quite fair and even good bags in parts of Scotland, such as on certain estates in Perthshire, Banffshire, Aberdeen and elsewhere, the general outlook cannot be said to be very cheerful, and in Yorkshire it is generally poor. When disease breaks out in undulating districts where there are no great variations in altitudes, it usually becomes widespread.

We would like to take this opportunity of thanking all those who have sent us reports and at the same time of reminding them of the great assistance which they can render the Grouse Migration Enquiry, of 43, Castle Street, Edinburgh, by collecting and returning rings, whether taken from shot birds or those which have never been put on to the young birds at all.

The following are reports of various districts :

ABERDEEN

In the Lumsden district prospects appear to be good. Birds wintered well and nested early, with an average of nine eggs. Coveys average eight, and there has been no disease or signs of heather beetle. In Crathie coveys average seven, but there were some very late nests ; in Cromar prospects are said to be better than last year.

A report from Kincardine O'Neil predicts a good season. Grouse wintered very well, there being less snow than for years and always some heather exposed. Though tick and disease have been much in evidence locally, these moors are entirely free. Prospects in the Ballater district are given as above the average and fairly good. Birds are in good condition, with no sign of disease. There are some nice broods of blackgame. In the Alford district there are very few blackgame, however, though grouse prospects are up to average.

In the Braemar and Upper Deeside districts prospects appear to be promising. There has been no disease nor any signs of heather beetle. On the south side of the Dee especially, good bags are probable. Coveys are irregular in state of growth, but all should be shootable by the 12th.

MR. MICHAEL HOLDSWORTH TAKES ONE BEHIND THE BUTTS

ANGUS

In the Edzell district coveys average five and prospects are not too good. Disease broke out after April 15th and seems to have spoilt what might have been a good season. At Clova, however, matters are a bit better and birds on the high ground are very healthy.

ARGYLLSHIRE

In the Inveraray district coveys average seven and a half, and at Craignure prospects are better than they have been for several years. On other shootings stocks are low. Heather is improving as the areas affected by the beetle are being systematically burned. There has been no disease. Blackgame remain much as they have been for several years.

AYRSHIRE

Reports from this county are not promising. There has been a lot of disease in places. The late winter and early spring weather did not help the birds. The serious decrease of blackgame is attributed in places to land on the edge of the moors going out of cultivation. In the south part clutches of grouse eggs averaged nine, but some coveys now are from one to three, for which the tick is blamed. Heather burning and moor drainage are advocated to combat the beetle, which has done much damage. In Girvan and West Kilbride things are better and no disease is reported from these districts.

BANFFSHIRE

Here prospects are quite bright. Grouse wintered very well, the condition of the heather in the autumn of last year being quite satisfactory. The spring weather was favourable and nesting was good. No disease has been reported and coveys average about seven. In one district of Upper Banff an excellent season is predicted. At Aberlour the high ground is expected to give the best sport, as a spell of wet weather has tended to move the birds from the lower ground. But blackgame are decreasing.

INVERNESS-SHIRE

Reports from this extensive county vary. In Strathglass prospects seem fair. The weather has been mostly favourable, there has been no disease, and the birds are healthy. Drought may have done some harm on dry moors. As elsewhere, blackgame are scarce.

In Badenoch there was a good stock left over, nesting was early, but the drought took its toll.

OVER THE FLANK AND BEHIND THE LINE

At Glenfeshie there is a nice show of birds and the outlook is quite good. In Beauly prospects are fair, as they also are at Aviemore, though at Braulen things are described as very patchy, blackgame are decreasing and capercailzie increasing. At Tomatin fine coveys of well-grown birds have been seen and the season may prove better than average. In Skye birds seem to have wintered well in spite of very wet weather, and are reported to be healthy.

coveys of seven and eight young birds which are strong on the wing and prospects seem good. Elsewhere there have been some diseased birds, and bags are expected to fall far below the average.

MORAYSHIRE

A report from Speyside is fairly good. Early nests contained an average of eight eggs and later ones six. There was no disease in the spring, but

FILLING UP THE PANNIERS AFTER THE FIRST DRIVE

KINCARDINESHIRE

In the Stonehaven district our correspondent reports that grouse wintered very well and there was a big increase of birds during December and January. Things, however, were back to normal in March. There were no severe storms and the nesting period was dry. The average number of eggs was nine and there was no disease. There are

in May and June there was a long spell of drought and disease appeared. There are no signs of heather beetle, but the tick troubled some of the young birds. Coveys run five to six. Had it not been for the period of hot dry weather a really good season might have been expected.

NAIRN

A fair season only is expected at Cawdor. Conditions generally have been good and grouse nested very well. There has been very little disease. Hatchings were good, but later coveys dwindled considerably, and those of eight and nine are down to less than half. This is attributed to the hot spell in May and June, when all pools on the hill were dried up and many young birds could get no water. Tick is still very numerous, but is absent from the lower reaches, and birds are looking well. There are no signs of heather beetle. Blackgame are doing better, and like the big extent of heather and birch trees.

PERTHSHIRE

The outlook on the whole is cheerful. Weather and nesting conditions have been satisfactory, there has not been much disease, and birds are strong and healthy in many parts. In places blackgame seem to be holding their own. On some estates good to very good bags are expected, and on many better than during the last four years.

On one estate it is reported that the heather beetle started in 1934 and gradually got worse. In 1936 it had spread half-way up the hill from the lowest ground, continuing for a distance of five miles long by one mile broad. Eventually it became three miles broad. The heather looked black and dead. The grouse left, and for three years there was very little shooting. Things are now improving, however, the heather looks much healthier and prospects are much brighter.

In the Pitlochry district prospects are only fair. There are some late birds, but these should be ready for shooting by the 12th. On one place blackgame seem to be increasing. At Bankfoot things appear below the average, as some dead birds have been picked up, and near Blairgowrie there has been disease. At Crianlarich coveys range from five to fourteen, birds are healthy, but are shifting about the moors.

ROSS AND CROMARTY

In this county prospects vary from poor to well up to the average. Birds have suffered from the parched state of the heather in some parts. One report from Ardgay gives coveys of from seven to ten, and predicts fair sport, but there are very few, if any, blackgame. Blue hares left when the heather beetle came, but are now coming back. At Ardross there has been no sign of disease, young birds are well grown and blackgame are said to be increasing.

WALES

Grouse are reported to have done badly in the Plynlimmon district. Coveys are small, and there are many late broods. Hatching of blackgame, however, has been very good, being as high as 93 per cent. in some cases.

THE REVIVAL OF GOLF CHALLENGE MATCHES

By E. R. TIPPLE

THE brilliant young South African golfer, A. D. Locke, has revived interest in challenge matches. On his various visits to this country he has been prepared to come to terms with any well-known golfer. Indeed, the more famous the player the more anxious has he been to arrange a game. Some of his advances have been politely ignored, but other challenges have been only too willingly accepted. Then he has proceeded to demonstrate, in no uncertain fashion, just how such a match should be played.

He has suffered a few reverses it is true, but generally he has achieved handsome victories. In just over two months he has beaten the British Open Champions of 1936, 1938 and 1939. In a series of 18-hole games he beat Alfred Padgham by four matches to three. Against R. A. Whitcombe he won by 6 and 5, and against R. Burton by a margin of 10 and 9 over 72 holes. In addition, he has beaten the match play champion, D. Rees, over 36 holes. Results like these leave no doubt as to who was the better golfer, and prove what an extraordinarily high standard Locke is able to maintain.

Against Burton, Locke made fewer mistakes than he did when opposing Whitcombe, but obtained his par figures with relentless consistency. To illustrate his machine-like golf is the fact that he did not find a single bunker until the first 34 holes had been played. When he was occasionally outdriven off the tee it did not cause him the slightest concern, for he quickly turned this questionable disadvantage to his favour by producing accurate second shots which must have made the greens seem very small for the poor champion. Ten under fours for the 63 holes played was a score few golfers could hope to equal.

In each of these matches Locke was quick to profit by the mistakes of his opponent. He was content to keep his ball in play and go for the regulation figures whilst the other could do what he pleased. If the latter occasionally produced "fireworks" all well and good, but more often than not, in attempting a spectacular stroke to pierce this armour of consistency Burton would even fail to reach the green, so Locke was presented with hole after hole.

Nothing is so disturbing as to play against a golfer who keeps on reeling off steady figures. You despair of ever obtaining an opening, and so your own game falls below its usual standard. An erratic opponent, on the other hand, even if he is spasmodically brilliant, provides an easier match for you can realise, with some degree of certainty, that he will make a sorry mess of many holes. This knowledge gives you confidence which you never maintain when playing against the consistent performer.

However, it never pays to reckon that your adversary is faultless. If, for example, he has put his approach within 3yds. or 4yds. of the flag he may not hole the putt, so it is better to be sure of getting a shot somewhere on the green rather than try to place the ball inside his. Once on the green you always have a chance of holing a putt, and if you get your blow in first his putt will appear very different! I know I have lost many holes because I have tried to do too much when expecting my opponent to hole a putt which he eventually missed. Such a mistake is costly because it affects the play at subsequent holes; you remember it and perhaps are pardonably annoyed with yourself and then promptly proceed to lose a few more.

No doubt one reason why there are not more challenge matches nowadays is because the professionals have such a crowded fixture list of important tournaments, and they cannot spare any extra time away from their own clubs. It is a pity, because they are a change, and are both interesting and instructive from the spectators' point of view. Before we had such a profusion of competitions challenges between the outstanding golfers were regular occurrences. The Morrises, the Dunns, the Parks, John Ball, Vardon, Allan Rolland, all played many historic games which make interesting reading now. But what is to prevent club golfers taking part in keen games between each other? They would make a welcome variation from the usual four-ballers.

Such matches could be played by singles off handicap or instead of one golfer conceding strokes to the other he could give him so many holes start. I have had many enjoyable challenge games of this kind. Usually my opponent has regarded nine holes up, for example, as being infinitely better than the nine strokes taken at the stipulated holes. One friend threw down such a challenge, and after it had been accepted turned to the others present and said: "It's easy. I only have to halve one hole to win!" But he was firmly reminded that the match was to be over eighteen holes, and these were to be played on level terms.

Conceding holes up instead of strokes is easier for the shorter handicap man despite the fact that the allowance seems very generous. When giving nine strokes there are only nine holes which are played on level terms, whilst, with the holes start, the full round is free of stroke holes. The larger handicap man has no strokes to look forward to later in the game and, as his once big lead slowly begins to disappear, he tries to play above himself—with disastrous results. Therefore, if anyone comes along with a challenge of this kind, beware!

In an ordinary four-ball game at least one of the players often has little to do because his partner is playing too well. To provide interest for all four throughout the round a match in which the combined instead of the better score of each side counts is worth playing. This can only be done when the course is fairly free, otherwise with everyone holing out congestion will occur. The game does give each golfer a chance to do his share of the work, and often some odd results will be recorded. Three-ball matches, in which the longest handicap player opposes the worst ball of the other two, provide yet another change from routine. But if you have never taken part in these and other rather novel types of games you will be wise if you study the handicap allowances beforehand. Then you may decide that an ordinary game with the normal number of strokes will be the best after all!

JUNIPERS ON SALISBURY PLAIN
A wide variety of shapes and manners of growth, the greatest height of these little trees is six to eight feet

JUNIPER: TREE *of the* LIMESTONE HILLS

By PETER B. COLLINS, A.R.C.S., B.Sc.

THE group of trees found especially on the various ranges of limestone hills in Britain falls into two divisions. First, there is a small aristocracy, as it were, composed of the beech, the ash and the yew; and then, as members of the common people, come the whitebeam (including various closely-related species of *Sorbus*), wayfaring tree, spindle, purging buckthorn, and the juniper. Of this minor group, the first alone attains the size of a timber tree, while the others are noticeable principally only when covered with fruit. But it is with the last, the juniper, that we are here concerned.

There are several rather surprising things about the juniper, and not the least of them is the fact that it is so little known. For not only is it a native of Britain, but it is also thus one of our small total of three native conifers (the other two being the Scots pine and the yew). There is, indeed, not much in the juniper's general make-up to support the idea usually created by the term "conifer." Here is none of the stately height of fir or pine, none of the impressive and ancient appearance of the yew. Instead, we see usually a low, straggling bush, scarcely meriting the name of tree at all, sprawling nondescript over the hillside. Often scarcely larger than a gorse bush, and at the apparent mercy of the wind and weather, the juniper can thus not even compare with the smaller broad-leaved trees. Yet, in its way, it is a tree of tremendous character, especially if we consider it, not merely as a botanical species, but as an essential constituent of much of the most attractive scenery in Britain.

Near London, even, you can see the juniper flourishing, and observe its influence—though somewhat controlled by that of man—on the landscape, in such places as the range of the North Downs, along which the tree has given its name to more than one "Juniper Valley." But although it does indeed grow here in characteristic fashion, you must go farther west, towards the open country of the Hampshire—Wiltshire border, to see it at its best. If you take, for example, the main road from Basingstoke to Stockbridge and then on towards Salisbury, you will have ample evidence of the juniper's part in creating scenery, for these bare, rolling, grassy uplands suit it admirably. Here it assumes all manner of shapes, apparently without much relation to the conditions under which it is growing. On the same half-acre of hillside you may see low, straggling bushes; curious, many-spired Gothic clumps, in which a number of small stems—you can hardly call them trunks—shoot upwards together in a semi-fastigiate mass; stunted, wind-blown shrubs; or neat, conical, soldierly trees, each like a perfect miniature churchyard cypress—a regular army of grey-green little trees, creeping steadily over the Downs. At first these junipers are liable to be mistaken for furze, but the greyer foliage, and the fact that sometimes, at least, they form real trees, is soon enough to point the difference, which closer examination makes obvious enough.

It is a curious fact that although, as a photograph shows, these little trees may have a long and apparently hasty leading shoot, their growth is extremely slow, and rings are recorded of their hardly altering in shape or appearance for 30 years or more! Moreover, the age even of a small juniper may be a hundred years or so, and larger trees are correspondingly older. However, they do spread gradually, as the presence of small seedlings among the older trees sometimes shows. Such seedlings do not always survive, being destroyed by rabbits, which probably accounts for the fact that many groups of junipers consist of old trees only; but where other young shoots are available rabbits appear to shun juniper, a fact which probably accounts for the tree's considerable success in many places.

Other factors affecting its successful growth include its ability to flourish on a poor and shallow soil, and to withstand exposure to the prevailing wind. Often, as on the North Downs, you may come across junipers blown almost flat against the slope of the hill, yet still growing well. When junipers grow close together, however, nothing much grows with them, except an occasional thorn, an elder or two, and a few rank briers. This may be seen well on the Chilterns, where such patches of "juniper forest" provide a favourite home for cirl-buntings.

Although the best types of juniper will eventually produce a conical tree, such as some of those illustrated, with advancing age this breaks up, revealing the presence of a number of stems, which bend outwards, straggling apart until the final effect is that of a fair-sized bush. In appearance this resembles the "gorse-bush" type of tree already referred to.

This later type of juniper is very well shown in the Lake district, on the slopes towards Easedale Tarn above Grasmere. There, the junipers, clothing the rough hillside in the company of bracken, are growing on the hard limestone, sometimes with a fair depth of soil, but more often, as the picture shows, on a quite precipitous slope, where rain and weathering prevent any but a loose surface soil. Yet they are flourishing trees, doubtless many score years old, and 10ft. or more in height. In the matter of size, incidentally, the juniper reaches 30ft. with us, rarely, and in sheltered situations, with a girth of 5ft., but a height of 15ft. and a girth of 18in. is a more usual maximum.

One other feature of this tree, though far removed from our present point, deserves mention. This is the use of its berries for flavouring gin. The berries, which replace the cones of the typical conifer, take two years to ripen, being then very small, blackish, with a blue bloom. Both the word "gin" and the name "Geneva," as applied thereto, are derived from the French word for this little tree, "genévrier." In former days the use of these berries was not confined to this, for John Evelyn speaks of them as "one of the most universal remedies in the world" for all sorts of internal complaints. And he also strongly recommended planting this tree for hedges.

AUGUST 12TH!

3-Garment Shooting Kit

BURBERRY SUIT

with Burberry Pivot Sleeves

Pivot Sleeves allow such absolute freedom for arm-swing and shoulder-play, that men who shoot quickly notice a marked improvement in their skill when wearing a Burberry Shooting Suit;

and

THE BURBERRY

—the Weatherproof Overcoat that satisfies the sportsman's every need. Keeps him dry when it rains, warm when it is chilly, comfortable under every conceivable change of weather or temperature.

The man who includes these two items in his kit for the moors makes fewer misses, cleaner "kills" and shoots at perfect ease, completely protected whether it rains, blows or swelters.

BURBERRY GAMEFEATHER SUITS

For shooting suits, the best possible camouflage is Burberry Gamefeather Tweeds, which are woven in the colours and on the principles of the plumage of gamebirds. These beautiful suitings are now available in fine Saxonies as well as Scotch Cheviots.

There are many model suits to choose from, each different in design, yet all planned to adjust weight, free the arms and shoulders, and add to the pleasure of shooting by ease, balance and elimination of restriction.

THE BURBERRY

Weightless—wind-proof, rain-proof, drizzle-proof—naturally ventilating—The Burberry provides a delightful Overcoat and perfect Weatherproof.

Designed on easy-fitting lines from thin and flexible materials, it makes no difference to the "set" of the gun, and is the one coat in which the "shot" can maintain top form comfortably protected against wet, wind and cold.

Patterns and full particulars sent on mention of "The Field."

WARNING

No garment or material, unless it is the manufacture or merchandise of Burberrys Limited, may be described as "BURBERRY," a Registered Trade Mark protected all over the World.

N.B.—Proceedings will be taken against offenders using the word "Burberry" wrongfully, whether with or without knowledge.

BURBERRYS LTD. HAYMARKET LONDON, S.W.1

THE LIBRARY OF THE UNITED SERVICE CLUB

"The club has now approximately 2,000 home and 1,000 foreign members, two-thirds of these being from the Army and one-third from the Navy"

GREAT SOCIAL CLUBS—V. THE UNITED SERVICE

By BRIGADIER-GENERAL G. C. HIGGINS, C.M.G., D.S.O.

VIEW OF THE STAIRCASE

TO try to condense the history of the Service Clubs, which on the compilation of their own historians takes several hundreds of pages of print, into a few thousand words, is a task for which I feel justified from the start in asking for every consideration. One can, indeed, only present mere cameos of them, little facets reflecting the light and shade which fall from their lofty windows on generations of soldiers and sailors. And to do even this in the case of the United Service Club I have to quote largely from the admirable history of the Club compiled by Major-General Sir Louis Jackson.

The meeting to inaugurate this Club, the first of the Service Clubs, and for long known as the Senior, was held on May 31st, 1815, at the Thatched House Tavern in St. James's Street, at the request of Lord Lynedoch, the victor of Barrosa. Lord Lynedoch, being called to the chair, then read a memorandum. So adequately and lucidly did this memorandum express the reason why this Service Club, and the others which followed it later, came to be formed, that it is unfortunate that space does not permit my repeating it here. In those days, with the exception of the Family Club of the Guards, there were no Service Clubs as we understand them now, only the old proprietary coffee-house clubs such as White's, Brooks's, Boodle's and Arthur's. The mighty Carlton Club had yet to be born. A few military coteries existed, the better known of them being the Flanders Club and the Peninsular Club. They did, indeed, meet for dinner at certain coffee houses, and from time to time the Royal Navy Club also dined at a coffee house in Cockspur Street, but none of these answered to the modern definition of a club. The meeting at the Thatched House Tavern proved successful, and it was decided forthwith to form a General Military Club, limited, after some discussion, to general and field officers only of the Regular Army, Regular Militia and East India Company's Service.

Lord Lynedoch was appointed chairman of the committee of management. He was, therefore, the founder of this club and all Service Clubs are, without doubt, indebted to him for having the initiative to conceive the idea and the ability to bring it to such a successful conclusion. Well known throughout the Army as General Sir Thomas Graham, Lord Lynedoch, although he had never gained a regular commission until comparatively late in life, had eventually become one of Wellington's most able and successful generals in the Peninsular War. Possessed of a wide variety of interests outside his own profession, Lord Lynedoch was an outstanding man of his times, being an experienced traveller and a well-known and able Scotch landlord. He had married the beautiful Miss Cathcart, twice painted by Gainsborough, and her comparatively early death is said to have greatly affected him for the rest of his life. He lived, however, to watch over the destinies of the Club he had founded until the age of 95. It is recorded that until recent years a saddle of mutton was always carved differently at the Senior to elsewhere—namely, crosswise instead of along the backbone. Lord Lynedoch had said that that was the correct way, and that was sufficient.

On June 13th, 1815, five days before the Battle of Waterloo, the Duke of Wellington wrote from Brussels saying that he would be very happy to join the newly proposed club. The following year when a motion was put forward that the Navy should join the Club, the old Earl of St. Vincent dissented on the grounds that "such a vast extension of military association in this free country . . . wears an unconstitutional aspect and cannot fail to attract the attention of Parliament." He was right as to what Parliament would think. When the Club tried to obtain a Crown lease of some ground in Charles Street, on which the Club might be built, Lord Liverpool, the Prime Minister, saw the greatest objection to the formation of a military club, and the lease was refused. It was actually described in the House of Commons as a "formidable body" and "constitutionally dangerous." The Club, therefore, to begin with, rented a house in Albemarle Street, and whilst here, in February, 1816, the Navy agreed to join with them, and the name was then changed to the United Service Club. It then had 800 members, and a Crown lease of the site at the junction of Charles Street and Lower Regent Street having been granted, Mr. Robert Smirke, afterwards Sir Robert Smirke, the famous architect, was engaged to build their first club-house. Smirke was the designer of the British Museum, the General Post Office and the Custom House. The house in Charles Street was not completed fit to live in before February, 1819, and cost altogether, with the furniture and fixtures, £32,234. By 1826, the accommodation in Charles Street having got too small for the number of members, it was decided to sell the house to the "Junior," and build another one. The site chosen could not have been improved upon. King George IV, having recently moved to Buckingham Palace, Carlton House, his former residence, was doomed to demolition. The limits of where the east wall of Carlton House stood now mark, approximately, the position of the west wall of the existing club house. Another famous architect was chosen to design the new building—this time, the now much discussed Nash. Although Nash may have his critics amongst the experts on these matters, I venture to suggest that if any young naval or military officer is not satisfied with the house that Nash provided for him, he has probably chosen the wrong profession to be in.

On November 18th, 1828, they got into their new home. The estimate for it had been £31,000, and the ground rent was £600 a year. The only portrait they had then to adorn the lofty walls of this great house was that of their founder, Lord Lynedoch. Things now went on fairly normally and peacefully, with the exception of the usual club disputes on the everlasting subject of an extension of membership. From their windows the members viewed the Coronations of William IV and Queen Victoria, and by way of variety, had them broken by the mob in April, 1831, when it attacked the Club the same night that Apsley House suffered a similar fate, the Reform Bill being the excuse. In 1842, Nash having died some years previously, Mr. Decimus Burton was appointed architect to the Club. Burton had built the Athenæum, so the Club's architectural standards were not likely to suffer by their new choice. He immediately carried out complete interior re-decoration and also made some minor alterations for his new patrons at a cost of £6,000.

In 1843, the Club lost its founder, Lord Lynedoch. The window blinds were lowered and his portrait draped with black. Early in 1858 the Club had bought the adjoining house, No. 117, and Decimus Burton was given the order to carry out extensive alterations to the club house. Outside, Burton embellished the rather plain exterior. He provided a frieze, altered the window dressings, fluted the upper portico columns, and removed the columns of the west front, substituting a stone balustrade for the area railings. He also replaced Nash's mastic stucco by Portland cement stucco. Inside, he converted the morning and writing rooms into

one large room, substituted real mahogany for the deal doors, and put plate glass in the windows. With the additional frontage now at his disposal he provided a new house dinner room, a new smoking room and a smoking-billiard room, together with some further domestic enlargements. The cost of these alterations amounted to £38,000, and whilst they were taking place, the whole of the Thatched House Tavern was rented for the accommodation of the members. By the late '60's, the Club was experiencing money difficulties having obviously spent a great deal. In many years past, repeated proposals to increase the membership and so raise a larger income had always been defeated by the die-hards. But at last, in 1869, after several stormy meetings, it was carried that the entrance fee should be raised to £40, the subscription to £7, and that 50 supernumerary members should be elected for the current year only.

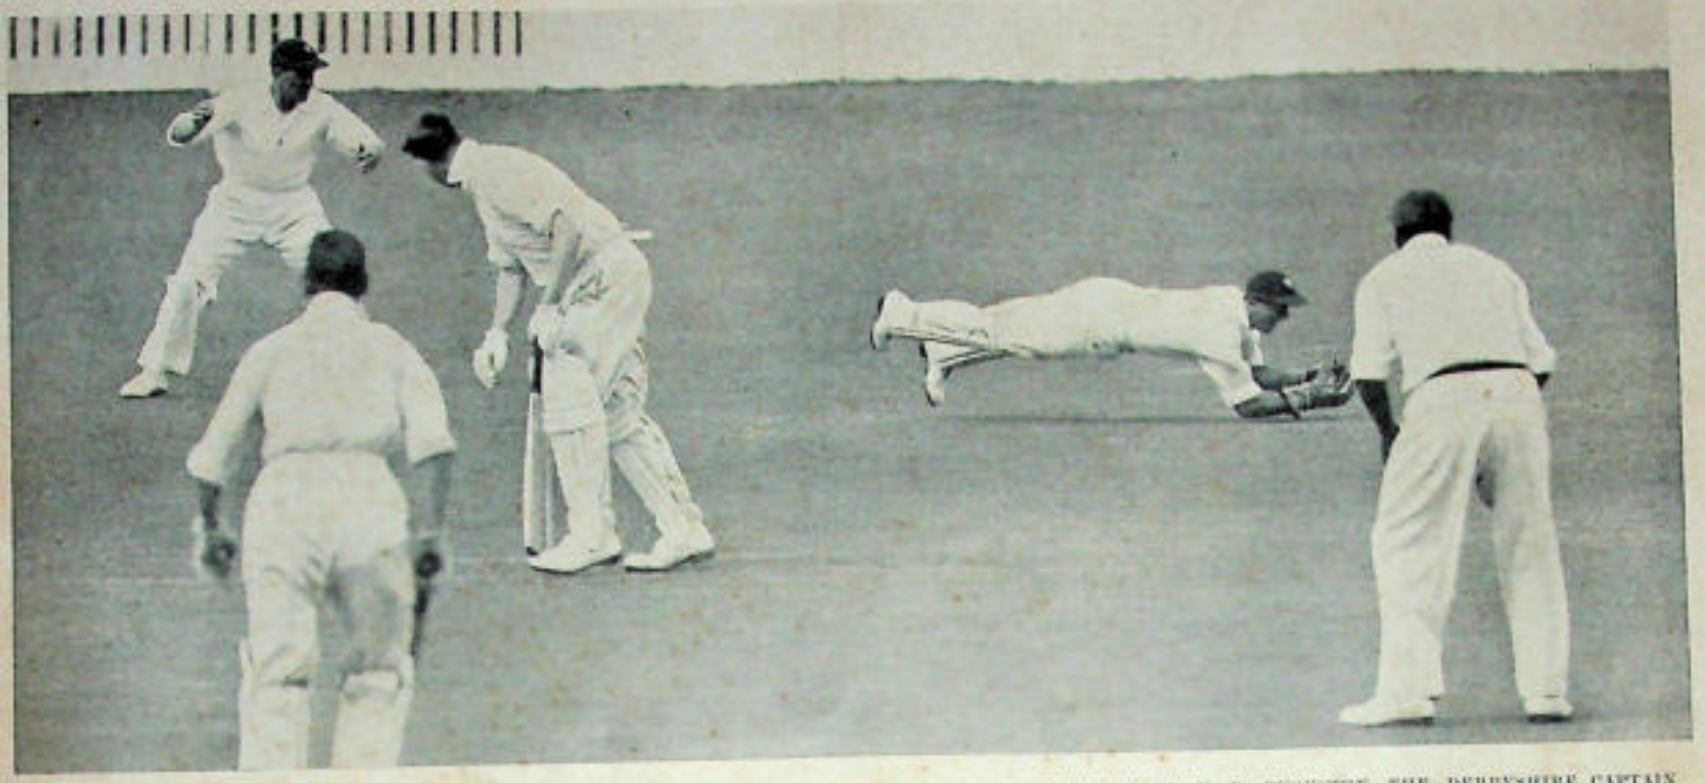
Twenty years later, owing to the lack of candidates coming forward, the Club was again forced to modify their stringent rules as regards membership and to admit into their sacred precincts naval lieutenants retired with the rank of commander, and Army captains retired with the rank of field officer. There is no doubt that at this time the Club was not as popular as it had once been, and the members themselves were to blame for this. Every single motion to improve the accommodation for smokers and to permit the entertainment of visitors had been vetoed by them. They were now no longer, either, alone in the field, having the strong competition of the "Rag," the Naval and Military and several other Service Clubs to contend with. It is obvious that these old members of the Senior must have been a very difficult lot to deal with, but probably not so difficult as the original members whose manners and customs by all accounts would not endear them to the members of clubs of to-day. Spitting on the floor was a common habit, mahogany chamber-pot cupboards were kept in the drawing room and in the house dinner room. One member used to be seen cleaning his teeth after breakfast in the coffee room with the help of the slop basin. But these strange acts must have been the customs of the times and cannot have been merely peculiar to the Service.

The Army and Navy were at this time aristocratic professions, and there were many aristocrats among the members of the Senior—the Duke of Wellington, the Lords Hill, Lynedoch, Fitzroy-Somerset, Combermere, Saltoun, Hardinge, Beresford, Cardigan, Exmouth and Gough were all original or early members of the Senior. And nearly all these noblemen were also members of White's or some such similar club, so that one is forced to conclude that these seemingly somewhat strange habits must have prevailed in other places outside the walls of the Senior. Another of their peculiarities was their dislike of strangers. It is reported that when some newly elected member had politely held the door open for one of these old gentleman with some civil remark, all that he got for his answer was: "—— you, sir! Can't I walk about my own —— club without being spoken to by a —— like you!" But at long last, in 1892, defeated by the cold figures in their own balance-sheets, the Club decided to admit into their magic circle naval lieutenants and army captains—not only that, but guests were to be admitted to breakfast and luncheon! He must have been a brave and hungry guest who first dared to sit down in the early hours of the morning and try to swallow food in that hitherto impregnable fortress. It was about this time when sponges and hair-brushes started to disappear mysteriously from the lavatories, until very soon there were scarcely any left. One can only imagine that these pioneer guests were determined to take away something as a souvenir of their bold adventure, and out of kindness chose articles which they knew could be easily replaced. But others coming later, bent on the same mission, found it necessary to cut through a steel chain before they could get away with their souvenirs.

THE COFFEE ROOM

"Famous sailors and soldiers painted by celebrated artists look down from the walls of every room you enter . . ."

It appears that when the Club relaxed their rules and admitted children in the shape of naval lieutenants and army captains, they did not find themselves in a bed of roses. The staff servants were shocked to see them. A young captain going upstairs two steps at a time was instantly pursued by a page boy requesting that he would descend and speak to the hall porter. This important man then said: "I don't think that you are a member of this club, sir." "Oh, yes I am," said the captain, and gave his name. "I beg your pardon, sir," said the porter, "but we have never seen a member run upstairs before, sir." On another occasion, when some of these new members were lunching together in the coffee room, one of the old brigade came in and, after looking slowly round the room, remarked, "My God! What a nursery!" and walked out again. But worse even than this was to follow.



With their constitutions greatly weakened by these modernistic improvements and further impaired by the bewildering rush of events in the world war, the old die-hards were in no condition to withstand a mass attack by 470 members demanding the admission of the fair sex as guests to a certain portion of the Club. The walls of Jericho had fallen. Admirals and generals were seen to leave the meeting in tears. One old gentleman had actually cried aloud in a voice of anguish: "For God's sake, don't let them in here!" However, like all good sailors and soldiers, they have taken their defeat well. For whenever I lunch in that hospitable part of their fine house, I notice that it is not the young men who are entertaining the pretty ladies. No, sir! On the contrary, it is the admirals and generals. They realise now, we must hope not too late, what they have missed in the past.

The Club has now approximately 2,000 home and 1,000 foreign members, two-thirds of these being from the Army and one-third from the Navy. The membership is limited to permanently commissioned combatant officers of the Regular Forces of the Royal Navy, Army and Royal Air Force, or British officers of the similar forces of any British Commonwealth, Dominion or Colony, or of the Indian Army, retired or serving. It is quite beyond the scope of this short article to attempt to describe the remarkably fine collection of pictures and statuary in the possession of the Club. Famous sailors and soldiers painted by celebrated artists look down from the walls of every room you enter, and as you mount the grand staircase which branches into a double flight of stairs leading to the spacious landing above, the view of these fine portraits of the men who have made history is a most impressive one. The ceiling above you here is Nash's original work, and adds to the general dignity and grandeur of this fine approach to the upper rooms of this great Club.

EVANS, THE NEW KENT WICKETKEEPER, MOVES ACROSS SMARTLY TO THE LEG SIDE WHEN DISMISSING R. H. R. BUCKSTON, THE DERBYSHIRE CAPTAIN

GOING BY THE AVERAGES

By NEVILLE CARDUS

THERE is no commoner term of contempt thrown at Selection Committees than, "They go by averages." As a matter of fact, they many times do not. But the truth is that averages are frequently as reliable a guide to a cricketer's ability as any. Who are the best batsmen in the country at the present moment, judged not only by figures, but by style, organised technique?

I think most of us would agree to answer that question by mentioning the names of Hammond, Compton and Hutton, with Sutcliffe a candidate because of his character. Well, these four players are head of the averages as I write these lines. The four greatest of living batsmen are Bradman, Hammond, Headley and Compton; you will usually find them at the top of the averages. The great batsman who appears fairly regularly in first-class matches can most times be picked by a glance at the "detested averages."

But, to tell the truth, I do not always trust statistics about the nearly-great player, especially about the nearly-great bowler. The averages, indeed, are more just to batsmen than to bowlers. A bowler is much at the mercy of his fieldsmen, his captain, and the general psychological atmosphere of his team. A batsman can, so to say, play a solo on a good wicket; the bowler is dependent on factors beyond his own control.

I look through the bowling lists of the week ending July 29th; amongst 27 names qualified with an average of over 21, I cannot find Partridge of Northamptonshire. He is nearly the best fast-medium bowler in the country. I saw him in great form the other day at Blackpool, against Lancashire. The wicket was easy, but the wind suited the "off-cut" which Partridge gives to the ball. He overwhelmed his opposition in a way that recalled Tate at his best on mornings at Hove when the sea air was right for his style of attack. Partridge, on this extraordinary day at Blackpool, was no mere seam-bowler; he "brought" the ball back off the ground like a knife. When he got a batsman lbw., he nearly lamed him into the bargain.

The wicket was, as I say, easy. But it was just spongey enough to hold Partridge's action or "cut"-break. I have several times been told of Partridge's gifts by county cricketers of judgment. There is no doubt that if he had played for a year or two in a fashionable county he would long since have forced his claims home for wide and honourable recognition. He certainly thrilled me at Blackpool last week; I have not seen more hostile bowling than this, or more technically clinching and overpowering bowling for years.

Could Partridge make the ball "whip in" to the wicket on Australian turf? Could Perks obtain his splendid effects with a "cut"-spin on Australian turf? These questions are important for selection committees. The averages supply no information or guidance here. A few years ago, when Australian wickets were faster and glossier than they are to-day, I should have regarded both Partridge and Perks as doubtful starters for a tour to Australia.

On a fast Adelaide turf, for example, "cut-spin" was out of the question; you might as well have asked a great billiard-player to get *his* special effects of spin on a table of polished mahogany. Recently, though, the texture of Australian pitches has changed; it is becoming more and more resilient. When I was in Melbourne last year, I discovered that even *my* modest and middle-aged attempts at a breakback were not entirely in vain—and on a splendidly prepared stretch of turf!

"New-ball" bowlers are, of course, a dangerous gamble in Australia. Hirst could not swerve the ball there. In recent times, Copson and Bowes have both failed badly to reproduce effects in Australia which come naturally to them on a "green" wicket in this country. Yet, with all these "snags" in my mind, I commend Partridge to the attention of Mr. Perrin, the best and most thorough of our selectors.

I was much interested in Northamptonshire's cricket when I saw the team at Blackpool. They are definitely on the up-grade. Given another batsman and another bowler of excellence, they would win more matches than they lost. I am told that R. P. Nelson, the captain, has had a stimulating influence on his men. Imagine his task—first of all, to get rid of an inferiority complex of two or three years' duration!

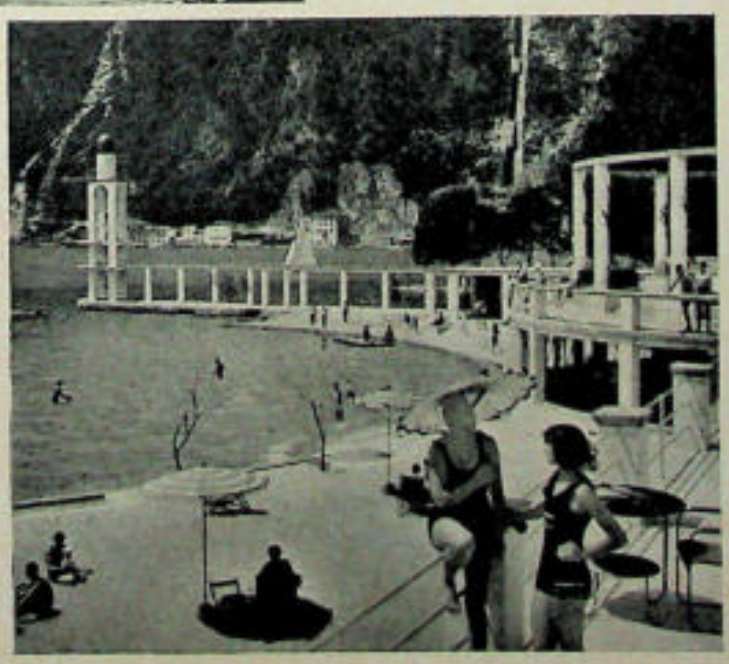
Habit is important in this world; the knack of winning (or of losing) matches at cricket grows by what it feeds on. There are at least three players in Northamptonshire to-day, who would probably be playing for England now if first of all they had taken the precaution of playing for Yorkshire (one of them is actually a Yorkshireman); I refer to Timms, Brookes and Partridge. A fairly strong side could be got together of cricketers from the so-called "weak" counties. The attack, at any rate, would bear comparison with England's "official" best. For instance, consider Perks, Partridge, Hollies, Nichols, and Creese.

Nothing in the present season so far has been more satisfactory than the improvement, the levelling-up process, amongst the counties which usually are regarded "easy prey" (with a rest on the third day, free gratis and for nothing). The chain of English cricket at large is as strong as its weakest link. It is a sign of health that Worcestershire are equal to an occasional victory over Yorkshire, that Northamptonshire can again give Lancashire a fright, that Essex are included, as I write, amongst the "elect" of the county championship table. Most of us have a sentimental love of seeing the "little fellow" hit back and knock superiority over like an Aunt Sally in a fair ground.

K. H. WEEKES, WHO MADE 146 FOR THE WEST INDIES AGAINST SURREY, OPENS HIS SHOULDERS TO A DELIVERY FROM CONSTABLE

The Days are all too Short . . .

for all the wonderful things there are to see and do in **ITALY**



What are **your** holiday essentials? **Sunshine,** of course—a succession of golden days, so that you may enjoy all the pleasures that fine weather can bring.

Have you, like the poet Keats, "a languishment for skies Italian" and do you yearn to "sit upon an Alp as on a throne"? In the **Italian Alps** there are hundreds of snow-capped peaks to conquer and flower-carpeted valleys in which to roam. Or do you prefer the serene beauty of the **Lakes**—Maggiore, Como, Garda—each seemingly more enchanting than the last? Here, as well as in the mountains, are some of Europe's finest **Golf** courses. Perhaps you feel the call of the sea; do you like vast sandy beaches such as those at **the Lido, Viareggio** or **Rimini**, or do you prefer to plunge into vivid blue water from the rocks at **Rapallo** and **Capri?**

Wherever you go you will be within easy reach of Italy's historic cities—Imperial **Rome,** carefree **Naples,** romantic **Venice** or Renaissance **Florence,** each with its wealth of art and architectural treasures.

Whether you travel by rail, car or air you will find that a holiday in Italy is an inexpensive proposition.

15-17 day tours by "Special Trains" visiting the Italian Lakes, Milan, Venice, Florence, Rome, Naples and Capri (2,730 miles) are organised by the principal Tourist Agencies, and the inclusive cost is only 25½ guineas.

The Italian Railways offer reductions of **50%** to **70%**

Motorists pay 1/2 a gallon for petrol. Hotel Coupons cost from 5/6 to 20/- a day, absolutely inclusive, and the Special Tourist Rate of Exchange still further reduces the cost of living.

For information, descriptive booklets, &c., apply to

E.N.I.T. (Italian State Tourist Department)

LETTERS TO YOUNG FLY FISHERS

VII.—Sea-Trout Fishing

MY DEAR BOB,—So you have caught your first trout—congratulations. You seem to have had a fairly hectic time getting it in. I do not think from your description that you made any mistake either in this or the one you lost, except that you let the fish get below you. But these Devonshire fish fight uncommonly hard for their size, and it is not always possible to prevent this. However, it is as well to remember, particularly when you are fishing a river where the trout run larger, always to keep below your fish; then you have the current to help you since it is pushing the fish in your direction, and when the fish is played out it will drift more easily into your landing net, or on to the shingle if you have to beach it. If you are wading, and the fish gets below you, it is odds you will have to climb on to the bank to reverse the positions again; and this is awkward when you have a fish on your line.

I know you will be saying to yourself: "It's all very well to say 'Keep below your fish,' but how can I do it if it rushes by me?" There is, I fear, no method by which you can be sure of preventing a fish doing this, but there are one or two points to bear in mind which will help. When a fish feels a pull in one direction it generally tries to run in the other; so always keep a tight line. Most fish feed in a position upstream of their resting holt, and if they are scared and the line is slack, so that they do not feel a pull, will run downstream towards their holt. Again, do not strike too hard.

If you do so with a small fish you may easily turn its head downstream, and in its fright at this surprising event it will probably bolt straight ahead and be below you before you know where you are; so what you have to aim at is to keep your line taut enough to induce the fish to struggle against the resistance, and tire itself quickly, but not enough to turn its head downstream.

I am afraid your estimate of its size is rather optimistic. An 11in. trout is a good one for most Devonshire streams, but it is not likely to weigh ¾lb.; a little better than ½lb., I should think, say, 9oz. It generally takes a 12in. fish to weigh ¾lb., though of course some fish are fatter than others, and one can only make a rough estimate from length alone. However, for approximate purposes you can take it that 8in. to 8½in. means a ½lb. trout; between 10in. and 11in. a half-pounder; 12in. will average ¾lb.; and a 13in. trout in good condition will be as near as needs be to the 1lb. mark. A 2-pounder will be upwards of 16in. long; should you get one from a Devonshire stream it will look big, I promise you.

I dare say it sounds optimistic to talk about fish of 16in. or more after the little chaps you have seen and caught from your water. A brown trout of that size would be a trophy—decidedly a trophy—but do not overlook the possibility of sea trout; if not at B., at all events, further downstream. If a spate comes down the stream in August make inquiries immediately. A talk with the proprietor of a tackle store in Barnstaple will give you all the information you want. It will probably take twelve hours or so for the heavy water from where you are to run down to Barnstaple Bay, where the sea trout will be waiting to come in; so if you find the river too thick to fish one day take the opportunity to go over there. You will want some special flies for sea trout anyway, so you can buy them there and tap the tackle dealer's knowledge of the district at the same time. Take his advice as to size for the flies.

If the sea trout do come in you will have to adopt rather different tactics from those you have been employing for brown trout. There is no difference between a sea trout and a brown trout except that one goes to sea and only comes back to the river periodically, while the other stays in the river all the time. When they are young, for the first two or three years of their life before they go to sea, neither you nor anyone else can distinguish a sea trout from a brown trout, except that just before it migrates, the sea trout generally turns silvery and looks like a tiny salmon. When they come back it is otherwise; the sea trout is then a substantial fish of ½lb. to 2lb. or 3lb. in weight and is bright silver with a few black spots on it. The only difficulty then is to distinguish it from a salmon, but a salmon in the Taw is practically always much bigger than a sea trout.

I do not think it is very much use trying to catch sea trout with the small flies you are using for brown trout. After these fish go to sea they feed almost entirely in salt water. When they come into the river again it is either for the purpose of spawning, which will take place early in the winter, or for resting in a safe place free from the numerous enemies which attack them in the sea; and, in either case, they are not greatly interested in food. They do not feed regularly as do brown trout. In the lower reaches, it is true, you may find fish which run in with the tide and go out again a couple of tides later, perhaps. Sea trout seem to hug the coast when they are at sea and drop into estuaries from time to time on their way to or from their own river, and these fish probably feed quite normally on whatever the estuary holds; but I do not think they often go far above tidal waters.

The majority of the fish you will encounter will be those that have come into the river to spawn. They will be resting while the eggs or milt develop and will only take "an occasional snack" when the spirit moves them, so it is very little use offering them an imitation of the ordinary fare of the river. For a year or more the bigger ones have been feeding in the sea, and the only chance is to offer them something that looks like a small fish, or a prawn, let us say. The angler is under the disadvantage of not knowing with any certainty what trout do feed on in the sea; but a "fly" which looks like a small fish seems to be a fairly safe bid.

If I were restricted to one fly, I think I should choose Teal and Silver (unless some particular fly had a great reputation locally). Second and third choice would be Peter Ross and Butcher. All have silver bodies. For sea trout a good maxim is "when in doubt use a silver body." These fish will not be found lying broadcast in a river like brown trout. They will all be in the big pools. For many months they have been in the sea and are not accustomed to swift running water. Hence look for them in the pools. I suppose I ought not to say "look for them," for this is just what you must not do. The most important thing of all in sea-trout fishing is to keep out of sight. They are extraordinarily shy fish, and your only real chance of catching them is not to let them know you are there. But if you can possibly do so, examine the river at a time of low water when the fish are not there and note exactly where all the bigger pools lie, their shape, and how they can be fished in high water.

Sometimes, when there is a shallow run above them you will be able, even in fairly high water, to stand 8yds. or more up the shallow run and cast a fly into the pool from above. If a pool has a fair stream running through it, a good plan (if there are bushes on the bank behind which you can hide) is to cast across stream, and immediately the fly is on the water pull 4yds. or 5yds. of line off your reel and let the fly and line float unimpeded down the pool. Just before it gets to the end of the pool check the line. The current will now pull on the line in the water and your fly will drag across stream as it straightens out. Sea trout have a habit of following a fly which floats over their heads, though they seldom do more than inspect it; but if it suddenly starts to swim across stream they will often make a dash for it before it gets away. The main idea in sea-trout fishing is to excite the fish's predatory instinct without arousing its suspicion. The difficulty in bank fishing is to recover the fly without being seen. If possible, it should be worked upstream again under one's own bank (by pulling in line through the rings) and then lifted out preparatory to making a new cast, care being taken not to show oneself. In fishing from an upstream position let the fly "hang" in the water, work it gently from one side of the pool to the other; then let a couple of yards of line run out through the rings and work the fly across again in its new position.

This is a good deal easier than fishing from the bank, but makes it difficult to land a fish. You will have to play it without showing yourself (if you want to stand a chance of another); then steer it into shallow water at the side, if this is possible, bring it upstream to you in the shallow water and net it. If you are on the bank, try to walk the trout out of the pool as soon as it shows signs of exhaustion—but do not approach the edge of the bank while you are playing it—then use the shallow below to float the fish into your net.

If you are wading for sea trout you must have a wading staff. A home-made one will do, but you can buy one quite reasonably with a screw fitting for a landing net at the top end. The bottom end should have a spike, and it will be more comfortable to use if it is weighted. Wear it with a looped cord to go over your shoulder and under the other arm, so that you can drop it when you want to use both hands without losing it.

Your affectionate uncle,

HARVEY.

ON THE SHIEL, A SEA-TROUT RIVER OF ARGYLLSHIRE. THE ANGLER IS LORD GLANUSK

PRACTICAL HINTS ON GROUSE BUTTS AND DRIVES

By DUGALD MACINTYRE

GROUSE butts are built of one height, but sportsmen not so, hence a 6ft. gun looks askance at the average butt, in which he is expected to conceal himself. When the grouse see the occupant of a butt they shy off at the last moment from him, so giving his neighbours chances which were really *his* chances.

The knowing keeper has sympathy for the tall sportsman, however, so he has a nice pile of heathery turves piled up against each butt. Mr. "Long" can make his butt a height to suit himself in a couple of minutes, by use of those spare turves, and Mr. "Little," who comes after him to the same butts, can tumble the spares off again.

The same thoughtful keeper knows that certain butts which are situated in level places, or have springs of water near, are liable to be muddy quagmires after heavy rains. There are butts which no drainage can improve, and for those the only remedy is wooden bottoms.

Unfenced butts are abominations where there are cattle or sheep, for the cattle knock them about, and the sheep leave an unpleasant aftermath of ticks behind.

The fencing round butts should be of the simplest character. Four short posts driven into the ground at strongly inward angles, and two rows of barbed wire round, will keep out sheep and cattle. The posts must be painted heather colour, and, partly driven, are left so until the wires are stapled on; when the completion of the driving tightens the wires. Some old sacking round that part of the fence which guns and loaders must step over, and the fence is complete. Fenced butts become parts of the landscape at last.

The walls of the butts may be partly of turf and partly of stone, but, on all counts, half-sunk butts with growing heather outside are most natural, and it may be said that butts which are too large of circumference allow high grouse to look into them.

There may be three men and a couple of dogs in one butt during a drive, however, so that butts of 6ft. in diameter, which are splendid for one occupant, are certainly too small.

It is really no fun for a retriever to be imprisoned in a butt during a drive, for its master and his one or two loaders have no time to spare for the dog, whose nerves may suffer owing to constant jars of shots fired over its head.

The keeper who knows takes his party by the least conspicuous route to the first row of butts, and it will please him to see that guns are kept well down while the party files into its hides. The glitter of sunlight on wrongly carried guns may be seen a mile away by the beaters, and what the beaters can see, grouse can also see.

Perhaps the keeper carries a telescope, and, if so, he knows enough to avoid letting the sunlight play on its polished brass. He may want to see how the distant beaters are shaping, and from that butt which has the best view, or a flanking point near it, he watches the work of the beaters, and incidentally notes the quality of shooting of individuals of the party.

A headkeeper usually takes no share in picking up grouse round the butts, nor does he wish his beaters, or even the keepers who walk with, and direct the men, to lose time collecting dead birds. Beaters with their company commanders move off to right or left (or both) without approaching the butts. Fresh keepers or dog-trainers set to work to collect the slain, and the occupant of each butt informs the dog-men how many birds he has down before hurrying off to join the other members of the party, and the keeper, in the walk to the next row of butts.

Long experience of his moor teaches a keeper how to avoid loss of time. It may be that he splits his beaters into two parties, the better to enclose a mountain which is to be driven, and, if so, he knows which party of beaters has the worst journey, and allows it time accordingly.

The best drives are those where there is no seemingly interminable wait at the beginning. Very long drives cause grouse flushed early in them to alight before they reach the butts, and when grouse do that in large numbers, and others pass over them to face the music at the butts, the wise old grouse hear the shooting while lying in the heather, and often break out at the flanks in spite of good flanking.

The occupant of a grouse butt who means to shoot at his best, and knows how to set about it, takes stock of his position before the birds begin to come. Is there a knoll in his front? Then he decides not to be surprised should grouse come over low and swiftly. He makes up his mind to snap the first bird as it tops the knoll. He has it all arranged, his second bird is also killed in front, at close range, and, changing guns, he gets one behind, perhaps, and a laggard a moment later. Grouse driving is really problem solving in double-quick time, and the man who successfully solves each problem as it comes is a super-shot.

THE OLD CORDUROY JACKET

By PATRICK CHALMERS

"YOU'D better *ride* up the brae, Giles," said George Wilmer, "you've got a top butt and you're not so young as you used to be."

"Hang it, George," replied Mr. Breckenridge-English, R.A., "I'm not a day older than you are, and *you* take the hill like a he-goat. Why don't you offer me a bath chair?" This was logical, but, as a portrait painter, Breckenridge-English ought to have realised that age is arteries, not *anno domini*.

He started to walk uphill; Curtin, his chauffeur, and loader, followed him. Sir George Wilmer's moor, Kirkfeshie is, as most people know, an excellent one, although the ground is abrupt in its up-and-downs. The drive for which the guns were now taking their places provided an example of this abruptness.

The host glanced after the pedestrian. The August day was hot and blue and "lown." "Old Giles was at school with me," Wilmer said to young Billy Keyserling who, having had the luck of a lower butt than that for which the artist was bound, loitered and leisurely re-lit his pipe. "But that was 50 years ago. Personally, let me tell you, I wouldn't walk up that precipice on a hot day like this when I could ride up on a nice, canny shelt. No, not if the Kingdom of Heaven was at the top."

"Surely not *fifty* years ago?" said Billy, as the sycophant who cries, "Oh, King, live for ever," "I won't believe that you're turned sixty——"

"Alas, too true, and I've known Giles English all my life; I knew his wife too, nice little woman she was——"

"He's a widower then? I wondered."

"Yes, he hasn't married again—must be a dull way of living for a man of his occupation and tastes. He's no family either, except a daughter, wife of a chap in some embassy or other."

Billy Keyserling, a bachelor, was on the point of saying that it was not given to every man to be a Bluebeard, but he remembered in time that Lady Wilmer, his hostess, was the third wife of Sir George. He fell back on the correct supposition that Breckenridge-English, after all, had his painting. He added that he, Billy, had, perhaps, better be moving on. He rose from the sun-warmed boulder on which he sat, lit his pipe for the third time and went to his butt.

Giles Breckenridge-English was a thin greyish man in Lovat mixture. A small moustache suggested the soldier rather than the artist; his kindly, rather vague face was lean and lined; he wore spectacles and his brown eyes, as those of a monkey, were at the same moment melancholy and humorous. He had a small piece of plaster on the second finger of his right hand against the kick of the trigger-guard. He was, as a rule, not a good shot, though he had, now and then, his inspired moments. Nor could it be said that he was particularly fond of shooting. But his friendship for George Wilmer was of long standing and great sincerity, and he still enjoyed, like a schoolboy, the holiday atmosphere of "the hill" in August. He recognised, too, that mountains are the beginning and the end of all things in Nature. Kirkfeshie was a place of memories to Breckenridge-English who had, since a boy, shot there annually. And boyhood was a long time ago; George was right, he was an old man and a fool not to have accepted the pony. Creaking doors, however, stay long upon their hinges. Still, he was breathless and slightly giddy when he reached his butt. Hill-climbing served lots of men so, even young men. Well, at this particular drive there was always a wait—fifteen minutes at least. After that the next quarter of an hour would be strenuous, it was a wonderful grouse year. Before then, long before then, he'd be as right as rain. In his waistcoat pocket there was a little box of tablets, also a small flask. A tablet and a thimbleful of brandy were the palliatives for this particular lack of condition. Or so he had been told. He felt for the little flask's flat silver shape and found only the buckle of his braces. Confound it, he'd shed his waistcoat half an hour ago and told Curtin to put it in the panniers. Curtin propped a pair of guns against the butt's wall. He looked at his employer with a respectful curiosity and some affectionate concern.

"Feeling the heat, sir?" he enquired.

"This brae-face, Curtin, is far steeper than it was forty years ago."

"I'll fetch your flask, sir. I see David and the panniers by the burn-side; there'll be time enough." Curtin always knew what was wanted, and could produce it with the aplomb of a fairy godmother.

"I'd be awfully obliged, Curtin; I hate to bother you."

"You'll be all right by yourself, sir?"

"*Et tu*, Curtin? Are you, as Sir George, making a Methuselah of me?"

"Anyone may suffer from the heat, sir. It will not hinder me five minutes to fetch you your tonic, and, if I may say so, you'll shoot none the worse for a taste of brandy."

Curtin went linking down the brae; truth to tell he thought the guv'nor was looking poorly, and the guv'nor was one of the best. Curtin's long legs carried him easily over the rough ground.

A moment or so later Breckenridge-English found himself leaning idly on the lip of the butt. On a far-off rigging the drivers were taking up an alignment; he could see the flip of a white flag. The heather was red with summer. Sunshine and shadow strode across the face of the moor. A grouse cock chuckled, and, from further up the brae, came the baa of a blackface.

Mr. Breckenridge-English was feeling younger and fitter than he had done for years. Indeed, he could not remember when he had last enjoyed so abundant a sense of well-being. He had been a fuss-pot about the flask. To acknowledge the fact he broke off what he was saying to the lady who was with him in the butt. The latter was fair-haired and hatless, but upon a finger she dangled a knitted tam-o'shanter, like the bridegroom in the ballad. She seemed to be at the apogee of her looks, and thus in the early thirties. You may have seen a speaking portrait of her in a white frock. It is by Breckenridge-English, and in the Tate Gallery. The face is full of witchery and animation; the grey eyes are infinitely kind and tender. It is called *The Wife of the Artist*.

Her dress here, in the butt, had there been anyone to see it except her companion, might have been thought slightly unfashionable. It was a costume by Redfern, but Breckenridge-English was only aware that it suited her and that it was, at the moment, as natural as ninepence for her to be wearing it. He said:

"Curtin doesn't make company of you, Mary. It's evident that you might just as well not have been here for all the good he thinks you capable of in an emergency." The girl addressed as Mary smiled. "Curtin," she said, "would probably see no necessity for my coming."

The two, elbow to elbow, leaned upon the butt's rim and continued to be as eagerly reminiscent as the united lovers which they seemed to be.

"Two years ago, Mary, in this very butt, I asked you to marry me. I had no loader, of course."

"My dear, you didn't want one, for you never fired a shot the whole drive."

"Too busy making you rash promises, my child, till death us do part and so on."

"And I said you were not to talk of parting on such a fine day or, for that matter, on any day."

"And, I'm sure I obeyed you, though, after all, I daresay it's not too bad—to die, I mean."

"I'm sure it's not. And, anyhow, I promised to try it first (d'you remember) and call for you later——"

"That was good of you, Mary. I was to stay here in this 'body of humiliation' all on my lonesome while you went off amusing yourself with Leonardo or Boucher, or someone more exciting than poor old Giles."

"And *I* said——"

". . . And so did I——"

"You said *Dieu de Dieu c'est un rêve*! No one but you, Giles, would propose in a grouse butt. All polyglot."

"Never mind, you understood me all right, my sweet. And the beaters came and we hadn't a head to gather."

"Not a head."

"But in a minute we'll make up for that."

"Yes."

"It's funny, but I seem to see what's going to happen. I see myself as a sort of Ripon."

"Ripon?"

"A chap who always shoots as I, for once, am presently going to shoot."

"Those five grouse?"

"*What*, do you foresee them, too, Mary? That little wild lot of five birds? They'll come, all of a sudden, over that hillock. I shall shoot one with my first barrel."

"And you'll hand back the gun with one barrel still loaded to——"

"Yes, and I'll have a brace with the second gun and get the first back in time to shoot the remaining brace. Quick work, eh?"

"Very."

"But somehow now I don't want to shoot that two-and-a-half brace, or anything else, ever again."

"Again?"

"Mary, Mary, my dearest, I don't understand. Have we, you and I, stood this drive out before? And I've not worn a corduroy Norfolk jacket for thirty years and more. Mary, I don't——"

"You've got it on to please me, dear, you know I love to see you in that Norfolk jacket *and* that floppity tie."

The man in the corduroy jacket turned. He took the girl's two hands in his own. They were cool, comforting and familiar. His own hands, they were familiar too, but *something* was different—of course, these were the hands of a young man who, about a million years ago, had married on the strength of a first Academy picture. And *Mary*? Mary had been dead for a quarter of a century? "No, she hasn't, darling," said Mary, as though she read his unspoken words. She had always been able to do that.

Breckenridge-English was obviously dreaming. "*Dieu de Dieu c'est un rêve*," he repeated. Yet obviously Mary's hands were no hands of a dream. And he could, most reassuringly, feel her wedding ring hard against his right palm.

"What then?" he said.

"My beloved," Mary's voice seemed very happy, "it was being broken to you gently, but, oh, *can't* you guess?" She released her hands and stood aside. Breckenridge-English saw Curtin and the Gun and loader from the next butt. Their faces were startled and white beneath an August tan. They were bending over an elderly gentleman in Lovat mixture, whom they had placed supine upon the heather. A grouse pack swept past, skimming low and unshot at. Breckenridge-English saw that the motionless figure on the ground had a small piece of plaster upon the second finger of the right hand just where the trigger-guard kicks. This poor chap, round whom Curtin clucked like a frightened hen, was clearly dead. He reminded Breckenridge-English, who saw him with sympathy but complete detachment, of someone he used to know. But Mary was here and in charge, and no one else mattered, or ever could matter.

Mary once more took Mr. Breckenridge-English by the hand. Together they looked for a moment at the elderly gentleman with the plaster on his finger who lay so still. "Your old clothes, my own," said Mary of the latter. She spoke very gently. "You must come with me, now," she said, "it's only a step."

Giles Breckenridge-English went.

THE CORRECT METHOD OF FINDING AND RINGING GROUSE CHICKS

In finding the young birds only a steady dog should be employed. In the photograph such a dog is seen finding a young grouse which has been marked down by the keeper.

Lifting the bird. This must be accomplished delicately. In the first place, the keeper calls off the dog. He then proceeds to pick up the young chick carefully in order to affix the ring.

These photographs show the method of holding the bird. Note the keeper's position. He holds the chick in his right hand with his thumb below its right wing his index finger along the back above the head, and his remaining fingers under its left wing. He rests his wrist or forearm on his thigh, thus preventing pressure on the bird's body and strain on the wings.

The next procedure is to replace the chick. First of all the keeper looks round for a convenient site. When found, the keeper then proceeds to dig a hole with his heel below a tuft of heather.

Into the hole the bird is placed with care. Here it will be safe until the covey is being called together, when it will have no difficulty in emerging from its hiding-place.

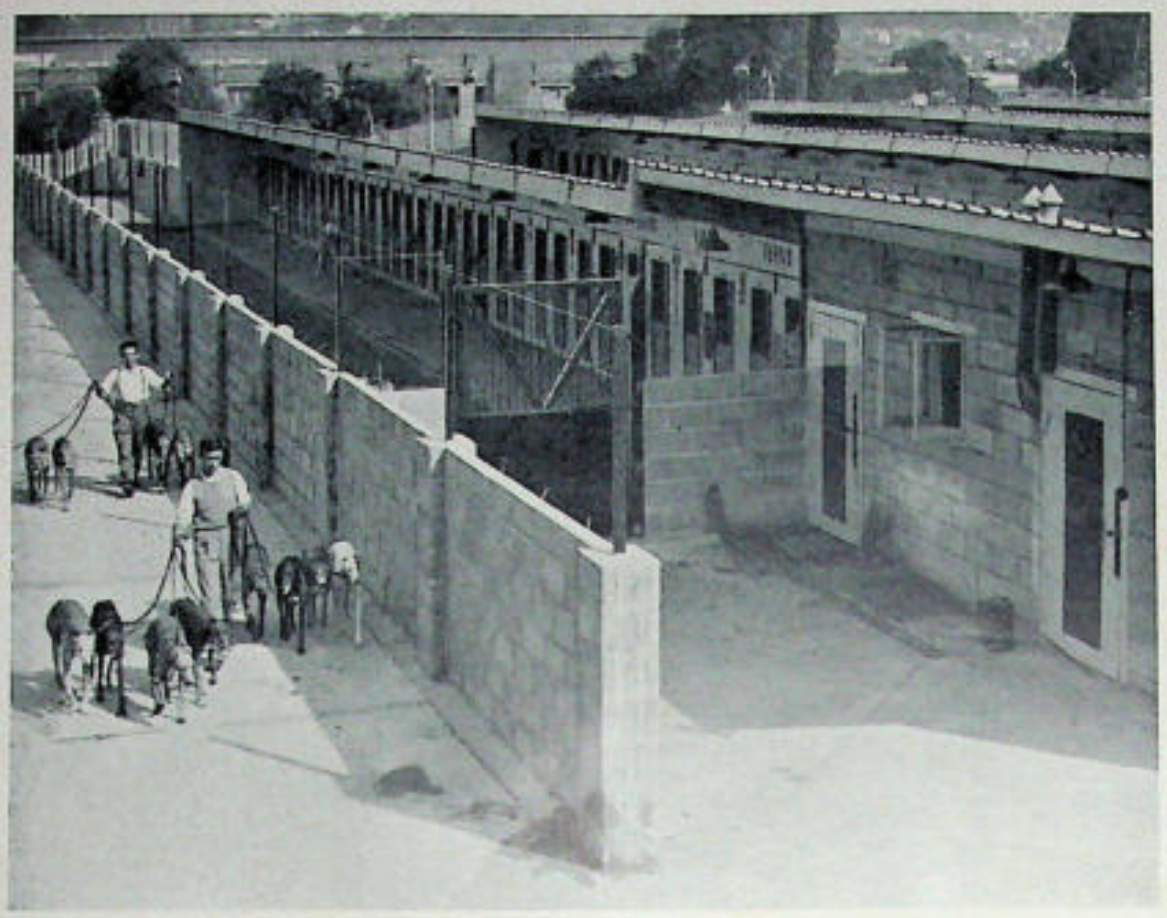
GROUSE IN CONTEMPLATION

By THE HON. A. ELPHINSTONE

AS each grouse season comes to an end and we go down from the hill in September for the last time, it seems that the past six weeks have slipped by at a quite unfair rate and that a gulf of almost countless months separate one from the next season. As the autumn sun sinks low over the hills and the last drive finishes, one looks with longing at the scene of heaving hillsides, where so many blissful days have been spent and which one is now to leave for a long ten months. The eye travels over all the well-known faces and corries and with the sight of each some cherished memory springs up in the mind, recalling some great day or some thrilling moment. Perhaps it was where a high right-and-left was got, perhaps where, not so long ago, a huge pack of grouse had risen and come forward in perfect style over the line. Every place has its own peculiar memory, and, indeed, on the last day of the season, these memories seem to have an added glamour, since they recall for the last time all the chain of events which has gone to make the last few weeks so wonderful. The last look over the hills, probably made specially beautiful by the colours of the September sunset, must be a long deep contemplation, for it is the final drink of the nectar of Scotland which is to keep one going during a weary ten months, spent perhaps in London, until the soul will be refreshed once more by new draughts of hill, wind and heather scent.

But still, however sadly we may leave the moors after the shooting is finished, there is plenty to keep the mind occupied during the following months, and as the warmth of autumn gives place to colder days, the world seems to change into one where there is no room for thoughts of grouse and blazing sun and warm bracken scent. Maybe in the evening when the blinds are drawn and the fire is crackling defiance to the winter wind, we will sit and glance through our game books and recall past days, or discuss with a friend the memories of a certain day or drive. But all the same the grouse feeling seems to disappear with the grouse weather, and the only thoughts are how deep the snow is on the hill, and if the nesting season will be good. Perhaps if one is lucky there may be other game to seek—November partridges twisting over the hedge with a strength and cunning gained during two months of experience and often conquering even the best shots. Or pheasants on a glorious crisp winter's day of frosty weather. If one is even more fortunate, the chance may come to chase the wary goose on a wild snowy night.

Then, as winter passes by and spring comes, other and new thoughts come with it. Once again the world changes and shooting days in field and wood and marsh recede into the background. Life wakes afresh for a new lease and birds and beasts alike cast off their winter shyness, and during the period when they turn to the homely business of mating and nesting, become fearless and tame. No more are they thought of as wild creatures to be hunted by men, but as familiar beings in whose well-being we take a great and personal interest. The nesting season for grouse becomes a widespread topic of conversation. Owners and tenants from all parts of the country discuss and compare reports from their moors as to weather conditions, numbers of nests and eggs, &c. And so the time goes on: the grouse hatch and the young birds begin their career, which in its early stages is so keenly watched by keepers, and later on so pestered by the guns. More news travels south as to the conditions of the young birds and more discussions follow round the dinner-table. Finally, the summer closes and the birds, for good or for bad, have hatched and grown up.



It is such a moment that we have reached now, the brink of the season. Soon the immigration of sportsmen, cartridges, dogs and guns will start into Scotland—carefree once more at the idea that in a few days or even hours they will tread once more the soft heather, smell the well-loved scents and hear the cherished sounds. If the few weeks after the last season was a time for reflecting over days past and gone, surely this is the moment to ponder over others yet to come. The autumn weather is here and in its turn it has banished memories of cold pheasants and even colder duck! In a while we shall form a part of the joyous throng making its way towards the hill. Well can I imagine the first day. A typically hot August one with brilliant sky and an occasional cloud, casting dark shadows which creep silently over the hillside, darkening for a moment a small patch and passing on, leaving it again bathed in sunlight. A friendly handshake with the keepers and beaters and then the first drive begins. I can almost see now the first coveys approaching the line of butts and hear the sound of the first rather muffled shots. At last some come over me, two single birds, well up, though not too high. With a leaping heart I raise my gun and fire, hoping madly to start the day well. Now, before it happens, I imagine them falling with a feathery wump behind. Ah! But will this really happen when the moment arrives? The day goes on and all the pent-up keenness of weeks finds expression. Drive succeeds drive, and in the good old style, the grouse come forward in coveys and singletons, high and low, slow and fast. Just like always they suddenly surprise us by coming unexpected from behind, or by swinging suddenly on us from behind a knoll to our side. The day has all the thrills we know so well. And so, finally, it comes to an end, and we go home with a new life in our veins and thankful that Scotland exists with its grouse! Maybe we have shot well or badly, it hardly matters, for there are so many other things to claim our attention. And it is just this which to my mind makes grouse shooting what it is.

A partridge or pheasant day depends largely for its enjoyment on the fact of there being plenty to shoot. It is true that September shoots share a large amount of the joy of grouse days, for the weather is usually pleasant and hot, and the stooks of ripe corn standing in every stubble give a warmth of colour to the countryside, which is anyway rich with soft autumn tints. But later on in the season, when the cold dreary days of November come, the abundance or lack of birds may make or mar the day. Under those circumstances, if the partridges do not appear, and the guns stand idle in their places, there is little recompense in observing the surrounding land with its bare fields and hedges which have been stripped of their foliage by the harsh winter wind and which now afford no shelter to man or beast. So it is with a pheasant shoot. The scenery can be uninviting, like the weather. The guns are little rewarded if they stand for half an hour with cold fingers and toes and nothing comes. It is a little different with wildfowling, for that, whatever the weather and the luck, is supremely thrilling. The goose or the duck with all its cunning, needs an active body and brain to outwit him; there are too the delights of darkness and moonlight nights and the sound of other birds calling through the night.

But grouse shooting has other and subtler charms. There is the infinite variety of views and landscapes that presents itself: heathery slopes, rocky corries, boggy flats or bracken-covered faces, each adding its different tint to the colour of the whole. And, indeed, as the clouds move, and the sun comes and goes, these colours themselves may alter, becoming sometimes deep and rich, other times light and clear and again soft and hazy, with all the tints indefinable, blending into each other. There are beautiful burns, here rushing swiftly between steep banks, there running smoothly over flatter ground. Occasional birches and rowans growing in some sheltered spot give a lonely beauty to the view. Then there are the distant hills, pale blue or grey, forming magnificent silhouettes on the horizon. I think that of all the good things about grouse shooting, the scenery is undoubtedly the best. Its ever-changing aspects always hold the attention when nothing else is happening. Another delight is the type of man whom one meets as keepers and beaters on highland, and other moors. It would be hard to say anything too good about them. Bred up on the hill and spending their lives on it, they are as natural and charming as the country which gives them their livelihood. Lastly, of course, to cap the enjoyment, there is the actual shooting. This, I contend, defies description. There is so much in common with all kinds of shooting that it is difficult to award a special merit to any one sort. Yet there is something which marks out grouse from all others. Perhaps it is the great variety of shots that the Scottish grouse presents, perhaps the perplexing shots that look so easy and are really so difficult, I don't know. But whatever it is, it will surely always be the same, as much this season as last and for all time to come. And with the thought of it we shall all travel north with an even lighter heart and greater expectation of the sport we are to get during the coming weeks.

"HEATHERY SLOPES, ROCKY CORRIES, BOGGY FLATS OR BRACKEN-COVERED FACES"

A RANGE OF KENNELS AT WEMBLEY STADIUM

THE GREYHOUND IN HISTORY

By DALE BOURN

IN canine history the greyhound must be given a position most notable and most high. It is claimed that the greyhound is the oldest pure-bred dog of which we have authentic data. It is said that when Mena, the first known King of Egypt and founder of Memphis, rode out from the city, there was a leash of greyhounds in his train. As this was about 4,400 B.C. we have no definite proof of the fact. On the other hand there is plenty of proof that the greyhound was loved and honoured amongst men before the building of the first Pyramid.

Records tend to confirm the belief that the greyhound was known as a distinct species 7,000 years ago. In early Assyrian art we find the greyhound chiselled in stone. Grecian and Assyrian paintings and sculptures depict the greyhound hunting the gazelle and the hare. The greyhound was known to the Medes and Persians in their wanderings. Phœnicia and Ur of the Chaldees knew him. Ovid extolled his virtues. Herodotus and Xenophon wrote of him. Solomon referred to the greyhound as being one of the four "things which are comely in going," the other three being a lion, a he-goat and "a King against whom there is no rising up."

Grecian writers on hunting made mention of the fact, not generally known even nowadays, that the greyhound hunts by sight and not by scent. In actual fact the sense of smell is practically undeveloped in the greyhound.

The remarkable presentation of the original type of greyhound is demonstrated by the fact that in the British Museum there is a lamp dating from 400 B.C. shaped in the form of a greyhound's head, holding a hare in its mouth. This head might quite easily be the model of any present-day racing or coursing dog. The breed has changed but little in the thousands of years of its history, but like his brothers, the Saluki and the Afghan, the greyhound's mission has always been to run down some form of game. He has been crossed and recrossed, and was undoubtedly the forefather of the deerhound and Irish wolfhound.

In Britain, the greyhound has been known since before the days of Canute. Elfric, King of Mercia, is reputed to have had several greyhounds, whilst Canute decreed that no one "inferior to a gentleman" could be the owner of a greyhound.

History tells us that in mediæval times King John accepted greyhounds in place of fines. The famous story of the faithless greyhound, Math, who deserted King Richard for Bolingbroke, is even now recorded in the nursery history books.

Greyhounds became most popular at Court in the time of Queen Elizabeth, and the "hunting of the hare" became a royal sport. The Queen herself was particularly fond of the breed, and went coursing in Gray's Inn. It was she who caused the first Rules of Coursing to be drawn up, and this originated a sport which has been popularly supported ever since.

In 1491 there was published the *Boke of St. Albans*, which contained the details and description of the greyhound. The rhyming description given in this book is worth reproducing, as it has never been improved upon, and is still considered by many to be the most comprehensive. It is certainly unique. It runs:

"The head like a snake,
The neck like a drake,
The foot like a cat,
The tail like a rat,
The side like a bream,
The back like a beam."

With all this weight of history behind it, it is not to be wondered at that the greyhound as a sporting dog has become more and more popular. Originally, of course, the greyhound was used solely for coursing, and in 1858 the National Coursing Club was formed which drew up their own rules for governing the sport. One of the main outcomes of this club was the start of the *Greyhound Stud Book*, which is recognised universally as being the most perfect system of registration in the world. The rules of this book are exceedingly strict, inasmuch as a greyhound without a pedigree or unregistered in the *Greyhound Stud Book* is unable to compete at any coursing meeting. The National Greyhound Racing Club have very wisely made it compulsory that all racing greyhounds must be registered in the *Greyhound Stud Book* of Great Britain or the *Irish Greyhound Stud Book* before being allowed to race on any licensed racecourse.

Before the advent of greyhound racing, the demand for greyhounds was only confined to the requirements of the coursing field. Only a limited number of animals were required for this sport, with the result that breeders used to do away with a lot of unwanted puppies, it being a waste of time and money to rear them. The growth of greyhound racing immediately gave a tremendous fillip to breeding. Many of the breeders were farmers, and they suddenly found a brand new market with a rapidly widening demand at steadily increasing prices. Whereas the coursing puppy would fetch £10 to £15, prices jumped into the 50 and 60 pound range. To-day track greyhounds have changed hands at prices as high as £1,500 to £2,000.

Ireland used to be the chief source of supply for coursing greyhounds, and so the export of greyhounds for racing became a tremendous trade, and big and quick money was made. As more and more breeders started up in England the demand from Ireland gradually fell away, but still many well-bred Irish greyhounds are imported into this country for racing and for stud purposes.

Greyhound racing having taken firm root and become the vast industry that it is, it followed that the breeding of greyhounds became a highly developed and specialised business in this country.

Irish and English farmers are now both big breeders of greyhounds, as well as many private owners who have entered the field with a commercial object. It is the big greyhound racing companies, however, who have the biggest interest, since a constant supply of high-class track greyhounds is essential to the continuance of their business. Many of these companies have their own kennels, training and breeding establishments. Situated in the countryside not far from London, as most of them are, they make ideal homes for the thousands of greyhounds that are trained for the many racecourses now in existence.

The Greyhound Racing Association own the most modern kennelling establishment in the world on a 200-acre estate at Northaw in Hertfordshire, as well as a big breeding establishment at Blythe Bridge in Staffordshire, and at Hersham Farm, near Chertsey, Surrey.

At Northaw, over 700 greyhounds are quartered and trained to race on their four London tracks during the racing season. Recently a larger estate at Barrow Hills, near Virginia Water, was acquired, and is now being equipped with all the most modern improvements to house over 1,000 greyhounds. It will be a veritable "greyhound city," complete in itself.

Great care is taken to breed to live and to get the strain to reproduce all the fine qualities of the proved good racing greyhound.

Nowadays, the tendency is to try to breed a good "stayer" in preference to the sprinter. The argument here is that the longer races are more popular with the public in that a good greyhound is more likely to win a race on true merit rather than on the "luck of the race."

The big breeders, therefore, examine the strains of the various sires and dams very carefully with a view to trying to reproduce all the fine qualities that they require in the progeny.

The bitches from whom it is intended to breed, when in season, are sent to wherever the various sires are standing. The stud fees on these occasions average between £20 and £50. The bitches are then sent to the breeding establishment where the puppies are whelped. These litters may vary from one to ten—the average being four or five. Here especial care is taken of the bitch when in pup and of the puppies when whelped. Every modern method of science and veterinary surgery is used in the care of the puppies. The first consideration is to assure that each dog will have the strongest possible constitution. To this end, the youngsters are fed only on the finest beef, milk and especially baked rusk bread. If necessary, a foster mother is sometimes utilised, and some of the finest dogs on the racecourse at the moment were reared in this way.

The puppies are given absolute freedom in their special paddocks and on their walks, and especial watch is kept on them for any early illness or ailments.

Each litter is registered in the *Greyhound Stud Book* and with the National Greyhound Racing Club. The puppies live a healthy carefree life for their first few months while being nourished and nursed like any human baby. It is when it reaches the age of from ten to twelve months that the serious side of its racing career is started. The puppies are then sent to the training establishment. At this stage they are invariably quite untamed, having had little contact with man. They are immediately inoculated against distemper if it has not already been done, and after a few weeks in the puppy range they are allotted to their respective trainers.

By a rule of the National Greyhound Racing Club, no greyhound under the age of fifteen calendar months shall run in any race. Until they reach that age, therefore, their time is spent in being exercised and schooled.

From long practice psychological methods of breaking them in have been found, and only men with the right temperament for the job are employed in the puppy kennels.

Having enjoyed the carefree indolence of puppyhood, they get down to the really strenuous but none the less pleasant job of training for their racing careers.

And it is at this stage that the results of research and painstaking study of the ancient breed of dog begin to tell in his transformation from the wild hunter to the sleek, polished animal that attracts millions in England each year to greyhound racecourses throughout the country.

"8 Guns" IN A DODGE

—to say nothing of the dog

—to say nothing either of the lunch hamper and the shooting sticks, the top coats and the mysterious package George says he *must* take with him!

It's an accommodating vehicle—the Dodge shooting brake—as sturdy as it looks (and extremely comfortable!) It seats eight in comfort. It solves once and for all the troubled problem of transport on the moors.

The high ground clearance and the special springing make it as easy to drive as it is to ride in, over really rough country. Running costs are surprisingly low. There's time to get a Dodge for the twelfth!

DODGE DE LUXE ESTATE CAR. PRICE £355 EX WORKS
The De Luxe model Estate Car is fast, comfortable and silent. Smooth running as a luxury saloon, every effort has been made to combine the comfort of the private car with the roominess and robust character necessary for use on the moors. The engine of 23.4 h.p. provides a tremendous flow of power, whilst the combination of long springs, hydraulic shock absorbers and high ground clearance make this the ideal Estate Car.

DODGE ESTATE CAR. PRICE £299 EX WORKS
This model has been designed for work under rough and most difficult conditions. Possessing a larger body than the de luxe model and mounted on a rugged commercial type chassis with special springs and hydraulic shock absorbers, it is ideal for a wide variety of uses additional to passenger carrying requirements. Available in two engine sizes, 19.8 h.p. or 23.4 h.p. it is a most excellent general purpose vehicle.

Both the above models are available in two types, as an Estate Car with fixed seats and tailboard, and as an Estate Wagon with removable seats and drop tailboard.

PROSPECTS FOR PARTRIDGES

PROVERBIALLY prophetic mantles are uncomfortable garments. Of which fact none, probably, are more acutely conscious than well-meaning analysts of partridge seasons. For, however sound the basis of one's reasoning, early forecasts can seldom be more than speculative at best. It is easy enough to summarize conditions at midsummer, but it by no means follows that a great, or even a good, hatch will retain the same perspective a month later. Until the harvest has been lifted, no one can gauge the percentage of baby partridges, which are eluding the most vigilant of keepers in the standing crops, or foretell their reaction to sudden and violent weather changes. The very fact that, as between first and second grade shoots, the average number of young partridges, surviving to maturity, falls from eleven per nest in a good season to less than two in adverse circumstances, suggests how dangerous may be the most intelligent anticipation. Wise men, I fancy, hold their peace until September, but "prophets" of the Press must risk their "honour" in July.

Which observation, may I say at once, is no reflection on my numerous correspondents. Without the help of friends and keepers, to whose collaboration I would pay a grateful tribute, this brief survey of the country would be sadly incomplete. As it is, in several places where late nesting has occurred, the issues are still in the balance. For, although it is sometimes said that it can never be too dry for partridges, dryness in this connection is synonymous with warmth. And although the long drought was in favour of the nesting birds, warmth, save for one brief heat-wave, has not been a conspicuous feature of the summer. This has rather been a season of extremes, temperatures sometimes varying as much as 30° from one day to another; and extremes are seldom good for man or beast. In several areas babes at hatching suffered from the cold east windy snap towards the end of June, though as a compensatory factor the intense thunder-rains which in seven midsummers out of every ten we associate with flooded nests and tiny corpses, were local rather than general. In some parts of the North and Midlands, however, their coincidence with cold winds has materially reduced a first-rate hatch. In others more southerly, an early hay harvest has had its drawbacks. Particularly in sparsely keepered areas, I hear of heavy casualties through prematurely cut-out nests. So, were I forced to bet, which, thank goodness at the time of writing I am not, I should plump for a bright season with some cloudy patches.

Even so, the outlook is more than average, and for brevity's sake I propose to quote my correspondents without further comment. Generally, nesting was later in the North than in the South, and, as typical of several Yorkshire shoots, here is a report from the well-known Birdsall estate: "Fine dry weather, and a 90 per cent. hatch; broods doing well, but some losses through cold wet conditions at the end of June." Durham and the border counties suffered more severely, the cold snap coinciding with the main hatch, but in the North Midlands the outlook is better. Conditions in Notts are a bit patchy, broods ranging from six to fourteen, but the mean of three estates on the Cheshire—Stafford border show an "85 per cent. hatch and coveys doing well." From Herefordshire and Shropshire comes news of "an ideal nesting season" and bright prospects, while a few reports from Wales indicate a considerable improvement on last year.

East Anglia reports are also good. One from Euston is typical of the Thetford and King's Lynn areas, where disease was rampant two years ago: "Partridges went down on full nests; an average hatch of 95 per cent., and hand-reared and wild game doing well." With a few exceptions this roughly represents conditions in Suffolk and Cambridgeshire, but storms in Northamptonshire have reduced a good hatch somewhat. Of the Berks—Oxon district a friend writes: "Ideal nesting weather; full nests and a good hatch. I have seen two coveys of seventeen and nineteen. In the Reading district storms have done some damage, but the downland areas have entirely escaped, and with average broods of eleven to fourteen, it should be a first-rate season."

Hampshire shoots have fared well on the whole. From reports of five well-known properties in the Alresford—Stockbridge—Romsey area I find the mean of hatchings and broods safely away is 92 per cent., and thirteen birds. Wiltshire news is also good, and strong coveys are reported in Somerset and Devonshire, though there was storm trouble in Devon at hatching time and the outlook is more patchy. From the Maidstone and Canterbury areas reports are fair, though Kent is not a great partridge county, and Sussex is rapidly deteriorating in that respect. Such of the eastern half as is not falling year by year into the clutches of speculative builders is a kind of National Park for foxes, though on two or three big estates which still remain intact the outlook is better than for the last two years. Good hatches were the rule, and the coveys which I have seen are good strong birds. On the south coast marshes, where partridges mostly fend for themselves, the show is a good deal better than one would expect, considering all wis's which they have to contend. From Hertfordshire a friend tells me of "first-rate breeding stocks going down on full nests and hatching well. Only a single egg left in odd nests." But a change to cold weather during hatching, followed by heavy rain, did some damage, and such conditions may, as a generalisation, be applied to Southern and Eastern England rather than the North or West. To sum up, in broad outline, things are hopeful, and not the least encouraging feature is that in something like 50 reports there is no mention of disease.

J. D.

DOGS FOR THE MOORS

THERE is no finer or more cheering sight than the main line platforms of the three northern termini of London at the beginning of the second week of August; piles of luggage surmounted by gun cases and cartridge bags, and here and there through the crowd struggling individuals being pulled along willy-nilly by dogs of various kinds. The dogs are an essential part of the scene and for many people the August grouse shooting over dogs is among the best which the shooter's year has to offer. Dogs for the moors—I do not propose here to offend anybody's susceptibilities by making out a case for any particular type of dog in preference to any other type, because I think that it will be of more interest to discuss the subject as a whole.

For all that there are so many people who look forward to their "dogging," there can, unfortunately, be little doubt but that the amount of grouse which are annually shot over dogs is on the decline. This is very regrettable, and is an outcome of the increasing urbanisation of life at the present time. It is something quite apart from the one-gun-one-dog rough shooter and must be considered separately; such men are on the increase, but the "dogging" grouse shooters are on the decrease.

The rough shooter is very often a Saturday sportsman and can, anyhow, arrange his day to suit himself, not so the man who essays to shoot grouse. The latter has to fit in with the rest of the party, and with his host's arrangements, or, if he happens to be the host, with the arrangements which his particular moor happens to call for, and which have been laid down for him by his keeper. More than this, he is probably on holiday and will be called upon to shoot on an average three days a week throughout his visit. Small wonder, therefore, if his limbs, accustomed to a sedentary existence upon an office chair, give all too early warning of a surfeit of unwonted exercise. It is, I think, the "soft" condition of so many of those who annually go north for the Twelfth that is bringing about the reduction in the number of "dogging" days and the early, in many cases the much too early, commencement of driving.

For those who are fit, and who realise that there ought to be a great deal more in a day's shooting than mere "target practice," the shooting of grouse over dogs will keep its fascination, and it will offer them something which they can never find while they are standing in a butt with the birds being driven over them by beaters who are doing the work.

If the man must be fit to enjoy his shooting over dogs, the dogs must also be fit, and any shortcomings in this respect will be quite sufficient to wreck a day's sport. The majority of people whose dogs let them down have no one but themselves to blame, and their fault is usually not that they forget about the dogs, but that they do not start to think about them early enough. If a man does not get very much grouse shooting in the season he may not think that it is worth while to keep dogs for twelve months in order to get one month's work out of them, and he will then be compelled to hire the number that he needs. This business of hiring dogs need not be an unsatisfactory one, but if that is to be avoided it is absolutely essential that the dogs should be delivered from the kennels in ample time—three weeks before the opening day is not too soon.

Directly hired animals arrive they should be isolated, as one can never be too careful in remembering the possibility of disease. Before they come, careful inquiries should have been made about the diet to which they have been accustomed, and this should be adhered to if possible. The change of air, of surroundings and in those who have charge of them will be quite unsettling enough for the dogs without any added danger of internal derangement on account of strange food. So, then, isolate the dogs and feed them in the way in which they are used to being fed. When they first arrive these hireling dogs should not be fussed, they should be shut up, preferably together or within sound of each other, for company, and then left alone. In the succeeding three or four days they will, of course, be exercised in the usual way and will then begin to settle down and to get to know the man or men who are to work them on the hill; this is most important, and it is as well if such men are given the task of feeding the dogs.

However good the dogs may be, it is as well to go on the principle of making quite sure, and with this end in view the exercise should be so arranged that it will all help to produce hard condition and, which is just as important, hard feet. Condition and good feet are absolutely vital to sport, and they must receive attention whether the dogs are hired or owned. Conditioning should begin in the early days of July with a gradually increasing amount of "strong" food and exercise. A dog cannot perspire except through its tongue and the sides of its mouth, and as this is of but little value in conditioning, it is therefore best avoided. For this reason it is as well to exercise in the cool of the early morning and evening, and the best form of exercise is that which can be given on quiet bye-roads behind a bicycle. Experience has shown that fast work is not necessary; long, steady work is what is required, and if the dogs are gradually trained on until they can do a steady ten miles behind a bicycle and return home fresh and cheerful, there will not be very much amiss on the hill on August 12th. The steady work will build up condition and will dispose of surplus fat, while the hard going will see to it that the feet are in proper trim.

LORNA COUNTESS HOWE'S "BANCHORY SPEY"

If these precautions are taken the dogs will be fit and well and then, for the man who is also fit and well there will be days ahead which nothing can rival. Not only will there be the exhilaration of the actual shooting, but there will also be all the interest and fascination of the dog work which, to be seen at its best, must be performed by dogs which are used to working together. For this reason dogs should be kept in "sets" and should never be used in a haphazard manner, for the essence of these days is that of team work, team work in which both the dogs and the guns play important and interdependent parts.

BEST DAYS WITH OTTERHOUNDS

The Cheriton and Dartmoor Joint Week

UNFORTUNATELY, the weather has spoilt the hunting this week, the continuous rain having made the Teign impossible to hunt on Monday, July 24th, when the Cheriton met at Teignbridge. Hounds were taken to the ponds below, there were a few "touches," and they carried a "line" across to the river, marking in the left bank. The terrier bolted the otter, which hounds managed to swim 200yds. in the heavily flooded river before he put in again and had to be left. They then drew the clay ponds above Teignbridge and had a faint "line" a short way up the stream towards Ugbrooke.

The Masters—Mr. Tritton and Mr. Pelly—were so anxious to show the large "field" some sport that they decided as a final effort to draw down the marshes and withy-beds under Sampford Orleigh as far as Jetty Mill. About a quarter of a mile above the Newton Abbot—Kingsteignton Road they put off an otter, which they hunted down to the first lock gate of the canal. Here in the reeds they killed him. It was at once apparent that more than one otter was still on the move, for hounds were swimming down in full cry again. They were stopped at the main road, the otter having gone on down to the tide. On returning, they were hard at it again, driving another otter upstream and through the reeds to ground in a drain. While they were marking here word came that yet another otter was to ground near the lock gates. Taking the pack back there, he was bolted and swam well down to the main road and on under the railway goods yard to the flooded Teign, up which he turned and hounds were called off.

The next day the Dartmoor met at Granite Lodge, Stover. The pond was drawn first, but proved blank. However hounds carried a speaking "drag" out of it and away down the stream past Teigngrace to the Teign, where they stopped as the river was still in flood. On being brought back to Stover they had a good "drag" all the way up through the golf links and on to the main Plymouth Road, where it faded out a short distance below Liverton. Hounds were then vanned across to the Lenon at Mill Cross Bridge and drew that stream as far as Half Way Inn without showing much interest. Wednesday, the Cheriton met at Jews Bridge to draw the Bovey. They drew down the Leat and then across to the Bovey at the junction. Hounds owned to a good "line" the whole way up to Bovey Tracey and again in Parke, but it died out above and the day's proceedings came to an end just below Lustleigh Cleeve.

The following day we returned to the Teign, when the Dartmoor met at Chudleigh Bridge. As the water below had been unhuntable on Monday it was decided to take hounds down to Preston and draw up. They hit off a screaming "drag" at once, and just before reaching the junction with the Bovey, they took a line across the meadow to the Stover beat with a grand chorus. The beat was tried out carefully but without result, and on returning to the Teign the "drag" gradually petered out, and was almost certainly dead. Raymond drew on most carefully through all the strong holdings, but had to finish at Ashton without finding an otter.

On Friday the Cheriton met at Christow. They drew up and seemed very interested in Bridford Weirpool, but, on continuing, seemed to be less keen and the Teign was drawn to Fingle Bridge, as well as the Doccombe Brook, before calling off. Saturday saw the upstream draw continued when the Dartmoor met at Fingle Bridge. Hitting off a fresh drag almost at once, hounds worked up to their otter about a mile above. He appeared to be lying rough on the right bank and, after running the land for a short distance, took to the water and dropping down slipped into a big root. Here hounds marked him well, and he was quickly away downstream. For a short time there was quite a merry rattle up and down, but the otter then got into a strong place in the left bank, from which he defied all efforts to evict him. Later the Teign was drawn to Sandy Park Bridge without finding again, and an exploration of the South and North Teign Rivers and the Blackaton Brook, from Leigh Bridge, failed us.

So ended the Joint-Week, much enjoyed by a large number of people on account of the lovely country through which they passed, but ruined from a sporting point of view by the heavy and continuous rains which kept the Teign and its tributaries in half spate. D. C.

THE HAWKSTONE RIVERS STILL IN FLOOD

MONDAY, July 24th, still found the rivers in flood, but hounds met at Aston-on-Clun and hoped for the best. There was a drag for the first quarter of a mile up to Oker, which failed to materialise. On reaching Clunton without finding, hounds were vanned to the Onney, which was drawn blank for about four miles.

Wednesday, the meet was at Kington. Mr. Stanier drew down just past the recreation ground, where there was a good drag. The river being very high the Master realised it was best to draw up, where unfortunately the drag gave out, so the Kington otter won for the second time this season.

They drew on for about two miles with only slight touches, and then hit off a very fresh drag, which continued up the Gladesevy Brook. It was strong but intermittent.

Hounds found their otter under the Forest Wood. He was bolted by Meg and viewed going upstream, where he was lost for some time until Miss Clegg-Hill poked him out from a broken culvert. Hounds then hunted her well till she was rolled over in the middle of a field an hour and 30 minutes from the find—a 13lb. hatch. S. W.

THE BUCKS OTTERHOUNDS ABOUT TO DRAW THE LAKE IN EYTHORP PARK

THE CARLISLE IN RIVER AND SEA

AS near as makes no difference to twelve hours the Carlisle Otterhounds hunted a game sporting otter in the Border Esk and Solway Firth after meeting at the Metal Bridge near Gretna on Thursday, July 20th. It was a memorable day. None of us who was fortunate enough to be there will forget it. Our thanks to Huntsman Will Hind, who worked his hounds magnificently, and no tribute can be too eloquent for the endurance and cleverness of his pack.

Hounds were cast off to try above the Bridge, and along the right-hand bank there were slight signs, but after trying a short distance farther up scent disappeared. It was decided to cast over to the Lyne. There was hardly a whimper along the willow bank of this tidal reach, but it was not long before hounds came across their otter. What a chorus of voices proclaimed the find! Rock, the little black terrier, was put in, and he could be heard sharply baiting the otter, but in spite of encouragement by the huntsman out he came. Will sent into the hover Joe Armstrong's terrier Mack, a little demon for otters. The game little beggar had the quarry out in a jiffy! "Tally-ho!" "Gone away!" proclaimed that sport had begun in earnest. The long chain of bells was followed intently till it slowly dwindled upstream. Hounds with a rare cry were soon hot on the drag and, led by Mountain, the pack swam the foil with melody that became a roar echoing through the valley of the Esk. Mountain is a pure bred not long in the Carlisle kennels. He came from the Dumfriesshire, the all pure otterhound kennel just over the Border and believe me, without throwing the least discredit upon the capabilities of the other mixed hounds, Mountain did hunt! He could not be thrown off the scent, and his sonorous note told us he was in constant touch with the otter, which took rest at almost every willow bush, but never did the field get a view of him. Only once did hounds leave their otter when he got into the reach above the footbridge. Hounds got mixed up with a stale line, but after puzzling about for a little time they got on to the scent of their otter again, locating him amongst the willows. Another spell of merry hunting followed as they pushed him downstream. At this point the gathering thunder clouds sent down a deluge, but the enthusiasm amongst the followers was too animated to be damped by rain; indeed, excitement was so great that those who were decidedly wet outside refrained from becoming wet inside! We were never out of sight of Metal Bridge Inn, our anglers' paradise!

Sport continued downstream, where the otter made good use of available cover, but could not outwit hounds, whose clever scenting powers and swimming ability were admirable to observe. Leaving a clump of willows on the right-hand bank, he went back upstream for a couple of hundred yards and then back down again, and was viewed going into the stonework of the right-hand bank. Being forced to quit this hover, he made downstream, where, with lively and melodious cry, hounds swam on the foil. By this time the tidal water had come up to where hounds were hunting and the river rose about 3ft. or 4ft. The otter took advantage of this and went downstream against the current. Hounds found it impossible to swim him, but winded him whenever he took a short respite under a willow bush as he continued on his journey downstream.

The pack hunted merrily, pushing their otter into the wider reach just above the Metal Bridge, and it was now that the otter began to show himself

frequently as he swam down the middle of the river. He was seen crossing over to the willows on the left bank, and from there he made upstream, then crossed over into mid-stream, where he vented often before setting his mask downstream. Eventually the otter went below the bridge, and what a rare sight it was to see the whole of this pack swimming their quarry with melody which reminded me of the line: "As music from a hundred throats came from these noble hounds." Crowds massed along the bridge saw the picturesque scene. Hounds worked beautifully and kept up a continuous volume of music as they took their otter in great style through the arch of the bridge downstream to the railway viaduct. But there the otter found no cover and decided to double back upstream again. He took to the left side of the island for his return excursion to the Metal Bridge. He did not get above, however, as hounds turned him and swam him seawards past the railway bridge. At a very hot pace hounds pushed him through this wide Border river for a mile and a half down to the sea.

It is of great depth where the Esk joins the Solway, and so the huntsman had to requisition a boat to keep in touch with hounds. A grand swimming hunt followed as hounds drove their otter through the flow of the Solway Firth, and nothing is more formidable than that, believe me. Time and again the otter would show his mask at this point and yonder point in the brine, but hounds absolutely disproved the opinion that scent does not hold well in the sea, for they spoke to the foil decisively and hunted their game diligently and faultlessly. He made no attempt to leave the sea, but kept on down the estuary, hounds exhibiting their rare swimming powers and unflagging endurance by keeping close to his rudder.

Hounds were racing to overtake their quarry. First one hound then another would take the lead. It was a very fast, exciting hunt. Once at Sarkfoot, Gretna, he attempted to get up the River Sark, but he turned and made back towards the channel of the Esk, but darkness was falling and the order was given for home. It was 10.15 p.m. The day had been long and memorable, and perhaps we shall never see its like again. He was a game otter and deserved to get free; on the other hand, hounds gave of their very best and deserved reward, but—

"He's wily and canny the otter
No sport is more thrilling
No beast takes more killing
Than the varmint that's known as the otter."

And don't we know it! HARKAWAY.

SPORT WITH THE WYE VALLEY

ON Monday, July 24th, the meet was at Stretton Grandison, and under the road bridge were tracks of a small otter going upstream, and off hounds went towards the Canon Frome mill pool. Here we met misfortune, for the gates of the weir had been lifted to allow the extra water to get away, and the otter had no doubt gone with it, for we had no drag afterwards.

We next went to Bromyard and drew a stream which hounds had not been on for years. I believe the last time it was drawn Griff Davies killed a 30lb. otter, but to-day it proved completely blank, although there was plenty of water, thanks to all the rain that has fallen, and is still falling. This finished the day and bome was the order. Once again the River Wye has defeated us, and by the scene at Hoarwithy, where the water has taken gardens and sheds to the banks below, we thought it much safer to keep away, so after meeting at the British Lion, Fawley, hounds were vanned to the Gurneys Oak stream and put on just above the mouth.

We soon had a nice drag, and hounds were running on with this past Brockhampton to the deep water here, across the corners they went, and everything looked quite promising. On getting to the main road just below the deep weir pool hounds were very keen, but our hopes vanished, for we could track a big otter going downstream. This proved correct, for although hounds could race away on the drag and they knew an otter had been about and drew this deep water extremely well, it was rather disappointing for them that this big otter had taken it in his head to travel down to the Wye this very morning. Crossing over to the Frome, hounds again had a beautiful drag, and took it to the Lugg, which was very heavy, and we then drew up to Dormington Bridge, and finished the day. M. L.

SUPERB HOUND HUNT WITH EASTERN COUNTIES

FROM the meet at the Brandon Ram, on July 27th, the E.C.O.H. pack showed fine sport on the Little Ouse, below the town, when one of the best hunts for a number of seasons was witnessed. Hounds were put in to draw down river towards Lakenheath, in the Fen country, and having found the Brandon covert to be blank they soon afterwards took a fresh line up the first runner below the sluice. The reeds there are intensely thick now, and hard to get through, so that when some five couple put up an otter in the middle of the carr there, nearly half an hour had passed before the Master, with the rest of the pack, had got over to the scene of action, as they had been upwind and the main body were unable to hear what was going on in the reeds. However, the reunited pack soon forced their otter into the river, where they swam her downstream with much melody for half a mile under the railway bridge to mark their pilot in a boathouse just below the bridge. She was reluctant to leave the boathouse, but bolted at long last and set off downstream for a further half a mile to the next sluice, with hounds swimming her beautifully and with a terrific cry. On reaching the sluice, however, this stout otter turned and went back upstream; scent had now become very catchy, and it took hounds all their time to keep her on the move, but they stuck to the job well and hunted on slowly.
