Scent was but little better on land, but they kept on terms with their pilot and eventually brought her back to the river once more, where she took them further up stream and into the boathouse again. This time, however, she left it at once, and continued on up to the railway bridge with hounds now on excellent terms with her, and throwing their tongues in a grand chorus until she doubled back again and took them for another long swim at a slower pace right away down to the second staunch, where they took a line over to the carr, and for the first time were out of touch with their hunted otter. Mr. Russell now cast them right up river, and it was not until they got into the big carr above the railway that they put their otter away again. They now hunted her back to the river on a much improved scent, and then swam her fast upstream towards the Brandon Staunch, near which they forced her out into the carr, where they roared round on close terms with her in this vast and very thick covert. There was a lot of water in the big dykes that cross the carr, and with scent now greatly improved, hounds drove their otter at a tremendous pace both on land and in water, until after a rare spell of one-and-a-half hours in the carr she went away back to the river, getting in just ahead of the leading hounds, and set her mask down stream, but they were now fairly glued to their pilot, and swimming her hard they ultimately forced her out into the carr again, where they hunted her round like smoke for a further fifteen minutes until they rolled her over after a magnificent hound hunt of six-and-a-quarter hours. DRIFTER.

THE AGRICULTURAL CONFERENCE IN BELFAST

THE Agricultural Education Association held its annual conference in Belfast last week, and an official welcome was given by the Government of Northern Ireland in the form of a dinner, attended by the Prime Minister (Lord Craigavon), the Minister of Agriculture (Sir Basil Brooke), and the Minister of Labour (Mr. J. F. Gordon). References to the important part that Northern Ireland has played in agricultural administrative development were made by Mr. W. B. Mercer, the chairman of the association, and Dr. C. Crowther. Sir Basil Brooke, in his reply, said that although in size and numbers Ulster was only a small part of the United Kingdom it was a much larger contributor to the home food supplies than its size or numbers would suggest. There were more farmers in Ulster than in the whole of Scotland. The measure of success which attended the Northern Ireland Milk Scheme, he said, might be gauged by the fact that the farmers are receiving for their liquid milk as good a price as in England or Scotland, and the consumers are receiving the cheapest milk supply in the United Kingdom. In a reference to the Northern Ireland Pig Scheme, Sir Basil stated that since 1933 the bacon output had risen from 28,000 pigs per annum to over 800,000, and that Ulster was now producing one-third of the total United Kingdom output of bacon and hams. The Ulster pig had practically disappeared, and its place had been taken by the Large White.

During the conference a large number of papers on widely different aspects of scientific work affecting agriculture were read by members of the association and of the agricultural staff of the Ministry of Agriculture for Northern Ireland. Mr. J. Morrison, of the Agricultural Research Institute of Northern Ireland, said that during 1937–38 the value of the gross output of agricultural produce, exclusive of State subsidies, reached a record figure of nearly £16,500,000. This increase reflected a rise in the value of the output of live stock products rather than of field crops.

Over 80 per cent. of the agricultural holdings were under 50 acres in extent, and probably not more than 20,000 permanent agricultural labourers were employed. Mr. Morrison said that the potato crop accounted for approximately 64 per cent. of the total income from field crops, the total annual production of potatoes varying from three-quarters of a million to a million tons annually. He referred to the very significant change over from the production of store cattle to fat cattle, which has been taking place since 1925, and of the rapid development of an export trade in fat cattle. The value of the output of the pig industry exceeded £4,000,000 per annum. He referred also to the importance of the poultry industry in Northern Ireland, and of the remarkable increase in sales of eggs in Great Britain during recent years.

In a very stimulating and witty address on Grass Land Problems in Northern Ireland, Professor S. P. Mercer spoke in favour of the shorter ley, combined with August sowing. One of the advantages of the August sowing is that it gives fresh autumn and winter feed for lambs and other stock, and mixtures containing a fair proportion of Italian rye-grass, sometimes with the addition of rape, were being tried. Professor Mercer emphasised the necessity for maintaining fertility, and had some interesting remarks to make upon the destruction of rushes; in Northern Ireland they had found that the secret of rush destruction is the application of the mowing machine at precisely the right time. Two cuttings for two successive years eliminated about 80 per cent. of rushes.

Mr. H. Trefor Jones, in a paper on "Smoke Pollution," said that in a town the size of Leeds, domestic chimneys contributed the equivalent of nearly a ton of sulphuric acid per acre per annum, and it was not surprising that in these conditions vegetation should completely fail, and that metals, wood and stone should rapidly corrode. Most of the damage from smoke pollution was done during the dormant months. Spring-sown crops survive fairly well, but it is unsafe to spray potatoes with copper preparations even under conditions of mild pollution. Liming could do something to lessen the bad effects of smoke pollution, and much of the nuisance caused by smoke could be prevented at the source.

Dr. H. H. Corner, referring to "Pine" disease in sheep, stated that this is a special form of anæmia common in the Border Counties, the Highlands of Scotland, in North Wales and in Devon. This is a wasting disease, which can be successfully treated by feeding small quantities of cobalt. The economic way of doing this is to dissolve 1oz. of cobalt chloride in 3 or 4 pints of water and spray the solution over a mixture consisting of 1cwt. each of steamed bone flour and common salt. This mixture is put into boxes to which the sheep have constant access. The cost is not more than 2d. per sheep per annum.

Mr. James Mackintosh suggested that the amount of protein fed to dairy cows might well be reduced without detriment. He said that 0.5lb. of protein equivalent per 10lb. of milk of average quality might serve as a satisfactory standard instead of the usually recommended 0.6lb. protein equivalent. Professor Baskett, dealing with the subject of fat formation in pigs, said that the backfat of pigs receiving considerable amounts of de-germed maize meal had a significantly lower iodine value than pig receiving half their ration as maize meal.

In the biology section Dr. Muskett described methods which are being tried to discover a rapid and satisfactory way of finding out the relative efficiency of different types of fungicides now being recommended for seed disinfection. Dr. Carrol, of the Agricultural Zoology Department of University College, Dublin, described the increasing importance of eelworms in Free State agriculture and horticulture, whilst the spread of the chrysanthemum midge was referred to by Mr. R. Chamberlain.

During a paper on "The Teaching of Agricultural Engineering" (read in his absence) Mr. S. J. Wright, Director of the Agricultural Engineering Institute at Oxford, stated that the real reason for teaching elementary principles is that, in the farm, they are often of much greater importance than the so-called practical things themselves. He instanced the ignorance of many students about wheel slip, and said that unrecognised wheel slip probably costs our farmers something like 5,000,000 gallons of fuel every year, to say nothing of wasted effort. Other papers dealt with marketing schemes in England and Wales, and in Northern Ireland, with Peat Land Reclamation, and the flax-growing industry.

Visits were made to the Plant Breeding Station and Veterinary Research Laboratory at Stormont, to the Agricultural Research Institute at Hillsborough, and to farms of the Irish Peat Development Company at Maghery. The Agricultural Education Association has a membership of 500, and includes most of those engaged in agricultural education and research in the British Isles. D. H. R.

TOM M. SCOTNEY

TIMBER MERCHANT & SAWMILL OWNER
FARM & ESTATE
APPLIANCE MANUFACTURER.

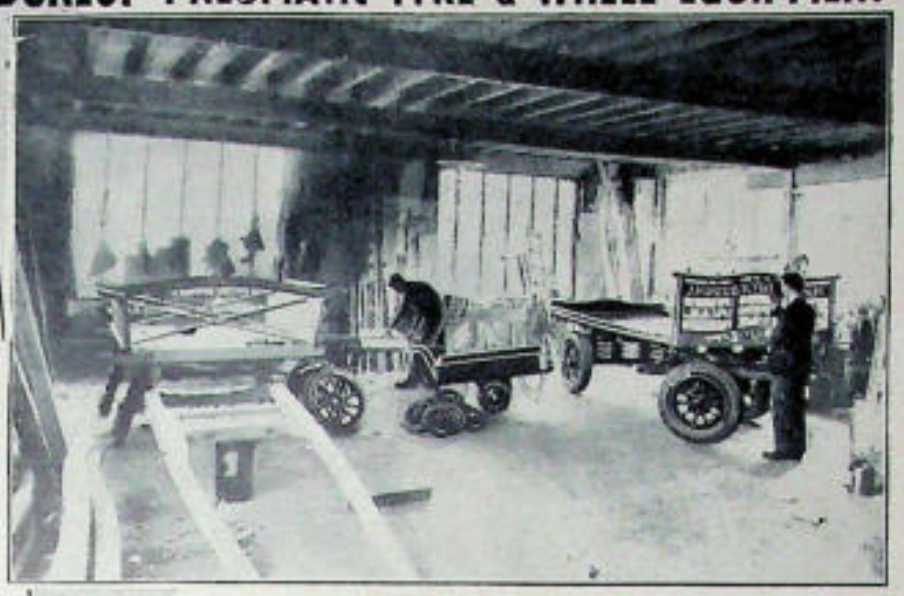
SAINT IVES, Hunts.

N. S. Downes Esq. District Manager,
Dunlop Rubber Co. Ltd.
Chapel Field Road,
NORWICH.

Dear Sir,

Nine years ago, we decided to build the future of our business, on what was then a new principle: Pneumatic Tyres for Farm Carts, Barrows and Trucks.

As you know, the Dunlop Rubber Co. had at that time developed and manufactured equipment, but were faced with the problem of convincing users of the advantages in converting to pneumatic tyres and wheels.



We decided to pioneer the equipment, and for this purpose arranged demonstrations in all parts of the country.

It was difficult indeed to bring users to change from the types of tyres and wheels which had been in use for so many years, but we persevered, as we were convinced that the principle was a step forward in our industry.

Today, we are manufacturing more vehicles than ever before, and we are glad to be associated with the Dunlop Rubber Co. in the development of equipment which has made transport in the fields and factories so much more efficient.

Yours faithfully,
Tom M. Scotney
TOM. M. SCOTNEY.

A PRODUCT OF TRADITIONAL CRAFTSMANSHIP

In these days of mass production a hand-spun, hand-woven Harris Tweed has a distinctive individuality of its own due to the inherent craftsmanship called forth in the making of such tweed

HARRIS TWEED

HAND SPUN
HARRIS TWEED

The registered Trade Mark stamped on the cloth itself is an assurance that the tweed has been made from pure Scottish wool, spun, dyed and finished in the Outer Hebrides—the home of Harris Tweed. The addition of the word HAND SPUN above the Trade Mark is an absolute guarantee that not only has the Tweed been woven by hand at the homes of the islanders but the yarn has been spun by hand on the spinning-wheel in exactly the same way as has been done for generations.

Rare Armour at Christie's

REFERENCE was made in the *Field* of July 15th to the famous collection of arms and armour of the late Clarence H. Mackay, which was put up for auction at Christie's on July 27th, and very remarkable pieces of mediæval craftsmanship came under the hammer. In view of the importance of the collection some of the prices were not up to expectations. But the rare type of "Hundsgugel," or pig-faced visor, here illustrated, stated to have belonged to the fourteenth-century ancestors of Graff Trapp (there are two others in the castle at Churburg), withstood bids for the National Art Collection and was purchased, it is said for a private collector, for 2,600 guineas.

A 14th CENTURY BASCINET WITH "HUNDSGUGEL" VISOR
Italian (Tyrol), circa 1350

There were no further offers after 410 guineas for the fine Milanese Pageant Shield which depicts the Emperor Charles V taking John Frederick, Elector of Saxony, prisoner after the Battle of Muhlberg in 1547, an incident of which there is an original drawing by Martin Heemskerck (1555) in the British Museum. The shield was withdrawn, together with a fine embellished Morion. An Augsburg suit of armour of 1550 brought a bid of 1,300 guineas, but even then was bought in.

There were "plums" for bidders, as when the boy's suit of armour of 1540 went for 160 guineas and the hilt of Coventry's old civic sword, once found among refuse, went for 290 guineas; the latter had once fetched 400 guineas. One of the disappointments of the vendors was the lack of support for the Ispahan carpet used at the coronation of King Edward VII, which was bought in for 6,200 guineas. There were some magnificent tapestries. Four Beauvais tapestries, known as the Italian Grotesques, which were woven by Philippe Behagel after designs by Jean Baptiste Bernin about 1700, went to Mr. Baeri, of Paris, for 1,450 guineas. A set of five was sold in the Mortimer Schiff Collection in June, 1938, for 2,900 guineas.

In the sale of Mrs. Evelyn St. George's pictures at Sotheby's a Goya portrait of Dona Antonia Zarate made a record at £6,800, and an El Greco painting of St. Catherine secured £3,800. Some Orpen portraits were to be had as bargains.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

A Meatless Luncheon in August
The Fare: Smoked Eels and/or Soused Herring
Œufs mollets St. Germain
Etuvée de St. Pierre à l'Orientale
Haricots verts Maître d'Hôtel
Fromage et Salade verte
Fruits
The Wine: Chavignol

EELS are delicious and nutritious, but not glamorous. Many people do not like the look of eels; never attempt to press eels upon such people: give them herring. A soused herring is more human; soak it in plenty of white wine with lots of onion; serve with it fresh tomatoes sliced and dressed in oil and vinegar.

Œufs mollets are new-laid eggs boiled in plain water six minutes, then cooled in cold water, when the shell can be removed, the white of the egg being sufficiently firm to hold the semi-liquid yolk inside. They are *St. Germain* when served upon a *Purée de pois nouveaux*; that is, garden peas boiled and mashed.

The *St. Pierre à l'Orientale* is not quite so simple. It is a John Dory, a very ugly fish with too big a head for its body, but what there is of the body is extremely good. Cut off four fillets from the backbone and put the head, fins and trimmings into a saucepan with a shredded onion, two cloves of garlic, parsley, thyme, bayleaf, pepper and salt, some lemon juice and equal parts of white wine and water. Let the lot boil fast a few moments; skim and let it simmer during 20 minutes; pass through a fine sieve and save this precious liquor or *fumet*.

Next take the fillets of Dory and drop them gently in very hot olive oil, adding in the pan some minced onion, quarters of tomatoes and two pimentoes cut up diecwise. Turn the fillets once over and then add the *fumet*; bring to the boil; then reduce heat, cover the pan and let the fish simmer in its liquor gently from 30 to 35 minutes. To be *à l'Orientale* the fish should be served with rice *Pilaff*.

A dish of new French beans, just tossed in a little butter and served with plenty of chopped parsley, will be welcome after the somewhat highly flavoured Dory.

One white wine from beginning to end should prove quite acceptable, and if one can secure a Chavignol, not a great wine but a very agreeable one, it will introduce into the meal an element of novelty which is always desirable.

FIFTY YEARS AGO

From the *Field* of August 3rd, 1889.

GOODWOOD Races. "It was 'glorious Goodwood' indeed. . . . Suffice it to say that the course was in splendid condition, the verdure 'green as emerald'; that the Royal Standard floated again from the summit of Goodwood House, where its noble owner entertained a distinguished circle of the intimates of royalty, and that the general company kept up the high reputation of Goodwood for being a social function which only Ascot can rival.

"But if Goodwood keeps up its high social character, it would be idle to deny that in sport it is not the Goodwood of yore. For that there are many reasons. The large prizes now, for good or evil, offered by so many newly established meetings have played havoc with many others that pursue the tenor of their way on the old lines. The time was when 'the hundred sovereigns added' to the Goodwood Stakes was considered a handsome sum, or at least one that tempted good horses and brought out good fields; but that era has long passed. The Cup is but the shadow of a shade; and even the Stewards' Cup—that most popular and gambling of short cuts, only to be equalled by the Hunt Cup at Ascot—has for the last few years been dwindling down to small proportions; this year about as small as on record."

TOUGH BEARDED SHAVER USES SAME BLADE 12 YEARS

The world-famous flight of the "Flying Fool" in 1927 was as great a thrill to J.B. as it was to you and I. But about the same time—12 years ago—J.B. enjoyed an even greater thrill! . . . He bought himself a Rolls Razor. Read what J.B. has to say about his Rolls today—12 years later. "I have calculated that my blade (the original) has covered nearly 2,500 yards of shaving area, not including under the chin. And thanks to your patent guard, cuts are unknown." *Signed*—J.B., Leeds.

LETTERS TO THE EDITOR

COUNTY CHAMPIONSHIP MATHEMATICS

SIR,—That there is a serious flaw in the mathematics of the County Championship points system must by this time be clear to anyone who takes the trouble to study the tables as they appear.

A few of the anomalies revealed by the table published on July 1st provide ample proof of this statement:

	P.	W.	L.	D.	Pts	Aver.
(1) Derbyshire ...	10	5	4	1	68	6.80
Surrey	11	6	3	2	72	6.54
(2) Essex	12	5	6	1	78	6.50
Lancashire ...	12	5	3	4	72	6.00
(3) Glamorgan ...	12	3	3	6	48	4.00
Worcestershire	13	3	6	4	52	4.00
(4) Hampshire ...	13	0	9	4	32	2.46
Northants ...	10	1	5	4	16	1.60

Surrey, Lancashire and Northants have playing records obviously superior to those of the counties placed above them by the eccentricities of the points system. And no sane person could maintain that Glamorgan and Worcestershire should in equity have the same averages.

An imaginary case will show to what extremes of absurdity the present points system can attain. Last season Leicestershire won four and lost nine of 22 county matches played, and had an average of 3.63.

If some other county—Wessex—had lost all its 22 matches after obtaining first innings lead in each, the final Championship table would have revealed the following Gilbertian state of affairs:

	P.	W.	L.	D.	Pts.	Aver.
Wessex	22	0	22	0	88	4.00
Leicestershire	22	4	9	9	80	3.63

Which, as Euclid very justly remarked concerning other matters, is absurd.

In its present form the points system fails to achieve its essential purpose—it does not provide a fair reflection of the form of the various counties. More often than not the Championship table is a ludicrous misrepresentation with little relation to fact and form.

Yours faithfully,

20, Dale Road, E. L. ROBERTS.
Purley, Surrey.

TAMING A RAVEN

SIR,—As the letter under this heading in your issue of July 1st has gone unanswered, I am sending a few lines that I hope may be of assistance to your readers who may now be bringing up and taming one of the crow family, and who wish to do so with due regard to the captive bird's welfare.

Assuming that the bird has never been placed in a cage, and is strong and full feathered, except in one wing which has had the longest feathers shortened, it is well to consider just how control of the bird can be obtained.

The only control that can be got over the bird's shyness is through feeding it. It must associate people's approach with feeding-time. Someone should remain in its presence until its appetite is satisfied. If this is not done, and it is allowed to feed by itself, it will never get tame but always try to hide itself when anybody approaches, waiting to come back and eat the food brought it as soon as left alone. On account of this the most suitable place to keep it in is a courtyard and not an open garden. If it finds sufficient food for itself you cease to have any control over it. It will eventually know feeding-time just as well by hearing a whistle as by seeing someone approach with food.

The longer taken over feeding the better. A crop full of soaked dog biscuit or strips of raw meat will soon be taken, but a piece of rabbit will keep the bird happily occupied for a considerable time pulling at it before a cropful is got. If a little fur is eaten it will do no harm. The liver is a tit-bit which will be much enjoyed.

Of course, the bird wants to be able to fly and hop up somewhere off the ground and into a roof or similar place, where it should spend most of its time. A roof or tree stump, however, does not make such a good roosting place for the night as something that it can get its feet round like a branch of an old tree. The reason is that in a wind it can be more comfortable if the feet can grasp right round something.

If the bird shows signs of roosting in a particular place as is sometimes the case, and it is a suitable one, encouragement can be given to it to continue using that spot by providing something soft for its feet. A piece of old carpet nailed round the branch is often much appreciated especially during cold weather and if always kept dry.

The crow family are well known to be fond of playing with anything bright like a small piece of mirror or string of beads. Something of this sort should, therefore, be placed at hand.

A bath should be provided as the bird may take kindly to bathing. The best position for a bath is, of course, in the sun. It should be saucer-shaped, with edges level with the ground so that the bird can wade in gradually until in a sufficient depth to throw the water over its back with its wings. A bath with steep sides which has to be jumped right into will very often never be used.

Yours faithfully,

Copse Hill House, C. C. T. GILES.
Wimbledon.

SIR,—The taming of any pet depends upon the temperament of the person, and the time they can devote to the work.

I have kept ravens for over 20 years, and have never experienced any difficulty in taming them. It takes fully two years before they talk freely, but if obtained from the nest when quite young they give very little trouble.

Until they are six months old I feed them three times a day, afterwards twice only, morning and evening. The first meal is flesh food, generally rabbit, and always with the fur attached; the second, usually a puppy biscuit, or bits from the house, avoiding carefully anything containing salt.

To teach them to talk, repeat the words you wish them to learn as often as possible, slowly and distinctly, avoiding words of more than two syllables to commence with.

Ravens dislike stroking, but do not object to having their heads and throats stroked gently with a finger. I never pinion or mutilate my birds, and find they come on better with entire freedom.

That "patience is a virtue" is indeed true in taming any wild creature.

Yours faithfully,

Parkend, M. LEIGHTON RIDGWAY.
Moreton Valence, near Gloucester.

SIR,—In a recent issue an enquiry appears on the subject of taming a young raven.

I have no experience with these birds, but my son and my wife have tamed a young rook which fell from a nest in a high elm in our garden.

This bird, now three months old, continues to be fed by hand, occupies a cage at night, and after his breakfast flies about the garden and spends much time up in the top of the tree in which he was hatched. He is called two or three times for meals, when he planes down on to my wife's or son's head or shoulder. He appears to take no notice of his wild relatives.

Some year or two ago I told you of my method of restricting my sparrow family. Our first week's catch this summer was 60.

Yours faithfully,

Start Hill House, G. P. A. CHURCH.
Bishop's Stortford.

BRITISH AMATEUR SCULLING

SIR,—The sudden and unexpected advent in the Diamonds at Henley of Mr. Burnell as a first-rate sculler is so reminiscent of my own experience 55 years ago, that I should like to point the moral for the much-needed encouragement of British sculling.

Let more oarsmen in all rowing clubs try to discover whether they are born scullers or not, for no one can be sure of this without serious trial. In any case, sculling practice would teach watermanship as nothing else can.

If such trials were more frequently made, further discoveries of latent capacity would be forthcoming, and British amateur sculling would soon recover its former prestige.

Burnell has given our oarsmen a fine and encouraging lead, and we scullers are proud of his magnificent effort against Verey, the Pole, in the semi-final heat. The cost of sculling boats and, if justified, of professional sculling should, where needed, be helped by the National Fitness Campaign.

Yours faithfully,

Burnham Overy, W. S. UNWIN.
Norfolk.

AMERICAN CREWS FOR THE LADIES' PLATE

SIR,—As an American with some interest in rowing and also as one who saw all four days of Henley this year, I might perhaps make a comment.

We have seen Kent and Tabor fighting it out for the Thames Cup this year, and the records show that either one or the other is a consistent winner of this event.

Is it not time to recognise that these two schools are beyond the Thames class? It is not derogatory to their English competitors to say that these boys, rowing together all spring and in training all that time, are bound to be better than the young business men who make up most of the English entries in the Thames.

Surely the Ladies' Plate is the place for American schools. If the regatta authorities want such entries to continue it would appear that either the conditions for the Ladies' Plate should be changed to admit foreign crews or a new event on the order of the Ladies' Plate should be created.

Yours faithfully,

London, W. 8. ROBERT P. POST.

GROUSE IN CUMBERLAND

SIR,—Although prospects on the low moors of Yorkshire are the worst they have been for many years, it must not be taken for granted that the whole of the North of England has been affected by this year's outbreak of disease which has visited many of the best moors. Some of the high moors in Cumberland, Durham and Northumberland are looking forward to their best season for several years.

The reason is, I think, not far to seek. In the spring of 1937 heavy snow lay on the high tops right up to the end of April, and the result was disastrous. While the great majority of birds migrated to the lower moors, many others died or did not breed at all. The deep snow, however, had one beneficial effect—it kept the late frosts off the heather, and the growth and bloom that year was quite phenomenal, with the result that in 1938 what birds there were did exceptionally well.

Although few could be spared for shooting last season, this nesting season began with a young and healthy stock on good clean ground, and as a result they have done exceptionally well. The hatch was very good indeed, and the heavy rains this summer did not commence until the young birds were old enough to withstand them. It was feared that the spring drought might have ill effects, but this ended just when keepers were getting anxious. On our moors, comprising Burnhope, Ireshope, Killhope and Killhope, in Weardale, and Tynehead, Priorsdale and Crossgill, in the Alston district, never a sick bird has been seen the whole spring, and I have never seen coveys so consistently big and healthy—the average must be nearer ten than eight. The shepherds on the moors, as well as the keepers, are remarking on this, and as lately as yesterday, in a two-hour walk on one beat, I flushed 20 coveys varying between eight and thirteen birds. Anyone with experience of grouse moors knows how close birds lie at this time of year on a warmish day, so this should give an idea of the stock there must be on the ground.

Similar satisfactory conditions also prevail on neighbouring moors, such as Moorhouse, Birkdale and the Killhope side of Allenheads, and several others.

I think I am right in saying the low moors of the north of England have not had a bad year for seven or eight years, and are, according to the cycles of disease, now due for one; whereas the higher moors had their bad time in 1937 and 1938. Surely a provision of nature that climatic conditions should affect different moors in different ways, as if the high and low moors were depleted in the same years recovery from the ravages of disease would be a slow process indeed.

Yours faithfully,

Bracken Bank, R. N. BURTON.
Lazonby, Cumberland.

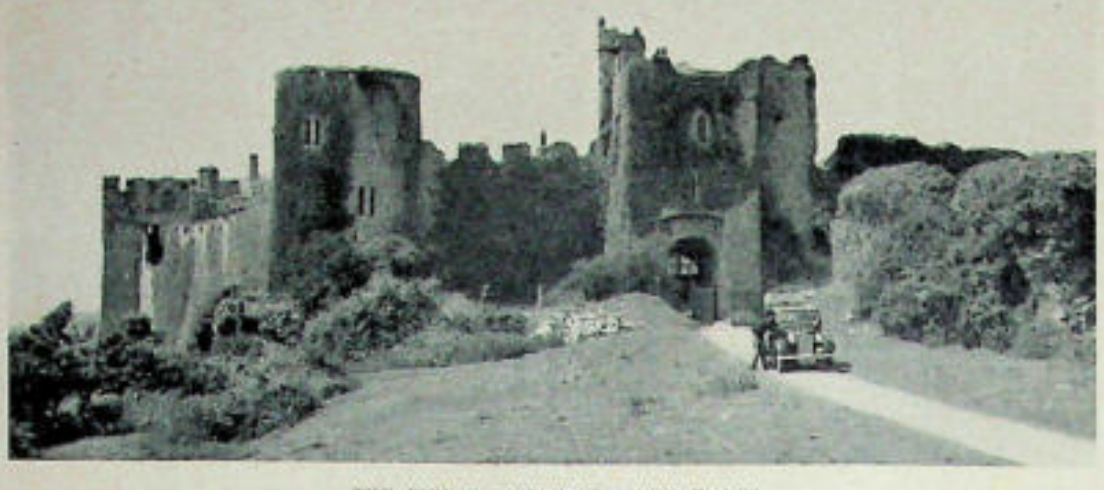
TWO YOUNG CUCKOOS REARED IN ONE NEST

SIR,—It is, of course, quite a common thing for two cuckoos to lay an egg in the same nest, but it must be most exceptional for both young cuckoos to be reared. Almost invariably one gets thrown out within 48 hours of hatching.

Consequently, upon reading in the *Field* of this alleged occurrence at Mill Hill I obtained permission to visit the garden in question, and took with me another enthusiast, Mr. E. E. Pettitt.

The evidence of the gardener who found the hedgesparrow's nest when the two young cuckoos were half grown, supported as it was by the lady of the house, who had never before seen a young cuckoo and did not realise it was anything unusual, was absolutely convincing to both of us. Incidentally, the gardener showed us in the same 3-acre property another hedgesparrow's nest containing one young cuckoo about half grown.

We were told, and believe it, that for days after leaving the nest the twin cuckoos were to be seen sitting near one another on a railing waiting to be fed by the foster parents, but they had left the garden when the letter appeared in the *Field*.



We saw the nest, which was surrounded by twigs in a thick, tight privet hedge, so that it is more than likely the twigs prevented either young cuckoo being thrown overboard by the other; supported by the twigs like matchsticks round the nest, he might well be able to resist the "ejectment order" of the other. The young hedgesparrows, being smaller and weaker, would fall through between the twigs. That is my explanation of the phenomenon.

The story had been sent in to the *Field* by a third party, and was consequently inaccurate. The suggestions offered recently by your correspondent, Mr. Brice-Smith, are exactly correct.

The "hissing," of course, emanated from the young cuckoos, and the fact that each had to live on half rations probably inclined them in their greed to grab the heads of their foster parents when being fed, which would explain the baldness of the hedgesparrows, a fact which was confirmed by the gardener.

Yours faithfully,

Gurdons, EDGAR P. CHASCK.
Witley, Surrey.

THE FINEST CASTLE IN SOUTH WALES
(See letter "Manorbier Castle")

MANORBIER CASTLE

SIR,—Perhaps Manorbier Castle is one of the most beautiful in the world; it is certainly the finest in South Wales. As an example of a Norman baron's house, and thought to originally date to the tenth century, it is one of the few old castles still used as a residence.

The keys of Manorbier are now preserved in Tenby Museum, and it is recorded that they were found at the bottom of the well in the courtyard.

The main structure was started in the reign of Henry I by a Gerald de Windsor, who married Nesta, a beautiful Welsh Princess; and at one time the castle was allowed to go to ruin, and it is said that smugglers made use of it for hiding their goods. Now the castle is in an excellent state of preservation.

Enfield, Middlesex. Yours faithfully, G. LESLIE HORN.

HARBOURING A VIPER

SIR,—After many efforts I have succeeded in persuading a pair of swallows to make use of a specially-made ledge in my garage for their nest, and the entire efforts of the household have been directed towards keeping away cats and small boys. The cats have been particularly troublesome as the height of the garage made it necessary to leave the car outside to deprive them of a jumping-off place. It now seems that I have been harbouring a viper in my bosom!

One Sunday I discovered that the youngsters, now nearly ready to fly, were being fed almost exclusively on my bees.

It appears, from the nonchalance with which the slaughter was being carried out, that this has been going on for some time, and that two other pairs had caught the habit.

In five minutes I counted fifteen bees taken, and at various times during the day I found the same thing happening.

At a conservative estimate one can safely say, I think, that upwards of 2,000 bees were being taken every day, a pretty formidable total when it is realised that a queen in full lay will only just produce that number.

I tried to get a photograph of the parent birds with bees in their beaks, but the light was against me, and by the Monday the youngsters had left the nest.

I imagine that shortly they will be able to help themselves, and I am seriously thinking of giving up bee-keeping and of taking up guinea pigs!

Scientifically it seems strange that no untoward effect appears to have been experienced by the young birds, especially so when one realises that reflex action after death is retained by the sting muscles, and that the poison sac continues to pump out its contents for several minutes.

Perhaps sudden annihilation which prevents the sting from ever being brought into play is the explanation.

Witham, Essex. Yours faithfully, K. RIDGWAY CRAWSHAW.

DEVOTION TO DUTY

SIR,—Your readers may be interested in the following account of a hen pheasant's "devotion to duty." Not far from this hotel is a small copse on the edge of the Plain. The centre of the copse is fairly thick undergrowth, but for some 15yds. round the edge the undergrowth has been beaten down by troops who use the copse during training as "cover from air." The distance between trees is just sufficient for a tank to take cover from air, which happened a few days ago. After the tank had left it was discovered that it had driven over a pheasant who courageously stuck to her nest—with dire results to herself. Why she should have chosen to build here on the edge, and near a road also, rather than in the much better cover of the centre of the wood is—well, rather astonishing.

The Crown Hotel, East Everleigh, Marlborough, Wilts. Yours faithfully, L. T. MITCHELL.

SAVING THE LIFE OF A ROE

SIR,—I had an interesting experience while I was out one morning recently stalking roe. I rose at dawn, and had been out for about two hours looking for a shootable buck. I was walking fairly slowly through some very coarse heather when I heard a sharp scream close behind me. I looked round but could only see the heather moving as if two animals were fighting about 5yds. from me. I put off the safety catch of my rifle and walked cautiously towards the commotion in the heather. When I was about 6ft. away I saw something like the brush of a fox, but I wasn't sure. All this time the little high-pitched screams continued, and I only realised what they came from when a doe appeared on the scene and started darting in and out. Then I saw the whole thing: A vixen had attacked an almost newly-born fawn and was trying to carry it off. The vixen then chased the fawn (which could just walk) into some very thick bracken, so that again I could not see it. I was able, all the same, to follow them because of the fawn screaming. It then looked as if the doe and the vixen were going to fight, but neither had quite sufficient courage to go at the other. I had, of course, been trying to get in a shot at the vixen, but what with the long heather and bracken, this had been impossible.

I again got within 2yds. or 3yds. of them, and the vixen left the fawn, more because of the doe than because of me, whom it hardly noticed. Not till then was I able to use my rifle, which I did from the shoulder and shot the vixen at about 10yds. range. The noise of the shot frightened the doe away, so that I was left with the fawn, which did not seem to be in any way damaged. I have often been told never to handle young fawns as their mothers are apt to desert them if they smell of human hands, so we stood and looked at each other for about half a minute, and then it walked away into the wood.

Rothiemurchus, Aviemore, Scotland. Yours faithfully, A. I. GRANT.

CONFETTI FOR A CHAFFINCH

SIR,—It would appear that some, at least, of the chaffinch family are possessed of the artistic sense.

A pair which built in my shrubbery, about 50yds. from the church porch, ornamented the outside of their home with coloured confetti collected from those thrown outside the church after weddings.

They can only be intended as decoration, as they form no part of the structure of the nest, being merely stuck on the outside, rendering an otherwise cunningly concealed nest rather a conspicuous object.

Is this decorative fancy at all a common thing?

Alverstoke Rectory, Gosport. Yours faithfully, GUY LANDON.

IN MEMORY OF AN EXCELLENT BOWLER

SIR,—Whilst travelling on the Dover road from London I made a "good, unsought discovery" which will be of interest to all lovers of the ancient game of bowls. I had halted and refreshed at the Prince of Wales Hotel, Milton, near Gravesend, and was strolling round the bowling green at the rear of the house, when I came across a curious monument set up in 1776 to the memory of "Alderman Nynn, an honest Man and an Excellent Bowler."

As I rarely go abroad without my camera, I took a photograph of the memorial, and herewith enclose a copy of my picture.

Thanks to the preserving care of mine host and his predecessors, the monument is in good condition.

"DEATH HAS . . . CLOSE RUBB'D HIM AT LAST"
(See letter "In Memory of an Excellent Bowler")

The following is a copy of the inscription:

To the Memory of
Mr. ALDERMAN NYNN.
An honest Man and an Excellent Bowler.
CUIQUE EST SUA FAMA.

Full forty long Years was the ALDERMAN seen,
The delight of each Bowler and King of this Green,
As long he remember'd his Art and his Name,
Whose hand was unerring, unrival'd whose Fame,
His BIAS was good and he always was found
To go the right way and to take enough ground.

The JACK to the utternost verge he would send
For the ALDERMAN lov'd a full length at each end.

Now mourn ev'ry Eye that has seen him display
The Arts of the Game and the Wiles of his play
For the great Bowler DEATH at one critical Cast,
Has ended his length and close rubb'd him at last.
F.W. posuit MDCCLXXVI.

Norbury, S.W. 16. Yours faithfully, JOHN H. TWYCROSS.

"Twelfth" Night

There's the morning drive to talk over; there are good cigars to be smoked; and there is Johnnie Walker in the glasses. Now *there's* a whisky! Blended from all the finest whiskies in Scotland, marvellously mellowed and matured. And blended with Johnnie Walker's consummate skill.

Gentlemen! your

Johnnie Walker

BORN 1820—STILL GOING STRONG

RESCUING AN ELEPHANT

SIR,—I enclose three snapshots of an accident which occurred recently to one of our working elephants in the north of Siam, and is described as

follows by the man who directed the rescue operations:

"118 *Poo Orm*: I was awakened yesterday morning about 4 a.m. with the news that this elephant was stuck in a deep pool up-river and could not get out. I sent off the company's bus at once with all the men in the compound and all sorts of gear, and followed shortly after.

"When we got to the place we found the elephant almost submerged, the top of his head being just visible, and at times part of his back. He was still alive and was breathing about once a minute by raising his trunk out of the water. He had been there since 6 o'clock the evening before.

"Our headman in charge of the working party had collected a lot of boats and villagers to help, and some of our elephants arrived shortly after we got there. They should have been there long before, but I think the headman had used all available men to search for boats; it is not easy to get boats of any size in that part.

"Long poles were driven into the river bed close to the elephant and boats tied to these; villagers then dived and found out what was holding him. He was caught by the forelegs by a sunken tree which was between his legs and mixed up with the hook bobbles. There was a strong current and the weight of the water had forced him back so that he was not standing normally but with his legs stretched out in front.

"The villagers were astonishingly brave, diving repeatedly round his legs, first to find out what was wrong so that we could decide what to do, and later to attach a chain round the tree.

"First efforts with an elephant dragging in the river failed, but then we tried with Poo Chai (one of our elephants) on the bank and a long wire rope to the chain, and either owing to the slightly different angle or the better foothold, the tree broke and Poo Orm was freed. As soon as he was brought into shallower water men dived down and got his chain hobbles off, and he was then walked slowly down to a level place where he could get out. He was freed at 11.30 a.m., having been over seventeen hours in the water.

"There is no doubt he knew the men were helping him, and he stayed wonderfully quiet, even considering how exhausted he must have been.

"He was naturally desperately cold when he got out, but as far as we could see there were no injuries. Whether he is all right inside remains to be seen after he has been rested; and it is possible that he may not be as good in the water in future.

"His legs were not cut, and he started to eat as soon as he got on shore, which I think is a very hopeful sign.

"The whole affair was amazingly interesting, though rather harrassing for the first hour or two, as it seemed impossible that he could be saved. Another 6in. of water would have been sufficient to drown him; he could only just see by raising his head to the limit."

SALVAGE OPERATIONS IN PROGRESS
(See letter "Rescuing an Elephant")

The snapshots show:

(1) All that was to be seen of the unfortunate elephant from the river bank. Note the swirl of the current and what appears to be as a bit of the animal's trunk.

(2) Operations started. The tip of the trunk is clearly visible.

(3) Operations in progress. In this photograph part of the back shows, but the animal does not appear to be breathing at the moment.

I may say that Poo Orm does not seem to have suffered at all as a result of his narrow escape, although his age is estimated at about 60."

Yours faithfully,
A. R. MALCOLM.

AN OCTOPUS IN LOCH CAIRNBAWN

SIR,—During a recent visit to the north-west of Scotland, when I stayed at Kylesten Hotel, Sutherland, the following incidents might be considered sufficiently unusual to be of general interest.

One evening of ebbing tide, I was walking along the rocky shore of Loch Cairnbawn when I noticed what appeared to be a large goldfish swimming in from the deep water. On closer inspection the goldfish turned out to be a small octopus of about 2ft. diameter. In swimming, the creature's tentacles are extended behind and propel it with much the same action as the legs of a frog.

The octopus swam into a small pool amongst the rocks, where it later became land-locked, apparently being quite blind and incapable of finding its way out. In the course of a few hours it had changed from a golden pinkish colour to a deep rusty brown, and appeared to be in a state of semi-asphyxiation. However, with the next full tide it disappeared. None of the local inhabitants had ever heard of an octopus being seen in shallow water before, unless dead.

The other incident was the catching by my wife of a small herring of under ¼lb. on a "cuddly fly," with white wing and red body, the herring's minute mouth just containing the point of the hook.

Rumour of this unusual catch must have spread, for the next evening a local fishing smack was in Glencoul (never before fished with herring nets), where they made a catch of 200. I believe that it is very seldom that a herring is caught with rod and line.

Yours faithfully,
JOHN R. R. SMITH.
Dunscrieff,
Moffat, Scotland.

RINGING A RAT

SIR,—Captain Brook, of this address, instructs me to send you herewith a photograph of a young rat which was picked up on a farm near here the other day, and it occurs to him that it may be of some interest to readers of the *Field*. Apparently, when very young, the rat had got its head into a chicken ring and as it grew the effect of the ring slowly starved it.

Yours faithfully,
E. W. BROOK.
Kinmount, Annan, N.B.

STARVATION BY STRANGULATION
(See letter "Ringing a Rat")

PARTRIDGE V. TURKEY

SIR,—At 7.30 a.m. on Sunday, June 18th, I was looking out of my bedroom window that overlooks a field with recently cut hay, which is cocked; it

is a small field where I have always noticed for the past five years there have been a covey of partridges reared on it.

I saw a hen turkey making its way to a fence that divides this field from another, it walked to where two old partridges were with their chicks; all of a sudden the turkey chased one partridge, no doubt the cock bird, because I saw the other remain and make the usual noise, and keep lowering its wings as if it was protecting its chicks.

The turkey chased the partridge for quite 70yds. or 80yds., and then it stopped; eventually the partridge found its way back to its mate and chicks.

About five minutes afterwards the turkey found its way to the partridges again, this time to meet with some opposition, for one of the partridges flew or jumped at the face of the turkey and held on for a second or two, while the other partridge made the same noise and lowered its wings again and remained.

The partridge then dropped off the face of the turkey, which ran away as fast as it could go, and this time the partridge chased it.

I thought what intelligence and pluck partridges must have.

Yours faithfully,
DANIEL ALDIS.
Lynn Road,
Grimston.

Have you seen the 16mm. Magazine Ciné-'Kodak' in action? It's the world's sweetheart of ciné-cameras. So petite you can slip it in your pocket. So sophisticated that—well, see how advanced some of its features are. Yet it's as easy to handle as a box camera.

TWINKLE, TWINKLE, LITTLE STAR

Film yourself (you can!)—your kiddies—sport from a distance, with long-focus lens—slow motion. All these are nothing to a Magazine Ciné-'Kodak'. Just load with film (3 seconds' work) and press a button.

TROOPING THE COLOURS

To get marvellous colour movies just change to a magazine of 'Kodachrome' Film—in mid-reel if you like. Not an inch of film is wasted.

For night shots, ordinary home electric light is often bright enough with Ciné-Kodak Super-XX Film.

Spend five minutes examining this wonderful little camera at your Ciné-Kodak Dealer's. Ask him also for a booklet on Ciné-'Kodaks', or write to Mr. F. Taylor, Dept. 57, Kodak House, Kingsway, London, W.C.2.

Ultra-fast f1.9 Anastigmat lens; seven long-focus and wide-angle lenses available (extra); 3 speeds (16, 32 and 64 per sec.) Capacity 50 ft. magazine of 16mm. film. Price (with carrying case), £40.

The MAGAZINE
CINÉ-'KODAK'

WHAT AILED THE FISH?

SIR,—With reference to the interesting experience of Lieutenant-Colonel R. Steuart-Menzies as stated in your issue of June 3rd. The cause for the queer behaviour of this fine 29lb. salmon leaping ashore was very probably due not to the reasons mentioned, but to a worse enemy. I should be inclined to give the following diagnosis:

Pain, I think, could be ruled out. I do not think fish suffer pain that we know of other than the burning sensation caused by placing the dry hand on them.

There is the possibility of the otter, but should there have been one in the vicinity, master or man would have seen it prior to the incident of the fish. Whether seen or not, the otter would certainly have been aware of the anglers and that would not have been his time to broadcast a hunt or kill, so I think the question of an otter can be ruled out.

Lampreys. These are suckers and though I know next to nothing about them, I have never heard of a Spey salmon with a lamprey attached to it.

Eels. These I think are undoubtedly the answer. They have a particularly keen sense of smell, and the fresh blood oozing from the salmon's gills would at once attract any in the vicinity. They are very voracious feeders and would at once attack the spot where the blood was coming from, and I do not think any living fish could withstand an attack on so vulnerable a part as its gills without going almost mad with fear.

Congratulations to your correspondent on his presence of mind and agility in gaffing the fish. A salmon jumping ashore does not waste much time admiring our scenery.

Yours faithfully,
London. W. M. HOGGAN.

PARTRIDGE LAYS IN PHEASANT'S NEST

SIR,—I thought that the following incident might be of interest to your readers.

One of my staff recently observed a pheasant's nest in the garden and kept watch on it. After about a fortnight he was astonished to see a large pile of eggs in the nest. He counted them, and found there were 23. All the eggs appeared to be almost exactly the same in size, but ten of them were just slightly lighter in colour than the remaining thirteen. My man had no doubt that they were all pheasants' eggs, but realising that a hen pheasant could not successfully cover 23 eggs he took them all and put the ten lighter-coloured ones under one hen and the remaining thirteen under another.

The eggs of darker colour hatched first. They were not all fertile, only eight pheasant chicks being hatched. The lighter-coloured eggs hatched about a week later. All were fertile, and each egg produced a *partridge* chick.

I am wondering whether any of your readers have known of a case where a partridge has laid almost a full clutch of eggs in a pheasant's nest, for this is undoubtedly what happened in this case.

Yours faithfully,
Lullenden, East Grinstead. BERNARD C. ROBINSON.

HARDLY CLEAR ENOUGH FOR THE MOTORIST
(See letter "An Ancient Signpost")

AN ANCIENT SIGNPOST

SIR,—While journeying from Banbury to Stratford-on-Avon recently I came upon the ancient signpost shown in the photograph at a cross roads near the village of Wroxton. It bears the inscription that it was given by Mr. Frank White in the year 1686. Hands carved in the stone indicate the ways to Stratford, Banbury, London and Chipping Norton. The Stratford and London indications are just visible in the picture.

Yours faithfully,
45, Shepherds Green Road, Erdington, Birmingham 24. S. F. PHILPOTT.

STRANGE BEHAVIOUR OF A FRENCH PARTRIDGE

SIR,—A keeper employed by a friend of mine in Herefordshire told me that recently he had a French and English partridge occupying nests about 40yds. apart in the same hedgerow. Both began to sit. He saw them frequently, and one day found the French partridge sitting on the eggs and nest of the English partridge, who was sitting beside her. The English partridge was sitting on twelve dummy eggs, and the next day he put a nest full of pipped partridge eggs under her, and drove off the French bird. He returned in an hour or two and found the English bird firm on her nest, and the French one sitting about 1ft. away. He drove her away again, and did the same in the evening. Next day the English partridge had hatched out the pipped eggs and gone off with them. I believe the French one deserted her own nest.

The keeper told me it was common talk among keepers that French partridges would forsake their own nest and go and brood on an English bird's nest, but he had never actually seen it happen till this season. Can anyone relate a similar behaviour, or explain why the French partridge should leave its own nest and annex that of an English bird? Perhaps it recognises the superior quality of the English variety!

Yours faithfully,
"Berrimans," Stroud, Glos. E. ARMITAGE.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—We are anxious to raise the sum of £26 in order to help a very pathetic family—a brother and two sisters living in extreme poverty. They were left very badly off on the death of their father, a Yorkshire doctor, and for the last 30 years the son, aged 58, a scholastic coach and tutor and B.A. of Cambridge, has provided for his two sisters. Unfortunately he has been out of work for nearly a year and there seems little prospect of his getting employment. The elder sister, aged 62, does temporary domestic work for which she receives a few shillings weekly, but the younger sister, aged 60, suffers from acute deafness and is quite unable to work. We want to make them an allowance of 10/- a week, which, with help received from another society, will make life easier for them for at least a year.

Watch point

Don't keep your Gold Flake to yourself! That's one of the rules of the game, if you wish it to be a love game. Remember how popular they are with women nowadays. It's the flavour of the really fine Virginia tobaccos of which Wills's Gold Flake are made that appeals to the ladies as much as to you. So, if you want to be the court favourite, be generous with your Gold Flake.

WILLS'S GOLD FLAKE
is the man's cigarette

IN THE CITY

By OUR CITY EDITOR

A VERY substantial movement has developed in the last few weeks towards buying home industrial equities. I am told that high-class and fixed-interest bearing securities are being sold and the money immediately put into good class industrial ordinary stocks and shares.

The recent state of the market for high-class stocks suggests that something of the kind is going on. Underwriters of important new loans, such as the latest Australian Government and Sudan Government loans, who had been left with large amounts of the issues on their hands, find the stocks moving off very slowly indeed.

The demand is for equities. I understand it is based on an industrial boom in Great Britain. This is largely due to the rearmament plan. There are, however, other factors such as the substantial credits which have recently been granted to Poland, Rumania and other countries to purchase British goods.

It is plain that industry is booming. This is reflected in very substantial reduction in unemployment, in splendid railway traffics, a very high banknote circulation, record steel production, increased motor car registrations and other pointers of industrial prosperity.

The demand is centred very largely on the better class equities. There is, for instance, buying of Imperial Tobacco £1 units at a price around 6¾. The company has just announced a maintenance of the interim dividend on the ordinary for the current year at 7½ per cent. tax free. Total distribution in recent years has been 25 per cent. tax free. It is thought that in view of industrial prosperity the recent increase in tobacco prices will have little effect upon consumption.

I am told that Marks & Spencer 5/- "A" shares are worth buying at their present price of about 58/6. This company is, of course, one of the best known of the chain stores. It is not often recognised, however, that Marks & Spencer, with stores dotted all over the country, is now one of the largest retailers of foodstuffs in the country.

The company has an excellent record. It is sound in every respect. There is a general belief that it is participating substantially in the prosperity enjoyed among the people of this country. I regard it as a share worth putting away for a time.

In connection with trade activity, I might mention that various commodity shares should be worth at least speculative attention. I find in some quarters a confident belief of improvement in rubber shares. The statistical position to-day, thanks to the International Regulation Committee, is better than for many years.

Production quota for the final six months of this year is to be 60 per cent. of standard tonnages as compared with 55 per cent. in the first half of the year. That must to some extent benefit producers, if the price of raw rubber can be held around 8¼d. per lb.

There are many buying Anglo-Dutch Rubber shares around 22/- and Rubber Trust ordinary around 28/-. I consider that the shares offer some speculative attraction. They will be among the first to go ahead on any general recovery in the market as a whole.

Then, again, base metal shares should receive some consideration by those who can take some risk with their money. The demand for copper is now substantial. The statistical position is improving.

Among coppers, I select Roan Antelope 5/- ordinary with a price of 16/-. Results for the year ended on June 30th are unlikely to be as good as for the previous year, but the Stock Exchange invariably looks ahead and discounts the future. Those prepared to ignore temporary market movements may easily find Roan Antelope shares a profitable holding.

Most of the shares I have mentioned will produce reasonable income, but the main object at the moment is to find capital appreciation. There has been great activity in rayon shares. The industry is staging a recovery, but the shares are highly speculative under present conditions in that particular market.

AQUARIUM ADDITIONS

The Zoo Aquarium, always popular with visitors, has just been presented with some curious and highly coloured fish from the Red Sea by Colonel E. T. Peel. Perhaps the outstanding member of this collection is the dragon fish. It has enormous fin rays which give the fish a most striking appearance when spread out. On summer evenings the Zoological Gardens are kept open late, and visitors are well advised to pay the extra amount and visit the Aquarium.

New Books

BOOKS ON THE COUNTRYSIDE

East Anglia, by DOREEN WALLACE: *The Lowlands of Scotland*, by GEORGE SCOTT-MONCRIEFF. (Both Batsford; 8/6.) *Highways and Byways of Essex*, by CLIFFORD BAX: *Highways and Byways in the Welsh Marches*, by S. P. B. MAIS. (Both Macmillan; 7/6.) *The Islands of Scotland*, by HUGH MACDIARMID. (Batsford; 10/6.) *Companion into Worcestershire*, by MAXWELL FRASER. (Methuen; 7/6.)

England, judging by the publishers' lists, is becoming more and more national-minded or, perhaps, in these days when the word national is subject to a number of doubtful political interpretations, more and more home-minded. I think that is a very good thing, and I do not think one can have too many books about the English countryside, the English people and English customs. The more we get to know our own country, its history, its lore, the ways of its people, the better not only for us but also for the country.

Three of these books come from Batsford. That means that they are produced as well as books can be produced, and finely illustrated. Two deal with parts of the country fairly well known to the tourist (though by no means as well known as they might be) and the other with a number of islands of the coast of Scotland, islands which are as yet little known by the average Englishman. I think (it is, of course, unavoidable in the series to which they belong) that each has suffered from over condensation. Miss Wallace knows her East Anglia and has written a fine book, but she has only whetted my appetite. She could, I feel sure, write an infinitely more comprehensive one. I do not think Mr. Scott-Moncrieff could. There is matter enough in his pages for three books. He is altogether too brief. The Lowlands of Scotland are packed with history and legend, and much else which could not find a space in this volume. And what a pity that is. Mr. MacDiarmid has done his work well. He knows the islands and loves them, and his is a fitting companion to Mr. Mason's *Islands of Ireland*, than which I can say no more.

The remaining three books fall into rather a different category. They set out to cover certain districts as fully as possible from every angle. The *Highways and Byways* series needs no introduction. Mr. Clifford Bax's book, beautifully and modestly written, is well worthy of a place in a series every one of which has maintained a high standard. He knows how to deal with a church such as Thaxted, and a resort such as Epping, and he knows Essex backwards. Mr. Mais's book should never have found a place in the series. It is altogether too superficial. Miss Fraser has done Worcestershire beautifully. This book must rank among the very best on the county, and is written in a lovely simple prose of a type altogether uncommon in these days.

There are six books in this list. I am not going to attempt to compare them—Mr. Mais's suffers only because it has found the wrong home. Each is written by a person who realises that the life of this country of ours depends upon the country life rather than the life of any individual town, and each is a straightforward account unclouded by sentimentality.

BRIAN VESEY-FITZGERALD.

* * * *

The Insect Legion. By MALCOLM BURR, D.Sc., F.R.Ent.S., &c. Pp. xiv and 321, 30 illustrations. (Nisbet; 12/6.)

Dr. Malcolm Burr is a well-known authority on orthopterous insects; in fact, the results of his work on them have formed the basis of their modern study. It is seldom these days that a popular book on insects comes from the pen of an expert entomologist, and rarer still that such a popularly written book can retain the interest of adults—for it must be admitted that much that is written on the subject is rather hackneyed.

When the author was writing this book, to which he has given the sub-title of "The Significance of the Insignificant," he told me that it would be an endeavour to explain to the man in the street (surely he must be getting very wise by now?) the importance of modern entomology to mankind. This was rather a restricted statement, for besides the general reference to the insect world and the explanation of the medical and economic aspects, he writes about many other facts that will interest not only the general reader, but also many of his colleagues. In saying this I have in mind the chapters dealing with "A Sense of Proportion," which is concerned with the geological record of insects, and especially his treatment of the history of entomology. He takes us back as far as Cave Man, giving an illustration of the Palæolithic painting in the caves of Azañ, near Valencia, showing a man climbing a cliff to collect honey, with the angry bees buzzing around him. It seems that Dr. Burr has traced almost every mention of insects in ancient, classical and mediæval times. The earliest records concerned the same subject as depicted in the Spanish cave painting; man's weakness for honey is as old as the hills.

The part of the book dealing with the modern side of entomological history begins with events in the fifteenth century. It is particularly interesting to read the detailed vicissitudes of the material that went to the making of the first book on entomology published in this country, known as Moffet's *Insectorum sive Minimorum Animalium Theatrum*, which appeared in 1634. The title-page, with portraits of Moffet, Penny, Wotton and Gesner, whose combined work is embodied in that book, is reproduced from an illustration in one of Dr. Burr's articles that appeared in the *Field*.

The anecdotes collected about insects will attract the specialists as much as the general reader, and anything amusing that has been written about these six-footed creatures seems to have been seen by him. He mentions, for instance, the now forgotten caricature of the potato beetle that appeared on the pantomime stage in England in 1887, when the Demon King came on the stage dressed in black and yellow stripes, the appropriate livery, and sang:

"Take care of your little potatoes, boys!
And all your tiny spuds.
Just watch your jolly cauliflowers
And all your fuchsia buds.
You'd better hide your bread and cheese,
And everything you've got,
For the Colorado Beetle's come,
To collar the jolly lot!"

This book will be found most entertaining reading by all interested in entomology and natural history generally; it is the best of its kind published for many years.

E. F. LINSSEN.

Angel from a Cloud. By RICHARD INCE. (Massie; 8/6.)

Personally I like historical novels. It is true that the reader is presented with a character designed and coloured to suit the author, but what matter? Before, the man was a name hedged in by the other names and facts which constitute history. The novelist takes him up, and he lives. No longer a name, now he is become a being, and the dry bones of history have taken flesh upon them.

So it is with this book. Dr. John Donne was one of the most gifted and saintly deans St. Paul's has known, so the writer tells us. Most of us, if we are honest, may not even have known that, but in his book Mr. Ince makes Donne live. The book is divided into three parts—In Pursuit of Love: In Pursuit of Fortune: and In Pursuit of God. In each section the characters are real and vital, and the reader senses the spirit of the main player as he struggles to know Truth. In Love we see him sensuous and passionate: in his search for Fortune, striving but frustrated; and in his search for God, at peace.

At times the author is apt to over-philosophise, but not often, and since his command of the English language is better than that of most, this fault is gladly forgiven him. His characters live, even down to the Countess of Bedford. She prattles on, "blowing pretty bubbles of delight out of the fragrant soap of her cheerful egotism."

John Donne (pronounced to rhyme with "sun") was a poet of no mean repute, and his lines are skilfully woven into the story. They provide a good light on the refining of his character. Early on there are the lascivious, yet strangely realistic lines, "Going to Bed," which one might describe as a rejoicing "in iniquity"; and then, towards the end, the verse written as an old man:

"Wilt thou forgive that sin which I begun,
Which is my sin, though it were done before?
Wilt thou forgive those sins, thro' which I run
And do run still: tho' still I do deplore?
When thou hast done, thou hast not done,
For I have more."

Not only is this an extremely readable novel, but it is a parable of life, worthy of consideration.

LESLIE N. RADCLIFFE.

Greensleeves. By BERYL NETHERCLIFT. (Heath Cranton, Ltd.; 5/-.)

These days, when it is hard to escape from the metropolitan atmosphere anywhere in the Home Counties, it is refreshing to read about a rustic retreat like Greensleeves, in Sussex. There is plenty of pretty scenery in this district, but little that is still rural, little where the influence of London is not felt. But this forgotten farm lies hidden "far from the madding crowd." The authoress has found its secret and interpreted it with great charm and deep understanding in the pages of her book. She is very sensitive to the pastoral scene, but even more so to the "tangibly tranquil atmosphere that hung over the house—stilly sweet, like a benediction." It will be agreed, I think, that "the fragrance of lives lived long and lovingly in a place can never altogether forsake it." The book is dedicated to the memory of Viscountess Wolseley, and illustrated by Edith Elphick.

W. H. T. LONG.

The Salt of the Earth. By JOSEPH WILTLIN. (Methuen; 7/6 net.)

Though this is a book about war and modern war and all the chaos and horror that it brings, it is not likely to shock to anything like the same degree as the usual type of book which the Great War produced (if, that is, the scars of war holds anything fresh for us). This is because it is written by a man who is a poet rather than a journalist or the usual type of person who writes about war. His book is in prose, yet there is poetry on every page—his writing is poetical, and his thinking is the thinking of a poet. Thus it is that no matter how hideous he makes the experiences of Peter, a railway porter in a small village of Ruthenia and the chief character in the book, their ugliness is cloaked by the sheer beauty of his language. It is a book all the more worth reading in that it was, I understand, awarded the prize of the Polish Academy of Independents. In any case, a book which can see war as this one sees it is worth some sort of attention.

HUMPHREY DANIEL.

The Book of the Mushroom. By A. DEFRIES. (Methuen; 2/6.)

The popularity of mushroom-growing in this country is beyond doubt, and it can be explained, as Mr. Defries points out, by the fact that the market is not yet glutted and by the variety of places in which mushrooms may be grown—on ships, in flats or in pastures. The things essential to success are scientific equipment, capital to buy it, and the right methods of cultivation.

Mr. Defries deals with these subjects in the manner of an expert, and his chapters on spawns and diseases will be of particular value to the beginner.

* * * *

Huntin', Shootin' and Fishin'. By K. R. G. BROWNE. Illustrated by A. H. D'EGVILLE. (Cassell; 5/- net.)

Of the making of funny books about field sports there is apparently no end, and it is a fortunate thing that there appear to be as many and as unsuspected ways of dealing with the subject.

Mr. Browne gives advice to the novice in all branches, and contrives to mix in a few home truths—"the Englishman's natural instinct being to shoot what he cannot understand" being a case in point. Mr. D'Egville's drawings are a sheer delight, and will recall many a situation to the field sportsman.

* * * *

Cattle, Sheep and Pigs. By FRANK T. BARTON, M.R.C.V.S. (Jarrolds; 7/6.)

This invaluable work of reference was first published before the War, and now appears in a wholly revised form, with over 100 new illustrations, in its third edition.

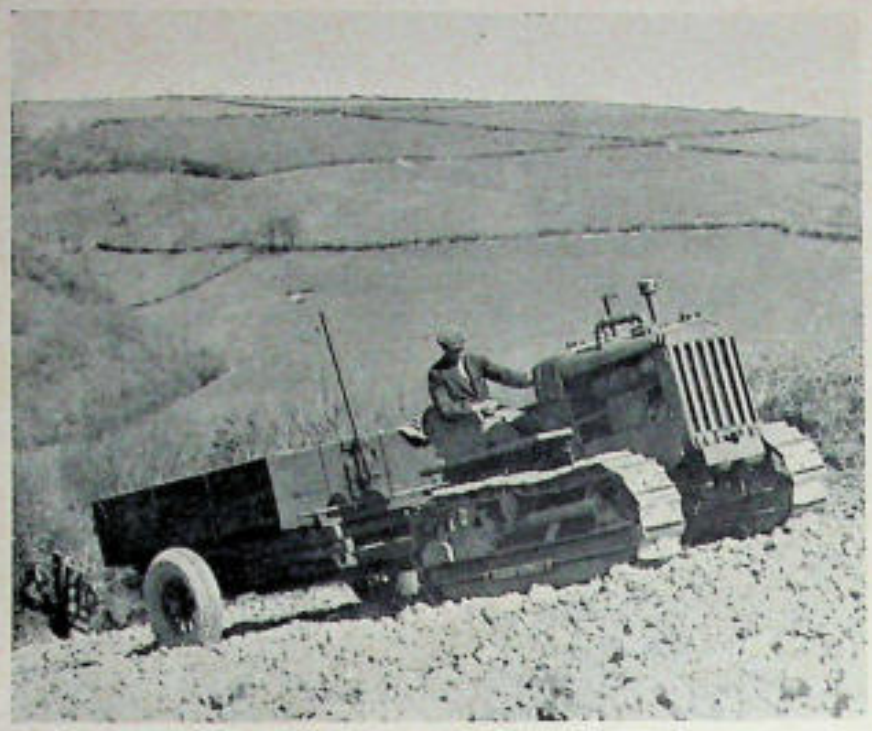
Mr. Barton's method has been to take the various breeds of stock, and to point out how farmers, living in different parts of the country and using their stock for different purposes, may purchase the breeds most suited to their needs. He also gives the latest views on diseases affecting stock and the best opinions as to how they may be cured and prevented. Food for cattle and sheep is the subject of a special chapter, and there are useful hints on the marking of livestock, the disbudding of calves, and the ringing of pigs.

There is, what is unusual in books of this type, an index which is comprehensive.

ROBERT COLVILLE.

ROWLAND WARD LTD.

The Scottish Stalking Season



Rousleyn Gordon-Cumming's 14 pointer. Circa 1830

To encourage the cult of fine heads, we are glad to announce that we will mount free of charge the Red Deer head, which, in our opinion, is the outstanding trophy sent to our studios during the forthcoming stalking season. This offer will also hold good in subsequent years.

We will also mount free of charge the best trophy shot by a young stalker under twenty years of age. Such a trophy must be accompanied by a letter establishing the bona-fides of the applicant.

We will always be pleased for our work and our prices to be compared with those of any firm of taxidermists. New methods of modelling have enabled us to reduce considerably the former without impairing the high standard of craftsmanship associated with the name of Rowland Ward, which remains the best in the world. Our price for a modelled stag's head on a shield is £5 10. 0. Other prices will be sent on application.

THE 3-TONNER TIPPING TRAILER USED FOR THE PRINCIPAL HAULAGE JOBS OF THE FARM

SOWING ARTIFICIALS WITH A CATERPILLAR TEN ON THE FARM AT CASTELL GORFOD

A LANDOWNER'S WORK IN WALES

II.—The Part Played by Machinery

OF all our agricultural problems of the day, none perhaps is so critical as that of the derelict or semi-derelict farm. It is more than an internal problem of the industry: it is a matter of deep national concern. Millions of unproductive acres represent just so much depreciation of the country's assets, and it is urgently necessary to get this land back into condition, not only for our economic benefit in peace time but for our security in the event of war. Recent Government moves indicate official recognition of the need, but it is doubtful whether the practical difficulties are fully appreciated.

The reasons for such decay of the land need not be entered into here. What is of moment is the question of the right people to undertake the much-needed improvements. The occupiers of the land, as tenants, will rarely be capable of effecting much. Those who have been in a position to progress have not let their land fall back. To expect the State to carry out the work is to ask for nationalisation. The move towards general improvement must come from those with a permanent interest in the land. Only the landlord to-day is in a position to undertake the regeneration of the land in a practical manner.

In this connection, I do not assume that every landlord is in a financial position which makes it easy for him to undertake improvements, but generally I would suggest that they are in a better position to obtain and use credits for the purchase of machinery and the carrying out of reclamation work than tenants, and that, when farms are put in good shape, it is not difficult to find good tenants for them and to secure a return on the capital invested.

The conditions obtaining on the Castell Gorfod Estate, owned by Captain Buckley, have already been outlined in a previous article. In many respects, his work has depended for its success on the employment of modern machines and equipment.

Bracken, for instance, had to be tackled when he commenced reclamation and presented a difficult problem. Men for scything were not, of course, available, and the fern was growing on many slopes too steep for even a crawler tractor or for horse mowing. Eventually, an Allen self-propelled motor scythe was tried out and proved to be most satisfactory. It is capable of travelling across the steepest slopes and deals with bracken of any length and also with brambles, if they are not too thick. The combination of ample power and large travelling wheels enables the machine to negotiate really rough ground and hillside stones. It is considered that the bruising cut of the mower blade is much more effective in killing bracken than a clean scythe cut.

The heavy work of the farm has been carried out for the last two seasons by a Fowler Three-Thirty crawler tractor, of the Diesel type. This has been extremely economical in operation, and has given proof of the value of the bigger crawler in this hilly country. The machine is of the wide gauge type, and its driver has become a real expert in handling it in what might be danger spots for the novice. In his hands it has had every care in maintenance and has repaid by an absence of trouble. The fuel bill has been well under £20 for a full year's working.

Not only has this machine been responsible for all the major operations on the Castell Gorfod farm, but its services have been begged by neighbouring farmers, whose lack of equipment has rendered it impossible for them to get ploughing done in these days of high labour costs. An example was given me by Captain Buckley when I visited his farm, and he pointed out a 10-acre field which he had ploughed for a neighbour. This farmer had in years gone by ploughed this particular field with a one-way plough borrowed for the job and with his own horses. It had always been a month's hard work. Now the plough was no longer available. Captain Buckley's Fowler went in and did the job in 21 hours on 17 gallons of Diesel oil and a pint of lubricant.

The big Diesel outfit which has now broken the back of the reclamation work on the home farm is to be made generally available to the tenants for work on their steep hillsides or for very heavy operations, after which they are in a position to complete the lighter draft jobs with horses or wheeled tractors. A wheeled tractor is being purchased for use on many jobs at Castell Gorfod, as it is considered uneconomic to employ the heavy machine for many light jobs.

In selecting a machine for this class of work Captain Buckley considers that a four-speed tractor is desirable with a high top gear which can be employed for rapid haulage down from the hill tops with loads and back with the empty trailer. He looks for a quick-acting foot-operated brake which should actuate drums on both rear wheels together. The application of an independent rear-wheel brake to either side of the tractor when descending hills causes the machine to swing round.

He has found a difficulty in keeping up engine temperature when descending the long hills and proposes to equip his machine with an extra large auxiliary petrol tank to permit of a change over from paraffin to petrol on the down grades.

The equipment used for cultivation includes a three-furrow Ransome's plough, and the same firm's No. 3 Baronet disc harrows—a substantially constructed set of large size that is well up to any task that can be imposed on it. As mentioned, a three-row ridger by the Ipswich firm is employed for potato planting, and a Hornsby drill is used for sowing cereals. For rolling, a triple gang, opening out and covering 18ft., made by Wilders, is employed behind the tractor. Much of the grassland has been reclaimed by the use of a Bamford self-cleaning grassland harrow, which has given satisfactory service and has proved effective for tearing out moss and grass mat. A Ransome's dagger harrow is also in use. The sowing of artificials is entrusted to a Deering manure distributor, and when seen working with the Caterpillar Ten this was doing very even work with granular concentrates.

He has himself developed an ingenious planting device which has enabled two men and a tractor driver to plant and cover at the rate of three acres a day. The men planting sit in a wooden sled drawn at a very slow speed by the tractor, along the ridges which have previously been opened by means of a Ransomes three-row ridger. The sled is provided with sufficient space for carrying a supply of seed potatoes which are dropped down two spouts by the men. At the rear is fixed a frame with covering bodies, which immediately split back the ridges over the potatoes. The whole appears to be a very practical outfit and costs a very small sum to produce.

Haulage on such stiff hills would naturally present an insuperable problem if one relied upon horses under present-day conditions, and Captain Buckley has had built on the premises several special tractor trailers, among which a 3-ton tipper is of special interest. This is on Dunlop land tyres and is used behind the crawlers for taking full-weighted loads up to the top fields. While manures and other supplies have to be carried up the 460ft., which is the difference in level between yards and top fields, all the produce comes down, a matter which is very helpful in such a process as grass drying. There is an I.C.I. Mark III plant in the buildings, which itself is on a slope, the wet grass coming in at the top and the dried going away still downwards at the bottom.

Last year some good outputs were obtained, especially in connection with the saving of partly made hay. Of this material, 10 tons of dry product were obtained in seven hours with the consumption of 15cwt. of coke. It is baled with an International standard rain baler, which has proved most satisfactory.

This type of drier is very simple, and includes two sets of two trays each. Producer gas is first obtained from coke, and is then used to heat the drying air, which is passed through the trays. The batches of grass are dried in a continuous process, since the air which has gone through a partly dried batch is recirculated through another batch which has just been put on. In the meantime a finished batch is being withdrawn from another tray for baling.

The material for drying is cut and loaded with a Wilder Cutlift outfit and brought down to the drier on light trailers built by Captain Buckley's carpenter.

It is this landowner's view that the provision of equipment for such work of reclamation as that on which he has embarked must be in the hands of someone prepared to hire it out to a number of small farmers, just as threshing machines are commonly employed. In some districts, such a practice is common. I would like to make the suggestion that many landlords might well look into the question, with a view to providing such equipment themselves for the use of their tenants and that such a provision might well be in the interests of everyone concerned.

D. N. McHARDY.

SALVIA GRAHAMI, WHICH RANKS HIGH IN THE LIST OF EFFECTIVE SMALL SHRUBS TO GROW AGAINST A HOUSE WALL

The Country House

SAGES FOR THE BORDER

By ELEANOUR SINCLAIR ROHDE

TO those of us who have a special fondness for aromatic plants, the sages make a great appeal. Some of them are amongst the most decorative of border plants, whilst at least one of them—*Salvia Grahami*—ranks high in the list of effective small shrubs to grow against a house wall.

We have this charming and deliciously scented Sage against a wall facing east. It grows about 4ft. to 5ft. high, and from June to the end of November it produces its bright crimson flowers in continuous profusion. In winter it needs the protection of a few leafless boughs and in a severe winter such as last, matting also. It is easily propagated by cuttings struck even in the open in sandy soil. This Sage is a native of Mexico and is too tender to grow in the open, but is a rampant grower against a wall facing east or preferably south. In bleak parts it is best grown as a pot plant and brought into the shelter of a cool greenhouse in winter.

Amongst the border sages the handsomest is undoubtedly the Vatican strain of *Salvia sclarea*, which grows nearly 5ft. high. This strain originated in a sport that appeared in the Vatican garden, and it comes perfectly true from seed. No soil is too sandy and poor for this Sage, and yet it does equally well on a rich soil. With its huge rough leaves and spikes of pale mauve flowers with large pink bracts, it is a noble border plant and ideal to associate with Delphiniums. Long after the Delphiniums have faded, this Sage remains decorative, for the pink bracts remain till nearly the end of October. Seedlings usually flower the following season, but the plants are at their best the year after that. They are short-lived perennials and fresh stock should be raised every second year. I find these Salvias particularly useful to associate with Hollyhocks, for their abundant handsome foliage helps to conceal the lower and rather bare growths of the Hollyhocks.

S. argentea has silvery woolly leaves its first season, but they are darker by the time the plants flower. The chief attraction of this Sage is its lovely white flowers which stand out conspicuously. In common with most Sages it does best on a very sandy soil but does well on rich soil provided it is well drained.

The most charming of the blue-flowered Sages are undoubtedly *S. uliginosa* and *S. coerulea*, both of which grow over 4ft. high. They do not flower till September and are amongst the most striking blue-flowered plants. Both require a warm sunny border. *S. azurea grandiflora*, which grows about 3ft. high is not quite so attractive, but hardier.

S. dichroa and the improved form *S. dichroa magnifica* seed themselves on warm soils. Although not as striking as the Sages mentioned above, these are effective border plants. They grow about 3ft. high and have long spikes of lavender-coloured flowers with white mid-lobes.

S. virgata nemerosa is to be found in most borders and the charming white-flowered form less commonly. In mass both are very effective, and they are decorative well into the autumn. In good soils they grow quite 4ft. high, but in poor soil not much over 2ft. *S. glutinosa* is one of the very few yellow flowered Sages. It is a strong grower, attains about 3ft. with handsome foliage and whorls of yellow flowers. *S. pratensis*, the Meadow Sage of the Alps, is effective only in mass and the garden form *Tenori* is usually grown in borders.

The annual Sages are useful for filling gaps in the border, but rather weedy. The flowers of *S. horminum* vary from mauve and pink to rich blues, such as the hybrid Oxford Blue. They look well in mixed colours.

The half-hardy perennial Sages are popular bedding-out plants, but *S. splendens* appeals only to those with a craving for the most crude and vivid effects. These Sages are disappointing in a wet summer, and it is advisable to choose early flowering varieties such as Pride of Zurich or Fireball. They are easily raised from seed sown in heat in March and planted out in June.

S. patens, a favourite for the rich blue of its flowers, is tuberous rooted, and is usually started in a greenhouse in March, in a minimum temperature of 50 degrees. Each tuber should be potted separately in a 3-inch pot in a very sandy compost. After hardening off in a cold frame, the plants can be put out at the end of May, but not in a bleak spell. They need a position in full sun, and do best where they can have the protection of a sunny wall. In parts that are too bleak to grow this Sage in the open they are popular cool greenhouse plants. If grown thus they are transferred from the 3in. to 5in. pots when large enough.

Plants in the open should be lifted before the severe frosts begin and spread on a greenhouse staging to dry. When perfectly dry, the foliage should be cut off and the tubers stored in sand in a frost-proof shed. This Sage is easily propagated by cuttings taken in spring and struck in very sandy soil in a frame kept close till the cuttings have rooted. It can also be raised from seed sown in a temperature of 55 degrees in February. The plants usually flower in late summer.

CHARCOAL BURNING—II

FOR some years experiments have been carried out for the reproduction in a portable kiln of the process of charcoal burning described last week. It was thought that the required slow smothered combustion could take place within a steel drum controlled by dampers. Success has now crowned these efforts and two separate firms market portable charcoal kilns. It must be admitted that the artificially-produced charcoal is not quite of the quality achieved by the old burners in the "pit," but it is accepted by manufacturers, and that, after all, is the acid test.

A cord of wood should yield 30 bushels of charcoal, so that the seven cords in a pit will produce 210 bushels, or say 200 bushels to allow a slight margin. About 150 bushels of charcoal go to the ton, which used to sell for £7 delivered to Billingham, though prices are now higher. The gross return from a pit would thus be £9 6s. 8d. From this must be deducted rail carriage, cost of burning, which is usually 4d. per bushel, water and use of sacks, in all about £5 1s. 8d., leaving a net return of £4 5s. per pit, or 12/- per cord of wood, a price slightly in excess of the usual firewood rates.

Against this must be set the occasional pit that goes astray and is a total loss, a state of affairs that is avoided in the new portable kilns. The most notable advantage of the kilns is that they can be worked by a labourer, granted that he has reasonable intelligence, and he will do as good work as a skilled burner. Each kiln holds about a cord of wood and an observer of a trial of a battery of three kilns in the New Forest in 1937 reported a return of 7/- or 8/- a cord for the wood used, when the prices were less than they are to-day.

For estate purposes and in order to occupy fully the time of the attendant, a battery of three or four kilns are economic; and the profitable use is made of otherwise waste wood. The kilns can be used in any weather and at slack periods of the year, thus finding whole-time employment for a seasonal worker.

A possible home use for charcoal is as fuel for central heating plants. In time of war, an eventuality for which careful preparation is being made by many, fuel will be scarce, and the possibility of producing and burning charcoal is not one to be lightly cast aside.

In 1937 a gentleman, in no way connected with the kiln manufacturers, had the idea of using charcoal for greenhouse boilers, domestic and central heating plants. He took home with him two sacks of 2½ bushels each, weighing 36lb. per sack. For the next three days the central heating for his house was operated on charcoal. It covers three sitting rooms, a hall, four bedrooms, all of moderate size. Consumption was 1¼lb. per hour, and the system worked perfectly, but rather more careful stoking was needed, especially in regulating the draught. The stove was filled up at eight o'clock each night and was still burning when stoked at seven o'clock next morning.

Accepting these figures, the cost of fuel for the winter six months would work out at £17 10s., a figure not very different from what one would expect the coke or anthracite bill to amount to. This calculation is based on a value of £7 per ton for the charcoal. In fact, if the charcoal is burnt by a man during slack times of the year, and if waste wood is used, the actual cost is very much less, and the operation becomes very profitable.

Another use which it will probably take a war to bring to the stage of practical politics is as fuel for a gas producer vehicle. An experimental vehicle of this type is now undergoing trials, and we may expect to hear more about it.

In the past the chief obstacle to the expansion of the production of charcoal was foreign competition combined with high freight charges on the home-produced article. Possible markets were limited to those within easy reach, as the rail charges made it prohibitive to transport it far. This problem has long been a major difficulty in the home-grown timber trade, the Inter-Departmental Committee in 1933 reporting that the cost of transporting timber formed so large a portion of the delivered price that it adversely affected the industry. Pitwood in Scotland is available in great quantity, but rail charges, often 50 per cent. of the delivered price, make profit impossible.

The difficulty which the railway companies face is the great number of growers and the impossibility of securing guarantees of minimum traffic that they feel would justify reducing freight charges. The stalemate is unfortunate, for the home-grown timber industry is crippled and unable to expand without the essential cheap freight rates. Now that the railways have their "square deal" it is to be hoped that they will mete out the same treatment to the woodland owner.

A New British Triumph for the DEAF

NOW the deaf are offered the most remarkable and latest discovery from the Ardente research laboratories.

"AERODENTE"

Entirely different, unstoppable, and GUARANTEED by its inventors and makers.

Most uncanny in its ability to pick up sounds from all directions and convey them to YOUR deaf ears clearly, undistorted and tone true.

NOW YOU CAN HEAR *without Plugs or Attachments*

GENERAL CONVERSATION ——> where you wish with amazing clearness never before believed possible.

TALKIES, THEATRE, CHURCH MEETINGS ——> HEAR anywhere in the building—yes HEAR the talkies before you can see them—even from the Cinema entrance or staircase.

WIRELESS ——> HEAR without the loud speaker being on so you don't have to disturb others who do not wish to listen.

TELEPHONE ——> just place AERODENTE alongside without PLUGS or ATTACHMENTS and hear perfectly without even listening with the Telephone receiver. You do not have to contravene the Telephone regulations or interfere with their wiring.

YOU WILL BE AMAZED and DELIGHTED

at the extraordinary results to be obtained with the wonderful new Ardente discovery. The design and construction of the new Ardente "AERODENTE" are a triumph for British Aural Science. Marvellously simple, powerful, and the smallest possible. It represents the triumph of years of research by Ardente scientists.

Prof. Sir AMBROSE FLEMING, Kt., M.A., D.Sc., F.R.S., inventor of the wireless valve which made broadcasting possible (himself deaf and an Ardente user), says: "*I think your 'Ardente' is a marvellous invention.*"

WILD FLOWERS

Little Known Specimens

By E. M. REYNOLDS

FOR purposes of comparative familiarity wild flowers may be divided into three main groups, namely, those commonly found in all districts, and with which, therefore, we are all more or less familiar—at least, by sight, if not necessarily by name; those somewhat local in their distribution, that is, whilst not uncommon in certain well-defined localities practically unknown in others; and, finally, those which may be said to be truly rare and of which specimens are very seldom found in any part of the country.

It is largely with the second class that we are here concerned, for whilst it is undoubtedly true that the serious botanist of many years' experience may account the discovery of but one rare specimen sufficient reward for perhaps weeks, months or even years of patient searching, to the majority of collectors such results would appear completely inadequate and wholly disproportionate to the amount of time and labour involved. Of course, a rare herb may occasionally be discovered, perhaps more by luck than judgment, but for most of us new discoveries are mainly drawn from that large class composed not strictly speaking of uncommon plants, but of those peculiar to soil or climate of some particular character.

Under the heading of "locals," then, comes the Golden Samphire (*Inula crithmoides*), which is found, though scarcely in profusion, on certain salt marshes and sea cliffs. It is of the Compositæ order, *i.e.*, each apparent flower is in reality a head of minute florets springing from within a ring of small leaf-like structures called *bracts*. The stem is about 1ft. or more high, and throughout its length is clothed in bunches of very narrow, yellow-green, fleshy leaves which are sometimes divided at their tips into several small, rather claw-like lobes. The flower heads are borne on long, bract-encased stems and are about an inch in diameter. Both ray and disc florets are a bright golden yellow.

Salt marshes, indeed, yield many a treasure to the enthusiast who does not object to a little mud on occasion, and those botanists who have not yet explored any such district should do so at the first opportunity, for it will be found to provide a type of flora quite distinct from any previously encountered.

A peculiar and most interesting little plant, not unusual in such places, is the Jointed Glasswort (*Salicornia herbacea*), whose name derives from the fact that in days gone by the plant was used in the manufacture of glass. Rarely more than 6in.–9in. or so in height, it has succulent, cylindrical, leafless stems composed of a number of short sections fitted one into another or "jointed." The minute flowers are most inconspicuous, being produced in the joints of the upper branches.

Thrift or Sea Pink (*Armeria maritima*) is another seashore plant. Its roundish heads of small pink flowers are borne on long, leafless stalks which spring straight from the root and appear from amongst dense tufts of exceedingly narrow, almost grass-like leaves. The flowers have five equal petals, and immediately beneath each head the stem is encased in a thin, brownish, papery sheath some inch or so long, ragged at the edges.

To turn, however, to a very different type, peculiar to chalk downs is the Round-headed Rampion (*Phyteuma orbiculare*), an unusual looking plant with long, slender, erect stems each bearing an almost spherical head of deep blue flowers which are coiled while in bud, but are later seen to be composed of five long, narrow segments. The leaves from the base of the plant are long-stalked, usually pointed-oval, though occasionally heart-shaped, toothed. Those of the stem are small and stalkless. The height varies from less than 1ft. to 18in. or so, while the flower heads are roughly an inch in diameter.

The Deadly Nightshade (*Atropa Belladonna*) is also held to be native to chalk and limestone. It is most often found in the neighbourhood of ruins and old quarries, but is not entirely confined to such localities. For some reason which can only be attributed to the similarity of names, the charming Bittersweet or Woody Nightshade, so familiar in our hedgerows, is commonly mistaken for this plant of such sinister repute. In actual fact the two could scarcely be less alike, at all events, when in flower and fruit. The Deadly Nightshade has a stout stem, leaves usually set in pairs of extremely unequal size and quite entire, and large, drooping bell-shaped flowers of purple shading to green, produced singly on short stalks from the juncture of leaf and stem. The corolla is about an inch long and has five short lobes. The flowers are succeeded

THE DEADLY NIGHTSHADE, USUALLY FOUND IN THE NEIGHBOURHOOD OF QUARRIES AND OLD RUINS

by large black cherry-like berries partially cupped in their green calyces.

The Woody Nightshade, on the other hand (*Solanum dulcamara*) is a plant of somewhat rambling growth, commonly found climbing about the hedges. The upper leaves often have one or two ear-like lobes at their base, and the flowers are produced *not singly* but in drooping clusters. The violet corolla is so deeply five-lobed as to appear at first sight to be five distinct petals and with maturity these turn backward towards the stem. The stamens are drawn together to form a bright yellow, central, cone-like projection, causing the flowers to be very distinctive. The berries in this case turn a brilliant red.

Finally, mention must be made of a small herb which is very little known, not on account of its rarity, for it is in fact by no means uncommon in dry or sandy localities, but by reason of its inconspicuous mode of growth. The tiny pink flowers of the Hare's-foot Trefoil (*Trifolium arvense*) are almost completely hidden among the long, soft hairs of the calyx, and the cylindrical heads thus composed may easily be overlooked, presenting as they do, with their rather nondescript colouring, but little contrast to the soil from which they spring. Even if noticed they might well be put down at a casual glance, to some form of seed pod, and thus passed over. Nevertheless, upon a close examination the plant is revealed as quite charming, with its slender branching stem and trifoliolate leaves, while the furry, oblong heads, faintly tinged with the pink of the hidden flowers, make it readily distinguishable from any other species.

GOLDEN SAMPHIRE, FOUND ON CERTAIN SALT MARSHES AND SEA CLIFFS

HORTICULTURAL ADVICE

Hyacinths and Lilies

By CARTHEW ALLERDYCE

TWO pot plants of which I am specially fond are hyacinths and lilies. At this time of the year it is necessary to think about the purchasing of the bulbs, and though I can only touch on the fringe of the subject, I do wish to give some rather special advice.

There is nothing nicer than having a good show of hyacinths for Christmas and the New Year, and this can easily be done these days if the specially "prepared" hyacinths are purchased. The prepared hyacinths are treated by cool storage, &c., and are usually released from the preparing chambers at this time of the year. If they are withdrawn earlier the flowering results are never as good.

There are a large number of varieties which are prepared for early forcing, but of them I am going to choose a few that are especially easy to force for Christmas. Bismark is the deepest of all blues. It bears a good spike with huge bells; Dr. Lieber I like because of its dense spike. It is a bright electric mid-blue. Electra is a deep salmon-red and makes quite a pleasant change. Garibaldi is really beautiful, being a brilliant carmine scarlet. It is usually difficult to get this variety in a very large bulb.

For a rose-pink, there is little to beat Lady Derby, while Nimrod, the flesh pink, flowers very early. Tubergen's Scarlet is rather a unique colour being a vivid scarlet, but the bells are rather loose. Yellow Hammer is the only yellow that falls into this group.

In the January group may be placed a large number of other varieties such as La Victoire, the crimson; City of Haarlem, the yellow; La Grandesse, the white; and Grande Maitre, the vivid deep mid-blue.

Any of these varieties may be obtained from Messrs. John Peed of West Norwood, S.E.; Messrs. Carters Tested Seeds, Ltd., Raynes Park, S.W. 20; Messrs. Clibrans, Ltd., Altrincham; Messrs. Wells, Stourbridge; and Messrs. Barrs, of 11, King Street, Covent Garden, London.

When the prepared hyacinths arrive they should be laid out in a cool, dry place, and the temperature should not be more than 60° Fahr. In a few days they should be potted up into a compost consisting of half good loam, one-third horticultural peat moss, and one-third sharp silver sand. They can then be placed on some "standing ground" which has loose ash or a concrete base. The position should be a cool, shady one, if possible. The pots should then be covered with horticultural peat-moss, well-washed ashes, sand, straw or good leaf mould.

By the middle of November the bulbs should have made sufficient root-growth, and the pots may, therefore, be placed into cold frames for a fortnight. During the last days of November they will be moved into the greenhouse and placed on the staging. It should always be remembered that full root action is most important.

For the first week, the pots should be shaded from excessive sun and the temperature of the house kept at about 60° Fahr. Directly the flower spike is out of the bulb, the temperature may be increased to 70°. It is advisable to water sparingly until the first bell has loosened from the bottom of the flower spike, and this prevents the foliage from developing too sturdily. After this, water may be given freely.

Some gardeners find that it improves the colour and substance of the flower spike if a little food is given after the bottom bells start loosening. Clay's Fertiliser seems quite satisfactory for the purpose, and this can always be obtained from Messrs. Clay and Son, Ltd., of Stratford, E. 15.

Of the lilies, there is little to compare with the Bermuda Easter Lily (*Lilium longiflorum Harrisii*). These can now be obtained in this country from Messrs. Robert Tucker & Co., 12, Colman St., London, E.C., from whom further information is obtainable. This is a stem-rooted lily, and it is necessary to plant deeply so that top roots develop above the bulb. A 6in. pot should be allowed for each bulb, or, if preferred, three can be placed in a 10in. pot. Plenty of crocks should be used, and the compost should consist of three parts of good soil and one part of well-decayed manure.

The bulbs are ready for delivery early in September and, after potting, should be stood in a cold frame for six weeks. Little water should be given until the plants show 2in. of growth.

To Officers in the Regular & Territorial Army

THOMAS & SONS supply Uniforms cut and made in the very best manner and of the highest quality materials by cutters and workmen thoroughly conversant with military work, to Gentlemen who are accustomed to wearing first-class clothes.

Their charges for these outfits are comparatively little more than the usual scale rate, but in the long run represent better value for money spent.

CAR TROUBLE TRACING TACTICS

The Routine for Solving Mechanical Failures

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

MOST motorists have, I imagine, experienced at some time or another those annoying occasions when, for no apparent reason and without any warning, an engine which has been performing splendidly throughout the trip suddenly chooses to stop when the car is brought to a standstill. Despite continued attempts with the self-starter, some experiments with the throttle-opening and, perhaps, the guarded use of the choke, it has displayed no inclination to come to life again.

Such occurrences are most irritating, particularly if the incident happens when driving in heavy traffic, or when the car's refusal to start coincides with the "GO" signal from a traffic light or policeman, so that following drivers are quick to voice their hearty disapproval. In the majority of cases the cause of the unexpected stoppage is nothing serious, and can be remedied in a few seconds, but the important point is to recognise the reason for the stalling and then take the proper steps to correct it.

One of the most common causes of failure is when a car which has been travelling fairly fast is brought to rest in traffic, when the heat of the engine at tick-over speed tends to produce too strong a mixture through the slow running jet, which will cause the motor to stall. Inexperienced drivers are prone to pushing the starter button and jabbing the accelerator in an effort to restart, but this merely aggravates the trouble as would the use of the strangler.

The correct treatment to apply is to open the throttle a little and depress the starter, taking care that an even pressure upon the accelerator is maintained. This should do the trick, but alternatively the throttle may be opened really wide and the engine turned over a few times. This will clear the cylinders and the induction pipe, so that within a few seconds the car will start with a roar. Yet another method is to allow the engine to cool for a few minutes and then attempt to start in the normal way, for the effects of the momentarily rich mixture will have dissipated by that time. Any jabbing on the accelerator must definitely be avoided.

Should the engine fail to respond after a series of efforts it is advisable to adopt a systematic routine examination to trace the trouble.

First of all, it is important to ascertain whether or not there is sufficient petrol, for although the automatic gauge may register a gallon, or perhaps more, it may be inaccurate, so that there may be no fuel in the tank. It is amazing how many drivers fail to check up on the petrol, even when the supply is completely exhausted, and garage hands are legion who can tell of "breakdowns" which have taken them out when the fault has merely been one requiring replenishment of fuel.

Speaking generally, if the engine has showed no signs of distress, and there have been no untoward noises from the mechanism, the trouble is usually confined to two possible sources—either the petrol feed system or the electrical system. Of the two, the electrical equipment on modern cars is the more liable to be the cause of the failure of the main power unit.

If explosions in the silencer or spitting in the carburettor had not preceded the stoppage and it is not a case of a choked jet or lack of fuel, it is almost certain that there is no fault with the carburation. The ignition therefore automatically comes under suspicion.

On elderly cars a short in the ignition switch might cause a stoppage, but with modern cars this is a rare occurrence. The general procedure is to remove the high tension wire from the centre of the distributor and hold the lead close to the cylinder block while the starter button is being depressed. Should there not be a good spark, this means good reason to believe that the trouble lies with the contact breaker or the coil and their connections. If the spark is good then a plug should be removed, reconnected with its lead and placed upon the cylinder head so that the base of the plug is in contact with the engine. The motor should be turned over and the spark observed. Each individual plug should be tested in this manner unless a sparking plug tester is available, and if any fail to show a spark or the flashes are only weak or intermittent then the trouble lies with this component and may be a bad or broken connection.

Since a variety of reasons can contribute to ignition failure apart from bad connections and loose wires in the circuit, unless the trouble can be traced speedily and the repair carried out on the spot, it is often advisable to get a passing motorist to send back assistance from the nearest garage.

If the first test proved that the failure occurred in either the contact breaker or the coil, while connections appear to be in good order for these parts, then normally the best course is to place the car in the hands of a mechanic. High tension wires may be "leaking," or, perhaps, the coil or condenser is damaged. However, should the electrical system be found in order, then, of course, the petrol system must be examined. If there is petrol in the tank and the fuel is not reaching the carburettor the trouble may be due to the pump; if electrically operated, rapping it with one's knuckles may do the trick.

The simple troubles I have described are the most liable to occur, but not infrequently there are rather more mysterious causes which give considerable difficulty before the point of weakness is located. For instance, I heard of a case some years ago where an engine cut out while running perfectly. When the car had been brought to rest the motor started easily enough and the car ran for some distance. Unfortunately, the same thing recurred time and time again, so that the owner resorted to a general examination by a garage. Eventually, after much wracking of brains and not a little experimenting, it was discovered that something quite large had been floating about inside the petrol tank. At intervals it had become lodged over the supply pipe, which, in this instance, lead to a vacuum tank which drew the petrol up to the carburettor. As the feed operated on the suction principle, immediately the car had stopped and the suction was discontinued the obstruction floated off until it was drawn over the pipe again.

Here is an instance which provided a baffling problem. A car was running well, yet after being reversed and driven a short distance forward it stopped. Various efforts were made to start it, but all were unsuccessful. The petrol supply was in good order, the ignition functioned perfectly, there was no loss of compression; indeed, everything was apparently in apple-pie order, yet nothing would induce the car to start. There were no clues to work on so far as the engine and components were concerned, but actually in reversing the car had gone gently against a bank and the end of the exhaust pipe, which protruded slightly, became effectively stopped up with the soil forced into the pipe when the car had backed right on to the bank. These things are, perhaps, extraordinary examples, but nevertheless they do occasionally happen.

Apart from the power unit itself, there may be unexpected breakdowns which could occur in the transmission. Where the cause lies—and it is normally a breakage in these cases—can only be revealed by examination, which should begin with the clutch, along to the coupling, the differential, and, finally, from the differential to driving shafts for the rear hubs. The breakage of a driving shaft can be particularly annoying, because a car may be driven to a parking place in perfect order, with no suspected trouble and left there all day. Yet, when the return journey is about to begin, everybody is on board, the gear engaged and the clutch let up, it is most galling to discover the car will not move at all! This may have been caused by someone engaging the clutch with a jerk with engine running hard and with the hand brake jammed on.

Although unexpected breakdowns are really rare with modern machines, in each of my cars I invariably carry a length of cable for towing (and this can be most useful when bogged) as well as a set of wheel chains, which are a blessing under many conditions. Being prepared can save a lot of heart-burning and often obviates needless expense.

All square on the Twelfth

THE Estate Car duly arrived before our first guests.

"If it's half as good as it looks," I said to Jane, "I'll be more than happy."

We drove it up on the moors yesterday, with the keeper, to lay our plans for the first shoot. There's a track up, so steep and rough that we used to dismount and lead the ponies.

"She'll never do it," gasped Jane, and I noticed Donald gripping the seat, his eyes tight shut.

When he opened them we were at the top and he hadn't even felt a jolt.

"Mon, that was grand," whispered Donald.

* * *

What an engine it has, and what an astonishingly roomy body! In the afternoon we took our early guests to the golf club. I let her go over the hilly main road. The performance was a revelation, and we were eight up, plus bags.

"We'd have needed two cars for that trip," said Jane when we got home.

"We're going to halve our petrol and oil bills. And think how much more fun it is than the old car!"

I rang up my brother later. He likes his comfort.

"... There's still a week before the Twelfth," I finished. "Take my tip and change to a Ford Estate Car. It'll carry your eight guns right up to the butts. Think how much walking you'll save, and you can start half an hour later ... Lunch? There'll be room for more food than even you could want. And think of the rest of the year, the fetching and carrying, the luggage from the station, the children on picnics, the friends at the golf links, the ..."

"All right," he chuckled. "I ordered mine yesterday. Didn't think I'd let you be one up on me, did you?"

THOUGHTS ON THE STATES

A Visit to America's Coventry

THE best testimony to the success of the Junior Car Club cum Autocheque American Rally is the fact that most of us who took part in it are already planning to return next year.

For last month's 2,000 miles scamper hardly scratched the skin of American life. We lived in luxury hotels, encountered affluent people, rushed along magnificent highways and visited world-famous resorts. But as to how the average American thinks, his mode of living or the conditions outside the main traffic arteries and the great cities they feed, we are quite ignorant. Indubitably, the thing that has impressed us most on this trip is the remarkable hospitality and kindness of the Americans of all classes towards us. Again and again people came up to our cars asking where we came from, and exclaiming, as they shook us warmly by the hand, that they were pleased to meet us. Some even said it was an honour. At times the interest we and our variegated convoy class aroused was almost embarrassing, and we began to wonder whether our cavalcade of Rolls, Bentley, Humber, Wolseley, S.S., Rover, and so on, was being regarded as some new kind of circus or performing troupe.

Hospitality reached its peak at Huntingdon, West Virginia, where the locals threw a really jolly dance; and at Chicago, where two friends of our compère, Graham Lyon, gave a cocktail party in their country home. It was not a large house, but it had been cleared and arranged to accommodate nearly 50 of us at a few hours' notice. As our cars arrived, one of the hostesses, standing at the foot of the garden stairs, welcomed us with easy and sincere grace. At the top of the steps was her husband, and inside, helping with the drinks, were our other host and his wife.

An English party of this kind would be inconceivable, for not one housewife in a hundred would upset her house for a crowd of people she had never met and would probably never see again. And even if she could bring herself to do it, it would inevitably prove a formal and sticky affair.

In America they do things differently. They are specialists in making one feel at home, with the result that after the first "Old Fashioned" you "get acquainted," and feel thoroughly at ease. This particular party proved such a success that it started at 6 o'clock and went on till 11 with such gusto that some of us did not get dinner till midnight. And as a postscript, it may be added that our hosts motored fifteen miles into Chicago and fifteen miles out again in order to provide us with transport and ensure that we did not get lost.

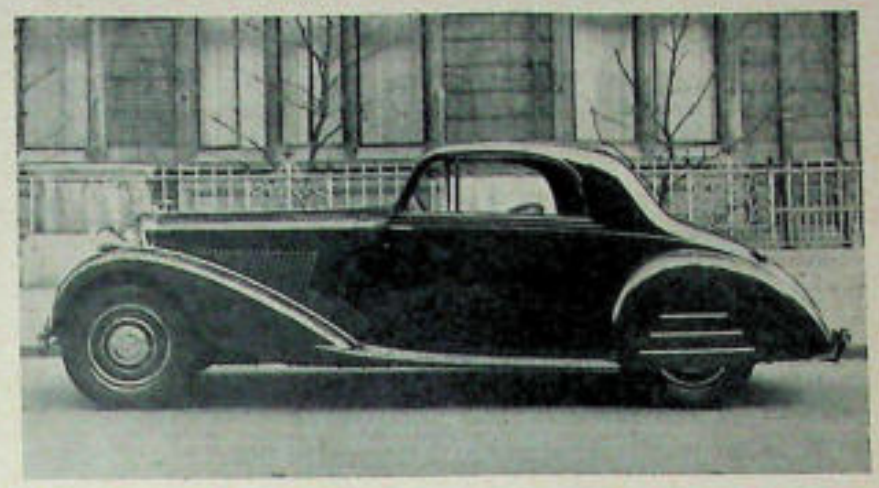
From Chicago we went to Detroit, which is to the world of motoring what Coventry is to England. Here we were entertained by the Chrysler Corporation, the youngest and possibly the most virile of the great American car manufacturing groups. Started in 1924 by Walter Chrysler who, as a lad, was so poor that he had to make the tools with which he scratched a living, the group now employs directly 75,000 hands, owns 24 plants in and around Detroit, and 52 other plants in different parts of the world. When in full swing it turns out 2,000 Plymouths, 1,800 Dodges, 500 Chryslers, 500 De Sotos, and 850 trucks each working day.

We walked round the Plymouth assembly plant and saw two conveyor systems turning out three cars a minute. When this total is added to the still larger outputs of Chevrolet, General Motors' best seller, and Ford, both of which are made in Detroit, we began to realise why there are more cars in New York than in the British Isles, why the United States roads have to deal with over 25,000,000 vehicles, and why car parks accommodating anything from 10,000 to 15,000 cars are quite a common sight.

Having studied factory conditions, we were whisked off by our Chrysler hosts to the Yacht Club built out into the lake by a group of millionaire magnates. It was a lovely and spacious mansion, reminding me of buildings I had visited in Spain. Its harbour, with its 50 or 60 yachts, its swimming pool, and pleasant lawns suggested the Riviera in the vividness and variety of its colouring and intensity of the sunlight and heat. The choice of food had been carefully considered, with the result that the meal was not only most palatable and easy to eat, but also exceptionally interesting as an example of the American gastronomic art. In a short and informal talk our hosts welcomed us with obvious sincerity, and referred in moving terms to the immense impression created by our King and Queen's visit, and the remarkable display of spontaneous enthusiasm that had greeted them in America.

The practice of hospitality seems to come naturally to Americans of every class. The keynote to the hotels is their welcome. When you are called by telephone in the morning a pleasant voice calls good morning and tells you that it's a fine day or that the temperature is so much. Heading your breakfast menu are the same words "Good morning." Banners across the streets of villages bear a greeting of welcome to so-and-so, and a "Come again" notice on leaving. And then, on entering Boston we encountered the city's official "greeter," and were told that this was a standard and most important position in civic life.

In a simpler sort of setting we noted the same open-hearted reception. Again and again, when taking refreshment at cafés, roadhouses or inns, or when replenishing tanks at one of the Amoco filling stations, where we paid for fuel by coupon, people would come up, peer into the car and ask where we were from. Almost before the words were out of our mouths they would tell us they came from Wigan, Yorkshire or Devonshire, that their mother had been born in Cheltenham or their great-grandfather in Manchester. They were proud of these connections with the Old Country, and glad to make contact with us. Having thus introduced themselves they invariably followed up by asking how we got on with our right-hand drive, which to them seemed strange, what the letters G.B. meant on our international touring plates, and what we thought of American roads and motoring conditions.



At one roadhouse I had an astonishing example of American honesty. Some six months ago Graham Lyon made a preliminary survey of the route and stopped at this place for a drink. Being engrossed with the results of his talk with the owner, he forgot to collect his four dollars change. When we called months afterwards the proprietor happened to mention to me that he had had an Englishman visit his place about Christmas time and that he had left four dollars behind. This had weighed on his mind ever since. One of the waitresses overheard this remark and told the owner that she thought the same Englishman had called as a member of our party a few minutes earlier. When she described the caller I recognised him as our compère, the man who had forgotten his change. So, without more ado, mine host handed me the money with his card to pass on to Lyon.

Life on the road in America is even more vivid and vital than it is in England. Apart from the constant stream of fast-moving cars which, despite the excellent standard of driving, forces one to keep alert, there is the added interest of studying the road signs. Never before have I seen so much reading and picture matter on the roadside. The signs vary from small tritely worded announcements to huge hoardings featuring pictures advertising oils, fuel, service and commodities of various kinds. In their immensity and numbers they undoubtedly detract from the beauty of the countryside. They also distract one's attention from driving, which is a bad feature. It was not surprising, therefore, to hear that there is a movement to abolish this form of publicity. It has advanced so far that one society has actually started propaganda which bids the public not to buy goods that are advertised in this way.

One of the most novel and subtle form of roadside announcement consisted of a series of small boards each of which bore as a standard heading the words "Lost Arts." Under this line came a sub-title such as "Permanent Roads," "Chivalry," "Patriotism," "Sculpture" or "Uncommercialised athleticism" with a bottom line giving the date and source of the "lost art." The object or meaning of this series aroused our interest, for we could discover no key to the scheme. We enquired from all kinds of people as to what the signs meant, but no one seemed to know. As a last hope I asked the secretary of the English-speaking Union in Boston, where our members were very pleasantly entertained to tea in cool surroundings that contrasted with the 90 odd degrees that prevailed in the streets outside. But as she did not know she promised to find out and write me later. Then someone suggested it might be the work of a well-meaning society attempting to show this machine-mass-minded age the advantages of other forms of culture.

Unfortunately, the solution, explained to me by a Professor of Forestry I met on the Cunarder Laconia on my way home, had no such high ideal. For the signs had been erected all over the country by a publicity concern in Buffalo, who had advertising sites to let at the points where these "Lost Arts" signs now stood! While the scheme undoubtedly attracted a lot of comment, to our mind the difficulty we had had in discovering its origin and objects created an unnecessary mystery.

A TYPICAL CORSICAN VILLAGE

CORSICA TO-DAY

ASK the majority of persons what they know of Corsica and they will tell you that it is the home of bandits and the vendetta. A few may even mention that it was here that Napoleon Bonaparte was born, but beyond these meagre facts you will find it difficult to gather any further information.

This Mediterranean island is situated 64 miles from Leghorn, and has been French, except for a brief interlude of three years, since 1768. Measuring approximately 114 miles in length, and, at its widest point, 84 miles, it occupies an area of 3,367 square miles. Except in the few towns, the Corsican prefers to speak a patois of French and Italian, but to the stranger French is always spoken.

A land of wine, woods, waterfalls and wild flowers, it has been justly named the Scented Isle, while the French have christened it "L'ile de Beauté." Largely mountainous, its highest peak, Monte Cinto, reaches 9,000ft. Tanning bark, olives, chestnuts and cork constitute the country's main products. It is also believed to possess various mineral resources, which, so far, have not been developed.

Although possessing the quick-tempered Latin temperament, the Corsican is a courteous, kindly and hospitable individual, a great talker and a moderate pipe smoker. Corsican girls, especially in the country districts, are dark and good-looking, walking with a graceful carriage, and the old women have the most contented faces, in marked contrast with those of other Latin races. Every Corsican loves his dog—usually a long-tailed animal—and honours the name of Napoleon.

The birthplace of the "Little Corporal" is to be found in the Rue St. Charles, Ajaccio, a narrow street by the Quay, and here, amongst the relics, one may inspect the bedstead upon which he is said to have been born. His memory is perpetuated by many street names in the capital. There is a Quai Napoleon, Cours Napoleon, Rue Napoleon and Rue Bonaparte, while in the centre of La Place du Diamant stands the famous monument of the Bonaparte family known to the inhabitants as the "Inkstand," because of its resemblance to an ornate specimen of that once useful article.

Mountain-flanked and tree-shaded Ajaccio, although the capital of the island, is not as large a city as Bastia, in the north-east, which is also commercially more important. An air service connects it with the French mainland, while it is a night's run from Marseilles or Nice by steamer.

Dried sausage, cold pork, chestnuts, goats' milk cheese and a kind of bread rusks constitute the principal items in the diet of the peasant, with, of course, a plentiful supply of light red wine, and salt or fresh water fish. The gastronomically venturesome may also try milk soup or cold lentils in oil.

Although the capture of Spada, the last of the bandits, marked the end of the outlaws of the "maquis," it is difficult to assert with certainty that the family vendetta has yet been entirely abandoned, but certainly towards the stranger the Corsican is invariably hospitable. It is rare, indeed, to stop at some wayside dwelling for a glass of water (a safe drink here) and not be asked if one would not prefer wine or coffee, although the preparation of the latter may entail lighting a fire specially.

Except for the tourist or business man, the usual mode of transport is donkey or mule back, horses being too expensive for most peasants. For the same reason, cattle are rarely if ever seen, their place being taken by Angora goats. Pigs (specially blest by the priesthood at certain seasons of the year) and sheep are plentiful, however.

The mule teams, accompanied by the muleteer in corduroy baggy trousers, broad red sash and checked cotton shirt, carry harness bells, and make a pleasant sound on the rock-fringed mountain roads. Sometimes a gourd of wine hangs from the belt of these hardy workers, and most peasants carry large umbrellas in wet weather.

Most of the mails are carried in small buses or cars, which also accommodate passengers. They are driven at breakneck speed by the islanders, who, immediately they find themselves behind a steering wheel of a car, slough their gentler natures and, pressing down the accelerator, race perilously along as if the furies were behind them and Ariel beckoning ahead. Often these maltreated cars are loaded well below their Plimsoll line with passengers and baggage, but they seem to have elastic properties for no matter how crowded a vehicle may be, it is rarely that the hail of a waiting peasant is disregarded.

Despite these inconveniences of congestion, the ride over the Calanches de Piana, which might aptly be described as mountaineering by car, cannot be neglected, especially if undertaken in the early spring, before the tourist invades these primitive fastnesses. From Porto, a straggling village snuggling peacefully on the shores of the Gulf of Porto, the climb to Piana begins.

As the serpentine road rises higher and higher, jagged terra-cotta coloured cliffs stand out against an ultramarine sea, while immediately below are verdant precipices. As the summit of the Calanches is approached, the road swings through overhanging rocks, and when at last Piana is reached, a superb view rewards the adventurer.

Despite the steepness of many Corsican roads, motor accidents are comparatively few, although sometimes roadside crosses may be seen inviting passers-by to pray for the repose of some victim's soul. One fears that were such a practice to become common in Great Britain, the whole countryside would resemble a vast necropolis.

The railway which runs from Ajaccio to Bastia is, for the greater portion of the way, one of the most scenically beautiful in Europe, despite the number of its tunnels, which average one every four miles. It traverses gorges of awe-inspiring beauty, runs through majestic pine forests, and crosses innumerable mountain torrents. One of its viaducts is made of solid marble, and the Vecchi Bridge, which runs over a waterfall-spanning road beneath, is a dizzy feat of engineering from which a glorious view is obtained.

Bonifacio, that precariously perched village which looks out across the Strait of Bonifacio towards Sardinia, seven miles distant, lures the lover of quaint streets and old buildings; while Calvi, in the north-west, claims fame as the birthplace of Christopher Columbus (an honour disputed by Genoa) and the repository of some old stone cannon balls, souvenirs of Nelson's visit in 1794. Bastia, too, although the busiest of the few Corsican towns, reveals many an old corner and even more ancient smells.

Scenically regarded, Corsica is a veritable paradise of rock-strewn coastline, ancient martello towers and innumerable bays, while inland there stretches the scented "maquis" with bells proclaiming the presence of some goatherd.

On the edge of jade green pools fishermen sit pensively when not tending their vineyards or working in the forest, and over all shines a brilliant sun, for winters are short and summers long in this land of content.

C. E. KETTLEWELL.

OLD MARTELLO TOWER ON N.W. COAST

A BRITISH ATLANTIC AIR SERVICE AT LAST

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field.")

IN a recent announcement Sir Kingsley Wood said that the long-expected commencement of the British North Atlantic Airway would be made, according to present plans, in August. The original intention, as was pointed out in a recent article, was that the service should be inaugurated in June, and the delay has been causing disquiet on this side of the ocean, and a certain amount of adverse criticism on the other.

In the meantime the Americans have pushed on with their plans. They have made crossings to schedule over both the southern and the northern routes, and they are now operating a regular service not only for mails but for passengers.

From the broader viewpoint, this progress is all to the good. In the last analysis, developments in air transport should not be made to wait on the preparedness of any one country. Moreover, Imperial Airways and Pan-American Airways are co-operating on the establishment of the Atlantic service, and it is, therefore, safe to assume that lessons learnt from these operations will be placed at the disposal of the British organisation.

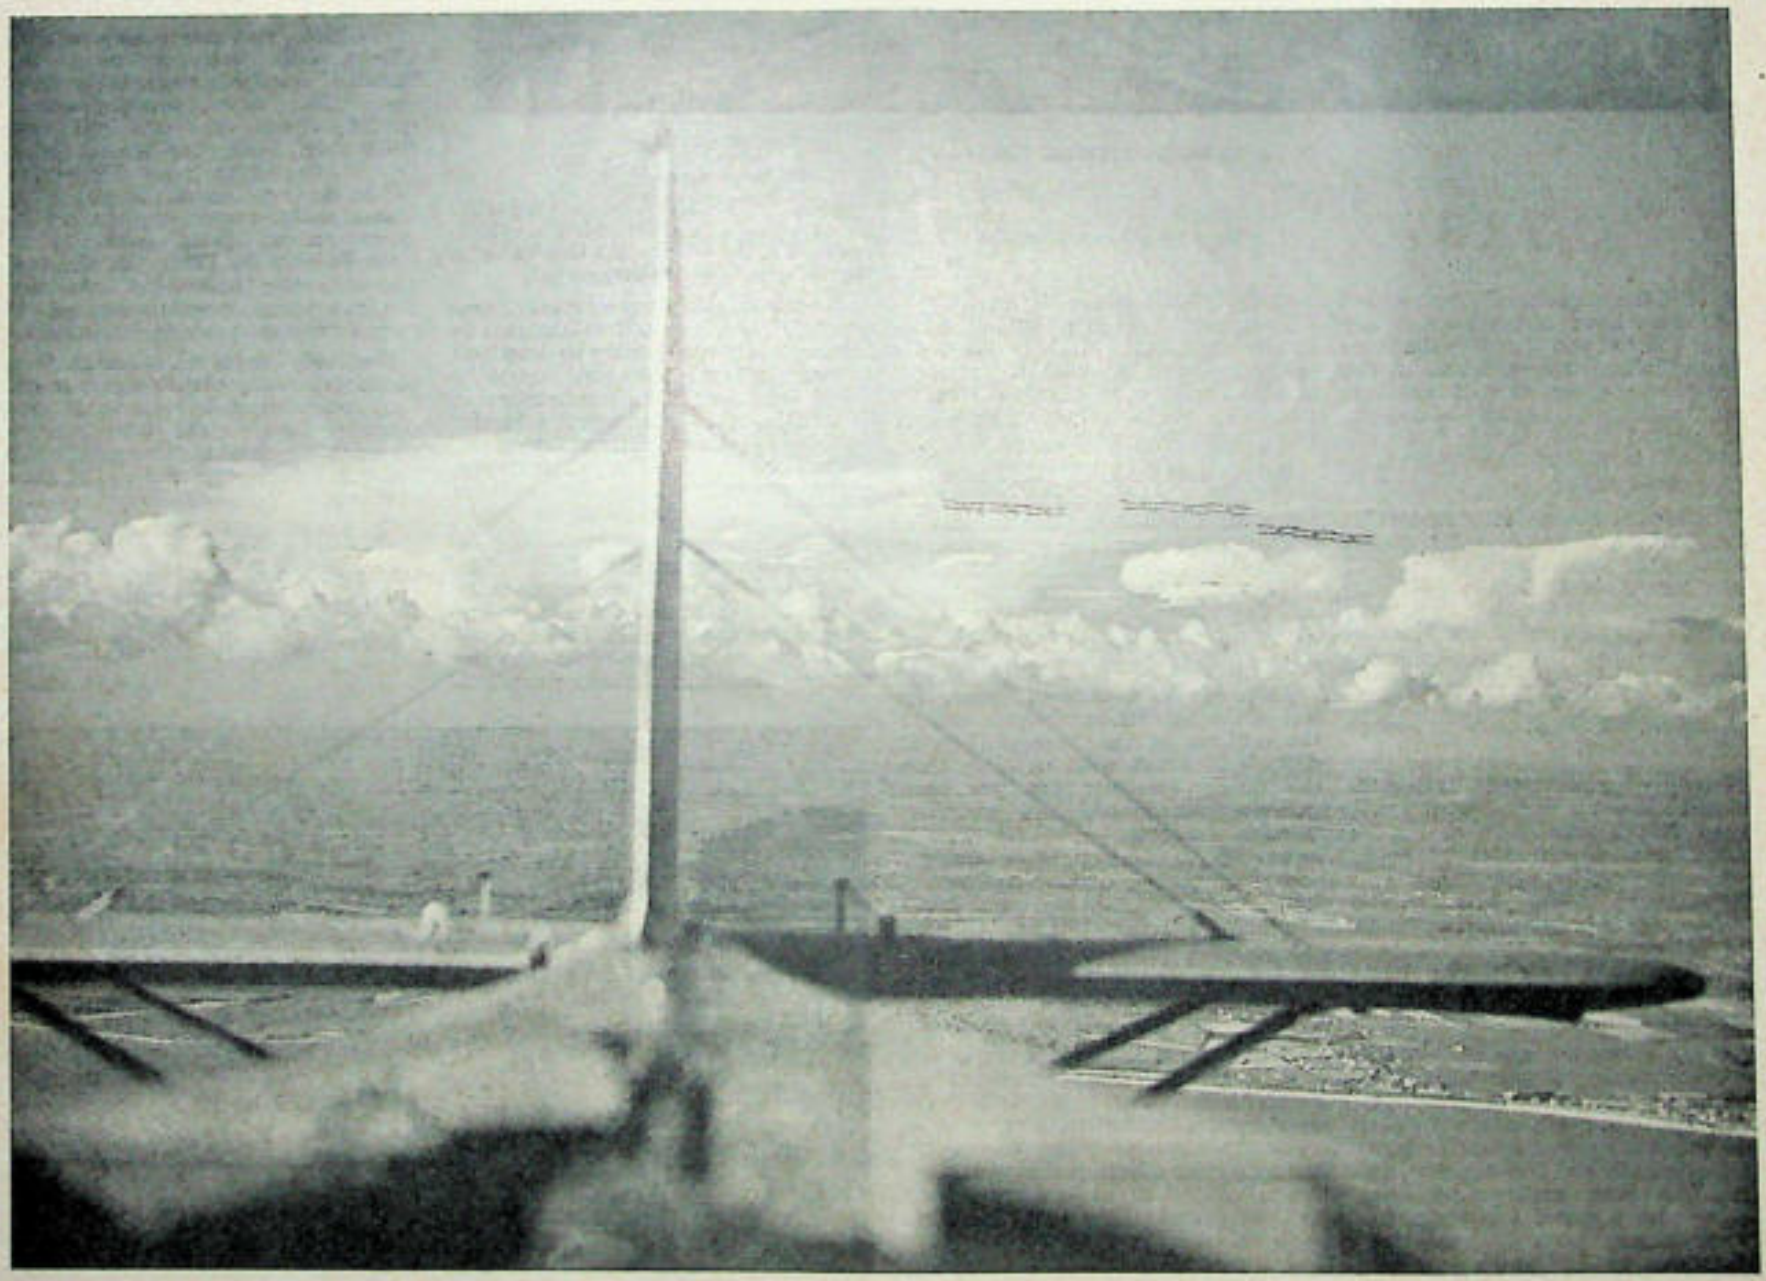
In air transport, however, the intangible asset of prestige plays a highly important part; and there can be no doubt that these American crossings have made—are likely to continue to make—a profound impression on the general public. Under these conditions there is a possibility, and perhaps something more, that the Atlantic airway may become specially identified with American enterprise. We cannot rest content with such a state of affairs.

When the British service starts it will of necessity be mainly confined to mail carrying, and will hardly be able to put up performances challenging the somewhat spectacular achievements of the American boats in their initial flights. The British types to be used are a modified, strengthened version of the Short Empire boats—"C" Class—boats, and they certainly will not be able to compete with the American Boeing 314 Clippers, which are of more recent design and planned with the Atlantic service prominently in mind.

In explaining the delays, Sir Kingsley Wood pointed out that they were due to the rearmament programme, to which priority had to be given, and he added that it was hoped next year to have "comparable equipment with our American partners." He was referring to the new "G"-class boats, the first of which, the Golden Hind, was launched a short while ago. It may be remarked, however, that "G"-class boats are smaller than the Boeing 314s. While the British design has an all-up weight of 72,000lb. (about 32 tons), the corresponding figure for the Clippers is more than 80,000lb. (approximately 36 tons). Furthermore, the American boats are now carrying passengers officially, yet the Golden Hind, which has still to undergo prototype tests, is equipped for mails only.

Now in the light of these facts it may be difficult to combat the idea that this country is in danger of losing the lead in Atlantic flying that was so splendidly established in the summer of 1937. Then, the superiority of the British boats was universally admitted and their performances were outstanding. This is no more than fact, and saying it in no way belittles the fine work carried out by Pan-American Airways at the same time.

There is a body of expert opinion that questions the wisdom of the American policy. It is contended that it is undesirable to carry passengers at this early stage, and that operations should be confined to mails until further practical experience of regular flying has been gained. Undoubtedly, there is much to be said for that argument. Weather forecasting on the Atlantic route is beset by many difficulties, not all of which have been yet overcome, and many practical problems must inevitably remain to be solved. In these circumstances, a disaster is by no means out of the question; and there can be no doubt that if it unhappily occurred it would have a highly adverse effect on the public confidence in Atlantic possibilities.



Here, however, it is not broad questions of policy that are being discussed; we are concerned with the threat to British prestige in the sphere of commercial flying that will undoubtedly claim more publicity than any other in the near future. American boats *have* carried fare-paying passengers. They have crossed by both the northern and the southern routes. Those are facts which cannot fail to impress the average man, who is more influenced by performances than by niceties of policy.

British operations with the modified "C"-class boats cannot, as has been said, hope to be so spectacular as the American achievements. And if experience should show that the Americans are right in their belief that passenger-carrying is reasonably safe and practicable under present conditions, British activities are certain to be accused of excess of caution and of lack of imagination. If, too, as seems not impossible, the "G" class are found next year not to be strictly "comparable equipment" to the American, it will become almost inevitable that the Atlantic airway will be regarded as an American enterprise in which Great Britain is a junior partner and a mere follower.

Undoubtedly, this is an important question; it can be argued from many different angles. In discussing it, too, full weight must be given to the exceptional difficulties with which this country has had to contend. It is, for example, impossible to deny Sir Kingsley Wood's assertion that the rearmament programme must take precedence. There can be no doubt that if this country had been as free as America to focus activities on Atlantic development the position would be better.

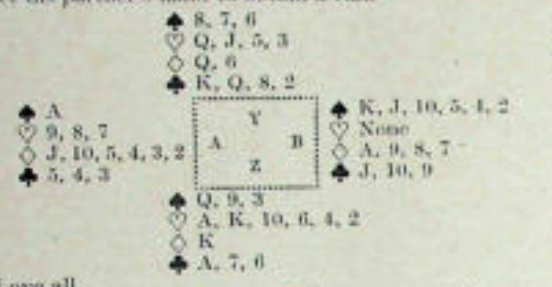
The Imperial Airways fleet has, too, suffered a number of serious losses lately, culminating in the fire to the Connemara, actually one of the boats intended for the Atlantic service.

Yet even allowing for these and other handicaps, it cannot be denied that the problem of Atlantic prestige is not one to be viewed with complacency. We gained an initial advantage and seem now in danger of slipping into a position of inferiority.

A VIEW FROM AN ACCOMPANYING AIRCRAFT OF PLANES OF THE FLEET AIR ARM IN FLIGHT OVER THE ISLE OF WIGHT

BRIDGE

THE SUIT PREFERENCE SIGNAL



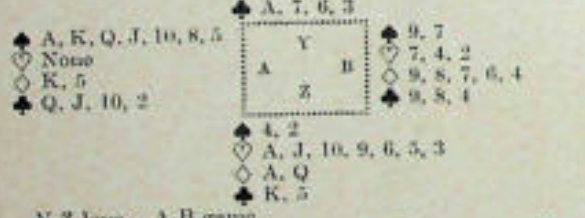
By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

AS a sequel to my last two articles on "Echoing" I should like to introduce to those readers who have not met it before, the suit preference signal, devised by Hy. Levinthal. This signal can be extremely useful and has been adopted by many English players.

The signal is designed to meet the situation where the opening leader has won the first trick and must obviously shift to one of the two suits other than the suit led and the trump suit.

The signal is as follows: If the leader's partner discards an unnecessarily high card, he wants the leader to shift to the higher of the two suits other than the led suit and the trump suit. If he plays his lowest card, he wants the lower of these two suits led.

This convention is particularly valuable when a singleton Ace has been led and the leader wishes to enter his partner's hand to obtain a ruff.



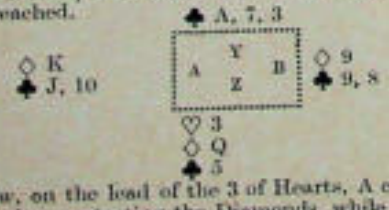
Love all.

Z	A	Y	B
One Heart	No bid	Two Hearts	Two Spades
Four Hearts	No bid	No bid	No bid

A leads his singleton Ace of Spades, and to get into B's hand he will have to switch to Diamonds or Clubs. B throws the Jack of Spades, requesting a switch to the higher suit. A now leads a Diamond, and B returns King and another Spade, to defeat the contract. It will be noted that if A had led a Club instead of a Diamond Y-Z can make eleven tricks.

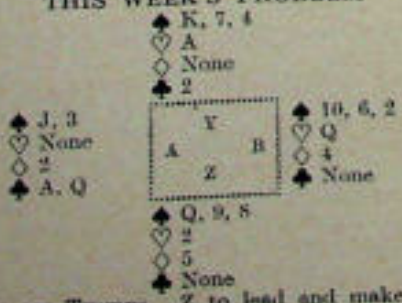
Many players get disheartened when they continually hold poor cards and find themselves playing against game or slam contracts. This is the time, however, when they should be most on the alert. It is likely that their partner holds some strength, and that careless discarding on their part will reveal to declarer the disposition of certain important cards and enable him to finesse successfully.

Alternatively, even the retention of small, apparently unimportant cards by one defender may prevent the declarer making his contract by a squeeze or throw-in play.



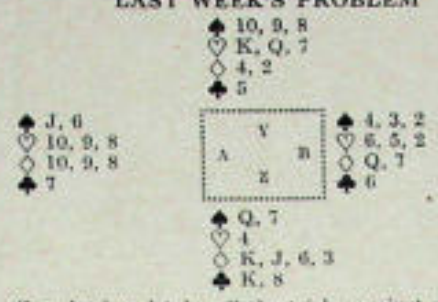
Y-Z love. A-B game.

Z	A	Y	B
Three Hearts	Four Spades	Five Hearts	No bid
No bid	No bid		



A, having already been penalised rather badly, did not feel like bidding Five Spades (in which contract he is only one down on a Heart lead) and rather hoped that Y-Z could not make Five Hearts.

After taking two tricks in Spades, A led the Queen of Clubs, taken by Z's King. Z took three rounds of Trumps, finishing in dummy, and played the Jack of Diamonds in the pious hope that B would cover if he had the King. However, B played the 4 of Diamonds, Z took the trick with the Ace of Diamonds and led all his remaining trumps except one. It was essential that B should keep his two Clubs until the following situation was reached.



Now, on the lead of the 3 of Hearts, A could throw a Club, thus protecting the Diamonds, while leaving B to look after the Clubs. If, however, B had discarded one Club, A would have been squeezed and the contract of Five Hearts made.

THIS WEEK'S PROBLEM

Spades are Trumps. Z to lead and make all five tricks against any defence by A-B.

LAST WEEK'S PROBLEM

Z to lead and take all the tricks against any defence by A-B.

SOLUTION

This problem is taken from the basic situation of the famous Vienna coup. Z leads the King and 8 of Clubs. A cannot discard Spades or Diamonds without establishing the desired two extra tricks for Y-Z. A therefore discards a Heart. Z now plays the Queen of Spades, the feature of the Vienna coup, and makes his three Heart tricks, and on the last Heart lead A has to throw the Jack of Spades or a Diamond, establishing the last three tricks for Y-Z.

CHESS

LIVELY PLAY

A lively game played in the tournament at Kemeri and Riga last March.

(Sicilian Defence.)

WHITE. Mikenas.	BLACK. Dorberg.	WHITE. Mikenas.	BLACK. Dorberg.
1. P to K 4	P to Q B 4	17. B to Kt 5 (d)	Q to Q 5 (e)
2. Kt to K B 3	P to K 3	18. P to K 6 (e)	Q to R 8, ch
3. P to Q 4	P takes P	19. K to Q 2	Q to Q 5, ch
4. Kt takes P	Kt to K B 3	20. R to Q 3	Kt to Q B 3 (e)
5. Kt to Q B 3	B to Kt 5 (a)	21. Q takes Kt	Q to B 7, ch
6. Kt to Kt 5 (b)	P to Q 4 (c)	22. K to Q sq	R to K sq (e)
7. P to K 3	K Kt to Q 2 (d)	23. P takes Kt	B takes P
8. Q to Kt 3	R to B sq	24. Q takes P	B to Kt 5, ch
9. B to Kt 5	Q to R 4 (e)	25. K to R sq	R to K 8, ch
10. Q to Q 3 (b)	Q to Kt 3	26. K to Kt 2	R to R sq (e)
11. Castles (g)	K to B 4 (e)	27. R takes R	Q takes R
12. P to Q Kt 4	B to K 2 (e)	28. Q takes P	Q to K 4, ch
13. B takes B	K takes B	29. P to B 3	Q to K 8, ch (e)
14. K takes P	Q takes P (f)	30. Q to B 5 (e)	Q to Q 7, ch
15. Kt to B 7	P takes R	31. B to B 2	Resigns (g)
16. Kt (B 3) takes P, ch	K to Q sq (e)		

(a) Kt to B 3 is probably better.

(b) P to K 5 is more aggressive.

(c) Not 6. . . . Kt takes P because of 7. Q to Q 4. Kt takes Kt or 7. . . . R takes Kt, ch, then 8. P takes R. Kt to K B 3; 9. Kt to Q 6, ch, K to B sq; 10. Q to B 5, and wins); 7. P takes Kt. R to B sq; 8. B to K B 4, Kt to B 3; 10. Q to K 3, P to Q 3; 11. R to Q sq. P to K 4; 12. B takes P, Kt takes B; 13. P to K B 4, with advantage to White. The text-move, however, is not good. Black should, instead, play 6. . . . Kt to B 3 or 6. . . . Castles. (If, after 6. . . . Kt to B 3, White plays 7. Kt to Q 6, ch, then 7. . . . K to K 2; 8. B to K B 4, P to K 4; 9. Kt to B 5, ch, K to B sq; 10. B to Q 2, P to Q 4 leads to an even game).

(d) If 7. . . . Kt to K 5, then 8. Q to Kt 4. P to K Kt 3 (if B to B sq, then Kt takes Kt followed by Q takes K P); 9. B to Q 3, with a very good game for White.

(e) This loses a valuable tempo. Black should, instead, play 9. . . . Q to Kt 3. If, instead, 9. . . . Kt takes P, then 10. Q to Q R 4, followed, if 10. . . . Q takes B, by 11. Kt to Q 6, ch, K to Q sq; 12. Q to K 8, ch, K to B 2; 13. Kt (B 3) to Kt 5, ch, K to Kt 3; 14. Kt takes B, ch, K to R 4; 15. P to Q B 3, with a fine game for White.

(f) Very good. If, now, 16. . . . Q takes Q, then 17. Kt to B 7, mate, or, if, instead, 16. . . . B to Kt 5, then 17. Kt to Q 6, ch, K to B sq; 18. Q takes Q, B takes Q; 19. Kt takes B, P to Q 5; 20. B to K 7, ch, K to K sq; 21. B to B 3, P takes Kt; 22. Kt to Q 4, with advantage to White.

(g) Threatening 12. R takes P, P takes R; 13. Kt takes Q P and wins.

(h) B to K 2 at once is better. If, instead, 11. . . . P to K R 3, then 12. B to K 3, Q to Q sq (if 12. . . . B to B 4, then 13. Kt to Q 6, ch, K to K 2; 14. B takes P); 13. P to B 4, Kt to B 3; 14. R takes P, P takes R; 15. Kt takes Q P with a powerful attack.

(i) If B takes B P, then Kt to Q 6, ch wins a piece.

(j) If 14. . . . Kt to Q B 5, then 15. P to B 4, followed, if 15. . . . Q to K 6, ch; 16. R to Q 2, Q takes B P, by 17. Kt to B 7, threatening a deadly check at Q 5 with a Knight.

(k) If K to B sq, then B to B 4, threatening P to K 6.

(l) Better than Kt takes R. White now threatens either P to K 6 or R to B sq.

(m) Kt takes P is, perhaps, slightly better, but in any case Black has a very bad game.

(n) Threatening P to K 7, mate.

(o) If 20. . . . Q to B 7, ch; 21. K to B sq. P takes P, then 22. Kt takes P, ch, K to K sq; 23. R to B sq, with a winning attack.

(p) If 22. . . . P takes P, then 23. Kt takes P, ch. K to K sq; 24. Kt takes P, ch, with a winning game.

(q) If R takes R, then Kt to K 6, ch, and mate in two more moves.

(r) 29. . . . R takes Kt; 30. Q takes R, ch, Q takes Q; 31. Kt takes Q. K takes Kt is, of course, quite hopeless.

(s) Threatening either Q to Q 6, ch or Q to B 8, ch.

(t) If 31. . . . Q to K 7 (to prevent Q to K 7, mate), then 32. Q to Q 6, ch, B to Q 2; 33. Q to B 8, ch, B to K sq; 34. Kt takes B, Q takes Kt; 35. Q to Q 6, ch, Q to Q 2; 36. Q takes Q, ch, K takes Q; 37. Kt to Kt 6, ch, and wins.

A GOOD GAME BY ELISKASES

The following game, from a tournament at Bad Harzburg, was well played by Eliskases.

(Indian Defence.)

WHITE. Stahlberg.	BLACK. Eliskases.	WHITE. Stahlberg.	BLACK. Eliskases.
1. P to Q 4	Kt to K B 3	15. P takes P (k)	B takes P
2. P to Q B 4	P to K 3	16. R to Q 3	Kt to Q 5
3. Kt to Q B 3	B to Kt 5	17. Kt takes Kt	B takes Kt
4. Q to Kt 3 (a)	P to B 4	18. Kt to Kt 5 (l)	B to B 4
5. P takes P	Kt to B 3	19. Q to Q sq	Q R to K B sq (j)
6. Kt to B 3	Kt to K 5 (b)	20. Kt to Q 4 (k)	B to K 5
7. R to Q 2	Kt takes B (c)	21. R to K Kt 3 (j)	B takes Kt
8. Kt takes Kt	P to B 4 (d)	22. Q takes B	B takes P
9. P to K 3	Castles	23. Q takes P, ch	Q takes Q
10. R to K 2	B takes P	24. R takes Q, ch	K takes R
11. Castles K R (e)	P to Q Kt 3	25. K takes R	R to Q 5
12. Kt to B 3	B to Kt 2	26. R to Q sq	R takes R
13. Q R to Q sq	Q to K 2	27. B takes R	R to B 5
14. P to Q R 3 (f)	P to B 5 (g)	Resigns.	

(a) This move, at one time frequently played, has not been seen much of late, Q to B 2 being generally preferred.

(b) B takes P is considered to be better.

(c) Nimzowitsch's move, Kt takes Q B P, has gone out of favour.

(d) If Kt to Q 5, then Q to Q sq, threatening K Kt to K 4.

(e) Castles (Q R), is better since White very quickly gets a pressure along the open Queen's file against Black's backward Queen's pawn. A game Spielmann v. P. Johner (Carlsbad tournament, 1929) was continued as follows: 15. . . . P to Q Kt 3; 16. Kt to B 3, B to Kt 2; 17. R to Q 2, Q to K 2; 18. K R to Q sq, K R to Q sq; 19. P to Q R 3, Q R to B sq; 20. K to Kt sq, P to Q 3; 21. Q to K 5, P to Q R 4 (to prevent P to Q Kt 4); 22. Kt to Q Kt 5 with the better game for White.

(f) Too slow. He should, instead, play Kt to Q R 4. Black could not reply with B to Q 3 because of Q to Q 3.

(g) A good move.

(h) P to K 4, although it condemns White's Bishop to inactivity, seems better.

(i) B to B 3, although uninviting, is, we think, to be preferred. If, instead, 18. P to Kt 3, then 18. . . . Q to Kt 4 (threatening R to R 5 followed by R takes P); 19. Kt to Kt 5, B to B 4; 20. R takes P, B to B 3; 21. R takes P or R to Q 3, Q R to K B sq with a winning attack.

(j) A strong move. If now 20. R takes P, then 20. . . . Q to R 5; 21. P to K Kt 3 (if 21. R takes B, then 21. . . . B takes P, ch followed, if 22. K to R sq, by 22. . . . Q takes P, ch and mate next move, or, if 22. R takes B, by 22. . . . Q takes R, ch; 23. K to R sq, Q to B 8, ch and mate in two more moves), R takes K B P and was for, if 22. P takes Q, then 22. . . . R to B 8, mate, or, if 22. R takes R, then 22. . . . R takes R, ch; 23. K to B sq, Q to R 6, mate.

(k) B to B 3, although still uninviting, is better.

(l) White has no satisfactory move. If 21. R to Q 2, then 21. . . . Q to Kt 4; 22. P to K Kt 3, P to K 4; 23. Kt to Kt 3, B takes P, ch; 24. R takes B, R takes R with a winning game for Black.

END-GAME STUDY

By P. HEUÄCKER.*

WHITE (3 pieces): King at Q B sq, Bishop at Q Kt 8, Pawn at K B 6.

BLACK (3 pieces): King at K R 5, Bishop at Q 5, Pawn at K 4.

White to play and win.

**New Freie Presse*, 1930.

PROBLEM No. 4025

By G. WATSON.*

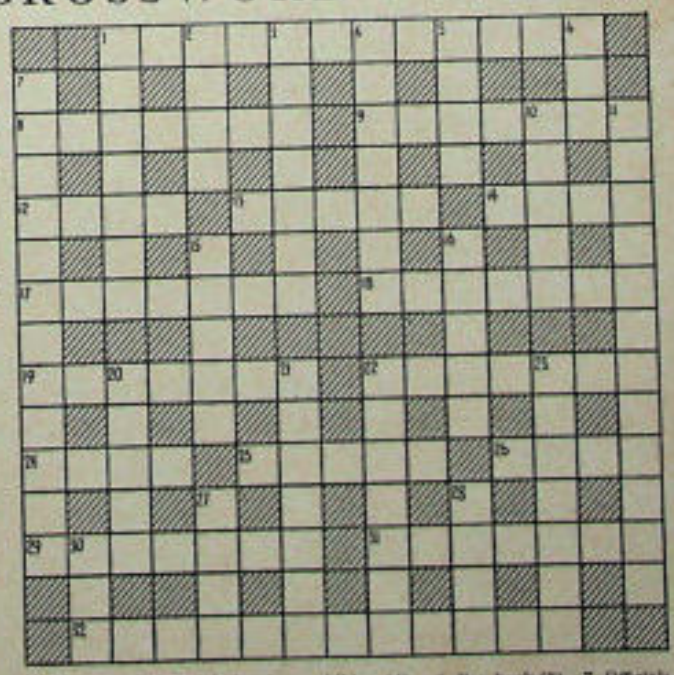
WHITE (8 pieces): King at K R 8, Queen at K 3, Rook at Q B 6, Bishops at Q B sq and Q R 2, Knights at Q 8 and Q R 8, Pawn at K B 4.

BLACK (8 pieces): King at Q 4, Bishop at Q R 4, Knights at K sq and Q R 6, Pawns at Q Kt 3, K 5, Q B 5 and Q B 6.

White to play and mate in two moves.

** Yorkshire Observer Budget*, 1937.

SOLUTION OF PROBLEM No. 4024



1. B to B 3, Any move; 2. Q, R or B mates.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Country House

Nettle Destruction.—The destruction of nettles by preparations of sodium chlorate may be carried out at any time of the year, but it is best to start the work in late spring or early summer when the plants have made some top growth and so have partly exhausted food reserves stored in the roots. The nettles should not be cut before spraying. It is generally better to spray two or three times throughout the season as fresh growth is made, using about 25lb. of the chemical per acre each time, rather than to give a single heavy application.—*A. R. A., France.*

Wood-Destroying Fungus.—Several different kinds of fungi cause decay in buildings, and it is impossible from the description given to name the species responsible for the damage in your case. From its habit of forming strands that carry it over large areas of brickwork, however, and, in particular, the drops of water in exhibs, we are inclined to suspect that the fungus may be *Merulius lacrymans*—the dry rot fungus. If so, we cannot attempt in a few short paragraphs to advise you as to the extensive structural and other methods necessary for its control, and strongly recommend you to send for identification samples of affected timber and specimens of the fungus (carefully packed in waterproof paper or cotton wool so that their moisture is retained) to the Forest Products and Research Laboratory, Princes Risborough, Bucks. We also think you should obtain from His Majesty's Stationery Office, London, a copy of the *Forestry Products Research Bulletin*, No. 1, "Dry Rot in Wood," price 1/- net. This gives a full description of the various kinds of fungi occurring in houses, with a simple table that should enable anyone to identify a particular species, as well as full instructions for the control of dry rot. The dry rot fungus is rarely found out of doors, and since you seem to be certain that the fungus strands originate from the soil, it is possible that the fungus in your house may not be dry rot. If so, less drastic action will be necessary and it is possible that with the structural alterations you have already made, especially in the way of improved ventilation, and by sterilising infected wood and brickwork by chemicals, the pest will be eliminated. Moisture is essential for all wood-destroying fungi, and it has been established that if the timber contains much below 25 to 30 per cent. of the oven-dry weight of the wood, they cannot exist. As wood that has been thoroughly air-seasoned in the open contains 15 to 18 per cent. of moisture, and in a properly ventilated house 12 to 14 per cent. and even lower, it follows that if the timber is in a satisfactory condition, and the house is kept well ventilated and dry, attack will eventually die out. The dry rot fungus, however, is an exception, for it can attack timber containing 20 per cent. (oven-dry weight) of moisture. Moreover, it is able to carry water by means of its conducting strands and penetrate even to dry parts of the house where, by its power of producing water by action on the wood, it can make the timber moist enough for further attack. For these reasons it is very difficult, if not impossible, to control dry rot by ventilation alone. If the fungus is not dry rot, we would recommend that you turn over the soil round the infected parts of the house to a depth of 2ft. and thoroughly drench this with a 5 per cent. solution of copper sulphate to destroy any fungus in the soil. Outside brickwork should be sprayed with the same solution. Interior woodwork and walls should be treated with a 0.1 per cent. spray of water-soluble salicylanilide. It would be advisable in any new constructional work to include 0.2 per cent. of this chemical when mixing the plaster, and 0.1 per cent. in any distemper used for decoration. Before undertaking any further structural work you certainly should have the fungus identified and seek the advice of the Department of Scientific and Industrial Research at the Forest Products Research Laboratory.—*C.J.S., Leeds.*

Kennel

Spaniel Hunting.—We are afraid nothing will now cure your spaniel of the bad habit of going off hunting. Whipping is not likely to be of any use. Some dogs are responsive to a sound rating, but when they have once become confirmed in the misdemeanour it is doubtful if anything will stop them beyond giving a kennel with a run attached in which they can be confined when not under observation.—*A. H. H., Bury St. Edmunds.*

French Bulldogs.—A French bulldog should answer your purpose very well. Usually they are good-tempered, do not require a lot of exercise, yet can walk when wanted to do so. Some breeders are: Mrs. Townsend Green, 18, Phillimore Place, Kensington, W.8 (kennels in Bucks); Mrs. Vaughan, Southfield Park, Harrow, Middlesex; Miss M. Billiter, Penn Cottage, Beaconsfield, Bucks; and Mrs. Roberts, L'Estanto Cottage, Stoke Court, Stoke Poges, Bucks.—*J. C. T., Berkhamsted.*

Swollen Udders.—Bitches that are not allowed to breed, frequently have a secretion of milk at the time they would whelp if they had been mated, and if this does not receive attention there is danger of the formation of tumours. When things get as bad as this it means an operation. Tumours are very unsightly, although they often do not seem to cause inconvenience. As a preventive, rub the parts with camphorated spirits and give an aperient. As your bitch seems to have the swelling rather badly, suffer first by massaging with warm olive oil.—*W. H. H., Andover.*

Stuttgart Disease.—Stuttgart disease, or specific gastritis, is a most serious complaint, with a high rate of mortality. We know of no form of inoculation as a preventive. We cannot say what is the cause, except that it is contagious. If your kennels are disinfected thoroughly and have a rest for a little time after a case, they should not harbour infection, but the job needs to be done well. Patients should be put on a liquid diet of a nourishing nature and not allowed water to drink. Milk and Vichy water in equal quantities, Benger's or a similar food, white of egg with milk, are all to be recommended. Three drops of cyllin in a capsule thrice daily. Wash the mouth frequently with a solution of permanganate of potash. Treat as an invalid for some time after apparent recovery.—*R. W. S., Ford.*

Shooting

Robbing Partridge Nests from Footpaths.—Under the Game Act, 1831, any person not having the right of killing game upon the land, nor having permission from the person having such right, wilfully taking out of the nest the eggs of any bird of game, or having any eggs so taken in his possession, is liable to a penalty for every such egg of 5/-. An old grass verge outside a hedge usually belongs to the owner of the land on the other side of the hedge, but it has often been left in case the road is flooded or founders, as otherwise the wayfarer would have the right to pass over the fields. The existence of a right of way does not affect the ownership of the land.—*J. G., Devizes.*

Right to Shoot Rabbits.—Rabbits are not "vermin" in the sense of the Gun Licence Act of 1870, so an occupier killing rabbits on his land must have a gun licence. Where, however, an occupier's only right to kill rabbits is due to the Ground Game Acts, he can do so only by himself or persons duly authorised by him in writing. The occupier himself and one other person authorised by him in writing are the only persons entitled under the Acts to kill rabbits with firearms. The person authorised by the occupier must be either: (1) A member of his household resident on the land occupied; (2) A person in his ordinary service on such land; or (3) A person *bona fide* employed by him to take and destroy ground game.—*G. L., Bradfield.*

Stable

Worms in Horses.—All horses are liable to become infested by worms if pastured on land infected by worm eggs or larvæ which can persist in the soil for twelve months or over, according to the species of the worms.—"*A Horse Lover*," *London.*

Travel

Staying in North Devon or Cornwall.—There is the Lee Abbey Hotel, near Lynmouth. The hotel looks out over the sea, which can be seen from all the public rooms, notable among which is the lofty octagonal room with its vaulted carving—and most of the bedrooms. There is here no set promenade, such as one finds at a seaside resort, but only yellow sand and ragged cliffs to set off the sea. Everything is natural and nothing has been spoilt. You would have to go a long way, believe me, ere you found a hotel more charmingly situated than Lee Abbey. It stands, for example, in its own nine-hole golf course. The first tee and the last green are both in front of the hotel, so that the enthusiastic golfer need not fear losing any precious minutes ere he can drive off after breakfast. And in Cornwall there is the delightful Tregenna Castle Hotel, which stands in lovely seclusion behind the famous little Cornish town of St. Ives. Its situation is high and lovely, and it stands amidst its own hundred acres of park and woodland stretching down almost to the yellow sands at Porthminster and up to the gorse-covered moorland. The gardens are full of sub-tropical flowering shrubs, with an occasional fountain and "other delights." To stroll among the Tregenna woods is to obtain many a lovely glimpse of land and sea, while the windows of the house itself, long, turreted and machicolated frame delicious pictures. At Tregenna Castle one may fare sumptuously within and enjoy all the country pleasures without. The hotel's own gardens supply the vegetables; from its farm come eggs, poultry and salads and Cornish cream is served with every meal. Out of doors at Tregenna, to say nothing of hard and grass tennis courts, the Castle provides its own golf. A nine-hole approaching and putting course was made some years ago, occupying about four acres. The length of the holes ranges from 80yds. to 135yds. with a total distance of about 1,000yds.—*R. S. P., Aldershot.*

Inns near Dorking.—The White Horse Hotel at Shere is 600 years old, and there is every reason to believe that it was once used as a church guest-house. It is a remarkable building, and, except for the new wing which was added 34 years ago, the original structure remains. From the outside the inn belies its age. You can see at a glance that it is not modern, but there is little to make you expect such a splendid old interior. The house has no foundation, the mud walls being built round oak beams, which run through the house from top to bottom. No nails or ridge-boards have been used in the construction, while many of the beams are of odd shapes. In all probability they were brought up from Shoreham by barges, for most of them are ships' timbers. The proprietor and his wife, Mr. and Mrs. Askew, take a real pride—as they may well do—in their old inn. You would also like the White Horse at Dorking. Here is a typical Dickens inn which has stood in Dorking High Street for at least 400 years. Americans often cross the Atlantic to see this old hostel, and they will tell you that it is the original Marquis of Granby, where Sam Weller met his mother-in-law in the bar parlour. It is strange to see the twentieth century sanitation rubbing shoulders with the sixteenth century oak, but it is one of the charms of the White Horse. Modern improvements have been made without in any way impairing the character of the queer old bedrooms, with their low ceilings and rough beams, while in the public rooms you will find some splendid furniture of the Georgian period. Not far away from Dorking, though a little difficult to reach unless you have a car, is the Abinger Hatch Hotel, near Abinger Common. Small enough to be friendly, big enough to be comfortable, the Abinger Hatch Hotel is a Mecca for walkers and motorists on Saturdays and Sundays. There are eight letting bedrooms and a suite, and they are all usually full in the summer months, which is, of course, the great compliment of all for the management, the cuisine, and the general attractiveness of the hotel. No local record has been kept concerning the foundation of the hotel, though inside the inn a solid oak beam here and there speaks of far-off times. At all events, Abinger retains an atmosphere of peace and quietness which are too rarely come at in this modern world. Outside the church, which stands opposite the inn, the village stocks can still be seen, mouldering and repaired in places, but there they are.—*W. R., Kingston-on-Thames.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, AUGUST 12th

OTTERHOUNDS—ENGLAND

BORDER COUNTIES.—Saturday (Aug. 5th), Rhydmeredith Bridge on Tanat; M., Llangedwyn on Tanat; Th., Dolgarrog Bridge on Conway; S., Meifod Bridge (for Banwy)—10.30.

BUCKS.—Saturday (Aug. 5th), Markham Moor; M., Round House, Lechlade; Th., Deddington Mill, near Banbury; S., Trafford Bridge near Banbury—10.30.

BURE VALLEY.—Monday (Aug. 7th), Bickling Mill—10.

CARLISLE.—Monday (Aug. 7th), Lazonby, Eden (up); Tu., The College, Kirkoswald; Th., The College, Kirkoswald—9.30.

CHERITON.—Saturday (Aug. 5th), Jacobstowe; M., Kersham Bridge (Taw); S., Town Mill's, Torrington (cap for Hunt servants)—10.30.

COURTENAY TRACY.—Saturday (Aug. 5th), in district; Tu., Millbridge, Fremsham; W., Millbridge, Fremsham; S., Headley Bridge, Bordon—10.30.

CROWHURST.—Saturday (Aug. 5th), Goudhurst Station; M., Onslow Arms, Loxwood; W., New Bridge—10.30.

CULMSTOCK.—Saturday (Aug. 5th)—Hemyock (R. Culm); M., Whitford Bridge (R. Axe); Th., Otterу St. Mary (R. Otter); S., Axminster—10.30.

DARTMOOR.—Monday (Aug. 7th), Longbridge (Plym); Th., Staverton Station (Dart); S., Dartmeet (W. Dart)—10.30.

EASTERN COUNTIES.—Saturday (Aug. 5th), Chilkofoed Fleet; M., Potash Bridge, Brandeston; Th., Earsham Bark; S., Glemsford Station—10.30.

HAWKSTONE.—Saturday (Aug. 5th), Carreg—10.30.

KENDAL AND DISTRICT.—Saturday (Aug. 5th), Gosshgham Bridge (Lune); M., Kirkby Lonsdale; W., Where leave off Monday—10.

WYE VALLEY.—Tuesday (Aug. 8th), Colgarron, Goodrich; F., Newbridge-on-Usk—10.30.

STAGHOUNDS—ENGLAND & WALES

DEVON AND SOMERSET.—Tuesday (Aug. 8th), Varde Down; Th., Exford; S., Comer's Gate—11.

QUANTOCK.—Monday (Aug. 7th), Triscombe Stone—11.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than first post Tuesday to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale) English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

RUNNING TO FAME

ONCE again we have seen the incomparable Finnish athletes in action in this country. Surely Maeki must be the best of them all.

Last week-end, when competing at Edinburgh, Maeki set up a new British record for the three miles of 14min. 3.4sec., and then proceeded to lower this figure to 13min. 59.4sec. at the International Meeting at the White City. That is powerful, magnificent running. Actually it took a deal of persuasion to get Maeki to run at the second meeting after his testing effort on the Saturday previous. Doubtless it was a mistake to engage him for two track meetings within a couple of days, but sport, even amateur sport, is linked up with £ s. d. and thrives on publicity. More is the pity.

Maeki's performances at distances from two to six miles in the past year have been phenomenal. In the space of three weeks he broke three world's records. He has run the two miles in 8min. 53.2sec., a world record and six seconds faster than even the great Nurmi at his best. He also holds the world records for the three miles, the 5,000 metres, and the 10,000 metres.

For long-distance running the Finns have always had a style of their own. Many maintain that for this type of race an athlete must come down on his toes, fall back on his heels and so go off again into the next stride. The Finns, however, come down lightly almost on their heels and go forward on their toes. Part of their success in long-distance running can also be traced to the fact that at home they mainly run in cross-country races and, as there is no scheduled season, they are always in training and always fit. They have, too, an obvious confidence in themselves. And races, after all, are won in the mind.

Consider into the bargain the outlook of most cross-country runners. Do they run to clip seconds off records or because they like the nip in the air and the tonic feeling of general fitness which they get from running?

The question: Why do men run? is not easily answered. Can you answer it personally, honestly? If it were in competition would it be to heighten the prestige of Britain? We do not like to see games turned into cash, but is it very much better to see them in terms of fame or prestige? That is a very difficult question to answer in these days when sport gets so much publicity.

We are now approaching the next Olympiad, as the International Meeting at the White City reminded us. People were saying as they left the ground that our performances were not good enough. Yet we did reasonably well, and no one could deny that our athletes enjoyed their races. Is that not the spirit of a game? Or are we, in this age of specialisation, to abandon our British angle on games and make our leading athletes almost professional in outlook? They would be made to see that their job is of secondary importance to their game. Our performances might then rank as second to none, but would we have gained anything? Our outlook on games to-day is a good one; it is worth keeping.

If, on the other hand, we feel that our prestige as a nation does suffer every time we are defeated in some international game then something must be done. Either our best men must become practically professionals or we must cease competing. But let us not forget that both failure and success are imposters.

SUMMER WEATHER

AS though we have not enough troubles to contend with these days, the weather has decided to show what it can do. The rain it raineth every day to spoil hard-earned summer holidays and, what is worse, to supply a bit more depression for the farmer, whose hopes of harvest are considerably damped. Sympathy, too, will go out to those who have looked forward to summer camps. At Beaulieu the Territorials were flooded out, and if the idea had been to give them a possible conception of what Flanders mud looked like conditions came near to doing so. This raises a point as regards camping sites and tents, for it seems that more forethought will have to be devoted to the matter. The very brief fortnight of training is wasted if slopping about on waterlogged ground is allowed to disorganise it. It seems better drainage and more permanent camps will be needed as an insurance against bad weather. And now that a battalion has to be accompanied by a train of cars and tractors, the parking spaces will have to be of such a nature that the coming and going of the vehicles does not make miniature lakes on or near them.

NORTHWARD MIGRATION

Were it not for the failure of grilse to make their customary appearance, northward migrants this year would take more thought for the rods they carry with them than is usual in August; for the rain which seems to have gone northwards, too, though unhappily without leaving the south, should fill the spate streams of the west coast and bring up whatever fish may be haunting their mouths. Lacking grilse, there is still an exceptionally good prospect of sea-trout runs whether one's destined watershed falls to east or west; for there has been something like an invasion of the Spey by sea-running trout and the Atlantic coast can always be relied upon for a full house in times of spate. Summer fishermen have had some cause to complain of the salmon's lack of adherence to schedule these last few years, but sea trout, once again, seem to be doing their best to make good the deficiency.

THE RABBIT ACT

Since the War, no fewer than eleven attempts have been made to legislate on the question of rabbits. Last week the Prevention of Damage by Rabbits Bill, introduced in the House of Lords by Lord Sempill, and in the House of Commons, on behalf of the Universities' Federation for Animal Welfare, by Sir Joseph Lamb, became an Act. Briefly, this Act empowers any county council to require an occupier of land either to keep his rabbits on his own land or to destroy them. The county council may assist occupiers to do so, and there are penalties for non-compliance. Spring traps must, in future, be set inside the rabbit holes, and not scattered about in the fields. It remains to be seen how this Act will work. If everyone were equally determined to keep rabbits down, it would be assured of an easy success. Unfortunately, there is a vast amount of money in commercial rabbit trapping, and these interests will constitute the difficulty. What is really needed is a policeman in every field.

MAIN ROAD CONGESTION

We have a Ministry of Transport. We point it out just in case, after the Bank Holiday, you should think we have not. Every main road out of London had its traffic jams—some a mile or more in length—and on a number of roads the congestion was increased through long stretches being "up." Conditions on our main roads worsen year by year, and no Minister seems to be able to do anything about it. The Alness Report, a very sane document and at the same time a damning indictment, of the Ministry of Transport aroused a considerable interest when it was published. No one seems to know what has happened to it since. It is to be hoped that it has not found a permanent home in one of the Ministry's pigeon-holes. And all this time the congestion continues and increases, and we hear optimistic talk about the completeness of evacuation plans. Perhaps Captain Euan Wallace has not driven through Staines at the week-end?

BLOOD-HOUND

(St. Hubert's hound: "able to lead all good hunters into Heaven."—*Turberville.*)

When good St. Hubert, bonny man,
Would find a halo heavy
He'd cheer his Talbot black-and-tan
Throughout the greenwood chevy;
And good St. Hubert had the gift
To say that here was given
A hound who had a voice to lift
A huntsman's heart to heaven.
With a hey, ho, chevy,
This day a stag must die.

Duke William made his forest new
That he might have good sport;
A Talbot run from scent to view
And William blew the mort;
The Saxon gaped at horn and haunch
And shook his head askance.
"What dog o' ourn," says he, "be staunch
As you black dog o' France?"
With a hey, ho, chevy, &c.

Count Gaston was a glorious youth,
His hair was like the sun;
He heard the Talbot tell the truth,
He saw the Talbot run,
And joyfully his horn he wound
And tightened up a girth,
"*Ma foi*," quo' he, "a valiant hound,
The surest hound on earth!"
With a hey, ho, chevy, &c.

To-day he hunts no hart of grease—
He hunts the good red-herring;
Or runs at head (of his police)
The line of lightfoot erring;
But still he lifts his solemn head
And speaks like bells at even,
And takes, as good St. Hubert said,
His handler's heart to heaven.
With a hey, ho, chevy,
Hey, ho.

PATRICK CHALMERS.

A COUNTRYMAN'S JOURNAL

MY sheepdog, Friday, has four bad warts on one of her back feet, and the most skilled of veterinary practices have been unable either to remove them or to prevent them from spreading. An old countryman to whom I have been of some slight service learns of this and comes to see me. His grandmother, he told me, was a wart-curer and, when she was on her deathbed, she sends everybody out of the room, and asks to see a young girl to whom she had taken a fancy. To her she confides the secret that is not to be told. I asked him what the treatment was. Nothing, he said, except show her the warts and tell her how many they be. What did he mean, I inquired, by his nothing? It's nothing, he said, because it's a charm. He himself had had eight severe warts for which he had tried all manner of remedies in vain. So at last he goes to this Mrs. —— and tells her the number, and she says nothing, and he says nothing, and he goes away. In a week, the warts had changed colour and in a fortnight they had all disappeared without leaving scar or mark of any kind.

"There was one bwoy-chap," he went on, "that ud sixty-four warts on his hand and arm. He sees Mrs. —— and she exes him how many, and he sez sixty-three. A month arterwards there was one wart left, and he never gets rid of this one wart till he goes and sees her again." I asked him if he knew of any other people who had been cured by her. "More nor twenty in my village," he said, "and lots more roundabout." The charm had never been known to fail, and all that passed between patient and charmer was her question of the number. She would never discuss her powers with anybody, nor would she explicitly undertake to make a cure, nor did she wish it to be known what she had done. Yet nobody who had ever been to her but had, as it were, left his warts behind. Nobody doubted her capacity to-day, though many had done so in the past.

I neither believed nor disbelieved, but it seemed to me the most thrilling story I had ever heard in an English countryside that our urban pseudo-civilisation has emptied of nearly every element of interest, adventure or vitality with which she was once so rich. How far back did this white witchery, handed down by word of mouth from generation to generation, extend? To the days of Herrick and his country lore, half herbalist and half magical? To the well-dressings of the Middle Ages? To the medicinal properties of megalithic monuments? Or to the whisperings of nature into the human ear yet older than they, to the hidden cult-knowledge of seers whose mysterious certainties had been transmitted not merely from the old to the young, but from Egypt to the Mediterranean and from Knossos to beyond the Pillars of Hercules? Who shall tell?

It is no good asking our archæological or our anthropological science for light, since its defect is absolute and prohibitive of extension in any but one-way knowledge. It knows too much and too little at the same time, and on these foundations has built up an edifice of ferro-concrete dogma and orthodoxy such as no light can penetrate and with which no religion, however rigid in its formulæ, could ever have competed. Its idea is that anything early is childish, and anything immaterial is the mumbo-jumbo of cheating medicine-men. How can rational argument be conducted with a state of mind like this?

For the matter of that, what would any branch of science say to the story that an old woman in an obscure village of *our time* was able to cure warts by a charm? The scientific pontiffs would not actually have her burned at the stake as King James I's court physicians would have done, or crucified as the pundits of Palestine did to one who cured people without medicines or operations. We no longer persecute for heresy because nobody believes in anything at all to-day except in science itself and the scientific theory of inevitable and automatic progress, a belief more preposterous than any superstitious notion entertained in his wildest dreams by a Solomon Islander. All that science could do if mystical cures ever threatened to shake human faith in its divinity would be to starve out the heretics by manœuvring the economic machine against them. Science could work that all right. It is pretty good at inventing new ways of killing people.

Well, we shall see. I have yet to find out whether this village magician undertakes to cure animals as well as men. If she does, we shall see!

H. J. MASSINGHAM.

WITHOUT COMMENT

From an account of a Karachi race meeting:

"Other fines during the afternoon included Rs. 5 from Abdul Latif for crossing over too soon near the bend in the first race, while Bhoop Singh and Mehar were each fined Rs. 25 in the third race for waving their arms and using them as whips."

Grain merit (Calandra granaria) *on wheat*

A POLICY AGAINST GRAIN PESTS?

By JOHN ROKEBY

THE recent Government announcement that "a permanent organisation has actually been established to carry on research on infestation of foodstuffs in storage and to provide an advisory service for industry" is welcome news.

The problem of pests in stored food is one that has long been virtually ignored by the authorities, and with the increasing stocks that are now being held against an emergency it is more than ever essential that something constructive should be done. It is only natural, however, to ask what form this organisation is taking; how, when and where it will work; and, above all, how it maintains contact with industries and individuals concerned in food storage.

This organisation consists of a staff of entomologists, chemists and other workers centred under Professor Munro at the Biological Field Station of the Imperial College, at Slough, Bucks. Many of the staff have already been working for some years on problems of stored food pests, and much time and expense have been saved, there being no need for special training of a new staff. Besides the problems directly concerned with the survey, investigations into the biology of grain pests of all types are being carried out, with a view to devising methods of control which can be applied until prevention becomes a general practice. At present, the most effective control is assured by using the pyrethrum–white oil spray which has produced excellent results in other similar situations.

The actual survey has established several important general points in relation to grain pests. The worst pests, such as the *Calandra* weevils and the flour moths (*Ephestia*), are shown not to be native in a wild state in Britain, but to be rather in the nature of a permanent population in many mills, granaries and ships and other transport media. The difficulties and dangers of such a situation are obvious, for infestation of grain may thus take place at almost any time from its entry into this country till its actual processing as a foodstuff. Furthermore, although on most farms there is a similar small permanent population of half a dozen or so assorted pest species—out of the total of 150 so far identified—these are far less frequent where a farmer keeps his own stocks of home-grown grain separate from any imported stocks, and where his granaries and stores generally are kept really clean. The matter of general hygiene, in fact, is the most important factor in preventing farm outbreaks.

Such facts, together with the knowledge that it is only very seldom that a farmer notices any appreciable loss or damage through grain pests, have made farmers as a whole loath to admit that there is any problem at all. Actually there is little doubt that a continual small loss does occur, while the presence of the pests, even in small numbers, makes every farm a possible source of reinfestation. Moreover, the very fact that the N.F.U. were the original body to subscribe to the first informal meetings implies that they, at least, admit that such a problem does exist. As a rule, however, farms are not important sources of infestation, and such insects as are found there have usually arrived, in the first place, with imported grain from other sources.

With regard to imported grain, it has been found that the hard Canadian wheats alone are really pest free, owing without doubt to the high standard of hygiene maintained in the Dominion's great grain ports. This is the more interesting since under laboratory conditions it has been found that the pests thrive best on hard wheats of precisely this type. The pests under consideration, of course, are by no means confined to wheat, and those on barley especially are of almost equal importance, while pests of flour and grain products generally are also under constant investigation. For the most part, however, the same factors govern infestation on all types of grain and grain products, and by every different sort of pest.

At present, then, we have a Government policy which may be defined as being the same as that for any other problem handled by the D.S.I.R., namely, the provision of advice and information to any industry or individual asking for it, this advice coming in the present case direct from Slough. It must be realised, too, that although the presence of large Government stores of wheat is probably responsible for this move being taken at this time, there is no intention of regarding it as a merely temporary measure. The proposal is, in fact, the establishment of a new Government laboratory, near London, for research into pests of stored food products. Such a laboratory will have a large and complete staff able to cope with every aspect of these problems, and it will be an essentially permanent establishment.

So much for the present. What of the future? While Professor Munro is gradually building up his research staff and giving such "first aid" to industry as he can, there is no doubt that the problem of pest infestation itself grows daily more and more urgent, not merely at home but throughout the Empire. The facts about the tremendous and disastrous increase of pests in stored products are well known, and should we be at any time compelled to depend on such stores, it would seem imperative that a policy of protection and control should be already in action and capable of immediate application under war conditions. During the Great War, exactly similar problems arose, and at the request of the then Government, the Royal Society appointed a special committee—the Grain Pests (War) Committee—to investigate means of pest control. At the present time it is instructive to read the concluding pages of their report, published almost exactly 20 years ago.

The committee came to the conclusion "that the whole subject of grain pests is of serious importance to the Empire, and that a permanent organisation should be brought into being to deal, not merely with insect pests, but with all living organisms causing destruction to vegetable foodstuffs." It was decided, too, that "in the first place the State should assume a general responsibility for the continuation of grain pests' work," and that "the Department of Scientific and Industrial Research might be willing to take up the scheme on the lines suggested above." After 20 years we are seeing some at least of these ideas put into action. Is it too much to hope that we shall have an early announcement of a complete and active, aggressive and not merely advisory Government policy? Action is timely, and it is greatly to be hoped that ample financial and administrative support for this new and urgent national service will make amends for the long delay in recognising in this country, which more than any other is dependent on imported foods, the magnitude of this problem.

THE THICKLY WOODED SLOPES AND RUGGED HILLS SURROUNDING THE ROYAL RESIDENCE AT BALMORAL

THE KING'S ESTATES IN SCOTLAND

By ALEXANDER KEITH

THE King and Queen enjoy a holiday on their Scottish estates, and are evidently as much attached to picturesque and secluded Balmoral as was Queen Victoria, who 90 years ago became first the tenant and later the proprietor of this portion of the ancient Earldom of Mar. Queen Victoria used frequently to reside at Balmoral more than once in a year. On her first visit, in September, 1848, she arrived by sea at Aberdeen—there was then no continuous railway connecting the city with the south—as her great-grandson arrived one year.

The attractions of Balmoral are its privacy, its deep and extensive pinewoods, its large grouse moors and deer forests, and its salmon and trout fishing on a long stretch of the river Dee. The grouse moors, leased from Mrs. Farquharson, of Invercauld, are on the north side of the river, and extend northwards to the watershed between the Dee and the Don. The deer forests, south of the Dee, form a triangle with a base of twelve miles along the river, and with its apex at Lochnagar, whose "steep frowning glories" dominate the whole estate.

The territory comprises the great Forest of Ballochbuie and the Forest of Balmoral itself, with Birkhall, which was their Majesties' autumn residence for several years before King George's accession. Balmoral includes Lochnagar. To round off the shootings the King takes on lease Glen Callater, which runs in a south-westerly direction behind the hills of the White Mounth, of which Lochnagar is the chief and central eminence, from a point a couple of miles south of the village of Braemar.

The Castle of Balmoral has been completely rebuilt since the estate was purchased by Queen Victoria in 1852. When she first saw the mansion in 1848 she was delighted by the quaint contrast of its small apartments with those of her palaces in England.

"It is a pretty little Castle in the old Scottish style. There is a picturesque tower, and a garden in front, with a high wooded hill; at the back there is a wood down to the Dee; and hills rise all round.

"There is a nice little hall, with billiard room; next to it is the dining-room. Upstairs, immediately to the right, and above the dining-room, is our sitting-room . . . next to which is our bedroom, opening into a little dressing-room, which is Albert's." It was rustic simplicity indeed after Windsor and St. James's."

The Royal holiday-makers, impatient to explore such an unaccustomed environment, scarcely waited to rest and refresh themselves after their six hours' drive from Aberdeen. At a quarter to three they reached Balmoral. At half-past four they were out and about, climbing the "high wooded hill" in front of the castle, and gazing across the tumbled mass of bare hills towards the majestic rocky ridge of Lochnagar. "It was so calm, and so solitary, it did one good as one gazed around."

But truth to tell, although the elevation of Loch-

THEIR MAJESTIES THE KING AND QUEEN AT THE BRAEMAR GATHERING

nagar is impressive from all points, the view from Balmoral lacks one feature which gives Lochnagar, seen from the east, a distinctive quality. On the east the three fairy hills known as the Coyles of Muick interpose their pinnacles between the observer at Ballater and the massive ridge, and are ranged like satellites to the major planet in a constellation of mountains.

Even the ascent of the hill did not satisfy the Queen and her Consort. Down they came again, and round the castle to the river. "We walked beside the Dee, a beautifully rapid stream, which is close behind the house. The view of the hills toward Invercauld is exceedingly fine." They were, in fact, looking on the Cairngorms from the east side for the first time. They had already seen them, on a previous tour, from the valley of the Spey.

Later, from the summits of the White Mounth, the Queen was to view the Cairngorms unrolled before her in a tumultuous panorama. From north to south, the long knobby ridge of Ben Avon, the shapeless mass of Bheinn-a-Bhuird, and to the left of them the mighty bulk of Ben Muichdhui, which, although the second highest mountain in the British Isles, scarcely out-tops its three neighbours—all, like itself, over 4,000ft.—Braeriach, Cairn Toul and Cairn Gorm. Braeriach, by the way, although the third mountain in the kingdom, is never mentioned in the geography books!

In this confusion of wild rocks the Queen could trace the whereabouts of her beloved Dee by the impudent spire of the Devil's Point, which marks the last turn (or the first) of the river next to its source at the Pools of Dee between Ben Muichdhui and Braeriach.

The best view of Balmoral, in the full glory of its setting, is got from north of the Dee. A little west of Crathie Church, opposite the Castle, a road strikes northward by Bridgend of Bush towards Gairnshiel and Donside. Two miles along this road one looks down upon Balmoral, gleaming white (it is built of light grey Crathie granite) in a setting of dark pines, which themselves are encircled and thrown into relief by the wide arc of the White Mounth.

Within the King's estates or on its boundaries there are no fewer than nine peaks of over 3,000ft. This company of giants, with Lochnagar in the centre, quite equals the Cairngorms in scenic dignity, being more compact than the greater range. Another excellent view of the environs of Balmoral (although the castle is not visible) is got from a point 20 miles to the eastward, above Tarland, at the summit of the Slack of Tillylodge, where the road from Midmar crosses the watershed into Cromar. Queen Victoria discovered this observation point for herself, and many a day in her long widowhood saw her carriage being driven through Ballater, round the base of Culblean by Lochs Kinord and Davan, through Tarland and up the winding slope to the Slack. The point is now known as the Queen's View.

A RIGHT ROYAL SCOTS WELCOME

THE PARADE AT THE BRAEMAR GATHERING

For sixteen years Balmoral was the whole of the Royal Family's estate on Deeside, but in 1878 Queen Victoria purchased Ballochbuie from Invercauld. Ballochbuie had at one time belonged to that unfortunate clan, the Macgregors, "the children of the Mist," and had been bought by the Farquharsons, for a tartan plaid (the Macgregors being notoriously destitute of clothing). And so, when Queen Victoria became proprietor she erected a commemorative stone, thus inscribed: "Queen Victoria entered into possession of Ballochbuie on the 15th day of May, 1878. 'The bonniest plaid in Scotland.'"

The Farquharsons themselves have had a romantic history. About the beginning of the sixteenth century a Donald Farquhar, a cadet of Clan Chattan, entered the service of Stewart of Invercauld, married his daughter, and ultimately succeeded to a portion of the estate. His son, Big Findlay, became the King's Baille of Strathdee, and added to his territorial possessions. He fell at Pinkie, but his descendants spread over Upper Deeside and across into Donside.

In the fifteen Jacobite Rebellion, for which the rendezvous was in Braemar, where the Invercauld Arms Hotel now stands, the then Farquharson of Invercauld was an unwilling participant, and was pardoned. He refused, as did his eldest son, to "go out" in the 'forty-five, but his daughter, Anne, wife of Mackintosh of Mackintosh, was a veritable Amazon on the Jacobite side, who saved Prince Charles from capture after the Battle of Culloden.

Soon after the purchase of Balmoral, Prince Albert, to secure greater privacy, shut up that part of the road on the south bank of the Dee which was connected with the north road about six miles east of Balmoral by a bridge known as the Bridge of Dee.

This bridge was built in 1752 by General Wade. It carried the military road from Blairgowrie to Braemar, where the Government had rebuilt Braemar Castle, which General Mackay's dragoons had destroyed in 1689 while chasing Bonnie Dundee before the Battle of Killiecrankie. Braemar Castle was garrisoned by Hanoverian troops to put down local Jacobites, and it was connected with a corresponding post on Donside, Corgarff Castle, by the road which passes through Gairnshiel and the moors over which the King shoots. This road motorists will agree, is very much as General Wade left it, and its single-arch hump bridges hold together (according to the natives, who are a humorous folk) by force of habit.

In Braemar itself, a few yards from the Princess Royal Park, where the Braemar Gathering, of which His Majesty is a Patron, is held before a great and cosmopolitan concourse in September, stand the ruins of Kindrochit Castle. This castle, legend asserts, was a personal seat of Malcolm Canmore, the first king of modern Scotland. If so, its proximity to Balmoral testifies to many centuries of Deeside's popularity with the Royal House.

SNAPSHOTS FROM THE IRISH HILLS

By CAPTAIN J. B. DROUGHT

THAT the "earliest moment at which grouse seasons can be accurately forecast is at lunch-time on the Twelfth" is probably as true as the rather cynical reflection that "anticipation is often the better half of reality." Most of us, perhaps, who cannot run to costly moors, might subscribe impartially to either theory. But does it really matter very much? Were grouse as rare as solitary snipe there would still remain the splendour of the everlasting hills, ever more insistent as July slips into August. Their blue distances are mirrored in the dingy office windows: with the roar of London's traffic merge their rivers in full spate. For once anticipation is our daily bread, until (if Mr. Patrick Chalmers will forgive me) "we wake when the glamour of morning is pale over Perth."

Though I for one shall wake to quite another scene: the haunting beauty of the Bay of Dublin, as the misty dawn is lifting from the Wicklow hills. And thence across the Galway bogs to where the Connemara giants reach out to the sky. But we shall not be contemplating any high adventure. For the grouse in Western Ireland has a good deal to contend with, not least the ineradicable indecency with which the native sportsman forestalls the legal opening of the season. But again this does not matter a great deal. For with all due deference, I greatly doubt whether men, who transfer their posteriors from shooting ponies to shooting seats and there stay put, get as much kick out of the proceedings as those who walk a bit and then drive a bit and come in with fifteen to twenty brace. I am not such a fool as to sneer at sport de luxe. I could do with more of it myself, now that the weaknesses of the flesh are beginning to find me out, and what little I have experienced of grouse driving on the grand scale has taught me a becoming respect for those who acquit themselves with distinction. Only I always have and always shall prefer the smaller days.

Of one thing I am sure. There is nothing like a dogging moor for teaching youngsters the ethics of the game. It is often said that walking up grouse is so straightforward as to need no comment. Sometimes, perhaps, but not, I think, on mountains of deep crevicod rocks, so steep in places that not more than two guns can walk in line, and a man is very often cut off from his neighbour by projecting spurs. You need wide-ranging dogs on a wilderness of this kind, not only to save miles of unnecessary walking, but also because very often you must hurry to a point without waiting for a colleague who may not be able to get up in time. Moreover, there is a vast difference in walking well-tended moors and those whose principal characteristics are illimitable stretches of high wiry heather with a few patches of treacherous bog thrown in. I have seen men accustomed to the driving heather lawns of Yorkshire so beat that they could scarcely shoot after a couple of hours' heel and toe in this country. A rule of common sense which is very often disregarded is speed. The pace of a party should be the pace of its slowest member. No one can shoot if he is puffing like a grampus; moreover, where birds are not in great abundance, and there is little chance of driving them successfully, it is just as well not to make them wilder than they naturally are. Irish grouse seem earlier to lend to wildness than their British relatives, possibly thanks to so many premature reminders of the opening of hostilities. Be that as it may, you save yourself a lot of unprofitable foot-slogging by hunting the sheltered sides of hills. Stalking old grouse on the really high tops is in about the same category of gambles as chasing wild duck on an open bog. But at least if you put them off the high ground early in the day you can see where they go, and as a rule on a warm afternoon you will get them in or around the oat patches which are a common feature of the lower slopes of many of the Western hills. And always, if possible, work dogs up or across the wind so as to keep new ground constantly to windward of them.

Though in this rough country it does not pay to be too orthodox. Artists paint delightful pictures of well-trained setters flushing coveys at the exact moment convenient to unflurried sportsmen on either hand. It does not usually work out quite like that. Very often you must judge by your dog's manner whether the birds are stationary or running on. If he hesitates, looks back at you, and draws on quickly you may almost risk a bet that the birds are running too. And then you may advantageously forget all the "rules of procedure" of the text books on grouse shooting, and do a sprint yourself to come down on the birds from the opposite direction lest they should rise out of shot. Even then you are as likely to sink knee deep in a bog hole as to get an easy brace. But that is the fascination of bog trotting. Nothing ever works out as it logically should.

I recollect a day when, starting in that frame of mind which, expecting little is seldom disappointed, we discovered to our joy that the local gunners had by some oversight neglected to include our moor in their pre-Twelfth comb-out of the surrounding country. That at least was the only explanation of the fact that seemingly most of the grouse in North Mayo had congregated on our ground, evidence conclusive that they had already withstood the storm troops somewhere else. They were more like October birds, packed, and up and off at a hundred yards, and it was just about as likely that they would lie to dogs as that a gaggle of geese would sit to a bevy of wildfowlers in the open.

There was nothing for it but to split our six guns into three parties, trusting that the grouse would give each crowd a few driven shots if nothing else. The scheme worked well, as the ground lent itself to our strategy of pushing the birds off opposite sides of the mountain into a boggy valley between, in which there was a little sparse cultivation. Here a couple of guns concealed themselves, the foot-sloggers converging gradually downhill on the bog. It was devilish walking, but we scuppered a few brace "en route," mostly long shots, thanks to the grouse conforming to plan and passing over the valley from one hill spur to another. Incidentally, that form of "driving" provides shots a good deal more difficult, to my mind, than those one usually gets in a butt, from which one can see the beggars coming for a good half-mile. For although I have read from time to time that grouse always "follow the undulations of a moor," I think this is one of those comfortable theories that do not always work out in practice. At any rate, our grouse had not read the rules, for they did not bother about "undulations" or anything else. They came smack over the valley at heights varying from 35yds. to about 100yds.

The real beano was in the afternoon. We had started very early, and stiff walking in the heat, conducive to knocking off for lunch about noon, decided us to take a good two hours' rest. Whether this long cessation of the barrage suggested to the birds that their troubles were over for the day, or whether they were tired too, I cannot say, but the fact remains that they were much more amenable when we once again got on the move. For one thing, several coveys had drifted in to the scanty oat patches in the bog, which we decided to drive in two beats. It was a very "scratch" affair, as there were not more than half-a-dozen beaters, but no plan meticulously thought out for days beforehand could have worked better. We could have walked most of the birds up with setters, so comparatively close did they lie. They came straight up the valley in twos and threes and coveys. None were "sitters," but all were fair sporting shots, and we ended up that day with 34 brace. Many a time I have shot that same ground for an eighth of that bag, and I shall always believe that thanks to the activities of "non-licence holders" for a few days previously we scuppered the best part of our neighbour's birds. Still, that being the luck of the game, may I be forgiven if I hope for something similar next week.

"WHERE THE CONNEMARA GIANTS REACH OUT TO THE SKY"

RABBIT SHOOTING IN A WOOD

SUMMER SPORT WITH A .22 RIFLE

By REGINALD ADCOCK

SUMMERTIME is the heyday of the .22 rifle. From May till September the interests of game on the moor, in covert or on the rough shoot demand that all ground be kept as free from disturbance as possible. Yet these are the very months when brood upon brood of vermin, both furred and feathered, is being launched into the world, and no time is more propitious for their very necessary decimation than those early days before they have entered upon their careers of pillage and crime, and when they are still inexperienced in matters of self-preservation. With its unobtrusive report, its advantage over the shot-gun in matters of range and its deadly accuracy, a light .22 rifle is so obviously the weapon for the job that it always seems a pity that keepers have so little use for it. True, it is not possible with it to snap those odd chances at winged vermin that sometimes occur, as when, for instance, a jay flaps quietly over a ride, or a sparrow-hawk comes dashing out of a coppice. On the other hand, with the leaf hanging heavy upon the trees such chances are of relatively infrequent occurrence; the field of view is too restricted, whereas it is a fact that vermin in summer are more prone to flit from tree to tree than to make long, sustained flights through a wood. And as they hop from branch to branch or alight in one tree after another, the rifle has a chance to speak, and with greater effect at long range than any shot-gun. That by itself takes many vermin by surprise.

And what pastime can be more congenial to a sportsman in these spacious days of high summer than to take the .22 rifle from its case, and stuffing a box of cartridges in his pocket, to saunter happily off to the woods and meadows, there to forget for a carefree hour or two the grim realities of a crazed and fever-stricken world. The shooting man, in my view, is fortunate above his fellows. All nature is his domain—peaceful meadows, quiet woodlands, desolate moorlands, barren mountains, bleak foreshores, windswept marshes, all afford him scope for his pursuit in due season. He can attune his mood to nature's varying whims, and knows how to draw advantage from the fickle vagaries of wind and weather.

So by many the .22 rifle has come to be regarded as part and parcel of summer; in a sense, it epitomises the very spirit of the season. It is a leisurely weapon for thoughtful unhurried use, the perfect companion for a solitary stroll along the quiet uncrowded byways of nature. It is reluctant to shatter the sleepy peacefulness that broods over the countryside. It does its work quietly and unobtrusively. Yet its effectiveness is such that it will as readily tackle a cormorant as a weasel; and the death it deals is as sudden and as painless as any humanitarian could wish either for the quarry or for himself.

Every sportsman has his likes and his dislikes, his particular fancies, maybe even his superstitions. Opinions and preferences concerning sights vary considerably. But I venture to suggest that the .22 rifle, at any rate, is really only half a weapon and does not attain to its full potentialities until it is equipped with a telescopic sight. The ballistic accuracy and regularity of modern .22 ammunition has reached a very high standard, and has made possible a degree of precision which cannot be fully used with ordinary iron sights. It is only a logical step to match ballistic accuracy with precision of aim, and the fitting of a telescopic sight is the means to that end.

For the .22 bullet is small, but provided it is correctly placed, its striking energy is ample to deal with all manner of vermin at sporting ranges. A telescopic sight, it might be claimed, virtually increases the power of the rifle in the sense that it ensures a kill, where under other circumstances only a wound might have resulted. Rabbits are a case in point; so often do they get away when they have obviously been hard hit by a shot fired from an iron-sighted rifle, that the opinion is frequently voiced that .22's are lacking in sufficient power to kill them clean. In point of fact they are not; but their power must be accurately directed to a vital spot. A telescopic sight will reduce the number of lost rabbits to a negligible proportion, provided that the temptation is resisted to try exceptionally long shots.

I have referred above to the necessity of reducing the numbers of young vermin before they are properly able to fend for themselves, and while they are yet ignorant of the significance of man. Having pursued them every year with a light rifle, and having derived infinite pleasure and a great deal of instruction from the pastime, I should not now think of changing to any other weapon. The sport starts in early May, when the young rooks require to be thinned out as they sit about their rookeries.

In June crows and magpies turn their youngsters loose upon the world, but are yet assiduous in their protection. They are often not easy to outwit. But in July and August the numbers of vermin seem thickest, when young jays, young squirrels, young sparrowhawks swell the ranks of the woodland pirates. The toll that may be taken of them with a little guile and patience is considerable. There is a clump of wild cherry trees in a corner of the woods through which I roam; every year when the fruit is ripening I sit in semi-concealment at the foot of an oak about 20yds. away, and there wait for the raiding parties of jays and squirrels to arrive. They are seldom long in coming after the sun has risen, and it is rare that I fail to make a good bag—thus saving the fruit from their greedy maws—for the benefit of the blackbirds and thrushes.

The shooting of squirrels is a special delight. They are noisy messy feeders, and their lack of table manners is often the cause of their undoing. The scene of their feasting is invariably littered with debris of one kind or another when they take their departure; so that if they are not caught in the act when their feeding place is first discovered, a second visit at the right time will seldom go unrewarded. A telescope on your rifle, when your quarry is squirrels, is invaluable. Their practice of hiding in a fork when alarmed, or circling the tree as you yourself move round it, is well known. But a telescope will discover their whereabouts, for with its aid the protruding tip of a tail or an inquiring eye looking over a bough is enough to betray the position of the squirrel, and to ensure that it is safely brought to book.

The last half-hour of daylight I like to dedicate to rat shooting, as the semi-crepuscular creatures come forth to feed under the hoppers in the chicken runs. In the failing light of evening optical sights again reveal their marked superiority over any other form. To spot a rat creeping about against a dull background, when the light has all but gone, may tax the powers of the best eyesight; to shoot a rat by such a light over a bead foresight and V backsight is out of the question. But a telescopic sight will not only pick the rat out, but will even make it possible to shoot it, when the naked eye by itself is no longer able to discern it.

FIRING FROM THE EDGE OF A CLIFF
Note silencer on rifle

THIS BIRD PROTECTION

By BRIAN VESEY-FITZGERALD

Who is the Greatest Enemy to Bird Life: Egg-Collector, Gunner, Gamekeeper, Photographer, or ——?

FOR some weeks now the correspondence columns of this journal have contained a number of letters on the subject of Bird Protection. We have published letters from people representing every shade of opinion. We have not denied to anyone, no matter what his views, the opportunity of expressing them. We have withheld no letters, and only twice have we had to use the editorial blue pencil. I think it can be said that every side has been given a fair chance to state its views.

We initiated the correspondence deliberately. The Bird Protection laws in this country, as they stand at the moment, are utterly useless in that they are observed by very few (if indeed by anyone at all), have far too many loopholes, and vary from county to county in the most fantastic manner. We feel that something should be done about them—and done quickly. Hence this correspondence, and the attempt to get the views of every side put forward. We are well aware that there is at the moment an Advisory Committee sitting to advise the Home Office on the subject of Wild Bird Protection. It might be thought that the matter could safely be left in the Advisory Committee's hands, and particularly since we have heard from Sir Samuel Hoare himself that he is a naturalist. But the composition of the committee does not altogether inspire confidence since it is by no means representative of every point of view; and it is essential that in so complex a business as the protection of wild birds every point of view should be heard.

What has come forward in the course of the correspondence in the *Field*? One thing immediately became plain—this question of Bird Protection is largely a question of egg-collectors *versus* anti-egg-collectors. The egg-collector maintains that he does no harm to the bird population (even of comparatively rare species) by the taking of eggs, and also that in taking their eggs he is furthering, in some measure, the science of ornithology. The anti-egg-collector has a number of objections to egg-collecting—that it is cruel, that it is useless, that it is wicked, that it is against the law. Nothing, in the eyes of the ardent protectionist, is so black as an egg-collector.

Let us try to consider these two sides. Egg-collecting is a pitiless trade. The trader in eggs deserves everything that can possibly be handed out to him in the way of punishment. Let us leave it at that. But the egg-collector? Some of them—very few, I will admit (in my personal opinion—I admit I do not know the work of all of them—only about half-a-dozen)—are really great scientific ornithologists, and one of them a really great field naturalist, to whom we owe a very large proportion of our knowledge about birds and the ways of birds.

Some of them have large collections—in some cases numbering thousands and including many clutches of the same species—but these collections have been taken over a period of many years, and certainly not, as is too commonly believed, in a few years, or even—vide Mr. Chance's 146 clutches of shrike's eggs—in one season. We might as well be truthful about it. The question of the effect on the bird population of the work of egg-collectors is complex. I personally do not believe—and I would take a great deal of convincing—that any species has been exterminated by egg-collecting, or ever will be. Once a species has been reduced—generally by some other agency—to what may be called its minimum population, then the egg-collector will very soon finish it off. The kite would not last long without the aid of the most rigid protection. But the effect on a multimum population is so small as to be non-existent—or so I think. As to the usefulness or otherwise of egg-collecting, I am more doubtful. The majority of egg-collectors collect not because they have any scientific leanings, or any interest in birds, but simply because they must *collect*. And some egg-collectors collect because out of collecting they make money. The small minority do definitely further our knowledge of ornithology. There can be no question about that.

The protectionist arguments are less easy to deal with because for the most part they are intangible. Cruelty. What is cruelty? And who is not cruel? Mr. Chance gave up shooting for egg-collecting. And I know a man who would not hurt a fly, who thinks nothing of popping butterflies in killing bottles. Wickedness—I seem to remember something about the first stone, and I'll leave it at that. Useless. In almost every case I agree—but not in every case. Against the law. There can be no argument here. It is against the law.

It is against the law, and the law must be upheld and enforced. The fine for taking the eggs of a protected bird is £1 for each egg. That fine should be enforced. But while on the subject of law-breaking, it is only fair to point out that the egg-collector is not the only man who offends.

Birds may be protected throughout the year, or for a portion of the year. A protected bird shot during the season of protection means a fine of £1 per bird. In every county of England, almost without exception, the four English owls—barn, brown, long-eared and short-eared—are protected throughout the year. They are shot just the same. Let us take the county I know best—Hampshire. All four owls are protected throughout the year, *even from owners and occupiers of land on their own land*, and so are all the hawks, falcons and harriers, with the exception of the sparrow-hawk which is protected (but not from owners and occupiers on their own land) from March 2nd to July 31st

THE SPARROW-HAWK IS SUPPOSED TO BE PROTECTED DURING THE BREEDING SEASON

inclusive. That means that any of these birds shot during the period of protection (and note the dates between which the sparrow-hawk is protected) should earn the shooter a fine of £1. I am not certain how many prosecutions of gamekeepers and others there have been in Hampshire—very few, I am certain—if any. But I also know that some of the birds, at least, are shot. I have seen them. The egg-collectors know it, too: and the egg-collectors know something about the pole-trap also. The egg-collectors—or some of them—know that they are breaking the law: but they say that a law which is not enforced impartially is no law. I am not concerned with the ethics of that viewpoint. I merely point out that it exists.

You cannot blame the gamekeeper. He has got to return the "goods" in the form of good sport. And the hawks—yes, and the owls—do take his chicks (though not perhaps so frequently as he would have you believe), and do, therefore, harm his sport. The man who spends some thousands on that sport expects some return. That is human nature. And the gamekeeper—many of them are also exceedingly good naturalists—has done a good deal for the population of small birds by keeping down "vermin" in the shape of hawks and crows, and so forth. But that is not the point. The point is that more often than not he is breaking the law and should be prosecuted, as the egg-collector is prosecuted. That is the law. No one could say that it is enforced. And I am not suggesting that it should be. I am merely showing how foolish the law is.

And if we are to consider these two—the egg-collector and the gamekeeper or the man with a gun—we must also consider the photographer. Bird photography is extremely fashionable these days. The bird photographer breaks no law. But if that law is framed to protect birds and to ensure a future population—and it must be said that there are many people who confess that they do not know for what purpose the law was framed—then some bird photographers at least defeat the object of the law, break the law in spirit if not in fact. Most bird photographers indulge in "gardening." They must, the nature of their work and the nature of the bird demand it. If you look at a reed-bunting's nest in the wild (to take but one example), and then at the photograph of a reed-bunting's nest, you will realise that "gardening" is unavoidable. The good, the skilled, photographers "garden" without doing harm. That I know, from personal experience of their work, to be true. But there are many—and their numbers increase each year—who are learning how to take bird photographs. Just what harm do they do? No one, so far as I know, has attempted to explore that avenue. It must, I feel, be considerable.

If the bird is shot, then there is one bird the less. That is quite definite. If the eggs are taken, more almost certainly will be laid—they may be taken, too: but the parent birds and the possibility of further eggs in the following season remain. If, during the course of learning the art of bird photography, the parent birds are made to desert the nest (and perhaps also their second nest), then the effect is the same as if their eggs had been taken.

As it stands, the law is farcical. The egg-collector is fined; the gamekeeper and the man with the gun 99 times out of a 100 is not; the pole-trap is still in use; no one has thought about the photographer, or the learner-photographer. If the law is to stand it should be enforced equally (the photographer is not breaking the law). If it is not then, as at present, it will not be respected. If it is not, then that is unfair and un-English.

What should be done? That is a very difficult question, and one that can only be settled by a round-table conference of *all* the interests concerned under the chairmanship of a completely neutral man, a round-table conference to which the participants should come determined by give-and-take to find a reasonable and satisfactory solution. We must wait and see what the Advisory Committee advises—and hope for the best. But a few thoughts may not be out of place.

In considering bird populations and in estimating their increase or decrease, a very large number of factors have to be taken into consideration. It is fashionable in these days to lay the blame for decrease very largely—and by some people wholly—at the door of the egg-collector. I am no egg-collector, but I would state as strongly as I can that that is an entirely wrong assumption. Personally, I do not believe that the egg-collector has ever exterminated, unaided, any species—or even seriously diminished the numbers of that species. The kite was not reduced to its present pitiful state by the egg-collector, but by the gun (*not*, by the way, the gamekeeper's gun), and the same is true of the osprey, and the white-tailed eagle, and the honey-buzzard, and the marsh and Montagu's harriers, the ruff, the godwits, the dotterel, and many others. Once the species has been reduced to a certain level, then the egg-collector—at least the irresponsible egg-collector—is a menace. There would be no kites at all to-day were it not for the most rigid protection. But the egg-collector was not responsible originally for the decrease. And it must be remembered also that other factors, over which the laws of protection have no control, have a very considerable and in some cases paramount influence on bird life—building, road-making,

drainage schemes and so forth. For example, the use of the drill has had much to do with the decrease in numbers of the corncrake; Pagham Harbour is no longer a good place for geese. And further—or so it seems to me—the great increase in the numbers of starlings is leading, though gradually, to a change in the habits of the rook.

There are other factors, some of which are unknown to us, that lead to an increase in certain species. The accelerated planting of coniferous trees will mean an increased population of crossbills in the not far distant future. Both the buzzard and the Dartford warbler are most definitely on the increase—despite the egg-collector, or thanks to the gamekeeper! Bird populations fluctuate for a number of reasons, and all, or all that are known, should be taken into account when considering populations. The danger point is attained when what I would call the *minimum population level* has been reached. The kite, having reached and probably fallen below that level, will not increase. The buzzard and Dartford warbler never reached that level and will increase, and then decrease, in the normal way of nature—with the added danger to the latter nowadays of heath fires. If you will cast your mind back you will remember a time—not so long ago—when the long-tailed tit was considered very scarce indeed. I would not regard buzzard or Dartford warbler as in any danger to-day. Certain other birds—the ruff is an example—will not now increase as breeding species, no matter how much protection they receive, simply because they no longer have enough of the right sort of breeding territory available. That is equally true of blackgame, which still maintain a very precarious existence in ones and twos in the South of England.

Remembering all that (and, of course, there is infinitely more that could be said), what should be done? Should egg-collecting be abolished? I do not think so, and I have no brief for egg-collecting. Some of our egg-collectors have done magnificent work. The Rev. F. C. R. Jourdain is among the foremost ornithologists of all time. Mr. Edgar Chance has taught us pretty well all we know about the cuckoo. And there are others. To stop such men as these would be quite silly.

But I do think egg-collecting should be controlled, and black sheep eliminated. Would it not be possible to institute some form of licensing? And to insist that before a licence was granted the applicant should prove that he had done work of biological importance? The licences would run for a season at a time, and would apply to the whole country with the exception of certain birds acknowledged to be on the danger list; and would be renewed only on proof that work of biological importance had been done or was being done.

Something would also have to be done about the gun. I am more concerned about the gunner-collector than the gamekeeper. The former needs controlling, and this could be done by the licence system again. The gamekeeper has got to earn a living, and satisfy an employer. Employers generally are becoming more and more ornithologically minded, and are extending protection on their own account—but in some instances at least (and I know one or two) they have no idea what their keepers do on the quiet. Gamekeepers as a whole are a magnificent body of men, very amenable to reason, and I should not like to see them interfered with. Furthermore, I am not of the opinion that they do very much harm, and I know that they do a great deal of good. But I do think that if the law is to be treated with respect it must be enforced impartially. That is not the case at present. Any new law must not be open to the criticism at present justifiably levelled at this present law. The law as it stands needs revision so far as the status of certain birds is concerned, and particularly in the limitations imposed by county boundaries. Otherwise it might do well enough, though it is, in my opinion, too stringent (or would be were it enforced) and too comprehensive.

The law must be changed. It might also be considered whether the work of the Watchers and Wardens Association could not be extended. That association, as summarised in its founder's letter published in our issue of July 29th, is the best idea yet put forward. It has done some really excellent work. But it seems to have wandered a little from its course. Could it not be brought back and greatly strengthened?

The main losses in bird population in this country each year are due not to the guns wielded by collectors or gamekeepers, not to the work of egg-collectors—not, indeed, to direct human interference—but mainly to the weather and to vermin, and secondly to indirect human interference in the form of building and road-making and draining and so forth. We should remember that.

We should also remember that we all—game-preservers, egg-collectors, ornithologists, bird-lovers—profess the same object, love of and care for our birds. It seems silly, therefore, that we cannot come to agreement. It is silly. At the moment we all hate each other like poison. Harsh words fly around, ugly rumours, pure lies. It is more than silly. It is idiotic.

And may I put forward just one more thought? What is really needed is not control of the egg-collector, or gunner, or gamekeeper, or photographer—so much as control of ourselves, so much as *control of protection*. We are in danger of becoming hysterical.

Well, I suspect that I have made a few more enemies. But I have tried to be honest about a horribly complex business. Write and tell me just how ridiculous I am. It would also be interesting, *after the heat of the moment*, to have honest opinions about this article.

WHY TROUT REFUSE TO TAKE SURFACE FLY

I HAVE just completed an annual exercise; one for which I sit down after dinner on a free night, so that I may feel no need to hurry over it; and one that always evokes a rapid alternation of pleasure and pain—the exercise, I mean, of transferring the gist of my fishing diary for last season to my game book; 40 odd pages of the former to a double page of the latter.

This is an exercise that ought not to have been left as late as the summer. But do not attempt it too soon. Wait for a rough night in November. By that time you will feel no longing to be back by the riverside; and you will have begun to doubt whether the portly trout, that freed itself from the hook just as it turned on its side within 6in. of the net, was really so much bigger than the 3-pounder you killed the week before. Time begins to deaden the sensation of pain before it has power to spoil the sensation of pleasure.

If you are not to make your game book unwieldy you must, when you write it up, ration yourself strictly in the matter of space. There is no room for much more than statistics. But few seasons fail to provide a red-letter day or two, and of these I allow myself the briefest possible record. To-night I have passed seven days as qualifying for such record—all, unusually, on a single chalk stream. An eighth—on the limestone—has been considered but rejected. Of one of these seven days, the record reads: "Sept. 2—3 brace, 9lb. 12oz." I have put a star against this entry. Next year I shall wonder what the star means. The context shows that the day was not the best of the season. There is no room to explain in the game book. I therefore propose to explain here.

That day has taught me—or I believe that it has taught me—more than I have learnt in any one day before. There were three lessons, and all, perhaps, deserve the audience of other scholars. But for the present I will confine myself to the first, which was (to me) entirely new. I had spent the morning on a popular stretch that is reputed to hold more big trout than any other of the fishery. The reputation is due, in my belief, to the fact that here the road directly overlooks the river from the face of a cliff, so that the big trout can be seen more easily than elsewhere. Still, the fish are there.

Very busy fish they were in the latter part of the season, and every one of them was nymphing. Now, I do not fish the nymph in chalk streams; not because I do not think it as fair a way of catching trout as any other, but because I do not like the method or succeed by using it—a case of cause and effect, no doubt, though which is which I do not know. I chose the stretch because at a dead period I was sure of finding movement there.

On some days it is possible, especially on the stream of which I write, to bully a nymphing trout into taking a fly. This did not prove to be one of those days. And so I sat down to a late lunch with one very ordinary fish in my bag—the only trout I had seen that was prepared, as a rare concession, to take victual off the surface.

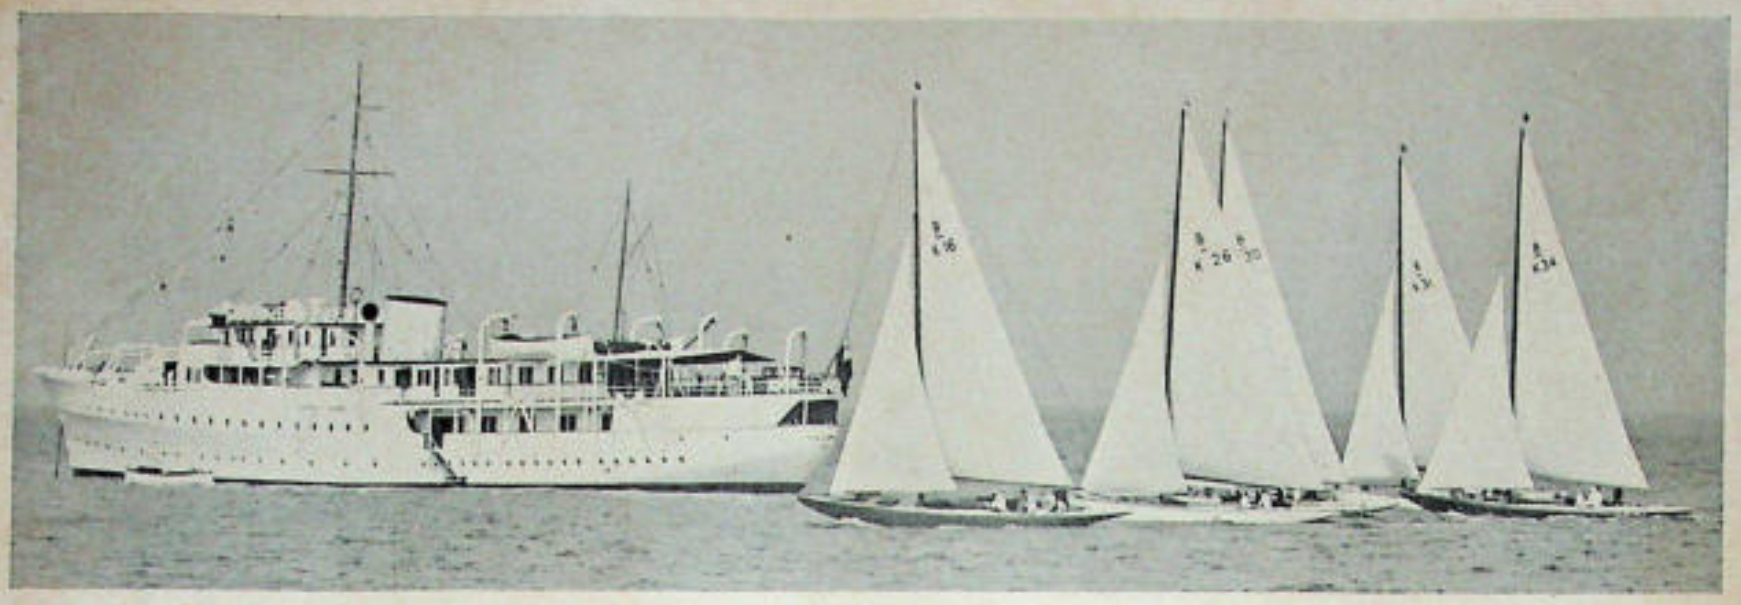
The popular stretch, which is absolutely straight, was now behind me. In front was a succession of acute bends, much protected by camp-sheathing. For some distance the runs that were to be found under the sheathing earlier in the season had been weeded up. The water last year was abnormally low, and in an attempt to hold it up the keeper had been wise to cut the weeds very sparingly. In consequence, the current was dispersed all over the stream, not only where the river is straight but also where it winds. Obviously the presence of camp-sheathing indicates the natural set of the current towards the bank. Before the weed has grown big there is no more likely place to find a good trout rising than under sheathing. If and when the weed covers the surface up to the sheathing, one would expect such trout to move out farther into the stream. There they appeared to have moved, but these, too, were nymphing.

At last I came upon a bend where along the face of the sheathing a narrow channel had been kept clear. Relatively to the rest of the stream there was here a noticeable current. Watching this from below I was delighted to see, one in front of the other and at satisfactory intervals, three sets of repeated and promising dimples, undoubtedly caused by trout feeding on the surface. Creeping closer, I made out the lowest of them to be about 1¼lb., and the next above to be appreciably bigger. The highest was hidden by a snag just behind it, but had all the airs of a personable fish.

Instantly the whole prospect of the day was altered. Gone was the listlessness that inevitably grows upon one as hour after hour hopeless enterprises succeed each other. Here at last were three better-than-warrantable trout open to methodical attack. And here, for the present, I am going to leave them. Their subsequent history (not entirely closed) gave me the second and third lessons of the day. Their mere discovery was the text of the first.

Pondering this discovery, and relating it to other incidents that now seem to have the same import, I feel convinced that trout in chalk streams take progressively to nymphing as the season advances, not because they develop a preference for the nymph, but because, as the current is deflected and broken up by the growth and subsequent cutting of the weed, they find it easier to make a satisfactory meal off the nymph than off the fly. Keepers follow present fashions. Some cut the weed so as to give the stream the appearance of an elongated gridiron. Others leave the weed at the sides and clear the middle. In either case the well-marked runs, mostly clinging to the higher bank, into which the surface food of May was drawn, are replaced by wide open spaces in which there is no defined current. In these the floating fly, once concentrated, is now dispersed. Even during a strong rise a trout sees only an occasional dun cross its "window." For the seeing of nymphs below the surface-film it commands a much bigger area. That is why we find it (with disgust) not lazily poised in one place, but dashing hither and thither and humping the water within a radius of yards.

Previous experience, hitherto undigested, seems to confirm this view. During the mayfly last year I kept disconsolate watch for part of several days on three master trout at the bottom of a club water on the Dunn. All were hunting nymphs freely. None troubled to look for anything else. Immediately below, in private water, several Leviathans (two at least of which proved to be over 4lb.) were taking every mayfly that passed over them.



At the time I accepted the usual explanation—that the club fish had been forced to concentrate on nymphs by the frequency with which artificials were floated over them. I find now another theory much more convincing. In the club water above, which for some distance is quite straight, the weed had been shaved almost uniformly from bank to bank. Fly was dispersed over the whole surface. Just beyond the boundary a great mat of weed extended from the far bank three parts across the stream. Both fly and current were diverted by this into the remaining fourth part under the near bank. The fish below, therefore, were satisfied by what they saw in their windows. The fish above were not.

Towards the end of the season I spent a morning on a reach of the Kennet (also straight) known as the Bracket Hatch. Here strips of weed had been left along the banks. The middle of the stream had been cleared. And here also a tantalising number of good trout were devoting themselves exclusively to the nymph. I found one fish, and one only, feeding on the surface. This was where, at the top of the reach, the river bed had been raised by an accumulation of silt, on which had recently appeared a crop of stiff rushes. The obstruction diverted enough water to form a short but substantial run under my own bank. In this a badger quill elicited two tentative rises and finally a business offer. And no prospect of completing the brace presented itself till, in the afternoon, I moved to another and a less uniform beat.

I could tell of other like incidents. But I prefer to appeal to all chalk anglers. Where in the stream do they see the great majority of persistent nymphers? And how often do they find one in a confined current?

But the lesson, if I have read it aright, is not so much for mere anglers as for keepers. By taking thought in their treatment of the weed they have the power, I suggest, to discourage in trout the worst of their bad habits.

DISTOFFER.

THE EIGHTS AT RYDE REGATTA PASSING MR. SOPWITH'S YACHT PHILANTE

RACING IN "RECORD COWES" WEEK

By K. ADLARD COLES and TERENCE STOCKEN

HARDLY can one remember a Cowes more dogged by black skies, rainstorms, chill winds and leaden seas—yet with one saving grace, as regards the weather; sufficient wind, at times, to make some of the smaller craft distinctly uncomfortable, but never of such force as to cause the abandonment of racing on any day.

Gleams of sun there were, on most days; brief, but recurrent; and though oilskins were necessarily far too much in evidence for a function which one at least tries not to think of in conjunction with turned-up collars and rain-blurred horizons, day's racing succeeded full day's racing, until the Week—"Record Cowes"—had run its course.

The 12-metre class, this year as last, were, of course, the lords of Cowes. The Bartlett Trophy, a challenge cup given by the late Sir Herbert Bartlett, sometime Commodore of the Royal London, for the premier-class yacht scoring the highest number of points during the Week, was won by Vim—but only by a very narrow margin.

With four firsts and one second she was run close by Tomahawk, who had chalked up three firsts and three seconds; Vim thus made 32 points against Tomahawk's 30, the next nearest being Jenetta with 16 and Blue Marlin with 11. No one else reached double figures.

This was the chief trophy for which Vim was eligible to compete, as a "foreign" yacht; the principal prize for "the big class"—as we have learnt to call them, vice the J's—is, of course, the King's Cup, open only to yachts of British nationality. This was carried off by Mr. Sopwith in convincing manner, Tomahawk coming home nearly 6min. ahead of Evaine. Tomahawk started favourite for this race, as she has shown a pretty consistent superiority over the other British "Twelves" this season; but all in the class were obviously extra keen to secure this coveted cup, and a hard-sailed race resulted in spite of the only moderate wind. Jenetta, tearing along for third place, split her mainsail and had to retire.

Other races in the premier class were: On July 29th (the opening day), under the flag of the Royal Southampton Yacht Club, the Fleuret Challenge Cup, held by Evaine, was won by Tomahawk, beating Vim by 30sec. On the 31st, a squally and blustery day, the racing, promoted by the Royal London, was marred by a protest at the start, by Tomahawk against Vim. The protest was upheld by the sailing committee, and the race awarded to Tomahawk.

The King's Cup took place on August 1st, and on the 2nd it was Vim's turn to win, which she did very narrowly. On the run, Vim produced and set a small balloon foresail, well inboard and drawing below the spinnaker, and which certainly seemed to help her along.

On the 3rd (Thursday), Vim again won in a commanding manner, Mr. Sopwith having put himself at considerable disadvantage by taking the off-shore position at the start and thus losing the advantage of the tide, hoping to pick up first the northerly "morning wind" off the Hampshire shore. In this race, Vim used a long-roped jib-topsail while reaching, and walked away with the prize.

On the Friday, a day of almost continuous rain, Vim again won by a narrow margin, and repeated the performance—this time with 6½min. to spare—on the last day, the Royal Southern Y.C. fixture.

Thus Vim and Tomahawk, between them, virtually monopolised the 12-metre picture at Cowes; Vim has carried off seventeen firsts in the total racing this season, whilst the British leader has won six.

The 8-metres also had their share of excitement in the course of the Week, beginning with the dismasting of Messrs. Kenneth Preston and Robert Steele's Saskia and Major Musker's Cedora in the hard south-westerly blow of the 31st. The new "Eight," Iskareen, belonging to Mr. R. Tree, won on the first two days of the racing (she was built in Sweden and designed by the designer of Vim), but the Hon. Mrs. Pitt-Rivers's new Christina—also Swedish built—though she won the Marchioness Camden's Cup on August 2nd, brought off no more wins during the remainder of the time, her other flags being one second and two thirds. Iskareen's career was cut short on the 4th, when she was in collision with Cedora and stove in her bows. The Lady Magdalene Williams-Bulkeley Cup was won by the 8-metre Carron II (Major Digby Peel) on the 1st, and this boat was the most successful of her class, gaining three firsts and two seconds in the seven days' racing, including the Lady Gore Cup on the 3rd. Severn II (Major Hall and Mr. F. A. Richards) won the Lady Dilke Cup.

In the 6-metre class the flags were very evenly divided on the whole, the three leading boats each gaining four places apiece. Catherine (Mr. J. Ewing and Mr. C. Ratsey) had the best record, with three firsts and one third, whilst Erin (Mr. Austin O'Connor and Mr. W. Hancock) took two firsts (including the Frank Chaplin Cup) and two seconds. The other two cups in this class were won by Mara (Mr. J. Dudley Head and Mr. G. Greville Williams), who was out of form at the beginning of the Week, getting a third and a second on July 31st and August 1st, but not scoring a win until the Thursday, when she won Colonel the Hon. Henry Guest's Cup, following this up the next day by taking the Royal Yacht Squadron Cup. In the stormy weather of the final day, Martell (Mr. Harold Bowden), who had had bad luck all the week and failed to take a flag, rounded things off with a dismasting.

The Dragons were out every day, an outstanding feature of their racing being the consistent success of the German boat Woge XII., owned by Herr Otto Ernst. This boat, it will be remembered, put in a lot of good work on the Clyde last year; during Cowes Week this time, she got a flag on every day except one, finishing with a record of four firsts and two thirds, but just failed to bring off Mrs. Kenneth Preston's Cup, which was won by 6sec. by Moccassin (Messrs. C. Taylor and M. Illingworth).

The 30 square metres also put in an appearance on each day, the outstandingly successful boat in this class being Mr. A. H. R. Fedden's Teal, who won four firsts in a row, and then a second and another first on the two following days. This left only two other firsts for the remaining boats to share, and they were both taken by Tre-Sang (Messrs. K. and R. Preston), who gained a second and a third also on other days. Waterwitch, (G. Wansbrough), out of luck the whole week, was another of the unfortunates who lost her mast in the wild squalls of the 5th.

There were Y.R.A. handicap events on every day of the week except August 2nd; the principal handicap cup being the Queen Mary's Cup, only eligible for competition by boats belonging to the Royal Yacht Squadron. This was won by Marianna, the 19-ton German-built cutter belonging to Lieutenant-Colonel Blewitt, D.S.O., after a fast race. The big ketch, Thendara, belonging to Mr. A. S. L. Young, of 145 tons—the queen of the handicap fleet—was unable to save her time over the smaller vessels, a circumstance which likewise put Cynara, the 115-ton ketch owned by the Marquis of Northampton, into second place.

The handicap classes are (as is usually the case) a little hard to follow, when surveying the week as a whole, owing to the fact that there are no hard-and-fast classes into which a given boat falls by virtue of size, class, sail area or any other readily reckonable characteristic. The classes for each regatta are drawn up in accordance with the ideas of the promoters of that event, and the divisions vary from day to day. It is not impossible that some of the lack of support from which the handicap classes have suffered in recent times may be attributable to this.

The most consistent of the handicap classes during Cowes Week was the Over 25 tons class, though this had to be divided into A and B divisions on two of the days, so that such boats as the ex 12-metres Noreen and Vanity V. and the ex 15-metre Lady Anne should not race *pari passu* against Old Fox, for instance. The latter won the event on the opening day when pitted against Diadem and Cariba, and won again (in B division) on the second day, Noreen winning the A class. The other winners were Morva, who won the Cowes Town Cup on the 3rd, Lady Anne (in A class) on the 4th, The Blue Peter (class B) on the 4th, and a sail-over for the latter on the 5th.

The Under 25 tons races were won on two occasions by John Dory, the only other time when this "class" appeared, Kismet being the winner.

The latter was third on the opening day in the 9–25 tons class, in which Neith was first and Freedom second. Freedom, again, won the Under 15-tons event on the second day.

An "extra" was provided by the holding of the Island Sailing Club events for boats of 4 to 25 tons on the 2nd and 3rd August.

On the second, for a prize presented by the town of Cowes, the A division was won by Neith, the graceful "pre-War" Herreshoff cutter owned by Major Henderson, with Kismet (Messrs. O. Wright and C. Pearce) second and John Dory, the small Clark-designed ocean racer, owned by Mr. L. H. Ryan, third. B division was won by Josephine II, a Swedish Albatross class double-ender, owned by Mr. C. Smallpiece; she is an interesting boat, being simply an enlarged Tumlare with 30 square metres sail area. Second was Iolaire, a gaff cutter owned by Mr. D. H. Owen-Edmunds, and third Freedom, also a gaff cutter, belonging to Mr. M. Wyatt.

The event on August 3rd, for the J. Samuel White Cup, was also in two divisions. Winners were: A Division—(1) Tuctoo, Commander Barraclough; (2) John Dory; (3) Neith. B Division—(1) Rouzelle, Mr. M. Sharp; (2) Freedom; (3) Marianna.

All the Solent One-Design classes were, of course, well represented, each day having its fleets of different sizes, shapes and colours. The West Solents and the Teals, the Q class (ex 6-metres), the Redwings, Solent Sunbeams, X class, Mermaids, Yarmouth O.D., and on Cowes Town day, some of the very small fry had their hour; there was even a class for ex-Redwings!

THE PROBLEM OF CLOSE FINISHES

Should the Camera Decide for the Judge?

A NUMBER of regular followers of racing, not professionals, but men and women with enough money to follow the game more than occasionally, are always asking me to advocate the photography of finishes, and when I refuse to do so, consider me to be an old Tory diehard. I admit that there are, to-day, cameras which can take the finish of a race perfectly, and that the photographs so taken can be developed, printed and on view in a very short time. Examples of all this have been shown recently at the dogs, and yet I remain unconvinced and I shall not advocate it being adopted at any race meeting under Jockey Club or National Hunt Rules.

In the first place it would be an unnecessary expense and racecourse companies are not having the best of years. Even such meetings as Sandown Park and Kempton Park are down on last year by several thousand pounds. Then the photographs might not have to be taken at all some afternoons, and so the whole thing be idle. But it is not for reasons of expense that I consider the whole thing should be forgotten, but because it just is not necessary in this country, whatever it may be in the United States of America and elsewhere.

I am not going to state at all that mistakes have not been made by judges in the past and that they will not be made again, but they are rare and far between. At the present time we have the best lot of judges that I have known in my long experience of racing in this country. They are all young and alert and very quick. There was a race at Sandown Park this week when five horses went past the winning post in a line. Heads and short heads divided them, yet the judge, Mr. Malcolm Hancock, gave his decision at once and the numbers went into the frames. It might have been argued that here was a case for the camera, but, apart from one fanatic, I never heard anyone suggest for one moment that the placings of the first four horses were not correct, and, what is more, even the owners and trainers of the four horses that just did not win never complained or tried to think that their horse really had won. The whole of the crowd accepted the decision at once and went off either to draw their winnings or to consider the problem set by the next race.

It may be true that in France or the United States of America there would have been a clamouring mob all around the place, and many gesticulations going on. Much abuse would, no doubt, be shot at the judge. It has, I know, happened here, and there have been occasions when in answer to much yelling, a number has been changed, but that is very rare, and with the latest set of judges, not likely to happen again. Not only are the present judges quick and well trained, but their honesty is never doubted, so that if in a close finish they may seem to make a mistake, no one really minds and racing goes on just the same. I am told that in some other countries the honesty of the judges is not always accepted nor believed in.

Photographed finishes of horse racing are not wanted in this country and are not likely to come. They are not needed.

Another grievance with some followers of racing is the naming of horses, or rather the neglect to name them. A two-year-old can run all his first season without a name of his own, but when he, or she, becomes a three-year-old he or she has to be named before he or she can run. I do not think that it matters very much, and I doubt whether any change will be made in the rules and regulations. It has cropped up again this season, because Lord Glanely has not named his colt by Colombo out of Rose of England, about the best two-year-old yet seen out.

I find it just as easy to speak or write of the Rose of England colt as I would do if it were called Bill Bailey, or any other name. Lord Glanely is waiting until he can find a name worthy of such a high-class and well-bred colt. Of one thing we can be certain, and that is that the colt will be well-named, for all that owner's horses have good names and not such awful things as Boomps-a-Daisy, which a poor beast has just had bestowed on it. Such names can mean only one thing, and that is the bestowers of them have no love for a horse, nor, indeed, any respect for the animal. Boomps-a-Daisy is more suited to some silly little Pekingese dog or a Siamese cat. It really makes one's blood boil.

It must be a long time since there were so many boys of real ability riding as there are to-day. Mullins, Littlewood, Mitchell, Wells, Burns, and Sprague, to mention only a few of the youngest ones. D. Smith must also be included, although he is now a seasoned rider. Yet he is still very young. It is a good thing that these very young riders are coming along, for some of the other men riding are getting old, and in some cases will not go on much longer. Carslake always excepted, for the longer that he rides the better he gets and the fitter he looks.

But to return to the apprentices of whom I have made mention, such as Mullins, Littlewood, and Burns and others. More than once recently apprentices have finished first, second and third in quite important races, with a number of leading senior riders behind them. I have also seen these apprentices ride most confident and strong finishes against the leading men of the day, who do not make them afraid or cause them to get in the least flustered. It is often recorded in the history of the sport that wonderful boys vanish as soon as they lose their allowance of five pounds. It is to be feared that many of them do so as soon as they cease to be fashionable apprentices. It is not always the fault of the boys, although some of them get too heavy and some of them get into bad hands and so lose their chances.

It is much to be hoped that when the present leading apprentices lose their allowances that they will not be dropped. After all, when a boy has ridden 40 winners he should be an accomplished rider, so that the loss of the five pounds should not mean much. I am sure that Mullins and Littlewood have come to stay, and that little Burns, the son of Tommy Burns, the great Irish rider, has a great future. One thing in his favour is that he is with Steve Donoghue, and that trainer puts him up continually, remembering, no doubt, his own early struggles to make his name. Russell is always giving Wells rides, while Captain Hogg never has any one else but his own boy, Littlewood, riding for him. Victor Smyth also gives Mullins any amount of riding, and will continue to do so when the boy loses the allowance, which he will do very soon.

A CAMERA IMPRESSION OF A CLOSE FINISH

The race is the Greenwood Plate at Kempton Park in which Mr. Hartigan's Colorado Boy won by a short head from H.H. Aga Khan's Mubarak, a neck separating the latter from Mr. Hardy's Motu Kari

Another little boy of promise is Dick, the son of the trainer and a member of a family that has produced many riders, including R. Dick, who rode for so many years for Lord Astor. This little boy rode a really good race at Lewes on a two-year-old named Happy Flight, sitting down and riding home against H. Wragg as well as that famous rider could have done himself. Happy Flight won by a length and a half.

Caerleon, the famous winner and sire of increasing value, was found dead in a paddock in the Earl of Derby's stud at Side Hill, near Newmarket, on Sunday morning. Caerleon was twelve years old, and he had enjoyed a most successful career. Perhaps his best performance was in the Eclipse Stakes at Sandown which he won in 1931. His value as a sire of winners was becoming increasingly recognised, and his stud fee for next year had been almost doubled. He was by Phalaris ex Canyon, and some of his most successful winners this year are Cockpit (Hastings Stakes) and Caerloptic (Newbury Spring Cup and Royal Hunt Cup).

THE ENTRANCE TO THE NAVAL AND MILITARY CLUB IN PICCADILLY
"Known to generations of London cabmen as the 'In and Out'"

GREAT SOCIAL CLUBS—VI. NAVAL AND MILITARY

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

THE NAVAL AND MILITARY CLUB, known to generations of London cabmen as the "In and Out," was not founded until the year 1862. It is, therefore, the youngest of the great Service clubs. At that date, the existing Service clubs were all complete to their full membership and anyone wishing to join one of them had to be prepared for a long period of waiting. With a view to meeting the requirements of those desiring to join a club immediately, a party of officers, chiefly from the Buffs, who were then quartered at the Tower of London, founded this Club. Its original membership was settled to be 150 at an entrance fee of 15 guineas, a home subscription of 5 guineas and a supernumerary subscription of 10/–. These sums were very shortly afterwards increased to £42, £8 8s. and £1 1s. respectively.

The Club started its life in a furnished house, No. 18, Clifford Street, in September, 1862. In less than a year this house was found to be too small, and at the end of 1863 the members moved to larger premises at 22, Hanover Square. Here they remained until about the close of 1865 when, the same difficulties over accommodation being experienced, they moved to Cambridge House, Piccadilly, where they have been ever since. Though, therefore, the Naval and Military is the youngest of the principal Service clubs, it has spent nearly all its life in a house considerably older than any of those occupied by the others. Ninety-four Piccadilly, or Cambridge House as it was then called, had been built by the 2nd Earl of Egremont, who had entered into occupation of it in 1760 and the house then bore his name. The invasion of Piccadilly by the aristocracy had started at its east end and before Egremont House was built, there were no houses of any standing so far west down Piccadilly, only, in fact, a collection of mean dwellings occupied by livery stable keepers and small dealers. Farther west, around Hyde Park Corner, were a number of small and poor lodgings frequented by drovers who attended cattle markets held in Brook Fields.

Horace Walpole, writing to Montagu in 1759, was amazed at the rapid development of a neighbourhood which he only remembered as the recognised haunt of livery stable keepers and purveyors of lead figures. "I stared to-day at Piccadilly like a country squire," he writes. "There are 20 new stone houses. At first I concluded that all the grooms that used to live there had got estates and built palaces." It appears that he was thinking of the houses, amongst others, just built by Lord Egremont, Lord Coventry and the Duke of Grafton. Lord Egremont died in 1763, it is said of apoplexy. He was a well-known gourmand and is

A MODERN NOTE. THE COCKTAIL BAR

related to have remarked, only a few days before his death, "I have three more turtle dinners to come. If I survive the last of them, I shall be immortal." Lord Egremont was succeeded by his son, who at the time of his father's death was a boy of twelve.

This third earl was a man of very great wealth. He is reputed to have given away annually £20,000 in charity. At Petworth, his country seat, he formed a valuable art collection; he was a patron of the painters Constable and Turner and also of the sculptors Flaxman and Nollekens. At Petworth he lived in feudal style and kept open house for all. As a successful racehorse owner, he has never been equalled in the history of the Turf, as he won the Derby and the Oaks each five times and the Gold Cup at Goodwood in the first year of its institution. He was also a noted agriculturalist. He made Egremont House his headquarters in London for 30 years before moving from there.

After him, in 1794, the house was occupied by James Milnes, about whom little appears to be known. He was succeeded early in the nineteenth century by the Marquis of Cholmondeley, who remained in occupation until his death in 1827. During this period it was known as Cholmondeley House. The next tenant was the Duke of Cambridge, the seventh son of George III and the father of the Duke who became Commander-in-Chief. The house was now called Cambridge House. It was while the Duke was in residence here that Queen Victoria was attacked in the courtyard on leaving the house after paying him a visit. A lunatic named Robert Pate, a retired lieutenant, struck her a severe blow with a stick. The next visit of a Queen of England to the Club house was fortunately a much happier one.

The Duke died at Cambridge House in 1850, and in 1851 Sir Richard Sutton, the ground landlord, took up residence himself. He was another very rich man to occupy this house, being Master of the Quorn, and was reputed to have spent in the course of his life £300,000 on foxhunting. He died here in 1855. After him came Lord Palmerston, the most famous of all Victorian Prime Ministers. The house now changed its name once again to Palmerston House. The sporting traditions of the house were fully maintained by the Prime Minister, as he habitually rode from here to the House of Commons. After his death, his body was brought from Brockett Hall to 94, Piccadilly, where it lay before being taken to Westminster Abbey. We now arrive at the tenancy of this house by the Naval and Military Club in April, 1866.

It will thus be seen that, in the comparatively short space of 80 years, this important London

house had been in the occupation of six members of different families before being acquired by the Naval and Military Club. People are apt to imagine that it is only in these times that such frequent changes take place. The original lease of the Naval and Military terminated in 1876, when the Sutton Estate granted a further extension of 60 years at an increased rental. Later this lease was again renewed. In 1876, on the extension of their original lease, the members determined to make the house suitable in every way for the needs and requirements of club life and embarked on an extensive scheme of alterations and additions to the old portion of the house. This included a new dining room, billiard rooms, offices and cellars on the site of the former stables, coach-houses and yard.

The work took two years to complete, and the Club was not reopened for the use of members before April, 1878. As the result of these alterations to the house, Lord Palmerston's bedroom had been converted into an upper smoking room; from this room formerly a small semi-secret staircase had led to Whitehorse Street, used, it is said, by foreign spies and other persons of a similar kind to gain access for interviews with Lord Palmerston. The ballroom had now become the library and Lady Palmerston's bedroom the new cardroom. This room had opened into her boudoir, called the Octagon Room and having a beautiful, painted ceiling. It was here where the beautiful Lady Palmerston wrote all the invitation cards to her receptions and, according to Mr. Gladstone, in this room she and Lord Palmerston had one day formed a Ministry.

The fine position of Cambridge House with its views over the Green Park, its historic associations, the beauty of its interior and the attractive features of the courtyard in front and its small terraced garden behind, all combined to make it for a number of years the most fashionable and popular of all the Service clubs in London. The waiting list became an extremely lengthy one and reached its highest point just before the Great War, when it took a period of fourteen years before admittance could be gained to the Club, after first having paid an entrance fee of 40 guineas.

At the close of the Great War, with the reduction in the naval and military forces and a less general desire on the part of the post-War generation to enter club life, difficulty began to be experienced in keeping up the membership. No longer were to be found the people prepared to wait fourteen years and pay 40 guineas for the privilege of joining any club, Service, social or political. It was found necessary in consequence to waive the entrance fee and to lower the rates of subscription for new members. The further necessity of providing accommodation for members and facilities for entertaining ladies, which had now become universally recognised, if any club was going to retain its membership in these difficult times, led to a lease of the adjoining house, No. 42, Half Moon Street, being obtained in 1919. On the ground floor of this new house dining rooms and sitting rooms were arranged for ladies, and on the upper floors 43 bedrooms for members were provided.

This involved extensive alterations to the building and the new premises were not ready for occupation until 1923. Ten years later the ladies' accommodation proved to be quite inadequate for the demands made on it, so it was decided to further increase it. For this purpose the second floor of the Club house, where formerly the Club offices had been located, was converted into three large drawing rooms, two dining rooms, a writing room, a cocktail bar, and a dressing room for ladies. The Club offices were now moved into the former ladies' rooms on the ground floor of 42, Half Moon Street.

The new ladies' rooms were opened in 1934 and proved a great success. The institution of associate membership for ladies being near relatives of members was adopted, and by 1936, 700 lady associate members had joined the Club. A few days before the opening of the new rooms, H.M. Queen Mary, who had from the start shown a great interest in the new scheme, honoured them by a visit and graciously consented to become an honorary life member. Her Majesty also presented to the members an engraving and several other mementoes of the time when what is now the Club house was occupied by Lord and Lady Palmerston.

There appear to be few, if any, anecdotes worth relating about the inner life of this Club. The Peninsular heroes were dead and gone when it came into being; drinking and gaming, to the extent they had been indulged in at the end of the eighteenth century, had ceased to be popular amusements; ladies were no longer the subject of public bets. The Club grew to manhood in the most conventional period of the whole Victorian era. When frailty walked abroad, she did so heavily hooded and cloaked.

LETTERS TO YOUNG FLY FISHERS

VIII.—The Technique of Lake Fishing

MY DEAR BOB,—Most certainly accept the invitation to fish at Blagdon. From your hesitancy, as also from your question: "Where is Blagdon?" I gather that the name of England's most famous trout lake is as yet unknown to you. It is actually one of the reservoirs of the Bristol Waterworks Company, and lies in a fold of the Mendip Hills a few miles from Yatton Station, which you would have passed if you had gone down by rail. It is not so much the number of trout caught there which has made it famous as their size. It produced a 10-pounder on one occasion. Your 9½ft. rod will do very well; it would hold a 10-pounder if necessary, though I do not think it will be called upon to do so. Indeed, you must be prepared for no call to be made upon its powers of resistance at all. Do not let that remark discourage you. The element of luck in fishing is, I think, even more pronounced at Blagdon than elsewhere. And I will tell you why.

Trout in lakes are rather different in their habits from those in streams. Where you have been fishing in the Bray, trout, as you must have noticed, lie in wait for food which the current brings down to them; they have only to rise and absorb it. But lakes have no current to speak of, except for a hundred yards or so where a tributary feeder runs in, and the trout in consequence has to get out and hunt for its food if it is to make a living.

Most of this food is found in comparatively shallow water. In lakes where the shallows are well defined and the trout small and numerous there will lie on a favourable day a shoal of trout scouring the area in search of food, one to every 100 square yards, let us say—very often more. So when a boat is drifting over the area there is a very fair chance of a fish seeing the angler's flies at least once in every dozen casts or so. But you do not find this great quantity of fish in a lake where the trout run big. It takes, I suppose, as much food to produce one big trout as ten small ones. In Blagdon the ordinary run of fish is from 1½lb. to 4lb., and instead of finding a feeding fish every 100 square yards you will find one per acre, perhaps, or thereabouts; so the chance of your flies alighting within its range of vision at any given cast is decidedly small.

All the same there is no reason why even your first cast on the water should not come within the range of a feeding fish; hence the vital element of luck. On the average, clearly, you are not likely to get a fish on any given day; but if you do, you will probably regard its capture as worth all the rest of your holiday put together. Not only are trout there big, but they put up a fight which will make you wonder whether it is you who are trying to get the fish into the boat, or the trout which is trying to pull you into the water. If you want to get a little practice in lake fishing before you go—it will be on your way home, I suppose—try a day or two on one of the Devonshire reservoirs. There are a couple near Bideford for which day tickets can be obtained, and one or two near Ilfracombe.

As I mentioned just now trout in lakes have to hunt for their food, and I think this is why the methods used by fly fishers differ from those used in streams. Normally flies are more of the sea-trout than of the brown-trout variety. This may seem odd to you since trout are in the lake all the time, and feed in the lake just as they do in a river, whereas, as I explained in my last letter, sea trout do very little feeding in fresh water and have to be enticed by rousing their predatory instinct with something one hopes is like the animals they chase in the sea. I believe that the reason why these large, and often highly-coloured flies are successful in lakes is simply because trout can see them much further than a small, sober-coloured fly. The fish sees something which looks alive moving in the water, dashes after it and has seized it before it has had time to consider whether it is good to eat or not. If it hesitates the animal will escape, so it goes for it blindly. Now if a gaudy fly can be seen twice as far off as a sombre one, then there is four times as much chance of its being taken, since it can be seen from any direction. The only risk is that the fly may look too good to be true.

So your best tactics in lake fishing will be to take with you your ordinary stream flies—get them rather larger if you are buying them specially—and use them if you see a number of fish rising together over one particular part of a lake. Over a weed bed is a likely place for this to happen, and it means as a rule that a hatch of fly is coming off the weed and the trout are grabbing the nymphs as they come up or are rising to the hatching nymph as it struggles from its shuck on the surface. But if there is no very definite rise going on, and you see only a very occasional whorl at the surface, then put on your regulation lake-trout fly, or flies, and work them by drawing them through the water for a yard or so before picking them off for a new cast.

The most common method of lake fishing is for two anglers to sit, one at the bow and the other at the stern of a boat and be rowed upwind by a boatman, who then manœuvres the craft so that it drifts broadside on across a shallow. During the drift the anglers, using two flies each, cast continually straight in front of them, draw the flies in, or play the dropper on the surface for a moment, and then cast again. It is important that only the straight overhead cast should be used, as with two men in a boat there is a danger that the flies may catch the other angler in the head if any other type of cast is made. A hook in the flesh may cause a nasty accident. The main difficulty lies in hooking your fish when you get one of the rather dashing rises typical of lake fish. Some men say "strike instantaneously," others say "pause before you strike." But I must leave you to decide which produces the best result with you. I believe it to be purely a personal idiosyncrasy.

At Blagdon this type of fishing is seldom practised. If you are in a boat your boatman will row you along within casting distance of the shore and you must try to get your fly into the line of foam which in most winds lies pretty close to the beach. Use only one fly—my own favourite for Blagdon is Dunkeld, but I doubt if the fly matters at all—size about No. 6. Do not attempt to use drawn gut; it is too fine for these large flies. Let the cast be tapered to finest undrawn only; and cast as far as you possibly can. For some reason Blagdon fish do not like boats, though in most lakes trout take no notice of them at all; but at Blagdon it is the man who casts the longest line who gets most fish.

BOAT FISHING ON LOCH BEGG. THE MOST COMMON METHOD OF LAKE FISHING IS FOR TWO ANGLERS TO SIT ONE AT THE BOW AND THE OTHER AT THE STERN

Unless your host is fond of boat fishing, probably you will not fish from a boat at all but from the bank. Your rubber thigh boots are just what is wanted for this shore fishing as you can wade out 30yds. or so into the lake. Your principal difficulty will be the wind, for your best chance of a fish there is always on the lee shore, by which I mean the shore on the lee side of a boat on the lake; the shore in fact against which the wind is blowing; and if there is any strength in it you will find it hard work casting, say, into the teeth of a west wind.

The best way to circumvent it is to wade out and then cast parallel with the shore—across the wind. The waves stir up the food along the shore of the lake and you will be surprised to find how big a fish will come into only a couple of feet of water when waves are breaking along the shore. At times lake fishing can be wearisome, but should you chance to be in Blagdon lake at a time when one or two of its monsters are hunting the shore line, and you can see (the wind will not let you hear) their resounding boils coming nearer and nearer to the place where your fly is riding the waves, you will understand, I think, why men go again and again to that attractive spot, heedless of blank days or time spent in casting into a lifeless waste of water.

Your affectionate uncle,
HARVEY.

CA' CANNY ECONOMY IN CRICKET

By NEVILLE CARDUS

THE composition of the English team to visit India throws some light, perhaps, on the problem which this time next year will be entertaining, if not agitating, our Selection Committee, for none of our major players have been included in A. J. Holmes's contingent, which, really, has a "consolation prize" aspect about it. Many of its members may be said to have just missed the most precious laurels of cricket—Dollery, gifted but disappointing; the two useful Langridges (Jno. and Jas.); Emrys Davies, who has lived too far from Lord's; Nichols, who has been wasted, so to say, for years; and Wellard, who had he been an Australian would have played in Test matches years ago.

Flight-Lieutenant Holmes can be proud of his team, which, taken all round, speaks not unfavourably of the strength of English cricket at the present time. At no period since the War have we possessed a "second eleven" as strong as this combination for India. Not more than two or three of them are likely to be called upon to play in Australia in 1940-1941; at least, I sincerely hope that Gimblett has not been finally relegated to the reserves; he has gifts which still need the encouragement and training that come from experience in the best class. In a recent article in this paper I argued the case of the all-rounder for the purposes of Test matches in Australia. There is a certain irony in the constitution of Flight-Lieutenant Holmes's team; three admirable all-rounders in it have never played for England in Australia, despite the general scarcity since 1914 of cricketers who can both bat and bowl. I allude, of course, to Nichols, Wellard and Langridge (Jas.).

I am all against the "specialist" bowler in Australia—unless he happens to be an undeniably great bowler, a Barnes, a Tate. An Australian Test match usually occupies five or six days; if a "specialist" bowler is not taking wickets regularly and consistently he is merely a "passenger" on the field for maybe two days out of the six. The fact should be emphasised in and out of season that on Australian wickets precious few bowlers have justified themselves as "specialists."

During the wretched weather of the last few weeks we have had to talk cricket to kill time waiting for the rain to cease. By the law of compensation which operates mercifully in all the activities of life, cricket is the best of all games to talk about; here, perhaps, is a case of cause and effect: we have learned the art of talking about it for the simple reason that so often we cannot play or watch it. A great pre-War cricketer the other day told me, between the cracks of a colossal thunderstorm, that the absence in the game to-day of the all-rounder is the chief difference between cricket as we know it now and cricket as it was when he was famous. And frankly he ascribed the decline in the all-rounder to deliberate "economy." "The game has become entirely a profession; and a player means to stay in it for as long a time as possible." I believe that this sort of "economy" is fallacious. First of all, the value of an all-rounder is extremely high in any period of cricket. To-day even a potential Rhodes or Braund would enjoy good profits and quick returns.

Then, the point may be put that "long" careers have been enjoyed by most of the great batsmen-bowlers; we need only mention Rhodes, Woolley, Warwick Armstrong, Noble, Hirst, John Gunn, Braund, Arnold Tarrant. It is only the fast bowler who is likely to suffer in physical endurance by departing from a canny specialism. The paradox is that at the present time a cricketer of less than the highest "specialist" attainments would be in the running for Test matches if he could provide merely moderate services as a batsman-bowler. Any cricketer worth his salt should wish always to be "in the game," in the thick of the action. The post-War habit of specialism has, I am certain, deprived us of several all-rounders of natural endowment. I need scarcely mention names. At the end of the present weeping summer it is likely that a new and most undesirable record will be set up—that of the fewest cases in the game's history of individual performances of the "double"—a 1,000 runs and a 100 wickets (I mean, of course, in the history of cricket since the counties became organised into heavy day-by-day engagements.)

And while we are discussing, between one deluge and another, this matter of the all-rounder, I cannot refrain from mentioning that nowadays when I hear folk paying tributes to Woolley, I notice that they refer only to his batting. So short are memories that the truth is overlooked that Woolley for years was one of the finest of slow left-handed spin bowlers. Even Tom Hayward might have played for England, had he "gone in for it," as a specialist bowler. But maybe it was Tom who started all this ca' canny specialist batsman economy! He insisted that a clause should go into his contract with Surrey absolving him from duties as a bowler. It is not generally known that once, at least, he took a hundred wickets in a season at the cost of less than 20 runs each. The ca' canny economy has even travelled to Australia, where there is no day-by-day strain on the players for months at a time. Last year Waite and McCabe were Australia's all-rounders. Shades of Giffen! Shades of J. M. Gregory! I had nearly said "Shades of Grimmett!" who at least commands a back-out of strong, if esoteric, properties.

ROUND THE WICKETS

By HUMPHREY DANIEL

AS he passes through the Main Gate of Lord's Cricket Ground and the roaring ranks of score-card and soft-seat sellers, the newcomer to this incredible world will doubtless be even more astounded to read that admission this day is going to cost him anything from 1s. 6d. upwards. If he has the money he will pass from barrier to barrier to the finest seat that money can buy. If he has the tip he will keep walking until he comes to the stands labelled "Free Seats," and get the best seat on the ground for a shilling. For the free seats at Lord's are opposite the Pavilion. They are behind the wicket.

That is where all the best cricket is seen. The people at the side see very little of it at all, because they do not see what the bowler is doing. They do not see how far the ball is swerving, how much it is spinning. Seeing what the bowler is doing with the ball is half the fun of watching cricket.

In the Free Seats at Lord's sit some of the greatest critics there are. There is one old gentleman who can tell you everything about the cricket of Middlesex you could wish to know, and very nearly everything about the cricket of every county. There is another gentleman who can tell Sims's googly and Peebles's googly every single time. There is a youngster who could write a lengthy book on Denis Compton and how very much better he is than Don Bradman and all the rest put together. There is even a lady who can pick out everyone of the Middlesex side by name, even though they are only shapes of white on a green background. I have yet to hear ironic clapping from the Free Seats. What I have heard has astounded me before now. And it might astound one or two of the gentlemen who sit in the windy shrine on the opposite side of the ground. Not all the best cricket is talked in the Press Box.

* * *

Wright was bowling at Maidstone. He was bowling at the top of his form—a lovely length, a top-like spin. He was the real Wright, the young man who has been hailed the most original bowler since the War. Yet when I first saw Wright bowl a few years ago there was not even a glimmer of this glory to come. I remember that it even seemed incredible that his impetuous run and his unbalanced action could pitch a length at all let alone produce a break at the end of it. But, like every other great bowler, Douglas Wright is a man of ideas. He realised that spin and spin alone was not enough to get wickets; that a leg-break proclaimed and heralded by a high, slow trajectory was almost useless against a batsman who could use his feet, get to the pitch of it, and kill it; that flight could hold few difficulties for a batsman with eyes like Headley's. He realised that the only way to spin a batsman out was to bowl in such a way that the spin would be able to work on the batsman. And so he started to be a fast spin bowler.

At first, of course, he had no length at all. Critics told him to bowl slower. Spectators were surprised. The Press did not notice his experiments because they gave no results, no sensational analysis. When he found that length things began to happen. He took wickets. He was chosen to bowl for England. He was acknowledged by Bradman as the most effective bowler we had got. As we watched him bowling there seemed something vaguely familiar about that violent rush towards the batsman, that windmill action all arms and legs, that curious way of delivering the ball off the right foot. Then, as a particularly vicious leg-break snapped back from outside the batsman's pads to clip off his off-bail with a click that all the ground could hear, I had it. Wright bowled like O'Reilly. It must be more than coincidence that the most promising bowler in England and the best bowler in the world should both bowl in exactly the same way.

* * *

A friend of mine and I have a small bet on the last Test match to be played at the Oval. He thinks England will walk it. He assures me that if Hutton does not make another treble century someone else will. The West Indies apparently are in for it. I am not so sure. Not sure enough, in fact, to prevent me from backing them to win the last Test match. I think they may win because in all probability the game will be played on a very hard wicket, a wicket fiery with all the sun of August in it. A fast bowler's wicket. I still think there are no two really good fast bowlers capable of doing for England what Gregory and Macdonald did for Australia. And I still have the lurking suspicion that our batting will not look quite so nice against a vigorous attack. The West Indies have got that attack. They have Martindale, after McCormick, the fastest bowler in the world for sheer pace. And they have Constantine and Hylton. I hope they win. Not just for the sake of my bet, but in the hope that they will remind us that there is such a thing as fast bowling.

Gregory scored a century in his benefit match at the Oval. That century was almost as inevitable as the conclusion to an algebraic equation—Surrey v. Yorkshire at the Oval (Gregory's benefit)=1 century by Gregory. It might have been dated in his notebook. To a man who plays as much cricket as Gregory does, who finds himself with a bat in his hands facing a bowler almost every day of the week, runs in themselves tend to seem rather hollow, rather meaningless things. A big score means as much to Gregory as a fabulous sum of money means to the man who adds up its figures in the ledger—absolutely nothing. It is the way the score is made, the shots he makes to make it, that matter more than anything. And so it is that he and his like do not concentrate on the scoring of runs. They like to experiment, to make shots just for the sheer fun of making them rather than to send their score along. There are many like him. And there are many more who do the other thing. They concentrate on the score. They make hundreds of runs. They lead the average race. Many of them play for England at some time or another. Gregory is not one of these.

He has never found fame, never seen his name blazoned in large block capitals on the sports pages, or amongst the chosen of England. "Not quite first-class," sigh the critics. "Good county player, but just not good enough for England." I wonder. I wonder if Gregory is very far behind all those who have been chosen before him. The only difference, I suspect, is that they play for fame and he plays for fun. He needs an urge, a goad to make him turn out runs to order. It is the big moment, the needle match, which produces the big thing. Gregory's benefit match was one of them. Some call this temperament, ability to rise to the occasion. I would call it inspiration—companion of the artist.

I do not often refer to Club cricket in these notes, but I think the feat of K. H. Chapman, the Harlequin and Middlesex Rugby footballer, not long ago is worthy of record. Playing for Stanmore against Radlett, he beat the Radlett captain with the first ball of the match, and had at one period of the game the remarkable analysis of 5 for 0. He bowls medium in-swingers and, getting help from the wicket, was practically unplayable. It is worth noting, too, that Stanmore had won an exciting match against Ickenham on the previous day with the seventh ball of the last over.

A FINE ACTION STUDY OF THINK SO, MELKSHAM MONICA AND HOPPINGWOOD SPOT

GREYHOUND RACING KENNELS

By DALE BOURN

BEHIND the glamour, the bright lights and the outward show of the modern greyhound racecourse, there is an organised industry employing thousands of men and women and millions of capital with the sole object of kennelling and training racing greyhounds.

Few of the multitude that follow greyhound racing, either at the racecourses or in the daily papers, ever give a thought to what goes on behind the scenes.

No one who has not actually visited the kennels and training establishment of a modern greyhound racing company can possibly have any idea of all the up-to-date equipment and staff that goes to comprise it.

Let us pay a visit to the best example of a greyhound racing establishment in the country. This is situated at the Hook Kennels at Northaw, Hertfordshire, although even this will be outdone by the new quarters at present in course of construction at Barrow Hills in Surrey. Both are owned and operated by the pioneers of greyhound racing and the biggest company of all, the Greyhound Racing Association, Ltd. Here is to be found a lovely pastoral estate of about 200 acres. On this estate is situated a self-contained greyhound village. Here is the home of anything from 700 to 1,000 greyhounds and the staff that tends them.

Before seeing how the greyhounds themselves are looked after let us see how the managers, trainers, veterinary surgeons, kennel men, cooks and all the others that go to make up the staff are catered for. Firstly, there is the big house in which the racing director and his personal staff live and work. There are modern houses for the trainers, the resident veterinary surgeon and his assistants. There are very comfortable sleeping dormitories provided for the kennel men and others of the staff. The recreation of the 160 or so members of the staff is given close consideration, too. A fully licensed club room with billiard tables, dart boards, table tennis, card tables, radio and a fine dance floor are all at their disposal in their leisure hours. Outdoors is an extensive football field and pavilion, also a big swimming pool. From time to time sports, swimming contests, dances and other shows are organised for their entertainment.

The personnel is one big happy company of good fellows who know how to work and how to play. Everything that can be done for their comfort and good is done. Everything that is necessary for their use is provided. A contented staff naturally makes for greater efficiency. Some of the married staff live nearby and are close to their work.

The establishment also contains its own garage, petrol station and repair workshop to house and service its fleet of Pullman vans which are used to transport the greyhounds to and from the various racecourses. These modernly equipped vans can hold 20 greyhounds, each in a separate compartment, as well as the five kennel men who accompany them. They are driven and serviced by the staff of highly experienced drivers and mechanics resident on the estate.

There is also an up-to-date laundry, complete with staff, and a company of gardeners who tend the big kitchen garden which supplies over 500 tons of vegetables annually for home consumption.

There is a workshop for manufacturing and repairing the greyhounds' racing coats, as well as the kennelmen's white coats.

An independent water supply is installed, as well as a system of incinerators. The estate has its own fire brigade, manned by its own staff, and the whole system is linked up by a network of modern concrete roads. The kennels themselves are modern brick-built structures, draught proof and electrically lit, divided into cubicles. Each cubicle accommodates two greyhounds, and a raised platform is built in each, which is covered in clean straw each day for sleeping and resting purposes.

The G.R.A., Ltd., at present control four leading racecourses in London—nine altogether in England and Scotland. To each track are attached five trainers, and to each trainer, five or six kennel men. When an owner sends a dog to the kennels for training, it is attached to one trainer or another, but the owner may, if he or she likes, choose any particular trainer if his kennel is not already fully engaged. Each trainer has his own separate block of kennels, which is adjacent to its separate paddock for exercising.

One modern ingenious invention fitted to the kennels is worthy of especial mention. In each kennel is a microphone wired up to a receiving set in the watchman's quarters. Whenever there is a disturbance or barking in any kennel, a light shows on a numbered board on the receiving set. The watchman has only to touch a switch to hear through the loudspeaker what is going on, and he in turn can speak through a loudspeaker to that particular kennel and quieten any restless dog, whose noise might disturb the rest of his kennel companions.

The feeding is carried out on a scientific basis, and the present system of timing of meals and diet is the outcome of many years of research. Special cookhouses are installed with expert cooks to run them, and especial care is taken to see that everything in contact with the food is kept scrupulously clean. Each meal is under the personal supervision of the resident veterinary surgeon. Again, the quality of the food and milk is from time to time tested for quality in the up-to-date laboratories in the hospital.

An indication as to the scale on which the kennels are run may be obtained from the huge annual consumption of food stuffs for the dogs. A special type of rusk bread, found to be more digestible than any other, is consumed at the rate of 2,500 tons annually. About 45,000lb. of best beef, 25,000 gallons of milk, the heads of 11,000 bullocks (which are boiled down for soup) and approximately 60,000 eggs are used annually, besides varying amounts of other special foods used for sick dogs and special diets. Most of the food is cooked in bulk, but at times the likes and dislikes of individual greyhounds are considered. The diet given to the dogs has been the subject of an exhaustive study by the veterinary surgeons since greyhound racing first began, and each dog receives a carefully balanced ration that contains the highest possible nutritive value.

In special cases and in cases of sickness the diet may be varied by order of the veterinary surgeon, and in these cases special delicacies such as chicken and calves foot jelly may be used. They couldn't be better fed at any first-class restaurant! Except in especial cases and sick dogs, feeding takes place at stipulated times, and training and exercise times are regulated accordingly.

The regular programme followed is that at 7 a.m. the dogs are let out into the paddocks in charge of their respective kennel men, what time the kennels are cleaned out and fresh straw and sawdust await their return. At 8.30 a.m. they partake of their first meal of the day—a busy time for all concerned.

The basis of all feeds is the best quality of slightly toasted wholemeal wheat flour bread, and the morning feed is composed of this type of bread and fresh milk. After this meal the dogs are taken for a long walk round the park with occasionally some road work to harden their feet if and when necessary, or they go through their various training duties if required.

Returning to kennels about 11 a.m. they are brushed and groomed and generally cleaned up. Then back to bed until 2 p.m.

For those dogs not racing that day or night, another short walk, training routine or a romp in their paddock is then the order of the day, preparatory to the big, eagerly looked forward to meal of the day at 3.30 p.m. This consists of the special bread broth made from home-grown fresh vegetables, barley and meat. According to the amount of work being done by the individual dog, so the amount of meat given to that dog is varied. After this feed, the dogs are kennelled up for the night and their day's work is done. Those greyhounds that are engaged in racing that afternoon or evening are not served with this last meal until they return to their kennels from the racecourse, although they do receive a bowl of milk in the racing kennels immediately after they have finished their particular race. From this it can be seen that the modern racing greyhound puts a new interpretation on the phrase "a dog's life."

When it is realised that the greyhound is a highly strung, nervous animal, it can be well understood that the first consideration in the policy of a huge kennelling organisation such as the one at Northaw is companionship plus atmosphere. His exercise is always taken in company with a kennelman. His odd romps off the lead in the paddock are always under the supervision of a kennelman. All progress in the development of the dog's health and racing qualities can only come through this human association. There is no particular trick in bringing out the best in a racing greyhound. It is a long, continual process of "getting to know the dog." It has been known in some cases that a greyhound has taken such a liking to a particular kennelman that the dog has never run true to form unless that kennelman accompanied the dog to the racecourse.

It amounts to this. Companionship is a necessary ingredient in a racing kennel, and atmosphere of a congenial nature is essential. Thus, sports grounds, lawns, flowers and swimming pools all set in a beautiful parkland are not only ornamental and useful but an essential background to a successful training kennels. It is a happy circle of trainers, kennelmen and their charges at a large racing establishment such as this, where companionship and trust is mutual, yet strict rules and hard work are the dominant factors, that goes to produce the highest efficiency in racing greyhound training.

THE DRIVE TO THE FOURTH GREEN ON THE REAL CLUB DE LA PUERTA DE HIERRO, MADRID

REVIVING GOLF IN SPAIN

By E. R. TIPPLE

UNTIL the Civil War ended all normal activities of life golf in Spain had become popular. From the construction of the course in Madrid, as long ago as 1895, the game had spread throughout the country until in 1936 rounds could be enjoyed in Barcelona, Bilbao, San Sebastian, Seville and many other places. Moreover, the character of the golf obtainable was unexpectedly good, the Madrid course in particular, where the Open and Amateur Championships were always held, being a fine, interesting test.

Most of the professionals were Spaniards and not Englishmen, as is usually the case in most European countries. The best known was Angel de la Torre, who paid frequent visits to this country before he finally left his own home for America, three years ago. Inspired by his successes and the standard of skill he had attained, other promising players, both amateur and professional, came into prominence. But just as the work of the pioneers seemed about to be properly rewarded hostilities broke out and golf and other games were forgotten.

Efforts are now being made to reorganise the game. It can be imagined just how difficult this will be. Not only is there a lack of money available for such a purpose, but the number of Spanish professionals has been reduced to just seven, the rest having been killed. These seven professionals have sent a letter addressed to a leading British firm of manufacturers, appealing for assistance. Already their appeal has had a response, and at least one firm has promised to send a collection of used and unused clubs to Madrid.

The courses in Madrid, says the appeal, have been totally destroyed "by both abandonment and shelling as well as extensive trench digging. They were both in the heart of the battlefield. We have already started rebuilding operations to the point of having a small number of complete holes actually open to practice and playing." That at least is good news and shows that little time has been wasted. But the letter continues: "That in regard to our professional activities in teaching and practising, which are of such vital importance for the resuming of golf life, we are most seriously handicapped through the total unobtainability over here at present of clubs, new balls and even practising balls."

Therefore they have asked that any contribution from golf clubs, private golfers or anyone else—even used clubs, bags or old balls—would be heartily welcome and enable them to show their authorities that the proposed official assistance is not undeserved and will be far from wasted.

I am sure that this call for help will meet with sympathetic response from individual golfers and any supplies should be sent to Emilio Cayorga (the oldest golf professional in Spain), Real Club de la Puerta de Hierro, Madrid.

Whilst this Spanish appeal is a deserving one, I think that caddies and even artisans in this country merit more assistance than they receive at present. The lot of the caddie is not an enviable one. No matter what time of the day or evening, they are expected to be at hand for a round. If it is raining, the golfers are clad in waterproof jackets and trousers to go out for their game, and perhaps give little thought to whether the caddies are also protected from the weather. The caddies cannot afford to refuse a job, particularly as little golf has been played of late, and despite occasional high fees it is a wonder how they manage to make a living. Many of them do not possess a change of clothing. So old flannel trousers, plus-fours, pullovers, coats and shoes which golfers keep in their lockers month after month without intending to wear again would prove a godsend to these men.

Sheridan in *Around Golf* tells a good story of one of the old type of caddies—Sandy Smith, a fisherman, who caddied for a certain Lord S. at North Berwick. He made a rare fuss of his patron and waited for him throughout his holiday.

When the peer pointed out that Sandy should not wait so long in case he missed other work Sandy replied: "I'll no lose anything through you, for, mark ye, I'm a very big man and few men's clothes fit me. Now you are the man I've been looking for for years, foe your clothes will fit me like a glove!"

"Sandy invariably carried Lord S.'s clubs and for many a year turned out like the "Hoose o' Lords itself!"

Although the artisans do not need presents of clothing, I think they would appreciate the opportunity of acquiring clubs and even balls. Furthermore, golf clubs would be doing a great service if they would permit them to play over their courses. At present there are over 170 artisan clubs in existence, but this number is small in comparison to the number of other clubs, and there has been a growth in artisan golf since the association was formed in 1921 by the late Lord Riddell, J. H. Taylor and F. G. Hawtree.

Before becoming professionals both Taylor and Abe Mitchell were artisan golfers, and the latter when a member of the Cantelupe Club at Forest Row had a handicap of plus ten! William Sutton, the former English amateur champion, was another who began his golfing career in the artisan ranks, showing that ability will be recognised even when opportunities for playing the game are restricted.

A FEW HAZARDS ON THE GOLF COURSE AT ROTORUA, NEW ZEALAND

Left: Chimneys on the tee which liberate steam from a boiling spring beneath it. Right: Not the hole, but a bubbling mud crater and possible source of trouble as regards lost balls. The Maori caddie is wearing his native flax skirt

THE ART OF GOOD LIVING

By *ANDRÉ L. SIMON*

A Fishless Luncheon in August

The Fare : Brochettes de foie de veau Parmentier
Roast Grouse
Pois Mangetout au beurre
Fromage et salade verte
Fruits

The Wines : La Fleur Pétrus 1933
L'Angélus 1920

THERE are many good things to eat in many parts of the world, but there is nothing quite so good as a young Scotch or Yorkshire grouse, just plainly and lightly roasted. It is the cleanest feeder of birds : it feeds on heather shoots and never gobbles slugs or insects ; its flesh is the most delicate and delicious. A grouse is so good that it is unpardonable to overcook it, as only too often happens ; it is also a grave error to devour it in hunger. One should serve just one dish—no fish—in front of a grouse, something tasty and fairly substantial to blunt the edge of one's appetite. *Brochettes* of calf's liver cut up in pieces as large as mushrooms' heads and passed through a skewer, with a piece of lean bacon and a mushroom head between each piece of liver, soaked in melted butter, breaderumbed, given more melted butter and then cooked under a hot grill, supply a sort of hot hors d'œuvre which will provide just the right preface to the poem that is to follow : the first grouse of the season. The *Brochettes* are *Parmentier* when served with some potatoes diced and cooked in butter.

The *Pois Mangetout* are a kind of green peas which are not nearly sufficiently grown in England. Their pods are free from all parchment lining and very tender. The peas are picked when quite small ; they can be seen through their transparent pods ; they are not shelled but cooked, pods and all, exactly like French beans.

The first grouse of the season deserves a really fine bottle of wine, but being August and lunchtime a red Burgundy might be a little oppressive, so we might turn to St. Emilion and drink L'Angélus 1920 with the grouse and after, but having led up to it with a bottle of a younger Pomerol, such as La Fleur Pétrus 1933.

FIFTY YEARS AGO

From the *Field* of August 10th, 1889

FREAK Horses. "When Frederick Chard, a travelling showman, was charged with working a horse whilst in an unfit state, a policeman deposed to having seen the horse, which was attached to a vehicle, leaning against the shafts, apparently exhausted. When spoken to, the defendant, in excusing himself, accused himself by saying that it was a freak of nature, and that the horse could not be got to carry flesh. Presently it fell down and was unable to rise, whereupon the policeman summoned the travelling showman. It came out in evidence that the horse, which 'had a head like a camel,' had been exhibited at Roundhay Park, Leeds.

"Fortunately, there have been scarcely any malformed horses exhibited, the records of shows bringing to light very few instances. The 'blue horse' exhibited many years ago was simply one with a very little hair on him, and was sometimes exhibited as the 'hairless horse,' when he is said to have been denuded of the very scanty allowance of hair with which nature had endowed him. Rather more than thirty years ago a horse was shown whose height was 22 hands. He was of the ordinary machiner stamp, but beyond being somewhat leggy, was of no unusual shape or proportions. A few years later the three-legged horse was exhibited in Regent Street. This was a chestnut cob, about 14.1, by no means badly shaped, but lacking a near fore-leg. There was no scapula on the near side, but only a gristly substance. The right fore-leg was placed somewhat across the body, to make up for want of support on the near side. . . . The cob performed a few simple tricks, and concluded his business by jumping a pole placed about a couple of feet from the ground."

IN THE SALEROOM

THE market for valuable books, autograph letters, historical documents and manuscripts has had to absorb a great number of important collections this year, resulting only too naturally in these times in disappointing prices being fetched from time to time. But, fortunately, those responsible have shown considerable acumen by not throwing the whole of a great collection into the auction rooms at one time. It has been said that some collectors are afraid of the destruction of valuable documents in the event of hostilities and are inclined to dispose of their treasures through the lack of enterprise by the great insurance companies in not combining and bringing forward an insurance scheme for the approval of the Government to cover possible losses.

However, when Sotheby's had to dispose of 514 lots from various sources the rarities secured relatively good prices. A letter from Jane Austen, written on March 14th, 1815, to her niece Caroline, fetched £58 ; *Rosamund Gray and Old Blind Margaret*, by Charles Lamb (first edition, Birmingham, 1798), was bought for the quite good price of £165 ; Walt. Whitman's *Leaves of Grass* (first edition, Brooklyn, 1855) sold for £102, and one would have expected a keener fight by Americans ; George Gardyner's *A Description of the New World* (first edition, St. Paul's Churchyard, 1651) was an undoubted bargain at £48 ; and an important letter from Benj. Franklin to David Hartley, dated March 31st, 1784, went at £200, not a bit too much.

When the sale of the Harmsworth Trust Library took place it showed there was an increasing demand for old atlases and books dealing with voyages and travels.

A geographie by S. & J. Blaen, of twelve volumes, including 558 double page maps (Amsterdam, 1667), fetched £100 ; J. Gastaldi's collection of maps, comprising a Mappe Monde, and maps of Europe, Africa, Asia, and America folio (Venice, 1562–1579) brought £500 ; and Thomas Baines's large collection of original MSS., journals, letters, notebooks, and sketches relating to his explorations in South Africa and Australia, 1848–1879, secured £280. Dr. Livingstone's letters were bought for the following prices : to R. Hayward (1843), £23 ; to Benjamin Pyne (1849), £20 ; to the Earl of Clarendon, £30 ; and to James Gordon Bennett, £62. A letter from Sir H. M. Stanley to Bennett relative to his expedition to find Living-stone (1871) fetched £55.

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, games, country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, Sept. 12th. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Bream's Buildings, Chancery Lane, London, E.C. 4. 2. Only amateur photographers are eligible to compete. 3. Photographs should be sent unmounted, and no prints will be returned. 4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final. 5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6. 6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.

Entries from abroad not arriving in time will be placed in the next of the series. Do not send negatives.

A TRAVELLER'S NOTEBOOK

ONLY the other day I met a friend who had just returned from a visit to the Rhine. "It's just the same," he told me. "The people are as pleasant as ever, and the last thing they want, or think about, is war." This did not surprise me. The Rhinelanders are very *gemütlich* and easy-going, though unfortunately some of the men from other parts of Germany, who come to holiday on the banks of the great river, are by no means so amiable.

* * *

I went to the Rhine first of all because of the glowing descriptions given me by a German friend in the French Foreign Legion, a friend still somewhere in the Sahara, since he prefers the comparative freedom of the Legion under the French to the conditions existing in his own country.

There were in those days, and still are, Dutch boats running from Rotterdam to Worms. The river boats provide, I find, a very pleasant method of transport, with all the advantages of sea travel without any of the drawbacks. For instance, the food and accommodation as one would expect on a Dutch ship, leave nothing to be desired, and since it is never rough, even the worst sailor will not feel unwell. By day there is always plenty to see, and by night when the boat ties up at the bank you can, should you so wish, go to have a jolly on shore. The quantity and the variety of the shipping is extraordinary, and the barges, their living accommodation adorned with flowers in window boxes, present quite a festive appearance.

* * *

The Rhine is really a national playground. Half the young men of Germany—when not engaged in military service—hike and bike on the banks or *Faltboot* down the river. A light, collapsible affair is the *Faltboot*, invented by a German engineer, whom thousands of young men have learnt to bless. The whole thing is so simple, though, of course, skill and courage are needed, for at night you merely extract your ship from the waters, pitch your tent, and retire to the nearest inn—in search of refreshment.

* * *

Koblenz, where the Rhine and Moselle join, is a pleasant town ; clean, picturesque and very amusing in the evening. There is a *weindorf* concerning which many travellers retain happy memories, having spent a night there drinking "the wine that comes from Rüdesheim," and talking to complete strangers as if they had known them all their lives. From Koblenz, too—I am referring to those who have come by train and not the Dutch boat—one can take the little ferry boats, all of them amply supplied with food and drink, down the Middle Rhine, which is without doubt the most picturesque stretch of all.

* * *

Crowning the hills that tower over the river there are castles, lots of castles. Not an advertisement mars the view—I once saw a large advertisement of a certain brand of corsets in the middle of the Sahara—and, a matter over which the Germans must be given full marks, you hardly see a sign of that monstrous modern invention the petrol pump. But one word of warning. It is almost certain the proprietor of every restaurant you enter will extol with tears in his eyes the merits of the Rhine salmon, and if you believe the story you will soon have tears in yours, for they taste more like Nigerian mudfish than anything else. The Rhine is a noble waterway, but also a very dirty one, and the rhyme learnt at school pathetically asking, "What fair divine can henceforth wash the river Rhine," after its passage through Koln still holds good.

* * *

Rüdesheim I like the best of all the places on the banks of the river, and very much fear it is on account of the wine feast, an annual summer debauch lasting about a week. Once I walked alongside the river from Boppard down to Rüdesheim, and averaged about six kilometres a day. This sounds ridiculous, I know, but there are so many temptations that Rüdesheim would never have seen me had I not encountered a young man carrying a heavy pack who was, so he said, walking to Italy. With him for very shame I completed my journey in one long lap.

* * *

There are vines everywhere, and one sees a marvellous example of intensive cultivation. Every inch of ground has been taken advantage of, and one marvels at the skill of the farmers who have created these terraced vineyards in the most unlikely places, while wondering how the labourers ever work the soil and thin the grapes without toppling into the Rhine.

". . . The wide and winding Rhine,
Whose breast of water proudly swells
Between the banks which bear the vine
And hills all rich with blossom'd trees."

F. H. M.

LETTERS TO THE EDITOR

BACK TO THE LAND

SIR,—Your readers may have perhaps noticed that the French Government is considering the giving of marriage loans to young peasants on condition that they remain on the land for fifteen years. This is being done for the purpose of increasing earlier marriages, increased birthrate, and re-peopling the countryside.

A certain number of people have the idea that this or a similar plan might be useful in England. All experiences of this sort, especially the very extensive ones which took place after the war, show that this plan alone is doomed to failure.

A townsman is no use planted in the country. You cannot transplant an old tree into a new climate or a new environment. The re-population of the country must begin in the schools.

All masters and headmistresses appointed to country schools should be country people and country lovers, otherwise their influence is always towards getting their best pupils into offices, into town posts, in the Civil Service, and so on.

Arrangements should be made in all country schools with neighbouring farmers that as part of their regular teaching boys should go on the farm for half a day three times a week, and that girls should go into the dairy or the kitchen for the same educational purpose. It will then be readily seen which pupils are fitted for this life, and which are not fitted. The aim of the future should be to secure for every young man on marrying in the country the opportunity of a little holding of at least "ten acres and a motor car," to enable him to compete successfully for a living and to enable his wife and family, as well as himself, to keep in touch with social life in the neighbouring villages and towns.

Yours faithfully,

8, Harley Street, London, W. 1. JOSIAH OLDFIELD.

"THE CUCKOO AND ITS EGG"

SIR,—The two letters on "The Cuckoo and its Egg," published in your issue of July 22nd, should not be allowed to pass without comment. Mr. W. Audas says of a reed warbler's nest in which he found a cuckoo's egg: "From the shape of the nest . . . which was built on slender reeds, it was impossible that the egg could have been laid, as in the first place, the nest was far too small for so large a bird as the cuckoo to sit in; and in the second, the weight of the bird would inevitably have swamped the nest. Does not this fact go far," &c. May I ask *what* fact? Perhaps it has not occurred to your correspondent that the weight of a young cuckoo for days before leaving the nest cannot be very much less than that of an adult.

Pursued to its logical conclusion, this statement means that it is impossible for reed warblers to rear young cuckoos in the nest, which, of course, is an utter absurdity. The "fact" which is somewhere in the quoted sentences is considered by Mr. Audas "to confirm the theory held by many ornithologists that the female cuckoo drops her egg into nests by means of her bill. She is provided with an enlargement in the throat, in which the egg could be carried in safety during her flight in search of a suitable place in which to deposit it." This is the old exploded regurgitation theory in a slightly new guise, for whereas its one-time exponents readily admitted that cuckoos could stand on nests, Mr. Audas would apparently have us believe that they cannot do so. The only possible inference, then, is that cuckoos hover above a nest and vomit an egg into it. Should he wish to develop this ridiculous theory he may find it difficult to explain why eggs are not smashed in the process of deposition.

Your other correspondent, Mr. Newham, is also a "hoverer" and produces another priceless piece of information. "The bird (cuckoo) must have hovered over the nest to drop the egg in, for it would topple over if it rested on the nest. The egg was hatched out, but the fledgling's weight was too great. I found it dead five days after its birth." We are not told why the "fledgling's" weight was too great, but let it rest!

But Mr. Newham brings forward what is, to me at least, an entirely new version. He says that the cuckoo carried her egg in her feet—feet, mark you, not foot. But I had better quote his very remarkable observations. "I can verify that the cuckoo does lay its egg in the grass, having studied birds all my life. I made a study of this when there were quite a lot of cuckoos in this vicinity. I rose early, between three and four in the morning, and took my position under an elm tree in the middle of a field, covered myself with a grey army blanket, had my glasses, and imitated its call. I attracted cuckoos; one bird settled just over my head, then flew down about 15yds. from me, laid still for about three minutes (I could only see its head at the time), then rose up, turned round, picked up the egg in its feet, then flew away. I distinctly saw this with my naked eyes."

To use an Americanism, can you beat it?

I really hope that Mr. Newham will tell us some more about this unique experience. Why did he go to his post in the very early hours of the morning? I suppose that he imitated the call of the cock, for it is not to be imagined that he could successfully copy the call of the hen. How many cuckoos were attracted? What did they do when they arrived? He tells us that one of them flew down into the grass about 15yds. away when he could only see its head. He presumes that it laid an egg because it "picked up the egg in its feet, then flew away." He must have implicit faith in the reliability of an eyesight which enabled him to observe so graphically an event which has never been witnessed by anyone else—or shall I say recorded?

Mr. Newham draws attention to the zygodactylous feet of cuckoos, and these merit deeper consideration than they have perhaps hitherto received. I think that we can safely dismiss his suggestion that they were so made purposely to pick things up. Those who have watched female cuckoos closely will be aware of the somewhat curious manner in which they will "creep" along a branch. Is it possible that there can be some connection between this arrangement of the toes and the peculiar creeping action?

Yours faithfully,

The Corner House, East Sheen, S.W. E. E. PETTITT.

SIR,—Your correspondent, H. W. Robinson, states in his letter which appeared in your issue of July 8th, that the cuckoo is not an egg eater.

I have made a special study of the cuckoo for many years and have found this bird to be a most confirmed egg thief.

When the cuckoo has laid her egg in a nest she usually carried one away in her beak, and this is almost invariably eaten.

I have watched, at close range, the cuckoo taking eggs from nests on her non-laying days; also, if there are no nests in a suitable condition for her to lay in—that is, nest with fresh eggs—she or her mate will destroy the eggs and the nest, so forcing the owners to lay again.

Yours faithfully,

The Bungalow, Leighton Buzzard. OLIVER G. PIKE.

CAUSE OF FLY SCARCITY

SIR,—Low rivers during the last winter, coupled with very severe frosts, have had the effect of reducing the normal river flies to an almost unparalleled scarcity. Not only is the effect felt by the fisherman, but the trout are taking all and every odd fly which comes their way. Irrigation of trout this year reveals that the ingestion of nymph and fly rarely reaches double figures, in place of as many scores.

The last fish that I have taken from the Avon, although in good condition and full of fight, showed, when cooked, a most unmistakable absence of fat. The flesh was hard and dry, resembling that of a migratory fish after a prolonged stay in a river. Is this perchance due to the absence of fly from the dietary?

To me it opens an interesting question upon which others with greater knowledge may enlighten me: is it cause and effect or coincidence?

Yours faithfully,

Easterton, Wilts. RICHARD LAKE.

THE LITTLE OWL

SIR,—I have read with interest several letters from readers on the subject of the little owl, and as I have kept one of these highly interesting birds as a pet for well over three years—a feat of which I am rather proud—I decided to relate this story in the hope that you might print it.

A few years ago, a mouse farm was started not far from my home and quite a few pairs of little owls took up their abodes in the vicinity of this farm, because, I suppose, some hundreds of mice must escape into the surrounding fields. I have found mice of all colours in the nests of the owls, which seems to prove it. Well, as I have always had success with all kinds of pets, I decided to tame a little owl, although I was told it is impossible.

I obtained this owl by dangling a woollen sock on a piece of string in a hollow oak which contained four owlets. These birds were little balls of grey fluff, and they showed their hearty disapproval of the presence of the sock by turning over on to their backs and striking out with their sharp little talons. As I had hoped, one of them got his claws entangled in the wool and I was able to draw him gently to the top of the tree. He showed no fear and peeped out of my jacket all the way home.

He used to eat ravenously anything I cared to give him, and was exceptionally fond of the white of a hard-boiled egg. I used to catch and skin mice for him, and these he used to swallow whole, taking about four minutes to do so. I kept him in flannel on a luke-warm stove.

He soon lost all his fluff, which gave way to a soft mottled grey plumage. By this time I had to keep him supplied with at least two mice every day, and this was no easy task. He soon learned to fly, and finally I left him to his own resources in the garden, and used to feed him regularly. After a time he used to fly into the house when he was hungry and not wait for me to go and feed him.

He got to know my family quite well, but if a stranger was in the house, he would fly indoors on to his usual perch, the top of a door, and calmly look for some one to feed him. And then suddenly he would notice the stranger and instantly the pupils of his eyes would dilate and he would stretch his neck and glare most balefully at the intruder. He would refuse any food I offered him, and continue to follow every little movement of the stranger and not until he had gone would he relax and allow himself to be fed.

In less than a year he learned to satisfy his own needs, and it certainly gave me a great deal of relief. But he would come indoors at any hour of the day or night to show us what he had captured. It was a strange and I might say rather unpleasant sensation, to wake up in the night and find a warm mouse, or a large earthworm being dangled in my face. This also has happened to my sister, and needless to say, she did not seem to appreciate it. And when the threshing machine had been at work nearby on the stacks, I found dozens of mice neatly beheaded at different spots in the garden.

The sparrows and starlings used to make a great fuss of mobbing this little owl, but one day they annoyed him so much that he killed two sparrows, more venturesome than the rest—but that is the only time I have known him attack any other bird.

He took a strong dislike to cats, and as our Pekingese also disliked cats, a kind of code sprung up between them. Whenever cats appeared in the garden, which was quite often, the owl would make a terrific din for so small a bird, and the dog—who is usually asleep—would dash outside and chase off the offender. But the owl held even the dog in contempt, and used to take meat from between his jaws.

His behaviour in the spring time and mating season is very strange. When he comes indoors he will suddenly alight on some soft object, such as a carpet slipper, and spreading his wings and ruffing his feathers until he appears twice his usual size, giving him a very comical appearance. He will cluck and make soft cooing noises like a hen with chicks. Also he becomes very irritable, and if anyone whistles or makes any offending noise, such as swishing a broom or stirring coals, he will have a fit of rage and fly on to the offender's head and flap his wings, all the time making a screaming noise. With any food that is given him he makes a great fuss—exactly like a hen calling a brood of chicks to her.

He takes a great delight in being gently scratched, and puts his head on one side and closes his eye for anyone who approaches to do so.

I even took him away 20 miles from home on a farm when I was on holiday. He did not mind his new surroundings at all and soon made the barn his abode. I stayed there for six weeks, and then brought him back home with me.

Finally, he is the most delightful and most interesting pet I have ever had, and when he perches on my shoulder and nibbles gently at my ear with his cruel little beak I often think he is trying to show his affection.

Yours faithfully,

Essex. DERRICK A. SHEAD.

THE HYSTERIA PROBLEM

SIR,—I was most interested in the letter from Mr. J. C. Clayton in your issue of July 15th regarding hysteria in dogs.

I have bred smooth smooth foxterriers for a number of years and have never experienced a case of hysteria. Fifty per cent. of the food supplied to puppies consists of fresh raw minced meat straight from the butcher.

Some puppies I have sold or given away have contracted this disease.

My first question of the new owner is "Have you fed the puppy on raw meat?" The invariable answer is: "No; but some cooked meat."

In one instance, the lady being much aggrieved, I took the puppy home and fed it entirely on raw meat with the result that it recovered in a few days and was successfully shown.

Yours faithfully,

15, Lansdowne Road, Bedford. F. W. POTTER.

SEEDS FROM NEW ZEALAND
(See letter "Palms in Skye")

PALMS IN SKYE

SIR,—I am enclosing herewith a photograph I took last June whilst on holiday in Skye. It was taken at Ord, Sleat.

It shows the only palm trees growing in the Isle of Skye. They were planted about 100 years ago by Colonel Ian Macdonald from seeds sent to him from New Zealand.

The Cuillin Mountains can be seen behind, across Loch Eishort. Yours faithfully,

104, Woodland Way, W. E. BALL.
West Wickham, Kent.

A STRANGE IMPLEMENT

SIR,—The implement which was illustrated in your issue of July 22nd is evidently the lever of an old "wool iron," used for closing the wool sheets after they have received their quota of fleeces. To be complete it should have on each of the two hooks a piece of chain long enough to reach across the filled sheet, and having sharp hooks at the further end. By engaging these hooks in the further side of the sheet, the two sides can then be drawn together with the lever. They are then skewered, and stitched. It is evidently the work of an old craftsman, who, like all his fraternity, liked to make use of old scrap. He appears in this case to have made the handle of the lever out of a pair of old hames.

Yours faithfully,

Itchen Stoke Manor, A. H. BARING.
Winchester.

A similar reply was received from Mr. E. Coward of Southgate House, Devizes. The Curator of the Museum who asked the question writes as follows:

SIR,—Will you please allow me to thank the various readers who have written to me direct in reply to my recent query in the *Field*?

Several seem to think that the implement was for use on a cross-bow, but it is not nearly strong enough for such a purpose. After consideration of the various suggestions received, I am now inclined to the opinion that it was used for pulling together the tops of sacks which were bulging with wool before being sewn up. I am very grateful for your assistance in arriving at this conclusion.

Yours faithfully,

Public Library, F. C. MORGAN
Museum, Art Gallery (Curator).
and Old House, Hereford.

CARRION CROW

SIR,—It is much to be hoped that Mr. J. F. Aspley will send to the British Museum (Natural History) the specimen of a carrion crow, illustrated on page 132 of the *Field* of July 8th, 1939.

In this part of France both raven and carrion crow are abundant, and I have, for some time, suspected the existence of a third species, intermediate in size between the two and with a call note about half-way between the raven's croak and the crow's harsh cry.

The British Museum asked me, some weeks ago, to try to obtain a specimen, but so far I have not been successful.

It would be of interest to the whole scientific world if Mr. Aspley's bird was found to support this surmise. Yours faithfully,

Ermitage du Kerdro, Le Pouldu. KERDRO.

TENTACLE-LIKE ROOTS

SIR,—I have read your correspondent's letter in which he states that the baobab starts life as a creeper, adding that this is the view held by the authorities at Kew.

A few years ago, when I was in the Western Provinces of this territory and in a district abounding in these trees, I remembered the saying that no one had ever seen a young baobab and offered a reward to the local natives for such a sapling. Within a few days I had the choice of specimens, undeniably baobabs, ranging in height from 3in. to 2ft.

The photo I enclose may be of interest. It is of the roots of a great cedar tree on the Nadungoro Plateau of Mount Maru. The soil, containing presumably a palatable salt, has evidently been quite licked away by game, and the remaining protuberant roots have afforded a most pleasant place for a quiet scratch. Tracks of elephant, rhino and buffalo are regularly seen under the roots, which are conveniently situated on a path from their drinking place at the Walatia River, and there is no doubt that all find it, literally, very much to their taste.

Yours faithfully,

Nadungoro Downs, C. HARLAND SMITH.
P.O. Box 124,
Arusha,
Tanganyika Territory.

A "DEGENERATE" MOOSE

SIR,—In the reply of mine, which you published in your issue of July 15th, to Mr. Johnstone's letter, owing to my bad writing there is a mistake. You print "Mr. Johnstone's last paragraph is rather absurd in meaning"; I wrote, "Mr. Johnstone's last paragraph is rather obscure." Perhaps you would be kind enough to correct this.

Yours faithfully,

Staffs. H. F. WALLACE.

ELEPHANT'S DOUBLE HEART

SIR,—I was very interested in the letter and photograph published in the *Field* of June 17th. Having had no experience with the African elephant, this so-called double heart might be phenomenal, but I am sure it will be of interest to your correspondent to hear that all Indian elephants have two pointed hearts, very similar to the photograph, but naturally much smaller in size. Evans, who wrote *Elephants and their Diseases*, mentions that certain other mammals, whales and dugong, share this peculiarity.

Of the innumerable post-mortems I have carried out on wild and domesticated elephants in Burma, I have never seen one without this double apex, giving it the appearance of a double heart.

Yours faithfully,

Shwebo, Upper Burma. J. H. W.

A TALL TOMBSTONE
(See letter "Peterson's Tower")

A RARE BUTTERFLY

SIR,—It may interest some entomologist readers that I took, on July 15th last, in the New Forest, a purple hairstreak (*Z. quercus*) var. *Bellus*, a fine newly-emerged female. As South, in *Butterflies of the British Isles*, says: "At least two such varieties have been taken in England," its scarcity is apparent.

Yours faithfully,

Oaklands, ERNEST E. JOHNSON.
Avenue Road, Brockenhurst.

WHEN IS A CAVE NOT A CAVE?
(See letter "Tentacle-like Roots")

PETERSON'S TOWER

SIR,—Peterson's Tower, or Folly, as it is sometimes called, is a veritable landmark for miles around Sway, Hants.

It was built by Judge Peterson, a wealthy retired Indian judge, about 70 years ago to test the quality of a certain type of cement he made locally, and is believed to be one of the first structures of any size to be built in the British Isles with this cement.

The tower is approximately 250ft. high, and has 345 steps. It took about two years to erect.

Judge Peterson is buried beneath the tower, and it is, therefore, sometimes spoken of as the largest or tallest grave-stone in England.

Yours faithfully,

Little Steddings, G. A. MUSGAVIN.
Forest Row,
Sussex.

COCK PHEASANT SITTING

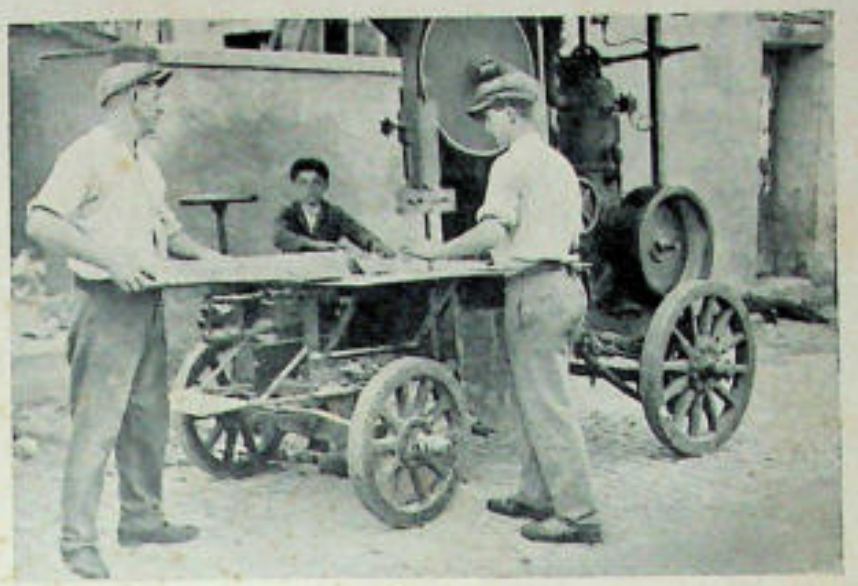
SIR,—I had the same experience here as your correspondent. An old Amherst cock pheasant drove a hen off her nest and sat on the eggs till they all hatched out. Afterwards he "mothered" them for more than a week, just as a hen would have done, till a day of thunderstorms and very heavy rain, when they were drowned. I imagine he left them and took shelter himself.

Soon after he took possession of the nest, a hen pheasant (I cannot be sure it was the same bird) laid her eggs on the very edge of the same nest for several days. The cock bird did not attempt to drive her off, but when the young hatched she deserted her eggs.

Yours faithfully,

Knebworth Hall, MARY KNUTSFORD.
Royston, Herts.

SIR,—Your correspondent from Balnacoil, Brora, who describes the "maternal" instincts of her Lady Amherst cock pheasant, will be interested to hear of a silver cock pheasant of mine who, finding that one of his wives was too flighty to trust, took on a clutch of eight eggs and sat the whole incubation period of 28 days. He would allow none of his hens near him, and was furious if one dared approach. Six hatched out, and he was a most painstaking mother, scratching and calling to his chicks like any old domestic hen. I never once during the month saw him off the nest, so he evidently fed in the early morning, as he was in excellent condition at the end of his voluntary retirement.



I wish I could record a happy ending! Jealousy, possibly at her husband's domestic success, I imagine, brought tragedy. One day, when they were less than a week old, I found them all either dead or so damaged that they had to be destroyed, while the unnatural mother was still chasing a crippled chick. The cock was evidently bored with the whole business, and took no interest in the destruction of the family he had taken such pains to raise.

Yours faithfully,

Farnham, J. D. SCALE.
Surrey.

HARVESTING WITH A WELL MATCHED TEAM

AT WORK WITH A SAW MILL ON WHEELS

(See letter "Summer in Luxembourg")

SCARCITY OF LANDRAIL

SIR,—For the information of nquirers on the above subject I should like to point out the following facts: Some years ago, in many parts of Dorset, landrails bred in considerable numbers. But with the increase in the number of little owls the landrails began to get scarce, until now one seldom hears a cornerake in summer, and very few are seen in the shooting season. The same applies to the nightjar, which was a very common bird in Dorset, but is now hardly ever seen, or heard, in its old haunts. Nightingales also have been reduced from great numbers to being very scarce in some of their greatest strongholds in this county. I have seen, in recent years, numerous remains of all these birds which have been killed by owls either on their nests or near them. Briefly, then, it is certain that any birds which call or sing by night are doomed in a place where little owls are plentiful. On the other hand, in the north of the British Isles, where, fortunately, the little owl is unknown, these things do not occur. And on my estate in Caithness, where landrails have bred for years, there seems to be no diminution in their numbers.

Judging from the extraordinary letters we see in defence of the little owl, there are still large numbers of our countrymen who have no idea of the appalling damage done by the most destructive of all the raptores, the foreign imported little owl. I could fill a book with known and proved cases, and which I have seen myself, of the havoc caused by these pests.

Yours faithfully,

Hyde, C. E. RADCLYFFE.
Wareham.

A NATTERJACK FROM LANCASHIRE
(See letter "A Rare Toad")

ROEBUCK ANTLERS

SIR,—Refering to Mr. G. Rausing's letter to you concerning a roebuck having clean antlers on May 29th in the Stockholm Zoo.

I have stalked and watched roe for several years, both in this country and abroad. From my own observations and from authoritative literature on the subject, there appears to be no doubt concerning the cycle of the shedding and growth of this animal's horns.

The buck will cast its horns any time from October until the end of December; buck have been shot during Christmas week with antlers intact. The new horn begins to grow almost at once, and therefore a buck who has cast early will have his new horns earlier.

I have shot roe in England quite clean, *i.e.*, without any trace of velvet as early as April 12th, at the same time I have seen roe still in velvet as late as the middle of June.

There appears to be a great deal of difference between the times of cleaning, individuals varying in coming clean from towards the end of March until the middle of June.

Climatic conditions and feeding also must affect these times—for example in one year roe seem to clean much earlier than in others, and I believe the same applies also to the casting period.

East Riding, Yours faithfully,
Morpeth. H. STUART TEGNER.

SUMMER IN LUXEMBOURG

SIR,—An easily accessible part of Europe which deserves more recognition from holiday-makers is the Grand Duchy of Luxembourg. In spring the apple trees which border the roads make a fine picture, but the part of the country which has earned the name of "Little Switzerland" is also lovely in summer, when there are shady woodland glens and streams to visit and rocks to climb overlooking the valleys of the Sure and ripening cornfields. I enclose a picture of a quaint harvesting scene and one of a portable saw which goes from house to house to cut up the winter fuel.

Yours faithfully,

London, S.W. A. SKIDMORE.

A RARE TOAD

SIR,—What is probably the largest colony of natterjack toads in Britain breeds in the slacks or damp hollows between the West Lancashire sandhills near Ainsdale (on the bird sanctuary), where this photograph was taken, and some interesting facts have come to light during observations I made this breeding season in conjunction with my friend, Mr. L. G. Payne, F.Z.S., Curator of the London Natural History Society. It appears that our West Lancashire natterjacks commence to spawn much earlier in the spring than do those of Hampshire, and whereas June is the main spawning season in the South, these colourful little running toads begin to breed in West Lancashire early in April or at the end of March. In mid-April the rattling chorus of the toads gathered in the pools is almost deafening—like thousands of nightjars at a distance—but some were still spawning in June. We have often found natterjacks spawning with common toads, and although I have kept these specimens in my vivarium for four years at a time, I have not succeeded in obtaining any hybrids. It was interesting to see how the bulk of the common toads spawn in the water on the heathy land covering the dunes towards Freshfield, and the natterjacks in the more barren slacks on the bare pans of sand at Ainsdale; the common toads seem to require the vegetation to hold their thicker chains of spawn from getting wind-blown, and the natterjacks seem to take a more coleopterous diet. Incidentally, an enormous destruction of natterjack toads takes place at the hands of birds, and possibly voles, and completely disembowelled specimens can be gathered in hundreds in spring. Herons have been known to kill them and one spring a couple of wigeon were watched feeding on them.

Yours faithfully,

47, Woodsorrel Road, ERIC HARDY.
Wavertree, Liverpool, 15.

PUPPY FEEDING

SIR,—I have a cross-bred Border rough-haired terrier bitch. She is a great hunter, killing all the rats and rabbits she can get hold of. She recently had a litter of two puppies. When they were eight weeks old she started bringing back young rabbits to them. About two weeks later, after one pup had been given away, she came in and searched the house for the remaining pup, whining all the time. Having found it she vomited up a part-digested young rabbit, perfectly skinned and ready for eating. She then stood guard while the puppy ate it. She has now done this five times. She always follows the same routine. Great anxiety till she finds the puppy, when she whines to it to follow her. It leaps up in great excitement and rushes after her, licking her mouth. She takes it to a secluded spot out of doors where she thinks they will be undisturbed, and then watches while it eats. We can only suppose she devised this method of bringing the puppy food as she found the rabbits too heavy to carry far. But how she does it is a mystery.

Yours faithfully,

Lymington, Hants. E. LA COSTE.

how time flies

It is nearly twelve years ago since George that incomparable barman introduced Lillet into the Guards' Club adding just a dash of orange bitters to two-thirds Lillet—one-third Gin.

* * *

Since that time the glad news has gone round Piccadilly . . . through Mayfair and out into the wide open spaces where men hunt foxes and hostesses hunt lions. 'Try a Gin and Lillet' has become 'the usual, please' and Lillet now wears laurels round its neck BECAUSE it carries all before it in cocktail competitions.

LILLET

5/6 *a bottle*

Agents:
Twist & Brownings & Hallowes Ltd.,
16 Water Lane, Great Tower Street, London, E.C.3

ADDING INSULT TO INJURY

SIR,—While fishing in Ireland a fortnight ago, my wife, who was fishing for the first time, put a worm on while we were having lunch. I personally propped the rod up in the fork of a stick, ran off about 2yds. of line, and placed a stone on the butt of the rod, taking care that it could not interfere with the reel.

As we were finishing lunch, the rod collapsed and disappeared into the river, which is about 12ft. deep at that point. Shortly afterwards, a trout jumped some 20yds. from the bank, and lay on the surface of the water.

I immediately rowed out, hoping to catch the line, and thereby secure rod and fish; but the trout, a fellow of about 4lb., saw me and dived.

I have not seen any more of him or the rod since, in spite of the fact that the river was dragged very thoroughly for many hours afterwards.

Possibly some of your readers may have had similar experiences. I should be very interested to know of them.

Yours faithfully,

Weybridge, SLACKLINE.
Surrey.

A NATURALIST IN THE CHIN HILLS

SIR,—I am just on my way back to my native country—South Africa—after a most interesting trip in the Chin Hills in Upper Burma.

I had reason to believe, before going on this trip, that such an out-of-the-way place should provide a wonderful field for the activities of a naturalist, and I may say that my anticipations were certainly fulfilled.

My idea was chiefly to make a collection of "ophidia," and I think possibly some of your naturalist readers may be interested in the varieties of snakes which I managed to collect.

The Chins regard all snakes with horror, and I found that I could get very little co-operation from them in my search for specimens.

I treated four villagers for snake bite while I was there—all bitten by *Lachesis gramineus*, which is the commonest snake in those parts. The other snake which seemed to be common up there was *Xenodon*.

Some of the varieties I got are tabulated under:

1. Family *Typhlopidæ*. One specimen found at Taungtek, near the Manipur river. A very rare snake as far as I know.

2. Family *Viperidæ*. Three specimens of *Lachesis gramineus*—the common snake.

3. Sub-family of No. 1 above—*Dipsadinæ*. Two specimens of *Dinodomorphus hexagonotus* (one, length 26in., dorsals 19–19–14; a fine specimen). One specimen of *Pseudodynastes pulverulentus*; only a small one.

4. Sub-family of No. 1—*Elapinæ*. Two specimens of *Callophis macclellandi* (one, length 29½in.).

Yours faithfully,

The Wheeler Club, WILLIAM WHEATSTONE.
Meerut, United Provinces.

A QUEER SEAT

SIR,—I thought the enclosed photograph might interest some of your readers. It shows a chair made with sixteen pairs of antlers from the red deer which roam parts of Exmoor.

I came across this chair outside a house near

THE EXMOOR ARMCHAIR
(See letter "A Queer Seat")

Minehead, and was told by the owner that only three such chairs were ever made.

They were made by the same man, who collected the antlers, and were bolted together to form the chairs.

It is the first time I have ever seen anything else but hat racks made from antlers; but perhaps some of your readers know of other uses to which they have been put.

Yours faithfully,

27, Pragnell Road, J. KING.
S.E. 12.

[It is a little difficult to see the point of such a seat.—ED.]

GUITING WOOD

SIR,—In your issue of June 24th, there is an article by Mr. H. J. Massingham which, after dilating on the beauty of Guiting Wood in the Cotswolds, states that Oxford Dons "having first sold Oxford to be developed as a second Manchester or Wigan, did not hesitate to lay waste Guiting Wood for gain." Anyone who considered the first part of this sentence may have wondered if the second part was more than whirling words, and for those who are interested in Guiting Wood, I may state the facts. There are 385 acres in the wood belonging to the College, of which 22 have been cleared for re-afforestation; the underwood and some of the timber has been cut on a further 20 acres in another part of the wood.

Yours faithfully,

Corpus Christi College, R. W. LIVINGSTONE.
Oxford.

VARIETY OF MARTIN

SIR,—On Thursday morning, July 20th, I saw a completely grey—almost white—martin hawking for flies over a water-cress bed in this neighbourhood. Is not this a very unusual variation?

Yours faithfully,

F. AINSLIE WILLIAMS.

Itchen Abbas House,
Near Winchester, Hants.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, ask your help for a poor woman, aged 67, the widow of a cobbler. Her only son has taken on the debt left at his father's death, but, as he has a family of his own, is unable to give additional assistance to the family purse. There are two daughters; one is lying critically ill in hospital with a rheumatic heart and the other is doing domestic work and trying to keep both her mother and herself. We have a promise of 7/6 weekly for this tragic family on condition that we raise the sum of 5/- a week. Will you make this possible? £13 needed.

IN THE CITY

By OUR CITY EDITOR

PRACTICALLY every branch of British trade is enjoying boom conditions. Never was the country more prosperous. There is more money in the tills of the deposit banks and in the hands of the public than ever before. This is proved by a record note circulation at the Bank of England.

It is true that prosperity is based on lavish expenditure by the Government on rearmament. That is the driving force. It results in record steel production, increasing railway traffics, increasing motor car registrations, and other pointers to industrial prosperity.

Money is available to purchase necessities and luxuries. Unemployment in the country has been very substantially reduced in recent months, with the probability of further contraction as the months go by.

These pointers have been duly noted by investors. There is a diligent search for securities in companies likely to benefit from the present period of prosperity. The brewery trade very naturally derives much benefit from reduced unemployment. Beer production during June was at the highest level for that particular month for several years.

Most reports and dividend statements coming from brewery companies reflect the better conditions. Future reports are likely to show even better results. An important point is that prosperity is likely to continue for several years to come.

There has been a movement towards brewery stocks and shares. Special attention is directed to companies operating in the centres of hectic industrial activity. For instance, Tennant Brothers Limited has its brewery at Sheffield. It is well known that Sheffield trade is particularly active.

Tennant Brothers Limited has a good record. Dividends have been regular, although varying according to conditions operating from time to time. The financial year ends on June 30th. For the last two financial years total dividend has been 12½ per cent. with earnings of over 16 per cent.

An interim of 2½ per cent. has been maintained for the year to last June. A final dividend is expected at the end of this month. The £1 ordinary shares have a market price around 43/-. The shares offer a return of over £5 16s. per cent., but there is possibility of an increased distribution.

Newcastle Breweries £1 units of ordinary stock are being bought around 69/-. Here is a company which has made steady progress since the depression period of 1932. The year ends on October 31st. For the last two financial years the dividend has been 15 per cent., supplemented by a 2½ per cent. cash bonus in 1938.

Naturally, the important Burton breweries must derive considerable benefit from industrial activity because of the widespread character of their trade. Ind Coope & Alsopps £1 ordinary with a price around 92/- are regarded as a sound investment. Total dividend for the year to September, 1938, was 27½ per cent.

There was also a scrip bonus of 20 per cent. Interim on the larger capital has been maintained this year at 7½ per cent. It is, however, possible that the final will be somewhat under the 20 per cent. distributed a year ago. Despite this the security merits investment attention.

I regard Taylor Walker £1 ordinary units as well worth investment consideration. It is a security which I believe to be worth buying and putting away for a time. Dividend for 1938 was 9 per cent., which went against 10 per cent. for each of the preceding three years. The lower distribution was explained by dearer brewing materials.

This brewery has a substantial and growing interest in the County of Essex. This is particularly so in an area which shortly will be developed as a result of the electrification of the railway from Liverpool Street and the opening up of a new tube railway to the area.

The units are now valued around 31/-. They return about £5 16s. per cent. on the reduced dividend of last year. Those prepared to exercise patience may find this security a remunerative investment.

PANDA PHILANDERINGS

Even pandas have to grow up, and Ming, the so-called baby giant panda, at the London Zoo, has practically trebled her weight since her arrival at the end of last year, and her temper in the Children's Zoo is becoming a little uncertain. She has now been given quarters in the Lion House, and from this vantage point she has opportunity to view Tang, the male giant panda. It appears that they have fallen for each other, and in the autumn it is hoped that arrangements for their courting will have been made.

New Books

TWENTIETH CENTURY COBBETT

Turn Left for England. By REGINALD POUND. (Chapman & Hall; 8/6.)

THIS book is apparently due in no small measure to Sinclair Lewis. Mr. Pound says so. Well, I read through the whole book, expecting on every page to find just what it is that Sinclair Lewis did not know. But I do not know now, which is very disappointing.

But the book is anything but disappointing. Mr. Pound set out on a bicycle to make a tour of England. He seems to have been followed by his car, and when the going was not too good he exchanged bicycle for car—and by so doing missed, I think, much that he might have seen. But he saw quite enough. He is a really keen observer with that very rare faculty of imparting the feel as well as the substance of what he has seen to his reader. He describes England green and pleasant, and England horrible and dirty. He hobnobbed with girl-bicyclists and men-bicyclists, with ice-cream vendors and commercial travellers, with A. P. Herbert and Henry Williamson, with monied man and tramp. He puts down what he saw and what he heard in simple compelling language.

He puts down also his conclusions—rather vague conclusions, perhaps, the gropings of a sincere man who is bewildered by the maze of modern life. But conclusions that are most thought-provoking. He sees a new temper rising in England "with possibilities unforeseen for ourselves and the world." He sees a new social order coming in England. He sees the youth of England, of every class except that called "the old school tie" class (and that is a class limited to about two or three schools), waiting for a leader. That temper is not realised by the men who govern us. The possibility of a revolt against the present social system is not realised by the politician or the financier. Mr. Pound is convinced of the existence of that temper, and the new order that will come from it is as certain in his mind.

This serious note—sometimes a bitter note—crops up with unexpected violence every now and again, and is the more forceful since the book as a whole is as leisurely as was Mr. Pound's bicycle tour. "It is," says the blurb, "honest, sincere, fearless, and as uncompromisingly English as its author's name." That is one of the few really truthful statements I have ever read in a blurb. This is a book that should be read by everyone who cares for England: by everyone who thinks of England more than as a place to live in or exist in; by everyone who thinks at all of the future of this country of ours. It is a magnificent book, quiet and leisurely, and friendly—and fierce and defiant. It deserved more than a Book Society's Recommendation.

BRIAN VESEY-FITZGERALD.

* * * *

General Regulations of the Federation Equestre International.

One welcomes the rules of the above very admirable organisation, which have been translated from the French by Captain G. F. Fressanges, the Secretary of the International Horse Show, Olympia.

It should be stated that French is the official language of the F.E.I., which now claims the membership of 31 nations in its muster roll.

The F.E.I. is the official organisation under which all dressage tests and military jumping events are judged in Great Britain and Ireland, and on the Continent.

In view of the impetus which dressage tests have received in England there has been a constant demand for an English version of the rules: fortunately the translation was undertaken by one who is so *au courant* with horse show organisation, and rules, and he has left nothing to be desired in his work. It is a straightforward translation with no ambiguous matter, and it is written in the correct phraseology.

Everyone who intends to compete in dressage tests would be well advised to study these rules carefully, particularly with regard to the smaller details. It will be noted that blinkers and bandages are prohibited and this fact alone has been responsible for many competitors at the International Horse Show, Olympia, having to alter their "tack" at the last moment; such little annoyances invariably upset the morale of the rider before riding into the arena to carry out his test. Plans showing measurements of the arena, the obstacles and their measurements, and the much discussed half-pass (*appuyer*) is carefully demonstrated by diagrams.

It should be noted that any British competitor wishing to take part in equestrian events abroad must obtain the necessary permit from the Institute of the Horse and Pony Club, which is the appointed representative in England of the F.E.I., thanks to the yeoman service of Brigadier-General T. H. Marchant, D.S.O., who was responsible for introducing these rules into England, and thereby providing more competitions for British horsemen to take part in. This book, which is to be obtained for 5/- from the Secretary, the Institute of the Horse and Pony Club, 66, Sloane Street, London, S.W. 1, gives the names and addresses of the representatives of the 31 nations which are affiliated to the F.E.I., under the headings of their respective countries, and the Dressage Committee from which the judges are selected. Here one notes the names of old friends at Olympia in Commandant G. Hector, of France, the enthusiastic founder of this splendid organisation, which has done so much to foster international goodwill and co-operation; General Von Poseck, of Germany, who is as distinguished an authority on dressage as he was as a cavalry leader; and Colonel Quarles Van Ufford, of Holland.

Captain Fressanges is to be congratulated on producing such an invaluable and accurate work.

F. C. HITCHCOCK.

* * * *

Skittie. By ALLEN W. SEABY. *Khyberie in Burma.* By Major C. M. ENRIQUEZ. (A. & C. Black; 5/- each.)

Mr. Seaby has chosen the history and trials of a Shetland pony as the theme of his latest book. From Shetland the scene shifts, with much invention and originality to the South of England, where the story has a happy conclusion. Mr. Seaby's great knowledge of his subject, combined with his admirable illustrations, make an exceedingly attractive book for any child.

Thousands of children read about the pony Khyberie on the Frontier, and now Major Enriquez follows his fortunes to Burma. It is, perhaps, sufficient to say that this book is as attractive as the last, and is illustrated by K. F. Barker.

* * * *

Who's Who in Racing. TOTE INVESTORS, LTD. £1 10s.

This is probably the most comprehensive book of its kind ever published. The main section is devoted to racing personalities of every kind, and the information given is accurate and full. There is also a social section in which details as to membership of the many racing clubs are set out. A description of the more important of the bloodstock breeding establishments in England, Ireland and France is a particularly good feature, and no less useful is the list of stallions and their successes. A table of the results of the principal races for the last twenty years is unusually comprehensive, as it gives placed horses with the owner, trainer, jockey and weight. I can imagine no one interested in racing from any point of view being without this book.

ROBERT COLVILLE.

Sky Roads of the World. By AMY JOHNSON. (W. & R. Chambers; 6/-.)

This is Miss Johnson's first book. She may write others which will be more technical, but certainly they will not prove more interesting to the general reader who "hopes to fly one day."

Sky Roads of the World is by no means a mere encyclopædic history or a book full of statistics. It is something much more personal; it is a record of Miss Johnson's own flights and those of other brave and well-known aviators. It has as its theme the romantic story of the pioneering which conquered the air. In these days, when we are apt to forget all the experience and endurance which led to our splendid modern air routes, it is a pleasant thing to be reminded of the people who blazed the trail for our future comfort. Miss Johnson has made another fine flight. WILLIAM LUSCOMBE.

The Principles of Insect Physiology. By V. B. WIGGLESWORTH, M.A., M.D., F.R.S. Pp. 434, 316 illustrations. (Methuen; 20/-.)

It is not often the pleasure of a reviewer to find that the book placed before him is something really excellent, one that he recognises will become a standard work of reference. The most casual perusal of the present text-book shows that it must be the result of profound knowledge of the subject and the industry of a life-time. Five years ago the author produced a small book, *Insect Physiology*, as one of the companion volumes in Methuen's "Monographs of Biological Subjects"; no doubt it was the nucleus from which the present work was formed. But during those few intervening years it has become evident that there is need for a much more comprehensive volume.

No form of animal life has so many species as are found in the Insecta, consequently experts have had to specialise in certain defined branches of study when dealing with such a vast assemblage of life. In the past this has been almost exclusively confined to morphology and taxonomy, the latter exercising a peculiar attraction for specialists. The physiological study of insects was considered, or rather treated, as a part of morphology, and it is only of recent years that the physiological aspect has been receiving the attention that is its due.

The increasing importance and the successes that have been gained by the biological control of injurious insects has undoubtedly been the reason for the impetus that was given seeking answers to many problems. What are the effects of climatic conditions on insects? What are the laws that govern their sensory stimuli, and what are the most effective chemical agents to bring about their destruction? How do insects feed, are they specific in their habits, and what are the exact details of the extensive interparasitism that obtains among them?

It is obvious that to find the answers to such questions requires a detailed knowledge of the inner working of the insects themselves, and when information was sought on these points it became very evident that the physiological side had been very much neglected. From that time much progress has been made by many workers in several countries and papers published in different languages in the various technical journals and transactions of learned bodies. To keep track of these scattered publications is quite a feat in itself and has imposed a burden on the scientist who must remain conversant with the researches of his colleagues abroad. The previous book by Dr. Wigglesworth necessitated the study of some 2,000 such publications, of which he quotes nearly 300, but in his new work he himself gives well over 2,000 references!

Present-day advances in experimental technique have rendered much of the older physiological work useless, and Dr. Wigglesworth has now given us a perfect text-book, the only one of its kind, for use in a branch of study that will continue to assume greater importance. The layout of the text is admirable, illustrations are given whenever called for, and although they are said to number 316, actually many times this number appears in the book; one figure alone contains some thirteen drawings. References are at the end of each chapter, they are truly numerous and include a definition of the material dealt with in the work to which reference is made; it is one of those small details that makes a reference book so much more valuable.

This new work may be considered as completing the entomologist's reference library and is the indispensable companion to Methuen's *General Textbook of Entomology* (by Imms), which has now run into its fourth edition; I foresee a similar demand for this new and most important work.

* * * *

The World of Insects. By DUNCAN and PICKWELL. Pp. 409, Figs. 194. (McGraw-Hill; 21/-.)

There are three kinds of books about insects, the very technical kind which seem to be quite unintelligible to ordinary mortals, then there are those that are printed privately which are usually concerned with the author's own collection of specimens and are seldom worth while reading, and finally we have the books written popularly for the general public.

These popular books were much of a muchness. Before the War they were published at intervals that could almost be timed, yet, with such a vast amount of material to draw upon, the plan followed by each book remained so similar that an attentive reader could assure himself of finding the usual pet items. The monotonous treatment palled after reading only a few authors.

To-day things have changed considerably. In the popular field we find that fewer books are published—perhaps just as well—and those that do see the light of day are now normally concerned with a rather more specialised subject. However, *The World of Insects* is a book based somewhat on the old lines: to write an introduction to entomology as a whole necessarily requires covering much of the usual ground, and so it could well fall under the heading of a re-write of an older book. This the authors have been able to avoid.

Both the authors are expert entomologists and they have not refrained from bringing their specialised knowledge into the book, the structure of insects, using Orthoptera as example, is explained and illustrated in great detail. In fact the physiological and morphological descriptions are treated at length and technical terms have not been omitted, but when they are first mentioned they are so lucidly described that the general reader is never left at a loss. The first terminological definition always appears in italics, it makes for easy reference and follows the modern practice of well-edited literature.

This book is one that will lead its reader more deeply into entomology, but nevertheless there is little fear that one will soon "outgrow" the book, as happens with so many popular works, for the detailed contents will remain a useful guide to the majority of us.

The final chapters deal with advice on collecting, rearing and observing insects and setting specimens for the cabinet, here the tyro will find illustrations to help him at every step. I was rather surprised to see that dipterous and hymenopterous insects were not set with wings extended.

The book is printed on art paper and bound in the usual excellent binding associated with McGraw-Hill. Illustrations are in line and photographic, a feature of them is the length of the captions and sub-captions, which are quite excellent reading in themselves.

E. F. LISSSEX.

BOOKS IN BRIEF

"One man in his time plays many parts," and R. HENDERSON-BLAND has done so on the stage and in his life. His experiences are recounted in *Actor—Soldier—Poet* (Heath Cranton; 12/6), and very remarkable they are. He took the part of Christus in the film "From the Manger to the Cross," visiting the Holy Land for the scenes, and this was evidently the most emotional event in his life; yes, even compared with the part he played in the Gloucestershire Regiment during the Great War, with its visions of Thiepval, Beaumont Hamel, Paschendaele and that epic retirement of the Fifth Army in 1918. What a contrast to days of theatrical ambition and memories of Sir Herbert Beerbohm Tree (wounded by the author in a fencing demonstration), Sir Henry Irving, Mrs. Langtry, Mrs. Brown Potter, Sir George Alexander and Lewis Waller! "A Sheaf of Poems" marks "Phase 4" of the volume, and in it are verses which re-echo truths, notably those addressed to Georg Brandes.

NEW USES FOR FARM PRODUCTS

The Avoidance of Waste in North America

VIEWED from a detached angle, modern life seems a confused patchwork of riches and poverty, abundance and scarcity, over-production and mal-distribution. However, in this vortex of human activity, aimless though much of it may seem, some developing trends are becoming visible to the keen observer. One is that the horizon of human knowledge is rapidly widening, as science marches on. Another is the increasing dependence of mankind on science in its various phases. Science has provided, for the agriculturist, new and better varieties of plants and animals, has produced fertilisers for our depleted soils, and poisons to check the ravages of insect enemies, has invented new ways of processing and preserving our staple foods.

Now we demand of our scientists a further service—to find new uses for the surplus food products and attendant farm-wastes which the world's markets seem temporarily unable to absorb. Agriculture and industry are interlocking to a rapidly increasing extent, and their dependence on one another is becoming very marked. We have already embarked upon an era when much of the raw material used in our complex industrial systems is to come from the farms.

In North America farming has hitherto been marked by extravagance and waste, largely because of the lack of demand for much of the stuff produced. "Get-rich-quick" methods have too often been in evidence. The early pioneers of Ontario burned down invaluable hardwood trees for the sake of the potash which they leached from the ashes, and because this method of clearing land for farming was quick and cheap. Even now considerable timber, valuable as fuel if not for lumber, is burned merely because it is in the way. Forests generally have receded steadily before the plough; too much so, in fact, for the good of many districts, now barren for lack of the moisture which the trees helped to bring and to conserve. Wide-scale grain farming has looked upon straw, and even manure, as useless waste, only to be burned.

But better methods are now gradually superseding these. Wiser planning will recognise in straw a valuable by-product, to be utilised in industry. The millions of tons consumed yearly by fire would afford a splendid source of wallboard and paper, and would thus conserve the timber supply. Cellulose is in great demand to-day, and research points to straw as a rich source. Already a beginning has been made in the direction of utilising straw for these purposes. Flax straw in particular would make excellent paper, but practically no use is made of flax straw so far in the West, though in Eastern Canada the fibre content of the plant is regarded as the most valuable part.

Corn cobs and oat hulls, once discarded as worthless, are being utilised in the manufacture of furfural, of which millions of pounds are now made yearly at a low cost. Furfural is a light-coloured liquid with a specific gravity slightly higher than water. In combination with carbolic acid it produces a synthetic resin which has a multitude of uses as a substitute for hard rubber. Acetone, a valuable solvent, has also been produced from similar material, and is useful in the manufacture of chloroform, ether and explosives.

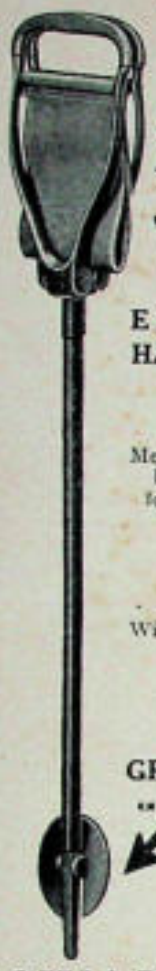
Another method, produced in State Experiment Stations, of utilising corn waste (stalks and cobs), is to produce a gas for household requirements of cooking and lighting. The generator for the gas can be cheaply made of concrete on the farm, and will supply the house with 100 cubic feet of gas daily at a small initial cost. The scheme requires the addition of domestic wastes as well as the corn stalks, and employs the natural process of fermentation, so that it may prove a boon to districts in the corn belt away from electric power.

On the Western prairies a certain amount of diversified farming is now being carried on, the principal object of which is to sell cream for butter to central dairies or "creameries." Consequently an important by-product of this region is skim milk, now mostly fed to calves and pigs. It is estimated, however, that the feeding of this skim-milk is not particularly profitable, and considerable research work has been carried on to find better industrial uses to bring larger returns. Quantities of an excellent waterproof glue used for aeroplanes and similar constructions are now made from the casein part of milk. The paper trade prefers size made from casein, much of which is now imported from South America. A textile fibre from casein, similar to rayon, and first produced in Italy, has possibly a bright future. Lactose (milk sugar) is estimated to be at present the largest waste in the dairy industry, and though part of it is now consumed by the brewers, and a smaller part used in medicine, it can be utilised in larger quantities as a cattle feed, or incorporated into foods for humans.

A comparative newcomer to North America, but rapidly gaining in popularity, is the Asiatic soy-bean, long grown in Manchuria, and there used widely as food and feed. Its peculiarity as a legume is its remarkable oil content, and this oil promises well in industry, for it is now extensively used in soap-making, while, when refined, it can be employed in salads and in butter substitutes. The meal is valuable as a cattle-feed, and also in the manufacture of plastics, while a breakfast food is also made from it. Scientific research during the past three years has established nearly 50 industrial and other uses from this remarkable plant.

One of the main crops in the Middle West, inherited from older civilisations, has always been Indian corn. While about 90 per cent. of the corn produced is fed directly to all kinds of livestock, there still remains a considerable quantity which passes through many complicated processes. Corn starch has long been sold over grocery counters, and corn syrup, familiar as a staple food, has recently jumped into fame as an infant food since the advent of the Callander quintuplets. Dextrin, or British gum from the roasted starch, has many uses in textile and other industries, while an oil is extracted from corn which is being absorbed into the manufacture of soap and also aids in the production of artificial rubber.

It has often been suggested that a motor fuel for use in farm machinery could profitably be made from surplus grains and potatoes. Accordingly, considerable research work has been done along this line, to determine the cost and efficiency of this alcohol. So far the beneficial results from this line of effort have been small. Though a mixture of alcohol with petrol makes for smoother engine operation, and tends to prevent the formation of carbon, there appears to be a tendency towards harder starting, while the solvent action of alcohol is a detriment to the cork floats of carburettors. The mixture, too, slightly increases the cost of operation.



A TYPICAL FOREST IN NORTHERN ONTARIO, SHOWING A STEEL TOWER USED FOR OBSERVATION PURPOSES IN CONNECTION WITH THE AVOIDANCE OF FOREST FIRES

In the drying of apples for shipment and in crushing them for cider there was at one time, considerable waste material (apple pomace), which at best, made a second-rate feed for cattle and pigs. Scientific investigation has aided here, in the development of pectin a natural substance which has a colloidal or "jelling" effect on many fruit juices. Pectin can now be obtained at all groceries in bottles for home jelly-making, while it is also employed extensively in factories where jams and jellies are prepared on a large scale. It has even been used in the rubber trade to "set" the rubber milk or latex.

The general trend of these experiments, now being carried on in most great modern States, is, by constant and patient research, to find new markets for materials produced on the farm. Much of this work is necessarily in the "blind-alley" class, for what may at first appear to be a profitable line of endeavour may turn out to be comparatively worthless. On the other hand, scientific research should, in the long run, contribute to the increased comfort and convenience of humanity in general. In the meantime, every movement which tends to co-ordinate different branches of human activity deserves encouragement. Surpluses of food will eventually be absorbed, and at some time in the future large-scale waste will be regarded as a sin against the community. Hence it is of the utmost importance that Science and Agriculture should march side by side towards the great task of efficiently supplying, with the minimum of effort and waste, the needs of humanity.

GET THE BEST RESULTS FROM YOUR SNAPSHOTS THIS EASY WAY

On the back of the already addressed tag you just tick off your developing and printing instructions. Nothing could be simpler—no packing, no wrapping, no writing. When the finished prints are sent you receive a fresh envelope for the next spool, and, in addition, a reply paid postcard for the easy ordering of new films. So no matter where you live or spend your holiday you get London service.

We have long been famous for the quality of our developing and printing. Our thousands of regular postal customers increase each year—this is what one of them says: "The films returned were beautifully done, and I shall send all my films to you in future." And another: "The quality of the work posted is far in advance of any other firm I have dealt with."

All films, whether miniature or not, have the care and attention of experts only. The best costs no more.

HEALTHIER MOTORING

Enjoy health-giving fresh air by motoring in Tickford Coachwork. The pleasure of touring is doubled. The Tickford Drop-Head Coupes and Four-Door Cabriolets are built up in electrically welded steel framework, giving lightness and great strength, and the ease with which these are opened and closed is not found in any other Coachwork of this type. The hoods are fully lined as in a Saloon, no framework being visible. Tickford Bodies are the result of over 20 years' specialisation in Open-Closed Coachwork in which are incorporated patents giving the maximum ease of opening and closing, with complete protection from wind and rain in rough weather. No other Coachwork of this type can give you the same advantages. Thousands are in daily use giving absolute satisfaction. Tickford Coachwork is included in the Models of the Armstrong-Siddeley, Daimler, M.G., and Rover Cars. Descriptive specification with pleasure from the Patentees:

PORTABLE ELECTRICAL STERILISER, HOLDING HALF-A-TON

The Country House

SOIL PASTEURISATION

By R. QUARENDON, Ph.D., B.Sc.

GARDENERS are realising to an increasing extent the need for soil which is clean as well as being in good physical condition and supplied with suitable plant foods. All soils contain pests and disease organisms in a greater or less degree, and their removal cannot fail to benefit in a striking manner the health and vigour of the plant.

Pasteurisation of the soil improves germination of seeds, reduces loss of seedlings, strengthens root growth, produces earlier and finer fruit and flowers in greater abundance, while weeding is almost eliminated.

There are two general methods of soil sterilisation, firstly by heating, and secondly by means of chemicals. The former is the most satisfactory, and is the one most generally employed.

For the pasteurisation of glasshouse soil on a large scale, there is little doubt that steaming is still the best and cheapest way. It consists of blowing in steam from a boiler at 70–80lb. per square inch pressure, and thus raising the temperature to a point where no organisms can survive.

Steaming can be carried out either by the tray or the "grid" system. When the disease organisms are near the surface, the former method suffices, but when the trouble is deep seated, as, for example, with eelworm, the latter method must be used to secure proper penetration. If thoroughly carried out, steaming need not be repeated for three or four years, but it pays to do the job thoroughly. Careless steaming may leave local untreated areas which soon become sources of re-infection.

In the tray method, a 1in. diameter iron pipe, drilled with holes along its length, is laid in a shallow trench along the soil, and is covered with a tray 9in. deep, made of match-boarding and lined with zinc. Steam is blown in until the temperature of the soil reaches 200–212° F., as judged by a thermometer pushed 10in. into the soil. It should continue for another 30 minutes for normal soils and longer for very heavy soils. The soil to be pasteurised must be moderately dry and must be dug one spit deep before steaming.

The general principles of the grid system are the same, but the iron pipe is arranged in the form of a comb some 8ft. to 10ft. long, having side-takes about 2ft. long pierced by holes some 3in. apart. This grid is placed in a trench about 18in. deep. The soil to be pasteurised is placed on top and the whole covered with a tarpaulin. Steam should be passed for 15 to 20 minutes.

Steaming by the tray method costs roughly £80 to £180 per acre, according to the thoroughness with which it is carried out, while the grid method also costs about £180 per acre.

For sterilising smaller quantities of soil, boxes holding about one ton can be constructed quite simply. A type which has been used with success is built up from 1in. deal boards provided with a thin steel lining bolted on. The steam pipe is laid beneath a false bottom.

Another cheaply constructed steamer has a concrete bed with channels in which the pipes are laid. It is surrounded by a brick wall 18–20in. high on three sides, the fourth being closed by a steel door with handles which can be taken away to facilitate the removal of the soil. When pasteurisation is carried out in boxes of this type, it is convenient to arrange them at somewhat above the level of the cart or barrow which receives the soil.

In all these cases, while the pasteuriser itself is comparatively cheap, it is the boiler which is the expensive item. A new one may cost from £250 to £450. There is a portable type of pasteuriser mounted on wheels, holding a ton of soil in which the steam is both raised and used, which costs £140.

For really small-scale operation, there are several units mounted on wheels which are capable of handling a hundredweight or two of soil. In these, water is boiled in an iron vessel, which is provided with a perforated false bottom on which the soil rests. A steriliser operated on similar lines could easily be constructed at home from a domestic gas-fired wash boiler at a minimum of expense.

Owing to the high cost of boilers, electrical pasteurisers have gained a considerable following during the last year or two, and with the steady cheapening of electrical energy their popularity will undoubtedly increase.

They have the advantage of relatively low labour costs, because close supervision is not necessary. Heating is more under control and is therefore more uniform. A fine crumb is produced, excellent for potting, and in some as yet unexplained way the electricity seems to have a beneficial effect on the soil. Moreover, it is not necessary to store the soil for three weeks before use, as is necessary with steamed soil.

Electrical pasteurisers consist of boxes of hard rubber or asbestos cement enclosed in an earthed metal case and provided with adjustable pole plates between which the electricity passes. The current warms the soil and automatically falls when the correct temperature is reached, thus overheating is almost impossible.

The soil is moistened outside the pasteuriser, and then tamped well down in the box. Good contact with the pole plates is important and can be assisted by adding more water to the soil near them. Different soils require different amounts of water to give the best results, but experience soon shows how much should be added.

A variety of sizes and types are available, from the smallest holding a mere 50lb., costing 75/- to the really big one holding 30 cwt., for the commercial grower, costing about £75. Convenient wheel-barrow types of 1 cwt. and 2½ cwt. capacity have been introduced by means of which the pasteuriser can be moved from place to place. A skip type specially suited to mushroom growers is also available, also a tomato house steriliser, while sterilisers built to special requirements can also be obtained.

All these pasteurisers have interlocking safety devices which make it impossible for the current to be switched on until the pasteuriser is closed. They run on A.C. or D.C. and consume from 1 to 1½ units per cubic foot of soil, or 3–4 units per hundredweight. Heating takes about an hour in the smaller size with a maximum current of 5 amps., and up to two-and-a-half hours in the larger ones at up to 60 amps.

When pasteurising composts, one or two precautions are necessary to get the best results. The soil should be heated separately from the sand, chalk, fertilisers or peat moss or other constituents, and mixed afterwards. Another important point is that pasteurisation increases the available nitrogen in the soil and to restore the fertiliser balance it is advisable to add 1½oz. of superphosphate per bushel of compost.

HORTICULTURAL ADVICE

Garden Guide and Holidays

By CARTHEW ALLERDYCE

EVEN gardeners have holidays, though I must admit that some people say they do not deserve them. I have a friend who always pulls my leg and says that my life is just one long holiday, out in the open air, doing a little hoeing, some occasional pruning, and so on! But a gardener needs change just as much as anyone else, and so here I am on holiday, hundreds of miles away from my own home town. I always enjoy the change as much as anything else. I cannot stop thinking gardening, and I get a lot of pleasure from wandering round other people's gardens and seeing what they are doing.

I have taken three gardening books away with me so as to improve my mind. They are three that have been recently sent to me as presents. The first one is called *The Garden Guide*, and is one of a new series of booklets issued by Messrs. Plant Protection Limited, of Yalding, Kent, for the guidance of the amateur gardener. It consists of 96 pages, and contains a number of excellent photographic illustrations.

As you might expect, the insecticides, fungicides, weed-killers and lawn preparations advised are those marketed by Plant Protection and manufactured by I.C.I., but this does not detract from the value of the book as a whole. For instance, I shall find most useful pages 90 and 91, on which appears a table of times to take cuttings.

The advice given on the soil and its cultivation is very sensible. I should have mentioned other things as well as Abol Hop Manure for digging into soils containing little or no humus, for, of course, one could use horticultural moss-peat, well rotted vegetable refuse, finely divided wool shoddy, and so on.

In the same way there are other garden fertilisers that one could use other than I.C.I., but the I.C.I. artificials are provided already mixed and they are convenient for they are supplied in granular form.

Anyway, the book gave me a great deal of pleasure, and *Field* readers who would like to have a copy should write to Messrs. Plant Protection, Ltd., of Yalding, Kent.

The next book I have with me is the Annual Report of the East Malling Research Station. This gives full information of the latest experiments carried out with various fruits. It is wonderful what is being done with fruit trees these days—feeding them through their trunks instead of through their roots, and so on. Some of it is a bit too deep for me, but on the whole I am enjoying it!

The third book is one on Lilies, by D. T. Macfie, price 5/–, the publishers being W. H. and L. Collingridge. It is obvious that Mr. Macfie has made a special study of the lily family, and I am interested to find that he is able to state quite clearly that the majority of the members of that family will succeed in any ordinary garden, given common-sense treatment.

He is obviously a practical man, for he gives certain advice which may cause the "Elder Brethren" to lift their eyebrows. Mr. Macfie does not mince his words. In Chapter 4, for instance, concerning soils, he says, "A great deal has been written about the soil in which lilies will grow, but it must be admitted that a great deal of it can be dismissed as *exaggerated nonsense*." He goes on to say, "Let us consider first the natural habitats of the plants and it will at once be seen how *utterly ridiculous* such suggestions are." (The italics are mine!)

I must say I like a man who calls a spade a spade. This chapter, therefore, gives practical details concerning lilies and soils, which all gardeners would do well to study. I think it was this chapter that I enjoyed most of all, and the chapter that precedes it, called "Where lilies will succeed." They make good reading, both of them. The chapters that follow on, "The Best Garden Lilies," with descriptions and details of them, are very helpful, but are not the sort of matter to peruse in detail on holiday!

I am very fond of lists, and so Chapter 9 fascinated me, for it contains nothing but tabulated information as to lilies that tolerate lime, lilies for the sunny situation, lilies for the waterside, lilies for the greenhouse, &c.

By the way, it is well worth while joining the Research Station—you can become a Founder, a Fellow or an Associate. I shall be happy to send further particulars.

I regret that in my article on July 29th I priced the Auto-Culto Junior, the mechanical cultivator manufactured by Messrs. Allen & Simmonds Ltd., at £36. This should have read £45.

SKILLED ADVICE BY

Archie Compston

KEEP THE ACTION MOVING

A marked difference between the "rabbit" and the "tiger" is that the latter keeps the action moving, not only through the ball but to the finish of the shot, whereas in the case of the "dub" there is often a complete collapse at the ball; compare the finish of the two movements.

Preserve your Drive from Wear & Weather

With COLDCOAT such preservation is simple and, whilst ensuring a neat and clean appearance all the year round, will save the inconvenience and expense of constant maintenance. COLDCOAT waterproofs and securely binds gravel, stone, ash and clinker surfaces, so that they resist the effects of weather and traffic whilst preserving a natural appearance. No skill or special apparatus is necessary to apply COLDCOAT.

"THE MODERN METHOD OF DRIVE & PATH MAINTENANCE"

is the title of an interesting booklet on the subject. May we send you a free copy? Ask for publication K154.

AUGUST IN THE KITCHEN GARDEN

Important Crops in a Slack Month

By ELEANOUR SINCLAIR ROHDE

ALTHOUGH a slack month in some respects there are important crops to be harvested this month and nearly all the vegetables to stand the winter, notably Lettuces, Brussels Sprouts and Cauliflowers should be sown during the next few weeks.

Onions and Potatoes are the chief crops to be harvested. In large gardens Onions are usually left on the soil to dry with their roots turned towards the south. But they dry better on a gravel or cinder path, and if grown on a small scale this can be done. If grown on a very small scale they can be dried to perfection spread out on netting lifted well above the ground. It is essential to store Onions in a dry cool place. If they are exposed to damp they start into growth, and then there is the trouble of topping and tailing them before storing again. It is better to store in net bags than in boxes. In any case they should be looked over occasionally as a few decayed bulbs soon affect the others.

Onions are no sooner lifted than it is time to sow again. Even in small gardens where Onions are not commonly grown it is always worth sowing a few rows to stand the winter. All through winter the thinnings are an invaluable addition to the salad bowl.

Further, autumn sown Onions usually make better plants than those raised under glass in early spring and they are seldom attacked by the Onion fly. Also they ripen during what are usually the sunniest weeks of the summer and not too late.

The preparation of an Onion bed for a first rate crop should also be done as early in autumn as possible, trenching the ground 3ft. deep, breaking up the subsoil and incorporating well-rotted manure and enriching the top spit with liberal supplies of mortar rubble, wood ash, leaf mould, old potting soil, &c. The ideal is a rich but porous subsoil into which the roots can penetrate easily and a very firm but finely pulverised surface soil.

Potatoes should be lifted when the haulms have almost died down. Those offered for sale have frequently been lifted before they are fully mature and consequently their flavour is poor. The simplest method of testing whether a Potato is fully ripe is to scratch the skin with a finger nail, and if the skin can be rubbed off the Potato is not ripe. It is an odd fact that whereas few people will eat unripe fruits the majority of folk are indifferent as to whether vegetables such as Potatoes, Tomatoes, Vegetable Marrows, &c., are ripe or not. Yet immature vegetables are as unwholesome as immature fruits.

Lettuces to stand the winter, if to be sown in the open, should be a very hardy kind such as Stansted Park, the old Bath Cos, or All the Year Round. In warm parts the end of August is usually the best time to sow, but in cold parts seed should be sown early in the month. The ideal, a sandy soil on a sheltered sunny border. In parts that are too cold or on soils that are too heavy it is always worth sowing in a cold frame early in September to provide seedlings to plant out in March. They come in at a time when lettuces are expensive and usually only imported stuff is available in the shops. Sow thinly, and even through the winter the soil along the rows should be carefully stirred with a handfork. If the soil is left caked the plants suffer even more than if left neglected in summer. In mild parts some of the plants are ready by late autumn, and therefore it is advisable to make a further sowing early in September.

Silver or Sea-kale Beet is far less commonly grown than it deserves. All through the last severe winter we were gathering ours, and though the mid-ribs were not as large and tender as in summer (when they are quite 4in. broad) they were very good. This vegetable is grown chiefly for the sake of these mid-ribs which should be cooked like Sea-kale. The green part of the leaf can be cooked like Spinach and is decidedly less acid.

Unlike the common Beet, Sea-kale Beet does best on a heavy soil and can do with any amount of manure. It is always worth giving the plants the protection of a few leafless boughs through the winter to keep the leaves from being touched by frost. This Beet sown now affords pickings right up to the middle of June.

All vacant ground should be planted up as soon as possible with Greens or Leeks. Most Brussels Sprouts and brassica of the Broccoli and Borecole tribes planted out in July, notably Collards, can be put out now. Leeks are invaluable, for they take the minimum of space and are hardy in the bleakest parts. Grown on exhibition lines, *i.e.*, in trenches and earthed up, Leeks involve considerable labour and take up a good deal of space. But those dropped into holes made with a dibber make quite good enough plants for all practical purposes, and lines of them can be fitted in, in very limited space. As soon as the tops of the leaves bend over they should be cut back to half their length, otherwise the strength of the plants goes into the leaves instead of the roots.

ESTATE COMPANIES

IS the old order passing? On every side we hear of the break-up of the large estates, of the formation of landowning companies, of dictators. It is disturbing, but then disturbing things have a habit of occupying prominent positions in newspapers, and of coming readily to the tongue of the speaker who would make an impression. But still democracy continues in this country at least, and no one speaks of the people who are buying land, adding to their holdings and gradually rebuilding large estates. Not perhaps of the same land, but new landed estates are being formed by the well-to-do business man.

History is merely repeating itself. The merchant princes of a bygone age moved into the countryside and replaced the impoverished aristocracy. After a time they were accepted by countryfolk, and founded the great families, some of whom are now impoverished by taxation. A fresh leavening of business is again returning to the countryside the capital that it needs, and the process goes on. We call it evolution. Repetition would be a more apt word.

Advocates of progress say that landownership is a business calling for up-to-date methods, and instance estate companies which involve periodic board meetings, recording of transactions by minutes, and strict form of balance-sheet and profit and loss account. All this contrasts strangely with the customary haphazard methods which exist on most estates, methods which have nevertheless proved their worth and fit in better with the rural scene.

The truth of this statement will be admitted by any business man who has sought to apply the methods of his office to his estate. Shortage of capital is one of the major difficulties of many landowners, and the limited liability which can be attached to an estate company enables outside investment capital to be attracted. If this is not desired it is cheaper to dispense with the limit of liability, which is not in any case intended to enable the evasion of just debts.

Another advantage is that by distributing the shares among his family, an owner can reduce his own liability to surtax. Reduction of death duties is claimed, but this involves transferring most of the shares to the heir three years before death, which can equally be achieved by transfer without the machinery of an estate company. A disadvantage is that while death duties on real property can be spread over eight years, the shares and debentures of a company rank as personal property. Duties on personal property must be paid within six months of death.

The position with regard to the various maintenance, farm loss and other claims is not altered, but in the case of the woodlands loss claim one of the principal advantages of claiming assessment under schedule D is lost.

If it is considered that the advantages outweigh the drawbacks, the landowner will become the governing director, his eldest son and other members of his family directors and the agent will be the secretary. The first step when forming a company is to prepare a statement showing the financial position of the estate, both as to capital, income and expenditure based on the experience of the past three years.

A formal valuation will be required, together with a deed, which for an unlimited company bears a stamp of £50, or for a limited company a duty of 1 per cent. on the share capital, in order to transfer the assets to the company. A way of avoiding the large stamp duty is to allow the transfer to rest upon an agreement for sale instead of a deed of conveyance. This is quite satisfactory.

The memorandum and articles of association are drawn to suit the circumstances of each estate, and all the other paraphernalia, including sending full particulars to Somerset House, and not forgetting to decide upon a registered office.

It is all very formal and businesslike, and rather out of tune with country life, but once the step is taken the actual dealings with the tenants remain a matter between agent and tenant as before. The great difference is that the agent refers matters to the directors, and decisions are recorded in the minutes. The estate accounts and records have to be kept in a more strict manner, and there is the annual statement of accounts to prepare, and severe penalties if it is inaccurate.

Experience is that estate companies are not being formed to any great extent. The formalities are scarcely essential for efficient estate management, and when not essential they become doubly irksome. The drawbacks are serious and largely offset the advantages. No, we shall not live to see an England composed of estate companies, any more than we shall see nationalisation of land, or our politicians in coloured shirts.

REGINALD DAVEY.

TRAVEL BY LAND, SEA AND AIR

A VERY UP-TO-DATE COACHWORK ON A 4½-LITRE BENTLEY. THE HEAD OF THIS DROPHEAD COUPÉ, DESIGNED BY JACK BARCLAY, IS COMPLETELY HIDDEN WHEN CLOSED

MY IMPRESSIONS OF THE AUSTIN 10

A Fine Car and a Great Improvement On Past Models

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

I HAVE for several years regarded the 10 h.p. Austin as one of the virtual leaders of its class, and my opinion still remains unchanged now that I have had an opportunity of thoroughly testing the latest production from the works at Longbridge.

Austin cars have always been noted for their unfailing reliability, which reputation they have justly earned over a long period of years. In 1934 I bought a new 10 h.p. Austin for my head mechanic, who has now been in my employ for close on nineteen years. That car is still in his possession, and he tells me he has covered over 60,000 miles to date. It has never let him down during that period in any way, and it was only after the car had covered 45,000 miles that he found it necessary to fit new pistons and rings. To-day the little car is running even better than it did after it was run in.

I have owned several Austin Tens myself, but the latest creation gives one the impression that the car is at least a Twelve, if not more—it runs and handles so well, and there is much more body space than before. The dimensions of the engine are exactly the same as they have always been since the model was first introduced seven years ago, although the brake horse-power has been considerably increased during this period. The motor has four cylinders with a bore of 63.5 mm. and a stroke of 89 mm., the capacity being 1.125 c.c.; the R.A.C. rating is 9.96 h.p. and the annual tax £7 10s. The engine, however, now gives off 32 b.h.p. at 4,000 r.p.m., and consequently there is an abundance of power which greatly improves the general performance of the car.

The valves are still side by side, and barrel-type tappets are employed, which have quietening ramps on the camshaft for silence. The cylinder head is of aluminium alloy and the carburetter a Zenith downdraught; the petrol tank, which is fitted to the rear of the chassis, contains six gallons, and the fuel is fed to the carburetter by means of an A.C. pump. The sparking plugs are 14 mm., and the advance and retard are automatically controlled by a vacuum device.

The clutch is a Borg & Beck, and the gearbox, which is in unit with the engine, has four forward speeds, the ratios being as follows: Top 5.3 to 1, third 8.23 to 1, second 13.08 to 1 and bottom 21.6 to 1. All but the low speed has synchromesh engagement. The suspension is carried out on orthodox lines by long semi-elliptic springs; the shock absorbers are hydraulic and of the double acting piston type, the ones in the front being set transversely, thus acting as an anti-roll device.

Girling brakes are employed and the drums themselves are 9in. in diameter—both foot and hand lever operate on all four wheels, the latter being conveniently situated between the two front seats. The chassis and floor is now a complete welded unit—this type of construction being light, extremely rigid, and strong, and as the body is bolted to the frame at various points it forms a box section. The interior dimensions of the coachwork have been considerably increased and there is ample room for four large adults, both front and rear seats being extremely comfortable. The doors are wider than one would expect with a car of this size, and the luggage compartment at the rear is also of generous dimensions.

The instruments are grouped neatly in two large dials, the one containing the ammeter, petrol and oil gauges, whilst the other is the speedometer. There is also an electric clock and a large glove locker on the near side of the facia board. The electrical equipment is a 12-volt and the battery is placed underneath the bonnet, being easily accessible. The equipment also includes a special jack which operates from the bumper brackets, dual electric windscreen wipers, safety glass to all windows, and automatic return direction indicators which are operated by a small lever mounted on top of the steering wheel. The dimensions of the chassis are as follows: Wheelbase 7ft. 9¾in., track 4ft., and the overall length of the complete car is 13ft. 1¾in.

The road performance of the new Austin Ten is truly remarkable. Its maximum speed, which is in the region of 70 m.p.h., is noteworthy for a car of this type and size, and on third gear a speed of 40 m.p.h. can be exceeded. The car is most comfortable to ride in from every point of view, as the seating has been so well arranged—the forward visibility is excellent, and the suspension is extremely good. The point which, however, pleased me most when driving this car was its remarkable stability on corners and its general roadworthiness. The driver cannot but feel completely at his ease, for the car gives one the feeling of solidity and safety.

The engine is full of life, and, although its maximum speed is about 70 m.p.h., it can carry on for mile after mile on the level at 60 m.p.h. without any apparent effort whatever, and it could certainly cruise along at 50 all day under similar conditions. This new model is at least 8 m.p.h. faster than the one I owned eighteen months ago, has more body space, and even better brakes—although possibly the transmission is not quite as quiet running when travelling on full throttle.

I frankly admit that I formed a very good opinion indeed of this latest product; it is really remarkable how greatly the performance has been improved during the past few years considering the size of the engine remains unchanged and that the body space and length of the chassis has been increased.

The price of this car complete, with full equipment and four-door fixed head saloon, is £175 or, with sliding roof, £185. There is also an open four-seater body available at £175.

The small car of to-day is certainly a masterpiece, and it is most gratifying to remember that Great Britain is supreme the world over in this particular market.

"AUSTIN CARS HAVE ALWAYS BEEN NOTED FOR THEIR UNFAILING RELIABILITY"

£80,000 HOLIDAY MONEY FOR MORRIS WORKERS.—Over £23,000 was paid out in holiday money to employees in the Morris Motors, Ltd., factory at Cowley on July 31st. The directors have decided to continue the arrangement which operated so successfully last year, whereby those employees with over five years' service receive two weeks' holiday with pay, and those with over one and under five years' service receive one week's holiday with pay. In addition, those workers who have not yet completed one year's service by the time the workers' annual holiday is declared, also receive holiday money under the scheme. The total sum which will be paid out to employees in the Morris group of companies for holidays with pay exceeds £80,000.

ROADSIDE SERVICE

Can It Be Improved?

THE NEW L.M.S. RAILWAY BOAT, PRINCESS VICTORIA, APPROACHING THE PIER AT STRANRAER

BY roadside service I mean the service we enjoy when we call casually somewhere out in the country or on the outskirts of a city for petrol, oil, air or water. I do not mean the service we get from our pet garagist or in the better service stations that are springing up in our cities.

What happens when we stop at a roadside filling station? The odds are that a youth will appear, take our order for so many gallons of such-and-such, and then begin fumbling with the wrong filler cap. He may be careless with the hose connection and scratch the paint, and he will certainly have no change on him. So he will wander back to the office to get it while we, if we are average motorists, wait champing at the controls to get away.

Compare this free-and-easy fill-up with its counterpart in the States. In the first place the service or filling stations in the country are backed up by the oil companies, and there is great competition between these organisations to acquire or win over to their brands filling stations of all sorts. The filling stations, even those situated out in the blue, are clean and brightly coloured. Maybe they are too lurid for our insular tastes, but, anyway, they can be seen. Then, if you are running on any particular fuel, you can purchase vouchers and hand the right number of these chits in on arrival at a station which announces such-and-such checks honoured. This saves time and trouble in payment. A similar chit system is used in various countries in Europe, and I can never understand why it has not been adopted in this country.

While you are being filled up with petrol the odds are that another smartly overalled server will have inspected the level of water in your radiator and the oil in your sump. He will have done this as a matter of course, and will advise you if you need more oil. He may easily have checked your tyre pressures, and will certainly have cleaned your windscreen. Should he do any other odd jobs for you and you offer him a tip he will politely refuse.

This habit of looking round the car helps him as much as it does you. The water may be low in the radiator, or the oil may need replenishing or changing. If it does, the operation is to your mutual advantage. It is good business, yet how often, except in the more modern service stations, do the servers of petrol suggest these extra attentions in this country?

Inside the service stations in the States you will find a really civilised toilet or "rest room." This term fooled me once when after a tiring afternoon I saw the words and thought, "Ah, I'll go and have a smoke, rest and read the paper for a few minutes while waiting for my friends to rejoin me." Alas, after mounting a long flight of steps, I found myself in a large, well-plumbed gentlemen's lavatory!

I believe the oil companies are behind the great development in roadside service in America. They have developed all kinds of touring aids that in this country are provided by the tourist agencies and motoring associations such as the R.A.C. and A.A. They provide you free with first-class maps, route cards and pamphlets relating to whatever district you may wish to visit. In our J.C.C. tour of the States the Amoco people actually sent a representative round with us to act as guide, philosopher and friend—by name Rudd Lowry. Nothing was too much trouble for him, and whether it was showing us the latest night club in New York or advising us as to the speed regulations in any particular State, he was equally well informed.

THE GARAGE ON BOARD THE PRINCESS VICTORIA WHICH CAN ACCOMMODATE BETWEEN 70 AND 80 CARS

Now the point of these random remarks is that were the personnel of the country filling stations more highly trained, they would reap their own reward in the form of increased business. Furthermore, a little extra intelligence and attention should not cost money like a new piece of plant or a battery of electric pumps.

Another direction in which we motorists are justly entitled to better service and consideration is in the matter of putting our cars on board ship. Tens of thousands of us take our cars abroad every year, and while methods have been notably improved at Dover, where we can drive on board up a ramp, this lay-out is still an exception in other ports. The more usual method is to sling the car up on a crane and dump it down in the hold of the ship, whence, with much man-handling, it is manœuvred into some obscure corner.

The other day friends of mine had to drive their car some miles from the landing stage to the docks 24 hours before their boat sailed. They had to return from the docks to their hotel by train, having previously not only disconnected the battery terminals and drained the petrol, but also the water from their car. The authorities, on being questioned as to the reason for this water-draining routine, said that it was to ensure that the water would not freeze if the car were left on the quay on the other side. Probably the regulation was sane enough in mid-winter, but as this occurred in mid-summer it seemed rather unnecessary.

The disembarkation of the car was a clumsy and out-of-date affair. A gang of men man-handled it somewhere down in the bowels of the boat. Another gang, wagging limos, assisted the man at the crane controls to hoist it on deck, where a third gang pushed it out of the way of the next car to emerge from the hold. Risk of damage to wings, fenders and bumpers was present at each of these operations. The car, having arrived on deck, was slung on to the quay some hours later, where it took something like a dozen men to push it to its appointed position. And then, of course, the old routine for replenishing with water and petrol and of re-connecting the terminals started again. The net result of all this rigmarole was that it took several hours to clear the car.

Well, time is precious, and never more so than when it has to be taken out of a limited holiday period. For which reason it seems about time that ship architects realised that a motor car to-day is just as much a piece of personal luggage as a cabin trunk, and made provision for dealing with its arrival and departure in an efficient and time-saving manner.

Happily, there are signs that this is coming to pass. I have already mentioned the efficient methods in force at Dover. And now comes news of another step in the right direction, this time by the L.M.S. Railway, who have installed a drive-on-deck plan in connection with the Scotland–Ireland ferry between Stranraer and Larne. Their new Diesel-engined boat, Princess Victoria, can accommodate between 70 and 80 cars, and specially attractive rates are offered for their conveyance with passengers.

The service is a quick one, and runs several times a day on Fridays and Saturdays in each direction. At this particular point Scotland and Ireland are fewer than 25 miles apart, and as Stranraer is little more than 110 miles west of Carlisle the ferry is strategically placed to serve both Scotland and the North of England. Last year nearly 5,500 cars used this route. This year, with this improved L.M.S. service, the numbers should increase substantially.

Reverting once more to service ideas in America, it is worth noting that when a tourist arrives *en auto* at an hotel in a big city a driver will be available to take over the car and deposit it either in the hotel garage, which may be under the hotel, or in a nearby place. As American car controls are mainly standardised this plan may not be workable or desirable in England. Anyway, two amusing incidents occurred as a result of this practice over there, and illustrate "service" in rather a strange light.

The first concerns the owner of a Bentley who, on obtaining his car next morning, found that his driving mirror had disappeared. Naturally indignant, he protested strongly to the hotel and/or garage manager. The latter was quite equal to the occasion and said he would certainly replace the missing accessory. So the two of them looked round among the 200-odd cars in the underground garage and discovered a suitable mirror on one of them. Its support was quickly sawn off to the correct length, and the mirror thenceforward changed its nationality!

The second story concerns two young women who trustingly handed over their Buick to a driver to take to the garage. When the time came to re-acquire it, they gave the ticket to the man, who duly turned up with a Buick, but unfortunately the wrong one! Picture, then, the two young women standing forlornly in the middle of the street surrounded by their baggage, and with only a few minutes to go before the boat sailed, awaiting the arrival of their own car.

Telephoning the garage produced no results for some time, for there were probably in that land of mass production at least 60 or 70 Buicks in the garage from which to choose. And as they had given up their ticket and did not even know where the garage was it would have availed nothing had they gone in search of their car themselves.

Well, the story ended happily, with the right car arriving in the nick of time. But it shows that even in America, the country of 100 (or is it 200) per cent. efficiency, things sometimes slip up.

W. G. McMINNIES.

SUNSET ON THE MATTERHORN AFTER A STORM

ALONG ALPINE VALLEYS

By A. HYATT KING

BEFORE the railways came to Switzerland there must have been much of the genuine thrill of adventure in store for the traveller who set out on his own feet to penetrate to the heart of the valleys. Now, regular train services convey a multitude of tourists from one end to the other of the longest and steepest in less than two hours.

But for this privilege of upholstered speed enjoyed *en masse*, in shelter from wind and rain, they must pay the inevitable price. Never can they know the subtle joys that only intimate contact with nature can bring. But to him who walks alone beneath the open sky, the valleys will reveal themselves in all the rich variety of their beauty, whether in the Oberland or Valais, the Grisons or the Engadine. Each valley that branches off from a great watershed such as that of the Rhône or the Aar is a world in itself, a microcosm of the grandeur of Switzerland. Each has a well-defined, almost human character: one is grim and stern, another is verdant and gracious; some run for miles straight as a bird's flight, others wind and twist among the vast spurs.

Yet all have something in common, the mysterious attraction which urges the traveller on at one time to trudge beside the leaping torrent and press on to get a closer view of the glaciers and snowfields. At another time it tempts him to linger high on the valley's side, in the luxury of contemplative idleness.

At Interlaken, on whose plain many valleys converge, the first thing that attracts the gaze of every visitor is the brilliant crown of the Jungfrau gleaming above the gap in the dark hills to the south. They feel they must get nearer, for it does not look a difficult journey. Yet once they eagerly leave the plain behind, the Jungfrau is coyly hidden from their view by the slopes of the intervening ranges through which the road rises steeply. On the bends they get tantalising glimpses of the mountain appearing always more fore-shortened, but not until they climb up through the pastures in the direction of Mürren or Wengen does she display to them something of her true majesty. It is as if the beautiful peak spreads the folds of the hills around her feet to tease her admirers.

Retiring in a different way is the giant that guards the end of the Nicolai Valley, 23 miles south of the Rhône. Right up to the last of many curves in the path, in fact until the last half-mile, does the Matterhorn remain invisible. There is no thrill in Switzerland quite equal to one's first sight of this mountain, the most sensational, the most photographed, the most tourist-ridden, but still the one that remains for sheer grandeur unsurpassed in the Alps. Against the deep blue it towers in apparent solitude above the wide snowfields, the embodiment of proud, dynamic beauty.

From a nearer view the soaring pyramid shape becomes squat, till it takes the form of a couchant lion, a fitting warden of this stupendous valley. Its unique position can best be appreciated by climbing up to the Matterhorn hut nearly 5,000ft. above Zermatt, on a ridge beneath the overwhelming mass. Hence one can look northward, right along the shadowy V-shaped cleft, a mosaic of greens and browns, with the white ribbon of the Mattervisp torrent running clear the whole length. At the eye's farthest range the battlements of the Oberland rise above their cloud-filled hollows.

But a clear sky by no means always greets the traveller along the Nicolai Valley. If the wind from Italy prevails in its perpetual strife with the air currents from the north and north-east, inevitably the cloud-banks will come lower and break. Then the prospect of the valley vanishes in the icy wall of rain. Ceaselessly the trees drip beneath the grey pall of cloud, which, like a kind of sounding-board, seems to magnify and reflect the roar of the torrent, drowning voice and footsteps.

But towards evening as Zermatt is reached the rain may stop and the "lingering flecks of the cloud-host" rise higher, thinning out to golden wisps of vapour floating along the streaming rocks. And there, to the right, is the Matterhorn! Its monkish, gabled cowl gleams white above the dark storm-wrack which still seethes round the terrible precipices. The sunset light deepens, the dazzling snow seems to glow with inner fire, then suddenly it dies—the soul of the mountain flees into space, leaving the mass cold and lifeless. But while the splendour lasted, what a reward for the pilgrimage through the downpour in the valley!

More spacious in its revelation of the sublime is the kind of valley which leads up, not to some peak or range, but to a pass, the Monte Moro pass, for instance, at the end of the Saas Valley. High above the tree line the track rises over a waste of scree and boulders, across dreary moraines and past wrinkled glacier snouts, till it reaches a desolate ravine. On and on, up the steep zig-zags, till one feels (like Alice with the Red Queen in "Through the Looking-Glass") that the greater the exertion the less chance there is of getting anywhere.

Then, without warning, the path drops down into space; the rich tapestry of the Italian landscape is unfolded, as if by magic, at one's feet, which have reached the frontier. The jagged masses of greys and whites sink into lesser heights, more undulating and variegated with belts of pine and larch. The eye travels on westwards over the lighter shading of olives and chestnuts to the bright patches of corn far below in the foothills, where the cerulean arms of the lakes—Maggiore, Lugano and Como—stretch forth and are lost in the luminous haze of the Lombard Plain.

And when a man has had his fill of wayfaring to the valley's end, a different yet equally satisfying pleasure can be his if he will spend a few days in a hut, high amid the brown crags, just below the ridges. Here he can watch in the early dawn the great peaks above the swirling mist, their summits touched with light, beautiful as the white sails of ships at sea. All through the day there are the austere harmonies of light and shade, forming infinitely varied patterns as the sun moves on and the clouds drift by.

The clouds! How different they are here from the ponderous masses of vapour that are seen by dwellers in the plain. Along the sides and on the crests of the valleys they become instinct with life; from the challenge that the hills offer to their progress they derive form and strength. Here a man can share their kingdom and appreciate their architecture. At one moment the wind hurls them like breaking seas against the crags, at another they float in "wise, majestic, melancholy train," casting solemn shadows far below.

But as the day wears on both clouds and valley appear to grow old. The higher outlines of the hills fade, and the oblique light picks out unsuspected scars and furrows in the long slopes. The battalions of clouds break into weird formations and rise, seeming to scatter before the dying shafts of light, whose power is as memorable as the dawn.

The drama is over, and the spectator at the hut watches the gloom spreading in the depths. Then silence. Only the faint murmur of waters reminds him that the spirit of the valley is not dead, but will be born again at day-break. He has found that the valley has indeed a character and being of its own, and that the majestic pageant is a true mystery into which, by his sojourning in the high places, he has been initiated. And he will wish to return many times to the valley as to a cherished friend, to renew and deepen his friendship. Assuredly he will not be disappointed.

CLOUDS BREAKING UP AT SUNSET

ZERMATT AND THE MATTERVISP TORRENT

ENTENTE IN THE AIR

The Importance of Anglo-French Co-operation

By LORD SEMPILL, A.F.C., F.R.Ae.S.

(Aviation Editor of "The Field")

THE arrangements made for the co-operation of the British and French air forces through a series of long-distance flights over each other's territory is probably one of the most important steps yet taken in the development of our air defence. As a gesture of solidarity between Britain and France, the initial flights have already been widely commented upon and praised; but it is not that aspect that is of the greatest interest, significant though it undoubtedly is. What is of fundamental importance is that these arrangements provide the last and most practical stage in the preparation of our air forces—and, of course, the air services of France—for any emergency.

To realise why this is so, it may be well perhaps to glance rapidly at the functions of air power in war. There can be no doubt that, vital though passive defence through A.R.P. and active defence through anti-aircraft guns and intercepter squadrons, &c., are, a most important function of the R.A.F. would be to carry out sustained attacks on enemy key points, for the purposes of crippling his activities and destroying those bases which might be used for attack on this country.

It is for this reason that the number of bombing squadrons has been increased and that latterly so much emphasis has been placed on this branch. The bomber may well be the most powerful weapon in any future war; and it will have to operate over extended ranges.

Now it is clear that efficiency depends here, as elsewhere, on first-class equipment capable of carrying a large military load over long distances at a speed high enough to embarrass the enemy, and on the skill of pilots and crews to make objectives of importance. As to the former, there can be little doubt of the excellent performance of the latest British types. As to the latter, there cannot but have been some reasonable cause for doubt through the very geographical nature of the British Isles.

There is little enough space within the British Isles for extended long flights such as bomber squadrons would be called upon to make in war; and even the flights that can be made must suffer to some extent as a practical training through the familiarity of the country over which they pass. What will be demanded of the bomber pilot and navigator is that they shall be able to reach a specified point in unfamiliar country with the minimum of ground aids. To some extent, training can be given by artificial devices; this cannot compare, however, with practical experience of flying over unknown routes.

It is just this experience which co-operation with the French will provide. It is understood that at least one flight may be made right across France, starting at some British aerodrome in the south and turning over Marseilles. This is the kind of journey bomber pilots would have to make in war, and much will undoubtedly be learnt from it. It is to be noted, too, that it is not proposed that any of the formations visiting France shall land in French territory, except under special circumstances. Thus, war conditions will be exactly reproduced. The flights will be of the out-and-home non-stop kind, that would be made under those conditions.

From this point of view, then, Anglo-French co-operation in the air has a threefold importance. It will provide invaluable practical experience; it will test the soundness of R.A.F. training methods in regard to long-distance flying; and it will try out equipment in the best way of all.

The initial flights, though they did not cover any extremely long courses, did show that the R.A.F. is being built up on sound lines. The performance of the Wellington heavy bombers, which maintained a speed of about 200 m.p.h. over a reasonably extended flight, was particularly striking. But perhaps even more impressive was the fact that in the first demonstration of all, no fewer than 100 machines took part, all completing their scheduled flights without mishap of any kind, either mechanical or operational.

Important lessons may be drawn from this fact. In the first place, as has been said, it shows the R.A.F. training is producing pilots absolutely fitted for the duties they would be called upon to discharge in war. In the second, it reveals that that high standard is not the special property of any one particular unit, such as the now disbanded Long-Range Development Flight. In the third, it gives some sort of indication of the rate of progress of equipping the Service with machines of the latest type.

Naturally, we view the importance of these flights from the British standpoint; but they are equally valuable to the French. They will do much to strengthen the collaboration between the two nations' air forces, which is already close; and they will give the people of each country an opportunity to familiarise itself with the other's progress and preparedness.

And it is not merely the staffs of the two air forces who will find these flights instructive. To the people of this country they cannot fail to bring a new sense of confidence and satisfaction.

For obvious reasons, details of R.A.F. progress have necessarily been kept secret, and there has undoubtedly been a certain amount of anxiety as to the actual state of affairs—anxiety that general statements and bald performance figures have been unable to dispel completely. Here is actual proof of present efficiency.

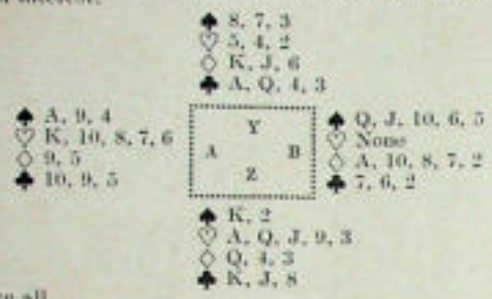
The flights are being carried out on a scale that gives a better indication of the numerical strength of the R.A.F. They are impressive in range and speed. To that extent, therefore, they will do immense good in dispersing the fog of official secrecy that has surrounded efforts of the past few years. More than that, the very fact that France and Great Britain are prepared to make such demonstrations for all the world to judge is a measure of confidence and progress.

We in this country will be glad, too, to have practical proof of the present standing of the French air service, which has had many difficulties to overcome. We shall not have to wait long.

Chas. E. Brown

VICKERS WELLINGTON LONG-RANGE BOMBERS IN FLIGHT NEAR PARIS

As a piece of practical and imaginative planning these flights have great significance and recording their progress will be one of the most interesting occupations during the coming months

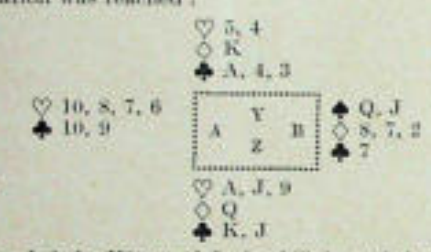


BRIDGE

TOO MANY TRUMPS

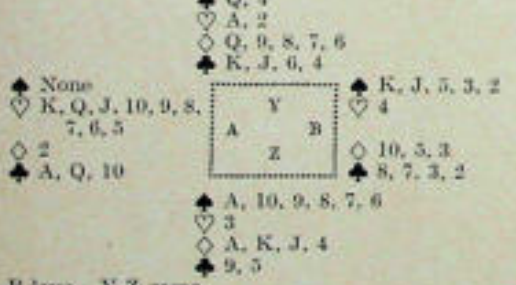
By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

OCCASIONALLY the declarer finds that the trump distribution against him is exceptionally unfavourable or put in his own, no doubt somewhat prejudiced, terms, an opponent has more trumps than he ought to have. When that opponent has to play after the declarer and the declarer's trump suit is not solid, the hand usually requires rather careful play.



Less often, the declarer finds himself in the unusual predicament of having too many trumps in his own hand and not enough in dummy. In this case he may have to make a trump reducing coup. One example of each of these two types of hands occurred in a recent duplicate match, and although the bidding and defence were by no means faultless, the declarer's technique is of interest.

Love all.

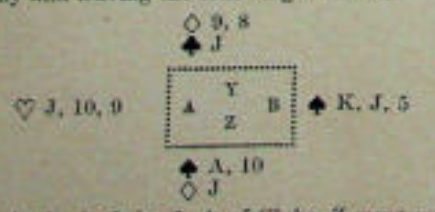


Z	A	Y	B
One Heart	No Bid	One No Trump	Two Spades
Three Hearts	Double	No bid	No bid
No bid			

A led the Ace and another Spade, and Z led the 8 of Clubs, taken by dummy's Queen. Y now returned a small Heart, upon which Z played the Queen. A took this trick with the King of Hearts, and led the 9 of Diamonds. Instead of passing this, B played the Ace of Diamonds and returned a small Diamond taken by Y's Jack. Z now ruffed a Spade and the following situation was reached:

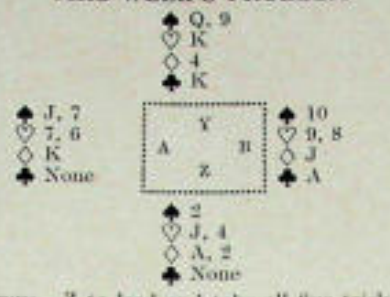
Z now led the King and Jack of Clubs and the Queen of Diamonds and A was compelled to give him the last three trump tricks.

The second hand presented a rather more unusual problem and owing to faulty defence, enabled the declarer to make his contract by a coup not often met.



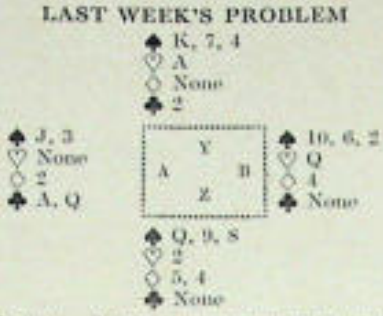
A-B love. Y-Z game.

Z	A	Y	B
One Spade	Two Hearts	Three Diamonds	No bid
Three Hearts	Four Hearts	No bid	No bid
Four Spades	Five Hearts	Five Spades	Double
No bid	No bid		



A's first bid of Two Hearts was made in the pious hope that the opponents would eventually double him in Four Hearts. However, since he was not vulnerable, Y-Z ignored his sacrifice bid and landed themselves in a Five Spade contract which B doubled with every prospect of a heavy penalty.

A's opening lead of the King of Hearts was taken by Y's Ace and the Queen of Spades led. B played low on this and also on the subsequent lead of a small Spade. Z finessed the 7 of Spades and played a Club which A took and returned a Heart. Here B slipped up by discarding a Club instead of a Diamond. Z ruffed the Heart lead, led the King and another Club which he ruffed and took three rounds of Diamonds, finishing in dummy and leaving the following situation:



On the lead of the Jack of Clubs, Z must make two more tricks since if B ruffs with the 5 of Spades Z overruffs with the 10, and if B ruffs with an Honour Z discards the Jack of Diamonds and must make the last two tricks, since he holds the Ace 10 of Spades over B's remaining Honour and 5 of Spades.

THIS WEEK'S PROBLEM

No Trumps. Z to lead and take all five tricks against any defence by A-B.

LAST WEEK'S PROBLEM

Spades Trumps. Z to lead and take all six tricks against any defence by A-B.

SOLUTION

Z leads the 5 of Diamonds and discards Y's Ace of Hearts. The 2 of Hearts is now led and A's best defence is to discard a Club. Y ruffs with the 4 of Spades and returns the 2 of Clubs. If B trumps with the 2 of Spades Z over-trumps and makes the last two Spade tricks. If B trumps with the 10 of Spades Z finesses A's Jack of Spades.

CHESS

BRILLIANT PLAY

For the following game, played in this year's Dutch Championship Tournament, Black was awarded a brilliancy prize.

(Queen's Gambit Declined.)

WHITE.	BLACK.	WHITE.	BLACK.
A. J. Wijnans.	Jhr. J. H. O. van den Bosch.	A. J. Wijnans.	Jhr. J. H. O. van den Bosch.
1. P to Q 4	Kt to K B 3	21. Kt to B 3	Q to B 2
2. Kt to K B 3	P to Q 4	22. Kt to K 4 (*d*)	Q to R 3 (*m*)
3. P to B 4	P to K 3	23. R to B 3	P to B 4 (*n*)
4. Kt to B 3	Q Kt to Q 2	24. Kt(K 4 to Kt 5	Kt takes K P
5. P to K 3 (*a*)	P to Q R 3	25. Kt takes Kt	Q takes Kt
6. Q to B 2 (*b*)	P takes P	26. Kt to B 3	Q to R 3
7. B takes P	P to Q Kt 4	27. K to Kt 2	P to B 5 (*o*)
8. B to K 2 (*c*)	B to Kt 2	28. Q to B 2 (*p*)	P takes P
9. P to Q R 3	P to B 4	29. R to K R sq	R takes Kt (*q*)
10. Castles (*d*)	R to B sq (*e*)	30. R takes Q (*r*)	R takes P, ch
11. Q to Kt 3	B to K 2	31. Q takes R	P takes Q
12. Kt to K 5	Castles	32. K to R sq (*s*)	R to B sq (*t*)
13. B to B 3	B takes B	33. R to Q 3	Kt takes Kt P
14. Kt takes B	Q to B 2 (*f*)	34. R to Q 2 (*u*)	Kt to B 5
15. B to Q 2	P takes P	35. R takes B P	R takes R, ch
16. P takes P (*g*)	Kt to Kt 3	36. K takes R	Kt takes P
17. Q R to B sq	Kt to B 5	37. R to R sq	P to Kt 5
18. B to Kt 5 (*h*)	Kt to Kt 5 (*i*)	38. R to Q B sq	P to Kt 6
19. P to Kt 3 (*j*)	B takes B	Resigns (*v*)	
20. Kt takes B	Q to Q sq (*k*)		

(*a*) A tame move. B to Kt 5 gives more chances.

(*b*) After 6. P takes P (the usual reply to P to Q R 3 in this opening), P takes P Black's Queen's Bishop would soon have more freedom of action than White's.

(*c*) After 8. R to Q 3, P to B 4; 9. P takes P, Kt takes P White's King's Bishop would be attacked.

(*d*) P takes P followed by P to Q Kt 4 is the logical sequel to his 9th move.

(*e*) A good move. If now 11. P takes P, Kt takes P; 12. P to Q Kt 4, then 12. . . . Q Kt to K 5 with a winning game for Black.

(*f*) Black has the preferable game.

(*g*) 16. Kt takes P is, perhaps, slightly better, although the continuation 16. . . . Kt to Kt 5; 17. Kt to B 3, Q Kt to K 4 would force a weakening of White's King's side.

(*h*) R to K 2 is better.

(*i*) Beginning a strong attack. Black now threatens to win a piece by B takes B.

(*j*) Not B takes B because of Kt to Q 7 (threatening either Kt takes Kt, ch or Kt takes Q) and wins.

(*k*) Not Kt to Q 7 because then Q to B 2 wins a piece.

(*l*) The King's Knight cannot move because of the reply Kt to Q 7.

(*m*) Threatening to win the exchange by playing Q Kt to K 4.

(*n*) This forces the gain of a pawn.

(*o*) A good move.

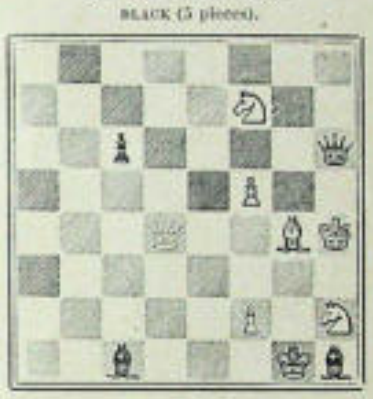
(*p*) If at once 28. R to K R sq, then 28. . . . Q to Kt 3, after which White cannot continue with 29. Q to B 2 because of 29. . . . Q takes Q; 30. R takes Q, Kt to K 6, ch.

(*q*) A very fine and powerful move.

(*r*) If, instead, 30. R takes R, then 30. . . . Kt to K 6, ch; 31. R takes Kt, Q takes R, ch; 32. K takes Q, R takes Q; 33. P takes P, K to B 2 with a winning end-game for Black.

(*s*) Not 32. R takes K P because of 32. . . . R to B sq; 33. R to B sq, Kt to Q 7.

(*t*) Threatening Kt to Q 7. If now (1) 33. R to B 3, then 32. . . . R takes R; 34. K takes R, P to B 8 = Q, ch; 35. K takes Q, Kt to Q 7, ch and wins, or if (2) 33. R to K B sq, then 33. . . . Kt to Q 7, 34. R takes P, R takes R, ch; 35. K takes R, Kt to K 5, ch and wins.



(*u*) 34. R to K B 3, R takes R, 35. K takes R, Kt to B 5 (threatening P to B 8 = Q, ch); 36. K takes P, Kt takes P gives the position that was actually reached after Black's 36th move.

(*v*) White is helpless. If 39. R to B 8, ch, K to B 2; 40. R to Q Kt 8, then 40. . . . Kt to Kt 4 and wins.

PROBLEM No. 4026

By Dr. E. PALKOSKA.*

BLACK (5 pieces).

WHITE (7 pieces).

White to play and mate in three moves.

* *Mezinarodnicky denik*, 1938.

SOLUTION OF PROBLEM No. 4025

1. Q to K 2. Any move; 2. Q mates.

SOLUTION OF END-GAME STUDY

1. R to R 7, B to R 8; 2. K to Kt sq, B to B 6; 3. K to B 2, B to R 8; 4. B to Q 4, B takes B (if P takes B, then K to Q 2 and wins); 5. K to Q 3, B to R 8; 6. K to K 4 and wins.

CONGRESS AT BOURNEMOUTH.—Play at this congress begins next Monday. The competitors in the Premier Tournament will be as follows: Dr. Euwe, S. Flohr, J. Mieses, Dr. Landau, I. König, E. Klein, W. Winter, A. O. Conde, G. Abrahams, A. E. B. Thomas, J. M. Aitken, and F. E. A. Kitto.

BRITISH CHAMPIONSHIP TOURNAMENT.—This tournament will be played at the City and National Chess Club, London, from November 6th to November 17th.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Country House

Making Lily Pools.—We should advise you to get in touch with Cement and Concrete Association, 52, Grosvenor Gardens, S.W. 1. They will supply the concrete and also some very helpful pamphlets on how to lay it.—*M., Guernsey.*

Position for a Sundial.—To set a sundial the longitude of the district must be ascertained, *i.e.*, the number of degrees that it is east or west of the Greenwich meridian. This must be found by studying a survey map. If it is east of Greenwich, four minutes must be added, and if west the same amount must be subtracted from the watch time, for each degree of longitude. The following example may make this clearer:

Andover is 1°-30′ west. To set a sundial here on October 1st, the following sum must be worked:

	Hrs.	Mins.	
Greenwich meantime	10	30	
For difference of longitude, deduct.....		6	(4×1°-30′)
Local meantime.....	10	24	
Difference of equation according to day of the year, add		10	
Andover Solar time..	10	34	

Therefore the dial should be set four minutes faster than the watch. The sundial is, of course, set by the sun, no account being taken of "summer time." The sundial should also be set in full sunshine. To ascertain the difference of equation the following table must be studied:

The difference in equation referred to in the above table is ascertained by studying a further table. For July and August the differences are as follows:

July 4th – 4mins. fast	Aug. 17th – 4mins. fast
„ 10th – 5mins. fast	„ 22nd – 3mins. fast
„ 19th – 6mins. fast	„ 26th – 2mins. fast
Aug. 4th – 6mins. fast	„ 28th – 1min. fast
„ 12th – 5mins. fast	

The "fast" means that the watch should be that much faster than the dial, on those days.—*J. W. H. E., Huddersfield.*

Garden

"Telegraph" Pea for Examination.—The haulm of "Telegraph" pea sent is stunted, the cause at the present time is an infestation of thrips, although it may have been injured previously by other insects. Unless destroyed recently by spraying, you will find them in the growing points and under the membrane covering the stalk of the young pod. They are yellowish-brown when young, black when old, about ¼in. long and thread-like in diameter. Spray regularly at intervals of three days with nicotine soap when an attack is observed. Chicken manure is very strong, and when in close contact with the roots of plants will sometimes kill them with dire results to the plant above. It may be the primary cause of the unhealthy haulm. The manure should be well mixed with the soil, and never used in excess.—*F. C., Cawberley.*

Hunting

Otter Hunting in the Lake District.—Owing to the West Cumberland Hounds having been abandoned, there are only two packs of otterhounds hunting in the Lake District, the Carlisle and the Kendal and District. The Carlisle meets on Monday and Thursday, and suitable places from which to hunt are Carlisle, Penrith and Appleby. The rivers hunted are Caldew, Eamont, Eden, Esk, Irthing, Liddle, Lowther, Lune, Petteril, Wampool, Waver, and their tributaries. You will be able to get further information from the secretary, Mr. W. Haig, 34, Moorhouse Road, Carlisle. The Kendal and District hunt on Mondays, Wednesdays and Saturdays, and convenient towns hunted from are Kendal and Kirkby Lonsdale. The rivers hunted are in Westmorland, North Lancashire and parts of the West Riding of Yorkshire. The secretary is Mr. C. A. Wilson, Kidside House, Milnthorpe, Westmorland.—*R. J., Torquay.*

Kennel

Car Sickness.—Several remedies are suggested for this annoying trouble. Ordinary precautions are to avoid feeding for some hours before the start, and do not let the dog have any drink for an hour or two earlier. In some cases a 5 grain dose of sodium bromide in a little water is efficacious, given half-an-hour before the start. Others recommend feeding with a little medicinal glucose in milk several days prior to the journey, and a teaspoonful may be given dry in the mouth before leaving. A 5 grain aspirin tablet has done good. A dose of chlorotone, about 3 grains in a capsule, often acts as a preventive. Let the dog have plenty of air.—*A. R. W., Hertford.*

Remedy for Mange.—There are two kinds of mange caused by parasites. In sarcoptic, which is the more common, the complaint spreads rapidly, causing soreness and intense irritation, with loss of coat. In this kind the parasite is on the surface, and a cure is not difficult. An old-fashioned remedy that works well is to dress thoroughly with a mixture of vegetable oil and powdered sulphur. This should be applied two or three times at intervals of four days, and finally the dog should be washed. It is most necessary to disinfect the sleeping bench of tar and to burn the bedding. Follicular mange is most difficult to cure, as the parasite burrows to the roots of the hair. It often begins with a small bare patch and extends slowly. In treating a dog for sarcoptic mange be sure to wash afterwards in disinfectant as it may set up irritation of the human skin.—*V. A. D., Co. Wexford.*

Post-Mortem Examinations

Food Remains of Little Owl.—A correspondent forwarded for identification, the bones removed from the nest hole of the little owl. The specimens consisted of the portions of three frogs, the leg bones of two blackbirds, part of the leg bones of a bird which was probably a thrush, and one wing of a house sparrow.—*R. S., Essex.*

Fractured Spine of a Partridge.—A newly dead hen French partridge had been picked up; she had been brooding her clutch. Her body was in a very good state of nutrition; no disease was found. Her death was due to a fracture of the backbone at the end of the neck, possibly due to the bird having been struck down. Her ribs were not broken as usually happens when sitting partridges are trodden upon.—*R. P., Norfolk.*

Air-sac Mites in a Pheasant.—We received for examination the body of a hen pheasant which had died in an aviary fourteen days after commencing to sit on her clutch. Her body was emaciated, and her lungs were heavily infected with minute insects known as air-sac mites, *Laminosioptes cysticola.* These microscopic mites multiply in the air-spaces of the lungs and over a long period progressively weaken the infected bird, and appear invariably to cause death. The nesting material and all the litter in the aviary should be burned; the nest-box and the interior of the aviary, including all its fittings, should be thoroughly scrubbed with hot soda water and soft soap to each gallon of which a cupful of paraffin has been added.—*D. D. C., Devon.*

Disease among Aviary Birds.—Fatty degeneration of the liver caused the death of a cock whydah, a cock budgerigar and a hen redpoll, which was six years in the aviary. All three birds were excessively fat, due to their taking insufficient exercise; no contagious disease was found in the three birds. Congestion of the lungs, due to the contractions of a chill, caused the death of a grey linnet cock; another result of chill, hæmorrhagic enteritis, was found in an Australian finch. Aviary birds are highly susceptible to chill in summer through roosting out in the flight during a cold night following a hot midday. Both these little birds were in a very good state of nutrition. Two cock finches, a Bengalese fawn and a munnikin were suffering from coccidiosis. This contagious germ infection of the bowels is spread through contamination of the food and aviary floor by the infected droppings. Since the germs of this disease are capable of remaining alive for many months on the ground, one readily sees how the disease spreads in aviaries which are not thoroughly cleansed, preferably every day. This fact should be kept in mind by aviculturists who are designing a new aviary; the floor of which should be made of concrete or tiles which permit of thorough scrubbing. It is a mistake to lay down a grass or earth floor, and on a clinker base is equally insanitary; the planting of shrubs and flowers in the aviary flooring is a mistake. If shrubs are required, they should be planted in tubs which can be removed at will. All perches, nest boxes, trays and other fittings should be designed and placed so that they can be scrubbed clean like a kitchen table. Dirt in aviaries spells disease.—*H., Berks; H. McK., Bucks; J. T., Berks; M. R., Derby; R. H. R., Hants; P. A. C., Surrey.*

Shooting

Date of Pistol.—This pistol is a typical "Belt Pistol" of the 1845 to 1850 period, and was a very popular type of weapon for officers serving in India. The late Lord Roberts carried one as a subaltern in India, and mentions in a letter that they were the best pistols as stopping weapons one could find, so they were evidently carried and used well into the 'sixties. However, the date of manufacture of this pistol can be put quite definitely as about 1845. They sometimes, but not always, went in pairs. As regards the business of Reilly, this is now carried on by Charles Riggs & Co., Ltd., 22, Woonwood Street, London, E.C. 2.—*R. H. M., Risalpur.*

Travel

Hotels near Cirencester.—You would most certainly like the Mansion House Hotel at Evesham. It is a beautiful old house, mellowed by age, and one has a friendly feeling of being at home when one is there. This does not only apply to the visitor who intends to stay for a long period; it is the same whether he or she is staying for a month or a night. For over 400 years, extensions, additions and modern improvements have made this a delightful country house. Warmed by big open fires and central heating in their seasons—all the 20 bedrooms also include gas or electric fires—the hotel is just the place for anyone who wishes to stay in a typical English country house hotel. The fact that the hotel increases its clientele considerably every year is one recommendation; another is that Mr. Purves, the proprietor, has developed a really delightful garden. He has many rare and beautiful plants, which he has collected during the last ten years, in the Alpine section. Then there is the Noel Arms at Chipping Campden. It is a fourteenth century inn, and contains all modern amenities for the comfort of guests. If you want to be in Cirencester itself, there is the pleasant Wellesley House Hotel. The cuisine there is excellent and rooms are comfortable and tastefully furnished.—*H. B. L., Wadhurst.*

On the North Cornwall Coast.—We would recommend The Dormy House Hotel at Rock, near Wadebridge, North Cornwall. It is in its way an *Ideal* hotel among hotels for everyone there is friendly and happy. This, of course, is a compliment to mine hosts, Commander and Mrs. Bannerman, not forgetting the cheerful and efficient staff they have gathered round them. The cooking is excellent, the beds are comfortable, and the general atmosphere most inviting. But these are not the only reasons for the success of Dormy House. Much of the charm of the place attaches to the attention which Commander and Mrs. Bannerman give individually to all their guests. To golfers the Dormy House is a veritable paradise. There are two courses, eighteen holes and nine holes, affording natural seaside golf, yet it is not necessary to be a golfer before you can enjoy a visit to Rock. Guests at the Dormy House Hotel pay a minimum weekly subscription of 5/-, and this enables them to play, free of charge, lawn tennis, squash, badminton, billiards, table tennis, while there is shooting over 1,200 acres and fishing in the little River Allen for over two miles. There is, too, an excellent dance room at the Dormy House. On some Saturday evenings a small orchestra plays, but on most days the dancing is informal to a gramophone or wireless. Let it be noted that there is no danger of any noise disturbing other guests as the position of the dance room has been carefully chosen at the end of the entrance hall, well away from the bedrooms.—*L. N., London.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, AUGUST 19th

STAGHOUNDS—ENGLAND & WALES

DEVON AND SOMERSET.—Saturday (Aug. 12th), Comer's Gate; Tu., Alderman's Barrow; Th., Hawkridge; S., Brendon Two Gates—11.

QUANTOCK.—Monday (Aug. 14th), Park End, Cothelstone—11.

OTTERHOUNDS—ENGLAND

BORDER COUNTIES.—Saturday (Aug. 12th), Meiford Bridge (for Barmy)—10.30.

BUCKS.—Saturday (Aug. 12th), Trafford Bridge, near Banbury; Tu., The Greyhound, Tidmarsh, near Pangbourne; Th., Newstead Mill, Stamford (up); S., Newstead Mill, Stamford (down)—10.30.

BURE VALLEY.—Monday (Aug. 14th), Billington F., Dale Ride, Holkham—10.

COURTENAY TRACY.—Saturday (Aug. 12th), Headley Bridge, Bordon; M., Terwick Mill, Rogate (W. Rother); Th., Weeks Bridge, Ringwood; S., Trigon, Wareham—10.30.

CREDITON.—Saturday (Aug. 12th), Town Mills, Torrington (cap for Hunt servants)—10.30.

DARTMOOR.—Saturday (Aug. 12th), Dartmeet (W. Dart); Camel Week (by invitation); M., Egloskayle, Wadebridge (Camel); W., Dunmere Bridge, Bodmin (Camel); Th., Where leave off Wednesday; S., Shebbsbridge, Wadebridge (Allen)—10.30.

EASTERN COUNTIES.—Saturday (Aug. 12th), Glemsford Station; M., Holbrook; Th., Easton Road; S., Thorpetree—10.30.

WYE VALLEY.—Tuesday (Aug. 15th), Cowbridge, Glam; W., Ogmore Castle; F., Peterstone—10.30.

OTTERHOUNDS—SCOTLAND

DUMFRIESSHIRE.—Saturday (Aug. 12th), The Kennels (Annan); Tu., Dalbeattie Bridge (Urr); Th., Drumlanrig Bridge (Nith); S., Auldgirth Bridge (Nith)—9.30.

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage Home and Abroad.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale) English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

COUNTRYSIDE ELECTRICITY

BRITAIN'S rural population occupies 89 per cent. of the country's total area, and yet it constitutes but a mere 20 per cent. of the total population. Putting it in actual figures, we find that the density of Britain's rural population is only 115 per square mile as compared with 4,810 per square mile in the towns, and this alarming urban preponderance is yearly increasing.

For a hundred years or so this seeping into the cities has gone on, and only now are we beginning to realise the tremendous danger in which we stand by allowing labour to be driven from the soil by bad wages, bad housing and bad conditions.

We have now begun to shout "Back to the Land," only to find that those to whom we shout are less eager to return than we had hoped. They cannot be blamed. In the country there are long, tedious hours of work in miserable conditions as often as not, and nothing to show for it. While in the towns, the labourer argues, things cannot be worse, and may be greatly improved—as often as not their surmise is correct.

That there cannot be a panacea for agricultural maladies is obvious. The problems are many; the solutions must be many, but there is no reason for ignoring the runners because we cannot eradicate the tap-root.

One of these contributory evils is the lack of those amenities which the townsman considers essential. Perhaps the most important of them is an adequate electrical supply. Its importance in some directions needs no explanation, but in others the difficulty is more subtle. Economists tend to forget the important role that women play in determining a decision to leave the countryside. Where they have had acquaintance with better living conditions they will not readily tolerate a return to bad housing, unnecessary labour such as pumping, and ill lighting.

A proper supply of current at a reasonable price, quite apart from its good effect on the efficiency of a farm, supplies that extra refinement which makes all the difference to a labourer's life. It gives certain essential amenities such as lighting, ironing and cooking, and in many cases makes a piped water supply possible, or at least removes the necessity for hand pumping; while contributory factors to village life, such as the school and local hall, can receive those improvements which will turn an icebox—and often enough a damp one at that—into a cheerful and warm building.

It may be argued that the expense of electricity prohibits its use by the country dweller, and that were a supply to hand he would not avail himself of it. Quite obviously electricity *is* more expensive in the country than the town, but to say that people will not use it is untrue, for it has been found that, of those persons in rural districts who have electricity available, 90 per cent. take advantage of it.

The solution to the difficulty lies largely in the hands of the country dwellers themselves. Obviously an electrical supply concern cannot afford to lay expensive cables to a hamlet for the use of two houses, while thirty others adopt a policy of "wait and see." If local communities will get together and apply for an electrical supply, they will receive it, but they must not complain if they are content to sit on the fence and do nothing about it.

In 1929 there were 3,700 miles of electric mains in rural areas, while to-day there are over 20,000. This increase of 440 per cent. means that 67 per cent. of premises in rural districts have supply available to them. The other 33 per cent. can have the same amenities if they are willing to co-operate with one another in making wayleaves easier, and in seeing that unfair rating assessments, &c., are reduced. Let those who have position and influence set the pace and the others will follow.

ENGLISH DESERTS

THE waste lands of Northamptonshire have at last achieved publicity. The Kennet Committee has issued its report. It is a good report and makes some good suggestions. But we have seen many good reports recently, and seen them pigeon-holed. We should not be too optimistic. Iron ore has devastated Northamptonshire. What only five years ago was pleasantly-wooded farmland is now a desert. Everything has given way to the hungry mechanical shovels that can swallow 11 tons of earth at a mouthful; everything—wheat-land, pastures, woodland, even houses. Perhaps something will come of the Kennet Committee's recommendations. Perhaps a huge larch forest will grow up. And perhaps not; larch costs money to plant. But the Corby district is not the only desert in England. Outside London a desert of houses, a monstrous rubbish heap of bricks, is growing up. An ugly rash, the disease spreads many miles each year. And unconcerned, we watch the slums of a few years' time arising, and our countryside, good farming land, disappear. And we do nothing. Private enterprise is beyond criticism in England. Go and look at the towns that have recently sprung up south of London; for that matter go east or west or north—these are examples of Private Enterprise uncontrolled.

NEXT WEEK'S ISSUE

will contain a description of a day with the Kendal and District Otterhounds, an account of the United Counties Hunter Show, which is the oldest hunter show in the country, and more Reports from the Moors. Mr. Cheevnix Trench writes on shooting in the Himalayas, and all the usual features are included.

TREASURE TROVE

No one can have read without more than passing interest of the discovery of the remarkable collection of gold and silver Anglo-Saxon relics at Sutton Hoo. Although their intrinsic value may not have been great, their worth as silent witnesses of a past culture is beyond price. The silver plate from Constantinople, bearing the hall-mark of the Emperor Anastasius, invites romantic speculation. The treasures as the subject of a coroner's inquest left the question to be decided as to whether they belonged to the owner of the ground, Mrs. Pretty, or to the Crown. No doubt many of us have wondered what would happen if we found buried treasure on our own property, and governing factors are whether the original owner instead of hiding it or casually losing it, parted with it purposely in such a manner that it was evident he intended abandoning it altogether. As the evidence proved, the treasure was in a burial ship, and its interment was in the nature of a public ceremony, the verdict was that the articles were not buried or concealed secretly, that there was no case of an owner intentionally hiding them with the object of returning later to recover them. The legal finder was Mrs. Pretty and the case not one of treasure trove.

PICADOR—PRISON—PESETAS

Recently during the National Anthem, we noticed a lady who dived unremittingly into the depths of a voluminous handbag in search of articles unknown, regardless of the unwinking stance of those around her. We may safely do such things in England. Why, if we stood on our heads, or sucked Brighton rock throughout such an occasion nothing would fall upon us save the disapproving eye of the more patriotic; however, this is not so elsewhere. Last week in Algeciras, Major M. J. Malley, Embarkation Medical Officer at Gibraltar, and his wife visited a bull-fight. All went well until the strains of the Fascist anthem broke upon the air, when, presumably, carried away with enthusiasm for bulls and toreadors, Mrs. Malley quite forgot to elevate her right arm at an angle of 45deg., for which omission her husband had the doubtful pleasure of spending a night under lock and key, regaining his liberty the next morning at a price of 1,000 pesetas—about £23. The absent-minded are advised not to visit Spanish bull-fights.

A SERIOUS LOSS FOR THE WESTMEATH

The Westmeath Hunt will find it very difficult next season to replace Captain J. B. Grant, who had been a most successful secretary and who died recently, following an illness which began during the last season, at Ratheonrath House, Co. Westmeath. Captain Grant had achieved success in many ways. He was well known as an amateur rider and had many successes in both steeplechases and Point-to-Points, his first being at Mullingar when he was seventeen. He was also a well-known shot, being particularly adept at snipe. During the War he was seriously wounded when serving with his regiment, The Queen's Bays. But perhaps he will be missed most as secretary of the Westmeath. Few secretaries have performed their duties more carefully or have been a more useful and understanding connecting link between the Hunt and its farmers.

THE CHARM

Better than all remembering that you are
The tiniest grain within a grain of star,
Remember, whenever fevered eddies whirl,
That Wentworth sleeps through afternoons of pearl:
Souls ninety-seven, and not a soul in sight,
And not a sound from farmsteads on the right;
That half an hour—or is it half an age?—
Is needed for the black and slinking cat
To reach the pond to left, where ducks have sat,
And then an hour, or century more, for rage
To soften in the immemorial feat
Of licking paws and whiskers in retreat.

GEOFFREY JOHNSON.

A COUNTRYMAN'S JOURNAL

TO my mind there is no more shapely apple tree than a Bramley Seedling. The growth is compact, symmetrical and many-branched, the leaves are larger than in other varieties and closely massed, while in late summer the apples are of a beautiful clear luminous light green. They are rounded and appear as soft globes of green disposed among a network of boughs and close mesh of foliage. In out-of-the-way villages they still say that St. Swithin's Day, if rain falls upon it, "christens" the apples, but none can say what they mean by this.

Why so? The answer, I think, lies back in the Industrial Revolution which had a spiritual effect beside that of giving husbandry its mortal wound. It externalised Nature for the townsman, turning it into his Fair Rosamund when he could get away from the serious business of life, and it stopped up the springs of self-expression in the countryman. The loss was for both, as is inevitable when two parts of an entity are forced asunder. Nature became a peep-show for the one, a flowerless toil for the other. But these parted elements were once united, not, I mean, only in the artist and the poet but in the whole community, and in trying to answer the riddle of the rain christening the apple it is to that unity we must refer. For the countryman the apple is now something profitable to grow, for the townsman something pleasant to eat. But once the apple was grown to be eaten by the people as a whole. As a result, an immense corpus of legend, song and ritual gathered itself about the apple tree. The wassailing of orchard trees gives the clue out of sackfuls of these rites and ceremonies. The folk assembled round the fruit-tree and sang this song:

> "Wassail the trees that they may beare
> You many a plum and many a peare,
> For more or less fruit they will bringe
> As you do give them wassailing."

They then encircled the tree and passed round a toast of cider-cup with roasted apples in it, pouring a libation on the roots when all had drunk. Another song was sung: "Stand fast, root, bear well, top," &c., a blast blown on a cow's horn and the tree rapped with sticks. Rite and observance far back in time and far away in space lay behind this orchard revel of our ancestors, whose varieties in secular form were all survivals of the archaic tree cult and of the common belief that the fertility-power of the fruit tree depended upon human conjuration and co-operative rhythm. In ancient rustic rites the Norse Balder was the apple tree personified, as was Apollo in Greece.

Science says that this ceremonial, first religious and then secular, proceeded from a biological fallacy, while Mr. R. H. Hodgkin, of Queen's College, Oxford, in the second volume of his *History of the Anglo-Saxons*, remarks upon Beating the Bounds, Rogation Tide, Midsummer Fires, Harvest Home, Hogmaney, Plough Monday and the junketings of May Day, as "the grosser forms of heathenism" which were "the regrettable signs of affection for their old ways displayed by the Anglo-Saxon peasantry." Granted that the actual data were the product of imperfect knowledge, yet the unconscious or misapplied recognition of a common bond between man and the earth was not only soundly scientific but essentially religious.

Behind the magic and misinterpretations (but not greater than that of the Anglo-Saxon historian) lay the quest of the soul for expressing its unity with the divine spirit as it was manifested on earth. Behind the self-regarding promptings and devices and mummeries lay the transcendental sense that all creation is one, the proliferation and intricate branching from a single root whose fibres took their nourishment from an unseen and unknown source. The old Church was more tolerant of such intuitions ritually expressed than is the Oxford don preening himself upon his modernity: it desired only to purge such recognitions of savagery and idolatry—that is to say, of the loss of the end in the means. The reason why the mechanism of such ends utterly disappeared from country life was because the commercial idea of the Industrial Revolution, allied with scientific negation, admitted no authority, desired no end and formulated no system but those of material gain. I wonder if the idea of St. Swithin christening the apples is more fanciful than the reduction of all life and all phenomena to the measure of a differential equation or a pass-book.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a London daily:

"She worked in dungarees and held the 300lb. kicking sheep under her knee. She is one of a family of eight children, and her brothers taught her to shear sheep instead of play games."

From a Rhodesian daily:

"The judges were Mr. A. Lockie and Major A. Browne, a visitor who at one time was the champion amateur huntsman of England."

A GENERAL VIEW AT BALLS BRIDGE

IRELAND'S HORSES—AND ITS SHOW

By COLONEL PAUL RODZIANKO, C.M.G.

(Director of the Irish Equitation School from 1928 to 1933)

EVER since 1731, when the Royal Dublin Society started the idea of improving agriculture and cattle breeding, the Dublin Show has grown and developed until it is now the most unique and, I think, most glamorous show in the world.

It is especially different in this sense. The Dublin Show is not merely a splendid display of horse-flesh and riding, it is an enormous market for the breeders of Ireland, a stimulant to every farmer who owns a mare as well as to the professional dealers and experts.

Apart from the well-kept grounds that make such a fine stage for the seven or eight hundred horses, cobs and ponies entered and the perfect organisation that makes pleasurable every crowded minute of the five days, there is a real and important purpose in this great gathering.

The show has of course the reputation of being a great social function, but it is far more than that, and it is more also than a mere display of equestrian skill and champion horses. Many of the thousands who flock to Balls Bridge come only to see the jumping competitions, but many other thousands come primarily to buy and sell. The money earned at the Dublin Show is used to provide prizes and keep the horse trade of Ireland going.

The majority of exhibits in other shows are regular show horses kept for that purpose and which appear year after year like old stage favourites, whereas 90 per cent. of the horses shown at Dublin are sold and never appear there again. The horses are not shown merely to win glory for their owners but to display their capacities, and if they win prizes of course the value goes up.

Since the 'sixties, when the Leaping Competitions were considered tests of the suitability of horses as hunters, and the judgment was given according to "superiority of form and style," tremendous changes have been seen at Balls Bridge. Gradually horse jumping has ceased to be merely a test and become a sport in itself, the obstacles have grown longer and the modern exact rules have come in.

Now the International Military Jumping Competitions are the greatest draw of any horse show. The teams of highly-skilled officers riding their well-trained, well-picked horses for the big cups and trophies, has the most attraction for the crowds. As well as this the foreigners provide a market for Ireland's most promising jumpers.

When in 1926 the first International Military Jumping Competition was held at Balls Bridge, it made a difference of thousands of spectators. Of these extra thousands a hundred may be counted on to buy and the rest help pay for the numerous prizes for other classes.

The inspiration derived from watching the crack teams of officers has had a definite effect on civilian riders and the general standard has greatly improved. A scientific style and precision cannot of course be learnt merely by watching others, but it gives an idea that leads the would-be expert to serious study.

In the Civilian Jumping Competitions you get a number of "old timers" ridden by their owners for the sport of the thing year after year, but you also get the dealers and breeders, who find the Dublin Show ring the finest way to show and sell their best jumpers.

Meanwhile, in the judging rings there are hunter, cob and pony classes and parades of prize-winning horses; and in the bloodstock paddock the pattering voice of the auctioneer selling, selling, selling.

The horses of Ireland make their début to the world at Dublin Show, whether it is the farmer who has got a likely foal by hunter mare is out to make a little money, or the serious breeder who is out to show what kind of a "lep" his horse will give over the double banks or the plucky, hard-riding colleen, who puts her dearest hunter around the course for the glory of the sport, it is all part of the great aim to stimulate the horse trade.

Even in the present uncertain times all worries are thrown off at the Dublin Show, and trade has been good, which means that hundreds of Irishmen will go home with a little money in their pockets and again take pains to breed a good horse. It means that the futility of a financial depression has been cast aside and the best trade in the world been stimulated. And in the show ring at least, politics are forgotten, the officers of various countries ride like the sportsmen they are, and no "crisis" is discussed save that of who shall win the Cup.

Irish horses have been famous for centuries, but to what a huge extent the Dublin Show has helped in maintaining and spreading their reputation; and no one man has done more for the show itself than the untiringly energetic president, the Hon. W. E. Wylie.

Many people find enough to enjoy in the spectacular side of the show. They wander around the judging rings, where every kind of horse can be seen competing in various classes, notice the fine young hunters and thoroughbreds, and to try to pick the winners; but the fundamental purpose of Dublin Show should be remembered by all. It provides the best fair market for the breeders of Ireland, and encourages them to produce the right type of horse. This is of benefit to the whole world for the right horses do not just grow like wild flowers, they are the result of careful selection of dam and sire. The farmer must be induced to "try" to produce good hunters. This he will not do if he can sell any likely filly of the brood-mare type at four years old to abroad, and keep the worst fillies because they work just as well and then breed bad foals from them.

The unique Irish hunter mare is in danger of extinction and to avoid this the Royal Dublin Society has inaugurated a scheme to give premiums of £12 each to the farmer whose mare produces a living foal to a thoroughbred horse.

Hunter breeding is not scientific, but it must not be haphazard for conformation is hereditary, and if certain general principles are not followed the results will be disastrous.

As well as aiding every kind of breeder and dealer, the Horse Show is of great benefit to racing, and, of course, the many visitors from England and abroad are of value to the hotels of the whole city. And what light-hearted crowds they are that stroll round listening to the thrilling jargon that accompanies the selling of a hunter. The most pleasant of diseases, "horse fever," soon affects them all. Long may it live, the Dublin Show, that has given Irish horses and Irish hearts a reputation throughout the whole world.

MILITARY TEAMS PARADING AT BALLS BRIDGE BEFORE THE START OF THE JUMPING COMPETITIONS

DUBLIN'S SPECTACULAR HORSE SHOW

By R. ANSELL WELLS

HELD, as usual, at the Royal Dublin Society's beautiful ground, from August 8th to 12th, the Dublin Horse Show was, this year, as successful as ever, and the total attendance figure of 96,155, although slightly less than last year, must, under present world conditions, be looked upon as eminently satisfactory.

In discussing a show of this kind there are various points which must be borne in mind, and the classes at Dublin are different from those which are to be seen at the English shows in that they are so large and the entries in them are not composed entirely of made horses. Here in nearly every class there are approximately 30 competitors, many of them young and partly schooled horses, and for this reason the judging at Dublin presents problems which are not met with elsewhere.

Quite apart from the task of assessing the merits of partly-made horses there is also the difficulty which is experienced by even the most practised judges in making a preliminary selection without missing a horse; this is by no means easy as, quite apart from the difficulty of actually seeing all the horses which there are in the ring, there is also the difficulty of keeping one's mind fresh and active throughout a long day's judging. To draw attention to this is only to mention something of which the judges themselves are aware and in no way to detract from the way in which those gentlemen who had been asked to adjudicate this year discharged their very onerous duties.

In accordance with the usual custom at this show, the three rings were allocated to the heavy, medium and lightweight hunters and were presided over by the Right Hon. the Viscount Knutsford and Captain H. A. Jaffray, M.F.H., Captain T. Wickham-Boynton, M.F.H., and Mr. Adrian Scrope, and Captain Guy Lucas and Mr. Herbert Sutton respectively; while Mr. J. G. Bletsoe and Mr. H. J. Bonner had charge of ring four in which were judged the brood mares and produce classes. The judging for the championship was carried out by one judge from each of the hunter rings, those selected being the Right Hon. the Viscount Knutsford, Captain T. Wickham-Boynton, M.F.H., and Captain Guy Lucas, and was done in the main jumping enclosure.

The result of the judging for this supreme award created a certain amount of surprise and not a little comment in some circles, though anyone who saw the horses could not for one moment doubt the merits of the winner. I cannot say from memory, or find out with any degree of certainty, whether this year's show has made history in this respect, but it must be almost a record for a five-year-old light-weight horse to be selected as Champion of the Show.

Such was the horse which was awarded the supreme honour this year, and whatever may be said about the question of giving a championship to what is possibly the least valuable type of hunter there can be no doubt but that, if the champion should be selected for merit regardless of which category it belongs to, there could be no better choice than Mr. H. Davis Kenny's Wavering Bee. This is a little chesnut horse of the very highest quality. Bred by Mr. James Daly, of Navan, Co. Meath, he is by Wavetop (by Spearmint) out of Flying Bee (by Honey Bee), and was purchased by his exhibitor as a foal at the bloodstock sales.

As a yearling he did not show signs of fulfilling early promise, but the decision to persevere with him has been amply rewarded, and he now leaves nothing to be desired. It is really rather stupid to try and pick upon points which are worthy of especial mention as no fault can be found with this horse on any score except perhaps that of his size. He is a perfectly made hunter in every respect, and has, in addition, that wonderful freshness of movement which is only found in the Irish-bred horse in Ireland; it may be that it is something to do with the country, but these horses do not seem to retain their spring and vitality when they are exported, and if they are to be seen at their best they must be seen in the country in which they are bred; they are then quite incomparable.

This champion is indeed a champion in the fullest sense of the word, and can bear comparison with any other champion of recent years. In addition to winning the championship he also won the Samuel Ussher Roberts Perpetual Cup for the best light-weight hunter, the Laidlaw Champion Cup and the "Bright Prospect" Trophy for the best hunter in the show, which latter was presented by his owner, Mr. Kenney, who won the Laidlaw and the Babe in the Woods Cup outright in 1925, and, in addition to his own class, he also headed that for ladies' hunters up to 12–13st., in which he was seen under a side-saddle. Directly after winning the championship he was purchased by Mr. Young, acting on behalf of Mr. Bernard A. Selby.

In the class for light-weight ladies' hunters the well-known English exhibitor, Mr. A. H. Ashcroft, was third, with his horse Right Away, and Mrs. Ashcroft gained second place with V.S., both of which are well-known winners at the English shows. As may easily be seen from the first three horses, this class was an exceptionally strong one, being well filled with horses of a good class. By comparison the class for ladies' hunters up to from 13 to 14st. was a disappointment, since it did not include a really first-class horse among the whole list of entrants. The first prize was won by Mrs. J. A. Aizlewood's Shangri-La, a brown six-year-old by Englehorg, which seemed to give the judges, Mrs. A. R. Kent and Mrs. Oliver H. Gilbey, a very good ride, despite a rather unprepossessing appearance due to a poor fore-end and neck.

The second prize horse in this class was Mr. N. Galway-Greer's Drimmore Star, which, when seen under a cross-saddle, had not qualified for an award. Shangri-La had received a third prize when judged under a cross-saddle, having been beaten by Mrs. R. Collen's seven-year-old, Manners, first prize, and Lady Athlumney's Johnny Burgoyne by John o' Groats—Tomona, second, which latter received a third prize in the side-saddle class and gave the appearance of being able to go a good gallop, putting his feet well out and really covering his ground.

Mr. Galway-Greer won the Army Tattoo Committee's Perpetual Challenge Trophy for the owner whose horses obtain the greatest number of points in the hunter classes, with a remarkable list of successes. This owner's Grey Owl obtained a reserve in a small class of weight-carrying hunters, up to 15st. and upward, five years old; Steel Dust was fifth among the 14st.–15st hunters, six years old and over; Tradition, a very taking chesnut, by Pseudonym, won the class for five-year-old hunter geldings up to 13st.–14st. from Mr. Terry O'Brien's Bachelor's Tax; and Crover Bay, a high-class six-year-old, won in a big class of hunter mares up to 12st.–13st. from Mr. James McCutcheon's Slieve Ciamaltha. Other successes achieved by this owner were a second prize in the class for three-year-old geldings (to be led) for Merry Prince (by Wilson—Irish Battle), which was just defeated for first place by Mr. Eamonn Rohan's Cahir Valley, and a fourth prize among three-year-old fillies for Irish Gold.

On the whole, it seems that it may be said of Ireland, as it is of England, that the high-class heavy-weight horse is the most difficult to find; these classes were the smallest of those for hunters, and horses that one already knows held their own among the newcomers and others which were fresh to English spectators. Among the six-year-old horses up to 15st. and upwards Mr. H. M. Read, from Roscrea, produced a winner in his Knight of the Castle, by Knight of Kilcash—The Jewel, which beat Mr. Ashcroft's Acclamation, and thereby placed himself on a par with the winners in the English show ring. Third prize in this class was won by Mr. Bobbie Laverty's Big Wonder, a powerful chesnut son of Miradore out of a mare by Tag-Rag. Only six five-year-old horses appeared in the class for youngsters up to 15st. and over, and they were headed by Mr. Terry O'Brien's

LEFT: MR. H. DAVIS KENNY'S WAVERING BEE, WITH MR. KENNY JUN., UP *RIGHT* THE FRENCH JUMPING TEAM AFTER WINNING H.H. AGA KHAN'S TROPHY

brown gelding Jorrocks with Mr. John J. Ryan's Bree Hill in second place.

There was not a six-year-old horse up to 14st.–15st. which could compete with Mrs. A. H. Ashcroft's well-known winner, Trespasser, which scored a fairly comfortable win in a large class, the best of the others being Miss L. L. Seymour's Pierre, a bay gelding by Popett.

To interest Irish breeders in hacks a new class for novice hacks, four years old and over, not less than 14.2 hands, and not exceeding 16 hands was introduced, and the English hacks, Thor and Gentleman John were paraded in the ring on each day of the show.

Both were bred in Ireland and were exported, un-made.

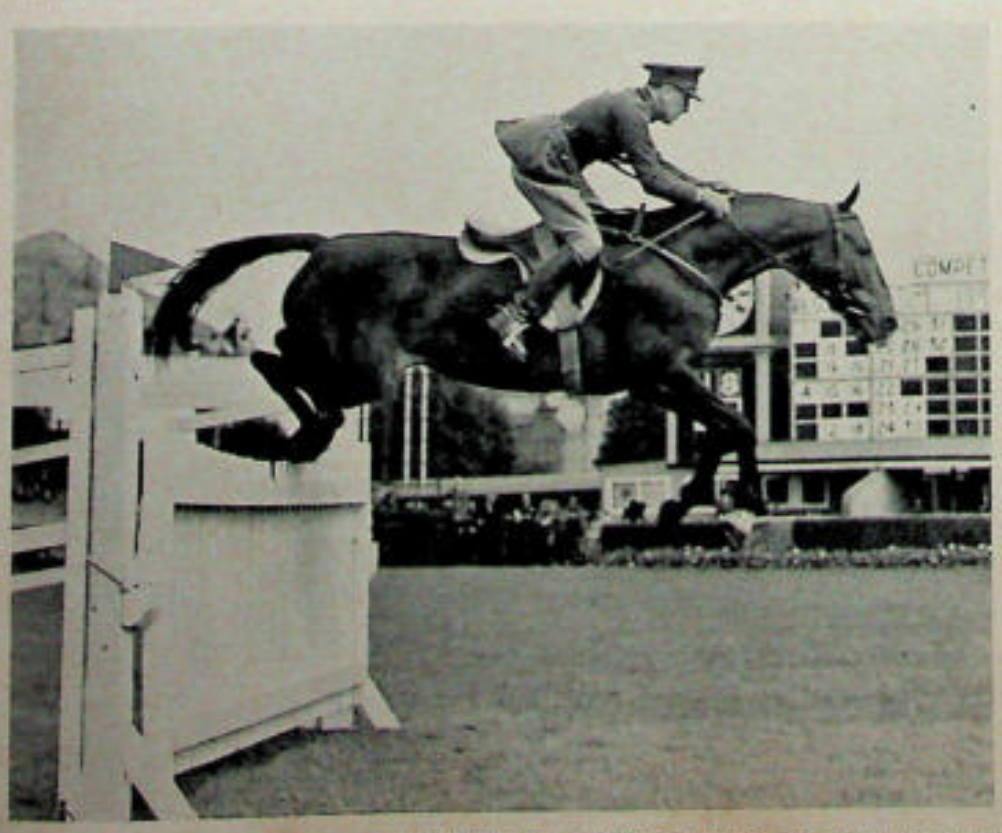
The judges in this class preferred Mrs. C. H. Nicholson's Leprechaun to Miss M. L. R. Moore's Rob Roy, second; and Miss Mary P. Horan's Sunbeam was placed third. The first three horses were thus the property of ladies, and the fourth horse, Mr. Bertie Graham's Red Sarrail, was ridden in the ring by a lady.

Heavy-weight cobs put up a good show, and the best was Mr. J. W. Murland's Reliance, by Corcel, by Corcyra. Second and third places were taken by Mr. George Ervine's Castle Corr and Mr. J. M. McMahon's Ladylike respectively.

Space does not permit of anything like a detailed survey of the 785 horses which were included in the 56 classes judged on the five days of the show, so some must be omitted altogether and but brief mention made of others. It was interesting to note that of the six stallions which were entered in the class for thoroughbred stallions calculated to get weight-carrying hunters, not one was bred in Ireland, five coming from England and one from France.

The classes for thoroughbred young stock were well filled and produced some likely looking youngsters as well as some good brood mares and foals. Major C. Mitchell's liver chesnut daughter of Southannan—Palm Tree won the class for thoroughbred brood mares and her colt foal by Spion Kop was adjudged the best of his age and sex. Second prize among the mares went to Major P. W. G. Stuart-French for Turkish Dancer and the same owner also gained second prize for a filly foal out of this mare by Interlace. The first prize filly was the property of Miss Kellett and was by Lucca out of Golden Ramor, which received a third among the brood mares.

Dublin's permanent course for jumping with its banks and stone walls is an unequalled test, and this year the jumping was of a particularly high standard.



It was a matter of universal regret that the Italian team which had entered for the military events were unable, at the last moment, to fulfil their engagement, as they could not bring their team up to strength for this show, but the international aspect of the show was well maintained by the presence of teams from Great Britain, France, Germany, Belgium and Switzerland as well as the Irish team.

Ireland started off well with a win in the first event by Red Hugh, ridden by Commandant Corry, who completed a faultless round of the special course in 1.32⅘ sec.; second place was taken by Alant, ridden by Rittmeister Hasse of Germany, with another clean round and a time of 1.33⅘sec., and the only other faultless rounds were also put up by Irish competitors.

In the competition, which was held on the second afternoon of the show over the permanent course and in the only heavy rain of the whole week, Germany came to the fore, represented by Baron IV, ridden by Rittmeister Brinckmann, who put up a very good clean round for first place. It was in this competition that Rittmeister Hasse gave such a fine display of horsemanship in the course of two rounds which he made on Alant and Tora; on his first horse he fell at the double bank, and with consummate skill averted what might have been a very nasty accident; his second horse made a bad mistake at the sleeper fence, but he managed to save the day, although he did not feature in the awards.

Another German horse, the grey Schneemann, ridden by Rittmeister Huck, was equal second in this competition with the French horse Jacynthe, ridden by Captain Chevallier. Germany was fourth and England was fifth with Blue Steel, ridden by Major D. Cleeve.

Germany was in winning vein and again on the third day took first place over the permanent course with Tora, ridden by Rittmeister Hasse; on this occasion Switzerland was second, represented by Lieutenant Mylius on Rainbow II; Ireland was third, France fourth and Germany fifth. The most important day of international jumping was the Friday when there was the competition for the Aga Khan Trophy for International Military Jumping.

LEFT: COMMANDANT D. J. COREY JUMPING THE GATE ON DUHALLOW. *RIGHT* RITTMEISTER HUCK ON ARTUR

On this occasion the president, Dr. Hyde, and also Mr. de Valera were present, and the competitors were played into the ring before the event by pipe bands and saluted the President to the accompaniment of their respective national anthems.

The reception which was accorded to the English team—Major Sheppard, Major Cleeve and Captain Butler—was such as must have moved the heart of any Englishman present, exceeding as it did even that given to the Irish team and being followed by the singing of the National Anthem by the crowd. In the ensuing competition France was first, Ireland second, Germany third and England fourth, though the English team received some compensation for their lack of success through the presentation of the special individual prize to Major R. B. Sheppard, who on Blue Steel was the only competitor to do two clear rounds.

England were out of luck through the whole show and only succeeded in getting a third prize on the last day when Captain Butler did well on Big Sweep in the very last event. Before that there had been a tremendous duel between Commandant D. J. Corry and Captain Chevallier for the Irish Challenge Trophy. These two competitors each did five rounds of the course, or part of it, before the result was decided; Commandant Corry on Red Hugh eventually being declared the winner after a fine display of consistently safe jumping. Germany added to her laurels by winning the last competition from Ireland.

One of the most enjoyable of the jumping events was the inter-hunt competition, which was won by the Mid-Antrim Harriers with the creditable total of only 8 faults for the two rounds, the South Dublin Harriers being second with 9 faults. The parade of the teams on this occasion was headed by the Galways Blazers, by which name most people know the County Galway Hounds.

The only other parade of competitors took place before the Irish Challenge Trophy and provided a sight which is not seen anywhere else but in Dublin; civilians in ordinary dress and hunting clothes took part with the officers in their uniforms, and an unusual feature was one competitor in full clerical dress and a top hat, the Rev. M. J. O'Reilly, who, although he did no good on this occasion, had already ridden his horse, Star, to gain a second prize in the competition for heavy and medium weight hunters over the big course.

BLUE PETER'S CHANCES IN THE ST. LEGER

THERE is little more than a fortnight before the last of the season's classic races is run on the Town Moor at Doncaster. Every follower of racing seems to think that the great race is as good as over, and that it will be won by Lord Rosebery's good colt, Blue Peter, who has already won the Two Thousand Guineas and the Derby. If he wins he will be the second horse to gain the Triple Crown in the last five years Bahram being the only one to do so since Rock Sand won it away back in 1903.

Blue Peter has won the two earlier classics and also the Eclipse, and there can be no doubt that he is a really high-class three-year-old, but many funny things have happened in the St. Leger. Odds-on favourites have gone down more than once in my time, and other hot favourites have been beaten. Horses that appeared to have only to start to win have been beaten.

It has been argued that it is the distance that beats some of the Derby winners, but, although the St. Leger is a quarter of a mile longer than the Derby, more than one great rider has told me that it is no greater test of stamina, if indeed as great as the Epsom race. Scottish Union, who won last year, is not a real stayer, but a great middle-distance horse. I doubt whether Coronach was a genuine stayer, and I have never thought that Caligula, Polemarch or Salmon Trout really stayed, but they stayed long enough to win this Doncaster race.

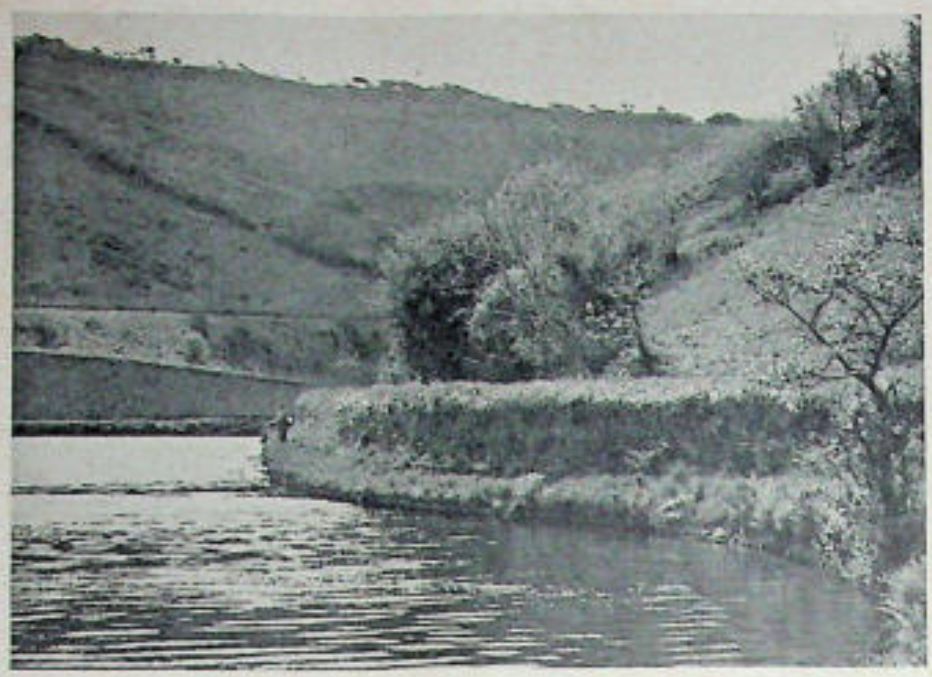
If on any of this season's known form Blue Peter is to be beaten at Doncaster it will be, so it has been argued by those people who must argue, because he cannot stay the mile and six furlongs over which the race is to be run. If my view just expressed is correct then Blue Peter will win, for as he stayed the Derby distance with ease at Epsom, he should be able to stay the St. Leger distance. Further, his trainer has satisfied himself that the colt can stay a mile and six furlongs with ease. Horses that have lost the St. Leger when they looked good things have been beaten sometimes because they have lost their form; sometimes because they have met opponents who have made exceptional improvement during the summer; sometimes because they have been over raced during the summer and sometimes because, like Manna, for instance, they have gone wrong just before the race.

Is it possible, I am wondering, whether there can be any horse in the race at Doncaster at the beginning of next month, who has made exceptional improvement during the summer or who, it may be, has only just reached his best? Of one thing we can be sure, and that is that Blue Peter will not be beaten because he has been over raced this season. He has been most carefully and judicially managed and will come to Doncaster, if all goes well with him, a larger and better colt than he has been before.

Heliopolis is, I consider, his most dangerous rival, but he has had more racing than Blue Peter and did not run quite as well as I had expected at Goodwood. He may have another race this week at Hurst Park. Still, he is trained by a master of his profession, Walter Earl, and he will know just how much work his horse wants; some want more, and some want less. Heliopolis will stay every yard of the St. Leger distance, and, although on known form he should not beat Lord Rosebery's colt, he will give him a race. I would repeat in this connection what I wrote after the Derby. Heliopolis did not get a clear run in that race, whatever the photographs in the papers may show. The films show that he was crossed at a most important part of the race. If I have a bet on the race I shall not leave out Heliopolis, each way.

I was not so much impressed with the running of Pharis II at Longchamp in the Grand Prix as were some others who saw him run. He is small, and if he stays home as well as some of our colts, then I shall be surprised. I consider that he beat nothing in the Grand Prix, for Tricameron had been going backwards and forwards between this country and France, and, even if he were at his best, he is not anything like the same class as Blue Peter and Heliopolis. After all, it was only close home that he caught and beat Tricameron. It is said that he was interfered with, but such interference may have helped him to stay the distance.

FLIERS IN THE FLYING HANDICAP PLATE AT WINDSOR



Mr. Monkhouse's Angel Bread is leading the field half-way with the winner, Captain G. S. Barnes's Portworth, coming through on the right

There has been support for a comparatively unknown three-year-old owned by Lord Astor, named Quick Ray. He has won his only race this season, but that told us little about him. He is a very good looking and a very well-bred colt, well enough bred to win any race. Presumably Gordon Richards will ride him, and he has always shone as a rider at Doncaster. His handling of Chulmleigh a few years ago in the St. Leger was masterly. He had a much easier ride on Singapore, also owned by Lord Glanely and trained by Captain T. Hogg. Quick Ray has been quietly backed by some people for the race. Another sort of outsider is Wheatland, who keeps on winning races and who stays well, but he has a long way to make up on form to beat either Heliopolis or Blue Peter, one of whom will surely win the race. Heliopolis each way remains my bet.

There is still more outcry for photographs to decide close finishes after two or three incidents at Windsor, but I am still of the opinion that it would be waste of money. It is true that I did not agree with the results at Windsor, but then I may have been wrong, and a few mistakes, if they were mistakes, would not justify the great expense that photographs of finishes would entail. Anyhow, there is no chance at the moment of the camera coming to the racecourses of this country.

GNOSTIC.

GOOD CATCHES *from* NORTH DEVON RESERVOIRS

A NICE RIPPLE ON TOP RESERVOIR AT ILFRACOMBE
Many bays and corners are a feature of these reservoirs

FORTY years ago an angler took 40 trout from the Ilfracombe reservoirs before breakfast. Then, returning for the evening rise that same day, he accounted for another 30! Although such catches are not likely, or indeed permissible, these days, yet the two Ilfracombe reservoirs still give very good sport on the right day.

These reservoirs are within three miles from the centre of the town, and within 200yds. of one another. They were formed by the building of two dams across the beautiful valley, or combe, formed by the Beaconbridge and Folly streams, and one reservoir is at a higher altitude than the other. Both are about 250yds. in length, while their breadth varies from 20yds. to 80yds. The edges conform to the natural contours of the valley, and there are thus many little bays and intriguing corners. This means variety. The fishing is by no means so monotonous as might be expected from the term "reservoir."

At the time of the big catch already mentioned, the higher reservoir contained rainbow trout and the lower ordinary browns. Now, both are stocked with the brown variety only. Conditions here would appear to be ideal for experimenting, not only with varieties of fish but also with methods of fishing.

At the present time, the fishing is restricted to the use of an artificial fly. It would be interesting to see the effect of opening one of these reservoirs for spinning, or to the use of a small fly spoon with single hook. If this were done for a limited time, say, one season, then it might possibly have the effect of weeding out some of the cannibals that are known to exist. If successful, then the same procedure could be adopted in the other reservoir, and a general improvement in fly fishing would result.

Daily tickets can be obtained from the council offices, or from the keeper, for half-a-crown. The limit for any one day is eight fish, and any that measure less than 8in. must be returned.

Fish of over 2lb. are sometimes caught, and these are very big trout for Devon. A typical basket of six fish, taken recently on a favourable evening between 6.30 and 9.30, weighed 2¼lb. The best fish of this catch was one of ¾lb. There was one half-pounder, while the remainder averaged 5oz.

Some suitable dry flies are March Brown, Black Gnat, Coachman, Alder, Blue Quill and Silver Horn. There is always a good hatch of the latter fly during the second half of the season. Perhaps the most successful wet fly is a Silver Doctor, and this should be fished fairly deep. Others include Blue Upright, Greenwell, Butcher and Black Gnat. Late in the season good results may be had with a Red Ant fished close under the banks.

In Bideford there are two reservoirs which are stocked by the local authority with brown trout. Unlike the Ilfracombe reservoirs, however, they are some distance apart, and the day tickets are not interchangeable. Jennets reservoir is some three miles outside the town, off the main Bideford—Torrington Road. Gammaton reservoir is on the other bank of the Torridge, and is reached from the old Bideford—Torrington Road. Cars can be taken to within a short walk of both areas.

Although these Bideford reservoirs are delightfully situated, they do not, perhaps, give such variety of fishing as those of Ilfracombe. On the other hand, the fish caught in them appear to be more uniform in size, and a few ounces heavier; 10in. is the minimum length that is allowed by the regulations.

Jennets reservoir is shaped like a three-pointed star and covers a considerable area. Unfortunately, a number of rushes and weeds grow in the water close to the banks, so that a deal of care is needed when landing a fish. At Gammaton there is a fair amount of rocky bottom, but the edges are free of all weed. Although the fishing here may lack some of the variety of the other reservoir, there is the decided advantage of a more constant breeze. Black Gnat, Coch-y-bonddu, Tup and Red Badger Quill are all good dry flies, while the sea-trout flies, Butcher, Mallard and Claret, and Mallard and Teal, are among the favourite wet ones.

Neither at Bideford nor at Ilfracombe are boats used. It is not known whether they are barred by regulations, but if not, then they would be a decided advantage. Any enterprising fisherman with a light, folding type of boat should have a distinct advantage at any of these North Devon reservoirs.

Considering the advantage in weight between these reservoir trout, and those to be taken in the North Devon streams, it is rather surprising to find that the fishing is not more widely known. It is recognised that they cannot hold an unlimited number of sportsmen, but they are not yet by any means "over-fished."

D. M. F.

AN OFF DAY

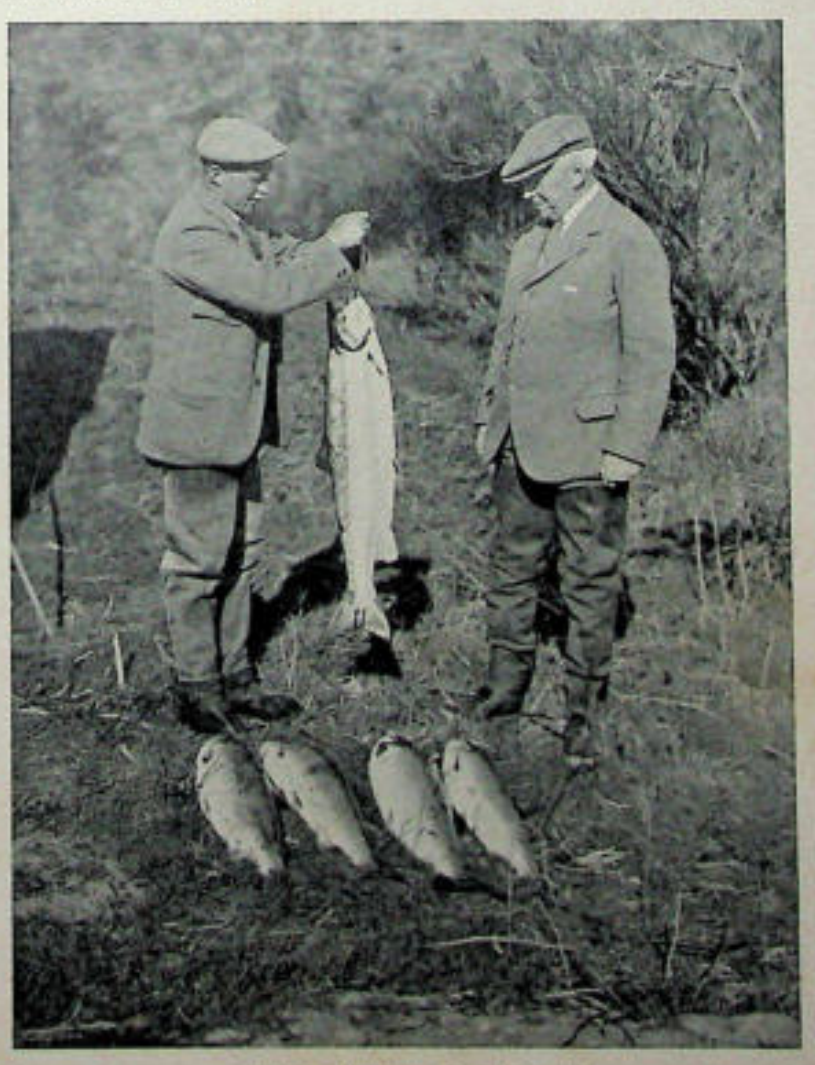
A BUMBLE BEE stung me just as I reached the water. I flung down my fishing gear, and howled with rage. The bee sailed away in the light breeze over the surface of the loch, followed by several decidedly unprintable and well-deserved words.

I had climbed nearly twelve hundred feet in hot sunshine and the most perfect Scottish scenery. White tails bobbed in and out of the rocks. I had seen three little plover chicks basking in the sunshine by their nest, and an old cock grouse had nearly given me a heart attack by "kuk-kuk-kurring" away suddenly from under my very feet. The blue sky was filled with gulls wheeling and diving with harsh cries, and curlews flapped around with their plaintive note.

My face swelled to an astonishing size, and, despite the pain, I could not help laughing as I examined it, Narcissus-like, at the water's edge. I had often heard of the expression, "a bear with a sore head," and wondered at it. Now I knew. I applied some of the contents of my flask externally to the sting, and felt a little better. I applied the remainder internally, and felt better still.

After an interval for tea I started fishing. The sun went in, and a cool breeze played round my bare knees, and crept up my sleeves. I could only see out of one eye, and fished away rather half-heartedly for an hour, when I had two rises in quick succession, and the second proved to be a nice ¾lb. fish, which fought well but was safely netted.

The sun came out again, the cool breeze dropped, and the loch was ringed with rising fish. I landed two more, and then seemed to be unable to catch anything but perch, as seven were hooked in a very short time, much to my disgust.



Fate had another little jolt for me, as in landing one of them my rod top snapped. It was a 20-year-old rod, and had been mended several times. As I mused over the question of repairing it I rounded a corner of the loch, and saw a small cottage. A wisp of smoke from its one red chimney indicated life within. "The cottage of the Seven Dwarfs," I murmured to myself as I knocked at the door. A small voice said, "Come in!" and the next moment I nearly cried out in delight. In a small stone-floored kitchen, on a tiny wooden stool before a crackling red fire, was perched the nearest and most life-like personification of the immortal Dopey. I looked round for the others, when a voice spoke behind me. It was not, alas, Snow White who was addressing me, but the well-known tones announcing that ". . . this is the National, and also the Empire, programme."

Dopey could not lend me a rod top, but he offered to row me round the loch. We embarked in a creaky old boat, half full of water, after both had satisfied ourselves that the other could swim. He was, apparently, a kind of "watch on-stop on" custodian for the reservoir, which served the big city ten miles below in the valley, and was full of statistical information concerning it. We pottered round the loch, and caught nothing, but talked at great length on this and that. He said sometimes he was alone for a week or more, ". . . but the air's grand, and I ha' the wireless." He went "doon to the toon" when he was getting short of food, but he was quite happy by himself. I said I would take his job on when I retired.

I caught one more ½-pounder when we landed, but I found it difficult to cast, and my face was still very sore. Dopey was most sympathetic, and said: "You bee sairtainly gave you both barrels!"

As I walked home I turned for a last glimpse of the loch, and in the distance I could see Dopey, with the oars over his shoulder, striding happily back to the cottage, silhouetted against the golden sunset, as he did in the film. I listened hard, expecting to hear the strains of the well-known marching song, but perhaps I was too far away. I envied Dopey. He had fresh air, fishing, and perfect scenery around him. And on the window-sill in the cottage I had noted two bottles of an amber nectar that, either neat or diluted with the water of the loch, would be a big help to happiness also.

W. S. D.

A SPRING MEMORY OF THE SPEY
At the end of the day Sir Ian Hamilton Benn watches his gillie weighing up five on the bank

THE HEAVY 20-BORE GUN

By CAPTAIN PAUL CURTIS

FOR a matter of fifteen years or more, ever since the vogue for ultra light 12-bores began, I have been championing their cause in the American sporting magazines. Not because I used them or had especial regard for them in connection with our rough shooting, unless it were for southern quail and where snipe are plentiful, but because of certain factors in internal ballistics in their favour, because they represent the finest example of the modern gunmaker's craft and because of the fact that they at least deserved serious discussion in a country where they were so little known or understood.

Now, to show the perversity of man, with the editor's tolerance, it is proposed to take up the neglected cause of the heavy 20-bore, the American prototype of the British light 12-bore.

I am aware of the prejudice, namely, on the grounds of safety, whenever the 20-bore is mentioned, when one notices old heads being shaken with a frown of admonishment; and the same people are inclined to shy from a fellow guest who appears with the small gun as if he had a pocket full of adders instead of the little cartridges which he shoots. It is hard to conceive any attitude more ridiculous. It must be admitted that there have been some unfortunate accidents whereby fingers were lost when a tube was blown up because the shooter had in some manner dropped a 20-bore case into the barrel of a 12-bore; but the situation has been harped upon so long in the papers that it is hoped that it is unnecessary to go into all that again. We have had these accidents in the States also. The writer has appeared in court on several occasions in support of the gunmaker in a suit for damages, but that is hardly a sufficient reason for condemning the 20-bore gun rather than the stupidity or carelessness of some shooters. One might as logically condemn electric lighting because an occasional house was burnt down through faulty wiring.

The factors in favour of the light 12 are many, chief of which is its portability and handiness for the less active when only light charges are required, and the fact that the more charitable area of the 12-bore tube affords a shorter shot column with less pellet deformation and lower pressure.

There can be no doubt that the featherweight 12's with their 2in. cases have solved the problems of many shooters, but it is equally true that they are being used unsatisfactorily in instances where a stronger shooting gun would be of advantage. It is for those whom the shoe fits that the following advantages of the 20 are brought forward.

To begin with it is a more powerful weapon, usually weighing about 6lb. and bored for 2¾in. cases. The usual load is 2¾ drams of bulk smokeless and a full ounce of shot. Bored as they generally are full choke left and modified right, they represent a type that can be depended upon consistently to bring down heavy duck up to 50yds. So they would be equally effective for high-driven pheasants in view of their close boring.

This, however, is not the disadvantage which might be imagined, because the narrower tubes may be pointed with greater accuracy. It would seem that accuracy in shooting at long range has not been increased in Great Britain by the introduction of the driven game system. Accuracy, as we used to know it, has been sacrificed for speed in handling a pair of guns and getting off a lot of shots at certain angles and ranges.

This opinion may call down a storm of protest, but the facts are too definite to permit much argument. Outside of the gun made for the colonies, the average high-grade weapon built to-day is bored improved cylinder, and very infrequently more than half a choke. Does not that show beyond all doubt that a wide pattern is demanded?

It may be said in justice that a range of 40yds. is all that is required. True enough. But a 20-bore is deadly at such distance with the full ounce charge. There are many things in its favour apart from its narrow muzzles. Its narrower tubes and body are very strong. Recoil is hardly noticeable, as it comes back on its long line, and its slender barrels can be aimed with great ease.

There is a slightly higher deformation of the charge due to longer tubes, a longer shot column and tighter choke, but that can be tolerated in view of the more generous load, and it is a satisfaction that it is lost with a gain in accuracy. Chamber and barrel pressures are higher, but so long as they are not dangerous—and they are not so in a suitable pair of tubes—such things are not worth considering. One would not refuse a motor car of higher power because one could more easily be killed in an accident at higher speed.

This American type of 20 is the result of the fact that makers produce no high-grade shotguns of the British type over there, and most of the machine-made guns are heavy—hence in a desire for a lighter weapon with strength and range they developed what might be called a magnum 20. And in so doing they produced a more effective weapon.

There has been a concerted effort to popularise the ultra light 12 in the States, but it has met with little or no success; yet strange to say there is not a reputable London or Birmingham maker who does not annually ship 20s of the American type to the States and Canada in considerable numbers.

PRACTICE AT A SHOOTING SCHOOL IS A GOOD WAY OF FINDING THE IDEAL WEAPON

Do not confuse these guns with the 5lb. 2½oz. 20s occasionally seen about England, where they are looked down upon as the small boy's rabbit gun. For these American 20s, though they come from Bond Street, are a different breed. Do not condemn them, either, because it is possible to drop a 20-bore cartridge into a 12-bore barrel with disastrous effects. And if you have a chance to try out one of the 20s of the Yankee type, do not forgo the opportunity, even if it is at a stand for the highest pheasants of which you know. You will be surprised at its reaching qualities and how easily you connect, not only because of those narrow muzzles that point so definitely at the mark, but because you will instinctively shoot with greater care and, maybe, better results.

RIGHTS OF A SHOOTING TENANT

By W. J. BROWN

A SHOOTING tenant's position is peculiar in many ways. He does not own the land, and he does not occupy it, but he has certain rights which the law protects.

A word may be useful as to the taking of the shooting in the first place. It may be that during the spring a prospective shooting tenant makes some inquiries as to the shooting rights over a particular piece of property for the next autumn. If the owner, or the tenant who has the shooting rights, as the case may be, agrees to let them in the future, that agreement should be in writing.

Nothing formal is necessary at this stage—an interchange of letters will be enough. But if the arrangements are merely verbal they are not binding, and either party could ignore them if he chose before the time came. Whereas if there is writing, and the lessor changed his mind, the prospective tenant can hold him to his contract or sue for damages.

The actual letting should always be by deed. It is as well to have this drawn up by a solicitor if both sides wish to protect themselves. There are so many questions to be borne in mind. Is the tenant to have the exclusive right? Can he course hares? What length of notice is required to end the agreement? What game is to be left? What arrangements for helpers? The deed will require stamping *ad valorem* on the rent paid. If the shooting is in Scotland or Ireland, however, no deed is required.

A shooting tenant has certain liabilities, which it is well to bear in mind. He must exercise his rights in a reasonable way, either by himself or his guests or beaters. He cannot damage crops or hedges to an unreasonable extent, and if he did it would be no defence to say that he had done so in pursuit of game which he had a right to take.

He is not liable for damage done by rabbits or hares which are the normal stock carried by the land, for the occupier can shoot these, whether he has the sporting rights or not. But he will be liable if he *introduces* on to the land an abnormal number of rabbits. He is also liable under the Agricultural Holdings Act, 1923, for damage done by game, which is defined for the purposes of this Act as deer, pheasants, partridges, grouse and blackgame.

The liability arises in this way. If the tenant of agricultural land is not granted the sporting rights he can only kill rabbits and hares. He cannot, therefore, protect himself against the ravages on his turnips which one of our elder statesmen laid to the door of the landlord's pheasants. So the Agricultural Holdings Act gave him the right to claim for damage by game against his landlord. And the Act also provided that where the right to take and kill game was vested in anyone but the landlord, then the landlord should be allowed to claim indemnity from the person who had the right. Hence, if the tenant claims from the landlord, the shooting tenant will have to pay.

There is also the natural liability for wanton damage to the land. The shooting tenant must use reasonable care in exercising his rights. If he trumples down standing crops he will be liable for the damage, even though he did so solely for the purpose of coming to terms with his game. And if he or his beaters damage fences he will either have to make them good or pay the damage.

What of his rights? When a landlord lets the shooting rights, there is implied in the lease a covenant for quiet enjoyment, so that the tenant is not unreasonably interfered with. But unless there is an express term in the agreement the landlord can still use the land in the ordinary and accustomed way, having regard to the character of the land at the time when the rights were granted.

For example, a tenant who had taken the shooting round a quarry could not object to the noise of blasting operations. If the land is agricultural, the grantor of the shooting rights (a better term than landlord, because it may include a tenant who has the shooting to let) cannot be prevented from continuing the normal course of husbandry. The shooting tenant cannot, for example, prevent his cutting timber.

In one such case the judge said: "There is evidence that the cutting of the trees will prejudice the pheasant shooting this year, and I have no doubt that it will, but there is no evidence that the landlord is not cutting them *bona fide* and because the trees in the ordinary and proper course of management require to be cut." And in another case the occupier of a farm, over which the sporting rights had been let, cut underwood and grubbed up furze over about a tenth-part of the area, but that was held not to be a breach of the covenant by the landlord to the shooting tenant for quiet enjoyment.

It is usual in a shooting lease to insert specific covenants that the grantor will not work in the coverts after a certain date, or to limit the work to be done there. If there are no such covenants the grantor would not be liable because he carried on thinning, faggotting and timber hauling, even if it disturbed the game, provided that it was in the ordinary course of estate management.

But the grantor must not intentionally do anything to injure the exercise of the rights he has granted. He may not entirely change the character of the land, for example, by selling it for a building estate, or cutting down all the timber for commercial purposes. If he does so, the shooting tenant may either get an injunction to prevent his doing so, or may recover damages for the injury to his rights.

In one famous case it was held that a shooting tenant was entitled to protect his rights by burning heather to leeward to stop a fire spreading. But this remedy of self help should be used with caution. And, incidentally, when taking shooting rights over heather, any agreement for burning it should always be included in the lease.

TWO GREAT BATSMEN

By NEVILLE CARDUS

THE evidence is accumulating that the next English team to visit Australia will be extremely strong in batting, and that it will contain two of the finest young players we have ever sent over the seas. I allude, of course, to Hutton and Compton. Comparisons are probably odious; none the less, it is fascinating to make them, so long as we bear in mind that there is one glory of the sun and another glory of the moon. Whenever I see Compton at the wicket this season, I am satisfied that he is the best young stroke-player since Hobbs flashed on us thirty years and more ago. And whenever I see Hutton I am equally as satisfied that he is the most complete batsman, the most fully and beautifully organised in technique, since Tom Hayward.

Recently I was fortunate enough to be present at Leeds when Hutton won the match for his county against Lancashire. On a bowler's pitch he scored 105 out of 147 for five; nobody else got as far as 20. We saw Hutton "fathering" such veterans as Leyland and Mitchell. He commanded the situation, and played on an average five balls an over. His colleagues were obviously mortal and fallible, likely to lose their wickets every ball. Hutton played every ball *with the middle of his bat*. He cut the slightly short ball outside the off-stump late and on the ground; he turned the slightly short ball on the leg-stump with strong and certain wrists. When the Lancashire bowlers pitched the ball up, to avoid these two behind-the-wicket strokes, Hutton stepped out of his ground and drove with a power that was concealed by his easy poise.

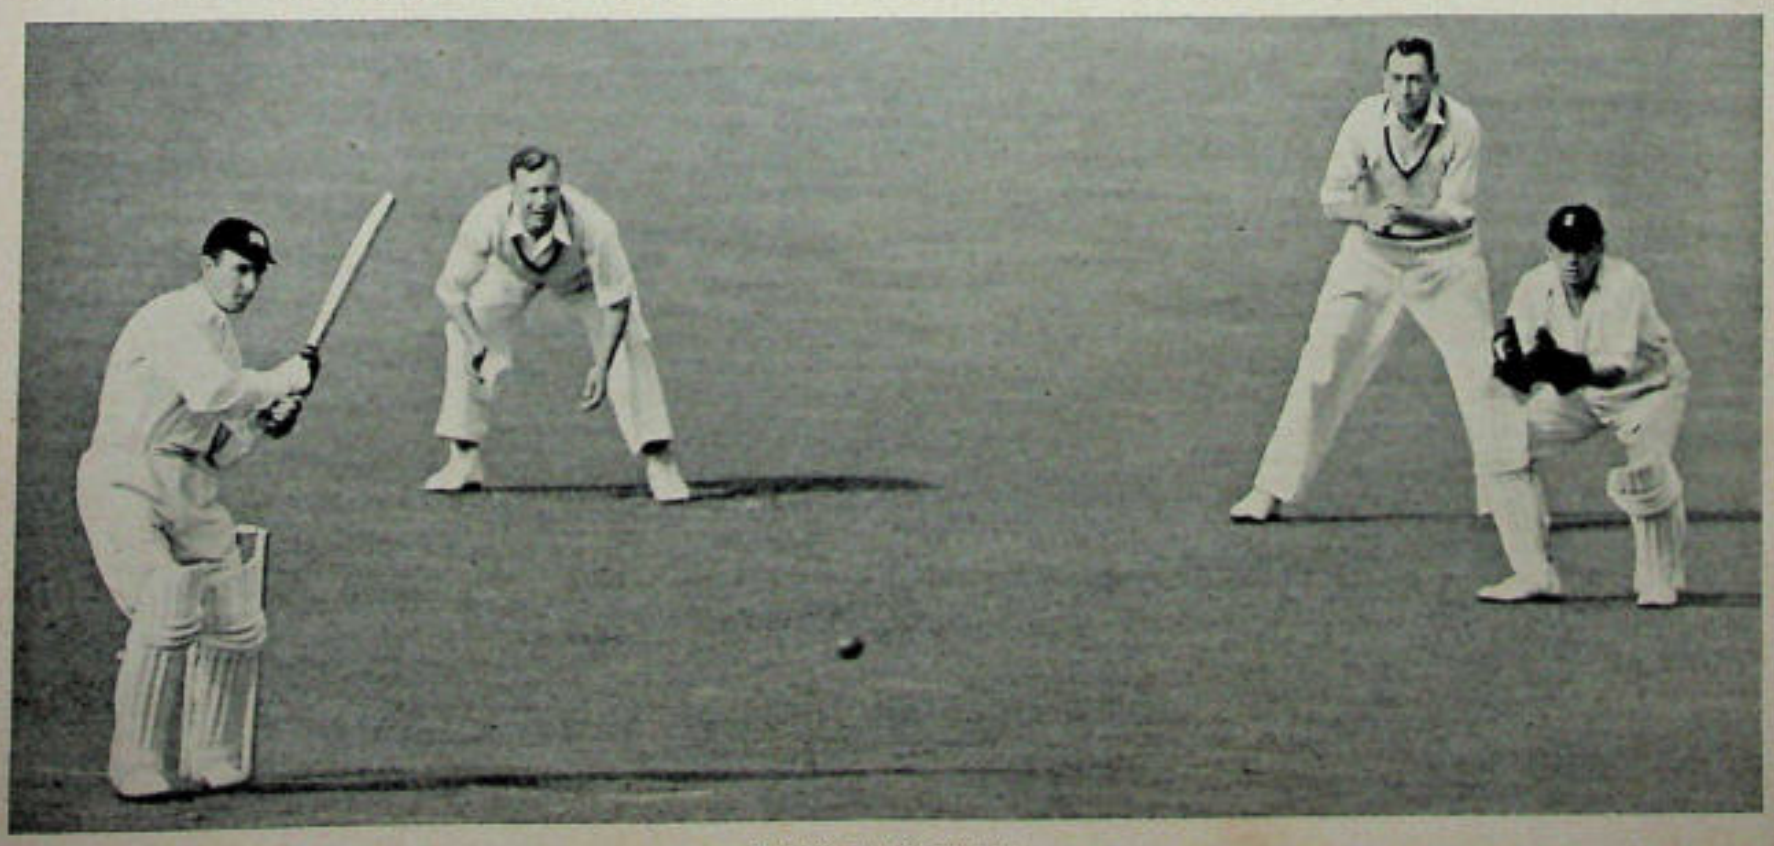
In a cricketer who is still not much more than a boy it was quite astonishing to find batsmanship as "knowledgeable" as this, as wise and as soundly principled. And for all the science and thoughtfulness of it, the innings was free, stylish, alive, with a sense of Hutton's own enjoyment of what he was doing. This was not the inhuman robot who achieved the "record" in the Oval Test match a year ago; here was an artist as well as a craftsman. The true sign of a great player is the ability to control a perilous situation.

The view generally held amongst cricketers up and down the land is that Hutton possesses a "sounder" defence than Compton's, and that Compton will always be the easier of the two to get out. If you watch Compton carefully, you will now and again suspect that he does not put his left leg close enough to the offside ball. But I am coming to the conclusion that this is an apparent and not a real defect in Compton's technique. The fact is that he makes his offside strokes strongly and securely enough. I fancy that even though he may sometimes play the offside ball with his arms in front of the front leg—I fancy that he neutralises this formal weakness by a right arm of uncommon power.

Compton is certainly a more improvisatory stroke-player than Hutton is: Hutton seems to have planned an innings, thought all the details out in advance. Compton, at his most brilliant, gives the impression that he is free to treat any ball in two or three different ways. A cover-drive by Hutton is handsome but logical. The same stroke by Compton is seemingly inspired on the spur of the moment by the player's spontaneity of temperament; he might have given us a hook, a pull, or a late-cut instead!

Hutton and Compton together in a great stand will be an example on the cricket field of the eternal dualism of life and all activity—the classic and the romantic; age and youth (for Hutton's cricket has never lacked old-headedness); reason and instinct; the Aristotelean and the Platonist—if in an article on such an innocent game as cricket I may use this strong language.

I believe that Hutton and Compton are, at their slender years, as gifted a pair of batsmen as cricket has known in all its history. The jealous old 'uns will no doubt remind me that bowling is so poor that it is easy, or comparatively easy, for a young batsman to make a reputation nowadays. "How would Hutton and Compton fare against, say, Kortright, J. T. Hearne and Blythe?" The answer is that a great player satisfies an *absolute* test by his technique, which we can examine as style and science to find out whether it is convincing and comprehensive in itself. If you watch Hutton, you will see little if anything that is wrong in mechanism and range; obviously here is a method (and a governing mind and character) guaranteed to cope with any of the known resources of bowling, ancient or modern.



Besides, it is fallacy to suppose that in "the old days" bowlers of the calibre of Barnes, Hearne and Blythe were swarming over all our cricket fields, terrifying the young batsmen of that period. I have seen Hutton and Compton tackling a difficult attack on a difficult wicket—an attack as challenging as most in existence before 1914. By their methods, as well as by performances, by technique as such, Hutton and Compton compare well with any players of their ages that I, or anybody else, have ever seen. The imagination trembles with pleasure to think of the splendid things these two players will accomplish, to the pleasure of thousands—if only they are allowed the chance.

Hutton and Compton are typical of the revival that has happened in batsmanship during the last few years. Only yesterday, it seems, we were groaning under the boredom of the "dead" bat, the poke "round the corner" off the pads. Our eyes and our sense of cricket's loveliness were outraged by the "two-eyed" stance. Hits on the offside were becoming obsolete. This year, in spite of the wet weather, we have seen brilliant stroke-play in most matches—even in the Lancashire and Yorkshire match. I cannot recall, in all the thirty years I have watched cricket, a more *cultured* stroke-technique than you may see any afternoon in this present weeping summer from Hutton, Compton, Oldfield, the boy Robertson, Barnett, Hardstaff, Dollery, Washbrook—to name only a few, and not to mention Hammond. Oldfield, I am glad to see, has got the chance he has so obviously deserved. He has all the requirements the selectors are looking for. He is young, a batsman of rare ability, and a great fielder. In the North many consider that Hutton has only one rival and that is Oldfield. When he comes to the Oval this Saturday we shall see how true that is. When the new leg-before-wicket rule was brought in, the diehards said it would spoil footplay and cramp strokes. It has so far had an entirely opposite and refreshing effect!

HUTTON HOOKING

"I am equally as satisfied that he is the most complete batsman . . . since Tom Hayward"

COMPTON TURNS TO LEG

"Whenever I see Compton at the wicket this season, I am satisfied that he is the best young stroke-player since Hobbs flashed on us thirty years and more ago"

Democracy in cricket. These two spectators, seen at Lord's, might be colonel and batman

ROUND THE WICKETS

By HUMPHREY DANIEL

ONE of the gunners had found a cricket ball in his kitbag. Prospective players, in ammunition boots, overalls and khaki shirts, had taken the field on the narrow stretch of mud which lies behind the group of huts officially known as Hyde Park Camp—and unofficially as anything under the sun. We recognised it at once. It was the Oval. There could be no doubt about it. There was the Pavilion, four of them in fact. There, undoubtedly, was the Vauxhall end with the camp's four boilers smoking themselves black in the face in their efforts to look like gasometers. There was the enormous crowd—a bunch of gaping faces peering round the fence and looking as if they had taken the wrong turning for Regent's Park. And there, too, was the sight-screen—a lone tea-cloth of doubtful hue which some trusting soul had hung out to dry outside the cook-house.

Only one thing suggested that it was a game of cricket, and that was that it was played with a cricket ball. The wicket at one end was an edifice of two billycans, one perched perilously on top of the other; at the other end, nothing—with the batsman at the mercy of the bowler's generosity—and direction. For bats there were a variety of inventions. The first man in tried an ordinary piece of wood. When at last he did make contact he had to leave the field wringing his hands like a maiden in despair, but hardly with the language of one. The next man tried a broom—one of those things which always remind one of "black and midnight hags." He was equally unsuccessful. As he had perforce to use a scythe-like motion, because every attempt at playing straight resulted in a blow on the chin, it was not very long before the crash of the billycans behind him were ringing his fall. The next man had the best weapon of all. It was a large and heavy Army spade. The batsman dealt out blows right and left like some mighty Vulcan at his forge. The game became even more complex, even more devoid of rhyme or reason. The stoppages became even more frequent because where before the ball had merely to be poked out of the dixie of potatoes behind the wicket it now had to be retrieved from under the huts—a game in itself. It was on one of these quests into the nebulous unknown that a speculative pole struck a bottle—and we, in turn, struck beer. And it was here that Alby appeared on the scene.

Alby, known to his few enemies as Albert, held the position of assistant to the cook. In other words, Alby was not only a very wise man but also a very resourceful man. And it was not beer this time which had drawn him from the cook-house. In his arms he bore what at first sight appeared to be a small tree and at second proved to be the roughest of roughcasts of a cricket bat. It was so large that it covered the entire wicket, and as Alby was so small that he could put his legs behind it and defy the world in general, we had some difficulty in getting him out. Just as we were getting rather tired of Alby, and Alby's position was looking rather unhealthy, the bowler happened to notice a large saucer-like hole, made possibly by some unfortunate gunner in the face of the sergeant's wrath to encourage the earth to swallow him up, about 2 yds. from where the leg-stump is normally rooted. It was so large that his first attempt went straight home. Alby, seeing the ball sailing innocently down somewhere outside his rear, turned his attention to more pressing issues (I suspect it was what had happened to the bottle of beer). We were quite unable to convince him that the crash of his wicket had been made by the ball and not the boot of an exasperated wicket-keeper. And so we finished, in true army tradition, in hot argument—and the canteen.

* * *

There was a time, well within memory, when Worcester was amongst the down-and-outs of cricket. They were always at the bottom of the table; they never had any batsmen, never made many runs, and they never had any bowlers and never got many sides out. When they won a match, it was almost headline news. The only time they touched the threshold of fame was when the Australians came and used them as a sort of bicycle to try out their paces at the beginning of the season; when Bradman used to come to score an inevitable double century which broke the hearts of their bowlers for many a day. Poor little Worcester it always used to be. To-day poor little Worcester are sixth in the county championship. They are above strong Surrey, above great Lancashire. They have swamped sides like Sussex. They have beaten Yorkshire. Poor little Worcester are getting up. They are not only on their feet again, but taking on the might of the game. Why is this? What has turned the weakling into a side to be respected and even feared? There is, true, the fast bowling of Perks, and the thrilling batting of the boy C. H. Palmer. But that is about all. And it cannot account for everything. Worcester's rise is one of the great surprises on which the game of cricket is nourished.

* * *

Not even the most sensational of co-starred comets from Hollywood can challenge the popularity of Compton and Edrich nowadays. They are doing a great service to the game. They are bringing back youth into it. Compton can hardly move off a cricket ground now without an admiring train to uphold his greatness. (The other day I saw a gentleman come out of the gates of a county ground simply howled out of existence when he put forward quite a creditable pretence to a crowd of small boys after autographs that he was indeed the one and only Denis Compton.) Edrich has not been so fortunate, or rather he has been too cherished by fortune, almost bewitched by her smile. One day I have no doubt the less intelligent representatives of the press will say of him: "Failed, because he had too many chances." People are still speculating about Edrich. What is the matter with him? Is he really a great batsman? Is he going to prove us all wrong in the end and the selectors right?

The answer, I think, lies at the other end—when Compton is batting. Watch Compton drive a half-volley. The stroke is decided without hesitation, is perfectly balanced, instinctively timed; the ball fairly skids over the ground to the boundary, *all along the ground and between the fielders*. Now watch Edrich play the same shot. There is not the same quick decision, the same balance, the same timing. And more often than not the ball goes straight at a fielder. And how many times in an innings does Edrich stir the hopes of opponent spectators by being caught off "bump" balls? He is always doing it. He obviously gets too far over the ball, nullifies the power of his shot by driving the ball into the turf. The difference between Compton and Edrich is the difference between a great batsman, an immortal player and a great county batsman, someone to be remembered when all the deeds of a Compton have been told. The ingredients of a great batsman are an uncanny pair of eyes, a brain behind them which can read instantly the message they telegraph, a comprehensive array of strokes perfectly geared and timed, an ability which is almost an instinct to put the ball anywhere, and the fortune to be born a great batsman. Compton has them all. Three years ago, when I first saw him bat, I did not think so, but he has turned out to be the greatest discovery since Hammond. He has proved me wrong. I hope Edrich will.

KEEPERS AND BEATERS DURING A HALT ON THE PITCHROY MOORS BANFFSHIRE

THE SCIENCE OF MANIPULATING GROUSE

By MARTIN STEPHENS

I ALWAYS think "driving" as applied to grouse is a bad rub. It does not suggest the process required. It makes one think of a "kick in the pants." Now, the grouse does not need a kick in his buff and brown breeches: he wants a gentle hint. He should not be driven, but manipulated.

Large numbers of beaters are not required for such purposes. Naturally, every man differs to some extent, and much depends on whether drives are to be "staggered" or not. For a single drive in August I should say up to two dozen are required, while in September one can do with less. Beaters should be warned before moving off about talking. It is not sufficiently generally realised to what extent the human voice terrifies birds and beasts. I know a first-class keeper who will not even use a whistle. They should be deployed whenever it is possible on a line parallel to the butts, and they should remain evenly spaced. This information may seem a little elementary, but it is essential to carry it out. A mile from the butts would be a good distance for deployment, though in August it could be less.

If beaters carry a flag, or a handkerchief tied to a stick, it is a good thing to give the keeper or underkeeper a coloured flag, which has a certain commanding significance as it flaps. As the beaters approach the line of the butts each should be made to hold his flag as high as possible above his head to draw attention to his position, particularly so when there is dead ground in front of the butts.

Beating is comparatively simple. Flanking is all important and extremely difficult. In my opinion the headkeeper should normally be the chief flanker, and an added advantage to this is that in the majority of cases he will get a clear view of guns, grouse and advancing line. He can thus make plans for future drives, or for the placing of future lines of butts. In a normal drive, if there is a cross-wind at all, he will be on the down-wind side of the butts, about 100yds. in front and to the flank.

There will be another trained flanker about 200yds. farther away from the butts, and slightly farther out, and the same on the opposite flanks. If the keeper can see beaters and butts he is in a good position for signalling the "off."

Early in the season birds will not fly far, but will settle again. This becomes annoying if there is a grouse trap in front of the butts, as birds are inclined to settle in it and rush the butts at the end of a drive. These coveys should always be fired at, even if they are almost out of range. The converse holds good. When birds are wanted through the butts, for a return drive, packs coming up-wind should not be fired at till the leading birds have passed the butts. When driving is started too early, as I am afraid far too often is the case, no attempt should be made to force forward every bird. A covey of cheepers, whose parents have been driven forward, are probably a covey lost.

The art of the flanker is a subtle one. It is the art that is required on the Stock Exchange, in a love affair, and in cross-examination that of knowing when to stop. If the flanker jumps up as soon as he sees the birds coming to him, and waves his flag like a semaphore arm in a crisis, the birds will almost certainly break back over the beaters. On the other hand, if he flaps it like a signaller ending a hundred word message, the birds will but quicken their pace and pass on. A good flanker appears suddenly at the critical moment. His appearance coincides with the arrival of the grouse to his front as accurately as a Hollywood star's with the press photographers. Such a flanker, incidentally, can help quite a lot with the pick-up.

For many years I have held it as a first principle of manipulating game that a very close study must be made of the direction of the wind. I was very much surprised to read an article in the *Field* by Arthur Hipgrave, probably the most experienced partridge general living, that he did not alter his partridge drives in any way owing to the direction of the wind. Yet I cannot believe that wind is not of paramount importance in grouse driving. On a property on which there are several beats I would advocate that where there is a possible choice, the beats and order of drives should not be arranged till the direction of the wind is known. The first drive will, of course, be down-wind. Grouse will fly back to dinner into the wind, but they will not fly away from dinner into the wind. Therefore they should be put off their feeding grounds first. What the grouse has in his mind all the time, except in moments of panic, is the question of to-morrow's dinner and to-day's.

If there is a real hurricane blowing it is not as easy to put grouse down-wind as one might imagine. There is also a degree of wind which a grouse will not fly into to get back to the most tempting feeding grounds. When grouse have been pushed off high ground to a lower and more sheltering part of the moor they become exceedingly difficult to manœuvre. I learnt this from Lord George Scott's book, and then went and saw it in practice. It is a very easy thing to ignore the obvious. The man in the butt can remain unconscious of minor tactics throughout his life if he wants to.

Placing of butts, however, is a thing that even the least observant of us can look at, and in the intervals before the drive starts it is rather fun trying to work out what has gone through the minds of the keepers who placed them. Or rather what is going through the mind of the grouse that flies over them, for they should be put to intercept the natural flight of grouse. Grouse are very fine cartographers, and they are connoisseurs of contours, which they cling to with an abiding affection. Therefore it is easier to place butts on undulating ground. Bear in mind in particular the spot where the grouse will ultimately land. One does not wish them to end their day in MacNaboth's vineyard over the burn. A sheltered lower hillside beyond the butts is an attraction to them as a settling point.

I think all lines of butts should be made longer than is required. Six is the ideal party, but for reasons of hospitality many hosts want to have eight out. One can leave the flank butts empty according to the wind and adjust the flankers as necessary. No numbers should be painted on butts. Numbers have a mesmeric effect on guns. If No. 1 gun is in a butt labelled 3, it is no good expecting the man who drew 3 to find his way to No. 5. He is on his holidays, and be damned to arithmetic.

Butting must be adjustable. "Nothing is sacred"—not even the line of butts which the last laird but two erected three years after the death of the Prince Consort. A case in point is the lone butt of the Two Burns drive at Moy. Lord Chesterfield, arriving late and being unable to take his place in the line, placed himself some way below No. 1 butt, and shot 39 grouse. Macintosh immediately erected a butt there, where it remains to this day.

GREAT SOCIAL CLUBS—VII. THE TRAVELLERS'

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

CLUBS are like regiments. Outwardly, they may appear to the casual observer much the same—resembling two regiments standing on parade. Inwardly, some intangible spirit or aura permeating through all the members of either of them makes them, in truth, completely different one from the other. The Travellers' Club is certainly no exception to this rule. Ever since it was founded, it has possessed a complete and distinct personality of its own. Internationally, it is probably the most famous of all the clubs to be reviewed in this series.

Lord Castlereagh, the statesman, is credited with having been the moving spirit in its foundation. At its inception, it was set forth that "the object of the club was to form a point of re-union for gentlemen who had travelled abroad, and to afford them the opportunity of inviting as honorary visitors the principal members of all foreign missions and travellers of distinction." To be eligible for candidateship "it was necessary for a person to have travelled out of the British Isles to a distance of at least 500 miles from London in a direct line." This rule still holds good to-day.

As, however, more than one great traveller has been rejected for the Club, it would appear advisable for the intending candidate to fortify himself with further credentials than that of a morning's flight to Rome or Vienna. Early in the history of the Club, it was discovered that several members did not possess these necessary qualifications. This got out to the papers and was much too good copy for them to miss, and they made a "sensation" of it. They then published a list of places of the prescribed distance from London to help the members and intending candidates!

The immediate necessity of the Club was to find a home for its members, and in 1819, an agreement was entered upon for the lease of No. 12, Waterloo Place for 21 years, for the Trustees of the Society called the Travellers' Club. At the start, the number of members was limited to 400, but applications of candidates were so numerous that it was shortly extended to 500, and then to 600 members.

It became necessary to try to secure a larger building. Fortunately, at this time George IV had decided to move from Carlton House to Buckingham Palace. Carlton House, on which he had spent vast sums of money, now came under the demolition order. In consequence, a large number of sites along the south side of Pall Mall became available and the Trustees of the Travellers' Club were able to obtain a crown lease of their present site from October 10th, 1829, for 99 years. It has since been renewed. The committee to settle the arrangements about the new house was certainly a powerful body. Amongst its members were the Marquis of Lansdowne, the Earls of Aberdeen, Ancrum and Dartmouth, Earl Beauchamp, Viscount Palmerston, Lord Auckland and the Hon. Robert Clive. They selected as their architect Mr., afterwards Sir, Charles Barry, who later was to become the architect of the new Houses of Parliament.

The house he erected for them is generally accepted to be one of Barry's finest works. When it was completed, he is said to have exclaimed that he had raised an edifice which did not admit of alteration in the smallest particular. Later on, we

THE DOOR OF THE LIBRARY

It is covered with book jackets and imitation shelves

are to see how his prophecy was vindicated in a manner probably he could never have expected. Barry derived the general idea of the Pall Mall front of the house from the Palazzo Pandolfino at Florence, the design of which is attributed to Raphael. Mr. Leeds, author of the *Public Buildings of London*, states that the resemblance between the two serves to show how much the beauties of a model may be improved upon by a free imitation of it in the hands of a master. He claims that there is a "sveltezza" in the English Palazzo, which the Italian one does not possess and more variety in its individual features; it has also more unity of character. In another passage, Mr. Leeds says: "We here behold the full beauty of the Italian—not the Palladian—style, purified from its defects and all its baser alloy, and stamped by a severe kind of dignity that renders it truly captivating." To mark their appreciation of Barry's work, he was now made a member of the Club—a singularly fitting compliment. The house, together with all fittings and furnishings, has cost the members £30,905 10s. 7d.

To revert to the early years before Barry's house was built, 12, Waterloo Place was first opened for the reception of members on August 18th, 1819, and the names of the first foreigners to receive an invitation as visitors were selected on May 20th, 1820. The conspicuous feature of the first elections held was the number of candidates who failed to pass the ballot. This particular feature has remained no novelty in the elections at the Travellers' and has persisted all through its history up to the time of the Great War. Probably, one of the most marked changes in society that the War brought about has been the complete indifference now shown by members of nearly every club in their own elections.

It is, indeed, now quite necessary to drive members into the room where the ballot is held in order to get the necessary quorum. Personal enmities seem largely a thing of the past or, at any rate, appear no longer to extend to club life. Yet in the times we are speaking of, there were no ends to which people would not go to exclude a person uncongenial to themselves from entering their club. An instance is on record of a Scottish nobleman having hired a special train from the north of Scotland to London so that he might be in time to blackball a man coming up for election at his club. It is doubtful whether this nobleman has one living descendant who would take the trouble even to walk across the room to blackball anyone for his club.

Among some of the original rules of the Club which to-day strike a strange note are: "Every member making use of the smoking establishment is requested to put one shilling in the box for the use of pipes" and another that the secretary should dine with such of the upper servants, at a separate table, as hereafter may be agreed upon. The admission of distinguished foreigners had not in all cases proved an unqualified success, some of their names and titles having been found to be the most distinguished part about them. There had also from time to time been complaints from the members on the subject of the overcrowding of the accommodation in the house due to their excessive numbers. Finally, after these various points had

THE STAIRCASE AT TRAVELLERS' CLUB

The narrow rail was added to help Prince Talleyrand up and down when he was a member between 1830 and 1834. An inscription is attached to the rail stating the purpose for which it was added to the wide balustrade

caused friction more than once, it was resolved that the recommendation of two members of the club for their introduction was not sufficient, unless the same shall be supported by the recommendation of the Ambassador or Minister of the country concerned.

The most famous of all the Foreign Ministers and diplomats to make use of the Travellers' Club was Prince Talleyrand. When he was in England between 1830 and 1834 as the representative of the Orleanist dynasty at the Court of St. James's, he made constant use of it. He took great pains to ingratiate himself with English society, and his social success was very great. Much of his leisure time was spent playing whist at the Travellers' Club. The handrail of the grand staircase being far too wide to permit of anyone's grasp, it was therefore furnished with a central mono-rail by the grip of which the aged statesman went up and down. An inscription on the rail reads: "This rail was attached to the balustrade for the use of Prince Talleyrand-Périgord, Ambassador of France, 1830–1834, during which time he was a member of the Club."

In December, 1850, a fire broke out in the night and the billiard room and all its furniture was completely destroyed. Barry was again called in to repair the damage. In 1861, Mr. Robert Smirke, professor of architecture at the Royal Academy, informed the committee that the Royal Academy proposed to award its silver medal to the student who made the best architectural drawing of the garden front of the Travellers' Club. This had always been considered to be the most beautiful front of the house.

Six years later the committee got themselves into serious trouble by an ill-advised action on their part. Without consulting any authority on these matters, they removed Barry's ornamental stone balustrade outside the Library and substituted iron railings. Mr. Edmund Barry immediately wrote to the committee, protesting against his father's work being defaced. The committee, however, would not yield, whereupon Mr. Barry set public opinion ablaze by a letter to *The Times* in which he complained of this act of vandalism in destroying the charm of symmetry, finish and beauty of proportion which had always caused the garden front of the Travellers' Club to be considered one of the best works of Sir Charles Barry. He described the substitute put up by the Club "as common bulging iron railings of a design which I can only describe as Baker Street vernacular." After this, the Commissioners of Woods and Forests joined in the fray and demanded to know why the committee had done this without their sanction and contrary to the terms of their lease. Yet still the committee quibbled, and tried to get out of making any alteration. Fortunately, the Woods and Forests stood firm, and Barry's balustrade had to be put back. It is to be regretted that people who do the same sort of thing now are not treated in the same firm way.

In the course of the Club history the committee has also had some very difficult members to deal with. Quite early on, a certain Colonel Fox, a Member of Parliament, took upon himself to erase the name of every candidate in the book who was not down as being proposed and seconded by a member. The committee wrote to him most strongly, objecting to his action. Thereupon, Colonel Fox replied to the effect that he had again defaced the opposite page and would continue to do so every time a candidate's name was put down in the book without the names of his proposer and seconder. At the time this controversy took place there was nothing in the rules to say that this was necessary whenever the candidate's name was inserted in the book. It must be obvious, however, to every clubman that Colonel Fox's principle was a right one, and eventually he won the day, a rule being passed to give effect to his wishes.

The next trouble was of a more serious nature. In 1878, Colonel Dawkins, a member of the Club, published several pamphlets under his own name addressed to members of the Club. In these pamphlets, the honour, rectitude and respectability of the members of the Club were impugned. One of them was addressed to General Stephenson, then in command of the Home District and a member of the Travellers'. The inscription on the wrapper was entitled, "Dishonourable conduct of Colonel (now Lieutenant-General H. Stephenson)." Needless to say, these pamphlets were placed before the committee, and Colonel Dawkins was asked to explain his conduct. He, however, declined to give any explanation or to submit to their jurisdiction.

After several discussions his expulsion from the Club was finally ordered by a general meeting. Dawkins then brought an action against the Club, which he lost. Undeterred, he took the case to the Court of Appeal, who confirmed the original decision. With considerable generosity, the Club returned him his subscription for 1879. The only other person to put the Club to any real serious inconvenience was a member who used the billiard room as a place to shoot himself in.

After the War the Club, like many others, had to face up to the difficulty of maintaining their membership. Among the steps taken to popularise it was the very important one of placing the election of candidates in the hands of the committee. It was obvious that the long-persisted-in custom of blackballing candidates had to end if the Club was going to survive the difficult times ahead of it. There can certainly be no club which can show from its foundation a more distinguished roll of members than that of the Travellers' Club. On the Club's first roll there were no fewer than five who became Prime Ministers—George Canning, the Duke of Wellington, Lord Aberdeen, Lord John Russell and Lord Palmerston. Seven, also, of the original members were destined to be Governor-Generals of India. Famous statesmen of more recent times who have also been members are Mr. A. J. Balfour and Mr. Baldwin. All through its history the Club has borne on its roll the names of men distinguished for all time in every sphere of the national life. It can, in truth, be said that it is the history of England since 1819.

There are no oil paintings of any note in the Travellers' house, but a large collection of engravings of past distinguished members are to be found everywhere. The library, reputed to be one of the most beautifully proportioned rooms in London, not unnaturally includes some valuable early books of travel.

THE SMOKING ROOM

Among some of the original rules of the Club is one to the effect that "Every member making use of the smoking establishment is requested to put one shilling in the box for the use of pipes"

LETTERS TO YOUNG FLY-FISHERS

IX.—Dry-Fly Fishing and What it Means

MY DEAR BOB,—I am delighted to hear that an invitation to your cousin's water has materialised. As I mentioned in my first letter it is an uncommonly good piece of dry-fly fishing. You will need to use there a different method of fishing from any you have done hitherto, but the tackle you now have will do very well; in fact I had the possibility of dry-fly fishing in mind when I suggested certain of the tackle details in my original list. For example, my emphasis on a tapered line and tapered cast. In dry-fly fishing accuracy in casting and the way the line falls on the water are all important; hence the necessity for a line which tapers gradually from the rod point to the fly.

This does not matter so much as regards wet-fly fishing in rapid streams, for in them a long line is a disadvantage; very little line should lie on the water, as I explained earlier; but in dry-fly fishing you will always have 10yds. or more of line lying on the water, and you would find yourself badly handicapped if you had to cast with parallel line and gut. So while a tapered line can be used quite well for wet-fly fishing, a parallel line cannot be used advantageously for dry-fly fishing. If you are going to do both, the tapered line is the better investment.

I can see you have been talking to someone about dry-fly fishing, and I am not sure that you have got quite the right idea about it. Simply using a dry fly (*i.e.*, one which is tied with stiff hackles to make it float) is not necessarily dry-fly fishing. But I am not going to write you a treatise on the origin and development of the dry-fly system. Suffice it to say that at the beginning of the last century anglers began to note that in certain streams trout had the habit of picking flies off the surface during a hatch, and that the methods then in use—which were really the same as those you have been using in Devonshire—were not a very good imitation of the behaviour of the fly when it had just hatched.

They tried to devise a method which imitated the behaviour of those "duns" more exactly, and found they caught more fish. The system has been developed very ingeniously during the last hundred years and has now become what we call "dry-fly fishing." What I should like you to bear in mind most particularly is that the real aim and object of the dry-fly fisherman is the imitation of the behaviour of the flies during a hatch; the imitation of the appearance of the fly is often helpful, but the main point is to imitate its behaviour.

When you first get to Dorset it is odds you will be tempted to think you have come to a pretty poor fishing water. Apart from a weir at the head of the reach and the weirpool it has formed below, there are no deep holes, no rocks or small waterfalls, and few sizeable stones behind which a trout can lurk; the whole three-quarters of a mile consists of moderately swift unbroken water, filled with weed in September; just the kind of water, in fact, in which feeding trout are not found in Devonshire. Actually there is more clear bottom than appears, for the full-grown weed trails a long way downstream and hides many clear gravel runs where trout will be lying hidden from your view.

But chalk-stream trout have adopted a different mode of feeding from those in swift water. There is no need for them to find a quiet lay-by and dart from it to absorb a morsel. While feeding, they take up a position in the stream itself, a few inches under the surface, except in shallow places. If you are on the water when the rise is on and you can get the right angle for the light, you will see shadowy forms lying broadcast all over the river, on the top of a weedbed and at the tail of the trailing weed. Wherever there is a gleam of yellow gravel visible, careful inspection is almost sure to show you one or two trout, and when the rise starts you will see the rings of fish feeding quietly under the banks as well.

It is while the rise is on that one fishes in a chalk stream. That is one essential difference in the technique. You do not cast where you think a fish is likely to be; you cast to a rising fish whose rings you can see; in fisherman's English you "fish the rise"; you do not "fish the water." Although nowadays this has become a convention, there is sound reason behind it. Except in a few places where an open patch of gravel enables you to see a fish, it would be useless to cast on a chalk stream when no fish are rising, for they are under the weed and will not see your fly or take any notice of it. On the other hand, they will see you on the bank, for a man is much more visible to a fish lying under strands of waving weed than a fish is to a man, since the shadows on the bottom confound the fish with its surroundings. To "prospect" on a dry-fly water on the slender chance of a fish seeing your fly is rightly considered unsportsmanlike, for you spoil the water for other rods, while your own chance of success is exceedingly small.

I am telling you this because you will probably find that your cousin will impose what appear to you to be "rules" for fishing his water and you may be inclined to chafe at restrictions which involve many hours of idleness, but there is good reason behind them. You may remember I mentioned that your three-quarters of a mile of the Bray would be none too much for a day's fishing, and from your letters you evidently found it so. But on a chalk stream it is otherwise. Your cousin has probably about the same amount of water, but there is room for three rods instead of one; and I verily believe that, if they were first-class fishermen, three rods could fish the rise on his water day in and day out through the season without doing it any material damage. So never cast except to a feeding fish.

I do not think you will find the fishing itself any more difficult than the fishing in Devonshire once you have grasped what it is you are trying to do. Flies hatch out in just the same way, but since the water is altogether quieter they remain on the surface longer after they have hatched and the trout get a better chance of taking them in the dun stage. You will not find the fish make a sudden dash to annex a fly as they do in a swift stream. There they have to be very quick about it or the swift current will have carried the fly out of reach, so they are not usually particular as to how the fly floats. But in a chalk stream they can see the fly coming down on the surface from a couple of yards away, and there is plenty of time. Trout generally get in front of the fly; then rise and suck it in just as it comes over their nose. And what you have to do is to make your artificial fly come floating down on the water in just the same way.

The first thing to notice is that flies *stand* on the water; they do not float with their bodies; they stand on their feet with the body held above the water. This is very important because you can easily realise how very different *from below* a fly must look when it is standing on the water from one which is lying in the water. In one case the surface of the water is between the fish and the fly; in the other the surface is broken by the fly's body. One still occasionally sees flies offered for sale with hollow bodies or bodies made of cork, and their merits extolled on the ground that they float well. Such flies are perfectly useless for dry-fly fishing since the body does not have to float at all. The fly must stand up on its hackles with the body held above the water if it is to imitate a dun which has just hatched.

In consequence flies for dry-fly fishing are tied with a rather stiff hackle which stands out like a ruff all round its neck, and if you take one of these flies and drop it on to a glass of water you will see that only the hackle points penetrate the surface, and it is when a fly alights like this on the water as the result of a cast that you stand the best chance of getting a fish. So to fish successfully the fly must fall lightly and it must remain dry enough to stand on its hackles for several casts.

DRY-FLY WATER WHERE THERE ARE NO DEEP HOLES, NO ROCKS OR SMALL WATERFALLS, AND FEW SIZEABLE STONES BEHIND WHICH A TROUT CAN LURK

To attain this end a fisherman does three things: he greases his line so that it floats (but not the cast, for grease will make it too visible to the fish); he makes "false casts" backwards and forwards in the air half-a-dozen times or more between each cast to dry his fly; and he casts at a point in the air above the water so that his line extends first and then drops; the fly should flutter down, so to speak, on to the water and not come down hard on to it, otherwise it will immediately become waterlogged and fish will ignore it.

Some, probably most, dry-fly fishermen anoint their fly with paraffin (or some patent preparation) which helps in keeping it dry. The effect is to waterproof the feathers temporarily so that the water is thrown off easily as it is from a duck's back; but it should be noted that such preparations do not, as is often believed, make a fly float; they only preserve its floating powers. A fly which will not float well when perfectly dry will not float when anointed even with the most expensive unguent. I will write you about the fishing itself next week.

Your affectionate uncle,
HARVEY.

A TITHE BARN IN DANGER

By DENNIS FLANDERS

As many motorists know, the great trunk road to Bath beyond Marlborough runs along the crest of the Wiltshire Downs for many lonely miles. Where it drops into the vale of the Bristol Avon stands the village of Cherhill, a typical village of a townsman's imagination. There is an inn on the main road, three lanes leading off, connected by another; all lined with hedges and interspersed with elms. Between them stand a few thatched cottages, with their own kitchen gardens, and at the end of the village are the church, the manor house and the tithe barn. There it stands, between the Downs and the Vale, a complete mediæval village. I said "stands," using the present tense. For there may be an unfortunate change in the near future. The great tithe barn, an integral part of the village, with its position so close to the church, is for sale. And it has a great deal of fine timber and a roof of stone tiles—two things in great demand to-day by builders of "antique" houses, and by our cousins across the Atlantic.

In the thirteenth century this Wiltshire village belonged to Richard FitzJohn. After his death it passed to his brother-in-law, the Earl of Warwick. It was again a part of the Warwick estates when the King-Maker was killed at Barnet, in 1471, after which it reverted to the Crown. Henry VII subsequently restored the confiscated land to the same family for one generation. During the seventeenth century there is actual mention of this tithe barn in the church records. Since the end of the fourteenth century this barn, for all the world like a cathedral, has stood up against the winds that blow down from the lonely hills.

Its total length is 110ft. and width 35ft. You could put the whole church inside it and a few cottages as well! The main structure is rough-hewn timber, built on the cruciform principle, standing on a low masonry wall, and roofed with shale stone tiles. It is divided into eight bays by means of seven trusses. There are four porches walled with stone of a later date. The flooring is various, part of concrete, part of timber and part of naked earth. The side walls are of oak studs and panels, and the ends are of weather boarding applied to oak stud framework. It has been inspected by H.M. Office of Works, which has issued a scheduling order and recommended preservation.

These remarks will show that the barn is well worth saving, both from an historical and a structural point of view, and because it is an essential part of a complete mediæval village. Its inspirational value, too, is tremendous. And then, beyond all these reasons, is its æsthetic value. I have seldom seen anything more impressively beautiful than its dark interior, with the sunshine streaming in through the open doors, touching the old beams with brightness and diffusing light into the utmost recesses of the roof, as can be partly seen in my drawing reproduced above.

As to the present state of the barn, the official report tells a sorry tale of fractures and leakages, leanings and saggings—but for all that, its condition is very far from being hopeless. The greatest trouble is the weight of the tiles (estimated at 100 tons!) under which the roof rafters are sagging. Once the tiles are off the timbers can be straightened, the roof put back, and the barn can go on for another 500 years.

Now it could either be a Youth Hostel or a village hall. In the first case a partition could be made in one end to contain the sleeping quarters, and the rest of the barn used for meals and as a common room. Schemes have already been set on foot with this in view, but have failed, so far, through lack of funds. In the second case, what a splendid meeting-place it would make as a village hall! The local branch of the County Library could be housed there instead of in the school as at present. Nor must it be thought that these ideas are doomed to failure. There are many examples of successful preservation; a tithe barn in Hertfordshire, now turned into a library; one at Bradford-on-Avon an agricultural museum; and the Youth Hostel Association use a barn at High Roding, and converted water-mills at Houghton and Winchester. Also quite a large number of stone tithe barns are preserved as ancient monuments for all time.

As usual, the difficulty is lack of funds. Mr. J. Millhouse, of Woodhall Spa, discovered it a few years ago and bought it on the spot. He has spent a lot of money on it, and treated it with great care. Without his aid it might now be a ruin. To-day, circumstances compel him to sell, and the Office of Works have given permission for unconditional sale.

Now, indeed, we must hope that someone will come forward and provide for its future. Expert help and advice are at hand, only the money is wanting. If this is not forthcoming we shall never see that lovely interior again, and the barn, in one of the most delightful positions imaginable, will be but a memory.

HANDICAPS OF POLO PLAYERS

CHIEF UMPIRE

Major Michael Cox was appointed Chief Umpire at the beginning of the season with a view to obtaining uniformity in the interpretation of the rules. There was some complaint at the start of London polo of too much whistle, but it has gradually been borne on the players that the remedy lies in their own hands

IN the Revised Handicaps issued at the end of the London season, and which are operative during the remainder of the season, as yet happily some distance away—you may read the history of the past three months. At a time when we are in urgent need of new blood in the game it is refreshing to observe that several young players have been judged worthy of advancement, more than one to the extent of a "double-remove," notably Jack Traill and Captain J. H. Montagu-Douglas Scott, who have ended up at 5 goals.

Another who has been one of the outstanding performers this season, the Hon. J. Hamilton-Russell, has gone up to 6—a well-deserved promotion. There is also Captain R. O. Critchley, who has been a great stand-by to Edmundsbury, and goes up to 5. But although most of our best players in the past were started in the game and developed their skill in the Army, the change-over to mechanisation (which many of us continue to regard as an unwarranted risk) that has been the fate of the cavalry has made it increasingly difficult to keep the game going, and if polo is to have a future we must look more and more to the civilians.

Judged from American standards, our young entry is both less numerous and less promising than we might hope for, but it must be remembered that the American player makes his polo his chief recreation, whereas with us the game is a mere incident in the year. This is intensified by the fact that English polo is essentially a part of the London season, which lasts only from May till July. Any polo manager will tell you that it is impossible to get up even a members' game at any of the London clubs once Goodwood Week has begun.

To be sure there is still lots of fun to come. The Cowdray week, not long concluded, has provided as good and as enjoyable polo as any tournament this summer, followed by Rugby, where the Optimists won the Open Cup, holiday tournaments at Le Touquet and Deauville, and, to wind up, the Dunster meeting, which goes right on to the end of September. But that very dispersion tends to lower the standard. How much more fortunate are they in America, for, though there is any amount of polo played all over the country, Meadow Brook is able to accommodate all the important polo in the East and, with its delightful country atmosphere, within easy reach of New York, there is no need to go farther. Accordingly, though they play only a tithe of the tournaments from May till October that we cram into twelve weeks or less, there is constantly the feeling that the play is progressive, leading up to the grand finale, the Open Championship, and with the 20 goals American tournament, the 12 goals, and the 20 goals championship, there is the opportunity for the young player to develop his game in constant fast polo.

Regarding that same American 20-goal championship, I have just had news of how things went. The winners were Bobby Loewenstein's not inappropriately named League of Nations team, who beat Laddie Sanford's Hurricanes in the final by 15 goals to 9, having on their way beaten Tommy Hitchcock's Sands Point team with young W. H. Chisholm and A. L. Covey, of the Yale team, and Jock Whitney at back. The former two were in the Sands Point team that won the League 20-goal tournament at Meadow Brook. That is the way to bring on young blood. Think what an incentive it must be to be playing in a team with Tommy Hitchcock with all his experience and encouragement to play up to. No wonder their men come on apace.

The tie between the League and Sands Point was, I am told, about the best game of polo they have had yet at Meadow Brook this season. George Oliver is a most promising player from the South, Loewenstein is always well mounted, but Bob Skene on this occasion surpassed himself, hitting 10 goals of the 12 his side made against 8—and that against Tommy Hitchcock. This season's polo in America has, I reckon, put 2 goals on to his handicap, and they say now that undoubtedly his place is No. 2, supporting thus a remark in these notes some time ago. There was another promising youngster in the final, Harry Evinger, one of those hard-riding, hard-hitting Texans that exist up from time to time. Cecil Smith and Rube Williams were the lungs. So ends a gallant and distinguished career.

It is a pity the young and promising player in England is constantly (especially in the Army) compelled to keep a low handicap team together at the expense of his personal progress: too often he is forced to play back in the game, at No. 3 or back, and so, though we have plenty of useful players throughout the country in those positions, we are hopelessly short of good forwards. Perhaps some day we shall have a polo centre that will accommodate as many people as wish to play, not too far from London, and which, owing to the large number of players who wish to stable their ponies and to play all their polo there, may be able to reduce the cost of playing, which year by year makes it increasingly difficult to keep in the game.

In our country clubs they are hard put to it to keep going, and that they do so at all is thanks to the few wealthy and public-spirited sportsmen who are ready to put their hands in their pockets to make up deficiencies. But on every hand one hears that regular players, who used to be able to pay for their polo by making young ponies and selling them at a reasonable profit at the end of the season, are giving up owing to the importation of foreign—mostly Argentine—ready-made ponies, which can be bought at a lower figure than the English article can be produced, and are very nearly as good. There is a strong, but at present not vocal, agitation for the imposition of an import duty that will at least give the home producer the chance to compete with the importer on an equality.

THE XOEUD-VINCENT GROUND AT LE TOUQUET

Now brought into use this season after having lain fallow since 1914

two of them. It is as much the system of playing their polo as anything else, time, money temperament or climate that brings on young American blood.

At the time of writing I know of only three teams definitely entered for the Open Championship this autumn, though no doubt others will be added. These are first and foremost Greentree, who won in 1935 and 1936 before being deprived of their honour by their cousins of Old Westbury in 1937. Now Jock Whitney has all the best of Sonny Whitney's string—and what a string that is—and, as the racing experts say, "Anyone who wins will have them to beat." The team will be J. P. Grace (young blood again), Bob Skene, Tommy Hitchcock and Jock Whitney. Charlie Wrightsman's Texas team will consist of himself, Eric Pedley, Cecil Smith and Winston Guest, which on paper is probably the most formidable of all three, and Bostwick Field, an amalgam of that and Aknusti will be G. H. Bostwick, E. T. and R. L. Gerry and Eric Tyrrell-Martin. There is, too, a probability that Mike Phipps and Stewart Iglehart will team up together.

The projected challenge for the cup of the Americas has come to nothing, which is regrettable, for the likely American team with Pedley, Smith and the two Guests would have had a fair chance of recovering the cup, though Americans do not, I think, show up so well against Argentines as they do against us. I hear that the British ponies who remained over there after the sale have mostly been going well, but I grieve to hear that old Tatters, the flea-bitten grey by Tag Rag out of Corunna, has died as the result of a haemorrhage of

It certainly seems to me that the production of the home-bred pony should be encouraged, and it would no doubt have the effect of keeping men in the game who cannot well be spared. In England polo is less of a rich man's game than it is in America, and most of our good players manage to keep up by selling one or two ponies each year. We have our peculiar needs and these should be considered sympathetically.

Though three teams are, I understand, to be broken up at the end of this season, it is to be hoped that there will be replacements and that we need not despair. The ideal team is one in which each member has his own string of ponies, which the leader may be able to supplement by the loan of one or two of his own as occasion arises. It gives a great incentive to the individual and seems in every way desirable.

If we ever challenge again for the Westchester Cup (and that at present seems problematical), I hope that an intensive search will be made in England a good two years before the series begins for suitable ponies.

There are undoubtedly plenty of them about, but the trouble is that so many of them never get a chance to show their quality through being kept in moderate polo. As an instance three English ponies that we had seen last year in London, and which had not impressed us with their ability to any vast extent, proved themselves on the International Ground at Meadow Brook as unquestioned internationals. There are scores of the same sort up and down England to-day if only we can find them. JEMADAR.

SIR JAMES WILSON OF INVERTROSSACHS LEADING HIS PARTY UP TO THE BUTTS OVERLOOKING LOCH VENNACHAR

A DISAPPOINTING TWELFTH

WHATEVER fortune may have befallen all the various parties who were out on the moors on the Twelfth, it can be said that at least in certain cases they enjoyed bright weather. And whatever the sport, it is indeed a disappointing experience to wake up to torrents of rain—there seems nothing quite so wetting as a Highland deluge—on this day of days. Where grouse are plentiful, too, heavy rain is inimical to the best of results, as birds are far more likely to become restless, and when shot present a bedraggled appearance which, especially where they are to be sent away as presents, is to be deplored.

There is a good deal of truth in the well-worn saying that "the best time to estimate grouse prospects is at lunch-time on the Twelfth," and experiences in many instances seem to be bearing this out. As, of course, is always the case, whether for business or social reasons, some moors are not shot right at the very beginning, and it is not possible to make any really fair or comprehensive statement by way of summary of the whole situation. Comparatively few reports, too, have yet come to hand. Whatever, therefore, is said must fail to be representative of the shooting as a whole. However, at a venture, it would seem that if the season turns out to reach the average of recent years it is quite as much as can be expected. This opinion is based both on those reports of bags that are already in and on the general situation up to the beginning of the month. As has already been made known in the *Field*, a generally favourable winter was followed by a wet spring, and then by prolonged drought in May and June. There was disease—a great deal of it in some places—and the tick has done its worst in not a few districts. The heather beetle has deprived the grouse of its livelihood on large areas of normally good shootings, and while some moors have been forsaken by the birds, others have been overcrowded. All these are factors which are bound to exercise an adverse effect, though the real extent of it cannot be measured till the season has advanced.

Of those counties in Scotland in which the pre-season prospects seemed to encourage a fairly cheerful outlook, Banffshire and Aberdeen provided the brightest spots, and what reports there are to hand have confirmed this view. On the Balmoral moors, for instance, there has been no disease, and H.M. the King, who was shooting on the opening day, found a good stock of birds. At Glenmuick, too, Sir Victor Mackenzie enjoyed fair sport. At Pitlochry, in Perthshire, where birds are reported as healthy, there are still a number of backward coveys, which has militated against early bag-making.

Coming to England, while on certain moors near the borders of Cumberland, Westmorland and Durham there has been some good sport, Yorkshire for the most part has fully justified the pessimistic reports that were made. This has been the black spot for disease, which has made untold ravages over a very wide area. Probably the generally undulating nature of many of the moors which cannot claim the great variations in altitude that those in the Highlands can, has helped to make matters worse. No sadder case of the seriousness of the situation is likely to be forthcoming than that on the famous Blubberhouses moor, the scene of much shooting history, where the bag on the Twelfth was but nineteen brace to seven guns.

When, however, the season is a little older and shooting has become general will be the time to see just how wide-spread has been the inroad of disease and what districts have been more fortunate.

Aberdeenshire

ACHBEENACH.—On the 12th, 25½ brace of grouse were killed by six guns in three hours before lunch, walking up: Admiral Lumsden, Major-General Sir Frank Connor, Lieutenant-Colonel R. H. Woods, Mr. A. M. Bennett, Mr. Q. H. I. Irvine and Captain M. B. Pollard-Urquhart. Strong westerly wind, heavy showers. Plenty of birds, all fully grown, but wild and rising far out.

BALLOGIE.—On the 12th, 80 brace of grouse were killed by eight guns: Sir J. Burnett, Sir George Abercromby, Brigadier-General H. P. Burn, Lieutenant-Colonel W. V. Limmles, Major H. M. Clowes, Mr. D. G. Cochran, Mr. P. E. H. Warner and Colonel R. J. Nicol. Plenty of birds. A strong wind in the worst possible direction.

CLOVA.—On the 12th, 160½ brace of grouse were killed by six guns: Mr. E. Hubert Litchfield, Mr. Wm. N. Beach, Mr. Post, Mr. H. C. Brown, Mr. E. G. Baetzer and Mr. H. Baetzer. Very heavy north wind, fine, some slight showers. Birds strong and plentiful.

KILDRUMMY.—On the 12th, 54 brace of grouse were killed by six guns: Mr. W. A. Bailey, Colonel W. Dugald-McCombie, Colonel J. C. Simpson, Lieutenant-Colonel F. C. Maitland, Lieutenant-Colonel R. P. Varwell and Brigadier-General C. Ogston. Birds very plentiful and strong. Very strong wind interfered with driving.

Argyllshire

ACHNAGOUL.—On the 12th, 20½ brace of grouse were killed by four guns: Mr. J. Campbell Blair, Mrs. Campbell Blair, Major G. E. G. Grant Forman and Mr. John MacKean. Birds plentiful but wild.

Ayrshire

SOUTHANNAN.—On the 12th, 40 brace of grouse were killed by nine guns: Mr. David Boyle, Mr. Alasdair Boyle, Mr. Ranald Boyle, the Earl of Glasgow, Air-Commodore the Hon. John Boyle, Mr. C. L. Hill, Mr. H. Cowan-Douglas, Mr. P. Wilkinson and Sir C. MacAndrew, M.P. Strong west-north-west wind spoiled morning drives, but day was fine and sunny. A very good show of birds, all strong, and no disease at all. Heather good.

Cumberland

BRACKEN BANK.—On the 12th, 67 brace were killed by eight guns: Mr. A. C. Shepherd, Mr. T. B. Foster, Captain the Hon. Caryl Bartuc, Mr. A. Mathias, Colonel Williams, Mr. G. Cuthbert-Walker-Heneage, Mr. Mervyn Seames, Mr. Stanley Robinson. A strong wind did not help driving. Shorter drives produced best results. A surprising number of backward broods. A very nice lot of birds, and much better results may be expected next week.

Inverness-shire

DALRACHNEY, CARRBRIDGE.—On the 12th, 48½ brace of grouse, 1 woodcock and 1 snipe were killed by seven guns: Mr. Alastair Currie's party walking in line, two parties—Mr. J. D. Jenkins, Mr. T. F. Rawle, Mr. R. Mackay, Colonel D. Mackay, Colonel G. P. Grant, Mr. J. M. Munro Kerr, Mr. H. L. Usher in morning only. Strong N.W. breeze. Birds strong and wild.

GLENSHERO LODGE, LAGGAN BRIDGE.—On the 12th, 41 brace of grouse were killed by four guns: Major Horne, Captain Norton, Sir Peter Farquhar and Captain Trotter. Very wet and windy. Birds very patchy and a lot of second broods.

MOY.—On the 12th, 61 brace of grouse and 15 various were killed by five guns: Mr. F. D'Arcy Cooper, Mr. R. Thibaud, Mr. S. R. Cooper, Mr. H. A. Benson, Master D. Martin. Driving and walking up.

Kincardineshire

GLENFARQUHAR AND DRUMTAVERD.—On the 12th, 85½ brace of grouse and 4 blue hares were killed by seven guns: Sir James Caird, Bart. (Proprietor), Viscount Arbuthnott, Brigadier-General A. G. Pritchard, Mr. John Elliott, R.A., Mr. Peter Elliot, R.S., Master James Scudamore, Master Edward Scudamore. Better show of birds than last year. Birds strong and well grown. No signs of tick except on blue hares. Heather good; in bloom.

CRY AND RICKARTON.—On the 12th, 9 brace of grouse, 11 hares and 7 rabbits were killed by 3 guns: Viscount Stonehaven, Lord Forbes, and Commander Hobbs. Short day. Shooting over setters. Coveys extremely wild. Stock of grouse patchy.

Perthshire

BALNAKEILLY.—On the 12th, 35½ brace of grouse, 2 snipe and 1 wild duck were killed by five guns: Mr. A. E. Berry with Mr. Doble C. Berry, Captain John Courage, G. Cross and Miss H. Kalaud. Walking in line, birds strong and no evidence of disease. Driving prospects better than average of last two years.

BORESPIC.—On the 12th, 16½ brace of grouse were killed by three guns: Sir Robert Burrows, Mr. Miles Burrows and Mr. David Burrows. Coveys small, but well grown, healthy.

CASTLE MENZIES.—On the 12th, 59 brace of grouse were killed by eight guns: Lieutenant-Colonel J. Gordon Ramsay, Major W. H. S. Alston, Captain F. Bonham Carter, General Sir Archibald Cameron, Lieutenant-Colonel S. H. Charrington, Brigadier-General K. J. Kincaid Smith, Mr. Alex. Mitchell, General Sir Arthur Wauchope. Driving was difficult owing to wind.

DALMUNZIE.—On the 12th, 32½ brace of grouse were killed by two guns: Mr. Archy Birkmyre and Mr. J. Robertson. Weather fair, occasional showers. Birds seem more plentiful; young, healthy. No signs of any disease in birds or heather.

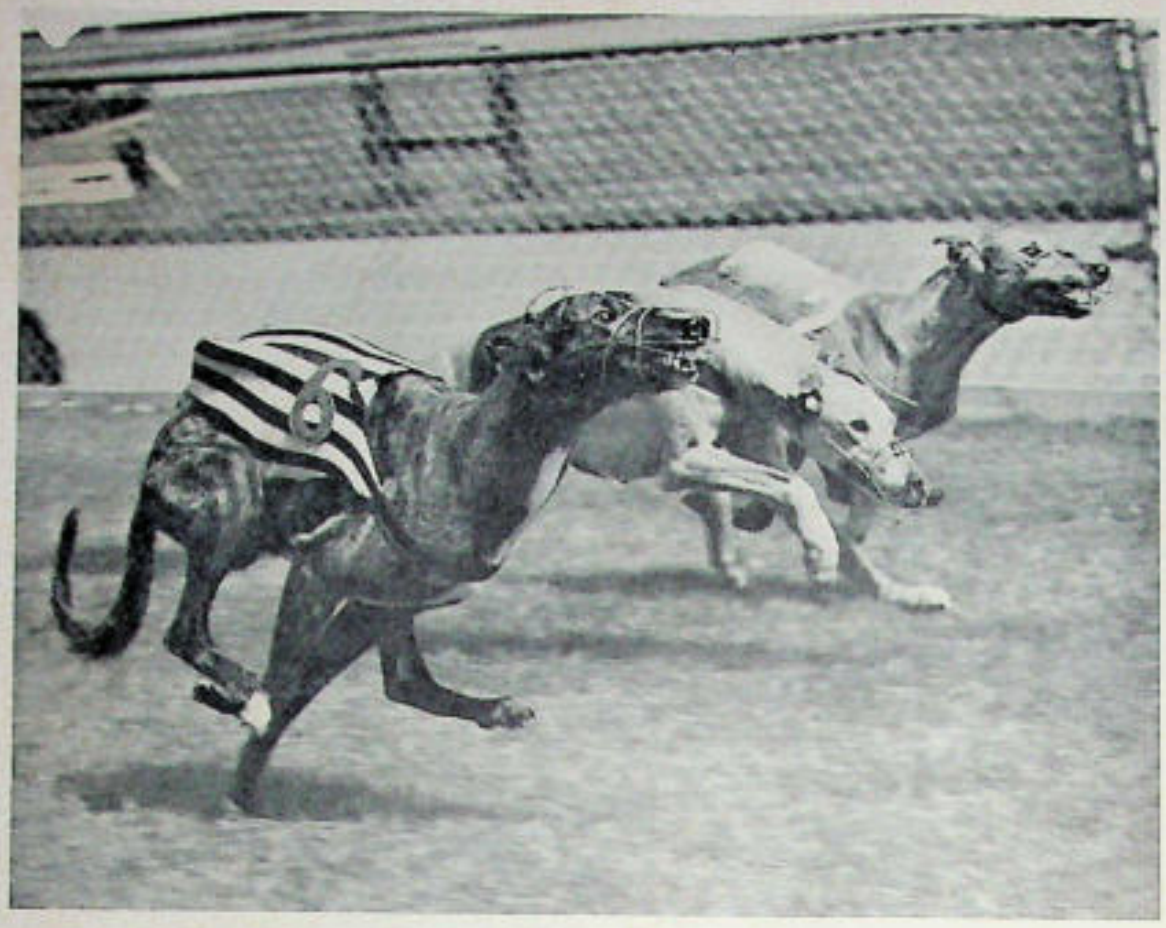
GLENDEVAR.—On the 12th, 25½ brace of grouse were killed by three guns: Hon. A. Dewar, Hon. Mrs. Dewar and Mr. Douglas Parker. Birds quite well grown, but rather patchy on the ground shot over.

KIPPEN.—On the 12th, 33 brace of grouse were killed by six guns: General Sir Reg. May, Admiral Thomson, General Reddie, Colonel Innis, Major Duncan, Mr. D. Thomson. Birds very strong and wild; good coveys and up to usual.

ORCHIL.—On the 12th, 14 brace of grouse and 3 woodcock were killed by four guns: Colonel R. G. Dawson, Mr. Peter Dawson, Mr. J. M. A. J. Dawson and Captain A. T. Dawson. Fine day. Mr. J. M. A. J. Dawson and Captain A. T. Dawson. Fine day. Birds in good condition and well grown. Numbers not up to average.

RIEMORE.—On the 12th, 24 brace of grouse were killed by four guns: Mr. Alexander Ramsay, Mr. Michael Lyle, Major J. R. Cooper, D.S.O., Sir A. M. Lyle. Birds very wild. Coveys on the whole small—average about five. Judging from this part of the moor the season might be an average one. No signs of disease, and the heather promises well.

THE BARRACKS.—On the 12th, 15 brace of grouse were killed by four guns: Major Mann-Thomson, Mr. J. W. Mann-Thomson, Sir George Stirling, Bart., Colonel the Hon. D. P. Tollemache. Coveys were good but scarce. Heather good.



TULLIERET.—On the 12th, 15½ brace of grouse, 20 hares and 13 rabbits were killed by three guns. Sunny fine day, westerly wind. Birds wild, strong and healthy, heather good, fair prospects for season.

Ross and Cromarty

KINLOCHEWE.—On the 12th, 17 brace of grouse were killed by five guns: Mr. Leslie Garton and party. Coveys fewer and smaller than last year. Birds fairly well grown. No trace of disease. Very wet morning.

Yorkshire

DEEPSIDE MOOR.—On the 12th, 65½ brace were killed by seven guns: Lord Charles Bentinck, Lord Bingley, Earl Grey, Lord Colum Crichton-Stuart, Sir Ronald Graham, Captain Macmillan, M.P., and Mr. Richard Cavendish. Weather was showery with some bright intervals. Birds all very healthy and in good condition; some very late broods.

A TRIAL AT THE WHITE CITY
Doctor Champion (No. 6) at speed with Neurology and Sneezy

THE VETERINARY SIDE OF GREYHOUND RACING

By DALE BOURN

DURING the parade at any greyhound race-meeting many are the remarks that can be heard on all sides concerning the appearance of the animals. Such ejaculations as, "Don't they look wonderful!" "Don't they look fit!" "Aren't they beautifully sleek!" are the types of remarks that are made by many present—mostly, need it be said, by the fair sex!

Few, however, give a thought to the magnitude of the task of keeping 65,000 or so greyhounds registered with the National Greyhound Racing Club in racing trim or to those who devote their time to this end.

Being as susceptible as young children to illness and disease, and their value, or potential value, being what it is, it is obvious that no risks can be taken with their health.

The collection of many hundreds of greyhounds in one kennelling establishment creates a grave danger to the spread of contagious diseases.

Again the hazards of the race itself are responsible for many unavoidable accidents. It is small wonder, then, that the N.G.R.C. insists upon very strict veterinary supervision over all the many race-courses licensed by them.

Since the advent of greyhound racing, veterinary surgery and research work has taken enormous strides forward. The big racing companies have utilised, advantageously, many thousands of pounds to further this great work.

Each racing kennel has a resident veterinary surgeon, and one or two assistants attached to its staff. A racing establishment such as that owned and operated by the Greyhound Racing Association at Northaw is equipped with an up-to-date hospital, laboratory, operating theatre, x-ray apparatus and ultra-violet ray room.

Research and investigation have proved that diseases may be imported into the kennels from an outside source. These may be introduced by a newcomer or by food contamination, and many are the safeguards used to protect the kennels. For instance, isolation quarters are provided, and into these go all new arrivals for a fortnight and remain under observation during this period. Any symptoms of contagious diseases will have manifested themselves within this time, and can accordingly be treated in order to prevent infection or contagion to the rest of the kennels when they are transferred into regular training quarters.

So strict are the measures taken in this respect that those visiting observation kennels are made to dip the soles of their shoes in disinfectant before entering and again on leaving.

Infection due to food contamination is guarded against by regular veterinary inspection and analysis of the food prepared for consumption.

The milk they drink is analysed at definite intervals and is regularly tested for purity and fat content. It is part of the vet.'s daily routine to inspect all kennels to see that they are scrupulously clean. What is probably most remarkable is the revolutionary discovery made by veterinary officials of greyhound racing companies in the treatment of the two most serious canine maladies—distemper and hysteria. Distemper—the bugbear of all dog breeders—is rather akin to a virulent form of contagious gastric influenza, resulting in high fever and causing the animal to waste away until it dies. Hysteria, on the other hand, is a nervous disorder—the origin of which is as yet undiscovered.

It is the prevention, rather than the cure, of these two deadly maladies with which the vets. at the big racing establishments are concerned. Modern veterinary research work by the Royal College of Veterinary Surgeons in co-operation with the laboratories of the big pharmaceutical companies and those of the greyhound racing companies, and originated and sponsored by the *Field*, has resulted in the discovery of an anti-toxin which has completely defeated this distemper. In recent years at Northaw, mortality from this cause has dropped from 53 per cent. to less than 1 per cent., or practically nil. No death from this cause has taken place at Northaw for three years. Nowadays puppies are inoculated with this anti-toxin serum between the ages of one and three months.

Hysteria, it has been found, can be counteracted by a complete change of diet. Thus a dog showing the slightest symptoms of this malady is immediately switched over to an entirely new diet. If the animal has been used to a preponderance of vitamins, it is straightway changed to proteins and vice-versa. Complete rest and quiet in a darkened kennel is a further necessary part of the treatment.

Modern kennels being constructed draught- and damp-proof as they are as at Northaw, and having central heating and air-conditioning installed, have obviated such ailments as cramp and rheumatism, but when a greyhound—usually passing the prime of life—is attacked by a bout of either of these, treatment by infra-red radiant heat or ultra-violet ray is at hand.

Other complaints, such as bronchitis, pneumonia, enteritis and gastritis, although most rare nowadays, do occasionally occur, and the vet. immediately has all such cases removed to the hospital for treatment and nursing.

"Accidents will happen" is a trite saying, but nevertheless very apt when applied to the racing greyhound. Whereas diseases are now, thanks to modern veterinary precautions, most rare, accidents and injuries still continue. Up-to-date veterinary surgery saves the life of many an animal that would in the olden days have been "put down."

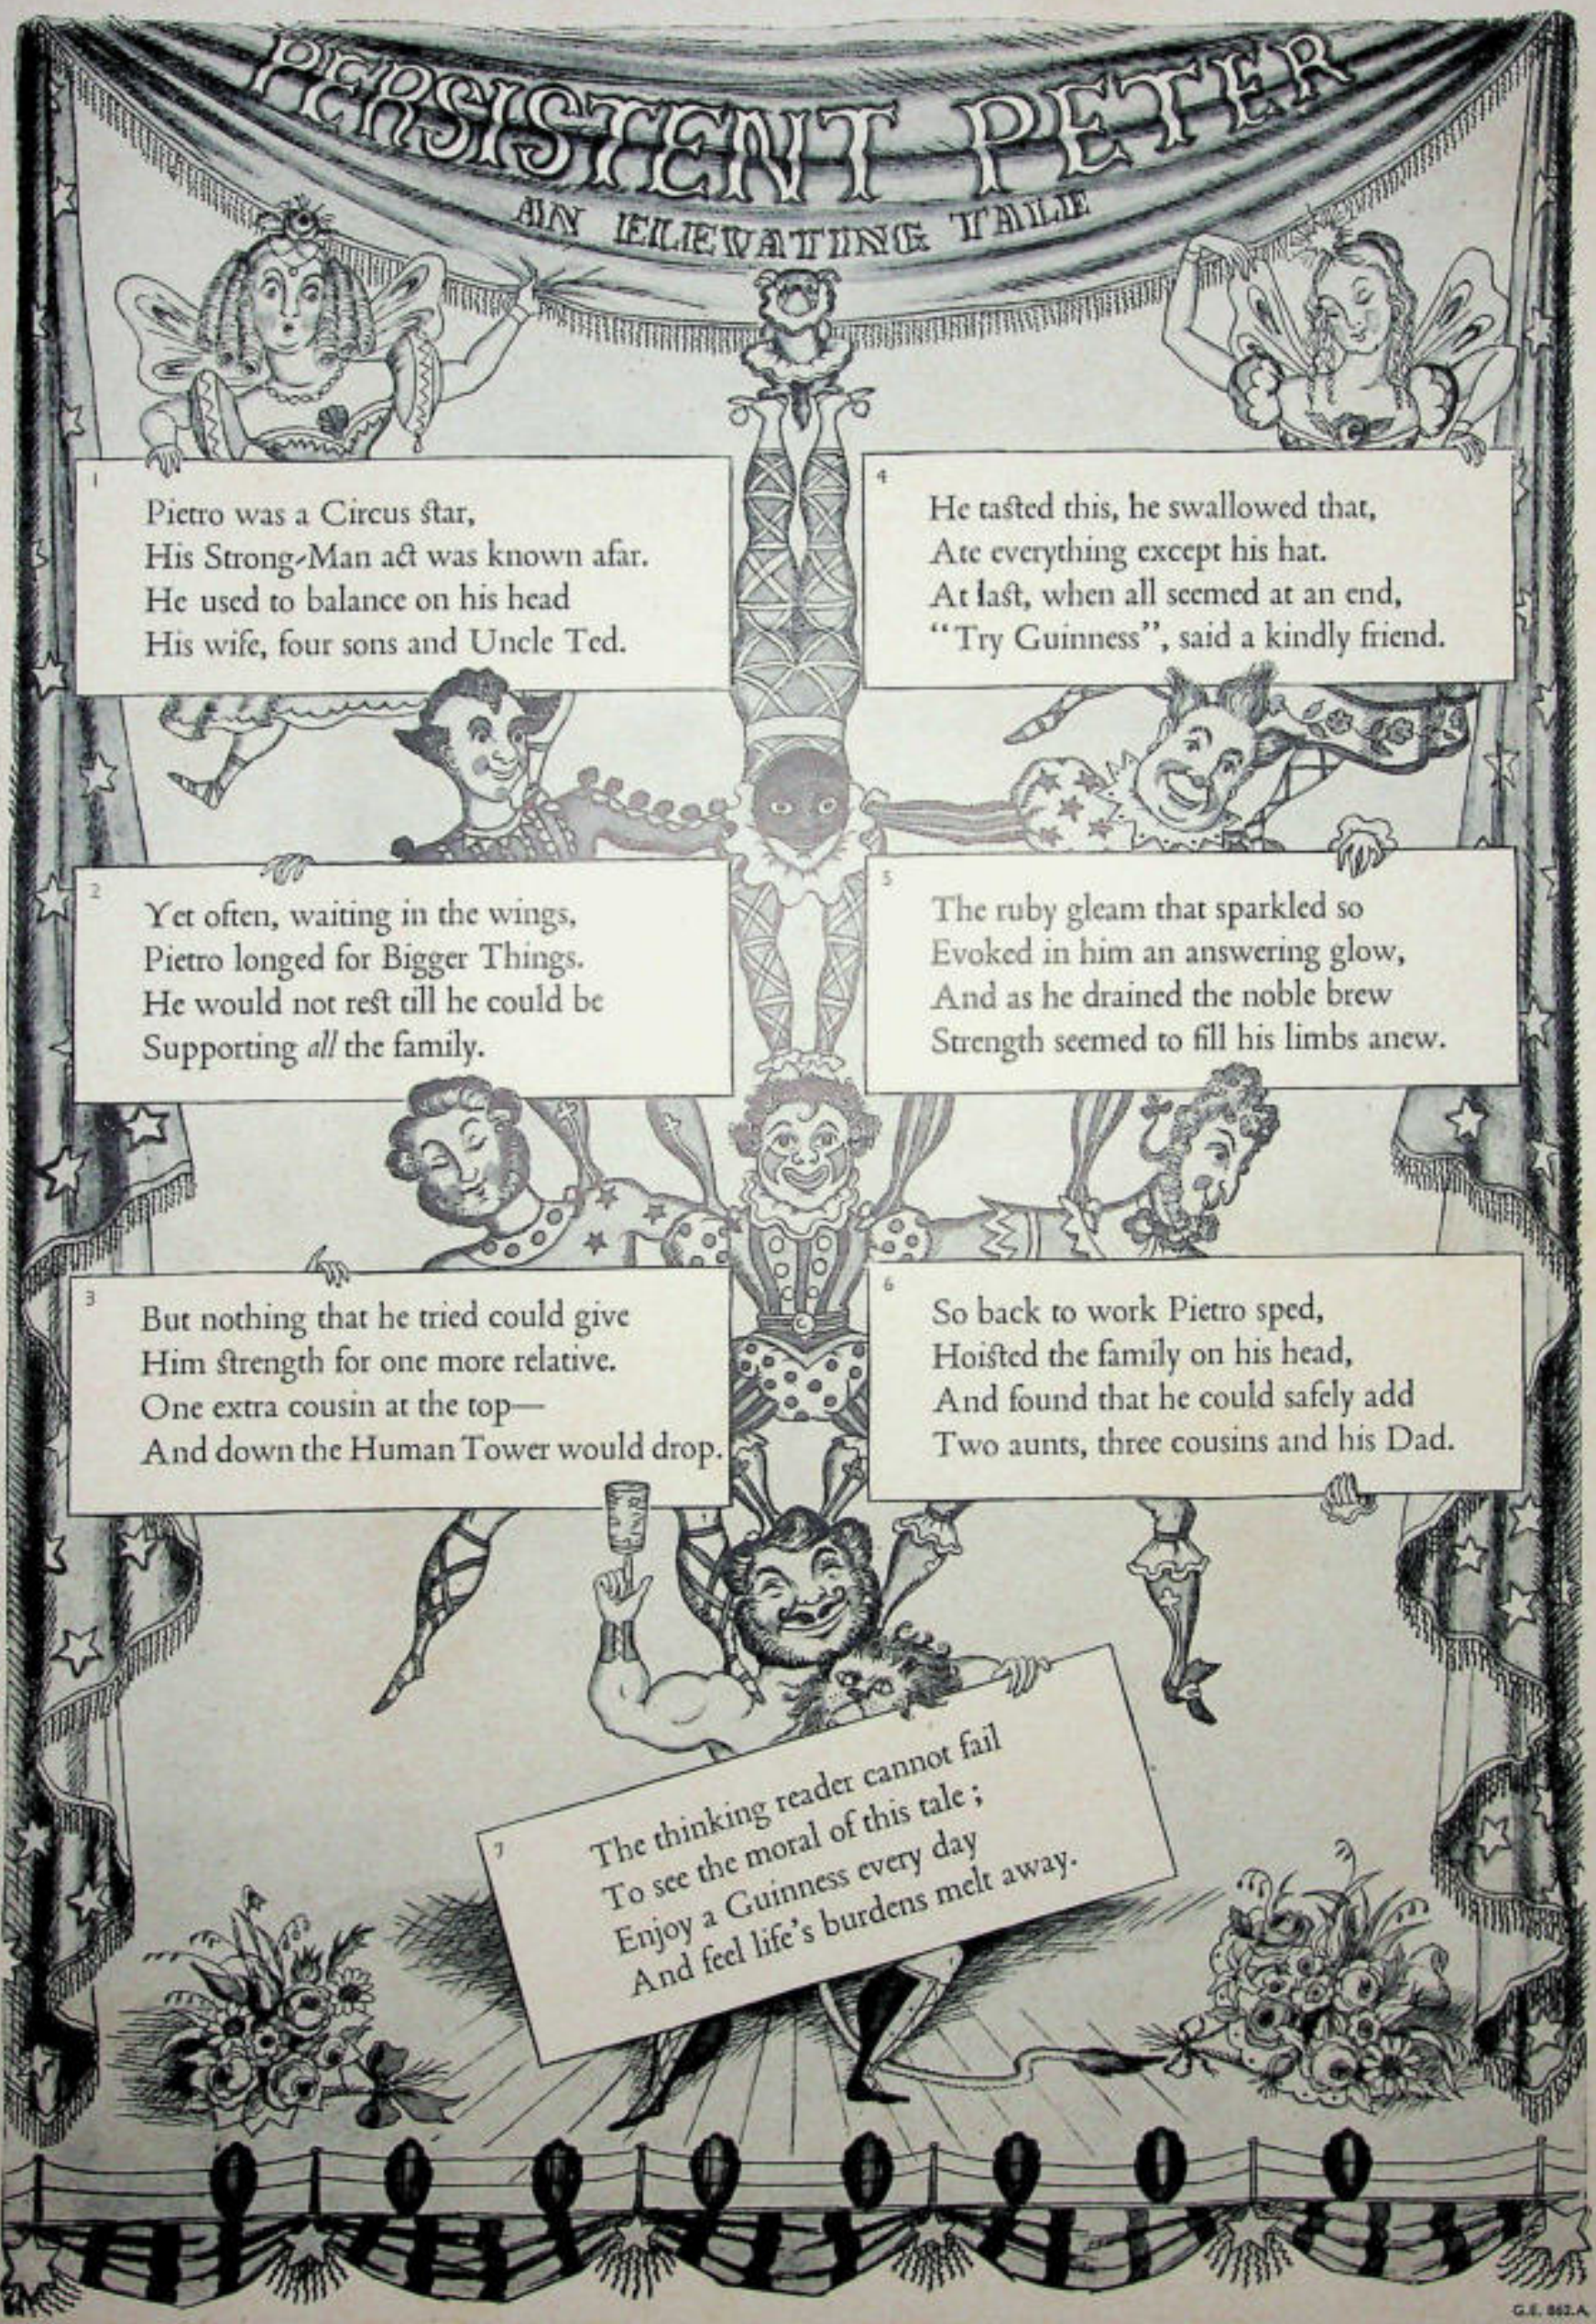
It is not to be wondered at that these animals suffer injury from time to time when it is realised that they may be racing once and occasionally twice a week on "going" that may be anything from hard to slippery and soft, according to the weather. Travelling as they do at about 40 m.p.h., injuries are bound to occur at times.

These injuries may be of the minor type, easily got over, after treatment, in a few days. On the other hand, they may be extremely serious and practically fatal.

The most common injury to a racing dog is "track leg," which is met with in other sports. It is more prevalent in greyhound racing, and one of its causes is the strain on the leg involved in negotiating bends. It is a strain of the tendon in the muscle above the hock and inside the thigh. A cure is never certain, but treatment with hot and cold fomentations and rest go a long way to alleviate it. Knocked-up toe is another injury fairly common on the racecourse. It is an injury to the second joint of the toe and is a severe strain. It is treated by firing and blistering.

Pulled dew-claws are fairly common, too. These claws are of some use to the greyhound, but they can get along quite well without them, and amputation after injury is quite frequent without apparently affecting the running of the animal to any extent.

Various other minor injuries such as torn nail beds, fractured toes and split toes are sometimes serious enough to warrant amputation. These operations, which are performed painlessly under anaesthetic by the Resident Vetinary Surgeon, in some cases have no effect on the greyhound's running, and in others, very little, so that a valuable animal may not necessarily be hampered in its racing career by any such injury. Indeed, there are many greyhounds racing to-day without a dew-claw, toe or toe-nail, which run just as well as if they still possessed them.



Hurdlers are, of necessity, more prone to serious injury than flat racers, but even with them the amazing development of modern surgery has done wonders, and it has to be a very serious accident indeed which keeps a greyhound off the racecourse for all time.

How often does one read in the Press that such-and-such racehorse broke a leg in some race or other and "had to be destroyed"? Not so in greyhound racing. There are several cases where a dog has broken a leg and the vet. has taken it in hand, set it, and after months of treatment the dog is once more on the racecourse.

Even broken or fractured necks are not necessarily fatal if taken in hand in time. At the present moment there is a puppy at Northaw who, while out exercising, fell and broke its neck. In past years this would have been fatal—the dog would have died or have been put down. The vet., however, took this pup in hand immediately, and by skilful surgery was able to set it. After months in plaster of Paris, followed by treatment and massage, the puppy gradually recovered and is now romping about as usual. A miracle of modern veterinary science. The puppy's life was saved, and it remains to be seen whether complete recovery takes place. To paraphrase Gilbert and Sullivan, "A Resident Veterinary Surgeon's life is not a happy one." He is "on the job" all day, and sometimes a lot of the night. His daily routine is like that of a surgeon at a hospital. First thing in the morning he receives the report of all the trainers and visits or prescribes treatment for all new "patients." Then, if necessary, X-ray photographs have to be taken of injuries, ray treatment given to convalescent animals and special diets prescribed. He has to inspect the food and do a round of the kennels. Each day he sends in a report to the Racing Managers of all new "patients" and their various ailments.

By a rule of the N.G.R.C. all greyhounds have to be kennelled at the racecourses at which they are racing at least one hour before the first race. The vet. has to attend to this and inspect the dogs and pass them fit for racing or not, as the case may be. Again he inspects them as they leave their kennels for their respective races, and is in attendance the whole time in case of injury before they are transported home to their training kennels. As most meetings do not end until after 10 p.m. it can be easily understood that the vet. has a full-time job. Even then he may be called out during the night to some emergency case.

The veterinary profession are to be everlastingly praised and given credit for all they have done to further the interests of greyhound racing and as a result of this the interests of all dog-breeders throughout the world.

PERSISTENT PETER
AN ELEVATING TALE
1
Pietro was a Circus star,
His Strong-Man act was known afar.
He used to balance on his head
His wife, four sons and Uncle Ted.
2
Yet often, waiting in the wings,
Pietro longed for Bigger Things.
He would not rest till he could be
Supporting all the family.
3
But nothing that he tried could give
Him strength for one more relative.
One extra cousin at the top—
And down the Human Tower would drop.
4
He tasted this, he swallowed that,
Ate everything except his hat.
At last, when all seemed at an end,
"Try Guinness", said a kindly friend.
5
The ruby gleam that sparkled so
Evoked in him an answering glow,
And as he drained the noble brew
Strength seemed to fill his limbs anew.
6
So back to work Pietro sped,
Hoisted the family on his head,
And found that he could safely add
Two aunts, three cousins and his Dad.
7
The thinking reader cannot fail
To see the moral of this tale;
Enjoy a Guinness every day
And feel life's burdens melt away.

G.E. 862.A.

BEST DAYS WITH OTTERHOUNDS

The Kendal and District in Yorkshire

TOM STUBBINGTON, VETERAN HUNTSMAN OF THE COURTENAY TRACY, WITH CONTEST AND MASTERFUL

WITH their arrival home at kennels on Wednesday last, these hounds concluded a fortnight's visit to the rivers Nydd and Wharfe, in Yorkshire, and although the results did not add to the record, the finding of some otters about after the sorrowful results of our hunting in the last few years was very pleasing, and one cannot help but think that the efforts of the newly-formed local committee to preserve are already bearing some fruit, and for which we owe them our very best thanks. It is a pity that more fishermen do not come out otter hunting, for they would then perhaps change their views about an otter spoiling the fishing, for we have many times seen salmon leaping time after time and trout feeding in the river within quite a short distance (yards) of the hounds and the otter while the hunt has been proceeding, a sight which I know could be confirmed by the editor of his own observation.

July 19th. Our first meet in Yorkshire this season was at Newton Kyme. There was a large field, including many old members of the Hunt, to welcome again the hounds and their Master, Sir Maurice Bromley-Wilson. The River Wharfe was rather bigger than we could have wished, but, however, the Master decided to try down, and they had hunted only about half-a-mile when they marked in an old deep rabbit burrow. Pip was put in, and a small cub came out and fell into the river and disappeared. Another cub was bolted, but escaped into another rabbit hole. The Master immediately gave orders for Pip to be picked up, and he took hounds away back to Newton Kyme to hunt upstream. They had arrived about quarter of a mile from the railway bridge when they put off another otter, but a huntable one this time.

The current was very strong, and the bank where they had put it off very steep and undercut with deep water and a very strong current, and it was a most difficult place to handle. No terrier could be put in, and hounds could only be put in above and allowed to swim down to it. The otter kept returning to the same place, and was only destroyed by banging with a spade on the ground above it, and after two-and-a-half hours of this, with the river still rising, the Master decided to leave it, and walked hounds back to Thorp Arch to call it a day (and a quite good one) at about 3 p.m.

Thursday, July 20th. We met at Thorp Arch to hunt Clifford Beck, the River Wharfe being too big to hunt. The Master again hunting hounds, we went on to Clifford Dam, only to find it blank, and then up to Braham Village, but nothing but foxes to be found all the way, and no use to us. The Master then decided to take them to Collingham Bridge, on the Wharfe, but there was nothing doing. We hunted right up to the fish ponds, hoping that we might find there, but all known places were vacant, and Sir Maurice blew off to end a blank day.

July 22nd. The meet was at Harewood Bridge, on the Wharfe. There was a large field again to meet the Master and his hounds, and it was a nice morning for a hunt if only the river had not been quite so big. The Master decided to try upstream, and as they got towards Rougemont hounds picked up the line of a fox, but they were soon brought back to the river, where they picked up a drag, and they kept touching all the way up to the old ash tree root, where they marked. It was impossible to put a terrier in the river covering the entrance to the root, but the otter was dislodged, and we hunted for about one-and-a-half hours under difficult conditions owing to the high state of the water. At last it got back to the root we had found it in, but this time he refused to bolt, though we tried all known means, and the day ended between four and five o'clock. Too much water.

July 24th. We met at Addingham Low Mill, Sir Maurice Bromley-Wilson again hunting hounds. There was a nice field out, and the river was in good order for hunting. Hounds picked up the drag on the weir and touched all the way up to Addingham High Mill, where they found under the big root and put it off. It was never viewed—the cover is very thick and overhangs the river, and it is bad to see here—and hounds swam the wash down to the shallow, but the otter, when bolted, had turned up and had got into a drain just above the root which drains a meadow where the grass had not been cut, and so, as we were not allowed to dig, it had to be left, much to everyone's sorrow, for we would have had a good hunt. The weather by now was changing. It went very dark, and the thunder started, and a deluge of rain came down and everyone bolted for the tea-rooms at Bolton Abbey, wet to the skin, and so ended the day sooner than we could have wished. July 26th. The meet was at Burnstall, above Bolton Abbey, a charming country, a good field, and all well set for a good day's hunting. Hounds were put in, and we started full of hope. We went upstream and tried right up to Kettlewell, but instead of hearing hounds speak all we could hear was of the number of otters which had been trapped or shot in the river all the way up, and so we went home after a completely blank day. What the Master thought remains to be recorded.

July 27th. The meet was at Walshford Bridge to hunt the River Nydd. We were very glad to see Major Dent out again to meet us. The river here has been spoilt for hunting and as a home for the otter, all the cover on the banks having been cut by the catchment board. There was no sign of any otter having been about. We tried up the Crimple, and then back to the Nydd; up through Ribstone Park, hounds still silent, except to an occasional fox. At the hairpin bend, where we have generally found, we had the same experience, drew up to Goldborough Hall blank. Here the Master put hounds in the van, and we harked back to Low Crimple Bridge, and brought the River Crimple up to Spofforth. Blank, very disappointing; and so finished the day.

July 29th. Met at Killinghall Bridge, on the River Nydd, again, a good field out, which included visitors from the Malton and District. The river was big and rising, but the Master decided to try down, and after about half an hour's hunting we found, but the water was covering the roots and still rising and very deep. We could not put a terrier in, so owing to the conditions it had to be left. We then drew on up to Birstwith, where we had lunch.

However, we did do some good, for we found a W.D. motor water tank fast in the river bed, and unable to get out, and there being no troops about the Master enlisted the whole of the field, put them on to the end of the rope, and so pulled the water cart ashore with a loud cheer, which made hounds dash for the water, thinking, no doubt, that an otter had gone away—another of our good deeds, for the Master is always willing to help anyone, and we have saved many a sheep we have found fast or on its back.

We then drew the river up to Birstwith Dam without finding any trace of an otter, and on up to Ross Bridge still blank, and so finished the day.

July 31st. We should have met at Thorp Arch, but owing to the river being a raging torrent the Master took hounds to Spofforth Bridge to hunt the River Crimple. Hounds were very silent except to an occasional fox, and we hunted on up to Humphrey Bark, where hounds were pulled out after another blank day, and so ended our visit to Yorkshire for 1939. Mostly too much water and too many foxes for us, but the latter, no doubt, pleasing to the local foxhunting people out at various times, and whom we were very pleased to see.

REDFORDE.

THE HAWKSTONE'S FIVE-HOUR HUNT

ON Saturday, 29th, the meet was at the Radnorshire Arms, Presteigne. The Lugg being too high, hounds were taken to Coombe on the Hindwell. Mr. Stanley hunted hounds. There was no drag at first, but above Red Bridge, hounds became interested on the water, and continued past little Brampton; they came up to their otter on the left-hand bank half a mile below Knill Court. They swam him up to the holt, where he was found last year and marked solidly. He bolted and went upstream, where he was viewed by the second whip. He then swam down some way, and took refuge in an old oak tree from which hounds soon shifted him, and the hunt continued fast and furious down-stream, until two fields above Little Brampton Bridge hounds caught him, but were unable to hold him owing to the flooded state of the river. He then disappeared, and it was not until after lunch that they refound him. They hunted him for some time in a big bend of the river, until he slipped down under the road bridge to a long pool, where he was left after a good hunt of five hours.

On Sunday hounds journeyed to North Shropshire, where they were kindly put up by Constance Lady Stanier at The Citadel, as near to their original home of Hawkstone as it is possible to be.

The Dee was quite out of the question, and arrangements had been made to hunt the Roden, but the heavens opened again on Sunday night, and everywhere and everything was in flood. So after the joint Masters had motored all over the countryside, they decided to meet at Sandford Hall on Monday and draw the marshy country round the pool there again. The old customer of a few weeks ago was at home again, and hounds pursued him round this impossible jungle for two hours.

In the afternoon they drew down the Losford Brook and picked up a drag on the Shavington estate. They found their otter lying rough on Mr. Griffith's farm a mile above Tern Hill, and were soon hunting him hard upstream. Although the brook was overflowing its banks, scent was extremely good, and hounds never left him. They caught him after 50 minutes when he landed on the bank—a 14lb. dog.

On Wednesday they met at Aquilate Hall, near Newport, the home of Mrs. John Morris, who kindly entertained the field and generously provided boats and boatmen. Most of the field spent the day on the mere, which is about a mile and a half long and half a mile wide in some places. An otter was put down immediately and hunted all the way round this enormous stretch of water. The reeds were very thick, and the otter never left them. He was viewed once or twice, and it was hoped he might go down the river Meese, which goes out at the top end, but he never did, and in the afternoon it rained again, and the occupants of the boats became very wet. Mr. Wallace blew off about 4.30, and Mrs. Morris kindly provided shelter and tea for the field.

On Friday they met at Forton on the Meese and Mr. Wallace had a successful hunt and killed at Calvington. On Saturday the meet was at Tern Hill.

There was a beautiful drag up through Buntingsdale, and hounds found their otter in the reed bed above Victoria Mill, Market Drayton. Hounds never left him for 35 minutes, racing him round the reed bed and back into the river, over and over again, before they killed him—a 21lb. dog. Drawing on up, they luckily ran into another otter in the rhododendrons at Oakley Hall, and killed it immediately. Thus ended a most successful week in North Shropshire, which partly made up for not being able to hunt the Dee.

The Wye Valley and the Carlisle have also had some very good and interesting hunts during the past week, and reports of these days will also appear next week. The Welsh rivers hunted by the Pembroke and Carmarthenshire Otterhounds, which were very flooded a few weeks ago, are now once more in a huntable condition, and it is hoped that it will be possible to publish reports from these rivers also in next week's issue. S. W.

Owing to lack of space it is impossible to publish this week's accounts of the Kendal and District back in their own country, the Dartmoor or the Eastern Counties. These reports will, however, appear next week.

FIELD TRIALS ON GROUSE

The I.G.L. Pointer and Setter Society Meeting

THESE trials were held on August 7th, 8th and 9th over the Douglas Castle Moors, Lanarkshire, by kind permission of the Earl of Home. The judges on the first two days were Captain W. S. Medlicott and Mr. M. Moreton, and for the Champion Stake Captain Blaine and Captain Colville. Upon the first day, when the Brace and Puppy Stake were run, there was unfortunately a very poor show of grouse and too many hares. It also rained in the afternoon.

For the Brace Stake five brace of dogs came up for trial, and after the card had been run through once the judges retried Mr. Eden's Gordon setters, Jill and Judy of Cromlix. The trial, which had begun well, came to an abrupt end when a hare jumped up in front of Judy, which she promptly caught. Mr. Holt's Irish setters, Keane and Duchess O'Moy, were then called. Keane pointed almost at once, but Duchess went past him and birds rose. Mr. Nagel's Irish setters, Brantome Muscat first, Mrs. Holt's Keane O'Moy second, and Mrs. Foot's Beorcham Welcome third. Certificates were awarded to Mrs. Eden's Jill, Judy and Jack of Cromlix, the Duke of Montrose's Isle of Arran Flash, Mr. Verschoyle's Ardreigh Rust and Miss MacIntosh's Boyndie Brigela.

Muscat ran very consistently throughout. He had not much to do in the morning, but later, when running with Keane, put up an excellent performance, made two pretty finds of single birds on rather tricky ground, and ended up with a fine draw up to a brood. He has a reliable nose and pegs his game with great confidence. Keane did some excellent work early in the day, finding birds at long range, but later lost his pace and was inclined to potter. Both dogs are excellent trackers.

Beorcham Welcome is a particularly stylish setter, carries a grand head and can find game, but is inclined to wander off occasionally. He made a couple of stylish finds the first time down, close in, and followed up by a clever find on an old cock grouse which had crept away along a hollow. Muscat ran a very similar trial to that in the Aged Stake, made no mistakes, but was perhaps inclined to get out of the beat on two occasions. Witch is a fast, untiring worker, knows her job thoroughly, and uses the wind extremely well. She found a lot of game during the day, and she and Muscat must have been difficult to separate.

Jill of Cromlix, another hard-going Gordon, well deserved her position in the stake, and at one time must have been higher up after she had found a couple of single birds which might easily have been missed. In the end she went past Muscat in her keenness and took a point from him.

The most unlucky dogs in the stake were North Dyke Gardie and Banchory Spey, both pointers of class who did excellent work in the first stages, but got into trouble later on bad semi-enclosed ground where a lot of birds had collected with sheep in close proximity. They had some consolation by being awarded diplomas.

At the conclusion of the trials Lord Hamilton proposed a vote of thanks to Lord Home for lending his ground, and on behalf of Lady Howe the owner of the winner, thanked the judges for their services. Captain Blaine replied. A. G.

FIELD TRIALS AMONG THE HEATHER. WATCHING WORK ON THE MOORS DURING THE SCOTTISH TRIALS

and Bounty D'or followed. This brace go a good gallop, quarter well, and were handled to perfection by Abbot. Brantome drew up to birds well in spite of the presence of a hare, and was well backed by Bounty. This ended the trial and a win for this brace. No other award being made.

There were only seven entries for the Puppy Stake, and after all had been tried once it was evident that the issue rested with Mrs. Kemmis' Black Doctor, Lorna Countess Howe's Banchory Spey and the Duke of Montrose's Isle of Arran Tyne, all the others having committed various offences, chiefly brought about by the presence of hares.

Doctor and Spey then met, the latter a particularly stylish puppy who had little to do in the first round owing to shortage of game, whilst Doctor had proved himself a great game finder. Doctor pointed almost at once, but was unsettled when Spey came up to him on back and left his point, which was then made out by Spey. They were put down again, when Doctor made a mess of things by getting away on the line of a hare.

Spey and Tyne were tried together. Tyne is a fast good quartering puppy, but gave one the impression that he is galloping rather than hunting, but was steady to hares. Both behaved well to a hare, and then Spey got his chance and made a stylish find of a single grouse and ran out a clear winner with Tyne second and Doctor third.

Next day the All-Aged Stake was run upon another beat. The weather was much better and, fortunately, there was more game as 24 dogs had to be tried, of which fourteen survived the preliminary stages. They were soon reduced to twelve owing to an unfortunate accident to Mrs. Nagel's handler, which meant the withdrawal of Bluff and Brantome D'or. After a series of interesting trials the judges placed Mr. H. Mitchell's Lingfield and backs well. He got off rather lightly in the afternoon when Bluff D'or had to be withdrawn. Mrs. Eden's Jack of Cromlix was unlucky not to get into the money. He had some first-class work to his credit in the early stage, but took the edge off a good trial later by blundering rather carelessly into a bird.

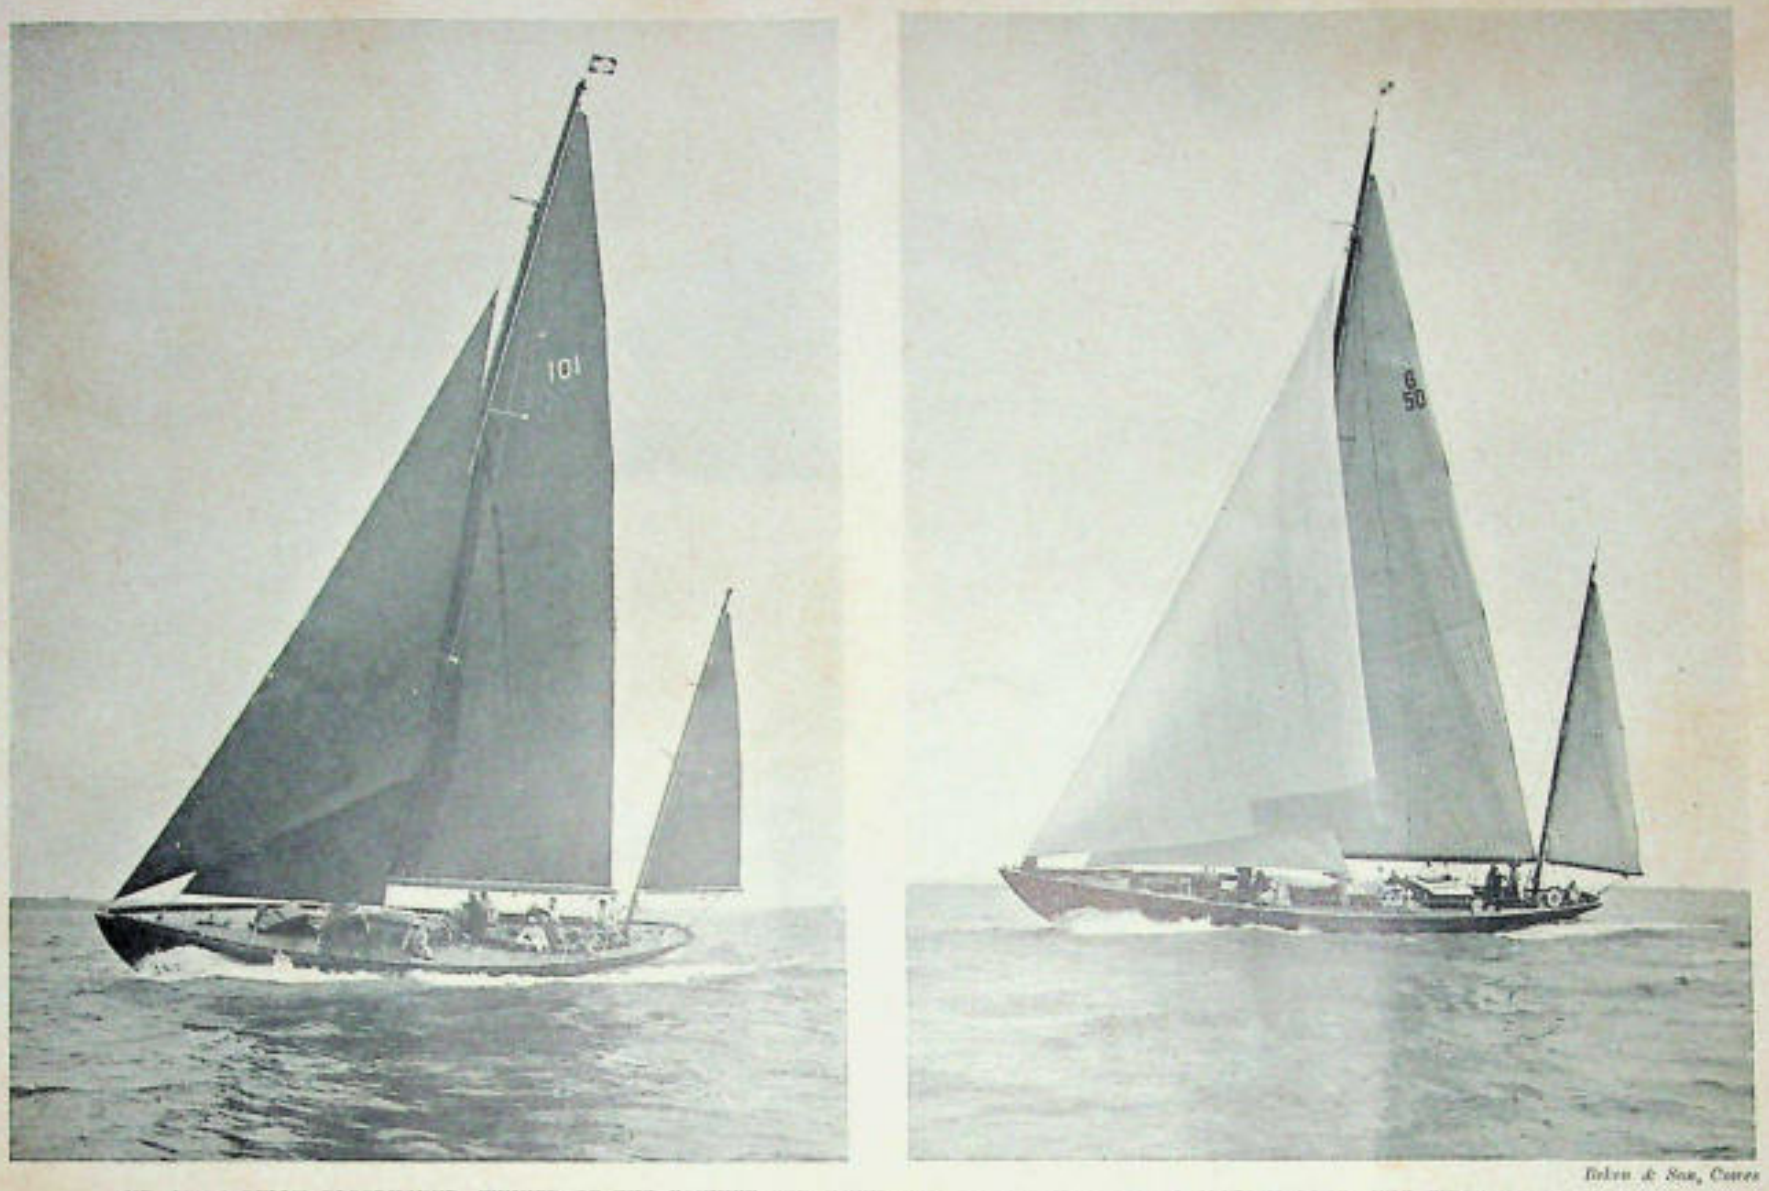
The final day was reserved for the Championship Stake, which was run under excellent conditions over very good ground at Muirhead, and there was just the right amount of game for an important trial. By lunch the card had been run once down, and though birds were more restless in the afternoon the judges were able to make their awards without any protracted trials. In the end Lorna Countess Howe's pointer, Ginger of Rishangles, run out a clear winner with Mr. Mitchell's Muscat second, Miss Brookes's Witch of Fearn third, and Mrs. Eden's Jill of Cromlix fourth.

Ginger is a pointer of high class, who gets well out when necessary, but can be very careful over tricky ground and on close-lying birds. This he proved toward the end, when he pegged a bird very

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, scenes, country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, Sept. 12th. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Breams Buildings, Chancery Lane, London, E.C. 4. 2. Only amateur photographers are eligible to compete. 3. Photographs should be sent unmounted, and no prints will be returned. 4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final. 5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6. 6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.



Entries from abroad not arriving in time will be placed in the next of the series. Do not send negatives.

Brace Stake.—Mrs. Florence Nagle's Irish Setter, *F.T. Ch. Sulhamstead Brantome D'or*, b. 5/1/34, by F. T.Ch. Sulhamstead Baffle D'or ex F.T. Ch. Sulhamstead Cleghan Belle, and Irish Setter b., *F.T. Ch. Bounty D'or*, litter sister to Brantome. Breeder, owner. Handler, G. H. Abbot.

All-Aged Stake.—1, *Lingfield Muscat*. Mr. Herbert Mitchell's English Setter dog, b. 21/4/35, by Lingfield Largus ex Lingfield Margaret. Breeder, owner. Handler, Harry Brown. 2, *F.T. Ch. Keane O'Moy*. Mrs. Mary Holt's Irish Setter dog, b. 28/4/33, by Cymwran Gorse ex Menaifron Penelope O'Moy. Breeder, owner. Handler, Miss Sutherland. 3, *F.T. Ch. Beorcham Welcome*. Mrs. R. M. Foot's English Setter dog, b. 15/2/34, by West Down Welcome ex West Down Wanda. Breeder, Captain G. Blaine. Handler, Duncan Lindsay. Reserve.—Lorna, Countess Howe's *F.T. Ch. Ginger of Rishangles*. Certificates of Merit.—*Jill of Cromlix*, Mrs. E. V. Eden's Gordon Setter bitch, b. 3/3/36, by Squib of Glemore ex Crescent Nell. Breeder, Mr. J. MacDonald. Handler, owner. *Jack of Cromlix*, litter brother to above. Handler, owner. *Judy of Cromlix*. Gordon Setter bitch, b. 4/8/37, pedigree same as above. Handler, owner. *Isle of Arran Flash*. The Duke of Montrose's Pointer bitch, b. 15/4/33, by Isle of Arran Fleet ex Isle of Arran Frolic. Breeder, owner. Handler, Alex Fraser. *Ardreigh Rust*. Mr. A. H. Verschoyle's Pointer dog, b. 1933, by Crusty ex Jess of Ardreigh. Breeder and handler, owner. *Boyndie Brigela*. Miss I. MacIntosh's Gordon Setter bitch, b. 12/3/37, by Boyndie Brian Boru ex Wishery. Breeder, owner. Handler, Harry Brown.

Champion Stake.—1, *F.T. Ch. Ginger of Rishangles*, Lorna Countess Howe's Pointer dog, b. 1/6/36, by Gaff de San Patrick ex Buoyant of the Borcen. Breeder, Mr. J. Frost. Handler, T. Gaunt. 2, *Lingfield Muscat*. 3, *Witch of Fearn*, Miss G. J. Brooke's Gordon Setter bitch, b. 21/4/33, by Amos ex Foyle Katie. Breeder, owner. Handler, R. MacDonald. 4, *Jill of Cromlix*.

Puppy Stake.—1, *Banchory Spey*. Lorna Countess Howe's Pointer dog, b. 3/2/38, by Gaff Di San Patrick ex Banchory Banner. Breeder, Messrs. Isaac Sharpe, Ltd. Handler, T. Gaunt. 2, *Isle of Arran Tyne*. The Duke of Montrose's Pointer dog, b. 23/3/38, by Isle of Arran Fleet ex Isle of Arran Pap. Breeder, Owner. Handler, Wm. White. 3, *Chilworthy Black Doctor*. Mrs. G. Kemmis's Pointer dog, b. 3/2/38, by Gaff Di San Patrick ex Banchory Banner. Breeder, Messrs. Isaac Sharpe, Ltd. Handler, R. G. Powis

Beken & Son, Cowes

MR. ISAAC BELL'S BLOODHOUND, WINNER OF THE FASTNET CUP (LEFT), AND NORDWIND (GERMAN KRIEGSMARINE), THE FIRST HOME AFTER A GREAT DUEL WITH LATIFA

"... livelier acceleration and increased power are obtained when Ethyl is used"

SIR MALCOLM CAMPBELL

"and you need livelier acceleration for this job!" said the Sergeant

Livelier acceleration—plus higher power and mileage—can always be obtained when pinking, either audible or *muffled*, is stopped by Esso Ethyl. Modern high-compression motors take full advantage of high-compression petrol, and in return give you all the power and performance the manufacturer built into them. Fill your tank with Esso Ethyl and give your car a chance to show how good it is.

WALKÜRE (GERMAN KRIEGSMARINE), GOLDEN DRAGON (MR. H. S. ROUSE), PHRYNA (MESSRS. R. A. P. BEVAN AND H. W. PATON) AND JOYRENA (MR. J. F. ROY MITCHELL) AT THE START OF THE FASTNET RACE

THE FASTEST FASTNET RACE

By K. ADLARD COLES and TERENCE STOCKEN

BY common consent, the weather conditions prevailing for the Fastnet Race—the eleventh of its series—were just about everything that they should have been. Nobody wants blue skies, a gentle breeze and a soldier's wind the whole time; this, the biennial classic of the off-shore season, the race from which sprang the Royal Ocean Racing Club itself, should properly be a severe test of boats and crews alike: the Fastnet Cup, a trophy not lightly to be gained.

This year the outward half of the race was nine-tenths windward work, and a good thrash with, on occasion, plenty of sea, giving everyone a chance to show what they could do—or what they could not.

The big boats got the better of this outward leg, rather naturally; and first round the Rock was the biggest boat in the race, Nordwind, the German Admiralty boat, 60ft. on w.l. Five minutes on her tail came the R.O.R.C. Commodore, Michael Mason, in his yawl Latifa; 55½ hours out from Spithead. Seven more of the big fellows went round in the next fourteen hours or so, before the first of the smaller boats reached the turning point. This was the little Roland von Bremen, smallest boat in the race, which rounded the rock at 10.11 on the Tuesday.

Homeward bound, in spinnaker conditions, the advantage turned a little in favour of the smaller boats. One or two "balloons" went west here, including that of Zeearend, winner of the previous Fastnet; but the run to the Scillies produced some extraordinarily close duelling. Latifa and Nordwind, for instance, never lost sight of each other throughout the race, and on the homeward leg the struggle at times became ding-dong.

Two other boats which had a neck-and-neck struggle, and at times hufling matches almost like a couple of One-designs, were Erivale and Olivier Van Noort. Chris. Boardman, the Olympic 6-metre helmsman, was steering Erivale, while Jan Heinen, crack Dragon helmsman of the Netherlands, was at the helm of Olivier Van Noort. Having retained touch over the whole journey (rounding the rock half an hour apart), coming home they found themselves together to the northward of the Scillies. Lufling tactics of the best metre-racing variety ensued, and after a sail of 635 miles distance made good, Erivale eventually reached the line at Plymouth 1¼min. ahead. Nice work!

The order of *finishing* for the first eleven boats was Nordwind, Latifa, Benbow, Bloodhound, Zeearend, Lara, Erivale, Olivier Van Noort, Roland von Bremen, Rose, Morva. On corrected time, the winners resolved into: First, Bloodhound (Isaac Bell); second, Zeearend (C. Bruynzeel); third, Roland von Bremen (S. K. das Wappen von Bremen).

Bloodhound's win was a thoroughly deserved and very popular one; she is a beautiful Nicholson yawl, a sister hull to the cutters Foxhound and Stiarna, her yawl rig, deck and internal fittings having been designed by Olin Stephens. Her deck arrangements are severe in their simplicity; she has no streamlined deckhouses—in fact, no deck-house at all—merely a long cockpit with a "hood" hatch at the fore-end, and a small skylight amid-ships. She has that generally graceful, thorough-bred look which Mr. Nicholson knows so well how to impart to his designs.

Zeearend, as mentioned, was the 1937 winner, and has done extremely well again, taking second place by 5 min. over the hour.

Roland von Bremen, third on corrected time, is a new boat this year, and is not the old Roland we saw in the Fastnet two years ago. She, too, can plume herself on a great achievement; only 74min. separate these three boats on corrected time. Corrected finishing times:

			H.	M.	S.
*1.	Bloodhound	Isaac Bell	79	4	2
2.	Zeearend	C. Bruynzeel	80	9	22
3.	Roland von Bremen	S. K. das W. von B.	80	18	24
4.	Latifa	Michael H. Mason	80	36	22
5.	Benbow	E. Gere-Lloyd	82	15	40
6.	Olivier Van Noort	A. W. Goudriaan	82	44	51
7.	Erivale	J. H. Rawlings	83	7	45
8.	Lara	Kenneth Poland	83	33	9
9.	Eventide	T. C. Ratsey	84	40	59
†10.	Nordwind	Kriegsmarine	85	2	54
11.	Alle Noire	M. Baldenweek	85	3	41

18.	Stiarna	J. B. F. Gage	92	40	6
19.	Dex	R. Engineer Y.C.	93	32	51

* Winner, Fastnet Cup. † Winner, Erivale Cup, Elizabeth McCaw Trophy and Inter-Regimental Cup. ‡ Winner, Hong Kong Challenge Cup and Jolie Brise Cup.

LITTLE SHIP CLUB OSTEND RACE

Another event, starting on the same day as the Fastnet, but considerably smaller both in distance sailed and the minimum w.l. of the competitors, was the Little Ship Club race from Brightlingsea to Ostend. This race has become a very hardy annual, and a much-looked-for event on the East coast. If memory serves, this is its twelfth consecutive year. It is one of the few (if not the only) off-shore events which do not have a flying start, the competitors anchoring on the line with sails furled until the starting gun.

This year, four entries came down from Yorkshire, amongst them the well-known Wire and Maid of Abo, veterans of that North-east coast minor classic, the Outer Dowsing race.

The crucial point of this race is always the Longsand Head. Since the race of 1930, when (there being no course restrictions), Sunshine, then owned by Colonel C. F. King, ploughed a strong-minded furrow across the Longsand and got away with it, the sailing directions have stipulated that the Longsandhead Buoy must be left to starboard. Miss your tide round the buoy—and if there is a head wind and sea down the East Swin the smaller and slower boats invariably do miss it—and your chances of the race usually shrink to negligible proportions. This year it seems everybody missed it, but, after a while spent becalmed, the breeze came fair from the N.W. and got the lot successfully round.

There must have been many sighs of relief at this, for although to be becalmed on the far side of the Longsand is bad enough (one minds the time, *circa* 1934, when in such conditions Betsy, owned by Major Blewitt as he then was, put up a "long service" record for the 90-mile course—something like three days), to be becalmed with that interminable sand *between* you and Ostend, must be a despairing procedure.

Spinnakers were set for the run to Ostend, but the wind eased off as the Continental shore approached, and those boats which allowed the tide to set them to leeward of the harbour found themselves in the soup. Sposa, owned by G. H. Haynes, got in first, and as she was two hours ahead of the next two to finish, saved her time over them to win. Second and third were two of the Yorkshire entries, the Finnish "T" boats Wire (H. H. Marshall) and Maid of Abo (N. King), with one minute between them at the finish. Gadfly (F. S. Sheridan) won the Duleibella Shield, and Aurac (R. Gresham) got the special prize for being the boat which would have won under R.O.R.C. formula.

The L.S.C., of course, has a special rating rule of its own, whereby each boat receives an allowance of so much for every foot difference between it and the scratch boat. It works very well.

OLD SPORTING PRINTS

QUESTIONS asked by readers often concern the value of old sporting prints. They are not readily answered, as not only much depends on the rarity of the prints but also on their state. If the margins have been cut or torn the value is depreciated, and if the colours are faded, or have been retouched, the worth may sink from pounds to shillings. Also a number of prints have been taken off the original plates or re-engraved for reproduction, and even old paper is no criterion of the genuine article.

But when sets have been kept in portfolios and treated by their owners in the same way as books, especially if the original wrappers or title-pages have been preserved, their value may be considerable. Such prints originally sold for a few guineas will fetch their hundreds to-day.

Most of the old sporting engravings were bought by sportsmen of the time, a few were sought after by specialists, and it is one of the reproaches to a country with sporting traditions that no great national collection has been formed. Mr. C. F. G. R. Schwerdt undoubtedly possessed a collection of sporting books, prints and drawings relative to hunting, hawking and shooting of the widest range, and when he died it was put up for auction by Messrs. Sotheby's, some of it still remaining to be disposed of. Buyers have not been lacking, and although many quite good prints could be had for a few pounds the rarities have commanded their prices. These give a good idea of current values, the purchasers being mostly the leading art dealers in sporting works, among whom Messrs. Maggs have taken their share of the cream of the sale.

The Beaufort Hunt series of eight plates of foxhunting from "Going Out" to the "Return Home," with the supplementary plate, "Consequences," engraved by Henry Alken from the original drawings by W. P. Hodges and coloured by F. Rosenberg, were purchased by Messrs. Maggs for £1,200. The set, in their original pink wrappers, had the dedication coloured lithograph of a fox's head entitled "The Sportsman's Arms," and was on dated watermarked paper. Throughout the sale there was keen bidding for prints by and after Alken. A price of £360 was paid for a bound set of four of the celebrated "Night Riders of Naeton," by J. Harris, after H. Alken (1839), with their original buff wrappers. Mr. J. B. Sainsbury bought the Quorn Hunt set of eight by F. C. Lewis after H. Alken (1835) for £145, a price that was also secured for E. Bell's foxhunting set of four mezzotints after G. Morland.

H. Alken's "Humourous Miscellanies" brought £175, and his six "Hunting Qualifications" plates (1829) the same sum; while the "National Sports of Great Britain" (1820), with 50 coloured plates after Alken, secured £205. This figure was also given for R. G. Reeve's shooting set of four after H. Alken (1813), "Woodcock Shooting," "The Repast," "Pheasant Shooting," and "The Return," in one volume, and for S. W. Reynold's "The Falconer," Mr. Samuel Northcote, after J. Northcote, third state, printed in colours. Samuel Alken's rare first edition, "Delineations of British Field Sports, with Various Methods of Poaching" (24 plates) brought £295; and his "British Field Sports," with 27 drawings in pencil and water-colour—£130; while Dean Wolstenholme, junior's, "Shooting Verses" (1819), with four coloured aquatints after Dean Wolstenholme, fetched £160. R. G. Reeve's "Fox Chace" after Dean Wolstenholme was sold to Messrs. Sabin for £72. A rare shooting set—"Pheasant," "Partridge," "Grouse" and "Wild Duck"—by G. Hunt after Alken, without margins, went for £165.

As instancing the difference in values, a set of six Pollard's shooting coloured aquatints of 1812–13—"Duck," "Grouse," "Snipe," "Pheasant," "Woodcock" and "Sea Fowl"—were obtained by Mr. J. B. Sainsbury for £200; while a set of four Pollard shooting subjects of 1822 as knocked down to him for £24. C. Turner's Coursing set of four mezzotints in colour—"Going Out," "Coursing," "Finding" and "The Death"—after R. Jones brought £190; and his "Mr. Fleming, of Barochan, with his falconers, John Anderson and George Harvey," £110. Two foxhunting sets by T. Sutherland, one of four and one of seven after H. Alken, and another after D. Wolstenholme, each went to bids of £130. For R. B. Davis's "Hunter's Annual," Parts 1, 2 and 3, with coloured lithographs, £115 was paid; and £125 for Samuel Howitt's volume of five signed water colour drawings for Orme's *British Field Sports*. Other prices for Alken sets ranged from £115 to £130.

AN ALKEN PANORAMA OF INCIDENTS IN THE LIFE OF A SQUIRE'S SON

This cylinder with scroll containing 35 aquatint pictures was sold for £50 at the Schwerdt sale. On the cylinder itself is a view of the Steyne at Brighton. Another depicting "A Trip to Melton Mowbray," after Sir J. Dean Paul, sold for £90

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

A Luncheon Menu With Both Fish and Meat

The Fare: Melon charentais
Mousse de homard
Cotelettes d'agneau Paysanne
Cold grouse
Fromages et salade
Fruits

The Wines: Château Climens 1928
Bourgueil 1929

IN August, the little Charentais are the finest melons for flavour, but if you cannot get three ripe little Charentais for six people, a fair-sized Cantaloup will serve.

The lobster mousse or mould is not difficult to make, but it is tiring, as the lobster must be well pounded, all save the claws, of course, and if you want to know how good it can be, order it a day ahead and go to the Hind's Head at Bray.

The lamb cutlets are *Paysanne* when cooked in the oven with vegetables in the following manner. First of all dip the cutlets in boiling olive oil to seal their juices; keep them warm. Then brown in an oven dish some shredded onions; add the juice of one tomato per cutlet and a little crushed garlic; also pepper and salt. Now add the cutlets and one tablespoonful per cutlet of good meat stock. Cover the dish and cook in moderate oven during 20 minutes. Then give the cutlets a light covering of thin rounds of potatoes; add pepper and salt to the potatoes and a few pats of fresh butter as well. Continue to cook in a moderate oven until the potatoes are done, basting frequently. When ready, sprinkle some finely chopped parsley over the potatoes and serve in the dish.

Being no longer hungry, now is the time to enjoy half a young grouse, cold and just as good, if not better, than when hot, provided it has not been over-cooked and still shows a rosy blush.

A Château Climens, cold but not too frigidly iced, will prove quite enjoyable with the Melon, and it will not be out of place with the lobster. The red wine of Bourgueil has a personality of its own which may not be obvious at first with the cutlets, but it will improve on acquaintance and it will show to great advantage with the cold grouse and the cheese.

FIFTY YEARS AGO

From the *Field* of August 17th, 1889.

AN opinion of a 28-Bore. "As a recent purchaser of one of these 'toys,' I should like to give my experience of them. It was built for me by Powell, of Birmingham, and shoots 25grs. of Schultze and ¾oz. of shot, in paper cases; 28in. barrels. Though by no means a first-rate shot, I can kill rabbits with it better than with a 12-bore; but the best test of its shooting is the way it will bring down very high rocketing woodpigeons with No. 6 shot, which I find the best size. I have killed some very long shots at green plover, using No. 8. The gun is perfectly balanced, and the workmanship excellent.—Satisfied."

A TRAVELLER'S NOTEBOOK

I SOMETIMES wonder whether in spite of the enormous amount of money spent by the Government on social services we have progressed as much as we should have done. True, on the whole, things are very much better than they were in the days of Charles II, for then, as we know from Pepys' diary, it was no unusual thing for even the most exalted to be lousy, and the sanitary conditions were so appalling that the Great Plague became inevitable and the Fire of London a blessing in disguise. Yet there still remains much to be done.

It came, I must admit, as a shock to me, when I was told that it is no uncommon thing for people to sleep three or four in a bed in the East End, not in many instances as a result of extreme poverty, but owing to the bad housing conditions. The effect on people's manners and morals may well be imagined. In fact, it is such that even when they are able to find new and far better accommodation they sometimes use the bath as a convenient receptacle for coal. If we compare this state of things with the conditions during the reign of Abd-er-Rahman III in the tenth century, when there were miles of public drains in Cordoba and every Andalusian spent at least two evenings a week in one of the very numerous and well-equipped public baths, we begin to wonder whether we had better not do something about it if we are to justify ourselves and our civilisation.

* * *

There is only one way, so it seems to me, of improving matters, and that is by education of the young. I do not mean by teaching boys the thirteen times table, a list of the Kings of England, or any of those other pieces of information served up free by a benevolent Government for the compulsory edification of mankind, but by moral and physical training. And thank goodness a good deal in this way is being done, thanks to private effort, by the Boy Scouts, Boys' Clubs, and last, but not least, cadet battalions.

* * *

The other day I was invited to attend the annual inspection parade of the 1st (London) Cadet Battalion, "The Queen's Royal Regiment," and discovered as a result a number of very interesting things. Of this regiment, it appears, the four companies are based on four Boys' Clubs, one of them, now Sherborne House, having been opened as far back as 1888 by Miss Octavia Hill. Both clubs and battalion owe their continued existence to the help of the three schools, Sherborne, Haileybury and Westminster, the generosity of private donors, and a small grant per cadet from the War Office. Most of the cadets come from the very poor quarters of London, and so it is obvious are the material that need more than most instruction in physical training, drill, and the essentials which go to make a good citizen.

* * *

At the annual inspection the cadets, over 300 strong, were drawn up in line under Colonel Dunn, in Temple Gardens, the spot where one of the most picturesque incidents in English history was enacted, when the Dukes of York and Lancaster plucked red and white roses, flowers used as symbols in the subsequent Wars of the Roses. General Sir Alexander Godley inspected the parade, and subsequently a colour—one of the few to be in the possession of a cadet battalion—was first dedicated and then presented by the Duke of Atholl. Then the colour was trooped so impressively and with such precision I am certain some Guards' non-commissioned officers must have had a hand in things somewhere, and the battalion marched past. It was all admirably done by these boys, most of whom, I suppose, were between fourteen and seventeen years old, and seemed to me, considering they very rarely have an opportunity of all drilling together, quite remarkable.

* * *

To wind up with, we were treated to a display of physical training, when the boys "soared through the air with the greatest of ease," and showed how very fit they were. Sports cups and shields were then presented, including the Admiral Jellicoe sword, won in the King George V shooting trophy for boys of the Empire.

Of course, there are many other cadet battalions, all of which are no doubt doing excellent work, but I chose this one because it is largely recruited from boys who before joining have had little opportunity in life, and it shows what good stuff they really are, when they take to discipline, drill and physical training as a duck takes to water. It pleases our enemies to-day to regard us as decadent, a nation of shopkeepers beneath contempt. They would not have liked the annual inspection in Temple Gardens, for these boys will soon be men of the breed and type of those to whom Henry V cried before Harfleur, "Once more unto the breach, dear friends, once more." F. H. M.

LETTERS TO THE EDITOR

HIGH VELOCITY AND KILLING POWER

SIR,—Captain Paul Curtis in three articles in your columns has so strongly advocated the use of the light rifle of very high velocity for powerful American big game, that the inexperienced sportsman in this country who has read these articles, may be tempted to use such a rifle on tiger. I do not say he would be wrong, as I do not know.

Captain Curtis, however, in his article of December, 1938, says that for jungle shooting in the Orient against dangerous game at close-quarters, he would use a double express. Then in his article of July 1st, he tells of a certain maharajah who has killed 137 tigers with a .280 Mauser, mostly shooting on foot. This rifle fires a 140-grain bullet (I nearly wrote pellet) at a velocity of 3,050ft. secs. Now if a light bullet travelling in the region of 3,000ft. secs, hitting a big deer or grizzly in the lungs or stomach will knock him out instantly, there seems to be no reason why it should not do the same to a big cat.

One finds, however, that most of the recent books by experts such as Dunbar Brander, Burton and Burrard advocate the old-fashioned double heavy express firing a solid lead bullet of from 440 to 650 grains at a velocity of 1,900ft. sec.

The men whom one meets in India, at present, who have killed a number of tiger and panther, nearly all insist on a heavy double rifle, some using a .470 high velocity (velocity 2,125ft. sec.) and some the old express. No one seems to like the Magnum (*i.e.*, velocity over 2,500ft. sec.) for such game.

It is obviously very desirable to knock your tiger or panther down with the first bullet, but these beasts seem to have a strong aversion to being knocked down, and even after being hit in the vitals often display alarming vitality. Only a shot in the spinal column can be counted on to drop them, and shots in the lungs or stomach merely annoy. The writer has hit a panther through the heart with a Holland & Holland .375 Magnum soft nose, and he ran about 50yds. and half-way up a tree before he dropped dead. Later, it was found that the bullet had gone clean through, breaking up the heart *en route*. Such stories are common.

It would, therefore, be interesting to see in your columns the opinions of some tiger-shooting experts on the contentions of Captain Curtis. It would be particularly interesting to know from the above-mentioned maharajah whether his tigers dropped at once or whether he had a more heavily armed attendant beside him to finish the beasts off.

Yours faithfully,
T. ff. M. DARLING.

2, Magdala House,
Colaba, Bombay.

[Readers' opinions are invited. Below is appended Captain Curtis's reply.—ED.]

Far be it from me to tell an Indian sportsman what rifle to use. Generally speaking, I follow the time-worn principle of when in Rome, doing as the Romans do; and were I going to India I would like to have a .465 Holland & Holland with me.

At the same time, having seen the devastating effect of the .30 Magnum on Canadian game, I most certainly would not forgo an opportunity at a tiger or panther with one. Or, more particularly, with one of even higher velocity.

After all, so far as I know, the Halger and similar cartridges have not been tried on the big African and Asiatic cats, but I have complete confidence in the result to be obtained with them.

After all, Major Burrard, General Burton, and the other authorities whom Captain Darling mentions wrote at a time long before the era of super-velocity which we are now entering.

I am sorry that I am not at liberty to mention the name of the maharajah referred to in my article as having killed his 137th tiger. However, I should add that this was under conditions hardly representative of tiger shooting as a whole.

The beasts were stalked in an open country, where they could be plainly seen from the high banks above the dried river bed below. Most of the shots were at 100yds. to 150yds., where the .280 was at its best. Nevertheless, it shows what the cartridge is capable of in competent hands.

The A.D.C. assured me that when one had to be followed up, he and the maharajah used heavy doubles.

RIDING SIDE-SADDLE

SIR,—The recent correspondence on "Side-Saddle" is of great interest to me as, owing to an injury, I had to learn side-saddle twelve years ago, at the ripe old age of 42, as an alternative to giving up hunting altogether, and my experience might possibly interest others.

As Major Faudel-Phillips says, it can be accomplished in a much shorter time than one would expect, after riding the other way for so long. At first it seemed extremely dangerous and uncomfortable, and so unless it is a case of necessity the attempt in the "sere and yellow" is discontinued. Once over the first fence, however (in my case on the horse's initiative!), I found the seat to be remarkably secure—more so than the astride both in jumping, especially in the case of the horse pecking, and also with one that is putting his back up; though I would qualify the latter opinion by admitting that a quick and unexpected sideways fly back has caught me napping, since the hanging leg having left the grip of the pommel, disgrace in the shape of a "voluntary" has ensued.

Having said that, I think the astride seat has all the rest of the pull over the side-saddle. The chief drawback seems to be that in side-saddle the weight is so much on his loins and one's inability to get on his withers when going uphill or out at gallop is a tremendous disadvantage, and is one which practically puts the side-saddle out of Point-to-Points; yet I well remember, when framing the conditions for one of the earlier ladies' races, the criticism I received from the fairer sex for allowing 7lb. to side-saddle riders when in fact I personally thought it ought to be a matter of "stones."

I entirely agree that the left leg hanging only low enough below the pommel for a hand to be inserted enables the grip to be instantly acquired by raising the heel in the stirrup which gives a comfortable and secure seat—I could never see the reason for the long leg—I know I should roll badly and give sore backs at once.

For the following reason I came to the conclusion that the forward leg did most of the work by taking the strain in the jump and in the gallop. I started learning ordinary side-saddle (near), and continued for some four seasons; but my injury being in the right hip (forward leg), I was not without pain so, having borrowed an old (Victorian) off-side saddle to experiment with, I found that, leaving the work to be done by the left (forward) leg and hip I was in far greater comfort and have hunted thus for the last eight seasons. This, I think, bears out Major Faudell-Phillips's inference that the hanging leg (normally left) should hang easily until tightened up at the jump, &c., and the leading leg (normally right) secure the general balance and grip.

I personally think that horses like the extra length of rein they are given by the side-saddle, with perhaps more freedom on their mouths as they approach a fence, and I got this feeling since, on going "side-saddle," I continued riding my same horses and some of them certainly jumped more "hearty" than they did before when I thought I was holding them straight and with a short rein, but I don't suppose there will be general agreement with this. I am, of course, speaking of horses "wanting to go," as undoubtedly with a nappy one, one feels very helpless without the leg on either side—one spur and a stick are poor substitutes!

Yours faithfully,
London. "MERE MAN."

FISHING IN SWITZERLAND

SIR,—Fishermen who are acquainted with this neighbourhood need no advice from a humble follower of the gentle art; there may be others, however, who are unaware that good trout fishing is obtainable within half an hour's distance of Territet Veytaux, either by tram, train or car, and those contemplating a visit to this or other parts of the Canton of Vaud will find it worth while to bring a trout rod.

The Grand Canal and the Eau Froide, to name two waters very near here, are both full of trout, large and small; in the evenings of this July from 7.30 to 9.30 I have seen the Eau Froide water literally alive with trout rising all round, while in clear water on the Grand Canal scores of small trout can be seen and not a few of considerable size, trout of from 2lb. to 5lb. being by no means uncommon.

Suitable flies, tied at Vallorbe, can be obtained either at Vevey—where one easily and readily obtains a monthly and obligatory licence for the whole Canton from the Prefecture, price 10*s.* a month—from the establishments of E. Deriaz at Vevey or that of Monsieur Stapfer at Montreux. Messrs. Gasser, of Vevey and Moore, of Territet, whose names are household words amongst fishermen in these parts, are only too pleased to give fishermen information and advice, which in the case of the grateful writer has made a stay of some three months doubly attractive.

Local fishermen use not only the fly, but, with a lengthy rod and long line, the *vert de bois*, the *vert de terre* and the *asticot* (gentle), the last three being the most popular; and nothing could be kinder than the treatment given to me, even to showing where their favourite big trout lie—one of some 3lb. under the Pont de Noville, though risen to a tiny black fly, eluded me to grace the creel of a better man.

I am hoping for further sport in September and that this may catch the eye of some one or more who otherwise might miss an opportunity of spending some happy hours on the waters of the Canton of Vaud.

Yours faithfully,
Hotel Bonivard, WELLWISHER.
Montreux Territet,
Switzerland.

FARM WAGES

SIR,—In your leading article of the 29th ultimo it is stated that the reason for the migration of the farm workers to the towns is the low wages, giving the average wage as 34/9 reduced to 28/– after payment of rent. So far as I am aware the rent does not exceed 3/– per week, in these circumstances the net wage is more than 28/–.

The minimum wage in my county is 35/– and rent 3/–, but this wage is really no criterion of the wage received, for instance: waggoners, shepherds and herdsmen work overtime the year round, and the general workman gets the benefit of a lot of contract work.

On the whole there is nothing the matter with the farm cottages, they are often visited by the sanitary inspector.

The cottages have large gardens from which the occupier obtains his vegetables and fruit; he also keeps poultry and very often pigs. Now compare his position with the town worker with about 45/– per week and about 12/– per week rent. He has no garden, poultry or pigs. Consequently he has to pay for every bit of vegetable, fruit, eggs and bacon. An agricultural worker is in clover compared with his town brother.

Yours faithfully,
The Albynes, W. J. PITT.
Bridgnorth,
Salop.

WILD BIRDS (DUCK AND GEESE) PROTECTION ACT, 1939

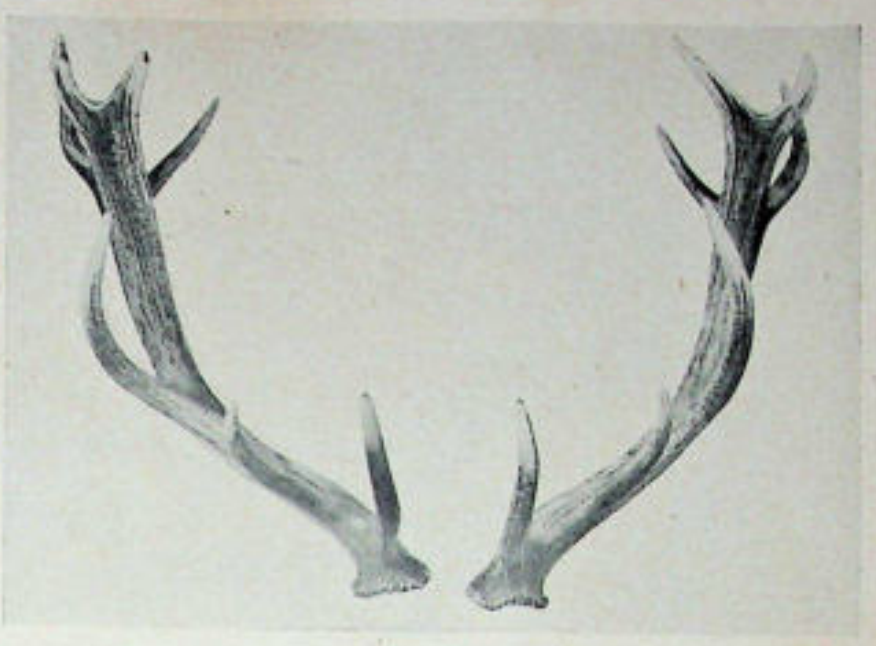
SIR,—I have read with interest the article by W. J. Brown in your issue of July 15th, which suggests that under the new Act no more orders varying the dates of the close season for wild duck are to be made (with one exception), and any orders now in force are to be valid no longer. This statement is misleading.

The new Act provides that no order shall be made whereby the killing and taking of wild duck or geese is prohibited for any period commencing after February 1st and ending before August 11th, and that any order made before the commencement of the Act shall be invalid if, and in so far, as it contains such provision. The Act does not prevent the making of an order to extend the close season. Such orders will continue to be made in certain counties as they have been in the past. The order for the Administrative County of Cambridge, provides for a close season for wild duck between February 10th and August 16th. The effect of the new Act on such an order is to leave untouched the extension of the close season to August 16th, while invalidating the order so far as it provides for the close season to commence after February 1st.

No doubt your commentator understood this, but the position should be made plain for the benefit of wildfowlers in certain counties who will still have to look for the annual advertisement three weeks before the end of the close season reminding them of its extension by a few days.

Yours faithfully,
Shire Hall, A. TABRUM
Castle Hill, (Clerk of the County Council).
Cambridge.

SNAKE ATTACKED BY FROGS



SIR,—I was taking my usual early morning exercise near my bungalow two days ago when I noticed a European nearby obviously interested in something happening at the edge of a flooded piece of country. (The monsoon is very heavy at present, and there is a good deal of casual water about.) On joining him I saw a grass snake, about 2ft. long, struggling with a fat frog in its mouth. A few seconds later, with the frog still in its mouth, it started to swim across the flood water, which was only about 15yds. wide at this particular place. I noticed innumerable frogs, all croaking like fury, at the edge of the water, and remember wondering at the time what would happen if the snake chanced to land up anywhere near them. This is exactly what did take place, but I was certainly amazed when three or four large frogs immediately attacked the snake which was forced to release its victim. It should be noted that at the time of attack the snake was still in the water, and I presume this would place it at a disadvantage and at the same time allow the frogs to adopt tactics which would hardly have paid on dry land! I wonder if any of your readers have known this happen before?

Yours faithfully,
H. N. CHARRINGTON.

FED STAG IN THIRD YEAR
Weight, 9lb. 14oz.; *points*, 14; *length, left*, 34, *and right*, 35

(*See letter "Feeding and Horn Growth"*)

THE TREATMENT OF "SUMMER GARGIT"

SIR,—You may be interested to publish this result. I saw an Ayrshire cow, a splendid beast and one of a famous prize-winning herd—owned by S. Mayall, Lea Hall, Shrewsbury, dying of gangrene, on June 28th this year. She was obviously getting rapidly worse and her owner had decided to send her to the knacker next morning. At this time one-quarter of the udder was purple and completely gangrenous and during the last six hours the infection had spread through the hind limb which was dragged in walking; in other words, she had a fulminating gangrenous mastitis which was rapidly becoming a generalised infection.

As an extreme measure he gave her sulphanilamide (Crooks). She weighed seven times as much as a human and the dose, therefore, was five times the maximum human dose—viz., fifteen five-grain tablets repeated at six-hourly intervals by day only. On the 29th she was no worse, next day much better, and after three days' sulphanilamide she was changed to ten tablets of prontosil rubrum for two days. This is a very similar substance and the change was only made because the supply of sulphanilamide was exhausted. After this five days' treatment her condition was obviously much better, her coat was glossy, her eyes bright. It was quite expected that the infected quarter would slough away. Instead of this, the most extraordinary thing happened. The udder opened and the mammary tissue of the quarter remained exposed and dependant but not suppurating for nine days when it dropped off on the fifteenth. She was given a foster calf on about the fourth day of treatment and it gained weight fast and thrived on the milk from the other quarters.

In her owner's opinion these results are so remarkable as to warrant widespread publication. Further experimental work will be done in the treatment of that form of mastitis commonly known as "summer gargit," so troublesome at this time of year in many districts. The results will be communicated. Yours faithfully,

B. F. HAYTHORNTHWAITE.

Weir Hill, Shrewsbury.

BLACK-AND-WHITE CROCUSES

SIR,—I wonder whether any of my gardening friends of the *Field* have ever come across a black-and-white crocus? I remember, 70 years ago, an old gardener showing me, with great pride, one he had raised with much trouble from seed. It was somewhat smaller than the well-known yellow or the mauve or the white or the purple varieties. Perhaps it was only a freak, as I have never seen any since. Yours faithfully,

GEORGE I. WILLSON.

29, Julian Road, Folkestone.

FEEDING AND HORN GROWTH

SIR,—I have read with great interest your correspondent's article entitled "Sesame and Antlers."

You may be interested to have the following additional facts.

Mr. George Sicht brought in 1932 some four-year-old stags from Warnham Court Park, recognised as the home of the finest herd in this country. One of these stags was a royal, and the weight of the cast-off antlers 3lb. 8oz. He started feeding the red deer in his park at Buckhurst in 1933, with the following results on three stags born in 1933:

Age.	lb.	oz.	Points.	Length Left	Length Right.
3	6	6	14	28	28
4	9	12	14	35	36
5	14	10	14	39	38
3	7	4	12	29	30
4	7	15	15	31	32
5	12	13	16	41	40
3	6	9	12	33	31
4	9	4	14	34	37
5	10	7	18	35	36

Mr. Vogt's experience is that the real influence of Sesame cakes on the antlers is shown only in the second generation. These further facts from Mr. Sicht's herd bear out these facts.

A three-year-old stag born in 1935 shed antlers with fourteen points, weighing 9lb. 14oz. In three years he showed this development:

Age.	lb.	oz.	Points.	Length Left.	Length Right.
1	2	0	6	21	23
2	4	8	14	26	26
3	9	14	14	34	35

The average weight improvement of the antlers of the three four-year-old stags is 150 per cent., compared to the stag not fed on oil cakes. The three-year-old stag born in 1935 (from a hind which had been feeding on Sesame cake for three years) surpassed these three stags by producing antlers equal to those of the four-year-old stags.

I should like to mention that Mr. Sicht feeds the deer with Sesame cakes (special Stag Nut from the British Oil & Cake Mills) all the year round. Maize (Indian corn) is fattening, but will not increase the size of the antlers considerably.

I enclose photographs to show the development of the horns of the three-year-old stag mentioned in the second part of this letter, and of a four-year-old stag which had not been fed.

These antlers are on exhibition in Rowland Ward's shop. Yours faithfully,

5, Queen Anne Street, W. 1. M. T. STEPHENS.

BIRD-SONG IN WINTER

SIR,—Those of your readers who are amateur ornithologists may be interested in the following particulars regarding winter song in the cases of three species which I have had under observation for some time past. A good deal of misconception exists concerning winter song, even where common species are concerned; much of it would be cleared up if more amateur naturalists kept day-to-day records—a simple enough matter which takes up little time and amply rewards the observer in interest and the knowledge thus gained.

The song-thrush, I find, takes a good deal of silencing; he will sing in winter on every possible occasion, and only severe frosts, if *followed by cold and sunless weather during the daytime*, seem to stop him. I have entries for fifteen days in November, nineteen in December, and twenty-two in January; February furnished a full quota.

The blackbird is not so spirited. Mild days in winter, especially if the weather be damp, not infrequently entice him; but during frosty or severely cold weather, even if the sun is shining, he seldom sings. Entries for November number ten, for December three only, and January eleven; as in the case of the song-thrush, February yielded a more or less full quota.

Most decidedly chaffinches do not like the depths of winter; at least, not for choral purposes. During the period November-January I had no entry for this species, the first songster being noted on February 6th. In this locality (Aldershot and environs) the song of one individual appears to be the signal for the others to start; from February 6th onwards I have entries for practically every day, and on most occasions several singers were in evidence. Yours faithfully,

56, Cranmore Lane, Aldershot, Hants. PETER MICHAEL.

DARING OF AN OTTER

SIR,—When fishing the Dunalastair water of the Tummel the other day I hooked a salmon and had it about played out when suddenly, seemingly from nowhere, an otter sprang at the salmon, and a great battle ensued. The otter seemed to get its body round the salmon trying to get it down, then got on the salmon's back, with its claws round the small part of the salmon's tail, and started to pierce its back with its tusks.

All the while this was going on I was shouting and throwing missiles into the water, but the otter took no notice; finally, I decided to put all force on to get the fish to the water's edge, and the otter still clung to the salmon's back, looking straight towards me till it was only a few yards off.

I wonder if any of your readers have experienced the same? Yours faithfully,

Dunalastair, Perthshire. P. H. PARKER.

"Twelfth" Night

There's the morning drive to talk over; there are good cigars to be smoked; and there is Johnnie Walker in the glasses. Now *there's* a whisky! Blended from all the finest whiskies in Scotland, marvellously mellowed and matured. And blended with Johnnie Walker's consummate skill.

Gentlemen! your

Johnnie Walker

BORN 1820—STILL GOING STRONG

THE LITTLE OWL IN BROAD DAYLIGHT

THE SHORT-EARED OWL IN LIGHT AND SHADE

THE EYESIGHT OF BIRDS

SIR,—Mr. Morrison-Scott's interesting article on the eyes of birds, in your issue of July 22nd, prompts me to send these three photographs of owls, which show clearly the effect of light on the pupil of the eye.

The little owl, photograph above, was taken by daylight about noon, and the pupil is accordingly contracted. The second of this bird with a cockchafer was taken on a dark night at about 10.15 p.m. (by flashlight), and here the pupils are fully dilated. In the photograph of the short-eared owl the same thing is seen in both eyes at the same time. The right eye in full sun has the pupil very small; the left eye, being in shade, shows it accordingly expanded.

Yours faithfully,

Meriden, G. K. YEATES.
Sherborne, Dorset.

THE LITTLE OWL AT NIGHT
(See letter "The Eyesight of Birds")

A TALE OF A TOAD

SIR,—On going round my garden and passing an old heap of sods, I noticed a few wasps working in and out of a hole, and made a mental note that there was a nest to be attended to. Passing the spot a day or two later I was surprised to find the site apparently deserted, not a wasp to be seen; but as the sod heap was shortly to be removed I warned my gardener of the possibility of a nest being there. He went to inspect, and reported all clear, and in the afternoon of that day, went to remove the heap. I happened to be nearby at the time when he called to me "there is a wasp nest here, sir," so I went to see, and found the beginning of a nest about the size of a tennis ball, but no sign of a wasp. I soon found out the reason, for comfortably settled down beside the nest was a toad, and he had snapped up every wasp as it hatched out. There was a small piece of comb with a few grubs in it, but as there was no sign of the queen, supplies were running short, and a few days would have seen the end of the toad's banquet. That toads will take bees is well known, but this is the first time I have heard of one destroying a wasp nest.

Yours faithfully,

Woodside, R. S. K. EYRE.
Crowborough, Sussex.

STRANGE BEHAVIOUR OF TWO WILD DUCKS

SIR,—I have two pairs of domesticated wild ducks on a small pond wired in with 8ft. wire, and a locked gate. Both ducks began to lay, one in an old coop and the younger one under a pampas grass bush about 6yds. away. When each had laid seven eggs my man who feeds them every morning found one nest empty, and the one under the old coop contained fourteen eggs. The next day both were seen on the nest side by side, and there were sixteen eggs. A day or so afterwards the younger duck, whose nest had been robbed, went broody and took possession of the nest under the coop, and in a few days when I had a broody hen I took up all the eggs and found there were seventeen. They did not all hatch out under the hen. The ducks soon began to lay again, and after laying about six eggs each, the older duck again robbed the other nest, and went broody and sat for a week, when I gave the eggs to a friend who had a broody hen, and they all hatched out.

I have during a long life had to rear large numbers of wild ducks and pheasants and various kinds of domestic ducks and poultry, but have never known of a duck taking the eggs from another one. I also wish I could have seen the duck actually removing the eggs, as I do not know how she would do it. It was done in each case at one time, probably at night, and no eggs were broken or lost. The duck's mouth is not adapted to carry an egg, and they must have taken a lot of pushing. The nest was not in any way disturbed. Can any of your readers relate a similar experience? I have asked several friends and keepers without result.

Yours faithfully,

Berrimans, Stroud, Glos. E. ARMITAGE.

FOOD OF THE PEREGRINE FALCON

SIR,—On July 24th last I examined a nest of the peregrine in Breconshire after the young had flown, and was able to identify remains of the following birds: Carrion crow, jackdaw, curlew, great spotted woodpecker, black-headed gull.

In addition there were leg rings of pigeons per the attached list. It would be interesting to know, if the birds can be identified, where they were released and bound for. Their direction of flight and course could then be plotted on a map.

Fulwood, Sheffield, 10.

CANADA GEESE

SIR,—I was interested to read the late Sir Jeremiah Colman's letter in your issue of July 8th. It is our experience, too, that Canadas are very greedy grazers and because of this farmers have requested us to keep their numbers down. Like the Gatton geese, the flock here disperses at the beginning of April. We believe they go to the large meres at the north of this county, but of course cannot be certain. At any rate, it appears that they leave simply because, being very quarrelsome among their own species in the breeding season, they migrate for the sake of peace, leaving only a few pairs to nest here. At the end of the summer there is a return migration of old birds with their young.

With regard to the fourteen to twenty-one days' absence in the autumn which Sir Jeremiah mentioned, I think it is almost certain that the birds fly off to the stubbles at that time, which perhaps are some distance from the lake. Our birds go to the stubbles here, too, for about the same period, but owing to there being no other water round here of any size and because the stubbles themselves are comparatively near the geese always flight in again at sundown.

Yours faithfully,

Walcot Hall, R. STEVENS.
Lydbury North, Shropshire.

ARMY HORSEMANSHIP

SIR,—The letter on Army Horsemanship, in your July 15th issue, is much to the point.

The interest in the horse is not dead in the British Army. The questions recently asked Mr. Hore-Belisha by the chairman of the Army Committee in the House, and also by another Service member, *re* the advisability of re-horsing certain mechanised cavalry regiments, elicited the response that it would be better to utilise the present sixteen horsed Yeomanry regiments! Necessary as these may be—they are only "part-time" units in "peace"-time, and not equivalent to Regular Line cavalry regiments, which could be sent abroad—such as to Palestine—where our present only two remaining Line cavalry units have proved the worth of horsed regiments in certain terrain.

The truth is, that we *have* over-mechanised, as many foresee. Why not recognise the fact and remount at least one Dragoon, one Hussar and one Lancer regiment before the nucleus of horse-trained personnel have disappeared?

Yours truly,
RUSSELL STEELE.

Cunard White Star Ausonia,
St. Lawrence River.

CUCKOO'S NOTE

SIR,—In reply to Mr. W. R. Thompson's letter in the *Field* of July 22nd, I have noticed that in this district the cuckoo failed to change its note as is usual about mid-June, and seems to have left now, whereas last season there was a young cuckoo in the field in which I caravan until the middle of September which I watched with great interest being fed by two meadow pipits, which on several occasions did this by perching on the cuckoo's shoulder since it was on top of a wire fence post.

Yours faithfully,
Palmyra House, WALTER C. PHILLIPS.
Newport, Mon.

HOOKING A RAT

SIR,—When fishing the Exe on the evening of August 2nd, a few miles above Dulverton, I had creeled some half-a-dozen nice trout before reaching a particularly good pool. Having here secured another nice fish I essayed to reach a piece of flat water across the main current. This necessitated a fairly long cast which was accomplished at a moment when, unknown to me, a large-size water-rat started off from my bank to swim across the pool. In recovering my cast of 4x gut I hooked the rat securely in the right groin and it started off downstream at several miles an hour.

I made sure it would break me, but the gut held against the pull of the rat and the not inconsiderable weight of water. After a struggle of about five minutes I drew it carefully on to a shelf of shingle, where it lay, quite literally a drowned rat.

Yours faithfully,
Wraxall, near Bristol. M. A. TODDY.

5¼LB. AND 6¼LB. IN WEIGHT
(See letter "Large Puff Balls")

LARGE PUFF BALLS

SIR,—I think the enclosed photographs of some large puff balls found on Salisbury Plain, near Bulford, may be of interest. The puff balls were growing in a ring, and there were six of them.

The photograph shows them compared to an ordinary tennis ball and a foot rule.

The larger one weighed 8¼lb., and the smaller 6¼lb.

Yours faithfully,
Fleet, Hants. H. M. S.

STRANGE NESTING PLACES

SIR,—At 6 a.m. on June 8th my chauffeur, who has been in my family's employ for some 35 years and is a great bird-lover, found that between daylight and that time a pair of flycatchers had half-built their nest on a sponge in the rack in which he keeps his under-the-car washing tools; the rack is hung inside a passage-way, open at the yard end and a door at the back entrance, about 2ft. from the side door of the garage and faced by the chauffeur's front door and the stable door. The stable is now used for my sporting dogs; there is a constant movement through the passage all day. The nest was finished on June 9th, the first egg laid on the 12th, and three others, one on each of the following days at exactly 8.10 a.m. and 8.40 a.m. each day. The cock bird brought one feather each day to cover the egg or eggs, and the feather was incorporated into the nest by the hen next day when she came to lay, except one day when the cock put in a hen's wing feather. Mrs. Flycatcher did not care for that class of furniture and outed it at once. She started to sit on the 17th and hatched the four eggs on the 29th; three of the four died about the fifth or sixth day; the last of the four got out of the nest on July 13th, sat on the top bar of the rack for about half an hour, then flew half-way across the yard, about 15yds., then another 15yds. to a mounting block, rested there for a time, then flew across the yard, about 25yds., to a fig-tree with the old bird, and has been seen no more.

Yours faithfully,
Coldharbour, Wivelsfield, RICHARD FOSTER.
Haywards Heath, Sussex.

HARVEST BUGS

SIR,—I recollect that a year or two ago a letter appeared in your columns inviting readers to supply information to a lady research worker at Oxford on the question of harvest bugs.

As we are nearing the time of the year when they usually launch their attack, I, personally, and perhaps others would be very glad to hear whether there is any improved deterrent or more beneficial form of treatment for the afflicted.

Yours faithfully,
Snowshill Hill, JOHN BOURNE.
Glos.

PILOT FISH ON A LINE

SIR,—An unusual capture was landed here the other day in the shape of a pilot fish. It was caught on a Spiller line set by one of our local drifters, and was forwarded to the Plymouth Laboratory.

Yours faithfully,
Trenance, GUY DE MAUPAS.
Mevagissey, South Cornwall.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, ask help for an old gentleman living in Devonshire. He has been unable to work for many years as he suffers from epilepsy and now, at 78, he has a hard struggle to make ends meet. A married brother, a schoolmaster, helped him for many years, but now his wife is an invalid and he cannot afford to continue this allowance. Will you help this gentleman, who is unable to help himself, by sending us £6 10s. so that we may allow him 2/6 weekly for one year?

Watch point

Don't keep your Gold Flake to yourself! That's one of the rules of the game, if you wish it to be a love game. Remember how popular they are with women nowadays. It's the flavour of the really fine Virginia tobaccos of which Wills's Gold Flake are made that appeals to the ladies as much as to you. So, if you want to be the court favourite, be generous with your Gold Flake.

WILLS'S GOLD FLAKE
is the man's cigarette
that women like

IN THE CITY

By OUR CITY EDITOR

STOCK markets are rarely at their best during the holiday month of August. Conditions this year are particularly subdued. I find many who hold the opinion that inactivity this year is not due entirely to political nervousness. It should be realised that there are large numbers who usually take an active part in Stock Exchange affairs now serving with the Defence Forces.

That may be one of the reasons. Under the circumstances, there is much satisfaction in the healthy feeling apparent in markets. There is no liquidation of any consequence. Buyers may be few and far between, but here and there there is a growing demand for securities.

As I have previously mentioned here, there are many who anticipate quite a boom in home industrials later on if only politics are settled. Others are equally confident concerning base metal shares. There is also a definite movement towards rubber shares.

The rubber market is capable of lifting stock markets out of despondency. Rubber shares are widely held and, largely because of their low denominational value, are popular with small investors. The position regarding rubber is steadily mending.

An increase in production quota to 60 per cent. of standard for the second half of this year instead of depressing the price of the commodity has had the reverse effect. A consumption demand for raw rubber has developed with the result that stocks are steadily diminishing. There is an abundance of rubber in producing areas. The International Rubber Regulation Committee sees to it that supplies are regulated to meet manufacturers' requirements.

That is the main reason for the present healthy statistical rubber position. Rubber is selling over 8½d. per lb., which is the best price since October of 1937. It will naturally take time for better conditions to be translated into increased dividends by producers. The Stock Exchange, however, invariably discounts prospects ahead.

Supplies of rubber shares which have been available in markets are being steadily cleared. Prices are rising. Many are anxious to secure supplies before the expected real rise materialises. That, I must say, is the way to make money out of rubbers or any other securities.

Doubtless the market leaders, such as Anglo-Dutch and Rubber Trust, will make definite headway. I find, however, that most operators favour lower-priced shares, so long as the companies are reasonably sound. That is where most business is seen at present.

There is a wide selection of rubber shares. Improvement in prices invariably means that the whole list moves ahead, although some shares naturally advance to a greater degree than others.

Those prepared for a flutter in this market might direct attention to some of the 2/- nominal valued shares, such as Sungei Tiram now about 1/3 each. I am also told that Hevea (Johore) with a price under 1/6 should be worth putting away for future capital appreciation. A share like Kepitigalla with a price under 1/- has possibilities from a purely speculative angle.

I find several firms of stockbrokers have compiled lists of rubber shares which are considered attractive. A very good plan is to inquire from a stock-broker which shares can be recommended. A share may appear attractive on the price quoted but, when it comes to dealing, it will be found that no shares are available.

That is mainly why I suggest to those contemplating purchases to inquire whether the shares of such and such a company can be bought at a certain price. I believe there is a good future for this market, but I must add that it is wise to consolidate a profit while the going is good.

THE WEAKER SEX

As a general rule of life the female is considered the weaker sex, but, like all rules, this, too, has notable exceptions. One such is to be found in the fish world in the form of the ceratioids, or sea-devils. In this group of anglers living between 200 and 1,000 fathoms below the surface, the females are very much bigger than the males and are equipped with a large mouth and some fine teeth, while the males possess mouths of far smaller dimensions and teeth to match. They have, however, large olfactory sacs and nostrils which are used in search of their prey or of the females to whom, in some families, they attach themselves with their mouths and become grown for the rest of their existence. As a rule the females have only one of these parasitical husbands, but two or three are not unknown. Generally they attach themselves to the abdomen and the union is so complete that it is almost impossible to tell where male and female join. The male appears to exist solely through the continuity of the blood-streams.

EXPERIMENTS ON THE GREEN

Changes of Putting Style Which May Be Helpful

By E. R. TIPPLE

MOST common of all remarks that can be heard in any locker room is: "My putting let me down; I kept on missing even those two yarders." Putting bothers golfers more than any other shot in the game. Even the experts endure periods when they can do little right on the greens. So it is comforting to watch the leading players miss those simple-looking putts after they have astonished us by their wizardry with the irons and their terrific length off the tees. But if such a sight is some consolation for our own inconsistent efforts it does not provide us with a solution to our problems.

A good putter makes the business of rolling the ball into the hole appear so very simple. I suppose it is when you get the knack. A golfer may know off by heart all the correct fundamentals which go to produce good putting yet may not be able to put them into practice. On the other hand, someone who has never touched a golf club before may take up a friend's putter and proceed to hole all kinds of putts with complete nonchalance.

ONE STYLE OF PUTTING
Leo Diegel's peculiar method

Whilst on holiday recently I watched several people amusing themselves on a putting green that no self-respecting golf-club secretary would dare to possess. It had not been cut for days; the grass was coarse and worn patches were everywhere. With an odd assortment of grips and styles, some of the party kept on getting in dead from a range of 10yds. and over, and they missed very few of those putts we call "awkard." Try as we might, my friends and I, despite our experience of the game, could not match their skill.

We blamed the queer clubs we had been given, the green itself—anything, in fact, but ourselves! No doubt one reason for these novices' success was their ignorance of the troubles that can so easily beset any golfer. They did not bother about the niceties of the game, but just went up and hit the ball. We, knowing more about golf, fussed about, and having got ourselves thoroughly "set," jabbed at the ball hopefully. So, if any golfer is experiencing difficulties with his putter, he would be wise to learn a lesson from these carefree holiday-makers—relax, keep the body, legs and arms free from any trace of tension. Once you get set over the ball the tendency is for the right hand to take complete charge of the club, then pick it up with disastrous results.

At times drastic measures are needed to solve putting problems. A complete change of style may restore confidence and eradicate persistent faults. Champions such as Cotton and Bobby Jones have experimented before they finally acquired a method that exactly suited them.

There is no set style for putting. Each of us can evolve his own, however queer it may look to others, and I do know that such experiments are worth while. As a start it would be advisable to copy one of the masters of the game. If that style proved to be unsatisfactory another could be tried or a combination of various experts' different methods. Jones tells us that he copied Walter Hagen for a time. Feet well apart with the weight mostly on the left leg. This did not suit him, so he next tried bringing the feet closer together, with the right slightly in front of the left. Finally he chose the style that made him one of the finest putters the game has ever seen. Ankles practically touching, body almost erect, left eye on the ball, the head turned slightly to the right. Both his thumbs were kept straight down the shaft.

Alteration to the grip may need to be considered. The reverse overlapping grip is well worth trying. The forefinger of the left hand is overlapped on the little finger of the right—instead of the opposite method which is popular for the long shots. A change of putters may restore lost confidence and bring about that desired sense of "touch." Most of the consistent putters I have seen use steel-faced clubs. They say they can feel the ball better with them than with wooden or aluminium heads, and the judging of strength needed is also easier.

Experiments in stances can be tried. Taking the ball off the left foot or off the right; open or closed stance. Then try keeping the left elbow pointing towards the hole with the right close to the body. Some believe in holding the club firmly with both hands, others say that a light grip is better. Each golfer can decide by practice which suits him; perhaps he will find he likes to keep the left hand tighter on the club than the right or *vice versa*.

Watching the experts on the greens, when their eyes are in, one can learn a great deal. Whatever their individual idiosyncrasies they all contrive to hit the ball a smooth, rhythmic blow. When they begin missing putts they check their swing and see whether they have lost that smoothness at impact. Espinosa, the American Ryder Cup player, says that when he is putting his best he is "taking the putter back with the left hand and striking with the right with a smooth, sweeping downward stroke and with a follow through, not a jab or a stab."

Any golfer will find that experiments with his putting style will repay his trouble. Good putters are not just born; they are made by their own efforts. So we need to follow the example of Cotton, Locke—who has treated us to an exhibition of wonderfully consistent putting this year—or Bobby Jones, to give just three names, and not be frightened to change our methods in searching for that elusive style that will enable us to strike the ball into the hole with fairly constant regularity.

GOLF SUPERSTITIONS

ANYONE who for the first time watches the play in any open competition may be pardoned if he wonders whether golfers really enjoy the game. They see players with strained, agonised expressions on their faces, walking up to the tees and greens; they notice their nervousness whilst the crowd looks on in deadly silence; and they overhear their expressions of relief, mingled with excuses for bad strokes, as the round is ended.

The very uncertainty of golf makes the question of temperament important. So many unexpected things can happen during a game that it is indeed difficult to preserve that priceless feeling of confidence without which little can be accomplished. A player may hit a perfect drive down the fairway and then find that the ball has been picked up by a wandering caddie; he may hit the spectators, perhaps without doing them serious injury, but his ball may turn off anywhere.

Outside disturbances of all kinds may occur to add to the difficulties. I remember a friend of mine during an important tournament, just as he was in a winning position, having to bear his caddie back to the club-house because he had had a fit. For a long time afterwards he insisted on carrying his own clubs!

On one occasion, as mentioned in *The Architectural Side of Golf*, a player, concentrating on his drive, was startled by the unexpected charge of a mob of Ancient Britons, who emerged, shouting and yelling, from a wood on the side of a fairway. They were recalled by the wrathful blare of the megaphone of a cinema director for having made a false start. The uncertainty of the game certainly makes most golfers subject to superstitions.

Women golfers, in particular, like to possess several mascots, and few would think of going away without lucky talismans. When playing in tournaments many men and women are particular about the clothes they wear, not so much from a sartorial point of view as from selecting certain garments that have been worn on previous occasions when they have met with success. Certain coloured ties may be favoured, or trousers rather than plus fours. Most players have some definite preference. I have known golfers wear the same clothes throughout a championship, fearing to make a change in case it altered their luck. Even so great a golfer as Miss Cecil Leitch wore, I am told, the same pair of stockings for a week, fearful of changing her luck by discarding them. On one occasion I debated about changing my attire after I had got through several rounds of a championship. I finally did so and was promptly beaten. Just a coincidence? Perhaps, but I regret having done so to this day.

A MORE CONVENTIONAL STANCE
A. Perry with a "Calamity Jane" putter

Winning the first hole is often regarded as a bad omen. No doubt the thought is uppermost that the fates are being too kind early on and are therefore likely to switch their favours to the other side in the later stages of a match. This constitutes one of the greatest of all golfing superstitions, although from a logical point of view it must be argued that the more holes you win and the quicker you do so the better. Then there comes the question of the numbers on the balls. No. 3 marking is the most popular, and I know quite a few golfers who will never use a No. 1. They may evade their real reasons for keeping to one particular number by saying that they always know which is their ball, but that is only a half-truth.

We have all experienced at one time or another a "bogey" hole—a hole that we never seem able to play correctly. Before we reach it we are resigned to our fate, and when it is over turn to our partners and say: "That is a poor one; should be altered, you know." On the other hand, there are just a few holes—and how few!—that we really like and play as nearly perfectly as we can, superstitions or no superstitions. When practising most golfers always decide to finish with a good shot even if that means staying out on the course an extra half-hour. Nothing is too much trouble or too illogical providing they can become more confident in themselves and their abilities, and that is the reason for golfers' superstitions.

Doubtless there are some golfers who do not believe in mascots, who do not worry about lucky suits or pullovers, perhaps they are even strong-minded enough not to be disturbed at seeing their caddie look at them cross-eyed. They are to be envied. Still, I think even they would look with favour on a black cat, which has an established place in our regard as the herald of good fortune.

On the most reputable authority an account is given in the book already refered to of two golfers on the tee of a certain short hole "seeing one of these lucky emissaries of fortune approaching." They agreed to wait and note which of them it would condescend to favour. It came up to one of the pair and "lovingly rubbed its back against his stockings with tail waving and eyes adoringly cast upward." He promptly did the hole in one! E. R. T.

A FIELD OF CHRYSANTHEMUMS BEING CUT FOR MARKET

THE INCREASING FLOWER INDUSTRY

Importance of the Local Trade

By W. E. SHEWELL-COOPER, F.L.S.

FEW people have any idea of the enormous quantities of cut flowers which find their way to the markets week by week. For many years the bulk of this trade was in the hands of France, the Netherlands and Belgium, and until restrictions were imposed and imports of flowers subjected to duty, early in 1932, the value of imported flowers was well over a million pounds sterling.

Before the War the acreage devoted to flower growing was probably round about 4,000 acres, and this year there is little doubt that the acreage will be approximately 13,000 acres. This great increase is undoubtedly due to the women folk of the country who, quite rightly, will beautify their houses with flowers, believing that "Man cannot live by bread alone."

Flower farming is one of the most fascinating agricultural pursuits. Like every other branch, it needs a specialised technique, but it cannot be said to suffer from the ups and downs of sheep or pig farming. Flowers are always in demand, year in and year out, and providing they are well grown, properly graded and packed, they receive their due reward.

Certain districts have specialised in flower growing. Cornwall, for instance, is well-known for its daffodils, anemones and violets. The Spalding area has made itself famous for its tulips. The Hampton district near London has largely concentrated on chrysanthemums, while North-West Kent grows flowers of all kinds. In the north, districts have arisen around Manchester and Liverpool, for instance, where large quantities of flowers are grown for the local trade. There is no reason at all why acreages in other counties should not be developed, for there are flowers to suit almost every kind of soil, and where there is a town there are always townswomen to buy.

Many growers have found it advisable to develop the local trade rather than to attempt to send packages long distances to central markets. The roadside market has come to stay, and thousands of flowers change hands week by week. Lord Darnley's glass-covered, wayside flower shop on the Rochester By-pass is a typical example of what can be done in this direction.

It must not be thought that good flowers can be grown without heavy manuring. Many of the most successful flower growers use up to 60 loads of good organic manure per acre when carrying out the initial preparation of the land. In subsequent years 40 loads may be found to be sufficient, but the greatest care should be taken to see that the land is rich in humus. The basis of all schemes for manuring on the flower farm should be the maintenance of organic material in the soil. In addition, it is not unusual to give heavy dressings of artificial manure. Superphosphate may be applied at 6cwt. per acre, steamed bone flour at 4cwt. per acre, and sulphate of potash at 3cwt. per acre. To the ordinary farmer these may seem heavy dressings. Such flowers as chrysanthemums do take a lot out of the soil; while many of the perennials like scabious and pyrethrum are in the soil for two or three years before being disturbed.

The best prices are always paid for the flowers of varieties of recent introduction. The worst two months for cut bloom, as far as prices are concerned, are July and August, when so many families are on holiday and when most gardens, however, small, can provide something for house decoration. It is during these months that novelties will sell and flowers that have been produced with longer stems or better size than those normally seen in the district.

Pyrethrums, early in June, are certainly popular. The soil in which they grow may be a fairly shallow one, for the plant is naturally surface rooted. It does best on a light soil, and needs a good dressing of lime every autumn, especially in the North of England, where the rainfall is high and frost damage is a reality.

Planting is best carried out in July, immediately after the first flowering period, though should the summer be dry it is better to wait until the following spring. The roots should be spread out evenly, and not planted so that they are "tucked up" in a bunch.

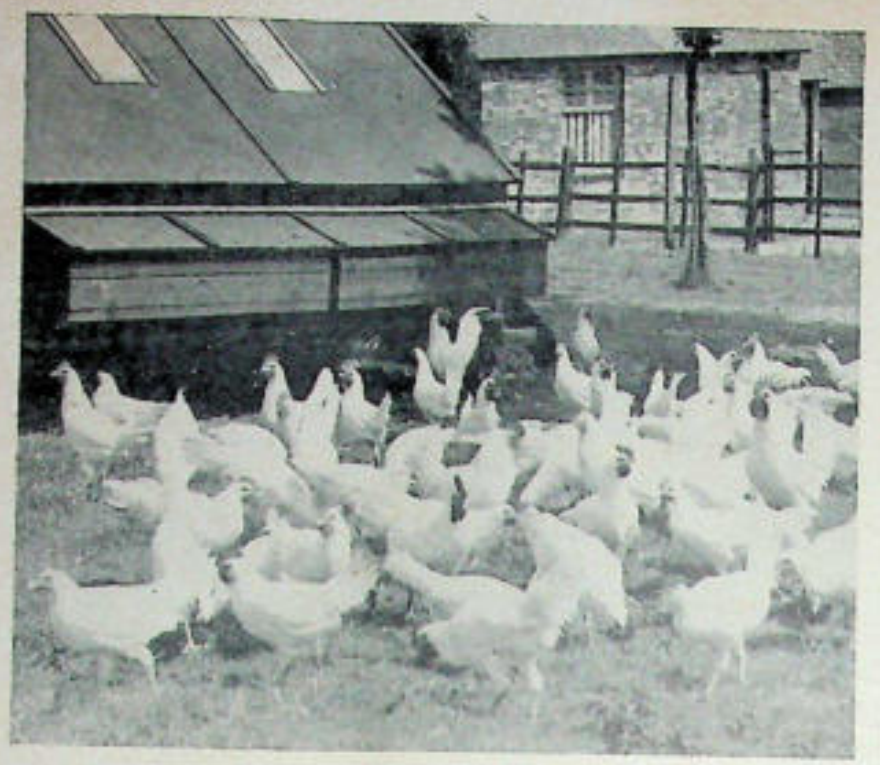
The modern varieties, like Margery Robinson, a bright rose pink on a 3-ft. stem, Eileen May Robinson, the large perfectly shaped salmon pink; Harold Robinson, the scarlet crimson with the lovely sheen; and Kelway's Glorious, the earliest crimson scarlet, have largely replaced the older smaller-flowered varieties like A. M. Kelway, James Kelway and Mrs. Bateman Brown.

The scabious (*Scabiosa Caucasica*) is another popular market flower, even though the main cut is during the two principal summer months. The introduction of such varieties as Goldingensis and Clive Greaves have been the cause of vastly increased sales. Clive Greaves, a rich mauve, and Goldingensis bears rich flowers of a deep lavender shade on long stems.

The flowers fetch better prices in the South than in the North, and there is at least one flower farmer near Manchester who finds that it pays him better to send to London than to market locally.

Scabious can be planted in the spring or early autumn in rows a foot apart. It certainly needs perfectly drained soil, and it is a lime lover.

Few cut flowers on the market can guarantee the ready sale that Alstromeria does. It succeeds well in any good soil, having good drainage, and seems to grow equally well in an exposed garden in the North as in a well-protected area on the South Coast. It is, however, susceptible to frost and water logging.



The Alstromeria has tuberous roots, which are often sold by the bushel in a similar manner to mint roots. It is better to plant in March than in the autumn, for a newly-planted bed may suffer from winter frosts. The tubers should be inserted 6in. deep and 6in. apart. The rows should be 1ft. apart. In a very short time the area devoted to this flower will be covered, for the roots have a tendency to run and to produce flower heads where they will.

A FINE DISPLAY OF TULIPS IN ABUNDANCE IN KENT

When purchasing Alstromeria it is necessary to insist on those with flowers of a deep orange shade and not light yellow. The main cut occurs early in July, though some years it is possible to [illegible] market late in June.

In addition to standard lines like Chrysanthemums and Daffodils, other perennials that have proved popular as cut flowers are Gypsophila, Paeonies, Ranunculus, Statice, Trollius, & [illegible]. Those who are interested in flower farming should consult *Modern Flower Growing for Profit*, published by Ernest Benn at 5/-. This is the standard work.

COLLECTIVE SECURITY

Colds, roup, pip, "bumble-foot", fowl cholera and typhoid, can be prevented by the regular use of 'Chloros' in the washing and drinking water. Although 'Chloros' is one of the most powerful disinfectants known, it is perfectly harmless to man, beast or bird in the strengths recommended for use.

BURBERRY

GAMEFEATHER SUITS

Why do the birds swerve from one's own guns and go over other butts without apparent fear? It may be the suit one is wearing is too conspicuous.

For many years past Burberry Gamefeather suits have enabled their owners to obtain a great deal more shooting than otherwise would have come their way. At least Burberrys are often told that this is the case.

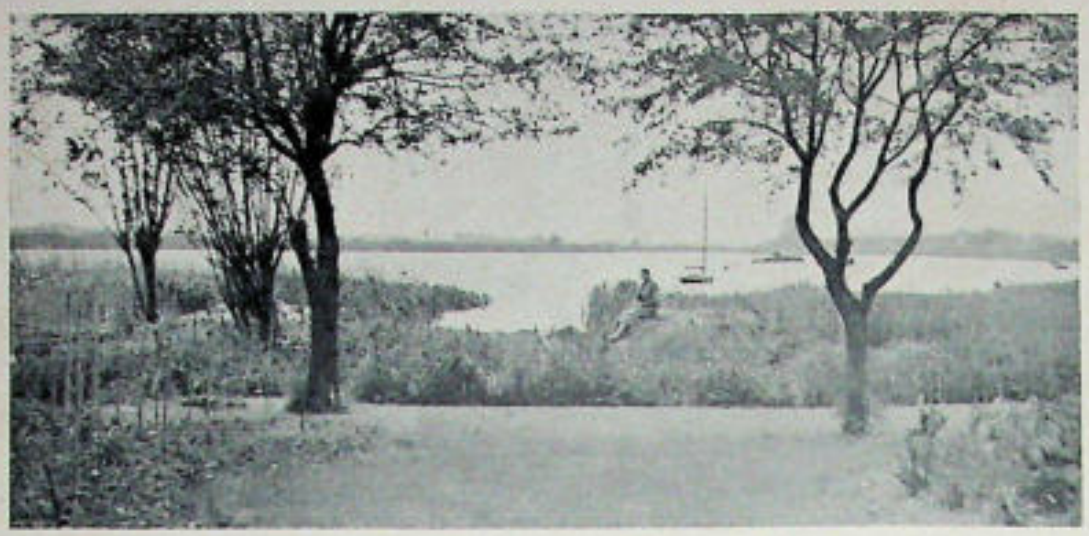
Gamefeather suitings contain in their colourings the same shades that serve to camouflage gamebirds themselves.

Gamefeather suits are a complete success in rendering the wearer invisible to game and they are, as well, handsome suits.

THE BURBERRY

Weightless — wind-proof, rain-proof, drizzle-proof— naturally ventilating — The Burberry provides a delightful Overcoat and perfect Weatherproof.

Designed on easy-fitting lines from thin and flexible materials, it makes no difference to the "set" of the gun, and is the coat in which one can maintain top form without let or hindrance.



The World's Best Weatherproof

One of the World's Best Overcoats

WARNING
No garment or material, unless it is the manufacture or merchandise of Burberrys Limited, may be described as "BURBERRY," a Registered Trade Mark protected all over the World.
N.B.—Proceedings will be taken against offenders using the word "Burberry" wrongfully, whether with or without knowledge.

Patterns and full particulars sent on mention of "The Field"

BURBERRYS LTD., HAYMARKET, LONDON, S.W.1

THE FIRST SPRING: CURVED BORDERS FLANKING THE CENTRAL GRASS PATH
In the background can be seen the dyke cut through the reed bed into the Broad

The Country House

MAKING A YACHTSMAN'S GARDEN

By J. A. ROBERTSON

THOSE who live close to the Broads and who sail and race upon them are usually anxious to obtain private access to the water, but firm land close to the water is usually very limited in extent and often already wholly occupied. When a nearby derelict garden beside the Broad was offered for sale in plots it was therefore natural to buy one. Like many such plots, it was long and narrow (200ft. by 30ft.); it was smothered with brambles, raspberry suckers, elder and ivy, and at the bottom it lost itself in reed-beds with an intervening and overgrown ditch and bank close to the edge of the reeds, so that the Broad was almost invisible.

When this thicket had been cleared it became apparent that there was a belt of tall and spindly trees at the top followed by a stretch carrying several fair-sized thorn trees springing from a carpet of ivy; then came three well-grown small oaks and a bat-willow with their roots in rough grass, and further down two umbrella-shaped thorns close to the ditch, which proved to be part of a series of small ponds. The earth and gravel taken out when these ponds were dug had been thrown up onto the edge of the reed-bed and now formed a firm broad bank or "hard." On this a slipway could easily be built. But before this could be done it was necessary to bring the water up to the hard, and by a convenient arrangement with the owner of the next plot it was agreed to cut a 14ft. party dyke for some 60ft. through the reed-bed, with one bank on either plot. Two labourers were hired to dig out the shoreward end of this dyke, to "diddle out" the two little ponds, and to put up a fence at the far upper end of the plot. The rest of the dyke was dredged by a hand grab worked from a small pontoon.

The mud, matted reed-roots and peaty bottom of the reed-bed were thrown up into banks on either side, which, when they had settled and consolidated, began to grow rough grass, purple loosestrife and reeds, forming useful natural jetties through the boggy reed-bed. Some time later a carpenter was brought in to build a simple slipway and chair, which proved very suitable for a racing dinghy, and, being built from shipbreaker's timber, was moderate in price and made of stout and well-seasoned material.

When the lie of the land had finally been revealed by the use of "slasher" and bonfire, it was clear that the best place to make a garden was on the landward side of the ponds, between the two umbrella-shaped thorns and the oak trees further up the plot. Here the ground was not shaded by trees and was covered in rough grass. Accordingly, in the hottest weather, this land was trenched to the depth of about two-and-a-half spits. The soil was so deep and so good that it was unnecessary to keep the top spit to the top, but the whole was turned upside down, which helped very greatly in the removal of the black, wiry roots of catstail and the bloated white underground stems of reeds. At the lower end of the piece of land which was trenched the spade struck sodden peaty sand at the bottom of the second spit, promising an abundant supply of underground tidal moisture even in July and August when the gardens farther up the hill, with a shallow soil on a gravel bottom, are invariably parched save in the wettest summers.

It was at once decided that the future herbaceous borders should be mainly planted with perennials flowering in these months, which also fortunately coincide with the time of the sailing regatta and the greatest use of the plot.

It may seem strange that tidal water should be a welcome source of moisture for plants, but although the rise and fall of the tide is considerable the water is not appreciably salt, for it consists of fresh water held up and driven back by the salt water entering the Yare and Breydon Water.

After trenching, the soil was levelled and raked, and two borders with curving edges were marked out on either side of a broad path which was sown with grass seed. One border was reserved for dahlias and the other was filled during the autumn with late-flowering perennials, though a few earlier flowering but moisture-loving plants were also included. The varieties selected were the following: *Achillea eupatorium* and *A. ptarmica* (The Pearl), *Aconitum bicolor*, Alstrœmeria, Astilbe (and Spiræa) in variety, Campanula (Telham Beauty), Chrysanthemum (early flowering) and *C. maximum*, Coreopsis, Delphinium, Echinacea (The King), Echinops, Erigeron (Quakeress), Helenium (Moerheim Beauty and Wyndley), Helianthus, Hollyhock, Inula, Kniphofia, *Meconopsis Baileyi*, Michaelmas Daisy (early flowering), *Monarda violacea* and Cambridge Scarlet, Phlox in variety, Potentilla, Poterium, *Rudbeckia speciosa* and Herbstsonne, *Salvia virgata nemorosa*, *Scabiosa caucasica*, *Statice latifolia*, Verbascum and Veronica.

As the border was a small one it was impossible to plant in large clumps if monotony were to be avoided.

Although the ground was low-lying and liable to flood, very few plants failed to survive their first winter. This was probably due to the partially sandy nature of the bottom spit, which was now on top, and to good drainage owing to the deep trenching of the border. The only weed to survive the trenching was the indomitable catstail.

The upper part of the plot was left wild and planted with bulbs, violets and primroses. The recalcitrant stumps of some twenty thorn bushes had first to be eradicated, and when the last of them had been removed the ground was thoroughly searched for bramble roots and some of the trailing ivy was torn up. This treatment has succeeded beyond all expectation, for now that the ground is no longer choked with undergrowth grass has ousted the ivy. Half a dozen home-grown seedling brooms (*Andreanus*) have been planted in groups on either side of the rough path leading down to the borders and little lawn. On either side of the plot a row of *Cupressus macrocarpa* about a foot high and planted 2ft. or 3ft. apart constitute the "sufficient fence" which each owner covenanted to erect.

Throughout the making of this little garden cost was a primary consideration, and for this reason it was necessary to forgo all forms of garden masonry and other costly embellishments. Apart from the digging-out of the dyke and ponds and the erection of the slipway and of a gate and fence, no hired labour was employed. In consequence there was little temptation to indulge in the unchastened enthusiasm and ambitious schemes of the vicarious gardener! But simplicity is not ill-suited to a background of Broadland scenery.

HORTICULTURAL ADVICE

Soil Sterilisation

By CARTHEW ALLERDYCE

THE partial sterilisation of soil has proved one of the most interesting developments of recent years. It has been taken up by golf clubs who wish to use organic matter free from weeds for treating their putting greens. Market gardeners have found the usefulness of having weed-free soil and so have dug up quite large areas for the purpose of sterilisation, replacing the soil thus treated afterwards.

The glasshouse grower could not carry out his work over a long period of years without sterilisation of soil, and he is able to treat the land covered with glass *in situ*. This enables him to grow good crops when otherwise the results would be very poor.

The partial sterilisation of soil should aim at doing five things. First of all, it should ensure that all insect life is killed. Thus soil that is so treated is free from all pests. This may be of great importance in the case of stacked turf (for instance, full of wire-worm) or soil that is known to have a high slug population. Secondly, all fungi and protozoa should be destroyed. There are many fungus diseases in soil that ruin the roots of plants or that cause the stem of the plants to die off at soil level. You have only to think of the damping off fungi as an example.

Then, as has already been said, all weed seeds should be destroyed. It is wonderful to have weed-free soil. Every seed you sow grows in an unrestricted manner, there is no patchiness. No weeding has to be done, and so for frames, boxes and even for borders, partially sterilised soil is ideal.

Point 4 refers to the non-spore-producing bacteria which are killed. These may be called the harmful bacteria, and so when they are out of the way, it allows the surviving ammonia-producing organisms to multiply exceedingly, and to carry out their activities in an unrestricted manner. This provision of the right medium for the ammonia-producing organisms is very important indeed and is, in fact, point 5. Soil that is properly treated with dry heat or steam may be said to be rich in nitrogen, for the bacteria work unhampered.

Unless you have seen the difference between seedlings grown in sterilised soil and those grown in unsterilised soil, it is impossible to realise it. Plants in sterilised soil can grow more quickly. They are healthier and better-looking, and, what is more, there is a saving of seed, for in sterilised soil almost perfect germination can be ensured.

There are various firms who specialise in structures for the purpose of soil sterilising. For the small garden there is a machine made by the Gloucester Incubator Company, of Stroud, Gloucestershire. Those who have electricity can sterilise by means of the electric soil steriliser made by Messrs. Electro-Horticultural Equipment Co., Ltd., of Harpenden, Herts, and the consumption can be taken as approximately one unit per cubic foot to be sterilised. A booklet on the subject can be sent to readers, published by the Electric Development Association of 2, Savoy Hill, London, W.C. 2.

An efficient machine is made by Messrs. Cope and Cope, of 10, King's Road, Reading, while Messrs. Charles P. Kinnell, Ltd., of 65, Southwark Street, London, S.E. 1, make the Mellik Soil Steriliser, which works by oil or electricity.

For those who have got quantities of soil to treat there is much to be said for the Reaseheath Steriliser or Warburton baking apparatus. This consists of a trough of brickwork 3ft. wide, 20ft. long and just over 1ft. deep. All these are inside measurements.

There are flues underneath 4½in. wide and 15in. high with a fire box at one end and a good chimney at the other. Full details on the construction of the steriliser, which can be done by unskilled labour in the garden, will be found in the book *Modern Flower Growing*, published by Benns, price 5s., obtainable from any bookseller. The drawings and the photographs are very easy to follow.

The earth is placed in the trough until full, and in the case of such a structure as this, about 3 tons is put in at a time. The soil is then covered with sacking and the fire is lit. After baking for four hours the earth is dug over and the baking continued for another four hours. At the end of this time the soil is removed and allowed to cool.

Those who have large greenhouses may sterilise by steam *in situ*. There are firms who will give quotations for doing this. The soil is not dug out, but perforated pipes are laid in the soil and the steam passes through them at high pressure.

BETTER STABLING

When you are buying stabling, strength and durability are big considerations. Your stables have to stand all weathers and heavy usage for years, and the welfare of the horses depends upon the quality of construction. Boulton & Paul stables have a reputation for reliability in this respect.

All types fully specified and illustrated in Catalogue 571 sent free on request.

HEALTHIER MOTORING

Enjoy health-giving fresh air by motoring in Tickford Coachwork. The pleasure of touring is doubled. The Tickford Drop-Head Coupes and Four-Door Cabriolets are built up in electrically welded steel framework, giving lightness and great strength, and the ease with which these are opened and closed is not found in any other Coachwork of this type. The hoods are fully lined as in a Saloon, no framework being visible. Tickford Bodies are the result of over 20 years' specialisation in Open-Closed Coachwork in which are incorporated patents giving the maximum ease of opening and closing, with complete protection from wind and rain in rough weather. No other Coachwork of this type can give you the same advantages. Thousands are in daily use giving absolute satisfaction. Tickford Coachwork is included in the Models of the Armstrong-Siddeley, Daimler, M.G., and Rover Cars. Descriptive specification with pleasure from the Patentees:

ANTIRRHINUM SEMPERVIRENS NEEDS A VERY SUNNY SHELTERED SPOT AND THE PROTECTION OF A PANE OF GLASS IN THE WINTER

DECORATIVE ANTIRRHINUMS

Useful Late Summer Flowering Plants

By ELEANOUR SINCLAIR ROHDE

THE modern craze for treating biennials as annuals has, at least in the opinion of old-fashioned folk like myself, more disadvantages than advantages, and this is especially the case in regard to Antirrhinums. Plants sown in January when there is very little daylight and rushed up in artificial heat cannot compare with those sown this month in natural conditions and given the protection of a cold frame through the winter. Further, apart from being sturdier, these plants bloom earlier.

Antirrhinums are amongst the most decorative and useful late summer-flowering plants, and I have a special liking for the delightful and handsome old striped kinds still largely grown in Scottish gardens, but seldom in this country, and the deep crimson dark-leaved variety formerly so popular with cottagers. Second to these I like all the tall-growing varieties in mixture. The "intermediates" are useful for planting in conjunction with the tall-growing varieties in large beds. For the different heights give variety just as much as the different colours. I recall seeing a huge bed of tall and intermediate Antirrhinums in mixed colours in an enclosed garden with the perfect background of one of the few old garden houses that survive. It is a mistake to omit at least a proportion of white kinds, for without these touches of white the gayest colours are apt to look a little heavy in mass. As in needlework a little yellow is also essential.

The dwarf varieties leave me cold, for to my thinking they are out of all proportion, and the new ultra-dwarfs largely advertised as being useful for the rock garden (though no true rock gardener would dream of putting Antirrhinums of any kind in a rock garden) are even more deplorable.

Early August is generally regarded as the best time for sowing seed in cold parts, and the third week in August in the south. Seed should be sown in boxes or pans standing on ashes in a cold frame. The compost should be two parts loam, one part leaf mould or prepared peat, and a little mortar rubble and silver sand. The whole should be finely sifted. Sow the seed as thinly as possible and then barely cover it with sandy soil. Germination can be assisted by covering with a pane of glass and brown paper, but this, though a good method in winter, is unnecessary at this time of year. If glass is used, however, it has to be turned and wiped daily.

Transfer the seedlings as soon as they are large enough to handle into deeper boxes or pans filled with the same compost, setting the seedlings 2in. apart. In the very mildest parts and on warm soils the plants can be put in their flowering positions in early autumn, but in most parts this is impossible, and they have to be sheltered through the winter in a cold frame or cold greenhouse. Theoretically Antirrhinums are hardy biennials, but hybridisation, and especially in the case of the lovely new varieties, has resulted in a breed that are anything but hardy. For instance, the old deep crimson kind cottagers used to treat as a perennial and the species *A. majus* that grew on walls and from which all hybrids are descended withstood almost any cold. In this country it had almost naturalised itself.

Though they need protection through the winter, undue coddling only makes the plants sickly. In cold parts, and especially where very fine specimens are desired, the plants are potted off singly in 3-in. pots and kept in a cold greenhouse with a minimum temperature of 40 degrees. They need the minimum of water, but as much air and light as possible to keep them sturdy.

In fairly mild parts, however, the protection of a cold frame is sufficient, opening the frame whenever the weather is genial and even in cold spells keeping the light a little lifted. Watering is important. This should be given only when the surface soil is dry. Water in the morning, giving enough to reach the farthest roots, and then leave well alone till the surface soil shows dry again.

If the plants are needed for greenhouse flowering in May they should be transferred to 5-in. pots in February, using the same compost as above. The mortar rubble is important, and a little wood ash is also a good addition. Kept in a temperature of 45 degrees to 50 degrees after February the plants should flower in May.

Some of the low-growing Antirrhinum species are possible in mild parts, notably *A. asarina* and *A. sempervirens*, but they are far from hardy in our damp climate. *A. asarina* has greyish foliage and cream-coloured flowers, and *A. sempervirens* has white flowers. Both bloom in late summer. They need the sunniest and most sheltered position available in very well-drained sandy soil and protection through the winter in the shape of glass raised 5in. or 6in. above the plants.

PITPROPS

By REGINALD DAVEY

IT is perhaps inevitable that a large proportion of the pitprops used in our mines are imported. It is not that the imported article is superior to our own. Though it is true that the supplies, grading and preparation of our own props are often inferior. Our props are every whit as strong as those grown abroad, and the Forestry Commission's supplies are as well marketed as those from over the seas, a lead which the larger estates are not slow to follow.

The real difficulty is that the coal from our mines is taken abroad by ships which return loaded with pitprops. If the return load were not forthcoming the freightage on the coal would be higher and less would be sold. It is natural that the mine owners should buy imported pitprops if it thereby increases their sales of coal.

A proportion of home-grown props are purchased, partly because the mine owners realise that a war would cut off their supplies of imported mining timber, and they would be left high and dry unless they take some pains to foster the home industry.

For this reason alone the home-grown pitprop is likely always to meet a fair demand, and provided the pithead is not more than 100 miles distant from the wood, a fair profit should result.

This is easily the most important outlet for our larch, spruce, pine and Douglas fir thinnings. Larch usually meets a more remunerative demand for pergolas, fencing, wireless poles and other purposes, but is the most favoured wood for pitprops. The Forestry Commission in the New Forest area mix all their coniferous species together and send them to the Kent coalfields under the description of mixed fir. The species accepted varies according to the colliery, but all take a wide range of sizes, a fact which renders the market so convenient for the woodland owner. Sizes vary for different collieries, the minimum diameter usually being 3in. and the maximum 9in.

The woodland owner who is contemplating selling pitprops will be well advised to ascertain the exact requirements of his nearest colliery.

The financial result will depend upon many factors, an example of an actual transaction being as follows:

	s. d.	£ s. d.
Price per ton at pithead		2 10 0
Rail carriage 180 miles	18 10	
Hauling to station	5 6	
Felling, seasoning and cutting	7 0	
		1 11 4
Profit equal in this case to 5d. per foot cube		18 8

Circumstances vary for each estate and a price of 8d. per foot cube is by no means unusual, especially owing to the recent substantial increase in the price of pitprops.

Mining timber is not difficult to produce, but it calls for care. The selection and marking of the thinnings is followed by felling with axe or saw as near ground level as possible. All branches and snags are then removed with the axe, and the bark, except of larch, removed with a special spade, draw shave or old bagging hook. The spade is easiest to work with. Next follows the laborious task of hacking the poles to the nearest ride, and by horse labour to the hard road, where they are stacked for seasoning. This may occupy six weeks if there are drying winds, or it may take several months.

Cross cutting with hand or saw power is the operation which controls the extent of profit made. Well done, with the colliery specification to hand, all lengths accurate and all cuts truly at right angles to the lie of the prop, means maximum production, minimum waste and no rejections.

For delivery the props must be correctly sorted, for they are competing with French and Portuguese timber delivered to our ports in any quantity, perfectly prepared and correctly graded.

The chief attraction of pitprops is that they offer a market for thinnings which are otherwise difficult to sell. Larch usually meets a ready demand for many purposes, but spruce, Douglas fir and the pines are a different proposition. To be able to sell them from 3in. diameter upwards is to increase greatly the financial potentialities of a plantation.

The earliest date at which a conifer plantation might be felled is the 60th year, and the Forestry Commission work to a rotation of 80 years for larch and 100 years for other conifers. If it costs £10 per acre to establish, compound interest at 5 per cent. has increased this outlay to £187 by the 60th year, so that any sales of thinnings from the 20th year onwards will likewise accumulate on the credit side. For example, £1 received in the 30th year is equivalent to £4 6s. 6d. received at maturity. In practice, nearly as large a sum is received for thinnings as is realised by the final crop.

A TRIUMPH DOLOMITE ON THE SUMMIT OF BIRKIEMORE, LOOKING DOWN GLEN EROOM, NEAR ULLAPOOL, ROSS-SHIRE, TO THE PEAK OF BEN MORE COIGACH

SOME POINTS ABOUT PLUGS

Component Parts Which Respond to a Little Attention

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

OF all the component parts of the modern engine which the motorist takes for granted, I imagine that sparking plugs stand supreme. The tendency is to instal them and then promptly to ignore their existence. There may be an occasional inspection and perhaps a periodical cleaning when the car is not pulling too well, but in comparison with the unceasing hard work and generally arduous life which plugs are expected to stand up to, the degree of attention they enjoy is relatively low. While it is true that sparking plugs to-day maintain an extremely high standard of efficiency and have been developed through the years to function under varying conditions, this is no reason why they should be thoroughly neglected.

If the best performance and economy in running is to be obtained, it is essential that the plugs are given their fair share of attention because they exert such a profound influence upon the general behaviour of the engine. I find that unless something is going radically wrong, the average motorist is not particularly sensitive to the gradual decline in the performance of his engine as the mileage increases. The process is a slow one and if he is driving regularly in the same car, the deterioration is not always easily discernible. This factor, therefore, rather rules out the old adage of "leave well alone" and makes a routine examination of the plugs desirable every two thousand miles or so. In the majority of cases the difference in an engine after the plugs have been cleaned and the gaps between the points reset, is really surprising.

The readjustment of the points should be done with some care and with the assistance of a gauge, for it is utterly useless to attempt to arrive at the correct setting with the eye alone. Neither should the edge of a visiting card or a matchbox be utilised, because these objects differ greatly in thickness, and consequently will not produce good results. The manufacturers invariably advise the correct gap setting in the instruction book, and this normally is in the region of from .020in. to .025in., or, with high voltage ignition systems, from .036in. to .040in.

The gap between the points increases with usage since the constant firing causes the electrode metal to burn away. Therefore the normal procedure is to tap the points closer together to enable a strong, healthy spark to bridge the gap. If the metal has become well worn and the burning appreciable, then it is a wise plan to buy a new set since maximum efficiency can hardly be expected from worn plugs and poor performance will result.

Cleaning is a job which can be done easily at home and this is even occasionally necessary with new engines. Either oil or excessive carbon deposit will impair the functioning of the plug, because both will tend to make the gap non-existent or perhaps provide a means for the current to leak, thus reducing the strength of the spark. It is, I find, often a good plan to clean the insulator as well as the metal points, although this is not necessary on every occasion when the plugs are removed for inspection and cleaning. With some types of plugs the insulator can be unscrewed and (whether of mica or a china-like substance) is easily cleaned with petrol and a rag. It is not desirable for any undue abrasion to take place on the insulator during this cleansing process, because any uneven surface will provide an excellent foundation upon which fresh deposits of carbon can soon be built up. Care should be taken when reassembling to see that the joints are perfectly clean. Those plugs with insulators that are not detachable are best left in the hands of the service station for cleaning, where the operation is carried out on a special machine within a few minutes and at very low cost.

With new engines the necessity to clean plug points frequently arises because during the running-in period the motor is turning over slowly, thus preventing the plugs from becoming as hot as they normally would under ordinary conditions. It is obvious that without sufficient heat the oil which may be thrown upon them cannot be burned off; also since it is common practice nowadays to mix upper cylinder lubricant with the petrol when running in, it is easy to see that the plugs have an additional obstacle to meet since they have more oil to deal with than might otherwise be the case. Naturally, when higher speeds become permissible these conditions will disappear, but during the running-in period I would recommend that the points be cleaned at 500 miles and again at 1,000 miles.

One of the advantages of the regular inspection of sparking plugs is that the nature of the points invariably provides a clue if the strength of the mixture becomes at all abnormal.

Over-rich or too weak mixtures not only militate against good performance, but, in the long run, both conditions—if permitted to continue unaltered—are apt to prove expensive, so that the routine cleaning of plugs may prove a stitch in time, especially when the motorist is not particularly observant of other symptoms which may show that all is not well with the carburettor setting. Sooty plugs mean a rich mixture, while hard "parched" looking points indicate that the engine has been running on too weak a fuel mixture.

Although plugs may be cleaned systematically and gaps set periodically, it is natural that, like anything else, they do need replacing from time to time. The plug manufacturers and the majority of car makers recommend 10,000 miles as the time when it becomes advisable for a new set to be installed. After that mileage, the points will have become somewhat worn, and with the diminishing effectiveness of the plug, the performance will deteriorate. All sorts of troubles can be traced to worn plugs, yet, after all, for the yeoman service they give, they are not prohibitively expensive.

A worn plug, for instance, will become overheated during ordinary running to such an extent that the points may become nearly incandescent, which would result in great loss of power. The engine designer—when the engine was being produced—took great care to see that his cooling arrangements were such that the correct type of plug would neither become too hot nor too cold in general use so that the maximum amount of power would be forthcoming at all times. But if the plug itself is faulty, obviously the engine cannot function at its best, as intended by the maker. The fact that the plug is becoming overheated is often recognisable by the fact that when the ignition is switched off after a run, the engine will continue to fire since the still glowing points will ignite the incoming gases.

The overheating can also occur if the wrong type of sparking plug is fitted. Therefore, when renewing, care should be exercised in obtaining the correct type for the model. Racing drivers and sports enthusiasts know only too well how plugs can make or mar performance. Perhaps the ordinary motorist has no necessity to indulge in any experimentation with plugs, but nevertheless he should use discrimination when buying. There are many types of plugs being marketed to meet varying conditions, but recently there has been a move to produce a plug which will operate satisfactorily in almost any circumstances. Improvement in design has evolved sparking plugs with a heat range which will ensure that they will not overheat with wide throttle openings nor exhibit any tendency to run too cool when idling, thus preventing any possibility of petrol and carbon causing shorting across the points. For instance, the Champion concern produce the L 10 plug, which will meet the conditions, previously demanding a choice of no fewer than ten types of 18 mm. plugs. This new plug has a special "Sillimanite" insulator, the exposed end of which is designed to resist any untoward action upon it by ethyl lead or benzole. The K.L.G. concern have also recently introduced a new model which will stand up to high temperatures and will still function in an oily engine.

THE MOTORIST AND HIS MEALS

Value of the American Kerbside Counter

MOTORISTS' preference for meals, and especially lunch, would form an interesting subject for a questionnaire. Were I to conduct such a thing I should divide motorists into two classes: one, those who travel alone or with a single passenger; and two, those who go accompanied by friends or family. I should ask each class to put down in order of merit the following kinds of middle day meal: (*a*) a fixed hotel lunch, (*b*) a restaurant type of lunch, (*c*) a snack lunch and (*d*) a picnic lunch.

One of the things I should like to find out is whether the general demand is for a few simple dishes or for a heavier meal. It would also be interesting to know what price the ordinary upper and middle class motorist considers a fair one to pay for lunch.

But the main object of the questionnaire would be to discover the most popular form of meal. The same motorist, in varying moods and under different conditions, would sometimes feel like standing himself a full-course meal and sometimes would be content with a snack. But there are very few ports of call in the country where these alternatives are available. If we go to a country hotel we must eat what is provided, the choice being necessarily limited. If we stop in a town there is probably a good restaurant to feed us—if we can find it. But the difficulty of finding a parking place and the fear of being harried by the police if we leave our car outside are definite disadvantages. Furthermore, the popular city restaurant is liable to be crowded, and its atmosphere does not compare with the quiet and restfulness of a country hotel.

The picnic idea is amazingly popular with family parties. One has only to count the number of car picnics one passes on the roadside about lunch time to realise this. Nor are the picnickers all owners of small family cars. I have seen Rolls-Royce, Daimlers and Armstrong-Siddeleys among them. Clearly, economy is not the motive that drives these big-car folk to feed at the roadside. It might be the reason for the small-car parties' kerbside eating, for a lunch that the housewife could provide for a shilling or two would cost the family eight or ten times as much were it eaten under cover.

Most motorists, and especially those on tour, would, I believe, prefer to eat in the country. Yet in England there are practically no roadside restaurants. In America I noted heaps of these places, which generally featured a quick-service counter. And it seems to me that an anglicized version of the same thing might suit a lot of people. My scheme would be based on the R.A.C. snack bar downstairs by the swimming pool. Here is a counter laden with a variety of sandwiches—incidentally, the best I know anywhere—drinks in decanters and jugs, cold meats and vegetables, various forms of sweets such as fruit tarts, cheeses, biscuits and fruit. One helps oneself to a plate, knife and fork, seizes the desired food, pays for it and plumps oneself down at the nearest table. The choice of food always astonishes me, and the fact that it is set out in so limited a space is also a source of surprise. As far as I know, the whole show, which must feed over 100 people each mid-day, is worked by two or three stewards and a couple of boy waiters.

Well now, imagine this sort of outfit dumped down in an attractive site and in a pleasant looking building on the roadside. I would not suggest meals being served at the counter as they do in some of the American places. A stool is not a comfortable perch to eat from after 150 miles' run. One wants somewhere where one can relax and stretch out a bit. So the restaurant equipment would include armchairs, not lounge chairs, and a number of separate tables. Wall and window seats would be effective and economise space.

One would help oneself to the food, and the whole conduct of the counter would follow exactly on the lines of the R.A.C. snack bar. By this means the motorist would be properly catered for whatever his mood. If in a hurry and not particularly hungry a sandwich or two and a glass of sherry will suit him well. If accompanied by his family, each member can choose what he or she fancies. And the advantage of the scheme is that one only pays for what one likes and what one has.

An essential feature of a scheme like this is that the food though simple should be thoroughly good. The American places to which I have referred understand this point. Their sandwiches, a meal in themselves, are made under one's eyes while one waits, only the insides having been prepared beforehand. Coffee that is a pleasure to drink is freshly made for each order, and invariably served with cream. Their apple pies, also served with cream, are tip-top, which is saying a lot, as I do not like apple pies as a rule. And then their selection of soups is immense, and yet served piping hot in fewer than two minutes. This is done by decanting the contents of the chosen tin into a metal jug which is then plugged into electric heat. The soup warms up instantly, and is then decanted into a bowl all ready for your consumption.

The kerbside counter restaurant would have other advantages besides quick service and selectivity of food. Its situation would eliminate parking trouble and the time wasted in finding a suitable hotel or restaurant in a city, while its charges should be inexpensive owing to its site and self service.

Some years ago, before the civil war, I was touring in Spain and used some such roadside restaurants which the National Touring Club of Spain had erected in standard and most attractive form at various strategic points. The buildings were most picturesque, both inside and out, and while the food did not descend to the simple lines suggested, it offered a wide choice and one paid for what one had. In this case the restaurant included limited sleeping-out sophisticated accommodation, by which I mean that the beds and plumbing arrangements were all that could be desired, petrol and oil supplies, which were very necessary as the next habitation might be 50 miles distant, and a sort of touring office of information. The whole place was in charge of a multi-language man, his wife and one or two assistants. It would be interesting to know what has happened in the interval of several years' civil war to this very excellent scheme. Have these charming places gone to rack and ruin, been razed to the ground or reverted to private dwellings?

In this country we have a certain number of road houses, some of which by concentrating on food, and especially on teas, continue to prosper. But the original road-house idea often featured as its chief attraction a swimming pool and dance floor. Some have ceased to function, a series of summers unfavourable to sun or water bathing having proved too much for them. Also their positioning was chosen not so much with the idea of providing meals for the motorist on tour as to be within easy reach of a large town, whose youth and beauty it was hoped would spend their summer evenings at the place. Possibly had these road houses concentrated more on first-class food they would have survived even the attacks of an English summer.

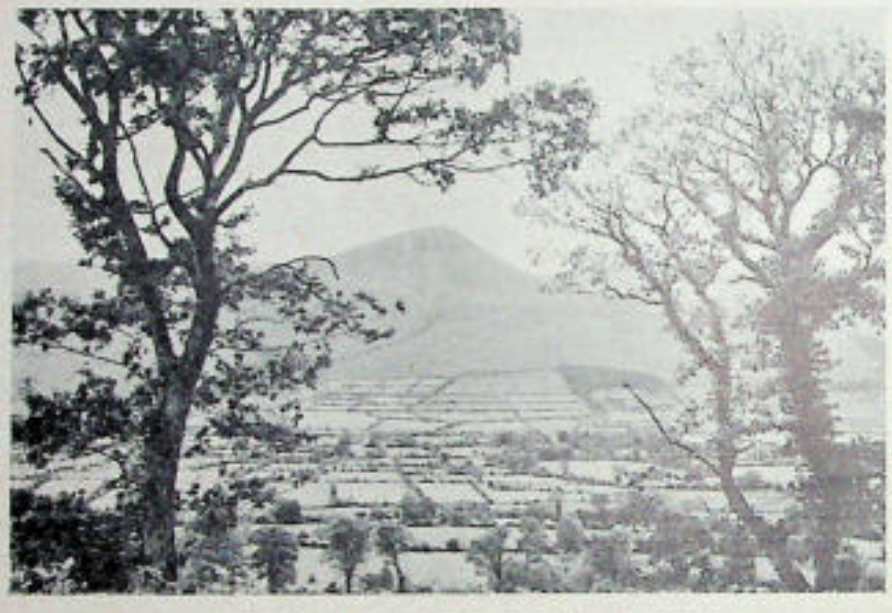
While the road house idea seems to have faltered, another angle of the same thing has forged ahead. I refer to the lorry drivers' ports of call. In a few cases pioneers have built quite imposing places for these knights of the road to rest and feed at. There are one or two such buildings on Watling Street, and in time no doubt the untidy huddle of huts that is the standard equipment to-day will give place to a better sort of building. Once or twice, returning very late at night, I have used these places and found such items as their bacon and eggs most welcome to a famished interior. And, of course, the charges are amazingly cheap.

And now a final word about the food we get at hotels. This has improved immensely in the last few years, and there are places where every course of a short but simple meal is a real pleasure to eat. If I was asked to suggest a line of development I should say that a wise policy would be to give us motorists less but make what we were given the best of its kind. People are always writing to me and saying that they do not need long and elaborate meals when motoring. They would much prefer a simpler and sometimes a better meal. And if there is one point that comes in for criticism more than any other it is the coffee. In America, where coffee is a staple drink, it appears half-way through lunch or dinner, and is universally excellent. Yet in England it is rare to drink coffee that even scores 75 per cent. of perfect. Is it that our people do not understand how to make it, or if they do, do not take the trouble?

W. C. McMINNIES.

THIS DISTINGUISHED-LOOKING OPEN CAR IS THE DAIMLER 2½-LITRE TOURER IN THE MAIN VILLAGE STREET OF STANTON, IN THE COTSWOLDS. WITH GOOD ROADHOLDING, A 80 M.P.H. OVERDRIVE GEAR, SILENT RUNNING AND REALLY COMFORTABLE COACHWORK, THE INTRODUCTION OF THIS NEW TYPE OF DAIMLER IS A MAJOR EVENT IN THE FIRM'S FORTY YEARS' HISTORY. ITS PRICE IS £700

IRELAND'S ARCADY



By SYDNEY ALBERGA

IRELAND is a country with a wide appeal, attracting for enthusiasts all kinds of people, ranging from sportsmen to scholars and pilgrims.

But even after the fullest allowance is made for this country's incomparable sporting amenities, and for its inexhaustible interest to archæologists as well as ecclesiastics, the Irish landscape, with all its haunting beauty, remains Ireland's chiefest charm.

And no Irishman, I think, would quarrel with me for putting its landscape first among Ireland's charms. Some of the loveliest scenery in the world Ireland can supply: few lands are richer in that fourfold combination of mountains, rivers, lakes and valleys; and few call back the visitor more insistently. Once visited, it is true to say that Ireland is sure of the visitor's return. For my part, I place it high on the list of what I consider revisitable places.

To everyone, then, his Ireland: mine is in the golden Vale of Tipperary.

"THE LOVELY AND ROMANTIC GLEN OF AHERLOW"

Fluellen boasted to his colleagues in arms that there is a river in Monmouth just the same as there is a river in Macedon. That was the Welshman's naïve way of calling attention to his country's possession of just as estimable attributes as any other. To him, apparently, rivers were no more than rivers, with but their names to distinguish one from another.

On this analogy, I suppose, we might well expect to find Arcadias outside of Hellas. Despite this supposition, however, I must admit it came as a surprise to me to find in Ireland, that is, in Tipperary, a countryside recalling, in so many respects, Greece.

But if ever you visit the lovely and romantic glen of Aherlow, you will look upon a landscape whose peaceful joy and gladness, and whose refreshing and well-nigh holy stillness are all authentically Arcadian. There is a pastoral beauty about the Glen of Aherlow comparable to the pastoral beauty of Arcadia, where to-day wild flowers lord it over ruined temples.

Do not let the song beguile you into supposing that a legendary distance separates you from the enjoyment of so much quiet beauty. Tipperary is, in reality, not such a long way to go. From Dublin to the golden vale is but a paltry 60 miles. The effect of coming face to face with this landscape is exactly similar to the effect of seeing for the first time Olympia or Delphi—it is a regenerative effect, as though you were suddenly born again.

Away and apart from the turmoil and tumult of a fretful world, lies this golden valley, where the only riot is that of gorse among heather; and for noise there is the soothing sound of burbling peat streams. Here, indeed, is a region of Pagan bliss recalling an earlier age—an age when time was fleeted away carelessly.

Even to-day this is the precise treatment meted out to time, as far as I could make out, by those apparently carefree inhabitants of Aherlow's glen.

No wonder Spenser chose it for the gentle revels of Cynthia and her attendant satyrs:

"Who knows not Arlo-hill?"

(Spenser's spelling, note, seems to fix once and for all the English pronunciation of Irish Aherlow.)

That question appears in the sixth canto of the *Faerie Queene*, but it is more a statement than question of the fame and repute which already in Spenser's time this romantic countryside enjoyed.

A first glimpse of the Galtee Mountains is breath-taking, that is, even if *your* breath is of a kind not easily taken away.

For I myself heard the gasp which apathetic friends emitted while watching the play of light on these fantastic peaks, late one summer's evening. The range of the Galtees reminded me of the Taygetos mountains of Sparta: both bulge like huge elephants crouching and huddling together in a frantic endeavour either to sun themselves or to seek shade, according to the time of day.

Sunset on the Galtees is followed by a rich afterglow of soft and delicate shades, ranging from deep purple to a misty blue. So rapidly, in fact, does the play of light here change the colour of the mountains that I think myself opalescent is the one and only word that fittingly describes these ever-changing colours.

An Irishman who watched this sunset with us, but whom I regard more for his sly humour than for specially acute powers of observation, expressed the opinion then, I recollect, that mountains the world over seemed to him much the same in shape and colour, instancing the Blue Mountains of Jamaica as being similar to the Galtees.

I could not help taking exception to this view, exchanging my own, which is that only the Greek mountains bear so close a resemblance to the Irish.

We all stood for a while listening to the silence, which I expected at any moment to be broken by the pipes of Pan. But, alas, in Ireland you never meet a shepherd piping his way about the countryside, as you so frequently do in Greece.

There is, however, another kind of music in Ireland to compensate for the lack of Pan pipes: it is the music of the waters singing merrily as they prattle along under grey stone bridges overgrown with moss.

Like the people of Ireland, its rivers have also won, it seems, a popular reputation for friendliness, and are thus for ever meeting. Always there is some indication or other of a meeting of these waters all over the country: seldom or never of their parting.

What, in fact, mainly distinguishes the Irish pastoral scene from the Hellenic—apart, of course, from the luminous clarity of Greek light, which Ireland lacks—is just this abundance of sounding and mingling water that fills the whole ambient air with its music.

In Greece, on the other hand, the rivers, so far as I can remember, are mostly river-beds. I have been rebuked before now for giving vent to this observation which, a Greek friend assures me, is libellous and grossly unjust to his country. I am afraid, however, I must let my observation stand, since it was as river-beds always that I saw the rivers of Greece.

That peculiar translucence of Greece is naturally absent not only from Ireland, but from all Northern lands. Where else but in the plains of Attica is there such a crystal clarity and diamond luminousness? Not even in North Africa is the air quite so pellucid.

For all this difference, the similarity between Ireland and Greece is sufficiently striking, at any rate, for me to have discovered another Arcadia in the golden Vale of Tipperary.

Tranquillity is the keynote in both these idyllic places, tranquillity together with a sense of security. Though just as this security is sometimes, in Greece, of a sudden destroyed, as, for example, by those ramshackle, tumble-down dwellings of Corinth, which to-day seem so grim a reminder of the ravages of earthquake.

Likewise, in Ireland, too, the destruction of peace and security is every now and then forced upon the visitor by an equally sad spectacle that often mars the blissful appearance of this countryside. I refer to those horribly scarred and gutted buildings, now desolate and untenanted save for a stray, self-satisfied cow or a timid mountain pony.

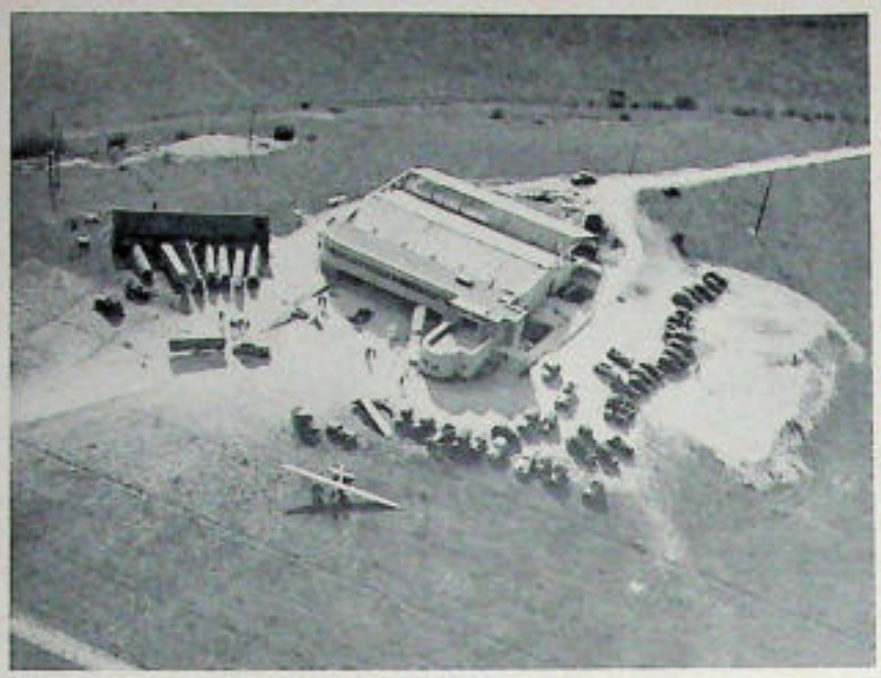
It is good, therefore, to escape into the glorious woods of Ballinacourty estate, or "demesne" as the Irish prefer their estates to be termed.

The fortunate owner of Ballinacourty is, moreover, an ardent Spenserian. He can, and often does, quote by heart yards of the *Faerie Queene*. Stumped for a line, he will immediately have recourse to his battered copy of Spenser's collected works, heavily blue-pencilled wherever the slightest allusion can be found to this region, either to Aherlow itself or the vicinity.

But my old friend is not at all content to restrict his enthusiasm for Spenser or Ballinacourty—it is easy to twig which is the major passion—to mere quotation and blue-pencilling. No, he is also a man with a plan, and this plan he confided to me when I was at Aherlow: it is to invite a number of Spenserian scholars to come and stay at the Glen of Aherlow Hotel, which he owns himself. His modest but fairly comfortable hostelry was built, it appears, in order to give employment to the unemployed villagers. For the master of Ballinacourty, as I soon discovered, is regarded as a kind of Sir Roger de Coverley among his tenants, as well as among the country folk for miles around.

Such a scheme, therefore, as his, for bringing together Spenserians at Aherlow, is really quite of a piece with his large-hearted generosity. "He is a lovely man, he is," all the villagers to a man will assure you.

But to get back to this plan of his. Surely there must be a Spenser Society, he once remarked to me; and, doubting himself for an instant, fell to asking me if I would find out for him when I returned to London, if, indeed, such a society existed. Perhaps some of its members would care to come to Aherlow and see for themselves the lovely Glen the poet had written about. He would be quite willing, he said, to bear the expenses of such a pilgrimage. And the simple way in which he made known to me this offer was just another proof, had I needed it, of his beneficence.



I remember the tall wild fuchsia, and the broom, of course. But there were several shrubs unfamiliar to me. I also remember crossing the wattle bridges, every one of which threatened to give way under my weight, even though mine is. I do not mind admitting, far more of the light fantastic nature than a good many others who must also have crossed these bridges and listened to the unceasing music of the chocolate-brown waters playing so gay an accompaniment to the song of the birds.

Spenser or no Spenser, something else showed me palpably that this is the fairies' ground—it lay spread out before me an emerald-green carpet embroidered with the vivid yellow of gorse and the dark purple of bell-heather, with here and there strands of the lighter purple of ling intricately woven into the pattern—not, I admit, a recognisably Greek pattern, but truly Arcadian none the less.

Not far off is the towering landmark of Cashel's Rock, a citadel of kings and nothing short of an Acropolis, an Acropolis, too, of which Ireland may well be proud.

"TOWERING LANDMARK OF CASHEL'S ROCK"

". . . THE PROGRESS OF THE GLIDING AND SOARING MOVEMENT HAS ACQUIRED A VERY SPECIAL INTEREST"

MOTORLESS FLYING TO-DAY

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field.")

NOT long ago in these articles it was pointed out that there was a growing tendency for all forms of flying to become dominated by the State to a greater or lesser degree, and that even the flying-club movement, which started as an endeavour to popularise aviation mainly for private and sporting purposes, had developed into a nationally subsidised system of flying schools through the formation of the Civil Air Guard.

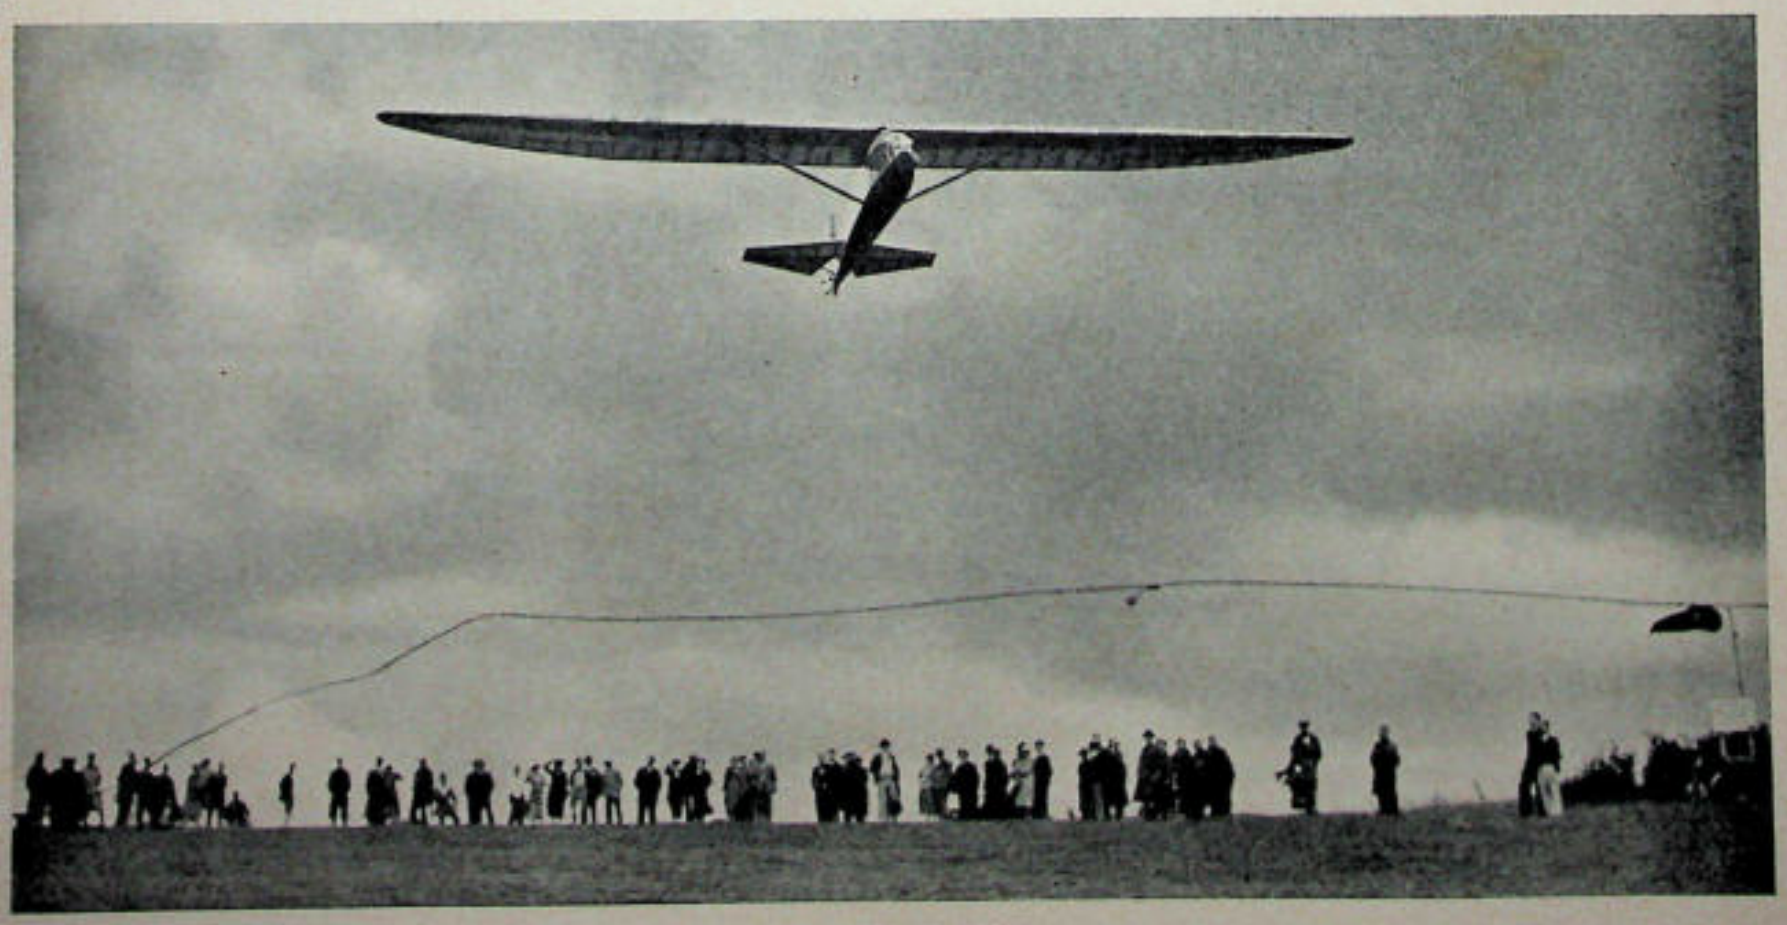
For that reason, the progress of the gliding and soaring movement has acquired a very special interest. Here it may be said that while perhaps the purely sporting aspect has remained the chief appeal, the closest approach is made to placing flying on a really popular basis. It is true, of course, that the gliding clubs do receive State subsidy; but so did the original light-aeroplane clubs. Motorless aircraft, by their very nature, have no obvious or immediately practical military or commercial applications. While the subsidies paid to the flying clubs for C.A.G. work are undoubtedly justified in that they help to create a potential reserve for air operations in emergency, support given to motorless flying is of direct value, mainly as encouraging the air sense and useful scientific and sporting development, and as making its practice available to a larger public.

In these circumstances, therefore, there is room for satisfaction in the continued progress of the movement in this country. This reveals that what might be termed the purely amateur aspect of aviation still has a wide appeal, and that achievement for achievement's sake in the air is still considered worth while by many.

The National Gliding Competitions are always a guide to the year's work in motorless flying, and this year's event, recently held, provides a useful index in this respect. The meeting, held at Great Hucklow, in Derbyshire, was somewhat hampered by bad weather, more particularly in the earlier stages, but even so the results achieved are highly commendable.

Results are not, of course, strictly comparable from year to year, since motorless flight is essentially dependent upon air conditions, over which competitors have no control. Exceptionally appropriate weather conditions lead to exceptional performances, though, of course, great skill is needed on the part of the pilot to take full advantage of them. How much this is so is shown by the circumstances in which the British height record was twice broken just before the National Competitions.

On June 22nd, Mr. N. McClean raised the record from 10,080ft. to 10,540ft., with an average rate of climb of 40ft. per second. Just over a week later, Mr. P. A. Wills, the previous holder of the record, recaptured it by rising to 14,200ft. He entered the base of a cloud bank at 3,200ft. and climbed the further 11,000ft. in 15 minutes—an average rate of climb of 735ft. per minute. A height of 1,100ft. was actually gained in 30 seconds at one point in the flight. Though this is the flight that is being recognised as the official record, both achievements are of considerable merit.



From time to time, adverse comparisons are made between continental and British gliding. The present British height record, for example, of 14,200ft. does not seem specially impressive by the side of the 30,180ft. reached by a German pilot. It must be remembered, however, that continental pilots are more favourably placed as regards securing good conditions. In the broad spaces of the Continent air formations of great assistance to altitude flights are frequently more constant than in the British Isles, where the requisite conditions are usually more localised.

If these facts are borne in mind, it seems clear that British sailplaning is steadily progressing, and it is to be hoped that more opportunities will arise for international competitions in which our pilots will be able to test their skill against the best of the continental exponents. In this connection it is of interest to note that motorless flying will be included among the sports at the next Olympic Games.

It was indicated earlier that the importance of motorless flying to-day is not lessened by its being that branch of aviation in which the purely amateur spirit remains almost untouched. The value of the movement, however, is less apparent and less easily defined than that of other aspects of flying. From time to time, of course, attempts have been made to put motorless flight to more practical use. An example that comes to mind is the experiments made in the U.S.S.R. some years ago with so-called "glider trains." Claims have been made, too, that gliding is a valuable preliminary to training on power-driven aircraft—though these claims have been disputed. There can be no doubt, however, that experienced power pilots can derive much benefit, and increase their knowledge of meteorological conditions, by taking a sailplaning course.

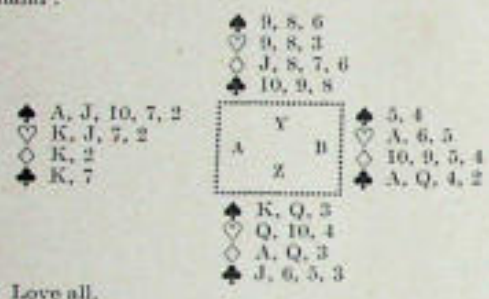
The chief practical advantage of motorless flying is, perhaps, more scientific than anything else, notably in the information it gives regarding meteorological phenomena, and of design by the production of highly efficient wing and fuselage forms. But even without these results, gliding and soaring deserve encouragement as obviously the least expensive of all forms of flying, and, consequently, as that which can give the greatest number first-hand practical knowledge of aviation.

In these days, when flying tends more and more to be thought of as a means of destruction on the one hand and of highly organised transport on the other, it is refreshing to find one branch in which the individual skill of the pilot is the paramount factor in success and in which the development of that skill is the primary aim. A wider appreciation of motorless flight in its real aspects is something that would further a deeper and fuller understanding of the problems and promise of the air.

LAUNCHING A GLIDER

"A wider appreciation of motorless flying in its real aspects is something that would further a deeper and fuller understanding of the problems and promise of the air"

BRIDGE



INITIAL NO TRUMP BIDS

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

MANY of my readers find difficulty in deciding the specific strength required for the initial No Trump bid. Since this vagueness is somewhat widespread, I propose to discuss, in this and the two following articles, No Trump bids and the responses thereto. It is usually recognised now that the weak No Trump bids vulnerable are far too dangerous. However, the weak One No Trump non-vulnerable has many adherents in this country, including followers of the Acol system and the various One and Two Club systems.

By considerably varying the strength of an initial One No Trump call according to one's vulnerability, one immediately introduces difficulties. Thus, assuming one has a strong No Trump call with no biddable suit, the non-vulnerable caller will immediately mislead his partner, whether he bids One No Trump or an unbiddable suit. If One No Trump is called, then the No Trump call non-vulnerable immediately becomes nebulous. If a suit is called the partner is also deceived.

Sometimes a weak One No Trump call non-vulnerable may upset the opponents' bidding if their strength is divided. More often than not, against good opponents the call is penalised badly. Thus, the weak One No Trump non-vulnerable has two inherent disadvantages. Firstly, it is a nebulous bid, and conveys little to partner; and, secondly, it is dangerous. Consider the following hand:

Love all.

Z	A	Y	B
One No Trump	Double	No bid	No bid
No bid			

A doubles informatively, and B makes a penalty pass. For all Z knows, 2 Clubs may be an even worse contract than One No Trump, and rather than risk a worse penalty he passes. On the opening lead of the Jack of Spades Z will almost certainly be 5 down—far too large a sacrifice for a non-vulnerable game.

The strong One No Trump vulnerable and non-vulnerable has one disadvantage—it does warn the opponents that the bidder has a good hand. But I personally believe that this is far outweighed by the advantages of precision and safety.

As to the strength and type of hand to which the One No Trump bid should be applied, the following outline of initial One and No Trump bids, and the responses thereto, will be based on the Culbertson system as described in the Gold book. While I do not wish to over-emphasise my own particular preference for the Culbertson system, I do feel that in this matter of No Trump bids the precise and definite requirements described by Culbertson are so valuable that they can be incorporated in any of the leading systems without necessitating any alteration in the normal calling of the system. Here are the requirements for the One No Trump as defined by Culbertson.

Hand Pattern.—The call should normally be limited to a hand of the 4–3–3–3 distribution, occasionally used for a 4–3–3–2 distribution and very exceptionally for other unbalanced distributions.

The reason for limiting the call to these two particular patterns lies firstly in the fact that the balanced distributions will not produce any more tricks at a trump contract. Secondly, the bidder's partner can usually rely on the One No Trump bidder having at least three cards in any suit.

No Trumps will occasionally be bid on unbalanced distributions with long solid, or nearly solid, minor suits, or for strategical reasons to keep the opponents guessing.

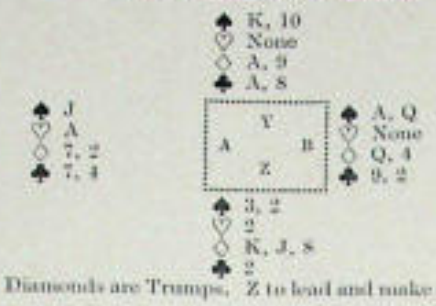
Honour Strength.—The hand should contain a minimum of four, and a maximum of five, defensive honour tricks.

♠ A, 8, 7. ♡ A, 6, 4, 2. ◇ K, Q, 7. ♣ K, Q, 8. Four Honour tricks.

♠ K, 6, 5, 2. ♡ A, K, 8. ◇ A, Q, 2. ♣ A, 3, 2. Five Honour tricks.

This requirement may be shaded to three-and-a-half Honour tricks if the hand contains at least eight Honour cards.

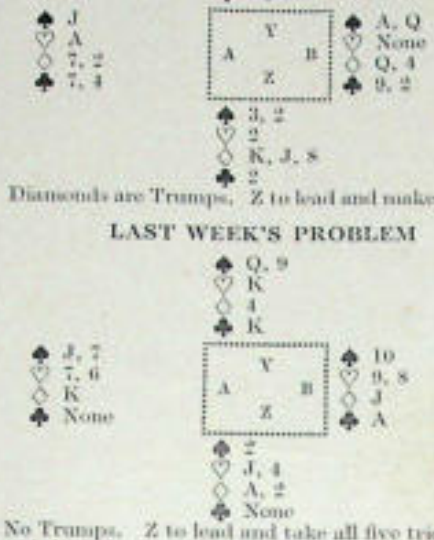
♠ K, 10, 7. ♡ K, Q, 6. ◇ A, 10, 3, 2. ♣ A, J, 7. Three-and-a-half Honour tricks—eight Honour cards.



After looking at the above hands, the reader may think that they seem rather strong, and begin to wonder what he should call Two No Trumps on.

Hand Pattern.—For all opening No Trump bids the hand pattern should be the same as already described for the One No Trump.

Honour Strength.—For an opening Two No Trump call the hand should contain between five-and-a-half and six-and-a-half Honour tricks. This may be shaded down to five Honour tricks with nine or ten Honour cards. For an opening bid of Three No Trumps the hand should contain between seven-and-a-half and eight-and-a-half Honour tricks. Occasionally six-and-a-half Honour tricks when holding eight certain tricks.



It is always difficult to be sure of what response to make to any unsystematic No Trump call. As we shall see, responses to a strong No Trump call are fairly straightforward, since the calls defined above are kept within such narrow limits. If, therefore, the player wishes to derive the maximum benefit from the above system of No Trump bidding, it is essential that he is very punctilious in keeping to these limits. Next week we shall discuss the responses to the initial No Trump bids.

THIS WEEK'S PROBLEM

Diamonds are Trumps. Z to lead and make six tricks.

LAST WEEK'S PROBLEM

No Trumps. Z to lead and take all five tricks against any defence by A–B.

SOLUTION

Z leads the Ace and 2 of Diamonds. A has to throw the 6 of Hearts and Y throws the King of Hearts. B is now squeezed. If he throws the 10 of Spades Y–Z make two Spade tricks; if he throws the 8 of Hearts Z's two Hearts are good, and a discard of the Ace of Clubs establishes Y's King of Clubs.

CHESS

A RAPID COLLAPSE

A game from the Russian Championship Tournament. Quite early in the middle game—at move 19—White established an advanced passed pawn, and Black's game rapidly fell to pieces.

(Ruy Lopez.)

WHITE. Pogrebisky.	BLACK. Lowenfish.
1. P to K 4	P to K 4
2. Kt to K B 3	Kt to Q B 3
3. B to Kt 5	P to Q R 3
4. B to R 4	Kt to B 3
5. Castles	B to K 2
6. R to K sq	P to Q 3
7. P to B 3	Castles
8. P to Q 3 (a)	P to Q Kt 4
9. B to Kt 2 (b)	Kt to Q R 4
10. B to B 2	P to B 4 (c)
11. Q Kt to Q 2	Kt to B 3
12. Kt to B sq	Kt to K R 4 (d)
13. P to Q 4 (e)	P to Kt 3
14. B to R 6	R to K sq
15. P takes B P	P takes P
16. Kt to K 3	P to K 4
17. B takes B	R takes B
18. Q to Q 5 (g)	Q takes Q
19. P takes Q	Kt to K 2
20. P to Q 6 (h)	Kt to Q B 3
21. B to K 4	B to Q 2
22. B takes Kt	B takes B
23. Kt takes P	Q R to B sq (i)
24. P to Q 7	R to B 2
25. Kt takes B	R takes Kt
26. Kt to Q 5	K to Kt 2 (j)
27. P to K Kt 4	R to Q 3 (k)
28. Q R to Q sq	R to Q sq
29. P takes Kt	Resigns.

(a) P to Q 4 is generally played here.
(b) If 9. B to B 2, then 9. . . . P to Q 4 followed, if 10. P takes P, by 10. . . . Q takes P; 11. B to Kt 3, Q to Q 3.
(c) A well-known position has been reached by a transposition of moves.
(d) Not a good move. He should, instead, prepare to play P to Q 4, e.g., 12. . . . Q to B 2 (the King's pawn will need protection); 13. Kt to K 3, B to K 3, threatening P to Q 4.
(e) Threatening to win a pawn by Kt takes P. If at once 13. Kt takes P, then 13. . . . Kt takes Kt followed, if 14. Q takes Kt, by 14. . . . B to Kt 5, winning the Queen.
(f) Black should not part with this valuable defensive piece. Q takes Q is better although after Q R takes Q White, who threatens Kt to Q 5, has a fine game.
(g) A very strong move. It is extraordinary how quickly Black's game now collapses.
(h) Much stronger than Kt takes P at once. The pawn cannot be saved and soon is captured with gain of time for an attack on Black's Bishop.
(i) If B to Kt 2, then Kt to Q 7.
(j) Black has no good move. If 26. . . . R to Q 3, then 27. Q R to Q sq, K to B sq (27. . . . K to Kt 2; 28. P to K Kt 4 give the position that actually was reached); 28. Kt to K 7, R takes R; 29. R takes R and wins.
(k) If 27. . . . Kt to B 3, then 28. Kt takes Kt, R takes Kt 29. Q R to Q sq, R to Q sq; 30. R to K 8 and wins.

A STRONG ATTACK

The following game, from a tournament at Reykjavik last January, shows a strong attack by Black.

(Indian Defence.)

WHITE. Gudmundsson.	BLACK. Stuervarr.	WHITE. Gudmundsson.	BLACK. Stuervarr.
1. P to Q 4	Kt to K B 3	17. P to R 4	Q Kt to B 4
2. P to Q B 4	P to K 3	18. P takes P	P takes P
3. Kt to Q B 3	B to Kt 5	19. Kt to K 2	P to B 4 (h)
4. Q to B 2	P to Q 4	20. P takes P	P to B 5 (i)
5. P takes P	P takes P (a)	21. Kt takes P	B takes Kt
6. Kt to B 3 (b)	Castles	22. K P takes B	B to R 6, ch
7. P to K 3	Kt to K 5 (c)	23. K takes B	Q takes Kt (j)
8. B to Q 3	P to K B 4	24. Q to K 2 (k)	K takes P, ch (l)
9. Castles (d)	P to B 3	25. K takes R	Q to Kt 7
10. P to Q B 3	B to Q 3	26. B takes Kt	Q to R 7, ch
11. P to Q Kt 4	P to Q R 3	27. K to Kt 5	Q to R 3, ch
12. R to Kt sq	Kt to Q 2	28. K to B 5	Q to Kt 3, ch
13. P to Q R 4	R to B 3 (e)	29. K to K 5	R to K sq, ch
14. P to Kt 5	R to B 3 (f)	30. K to Q 6 (m)	Kt takes B, ch
15. P to Kt 3 (g)	Q to K sq	31. K takes P	Kt to B 6, ch (n
16. K to Kt 2	Q to R 4	Resigns.	

(a) Q takes P is considered to be better.
(b) B to Kt 5 is usually played here.
(c) In our opinion this is premature (see note d).
(d) Not the best move. White should, instead, play 9. P to Q R 3, after which, since Black cannot play 9. . . . B to K 2 because of 10. Kt takes P, he has nothing better than 9. . . . B takes Kt, ch, which strengthens White's centre. The text-move gives Black time to guard his Queen's pawn.
(e) White has not shown any enterprise in the opening play, and Black has a very good game.
(f) Threatening B takes P, ch, to be followed, if Kt takes B, by Q to R 5.
(g) If P to R 3, then P to Kt 4, threatening P to Kt 5.
(h) A very good move, played to prevent White's Queen from getting to Q B 6.
(i) Another very good move. If now 21. P takes B, then 21. . . . B to R 6, ch; 22. K takes B, Q takes Kt (threatening R takes P, ch followed by Q to Kt 5, mate); 23. K to R 2, R takes P, ch; 24. P takes R, Kt to Kt 5, ch; 25. K to Kt sq, Q to R 6 and wins.
(j) Threatening R takes P, ch followed by Q to Kt 5, mate.
(k) A bad move. He should, instead, play 24. K to R 2, after which, since the continuation 24. . . . R takes P, ch; 25. P takes R, Kt to Kt 5, ch; 26. K to Kt sq, Q to R 6 is defeated by 27. P to B 3, Black has to play 24. . . . Kt takes P, ch, which leads after 25. B takes Kt, Kt to Kt 5, ch; 26. K to Kt sq, Kt takes R; 27. B takes P, ch, R takes B; 28. Q takes Kt, Q to Q 8, ch; 29. K to R 2. Q takes P to a position which is far from hopeless for White.
(l) This sacrifice forces a win.
(m) If 30. K to Q 4, then 30. . . . R takes B, ch; 31. Q takes R, Q takes Q, ch; 32. K to B 3, Q takes R and wins.
(n) This is good enough, but the best line is 31. . . . Q to K 3, ch; 32. K to Q 4, R to Q sq, ch; 33. K to K 3, Kt to Kt 4 or Q 7, mate.

PROBLEM No. 4027

By N. EASTER.*

WHITE (13 pieces): King at Q R 5. Queen at Q B 5. Rooks at K R 4 and K 8. Bishops at K sq and K B 3. Knights at K R 6 and Q Kt 6. Pawns at K 2, Q 4, Q B 4, K B 4 and K Kt 5.

BLACK (7 pieces): King at K 6. Queen at K 2. Rook at Q sq. Bishops at K R 2 and K B 3. Knight at K R 5. Pawn at Q R 3.

White to play and mate in two moves.

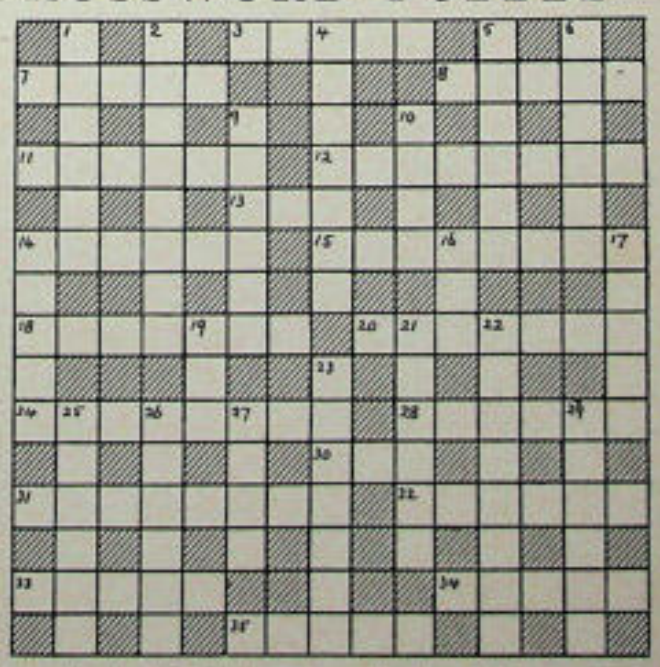
* *De Schaakwereld*, 1937.

SOLUTION OF PROBLEM No. 4026

1. Kt to K 5 (threatening 2. either Kt to B 3, ch). If 1. . . . Q to B 5 or K 6, then 2. Q to Q 8, ch, &c. If 1. . . . K to Kt 4, then 2. Kt (K 5) to B 3, ch, &c. If 1. . . . B to B 5, then 2. K takes B, &c.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 530



ACROSS.—3, 7 and 8. "But who hath seen the grocer —— housemaids to his teas, Or —— a battle of field-mice, Or —— a man a cheese?" (G. K. Chesterton) (5, 5, 5). 11. An educated fellow is loved by Venus (6). 12. This warrior had a fit of the sulks (8). 13. There's no company in Cairo (3). 14. Try to reach at a tin (6). 15. Deranges—in a very explosive manner (8). 18. Gustav, the composer, turns out to be the holder of the pistol. (7). 20. The weapons of Father Time (7). 24. Canoe, sir (anag.) (8). 28. "One flag, one land, one heart, one hand. One ——, evermore" (O. W. Holmes) (6). 30. Company (3). 31. Treading on the slope (8). 32. They go out (6). 33. The reverse of prolix (5). 34. An unimportant officer (5). 35. A Fleet Street gang (5).

DOWN.—1. Direct in an indirect way (6). 2. "Dead —— form good subjects for dissection" (Byron) (8). 4. When the general (7). 5. This name will remind you of Dean Swift (6). 6. X (6). 9. Time allowed for payment of foreign bills of exchange (6). 10. The home of the prolific old woman (4). 14. His father has become a nuisance in the garden (5). 16. The bride was in a yellow dress (hidden) (5). 17. The Salvation Army gets a place in the sun (5). 19. Dr. Johnson's favourite drink (3). 21. Made of sevenes, but hardly the best things for crossing them (6). 22. The Territorials start in rags (8). 23. "The —— homes of England!" By thousands on her plains" (Mrs. Hemans) (7). 25. A mongrel is followed by few (6). 26. The medicine is all gone (6). 27. Not to be struck in a bad temper (4). 29. A tenor has become elaborately adorned (5).

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Country House

Scot's Pines Dying.—The six leaves and small sections of bark sent have been examined carefully. There are certainly small ruptures with resin exuding on the leaves and bark, but we could detect no actual disease. By this time there may have been a further development, and if you would kindly send more material, say twigs 12in. to 18in. long, from the affected trees, we should be pleased to make a further examination. There is always an amount of risk in planting immediately a wood has been felled, as some root fungus from decayed stumps may affect the young trees. But this usually is a local matter and rarely an epidemic.—*E. C. S., Cupar, Fife.*

Elm Dying.—The specimen twigs sent are those of some variety of *Ulmus montana*, or possibly a hybrid with the above for one of its parents. If none of the other 23 trees are affected, the cause of death may be a constitutional weakness; there is no apparent disease in the twigs sent. Again, it may be due to something outside, affecting that particular tree. Want of drainage, and consequent stagnation of soil, and decayed roots. Sussex soil is very variable, and the tree in question may have been planted in a bad patch. Caterpillars have been very injurious to specimen trees this season, and some have died because of defoliation. There is no indication of this in the leaves enclosed.—*F. R. R. R., Eastbourne.*

Rush for Examination.—Rushes of this type are fairly common in Western Ireland, where the rainfall and humidity favour their growth. You state the land has good natural drainage, but it would be advisable to make certain of this point, since a water-logged soil will produce conditions favouring rushes. Rushes cannot persist on land that is being regularly stocked. They cannot stand up to being trodden by the hoof and grazed regularly, and our recommendation is that this land should receive dressings of a well-balanced fertiliser at the rate of 4–5 cwt. per acre each year for the next two or three years, and the herbage should be grazed wherever possible rather than cut for hay. When grazing it would be an advantage to turn in a considerable number of stock to eat the grass down quickly and then rest the land again. In other words, graze heavily at intervals rather than keep a small number of stock on the ground for a long period.—*R. S. R., Co. Mayo.*

Garden

Rose for Identification.—Unfortunately when the specimen sent arrived, the petal had fallen from the stalk. The writer is in charge of a very complete collection of old roses and rose species, but regrets being unable to name the rose sent. Many of these semi-double roses in old gardens are self-sown seedlings and have never been named.—*K. W., Co. Down.*

When sending plants to be named, send as many parts as possible—basal leaves, stem, flowers and fruit. Pack in moss, moistened paper, or damp leaves, in a stiff cardboard, tin or wooden box.

Plum for Examination.—The plum is Rivers's Prolific, one of the best of the early varieties. The tree is affected by "brown rot" (*Sclerotinia fructigena*). It is injurious to apples, plums and cherries and other fruits. This spring and summer have been favourable to many such pests. Prune out all dead wood, and burn all infected fruits and prunings. Spray heavily in winter with Burgundy Mixture, and again just as the leaves are bursting, and twice at intervals of three weeks afterwards.—*L. R. H., Leominster.*

Destroying Weeds and Brambles in Ruins.—In your case there is no need to go to the trouble of mixing a solution for spraying. Sodium chlorate can be purchased reasonably from any sundriesman. It is sold in tins. The crystals need only sprinkling over the plants to be killed. An ordinary flour dredger or an old tin with large holes pierced in the lid will serve the purpose. June is perhaps the best season, when nettles and brambles are growing freely, but the writer, who has often cleared ground in this manner, would not hesitate to do it at once.—*H. M. G., Llanelly.*

Mushrooms in Open Fields.—There is no doubt that a field grazed by horses develops heavier crops of mushrooms. The next best thing is to dress with horse manure. This prepares the soil to receive the spawn. Order it in March or early in April. That sold in bricks is used for this purpose. Break in pieces about 2in. square and dibble it in the most favourable parts of the field about 2ft. apart in April. Another plan is to build up a hotbed of horse manure, when the heat is declining to 80deg. Fahr., spawn it 6in. below the surface. When the whole is permeated by white threads bury portions all over the meadow with a spade in May or June.—"*Bank*," *Oswestry.*

Diseased Michaelmas Daisies.—Your plants are suffering from the "Wilt Disease" due to a parasitic fungus. It is fully described in the *Journal of the Royal Horticultural Society*, vol. XLVIII, part I, p. 38. It occurs frequently in gardens and nurseries, in fact, it is often difficult to obtain stock entirely clear of it. The old stems sent were full of the mycelium; this does not spread at once to the young suckers. If their tips are rooted, healthy plants are then obtained, which should be planted on an entirely fresh site at some distance from the old bed. Go over the young plants occasionally and at once remove any showing any sign of the disease. In this way you may soon be able to work up a healthy stock. Cuttings of sufficient length are usually available in May. The selection of healthy rooted suckers, well away from the old stool, for planting in March or April, would be another method, though not so sure as the other.—*F. J. H., Warrington.*

Kennel

Syrup of Iodide.—The dose of the syrup of iodide of iron would be about the same for your small springer as for the working terrier, and the medicine might be continued for from ten to fifteen days according to how it affects the appetite.—*I. S. A. F., Teignmouth.*

Welsh Corgis.—Some of the nearest breeders of Welsh corgis to you are Mrs. P. Gray, Rozavel Kennels, Gadbrook House, Betchworth, Surrey; Mrs. B. E. Gale, Grants Paddock, Limpsfield, Surrey; Mr. C. Lister-Kaye, Lisaye Kennels, Walliswood, Ockley, Surrey. You would probably have to pay from 3 to 5 guineas, according to the merit of the puppy.—*M. E. F., Chatham.*

Jack Russell Terriers.—Many generations of terriers have passed away since Parson Jack Russell died. If all the claims to have kept his strain going were to be credited we should have to believe that he bred an inordinate number. We do not know of any kennel that has dogs descended from his without adulteration. What you want is a dog from working kennels that has been bred on Jack Russell lines. Probably an advertisement in these pages would be the means of bringing you news of some.—*C. F. G., Pall Mall.*

Naturalist

Slug Identified.—The Black Arion slug (*Arion ater*). A common species. The specimen received is more variegated than usual, but this species varies from deep black to pale buff.—*G. T. H., Wilts.*

Moth Identified.—The Garden Tiger moth (*Arctia caja*). A common and widely distributed species. The caterpillar feeds on all kinds of plants. The Red Underwing belongs to a distinct family of moths.—*M. C., Argyll.*

Shooting

Keeping Pheasants from Straying.—It is never easy to keep pheasants from straying on a rough shoot. Feeding at regular times in some central spot is always a good policy, so that the birds become accustomed to it, and tend to remain on the shoot. Vermin and pigeons should be kept down by trapping and shooting, but the central coverts should be kept as quiet as possible. A useful book on the subject is, *Pheasant Rearing and Preservation*, which is published by Messrs. Gilbertson & Page, of Hertford, and costs 4/- post paid.—*F. G. A., Altrincham.*

Gun for Duck Shooting in India.—A suitably bored long-chambered 12-bore is an excellent weapon for duck shooting, but it must be of sufficient weight to do full justice to its load and to overcome the extra recoil. A gun bored for the 2¾in. case, firing 1¼oz. of shot, should weigh about 7¼lb., and one bored for the 3in. case, firing 1¼oz., should weigh about 8lb. There is no need to have barrels longer than 30in. If you feel that it would help your alignment, you might have shorter barrels. Half chokes in the right barrel and full chokes in the left would probably suit your sport. A good load for the 3in. cartridge is 50 grains of Amberite and 1¼oz. of shot. In a gun of the weight mentioned you would not be bothered by recoil with such a charge. If your ordinary game gun weighs not less than 6¾lb. you would find the Mullerite "Ace" or I.C.I. "Maximum" wonderfully effective, as both these cartridges handle 1¼oz. of shot from the 2¾in. case without setting up any extra strain or pressure. Of course, if you decide on the heavier type of weapon, there is a wide range of loads that may be utilised to suit different conditions. For instance, as much as 2oz. of B.B. or 1¼oz. of No. 1 can be fired on the low velocity principle from a 3in. case. I.C.I. load such cartridges, using Neoflak powder. But big shot should be employed in this connection to make up for the lessened velocity.—*W. H. W., Lucknow.*

Travel

Where to Stay.—In Southern England are the Carnarvon Arms at Dulverton in Somerset, and the Arundell Arms at Lifton, Devon. The former offers five miles of trout and salmon fishing on reserved water, splendid riding country, tennis and billiards, and the latter fourteen miles of excellent trout fishing and 9,000 acres of snipe and mixed shooting free to guests. If, however, you wished to stay in Wales, there is the Lake Vyrnwy Hotel, via Oswestry. There is excellent fishing here—rainbow and brown trout averaging 1lb. and ¾lb. respectively, and shooting over 21,000 acres.—*L. N., London.*

A Sporting Holiday.—Firstly, there is the Bracken Bank Hotel, at Laxonby, near Penrith, Cumberland. They have six miles of salmon and trout fishing on the Eden, grouse driving over several moors and rough shooting. Over the Border there is the Cape-Wrath Hotel, at Kooldale, Durness, Sutherland, N.B. This is a very nice sporting and tourist hotel, situated amidst magnificent scenery overlooking the Kyle of Durness. They can offer salmon, sea and brown trout fishing, and shooting over 30,000 acres. Then the Ballachulish Hotel, Argyll, has grouse shooting over 7,000 acres, and can also offer its guests facilities for fishing. As regards the Castle Hotel, at Glendevon, Perthshire—the hotel has 15,000 acres of good rough shooting, which can be leased by arrangement. If you would consider Wales, there is the Lake Vyrnwy Hotel, via Oswestry. There you will obtain excellent fishing and some grouse (driving and walking) shooting. The country for really economical, yet good sport is, of course, Ireland. For example, at the Butler Arms Hotel, Waterville, Co. Kerry, you can obtain excellent free salmon and sea trout fishing on Lough Currane, and reserved fishing on the famous Waterville River. The hotel has over 20,000 acres of reserved shooting—grouse, woodcock, snipe, &c.—*A. C. M. G., Sharpthorne.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, AUGUST 26th

STAGHOUNDS—ENGLAND & WALES

DEVON AND SOMERSET.—Saturday (Aug. 19th), Brendon Two Gates—11.

QUANTOCK.—Monday (Aug. 21st), Bowling Green, Holford; Th., Triscombe Stone—11.

ATHERSTONE WOODLAND.—Saturday (Aug. 26th), The Mare and Colt, Stonnerfield—6.

DEVON AND SOMERSET.—Monday (Aug. 21st), Nadrid Cross; Tu., Hawkcombe Head; Th., Raleigh's Cross; S., Winsford—11.

MENDIP.—Monday (Aug. 21st), Palace Farm, Wells; W., Castle Farm, Wookey; S., Westbury-sub-Mendip—6.30.

EAST SURREY.—Saturday (Aug. 19th), Folkington—6.

TIVERTON.—Saturday (Aug. 19th), Cadeleigh—7; M., Chipstable (Middle Hill)—7.30; W., Spearway Mill; Th., Well Farm, Coombevillis; S., Chain Bridge (for Stuckeridge)—7.

OTTERHOUNDS—ENGLAND AND WALES

DUMFRIESSHIRE.—Saturday (Aug. 19th), Auldgirth Bridge (NRh); M., Canonbie Bridge (Esk); Th., Waters Meet (Annan)—9.30.

BORDER COUNTIES.—Saturday (Aug. 19th), Tynidd Bridge (Tryweryn); M., Caerwys Bridge (Severn); W., Montgomery Bridge (Severn); S., Rhydmeredith Bridge (Tanat)—10.30.

BUCKS.—Saturday (Aug. 19th), Newstead Mill, Stamford (Down); Tu., Tinwell Mill, Stamford; Th., Little Alne Bridge, near Alvester; S., Bridgebury, Warwicks—10.30.

BUTE VALLEY.—Tuesday (Aug. 22nd), Stalkey Church—10.

CHERITON.—Saturday (Aug. 19th), Newbridge, Newton St. Cyres; W., The Square, South Molton; S., Weare Giffard—10.30.

CROWHURST.—Saturday (Aug. 19th), Ashurst Station; Tu., Bucksford Mill, Ashford; Th., Sevington Bridge, Ashford; S., Milton Bridge, Canterbury—10.30.

COURTENAY TRACY.—Saturday (Aug. 19th), Trigon, Wareham (Piddle); M., Mottisford Abbey, near Romsey (Test); W., Old Mill, Farnham; S., Barford St. Martin—10.30.

CULMSTOCK.—Saturday (Aug. 19th), Culmpton Station—10.30.

DARTMOOR.—Saturday (Aug. 19th), Slades Bridge, near Wade Bridge (Allen) (by invitation); Tu., Flete Mill (Erme); S., Dart Bridge, near Buckfast—10.30.

PEMBROKESHIRE AND CARMARTHENSHIRE.—Monday (Aug. 21st), Haverfordwest for Claddau; Th., Pontyfenny for Taf—10.30.

WYE VALLEY.—Tuesday (Aug. 22nd), Usk; S., Stone Bridge, near Berkeley—10.30.

TO HUNT SECRETARIES

We should be very grateful if all Hunt secretaries would let us have their fixture cards by the first post on Tuesday morning for inclusion in the issue of the following Saturday. This appeal is, at the moment, especially directed to secretaries of otterhounds, but we would also ask secretaries of staghounds to let us have their cards as they start hunting, and also we would appeal to secretaries of foxhounds to send their cubhunting fixtures in due course. Many people who find themselves out of their own country for a time and also hunting visitors from abroad look to the columns of the *Field* for information. This can be given only with the co-operation of the secretaries of the various Hunts.

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage Home and Abroad.

	Inland. £ s. d.	*Canada.* £ s. d.	*Elsewhere abroad.* £ s. d.
12 months	3 3 0	3 0 0	3 10 0
6 months	1 11 6	1 10 0	1 15 0

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable. Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale) English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

Printed in Great Britain by Bremner & Kaltzen, Ltd., Hatfield, Stamford Street, S.E. 1, and Published by The Field Press (1939) Ltd., The Field House, Bream's Buildings, London, E.C. 4, in the County of Middlesex, Saturday, Aug. 19, 1939

KEEP TO THE RULES

WHEN we were very young we did what was forbidden us—not because of any particular desire to be rebellious, but because forbidden fruits are always sweetest. That the fruit almost always possessed a bitter core was unfortunate, but childhood has a brief memory and the punishment left more marks upon our epidermis than upon our conscience.

This sport of getting one better over authority, whether it be parental or scholastic, has always been a valued source of delight to the puerile mind. When we were children we reasoned as children, but now that we are men it might be supposed that we have put away childish things. Unfortunately, experience bears witness to nothing of the kind—the "one better than authority" attitude remains with us, and whereas in the child it is generally to be winked at and sometimes even encouraged, in the adult it is highly dangerous and highly unnecessary.

It is as noticeably on the roads as anywhere else. The highways of this country are anything but what they should be, and in this journal constant reference has been made by Sir Malcolm Campbell and others to the inadequacy both of the roads themselves, and of the steps being taken by responsible bodies to improve them, but that is only half the story. How many of the appalling accidents which come about daily are due to thoughtless neglect of the road laws we are not prepared to say, but probably they form a surprisingly high percentage of the whole.

Often enough we hear people say: "Oh, but it's a silly law anyway!" Maybe it is, but that is no reason for violating it. Laws are made to be kept, and if half the people keep them and the others ignore them accidents are bound to happen. A good example of this is supplied by the pedestrian crossings. When they were first introduced many of us said they were a foolish addition to the already multitudinous road laws and paid attention to them only under the eyes of the law.

What has resulted? No one knows what to do now. The motorist waits for the pedestrian, the pedestrian waits for the motorist, then they start to cross together and at the best all parties concerned become very irritated with one another, and at the worst there is an accident. The man who goes to the crossing, holds up a hand and stalks majestically across, regardless of the density of the traffic, has our undivided admiration. For that purpose the crossing came into being, but the man who uses it thus is, in our opinion, something of a hero—though we fear that one day he may be a martyr.

Another typical piece of rule-breaking is the growing habit of crossing the traffic lights when they have turned amber. The amber is put there as a warning, not as an excuse. Ninety-nine times it is perfectly safe to cross, and it comes off successfully. The hundredth time, a cyclist comes off instead.

Someone has defined a gentleman as being a person who, when by himself, behaves precisely as he would in company. We wish that some motorists would remember this. Just because there is no one there to see you, that is no excuse for driving badly. We heard of a motorist recently who imagined he was unobserved, and tried to retrace his tracks on an arterial road by cutting round the end of the dividing strip down the centre instead of going 50yds. further and negotiating a roundabout. As a matter of fact, another car nearly hit him, and apart from the damage which would have been incurred by the innocent party there was nothing he deserved more richly.

"Laws are made to be broken" it is often said. Well, possibly, in some things that attitude may be excusable, but not where lives are the price of illegality.

A LOSS TO ANGLING

WITH the tragic death of Mr. Anthony Crossley, M.P., last week in an aeroplane accident, angling has lost one of its most prominent exponents of sea-trout fishing, for Mr. Crossley was one of the men who "discovered" that once mysterious stream, the Em in Sweden, which astonished the fishing world a decade or so ago by producing sea trout of almost incredible size. Mr. Barrett caught one of 28lb. in 1930, which held the world's record for fly fishing until recently; and Mr. Crossley himself has had fish of only a few ounces less weight. His method of fishing was inspired by the greased-line system of the late A. H. E. Wood, whose friend he was, though he had developed it into a technique of his own, which he described in his recent book, *The Floating Line for Salmon and Sea Trout*. Mr. Crossley was actually on his way to Sweden for another holiday after these great fish when the accident occurred which resulted in his death. He leaves a wife and three young children, to whom the sympathy of the angling world, as well as that of his many personal friends, will be extended in their sad bereavement.

FOOT AND MOUTH DISEASE

Two outbreaks of foot-and-mouth disease have been recently announced. The first was at a farm near Durley in Hampshire, and it is feared that cattle shows, which were to have taken place in that county towards the end of the month, may have to be abandoned. The second outbreak was at Thorganby in Lincolnshire. The usual restriction orders have been issued, and other precautions, such as the spraying of motor tyres with powerful disinfectants, have been taken. It is unfortunate that these outbreaks should have occurred at a time when many packs of foxhounds are beginning their cub-hunting season. The steady downpour of rain has resulted in late haymaking and corn cutting, which is likely to delay cubbing in some districts. It would be a thousand pities if these outbreaks were to continue throughout the hunting season, and this is only one of the reasons why the problem of this disease should be attacked with renewed vigour and its prevention made possible.

SPEED AT UTAH—

Records are becoming such normal features of everyday life that we have begun to grow positively *blasé* about them. In one way this is a good indication, for it demonstrates the public acceptance of their necessity. They are growing out of the stage of being mere spectacle into the realm of scientific research. None the less, it would be a great pity if those responsible for them were not accorded the praise they so richly deserve. A week ago Mr. John Cobb drove his Red Lion Railton over Bonneville Flats at an average speed of 352.94 m.p.h. during a test run before an attempt to beat Captain George Eyston's record of 357.5 m.p.h. set up last year. Admittedly this was only a trial run, and by the time these words appear in print he may have raised the record considerably, but, all the same, it is surprising to notice that one well-known daily newspaper gave this performance only twelve lines at the bottom of one of its pages. Surely an achievement such as this, both mechanical and human, deserves warmer acclamation even if crises are the mainspring of modern interest.

—AND ON CONISTON

Another magnificent speed record of last week has been that of the *Field's* Motoring Editor, Sir Malcolm Campbell, who broke his own water speed record of 130.91 m.p.h. put up last year, by achieving an average speed of 141.74 m.p.h. on Coniston Water. We offer our heartiest congratulations to Sir Malcolm, who has not only done a great deal to win and keep this record in Great Britain, but has also done so much to demonstrate the fine workmanship of British engineering and designing. The 1,750 h.p. Rolls-Royce engine used to break the record was built twelve years ago—surely there could be no better commentary both upon the engine's fine manufacture and the skilful improvement in the designing of the Bluebird's hull. In nine years the water record has risen almost exactly 43 m.p.h.—remarkably good going.

THOROUGHBRED FOALS

With grass for a couch and sky for roof,
Aristocrats from head to hoof,
In easy reach of their dams lie curled
The future kings of the equine world.

Bred with care from the swiftest lines,
Blue is their blood by the surest signs;
Slender of shoulder and sharp of ear,
Dainty-limbed as the fallow deer.

Deep in their eyes are the sleeping fires
That mark the courage of racing sires.
Note, as they leap to their dancing feet,
The charm of mares that their sons repeat!

See, as they circle and prance and fling,
How blood responds to the challenge of spring!—
Dreaming we see as we watch them there
The sun on the silks they will one day wear.

WILL H. OGILVIE.

NEXT WEEK'S ISSUE

will contain a long and fully illustrated account of Yachting Inland from New York to Florida; Major J. Fairfax-Blakeborough describes the St. Leger of 1839; Captain J. B. Drought contributes another article in the series the Gun Month by Month, and Captain Paul Curtis discusses the question When is a Charge? There is a further Letter to Young Flyfishers, and the second of two articles on Animal Life Round London. The writer of the series on Social Clubs describes the Bath Club. Sir Malcolm Campbell writes on The Abolition of Level Crossings; Lord Sempill on Crisis in the Empire Air Routes. Messrs. K. Adlard Coles and Terence Stocken review the Ocean Racing, and Edward Grace writes about Highland Lochs and Glens.

A COUNTRYMAN'S JOURNAL

ONCE more the village Flower Show. It is virtually the only survivor of the communal village festivals that were older than the Feast of Flora. Though the old associations have been peeled off it like the skin from an onion, it still remains in the tradition of the Middle Ages, when the local life was an intense reality and a sign that the spirit of place is not dust, as it appears, but embers that still contain enough reserves of heat and light to be nursed into a fire fed by local fuel and throwing a generous warmth upon all who collect about it. In a sense, the village is reborn in its flower show, and in the act of rebirth becomes reunited with its past. The sundering years roll back and the broken continuity is restored. And with its newborn life that is the old life resurrected from the dead, the life sufficient unto itself and not one that revolves a helpless satellite about the distant and arbitrary town, the Gothic democracy reawakens with the Gothic independence. Rich and poor, natives and strangers, meet as equals under the great marquee that is in very truth the temple of earth.

Within that pavilion are assembled the offerings and benefactions of earth—her roots, her flowers and her fruits, and it is certain that no temple nor sanctuary of the past could have been the scene of a braver cornucopia. The flowers are the banners of the congregation, and yet the polychrome fruits vie in splendour with them. Within the festal space of the pavilion use and ornament are blended as they were in all the old crafts of that old England which for a moment and in a blaze of many colours, in pomp and circumstance, we see risen from the grave. The throng presses round the trestle tables, and, perhaps, the most eager among it are those who look for what, in their estimation, are the richest colours of all, the blues and the yellows of a triumphant cultivation. Yet these ribbons of rivalry are not, as is the competitive demon in the larger world, a cause of strife and the hot provocation of successful greed and cunning. Here in the small community where all have striven with the earth to induce her finest, plumpest, most mellow and most glowing bounties, here contest and hierarchy in the results upon the loaded tables are the very bond of fraternity. In competing all contribute and acknowledge the great primaries, the sweet and shared universals of earth and home. These are the realities that recreate the past of the village community within the tabernacle of earth's plenty, since our ancestors never forgot these twin essentials of the good life.

But our fathers forgot them in their grandiose dreams of wealth and power and expansion, and it has been left for us to discover that in grasping at these enormous shadows we lost the substance near and dear. This tent of abundance is a parable, a many-coloured picture story instructing the people, as the paintings on the walls of the old churches once did, that there is more of true wealth in making the most of the little that we have than in gaining the whole world. A wise man found the world in a grain of sand, and it only needs to look round upon the treasures of the tent to see that the grain is like the sun in its glory. The tent's flap is open for the people to enter like pilgrims to a shrine—and is it not to a shrine where God's footstool is embroidered with threads of such brightness?—for the people to enter and for the people to leave where the games are set in an arc round this Aladdin's cave. Here in this solar system of the tent and the games gravitationally encircling it are work and leisure, work and pleasure, work and recreation brought as they were of old together again.

The village flower show is a model in miniature of the ancient fairs of the country town in which the work and the play and the economics of the countryside were combined in one place and at one season. It is because we have separated work and play in the world outside the village that work has been mechanised and dulled, and play has been mechanised and made the professional job of a few experts. But the village flower show is a gravitational field of home-made work and home-made play. The villagers raised the flowers and baked the cakes and potted the jam and grew the vegetables and appointed the sports of their own selves. Out of the work came the play as out of the earth, and the village between them came the riches of the tent. In those simple interchanges lies a world of meaning, a truer one than the shadow-world that was the ambition of our fathers.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a Sunday paper:

"Blubberhouses Moors, Yorkshire, were shot by a party of seven, which included the Earl of Harewood. . . . It was on these woods that the late Lord Walsingham set up a famous record by shooting 1,070 birds to his gun in one day."

When cool judgment is essential

EFFECT OF NERVES ON SHOOTING

IT has already been pointed out that the mental factor plays a most important part in all successful shooting. And in saying this something much more concrete and definite than the general fact that mind controls matter is meant. For by intensive mental application many of the more intricate problems of game shooting can be solved and their solution translated into deadly practice.

Apart, however, from the details of technique that are required for the execution of the various types of shots, some of which have recently been mentioned, there is the very real question of the nervous constitution of the individual. It is a matter of quite common knowledge that prominent athletes when put to the acid test of representing their side—it may be their country—in some great contest have failed simply because they did not possess the exhibition mentality. In other words, they suffered from "nerves" and accordingly went to pieces. As in games, so it is in shooting. Indeed, it may be all the more so in the latter, seeing that shooting is of all things a most individualistic sport. And the point to be stressed is that the best way to overcome this weakness—for such it is—is by means of the adoption of the proper mental attitude, not only towards the matters of the moment but towards all the wider issues concerned.

All will agree that the fact of a person possessing the inherent skill and yet not being able to turn that skill to full account is to be deplored. For it is a case of good material being wasted, when there is little enough of it at the best of times. Yet there is no need to delve into the higher realms of psychology, the very mention of which may suffice to frighten away many a practical-minded shooter. For the subject of mental complexes has been rather overdone, or perhaps it has been wrongfully presented. This is a pity, since so often the root of our evil lies in some comparatively trivial complex where it is left to thrive and prosper. Given a little mental effort it could so easily be pulled out and destroyed.

I have seen a man shoot well all the morning, and then fail miserably at the best stand of the day, simply because this happened to be immediately before lunch, when he found himself the cynosure of a gallery of ladies who had come out to be present at the meal. A disheartening business indeed, and quite enough to take the edge off a hearty appetite, and in fact to spoil the rest of the day. Yet it cannot be accepted that such a happening is unavoidable. It can be helped, and if a man has his heart in it it will be helped. I firmly believe that one of the leading reasons why Americans, for instance, do so well at sport is because they realise the immense part that the mental factor plays, and learn how fully to utilise it to their own advantage.

Another case of the handicap of "nerves" comes to mind. It is of a man who seldom shot well because he lacked nervous control. At a shoot, where he was under observation, he always seemed to have the "jitters." One day, when he was suffering from a mild attack of 'flu, he had to attend a shoot for social reasons. Feeling rotten, he for once ceased to care whether he hit or missed. And for once he hit as he had never hit before. This served as much as an eye-opener to him as it did to his friends. And the net result was that he seriously took himself to task, made the necessary mental effort and became a better shot, which he is to this day.

But just how should the nervous gunner start about overcoming "stage" fright? What are the initial steps? How is he to school himself? It is all essentially a case of self-help. Nobody else can take a gun and show him where he is going wrong, as may be done with certain types of shots. If he goes to pieces every time he is in company he had better go out more alone and practise by himself. Then as he improves he will gain more confidence. At the same time he can be schooling his mind. Shooting is a sport—it is not a matter of life and death! Everyone makes a fool of himself at times. And, anyway, if one always shot well, one would miss a lot of enjoyment. A great thing is to learn to concentrate. Herein lies half the battle. If one can really do this, one may become oblivious to everything except the business in hand. Then it matters not whether one is out alone on some lonely Galway bog or performing in front of a critical gallery at some fashionable East Anglian shoot on one of the big days of the season.

Talking of big days, here again the greatness of the occasion proves too much for some people. They begin thinking of the large expense involved, of the natural wish on the part of their host that justice should be done to the good show of birds, and possibly of the effect a poor performance may have on their chances of future invitations. Such thoughts set their nerves tingling, they become self-conscious, fail to concentrate, and perhaps even develop some sort of inferiority complex. In such unhappy fettle, if they should miss the first few shots there is little hope of their recovery.

Often have I seen a man put up a poor show at November covert shoots, and yet shoot well at back-end days at the end of the season. It might be argued that he was by then turning to advantage the skill he had acquired after the autumn shooting. There may be something in this, but I am inclined to think that quite 75 per cent. of his improved performance at the end of January was due to psychological reasons. Just as he was supersensitive to some tension at the November affair, so he responded to the easier and freer atmosphere of the back-end day when nothing mattered so much. Hence, his cares gone, he shot up to his standard.

The fact that few men become really good shots until they have passed the age of 30 is probably in some measure due to the development of nervous control. It would be interesting to know just how many of the contemporary first-class shots are under 30, or even 35, or at least were under these ages when they reached the peak of their skill. There are many people who do not shoot really well until they have passed 40 or 45, in spite of the fact that they have shot regularly since early youth. Even the late King George did not display all his brilliance until he was about 40. I knew a man who greatly improved in his shooting when over 65, and became a useful performer at driven game.

Nerve control plays a big part in shooting. But in the enjoyment of the social side of it it plays an even bigger part. For a man can be a bad shot and yet get a lot of fun and good fellowship out of his sport. The sufferer is he who is ever failing to rise to the occasion, and ever regretting the fact.

"SCOLOPAX."

WATCHING HOUNDS AT WORK FROM THE BANKS OF THE WENNING, A TRIBUTARY OF THE LUNE

A DAY WITH PURE-BRED OTTERHOUNDS

By ROBERT COLVILLE

THE great majority of packs of otterhounds contain a good proportion of foxhounds. The only two packs in this country which may be fairly regarded as consisting mainly of pure-bred otterhounds are the Dumfriesshire and the Kendal and District. Of these two the more purely bred is the Kendal and District.

Early this month I had the opportunity of a day's hunting with these hounds, and it was extremely interesting from more than one point of view.

The meet was at Gressingham Bridge on the River Lune, and when I arrived there soon after half-past nine the prospects of hunting the river did not appear to be very good. An icy wind was blowing down from the moors and the hills, the river was far too full and the water must have been exceedingly cold. Yet I could not but admire the beauty of the river here, although it is true that there are more lovely stretches.

In due course hounds arrived, together with Mr. J. F. Nanson, the assistant secretary, and soon afterwards came the Master, Sir Maurice Bromley-Wilson, Bart. He decided that the Lune was unhuntable at this point, and so hounds were vanned to the River Wenning near Hornby Castle. The Wenning is a much smaller river, and although it was flowing fairly fast it was certainly in a huntable condition.

Hounds were put in just below the Castle, and hunted up for a mile or two with no drag whatever. But it was a most lovely scene all the way. The Castle is built on a high hill and dominates the countryside for many miles around. It had been raining for many days past, but there was some promise of a fine day, and an air of hope was with the followers.

In time, but still with no drag, we came to a tributary of the Wenning called the Hynburn, and just above Hynburn Foot, on the opposite side of the river, hounds hit it off. I saw the otter go into the water and formed the opinion that it was a big one. We were, unfortunately, never to know for certain. Hounds raced downstream with the authentic deep cry of the pure-bred otterhound. The water was shallow in parts and here and there stones and shingle came out into the river, causing strong currents to flow around them. It was most exhilarating to see hounds apparently galloping over the water, then sinking into the deeper parts and swimming with the amazing speed which their bone enables them to achieve.

But after about a hundred yards it was clear that something had gone amiss, and for some time hounds hunted in the wash. It is possible that some fern leaves or earth were carried downstream from the holt, for hounds returned to it again and again only to swim down and then back. Several times they appeared to be on excellent terms, and I think there can be no doubt that it was only the state of the river that prevented a kill. The water was icily cold and there can have been very little scent.

The Master, who hunts hounds, decided to try up the Hynburn, but hounds were quite convinced that the otter was in the Wenning, and they crossed the meadows farther up back to the first river. The otter had completely disappeared, and so the Master decided to try right down the Wenning, past Hornby Castle again and in the direction of Claughton.

Apart from the state of the water there are several explanations of the defeat of hounds. A bitch otter with cubs had been seen a few days before in this part of the river, and it is possible

SIR MAURICE BROMLEY-WILSON, BART.
Master of the Kendal and District Otterhounds

that this was the quarry which would, of course account for the comparative lack of scent. A more likely theory, in my own view, was that the otter had achieved an impregnable position under some rocks. Some thought that the otter had swum downstream in the middle of the river, but that—although I would willingly believe an otter capable of it—would have been a very difficult feat as it could scarcely fail to have been seen by someone.

So sure was the Master that the otter was among those rocks that after lunch he took hounds back there again, but with no result. Accordingly hounds tried downstream, past the point at which they had been put in earlier in the day and tried on to the point at which the Wenning joins the Lune not far from Claughton. It seemed to me that this disposed of the theory that the otter had swum downstream. There was never a touch all the way, and yet the banks had no roots or rushes—in fact, I doubt whether there is a tree on the banks after the bridge at Hornby.

We came up the Lune from the point where the Wenning joins it, and I could not help noticing, by the way, the very excellent grass here and the fine cattle which were grazing on it. I believe that where the Lune has not flooded—which it very frequently does—the grass is still more luxuriant.

And now, for me at any rate, the moment of the day arrived. On the side of the river on which I was walking the ground was flat and splendid cattle were grazing. On the other side trees and undergrowth extended down to the water's edge and behind them the ground rose steeply. The clouds, which had threatened the morning, had disappeared and the sun was shining down on the sparkling river. The scene needed only one addition to make it perfect, and before many minutes that addition was made.

Hounds, which were on the other side of the river, suddenly hit it off again, and we had the amazingly beautiful sight of ten couple of pure-bred otterhounds in the water. There was a fast current flowing and I was impressed by the strength with which these hounds swam against it. The Master must indeed have great confidence in their ability and power.

What made this part of the afternoon especially interesting was that no one could at first get across to hounds. On a normal day the river can be forded, but the rain had swelled it so much that short of swimming across it was impossible to help hounds. Yet I doubt if they could have hunted better with assistance. There was a good deal of wash and hounds hunted in it for some time.

It soon became quite obvious that the otter had taken refuge in a large root. Had the river been normal hounds must have killed. As it was, there was far too much water, and had there been less,

in all probability the otter would not have gone there.

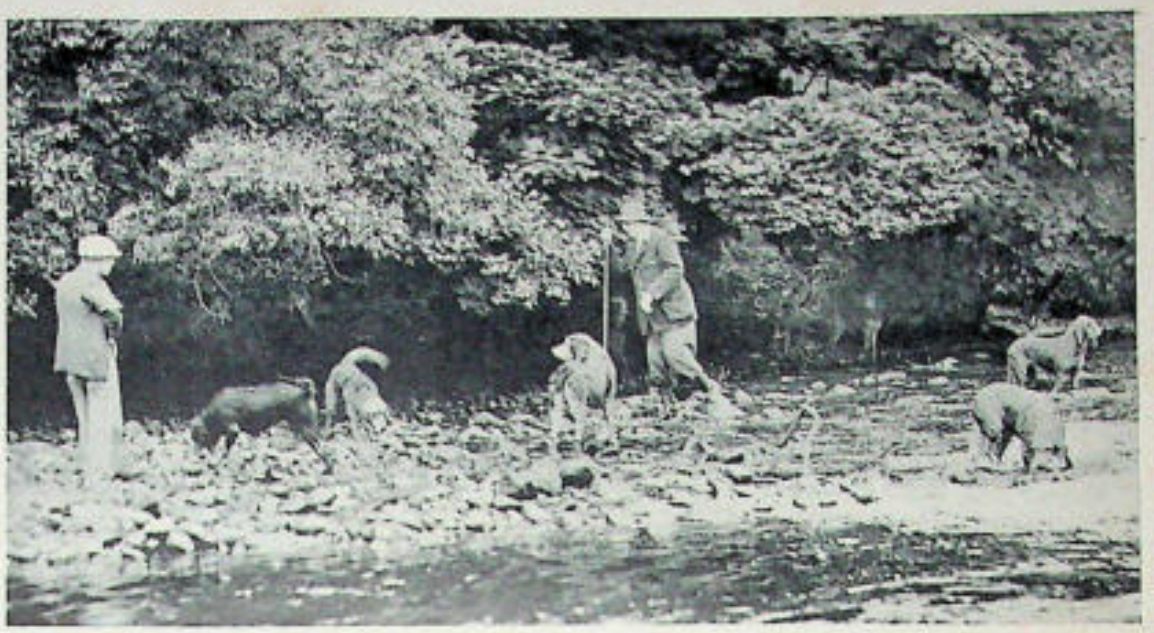
Determined efforts were made to keep the otter out, but any otterhunter knows how extremely difficult this is. There were two chances of a kill. One was that the otter would swim up and try to get into a large drain about 200yds. up. This was unlikely, as in order to do so he would have had to encounter a fairly powerful stretch of rapids. He did actually, I was told, try to swim up, but refused to face the current and returned. The other chance was that he would swim down. But he chose to stay where he was, and as this seemed likely to go on for some time Mr. Widdowson suggested that we should go up-stream, cross the bridge and arrive more nearly at the scene of action.

This took about half an hour, but when we came to the root nothing fresh had happened, and in the end the otter was given best. It was a most unfortunate thing that hounds did not arrive there two hours earlier. The morning had been an exhausting one for them, and had it not been for that they must have worn the otter down in time—for he also must have been getting tired. They hunted all afternoon with a grand cry and repeatedly came back to the big root, which was just below Gressingham Beck. When hounds were on the bank it was clear that the scent was being blown to them from the water.

But if the day had ended without a kill, it had had the great compensation in the excellence of the hound work, and in the beauty of the scenery. While we were watching to see if the otter would come up to the drain a fine salmon—he must have been a ten-pounder—kept on leaping, and a little farther up a sea trout was doing the same. And so the day ended, with a black storm coming up over the hills and the otter, tired but triumphant, at rest in his root.

There was some discussion as to whether this was the same otter that we had hunted in the morning, but the general opinion was that it was a different one. It was known that there were three otters on this part of the Lune. What is almost certain is that the afternoon otter was a dog, although the improvement in scent may have been caused by the weather.

The kennels are at Dallam Tower, near Milnthorpe, which is the home of the Master. He very kindly invited me there on the morning after hunting, and I had the opportunity of seeing hounds at my leisure.



Two things must immediately strike anyone looking at a pack of pure-bred otterhounds—the double coat and the great strength. I saw then the reasons for the power which they had displayed the day before when swimming against really strong currents. The majority of the hounds are pure bred, and while a few of the Dumfries sires have been used, the greater proportion are home bred. Some of the blood goes back to the Newry Harriers, and a certain amount is traced back to Welsh blood.

A Dumfries-bred hound which I particularly liked, both to look at and when hunting, is Piper. A splendid dog, with the head and bone of the true otterhound, was Ruler, who is by Bowman out of Glory. Trueman, by Dreadnought, is another good hound, and among the bitches I must mention Trustful, by Carmelite out of Truthful. I had been very interested to notice her on the previous day. She has formed the habit of swimming about in the wash in order to catch the otter should he come down again, and she used this ability with great persistence during the hunt below Gressingham Beck.

The average height of hounds is, I should think, about 27in., and I was greatly impressed by their excellent fronts, the levelness of the pack and by their great friendliness. All the puppies were not back in kennels, but those which I saw appeared to me to be well up to the admirable standard of the present pack.

The history and sporting possibilities of the neighbourhood have been the subject of many talented pens, and it is not necessary to do more here than to recall that one can easily and cheaply hunt six days a week during the winter. There is the Cumberland Hunt and the Cumberland Farmers', the excellent sport shown on the fells by the Coniston, and also by the Eskdale and Ennerdale who hunt on foot. The Vale of Lune Harriers hunt almost the same country as a good deal of the Kendal and District, and the Lunesdale and Oxenholme have one of the few real stag-hunting countries left.

The Kendal and District hunt waters in Westmorland, some in the West Riding of Yorkshire and also in Lancashire. The pack was established nearly 40 years ago, with a Mr. Bradshaw as Master. In 1921 the pack was divided and some hounds went to Malton. This pack was afterwards disbanded, and hounds were reunited. In 1928 Sir Maurice Bromley-Wilson, Bart., who had previously been deputy Master, assumed the Mastership and carries the horn.

HUNTING IN THE WASH ABOVE HYNBURN FOOT

HOUNDS AT HORNBY CASTLE AFTER THE MORNING'S HUNT IN THE WENNING

PORTMARNOCK, THE WINNER OF THE HYPERION STAKES AT HURST PARK FROM FAIRCHANCE AND FLYON

W. A. Rouch

LORD DERBY'S HELIOPOLIS, WHO WAS UNPLACED IN THE HYPERION STAKES, HAS, NEVERTHELESS, A VERY GOOD CHANCE IN THE ST. LEGER

FORM FOR THIS YEAR'S ST. LEGER

THE St. Leger will be run at Doncaster in rather more than a week's time. There can be no doubt that if he continues to keep sound, and there is no reason why he should not do so, Lord Rosebery's colt, Blue Peter, will start at very short odds. I had thought, and have stated the fact many times in these notes, that I considered that Lord Derby's Heliopolis had quite a fair chance of beating Blue Peter, and now Heliopolis has failed to get even a place in the Hyperion Stakes at Hurst Park, a race named after his sire. This race, was won by Portmarnock by a length and a half from Fairchance with Flyon third, half a length behind the second. Heliopolis was fourth. There was inquest after inquest after the race, and even an unofficial enquiry by the stewards. Heliopolis looked well in the paddock before the race, he even appeared to be lighter than he had done before this season. He was also sweating slightly. He was none too well behaved at the start and kicked out more than once. However, he got well away, and was third for a long time behind the pacemakers, Challenge and Nord Express. As the field was swinging into the straight, Perryman seemed to take a pull on Heliopolis as if to make sure of getting the rails in the straight.

Flyon and others then moved up on his near side, and it was obvious early in the straight that he was in danger of being shut in. And so surely enough he was. Challenge and Nord Express began to die away, and Portmarnock, Flyon and Fairchance had him hemmed in. D. Smith, on Challenge, quite rightly did not pull away from the rails and let Heliopolis through. Some visitors thought that he should have done so, but he was quite within his rights to do nothing of the sort. Rather more than a furlong from the finish there was just an opening, but Heliopolis could not, or would not, take it, and that was the end of his chance.

Those are the facts of the case. I am far from certain that Lord Derby's colt would have beaten Portmarnock in any case, and even if he had not done so, he would not have been disgraced, for, at his best, and when willing, Portmarnock is an exceptionally high-class horse. But I am not worried about the fact that Heliopolis was beaten, as I am of the fear that I have that for this race, at any rate, he returned to his old bad habits. He undoubtedly had, at one time, a temperament which was far from suited to a racehorse of his ability. His bad behaviour at Chester in the paddock, and, later, on the course, is not forgotten by all of us who saw it. Weston rode him then, and gave the colt a taste of the whip, showing that he was master. The colt won and he seemed to have learned his lesson.

I think that a large part of his defeat last week at Hurst Park was due to a return of this temperament. On the other hand, it may be that he has trained off. In this connection, mention must be made of his previous race at Goodwood, when he won by only a neck from a comparatively unknown horse, Silksworth. I thought, then, that he might have won with a lot more in hand than the verdict suggested, but it may be now that we have seen him run again that he has lost his form. I hope not, for fit and well and in the right mood, he still has a chance at Doncaster.

The more people that I meet who saw the Grand Prix at Longchamp this summer, the more of them disagree with me in my views about the winner of that race, Pharis II. I must admit to them all that the colt won in quite extraordinary style. He was brought almost to his knees not far from home and must have been half a dozen lengths behind Tricamcron half-way down the short straight. He then flew past his opponents, caught the leader, and swept past him to win with ease.

It was an astounding finish. Yet what chance would Tricameron have in the St. Leger against Blue Peter and others at level weights? His English form, and he has run twice in this country this season, suggests to me that he would have none at all. Yet Elliott, one of the greatest of modern race riders, considers that the French colt, which he will ride, has an excellent chance of success.

There have been, as I have written recently, many unexpected results to the St. Leger, and it is not a great race for short-priced favourites. Quick Ray, Lord Astor's fine-looking colt, is certainly expected to play a prominent part in the race. He has had but little racing, but he is bred to win such a race, being by Hyperion out of the Oaks winner, Pennycomequick. He is to be ridden by Gordon Richards, who, if he is still without a Derby winner in his record, has won the St. Leger more than once. His recent riding in the race, when he won on Chulmleigh, was masterly. He had a much easier ride on the same owner's Singapore, and yet the St. Leger has not been a really lucky race for Lord Astor, although he has won it. I give Quick Ray a good chance on the Town Moor.

There has been much more discussion on the racecourse as to the necessity of photographing finishes. I cannot think that such an innovation is in the least necessary, and I am supported in that view by some photographs of finishes which have been taken of dog races at Wembley Stadium at the instigation of Mr. Elvin, who manages that place with such success. The photographs are clear, and leave no doubt, except in one case, as to the results. The one exception leaves a doubt as to whether the result is a dead heat or whether one of the dogs has won by a nose.

All of which is very interesting, but the curious thing was that the judge at the Stadium agreed with the photographs, and gave his decision before they were developed, except in the case of the doubtful picture, and he gave a decision then in favour of the one dog when from the photograph it might have been a dead heat. There was one dead heat given by the judge, and the picture of that finish shows conclusively that he was right. That being so, it seems that the camera was not wanted. And that seems to me to be the end of the argument, and the end of the camera on the racecourse. Apart from the great expense entailed it seems that the human eye is just as good as the best of lenses, for I fail to see why the judges on the race course should not be as accurate and as good as the judges on the dog track.

Although Quick Ray may, as stated above, be expected to do well at Doncaster, such hopes did not receive any very great strengthening at Salisbury. In the Manton Stakes, which was run over a mile and a half last Monday, Quick Ray, ridden by Gordon Richards, could achieve only the third place. It is true that he had to jump over Kenilworth before starting, but the pace should have enabled him to win. The race was won by Cimon, by Lemnarchus out of Miss Mole, ridden by F. Herbert, and Inquisition, by Dastur out of Jury, ridden by E. Smith, was second. GNOSTIC.

MR. W. BARNETT'S TRIGUERO WITH T. BURNS UP. TRIGUERO, TRAINED BY R. C. DAWSON, IS AN OUTSIDE CHANCE FOR THE ST. LEGER

THE MOST PICTURESQUE AND STRIKING OF LONDON'S ANIMALS
A herd of deer in South Weald Park, Essex

ANIMAL LIFE ROUND LONDON—I

By R. S. R. FITTER, F.Z.S.

THE neighbourhood of London might be thought to be most inhospitable to wild life, but even apart from the hosts of birds, gulls, ducks, pigeons, starlings, crows, sparrows, which live in and around the metropolis, there are still some 42 kinds of mammals, five reptiles and seven amphibians to be found within 20 miles of St. Paul's Cathedral.

It is surprising how little is known about the distribution of mammals, reptiles and amphibians round London. The most conflicting statements are made by successive writers, largely because so many of these animals are retiring by day and thus rarely seen. The London Natural History Society is at present making an attempt to discover the facts about the distribution of these forms of wild life within 20 miles of St. Paul's, and all notes and records are welcomed by the Society's recorder.

Next to deer, the carnivorous animals have always been the most picturesque and striking, and it is because so many of them have gone that people imagine there are no "wild animals" near London. The true wild cat, anciently catamount or cat-a-mountain, and a beast of the chase, has so long ceased to be a denizen of the London basin that it is not even a legend. The wild cat of modern London is pussy on the spree, or gone back to nature, and only a beast of the chase for small boys and suburban terriers. The pine marten also has long since fled the woods of Southern England. One was seen in Redlands Wood, near Dorking, in 1879, and the last Epping Forest marten was seen in 1883. The polecat hung on a bit longer than the marten, for it was reported from Headley, Surrey, in 1886, from near Guildford about 1892, and from Epping Forest in the early 'nineties. As late as 1930 one was shot in northern Essex, but as many polecat-ferrets escape and go wild, reports of polecats in the South have to be treated with reserve.

It is pleasant to be able to pass from animals which have been exterminated to animals which still survive. Foxes are still hunted in the rural fringe of London by the Old Berkeley, Enfield Chase, Old Surrey and Burstow, Essex and other packs. Probably the post-War development of poultry farming in the zone about fifteen to twenty miles from London has had much to do with keeping up the fox population. In Richmond Park, where large numbers of waterfowl are kept, they do so much damage that the authorities have reluctantly been compelled to treat them as vermin. During the six years 1931-37 no fewer than 116 foxes were shot in the Park, and the shade of John Peel must surely have been turning in his grave. Even in the inner suburbs foxes appear from time to time, though some of these may have escaped from captivity. Foxes were seen, for example, at Peckham in 1926 and at Walthamstow in 1937. This year a pair is reported to have taken up residence in Ken Wood.

Though it was observed in Leicestershire and not near London, the following story illustrative of Master Reynard's sagacity may not be out of place here. This fox was seen by an old countryman, well versed in vulpine wiles, to be searching for something in a pasture where sheep were grazing. Having found what he wanted, which proved to be a pulling of wool about the size of a small apple, he trotted off with it in his mouth to a near-by pond. Here the countryman saw him walk delicately into the water and slowly submerge himself completely, leaving only the tip of his muzzle and the piece of wool above water. Finally, he went right under, leaving the wool floating on the surface, and swam ashore, where, after shaking himself, he trotted off. The watcher of this strange scene went to the pool and fished out the piece of wool. It was full of fleas, which had taken refuge in the only dry place available. The fox had found, indeed, a most ingenious way of cleaning himself.

Another beast of the chase still found, but not hunted, on the fringes of Greater London is the otter, which still occasionally frequents such rivers as the Thames, Mole, Wey, Darent and Roding. The most surprising habitat of the otter round London is an island in one of the Metropolitan Water Board's reservoirs in the Lea Valley, between Tottenham and Walthamstow. Here there has been a thriving family of otters for at least 20 years, feeding on the fish which abound in the reservoirs. Signs of their handiwork are to be seen in the large fish which are sometimes found lying on the banks with a portion bitten out of their shoulders.

It is interesting to remember that Venator, in the *Compleat Angler*, hunted otters in the River Lea. He told Piscator that he was going to the Thatched House at Hoddesdon, and then to meet "a pack of otter-dogs of noble Mr. Sadler's upon Amwell Hill, who will be there so early that they intend to prevent the sun-rising." Venator seemed to be in some doubt as to whether the otter was beast or fish, averring that "most agree that her tail is fish." The Carthusians, whose vows allowed them to eat no meat, took advantage of the fishy taste of otter flesh, and Pennant saw an otter in the kitchen of the Carthusian monastery near Dijon being prepared for dinner.

An animal that is much commoner round London than is usually suspected, on account of its nocturnal habits, is the badger. It probably no longer occurs in Ken Wood, but it may be found no farther from the centre of London than Epping Forest and Richmond Park, and in the rural parts of Essex and Surrey it is probably as common as anywhere in the country.

In Richmond Park, according to Mr. C. L. Collenette, there are probably at least four pairs with their setts in the various plantations. In Epping Forest there are at least three setts, one at High Beach and two over towards Theydon. Badgers also occur on Wimbledon Common and in Selsdon Bird Sanctuary. There are several records of badgers meeting untimely ends around London. Two were electrocuted on the railway at Worcester Park in 1925, and another at Norbiton in 1927. A female badger, weighing 22½lb., was found run over in Camp Road, Wimbledon, in October, 1936, and is now preserved in Wimbledon Golf Club House. Another badger fell into the Chingford aqueduct of the Lea Valley reservoirs in the great flood of January, 1918, and was taken out drowned at the weed-grate at Chingford Mill.

The two other carnivora resident in the country round London are the stoat and the weasel. Both are fairly common in the rural districts, though in some places the stoat is more often, and in some less often, seen than the weasel. Stoats approach as near the metropolis as Epping Forest, Abbey Wood, Richmond Park and Wimbledon Common. Weasels have been seen of recent years at Epping, Wimbledon, Titsey, Selsdon, Abbey Wood, Epsom, Northwood, and in Hertfordshire.

Hares still abound in many areas, notably the North Downs and the marshes of the Thames estuary. As late as the early years of the present century it still seems to have been paying occasional visits to Regent's Park. In 1937 Mr. C. L. Collenette estimated that there were seven to ten pairs inhabiting Richmond Park. There are several packs of beagles and harriers working the country round London.

The only truly wild deer in the neighbourhood of London to-day are the fallow deer of Epping Forest, but fallow deer are also to be found in Battersea, Greenwich and Richmond Parks, and red deer in Clissold and Richmond Parks. The 1,100 fallow deer in Richmond Park in 1892 had been reduced to only 200–250 in 1937, when there were also 50–60 red deer. Roe deer were introduced to Epping Forest from Dorset in 1883, but there do not seem to be any records of them there since 1917.

GROUND GAME SPORTING RIGHTS

By W. J. BROWN

THE rights over game are, as is well known, in the occupier of the land, unless otherwise arranged. If the land is not let, then the owner will have the sporting rights. If it is let, then in the absence of arrangement the rights pass to the tenant.

It may, of course, be that there is a shooting tenant, to whom the sporting rights have been let by the landlord who reserved them when he let the land, or by the tenant who has the sporting rights and has sub-let them.

I am not at the moment concerned with the rights of any of these gentlemen except the occupier of the land when he is not in possession of the sporting rights. This may be either because the landlord has reserved them and either holds them himself or has let them to a shooting tenant, or because the tenant occupier has sub-let the rights himself.

The preamble to the Ground Game Act, 1880, is as follows: "Whereas it is expedient in the interests of good husbandry and for the better security for the capital and labour invested by the occupiers of land in the cultivation of the soil, that further provision should be made to enable such occupiers to protect their crops from injury and loss by game." And the Act goes on to provide that "every occupier of land shall have, as incident to and inseparable from his occupation of the land, the right to kill and take ground game thereon, concurrently with any other person who may be entitled to kill and take ground game on the same land." The Act then sets out certain limitations which may wait for the moment.

This Act was passed for the benefit of occupiers, and it gives them the right to protect their crops from hares and rabbits (which are meant by ground game), in spite of the fact that the landlord has let the whole of the shooting rights elsewhere or has retained them himself.

It will be noticed that the Act uses the word "occupier." In many cases this will be the tenant, or even a sub-tenant, but it includes an owner-occupier as well; a man farming his own land has just the same protection under the Act as a tenant farmer, and can kill hares and rabbits although he has let the shooting. The Act *does not* protect anyone who has merely taken the grazing rights. He has only the right to keep cattle on the land, and is not the occupier.

The Act, as quoted above, says: "Every occupier *shall have* . . . the right to kill," and it later goes on to make this more clear by laying it down that any agreement or arrangement which purports to take away this right is void. A landlord cannot prevent his tenant from killing ground game by reserving the sporting rights or letting them apart from the holding. If the occupier does not choose to shoot rabbits and hares, that is his business, but it is the intention of the Act to see that he is not deprived of his right to do so.

Any agreement to take away the right is void. This may lead to some interesting results. Suppose, for example, a landlord has tried to reserve in the tenancy agreement all sporting rights over the holding. He is, of course, perfectly entitled to do this as far as game proper is concerned, that is to say, winged game, and to that extent the agreement is perfectly valid, and if the tenant shoots partridges he breaks his agreement. But the Act we have been quoting makes void any agreement to prevent the occupier killing ground game, so that as far as rabbits and hares are concerned the tenant can ignore the agreement altogether. He should, however, remember this. The Act gives him, as occupier, the right to kill his ground game. It does not give him the exclusive right to do so. So that, if the landlord has reserved the sporting rights he also, as well as the occupier, is entitled to shoot hares and rabbits.

An occupier should never agree to forgo his rights to kill ground game, even if he is to be paid to do so. He may choose not to shoot, but he cannot agree not to. In one case there was a clause in a tenancy agreement of a farm that if the tenant left the ground game unshot for the landlord's advantage the landlord would pay the tenant compensation for the damage done to crops. The tenant accordingly allowed rabbits and hares to multiply, and then claimed from the landlord compensation for the damage done to his crops. He could not recover it. Under the Act all agreements to deprive the occupier of his rights are void, and as the agreement was void he could not sue on it. If the tenant did not know the agreement was void so much the worse for him.

If the occupier is also in possession of the sporting rights he can, of course, allow whom he pleases to kill his ground game. But if he does not own the sporting rights, but is allowed by the Act to kill his ground game, although he can always kill it himself, he is restricted as to other people whom he may allow to do so.

As far as *shooting* is concerned he may only allow *one other person*, and he must be one of certain classes. These are (1) Members of the occupier's household resident on the land in his occupation, (for example, a son living on the farm); or (2) persons in the ordinary service of the occupier on the land in his occupation (for example, a farm labourer); or (3) any other person *bona fide* employed for reward in taking or destroying ground game (this includes anyone employed to kill rabbits on the terms of keeping what they kill, but without other payment.)

But the occupier may allow any number of people to kill ground game *otherwise than by shooting*, provided the people come within one of the three classes mentioned above. So that a day's hare shooting means that only the occupier and one other person can kill. But a day with the ferrets allows the occupier and one other to shoot, and any number more to help, provided they come within the three heads above, and do not shoot.

Two last warnings may be given. If the occupier gives his permission to others to shoot or kill, it must be in writing. And if an occupier is only allowed to kill rabbits because of this Act, and not because he is the owner of the land, he cannot shoot between the expiration of the first hour after sunset and the commencement of the last hour before sunrise.

The Ground Game Act also forbade an occupier to set spring traps for rabbits except in rabbit holes, but this prohibition now applies to everyone under the Prevention of Damage by Rabbits Act, 1939.

FATAL SHOTS AT BIG GAME: WHERE TO PLACE A BULLET

TO kill his game "clean" is the aim of every sportsman. To do this he must first stalk or spoor his quarry, he must know exactly his target on its body, and he must hold straight. I am not concerned now with the first and the last of these three things, fascinating as they are, but only with the second.

When I was a medical student in Edinburgh more years ago than I care to think, I overheard two city urchins, "keelies" they were called in those days, discussing which was the coarsest (roughest) football team in the city. It was agreed it was the University, because "they were a' medicals, and kent the fatal pairts." That's it, the fatal parts, and I am inclined to think that is *the* bit of his business the average sportsman knows least about. He will talk like a professor on barrel flip, bullet weights, propellents, "drop," and so forth, but how often has he a precise knowledge of the geography of his chosen animal, and of the most lethal wound he can inflict on it?

How often has he even post-mortemed his kills? It is true that in modern books on big game hunting, such as the Lonsdale Library volume, photographs are published showing the spot to hit. Notwithstanding that, there is still controversy in the sporting press on such a subject as the reliability or otherwise of the tip of an elephant's ear as the guide to its heart. Surely that is a question on which there should be by now no room for dispute.

When a man shoots to kill, and that is the purpose of all of us, he wants to cause rapid, if possible, instantaneous death, or failing that, wounds so gross, as to immobilise the animal and enable him to "finish it off" without loss of time, or undue risk to himself. It should be clearly understood that to achieve instantaneous death only one or other of two injuries will suffice—intense hæmorrhage, or destruction of the vital portions of the brain. Perforation of the so-called "silent" areas of the brain will not necessarily cause instant or even early death—indeed recovery is possible—nor will severing of the spinal cord, except in the neck area, invariably do so.

Severe hæmorrhage causes almost immediate unconsciousness and death supervenes very rapidly unless by some means the hæmorrhage is stopped. Anyone wanting proof of this should arrange to see the slaughter of cattle by the Jewish method.

To cause death by either of these means is by no means easy, and emphasises the point that the beast is not the target, only small portions of its anatomy. The experienced hunter is well aware of this, and many for that reason make the shoulder the target of choice.

They count on smashing the shoulder, and so making movement difficult, if not impossible, or, failing that, to wound the ribs and lungs or heart, both of them grave, though not necessarily fatal, wounds.

Some men quite mistakenly bank on the heart or neck shot. A man may survive a heart wound. It was a well-known tale in France during the War that one of the generals in high command there had sustained a bullet wound in the heart at Omdurman, and survived to perform distinguished service.

Some years ago the *Field* published a photograph of a stag's heart preserved in spirits of wine. The wound inflicted by a big bore showed clearly. The story was that the animal had carried on apparently untouched into a wood 100yds. or so away. Its dead body was found on search being made. No doubt similar stories have been told many times, and it may be taken as certain that a bullet wound in the heart of a charging lion, in the absence of other material injuries, is no accident insurance policy.

The neck as a target is for quite other reasons still less reliable. It is true that a bullet breaking the neck bones and severing the cord has immediate and catastrophic consequences, but it by no means follows that every bullet traversing the neck does these things. A little reflection will show that a bullet might traverse the neck from many angles without inflicting very serious or material injury. An old gentleman of my acquaintance sustained a bullet wound through the neck, severing the windpipe, nearly 40 years ago in the South African campaign, and is none the worse.

To hit the neck bones in a moving animal and at anything other than the shortest of short ranges, can only be regarded as a complete fluke. It is a shot that should seldom be attempted.

To smash a leg is quite useless. There is an East African conundrum which runs: What goes faster than a kongoni on four legs? And the answer is: A kongoni on three!

Many a conscientious man has followed a kongoni on three legs for hours, and lost him in the end. Smaller buck, shot through both forelegs, will progress on the stumps, and seek sanctuary in long grass. If they are not found, and it is not always easy to do so, the torture of their last hours does not bear thinking of.

To return to the two wounds that fill the bill, it will be agreed by all experienced hunters that the head shot at elephant is ideal. But how small a target an elephant's brain is! And of how many other animals can it be said that the brain is a practicable target, even at very short range?

What, then, is a generally applicable and at the same time fatal shot? At the root of the neck, taking the slot at the top end of the breast bone as a centre, there is a fatal area of quite considerable dimensions. There is under each collar bone the great artery proceeding to the forelimbs; there are the great vessels springing from the main artery of the body and ascending each side of the neck; and there is the great main artery itself. Severance of any one of these vessels is sufficient to cause instant unconsciousness and death in a very few moments.

Death is impressively swift in these cases. Most animals shot "dead" fall on one side, but I have seen animals hit in this area subside on their bellies, all four legs a-sprawl. They were and they were not.

This shot, which I call the "collar stud" shot, can only be taken with the animal in the head-on position. It is a very comforting shot, for one knows that if one fails to cut one of these great vessels, a raking shot with the infinity of destruction it causes is a certain alternative.

There has been, and perchance there always will be, furious controversy between small and big bore exponents. One cannot avoid suspecting that the big bore man, with his desire for knocking down and smashing his game, had he had a fuller knowledge of anatomy, and of the varying effects of wounds dependent thereon, would agree that any bullet with the drive behind it necessary to reach this target would do his business; and that further, that weapon with which he can most surely place his shot, whatever its size or bore, is for him the ideal weapon.

"CHIRURGEON."

THE OVAL TEST MATCH

By NEVILLE CARDUS

SATURDAY at the Oval was blessed by hot sunshine and a blue sky. The West Indies revelled in a brilliant light, which must have seemed to them a light reflected from their own beautiful islands. Though Grant lost the toss and England on a perfect wicket at one time were 300 for five; in spite of this obstacle before them the West Indies kicked back and England's last four wickets fell for 19. The final total, 352, was, in the circumstances, a tribute to the keenness of the West Indies' out-cricket.

The turning point of the day occurred during a stand for the sixth wicket by Hardstaff and Nichols. Hardstaff was brilliant; and Nichols defended, reliable as an able-bodied seaman. England were now 333 for five, and surely this was the hour in a sweltering afternoon when the strongest and most enthusiastic bowling begins to seek the consolations of philosophical resignation. Suddenly Constantine transformed himself. This year he has assumed the disguise of a thoughtful professor of bowling, an inquirer into the subtleties of spin and variation of flight. He has usually put behind him the old impulsive energy; he has often reminded me of a student from the Orient in gold-rimmed spectacles talking Babu English.

On Saturday afternoon, just when the English innings was going smoothly along a tranquil and thoroughly civilised course, Constantine abruptly flung theory and deliberate reason aside. Original blood and genius took possession of him. He ran Nichols out from, or near, cover-point—fielding to his own bowling. Hardstaff called Nichols unnecessarily for a short run; Constantine leaped to the off side, picked up the ball and hit the stumps, the whole terrific action done in a flash of lovely suppleness, fierce as the jungle. Constantine then took three wickets in fifteen balls for 11 runs, and, at the end, his analysis on the Oval at its easiest was 17 overs 3 balls, 2 maidens, 75 runs, 5 wickets.

The English innings was curiously diverse. First of all, Keeton played a ball from Johnson into his stumps and departed for a duck, with only two runs scored. Hutton and Oldfield then played cricket of rare ease and charm of technique. They added 131 in less than two hours. Hutton was in his most assured vein; his style seemed the best that can be witnessed at the present time in this country, strong, sound, yet touched with art. Oldfield's first appearance in a Test match in this country was a complete success. He scored 80, and I doubt if a crowd at the Oval has for many a long year watched neater and more ingratiating play than Oldfield's. His cutting and his glancing to leg were clever and delicious; his general technique told of sense and organised foundations. He has already staked a claim in the English team for Australia next year.

After Hutton and Oldfield got out—Hutton deceived by pace off the ground into a return catch to Johnson; Oldfield caught at the wicket attempting a late glance to leg—after these mishaps Hammond apparently cast a shadow over the innings for a while. He was heavy-handed and a little solemn. His strokes could not penetrate the offside field, and the West Indies bowlers appreciated his weakness on the leg-side. Grant caught him brilliantly from a tepid push towards short square-leg.

Now came Hardstaff's two-hour innings of 94, containing some of the handsomest off-side strokes any cricketer could wish to see. But England 130 for one; then England 300 for five; and after that England 352 all out!—this was not good enough, even though in a three-day match a total of 300 *should* be good enough against all teams except Australia. None of England's wickets was given away, except, perhaps, Hardstaff's who, when the "tail" was palpably in the process of being devoured, struck out recklessly. The West Indies bowlers had to work for their successes; during more than one period of the day there were discouraging prospects before them. They declined to waver. They played cricket, and a gallant captain and tireless fielding lent them support and encouragement.

Monday was again hot and fine, with thunder in the air. The West Indies have written a notable page in their history of the game. On an easy wicket they scored 387 for five, and the virtue of this performance is that it was achieved after a disaster which might have unnerved the strongest team. Headley was run out foolishly when, with his score 65, he was thoroughly set and master of all he surveyed. He and J. B. Stollmeyer took Saturday's score of 27 for one to 128 for two, easefully yet with style and animation. The first-line of the English attack was conquered resolutely; moreover, it was not allowed to "come again" all day. When the West Indies were 110 for one we witnessed the spectacle of Hutton and Compton bowling for England. Hutton, indeed, captured the West Indies' second wicket at 128 by deceiving Stollmeyer into a precipitate stroke to the hands of forward short leg. Now occurred the mishap that threw the wicket of Headley wastefully away. V. Stollmeyer pushed a ball towards short mid-on; there was not a ghost of a run, but he dashed down the wicket calling Headley for one. Then he screamed "No!" when Headley was rushing along as though pursued by demons. Hardstaff threw in ruthlessly, Wood swept off the bails, and the second-greatest batsman was out, with apparently a double-century in his possession for the asking and the waiting.

Victor Stollmeyer might well have wished the earth to open and swallow him from view and from the wrath of his colleagues. He did no such weak thing. He realised his debt, and manfully he paid it—with interest! After lunch, Gomez was quickly bowled by Perks, fourth out at 164. Stollmeyer for a while batted like a depressed and doomed man. Fortunately, he could not time the offside pace of Nichols and Perks. At the wicket's other end, Weekes, a left-hander, punched hard from his back-foot. The English attack suddenly deteriorated again, as it had deteriorated before lunch, during the V. Stollmeyer and Headley partnership. Hammond scarcely employed his resources economically; he worked the fast bowlers hard—and how these West Indies batsmen revel in tired fast bowling on an easy turf! Weekes hit Nichols for six—an amazing back-footed straight drive. Stollmeyer now showed us a careful method. The stand actually added 163 in a hundred minutes, and Stollmeyer was not disposed of until he succumbed to a catch at the wicket, four short of his hundred. Weekes proceeded to hit like a mule; and on Tuesday Constantine followed suit. England batted again 146 behind. And they batted all day, Hutton and Hammond making centuries. The match was dead and buried, but the West Indies took all the honours.

THE START OF THE THIRD TEST MATCH

Hutton plays back to Martindale, with Keeton, shortly to leave him, backing up at the other end

ROUND THE WICKETS

By HUMPHREY DANIEL

THE last Test was nodding in the heat of the Saturday afternoon sun. It had just taken tea. It was now, like all good Test matches, waiting patiently for close of play to put it to bed. And, like all good Test matches, it was giving no trouble, making no stir. Runs were flowing gracefully; bowlers were running like clockwork. England ruled the game. Spectators dozed, hypnotised by the monotony of its rhythm. Suddenly a spark of life flashed through the game like a knife going through a Constable landscape. The batsmen were just taking a single from a shot short of cover-point. The bowler, quick as lightning, darted at the ball, pounced on it, picked it up, hurled it at the wicket, and shattered it with the batsman yards out, with the thrust of a warrior hurling a spear.

Single wicket matches are a thing of the past now. They are only resurrected to provide horse-play for the crowd when the players are too tired to play and want to go home. They died with the giants of long ago. But this inspired piece of cricket, this superb bit of fielding which was to alter the whole course of the game, this furious challenge to take on the whole of England single-handed was a challenge which might have been made by Alfred Mynn himself. Only Constantine to-day could have made it. Nineteen minutes later the English innings, young and still adolescent, was completely dead. Constantine had finished it off with the vigour of a lion at the kill. He had taken five wickets. They were all taken in various ways, by subterfuge typical of the man's originality.

A tricky leg-break caught Hammond unawares and made him tepidly push the ball into short-leg's hands. Oldfield, in his innocence, played what he thought was a leg-break for a single to fine leg, and was caught at the wicket because what he thought was a leg-break was really a googly. (A few runs earlier the wicket-keeper had missed a very difficult chance of stumping him off a similar ball; and Constantine had good-naturedly scowled at Sealey, the way Alexander looked at Mose—as if to say, "Decarbonise yoursel', bo'. Decarbonise yoursel'.") It was a rasping break-back which removed Wood's leg-stump, neatly, precisely, without loss of blood; a break-back which sent Wood back tracing a memory of its path with his forefinger in the air like a man who has been hit with a mallet; a break-back which Lockwood himself would have been pleased to own. Wright was stabbed in the pads by a top-spin of such unexpected ferocity, that it might have come from "Clarrie" Grimmett himself. A perfect yorker shattered the columned symmetry of Hardstaff's wicket as drastically as the Turkish powder shattered the pillared beauty of the Parthenon.

The applause which surrounded Constantine's return to the Pavilion was an acknowledgment to the greatest "all-round" bowler we have yet seen. Not even Barnes, nor Spofforth, nor O'Reilly can challenge his right to that title. Constantine, in his youth, has been one of the two fastest bowlers in the game of his day. He is now one of its most accurate and most effective leg-break bowlers. Constantine can bowl fast, he can bowl slow spin, he can bowl a swirling out-swinger with the best of them. And the next ball, in the same breath, with the same action, he can put down a "wrong-un" which would puzzle Hobbs himself. The bowling of Leary Constantine has all the variety, all the gaiety, all the wit in the repertoire of a coloured minstrel.

* * *

"The boy who bowled Bradman," they called him. It is some time ago now since a youngster of sixteen or so went up to the nets at Lord's to help the Australians try out their armour for the coming conquest — and showed them the holes in it by bowling most of them out. A sort of Mozart of cricket. In nine days, of course, everyone had forgotten him. Possibly one or two have thought there was something vaguely familiar about the face of the boy who sold them their score-card at Lord's. All through the summer he has sold them. Before his eyes have passed the cream of cricket. He has watched them all. Hammond, Headley, Hutton have all played before him. They have not passed unheeded. The other day he scored a century for the Young Professionals against a very determined and very worthy attack of Young Amateurs. It was a century composed of a great variety of strokes. A century of amazing culture and technique for one so young. Some of those strokes were curiously familiar. His batting seemed to compound, like a tiny prism, all the most dazzling and most peculiar shots of the great batsmen of to-day. There was another cricketer who did the same thing before him. He, too, sold score-cards. He, too, shook his lance at the very halls of fame themselves. He, too, scored a century, at an important boys' match at Lord's ground. To-day he plays for Middlesex—when he is not playing for England. To-day, he is acclaimed one of the two most promising batsmen of his day, of the noble lineage of Victor Trumper himself. His name is Denis Compton. Yet three years ago he was nothing, not even a "boy who bowled Bradman." One day, maybe, there will be headlines for the boy who bowls Brooks.

* * *

The M.C.C. do not spend so much of their time asleep in bath-chairs as some people seem to think. They have too much to do. They control an organisation which has come to be as much part of our national make-up as the monocle and the old school tie, the briar and the bowler, or even the umbrella itself. It is a great responsibility. It has never been an easy one.

Ever since the War their charge has given trouble. When Gregory and Macdonald swept over the land scattering bails before them like leaves before an autumn wind, they were told that the batting was bad. When Douglas Jardine divided Australia into three parts, harassed it on all sides, laid siege to it and took it by storm, it was the spirit of the game which was wrong. When Bradman came to challenge Jimmy Wilde's impersonation of the might of the atom, they were told there was no bowling. "What is wrong with English cricket?" implored its writers. "Too much pad-play; too many averages; too much up-and-down bowling; too many feather-bed batsmen," answered the chorus. "Not enough something-or-other," observed the knowing ones. "Cricket in the doldrums," observed a great one.

It was left to the M.C.C. to find the cause of all this rough-house, to find out exactly what was wrong with English cricket. It did not take them long. They saw that its batsmen were uninspired. They saw that its bowlers were unimaginative. They deduced that the batting was bad because the bowling was bad; that pad-thrusting batsmen were the offspring of short-of-a-length bowlers. That the bowling was the cause of the trouble.

They started by giving them more inches of stump to bowl at. They followed this with the new l.b.w. rule. Then came the edict that all wickets were to be natural wickets, wickets made of earth and grass. Now comes the eight-ball over. They still have not solved their problem. But they have not finished their calculations yet.

The bowler of the year—Copson, of Derbyshire

R. E. S. Wyatt playing the forward "dead-bat" shot

LETTERS TO YOUNG FLY-FISHERS

X.—How to Fish a Chalk Stream

MY DEAR BOB,—Yes, I think the patterns you now have will all serve well enough for a chalk stream except the March brown, which will be of little service to you unless you use it on occasion to imitate a sedge. You will want a few more patterns though not really very many. I will write you about that presently, when I try to say something about the different hatches a chalk stream produces; but, first, as to the fishing itself. You will have to find out from your cousin whether he wades the water or not; probably he does not. Some chalk streams can be waded, but most of them are just a little too deep; also some owners object to wading. Privately, I think this is a mistake if the water is suitable, for wading keeps the bottom stirred up a little, and is rather like hoeing the ground in a garden. But he or his keeper will tell you what the custom is on his water.

If you fish from the bank choose the right bank for preference, other things being equal. The right bank is the one on your right-hand side if you were standing in the water facing down stream. This will save you a good deal of back-hand casting unless you have already acquired the knack of casting with either hand. Wait till the rise starts. If it were the spring or early summer, this would occur any time after about 10 a.m. according to the day, but in the autumn the rise is always uncertain. However, you will be able to find out when you get there about what time the rise has been starting recently, and unless you differ from most fishermen you will find yourself on the water some time before it begins.

The first indication given that the hatch is coming on will be the ring of a trout as it takes something invisible off the surface; but do not be in too much of a hurry to start. If you can possibly manage it, restrain your ardour and watch the stream. After a minute or two, the same fish will rise again, or another close by, then another, and in the course of ten minutes or so you will be able to see half-a-dozen fish busily feeding. Then is the time to start fishing. Your line, of course, will have been well greased some time earlier. Almost any of the preparations sold for the purpose will do. You can get a tin for sixpence or so.

Once the rise is sufficiently well "on," select the fish for which you intend to try. This will depend mainly on its position; pick the one you think you can cover most easily, though, naturally, you will try for the one you think the biggest if it is within range. But you have to bear in mind that if your line falls over one fish when you are trying for another beyond it, you will almost inevitably put the nearer fish down, and it may rush away and disturb the fish you are after; so it is generally better to try for the nearer one first unless you can cast so that your line does not fall across it in reaching the further fish. Remember your object is to make your artificial fly alight on the surface so that it looks like a natural fly which has just hatched out from its shuck and is standing on the water drying its wings before flying away.

If you put your head down and look along the surface of the water, you will see, in a good hatch, quite a number of flies poised on the surface. It is some of these that the trout are taking. So cast in such a way that your fly will fall about a yard above the feeding fish and in such a position that the current will carry the fly over its nose.

You may remember that in writing to you about wet-fly fishing, I advised you to have as little line on the water as possible, since the current would pull on it and make the flies move unnaturally. In dry-fly fishing, you always have a lot of line lying on the surface, so the danger from drag is greatly increased, although the current itself is less turbulent than in a mountain stream. But it is even more important not to let a fly drag.

To get over the difficulty, dry-fly fishermen try to cast so that their line does not lie out straight on the water but in waves, rather a snake-like effect. If the line falls perfectly straight some part of the current moving quicker than the rest will carry the line with it, and the fly at the end will immediately drag, but with a wavy cast there are a few seconds while the waves are straightening out in which the fly will float unimpeded. It is seldom possible to get more than a yard of clear floatage, so you must not drop your fly too far in front of a fish; on the other hand, if you drop it just over the fish's nose, it will see the fly fall, and its attention will be called to the gut to which it is attached.

As mentioned, it is no use hoping that a fish cannot see gut, however fine. It can always see it if its attention is called to it. Fine gut is a great help to the novice. It makes less mark on the water as it falls for one thing. But in dry-fly fishing, you can take it as an axiom that the finer the fisherman the coarser the gut he can afford to use. Some of our greatest experts use nothing finer than 2x drawn; but do not attempt to use it yourself. Use 4x or even 5x points until proficient.

This question of fish seeing the gut is, I think, second only in importance to the avoidance of drag; it may even be the more important. There are days, especially those "heavy" days with a leaden sky, when it seems well-nigh impossible to cast over any fish without making it bolt for safety. There must be something in the light which makes the gut more visible; at least, I can see no other possible explanation. There are times during an evening rise when the same thing happens. Above and below the point where one is fishing the river is aboil with rises; but directly a cast is made every fish in sight of it goes down at once, no matter how gently the line falls on the water. This question of the visibility of the gut cast introduces rather a nice question of chalk-stream tactics. If you cast well upstream drag is reduced to a minimum, but there is much more chance of the fish seeing the gut which, of course, comes down-stream ahead of the fly—the more directly behind the fish you are standing the more chance there is of the fish seeing the gut. If you cast across stream, provided you do not overcast your fish, there is little chance of the gut being noticed, as it is further away from the trout than your fly, but the danger from drag is greatly increased.

You can compromise—most people do—by taking up a stance which will allow you to cast slightly upstream and well across, trying to make an upstream belly in your line as it falls. It is always better to cast slightly on the near side of your fish, as it will move 6in. or more if the fly takes its fancy, and even if it should unfortunately drag the fish may not notice it if it is a few inches away to the side. A fish lying high in the water can only see what is on the top of the surface for a very limited distance, and at the edge of this "window," as it is called, flies must look rather blurred. At all events, I have found that I rise two fish when casting across to one when I am casting upstream.

When dry-fly fishing, I advise you, whenever possible, to use the shoulder cast. It is not so easy to cast accurately in this way as it is with an overhead cast, but it is much easier to make this wavy line on the water. Another advantage is that the line is not so high above the water when it extends and has not so far to fall. A year or two ago a writer in the *Field* called attention to what he aptly described as the "scar" cast; when the line in falling makes a scar on the surface like a crack in ice. This is very apt to frighten fish. It means that the line is falling too heavily on the water, and may be due either to a downward direction given to the line in casting, or to the extended line falling from too great a height. The force with which the line strikes the water varies as the square of the height from which it falls. Consequently a line falling from 8ft. above the water strikes with four times the force of a line falling from 4ft. Either the shoulder cast or an underhand cast is of great assistance in avoiding this fault.

Another fault you must try to avoid is what has been called "skate"; it is not quite the same thing as drag, though it is its first cousin, and has much the same effect on a fish. It is a quick movement of the fly on the top of the water when it first falls; a sort of skid along the surface before it settles down. It comes principally from one of two things—either from too much force in the cast, so that the line extends and then jerks back an inch or two; or from not dropping the rod point as the line falls. If the rod point is not dropped soon enough there is a loop of line between rod and water which "settles back" so to speak, and in doing so moves the fly. To avoid skate from too vigorous a cast, it is as well to "shoot" a yard or so of line. To achieve this, pull a yard or so of line from the reel, between reel and bottom ring, and hold it in the left hand while you are making false casts. When the final cast is being made, usually when it is about two-thirds out, let it go, and the weight of the line will pull it out through the rings. This results in an "easy" finish to the cast and the fly will flutter down, falling very lightly on the water. But only practice will teach you the best moment to shoot line; it depends on the rod and weight of line you are using.

I have said very little about flies. There is a moral behind this. It is how your fly behaves that matters and not what it looks like.

Your affectionate uncle,

HARVEY.

"IN THE COURSE OF A FEW MINUTES OR SO YOU WILL BE ABLE TO SEE HALF-A-DOZEN FISH BUSILY FEEDING"

HUNTERS PARADING AT THE UNITED COUNTIES HUNTERS' SHOW, NEAR CARMARTHEN

A SHOW FOR HUNTER BREEDERS

So far as I am aware the United Counties Show is the only one in this country which is devoted exclusively to hunters. And while there is something to be said for shows which include cattle and so forth, it is very pleasant to set out for a show of hunters—particularly Welsh hunters.

Every hunter shown must be by a thoroughbred sire, and the value of this rule to the show during its long history is incalculable. Soon after the show started there was a proposal that this rule should not apply to brood mares, but it was, fortunately, defeated.

No attempt is made to render the show attractive to what might be called the general public. The hunter trials with which the show concluded may well keep people there, but did not induce them to turn out. Generally, of course, there are more than sufficient people in South Wales who are genuinely interested in hunter breeding to fill the ground completely. This year the fact that a few fine days followed weeks of steady rain resulted in a number of farmers devoting their energies to hay-making and the cutting of corn, so that the attendance was slightly less than usual. A number of dealers were present, many of whom had come on from Dublin, but the general air of unrest seemed to be interfering with the sales.

Last week witnessed the 70th meeting of this society in the very attractive ground just outside Carmarthen Town. The whole arrangements were excellent, and were due to the unaided efforts of the hon. secretary, Major J. W. Bishop, who is to be congratulated on his knowledge of the subject and his ability to administrate a show. It is impossible not to remark on the excellence of the show ring. It has no deceptive dips and shallows, and it is possible to gallop a hunter straight and let him really extend himself. This, I think, is how a hunter should be shown, at all events, in a place like South Wales, where breeding is the corner stone of the show. And let it be said at once that the hunters at this year's meeting were well able to take advantage of the ring.

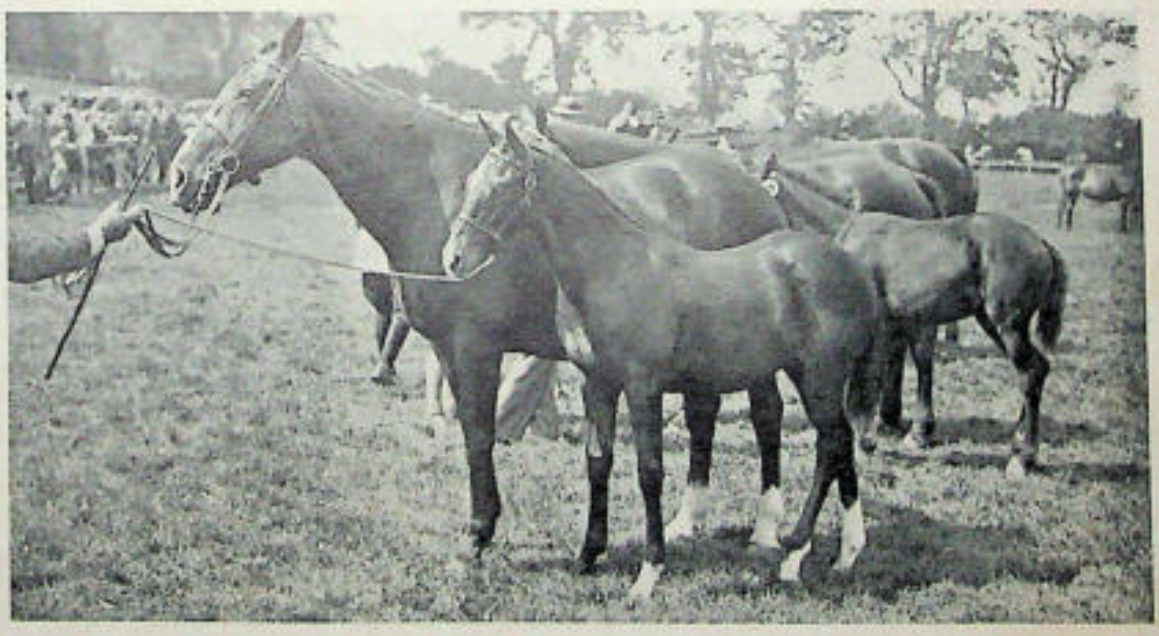
The judges of the Breeding classes were Mr. H. S. Brenchley and Mr. Cecil Argles, and the Riding classes were under the care of Viscount Knutsford and Mr. J. Castle. All four joined in the judging of the Champion Cup, the President's Prize and the Hunter Trial.

Perhaps the most important class of the day was that for the best brood mare likely to produce a weight-carrying hunter to be shown with foal at foot. The entries were good and well up to standard, and the class was won by Wild Woman, an aged bay mare, by Wild Fellow. She also won the gold medal offered by the H.I.S. (Scheme B), and the silver challenge cup presented by Mr. H. Dyke Dennis. Second in this class was Vera, a chestnut mare eight years old by Vicot.

The best hunter foal was Magician, a four-months bay colt, by Blue Charm out of Maitresse, by Maitre Corbeau and bred by Mrs. Vaughan.

The yearlings were, as a class, admirable, and it must have been difficult to make a decision. Yet the winner, a chestnut gelding, by Blue Charm—Wild Oats, deserved to win. He had the most lovely walk, and it would have been a pleasure to watch him moving for a long time.

The entries in the classes for the two- and three-year-olds were, I thought, the best of the day. The former class was won by Sing Song, a chestnut filly, by Border Minstrel out of Easter Morn, and Jewel, a brown filly, by Oudry out of Janet was second. Sing Song was also awarded the silver medal offered by the H.I.S. (Scheme C) for the best filly under four years old.



The best three-year-old was Star and Crescent, a bay gelding, by My Stars out of Black Sea, by Soulouque. Black Sea had a good career, winning six steeplechases over two and three miles. Second in this class was Marquis, a chestnut gelding, by Valparaiso out of Fly, and Star, a bay gelding, by King Harald out of a dam by John Gay was third.

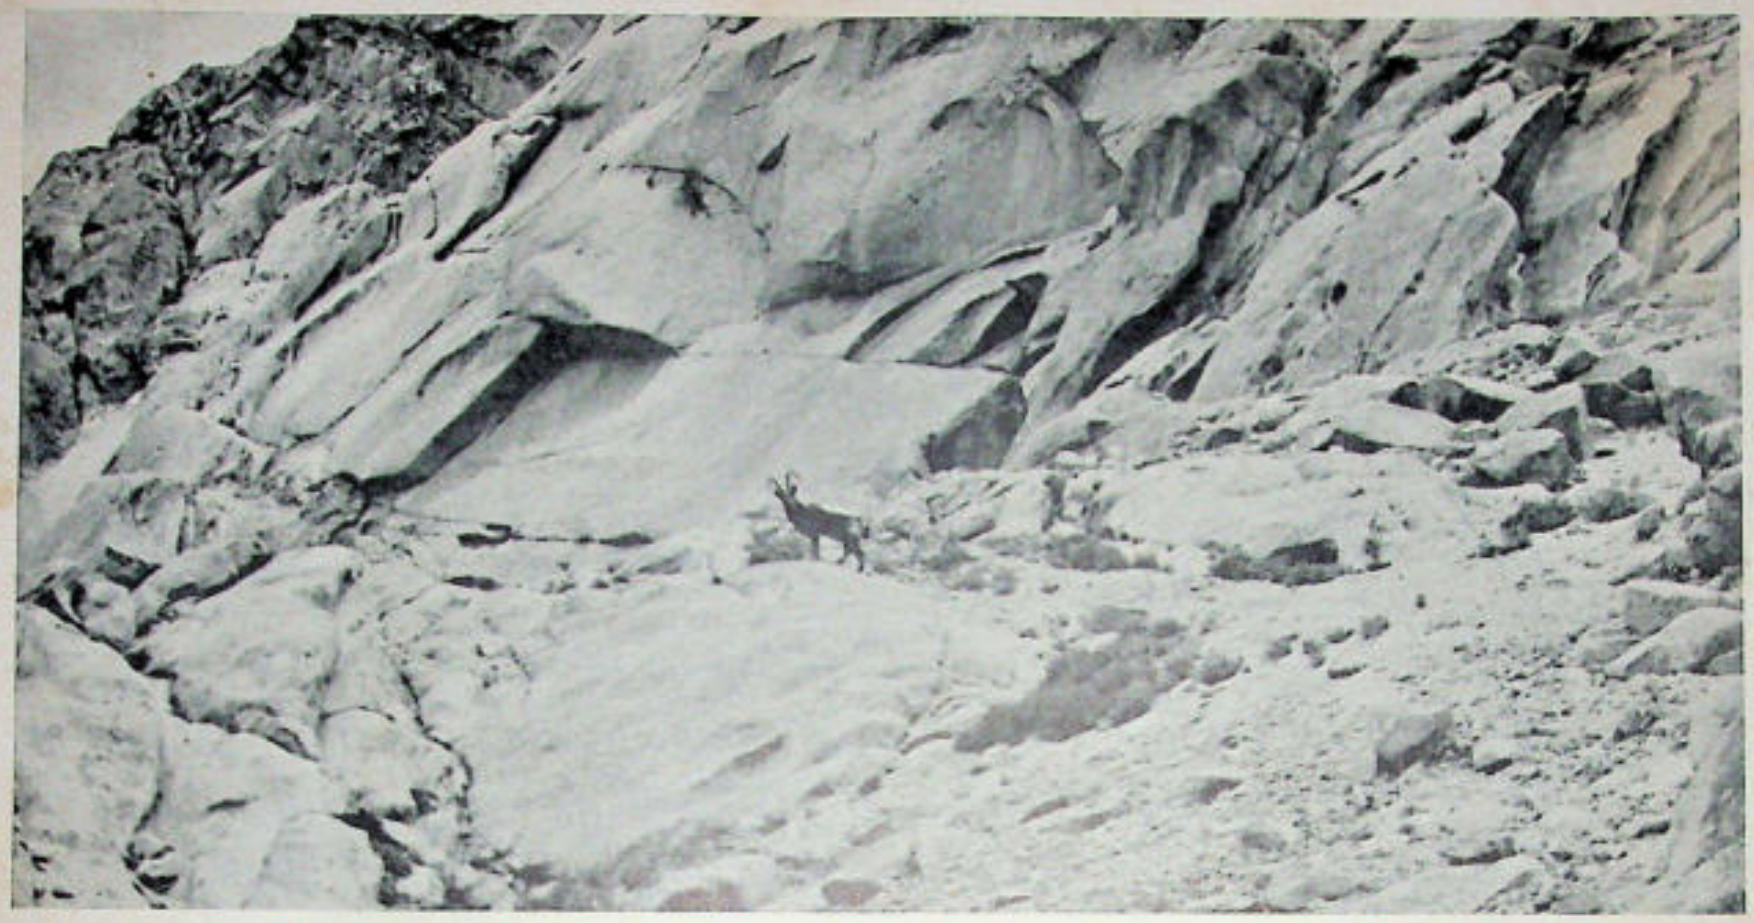
The produce group class followed. Three premiums of £2 each were offered to owners of the best group of three hunters not more than three years old and by the same sire. Groups were exhibited by Blue Charm, Border Minstrel and King Harald.

Saul, a bay gelding, by Despote out of La Belle Tapine (who was bred "over the border" and a winner over the fences both in Ireland and England) was the best four-year-old, followed by Niger, a brown gelding, by My Stars.

This class was followed by a most interesting parade of mares for breeding lent by the H.I.S. and private persons to breeders in Carmarthenshire. As they paraded, it was impossible to avoid the reflection that so many of our horses have been sold to foreign powers. Should war break out we should have immediately to purchase (largely from America) no fewer than 15,000 horses for an even greater number of yeomen. The horses are not bought and the men are not trained, while the real horsemen are becoming ditched in tanks in places where horses could gallop through.

The five-year-olds were a good class, and the best was Mars, a bay gelding, by My Stars. In the same class was Brown Jack, a brown gelding, by the same sire, who won the prize presented by the president, Dame Margaret Pryse-Rice, D.B.E.

WILD WOMAN (BY WILD FELLOW) WITH HER FOAL



In addition to being the Champion Brood Mare for the second year in succession, Wild Woman won the Gold Medal offered by the H.I.S. and Silver Challenge Cup presented by Mr. H. Dyke Dennis

The best light-weight hunter was Pat-a-Cake, but I thought the heavy-weights were, as a class, considerably better.

The heavy-weight awards went to Gabardine, O.K. and Jupiter—the latter two being sired by My Stars. I had rather expected that Kirtin, a bay gelding, by Kindred, would have secured some recognition.

There was a useful class for the best mare or gelding likely to make a polo pony. A good many of the entries seemed to me rather heavy for polo, however excellent as hunters in South Wales. However, the judges went for the type, and the class went to Easter Girl, by Brest, followed by a bay gelding by My Stars, and Dandy, a two-year-old chestnut gelding, by Silverdale.

Altogether it was a very excellent show, and one which could take place only in a country where the farmers take hunter breeding seriously. R.C.

A SHOOTABLE IBEX (PERHAPS 39 INCHES) IN LADAKH

SOME HIMALAYAN SHOOTS

MOST people think only of tiger and other jungle game in connection with shooting in India, but there is excellent stalking for magnificent heads in the Himalayas for the diminishing number of sportsmen who are prepared to walk.

The three most prized trophies (I am writing of horned game) are the markhor, the ibex and the Great Tibetan sheep, generally, but inaccurately, known as the ovis ammon. They all provide fine sport in beautiful country and a healthy climate to the man who has not lost the use of his legs.

The best place for ovis ammon is Ladakh, where shootable heads (38in.) are common, though good ones (44in. or over) are always difficult to find. Ammon heads nearly always have their points broken, and girth is really a better criterion than length in judging a head.

It is possible to do a Ladakh shoot in two months. This includes a visit to the Changchenmo, the only place in British territory where the graceful Tibetan antelope is found. But it involves really hard marching, 30 miles a day, so long as you can use ponies. Do not try double-marching with yaks; if pressed too hard, particularly in snow, they just lie down and die. The cost will be about Rs.1,800 (£135) from Rawalpindi if you are prepared to live hard. It is cheapest to go in late summer, for in the spring transport charges are higher. If you must go in spring, you can save about Rs.150 by sending as much baggage and stores as possible to Leh in the previous autumn. You can sleep in rest houses as far as Leh. Early in the year it is worth taking skis over the Zogi La.

Most authorities say that ammon are easier to find in the spring, when the snow keeps them low down; my own shikari, a man of great experience, prefers July and August, when he says that ammon graze on the new grass which is more plentiful on the lower slopes. Personally, I found ammon pretty high in April and May.

The game list of Ladakh also includes Tibetan antelope and gazelle, burrhel, sharpu and ibex; red bear can be shot on the way to Leh, and there is always the chance of a snow leopard.

It is impossible to imagine a finer holiday than a shoot in Ladakh; but it can be bitterly cold at any time of year. Ammon are usually found over 15,000ft., which makes it necessary to work as much as possible on horse-back. The hills are not steep, and there is no stiff climbing to be faced. Some of the lamaseries, especially Hemis, are worth a visit, though the odour of sanctity is a little overpowering; and the great salt lakes, such as the Tso Morari and the Pangong Tso are extraordinarily beautiful.

The biggest ibex are to be found in Baltistan, where a 45in. head is nothing remarkable. There are also good markhor there, both of the Astor and Gilgit varieties; but you have a better chance of a really fine head, say, 50 in., in Astor or Haramoah. Two months and Rs.1,400 should be ample for any of these shoots. The best time of year, especially for markhor, is undoubtedly the spring, before the melting snow allows them to retreat to their summer grazing grounds.

The surroundings are not so pleasant as in Ladakh, for you feel rather shut in among the great mountains. The climbing is much stiffer, but the shooting grounds are not normally high enough to trouble your breathing. There are no hardships comparable to those of Ladakh, for the climate is warm and villages with fresh supplies are plentiful. Resist the temptation to gorge yourself with apricots and mulberries, or you may pay for your gluttony with dysentery. Take lots of matches, quinine, aspirin and castor oil, which will be much appreciated in the villages.

A disadvantage of any shooting in Kashmir is the necessity of taking Kashmiri servants. Some are honest, but none are cheap. Your agent will try to make you take a shikari, a cook and three coolies; one coolie is quite enough, and I believe, though I have not proved it, that only a beginner need take a Kashmir shikari to Astor or Baltistan; anyway, the latter relies on the local shikari for information.

GREAT TIBETAN SHEEP (45 INCHES, WITH BROKEN HORNS)

TIBETAN ANTELOPE (24 INCHES) IN THE CHANGCHENMO

In Ladakh, however, a good shikari who knows the country and the language is absolutely essential, and the Ladakhi is generally useless. Your block is so big that you need someone who can take you straight to the most likely places. The trouble is that you cannot expect a "Special List Shikari" to rough it. Why should he?

Baluchistan is a most attractive shooting ground, and one much neglected. It is essentially a country for the fairly experienced shot, as good shikaris are rare and the heads such as appeal to the specialist in hill-shooting rather than the big game general practitioner. The game includes gud, Sind ibex, straight-horned markhor, Persian gazelle, and a few black bear and panther. I once saw there the fresh skin of an animal that was remarkably like a snow leopard.

The Sind ibex is found in the Kirthar Range, north of Karachi, and in the barren hills of Mekran. It cannot be described as pleasant shooting owing to the total lack of water in many of the best ibex haunts.

Gud, *alias* urial or sharpu, are found all over Baluchistan, and there are many good heads. In the Indian Officers' Club of the Zhob Militia there is one of 39in., and a 30in. head should not be hard to obtain.

Straight-horned markhor are probably the most difficult to bag of all hill game, but there is a better chance in Baluchistan than anywhere else. There are plenty of decent heads left of 28in. or over, but the ground they favour is very precipitous, the rock often rotten and crumbling. Moreover, constant persecution by Pathan hunters who spare neither youth nor sex has made them very cunning and, I think, more nocturnal in their habits than other varieties of markhor.

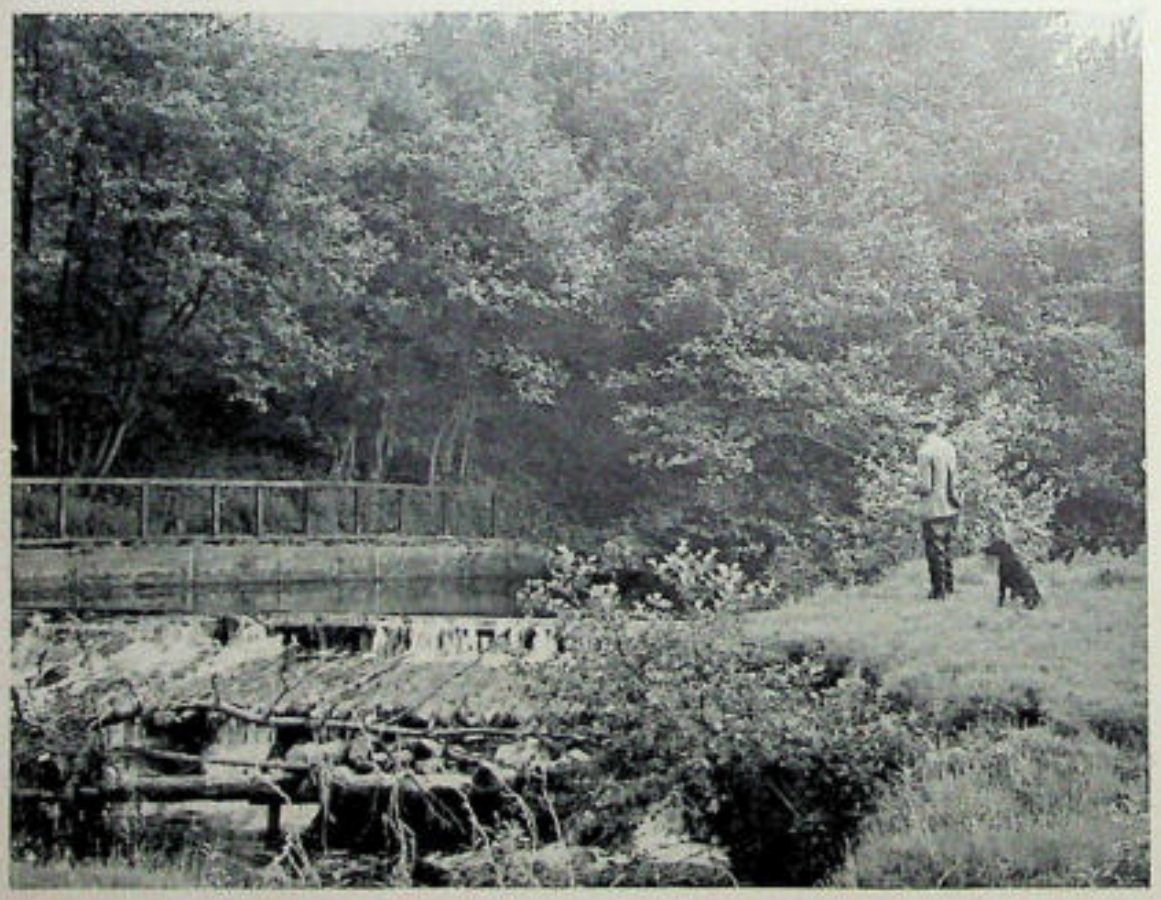
The most accessible places for them are the Zarghun, Takatu and Khalifut ranges near Quetta; I hear the actual Khalifut Reserve has, however, recently been closed. There are supposed to be good markhor on Gadiba, in the Loralai Agency; but there are also bad outlaws and permission to shoot there is seldom given. The Takht-i-Suliman is a famous place for markhor, but I think it has been rather shot out; a large escort of levies is necessary in that area, who are rather a nuisance when stalking.

There are certainly markhor in many other places; and a man with sufficient leisure and a knowledge of Pushtu could wander round collecting information of varying reliability from local levies and poachers. By a happy arrangement, the two positions are usually held by the same individual.

Shooting in Baluchistan is not possible in the hot weather, and is best in November. It is very cheap, as a lorry will take you to within two marches of anywhere you are allowed to go. Moreover, you can travel light, as a European can live and eat with Pathans without damage to his prestige or digestion; this would be quite impossible with Kashmiris. Your only essential baggage is your bedding, flour, tea, sugar, salt and a kettle. If you are caught by a snowstorm you are unlucky, but you can probably find a cave for shelter.

.318.

POINTERS FROM THREE INSTRUCTIVE TROUT



IN a former article I broke off an account of a September day on a certain chalk stream in order to discuss the first of three lessons received in the course of it. To deal with the other two I must go back to a run under my own bank that had survived the rank under-water growth of summer and the keeper's treatment of the weed above; and to the heartening moment when, having seen for nearly five hours nothing but nymphing fish, I found in it a file of three good trout confidently taking such duns as floated over them.

The three were well spaced out, so I began by attacking the lowest, though manifestly it was not the biggest of the file. This fish made little difficulty about accepting a blue upright. I hustled it downstream to some open water, but it was not to be wheedled into exhausting itself there. After a little straightforward fighting it sidestepped into a weed-patch, in which a few seconds later I felt it firmly stuck. In order to hold up water the weed last year had been very sparingly cut. This had two results—firstly, that it was almost impossible to prevent a hooked fish from going to weed; and secondly, that many of us by much practice gained confidence in the technique of dealing with it when weeded.

Probably most anglers are aware that a firmly-weeded fish has seized a mouthful of sturdy growth and is holding on to it desperately. To use violence now is to play its game. It has transferred the strain, and strong pressure will sooner or later either break the gut or pull away the hook. Let everything go slack. Retain only (to use the language of the riding school) a light feeling of the fish's mouth. Time is now on your side. The locking of its jaws interferes with its breathing. It is said that if you wait half an hour your trout will, of its own motion, emerge from its refuge and give itself up.

It may be so. Personally, after three or four minutes, I go in, unless the water is very deep—in which case I end, I suppose, by going in all the same. By that time the fish has not a kick left in it, and one can net it in the weed or, if one has to reach out, persuade it to the surface with the handle of the net.

I acted, successfully, on these lines. No. 3 of the file, 1lb. 9oz., was accounted for. Nos. 1 and 2 were still undisturbed.

A SHADY STRETCH ON CROGLIN WATER, A CUMBERLAND TRIBUTARY OF THE EDEN, WHICH IT JOINS JUST BELOW KIRKOSWALD

No. 2 proved a less accommodating fish in every way. It was wholly unimpressed by my blue upright. Nor, though I saw it eat at least two pale wateries, would it have anything to do with a Lock's fancy, even when presented on a 000 hook. Eventually it sucked down a badger quill—which I found a very popular fly last autumn—and, like No. 3, made a vigorous dash downstream; ending by forcing its way into the weed patch from which I had extracted No. 3 half an hour before.

At this point I went astray. No. 2 did not give the feeling of being firmly stuck. At the least pressure it continued to forge into the weed. I entered the water, which was too deep to be comfortable (I was fishing in shorts), and holding as hard as I dared, tried to prod it with the handle of my net. The holding and the prodding soon brought it to the top, but it came up far from exhausted. It splashed about vigorously. We were at too close quarters for give and take. The gut parted. This fish was an ounce or two over 2lb.

Here endeth the second lesson. It added a rider to what the experience of last year's droughty season established, to my satisfaction at least, as a sound rule of conduct. A weeded trout should be humoured and allowed to drown itself. *But wait until you feel that it has taken firm hold of the weed.* How you should act if it refuses to do this I am not prepared to say. Perhaps further experience will teach me. Perhaps another learner (for we are all learners) can tell me. Probably it is right to keep up modified pressure. Certainly the fish that harbours in weed without seizing it is no more likely to defeat itself than if it had hung you up in a snag—a much more serious danger than weed.

Anyhow, there is the rider. I imply, presumptuously perhaps, that the main problem has been solved. The rider draws attention to a supplementary point that calls for further consideration.

It now remained to attack trout No. 1. This fish was protected from the rear by a small bush which dipped over the sheathing into the water. It was necessary, therefore, to present the fly to it by the cast descriptively called the "Question Mark." There is a great fisherman of the Test who is said to be able to execute this cast 99 times in 100 attempts. I cannot even remotely approach this average. I just go on trying till it comes off. So it was some time before I had made a fair offer more than about half-a-dozen times. Then, in lifting the line off the water, I caught the bush. Some force was necessary to free the hook. The trout was certainly disturbed and ceased to rise. I waited a few minutes. It did not reappear. Irritated with myself for bungling first No. 2 and then No. 1, I passed on to look for another likely feeding place.

I wandered up for about a quarter-of-a-mile without finding employment. Time was getting on, and tea seemed an inviting prospect. My car was half-a-mile ahead. Home, by a short cut across the meadows, was half-a-mile behind. I decided, after hesitation, to walk home, intending to return presently to the further water on the chance of an evening rise. It chanced that the short cut passed close to the point of the bend where I had found my three rising fish. And there was No. 1, feeding industriously as when I first saw it. To cut a long story short, it was hooked, played and landed, and weighed 2lb. 5oz.

That was the third lesson of the day. Perhaps it would be better described as a refresher course; a reaffirmation of a rule that year after year we all break, though we should have known since infancy that it is absolute. The fish that gave the lesson was the best I killed during the back-end, and it was the victim of a combination of two accidents. I had definitely abandoned it; and it had later to meet a separate attack only because (1) I changed my plans and (2) the short cut by which I walked home happened to bring me again in sight of its feeding place. We cannot be told too often never to leave a worthy trout until it is quite certain that it has gone down permanently. I am constantly being told this, but never before have I been told so emphatically.

I will conclude this narrative, perhaps irrelevantly, by describing how the day was promoted to the red-letter class. The score at tea-time—one-and-a-half brace, 5lb. 3oz.—was nothing sensational. After tea I was delayed first by rain, then by a telephone call; and when I reached my water there was barely an hour of daylight left. Almost at once a few blue-winged olives began to come down, and for 20 minutes there was a strong rise. In that time, using a large orange quill, I added to the score another one-and-a-half brace—4lb. 9oz., the best trout weighing 1lb. 13oz. An easy success to crown a day of what was very like hard work. It is so often the other way about.

DISTOFFER.

A GROUSE SEASON OF EXTREMES

NOW that a good number of reports have been received it is possible to make some sort of a comparison between actual results and pre-season forecasts. In many districts the ravages of disease and other adverse factors have, as was expected, told their tale. However, there have been a few exceedingly good bags, and in Banffshire as many as 428 brace were killed in one day's driving on an estate where all the returns have been high since the Twelfth.

SCOTLAND

Aberdeen

BALLOGIE.—On the 14th, 111 brace of grouse were killed by seven guns: Sir George Abercrombie, General J. Hamilton, General H. P. Burn, Mr. H. M. Clowes, Mr. D. G. Cochran, Mr. P. E. H. Warner and Colonel R. J. Nicol. South wind and a good stock of birds.

BELSORNEY CASTLE (GRUEMOCK BEAT).—On the 14th, 95½ brace of grouse were killed by five guns: Sir Thomas Birkett, Captain H. L. Mathews, Captain E. Dangerfield, R.N., Commander Pinsent and Mr. J. A. Ingleby. Weather good, light southerly wind. Birds strong and healthy.

CASTLE FORBES.—On the 12th, 14th, 16th and 18th, 8½, 13, 25½ and 21½ brace of grouse were killed by four guns: Mr. M. H. Tetley, Mr. F. E. Tetley, Mr. I. B. Tetley and Mr. L. West. Birds very wild on first two days. Young birds very well grown but rather scarce on Bennachie. Some tick in evidence.

CLOVA.—On the 12th, 14th, 15th, 16th, 17th, 18th and 19th, 109½, 126, 86, 157, 112½, 48 and 125 brace of grouse were killed by six guns: Mr. E. Hubert Litchfield and Mr. William N. Beach, of New York, with four other American sportsmen. Birds are plentiful. No tick. No grouse disease. Birds healthy. Also heather. (764 brace in seven days.)

CORNDAVON.—Between 12th and 18th, 436 brace of grouse were killed by six guns: Sir Louis Pearson and party. Driving. No disease and birds well grown.

CORSE MOOR.—On the 12th, 25½ brace of grouse were shot by three guns: Colonel Pratt, Mr. Pratt and Major F. Savile. Sunny and very windy. Birds plentiful but wild. No disease. On August 14th the same guns shot 21 brace. Light rain.

CRAIG CASTLE.—On the 12th, 111½ brace of grouse were killed by six guns: Mr. John Paton, Captain A. Davidson, Mr. Donald Cameron of Lochiel, Captain Keith Caldwell, Miss Susan Vaughan Lee and Mrs. Vaughan Lee. Weather rough and showery. A good show of well-grown healthy birds. On the 14th, 108 brace were killed by Colonel M. G. Farquhar, Baron de Montclos, Mr. J. Paton, Captain Keith Caldwell, Miss Susan Vaughan Lee and Mrs. Vaughan Lee.

DESS.—On the 12th, 35½ brace of grouse, 2 woodcock, 1 snipe and 1 blue hare were killed by four guns: Mr. W. R. Davidson, Captain D. G. Davidson, Sir Malcolm Ramsay and Commander St. John. On the 14th, 18 brace were killed by the same party, with the exception of Sir Malcolm Ramsay, whose place was taken by Mr. Harvey Cochrane.

DESSET HOUSE.—On the 12th, 58 brace of grouse were killed by seven guns: Mr. David Wagstaff, Mr. R. T. Wagstaff, Mr. Charles Fellowes-Gordon, Mr. Ian Fellowes-Gordon, Mr. and Mrs. J. A. White and Dr. McKenzie. On the 14th, 103 brace of grouse were killed by seven guns: Mr. David Wagstaff, Mr. Charles Fellowes-Gordon, Mr. Ian Fellowes-Gordon, Mr. and Mrs. J. A. White, Mr. R. T. Wagstaff and Dr. Russell.

EDINGLASSIE.—On the 12th, 33 brace of grouse (short day walking); on the 14th, 134 brace (driving); on the 15th, 110 brace (driving); on the 16th, 103 brace (driving); on the 17th, 115½ brace (driving) were killed by seven guns: Colonel R. Abel Smith, Colonel Robin Buxton, Major L. Greenlees, the Hon. Robin Gordon, Captain D. Player, Mr. C. Pym and Mr. J. Fergusson. Captain A. Abel Smith also shot on the 14th. Weather perfect. Birds very forward and will probably be an average year.

FINDRACK.—On the 12th, on the Red Hill beat, 19½ brace of grouse; on the 14th, on the Stot Hill beat, 25 brace; on the 16th, on the Balnacraig Hill beat, 9 brace (half-day); and on the 18th, on the Benaghallie beat, 14 brace were killed by three guns: Major Wybrants and party, walking in line. Birds plentiful but wild.

FINDRACK.—On the 12th, 15th and 18th, 23½ brace of grouse were killed by two guns: Mr. J. Harvey Cochrane and Major Laidlay, walking in line, on the Clash Hill beat.

KNOCKESPOCH.—On the 12th, 42 brace of grouse, 19 hares, 25 rabbits and 2 pigeons were killed by six to nine guns: Lieutenant-Colonel Sir C. W. Miles, Bart., Captain L. C. P. Tudway, D.S.O., D.S.C., R.N., Major and Mrs. C. de Lisle Bush, Captain and Mrs. D. M. Wills, Mr. L. Temple-Richards, Mr. C. M. Wills, Miss E. Wills (latter three mornings only). Walking in line. Birds mainly well grown and coveys good, but probably less birds than last year. No disease, heather-beetle or tick.

LITTLEWOOD.—On the 15th, 177½ brace of grouse were killed by nine guns: Sir Alan McLean (proprietor), Lord Marchwood, Hon. P. M. Thesiger, Major-General Sir James Burnett of Leys, Bart., Colonel R. J. B. Yates, Mr. E. S. Hervey, Mr. Colin McLean, Mr. David C. H. McLean and Mr. Alastair McLean. Birds healthy and well grown. No disease. The bag is a record for the beat. On the 17th, 157 brace of grouse were killed by nine guns: Sir Alan McLean, Lord Marchwood, Colonel J. Barclay Milne, Mr. J. Paton, Mr. W. Bailey, Mr. Colin McLean, Mr. E. S. Hervey, Mr. D. C. H. McLean, Mr. Alastair McLean. No disease. Birds very plentiful and well grown. On the 19th, 106 brace of grouse were killed by six guns: Sir Alan McLean, Mr. W. Bailey, Mr. E. S. Hervey, Mr. Colin McLean, Mr. David C. H. McLean and Mr. Alastair McLean.

WARDHOUSE.—On the 12th, 8 brace of grouse were killed by two guns: Dr. E. S. Russell, Master Bruce Fellowes-Gordon. Walking up. A good show of birds, but extremely wild. On the 15th the same party killed 20 brace.

Angus

GLENAGIL.—On the 14th and 15th, 53 and 54½ brace of grouse respectively were killed by Lord Forres and party. Disease in spring did considerable damage. We only see about half the birds we would like to. Coveys are, however, large, and the young birds strong and very well grown. On the 14th, old young birds—45 per cent. old, 55 per cent. young. No bad birds, old or young, seen. In March April over 200 dead birds were picked up.

TULCHAN AND FORTAR.—On the 12th to 17th, 180 brace of grouse were killed by six guns: Lieutenant-Colonel R. G. Sharp and party, shooting over dogs. Birds wild and no disease.

Argyllshire (Isle of Islay)

KILDALTON CASTLE.—On the 12th and 14th, 12 and 23 brace of grouse were killed by two guns: Mr. Jack A. MacTaggart (tenant) Mr. Harry D. Boyd. Short day. Grouse plentiful, beyond average for same beat.

Ayrshire

ALTON ALBANY.—On the 12th, 12½ brace of grouse, 2 ducks and 3 hares were killed by two guns: Mr. W. R. Cuthbertson and Mr. A. L. Turner, walking up. Birds strong on wing and very wild.

SOUTHANNAN.—On the 12th, 40 brace of grouse were killed by nine guns: Mr. D. M. Boyle and party. Birds are plentiful, strong and healthy.

Banffshire

CABRACH.—On the 12th, 14th, 15th, 16th, 17th, 18th and 19th, 220½, 207, 180½, 285, 428, 182½ and 302 brace of grouse were killed by seven guns: Major Cayzer, General Hon. R. Brand, Captain W. Rumbery, Colonel A. Campbell, Captain C. Darby, Mr. Nicolas Cayzer and Mr. Stanley Cayzer. Birds plentiful and strong on the wing.

GLENFIDDICH AND BLACKWATER.—On the 12th, 83½ brace of grouse were killed by five guns: Captain A. Franklyn and party. Grouse plentiful and healthy; will drive better later when better bags are expected. No disease. On the 14th, 158 brace; on the 15th, 165½ brace; and on the 16th, 117 brace were killed by seven guns.

GLENLIVET.—On the 12th, 65½ brace of grouse were killed by Mr. S. F. Peshall and party (nine guns).

Caithness

STEATHROKE.—On the 12th, 32 brace of grouse were killed by two guns: Mr. A. Grant and Mr. W. N. Urwin. Shooting over dogs. Out for a few hours only owing to rain. On the 15th, 16th and 17th, the same guns had 40 brace, 33 brace and 35 brace respectively. Birds very strong and no sign of disease, though there was a prolonged drought from middle of April to end of June.

East Lothian

YESTER HOUSE.—On the 12th, 14th and 15th, 76, 65 and 115 brace of grouse were killed by five guns: Mr. Herbert A. Pratt, Mr. Garrard Winston, Mr. Morris Kellogg, Mr. George de Forest Lord and Mr. George de Forest Lord, jun. of New York. Best shooting of last four years. August 12th very high wind, hard shooting.

Elgin

CASTLE GRANT.—On the 12th, 104 brace of grouse, 8 snipe and 3 duck were shot by nine guns: Mrs. Chichester du Pont, Mr. and Mrs. James Mills, Mr. and Mrs. J. C. Rathborne, Sir Edward Chichester, Bart., Captain Percy Wallace, Mr. A. Choate and Mr. E. C. Cole. On the 14th, the same party had 130 brace and 40 hares. Birds very healthy and well grown.

Inverness-shire

ABERNETHY FOREST.—On the 12th, 44½ brace of grouse were killed by four guns: Sir Richard Holt, Mr. T. H. Naylor (alternately), Lord Henley, the Hon. A. P. Methuen and D. T. Raikes. Indifferent day, a little drizzle in the morning. Stock of birds just about an average.

AVIEMORE.—On the 12th, 10 brace of grouse, 2 hares and 1 snipe were killed by three guns: Lieutenant-Colonel R. Lumsden, Miss Anne Lumsden and Master Ian Lumsden. Shooting over setters. Birds in good condition and well grown. No disease and heather promises well.

BALNESPICK.—On the 16th and 19th, 90 and 68½ brace of grouse were killed by nine and eight guns respectively: Mr. W. H. and Dr. G. B. Fleming and party. Birds strong. No disease.

BUNTAIT BEARNOCH.—On the 14th, 10½ brace of grouse were killed by three guns: Colonel H. MacMicking, Mr. R. Monteith and Mr. Donald Cape. Birds strong, wild. A wet day spent walking up. On the 15th, 13½ brace of grouse and 2 hares were killed by four guns, same party as above and Major Stewart-Cape.

CATLODGE.—On the 12th, 26 brace of grouse were killed by four guns: Captain W. G. Tennant, R.N., Mr. C. H. Ashrolus, R.A., Mr. W. A. M. Miller, R.H.A. and Paymaster-Captain G. A. Miller, R.N. Coveys variable but well grown. No disease.

CLAVA.—On the 15th, 58½ brace of grouse and 22 hares were killed by seven guns on the low moor: Colonel H. Wilkinson, Captain C. Mackintosh-Walker, Major R. H. Allenby, Major G. P. Miller, Mr. R. Raybor, Mr. R. Dill and Mr. J. G. Murray. On the 16th, on the high moor, 53 brace of grouse, 37 hares and 1 golden plover were killed by seven guns: Colonel H. Wilkinson, Major R. H. Allenby, Captain Black, Captain C. Mackintosh-Walker, Mr. R. Taylor, R. Dill and Mr. J. G. Murray. Birds strong and wild. Weather fine with wind.

CORRYBROUGH.—On the 17th, 218½ brace of grouse were killed by ten guns: Sir William Malkin and party. This looks like another really good season. The above bag is a record for the moor.

CULACH.—On the 15th, 43 brace of grouse were killed by five guns: Sir John T. Cargill, Mr. Ronald Greenlees, Mr. R. T. Neilson, Mr. George C. Todd, Mr. D. Cargill Todd. Shooting over dogs. Again a very disappointing show of birds. Long stretches without a bird. For some inexplainable reason the birds have evidently left the ground meantime. Any amount of signs of birds.

DALWHINNIE.—On the 12th, 25½ brace of grouse; on the 14th, 42 brace; and on the 16th, 32 brace were killed by three guns: Colonel T. C. Dunlop, Colonel E. B. Maxwell, Colonel W. Clutterbuck. Good coveys. Birds well grown and wild.

DUNMAGLASS.—On the 12th, 43 brace of grouse were killed by six guns: Major Casey, Wing-Commander Fielden, Captain A. Black, Dr. J. Bellby, Miss N. Barber, Major Barber. Grouse scarce and many cheepers; expect season to be well below average. Heather excellent.

ESKADALE.—On the 12th, 18½ brace of grouse were killed by three guns over dogs: Colonel F. H. Hancock, Mr. A. M. B. Buxton and Mr. E. R. W. Robinson. Considerably fewer birds seen in this ground than last season. Coveys very variable both as to number and size of birds. On the 17th, 34½ brace of grouse were killed by two guns: Colonel F. H. Hancock and Mr. A. M. Buxton, shooting over dogs. Birds were scarce on the lower ground but much more plentiful on the higher ground. Coveys averaged about eight birds, and were quite well grown.

LEACHIN AND CUAICH.—On the 12th, 80½ brace of grouse were killed by six guns: Sir John T. Cargill, Dr. and Mrs. Greenlees, Mr. Ronald Greenlees, Mr. R. T. Neilson and Mr. I. I. Murray. Shooting over dogs. A final show of strong, healthy birds, but fairly wild, many coveys rising far out of shot. No rain and a fine fresh day for walking. On the 14th, 50 brace of grouse were killed by the same party. Shooting again over dogs. A very disappointing show of birds. They must have left the ground as they were there earlier in the season. Good strong, healthy birds as a whole, but a few "cheepers."

LEYS CASTLE MOORS.—On the 12th, 47 brace of grouse and 7 snipe were killed by five guns: Mr. Francis W. Walker of Leys, Mr. Donald Walker, Mr. K. W. Walker, Mr. A. Sutherland and Major D. Ross. After a good deal of rain overnight the day opened rather dull but brightened later. One or two showers occurred during the day, but the sport was good and birds numerous, although very wild. Four guns were out in the morning and a fifth joined the party after lunch. The bag was obtained walking in line.

NESS CASTLE MOOR.—On the 16th, 3½ brace of grouse were killed by one gun: Mr. Lewis Upton Way.

RALIA.—On the 14th, 66½ brace of grouse were killed by six guns: Colonel Walker, Colonel McMullen, Mr. C. A. Hingston, Mr. K. V. McCraith, Mr. C. Chadburn and Mr. H. D. Snook. Windy, birds healthy and better show than for several years.

STRATHMASHIE.—On the 12th, 12½ brace of grouse were killed by three guns: Mr. Clouston, Dr. Clouston and Mrs. Eden. Birds very wild and scarce. Very wet day.

STEUV.—On the 12th, 39½ brace of grouse were killed by three guns: Mr. R. Frank Spencer-Nairn, Captain R. Richards and Captain A. Dunlop. On the 15th, 42½ brace of grouse were killed, Mr. Sealey Newell taking the place of Captain Richards.

TOMATIN HOUSE.—On the 12th, 214½ brace of grouse were killed by eight guns: General Hamilton of Skene, Major Keith Purvis-Russell-Montgomery, Captain Roper-Caldbeck, Captain G. A. Barnett, Captain M. Melvill, Mr. Fleming, Mr. Rose and Colonel R. A. Balloch. Birds plentiful and well grown.

Kincardineshire

GLENSAUGH.—On the 12th, 39 brace of grouse were killed by Mr. H. G. Beazley and party.

Morayshire

REVACK.—On the 17th, 162½ brace of grouse were killed by eight guns: Mr. Reginald Abel Smith, Mr. H. Pilkington, Mr. H. de Zoete, the Hon. G. Gibbs, Mr. S. R. Allsopp, Major J. H. Drake, Mr. J. Buxton and Mr. E. Hayne. On the 18th, 66 brace of grouse were killed by same party. On the 19th, 85½ brace of grouse were killed by nine guns: Mr. Reginald Abel Smith, Mr. H. C. Pilkington, Mr. H. de Zoete, the Hon. G. Gibbs, Mr. S. R. Allsopp, Major J. H. Drake, Mr. J. Buxton, Colonel C. Norman and Mr. C. Barclay.

Peeblesshire

GLEN.—On the 12th, 140½ brace of grouse were killed by seven guns: A. F. Pillot, Eugene Du Pont, Wm. W. Hoffman, George Meyer, Thos. Eastman, Gerald Livingston and Jules Noyes. Fair year, no disease, no ticks, large percentage of young birds killed. Keeper reports large number of late hatches.

NORTH SLIPPERFIELD.—On the 14th, 191 brace of grouse were killed by six guns: Mr. A. H. Bruce, Lieutenant-Colonel A. V. Holt, Major T. Banken, Mr. Arthur Young, Mr. David Sutherland and Lieutenant-Colonel Arthur Sutherland. Fewer birds than last year. Damage by the heather beetle shows no sign of decreasing.

Perthshire

ARGATY AND THE KING'S LUNGIES.—On the 15th, 34 brace of grouse and 16 blue hares were killed by six guns: Mr. D. C. Bowser, Mr. H. C. H. Bowser, Mr. D. S. Bowser, Mr. H. F. Bowser, Mr. P. H. Dickson and Mr. W. McNain Smaldon. Birds very plentiful and sitting well. Large well-grown coveys.

AUCHESSAN.—On the 14th, 21 brace of grouse were killed by two guns: Mr. S. Poynte Wright and Captain R. V. Garton, shooting over dogs. Looks like a fair average season. Birds fairly plentiful, coveys good in numbers, but birds very forward and wild. No sign of disease. Heather very good. On the 18th, 28 brace of grouse were killed by three guns: Mr. S. Poynte-Wright, Major J. A. Garton and Captain R. V. Garton. Shooting over dogs.

AUCHLYNE.—On the 12th, 45 brace of grouse; on the 14th, 42 brace of grouse; on the 15th, 35 brace of grouse; and on the 16th, 59 brace of grouse were killed by six guns: Colonel and Mrs. Crabbe, Mrs. Cunningham-Jardine, Colonel Roper-Vere, Colonel Stephenson and Major J. Johnstone. Walking. Average show of birds. No sign of disease.

BLAIRMOYLE.—On the 12th, 32½ brace of grouse were killed by four guns: Mr. George Crabbe, Mr. Patrick Crabbe, Mr. Willie Crabbie and Mr. M. G. Frank. Lovely day for walking. Birds very wild, but plenty of them.

CLUNY.—On the 12th, 42½ brace of grouse were killed by three guns: Mr. G. A. D. MacDonell, Mr. Angus MacDonald and Mr. Colin MacDonald. Fine day, rather high wind. Birds strong and wild.

CORRIEARKIE DALWHINNIE.—On the 12th, 14th and 15th, 41½ 42 and 33 brace of grouse were killed by two guns: Mr. John Mason and Mr. Guy Farquhar. Plenty of strong healthy coveys. No signs of disease. More could have been got, but birds were inclined to be wild owing to previous wet weather.

CROSSMOUNT, KINLOCH-RANNOCH.—On the 12th, 14th and 18th, 38, 29 and 20½ brace of grouse respectively were killed by three guns: Mr. Ivan Wright, Mr. E. L. Sackling and Mr. R. F. Wright. Birds strong and wild. No disease.

DOUSE LODGE MOOR.—On the 12th, 34 brace of grouse were killed by three guns: Colonel Ian Bain-Murdoch, Mr. Iain Monerieffe and Sir A. K. Muir. The moor has suffered for the last three years from a bad attack of heather-beetle and is now recovering.

DUNALASTAIR.—On the 12th, 84½ brace of grouse were killed by six guns; on the 14th, 129½ brace (six guns); on the 15th, 79½ brace (five guns); on the 17th, 73 brace (three guns); on the 18th 60½ brace (three guns). These bags were obtained walking up, and the following guns were included: Captain J. de Sales La Terriere, the Hon. C. Douglas, Sir R. Graham, V.C., Captain J. Burns, Mr. G. Burns and Mr. Nunneley.

EAST GLENTURRET.—On the 15th, 139 brace of grouse were killed by eight guns: Mr. H. S. Latilla and party. Shooting over low beat. Birds seen more plentiful on this beat than for some years past. Very well grown.

GLENSAMOND.—On the 12th, 45 brace of grouse were killed by eight guns: Mr. and Mrs. A. Smith-Bingham, Colonel Galbraith, Major P. Dollar, Captain Tennyne, Captain Stocks, Captain the Hon. Arthur Baillie and Mr. F. Stanley-Clarke. Birds healthy and strong; very high wind. Sitting very close. On the 14th, same guns killed 75 brace. Very hot and sultry. Birds not getting up.

GLENARTNEY.—On the 12th, 123 brace of grouse were killed by eight guns: Mr. H. G. Latilla, Colonel R. Stewart-Menzies, Colonel F. Johnson, Captain W. M. Clarke, Captain R. Clarke, Major G. Neilson, E. Mayo and Miss G. Neilson. Birds plentiful and forward. Good proportion young birds. Stags very forward.—On the 14th, 104 brace: on the 16th, 112½ brace; on the 17th, 92 brace.

INVERTEDDSACHS.—On the 12th and 14th, 54 and 64½ brace of grouse respectively were killed by eight guns. Birds were uniformly strong and healthy; no cheepers. Coveys averaged seven birds at least. Heather in splendid condition, no sign of beetle, which was troublesome in 1935 and 1936. No disease.

KINLOCH.—On the 14th, 265½ brace of grouse were killed by five guns: Mr. Pulitzer, Miss Grace Amory, Duke of Marlborough, Mr. Scrope and Mr. Cobold.

LASSINTULLICH.—On the 12th and 14th, 54 and 34½ brace of grouse respectively were killed by two guns: Mr. J. B. Minshull and A. N. Forman. Birds healthy and strong. Very wild. Walking up. Weather, high gusty wind.

LAWERS.—On the 14th, Dunira home beat, 64 brace; on the 16th, Dunira, Ballindalloch, 105 brace; and on the 18th, Carriglen, 125 brace of grouse were killed by seven guns: Mr. S. A. Courtauld, Major A. M. Tabor, Major Colvin Watson, Mr. R. S. Tuke, Mr. J. Tabor, Colonel W. H. Lewis, and Mr. W. P. Courtauld. Birds plentiful. Weather and heather good and strong.

LUDE.—From the 12th to 19th, 143 brace of grouse and 28 snipe were killed by four or five guns: Mr. W. G. Gordon's party. Four days, three half days. Walking up. Big coveys very wild. Ground very patchy.

ORCHIL.—On the 14th, 16½ brace of grouse, 2 snipe and 1 woodpigeon were killed by four guns: Colonel R. G. Dawson, Mr. Peter Dawson, Mr. J. M. A. J. Dawson and Captain A. T. Dawson. Fine weather. Birds very wild during morning. Sat well during afternoon.

RIEMORE.—On the 14th, 21½ brace of grouse were killed by four guns: the Hon. Bernard Bruce, Mr. Ian Ogilvy, Mr. Roger Sandford and Mr. Michael Lyle. Walking up. It looks as if the bag were going to be below average for no obvious reason. Few coveys on certain parts of moor; other parts quite well stocked. No disease.

TULLYBELTON.—On the 12th, 19 brace of grouse were killed by five guns: Colonel Yeoy Holt, Major H. F. K. Wedderburn, Mrs. Richard Mack, Captain J. FitzPatrick Lewis and Mr. G. Hay-Drummond. Walking up. Birds healthy but very wild, especially in the afternoon, when several large coveys were seen. Prospects good. Small moor.

Renfrewshire

MUIRSHIEL, LOCHWINNOCH.—On the 14th, 107 brace of grouse and 13 hares were killed by eight guns: Lord Howard of Glossop, the Hon. Miles Fitzalan-Howard, the Hon. Michael Fitzalan-Howard, the Hon. Martin Fitzalan-Howard, the Earl of Macclesfield, Lord Cornwallis, Major Gregory-Hood and Mr. G. Gwyer. A good stock of birds especially on the high ground, which are well grown and healthy.

Ross and Cromarty

GLEN CALVIE.—On the 12th, 7½ brace of grouse were killed by two guns: Mr. N. E. McLean and Mr. Gillian McLean. Very wet. Shot for two hours in afternoon. On the 15th, 21½ brace were killed by two guns: Mr. Gillian McLean and Mr. Miklos de Kiss. Out in afternoon only. Coveys large and well grown.

KINCARDINE, ARDGAY.—Between the 12th and 17th, Colonel Sir Henry MacGeagh, Major Robert Allen, General Sir Alexander Wardrop and Mr. Graham Ling had 71½ brace of grouse over dogs in three-and-a-half days. An improvement over last year. No signs of heather-beetle or disease, but birds still patchy although strong and some good coveys.

LEDGOWAN.—On the 12th (afternoon only), eight brace of grouse, and on the 15th, 17 brace were killed by three guns: Lord Latymer, the Hon. Thomas Money-Coutts and the Hon. Alick Money-Coutts. A very bad season. The drought of May and June killed most of the young birds. Shooting over dogs.

TULLOCH.—On the 15th, 55½ brace of grouse were killed by six guns: Lord Forester, Sir John Dick-Lauder, Mr. Bankes, Mr. Reid, Mr. Gascoigne and Mr. A. Mackenzie. Birds plentiful but very wild. Shooting over dogs.

Sutherland

KILDONAN.—On the 12th, 41 brace of grouse were killed by three guns, shooting in the afternoon. On the 14th, 31 brace of grouse were killed by four guns: Sir Richard Guy, Mr. R. M. Mortimer, Mr. F. E. Bull and Mr. H. E. B. Abbey. On the 15th the same party killed 40 brace, on the 16th 36½ brace, on the 17th 56½ brace, and on the 18th 54½ brace.

ENGLAND AND WALES

Cumberland

BRACKEN BANK.—On the 14th, 94½ brace of grouse were killed on Sally Grain and Wellhope, on the 15th 41 brace on Crossgill, on the 16th 101 brace on Barnhope, on the 19th 61 brace on Kilhope, and 50 brace on Priorsdale by eight guns: Mr. A. Mathias, Mr. A. C. Shepherd, Mr. G. Cathcart-Walker-Heneage, Mr. S. Robinson, and Mr. Dowe, the Hon. Cary Batling, Colonel Williams and Captain Roberts-George. Also Colonel Baxter, Mr. Baer, Mr. F. and Mr. A. Baxter and Colonel Whitefoord, walking-up, have killed from 11 to 16 brace a day. Birds plentiful forward and strong.

Denbighshire

LLANARMON.—On the 12th, 101½ brace of grouse, 1 snipe, 1 pigeon, and 1 various were killed by seven guns: General Sir Edmund Ironside, General Sir Henry Jackson, Major Douglas Jones, Captain D. M. Ritchie, Mr. W. E. Rootes, Mr. F. O. G. Lloyd and Sir Alfred McAlpine. Birds were strong and healthy.

GREAT SOCIAL CLUBS—VIII.

ARMY AND NAVY

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

THE Army and Navy Club, commonly known as the "Rag," was the third of the Service Clubs to be formed, with the exception of the Guards' Family Club, which was founded in 1813. Both its predecessors, the United Service and the Junior United Service, had been doing very well, and yet there was still obvious scope for a third club. Accordingly certain Army officers approached Lieutenant-General Sir Edmund Barnes, G.C.B., a former Commander-in-Chief in India, and, having secured his sympathy to their project, it was decided to found a club to be named the Army Club, and to restrict the membership to all officers on full or half pay of Her Majesty's Army.

The next step was to secure the approval of the great Duke of Wellington. He refused, however, to give it unless the club was open to officers of the Royal Navy and Marines. What the Duke said was law and the projectors fell into line with his views. By August, 1837 a sufficient number of original members having been selected, a meeting was held on the 28th of that month for the purpose of electing a committee of management and to settle on rules and regulations, Sir Edmund Barnes being in the chair. This date marks the foundation of the club. Quite early in 1838 the Club was able to find its first house. This was No. 1, King Street, situated at the north corner of King Street and St. James's Square. The house had just been vacated by the Oxford and Cambridge Club, who were about to move into their new building in Pall Mall. No. 1, King Street had originally been part of a much larger mansion owned by the Earls of Halifax.

The first general meeting of the Club was held in this house on April 2nd, 1838, and Admiral Sir Philip Durham was appointed chairman of the committee in place of their founder, Sir Edmund Barnes, who had died shortly after the Club had moved in. At this meeting it was decided that the membership should be limited to 1,000, and that the entrance fee should be 15 guineas. The following year this was raised to 20 guineas, with a subscription of 5 guineas. Six years later it was raised again to 25 guineas, and the subscription to 6 guineas. Strict rules against gambling in any form had been passed, and no smoking was to be allowed in the house. Seven years after its foundation, the membership had reached 1,358, the great majority of these being junior officers.

The story of how the Club acquired the name of the "Rag" has often been told, but it must be repeated here for the benefit of anyone who has not heard it. This name originated from the remark of a certain Captain Duff, a member of the Club. Duff was one of the wild spirits who frequented the haunts of those who led the night life of London of those days. He had been in a number of regiments, and at the time he joined the Club appears to have belonged to the 10th Light Dragoons.

The story goes that one night Duff, in the course of his nocturnal rounds, entered the Club very late and called for supper. When the bill of fare was shown him he declared that it was so meagre that it was a rag and famish affair. At that time one of the worst and most disreputable gaming-houses in London was called "The Rag and Famish." It was situated in a turning off Cranbourne Alley. The name seemed to appeal to the members, possibly for a very good reason, and it has stuck to the Club ever since. Duff himself was so pleased about suddenly becoming famous in this way that he designed a Club button—a picture of a starving man gnawing a bone—and this button was worn on the Club uniform coat for some years.

By 1846 the number of members had become too large for their King Street house, and the committee, who had been for some time looking for a house to build on, bought the freeholds of No. 20, St. James's Square, No. 3, George Street and Nos. 36, 37, 38 and 39 Pall Mall. This cost them, with expenses, £50,000 odd, the greater part of this money being raised by an issue of debentures. It is here where we must dispel with deep regret the long-standing illusion that the members of the "Rag" ever sit where once the beautiful Nell Gwynne sat. The author of the *Army and Navy Club*, 1837–1933, has furnished the most convincing documentary proof that Nell Gwynne never inhabited any one of the houses bought by the Club in 1846. There appears to be no doubt that this famous lady lived in the house on the south side of Pall Mall, which is nearly opposite the Pall Mall entrance to the Club. And that is the nearest we can get to her. For those, however, who set store by these things there is some small consolation. Another of Charles II ladies, Moll Davis, actress, singer and dancer, and a rival of Nell Gwynne, did live at No. 20, St. James's Square from 1676 to 1687. For this we must at least be thankful, as Moll Davis did mightily please Pepys, the great authority on the ladies of those days, both when dancing a jig in boy's clothes and also when clad as a shepherdess. Illusions die hard, and this one is fostered no doubt by the fact that the Club possesses two portraits of the beautiful Nell by, or attributed to, Lely.

To return to the project of the new building, after numerous designs had been submitted and rejected, the architects chosen to carry it out were Messrs. Parnell & Smith, and the foundation stone was laid on May 6th, 1848. For the ground and first floors the architects had selected as their model the Palazzo Cornaro, on the Grand Canal, Venice, which had been built by Sansovino in 1552; the upper story was modelled on the lines of the Library of St. Mark. At the end of 1850 the house was ready for occupation, and had cost altogether, with the purchase of the site, over £116,000. Fortunately, as regards paying for this, the Club was doing very well and had 1,000 members and a long waiting list. Now that the house was up, its architecture came in for the usual criticism. To those people who had grown accustomed to the earlier and more modest domestic architecture of the small St. James's Street clubs, it is not surprising that they were able to find things they could complain about. But they might as well have compared Blenheim or Castle Howard to a Cotswold manor house, and could they have lived to see what is put up and pulled down in these days, perhaps they would not have been so difficult to please.

However, all the critics were not hostile. One writer, after dilating on the magnificence of the palaces in Pall Mall and describing the new "Rag" house as the best of the lot, goes on to complain "that the fashionable clubs, the aristocratic clubs, do nothing for the general aspect of London, and have made no move in a direction where they ought to have been first. Can anything be more paltry than that bay window from which the members of White's contemplate the cabstand and the Wellington Tavern? And yet a better management might make that house worthy of its unparalleled situation, and if it were extended to Piccadilly, it would be the first thing of its kind in Europe." The writer, of course, misses the point; the Service Clubs having five times the number of members that the clubs he refers to have. Both classes of clubs have the houses that suit them, and we must devoutly hope that the small clubs in St. James's Street will remain as they are.

Very little alteration was made in the work of the original architects, as regards the interior of the club house, until the great rebuilding scheme of 1926, except that some time earlier, a smoking-room had been added to the ground floor. Before then, this space had been occupied by the visitors' dining-room, and beyond it was the house dining-room.

The original conception of the library had been to make it cover the whole length of the Pall Mall front, but the design was subsequently altered so as to provide for space out of it for a Members' dining-room. During the time when the Emperor Napoleon III was an exile in England and lived at 3, King Street in 1847 and 1848, he was made an honorary visitor and honorary member of the Club, and made considerable use of his privileges. After returning to France and becoming President of the French Republic, he presented the Club with a valuable piece of Gobelins tapestry—the Festival of Pales, after Suvée. By 1862, the "Rag" was in a very flourishing condition; the membership had reached two thousand, and they were in a position to impose an entrance fee of £40. It was about that period when the house dining-room and visitors' dining-room were converted into a smoking-room.

There would appear to have been ample justification for this, seeing that the receipts for cigars, which in 1841 had been £89 11s., had risen by 1862 to £1,573 7s. 11d. As the long peaceful years drew on the Club continued to consolidate its position, and when we reached the never-forgotten date of 1914, it was well provided with the necessary funds and membership to withstand most shocks. Naturally, in the early part of the Great War the Club experienced many anxieties as to its future well-being, but eventually it came through these four difficult years satisfactorily, and in December, 1918, the membership totalled 2,520.

Feeling safe now as regards the future, in 1919, they bought three more houses in Pall Mall for the purpose of building a ladies' restaurant, more bedrooms and generally extending the Club's premises. The price of these houses was £56,000. Nothing, however, was done with the houses until 1924, when, having bought yet another one in Pall Mall, the most extensive additions and alterations were decided on. These were to include, apart from the new bedrooms, squash court and ladies' restaurant on the Pall Mall sites, a new smoking-room in the old house and various alterations to the rooms on all these floors. The total cost of all this amounted to £167,471 1s. and the whole was not finished before March, 1927, having started in January, 1925. Certainly the members of the "Rag" cannot be accused of being frightened of spending money, as in major operations alone they have had to find nearly £350,000 since the Club's foundation. Many years ago now, when men had more time and inclination to talk about clubs, in these far-off peaceful days when

> "Nor war, nor battle's sound
> Was heard the world around"

any conversation on the comparison of the rival merits of the three great Service Clubs invariably ended with someone remarking, the great thing about the "Rag" is that the house is their own. Yes, long before the slogan started, "Buy your own home and be happy," the "Rag" had done it. Having finished their extensive new improvements, the members had only a short time to enjoy them before the great slump started—a far more devastating factor in club life to contend with than any war. Difficulties now began to be experienced, as in all other clubs, as regards keeping up the membership. A bold decision was finally come to. It was to suspend the entrance fee, and to reduce the subscription for country and overseas members. The result proved completely successful and the Club has gone on from strength to strength ever since.

The Club contains many good oil paintings of famous admirals and generals. The majority of these adorn the lofty walls of the fine coffee-room looking out on to St. James's Square.

In the smoking-room is the much discussed "Head of a Woman," attributed to Greuze, and "Nell Gwynne," by Sir Peter Lely. Under her picture on the chimneypiece rests her silver fruit knife of the date 1680. Probably the best portrait in the room is that of Mary of Modena, by Simeon Verelst. On the principle, one must imagine, that one cannot have enough of a good thing, the portrait was for long supposed to again represent Nell Gwynne.

The small Nelson Room contains much of interest and more of the Club's patron saint. Inset in the overmantel of a fine chimneypiece of Carrara marble is a mirror. On the marble underneath are sculptured the words, "Glass of Nell Gwynne." Beside it hangs an engraving of the lady after Peter Lely. Her rivals in this room are Nelson's Lady Hamilton (a fine miniature) and Madame Davis (engraving). In a case are to be seen some very old lists of the senior serving officers in the Navy and Army, and the Club's Roll of Honour book. Another exhibit of note in the room is an autograph letter of Nelson written from the Albemarle, New York, dated November 14th, 1782. His letter is in reply to a request from a friend asking him to exert his influence on behalf of someone. Nelson expresses his willingness to do so, adding, "My interest at Home, you know, is next to nothing, the name of Nelson being little known. It may be different one of these days; a good chance only is wanting to make it so."

Space does not permit of any further mention of the large collection of pictures, tapestry and statuary now in the possession of the Club.

The establishment of the Club is at present 2,400 members, excluding those on the foreign lists, and the club is in the happy position of being full up, with a waiting list for candidates.

[We greatly regret that we were not able to illustrate this article.—ED.]

HUNTING TROPHIES

During the coming season members of established Pony Clubs will be able to have their trophies mounted by Messrs. Rowland Ward at a reduced price representing a 15 per cent. reduction on the normal charges.

There is a special offer whereby the mask, accompanied by the best essay describing the kill, will be mounted free of charge. These essays will be judged at the end of the hunting season by the Hunting Editor of the *Field*, and, subject to sufficient merit, the best account will be published.

Any mask which is sent in for this competition will be charged for at the special rate, and must be vouched for as having been presented to a genuine member of the Pony Club in question. On completion of judging, the amount paid will be refunded to the winner. Each essay should be accompanied by a note guaranteeing that it is the member's own work.

Further particulars may be obtained from Rowland Ward, Ltd., 166, Piccadilly, London, W. 1.

THE RIVAL SIX-METRE HELMSMEN
Mr. Rolf Svimdal and Mr. J. H. Thom

THE SEAWANHAKA CUP DUELS

By K. ADLARD COLES and TERENCE STOCKEN

HELD this year on the Clyde, the Seawanhaka Cup races have provided some exciting moments, and—caused by an untimely succession of calms—some disappointments: the former, however, predominating.

The British defender, Circe, owned by Mr. J. H. Thom, was, of course, the winner of the previous series, held last year in the U.S., when the British challenger, as she then was, took the trophy away from Goose, the American champion.

It does not necessarily fall to the winner of the previous contest to defend the Cup the following year, although the races are always held in the home waters of the cupholder; and there was keen rivalry last month between the three leading Clyde Sixes—Circe, Erica (Mr. R. M. Teacher) and Johan (Messrs. W. B. and N. P. Donaldson), for the honour.

The preliminary trials left the decision still in doubt, each boat showing little superiority over the other when every point of sailing was taken into account, Erica, perhaps, having slightly the better of things in ghosting conditions. The selection was postponed until 48 hours before the Seawanhaka championships began, and Circe was then chosen to defend the Cup. She was fairly generally regarded as the right choice, in view of the constantly winning form she has shown during the season, but the closeness of the running and the difficulty of making a final decision shows the extremely high level of general merit which the Clyde Sixes have reached.

The challenger was the Norwegian Six, Noreg III, part-owned by the Crown Prince Olaf of Norway, but entered in the name of Mr. Rolf Svimdal, challenging on behalf of the Royal Norwegian Yacht Club; Circe defending in the name of the Royal Northern Y.C. Noreg III was built and designed by Anker & Jensen, of Oslo, and is a new boat this year; the defender was built by Robertson & Sons of Sandbank, designed by David Boyd of the same firm, and dates from 1937. The Norwegian boat has swept all before her since she appeared in Scandinavian waters, amongst her successes being the coveted One-ton Cup, so that Circe was up against the very pick of the 6-metres from across the North Sea.

The first race (on Monday, August 14th) opened with an unpromising false start for Circe, which sent the challenger away with what looked like a commanding lead, but Mr. Thom rose to the occasion, and with superb helmsmanship to windward, pipped Noreg at the weather mark and went on to win.

The second race was a walkaway for Circe in the end, though, at first, it did not look like it; the wind was fickle, and halfway between Gemline and the Barnhilt mark Noreg fell into a calm patch, and on the homeward leg of the first round collected another, after which Circe never looked back, and won by 9min.

As the first boat to win three races out of five finished takes the trophy, only one more win was wanted by Circe, but the challenger got the better of the start in the third race, and Circe having trouble with her spinnaker on the leeward leg, Noreg opened out a bit of distance. Circe appeared faster than her rival on a run in this race (once her spinnaker was fixed), but the Norwegian boat was superior to windward, and won by 3min.

It was still anybody's contest, but the suspense was unduly strung out by an irritating succession of calms on the three following days. It is a rule for the contest that the course must be completed in four-and-a-half hours, otherwise no race.

It was not until last Monday that another race was staged, and this not only added to the excitement by Noreg levelling up the score of wins at two-all, but also in the manner in which she did it. Over the first round of the triangular course she led by 36sec., and had shown herself a trifle closer winded when she led by nearly a minute at the second mark. But Circe closed up on her and reduced the lead to 25sec. It was on the last beat that a great struggle took place. The Norwegian boat had to luff on a couple of occasions to prevent the defender passing her, and had she not put about smartly at the finishing line Circe would have won. As it was she lost by a second in a race of 2hrs. 20min. sailing over the fourteen miles course.

LEFT: CIRCE, DEFENDER OF THE SEAWANHAKA CUP, RACING ON THE CLYDE AGAINST THE NORWEGIAN CHALLENGER, NOREG III
RIGHT: NOREG III ROUNDING THE CUMBRAE MARK ON THE FIRST DAY

With such an interesting position the deciding race was eagerly awaited, but Tuesday brought conditions which made it impossible to sail and also to give the final result of a series of races which, but for those vexatious calms, provided some fine sailing and opportunity for the display of much skilful helmsmanship. Noreg appeared, on the whole, to be slightly better to windward, though not invariably so, as Circe demonstrated in the first race; but taking all in all, the merits of the two boats seemed remarkably well balanced. The amateur crews were as follow:

Circe: Helmsman, J. H. Thom; M. Macbehose, Wm. McAusland, John and Herbert Thom.

Noreg III: Helmsman, Rolf Svimdal; C. Bache, F. Ferner and Jens B. Lund.

MR. T. O. M. SOPWITH'S TOMAHAWK
The most successful of the House 12-metre Fleet, and Vim's closest rival

THE TOMAHAWK-VIM PROTEST

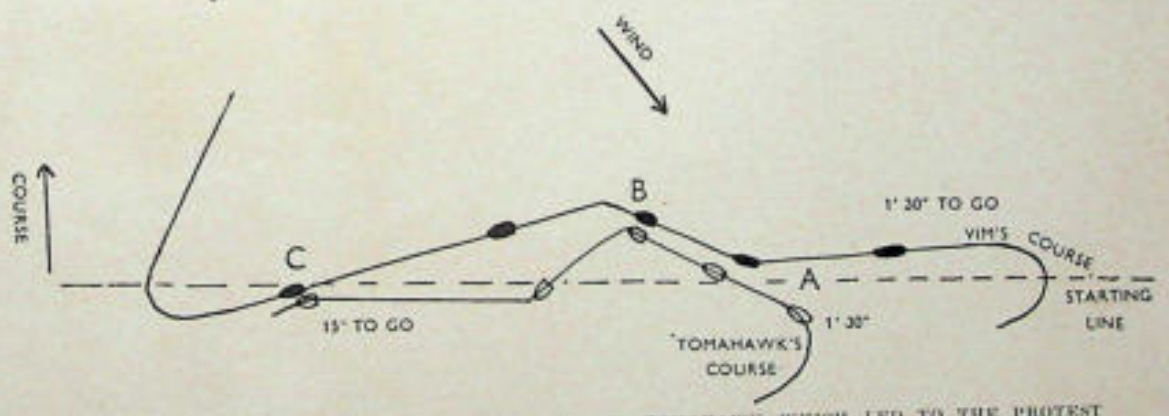
Different Interpretations of Rule 30

MANY yachtsmen have been a little puzzled by the circumstances of Tomahawk's protest against Vim at the Royal London Yacht Club Regatta on July 31st, for it seemed strange that such an experienced racing man as Mr. Vanderbilt would have committed such an elementary mistake as was reported in the newspapers.

To quote from a typical report of a well-known writer in the *Daily Telegraph*: "A few seconds before the starting gun . . . Mr. Vanderbilt put his helm hard up and bore away before the wind across the bows of Tomahawk, which was to leeward."

Well, even the most experienced yachtsman does silly things on occasion, but what puzzled most people was why Mr. Vanderbilt, if he had made such an obvious blunder, did not lower his racing flag and go home. If it was as simple as all that, why did Mr. Vanderbilt trouble to contest the protest before the Sailing Committee? Obviously Mr. Vanderbilt thought he was in the right, and, such being the case, it is of interest to consider what line of argument could be taken in favour of an incident which, to put it frankly, was much criticised at the time.

A diagram here reproduced shows a sketch made rather hurriedly by an eye-witness:



It will be seen that both yachts have come about and are reaching across along the line. In position A, with about 1min. 30sec. to go, before the start, Tomahawk is clear ahead of Vim but to leeward of her. As Vim comes up on her weather quarter Tomahawk luffs her, and Vim, being overtaking boat, responds. Vim is travelling faster and wins the luffing match, for at point B the position of the two boats is such that if Tomahawk luffed further she would strike Vim abaft her main shrouds, so Tomahawk loses, for under Rule 30 (B) she may luff no further.

Now comes the crux of the situation. Tomahawk bears hard away back to the line and crosses it. Vim also bears away, but not so much, and whilst also steering to cross the line she sets a course nearer to the wind which takes her well clear of Tomahawk. She holds this course and does not alter it. On these courses the yachts are actually drawing apart, but the American yacht contends that Tomahawk, after crossing the line, alters course as shown in the diagram, and on her new course she meets Vim (which has not altered course) at point "C." At this point there is almost a collision, which is averted by Tomahawk bearing away again. It is on this point that Vim gets disqualified in the protest.

Consider the position from the point of view of those ashore at the starting line witnessing the incident. The two yachts are converging, although on approximately the same course. Vim, the windward yacht, does not give way an inch to Tomahawk, the leeward yacht with the right of way. What has happened a few seconds before, if it has been seen from the shore, is forgotten, and Vim appears to be grossly violating one of the most elementary rules in yacht racing. Hence the disqualification. Hence the newspaper articles, and hence the somewhat unhappy impression of the whole incident.

But is the impression of those ashore the correct one? Is one really to believe that Mr. Vanderbilt, the most prominent American yachtsman, a man of great racing experience and the author of a very expert book dealing largely with the rules of yacht racing, is guilty of making a gross mistake and then carrying on the race instead of retiring. Mark you, the incident happened within hailing distance of the shore directly under the noses of the Sailing Committee. The answer must be that, whatever the subsequent verdict may have been, Mr. Vanderbilt thought at the time that he was in the right, and it is interesting to consider what grounds would justify Vim in refusing to give way to Tomahawk.

The difference of opinion, one believes, must lie in the meaning which is placed on the Right of Way Rule 30 (B). This rule, it will be remembered, after setting out the rights of an overtaken yacht to luff an overtaking yacht limits these rights in the following words, "until she is in such a position that her bowsprit end, or stern if she has no bowsprit, would strike the overtaking yacht abaft the main shrouds, after which she may maintain her course, *but may luff no further*." Note the last words.

AN IMPRESSION OF THE COURSES TAKEN BY VIM AND TOMAHAWK WHICH LED TO THE PROTEST

This position had arisen at point B in the diagram (it is believed that this is undisputed), and Tomahawk having no right to luff more, and with little time to elapse before the starting gun, bore away back to the line. Vim's contention appears to be that Tomahawk, having selected to bear away on a new course of her own free will, was entitled to hold it, but under Rule 30 (B) could luff no further. But, unless the diagram is at fault, it appears that Tomahawk after bearing away did in fact alter to a course closer to the wind, and it was due to this luffing that the incident arose, for all in the American yacht are agreed that Vim sailed a straight course after point B.

The question hinges on the interpretation of the word "*further*." Is it, further in time—or, further in distance?

Do those words mean that the overtaken yacht may not luff again at any subsequent time as long as the overtaking conditions remain—or do they mean that a boat, having luffed and failed, has nevertheless the full rights of the leeward boat over the windward one, as is usually interpreted?

That is to say, may she not (after bearing away) return to windward once more to the extent of her original course—but *no further*, and demand the usual right of way in doing so?

Both these interpretations can claim to be covered by the words "may luff no *further*," and it seems plain that one construction was placed upon the rules by Mr. Vanderbilt and the other by Mr. Sopwith.

It will now be seen that there are two opinions, and the rights and wrongs of the matter depend on the meaning read into the rule. It can reasonably be contended either that Tomahawk had no right to alter course a second time, in which case she was in the wrong, and not Vim, or (as the Sailing Committee decided) that Vim, being the windward boat, ought to have got clear of Tomahawk.

It is not our purpose to defend Vim as it is, of course, only the Sailing Committee or the Y.R.A. (on an appeal) that are in a position to judge, as they have statements from both sides and all relevant matter and witnesses. Moreover, quite apart from the point at issue, it must be remembered that Rule 30 goes on to provide that "in cases of doubt as to the right of the leeward yacht to luff, the windward yacht (in this case Vim) must respond to the luff and protest if she thinks fit."

But it seems only fair to an American visitor who has added so much to the sport at our regattas this season to point out that the incident was not due to a deliberate breach of the rules on the part of Vim, but was the result of a difference of opinion of two experts on the meaning of the rule. There is room for two opinions, and it is obvious that the case is one that cannot lightly be dismissed, and raises a point of interest quite irrespective of which yacht was in the right or the wrong.

Since the above was written comes the news that Mr. Vanderbilt has lodged an appeal with the Y.R.A., which will be heard in the autumn. Whether this appeal is based on the grounds suggested in this article, or on other grounds, remains to be seen, but the lodging of the appeal is to be welcomed because whatever the outcome it will throw further light on the meaning of Rule 30, and will clear the air.

K. A. C. and T. S.

PRE-WAR "RATERS"

A correspondent points out that in an article on racing at Cowes a comparison made between the pre-war classes and the one-designs of to-day is calculated to give a wrong impression of the conditions which then existed.

"In the early nineties," he writes, "there were 5 raters, 2½ raters, 1 raters and ½ raters. Their rating rule was succeeded in about '96 by another measurement rule under which the 36, 30, 24 and 18-footers were evolved. The 'footer' measurement rule was eventually succeeded by the first edition of the present international rule in about '06 or '07.

"Further, about '92 in addition to the original Red Wing class there were two One-design classes—the South Coast One-design class, boats of about 15 tons, of which there were either four or six boats, and also the Solent One-design class, of which there were over 20 boats which raced in two divisions. They continued to race after the South African War, and at least three still race."

In the account to which our correspondent refers there was a somewhat obvious inaccuracy in linking up Wye with the Clyde boats.

BEST DAYS WITH OTTERHOUNDS

The P.C.O.H. Hunt the Ginning

THE day following Carmarthen Hunter Show was brilliantly fine and warm—real "shirt-sleeves weather" at last—when the P.C.O.H. met at St. Clears to hunt the Ginning. This is a clear-flowing, pleasant little stream, which has its birth on the borders of Carmarthenshire and Cardiganshire, coiling its way from there between wooded banks and green open meadows to the sea below Laugharne.

Captain Howell (at one time Master of the Pembrokeshire Foxhounds for a period of nearly 20 years) hunted hounds, drawing up from the bridge; and, after owning a faint touch or two soon after they put in, they became very keen as they reached Pen-y-Coed Mill. There they carried a line across to the lily-pond and a distinct line back over the meadows and the river again, but though both this and the leat were tried, the otter never materialised. The drag faded out, and they continued in silence to Castell Gorfod, which proved a very haven of refuge from the almost tropical heat. A hot and weary field arrived at this Arcady, but after the unlimited refreshment and rest provided for them by Captain and Mrs. Buckley everyone proceeded on their way like giants refreshed.

On moving off again hounds began to feather a little, but there was no continuous drag, and when, at 2.25, they came up with their otter it was without any warning. They marked strongly, with a sudden lovely crash of music, beneath an oak tree on the right bank at Corn-Gafr, and in five minutes he bolted and was viewed below. There was a scent on the water, and hounds came fast down-stream, but before he had gone very far their otter paused beneath some root or other, and though they could own the wash below they could not, for a while, get on terms with him again. Then he came away, floating gently on the surface of the water as he made his way slowly downstream, and presently hounds began to get him going well. He was viewed several times on the shallows, through a lovely rocky stretch, working further and further down, and when he took refuge in the various holts with which the river abounds the pack marked him well and drove him to take to water again. The lifting wooded slopes above Castell Gorfod echoed and re-echoed, to the sweet cry of hounds, and an old crippled farmer who came down to the river bank in order to get a glimpse of hounds—which is the very breath of life to a Welshman—was overjoyed at the "heavenly music," as he so described it.

Presently they came to a deep, sticky pool, where much holding was provided by the alder roots on either bank. Their otter was tiring now, scent seemed less good, and hounds had hard work to keep him on the move. It was nearing 4.30 when at last he crossed the bottom ford and entered a holt under the right bank a few yards further down. Here they marked him well, but he refused to leave, and after being cast right downstream and right up as far as the original holt, they proclaimed him to be there still on their return.

Roysterer, however, swam him away to a holt on the opposite side, some 20yds. below, and though it took some time to persuade him to move again his chain was viewed at length rippling across the still water before he came up to vent in some bushes on the other side. After dodging to and fro between these two holts he finally made up his mind to go over the bottom ford, where, below the long shallows, the river suddenly deepens. A gigantic tree-root at the left bank offered impregnable shelter, and just as it looked as though hounds were about to receive their well-earned reward he vanished into the rough water swirling around the roots. Behind him a ditch was connected, by means of a sub-aqueous entrance, and he slipped up this unseen to the field beyond, when he entered a bank honeycombed with rabbit-holes. And this spelt "finis" to the hunt. Whether or not he came back down the ditch to the river will never be known—if so, he had an everlasting refuge in that vast root, for the water was too strong there for hounds to get a mark at him. It was 6.20 when at length Captain Howell called them out, and reluctantly left the otter in possession.

DWRGI.

THE DARTMOOR CAMEL WEEK

THE annual Camel week, by invitation of the Tetcott Otter Hounds, commenced on Monday, August 14th, with lovely weather, which continued throughout the week. The meet was Egloshayle. Hounds hit off a screaming drag on the marshes, which seemed to point up the Allen, and by the time Polbrock was reached, it had given out. Drawing on up the Camel, they struck a fresh drag above the Ruthern stream, carrying it on till they found in the left bank just below Dunmere. The terrier soon bolted two otters, one of which went down-stream, while the other went up into the pool above. We hunted this one, with a very poor scent for two-and-a-half hours, before he dropped down and put into an impenetrable place, where he had to be left.

Wednesday from Dunmere Bridge, hounds had a line from Dunmere weir pool, and after taking a double up the Clerkenwater stream, they found about 300yds. above. It was soon evident that again we had a brace of otters on the move, and also not much scent. After a good upstream swim, hounds were only just able to keep touch with their quarry, and after a rather sticky hunt of three hours, they had to be left in strong holts very near where they were found.

The next day from Helland Bridge we had a very good hunt. Having taken a speaking drag from the meet to the find, at the lower end of Shell Wood, hounds hunted beautifully, pushing their otter steadily upstream, until within a few hundred yards of Tresarret, when the otter turned and made downwards. Soon afterwards he did the disappearing trick, and as hounds had been hunting for three hours they were called out and lunch was taken. It was decided to draw back towards the meet, and shortly below the original finding place and on the Helligan Wood bank, hounds marked and the otter was quickly away. The pack stuck to him well, never giving him much time to rest, in spite of the poor scent, swimming him down to about half a mile above Helland, where he was left in a difficult pool at 6.45 p.m.

Saturday, on the Allen from Slades Bridge, we had a red-letter day, which a very large field of local sportsmen thoroughly enjoyed. After a completely blank draw to Dinhams Bridge, we were just entering Tretawn Wood, when hounds suddenly marked, and away went a brace of otters. One put in again at once, while the other continued down; scent was quite good, and hounds were able to hunt with little help from their huntsman. Driving her on down, she put in several times, but bolted always without the use of the terriers.

After 50 minutes of the very best, with several excursions on land, she was killed on a stickle, three-quarters of a mile below the find, weight 17½lb.

We then drew up and Captain, a first-season hound, fresh found the second otter, a little above the original holt. He also dropped down, but quickly crossed over to a small leat, and when making back was killed after a sharp fifteen minutes, weight 16½lb.

On returning up the stream, hounds found a third otter 110yds. above where the others were found. This otter also dropped down, and by some thick reeds on the left bank, made across to the leat, and going down this, put into two large rabbit burrows, one after the other, from each of which she was evicted by the terrier. Finally, she made back to the river, and turning up at once, hounds hunted her with a grand chorus, on a much improved scent. A little above she slipped through a field of meadow-sweet, to the leat and into another small place. The terrier Tiger (only sixteen months old) did extremely well and managed to bolt the otter again, and hounds rolled over their third otter just before she made the river—a bitch 12lb. This ended an excellent week's sport in Cornwall, the greater part of the credit for which goes to Hunt's good Cornish friends in the Bodmin, the district whose organisation and keenness made it possible.

D. C.

KENDAL AND DISTRICT'S GOOD HUNT ON THE LUNE

AUGUST 14th. The meet was at Middleton Bridge for the Lune. The river was in grand order for hunting, and a very good hunt ensued. There was a good field, and we were pleased to see out with us again our visitors from the Courteney Tracy and the Bramham Moor, and several others, who had come long distances from Yorkshire. Kitchener was hunting hounds, and after giving a certain amount of law to the late-comers, put hounds in below the bridge. Hounds began to feather, and spoke to a drag just before arriving at the meeting of the waters, when they turned up Lune. They crossed over to the right bank, and just at the place where we usually cross, they picked up a burning-hot drag, and with every hound throwing his tongue, they set off at a gallop, and at such a pace that not even the "young uns" "on the double" could keep up with them, and without a check right up to Broadraine Mill.

This was evidently a young dog otter travelling the land. On arriving at the mill, he had evidently crossed the weir and had been swimming the pool and landing on both sides; they then took the drag (and still throwing their tongues) along the rocks now, right up to a big rabbit burrow amidst some good roots about half a mile below Lincoln's Inn Bridge. Pip and Killer, the new terrier, were put in, and after some good work by the new terrier especially, bolted the otter, which immediately went downstream with the hounds screaming away in his wake, he crossed over to the other bank, after swimming down some distance, and was viewed away, and then he turned upstream and was seen to land under a root and get into the rabbit burrow again, which was in a steep bankside with numerous holes, impossible to stop, and there, despite all our efforts, he remained.

When at about 1.30 p.m. we left him and hunted up to Lincoln's Inn Bridge, where we had lunch, the remainder of the proceedings were rather in the nature of an anti-climax after our exciting morning, as we continued to hunt up to Lowgill without touching anything, and there Kitchener blew off and ended a very good day.

REDFORDE.

GOOD COASTAL SPORT WITH EASTERN COUNTIES

MEETING at Easton Broad, on the coast above Southwold, on the 17th, hounds had a line up from Potter's Bridge, which took them into the reed bed by Jay's Farm and out at the top, where they went on for three-quarters of a mile and crossed to the reed bed on the opposite bank, hunting the drag out on to the open grass country above, whence they brought the line back to the reeds and checked.

Mr. Russell held them on forrard, and they hit the line again, running fast up to the main road and crossing it at the meet, whence they raced over to Easton Broad and put their otter away, hunting him into the Broad and swimming him along the verge of the reeds with a great cry, until he turned up a runner and into the reeds. They now took him on towards Porter's Bridge, and shortly after he had been viewed they checked, refinding him after 30 minutes.

This good otter now took them back to the Broad where they swam him over to the seashore, hunting him round for 20 minutes in the reeds nearby before he returned to the Broad, where they swam him up a runner and into the middle of the reed bed where they lost touch once more for a spell, and having got him moving again, they had a further half-hour of sticky work before they lost him. Master cast them for a time until they drew out on to the sea shore, defeated and dead-beat, after a fine hound hunt of 6 hours, chiefly in the most wicked lot of reeds that they have come across this summer.

Hounds met at Thorpeness on the 19th, and having hunted a stale line along by the coast towards Aldeburgh, hounds went back to the Meare and soon found an otter on the bottom island opposite the boat house. Having swum him through the channel they got him into the Meare, where, followed by a fleet of some thirty craft and swarms of wading kiddies, they swam him right over to Otter Isle, which they circled before coming down the Meare to the Magic Pavilion.

After a spell of hunting in the channels here they recrossed to Otter Isle, before swimming over to the foot, where their pilot drew out and got into the Hundred River, where he took them up towards the railway before getting into the Meare again. They now swam him with a magnificent cry right down the big water by Crusoe's Isle to Otter Isle, where he landed but was viewed as he got in again, to swim twice round the island. This was the finest bit of swimming I have seen for a long while, every hound of the fourteen couple throwing its tongue.

You could have covered the lot with the proverbial outsize blanket! A rare sight and a terrific cry, which, however, did not please their otter, who crossed over to the foot and got into the river again, where a long spell of hunting in the reeds followed; the otter and hounds had just about shot their bolt by now, and the last half an hour before the Master blew them out was very sticky business. This had been another fine hound hunt of 4½ hours' duration.

DRIFTER.

THE HAWKSTONE'S GOOD SPORT

ON Monday, the 14th, the meet was at Sommerford on the Peak. Mr. Wallace drew upstream and there was a faint drag which petered out before they reached the main road bridge. Hounds drew on to Penbridge, then up the Mytton Brook, where it soon became apparent that an otter was about. Mr. Wallace thought for some time that he was below the mill, but on drawing up above they definitely put down their otter and accounted for him in a very short time. While hounds were breaking him up there was a new holloa from some men working in the next field. So when hounds had eaten their quarry away they went and picked up the line of what proved to be a second otter. The line took them over several fields and then down the road, and they came up to him in the garden of a house where they killed him.

S. W.

GREYHOUNDS STARTING FROM THE TRAPS AT A G.R.A. RACECOURSE
This part of the dog's racing tuition is done gradually, as only by experience can it learn what is required of it

GREYHOUND TRAINING

By DALE BOURN

THE really serious business life of the greyhound begins when it is put into training. Having led a gloriously free and easy puppyhood, the greyhound does not take easily to the restraint that training must of necessity place upon its freedom.

At about the age of a year, the greyhound is taken in hand by its trainer and his staff of kennelmen. Up to date, the puppy has in all probability never known a collar and leash, and it is only by patience and kindly persuasion that the dog can be taught to become used to wearing this necessary apparel. Dogs, like humans, are temperamental and some take quickly to discipline whilst others are slow to obey. Many and various are the ruses that have been tried and experimented with in order to find the quickest and surest method of disciplining the puppies.

Each dog, having an individuality and personality of its own, requires personal attention in its schooling. Not only has the dog to learn to wear a collar and leash, but it has to be taught to walk quietly and properly with its kennelman. Then again it has to learn to wear its racing coat and muzzle, since the N.G.R.C. have laid down rules that necessitate the wearing of both of these when racing.

Having learned its elementary lessons, the puppy has then to be schooled to the racecourse. Here he has to be taught to get used to the starting trap and to chasing the mechanical hare. This part of the dog's racing tuition is done gradually, as only by experience can it learn what is required of it. Various methods have been tried to teach the dog to leave the trap. A dish of food has been shown to the dog before it was placed in the trap and then put in front of the trap in order to entice the dog out when it opened. Again, a piece of light ply-wood has been fixed to the trap so that when it opened, the dog got a sharp rap on its backside to help it on its way! Later on the puppy is placed in the trap between two other experienced dogs who act as "schoolmasters."

Whatever methods are used, however, it is really by the infinite patience and kindly treatment of the trainers that the dogs are eventually schooled and taught to do what is required of them, and it is only by gradual experience that they learn it.

It is the ultimate object of every trainer to get his charges into the very pink of condition of physical fitness. Diet, grooming, massage and exercise all go to bringing this about. The major part of the training, however, is done on the track. Short walks and occasional gallops are the best methods of getting the dog fit. Greyhounds intended for hurdling have to be taught to jump. This again is a gradual process. The dog is each day called to food over some obstacle which is gradually heightened until it has become natural and easy for it to jump.

The dog is then "finished off" on the track itself. When a puppy is considered fit to do so, it is given a series of trials on the racecourse. These at first are over a short distance such as 300yds. in order to accustom the dog to actual racing conditions. The distance is gradually increased until the actual racing distance required is reached. This distance varies with different racecourses, but the most general flat race distance is 525yds. If in the opinion of the racing manager the dog is ready, it then undergoes its first three "official" trials that are required of it by the rules of the N.G.R.C. before it can race in public.

These "official" trials must take place on the licensed racecourse on which the dog is to race and in which at least three greyhounds, which must be registered with the N.G.R.C., take part, and it must be in the presence of the racing manager or his deputy and at least one Steward. The results of these trials must be entered in the greyhound's identity book. Subject to the confirmation of the racing manager, the dog is now ready to race, provided it is over fifteen months old—the earliest date that any dog can race by a rule of the N.G.R.C.

On the purely racing side, the position of racing manager is the most important. It is he and his staff who are responsible for the arranging of all racing programmes and for the running of the dogs.

Unlike horseracing, greyhounds are not handicapped by carrying weight, but are what is called "graded." Each dog, having gone through a series of trials, has its time noted and it is graded according to the time it does. Thus in a race of six greyhounds all six are graded as close as possible to each other according to their recent times over the distance of that particular race.

It is the Utopian aim of all racing managers to grade the dogs to finish level. He has no easy job; he must know and understand the individual mentalities of his trainer as well as the individual habits and points of the dogs. He has to take many things into account. Some dogs improve rapidly and some slowly; some go back. Some "trap" quickly and finish slowly, and *vice versa*. Some are in the habit of running wide whilst others hug the rails. Again in some previous race or trial, a dog may have been badly bumped, baulked, or it may have checked badly in some bend.

All these points have to be taken into account when the racing manager is making up his programme for a meeting. He has always to be on the watch. It is his job to present races to the public that are open and fair. It is his knowledge and brains versus the public and the bookmakers, and he is liable to be slated by both! If a favourite wins, the bookmakers curse him; if an outsider wins, the public curse him! Owners and trainers slate him occasionally for, as they think, outclassing their dogs.

A good racing manager is worth his weight in gold to any first-class racing establishment, and it is greatly to the credit of all good racing managers that in a race of only six runners, in a graded race, it is an extremely rare occurrence for a dog to start odds-on. There is a certain racing manager to-day at one of the leading racecourses in London who is the proud owner of a gold cigarette case, a present from the directors for having graded over 2,000 races without one odds-on starter.

Over and above his grading duties, the racing manager has many other routine jobs to attend to. Besides keeping his own records of the performances of the dogs under his control and making up the racing programmes accordingly, he has to make periodic reports to the N.G.R.C. of any newly-appointed officials, also of all complaints to, and decisions of, the Stewards, of all fines inflicted and of all greyhounds sold or claimed. The results of his work are watched carefully during the racing by the Stewards of the meeting who make reports to the director of racing, so that he is liable to be called and to answer an inquiry at any time, should the Stewards consider that the running of a certain dog or dogs warrants such an inquiry. The racing manager is a busy man in any racing establishment and has to have his wits about him all the time.

Besides these graded races, which are the backbone of the racing programmes, there are many "open" races. These are races held on any licensed racecourse for which entries can be received from other racecourses and are not confined to the dogs of that particular racecourse.

As in horseracing, so in greyhound racing, there are several "classic" races throughout the country, varying in importance and in the size of purse. All these are "open" races and entries are received for these from kennels all over the country. There were over 900 of such races run in this country in 1938. These races are run off in heats and semi-finals and a final. The most important, naturally, is the Derby run at the White City over 525yds. each year under the auspices of the Greyhound Racing Association, Ltd. The final produces a crowd of over 90,000 people and the winner may be worth anything up to £2,000 in value, besides the prize money and its breeding value.

Other open classic races, to mention a few, are the "Laurels," run at Wimbledon over 500yds; the "Greyhound Cesarewitch," run at West Ham over 600yds.; the "Scurry" Gold Cup, run at Clapton over 400yds; the Greyhound St. Leger, run at Wembley over 700yds.; and the "Gold Collar," run at Catford over 440yds. There are many others both in London and the provinces which attract the best dogs all over the country. Handicap races are sometimes run both on the flat and over hurdles. In these the dogs are handicapped, like athletes in a race, by the distance they have to run—thus each dog's starting trap, which in this case is a single trap, is placed at various distances from scratch and are all opened simultaneously at the "Off." There are also "selling" and "selling and claiming" races, besides occasional "matches" and "inter-racecourse" races.

When one considers the great trouble and care that is taken to produce racing to the public that is open and fair and the supervision that is employed over its general integrity, besides the many variations in the distances, types and values of the races themselves, it is not in the least to be wondered at that greyhound racing has not only captured the imagination of millions of followers, but also commands their respect and complete confidence as a straight and fairly run sport as well as a magnificent spectacle.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

TWO MENUS FOR THOSE SUBJECT TO DIABETES

LUNCHEON

The Fare: Quatre raviers à la Grecque
Œufs brouillés à la Lyonnaise
Escalope de veau Florentine
Fromage et salade
Fruits

The Wine: Vin gris de Lorraine

DINNER

The Fare: Cotriade Nantaise
Sole au plat Charentaise
Poulet sauté aux Champignons
Aubergines frites
Glace à l'Ananas
Fruits

The Wine: Champagne nature non mousseux

THE four Luncheon Hors d'œuvre consist of artichoke bottoms, fennel hearts, the white of small leeks and "button" mushrooms, all cooked in water and olive oil and served with a vinegar and olive oil dressing.

The scrambled eggs *Lyonnaise* are a tasty and economical way of serving up a hash of left-over boiled beef. Scramble the eggs in the usual way, but keep very moist, and use half to cover the bottom of a baking dish; spread the beef hash over the scrambled eggs and then, as a third layer, the other half of the scrambled eggs. Then sprinkle a dusting of grated Gruyère or Parmesan cheese, add a few small pats of butter and brown under a very hot grill.

The *Escalope de veau* are thin pieces of veal cooked in butter and they are *Florentine* when served with spinach.

For dinner, the *Cotriade Nantaise* is the pot-au-feu of fish as served at Nantes; a kind of *Bouillabaisse*, but without garlic and saffron. The *Sole au plat* is a sole cooked in white wine, and it is *Charentaise* when the white wine is from the Charentes country. The *Poulet* is a stew of chicken with a large allowance of stewed mushrooms as garnishings, and the *Aubergines* are egg-plants, skinned, cut up in thin and long sticks, like the classic fried potatoes, and fried in deep fat. They can be served with the chicken or, preferably, as a separate course.

As regards wines, the more generous and richer sorts are, unfortunately, dangerous, but the sharp local Lorraine wine, called *gris*, although not grey but more of a raspberry vinegar pink, is so entirely free from all traces of sugar that it cannot do any harm. There are also some still Champagnes which comply with the diabetic standards, being low in alcoholic strength and free from sugar.

"Twelfth" Night

There's the morning drive to talk over; there are good cigars to be smoked; and there is Johnnie Walker in the glasses. Now *there's* a whisky! Blended from all the finest whiskies in Scotland, marvellously mellowed and matured. And blended with Johnnie Walker's consummate skill.

Gentlemen! your

Johnnie Walker

BORN 1820—STILL GOING STRONG

FIFTY YEARS AGO

From the *Field* of August 24th, 1889.

BAGS made on the Moors. "Taking the Scotch moors one with another, it may safely be said that they have so far supplied fewer grouse than was the case last year, and in ordinarily good seasons; from the Deeside district, which contains some excellent shootings, the yield being estimated at only one-fourth of last year's. This is, of course, exceptionally bad, and possibly within that locality the disease has proved almost more disastrous than heretofore. Another peculiarity in the season just opened, is that the smaller moors have, comparatively speaking, provided the best sport, and show least signs of disease in the birds; no doubt, on this fact, upholders of the belief that overstocking is injurious, will find some consolation.

"As to the reports from the Scotch moors, the best bags have not quite reached the records of former years. Still, the following exceptional ones may be placed alongside any previous year, without suffering by comparison. The best is, undoubtedly, that from Glentromie Lodge, Inverness-shire, where Mr. John Hargreaves and party, in five days, shot 1,094 brace of birds, viz., on the 12th, 260 brace; 13th, 219 brace; 15th, 250 brace; 16th, 178 brace; and on the 19th, 187 brace. In Perthshire, on the Moness shootings, during last week, Comte de Paris, Comtesse de Paris, Duc de Chartres, Duc de Orleans, Marquis d'Harcourt, and M. Auberif Vitit, bagged 538 grouse, 91 hares, 2 wildfowl and 5 rabbits. In 1888 the same moor, in two days during the first week, yielded 455 brace of grouse, and not nearly so many hares as was the case this year . . . On Glenmuic, near Ballater, the five days' bag, up to and including Friday week, was 704 brace of grouse. H.R.H. Prince Edward of Wales was shooting here with Mr. Mackenzie's party.

DEVICE AT THE END OF THE "BOKE OF HAWKYNGE, AND HUNTYNGE AND FYSSHYNGE"

OLD SPORTING WORKS

WHEN old sporting works come into the market their intrinsic value becomes very much a matter for the expert, and the collector with a discerning eye for the eighteenth century and early nineteenth century sporting print will find himself very much at sea in assessing them. Some quite interesting books on the chase, *La Chasse Royale*, dedicated by Charles IX to Louis XIII (1625), and *La Venerie* of J. Du Fouille (1561), with *Plusieurs Receptes et Remedes pour guerir les chiens de diverses maladies* recently fetched £25 and £20 apiece. But the bidding for Dame Juliana Berners' black letter *Boke of Hawkynge and Huntynge and Fysshynge* at Sotheby's sale of the Schwerdt collection went to £360. Printed by Wynkyn de Worde and described in the Huth catalogue as the only copy known of these parts of the *Book of St. Albans*, it was believed to be an edition earlier than 1496, although the device at the end is considered to point to a much later date. Dame Berners' black letter *Book of Hawkynge, Huntynge and Fyshyng with all the the Properties and Medecynes that are necessary to be kepte*, printed by Wyllyam Powell (*circa* 1550), went for £295, and the same author's *Hawking, Hunting, Fouling and Fishing, with all True Measures of Blowing, "a work right pleasant and profitable for all estates,"* printed by Adam Islip (for) Richard Olive (1596), brought £210.

A TRAVELLER'S NOTEBOOK

I DON'T know if you will agree with me, but I have always felt it to be unfortunate that all nations have not a similar sense of humour. It would, I think, prevent many wars. But, it is an unfortunate fact, many foreigners regard *Punch* as a sure indication not of English humour, but of English idiocy, while we for our part can see nothing funny whatsoever in the wisecracks produced in Continental newspapers. Eastern stories, however, are a different matter, for, though rather inclined to be long winded, one finds them exceedingly amusing.

* * *

That Turkish Aesop, that traditional wit, Nassredin Khodjah, has left many stories behind him to delight not only the Turks, but the British as well, though unfortunately they are not as well known as they should be. Even Tamerlane fell beneath the spell of this remarkable man and spared Neapolis as a result. The story runs as follows: Tamerlane encamped outside Neapolis, and the inhabitants were preparing to resist the invader when Nassredin offered to sally forth as ambassador. This generous suggestion was accepted, and Nassredin began to consider what present he should offer to the tyrant. Should it be figs or quinces? "Undoubtedly quinces," said his wife when, like a good husband, he consulted her; "they are much larger and heavier, and he will be very pleased." "No," said Nassredin, "women are always wrong," and so equipping himself with a basket of juicy figs he trotted off to the camp of Tamerlane.

* * *

Even that tyrant was anxious to see the Turkish wit and admitted him into his presence. But the sight of the Turk's bare, bald head was too much, and Tamerlane took the juicy figs and threw them one by one at the face and head of Nassredin, where they burst with a resounding squelch. As each fig hit him, Nassredin exclaimed, "Thank God," a pious ejaculation which excited the tyrant's surprise. "Why do you thank God," he asked, "each time I hit you?" With much composure the ambassador, who must by this time have presented a sorry sight, exclaimed: "I am thanking God because I did not follow the counsel of my wife: she told me to bring quinces." This remark so amused Tamerlane that he talked with Nassredin for three days, and then marched away. The ready wit of the Turk had saved the town.

* * *

Another Turkish tale always amuses me, and it is rather like an old English one. A priest went up into the pulpit to preach, and said to his congregation: "Now do any of you know what I am going to preach to you about?" They consulted among themselves for a minute, and then at last a spokesman got up and said: "Well, some of us do, and some of us don't." The priest, who had been asked out to lunch and was in a hurry, smiled triumphantly. "Then let those that do tell those that don't," he exclaimed and came down from the pulpit.

* * *

An Egyptian story also reveals quiet humour. A young man in a starving condition arrived at a marabout (the tomb of a saint), and the old keeper out of pity fed him and produced a small donkey to help him on his way. Some time later the animal died and the youth, having buried it, placed stones upon the grave and announced that a saint lay buried there. Soon the place became famous and the old keeper, finding his business was deteriorating rapidly, hurried to investigate the cause. His search led him to the youth, who was prospering so exceedingly that he cried out in amazement: "Tell me, oh, my son, how you performed this miracle?" "I cannot lie to you, oh, my father," replied the youth; "I have buried there the donkey you gave me. But," he continued, "I have always wondered who lies buried in the tomb you guard, oh, my father." "Treat my reply as a trade secret, and I will tell you; the tomb contains the mother of your donkey."

* * *

And, last of all, a story of Fez. One day a young man and his father, both of them looking as if they had come down a good deal in the world, were sitting outside a Moorish café. Young men kept passing by and every now and then the son, a rather dissipated-looking person, would sigh deeply and exclaim: "Eywallah, eywallah, look, oh my father, there goes Hassan, to whom I gave emeralds, Mustapha, to whom I gave rubies and Ali, to whom I gave diamonds." At last the father could stand it no longer. "Now look here, my son," he cried angrily, "it's all your fault; if only you had taken my advice and made Hassan, Mustapha and Ali give you emeralds and rubies and diamonds we should still have been able to hold our heads up as a respectable family of Fez."

F. H. M.

LETTERS TO THE EDITOR

COUNTY CHAMPIONSHIP SCORING

SIR,—May I write in entire agreement with Mr. E. L. Roberts' letter in your issue of August 5th. The eccentricities of the present County Championship system of scoring have been manifest since the early weeks of the season. What is even more surprising than that such a system should ever have been introduced, is the attitude adopted towards it by established critics of the game. For one and all have condoned the system's greatest fault, that of awarding consolation points to a county leading on first innings and losing the match.

We have had many absurdities in the championship scoring system in the past, but this surely crowns all. Recently we had the case of Essex leading Sussex in the first stage by a bare 20 runs, and losing by a huge margin after a miserable batting display. Earlier in the season the same county declared leaving Notts 180 runs to make in two-and-a-half hours, because, although Notts are virtually the strongest batting side in the country, and it was a perfectly plumb wicket, Essex would get no points anyhow as a result of a 30 runs deficit on first innings.

There is no longer any virtue in saving the match, and the rearguard action loses all vital interest. Nor is this state of things without a remedy, as apologists will immediately state. I suggest a perfectly logical system which will eliminate the absurdities to which Mr. Roberts refers.

A win to count, say, five points, a win on first innings one point, a loss on first innings nothing, and an outright loss minus one. I have not decided on the exactly correct proportions, but I think this system could be applied at any time and shown to be satisfactory. The inducement to go all out for a win is there, there is the minimum differentiation between gain or loss on first innings, and there is equally an inducement not to throw away the match because there is nothing left to fight for. And a word to the framers of the present system. It is no excuse to say that a thing cannot be judged until it has actually taken place. If the M.C.C. had taken the trouble to pick out the championship table for any pre- or post-war year, and apply their system to it, they would not have remained for long in doubt as to its efficiency. That they have quite obviously failed to do so is a painful reflection on their sensibility.

Yours faithfully,
TERENCE A. PRITTIE.

Travellers Club,
Pall Mall, S.W. 1.

SNIPING IN WAR

SIR,—Many will remember that after war broke out in 1914, we lost hundreds of good men who were shot by German snipers, and these severe losses became worse when trench warfare began.

In his delightful book, *Hesketh Prichard—a Memoir*, Mr. Eric Parker gives some accounts of how, through the pluck and energy of that fine sportsman, the sniping corps was inaugurated, with the consequence that the enemy found our snipers more than a match at the game of slaying without being slain.

Hesketh Prichard (Major, D.S.O., M.C.) wrote a book, *Sniping in France*, which gave the full history of the formation of the Sniping Corps, and which did such wonderful work in saving hundreds, if not thousands, of lives.

As preparations are being made for a possible war, it is pertinent to ask whether the authorities are doing anything to form such a corps, for it will certainly be needed if war comes again.

We are always slow at the start, with the natural consequence that we lose not only treasure but most valuable lives. The delay in forming a convoy system against the attacks of submarines on shipping, and the lack of a sniping corps early in the last war, are both grave instances of dilatoriness and red tape, which should never occur again if the Naval and Military powers use commonsense and promptitude.

Yours faithfully,
DENIS D. LYELL.

Belmont,
Moffat.

CHESAPEAKE VERSUS LABRADOR

SIR,—Being keenly interested in Chesapeakes, I should like to make some comment on Mr. Leckie-Ewing's letter. He writes of ". . . many years ago," and until recently the "big, bold and fearless" Chesapeake was "often hard in the mouth," and certainly difficult to control. But in the Eastern States, at any rate, there has recently been a great change. It is only in the last few years that serious efforts have been made to breed and train Chesapeakes for field trial work. When the standard of earlier trials is compared with that attained to-day, the progress made is absolutely amazing. In all breed retriever trials Chesapeakes are still very much in the minority. Nevertheless in 1937 (if I remember the date) a Chesapeake was awarded the title of best retriever of the year, and last winter I witnessed several very fine performances by Chesapeakes. The Labrador has been subjected to selective breeding for years. It follows that a good Labrador is easier to obtain than a good Chesapeake. They are also less headstrong and easier to train. On the other hand, a Labrador has not the stamina of a Chesapeake. When it comes to brains and noses I hold the Chesapeake second to none in the sporting world. It is possible that the dogs bred round Chesapeake Bay are superior in these respects to the Canadian and Western strains. The dog in the illustration would appear to be from a Canadian strain. But it has to be remembered that the Chesapeake is very independent. He is not necessarily stupid when he does not do what you want. With my dogs I am apt to find that the harder the thing I ask them to do the better they do it. Easy tasks bore them and they will not try. Chesapeakes have excellent noses, but they also are adepts at marking the fall of a bird. They are so clever at finding by sight that they sometimes have to be taught to use their noses. In the case of one of my dogs it was years before I discovered that he had a first-rate nose.

Although the breed is a hundred years old, scientific breeding of Chesapeakes is in its infancy. It is going to take some years to produce regularly the type of Chesapeake best adapted to this country. If it can be done without loss of stamina or coat a valuable addition will have been made to our retriever breeds.

Yours faithfully,
HELEN INGLEBY.

Loo-Water, Heacham,
King's Lynn.

WOODPECKERS NESTING

SIR,—Last spring I was fortunate enough to have a pair of lesser spotted woodpeckers nesting in my damson orchard in Shropshire. The nest was in an old damson tree, 12ft. from the ground and quite close to the house. From a "hide" 17yds. away I watched the birds for many hours during their nesting operations. The late T. A. Coward in his *Birds of the British Isles* states that it is not certain whether the male bird of this species takes part in the excavation of the nesting hole. In the present case the male began excavations and worked hard until the nesting hole was complete; in fact, he took rather longer "shifts" than the female. Apropos the "drumming" controversy, the male "drummed" constantly on a bough within a few feet of the "hide," and I watched him through a pair of 8×25 field glasses. I have no hesitation whatever in stating that the sound is entirely mechanical, and had any upholders of the "vocal" theory been present with me, I am sure they would have been completely converted! I tried to obtain evidence of any semi-rotary movement of the head, a theory that has been suggested in some quarters, but I could detect no such movement. All "drumming" ceased as soon as incubation had started and complete silence reigned until the young had hatched. Both birds took part in incubation, each remaining on the eggs about 25 minutes at a time. I only saw the male bird "drumming," the female remaining completely silent, as far as I could tell, throughout the nesting operations. When the male uttered the call note, which is so similar to that of the kestrel, he would draw himself up to his full height and throw his head well back. I never obtained even a glimpse of the youngsters before they left the nest, and I was therefore unable to ascertain their number. This seemed to me rather surprising as young green woodpeckers will cluster at the nesting hole for several days before they finally fly.

Yours faithfully,
R. L. VERNON.

The Elms,
Bembridge, Isle of Wight.

THE BAOBAB TREE

SIR,—A correspondent in your issue of June 17th quotes some misleading information in regard to the baobab or cream of tartar tree (*Adansonia digitata*).

This tree is common in the Kruger National Park north of latitude 24°, where it is found not only as a solitary grower, but often in groups of considerable extent.

It has nothing of the parasite in its nature, and it can only be supposed that the quoted author misunderstood his native informant regarding the name of the tree in question. Several species of *ficus* have the trait strongly developed, though the epiphyte seems usually to spring from a seed dropped by a bird at the base of the stem or among the branches of the host. Thence the creeper spreads up or down, eventually to strangle its foster parent.

I have successfully reared young baobabs both from seeds and from tiny saplings, and have at present two growing in my garden, which are about two years old and between 5ft. and 6ft. high. Another one, planted elsewhere from seed, about five years ago, is now about 10ft. in height. No doubt the rate of growth decreases rapidly with age, since the mature tree, though often of immense girth, is seldom of any outstanding height.

As regards age, it is, of course, impossible to offer an opinion of any value without data. A large tree grows in the park just north of the Olifants River, and during the last 30 years I have observed little appreciable difference in its size. It is probably under 30ft. in height, and some years ago I measured its girth at about 4ft. from the ground, as 52ft. 2in. I have been told that it was an outstanding tree 50 years ago.

The old saying that "no one has ever seen a young baobab" does not necessarily imply that there were no young baobabs to be seen; there is nothing mysterious or sinister about this remarkable looking tree.

Yours faithfully,
J. STEVENSON-HAMILTON.

Kruger National Park.

GUITING WOOD

SIR,—Dr. Livingstone talks lightly enough of my account of what has happened to Guiting Wood. I wish he could hear what the people in the neighbourhood say about it. He dismisses as "whirling words" my reference to the part responsibility of Oxford dons for the industrial development of Oxford. Has he read Mr. John Betjeman's book on Oxford published this year? He mentions the "reafforestation" of the acres above the Broadwater. But he fails to mention the physical conditions which make it impossible for timber, once felled, to grow on this, the richest and most beautiful portion of the wood. The slope here is acutely steep, the oolite limestone not far below the surface, while I gather from enquiry that this part of the wood was of very great antiquity. Now that there is no timber to retain the humus, it must, forced alike by rainfall, drought and the lie of the land, inevitably slide downhill. When the topsoil is thus removed, the land will be unable to support any growth but scrub. He talks airily of 385 acres of woodland without giving your readers any idea of the difference between the parts yet untouched which have nothing like the beauty and character of the areas so relentlessly felled. If any of your readers think with Dr. Livingstone that I wrote "whirling words" about Guiting Wood, I beg them to go and see it for themselves, walking above the banks of the Broadwater and looking up that now desert slope, where the lilies of the valley once grew in multitudes. I am the last to object to judicious felling and thinning, but this unique and exquisite piece of woodland has been completely wiped out. Its beauty has vanished for ever.

Perhaps you will allow me here to refer to another matter. I told the story of the wart-curer in my article of August 12th. It may interest some of your readers to know that neither I nor the dog went to see her. By deputy I asked her to undertake the cure of the dog; she consented and the warts are cured. She never takes any fee.

Yours faithfully,
H. J. MASSINGHAM.

Hacks.

LESSER WHITETHROATS AND FORGET-ME-NOTS

SIR,—It may be of interest to some of your readers interested in birds, that we have had nesting in the garden here for three years in succession a pair of lesser whitethroats. This dainty little warbler, well known for its craftsmanship in building, has chosen the same nesting site each year in an orange tree, curiously enough, on the same branch.

I have examined the neat little structure, and found quantities of coloured wool, bits of cotton and string cleverly woven in.

This year I was very surprised to find the nest "decorated" with a floral design of forget-me-not heads, all around the rim.

Is this not unusual?

Yours faithfully,
WILLIAM MARSHALL.

"Sainte Colombe,"
Vence Hill, France.

A GREAT CONCOURSE OF BATS

SIR,—On Monday evening, August 7th, I was coming away from fishing the Test at 9.10 p.m. when it was too dark to see one's fly clearly. There was, however, plenty of light on the water looking downstream, and on it I saw the reflection of what looked at first like a big flock of small birds, but which as they swung silently past me I saw to be a great concourse of bats. They flew three times past me in a wide circle, turning together exactly as a flock of starlings will do, and I estimated their number as something over 200. This was a new experience for me, and may interest others.

Yours faithfully,
H. H. GORDON CLARK.

Moorhurst,
Holmwood, Surrey.

AN ARBOREAL MORTUARY
(See letter "The Royal Oaks of Richmond")

THE ROYAL OAKS OF RICHMOND

SIR,—After many years of strange indifference, we suburban dwellers to-day understand something of the splendid legacy that falls to every generation in the parks and open spaces of outer London. Those of us who live south of the river are forever contrasting our happy lot with that of our less fortunate brethren of the northern heights, and if any comparison be made, we look to Richmond Park in the beauty of its woodland and wild life to turn the scale of argument in our favour and to silence the northerner.

But to-day much of the Park woodland is decaying or dead, and more of it appears to be doomed to the same fate.

One evening in mid-July the writer entered the Park by Ladder Stile Gate, and, starting down the track through High Wood toward Ham Cross, circumvented the century old Isabella Plantation and returned again to Ladder Stile across the slope of Broomfield Hill. He seemed to be passing through a mortuary of oaks, with the hand of death laid upon tree after tree. A few fallen limbs lay at his feet, but for the most part the oaks had retained their dead wood, though among the veterans many had scarcely a handful of foliage to show that life was not extinct. Some way south of the plantation, on the margin of the gravel-pits near Thatched Lodge, he noticed a number of young oaks that could hardly have been planted more than 60 to 80 years ago, and these appeared in little better case.

The writer is no expert in forestry and would not presume to offer criticism or advice, but observation and inquiry seemed to confirm the fact that little had been attempted in the way of preserving the timber in this corner of the Park for many years. Is such preservation possible, or can nothing be done to save these ancient trees, many of which must date from King Charles's day or even earlier?

At the northern extremity of the plantation were some of the finest silver birches that the writer had ever seen. One of these must have been 10ft. or 15ft. taller than the slower growing trees in the vicinity. Here again decay had begun, and on almost every birch-tree that bordered the enclosure for some distance the deadly growth of fungus could be seen and its cancerous work detected. Surely something might be done here before it becomes too late. The horrible growth seemed to have spread from tree to tree, and quite a number appeared to have lost their branches or fallen entirely during the last few years. Many of the birches in the Pond Plantation are in a similar condition.

One of the foremen engaged in clearing the timber was telling me some time ago how he had found in an oak a maggot about 5in. in length. I remember he prophesied at the same time that not a single one of the old oaks would be left standing a few years hence.

Much good work has been accomplished of late at the northern end of the Park by those whose responsibility it is to care for the timber, but in face of the fact that almost every oak in the area, above a certain age, is attacked by disease, cannot a more ambitious method be adopted to deal hopefully with such a serious situation? Meanwhile every encouragement and all possible assistance should be given to those who are engaged in the salvage work. It must be a herculean task. Possibly an increase of staff might help in meeting the present crisis.

New trees may be planted by the score, but if during the present generation we should lose almost every ancient oak in the vicinity, and a considerable proportion of the younger trees also, Richmond Park will forfeit for the next hundred years all its peculiar character and charm.

Yours faithfully,
Putney. ABSOLOM.

CAUGHT WITH A ONE-PIECE BAMBOO ROD AND LARGE MINNOW
(See letter "A 65-pounder from Norway")

INCREASE OF NESTING CURLEW

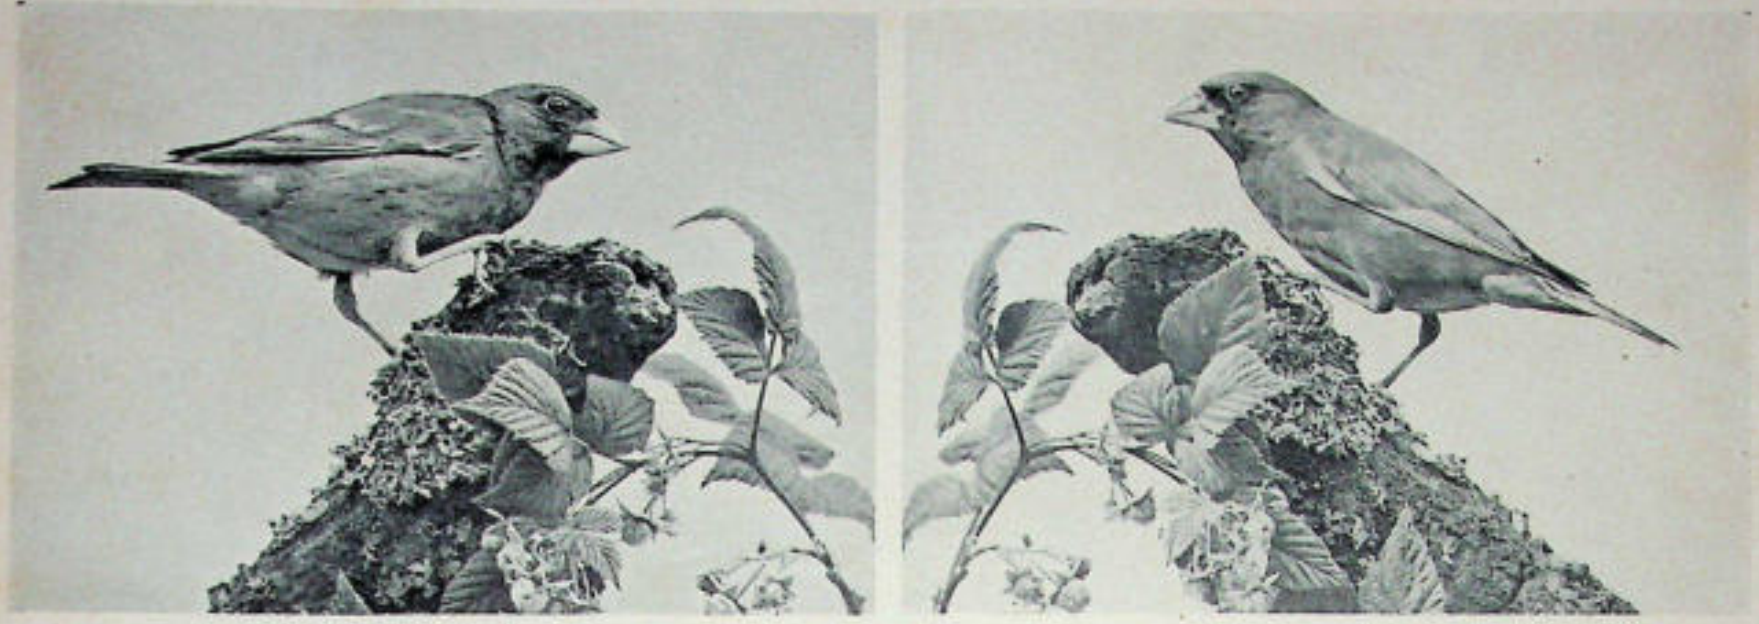
SIR,—I have noticed a considerable increase in this part of South Pembrokeshire of curlew nesting this season. Before this spring, where an occasional nest has been found several more have appeared, generally to be found in small patches of rush or bracken. While visiting Monmouthshire in May one constantly heard the charming love-call of curlew, so I do not think their increase was confined to this county. I wonder if others have noticed the increase? Directly the young birds are strong enough the parent birds seem to move them to the Milford Haven estuary only a few miles away, where no doubt they find plenty of food for their growth.

South Hills, Yours faithfully,
Milton, Tenby, S. W. BOWEN-SUMMERS.
Pembrokeshire.

ROPE MAKING

SIR,—You were kind enough to publish last January a photograph and letter which I sent you concerning rope making in the Bloody Foreland District, Co. Donegal.

I was abroad at the time, but my attention was called later to a letter in the *Field* saying that I had been misinformed, as the ropes illustrated were only used for small stacks. The matter, of course, is not of much importance, but I like to be accurate, so may I say that the information as to the use of the ropes was given me on the spot by the girl in the photograph. Also, that a few days later, near Letterkenny, Co. Donegal, I took another photograph of three men roping a large stack, and using these very ropes of twisted hay. This photograph was, unfortunately, a failure, otherwise I had intended to send it you as a companion to the one you printed. May I add that, to the best of my recollection, the haystacks in the Bloody Foreland district are mostly small, so that in one way your correspondent is right.



Yours faithfully,
Cheltenham. DORIS HANNA.

A 65-POUNDER FROM NORWAY

SIR,—The enclosed photograph which I took of an exceptionally large salmon may be of interest. The fish was caught at the mouth of the River Driva, near Sundalsoera, Norway, on May 29th, 1939, and weighed the next morning 65lb.

It was caught by one of the villagers using a one-piece bamboo rod and large minnow, and he told me that the line broke a split second before the fish was gaffed.

Loup House, Yours faithfully,
Clachan, Argyllshire. ANGUS MACKINNON.

THE HEN AND COCK GREENFINCH
(See letter "Problems of Bird Photography")

PROBLEMS OF BIRD PHOTOGRAPHY

SIR,—All too often, when taking bird photographs, I have been bitterly disappointed with the final results. There are innumerable causes of failure, but I think one of the chief reasons for dissatisfaction is due to the absence of colour. The blue of the sky, the varying tints of the surrounding foliage, the often bright colouring of the birds themselves, that add so greatly to the attractiveness of the scene when the exposure is made, all appear, in the finished enlargement, plain black and white. What wonder that one is disappointed! I have recently had a marked instance of photographs failing to come up to expectations for the above reason. Here the greenfinch usually nests in the dense shade of evergreens. Consequently, it is a difficult although common, subject. As greenfinches come regularly to my bird table, I thought I would try to get some studies of these birds in a good light from one of the windows of my house. It was surprisingly easy. I chose what I thought was a suitable perch with the sky as a background and then started feeding round about with mixed birdseed. A pair of greenfinches came almost at once and very boldly. It delighted me to see that the cock was a particularly handsome specimen. In his brilliant green livery offset with yellow he reminded me of a little parrot. In contrast, the plumage of his mate was very drab, so much so that when she alighted on the perch I often, for a moment, failed to distinguish her from a hen house sparrow.

Technically, the photographs I took of this pair were quite good, but there was astonishingly little difference between the sexes. Should you care to publish the two enclosed enlargements your readers will be able to judge how dissatisfied I felt with my efforts.

Yours faithfully,
M. S. WOOD.
Windermere.

AN ALBINO SWALLOW

SIR,—A completely white swallow has recently appeared within 400yds. of my lodge in Norfolk.

It was, presumably, hatched from a nest of swallows under a railway bridge on the Midland and Great Northern joint-committee's line from King's Lynn to Fakenham, and was quite mature when I saw it.

It would be interesting to know whether albino swallows or martins are very rare.

Yours faithfully,
CEDRIC CLIFTON BROWN.
Congham Lodge, Hillington.

CLEANING THE DRAINS

SIR,—This photograph, taken at Bigby, Lincolnshire, shows a common sight at this time of the year in these parts and also in the Fen country. The drains become overgrown with weeds which are removed with the long rakes seen in the picture and deposited on the bank-side. As each portion of the drain is finished the wooden screen is moved further down the drain to stop weed floating to the parts already cleaned. These drains frequently harbour numberless rats, and it is no bad sport standing by with a gun or dog, especially if, as in many of these parts, the local council pay 1½d. per rat tail produced.

Yours faithfully,
"Rosmont," E. H. JOHNSON.
Brig Road, Barton-on-Humber,
Lincs.

AN IMPORTANT TASK WITH FINANCIAL AND SPORTING COMPENSATIONS
(See letter "Cleaning the Drains")

PUPPY FEEDING

SIR,—May I be allowed to point out to your correspondent Mr. E. La Coste that the behaviour of his bitch is by no means extraordinary, since it is the natural way for a dog to feed its puppies. The fact that she hunts and catches rabbits arouses a natural instinct, or rather accentuates it, and she merely vomits the partly digested rabbit as wild dogs do, since the undigested rabbit would be too much for the puppy to tackle with its only partly developed digestive tract. This method is very much akin to the one adopted by pigeons when feeding the young birds, with which most people are familiar, the partly digested food being known as "pigeon's milk."

I can assure your correspondent that the bitch has not evolved this method herself, but is really observing a law or instinct of nature. I have a bitch at the moment which also does exactly the same thing.

Yours faithfully,
City and Counties Club, P. H. G. COOMBS.
Peterborough.

SIR,—Mr. de la Coste's letter on puppy feeding is interesting. I, too, have an old Border terrier bitch. She has had many litters of puppies and, after four weeks, gets dreadfully bored by her enforced absence from the drawing room or the house where much is going on in which she wishes to join. She therefore endeavours to teach the pups to eat solid food: and if they do not care about it, they can go hungry—anyhow, she is free for the afternoon. She, too, offers them predigested rabbit; but should her puppies arrive in the spring, she visits hen runs in the vicinity and, each morning, places a freshly killed chicken in the puppies' box, pushing their noses against it, and finally leaving it with them. If I remove any of these titbits from the box they are quickly replaced by freshly killed specimens. Later, she puts bones, dog biscuit, and even bits of cake begged from the cook into the pup box, and steadfastly refuses to feed them more than twice a day.

Her puppies are always strong, fat, and have never had distemper.

Yours faithfully,
Lentran, Inverness-shire. C. MITFORD.

WOODCOCK SITTING IN JULY

SIR,—With reference to the letter from "A. H.," Monmouth, appearing in your issue of July 29th, I imagine that woodcock hatching in July is quite common in Ireland. I find at least one nest every year in Co. Wicklow. The latest date I know for the eggs to hatch is July 27th.

Yours faithfully,
DAVID L. ROBINSON.
Stephen's Green Club,
Dublin.

WHAT AILED THE FISH?

SIR,—I think the unusual behaviour of this fish was caused by a blood suffusion of the gills due to the injury of the tongue. This would produce a feeling of suffocation, and would account for the flurry in mid-stream and the subsequent rush to the side and the leap on to the bank. This in a fish is the equivalent to the towering of a bird when shot through the lungs.

I do not think pain had anything to do with it, for, like Mr. W. M. Hoggan, I have come to the conclusion that fish have a very low recording of pain.

Some years ago when worming for perch I foul-hooked one behind the eye, and the removal of the hook brought away the optic. In my disgust at this, to me, painful happening, I threw both the fish and the line back into the water, the eye being still on the hook. Within five minutes I had another bite, and brought to bank the same perch which had taken its own eye for bait. A case of this kind gives one food for thought. In spite of this happening I have never again tried to remove a badly placed hook without first killing the fish.

Yours faithfully,
Parkend, M. LEIGHTON RIDGWAY.
Moreton Valence,
near Gloucester.

CONDOR NESTING MATERIALS

SIR,—I have lived many years in Southern Patagonia, and during that time I have pulled down the beginnings of many scores of carancho's nests from the heads of water-pumping windmills on this property.

I have always marvelled at the amazing variety of articles which go to make up these nests, but not until I came across a rather more remarkable one than usual, a short while ago, did it occur to me that it might be of general interest to record the extraordinary collection of miscellaneous bits and pieces which go to make up the foundations of these nests, and of this one in particular.

I made the following list in my notebook as I threw each article to the ground: Three goose feet, three hare feet, one wing of a seagull, one foot of a seagull, a lamb's foot and back quarters, calefate twigs, odd galvanised coach nails, one sheep's foot, oil caps off the windmill, a 2ft. length of ½in. rope, small piece of wire netting, the top of a sheep's skull, horse and cattle manure, wool, half the skeleton and piece of fur of a skunk, bits of sacking, dried grass, horsehair, at least 10yds. of five different sorts of wire, which, besides the two or three gauges used in the local fencing, included a short length of very find gauge steel hawser of a type I have never seen within many miles of this isolated spot.

I also enclose a photograph of a carancho's nest and eggs, which I found built in a calefate bush. The nest contained, as can clearly be seen in the photograph, one normal egg, coffee coloured with dark red-rust splashes; one a fairly even café-au-lait shade all over; and a third almost pure white.

The colouring in these birds' eggs often varies quite considerably, though I have never seen or heard of such complete lack of colour pigment as in this case.

It would be interesting to know to what extent pigmentation varies in the case of other birds.

Yours faithfully,
Estancia "Condor," E. M. DAVIES.
Rio Gallegos, Rep. Argentina.

CHAFFINCHES AND CONFETTI

SIR,—In the *Field* for August 5th your correspondent, Mr. G. Landon, mentions a chaffinch's nest "ornamented" with confetti. I have a record of at least one other case in which confetti was used, and have found other chaffinches' nests in which chips of light-coloured touchwood, fragments of white paper, bits of white lint, strips of green and red paper and green leaves, respectively, were used in a similar manner.

A VARIED PIGMENTATION
(*See letter "Condor Nesting Materials"*)

It is well known that pieces of lichen are often attached to the outer surface of the nests of this species, but their presence is protective only in so far as they help to assimilate the nest to its environment: when they do not they attract attention. Perhaps the use of confetti, and other bizarre substances, is an extension of the "lichen" trope.

Most nest building is instructive, not intelligent, (*i.e.* "primary" not "secondary" behaviour in the technical sense); it is on record that a young greenfinch builds a typical nest in its first year, and I have proved the same myself with a song-thrush. Chaffinches using unusual and conspicuous nesting materials will attract enemies and fail to bring off their broods, in fact the other confetti nest was destroyed. But to assume that some chaffinches have a decorative sense because some of their nests seem to us decorative is dangerous; we do not know what is in a bird's mind, but it is very certain that it differs greatly from ours.

Yours faithfully,
Holt Anstiss, E. W. HENDY.
Porlock, Somerset.

A KINGFISHER'S ROD PERCH

SIR,—The following incident may be worthy of record. I was fishing the Kennet recently, and while in the act of recovering my line after a cast, a kingfisher perched on my rod about 3in. from the top. He then flew off downstream and perched on a railing about 35yds. away on the opposite bank. He sat there for five minutes, looking at me, obviously wondering what it was all about, then crossed the river and flew off down a sidestream.

I know that there have been fairly frequent instances of this, but have always supposed that they were confined to cases where the fisherman was sitting in a boat, or on the bank of a river, watching his float and practically motionless.

My impression was that he was a young bird. He certainly did not appear to be in the least alarmed.

Yours faithfully,
Harbrook, H. UNDERDOWN.
Ramsbury,
Near Marlborough,
Wilts.

AN UNUSUAL LANDRAIL'S NEST

SIR,—Since my letter of July 22nd entitled "A Landrail's Nest" appeared, a dog when out with its master killed a landrail chick on Garburn Pass, Westmorland, late in July, at a height of 1,500ft. above sea level. It was about ten days old and the old bird was seen to have other chicks with her which escaped unhurt. I have not heard of a landrail nesting on such high uncultivated ground before. Surely this must be unusual.

Yours faithfully,
Fayrer Holme, CATHERINE M. CLARK.
Windermere.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, ask your help for a brave old widow of 85 who is suffering from heart disease. She lives in a tiny flat, but her sister is only next door, and Mrs. G. knows that if she feels ill and knocks on the wall there is always someone there who will answer her call. Mrs. G.'s medicine costs 3/- a week and her rent 11/6, so that the old age pension of 10/- weekly is quite insufficient for her needs. Her sister is unable to give her financial assistance as she has a family of her own, but people interested in her will guarantee 13/- weekly provided we give 5/-. Will you help towards the £13 needed so that Mrs. G. may end her days where she is well cared for?

IN THE CITY

By OUR CITY EDITOR

RETAIL trade statistics compiled by the Board of Trade indicate that much of the money now being spent by the Government on rearmament is percolating through to the shopkeepers. More people are earning good wages, and these are being spent more lavishly on the ordinary needs of life.

One section which should benefit considerably from this addition to the national spending power is that dealing with the needs of the male portion of the community, such as clothes, hosiery, boots, &c. In this section there are a number of companies whose records prove them to be worth the careful consideration of investors.

Take, for instance, Austin Reed, Ltd., men's outfitters, hosiers, hatters, &c. with shops in London, Birmingham, Bristol, Glasgow, Leeds, Liverpool, Manchester, Norwich, Oxford, Sheffield, Southampton, Coventry, Hull, Plymouth, Nottingham and Edinburgh. Its issued capital is £752,509, of which £252,509 is in ordinary £1 shares, on which dividends of 10 per cent. have been paid for many years past.

The balance sheet is a good one, reserves having been accumulated totalling £150,000 and net liquid assets amounting to £288,803 being shown. At about 32/6 the ordinary shares offer a yield of £6 3s. per cent. There are also in issue 5 per cent. preference shares valued in the market at 21s. These may be regarded as a very sound investment, the dividend being covered more than six times over by profits.

Another company in the same line of business with branch shops spread just as widely throughout the country is Hope Brothers, Ltd. This company's capital is £700,000, of which £400,000 is in £1 ordinary shares. Profits suffered somewhat last year from the uncertain political conditions, and only 6 per cent. was paid as compared with 8 per cent. previously. As a result the shares reacted to 18/3. There are also in issue £300,000 of 5½ per cent. preference shares quoted at 19/6, the dividend on which was covered two-and-a-half times over by last year's profits.

On the manufacturing side of the hosiery business we have R. & H. S. Rogers, Ltd., shirt, collar and pyjama manufacturers with factories at Bermondsey and Coleraine. Dividends of 12½ per cent. have been paid on the £90,000 of ordinary capital. It was not quite earned last year owing to the special difficulties, but business is stated to have improved again in the current year. The £1 shares are valued at 28/3, while the 5 per cent. preference shares, covered three-and-a-quarter times over, are quoted at 18/9. The balance sheet shows reserves totalling £75,000 and liquid assets amounting to £207,369.

Boots are another requirement always in demand. One of the foremost companies covering both the manufacturing and the retail side of this industry is J. Sears & Co. (True Form Boot Co.), Ltd., which controls Freeman Hardy & Willis Ltd. Between them the two companies own 836 shops, depots and factories. The issued capital is £3,354,530, of which £531,250 is in 5/- ordinary shares quoted at 13/-. Last year they received 15 per cent. less tax as compared with 13½ per cent., free of tax, for the preceding four years. The capital is rather highly geared, there being £2,000,000 in 7 per cent. preference shares. These can be bought for 23/6 to yield £5 19s. per cent.

Then last but not least come the clothing companies of which Montague Burton, Ltd., is an outstanding example. It owns factories at Leeds and Walkden in Lancashire, and has about 620 retail branches throughout London, the provinces, and Scotland. Its issued capital is £5,229,163, of which £2,229,163 is in 10/- ordinary shares quoted at 12/3. At this price they yield £5 14s. per cent. on the dividend of 7 per cent. Here also there is an attractive 6 per cent. preference share obtainable at about 22/-.

LION CUBS AT EDINBURGH

The most recent attraction in the Scottish National Zoological Park, at Edinburgh, are two baby lions, which were born some days ago. Their mother is "April," one of three lionesses presented to the Park by H.R.H. the Duke of Kent, and their father is "Simba," a young lion which came here last year from Zanzibar. Following the practice lately adopted in the Park, when lions are born the father has been left with his family, and the cubs are being allowed access to a rock den from the very beginning. When "Topsy's" last family was born she made a strong point of getting them into the rock den, and they spent most of their time in the open. "April," however, is apparently not quite so confirmed a believer in the value of fresh air and exercise, and prefers to keep her cubs in the cage. They are, however, on view most of the time, and are a source of great interest.

BUDDING GOLF CHAMPIONS

The Value of Tournament Play for the Young

By E. R. TIPPLE

J. BRUEN STARTED HIS CAREER AS A GOLFER BY WINNING THE BOYS' CHAMPIONSHIP IN 1936

WHAT age should a boy or girl reach before being allowed to play golf? This is a controversial question, the answers to which vary according to individual opinion. Even to-day there are many people who regard golf as an "old man's game" and consequently would not permit their children to indulge in it, however logical might be their plea. Others do not mind youngsters playing during the holidays, providing they do not inveigle their parents into any matches! but would object to the game at school. A few encourage their sons and daughters to play and to practice as much as possible, hoping that the family may bring to light a budding champion.

Probably the chief objections to golf are that it is a selfish game and that it does not promote that team spirit which, so we are told, is so important for the young. Undoubtedly golf can be regarded as a selfish game, just as a man who sets up in business for himself is selfish in working on his own behalf. The game, as a general rule, may not promote team spirit but on occasions, as in the Halford-Hewitt tournament or inter-club matches, interest is shown in the games of one's fellow-members.

Team spirit may be an essential for a youth whilst at school, but when he leaves he needs something more than that. Golf can be a great builder of character; it can teach youngsters to rely on themselves and their own capabilities, and it can bring out the value of self-discipline. Golf demands a control over the emotions, and it teaches youngsters to fight against odds, and not to admit defeat until a game is actually finished.

For these reasons alone I think the young should be encouraged to play the game if they wish to do so, but no boy or girl should be forced to play when they prefer other games. The time to learn and acquire a really good swing is when your muscles are supple. If one waits until that unsympathetic period of one's life—middle-age—the prospects will not be cheerful. How often is the remark heard, "I wish I had started playing earlier; then I might have had a chance of doing something."

During the holidays golf "keeps youngsters out of mischief," as I heard one parent say, who does not approve of his son playing at school. Surely there can be no objections to golf if it does not interfere with organised games? Very few schools possess their own private courses, so during term time the opportunities the boys have of playing golf are limited. Some boys cycle several miles to the nearest course when they can, and surely this is better than their going for idle walks? Just because a boy shows promise at golf, it does not mean that he is no good at other games. Lucas was captain of football and cricket when at Stowe, yet he played golf as well. So did Langley, who also participated in Walker Cup golf; yet he, too, managed to excel at team games, notably cricket. Other examples could be given to prove that golf is not just a waste of time for schoolboys, tending to disturb their regular games.

Just being allowed to play golf is not enough—enthusiastic youngsters need to be encouraged to play in competitions which will provide the necessary incentive for them to improve their play. The Boys' Championship, which is being played this week at Carnoustie, has been the means of bringing to the fore many international golfers. It may not be generally known that Henry Cotton took part in the very first championship—at Ascot in 1921. And he was not successful either! Others who have played in this event include J. Bruen—winner in 1936—Hector Thomson, J. McLean, P. B. Lucas, J. D. A. Langley, and John de Forest. Without such early experience of tournament play would these youngsters have progressed as they did to Walker Cup honours and to win Open and Amateur Championships?

This Boys' Championship is one of the most important of all competitions, and is a valuable asset to British golf. It acts as a training school for promising young players. It is criticised on the grounds that many who take part in it become snobbish, that several of the competitors are likely to be ruined by the publicity they receive and likely to gain a false impression of their own importance. I have played in it myself on two occasions, and watched on many more, yet I have never witnessed any incident upon which adverse comment could be made.

Such a tournament, instead of making egoists, humbles any who show signs of being swollen-headed. It acts as a levelling process. The local hero, accustomed to admiration at his own course quickly discovers he is not so good as he imagined himself to be. Then, if he possesses any ambition at all he will set about improving his standard of play and be keen to do better next time. I write from personal experience, for when I first entered this event my opinion of my own prowess was not modest. After being quickly and decisively beaten I returned home with more humble ideas.

The emphasis that is put on long hitting by the boys is not wise. One reads in a report that a boy is considered to be a long driver. So next day he says to himself: "All right; they say I can hit the ball, I'll show them I can do better still." He becomes obsessed with the one idea of length at all costs. Another boy whose feats were not reported says to himself: "Blank is a long hitter is he, I'll show the crowd I can beat him." He, too, begins to worship the god of length and concentrates on long driving.

Terrific drives may be spectacular to watch, but they do not win competitions by themselves. Youngsters should be made to realise that there is more in the game than prodigious hitting. They would be wiser if they were not proud of "my drives at the tenth and fourteenth," but because they took only 30 putts during the round. Even the finest professional returns only mediocre scores, relatively speaking, when his putting is indifferent. So young boys and girls should be brought up with the idea that the short game and accuracy through the green are the essentials.

More competitions are needed for the youngsters, particularly during the holidays. To play golf properly requires not only physical fitness but also grounding in its fundamental principles. The earlier one starts getting this the better.

PHENOMENAL PUTTING

Padgham's Great Golf at Brighton

IN a season that has been conspicuous for the unusual number of ties and close finishes, A. H. Padgham's comfortable victory at Brighton last week was particularly noteworthy. With an aggregate of 279—one of the lowest totals ever recorded in an important tournament—he won by the wide margin of five strokes. This is his second big success of the year, for he won at Moor Park in the spring beating R. Burton in the replay.

Although accustomed to low scores, no one was prepared for such a remarkable return as Padgham's 64 in the second round. Nothing like it has ever been accomplished before in a major tournament over a course measuring 6,800yds.

In establishing this record, the former Open Champion was so accurate with his long shots that he was only twice off the fairway. However, his length—obtained with that apparently care-free, easy style—was not the deciding factor, but his phenomenal putting. He needed only 26 putts in the whole round—beginning with a single putt on each of the first five greens. Yet he took 4 at each of two short holes—to show he was human, and not a machine—but had eight "birdies" and two "eagles" elsewhere.

With King losing ground in the third round, the question was whether Padgham would suffer from having too big a lead. Despite the consistent golf of Alliss and W. J. Cox he was not to be trapped, and with complete confidence left them trailing far behind. In a tournament that was instructive from the Ryder Cup team point of view, it is interesting to note that only eight players managed to equal or better an average of 4's, whilst 27 equalled or beat the par score of the East Brighton course, 74 for the four rounds.

Burton, the Open Champion, finished far down the list with 298, but has obviously not recovered from his dental operation.

INDOOR FLORAL DECORATIONS

Universal Popularity of Spring Bulbs

By ELEANOUR SINCLAIR ROHDE

FEW indoor plants are so universally popular as the spring bulbs which flower during the bleakest weeks of the year, for the vivid colours of the flowers are suggestive of blue skies and the sunny shores of the Mediterranean. Immense bowls of these bulbs in flower are fashionable now, but I think it is a mistake not to make more use of the smaller bulbs such as Campanelle Jonquils, Muscari and Crocuses, for charming miniature gardens can be made with them in wide shallow bowls with a judicious addition of moss-covered stones, &c.

The earliest bulbs to flower indoors are Roman Hyacinths and the specially prepared miniature Hyacinths. Roman Hyacinths are not so popular now as formerly, for white is the least desirable colour in early January, but in the specially prepared miniature kinds the colours range from white to yellow, blue and crimson.

So far as the very large Hyacinths are concerned I have come to the conclusion that the best way of growing these monsters is in tin-lined baskets, and the baskets we use are the thick plaited kinds like waste-paper baskets in shape and obtainable from any greengrocer for a few pence each. They are the sort in which new potatoes are sent from the Channel Islands, &c. Even in very large bowls Hyacinth roots do not stand a fair chance, for they have to curl round and round. Given a depth of 18in. the roots go straight down and the giant Hyacinths grow nearly 2ft. high. Standing on the ground these baskets look very effective. If there are drainage holes in the linings of the baskets the bulbs can be grown in soil, but if unlined they must be grown in the prepared fibre commonly used for bowl culture. Blue, pink and yellow Hyacinths are the kinds that make the best show. Red Hyacinths are always a little difficult and seldom make such large heads of flowers. Jan Bos and King of the Belgians are two of the richest reds.

Crocuses are amongst the earliest bulbs to plant for indoor decoration, for they always do best if put in in August. The gorgeously coloured and vividly striped kinds which attract every eye at shows are particularly effective. Last spring one well-known firm had some outstandingly fine hybrids.

Yellow Crocuses can never be grown indoors, for they do not tolerate the slightest forcing, even that of a cold greenhouse with no artificial heat whatever. The only way is to plant them in wide shallow pots (about 6in. deep) with good drainage and plunge them out of doors in peat fibre or weathered ashes. The bulbs should be planted as thickly as possible, *i.e.*, touching each other. When the buds show colour they can be brought indoors and, being safe from birds, &c., make a lovely display of golden colour. Indoors yellow Crocuses seem to catch and intensify every ray of sunlight. They look best not in coloured bowls but terra-cotta pots, preferably pots with straight sides.

Other coloured Crocuses can be grown in shallow bowls, and I think they look more effective in pebbles than in fibre. If pebbles are used it is essential to put a good layer of crushed charcoal at the bottom of each bowl.

In the case of all bulbs grown in fibre the fibre has to be prepared first by thorough moistening. It should be damp all through, but of such a consisteney that when a handful is squeezed no moisture drips out. Rain water is ideal or soft water failing rain water. The bowls should not be rammed with the moist fibre, but merely filled, as if too tightly packed the roots when they begin to grow will force the bulbs upwards. Plant with the tips below the surface. It is fatal to start bulbs in a cupboard, for they cannot get enough air. A cool cellar is the best place. Darkness is essential to encourage root growth. In a cellar with any form of artificial heating the bulbs cannot be expected to make good. For the first few weeks very little watering is needed, and none should be given unless the surface fibre is dry.

The easiest way of giving bulbs, or for that matter any plants grown indoors, a severe check is to give them water straight from the main. In winter especially this water is icy-cold and the results will be poor and late-flowering. The water, if from the main or rain water from an outside butt, should stand in the same temperature as the plants for twelve hours before being used.

Daffodils never seem to do so well in fibre as in soil. The best compost for them, as for the majority of bulbs, is two parts good loam and one part prepared peat or leaf mould, sharp sand and a little bonemeal, allowing a pound of bonemeal to every bushel of soil. The compost should be thoroughly well mixed but not sieved. Clean pots are essential, but if washed cannot be used till perfectly dry. New pots have to be soaked and not filled till quite dry. The best Narcissi for bowl culture are King Alfred, Alice Knights, Mrs. E. H. Krelage and the Jonquils.

PROFITABLE WOODLANDS

By REGINALD DAVEY

IN order to encourage the commercial management of private woodlands, very extensive tax concessions are made. So wide are they that not infrequently they achieve their object. This is to turn a loss into a profit and make the setting in order of the woodlands on a private estate a matter which the owner not only can afford to undertake, but will be money out of pocket if he ignores.

When woods are managed on a systematic plan a crop worth from £100 to £200 or more per acre can be taken each year, the replanting costing from £10 to £12 per acre. The earliest maturing conifers cannot be cut before the 60th year, so that in the case of woodlands previously neglected, it is the cost during the years of planting that must be met. If the woods are fairly well stocked with timber, from £50 to £70 per acre, then generally speaking the owner can undertake commercial forestry with the knowledge that he will make a definite, if small, profit each year.

In the case of neglected woods where the average crop is below these figures, then for the first few years a loss may be inevitable; but examination will often show that what was thought to be a loss is in reality a profit.

For every estate of any size, one, two or more men are employed in the woods, if only on ride-trimming for the keeper. If there are two men their wages will come to £250 per annum, if sundry expenses are included. For commercial forestry a third man will be needed, and trees and netting must be bought. The costs will increase to £400 per annum, and if this overtops the revenue, then both income tax and surtax can be recovered on the deficit, which will, in this case, reduce the annual outlay to less than £200 per annum, if the owner pays income tax and surtax at the combined rate of 10/– in the £.

The recovery of income tax and surtax is a matter of procedure. Woodlands suffer tax under Schedule A in respect of ownership, and relief for excess cost of repairs can be recovered in a maintenance claim as described in the article of August 5th. Tax also is paid under Schedule B in respect of occupation, at one-third the annual value, which is usually one-third of about 2/6 per acre.

If the woods operate at a profit tax, will normally be paid on this nominal assessment, but if they consistently show a loss and are managed on a commercial basis, the owner may elect to be assessed under Schedule D in respect of the loss or profit for the preceding year. This election lasts so long as the owner lives, but on his death the basis of Schedule B revives.

A father is thus able to secure the benefit of tax recovery under Schedule D, for the production of plantations, which, after his death, will become the property of his son and be cut, the son receiving the proceeds, but paying tax only on the nominal Schedule B figure each year.

As in the case of a farm loss claim, the loss on woodlands is set off against the owner's other income for the purpose of income tax and surtax recovery. But woods receive even more favourable treatment than farms, for each new plantation formed may be treated as woods on a separate estate, and assessed under Schedule D after the timber is felled but before replanting.

On estates with a valuable crop of standing timber, this allows the owner to fell trees, paying tax only on the nominal Schedule B figure, and to replant with recovery of income tax and surtax on the cost under Schedule D.

It is very extraordinary that all this persuasion should be necessary to prove to landowners that it is in their own interest to plant up their woods. It forms a first-class insurance against death duties, and one that is not aggregated, so does not increase the dutiable value of the estate as does insurance. With thinnings giving profitable returns after about the 25th year, and a mature crop of conifers at the 60th year, it is the finest possible endowment for a son.

Plantations of light-demanding trees form first-class coverts up to their 20th year, and are preferred by pheasants to the usual timber and underwood.

Recent research in coverts shows that woodlands properly laid out and planted with timber-producing species can hold twice as many pheasants as the same woods not laid out, and with overgrown underwood and little or no ground vegetation. An equally important point is that correct covert and flush point design means a higher proportion of birds driven over the guns. This would represent an increased shooting rent of 1/– or more per acre.

BERBERIS STENOPHYLLA CAN BE CLIPPED AFTER FLOWERING, AND MAKES A FINE SEMI-FLORAL HEDGE

HEDGES FOR EVERY PURPOSE

By RICHARD SUDELL, F.I.L.A.

WHAT is the *best* hedge? The answer is more involved than might be supposed. It depends on what is wanted from the hedge, where it is to be grown and on various other matters.

To take the various types of hedge: the first is the boundary hedge in a district where cattle pass along the roadside or graze in adjoining fields. A hedge of this kind must be strong, and preferably thorny, so that it will keep the animals at bay. Nothing has yet been found better than the common thorn hedge for this purpose. It lasts indefinitely, it keeps its uniform appearance from base to tip, even to a height of 10ft. or more, after fifteen or twenty years of growth—that is, of course, if it is properly cared for by the gardener.

Thorn hedges have the one disadvantage that they are not evergreen, and though this does not matter greatly where field boundaries are concerned, a deciduous hedge along the road frontage of an estate is often frowned upon by the owner. Holly can be mixed with thorn if desired, one plant to six of thorn.

A hedge, every bit as thorny and impenetrable as that of quickthorn, can be made by planting one of the evergreen Barberries—*B. stenophylla* or *B. Darwinii*—but this is rather costly where long boundaries are to be hedged. A mixed hedge of holly, thorn and beech is decorative and useful. The beech retains its winter russet foliage, and this contrasts well with the dark holly, while thorn grows quickly and helps to thicken the hedge and make it impenetrable.

In residential suburban areas, where hedges are really more ornamental than necessary, and if necessary are so only to ensure privacy, not because forraging animals must be kept out, a different type of plant can be used.

Flowering shrubs, or shrubs that colour well in autumn and carry berries in winter, are ideal for these hedges. For tall screening hedges heavy evergreens can be used—rhododendrons, laurustinus and Portugal Laurel are good. These should be given plenty of room and allowed to grow rather naturally. They are not suitable for formal clipping. *Berberis stenophylla*, on the other hand, can be clipped twice annually, and will still flower brilliantly in April, so that a semi-formal hedge can be made.

Smaller floral hedges can be fashioned from Cotoneasters of several kinds, from Forsythia, Osmanthus, Rosemary and Lavenders.

Flowering hedges of good appearance, but not necessarily evergreen, are sometimes acceptable for suburban garden boundaries, particularly when they are used in association with a low stone or brick wall. Penzance briers, for example, make a good hedge if well trained, and *Berberis Thunbergii atropurpurea*, which has purplish red summer foliage and glorious autumn tints, is another good subject.

Internal hedges in a garden are in a different category from the boundary hedges. They can be divided into three groups, according to their purpose.

First there are the hedges that are intended as screens, either against wind, when they should be thick belts of shrubs and trees, or just to secure privacy in certain areas, when they can be merely light trellis with roses or clematis over it, or a thin line of evergreens.

The wind-screen hedge is usually one of the first things to be planted in a garden, and in a seaside garden it may be practically impossible to get on with other parts of the design until some wind-screen is provided. The method of shutting out ocean breezes is this: first a belt of land on the exposed side of the garden is marked out. As much as 10ft. width is desirable, but naturally the area that can be spared depends on the size of the garden.

At a point about 6ft. from the boundary a wide and deep trench is excavated, the soil removed being piled up between the trench and the boundary line. A row of wattle hurdles fixed on the ridge serve as protection until the planting is established.

The trench itself is then filled in with good soil, and in this trench are planted young shrubs of good seaside temperament—Euonymus, for instance. Inside that might be a line of Tamarix, and if the garden is large a row of pines or other conifers, or perhaps evergreen oaks, and then more shrubs, so that the fully grown belt is like a rounded ridge in outline. This breaks the force of the winds, and each row of shrubs or trees shelters the next.

It is generally desirable to mix evergreens and deciduous shrubs in a wide shelter belt. Deciduous trees in particular are useful; they provide good backgrounds to the garden in summer, and in winter, though they break the force of the winds, they do not offer such resistance that the tops are broken, as is very often the case with evergreens.

The second use of internal hedges is to divide sections of the garden and so add to its interest. Here, too, the hedges may be tall or dwarf according to circumstances. It is sufficient division between a sunk garden and an open landscape if a hedge of lavender is set on the top of the retaining wall, but if the old sunk garden is turned into a modern bathing pool, a tall hedge of laurel or yew might be preferable. Generally it is wise to consider the use of floral or autumn tinted hedges first, as these hedges are essentially a part of the garden pictures. Common privet as an internal hedge would be intolerable. Out of the way subjects, such as fuchsias (*F. Riccartonii*), hydrangeas (*H. hortensis*, in sheltered gardens), double flowered Gorse (where dogs are to be kept out), or the showy Veronicas, blend gracefully with most sections of the flower garden, and form ideal backgrounds for narrow flower borders, or edgings to flagged paths. Double hedges, with a centre walk of stone or brick, or with just a wide grass path between, are good substitutes for the pergola when parts of the garden are to be divided, but not fully screened from each other.

Lastly, there is the use of hedge plants to tie up the garden design. Examples of this use of hedges can be seen in many old gardens, where Yew is extensively planted. Often the hedge of Yew is desirable not so much to screen parts of the landscape as to link each separate feature and give a grateful feeling of unity to the layout.

Yew, of course, is the hedge par excellence, and not nearly so slow growing as gardeners are inclined to think. Its particular virtue is its permanence. One can cut an old Yew hedge back into the old wood, and it will not die. Moreover, it needs rather less clipping than most formal hedge plants. *Lonicera nitida* and privet must be clipped far more frequently, because of their rapid growth. *Cupressus macrocarpa*, which gives fine imitations of old yew hedges after five years, generally looks decrepit and patchy after the next five, and the other Cypresses are not much better for formal hedges.

HORTICULTURAL ADVICE

How to Plant Daffodils

By CARTHEW ALLERDYCE

A RELATIVE of mine would not be without his daffodils for worlds. He calls them his "Jolly Companions." He says that they make just all the difference to him in the spring and he looks forward to them, perhaps, more than any other flower.

He has got them growing almost everywhere. He plants them in the north border underneath shrubs. He has them in the grass orchard by the thousand. He has them planted to flank the drive to the house. He even has them in the hedgerows. He has baby varieties in the rock garden, special types on a bank. In fact, you can say that his garden is a riot of gold at daffodil time.

I suppose I have caught the fever from him, for I think I have planted more daffodils this last few years than ever before. I conceived the scheme of planting a ring of daffodils round every tree in the orchard, and each tree is blessed with a different variety. In this way it is quite easy to label the different kinds and get to know about them. Visitors, too, are interested in studying them.

Another thing I have done is to plant a row all the way down the edge of the wire around the tennis court. Here again it is possible to plant 20 or 30 of one variety, 20 or 30 of another variety and so on, and to hang the labels up on the wire-netting.

The bulbs are not put in in serried lines, but they do follow the edge of the wire-netting (roughly), and no bulbs come out too far into the "runback" to prevent proper mowing being done when the early tennis season starts.

I always find that the early planted bulbs succeed best. All narcissus should be in by the end of September and also the Poeticus types, as far more harm is done to them by late planting than in any other way. Large bulbs can be planted at a greater depth than small bulbs, and it is generally accepted now that shallow planting produces earlier blooming.

Naturally, the depth of planting differs with the type and class of soil. On light land in the West, for instance, daffodils like Ornatus can be planted 3in. deep, while in Lincolnshire the best results are obtained from 4in. deep plantang. Emperors, especially if they are large, may be planted 5in. deep. These depths mean from the surface of the soil to the bottom of the bulb—this is important.

There are many firms willing to supply daffodils for early planting: Messrs. Dounard Nursery Company, of Newcastle, Co. Down, Eire; Messrs. Cross and Co., of Wisbech, Cambs; Messrs. Peeds, of West Norwood, S.E. 26; Messrs. Clibrans, Ltd., of Altrincham; and Messrs. Dobbies, of Edinburgh. I shall be glad to have catalogues sent to any readers who care to drop me a post card.

In order to get a natural effect when planting in grass it is best to just throw the bulbs on to the grass in a haphazard fashion—though not from a great height—and then to plant them exactly where they fall. When they are placed "naturally" they never look natural. Though this throwing method is decried by some gardeners for fear of bulb injury, it certainly does give the most natural effect and, further, there is no need to throw the bulbs higher than from knee height.

In grass there is no need to plant the bulbs as deeply as in cultivated land. Holes can be made with a trowel or with one of those special bulb-planting implements that remove a circular ring of turf and replace it just as easily.

In some gardens daffodils are grown as cut flowers in rows 9in. apart, the bulbs being 1in. or so apart in the rows. In the Scilly Isles the growers leave a path 18in. or 20in. wide for every eight rows and use the soil thus left unplanted for what they call "grooting"; that is, the covering of the beds with soil, in a similar manner as asparagus beds are treated. This grooting work is done early in August, the soil being left there until early in the autumn.

Weeds are always a nuisance with bulbs in cultivated land, but calcium cyanamide may be used at the rate of 1oz. per square yard just as the foliage appears. In this way the weeds are controlled without much damage to the foliage. To get the best blooms on cultivated land it is not advisable to dig in farmyard manure before planting, but to give a really heavy dressing of dung to the previous crop.

The ground, before planting, should receive the following mixture at 4oz. or 5oz. per square yard: Superphosphate, one part; fish guano, one part; basic slag, two parts; sulphate of potash, one-and-a-half parts. On light land potash is specially important, though it never gives good results alone. It is necessary to have the organic matter there, plus some available nitrogen.

SAFETY AND THE CHILDREN

America's Energetic and Imaginative Plans

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

IT has long been my firm conviction that one of the finest methods for ensuring safety upon the roads is by educating the coming generation in the principles underlying safe walking and safe driving. I know that sincere efforts are being made in our schools to inculcate an understanding of existing road conditions in the children, and there are various admirable schemes for teaching the young the fundamentals of good conduct upon the roads. While these efforts are praiseworthy, it seems that they are altogether too isolated and spasmodic. Undoubtedly they confer benefits upon the children fortunate enough to take advantage of them, but the pity is that there is not a regular safety lesson in the curriculum of every school in the country so that a knowledge of personal safety should be regarded as equally important as competency in the three Rs.

Safety organisations in this country do excellent work among the children, but there are obstacles in the way in the shape of stubborn officialdom and —with some schemes—parental disapproval. Because of opposition from such sources workable proposals similar to that encouraging school children to form road prefect systems or safety patrols, have not made the headway which they deserve. Such schemes have been tried and not found wanting in the United States, and judging by reports received from the other side of the Atlantic, the majority of American children are becoming increasingly traffic conscious.

Through the National Safety Council of America, whose membership includes State and municipal services, public service and civic organisations, schools and other community groups, as well as private individuals interested in the prevention of accidents, thousands of children benefit directly from the advanced methods evolved and developed by experts on road safety.

The aim of this council—like that of its British counterpart—is to instil safety consciousness not only into schoolchildren but into the public at large. Certain of the methods they employ are ingenious and compelling, and I feel certain that they will—over a period of time—prove successful.

In Garfield, in New Jersey, for instance, each of the ten schools in the city has been provided with a large, clear map to be hung in the corridor. These maps indicate the crossings within the vicinity of the school which it is safest for the pupils to use. Apart from ensuring that the children will leave and arrive in the neighbourhood of the school safely, the maps will probably prompt the pupils to select the safest route for the entire journey home.

When the schools are dismissed for the day, the children are filed out two abreast to the points considered to be the safest crossings. Here they are shepherded across by patrol boys, who use bamboo poles painted black and white as "traffic gates." Personally, I am of the opinion that instead of being marched across the highway in "crocodile" fashion, it would be better to adopt the "wave" system. This means that the students are formed up four abreast and marched along the pavement. The column is then halted, told to turn to the right or left and then marched across the road in a compact "wave."

The advantages of this method are that it is quicker, and it does not upset the regular flow of traffic as might be caused by "crocodile"—or two abreast—style of marching. A recent experiment in England with the "wave" system proved that 300 pupils could cross the road in 10 seconds, whereas by marching "crocodile" fashion the move would have taken two-and-a-half or three minutes.

However, to return to America, the patrol boys conducting the crossing are specially instructed in their duties, and are thoroughly drilled in what they are called upon to do. Each patrol has a chief, a captain, a judge, a court clerk, a quartermaster and a safety adviser. It is found that in order to keep the lads keen and alert, the scheme is best run on a competitive basis so that at the end of each term the smartest teams are given awards. These patrols have been equipped with white raincoats and helmets to assist visibility in bad weather, while under normal conditions they wear a form of wide, white Sam Browne belt and a peaked cap. To make the work of these schoolboy patrols easier, no parking is permitted near to the crossing points. This scheme is run under the auspices of the Automobile Association of America, and was inaugurated originally about 20 years ago.

Various ideas and innovations for safety which are to be incorporated into the everyday life of the schoolchild must—if they are to be consistently successful—be devised so that a steady, unrelaxing interest is maintained by the pupils. This has not proved overwhelmingly difficult for it is found that normally once a start is made the pupils become extraordinarily enthusiastic, and once given some small responsibility they take a pride in the work. The distribution of merit awards and badges of rank keeps the competitive spirit alive, while the formation of school safety councils has been a means of developing the interest of the pupils.

Some of the advanced methods through which it is calculated that the pupils will imbibe the essentials of road safety thus providing them with a knowledge of the best means of preventing accidents, are worth recording. Different schools have adopted different techniques, but here is a selection of the outstanding examples.

For the schools and homes in Green Bay, Wisconsin, there is a weekly broadcast by the "Safety School of the Air." The programme is introduced by a safety theme song, which is followed by an anecdote telling of some of the dangers which beset children. The story is written and broadcast so that it will not only intrigue the children, but simultaneously create a lasting impression.

Students are invited to write safety playlets for radio use, while the "elocutionists" in the schools are called upon to speak the parts. Apart from the radio lessons, this area has other means of appealing to the children, and these are decided by a committee of teachers who are responsible for the safety activities in their own particular schools. This committee meets fortnightly and studies methods for the attractive presentation of safety material. Common problems are discussed and courses of study arranged together with contests and special forthcoming projects.

In another school there is a Student Safety Council whose members volunteer for after-school activity in instruction. This work has included the maintenance of a traffic accident map of the town in which the school is situated, and for this purpose access is given to the Police Department accident reports. A reckless driving committee interviews students who are considered to be careless upon their bicycles, and in exceptional cases this committee even send letters to parents requesting assistance in coping with the "dangerous driver." This same council make and display safety posters for the school building and write articles on the topic for the school magazine. Regulation of bicycle traffic in and near the school is undertaken in order to reduce the accident hazard as well as distributing safety literature to the children in their homes. They have seen demonstrations of the various equipment used by the State Highway Department and hear lectures by experts.

"School Safety Courts" have been tried in some establishments and worked according to plans formulated by the Chicago Motor Club. The school courts—officered by pupils—are designed to meet at regular intervals to hear and try cases of violaters of a code of safety rules which are laid down and distributed to every student. They have a judge, prosecutor, defender, clerk of the court and a jury, while witnesses may be called when necessary. This, I think, is an excellent idea, for it must be instrumental in preventing accidents because once "sentence" is passed upon some erring child, I imagine he or she is not prone to repeat the same mistake.

BACK-SEAT BLINDNESS

Drastic Re-designing May Solve the Difficulty

HAVING spent several days traversing interesting country in the back seat of a car, I am appalled at the limited views it provided. If I looked ahead a high scuttle and lowish roof line effectively reduced the picture except in the case of long-range scenes. In the ordinary close-up or middle distance views the upper parts of trees, buildings, mountains, clouds, and so on, had to be left to the imagination.

There was also the snag of dodging the front passengers' and driver's heads. And it is surprising how irritating this can become. You have just settled down in a position which suits you when the driver takes up a new perch and you have got to re-arrange your own.

If the body happens to be of the four-light type your view sideways is about 50 per cent. of what it might be, and your blindness is probably completed by an undersized back window, necessitating uncomfortable neck-winding in order to see anything astern, such as traffic cops or overtaking cars.

These experiences suggested lowering the scuttle line, raising the top of the screen, making the front seat passengers sit lower than those at the back, and placing the latter, at any rate in a four-seater car, in such a way that they did not sit directly behind the people in front. The remedies for insufficient side and back views are obvious, and could be effected by larger windows.

But another line of thought produced more far-reaching results. It started with the idea of putting more people on the front seat, so that they could see better. I believe that in America front seats are already able to accommodate four people. Well, let us consider three abreast for the time being. Many cars of to-day could seat three in front if the body were built out to the full overall width of the car. In other words, the outside edge of the seat would line up with the outer edge of the wings. This instantly suggests some sort of streamline form in which the contours of the bonnet, radiator and front wings are gracefully blended. Already there are signs of this sort of thing coming to pass. Bonnets are becoming lower, and soon, perhaps, their lines will blend and level up with those of the wings. Headlamps will be flaired into this new shaping, and the full overall width body will flow smoothly from this front end formation into a tapering or semi-tapering tailpiece.

The most advanced streamline body that I have seen graces Major Gardner's 200 m.p.h. M.G. In this very highly-developed construction both front and rear wheels are enclosed. Though the width of the body is considerable, its form has a certain elegance and balance to which one would very quickly get accustomed. At a glance it should be wide enough to seat three abreast were it adapted for ordinary touring requirements. Another highly-developed streamline body figures on a new 12 h.p. Fiat. Again one notes how the wings are flaired into the bonnet and continued rearwards to give extra width to the body. Other notable points on the Fiat are the sloping front, streamlined headlamps, the absence of all projections such as handles, and a longish semi-tapering tail.

Quite apart from the improvement of view under discussion, this car, when recently tested by an expert, proved what new economies in running and advance in performance may be expected from the latest technique. Propelled by an engine of only 1,100c.c. giving some 42 b.h.p. with a 7 to 1 compression ratio, this car was said to give a fuel consumption of 40 m.p.g. at a speed of 60 m.p.h., and equally remarkable, some 48 m.p.g. at 30 m.p.h. It weighs 16½cwt., and could attain a maximum speed of 90 m.p.h.

How much of this combination of achievements was due actually to the streamlining of the body, and how much to the engine and reduced frontal area of the car, I do not know. But that streamlining played an important part, and that at an every-day and not an extra high speed, was proved when this car and another of comparable size were set to free-wheel to a full stop from a flying start at 50 m.p.h. This test showed that the streamline car could free-wheel 40 per cent. farther than the ordinary type. In this body the rear, but not the front, wheels were enclosed. Presumably, should the front wheels be enclosed the track would have to be reduced to give wing clearance at full lock. I see no disadvantage in this, as several cars already have a wider track at the back than in front.

Assuming now that the three-abreast front seat is accepted, it seems natural to arrange the remaining two seats in the back in such a way that their occupants could obtain a clear view between the middle and outside front passengers' heads. With such an arrangement some of the rear width of the body might be devoted to carrying luggage and the spare wheel. If the back panel were given a pronounced downward sweep which the streamline form suggests, it would require a clever planning to achieve any sort of a rear window view. Cars with bodies of this type that I have driven afford but the scantiest view, sideways, downwards or across, of anything astern. The height of the rear squab in relation to the driver's eye is too great, so that reversing is made a far more anxious process than it might be.

The streamline tail, even when carried out in a moderate manner, means a certain amount of overhang and some practice in getting used to while manœuvring. Probably it has a worth-while effect as far as economy and speed are concerned, but from the ordinary driver's point of view it may be considered a nuisance. On the other hand, it should eliminate mud and dirt-collecting eddies which deface so many back panels. It might also afford a sensible amount of luggage space, sufficient, in fact, to allow four normal people to take with them enough baggage for a fortnight's tour. For, even to-day, with a more practical appreciation of one's touring needs, it is a rare thing to come across a boot which can accommodate four full-size suitcases. I find that all too often the four suitcases described in the catalogue turn out to be attaché case size, just big enough to take odd belongings for a single night's rest.

"THE MOST ADVANCED STREAMLINE BODY THAT I HAVE EVER SEEN GRACES MAJOR GARDNER'S 250 M.P.H. M.G."

The type of body thus suggested would in plan view be full width from the front wings as far as the front seat. From that point it would taper astern, the whole effect being nearer a true streamline than many of the present types. It would, in effect, reverse the present seating plan of two in front and three behind. It might further be suggested that the driver should sit in the middle of the front seat, but I doubt whether this would be a popular plan. For one thing if the seat was full one or other passenger would be disturbed whenever the driver wished to dismount. And then when he was travelling alone he would experience that lost feeling which even the presence of a single armrest on the door does something to alleviate. On the other hand, the central steering and controls would afford a saving in those cars in which these features have to be adapted to the near or off side according to the country concerned.

There is one final point that can assist rear-seat visibility, and that is a transparent roof, assisted if need be by a sliding opaque cover or blind. When in America recently, I noted that the latest and smartest taxis in New York provided this sort of facility, and advertised it by proclaiming themselves "sky view" cars or words to that effect.

In these fast changing times there are aeroplanes everywhere, balloon barrages and taller and taller buildings to arouse interest. People are more conscious of the foliage of trees, the light and shade on the hills, the lovely effects of clouds, the intricacies and beauties of skyline mountain views, and so on. The transparent roof will help to bring these above-the-horizon features into the view of even those relegated to the back seat.

W. G. McMINNIES.

AN M.G. OF GRACEFUL, BUT MORE ORTHODOX LINES THAN MAJOR GARDNER'S—A 2.6 LITRE SALOON AT DENBIGH CASTLE

HOLLAND'S VARIED CHARM

By LILIAN F. GRAY

Netherland Tourist Office

THE HALL OF THE KNIGHTS, THE HAGUE

HOLLAND is certainly a country for the individualistic type of visitor and for the holiday connoisseur—the zestful collector of holidays that are different — the Netherlands is definitely a rare find. With the exception of Scheveningen, the popular seaside resort just outside The Hague, few places provide much in the nature of large-scale entertainment, and the most that the average Continental traveller sees of Dutch life is from the train. Both the individualistic visitor and the connoisseur can therefore enjoy Holland's quiet charm and wealth of artistic treasure in leisurely comfort.

The former may not at first be obvious to eyes which have seen greater magnificences, but after a while this placid landscape, dotted with trees and windmills, model farms and spotless villages, grows very agreeably on one. The great number of canals, waterways and lakes provide, too, that luminosity in the atmosphere so tantalisingly elusive to the artist, yet which was so masterfully caught by their own renowned landscape painters.

Seekers of old buildings (as distinct from old ruins, of which the Dutch have very few) can wander in any direction from The Hook, Vlissingen and the airports of Amsterdam and Rotterdam in the sure certainty of finding in most towns or villages something to interest them. The Town Hall, the Weigh-House, the Old Church—or even the so-called New Church—with their pointed steeples and roofs will still be standing much as they were when built several centuries ago. In this connection certain names immediately come to mind: The Hague and Middelburg for their historical and distinctive buildings dating from the thirteenth century, and Utrecht, Dordrecht, Amsterdam and Rotterdam for their colourful sixteenth and seventeenth century quarters. In a niche of its own Leiden, the University town, can best be described as a Dutch replica of our own Cambridge.

There are other places of historical interest, though not so well known—Gouda, for the lovely stained glass windows of St. John's Church; Kampen, with a fine sixteenth century town hall; Amersfoort, with its unique watergate, the Koppelpoort; 's Hertogenbosch, with its huge late Gothic cathedral; and the wooded province of Guelders for castles and chateaux. Zierikzee (Zeeland), Deventer (Overyssel), Hoorn (North Holland), Leewarden (Friesland), Maastricht (Limburg), and Nymegen on the Waal, all retain a peaceful old-world air of several centuries ago.

Of the Dutch waterways—as indeed of most things connected with Holland—whole books have enthusiastically been written. It is all the more surprising, therefore, that so few English yachtsmen sail on some of the main canals and rivers, or realise how very delightful a yachting holiday can be spent round about the islands of South Holland, or in exploring the IJssel Meer (more familiarly known as the Zuyder Zee), or even in gently cruising on some of the Dutch inland lakes. The Brassemer Meer, the Kaager Meer, and the Sneeker Meer, are perhaps The Netherlands' own favourite racing grounds, though several other lakes run them a close second in popularity.

To take a small boat along the *grachten* of the towns or through picturesque water villages such as Giethoorn (Overyssel) and many others, leave memories of characteristic Dutch life not easily forgotten. If only the charm of these backwaters were more generally known, many a vacation would be spent in lazily paddling a portable canoe or locally hired punt. Cruising charts can be obtained from The Cruising Office of Amsterdam, 590, Keizersgracht, while excellent maps are issued by the Topografische Dienst, 's-Gravenhage, 15, Prinsessegracht.

For anyone primarily interested in peasant costumes a fair number can still be seen. Those of the Isle of Walcheren and of Marken in the IJssel Meer are kept alive through tourism, artists and photographers, but those of Edam, Volendam, Buurtschoten and Sparkenburg (all on the IJssel Meer) are more unselfconsciously worn. In most "off-the-track" villages one gets occasional glimpses of quaint, puritanical dresses, accompanied by the clatter of *sabots* on hard brick roads.

To those of a practical or engineering turn of mind the dykes, dams and sluices of the Dutch waterways are a never-ending source of admiration. Not only is the sea kept at bay, but land is gradually being recovered in several areas. Most notable of all the Dutch achievements is the reclaiming of large tracts of land where once swept the waters of the Zuyder Zee. Not only is land being reclaimed here, but already farms, villages and fine motor roads are firmly established.

Alkmaar for cheeses, Delft for pottery, Friesland for farming, Haarlem and Boskoop for bulbs and flowers; The Hague, Rotterdam and Amsterdam for the finest of Old Masters' collections; Breda, Leiden and many others for lovely carillons. These complete what is but a slight indication of Holland's highly individualistic and varied attractions.

Netherland Tourist Office

THE OLD HARBOUR, VLISSINGEN, ISLE OF WALCHEREN

POOLING THE LONDON-PARIS AIRWAY TRAFFIC

By LORD SEMPILL, A.F.C., F.R.Ae.S.

(Aviation Editor of "The Field")

ONE of the most important references to our commercial aviation policy was made recently by Sir Kingsley Wood, when, at the Bleriot anniversary banquet, he referred to the close collaboration between this country and France in the field of civil aviation. Later, the scheme for pooling the receipts of Imperial Airways and Air France on the London–Paris airway and for co-ordinating the traffic on this route for the elimination of wasteful overlapping and competition, was announced.

This plan, which is to come into force when the winter schedules start in the autumn, is designed to provide better travelling facilities for the public between the British and French capitals. At present, the combined services of Imperial Airways and British Airways between London and Paris—which this year have been flying in conjunction—operate every two hours, while Air France dispatches machines every hour. There is no night flying, and the practical result is that there is an excess of services at some times of the day and barely sufficient at others.

Under the new scheme, the combined British and French services will be spread over the 24 hours. There will be 20 services daily during the summer and fourteen during the winter, though provision will be made for augmenting these schedules during rush hours, and the possibility of half-hourly departures during these periods is visualised. One of the most important aspects of the scheme is that the provision of such extra services will be simplified, since neither company will infringe on the rights of the other, and the problem of providing flying stock will be eased.

From the public's point of view, there can be no doubt that these plans carry with them the promise of considerable benefits. The need for night flying on this route has been expressed for many years and a co-ordinated time-table means simplification of booking and absolute regularity of service throughout the day.

It is expected, too, that the companies themselves will benefit as well, for the traffic will be spread in the most advantageous manner, and it can be handled in a more scientific and economical way.

This scheme, which has been described by the traffic manager of Imperial Airways as opening up "a vast new field of air transport," is, it is understood, a preliminary to further agreements in the same sense between the British and French commercial aviation authorities. In particular, the extension of the pooling arrangement to include the Marseilles route is suggested as more than likely. Undoubtedly, this would confer great benefits on the travelling public, for under existing arrangements Imperial Airways cannot book passengers in either direction between Croydon or Southampton and Marseilles. The elimination of restrictions such as these cannot but further the progress of commercial aviation in general.

From these aspects, therefore, the new agreement does appear to have undoubted advantages for both public and operators, and the general welcome its announcement has received is seen to be justified. Yet there are other principles involved, of a more fundamental nature, and it is well that these should be briefly reviewed.

The scheme is an extension in the international field of that co-ordination and centralisation which is typified in the formation of the new British Overseas Airways Corporation. Its effect, broadly stated, is to eliminate competition on the London–Paris route. Now this is something of a revolution. The London–Paris route was the first commercial air line to be operated by British aircraft, and for 20 years it has been the scene of keen competition, not only between British and foreign companies, but between British companies themselves. To this fact may undoubtedly be ascribed the remarkable improvement that has occurred, evidenced by the reduction of the flying time from two-and-a-half to one-and-a-quarter hours.

Moreover, it cannot be denied that much of this improvement has been due to the enterprise of the French and unsubsidised British companies rather than to the efforts of the officially sponsored British organisation.

Obviously, this new agreement does remove, to some extent at least, the stimulus of that foreign competition. True, it will operate to the extent that uniform timings will have to be maintained by the fleets of the two organisations concerned; but there is no obvious guarantee that those timings cannot be reduced to the lowest common denominator of the combined equipment. Within a few months, then, both internal and external competition have been removed.

The suggested extentions if they should be pushed to include all routes on which British and French aircraft operate might well eliminate competition where it has been specially useful; and if such international pooling agreements are to be a first point of policy of the new corporation the time might come when competition on the world's airways might cease to exist.

Whether the new corporation will be vital enough to resist the obvious dangers of the position only time and experience can show. It may be—and indeed it is to be sincerely hoped—that the danger will never materialise. But it is clear that the position should be faced at the outset, and that, in the welcome to the obvious advantages of the scheme, possible weaknesses should not be altogether ignored. What is emphatically needed, as has been pointed out before, is continuous vigilance to make sure that the new corporation does not fall into a policy of *laisser-faire* and that enthusiasm at home makes up for whatever is lost by eliminating international competition by insisting on vigorous and uninterrupted progress.

THE IMPERIAL AIRWAYS FLYING BOAT CORINNA

"The London-Paris route was the first commercial air line to be operated by British aircraft, and for twenty years it has been the scene of keen competition . . ."

"A GREAT DEAL OF FORETHOUGHT HAS BEEN EXPENDED ON THIS CAR"

THE 16/65 H.P. WOLSELEY

THOSE who require what might be described as a "family car" would do well to turn their attention to the Wolseley 16 h.p. saloon. It has been built with an eye to producing a high-grade, medium-powered vehicle, with ample seating accommodation, and on the whole, the designers have been very successful.

Priced at £320, really good material has gone into the making both of coachwork and engine, with the result that the particular car I drove recently left me very satisfied with its performance. The engine is a six-cylinder unit with a bore and stroke of 65.5mm. by 102 mm., and rated at 15.95 h.p., the annual tax works out at £12.

There is no sluggishness on the part of the engine or any feebleness of top-speed performance—as a matter of fact it has a top speed of 75 m.p.h.—and it has the appearance of reliability and excellent finish. Here is none of your imitation leather upholstery, painted tin "woodwork," &c., while in motion there is excellent riding comfort and very little engine noise.

The pleasant smoothness over rough surfaces, a smoothness in advance of most cars of a similar price, is due largely to the method of springing employed. Known as phased suspension, it is achieved by using semi-elliptic springs with periodicities at a predetermined variance. Thus the springs cannot swing in unison, and the sick-making sway found in some cars is destroyed.

The Lockheed brakes are smooth and effective in operation, while the steering is surprisingly light for a comparatively heavy car. The steering column, incidentally, is adjustable both for height and for rake, and this feature is indicative of the whole design of the car, which has been to give as much ease as possible both to driver and passengers alike.

Acceleration is excellent, and I found that at traffic lights I could be away before most other road-users, while on the open road quite high speeds could be maintained in comfort. The only engine criticism I might make concerns the petrol consumption; 22 m.p.g. does not seem over much for a 16 h.p. engine.

The lines of the coachwork are in keeping with the performance—clean and dignified. There has been no attempt to achieve anything freakish at the expense of comfort or visibility, and the results have justified, to my mind, the maker's plans. At the back there is a fair-sized boot, beneath which lies the spare wheel in its own locker.

In its fitments, the car is particularly fortunate. It is impossible to mention them all in this column, but there are such things as a jackall hydraulic four-wheel jacking system, and a sensible lighting arrangement whereby the dipper switch extinguishes both head-lights and switches on the near-side fog-lamp at the same time, the other fog-lamp being an auxiliary. There are large glove trays, ample door pockets, and a roof net, while there is even a simple but effective method of raising the rear curtain in one movement.

A great deal of forethought has been expended on this car, and it has justified the trouble. W. R. J.

BRIDGE

INITIAL NO-TRUMP BIDS—II

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

SO long as the strength of the initial No Trump call is that recommended in my last article the honour strength is clearly defined between a definite minimum holding and a definite maximum holding. The responding player can immediately tell the combined honour strength of the two hands within one to one-and-a-half honour tricks, and can base his response accordingly.

When considering a response to an initial No Trump bid the player should always remember that the No Trump call is probably a 4-3-3-3 distribution. This knowledge will enable the responder to determine whether the bid is more likely to produce a game in No Trump than in a suit.

Without a five-card suit and only one plus honour trick or less, the responding hand should pass. He should also pass with only half an honour trick and a five-card suit headed by less than a King or Queen.

After the pass the weakest response to the One No Trump call is a bid of two in a suit. This shows between half and one honour trick and a five-card suit (if the hand only contains the minimum half an honour trick then the five-card suit should be headed by a King or Queen). With a six, or longer, suit, and half, or less, honour tricks, the suit should be rebid as a sign off, thus:

Y	Z
One No Trump	Two Spades
Two No Trump	Three Spades

Z has something like ♠ J, 9, 8, 7, 6, 4; ♡ 9, 2; ♢ 7, 4; ♣ 8, 3, 2. If the Spades are headed by half an honour trick there should be a game, and the rebid over Two No Trumps would be Four Spades. However, and here we begin to notice the influence of the strong No Trump on the response, when the hand contains a six-card suit headed by a Queen, or better, and one honour in at least two suits, a single raise should be given, thus, with

♠ J, 6; ♡ Q, 8, 7, 5, 4, 2; ♢ Q, 3; ♣ J, 9, 7.

the response should be Two No Trumps, since the hand is too strong for a call of only Two Hearts.

Since the One No Trump call should have three cards with the six-card suit, it follows that a bid of Two No Trumps should be made with a six-card suit headed by an Ace and as little as a Jack outside.

A single raise in No Trumps will be given on hands ranging in strength from one plus honour tricks, and an unbalanced distribution to two honour tricks, with a balanced distribution, thus:

(a) One plus honour tricks in two suits and a five-card suit headed by a Queen, or better.

♠ 8, 3; ♡ Q, J, 8, 7, 3; ♢ K, 3, 2; ♣ J, 7, 4.

(b) One plus honour tricks in three suits and four or more honour cards.

♠ 10, 3; ♡ J, 9, 8, 7; ♢ K, Q, 9; ♣ Q, 4, 3, 2.

(c) One-and-a-half honour tricks in at least two suits, or two honour tricks in two suits and no five-card suit.

♠ Q, J, 3	♡ A, 9, 4, 2	♢ 10, 3, 2	♣ 8, 7, 4
♠ K, 3, 2	♡ K, 3, 2	♢ Q, J, 2	♣ 8, 3, 2
♠ A, 4, 3	♡ 9, 3, 2	♢ K, Q, 4	♣ 7, 4, 2

The raise from One to Three No Trumps is given on hands ranging from one-and-a-half honour tricks with a six-card suit to two-and-a-half honour tricks and a balanced distribution. With any hands stronger than these, a slam is possible or a suit contract will be better, and therefore it will be necessary to make a jump take-out.

Three No-Trump bids should be based on hands fulfilling the following requirements:

(a) One-and-a-half honour tricks including a six-card suit headed by Queen, or better, and half-an-honour trick outside the six-card suit.

♠ Q, 10, 3; ♡ K, Q, 8, 7, 6, 4; ♢ Q, 10; ♣ 9, 8.

(b) Two honour tricks, including a five-card suit headed by Queen or better.

♠ K, Q, 8, 5, 2; ♡ 9, 3, 2; ♢ 8, 3, 2; ♣ A, 3.

(c) Two-and-a-half honour tricks with a 4-4-4-1, a 4-4-3-2 or a 4-3-3-3 distribution, or with a suit distribution in which there is no biddable five-card suit.

♠ K, 10, 2	♡ A, Q, 4, 2	♢ Q, J, 2	♣ 9, 3, 2
♠ K, Q, 2	♡ 10, 3, 2	♢ A, 3, 2	♣ K, 4, 3, 2
♠ K, 2	♡ A, Q, 2	♢ K, 3, 2	♣ 9, 8, 7, 6, 2

A suit bid of three is forcing to game and can be made, after the strong One No Trump bid, on hands much weaker than those on which a forcing bid is usually given. The requirements are as follows:

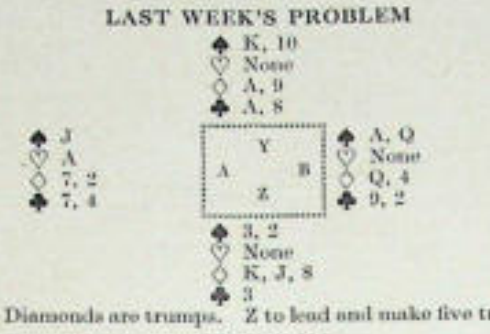
(a) Two honour tricks, any five-card biddable suit and an unbalanced distribution, one-and-a-half honour tricks and a 5-5-2-1 distribution or one-and-a-half plus honour tricks and a six-card major suit.

♠ K, 9, 7, 6, 2	♡ A, 4, 3, 2	♢ K, 3, 2	♣ 2
♠ K, 5, 4, 3, 2	♡ K, 3	♢ K, 9, 8, 7, 6	♣ 2
♠ A, 9, 8, 7, 6, 4	♡ K, 3, 2	♢ Q, 3	♣ 10, 2

(b) Three honour tricks or two-and-a-half honour tricks, any five-card biddable suit and a balanced distribution.

♠ 9, 3, 2	♡ K, Q, 2	♢ A, 4, 2	♣ K, Q, 9, 8
♠ K, 8, 5, 4, 2	♡ A, 3, 2	♢ K, Q, 2	♣ 10, 2

Next week I shall deal with the re-bid by the opening No Trump bidder and the responses to an initial bid of Two No Trumps.



(To be concluded.)

THIS WEEK'S PROBLEM

Hearts are trumps. Z to lead and take all seven tricks against any defence by A-B.

LAST WEEK'S PROBLEM

Diamonds are trumps. Z to lead and make five tricks.

SOLUTION

Z takes three rounds of Diamonds, discarding a Spade from dummy on the third Diamond. If B discards a Club, Y.'s two Clubs are good, if B discards a Spade, he is thrown in with the Ace and has to give Y two Club tricks.

CHESS

CONGRESS AT BOURNEMOUTH

At this congress nine tournaments, among them a Premier Tournament and the British Ladies' Championship, are being played, and have attracted over 100 competitors.

In the Premier Tournament six well-known foreign masters—Dr. Euwe, Flohr, Messrs. Dr. Landau, König and Klein—are taking part, together with six home players. In the absence at Buenos Aires of our representatives in the International Team Tournament, the possibility of a British success at Bournemouth is very remote. At the end of the first week's play the scores were as follows: Dr. Euwe and S. Flohr each 5 points out of 6, E. Klein 4½, L. König and J. Mieses each 3½, J. M. Aitken and A. G. Conde each 3, Dr. Landau 2½, F. N. Wallis 2, F. E. A. Kitto and A. R. B. Thomas each 1½, and G. Abrahams 1.

In the British Ladies' Championship Tournament Mrs. R. P. Michell was leading with 5½ points out of 6.

A game from the first round of the Premier Tournament.

(Caro-Kann Defence.)

WHITE. J. M. Aitken.	BLACK. S. Flohr.	WHITE. J. M. Aitken.	BLACK. S. Flohr.
1. P to K 4	P to Q B 3	16. P to K Kt 4	P to Q Kt 4
2. P to Q 4	P to Q 4	17. Kt to K 5	Q to Kt 2 (c)
3. P takes P	P takes P	18. Kt to Kt 3	Kt takes Kt
4. B to Q 3 (a)	Kt to Q B 3	19. Q takes Kt	P to R 4
5. P to Q B 3	Kt to B 3	20. P to R 3 (j)	P to R 5
6. B to K B 4 (b)	B to Kt 5	21. Q to B 2	P to Kt 5 (k)
7. Q to Kt 3 (c)	Q to Q 2 (d)	22. R P takes P	B takes P
8. P to K R 3	B to R 4	23. Q takes R P	B takes P
9. Kt to Q 2	B to Kt 3	24. R to K 2	Kt to K 5 (l)
10. B takes B (e)	R P takes B	25. Q to Q 7	R to B 2
11. Castles (f)	R to B sq (g)	26. Q takes R	Q takes Q
12. K Kt to B 3	P to K 3	27. Kt tks Kt P	Q to B 5
13. K to Kt sq	Kt to Q R 4	28. Kt to K 7, ch	K to R 2
14. Q to B 2	R to K 2	29. R takes Kt	P takes R
15. K R to K sq (h)	Castles	Resigns.	

(a) Rather tame. P to Q R 4 gives more chances.

(b) If, instead, 6. P to K R 3 (to prevent 6. . . . B to Kt 5) then 6. . . . P to K 4; 7. P takes P, Kt takes P, after which Black has an isolated Queen's pawn but good play for his pieces.

(c) It is considered better to postpone this move until Black has played P to K 3 and so deprived himself of the possibility of playing B to Q 2 (see variation in next note). Either 7. Kt to K 2 or 7. Kt to B 3 is probably better.

(d) An alternative here is 7. . . . Kt to Q R 4, *e.g.* 8. Q to R 4, ch (if Q to B 2, then P to K 3), B to Q 2; 9. Q to R 2 (if B to Q Kt 5, then Kt to B 5), Q to Kt 3; 10. Kt to B 3, P to K 3; 11. Castles, B to Kt 4; 12. Q Kt to Q 2, B takes B; 13. Q takes B, R to B sq with an even game (Marôczy v. Capablanca, Lake Hepatcong tournament, 1926).

(e) Q to B 2 is, we think, to be preferred.

(f) This is very risky. K Kt to B 3 is preferable.

(g) The continuation 11. . . . Kt takes P; 12. P takes Kt, R to B sq, ch; 13. K to Kt sq, Q to B 4, ch; 14. K to R sq, Q takes B; 15. Q takes Kt P, Q to Kt sq is also good for Black.

(h) Kt to K 5, either here or at the next move, is perhaps slightly better. Black's best reply is Q to Kt 4.

(i) Black has a good game with prospects of a strong attack.

(j) P to Q R 4 is slightly better.

(k) This move leads to the breakdown of White's King's position.

(l) Threatening 25. . . . B takes Kt P; 26. R takes B, Kt to B 6, ch; 27. K to R sq, Q takes R, ch; 28. K takes Q, Kt takes Q, ch. White has no good move.

The following game was well played by Klein.

(Queen's Gambit.)

WHITE. E. Klein.	BLACK. P. N. Wallis.	WHITE. E. Klein.	BLACK. P. N. Wallis.
1. P to Q 4	P to Q 4	16. B to Q B 4	P to Q Kt 4
2. P to Q B 4	P takes P (a)	17. B to R 2	B to Kt 2
3. Kt to K B 3	Kt to K B 3	18. B to B sq (*f*)	Q to B 2
4. P to K 3	P to K 3	19. R to K sq	K R to Q sq
5. B takes P	P to B 4	20. B to Kt sq	Q R to B sq
6. Castles	Kt to B 3	21. P to K R 4 (g)	B to R sq (h)
7. Kt to B 3	P takes P (b)	22. Q to Kt 4	Kt to K 2
8. P takes P (c)	B to K 2	23. B to B 4	Q to K 4
9. P to Q B 3 (d)	Castles	24. R (Q3) to Q sq	R takes P (i)
10. B to K 3	Kt to Q 4 (e)	25. P to Kt 4	Q to Q sq
11. R to B sq	Kt takes Kt	26. Kt takes P	K takes Kt (*j*)
12. R takes Kt	B to B 3	27. Q tks K P, ch	K to B sq
13. B to Q Kt 5	Kt to K 2	28. K takes R	Q takes R
14. Kt to K 5	Kt to Q 4	29. B to Q 6 (*k*)	R to K sq
15. R to Q 3	P to Q B 3	30. B to R 2	Resigns.

(a) In our opinion it is better to decline the gambit.

(b) We do not like this move which opens a file for White's King's Rook and a diagonal for his Queen's Bishop.

(c) White has an isolated Queen's pawn—but "he who fears to have an isolated Queen's pawn should give up chess" (Dr. Tarrasch).

(d) This move prevents Black from playing his Queen's Knight via Q Kt 5 to Q 4.

(e) This move has the disadvantage of depriving the King's side of the defence afforded by the King's Knight.

(*f*) Making way for the Rook at Q 3 to go to the King's side, if required.

(g) White has completed his preparations and now starts a King's side attack.

(h) To capture the pawn would be fatal since White could continue with either Q to R 5 or R to R 3. The text-move is played in the hope of obtaining some counter-attack by Q to Kt 2.

(i) Whatever Black plays, he has the inferior game.

(j) If 26. . . . R takes R, then 27. Kt to R 6, ch, K to B sq; 28. R takes R with a winning game for White.

(*k*) Threatening Q takes R, ch.

A PRETTY FINISH

In a game played in a simultaneous performance by Dr. Alekhine in Trinidad the following position was reached:—White (Dr. Alekhine): King at K R 2, Queen at Q R 3, Rook at Q B 5, Pawns at Q R 2, K B 2, K 3, K Kt 3, K R 3 and Q 7; Black (Nestor): King at K R sq, Queen at K 3, Rook at Q sq, Pawns at K B 2, K Kt 2, K R 2, Q R 3, Q Kt 4 and Q B 5. White to play.

The World's Champion now finished off the game very prettily, as follows: 1. R to B 8 (threatening either R takes R, ch or Q to B 8, ch), R takes R; 2. Q to K 7, Resigns (if Q to Q B 3, then P to Q 8 — Q or R, ch).

PROBLEM No. 4028

By O. WÜRZBURG.*

WHITE (5 pieces): King at Q Kt 8, Queen at Q Kt 3, Rook at K B 6, Bishop at K R 2, Knight at K 3.

BLACK (4 pieces): King at K 5, Pawns at K 2, K 3 and Q 5.

White to play and mate in two moves.

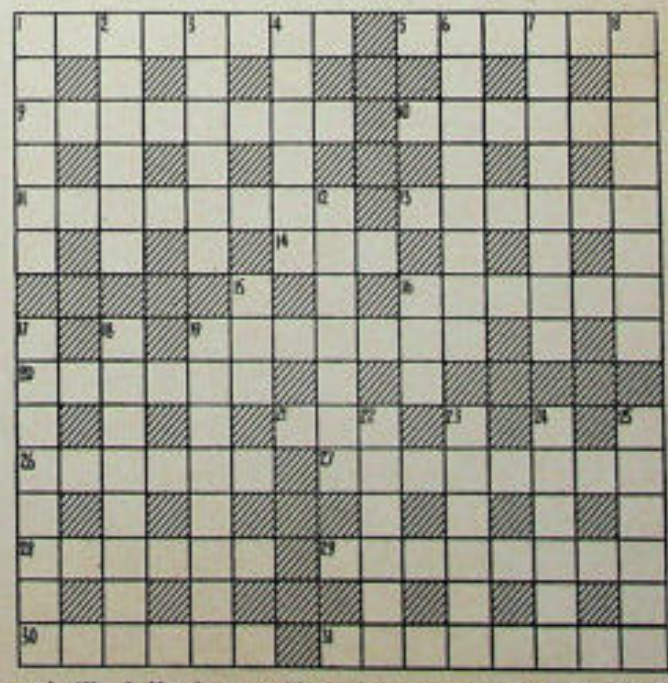
* *Chess Review*, 1938.

SOLUTION OF PROBLEM No. 4027

1. P to B 5. Any move; 2. Q, R or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 531



ACROSS.—1, May leapt to find a kindred soul (8). 5, Wigeon and pochard are little less than the same (6). 9, It is not necessary to have an auctioneer to put these up and have them knocked down (8). 10, This kind is something more than a disgrace (10). 11, A Lancashire delicacy takes an important place in the assembly (6). 13, This tongue may be found in many a fernery (6). 14, With my little eye (3). 16, You cannot very well unless you depart (6). 19, The tale can be got from this competitor (7). 20, It is foolishness to allow an attack of this kind (6). 21, This bullion is noisy (3). 26, Flower, not necessarily carnivorous, but seeks a prey (6). 27, One of Alice's companions at the tea-party (8). 28, A relationship that is generally local (6). 29, A game that might keep your hair in curl (8). 30, I dress to show we are adherents to the cause (6). 31, Not quite old enough yet to go to work (8).

DOWN.—1, This boatman will lay you the odds (6). 2, In a car if upset this may be useful (6). 3, One might get trees from a sample (6). 4, In this court many a decision is made (6). 6, May be an exciting and dangerous game for him (8). 7, Impeccable, and rarely decisive (6). 8, A bloodhound sometimes does this, but more often they take charge of the hounds (8). 12, Praise is ended by an Archbishop (7). 15, A pen you cannot write with (3). 16, Masticated, but might easily have been drunk (3). 17, One has known a cat to fall on these; perhaps it was a game (8). 18, Despite the name it is a warm-blooded little creature (8). 19, Imagine a sparrow singing the leading parts? (8). 22, So Rome has very sour manners (6). 23, A bangle round a mule? (6). 24, "We ——, and God works" (Kingsley) (8). 25, The master of these has an appointment with the Courts (6).

SOLUTION TO No. 530

Published August 19th

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Farming

Laying Hedges.—There are several methods of laying hedges, and they vary in each district. The system which is practised most, however, is the one used in Leicestershire and the adjoining counties. The fencer faces his hedge and works from left to right. The cut is made in the upward direction as low as possible and about halfway through the stem. The upward cut is superior to the more common downward cut, as it helps to exclude moisture and hinders decay. The stakes themselves are not laid in the line of the hedgeroots, but a foot or so outside it, on the field side. The hedge stems when partly cut are then laid along the line of the hedge inside the stakes, and the top 2ft. or 4ft. is placed between two stakes and the top thus protrudes into the field, forming a dense thicket, which can later be trimmed back if desired, but is usually left. The hedge is finally crowned with a binding of hazel rods. It has several advantages over the other methods. The young stems are completely protected from grazing stock. The hedge, when laid, is almost impenetrable. In weak places, stool shoots from stocks growing up to 10ft. or 12ft. from the line of the hedge may be incorporated for the purpose of strengthening. The actual line of the hedge may be advanced, either to be on the crest of a bank, or to avoid a low place or for any other reason, for a distance of up to 10ft. or a little more.—*D. P., Driffield.*

Cow-stall Floors.—There is a short summary on this very complex question given in the *Journal of the Royal Agricultural Society of England*, and, with the short space at our disposal, we feel we can do no better than quote it for you: "Attempts have been made by many firms interested in the construction of cowsheds to discover a type of material for stall floors which would be superior to concrete. A. B. Fowler has continued his investigations on this subject and has issued a report dealing with rubber and rubber plastics. (The Construction and Equipment of Cattle Byres—III. The use of rubber and rubber plastics for byre flooring. *The Scottish Jour. Agric.*, April, 1938.) He enumerates six features as being essential to a good stall floor—durability, resilience, warmth, impermeability, continuity and roughness—and lays special stress on resilience in the prevention of laminitis or 'hot feet' which is often followed by loss of condition and of milk yield in heifers that are undergoing their first winter in a cowshed. Rubber blocks or rubber casings filled with concrete were found to be unsatisfactory, because the pressure of the cow's hoods led to a formation between the blocks of gaps, into which urine soaked. A floor where this occurs is unsatisfactory, especially where an infectious disease such as contagious abortion or mastitis is present, because effective disinfection is impossible. Rubber mats of a size large enough to cover the standing for one cow were next tested, and these, though durable, resilient and impermeable in the structure of the mat itself, were found to have two serious disadvantages. These were excessive smoothness, in spite of surface studs, and the likelihood of detachment at the edges, allowing urine and dirt to find their way between the mats and the concrete bed. Rubber plastics, consisting of various substances—powdered rubber, powdered cork, marble and granite chips and cement, mixed with rubber latex—were next used. These were mixed on the spot, and, when the mixing and laying were properly done, good floors were obtained which were warm, impermeable, resilient, continuous and non-slippery. As for durability, Fowler remarks that, after nearly three years' use, the materials show some wear where heavy treading has taken place, but that these small areas, and also any places where small blisters appear, can easily be cut out and replaced by fresh plastic. He considers a strong heel kerb to be essential, and states that any desired degree of roughness can be obtained. As to cost, he states that, while somewhat expensive to lay, these materials are found in practice to repay the extra cost, which, at present prices, amounts to approximately 20/- per standing; he suggests that if the cost is too high to permit of all the stalls being done, those required for first-calf heifers could be laid, since their use for heifers materially reduces the loss from 'hot feet,' big knees and swollen hocks. It should be added that the degree of benefit to be derived from a good plastic rubber floor will depend on the extent to which heifers suffer from the above-mentioned troubles. Experience elsewhere has shown that heifers during their first winter in a cowshed do not always suffer to the extent indicated, and it is questionable if, under these conditions, the additional expense of a rubber plastic floor is warranted."—*B. R., Minehead.*

Garden

Specimen for Identification.—A twig of willow carrying but three leaves is a very small specimen for the purpose of identification. We can only suggest that it is a form of the white willow, *Salix alba*. This often has beautiful silvery foliage, and no doubt would flourish in Finland.—*V. H., Sheffield.*

When sending plants to be named, send as many parts as possible—basal leaves, stem, flowers and fruit. Pack in moss, moistened paper, or damp leaves, in a stiff cardboard, tin or wooden box.

Nettles and Coarse Weeds in Woodland.—Flowering shrubs to take their place. Cutting nettles in early June and again in late July will much reduce their vigour and eventually cause them to die out; it is rather a slow process. Sodium chlorate at the rate of 2½lb. to 25 gallons of water sprayed on the weeds will not only kill the tops but travel down the stems to the roots and eradicate them. But some care is necessary to prevent its reaching the roots of trees, &c. The soil is useless for planting until six months have elapsed. If the ground is suitable you might try some of the hardier evergreens, such as vinca major and vinca minor, rhododendrons, kalmias, *Mahonia* (*Berberis*) *aquifolium* and *Eurya japonica* for the more open places, also hypericums, such as *H. calycinum* and *P. patulum*. There are many beautiful berried plants, especially if you contract for both sexes to obtain fertilisation, green-leaved aucubas, skimmias, *Gaultheria hispida* and *G. Shallon*. Deciduous plants will be less well suited, but *Viburnum tomentosum plicatum* and *V. t. var. Mariesii* often flower well in partial shade. If the wood is a sheltered one, *Hydrangea hortensis* will do well, but it is somewhat tender in exposed places.—*D. D. S., Mersham.*

Kennel

Cracked Nose.—Try rubbing the spaniel's nose with borate of glycerine. That will probably bring about an improvement. A dose of sulphate of magnesia (about 10 grs.) would also do good. If put in a little milk that had been well sweetened, the dog would probably drink it.—*B. A. F., Longford.*

Miscellaneous

Goat Herd.—With regard to your first enquiry about starting a milking goat herd, we should advise you to write to the secretary of the British Goat Society. His name is H. E. Jeffery, and he lives at The Cottage, Roydon, Diss, Norfolk. He will be able to tell you where you may buy stock in Worcestershire, and you could then go over and see the owners and discover on what lines they have been running their own herds. You will find a great deal of information in the Goat Society's Year Book as to the running of a herd, and I have no doubt that Mr. Jeffery will be very willing to assist you. As regards the treatment of bracken, we think the best method of getting rid of it is to use the Holt Bracken Breaker. This machine has had the approval of the Department of Agriculture for Scotland, and also has been approved by Professor Millard of Leeds University. As to the destruction of blanket weeds in a small lake containing trout, we advise one of the two following courses. You can either spray the surface with one part of copper sulphate in a very large proportion of water, and if you do this, you should choose a windless day as otherwise the spray may get blown on to you. Another method is to put ½lb. of copper sulphate in a bag or sack and tow it about the lake at the end of a cord.—*C., Worcestershire.*

Naturalist

Track of an Otter.—The track of an otter in the mud is correctly known as the "seal," though it is also sometimes known as the "mark" or the "spar." In some packs you may find local terms, but the foregoing are strictly correct. The "seal" is easy to recognise as there are just five toe marks and no heel.—*N. R., Kent.*

Shooting

Eley Waxed Waterproof Cartridge.—The new Eley Waxed Waterproof Cartridge is absolutely safe in any ordinary gun with 2½in. chambers, and, as you say, it gives excellent shooting. Pressures are normal.—*T. D. S., Pulfield.*

Post-Mortem Examinations

Coccidiosis of Pheasant Chicks.—On so many rearing fields the main trouble among chicks in or past their third week of age is the contagious germ infection of the bowels known as coccidiosis. The disease is usually manifested by drooping wings, wateriness of the eyes, diarrhœa and lameness. The disease is spread through contamination of the ground and food by the germ-containing droppings of infected birds. A common source of the infection is a "carrier" brood, *i.e.*, the hen is excreting the germs, though showing no signs of ill-health. Thus if the disease starts in one or two coops the foster-hen is probably the culprit, and she should be destroyed. Sickly chicks should at once be removed from the coops. As a preventive feed all the chicks on a balanced mash of which 20 per cent. is composed of dried skim milk; failing a milk powder use 2 per cent. of molasses. Move the coops each day on to a clean patch of ground. Rain, by keeping the chicks closely congregated in or about the coops, tends to help the spread of the disease. Where practicable, disinfect the used patches of ground each day by burning straw over them. When poults are moved to covert dress the rearing field with 2 tons of quicklime and 56lb. of copper sulphate per acre, and do not use this infected field for rearing during the two succeeding seasons. The reason for this measure is that the germs of coccidiosis are capable of remaining alive on the ground for some 12 to 24 months. Avoid so-called "cures" of coccidiosis; there is no known curative in the form of a medicine for the obviously ailing chick.—*G. E. V., Wilts; G. N., Kent; J., Berks; G. W., Midlothian; G. H., Devon; W. J. B., Cornwall; C. W., Hants; J. S., Ayrshire; R. L. B., Monmouth.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, SEPT. 2nd.

STAGHOUNDS—ENGLAND & WALES

DEVON AND SOMERSET.—Saturday (Aug. 26th), Winsford; Tu., Heathpoult; Th., Cuzzicombe Post; S., Dunster—11.

QUANTOCK.—Monday (Aug. 28th), Wraxcombe; Tu., Triscombe Stone—11.

FOXHOUNDS—ENGLAND AND WALES

ALBRIGHTON WOODLAND.—Saturday (Aug. 26th), The Mare and Colt, Sommerfield; W., The Park Gate, Hurcott; S., Island Pool—6.

BICESTER.—Saturday (Aug. 26th), Grove Wood, Wotton—6.

MENDIP.—Saturday (Aug. 26th), Westbury-sub-Mendip—6.30.

MEYNELL.—Saturday (Aug. 26th), Newchurch—6.15.

SUSSEX, EAST.—Saturday (Aug. 26th), Whydown Cross Roads—5.30; M., Peppermeye Farm; W., Moor Hall; S., The Kennels, Catsfield—6.

TIVERTON.—Saturday (Aug. 26th), Chain Bridge (for Stockeridge); M., Culmstock; W., Heron Bridge; Th., Fordlands Cross (for Allen's Down); S., Beauchamp House, Washfield—6.30

OTTERHOUNDS—ENGLAND AND WALES

BORDER COUNTIES.—Saturday (Aug. 26th), Rhydmeredith Bridge on Tanat; M., Newtridge Melford (Vyrnwy); Th., Llanerllyd Bridge Dolgelley; S., Dyssynni Bridge, Towyn—10.30.

BUCKS.—Saturday (Aug. 26th).—Bledlingbury, Warwicks; Tu., Dudgrove Bridge, near Lockslade; Th., Upton Mill, near Northampton; S., Cablecote Mill, near Newport Pagnell.—10.30.

CARLISLE.—Monday (Aug. 28th), Lowther Castle Gates, Lowther; Tu., Patterdale; Th., Askham Bridge, Lowther; F., Pooley Bridge, Eamont—9.30.

CHERITON.—Saturday (Aug. 26th), Weare Gifford; W., Braunton Ponds; S., Lynmouth—10.30.

COURTENAY TRACY.—Owing to an outbreak of foot-and-mouth disease, all meets arranged this week are cancelled. For alternative fixtures phone Gratcley 206.

CROWHURST.—Saturday (Aug. 26th), Milton Bridge, Canterbury; W., Slaughter Bridge, Horsham; S., Shoreham Village, Kent—10.30.

CULMSTOCK.—Saturday (Aug. 26th), Tiverton for River Lowman; Tu., Chard Junction; (R. Axe); S., Bolham, near Tiverton (R. Exe)—10.30.

DARTMOOR.—Saturday (Aug. 26th), Dart Bridge, near Buckfast; Tu., Dartmeet (R. Dart); Th., Lifton (Lyd and Lew) (by invitation); S., Pudlinch Bridge (Yealm)—10.30.

EASTERN COUNTIES.—Monday (Aug. 28th), Corporation Farm, Kirton; Th., Passingford Bridge; S., Broomfield Mill—10.30.

HAWKSTONE.—Saturday (Aug. 26th), Lampeter—10.30.

KENDAL AND DISTRICT.—Saturday (Aug. 26th), Mytton; M., Dorford Bridge; W., Paythorne—9.30.

WYE VALLEY.—Saturday (Aug. 26th), Stone Bridge, near Berkeley; Tu., Kenchurch—10.30; S., Perry Bridge, Wrington, near Bristol (by invitation)—11.

OTTERHOUNDS—SCOTLAND

DUMFRIESSHIRE.—Saturday (Aug. 26th), Jedfoot Station (Teviot); M., Romcliffe (Tweed); Tu., Where leave off 24th; W. Where leave off 29th; Th., Where leave off 30th; F., Where leave off 31st; S., Where leave off 1st—10.

TO HUNT SECRETARIES

We should be very grateful if all Hunt secretaries would let us have their fixture cards by the first post on Tuesday morning for inclusion in the issue of the following Saturday. This appeal is, at the moment, especially directed to secretaries of otterhounds, but we would also ask secretaries of staghounds to let us have their cards as they start hunting, and also we would appeal to secretaries of foxhounds to send their cubhunting fixtures in due course. Many people who find themselves out of their own country for a time and also hunting visitors from abroad look to the columns of the *Field* for information. This can be given only with the co-operation of the secretaries of the various Hunts.

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage Home and Abroad.

	Inland. £ s. d.	*Canada.* £ s. d.	*Elsewhere abroad.* £ s. d.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale) English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.

Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

Printed in Great Britain by Hudson & Kearns, Ltd., Hatfield, Stanhope Street, N.W. 1, and Published by The Field Press (1936) Ltd., The Field House, Bream's Buildings, London, E.C. 4, in the County of Middlesex, Saturday, Aug. 26, 1939

COUNTRY AMENITIES

"ONE little thing," they say, "leads to another," and hence this article. In our issue of August 19th we were at pains to explain the importance of electricity to the rural dweller whether he be landlord or labourer. We have been taken to task by certain persons, who maintain that the problem of the countryside is by no means electricity, and that there are problems of a similar type of far greater concern.

This we willingly admit, indeed, in the article under discussion it was carefully pointed out that the problems are many, and must be treated as separate entities. Electrical supply is but one member of a large family.

Two other interrelated matters have been suggested as a worthy theme to be dealt with in this column. One is the question of getting water, and the other of getting rid of it when it has served its purpose.

Wishing wells are great fun when located in fairy stories, but the only wishing most countryfolk do with wells is to wish them less deep and less exhausting in use. To expect a woman to walk a good distance, maybe in rain, to lower and raise a heavy bucket, and then to have to carry it back to the house is absurd. When her sisters in the town twiddle a tap and produce water *ad lib.*, while she, poor woman, has to work thoroughly hard for every drop, there is little wonder that the country-dweller rebels.

It is no argument to say that it has always been thus, and no one complained in the old days, so why should complaint be made now. That is an excuse, not a reason for the present state. Obviously in some isolated farmhouses, it would be almost impossible to provide a pipeline for water—the expense would be prohibitive. But we are by no means convinced that all is being done that could be done in more closely populated districts. Cost might be heavy it is agreed, but the townee is given almost everything his heart desires; surely those whose life is of necessity extremely vigorous, deserve something better than platitudes about their pretty cottages.

Sanitation is another difficulty. As it is, in the majority of country districts, sanitary arrangements are positively primeval. The townsman goes for a holiday on a farm, and the odds are ten to one that upon his return he will say that he had a good time except that the sanitation was so frightful. He complains bitterly, after a mere two or three weeks, but the countryman accepts them for two or three decades and says nothing. Possibly that is a pity, for when there is sufficient outcry over anything that is at all reasonable, something is nearly always done about it.

As things are at the moment, authority runs round with a tape measure condemning cottages wholesale because they have not the official window space, while these so pressing problems are passed over without a word.

What is needed is a little commonsense, and, as in most problems, a little give and take. There are certain good and necessary laws concerning what you can do and what you cannot do with waste material, but if they are brainlessly applied to each and every case regardless of individual needs and difficulties, they become as much a hindrance as a help.

We would plead with rural district councils to awake out of the somnolence into which some of them appear to have fallen, and to use the intelligence which Nature has accorded them. The countryman neither needs nor expects the ease of a town, but he does deserve amenities far in advance of those he has obtained.

NATIONAL FITNESS

THE National Fitness Council has come in for a good deal of criticism recently. Their report, just issued, will do something to allay further criticism. In this country—unlike some—we cannot compel people to undergo physical training, and the Council can, therefore, do no more than encourage those bodies who do do something for those people who are not averse to physical education. They can attempt to hold up the increasing encroachment of building on ground that has been used and should be used for recreational purposes, and they can, in this way, at least, show that they are doing something with the money at their command. They have some £4,000,000, to spend up to March, 1940, and, though that seems a small sum in these days when we think in billions, it comes out of the taxpayer's pocket and the tax-payer likes to know where it is going? In this case he has quite a good notion of what is being done. In some he has none at all, and in others, as often as not, an erroneous idea. Physical education is obviously being looked after as well as conditions allow. We have always regarded Mental Education in this country as being practically beyond reproach. If there is any truth in the report that the Army authorities have found that a number of militiamen can neither read nor write, the tax-payer has every right to demand from the Board of Education a full explanation of what is being done with his money.

NEXT WEEK'S ISSUE

is a special Autumn Number, and will include a coloured cover especially painted for the "Field" by Mr. Richard Harrison, and articles by "Scolopax" on Estimating Killing Range, Frank Wallace on Deer Stalking, Lord Dorchester on Autumn Shooting, W. N. Winnall on Mixed Sport in September, J. C. M. Nichols on Early Duck Shooting, and Captain J. B. Drought on Tactics in Large-Scale Partridge Driving. Martin Stephens writes about Stag, Salmon and Grouse, and R. Ansell Wells sums up the Show Season. Guy B. Farrar contributes two pages of his now famous photographs of birds by the seashore, which were first published in the "Field." The last of the social club series describes the New Club, Edinburgh. Sir Malcolm Campbell writes about his Coniston record. Miss Eleanour Sinclair Rohde writes about September Kitchen Gardens, and Dale Bourn on Greyhound Racing. In addition, there will be articles on Farming, Aviation, Golf, Yachting, Travel and Turf. The price remains one shilling.

THE DONCASTER SALES

The usual yearling sales will be held at Doncaster this year from September 5th to 8th, and Messrs. Tattersall's have an extremely attractive and interesting programme. Some of the most interesting yearlings come from Lady Robinson, of Kirklington Hall, who is offering a bay filly by Young Lover out of Dazzling Light, and also a bay or brown filly by Bold Archer out of Lady Arbelle, by Golden Myth out of Bess of Hardwick, by Hurry On. Later, yearlings will be offered from Mr. H. S. Gill's Yeomanstown Stud. Among these are a brown colt by Apron out of Spiora, a bay filly by Museum out of Ladytown (by Apron out of White Witch) and a brown filly by Sir Cosmo out of Happy Climax. Other yearlings came from Mr. F. W. Pitt, the Sezincote Stud, Major K. G. Williams, the Brentwood Stud, and the Waltham Lodge Stud. A glance through the catalogue shows that this year's sales will be as interesting and as important as ever.

SEPTEMBER ON THE THAMES

Few loafing places are more restful at times of stress and strain than rivers, and to the many who must wish to get away from the incessant talk of war the upper reaches of the Thames offer all that is beautiful. On a warm September afternoon you can laze in your punt and watch a fisherman cast again and again with what Ruskin called the "transcendent patience of genius by which alone the Thames trout is captured." Or moor just below a weir, twisting a willow bough round your wrist as anchor line, and watch the current roaring under your punt, fresh from the waterfall. A thousand, thousand bubbles whiten the stream, while your horizon may be whitened by the sails of a handsome sailing-craft which comes spanking down the breeze on its way to the lock. Yet perhaps the great charm of the Thames is to journey from place to place, listening to river lore as you go.

A COUNTRY STATION

A row of lupins, and a little house
So tucked in ivy, strangers scarce would guess
(But for the high wires strung across the cress,
And unless
It chanced to be one of the hours the infrequent train
From Hertford trudges through our country fields)
That, for backyard, its wall of firebrick shields
A platform.
Dress
Hebe in lupin-blue—and you've the master's wife,
With whitred hair. She loves the world about:
Her flowers, the Shirley poppies coming out.
No doubt
The youngest rabbits know her, and the bees,
The ticking snipe, alert along the meres.
And so, of course, do all the engineers
With smile and shout,
With swinging hose, clanged shovel, flourished cap,
Saluting her—gods throned in iron and steam—
While she does garden-work. Have dreams their dream,
Or, as she looks,
Is she Placidity? A swallow's death
On a train's funnel, or her roses' ills,
The chief of grief life's cornucopia spills?
She hears the rooks,
The redstart, and the wind, and then the roar
Of wheels—that passes; and bends down again
To soil grown sulky with the weight of rain.

S. M. TUSTING.

THE *FIELD* IN WAR

These are times of crisis. In the event of war the *Field* will continue to publish, and we shall do our utmost to maintain the paper at its present standard. We would, however, crave the indulgence of our subscribers for any changes there may be; such changes will be unavoidable in an emergency.

A COUNTRYMAN'S JOURNAL

BEYOND Brill, that, with one exception (Chetwode), is the only village in Bucks with a Celtic place-name, rises a horseshoe-shaped sheepwalk, and just at the bend of the crescent stands a rectangular Roman camp. The pastures are bare and fall away to the immense plain north, east and west of it in massive swoops of land that should make any artist worth his salt bend a knee to the earth, God's footstool and queen-mother of all the arts. The slopes are bare, but in the neighbourhood of the camp wide-armed sycamores and star-pointing ashes temper the blaze of summer-light to the space within the fosse and ramp. It looks a sanctuary, if the last use of it known was as a strategic outpost. And what an outpost—no eagle in his aeropolis of Titan rock could outview those leagues of level land, the Midland plain ahead, the Upper Thames basin to the south-west, the Vale of Aylesbury to the east. In the summer heats this vast two-dimensional expanse is veiled with a peculiar blue haze, softer than the most gossamer of stuffs, mysterious as our life in the world, as though the very soul of the earth was visible spreading its blue wings above the prostrate body. Wilson Steer, alone of modern artists, has dared the supreme adventure of luring this spirit into a cage of canvas.

The Celtic village, clung to the opposite mount; south-westward I could guess at the fields of Sutton Courtenay, where Saxon villagers beat their swords into ploughshares; while to the south-east, behind the secreting folds of the mist, the great white sign of the cross, once perhaps the symbol of generation to those strange voyagers who peopled the uplands 1,500 years before the Celts, looked down across the Icknield Way into that same curtain of blue that hid from me the chequer of fields reaching to the horizon. So time hides from us all the true lineaments, the sure interpretation, the inward meaning of those two thousand years and half a thousand more that passed between the villagers of Whiteleaf and those of Sutton Courtenay.

One thing was certain that, taken separately or in relation to one another, not the utmost jugglery or sleight-of-mind by professors could fit these four cultures into the modern theory of automatic progress. The building and engineering of the Romans were shoddy and makeshift in the fourth century compared to what they had been in the first. At Sutton Courtenay the heathen Saxons lived in such squalor—burying their dead under the floors of the living rooms in their wattle-and-daub and turf-thatched huts—that the Bronze Age hut-circles on Dartmoor 2,000 years before were genteel residences beside them. The monkish chronicler, Gildas, drew such caustic portraits of the Romano-British princes who resisted the Saxon invasion that they might be said to rival even the Italian despots of the Renaissance in vileness. Yet in the values that are the life-force of civilisation—the arts, the imaginative faculty, the grace of living—the Celts were the cultural superiors of both their conquerors, not only of the Saxon barbarians but of the acquisitive, coarse-fibred Romans. It is quite possible to make an excellent brief for the Early Bronze Age builders of Stonehenge having a higher civilisation than those of all the peoples succeeding them up to the conversion of the brutish Saxons in the seventh century. Then, in four centuries, the Anglo-Saxons made such cultural strides that Duke William overcame a people who knew more about the art of living than did any of his band of greedy adventurers. The cardinal fallacy of the theory of automatic progress is that, fixing one eye on the gains, it closes the other to the losses.

But if the broad and simple test of craftsmanship be applied to the records of the past, then we are coming closer to reality. The bronze work-boxes of the heathen Anglian women and the famous riddle of these savages about the plough, these tell us more of how the Anglo-Saxons redeemed themselves from their own brutishness than does a library of books. "When gold and gems adorn the plough"—their agriculture and the crafts attached to it made them receptive to conversion and so to civilisation. The fluctuations of craftsmanship, not power, wealth and conquest, are what register the ups and downs of civilisation, and the wider its diffusion, the higher its standards in a community, the greater its capacity to overcome the barbarism latent or active in every human society.

H. J. MASSINGHAM.

WITHOUT COMMENT

From an article on vermin:

"Before closing this article I must relate one very amusing incident that happened to me when out on an ant hunt. I managed to allow several to crawl on to me and visit places on my body that was definitely out of bounds, and apparently I didn't catch all of them; the result was that when I got into bed that night the survivors got on the move much to the consternation of my wife. I was at once ordered to remove myself to other quarters.

"[We regret the photos were not clear enough to be reproduced with satisfaction.—ED.]"

POLICY AND GAME RESERVES

By MARTIN STEPHENS

THE expression "National Park" is so widely used to-day, and in so many directions, that the man in the street is probably rather fogged about one's meaning. The National Park I am writing of is the variety that is a reserve of wild life. With a view to protecting the vast animal population in our Colonial Empire the British Government is committed to establishing such parks in all our African Colonies, while interested bodies, notably the Society for the Protection of the Fauna of the Empire, have always made the National Park question a main plank on their platforms. We are in every possible way committed to such a policy, and personally I think it is a good one.

Like other counsels of perfection, however, this policy has certain inherent dangers which need to be stressed as they are looming rather large just at present. The first danger is that where and when National Parks are created there will be a tendency to sit back and let the game elsewhere be killed off. "After all, you asked for a National Park and now you've got it, and you can't expect to have animals running about all over the country for ever." Now, if that is going to be the National Park policy it were better that a millstone were hung about its neck and that it were cast into the midst of the sea.

Those who advocate these parks do so on the understanding that at the same time a parallel policy is kept in being of trying to preserve wild life as far as possible wherever the needs of husbandry are not overriding to a paramount extent. Game has been disappearing at an alarming rate, largely owing to native hunting and a lax administration of the Arms Acts, in all our African colonies except Kenya. And unfortunately there appears to have been a depressing, and let us hope only temporary, change for the worse in Kenya in the last year or two. The object of the National Park policy is not to accelerate this diminution outside the parks, which is a dissipation of natural assets, but to slow it down and if possible prevent it. There are many parts of Africa which will hold game for hundreds of years to come, and which can never be closely settled either by natives or Europeans. For reasons of climate, health and accessibility they can never be turned into parks, yet every effort must be made to preserve game in them.

There is no doubt at all that persons exist at the present time, and persons in high places, who welcome National Parks as a means for wiping out game elsewhere. That they do this in defiance of the declared policy of the Colonial Office—in so far as that body, well intentioned if at times a little lacking in precision, has ever declared its policy—does not appear to matter to them. Fortunately they are few and far between. But these diseases are extremely contagious. It was, therefore, a most timely announcement that Lord Onslow made at the last meeting of the Fauna Society to the effect that the policy of the society in no way recognised the fact that the establishment of National Parks meant the disappearance of game elsewhere. "Control," I find, is the more generally accepted euphemism. Personally, I advocate a wisely-planned measure of control, but the use of the term is being abused.

The truth of the matter is that there exists somewhere a just ratio between the interests of game and the interests of husbandry. In the majority of cases husbandry will be the predominant partner, and game must give way. But there comes a time where game is so obviously the predominant interest, so much more clearly the greater economic asset, that it should be placed first. If a native pushes out into uninhabited country and establishes his shamba on the edge of a recognised elephant country, he can hardly expect to be closely followed by the Game Wardens' Department wishing to "control" every elephant in a 50-mile radius of his patch of mealies. Whether game should become the predominant partner at a 60 : 40, or a 70 : 30, or an 80 : 20 ratio, must always be a matter for argument, adjustment and compromise between the interests concerned.

But there are other drawbacks to this policy which must be taken into consideration. The first and most important is the question of policing. It is perfectly useless declaring a National Park unless it is placed under adequate European supervision and unless it be properly policed. And by "properly policed" I mean the enforcement of the law. The Game Warden's staff must be sure that native (and, of course, European) poachers will be adequately dealt with. It is no secret at all that native poaching is fairly common in the Serengeti National Park in Tanganyika. This is a grave reflection on the ability of the Government to enforce its own laws. To declare a National Park and then not to police it is to declare a public pleasure ground for poachers. If one wants to point this moral nearer home take a walk through the woods near Ashridge on a Saturday evening in winter, and view the poaching public in pursuit of the only pheasant that has not fled to the embracing safety of a once-a-week syndicate's preserves.

Mention of the Serengeti Park brings us back to the question raised again and again in the columns of the *Field* of the deed of covenant under which that Park is created. It is of peculiar importance as it is the first National Park brought into being under the Colonial Office administration, except the King George V National Park in Malaya. It has, therefore, a wider significance than its local reactions and may possibly become the sealed pattern for such institutions. Frankly, this would be a calamity. National Parks are being pushed ahead in the Sudan (which comes in rather vague fashion under the Foreign Office) and in Kenya at the present time. The situation in Uganda and Northern Rhodesia is obscure. We hope they will not follow the Tanganyika model, but that of South Africa and the Belgian Congo, whose National Parks are indeed a model to the world. Those great areas are handed over to trustees in perpetuity, and this is as it should be. In Tanganyika the status of the National Park differs in practically no material particular from the present Kenya Game Reserves. What can be done in Brussels or Cape Town can presumably be done in London. It could even be accomplished in Dar-es-Salaam.

There is still a great deal of game left in Africa to delight the eye and kindle the enthusiasm of our children's children, and at some far-distant date to be so regarded by the aboriginal population whose present feelings for the average ungulate are in terms of next Sunday's joint. I hope I am not a last ditcher trying to prevent the legitimate expansion of interests other than my own. But I would rather be a ditcher than a hedger, and on this particular question there are a good many hedgers about.

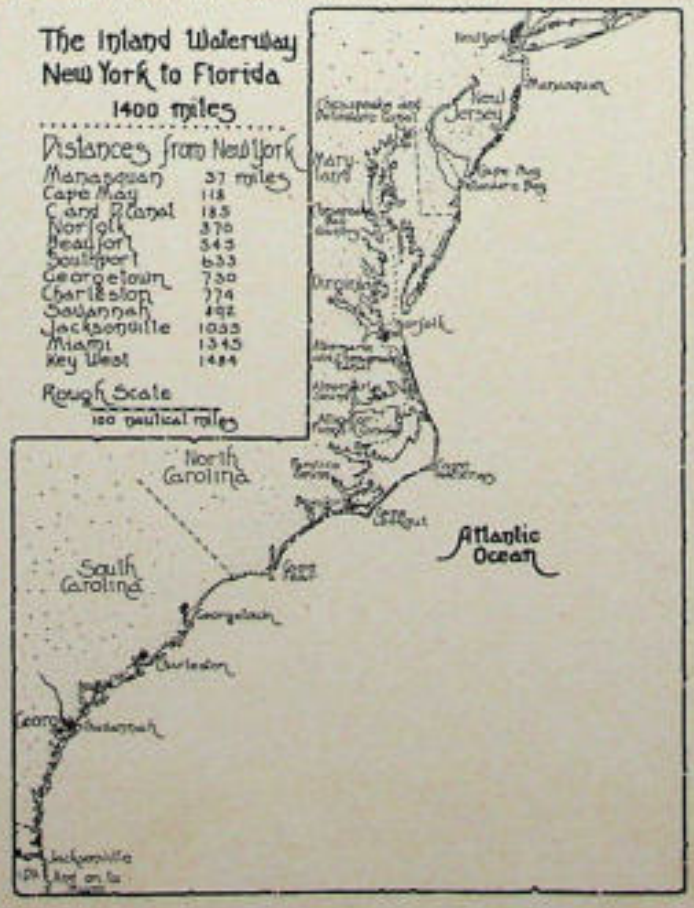
A CYPRESS SWAMP IN NORTH CAROLINA PENETRATED BY MEANS OF THE CHANNEL WHICH RUNS IN THE BACKGROUND

CRUISING INLAND FROM NEW YORK TO FLORIDA

By J. A. EMMETT

THE thickly populated eastern coast of the United States is characterised in winter by the difference in temperature between its northern and southern extremities. From New York north ice and snow prevail, while to the southward the weather becomes gradually warmer until the sub-tropical climate of Florida is reached.

For years residents of the north have taken advantage of this, going south for the winter by motor car, train, and even by the air, to spend the colder winter months where heavy clothing is unnecessary and fuel bills unknown. And now, with the completion of a 1,400-mile inland waterway along the Atlantic coast between New York and Florida, yachts, both large and small, are making this annual southern trek, too, and returning in the spring, both going and coming in comfort and security because of its sheltered reaches.



To make this inside route possible the Government has utilised the bays and large rivers, deepened the maze of salt-water creeks and marshes, and dredged connecting canals to permit boats of up to 7ft. draft making the entire run. The few locks, less than half a dozen, are free of charge, the entire route is well marked by a distinctive system of buoyage, and many towns and cities along the way have established municipal docks, most of them free, at which the boat-owner can tie up and secure every reasonable service.

In the past those few yachts which did go south in the autumn, to be joined there by their fortunate owners, had to be large and able to make the necessary outside ocean passage with its difficult capes to be weathered and the rough Gulf Stream to be crossed. Now, because of the inland waterway, all that is necessary is a serviceable boat of the power-cruiser type, or an auxiliary with an engine reliable enough to stand up to the 1,400 miles of running. Seaworthiness is no longer essential as the entire course is completely landlocked with distances such that every night can be spent in harbour.

The average yachtsman in that thickly settled section around New York City, where so many boats are owned, has always had to lay his boat up in late October and wait until April before he could fit out again. Winter had to be spent ashore, a hibernation which, while it may not have been shortened, was made more pleasant by dreaming of the coming annual vacation.

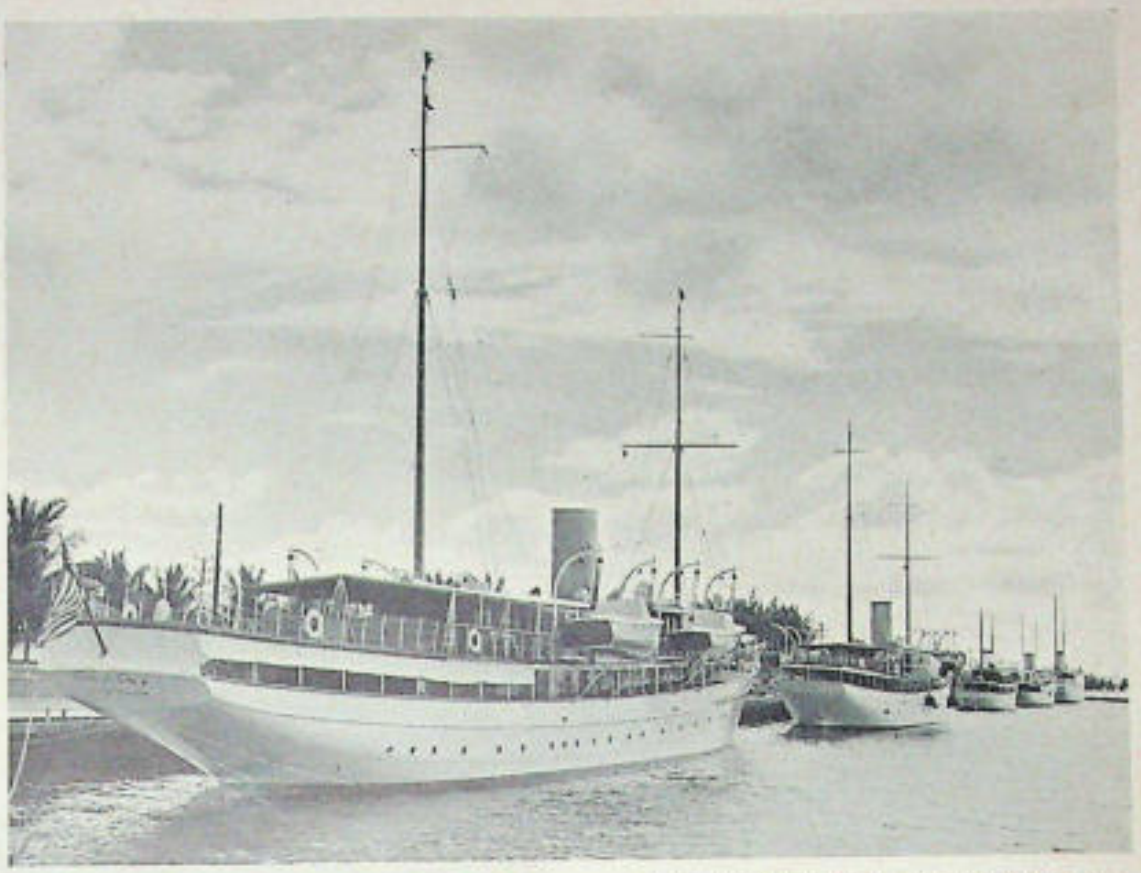
Now many boat-owners take this vacation in the winter instead of during the summer, going then as far south along the waterway as time permits, and either returning on their boat or leaving it in the care of one of the many shipyards being established along the way to rejoin it for another couple of weeks later and bring it north again. Others, more fortunate, pull out of cold New York in November or December and cruise leisurely to Florida, visiting many points of interest along the way to return in March or April. In this class are an increasing number of retired business and professional men and pensioned Government employees and their wives, whose children have grown up with homes of their own.

Not so many years back, these same people went south by motor car to live the winter in rented quarters. But the increased traffic on the main highways makes such travel less pleasant if not really dangerous, and leases in the south have gone up with the increased winter migration there. So to-day they prefer to buy a small cruiser aboard which, if they wish, they can live comfortably the year round going and coming on the waterway, north in hot weather and south in winter. While all sizes and types of yachts are using the new waterway, boats seen most frequently along it are of the power cruiser type, between 30ft. and 40ft. in length, and costing from £300 to £500. The interior layout will be identical to that of British cruisers, although the power plant may be slightly more powerful because of the cheapness of petrol in America. On such a boat an 80 horse-power motor, for instance, may use around 5 gallons of petrol an hour to maintain a cruising speed of ten knots, or 700 gallons for the trip.

While the American gallon is slightly smaller than the Imperial, petrol costs the American car owner only around 18 cents or 9d. per gallon, in which figure is included a state road tax of approximately 2d. The boat-owner, who is, of course, not using the highways, is entitled to a rebate of this tax, making the cost 7d. or around £20 altogether.

As for food, which one must eat ashore as well as afloat, the advantage going south by boat is that one is passing through a section where market gardening is a year round proposition and where the different citrus and other fruits are in full bearing. Meats are comparatively high, but if one does not mind a diet composed chiefly of seafoods, vegetables and fruits, food costs can be kept very low.

The only other item worth considering is by those owners who prefer to lay for the winter in some private or municipal basin in one of the larger southern cities. There is seldom any charge in the smaller towns, but in places such as Miami and Jacksonville there is a fee averaging 1d. per foot of



overall length per day with a monthly rate averaging considerably less.

This Inland Waterway, as the accompanying chart shows, cuts in 23 miles below New York to follow the bays and rivers of New Jersey 100 miles to Cape May. Going up Delaware Bay, the route cuts through by a sea-level canal into 200-mile-long Chesapeake Bay with its wealth of names familiar to every Englishman; rivers such as the Wye and the Tred Avon, and places such as Oxford, Cambridge and York.

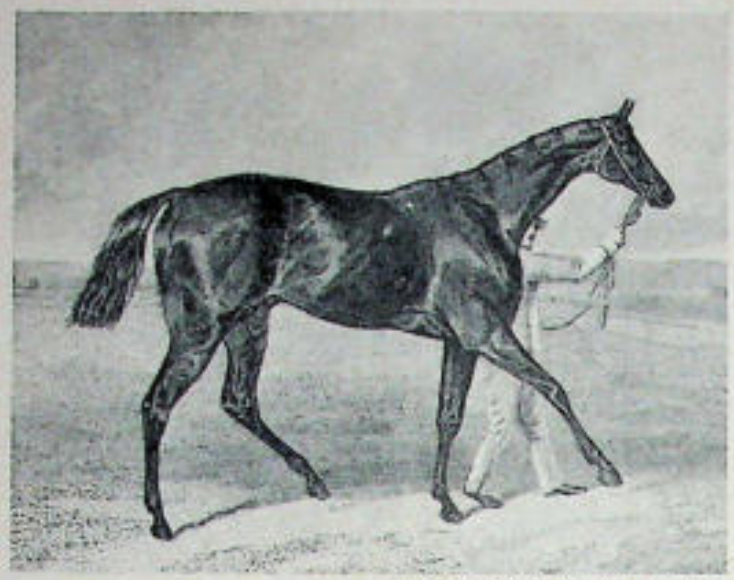
At Norfolk one commences to traverse the lovely sound country of North Carolina; a sportsman's paradise, where deer and bear are a common sight, and where a few straggly palmettos or seeing the first alligator reminds one he is getting further south. Then through the winding creeks of South Carolina and into the sea island country of Georgia. Here winter homes of northern sportsmen dot the islands, and fish are plentiful, wildfowl abound, and in the woods and swamps which stretch for miles back from the coast is good shooting.

Next is Florida. There one has a wide choice of destinations likely, making for whatever place is most favourable to one's particular sport or amusement. Some prefer to dock in the different cities and spend an idle but restful winter. Others keep going to explore the maze of rivers and winding sounds, or to make the day's run to the Bahamas or other nearby colourful islands off the coast.

Those who are angling enthusiasts harbour near one of the many inlets which connect the inland waterways and the ocean. There and in the surf outside, fish of all kinds are plentiful, and offshore runs easily made after the big game fish for which Florida waters are famous.

CRAFT WHICH USE THE INLAND WATERWAY

Berths such as that shown above, on account of but little rise and fall of tide, are popular with the larger yachts. All sizes and types of boats are using the new waterway, those seen most frequently being of the power cruiser order, between 30 and 40 feet in length, and costing from £300 to £500. On the left is a typical boat



Coupled with the national tendency towards a more leisurely way of living, and Government legislation of working hours and even retirement age, this new waterway is certain to have a great influence on American boating habits. Each year, as is evidenced by the fact that boat-builders are busy and marine engine manufacturers are behind on orders, more people are deserting the crowded highways to find rest and recreation on the water. There is no doubt but that many of these are purchasing boats because a safe and comfortable way to use them the year round has been opened up.

A MIXED FLEET. IN THE FOREGROUND IS A FAST EXPRESS CRUISER, AND BEHIND IT ARE TWO AUXILIARY CRUISERS

A ST. LEGER DEAD-HEAT OF A HUNDRED YEARS AGO

By J. FAIRFAX-BLAKEBOROUGH

From the painting by Charles Hancock

THE ST. LEGER RIVALS OF 1839

Charles XII, winner of the deciding heat for the St. Leger, and Euclid (right), whose owner disputed the dead-heat

From the painting by J. F. Herring

APART from the fact that the St. Leger of just a century ago provided the first dead-heat in the history of the race, the whole of the story surrounding the great Yorkshire Turf event of that year is of deep interest, especially to northerners.

The ultimate winner, Charles XII, was bred and owned by Major Yarburgh, of Heslington Hall, York. Charles XII was by Voltaire out of a Prime Minister mare, also bred by the Major. He was a hot-tempered horse, difficult to handle, and was originally trained by Tom Dawson at Middleham, but had been transferred to John Scott's place at Whitewall, Malton, for his St. Leger preparation. In *The Life of Mathew Dawson*, we read that Herring, the animal painter, whose pictures are now so much sought after, was a great friend of Tom Dawson's and often stayed with him at Middleham. "He would wander about paintbrush in hand, painting any horse that took his fancy, and he generally gave these pictures to his host so that Mr. Dawson had many examples of Herring's work. The finest he had was that of Charles XII."

Why the horse was transferred to John Scott is not recorded, but so it was, and so it fell out that, ridden by Wm. Scott he secured for his owner an honour for which he had long hoped and competed. The *Rural Almanack* (1839), referred thus to the curiously progressive way in which Major Yarburgh eventually won the St. Leger:

> "It is a singular circumstance and worthy of notice that Maj Yarburgh in essaying to gain the great Doncaster St. Leger has obtained that desired object, as it would appear, step by step, by steady perseverance. In 1827 he was placed third for the race with Laurel; in 1828 he ran second for the race with his filly Belinda, and in 1839, when his turn arrived to have the proud distinction of recording his name 'first in the throng,' the fates did not permit such to take place until his horse Charles XII had first run a dead heat with Mr. Thornhill's Euclid. The Maj's horse won cleverly by a head in the deciding heat, and on Thursday of the same meeting came in first for the Cup, thereby proving Charles XII to be one of the stoutest three-year-olds that has been out for many years."

Charles XII was favourite for the 1839 St. Leger, the betting being 7 to 4 on him. Second favourite, at 6 to 1 against, was another York horse, Bloomsbury, owned by Mr. W. Ridsdale ("The Man of York"), winner of that year's Derby, and made famous in view of objections lodged regarding Bloomsbury's pedigree as declared by his nominator. This culminated in an assize trial for the recovery of the Derby and Ascot Stakes. In this Mr. Ridsdale was successful, having proved the accuracy of the pedigree given at the time of entry and the inaccuracy of the entry given by John Orton in the *General Stud Book*. In the St. Leger, however, Bloomsbury could finish only seventh.

According to Orton, in his *Turf Annals*, "Euclid went off with the lead, but after going a few hundred yards Charles took it from him and made strong running." The course was very heavy along the flat, where Charles XII remained five or six lengths in front. Again to quote Orton:

> "On approaching the distance Euclid began to draw upon Charles and looked very like the winner. The race now became very interesting between Charles and Euclid. On approaching the stand the general cry was that the latter was the winner, and he certainly there appeared to have the best of the race, but after a severe contest the judge declared it to be a dead heat. . . . Previous to the contest to decide the race the betting commenced at 6 to 4 on Charles but closed at 6 to 5 on Euclid. At starting they both walked from the post for a short distance, when Euclid went away at a slow pace until near the foot of the hill, where the pace began to improve, Euclid still keeping his ground. In going along the flat Euclid had several lengths, but after passing the Red House Charles gradually advanced upon him, challenged him at the distance, and after a splendid struggle won by a neck."

Mr. Thornhill, owner of Euclid, did not agree with the verdict, and Mr. Arthur Portman, his grandson, has recorded: "My grandfather always used to tell me that from his view of the race Euclid certainly won the first time, and that this was the opinion of most of the onlookers, but the judge ruled otherwise. So there the matter ended."

"Alfred Highflyer," in his review of the race in the *Sporting Magazine*, referred to "the great stride of Charles XII, which told with such painful effect upon the game little Euclid at the run in," and added, "Both the horses were admirably jock'd." He then goes on to speak of Bloomsbury in the betting market, fluctuating "in an enigmatical character" between Sunday and Monday from 4 to 1 to double those odds. "The finishing stroke was done, however, on the morning of the race, when a noble lord offered 10 to 1 in hundreds against him. From his appearance it was evident to the most careless observer of the running horse that he was not up to the mark. The fact is the horse was "nursed up" too much." Bloomsbury, by the way, had been sent to Hambleton for his St. Leger preparation.

Reverting to the stride of Charles XII, another contemporary writer said: "It is worthy of being placed on record that the stride of Charles XII in the dead heat, immediately after he had been passed by Euclid by a head opposite the grand stand, was exactly 24ft. 6½in., measured by his footprints, left plainly visible on the turf. The stride of Euclid was much shorter but much quicker, and more clean and elastic than his opponent." Charles, by the way, stood 16 hands, Euclid only 15.2.

Mr. Andrew Johnstone, of Halleaths, Dumfriesshire, was at this time getting together the nucleus of a thoroughbred stud which was later located at the now built-over Sheffield Lane Paddocks. He was in China on the family tea plantations when he instructed Thos. Dawson to buy him the best stallion he could obtain for 3,000 guineas. In the *Life of Mathew Dawson* we are told that Tom Dawson offered Mr. Thos. Thornhill, of Riddlesworth, Norfolk, 2,000 guineas for Euclid prior to the St. Leger. Mr. Thornhill's reply was that he would rather shoot than sell him. The following year Mr. Johnstone made another attempt to buy Euclid, and in some correspondence the late Mr. John Johnstone gave me regarding the Sheffield Lane Stud is a letter dated February 3rd, 1840, from Squire Thornhill, which reads:

> "SIR,—When such persons as Mr. Weatherby and Mr. Tattersall apply for the price of horses in training it is repeatedly for the purpose of trying to find out the opinion of the owner. This is my reason for the answer they received from me.
>
> "Euclid is in a match with Corsair of 300 each with bets; a sweepstake of 300 each with Cesar and Bosphorus, and in the Claret. If he is well I do not see how he can lose any. I am informed that £3,000 is considered a cheap price for Charles XII. He has no engagements of this sort, and from his performance cannot be matched to advantage. Had Euclid only three legs I would not take 2,000 for him as a stallion. Under all these circumstances, you will see the impossibility of our coming to anything near the mark.
>
> "I remain your obt. servt.,
>
> "THOS. THORNHILL."

Euclid was successful in all the engagements named by his owner. Eventually Mr. Andrew Johnstone bought Charles XII from Major Yarburgh and "The Druid" tells us that Mr. Johnstone later had £1,000 profit bid but declined the offer.

Before Charles's racing career ended Mr. Johnstone had recouped himself well, yet at stud his fee for the first season (1844) was only 12gs., and as a sire he did not prove a success. To quote again "The Druid":

> "At first his stock sold pretty well at Doncaster, but at last he himself could only command a £20 bid. He was then sold privately for £50, but the vendor forfeited £20 rather than take him. His tail was so short and his back so down that even Tom Dawson stood at the ring-side and asked what he was."

Charles XII was destroyed in 1859, being buried at the Sheffield Lane Paddocks. Although "Alfred Highflyer" (in an article written earlier than that from which I have quoted) said of the 1839 dead-heat that the Leger of that year "has in the annals of the Turf no parallel, and which perhaps will never again be equalled," there was another dead-heat in the St. Leger in 1850. This was between two more notable horses—Voltigeur and Russborough, the former of which won when the race was run off. Again there was dissatisfaction as to the verdict. In looking up details regarding this second dead-heat I have come across a letter written to me years ago by Mr. (afterwards Sir) Edmund Russborough Turton, of Upsall Castle, Thirsk. The letter is dated from Russborough in Ireland, and the following is an extract:

> "Russborough was named after my grandfather's (the 4th Earl of Milltown's) place and everyone concerned with his stable were fully convinced that Russborough beat Voltigeur for the Leger by a head. My father, who had backed Voltigeur on the advice of Mr. Billy Williamson, was convinced he had lost his money. It was the general opinion that the judge never expected Voltigeur to be beaten and was so flumaxed at Russborough coming up that he gave it a dead-heat."

AN EXPLANATION

In his article in our issue August 12th our contributor "Gnostic" dealt with the naming of horses and made adverse comments upon the naming of Boomps-a Daisy, which belongs to Mr. Farquhar Deuchar, of Shortridge Hall, Warkworth, Northumberland.

We much regret having published the paragraph, the more so because we know Mr. Farquhar Deuchar is a keen lover of horses. We desire to withdraw the remarks we made and apologise to Mr. Deuchar for any annoyance they may have caused him.

BROWN RAT APPROACHING ITS HOLE

"The real rat, both black and brown varieties, which does many millions of pounds worth of damage every year, is nowhere commoner than in the docks and warehouses of London"

ANIMAL LIFE ROUND LONDON—II

By R. S. R. FITTER, F.Z.S.

IN a previous article the position of the surviving native carnivora within 20 miles of London was considered, together with a few other species of interest to the sportsman. Now it is the turn of some of the pests among London's fauna.

One of the most spectacular changes in the fauna of the British Isles since 1900 has been the rise of the alien grey squirrel simultaneously with the decline of the native red. The London district is at present one of the most thickly populated grey squirrel areas in the country, and this is because at least half-a-dozen separate introductions were made there early in the century.

Somewhere about 1890 a veritable mania began among British landowners for releasing grey squirrels from North America on their estates. The Duke of Bedford began it, with ten squirrels at Woburn, the centre from which most of England was colonised, either directly or by gift. In the same year Mr. G. S. Page, of New Jersey, released five grey squirrels in Bushy Park, but these appear to have died out. The continuous history of the grey squirrel in the London area begins with the release of 100 of them by another American at Kingston Hill, next to Richmond Park, about 1902. From this centre south-west London and the valleys of the Thames and Mole were eventually colonised.

The next introduction was right in London. Between 1905 and 1907 some 90 grey squirrels were brought from Woburn to the London Zoo, and some were allowed to escape into Regent's Park, where they speedily became one of the attractions of the Sunday promenade. From Regent's Park, Hampstead was soon colonised, and by 1913 grey squirrels were as common as red in and around the Heath. Grey squirrels soon appeared in the other central parks, and in many squares in Bloomsbury and elsewhere. In 1935 there was a drey in Russell Square.

A fourth introduction took place at Kew Gardens with Woburn squirrels in 1908, and a fifth at Farnham Royal, Bucks, in the same year with squirrels direct from America. At least one introduction in the Kentish part of the London area is on record, near Sevenoaks, about 1911, and there was probably one in the Chislehurst—Bickley district also.

By 1934, when the Bureau of Animal Population made the first of its national grey squirrel surveys, grey squirrels had spread from these six or seven centres over practically the whole of the London area, except for Essex, parts of the south and south-east suburbs, the Thames estuary in Kent, and a strip of Middlesex between Hounslow and Staines. The Lea Valley still formed a barrier against the pest, for pest it was found to be as soon as it became at all common in any area. By the end of 1935, however, the vanguard of the invading army had forded the Lea, and by 1938, despite vigorous measures by the Forest authorities, grey squirrels are probably as common in Epping Forest as anywhere else in the London area.

Grey squirrels are almost omnivorous. Their staple diet is vegetable matter, such as fruit, nuts, bark and green shoots, but they have been recorded as eating such diverse food as birds' eggs, unripe walnuts and the leaden plant-labels in Kew Gardens. Hardly, therefore, had people begun to rejoice at the graceful new addition to our fauna than there was an outcry at its destructiveness, in which gardeners, farmers, game-preservers all joined. As a result over 2,000 grey squirrels were shot in Richmond Park alone in the five years before 1937, and 4,000 were shot in Kew Gardens between 1917 and 1937. In Richmond Park there are still estimated to be five to ten pairs, but at Kew they have now been nearly driven out.

The spread of the grey squirrel coincided with the disappearance of the red, which, in 1900, was a common sight in the woodlands round London. After the turn of the century a mysterious disease seems to have smitten the red squirrel, and it completely disappeared from many of its familiar haunts, some time before the grey squirrel had got into its stride. What the grey did was to occupy the niche left vacant by the red, not to drive it out. The red squirrel is a native of coniferous woods, rather than of deciduous, whereas the grey has the reverse preference. What does seem to be happening is that the grey is resisting the reoccupation by the red of its old territory. Nevertheless, the red squirrel seems to be slowly regaining ground, especially in parts of Surrey. In Epping Forest the red squirrel has always been common, even in the worst days of the plague. This appears to be due to an introduction of a continental strain about 1910, which must have been immune from the scourge which was sweeping the indigenous stock.

Most of the greatest mammal pests in England are rodents. The grey squirrel is often called the tree-rat. The real rat, both black and brown varieties, which does many millions of pounds worth of damage every year, is nowhere commoner than in the docks and warehouses of London. Both black and brown rats are invaders from Asia, and such exotics as the Alexandrine rat and the tree or roof rat are also found in the London docks.

STOAT AT THE NESTING HOLE OF A HOOPOE

This photograph was taken in France

"THE LONDON DISTRICT IS AT PRESENT ONE OF THE MOST THICKLY POPULATED GREY SQUIRREL AREAS IN THE COUNTRY . . ."

Of the house mouse, all that need be said is that it is commoner than most London householders would wish. Field mice, both long and short-tailed, are also too frequent for the peace of mind of gardeners. The bank-vole appears to be commoner than is usually thought, owing it its close resemblance to the field-vole, or short-tailed field-mouse, for which it is commonly mistaken. The water-vole is found on most suitable streams, but the dormouse is getting scarce and the harvest mouse extremely so.

The rabbit is another universal pest. Its holes are to be found in almost every field, and the killing-off of many of its natural enemies, such as stoats, weasels and birds of prey, together with the relative absence of men with shotguns, has made the neighbourhood of London something in the nature of a rabbit's paradise.

The five British insectivora are still to be found near London. Moles are very common; few fields are without their lines of hillocks, which can be seen near the centre of London, as Ken Wood. Hedgehogs are also frequently met with, even in suburbs like Lewisham and Wimbledon. Of the three shrews, the common is often to be seen lying by the roadside after its strange autumn mortality, the pigmy is found less frequently, and the water-shrew is decidedly scarce. In Richmond Park there is still an ancient shrew ash, where as late as 1852 ailing children were being brought for cure.

Much, however, remains to be learnt about the present distribution of mammals in the London area, and the recording scheme of the London Natural History Society, mentioned in the first of these articles, is deserving of the support of all who are interested in the animal life of the London area.

A CHARGING (?) RHINOCEROS

WHEN IS A CHARGE? *By CAPTAIN PAUL CURTIS*

THE article by "M. T. S." in the issue of May 27th, under the title "Risks with Dangerous Game," prompts these observations on the subject. I quite agree with the writer that "practically no beast is dangerous until one has made it so." And I will go even further than that and declare that far too often big game is considered dangerous in a mistaken belief that it is charging when actually that is the furthest thing from its intention.

I once drew a storm of protest about my head by making the statement in an American sporting magazine that all of the so-called dangerous game in the country could be driven from the Rockies into the Pacific Ocean with a carriage whip—but I have modified my opinion since. The point is that the wish is father to the thought that big game is dangerous. Just as when we were children we liked to believe in Santa Claus, so we persist in fostering the idea. What hunter of big game in his inner self does not fancy the opinion that he is a man of prowess?

However, one can be quite honestly mistaken in believing that a panicky rush to escape is a deliberate charge. For as the late Colonel Roosevelt once pointed out to me, there are four general directions in which a wounded or missed beast may go when a shot is fired—directly away, or directly towards the shooter, or to the left or right, which means that there is a 1 to 3 chance that the beast may run in the general direction of the shooter.

One may believe that the chances of it running towards the shooter when only trying to escape are very remote, until the excuse for it is known. For instance, let us say that an unsuspecting animal is quietly feeding and is first apprised of the proximity of the stalker by the roar of his rifle. Quite often the animal does not know from what direction the noise came, and may easily run slap at it. It is all the more likely if the animal is struck, and shock is added to the element of surprise, and it is particularly true of mountain stalking, where the noise of the rifle is re-echoed and hurled back and forth from mountain to mountain until it sounds more like a bombardment than a single shot.

Another contributory factor is that most mountain game is seen and stalked above the timber line, and generally the stalker approaches it from below. Naturally, when frightened, the game makes for the timber, and that brings it downhill towards the stalker. It is for this reason that old hunters always say one should never approach a grizzly from below, as it is more apt to charge, and is coming so fast that it is difficult to stop. Personally, I believe that in these instances the charge so called is nothing but an effort to reach cover in the shortest possible time, though, of course, if you are right in the bear's way you may get into trouble. I recall such an instance many years ago in Wyoming when we were hunting a grizzly, and it came down a hill and almost ran over my guide; in fact, it was so close that it slapped at him with a roar as it passed, ripping a boot off the guide's leg and bowling him over, but the bear did not stop to continue the fight. Nine times out of ten the victim of such an affair would go home and say he was charged, but we know better.

A perfect example of a mistaken charge was given to me several years ago. While some 200 miles north of the Transcontinental Railway, in Canada, I ran into another hunting party. I had, at the time, secured my quota of game, but the other sportsman had been less fortunate, and was afraid that he was going home without his bear. However, I had seen three of them on a slide where they were feeding a day's ride back, and offered to return and show his guide the place, as I had nothing better to do.

Sure enough, when we arrived at the place the bears were still there, and we began the stalk. We crept up to within about 200 yds., or less, of them, behind some stunted mountain junipers which were little more than waist-high.

There were three bears, apparently an old female and two yearlings. The old bear was busily engaged in digging out a marmot for her supper, and had made such an excavation that only her stern was visible, as she made the earth and rocks fly. After waiting vainly for her to back out and turn the guide told the sportsman to shoot at her, and apparently he only grazed her flank, for she came out of the hole with a roar of rage and struck the nearest yearling a tremendous blow that sent it reeling down the slope. No doubt the old lady thought it had bitten her—at any rate, she started for the timber and came straight at the spot where we were sitting. The sportsman continued to fire as fast as he could operate the bolt of his Mauser, and missed four times. By then the bear was getting too close for comfort, and I raised my rifle to finish it off as he frantically began reloading; but the guide coolly told me to hold my fire, and standing up he hurled his sombrero with a piercing yell at the approaching bear. The beast stopped as if it had four-wheel brakes, and turning aside disappeared in the cover.

We were all certainly justified in believing that we were being charged, and the guide took a chance in letting it get so close; but the result warranted his suspicion that the bear had not seen us, and I always admired his sportsmanship in refusing to kill it for the patron who had been given such an excellent chance and made a mess of it.

However, one must not make the mistake of thinking that because one animal refuses to charge they are all alike; their personality differs just as ours does. I, personally, know two men who were mauled by grizzly, and also knew two others who were killed outright. In every instance it was due to getting too close to the bear unawares. One is an Indian, who has lost the use of both of his arms, which he thrust in a grizzly's jaws to save his life. The poor fellow had a very old rifle of low power, and he crept up to about 20yds. of his bear before opening fire. That was his mistake. The other is a forest ranger, who was at death's door for months as a result of an unprovoked attack. He came upon a grizzly unexpectedly while it was feeding on the carcass of a moose, and it rose and rushed him before he had time to fire. Another case of being too close, which so often prompts a charge. If there had not been a light fall of snow on the ground the bear would have heard his footsteps and most likely have made off before he was in sight.

Of the two who were less fortunate, one was killed on Kodeak Island, Alaska, and found dead in thick scrub with the bear dead beside him; the other was an unarmed forester, killed near Jasper, Alberta. So I cannot quite agree with "M. T. S." that the grizzly owes a certain amount of its reputation to its name. I used to think, as he does, but four such cases within the limited scope of one man's acquaintances are too many to warrant it. I have also learned that a great deal depends upon environment. In some sections of the continent, the grizzly are largely vegetarian until the salmon run, when they subsist on fish.

These bear seldom charge. But on the eastern slope of the Rockies where there are no salmon, where it is colder and berries are scarcer, the bear are almost entirely meat-eaters, and they are much more dangerous. There was one section of south-western Alberta where, shortly after the War, the grizzly had, as a mass, become man-eaters, and would actually stalk the hunter—but there was a reason for it.

The country spoken of was the hunting ground of the Stoney Indians, a tribe of which about 70 per cent. were wiped out by the great influenza epidemic of 1918-19. The Stoneys lived in dugouts—a great hole dug in the ground, logged over and covered with sod. In the centre of the roof was an opening which served as entrance and chimney, and the sole source of light and ventilation. These abodes afforded a perfect situation for the influenza to do its worst work. When some of a community died the others got frightened, and, deserting the sick with the dead, they rode away to the next village—so it spread like a prairie fire.

Bears like their meat high, and their noses soon led them to these charnel-houses. It was then but a step from feeding on the dead to killing such of the living who were too weak to defend themselves. They lost their fear of man and acquired a supreme contempt for the puny things. So much so that when a man I knew disregarded advice and went into the country a year or two later to hunt bear he had to get out in a hurry. He found to his surprise and embarrassment, that the bear he was hunting were stalking him. There was no chance to rest for they were after him all night, so he saddled up and got out as soon as he could. For some years in that locality practically every shot fired at a bear that did not drop it in its tracks provoked a charge.

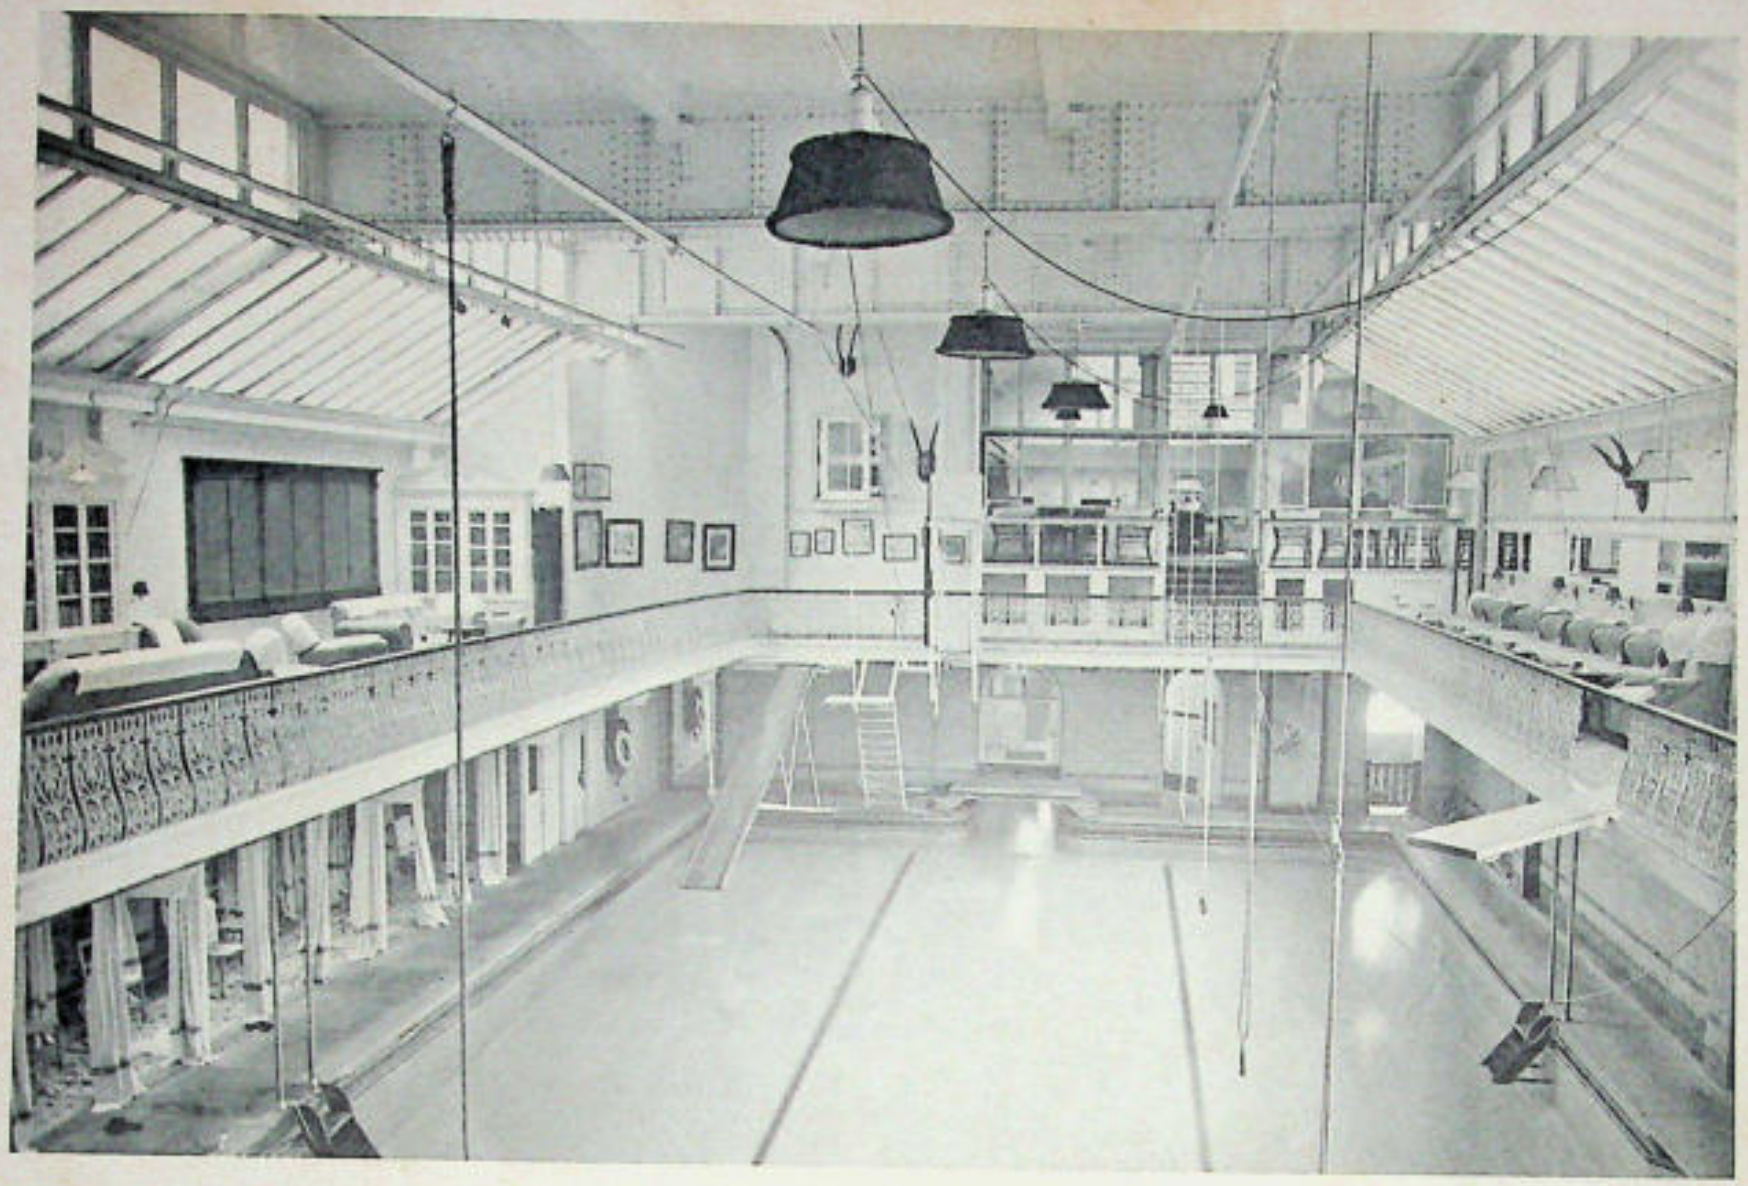
However, this is an unusual case. I realise that the big game of Africa and Asia presents many species more apt to charge than the grizzly, particularly amongst the cat tribe. Nevertheless, I feel sure that, even there, many an attempt to escape in the wrong direction is mistaken for a charge, and were it not for the fact that jungle shooting makes it necessary to get to close quarters, there would be fewer determined charges.

With rare exceptions harassed game will not come on intent on mischief for over 100yds., usually it is not over 25yds. It is when they feel that they are too close either to run or slink that they put up a fight.

To cite an instance: I always scoffed at the suggestion that a moose would fight; but one day when we were following a trail in New Brunswick we suddenly ran into a moose in a small clearing. It was a splendid bull, and not over 15yds. from us; but as it was in bright sunlight and we were in the deep shadows of the forest, it made no attempt to run off, but came slowly towards us grunting a challenge, probably thinking that we were another bull.

The guide, who was unarmed, went up a tree like a monkey, as I motioned to my companion, who had never killed a moose, to take it. Fortunately, I noticed that his rifle barrel was wobbling owing to excitement as he raised it, and I prepared to back him up. At the report of the Mannlicher, the bull dropped its head and came right at us, and a quick shot from my Springfield, which tore a vertebra completely out of its neck, pulled up the beast at our feet. The guide said we were charged, my companion said so, and I suppose we were; but did the beast see us, did it know what we were, or was that blind rush just the reflex action to the first shot? I will never know. At any rate, it is one of a very few rare cases when a moose has come on.

BIG GAME IN KENYA: *Photographed by LIEUT.-COLONEL C. H. STOCKLEY*



SOMALILAND NETTED GIRAFFES

There are many races of Giraffes (which are found in suitable localities all over Africa south of the Sahara, with the exception of the Congo Forest areas), and of them the Somaliland or Reticulated Giraffe, with its large dark brown spots separated by a network of whitish lines, is the most handsome

GREVY'S ZEBRA

Zebra is the popular name for fully striped members of the horse tribe. It does not indicate any kinship for the animals that bear it. There are, indeed, three very distinct species, called commonly Zebras, and they are linked together by the stripes only. Stripes are, of course, a characteristic inherited from that common ancestor from which horses and asses (who have lost the stripes) are also descended. Grevy's Zebra is the largest, if not the handsomest, and stands about thirteen hands at the withers. It is found only in open country in Northern Kenya, Southern Abyssinia and Somaliland

THE FAMOUS SWIMMING BATH

"The original idea had been to have a central bathing place available for members of all the West End clubs, but this scheme was afterwards superseded by one that eventually gave the Bath Club all the amenities of a West End club, and, in addition, a large swimming bath . . ."

GREAT SOCIAL CLUBS—IX. BATH CLUB

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

WE must now leave the ancients behind, and all the bucks, beaux, bloods, wits and gamesters of the eighteenth and nineteenth centuries, who have so largely helped us to fill up the lines of the histories of the clubs we have dealt with so far. If the members of the Bath Club do anything peculiar, or have any strange habits, it must be left to some future club historian to tell the world about them. Not on me shall fall the anger or derision of 2,000 young men, mostly athletes, stalkers, big game hunters, foxhunters and polo players—in short, not good men in any way to upset, if it can be avoided. Stern facts only shall be dealt with—no drinking, gambling or blackball stories here, no anecdotes about ladies. The Bath Club was founded in 1894. The idea was that of the late Mr. C. Williamson Milne, who died in 1930. Lord Desborough has been president and chairman of the Club ever since its foundation—that alone would be good enough to ensure the success of any club. The original idea had been to have a central bathing place available for members of all the West End clubs, but this scheme was afterwards superseded by one that eventually gave the Bath Club all the amenities of a West End club and, in addition, a large swimming bath, and also Turkish, electric and steam baths. The building now acquired for these various purposes was Lord Abergavenny's house in Dover Street.

This house had been built about 1780 on a site which ran through to Berkeley Street. When the Club acquired the freehold, the house was in three sections, with the front in Dover Street.

In the central section, which had originally been a garden, was a fine ballroom; behind it were the stables with access on to Berkeley Street, at that time paved with cobble stones and consisting chiefly of mews. The committee had now to consider how best to adapt all this material to meet the requirements of a Club which was to be a pioneer in providing these extra amenities hitherto never installed in any existing London social club.

On the site of the ballroom they built the now famous swimming bath; in the Dover Street section, room was found for the Turkish baths; the Berkeley Street section was converted into a gymnasium with bedrooms above it. But this was not all, for when the centre block was near completion, and the builders were about to lay down a lead roof, Lord Desborough inspected the work

THE COCKTAIL BAR IN THE GRILL ROOM

and exclaimed: "This is the ideal place for squash racket courts." So the two courts, known to all who play or follow this game throughout the world, were built here owing to Lord Desborough's inspiration in 1903. This was the first London social club ever to build squash courts. Its example has now been followed by many others.

Many additions to the house have been made since then, and now the whole site of Lord Abergavenny's house has been built over and there are 70 bedrooms and flats available for members in the Club. It can be safely said that all this work has been very well carried out, and wherever possible the original features of the house have been retained. Several of the Adam ceilings in the main Club rooms are still there, and the scheme of decoration throughout the Club wisely conforms with this period.

The Amateur Squash Rackets Championship, established in 1922, is held every year at the Club and has been won five times by members of the Bath Club, four times by Captain Victor Cazalet, M.P., and once by Captain J. E. Tomkinson. In 1927 Captain Cazalet also won the Canadian Amateur Squash Championship and, in 1924, Captain Gerald Roberts was the winner of both the American and Canadian Amateur Championships when he visited Canada and the United States with the British team.

In 1922 the Club founded the Bath Club Cup Squash Rackets Invitation Tournament for competition among the West End clubs. After 25 years' service, Charles Arnold, the famous squash rackets professional, retired from the Club in 1938. Among his most distinguished pupils were the King, the Duke of Windsor, the Duke of Kent and the Bishop of London. It is gratifying to all his old friends—for whom he did so much—to know that Arnold is still taking an active part in squash. He has been succeeded as professional at the Bath Club by Leslie Harner, who received his training at Marlborough College, where his uncle was coach.

King Edward VII and Queen Alexandra were the first patrons of the Club, and in 1903 paid it a visit to witness a life-saving entertainment under the auspices of the Royal Life Saving Society, of which Lord Desborough has been president since it was founded by the late Mr. William Henry, a member of the Club. The children of King George V—Prince Edward (Duke of Windsor), Prince Albert (the King), Prince Henry (Duke of

Gloucester) and Princess Mary (the Princess Royal) —were all taught swimming at the Bath Club. The King and Queen are now patron and patroness, and both Her Majesty and Queen Mary have attended to see Princess Elizabeth and Princess Margaret swim.

There have only been two bath masters in the 42 years of the Club's existence. The first, John Daniels, who taught the King and his three brothers to swim, retired on a pension after 27 years' service and was succeeded by the present instructor, Fred A. Unwin. Unwin is ex-backstroke champion of the world for 100yds., 150yds. and 400 metres and has held the world's record for the first two distances; ex-English backstroke champion for four years; British Olympic Games representative for 100 metres backstroke and 400 metres free style, and was British Olympic coach at Antwerp and Paris.

Among the prominent swimmers at the Club is General B. C. Freyberg, V.C., famous for his gallantry at Gallipoli. General Freyberg attempted in 1926 to swim the Channel, having had his preliminary training at the Club under Unwin. He started from Cap Gris Nez and reached within 400yds. of St. Margaret's Bay, after being in the water for nearly 17 hours. Mr. Osman Halliday is the chairman of the swimming committee. He is famous for his high diving from the trapeze.

There have also been only two lady instructresses: Miss Ada Lewin, famous for her diving, who retired on her marriage in 1901, when she was succeeded by Miss Amy Daly. Miss Daly is an honorary life governor and member of the Central Executive Committee of the Royal Life Saving Society.

Princess Mary, who had commenced swimming lessons with Miss Lewin, continued her tuition under Miss Daly, who is now teaching Princess Elizabeth and Princess Margaret. Princess Elizabeth has passed the elementary and intermediate examinations, and Princess Margaret has passed the elementary examination of the Royal Life Saving Society.

Miss Daly numbers among her pupils the late Lady Constance Mackenzie, the late Lady Alington, who was the first lady swimmer to win the gold medal diploma, with honours, for life saving, and the late Mrs. Edgar Syers (winner of the Olympic Games skating), who won the national graceful high diving competition. Miss Daly has long been distinguished for her wonderful methods in teaching children.

Members of the Club are allowed the privilege of having their children, girls as well as boys, taught swimming there. This is the origin of the limited number of ladies who are permitted to join the Club, as they are recruited from the daughters of members who have been junior members.

The shooting trophies in the house are very numerous, and a number of the heads from the collection of Mr. H. F. Varian (a member) are exceptionally good specimens. In the Front Hall there is a splendid wapiti, also the record tarpon, weighing 182lb., caught off Florida in 1899, by Lord Desborough. Elsewhere is the curious skull of a lion from the collection of a member, bearing the inscription: "Lost his life, May 18th, 1902, as a result of a meal off a member of the Bath Club." The member in question had his arm badly mauled before killing the lion.

THE SMOKING ROOM

"Stern facts only shall be dealt with—no drinking, gambling, or blackball stories here, no anecdotes about ladies"

It would be interesting to have a record of the number of individual championship and team championship cups which members of this Club have won or helped to win. It must surely be a very long list when one finds amongst the roll of past and present members the names of Lord Desborough, Lord Hawke, Lord Kimberley, Lord Clydesdale, Mr. Harcourt Gold, Mr. Walter Buckmaster, Mr. Roger Wethered and Captain Humphrey Guinness.

There seems, indeed, to be no sport or game in existence which has not one of its champions represented among the members of the Bath Club. Few clubs, Service or otherwise, can show such a great Roll of Honour as the Bath Club does. Engraved on the panels of the memorial in the Bath Gallery are the names of 255 members and seven staff who fell in the Great War. Included in these are no fewer than eight V.C.'s. The present head waiter, Captain A. E. Howard, survived his wounds and was awarded the Military Cross. In the Front Hall is a very fine silver shield, designed by the late Lord Alwyne Compton, at that time chairman of the House Committee, as a memorial to those who fell in the Boer War.

The Card Room of the Bath Club can claim no exciting stories of the past like those of many of the older clubs. But it was here that the first rules of Auction Bridge were drawn up.

There is an excellent collection of Pelligrini's cartoons dated 1872–3 in this room of celebrated Club men.

The membership of the Club was originally fixed at 2,000 members. The entrance fee is 30 guineas and the annual subscription 12 guineas. There is a long waiting list for candidates.

Sir John Wilson Taylor is the secretary, and he has held that post ever since the early days of the Club.

PART OF THE COFFEE ROOM

The high ceiling of this magnificent room gives it an air of spaciousness and elegance

FLAT OUT OVER THE HURDLES AT HARRINGAY

GREYHOUND COURSE MANAGEMENT

By DALE BOURN

HOW many people whenever they travel by train ever give a thought to all the planning, brains, organising and experience that have been utilised in order that they may travel in comfort and safety? How many ever think of the engine driver, the guard, the station-master, the signalmen, the pointsmen, and all the many others who work and plan so that they may travel on schedule on any day of the week? Not many. So in Greyhound Racing, it is a very small minority who ever think of what goes on "behind the scenes." Even in this new industry, not months, but years have been taken in experimenting in perfecting the organised management of the modern greyhound racecourse.

Great care and foresight is the keynote of the policy of greyhound racecourse administration in order that the very best possible presentation of the sport may be made to the public. No detail is overlooked.

Depending on the size of the stadium, hundreds of employees are allocated to various jobs at every meeting. The catering department alone use a small army, besides the staff of commissionaires, ticket sellers, police, tote operators, track men, electricians, &c. However, it is the racing side of the staff with which the public come into little contact and whom they rarely see during a meeting. It is they who work and organise behind the scenes.

At a big stadium there is a general manager, who is in charge of the small army that runs the stadium. It is he who is responsible for all matters appertaining to the stadium, but who is not concerned with the racing department except in so far as where the two interests might be mutual.

The National Greyhound Racing Club book of rules lays down that "The following officials shall be appointed for every racecourse subject to the approval of the stewards of the N.G.R.C., viz. at least three stewards, a veterinary surgeon, judge, racing manager, starter, timekeeper and driver or hare controller, each of whom (stewards excepted) must obtain an annual licence from the N.G.R.C.". The cost of this licence on issue and renewal is 5/- annually. This band of officials are in full charge of the racing at all meetings, and each has his own individual job.

The veterinary surgeon is the first man on the scene, as it is his duty to examine each dog that is racing at the time of "kennelling," that is one hour at least before racing begins. With him is a member of the racing manager's staff, who assists him in identifying all the dogs from their respective identity books, which must be produced before a dog can be accepted for a race. He makes a report to the stewards of all dogs that are in his opinion not fit to race. Again, he examines each dog before it leaves its kennel for the race and again afterwards. He is present all through the meeting and attends any injured dog, again making a report to the stewards on the nature of the injury.

The racing manager and his staff, as has been previously shown, are responsible for the making up of the programme and for the grading of the races. He is also responsible for making returns and reports to the N.G.R.C. registry, and is governed by various N.G.R.C. rules. He and his staff are situated in such a position as to be able to see quite clearly in order that they can note every incident in, and result of, every race.

The judge is likewise situated, and it is his sole job to note the placings and to announce his decision immediately, and his decision is final unless an objection to the winner or any placed greyhound is made and sustained. He is, however, not prevented from correcting a mistake, such correction being subject to the confirmation of the stewards. The judge must immediately communicate the numbers of the placed greyhounds in order of placing, and when satisfied they are shown as indicated he must notify the same to the stewards.

Nowadays, experiments are taking place at the biggest courses in photographed finishes. If these are successful, they will greatly assist the judge in close finishes. The public sometimes do not realise that the judge, who is situated dead in the finishing line, is really the sole person who is in a position to judge a race. In a close finish it is quite impossible to judge a race from any other angle except dead in line with the finishing line. His is not an easy job as sometimes there might not be more than a "head" or "neck" between three or four dogs.

The timekeeper takes note of all "times" in a race which he communicates to the number board for display, and in this he has recently been assisted by the installation at many racecourses of a ray-timing apparatus. It is generally reckoned that a "length" in distance is .06 of a second in time, so that on the receipt of the "distances" from the judge's box the racing manager is able to calculate the time taken over the course of every dog in the race.

The starter is responsible for seeing that the dogs are properly placed in the starting box and for giving all the necessary orders and signals for securing a fair start upon receiving the signal to start from the stewards.

The starting box itself is one approved by the N.G.R.C., and consists of six divisions. The front of it is made all in one piece with strong iron bars, so that the dogs can see through and at the bottom of which is a roller so that a dog "pawing" the bottom of the bars does not hurt its paws. At the starting signal the entire front flies upwards, giving a free and unimpeded exit for the dogs. The most modern starting boxes are electrically operated, and on top of it is a light, which flashes as the trap opens, thus giving a visual signal to the timekeeper.

The hare driver has to be an expert at his particular job. He is placed in a control box from which he, too, can plainly see the whole course, and in which are situated his controls. There are five or six different types of hare equipment in general use to-day, but the principle of driving in each is the same. The hare has to be driven in such a way as to give each dog in the race a chance of seeing it on the bends, and yet not allow the hare to get so close to the leading dog as to check its speed. On courses with sharp bends this is extremely difficult, and of necessity a dog who is a long way behind is sometimes unsighted. The hare controller is responsible only to the stewards and takes all his orders from them and is not allowed to leave his control box without their permission. His judgment must be first class, as his driving of the hare can make or mar a race.

Of the 132 rules in the N.G.R.C. book, no fewer than 23 concern the stewards of a meeting. These racecourse stewards are appointed by the operating company, and must be approved by the N.G.R.C. as opposed to the stipendiary stewards of the N.G.R.C., who really act as inspectors for the club.

The duties of racecourse stewards can be aptly summed up in the N.G.R.C. rule which reads: "It is the duty of each steward to supervise all events on his racecourse in connection with the racing and to maintain as far as possible the general integrity of the racing." By another rule, there must be at least three stewards present at every meeting. These stewards have wide powers, but are governed by the N.G.R.C. rules.

It is they who decide what action should be taken if anything untoward should happen, such as a dog escaping from his kennelman, a breakdown in the hare control, the trap failing to open, and many other unexpected incidents. By far their most important business is to see that a race is "well and truly run." To this end they are guided by the N.G.R.C. rules, which lay down what should be done in certain circumstances. The most important rule is No. 13, which lays down the circumstances under which a "No Race" should be declared or a "disqualification" made.

It is a "No Race" if the leading greyhound gets so close to the hare that it checks its speed. If through fighting, *or any other cause*, in the opinion of the stewards, the result of the race is definitely affected, then they may (*a*) declare a "No Race," or (*b*) disqualify a greyhound or greyhounds. They have to be extremely quick in their actions as the public have been brought up to expect a prompt decision. It is the stewards who give the order to start a race, and who "O.K." the result of a race by means of putting up the green light on the number board. Should they be dissatisfied at any time with the running of any dog, they can call upon the racing manager, the trainer and the veterinary surgeon for an explanation. If still dissatisfied, they can institute an enquiry to be made, a report of these proceedings, and their findings must be made to the N.G.R.C. They also have power to fine any person under their control up to £10, and to suspend any such person from acting at that meeting if necessary. An appeal can be made to the N.G.R.C., to whom all the facts must be reported. A steward must be in attendance at all trials.

The Greyhound Racing Association go further, in some cases, than the N.G.R.C. in order to safeguard their racing. One example is that they have a steward present at "Kennelling." This is especially important when an open race is on the card, as dogs from other courses are present and may not be known to that particular racecourse staff and extra care has to be taken as to identification and fitness to run.

The stewards officiating at a meeting make records of all races run, noting their times, starting prices, Tote dividends and distances, so that they have a complete record of every race run on their racecourse under every kind of condition. From this they make a report to the racing director as to the quality of the racing.

All these various departments are in inter-telephonic communication with each other, so that in the event of any "incident" they can immediately communicate with the stewards to ascertain their instructions.

Each individual in any of the above-mentioned posts is properly trained for his particular job. They are not casual appointments. Months of work and experience have to be gone through before they are properly trained and approved to act in their particular capacity, and their integrity and judgment must have been proved to be above reproach.

Thus it is that nowadays the organisation and machinery of these greyhound racecourses runs with clockwork precision. Each man is trained for his job and each job has its own particular function. They are the cogs in the wheel that runs smoothly round.

Over and above that there is a duplicate for each piece of equipment, and an understudy for each job. If a trap goes wrong, or a dynamo breaks down, there is another trap and another dynamo to take its place. If the judge or the hare driver is ill or unavailable, there is another trained judge or hare driver to take his place. The system is as near perfect as human ingenuity can make it. Doubtless as time goes on, more and more improvements will be thought of and made, but every innovation, every new improvement will be for the advantage of greyhound racing, and for the benefit of its millions of patrons.

LETTERS TO YOUNG FLY-FISHERS

XI.—How, and How Not, to Fish the Nymph

MY DEAR BOB,—I am sorry your cousin will not be there when you arrive for your visit. A couple of hours on the water with him would probably teach you more about dry-fly fishing than I can hope to do on paper. But it has one advantage; by the time he joins you, you will have encountered the difficulties in person, and will be able to ask him to show you where you have gone wrong, as you are sure to do at first. I quite expected he would have something to say to you about nymph fishing; but do not worry. The kind of "nymph fishing" he means is simply wet-fly fishing, and as I have already suggested, wet-fly fishing spoils a dry-fly water, or may do so, and many owners very properly object to it.

Genuine nymph fishing, however, is a very different thing, and you will find he will not object to the use of a nymph if it is fished properly like a dry fly. Nymph fishing is, in reality, a perfectly legitimate part of dry-fly fishing, and has enormously increased the interest of fishing some chalk streams where trout, for some unknown reason, very seldom seem to take the hatching dun from the surface. In a former letter I told you very briefly how dry fly came to be adopted by trout fishers. They found that the hatching dun was taken very readily by trout and started to imitate its behaviour. Further study of fly life on a stream showed that fish also took the spinner, on occasion, while dipping on the surface to lay its eggs, and took the "spent" fly even more readily after it had fallen dead on the water with outspread wings. Both these stages in the fly's life were consequently added to the dry-fly fisherman's repertoire.

But there is another stage in insect life which interests the fly fisherman—the time when it has just finished its pupal existence and is coming, or has come, up to the surface to hatch. This is known as the "nymph" stage, and you may remember I suggested you could imitate it in Devonshire by using a gold-ribbed hare's ear. Unfortunately, this stage has become confused with the earlier stage in a fly's existence, before it has assumed its pupal dress, when it is more properly called a larva or grub.

Anglers have got into the habit of referring to these grubs as "nymphs," which has introduced what are really abuses of the dry-fly system. Men have even been known to cast a fly downstream, and bring it back in jerks on the spurious excuse that they are imitating a nymph swimming up-stream in its larval stage.

No method should be used in which the fly is moved by the angler or the water "raked" by "prospecting" or "fishing the stream." It not only disturbs the water for other fishermen, but calls attention to the gut which fish see very easily if it is drawn through the water. Never fish in such a way as to spoil other men's sport, whether they are on the water or not; but as long as you are casting to a rising fish, using a single fly and letting it float down unimpeded you are dry-fly fishing, whether the fly itself is dry or wet.

As to the legitimate use of an artificial nymph on chalk streams and the best way to fish it, we are still very largely in the dark. It is possible to tie a very fair imitation of a natural insect in this stage of its existence, but it will not necessarily catch fish for you.

Much the same difficulty occurs when imitating duns or spinners. The late F. M. Halford, who by his investigations into the natural history of flies did more for the science of dry-fly fishing than any other man, devised a number of very beautiful patterns of flies for chalk streams which are probably, on the average, as good imitations of the natural insects as we are likely to get; yet they do not catch more fish than patterns which seem to have far less resemblance to the fly on the water. History is repeating itself with good imitations of nymphs. I suggested in my last letter that a good imitation of a dun's behaviour was of more value than a good imitation of its appearance; and I suspect the same to be true of the nymph.

But just here is the difficulty: we do not know how the nymph behaves. Odd scraps of knowledge and observation are available, but at present we cannot fit them together. When the nymph is in its pupal stage, it is on the weed or may be on the bottom. It then rises to the surface. Some men hold that it swims to the surface with a wriggling motion, and claim that it is this motion which attracts the trout; others that it floats up inert, and it has been suggested that the insect secretes an air or gas bubble which helps it to rise. A few years ago the late Colonel E. W. Harding wrote a book in which he described experiments he had made in a tank and suggested that the trout saw the nymph rising by means of the mirror which is formed by the underside of the water surface; that it aimed at the point where the nymph and its image in the mirror met, which accounted for the rather peculiar form of rise a nymphing fish makes ("bulging," it is commonly termed), and also for the fact that nymphs are generally taken just under the surface; it seemed at the time a likely explanation.

But recently our foremost entomologist, Mr. Martin E. Mosely, has published some observations he has made of olive nymphs hatching in an aquarium, and says they spend as much as 20 minutes at the surface before they get clear of their shuck. He argues, in consequence, that hatching nymphs float down for some hundreds of yards at the surface before hatching, and that it is these floating nymphs which the trout take. As against this, Mr. C. E. Pain, who has been conducting an investigation into fly life in the Test valley, tells us that when gauze nets were set for catching these floating nymphs they had to be sunk some little way below the surface before they intercepted them in any number, and that many of the nymphs so caught hatched and flew away from the net directly it was taken out of the water, showing they were ready to hatch. At the moment it seems that confusion is worse confounded.

A possible logical conclusion from these conflicting observations is that nymphs in streams leave their holt to hatch and are swept along by the current, but do not necessarily need to be actually at the surface during the period they are freeing themselves from the shuck. This fits in pretty well with observations of trout when they are nymphing. If one day you are by the river when the hatch is first starting (trout generally take nymphs for a while before coming on to the surface fly), get into some position where you can watch the trout feeding. You will see that they take up a position either over or just behind a weedbed, and move quickly from side to side over a strip of river a couple of yards or more in width. It is described sometimes as rushing about over a weedbed, but the action is more like a wicket keeper fielding an erratic bowler. Sometimes they break the surface in catching whatever it is they are taking; more often they do not. But they have the general appearance of intercepting something that is coming down in the top one-foot layer of water.

When they are doing this they are uncommonly hard to catch. It may be that this is due to our ignorance of what the nymphs look like when they are coming down, or simply that the trout is covering so much ground that by the time one's fly has fallen near the last rise the trout is somewhere else.

The old advice "wait till the trout have finished nymphing and take to the surface fly" is sound enough on many waters; but on streams where they bulge for three hours and take duns for ten minutes, it is not very profitable: so if the fish do not start taking surface fly after half-an-hour or so, you had better see what you can do with a nymph, which you fish exactly like a dry fly, with the same precision and the same care to avoid drag.

WEEDBEDS: YOU WILL SEE THAT TROUT TAKE UP A POSITION EITHER OVER OR JUST BEHIND A WEEDBED

There is one kind of nymph fishing, and a very fascinating kind, too, where the angler deliberately makes his fly drag, but that is a speciality which I do not advise you to attempt yet awhile.

As to the pattern of fly, I do not think it matters much in the present state of our knowledge. The best fly you can use is a gold-ribbed hare's ear, for nymph hatching at the surface; but you can make a serviceable nymph by trimming off most of the hackle from a blue dun, or some other fur-bodied fly of the right size, the right size depending on the fly the trout are taking. Or you can try a small silver-bodied fly to represent the shiny appearance of the air-filled shuck just as the fly is hatching out.

Silver-bodied flies, or flies with flat silver or gold ribbing, are occasionally successful when allowed to sink as well as on the surface. The tinsel probably reflects the weed and gives the body a translucent appearance. To make such flies sink a few inches trim the hackle short; to fish them in the surface film leave the hackle intact. Do not oil your fly for nymph fishing, and do not make false casts in the air if you can avoid it. In a swift current flies do not sink very readily and there is nothing less likely to attract a trout than a nymph which sinks after floating a yard or so, when it ought to be doing just the opposite.

Your affectionate uncle,

HARVEY.

"PERAMBULATION OF GRASS FIELDS INTERSPERSED WITH PLOUGH"

The Gun Month by Month

THE SPORT OF OUR GRANDSIRES

By CAPTAIN J. B. DROUGHT

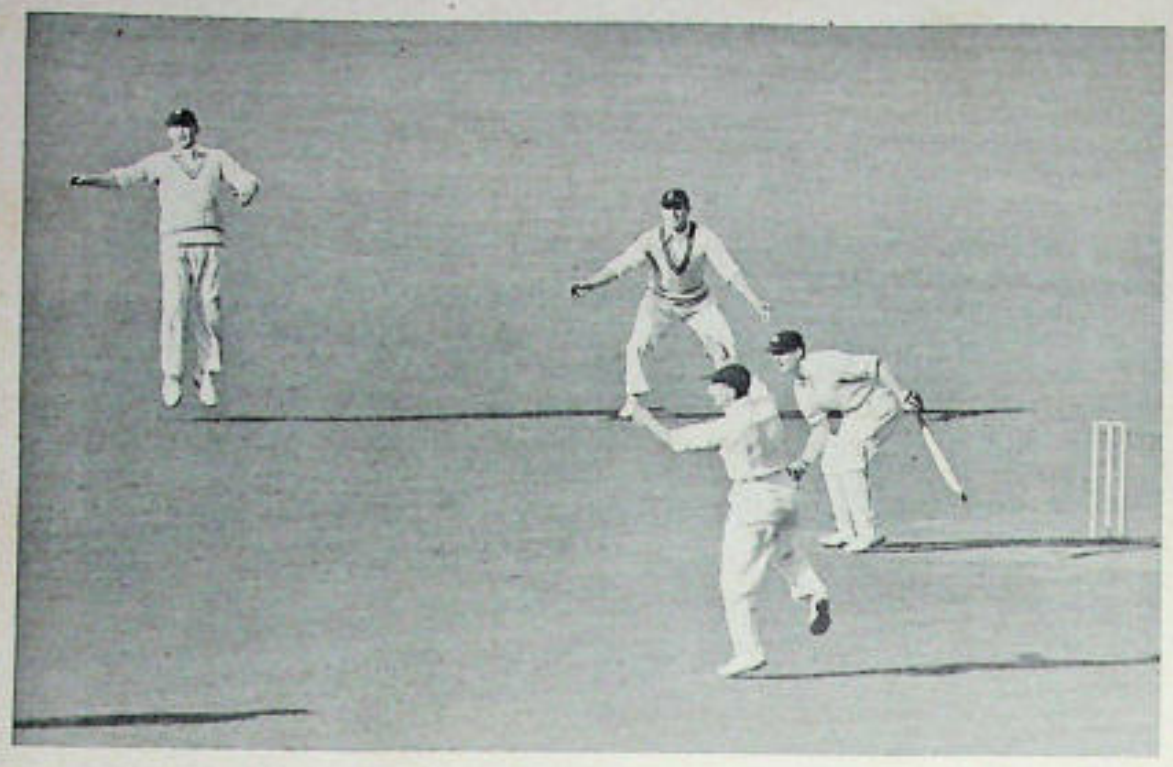
LAST month I was fishing on a Galway lough with a one-time keeper, associated with many of my youthful recollections. And as we trolled we talked of bygone incidents, which always seem to gain in happy retrospect with the passing years. "God be with them times," said he, "they'll come no more. Why would they? There's not a score of grouse this day where ye would be getting a hundred brace aforetime, nor did any man see a partridge hereabouts these 30 years. Don't the gentry get great lots of them in England, and why would they be coming all this way for just the duck and snipe that does be in it. Will ye tell me that?"

To which I had no answer, but it set me thinking. Are we reducing shooting to the level of a mathematical calculus? Is research, in laying bare what used to be delightfully mysterious, accentuating artificiality in sport? Not that I would belittle the value of all that scientific discovery has wrought in recent years. More particularly to those who are financially unequal to experimenting on their own, those encyclopædic pamphlets which, with commendable public spirit Imperial Chemical Industries issue free gratis to anyone caring to apply for them, are invaluable. No one need, in fact, go begging of the last word in research. For what are day-in-day-out subjects of analysis on the Knebworth Game Estate are of as much benefit to those whose birds are reckoned by the score as by the thousand. But no one can go on learning and cherishing illusions too.

The glamour still embracing marsh and moor attaches less and less to field and covert. Still a certain mystery surrounds our wilder birds. The inconsistencies of snipe and 'cock and geese are still as ever food for controversial speculation. Whereas the domestic affairs of partridges and pheasants are focussed in the scientific microscope. We have made giant strides since less than half a century ago when nature was their only nursery. From the Newmarket to the French and Euston systems was a biggish step; to the Knebworth rearing pens has been a bigger one. For to-day our game birds' every need from vegetables to vitamins is weighed quite literally in the balance, and even synthetic substitutes for insect life are made available.

Now I am not inferring that this is anything but to the good. No one can afford to lag behind, even though less and less is left to his imagination. Besides, two factors tend to render modern sport less natural and therefore more scientific than aforetime. First with the breaking up of large estates, and the ever-spreading tentacles of cities and arterial roads, more and more game-holding ground is every year absorbed into commercial enterprise; which means a denser concentration of game in more circumscribed areas, or in other words increasingly intensive methods of production. And, secondly, quite beside the fact that a revolutionised system of agriculture has in its turn revolutionised the methods of approaching game, men have no patience for leisurely pursuits. In these hard times hard-headed syndicates demand their money's worth. Pot-hunting is a lost art. Why waste the precious week-end pottering round with 20 cartridges on the off-chance of something getting up, when with 200 one can get the surety of the set piece? Why, indeed? If one loses what to my mind chiefly constitutes the charm of shooting—the subtlety of woodcraft which pot-hunters must employ—well! one cannot have it both ways, and not all men think alike. Which, since the big bag merchants are the mainstay of preservation, is a very good thing too.

Much used to be, and still is, written about the "Festival of St. Partridge." A horrible expression, but let that pass. In truth I fancy nobody thinks highly of the "Festival" in these days. For nobody drives partridges before September's latter end, and although the humble shooter, walking up in much the same way as his grandsire did, must needs scupper his birds while they are young and fairly innocent if he would scupper them at all, few pastimes are less inspiring than the solemn perambulation of grass fields, interspersed with plough from which even the attenuated stubble has been shaved. For the simple reason that the partridge, well aware of the opening of hostilities, takes care to beat it while the going is good.



And yet there still are spots where you may shoot partridges, even, though I tempt the sceptics, in the Alken tradition, over dogs. But these are birds born and bred on the fringes of the Scottish and Irish mountains, and of another feather to their relatives of English roots. And principally because they live for the most part at high altitudes on ground where food supplies are sketchy at the best of times, they eke out rather precarious existences. You may find big coveys, but they will usually be few and far between, which is one reason why canine assistance so often proves invaluable.

May I borrow a sentence from one who knows these gamesters a good deal better, I fancy, than most people. "The hill bird is more cunning than its lowland relative, and is capable of perverse habits. Coveys often rise a hundred yards away out of thick grass or heather and fly as far as grouse. At other times they squat in the barest places and allow themselves to be trodden on before rising. I have seen partridges, after one flight, burrow into tussocks and permit themselves to be caught by dogs rather than rise a second time. They cannot be "driven" on the hill, for they have no particular object in view. Their powers of running through rough ground are remarkable, and it would be difficult to believe that birds could move such distances were it not for the evidence of dogs."

So if I were to say that in pursuit of these elusive specimens a couple of energetic guns may anticipate sheer fun that would be true. And were I to say also that they can put their shirts on several hours of real hard labour that would be true also. For once, when I was younger and more innocent, I went chasing hill partridges in a suiting of winter weight and good stout bobnailed boots. I might have made better practice in running shorts and shoes and carrying a bow and arrow. For the average Frenchman has nothing on these pedestrians for speed. When, if ever, you catch up with them, you usually find either that they have legged it into the only standing crops in half-a-dozen parishes, or that they rise from quite a different spot to that in which you have marked them down five minutes previously. And sometimes even when a dog has seemed to be drawing on to birds no birds are there. You give up the unequal contest, retrace your steps, and then quite probably a quarter of a mile beyond, from under your feet a covey bursts and scatters like a shrapnel, scattering also what is left of your wits. Equally probably you miss them handsomely.

But that is the fun of this game of hide and seek with a quarry whose only consistent attribute is inconsistency. It has been suggested that the reason why hill birds, eluding the keenest canine noses, are never where they ought to be is that, by alternate squats and sprints they not only withhold scent but also distribute it haphazard, so to speak. I don't know if this is so, but I do know that a dog I have which seldom if ever faults on grouse, is seldom if ever right on partridges. On one occasion last year a large covey settled within almost a stone's throw of where we were lunching. We immediately followed to find them gone, but the setter took a strong line, acknowledging birds all the time for something like a quarter of a mile. Then he stood stiff to a complete blank, and as frustrated we walked back, the brutes were clustered not 50yds. away, but on the off-side of a stone wall we were negotiating, and they rose to empty guns.

Such incidents one could multiply almost by the score, but they are, as I have said, what makes this upland game so fascinating. You will never get big bags—at least, of my own experience I do not think so—but you will get plenty of healthy exercise, and a satisfaction sometimes of out-manœuvring a plucky opponent by the sweat of your brow. More often possibly the birds will trump your tricks, heading with maddening frequency over one mering and then another, the while you tag on in a bath of perspiration and muttering evil words. Even so, you will still have something to look forward to—an outsize ice-cold quencher of a thirst you would not part with for a fiver.

FAREWELL TO THE WEST INDIANS

By NEVILLE CARDUS

THE tour of the West Indies was terminated before the team could go to Hove and Canterbury and enjoy themselves free of Test match worries and become inspired to gaiety by holiday crowds and also by the knowledge that they had given England a great game at the Oval. With pleasure I seize this opportunity to review the West Indies' season here, and to express gratitude for the pleasure I obtained from their spontaneous play whenever I saw them.

On paper the West Indies record day by day is not impressive: 25 matches, 8 victories, 6 defeats, and 11 draws. It would be hard to prove by statistics that as an all-round side they were the superiors of an average English county as, say, Essex or Worcestershire. Yet the fact is that in the second and third Test matches England could seldom, if ever, relax severe efforts; at Manchester, indeed, England batted on the closing afternoon very much as though feeling the chill of imminent defeat.

For too long the English summer petrified the West Indies cricketers physically if not mentally; the moist wickets and moist air aggravated the swerve of the new ball—and in their own beautiful islands there is little chance to learn how to cope with late swerve: the ball quickly looses seam and "shine" on the hard grounds; moreover, the clear air makes for a more or less direct flight. As soon as warm weather blessed them, the West Indies improved technically and spiritually; at Old Trafford and at the Oval England quickly realised that Grant was in command of a *team*, not of a collection of spare parts.

Grant deserves high praise both as leader and cricketer. His personality was charming; he made friends at once. He looked the part in the field—tall, supple, graceful. His cavalier treatment of Goddard in the Manchester Test match will remain a happy memory. As a fieldsman close in on the leg-side he thrilled us constantly by his daring and accuracy and speed. He was inclined to underrate his own skill as a slow off-break bowler; I shall always think that he took himself off too soon in England's first innings at Old Trafford; England were collapsing, and Grant's spin was nipping dangerously back from the sensitive turf. Then, for no apparent reason, Grant retired in favour of Cameron. A captain is often a doubtful judge of his own usefulness as a bowler.

The West Indies attack, taken by and large, was steady, and occasionally, more intelligent than England's. Constantine amazingly transformed himself from a fast to a "variation" bowler. He thus cheated age and, so to say, "began again." At first glance, I thought that Constantine's changes of pace were obvious and calculated to deceive nobody except himself. And he certainly set his captain a task with the setting of the field for an over which might contain eight different and apparently unrelated balls. But Constantine after a while subtilized his contrasts and made them less apparent to the careless eye. He bowled determinedly as well as thoughtfully; he seemed to will himself to capture a wicket at every attempt. His fielding lacked only a little of his old and original swift opportunism: he still deserved to have the first refusal of all chances, whether sent in front or behind or above the wicket. He was equal to running a man out off his own bowling from cover-point. And once, I swear, he fielded and prevented overthrows from a quick return of his own. Natural genius came out of his cricket in flashes.

Headley was, of course, the great batsman of the side; on *all* wickets he proved himself as reliable a batsman as any taking part in the game at the present time. He was almost exclusively a back-foot player, and it is only because of some doubt as to whether he can jump from the back to the front foot with Bradman's rapidity that I rank him second to Bradman as a punishing stroke player on good pitches. Headley would take his place automatically in the best company of any period of cricket's history.

For several weeks of the season the West Indies seemed terribly dependent on Headley for runs and defence against anything like formidable bowling. Here, again, we had to modify first impressions considerably. In the first Test match, at Lords, J. B. Stollmeyer showed signs of a fluent forward method; he strengthened his play match by match, and scored in the season 916 runs with an average of 30.83, an excellent performance for any young cricketer. At Lord's I was at a loss to understand the form of K. H. Weekes; he seemed hopelessly short of aim and eyesight; indeed, I think I wrote at the time that he shaped like a left-hander batting the wrong way round. A few days later, Constantine told me I had made a mistake about Weekes. "Some day," he said, "you'll see him on a good wicket, when the sun is shining—then just you look out!" Well, Weekes gave us good cause to look out in the Oval Test match; his innings of 146 was as violent as one by Bartlett at his most vehement. Constantine failed as a batsman until the Oval Test match, and J. E. D. Sealy unhappily did not live up to the aggressive cock of his cap. None the less, the West Indies found a reasonable amount of batting to revolve around the great axis of Headley.

If the rubber were beginning again in a warm summer with the players, of course, fresh, I doubt if England would win it convincingly in three-day engagements. The tour as a whole revealed a gradual toughening of mental outlook in a big match; to the original West Indian impulse a touch of "English professional" realism has been added. I only hope that realism will never get the upper hand of impulse. The West Indies cricketers have a contribution of their own to make to the game; they, and they alone, can make a Test match young again and perpetually engrossing.

One word more about the bowling. Clarke was a clever leg-spinner, and Hylton would improve the chances of most English teams in the championship. It was a mistake to leave him out of the Oval Test match. Not the least valuable of the West Indies' assets was Mr. Kidney, the manager. He had a quiet way of making a friend—and he made a lot.

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

SMOKING AND THE PALATE

THERE are many people who do not smoke. Some because they do not like it; others because they think that tobacco is bad for them; others because they prefer to spend in some other way or to save the money that they might spend on tobacco. But there are many men and women who smoke either because they like it, or because they think that it is good for them. Non-smokers, like non-drinkers, often imagine themselves to be better than their brethren, and there is no reason why they should be deprived of the measure of consolation which they find in their conceit. They deserve neither blame nor praise from those of us who find in smoking a harmless enough relaxation.

But smoking can be, and often is, more than that. It may easily become a mere nervous habit, a craving for continuously lighting one cigarette after another, puffing out smoke unceasingly without any regard for the comfort and feelings of others. It may also be the most reasonable gratification of our sense of smell and one that is conducive to greater peace of mind as well as to a pleasurable stimulation of our higher faculties. Such is the manner of smoking indulged in by the believer in the Art of Good Living.

I cannot speak of cigarettes, not being an addict to this form of smoking, but I can vouch for the fact that a good cigar is one of the real joys of life, a joy to look at, to hold, to smell and to smoke; it exhilarates, stimulates, charms, soothes, without any fear of any unpleasant reaction.

There are people who deprive themselves of the joy that is to be had from a good cigar because of the fallacious argument that it would interfere with their enjoyment of fine wine; it must, they say, be bad for their palate.

I do not believe it. I am even ready to go further and to maintain that to smoke good cigars, in moderation, of course, since excess must be had always, helps the palate. Our sense of taste, like all our senses, improves with training. You cannot enjoy wine nor cigars by reading all about them in books, however wonderfully accurate the author may write about the bouquet of the wine and the aroma of the cigar. You must drink good wine and smoke good cigars to know what it all means; and the more good wine you will drink with appreciation, and the more good cigars you will smoke with even more leisurely appreciation, the keener your senses of smell and taste will become.

The fact that the bouquet of the wine is so entirely different from the smell of the cigar is all the better; both are good, and that is what alone matters. The best all-round connoisseur of wine I ever knew was the late Lord Rendlesham—he knew more about claret than most of the Bordeaux merchants, and more about port than any of the Oporto shippers—and yet he smoked good cigars not in moderation but—to my own way of thinking—in excess; and he also smoked a pipe, when fishing or in the open.

A HOLIDAY IN REVERSE

INSTEAD of taking your holiday in summer and toiling through the winter, reverse the process this year.

Leave the English winter behind. Go out and enjoy the glories of a South African summer. Between October and March the climate is delightful: there is an abundance of interests and you are assured of a welcome as warm as the sunshine.

The return passage (England—South Africa) with twelve months' duration ranges from £47 Tourist class: £65 Cabin class: £72 First class. Consult the Travel Bureau, South Africa House, London, W.C.2, or obtain detailed information from any of the principal Travel Agencies.

SOUTH AFRICA

FIFTY YEARS AGO

From the *Field* of August 31st, 1889.

THE Wheat Production of the World. "The International Congress of Grain and Flour, held in Paris last week, was very well attended, and one of the most interesting features in connection with it was the paper read by M. Grandeau, the well-known inspector of agricultural schools and stations, upon the wheat production of the world. His main object, as he explained at the outset of his lecture, was to show to what a degree the cultivation of wheat had increased of late years out of Europe; and how imperative and at the same time easy it would be to increase the production in France so as to be independent of imports from abroad. The figures which M. Grandeau quoted are, I imagine, only approximate.

EUROPE.

Name of country.	Total production in bushels.		Yield per acre.
France	294,000,000	..	16½
Russia	258,500,000	..	9
Spain	167,750,000	..	15½
Italy	140,000,000	..	12
Austro-Hungary	129,250,000	..	16
Germany	101,200,000	..	19
Great Britain	91,000,000	..	31
Roumania	32,800,000	..	—
Bulgaria	26,000,000	..	—
Turkey	23,250,000	..	—
Belgium	14,000,000	..	—
Portugal	9,250,000	..	—
Sweden and Norway	6,050,000	..	—
Greece	6,050,000	..	—
Holland	5,500,000	..	—
Denmark	4,670,000	..	—
Servia	3,850,000	..	—
Switzerland	1,925,000	..	—
Total	1,319,645,000 bushels or 164,955,625 quarters.		

OTHER COUNTRIES

United States	512,000,000	..	12
British India	204,825,000	..	11
Australia	45,375,000	..	12½
Canada	36,380,000	..	13½
Algeria	28,580,000	..	12½
Japan	41,250,000	..	—
Argentine Republic	27,500,000	..	—
Chili	16,500,000	..	—
Egypt	6,600,000	..	—
Total	989,450,000 bushels or 123,681,250 quarters.		

In other words, Mr. Grandeau puts the total wheat production of the world at:

	Qrs.
Europe	164,955,625
Other countries	123,681,250
	288,636,875

"And he then goes on to demonstrate that it would not require a great effort for French wheat growers to render themselves independent of foreign imports, the increase needed being only about 11 bushels per acre; and this increase, he thinks could easily be obtained by improving the quality of the seed and increasing the quantity of artificial and farmyard manure put into the land. He also met, and very fairly met, the objection that an increased production of wheat would mean a further drop in prices, by pointing out that the rapid increase in the population of the globe would more than neutralise that tendency, and he concluded a very interesting lecture by some figures relating to the rapid increase of wheat growing in the Argentine Republic, the United States and Australia.

"Twenty years ago, he said, the Argentine Republic had to import wheat; from 1870 to 1878 it was self-supporting, and no more; and in 1878 it had a population of 2,800,000 and a foreign trade of £16,000,000. Now it has 4,000,000 inhabitants and a foreign trade of £48,000,000, exporting wheat in large quantities. The figures for Australia are still more striking, for that country now contains 8,464,000 head of cattle, 89,266,000 sheep, 2,822,000 inhabitants, of whom 847,000 are employed on the land, and exports 192,925,000 bushels of wheat—and all this within 50 years!"

A TRAVELLER'S NOTEBOOK

THE Spanish Civil War is over, but from the reports one hears it is very doubtful how long there will be peace in poor distracted Spain. This is a tragedy. Even in the old days of the monarchy the patient, gallant young men of Northern Castile were despatched to serve in the inhospitable Riff hills, and many of them never returned. During the present century the Spaniards have endured the agony of protracted death. And yet in the old days one would hardly have suspected it, the people were so kind, so hospitable, and so ready to enjoy themselves on the rare occasions opportunity offered.

* * *

Before the Civil War I used to visit a large village called Ezcaray in the Alta Rioja country of Northern Castile between Haro and Logroño. The branch line train did not hustle much, as the engine driver seemed to have friends at every station to whom he had much to tell, but it was all so very friendly nobody minded. Food and cigarettes were exchanged among the passengers with true Castilian courtesy, and any foreigner became almost overwhelmed by kind attention. At Ezcaray the whole village always turned out on a Sunday to meet the train, and if you had friends a sort of triumphal procession was formed to escort you from the station to the square.

* * *

The last time I went to Ezcaray I was met by Feliciano—the son of the town clerk and a man as pleasant as his name. As it was Sunday there was dancing in the square, for the Conde, whose gloomy, fortress-like mansion overlooked the main street, maintained a very good brass band to keep the population amused. We joined the revels. We danced on the cobble stones, round the fountain, along the pavement; there was an air of spontaneous enjoyment about it all, which was extremely pleasant. Gloom and dignity—two of their most marked characteristics—the Castilians alike forgot and revelled in the strains of La Paloma and the Jota. Delightful to watch was the Jota, as when the music quickens the partners break apart and dance facing each other, their fingers serving as castanets.

* * *

One night I engaged the band for a quite ridiculously small sum and gave a dance in front of the hotel. It was very pleasant, and all went well until a drunken peasant from a neighbouring village took my partner away from me and was promptly knocked down by Feliciano. Then we retired to a neighbouring tavern and sang and drank claret till midnight. But the star turn of the evening was still to come. I escorted my friend home, and on the way back felt thirsty again and, hammering on the locked and bolted tavern door, made so much noise that the police came running up drawing their swords. Things looked rather alarming for the moment, but when the policemen realised it was only the amiable, though slightly mad Englishman, they assisted in the assault so that we could all have a drink.

* * *

Life was good in Ezcaray. In the morning one could learn Spanish from the priest, or walk in the hills—a quiet and extremely cheap existence. But in the evening it was more exhausting; one's friends finished their work and felt it their bounden duty to entertain the visitor. There were only two kinds of amusement—walking up and down and pelota. The former, which entailed strolling for hours over the cobble stones at slow stately pace, was wearing to a degree, and the latter I tried once and only once, for my hands—they hit a hard ball with bare hands—got cut to pieces.

* * *

To begin with ceremony was the order of the day. All my friends used formal address or Señor Capitan. But after a glass of wine, it was "tu," and "Francisco amigo mio," a change that made things very much more pleasant. As a rule in Spain one is very rarely invited into any of the houses, partly perhaps because many of the people are very poor and live lives of most Spartan simplicity. The money they do have almost all goes on clothes, and I have known families who have almost starved themselves in order to cut something of a dash in public.

* * *

Castilian pride is a remarkable thing. I know one Spanish landowner whose family has been settled in Andalusia since the Conquest, who yet proudly announces, "I am a Castilian," just in the same way as some of the Moors, whose ancestors left Spain in 1492, will say "We are Andalusians." Perhaps it is owing to this intense pride the Spaniards are so kind to foreigners, though sometimes you are inclined to wish they would not behave as if you were an escaped lunatic who must not be lost sight of for a single instant.

P. H. M.

LETTERS TO THE EDITOR

"PRE-WAR RATERS"

SIR,—Your correspondent's notes in your issue of August 26th require a slight correction. As an owner I remember about some of these boats.

In the early 'nineties I was part owner with the Earl of Mount Edgcumbe of a 2½ rater, Ferida, with which we won 38 flags.

Next we went in for the 5 raters, Flavia and Valeria, which carried three paid hands; and my last 5 rater was Allegra, afterwards renamed Radiant, which later reached the top of the handicap class; owner, Major F. Hughes.

After the South African War I became the originator of the South Coast One-design class, and these were designed by Mylne. They carried five paid hands, and were 24 tons and cost £1,200. This class only lasted until the introduction of the International Metre Rule. It is interesting to note that they were several tons smaller than the twelve-metres of to-day, and to compare the cost in 1939 and the size of the crews required for racing.

There were eight of these One-designers, and not four or six as stated. Harmony, owned by the late Earl Brassey and myself; L'Amoureuse, Lieutenant-Colonel R. Charteris; Eilun, Hon. A. Greville; Jean, Colonel Gretton; Herouine; and the rest I forget, but Mr. Coates had one.

Yours faithfully,

Quidenham, Norwich. ALBEMARLE.

THE CUCKOO'S EGG

SIR,—Since sending you the note of a cuckoo's egg in an otherwise empty wren's nest, considerable and some extraordinary correspondence has followed. Many years ago there was at intervals similar exchanging of views on the laying of the cuckoo, but after the passing of that era, I understood that it had now long since been established and accepted that the cuckoo, after laying, placed the egg in a nest by means of its bill; and I was astonished to see from the recent correspondence that there are so many still holding what I always thought was an obsolete view. To lay direct in a wren's nest surely is something of a physical impossibility; even if it were possible the chances are that, habitually done the egg would often drop down on the other eggs and either break those or itself, and such a risky proceeding is quite against the laws of nature, which are not so freakish as all that. I may add that the position in this instance was a somewhat unusual one for a wren's nest, being in a bramble and dead and dry bracken thicket, being built of and lightly held amongst the latter, and the cuckoo handicapped still more by being an ungainly and clumsy bird would crash the whole by trying any direct laying feat, as the correspondents have tried to point out with reed warblers' nests.

In the last letter Mr. Pike says: "If there are no nests in a suitable condition for her to lay in—that is, nest with fresh eggs—she or her mate will destroy the eggs and the nest, so forcing the owners to lay again." Really that seems to be the "grand finale"! It does not quite agree with the lone egg in the otherwise empty wren's nest, deserted, never tenanted, and which I mentioned, showed a lack of intelligence on the cuckoo's part.

He also says the bird is a most confirmed egg thief, and usually carries one away in her beak "and this is almost invariably eaten." However, Coward in *The Birds of the British Isles* says: "In the stomach of one cuckoo out of fifteen examined Professor Newstead found fragments of the shell of a pipit's egg."

Yours faithfully,

Oaklands, Brockenhurst. ERNEST E. JOHNSON.

RED DEER NURSERIES

SIR,—Motoring up the glen as far as the road is possible, a friend and I obtained many attractive glimpses of the red deer hinds and their calves in the middle of July. At the white gate the territory of the stags ceases. Beyond that one sees only hinds, while conversely not a hind is to be found in the range of the stags, so strictly do they stick to their own observed boundaries at this season. At one point the heather rose steeply on our right, while on the left the hillside was timbered with silver birches beyond the burn. On a green patch among these graceful trees a number of hinds and their calves were resting. The calves, only a month or so old, were very small beside their mothers. One could see only their heads with pointed ears and bright eyes above the grass as they lay beside the hinds, though now and then one or two of them would rise and go scampering off, light as thistle seed in the wind, presently to return to their appointed places. It was a scene for the brush of some great artist, so typical were the whole surroundings of these dainty creatures.

Meantime our attention was diverted by a great herd of hinds, most of them accompanied by their calves, in the open heather on the other side. They were timid of the car and at our approach began to move up the hill. There were over a hundred hinds, and as the herd became mixed we could hear them calling to their calves and the calves answering. As a rule they are silent creatures, but the air was filled with their harsh bleating and the short, shrill cries of the calves, which amounts almost to being a squeal. I noticed that when a calf went to the wrong mother she did not butt at it as a sheep would do; instead she turned and got out of the way, as though afraid of it. I remember some years ago seeing a number of calves playing outside a planting in which their mothers had sought shelter from the first morning sun. Then, for the first time, I heard their shrill, sharp cries, and for a time wondered what it was.

Most of the calves are born in June. The mother leaves it in a trampled hollow in the bracken or heather along the chosen slope, and she does not go back to feed her calf during the first twelve hours of its life, simply watching over the place at which it is hidden. During that period the calf lies flat out, and can be approached and handled, but, once the mother has been back to feed it, it will rise and scamper off as one draws too near. When only a day or two old the little creatures are nearly as swift as their mothers, and it would take a swift sheepdog to catch one. A shepherd I know sent his dog to chase a herd of hinds and their calves off his pasture, and the dog tried to shepherd in a young calf which had broken away from the herd. The desperate mother intercepted the chase, meeting the dog with a blow of her fore-hoof, which unfortunately struck his forehead, killing him instantly. I have seen a number of hinds united to drive a fox out of the bracken along their nursery slope, and it would have gone hard with the fox had they got him cornered!

Yours faithfully,

Peebleshire. H. MORTIMER BATTEN.

HIGH VELOCITY AND KILLING POWER

SIR,—With reference to Captain Curtis's articles on high-velocity bullets for heavy game, the following conclusions result from using a .318 (with light bullets), a .375 magnum and a .400 and .470 medium velocity rifles. Most of the shooting was done in Northern Rhodesia in 1935, 1936 and 1938, and in Scotland in 1937.

The effect of the light high-velocity bullet seems to depend largely on whether it strikes a bone or not.

If any bone closely connected with the spinal column is hit, the animal collapses immediately, but if the wound is in the soft tissues (even if lungs or heart are blown almost in pieces), the animal seems able to run up to a hundred yards before it drops. This did not apply to Scottish stags shot with the .270-grain bullet from the .375, but to the African game.

The best compromise between velocity and bullet-weight seems to be the 300-grain bullet of the .375, more effective than the .318 on the one hand and the .400 on the other. For results with the 300-grain bullet, thirteen head collapsed to the shot, while 26 ran for distances varying from 10yds. up to 800yds. before falling.

Perhaps it is hardly fair to include two elephants, one rhino and six buffalo among those which did not fall to the shot (although one buffalo dropped to a shot in the throat, reaching the neck vertebrae), because the real question is whether lion or tiger will drop at once.

A tiger shot with the .470 did not succeed in regaining his feet, but a lion "knocked down" with the .400 was able to get up and "demonstrate."

A cheetah shot last year with the .375 never moved, although the bullet (300-grain soft-nose) went right through and raised a puff of dust far beyond.

Yours faithfully,

42, Leinster Gardens, W. 2. C. R. P. HENDERSON.

SIR,—I write in response to your invitation for reader's views on the subject of high velocity rifles and killing power.

I think that the nature of the bullets is a most important factor. I wrote to you on this subject, and you published my letter in the *Field* of August 20th, 1925. It was commented upon by "Mannlicher" in your number dated September 3rd of that year.

I used a .470 double-barrelled high velocity rifle in India, with soft-nosed split-sided bullets for thin-skinned game and with solid nickel bullets for bison.

During my tour in India I heard the greatest praise for such a rifle with these bullets.

I am of opinion that the hunter after big game can have no better weapon; but he must carry on his belt two pouches, one containing soft-nose bullets and the other solid nickel ones. He should then have nothing to fear if he is proficient with his rifle.

Apart from the incident reported in my letter of 1925, where I described the damage done by one soft-nosed bullet to a bear, I have shot panther, tiger and bison fatally with this rifle; and although I have no great experience I have accounted for all my animals hit with the .470 without having to "follow up."

Yours faithfully,

The Old Rectory, Farnborough, Hants. B. G. MASON

SIR,—I see that the hardy annual of big versus small bore rifles is once more in bloom, and that you invite comments.

I do not write books, and but seldom contribute to the Press, but there is, alas! I imagine, more innocent blood on my hands than on those of any living man and, having used both, I unhesitatingly pronounce in favour of the heaviest weapon that the individual can handle promptly.

As goes without saying, the projectile must, of course, have in the neighbourhood of, say, 2,000 f.s. velocity.

Both big and small rifles will kill, and that instantaneously, *if* the exact right spot be hit, but the heavy bullet admits of a greater error.

I have killed elephants and buffalo without the slightest trouble using a .303 cavalry carbine, but this was because I had no other weapon handy. My initial battery consisted of an 8-bore firing 9 drams of C. and H. black powder behind a ball of over 2 oz., and a Martini-Henry.

In spite of inexperience I lost fewer wounded beasts with these than with the latter-day h.v. (even up to .450) small bores. In fact, I do not remember having lost one single animal that had had the benefit of the 8-bore.

It is a *reductio ad absurdum*, but let me put it this way. A greater margin of error would permit of a .450 paralysing *the* spot than would a .280, a pom-pom could be several inches out and yet produce the same results, whereas a 15-in. naval gun could be a yard wide.

Yours faithfully,

Elgin. JOHN MCNAB.

BOOMPS-A-DAISY

SIR,—I have long been an enthusiastic reader of your excellent newspaper.

The other day, however, I was reading an article by one "Gnostic" in your issue of August 12th, and was surprised and disgusted to note that this boorish specimen of the modern journalist had written in his sixth paragraph an admonishment to the gentleman who had named his horse Boomps-a-Daisy. I will not enter into the discussion as to whether this is a good name for a horse, as it is merely a matter of opinion.

However, had this ignoramus taken the trouble to inquire into the ownership of the horse before stating that the bestowers of such names have no love for the horse, he would have seen that the owner of Boomps-a-Daisy is one of the greatest sportsmen in the North of England, and that his interest in racing and hunting was second to none. As I have no doubt that he takes the *Field*, I feel that the least you can do is to request this writer to apologise to this owner, whose address I have no doubt he can get from *Who's Who in Racing*. I trust that you will continue to keep up the high standard of journalism for which you are famous in the sporting world, and will not allow such trash to appear again.

Yours faithfully,

London. FIELDSMAN.

[An apology appears on page 554.—ED.]

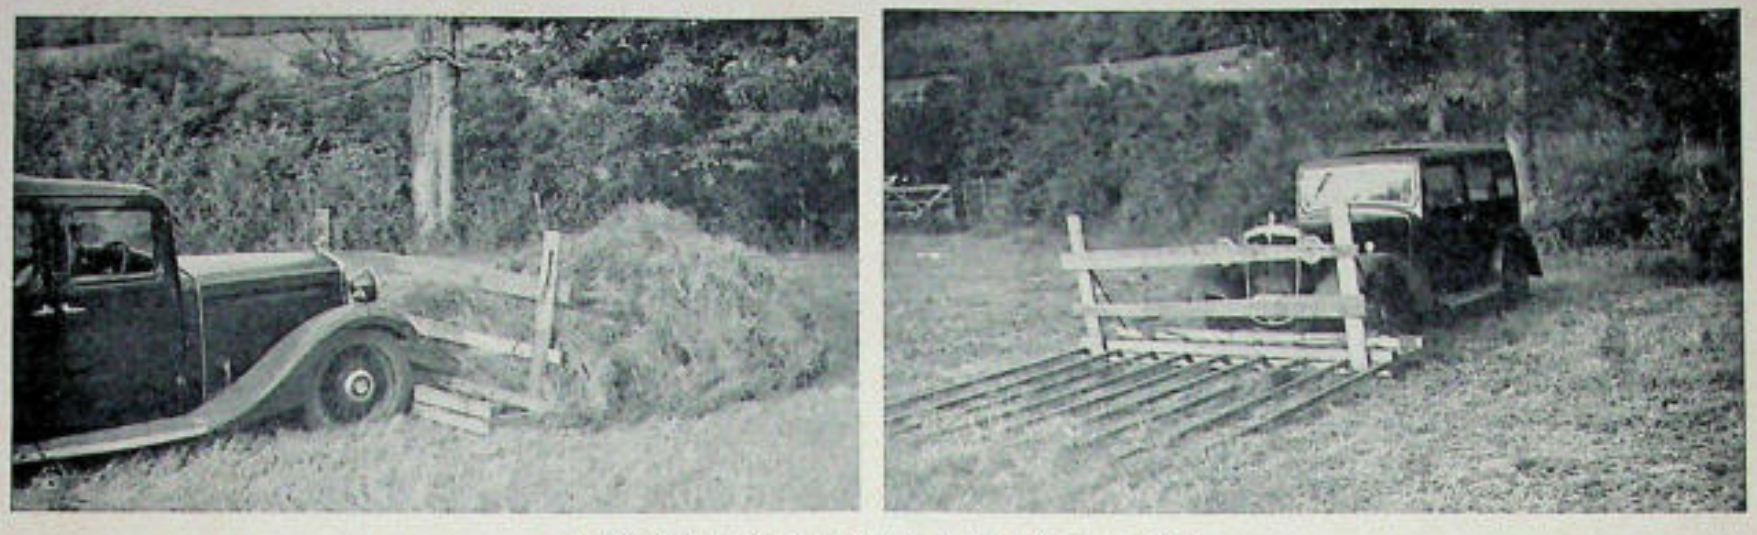
THE THIRD TEST MATCH

SIR,—In an issue of the *Field* of a week or two ago, I noted that your cricket correspondent, Mr. Humphrey Daniel, expressed the expectation and hope that the West Indies team would win the third Test match, and he thought they would because he had "a lurking suspicion" that the English batsmen would not be able to deal with the fast bowling of Martindale, Constantine and Hylton if the wicket proved fast and fiery, as was likely.

Apparently, therefore, Mr. Daniel hoped that our batsmen would be beaten all ends up by the fast bowling aforesaid so that his wish that our team would lose might be gratified—or if he did not mean that what *did* he mean?

I am an Englishman, and although I yield to none in my admiration for the West Indies team for their sportsmanship, and the grand cricket they have shown us this season, I am afraid I must confess that I was unsportsmanlike enough to hope that Hammond and his merry men would win the third Test match, and win in no uncertain fashion.

Yours faithfully,



Singlestack, Catisfield, Fareham, Hants. C. L. STEVENSON.

A QUEER SEAT

SIR,—Returning to the letter from Mr. King, in your issue of August 12th, I might mention that one of these seats (made from antlers) is in this hotel. If only three were made it would be interesting to find where the remaining one is.

Yours faithfully,

Royal Castle Hotel, Lynton, Devon. EDGAR W. WOOD.

A HOME-MADE CONTRAPTION FOR COLLECTING THE GRASS
(See letter "Haymaking")

HAYMAKING

SIR,—I enclose herewith two photographs I took one evening whilst passing through Cudham, in Kent.

I noticed an ordinary saloon car running about the field. In front of the bumpers there was attached a "grass catcher." The farmer told me he made the contraption himself, in which the mown grass was all very quickly collected, and was then made into a stack.

My two photographs clearly show his ingenious invention.

Yours faithfully,

104, Woodland Way, W. E. BALL.
West Wickham, Kent.

HARBOURING A VIPER ?

SIR,—It seems to me, in providing a safe place for a nest of swallows, that as a beekeeper, Mr. K. Ridgway Crawshaw has not been harbouring such a viper in his bosom as he supposes.

Some few birds may have a peculiarity in their structure that renders them indifferent to the poisonous stings of insects, but with their delicate mouth and crop I cannot believe swallows to be indifferent to the stings of bees. I think it probable that the swallows which caught the fifteen bees in five minutes to feed their young were picking out drone bees which, of course, have no stings.

In spite of the twists and turns of the pursued bees, on account of their wonderful command of wing, the swallows would easily be able to distinguish between drone and worker bees.

For various reasons sticks of bees sometimes contain a large surplus of drones amounting to many hundreds. As they simply live in the stick without doing any work, or collecting any nectar for honey, they are best reduced in numbers, and swallows which take to eating them are consequently doing the beekeeper a service.

Yours faithfully,

Copse Hill House, Wimbledon. C. C. T. GILES.

ELEPHANTS' HEARTS

SIR,—In his letter in your issue of 12th August, "J.H.W.," writing from Upper Burma, states that "all Indian elephants have two-pointed hearts." This is interesting, and as he says he has held "innumerable post-mortems," perhaps he could send you a photograph to show exactly what they are like, and whether they resemble the abnormal photograph I sent you, and which you published in the *Field* of June 17th ?

I never had the opportunity of seeing the heart of an Indian elephant, but have seen a number of them cut from the African species, and invariably they had the normal shape. Therefore, when Captain Forbes sent me the photograph of the double heart cut from an elephant shot by Mr. E. G. Coryton it certainly appeared to be a malformation. No one could possibly imagine that Indian elephants systematically grow such abnormal hearts, and if anyone who reads this with knowledge of the shape of Indian elephants hearts can corroborate "J.H.W.'s" statement, it would be of interest to naturalists and hunters. Possibly some authority at the Zoo can supply such information ?

Yours faithfully,

Belmont, Moffat. DENIS D. LYELL.

ALONG THE ANTRIM COAST

SIR,—In the issue of your journal dated July 29th, there appeared a most interesting article dealing with the Antrim coast, and having recently visited the scene, I can fully endorse the high tribute paid to that part which lies in the region of Ballycastle and Ballintoy. One of your illustrations of the latter place showed Sheep Island in the foreground with Rathlin in the far distance. Too far away, in fact, to do justice to the rugged grandeur of its precipitous cliffs, with the Western Lighthouse perched like a sentinel upon a pinnacle of rock.

The west end of this island seems to escape the notice of visitors owing to the lack of regular transport service, but the sturdy islanders of Rathlin (the fishermen, lighthouse and postal service contractors, &c.) frequently call at Ballycastle, and I feel sure would be pleased to cater for visitors. Moreover, their motor boats are as staunch as their owners are capable. I enclose a photograph of the Western Cliffs, which I think you will agree amply supports my opinion of the district.

Yours faithfully,

M. W. NICHOLAS.

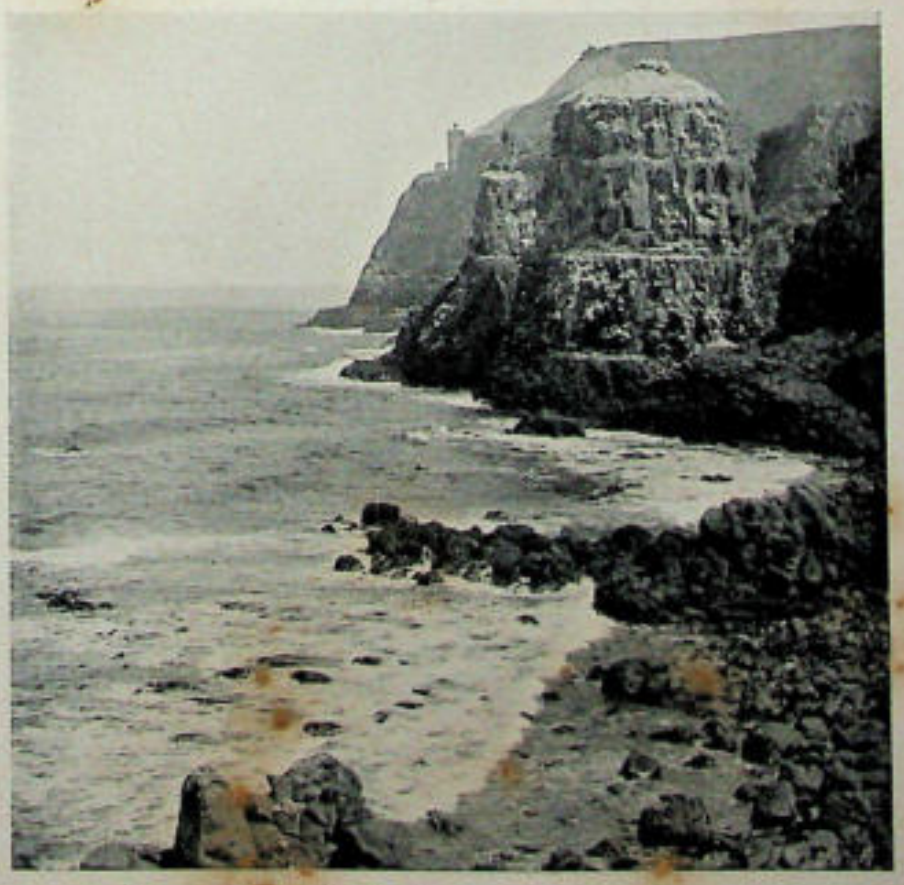
67, Davenport Avenue,
Hessle, East Yorks.

A DRINKING HARE

SIR,—I was fishing last month on the Derbyshire Wye one night at about 8.45 p.m. I saw a hare coming down the hillside straight for the river, so I stood perfectly still and he came right to the edge and actually put his feet into the water and drank steadily for about a minute, then he turned round and quietly ran up the hill.

I have always been told that a hare does not drink, and, although I have mentioned it to one or two of my shooting friends since I returned, they state they have never heard of such a thing, so I am taking the liberty of writing to ask if you have had anything similar reported to you.

Yours faithfully,



Stewton House, E. SUTCLIFFE.
Louth, Lines.

THE CUCKOO'S NOTE

SIR,—Like your correspondent W. R. Thompson (*Field*, July 22nd), I have not heard the well-known double note of the cuckoo this summer (I have not been able to go very far afield, however), so it would appear that Dorset cuckoos are not the only "offenders." I last heard the bird on July 22nd—admittedly, a rather *throaty* call, but certainly not a "double" note.

Yours faithfully,

Davena, PETER MICHAEL.
56, Cranmore Lane,
Aldershot, Hants.

ITS PRECIPITOUS CLIFFS, WITH THE WESTERN LIGHTHOUSE PERCHED LIKE A SENTINEL UPON A PINNACLE OF ROCK"
(See letter "Along the Antrim Coast")

A party where men are men and the whisky is Johnnie Walker. This whisky has all the finest whiskies of Scotland in its blend. Over a century's skill combines these whiskies in the smoothest and most satisfying drink a man could ask for. The blending does it !

Gentlemen ! your

Johnnie Walker

BORN 1820—STILL GOING STRONG

HARVEST BUGS

SIR,—Our family first met these pests in the West Highlands, actually on a small island grazed by goats eight or nine years ago, even though we have frequented other parts of the same country much longer.

We were acquainted with sheep ticks, which experience showed could be pulled out and forgotten.

Similar treatment was applied to the harvesters, but the area still itched, and we came to the conclusion that the head was left in. We then sought for a lethal agent and having some paint remover handy which contained petrol, alcohol, benzol, &c., we applied this—just a dab on the insect—with immediate success. On another occasion, having no paint remover, I tried paraffin oil—actually it was vapourising oil as used in marine paraffin engines—with almost as rapid a cure.

The technique is to apply a dab of either of these agents and forget about the insect. If unable to forget about it owing to a continuation of the irritation, apply another dab. I do not know what to do if this is unsuccessful, as I have not yet been in such a predicament.

On no account should the creature be forcibly pulled out, either alive or dead. They have, so far, always dropped out.

Several insects which my brother pulled out caused severe irritation which lasted for months. This was before we discovered the paint remover cure.

As far as I recollect, the sheep ticks caused no irritation, but the harvest bugs caused severe irritation. On one occasion I tried to leave one undisturbed to see what it would grow into, but had to have recourse to the paraffin before the insect had time to develop at all.

Our remedy may be common knowledge, but I have not seen any previous correspondence on the subject.

Yours faithfully,

Barmufflock, R. MORRISON.
Bridge of Weir,
Renfrewshire.

BIBLICAL REAPING

SIR,—Until I came upon the scene shown in the photograph, I had believed that the mechanical reaper and binder was in universal use, at any rate, over grain land as extensive as this.

This almost Biblical picture proves that I have been wrong; it might enlighten others whose opinions were the same as mine.

It was taken near the banks of the upper Wye at Llangurig, Radnorshire, and illustrates the large acreage of grain which the farmer and his "chap" have sheaved and bound entirely by hand. An arduous task, but I gathered that mechanised farming was not too well thought of there.

The speed and efficiency of this hand work was surprising and the skill of their craft can be judged by the neatness and alignment of the sheaves.

Yours faithfully,

Saddle Gate, RONALD BARRAUD.
Wollaton, Nottingham.

"MOROCCO ALE"

SIR,—Old drinks are always of interest, and among those which has been forgotten is the famous Morocco Ale, a dark, mysterious brew which was formerly served at Levens Hall, that

WHERE MECHANISED FARMING IS NOT TOO WELL CONSIDERED
(See letter "Biblical Reaping")

this ale, and the brewer was "sworn in" never to divulge his secret.

Although the original recipe is still preserved, the brewhouse and the brewer are no more. The last brewing was in 1890, and the last barrel from the gloomy old cellars was drained many years ago.

Up to 1880 the Mayor and Corporation of Kendal were always entertained by the owners of Levens Hall on their way home from Milnthorpe Fair. According to one authority they used to "eat raddishes and drink Morocco until the sun went to bed," toasting the Lord of Levens and wishing:

"Luck to Levens
So long as Kent flows,"

The toast had to be drunk standing on one leg.

Yours faithfully,

Huddersfield. S. MOORHOUSE.

CUCKOO TRAGEDY

SIR,—When in South Uist in June, I was interested in a cuckoo which came each morning and sang his song, perched on a direction pole at the lodge gate. He would not allow me to get within camera range till I built a hide. One morning, after waiting half an hour, I heard him in the distance, and calling him, he came and settled on the perch, but hearing the camera click he made off and would not return.

Some days later, climbing the hill, I heard him cuckooing on the far side of a loch. I called him, and in a few minutes he flew across and perched on a boulder within 20yds. of me. Suddenly there was a flash and a scuffle, and from behind him came a black object, and in a moment cuckoo and attacker were gone. I rushed forward, and from behind the rock a hoodie crow flew off, leaving the cuckoo on the ground. The feathers on the cuckoo's shoulders were torn, and there was a punctured wound in its abdomen from which blood flowed. I put an end to the poor bird's misery. My first impression was that the attacker was a hawk, but as he flew off there was no doubt as to his being a hoodie. The incident is so unusual as to be worth recording.

Yours faithfully,

Edinburgh. A. B. FLETT.

THE HOME OF A "DARK, MYSTERIOUS BREW"
(See letter "Morocco Ale")

historic mansion which stands beside the Lancaster to Kendal road.

If local legend can be relied on, this strong drink had no effect on the head, but a distinct potency against the feet. Only the lord of the manor, his heir and the lawyer knew the secret for brewing

THE successful modelling and mounting of RED DEER HEADS and all sporting trophies is the achievement of the skilled artist, and over 100 years experience in THE ART OF TAXIDERMY has enabled us to produce a standard of efficiency always in evidence in a "SPICER."

GOOD SPECIMENS ARTISTICALLY MOUNTED are naturally a proud possession, considerably enhanced by the knowledge that it is now possible to keep them intact from moth and insect damage indefinitely.

Years of research have produced an INFALLIBLE TREATMENT which entirely eliminates the ravages of moth to which mounted heads, etc., were particularly susceptible. This treatment which is known as "KILDEW" is indestructible and all specimens to which it has been applied are GUARANTEED PERMANENTLY PROOFED against moth and other insects for ALL TIME.

As SOLE CONCESSIONAIRES FOR THE BRITISH ISLES this process can only be applied to specimens mounted by PETER SPICER & SONS, and from the commencement of the STALKING SEASON 1939 onwards RED DEER TROPHIES entrusted to us for mounting will be so treated and carry a GUARANTEE OF PERMANENT IMMUNITY from moth and other pests.

Our charge for modelling and mounting a Red Deer Head on oak shield is £5 10s. 0d., and the "KILDEW PROCESS" will in future be incorporated WITHOUT ANY ADDITIONAL CHARGE.

LEAMINGTON SPA, ENGLAND

A 53-POUNDER FROM NORWAY

SIR,—I have just returned from my usual salmon-fishing holiday on the Stjordal, north of Trondheim, Norway. Up to July 15th we (two rods) had caught 22 salmon, a few grilse and sea trout (one 9lb.), totalling 450lb.

Among these I got a fish of 53lb. — length 50in., girth 29in. — which was in such splendid condition that it couldn't fight like the smaller ones often do, and I got it out in half an hour. My younger grandson tied the small double-hooked fly, John's Fancy — not unlike a black doctor.

It was a marvel that nothing gave way, for the top of my favourite old rod had been roughly tied up with string. The line was like the writer, dreadfully old, and the cast only a medium one.

Yours faithfully,
Braeside, M. C. SMELT.
Rosslyn Hill, N.W.

BIRTHMARKS ON LEVERETS

SIR,—There is an old saying in country places where hares are not uncommon that it is possible to tell when you find a leveret whether it is a singleton, a twin, or one of triplets. A singleton they say has no mark, twins have a white star in the centre of the forehead, and triplets have a larger one. I have known this saying for over 50 years, but am still not certain if it is only a legend, or founded upon fact, if the latter, can any reader give the biological explanation?

Yours faithfully,
Parkend, M. LEIGHTON RIDGWAY.
Moreton Valence,
near Gloucester.

COCK GROUSE AS A FATHER

SIR,—One morning, during the second week in July, while I was on my way from Inverness to Lochinver on the West Coast, having taken a friend in to catch the early train, I had the good fortune to witness a wild drama which must be rather unusual.

It was about 4 a.m., and dawn was just breaking over the Sutherland Hills. Travelling slowly over an extremely rough section of road now being made near Altnaceallgach, I came upon two birds fighting by the roadside. I moved as near as I dared. I found that a kestrel and a cock grouse were battling ferociously, and it appeared that the hawk was having a very thin time of it.

Suddenly they both became aware that I was watching them, and the kestrel flew off. I then saw the hen grouse and three very small cheepers in the ditch behind the tussock where the father had fought for the family.

Presumably the kestrel had stooped on one of the young birds, and the cock had challenged him. Most keepers who have a true knowledge of birds consider it very rare for a kestrel to kill birds at all, and it must be most unusual indeed for it to stoop on anything so large as a half-grown grouse.

Yours faithfully,
6, Deauville Mansions, D. M. BAKER.
S.W. 4.

"A MARVEL THAT NOTHING GAVE WAY"
(See letter "A 53-pounder from Norway")

BEARING REINS

SIR,—I am very curious to know how far bearing reins are used in the training of harness horses. I cannot but feel that those exquisite creatures one sees in the show ring, whose necks are arched—it seems—almost to breaking point, and whose fore-feet barely touch the ground, have achieved this perfection of action by some such artificial means. According to the late Mr. E. F. Flower, it was a common sight in the '80's to see horses with their heads reined back to the farthest limit by exceedingly tight bearing reins, which, coupled with a severe curbed bit, caused the horse to toss his head incessantly, and foam copiously at the mouth, attracting admiration from the casual passer-by for the spirited effect achieved.

I should be interested to know how far this was true, and also hear from your readers points for and against the use of bearing reins.

Yours faithfully,
17, Joubert's Mansions, D. ALLEN.
Jubilee Place, S.W. 3.

REMEDY FOR MANGE

SIR,—Will you give me a little space to answer "V. A. D." in August 12th issue of the *Field*? Under the heading "Remedy for Mange," it states, follicular mange is most difficult to cure. May I, as a judge and breeder of over 25 years, modify this statement, as it is likely to depress novices in the dog world. Follicular mange is extremely easy to cure, now that a remedy has been known for over twelve years — a preparation known as Odyline. Any veterinary surgeon will supply it; at least, I have never found any difficulty, and, used according to directions, follicular mange can be cured in a few weeks. It is easier to cure than sarcoptic, as follicular only attacks the face and the hind legs usually, and resorting to this oil at once, I have cured dozens of dogs and never had any bother, and the coat grows better than before the infection.

Yours faithfully,
The Bridge House, NORAH BRADBURY (Mrs.)
Luckington,
near Chippenham.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1, ask for 2/6 weekly for gentlewoman, aged 56, living in Cornwall. She was a science mistress, but is now nearly blind and entirely without income. This brave lady has had several operations on her eyes, but although she can hardly see at all is not yet "blind within the meaning of the Act" and is therefore not eligible for a pension from a society for the blind. She lives with a married sister who can barely afford to keep her, and there is no money for clothes or anything else she may need. Will you send us £6 10s. to help this poor lady as her health is failing and she cannot support herself?

IN THE CITY

By OUR CITY EDITOR

IT is difficult in these days of acute tension to make any forecast regarding the course of events in the investment world. We literally live from day to day, and before this article is read every phase of City life may have undergone a drastic change. For the time being, at least, every owner of capital whether it be large or small, in volume is endeavouring to keep his position as liquid as possible.

At the same time there is always hope that though the worst is feared it may not happen. Herein lies the reason for the widespread disinclination on the part of investors to part with their securities at the low levels to which so many of them have fallen. For over two years Stock Exchange business has been subject to a series of crises causing heavy fluctuations in prices. There have been good recoveries from the fits of depression, but throughout the continued state of tension has acted as a severe handicap on any real advance.

One effect of this general uncertainty has been the elimination of speculation and the concentration of attention on safety. This is evidenced in the substantial expansion that has taken place in the yields offered by leading equities, which, at one time, were regarded as equal in safety to the highest form of investment stocks. The ordinary risks of business are given exaggerated importance, and wherever they exist investment values have fallen.

In this search for safety many thousands of investors have turned to the shares of our great banks. The British banking system has been tested by every kind of difficulty and stress which it is possible to imagine, and has throughout remained impregnable.

Take, for instance, its experience throughout the Great War. Apart from a few days at the beginning while the nation was adjusting itself to the new conditions which burst upon it so suddenly, the leading banks carried on imperturbably. They stood solidly behind the Government and the people providing a financial bulwark against panic, which was of inestimable value.

As investments they were equally successful in demonstrating their strength. Share values fluctuated it is true, but only to a limited extent. In every case dividends were steady and almost unchanged. When one considers the immense financial stress and strain of those four years the achievements of these great British banks stand out with almost imposing splendour.

Since the War, they have continued to serve the nation with the same steady, nerveless solidity. Depressions have come and gone. Monetary systems have been swept away and new currencies have come into existence. Gold has lost its place as the world arbiter of value, and all kinds of methods have been tried in its place, none of which has yet proved effective.

Throughout it all the British banking system has maintained its serenity. Relying on its immense financial strength and its thoroughly tested organisation, it has surmounted every crisis in world affairs with success. The fact that sterling still stands supreme among world currencies is largely due to the consistent support the banking system of this country has invariably given to the national needs.

In these circumstances, it is obvious that few forms of investment can be more comforting in these days than the holding of the shares in our leading banks. The eleven London clearing banks have a total issued capital of £78,197,000, and this position is strengthened by accumulated reserves totalling £60,596,000. Between them they handle deposit and current accounts totalling over £2,239,000,000.

The shares of the half-dozen leading concerns can be bought to give yields of about 4 per cent., and if past experience can be relied upon the income thus available may be expected to continue.

BABOON BUFFOONERY

A young drill, one of the colony of baboons and associated monkeys living on the "Baboon Rock" in the Scottish Zoological Park, Edinburgh, discovered that he could jump from the central rock, across the ditch which borders it, on to the surrounding parapet wall, and as his wanderings were doing no harm, no effort was made to restrict him. Gradually, however, he increased the distance he would venture from the home boundary, and then he discovered a kiosk with a tempting display of biscuits and sweets, and he promptly helped himself to a packet. The next time, he saw a small boy with a packet of biscuits in his hand and immediately annexed them. His first robbery of this kind caused only amusement, but he began repeating it rather frequently, and some of the people who have been robbed have not enjoyed the experience. He is now in a cage in the Acclimatisation House, where he has to play the mendicant instead of the robber.

The Bridle Pair

They're riding for a fall. He is falling for her and she has fallen for his cigarettes. That's because they are Gold Flake. Ever since women became aware of the flavour of Gold Flake—that distinctive flavour of the really fine Virginia tobaccos of which they are made—nothing but Wills's Gold Flake will satisfy them.

WILLS'S GOLD FLAKE

A PEACEFUL HOLIDAY SCENE AT BABBACOMBE REGATTA

UPS AND DOWNS OF THE TORBAY AND DARTMOUTH FORTNIGHT

A Diary of West-Country Racing

By K. ADLARD COLES and TERENCE STOCKEN

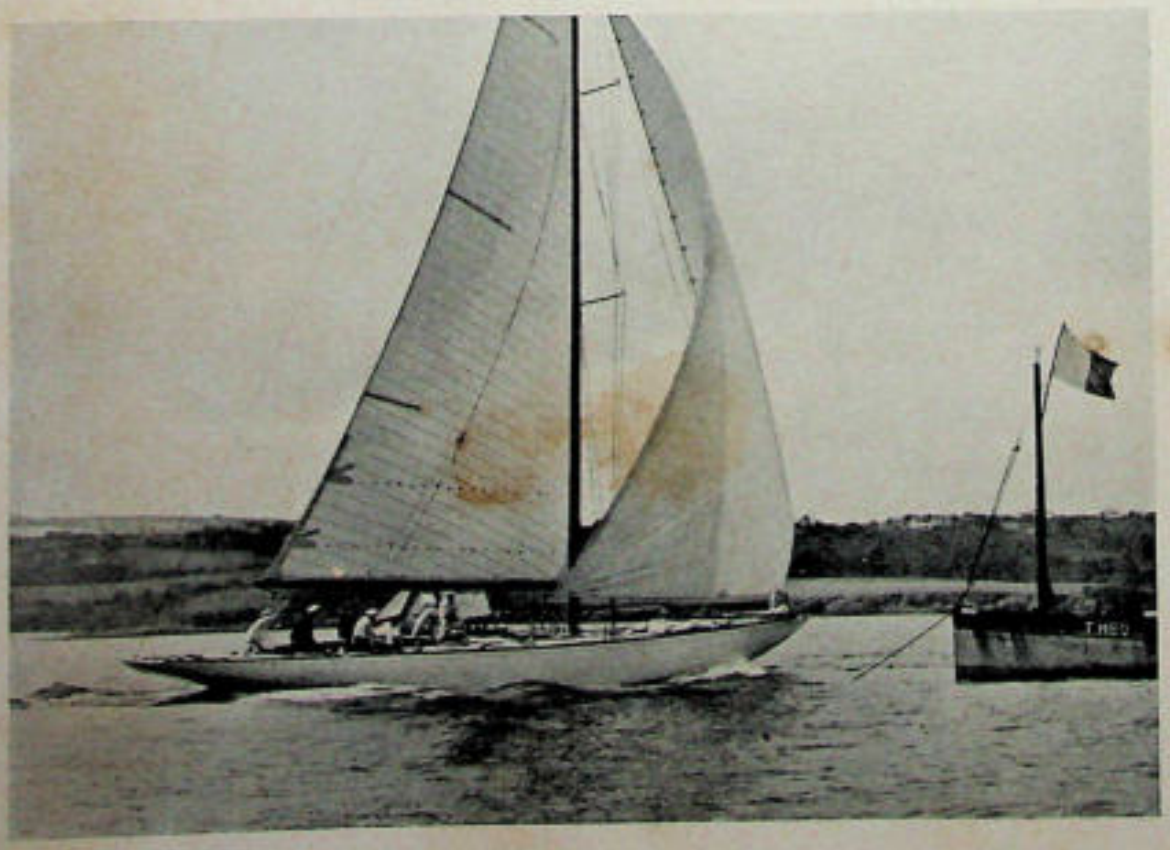
COWES having held the centre of the stage during the early part of August, the burgees and bunting travel westwards for the last half of the month, first to Weymouth and then to Torbay and Dartmouth for the "Fortnight" the the annual West-country yachting festival.

The fortnight opened at Babbacombe, in the north-west corner of Lyme Bay, below Teignmouth and "round the corner" from Torquay; the first day's racing being on August 14th.

The Twelves were unfortunate on this opening day, as the weather mark boat had sunk, and although both rounds of the race were sailed in very light airs (an entirely unofficial mark boat having been adopted by the yachts, since they had to go round something) there were naturally some protests, and the Sailing Committee agreed to re-sail the race at a later date.

In the Y.R.A. handicap events, Morva (P. M. Holman) won the under 75 tons, and Violetta (Captain H. Mitchell) the under 25 tons. There were also three divisions of the Torbay handicap class, and 14 and 12-foot dinghy events, as well as a race for the new Teign One-designs.

The next day (15th) was at Paignton, but by long custom the first day's events were confined to the local classes. Torbay Handicap, Class I, was not sailing, but Asphodel (Major Ball) won in Class IIA. In the International 14ft. dinghies, Nimrod (W. R. Dann) followed up her win of the previous day with a sail-over, while in the 12-footers, Squadron-Leader MacDonald won again in Farandole. There was also a race for the Dart dinghies, won by Imp (the Earl of Cathcart), and the Teign O.D.'s.



On the 16th, the Paignton second day, the Twelves were out; and this time the mark boat, instead of sinking, varied the programme by running away as the boats approached. This again puzzled the fleet, and the first boat to realise what was happening naturally got the advantage. This was Blue Marlin, which eventually won the race, with Evaine second and Flica II third. Evaine protested, but the protest was overruled. Morva and Violetta were again the winners in the two handicap classes; one or two of the Fastnet yachts, notably Golden Dragon and Griffin, came round from Plymouth and took part in the smaller (under 25 tons) event. The Torbay division of the West Solent O.D. class were out on this day, Sir R. Leeds' Linette being the winner.

On the 17th there was no regatta, but the race which had been voided by the sinking of the Babbacombe mark boat on the Monday, was re-sailed. There were the lightest easterly variables prevailing all day, and the finish provided the slowest of slow-motion drifting matches, Trivia taking 20min. to travel the 70ft. or so separating her from the finishing line, what time Blue Marlin stole up and edged across, getting her gun 10min. before Trivia. Tomahawk was a close third.

On the 18th was the Royal Thames Day at Brixham, and appropriately enough Flica II, the Brixham Twelve, took her first winning flag of the season, by a few seconds from Trivia, with Jenetta third.

The wind was again very light, and fell away almost entirely towards the end, leaving several classes all on the line together, a huddle composed of the various cruisers, the West Solent class yachts, the three entries in the Brixham trawler race and the Twelves.

The trawlers were racing for the King George V. Perpetual Cup, which was won by Valerian (W. D. Beaumont), the other two competitors (Alas! the fleets of yesteryear) being Rulewater (A. Masser) second, and Silver Lining (P. Upham). In the

A MARK BOAT WHICH "STAYED PUT"
Blue Marlin off Brixham in the Twelve Metre racing

how time flies

It is nearly twelve years ago since George that incomparable barman introduced Lillet into the Guards' Club adding just a dash of orange bitters to two-thirds Lillet—one-third Gin.

★ ★ ★

Since that time the glad news has gone round Piccadilly . . . through Mayfair and out into the wide open spaces where men hunt foxes and hostesses hunt lions. 'Try a Gin and Lillet' has become 'the usual, please' and Lillet now wears laurels round its neck BECAUSE it carries all before it in cocktail competitions.

A FINE SIGHT. THE START OF THE BRIXHAM TRAWLERS RACE
Entries for the race only numbered three and it is sad to think that this event may disappear from the programme

ex-metre race, Violetta was given winning gun, but Lady Anne (Sir V. Gabriel) protested that the shorten-course signal had not been correctly displayed, and the protest is to be referred to the Royal Thames Committee in London. In the big handicap class, Flame, steered by her owner, and designer, Mr. C. E. Nicholson, won from The Blue Peter, with Morva third.

The following day (19th) was Brixham Royal Regatta, with a fresh wind (N.E.'ly) to begin with, but easing off later. Tomahawk won in the Twelves, with Jenetta and Evaine second and third. In the big handicap class Flame was again the winner, but Morva's second place was protested against by Diadem (G. Flynn Terrell), one of the grounds being that by fixing her spinnaker boom on the fore-stay, Norva was enabled to haul it right forward like a bowsprit when reaching, and thus gain unlooked-for advantage. This protest was upheld by the sailing committee.

There were also cross-protests in the West Solent restricted class, between Persephone (N. Field) and Estelle (W. B. Vanderhoof); the former claiming that she had not been given "water" at the finishing mark, which she fouled and also struck Estelle's quarter. The latter claimed an overlap and also that the gun had gone before Persephone cried for water, and her protest was upheld, so that Benita (C. S. Wollen) and Linette (Sir R. Leeds) were given second and third places. There are two Estelles, by the way, and the one referred to above is not the Estelle (B. T. Rumble) which took first flag in the under 25 tons handicap.

The second week began on the 21st, with the first of the three Torquay days. Bafflingly light airs again slowed things up, but in a close finish Blue Marlin, steered by Mr. Colin Newman, won from Trivia, with Flica II third. On the 22nd, after a postponed start, the breeze came out of the south-east, and the Twelves had a good race on three rounds of a triangle. In the big handicap class, The Blue Peter swept everything before her with an outsize in spinnakers tacked to the stemhead and sheeted home like a genoa, reducing Lady Anne's considerable initial lead as though the ex-metre boat were standing still, to win by nearly a quarter of an hour on corrected time.

The third day of the Torquay racing was one of the best of the whole fortnight as regards weather, ideally fine conditions combining themselves with a S.S.E. sailing breeze, which for once in a way held for most of the day, easing off towards the end, but never relapsing into those irritating periods of calms and uncertainties which most other days had had to contend with.

Flica II and Tomahawk had a great duel for most of the day, but as the breeze eased, Tomahawk drew away and won by a bit over a minute, Blue Marlin being third. Trivia, who earlier looked as though she had the race in hand, retired after a luffing match with Blue Marlin in the second round. There was no race in the big handicap class, as The Blue Peter was the only yacht to start. Violetta won the under 25 tons, with Etain (H. C. Christopherson) second and Golden Dragon (H. S. Rouse) third.

The Port of Dartmouth Royal Centenary Regatta also began on the 23rd, but on the first day, of course, most of the important classes were absent at Torquay. On the 24th, Class II of the Torbay Handicap class turned out, the event being won by E.S.O.F.A. (O. F. Ahlmann), a boat which has been doing a lot of winning in her class; and the West Solents also raced, Benita being the winner.

On the 25th, under the flag of the Royal Dart Y.C., the Twelves appeared, and—with that strange malaise which has afflicted mark boats in this part of the world of late—there were considerable differences of opinion as to whether (*a*) the mark boat was there at all or (*b*) if so, how far it was out of position. There were no protests, however, and the mark boat was there after all; the leaders of the fleet on the first leg—Tomahawk, Trivia and Flica II—having miscalculated their course to the Skerries, had a foul beat to recover ground, enabling Blue Marlin and Jenetta to get away with things to the line (only one round was sailed), Trivia taking third place.

Last Saturday heavy rain and a southerly sailing breeze appeared to make many competitors fear to risk their gear. The rain ceased at the start, however, and after a brisk race of two rounds Tomahawk added another to her winning flags this season, with Blue Marlin second and Jenetta third.

No one turned out in the big handicap class except Lady Anne, so this race was off. In the 8 to 20 tons class Mystico (D. H. McCowen) was the winner, with Loyalty (Captain Hughes) second and Estelle (B. T. Rumble) third. The Dart dinghies were, of course, present in their home waters, Louana (Miss M. Leslie) winning her race.

So the western season draws to its close; at the time of writing there is the Royal Thames Regatta to be sailed at Dartmouth on Monday, the 28th; after which the fleet travels eastwards again for the last south coast regatta of the season: Bournemouth Town, to be held on August 30th.

There will be no more racing for the Twelves after this, and we must turn our attention to the East Coast, where Burnham Week will be in full swing from September 2nd to September 9th.

THE SEAWANHAKA CUP VICTORY

AFTER many postponements owing to calms, Circe, the British defender, retained the Seawanhaka Cup. Noreg III, ably handled by Mr. Rolf Svindal and her crew, had made a bold challenge for it, and after they had won the fourth race of the series and made the score two-all, no one could have predicted the issue.

In the deciding fifth race the Norwegian six-metre got away well in two rounds of a windward and leeward course and Noreg, doing better in the windward work, had a lead of 28sec. at the mark. Circe on the run back soon wiped this out and under spinnaker gained 3min. 6sec. Then came a repetition of the start, with Noreg working up and leading by over half a minute.

Circe again having the best of the duel on the return, crossed the line just under four minutes in front of the challenger and beat the time allowance for the race. It was a well-deserved success for Mr. J. H. Thom, who had such a skilful opponent to contend with and one to whom all thanks is due for the very fine racing provided.

LAWN TENNIS IN AMERICA

ONCE again we have lost the Wightman Cup after our chances had been estimated as promising, and now the critics will be able to say how they would have selected the team.

Our players lost both doubles and only won two of the five singles. Miss Marble beat Miss Hardwick (6/3, 6/4) and Miss Stammers (3/6, 6/3, 6/4) and, paired up with Mrs. Fabyan, defeated Miss Stammers and Mrs. Hammersley by 7/5, 6/2. Miss Jacobs lost one of her singles to Miss Stammers (2/6, 6/1, 3/6), but in the other beat Miss Hardwick (6/2, 6/2). In the remaining single Mrs. Fabyan lost to Miss Scott (3/6, 4/6). Miss Bundy and Miss Arnold only allowed Miss Nuthall and Miss Brown four games in the other double, winning by 6/3, 6/1.

In the Davis Cup at Brookline, Australia have had a fairly easy passage to the Challenge Round against the United States, having beaten the Jugo-slavians in the Inter-Zone final by four matches to one. In the singles A. K. Quist (Australia) beat D. Mitic 6/0, 6/4, 6/3 and F. Kukuljevic 6/2, 6/3, 6/4. J. Bromwich (Australia) lost to F. Puncec 2/6, 6/8, 6/0, 2/6 and beat Mitic 6/1, 6/3, 6/2. Bromwich and Quist in the doubles beat Puncec and Kukuljevic 6/2, 6/3, 6/3. The Challenge Round takes place this week-end.

BRITAIN'S RYDER CUP SELECTIONS

Seven Places Allotted on Sheer Merit

By E. R. TIPPLE

Left: R. A. Whitcombe, who carries on the family tradition of providing a member for the side. Right: A. H. Padgham, who showed such great form at Brighton

SEVEN of the ten players who will represent Great Britain in the bi-annual Ryder Cup match, which will take place on the Ponte Vedra Club's course, Jacksonville, Florida, on November 18th and 19th, have been chosen. They are: Henry Cotton (captain), J. Adams, R. Burton, S. C. King, A. H. Padgham, D. J. Rees, and R. A. Whitcombe.

Charles Whitcombe, who has taken part in every match since the series was inaugurated in 1927, was invited but declined to make the trip. Having captained the last four British teams Whitcombe let it be understood that he did not wish to play in America again. He probably feels that at the age of forty-three he should make room for a younger golfer more able to stand the strain of international rivalry. Whitcombe is to be admired for his decision, and his past services to British golf and our Ryder Cup teams will not be forgotten.

The selections contain no surprises. Indeed, the majority were automatic choices. Although many held the opinion that sweeping changes should be made in the side that was so decisively beaten two years ago, it is difficult to suggest any alternatives. Five of the seven played in the 1937 match. R. A. Whitcombe was a member of the 1935 team, whilst J. Adams is new to Ryder Cup honours. If they have a record of successes spreading over the past few years they have shown this season that they are able to withstand the challenges of the younger school. They have earned their places on sheer merit.

Cotton, with his great knowledge of the game and its leading exponents, should make an excellent captain. By his own performances he may well inspire the members of his side to produce their very best—and their best will be needed if we are to reverse the last result. Although Cotton was below form at St. Andrews, his recent victory—the third in successive years—in the German Open Championship over the difficult Bad Ems course indicates that he has lost none of his old skill.

The inclusion of Adams has not been made before it was due. He was distinctly unlucky not to be chosen two years ago. Although he has not won any big tournament this season he has shown consistently good form. Twice runner-up in the last four Open Championships is a record that speaks for itself. With an easy flowing swing, characteristic of a true Scot, Adams has not a weak shot in his bag. But apart from actual playing skill his greatest asset is his calm, unruffled temperament. No occasion, however important, is likely to disturb him. Indeed, the greater the occasion, the more critical the period of a match, the better he seems to play. Cheery optimism and an equable temperament are vital assets for Ryder Cup play.

Richard Burton, as the present Open Champion, was certain of his place in any representative team. Ill-health has upset his play in recent weeks, but he has plenty of time in which to become fit. Occasionally rather erratic with his long shots, Burton has the happy knack of producing an unexpectedly brilliant recovery stroke which can be thoroughly disturbing in a match. He is a great trier, never giving up hope until the game is over. At Southport in 1937, in partnership with Percy Alliss, he won the solitary point for Britain in the foursomes. This was gained despite many wayward strokes and was a typical example of his fighting qualities.

As the winner of the Vardon Trophy, awarded each year to the professional obtaining the best results in the major tournaments, R. A. Whitcombe maintains the family tradition of providing at least one member of the side. Like Adams, he has been extremely consistent this year, his only lapse being when he played Bobby Locke and suffered a crushing defeat. Supposed to be a better stroke than a match player, Whitcombe has shown time and again that that opinion is hardly correct. He is a great golfer and would be better still if he would make up his mind to be more bold with his putting. All too frequently he has the bad habit of not giving the hole a chance, particularly with those 5yd. putts.

THE CAPTAIN

T. H. Cotton, playing-captain and an inspiration to the team

The two heroes of the last match—King and Rees—were obvious choices. I shall never forget watching them struggle against the odds at Southport, and after being in apparently hopeless positions the former halved his single with the redoubtable Shute, whilst Rees defeated Byron Nelson, the present American Open title-holder. Both are admirable fighters and particularly deadly on the greens. The way Rees bangs the ball into the hole—never expecting it to go anywhere else—is a joy to watch. Despite his lack of physique the young Welshman hits the ball as far as anyone needs to and is not perturbed by the most majestic opponent. Indeed, two more confident golfers than these would be hard to find anywhere.

Left: R. Burton, the present Open Champion and a determined fighter. Right: J. Adams, a newcomer to Ryder Cup play, with no weak shot in his bag

Left: S. L. King, who halved with Densmore Shute in the last Ryder Cup Match at Southport. Right: D. J. Rees, who beat Byron Nelson, present U.S. Open Champion

Padgham's return to the form which enabled him to be the outstanding player of 1936 is well timed. His success at Brighton will make him more sure of himself than ever and left no doubt as to the merits of his inclusion. But before he found his old touch he had to endure two long years in which he could do little right, a bad spell that would have ruined many golfers. Although his consistency on the greens deserted him, and his accuracy in the long game was lost, Padgham refused to be dismayed. Any golfer who has passed through such an experience—and most of us have at one time or another—will appreciate just how much credit he deserves for his unruffled perseverance.

The team, in all probability, will not be completed until after the match-play championship to be held later this month. Those in the running for the three final places include Alliss, Perry and Cox—members of the 1937 team. Of those who have never played in Ryder Cup games, Cadd, Fallon, Lees or Curtis may be favoured. If for the sake of the experience alone one or two young players of promise should be included.

Before the team sails, on October 24th, a match will be played at Walton Heath against a team of amateurs on October 12th and 13th. This should provide an opportunity of testing out foursome partnerships—a vital necessity. The British record in the foursomes is deplorable. Only in 1933 did we collect two points, in each of the other matches just one victory has been recorded. With the above exception America has started the singles with a lead—if small, at least encouraging. From the psychological point of view the importance of a good display on the first day cannot be stressed too highly.

The selectors have chosen the majority of the team without unreasonable delay and have performed their task satisfactorily so far. They are now faced with the problem of not so much who to choose as to who to omit. Events this month may solve their difficulties. But they should plan a series of practice games to discover the ideal partnerships for the foursomes, on the result of which victory will largely depend.

No British team has ever been successful in America. In the past the weather, the larger ball and lack of time in which to become acclimatised have proved too big a handicap. This year no such excuses, except regarding the ball, can be made. The weather in Florida during November is not likely to be extreme, and the British side will have about three weeks for serious practice beforehand. The Ponte Vedra course is, I understand, very similar to many of our own seaside lay-outs. It has holes of over 500yds. in length, and many of the fairways are bordered by lagoons—those are hazards rarely encountered in this country. Water hazards permit of no recovery shots, the player has to suffer a penalty stroke at least, so accuracy will be more important than usual. In short, a fine test of golf awaits what promises to be a fine British team.

DAFFODILS ARE AMONGST THE SPRING FLOWERING BULBS THAT SHOULD BE PLANTED IN LARGE DRIFTS

The Country House

BULBS TO PLANT NOW FOR SPRING

By ELEANOUR SINCLAIR ROHDE

THE majority of spring and early summer-flowering bulbs have to be planted this month, and the earlier the spring-flowering bulbs are put in the better. Snowdrops, Crocuses, winter Aconites, early-flowering Iris species, Scillas, Daffodils, Crown Imperials, Muscari, Chionodoxas, should all be planted as early this month as possible.

In large gardens where drifts of spring-flowering bulbs can be arranged, it is fairly easy to plan; but in smaller gardens this matter is usually rather a problem. The Crocus species, &c., do best in the rock garden, but winter Aconites, and the later-flowering Crocuses, for instance, need to be planted in drifts if they are to look picturesque in spring. Grass is the ideal setting, but there is always the difficulty that the grass cannot be mown until the leaves of these early-flowering bulbs have died down completely. Used as edging plants they look charming along a path in a cottage garden, but not so attractive round formal beds. In many small gardens, especially those of the suburban long-strip variety, fruit trees are used instead of flowering shrubs to form a screen at the end of the garden, and if these are grown in a square plot of grass (the grass not allowed to grow within 3ft. of each tree) bulbs can be planted in the grass for charming decorative effect in spring. I also like to see stray clumps of Primroses in the grass, and later a few of the common Columbine. The effect is rather suggestive of the "flowery meads" depicted in tapestries. The point to bear in mind is that whereas the bulbs can be planted fairly thickly in informal clumps, the Primroses and Columbines should be sparsely planted, otherwise the effect is spoilt.

The best Snowdrops to plant in turf (provided the turf is not too coarse) are *Galanthus nivalis* and *G. byzantinus*. But for the rock garden *G. Elwesii* is best, for unlike the majority of Snowdrops, which enjoy a rich and rather moist soil and the protection afforded by deciduous trees, *G. Elwesii* does best in poor soil, full sun, and a very well-drained position. Planted in moist soil, this handsome species is apt to die out, but in a hot spot in a rockery frequently seeds itself.

Winter Aconites can be very contrary, and they succeed only in very fine turf, for in coarse grass the tubers are apt to rot. Like Snowdrops, the tubers should not be out of the ground a day longer than is necessary, and where they have proved a failure it is a good plan to buy the plants locally immediately they have finished flowering. I have moved Aconites even in flower quite successfully. Aconites are invaluable in a bee garden on account of their early flowering. I have them grouped with Crocuses near the hives in my bee garden amongst clumps of *Nepeta mussini*.

Crocus species should be planted as early this month as possible, and they do best in sunny sheltered nooks in the rock garden. I notice at the spring shows that the modern hybrids of the Dutch Crocus are rivalling Tulips in size and splendour, and these magnificent kinds in which some firms are specialising, are undoubtedly amongst the finest early-flowering bulbs. I shall be sorry, however, if the old Dutch forms disappear altogether. Theoretically, Crocus clumps should be lifted every few years and divided up, but Crocuses always seem to me companionable flowers. Planted out singly they have a forlorn appearance, whereas allowed to make big clumps they look delightful. Further (and again in spite of theory) I notice that the flowers in these big "neglected" clumps are just as large and decidedly longer-stemmed than those grown singly. I once counted the number in one of the large clumps in our garden, and there were over a hundred fully out, and lots more coming on. The clumps looked like ruffled pools of gold from a little distance, and the bees revelled in them far more joyously it seemed to me than in the smaller clumps.

Chionodoxas and the large-flowered Crocus hybrids flower simultaneously and associate to perfection. The white markings on the Chionodoxa give a touch of lightness to the picture. It is a pity not to give low growing bulbs the background of small shrubs, such as *Daphne mezereum*. Personally, I prefer the white-flowered form for the flowers have a pearl-like appearance rare in white flowers. No blue is so rich as that of Scillas, all the more appreciated, perhaps, because blue is a rare colour in early spring. Scillas as a rule do badly in turf, but they are ideal for edgings. Of *Scilla sibirica* one can never have enough, but the May-flowering *S. hispanica* is a terribly rampant spreader, and can never be planted near any choice plants, for the bulbs work themselves down quite 2ft., and spread so vigorously that they are difficult to eradicate. For waste ground, however, these handsome "blue bells" on stems quite 15in. high, are invaluable, and they are amongst the very few plants that succeed admirably under firs and pines. *Ornithogalum nutans* is another rapid spreader, with its bluebell-like flowers silvery white without and green within, these bulbs look particularly well under birches.

English Irises always do best planted in early autumn. These Irises are decidedly handsomer than the rather weedy Spanish Irises, and whereas the latter are apt to die out after two years, the former increase well and go on for years. They are amongst the richest blue-flowered plants, and invaluable for picking.

FARM LOSS CLAIMS

By REGINALD DAVEY

IT is very pleasant to have a home farm, but it is apt to be expensive. Very few home farms are run at a profit, and the reason is not always mismanagement. To farm as a tenant purely for profit is a very different matter to being an owner-occupier, who will farm with his weather-eye on amenity and would never for one moment be satisfied to see his farm run on the apparently slipshod lines of the working farmer.

Much can be done to reduce the cost by careful management, but what is essentially uneconomic cannot be made to show a normal profit. That the ultimate loss can be substantially reduced by a reclaim of income tax and surtax is not widely known.

Farmers pay tax under Schedule B of income tax in respect of their supposed profits, so that the owner-occupier will have two taxes to meet, Schedule A in respect of his ownership and Schedule B in respect of his occupation. Last week it was explained how an owner could obtain relief from excessive taxation under Schedule A. Under Schedule B, which is based on a hypothetical estimate of the profit equal roughly to the rental value of the farm, a farmer who makes a loss or a profit less than the rent has two courses open to him. He may elect to be assessed under Schedule D on the actual profits for the preceding year, but this election applies also to future years.

The more usual and better remedy is to claim relief under Schedule B. It is necessary to give notice to the inspector of taxes within twelve months of the end of the year in question. The effect is to claim adjustment of the assessment by reference to the amount of the loss and the aggregate of the farmer's other income. Not only, in the case of a loss, can all tax under Schedule B be remitted, but income tax and surtax on the amount of the loss can be reclaimed, if paid in respect of other income.

This election applies only to the year for which it was made, and if subsequently a profit is made which exceeds the Schedule B assessment, the farmer has merely to pay tax on the basis of the assessment, and not of his higher profit.

It is not surprising that a nationally important but economically precarious occupation like farming should be so leniently treated by the Revenue. They do insist upon proper evidence of farming results, a matter that does not trouble a landowner with his agent and farm bailiff, to the extent that it does the unlearned working farmer.

If proper books of account are kept, they will be accepted. If not, Form 79d, or something very like it, should be completed. The submission of a claim generally brings a multitude of questions, all more or less difficult to answer; and the completion of Form 79d in the first place obviates much of this.

In the accounts produce supplied to the mansion must be credited, as also must the value of the grazing of the owner's hunters, and the proportion of wages of farm workers when employed in the gardens or woods.

With the wages can be included the value of the board of men housed in the bothy, but not the value of any rent-free cottages, which are covered by the item for rent. For an owner-occupier the rent is replaced by the net assessment under Schedule A of the farm and cottages, but excluding the farm-house, plus tithe, land tax, drainage, rates, and the cost of repairs. If the owner submits an annual maintenance claim, then in lieu of net Schedule A and repairs, he may charge the gross Schedule A assessment plus tithe.

There is often a doubt as to whether items like fence repairs are farming operations, or should more properly be included in the maintenance claim. It is to the owner's advantage, in cases of doubt, to include the item in the farm loss claim, where he will obtain reclaim of tax at once and not on the basis of a five years' average.

The stocktaking valuation and preparation of the claim is the matter for an expert, but it is useful to consider the extent of the information that has to be supplied. The basis is the profit and loss account, and the fuller the information supplied the less the subsequent questions to be answered. To prove the accuracy of the account a balance sheet reconciling the capital at the beginning and end of the year must be accompanied by a reconciliation of live-stock numbers. Sometimes an account is asked for to show the amount of corn grown and how it has been disposed of. Births and deaths have to be disclosed in the live-stock statement.

Frankness and impartiality are the ideal methods of approach, and if the inspector comes to associate these traits with an agent, future claims will be paid with a minimum of burdensome questioning.

A BENEFICENT LANDLORD

The Fourth Duke of Portland and His Work for Agriculture

IN Professor Turberville's preface to his second volume of the *History of Welbeck Abbey and Its Owners** there is the surprising statement to the effect that the fourth Duke of Portland is not included in the *Dictionary of National Biography*. His many activities on the land, in estate management, in naval architecture and the wide breadth of vision he displayed, certainly entitle him to the recognition which has not been denied to ancestors who took a more prominent part in the political affairs of the nation.

From the time of Hans William Bentinck Earl of Portland, loyal friend and counsellor of William of Orange, who was beset with disappointment and rivalry in this country, Professor Turberville reviews the lives of the first to the fifth Dukes of Portland, and from letters and historical documents placed at his disposal he has succeeded in giving a realistic picture of their characters, and the manner in which they faced their responsibilities. Naturally enough the greater part of the work is devoted to the career of the third Duke of Portland, who, through his marriage with Lady Dorothy Cavendish, made an alliance which was satisfactory in more ways than one. Eminent statesman, Lord Lieutenant of Ireland, twice Prime Minister, and holder of many high offices both with the Whigs and when, at the time of the French Revolution, he allied himself with Pitt, the third Duke played a prominent rôle in the history of his country. Despite the political interest of this career it is the fortunes of his successor that provide the more human note.

In William Henry, fourth Duke of Portland, one feels were found the sound business instincts and foresight which would have made him a leader of thought in the 20th century. His predecessor had left him troubles enough financially. There is a note to the effect that the Steward's accounts at Welbeck show that the third Duke's household and miscellaneous expenditure in 1784 was £4,000; in 1786 it had risen to £10,000; in 1797, stood at £12,000; in 1798, £18,000; in 1801, at £21,000. It fell to £12,000 in 1803, rose to £20,000 in 1804, and to £38,000 in 1805, sank to £17,000 in 1806 and to £18,000 in 1807, only to rise again in 1808 to £37,000, and in 1809 to £45,000.

And so when the fourth Duke succeeded to the estates he found them loaded with debts (exclusive of annuities) to the amount of £512,000, while there were minor liabilities of his father and Lord Edward Bentinck of several thousands more. In the space of four years he succeeded in clearing off more than £350,000, partly by the sale of the old family seat of Bulstrode to the Duke of Somerset, sales of properties at Ogle and in Cumberland, and from sales of timber and revenues from properties in Marylebone. He was able to show, in 1844, that the value of his estates was increasing every year. He calculated that the income from Marylebone was about £50,000 a year; from Nottinghamshire, £20,000; from Northumberland, £7,000; from Scotland, £14,000; and from money invested in Government stocks, £13,000, making a total income of £104,000.

When, during his father's lifetime, on his marriage to Henrietta, eldest daughter and co-heir of General John Scott, of Balcomie, Fife, he took up his residence at Welbeck, he devoted himself to its management. There exist letters to his steward containing lucid and precise instructions, very careful in detail, relative to every kind of activity on the estate: the rearing and sale of stock, the cultivation of crops, the means of preventing or curing disease in plant and animal. Sometimes he sent recommendations allowing a large measure of discretion to those on the spot. He asked for views of farmers and shepherds, and from time to time called for detailed reports from the former as to the state of their pastures, the numbers of their cattle, their ewes and their lambs, and the productivity of their turnip seeds. He sent instructions on the planting of trees, and expected full information of the game and kennels at Welbeck. But he was also concerned about the exploitation of coal mines and railway development. His Kilmarnock-Troon railway was the first to be made in Scotland.

When the price of corn (reckoned at a standard of 100/- a quarter) sank to as little as 70/- (and once to 52/6), the Duke, in 1815, made a reduction of rents on his estates on a sliding scale. They worked out in the following fashion on £10 of rent. When wheat was selling at 4/- per bushel the proportionate rent would be £6 12s., when selling at 5/- it would be £7, and when selling at 12/-, £9 16s. Whenever the price of wheat reached 12/6 the rent would be at par.

A further arrangement regarding the payment of rent was made soon after the abolition of the corn laws which the Duke regarded as a calamity for his tenants as well as for himself. He divided his tenants into three classes; those who paid a high rent, those who paid a moderate one, and those who paid an almost nominal one. Half the rents due were commuted into a corn rent, to fall with the price, however low it might become, to rise with an increase in price, but never beyond 64/- a quarter. The third class of tenant was unaffected by this, but the others gained considerably.

Reference is made to correspondence, in which the Duke relates with enthusiasm the results he had had after he had converted a rabbit warren in Clipstone Park into arable land by the use of bone manure one year and of lime a second year. He gives details of how he broke up old grass lands for cultivation; of how he had sowed a whole field with turnips (afterwards folded by sheep) except for one acre, but hoed and fallowed that acre with the rest. He then sowed the whole field with barley, and the part that had borne turnips produced seven quarters of barley per acre, whereas the acre in which no turnips had been planted produced but four quarters.

He experimented without cease, believing that if you wish to make the best use of your land it is no use following traditional methods or trying to work by rule of thumb. Once when he applied 40 loads of manure to one acre, 35 to a second and 30 to a third, and planted the whole with cabbages, he found the crops produced were in inverse ratio to the quantity of manure used. He conceived the idea of converting waste lands to useful purposes by the creation of water meadows. He was always prepared to undertake expensive works on a large scale, such as tile drainage, which he carried through systematically at his own cost, charging those who benefited a small percentage on his large capital outlay. In forestry, in developing his coalfields, in exploring mineral possibilities, the Duke's active brain was as busily employed as in facing up to agricultural problems. What would he think of the latter to-day?

But even there his interests did not cease. He spent energy and money endeavouring to make Troon the principal port on the Firth of Clyde. He was agitated over the design of ships in the Navy, and, in practical fashion, backed up the ideas of Captain William Symonds (afterwards Rear-Admiral Sir William Symonds), on naval construction. "If I had the misfortune to be a king," said he, "I would have no ship in my fleet that could not sail well; but certainly none that was dangerous, as all the present race of 10-gun brigs is." So he built the Pantaloon, after experiments on models, vowing that if she was dangerous he would burn her. She cost £5,783, was pitted against the fleet, arousing "admiration and astonishment," and the last generation of Great Britain's sailing-ship navy became, in face of much opposition, Symonds's creation as Surveyor of the Navy.

The revolutionary designer, however, had not the foresight of his patron when it came to ships of steam, and when the Duke was agitated concerning the progress being made in steamships in the French Navy, Symonds considered a vessel built of iron totally unfit for purposes of war, and a steam-driven ship dangerous because the fire from her funnels might ignite loose powder on her decks, while if a shot hit her "steam-chest" the whole crew would be scalded to death.

From winning the Derby (in 1719 with Tiresias) to arranging for experiments to stop wood from the ravages of dry rot, nothing seems to have been beneath the notice of this very remarkable man, and Professor Turberville is to be congratulated on doing him justice in the record of Welbeck and its owners.

Welbeck came into possession of the Bentinck family through the marriage of the second Duke with Margaret Cavendish-Holles-Harley in 1734, and improvements to the exterior and grounds took place during the life of the third Duke, who employed Humphry Repton to execute them.

But the most amazing work was that put in hand by the fifth Duke of Portland, a recluse around whose name Professor Turberville warns his readers a mass of foolish legend has grown. He constructed an immense riding house, only exceeded in size by one at Moscow, excavated the vast Welbeck tunnels and underground chambers, one of them 160ft. long and 63ft. wide intended as a chapel, and now used as a picture gallery and occasionally as a ballroom. At the time of his death the Duke was engaged on vaster excavations for a series of rooms in the space now utilised as a sunk garden. Both above ground and below the work seems to have gone on for years, employing an army of labourers and with the expenditure of prodigious sums of money. The Duke's dug-outs were in advance of his time! R. N. R.

A CORNER OF A SITTING ROOM THAT HAS A SIMPLE ELEGANCE AND WILL RETAIN ITS CHARM IN SPITE OF ANY CHANGES IN FASHION OR STYLE

FASHION AND STYLE IN LIGHT

By A. B. READ, A.R.C.A.

IT seems impossible to determine whether fashion changes because there is any demand for change, or whether interest in everything that is new has been exploited to keep the wheels of commerce turning. In women's clothes fashion changes from week to week, almost from day to day, and in some cases from hour to hour. While on the one hand there seems to be this urge to use and wear and surround ourselves with things that are new, there remains on the other the solid comfort and enjoyment that is given by well-designed buildings and well-designed pieces of furniture and equipment that were made hundreds of years ago, and are still as satisfactory in appearance and use as they were when they were first made. As far as one can judge there has always been respect for age and an admiration for youth, and it may be that however good a style, a tradition, or an art may be, there is a continual urge for development or change that keeps us looking forward rather than back.

It is interesting to think about this evolution in every piece of design whether it be clothes, household equipment or furniture, or even the things that we use in the way of mechanical equipment like the telephone or the motor car. However fine design may be at any one stage of its development it looks odd and queer and quite often funny as the years pass, and it, therefore, seems impossible to fix a standard of design or to come to any finality in the design of anything.

Logically one would expect that having built a house exactly as we wanted it, complete with its furnishings and equipment, we could settle down and feel that here was perfection. Almost invariably, however, we continue to be interested in new ideas, fascinated by new facilities that scientific research and experiment provide and brought to our notice by powerful and persistent advertising. To the old house in the country is offered the benefits that the telephone or electricity or the motor car would seem to provide, and with life as we are almost forced to live it to-day it is impossible to be separated from the benefits or consequences of invention or from the trends of design whether they be logical or merely frivolous.

Because of this interest, whether it be natural or forced on us by circumstances outside our control, industry is continually placing in the hands of the designer and the manufacturer opportunities that have been withheld until the present time. Not only is electricity itself of comparatively modern invention and development, but the methods by which it is introduced for the lighting of our homes is not only changing now but will continue to change in ways that it is impossible to foresee. We have come to regard the ordinary tungsten bulb lamps as being normal and permanent since they have been in constant use for many years, but even now lighting from gaseous discharge tubes with lower current consumption and more efficient light output are being used in large stores for general lighting and the lighting of showcases. Within a short time lighting on these lines with its economies and its truer colour values will undoubtedly be used in some modified form for home lighting.

Indirect lighting has made it possible to bathe wall and ceiling surfaces of rooms with light, but it is possible that in years to come light will in fact be provided from luminous surfaces rather than from concentrated sources of light like the lamps we use to-day.

These, however, are fundamental changes, while perhaps more important and more obvious are the changes in the actual style of interior furnishings. There was, and still is to some extent, an off-white vogue. As a reaction against over-decoration and Victorian embellishment and fussiness, the off-white fashion was a relief and a success. It provided simple, clean, airy and well-lighted rooms that seemed gay and sparkling after the heaviness of fake period or left-over Victorian interiors. As a background for lighting it was ideal, and under its influence lighting fittings and lamps gained new interest, utilising to the full the possibilities for reflection that white or off-white walls and ceilings provide. Pottery lost its patterns and glazes were ivory or plain brilliant colours. Chairs and settees lost all their constructive lines and became architectural, very heavily upholstered with square, heavy, straight sides and low backs. If mirrors were used they covered whole walls or sections of walls, and had plain polished edges and simple fixings. Fabrics for curtains and furniture became plain or extremely simple in design, either to match or to contrast with their simple setting.

This simplification was justified on the grounds of functionism, but undoubtedly in the desire to give every piece of fabric, furniture and every piece of table-ware a simple form and an absence of other interest, the real beauty of construction and gaiety of decoration was lost and now there is a return to refinement and a certain elegance. Chairs begin to show curves that are no less functional and are more graceful and are upholstered with fabrics that, while not being traditional, have nevertheless a romantic appeal. Porcelain and pottery have regained a little of their daintiness and have become less crude.

The only conclusion that one can arrive at is that in a changing world and with conditions of life that are far from settled, we should benefit as much as we can from the thrill and interest that modern invention and production provide. After all, in Victorian times the choice of a dress was discussed for weeks, and when it was made was treasured and worn perhaps for years, while to-day clothes are bought for a season or perhaps for a single occasion, and in the same way too, it is rare that anyone can settle down with the idea of living in one house for a lifetime. Under these conditions it would be folly to buy furniture and furnishings that were made to outlast their usefulness, and it is wiser to furnish and light our homes in ways that will not make a change within a few years a matter of too great importance owing to drastic rearrangement, redecoration and its accompanying expense. Lighting can be varied in many easy ways, and new shades on old lamps, even new lighting fittings, are a small item of expense every few years.

It is sometimes difficult to choose wisely and equip our houses or flats with lighting that is interesting and up to date, without being just modernistic and fashionable. Whatever may be the contemporary vogue it should always be possible to choose materials, furniture or lighting ideas that we can live with happily for a number of years without feeling that they are out of date.

HORTICULTURAL ADVICE

Fuchsias Are Again Popular

By CARTHEW ALLERDYCE

IT is curious the way plants have their ups and downs; how they suddenly increase in popularity and then seem to fade into oblivion. It is fashionable to grow this plant or that plant: I often wonder who sets the fashion in the first place. I could not help thinking this when at the Chelsea Show this year, for it seemed to me that there were nearly three times the number of orchids shown than ever before. Orchids are coming back into fashion, I was told.

People are certainly taking a greater interest in fuchsias than they have for years, not only those to grow out of doors, but the types that look most attractive in rock gardens and those which are so decorative when grown in pots under glass.

Under glass the keen fuchsia grower has the opportunity of growing his plants in all kinds of forms; the commonest perhaps is what is known as the pyramid, though in a small glasshouse the bush form will perhaps be the most useful. There are some varieties that are very suitable for planting in hanging baskets, while it is possible to train them so as to clothe a back wall or so as to cover a pillar and provide colour along the rafters of the glasshouse. Two good varieties for pillars and rafters are the Shah and Mrs. Todman.

A nurseryman who has specialised in fuchsias is Mr. H. A. Brown, of 20, Chingford Mount Road, South Chingford, London, E. 4. He was one of the founders of the Fuchsia Society. I understand he has since become a missionary and his business is being ably carried on by his father. (The Hon. Secretary of the National Fuchsia Society is Mr. W. W. Whiteman, Abbots Lodge, Sandhurst, Gloucester.)

Other nurserymen who offer fuchsias for sale are Messrs. Cole & Co., of Peterborough; Mr. F. H. Hughes, of Westfield Nurseries, Hollywood, Birmingham; Mr. J. H. Dalrymple, The Nurseries, Bartley, Southampton; Messrs. Oliver & Hunter, of Monavie, Dumfriesshire; Mr. James Slaney, The Nurseries, Lynn, Lichfield; and Mr. L. A. Jones, of The Nurseries, Shirley Road, Acocks Green, Birmingham.

It is always difficult to draw out a select list from the wealth of variety, and this is particularly true of fuchsias. The following, however, have all received an Award of Merit or a Highly Commended from the Royal Horticultural Society: Mrs. Marshall, which has a rosy-cerise corolla and creamy-waxy tube; Masterpiece, large magenta corolla and sepals of scarlet-cerise, turned right back; Marinka, with a rosy-scarlet corolla and crimson-scarlet sepals—it is a very free flowerer; Fascination, with a rosy-pink corolla, bright red tube and sepals; Display, a rosy-carmine corolla, tube and sepals rosy-cerise—free flowering; Ballet Girl, white corolla veined with cerise, tube and petals cerise; and Rose of Castille Improved (which must not be confused with the old Rose of Castille), a violet-purple corolla, flesh-coloured sepals and really large flowers.

Those who intend to work up a stock should root cuttings either in September or the spring. The advantage of rooting cuttings in September is that much larger plants are produced by the late spring of the following year. September cuttings always make better plants in the long run than those rooted in the spring. Those who suggest that September cuttings are not easy to strike should try using "Hortomone A;" when cutting striking becomes almost child's play.

It is usual to insert the young shoots singly into small pots of sandy soil at a temperature of about 70° Fahr. As soon as the cuttings are rooted they may be potted on into clean 3in. pots, using the following compost: Ten parts by bulk of medium loam, five parts by bulk of good moss-peat, and three parts by bulk of coarse sand, adding to each bushel of this mixture 1½oz. of hoof and horn meal, 1½oz. of superphosphate of lime, ½oz. sulphate of potash, and 1oz. of ground limestone or chalk.

There is no need for fuchsias to be grown in heat, and, in fact, they will do best in the cool dry part of the greenhouse from October to March, when at this time they may be put into a shadier position. There is no need to water heavily, and, in fact, fuchsias never need soaking except perhaps during the hot summer months, and they may be outside.

Those who want to grow bushy plants should pinch out the points of the growing shoots in the spring while, in the case of pyramid plants, the main shoot is taken on, while the side growths are pinched back to the second pair of leaves. Training should always begin directly the plants have had their first potting, and, in fact, it is at this time that the decision will have to be made whether the plant is to be a bush, standard, climber and so on!

As grey dusk darkens into night, see that a CRAWFORD'S is within an elbow's distance. Such painful recollections as that point-blank miss will then become but trivial thoughts, unworthy of brooding. Yours have not escaped the charm of this rare mellowness . . . . . this warmth aglow with friendliness . . . . .

"SPECIAL RESERVE" and "FIVE STAR" VERY OLD LIQUEUR ...a whisky for special occasions.

. . . . such kindly age . . . .

A & A. CRAWFORD — LEITH, SCOTLAND.

A Natural Drive Made Durable

Gravel and stone surfaces can retain their natural charm whilst preserving a clean, well-kept appearance, without attention, year in and year out. COLDCOAT waterproofs and binds such surfaces so securely that they resist not only the effects of sun, rain, snow and frost, but the severe wear of traffic also.

"THE MODERN METHOD OF DRIVE & PATH MAINTENANCE"

is the title of an interesting booklet on the subject. May we send you a free copy? Ask for publication K 154.

Mr Can't: 'How I envy you your hearty appetite!'

Mr Can: 'What you should envy is my morning **Eno's***!'*

Do you enjoy eating? If not, it is a sure sign that you are unwell. Healthy people have hearty appetites. They *look forward* to their meals. So should you! Take Eno's 'Fruit Salt' every morning—and you'll ensure a good digestion and a healthful system. Eno's is good for you—the daily preventive of constipation that is pure, safe and invigorating. Do not neglect so simple and yet important a rule of life — take Eno's, and be hearty, healthy Mr Can. Get a bottle today.

Eno's 'Fruit Salt'

- The words 'Eno' and 'Fruit Salt' are registered trademarks
- Eno's costs only 1/6 and (double quantity) 2/6 at all chemists

For WIDER HORIZONS

This BISTEL Telescope gives powerful magnification and perfect definition, yet is extremely light and compact. You will find the BISTEL invaluable when shooting, yachting, cruising or mountaineering; carry it with you on all open-air or holiday occasions.

THE BISTEL TELESCOPE **PRICE £5**

is easily carried and focused with simple precision. Length closed, 10 in.; extended, 16 in. On firing points shows .22 shot holes at 100 yds. Sliding dew shade. Finished black waterproof material.

HEALTHIER MOTORING

Enjoy health-giving fresh air by motoring in Tickford Coachwork. The pleasure of touring is doubled. The Tickford Drop-Head Coupes and Four-Door Cabriolets are built up in electrically welded steel framework, giving lightness and great strength, and the ease with which these are opened and closed is not found in any other Coachwork of this type. The hoods are fully lined as in a Saloon, no framework being visible. Tickford Bodies are the result of over 20 years' specialisation in Open-Closed Coachwork in which are incorporated patents giving the maximum ease of opening and closing, with complete protection from wind and rain in rough weather. No other Coachwork of this type can give you these same advantages. Thousands are in daily use giving absolute satisfaction. Tickford Coachwork is included in the Models of the Armstrong-Siddeley, Daimler, Hillman, M.G., and Rover Cars. Descriptive specification with pleasure from the Patentees:

"IT CANNOT BE GAINSAID THAT THE CROSSING GATE IS AN ANTIQUATED CONTRAPTION AND, IN THIS AGE, IS DANGEROUS"

ABOLISH THE LEVEL CROSSING

An Archaic Arrangement Which Should Not Be Tolerated

By CAPTAIN SIR MALCOLM CAMPBELL
(*First to achieve 300 m.p.h. on land, and holder of the Water Speed Record*)
(Motoring Editor to the "Field")

WE motorists are occasionally lifted from our despondency over the sad state of British roads when—with a blare of publicity which would sometimes do credit to the inauguration of a new trunk road system—some stretch of new highway is declared open by the local dignitary, with the assistance of a Ministry of Transport official. Despite the fact that these grand openings are all too infrequent, they do hold out a little hope and prove that here and there in England some half-hearted effort is being made to keep in step with the march of transport progress. Even the most soured critic must confess that now and again we witness an improvement in traffic control, or perhaps, a corner that has long been a death trap has been neatly "ironed-out." There is no denying that we do see advances, but one of the old bugbears of the driver stands aloof from all this.

I am referring now to the hundreds of level crossings which are dotted all over the countryside, upsetting the traffic in the towns and complicating life in the cities. Why they should remain unaltered when other things change for the better has always mystified me. It cannot be gainsaid that the crossing gate is an antiquated contraption and, in this age, is dangerous. It is inadequately illuminated at night and badly controlled by day. Not only does it waste time, but it creates traffic congestion, and congested traffic often breeds danger.

There are crossings which have not been improved for years, and although Captain Hudson as Parliamentary Secretary to the Ministry of Transport, told the House of Commons that he hoped the abolition of crossings could be expedited, he admitted at the same time that there had been no abolitions at all for five years.

The Select Committee of the House of Lords, when reporting on the prevention of road accidents, saw the need for alteration when they recommended that "all level crossings on main roads should be bridged or tunnelled." Although we have these two expressions of hope, I doubt whether we shall see any drastic move directed at the crossings yet, because, apparently, the local authorities are not anxious to approve the removal of these obstacles to road traffic, and, unfortunately, the matter rests largely with them.

The lethargy of local administrations is difficult to understand in this instance, since the Government are prepared to meet no less than 75 per cent. of the total cost.

It is not only the rural councils which are to blame either, for in the Metropolitan area there are more than 100 crossings. The unconscionable delay caused to both pedestrians and vehicular traffic is surely appreciated by the authorities in the London district, yet, apart from a recent decision to abolish six crossings on the L.N.E.R. line because of the extension of the Central London electric line and promises to remove one or two others in the future, the number of level crossings in the area will still exceed the century!

I have before me some figures showing the length of time some of these crossings are closed during the normal day, and they prove conclusively that time wastage is colossal. Quite often level crossings put the bar up to road traffic for more than half the time they are open, while, in one case, it is reported that the gates are closed across the road longer than they are open. Where there is a frequent train service, therefore, there is nearly always a 50–50 chance that the motorist will find the road blocked and he is forced to wait many minutes before the gates are opened. Even then he is obliged, because of narrow roads and delayed traffic from the opposite direction, to keep behind a slow moving line of traffic which is hampered by straying pedestrians also anxious to get across, so that the time of the actual delay is considerably more than the wait at the crossing.

Some level crossings are worse offenders than others, because of the density of traffic upon the line and sometimes because of the manner in which they are opened and closed. In some districts it is nothing to wait from ten to fifteen minutes before getting across. There is, for instance, one near my home in Surrey, where I have quite often been forced to spend something like a quarter of an hour.

I know of another in Essex, which is the bane of holiday-makers and trippers at the week-ends. On Saturdays and Sundays much traffic has to cross the main Southend–London line at this point. The net result is that there is a lengthy line of cars queueing up on the twisting road leading to the crossing, and if a motorist happens to be near the end of that line, the chances are that there will be two openings of the gates before he is able to get across. On one side of the crossing there is a sharp bend, so that quite often only single-line traffic is possible. Indeed, such a sorry state of affairs exist that it becomes a matter for congratulation if anyone is fortunate enough to traverse the lines without having to wait.

I know that in the open country few of us object to being held up for a few minutes to allow trains to pass, but in the cities and in busy areas it becomes a different question, especially when—as in Acton—there are two level crossings with not much more than 100yds. separating them and both tracks carrying frequent and regular main-line services.

It is a pity that the Ministry of Transport cannot bring more coercive action to bear upon the local authorities, who complacently watch matters grow from bad to worse as the numbers of cars upon our roads increase. Bridging and tunnelling does not entail great difficulty, and although it is expensive, the Government, after all, are prepared to meet three-quarters of the cost. It is difficult to understand why local authorities do not register more enthusiasm in getting the matter adjusted, because many motorists adopt alternative routes if they know the location of a crossing, while local resident drivers have their own "patent" ways, so that the by-roads not originally designed to carry heavy traffic have far more than their fair share. Because of the nature of these secondary roads accidents are more liable to occur and because the surfacing is obviously never so good as that of the main road, I imagine repair bills over a lengthy period would go a fair way to meeting the one-quarter of the initial cost which the local councils are called upon to pay.

In America the problem of crossings is of a greater magnitude than our own, but there intelligent steps are being taken to eliminate as many as possible and to improve the remainder. For instance, in the state of Illinois there are more than 18,000 grade crossings, as they are called, and with this huge total goes a record of crossing accidents higher than that of any other state. But Illinois is overcoming her obstacles with commendable foresight.

Approximately $30,000,000 have been expended in bridging and tunnelling some 400 crossings, while $1,000,000 has been spent upon improving conditions at 350 others on more lightly travelled roads. In view of the unusual number of crossings in the state and the number of accidents which accompanies them, Illinois have a "Bureau of Grade Separation," which was created in 1936, and which handles all problems connected with railway–highway intersections. This Bureau works in close co-operation with local authorities and with the state Commerce Commission, and can claim excellent results over the three years of its establishment.

I believe that a similar bureau might be formed within the Ministry of Transport, and should specialise and concentrate solely upon the improvement of British crossing conditions. Such a body could maintain constant touch with the authorities in whose districts level crossings exist and with the railway companies. I feel that properly managed, such a bureau would succeed in convincing the local administrations that railway crossings are a liability to all road users, but more particularly a liability and a source of inconvenience and annoyance to the inhabitants of their own particular area.

SIMPLER CONTROL: IS IT NEEDED?

Human Touch at Brooklands

SUPPOSE, just suppose, that you could control your car from a standstill up to full speed by the operation of a single pedal or lever; and that this full range single control included braking effects of every variety and worked with a smoothness, response and slickness that you had never encountered before. What would your reaction be?

Most drivers, I think, would answer that a car fitted with this imaginary single control would be dull in action. They would point out that the manipulation of the gear lever, clutch and brake pedals gives them a certain satisfaction, especially when they perform these operations with due *finesse*. On the other hand there are probably quite a lot of drivers who never instinctively think about the details of driving and prefer to devote their minds to conversation with their passengers or enjoyment of the scenery. What would their view be of a car with simplified control?

Slowly, although we may not recognise the steps that lead us in this direction, we are coming to simpler control. At one time no carburettor would function properly without the aid of levers to control the mixture when starting and when warm. But to-day the technicians have overcome all that, and the latest carburettors provide suitable mixture from the moment you press the starter switch up through the full range of speed without any tinkering with taps on your part.

The same simplification has come about in ignition control, for how often to-day do we find a car with a hand control for the advance and control of the spark? This operation is done automatically, and well done too.

Take even the question of gear changing. When Armstrong Siddeley pioneered the self-changing gear, Vauxhall's the synchromesh, and Daimler the fluid flywheel, the art of gear changing as it was then was obviously doomed. True, for a few years the knowing ones who could snick-a-snack a gear in and out in a difficult box tried to pooh pooh the new simplification with the narrow angle argument that it took all the fun out of driving. They forgot, perhaps, that what was fun to them, i.e., being able to change speed well, was hell to others who never could rely on making a decent change.

To-day any fool can change speed decently. But the expert will change speed better still. And the progress of the car when driven by an expert will be entirely devoid of sound or shock. You will feel perhaps a surge of acceleration or the effects of retardation, but there will be no jumpiness in the sensation. And if that sort of travelling is once accepted as the ideal, what argument is left against a single unit control which produces the same effects, but without the need for an expert driver's deftness?

Personally, as a motorist who uses a car a great deal as a means of getting from A to B, which are often hundreds of miles apart, as quickly, safely and comfortably as possible, I should welcome any simplification in driving. I do not like bending forward to change gear with my left hand. I would much rather have the lever just under the steering wheel where I could flick it about with a finger and thumb. I dislike all this dip and switch business at night. The whole thing to my mind is a risky proceeding, and the solution of this dazzle problem is the most urgent of all. It may seem absurd, but even the rigmarole of stopping and re-starting, as for instance when shopping, is irksome. There is so much to do. First you put the gear into neutral, then you switch off, and then apply the hand brake. On re-entering you reverse the routine with the addition of pressing the starter and jiggling the accelerator. Some cars I know eliminate an item or two from this drill, but most conform to it.

In the phantom car of the future perhaps the operation of a single lever will stop it and lock it. Who knows?

And now to turn to a new subject, to wit, Brooklands. Some weeks ago I wrote on the subject of making motor sport more human. And at Brooklands the other day there was a first-class example of what I had in mind. A race for veteran cars was staged as a novelty. Some of them only had three wheels, and some so little power that they had to be assisted up the hill by pedalling or by being pushed by their passengers. Result: the crowd hooted with delight, for the very first time as my friend, Percy Bradley, clerk to the course, who was standing beside me, had to confess.

Another very human touch, it seemed to me, was to see a demure slip of a girl Miss D. Stanley-Turner, drive her supercharged 750 c.c. M.G. round that track with the fire, determination and skill of the hardest boiled speed ace. But how many of the crowd on the hillside, sucking their ices or draining their ginger pop, realised or even saw for more than a few seconds this feminine David struggling with the Goliaths of the track?

A network of loud-speakers attempted to tell us something about the racing, but waged a ding-dong battle with the staccatto exhausts of the racing cars and the constant screaming of the vendors of ice-creams and evening papers. But even the loud speakers could have told us more. For instance a little human information about the drivers themselves if this could not be included in the programme itself, would have been acceptable and interesting. Comments on the cars and on their behaviour in the race. For instance what was the trouble with Chris Staniland's Multi-Union, or a bit of inside information about Maclure's astonishing win at 122 m.p.h. on a 1½ litre Riley. The two great green Lagonda single-seaters, fresh from Le Mans, running round in formation at 120 to 130 m.p.h., aroused the interest of the crowd, who probably would have liked to hear more about them.

And standing among these people looking down towards the new cut in the hillside I noted that all that most of them could see was the tops of the drivers' helmets. The cars themselves were invisible. Yet here was a natural grandstand, formed by the slope of the hill, which with a little scheming, I should have thought, would have provided a full view of the cars along this most exciting stretch.

Another point, the course of each race is described at the heading of each list of entries. But as at each meeting there must be many new-comers ignorant of the geography and terms used to denote Brooklands features, it might be well to include in the programme a plan of the track or maps of the various circuits used with references showing the best vantage points to take up for the different events. One semi-aeroplane photograph was the only thing of this sort I saw at the back of the members' hill.

It was a grand idea to let us all see Major Gardner's 200 m.p.h. M.G. As it circled the track it looked for all the world like a dark green shadow, so flat was it to the ground. But I could not help thinking, that although we had been told that it would only perform a modest 80, many of the spectators would put down the slipping of its control to some sort of misbehaviour. But perhaps the loud-speakers explained all that and I did not hear them.

For Chris Staniland's track record attempt I took up a position on the inner road which leads from the paddock to the Flying Club. For here just before the car reaches the Vickers' sheds you get a magnificent idea of speed at close quarters. Though missing on one of its cylinders, this lovely-looking racing car lapped at 140 m.p.h.

On the general topic of making motor sport more attractive to the public I am not at all sure that the future may not lie in making a meeting a mechanical combination of a horse show and a speed event. Of one thing I am certain, and that is that variety is the secret of a good afternoon's sport. Purists for speed may look askance at the introduction of circus turns, but I warrant that if a team of Chrysler death drivers were given a couple of events in which to show off their tricks and the stunts were well advertised, the attendance figures would show a welcome uplift.

W. G. McMINNIES.

A DAIMLER RITZ SALOON IN THE ISLE OF SKYE. IN THE BACKGROUND, COVERED IN MIST, ARE THE 3309 FEET CUILLIN

THE VAUXHALL PROGRAMME.—During the last few years Vauxhall Motors have spent several million pounds upon extending their factory, and installing the latest machinery and equipment. They have strengthened their "brain power" by recruiting engineers of international reputation—and given them a £175,000 research building in which to work. The results of this long-term policy are apparent in the latest announcement that, for 1940, the Vauxhall range has been improved in appearance and quality—while at the same time all prices have been considerably reduced.

A SCENE WITHOUT PARALLEL
White sails on the waters of the Clyde, with its lovely background of hills

WHEN THE HEART TURNS TO THE HIGHLANDS

By EDWARD GRACE

As the months are slowly passing in a pageant of striking contrasts, the summer in the Highlands of Scotland is now reaching its climax. August and the beginning of September sees the fulfilment of all the long days of brilliant sunshine.

The scenery is painted in ever-changing colours by the bright sunbeams and swiftly passing shadows which drift over mountain and valley beneath the fleecy clouds. The time has once more come when the early morning mists spread lightly over the lochs and hills like the first messengers of autumn; the migration of sportsmen from the south has taken place; and most important of all, the heather is in bloom, covering the mountains and hills in exquisite tints of purple.

Travellers can see this Highland pageant at its best by sailing on the Clyde, or by steaming up the lochs which stretch from the sea far into the mountains of Argyll. Every day the steamers pass down the wide river up Loch Long to Arrochar; through the Kyles of Bute to Inveraray by Loch Fyne; or across the open sea to Arran, that wild island where the great rugged peaks of Goatfell and Ben Tarsoinn cast deep shadows on the valleys below. All day the seagulls follow the ships, crying harshly, and wheeling down for food into the white foam in the wake.

But what a contrast to these open shores are the inland mountains and moors. Go to the Black Mount and Rannoch Moor, for instance, and you will find a stretch of the most desolate and forsaken country in Europe. For miles in all directions there is nothing to be seen but endless bog, bright green moss and stagnant water that is black as pitch. There is no movement over this dreary landscape even when the wind is blowing, for trees are non-existent. Not even the birds fly over the dark pools, or break the utter silence with their cries. It would seem that the four seasons also have left the lonely wastes unvisited, for the only change seems to be the white covering of snow in winter, which lasts until the rain once more sweeps over the oozing bog.

It was on such a stormy day as this that I drove with three passengers over the only road to cross the moor. In driving rain we climbed up the long hill to the top of Black Mount, and shuddered as we approached the entrance to Glencoe. Looking downwards into the dark valley we seemed to be entering some awful chasm, bounded by the great walls of black rock which lost themselves in the heavy clouds sweeping inland from the sea. Slowly we descended into the midst of these great mountains whose summits we could only imagine.

Occasionally a gap would appear in the clouds, revealing huge boulders high above, which seemed to be drifting with the wind silently across the angry sky. One might already imagine drifts of snow swirling madly in between the rugged glens, and covering the overhanging crags with a mantle of white.

In the heart of the glen, hardly noticeable beneath the surrounding mountains, there stands a lonely white farm cottage on the site of the great massacre of 1692. It was here that we were to stay for the coming week, while the car was to be garaged in an adjacent cattleshed, to the bewilderment of the resident cows. There was barely room for the little white farm and the cowsheds between the rocky sides of Bidean nam Bian and the river Coe which dashed its way over the stones and waterfalls into Loch Leven several miles below.

Each day we spent motoring through Highland roads before returning to the ever-changing but always terrifying grandeur of the Glen of Weeping. The only road or pass to the north winds down to the beautiful shores of Ballahulish and then turns inland again to follow the steep banks of Loch Leven. We followed this road for a hundred miles as it led through Fort William, nestling beneath the clouds which surrounded Ben Nevis, up the Caledonian Canal to Loch Ness and Inverness.

After the grey rain clouds of Glencoe, the country round Loch Ness seemed once more to be enjoying the warmth of summer. The hills were gentle and tinted with silver as the sun shone on the moisture from passing showers. The waters of the loch itself were a glorious deep blue against which the fresh green woods stirred in the breeze.

The next day we brought the car down the narrow track leading for miles through Glen Etive to the beautiful loch of that name. The best speed that one can travel on such a road as this is anything between five and ten miles per hour. One has to steer between endless potholes and round innumerable blind corners as the road winds between the rocks and mountains. There is just room for the four wheels of one car to be on the road at a time. Occasionally a wider space has been made on one side which will just allow two cars to pass. But the glen is so deserted and utterly lonely that in a whole day we only met one other car which was loaded with fishing rods, and whose driver cheerfully backed a hundred yards to let us pass.

The scenery for countless miles was unbelievably magnificent. A drenching rain and heavy clouds obscured the mountains for part of the day, but one does not have to see their summits to realise the wild beauty and strength of the Highlands. The secret of this rugged country is not the height of the hills above sea level, but the awful grandeur of the rocks, crags and glens that make homes for no one but stags and eagles; the winding burns that find their way between the rocks and heather; the countless waterfalls and cascades that come dashing down the clefts in the mountains' scarred sides.

When the rains are swept away by the wind, new colours appear as the sun paints the dripping heather in delicate hues, and the sombre rocks are spanned by rainbows adding reds and blues to their dark unchanging brown. Soon white billowy clouds come drifting in from the distant sea to play round the tops of the mountains and dazzle the sky with their brightness. When the day draws at length towards evening, deep shadows of fantastic shapes change the valleys to a dark purple which contrasts strangely with the shafts of ruddy light as the setting sun throws a halo round the western hills.

When it was dark the headlights of the car threw a long white beam on to the narrow road. But all round the darkness, which even the stars failed to penetrate, covered the valley and hid the mountains, silent in the passing clouds.

URQUHART CASTLE, LOCH NESS
"The waters of the loch, a glorious deep blue, against which the fresh green woods stirred in the breeze"

CRISIS ON THE EMPIRE AIR ROUTES

By LORD SEMPILL, A.F.C., F.R.Ae.S.
(Aviation Editor of "The Field")

NO recent development in British commercial aviation has been more grave than the decision of Imperial Airways to restrict, for an unspecified period, the booking of passengers on the Empire air routes. The announcement of this step came as a profound shock to many who had seen in contemporary trends welcome evidence of continued forward policy in our civil flying, and who had found room for congratulation in the signs of continued airline expansion, despite the heavy drain on the aircraft industry's resources and the national funds caused by rearmament.

It may at once be admitted that in the peculiar circumstances that have arisen, and in the absence of special Government assistance, no other course appeared open to the Company. The official reasons are the immense increase in mail traffic; a serious shortage of flying stock, aggravated by late deliveries of new machines owing to preoccupation with military production, and by the loss of existing craft through what is termed a "singularly unfortunate" series of accidents; and a lack of trained personnel. These circumstances have combined to produce a state of affairs in which the capacity of the fleet is insufficient to carry both mails and passengers; and since mails have, by agreement with the Government, priority, the inevitable result has been the serious restriction of future passenger bookings for an indefinite period that is expected to last at least until after Christmas.

As to the lateness of deliveries of new types and the difficulty of obtaining trained or semi-trained personnel for the operation of the aircraft, little need be said. The seriousness of the position in regard to the former had become obvious for some time past. The Ensign class of air liner was more than a year late in going into service and was then withdrawn temporarily; it is only just beginning to be used again in the fleet. A sidelight on the position is the fact that other airlines have had to purchase machines from American sources.

The question of personnel has arisen partly through the non-availability of Air Force pilots finishing their term of service, who have formed the chief source of recruitment, and who are now required either in the Service itself or for training.

On the face of it, then, the reasons seem sound for a step that is generally regretted. Given these postulates, no other course of action seems possible. But it is a larger and more important question whether these conditions ought ever to have been allowed to arise.

In the explanation issued regarding the announced restrictions it is stated that it has been the policy of the company to look exclusively to the British industry for its equipment. This does not mean that the industry is to blame for the shortage of machines. There are many indications of enterprise on the part of British aircraft manufacturers, which, had it received more official encouragement and been backed by a more forward policy of construction on the part of the airline operators, would not have left us dependent in such an emergency on foreign equipment. Now it has been urged in these articles before that while it is very desirable that subsidised British lines should employ British machines, the first aim must be the maintenance of the service in the most efficient way with the most efficient equipment, and that the existence of abnormal conditions at home makes the purchase of equipment elsewhere at least excusable. In the case of the concern on which British prestige primarily depends, this need for efficient operation would seem particularly insistent. That mail traffic was growing at a rate that threatened the carrying capacity of the fleet must surely have been foreseen; and in view of the important issues involved, steps might well have been taken earlier to reinforce the flying stock, instead of waiting until a state of crisis was reached. There is no doubt, however, that a Government determined to meet this emergency and preserve British flying prestige could do so by utilising its own resources. The flight to Australia recently by Vickers Wellesley bombers has shown how Empire communications can be maintained by military aircraft, and with little modification this type of aeroplane would serve as a reliable and fast mail-carrying machine until new and efficient civil aircraft now under construction are ready. For it is clear that something much more than a mere inconvenience to intending passengers is concerned in this affair. British airlines have undoubtedly lost considerably in prestige in the past few years, and it was admitted by Captain Balfour, the Under Secretary of State for Air, when speaking in the debate on the British Overseas Airways Corporation Bill, that it would take two or three years yet to remedy the present situation. The whole trend of recent official pronouncements and actions has been to suggest that vigorous efforts were afoot to make up an admitted leeway. This latest development will inevitably go far to cast doubts on the genuineness of the attempt.

Some 1,100 passengers have been carried every month on the Empire air routes, but restrictions on passenger bookings must drive intending passengers to foreign lines; and it is a difficult matter to woo back regular travellers who have grown accustomed to other services.

In a short article, this important question cannot be dealt with in all its many and far-reaching aspects; but one thing is clear: The new Corporation, when it takes over the airways later in the year, will be faced with a very grave problem, for the solution of which the greatest energy and determination will have to be shown if British prestige on the world's airways is to recover from this blow.

THE LONG-DISTANCE RECORD HOLDERS IN FLIGHT

"The flight to Australia recently by Vickers Wellesley bombers has shown how Empire communications can be maintained by military aircraft, and with little modification this type of aeroplane would serve as a reliable and fast mail-carrying machine until new and efficient civil aircraft now under construction are ready"

A FIRST-CLASS MECHANICAL PRODUCTION

THE S.S. JAGUAR "100"

WHEN I took over one of the S.S. Jaguar "100's," the mechanic who brought it to me, and who had not driven one before remarked: "Well, sir, I thought my motor-bike took some beating for thrills, but this is wonderful. She's not like an ordinary car."

As space is limited, I will say little of the appearance of the Jaguar "100." I noticed it was the subject of admiring glances everywhere I took it, and I am not surprised, for to my mind it is the most graceful sports car on the market.

The car has a Le Mans type of two-seater body with quite a respectable space for luggage behind, while the hood, so often a conjuring feat to erect or put away, is well made and well designed. It is possible to put it up before the rain has soaked the occupants so thoroughly as to make a hood more or less superfluous! The seats, I felt, were not above criticism. They were comfortable enough at first, but seemed to give inadequate support to the back.

The arrangement of the dials on the facia board was effective, and both the revolution counter and speedometer were clearly visible, though the fuel gauge on the car I drove was incorrect—a small matter, admittedly, but one which might be extremely irritating. Here my criticism ends. In every other way I felt that I was driving a first-class production.

From the driving position the view, despite a long, sleek bonnet, is really good. The width of the car—5ft. 2in.—seemed rather remarkable, but did not make visibility at all difficult, while it certainly added to the attractive appearance of the car.

The "100" model may be bought on a 3½ litre or a 2½ litre chassis, priced at £445 and £395 respectively. The type I drove was the 3½ litre, which has a six-cylinder unit with bore and stroke of 82 mm. by 110 mm. It has a Treasury rating of 25.01 h.p., making the tax £18 15s. The standard compression ratio is 7.2 to 1, though the car lent to me actually had a slightly higher one, since so many owners have this alteration made.

The four-speed gearbox has synchromesh on second, third and top, and is perfectly simple to operate, though it still leaves plenty of scope for skilful usage. The ratios are first, 12.04; second, 7.06; third, 4.58; top, 3.8.

To drive, the car is superb. It holds the road, as one would expect, like a leech, while the steering is light, but not too light to be positive and thoroughly steady; while the Girling brakes with their 13in. by 1¼in. effective surface give even and rapid braking.

The roads I travelled over were not of the fastest, and I was unable to clock more than 90 m.p.h., though the car was certainly capable of a good deal more than that if given a chance. The times one is able to travel at over 90 m.p.h. on British roads are not many, and probably the rapidity with which that speed is reached is of more value than the speed itself.

When getting away from traffic lights not once did I find even a motor-cycle which could touch me, and that acceleration stands throughout its whole range. I have no space to write more. I can only join with the mechanic in saying: "She's not like an ordinary car."

W. R. J.

BRIDGE

INITIAL NO TRUMP BIDS—III

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

IN the last two articles we have discussed the requirements for initial One, Two and Three No Trumps and the responses to the One No Trump bid. This week we shall consider the rebid by the One No Trump bidder.

If the initial bid is One No Trump and the response is Two No Trumps, the first bidder will only pass if he has the absolute minimum—in other words, a very bare four honour tricks.

If the initial No Trump bidder has a biddable major suit, here is the time to show it. Thus, with ♠ K, Q, 3; ♡ A, Q, 8, 2; ◇ K, J, 2; ♣ K, Q, 6, after partner has raised One No Trump to Two No Trumps, the bid is Three Hearts. If partner has four trumps the hand will probably play better in Four Hearts. If he has not, then he can still bid Three No Trumps with every prospect of success—*e.g.*,

(*a*) ♠ 6, 4, 2; ♡ K, 7, 6, 3; ◇ 9, 3; ♣ A, 9, 8, 7.
(*b*) ♠ 6, 4, 2; ♡ K, 7, 6; ◇ Q, 4, 3; ♡ A, 9, 8, 7.

With hand (*a*) Four Hearts is probably a safer contract than Three No Trumps. With hand (*b*) Three No Trumps has a sporting chance.

If the response to One Trump is Three No Trumps even if the No Trump bidder has a maximum of five honour tricks, he *must* pass because the Three No Trumps bid shows at the most two-and-a-half honour tricks and a poor distribution, or, alternatively a six-card suit headed by Queen or better and one-and-a-half honours.

Of course, hands can be produced which will give slams and will not be bid, but on careful examination it will be seen that most of these slams depend upon lucky leads or incorrect defence.

If the response to the One Trump bid is two in a suit, the initial bidder immediately knows that his partner is bidding on minimum values with a maximum of about one honour trick, and he should accordingly be careful as to his next bid. Game is only likely if the No Trump bidder has a maximum of about five honour tricks and strong support for the responder's suit. The rebid will be two No Trumps with

(*a*) Four-and-a-half honour tricks or more and all unbid suits stopped

♠ K, Q, 2; ♡ A, Q, 3; ◇ Q, 9, 8, 7; ♣ A, K, 3.
Partner having bid Two Diamonds.

(*b*) Four honour tricks and at least eight honour cards with all unbid suits stopped

♠ K, 8, 2; ♡ A, K, 10; ◇ Q, J, 7; ♣ A, 10, 8, 7.
Partner having bid Two Spades.

(*c*) Strong support for partner's suit

♠ A, J, 3; ♡ K, J, 7; ◇ K, 4, 3, 2; ♣ A, Q, 10
Partner having bid two hearts or two spades.

If holding a biddable suit which can be shown at the two level this may be bid if the opening bidder has any additional values. Thus with

♠ A, Q, 3, 2; ♡ K, 8, 7; ◇ K, Q, 3; ♣ A, Q, 9.

Two Spades can be bid over any call of two in a suit.

With any hands weaker than the above the No Trump bidder should pass.

The raise of partner's suit should be given holding A, K, x or A, Q, x of the suit and all suits stopped; or, alternatively, at least four-and-a-half honour tricks if any suit is weak—*e.g.*, raise two hearts with

♠ K, J, 3; ♡ A, K, 2; ◇ K, 10, 2; ♣ Q, J, 3,

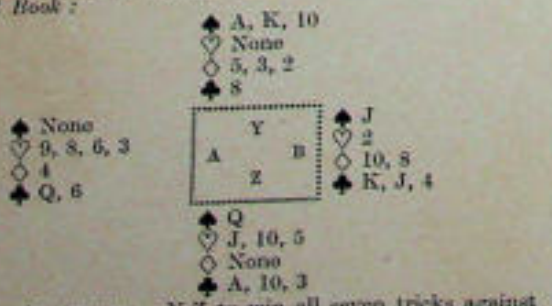
but not with

♠ K, Q, 3; ♡ A, Q, 2; ◇ 8, 6, 2; ♣ A, Q, 3,

since three diamonds will probably be lost straight away.

Alternatively, with four-and-a-half or more honour tricks the opener may raise a major suit with four cards in the suit. In this case his trump support is sufficient to bid four in the major suit if the responder should have a six-card suit and try for Three No Trumps.

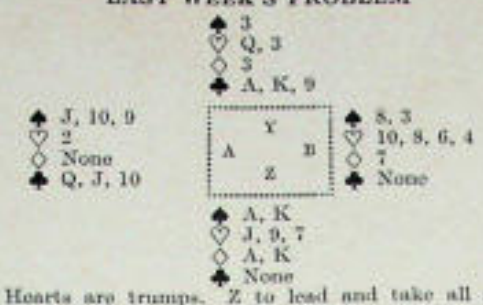
If the responder has forced with a suit bid of three, the rebid should be Four No Trumps, holding the maximum or nearly the maximum of five honour tricks.



If the responder forces in a minor suit a raise should be given if two of the three top honours are held. If a biddable major suit is held this should be shown first.

If the force is in hearts a biddable spade suit should be shown. The trump suit may be raised holding four trumps or three, including the two top honours.

In all other cases the rebid will be Three No Trumps.



THIS WEEK'S PROBLEM

The following problem is taken from Culbertson's *Red Book*:

Spades trumps. Y-Z to win all seven tricks against any defence by A-B.

LAST WEEK'S PROBLEM

Hearts are trumps. Z to lead and take all seven tricks against any defence by A-B.

SOLUTION

Z leads the Ace and King of Spades, discards the 3 of Diamonds from dummy and ruffs the Ace of Diamonds with the 3 of Hearts. A Club is then ruffed by Z and the King of Diamonds ruffed with the Queen of Hearts, and Z must take the last two tricks.

CHESS

CONGRESS AT BOURNEMOUTH

THIS congress came to its conclusion on Friday, August 25th. The Premier Tournament resulted in the victory of Dr. M. Euwe, the Dutch champion, who went through the contest without defeat and scored nine points out of eleven. The second and third prizes were shared by E. Klein (Austria), who also was undefeated, and S. Flohr (Czecho-Slovakia). If Flohr had won his game in the last round—against König—he would have tied with Dr. Euwe. The fourth prize was shared by I. König (Jugoslavia) and Dr. Landau (Holland).

The British Ladies' Championship Tournament was won by Miss Elaine Saunders, who did not lose a game and made the fine score of ten points out of eleven. The wide margin of two points separated her from her nearest rival. This is a really remarkable performance, for Miss Saunders is only thirteen years of age. We offer her our hearty congratulations.

The following table shows the results of all the games in the Premier Tournament. The game between Dr. Euwe and Dr. Landau in the last round was not played, as they decided to return home in view of the dangerous international situation.

	Euwe	Flohr	Klein	König	Landau	Conde	Aitken	Wallis	Thomas	Mieses	Kitto	Abrahams	Total
Dr. Euwe	—	1	1	1	1	1	1	1	1	1	1	1	12
S. Flohr	0	—	1	1	1	1	1	1	1	1	1	1	11
E. Klein	0	0	—	1	1	1	1	1	1	1	1	1	10
I. König	0	0	0	—	1	1	1	1	1	0	1	1	9
Dr. Landau	0	0	0	0	—	1	1	1	0	1	1	1	9
A. G. Conde	0	0	0	0	0	—	½	0	1	1	1	1	5½
J. M. Aitken	0	0	0	0	½	½	—	1	0	1	1	1	5½
P. N. Wallis	0	0	0	0	0	1	0	—	1	0	1	1	5
A. R. B. Thomas	0	0	0	½	1	0	1	0	—	0	1	1	5½
J. Mieses	0	0	0	1	0	0	1	1	1	—	0	1	5½
F. E. A. Kitto	0	0	0	0	0	0	0	1	0	1	—	1	4
G. Abrahams	0	0	0	0	0	0	0	0	0	0	1	—	1

BRITISH LADIES' CHAMPIONSHIP TOURNAMENT.—The final scores were as follows: Miss E. Saunders 10 points out of 11, Mrs. R. P. Mitchell 8, Miss M. Heaniker-Heaton 7, Miss M. E. Lander and Miss A. B. Pouyard each 5½, Miss A. M. Crum and Miss Rowena Dew each 5, Mrs. D. E. Budge and Miss M. Musgrave each 4½, Miss K. Austin and Mrs. Winser each 4, Miss M. L. Harrison 3. There were four prizes.

MAJOR OPEN TOURNAMENT.—The scores of the prize winners were as follows: (Section A) D. Podhorzer 9½ points out of 11, E. A. Znosko-Borovsky 7, Dr. Fazekas, F. Sämisch and A. Speyer each 6½. Speyer lost two games by default. (Section B) P. C. Head 7 points out of 10, Alfred Eva, D. M. Horne and A. Aird Thomson each 8½.

Five other tournaments were played.

The following game shows a very neat finish by the veteran J. Mieses.

(*Sicilian Defence.*)

WHITE. J. Mieses.	BLACK. Dr. Landau.	WHITE. J. Mieses.	BLACK. Dr. Landau.
1. P to K 4	P to Q B 4	15. P to Q R 3	P takes P (g)
2. Kt to Q B 3	Kt to Q B 3	16. P takes P	Q to K 2
3. P to K Kt 3	P to K Kt 3	17. Q R to Kt sq	P to Kt 3
4. B to Kt 2	B to Kt 2	18. K R to K sq	P to Q R 4 (h)
5. K Kt to K 2	P to K 3	19. P to Q 4	B to K B 3
6. P to Q 3	K Kt to K 2	20. P to Q 5	P to K 4 (i)
7. B to B 4 (a)	Kt to Q 5	21. P to Q 6	Q to K 3
8. Q to Q 2 (b)	Q to R 4	22. Kt to B 4	Q to B 4
9. P to K 5 (c)	KKt to B 3	23. Kt to Q 5	R to K 3 (j)
10. Kt takes Kt	P takes Kt	24. P to Q 7, ch (k)	B takes P
11. Kt to K 2	Q to B 4 (d)	25. Kt to B 7, ch	K to K 2
12. B takes kt	Q P takes B	26. Q R to Q sq	Q R to Q B sq
13. Castles (KR)	B takes P (e)	27. Kt to Q 5, ch	K to K 3 (l)
14. B to B 6	B to Q 2 (f)	28. Kt to K 3 (m)	Resigns.

(*a*) B to K 3 is usually played. The text-move is of doubtful value.
(*b*) If B to Q 6, then Q to Kt 3.
(*c*) This is not a good move.
(*d*) 11. . . . Q takes Q, ch; 12. K takes Q, P to Q 3 (threatening P takes P) would give Black the advantage. To save his Queen's Bishop White would have to play 13. P to K Kt 4.
(*e*) If Castles, then P to Q B 3 followed, if P takes P, by P takes P, or, if B takes P, by B takes B and Kt takes P.
(*f*) P to B 4 is better. White intended to reply with P to Q B 3, K R to K sq and perhaps Q to Kt 5.
(*g*) Mieses is of opinion that, although Castles would be risky, it was probably Black's best move.
(*h*) P to K B 4, to be followed by B to Kt 2, is better.
(*i*) Black has nothing better than Castles.
(*j*) If 23. . . . Castles, then 24. Kt takes B, Q takes Kt; 25. R to Kt 5. If, instead, 23. . . . R to Q B sq, then 24. Kt takes B, Q takes Kt; 25. B to Kt 5, Q to K 3; 26. R takes K P.
(*k*) Much better than Kt to B 7, ch.
(*l*) If 27. . . . K to K sq, then 28. Kt takes B, ch, K to K 2; 29. Q to Q 6, ch, K to Q sq; 30. Q takes B, ch, Q takes Q; 31. R takes Q, mate.
(*m*) Threatening either Q to Q 6, mate or Q takes B, mate. If, now, B to K 2, then Q takes B, ch followed by Kt to Q 5, mate.

A curiosity from the seventh round of the Premier Tournament.

(*Polish Defence.*)

WHITE. Dr. Euwe.	BLACK. G. Abrahams.	WHITE. Dr. Euwe.	BLACK. G. Abrahams.
1. P to Q 4	P to Q Kt 4 (a)	7. Q to Kt 3	Kt to Q B 3 (c)
2. P to K 4	B to Kt 2	8. P takes P (d)	Kt takes P
3. P to K B 3	P to Q B 3	9. Q takes B	R to Kt sq (e)
4. P to Q B 4	P takes P	10. Q tks R P	R to R sq
5. B takes P	P to K 3	11. B to Kt 5, ch	K to K 2 (f)
6. Kt to B 3	P to Q 4 (b)	12. P to Q 6, ch	Resigns (g)

(*a*) The Polish defence. It is of doubtful value and is very rarely seen.
(*b*) Premature. Kt to K B 3 should be played.
(*c*) This turns out very badly, but Black has the inferior game in any case. If 7. . . . P takes B, then 8. Q takes B, Kt to Q 2; 9. Q to B 6.
(*d*) Not 8. Q takes B because then 8. . . . Kt to R 4 wins the Queen. (If 9. B to Kt 5, ch, then 9. . . . K to K 2).
(*e*) If 9. . . . Kt to B 7, ch; 10. K to B sq, Kt takes R, then 11. P takes P, P takes P; 12. Q to B 6, ch and wins.
(*f*) If 11. . . . Kt takes B, then 12. Q takes Kt, ch, Q to Q 2 13. P takes P.
(*g*) If 12. . . . P takes P, then 13. B to Kt 5, ch, Kt or P to B 3; 14. Q to Kt 7, ch and mate next move. If, instead, 12. . . . K to B 3, then 13. P takes P with a winning game for White.

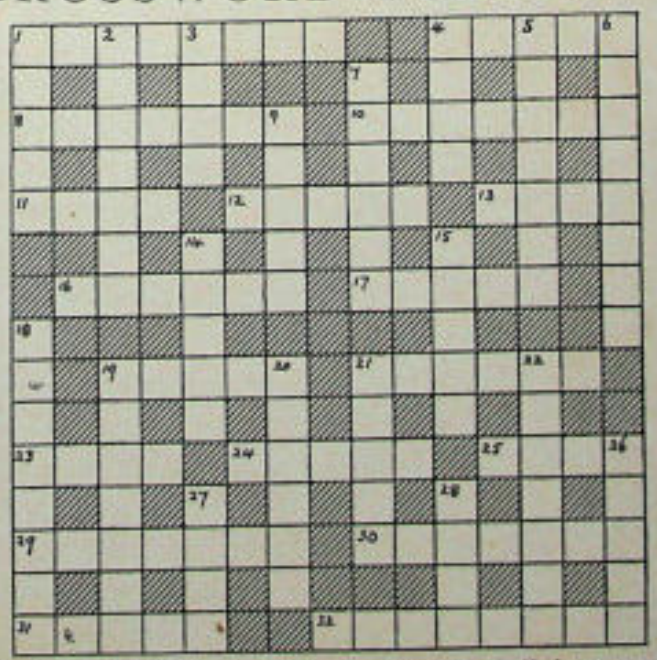
PROBLEM No. 4029

By A. NAGLER.*

WHITE (6 pieces): King at K R 3, Queen at Q B sq, Rooks at Q B 4 and Q Kt 8, Bishops at Q B 3 and K Kt 8.
BLACK (2 pieces): King at Q 3, Knight at Q 2.
White to play and mate in two moves.

* *Schweizer Illustrierte Zeitung*, 1939.

SOLUTION OF PROBLEM No. 4028



1. Kt to B 5, Any move; 2. Q, R or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 532

ACROSS.—1 and 4. "Our lordly style you shall not quench with base —— (The word is French): Distinction chis before a herd of vulgar —— (a Latin word)" (*Falstaff*) (8, 5). 8. "When the coster's finished jumping on his mother. He loves to lie a- —— in the sun" (*The Pirates of Penzance*) (7). 10. A prize for wasting away (7). 11. This will remind you of Fluellen (4). 12. Apparently a slender animal (5). 13. "And all went merry as a marriage —— " (*Byron*) (4). 16. Climb up, maybe, into a position for a stroke. 17. An unmarried female is out of order (5). 19. "There lives more faith in honest ——, Believe me, than in half the creeds" (*Tennyson*) (5). 21. A poor score for Bradman (6). 23. I hurried in the East (4). 24. What a funny clue! (5) 25. Stop in the bowels of the ship (4). 29. There is a loophole in this clue (7). 30. Bookmaker's assistant? (7) 31. This as well as adversity, has sweet uses. (5). 32. "Most potent, grave and —— signiors" (*Othello*) (8).

DOWN.—1. A ministry which started in a cab (5). 2. Ten cans (anag.) (7). 3. Yes, Yes! cried the backward

River Goddess (4). 4. Give her scope to see over the parapet (4). 5. No longer on a paper? (7). 6. A mirror for the Secret Service? (5). 7. Obviously this animal is an acrobat (6). 9. She was a perfect darling (5). 14. A whip means nothing to a Yorkshireman (5). 15. Salutes are —— and the office boy (5). 18. Art is not to a barrocat (8). 19. Aligned 15. Salutes are —— and the office boy (5). 18. Art is not to a barrocat (8). 19. Aligned (anag.) (8). 20. A delightful country (6). 21. Dumas wrote about the black one (5). 22. "Kindness in another's ——, Courage in one's own" (A. L. Gordon) (7). 26. A dull advertisement (5). 27. An entertainer without any nonsense (4). 28. Gore is most acceptable to him (4).

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

ANSWERS TO CORRESPONDENTS

THE "FIELD" Staff of Experts is prepared to reply, on this page, to questions which are deemed to be of general interest. Anonymous letters will be ignored. Natural History objects for identification, if of a perishable character, and birds for post-mortem, should be properly packed and sent in as fresh a condition as possible, accompanied by all available relevant information. *Birds for examination should not be posted to arrive on a Saturday as in hot weather they decompose over the week-end.* No fee is charged for these services. We do not examine for poison.

CARTRIDGES FOR TESTING.—Cartridges for testing (not less than six) should be sent by passenger train, packed in a wooden box, labelled: Safety Cartridges. Class VI, Division I. No fee will be charged for making tests; and results will be reported on this page as speedily as possible. Arrangements can be made for the inspection of shootings in the United Kingdom, and for a valuation by an expert at a fixed fee.

All questions are answered through the post, and a selection of those of general interest is published on this page.

Angling

Trout for Examination.—The trout sent in was very far gone and did not give us the best chance of getting all the clues we would have liked. From examination of this fish, and the reading of the enclosed letter, and, knowing the history of the river, we are of the opinion the disease "furunculous" has broken out, and is attacking both salmon and sea trout. It seems likely that we shall hear of more deaths from the same cause in that river and others of the same watershed.—*—E. A. T., Glan Llyn.*

Garden

Identification of Specimen.—The specimen sent is evidently a peculiar variety of *Asplenium Filix-fœmina*, perhaps better known as *Athyrium Filix-fœmina*. Some 40 to 50 varieties have been named, yours approximating closely to the description of *A. F. f. Fieldiæ* (Field's variety.)—*E. M. D., Workington.*

When sending plants to be named, send as many parts as possible—basal leaves, stem, flowers and fruit. Pack in moss, moistened paper, or damp leaves, in a stiff cardboard, tin or wooden box.

Twig for Identification.—In reply to your enquiry, a twig of willow carrying but three leaves is a very small specimen for the purpose of identification. We can only suggest that it is a form of the White Willow—*Salix alba*. This often has beautiful, silvery foliage and, no doubt, would flourish in Finland.—*N. H., Sheffield.*

Training the Japanese Cherry.—These cherries resent pruning, nor is there any necessity for it except to keep them within bounds or to form a certain shape. In your case, the two large boughs may be trained horizontally; they will form a beautiful screen and flower all the better for their position. Now is a good time to begin the operation.—*E. P., Brentwood.*

Kennel

Sickness in Labrador.—Try giving 12 grains carbonate of bismuth three times a day. Just shake a powder dry into the mouth. If this is not effective, as we think it will be, write to us again.—*E. A. S., Yorks.*

Old English Sheepdogs.—The breeders nearest to you of whom we know are Mrs. Brierley, Cellum End, Leckhampton, Cheltenham, and Mr. A. G. Hartland, Eva House, Newton Road, Hereford. Other big breeders are Mr. H. A. Tilley, East Compton House, Shepton Mallet, Somerset, and Miss A. Tiverman, Pastorale Kennels, Chigwell Row, Essex.—*Miss H., Shropshire.*

Miscellaneous

Getting Rid of Rabbits.—In view of the recent Prevention of Damage by Rabbits Act, your best course would be to apply to your local county council. Generally speaking, there are three ways of getting rid of rabbits: by using gin traps, ferrets, or cyanide fumigation; and you will find further information on the subject in two pamphlets published by Ubaws. The first is a monograph No. 4E, written by Mr. C. W. Hume and entitled "Instructions for dealing with rabbits." The second is written by Mr. H. B. Kirkman, and is entitled "Man v. Rabbit." We do not know whether you are familiar with the work done by Captain Buckley on his farm in Carmarthenshire. Some account of it appeared in the *Field* on July 29th of this year. He used an I.C.I. product called "Cyanag." This is blown by means of a hand rotary blower into the individual rabbit hole. When the powder mixes with moist soil, it liberates hydrocyanic gas. Immediately after this operation the rabbit holes were sealed up. After that it was only necessary to allow the farm labourers to enjoy themselves with ferrets. We have seen this farm on more than one occasion, and there was not a sign of a rabbit on it. It took two men a fortnight to clear about 200 acres, and the total cost of materials and labour amounted to not more than £15. We would suggest that you try this latter method, as it has proved very successful on this estate.—*C. G., Edinburgh.*

Naturalist

Bees Killed by Birds.—The bee was killed by a titmouse, probably the great tit. It is not unusual to find numbers of dead bees under lime trees, with their bodies pecked away by these birds to extract the honey.—*L. T., Berks.*

Post-Mortem Examinations

Starvation of a Manx Shearwater.—A correspondent picked up an adult female Manx Shearwater (*Puffinus puffinus*) in Berkshire, and kept it for four days until its death in an enclosure with a collection of fancy waterfowl. The Shearwater died of starvation; no evidence of any infectious disease was found. Probably the bird had been driven inland by a gale and was too exhausted for further flight when picked up. Since the Shearwater feeds out at sea probably the only chance of saving it would have been to force feed it with fresh fish for a day or two before transporting it back to the coast.—*C. H. C., Berks.*

Fowl Paralysis.—Five examples of fowl paralysis have been received for examination; two cockerels and three pullets of the utility breeds. The signs of the disease may appear in young chicks about two months of age, but as a rule they develop as the birds attain sexual maturity. The affected bird breaks down soon after commencing to lay, or becomes paralysed in one or both legs or wings, some develop a twisted or wry-neck, in others the iris of the eyes becomes clouded, thickened and pale, eventually leaving a reduced aperture for vision, which is defective in the advanced case. There is no known curative. The disease is inherited from the parents, consequently the paralysed stock should be destroyed for table purposes. Blood related stock should not be used for breeding purposes.—*W. J. R., Wilts; G. T. M., Sussex; H. N. P. S., Hants; J. T. L., Worcester.*

Further Losses Among Grouse.—We have received grouse from nine additional moors which had been picked up, and were found to have been suffering from trichostrongylosis. This is the contagious thread-worm infection of the bowels which is causing the reduced bags in so many parts of the north. In addition we received two examples of coccidiosis, a germ infection of the bowels; one was an old cock, the other was a half-grown chick. A tenth bird was suffering from a severe tapeworm infection of the bowels. Where stock has been depleted by these bowel diseases, all of which are transmitted via the droppings, the infected moors should be close shot this season so as to leave the minimum of birds for the winter.—*E. H. M., Yorks; M. N., Perth; R. D., Cheshire; F. G., Perth; J. C. M., Perth; R. U., Cheshire; W. R. M., Dumbartonshire; G. R., Forfarshire; A. C., Mc., Kirkcudbrightshire; E. B., Lanes; C. G., Inverness; T. E. R., Inverness.*

Shooting

Record Pheasant Bag.—The bag to which you refer was made at Hall Barn, Beaconsfield, on December 18th, 1913. There were seven guns, including the King and the Prince of Wales, and the total amounted to 3,937 pheasants, 3 partridges, 4 rabbits, and 1 various, making 3,945 head.—*W. F. L., Cockham Dean.*

Shooting from Left Shoulder.—There is no reason why, if you are naturally left-handed, you should not shoot perfectly well from the left shoulder. It is certainly sound policy to be fitted by a gunmaker, and though you are only eighteen, it should be possible to allow for any broadening of your shoulders by having the stock slightly cast on. The triggers, of course, would be adjusted accordingly.—*J. H. E., Brock.*

Rating of Sporting Rights.—The position regarding severance and rating seems to be correctly stated in Koosman's *Rating Relief Acts* as follows: "Sporting rights are in certain circumstances separately rated, and separately entered in the valuation list: first, where the land is let at a rent and the sporting rights are severed . . . and are 'let' . . . secondly, where the land . . . is not let (e.g., where it is in the owner's hands) and the sporting rights are severed . . . and are 'let' . . . The word 'let' does not apply when rights are enjoyed under a mere licence. Rights against the licensor of an exclusive licensee who himself shot or fished or granted permission would be given by the licensee if properly drawn."—*H. G. P., Norfolk.*

Furnishing a Gunroom.—The most important point about a gunroom is that it should be free from damp. For, however, well made cabinets, &c., may be, if the room itself is not dry the atmosphere will always constitute a danger. Where the atmosphere is kept dry weapons need not be inspected nearly so often, an occasional rub over being sufficient. As you are taking necessary steps to ensure this, you have only to consider what furniture and fittings are required. The usual size of cabinet takes six guns vertically, and displayed in this way behind glass they are shown off to the best advantage. It may be made of oak, will be dustproof lined with baize and fitted with drawers for cleaning utensils, &c. There is usually a place for cleaning rods in the corner behind the guns. Any gunmaker would give you a quotation. A strong cupboard fitted with shelves for storing cartridges, and a medium-size table would complete the necessary furniture. Some pegs on the walls for hanging cartridge and game bags would always be useful. It may be added that the ideal conditions for the storage of cartridges are an atmosphere with a relative humidity of 60-65% and a temperature of 60-65° Fahrenheit.—*J. B. W., Covent Garden.*

Loads and "Blown" Patterns.—The term "blown shot" is sometimes used to express a scattered pattern. Other terms for it are "blow out" and "cartwheel." It simply means that open spaces are left in the centre of the pattern at the fuller ranges. A frequent cause of this is the use of too heavy a powder charge for the shot load. However, in the case you mention, it is difficult to see why the combination of 36 grains of Schultze and 1oz. of shot should be expected to give such a result, as this is a smaller powder charge than the standard, being actually the normal amount for ⅞oz. of shot. The alternative suggested of 32 grains of Modified Diamond and 1oz. should prove a well-balanced load. The former charge should give rather low velocity, and it would seem that a slight increase in the powder load might be an advantage, especially where No. 7 shot is concerned.—*T. G. S., Corsfa.*

THE "FIELD" LIST OF HUNTING APPOINTMENTS

FOR THE WEEK ENDING SATURDAY, SEPT. 9th

STAGHOUNDS—ENGLAND & WALES

DEVON AND SOMERSET.—Saturday (Sept. 2nd), Dunster; Tu., Mountsey Hill Gate; Th., Brendon Two Gates; S., Sandyway—11.

QUANTOCK.—Monday (Sept. 4th), Park End, Cothelstone; Th., Bowling Green, Holford—11.

FOXHOUNDS—ENGLAND AND WALES

ALBRIGHTON WOODLAND.—Saturday (Sept. 2nd), Island Pool; M., Heckman's Gate; W., Wyrley—6; S., Harrington—7.

ATHERSTONE.—Saturday (Sept. 2nd), Merrill's Oaks—6.30.

BICESTER.—Saturday (Sept. 2nd), Arncott Big Wood—6.

CRAWLEY AND HORSHAM.—Saturday (Sept. 2nd), The Kennels; M., Gervase Wood; Tu., Gazebone Farm; Th., Greenstreet Gorse; S., Flat Deserts—6.

MENDIP.—Saturday (Sept. 2nd), Litwood—6.30.

MEYNELL.—Saturday (Sept. 2nd), Byrkley—6.15.

SUSSEX, EAST.—Saturday (Sept. 2nd), The Kennels, Castle Hill—6.

TIVERTON.—Saturday (Sept. 2nd), Beerhamp House, Washfield—6.30. M., Stawley; W., Hornhill; Th., Withleigh; S., Broadmead Cob—7.30.

OTTERHOUNDS—ENGLAND AND WALES

BORDER COUNTIES.—Saturday (Sept. 2nd), Dyserth Bridge, Towyn; M., Dinas Mawddwy; W., Llansantffraid for Cain; S., Llanestmadwy Village—10.30.

BUCKS.—Saturday (Sept. 2nd), Caldicote Mill, nr. Newport Pagnell; Tu., Worsham Mill, nr. Retford; Th., Ravenstone Mill, nr. Newport Pagnell; S., Thornton, nr. Buckingham (cap for hunt servants)—10.30.

CARLISLE.—Monday (Sept. 4th), Temple Sowerby, for Lyvennet; Tu., Temple Sowerby, Eden (up); Th., Appleby, Eden (up)—9.30.

CHERITON.—Saturday (Sept. 2nd), Lymouth—10.30.

COURTENAY TRACY.—Saturday (Sept. 2nd), Sutton Maskeville Bridge, nr. Tisbury—10.30.

CROWHURST.—Saturday (Sept. 2nd), Shoreham Village, Kent; W., Isfield Mill; S., Cuddingstone Village—10.30.

CULMSTOCK.—Saturday (Sept. 2nd), Bolham, nr. Tiverton (R. Exe)—10.30. Wye Valley visit Culmstock Otter Hunt country.—Saturday (Sept. 2nd), Perry Bridge, nr. Bristol (W.V.O.H.); M., Lovington Mill (W.V.O.H.); Tu., Tonedale (C.O.H.); W., Holt Mill (W.V.O.H.); Th., Hambridge Mill (C.O.H.); F., Parrot Works, nr. Martock (W.V.O.H.); S., Barton Bradstock (C.O.H.)—10.30.

DARTMOOR.—Saturday (Sept. 2nd), Puslinch Bridge (Yealm); Tu., Harkworthy Bridge (Walkham); Th., Wooden Bridge (Inny) (by invitation of Tetcott); S., Laddiswell Stn. (Avon)—10.30.

EASTERN COUNTIES.—Saturday (Sept. 2nd), Broomfield Mill—10.30.

HAWKSTONE.—Saturday (Sept. 2nd), The Castle, Brecon—10.30.

PEMBROKESHIRE AND CARMARTHENSHIRE.—Monday (Sept. 4th), Solva—11; Th., Llwyngwair Lodge—10.30.

WYE VALLEY.—Saturday (Sept. 2nd), Perry Bridge, Wrington, near Bristol (by invitation)—11.

OTTERHOUNDS—SCOTLAND

DUMFRIESSHIRE.—Saturday (Sept. 2nd), Where leave of 1st—10.

TO HUNT SECRETARIES

We should be very grateful if all Hunt secretaries would let us have their fixture cards by the first post on Tuesday morning for inclusion in the issue of the following Saturday. This appeal is, at the moment, especially directed to secretaries of otterhounds, but we would also ask secretaries of staghounds to let us have their cards as they start hunting, and also we would appeal to secretaries of foxhounds to send their cubhunting fixtures in due course. Many people who find themselves out of their own country for a time and also hunting visitors from abroad look to the columns of the *Field* for information. This can be given only with the co-operation of the secretaries of the various Hunts.

THE FIELD

THE FARM AND THE GARDEN

With which is incorporated "Land and Water" and "The County Gentleman"

Prepaid Terms of Subscription, including postage Home and Abroad.

Cost of binding half-yearly volumes (26 issues) in dark green cloth, gold lettering—15/- each. Carriage extra.

The Editor of the *Field* invites articles on all topics which may be of interest to sportsmen, sportswomen, lovers of the open air, farmers and naturalists throughout the world. Articles should be typewritten; stamped and addressed envelope for return in case of unsuitability should be enclosed; and the name and address of the contributor should be typed at the head of the first page of the manuscript.

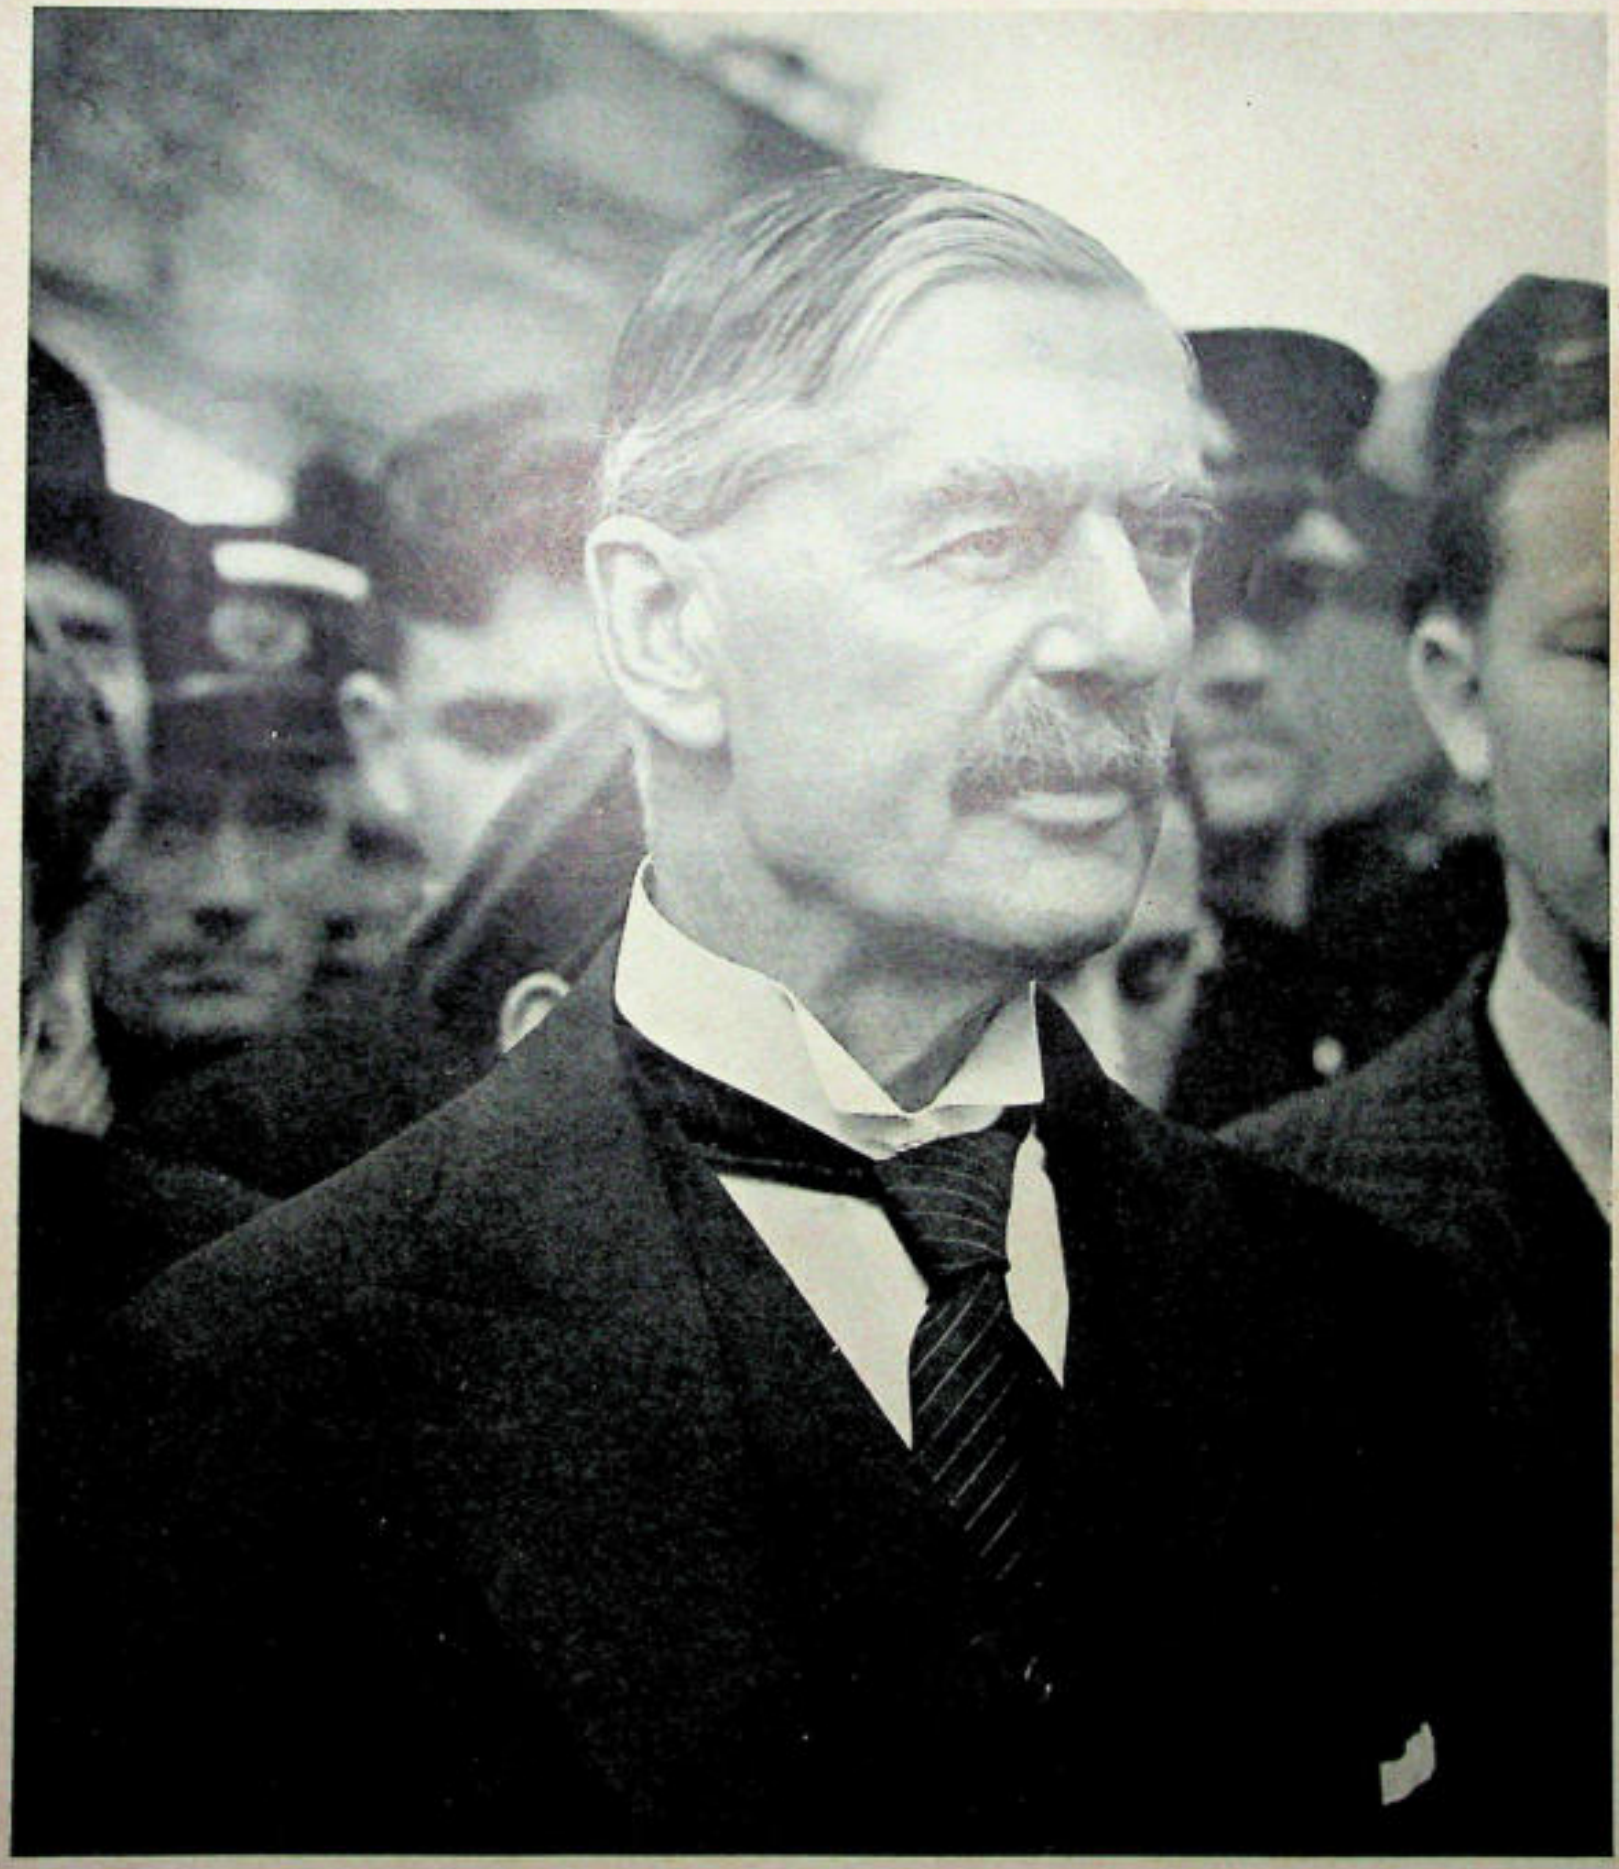
The copyright of all contributions shall belong to the proprietors of the *Field*, together with the right of republication in any form they may think desirable.

Apart from any express agreement that may be made, contributions are only received and considered on these conditions. The Editor, while exercising every care in handling and returning manuscripts and photographs, cannot accept responsibility for their loss.

Letters to the Editor should be as short as possible. Illustrations with letters will be inserted if suitable.

Small classified advertisements should reach this office not later than Monday evening to ensure inclusion in the current issue. The *Field* is the supreme organ for all advertisements relative to country life and sport, situations vacant and wanted, farm hands, gardeners, gamekeepers, stable employees and yacht hands, grooms, chauffeurs, horses and dogs, secondhand motor cars, guns, fishings, &c.

The *Field* will not accept advertisements for Live Grouse (wanted or for sale) English Partridges (wanted or for sale), Grouse or Partridge Eggs (wanted or for sale), all other kinds of live game wanted—*e.g.*, Hares.



Full particulars regarding rates for trade advertisements can be obtained from the Advertisement Manager, The Field House, Bream's Buildings, London, E.C.4.

"IF THIS CUP . . ."

THIS was to have been our Autumn Number. It was to have been full of good things. There are still a a number of good things in it, but by no means so many as there would have been had the International situation permitted.

We are writing this on September 1st. It is now three o'clock in the afternoon, and the office radio has just notified us that the King has signed the General Mobilisation Order. Last night Adolf Hitler made one of the most astonishing statements ever broadcast to a nation as an excuse for war. From its beginning unto its end, without exception, it was untrue. And this morning German troops invaded Poland, and German aeroplanes bombed Warsaw, and seven other Polish towns. Even as we write this the horrors of war spread over the Polish countryside. It is the act of a madman: the act, it must surely be so, of a man crazed with blood lust.

Twenty-five years ago Germany forced the world to war. And now she does so again. For though we have not had, at the time of writing, any official pronouncement from the British Government, we cannot but be certain that we shall fight in the defence of Poland, and we cannot but be certain that there is no country in the world that will escape the horrors of the holocaust that Hitler has let loose. Some countries will remain neutral so far as they are able, but to everyone will come in varying degree sorrow and privation. There could be no more damning indictment of dictatorship.

By the time this is published—and we have no doubt that it will be published—Great Britain will surely be at war. By that time perhaps British lives will have been lost; by that time the whole life of this country, and of every single person in it, will have been upset, and reorientated. But we can be quite sure that there will be no panic, for that is not the English way. If we take long to make up our minds we are, as the Prime Minister said, slow to let go. It is not the English way to shout, as it is not the English way to boast. If we have to fight we fight. And that is a fact which Herr Hitler has yet to discover.

No man has fought harder for peace than Neville Chamberlain. There are many, and their voices are loud, who blame him for not taking a firmer stand in the past. But Neville Chamberlain had much ground to make up when he took over office from Lord Baldwin, and he has made up the ground in the most remarkable manner. There are those, and their voices are loud, who point to the deficiencies of British Diplomacy during the past year. That there have been deficiencies no one could deny. But we have a proverb about spilt milk, and it is as well for us to remember that proverb now. What is past is past; what mistakes we have made, we have made. It is the future that matters, and the future of each one of us rests upon the concerted and determined efforts of the country as a whole.

No one can say what that future might hold; so long as is possible each one of us will do the job allotted to him to the best of his ability, whether that job is civil or military. And, for such is the English way, we shall do that job without grumbling, and without faltering.

No one can tell what the future may hold. We have, though we write before any actual declaration of war, embarked upon a World War. We do not know under what conditions that may be fought, we do not know under what conditions we may have to live, we do not know which of us is to die, which of us to lose loved ones. But we do know that we fight for Liberty. And we do know that we shall win.

Liberty. During the course of the world's history some millions of men and women have died for the belief that is held in that word. As generation has succeeded generation the idea of liberty has grown stronger and stronger, and in some districts of the world—and of recent years in the British Empire in particular—Liberty, or at least our twentieth-century conception of it, has flourished unimpeded. And throughout the history of the world men have arisen who have endeavoured to set back the clock of civilisation and to reduce their peoples, and neighbouring peoples, to servitude. There is no need to recount their names. But it might be as well to draw attention to the number that have originated in Germany. Adolf Hitler is the latest and the most ruthless.

We write in London on an afternoon when life seems to have departed from the city. The office which generally hums throughout the day is empty and silent. There is little commotion in the streets outside beyond the voice of a newsvendor declaiming news already dead. Already dead; yet it was news only half an hour ago. The pace with which events move in these days is staggering and quite beyond our comprehension. News is news in these last few days for no more than half an hour at a time. And so often in these last days we have accepted as news what was only opinion or rumour. Our minds have become fogged so that it is difficult for us to keep up with the ever-changing situation, with the increasing ferocious attempts to alter the map of Europe. As we write we know the latest news. By the time that this is read by all our readers that news will be as dead and as forgotten as the Pharaohs who waged war thousands of years before the Saviour of the World was born. Obviously it is no good attempting to write any more.

We are engaged upon the second World War in the space of a quarter of a century, and against the same people. The moral to be drawn from that is quite obvious, and we can do no more than set about putting that moral into force with all our hearts and with all our souls and with all our minds.

A COUNTRYMAN'S JOURNAL

THIS is the story of two things that I saw on the same day. I was up in that part of the Chilterns, which still keep a clear skin against the rash of suburbanism, a kind of dermatitis, that has crawled all over the eastern and middle part of the range. Below the furry downs the Icknield Way wound snakily over the ankles of the spurs that give an indented line to the south-western scarp, feeling its path towards the fords of the Thames. The network of valleys and combes in the interior, amazingly intricate in their convolutions, have broad arms or causeways of land thrown across them, diverting the valleys to their ends and bearing some heaths, some woodlands, by no means always beech because of what Cobbett called "the red tenacious loam with flints, grey on the outside and dark blue within," above the chalk, encouraging to a mixed growth. Others are cornlands, for this land, with its cloak of tertiary deposits, is very favourable to arable, more so than other chalk downs, whose calcareous soil is purer. On one of these high wide cols above Fawley Bottom is an enormous cornfield carrying in succession wheat, oats and barley, all in good heart. It does the human heart good to see it in its rich, exhilarating, varied setting, and in a country that still preserves its identity, its individual character, its soul against the flood of pseudo-urban culture at its doors, intact and uncorrupted, and as it was two, three and four centuries ago.

But there is a serpent in this Eden of green and gold and russet fallow like the tiling of the old cottages. Among the barley, with the bearded ail brushing its posts, stood a gargantuan notice-board with "Building Lots for Sale" written in capitals across it. There is not much to be said about a thing like that, not much more than Belshazzar said when he saw the writing on the wall. For if a country so blasphemes the ancient prayer, "Give us this day our daily bread" as to allow the staple of its existence to be bought and sold for villa and bungalow sites, then it is clear that money is its god, that it will do anything for money, and that the soul of that country is in bitter peril. I say nothing about national issues; there is still another issue, and that is the worst danger that can befall any nation at any period, the danger of substituting god for God, a detestable little money-god for the Being that gave us this lovely, this bountiful land to be our home, to cultivate for our need, to make things of use and beauty from its resources, and to fill us with joy and thankfulness because there is no other land to compare with it in excellence. It is a good thing for that great Englishman, William Cobbett, that he is dead, since, had he seen a thing like that, his heart would have burst.

Away from that stink to a cottage of stone, brick and timber in the vale, possibly of the sixteenth century. This cottage stood derelict, and was taken by an artist who understood that art is not a matter just of hanging pictures in galleries for the appraisal of a few connoisseurs, but that it is a necessity of existence for all. He knew that because he had studied the works of the pre-industrial ages, when every man who did a job of work, any work, was an artist, because he was free to put his best into it, whether it was turning a chair or ploughing a field or building a cathedral. There is just as much art in making a good hoe as in painting a picture called "Anita," or "Patagonia in Spring Time" that looks like a drainpipe with a toad poking out at one end. Well, this man enlarged the cottage: he put a new coat of thatch on it with a geometric pattern under the ridge-board in the style of Norfolk reed-thatching; he put a bathroom and a wide staircase of elm and other conveniences, and he had electric light installed. He placed pots and other furniture made by the family in it, and he made new rooms with new doors to them of three-ply wood, but in such a way that the grain of the wood (even three-ply has *expression*, that is to say, the grain). I went over this cottage soon after it was finished, and the marvel was that it was actually a better house—I do not mean merely in its comfort, but also in its character and structure and appearance—than it had been when it was built. It was the same house, except that the love and skill (that is to say, the art) of the children had been lavished upon the loving and skilful work of the fathers, and in that sense "progress" is a reality. In the scene upon the hills, the tradition had been brutishly violated; in the house down in the vale the tradition had been extended and enriched by a new act of creation, that with reverence, but without slavishness, was linked to the old.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a Transvaal paper: "Great speed at which some snakes can travel was shown here to-day. J. van Rensburg, a farmer of Doorndraai, states that he saw a 12ft. python give chase to and catch an impala rooibok. Van Rensburg said the python was hard on the heels of the rooibok for 300yds., finally bringing it down after clearing a bush 4ft. in height, behind the buck."

The average driven pheasant is within easy range

ESTIMATING KILLING RANGE

IT is remarkable how many faulty ideas are given expression on the subject of shotgun ranges. It is true to say that there are persons who shoot regularly and yet have only a vague notion of what a full 40yds. looks like. On the whole I think that the indifferent shot is the less knowledgeable in the matter, though it is hard to make a classification. The poor performer who seldom brings off a kill at full range may become inclined to lose interest in the 40yds. measure and rather to think in terms of 25yds., at which so much game is bagged. Concentrating thus on the nearer ranges, he fails to develop his powers of judgment, and 35yds., 45yds. or even 55yds. may appear much the same.

One effect of this is that all kinds of erroneous ideas about the killing capacities of guns and loads are made public. It is natural to suspect exaggeration when tales of long shots are heard, but in reality lack of judgment may as often as not be responsible. The trouble is that inexperienced persons may get a wrong conception of what to expect from their guns, and this can lead to misfortune; for if birds are continually fired at when out of range they will at least be rendered wild and unapproachable, and they may be pricked and become unfit for breeding. At the same time distance may be overjudged. This may mean that birds when in deadly range are allowed to go, which to a host keen on making a good bag can be a disappointment. Whether things are overdone or underdone, the nett result is unsatisfactory.

The greatest errors made are usually in relation to the height of birds. Here the tendency is to overjudge. When it is realised that a bird 30yds. up is considered a "good bird," it will be appreciated that the one at 35yds. or 40 yds. is often thought to be out of range. Such may be left alone or if fired at and missed may be written off as out of range, or if killed may be looked upon as a phenomenal shot. Yet if it were crossing at this distance it might not be thought to be any further than was the case.

Of course if, say, a pheasant is 40yds. up (120ft.) it will be out of range of any ordinary gun except when right overhead. But if a going-away bird can be killed at this range when its less vulnerable parts are largely covered, there should be no question as to the effect of a properly placed charge of shot when the vital organs are at its mercy. But it is in pheasant shooting especially that the most fantastic ideas as to range are expressed, when actually it is seldom that a bird crosses the line out of range.

One of the best ways to learn to judge vertical ranges is to get to know the height of some church tower, building or high tree. Then various birds passing over such marks may be watched and their appearance carefully noted. So when partridges appear the size of quail and pheasants the size of partridges, one can have a fair idea of the height they are above *terra firma*. A really keen man can always be keeping his eye in without going out of his way. When, for instance, he walks along Piccadilly, he can be studying the appearance of the pigeons as they fly and wheel over the buildings. And he can easily judge the approximate altitude of the latter by finding out the height of a single storey. Certainly when one can plainly see the ring on a woodpigeon's neck, that pigeon is within deadly range of an ordinary gun. Those who do much wildfowling become, as a rule, better at range judging than orthodox game shooters. They learn to judge by sound as well as by sight, and may tell by the noise of wing beats how far up birds are. For under certain conditions the fact that wing beats are distinctly heard means that fowl are out of range.

By continually pacing it out one can learn what a full 40yds. looks like. This, after all, is the main thing to get to know, for in a general way it is the limit of the killing range of an ordinarily-bored game gun.

Once the appearance of this is firmly imprinted upon the mind, the rest is easy. When one goes into a grouse butt, it is a good plan to make a mental note of the lie of the land around the 40yds. mark. Then one knows roughly where to take the first bird. Indeed, when shooting from one and the same spot, there is no excuse for not knowing when birds are within range. It is in walking-up, when the immediate vista is always changing, that the matter presents difficulty. Big open fields may create optical delusions which would not be experienced in a more enclosed country. Distances do not look the same over water, and in misty weather birds are usually nearer than they appear to be. Again, in the half-light of a dark November day, both the range and flight of game may be deceptive.

These are all cases in which only long practical experience can lead a man to make an accurate decision, though conditions may be such that even the expert is baffled. Herein lies some of that uncertainty which is ever an attraction of shooting.

Of course, if range-judging is important in game shooting, it is doubly so in rough shooting and wildfowling. There are so often occasions upon which a pigeon, duck or goose, for example, passes just within range for a matter of a second or so. Unless one can judge exactly the point at which this will happen, the chances of a kill are eliminated. One has to time matters so that the shot is made precisely when the quarry reaches this one and only spot. Conditions of the kind are often created when one is waiting for fowl at some vantage point. And not only is great experience needed to make this necessary calculation, but also in the correct alignment of the gun. For all the swing that is always required, unless a shooter knows the immense allowance that has to be given when birds are crossing at 50yds. or more, and at a great pace, he will place his charge literally yards behind. Nothing brings this more forcibly home than the case of a shot at a bird flying low over water when the position of the pellets in relation to the object is marked by the splash in the water.

One of the best ways of learning how to estimate range is to be frequently out and about alone with a gun. Shots can be carefully paced, trees and ground can be studied. In this way one can get to know what 40yds. looks like under all sorts of conditions; and while too long and so unsporting chances will be avoided, opportunities that are just within range will not be allowed to pass. Nothing is more reprehensible than wounding by firing at absurd ranges; at the same time it is as well to be able to deal with all game that is within deadly range. If a man learns to judge range in a split second and can use his gun, he will be a most valuable contributor to the bag.

"SCOLOPAX."

"AND AT NO GREAT DISTANCE THERE IS PERHAPS A LOCH"

MIXED SPORT IN SEPTEMBER

Varied Days to be Enjoyed on the Fringe of the Moors

By R. N. WINNALL

THE advent of September heralds in a new phase of activity to those who shoot on the moorlands. Days which have hitherto been passed mainly in the pursuit of grouse, whether walked up or driven, become less frequent and instead a greater amount of time is spent on the fringes or outlying portions of the moor and the cultivated land beyond. In such places grouse, although they certainly figure in the bag, are considerably less numerous; but despite this fact the shooting that is obtained is very pleasantly productive and affords great variety. From the edge of the moor one can hope for anything from a roe or a blackcock to a rabbit or a pigeon, and while no doubt toll of all these will have been taken in August, during September there is more opportunity of concentrating on them, and the fact that partridges are then in season provides an additional incentive to alter your plan of action in the manner that I have described.

The type of country that you find on the fringe of a grouse moor varies considerably. In places the heather gives way to pine woods or large areas composed of grass and whin bushes; in others the land is immediately of an arable nature, or on the lower slopes "between the desert and the sown" there may be swampy places such as are to be found in the middle of the moor itself, and at no great distance there is perhaps a loch which will provide you with a certain amount of duck shooting, though I hesitate to state that you will necessarily make a very large bag of them!

As the country on the edge of a moor varies so does the sport. There is no doubt, however, that at the beginning of September partridges will be the chief objects of pursuit in all places where they

AT SOME PLACES THE LAND ON THE FRINGE OF THE MOOR IS IMMEDIATELY OF AN ARABLE NATURE

occur. They do not as a rule inhabit the heathery portions of the moor where there is little to their liking in the way of food, and still less chance of dusting themselves, so they must be looked for elsewhere; in grass fields, amongst whins where these do not cluster too thickly, in roots and, of course, in the corn. In many parts of Scotland you can never be sure that by September all or, indeed, any of the corn will have been cut, and in that case it becomes needful to seek the partridges elsewhere. Generally, however, there will be a few coveys in grassy places on the edge of the moor and in areas of mixed heather and grass. They are not often very numerous, and it is a good plan, if possible, to discover beforehand the locality frequented by any particular covey so that when the time comes for shooting you have a fairly accurate idea of where it is likely to be, and that will make the task of walking the birds up considerably easier.

But there is far more to this September shooting than partridges. You may, for instance, after having sought out and taken toll of a covey whose whereabouts you already knew, find yourselves near a wood which is almost certain to contain a few woodcock, some blackgame and perhaps, if you are in the right district, one or two capercailzie, the male of which was once described by a friend of mine, who was nearly overwhelmed by one, as a "flying battleship"! It will behove you naturally to go through this wood, and if there are four or five in the party you can arrange a little driving of an impromptu nature, for two of you can move along to the far end and stand outside while the remainder go into it with the dogs and advance towards the stationary guns. If the wood is too large for a single drive of this type it may be possible to do it in two or more parts, particularly if it is intersected by rides; alternatively, all of you can walk through it in line. It was in an impromptu drive such as I have described that I brought off the best shot at a grey hen that I am ever likely to achieve. She came tearing down wind with a gale behind her, and my pride when she crumpled up was inordinate!

It might happen that after doing this, your way would lead across an area of poor heather interspersed with patches of swamp and a few trees. Here again is an ideal place for blackgame, which on the whole prefer this sort of country to the moor proper, and you may also come upon a woodcock or an odd grouse, besides rabbits and hares.

RISING FROM THE REED BEDS

GROUSE WITH OTHER SPORT NEAR TO HAND

Blackgame have a liking for moister places than grouse, and even on the moor are generally to be found in the damper portions of it.

Another favourite haunt is the side of a burn whose slopes are clothed in bracken and stunted trees. The cocks are far more wary than their wives, and do not often give you the pleasure of rising within a few yards of you!

In wet or boggy parts it is always likely that there will be some snipe, though their presence in any quantity can by no means be relied upon, for September snipe always seem to be more than usually erratic in their habits, and it is never possible to be quite sure where or when they will turn up. There is a further chance that in such a place as this, particularly if there happens to be a burn in the vicinity, you may also surprise a mallard or possibly a few teal. Duck sometimes remain alongside burns during the day, but not generally in any great numbers; a single bird or a pair is the most you are likely to find, though on a larger area of water such as a river or loch there will be more of them.

At flight time they will visit a loch if there is one in the vicinity, and there is a chance that at that time they will feed in the cornfields near the edge of the moor. This is most likely to be the case if you are near an estuary or if there are any really large sheets of water in the vicinity. I have in mind an estate overlooking the Solway, where I have had very good fun in this respect. Here there was also a loch of no great size, and it was possible with the aid of a dog to obtain several mallard from the reed beds along its shores during the daytime. On one occasion in fact the dog "retrieved" one before it even had time to rise and brought it to me unharmed!

And since we have been talking of flighting you must not forget that grouse and blackgame at this time of year will also flight down from the moors to feed in the cornfields, and that excellent shooting can be obtained if you take up a position behind a dyke or other place of concealment in their line of flight and intercept them. Mention must also be made of the shooting of pigeons as they come to the woods to roost or as they fly down to the corn to feed, of rabbits that lie out amongst the whins and in the grass, and of the occasional roe deer that may be encountered in the more wooded places. All these things combine to give endless variety to September sport, and to make it one of the most pleasant of all forms of shooting.

PARTRIDGE DRIVING TACTICS

By CAPTAIN J. B. DROUGHT

COVER GOVERNED BY THE HEIGHT OF THE HEDGE

In cases as above it is essential to stand close up to the hedge otherwise guns would be in view

MOST people can drive partridges—on paper. It is so easy to visualise the ideal beat, so shaped and sized that birds never pass over to your neighbour's vineyard, and so richly furnished with roots and clover, kale and rough stuff that they never dream of taking any direction but the right one. But it is quite another thing to translate theory into practice. For to put it bluntly, save on shoots of super-quality, with which to my regret I am imperfectly acquainted, one does not very often find at one and the same time coveys so abundant and cover so luxuriant as to make for the shooters' bliss on all occasions.

It might in fact be true to say that to kill partridges artistically is a good deal easier than to drive them successfully. For good driving involves the co-ordination of many factors which are largely indeterminate beforehand. In the sense of regularity of habit, partridges are calculable birds. At certain times of day every keeper knows, or should know, where to find them. But neither he nor anyone can make them go where they do not want to go. And so it follows that the major influences determining their flights are the situation of such holding cover as they normally frequent and the strength and direction of the wind.

With varying types of ground plans must obviously differ in degree. Yet the underlying principles are everywhere the same. The object of driving is not simply to put a maximum number of coveys over a given stand. It is even more essential to drive them in such directions as will ensure that throughout the day birds will constantly be settling 'twixt the drivers and the guns. And that is why I stress the strategical importance of holding cover. For whether birds are blanked into or driven out of it, each area must form, for want of a better term, a kind of temporary concentration camp. Which explains why beats must hinge on one another in order to ensure successive "feeding," and why for this accomplishment wide detours may be necessary.

Some people argue that to-and-fro driving is the most profitable, especially on shootings so extensive that there is no danger of birds flitting the boundaries. It is a matter of opinion, but I would urge in certain circumstances one definite objection to it. The distances young partridges can fly early in the season is governed by their stamina. For this reason driving prior to October may be unwise anyway, and, even then, to keep possibly backward birds constantly on the move against head-winds, with scarcely any rest between-whiles is the negation of sport. In any case, they will not stand for it for long.

One cannot emphasise too strongly the wisdom of alternate plans. Most days of unhappy memory are due to keepers coming out with one cast-iron idea which a sudden veering of the weather-glass renders totally unsuitable. Then either drives take place in changing winds against all principles of common sense, or else beats are reversed at the last moment so that not one is complementary to another. Either way failure is inevitable, not only because beaters are at sixes and sevens, and guns *en l'air*, but also because birds will scutter to all points of the compass.

Nothing is better calculated to throw a whole day out of gear than lack of cohesion. At one time or another most of us have probably suffered politely but ungladly the host who usurps his keeper's functions; the keeper who cannot control his men; the beater who will not do as he is told; the gun who contravenes all principles of field-craft. So, perhaps, I may suggest very briefly and without embroidery, what, in my humble view, are golden rules.

Down-wind drives are preferable at the beginning of a day because nothing short of a gale will stop partridges returning to their feeding grounds in late afternoon. And even in calm weather beaters should be more or less half-mooned to stop birds running to the flanking hedges. In a strong cross-wind it may be advisable for the outer flankers, towards whom it is blowing, to be almost as far advanced as the line of guns. Beaters tend to bunch together especially when going through thick roots, leaving wide spaces through which birds run back, and for this reason it is advisable to halt the line and reform when necessary, and invariably to do so when a large number of birds is concentrated close up to the guns, so that they can be flushed successively and not *en masse*.

The head keeper should always be in sole charge of operations. But two sets of beaters may be desirable on shoots where, in order to preserve the continuity of beats, wide detours are essential, or where too broad a frontage would otherwise have to be taken in one sweep. Moreover, this saves valuable time and obviates the temptation to prolong shooting until too late an hour. This, incidentally, is unsporting for two reasons. First, partridges make their chief meal in late afternoon; secondly, to shoot in a failing light birds that are never easy at the best of times, is to increase the chances of just wounding or pricking by 50 per cent.

That raucous noises are just as futile as haphazard flag-wagging may be impressed on beaters. Nothing on earth will stop partridges in full flight save straight shooting, and men who have the intelligence to squat when birds are coming down to settle, and then show themselves at the psychological moment are the men to pick as flankers. For on their manœuvring depends more than anything the line the coveys take. It will always be the line of least resistance, and if the first birds up find one unguarded flank, the remainder are more than likely to follow suit.

It is impossible to lay down the law on gun positions. Their distance from screening cover will obviously depend upon the lie of ground, though, if possible, ploughed fields which, wet and sticky, severely cramp the shooters' style should be avoided. But guns may remember that birds can see as well as hear, and that avoidable movement even when the beaters are still afar off, is as fatal, as avoidable imprecations when birds are breaking back. Nothing is more calculated to make them repeat the performance at the next attempt.

And now my space is out. I do not pretend that this brief survey covers more than the fringe of partridge driving. For when all is said, it is an art of which even those who have served lifetime apprenticeships would hesitate to claim the mastery.

BIG GAME AND STALKING TROPHIES

THE East African Professional Hunters' Association proposes to issue a book of African Big Game Records.

With this end in view, the Association has prepared schedules and measurements. Their policy, it is gathered, is that only measurements which are average and above average will be included, and these will in the first place be placed before the committee which administers the association and which reserves the right of inclusion and exclusion.

Forms of schedules and full information may be obtained from the secretary of the association, P.O. Box 825, Nairobi, Kenya Colony, who hopes that all those who are interested will apply.

If this idea results in bringing to light some outstanding trophies that are at present unknown to the public, it will mean that very interesting information will be available for sportsmen visiting Africa, and, indeed, for all others who follow big game. The "magnum opus" on the subject is, of course, the book published by Rowland Ward, Ltd., of Piccadilly, which is the most complete and most reliable work of its kind in the world. And while on this question, it is worthy of note that during the forthcoming Scottish stalking season the latter are offering to mount free the red deer head which, in their opinion, is the most outstanding of those that are sent in to their studios. In addition they will do the same in the case of the best head secured by a stalker under 20 years of age. Naturally, in the latter connection suitable *bona fides* must be submitted.

This should provide an extra stimulus to all who are intending to visit the forests. Even to those in good training, a long day on the hill can prove very arduous, though the young stalker especially forgets "the heat and burden" when the chance of a fine trophy lies ahead.

The great desideratum in the compilation of records of game trophies is that the system of measurement should be simple and the final judgment in the hands of a responsible body which understands its business and is competent to make a proper decision. In this way all that is implied by the word "authority" is brought into being and sportsmen are given a sure "peg" upon which to hang their standards. They then know where they stand and the degree of importance that their trophies represent in the eyes of the hunting world.

LETTERS TO YOUNG FLY-FISHERS

XII.—Fly Hatches on a Chalk Stream

MY DEAR BOB,—In my last letter, your inquiry about nymph fishing distracted me from a consideration of chalk-stream hatches and I had almost forgotten my promise to tell you something about them; but when you ask me to give you a complete list of flies to carry with you for chalk-stream fishing you have asked for a letter which would certainly be overweight for the ordinary three-halfpenny post; that is to say, if you want to be equipped for every emergency. There are, I suppose, a dozen different species of fly which put in an appearance at one time or another during the season, and several hundred patterns which have been dressed to imitate them.

You are kind enough to refer to yourself as my pupil, and I am averse to you carrying a great number of different patterns, for if you do you will be for ever thinking that you have got "the wrong fly," and will waste your time in changing it, whereas the fault in most cases lies in your use of it. Either you are not keeping out of sight, or you have roused the trout's suspicion by some fault in your casting. Even in cases where several changes of fly result finally in rising the fish, and you are tempted in consequence to think that you have found the right fly at last, it is at least as likely that you have found a fly which floats properly and that many other patterns would have had the same effect if they had been cast and had floated as did the one which brought success.

All the same, for chalk-stream fishing you should carry a rather more extensive selection than the half-dozen patterns you used in Devonshire, so I will try to suggest a very few patterns which have shown themselves capable of deceiving trout which are selecting one particular species of fly coming up on the water.

On most south-country chalk streams fishing seldom begins till May, though April 1st is usually the official opening day. But whether you are there in April or the beginning of May, the hatch will consist of a large and rather dark type of Olive, with a smattering of iron blues; and if you get cold, blustering weather there may be a big hatch of iron blues and a smattering of olives. Since the keeper has shown you an olive you know what it looks like and will be able to recognise it on the water.

One of the most successful of imitations is Greenwell's Glory, but do not forget the tip about gold-ribbed hare's ear. If there are olives hatching out and the fish will not take a Greenwell try the hare's ear as they are probably rising to the nymph. If that fails also, try a very small pattern of blue dun. This is a deduction from experience. There may be a sparse hatch of iron blues which the fish are taking coming up along with the olives. I think you will easily recognise the iron blue on the water. It is like an olive in shape with wings held upright on the back, but is much smaller and looks almost black on the water.

It is useful to remember, especially early in the day, or late in the evening that fish may have been feeding recently on spent spinners. You can get attractively-tied imitations of the red spinner with hackle-point wings spread out like those of a spent fly, but I think you will find that an orange or red-quill hackle fly is just as effective if you cut off the upper and lower part of the hackle, leaving the side strands standing out which look very much like the spread wings of a spent fly. Do not oil spent patterns. The natural fly comes down waterlogged just under the surface.

Some chalk streams have a hatch of grannom which occurs usually in April. If you pull up a piece of weed and see that it is covered with a mass of small caddis cases in early April they will be grannom. A good hatch is generally rather dramatic. Flies come off in myriads, looking as if a mass of artificial march browns had suddenly come to life. The female fly has a green egg sac at the end of its abdomen, and you can get artificials tied to imitate them, with the same name.

Directly the weather warms up there should be pale wateries about. Unless your eyesight is a great deal better than mine, even with the assistance of glasses, you will not see them on the water; but if you find them clinging to your coat you will know there is a hatch coming up. They are a frail-looking fly, greyish white in colour, though I have never found an artificial tied to represent them to be any good. Perhaps they look different to a fish; but either a very small blue quill or, curiously enough, a small orange quill is sometimes effective.

I need not bother you with the mayfly, which comes up any time between about May 20th and June 7th according to the river, because I think you know about it already. Imitations are legion and fished like any other dry-fly dun pattern; but by the time the mayfly arrives blue-winged olives may be hatching out. If I say that the fly is about the same size as an olive with rather more conspicuous wings which have a slightly blue tinge, I think you will recognise it when you see it.

It is, in the main, an evening fly, and often it is too late to see the colour of the wings, but if you see what appears to be a rather large-winged olive hatching out in summer in the late evening you can diagnose B.W.O. and in nine cases out of ten you will be right. Neither I nor, alas, anyone else, can tell you what will catch trout during a mad rise to the B.W.O., but put up a good-sized pheasant tail and do not change it. I do not think anyone gets many fish in a blue-winged olive rise, but sometimes the fish seem to like a pheasant tail even after much casting and you may suddenly run into a bit of luck.

E. A. Barton

SEPTEMBER ON THE TEST

"There are also a number of sedges which you will find on grass stems and riverside plants"

Caperers are likely to be about in June and later. They are one of the very few sedges which fly much in the daytime. You will recognise them almost at once by their name, for their flight is well described as capering over the water. The Houghton Club have a good imitation—Lunn's caperer (hackle or winged)—which takes fish on the Test and would no doubt take them elsewhere. There are also several other dressings usually sold under the name of the Welshman's button, which also kill well at times. When fishing with this fly a very slight pull on the line just as it is passing a fish will often bring it up.

There are also a number of sedges which you will find on grass stems and riverside plants which rarely fly in the daytime, though you will see them fluttering over the water late in the evening; among them the great red sedge, a substantial insect as large as a mayfly. It is quite common to find them in trouts' stomachs, though how they get them is a mystery, unless it is when they crawl down a reed to lay their eggs under water. There is one dressing a friend gave me recently which has a body of claret-coloured mohair (or what looks like it) and wings from a pheasant's tail feather; and it is certainly effective. It is tied with the wings penthouse-wise over the back like an alder and is not at all the buzzy-looking object with much hackle and upright wings usually sold as sedges, cinnamon or red, in the shops. Ask your cousin to tie one for you on these lines and try it this month while you are down there on a chance riser under the bank; such a fish as you will often come across when there is no regular rise going on.

One or two other patterns may be useful at times; black gnat, for example. The natural will often be found swarming over the water in a tree-covered stretch on a hot day in late spring or summer; Halford's female black gnat is a good pattern. Then there are smuts. It is quite impossible to imitate these tiny insects for which trout have a great liking, especially on still hot days in summer when there is "nothing doing."

The small 00 black spider you took to Devonshire will probably prove as successful as anything; not that that is saying much. I advise you to carry a few Wickham's Fancies. This is a definitely fancy fly, but it floats very well, since it has a hackle ribbed down the body, and if you are fishing on one of those rather deadly days when only an occasional fish moves, generally under the bank, it is no bad plan to put up a Wickham and cast it to such fish as you see. But do not be led astray into prospecting with it.

Later, of course, you will add to your collection of patterns; if you are like most of us, you will add to it greatly; but you will find even then that you actually use very few of them; about half-a-dozen in all, I expect. They will not always be the same half-dozen, for one's ideas wax and wane on the usefulness of a fly; but the ones I have named will be ample for your requirements at the moment.

Yours affectionate Uncle,

HARVEY.

STAG, SALMON AND GROUSE

By MARTIN STEPHENS

THE Stag, Salmon and Red Grouse Trick in one day is a very old one, and, given time, opportunity and a fairly long purse, not a very difficult one to pull off. At least, so say they who have not accomplished it. In any case, in these days of motor cars it is a good deal easier than it was when one had to walk. But still, if it is not a very difficult achievement to perform given the right set of circumstances, it is, nevertheless something that not everybody has done. And one October our old friend, Louis Muttlebury Miltown, was stopping in just the right spot to perform it. Pitcall, in Sutherlandshire, is not exactly on the ground which St. John made historic, but it is not very far from it, and the upper reaches of the Helmsdale, the great forest of Pitcall itself and the low ground round the lodge, offered a very good chance of bringing off the triple event.

Charles Ramsay, his host, had had so many opportunities of carrying the event to its final stages that he had never bothered to do it, but he advised Louis to begin on the salmon. Doing anything against time is the devil, but fishing against time is the devil incarnate. Once you have caught your salmon you can off to the hill with six hours to spare. After all, you can always pot a grouse sitting on a rock. Louis deprecated such a possibility. "Well, you haven't stipulated for a 40-lb. salmon, a royal, and four birds with four cartridges from one pack of grouse."

"It was a salmon. They had completed the first leg of the course in record time"

So it was arranged. Louis was to fish up till midday, up to which time the stalker and gillie would wait for him. But if he had not caught his fish by then, then it would be no good going to the hill. Of course, as is so usual in the arrangements of anglers, the weather played him false. There were two days of blinding sunshine and low water during which the catching of salmon, or rather the catching of a salmon, was obviously impossible.

Next there followed two days of thunderous rain, broken by swirling mists all over the high tops, and then the weather broke fair again to what seemed an ideal fishing morning. Louis decided that this was the day for his first attempt. He, therefore, asked if he might try, knowing that the process could not be indefinitely prolonged, for his host had other guests; and a rod on the river and a rifle on the hill could not be kept indefinitely at the disposal of one stout, middle-aged southerner who wanted to put up another "record." Why not be the first man to paddle across the Bristol Channel backwards in a bath-tub?

However, the day started well. Louis had made up his mind that the salmon was the difficulty, and once it was on the bank there would be no further trouble. And it was by 9.30 a.m., to the vast delight of his attendant, and Louis's own smug satisfaction. It was a lean red fish, as ill-conditioned and likely to be as unpalatable as any fish taken in these islands that autumn. Nevertheless, it was a salmon. It might have taken the very indifferent cast of a very indifferent fisherman in a very indifferent way. In point of fact, it had. It might have been killed in seven minutes of the most indifferent fight which an expert could have reduced even more. In point of fact, it was. But it was a salmon. They had completed the first leg of the course in record time.

Three hours later, Archie, the second-stalker, was adjusting his glass with rock-like firmness against his stick, while that of Louis waved as vigorously as a semaphore arm. They were on the high ridge which was their march, running round in a half-circle for perhaps six or seven miles. Below them was a lower ridge, which gave a cup-like twist to the high tops of the forest, and in the middle of this lower ridge, and about half a mile to the right of them, was a pass surmounted on either side by high granite cliffs like the supporters of a coat-of-arms. It was on this point that Archie's glass held fast, for a long file of deer, perhaps some twenty or thirty, were passing through it.

Suddenly Archie put down his glass. "Yon's the Big Royal," he said. The Big Royal of Ben Na Cruachan had been much talked about that season, and twice stalked. On the second occasion, as a bullet had crashed 2ft. below his "tum," he had made off to more hospitable domains beyond the march and had been no more seen. Now he had evidently returned. He was the prize of the whole forest. And there he was, standing on a bump not more than 1,200yds. away, as authentic as the Bank of England, and much more certain of himself.

Now Archie and Louis were out that day to kill a stag, and here they were about to commit the cardinal error of killing *the* stag, which is quite a different thing. But all thoughts of doing the hat trick needs must disappear before those majestic tines. Not to attempt the stalk would have been the sin against the light. After all, it would be far better to lay those superb antlers against the larder wall than to place a switch, a raw, red salmon, and an old grouse together in lowly union.

Not that any of these thoughts entered their minds. They were far too busy with the subject in hand, and the subject in hand had moved off his bump and was following slowly up towards the heights. And therein it was shortly seen that he was offering them a very pretty problem. For the place these deer had chosen for their siesta was immediately below a great bluff. They could not be approached from above the bluff, as, apart from it demanding a long detour through the neighbouring forest, they were probably completely covered from view. If, however, they chose to approach from below they would become unpleasantly apparent both to the eye and the nose. And they had an adequate line of retreat to the other side of the divide along the base of the bluff to where the ground more or less flattened out about half a mile beyond.

"I think we'll just bide a wee." And "bide a wee" they did, from two till three, and from three till four.

At four Louis could stand it no more. His thoughts were all back now with that red and solitary salmon, the first part of that uncompleted triangle: a triangle by no means after the example of Isosceles, having equal legs. The leg he was now regarding was, so it seemed to him, ill-favoured, hairy about the heel, and of illimitable length. He determined that the situation should be eased. 'Tis better to have moved and lost than never to have moved at all.

The problem was a difficult one; indeed, it was desperate. The only possible advance was from below, and there they were almost certain to be seen. The only way that the deer could be moved was by separating, and for Louis to take up as good a position as he could on the slope below and for Archie to make a long detour on to the top of the cliffs, and then by either a sudden and unwelcome personal appearance, or by the hurling of boulders to frighten their stag off. Unfortunately, he was still surrounded by at least twenty other deer, and the chances were that if there was any sudden movement the whole lot would make off, and all chance of getting a shot would disappear.

As the decision only offered two alternatives, there did not look like being much more brain racking about it than is included in the spin of a coin. Finally they decided that Louis was to go round to a little knoll below the stag, and when he had reached it Archie was to move slowly forward. It was hoped that thereby the deer

would make off between Louis's knoll and the main precipice.

Louis had only gone a few yards before his confidence had almost vanished. He felt most horribly alone—that every step he took must be a wrong step. Quite why, he could not say. He moved slowly down the slope till he was hidden away from the top of the ridge and the precipice beyond it by an intervening shoulder. He was as isolated as Crusoe on his island. He turned to the left, parallel to the main cliff, whose summits, bathed pink in the afternoon sun, were just visible over the top of the hillside. He moved on, weighted with a sense of guilt, till he came to a spot which he reckoned was below his knoll. He had been on the move for about three-quarters of an hour, and he was beginning to stumble. His rifle seemed far too heavy. He was in what they term in Yorkshire a "muck sweat." Then, as he neared the top of the rise, he doubled up and, finally, crawled to the ridge.

He found himself a little to the right of his objective, but there, to the left of him all right, were the deer, about 400yds. off. He pressed himself closer to the earth and laboriously unshipped his telescope. As he did so he looked back, took out his large yellow bandana handkerchief and waved it at the hill behind him. It was the signal to Archie to start moving. And as he waved there was a sudden glint like a helio at half cock as the sun caught the lens of Archie's glass, fixed on him with critical precision. The helio suddenly went out. Louis could almost hear the telescope being clapped to.

A pause, and there was a resounding crash from the precipice behind and a great boulder came hurtling down the hillside. It sounded to our hero the sort of fusillade that might well have flattened

"He had been on the move for about three-quarters of an hour and was beginning to stumble"

was a spurt of dust below—3ft. below—the stag's hindquarters, and, with a toss of his head he, too, joined the throng and made off. Louis unloaded his empty case and began wondering what was to be said to Archie.

Suddenly there was the noise of a lesser avalanche from the precipice opposite. Louis looked up and saw Archie descending the hill as fast as his legs could take him. He arrived a little out of breath. "Come away," he panted. Louis came. They ran up to the bottom of the precipice, followed it, walking and running, for 400yds., the walks gradually becoming far more frequent than the runs, till they came to the drop in the ridge where the precipice ended. There was a hollow here about 200yds. across and a burn head. And here the deer had paused. It was a still day, and the converging scent of Louis and Archie had not yet reached them. (We are much too apt to regard scent as pin point, a directional affair; it is more dimensional, moving as it does by the square yard.)

They stopped just short of the hollow and Archie signalled to Louis to regain his breath and himself crawled slowly forward. Then he turned half over on his side and, with an imperative swing of the

"He was the prize of the whole forest"

the walls of Wellington's San Sebastian, even of Franco's. The deer, mildly interested, moved a few yards and continued to feed. Archie then proceeded to follow it with loose rocks and small boulders.

The effect of this on Louis's taut nerves was of an Alpine avalanche. It was accompanied by penetrating, loud reports, as the rock jumped from point to point. And then it dawned upon the nearest hinds that this was the work of no natural agency, and that that avalanche was a Gadarene avalanche. And off they went past Louis, a file at a canter and 200yds. away. But as they went other and unexpected deer rose as from the dead and joined in the flight. And then suddenly Louis saw the master stag, a little slower, perhaps, or a little more sedate, but not one whit less determined to get away with the best of them, and a stag so magnificent as to make all the rest of them look like common switches. He suddenly realised that those others, which seemed a moment ago such "harts of grease," were as nothing.

The stag came right across Louis's front, last of the procession save two youngsters, and paused outlined upon a rock as he stopped for a moment to look back. He was a good 300yds. away, and probably more, and very clearly out of shot. But he seemed in the clear light of the late afternoon, and in that definite silhouette, to offer a shot that was permissible. Of course, Louis knew it was not, but even as he lingered on it the thought crystallised into consciousness that it would be the triumph of triumphs to kill the big stag without benefit of stalker. He drew a bead and then a trigger. There

half-bent arm, signalled Louis to join him. Louis crawled forward and as Archie thrust the rifle into his hands he saw that the Lord had delivered him into their hands, more completely than he had to Cromwell at Dunbar.

Standing in front of the whole mass of deer with two lesser stags to right and left, like a leading tenor in front of the chorus with attendant singers to flank him, was the big stag. He was, perhaps, 70yds. away. It was a chance so easy that it seemed shameful to take, a chance such as would never occur again in a lifetime, ought, indeed, never to have occurred. Louis dropped him dead. What else could he do? And then, the avalanche having come again, the deer made off over the divide and over the march. What mattered it to Louis or Archie if 30 or 300 deer left their ground when the one deer that mattered was on it, and that deer dead.

An hour later the pony was up and the stag upon it, and Archie, Sandy and Louis passing in the last half light of day down the road to the lodge. The grouse were calling in the heather and they flushed two brace of them, right off the path. But so busy were they savouring their triumph and discussing it with Sandy that the third leg of the bet, so easy of attainment, was quite forgotten till they got back to the lodge, and had to admit that they had never bothered about it after all.

(This is an extract from "Sporting Progress," to be published later by Eyre & Spottiswoode.)

"Signalled Louis to join him"

SOUND HORSEMANSHIP

Riding for All. By R. S. Summerhays. (Bell; 3/6.)

Any pleasure which we feel at the widespread increase in riding on the part of the general public—and it is an important and valuable movement—must be slightly offset by the reflection that a great many beginners are handicapped at the outset of their riding career by a lack of proper and efficient instruction. Not even every riding school deserves the name. Mr. Summerhays' book, therefore, should be of the utmost value to a great many novices, for he starts right at the beginning, and his remarks are intended to produce efficient riders rather than star performers. There is, of course, no reason why the first should not become the latter, but that is not the purpose of this book.

Mr. Summerhays starts right at the beginning with a chapter on the horse's point of view, and then proceeds to show how the rider may best take advantage of it. There are remarks on the seat, the gait, jumping, gymkhanas and the stables. Everything necessary to produce a sound horseman is contained in this book.

EARLY DUCK SHOOTING

By J. C. M. NICHOLS

(With illustrations by the author)

MALLARD IN FLIGHT

IF asked to define "early duck shooting" I would say the first two months of the shooting season, after which (in October) there seems to be a definite falling off in the numbers of ducks to be found both inland and on the coast. Our home-bred ducks have now changed their quarters for "pastures new," many perhaps have taken their departure to France or Spain, and their places will not be filled by foreign fowl until the frosts of November herald a general migration from the North-east.

To many perchance my title will suggest the pursuit of immature fowl in the early days of August, somewhat as depicted in our old sporting prints—stalwart gentlemen with inordinately long guns, pressing along a dyke-side to flush protesting ducks on the very noses of their water-spaniels—in brief, a proceeding rightly termed flapper-shooting.

A duck-shoot on the opening day of the season was, in several places that I know, quite a time-honoured custom, almost indeed a local festival.

Long before daybreak all the guns in the neighbourhood would be astir to work the marshes—some by leave of the farmers and landholders, many (I fear) by "French leave."

The keeper hands would sleep out in barns, &c., so as to be out on their ground as soon as ever there was light enough to shoot by, and as dawn broke the sound of firing would resemble a regular battle.

When one is young and keen, a foray of this sort was not without a certain charm of its own. The long tramp across the marshes with an eagerly questing dog as the morning mist rolled away from the land, and little bunches of duck and plovers wheeling to and fro; while the intermittent moan of a fog-horn away at sea reminds us that it is still "thick" in the Channel, and every now and again a regular burst of firing would urge us to take what cover one could find and await our luck.

On such occasions the bag was (individually, at all events) a modest one, though in the aggregate a good number of ducks were shot, including (I fear) many backward birds that should have been left for a later day. "If I don't get him t'other chap will" being the prevailing sentiment.

With the recent passing into law of the Ducks and Geese Protection Bill, and the consequent postponement of the "opening day" to August 12th, all but exceptionally backward birds will have reached maturity or at least a fair sporting chance against the gun, and there is no doubt that the alteration of date will be generally beneficial; although I cannot help thinking that in a "forward" season it will work out hardly on some owners, &c., of marsh-land shooting.

Our home-bred ducks (mallard, teal and shoveller), once they are strong on the wing, are not long in shifting their ground, and if they are not dealt with opportunely may be lost for the season.

There is no doubt that flighting in its various forms is the most sporting way of dealing with "early" ducks, if only because really backward birds will hardly be met with on flight; while generally you have the advantage of dealing with your duck in some detail, vastly to the improvement of the bag. A morning flight in August will mean early rising, indeed, as the flight may well be over by 5.30 a.m.; while the evening flight in marsh country can be almost a martyrdom (I speak personally) from the attentions of marsh-gnats and mosquitoes. Still, I can recall many an enjoyable evening in August spent on cornfield or marsh (as the case might be) with ducks like black champagne-bottles silhouetted against the gradually darkening sky, or teal flickering in like bats over the reed-beds.

One of the most successful and (considering its modest area of some 400 acres of marsh and broad) the most prolific duck-shoot that I am acquainted with is the Salthouse shoot, owned and managed by Mr. Roy Pope, of Blakeney.

Here upwards of 1,300 wildfowl (all genuine wild birds, mallard, teal, wigeon, &c.) have been shot in a single season. The Salthouse marshes, as I can well remember them about forty years ago, consisted merely of grazing land with no more water than the usual drainage-dykes and a line of small brackish pools along the seaward boundary dignified by the rather pretentious name of "broads."

Liable to occasional inroads by the sea, both the Cley and Salthouse marshes were intentionally flooded during the War (with the object of hampering a possible hostile landing), and in 1921 they were completely "drowned" when the tide washed right up to Cley Village and the coast road. The breaches in the sea-walls were soon closed again by natural causes, the sea piling up an enormous accretion of shingle which now forms an effective bar to further encroachment; but the flooded area had reverted to its primitive condition of salting and mud-flat intersected by several large sheets of salt or brackish water.

Lying in the direct path of migration from North-Eastern Europe, the Salthouse marshes now formed a most attractive landing place for every kind of waterfowl, and by the enterprise of their present owner have been still further improved in this respect.

SHELDDUCK AND SHOVELLER

Mr. Pope's first care was to restrict the brackish area by altering the level of the banks and then to "sweeten" the various broads and pools by bringing a stream of water on to the central marshes from a fresh-running dyke. Belts of reeds (which have since flourished amazingly) were then planted to provide shelter for the mallard and teal, while by judicious feeding the water was made still more attractive to them. Barley is fed for the mallard and millet for the teal, besides which there is now an ample supply of natural food, both sea-aster (the seeds and shoots of which are a favourite food for the teal) and "eel grass" for the wigeon.

The Salthouse shooting records from 1928 to 1932 show a steady improvement in the totals obtained. Thus for the season 1928-29 the bag was 311 wildfowl, with 214 various, total 525 head. In 1929-30 only 270 wildfowl, but 60 coot, 36 snipe and 49 plover bring the total to 415 head. In 1930-31 we find 628 wildfowl and 51 various, with 102 snipe, 2 woodcock and 69 plover, making 852 head. In 1931-32 comes a slight drop in the bag of ducks, &c., viz., 513, but snipe, plover and various bring the total to 895 head. Next we come to 1932-33, which, as far as I know, is the record season for Salthouse and is worth examining in some detail.

In six days' shooting during August and September of 1932 a total of 541 ducks were bagged, consisting of 211 mallard, 230 teal, 40 shovellers, 3 wigeon, 1 gadwall, 12 garganey, 1 pochard and 43 shelduck; while the whole season produced 409 mallard, 517 teal, 298 wigeon and 120 various other ducks—total wildfowl, 1,344; which with 333 snipe, plover, &c., made a grand total of 1,677 head. On August 15th, 22nd and 29th bags of respectively 63, 67 and 58 teal were obtained.

During the first two months the marshes were shot on an average once in ten days. It says much (I think) for their attraction for wildfowl that the average of the bags was well maintained. I know few duck-shoots which would bear shooting at such short intervals without serious detriment to the bag.

The season of 1933-1934, though not quite so good in point of numbers, produced an even greater variety of wildfowl. In all 241 mallard, 450 teal, 185 wigeon, 41 shoveller, 15 pintail, 9 garganey, 1 gadwall, 3 pochard, 7 golden-eye and 29 shelduck—ducks, 981—were shot. To these we must add 10 geese (4 brent and 3 greylags, and one each of bean, whitefront and pink-footed), also 3 wild swans (2 bewicks and 1 whooper), which, with 310 coot, 71 snipe and 93 plover and various, bring the total up to 1,468 head. Of the geese the greylags were shot on October 21st, the rest towards the end of the season. The inclusion of shelducks in the bag may well be queried by some, as these handsome ducks are generally considered quite uneatable; but I am assured that a "good home" can always be found for them at Salthouse. I myself have been asked by little nippers in the village to "shoot them a shelduck." For why? "For father's dinner," was the dutiful reply.

Mr. Pope has found by experience that early morning flighting (however successful on other shoots and under different conditions) is not a good way of working the ducks at Salthouse.

The reason is that these marshes being, as I have stated, a natural feeding-ground, are full of ducks at night-time, and to start shooting before daybreak gives them a scare from which they do not soon recover.

On various occasions I have been privileged to take a gun at Mr. Pope's duck-shoots. The guns (usually six in number) would meet at the marsh-side about 9.30 a.m., and proceed to walk quietly down to their positions round the central broads—some to regular butts constructed of canvas and reeds, others to convenient places in the reed beds. Of course no shot must be fired until all the guns are properly posted. During the "walk down" some hundreds of duck may be flushed, to fly out to sea or perhaps to wheel round and pitch again on the adjacent marshes; but they have not been unduly alarmed and with luck some numbers of them will return in small parties during the next hour or so.

In fact it may quite well be a positive advantage to have "put away" a certain proportion of the ducks in this manner, rather than to have roused the entire stock of birds at the first volley of shots.

All being ready the shooting starts, teal rising like swarms of bees from the different pools and reed-beds, wigeon with their white underparts catching the light as they wheel up towards the sea-bank, and shelducks flying high and steadily like geese. After the first lull in the shooting the keepers start to walk round the outside marshes to rouse any stray birds towards the guns.

A "pick up" at midday (rather strenuous work for man and dog in the mud and reeds) is followed by lunch and a well-earned rest, and the day may be finished off with an evening's flighting.

A rough windy day (with rain or no) is usually the best for sport, as the fowl notice the shooting less, and will not stay long on the sea.

On a still, sunny "butterfly" day conditions are reversed and are found a handicap to making a really good bag.

REPORTS FROM THE MOORS

AMONG further bags which have been reported may be mentioned those of 194½ brace on August 19th, at Beldorney Castle; 190½ brace at Clova, on the 21st; 263½ brace at Meallmora (Dalinagary beat), on the 17th; and 225½ brace at Lochan, on the 19th. These all represent excellent sport and would compare very favourably with results in any generally good season. Two of the above were made in Aberdeen, which county has proved to be well up to and even above expectation. Cumberland, too, has turned out to be a fairly bright spot in a season that has been mostly disappointing in England.

SCOTLAND

Aberdeen

BELDORNEY CASTLE (CRAIGWATER BEAT).—On the 19th, 194½ brace of grouse were killed by seven guns: Sir Thomas Birkett, Captain E. Dangerfield, Captain H. Mathews, Commander C. Pinsent, Mr. Lionel Heald, Mr. John A. Ingleby and Mr. J. Libbell. Wind northerly, slight mist. Birds strong and healthy.

CLOVA.—On August 21st and 22nd, 190½ and 148 brace of grouse respectively were killed by six guns: Mr. W. N. Beath and Major E. Hulbert Litchfield, of New York; Mr. H. C. Brown, Mr. A. H. G. Post, Mr. Howard Baetjar and Mr. Edwin G. Baetjar, of Boston, U.S.A., shooting on Cushindarroch.

EDINGLASSIE.—On the 21st, 86 brace of grouse (two drives given up owing to mist); on the 22nd, 99½ brace of grouse; on the 24th, 110 brace of grouse; and on the 25th, 107 brace of grouse were killed by Colonel B. Abel Smith, Sir Gavin Simonds, Colonel Macbeth, Brigadier-General J. Hamilton and Mr. P. K. Stephenson. The following also shot during the week: Mr. J. Palmer Tomkinson, Captain Henry, Colonel Medlicot, Captain D. Abel Smith, Colonel Scott Duff and Major Chance.

KNOCKESPOCK.—On the 14th, 15th and 17th, 119½ brace of grouse were killed by eight guns walking: Captain D. M. Wills and party. On the 19th, driving, 75 brace.

Ayrshire

ALTON ALBANY.—On the 23rd, 67 brace of grouse and 13 hares were killed by seven guns: Mr. W. B. Cuthbertson (shooting tenant) and party (seven guns), driving grouse. Birds strong and healthy.

SKELMORLIE AND BARR.—On August 18th and 19th, 84½ brace of grouse each day were killed by eight guns: The Earl of Eglinton, Mr. L. H. Wilson and party. Birds healthy but coveys small.

Inverness-shire

DALRASHNEY MOORS, CARRBRIDGE.—Mr. Alastair Currie and party have been having excellent sport during the past ten days. The bag to date is 627½ brace of grouse, the best day being on the 25th, when 127½ brace were got by eight guns shooting with one gun only. Among the guns have been: Admiral T. N. James, Colonel F. C. Dundas, Colonel G. P. Grant, Colonel D. Macleay, Mr. William Thomson, Mr. J. D. Jenkins, Mr. T. F. Rawle, Mr. S. Macleay, Mr. J. M. Munro Kerr, Mr. H. L. Usher, Mr. J. D. Waddell and Mr. Currie.

KINVEACHY FOREST.—On the 22nd, 108 brace of grouse, 1 golden plover; on the 23rd, 143 brace of grouse, 1 teal, 3 snipe; on the 25th, 120½ brace of grouse; and on the 26th, 115 brace of grouse were killed by Sir Spencer Maryon-Wilson, Bart., and a party of seven guns. The bags would have been larger, except for bad scenting conditions due to the heat and dry heather, which were great handicaps to the dogs.

MEALLMORE.—On the 15th, 181 brace of grouse (Home beat); on the 17th, 263½ brace (Dalinagary beat) and on the 19th, 192 brace (Westerhanger beat) were killed by eight guns each day; on the 15th, Sir Theodore Brinckman, Mr. C. W. Ogden, Major Barnard, Mr. J. Harrison, Miss Ogden, Mr. F. Rosegarten, Captain H. C. E. Bolckow, Mr. C. H. Gibson (181 brace). On the 17th, Sir Theodore Brinckman, Mr. C. W. Ogden, Major Barnard, Miss Ogden, Sir R. Spencer Nairn, Captain J. Godman, Captain H. C. E. Bolckow, Mr. C. H. Gibson (263½ brace). On the 19th, Sir Theodore Brinckman, Lord Clough, Lord Lovat, C. W. Ogden, Major Barnard, Captain J. Godman, Mr. C. H. Gibson, Captain H. C. E. Bolckow. Birds nothing like so plentiful as last year. This can undoubtedly be accounted for by a certain amount of disease, evidence of which can still be seen.

NAIRNSIDE.—On the 21st, 115½ brace of grouse were killed by eight guns: Captain Sir Theodore Brinckman, Baroness Burton, Lord Somerleyton, Sir K. Lister-Kaye, Major J. Mellis, Mr. G. Harrison, Captain E. W. Jolicey, Captain H. C. E. Bolckow. Birds very healthy and in fine condition, no sign of disease, but birds not quite so plentiful as last year. On the 19th, Captain Sir Theodore Brinckman, Captain H. C. E. Bolckow and Mr. C. H. Gibson, walking in line a small bit of Low Moor, killed 49 brace of grouse, which constitutes a big bag for such a small piece of ground. Birds very healthy and in fine condition.

Kincardineshire

GLENTANNER AND DELAVAIRS.—On the 24th, 60 brace of grouse and 11 blue hares were killed by eight guns: Sir James Caird, Bart., Viscount Arbuthnott, Viscount Colville, Captain Forsyth-Grant, Colonel Remy-Tailyour, Brigadier-General A. G. Pritchard and Masters James and Edward Scrimgeour.

Midlothian

DEWAR AND GARVALD.—In ten days' shooting, walking up, Mr. A. C. B. Lloyd, Colonel J. W. Balfour-Paul, Mr. J. B. Lockhart Clunt and Dirculich.—On the 21st, 60 brace of grouse were killed by eight guns, driving. Misty in the morning, fine later. Good show of birds.

COCKHILL (CALLANDER).—On the 19th, 31½ brace of grouse, 2 blue hares and 3 snipe were killed by five guns: Mr. Robert Neill, Mr. Thomas Neill, Mr. Greer, Mr. A. Greer and Mr. Meikle (driving). Weather very warm. Birds strong and healthy, with coveys large with a few lots of chicpeys. Best stock for at least four seasons. Heather in good condition.

CRAIGNOUK.—On August 12th, 14th, 15th and 18th, 21½, 17, 7 and 11 brace of grouse were killed by three guns over dogs: Colonel Cecil Parker, Major O. E. Chapman and Captain F. L. Trotter. Birds wild and scarce. No disease.

DALNACARDOCH.—On August 26th, 54½ brace of grouse were killed by six guns: Major H. F. Ruddon's party: Captain J. W. D. Evans, Captain E. A. Knight, Captain S. Howard, Mr. A. Thorneycroft, Mr. J. McCormack and Major H. F. Ruddon. A good show of healthy birds. A strong wind prevented many birds from coming forward.

STRATHALLAN MOOR.—On the 19th, 54 brace of grouse were killed by seven guns: Sir James Derby Roberts, Lady Roberts, Captain G. B. Metcalfe, Mr. Norman M. Lee, Mr. C. W. Aykroyd, Mr. John Holdsworth and Mr. Michael Holdsworth.

SUIE.—On the 14th, 16th and 18th, 32 brace of grouse, 5 hares, 3 rabbits and 1 snipe were killed by three guns: Hon. Francis Curzon, Mr. Jeremy Clutterbuck and Mr. Francis Curzon, jun. Walking over pointers. This cannot but be considered a most disappointing result, as there has been no heather-beetle and no disease traceable on this moor. Coveys were few and none contained more than six birds. The keeper could not account for the scarcity, except on the theory that the grouse had shifted their ground temporarily, which can only be proved when driving commences.

SUIE LODGE, LUIB.—In August, on various dates, 75 brace of grouse were killed by two guns over dogs: Hon. Francis Curzon, Mr. Francis Curzon, Jun., Mr. Jeremy Clutterbuck and Mr. Timothy Clutterbuck. Birds are not so numerous as usual, and coveys seldom consist of more than six birds. In spite of fine and warm weather they have been wild on some beats. Heather first-rate, with no sign of beetle and no disease. Best day 20 brace.

TARVIE.—On the 19th, 68 brace of grouse were killed by seven guns: Mr. A. E. Berry, Mr. Derbe C. Berry, Mr. G. Cross, Captain John Courage, Mr. B. M. Courage, Mr. E. V. Ford, and Miss H. Enland. Driving. Birds strong on wing and no sign of disease.

THE BARRACKS (RANNOCH).—On the 25th, 51 brace of grouse were killed by four guns: Major Mann-Thomson, Colonel the Hon. David Bruce, Mr. W. J. H. Forbes and Mr. Mann-Thomson.

TULLYBELTON.—On August 22nd, 37½ brace of grouse were killed by seven guns: Prince Piss, Lord Portsvid, Lord Chaplin, Colonel R. E. Middleton, Mr. A. Murray, Mr. P. McCall, Captain J. Fitzpatrick Lewis. Misty, still day, visibility and light bad.

Renfrewshire

MUIRSHIEL (LOCHWINNOCH).—On August 21st, 132 brace of grouse and 2 hares were killed by nine guns: Lord Howard of Glossop, Hon. Michael Fitzalan-Howard, Hon. Martin Fitzalan-Howard, Lord Elibank, Lord R. Crichton Stuart, Colonel W. Cunningham, Mr. A. H. Bruce, Mr. W. Logan and Mr. D. Johnston. As already reported, there appear to be plenty of birds, especially on the high ground.

Ross and Cromarty

CRANNICH.—On August 22nd, 28 brace of grouse and 2 hares were killed by six guns: Duke of Somerset, Earl Temple, Colonel Spencer, Major Atkinson, Mr. Baskes and Mr. Caillard. Weather fine and clear. Fair show of birds, not as good as last year. No disease.

LOCHLUICHART.—On August 24th, 77½ brace of grouse and 1 hare were killed by six guns: Duke of Somerset, Earl Temple, Colonel Spencer, Major Atkinson, Mr. R. Caillard and General Pollok McCall. Weather fine and warm. Very good show of birds, no disease.

GLENCALVIE.—On August 23rd, 12½ brace of grouse were killed by two guns: Mr. P. B. G. McLean and Mr. G. Webster. Shot in afternoon only.

WALKING THROUGH THE HEATHER ON THE GLENBUCHET MOORS, PERTHSHIRE. COLONEL J. BARCLAY MILNE AND PARTY

Captain Henry, Colonel Medlicot, Captain D. Abel Smith, Colonel Scott Duff and Major Chance.

KNOCKESPOCK.—On the 14th, 15th and 17th, 119½ brace of grouse were killed by eight guns walking: Captain D. M. Wills and party. On the 19th, driving, 75 brace.

Ayrshire

ALTON ALBANY.—On the 23rd, 67 brace of grouse and 13 hares were killed by seven guns: Mr. W. B. Cuthbertson (shooting tenant) and party (seven guns), driving grouse. Birds strong and healthy.

SKELMORLIE AND BARR.—On August 18th and 19th, 84½ brace of grouse each day were killed by eight guns: The Earl of Eglinton, Mr. L. H. Wilson and party. Birds healthy but coveys small.

Inverness-shire

DALRASHNEY MOORS, CARRBRIDGE.—Mr. Alastair Currie and party have been having excellent sport during the past ten days. The bag to date is 627½ brace of grouse, the best day being on the 25th, when 127½ brace were got by eight guns shooting with one gun only. Among the guns have been: Admiral T. N. James, Colonel F. C. Dundas, Colonel G. P. Grant, Colonel D. Macleay, Mr. William Thomson, Mr. J. D. Jenkins, Mr. T. F. Rawle, Mr. S. Macleay, Mr. J. M. Munro Kerr, Mr. H. L. Usher, Mr. J. D. Waddell and Mr. Currie.

KINVEACHY FOREST.—On the 22nd, 108 brace of grouse, 1 golden plover; on the 23rd, 143 brace of grouse, 1 teal, 3 snipe; on the 25th, 120½ brace of grouse; and on the 26th, 115 brace of grouse were killed by Sir Spencer Maryon-Wilson, Bart., and a party of seven guns. The bags would have been larger, except for bad scenting conditions due to the heat and dry heather, which were great handicaps to the dogs.

MEALLMORE.—On the 15th, 181 brace of grouse (Home beat); on the 17th, 263½ brace (Dalinagary beat) and on the 19th, 192 brace (Westerhanger beat) were killed by eight guns each day; on the 15th, Sir Theodore Brinckman, Mr. C. W. Ogden, Major Barnard, Mr. J. Harrison, Miss Ogden, Mr. F. Rosegarten, Captain H. C. E. Bolckow, Mr. C. H. Gibson (181 brace). On the 17th, Sir Theodore Brinckman, Mr. C. W. Ogden, Major Barnard, Miss Ogden, Sir R. Spencer Nairn, Captain J. Godman, Captain H. C. E. Bolckow, Mr. C. H. Gibson (263½ brace). On the 19th, Sir Theodore Brinckman, Lord Clough, Lord Lovat, C. W. Ogden, Major Barnard, Captain J. Godman, Mr. C. H. Gibson, Captain H. C. E. Bolckow. Birds nothing like so plentiful as last year. This can undoubtedly be accounted for by a certain amount of disease, evidence of which can still be seen.

NAIRNSIDE.—On the 21st, 115½ brace of grouse were killed by eight guns: Captain Sir Theodore Brinckman, Baroness Burton, Lord Somerleyton, Sir K. Lister-Kaye, Major J. Mellis, Mr. G. Harrison, Captain E. W. Jolicey, Captain H. C. E. Bolckow. Birds very healthy and in fine condition, no sign of disease, but birds not quite so plentiful as last year. On the 19th, Captain Sir Theodore Brinckman, Captain H. C. E. Bolckow and Mr. C. H. Gibson, walking in line a small bit of Low Moor, killed 49 brace of grouse, which constitutes a big bag for such a small piece of ground. Birds very healthy and in fine condition.

Kincardineshire

GLENTANNER AND DELAVAIRS.—On the 24th, 60 brace of grouse and 11 blue hares were killed by eight guns: Sir James Caird, Bart., Viscount Arbuthnott, Viscount Colville, Captain Forsyth-Grant, Colonel Remy-Tailyour, Brigadier-General A. G. Pritchard and Masters James and Edward Scrimgeour.

Midlothian

DEWAR AND GARVALD.—In ten days' shooting, walking up, Mr. A. C. B. Lloyd, Colonel J. W. Balfour-Paul, Mr. J. B. Lockhart and party killed 245 brace of grouse, 67 various. Birds very strong and wild. No disease. Weather excellent.

Morayshire

REVACK.—On August 23rd, 151 brace of grouse were killed by seven guns: Mr. Reginald Abel Smith, the Duke of Grafton, the Hon. G. Gibbs, Mr. H. Pilkington, Mr. H. de Zoete, Mr. J. Buxton and Mr. S. R. Allsopp. On the 24th, 57 brace were killed by same party. On the 25th, 61 brace were killed by same party (less S. R. Allsopp) (morning only).

Peeblesshire

DAWYCK.—On August 19th, 95 brace of grouse, 1 snipe and 9 hares were killed by seven guns: Mr. F. R. S. Balfour, Mr. Alastair N. Balfour, Mr. John Balfour, Sir Walter Maxwell Scott, Bart., Mr. E. Elliott, Colonel W. Thorburn and Mr. Mark R. Norman, driving.

Perthshire

ARGATY AND THE KING'S LENDERS.—On the 21st, 25½ brace of grouse, 15 hares and 2 snipe were killed by six guns: Mr. D. C. Bowser, Mr. H. C. H. Bowser, Mr. D. S. Bowser, Mr. W. McNair Snaddon, M.P., Mr. A. Bryce Duncan, and Major C. Falconer Stewart. Walking up. Plenty of birds, somewhat wild as a result of night's rain and wind.

BALNAKEILLY AND TARVIE.—461 brace of grouse, 2½ couple of snipe and 1 couple of wild duck have been killed by Mr. A. E. Berry and party of six guns, walking in line for few days, afterwards driving on August 18th, 19th, 21st and 24th. Birds were strong on wing and no signs of disease. A thousand brace could be shot by the end of the season.

ENGLAND AND WALES

Cumberland

BRACKEN BANK MOORS.—On the 21st, on Burnhope (Redan beat), 43 brace of grouse were killed: on the 23rd, on Crossgill, 65½ brace, on Priestdale, on 25th, 58 brace; and on Tynehead, on the 26th, 47 brace, by the following guns: Mr. F. Scully, Mr. S. Robinson, Mr. H. K. Pierson, the Hon. Caryl Baring, Colonel Williams, M. de Smit, M. Cock and M. Durand. Birds continue to show up well, but driving was interfered with badly on the 21st and 25th by mist, and on the 26th by thunderstorms and rain. Bags of 10 brace and 12½ brace were killed on the 22nd and 24th by three guns walking.

Northumberland

LINHOPE.—On the 28th, 109½ brace of grouse were killed by Lieutenant-Colonel J. F. Chenevix-Trench's party of eight guns: Captain Marcus Heywood, Captain Simon Browne, Sir Christopher Magnay, Major E. C. Robbenese-Roddam, Lord Carew, Mr. Charles Chenevix-Trench, Sir Leonard Milburn. Birds strong and healthy with a large percentage of young birds. On the 29th, 26 brace of grouse were killed by seven guns on Blakehope: Major Evelyn Shirley, Mrs. Shirley, Mr. D. Robbenese-Roddam, Sir Christopher Magnay, Mr. Nicol Gray and Lord Carew.

Yorkshire

GAYLES MOOR.—On the 15th and 16th, 41 and 32 brace of grouse respectively were killed by three guns; Major G. H. Cradock and party (driving on the 15th and walking-up on the 16th). Very hot. Birds in excellent condition and no disease. Small moor of 570 acres.

A FORDSON TRACTOR IN OPERATION

NEW SYSTEMS *of* FARM MANAGEMENT

TRADITION in farming makes a first-rate servant and a thoroughly bad master. At this time of year when a fresh annual cycle is about to commence it is worth while examining how far one's system of management is dictated by custom and to what extent by logical reasons. Probably every custom had a perfectly logical origin, but that origin may be so many hundreds of years away that no justification for the practice may exist to-day.

In no direction has the influence of past ages affected our systems of management so much as in the determination of the uses to which we put our land. Location, rather than soil or climate has been the determining factor in this connection, as exerting the principal effect of the disposal of produce.

Writing in the year 1570, William Lambarde in his *Perambulation of Kent* has the following comments in this connection: "The Gentlemen be not heere (throughout) of so auncient stocks as else where. . . . Yet bee their revenues greater then any where else: which thing groweth not so much by the quantitie of their possession, or by the fertilitie of their soile, as by the benefit of the scituation of the countrie it self, which hath all that good neighbourhood, that Marc. Cato, and other old authors in husbandry require to a well placed graunge, that is to say, the Sea, the River, a populaous Citie, and a well traded Highway, by the commodities whereof, the superfluous fruits of the grounde bee deerely sold, and consequently the land may yield a greater rent.

In that black letter passage, just as in "Marc. Cato and other old authors," lies a sound business proposition. It has determined cropping systems for thousands of years, and is responsible for the continued intensity of specialised production in such places as Kent even to-day. Yet the logic on which it was based no longer holds good. To adhere to the ideas implanted by the original reasoning is to ignore the opportunities in marketing which are offered to every farmer as a result of modern invention and progress.

Developments in the transport vehicles using the roads have been much more striking, especially in the last few years than extensions of the "well traded Highway." The result is that without any spectacular increase in the extent of such highways in farming districts, there is hardly any district in the country that is not brought within easy reach of good markets by means of the fast-moving modern light-weight truck. Marketing no longer requires such close contact between buyer and seller as was once entailed by the need for word of mouth conversations. The telephone still maintains that intimate touch over a distance of maybe fifty miles; and the overnight talk between merchant and farmer will send the farm lorry speeding on its journey next morning with just as much assurance of prompt delivery as if the two parties were in the same parish.

In making the fullest use of the new opportunities the farmer has hardly been able to keep pace with the rapidity with which the automobile engineer has been progressing. There still lies before us a tremendous field for reorganisation, based on our new facilities. Unless every chance for improving output is seized, farms must in many cases tend to slip backwards as regards condition and financial returns. This is particularly true where the staple products of former times are of a kind which is meeting a falling demand, and the attitude of mind which leads a man to say that his farm has always grown such and such crops and will grow no other is simply courting disaster. In contrast, it may be said that some of the most outstanding examples of successful farming to-day are the result of a complete changeover in policy undertaken to meet an alteration in the times.

Matters which call for examination in the most critical light extend far beyond the system of utilisation of the land. In all considerations of manuring, for instance, one ought to have some guiding information on particular soils when making decisions on practice. The advisory service officially maintained throughout the country might be much more fully utilised in this connection than it is, for the time and trouble involved in getting soil samples analysed is but small as compared with the advantage of being able to spend one's allocation for manures to the best advantage.

In the use of feeding-stuffs, both home grown and purchased, the exercise of far more critical judgment than is often given to rationing would be well repaid. It often takes a season of scarcity of hay, for instance, to reveal that normal consumption has been unduly extravagant. In the very cultivation of the land, it can be demonstrated that many of the usages laid down by custom and followed without question for generations, are in themselves no longer sound and merely represent unprofitable expenditure.

In urging critical examination of traditional systems of management, I would repeat that I have not a word against customs of antiquity as such. They were probably originated by the most progressive men of their day. The only trouble is that many have long outlived their usefulness, as a result of changing times. They are retained chiefly because adherence to their dicta entails much less mental effort than thinking out a new line of action.

The old Order. Captain Horatio Ross and his Stalker

TWO STALKING CONVERSATIONS—WITH A DIFFERENCE

By FRANK WALLACE

"I HAVE had the happiness of being a deer-stalker for more than half a century." These were the words used by the late Horatio Ross when examined by the Select Committee of the House of Commons on the Game Laws, 1872–73. With these words the late Lochiel opened his introduction to *The Red Deer* in the Fur and Feather series, a volume seldom out of my hands when I first began to stalk in 1896. Little did I think then that the glories of deerstalking would ever suffer eclipse. Only a week or so ago a writer in these pages was deploring its decline, and that there is some reason for his jeremiad is, unfortunately, true. Into the causes of this it is unnecessary to inquire too closely. One of the alleged reasons is that young men to-day are bored with stalking. That it entails too much physical exertion, and that they prefer a less strenuous form of exercise. This may be, and is in some cases, true. It is also said that to be led by a professional stalker spoils their enthusiasm, and that could they stalk alone they would be more ready to pursue the red deer. This, again, may be true, but one must learn to walk before one can run, and it seems to me that many of the young men of to-day are rather indulged. Stalking, when I was a boy, was looked on as a highly-prized treat, only rarely granted and anything but a matter of course.

I have lately been privileged to hear the views of two young gentlemen on the subject, and differing widely they proved, as the labels on the old "Spellikin" boxes of my childhood used to read, "Not only instructive but amusing." At least so they seemed to me.

The first of these was brought to lunch by some friends, and, as he was said to be an experienced stalker, I was told off to entertain him. A pimply youth of about eighteen (I learned, as will be seen, that he was known to his intimates as "Stinker"), obviously on the best of terms with himself, I found it somewhat difficult at first to adapt myself to his mentality. The entertainment of those much younger than oneself is not always easy, and I could tell at once that he was going to be difficult. It is quite permissible to be bored by stalking. Tastes differ, thank goodness, but I had not previously met anyone who professed to be a stalker and yet was bored by stalking. Possibly it was I who bored him. However, I started bravely.

"You're keen on stalking," said I, with bright interest.

"Oh, yeah! It's all right," he languidly replied, without looking at me.

"Have you killed many stags?" was my next effort.

"Oh, yeah! About fifty. I don't keep count." To one brought up religiously to enter every victim, however insignificant, in a carefully kept game-book this was a bit staggering. At his age stags had seemed to me the equivalent of ovis poli, markhor or 90lb. tusks to more experienced sportsmen.

"Any good heads?" said I, heavily wallowing.

"Oh, yeah!" (I winced.) "Sure thing. Three royals and some good ten-pointers." My suspicions were becoming a certainty. He *had* been to the "movies."

He stopped in front of a picture of deer. It showed a bunch of stags, most of them bad heads and switches with one good young eleven-pointer. In desperation, just to find out what his answer would be, I asked which one he would shoot.

"That," he answered, indicating the eleven-pointer.

"It's meant to be a young stag," I ventured.

"Oh, yeah! What's that matter? It's the best head."

No longer able to contain myself, I answered him in his own language. I, too, had been to the "movies."

"Boy," said I, "you've sure spilled a mouthful!"

That did rouse him. Behind that pimply façade I saw the words "You kan't do this to me" trembling. The spark faded.

"Oh, yeah!" said he indifferently. "I'll be going." And he went. I hope I did not look as much of a fool as I felt.

The other boy was of a very different type. Younger by a year or two he came into the room as if he stepped the hill. Looking straight at me with wide, alert, very blue eyes his smile was like the sun breaking through the mist. Absolutely natural, he treated me as an equal, but with a charming deference that one does not always find. There was no need for me to make conversation. He darted about like a dragon fly with a running accompaniment of remarks.

"I say, that's a nice head, but I like that one better. What a ripping picture. Lionel Edwards. He can paint stags. I like them just as much as his horses. I love stalking. Of course I haven't done very much, but I count the days till I get back to Scotland." Curiously enough, a very distinguished and well-known American made exactly the same remark two days later. He was old enough to be the boy's grandfather.

"How many stags have you killed?" I asked, stemming the torrent.

"Well, I killed my first one two years ago, and I killed two last year. They all had rotten heads. You see, father's frightfully particular. I mean about going out and what I kill. I always go with him, though, when he stalks, so I've really done quite a lot for my age. Of course, he's quite right really (this very confidentially). It's pretty sickening when you've got up to a lot of stags and some have really good heads like that one"—he pointed at the picture of the 11-pointer. I interrupted.

"Which of those would you shoot?"

He examined the picture with great care. "Oh, one of those twerps. That switch, I think."

"Go on," said I, satisfied.

"What? Oh, yes. Well, it's not much fun, really, shooting a stag you know might improve, though I would like to get a good head. Father says I can shoot a really good one when I'm twenty-one, if he's got enough money then to have a forest. If I did now, there's not so much to look forward to, and I think of that stag a lot. If I shot one now, and it might improve, I should be pretty sick afterwards. You know, I should always be thinking of what it might have been."

"Might-have-beens are very important," I agreed.

He looked at me quickly, but I looked away.

"Yes, they are, aren't they?" he said. He darted off again. "What nice books you've got! I've read a lot of them. I like Millais best. Who's Bonar?"

I showed him *Forest Creatures*, and he rapidly turned the pages.

"I say, this is jolly good. 'You never may say with certainty where a head of game may not be, I've found that. When you're alone you can't relax. I like being with a stalker because you can look about at the hills and everything, and not be watching all the time. This book's a lot about driving and other game, isn't it?" I told him it was. "There's such an awful lot to learn." He sighed. "I suppose stalking in Scotland is pretty tame after big game?"

I assured him it wasn't, and that a day on high ground in Scotland was about as good sport as one could get anywhere.

"What's the most important thing to learn about stalking?"

This was a bit of a poser, but after a good deal of conversation, we agreed that to learn to shoot from any position, especially off the shoulder, was, so to speak, the ground-work. Then very careful spying, and, if you were stalking alone, the location and memorisation of landmarks which appear so different when viewed from a closer or different angle. Sudden movements he considered very bad, and I gathered that on one occasion he had had to take his father to task for this sin, which had resulted in his losing the chance of a shot.

"Don't you think stalkers are awfully apt to pinch the best place when they get near a stag?" he asked gravely.

I told him I thought it was the commonest fault.

"I thought it might just be my own idea," he remarked naïvely. "I'm glad you think so too."

"Don't ever get in a cramped position to shoot," I ventured, as he seemed to ask for advice.

"No; I'll remember that," he said. "One's a bit inclined to if one's excited. Another thing our stalker's awfully apt to do," he went on, "is to go too fast. I mean he comes on deer suddenly, and they see him. I always try to go very slow when I'm after roe."

"It's even more important after roe," said I. "They see much quicker than red deer and they're more suspicious."

"It's much harder to get a good head, too, isn't it?" he asked. "Millais says so."

I told him I had been trying to get a first-class roe for nearly 40 years, and had not succeeded yet.

"Anyway, it's grand sport trying, and you never know what may turn up."

"That's the whole fun of stalking."

"By the way," I asked, as he was going, "Isn't—I named my previous visitor—at your school?"

He laughed. "Oh, yes. His father's got ——" mentioning a big forest. "Stinker's not a bad chap, but he's a bit blasé. I think his father's got too much money." I was relieved that I was unlikely to come under his condemnation on that score.

"He's shot an awful lot of stags, but I don't think he really enjoys it. It's a bit too easy for him. Why," he went on in a burst of criticism, "he'll have done everything before he's grown up. He hunts and fishes and shoots and stalks, and I believe he goes to night clubs, and, well—everything," he ended comprehensively.

I felt a bit sorry for Stinker, and I felt, too, a bit sorry for his father, though I am quite sure my sympathy would have been wasted. I could not, however, help reflecting that possibly stalking is made too easy for some young men, and that this may, in part, account for its decline. Most of the young men who are kind enough to include me among the number of their friends, are enthusiastic stalkers. Many others would be if they had the chance. Unfortunately, in these days, many of those who are in a position to buy or rent forests, prefer other forms of relaxation. That it is out of fashion at the moment is true; that it will sink for ever I cannot believe. The real stalker, such as my young friend, will always be there, and the sport itself will always remain what it is, one of the grandest in which anyone can indulge.

"Good-bye, and thanks awfully," said my visitor as he left. "Would you mind awfully if I came again? I've loved being here."

"No," said I; "come again whenever you like, I've loved it, too."

So he went, and I was sorry to see him go, with his smile and his enthusiasm and his keenness, for it made me think of the time when I was his age, before I had met any might-have-beens, when the meadows were still trackless, the hills not so high, and memories, too, were not there to keep the shadows from stretching too far.

Stag Party

It is a party where men are men and the whisky is Johnnie Walker. This is a whisky which has all the virtues, just as it has *all* the finest whiskies of Scotland in its blend. Over a century's accumulated skill goes to combine these whiskies in perfect harmony. The result is the smoothest and most satisfying drink a man could ask for. The blending does it!

Gentlemen!

your **Johnnie Walker—**

GOING OUT ON AN AUTUMN MORNING—WHEN THERE IS A REJUVENATING SNAP IN THE AIR

THOUGHTS ON AUTUMN SHOOTING

By LORD DORCHESTER

THOUGHTS on autumn shooting cover a wide range of sport during the pleasantest months of the year, and conjure up memories of some of my happiest days with dog and gun. Weather conditions, for one thing, are usually ideal (always touching wood, notwithstanding), for during autumn latest summer blends with earliest winter in a happy combination of warmth with freshness. Gone are the breathless days of August, while the real chill of winter is still far distant, albeit autumn gives us the aftermath of the one with a foretaste of the other. There is such a rejuvenating snap in the morning air, and so heartening a glow from the mid-day sun, that a man cannot fail to enjoy himself to the hilt, whether he is merely pottering up and down hedgerows with his spaniel, or getting his two in front and one behind each time a covey tops the belt.

It was on just such a day when, at the age of eleven, I fleshed my maiden blade, or, in other words, shot my first running rabbit. I have slain thousands since then, of which I can remember nothing, but every detail of that first kill is engraved indelibly on memory's tablets.

My stepfather walked beside me to enforce the safety codes, as we flanked a hedgerow some hundred yards ahead of a keeper and his two dogs. Hunting men will know, or know of, those thick Blackmoor Vale doubles with their great overgrown banks and bramble-covered ditches, such as we were beating that day. I heard one of the spaniels yelp to a find, followed by a shout from the keeper, "Look out forward, do 'ee mind out, her be a'comin' down ditch right to 'ee," and on the heels of the burred West Country warning the rabbit burst from the ditch at my feet and went racing down the hedgerow, as though the devil had kicked him. Somehow the unwieldy 20-bore found its way to my shoulder, went off with a bang and a violent kick, and there was the rabbit turning a somersault, dead as a doornail.

My first running shot, and a clean kill—my goodness! what a lot I have missed since then. But even the memory of that first shot still lingers, and so even to-day when I take the field on a bright autumn morning how often does my mind go back to leafy Somerset, its rich green meadows and towering hedgerows! I see again a tall bewhiskered figure stalking beside a small boy who is clasping anxiously a badly-balanced gun, while a velvet-clad keeper seeks to restrain the enthusiasm of two badly-broken spaniels. Autumn shooting, as I have said, covers a wide range of sport, and may mean anything from a hedgerow hunt after rabbits, to a 500-brace day on one of the big partridge shoots; or, alternatively, a rough walk in Scotland, where starting in the low ground after partridges, we work our way uphill to take on the rabbits in the bracken as best we can, then emerging from the bracken on to the moor we pick up a few brace of grouse before reversing our proceedings on a long downhill slant to the lodge. Bog trotting, too, in Ireland, after snipe and duck, and even deer stalking, fall within the category of autumn shooting, but what I have in mind is one of those jolly mixed days in England when, with partridges and wild pheasants as our objectives, we spend the day alternatively walking and driving.

Four guns and a couple of keepers, and at the most half-a-dozen beaters, we start by walking some of the stubbles and plough into roots or clover ley. This having been accomplished, there arises the question as to whether we shall walk up the partridges which we have driven in, or drive them over a convenient hedge. The young are all for walking up, the mature in age, myself among the number, favour a drive, but the keeper has the casting vote. That worthy points out that four guns cannot possibly cover the intended front, and also that a drive over this particular hedge may put the birds off our ground, and so in this the first serious attack youth has its way, and we walk up. Later on we come to a field of roots, which is known to harbour a number of wild pheasants, and this time age comes into its own, because the keeper wants to hustle these birds towards home, and so a very pretty drive ensues, pheasants and partridges coming together or alternately, or anyhow.

One gun only is the order of the day, and great is the fumbling to reload when a noble cock pheasant comes sailing along just after we have saluted a covey of partridges. It is a still day, and the partridges do no more than just skim the hedges, but the pheasants, with no near cover in view, soar straight aloft the moment they are flushed, and, flying high, make for the home wood half a mile away.

Thus walking and driving, with intervals of beating converging hedgerows to their points of junction, the day passes all too quickly, but what a delightful day it has been! Forty-brace odd of partridges, some 30 pheasants, a dozen rabbits and two or three hares, just enough for soup, although we might have had 20.

Small beer, my masters, you with your two guns, and your loaders, your spare magazines, and 200 brace before lunch, but there is a lot of good drinking in small beer, and some of us prefer it to champagne.

PARTRIDGE SHOOTING OF YESTERDAY AND TO-DAY

Though shooting over dogs, as shown in Stubbs's painting, is still carried on in a few places, the more general method is that of walking, as shown in the photograph. The Gun in the latter is Mr. Patrick Chalmers

CHUKOR IN NEW ZEALAND

By JOHN MACONIE

ALTHOUGH two years have elapsed since an article on Chukor as a sporting bird appeared in these columns, when its introduction into the Homeland was then mooted, so far as I have seen no great interest was evinced. Nor did any inquiries or discussion appear in the correspondence. Perhaps a few remarks on their introduction into New Zealand and the success attendant thereon, might not be out of place now. Possibly it may be even a guidance. While the various varieties of this bird are to be found throughout part of Europe and a great part of Asia, there are but few places where it has been successfully acclimatised. It has been established in St. Helena, I have read, but the most outstanding instance of success in its introduction has been in New Zealand, where almost every acclimatised animal seems to have thriven even better than in its native habitat. In this particular instance it has thriven certainly as well.

Though chukor were first introduced into the North Island possibly earlier than 1926, they never were a success there, and are not now to be found in that half of the Dominion. Speaking with surety of the South Island, importations from India were first secured by the Otago Acclimatisation Society in 1926, when 25 birds were liberated in the Hunter River Valley. In 1928 a shipment of 42 out of 50 ordered, were landed in Dunedin, and of these 24 were again liberated in the same locality. A further shipment of 38 out of 46 shipped at Calcutta in 1929 came to Dunedin. Of these, 28 were liberated near Cromwell. A batch between the first and second mentioned were not successful, all but one having died en route. From these meagre liberations in Otago have sprung the thousands which are now to be found over hundreds of square miles of this countryside.

Farm rearing of the birds has been tried by the North Canterbury Society for several years, but no great success attended this venture, and within the past few years the stock birds have been liberated, more attention being paid now to pheasants and Californian quail. The chukor has found the foothills of the Southern Alps suitable, and Otago seems to be the favoured province, although they are to be found in the back country of the Ashburton Society in North Canterbury

The birds are extremely hardy, and range throughout the year from the relatively low-lying flats of 600ft. to 800ft. above sea level, to an altitude of 7,000ft. to 8,000ft. Extremes of heat and cold are alike to them. The clutches of young birds usually number from ten to fourteen, and in the shooting season, usually May to July, great coveys are to be seen. Often they are distinctly heard, though not visible among the rocks with which their colouring effectively blends. A dry climate is essential for their welfare, and rocky barren hillsides are their favourite haunts.

They have increased and spread enormously in Otago, but they are evidently too wary for the sportsmen, who make little impression on their numbers. A dozen birds for the season to one gun would be reckoned good here, and such birds are usually shot during quail hunting. Possibly more organised beating and driving as is employed in the Himalayan heights would produce better results. They are seldom seen in flight and then only when flushed or disturbed. They always prefer running or walking to flying, even though their flight is so swift and strong. In feeding they are prone here to take strychnined carrots, laid for rabbits, to their undoing.

Regarding any proposed introduction of these birds into Great Britain a few notes on their feeding would not be out of place. So far as being destructive of anything of economic value in New Zealand, there is no evidence. Possibly they are insectivorous as well as gamnivorous. Their chief food appears, from investigation, to be the seeds of blackberry, Wild Irishman (*Discaria*), Yorkshire Fog, some trefoils, probably sorrel and clover, catsear and chickweed. No instance of damage to crops has ever been mentioned by agriculturalists or pastoralists. It would be a pity if their introduction into Britain should militate against such sport as is afforded by the red grouse or what is more likely in the Highlands of Scotland, our picturesque white game.

Whether the original stock of chukor in New Zealand came from domesticated birds in India, or from a purely wild strain of the N. W. Provinces, I cannot say, but an interesting account of how the natives of Iran shoot and trap chukor appeared in the Royal Geographical Society's Journal of July, 1936, from the pen of J. V. Harrison. The article is entitled "Kuhgala S. W. Iran."

THE ART OF GOOD LIVING

By ANDRÉ L. SIMON

Cigars in Condition

NOTHING that is really best in the world ever just happens; it always requires a certain amount of trouble, care, expense or imagination and cigars are no exception to this rule.

The most important of all is the moment in the life of a cigar when it is lighted, and unless it is "in condition" at that all-important moment, everything is lost.

The tobacco leaf is extraordinarily sensitive, and the finer the leaf, the more sensitive it is to atmospheric conditions; it feels the damp much more acutely than the most rheumatic person: it not only feels it, but it cannot keep it out of its sensitive fibre and damp air is fatal to any good cigar: it makes it sick and unfit to smoke. If it only meant keeping cigars in a hot cupboard to keep them in health, or in condition, all would be well.

Unfortunately, a "baked" cigar, such as one usually gets at luxury hotels, is only a little less bad than a damp cigar; it is not so rank; there is between the two the difference between dry and wet straw; the dry is better than the wet to sleep on, but a spring mattress is quite another thing. So is a cigar in condition.

I remember going to Rio de Janeiro in 1907 with a provision of good cigars—Santa Damiana No. 77—carefully packed to keep the sea air out; they did not last me very long. From Rio I went to Sao Paulo overland and then to Santos to continue my voyage southwards to Buenos Ayres. I joined the boat in the evening and dinner was served soon after we sailed. After dinner, a fellow passenger, whose name was Noel—he was outwards bound to his new post as British Consul at Rosario—took out of his pocket a little parcel and unwrapped one after another alternate sheets of tissue and silver papers; at last he uncovered and lighted a cigar that was in condition and so good that I was ever so keen to ask for one.

There was no band on the cigar but the shape and size were familiar to me and, affecting perfect indifference although in a tense state of excitement, I said to Mr. Noel, "Would it surprise you if I told you the name of the man who sold you this cigar, and what you paid for it?"

"It would," agreed Mr. Noel.

"Well, I believe that his name is Klingenstein, his shop in St. Mary Axe, and that you are smoking a Santa Damiana No. 77."

All correct. And from Santos to B.A., Mr. Noel most generously pressed upon me his carefully packed cigars that were "in condition."

A TRAVELLER'S NOTEBOOK

AT times, I think, life seems rather like a comic opera, for some people behave exactly as if they were playing a part before a large and enthusiastic audience. I will give you an example of this. Years ago, when I was area intelligence officer in Turkey, fate decreed I should be allotted a Circassian secret agent named Suleiman who lived up to the very best stage traditions.

* * *

He was short and by nature very rotund, and various protuberances under his coat—occasioned as I afterwards discovered, by a small arsenal—made him present an even more curious appearance than he otherwise would have done. He boasted a cavalry moustache, which he used to twist, and displayed such pomposity of manner that he was obviously meant to be nicknamed "The Magnificent." Communication between us was a matter of some difficulty, for I spoke no Turkish, and he could only produce exceedingly bad French interlarded at intervals with a language which may, for all I know, have been Circassian.

* * *

As regards secrecy, his ideas were highly original. One might have thought that daily visits to my office tent would have afforded ample opportunity for communication between us. But no; this was not his idea at all; he like the dramatic touch, and every now and then in the middle of the night, when I was sound asleep, Suleiman would arrive and impart in a stage whisper such gems as: "The brigand Mustapha was seen in Yarimja three weeks ago." It was, I suppose, his way of impressing me he was earning his pay, and I do not suppose he ever realised in what danger he stood of suffering assault and battery. With all this song and dance about secrecy, one might have expected he would take great pains not to be seen with me in public. But no, not at all; rather the contrary in fact. Whenever I went to Constantinople, Suleiman would rush up to me on the crowded platform, salute smartly, and engage in bright conversation, so that half Anatolia must have been fully aware of the occupation in which he was engaged.

* * *

All the same Suleiman had his good points. He looked upon it as being part of his job to bring me presents of lobsters, Tafahnjil grapes and tobacco, which had, I am quite certain, been smuggled across the gulf. What is more he was a brave man, and on one of the few occasions when his information was accurate enough to bring us in contact with the enemy, he displayed great courage and advanced with a rapidity that seemed almost miraculous in one of his build. How he got on when we left Turkey, I do not know, but the future seemed uncertain, for he begged from me two Mills bombs which had been found during a raid on a Greek house. He said he was going to keep them on his mantelpiece lest any enemy should come upon him by stealth and started playing with the pin of one of them in such an alarming way that I made my farewell in a hurry.

* * *

Another strange character was an Arab prince, with whom I shared a carriage in the Orient express. Though quite funny, he was also an exhausting companion, for he either poured out to me a long story concerning his adventures in England or else played a violin from which he produced most curious noises partly due, no doubt, to the jolting of the train. He had with him a dog, which was supposed to have a pedigree, and certainly had a temper. It proved a very expensive luxury, as at every frontier after he had declared in ringing tones, "I am a prince," hard-hearted Customs officials charged him a sum large enough to be in keeping with his rank.

* * *

He became very put out by this and the scrupulous attentions to which his luggage was subjected, but announced pontifically: "They do not know me here. Wait till we come to the Turkish frontier, and then you will see them salaam; they will acknowledge my position." Alas! when we did arrive at the Turkish frontier history repeated itself, and there was a most distressing scene. The poor man almost burst into tears when the Turkish Customs official advanced in menacing fashion upon his luggage, and it was only after lengthy explanations and a large tip that a reluctant salaam was forthcoming. But my companion—a man, I imagine, easily pleased—displayed great delight. "He knows I am a prince," he exclaimed, and after painting a glowing picture of how brothers, servants and eunuchs would be waiting for him at the railway station, offered to take me across the Bosphorus in his yacht. But at the terminus not a brother, not a slave, not even a eunuch appeared, and the pedigree dog promptly bit a porter, who did not seem in the least comforted on being assured the wretched animal belonged to a prince.

F. H. M.

LETTERS TO THE EDITOR

RETRIEVER TRIALS

SIR,—Much has been written in your columns and elsewhere on the subject of retriever trials, and possibly any further allusion to them may appear superfluous, but having been a member of the late Mr. W. Arkwright's committee, which originated retriever trials in the year 1900, and having watched their evolution since that year, I may perhaps be permitted to give my impression of these trials as I see them to-day, and especially now that increasing old age prevents me from taking an active part in them.

The conclusions I have arrived at are as follows: Unquestionably field trials, though they may have their defects, have been of very great value and have done much to improve the working qualification of retrievers, and there are far more good working dogs in the country to-day than ever previously. The handling of dogs, too, has greatly improved, and there are many more people—men and women—now capable of training their dogs than the past ever knew.

Field trial meetings, too, are conducted on very good lines, and it is doubtful if much more real improvement can be made in this direction, but I venture to mention a few minor details which I think might have the attention and consideration of the authorities.

Field trials have become very popular, and every year there seems to be more demand by retriever owners for nominations at the various meetings. This has resulted in many of the Stakes being thrown open to too many competitors.

Sometimes it happens that judges are asked to give an adequate trial to 24 dogs in two short winter days, and I maintain that this cannot possibly be done, especially as it sometimes happens that game is not too plentiful; and I consider that when only two days are allotted to the decision of a stake not more than 20 dogs at the most should compete and preferably eighteen, and in a one-day stake not more than twelve dogs should compete. Sometimes it has happened that the donor of the ground has kindly offered it for a third day, but one cannot always expect this concession, and, moreover, it is not always convenient for a handler to stay on with his dog for more than two days. When time has been too short a judge has sometimes said to a handler: "We liked your dog very much and are sorry we had not time to see more of his work."

This is small consolation to the handler, and he goes home disgruntled and dissatisfied. This is wrong.

Pace without Production.—No-one wants a pottering retriever, but I am certain that many very fast dogs miss finding birds through their excessive pace—dogs too that have quite good noses but which do not give their noses a chance. I have seen this happen at trials, and had a good example of it last season on my own shooting. A friend brought with him a dog which I know had quite a good nose; at one of the drives a bird was down in a small patch of sugar-beet. The dog was sent out and began a fast gallop. He must have galloped over the bird a dozen times. After about ten minutes his owner called up the dog and walked himself into the sugar beet and picked up the bird stone dead.

I think that this sort of thing should be more severely penalised at field trials than it is.

Water-work.—A great deal has been written on this subject. Personally, I always feel averse to giving a prize or certificate to a dog that I have not seen in water, especially as in some shootings a dog which declined water would be absolutely useless. In the early days of trials a water test was considered a *sine qua non*, but nowadays at some meetings a water test is ignored, and I know of more than one stake that has been won by a dog that does not face water.

A natural test is the one that appeals to most people, but I always think that there are two objections to it. The loss of time involved, and the very great difficulty of giving all the dogs an equal chance. Many dogs will enter water at command, and if not, a bird thrown into the nearest pond will tell a judge probably all he wants to know. Such a test is, of course, artificial, but much better than none at all.

Training before Game Finding.—I think that of late there has been a tendency on the part of some judges to attach more importance to strict training than of game finding. At one meeting a judge told a handler to cast his dog in a direction where there was no bird down. The bird which was to be gathered lay much more to the right hand. After wasting about ten minutes watching the dog working where there was nothing to be found, the judge said: "Try your dog to the right." The dog found the bird at once, and the handler said: "I thought the bird lay more to the right, sir." The judge replied: "I knew where the bird was all the time, but I wanted to see what control you had over your dog." This is absurd—a mere waste of time and nothing gained. We take our dogs to trials to find dead and wounded game and not to give exhibitions of intensive training.

Pace.—Whilst on the subject of pace I should like to mention an episode which I am told took place later. A shooting party had out with them a retriever bitch (breed not stated). A very strong running pheasant was down which got a long start. The bitch was put on the line of the bird, and took the line very slowly at first, gradually increasing her pace. She hunted the bird a long way and finally into a big field of roots through which she took the line most carefully, eventually getting the bird at the top end of the field. A young and enthusiastic field trial man who was present is reported to have exclaimed: "A wonderful bit of work. What a pity the bitch is too slow for field trials!" I wonder how far a galloping dog would have taken the line of that bird. Not fifty yards, I'll wager!

The Collie System of Handling.—Of late a new system of working a dog seems to have arisen. By this I mean the system by which a dog is stopped and turned by a series of whistles. I take off my hat to the handler who by this means gets such wonderful control over his dog, but I do not consider it is true retriever work. I understand that a catapult is part of the equipment of such a handler.

At all field trials a handler generally knows, or is told, where approximately the bird he is seeking lies, and by clever handling can guide his dog to the spot. But I contend that this is wrong, for it means that the handler is finding the bird for his dog instead of the dog finding the bird for him.

What is prettier in retriever work than to see a dog seeking his bird and making his own casts without the help of his handler, provided, of course, that he does not get out of hand and only looks to his handler for a wave of his arm?

In conclusion, I should like to pay the best possible tribute in my power to all the ladies and men who act as judges at field trials. Throughout the years in which I have enjoyed all the pleasures of field trials, I have invariably found that all judges have set out with the fixed intention of doing their best to discover the relative merits of the dogs awaiting their judgment, and to award the prizes without fear or favour. Mistakes may have been made, it is true, but this has generally been the result of inexperience which time and practice is sure to improve.

Dalliett Hall, H. REGINALD COOKE.
Bridgnorth, Shropshire.

WHY TROUT REFUSE TO TAKE SURFACE FLY

SIR,—Your contributor "Distoffer" presents under this heading in your issue of August 12th what appears at first sight an attractive theory to account for the increasing disposition of trout to prefer the nymph to the floating dun.

I am with your contributor in doubting whether this disposition of the trout is due in any way to the frequency with which artificial flies are floated over them. My own observations over a stretch of years on a length of the Itchen, where the weeds rarely reach the surface and there is practically no confined current, is that it is a question of what is most profitable for the trout for the moment. I have found trout nymphing exclusively under the bank where the current is strongest, unless a cross stream wind served to carry the subimagines hatched in the entire width of the river under the bank where the trout lay. I have observed trout nymphing hard under a bank on one stretch, and on the next bend where the wind was drifting every hatched fly under the same bank the trout have been taking the surface fly as the more profitable line. I think it stands to reason that in any run of water the number of nymphs carried down by the current must exceed, and probably greatly exceed, the number of hatched duns which emerge from the same area of surface, and that it needs a wind carrying the duns emerging from a much larger area of surface into the run where the trout are nymphing to divert the trout from the easier and frequent nymph to the floating dun.

Of course, there are occasions (as at the beginning or end of a hatch) when the number of nymphs brought to the trout is too small to satisfy his appetite, and in such conditions a trout may find it necessary to take both nymph and floater—but I found such conditions rare.

When a trout is, as your contributor says, dashing hither and thither and humping the water within a radius of yards, he is bulging over weeds. But on the length of the Itchen I referred to the nymphing fish were seldom bulging, but lay under one bank or the other where the stream ran strongest, taking with a minimum of exertion the nymphs brought to them by the current.

Yours faithfully,
34, Essex Street, G. E. M. SKUES.
Strand, London, W.C. 2.

GUN FOR DUCK SHOOTING IN INDIA

SIR,—With apologies to your experts, I wish to draw your attention to what I venture to think mistaken advice given in your "Answers to Correspondents," in your issue of August 19th, to "W. H. W.," Lucknow.

I have shot in India for over 30 years, and have seen, in the hands of others, all manner of guns. I have yet to find the owner of a heavy duck gun who was uniformly pleased with it. A standard gun, firing standard 2¼in. cartridges, is much more satisfactory as a rule. Duck are scarcer all over than they used to be, and one seldom confines oneself to them for a whole day; one perhaps begins with them, goes on to snipe, and finishes with partridge, jungle fowl, or the like; all of this may be some miles from a car, and a change of guns may not be easy or convenient. The standard gun brings in as many birds as the heavy gun, and is far easier to handle when standing in water on a muddy bottom or from a light boat, and it is not so liable to smash birds only seen at close ranges through an opening in reeds. This applies particularly to the Lucknow area, which I know very well, for at least 100 miles round that place.

On the big lake jhil at Kuladil Khan, near Quetta, and possibly, but less so, at Zangi Nawar, also in Baluchistan, and at the Manchar Lake in Sind, a duck gun is less of a drawback, as one gets many possibilities at 70–80yds. which otherwise have to be passed up, but even here people who have tried both the standard and the duck guns seem really to prefer the former, and do just as well or better with it. I do not know of similar conditions elsewhere, in Northern India, at any rate. I cannot speak for Kashmir.

Finally, unless one carries a large stock of one's own, the special loads for a duck gun are not easily come by in reliable makes and on a really hot day every extra pound in gun and cartridges makes a great difference to one's enjoyment; such days at the beginning and end of the season are common in the Lucknow area.

Please excuse me writing to recommend an amendment of your advice to "W. H. W." I am quite certain he will be sorry if he follows it. With apologies,

Yours faithfully,
Hotel de Chantaco, C. L. FARLEY (Colonel).
St. Jean de Luz,
Basses Pyrenées, France.

[The reply given was in answer to a correspondent who asked for definite information about long-chambered 12-bores for shooting duck at extended ranges, and was not meant as general advice. As was pointed out, an ordinary 12-bore used with "Ace" or "Maximum" cartridges can be very effective for such sport.—ED.]

SCOTS PINES DYING

SIR,—From the reply sent to E. C. S., Cupar, Fife, published in a recent issue, it would appear that the young Scots pines have been attacked by the pine weevil (*Hylobius abietes*), signs of whose presence on five- or six-year-old trees are beads of resin on the bark, and minute exposed areas of cambium. The damage to the leaves is probably the work of the pine sawfly (*Lophyrus pini*), whose larvæ devour the needles, and may strip a plantation. Apart from the laborious business of collecting and crushing the larvæ, nothing effective can be done, spraying being out of the question in forest work. The weevils can be trapped with 2ft. of 2in. pine poles, fresh and sappy, and laid in a trench in the ground, from May to September, and removed and burnt each fortnight. The weevils will breed in these traps, hence the damage which occurs when young pines are planted on an area which previously carried pine. The stumps and odd pieces of timber left forming breeding grounds for beetles and weevils, an attack must be expected.

Seldom is it serious provided the plants are grown on a suitable soil, planted in an efficient manner, and protected from damage by weeds during the first two or three years. When this is the case, the initial check period will be short, and the trees will soon begin active growth. Trees growing on land ill-suited to their needs, never seem to make a start, and fall easy prey to all the ills of the species. When an ailment becomes epidemic, it is usually found that a more fundamental cause is responsible for the weak and sickly growth, and premature death. Strongly growing trees are seldom, if ever, killed by forest pests.

Yours faithfully,
East Grinstead, REGINALD DAVEY.
Sussex.

HARVEST BUG

SIR,—An infallible remedy always at hand is a mixture of common salt and vinegar rubbed well in till the flesh at point of contact is laid bare.

Being antiseptic, the irritation immediately disappears, and the minute sore speedily heals without further treatment.

Yours faithfully,
19, Dyke Road, EDMUND TREVELYAN.
Hove 4, Sussex.

UNNECESSARY AND UNSIGHTLY ADVERTISEMENT
(See letter "Countryside Hoardings")

COUNTRYSIDE HOARDINGS

SIR,—Now that we are used to advertisements for petrol, oil and land for ribbon building in the country, up-to-date publicity is making a start in the countryside itself. This photograph shows a large and apparently permanent advertisement board fixed in a field well away from dwellings, advertising the manure used. It was taken from the road between Bawtry and Goole, Yorkshire. Surely the next development will be hoardings proclaiming the virtues of the plough, harrow, binder and other machines with which the fields were tilled and harvested? These things undoubtedly spoil the country. Do they really sell more seed and manure?'

Yours faithfully,
Villiers House, EDWARD RICHARDSON.
Villiers Road,
West Bridgford, Nottingham.

A LUCKY CATCH

SIR,—Last year on returning from my annual holiday in Scotland, a Worcestershire relative suggested our taking a rod and visiting the old "Brick Pits," now a fair-sized bit of water full of perch, roach and an occasional pike. Not having fixed up my trout rod for worm, I suggested having a flick or two with a cast I had used the day before on a Scotch loch. As far as I remember, the tail fly was a green and teal. To my utter surprise, hardly had I cast when I hooked a fair-sized pike, apparently in the gills, for after playing him for some moments I got him towards the bank, only to realise we had neither of us brought out a landing-net! Too big to get up the steep bank, and in deep water, it was impossible to land him, and one snap of his jaws on the fine though strong gut, and he was gone.

Yours faithfully,
Tarvie Lodge. MARY HUNGERFORD (Miss).
Enochdhu, Blairgowrie, Perth.

TWO GROUSE AT ONE SHOT

SIR,—The following experience while shooting last week at Strichen with Mr. A. B. Trail, I believe, will prove of interest. In the morning I had a covey of grouse pass me, and killed two birds in front with my first barrel, and two in rear with my second, using one gun. My next shot in the afternoon was at two coveys which joined and passed me in the end butt. I again killed two in front with my first barrel and two behind with my left and two more birds fell behind within 100yds., and were collected dead.

This made a total of ten grouse down with four consecutive shots, which very considerably helped my average.

I believe that this is the more remarkable, Mr. Editor, as you personally know that the guns used are full choke and modified rather than of conventional boring.

Yours faithfully,
Strichen, PAUL A. CURTIS.
Aberdeenshire.

[This correspondent has explained that he carefully picked his bird each time and made no attempt to "brown" the coveys.—ED.]

COCK PHEASANT CROSSING

SIR,—Are there any authenticated cases on record of a cock pheasant having crossed with the common poultry hen, or with the guinea fowl hen, and were the eggs fertile?

Yours faithfully,
South Africa. "ENGLISH PHEASANT."

A CENTURY OF DRIVEN GROUSE

SIR,—In Mr. Martin Stephens' appreciation of the above in the *Field* of August 5th, the most ancient, most royal and most British bird in these islands is dubbed a parvenu. The "Eun fraoch"—heather bird, not moor-fowl—of the Celts, named and famed a thousand years B.C., centuries before Angle, Saxon, or Roman set foot in our islands, to be dubbed parvenu is a little hard.

I have no idea as to what a "Strathhaggis party" may be, but I am quite sure that nothing it may say or do will turn that ancient British gentleman, the red grouse, into a snob.

Yours faithfully,
Overdale, A. W. DUNCAN.
Crieff, Perthshire.

PHOTOGRAPHED IN THE DARK
(See letter "Luminous Wood")

LUMINOUS WOOD

SIR,—While on manœuvres recently, we spent a night in a wood in which many of the trees had been felled for some considerable time, so that the bark was rotten.

On chipping some of the bark off, it was noticed that the underside of the bark was brightly luminous. The tree trunks were wet at the time, and I brought some chippings away. These kept their luminous quality for seven days, becoming slightly more luminous when moistened.

The enclosed photograph was taken of three chippings entirely by the light emitted by them.

It would be interesting to know the explanation.

Yours faithfully,
Plymouth. "PLAFFCH."

RAIN STORAGE TANKS

SIR,—The enclosed photograph was taken in Lingah, a coastal town on the Persian Gulf, now the Gulf of Iran. It shows a rain-water storage tank or reservoir, being constructed.

These reservoirs are known as Birkehs, and are built of a local cement called Gateh, rather like plaster of paris and sand-stone.

They are built inside and outside the town in almost every available watercourse leading from the hills to the sea, and hold, when full, anything from 40,000 to 80,000 gallons.

There are two main openings—the inlet and outlet.

The peculiar dome-shaped covering or roof is to prevent excessive evaporation during the summer months, when the temperature is usually about 98 deg. Fahr., and has been known to reach 118 deg., or thereabouts.

The builders are local Iranian Arabs. Note the human chain formed to transport cement and other building materials to the skilled workers at the apex.

Guinea-worm is very prevalent in the town, and this is believed to be largely due to the insanitary condition of the water supply. In its passage from the hills to these Birkehs, it gathers up the filth of years, and it is not uncommon for cats, dogs, birds, old tin cans, shoes, &c., to be deposited in this delectable *aqua pura*!

Yours faithfully,
Little Steddings, G. A. MUNGAVIN.
Forest Row,
Sussex.

HIND EATS GROUSE

SIR,—Having read of many discussions on the above subject, I thought the following might be of interest.

One of my guests, Mr. W. Forbes, was out stalking on Rannoch Barracks recently; while he and the stalker were watching a herd of stags and hinds about 150yds. away, they noticed a hind which appeared to be eating a grouse. On further scrutiny through glasses, it turned out to be a cock grouse. By the amount of blood on the feathers, it seemed the grouse must have just been killed.

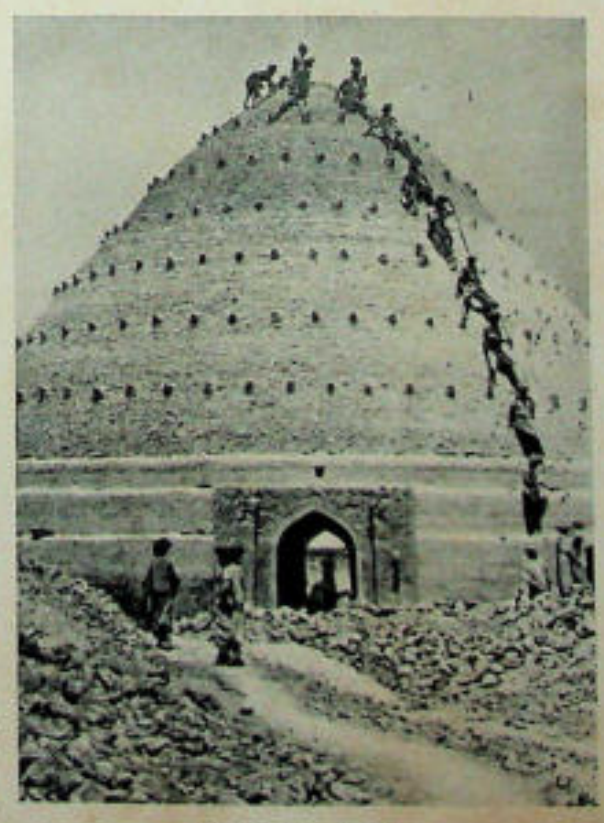
No shooting has taken place on this part of the ground, so it could not have been a wounded bird. After watching for some minutes the hinds caught our wind and moved off. The hind did not relinquish the grouse, but trotted off out of sight with the remains of the bird still in its mouth.

Yours faithfully,
The Barracks, J. MANN-THOMSON.
Rannoch Station.

SCARCITY OF LANDRAIL

SIR,—Having read a letter on "Scarcity of Landrail," by Mr. C. E. Radclyffe in the *Field* of August 12th, I should like to point out that in Westmorland and some adjoining counties the landrail is now extremely scarce where formerly it was abundant, and no little owls have yet appeared in this part of the country. An odd specimen may have been reported as shot, but that is all. I know nothing about the habits of the little owl, but should think it most unfair to accuse it of responsibility in the instance cited in Dorset, when the same obtains in other parts of the country where it is not known.

Yours faithfully,
Fayrer Holme, CATHERINE M. CLARK.
Windermere.



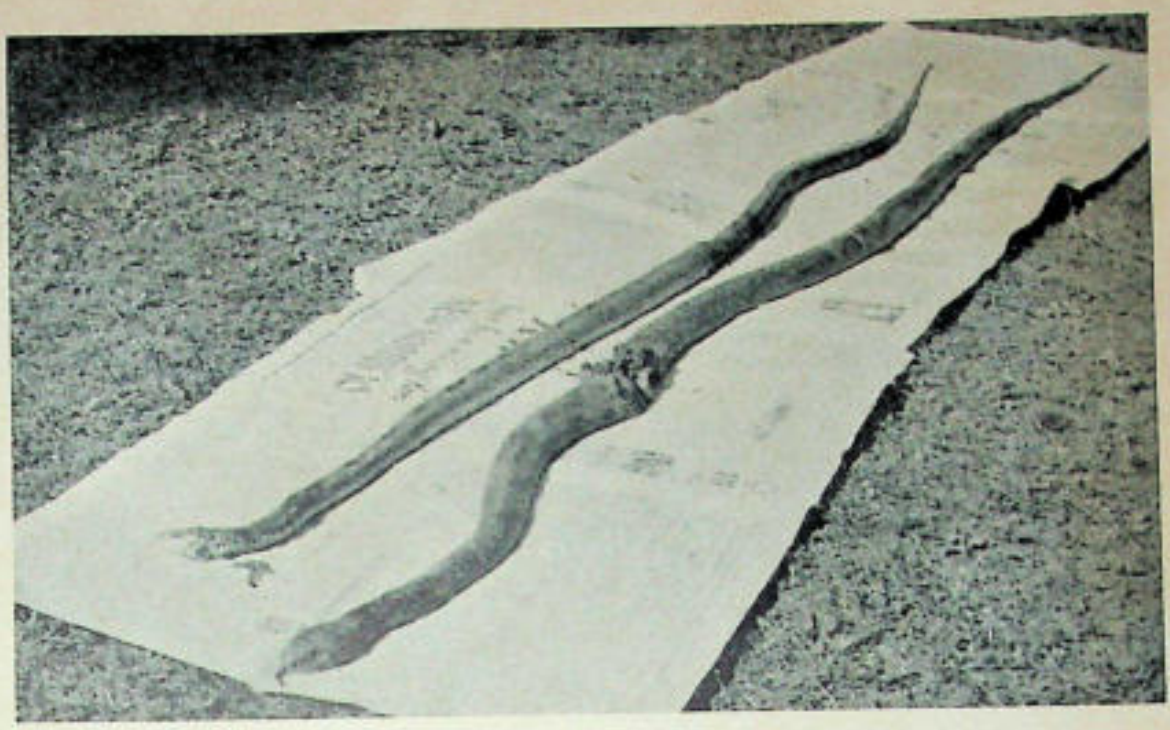
DARING OF AN OTTER

SIR,—I should think the otter which attacked Mr. Parker's hooked salmon, and held on to the fish until it was almost ashore, has about made a record for boldness. I knew of an otter which came at a newly-hooked salmon, and alarmed the fish so much that it made a long run down the river, and so broke the angler's tackle.

On the Earn, near Comrie, in the past summer, an otter came at a brown trout which an angler had hooked. That was during the darker hours, however, and the otter deserted at near sight of the angler.

Otters do queer things at times, as a Mull lady who returned to her picnic basket (which was left near a seaside cairn) found. What she thought was a little brown dog was busy among the eatables, and it was only when the supposed dog plunged into the sea and disappeared that the lady knew it for an otter.

Yours faithfully,
Perthshire. D. M.



BUILDING A BIRKEHS
(See letter "Rain Storage Tanks")

SNAKE CANNIBALISM

SIR,—I enclose a photograph of two snakes, a king cobra (*Naia hannah*) and an Indian python (*python molorus*). When shooting at the bottom of the garden last November, the beaters reported that there was a pheasant sitting on a bamboo. My wife went into the jungle, fired at what she thought was a pheasant—to her surprise, down dropped a snake. When it was picked up there was a second one bulging out of the wound; unfortunately, the beaters pulled it out before the photograph was taken. The king cobra, 7ft. 6in., could only have swallowed the python, 7ft., that day, as it was in perfect condition—the cobra was asleep.

Yours faithfully,
D. G. SMYTH OSBOURNE.

Soom Tea Estate, Darjeeling.

SEVEN FEET OF PYTHON FROM INSIDE SEVEN-AND-A-HALF FEET OF COBRA
(See letter "Snake Cannibalism")

THE CUCKOO AND ITS EGGS

SIR,—Mr. Oliver G. Pike's letter in your paper of August 12th prompts me to send you the following account of a cuckoo and a wagtail's nest. For the last three seasons a pair of wagtails have built their nest in the ivy-covered walls of the lane running past this house. The distance from the windows of the house to the wall is only about 30ft.

A cuckoo has laid in this nest each year, and the last two years the wagtails have hatched and reared a young cuckoo. This year the wagtails built their nest as usual, and laid four eggs in it. One morning early my wife called me to the window and we watched a cuckoo flutter along the wall to the nest, put his head in and bring an egg out in his mouth. This egg he then ate. He then took another egg and ate that also. Taking yet a third egg, he flew away with it in his mouth. I went out to the nest, saw there was one egg only left, and picked up the shells from the ground where he had dropped them.

Two days later in the evening my wife again saw the cuckoo and called me, and we watched him take out the remaining egg and fly away with it. The wagtails did not lay again in this nest.

What can have been the cuckoo's object in entirely robbing this nest?

Yours faithfully,
RUBY.

Dunster.

FARM WAGES

SIR,—I was very glad to see Mr. Pitt's letter re the above, as so much has been written lately on the hardships and low wages of the farm worker that it is well to contradict these misleading statements. On the estates I manage the farm hands' wages average 37/- per week with a good cottage and garden rent free, as much firewood as they care to burn and one quart of milk per day, and 11d. per hour overtime for hay and harvest. The cottages are all in good repair; as Mr. Pitt points out, the sanitary inspector sees to that most efficiently. In one instance, electric light is on the estate and has been installed in all the cottages and is also free. Can this compare with the town worker?

Yours faithfully,
ARTHUR F. BRACHER.

Crowsley Park Estate Office,
Crowsley, Henley-on-Thames.

WOODCOCK SITTING IN JULY

SIR,—Your correspondent "A. H.," whose letter appeared in your issue of July 29th, will be interested to learn that a woodcock was sitting on four eggs on the Newton House estate near Whitby, Yorkshire, on July 31st, 1912, and recorded in the *Field* on September 7th, 1912.

Yours faithfully,
F. SNOWDON.

Whitby,
Yorkshire.

WHERE "GIRLS" ARE BOYS

SIR,—On the Island of Marken, near Amsterdam, Holland, the youthful population appears to consist entirely of little girls. The only way you can discover the sex of the children, as all children under the age of five are dressed alike, is to have a look at the child's cap. You may be sure the wearer is a boy if you find a rosette embroidered on it. When the boy reaches the age of five he leaves his skirts and takes to trousers, and upon reaching seven years of age his curls are cut off. A girl's back hair is allowed to grow long until she is seventeen, and at this age it is cut short, leaving it long at each side. She is now considered grown up and wears a white cap in the place of the flowered one she has worn since a baby.

THREE BOYS FROM THE ISLAND OF MARKEN
(See letter "Where Girls are Boys")

Yours faithfully,
J. DENTON ROBINSON.

The Cottage,
Langholm Crescent,
Darlington.

A UTILITARIAN GARDEN SEAT
(See letter "You Can Take it With You")

YOU CAN TAKE IT WITH YOU

SIR,—The illustration of a long curved garden seat which appeared in a recent number of the *Field* prompts me to send you the enclosed picture of another unusual type of seat which I photographed in a Yorkshire country garden (Newburgh Priory, Coxwold).

As can be seen from the picture, it is of utilitarian construction, being sensibly fitted with a wheel and handles like a garden barrow.

The wheel does not touch the ground when the weight is borne by the legs.

No doubt the ease with which it can be moved is a certain advantage, though it seems to lack that "oneness" with its surroundings which makes a seat look as if it really belongs to its own particular garden.

Yours faithfully,
BERTRAM UNNE.

30, Swan Road,
Harrogate.

HOOPOE IN LINCOLN

SIR,—I thought you might be interested to know that on a recent Friday evening I saw a hoopoe fly out of a small plantation of ours. Also, that for the past six years I have been very keen on birds and during that time there has not been a house-martin's nest on this house. This year, however, there have been two. I thought that these two minor discoveries of mine might be of interest to your readers.

Yours faithfully,
ROBERT W. ALEXANDER.

Brant Broughton, Lincoln.

THE RESULT OF COMBAT?
(See letter "The Horns of a Dilemma")

THE HORNS OF A DILEMMA

SIR,—I enclose a photograph which I expect will be of interest to your readers. There is a herd of buffalo that lives on my estate out here, and the other day I came across a bull in the extraordinary condition shown, with its off foreleg through the loop of its horn. The animal was in an upright position when first seen, but ran off and fell down on my approach.

I was then able to take this photograph before despatching the unfortunate beast. It proved quite impossible to extricate the foreleg from this position.

It would be interesting to know how the animal got into this state. I suppose possibly in combat. Also whether there are any other records of a similar occurrence.

Yours faithfully,
Lolldaiga Hills, H. D. HINDE.
Nanyuki,
Kenya Colony.

SEALYHAM FISH RETRIEVING

SIR,—I think you would be interested to hear of an incident which occurred here the other day. While fishing the River Lyon, I hooked a 1lb. trout, but had no landing net with me. Having played it for some time, and failed to land it, my Sealyham dog—who, incidentally, is seventeen years old—jumped into the water which was about 1ft. deep. He made several attempts to get the fish, and, at about the sixth caught it. He brought it on to the bank and gave it to me. The hook was still in the fish's mouth, and there was no mark on it. The previous day he had caught a snipe and brought it to hand while out fishing. He has never been trained, but will retrieve from water, though not on dry land. I think you will agree that it was a stout effort considering his age and the natural inclinations of his breed.

Yours faithfully,
Cashlie, C. D. EARLE.
Glen Lyon, Perthshire.

A GOLDFISH FROM THE BLUE

SIR,—Recently a resident of Hythe was walking, leisurely reading, in one of the by-roads of the town, when a goldfish fell on his paper. He looked up but could see nothing to account for it, his view being partially obstructed by the surrounding houses. He took the fish home and put it into a glass bowl of water, and it seemed none the worse for its fall.

What probably happened was this: A heron, feeding in one of the private goldfish pounds in the neighbourhood, was disturbed when it had insecurely picked up the fish and dropped it when flying over the town.

The goldfish was fortunate in falling upon such a soft surface as an open paper.

Yours faithfully,
P. VERNON DODD.
Hythe, Kent.

WILD BIRDS (DUCK AND GEESE) PROTECTION ACT, 1939

SIR,—I am much obliged to Mr. Tabrum for elucidating a point which I had failed to make clear. The effect of the Act is to prohibit any order curtailing the close season earlier than August 11th, but it does not prevent an order which extends the close season after that date if the local authority see fit to make one.

Yours faithfully,
20, Leicester Road, W. J. BROWN.
New Barnet.

A GIANT PUFF-BALL

SIR,—I enclose a picture of a "puff-ball" or "puffer," found here which is of extraordinary size and weight. It weighed 10lb., was 45½in. round and 18in. high, growing on a stalk about the size of my little finger. I found it on a manure heap mainly of stable manure and occasional small lots of rabbit paunches.

A MAGNIFICENT SPECIMEN
(See letter "A Giant Puff Ball")

It was on view in the *Hants Chronicle* Office, Winchester, and now has been placed in the Winchester College Museum.

Yours faithfully,
Headbourne Worthy, PATRICK V. LAWFORD.
Winchester.

THE FRIENDS OF THE POOR, 42, EBURY STREET, S.W. 1.—A delicate elderly couple who have known better days are in great need of help. The husband, now aged 67, worked in a small silk firm which gradually lost ground until, at the age of 60, he was the only member left. To re-start at that age was hard, but he managed to keep going by doing odd commission work until last summer, when times became more difficult and his health broke down. At present his only income is 19/3 weekly, a charitable pension, and after paying the rent of 10/- weekly there is very little over to keep him and his wife, especially as they are in poor health and need proper nourishment. Their names are high on the waiting-list of an almshouse, but unless we can help them in the meantime they will be too ill to settle in when a vacancy occurs. We want to allow them 10/- weekly, and also help them with the moving expenses. £26 needed.

IN THE CITY

By OUR CITY EDITOR

LAST week I drew attention to the stability of the country's great banks over the last quarter of a century despite the Great War and its aftermath, the sweeping economic changes seen throughout the world, depressions, booms and prolonged political uncertainty in Europe and elsewhere.

It is in investments in institutions of this kind that the investor can place the utmost confidence even in the present state of world affairs.

Banks are not the only great organisations to be able to show such inspiring records. The great British insurance companies are able to look back on an equal measure of success in withstanding economic and political storms and strife.

Insurance is a necessity of modern economic life. In its many different forms it offers provision for the future and for dependents, and protection of life and property against sickness, accident, fire, theft and the many other hazards of existence.

Under all conditions people will make some effort to save, some effort to protect life and property, and it is this need which is the foundation of insurance business. But from the investor's point of view there is another very important aspect of insurance.

An insurance company if it is to be sound and successful must itself provide for the future. Its assets must be so organised as to provide ready funds to meet all claims as they fall due, with a substantial margin for emergencies. In other words, the insurance company must be an expert investor.

In buying shares of the great British companies the investor can rest assured that he is placing his funds in the hands of those who have probably forgotten more about investment than he ever knew. His dividends come from investment income, and year by year the investments are swelled by insurance profits.

The record of insurance companies in the Great War was remarkable. The Right Hon. C. A. McCurdy, K.C., in a special study for the Trust of insurance shares, shows that £1,000 invested in a group of 24 leading insurance shares in 1913 would have given a return of £4 18s. 8d. per cent.

The lowest level to which the shares fell was in 1916 when they would have been worth £840, but income in that year had risen to £5 2s. per cent. By 1918 the value had risen to £1,234 and income to £6 0s. 9d. per cent., and in 1919 the value was £1,772 and the income £7 6s. 11d. per cent. The same shares in 1937 had reached a value of £4,620 and the income on the original £1,000 was no less than 15¾ per cent.

It seems evident from such figures that in war conditions any increased difficulty of insurance business is offset by the rise in interest rates and increased volume of investment necessitated by Government borrowing and inflationary measures.

Let us take the case of one typical insurance share, say the first on the list on which the above figures were calculated, the Alliance Insurance Company. In 1913 the highest price of its £1 fully-paid shares was £14¾ and the lowest £12¾. The dividend that year was 12/- per share.

In this particular instance the lowest price touched during the War was £9½ in 1917, but in the same year they touched £11 ⅛. The dividend was maintained steadily at 12/- per share throughout the War.

In 1919 the shares reached £16, though the dividend was unchanged, but in the next year the payment was raised to 14/- per share. This was maintained until 1923, when there was also a special bonus of 6/- per share.

In the two following years 16/- was paid and then 17/-, while each year since 1926 the payment has been 18/- per share. Over the past ten years the price of the shares has varied between extremes of £16 and £33. This may appear a very wide variation, but it must be remembered that the period has been an eventful one and covers the world depression and the 1931 financial crisis.

The important fact is that throughout the quarter of a century the investor has never suffered any reduction in his income nor had the slightest cause for any anxiety regarding the fundamental soundness of his holding.

"W. G." BEAGLER.—The following appeared in a daily paper: "The keenest follower of this pastime he ever met used to come down from Eltham for every meet. He was the life and soul of the hunts organised by Sir James Russell at Halstead Place. What was the name of this constant pilgrim from a London suburb? None other than Dr. W. G. Grace. Yes, it was the great man himself. He was as unerring in all the arts and the science of this river sport as on the tented field of our national summer game."

THE NEW

CASE

OUTSTANDING POWER AND FUEL ECONOMY

MANY NEW IMPROVEMENTS

New styling with grid and radiator shutter for accurate temperature control from driver's seat. 4 speeds : 2½, 3½, 4½ and 9 m.p.h. Spiral long-life bevels with new long teeth gears for efficiency and silence. New full pressure lubrication with oil pipes reduced to a minimum. Easy wheel changing. The result of over forty years' experience in the building of really high grade tractors.

The famous Case model "C" tractor has been redesigned with traditional Case thoroughness and is now the model "D". It embodies all the time-proved features together with many new improvements which increase both power and efficiency. Here is a tractor that will do the job in less time, at less cost—a better 'CASE' in every respect, but note the price is unchanged!

SCIENTIFIC BRACKEN CRUSHING

Practical Results from Experiments

THE curtailment of pastures and other useful feeding ground by the insidious spread of bracken is a subject to which much attention has been directed in recent years, for not only are the remoter parts of the country affected, but the weed is even increasing in such places as Richmond Park and other commons close to London.

Great interest in bracken eradication was caused by the discovery of Captain V. H. Holt. He has found that the crushing and bruising of bracken was a more effective method than either scything or other forms of cutting for its elimination. The special merit of bruising and crushing as against cutting bracken lies in the fact that the bleeding of the underground rhizome is continued over a much longer period, with the result that the impoverishment of the underground root system is much more complete.

A further and very important advantage to be gained by this bruising and crushing, as distinct from cutting, is associated with bracken disease. It is a well-known fact that fungi gain an easy entrance into plants through wounds and that many parasitic forms are unable to obtain access by any other channel. The ragged wounds, sticky with the sap of crushed cells made by the Holt Breaker at intervals of 4½in. up the bracken stem, thus provide an unlimited number of potential disease centres. It is not surprising, therefore, that within two or three weeks after crushing, each of these wounds shows clear evidence of fungal invasion. These growths have been examined by Professor W. A. Millard, D.Sc., of the Agricultural Department of Leeds University, who reports that "they are of a nature which greatly accelerates the decay of moribund tissues."

BRACKEN CRUSHING WITH HITCH ENABLING HORSE TO WALK ON TREATED GROWTH

The results of fungoid activity are still more apparent in the year following treatment, for then it is frequently seen that the bracken shows unmistakable signs of disease. Bare patches appear and in one case on Westerdale Moor, where a hillside rolled three years ago has since received no further treatment, the bracken is rapidly on the decline. Plants from this area have been examined by Professor Millard, who reports that he found them to be "infected with the same organism which is associated with other authenticated cases of bracken disease in Yorkshire." When it is recalled that before rolling with the Holt Breaker no signs of this disease had appeared, and that, even now, on the same moorland, those areas which have not been rolled are still free from disease, the evidence in favour of the Holt Breaker as an inciter of bracken disease is very convincing.

The Holt Bracken Breaker was approved immediately upon its introduction by the Department of Agriculture for Scotland for grants in aid of destroying bracken. It has the advantage of being extremely simple, is practically indestructible, and can be used by an ordinary unskilled workman.

The Breaker can go wherever a horse can travel, and if the implement is to be used on rocky ground where the boulders are of a very hard nature, such as granite or whinstone, the drag bars can be supplied in a special nickel alloy iron extremely resistant to wear and fracture. On rocky ground having sandstone boulders special dragbars are quite unnecessary.

A great improvement in design has now been made to the machine, Captain Holt having devised a new type of bearing, which is the subject of additional British, Foreign and Dominion patents (British Patent No. 496,806); it consists of a forward extension, 6in. long, of the half clip bearings, with an additional bolt at the end of the extension to which the coupling chains are fastened. When there is a tendency to overrun, the extension pieces of the bearings drop upon the ground and acting as skids, or sprags, hold the sections and completely eliminate overrunning and tangling.

The new bearings also effect a further major improvement in that drag chains and weights, which were previously necessary to steady the implement, can now be dispensed with. This not only reduces the draught of the machine, but also avoids the tangling of the sections with the drag chains, which previously caused the operator a good deal of trouble with consequent loss of time.

As regards the cost of crushing down the bracken,

it is necessary to pass the Breaker over the ground once only, the smallest size of Breaker giving a cut of 4ft. 2in., and suitable for a small draught horse, will cover eight to ten acres per day at a cost of 9d. or 1/– per acre, the factor being the ability of the operator to keep walking behind the implement, the work being extremely easy.

The convenience, however, with which the bar sections of the Breaker are ganged together so as to give a wider cut and form a suitable load for a large draught horse, or pair of horses, or a tractor, make it a machine specially adapted for large-scale work, and in the multiple bar sizes the cost of treating an acre is appreciably lowered. A five-gang Breaker for tractor draught, with sections 2ft. 9in. long, has a cutting width of 12ft. 6in., and can be used alternatively to form a double Breaker for one large draught horse and a three-gang Breaker for a pair of horses, hooks being fitted to the drawbar or swingle tree and to the chains connecting the sections where required to make the conversion easy.

The implement can be used on many other weed plants, including nettles, and has been found most useful and economical in clearing young plantations of bracken and rubbish which can only otherwise be done by careful scything; it is quite easy to work the Breaker between the rows of young trees in all plantations where the rows are moderately straight.

On open ground a hitching arrangement which enables the horse to travel on the treated growth just outside the growing bracken makes the work for the horse much lighter if the bracken is treated at the best stage of its growth, *i.e.*, when the fronds are just reaching their maximum growth, having drained the rhizome and before they have begun to store up food for the root system. A draught ring is provided for this purpose in the centre of the stretch stick, to which the horse can be hitched by means of a single chain about 3ft. long between a whipple tree and the centre ring in the stretch stick.

It is well worth while to make every effort to tackle the bracken at this stage, because one crushing in a season will be found all that is required, whereas two or three treatments are necessary if the Breaker is used when the bracken is in its early stages of growth, the cost, of course, being proportionately higher.

The ideal stage of growth may be recognised in the tips of the fronds being almost, but not quite, fully uncurled. This will be found to occur in the South of England in a normal season at the end of June, and in Yorkshire, *e.g.*, on Westerdale Moor at 700ft. to 900ft. above sea level, in the middle of July. Haymaking and other farming operations

LEFT: UNTREATED BRACKEN
RIGHT: BRACKEN TREATED IN 1936 AND 1937

will often interfere with the work of destroying the bracken, and for this reason it may be necessary to begin the work rather earlier, the time of commencing depending also on the area of bracken ground which it is desired to treat in the season. The crushing, of course, must not be deferred until after the fronds are fully uncurled, because they have then commenced to build up the reserves of food required by the root system.

The real merit of a bracken machine lies in its capacity to reduce or eliminate subsequent growth, and in this connection the Holt Breaker continued to have very noteworthy successes last season. The illustrations show some of the control patches on Westerdale Moor indicating the progress made, and it has now been proved possible in three years to destroy strong growing bracken and to produce in its place the useful grasses or heath plants indigenous to the locality.

OLD HARRY'S BIRTHDAY

By JULIAN TENNYSON

I HAVE written of him before in the *Field*. I told how, some 45 years ago, as a young man, handsome and upstanding, he was smashed nearly to fragments in one of the worst railway accidents East Anglia has ever known; how he came out of hospital six months later, shrivelled, stunted, a crippled dwarf of a man, to find awaiting him in Willingfield the brief but riotous tenancy of the Frog and Tadpole; how, when the brewery turned him out, he took over the job of village sexton, toiling with a spade almost as big as himself at graves "three foot wide an' six foot deep at sixpence a foot." The deaths averaged two a month, and the sixpences hardly covered the bottom of his money-box.

So Harry Catlin looked round for something to supplement his income. He chose "beating," one of the toughest and most exacting jobs in the countryside, even for a strong young man. Everyone said he was mad, that he would collapse on the first rough day. He had the laugh of us, for not only did he walk his younger colleagues to a standstill, but he also learned the wiles of the work so thoroughly that he became a necessity to every shooting party in the neighbourhood. How he did it was one of the miracles of East Anglia—which is also a true description of Harry himself. And as time went on this indomitable old man took on still more work: pumping the water at the rectory and cleaning out the village school. But beating remained his life and his love, and at beating his skill and fame are fabulous.

He had a birthday the other day, his 70th, and he and Mrs. Catlin chortled over their breakfast as they remembered how, 45 years ago, the doctors had given him a few painful weeks to live. Gnarled and hard and tough as a dwarf oak, he felt good for another fifteen years. He went about the day's work with an added twinkle in his dim eyes, and he licked his cracked old lips when he thought of the treat in store for him. For that evening was to be a festive one; Harry's 70th birthday couldn't pass unnoticed. The landlord of the Frog and Tadpole had promised him two free drinks, and the tinker, the saddler, the blacksmith and all the rest of the tap-room community had volunteered goodness knows how many more. The tap-room was likely to have its most jovial night since the outrageous orgies of his own tenancy, and Harry himself looked forward to drinking more free beer than at any time since the evening when he was released after doing three weeks in jail for refusing to pay for a coat which, he declared, had fallen to bits on his back the first day he wore it.

After an early supper he said to his wife: "Don't yew wait up fer me, m'dear, an' don't let them owd stairs get too crooked while I'm gorn!" He winked, poked her playfully in the ribs and thrust up his rough cheek for a kiss. He then stumped off to pump the water for the vicar.

He left the rectory about half-past seven and set off down the steep hill for the Frog and Tadpole, rubbing his hands on his breeches in excitement. He whistled a tuneless little ditty, but so softly that George Haynes, the young ploughman from Hatchett's, whizzing round the sharp bend on his bike—he was afraid of being late for the party—heard not a sound; he failed, too, to distinguish the squat little figure in the dim light. A second later poor Harry sprawled senseless in the hedge.

Haynes did not lose his head; when he had recovered from his shaking he came straight down to the Frog and Tadpole, and in ten minutes the whole of the tap-room, supplemented by the vicar and the constable, had formed a silent and anxious gathering at the top of the hill. Harry was pulled out of the hedge; his eyes were tightly closed, his face drawn and ashy-grey. From a horrible gash on his forehead oozed a trickle of thick blood; the bridge of his nose was a pulpy mess; one wrist dangled limply, waggling like a puppet's. Hatchett's shepherd, who had been apprenticed to a vet in his youth, knelt over him.

"He ain't dead," said he, "but he soon will be." Sadly we picked the little man up and carried him down the hill, passing the graveyard where he had so often leaned on his spade to watch just such a procession as this. When we came to the neat thatched cottage, the vicar went in first to break the news to Mrs. Catlin.

She bore it without a tremor, like the brave woman she is; poor soul, she has suffered so much for her husband ever since he set out on that fateful train journey. She helped us to undress him, staunched the flow of blood, and talked to us calmly while she waited for the doctor. All this while Harry had not opened his eyes; but the shepherd, bathing his wounds with some secret preparation of his own, assured us that he was still alive.

Three hours later the doctor, his face very grave, came out of the cottage and faced the crowd that blocked the roadway; three-quarters of the village had turned up by that time, for the news was known to everyone long before we had got Harry into bed. "Harry's still unconscious, and I don't think he's got a chance," was all the doctor said. There was nothing more to be done, and we trooped off home with hardly a word.

It was just the same next day, and the day after, and the day after that. The doctor came down to the tap-room every morning and evening, and always he brought the same bulletin: "I doubt whether poor Harry will ever regain consciousness, and it'll be a miracle if he lasts to the end of next week." He used to stop a while and talk to us about Harry in his quiet, deep voice, nodding his head sympathetically as he listened to our tributes to the old man's fortitude and his past prowess in field and covert.

There wasn't much chat in the tap-room, because every day we expected to hear that Harry was gone. The doctor came in on the Friday and said that he was getting weaker and would probably die during the week-end. But he did not; on the Monday morning he opened his eyes and, after staring at the ceiling for some while with the fixed solemnity of a baby, demanded in a loud voice why the devil his wife hadn't called him earlier. He then relapsed into a long coma, from which he awoke at intervals to gibber deliriously about graves and partridges.

By the end of the week the amazing old man was more or less in his right senses and so far recovered that there was no longer any need for the doctor to bring us bulletins. And ten days later he was sitting in his armchair, his head, his left arm and half his face invisible beneath a thick shroud of bandages, looking out upon the world with a twisted but philosophical smile. The doctor said he didn't pretend to know how it had happened: it was one of the most astonishing processes he had ever watched.

For a fortnight Harry hardly moved out of his chair; and then one Sunday morning when the tap-room was full, the doctor suddenly appeared in the doorway, supporting the withered little fellow on one of his stout arms.

The doctor has a sense of humour. "No more beer for six months, not a drop!" he said. The publican groaned.

"No more digging graves, not even your own," announced the doctor. One of the sidesmen sighed and shook his head.

"No more cleaning out the school." The schoolmaster mumbled his dismay.

"No more pumping the water," the doctor went on, ticking off the items on his fingers. "Poor owd rector!" said someone with a laugh.

"And," said the doctor, with awful emphasis, "*no more beating*. Harry, you old sinner," he concluded, "you're damn lucky to be alive!" And with that he went out, while Harry, to the cheers of the company, hobbled over to his favourite corner.

You can see him there every day now, sipping ginger beer for as long as D.O.R.A. permits. He doesn't seem to have changed at all, for he was such an odd shape before that a few more twists and scars are hardly noticeable. We tease him about most things, but not about beating, because at the mention of the word his eyes begin to water and his face grows suspiciously puckered.

His mind is quite made up. The doctor can threaten and curse, but old Harry has announced his firm determination to take the field again before very long. And knowing his rich abundance of East Anglian obstinacy, I shouldn't be a bit surprised if he does. It isn't that he wants the money; he needn't worry about that, anyhow, because we've made secret plans among ourselves to add a little bit to his old age pension.

Those six months are nearly up now; and, my word, what a party there is going to be in the Frog and Tadpole on the night when old Harry Catlin goes back to beer!

INTERNATIONAL *Estate Wagons*

International chassis offer the estate wagon purchaser outstanding advantages. They are fitted with powerful, economical engines and effective hydraulic brakes. There is ample length to accommodate roomy, comfortable bodies suitable for country estates, golf clubs, colleges, schools, seaside hotels, etc. Bodies can be provided to meet every need.

The International Harvester distributor or representative will gladly discuss your individual requirements.

Insulated Game Carrying VANS

International chassis, fitted with insulated bodies of the type shown at the right, make a very useful addition to the shooting and hunting equipment. The long chassis provide space for roomy bodies which can be used to carry supplies, game, trophies, etc. Various types of material can be used to insulate the bodies against heat or cold. We suggest that you discuss your requirements with the nearest International Truck distributor or representative.

The Country House

KITCHEN GARDENS IN SEPTEMBER

By ELEANOUR SINCLAIR ROHDE

THIS month autumn work begins in earnest—routine jobs consisting chiefly of clearing weeds before they run to seed, digging and trenching all ground as it falls vacant, and harvesting crops as Onions and Potatoes.

The plants in full bearing that need most attention are Cauliflowers, late Peas, Celery, French Beans and Scarlet Runners. Cauliflower heads suffer badly in the spells of very hot weather we frequently get this month. They deteriorate rapidly, and even in a day get drawn with the sun. Each head that is showing a heart should have a leaf bent over it, but this must be done carefully, and not so as to break the leaf. Further, whereas most vegetables are best picked just before they are required in the kitchen, Cauliflowers should be gathered in the early morning before the dew has dried off them. The flavour is better, and even a few hours of hot sun is sufficient to draw a Cauliflower head in perfect condition. Most cooks are very conservative in the ways of cooking Cauliflowers, but when there is a glut of them a little variety is pleasant. Cauliflower and Tomato pie is excellent. To make this, cut a Cauliflower that is nearly but not quite cooked in slices and fill a well-buttered baking dish with alternate slices of layers of Cauliflowers, a really good white sauce thickened with cheese, and slices of skinned Tomatoes. Sprinkle with finely-grated brown breadcrumbs and cheese, and a few little pats of butter. Bake in a hot oven for fifteen minutes.

Late sown Peas should have their tops pinched off as soon as they reach the tops of the pea-sticks. This encourages early setting of the pods. Every pod should be gathered before it begins to harden, otherwise the oncoming Peas are retarded. Similarly with French Beans and Scarlet Runners. If pods are allowed to mature the plants soon cease to be productive. In the case of Scarlet Runners, the weak tips should always be nipped off, as they are never productive, and merely take the strength from the lower part of the vines. Earthing up Celery is an art. The ideal is to do the early earthing up in such a way that the soil does not press closely enough to prevent the heart expanding. The outside of the ridges should be banged firm with a spade at the second earthing up, but inside should still not be too firm. Celery blanched with sea sand has an excellent flavour, but river sand can never be used as it may contain oxide of iron.

The last sowing of Lettuces is made this month also Corn Saladand American Cress to stand the winter. In mild parts hardy Lettuces such as the old Bath Cos, Stansted Park and All the Year Round can be sown on a warm border in the open the first week of the month. But even in mild parts it is always advisable to make sowings in cold frames. Thin sowing and thinning as soon as possible to about 2in. apart are essential, for first-rate results cannot be expected from plants that have been left huddled in the seed rows. It is important all through the winter to keep the soil aerated between the rows and until the turn of the year, or until severe frosts begin the frames should be kept open during the day. Over coddling merely makes for sickly plants.

Corn Salad and American Cress are little grown during summer, but in winter, when variety for the salad bowl is not easily found, they are useful. Both are of the easiest culture, merely sowing the seed in drills 6in. apart and thinning to 3in. apart. The thinnings can be used. In winter we also add a teaspoonful of chopped evergreen herbs, such as Lavender, Rosemary, Sage Garden Thyme and Winter Savory, and this is a great improvement, for Lettuce by itself is dull.

Small fruits need attention this month. Late Strawberry beds, if not attended to in August, need immediate attention. Many growers believe in burning the straw as it lies, and though this may seem harmful they assert that it is not, and that it destroys insect pests. Any plants that show "small leaf" should be taken up and burnt. Plants layered into pots and by now well rooted should be put in their permanent positions as soon as possible. Young plants that have been ordered by post to be planted this month should be put in water for at least three hours. The job of planting should be done with a trowel and never a dibber, as by using the former it is possible to spread the roots out properly and make them very firm. The usual distances to allow are 18in. between the plants and 2ft. between the rows. Never bury the crown of the plants.

All Raspberry canes that have fruited should be cut out as soon as possible, so that the new growths will have all the light and air. New growths should be tied up, but not too tightly. Autumn fruiting canes are not pruned till spring, and in mild parts quite heavy crops of these autumn fruiting kinds may be gathered right up to Christmas. Lloyd George is still a favourite variety. It is essential to support autumn fruiting kinds, for unlike summer fruiting varieties they bear towards the tops of the canes instead of the whole length. Consequently when improperly supported the fruits are apt to get splashed with mud in late autumn.

Blackberries should be pruned as soon as they have finished fruiting. These fruits vary so greatly that a particularly prolific first-rate kind should be propagated, and this should be done now. On sandy soils it is only necessary to layer the tips by arching over the young canes and covering their tips with 2in. of soil. On heavy soils the tips should be layered into pots filled with a compost of loam and leaf-mould in equal quantities. In either case the rooted tops should not be separated from the parent plants till spring.

MAINTENANCE CLAIM

By REGINALD DAVEY

A FEW years ago readers of *The Times* were amused at the problems of a certain Mr. Doe, who, having made a fortune in the City, retired into the country to live on his recently-acquired estate. Of his abortive attempts to apply business methods to the countryside, of the various calamities that befell him, and finally when he had "come to himself," of the precautions which he took to avoid inroads into his finances. Not only was he able to reduce his liability in respect of the various calls by the State, but he actually counter-attacked by means of a mysterious weapon called a "Maintenance Claim."

An owner pays tax under schedule A of income tax in respect of all real property that he owns. This is the landlord's property tax, and the amount is based on the rental value of the land or buildings. To arrive at this figure certain deductions may be made, including an allowance for the cost of carrying out the periodic repairs necessary to maintain the property. This repairs allowance is calculated on a sliding scale according to the amount of the assessment, but 20 per cent. is an average figure for houses, and for land it is one-eighth.

Invariably the expenditure on repairs exceeds this figure, and to meet the hardship it is possible to reclaim income tax and surtax on the excess cost of repairs, insurance and management so far as it exceeds the statutory allowance. If the property is under-assessed by reference to the rent paid, the amount of the under-assessment must be deducted from the claim.

In order to avoid large variations, the claim is computed on the basis of the cost of repairs on the average of the preceding five years. In the case of a first claim where previous figures are not available, the Inspector of Taxes will admit a separate claim for each of the first five years, after which the average will be the basis.

Relief is usually given by way of repayment, but if the claim is submitted in good time the relief can be set off against tax due. This is convenient and quite possible in most cases, for the claim for the five years ended April 5th, 1939, will affect the tax year 1940/1, the first instalment of which will not be due till April 5th, 1940.

When a claim is first considered, it is possible to submit at the one time claims for the preceding five years, which will usually involve a substantial initial repayment. The revenue do not inquire the source of money spent on repairs, so that a purchaser can secure benefit from a predecessor's expenditure. A tenant for life can likewise include in the claim sums advanced by the trustees out of capital monies. Even a loan for improving the cottage of a farm worker can be shown in the maintenance claim.

To prepare a claim, form 99 must be secured from the inspector. Headings are provided for maintenance, repairs, insurance and management. The last item covers the agent's salary and expenses. Insurance means fire insurance. The meaning of "repairs" is quite clear. It is "maintenance" that causes most of the difficulty.

It would cover the replacement of a worn-out building, provided it is necessary in order to maintain the existing rent. If any additional rent or interest is payable the replacement becomes an improvement and may not be included in the claim. It may even pay to forgo interest on an improvement required by a tenant rather than lose the reclaim of income tax and surtax.

Improvements and additions to buildings are allowable, if no increased rent is payable, and provided they are made in order to comply with a statutory requirement. An example would be modernising a cowhouse in order to comply with an order from the sanitary inspector. There must be a statutory requirement coupled with no payment of interest, for the claim to be admissible.

Ordinary farming or garden expenditure may not be included, but certain unusual items sometimes arise. For example, the wages of a caretaker looking after an empty house during a period of vacancy, or the wages of a gardener looking after the garden of an empty house which it is desired to let, in order to keep the place looking presentable and maintain the rental value.

All the land and houses on an estate must be included together, and individual buildings may not be treated alone. The maximum limit for the claim in any year is the total tax paid under Schedule A. There is accordingly a maximum as well as a minimum figure to bear in mind. In spite of this it will usually be wise to prove all expenditure, even beyond the maximum, so that the benefit may be received in future years.

SKILLED ADVICE BY

Archie Compston

COMMENCEMENT OF THE TAKE-BACK

The most noticeable difference between the "dub" and "class" golfer is to be seen in the commencement of the "take-back."

The "rabbit" will start the club head first, working from the shoulders downwards, whereas the "tiger" starts the movement from the feet upwards. This gives greater freedom and width in the "throw-back" on the back swing. Compare the two movements.

MEDLARS, WITH THEIR BROWN, ALMOST SPIDERY, FRUITS, ARE GATHERED SOME TIME IN NOVEMBER

A NEW INTEREST IN FRUITS

By W. E. SHEWELL-COOPER, F.L.S., N.D.H., F.R.S.A.

IT has been said, with some justification, that there is a real wave of Victorianism sweeping over our gardens. Carpet bedding is being seen again. The Horticultural Department of Reading University gave a very fine demonstration of this at the Centenary Royal Agricultural Show this year.

Pelargoniums are again in favour. Such an interest is being taken in fuchsias that a National Fuchsia Society has been formed, and held its first show in the R.H.S. New Hall in July.

With flowers, so it is with fruits. More inquiries are being received now about mulberries, quinces, bullaces and the like, than for many a year. This modern studied interest is a reasonable one, for there is something monotonous in the continual cult of the apple, pear and plum. A quince in an apple pie makes all the difference! Properly preserved, mulberries form a conserve above all others. The medlar, served as an alternative to nuts with port, is the connoisseur's delight.

Apart from the fact that the epicure may crave for these almost unprocurable delicacies, the garden delights in them for the trees themselves, as trees are so decorative. The mulberry is just the setting for an old-world garden. The medlar looks equally well, and not only is it pretty when flowering, the flowers being large, white and solitary; but it looks just as attractive and weird when the brown, almost spidery, fruits are gathered some time in November.

The medlar will grow on practically all soils, though a deep, rather moist loam is said to be preferable. It is believed that when planting medlars on a dry soil, the trees should be purchased grafted on to the whitethorn stock.

There are three stocks usually used by nurserymen—the wild pear for standard trees, the quince for dwarf trees, and the whitethorn for situations as described above. Standards grow well in grass, or even in hedgerows, and prove popular specimen trees for any sunny spot in the garden. A medlar, though, does just as well as a bush or a pyramid.

The young trees should be pruned in the same way as an apple, and once established in six or seven years' time, little pruning is necessary other than the cutting out of dead and diseased wood, the removal of crossing branches, and perhaps the cutting out of one or two misplaced growths, so as to let in light and air.

It is usual for the fruit to be gathered in November and to be stored, calyx downwards, on sheets of clean paper in a cool, dry room. In about three weeks time the fruit should have turned brown and should begin to decay. This is known as "bletting." It is when decayed that the fruits are fit for use.

There are three good varieties—the Dutch, which bears large fruit of good flavour and is perhaps most suited as a standard; Nottingham, which bears medium-sized fruit an inch in diameter, pear-shaped and of excellent flavour. It is best grown as a bush; while Royal, a prolific cropper, even when young, bears fruits of a nice acid flavour. It is known to do well both as a bush and as a pyramid.

Only one variety of mulberry is normally grown in this country for fruiting, and that is the black. It was originally a native of Persia, but is now fully acclimatised. It crops heavily, and is of excellent flavour.

It dislikes a shallow soil, and the best fruit is always obtained from trees growing in cultivated land. In gardens north of Birmingham it should be grown against a wall. It can be planted as a standard, as a bush, pyramid or wall tree. Its roots are thick and fleshy, and great care has to be taken when digging them up out of the nursery, and when planting them, not to break them. The best time for putting in mulberries is March and early April.

The fruit usually ripens late in August and early in September, and should be picked when it is blackish-purple. It is quite a good plan to lay cloths on the ground and then to shake the branches. Only the properly ripened fruits fall off, and these are in the right condition for dessert purposes. The cook will prefer to receive hers when they are bright red.

The quince is certainly an ornamental tree, and bears quite large and beautiful flowers in June. The fruits are also attractive, for they are golden in colour and will hang on like large lemons, long after the leaves have fallen.

Quinces do well on rich loamy soil, and flourish near a pond or on swampy ground. As a matter of fact, they look well close to a stream or pool because of their pendulous growth.

Quinces may be planted as bushes, pyramids or standards. The standards should be three or four years old when purchased, and the bushes two or three years of age. Planting should be carried out before Christmas. Little pruning is necessary, and all that is to be done is to cut out overcrowding branches to let in light and air, and produce an evenly-shaped tree.

It is never advisable to store quinces in an ordinary storeroom for their flavour will taint the other fruits. It is quite easy, though, to keep them for a couple of months in boxes filled with bran or chopped straw somewhere on their own!

Bereczki is the best flavoured quince there is. It crops heavily, has very large fruits and, what is more important, often crops when the tree is only two years of age. Portugal bears a large pear-shaped fruit, mild in flavour. Its flesh turns red when cooked. It is a strong, vigorous grower, but not such a heavy cropper as other varieties. Meech's prolific is a good growing, good bearing, variety which throws large fruits. Its great advantage is that it may be used late.

The bullace is a pleasant alternative to the eternal plum. In the Midlands it is known as the Winter Crack or just Crack. This may be derived from the German namé Krieche. The Black Bullace is, perhaps, the oldest English variety. It bears oval, dark red-purple small fruits, forming a slender, twiggy, round-headed tree. It is best not to pick bullaces until they have been frozen, but once gathered they are excellent for bottling, jam-making, and in East Anglia, many a housewife produces from them a delicious wine.

The White Bullace is another old variety which can be distinguished from the white damson because of its roundness. The fruits are of a pale milky-yellow colour and are covered with a thick white bloom. Either of these varieties will flourish wherever plums are grown.

Other fruits that might come under the "old-fashioned" category are the crabs, the cranberries and bilberries. All have a claim to being decorative as well as profitable.

HORTICULTURAL ADVICE

Care and Attention of Lawns

By CARTHEW ALLERDYCE

THERE is nothing nicer than a perfect lawn, but, unfortunately, there are still some people who believe that turf can just look after itself. A lawn needs as much care and attention as any other part of the garden, and it has been estimated that if a grass tennis court received the same care and attention as some of our best putting greens, they would cost in upkeep £50 per year each.

Many lawns form a dense mat below, because they are not properly aerated. Correct aeration helps a great deal during drought periods, and does much to discourage the growths of moss. Regular spiking has now become a routine operation on our best lawns, and it is fortunate that there are several mechanical automatic spiking machines on the market for the purpose. One is made by Pattisons & Co., Ltd., of Stanmore, Middlesex; another, the E. Smith Renovator, by Messrs. Dickson & Robinson, of Cathedral St., Manchester; while a special hollow tine piercing fork is made by William Paul's, of 182, West George Street, Glasgow, C.2.

It is a mistake to cease mowing a lawn too early. It is essential to go on mowing as long as the grass is growing. The more the mower is used, the less is the withdrawal of soil nutrients. Experiments have shown that mowing three times a week, for instance, gives better results than mowing once a week.

Rolling may usefully be done in the autumn, providing care is taken not to consolidate the soil, and so cause poor aeration. The roller used should be no heavier than 2 cwt., and the rolling should not be done (as is commonly practised) on a wet day. If bumps appear in the turf, and need flattening down, the turf should be removed at this point in the normal way, the necessary subsoil dug out, and the turf replaced, watered and rolled down.

Moss can be removed if raking is methodically done with one of the modern wire fine-tined rakes. There are two on the market at the moment, one known as the Springbok and the other as The Flexo. These rakes scratch out the mossy material satisfactorily without disturbing the grass roots unduly. The moss, once removed, should be swept up and may be put along rows of crops to act as a mulch.

Those who have lawns that are still infested with weeds or clovers should do everything they can now to make them weedless. A mixture that has proved very successful consists of three parts of sulphate of ammonia and one part of sulphate of iron. This should be applied at the rate of 2oz. to the sq. yd. It is necessary to keep the chemicals perfectly dry before applying them, and to see that the composition is perfectly fine and contains no lumps. This dressing must be applied evenly or else it will scorch.

Those who fear scorching may use one of the proprietary lawn sands, such as are offered by Messrs. Sutton's of Reading, Messrs. Carter's of Raynes Park, Messrs. Ryder's of St. Albans, and Messrs. Ozone Chemical Co. of Wheelock, Sandbach, Cheshire. Those who like to buy the fertilisers mixed to their own recipes should approach such firms as E. G. Jepson & Co., 5, Crown Point Road, Leeds, or Messrs. Couper, Friend & Co., of 33, Eastcheap, E.C. 3.

A good lawn sand may be made up of three parts sulphate of ammonia, one part calcined sulphate of iron, and one part sand. This should be applied at 4oz. to the sq. yd. The sand does prevent any undue scorching.

New lawns may be laid down at this time of the year, either by turfing, seed sowing or by planting out stolons of a stoloniferous variety of grass. Seed sowing is the most inexpensive method, and has proved a very satisfactory way of establishing perfect turf. Seed mixtures are offered by Messrs. Carter's and Messrs. Sutton's, and, in addition, such firms as Messrs. Geo. Woodhead & Son, of 83, Kirkgate, Leeds, Messrs. Clucas & Co., Ormskirk, Lanes, the Fine Turf Culture Co., 18, Putney Bridge Road, S.W. 18, and Messrs. W. W. Johnson, of Boston, Lincs, offer the finest quality grass seed for all purposes.

An excellent formula consists of five parts Chewings Fescue, two parts Creeping Red Fescue, and three parts New Zealand Bent.

Those who prefer to turf should approach such firms as John R. Stutt, of Potter Hill, Paisley, Maxwell Hart, Ltd., 39, Victoria Street, S.W. 1, and Messrs. Clark & Co., 13, Victoria Street, S.W. 1.

If the stolon method is to be attempted these should be removed, cut into short lengths and distributed evenly all over the prepared ground. A slight top dressing of soil is necessary afterwards. The grasses soon grow.

GIVE COLOUR TO YOUR ROOFS

Ruberoid Slates in warm, mellow colours always look neat and give permanent service at moderate cost on all types of estate and farm buildings, bungalows, garages, summer-houses and garden shelters. No experience is required for fixing. Ruberoid Slates are supplied in Twin Butt form or in neat Octagonal strips, complete with all accessories for fixing. Three colours: Venetian Red, Westmorland Slate Green, and Steel Blue. Stocked by leading Builders' Merchants and Ironmongers.

Specimen Slates and explanatory booklet sent on request.

THE TWO OCCUPANTS OF AN 8 H.P. THREE-WHEELER MORGAN STOP TO ADMIRE HELM CRAG ACROSS THE CALM WATERS OF RYDAL WATER

BOAT DESIGN FOR THE WATER-SPEED RECORD

"I Feel Confident that a Speed of 200 m.p.h. Can be Achieved"

By CAPTAIN SIR MALCOLM CAMPBELL

(First to achieve 300 m.p.h. on land, and holder of the Water Speed Record)

(Motoring Editor of the "Field")

EVER since I made my first attempt on the world's water-speed record in 1937 I have felt convinced that speeds undreamt of in the past would be reached on the water in the not too far-distant future, and now after our recent success on Lake Coniston with a boat of entirely new design I feel confident that a speed of 200 m.p.h. on the water can and will be definitely achieved in a very few years' time.

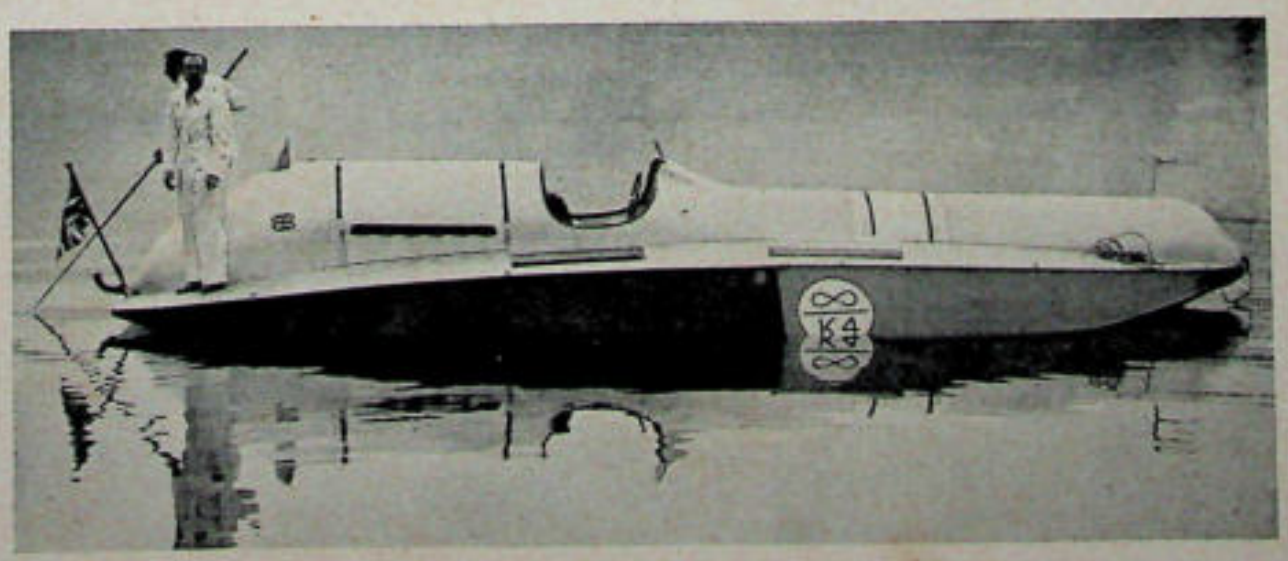
Progress in this sphere has been comparatively slow when it is borne in mind the enormous strides that have recently been made with the automobile and aeroplane and the high speeds that have been recorded by both.

Since there is so much in common between the racing aeroplane, car and boat it is obvious that certain lessons learnt in the realms of the one should assist in the others, provided those lessons are properly applied, which in the past they certainly have not been so far as high-speed boats are concerned.

Let us for one moment look back over a period of ten years and see how slowly the speed has been mounting up: in March, 1929, Gar Wood, the American, set up a new world's water record with a speed of 93.12 m.p.h. The following year the late Sir Henry Seagrave raised the figure to 98.76 m.p.h. In 1931 there was a ding-dong struggle between Gar Wood and Kay Don, first Wood holding the record with 102.25 m.p.h., then Don with 103.49, and finally Kay Don with a new boat raised the figure to 110.22 m.p.h. In 1932 Gar Wood broke the record with 111.7, and a few months later Don raised the figure to 119.81 m.p.h. Wood made another attempt in September of that year with a much more powerful boat and put the record up to 124.86.

That figure remained unbeaten until the Blue Bird came into the picture in September, 1937, when the speed was raised to 129.5 m.p.h. A further attempt with the same boat twelve months later only succeeded in adding a very small margin to the record, bringing it up to 130.93 m.p.h.; so that over a period of ten years only 37 miles per hour was added to the world's water speed record. Surely, therefore, something must have been wrong somewhere, especially when both the motor car and the aeroplane speeds have been soaring up and up.

To give some comparison over the same period, ten years ago the land speed record stood at 231.3 m.p.h.; to-day it has been raised to 368 m.p.h. and the aeroplane from 347.7 to 469.225. It is quite obvious that the aeroplane will always be ahead of the car so far as purely speed is concerned and both will be a long way in front of the boat, but there is no reason why there should be the huge margin between their respective performances which now exists: of that I am certain.



Regarding our recent successful efforts on Lake Coniston, although the record was raised from 130 m.p.h. to 141 m.p.h. in the first attempt, *i.e.*, an increase of 11 m.p.h., the performance was much more significant than most people could realise, inasmuch as only an old test engine was being used at the time, the boat was not in racing trim, and moreover, we were purposely using all the same underwater gear that had been employed in the old boat, so that we could tell exactly that any improvement gained was due entirely to the hull design and not contributed to by any other factor.

It is my belief that had we carried out prolonged tests and effected one or two minor modifications to the old boat, we should have reached a speed well in excess of 150 m.p.h., and with still further alterations which would have taken several months to complete, I think 165 m.p.h. or more would have been possible. When we commenced building the first Blue Bird speed boat in 1935 we did incorporate in its construction the lessons we had learnt on the road and race track, and the point which received the most meticulous attention was the ever-important problem of power to weight.

Gar Wood's American boat, which was holding the record at that time, was equipped with four supercharged Packard engines each of 1,800 h.p., making a total of 7,200 h.p. Our boat had a single Rolls Royce motor of 2,000 h.p., weighing approximately 1,850lb., and the total weight of the complete craft topped the scale at slightly over 2 tons, so that we had a power to weight ratio of 1 b.h.p. for every 2¼lb. of weight, which was a remarkable engineering triumph.

Our new boat is practically the same weight even though it is somewhat larger, but its outstanding success is due to the fact that underwater friction has been reduced to the absolute minimum—in fact, it shows an improvement of 45 per cent. less in this respect than our first boat. The new craft has taken nearly two years to build, over one year of which was spent in carrying out exhaustive tests with models in the tank and wind tunnel, but all that spade work has been well worth while, and we are delighted at the results achieved, as it proves the faith we had in this particular design was justified, and that there are enormous possibilities for the future.

A LICK AND A PROMISE.—The problem of keeping the 50,000 R.A.C. signs clean is a big one, and an official of the Club was struck by the fact that one particular "village" sign in Hampshire never seemed to need attention. By a lucky coincidence the reason was discovered. The sign has been erected on the grass verge adjoining a gate into a farm. Each time that the cows are driven in and out of the farmyard one of them bestows three or four hearty licks on the sign.

ORWELL WORKS, IPSWICH

WELCOME THE STYLIST

His Work is to Beautify the Body

THE NEW 2-LITRE SUNBEAM-TALBOT SALOON, WHICH, WITH A 13.9 H.P. RATING AND A WEIGHT OF UNDER ONE TON, OFFERS AN EXCELLENT POWER-TO-WEIGHT RATIO

THE first time I saw styling mentioned as a process in the manufacture of motor cars was a few years ago in a Studebaker catalogue. The writer, I remember, emphasised the new beauty of the car's interior and especially of the layout and decoration of its instruments. This was all the work of a famous woman stylist, one of the first experts in this line of business to be called in to add beauty culture to a car body.

But when you come to think of it, it is a sensible idea. You would not expect an architect or builder to plan the décor of your home. You would go to an expert in colour, comfort and culture. And the same thing is happening in motor cars. The designing and production people are responsible for the works and the stylist, the latest addition to the staff, makes their efforts satisfying to the senses. He dresses the chassis, as it were.

A few years ago what is now called the styling of a car was carried out in spasms by periodic inspections of the chief body builder's efforts on the drawing board and in the full-size "mock-up" by the directors, sales manager and perhaps by a highly-favoured distributor or outside car critic. Now in their various spheres of activity all these people were experts and successful. But not one of them could know as much about styling as a man or woman who had been specially trained in this work. So the aforesaid magnates, armed with pieces of chalk, would gather round the body on which their next year's hopes were centred, and make marks here, there and everywhere to indicate how it needed altering in line, curve or contour. The body-maker would sadly contemplate the result, and during the next week or so do his best to follow the chalk marks. Then down would come this committee of taste again, there would be more criticism and still more chalking.

The same sort of thing would be repeated when it came to choosing the colour schemes, the trimming and furnishing of the car. It was perhaps not surprising, therefore, that some of the cars styled in so Soviet a way were not as beautiful or roguish as they might have been. And even to-day many cars are not so beautiful in form. I think any artist or sculptor would agree with that statement. There is an absence of balance and proportion, a failure to develop a motif or a line to its logical conclusion, a weakness in symmetry and a lack of taste in colour values and blending that in their total detract from the beautiful thing a motor car might be.

Of course there are exceptions to this and one has only to open the doors of various cars to spot in an instant where the stylist has been at work and where he has not. To my mind, one of the notable examples of good styling in this country is provided by the Humber, Hillman and Talbot cars. All these models display excellent taste in their colour schemes, both inside and out, and in their general décor. Without pretension or vulgarity they suggest real comfort, well being and just the right amount of brightness.

Then the new Daimlers, which have attracted so much favourable comment and done so well in the big coachwork competitions, show a proper appreciation of the value of style allied to practical requirements.

A VAUXHALL 12 ON THE "IMPRACTICABLE" ROAD FROM DEVIL'S BRIDGE TO RHAYADER

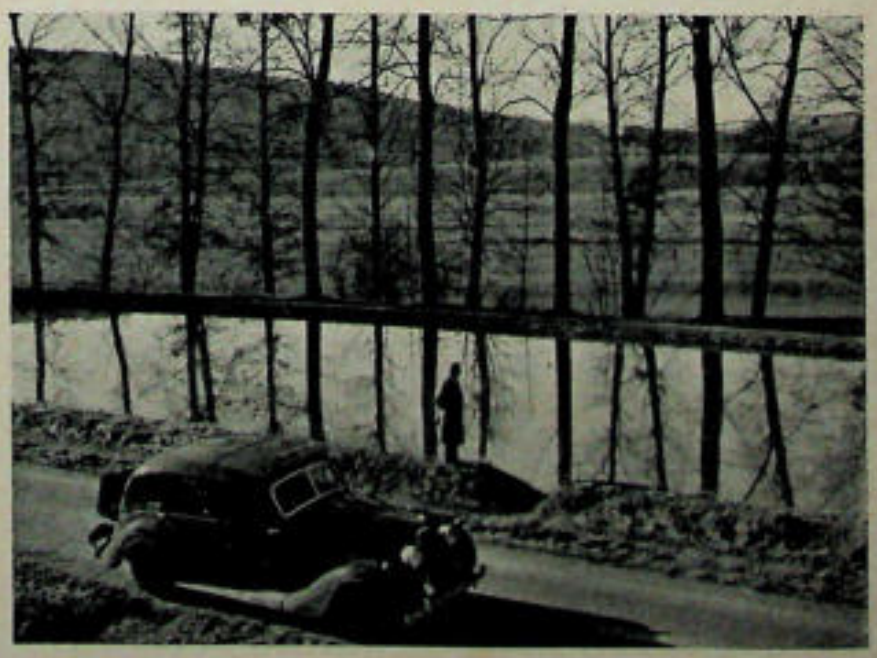
And the other day when looking over the new Vauxhall range of cars for 1940, I found the same pleasant qualities. Indeed, they were so obvious in their charm that I inquired how they had come to such a pleasant arrangement. The answer I received was that a new styling department in charge of an expert in these matters had been created and the tasteful effects I had admired were some of the results.

Styling, of course, goes much further than the choosing of colours that harmonise or the designing of instrument panels to appeal to the ladies. It will, even if it does not at the moment, embrace practically the whole of the body and its fittings. And I can imagine the battles that will be waged between the drawing office, production and styling departments to decide on the best compromise between what is practical and what is pretty. In which warfare the old saying that what looks right is right will probably provide the solution.

In considering car style in greater detail the first thing to remember is that it is much easier to make a big, long wheelbase car look handsome than a short dumpy vehicle. And as the overall heights of cars are more or less the same regardless of their wheelbase, it is very difficult to impart well-balanced proportions to a small car. You see, the thing is too tall for its length.

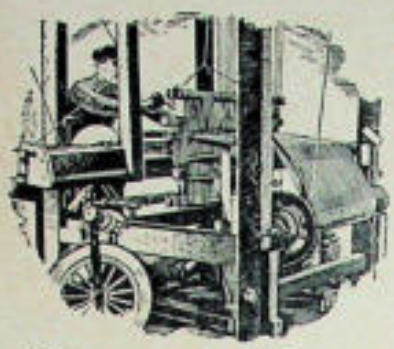
Some people seem to think that style is attained by ornamentation, whereas if the basic proportions are correct and the curves and lines flow smoothly and in harmony there should be no need for much, if any, ornamentation. An example of what I mean is afforded by those quite imposing-looking cars, the fronts of which expose masses of chromium-plated grille, filling in space between the prow of the bonnet and the wings. To my way of thinking, this motif should be suppressed and not emphasized. The grills are necessary, but they are not beautiful, and to pick them out with chromium from a black background always reminds me of a man dressed in a dark suit but wearing a red waistcoat. And, after all, dressing a car is not so very far removed from dressing a human being. And the best-dressed people are invariably inconspicuous as regards their attire. If, on the other hand, you make the car feminine, well, then I don't know women's dress fashions well enough to say whether the simile still holds good or not.

On the subject of body shape, a well-known and successful coach-builder once told me that the nearer a body could approach the form of an egg, the more beautiful it would be. Incidentally, that was some years before people began to think of streamlining as applied to cars. But the old coach-builders' theory had a lot in it because if you judge a car on shape alone you'll admit that an out-and-out racing car, such as the Mercedes or Multi-Union, has an immense appeal, not only on the score of proportion but also because it looks its part, just as a bird looks as if it ought to fly and a ship to sail.



The two most famous stylists in the States are Raymond Loewy and Norman Bel Geddes. The former has styled ships, locomotives, and even, I believe, bridges! I saw a new locomotive dressed by him and was immensely impressed by its bullet-shape, suggesting tremendous power and speed. A brilliant touch, which may or may not have come under the heading of styling, was this monster's foghorn syren, every bit as deep and loud as those of the Atlantic liners. Its note again suggested power.

Norman Bel Geddes was a movie director in Hollywood. But he grew tired of designing sets and seeing that Kahn, the millionaire, was willing to assist artists with ideas and initiative, sent the magnate a many-dollared telegram, which practically exhausted his funds. But it had the desired result for Kahn sent him money for his trip, and took him up on the grand scale for theatre decoration. Geddes's latest triumph was the Futurama at the World's Fair, which, with other effects, was said to have cost General Motors three-quarters of a million pounds.



It will be interesting to see how the art of styling progresses in this country. Fashions and treatments which may appeal in France or the States may fail to catch on here, or *vice versa*. And then the styles that satisfy us in England may not be the right thing to attract our customers' overseas.

Anyway, whatever happens, it is grand to know that at last beauty culture is to be applied to car bodies. Until recently we all were more interested in the works and the appearance of the car did not receive the attention to which it was entitled. But to-day we know that it is almost impossible to buy a bad car, and being satisfied with the performance we take stock of other things and notably body comfort, appointments and style. So much is this now the case that I know of a very experienced owner who, after being faithful to one make of car for four years, and still being fully conscious of the fact that for his job it represented the best possible means of transport, went over to another make because he considered the latest models of his old favourite too hideous for anything. That sale was definitely lost on appearance, and judging from inquiries I have made since it was not the only one.

W. G. MACMINNIES.

RÉFLEXIONS FRANÇAISES.—THE DRIVER OF A HUMBER IMPERIAL SALOON STOPS TO CONTEMPLATE THE SCENE ON A QUIET ROAD IN FRANCE

Pride of craftsmanship

Away to the north-west of Scotland lies a group of islands known as the Outer Hebrides, the home of Harris Tweed. For generations the islanders have made this famous tweed, a cloth which reflects the sterling worth of these hardy folk. Woven by hand, Harris Tweed is the very embodiment of traditional skill and pride of craftsmanship, a pride shared by weaver and wearer alike.

HARRIS TWEED

See that this label is sewn in the garment you buy. It is a guarantee that the Tweed is made from pure Scottish wool, spun, dyed and finished in the Outer Hebrides and handwoven by the islanders at their own homes.

INDIA FOR A HOLIDAY

A Close-up View at Minimum Expense

By C. G. EARLY

THE WAYFARING MISSIONARY TRAVELLING BY BULLOCK CART

INDIA for a holiday! The idea need not be turned down as fantastic. Indeed, it seems fantastic that so few people should venture East and enjoy the privilege of seeing for themselves something of their brilliant, wistful sister in the British Commonwealth of Nations.

People of reasonably simple tastes can have the holiday of their lives for about £180, and enjoy a really valuable close-up view of the country, and be back in England within three months. The pleasantest time to be in India is from the middle of November to the middle of February, when the climate is glorious. The voyage occupies a little more than a fortnight each way, if one travels by train across France.

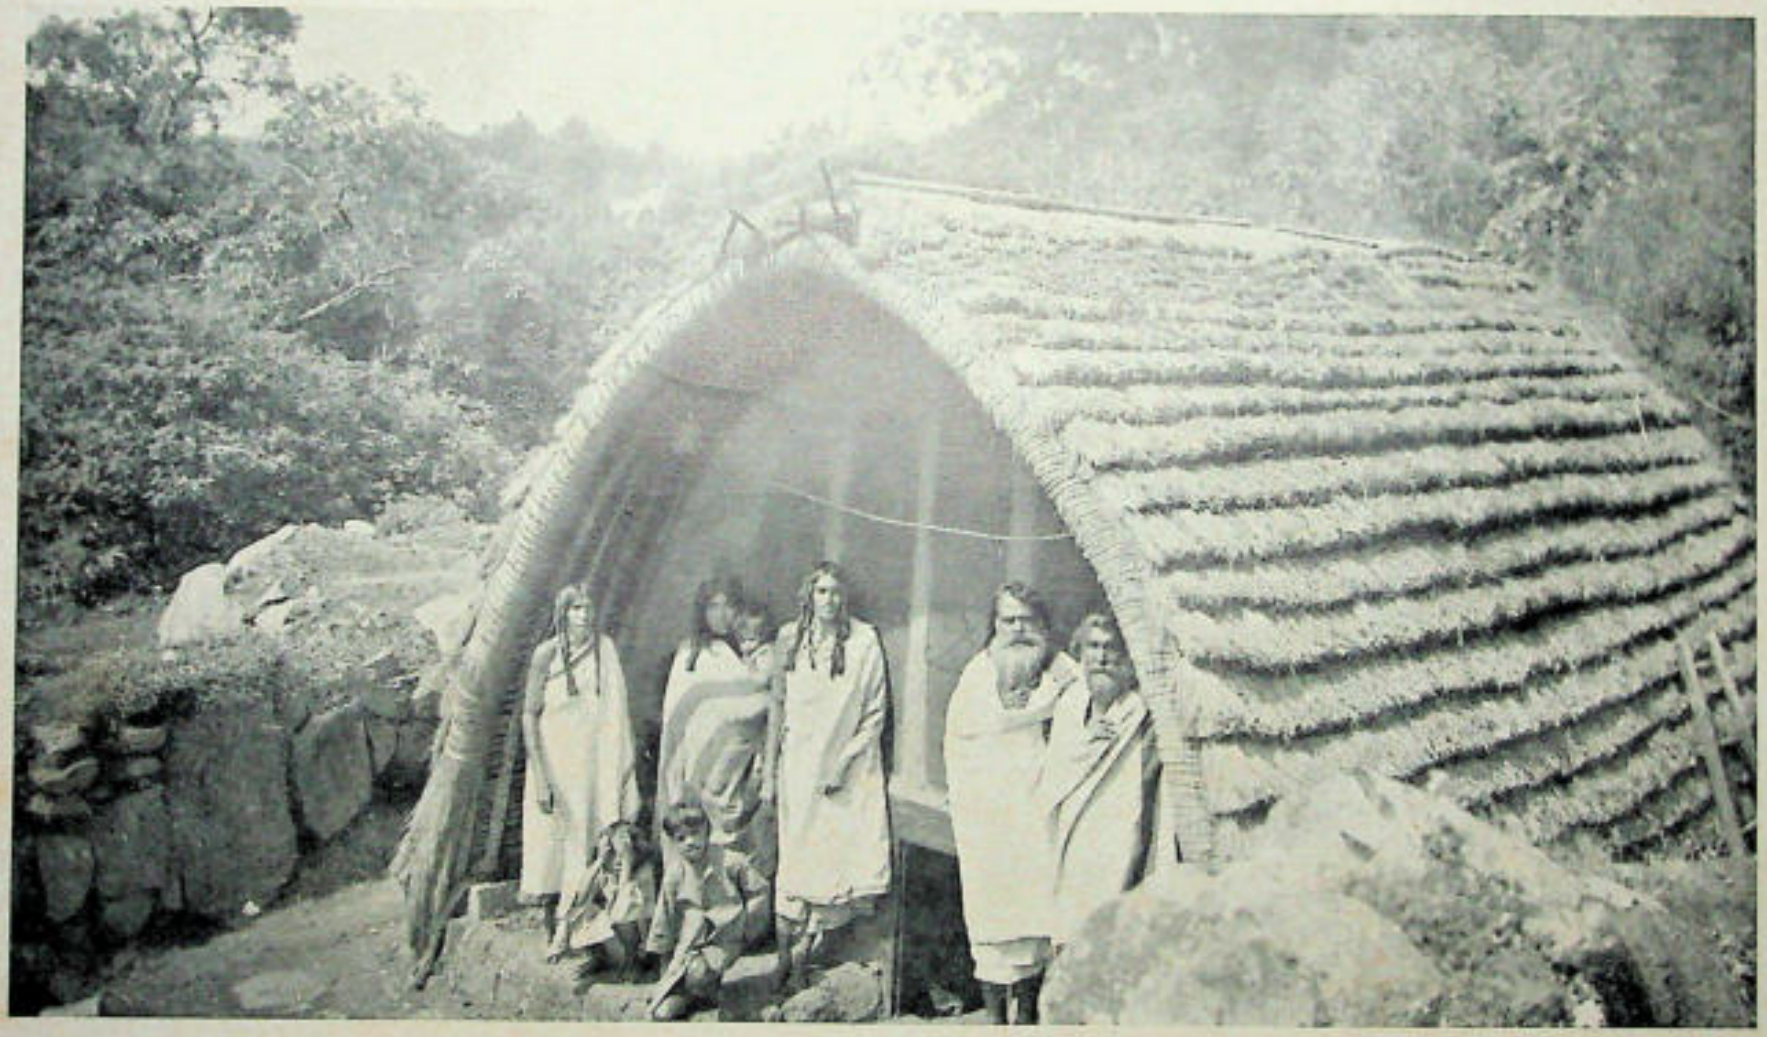
Steamer fares need not be more than £80 for the double journey, and in India one can travel 5,000 miles comfortably for £25, in airy second-class carriages provided with electric fans and with sleeping accommodation on night journeys. The travel agents at Bombay will provide an efficient English-speaking Indian manservant, whose wages for the whole trip will not be more than £5 or £6, including his food; his railway tickets might cost another £5. This leaves about £60 for hotel accommodation, meals and sundries. Hotel expenses can often be greatly reduced by using the excellent bedrooms provided at many of the larger railway stations, at very much less than hotel rates.

There is no need for the "tropical equipment" pages of the stores catalogue to alarm one. For a winter tour in India ordinary clothes such as one wears in the English summer will be quite adequate. Two people travelling together could easily pack everything they need into a medium-sized trunk and a couple of suit-cases, with a holdall of bedding.

As to itinerary, the soundest advice one can give is *to leave the beaten track*, and to see the real India of the countryside into which the ordinary tourist rarely penetrates. Of course, some large towns and "show places" will be seen. Much too often the winter visitor sees nothing else, and that means that he does not see India. To make the best use of a few weeks, it would be well to eschew wasting time in the European clubs in the large centres of population, and even to leave on one side the hill-stations. These are beautiful, but, after all, snow-mountains can be seen in Europe, and they are not characteristically Indian.

It is certain that if the visitor resolutely determines to break away from the tourist routes along which the "conducted parties" are shepherded, his happiest memories will be of days spent in roadless country among remote villages which can be reached only by bullock-cart, beside rivers which have no bridges and are crossed in wicker-work coracles, of nights in the jungle beneath brilliant star-lit skies, listening to the laugh of the jackals as they go a-wooing in the darkness beyond the camp-fire. The best guides into the life of the real Indian countryside are missionaries. They know the vernacular, they are in closest touch with the simple, friendly, courteous peasants who are the backbone of the country and who form 90 per cent. of its population. Any missionary society would be glad, at its London headquarters, to put the intending tourist in touch with some of its workers in India, and the missionaries will take their guests beneath the surface and show them things which Europeans seldom see.

After landing at Bombay, and seeing something of this strangely cosmopolitan city, the traveller would do well to go North, 40 hours by train into the Punjab, the romantic land through which wave after wave of invaders poured down into Hindustan. From Peshawar the journey east and south, as far as Bengal, can be made in easy stages, covering some weeks. At Delhi it will be well to remember that there have been other Delhis before the present rather self-conscious newcomer was born: they will well repay exploration. When Agra is reached, however great the fascinations of the Taj Mahal, one whole day *must* be spared for an unhurried visit to Fatehpur Sikri, only an hour's run from Agra, but strangely neglected by travellers. This is the Emperor Akbar's deserted capital, occupied for only a few years, still standing almost exactly as it was built.



It is a thousand pities that so many people neglect a visit to one or two of the Rajput States, where one seems to be back in feudal India. In Jaipur one has seen as many as 70 elephants belonging to the maharajah, out for an evening stroll through the streets, and the whole countryside is gay with sacred peacocks. Besides Jaipur, one ought to see Udaipur, the wonderfully picturesque little capital of Mewar State.

Further east, Lucknow and Benares, not far apart, will provide a striking contrast between Muslim and Hindu culture. One of the most fascinating ways of seeing Benares is to take a boat for the morning, and have it rowed slowly along the river-front while thousands of pilgrims from every part of India are bathing in "Mother Ganges" in the hope of finding cleansing in her sacred waters. Among the fifteen hundred temples of this amazing city one is, of course, at the very heart of Hindu India.

Calcutta, the most European city in Asia, will probably be the eastern terminus of the journey, and it is not likely to detain the traveller long, for he will want to turn southward. The most interesting way to Madras is via Nagpur and the Grand Trunk train; the train passes through the Central Provinces and the Nizam's Dominions, and one can easily visit Hyderabad City.

And so to Madras and the cheerful, easy-going Tamil country, a very different world from North India. From Madras one can return right across the Peninsula to Bombay, or one can fare still further south to Ceylon and sail from Colombo.

One last word. Of all India's attractions, the chief are the charm and friendliness of her people. Let every traveller reciprocate this friendliness, and remember that he is a guest.

THE AIR O.T.C. IN CAMP

By LORD SEMPILL, A.F.C., F.R.Ae.S.

(Aviation Editor of "The Field.")

THIS year for the first time the annual training camps of the Public Schools O.T.C. have included a special one for the Air Sections. This development is of interest not only because of its novelty, but because it indicates that the need for establishing strong links between the public schools and the Royal Air Force is being fully recognised.

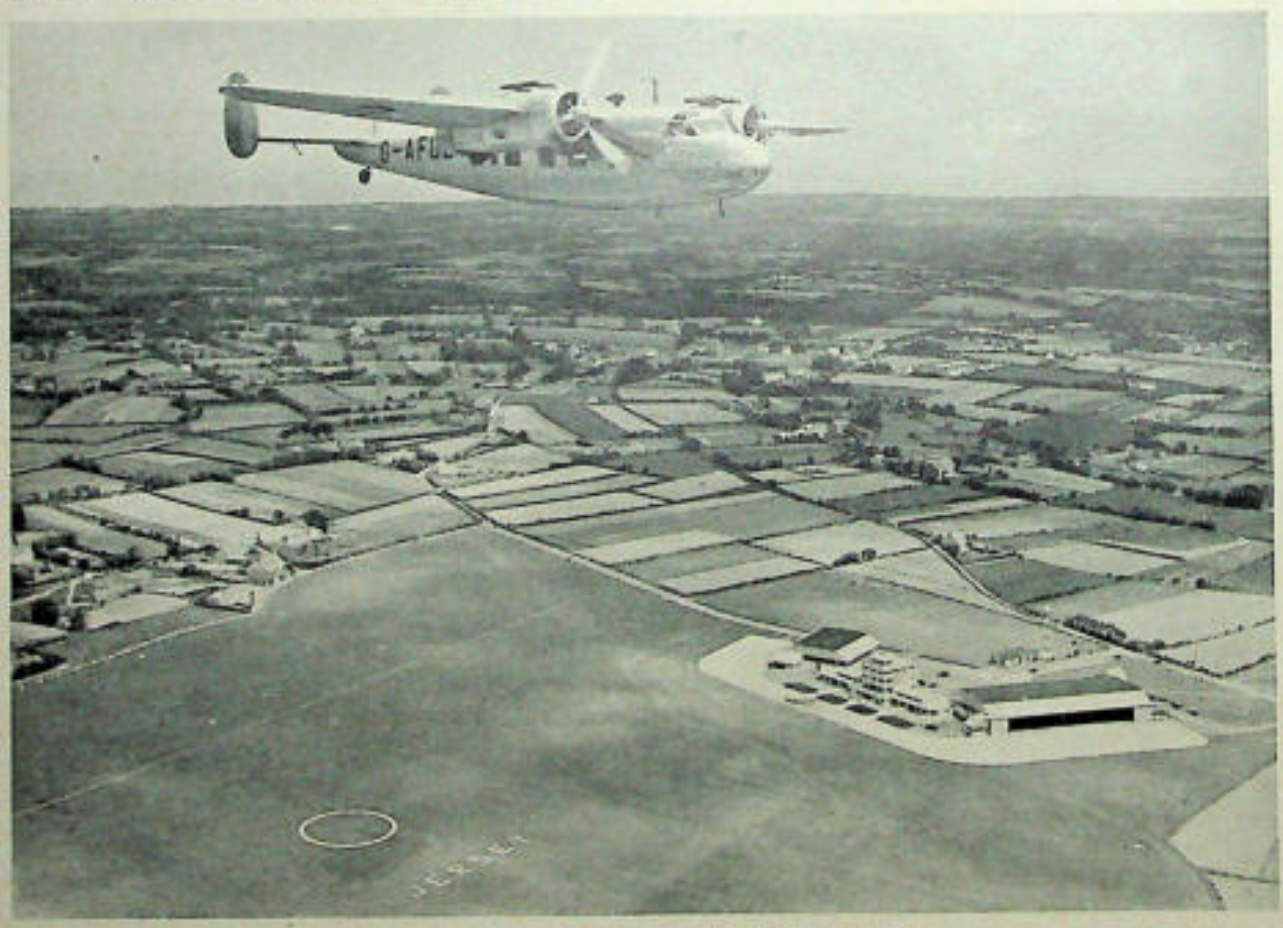
The camp, which lasted a week, was held at Mr. Norman Holden's private aerodrome at Norton Priory, Selsey Bill, and it was attended by some 250 boys representing 36 public schools. The organisation consisted of four air cadet squadrons, each composed of the contingents from nine schools, the whole being formed into a unit known as the Public Schools' Air Cadet Wing.

Here, under ideal camping conditions, the boys have been brought into direct and valuable contact with practical aviation and with the work of the Royal Air Force, stations of which were visited, the boys being transported in many cases by military machines. The whole programme had been designed to give practical point to the training carried on throughout the year in the Air Sections of the O.T.C.s at the various schools.

Since these Air Sections have not been much publicised, it may be of interest briefly to indicate their nature. They do not in any way conflict with O.T.C. training. Indeed, the Air Section training might almost be looked upon as specialised post-graduate instruction for those with special interests in aviation matters.

That the camp itself will prove to be a very valuable culmination of that training cannot be doubted by anyone who has studied the good work done in past years by the Public Schools Aviation Camp, which was initiated by Dr. H. Birchall of Taunton, and of which, in fact this O.T.C. camp may be considered a logical and important development.

The importance of bringing the public schools into intimate relationship with the Royal Air Force has long been recognised, and under to-day's conditions, when first-class officer personnel is increasingly required, that importance has naturally grown. Until the formation of the Air Sections no real means of establishing such contact existed.



As a preliminary training ground for the Army, the Public Schools O.T.C. has done invaluable work for many years past, and its existence has been very important not only in educating those boys who were determined on an Army career, but in influencing others to qualify for commissions in either the Regular or the Territorial Army. The Navy, on the other hand, has not felt the need for such contact, at any rate to the same extent; for the majority of Navy cadets enter direct from preparatory schools.

That the Royal Air Force, which recruits its officers in much the same way as the Army, should have some link with the public schools is, therefore, obvious. It is this which the Air Sections provide; and it is to the credit of the originators of the scheme that means have been found to attain the desired end without in any way competing with the normal Army activities of the O.T.C. The groundwork of discipline and drill, acquired in qualifying for the Certificate A, is as essential to the would-be R.A.F. officer as to the Army candidate.

On this ground, then, the Air Sections may be considered a very valuable addition to the public school training. But there is another aspect of their work that is no less important. Small as the sections are, not all the members will want to enter the regular Air Force or one of the non-regular branches, such as the A.A.F. or the Volunteer Reserve. There is, none the less, a very widespread interest in aviation among the boys of to-day, and the Air Sections provide yet another outlet for it, as do, in other ways, the Air Defence Cadet squadrons and Air Scouts. There is, in these bodies, an educative value of a generalised, as well as of a specialised nature. They are, therefore, an important addition to those forces which are creating an informed opinion in regard to air matters—the existence of which must become more and more a national necessity as aviation advances.

The success of the Air Sections so far is an indication of how well they fit in with modern requirements. The original Public Schools Aviation Camp showed how much interest there was in the schools to be turned to good account, and an organisation planned as an integral part of the schools' curricula can hardly fail to yield even more valuable results, if only because the net for talent and promise is spread wider.

It would be foolish to predict, of course, that the Air Sections can ever grow to a strength comparable to that of the ordinary O.T.C. Indeed, it is doubtful whether such a development would be desirable. Their best sphere would seem to be to direct and fertilise an already existing interest and intention. On those lines progress seems assured.

THE CHANNEL ISLANDS IN UNDER THE HOUR

The new De Havilland "Flamingo" air liner arriving at Jersey Airport at the conclusion of its first passenger flight

THE SINGER ROADSTER

I DROVE a car the other week-end which seems to have won the hearts of many small car enthusiasts—the new 9 h.p. Singer Roadster. It is not very difficult to understand its popularity for reasons I shall try to set out.

The engine is a four-cylinder unit with a bore and stroke of 60 x 95 mm., and, with an R.A.C. rating of 8.93 h.p., the annual tax becomes £6 15s. Translated into terms of performance, this engine is an extremely effective unit, and, bearing in mind such factors as horse-power and price (£169), its achievements are remarkably good. For instance, the car has a top speed of something not far short of 70 m.p.h., while acceleration is surprising, 0-30 m.p.h. in 6 seconds as an average, while some individual cars will manage that figure in a fraction of a second less.

On top of this there is an excellent petrol consumption, working out about 35-36 m.p.g. on an average run, and since the tank at the rear holds, 7 gallons the car has a cruising range of over 240 miles.

The gearbox is very simply operated and has synchro-mesh on top and second gears—there are only three—and ratios are as follows: Top, 5.43 to 1; second, 9.9 to 1; and first, 18.08 to 1; reverse is 22.26 to 1.

Springing, carried out by means of long, semi-ellipties, is quite efficient, and on ordinary roads shows little of that "bucking" motion so often noticeable in the small car, though on really rough surfaces it is apt to be a little bone-shaking. Normal motoring, however, is very pleasant, and the car sticks to the road on corners surprisingly well. As in all small cars, steering is light, but at the same time it is positive and not too whippy. Braking, too, is quite satisfactory.

I believe one of the reasons for this car's popularity is the thought which has been expended upon it to make it appear smart and "ship-shape." Examples of this are to be seen in the five pressed steel "Easy Clean" wheels and the arrangement whereby the hood and side screens pack away completely behind the rear seat in the neatest manner. The hood takes a moment or two to erect, but, once fixed, thanks to the judicious use of zipp fasteners, is thoroughly water- and draught-proof.

In appearance, the coachwork on the Roadster is most attractive. It is smart, but at the same time quite practical, with one possible exception—I think most drivers would willingly sacrifice something of the sweeping line of the car's tail for a little more luggage space in the boot. Still, that is only a personal preference, and since the car is a two four seater, as a general rule the back of the car would be used to carry luggage. My only other criticism is of the front seats. They are comfortable enough to sit on, but the backs are insufficiently padded and feel hard to those whose adipose tissue is inadequate to cope with the situation. On the other hand, they are well designed and do not leave you with a backache, which will excuse them much.

Taken all round, the Roadster is an attractive little car and has received what it deserved—popularity.

TOO MANY TRUMPS

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

SEVERAL weeks ago, under the above title, I dealt with the rather unusual predicament of the declarer who had too many trumps. This week I propose to discuss examples of the case when one of the opponents has more than his fair share of trumps.

When the declarer is likely to be forced in trumps it may pay him to dispense with the usual procedure of extracting the opponents' trumps and instead, run his side suit, allowing the opponents to ruff. In the following hand this play was adopted as a safety play against a bad trump distribution.

	♠ 6, 5, 4, 2 ♡ K, 8, 3 ◇ J, 10, 3 ♣ 10, 8, 3	
♠ K, Q, J, 9, 8, 3 ♡ A, 6, 5, 2 ◇ 5, 4 ♣ 9	Y A B Z	♠ A, 10, 7, ♡ J ◇ 6, 2 ♣ K, Q, J, 7, 6, 5, 4
	♠ None ♡ Q, 10, 9, 7, 4 ◇ A, K, Q, 9, 8, 7 ♣ A, 2	

Game all.

Z	A	Y	B
One Heart	One Spade	No bid	Two Clubs
Two Diamonds	Two Spades	No bid	No bid
Three Clubs	No bid	Three Hearts	No bid
Three Spades	No bid	Four Diamonds	No bid
Four Hearts	No bid	No bid	No bid

With such a freak distribution Z is fairly safe in bidding only Two Diamonds, since it is most unlikely that the bidding will stop there. Moreover, with such strong Diamonds it is more than likely that partner will prefer Hearts. Subsequently Z showed first round control of both the opponents' suits in the hope that this picture of his hand would enable Y to try for a slam with strength in Hearts. Y's encouragement of Diamonds did not justify a gamble on slams and so Z signed off with Four Hearts.

A led the King of Spades, which Z ruffed. The 4 of Hearts was returned, taken by Y's King. When B's Jack of Hearts fell it seemed possible that A held the three remaining trumps, i.e., as many as Z. With another force imminent the prospect was unpleasant. However, Z did not mind A taking three trump tricks, so long as the contract of Four Hearts was safe.

Z therefore proceeded to lead his Diamonds. When A ruffed, if he returned a Club Z could afford to lead trumps himself and would eventually concede a Club trick. Actually A returned a Spade, Z carried on leading his Diamonds, allowing A to ruff again, and later ruffed a losing Club in dummy, giving the opponents only three Heart tricks.

In the following hand the declarer had to allow for a bad distribution of the opposing trumps by playing the hand for a cross ruff:

	♠ Q, 10, 7, 6 ♡ A, K, 8, 7, 6 ◇ 4 ♣ K, Q, 6	
♠ 4 ♡ J, 10, 9, 5, 3 ◇ Q, 10 ♣ J, 10, 5, 3, 2	Y A B Z	♠ 8, 5, 3, 2 ♡ Q, 2 ◇ K, J, 7, 6, 3 ♣ A, 9
	♠ A, K, J, 9 ♡ 4 ◇ A, 9, 8, 5, 2 ♣ 8, 7, 4	

Z	A	Y	B
One Diamond	No bid	One Heart	No bid
One Spade	No bid	Four Spades	No bid
No bid	No bid		

A made the rather inspired lead of the 4 of Spades, which Z took with the Ace. The chances of establishing an extra Heart trick were rather remote, and since Z could see two Hearts and one Diamond and a Club trick, he required four trump tricks. In the cross ruff play it is essential that opponents do not ruff one's plain suit winners and therefore Z led a Club. B's return of a Spade was taken with the King of Spades and the Ace of Diamonds, Queen of Clubs and two Heart tricks made in that order. Four more tricks were made by cross ruffing Hearts and Diamonds. It will be noted that if Z had led Ace, King and another Heart, before making the Queen of Clubs, B would have discarded a Club, and ruffed Z's Queen of Clubs. This particular point is very important and illustrates the fundamental principle of making one's plain suit winners before starting on the cross ruff play.

THIS WEEK'S PROBLEM

	♠ 7 ♡ K, Q ◇ None ♣ 5, 4, 3	
♠ None ♡ A ◇ K, 10, 8, 7 ♣ 2	Y A B Z	♠ Q, 3 ♡ 4 ◇ 6, 2 ♣ 9
	♠ K, J, 6 ♡ 2 ◇ None ♣ K, Q	

Spades are trumps. Z to lead and take five tricks.

LAST WEEK'S PROBLEM

The following problem is taken from Culbertson's *Red Book*:

	♠ A, K, 10 ♡ None ◇ 5, 3, 2 ♣ 8	
♠ None ♡ 9, 8, 6, 3 ◇ 4 ♣ Q 6	Y A B Z	♠ J ♡ 2 ◇ 10, 8 ♣ K, J, 4
	♠ Q ♡ J, 10, 5 ◇ None ♣ A, 10, 3	

Spades trumps. Y-Z to win all seven tricks against any defence by A-B.

SOLUTION

Z leads the Jack of Hearts, Y discarding a Diamond. Z leads the 5 of Hearts and Y ruffs with the Ace of Spades. B is now squeezed. If he discards a Diamond, Y leads a Diamond for Z to ruff. The Ace of Clubs and another Club is led and ruffed with the 10 of Spades. The King of Spades is led and now Y's Diamonds are good.

If B discards a Club, the Clubs are established by ruffing with the King of Spades and a trump lead gives Z the remainder of the tricks. Finally, if B discards the Jack of Spades, the Y-Z hands can be cross ruffed.

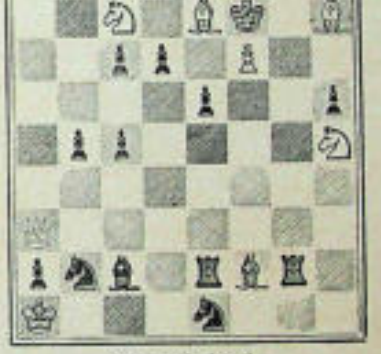
12. Q to B 2	Q takes P (B 4)	30. Q to K B 5	P to K Kt 3
13. P to Q R 4	R to K sq	31. B takes B (l)	P takes Q
14. B to R 3	Q to R 4	32. R to Kt 7	Kt to Kt 5 (m)
15. K R to Kt sq	Q to B 2	33. R takes Kt ch (n)	P to B 3
16. P to B 4 (b)	P takes P	34. R to Kt 7	R to Q 2
17. Q takes P	B to K 3	35. R takes R	Resigns (o)
18. Q to B 2 (c)	B to Q 4		

(a) The usual move, B P takes P, seems better.
(b) White has a good game.
(c) If Q to R 4, then Q R to Q sq.
(d) A variation here is 20. B takes Kt, Q takes B; 21. B takes P, ch, K to R sq (threatening either P to K Kt 3 or B takes Kt); 22. B to B 5 (not 22. Q to K B 5, because of 22. . . . B takes Kt 23. P takes B, Q to R 5), B takes Kt; 23. P takes B, Kt to K 4; 24. Q to K 4 (best), P to K Kt 3; 25. B to Kt 4, Q to R 5 (threatening P to B 4) with advantage to Black.
(e) Black has nothing better.
(f) Threatening B takes P, ch.
(g) This opens the King's Knight's file for White. B to K 5 is better.
(h) Threatening Kt to K 4. Black should, instead, play Q R to Q sq.
(i) Not 26. B takes P, P takes B; 27. Q takes Kt because of 27. . . . Q takes Q and wins for, if 28. R takes Q, then 28. . . . R to Q 8, mate.
(j) White can play B takes P, but he prefers to begin a King's side attack.
(k) A fine move. If now 29. . . . Kt takes B, then 30. R takes P, R takes R; 31. B takes R, ch, K to Kt sq; 32. B to K 5, ch, and wins for, if 32. . . . Q to Kt 3, then 33. R takes Q, ch P takes R; 34. Q takes P, ch, K to B sq; 35. B to Kt 7, ch, followed by 36. Q takes Kt.
(l) Another fine move.
(m) There is no move to save the game. If R takes R, then R takes R, ch, followed by R (Kt sq) to Kt 7, mate.
(n) Good enough—but R to R 7, ch followed by R to R 8, mate is quicker.
(o) If 35. . . . Q takes R, then 36. B takes P, ch, Q to Kt 2; 37. R takes Q, Kt to Q 4; 38. B takes Kt and mate next move.

A game from the third round of the Premier Tournament.

(Irregular Defence.)



WHITE. P. N. Wallis.	BLACK. J. Mieses.	WHITE. P. N. Wallis.	BLACK. J. Mieses.
1. P to K 4	P to Q 3 (a)	19. Kt to K 2 (i)	Q to Q sq (j)
2. P to Q 4	Kt to Q B 3	20. Q to Kt 5	P takes P
3. P to Q 5	Kt to Kt sq (b)	21. R P takes P	Kt takes K P (k)
4. Kt to K B 3	Kt to K B 3	22. Q takes Q	Q R takes Q
5. Kt to B 3	P to K Kt 3	23. P takes Kt	P to Kt 4
6. P to K R 3	P to K 4	24. K to B 2 (l)	R takes Kt
7. B to K 3	B to Kt 2	25. R takes R	P takes R (m)
8. Q to Q 2	P to Kt 3	26. R to R sq	R to K R sq
9. B to Kt 5, ch	B to Q 2	27. K to B 3	P to Q B 3
10. B to Q B 4	Q to B sq (c)	28. P takes P	B takes P
11. B to K R 6	Castles	29. R to R 2	K to Kt 3
12. P to K Kt 4	Kt to R 3	30. Kt to Kt 3	P to Q 4
13. Kt to K R 4	P to Q Kt 4 (d)	31. P takes P	B takes P, ch
14. B to Q 3 (e)	Kt to B 4 (f)	32. K to K 3	K to Kt 4
15. B takes B	K takes B	33. R to Q 2	K takes P
16. P to B 3	Kt takes B, ch	34. R takes B	K takes Kt
17. Q takes Kt	P to K R 4 (g)	Resigns (n)	
18. Q to Q 2 (h)	R to R sq		

(a) This move forms, in conjunction with Kt to Q B 3, an Irregular defence which Mieses has frequently played during the last twelve-month.
(b) Black has sacrificed two moves in order to tempt White to play P to Q 5 and produce a close type of game.
(c) Preparatory to playing the Queen's Knight via Q R 3 to Q B 4.
(d) Beginning an attack on the Queen's side.
(e) 14. B takes P, B takes B; 15. Kt takes B, Kt takes K P, would not be good for White, since he would be exchanging his King's Pawn for the less valuable Queen's Knight's pawn.
(f) Threatening P to Kt 5, which would lead to the fall of White's King's pawn.
(g) A good move.
(h) Not 18. Kt takes Q Kt P (because of 18. . . . B takes Kt; 19. Q takes B, R to Q Kt sq, followed by 20. . . . R takes P) and not 18. P to Kt 5 (because of 18. . . . Kt to R 2, threatening either Kt takes P, or B takes P).
(i) A mistake. He should, instead, play Castles (Q R) so that his King's Rook is guarded.
(j) Threatening Kt takes K P followed by Q takes Kt, ch. If, now, 20. Kt to Kt 2, then 20. . . . P takes P leads to the gain of a pawn by Black.
(k) A very good move.
(l) White cannot play 24. Kt to B 5, ch, because of 24. . . . B takes Kt; 25. R takes R, R takes R, threatening either R to R 8, ch, B takes K P or B takes Kt P.
(m) Black has won a pawn and now finishes off the game very quickly.
(n) If 35. R takes K P, then 35. . . . P to R 6; 36. R to Kt 5, ch, K to R 5; 37. R to Kt sq, P to R 7, followed by 38. . . . K to Kt 6, and wins.

PROBLEM No. 4030

By E. PLESNIVY.*

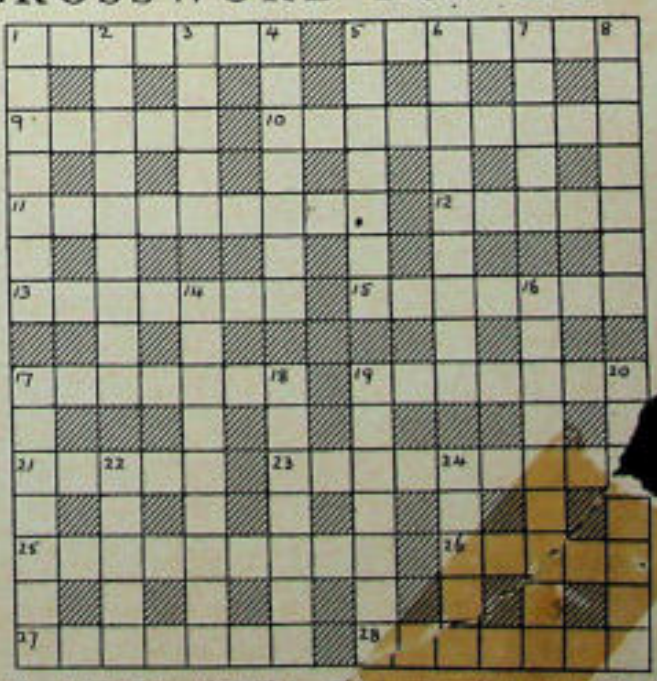
BLACK (14 pieces).

WHITE (7 pieces).

White to play and mate in three moves.

* First prize, *Narodni Politika*, 1938.

SOLUTION OF PROBLEM No. 4029

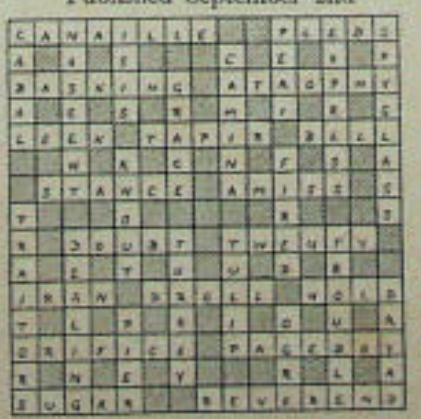


1. R to B 7, Any move; 2. Q or B mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 533

ACROSS.—1. The saving grace? 5. The saving Grace. 9. Father expects that Edward and young Charles will pass the medical examination (Hebden). 10. "O woman! in our hours of ease, ——, coy and hard to please" (Scott). 11. Grand tees to alienated feelings. 12. He met with an upset. 13. A dog and a fighter. 15. "No —— fright him, and no labour tire" (Dr. Johnson). 17. This was defined by Dr. Johnson as the knee of a horse. 19. C possesses half a score. 21. A strange graduate at a dance. 23. "From —— our comfort flows; The only wretched are the wise" (Prior). 25. A fitting clue for these times. 26. A fish, not surprisingly, ends in a stream. 27. Indispensable element. 28. Conveyances for the very young.



DOWN.—1. "He did —— me past all saying nay" (*The Merchant of Venice*). 2. Musical proposals. 3. A rose at Covent Garden. 4. This clue is not so old. 5. This is fish indeed! 6. Hope put this country on the map. 7. I estimate. 8. R.H.A., R.G.A. and R.F.A. 14. Irate? 16. "Let observation with —— wide survey mankind from China to Peru" (Dr. Johnson). 17. Pa begins a moral story. 18. Harmful. 19. "Where Nature's end of language is declined, And men talk only to —— the mind" (Young). 20. Here a clue is almost unnecessary. 22. It takes three to make a league. 24. Concerning an inverted tub.

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

PENNY-FARTHING DAYS

When the Country Inns Awoke to a New Life and Prosperity

A REAL MOUNT
This took a lot of learning and was the novice's nightmare

IT is difficult to realise, after the lapse of so many years, all that the coming of the ordinary bicycle meant to the younger generation towards the close of the last century. The velocipede, or boneshaker, as it used to be called, had proved a failure, not only mechanically but in every way, and had long been the butt of the humorous press. But with the innovations brought about in the first ordinary, or high bicycle, a new era commenced.

One needs to remember that, sixty years ago, spectacular sport as we know it was unthought of. Though cricket held pride of place, it was only a summer game; while football, as an organised sport, was scarcely in its infancy. The Rugby Union had been formed some years before, but professional football, if it existed at all, had not yet come out into the open, and week-end games only attracted the few. The younger men were, in fact, ready and waiting for the advent of any new form of athletic exercise able to appeal to the many.

When the ordinary machine was proved equal to a journey of thirty or forty miles on a Saturday afternoon, the popularity of the new sport of cycling—or bicycling as it was called at first—was assured. Clubs were formed all over the country, each setting out with its own captain and bugler, and wearing the tight-fitting uniforms, braided and buttoned up to the neck, that the older generation remembers so well. Improvements, both in the design of the machine and in its efficiency, came rapidly, and in the late 'eighties the number of cyclists was estimated at not far short of 500,000.

It was impossible that all this should be accomplished without creating a certain amount of opposition, for many people considered that cyclists had no right to use the roads at all. The Saturday invasion must have been a sore trial to the coach drivers in the narrow country lanes of 60 years ago, and the club bugles can hardly have eased the situation.

It is recorded that, on one occasion, a gatekeeper demanded a toll of five shillings from a cyclist, and impounded his lamp when he refused to pay, and every local authority endeavoured to enforce its own sweet will in regard to hours of lighting, warning whistles or bells, &c. On another occasion the driver of the St. Albans coach set about a cyclist with his whip, while the conductor accounted for the machine with a weight on the end of a cord. This affray, and the subsequent litigation, not to mention the heavy fines imposed, brought matters to a head, and the cyclists' right to the use of the road was established in due course.

The coming of the bicycle met a very apparent need. Coaches already savoured of a past decade, and nothing had emerged to take their place. Railway stations were few and far between, and train services on many lines almost negligible. The possibility of suburban and tube systems, as we have them to-day, would have seemed the fanciful dream of a creative genius, and the average man was a virtual stranger to country within fifteen or twenty miles of his own home. But with the establishment of cycling, the post-houses and country inns awoke to new life and prosperity, and little known places, such as Ripley in the south, and Epping in the north, seemed almost at one's door.

At the commencement of each summer season a meet was organised at Hampton Court, when about 2,000 cyclists assembled and paraded the park in pairs. This was abandoned after a few years, when its purpose in publicity had been served. The Press had now voiced its unqualified approval of the bicycle; the universities had formed their own bicycling clubs, military cycling was established on a firm basis, and the Queen herself had shown her interest by ordering two tricycles to be supplied to her at Osborne House.

Track racing now came to the front as a popular form of sport, and when Cooper and Keen, among the professional riders, with Cortis, Hillier and Keith-Falconer among the amateurs, began to set up an entirely new chain of records, national interest rose to its height.

It may surprise many to learn that an ordinary racing bicycle in the 'eighties weighed less than the average roadster in use to-day, despite the fact that the great majority of record holders were tall men. The machine on which H. L. Cortis first covered 20 miles in the hour scaled not more than 22lb. Such machines would, naturally, have been unsuited for use on the unmade roads of years ago, and the ordinary bicycle made for general use was a different proposition, and often weighed twice as much as the racing model.

Even the main roads were, in the 'eighties, undeniably bad, and the lesser roads were infinitely worse. Little time and thought were given to their upkeep, and the large majority of cycle accidents was due to this cause. Flints, often as large as hens' eggs, were left loose on the surface of the roads, and it is interesting to note that the girth of the old ordinary wheel was designed, not so much to accelerate speed, as to help the machine to over-ride such obstacles as these. The first and most obvious reason for the pneumatic tyre was the need of some medium to act as a cushion between the rider and the rough surface of the roads.

It is to the cyclists of a past generation, and to the powerful influence that they brought to bear upon the responsible authorities, that we owe, in the first place, much of the road reform that we appreciate to-day.

On the arrival of the pneumatic-tyred safety the old ordinary suffered total eclipse. Pneumatic tyres were adapted to the earlier type of machine, but nothing could save it from extinction. The reasons for this have been stated so often that no repetition is needed here. Undoubtedly, the modern machine is superior in every essential, but the heyday of cycling came in the "Penny-Farthing" times, when there were developed a higher meed of courage and ability, and, certainly a more graceful style of riding than is usual to-day.

E. P. OLNEY.

THEN AND NOW

WHEN war broke out in 1914, the *Field* appeared with a picture of H.M.S. Iron Duke as a frontispiece (the censor soon prohibited the reproduction of photographs of battleships) and beneath it the caption of "Seconds out of the Ring." Before the war had been long in progress nearly everybody was in the ring.

How very similar are the reasons which then induced us to fight to those of to-day; one man's ambitions backed and urged on by others no less ambitious. For the Kaiser we have but to replace Hitler, the man of lower origin, and many scraps of paper. Words which were written then apply no less to-day. On August 8th, 1914, we wrote "England has found herself drawn into the vortex, not in the interests of these islands only, not only in defence of her allies or of her colonies and free Kingdoms in every quarter of the world; but in the even higher cause of international honesty and of the world's freedom and civilisation against the brutality of an arrogant and despotic militarism. Make no mistake about the issue, it is not merely for the position of the Empire, but for the very existence of England that we are fighting to-day."

In a prophetic vein which even then could scarcely be realised by our own countrymen, it was pointed out that the whole manhood of this country and the Empire would be involved in a gigantic conflict so wantonly aroused, and that it would not be found wanting to carry on the fight in which we could never admit defeat. We had no quarrel with Germany, we had none to-day, and we had never then, as now, acted aggressively towards her.

To-day the stand is being made against much the same vicious system which influenced Germany's leaders in 1914. The battle is being fought with grim tenacity to save the world from the policy which recognises Force as the sole arbiter in decisions which affect the lives and freedom of peoples who have not the means to withstand it. Nevertheless, the spirit which was counted upon then animates us to-day, the spirit of France and our own people as far removed from arrogant brutality as it is from presumptuous self-confidence or overweening pride, and Germany's leaders who have once again plunged Europe into universal misery in such a cause as they have taken up, backed by treachery and lies, can no more now as they could then hope for eventual success.

But in 1914 it was a different war we had to face at the outset. Bitter as the struggle became, we knew little of the methods by which our opponents would endeavour to win it; gas masks were unknown, and the processes which Germany and her scientists have made it their business constantly to perfect, in defiance of the usages of warfare, were undreamed of. The sinking of a "Lusitania" or an "Athenia" would have been considered an impossibility. Despite disturbances from Zeppelins and aircraft, life in the country went on very much as before. A month or so after the declaration of war, race meetings were being held at Gatwick, Lewes, Manchester and elsewhere, and the autumn handicaps were published. Leicestershire was playing Notts, Warwickshire was playing Surrey, and the full programme of first-class county matches was in progress as usual; the World's Sculling Championship on the Thames between Ernest Barry and James Paddon was exciting attention.

The hope was expressed that sport would go on to keep those fit and ready who might be called into the desperate stand or ordained to supervise incessantly those wheels of life and industry which no community can afford to let run down. It was not a spirit with which one could quarrel, and the lesson, in fact, could be driven home to-day. Though great gatherings are out of the question, country pursuits and recreations which are at all possible for those who are engaged on National Service will all act to relieve tension and strengthen the will and morale to carry on.

If one were to adopt the attitude that all things must cease in face of Hitler's threats and indulge in gloomy forebodings, then, indeed, his battle would be fought and won at the outset. It is our job to face difficulties as they occur and not to anticipate them. That was the spirit in the last war and will be in this, in face of possible setbacks, until final victory is achieved.

It is, perhaps, hard to look back, especially for the generation which fought the war to end war. Countless lives were sacrificed to bring Germany to her knees, countless follies were committed in the years after the War. But regrets are useless, and the determination now must be that such a situation will never recur. After all, the last war was not fought in vain. We are reaping the benefit of some of its lessons to-day. If the great desire for peace allowed us to relax, we at least gained a stiffening and a discipline which will stand us in good stead.

We have learned for one thing the kind of enemy we have to fight and the unscrupulous tactics for which we have to be prepared. No greater example of calm, well-working machinery could be furnished than that of the scheme of evacuation which was carried out last week. People are told to carry their gas masks; they do so. Householders are ordered to black out their lights; it needs no waste of official effort to make them comply with the order. And the Government is happy in the assurance that whatever measures it may have to take to assist in keeping order and help to win the war the public will wholeheartedly give all the support needed.

As to the Government itself, it surely can be said that when danger threatened every action was taken to meet it. Since the fateful crisis of last September a prodigious effort has been made to place our Forces on a war footing. Our Navy and our Air Force have been developed at a speed which puts four or five year programmes in the shade. It must have come as a surprise to many people in this country to find how efficiently our aerial defences have been organised, and we hope that many an unexpected feat will equally surprise our enemies.

As to the Army, gone are the days when the very word "Conscription" would have aroused opposition. From all political parties its necessity has been apparent when any of the hesitancy which greeted it during the last conflict would have proved fatal. When the call came for volunteers they were not lacking to fill the ranks of the Territorials, the Militia was organised without the slightest friction, and now with the Regular Army they both stand as a great national unit. Eager volunteers there still are, men with past military experience anxious to play their part. They must wait in patience until the moment arrives when the machine is in order to absorb them.

The effort has been great, the cost uncounted, but still further efforts will be needed and will be fulfilled to bring this country and its Allies triumphant against the forces of evil and oppression.

A COUNTRYMAN'S JOURNAL

SITTING dazed before the magnitude of the tragedy that has befallen mankind, I called to mind scenes I had witnessed a month before, scenes which appeared to anticipate in the skies the giant agony of earth. At that time, thunder and lightning were of daily occurrence; the rains or hail-storms of sudden and capricious violence, while the brief visitings of the sun were of a biting intensity. Day after day the heavens were in huge commotion, as though the Dark Angel were making his second assault upon their battlements. At times the skies were of a terrifying grandeur and of the beauty of Michael Angelo's *Last Judgment*.

White cloud-wrack floated across bottomless chasms of metallic indigo. Cordilleras of cloud, riven with precipice, stark with peaks, smeared with glaciers and scarred with col and ravine, blocked out half the sky. "Sometimes we see a shape that's dragonish" and, during those days of celestial upheaval, the clouds assumed grandiose or monstrous shapes that could not have been paralleled on earth except during the Jurassic Age when the great saurians splashed through the swamps. Stalked cumulus opened out into great umbels, and I noticed a row of these clouds, like a border of giant cactus, each more fantastic than its neighbour.

Seas and promontories, legendary or palæozoic beasts in grapple, contorted ranges, fishes rivalling the sombre dreams of nature in the abyssal depths of ocean, flora of a planet greater and more prolific than a million earths, vast desert landscapes scarred with plutonic rock—such spectacles succeeded one another in majestic formation and dissolution into chaos, up-rearing, grinding together in crash of sound and convulsion of movement, sprawling in ruin, rebuilt into shapes yet huger, wilder and stranger.

Day after day the sky was El Greco's "Toledo Landscape" and little man on his domestic earth looked on scenes such as were viewed only by Prometheus and Alastor. Winds came bellying out of a stillness full of menace and died a sudden death into an unnatural calm. Rain was emptied as though from a broken pitcher and in the climax of its thrashing fury ceased as though by the turning of a tap. The very temperature ran up and down like a float whose bait is mouthed by a fastidious fish. If the mind of a man in utter distraction, torn this way and that, now raging, now apathetic, and all the time beset by inward fantasies, had been represented in visual action across the face of a screen, and that screen had been enlarged into the vault of heaven and those images of emotional stress translated into forms of vapour undergoing perpetual change as registers of the fluctuations of that passion, the skies of those days would have been a faithful rendering of the movements of that mind.

In the middle of this period of elemental turbulence and monstrosity two storms, rushing headlong from opposite quarters of the sky, met overhead in a collision that was almost human in its violence. Thunder and greenish lightning split the heavens with never more than a few seconds' intermission. The thunder itself abandoned its rolling Miltonic periods for the sharpest detonations, for a gigantic whip-cracking and splintering, for rending, jagged, *shrill* sounds that might have been the voice of the lightning. Sometimes I was reminded of the collapse of a big timber-yard, of the fall of a tree or of a landslide, nor was it altogether easy to put away the thought that the elements were reflecting the awful passions of mankind.

Time went on and then on one night occurred these three scenes. First, the full moon shone down upon the low mist risen from the further fields and turned them to snow, yet of a purer, more ethereal substance than snow. Later, the mist rose higher and at the same time covered all the fields near and far, while a court of dark cloudlets was gathered about the moon. The tops of the trees above this sea of mist were like the dark hillocks of these clouds, while the crests of the hedges, long promontories just out of the swell of the silver sea, were like bars of cloud. Heaven and earth were indistinguishable; it was only by an accident, a trick of vision, that the sky was above the earth. Their substances were interchanged, and the whole scene appeared animate, charged with spirit, "breathless with meditation." Later still, the mist cleared and the moon had become an eye in a long tapering cloud filled with its light. The cloud seemed like a Cyclopean eye whose eye regarded the sleeping world to meet it with serenity and reassurance. But who among us at present, farmers, has peace on earth again?

H. J. MASSINGHAM.

The warmakers at work

DR. JEKYLL AND MR. HYDE?

By R. N. ROSE

DURING the war which we dignified with a capital letter and described as "Great," a small badge was sold and worn by a number of people. It proclaimed that the wearer had sworn never to shake hands with a German, speak to a German, or have any dealings with one for the rest of his life. This was hate, engendered by the disaster Germany had brought upon the world, the savage crimes she had committed in ruthless warfare, and possibly accentuated by personal grief brought about through the loss or maiming of relatives.

It is safe to conclude that few Englishmen who bore one of the badges ever kept their resolve. As a nation we are not good haters though, with greater experience of their neighbours, the French never ceased to distrust the Germans. I once met a native of Cologne in Luxembourg, in 1926, who said he would not visit France because of "the Great Hate," though, of course, he exaggerated as far as any personal animosity was concerned.

He also turned to me and asked if I hated him. I replied "Of course not!" Thereupon he launched into a passionate outburst on the madness of warfare, saying we would have shot one another on sight a few years back, and that he had joined a society numbering over a million members who had sworn never to take up arms again on any pretext whatever. But he grew hot with indignation at the treatment he conceived his country had been subjected to at the end of the war. The small son with him then should soon be ready to serve as cannon fodder.

Ten years after this encounter I visited the Black Forest with my family. Nowhere could we have met with a more friendly reception. Mine host at Freiburg, when we arrived without baggage or money, as the banks were closed, insisted on furnishing us with ready cash. He had never seen us before. Everywhere it was the same; nothing was too much trouble; in fact, attentions were sometimes embarrassing. It has been said this was propaganda.

It was a momentous occasion for a visit to the Rhine valley, as the first recruits since the war were arriving in foresters' carts covered with greenery. The young men themselves were bedecked with ribbons and flowers and gaily celebrating the opportunity of sacrificing themselves for the Fatherland.

Three weeks ago I met a man outside my house whom I knew to be a German. I asked him if he was one. He replied, "Yes," and his name was Dr. Beisner. Was he a Nazi—"Yes." Then I inquired, hardly realising how prophetic were my words, "Your country and mine will be at war in September, and can you tell me why you should force this war upon us, as people in this country have no aggressive intentions towards Germany?"

"There will be no war; it is unthinkable," he answered. Whether he believed it or not, I asked him to pay me a visit and give me his views. To this he consented.

We spent nearly four hours hammering out our viewpoints, and it is unnecessary to go into all the arguments. He admitted that the Army's entry to the Rhineland broke Germany's pledged word, that treaties had been violated, but the eternal excuse was the injustice of the Versailles "diktat."

Many people in this country, I told him, although I was not one of them, condoned the Rhine occupation, and even Austria and the Sudetenland on the grounds that, after all, the peoples of these countries were German or of German sympathies. But, and here was a very big BUT, why the conquest of Czechoslovakia and domination of races which had no connection with Germany?

To my amazement he replied he could not quite say, but doubtless the Fuehrer's reasons were very strong, and the Czechs would have constituted a menace to the Reich.

"Danzig," I said, "of course you realise, will mean war." He agreed, but went into a diatribe against the Poles, who he said were ill-treating Germans. We in England had no conception of what the Poles were like. On the wireless they even claimed Berlin! Then to my reply that the seizure of Danzig and the Corridor would eventually mean the extinction of Poland he answered that Versailles was again responsible.

"In considering Versailles, and leaving out the small point of the sufferings of France in the War, what," I asked, "would have been our fate had Germany won? What sort of an existence would we have had?"

The answer was stupendous. In Germany the military party was doomed after the war, and had Germany won her terms to the Allies would have been generous and not of a vindictive nature. I am afraid I was almost rude enough to reply: "You're telling me."

It was of interest to learn that my visitor disapproved of all those small countries in Europe with their "barriers." He visualised a United States of Europe, and doubtless with Germany as the "Uniter."

Dr. Beisner soon disappeared (he said he was leaving England at the end of August), and his wife followed in a hurry. Incidentally, he had spent many years round steel works in Russia and France.

All the foregoing is a rather long preamble to an article which appeared in a daily paper recently about German sportsmen and the spirit of good fellowship which existed between them and English sportsmen. How they cheered our teams, and how we would again meet them in friendly rivalry and good fellowship.

Well, I am afraid that writer has the psychology of some Germans at least, all wrong.

Friendly they may appear, but many a German's ideas do not seem to have changed much since the days of the Kaiser.

A German will weep over a forget-me-not or a waterfall and yet be capable of the most brutal atrocity. The German at war is a strange being. Von Kluck, it is said, would pat French children on the head and give them chocolate, yet there is a good memorial left behind to the Germans he commanded in the wall scored by machine gun bullets at Dinant. Every bestiality of war has been adopted by Germans; poison gas, flame-throwers and "sinking without trace," to mention a few.

From Germany we get such phrases as "Blood and Iron," "Leaving them only eyes to weep with," &c. Summing the whole character up calmly, there seems to be a sadistic strain in some German blood. When our troops entered Cologne the inhabitants must have been self-conscious of this. They retreated below ground, fearing the medicine, that, as conquerors, they would have dealt out themselves. When the troops took off their boots before treading on the polished floors, they recovered their balance.

We may not want to wear a "hate" medal, but must beware of false sentiments. The generation that is suffering twice in its lifetime through German lust for power is not likely to be kindly disposed. If there are among the German people those who are opposed to a régime of force and terrorism, now is the time for them to make their presence felt!

Soft clay and hummocks of limestone in the Qattarah depression and decidedly bad going

TRANSPORT IN THE LIBYAN DESERT

By MAJOR C. S. JARVIS

WHENEVER the defence of Egypt is considered a threat to its security by way of the Libyan sands has to be reckoned as something more than a bare possibility. In the last war Egypt had to be defended from attacks coming in from the desert from both the east and the west—the Turks advancing across Sinai to cut the Suez Canal and the Senussi Arabs trickling in over the Tripoli border in the vain hope of reaching the Nile Valley and stirring up revolt.

To cope with these attacks we had nothing but the cavalry and light horse of those days, foot-slogging infantry with rifles, and the ordinary guns—horse, field and some batteries of howitzers; and the great sand barriers of the desert hampered all movement. The cavalry were unable to make full use of their mobility and were tied down to water supplies; the infantry could struggle through the sand at a mile and half an hour, and no more; whilst the guns were more or less immobile until wide sand rims were provided for the wheels.

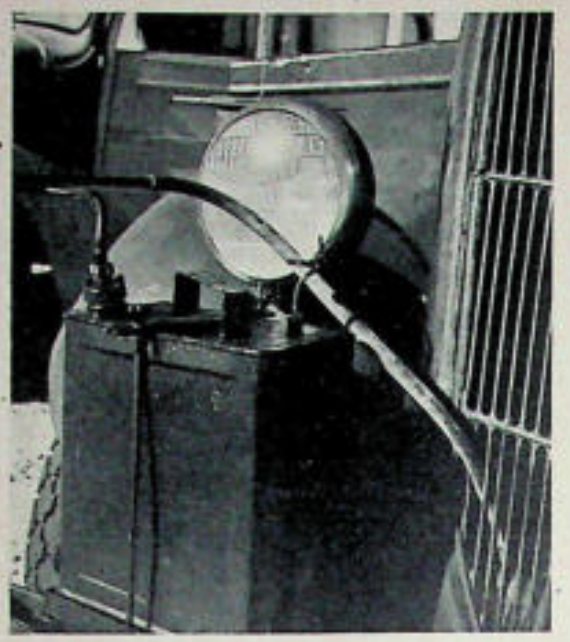
Luckily the soft going hung up the enemy to an equal or even greater extent, and when the Turks advanced against the Canal across Sinai they had to drag their guns on sledges drawn by oxen. These animals required a vast amount of forage and water, and it would seem that the troops suffered in consequence, for when 4,000 Turks surrendered to our troops at Romani after the second unsuccessful attack on the canal, over 50 per cent. of them were suffering from dysentery from drinking the foul desert water.

Then came the days of improvisation and invention. Roads of wire netting were laid on the desert and along these the infantry could march as well as on a macadam highway, and cars could travel at speed. Volunteers were called for from the Yeomanry and the Anzac mounted division, and eighteen companies of Imperial Camel Corps were formed, whilst the possibilities of a mechanised force were explored and two new units were created, the Armoured Car Patrol, and the Light Car Patrol. The Armoured Cars were equipped with the most expensive and aristocratic car of those days, the Rolls-Royce, whilst the Light Cars functioned with the cheapest and most democratic, the old two-gear Ford.

ROUGH SKETCH SHOWING PLACE NAMES

These Light Car Patrols, who were a most redoubtable and resourceful body of men, were the originators of desert motor travel, and, though mechanisation with every possible improvement and every conceivable invention has proceeded apace since those days, the landmarks in the Libyan waste left by these military pioneers in 1917—now in the form of faint car tracks in heavy and difficult going—are not easy to surpass, even to-day. The difference is that where in the past a patrol won through by man-power pushing behind, a light mechanised column can now travel with comparative ease; but those soft and treacherous spots that defeated the old car patrols 20 years ago, are still a barrier and a fairly effective one.

For the last five years the mechanised units of the British and Egyptian armies have been manœuvring in this waterless belt of sand, gravel and limestone, and acquainting themselves with the desert over which they may be called to fight. It is an inhospitable waste and entirely waterless, except along the coast line and in the five low-lying oases—Siwa, Baharia, Farafra, Dakhla and Kharga, where artesian wells with great supplies of pure water flow to the surface in abundance.



Thoughts are not now so concentrated on the defence problems of this region, but there are a variety of routes a possible invader might take, and they have all their special drawbacks and very few advantages. There is the coastal road via Sollum and Mersa Matruh, which is hard going and suitable for a force of all arms, but Mersa Matruh is well fortified and the road is commanded from the sea for the greater part of its length. Then there are the possible tracks across the desert w various oases as objectives for water supplies, the drawbacks to these routes is that the easiest too far to the south if it is proposed to strike Joe Nile Valley in the vicinity of Cairo, and of the only be traversed by light mechanised brother nothing else.

Much of this desert also is diffi[illegible]ing to the transport, and some of it is [illegible] as huntsman in passable stretches consist of [illegible] Otterhounds, and to which south of Siwa are [illegible] measure of the praise towering in height that th[illegible] by Mr. Harry Glaister, be ruled out as a possib[illegible]ds and former Master depressions with treache[illegible]n be said: "The *sabakha*, or wet clay marsh[illegible] by themselves. limestone rock with drifted [illegible]

CAR CLIMBING WINDWARD SIDE OF BIG DUNE
The sand packs hard on the windward side (north-west), but is loose on the south-eastern or lee side

THE CAR'S COOLING APPARATUS
Petrol-can condenser which preserves the boiling overflow

There are few, if any, Arab guides capable of showing the way across this desert, for it is too bare a country for the nomad and his grazing flocks. The Arabs of the old camel caravan trade, now fast disappearing, know the recognised routes from oasis to oasis and to the coast, but the intervening desert is a *terra incognita* to them. Moreover, if you put an Arab camel man into a car to show the way he is the most unreliable of guides because he is thinking in terms of four miles an hour when actually he is travelling at forty. He loses his head completely when the landmark he is looking for is not visible at midday, for the simple reason that he passed it all unknowingly shortly after the sun rose.

The possible routes across this desert from west to east are known only to a few, and these are the members of the British Armoured Cars and the personnel of the Light Car Patrols of the Egyptian Frontiers Administration.

Landmarks are regarded by these men as being on the whole unreliable because the outlines of the many fantastic-shaped hills vary according to the point of the compass from which one views them. The conspicuous hill with the well-defined twin humps as seen from the north and south is a clean-cut sugar loaf if viewed from the east or west. Moreover, the Libyan Desert has a disconcerting habit of repeating unusual-shaped hillocks. It devises by process of disintegration through wind-blown sand a rocky outcrop that resembles a squatting Sphinx or perhaps a lion rampant, and is apparently so pleased with this sculptured effect that it fashions half a dozen of the same model along the next 200 miles of desert to disconcert the unwary traveller.

The car patrols operating in this desert work with the sun compass, which is a metal disc with the degrees of the compass marked on it, and a short steel rod in the centre that throws a shadow denoting the direction in which the car is proceeding. This is fixed to one of the front wings, and the navigator with one eye on the compass and the other on the speedometer, as it were, jots down the distances

THE SUN-COMPASS
This saves getting out of the car to take re-sights with the prismatic

run on each bearing. In the evening, when the cars camp for the night, the navigator with the protractor and his note book plots the day's run and puts the position on the map. This device, perfected by Major Bagnold, the well-known Libyan explorer, was first invented by Major Claude Williams, a New Zealander of the Light Car Patrols in 1916.

Another ingenious device, also invented by the patrols of 23 years ago, is the water reservoir or

MAPPING THE RUN
The face of the desert is the navigator's table

condenser, which is merely a two-gallon petrol tin with a copper tube inserted through the cap, the other end of which is attached to the radiator overflow. When the water boils, as it does all too frequently in hot weather and heavy going, particularly if there is a following wind, the boiling water and steam, instead of sprinkling itself on the desert, goes down the pipe, cools off and condenses in the tin, to flow back to the radiator again. With this very simple fitting a car will do many hundreds of miles without any additions to the radiator, whereas without it possibly some four or five gallons of precious water would be required every day to keep the proper level.

Then there is the Camel Corps—a body of big, savage-looking Sudanese, mounted on fast-trotting Bishareen camels. Like the cavalry in the British Army, the Camel Corps is afflicted by mechanisation-itis and is slowly passing away as a mounted force, but a few of its companies have been spared the stroke of the spanner. There are still many useful jobs that mounted men can perform far more satisfactorily than any car, not the least of which is the ability to patrol by night without revealing their whereabouts with big head-lights. Another little point when silence and secrecy is essential is that, though a camel's stomach makes a distinct rumble during process of digestion, it gives off far less noise than does a six-cylinder engine.

TACTICS OF THE TUNNEL CAST

By COLIN DAVY

I SUPPOSE all fishermen are the same, and behave in a perfectly idiotic manner when they reach the river. Even though there is a whole long summer's day before you, and a hostess who understands fishermen and has told you that there will be the cold ham on the sideboard at whatever time you come in, you still jump from the car as if there is not a second to spare, or if you are less fortunate and are upon your feet, break into a self-conscious shambling run for the last 100yds. And if on viewing the water it is found that weeds are being cut up above, one is as utterly forlorn as if the last trump was about to sound and there was no such day as to-morrow. On the other hand, if there is a fish or two rising, one feels positive that the rise is just over; hands tremble so much that the line cannot be pushed through the rings or the gut through the eye of the fly, and in crazy haste the landing net is left behind.

I know most fishermen are the same, because nearly all begin a fishing article with almost the identical words I have used.

On the day in question my cousin and I behaved exactly the same as we always do—left the car in a place where the A.A. man was bound to ask us to move it, and ran to the bridge. There was only a local poacher and a telegraph boy to witness our lack of control, and we have no shame one with the other. With our stomachs painfully creased by the edge of the parapet and our breastbones uncomfortable on the stonework, we looked at the water for which permission had kindly been given us; 200yds. upstream there were two fish rising steadily.

Dodging a charabanc bound for Cleethorpes, and swerving to avoid a motor cyclist, we ran across the road to look downstream; 60yds. below a good fish rose twice in 10 seconds.

"Would you like to go up or down?" I asked.

"Up, if you don't mind," said my cousin. "I think the wind——"

Zonk!

She broke off her words at the strange echoing sound which came from beneath us. Zonk! It went again. It was a sound like something falling into a cistern or into a deep well. "It's a fish rising under the bridge," she told me. "There are a lot there, and they seem to feed all day long. I suppose because nothing ever disturbs them, and because it's dark. They must feel nice and safe there."

"But if they rise all day, why not have a go at them?" said I. "And if it's dark—well, it wouldn't matter if one made rather a mess of one's cast. One could fish with much thicker stuff, too." "It's impossible," she said. "It's just a long narrow tunnel—much too narrow to cast in. And, anyhow, the fish all lie at the far end. The tunnel is nearly 30yds. long. No one could cast up it. Don't try. You'll only break mummy's rod. Then she'll be livid. And, anyhow," she went on, "look at that wretched pole across the tunnel to keep the cattle out. It won't come unfastened. What are you going to do, if you do hook one? He'll come running downstream, and you'll get your line round the pole, and he'll break you for certain." Zonk! came the sound again as if to confirm her words. Zonk—Zonk—Zonk!

We arranged to meet upstream under a tree for luncheon. She went up, and I started to make a detour away from the bank to fish the lower reach. As I set off through the long grasses I heard the sound again. Zonk! It echoed provokingly in my ears. Two hours later, with two nice fish each of over 1lb. in my bag, I started upstream to join my cousin for luncheon. The rise seemed over for the time being. But as I reached the bridge again there came that resounding Zonk! The bridge fish were still feeding. I crept nearer and stooped to look down the tunnel. About 20yds. up, right in the middle of the lane of illumined water down its centre, the surface bulged upwards, and broke as a mighty head appeared. Again that sound echoed down to me. My hands began to tremble. "A king of fish!" I muttered. "An Emperor!"

As my cousin had said, it was no ordinary bridge but a tunnel. The road which crosses the stream is one of the "arterial" variety, and fully 30yds. wide. The tunnel appeared nearly 40yds. long, and the Emperor was rising about half-way. The roof of the tunnel was about 5ft. above the surface of the water, and the tunnel itself seemed less than 12ft. wide. Even with a helpful wind behind it would be impossible to cast a fly more than a few yards into it.

I was turning away when once again there came the same delicious sound, and again the surface was broken. But this was not the Emperor; it was another fish a good 10yds. nearer to me, on the right of the tunnel and feeding about 3in. from the wall, in what appeared by contrast to be almost pitch darkness. It presented an awkward casting problem, but there was still a chance that there might be yet another fish even closer to the entrance.

Stealing forward inch by inch in the water so as not to send up a ripple, I considered the problem. If one fished with one's body pressed back against the far bank, and resting the butt of the rod on the bank, only used the top three-quarters of it. . . . If one used the rod almost horizontally. . . . If one's fly did not catch the nettles behind, nor one's rod-top the roof of the tunnel. . . . If one had the luck to get a helpful puff of wind behind. . . .

At the first three attempts to cast a fly into the tunnel the gut caught on the cattle pole, and it was necessary to take three steps forward to release it from under the bark. At the next attempt I was so occupied avoiding the cattle pole that I forgot the nettles behind, and caught my fly in them. It took five minutes to cross to the nettles, disentangle the fly, and return to my position without sending a ripple upstream.

At the very next cast I was into the nettles again. By the time I was back in position I was not only sweating freely and cursing savagely, but I could hear my cousin shouting from upstream. I knew that if I did not come soon the thermos containing our lemon cocktail would be empty. Once again, with the butt of my rod on the bank behind me and my right hand about half-way up the bottom joint, I began to cast, at the same time praying to the patron saint of fishermen to give me his aid. He answered me immediately. For the first time the fly missed the cattle pole on its return swish, the top of the rod missed the masonry, and at the end of the backstroke the fly missed the nettles behind me. It flew straight and true up the tunnel.

Zonk! By a miracle I waited long enough. Probably it was the thought of my aunt's rage if I broke her rod on the stonework. I did not strike. I just *felt* for the fish. It was there! A little later it came downstream. The cast held. Three minutes later it was in the net. A lovely fish just under 2lb.

We lunched. The thermos of cocktail was less than half full. It was more than I deserved, for though shame consumes me as I write it, I confess that I kept my tunnel method to myself.

* * *

A month later I sent a telegram asking if I could come up to fish again.

* * *

"Where are you?" called my cousin. "I'm getting infernally wet, and there's not a fish rising anywhere. My dear man, what on earth are you doing in there?" I poked my head out of the tunnel to see her looking down at me over the parapet of the bridge. She appeared both wet and vexed.

"I could hear your reel, but I couldn't see you anywhere," she went on. "Do you mean to say that you've been sheltering in there all the time? I call that the limit. And here have I been, soaked to the skin, waiting for fish which have no intention of rising, and telling myself I mustn't be a fair-weather sportsman. And you've been in there quite dry all the time! Come home at once. I'm soaked and half frozen."

I cocked my leg over the cattle pole and emerged. "It—it's rather fun in there," I remarked feebly. She regarded me sourly, but then her expression changed. "You—you haven't been trying to fish in there?" she said. "You haven't—you haven't got one?"

I hung my head. "I have," I said. "Actually, I've got five. But the Emperor is still there. I—I left him for you." I did not mention that as well as the Emperor there was a fly and a foot of 3x gut . . . *left for her!*

"IF ONE FISHED WITH ONE'S BODY PRESSED BACK AGAINST THE FAR BANK . . . IF ONE USED THE ROD ALMOST HORIZONTALLY . . . "

MR. RICHARD HARRISON'S PAINTINGS

On the cover of our Shooting Number dated August 5th, there appeared a painting of grouse by this artist, and the cover of our Autumn Number showing pheasants in flight was also by Mr. Harrison. Signed prints of the former picture were issued by the artist, 120 at a guinea each, and can be had from him at Tanfield House, near Ripon, Yorks.

FARMERS AND THE WAR

SPEAKING on behalf of the Secretary of State for Scotland as well as himself, the Minister of Agriculture and Fisheries broadcast an important message to farmers and the rural community generally recently.

He said that the farmer's main job is to increase, in an orderly fashion, our home production of essential foodstuffs—a task just as vital to the nation as that which has to be carried out by our armed forces.

As far as immediate after-harvest plans are concerned, the majority of farmers must think in terms of ploughing up more land, both for the supply of human food and animal feeding stuffs. The immediate task is to plough up as much land as possible for next year's harvest. The County War Agricultural Executive Committees will be responsible for seeing that these plans are carried out in each county. It will take some little time, however, for the committees to give precise directions, and in the meantime farmers should get on with the job by ploughing up at least 10 per cent. of their present grassland.

The Minister announced that as regards land that has been under grass for at least seven years, the Government propose to extend, until December 31st next, the present ploughing-up grant of £2 per acre available under the Agricultural Development Act.

Newly-ploughed land should be sown to wheat where it is likely to yield a satisfactory crop, or alternatively should be used for potatoes or such crops as oats, barley, beans, peas, rye or mixed corn for next year's harvest. With the exception of hops, all the existing restrictions on production or acreage, such as the levy on the excess acreage of potatoes, will be removed.

The Minister gave an assurance that the Government were doing their best to see that farmers will get the necessary supplies of labour, machinery, oil, fertilisers, feeding stuffs, seeds, &c., and that the committees would play their part in helping with farmers' needs as soon as possible. For the present farmers should continue to buy their requirements from their usual merchants. There must be no waste and should not buy more than they need.

WITH COMMENT

It has been announced that produce should be marketed through the usual channels. The Gestapo are employing the usual quantities for the distributive trades are required farmers will continue to work full time job and the only exception is that it is desirable that this year's wheat harvest should be kept in stack on the farm as far as possible.

The Minister went on to say that there is at present no shortage of feeding stuffs for livestock, and he appealed to farmers not to take any hasty steps, such as reducing their flocks and herds. The country must have sufficient supplies of livestock products, especially fresh milk, and the Government will control supplies and distribution of feeding stuffs so that the necessary stock can be maintained. At the same time farmers with livestock are strongly urged to make every effort to grow on their own farms as much as possible of the feeding stuffs that they will require.

The Minister said that the contribution which those engaged in agriculture were being called upon to make had never before been of such tremendous importance to the nation. In doing their job, farmers would, in many cases, have to alter their usual farming practice, perhaps in a manner that they, as individuals, might not like, and they would be called upon to suffer a degree of control which in ordinary times would not suit their particular ideas. Farmers would understand that, said the Minister, and would yield to none in their willingness to place themselves and their farms unreservedly at the service of the country.

The effort that will be demanded of them is one which has been carefully considered and carefully planned, having regard to available supplies of food, and to the ability of the industry to carry out its allotted role.

Farmers can best help at this juncture by co-operating to the fullest possible degree with their County War Agricultural Executive Committees and Sub-Committees, when they hear from them. The Minister appealed to farmers to trust the committees as friends and as men who know their job, and to have patience and understanding. Uncertainties, delays and inconveniences were bound to occur in the initial stages, but the farmer should carry on, using his own judgment and getting on with the job as well as he could. The Minister said that he, the Secretary of State for Scotland and the Food Controller would be keeping in very close touch with the National Farmers' Unions, and he expressed the hope that farmers would themselves use their own organisations to the full for obtaining any additional information that they may require.

The Minister laid stress on the important part that the agricultural workers are called upon to play, and said that the Government's plans could not be carried out without their full co-operation. Every worker at present on the land should, therefore, continue to carry on with his present job, which, the Minister said, is National Service of the highest importance; and he appealed to the workers to give help and encouragement to the additional workers—men or women—who would be needed to supplement their own skilled efforts.

To members of the Women's Land Army who have volunteered to undertake farm work in a national emergency, the Minister said "Thank you," and asked them to hold themselves in readiness for the instructions that will be given to them as regards training or employment.

The assistance that smallholders, allotment holders and those with a reasonably-sized garden can render in the present emergency was stressed by the Minister, who said that they can help—more, perhaps, than they realise—to feed themselves and others. Some can be preparing the ground for vegetables in the spring and others can keep a few poultry. Poultry kept in small numbers in city and suburban gardens, or on allotments, can be fed almost entirely on all forms of household waste.

The Minister also asked country people, when they have an occasional free hour or two, to give assistance to farmers who may be short-handed, particularly at this moment when it is so important to complete our harvesting operations. He went on to say that it did not need any words of his to encourage country folk to give a real country welcome to those who have to evacuate their homes in towns or cities—that welcome has already been given.

Speaking to those to whom life in the country is new, the Minister suggested that they should try to understand the habits and customs of those with whom they have to live and try to co-operate with them and help them. He indicated a few ways in which they could be helpful—by not leaving gates open and not making gaps in hedges, by not leaving lighted cigarette ends near haystacks, and by not letting dogs worry farm stock.

After appealing once more for the fullest co-operation of all concerned, the Minister concluded with the following advice: "Have confidence in those to whom authority has been delegated. Have patience and exercise tolerance if things do not go exactly as you want them to go. Above all, work like blazes; the results of your work are of vital importance."

(*War Regulations concerning farmers are given on the page 662*)

LAND UNDER THE PLOUGH WILL BECOME A BIG FACTOR IN OUR NATIONAL FOOD SUPPLY

AN OTTERHUNTING JUBILEE

The D.O.H. Achieve their 50th Season

A MEET AT STAIR BRIDGE
Miss Bell-Irving, a former Master, is on the extreme right

WITH the acquisition of some dozen couple of mixed and cross-bred otterhounds, not a pure-bred amongst them, the produce of several packs, the Dumfriesshire Otter Hunt came into being 50 years ago. Yet after a short span of years of discriminating and judicious breeding this kennel sent to the foremost dog shows of Britain hounds which annexed the highest honours. The stamp of rough-coated hound exhibited by the Dumfriesshire Hunt became a paragon of the breed accepted even by such high authority as the Kennel Club. Contrary to opinion held in many quarters breeding for the show bench did not detract hunting capabilities, and as regular followers of the pure-bred rough-coated hounds will bear witness their musical cry and clever scenting powers are unrivalled by any other sporting dog.

The Dumfriesshire Otter Hunt was founded in 1889. It was the culmination of the yearning on the part of two keen otter-hunting brothers, Messrs. Wilson and Maxwell Davidson, to have a pack of their own in Dumfriesshire. Since school days they had followed the Carlisle, hunted in these days by William Sanderson, better known as "Sandy" and later by Tom Parker, whose son was to subsequently carry the horn for the Dumfriesshire Hunt. They found some of the keenest sportsmen in the South of Scotland willing to back them up in their venture, and when a meeting was called in Dumfries for the purpose of establishing a pack it was attended largely by the county's leading sportsmen. There it was agreed to form the Hunt to provide sport on the rivers in South Scotland.

The task of laying the foundation of the kennel devolved upon Mr. Wilson Davidson, who was appointed honorary huntsman, and his brother Maxwell. Conveniently, a small pack of mixed hounds belonging to Mr. Harry C. Clift, of Newbury, Berkshire, was on sale, and as a result Mr. Davidson purchased six couple. Mr. W. C. Yates had a pack in Ireland which he disposed of in 1889 to Sir Henry Bromley, and from this pack Mr. Davidson acquired a few hounds which he considered would be reliable on the line of an otter. A few hounds from the Kendal, Carlisle, and West Cumberland packs were later obtained, completing the embryon of the Dumfriesshire kennel. "To hunting men," commented Mr. Davidson, "they were certainly an ill-assorted lot, not even a pure-bred otterhound among them."

In subsequent years, by careful selective breeding and the infusion of Welsh hound and French Griffon blood into the kennels, there was produced the heavy fewed rough-coated hound for which the Dumfriesshire pack has since become noted. I believe this French blood originated from the pack that was sent over to this country by that great French authority on hounds and hunting, Le Comte de Couteulx.

For many years blood from the Dumfriesshire kennels has been much sought after, and specimens of the pure bred hound have been sent to almost all parts of the world—to the Continent, to India and Ceylon, to China, and to many parts of our Empire. Before me lies a letter confirming the sale of two hounds, Comely (six years old) and Tyrant (three years old), to a Mr. Charles Keyes, of Massachusetts, U.S.A. From the Otter Hound Stud Book compiled by Mr. Davidson it will be observed that drafts from the Dumfriesshire were used for breeding purposes in the kennels of most of our English packs.

According to my father's diary, "The first meet of the Dumfriesshire hounds was at Gotterbie on Monday, May 20th, 1889. Casting off opposite the farm of Gotterbie, hounds soon found an otter which afforded poor sport, the river being very low, hounds killing after a short hunt. This, their first, otter was presented to Mrs. A. J. Johnstone, of Halkeathes. Proceeding up the river nothing was done till we reached Johnstone Bridge, when hounds began to feather on the rocks above. Boatman opened and led the pack to the mill dam, where an otter was put off, and soon succeeded in driving it with the river. We had a splendid hunt of nearly four hours, hounds hunting nearly to perfection. In spite of so many rabbits on the edge of the river, they entered well to their game, some of the young hounds hunting and swimming the water exceedingly well."

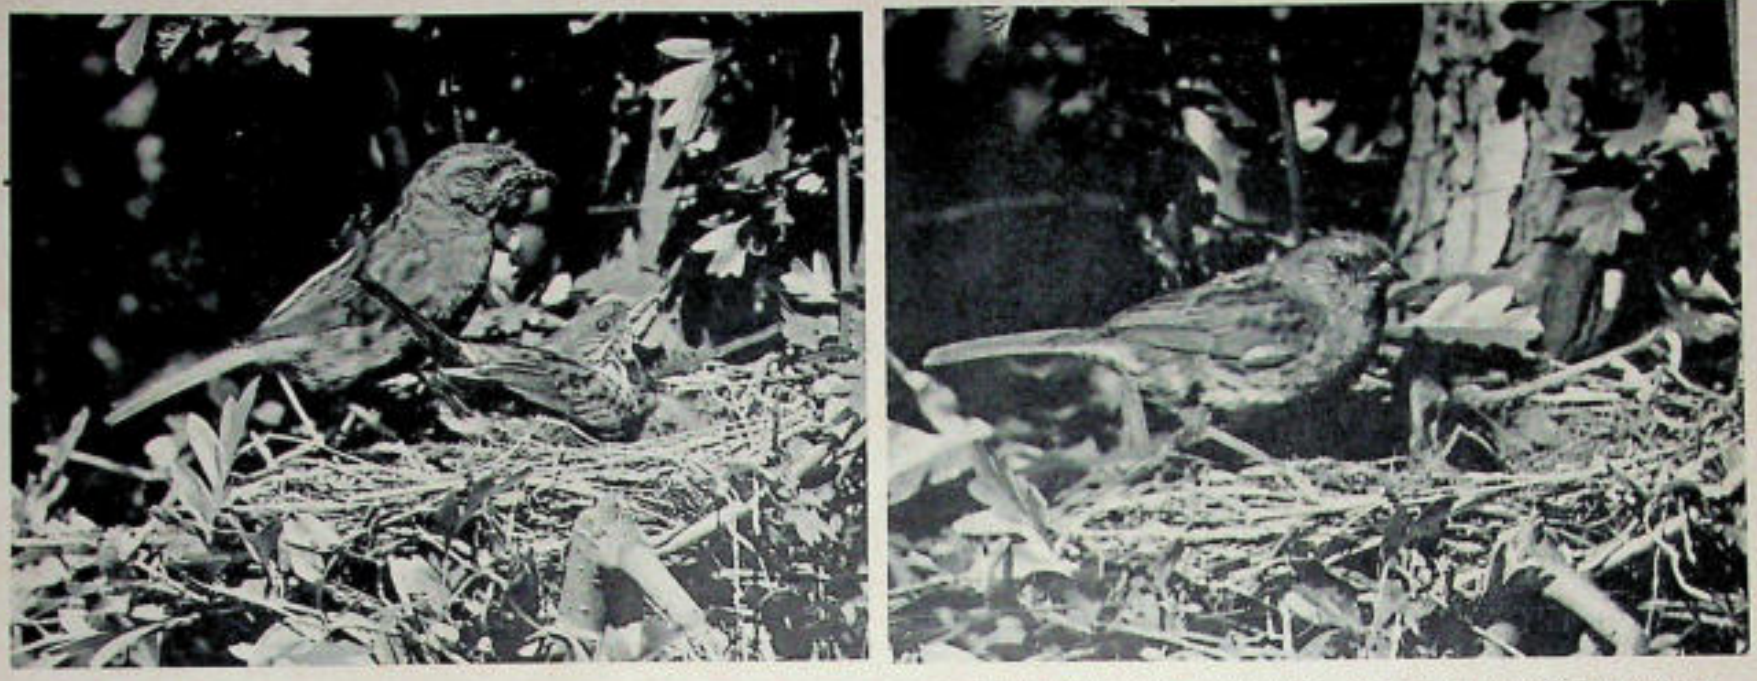
Since that far-distant day there have been some remarkable hunts under the auspices of the D.O.H. Just a week or so before the pack accounted for their 406th otter in 1921 there was a very strange otter hunt. Hounds met at Milkfoot, struck a drag up the Milk over the Whitehill ponds, marking their otter in an old fox earth above Mary's Pool. As he could not be shifted, he was left. A fresh drag was struck about Murrayfield, but hounds could make nothing of it. On their way back hounds suddenly broke away when passing Mary's Pool, the otter, marked there in the forenoon, having evidently left his holt. It was nearly eight o'clock at night when they found him, hounds driving him up and down Mary's Pool over the rocks below and on down-stream till opposite Milkbank, where he turned; then back he came up over the stream into Mary's Pool again, where a grand hunt ensued.

JOE PARKER TRIES HOUNDS ACROSS STREAM

They hunted him in the dark under the overhanging trees and banks. A stable lamp was procured to throw some light on the scene, for it was now too dark to distinguish anything and hounds could be followed more by sound than by sight. The hunt had meanwhile been joined by the Masters of both otterhounds and foxhounds, and the huntsmen of both packs were there, whilst others, roused by the cry of hounds, appeared within the circle lit up by the flickering lamp. At last the otter broke away up-stream. It left the river at Castle Milk gardens and passed under the iron railings and crossed the golf course on its way back to the water below. Its shadowy form could just be discerned as it passed within the circle of light shed by the lamp ere it vanished into darkness.

Hounds were soon screaming across the golf course and through the railings into the river. Various mishaps had meanwhile occurred to the followers of this weird hunt, but the hunt continued merrily down-stream until the otter found refuge in a long, wet drain near Kettleholm. It was now 10.30 p.m., and so Scott drew off his hounds and went back to his kennels and an eleven o'clock supper that was never more welcomed! This unique hunt can still be remembered by those alive to-day who were lucky to be there.

I shall mention another memorable hunt in tribute to a hound. The pack had been invited to the Till in Northumberland. They fastened on a drag which took them to a strong embankment, but they could not speak to anything. All hounds came away with the exception of Royal, who refused to leave, but kept scratching between the stones. Many old and experienced hunters shook their heads, sceptical of any otter being there. The Master and huntsman had every confidence in the old hound and got permission to remove a stone to allow a terrier to enter. Instantly Royal threw back his head, and in response to his great cry a score of "view bollocks" proclaimed that the otter had gone away. The entrance, being under water, had puzzled many packs for years.



Unlike many of the English packs, the Dumfriesshire has ideal otterhunting rivers. The country includes Dumfriesshire, Kirkcudbrightshire, Ayrshire and Roxburghshire. Locally the principal hunting rivers are the Annan, Esk, Nith and Cairn; in Kirkcudbrightshire it is the Dee and the Urr; and on the Borders, the Tweed, Teviot, Kale and Ale provide sport. During the regular visits to Ayrshire at the invitation of the Ayrshire Otter Hunt Club hounds hunt the Ayr, Doon and Girvan.

Since the days when Mr. David Inglis, of Stair House, and Mr. Claud Hamilton, of Sundrum, persuaded the hounds to come to Ayr, this club of ardent supporters has been the chief pillar of the Hunt. The hon. presidents of that club, all influential sportsmen, are thereby worthy of note. In rotation they have been: the late Mr. Claud Hamilton, of Sundrum; the late Mr. J. W. Galloway, Ayr; the late Mr. C. D. Inglis, of Stair; the late Mr. H. M. Poe, Ayr; and the present holder of the office is Colonel J. Reid Kerr, of Greenock. Mr. David Highet, Locksley, Ayr, nephew of Mr. David Inglis, has been hon. secretary and treasurer of the club for over ten years.

Mr. David Bell-Irving was Master of the Hunt until 1908, when the honour was handed to his son William, who, regretfully to say, lost his life in an aeroplane accident in the early years of the War. In 1915 Miss E. H. Bell-Irving, now Mrs. Fergus Graham, became Master for a couple of seasons, when she was succeeded to the charge by her elder sister, Miss Bell-Irving, Bankside, who relinquished the duty in 1923 in favour of her brother, Major John Bell-Irving, Whitehill, who holds the Mastership at the present time.

Mr. Wilson Davidson was honorary huntsman from the formation of the pack to 1915, when he retired, having carried the horn for 25 years. Mr. Davidson died in March, 1936. Joe Parker, who had been kennel huntsman and first whip, succeeded him, but he died suddenly four years later. He was the son of old Tom Parker, huntsman at the Carlisle at one time, the pack which [illegible] John later hunted and with which [illegible] served as whipper-in prior to [illegible] Dumfriesshire. Will Scott [illegible] 1919 from Mr. W. Thompson, [illegible] him must be dealt a large [illegible] poured out on the kennel [illegible] well-known judge of otterhounds [illegible] of the Carlisle, recently [illegible] Dumfriesshire pack are a [illegible]

[illegible] for mechanical [illegible]passable. The [illegible] lines of vast sand dunes, [illegible] wide in extent and so [illegible] whole of this area can [illegible]y. Then there are [illegible] soft quicksands, [illegible] and steep cliffs of [illegible]wn-sand slopes.

THE ONLY TIME THE BIRDS WERE AT THE NEST TOGETHER. USUALLY THE HEN LEFT AT THE APPROACH OF THE COCK. ON RIGHT, THE HEN AT THE NEST

THE HEDGE SPARROW

By GUY B. FARRAR

THE misnamed hedge sparrow—it is not really a sparrow but an accentor—is a bird not often photographed, probably because it is a common species and its rufous brown and grey plumage give it a rather dowdy and uninteresting appearance when seen from a distance. But appearances are deceptive and a close-up of this unobtrusive little dweller in our hedgerows or shrubberies will reveal the very pleasing black and brown pattern of its mantle and scapulars in contrast to the smoky grey feathering on its neck and head.

An accentor is one who leads the singing; the high-pitched warbling of the hedge sparrow can be heard the whole year through except for a short period in August and September. This song bears some resemblance to that of a wren, but is more subdued, more musical and less assertive.

The nest, made of twigs, bents and moss, is lined with hair, wool and, sometimes, feathers, its construction depending on the material available. Those I have watched have generally been in thick hedges, especially privet, stick-heaps, or in tangled undergrowth, but, last season, I found one in a clump of tall rushes, a situation one would have thought more congenial to a sedge warbler or reed bunting. The one illustrated was placed in a hawthorn bush.

The hen sat on her four eggs, blue as the summer sky, for fifteen days, an unusually long period, and then three nestlings clothed in black down appeared, their orange mouths ever agape for food.

They were five days old when I began to photograph at this nest; the hen still brooded them together with the addled egg. As the nest was situated in the boundary fence of the Royal Liverpool Golf Links, and as an amateur championship was in progress, crowds of people passed within a few yards of the brooding bird at all hours of the day. She soon became accustomed to this unusual disturbance and refused to leave her charges even when cuddies looking for lost balls came within a yard of the nest.

Considering that the young were fed on green caterpillars and small black flies, I was surprised at the long periods that elapsed between mealtimes. The cock only came to the nest at about half-hourly intervals, the hen usually leaving the young at his approach and returning soon after his departure laden with food.

If she could find larvæ in this short space of time, it was obvious that the male could have fed at much shorter intervals. His infrequent visits were therefore due to laziness, or an instinct that forbade him to return more frequently, and not to scarcity of food.

During periods of strong sunshine the hen shielded the young with half-opened wings, remaining in this position until I covered up the nest. She was a very restless mother, continually changing her position or pulling at the lining of the nest until it was disposed to her entire satisfaction.

The young left the nest on the thirteenth day. I saw them in the early afternoon and by the next morning only the addled egg remained in the nest to remind me of a very pleasant period of bird watching.

SHIELDING THE YOUNG WITH HALF-OPENED WINGS

THE HEN WAS CONTINUALLY REARRANGING THE LINING OF THE NEST. IN THE LEFT-HAND PHOTOGRAPH SHE IS REGARDING IT DOUBTFULLY, WHILE A YOUNGSTER ASKS IN VAIN FOR FOOD. THE HEN SAT VERY HIGH WHEN BROODING THE YOUNG

FISHING IN THE NATIONAL PARKS OF THE ARGENTINE

By HAROLD HARDY

A RAINBOW FROM THE CHEMEHUIN

SALMON and trout are not indigenous to Argentine waters. They were first introduced about 35 years ago from the United States. When one considers that except in one isolated place, at Tonquist, 300 or more miles from Buenos Aires, where there are rainbow trout, an overland journey of some hundreds of miles was needed from the railhead to stock their national parks, or else a journey over the mountains from Chile, it will be realised what difficulties had to be faced. There were no motor cars, and the roads were then almost non-existent. The National Parks of Nahuel Huapi and Lanin, which are at present the places mostly fished, lie some 1,000 to 1,200 miles from Buenos Aires in a more or less south-westerly direction in the Cordilleras of the Andes and border on Chile on their western sides.

It must not be thought, however, that these districts are the only ones in which salmon and trout fishing can be had. There are hundreds of miles in a straight line north and south along the Andes of more or less unexplored waters, to which it is more difficult to obtain access as communications are not properly opened out yet, sometimes in other National Parks and sometimes outside of them. My experience, however, is confined to the National Parks of Nahuel Huapi and Lanin.

It was a great pleasure and an honour to be invited out by Dr. Bustillot, the President of the Parques Nacional, early in January of this year to advise them on their fishing, and what measures they could take to conserve it. The invitation came rather late in the season, and I arrived there towards the end of January, which corresponds to about July in this hemisphere. Probably the best months for fishing are November, December and January, though the spawning season is not until some time in May. The summer there last year was very wet, and consequently the lakes and rivers were running very high, a condition which was not too favourable for sport.

The Andes range, being the only mountain chain in this region, breaks up and precipitates all the rain clouds, and the result is a well-watered country. The rainfall ceases some 50 miles or so from the mountains, and from there to the coast, some 600 miles, almost desert conditions set in with widely separated shrubs, &c., growing where one might think nothing could live, but in which sheep thrive. When anything moves there are clouds of dust.

On approaching the mountains, the scenery changes, and there are numerous lakes and rivers in all the valleys. The character of everything alters, and one sees all around snow-capped mountains, the lower slopes covered into vast forests, and everywhere lakes and flowing waters.

The climate in their summer varies as it does at home, and there is rain and sometimes even a little snow. Usually, at that time, it is like the best summer weather in England, but the sun is much more powerful than it seems. This is, I am told, because of the height at which these parks lie, some 2,000ft. above sea level.

To reach the parks from Buenos Aires necessitates a journey of some 1,200 miles, but this is done nowadays by rail in some 27 to 29 hours, and a sleeping berth is provided. The way lies through flat country, and is monotonous and sometimes hot. The railhead at Bariloche is only fourteen miles from a first-class hotel at Llao Llao, which is built of native woods. Other smaller hotels are scattered through the parks and all have bathrooms, some attached to each bedroom, and are clean. The charges for the smaller hotels are about 10/- a day.

There is a well-run hatchery near Bariloche, and stocking is regularly carried out. They breed there sebago salmon, rainbow trout, brown trout and American brook trout.

The parks of Nahuel Huapi and Lanin are being developed, and there are enough roads to get to many places to fish. These are very rough, but all suitable for motor traffic. I fished in these parks a little over three weeks and travelled some hundreds of miles by car staying sometimes by invitation at estancias and sometimes in hotels.

It is not possible in the course of a short article to go into any detail, but I will give a short résumé of some of the fishing I had. Before I left England I had heard of the wonderful landlocked salmon of the River Traful and the owner, Mr. La Riviere, invited me to fish there. This river flows from Lake Traful and is very clear, as are all the rivers. It reminds one of a good class Scots river and looks fishy.

One can see the salmon, and they are there in quantities running up to 20lb. These fish take a salmon fly readily, but most of the Argentine fish are taken on spoons of about 2in. to 2½in., which are, I think, taken for the crayfish to be found in all their waters. Argentine anglers seldom fish with a fly. I did not take salmon heavier than 11½lb., but saw many much larger, and there are records of many which had been killed in the neighbourhood of 20lb. There are also all the varieties of trout to be found in the Argentine in this river. The largest I had there were American brook trout up to 6lb., and rainbow about 4lb.

We went one day in a dinghy with an outboard motor, some 20 miles up Lake Espejo (Mirror Lake) to a little river which had possibly never been fished before, and I took on a small Hardy spoon, fourteen American brook trout in about an hour and a half, average 6¾lb. The largest weighed 8½lb. They were weighed 20 hours later. I actually stopped fishing because it was too easy.

On another occasion, I caught a rainbow in the Chemehuin, where it flows from Lake Huechulafquen—a record for the Argentine—but in the clear water I could see larger ones. I took that day nine fish, five rainbows and four brown trout. The largest brown trout weighed about 5lb., most of them were taken on a fly using an 8ft. 9in. trout rod. The large rainbow was caught in very fast water on a small spoon and thread-like tackle, the line having a breaking strain of 6lb. On some of the smaller rivers there is delightful fly fishing, with fish running from 1lb. to an occasional 5-pounder. The flies one uses there are small salmon flies about No. 5 size.

There are no poisonous mosquitoes, but quantities of horse flies and midges. It is advisable to keep the shirt sleeves fastened as one, otherwise, gets rather nasty bites on the arms. Because of the ultra-violet rays from the sun and sometimes very strong dry winds, it is necessary to anoint one's face and hands with some form of face cream, otherwise the skin peels off and one's face is inclined to crack and blister. The same clothes as are used to fish in at home are suitable, and a good waterproof is essential. Transport is cheap, and petrol is the same price all over the Argentine. Hotels, at any rate the smaller ones, all charge 10 pesos (10/-) a day.

The cost of a trip of, say, four months, including steamer and all fares, transport and living in the country, should not, in happier times, exceed some £400.

FIELD TRIALS FOR BLOODHOUNDS

"IF A HOUND HUNTS AT ALL, HE HAS SOME CHANCE OF SUCCESS"

SOMETIME in the winter of 1935–36 an entirely new style of field trial was devised for bloodhounds. Called "police type," these trials are considered by most owners to be an improvement upon the former type which, however, they have not entirely displaced.

The practice favoured for many years, and still sometimes employed, is that in which the judge accompanies each hound as it works a line. There is also, besides the handler, a line steward who knows the exact direction taken by the quarry so that, in the event of an appeal for assistance, he can correct a handler whose hound is hopelessly at fault. The judge, of course, awards points to the hound for good work, or deducts them for faults or for help from the steward. A time limit is imposed, this being necessary if other hounds are to start their hunting on time. This time factor is one of my chief objections to the older type of trial. There are, perhaps, eight hounds to be judged during the day and, naturally, the same man must do the judging, which means that hounds have to be hunted at different hours. The first may be "laid on" at nine o'clock, while perhaps the last will not start before 3.30, and any student of hound work is bound to appreciate the change which can take place in scenting conditions in even fifteen minutes.

There are certain advantages in trials of this kind. One is that if a hound hunts at all, he has some chance of success, even if he does not find his quarry. Another is that the owner who has entered more than one hound is able to handle each of them himself because their lines commence at different times. Also, the handler may either ride or "foot it," and both judge and steward are mounted.

In the winter of 1935–36, Mr. J. E. M. Mellor, who was, at that time, honorary secretary of the Bloodhound Breeders' Association, tried out an entirely new plan at Conington in Cambridgeshire. Although scenting conditions were not good on this occasion, results were such that the Association adopted these new "police type" field trials.

The name was given because the primary object in such trials is to find the quarry without any outside help. The handler is allowed to assist his hound as much as he likes, even to the extent of looking for tracks himself. He may do anything except ask or receive advice from a human being but, unless the runner is found at the end of the line, his hound has no hope of an award.

All hounds are "laid on" their lines at the same time, and the first to find its man is the winner. There is no question of points being given or deducted. Lines start within a short distance of each other, radiating like the very crooked spokes of some huge wheel, each nearly four miles in length. Handlers draw lots to decide which line shall be theirs, and actual direction is known only to judges and runners. Even stewards are in the dark, for their duties are only to see that handlers receive no help and to note the times when hounds identify their quarries and handlers say, "This is the man." Judges have only to compare the times of successful hounds to decide the winner.

There are certain drawbacks to "police type" trials but, in my opinion, considerably fewer than in the other kind. I may be prejudiced in their favour partly because, on two occasions, I have handled winners in the new style trials. Some owners complain that they are handicapped by not being allowed to ride, and that, therefore, the good runner has a great advantage over others. This may be true to some extent but, on the other hand, a fleet-footed handler, urged on by the competitive spirit, may easily push his hound too much.

Under this treatment, a staunch hound will become pig-headed while a younger and less reliable one may be tempted to change to some other line. Also, I have noticed on several occasions that, in the older type of trials, when some handlers rode while others ran, the runners usually came out on top. Many get over this difficulty of keeping up by having their hounds at the end of long, light ropes.

The objection that if an owner has entered two hounds he must get someone else to handle the second one, cannot be countered, and this may be awkward when trials are a long distance from his kennels unless one entry is in the senior stake and the other in the junior, the two taking place on successive days.

One obstacle that, without an unlimited area of operations, is impossible to overcome, is that certain lines must run upwind more than others, but this applies to any field trials.

I think that these "police type" trials come as near to equal conditions for all entries as it is possible to get and that they overcome the chief difficulty—that of varying atmospheric conditions. Also, the only way to reach success is by the hound's working up to its quarry, which should be the ultimate test of any hound work.

The Association of Bloodhound Breeders runs field trials twice yearly, in the spring and autumn, with a senior stake on lines two hours "cold" and a junior stake on lines one hour "cold." Winners are eligible to compete for the Brough Cup, which is run for on lines six hours "cold." There are seldom more than four hounds entered for this event which, in 1938 was won by the Hon. Lady Johnson-Ferguson's Kittiwake of Kirtle, while her Kestrel of Kirtle was placed second, together with Mr. How's Reveller.

While the Brough Cup is regarded as the Blue Ribbon of the bloodhound world, there is also the Marlwood Beaker, to gain which a hound must successfully hunt a line 24 hours "cold." This is at present held by Kestrel.

Field trials require a wide area of fairly open country, and have been held in such widely separated districts as Cornwall, Dumfries-shire, Wiltshire and Buckinghamshire. The procuring of suitable stewards in sufficient numbers is not always easy, and here chief constables have often come to the rescue by lending members of their force for the purpose.

J. IVESTER LLOYD.

"BOTH JUDGE AND STEWARD ARE MOUNTED"

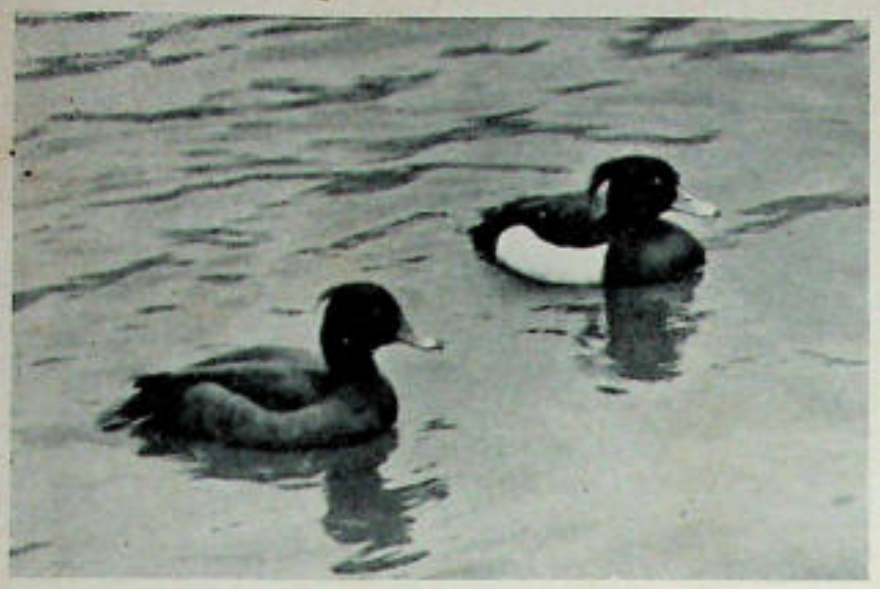
WAR PLANS FOR PET ANIMALS

Plans which the R.S.P.C.A. made last January for the evacuation and humane destruction of all schools' pet animals in the Metropolitan area and in a few places outside it have now been put into action. Over 500 animals—mostly dogs, cats, rabbits and guinea pigs—belonging to 69 schools have been destroyed at the Home of Rest for Horses at Boreham Wood and at the Society's own Home of Rest at Thames Ditton. The expenses of this valuable and necessary work are being met by the Society.

All the Society's clinics in the Metropolitan area have been open day and night for the destruction of animals belonging to the general public.

Plans have also been made for animals which may be injured during raids. The National A.R.P. for Animals Committee, representing all animal welfare societies and working under the auspices of the Home Office, has set up 22 Veterinary Posts in London. Injured animals should be taken to any one of these posts, where they will be treated, or if necessary destroyed, by a veterinary surgeon. The address of this Committee is: 36, Gordon Square, W.C. 2.

During the last war, it will be remembered that the R.S.P.C.A. was the only society permitted to work for sick and wounded British horses.



A special fund was raised for this important work, and the Duke of Portland was appointed chairman of it. In all, the sum of £200,000 was collected and spent on this object, and it is expected, though not as yet confirmed, that a similar Fund will again be raised on this occasion. An announcement about the Fund will, it is anticipated, be made shortly. It should be clearly understood that no orders have yet been issued for the compulsory destruction of pets. It is, indeed, highly undesirable that cats should be destroyed in a wholesale manner as an increase in mice and rats is bound to take place.

ANGLING IN WARTIME

Anglers who listened to the wireless warning against sports which necessitated the foregathering of many men must have congratulated themselves on their selection of so lonely a sport as angling for filling their leisure moments: though it is safe to say that many of them have added a private grudge against Adolf Hitler for having selected the last month of the trout season, which many of us had been looking forward to for the fulfilment of some of our quiet ambitions, for the attempted fulfilment of his outrageous aims. It is curious that so essentially peaceful a sport as angling should always thrive best among tumult and strife. Walton's classic covers the period of civil war, the last great war to be fought on English soil; and chance days on French streams in 1914 to 1918 stay happily in the memory when days of greater sport, perhaps after the clash of arms had given place to the whirr of the reaper, have passed into oblivion.

BIRD MIGRATION ON THE MERSEY ESTUARY

By ERIC HARDY

TUFTED DUCK BEGIN TO ARRIVE IN THE THIRD WEEK IN AUGUST

BORN and bred in Liverpool, with a seafaring father who collected Transatlantic bird records for his enthusiastic son, I am ever thankful for the opportunity to atone for life in this crowded city by a study of its bird life, particularly the migration in the vicinity of the Mersey estuary, which the editor has kindly asked me to summarise here. For twenty years I have been watching and recording local bird movements, which are most evident at the following localities: Hilbre Island in the Dee Estuary, our only rocky coastal area, rich in waders and a shelter for sea-duck in rough weather, its birds having increased since the Hoylake Council extended its by-laws to prevent shore shooting; the Alt Estuary at Crosby, whose mud banks likewise form good wader haunts that can be followed out with a retreating tide, while the great slag banks to stop coast erosion provide the rocky conditions for a few turnstones and purple sandpipers more normal at Hilbre; Formby Point below Freshfield, where the tides converge and deposit victims of oil and winter gales; Liverpool Bay, which is best worked from a boat; the muddy Mersey shore below Dingle Point, forming a wind shelter for waders (like Hilbre); Knowsley Park lake, our best passage water for duck; Liverpool Sewage Farm at Fazakerley, a regular passage haunt of green-sandpipers, ruffs, greenshanks, &c., but not nearly so useful as when I first knew it with twelve acres of permanent standing water, for sprinklers of little attraction to waders are replacing the settling pools. Eccleston Mere, preserved near St. Helens, is the next best duck haunt to Knowsley.

The bulk of the summer migrants to the Mersey Estuary arrive via North Wales and the Wirral coast, but we have observed cuckoos crossing Liverpool Bay to Formby Point, as if many early birds travelling up the west coast bypass the Wirral Peninsula. Mid-Wirral migration dates are always later than coastal records, and inland south-west Lancashire a few days later still. But I had better review the bird migration in the Mersey Estuary month by month from the field naturalist's point of view, commencing with March as the most convenient time of the year.

My sign of spring is the arrival in the estuary of the first British varieties of the lesser black-backed gull in the first week of March. Although both British and Scandinavian varieties are here in the winter, these newly-arrived birds are so much cleaner and more spruce than any we have seen all the winter that they are obviously newly arrived migrants from Iberian haunts. They spend a few weeks in the estuary before they appear at the Liverpool Sewage Farm at the end of the month, and they are there for about a fortnight before moving inland to Simonswood Moss, where a growing colony nests.

The first week of March also sees the pink-foot and white-fronted geese gathering in the Ribble Estuary below Crossens before moving north via the Solway; pied wagtails and meadow-pipits are moving up the coast and through the sewage farm in migrating parties; ruffs appear at the latter place. From long studies at the Cathedral Bird Sanctuary (*Bird Movements Inside Liverpool, Naturalist*, October, 1933) I noted that the winter starlings began to migrate out in the second week of March if a south-west wind favours them. Redwings and short-eared owls also begin a north-eastern move that week, while in the last week of the month there are the first willow-warblers, which are not yet in song and thus require close scrutiny of vegetation; a few sandmartins visit the Cheshire meres, there is a coastal movement of pintail, and by bird counts I have noticed a migration of skylarks up the Wirral sandhills.

April sees flocks of golden plover, with their black underparts, gathered in flocks of 200, 400, even 800, on the flats by the Sewage Farm, Storeton, or the Gowy Marshes before moving to their moorland nesting haunts, and a large herd of curlews likewise gathers on Simonswood Moss. The second week sees the arrival of swallows at Knowsley, yellow wagtails and sandpipers at the sewage farm, swallows are moving up the Wirral coast and willow warblers slightly inland in later weeks. Pied, white and yellow wagtails can be seen migrating across the Dee Estuary at Hilbre plentifully in the last week, when the Sandwich terns pass up the coast to northern terneries, and there are still odd flocks of fieldfares and the last redwings.

The first week of May sees the arrival of common terns at Ainsdale, but we do not usually find the first nests until the last week. Spotted flycatcher, grasshopper warbler, tree-pipit, turtledove and whinchat also arrive the first week, and there are many swifts passing over Hilbre on their way from the Welsh coast northwards. The first or second week sees a migration of Greenland wheatears, which generally pass through a fortnight or so later than the common wheatears; while there are still parties of dunlin, purple sandpipers, turnstones and sanderling on the coast, although many are resplendent in nesting plumage, and fieldfares inland. Even the long-tailed duck sometimes tarries in the estuaries (where it favours the marine lakes) into the third week, in its full nuptial plumage.

Although we look to the first week of May for the arrival of swifts there is a definite northward move in the first week of June, and at Carr Mill Dam and Knowsley Park Lake I have counted flocks of 200 and 300 (probably non-breeding birds) brought low to feed on gnats. White wagtails are still passing up the coast in the first week, yet by the third week the lapwings are flocking again on the marshes, over 100 strong.

July sees the turn of the tide in bird migration by the coming of the common gulls, which do not nest in these parts. They migrate down the coast slightly inland, but in East Cheshire they are only occasionally seen. My early morning nature walk is usually over the Childwall golf course, which is a gathering and preening place for gulls, and the appearance of the common gulls is most noticeable, the first migrating parties of pied wagtails coming about the same time.

The next week sees the coming of the early waders, still with traces of nesting plumage, and on the Freshfield shore appear dunlin, sanderling, little terns, kittiwake gulls and Sandwich terns, all these birds making the sandy shore a sort of resting place on a leisurely southward migration. I saw over 100 sanderling there the other July. The third week sees young yellow wagtails, with noticeably short tails, passing south in large numbers through the sewage farm, although the movement of adult yellow wagtails is not strong until the second or third week of August. The fourth week sees the first knot, and grey plover on the coast and a heavy migration of young blackheaded gulls southwards, most noticeable at the sewage farm where they flock; the movement of young herring-gulls coming a week or two later.

August sees the wader migration down-coast increasing, young ruffs of the year, with buff-brown on their plumage, appear at the sewage farm in numbers; godwits (black and bar-tailed), curlew-sandpipers, whimbrel, small flocks of oyster catchers and knots, appear along the coast in the second week, odd pied flycatchers passing south from Lakeland may be seen on Helsby Hill, and young willow-warblers, noticeably yellowish, are migrating south through city gardens and the Cathedral Bird Sanctuary, and a rise in temperature and a full moon usually sees the bulk of the swifts

LOOKING ACROSS THE MUDFLATS OF THE DEE ESTUARY TOWARDS THE CLIFFS OF THE FLINT COAST

"AT EBB OF TIDE." A PICTURE TAKEN NEAR LIVERPOOL

go. Curlews from the moors flock up to 90 on the sewage farm; golden plover and sandpipers appear at Burton Marshes, flocks of little terns are in the Dee Estuary; great and blue tits move into city gardens and parks from the country. Green-sandpipers and golden plover appear at the sewage farm in the third week, when tufted duck begin to arrive at Knowsley. In the last week the Wirral rooks begin to resume their winter flight-lines over Liverpool northwards to feeding grounds, the Welsh peregrines visit the Dee marshes, and odd pochard appear at Knowsley.

The first week of September sees an arrival of teal, a movement southwards of lesser black-backed gulls and the arrival of a few grey plover, knot and godwits. There are also one or two black-necked grebes and red-throated divers appearing offshore from now to November; immature cormorants appear at Knowsley Lake, although we are far from a nesting colony, and these must be migrants, and the first redwings pass over. Jack snipe appear the second week, sandpipers are numerous in the night migration over the city from the third week, when the last swifts pass through. The fourth week sees small parties of scoter in Liverpool Bay, the first grey geese go over flying high, there is a migration of mistle thrushes into town parks and gardens for the ripe rowans, and frequently at Southport and West Kirby a grey phalarope may appear now or later in the autumn.

October sees the coming of fieldfares, a south-westerly movement of skylarks down the Wirral coast and pipits more inland, a heavy movement of redwings, and an arrival of a few great crested grebes to winter offshore. The third week sees the coming of the red-breasted merganser offshore, and flocks of grey geese feeding in the Bescar-Rufford fields, averaging 20 strong last month, now reach about 400, and may be 1,000 next month. The last week sees a big arrival of drake pochard, tufted duck and wigeon at Knowsley, although the bulk of the females seem to arrive later in November. The short-eared owls arrive on the Sefton Meadows, and as flocks of mallard often appear at Freshfield at this time, there appears to be a southward migration of young wild duck.

More mergansers arrive the first week of November, golden eye appear in the second week, and shoveller and pintail are moving south in the third week. Our last swallow of the year is usually in the first week of November and the full moon brings many woodcock; scaup arrive offshore in parties in the first week, and hard frost from now on will bring a few Hebridean and Continental song thrushes; lapwings then flock at the coast, coming down the Ribble to move over to Ireland. Long-tailed duck are here every December now, and there is then a big arrival of Continental mallard at Knowsley.

The last week of the year sees an arrival of bramblings at our beechwoods, although these finches are in East Cheshire by October. January sees a few brownish young snows arrive, and I have noted the Scandinavian lesser black-backed gull as well as our British race here this month. In the second week of February my duck-counts at Knowsley have shown a noticeable northward movement of shoveller, while the great crested grebes come back from the sea.

WAR TIME ARRANGEMENTS OF VARIOUS SOCIETIES

MASTER OF FOXHOUNDS ASSOCIATION.—The Hon. Secretary of the M.F.H.A. informs all concerned that the temporary address of the Association until further notice will be c/o Messrs. Tattersalls, Knightsbridge, London, S.W. 1.

HUNTERS' IMPROVEMENT AND NATIONAL LIGHT HORSE BREEDING SOCIETY.—Until further notice the address of the Society will be as usual, 12, Hanover Square, London, W. 1. This applies also to the National Pony Society and the Secretary of the National Horse Association of Great Britain hopes as far as circumstances permit to collect correspondence from the office of the Association.

LITTLE SHIP CLUB.—All correspondence to the Club should now be addressed to its temporary offices at St. Peter's Chambers, High Street, Colchester, Essex.

TRENT FISHERY BOARD.—The Clerk to the Board, Mr. J. Inglis-Spicer, 68, St. James's Street, Nottingham, announces that the Trent Angling Championship has been abandoned. Entry fees will be returned to entrants as soon as practicable.

GREYHOUND RACING SOCIETY.—The General Purposes Committee of the National Greyhound Racing Society has decided to carry on the work of the Society, and has appointed a special committee to deal with matters affecting the future of the sport if, and when, the present Government ban upon sports meetings is lifted. The members of the special committee are: Mr. F. S. Gentle (Greyhound Racing Association, Ltd.), Mr. H. Garland Wells (Clapton, Reading, South Shields), Mr. A. J. Elvin (Wembley), Mr. W. J. Cearns (Wimbledon and Southend), and Lieutenant-Colonel E. L. Mears, D.S.O. (Glasgow Albion). All inquiries dealing with the Society or the Committee of London Greyhound Tracks should, for the time being, be sent to this address.

NATIONAL GREYHOUND RACING CLUB.—All current Identity Books have been photographed, and the films stored in a strong room. The complete set of Identity Books, numbering over 60,000, will be stored at Lord Denham's country house in Buckinghamshire. The Club will maintain a staff to deal with inquiries from owners and Racing Managers.

BRITISH FIELD SPORTS SOCIETY.—The Secretary announces that owing to the outbreak of war the committee has decided that the work of the British Field Sports Society shall be suspended for the duration of hostilities, a decision which it is believed will be endorsed by all its members. There is, however, not a shadow of doubt that when peace reigns once more, the society's help in the building up of field sports and all that goes with them will be essential. Apart from this, however, the society has certain obligations to meet, such as rent, rates and contributions to the staff pension fund, which it intends to continue. The secretary therefore earnestly appeals to all members to continue their subscriptions in whole or in part so that the society may be in a really strong position when its help will be most required. No further reminders for subscriptions will be despatched, but all renewals may be sent as in the past to 3, St. James's Square, London, S.W. 1, where they will be collected and duly acknowledged by the society's auditors, who will be in charge of its finances. Sincere thanks are offered to all those who have so loyally supported the society since its foundation nearly ten years ago. Since that date it has never looked back; its membership has increased steadily each year and the growth of its influence has been remarkable. The secretary hopes that all may meet again in happier times, and would like to take an opportunity of personal thanks to all those who have shown so many kindnesses to himself since he was appointed secretary on the formation of the society.

THE LONDON SALON OF PHOTOGRAPHY at 26–27, Conduit Street, New Bond Street, London, W. 1, still proposes to hold its annual exhibition of pictorial camera work, which is scheduled to last until October 5th. It is added that the basement of the gallery has been scheduled as a safe air raid shelter to accommodate 200 persons, so there should be no apprehension on the part of visitors to the exhibition.

UNIVERSITIES FEDERATION FOR ANIMAL WELFARE.—The temporary official address of the Federation is c/o Dr. F. J. Vinter, Torpoint, Harold Road, Hastings.

RED CROSS AND ST. JOHN JOINT APPEAL

H.R.H. the Duke of Gloucester and the officers of both bodies have made the following special appeal on behalf of the work of the British Red Cross and the Order of St. John of Jerusalem.

"In the grave issues which now confront the British Empire, the British Red Cross Society, of which H.M. the Queen is President, and the Order of St. John, have decided to work together as they did in the last war, with results which are still within the memory of the public.

"With this object, a Joint Emergency Committee has been set up, comprising an equal number of members of each body. Lord Cromer has consented to be the Chairman of the Committee with Major-General Sir John Kennedy as Vice-Chairman.

"In this war, which is so entirely different from any that has preceded it, it is impossible to foresee exactly where relief for the sick and wounded will be most needed, or in what form. But it is certain that there will be vast suffering and distress, and that the relief of the sick and wounded of His Majesty's forces, and of the civilian population, will call for much voluntary effort and financial support.

"Considerable voluntary help has already been secured, but it remains to find the money necessary to pursue the work. In the Great War, and indeed at all times, appeals made by the British Red Cross Society and the Order of St. John received the most generous response, showing that the heart of the Empire is with those who are risking their lives in support of the rights and liberties, not only of the peoples of the British Commonwealth of Nations, but of the whole civilised world.

"We earnestly ask you to help the Joint Committee in the great work that lies before them. A fund is being opened in the name of the Joint Bodies. Donations should be sent to the Hon. Sir William H. Goschen, K.B.E., Hon. Treasurer, Red Cross and St. John Fund, at Messrs. Coutts & Co., 1, Park Lane, London, W. 1."

From 1914–1918 the activities of the joint organisation were amazingly wide, covering as they did the sending out of agents and complete staffs to all Allied fronts half the world over. In all, a total of over £17,000,000—almost all from voluntary contributions—was expended on the great humanitarian work of the organisation. Immense though the task was during the last war, the joint committee of the societies will now face an immeasurably bigger one, for to their activities will be added that of giving aid to the millions of civilians who will also unhappily be subjected to enemy attack.

CANCELLATIONS OF SHOWS

NATIONAL DAIRY SHOW, which was to have been held at Olympia in October; the Motor Show, Olympia; Thame Agricultural Association Show, September 21st.

THE CAMBRIDGESHIRE will not be run, and the National Hunt Committee have cancelled meetings at Market Rasen (September) and Perth Hunt (September 27th and 28th). The M.C.C. tour to India is abandoned, and also, among other future golf fixtures, the Ryder Cup Match, the English Women's Championship, the professional match-play championship and the Dunlop-Metropolitan tournament.

LEFT: A VIEW TOWARDS SAUNDERSFOOT FROM THE BEACH AT AMROTH, A VILLAGE IN WHICH MANY DWELLINGS HAVE BEEN DESTROYED BY THE SEA. RIGHT: A SPRINGTIME VIEW WITHIN A FEW HUNDRED YARDS OF A COAL MINE

WHERE TRADITION DIES HARD

By D. N. McHARDY

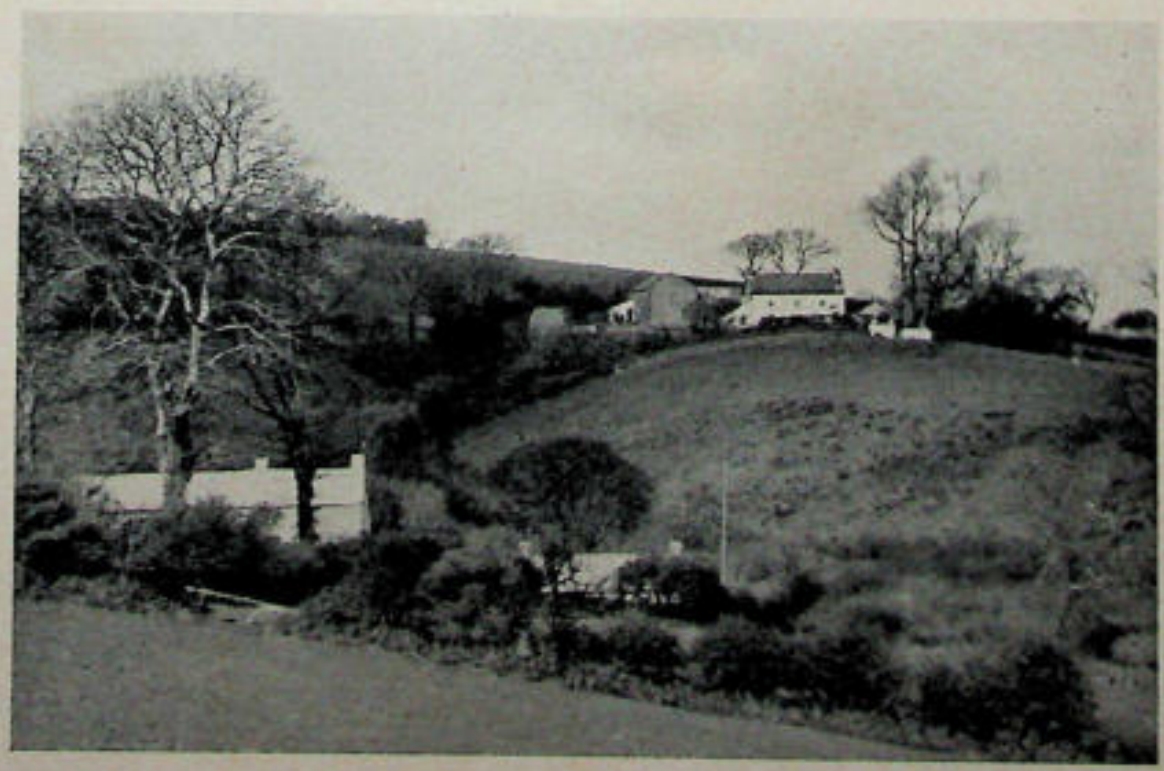
JUTTING south-west into the Bristol Channel, the broad peninsula which is Pembrokeshire has an individuality which is just as marked as that of the land of Cornwall, which, although narrower, bears a marked similarity of shape and direction on the map. Each has a group of natural harbours at the toe, which in times gone by served to promote communications with other ports.

Such influences as must have been derived from the intercourse with peoples who came to trade in Milford Haven and the neighbouring creeks and to do business at the river port of Haverfordwest, must have been responsible for the naming of Pembrokeshire "Little England Beyond Wales." Before the days of rail and road transport, the fact that the sea joined and the land divided, would have made it much easier to travel across the Bristol Channel than from the hinterland of Wales to the coast of Pembrokeshire.

It is certainly true to-day that there is very little of Wales about the people or customs of the county, and one may very soon discover an atmosphere much more suggestive of Somerset, not only in speech but in character. The Flemish influence may have been common to the ancestors of both. Known to comparatively few outside its borders, the county has been left very much to its own devices until very recently.

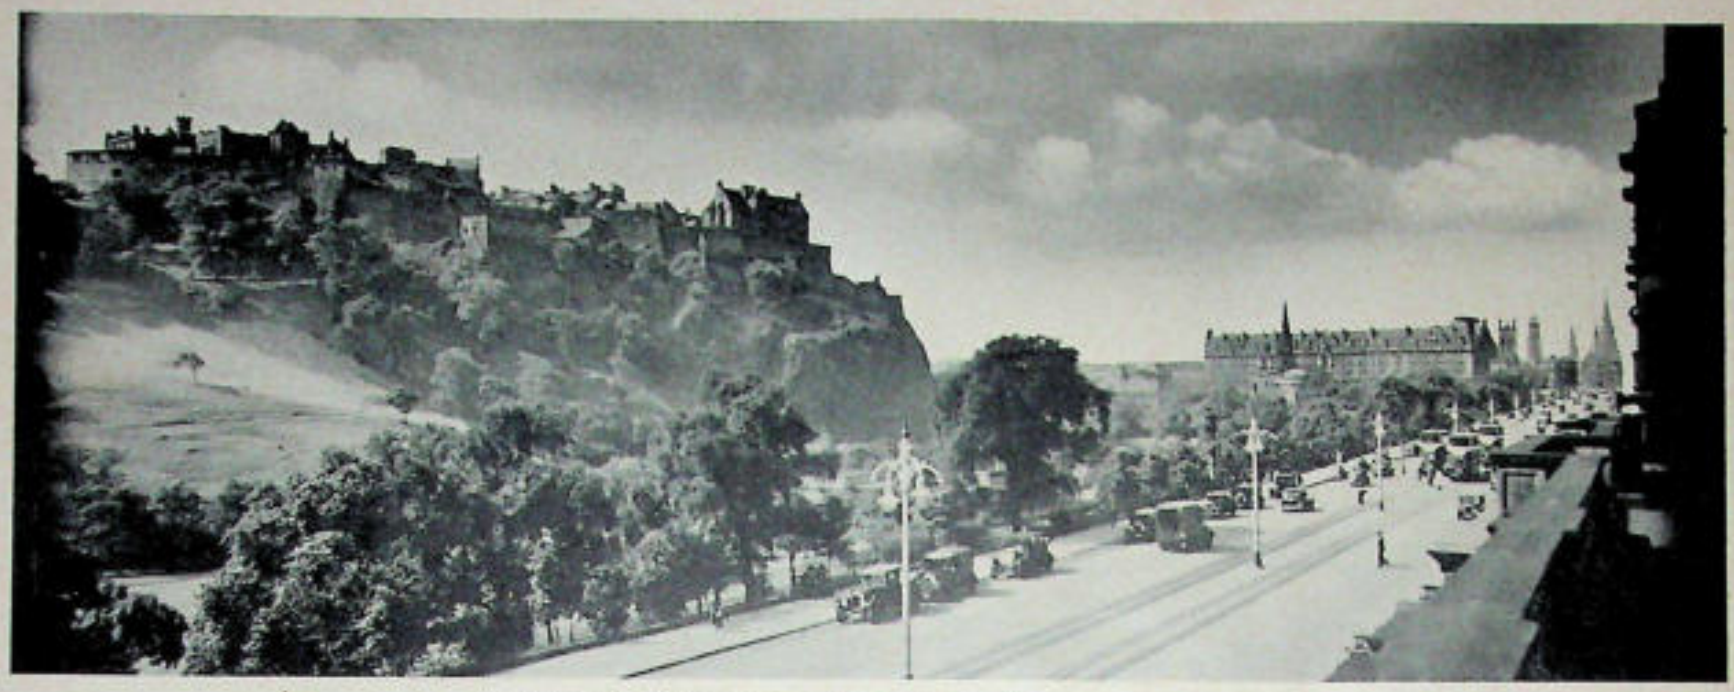
The attention of agriculturists from England has been attracted in the last year or two to the potentialities of the coastal belt for the production of early potatoes, and some remarkable enterprises have already developed. Waste and barren mountainsides have been reclaimed from the bracken and briars with which they were infested, the numerous adders have been dispossessed, and fine healthy crops of Sharpe's Express have taken their place. The district may easily compete with the Channel Islands since there is usually immunity from late frosts. What impresses one more particularly, in contrast to the success of the newcomers on the wildest land in the area, is the neglect of much of the easily worked land in flat and level fields. With a tenth of the hard work, the occupiers of such could get similar results.

Those who are lovers of the country may rejoice at the scarcity of the industries in the county. There is a very limited number of coal mines, from which excellent coal is obtained, and these are situated in some of the most beautiful valleys in the county. Although they have been worked to a great extent in the past and within the last few years, the scenery has not been spoiled, and everyone would welcome a resumption of work in the interests of the people.



When unemployed in the mines, some turn to small farming enterprises, rather with a view to occupying their time and providing for the family than with the hope of profit. The district contains in addition many small family farms, run in the traditional manner, with a few pigs, cows and poultry on each. A feature of the livestock is a general absence of the more common diseases like tuberculosis which ravage the intensively farmed districts of England. And this in despite of the absence of any of the modern buildings and appliances considered so essential to hygiene.

Modern conveniences are, indeed, looked upon with disfavour. A recent scheme involved the laying of an extensive system of water mains to bring a supply from the Preseelly range to the villagers of South Pembrokeshire, who have depended for many years on very good springs, from which it was a daily task to fetch a supply. The piped water is still regarded as unwholesome, and even possibly poisonous, by many who prefer to continue carrying their familiar supply from the spring.



Electric cables stretch overhead through most of the villages, but connection is generally to the houses of the people who maintain a holiday residence in the district rather than to the cottages. The paraffin lamp is still good enough for the villager, it suits his pocket, and what is more, it warms him as well in the winter, as one informed me.

In their little thick walled whitewashed cottages, sensibly built low to the ground to escape the winter gales, the country people with common-sense tastes are comfortable and generally satisfied with their quarters.

It is evident, however, that the ardent social reformer is on their track. They have perhaps few more years to enjoy themselves in peace, before they will be hustled out of homes in which they have been born and bred, to live in a new jerry built house with all modern inconveniences, and designed by a townsman architect with a complete disregard of country needs and ideas. Even the most remote must be sacrificed sooner or later in the cause of progress.

SOME TYPICAL PEMBROKESHIRE FARMSTEADS

A VIEW FROM THE SMOKING ROOM, LOOKING TOWARDS THE CASTLE

GREAT SOCIAL CLUBS. THE "NEW," EDINBURGH

By BRIGADIER-GENERAL C. G. HIGGINS, C.M.G., D.S.O.

THE New Club, Edinburgh, like a number of other foundations of various natures bearing a similar appellation, can hardly be considered juvenile. Founded in 1787, it is certainly junior to the old St. James's Street clubs like White's, Boodle's and Brooks's, but considerably senior to all the other clubs reviewed in this series.

The Club owed its origin to the cause which had given birth to all the early London clubs, that is to say, from the desire of men, of similar tastes and inclinations and moving in the same social circles, to meet together in a common room or house for the discussion of their own affairs. There were at this time numerous taverns and so-called clubs in the Old Town of Edinburgh where various groups and coteries of men of the same tastes and proclivities used to meet to dine and talk; probably a room or two was reserved for them for this purpose.

They bore curious names and their members apparently behaved in strange ways. The "Spendthrift" Club, for instance, was so named from the extravagance of its members in spending 4½d. each night. The "Dirty" Club's rules forbade any gentleman to appear in clean linen. At the date when the New Club was founded, the New Town of Edinburgh was still in course of formation, the North Bridge connecting the two towns having been only opened for traffic in 1772. After crossing the bridge at this period one was faced by the Register House, to the right was the Theatre Royal and behind it on two sides was Shakespeare's Square.

At Bayle's Tavern situated in this Square the New Club was founded. The tavern was situated on the north side of the Square, which was subsequently pulled down when the Regent Bridge was built about 1815. It was No. 1 on the Square and stood next to the house at the top of Leith Street. Bayle, the proprietor of the tavern, was a Frenchman, and previous to becoming a vintner and tavern keeper in Edinburgh he had been in the service of General Scott of Balcomie. The General had also a large villa, with policies, situated where Drummond Place now stands. This is the same General Scott to whom reference was made in the article on White's Club as being credited with winning £200,000 playing whist there. His three daughters, as is so frequently mentioned, married George Canning, the ninth Duke of Portland and the fourth Earl of Moray. Bayle had started as a vintner in the Old Town before moving to Shakespeare's Square, and soon after getting installed there his house became known as the "French Tavern."

THE FRONT OF THE CLUB HOUSE
From an etching by F. Lodge

There is no actual record to be found of how the Club originated, but Chambers in his *Traditions of Edinburgh* says that it was the offspring of an old club of a similar nature and consisted of men of rank and consequence. Mr. Cockburn in his *History of the New Club*, to which I am indebted, suggests that the Club which Chambers refers to was the Poker Club and that the New Club does indeed owe its origin to this Club. The name "Poker" in this case had nothing to do with the game of cards of that name, but signified the intention of its members to try and stir or poke up the Government of the day to form a Militia force in Scotland as a security, after the '45 Rebellion, against renewed trouble and insurrections. Whether it be true or not that the New Club rose from the ashes of the Poker Club, there is evidence that a very considerable number of their original members had been formerly members of this other Club. The first rules to be drawn up show that the original membership was limited to 110 members at an annual subscription of 2 guineas. This was very quickly altered to 160 members. Thirty years later it had reached 450 with an entrance fee of £26 5s. and an annual subscription of £5 10s. In fact, whenever the Club wanted more money, as has frequently been the case in the course of its history, it increased its membership and raised the entrance fee and subscription. Eventually we shall see that the entrance fee rose to 40 guineas and the membership to 1,000.

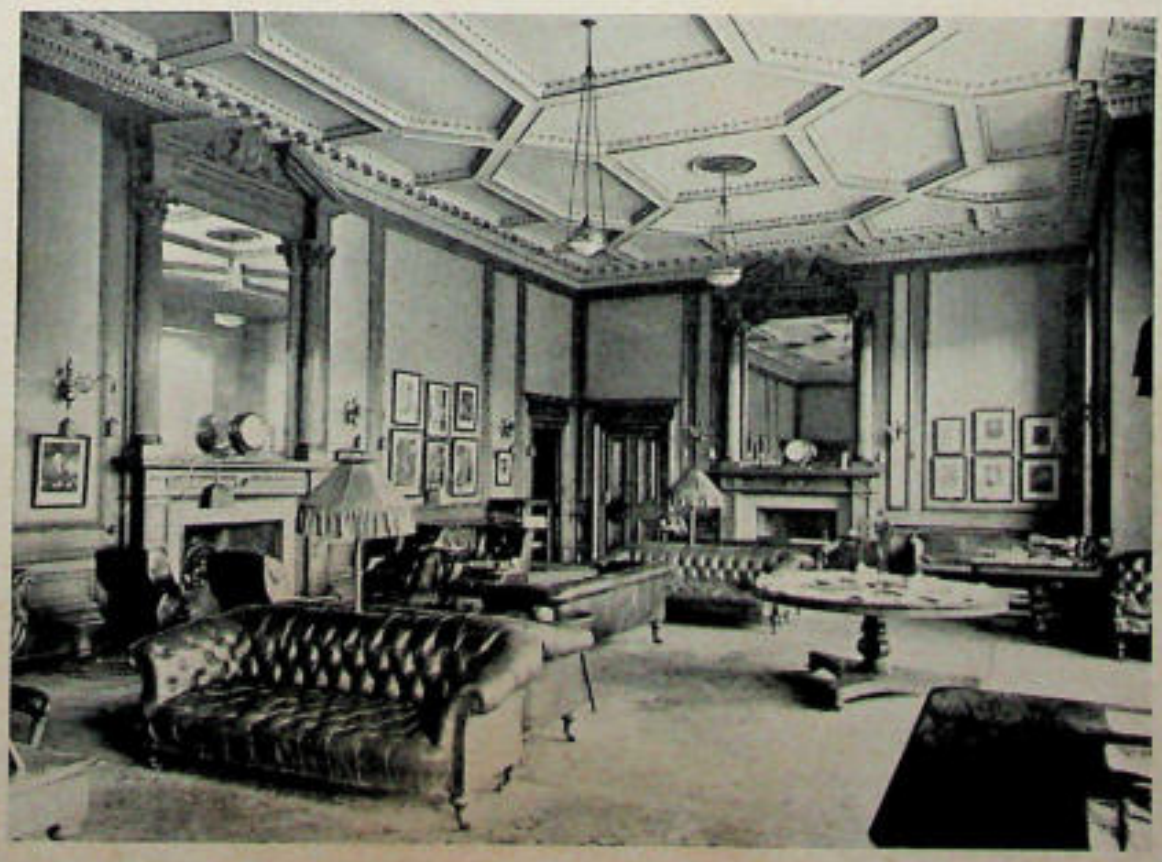
While at Bayle's Tavern the members cannot be accused of extravagant tastes in the furnishing line, as an inventory and valuation taken in 1795 disclosed its total value to be £139 11s., included in which was a water-closet valued at £57 17s. 6d., far the most precious of their possessions and the item most frequently referred to at their committee meetings. In the days we write of State lotteries were in force, and in 1798 the managers authorised the treasurer to purchase a ticket "for behoof" of the Club with a view, if fortunate enough, to buy or build a set of rooms for themselves. Mrs. or Mme. Bayle, we are not told which, who was responsible for looking after the two or three rooms rented by the Club, does not appear to have carried out her duties efficiently, as there were numerous complaints about this time of the rooms being very dirtily kept. Nevertheless, in 1799, the entrance fee was raised to 7 guineas and another lottery ticket was purchased. The charge for dinner was then fixed at 3/- and for supper 1/6. Dinner was to be at 5 p.m. and the bill brought in and collected precisely at nine.

During the time under review the gambling which took place in all the London clubs had, as we have seen in previous articles, reached fantastic proportions. Nothing, however, on this score is reported in the history of this northern Club, and the members appear to have contented themselves with buying tickets in the State lotteries, and in 1801 it was reported that the Club had won a

A CORNER OF THE DINING ROOM

THE SMOKING ROOM ON THE FIRST FLOOR

Breakfasts and dinners served in the club in 1873 *only differ by* 137 *from the number of those meals served in* 1936, *yet in the latter year* 3,947 *more luncheons were served*



prize of £2,000 in one of them. Elated with their success, it was decided then that all new members should pay an entrance fee of 10 guineas, presumably for the privilege of joining such a fortunate assembly of people; they also considered the propriety of buying a house for the Club. Shortly after this Bayle died. His wife was then awarded a pension, and at the same meeting a new water-closet was ordered to be erected. After having purchased the Lord Justice-Clerk's house at some unknown date, the Club appear to have disposed of it again in 1805 without ever having taken possession.

In the year 1809 they bought No. 3, St. Andrews Square, and this was to be their first Club-house owned by the members. The vendor was Mr. Charles Ross and the price £4,500. St. Andrews Square was the first square to be completed in the New Town and was described by Hugo Arnott in his *History of Edinburgh* (1787) as the finest square he ever saw. At the same time an unsuccessful bid was made for the adjoining house, No. 2, owned by Dr. James Gregory, a man whom every Victorian child has reason to remember, if not with gratitude. But it took more than gold to move Dr. Gregory. To provide the necessary money for the alterations to the new house, the membership was promptly increased to 300 and the entrance fee raised to the substantial figure of 20 guineas. Mr. William Burn, the well-known architect, was commissioned to carry out the necessary alterations.

A new Club manager in the person of Walker Douglas was now appointed at a salary of £250 per annum with 100 guineas a year for coal. He had, also, to provide a staff of three men and three women, their wages and victuals not to exceed the modest sum of £135 a year. From a table of wages paid in 1818, we find that the three housemaids were paid £7 a year each! The Club members had always been good claret drinkers, and in 1821 their wine committee was induced by the extraordinary vintage of 1815 to lay in a still larger stock of this wine than usual. The amount shown in the Club's ledgers was eight hogsheads and nine dozen of the value of £1,020; they also had two pipes of port and numerous butts of French wines to fall back on.

In 1824 some discussion arose about taking over the Excise Office, now the headquarters of the Royal Bank of Scotland, with a view to increasing their accommodation. Nothing, however, came of it, but the membership was increased again to 600 so as to have the necessary funds ready for a further purchase. It was then decided to buy Nos. 51, 53 and 55, George Street and move there from St. Andrews Square. But no sooner was the purchase completed at £8,700 than the Club decided to stay where they were and put the houses into the market again. This proved to be an unprofitable transaction, and they became, not for the first time, involved in debt. An acrimonious general meeting followed with the usual result of electing more members, now at an entrance fee of 40 guineas. Two years later, Sir Walter Scott was made an hon. member for life—an honour never previously bestowed on any member. After the Great War, the same privilege was granted to Earl Haig.

Fortified by the nice sum of £4,200 which had been paid in recent entrance fees, the members now, once again, began to agitate for increased accommodation and various houses, including the premises of the Royal Bank at No. 35, St. Andrews Square, were inspected. None, however, was found to meet their exact requirements. From a table of wages of the house staff compiled at this time (1832), we find that the three liveried waiters got £30 per annum, and that the under-housemaids had been risen to as much as 8 guineas a year each! The Club now had actually a balance in hand on the year's working and once more the question of a new house was gone into. At a general meeting (December, 1833) sanction was given for the purchase by the Club of a property in Princes Street

THE MORNING ROOM ON THE GROUND FLOOR OF THE CLUB

belonging to the trustees of the late Mr. Donaldson, also of the house then occupied as the tax office.

No. 85, the Donaldson property, was at that time the "Buck Head Hotel and Tavern." The terms of the agreement to purchase were very involved and cannot be dealt with here. The purchase-price plus the necessary new building for the Club's accommodation, was estimated at the time to be £27,000. They actually cost considerably more. Again, Mr. Burn, their former architect, was entrusted with the new work. At the anniversary meeting the following year, Sir William Maxwell proposed that the Club which had now existed for nearly half a century and yet still in defiance of all propriety, retained the name of the New Club, should be denominated the Caledonian Club. There were objections found to his suggestion, and it was finally decided to postpone a decision of the question for another year. Since then the subject has not been raised again.

On May 15th, 1837, the Club entered their new home, and took the management into their own hands, for the first time since its foundation. Immediately after becoming their own managers, the committee revised the charges for breakfasts, luncheons and dinners. Among the dishes for luncheon we read that the cost of fifteen oysters was 6d., so that for 1/- any member should surely have been able to satisfy himself. But the oysters came from the Forth, not from Whitstable. In this year, it was proposed "that members of White's, Brooks's, Arthur's and Boodle's Clubs in London, not being natives of Scotland nor possessing property in Scotland, shall on the written application signed by two or more members of the Club, be admitted on payment of his annual subscription in advance." The proposition was almost unanimously negatived!

A year after entering Princes Street, the members gave a ball which apparently marks the first occasion when ladies had ever been admitted to the Club-house. A blow to the amenities of their new home and also to all the other residents of Princes Street was now threatened by the proposal to extend the Edinburgh and Glasgow Railway from the Haymarket Station through Princes Street Gardens. The gardens had naturally been a source of great joy to the Club members, who had the privilege of possessing private keys for effecting their own entrance to it. In conjunction with the rest of the Princes Street residents, they strenuously opposed the coming of the railway. It was in vain.

Life in the Club now jogged along very quietly, enlivened only from time to time by the misdeeds of various secretaries and by the never-ending disputes on the advisability of an increased membership. When we reach 1856, the Club again decided to extend their premises and bought for this purpose No. 87, Princes Street. It is on this site where now stand the writing room and billiard room above, with the dining room behind. These additions were not completed until several years later and, to meet the expenses, 100 new members were brought in at an entrance fee of 40 guineas. This, then, brought the total membership up to 850.

In 1859, before the completion of the new additions, two gallant members had the temerity to move that the management be empowered to have a room set apart for the reception of ladies, and that such alterations might be included in the new building. They were just about 60 years ahead of their times, and suffered the usual fate of people who make premature advances to the other sex. In 1863, a desire having been expressed by a number of members for a cheap champagne, the secretary took them at their word, and ordered some from London at 36/- per dozen. We are left in ignorance as to how the members enjoyed it, and how many dozen were consumed. Perhaps they were contemplating giving more balls!

An interesting table in the Club history showing the number of breakfasts, luncheons and dinners served in the years between 1869 and 1873, compared with those served in the year 1936, brings out in a striking manner the remarkable change in fashion which has recently come in as regards the popularity of the various meals at clubs. Whereas the number of breakfasts and dinners served in the Club in 1873 only differs by 137 from the number of those meals served in 1936, yet when we come to the luncheons we find that 3,947 more luncheons were served in the Club in 1936 than were served in 1873.

Nothing of great interest is to be found in the Minute Book during the uneventful period of the closing years of the Victorian era. In 1906 a picture committee was formed and immediately took steps to begin the formation of a collection of portraits of distinguished Scotsmen and of pictures of Edinburgh. The result of their labours can be seen on the walls of the Club to-day. At the beginning of 1912 the card room and coffee room were extended to the north at a cost of about £3,000, so as to increase the light by allowing space for additional windows. In 1919 the Club bought the eastern portion of the Balmoral Hotel in order to provide more bedroom accommodation. £20,000 was spent on this, and the addition of a modern central heating system. 1922 saw the membership again increased to reach 1,000—at which figure it remains to-day. Ten years later, at the annual general meeting, it was decided that the admission of candidates for membership should cease to be by ballot and be entrusted to the committee.

This decision is the last of the changes of any importance to be recorded in the constitution of this Club, which has now weathered the storms of over 150 years of club life. The site of the Club-house in Princes Street is an unrivalled one, commanding as it does magnificent views over the Mound to the Assembly Hall and the Castle. The interior of the building is spacious and the rooms well proportioned, the best of these being the double smoking room and library, which possesses a fine ceiling. A large and comprehensive collection of engravings of Scottish notables are to be seen everywhere on the walls of the room. In the library are some particularly good aquatints of views of Edinburgh by those well-known engravers Havell, Sutherland, Rosenberg and F. Jukes. A very charming drawing of a panoramic view of Edinburgh from the Calton Hill by George Tytler (1803) gives one a striking impression of the beauty of the surroundings of the city in those days.

A MATTER OF NERVES

Reactions in the Face of Dangerous Game

THERE can be few studies more absorbing than the reactions of man to physical fear; and the effect it has in big game shooting is a subject which has always interested me very much indeed. The world is divided into three main classes. The small class who either have no nerves or, who from long experience or iron self-control, have got them right under; the great majority of us who feel a bit funny inside but generally put up a good enough show, though we eschew the big risks; and those who frankly cannot face it when they get near dangerous game. These men probably have "moral courage," an attribute which it is fashionable to rank above physical courage, in the highest degree, but they had better keep away from dangerous game. After all, there are lots of other things to do in life, and those who come all over queer when they see blood, or quail as the Austin Seven turns on to the Kingston bye-pass, had best stay at home.

I have read a great many books on big game shooting, and I have talked to many big game hunters, and I have some experience of my own, and I am quite sure that the average man experiences no fear in the actual moments of contact with the beast, during the charge or whatever form the danger takes. The terrors of the block can be borne, but it is the agonies endured outside the Headmaster's Room that are so unsupportable. Was one really spotted getting out of the pupil-room window, or has some silly ass just marked you out of chapel by mistake? One suffered even at the tender age of sixteen the pleasures of anticipatory fear. There is no fixed boundary between pleasure and pain. That is an elementary principle of the Hedonist. And it is the first thing that the white hunter must learn as he watches his client. His fear is the fear of the unknown. Tell him that there is a wounded rhino in that bush, and that it will charge in just ten seconds, and he will be much relieved. We all know the bronzed hero of the North-West Frontier whom lady novelists depict trembling at the door of a drawing room in Belgrave Square, saying "This is worse than the Nervo Kotal" (or the Knox Narai). On the Knox Narai (or the Nervo Kotal) our tanned warrior could sum up the chances of the situation fairly well. But in the drawing room, with what unknown lures might not Venus or even Aphrodite be waiting?

But there is one thing that heartens us more than we would care to admit, and that is the watching eye of a friend, of a tracker or gun-bearer. If there are natives watching, one tries, I think, to do the thing as if it was a matter of course: the British Raj, pukka sahib, You're a better man than I am, Gunga Din, and all that. There is also another type, and I have met him more than once. One has a certain sympathy for him, but he is a public danger nevertheless. He is the man with a strong imagination who is always dramatising himself. He pictures himself telling very modestly how he strangled the leopard with his own hands, or even being carried in on a litter "smiling bravely." It doesn't much matter to the self-appointed hero, but it's rather hard luck on the gun-bearers he takes with him, and who may stop what was coming to him.

Sir Alfred Pease, in his *Book of the Lion*, records the remark of a Somali Boy who fought a lion with a spear, on foot and alone, a far braver act than the ordinary white man is ever called on to perform. "Yes, I was very frightened, but I was still more frightened of what they would say when I got back if I had let the lion kill a horse and done nothing."

There is, of course, the courage of ignorance, and a lot of people get away with it under most hair-raising circumstances simply through not knowing what they are walking into. But as a rule the danger in big game shooting comes after the shot, so anybody who has wounded a beast ought to realise there is danger.

For a good many years now I have made notes of the reactions of individuals to apparently imminent death. They have a remarkable similarity. Few are even excited: they are detached, interested spectators of their own fate. Do you remember Chirac, in the "Old Wives' Tale"? He told Sofia that he much looked forward to the public execution at Auxerres, because "'as a psychological experience it will be very *interessant*—to observe oneself in such circumstances.' He smiled enthusiastically. She thought how strange, even nice, Frenchmen were. Imagine going to an execution in order to observe oneself." In the only incident of this type at which I have ever assisted, I was not the least frightened at the time. I was an interested spectator of my own fate for the space of about ten seconds, during which it all happened. The other day I was reading of Mr. Winston Churchill's books of "Reminiscences," in which he recounts that as his aeroplane crashed with him to earth he thought quite calmly that the end had come. I was delighted to find myself in such company. Did George IV—whose last words were: "My boy, this is death," think the same?

M. T. S.

LETTERS TO THE EDITOR

BIRD PROTECTION

SIR,—Your recent article on this subject deserves the gratitude of all bird-lovers for the eminently sane views you entertain; and moreover, coming from such an authoritative source, it takes due cognisance of the varied factors involved in the present controversy and which the correspondence on this subject in your columns has amply revealed. The policy of the Association of Bird Watchers and Wardens has been, in the main, to draw attention to the non-effectiveness of the Wild Birds Protection Act, as at present constituted, a point which you, sir, have emphasised and upon which there appears to be general agreement. It would probably be better to have no law at all than one which is so futile and unworkable. We are not out to make war on *all* egg-collectors; we ask them to leave certain species on the danger list alone, for, as you point out, this is one factor in a complex problem, and it would be unjust to dispute the claim of Mr. Jourdain to speak in the name of British oologists, or indeed to impede the work of many notable ornithologists, such as those who have contributed to the classical *Handbook of British Birds*.

There are the sincere students with whom there is no quarrel; but besides these experts, there is a vast number of *dabblers* who are merely interested in amassing eggs. They are the people against whom our rarer species have to be protected. The position of game preservers and gamekeepers is also understood, and any new legislation should, of course, apply equally to all sections of the community—bird-photographers as well.

It is felt that gamekeepers whose livelihood depends upon the extermination of vermin cannot be blamed so much as those who destroy the rarer species merely for personal gain. These men are under their master's orders and cannot act otherwise; but, of course, a great deal can be attributed to ignorance on the part of some owners, and especially shooting syndicates. Cruel traps, such as the gin and pole traps, are such abominable contrivances that their abolition would be a mark of humanity. A conference of all the varied interests who are concerned with our avifauna in addition to the Advisory Committee to the Home Office, would be welcomed by all, for any new legislation, unless applied in the proper spirit, will be as inefficient as its predecessor. I would, therefore, like to suggest that there should be one national effort—one National Trust—to co-ordinate all the individual and isolated attempts now being made. This might in time embrace all branches, including entomology and botany, for surely, sir, this is a national, not a sectional affair with the object of preserving our rarities as a study for ourselves, as well as for future generations.

There should be some form of governing body composed of experts, chosen from the British Museum and other individuals. This body might act in an advisory capacity in conjunction with the Home Office and direct general policy, issuing instructions from time to time to limit the number of crows, rooks, jackdaws and the all-too-numerous gulls, even grey squirrels, and altogether regularising the position as regards golden eagles, peregrines, &c. We have our National Trust to preserve our beauty spots and ancient monuments for our national enjoyment, and why not a National Fauna Trust to conserve our glorious national heritage?

Yours faithfully,

Harley Street, W.1. PHILIP MANSON-BAHR
(President, Association of Bird Watchers and Wardens).

[We publish this letter, but events which have taken place since it was penned make the writer's desire seem far distant.—ED.]

A RIFLE SHOOTING CAMPAIGN

SIR,—The following letter has been sent to all clubs affiliated to the Society of Miniature Rifle Clubs:—

"Hopeful for peace as we were to the last, it is now plain to everyone that the German Government meant to overrun Poland whatever the cost. Britain and France are thus at war with the aggressors.

"We appeal to you, as the hon. secretary of a rifle club, to call a meeting *as soon as possible* of your members with the object of settling the immediate future of your club. At the same time, we should like to impress upon you that this society and your club have been quite voluntarily doing work of national importance in teaching the art of shooting—*and there is more than ever the need to go on doing so!*

"Whilst most people will be engaged on other work of National Service, the rifle clubs can implement those services by providing recreative competitions for all. The fact that places of amusement will be closed because not more than 30 people should be congregated together gives your rifle club the chance to enlist many new members, and to stipulate that not more than that number can be dealt with on any one evening.

"There must be many men over conscript age, or awaiting conscription, which must necessarily be gradual, to whom such an offer would appeal. Moreover, there are many women who would also like to shoot. The great point is for everyone to be engaged in something which will help to equip our people with the necessary abilities to *quicken the end of the war*.

"Some kind of recreation is also essential. Why not .22 rifle shooting?"

Yours faithfully,

G. PETHARD (Secretary).

M.F.H.A. COMMITTEE

SIR,—I should be very grateful if you could spare the space to insert the following for the information for all concerned:

CONSTITUTION OF THE COMMITTEE AS FROM JULY 1ST, 1939.

District.	Elected.	Name.	Retire.
Northern (including Scotland)	1938	Sir R. Spencer-Nairn, Bart., M.F.H.	1941
	1939	Capt. T. Wickham-Boynton (chairman), M.F.H.	1942
	1939	The Earl of Yarborough, M.C., M.F.H.	1942
Midland (including Wales and Eastern Counties)	1937	Viscount Knutsford	1940
	1938	Mr. W. W. B. Scott, M.F.H.	1940
		Col. F. G. D. Colman, O.B.E., M.F.H.	1941
Southern (including South-West)	1937	Sir George Meyrick, Bart., M.F.H.	1940
	1939	Viscount Portman, M.F.H.	1942

Yours faithfully,

CECIL PELHAM

3, St. James's Square, (Hon. Sec., M.F.H.A.).
London, S.W. 1.

USING "WASTE" MATERIAL

SIR,—It is difficult to visualise any form of land warfare where intelligent and accurate long-range sniping would not create casualties and demoralisation. There are in this country thousands of men between 42 and 50 who are crack shots; many of them were snipers in the last war.

Many of these men are at present undecided how best to make themselves useful; I suggest that they should form a corps of veteran snipers and offer their services. I have not asked for official authority to make the above suggestion because departments of the War Office, who might concern themselves with the formation of such a corps, are busy doing their own work. Even if the idea should be approved, they have no time to spare.

I have tentatively discussed the possibilities of the idea and have been amazed at the response; an ex-R.A.F. officer (age 42), who is a Bisley shot and an ex-sergeant-major of the Black Watch, an ex-sniper, are amongst those who have already offered their services should the suggested unit be formed. Each knows personally several ex-officers, warrant officers or senior N.C.O.'s—men accustomed to responsibility, who have seen war, and who are crack shots—who would join as privates.

The organisation I suggest would work under brigade directing officers, but each man would act independently. He would be supplied with a passport, entitling him to ask for food, shelter or a lift if his own transport (possibly a motor bicycle) should break down.

His orders would be on no account at any time to stay within 300yds. of the nearest enemy, but to operate at long range and run like a scalded cat if necessary.

Several objections may be raised against the above idea:

(1) That Bren gunners can do the same thing and more. They may be able to do more, but they cannot do the same thing. The man who gets out of a tank in dead ground 500yds. behind the line will take cover if a machine gun opens. The accurate, unexpected first shot, from the factory chimney in the distance, may get him.

(2) It may be said that battalion snipers can do all that is needed. Their style is cramped by the fact that they must conform to the movements of their battalions—they are, to the proposed V.S.C., what Lewis gunners in the last war were to the Machine Gun Corps.

(3) It may be said that snipers might occupy posts which could be more usefully used by artillery observation officers or machine gunners. In that event, the sniper would have time to give way—our snipers must be men of discretion as well as valour.

Being a captain of the Regular Army Reserve, and liable to be allotted a job at any minute, I may be unable actively to help with the formation of the corps, but if anyone who is qualified will write to "Sniper," at Flat 14, 128, Cheyne Walk, Chelsea, S.W. 10, or ring up Fla. 3381, a start might be made.

It is possible that our services might be refused, or that no situation might arise where we could be of use, but we must take our chance of that.

Such knowledge as I gained sniping in 1914–1915 is at the disposal of the corps. I feel that we old-timers could most usefully be employed utilising the skill and experience which we possess rather than in attempting to learn a new and strange technique. As things stand, we are waste material, but we feel we might be useful.

Yours faithfully,

Chelsea. J. D.

A 53-POUNDER FROM NORWAY

SIR,—I have just returned from my usual salmon-fishing holiday on the Stjordal, north of Trondheim, Norway. Up to July 15th we (two rods) had caught 22 salmon, a few gribse and sea trout (one 9lb.), totalling 450lb.

Among these I got a fish of 53lb.: length 50in., girth 29in., which was in such splendid condition that it could not fight like the smaller ones often do, and I got it out in half-an-hour. My younger grandson tied the small double-hooked fly, "John's Fancy," not unlike a black doctor.

It was a marvel that nothing gave way. For the top of my favourite old rod had been roughly tied up with string. The line was like the writer—dreadfully old, and the cast only a medium one.

Yours faithfully,

BRAESIDE, M. C. SMELT.
Rosslyn Hill,
Hampstead, N.W.

REMEDY FOR MANGE

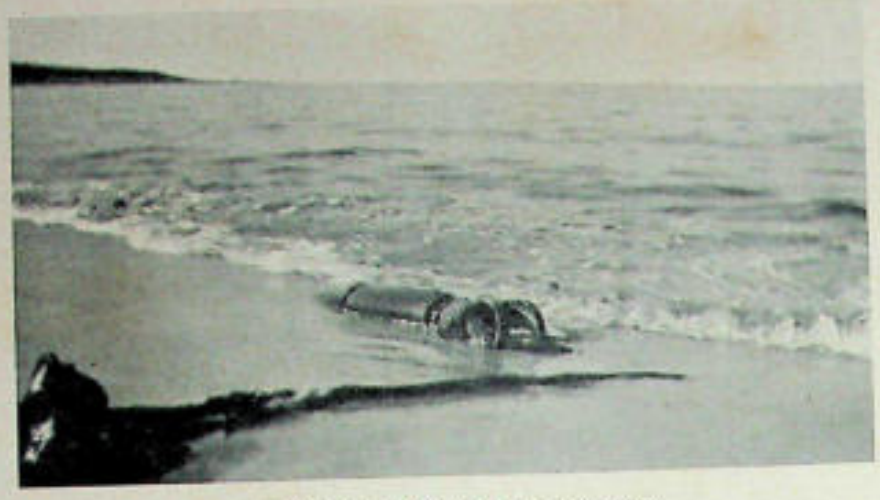
SIR,—It is comforting to think there is a possible remedy for follicular mange, as Mrs. Bradbury asserts. In *The Dog's Medical Dictionary* the late Mr. F. W. Cousens, a veterinary surgeon widely versed in canine ailments, wrote: "It is a most unsatisfactory disease to treat, for often after months of hard work the dog is no better, but on the contrary much worse, the disease having progressed in spite of everything. If the patient is not a valuable dog, and the attack is a bad one, it is much better to destroy him at once." Similar opinions have been expressed to me by leading practitioners. Mr. Cousens said he had had real success with the Bayer treatment, which appears to be prolonged over a year. I wonder if microscopical examinations were made of the dogs treated by Mrs. Bradbury. There is often confusion between sarcoptic and follicular mange. In the course of many years association with dogs I have come across very few cases of follicular mange.

Yours faithfully,

London. SIGMA.

POISE, that quality so inexplicably the essence of feminine charm, belongs to all women who use Larola, the world-famous skin food. By refreshing and stimulating the cells of the skin, Larola actually strengthens the skin and helps it to banish that roughness and redness which rob the complexion of its natural beauty. Larola is absolutely pure, contains no ingredients to clog the pores, and if used regularly on the face and hands will ensure that exquisite petal smoothness which is the secret of radiant beauty.

Write for free Larola Booklet "The Cult of Beauty." Post Free.



Larola

1/6 & 2/6 per bottle

Larola Soap: Boxes of 3 Tablets 2/-. Single Tablets 8d.

STRANGE VISITORS TO THE SEASHORE
(See letter "Squids in Northumberland?")

CARTRIDGE LOADER IN ELM TREE

SIR,—I think you will be interested to know that the cartridge-loading machine which I am sending you came out of the middle of a big elm. It was discovered by the timber merchants who sawed up the tree. The remarkable thing is that though the machine has been in this strange locality for some sixty years the spring was found to be in good order, and needed only a little oil.

Yours faithfully,
R. B. TURBUTT.

Ogston Hall, Alfreton.

[This is an old hand rammer and in wonderful condition.—ED.]

A QUEER SEAT

SIR,—I have in my possession two arm-chairs with very comfortable leather seats made from antlers and other deer horns. I also have various other pieces of furniture made from antlers and other parts of deer's horns and boar's tusks. I have been told by experts that this is a unique collection.

Yours faithfully,
E. A. WHITE.

Upper Cop Court,
Tetsworth, Oxon.

[A curious seat made from Exmoor antlers was published in our issue of August 12th.—ED.]

SQUIDS IN NORTHUMBERLAND?

SIR,—On August 17th I was sitting on the beach at "Football Hole," between Beadnell and Embleton, in Northumberland. Just before high-water, at about 4 p.m., we (I was with my family) noticed a large red object flapping about in the shallow water on the edge of the sand. We ran down to the sea and found that the object was what we believe to be a squid. It seemed to be trying to get on to the beach, and when it was left on the sands by a receding wave it blew jets of water from its nose or snout. While we were looking at it we suddenly noticed another a few yards further on, and then, looking along the shore, we saw that there were at least a dozen squid all apparently trying to commit suicide by swimming ashore. All the fish were about the same size, and of a cylindrical shape, the body, about 2ft. long, with, I think, eight arms or feelers growing out from the head, lined with double rows of suckers, about a foot to 18in. in length. There were triangular fins or flappers on either side of the body near the tail. They were a repulsive sight as they squirmed about and spouted on the sands, and several of them appeared to be dead, as they were washed over and over by the waves. This cannot have been the case, however, for in about ten minutes all had disappeared. From inquiries we have made it seems that numbers of squid appeared on the beaches to the north and south at the same time, and all behaved in the same way. The local fishermen say that they have never seen nor heard of such a squid before.

It would be interesting to know whether these fish are natives of the North Sea, and what was the reason for their extraordinary behaviour. I should perhaps add that the sea was perfectly calm.

Yours faithfully,
G. CONYNGHAM GREENE.

Newton House,
Newton-by-the-Sea,
Northumberland.

BEAR CUBS FOND OF SWEETS
(See letter "Cupboard Love")

CUPBOARD LOVE

SIR,—Two pictures I send may be of interest. They are of cubs found about ten miles from Gulmarg, when they were about three weeks old. I kept them in the kennels close to the club for over a month. They became exceedingly tame, and the lady in the picture could do anything she liked with them. They were of immense interest to the members of this club and the children all loved them. I had to part with them as they were beginning to get too good at climbing, and presented them to the Lahore Zoo. "Dina" is sitting on the lady's knee, and "David" is asking for more fudge. They loved sweets.

Yours faithfully,
ROBERT LAMB.

Gulmarg Club, Kashmir.

A WREN RELIC
(See letter "A Spire in a Garden")

A SPIRE IN A GARDEN

SIR,—One would hardly expect to find the spire of a city church in a suburban garden, and a Wren steeple at that, yet the enclosed photograph shows the spire from the church St. Antholins, which used to stand in Queen Victoria Street. Rebuilt after the Great Fire to the design of Sir Christopher Wren, it was demolished in 1875, and the spire found its way to its present resting place in a garden at Forest Hill. It is the only stone spire that Wren built.

Yours faithfully,
H. E. T.

Sydenham.

A PHEASANT'S NEST IN AUGUST

SIR,—On August 30th we were cutting a field of oats. I happened to be there, when I suddenly saw the tractor stop, and my man signalling to me. I went over, and there was a hen pheasant just off her nest with one young one about four days old, and nine eggs in the nest. All the nine eggs were addled. The hen was obviously trying very hard to hatch them.

There have been a number of late nests this year. More than I have known for some time.

Yours faithfully,
A. W. BOXHAM CARTER.

The Manor House,
Buriton, Petersfield.

POTTED EEL

SIR,—The photograph of a dead rat with a poultry ring round its neck encourages me to send you a photograph of a 2lb. eel which also met its death in a most unusual manner. It had forced its head into a small glass jar after a minnow and stuck there with the minnow in its jaws.

Yours faithfully,
R. DAND.

Patrick Brompton Hall,
Bedale, Yorkshire.

UNDER THE EARTH'S SURFACE

Ten Years Under the Earth. By NORBERT CASTARET. (Methuen; 12/6.)

Those who are beginning to wonder if the world has not given up most of her secrets, and whether there is much more on the earth's surface which is unknown to man should read this book. There may not be very much on *the surface* of which we have not a fair knowledge, but beneath the surface is a world of its own, in the main, unvisited by man; dangerous but intriguing, dark but indescribably beautiful.

In his book M. Castaret introduces his readers to this *terra incognita*, and who could be better qualified? Here is a man who has not merely sifted the evidence gleaned from these caves and subterranean waterways by others, but has, for the sheer love of exploration and danger, proved himself to be perhaps the most intrepid explorer of his generation, a man who has risked his life many times in the name of science and adventure.

In his foreword he says: "I am afraid that I have mentioned myself too often; but how do otherwise in telling of solitary adventures." His fears are quite ungrounded, for, like all truly great men, he is incredibly humble. The reader is told of hair-raising risks—literally jumps in the dark, the swimming of syphons and a host of other things as if they were everyday occurrences instead of efforts calling for the very highest courage and presence of mind.

Less dangerous, but none the less unpleasant experiences await the speleologist, such as the onslaught of an army of starving fleas which sometimes find their way into caves with the foxes, only to be left stranded on the animal's departure.

Fleas are the inhabitants of the cave mouth; history lies in the dark recesses. Here are the bones of cave-bear and mammoth and the strange drawings of man at the dawn of history. M. Castaret tells us of bear slides still showing the hairs of the brutes which, like their modern descendants, loved to slide into the muddy pools down the plastic clay slides within the caverns.

Art was born within these caves. Some of it crude, but some showing a virility which would shame many a modern-day artist. "There is nothing new under the sun," and as the author remarks with humour: "Even Cubism boasts a prehistoric ancestry. There are a few attempts, rare indeed, but just enough to show that the Magdalenians tried it out, and had the taste to go back at once to sane and natural representations of the animals of their time."

The illustrations are particularly fine. Most of us will never see these strange caverns with their distant history in reality, but thanks to M. Castaret's camera, we may study them at our ease by the fireside.

Here is a great book from a great man.

LESLIE N. RADCLIFFE.

* * * *

Quality Chase. By MARJORIE HESSELL TILYMAN. (Hodder & Stoughton, Ltd.; 8/6.)

This is a book about life in Birmingham and in London. The characters are imaginary, except those of Joseph Chamberlain, Bright and Newman. "Birmingham in the 70's. You may still talk with those who remember it. A honeycomb of artisans in a hive of hovels. Every man Jack for himself and the devil take the hindmost." This is how the book begins, and it ends, spiritually, in Brummagem again. Or does "Quality" Chase ever really leave his home city? Is the real provincial ever likely to allow London to submerge him? The story is naturally of the struggle of trade life, with the influence of the great Joe Chamberlain ever permeating the scene. "If a man went from Birmingham to London he would be going, as a matter of course, to see and hear 'Our Joe' give them 'what for.'" The book is well written and gives a good idea of family life in the great Midland city, and the inner side of the art-dealing business. The rise of Chase, the son of an illiterate collector of odd rubbish, his love of the beautiful, his appreciation of the patina on woods, his self-education and experience of the pitfalls in the higher realms of art dealing, and his willingness to take a plunge, intrigue the reader to the end. Perhaps the matter of greatest interest is how London and its dealers struck these Birmingham folk.

* * * *

Marshal Foch. By Captain CYRIL FALLS. (Blackie and Son, Ltd.; 5/-.)

This miniature biography will appeal to all, since it deals with a most brilliant leader of the Great War, who, in his final capacity as Commander-in-Chief of the Allied Armies, became a personality in every home throughout the land. Never has a single Frenchman meant so much to the people of this country. But to those who saw active service on the Western Front, the book will have the added interest of bringing back scenes and recalling incidents of over 20 years ago.

Captain Falls, who has a great admiration for the French Army which, more especially to-day, will be shared by many another Englishman, explains the impossibility of giving any detailed account of the military operations in which the Marshal took part. But he certainly has succeeded in condensing into a limited space a wonderfully comprehensive record from the time of his recall from leave to Nancy in late July, 1914, to the arrival of his forces on the Aisne, after the victory of the Marne. For the rest of the war, as he explains, Foch was to be "a maker of plans, an inspirer, a co-ordinator."

The author considers that in the earlier years of the War, Foch, like the rest, was to some extent mentally and materially enchained, and as a tactician made no contributions to the science of warfare as outstanding as those of Ludendorff. This seems fair criticism, though most will agree with the author that in 1918 he showed himself to be a strategist of a far higher order, and that the principles which were responsible for his success were not only those which he had evolved from his experience in 1915, but were also the logical development of those which he had enunciated at the School of War many years before. He never believed in the possibility of a "break-through" with decisive effect, as did Ludendorff. His strategy was to extend the battle to the flanks as soon as the offensive began to thin off into a point and block itself. In this he proved to be right. While the year 1918 saw the most momentous struggles with Foch in supreme command, the author agrees that the battle of the Marne won the war for France and lost it for Germany.

The book carries one right through from Foch's early days and background to the days of victory and peace. There are nine plates and several sketch maps of important battles and offensives.

* * * *

Weather in the Making. By DOROTHY FISK. (Faber and Faber, Ltd.; 8/6.)

It is a platitude, of course, to say that the weather is indirectly of immense concern to all of us. That this is an irrefutable truism is only too obvious. But to the countryman who is always in direct contact with the land and whose life is so largely bound up with the seasons, it is a matter of daily interest, as it may at once affect his pocket or his sport for better or for worse. Again there are many who in an academic kind of way find entertainment in a detached study and observation of the vagaries of our climate. To all of them Miss Fisk's book should appeal, for she has succeeded in presenting what is a highly scientific subject in a way that can be understood by any layman. At the same time there are chapters, tables and diagrams which should attract the serious attention of meteorologically-minded persons. The various cloud illustrations are appealing, representing as they do some of the sky effects that one often sees, but only for a passing moment. It is of interest to note that most cloud forms have their characteristic levels, the highest—the cirrus—being between three-and-a-half miles and seven miles from the earth. Existing where water vapour is scarce and temperature very low, they are the most tenuous and the coldest.

All will agree with Miss Fisk that "Study of the winds and the clouds and the rain, of sunrise and sunset and of the multitudinous lights in the sky, opens up a new realm, intimate, and at the same time mysterious, having all the qualities that win the heart and intrigue the mind."

W. H. T. LONG.

Life's a Circus. By Lady ELEANOR SMITH. (Longmans; 12/6.)

As the daily fight for existence and livelihood becomes more severe and pressing, there are few people who can describe their life as a circus. The word conjures up colour and romance, and that is what Lady Eleanor Smith's life has been composed of.

Of brilliant parentage, with a cherished strand of Romany blood not too far back—she could not abide conventions. As a child she loved the wildness of country life: a life spent on ponies roaming the countryside: a large library with the never to be forgotten thrill of the discovery of "Borrow." Above all the thrill of her kinship and understanding with gypsies: these folk figure often in Lady Eleanor's remembrances, for she mixed with Romanys all over Europe, and true "characters" they sound.

The circus was another sphere in which this young woman felt at home, and she toured, lived and worked for many months with a famous company.

But other personalities are in these pages, figures around whose names more solid renown clings than that of the sawdust and the waggon. Lord Birkenhead was a delightful father to this small girl who rode with him hunting—left always to pick herself up from the innumerable falls, and follow on. This youthful Lord Chancellor enjoyed his young family, sharing in their glee at being allowed to bounce on the Woolsack, under the disapproving glances of his sedate colleagues. (An enviable experience of which surely very few children can boast!)

Yes, it is refreshing to read of a life such as this one. We do not all dare to defy our "Nannies," and are tied by need to conventions. But Lady Eleanor could and did, and by so doing has filled her cup of life. And the telling of it makes a fascinating addition to her list of books. This is exactly what we expected from the author of *The Red Waggon.*

BRIAN VESEY-FITZGERALD.

IN THE CITY

By OUR CITY EDITOR

WHEN the history of the opening days of the war comes to be told one of the most remarkable features will be the promptitude and effectiveness with which the changeover from peace to war time was carried through in the City. There was not the slightest semblance of panic. The Treasury, the Bank of England, the joint stock banks and the Stock Exchange worked in complete accord, and the new financial machinery, all carefully prepared beforehand, was put into operation almost without a hitch.

The banks were closed for one day only, not because there was any rush of depositors to obtain their money, but in order to give the staffs the opportunity to familiarise themselves with many forms and instructions issued regarding the future conduct of business. Business, when resumed, was on normal lines, although slight delays were unavoidable in the clearing of cheques.

The fullest provision had been made for protecting the currency, and although, as a precautionary measure, postal orders were made legal currency, it was found that the currency in the hands of the nation was more than sufficient. Our leading banks have branches in every part of the country and full provision had been made to supply the branches with sufficient money to meet the requirements of the many individuals and businesses which were dispersed throughout the country districts.

Completely adequate plans were put into operation for continuing essential overseas trade and maintaining a steady value for the £ sterling in the foreign exchange markets. All foreign exchange transactions came under the direct control of the Bank of England, which fixed rates at which business could be done.

Dealings on the Stock Exchange were interrupted for two working days. Then the committee announced that dealings between members at their offices would be in order and for two days this was the way in which business was carried on. Then came the reopening of the "House" and the Stock Exchange was itself again, although the definite limitation was imposed that all transactions shall be on a strictly cash basis. This follows the practice during the last war. It was not until 1922 that normal conditions were resumed.

The important thing from the investor's point of view, however, was that there was in operation a market in which he could sell his holdings if necessity arose. He was confronted with rather wide prices, but this was inevitable. So far as gilt-edged stocks were concerned the minimum prices fixed before the temporary closing of the "House" were continued. This naturally limited business, although the urgent seller was generally able to realise his stock. Indeed, many actual transactions were done at prices above the minimum.

Other sections of the market were left free to find their own levels, and it is a remarkable fact that there has been comparatively little change from the quotations ruling before the "House" closed.

Such are the conditions under which business in the City is being carried on at the time of writing. It is fully realised, as Mr. Walter Elliott put it in his recent broadcast, that "the work of the nation must be carried on," and, so far as the City is concerned, this is being done.

It is obviously not the time to make recommendations to investors. Indeed, for the time being our view is that resources should be kept liquid. Money in the bank may be a very useful asset in these days. It is impossible at the moment to forecast the effect of war conditions on individual businesses.

Regulation by Government order is being applied over practically the whole of industry. Every necessary step has been taken to safeguard the nation's food supplies. Apart from this the whole of our resources are being directed to the successful prosecution of the war and the elimination of every phase of our economic life that may conflict with that object.

Thus, while every precaution is being taken to keep the financial, industrial and mercantile machinery going, the eventual effect on the individual concern must remain in doubt.

THE DAVIS CUP

After a start which made it look as though the cup would remain in the United States, the Australian team, after losing the two opening singles, won the doubles and the remaining ties. The scores were:

SINGLES.—J. E. Bromwich (Australia) lost to R. L. Riggs (U.S.A.), 4/6, 0/6, 5/7; beat F. Parker (U.S.A.), 6/0, 6/3, 6/1. A. K. Quist (Australia) lost to F. Parker, 3/6, 6/2, 4/6, 6/1, 5/7; beat R. L. Riggs, 6/1, 6/4, 3/6, 6/4.

DOUBLES. Bromwich and Quist beat J. Kramer and J. Hunt (U.S.A.), 5/7, 6/2, 7/5, 6/2.

"CLEMATIS ARE MOST EFFECTIVE ON COTTAGE PORCHES"

THE CHARM OF CLIMBING PLANTS

By A. C. BARTLETT

IT is a fact that the garden would lose much of its charm without climbing plants. Where space in the garden is restricted, one can always have attractive plants on the walls.

Care should be taken in the selection of plants for covering walls. Many beautiful old houses, barns, gates, &c., are smothered with ivy, yet this plant not only damages the brickwork but also smothers the lovely architecture of a fine house. Ivy is really only suitable for very large buildings or on ruins.

The Ceanothus family are excellent subjects for wall covering, and provide us with a wealth of blue flowers, ranging from pale to very deep blue. These are quite hardy, and once established soon grow away. Brilliant has lovely deep green box-like foliage and bright blue flowers. Gloire de Versailles is also a great favourite, this can be grown on the wall, or as a bush, and has bright blue flowers from July to October. Veitchianus is a variety which needs a warm wall, although, of course, quite hardy.

Also great favourites as wall plants are Pyracanthus, the foliage is evergreen, and most of the varieties have beautiful orange-red berries, which hang on till mid-winter. *Lelandii*, *Rogersiana*, *Yunnanense* and *Gibbsii* are excellent varieties and very easy to grow.

One of the most beautiful of climbers is *Ampelopsis Veitchii*, very charming in spring when bursting into leaf, and again in the autumn, when the leaves turn gorgeous shades. This plant, however, rather objects to new cement work, but once established grows away very quickly.

The common Virginian Creeper (*Ampelopsis Hederacea*) is also very attractive, but is best on porches and trellis, as it is a very rampant grower.

Then, of course, Clematis are most effective on cottage porches, climbing up old tree stumps, trellis, &c. *Clematis Montana* will cover a porch in a very short time, and is very easy to grow. *Clematis Jackmanii* is suitable for a pergola, this has beautiful purple flowers. Other popular varieties are Beauty of Worcester, Duchess of Edinburgh, *Jackmani alba*, Madame Edouard Andre. The roots of Clematis are best planted in shade, and deep trenching is essential, as this helps to retain moisture during summer, and it is a great asset if a good mulch of rotted leaves is given every autumn.

Jasmine is a plant that thrives almost anywhere, and although most varieties are deciduous, they appear green as the stems are greenish all the year round. For trellis or walls they are very effective. *Nudiflorum* is the old winter-flowering climber, and gives a brilliant display of yellow from November to March. It is also very fine when massed as a shrub, and allowed to ramble over mounds or banks by the water.

For climbing over a porch, a pink rambling rose and a pale lavender Clematis that blooms about the same time will give a beautiful effect, or if a deeper colour is preferred, use crimson Rambling Rose and *Clematis Jackmanii* purple.

For covering unsightly buildings, ugly fences and positions where immediate effect is desired, *Polygonum baldschuanicum* is excellent. This is a very rampant grower, the foliage is very neat, and the flowers are white, tinted pink. *Vitis Coignetiæ* is also useful for this purpose, the foliage of this is very beautiful in autumn.

Naturally Honeysuckle (*Lonicera*) must not be omitted from the list of climbing plants, both for beauty of flower and delicious scent, they have few equals. For walls, bowers, climbing posts and pillars, they are quite at home. Some of the most popular varieties are Scarlet Trumpet, *Aureo-reticulata*, *Gigantea Superba* and *Halleana*.

For covering low walls, or positions of no great height, *Berberis Darwinii*, *Cotoneaster microphylla*, *Abelia Chinensis* and *Aloysia citriodora* are ideal subjects, although, of course, strictly speaking, they are classed under shrubs.

Much prized as a wall plant is *Fremontia California*, this is almost evergreen, and has bright yellow wax-like flowers with orange stamens. It is best planted in a spot sheltered from wind.

The Peruvian Marigold (*Mutisia decurrens*) is a rare climbing plant. It is a perennial and needs another plant to grow into for support. The flowers are deep orange 4in.–6in. across, produced in July to September. It needs a sheltered situation in well drained light soil.

Solanum jasminoides, a quick grower, is attractive with its clusters of white fragrant flowers and evergreen foliage. This plant thrives best on a warm sheltered wall, except of course, in mild districts, such as Devon and Cornwall. Another treasure for a warm sheltered wall is *Clianthus puniceus* (Parrots Bill), this has striking scarlet flowers resembling a parrot's beak.

The following are a few shrubby wall plants: *Choisya ternata*, *Cristodendron Hookerii*, *Escallonia macrantha*, *Hydrangea scandens*, *Benthamia fragifera*, and many varieties of Camellias.

HORTICULTURAL ADVICE

The Cultivation of Mushrooms

By CARTHEW ALLERDYCE

FRESH mushrooms! What a picture these conjure up—thousands of them growing on specially prepared mounds in caves; masses of white heads peeping through the compost on the shelves at Wye College; millions growing just as happily in darkened glasshouses at Worthing.

Mushrooms have been grown, and are being grown, almost everywhere—in pig-styes, in lofts, in cellars, in barns, in disused cowsheds, and in houses specially built for the purpose. They have been grown on trays on board ship, and even in boxes in flats, but there is no doubt that if the best results are to be achieved, structures specially designed for the purpose should be used.

September is a good time to start, for if manure is collected together and turned in September, it should be possible to make up the first bed early in October. This means spawning some fourteen days later, and the growing of that spawn successfully in November. The first buttons should, therefore, be picked in December, and the beds should go on cropping throughout January, February and March and end about mid-April.

The heaviest crops of mushrooms are produced on specially composted horse manure. Before making up the beds, manure should be collected and stacked in small heaps. It should be mixed thoroughly by turning it three or four times, with a seven-day interval in between each turning. It may be necessary to add water during the turning process if the straw looks too dry. At the same time, any stones or woody material should be removed. It is advisable, when turning, to make certain that the outside of the heap becomes the inside, and the top the bottom.

In the end the product should be uniform in texture, free from any objectionable odour and nut-brown in colour. When picked up in the hand and squeezed, no moisture should exude. Another good test is to take up a portion of the strawy material in two hands and give it a slight twist and a pull. If the straw snaps easily, then the material is ready, but if it seems tough, then another turning should be given.

In the greenhouse and on shelves, the beds are usually made flat, but in caves and in special mushroom houses, the beds are often ridge-shaped, each bed being 4ft. 6in. wide at the base. Double ridge-beds are recommended by Dr. Bewley and Mr. Harnett in their book *Mushrooms*, these being 4ft. 6in. wide at the bottom, and at the top are two small ridges 21in. wide at base and 15in. from the top to the flat bed. This makes the top of the ridge 21in. from the ground and leaves about a 12in. space between the tops of the two ridges thus formed.

Good books on mushroom growing are published by Methuen & Co., Ltd., 36, Essex Street, W.C.; Shepherd & Hoskin, Ltd., 24, Buckingham Street, Adelphi, W.C. 2; and the Ministry of Agriculture, 10, Whitehall Place, S.W. 1. The former is called *Mushrooms*, the second *The Book of the Mushroom*, and the latter, *Bulletin No.* 34.

Once the beds have been properly made by the manure being put down in layers and being trodden firmly, the temperature will rise considerably, but the spawning should not be carried out till the heat has dropped to between 70 and 80 deg. F. Pure Culture Spawn should be used and quite small pieces the size of a walnut should be inserted into the manure compost, 2in. deep, and 10in. apart.

Firms that make sterilised Pure Culture spawn include W. Darlington & Sons, Ltd., Southcourt Road, Worthing; Hunter & Gow, Ltd., Thomas Street, Liverpool; George Monro, Ltd., Waltham Cross, Herts; J. Harnett, Tunfield Nurseries, Hoddesdon, Herts; and F. W. Young, of Coleraine, N. Ireland. The South Eastern Agricultural College, Wye, Kent, also specialise in mushroom culture, and under certain conditions, sterilised spawn may be obtained from them.

After spawning, the beds should be left for two or three weeks and then a casing of sterilised soil or subsoil should be placed over the whole of the bed to a depth of 1½in. This should be made firm.

The paths between the beds should be kept damp, but no watering should be necessary on the beds themselves until the first edible fungi begins to appear. From this time onwards the surface should be kept uniformly moist.

When cropping has started, a temperature of about 47 degrees should be maintained, and as cropping proceeds, a little salt may be added to the water for watering.

AN ECHO OF 1918. KING GEORGE AND QUEEN MARY WATCHING POTATO SPRAYING ON RAILWAYMEN'S ALLOTMENTS

WAR-TIME VEGETABLE CULTIVATION

By ELEANOUR SINCLAIR ROHDE

(In this series Miss Sinclair Rohde will write every week on the cultivation and uses of vegetables in war time.)

SPEAKING on the wireless recently the Minister of Agriculture emphasised the importance of even such small plots of ground as allotments for the production of foodstuff.

For some months I have had in mind a plan which may interest those in districts where it is possible to carry it out. There must be thousands of acres uncultivated in this country in the shape of the kitchen gardens of largish houses which have been to let for a long time and are likely to remain to let on account of the shortage of servants, and the fact that they are wholly unsuitable for modern requirements.

Could not these kitchen gardens be worked with the consent of the owners and by voluntary labour for the production of the most nutritive vegetables —Beans, Peas, and Potatoes? The owners have everything to gain, for the value of their properties would be enhanced by being under cultivation instead of left derelict. The required labour would naturally not be drawn from the ranks of those young enough to do full-time work. But there are countless middle-aged folk whose chief hobby is gardening, and who would gladly give an hour or so a day to the work.

Many problems arise—manure for instance. But in most cases this ground has been under cultivation for many years, and it would take comparatively little effort to make it productive again. It would surely be worth setting up local committees to consider this possibility.

Meanwhile every owner of even the smallest plot of available ground will doubtless be putting that plot under vegetables as quickly as possible. It is comparatively easy to turn flower beds to kitchen-garden use for the ground has already been cultivated. But waste ground is a more complicated matter for it is probably full of wire worm, &c.

Vegetables to Plant Now

In regard to planting vegetables in ground already cultivated. At this season it is too late to sow anything, but Coleworts to use in early December, and Cabbages for use in late spring can be put in any time during the next six weeks, and the sooner the better. Broad Beans and Peas can be planted later.

Coleworts are particularly useful members of the Cabbage tribe, because they heart up so quickly and make such compact growth that they can be put in a foot apart. Small plants are available in almost any district very cheaply, usually about 1/6 a hundred. It is advisable to make sure the plants come from healthy soil and are not liable to develop clubroot, &c. Choose sturdy plants, not lanky specimens. As a precaution dip the roots before planting in a mixture of soil and well spent soot (the soot should be at least a month old) and lime (either carbonate of lime or hydrated lime).

Coleworts planted now will probably heart up during the first half of December, and should be put into good, rich soil. Amateurs frequently fork over soil before planting, but this is a mistake, for all plants should be put into firm soil. Further forking over disturbs the highly complicated life of the soil, and the rhythm of that life should be resumed before plants are put in. All members of the *brassica* tribe need particularly firm soil. In loose soil they heart up poorly. Put the plants in with a dibber, not a trowel, and make the roots as firm as possible.

Spring cabbages should not be put into rich soil, for they have to stand the winter and sturdy growth is required. In too rich soil they make sappy growth. Nothing is gained by crowding cabbages. They should be 18in. apart, and 2ft. between the rows. Plant very firmly. In very severe weather it is a sound policy to draw the soil up to stems that suffer.

In regard to waste ground all turf should first be stripped off and stacked, for in nine months time it will be well rotted and be a rich compost to spread on the soil. (The treatment of uncultivated ground will be dealt with in a later article.)

I venture to urge the importance of making compost heaps, even in small gardens. I have improved the soil in our kitchen garden immeasurably by this system for over 20 years. It can be done most satisfactorily without the use of any chemicals whatever. Leading authorities have emphasised continually that these compost heaps, consisting of all fruit and vegetable refuse from the house, weeds, &c., when well rotted are equal in value weight for weight to the best stable manure. It takes roughly nine months for this refuse to turn into first-rate material. In this small household we estimate that the fruit and vegetable kitchen refuse amounts to about a cartload a month, and at the end of nine months we have at least three tons of splendid stuff to spread on the soil.

Even in small gardens this system can be carried out with no fear of bad smells, &c., for the daily consignment of weeds thrown on the daily kitchen refuse contains sufficient earth to absorb all. We put on the heap also all soft wood prunings, in fact, everything that rots. Some people assert that the seeds of weeds &c., are a serious consideration. In 20 years of experience we have found that there is no fear of propagating seeds by this method. The heat of a compost heap is considerable and kills the germinating powers of the weeds. That, at any rate, is our invarying experience. The only weeds we do not put on the heap are thistles, docks, and nettles.

The waste of all this good stuff is bad enough in peace time, but in war time it strikes one as almost criminal. I have not space in this article to say more of the experience we have gained about the making of compost heaps during the 20 years we have practised it, but will write further about it in subsequent articles.

DEVELOPING THE LAND. WORK WHICH BOYS AND THE UNEMPLOYED HAVE SHOWN THEY CAN DO

BUMPERS AND THE EDGES OF RUNNING BOARDS MUST BE PAINTED WHITE

AIR CONDITIONING OF CARS

By W. G. McMINNIES

IN the announcement of the new 12 h.p. Austin model, it is stated that customers can choose either a radio set or an air conditioning outfit. It will be interesting to hear in a year's time what percentage of owners availed themselves of these alternative fittings, one appealing to the mind, and the other to the body.

It is also interesting to note that a refinement such as an air conditioner should be incorporated so soon in a car of such moderate price as the Austin. Why, it is only a year or two ago that a heater, which is only part of an air conditioning apparatus, was listed as a very special favour on a few expensive cars. Nor are Austins the only makers to take this new step. The S.S. people of Coventry announced a similar development a few weeks earlier. And doubtless other manufacturers will follow suit.

Before going into details, let us consider air conditioning in general. We have it in some manufacturing plants where the humidity, temperature and cleanliness of the air must be maintained at certain standards. We have it in offices and hotels. And when I was sweltering in the streets of Detroit and Boston, U.S.A., I appreciated the coolness of the public rooms in the hotels I used. There was the same difference between them and the outer world that one encounters when emerging into summer heat after spending an hour in exploring a cavern.

But the people who plan and pay for the air-conditioning of hotels consider first on how many days in the year the weather conditions are such as to make conditioning worth while. Naturally this depends on the situation of the place. In one part of the country the average number of days calling for conditioning might be 100, and in another only 20. And on that figure depends the number of rooms which they equip with conditioned air.

As far as I understand in the present stage of development, air-conditioning on a car does not follow exactly the plan applied to hotels and factories. For one thing, in an hotel air-conditioning goes hand-in-hand with closed windows, which has the added advantage of keeping out the noise. But it also means that the conditioned air that enters the building has also to be drawn out of it after being used.

In air-conditioning sets for cars the air is filtered, but as far as my information goes is not at present humidified; not that that matters much. Air is forced into the car via the scuttle, ventilator and suitable ducts which lead to the conditioner. Here an electric fan causes it to pass through a radiator supplied with a controllable amount of hot water drawn from the engine cooling system and then distributes the warmed air in two directions, one along the inner surface of the windscreen where it acts as a defroster, and the other downwards and into the interior of the body.

The system I have roughly described is the one made by S. Smith and Sons (M. A.) Ltd., Cricklewood Works, N.W. 2. It forms a compact box-like unit, but is not an accessory that can be added to any car, as the car has to be designed to take it.

Some personal experiences of air-conditioning may be of interest. Last winter I drove a car so equipped, and was amazed at the speed with which the plant raised the interior temperature of the body. I tested the thing fairly thoroughly with the aid of a watch and thermometer. After running for about half an hour, so as to gain a fair working temperature as a basis, I took the time and the temperature, and turned on the switch which started the fan working. In ten minutes the temperature had risen ten degrees. In another ten minutes it had risen to over 70, and we were already too hot. Further experimentation showed how to control the temperature within pleasant limits.

Unfortunately, I overlooked one important factor and that was the general effect of the conditioner on the well-being of the passengers. We all know that on some cars we finish a long run with a dull, sick or headachy feeling. Some of it may be due to bad air, the only alternative to which may be an open window and a pain in the neck. So that one of the most important things to be investigated in this new air conditioning plan is the analysis of the air inside the car. Thus it would be most instructive to run together two fully laden cars of similar body plan, but one fitted with an air-conditioner, and then to take an analysis of the air in each. If the air-conditioned car proved infinitely superior from a purity point of view, its success should be assured on this point alone.

My own experience suggests that it is the conditioning, *i.e.*, purifying and changing of the air without noticeable draught, that will be the most appreciated feature of the saloon. For even in the depth of winter those of us who are not old and infirm only feel the cold in our hands and feet, and in the former especially. And for that reason I have often wondered why no one ever gave us a heated steering wheel or a wheel made of some material that did not feel so chilly as the standard stuff. As regards cold feet I am afraid that nothing can be done from the driver's point of view, though in a bygone age we used to fill up petrol tins with boiling water and install them as a sort of central heating arrangement on the front floorboards.

Misting-up of the driver's side of the windscreen has also been attended to by the Smith air-conditioner. Part of the air that has passed through the subsidiary hot water tank is forced by the fan into ducts whence it travels from the bottom of the windscreen upwards. According to the makers, de-misting will take place whether the air played on the screen is hot or cold. It is the movement of the air, and not its temperature that checks the formation of mist. Which reminds me of an amusing and true story of two officers returning from a guest night in the depth of winter. Snow lay thickly on the ground when they left the mess, and they had not gone far when they seemed to run into fog.

They switched off their headlamps, and proceeded steadily. The fog got thicker and thicker, and now they had to crawl along on bottom gear. Eventually after ten miles of this sort of thing one of them decided to get out and investigate. Outside it was perfectly clear; they had only mistaken a misted windscreen for the fog.

WAR-TIME MEASURES AFFECTING MOTORISTS AND FARMERS

CAR BLACK-OUTS.—Headlights must be black except for regulation strip of 2in. to 3in. in length and $\frac{3}{4}$in. deep below centre of glass. Reflectors must be blackened and a top hood fitted. Side lights may only have an opening 2in. in diameter, and this covered with two thicknesses of newspaper. All other openings than the red rear light and stop light must be obscured. Rear light must not exceed 2in. in diameter, must be screened with two thicknesses of newspaper and have reflector blacked. Stop light must be screened and not show more than a square 1in. in diameter. Number plates will not be illuminated. Bumpers must be painted white, and the edges of running boards. Direction indicators must only show through a strip $\frac{1}{2}$in. wide, the rest being completely obscured. A leaflet containing details of these orders is supplied by the police.

SUPPLIES OF PETROL.—Rationing starts this Saturday. The scale is reckoned in units, and books will contain coupons of units each, representing 1 gallon at a price of 1s. 6d.

This is the scale in units—a unit at present being 1 gallon, though it may be changed later. Quantities are as follows: Up to 7 h.p., four units a month; 8 h.p. to 9 h.p., five units; 10 h.p. to 12 h.p., six units; 13 h.p. to 15 h.p., seven units; 16 h.p. to 19 h.p., eight units. 20 h.p. and over, ten units. Motor cyclists, two units a month.

Ration books will be in two issues, one covering the period September 16th to October 15th, the other, October 16th to November 15th.

Motorists and motor-cyclists must apply for ration books at the post office or local taxation office from which they normally get their Road Fund licence. Application for ration books may be made in person or in the case of local taxation offices only by post.

R.A.C. SERVICE.—In view of the many new regulations and orders affecting motorists which have been made since the outbreak of war, the R.A.C. has found it necessary to establish an Information Department which will be able to answer any questions arising from the new conditions. Queries should be addressed to the Secretary, R.A.C. (Information), Pall Mall, London, S.W. 1, or by telephone to the R.A.C. Information Dept., Whitehall 2345.

DRIVING LICENCES.—As the driving examiners of the Ministry of Transport are being transferred to special defence duties, there may be considerable delay before new drivers can undergo the official test. As an emergency measure County Councils and County Borough Councils (large burghs in Scotland) have been authorised to issue a special licence entitled a National Service Driving Licence for a period not exceeding one year, on payment of 5/–, to holders of provisional licences who have not yet passed the test and to other persons who have not previously held licences of the kind which they now want, provided that they satisfy the council that they require the licence for the purpose of driving vehicles on work of national importance, are not disqualified by physical disability or otherwise, and are suitable persons to be granted such licence. Age limits as for ordinary licences will apply. No more provisional licences will be issued, but full driving licences will be renewable in the ordinary way.

MOTOR FUEL FOR AGRICULTURAL PURPOSES.—In connection with the rationing of motor spirit and Diesel oil under the Motor Fuel Rationing Order, 1939, arrangements have been made to deal with the special requirements of those engaged in agriculture. In view of the urgent necessity for ensuring that agricultural users of motor spirit and heavy oil shall be able to obtain supplies during the present period of harvest work and ploughing, it has been decided to permit purchase for such purposes under a special licence issued by the Secretary for Mines under the Motor Fuel Rationing Order.

Under this arrangement farmers will not be required to fill up special forms for their immediate requirements. When they need to purchase petrol or Diesel fuel for the operation of agricultural tractors, stationary engines or other machines used in farming, they must satisfy the supplier that they are persons genuinely engaged in agriculture and that they need the supply for agricultural work and no other. They will be required to sign a receipt for the quantity of fuel purchased on a bill head furnished by the person selling the fuel.

Details will be required of the engines or vehicles for which the fuel is needed and the name and address of the purchaser. The supplier of the fuel will be required to produce these receipts in order to obtain replenishment of his stocks. This system also covers vans and lorries operating on agricultural licences. It does not apply to farmers' private motor cars which are dealt with under the main rationing scheme or to farmers' lorries operating on carriers' licences or permits issued by the Regional Transport Commissioners. Such vehicles are dealt with through the Ministry of Transport scheme. Farmers owning vehicles of these kinds should form or join groups under the Ministry of Transport scheme as in the case of other owners of commercial vehicles. The requirements of suppliers of agricultural engines for the purpose of starting and delivering

such engines are also included in this scheme.

GOODS VEHICLES.—The Minister of Transport has made Orders under the Emergency Powers (Defence) Act which will have the following effect: (1) Any operator of a goods vehicle may use for the carriage of goods of all classes for hire or reward or for the purpose of any trade or business carried on by him any vehicle (*a*) which is specified in a current carrier's licence under the Road and Rail Traffic Act, 1933, and carries a valid identity certificate; (*b*) which is not specified in a current carrier's licence, but carries a certificate in a prescribed form issued by a Regional Transport Commissioner. The fee for such certificates is: (i) if an "A" licence would ordinarily but for the emergency have been issued, £1 10s. (currency one year); (ii) if a "B" licence would have been issued, £1 15s. (currency one year); (iii) if a "C" licence would have been issued, £1 5s. (currency five years).

This general relaxation of the conditions attached to carriers' licences may be withdrawn or modified either generally or in particular cases.

(2) The Regional Transport Commissioners may issue without fee a permit to any person to act as a driver of a heavy goods vehicle or of a public service vehicle or as conductor of a public service vehicle for a period of one year from the date of the permit.

(3) The Regional Transport Commissioners may issue permits: (*a*) modifying existing conditions on road service licences (no fee); (*b*) authorising a temporary service of public service vehicles for a period not exceeding one week (fee 5/–); (*c*) authorising a new service of public service vehicles, subject to such conditions as the Commissioner may consider expedient (fee £1).

The general object of these provisions is to remove restrictions on the carriage of goods by road which would be inappropriate under war conditions and to facilitate adjustments in road passenger transport services.

The effect of these Orders is: (1) to allow any vehicle specified in a current "A," "B" or "C" carrier's licence to be used for carriage of all classes of goods for hire or reward; (2) to enable the Regional Transport Commissioners to issue (at fees based on present "A," "B" and "C" fees) "certificates" for use in the case of vehicles for which an "A," "B," or "C" licence has expired or has not yet been obtained; (3) to enable the Regional Transport Commissioners to authorise new (bus and coach) road services or to modify existing licences for such services (fees are payable in some cases); (4) to issue "permits" in lieu of "vocational" licences for drivers of public service vehicles and heavy goods vehicles.

Operators of goods vehicles licensed under "A," "B" or "C" licences who have not registered their vehicles in the emergency index or have not joined groups are advised in their own interests to do so at once. They can still put this right by applying either to Regional or District offices of the Ministry of Transport. In fuel rationing it will not be possible for operators to obtain fuel for vehicles not registered in the emergency index.

The Minister has now made the Road and Rail Traffic Act (Exemption) (Amendment) Provisional Regulations, 1939, which exempt from the licensing provisions of that Act: (i) the use for manning of any war stations in anticipation of enemy attack and the mobilisation of the fighting services, of any vehicle hired by naval, military or air force authorities for naval, military or air force purposes; and (ii) the use of any vehicle by a local authority in discharge of their civil defence functions.

REGULATIONS WHICH AFFECT AGRICULTURE

WAR AGRICULTURAL COMMITTEES.—The Minister of Agriculture and Fisheries has appointed a War Agricultural Executive Committee for each county in England and Wales, and has made an Order (the Cultivation of Lands Order, 1939) authorising these committees to exercise on his behalf certain powers conferred on him by the Defence Regulations for the purpose of increasing home food production in time of war.

The aim is to obtain for next year's harvest an increase of about 1½ million acres in the tillage area in England and Wales compared with the acreage in June last. Each county has been allotted its share of this total, and the committees have been urged to see that every effort is made to complete their allotted tasks and, if possible, to exceed them.

The Minister, while retaining general control, has given the county committees as free a hand as possible to get on with the job of bringing a further 1½ million acres under the plough for next harvest. They have wide and far-reaching powers. Being people possessing a local knowledge and experience, they will use these powers wisely in the national interests. Specialist sub-committees will advise them and district sub-committees will be their eyes and ears. The Minister has provided each committee with many facts and figures about recent changes in arable and grassland acreage in every parish. Speaking generally, therefore, they know what land can most speedily be brought again under the plough. Records of individual farms are now being supplied to assist them further in selecting the plough land.

It is essential that land should be well cultivated so as to produce maximum supplies of food. The committees are empowered to take all necessary measures to this end. Directions have been given to them for dealing with bad cultivation after reference to the Minister. Changes in traditional methods of husbandry may become necessary in the national interests. The committees can give directions on cropping in individual cases, and, indeed, on any matter of cultivation or management. The immediate point of importance is that as large an area as possible of the newly ploughed land should be devoted to cereals and potatoes. Pending the issue of precise instructions, the Minister has already broadcast a call to farmers to get on with ploughing up at least 10 per cent. of their grassland. The grant of £2 per acre in respect of land that has been under grass for at least seven years will be available for land ploughed up before December 31st.

The ploughing up of grassland may present problems of pest infestation. A wealth of knowledge on this and similar problems has been accumulated by county agricultural organisers and specialist advisory officers. Such information will be of great value to the committees, who, moreover, have full powers for dealing with injury to crops or trees by birds, rabbits, game, &c. They can also enter on and inspect any land or buildings, and can operate in the committee borough areas after consultation with the borough authorities. The committees will have the close co-operation of the National Farmers' Union and its local branches in achieving the important objects in view.

ADVISORY COMMITTEE ON PUBLICITY.—The following committee has been appointed to advise on matters affecting publicity and intelligence in connection with the Government's campaign to increase home food production: Mr. R. W. Haddon (Chairman), Mr. Laurence F. Easterbrook, Mr. Cleveland Fyfe, C.S.E., Mr. W. Gavin, C.B.E., and Mr. Anthony Hurd.

EMERGENCY LIVESTOCK PRICES.—With reference to the Order made by the Board of Trade, provisionally fixing prices of livestock at recent levels, it is of importance to farmers to remember that during the present stage of control the cattle subsidy will be continued, and subsidy payments will be made in the normal way in addition to the market prices established by the Order.

DISEASE AMONG STOCK.—Every farmer will be aware of his legal obligations as regards reporting immediately to the police suspected cases of disease among his stock. The prompt reporting of disease ensures the early application of control measures which minimise losses and is, therefore, even more necessary in present circumstances than in ordinary times. All stock owners are, therefore, urged to exercise the greatest vigilance and to report immediately any suspicious sign that they may observe among their stock. By so doing, they will be helping to conserve the national food supply as well as serving their own interests.

SUSPENSION OF BULL-LICENSING.—It has been decided that during the War the licensing of bulls in Great Britain will be suspended. Farmers should, therefore, note that for the time being a licence to keep a bull will not be necessary and applications for licences should not be made. Fees paid by farmers in respect of bulls, for which applications for licences have been made but which have not been inspected, will be returned in due course.

AMENDMENT OF THE TUBERCULOSIS (ATTESTED HERDS) SCHEME.—The Minister of Agriculture and Fisheries has amended the Tuberculosis (Attested Herds) Scheme so as to provide that he may, at his discretion, decline to accept and proceed upon any application under the scheme by the owner of a herd of cattle. The amendment came into operation on September 5th, 1939. For the time being no fresh applications under the scheme will be accepted. The position of herds which are already attested, or which are undergoing or awaiting official or assisted tests under the scheme with a view to attestation, will not be affected, and any application under the scheme made on or before September 4th will be proceeded with.

The London Quarantine Station, East India Dock, London, E.14, will be closed until further notice.

WHEAT ACT, 1932.—The Wheat Commission dispatched cheques to 80,206 registered growers on September 5th, 1939, in respect of the final payment of deficiency payments for the cereal year ended July 31st, 1939. The aggregate amount involved in this final payment is approximately £2,271,500. In addition, 1,163 payments, aggregating £50,047 will be made as soon as possible in those cases where, by reason of the death or bankruptcy of a registered grower, or for some other reason, the Commission have had to investigate the title of persons claiming the deficiency payments. When these payments have been made, the Commission will have disbursed approximately £2,321,500 as the final payment for the cereal year 1938–39.

The final payment, together with the advance payments made during the cereal year, amount to a total payment of approximately £9,286,000 for 1938–39. Averaged over all registered growers who have received deficiency payments, this sum would provide just over £114 per grower. Approximately 36,800,000 cwt. of millable wheat have been credited to date in the books of the Commission to the 81,369 growers who have qualified for deficiency payments, and 197,647 wheat certificates relating to the sales of this wheat have been delivered to the Commission.

The deficiency payment for 1938–39 is at the rate of 5/0.56d. per cwt. (22/8½d. per quarter) in respect of all sales of wheat credited to growers for that year from wheat certificates delivered to the Commission. Where growers have already received an advance payment of 4/– per cwt. on account of any wheat, the final payment with regard to that wheat will, of course, be the balance of 1/0.56d. per cwt. only.

NEW WHEAT QUOTA RATE.—The Minister of Agriculture and Fisheries, after consultation with the Wheat Commission, has made the Wheat (Quota Payments: Standard Amount) No. 1 Order, 1939, which prescribes that the standard amount of the quota payment which millers and importers shall be liable to make to the Wheat Commission in respect of deliveries of flour, chargeable goods and chargeable imports during the period commencing Sunday, September 10th, 1939, shall be equivalent to 4/6 per sack of 280lb. This is a reduction of 1/– per sack on the rate which has been in force since June 18th, 1939.

FEEDING STUFFS PRICES.—An Order has been made by the Board of Trade prohibiting the sale by any person of animal feeding stuffs at prices higher than the highest prices at which feeding stuffs of a similar description, variety and quantity were sold by that person during the period of seven days preceding September 3rd, 1939. Infringements of the Order are offences against the Defence Regulations, 1939. Farmers are accordingly warned that they should not pay more than recently existing prices for feeding stuffs. Arrangements are being made to enable them to secure adequate and regular supplies of feeding stuffs and, in the meantime, purchases should be restricted to normal requirements for the immediate future.

SCOTTISH NATIONAL MARK.—The Department of Agriculture for Scotland announce that it has been decided to suspend the Scottish National Mark schemes until further notice.

The decision has been made owing to the control to which supplies of various commodities will become subject during the war, and because it will not be possible to maintain the inspection service and general supervision essential to the successful conduct of the schemes.

No further supplies of Scottish National Mark labels will be issued, and the incorporation of the Scottish National Mark design in packers' private brand labels will be discontinued when existing stocks of such labels become exhausted.

FAT STOCK MARKETING.—On and after next Wednesday, September 13th, no fat steers, heifers, or cow-heifers, fat calves, or fat sheep may be sold or offered for sale except in a livestock market. As a result of this Order, no fat stock may be sold privately on farms, but must be brought to an existing livestock market for sale.

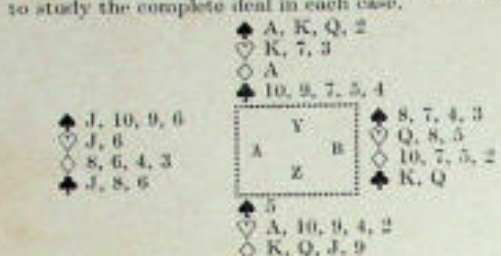
The Order further lays down the following maximum prices for the sale of these classes of fat stock:

Fat steers, heifers and cow-heifers:—

	A Live Cwt.
Quality standard with a killing-out percentage of 57 and over	48/–
Percentage 54 to 56	44/–
Ordinary standard with a killing-out percentage of 54 or over	40/–
Others, 53 per cent. and under	37/–

The terms "cow-heifer," "quality standard," and "ordinary standard" have the same meaning as in connection with the certification of cattle for subsidy. The maximum prices for fat cattle are in addition to subsidy at present rates:—

	Per lb.
Fat calves, first quality (special)	12d.
Do., second quality (medium)	10d.
Fat lambs	11½d.
Fat sheep	10d.
Fat ewes and rams	6d.



All estimated dressed carcase weight.

BRIDGE

TRUMP COUPS

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

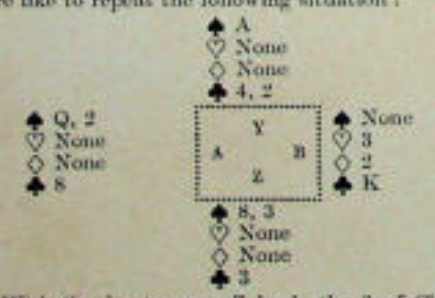
As a sequel to my last article, here are two further hands illustrating awkward trump situations, taken from G. Coffin's classic work on End Plays. The bare end play in each of these hands has been used before in my weekly problems, but it is very instructive to study the complete deal in each case.

Z	A	Y	B
One Heart	No bid	Two Spades	No bid
Three Diamonds	No bid	Three Hearts	No bid
Four No Trumps	No bid	Five No Trumps	No bid
Seven Hearts	No bid	No bid	No bid

Z's Four No Trumps showed two Aces and the King of a bid suit. Y's response showed the other two Aces, and Z, hoping that Y had strong Hearts, bid the grand slam.

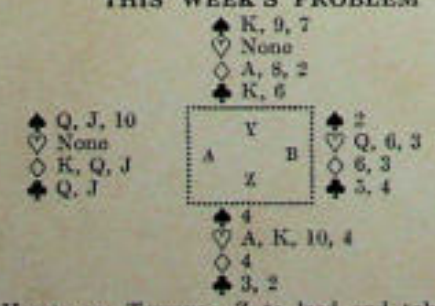
On the lead of the Jack of Spades Z took four rounds of Spades, discarding two Clubs and ruffing the fourth Spade. The Aces of Clubs and Diamonds were led, a Club trumped, two Diamonds made and the fourth Diamond trumped in dummy, leaving the following situation:

On the lead of the 10 of Clubs it will be seen that Y-Z can make the remainder of the tricks in spite of their trump holding.



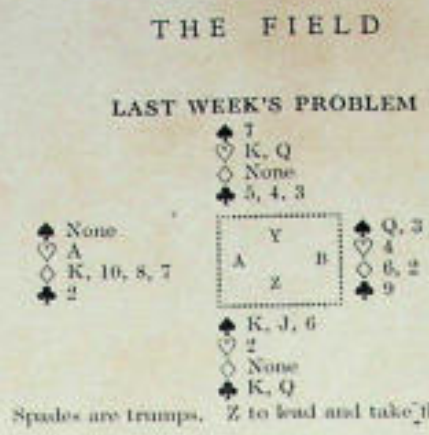
The next hand is called the Lydon Coup after John Lydon, who played the hand shown below:

Mr. Lydon, playing Z, was in a contract of Six Spades, the opening lead being the 5 of Diamonds. Clubs and Diamonds were cross ruffed and three Hearts taken, finishing in dummy with the following situation:



If the Jack of Clubs is led, Z can cover any trump played by B and then ruff the Jack of Diamonds with the Ace of Spades, leaving a trump tenace over B.

It will be noted that, in both the above examples, tricks are made by forcing an opponent to trump the lead of a plain suit. In this connection, I would therefore like to repeat the following situation:



With Spades trumps, Z leads the 3 of Clubs, taken by B's King. B's return is trumped with Z's 3 of Spades, and now A cannot make a trump trick.

THIS WEEK'S PROBLEM

Hearts are Trumps. Z to lead and take all eight tricks.

LAST WEEK'S PROBLEM

Spades are trumps. Z to lead and take five tricks.

SOLUTION

Z leads the King of Clubs and the 2 of Hearts. A's Diamond return is ruffed with the 7 of Spades, Z playing the 6 of Spades. The King of Hearts is led, and if B discards, Z discards the Queen of Clubs. If B ruffs, Z overruffs, extracts the last trump and makes the Queen of Clubs.

CHESS

POSITIONAL PLAY

The following game, from the Premier Reserves Tournament at Margate last Easter, shows fine positional play by the German master, F. Sämisch.

(Indian Defence.)

WHITE. Dr. Fazekas.	BLACK. Sämisch.	WHITE. Dr. Fazekas.	BLACK. Sämisch.
1. P to Q 4	Kt to K B 3	33. B takes Kt (j)	B P takes B
2. Kt to K B 3	P to K 3	34. P to Kt 5	P takes P
3. P to B 4	P to Q Kt 3	35. Q takes Kt P	Kt to K 3
4. Kt to B 3	B to Kt 2	36. Q to Kt 4	P to Kt 3
5. Q to R 2	P to B 4 (a)	37. P to R 4	K to R sq
6. P to K 4	P takes P	38. Kt to Kt 3 (k)	Kt to B 5
7. Kt takes P	B to B 4	39. Kt to K 2	B to Q 2
8. Kt to Kt 3	Kt to B 3	40. Q to Kt 3	Kt to R 6, ch
9. Kt takes B (b)	P takes Kt	41. K to R 2	R to K B sq
10. P to B 3 (c)	Castles	42. Kt to Kt sq	Kt to B 5
11. B to K 3	Q to K 2	43. Q to Kt 5 (l)	P to Q 6 (m)
12. Q to B 2	P to Q 3	44. Q to K 7	R to K sq
13. R to Q sq	Q R to Kt sq	45. Q to B 6, ch	K to Kt sq
14. B to K 2	R to R sq	46. Q to Kt 5	B to K 3
15. R to Q 2	P to K 4 (d)	47. Q to Kt 3	R to Kt sq
16. Castles (e)	Kt to Q 5	48. Q to B 2	R to Kt 2
17. B to Q sq (f)	Kt to Q 2 (g)	49. R to R 8, ch	K to Kt 2
18. P to K Kt 4	Kt to Kt 3	50. Q to K 3	K to R 3 (n)
19. P to Kt 3	K R to K sq	51. R to R 2	Q to K 2
20. Kt to K 2	P to Q B 4 (h)	52. Q to B 2	K to R 4
21. Kt to Kt 3	P to B 5	53. R to R 6	P to R 3 (o)
22. Kt to B 5	Q to B 2	54. Q to Kt 3	Q takes P, ch
23. Q to R 4	K to K 3	55. Q takes Q, rh	K takes Q
24. Q to Kt 5	P to B 3	56. R to R 2 (p)	P to R 4
25. Q to R 4	P takes P	57. R to R 4 (q)	P to Kt 4
26. P takes P	Kt to Q 2 (i)	58. R to R 2	P to Kt 5
27. R to R 2	Kt to B sq	59. P takes P	P takes P
28. R to R 3	B to B 3	60. R to R 8	R to K R 2
29. Q to Kt 3	R to R sq	61. R to Q 8	P to Kt 6, ch
30. R takes R	B takes R	62. K to R sq	K to Kt 4, ch
31. R to B 2	B to B 3	63. Kt to R 3, ch	R takes Kt, ch
32. R to R 2	R to K sq	Resigns.	

(a) The usual—and probably better—move is 5. . . . R to Kt 5, to prevent 6. P to K 4. If, in reply, 6. P to Q R 3, then 6. . . . B takes Kt, ch; 7. Q takes B, Kt to K 5. With the text-move Black is following a different plan, which consists in allowing P to K 4 and then seeking to demonstrate that White has a weakness at his Q 4.

(b) White now gets two Bishops against Bishop and Knight, but at the cost of allowing Black an increased pressure on Q 4.

(c) A weak move which restricts the mobility of his King's Bishop. He should, instead, play P to K Kt 3 followed by B to Kt 2.

(d) Black now commands White's Q 4.

(e) If 16. Kt to Q 5, then 16. . . . Kt takes Kt; 17. B P takes Kt, Kt to Q 5, followed, if 18. B takes Kt, by 18. . . . K P takes B with the better game for Black.

(f) B to Q 3, supporting his King's pawn, is better.

(g) Threatening P to B 4.

(h) Beginning an advance on the Queen's side, as a result of which White is left with a weak Queen's Knight's pawn.

(i) Threatening Kt takes Kt P.

(j) White has a difficult game and now decides to part with the better of his Bishops in order to get rid of Black's strongly-placed Knight. Perhaps 33. Kt takes Kt is better, although after 33. . . . K P takes Kt; 34. B to Q 2 Black can bring his remaining Knight via Q 2 to K 4.

(k) If Kt to B 6, then Q to K Kt 2 wins the Knight.

(l) A bad move. He should play Kt to K 2, although he would still have the inferior game.

(m) Very strong. Now neither of White's minor pieces can move, while Black's Knight is in an unassailable position.

(n) The King now advances to take part in the attack.

(o) There is no need to capture the King's Rook's pawn yet. It cannot escape.

(p) Not 56. R takes P because of 56. . . . B to Q B 2 (threatening R to R 8); 57. P to Kt 4, R to R 7, ch; 58. K to R sq, R to R 8; 59. B to Kt 5, Kt to B 6 and mate is inevitable.

(q) White has no good move.

A SMASHING ATTACK

A game from this year's Dutch Championship Tournament. It shows a smashing attack by White.

(Alekhine's Defence.)

WHITE. H. J. van Steenis.	BLACK. L. Stuyvers.	WHITE. H. J. van Steenis.	BLACK. L. Stuyvers.
1. P to K 4	Kt to K B 3	14. R takes B	K to B 2
2. Kt to Q B 3	P to Q 4	15. R to Kt 3 (c)	Q R to Q sq (j)
3. P to K 5	K Kt to Q 2 (a)	16. Kt takes P	Q to B sq
4. P to K 6 (b)	P takes P	17. R to Q 6	K takes R (k)
5. P to Q 4	P to B 4 (c)	18. P takes R	P to K 3
6. Kt to B 3	Kt to Q B 3 (d)	19. Kt to B 7	Kt to Q sq
7. P takes P (e)	Kt to B 3 (f)	20. Q to K 2	Kt to K sq
8. B to Q Kt 5	Q to B 2	21. R to Kt 5	Kt takes Kt
9. Castles	B to Q 2	22. P takes Kt	Q takes P
10. R to K sq	P to K Kt 3 (g)	23. R takes Kt	R takes R
11. Kt to Kt 5	P to Q R 3 (h)	24. Q takes P, ch	K to B sq
12. B to R 4	B to Kt 2	25. R to K sq (l)	Resigns.
13. Kt tks K P	B takes Kt		

(a) P to Q 5 is safer. White's best reply is Q Kt to K 2.

(b) A promising sacrificial line. Black now has difficulty with his development.

(c) Black's plan is to free his game by playing P to K 4. As a preparatory measure he brings pressure to bear on White's Queen's pawn in order to force—or induce—him to play P takes P. An alternative course is to play at once 5. . . . P to K 4, to be followed, after 6. P takes P, by 6. . . . P to K 3. If, instead of 6. P takes P, White plays 6. Kt takes P and (after 6. . . . P takes P) 7. Q takes P, then 7. . . . Kt to Kt 3 followed by 8. . . . P to B 3 wins a piece.

(d) Best. If, instead, 6. . . . P takes P, then 7. K Kt takes P, Q to Kt 3 (if 7. . . . Kt to K B 3, then 8. B to Kt 5, ch, K to B 2; 9. P to B 4); 8. B to K 3, P to Q R 3 (if Q takes P, then Q Kt to Kt 5); 9. Q to Q 2, Kt to K B 3; 10. P to R 4, P to Kt 3; 11. Castles with a fine position for White (Judowitsch v. Samuchowsky Moscow, 1931).

(e) If B to K 2 or B to Q Kt 5, then P to K 4.

(f) Not good, since it weakens his control of his K 4. He should, instead, play P to K Kt 3, to be followed by B to Kt 2.

(g) In a game Spielmann v. Dr. Landau in 1935, in which the same position was reached by transposition of moves, Black played 10. . . . P to K R 3, to prevent Kt to Kt 5. The continuation was 11. B takes Kt, P takes B; 12. Kt to K 5, P to Kt 4; 13. Q to Q 3, R to K Kt sq; 14. P to Q Kt 4, B to Kt 2; 15. Q to K 6, ch, K to Q sq; 16. Q to B 7 (threatening Kt takes R followed by R takes P) with advantage to White.

(h) This move looks harmless enough, but it is, in fact, not good (see note i). Black should, instead, play B to Kt 2 at once.

(i) This very fine and powerful move would not have been possible if Black had not played 11. . . . P to Q B 3.

(j) Not 15. . . . K takes R because of 16. Kt takes P, Q to Q sq (if 16. . . . Kt takes Kt, then 17. Q takes Kt, ch, K to B 3; 18. Q to K 6, mate. If, instead, 16. . . . Q to K 4, then 17. Kt to B 7, ch, K to B 4; 18. Q to B 3, ch, Q to B 5; 19. Q takes Q, mate); 17. Kt takes Kt, ch, K to K 4 (if K takes Kt or K to B 4, then Q to B 3, ch, and mate next move); 18. Kt to Kt 4, ch, K to K 5; 19. Q to B 3, ch, K to Q 5; 20. B to K 3, mate.

(k) K to K sq is better. If, instead, P takes R, then Kt to Kt 6, ch, and wins.

(l) Threatening Q to Kt 8, mate. Black is helpless, for, if 25. . . . R to K 4, then 26. Q to Kt 8, ch, K to K 2; 27. Q to B 7, ch, K to Q 3; 28. Q to K 6, ch, K to B 4; 29. R takes R, ch, and wins.

PROBLEM No. 4031

By Z. KOLODNAS.*

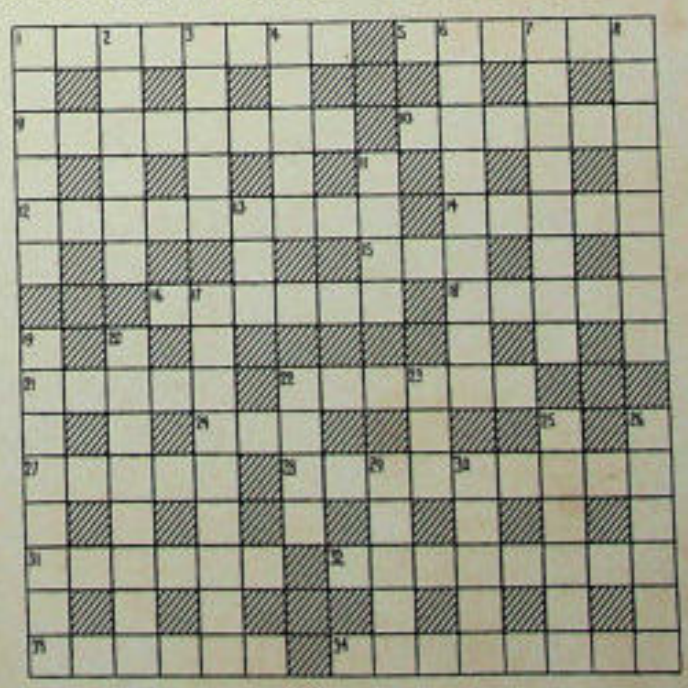
WHITE (7 pieces): King at K Kt 2, Queen at Q 2, Rooks at K 2 and Q 7, Knight at Q 5, Pawns at K 4 and K B 5.

BLACK (4 pieces): King at K 4, Knights at K R 2 and Q R 5, Pawn at K Kt 5.

White to play and mate in two moves.

*Basler Nachrichten, 1939.

SOLUTION OF PROBLEM No. 4030



1. Q to K 3 (threatening 2. Q takes R P, ch). If 1. . . . R takes Q then 2. Kt to B 6, etc. If 1. . . . B takes Q, then 2. R to B 6, etc. If 1. . . . R to Kt 4, then 2. Q takes R (Kt 5), etc. If 1. . . . R to Kt 3, then 2. Q takes R P, ch, etc.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 534

ACROSS.—1. At this the banker usually manages to get the better of his better (8). 5. Lures to his sitting room (6). 9. For a really good time, all we need is beer with these (8). 10. "The —— of Shelley, even in that age, gave great scandal" (Macaulay) (6). 12. "Sweet Lady —— him for your servant" (*Two Gentlemen of Verona*) (9). 14. Obviously a volatile (5). 15. Vows taken (3). 16. Needed for business (6). 18. A stone. (5). 21. This hat can be sat on (5). 22. Scratched or may register some points (6). 24. If you want to get this you must go "all out" (3). 27. 'Twill help an Englishman to find this if he goes North (5). 28. With some this is an exciting gamble (9). 31. "What —— it me to oppose them" Richardson (6). 32. Holes and pegs go with this (8). 33. There is a warm sound to this (6). 34. A definite decision—two words (8).

DOWN.—1. Excellent company and a small fellow (6). 2. Colourful enough (6). 3. China gave us one of the best of its kind (5). 4. "The thronged —— shakes with shouts for more" Byron (5). 6. An attraction at seaside resorts (9). 7. Try again to find the winner (two words) (8). 8. Sometimes have to be brought up (8). 11. Sixteen up make a standard Eastern coin (4). 13. May be binding (3). 17. A great feat (two words) (9). 19. Definitely binding (8). 20. To shift responsibility (8). 22. Will go across (4). 23. This anemone is an American flower (3). 25. Has a musical meaning (6). 26. Levers might be made of use to lighten an evening (6). 29. A stanza that may be got from 9 down (5). 30. "At your —— pleasure" (Shakespeare) (5).

THE ESSENTIALS OF LIFE

WE have now been at war for just on three weeks. The country, if it was ever upset, has settled down to war conditions, and life, with the exception of such novelties as gas masks, blackouts, petrol restrictions and slower trains, continues normally.

It is essential that civilian life in this country should continue as near to the normal of peace-time as is possible. It is said that it takes five people to maintain one soldier in the front line, and these five people will do their work far more effectively if they remain normal. Work, of course, cannot be continued at the same pressure as in peace-time: there is much more work to do and fewer people to do it: it must be done in shorter time and just as efficiently. And this naturally implies a strain upon the civilian worker. It is, therefore, essential that recreation should be provided for those at home, and the removal of the ban on cinemas and theatres will be appreciated.

The idea that the blackout restrictions should be mitigated, at least to some extent, is equally sound if they can be improved upon with safety. Men were not meant to live in darkness and solitude after their working day is done, and good work cannot be expected from men who are denied the normal intercourses of life at the end of their day. It is equally essential that the fighting forces are provided with some means of recreation, and this, as we point out on this page, is being attended to.

So sure are we that this question of recreation is of the greatest importance to the successful conduct of a war that we do not propose to alter the general style and contents of the *Field* to any appreciable extent. War news is broadcast over the wireless at frequent intervals, fills the pages of every daily newspaper, and every poster is a constant reminder of war—it impinges upon one's life in every café, in every train or 'bus, on every pavement. We do not propose to publish any photographs of gentlemen wearing gas masks ploughing their land. We intend to continue to portray and interpret the life and the spirit of the English countryside.

We are fighting, at least to as large an extent as any other, for that countryside. We are not merely fighting for the political status of a small town on the other side of Europe or the existence of Poland as a separate nation. We are not fighting for this minority or that. We are fighting for our very existence—and for much more. We are fighting for civilisation. No less.

For the past twenty years the world has been caught up in the wheel of dogma. False philosophies, false idealogies have swept over mankind. One "ism" has followed another: each with its specious appeal. They have tended to obscure the issue, to obscure all issues, to bring things down to a common level. Nazi-ism versus Communism (or so it once was) is now Nazi-ism versus Democracy. It would be as well to remove all such ideas from our minds. Democracy, Fascism, Nazi-ism, Communism, these are only creeds imposed upon mankind. We are fighting for something *basic*.

This war is the defence of civilisation against barbarism. And civilisation means much more than mechanical propulsion, and skyscrapers, and indoor sanitation. It means liberty—not only of the body but the soul. It means freedom of thought. It means freedom of religious belief. It means kindness and love, and freedom from exploitation. It is the root from which the tree of Democracy has sprung. We are fighting for the root: not the tree. In this essential does this war differ from the last.

Each individual's idea of liberty and freedom is personified to him, to a very large extent if not wholly, in his country: in the word Home. Home perhaps means different things to different people. A mansion, a cottage, one room in a tenement: hawthorn hedges coming into bloom, holly dark above the snow, the gentle swirl of a chalk stream, the turmoil of a Highland beck: the close turf of the downland, the rich red earth of Devon, the sighing of the wind upon a mountain top: the mewing of seagulls, the clamour of starlings, the whirr of pheasants, the drumming of snipe, the song of birds: the music of hounds; the majesty of deer upon a skyline: the peace of water-meadows on a June evening, and the chime of bells. Each one of us has some spiritual contact with some such thing. To each one of us there is something nostalgic about some aspect of the English countryside. In each one of us at some time there exists a great longing to see again some particular thing, to hear again some particular sound. These things are in the root of life, in the fire of patriotism, in the core of endeavour.

And these things we shall try to portray for those, who because of the madness of a man divorced from sensibility, are denied their solace for a space.

SPORT GOES ON

AFTER the first shock when it seemed as though a gathering of more people than that specified in the Riot Act would be banned, there are signs everywhere that a revival of sport and public recreation will be possible on a modified scale. Behind the lines in the last war the troops were able to enjoy their gymkhanas and their football and cricket matches, though sometimes they were rudely interrupted, and although modern methods of fighting and the aeroplane may impose fresh conditions, it is certain that ways and means will be found to keep up a spirit which counted for a good deal in maintaining a morale necessary for victory.

On the home front, hunting and the Turf will be hard put to it to carry on, but leaders will be found to show that difficulties are only made to be overcome. Not least among them, as far as hunting is concerned, will be the ladies who so gallantly took charge when the active male members of the hunt were on national business last time, and who saw to it that there was a run to be had for those on leave or others waiting their turn for active service.

For the first time in its history, and on the occasion of its centenary, the Cesarewitch has been cancelled, but the Jockey Club and the National Hunt Committee are considering what can be done to stage some sort of programme in October if it is possible for the Government to allow a resumption of racing in certain areas. The official decision will not be known until October 2nd. In the meanwhile, with some optimism, a new race, the County Plate of 800 sovs., is announced for Lincoln.

A great lead has been given in boxing by the exhibition staged in garrison towns by Mr. Hulls, at which the troops have had the opportunity of seeing such experts as Kid Berg, Arthur Danahar and Jock McAvoy in action. The Devonshire Sporting Club at Hackney is to reopen at the end of the month all being well, promoters are to endeavour to arrange their matches, and the British light-weight championship between Eric Boon and Dave Crowley will find its place in the scheme of things.

The Rugby Union has given a well-timed helping hand to its clubs by a moratorium on loans and, here again, although all fixtures are naturally cancelled, it is hoped to play games which do not interfere with Government regulations. The Harlequins expect to carry on, and seven-a-sides are to go on in Scotland, from whence comes the news that Murrayfield, that scene of many a glorious struggle, is to be given up to national needs. In Association football, even if large crowds have not been attracted, friendly games have started, the Scottish League matches are being resumed, and at the time of writing, the English Football Association will, if they have not already done so, decide on measures to be taken during the war.

Though a long period may elapse before English and American golfers meet to play against one another in the Ryder Cup match, there is work ahead for the selected members of our team to do if their captain's proposal is carried out. He has generously put forward the idea of playing a series of exhibition matches to help the British Red Cross and Order of St. John. The scheme is to play R. Burton and J. Adams in the North, D. J. Rees in Wales, R. A. Whitcombe on the south coast, and A. H. Padgham and S. L. King on southern courses.

Altogether a start has been made in putting up a good show for sport and games, and according to circumstances, other ideas may be developed under the national slogan of "Carry on." There is a spirit behind the British nation which stiffens when confronted with difficulties. It has shown itself here as it will elsewhere.

A COUNTRYMAN'S JOURNAL

HERE are crumbs dropped from the crowded table of events presented to our dazed senses during the early days of September. They are very trivial at the present moment, but in years to come their full significance will be realised. The countryside is now flooded with children, old folk and others from the big towns, and the following incidents, all authentic, are what I have gathered from personal experience of this phenomenon.

One party of children was taken to see the cows milked. "Wot's that comin' aht in the pile?" "That's milk." "Oh! we 'as our milk aht of bottles—not dirty stuff aht of a cow's belly." A group of small boys from the ages of about six to ten were crawling about on hands and knees at the bottom of a hedge, peering along the ground. A friend of mine asked them what they were doing. "Lookin' fer birds' nests," was the answer. Other children staying at a farm were taken by the farmer's wife to see the chicks fed. They stared in silent astonishment until one of them piped out: "Wot kind of seed does they fluffy things grow from?" Yet another party of small boys was watching the cows coming in to be milked. One of them asked the cowman, "Wot do they eat?" "Grass!" "Why don't they die?"

Some old folk who had lived in London all their lives spent the night at a country hospital before being dispersed to various homes the next day. The matron came along to inspect them, followed by her little Aberdeen terrier. "Ow, look Flossie!" one of the ancients called out, "That's a little calf. I aint seen one before." An old lady of advanced years was taken from London and arrived in the country at twilight. The next morning she looked out of the window at the trees and green fields and hedges and flowing lands, all of which were so utterly unfamiliar to her that she was heard to murmur to herself, "I must have gone to heaven." A girl of nineteen, lodged at a farm, heard the farmer talking about the old days when, of all the things he had relished above others, lambs' tail pie had been the best. "How many tails has a sheep got?" she said.

These stories all came my way in four days and from within a very small area, so that they represent a mere handful out of tens of thousands of similar ones lost to the recorder but all bearing upon the same point, namely, the incredible ignorance of the most elementary phenomena of nature that every country child knows better than his ABC and that every English child, irrespective of his or her circumstances, birth, residence, or education, knew, say, at the beginning of the nineteenth century. These fragments I have gathered are amusing enough until you begin to look below the surface, and then their poignancy becomes too deep for tears.

Look at the first story, the one about the children watching the milk spurting from the cow's udder. They had no conception of the meaning of what they saw because for them everything came out of a tin or a bottle. How anything got there was a blank. Yet observe how these products of urban culture used the old English and country word, "belly." It was an ancestral memory that had survived long after its signification had been entirely lost. For years we country people have been despised and derided by the townspeople because of our lack of culture, our simplicity, our lack of *savoir faire*, our educational backwardness. And the astonishing fact meets us with which only a sudden dislocation of the normal rhythms and habitudes of life could have made us acquainted, that the enormous majority of townsfolk (the very indiscriminateness of my examples shows it to be so) know next to nothing of the very rudiments of natural processes, of the common environment of the human race for thousands of years or of the radical necessities of existence. And this, if you please, in an age that above all prides itself on its scientific attainments and condemns previous ages for their ignorance! I have of late years come to think that science as we interpret it is nothing but a curse to the human race, but I did not fully realise before to what extent it has become an obstacle to knowledge.

There are some people who say that no good can ever come out of war. But I can point to this good, that by the example of these children we know that our civilisation has got to turn over a new leaf or perish. The twentieth century has made an appalling mess of life on earth, but at least it owes it to its children that they should know the difference between a hawk and a handsaw.

H. J. MASSINGHAM.

WITHOUT COMMENT

From an advertisement of a Continental hotel:

"The —— is a finely cultured restaurant with a cuisine of superior quality (a special veterinary surgeon controls every bit of meat used in the restaurant kitchen). . . also possesses amusing and peculiar public rooms."

WHAT OF OUR PHEASANTS?

The Harvest is Here, Who are to be the Reapers?

AFTER twenty-odd years of peace we find ourselves facing the same enemy and under not so very dissimilar conditions. The truth of the saying that history repeats itself is once again brought home and forcibly, too. The main difference—and it is the difference which invariably characterises the repetition of history that really matters—is that this time the notorious aggressor is having some of *his* most cherished acres laid waste by the ravages of war.

The time has slipped away—like an evening gone—since that first happy shooting season after the Great War, when again we took our stands by the covert-side and felt at long last that there was nothing to distract our whole interest from the pleasures of the chase. Gone was the feeling that the unknown to-morrow was ever lurking in the far-too-near background, casting its unwelcome shadow over the fleeting joys of the moment. For however hard one might try, complete escape from the world tragedy was impossible. And yet it was remarkable to what a degree one could become absorbed in a day's shooting, so that the thought of what was just passed or likely to come was expelled from the mind. A high cock pheasant coming over the big wood in all the glory of an autumn morning could make one forget the ardours even of a Somme battle.

What of the situation to-day? Many thousands of pheasants have been reared and are safely in our coverts. The efforts of our gamekeepers and others in the business of preservation have borne fruit and the harvest is there to be reaped. Who are to be the reapers? Naturally among the more active shooting men are many officers of the Services whose opportunities for sport this season at least will be exceedingly limited, if they materialise at all. Many keepers will be in the Forces and men of military age will not be available to act as beaters. Furthermore, petrol and other restrictions are bound to handicap the carrying-on of shooting arrangements, as the motor car especially is an essential factor in the case of nearly every estate.

There seem to be two leading considerations which at once demand attention. First and foremost comes the economic question of food supply. For this season we are presented with a kind of *fait accompli*. The heavy expenses of rearing are now a thing of the past and the birds are there. It may be that they will now have to fend for themselves, that they will be more at the mercy of vermin and poachers and that they will tend to become scattered from their rightful homes. For all that, the majority will survive, on one side or other of the boundary. The services of older men will have to be requisitioned as keepers and beaters, there will be difficulties in getting cartridges—certainly pet brands and loadings will not be available—but the game will go on. As far as beaters are concerned, indeed, there is no reason why boys and evacuees should not be able to perform with a fair measure of efficiency. In fact, judging by some of the quality of beating with which we have had to be content since the last war, they may prove to be little below the average. The 1914–1918 period showed how successful youngsters could be and what enthusiasm they could muster.

It can then be taken for granted that covert shooting will be able to be conducted in some way or other. This is good news, especially for economic reasons. Pheasants are excellent eating and apart from the useful form of diet they may mean in hospitals, they will be a welcome change from perhaps the same kind of meat over a lengthy period. At all events they represent splendid food at a time when all ordinary food has to be conserved and rationed. The various oddments, too, that are bagged at covert shoots, such as woodcock, pigeon, and rabbits, all help to swell supplies.

The chief question that now arises is the one of co-ordinating supplies of game with demand. Obviously no useful purpose would be served by glutting the market with pheasants during the latter half of November, as so frequently is the case under normal conditions. We all know so well the sight of pheasants hanging from every hook in Leadenhall Market and poulterers' shops. This is just after the big shoots when birds have been shot from any point of view except the economic one. And naturally sporting and social considerations take first place in times of peace. What steps can be taken to promote some measure of concerted action on the part of owners of shoots on the one hand and distributors on the other? The matter seems to call for the constitution of a central body of sportsmen whose object would be to try to space out the dates of the different shoots and at the same time to keep in touch with the main channels of distribution which in turn would reflect the state of demand.

Nothing of this sort would be workable unless it had the wholehearted co-operation of the leading shoot owners and was fairly representative of the country as a whole. But it does seem as if something worth-while could be done and certainly should be done. What have readers to say? Any suggestions will be very welcome.

The other leading consideration is the one of recreation. If the latter is necessary in peace time, it is also necessary in war time. Everyone needs an avenue of escape from the everlasting tension. Everyone needs healthy exercise and especially that sense of peace and freedom that only the country can give. Besides to the man at the front it is a comforting thought to feel that those things which mean part of the spirit of the homeland are going on in some way or other. The continuance of field sport connotes something of the stability of England and English life. There is a heartening and moral effect from the knowledge that the home fires are being kept alight. And wars are not just won by force of arms in 1939.

Grouse shooting proper is over, but what applies to pheasants also applies to partridges and other game as well. But pheasants are the *pièce de résistance* of the situation, since the numbers killed *in toto* and at any one time usually surpass those of other varieties. They also represent a considerable capital investment.

"SCOLOPAX."

THE CRAWLEY AND HORSHAM CARRY ON: CUBHUNTING AT WEST GRINSTEAD PARK

HUNT ECONOMY IN TIME OF WAR

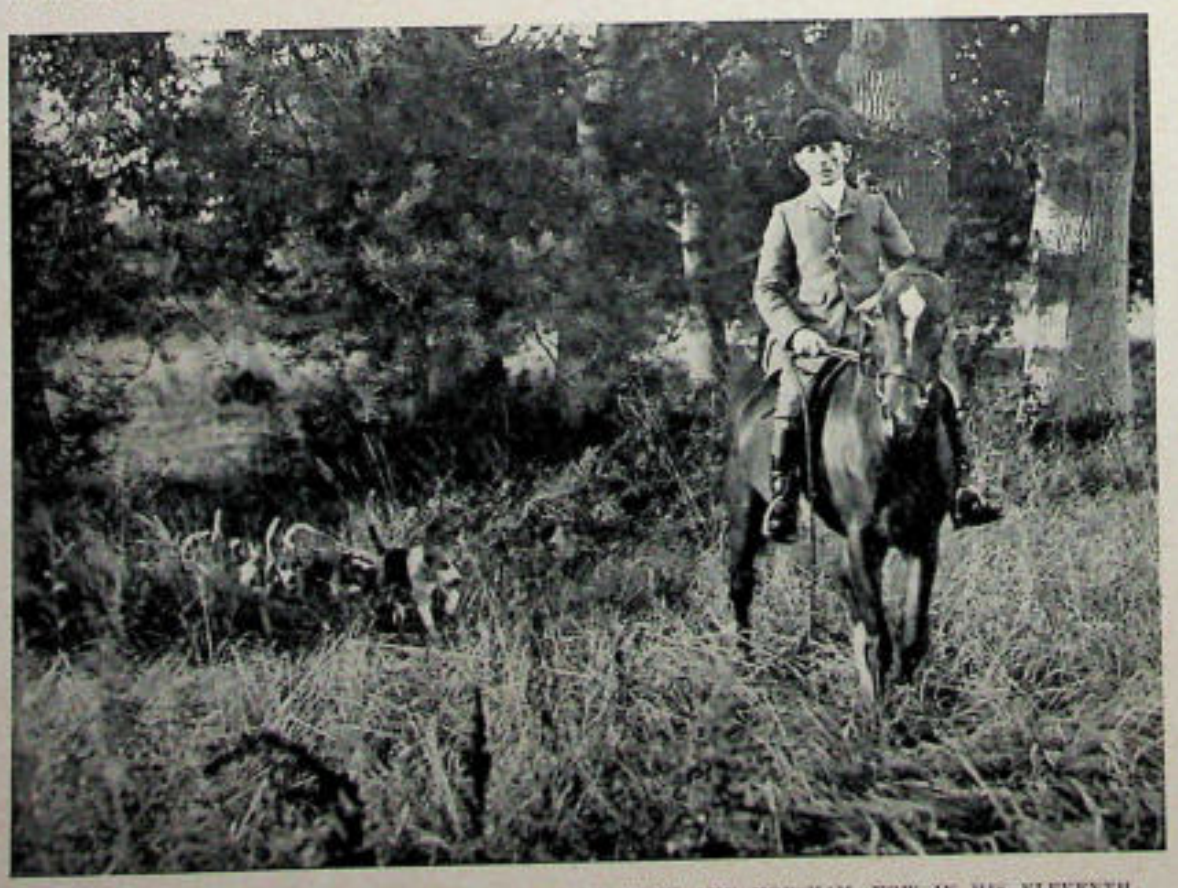
By CHARLES DEANE

ALAS, the blow has fallen! War is upon us at the very commencement of cubhunting, and we are faced with a future so fraught with unknown possibilities that all who have the responsibility of hunting—Masters, Secretaries and, indeed, Hunt Committees—must devise ways and means of carrying on.

It is obvious in the light of experience gained during the years of the Great War, that possibly the most we can hope for is that foxhunting will not be allowed to collapse, and it will most likely continue on purely nominal lines. I say nominal lines, because hunt establishments will have to be reduced to the bare minimum, servants, hounds and horses in the national needs, and in the suddenly-changed economic conditions with which we are confronted.

These approaching months may well decide the whole future of foxhunting; they will show if there still exists a really genuine will, among, not only those who finance it, but in the farming community, to keep it going till more propitious times. The financial aspect of carrying on a country, even on the most economical lines are, to say the least, not as hopeful as they were in August, 1914, when none even dreamt that income tax, and later super-tax, could reach their present levels.

We must remember the subscription lists in most countries have dwindled in recent years and I am filled with apprehension when I think that the majority of hunting men of middle age and under will have joined the colours, while their opposites in the fair sex will be no slower in showing their patriotism. With their departure from the country side will go their subscription, too.



Thus, despite the varying characteristics of most countries, one and all are at this moment faced with a common problem, where and how shall they start to cut down. Hasty decisions will not solve the difficulty, and whatever lines we decide to operate on, let the basis of our scheme make it possible to revive hunting after this war.

Let us consider where the bulk of the money is usually expended in the average three-day-a-week country, and see what items can be ruled out. The amounts are necessarily in round figures, but are sufficiently approximate on which to deliberate a line of thought.

	Peace.	War
1. Poultry claims	£400 ..	£100
2. Damage and sundry	200 ..	50
3. Wire removal and fencing	400 ..	nil
4. Covert rents	110 ..	nil
5. Rates and taxes	90 ..	60
6. Covert repairs	100 ..	nil
7. Subscription to Master	900 ..	450
8. Find money, &c.	150 ..	80
Total	£2,350 ..	£740

Item 1.—I suggest it would be advisable for a sub-committee of local farmers, in conjunction with the Master, to control the fox supply in proportion to the amount of hunting being carried on. In the general interests it would obviously be impracticable to allow the breeding of foxes to continue on a scale compatible with the normal requirements of a hunt. This course, coupled with the idea that whenever hounds hunted the primary object would be to kill foxes, on more or less cubhunting lines, should have the desired effect of preventing indiscriminate extermination, which, after all, is what we want to avoid. Apart from the reduction in the number of foxes, I am sure claims would be brought to the almost negligible levels as I believe the farmer would willingly help to prevent the collapse of hunting, and especially if his co-operation were sought at an early stage on some such lines as I suggest. Shall we, therefore, budget this item for the time being at £100?

Item 2.—I would rule this out entirely. Damage will be practically negligible. It is the large fields who cause the expense, and doubtless those who are able to come out hunting will be few, apart from the Hunt servants.

C. DENTON, THE KENNEL HUNTSMAN OF THE CRAWLEY AND HORSHAM, NOW IN HIS ELEVENTH SEASON WITH THESE HOUNDS

The Hon. Guy Cubitt is now on war service and Mrs. Gregson is sole master in the meantime

Item 3.—The removal of wire cannot possibly be undertaken on an organised scale, and this item could be totally eliminated.

Item 4.—Covert owners who receive rent should be interviewed on the lines of item 1, because in the case of most countries it will be impossible to pay any rents. Where long-term agreements exist and immediate cancellation is impossible, no doubt benevolently-minded sportsmen might be persuaded to assume individual responsibility.

Item 5.—Would be to a large extent affected by item 4; however, rates on kennels and buildings would still be a liability.

Item 6.—Covert maintenance and repairs could be eliminated.

Item 7.—In countries where guarantees are given to the Master, some mutual arrangement could be arrived at, perhaps if the number of hunting days are halved a pro rata reduction in guarantee might not be unreasonable. It must, however, be borne in mind that meal, hay, oats, straw, and all commodities will tend to become dearer.

Item 8.—With half the hunting, I would estimate find money would be more than halved. Let us, however, budget at £80.

Now the above is purely an assumption intended to indicate what might be done, and is in no way intended to be in the nature of an authoritative statement as conditions are never quite parallel in any two countries. It is only my own line of thought, dwelling on the immediate future; so let us now turn to the problem confronting the Master and see where he can reduce on the basis of a country with 40 couples of hounds hunting three days a week.

He is first of all faced with the unenviable job of making a decision as to what hounds he is to put down. Here, again, circumstances so differ that it would be impossible to lay down any universal solution to his problem. On the assumption that the war will be of long duration, obviously, it would be wise to make a sweep of the majority of four and five season hounds. Then I think it would be a wise course to put down a high percentage of third season hounds, a somewhat lower percentage of second season, and a still lower percentage of first season hounds. While in regard to this year's young entry, I should hide my time till cubhunting is well advanced, and dispense with any which are inclined to enter poorly.

On some such lines as these the Master will reduce from 40 couples to 20, which will provide a tidy saving in his budget. But next is the problem of all the puppies now out at walk. Their future will have to be discussed with the puppy-walker, as, if the war should prove to be of comparatively short duration, they are of not a little importance. It is futile to look too far ahead, but the problem of hound breeding is going to be a difficult one for every Master in a few months' time. But the trend of events by that time will indicate his course of action better than any prophecy at this early stage.

Let us consider in round figures the main items of the Master's expenditure and see where he can reduce.

		Peace.	War.
KENNELS.			
1. Hound meal		£340	£170
2. Flesh		180	90
3. Wages: Huntsman	£250		
First Whipper-in	143		
Second Whipper-in	117		
Kennelman	130		
Second Kennelman	100		
Boy	50		
	£790	790	573
4. Electric light, coal, &c.		220	180
5. Hound licences		30	15
6. Stopping money		100	50
7. Puppy show, &c.		70	—
8. Liveries		90	—
STABLES.			
18 horses, approximate cost maintenance, reduce to 6		1800	600
Total		£3,620	£1,678
Less Committee's subscription		900	450
		£2,720	£1,228

By reducing from 40 to 20 couples of hounds, and hunting three days a fortnight, I can halve cost of items 1 and 2.

Item 3.—For a start I suggest dispensing with my second whipper-in and second kennelman, thus saving £217 in their wages, and for the time being the boy can drive the knacker cart and assist in kennel.

Item 4.—As it will be essential to get hounds home in daylight whenever they go hunting, and as in all probability coal and light will be rationed, I think we can safely cut this figure down to £180.

Items 5 and 6 would be automatically halved.

Item 7.—As breeding would be on the smallest possible scale, I have deleted.

Item 8.—Delete.

The Hunt Committee's budget on the above lines points to a saving of approximately 70 per cent., and that of the Master roughly 55 per cent., but closer consideration of detail will undoubtedly produce something more tangible than I have been able to do from this very wide aspect.

A PERFECT AUTUMN DAY, WITH HOUNDS READY TO RATTLE THE COVERTS

DESTRUCTION OF HORSES

We learn that many privately-owned horses of potential use for the Army have been destroyed during the last few days. These horses belong to all classes of owners, and their action is to be deplored on the grounds of the best national interest. No doubt this has been done with the best motives, but we would appeal to all such owners to keep their horses until the proper authorities have had an opportunity of examining them. Arrangements for this inspection to take place as soon as possible have been made.

CUBHUNTING IN WARWICKSHIRE

The Warwickshire were out on eleven days (up to September 5th), and killed 21 brace of foxes. They were handicapped by the absence of any followers to help, surround coverts, &c., and the abnormally thick undergrowth in covert, combined with a very hot lifeless atmosphere, has been against them also. A good show of foxes was noticed almost everywhere. A good deal of corn was still uncut in various places when hunting first began.

The pack is to be reduced to 40 couples, but it is hoped that hunting may take place three days a week during the coming season.

THE INTERNATIONAL HORSE SHOW

The offices of the International Horse Show (Captain G. F. Fressanges, secretary) have been moved temporarily from 66, Sloane Street, S.W. 1, to Merlewood, Farnborough, Kent.

AUTUMN PASSAGE *on the* EAST COAST

By RICHARD PERRY

OF autumn migration little is written—no doubt because it is more obviously a scattered coastal movement than an infiltration inland. Apart from local movements, the inland ornithologist sees little of autumn emigrants and immigrants but martins and whinchats, fieldfares, redwings, golden plover, and an occasional bramb-ling. Yet the autumn migration is vastly more extensive and prolonged than that five-week rush in the spring. It begins in the last days of June, when scattered flights of swifts, as many as 50 in a flight, are speeding down our eastern seaboard, and is still in progress in January of the following year, when blackbirds and thrushes are still coming in from the Continent, and brent geese are still moving into winter feeding grounds. Such move-ments cannot be excluded on climatic grounds, because, instinctive or climatic, autumn migration is, fundamentally, movement from nesting terri-tories to winter feeding grounds. Whatever be the motive of such a movement, in the end the same purposes of escaping from hard weather are served alike by the early-moving cuckoo, the preposter-ously far-ranging sanderling, or the red grouse moving down from moorland to sheltered valley.

Yet this autumn migration is as regular to season and day as that of the spring. The return of greenshank and whimbrel in the first days of July is no less regular to the day than wheatear and chiff-chaff at the end of March. The signs of the season are no less plain and no less perennially intriguing in July than in March. When the first swifts are going south in June, the young common sandpipers of the year begin to appear on their hesitant way south. In the very first days of July the non-breeding curlew, who are about in small numbers throughout the summer, begin to pack in thousands on the mud-flats. And at this time, too, immature common, greater black-backed, and herring gulls begin to flock into those feeding grounds they will occupy throughout the winter, with the mature gulls gradually accumulating throughout July and August.

With whimbrel and greenshank come grey and golden plover; the latter a most regular spring and autumn migrant on the east and north-east coasts, markedly absent for six weeks from May to July. Mid-July, indeed, sees a great onset of migrants—not that they will be *en masse* and obvious; not at all; it will be merely the recording of perhaps a solitary bird of his kind each succeeding day. To think of autumn migration as a continual streaming in of unending thousands of migrants, which is, I believe, its popular conception, is a woeful error!

It is even more diffused than spring migration and, spread over so many months, the migrants take much finding. In mid-July, however, there will be great crested grebes at sea, seeming strangely out of their element against such a vast background; and young mergansers shooting through the waters of the bay, chasing marine game in great excitement. Now, too, comes the Arctic skua, his period of autumn migration coinciding roughly with that of the terns he robs, whereas it is likely to be August before the great skua appears in pursuit of the gulls, and he will still be in East Coast waters in December. Far ranging Manx shearwaters and gannets are also on the move at this season, when, by way of contrast, young cuckoos and snipe arrive at island loughs, the cuckoos to stay a week and more, the snipe the winter.

Small waders are really about at all seasons, but in the third week in July there is a marked increase in the numbers of first, dunlin and turnstone, and, a few days later, sanderling and purple sandpipers; bar-tailed godwit also increase at this season, and common sandpipers and whimbrel become very common. Indeed, in early August the whimbrel's seven whistles is as frequently to be heard as in May, and he gets about in packs of as many as 40 in a bundle. In the last days of July comes the first small *passeres*: young and very yellow British willow-warblers and chiff-chaffs and wonderfully tawny and white whitethroats.

As regular as clockwork; in the first days of August appears the little green sandpiper, and some-times his cousin the wood sandpiper, and, no less regularly (in spring and autumn) the whinchat. Throughout the summer there have been small numbers of immature long-tailed duck, and velvet and common scoter duck in the bays, but now their numbers are augmented by wintering scoter, with the characteristic sight of a long line of black duck skimming the waves at great speed a mile off-shore.

G. C. S. Ingram

A PAIR OF GREAT CRESTED GREBES IN LATE WINTER

Small waders continue to increase, and by the middle of August there may be as many as 2,000 turnstone in a single flight on the reefs out to sea, and perhaps 200 purple sandpipers with them. Late in August comes the first wave of Continental nesting *passeres*: pied flycatchers (those regular spring and autumn migrants on the East Coast), Continental and Greenland wheatears, stonechats, swallows, yellow wagtails, garden warblers and perhaps a barred warbler, swifts, meadow pipits (perching in trees, as ever on migration), sand martins, robins. Very nearly one and all are young birds of the year; and this is a feature of all migration in the autumn; mature *passeres* on autumn passage are almost a rarity—the which suggests a mint of problems about migration into which I have not space to enter here. At this time, too, the first young wigeon are coming up to the Border on their perennially invariable line of flight from sea south-east to north-west.

Some time early in September there is probably another wave of Continental *passeres*: turtle doves, house martins, wheatears, pied and spotted flycatchers, willow warblers, and white throats. At sea appear sooty shearwaters and black guillemots and velvet scoter. In the last days of September the character of the migration changes somewhat, and rather than southing birds passing through this country, it is birds coming in to winter: snow buntings, golden plover, goldcrests, bramblings, stonechats, redwings, blackbirds, reed buntings, and black-spotted song thrushes—though, of course, there are still wheatears, redstarts, and whimbrels passing through, and red-breasted fly-catchers, and terns and skuas, and lesser black-backed gulls. Wigeon begin coming up in great numbers, and with them the first pink-footed geese and black barnacles.

October opens with the great northern divers and long-tailed duck, and perhaps a great shearwater. October is the sportsman's migrant month, with ever-increasing duck and geese, and at mid-month the first woodcock, wild duck, brent geese, and scaup. Now, too, come grey crows, lapwings, and fieldfares, starlings, and jackdaws; and, for the remainder of the year, blackbirds, and song thrushes, and occasional chaffinches in November. Indeed, hardly a day passes without some little passage of blackbirds who, I should imagine, is the commonest autumn migrant on the north-east coast!

November continues the passage of sporting birds and green plover. Shearwaters are still about and various kinds of grebe; black-necked and Slavon-ian, great crested and red-necked. There are even wheatears and little terns straggling by. The first little auks come into onshore waters, and perhaps a grey phalarope, and the first goldeneye duck.

In December there are all these passages to a lesser degree, and this is the true month of the brent goose; but already spring migration is over-lapping autumn, with the perennial return of the fulmar petrels into their nesting cliffs on Christmas Day. Yet in the last days of January there are still big passages of fieldfares and redwings in progress, the brent geese have only just attained to their maximum numbers, and little auks are still passing south, when woodcocks are returning, to nesting territories.

THINGS THE STALKER CAN LEARN FROM THE TARGET SHOT

By A. DUNCAN MILLAR

IT is a matter for conjecture how the amount of trouble taken in cleaning, zero-ing, aiming and firing the many hundreds of rifles used by target enthusiasts at the recent or any other Bisley meeting compares with the similar trouble taken over the large number of sporting rifles used throughout Scotland during a stalking season.

The target expert is often heard to say that if he could not put a bullet through the vital portion of a stag's anatomy nine times out of ten at 100yds. range he would willingly eat his hat, while on the other hand the sporting shot laughs at the worried face the target expert puts on when a puff of wind comes along, and makes seathing remarks about the care and attention lavished on target rifles.

Both attitudes are, of course, scarcely correct. The target shot forgets that he may be called upon to take a shot at a stag after an arduous crawl—crawling is often much harder work than running!—not on the smooth firing point he is accustomed to, but on a steep hillside with a rock sticking in his tummy, heather in the way of his sights, sleet driving in his face, and a vile light. But many of the sporting shots would do well to take a leaf out of the target expert's book, and learn to use and treat their rifles in such a way as to obtain the maximum benefit from them.

Speaking generally, inside a range of 200yds., and relatively few shots are taken at stags beyond this distance, the average rifle used for stalking compares favourably in accuracy with the packed S.M.L.E. rifle as used at Bisley. An approximate idea of the accuracy of a new or well-kept modern sporting rifle is given by the fact that such a weapon may be capable of holding to a group of 2in. diameter, or even less at a range of 100yds.

With this in mind, let us consider how the would-be-successful stalker may make the most out of the extremely deadly weapon he possesses or is about to possess, always assuming that he has some elementary knowledge of the correct way of holding, aiming and firing a rifle.

Anyone in the happy position of being able to purchase a new rifle will do well to obtain expert advice not only as to the calibre of the rifle, but also on the type of sight to be fitted to it, in order that the latter may be best suited to his requirements. Optical considerations may determine whether open, aperture, or telescopic sights are selected, but whatever type of sight is decided on it should be robustly constructed and rigidly attached to the rifle. With a small high-velocity projectile having an almost flat trajectory over the first 200yds. of its flight, and on which even a strong wind has a negligible effect at short ranges, the need for adjustable sights, so essential for the purely target rifle, is greatly reduced. During the course of an arduous stalk the rifle is inevitably subjected to comparatively rough handling, and any delicate moving part of a backsight may easily become shifted on receiving a slight knock; it is for this reason that fixed sights are generally preferable to adjustable ones, and personally I strongly advise that if an adjustable sight is fitted, once the correct setting of the sight is obtained, some steps should be taken to lock the sight in this position.

Whether equipped with a new rifle or a trusty old favourite, it is always advisable to try out the rifle at a target at the beginning of the season. This should first be done at comparatively short range, say 25yds. to 30yds., firing at a target with a small and well-defined aiming mark, using all possible aids to steadiness in the form of sandbags, cushions, &c., and with the primary object of discovering whether there is any difference between the point of impact of the bullet and the point of aim. Any such error should at once be corrected by shifting the backsight. A vertical error is not so probable as a lateral one, though at such short ranges the shots may appear to strike a shade high. (In the case of some telescopic sights, the shots may strike low at short ranges, owing to the axis of the telescope, and consequently the line of aim, being considerably above the barrel of the rifle.)

Having ascertained that the rifle is shooting correctly, a few shots at a life-size dummy stag at a range of say 90yds. to 100yds. in order to determine and accustom oneself to the correct aim are always of advantage, and a target of this kind is always of use when lending one's rifle to a guest. Here let it be said to those people who decry target shooting as leading to slowness, that this is very far from being a necessary consequence of such activities, while the experienced target shot will learn to know first when he has let off a bad shot and later even where any such badly let off shot may strike relative to the point of aim—knowledge of the greatest use when a bullet fails to reach its correct destination in the stag's heart.

Even if a rifle is being lent to an expert shot, it is always better for him to determine for himself exactly how the rifle shoots rather than to have it explained for instance that one should aim "about 3in. low and a shade to the right"—instructions which are capable of being given a wide range of interpretations. A rifle which for one man will place the shots at the precise point aimed at, will, when used by another, give quite different results. This is by no means always the case, and when such a thing occurs it is generally due to the two men using habitually a slightly different aim, often due to difference in eyesight.

A great step forward has been taken when the user of a rifle is happy that his weapon will place a shot on the spot at which he aims. Aiming off to compensate for a known and constant sighting error is quite feasible, but this should be avoided whenever possible. A few years ago I lent a rifle to a friend who was having a day's stalking with me, and after a few shots at the dummy stag it was evident that for him the rifle was shooting about 9in. to the right of the point of aim. The target stag was facing to the left, and for a heart shot my friend soon discovered the necessary amount he had to aim forward; as it meant sending back some distance for a tool to alter the backsight and as my friend was an expert shot it was decided to carry on with the rifle as it was for that day remembering to aim off the requisite amount.

As it happened, the day was completely blank and the rifle was never taken out of its cover, but that evening sitting round the fire, Stephen suddenly remarked: "Do you know, I had clean forgotten that I had to aim off to the *left*; I was so set on remembering the amount *forward* I should aim that if I had taken a shot at a beast facing the right I would still have aimed off the correct amount *forward* and so have missed him by miles."

Telescopic sights especially are capable of giving an exceptionally accurate means of aiming, but they are also very easily put out of adjustment. How often does one hear the tale of woe—and by no means always from the user of a borrowed rifle who at least has some excuse—that the stag was standing broadside at not more than 70 yards range, "and I could swear that I let off a perfect shot, but it simply didn't have the least effect!" In at least seven cases out of ten a perfectly aimed and let off shot has been fired, but the 'scope has been so much out of adjustment, the error remaining undiscovered through not trying the rifle at a target, that the bullet has sailed harmlessly over the stag's back: in fact, the type of miss that can and always should be avoided.

When actually taking a shot at a stag, always make yourself every bit as comfortable as circumstances permit. Frequently, of course, there is no time for anything but a quick (not necessarily a hurried) shot, but every now and then there is time and to spare before firing at a stag at present lying in the sun on the other side of a hollow. In such cases it is a good tip to get the stalker's cap or your spare woolly rolled up, or to use a suitable tussock of grass as an additional support for the rifle, but always keep your left hand between any such support and the barrel. If the rifle is allowed to rest directly against some hard object when a shot is being fired, during the passage of the bullet up the barrel the latter will not be free to vibrate as it is accustomed to do when held in the normal way; consequently the "flip" of the barrel (a measure of its vibration) will not be normal, and the bullet will be thrown some distance from its usual line of flight.

Anyone accustomed to firing from the back position (similar to but not so exaggerated as that used by the Match Rifle competitors at Bisley) will find that this is the steadiest of all positions; it is especially useful when firing down a steep hill as it obviates the unpleasant sensation of getting purple in the face, experienced when one's heels are much higher than one's head for any length of time.

Incidentally, when firing either up or down a steep hill, at an angle greater than say 25deg. to the horizontal, there is a definite tendency for the rifle to shoot high owing to the gravitational force on the bullet, which acts vertically, being applied less at right angle to, and more along the line of the bullet's flight and consequently having a smaller effect. The actual variation due to this for any rifle depends on the vertical angle of the shot, and generally it is quite sufficient to keep in mind that it is essential not to aim high rather than deliberately to aim low, as this can easily be overdone.

The old adage "light up, sights up" and vice versa applies as much when stalking as when target shooting, but again, say in an extra bright light, it it better to take especial care not to take a low aim rather than definitely to aim high. Aiming off, in whatever direction, always tends to be exaggerated.

No matter how strongly the wind is blowing, except for a very long shot—never to be encouraged—lateral allowance due to the wind's effect on the bullet is so small that it can safely be neglected; much more important is an extra firm grip on the rifle to guard against the actual buffeting both of one's self and the rifle while on aim.

On returning home from a day's stalking everyone knows than in theory the rifle should be attended to before one's own person; it is equally well known that such theories are seldom put to practice. However, at least take the rifle out of its cover in order to give it a chance to dry; extract the bolt and put some sort of oil carrier—an oily piece of four-by-two, or an oily brush—once down the barrel, the whole of which operation takes but half a minute and at the same time makes considerably easier the final cleaning.

Before setting out in the morning always clean out thoroughly the protective coat of oil left in the barrel from the previous cleaning (not forgetting to replace the bolt!) otherwise the first bullet fired, after ploughing its way up the barrel through a layer of oil, is apt to take a somewhat erratic course on reaching the light of day.

"Blow-off shots," or the practice of firing one or more rounds, aimed at a convenient piece of soft ground, through the barrel before commencing serious shooting, are seldom necessary if the barrel has been well cleaned, but from an academic view point they may tend to keep the first shot fired at a stag more in the centre of the rifle's normal group.

VEGETABLE CULTIVATION AND COOKING

By ELEANOUR SINCLAIR ROHDE

IN regard to the absorbing problem of manure, I was delighted to see a few days ago a letter from Sir Albert Howard in *The Times* emphasising the wastage of humus—millions of tons of it—most of it in dustbins. I wrote a little on the subject of compost-making in last week's article (and hope to write at further length in subsequent articles) and mentioned that for twenty years we had used all vegetable waste both from the house and kitchen with inestimable benefit to the soil at no expense whatever.

Seeds that can still be sown are American Cress, Corn Salad, hardy varieties of Lettuce in frames, and Turnips. The thinnings of the first three mentioned make an admirable addition to winter salads when ingredients are usually few. The invaluable Coleworts or Collards can still be planted out. These small cabbages take so little space that they can be planted a foot apart and they heart up more quickly than any other member of the cabbage tribe.

Vegetable cookery in these days has to be simple, for no one has time for elaborate recipes, especially in houses where staffs have been reduced to a minimum and in the countless houses where the mistress is not merely maid-of-all-work to her own family but also to evacuees as well. Home-grown vegetables reduce food expenditure considerably, but the ordinary English method of cooking all vegetables by the simple method of drowning them in a large quantity of boiling water reduces the vegetables to such an unpalatable condition that no one eats them except in the smallest possible quantities. Another point most English ignore that cooked vegetables should be served piping hot.

The following vegetables are now amongst the most important in season: Beets (including Seakale Beet and Spinach Beet), Michaelmas Broccoli, Carrots, Cauliflower, Seakale Beet and Spinach Beet are invaluable and, to my thinking, the former is the more useful from the labour-saving point of view. Spinach Beet is undoubtedly a grand stand-by, for it affords a continuous supply of greens all through winter from the minimum of space, but stripping the leaves of their stalks takes considerable time if it has to be done in quantity, as anyone will testify who has done the job.

Spinach Beet, in my experience, is just as hardy (we were gathering ours all through the last severe winter) and far less trouble to cook. The leaves, with their large stems (and the stems of well-grown specimens measure 3ins. across) should be broken—not cut—off as near the root as possible. If cut, the plant is bled and therefore breaking the stems is the right way. The green part of the leaf can be eaten as spinach or used for soups, &c., and the stems make an excellent dish not unlike seakale. Boiling them deprives them of all flavour. They should be either steamed whole in a basin or stewed gently in stock or milk and water. Serve with a butter or cheese sauce.

Cauliflowers and Michaelmas Broccoli can be treated in the same ways. It is odd how few people eat the white heads raw, yet grated Cauliflowers or Broccoli are far more digestible than the same vegetables cooked, none of the goodness is lost and the vitamins are retained. The white heads, after being soaked for ten minutes or so in salt water, then rinsed and drained, can easily be grated on the threepenny graters obtainable from any of the cheap stores. There are numerous expensive vegetable graters but the cheap ones are quite as effective.

No vegetable should be grated long before it is to be used, for it loses flavour and is apt to turn colour. Grated Cauliflower mixes admirably with tomato pulp, grated carrot and turnip, ground nuts, yolk of hard-boiled egg, and any other green salads. Mixed salads are always more palatable and the addition of a dessertspoonful of finely snipped herbs over the whole makes a great difference. We add a dessertspoonful of about fifteen herbs to these salads. Incidentally, few people seem aware that lavender and rosemary, which are grown even in gardens where there is no herb plot, are edible, but the flavours are so strong that they should be used either in salads or soups, stews, rissoles, &c., very sparingly.

Here is a good way of using up the remains of cooked Cauliflowers or Broccoli. Butter a fire-proof dish. Put in alternate layers of cut-up cooked cauliflower and grated cheese. Remains of cooked carrots, turnips or onions may be added in small quantities. Pour over a thin white sauce thickened with cheese. Strew grated breaderumbs on the top and a few little bits of butter. Brown in the oven and serve very hot.

In my enlarged household I have been delegated the job of vegetable cook, the great idea apparently being that I can go on writing whilst waiting for the vegetables to cook. Colcannon, though I serve it frequently because it is such an easy way of using up all remains of vegetables, to say nothing of any good sauce, is a prime favourite. Scotch and Irish cooks in my experience make this delicious dish to perfection, possibly because it requires a touch of imagination to secure a few unexpected ingredients. To make Colcannon collect all the cooked vegetable remains—carrots, onions, cauliflower, spinach, runner-beans, etc., and it is essential to include well-mashed potato. Mix all thoroughly well together and add a little butter, whilst mixing also pepper, salt, and any left-over cheese or other good sauce and just a suggestion if liked of nutmeg or cinnamon but do not overdo any spice. Grease a fire-proof dish, put in the mixture and bake in a hot oven. When turned out, the outside should be slightly browned.

WAR HORTICULTURAL SUB-COMMITTEES

In counties where substantial horticultural industries exist the War Agricultural Executive Committees have been asked to establish a horticultural sub-committee to advise on the cropping in the best national interest of land and glass-houses hitherto devoted to horticultural crops. Occupiers of land devoted to the production of horticultural crops should get into touch with their committee. The Minister has appointed Dr. H. V. Taylor, O.B.E., D.Sc., A.R.C.S., V.M.H., Horticultural Commissioner to act as intermediary between the horticultural sub-committee and the Ministry.

THE POSITION OF NURSERYMEN

The President and Council of the Royal Horticultural Society wish to draw the attention of Fellows of the Society and of the public to the desirability of continuing to place orders with nurserymen. If orders are absent very much of the work that nurserymen have done during the past few years will be wasted. Moreover, it would be a calamity if, owing to the scarcity of orders, many of them were compelled to close their businesses entirely, for unless some stock is retained during the war it will be many years after the cessation of hostilities before they will again be in a position to play their essential part in the horticultural life of the country. It is hoped that these points will be kept in mind by all amateur gardeners and that orders for trees, shrubs, or other plants will not be discontinued unless this is found to be absolutely necessary.

The Ministry of Agriculture, in association with the Society and other bodies, is publishing a pamphlet and a leaflet on food production in the garden, which will serve as a guide to all those who desire to produce with least disturbance the maximum food value from their gardens. These pamphlets and leaflets will be obtainable either from the Ministry or from the offices of the Society. Arrangements are as well being made for the establishment of horticultural committees at certain centres for advisory purposes. Lectures will also be arranged throughout the country.

WAR-TIME NOTICES

THE ROYAL ENGLISH FORESTRY SOCIETY.—The office of the Society at 48, Dover Street, London, has been closed. Until further notice, the routine work of the office will be carried on at Conington Hall, near Cambridge ('phone Elsworth 230), to which address all correspondence should be sent.

LONDON NATURAL HISTORY SOCIETY.—At a meeting of the Council on Tuesday, September 12th, 1939, it was decided that the fixtures of the society as printed in the current syllabus be cancelled forthwith. It is hoped, however, to continue activities in a modified form, and members will be notified of further arrangements by the end of the year.

THE NORTHERN AND MIDLANDS SPANIEL CLUB announce that at a meeting held on Tuesday last the committee decided to cancel the Field Trials fixed for November 7th and 8th.

THE INSTITUTE OF THE HORSE AND PONY CLUB, LIMITED.—Owing to the declaration of war, the following measures have been adopted. The Special Course fixed to take place in October and the Annual Meeting of District Commissioners to be held on October 18th have been cancelled.

In the interests of candidates and riding schools efforts will be made to continue the examinations for instructors' certificates, and all candidates who have entered for these examinations have been asked to state whether, in the present circumstances, they still wish to present themselves for examination this year. The Pony Club Examinations for Test "A" arranged for September have been cancelled and steps have been taken to notify all concerned.

It is hoped that branches of the Pony Club will continue to carry on their activities, and District Commissioners who find their time too much occupied with other duties are requested to appoint representatives to act on their behalf, notifying headquarters of their names and addresses.

The quarterly journal, *The Horse*, will continue to be published. The offices at 66, Sloane Street, London, S.W.1, will remain open with a reduced staff. The hours for callers will be: Morning, 10.30 a.m. to 12.30 p.m.; afternoon, 2 p.m. to 4 p.m. The offices will be closed to callers on Saturdays except by appointment.

R.A.C. SERVICE.—It is announced by the R.A.C. that with the exception of the number of guides on the roads, the club is continuing its full service to members from the headquarters in London and branch offices in all parts of the country. Staffs are of necessity depleted owing to the large number of men who have been called up for service with the Navy, Army and Air Force, or who have joined one or other of the services. But all departments such as the legal, engineers, "Get you Home" Service, touring, &c., are functioning fully. In addition, the R.A.C. Information Department is dealing with scores of inquiries daily on the question of petrol rationing, lighting regulations, the restriction of provisional licences and similar matters which have arisen following the outbreak of hostilities. The club is also making representations to the Government departments concerned, in an endeavour to obtain some amelioration in the general conditions under which motoring is labouring at the present time.

STORRINGTON FOOT BEAGLES.—A special committee meeting was held at Newbiggin on August 28th, whereat the secretary was authorised to send out the following in the event of hostilities breaking out:—

In the first place the pack will have to be reduced to a minimum, and hunting days cut down to one day a week, with an occasional by-day.

If food shortage becomes acute, the pack will have to be disbanded, in which case the secretary will be pleased to hear from anyone who will take a hound or more for the duration of the war. In this case only a selected few of the best young hounds will be kept for breeding stock.

The secretary would like to point out that hounds have been kept throughout the summer months, and so far only a few subscriptions have been received, and liabilities have to be met. If subscribers feel that they cannot pay their full subscriptions, it is hoped they will send what they can to support the nucleus of a pack till better times.

ALTHOUGH THE DOGS ARE NOT TOO FOND OF THEIR BADGER COMPANION THEY SHARE THE MILK

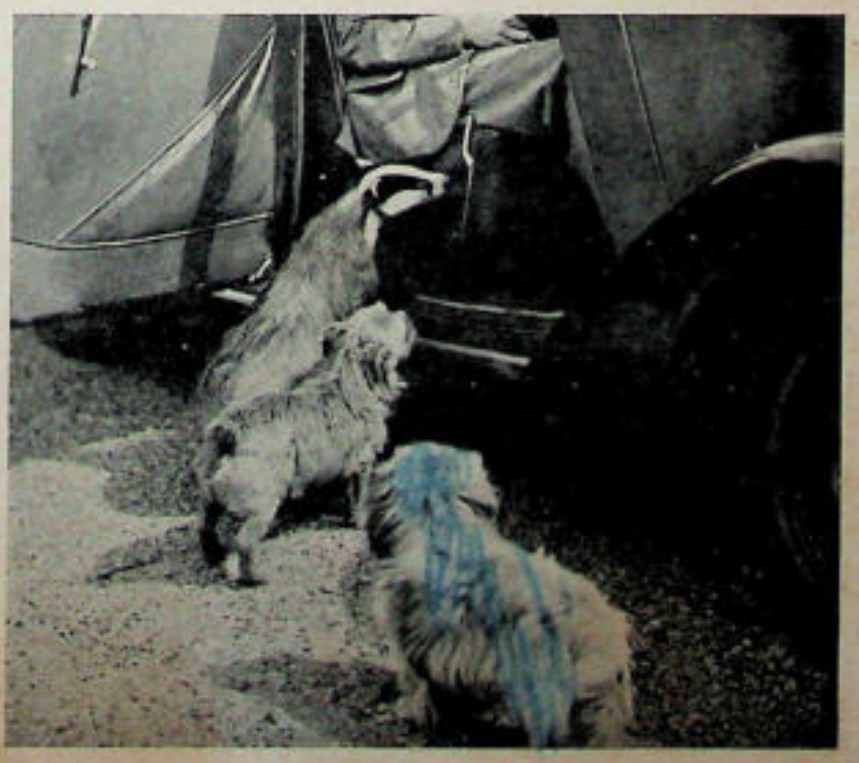
WHEN THE DOGS ARE BRUSHED THE BADGER WAITS FOR HIS TURN

A TAME BADGER

"WIGGEY-WIGGEY," the badger cub, was dug out of his earth in the middle of April when about a month old and given to the owner, Miss Anne Blewitt of Boxted, Essex. His brother who came with him soon died, but Wiggey survived on a diet of Patent Puppy Food and egg and milk, which he took five times a day from a bottle. It was a whole-time job keeping him clean, dry, warm and well fed. He lived in a box of straw with a blanket and hot-water bottle, and a stove near-by. He grew visibly every day, but for a long time after he should have eaten solid food he would still only take his bottle. Eventually he ate a piece of cake and then a raw baby rabbit, raw minced meat, and bread and milk. Now at the age of four-and-a-half months he feeds in the same way as the dogs, and likes plenty of milk to drink. He eats various insects he finds in the garden, and loves fruit. He picks gooseberries with his teeth, holding down the branch with his paws.

Wiggey has very strong fore-legs, and can climb and dig himself out of any place. He is scrupulously clean in his habits and in the house. His idea of playing is to bite and chew his friends' hands and ankles and the dogs' legs, and is only fierce when feeding. Although he may amble about during the day, he only really wakes up in the evening, when he follows his owner on long walks and plays about, running and turning with great speed on the tips of his toes, with his hackles up and ears laid back, using his tail as a rudder. He answers to his name and understands the word "No," but got rather out of hand while his owner was away recently, killing and eating a chicken and staying out all night. He is quite faithful, but seems to have no way of showing pleasure or affection other than by obedience.

Wiggey's own choice of a home is an upright barrel, which he climbs in and out of with ease. He sleeps in a ball with his head tucked underneath him, and when playing, turns somersaults, lying on his back with a plaything held in his arms on top of him. He is hated by all the dogs, but if they turn on him he just hides his head until the attack is over, as his skin is too tough for them to hurt him.



WIGGEY'S OWN CHOICE OF A HOME IS AN UPRIGHT BARREL

HIS IDEA OF PLAYING IS TO BITE

ALL EXCITEMENT: "WE'RE GOING FOR A RIDE"

AND WIGGEY IS THE FIRST ON THE RUNNING BOARD

LETTERS TO YOUNG FLY-FISHERS

XIII.—How to Tackle Grayling

MY DEAR BOB,—Your father is quite right. Until you are old enough to help effectively in the war, you are far better employed in a healthy pursuit like fishing, than in waiting excitedly for the next wireless announcement. At the moment your job is to keep calm and keep out of the way; and there is no better place to do this than on the banks of a stream. Thus you may not only fish with a clear conscience, but in the knowledge that by so doing you are making yourself more observant and fitter for your job should the war not be over by the time you are old enough to serve—which, please God, it will be.

In another week or so now the trout season will be over in most parts of England, since it ends on September 30th, though there are a few places where it goes on a week or two longer; and there are also streams where sea trout may be taken in October, but they are not likely to be available for you. Still there is no reason to put your fly rod to bed just yet, as several kinds of coarse fish may be taken with fly, on occasion, and there are also grayling to be found in many trout waters—and elsewhere. They may be taken in almost the same way as trout, though certain modifications in the methods you have been using hitherto are advisable.

You have already encountered grayling, I think, on your cousin's water, since you told me you had caught a fish which the keeper so named and trod it heavily underfoot. This arbitrary proceeding, however, should not be followed. It represents simply the natural resentment of a man whose employer expects him to keep "vermin" well under control and who regards their capture as something of a slight on his own competence. Since he probably expressed his opinion of grayling, it may surprise you that I should suggest fishing for them, but in reality it is only a practical illustration of the old saw: "One man's meat is another man's poison."

In a well-kept chalk stream, grayling are out of place, except for the man who wants to continue his season well into the autumn, for they are gregarious creatures, they herd together in shoals, consume a lot of food which would otherwise be available for the trout, and what is more they elbow the trout off the open, gravelly feeding grounds where the troutfisher otherwise would get his best sport. In most chalk waters grayling have to be netted out every year to prevent them outing the trout altogether.

But do not let that trouble you. There are generally enough left in to give good sport, and for many men a grayling is as good a fish as a trout any day of the week. If the present plan to billet you on your aunt on the Welsh Border materialises you will find that they are regarded much more respectfully in that neighbourhood. Severn tributaries in their upper reaches should give you ample opportunities to make their better acquaintance and form your own opinion. In Yorkshire they are held in as great respect as trout.

This shoaling habit of grayling is one to bear in mind when fishing for them. Where there is one grayling there are almost sure to be others. You may remember, in writing to you about nymph fishing, I commented particularly on the habit trout have of moving from side to side, and to a lesser extent up and down stream, while intercepting the nymphs which are coming up to hatch, so that, often enough, one is deceived into thinking that there are half a dozen trout on the rise while in reality there is only one. If the fish rising were grayling, however, it is long odds that there really are half a dozen fish on the rise, and by selecting the lower one for your first attack you may be able to land two or three out of the shoal.

Grayling rise rather differently from trout; not that there is any very noticeable difference in the appearance of the boil made on the surface—would that there were—but in fact they come up from the bottom (shoot up, one might almost call it) instead of lying poised in midwater and picking off flies by tilting their nose. They are not nearly so nervous as trout, generally speaking, probably because they lie near the bottom and feel more secure, so that provided they do not see you, or are scared by some sudden movement, you may often stay in one spot for an hour, casting continually over the shoal, and picking out an occasional fish.

For some reason it is rare to find grayling which are gut shy, though I have once or twice noticed a tendency for grayling in chalk streams not only to adopt the trout's method of feeding but also its suspicious character. As a rule, however, grayling will come again and again at the same fly which they have previously missed.

This habit of missing flies when rising at them seems to be inherent in all grayling. Some men hold that it is due to the depth from which they rise; and this may be so, for I have often observed trout to float backwards a few inches in taking a fly, as if to make sure of their aim, while a grayling, as I say, normally shoots up quickly from the bottom.

But it is quite as likely that the position of its mouth is to blame. If you examined the specimen which the keeper treated so cavalierly, you will have noticed that, apart from its colour—a sort of faintly dappled gray—it differed from a trout in its much more pointed head, its enormous dorsal (back) fin and in its mouth, which is located underneath, instead of at the end of its "nose." This sort of "underhung" mouth looks as if it were designed for picking food off the bottom, and most emphatically not for taking flies off the surface; so the fact that it misses so many of them should, perhaps, cause no surprise. Anyhow, if you get a rise and the fish fails to take hold try again—and again—without changing either your fly or your method. A grayling will often "connect" at its third or fourth try—a great blessing on a frosty October morning when hands are a bit numb and fly changing a burden.

Grayling also are blessedly ignorant of entomology. They do not pause to discuss—as in some poignant moments one suspects the trout of doing—whether a fly is *Baëtis rhodani* or *Cloëon simile*, but accept an artistic creation, even of the most modern artistic school, apparently on the principle that "a fly's a fly for a' that"; and even prefers a cheerful-looking insect with some colour about it to the rather drab specimens which Nature has provided.

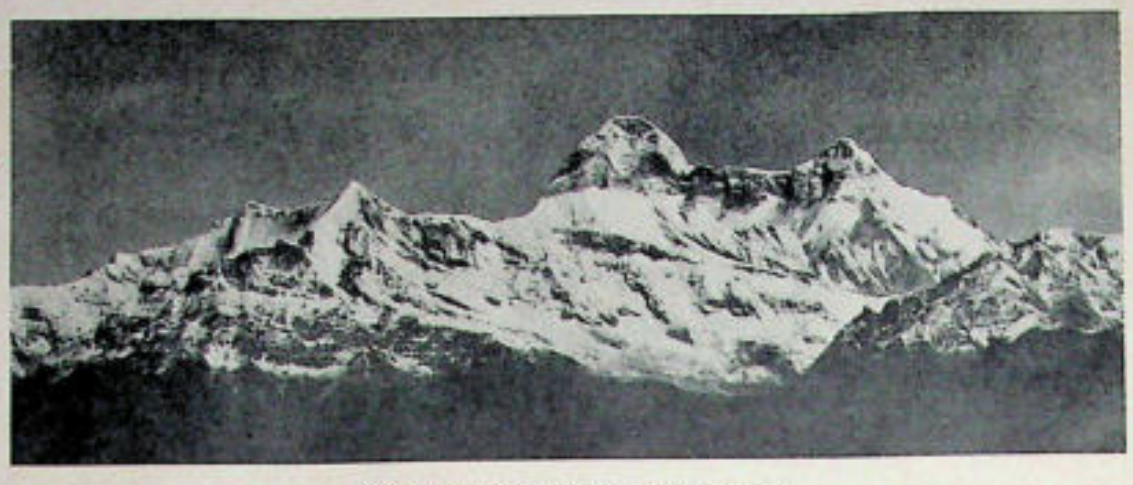
As a general all-round fly for grayling the old red tag is hard to beat, though there are one or two grayling flies which have obviously been inspired by it and may be an improvement on it; for example, the Witch which is, in effect, a red tag with a flat gold tinsel ribbing. Wickham's Fancy is another excellent grayling fly. Bradshaw's Fancy and Green insect are first favourites with many grayling fishers. But there are dozens of patterns. No. 0 is usually a killing size, but what will kill on one day—either in size or pattern—will often prove quite useless on another.

In considering method one comes at once on the vexed question of dry or wet; with the added vexation of "up or downstream"—and when grayling controversy arises, as it does every ten years or so, rival practices are thrashed out with heat and energy. But I should advise you to adopt a catholic attitude towards grayling and try first one thing and then another, until you find which particular method pays best on any given day.

In a chalk stream you will often find that grayling have to be approached exactly as if they were trout: a rise must be spotted, a stance taken up below, or to the side of the rise, and a single fly, either dry or wet cast to the place. If any attempt is made to fish "down and across," the fish stays down, or moves across in a highly disconcerting manner; or if the fly moves in approaching the fish, then the grayling does not.

But in swifter streams, and also on wide shallows in chalk streams, the method of casting straight across or slightly downstream and letting the fly drag as it comes over the shoal is often the most successful of all, provided the fish do not know you are there. This axiom of not showing oneself works even more effectively with grayling than with trout. A grayling seldom seems to suspect a fly of being other than something edible, but it is very suspicious of a man in its vicinity. There are days, in fact, when definite downstream fishing will provide a basket if a long line is used, and the flies can be recovered in short jerks if the gut sinks well, a point which is useful to remember when a rapid cannot be fished conveniently from below; but in such a case do not stand at the top of a shallow and lengthen line; stand well above it and cast a line to the top of the shallow, fishing it down by moving forward slowly and keeping a long line from the beginning.

One, two or three flies may be used for either method—but probably the most attractive sport of all is to be found (occasionally) on one of those sunny autumn days when the frost-mist has risen from the water and the grayling rise all day long on a swift shallow which can be fished with a single fly, either dry or "semi-submerged" by casting to them exactly as if they were trout on a day of early spring.



Your affectionate uncle,

HARVEY.

FISHING FOR GRAYLING WITH THE SNOW UPON THE GROUND

Even when the trout season is over and the winter months are upon us, there is no reason to put the fly-rod to bed

NANDA DEVI SEEN FROM ABBOTT MOUNT
This photograph was taken with a 30in. Dallmeyer lens at f.45 on a Wellington plate with an exposure of 6sec. at a distance 72 miles

EAST KUMAON: LAND OF SPORT AND SCENIC BEAUTY

By LIEUT.-COLONEL C. H. STOCKLEY

SOME 30 miles to the south-east of Bareilly, the Rohilkhund and Kumaon railway pushes out a tentacle northwards towards the Himalayas, which ends at the busy little town of Tanakpur, facing the green hills of Nepal across the Sarda River. This is the stepping-off place for East Kumaon, a beautiful and interesting country, probably better known 100 years ago than it is to-day.

Tanakpur itself is only alive from mid-October to April, its bazar aswirl with a varied throng of humanity and beasts of burden; then the shops put up their shutters, the caravans withdraw to the green grass left by the melting snows, and the little town becomes the quiet, mosquito-ridden, fever-stricken abode of the few whose employment prevents their leaving it.

The jungles around are famed for tiger and other game, while the Sarda River here breaks out from the hills and, flowing clear over a bed of sand and boulders, provides excellent mahseer fishing. Here also the caravan road comes down from Tibet, with only one high pass to cross at the frontier, and by it arrives a motley crowd of several races and religions, to exchange their wares for the products of the plains of India.

In the dusty bazar between its double line of wooden, tin-roofed shops stroll pig-tailed Tibetans from the far side of the passes, greasy-hatted Buddhists from the British side, round-capped, tight-trousered Kumaoni Hindus from the nearer hills, mingled with the professional caravan drivers. Many of these last are full-bearded Khattri Sikhs, but the crowd is so varied that an Afghan from Kandahar and a brass-worker from Benares may be found bargaining in the same shop.

But take the road into the mountains to find never-ending interest in the ebb and flow of the traffic using it; with scenery of ever-growing beauty, culminating in a panorama of 400 miles of snow-clad peaks unsurpassed throughout the world.

Eight miles north of Tanakpur frowns a wall of rock and jungle and, having hired ponies, an hour's tramp through the forest brings one to its foothills. Then five miles up a steep and rugged track, from sal and bamboo to mixed forest, and the resting traveller looks down 3,000ft. on the patchwork of the Tanakpur fields surrounded by dark green sal forest, with the broad silver ribbon of the Sarda winding through them. The top of this ridge is called Sukhidang, and tigers may be found there at any time, coming up in the hot weather as regularly as Government offices do to the hills, and the wise owner of a pony prefers not to halt there for the night.

Then five miles of winding path down through the greener, damper forest of the northern slopes, past a little Hindu shrine kept spotlessly clean by its smiling Pujari, who presents a bunch of marigolds in hope of some small contribution in return, and on to the camping ground by the Ladhya River, whose shining pools and glittering runs shout aloud of mahseer. Only half a mile below this camp I was broken by a 12-pounder after a hard fight, and caught him next morning after an equally tough struggle, with my first spoon still fixed in his gullet. Above the Ladhya the cliffs hold numbers of goural, and more than one angler has found a tiger gorging itself on a recently-killed cow in the bed of the river.

Next day it is a steady climb of 2,500ft. in five miles to the little resthouse at Dhuri, which is the limit to which the yaks come; for below this it is too hot for them, their loads being taken on to Tanakpur on mules or ponies.

From Dhuri the track winds up a long ridge to enter dense woods of moss-hung oak, pine and rhododendron, and in March the road is busiest and most beautiful. Round spurs and through shady ravines it curves, splashed with pools of golden sunlight and blood-red patches of rhododendron flowers, shed by the trees which flame among the dull green oaks. In a sunlit haze of dust come the caravans; sheep and goats, yaks, ponies, mules and oxen, the bells of the leaders tinkling and clonking, while the drivers urge on their charges with shrill whistles or guide them with long slender sticks.

POTATOES, WOOL AND BORAX COMING DOWN FROM THE HILLS

TRISUL, NANDA DEVI (25,640FT.) AND NANDA KOT, (ON EXTREME RIGHT), FROM NEAR LOHAGHAT

A motley, hardy crowd and mostly a cheerful one, inured to heat and cold, rain and snow, the Tibetans often as apple-cheeked as the strangers to their country are blackened by the biting winds off the snows. Passing the few fields and rough caravanserai of Baghaila, where panthers take toll of the pack animals of many a caravan, the road crosses a neck from which is got the first glimpse of the snows, here just a few white triangles showing sharp against the blue sky above the green hills.

Five miles on the track turns eastward down a winding valley through oak forest and soon comes to the first tea gardens, remnants of past prosperity. Then a turn in the road and straight ahead stands a dazzling wall of jagged blue and white, the glory of the eternal snows, with the great double peak of Nanda Devi, 24,640ft., and the highest summit in British territory, flanked by the long ridge of Trisul on the west and the castle of Nanda Kot to the east. Then the road enters the wide Champawat valley, contained by rolling hills capped with dark clumps of deodar, a clear stream edged with willows tinkling down its centre, and, passing between hedges of blossoming hawthorn, crab-apple and wild rose, one's thoughts inevitably turn to spring in England.

Then nine miles to Lohaghat, which was a cantonment a century ago, where there are graves of British officers in the little cemetery, the old mess house still stands, and tales are told of tea and indigo planters who, by their own unaided efforts kept the rebels of '57 out of this pleasant country.

The plantations have long ago ceased to be profitable and are rapidly reverting to the jungle, or have been turned into fruit orchards, for English fruit grows in plenty here, and were the 40 miles of pack road made usable by motor transport a thriving industry would result. The road goes on, climbing to the col between round-topped Abbott Mount and a still higher hill, capped with a white temple of great sanctity which is the scene of an annual fair more riotous than seemly. From the col climb 500ft. to Abbott Mount and the view to the north will more than repay the effort. There are wonderful views in the Northern Himalayas, but nothing to compare with this.

Far away to the left the wedge of Kamet is visible beyond the square mass of Badrinath, and thence to the great jumble of Dhaulagiri, from whose foot issues the dark valley of the Kali Ram, is more than 450 miles; the great sweep of mountains is centred by beautiful Nanda Devi, with the ruggedness of Trisul and Nanda Kot as foils on either side, and the glittering pinnacles of the Five Chimneys to the east. The view is clear across the valley of the Sarju with no intervening heights to lessen the effect of the giants rising beyond its rift in the dark green hills.

Hereafter the pack road drops 4,000ft. in fourteen miles to the Sarju and the white temple of pilgrimage at its junction with the Rishiganga at Rameswar, then climbs as much again to the Pithoragarh plateau, where is a mission and the last large village.

Thence the path winds on seven days' journey to the Lipu Lek Pass, where is the frontier of Tibet, and the road for pilgrims wishing to make the circuit of the sacred mountain of Kailas. Around the Lipu Lek will be found hill game, the great ovis ammon and the bharal, but all round Lohaghat there is sport in plenty—bear, leopard, sambar, serow and goural and pheasant and woodcock in the winter and tiger in the summer. These last follow the buffalo up from the plains, and some abandon a decent tiger's way of living to become man eaters.

Those who have journeyed through this country in peace time have found it a cheap and delightful experience, while a summer spent in Lohaghat or Abbott Mount, with trips for shooting and fishing, interspersed with lazing and fruit eating, has proved a pleasant and inexpensive way of enjoying life.

ANXIETIES OF DOG BREEDERS

By A. CROXTON SMITH

LITTLE did any of us imagine that when the bells rung to celebrate the end of the war in 1918 that we should have to go through similar horrors again. In these articles, of course, the national aspect has to be merged into the particular, my readers being preoccupied, as a side issue, with the future of their dogs. Last time, with the approval of the authorities, field trials and shows were continued to a lesser degree for several years. The last show, I believe, was Cruft's of 1916, an event memorable in its way because King George V made his first appearance as an exhibitor of Labrador retrievers, much to the delight of the many thousands who follow these events with interest.

This time, shows of any magnitude one naturally is led to expect may come to an end. The Kennel Club see no objection to the holding of such small fry as sanction shows, which only affect a few in each case, but in the aggregate afford amusement to large numbers of working men, who cannot afford to compete at the bigger. The proviso is made, however, that the approval of the appropriate local authority must be obtained before a licence will be granted.

Shooting men, masters of hounds and owners of greyhounds are faced with difficult problems, and so are those who have extensive kennels of show dogs. Some of these kennels cost anything from £500 to £1000 a year to maintain, and if there are no sales, or merely sales as domestic pets, their owners will be compelled to effect drastic reductions, keeping merely the key dogs and bitches. Whether or not they will be allowed to do any breeding has not been determined at the moment of writing. In the 1914 war they were permitted to carry on until July of 1917, close on three years after the opening of hostilities. At the moment we can only wait and see.

No doubt the Government are aware that very considerable sums of money are invested in gundogs, hounds and pedigree dogs, and that a great industry has grown up for meeting their needs. The export trade is not without its economic value to the country. No one, I am sure, would desire that the interests of the community should be in any way jeopardised by dogs, but if we can await events for a time before drastic action is taken it would afford much satisfaction.

In writing of dogs one cannot overlook those that are kept as guards and companions, which, with those used for herding sheep, come to well over 3,000,000. Ordinary men and women set such store by the companionship of their dogs that they would try their utmost to preserve them. One regrets that so many, becoming alarmed at the possibility of air raids, had thousands of dogs and cats destroyed in the first week. I did my best to reassure all who consulted me, counselling them to see what was going to happen before resorting to extreme measures. Wherever it could be arranged I advised that dogs should be sent to safe quarters in the country, and when that was not possible that they should most certainly be kept for a time.

After all, the majority are not what we should call gun shy, being unaffected by fireworks or thunderstorms. Such as become hysterical will be helped if they are given bromide strontia in a little water—3 grains for the toys, 5 grains for those about the size of fox terriers, and 10 grains for retrievers and such like. This will probably quieten them. The ingenious can improvise gas proof kennels if the worst comes to the worst. The dogs would hate the confinement, but critical times may call for severe measures to save them pain.

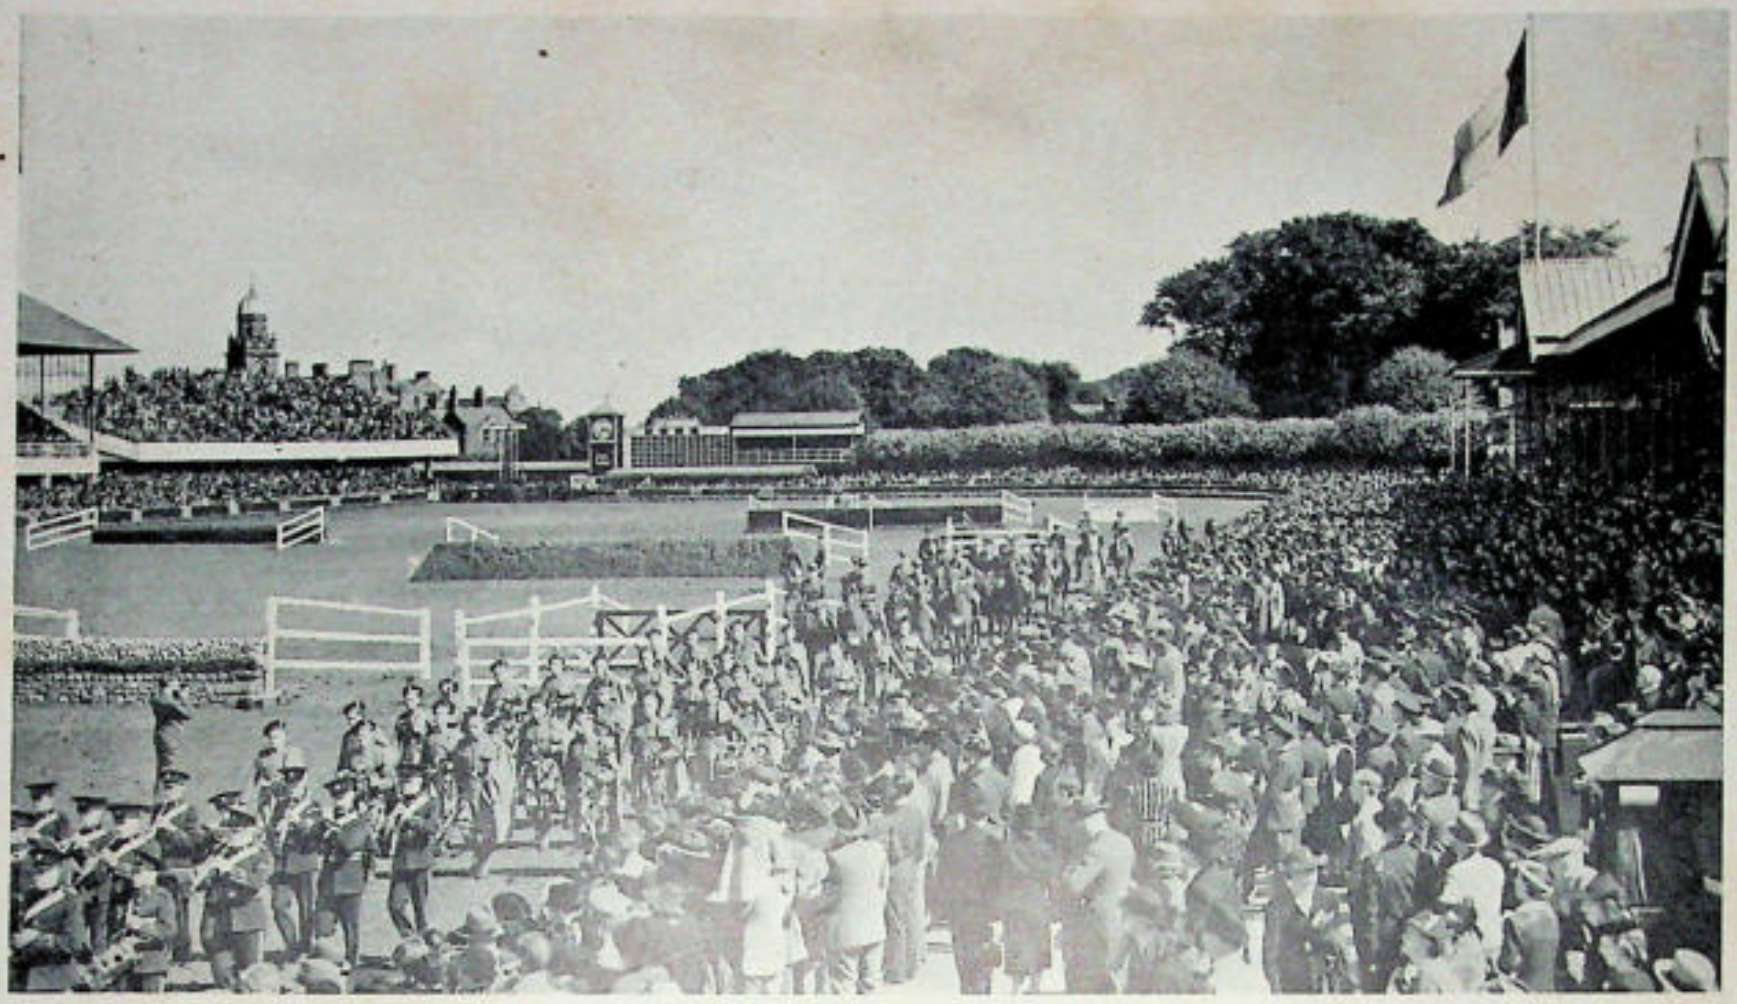
THE PUJARI OF A KUMAON SHRINE BY KALI'S STONE AT DHURA

A USEFUL SERVICE FOR GOLFERS

By E. R. TIPPLE

DURING these critical days the carrying on of normal business is particularly difficult. Ordinary routine has been interrupted as the majority of people are performing some form of national service. In common with many others, professional golfers have found few tasks awaiting their immediate attention.

This season they have suffered very much on account of general business conditions, the number of their club members serving in the Territorials and other Services, and the unusual numbers of people away from their particular localities.



Instead of becoming pessimistic and enduring these adversities without a struggle, professional golfers should emulate the national spirit and concentrate on personal service. They should let it be known that they are not merely satisfied by effecting a sale, but are anxious to assist their members in any way they can. They should maintain a keen interest in each and every member—we all are impressed when we know our personal requirements are carefully considered.

In America an interesting service arrangement is in force which could be copied over here. At the end of each day's play the caddy-master—or his assistants—carefully inspects each bag of clubs that has been used. If a defective club is discovered it is passed on to the professional for examination. When a minor repair is all that is required—for example, fresh whipping or the filing of the face of a wood—the work is done and a green label affixed to the club, stating what has been done and that no charge for the service is required.

If, however, the inspection reveals that major repairs are necessary, such as a new shaft, head or grip, a red label is put on the defective club. On this label is written the necessary repair and an estimate of the cost. In each case the bag is replaced so that when the golfer goes out for his next game he notices the label and discovers what has been done or what requires doing to make his set in first-class condition. Such thoughtful service is bound to impress him with his professional's keenness and interest and if any of his clubs require repairing he is likely to have the work done without delay.

This plan is quite simple and would cost little to operate. Although it would bring the professional regular business as regards repairing clubs the result would be more far-reaching. Players would realise that they would be having an inspection service that could only be obtainable from a club professional and consequently would visit him when they required new implements. They would keep in touch with their professionals and support them in every possible way.

Whilst there are many professionals whose methods are very unbusinesslike, some shops impress the visitor with their up-to-date equipment and the manner in which the goods are exhibited. A few professionals attached to the smaller clubs operate service arrangements already and with gratifying results. The service plan mentioned above would repay those who are wondering how to improve their business. No professional can go to too much trouble and a smart, tidy shop combined with a real interest in the members must attract attention.

A PLEASANT MEMORY OF THE SEASON—THE DUBLIN HORSE SHOW

A RETROSPECT OF THE BIG HORSE SHOWS

By R. ANSELL WELLS

WHEN we shall see another horse-show season is very doubtful, and this is a great pity, for the season with which this article deals was one of exceptional merit and interest. There can be no doubt that hunter breeding was gaining a very strong place in the show world, and not only the attitude of exhibitors, but also of the general public, this year has done much to encourage it. Now it is largely over for the time being, but it is impossible not to believe that as soon as may be possible this important and growing industry will re-assert itself.

The very busy, if not to say crowded summer season of horse shows drew to an early close; it was by no means over yet, but the majority of the big shows had been held and it may not be out of place if we make some study of the results and see if, from them, we can deduce any facts of importance.

Any attempt to review the shows as a whole is fraught with difficulties, and one might almost say with deceptions. A simple, straightforward comparison of results is apt to be misleading, because one cannot tell from it which horses were present when others headed their classes, and which horses did not happen to be going their best on certain occasions; another variable but important factor which must also weigh are the personal predelictions of the judges, and any judge whose opinions are worth having is bound to have certain views upon horses, or upon different stamps of horses, which will influence his decisions. To these difficulties must be added the enormous number of shows and the impossibility of summing up so many results, and when all these factors are taken together it will be seen that it is impossible to review the whole season.

Under the circumstances some plan must be evolved in order to help one to obtain a true proportion and to get a bird's-eye view of the season. The simplest plan is to accept the existence of a certain amount of "form," and to take it as a fact that horses will show true to that "form" on the majority of occasions. If one does this one can take the results at one or two of the larger shows as being a correct indication of the relative merits of the animals which are exhibited at them, and then, by a study of those results, a very good general impression of the season may be gained with a minimum of error. With this object in view I intend to examine the results at the Richmond Show, the International Horse Show, Peterborough Show, the Royal Show and the Great Yorkshire Show and to make such comparisons as may arise between these results and others which it may be relevant to quote.

It will be as well, for obvious reasons, to consider the shows in chronological order, and so we will start with Richmond. At this show there came to the fore two horses without some mention of which any report of the season would not be complete, though we are, strictly speaking, not concerned with them in a review of the hunters; I refer to Thor and Just Wait, two outstanding animals among the Hacks and the Weight-carrying Cobs respectively. Writing an account of this show in the *Field* of June 17th I said: "Interest was quickly aroused by the appearance of a really outstanding horse in the very first class of the [first] day, that for Novice Hacks, any height, which was won by Mr. A. R. Kent's chestnut gelding, Thor (by de Coverley—Orthobia, by Orthos). This horse is a six-year-old, and even the most captious critic would be hard pressed to fault him; his conformation is all that could be desired, he has good bone and was seen at the top of his condition. The excellent impression which he gives is in no way belied when he moves, which he does well in all his paces, being beautifully balanced and mannered." Also: "The class for Weight-carrying Cobs . . . here again was the encouraging sight of an exceptionally strong class and an outstanding winner. . . . In this case it was Messrs. William Young and Sons' seven-year-old grey gelding, Just Wait, which at once caught the eye and soon established himself as a certain winner. He is a real cob of an immensely powerful type, beautifully built and well put together, the final test being found in the way in which he moves and the impression which he gives of riding like a much larger horse."

Further acquaintance with this cob might lead one to add that he has the action of a thoroughbred and the manners of a hack, which would be no overstatement. This was, however, the first occasion upon which I had seen him, and the same is true of Thor, but the first impressions which were made by both these horses were fully justified during the rest of the season, in the course of which neither was beaten in any company and in which both carried off the highest honours to which they could aspire. Thor we shall, perhaps, see again in the show ring in the name of his new owner, Mr. Bernard A. Selby, but Just Wait has, I understand, been sold to one of those fortunate individuals who know and can afford the best, and who requires him for use and not for show purposes.

In the absence of any Produce classes the hunters at Richmond are confined to the Saddle classes, which brought out one or two horses which were to be seen again frequently during the season and which are worthy of especial mention. Mr. J. V. Rank's Snob (Sir Rowland—dam by Cheerot) was first among the Light-weight Hunters, and Messrs. John Druge's John Peel was the winning Medium-weight horse and also gained a third prize in the class for Ladies' Hunters. The Champion Hunter at this show was the first prize heavy-weight animal, Mrs. I. M. Oldham's chestnut gelding, Shah Jehan (Jehangir—Desborough, by Desmond); the impression which he gave was one of being slightly over-topped and at a subsequent appearance at Olympia he proved a disappointment since he did not figure in the awards; this may have been due to the undoubted fact that he is of a type which shows to better advantage out of doors, but the fact remains that he has not been heard of again in the best company.

At the next important show, the International Horse Show, Messrs. John Druge's John Peel had already begun to improve in condition and won a class for Novice Hunters up to from 13.7st. to 14.7st., also being adjudged the Best Novice Hunter. In the open classes he headed the horses of his weight, but had to take place below the heavy-weight winner, Miss E. M. Pitt's Mount Royal (Free Return—Scotch Sign) and Mr. Bernard A. Selby's light-weight winner, Percy III (Star and Garter—dam by Take Care), for the Championship. The Best Ladies' Hunter was Mr. A. H. Ashcroft's Right Away (Romus—dam by Hopeful Bachelor). The Champion horse, Mount Royal, was another disappointment and was never again submitted to any kind of test, as he was retired from the show ring immediately after this show.

At the country shows there is also the interest of the Produce classes as well as those for made horses, and it is with country shows that we now have to deal. I think, however, that it will be easier if I complete the story of the Saddle classes before starting upon any discussion of the young stock. At Peterborough John Peel headed the Usher 13½st. Novice Hunters, but in the Open classes he was entered in the 13½st. to 15st. class, in which he appeared much too small for his competitors and was relegated to fifth place. At this show his class would undoubtedly have been that for horses up to from 12st. to 13½st., and, had he been entered in it, he would have come up against Mr. Bernard A. Selby's Percy III, and the result of the judging

under those circumstances would have been very interesting, but by no means certain; as it was, their meeting was postponed until the Royal Show. The Middle-weight class was won by Mr. J. R. Hindley's well-known Bradbury (Fiver—Mayflower) and Mr. H. Sumner's Bandit (by Brigand) was adjudged the best heavy-weight. When seen under a side-saddle John Peel improved upon his previous placing and gained a second to Bradbury; the latter horse was eventually made Reserve to the Champion, Mr. Bernard A. Selby's Percy III.

The Royal Show found John Peel more happily placed in a class for horses up to from 13st. to 14½st., and he was also at the very top of his condition for this show, at which he won his class from Mr. Betts's Danno and Mr. Selby's Percy III; there could then be no doubt about his superiority, but, as I have said, the horse had been steadily improving all through the season. John Peel also won the class for Ladies' Hunters up to not more than 14st. and was awarded the Championship in competition with Mr. B. A. Selby's Sir Roger II, which had beaten Mr. J. V. Rank's Curate in the class for horses up to over 14½st.

John Peel was absent from Halifax, where the Great Yorkshire Show was held, and here Mr. Rank was successful with his Richmond winner, Snob, in the light-weight class, and with Curate among the heavy-weights; while Mr. Selby gained first prize in the medium-weight class with Percy III.

brood mares up to 12st. to 13½st. at Peterborough. Another good brood mare, Mrs. Walton's Delilah III. headed the medium-weight mares at the same show, and the heavy-weight prize went to Mr. Geoff. Kenyon's Mistletoe (by Macanna), whose foal by Forerunner was also adjudged the best colt foal. Mistletoe and her foal also came out to win their classes at Halifax, while the other class for brood mares at the Great Yorkshire Show was headed by Mrs. Howard Mander's Roytoi's Daughter (Popalong—Roytoi), second prize going to the Earl of Feversham for Cartouche (Carpathus—Belinda by Dunholm). The outstanding brood mare at the Royal Show was Mr. J. A. Rank's April Shower by Bhang.

Among other results of importance at these three shows were a fourth prize at Peterborough to Captain C. Palmer Kerrison's three-year-old son of Sir Rowland, Rowland Outlaw, and a first prize at the Royal which was awarded to Lord Digby's bay son of Border Minstrel—Kittywinks, which beat Major Rawson-Mackenzie's son of Grey Girl by Haine into second place. At the latter show Mrs. Muirhead-Murray received a second prize for a filly by Jean's Dream—Beacon, while at the Great Yorkshire Show, as was to be expected, the champion stallion was well to the fore, being represented in the prize list by foals that have already been mentioned and also by two colts out of Mr. Hemingway's Whorlton Lass and the Earl

The Islington Reserve Champion, Haine, by Hainault (by Swynford)—Almond (by Lemonde) (g.d. by Santoi), now in his nineteenth year, is still getting good stock and is the sire of A.R.P. out of one of the Dunholm mares, Rosemary V; he has also been represented in the prize lists by Mrs. Meller's Jaine out of Joan XI. The Brood Mare, Grey Girl, is by Tagrag out of a mare by Macanna, and Mr. Kenyon's heavy-weight mare, Mistletoe, is also by Macanna. The mention of Mrs. Mander's Roytoi's Daughter, reminds us that she is by Popalong out of Roytoi, and Popalong, as the sire of Knocklong Boy, was well to the fore at the Dublin Show, where the latter horse was the sire of four prize winners, the most important of which was Mrs. Rochfort Hyde's young brood mare Peppermint, which was bred from Pepper Wine, by Mount Edgar, and headed the class for young mares, six years old or under, likely to produce high-class hunters.

The size of the subject which I have tried to tackle in this article is such that there could be no hope of my being able to cover the ground at all thoroughly, but I have tried in the space at my disposal to draw attention to what may be truly described as the very few important roots of the successful show horses of the present year. In this review, which has been narrowed down as much as possible, many good horses have found no mention, despite the fact that they have won prizes, but no

W. A. Rouch

SHAH JEHAN, MRS. I. M. OLDHAM'S CHESNUT GELDING, WHICH WAS THE CHAMPION HUNTER AT RICHMOND

W. A. Rouch

MR. BERNARD A. SELBY'S PERCY III, THE LIGHT-WEIGHT WINNER AT THE INTERNATIONAL HORSE SHOW

Among the made hunters there was no very outstanding horse with the exception of John Peel; the other first prize winners were mostly old horses with firmly established reputations which were placed "up and down" according to the judges, and whether one or other of them was absent; the Young Stock, on the other hand, has been, generally speaking, of a higher standard, and there are one or two really high-class animals which have been seen and which have a long list of successes to their credit. The classes for yearling colts or geldings have practically resolved themselves into a series of duels between two exceptionally good horses, Mrs. Howard Mander's A.R.P. (Haine—Rosemary V by Dunholm) and Major Gordon B. Foster's Cherry Lad (Ladore—Cherry Lass); these two have been first and second all the time, and there is really very little to choose between them; at Peterborough A.R.P. was placed first, as he was also at Halifax, while at Windsor Cherry Lad was placed at the top, third and fourth places in the class being taken by sons of Border Minstrel.

Among two-year-old geldings, Major Gordon B. Foster's chestnut, Gadfly (Jean's Dream—Dragon Fly by Dunholm) is unbeaten, and among the fillies of the same age are two very good horses, Mrs. S. S. Lockwood's brown daughter of Cherry Lass by Erehwemos, Fur Coat, which won her class at Peterborough, and the Hon. Mrs. Clive Behrens' Swinton Helga, which won at both the Royal and the Great Yorkshire Shows; this latter filly is by Warrington—Swinton Honora by Dunholm. Among the three-year-old geldings there is a no less redoubtable winner in Mrs. Howard Mander's Mr. Rowland (Sir Rowland—Miss Chev), which was unbeaten at the three shows under consideration, and was also the champion animal from one to three years old at Peterborough.

The brood mares, which are, after all, the corner stone of the whole business, have been of good quality all through, and a very high-class animal is Major W. Rawson-Mackenzie's Grey Girl (Tagrag—dam by Macanna), which headed the class for

of Feversham's Cartouche, and a filly out of Lord Grimthorpe's mare Field Day (by Warrington).

The best hunter of the year in this country has been John Peel, and it is a pity that no particulars of his breeding are known; in my opinion, however, he must take second place to the Dublin champion, Mr. H. Davis Kenny's Wavering Bee, which I consider to be as good a hunter as one is ever likely to see. This little horse is by Wavetop (by Spearmint out of Wavinta, by Walmsgate, out of Flying Bee, by Honey Bee out of Embrace) by Collar, and Honey Bee was by Tredennis.

Tredennis (by Kendal—Hermit—Stockwell) is also the sire of Dunholm out of a mare by Berrill out of Fanessa, and Dunholm is one of the names which forces itself upon one when one considers the results which I have set out above. This horse is the sire of no less than three mares, of which the progeny is now in the very first class of hunter stock, Rosemary V, Dragon Fly and Swinton Honora are the dams of A.R.P., Gadfly and Swinton Helga respectively, and yet a fourth mare by the same sire, Belinda, is the dam of that good brood mare Cartouche. While we are still on the subject of mares, it is interesting to note that Cherry Lass is the dam, in two successive years, of Cherry Lad (yearling by Lodore) and Fur Coat (two-year-old by Erehwemos).

The champion stallion at Islington, Jean's Dream, by Beau Bill—Jean Ainslie (g.d. Sweet One, by St. Serf) can be said to have proved himself, being the sire of the unbeaten two-year-old, Gadfly, and having four prize-winning foals, two colts and two fillies, to his credit; when looking at his stock the way in which he stamps them is very noticeable indeed; they all have a strong look of their sire about them, and this is supposed to be one of the signs of a good stallion. Another very successful sire is Sir Rowland, by Sir Edgar—Olga, by Buckingham, his name being kept well to the fore by his son out of Miss Chev, Mr. Rowland, and also by Snob, while there is Rowland Outlaw slightly lower down the scale, but still in the picture.

horse has been omitted which has proved itself a consistent winner on all occasions. If some horses may seem to have achieved an undue amount of success we must not be discouraged; it is because they are of the stuff of which champions are made, and there never are very many horses of that kind at the same time. That they are there speaks well of the lines upon which breeding is being conducted and the very existence of so many excellent horses is a sure sign of a general high level of achievement.

As time goes on new horses will come into the picture, and it will be interesting to see who takes up the running; at the moment it would appear as though Jean's Dream is likely to repeat the success which he has already had with Gadfly and some of his foals that have been seen this year should, all things being well, which they are far from being at the moment, grow into the winners of the future.

In conclusion it is encouraging to note the large amount of support given to the hunter classes at shows by exhibitors, and to realise that the general public has been taking an ever-increasing interest in these classes and in the horse generally. One of the greatest causes for complaint at the Royal Show was that there were no hunters present upon the last and very popular day, the Saturday. It is often difficult to please both the public and the exhibitors, who wish to get their horses home again as soon as possible, and if the interests of these two parties cannot be reconciled, we can at least be pleased that the public is sufficiently interested to bemoan the absence of a type of horse, the breeding of which is not only the most fascinating and interesting occupation but is also an important industry and one which is directly responsible for maintaining a not inconsiderable portion of the population. The shows are the shop window of the countryside, and provide the only means of displaying to the gaze of interested people a product of this country which must ever remain unique in a world in which no other country can attain to the same high standard.

THE TWEED FISHING REPORT

THE following are extracts from the report issued by the Police Committee of the Commissioners of the River Tweed to the statutory meeting of the Commissioners for the year ending June 30th, 1939. The details of the work done are exceptionally interesting.

The total cost of prosecutions during the year has been £86 15s. 8d., and the amount of fines and expenses recovered during the year has been £54 3s. 9d.

District	Warned	Convicted	Acquitted	Withdrawn
Lower	13	17	4	—
Roxburghshire	8	24	—	1
Selkirkshire	8	13	—	—
Peebleshire	1	11	—	—
Lanarkshire	—	6	—	—
Total	30	69	4	1

Comparison with previous years: 1936–37, warned 85, convicted 61; total 146. 1937–38, warned 50, convicted 56; total 106. 1938–39, warned 30, convicted 69; total 99.

The Tweed Police Force varied from 7 to 24 bailiffs during the year. Commander Courtney Clarke (Superintendent) reports: All those warned promised me in writing not to offend again. Of those so dealt with in this and previous years, only two were caught breaking their promise during the twelve months. While the total of offenders is steadily decreasing, the area patrolled is increasing. The Tweed watershed covers 2,000 square miles. The number of offenders detected in the lower district shows a marked increase due to more efficient policing, and the effect is shown by the great decrease in illegal nets found in the water.

The number of nets seized was as follows:—

In the sea	9
Below Berwick Bridge	43
Above Berwick Bridge	16
Coldstream, &c.	4
Total	71

Nets seized 1936–37, 146; 1937–38, 142; 1938–39, 71.

The new passes at Selkirk, Philiphaugh and Walkerburn functioned well, and there was no congestion of fish below any of them. Bowhill Cauld (Ettrick): The Commissioners are indebted to the Buccleuch Estates for making further improvements to this cauld this summer. Peebles Cauld: The mill owners have agreed to remove the wooden combing at the top of the cauld during the winter months. It is considered that this will allow salmon to pass more freely over it, and the Commissioners are very greatly indebted to them for their action in offering to do this. Trow Mill Cauld (Teviot): The proprietors (Cavers Estate) have been notified that the cauld (reconstructed in 1936) is still a serious obstruction to the run of salmon and the cause of a great deal of poaching. Negotiations with the proprietor are in progress. Till Caulds: A special committee has been appointed to investigate these very serious obstructions and to endeavour to have them remedied. Other caulds are receiving attention.

Building of new caulds or rebuilding existing caulds: The Committee would like to draw attention to the legal aspect of this question, namely, that every cauld should permit of a free run for salmon over them in the ordinary or mean state of the river. It is therefore most desirable that any proprietor who proposes to build or rebuild a cauld should, before commencing work, consult the Commissioners with a view to ascertaining whether or not their proposals comply with the law. If the construction of a cauld is left to a contractor, without restrictions, the modern idea is to make the cauld of smooth cement with a combing of about 8in. to 12in. at the top. That is the most effective barrier to fish which could possibly be constructed. The ensuing damage not only affects salmon, but also brown trout.

POLLUTION

THE TEVIOT.—The pollution from Hawick downwards is deplorable, and is seriously damaging the salmon industry.

HAWICK.—The sewage works constructed a year or two ago have made little if any improvement on the old system. It is observed that the new system which relied on screens and a settling tank only, without any filtration, could hardly be expected to cope with the effluent into the upper reaches of a tributary which nearly dries up during periods of dry weather.

JEDBURGH.—The Burgh Council still continue to discharge practically the whole of their domestic sewage from the town into the Jed in a crude and entirely untreated state in direct violation of the laws of the country. This filth flows into the Teviot, which for several miles below Jed-foot resembles an open sewer. "The First Report of the Scottish Advisory Committee on Rivers Pollution Prevention" (1931) recommended that the Burgh should take steps to remedy this state of affairs. From 1934 onwards the Police Committee have been urging the Burgh to carry out their obligations. In 1937 the Commissioners were promised that if a little more time were given, something would be done. This promise is still unredeemed, and the pollution gets worse every year.

KELSO.—Until recently the domestic sewage of Kelso generally was discharged crude and entirely untreated into the Tweed. Screens (as a single unit) have been installed, but from complaints received, it is alleged that these have made little or no difference to the pollution of the river below the town and that salmon fisheries are still suffering severe damage from the pollution.

In general the Police Committee desire to draw attention to the efficient manner in which Peebles County have tackled their sewage problem. Full and complete schemes have been constructed at Peebles and Walkerburn (the latter takes Innerleithen sewage as well). The Police Committee suggest that such schemes will in the long run prove far more economical than dealing with these problems in a piecemeal fashion, as has been tried in other places, provided that financial assistance can be given to them.

SHEEP DIP

The Commissioners would again draw attention to the serious damage to fish life caused by the discharge of used dip directly into streams, burns, &c. It is deadly poison to fish. The danger can be averted by the simple remedy of making a pit or soak-away alongside each dipper, and draining the dipper into these so that the dip will percolate through the ground before reaching the burn or stream. Is it asking too much of proprietors to instruct their tenants to see that no dipper drains directly into any burn, &c.? It is entirely illegal to discharge used dip into any stream or burn in the Tweed watershed, and a conviction was obtained in the Sheriff Court last year, but these offences are difficult to detect. The co-operation of all concerned is specially urged to avoid in the future this wasteful and entirely unnecessary destruction of fish life.

The committee again desire to draw the attention of all riparian proprietors and also the general public to the fact that it is an offence to deposit or discharge rubbish or dirt (which term the committee are advised includes every description of domestic, agricultural and industrial refuse, sewage and used sheep dip) in such a manner that it will eventually find its way into the Tweed or any of its tributaries.

THE SEASON

Spring Fish. Ettrick and Yarrow were well stocked but relatively few fish showed above Peebles on the spawning beds. *Sea Trout* were generally good. *Backend Salmon* were well below usual numbers. It is difficult to gauge the final results of the spawning season, because the damage done by the abnormal flood on November 13th cannot be estimated. There was no furunculosis and very little fungus. Generally there was quite a good show of smolts migrating to the sea from March to May. Smolts were caught in some of the lower nets as late as July.

From the beginning of July to the close of the season a decided scarcity was experienced especially as regards grilse. In February the season opened with somewhat disappointing results among the lower nets, but higher up they did very well. The fishing improved later on, but up to the end of June salmon and trout were much below last year's catches in the lower reaches. The first grilse was caught at Holiwell on April 6th, and by the end of June the catches showed a great improvement on last year during the same period. A 50lb. salmon was caught off Burnmouth on May 15th.

The first spate occurred on October 4th, followed by a series of spates culminating on November 13th in one of the biggest floods within living memory, and nearly reaching the 14ft. mark at Kelso. The season was disappointing, the best individual day's catch being five salmon. The heaviest salmon caught was 31lb. at South Wark on November 22nd. The floods of the autumn continued through the close season (December and January).

The first week in February was very cold, and the second week one of floods. Excellent sport was enjoyed with the opening of the spinning season, and on February 15th and 16th on one fishing two rods landed seventy-three salmon. With the exception of a short period towards the end of March (when the river was low and clear) the fishing remained consistently good. April fishing was extremely good, one fishing above Kelso landing 217 salmon. Sport continued well into May, when a spell of fine weather brought the fishing in the Kelso district to a close. St. Boswells and Melrose district fishing was not so good. A few fish were caught as far up as Boleside in February. Generally speaking, the rod season was a remarkably fine one.

Salmon were later than usual in reaching the Ettrick. The first runs, apart from odd fish, passed through Selkirk at the end of June and beginning of July, and they are well spread out in the Ettrick and Yarrow.

The following were netted and removed from the various rivers mentioned:

Place—River—Month	Grayling	Roach	Pike	Gudgeon	Perch
Floors, Tweed, Aug.	295	—	—	—	—
Pavilion, Sept.	320	—	—	—	—
Carham, Sept.	135	—	—	—	—
S. Wark, Sept.	400	1	—	—	—
Bingham, Dub., Sept.	228	—	—	—	—
Cornhill, Sept.	110	—	—	—	—
Leet, Sept.	270	5	—	—	—
Ladykirk, Sept.	305	215	—	—	8
Twisel, Till, May	—	13,190	—	20	—
River Kale, May	25	—	—	—	—
Chesters, Teviot, Mar	260	—	1	—	—
Monteviot, May	1,150	—	3	—	5
Jed to Kale, May	935	1	—	—	2

The weather conditions prevented any netting in the lower district in January before the netting season started. The good results obtained in the Till were again largely due to the valuable assistance given by the Tillmouth gamekeeper (Mr. Shaw). In addition to the above about 1,000 grayling were removed from the Bowmont, and a number of pike taken out of St. Mary's Loch. It is hoped that every effort will be made to continue to net for coarse fish.

The assets belonging to the Commissioners amount to £6,121 12s. 1d.

PICKING AND STORAGE OF FRUIT

By W. E. SHEWELL-COOPER, N.D.H., F.L.S., F.R.S.A.

MANY farmers feared that the 1939 crop of apples would never be sold. It is one of those years when everyone has fruit, and in peace time only a percentage could be sold. The war has altered the situation entirely, and all farmers are urged to conserve all food stuffs and to market them as and when the Government directs.

On large fruit farms, progressive growers have already erected gas or cold stores, but there are

RINGING IN BUSHEL BASKETS
Apples being sent away which have kept well in an improvised store

hundreds of farmers throughout the country with a small acreage down to fruit who have no particular facilities for storing. Such men will have to devise suitable inexpensive methods and this article is designed to help them.

It has been shown by Dr. T. Wallace, of the Long Ashton Research Station, that fruit from young trees does not keep as well as a similar crop from trees that are more mature. They are susceptible both to rots and to physiological breakdowns. He has also shown that fruits picked too early may be less susceptible to breakdown and rots, but are liable to a kind of superficial scald as well as to wilt. It is necessary, therefore, to pick before the fruit is fully ripe. Terminal fruits, or the "king" fruits as they are sometimes called (they are the centre fruit of a cluster), are more susceptible to rot than the side fruits of the cluster.

To ensure lengthy storage it is necessary to pick fruit carefully. Pickers, unless they are warned, do not realise how delicate fruits are. It only needs the slightest bruise, made with the thumb and forefinger, and the skin and flesh are damaged, with the chance that fungus spores may enter and cause a rot to set in.

No fruit should be picked by taking it between the thumb and forefinger. Gathering should take place by lifting the fruit up with the palm of the hand. The operation has come to be known as "palming," and it is demonstrated quite clearly in the photograph. The stalks should come away from the spur without any bother or pulling. If it has to be tugged there is always the danger that next year's fruit may be damaged. If, on the other hand, the stalk is left on the tree, the fruit will not keep.

Farmers should learn that the receptacle into which the fruit is placed should be one that cannot cause any damage at all. Even the wicker ribbing of an ordinary basket can chafe the skin and so cause trouble later. Baskets should be lined and padded with felt, while an excellent container is an ordinary bucket painted inside with a good white enamel paint. The picker should place the fruit in the container and not drop it in carelessly. In the case of tall trees, picking stools or step ladders should be used, as it is a mistake to reach up and try to pull down branches, for in this way they are often damaged. An interesting picking stool is seen in the photograph. This can be easily moved about from tree to tree and orchard to orchard.

When ladders have to be put up into trees they should be placed into a fork, or on to limbs which should be stout enough to bear them. If the tops of the ladders are bound with sacking this prevents them from damaging the bark.

Some varieties of apples may be described as "keepers," while others are better used soon after they are picked. A list of long-keeping culinary varieties should include Lane's Prince Albert, Monarch, Wellington, Edward VII, Crawley Beauty, Bramley Seedling, Newton Wonder and Encore. Dessert varieties which store satisfactorily are Norfolk Royal, Blenheim Orange, Christmas, Pearmain, Waggoner, May Queen, St. Cecelia, Cox's Orange Pippin, Ribston Pippin and Upton Pyne.

Many a barn or shed may be converted temporarily into a suitable storehouse if it is lined and floored with straw to a depth of 1ft. The apples can be laid on the straw, piled up 2ft. or 3ft. deep, and in this way the necessary insulation is provided. Before storage it is always advisable to stand the fruit outside in boxes or baskets, for a fortnight or so,

THE PICKING LADDER WITH THE WHEEL, WHICH IS EASY TO MOVE ABOUT

so as to allow it to "sweat." It may be covered over temporarily with sacks or an old tarpaulin, so as to keep off rain and prevent damage by frost. It is when the fruit has completed its moist transpiration that it can be taken under cover.

It may be advisable to let wire-netting into the ground a foot below soil level, so as to prevent rats and mice burrowing. There is no need to have any windows at all. The necessary light can be provided, when the fruit is put in or taken out, by opening the door and, say, a wooden ventilator. If there can be two ventilators, one at either end of the building, so much the better, for then a through draught will be ensured as the new fruit is put into the store week by week. When closed, these ventilators help in controlling the temperature, which should keep at round about 40 degrees F.

The atmosphere in a store should never be too dry, for in this case the fruit will shrivel. This is the reason that so many growers prefer an earth floor to one made of wood or stone. If each fruit can be wrapped, disease spores cannot get from one specimen to another. Oiled wrapping papers are the best and may be obtained quite cheaply these days from horticultural sundriesmen. Iodised tissue wrappers have also been tried, and these have

CORRECT METHOD OF PICKING
Note the way the palm of the hand grips the fruit evenly and does not bruise.

been found effective, but they are rather more expensive. Wrapping in newspaper or plain paper is better than nothing. Wrapped fruit does keep better than when unwrapped.

For those who have no store at all there is always the clamp method. A shallow pit is dug outside and lined with clean straw. The apples are then placed in position to a height of about 3ft., the base of the heap being, say, 3ft. 6in. Over the top of the heap, however long it may be, a 3in. layer of straw should be laid, and for the first fortnight this should be removed during the day time to allow the sweat on the fruit to be evaporated. After three weeks the clamp should be covered with another 3in. layer of straw, and this may be kept in position by the use of sacks and perhaps hurdles laid on. It does not appear to be necessary to cover the straw with earth, as in the case of potatoes.

A trench 1ft. wide and 1ft. deep may be dug around the clamp so as to assist in the draining off of water, and a ring of wire netting may be put around the clamp so as to control rodents.

PUTTING POTATOES DOWN IN A CLAMP
Apples can be treated in similar manner only they must be handled more carefully

"KNIPHOFIAS IN MASS ARE INVALUABLE FOR AUTUMN EFFECT"

THE AUTUMN BORDER

Despite the injunctions to dig up our gardens there must still remain spots for Beauty at a time when all is gloomy around us. Many a lawn and border will be sacrificed, but some space in our gardens should be devoted to cheerful colour, and it must also be remembered that nurserymen and bulb suppliers still have their staff to keep and their stock to sell.

IN most gardens the herbaceous border is at its best in autumn, for even without skilful grouping Michaelmas Daisies, Heleniums, and the better Aconites, together with Dahlias, cannot fail to make a rich display of colour. So rich, indeed, that whereas for the summer border a great deal of attention is paid to edging plants, little trouble as a rule is bestowed on the front line plants for the autumn border. Yet a good edging adds enormously to the general effect. Amongst the best are *Sedum spectabile* (which everyone associates with autumn butterflies), and *Polygonum affine*, valuable not only for its spikes of pink flowers, but even more for the rich crimson its foliage turns in autumn.

Kniphofias are not so popular now as formerly, yet they are invaluable for autumn effect. Apart from their numerous other virtues they require no staking. Many gardeners pile ashes over them for protection during the winter, but it is better to tie the leaves together just above the crown, for this makes a protective thatch that throws off rain. It is not so much the cold but the damp of our winters that affects them adversely. They do best in a rich soil, provided it is thoroughly well drained, and best of all on a bed with a slight slope. Another important point is never to cut the flowering stems even when they have faded, for in common with all members of the liliaceæ tribe these should be left to die down naturally. In the case of plants that have flowered poorly leaving the flowering stems in this way often results in excellent flowering the following season.

Kniphofias are amongst the few herbaceous subjects that are best planted in spring so that they can get thoroughly well established before winter. A mild spell in May is ideal. The roots should be well spread out and the crowns put in not more than 4in. below the surface soil. In the event of a late spring drought liberal waterings are essential, and enough given each time to reach the furthest roots. Mere surface sprinklings are useless. Once planted Kniphofias should never be disturbed. Most of the species produce suckers, and these can be taken off in May and planted.

The old Victorian favourite *K. aloides* (known in those days however as *Tritoma uvaria*) is still one of the very best. Its magnificent scarlet heads, on 6ft. stems, are produced from July to September. *K. a. nobilis* flowers in September. Most of the hybrids flower in July and August, but Sunset, one of the best, flowers in September. So does *K. erecta*, the flowers of which turn upright as they open. Amongst the pick of the dwarf kinds is *K. Galpinii*, for this begins flowering in September and goes on all through a mild November. It does well even on heavy soils, and its dainty apricot-coloured flowers on 2ft. stems are invaluable for picking. They associate charmingly with Michaelmas Daisies.

Anemone japonica, although generally regarded as a weed, is invaluable for its continuous flowering, and the old white-flowered variety, Honorine Joubert, still deserves a place in every border. The comparatively new Snow Queen has semi-double white flowers, and though not so tall growing as the single kind is quite effective. Other excellent modern hybrids are *A. j. elegantissima* with rich pink flowers semi-double, Charmeuse with purplish-pink flowers (this hybrid flowers to mid-October), Max Vogel (rose pink) and the tall Whirlwind with semi-double white flowers.

The Hupehense hybrids are rather dwarf, but the best of them associate well with that invaluable Aster species *A. Thomsoni*, which also grows about 18in. high. This Aster is still comparatively seldom grown in spite of the fact that it flowers from July to November. *Anthemis Sancta Johannis* is another invaluable front row border plant, for it flowers till quite the end of October. The best form is Wells variety with golden flowers nearly 3in. across.

Michaelmas Daisies are now such a cult that borders devoted solely to them are now not uncommon. The most effective are, I think, the really rich blue, together with rose-red varieties such as Red Rover. Michaelmas Daisies that are at their best in October are invaluable. Amongst the pick of these are Blue Gown, with very rich blue flowers on branching stems 6ft. high; Spire, with a pyramidal habit of growth and flowers nearly 3in. across; Mulberry with flowers of a colour described by the name; Ruby Tips, Queen May, Harmony, Taplow Spire and Heather Glow. It is a pity to grow tall and branching Michaelmas Daisies in big clumps. Varieties such as Spire, which flower right down to the ground if grown allowing three stems to each plant, branch in all directions. Grown thus they are far more effective than when grown in clumps showing a mass of bare stems almost up to the top.

The pick of the late flowering Heleniums are *H. rubrum* and Chipperfield Orange. Crimson Beauty is a good front row plant, for it grows only about 18in. high and flowers from June to October.

Some of the less common Gypsophilas are useful autumn border plants, notably *G. Oldhamiana* and *G. pacifica*. Both these are pink-flowered and grow well over 3ft. and lighten the general effect which in autumn is apt to be rather heavy.

Amongst the latest flowering of all border plants, especially on warm soils, are Geums and Pentstemons. Geum Borisii is amongst the pick of the Geums in this respect. Pentstemons, especially when the cherry and mauve kinds are grown in mixture, are always delightful and invaluable for picking. The cheery little button chrysanthemums, once so popular with cottagers, go on till December in mild parts.

Heliopsis scabra incomparabilis, introduced comparatively recently, is a rich yellow-flowered border plant that will presumably soon be grown in every border, for it is first-rate. The still new *H. s. patula*, which grows well over 3ft., is if anything even finer.

E. S. R.

ESTATE WOODMEN

By REGINALD DAVEY

THE understandable reaction of at least one landowner to the crisis was the resolve to reduce his expenses by cutting down his estate staff. He found that with business at a standstill and the prospect of heavy taxation, he could hardly do otherwise than cut his coat according to his cloth. Reviewing his wage bill, he would part with a gardener or two, dismiss the underkeeper, and dispense with the woodland and sawyard staff, but a little thought cast doubt on the wisdom of this proceeding.

Quite apart from the national interest, which suggests the retention of all skilled woodmen and sawyers of which there is bound to be a shortage in the country, it is not always to an owner's financial interest to stop suddenly in the middle of a productive woodland programme. Nor is it profitable to give a standstill order to a sawmill which is in operation and contains both round timber, scantling and plank in all stages of conversion.

Restricted imports place a responsibility upon all private sawmills, all of which have recently been listed by the Forestry Commission, and it is desirable that they should be kept at least in reduced operation until the spring. By then the permanent scheme will be working and in all probability they will be taken over by the Government. Mills are no good without the men to work them, and with the reduction of staff inevitable in time of war it is in most cases to the owner's benefit to dismiss no one, but to carry on the normal conversion, well knowing that the controlled price for the timber produced will ensure a satisfactory profit.

The mill will then be found with the staff to work it, and the owner will have served his country well, and without being the loser thereby. To close the mill and dismiss the staff would involve losing the full value of much partly-converted material.

The same difficulty exists with the woodland staff proper. If men are told to seek other employment they will find it in other pursuits such as agriculture, and be lost to forestry for the duration of the war. Lack of skilled men is a problem of major importance in peace time, and with the greater stress of felling, extraction and conversion entailed by a restriction of imports every effort should be made to save these men. If they cannot be kept, their services might be offered to a firm of timber merchants, whose staffs will have been depleted and who will in any case require additional personnel to cope with the conversion of the huge quantities of soft-wood that normally arrives already sawn.

On most estates one or two men will be retained in the woods, whatever the decision as to the main staff. The head woodmen will usually have a diverse variety of duties which must be performed. For instance he may attend to the estate water supply plant. Recently formed plantations must have the weeds cut back each summer, or the trees will largely be smothered and lost. This work calls for attention even in the most troublous times. The question of proceeding with the planting programme is a matter for the owner's decision. The Forestry Commission will tend and plant up the nation's forests as usual; but for the private owner it is no use bilking the fact that labour and plant supply difficulties will arise.

Of more immediate importance is the coming winter, for if the men be kept at work until the spring the national situation will be clearer and probably we shall all have been told exactly what is expected of us. A hasty decision to stop all work at once is most earnestly to be avoided, and the reply is the profitable employment of the men in winter.

Timber in excess of 1,000 cubic feet can be felled only with the consent of the Timber Control, whose address is care of the Postmaster, Bristol. If the use of unseasoned timber is to be avoided it is needful that all mature conifer plantations should be felled this winter, so that they can have some chance of seasoning. Trees on most estates are sold standing, the timber merchant providing his own labour. In practice he will often be only too pleased to employ and pay the estate woodmen for this work. The difficulty is to secure adequate storage for seasoning. Most timbers season equally well in the round or sawn to sizes, and in the case of oak the trees can lie in the wood until required. Beech and Scots pine require to be under cover, but larch is safe for a year or more in the open.

Of equal importance is the thinning of existing plantations to secure the greatest rate of growth, a matter of some importance in a long war and of financial benefit to the owner. The operation is most profitable, yielding as it does the much-needed pit props. In a recent case an outlay of £100 in labour and haulage was estimated to bring a return of £125 for the stacked props. The question for the estate owner is not "Can I afford to keep on the men?" but "Can I afford not to?"

Where will you get your UNIFORM?

You would be wise to go to a firm who have had long experience of the intricacies of service wear. We have been military outfitters for over 50 years, and can supply Officers immediately not only with uniform, but full equipment, boots, shirts, camp kit, field glasses, prismatic compasses, and so on, under the one roof.

Please write for our price list of uniforms, ready to wear or made to measure, and full equipment, mentioning which Service you are joining.

W.A.A.F., A.T.S. and W.R.N.S. Officers' Uniforms made to measure guaranteed to conform with Regulations.

POST ORDERS
All Orders by Post will be fulfilled and goods despatched without delay.

BARBERRY, BLACKBERRY, CRAB APPLES AND CORNUTS MAKE A TYPICAL AUTUMN "MIXED BUNCH"

AUTUMN FLORAL DECORATIONS

By MARGUERITE JAMES

IT is so easy to develop a single-track mind on the subject of floral decoration. In my own case, if Eastern Floral Arrangement is mentioned I immediately think of twisted, lichen-covered branches and scraps of blossom. I have to be reminded that the land of the pink Cherries is also the land of the Chrysanthemum, and that the fall of the year finds there, as in our own country, a very different style of floral decoration from that which we call "typically Japanese."

I refer to the kind of decoration staged at Eastern horticultural exhibitions. This I can only liken to our green topiary figures; indeed, I have often wondered that some enterprising exhibitor here has not adopted the style, if not because of its sheer artistry (which might well be disputed) then because this method of display would be arresting and provocative. Flower heads alone are used for this form of Chrysanthemum exhibit. They are packed closely together over a cane or straw dummy, so that the result is a figure that appears to be modelled in flower heads. One could, I suppose, use the frames sold by topiary specialists to train box or bay, and pack the flower heads over the frame on a mossy bed, as florists do in making wreaths. A teddy-bear in bronze Chrysanthemums would be a fine figure for a children's party.

However, perhaps most of us like Chrysanthemums better in vases for our house rooms, and used in this way, they are some of the easiest of flowers to arrange. The colours are easy, too, for there are varieties in all colours except blue. Market blooms, in almost unlimited quantities, can be bought in white, yellow, orange, apricot, pink, bronze or dark red, and most of these can be in natural sprays or single, *i.e.*, disbudded, blooms. A good point about them is that whether they are tousled curly-heads, mopheads, tiny buttons, singles or any other type, they all last well; and I am sure that the practices so often recommended, charring, bruising and so on, are unnecessary, and, in most cases, useless.

Sometimes one likes to get away from the Chrysanthemums, and from equally obvious autumn decorations of coloured leaves, and revert to the cottagers' favourites, the silver moons of Honesty, scarlet lanterns of the Cape Gooseberry, and golden Helichrysums. All these dried lovelies, summer's rich legacy, make charming little arrangements for such places as landing windows, strong daylight being rather important. I like them, too, particularly the golden Helichrysums and silver Honesty, in rooms decorated in blue or mauve. There is not much real autumn material in the blue colour range. There is everlasting Statice, of course, and if you say this emphatically enough, it describes what some of us feel about it, specially when we see it used with fresh Roses or Carnations; this ought to be a criminal offence.

An interesting decoration for blue rooms can be made with fruits of various kinds, the blue-black berries of most of the Barberries, Damsons, outdoor Grapes, Blackberries, and the curious pinky-purple berries of several Callicarpa species. Until mid-October we can generally gather (in Kent) the steely blue heads of Echinops ritro, the Globe Thistle, and these, like the Helichrysums, mix happily with Honesty, or even, on occasion, with the early red "Goacher" or "Conqueror" Chrysanthemums.

Arrangements of bluish berries are improved by the inclusion of silver foliage and dark reddish fruits, or, alternatively, by orange and red foliage and fruits.

Typical autumn decorations in gold and brown do not light up quite so well as those of late winter and spring. For that reason one must choose the lighter colours in Chrysanthemums for dinner tables. Carnations, which never fail us through the whole twelve months, are another good choice where a decoration must be light in colour and texture, but not insignificant.

For breakfast and small occasional tables, the so-called autumn Crocus, *Colchicum autumnale*, can be gathered just before the flower is fully open, and set in plain or cut-glass vases or bowls. It opens delightfully indoors, and is quite charming alone, though a little light foliage can be added if preferred.

Glycerine and seed heads! These are my last-minute reminders. The glycerine is to preserve armfuls of Beech leaves, so that they can be used when the trees themselves are leafless. The proper time to gather Beech is when some of the leaves are green and some golden-brown. Stand the stems in deep containers filled with salt water for a day. Then put them into vases of glycerine and water—one-third glycerine—and they will keep well for months.

As for seed heads, now is the best time to go all round the grounds, secateurs in hand, to reap the harvest of good material that the gardener would probably overlook—Iris that is seeding, dry heads of Achillea, dry Poppy heads, Teazels, Rose hips, dry spires of Solidago and Verbascum, plumes from the Smoke Plant (Venetian Sumach), tufts of Old Man's Beard, and many more precious trophies. These will be useful later on, even if they are not needed now.

During your travels you may perhaps discover a "forkful" of loveliness to bring back to your boudoir table or desk, in the form of moss-covered earth and flaming scarlet or orange "Toadstools." Glorious things, these. You just dump them as they are in a thick pottery dish or bowl, with odd extra scraps of green moss and your decoration is complete. But keep them under your own eye, for possibly poisonous fungi must never stand in places where children's fingers may reach them.

HORTICULTURAL ADVICE

Grease Banding

By CARTHEW ALLERDYCE

THIS year I have seen hundreds of trees defoliated by caterpillars of the winter moth group. I went into one orchard in Gloucestershire, where there was not a leaf left. I walked down an avenue of limes in Essex which should have been clothed with foliage but which was bare, owing to the ravages of hundreds of caterpillars.

On the other hand, there have been lime avenues this year which have hardly lost a leaf, and there are thousands of orchards all over the country that have borne heavy crops and whose foliage has never been touched. It is all a question of pest control. The gardener has to think ahead.

In the winter moth group I class the true Winter moth, the March moth and the Mottled Umber moth. All of them lay eggs which hatch out into caterpillars, and it is these caterpillars that devour the blossoms and the leaves just as they develop in the spring. When there are thousands of them I call them a plague of caterpillars, and after the spring of 1939 it may well be that there will be a plague in 1940.

The female winter moths are unable to fly about for they have no wings. The males, however, have wings and can fly about at will for mating purposes. The females, after mating, crawl up the trunks of the trees into the branches to lay their eggs. This may happen any time from now on.

To prevent the females from reaching the branches, a band of sticky material should be placed around the trunk of the tree, or around each branch if the tree is trunkless. Horticultural manufacturers produce special banding grease, as it is called, which lasts a long time. It is very sticky, and the moths never get over it, for they are trapped like flies are on flypapers.

It is better not to apply the banding grease directly on to the bark, but to wrap round, first of all, a strip of special grease-proof paper. This should be tied firmly into position, top and bottom. It is on to the paper that the sticky grease is smeared, either with the hand or with a thin piece of wood, like an 8-inch label. Because of its very stickiness the smearing is not an easy job, but it is well worth while doing.

There are various firms which specialise in this banding grease, and they include Messrs. Plant Protection, Ltd., of Yalding, Kent; Messrs. Ozono Chemical Company, of Wheelock, Sandbach, Cheshire; Messrs. Murphy, Wheathampstead, St. Albans, Herts; Messrs. Corry & Co., Shad Thames, S.E. 1; Messrs. Kay Brothers, Ltd. of Reddish, Stockport.

Sometimes, after the bands have been applied, readers write in to say they are disappointed, for they cannot find that they have caught any moths! Birds have a habit of visiting the grease bands regularly, and directly a female is caught she is eaten up. It is not, therefore, always possible to see a large catch.

When moths are numerous, they may form a bridge over the sticky material with their bodies. One will crawl so far, and get stuck, another will get further over the dead body, and so on until the end of the band is reached. It is therefore advisable to inspect the trees from time to time to see that nothing has impeded the "stickability" of the material. Little twigs may get stuck, leaves and such-like, and these should be removed. It does not take a long time to go round the bands once a week and to disturb the tacky substance, and so keep it at its best.

Any ordinary grease will not do, for it does not keep "tacky" long enough. It is necessary to buy the special banding material made by one of the firms listed above. This will not only catch the females of the winter moth group, but they are invaluable for trapping all kinds of other insect pests, providing they are kept tacky right through until the early summer.

These bands have been much used for stopping capsid bugs when young, before they have their wings. The leaf-eating weevils when running up the trunks will also be trapped. Woolly aphides are often caught in large numbers.

In my book, *Garden Pests and Diseases*, published at 6d., full details appear of the control of the various garden pests and diseases and page 35 deals with grease banding. *Field* readers may have this book gratis, if they enclose 2d. for postage, and say how many fruit trees they have in their garden.

If a tree is staked it is necessary to grease-band the stake as well as the tree, or else the moths will use the stake as a kind of bridge. With old trees, it is possible to put the grease direct on to the trunk, and so save using the greaseproof paper.

LETTERS TO THE EDITOR

"OVER-FOXED" ESTATES

SIR,—During the last War, a meeting was held by the M.F.H. Association at which it was decided that foxes should be put down.

The motion was agreed to without dissent, and every M.F.H. present agreed to do his best to reduce the supply to reasonable proportions. On one estate, to my knowledge, 78 foxes were destroyed.

But since that period the said estate has become "over-foxed," like many others. Foxes provide sport for those people who have the means and leisure to follow hounds.

It seems likely that the preparation for defence and the declaration of war will not leave many people with means and leisure to hunt. Also foxes in order to exist consume poultry, game and rabbits which will be wanted as human food.

I, for one, do beg landowners and others to see to it that no more than a breeding stock of foxes is left. I have given instructions to my keepers to that effect.

They are young men of military age, and will in all probability shortly be called up to do their duty. But while in my service they will carry out my orders, and I hope other owners and tenants of shooting will do the same.

I send you this letter with the full approval of the Master of these hounds.

Yours faithfully,
CYRIL STACEY (Major, ret.).
Chairman of Committee,
North Cotswold Hunt.

WHEN IS A CHARGE?

SIR,—The "charge" of any animal, from the elephant to the domestic hen, cannot be mistaken. If there is the faintest doubt about it then it is not a "charge." When meaning business there is a something in an animal's eye, and in its whole bearing, that once seen can never again be mistaken.

I cannot agree that no beast is dangerous until one has made it so. Females with young are often very dangerous; and males, for one month or so out of the twelve, are sometimes so aggressive that it is highly dangerous to show one's nose within a thousand yards.

Animals wounded, or missed, and not seeing the shooter, will often go straight on, but will, more often, back track. And sometimes they will come back along the bullet's line of flight.

Some insects, hornets and wasps, will come back on the line of a projectile and let the "projector" have it in the neck. This has happened to me. A bullet seems to leave some trace of its passage through the air easily perceptible to the fine senses of wild beasts, and I have amused myself in places as far apart as the Highlands of Scotland and the middle of Borneo in watching the effect of a bullet fired a long way in front of travelling deer.

When the old hind in the lead reaches the "line" one can see her wince and recoil as if hit across the nose. It is then about-turn and off on another tack.

And this brings me to the hardy annual—big rifle versus the small bore. What Sir S. Baker said in 1861 (was it?) is true to-day. If really after dangerous game, and by "after" I mean in all sorts of weather, in all sorts of rough country, and following up wounded beasts, then, if one wants to live to a green old age, the heaviest rifle that one can use comfortably is the rifle to trust in. This is not to advocate the use of a .600 or .577 on Nilghiri tahr, of course, although even with such small game I found a .577 more satisfactory and humane than smaller rifles.

The nearer one's bullet is to pure lead, except for elephant or rhino, the better the results.

Yours faithfully,
Overdale, Crieff. .577.

ROBBERY IN MID AIR

SIR,—Reading something the other day about birds "towering" when shot through the lungs, reminded me of a curious experience I had some years ago whilst on safari in the Samburu country, Kenya. One morning when out shooting spurfowl, a large species of francolin, I had just got a successful right and left. The second bird, a large cock—probably weighing 2lb. or more—evidently hit in the lungs, started to "tower." Before he had got very high, a very large hawk suddenly swooped out of a nearby tree and seized the bird in mid air. He then at once proceeded to carry off his prey with the greatest of ease. The hawk, after flying 500yds. or 400yds., settled in the upper branches of a high tree.

Annoyed at being robbed in such a barefaced way, I proceeded to stalk the robber. When I considered I was close enough for an effective shot, I fired at the hawk. He toppled over backwards, but managed to hang on to the branch on which he had been perched, by one foot, at the same time dropping his prey. Then another curious thing happened. Almost before, as it seemed, the spurfowl touched the ground a second hawk, which had evidently been watching the first fellow, hurtled out of another tree and seized the bird, flying off with it almost before I had realised what was happening. In the meantime the first hawk, after hanging upside down for a few seconds, let go his hold, but when half-way to earth suddenly managed to right himself and flounder off in the direction taken by the second one. Both disappeared into a patch of forest, so I saw no more of them or my dinner!

It would be interesting to know if any of your other readers have ever had a similar experience.

Yours faithfully,
Vilima, SPENCER TRYON.
Molo, Kenya.

TIGERS IN NASIK

SIR.—Last May I had the luck to shoot two tigers in one beat (and incidentally missing a third in the same beat) at Tabrabad, in the Nasik District.

My shikar stand-by is the Hon. J. W. Best's *Indian Shikar Notes*, third edition, and following his instructions how to measure tigers, I found the female to be 9ft. 7in., and the male 9ft. 2in.

Tigers are rare in Nasik, and these had probably wandered over from Khandesh, and finding the hunting good remained there. They had over 50 buffaloes, &c., to their credit. I would like to know how the measurements of the tigress compare with other shikaris' efforts. It took six Bhils to lift her on to a charpoy and carry her a mile to the car.

Yours faithfully,
Asst. Sup. Police, H. S. MCGUIGAN.
Nasik, B.P.

A HEN COMPANION

SIR,—As an amateur at chicken-keeping, I am told that a hen I possess is a marvel. At about four months old she started laying, and except for missing about one day a month, she has layed a small off-white chalky egg, ever since, and she is now about a year old. She has lived under rather exceptional circumstances. Hatched out by a duck, at a time in the rains, when there were no contemporaries to put her with, she was kept in a box on the veranda. From the first she was of a gregarious nature, and cheeped to be spoken and played with, and when a little older, she would sit for an hour at a time on my instep as I sewed or wrote. When she got too big to remain in her box with a wire netting over it, she sat on the edge and never attempted to leave it, except for my instep. When three-quarter grown, we put her into the garden in the daytime to be with the other hens, but she never really became one of them, and always came back at night to sleep on the edge of her box.

One day she made a clucking sound, so I put her in a basket, and she produced her first egg, and every day since, except for a day about every month, she has gone on laying for the eight months. For three months she went to stay with friends while we were on leave in England, and there she layed her egg in a box of earth in an outhouse. Now, since her return, she chose to go to the "boys'" room and lay on a suitcase, with fatal results to the egg, as it rolled off and broke. So I have weaned her from that, and she now comes into the house again, and lays on a piece of newspaper on a chair in the bathroom. She comes when I call her, and will walk about the garden with me, though alone she never goes further than about 15 yards from the house.

At the proper season, she much enjoys a walk with me down an avenue, the trees of which are much eaten by white ant, and afford her a lovely feast when I knock away the mud which covers them. She is very fierce with the ducks when I am feeding them, attacking and pecking them, but from her own kind, I am sorry to say, she runs away, giving up her place.

She has pretentions to being a white Wyandotte, but is of smaller build, though very compact, and not leggy, as the native birds are in this part of the world. I do not know if her upbringing has anything to do with her continual laying; she certainly as a chick got a lot of titbits, but I now keep her to the two local corns "aish" and "durchen."

Yours faithfully,
ENID KIDD (Mrs.).
Sudan Plantations Syndicate,
Wad El Naim House,
Barakat, Sudan.

P.S.—I have two ducks who have inherited a funny habit from their father, an old drake, who would not eat corn off the ground, but jumped and caught a few grains at a time in his beak which were thrown to him.

One sad day he was found eating ducklings, and forthwith went into the pot. A month or two later two of the now half-grown ducklings started the same habit, and will now, as drakes, take it in turn to "jump-and-catch" their corn.

PENNY-FARTHING DAYS

SIR,—The above title, given to the article in the *Field* of the 9th, on the ordinary or high bicycle of the 'eighties and 'nineties, seems misleading, as it suggests that "penny-farthing" was then a name given to this early type of bicycle. In those days I was a schoolboy with brothers who rode these machines, and later at Cambridge where they were the mounts of the University Cycling Club. I never heard anyone speak of them as "penny-farthings" which must be an invention of the present century to contrast their appearance with that of the safety bicycle.

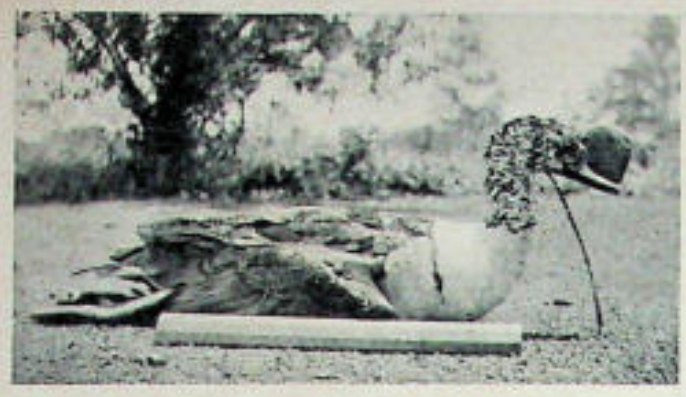
Yours faithfully,
Bryn-y-Grog, R. STEWART-BROWN.
Marchviel.

THE LATE H. C. BAGOT

SIR,—It is with deep regret that your readers, and especially those in Ceylon, will learn of the death of Mr. H. C. Bagot at the age of 81 years.

During all the years of his life he proved himself a sportsman in every sense of the word with rifle, gun and hound. And the writer, a member of the present generation, pays a small tribute on the death of a fine sportsman who knew sport under conditions which, alas, no longer obtain; and one of those whose numbers grow less with the passing years, leaving none who can take their place.

Yours faithfully,
Telbedde, B. MOORE-BOYLE.
Badulla, Ceylon.



HUNTED HARE CAUGHT BY EAGLE

SIR,—I have just seen a curious incident reported in the *Field* and should like to put on record a similar experience of mine.

During a drive for wild boar on the side of Lake Butsinto in Albania in January, 1938, my beaters put up a hare which was swooped on, in front of the line of beaters, and carried straight over my head. I had a shot at it with my rifle whereupon, the bullet apparently having gone very close to the eagle, the hare was dropped dead within about twenty yards of my feet.

Yours faithfully,
Taunton. DAVID FORBES.

WHAT IS THE KNOB FOR?
(See letter "The Knot-billed Duck")

AN ANGLER'S SURPRISE

SIR,—On Friday, August 25th, when fishing with two friends and two boatmen off Kingsdown, near Deal, a strong pull on my line broke the paternoster. This was replaced by another and immediately I had a bite and to our surprise I landed not only a fish on the new line, but I brought up also the paternoster I had a short time before lost with two good-sized pouting nicely hooked.

The odds against such an occurrence happening would appear to be so great, I thought it might be of interest to some of your readers.

I have of course had humorous remarks made as to the event being another good—if fishy—angler's yarn, but as I had four witnesses I feel less nervous about mentioning it than would ordinarily be the case.

Yours faithfully,
GLADYS M. ROBINSON.

Tunbridge Wells.

RE HARVEST BUGS

SIR,—In a recent issue one of your correspondents inquired for a remedy or preventive against bites and irritation set up by harvest bugs. Has your correspondent ever tried Citronella? It is a rare thing for keeping flies and gnats off when fishing or shooting. Put some round coat collar and hat. To kill harvesters dab spots with paraffin.

Yours faithfully,
W. H. HEATH.

Upton Dean,
Andover.

THE KNOT-BILLED DUCK

SIR,—I enclose a photograph of what I believe to be the knot-billed duck, *Sarkidiornis melanonotus*. Only the adult males have the curious knob on the bill, and I would very much like to know if any of your readers could tell me what it is for.

These duck, which are plentiful in the large swamps along the North Zululand coast, come inland during the summer months.

They seem to feed almost entirely on grass seeds and roost in trees at night.

Yours faithfully,
PETER NEWSON.

Lismore,
P.O. Ingwavuma,
Zululand.

GOLF CHAMPIONS OF NORTHERN INDIA

SIR,—Here are photographs from India which may interest English readers. The first shows the Amateur Golf Champion of Northern India, Mr. A. Chapman, in the centre of the picture with the Championship Challenge Shield. He beat Captain R. A. K. Sangster (on his left) by one up. On his right is the Bishop of Lahore, the Right Rev. George Dunsford Barne. The ladies are Mrs. J. F. L. Taylor (left), who beat Mrs. Freeman Taylor (right) by 2 and 1.

Yours faithfully,
H.

Gulmarg.

ABOVE: THE FINALISTS IN THE AMATEUR GOLF CHAMPIONSHIP OF NORTHERN INDIA WITH THE BISHOP OF LAHORE, AND BELOW THE WINNER AND RUNNER-UP IN THE LADIES' EVENT
(See letter "Golf Champions of Northern India")

A WASPS' NEST PROBLEM

SIR,—My father's account of the toad and the wasps, published in a recent *Field*, tempts me to write you an account of an interesting discovery I made here a few days ago.

Walking through a small spinney adjoining my house I saw what I took to be a new rabbit bury. Investigation showed it to be a hole about the size of one made by a rabbit, but only about 6in. or 8in. deep; in the hole was a wasps' nest with wasps still working (I enclose photograph).

The questions which arose were: What had tried to get at the nest; why had it not gone on with its work; and what had happened to the earth which had been dug out (there was very little around the hole)?

I suppose the answer to the first question is badger, or would a fox do this? The answers to the other two questions were supplied a few days later when, having killed the nest, I set to work to dig it out. I then found that it had already been dug out and that when I thought I was looking at the outside of the nest I was in reality looking at the inside of the shell of the nest, which had obviously been made only just below the surface of the ground—this accounting for the absence of loose soil around the hole.

ONLY THE SKELETON
(See letter "A Wasps' Nest Problem")

Yours faithfully,
J. S. G. EYRE.

Danemore,
South Godstone,
Surrey.

A BIG HORNET'S NEST

SIR,—I enclose a photograph of the largest hornet's nest I have ever come across, which may be of interest to you.

The nest measures 22½in. by 11½in., and was found on the small stream, the actual head of the Columbia River.

Yours faithfully,
C. M. EDWARDS.

Canal Flat,
British Columbia.

SOMETHING TO STEER CLEAR
(See letter "A Big Hornet's Nest")

A FINE ROE HEAD

SIR,—This may interest your readers: A roe was recently killed in Stockton Wood, which is above the Wylye Valley in Wiltshire, and is, I believe, a record head for England. I sent it to Messrs. Rowland Ward, who were good enough to measure it for me, and the measurements given are theirs:

	Length outside horn.	Circumference.	Tip to tip.
Previous record head for England	11″	3⅜″	6½″
The Stockton head ..	11½″	4″	7⅜″

I think there is no doubt that the roe is increasing in all suitable areas over the south of England; in many places they do a good deal of damage to forestry.

I shall be very interested to see what effect this present war has on their numbers.

Yours faithfully,
ARTHUR ARNOLD.

Mayles,
Wickham, Hants.

STALKING TELESCOPES WANTED

SIR,—I should like to appeal through your columns for additional telescopes for the use of the stalkers, gillies and keepers serving with this regiment. It is of the utmost importance that an adequate supply should be available. In 1914 a large number of private and estate glasses were forthcoming from owners of deer forests, and I hope that in this emergency also it will be possible to obtain from your readers any glasses that can be spared. They should be stalking telescopes, in good condition, of a magnification not less than X20, complete in the usual leather cases.

A careful register will be kept, so that if possible they may eventually be returned to the present owners. Letters on this subject, or the telescopes themselves, should be sent to me at this address.

Yours faithfully,
J. LESLIE MELVILLE
(Lieutenant-Colonel,
O.C. The Lovat Scouts).

H.Q., The Lovat Scouts,
Beauly.

IN THE CITY—1914 AND TO-DAY

By OUR CITY EDITOR

SOME time must inevitably elapse before business on the Stock Exchange settles down to anything approaching normal lines. Every industry in the country has its own war-time problems. Investors find extreme difficulty in forecasting the effect of the solution of these problems on the future prosperity of the companies in which they are interested.

For this reason price movements for securities are to-day vague and indecisive. Attention turns from one industry to another as the investor seeking safety for his capital endeavours to weigh up the probabilities connected with each.

So many unknown factors exist. There is, for instance, the prospect of additional taxation. It is impossible to tell where the burden will fall the heaviest. Indeed, the one thing of which we can be sure is that it will be heavy and designed at least in part to prevent anything in the nature of profiteering.

Apart from direct taxation profits will be eaten into by additional expenditure under the Civil Defence Act, compulsory insurance of stocks and other war-time expedients. These are problems which cannot be solved to-day. The operator in securities must, therefore, be prepared to cut a loss should markets turn against him. The successful operator always has sufficient courage to cut a loss.

There is, I find, a disposition among many to sell out shares in motor manufacturing companies. The contention is that the motor manufacturers will be unable to sell new cars with petrol severely rationed. That is probably a correct assumption.

It should not be overlooked, however, that the motor manufacturer of to-day can turn his works to other uses. Several of the companies are already engaged on Government work. Orders from that source will doubtless continue.

It may be interesting briefly to review what happened to the shares of motor companies which were in existence during the last war. There is the case of the Rover Company, whose £1 shares during 1914 found extreme prices of 90/7½ and 69/6. In 1915 the price went as low as 35/3, but by the end of 1918 the price was up again to 85/6.

Rolls-Royce may be taken as another instance. In 1914 Rolls-Royce ordinary touched a high of 59/4½ and a low of 50/–. In the first year of the last war the price went down to 25/–, but in 1918 the quotation was very nearly 77/– a share. Such movements suggest that conditions in the early days of the last war were similar to those existing to-day. I suggest that those who watch their markets and purchase on a fall will make money.

While some are selling motor shares others are buying Lancashire textiles. I understand that much of the recent buying has come from textile trade centres. The contention is that the industry stands to benefit from Government contracts. Many maintain that the outlook is brighter than for many years. That may be correct. What is certain is that the textile trade has been in a state of acute depression for many years.

Going back to 1914, it will be found that in 1914 Bradford Dyers ordinary shares varied in price between 24/3 and 20/6. In 1915 the price relapsed to 17/9, but by 1918 there had been a rise to about 34/– per share. In the boom which followed the war the price went to over 70/–. What has happened since then gives no encouragement to shareholders, and to-day the shares have a price around 5/6 with very little sign of any dividend coming.

This experience in Bradford Dyers was common to most textiles bares during the last war and what followed in the subsequent industrial boom. The problem is, "Will history be repeated." Many are doubtless banking on better conditions, which will probably come, but it must be understood that the Government stands firmly to cut out anything in the nature of profiteering. Still, fortune favours the brave. There may be subsequent profits in motor, textiles, and I will also mention shipping shares

WHY AN ADVERTISING BLACK-OUT?

By PERCIVAL MARSHALL

(Executive Chairman of the Periodical Trade Press and Weekly Newspaper Proprietors' Association)

IT is a remarkable thing that one of the most unexpected reactions on the outbreak of war should have come from those whom we regard as level-headed business men. I refer to the widespread rush to stop advertising in both the periodical and the trade and technical press, which marked the first few days of the new regime. That rush soon showed signs of subsiding, and in a number of cases cancelled appropriations have been resumed, and even new business has been placed. This is only common sense.

Presumably this panic was dictated mainly by a desire to effect an immediate economy in the conduct of business, and to cancel advertising contracts seemed such a simple way of saving money. Actually, this method of economising is a two-edged weapon which cuts both ways. The advertiser's name, and the goodwill of his particular product, which he has built up through years of intensive effort, disappears from the consumer's sight immediately. The buying public is left in the dark as to whether the advertiser and his goods are still in existence; his customers wonder whether he is loyally responding to the Prime Minister's definite request that all businesses should carry on, or whether he is on the point of fading out of the commercial picture.

By stopping his publicity the advertiser is in fact subjecting his business to a "black-out" in his particular market, a definite step backwards, from which it may take a long time to recover. Business is bound to continue, and both private and general industrial requirements will need to be filled on a large scale. The demand for certain existing goods of special service will be intensified, and new demands of all kinds will arise to meet the new conditions of life.

To stop advertising is to cut yourself off from the market, and to say to the readers of the journals you use "Relations are suspended—we are no longer interested in you." The psychological effect of ignoring your buying public in this way may have far reaching results. How much better to say to them: "We are carrying on—let us supply your needs."

The public at large will more than ever need appropriate reading material to divert their thoughts from the tragedy of the war, and to occupy their minds and entertain them during the enforced "black-out" hours. The periodical and magazine press will supply this want effectively and will continue to give good publicity value. So far as the trade and technical press is concerned, that two-edged weapon cuts another way. It inflicts definite injury on the journals which render such admirable service with vital news and important trade and technical information. These journals are themselves determined to carry on their service to industry. The stopping of your advertising can only diminish their resources for giving you that news and intelligence service which you must have if you are to carry on yourself. Why not make common cause with them, and help yourself by helping them in these difficult times?

The press is out to give both readers and advertisers the fullest possible value, consistent with any official restrictions, and it is in your interest to co-operate in the fullest possible measure. Do not "black-out" your business from your market; rather let the searchlight of the buyer be focused upon it.

Above all, let your world know that you are following the lead of the Prime Minister, and are loyally "carrying on."

[During the last war advertisers found the columns of the *Field* as valuable as ever in forwarding the interests of their businesses, and there is no reason why it should not serve them as well in the present war. The *Field* then was introduced to a large circle of new readers. It was in great demand in the Services, was sent to the Front by those at home, and in the words of the Prime Minister it "carried on" to give help and relaxation in times of stress. That duty its staff to-day will continue to fulfil. As far as businesses are concerned new channels will have to be developed to meet war-time needs. People will have to be clothed and equipped on sound lines and some firms have not been slow to rise to the occasion. Certain amenities too will be needed, and the false economy of retrenchment on necessities was clearly demonstrated during the period we are accustomed to refer to as "The Depression."—ED.]

MORRIS SERVICE FACILITIES.—Morris Motors Limited have officially announced that, to the best of their ability under existing conditions, they will continue to service all vehicles, marine and industrial engines of their manufacture. Comprehensive stocks of all parts for Morris vehicles are at present available and can be obtained through the medium of their distributor and dealer organisation.

A.R.P. AT EDINBURGH ZOO

The safe custody of the animals presents some problems which have had to be tackled by the authorities and staff. The possible effects of air raids on this Zoo were very fully considered months ago, and various preparations were made to deal with them. Many people seem to feel apprehensive that animals, which might be dangerous to the public, might escape during an air raid. There is only the most slender possibility that such a thing should happen, because it is almost certain that any explosion of a bomb in the neighbourhood sufficiently violent to wreck a cage or the wall of an enclosure, would also kill the animals inhabiting it.

Even this slender chance is, however, being guarded against, and a guard is being maintained at night—some armed keepers being on duty all the time, so that if a dangerous animal did, by any chance, escape during a raid, it would be shot at once. In view of the possibility of snakes escaping, through the cracking or destruction of their cases, all which might have been dangerous have been killed.

Various blast- and splinter-proof shelters have been constructed for the safety of the various units of the staff should bombs fall, and a number of the more solid houses in the Park, which are built of masses of whinstone, are also being used for this purpose. Provision has also been made for the possibility of outbreaks of fire. It has been frequently remarked, during the last year, that for Edinburgh citizens the Zoo is probably one of the safest places to be in during an air raid, for on the open spaces of the higher ground, which is everywhere whinstone rock, one would, by lying flat, be in comparatively little danger from the effects of any bomb except, of course, from a direct hit. If an air raid took place during the day, visitors would be directed to these higher parts of the Park or, if they preferred, to the emergency exits on the north side of the Park.

GREYHOUND RACING AT WEMBLEY.—With the approval and permission of the local police and Scotland Yard authorities, greyhound race meetings will be resumed on Mondays and Fridays at 3 o'clock until further notice. A large proportion of the Wembley staff has been called up for national duties of various kinds, but plans have been made for an adequate organisation to carry out the arrangements made by the management for the holding of the meetings.

YOUR CAR IN WAR TIME

By W. G. McMINNIES

A NIGHT DRIVING CASUALTY

PETROL rationing and the enforced black-out of car lighting will reduce motoring to a very meagre amount. Social visits, if necessitating the use of a car for more than a few miles, will have to cease, that is unless one has the health and strength to ride or cycle. With the partial closing of cinemas and other places of entertainment there will be little temptation to go out at night, even if one could find the way with a blacked-out car.

In towns and cities shopping will go on much as before, but in rural areas, where householders rely on a market town perhaps five or ten miles distant, the routine of victualling will not be so easy. But something can be done by the pooling of cars and the setting up of routine runs in which every seat is occupied and every occupant commissioned to undertake their own and friends' requirements.

For we are fortunate at the moment to have our cars at all and having them to be allowed to use them, if only to a limited extent. The time may come when they may be commandeered or when the fuel they use may be needed for the more vital demands of the Air Force, Army and Navy.

This may be a grim picture, but it is grimmer still in Germany. Why over twelve months ago when I made a tour of inspection of their principal motor roads in a fleet of Mercedes cars, hired by Government officials specially for our trip, the fuel was of so poor a quality that as soon as the engines slowed down on a gradient they started to "pink." And those were cars from the factory and not the ordinary everyday sort of hired transport. And then what is to happen to all the Germans who subscribed out of their wages for the much vaunted Peoples' Car? Will they ever see their money or their car? I doubt it.

The black-out orders will reduce night driving to a matter of necessity only. Nobody in his senses would dream of going out for pleasure. It simply is not worth it. In the first place one can hardly see at all and in the second one's rate of progress is little quicker than that of an active walker. The chances of an end-on collision are excellent and there is always the risk of knocking down a pedestrian. So my advice, after a test of this black-out driving, is to stay at home.

But for those whose business necessitates their travelling at night, people like doctors and drivers of lorries and delivery vans, quite apart from the thousands of Service drivers of all kinds of vehicles needed for the preservation of national safety, there are grim times ahead.

On the other hand, it may be that the present regulations are but a quickly improvised stop-gap and that later on the Lucas people may be able to produce a war time lamp that will satisfy the military requirements and at the same time allow motorists to see a little more of the road. The Government has already intimated its willingness to adopt practical suggestions, if public safety is unimpaired, but of course if any kind of new equipment is adopted time may be needed to supply the article or articles. Motorists should make a point of studying the daily papers, for new regulations are constantly coming into force.

After all, with so much white lining and reflector lighting about on the main roads we only need a small ray focussed on these signs in order to find our way. But the ordinary peace time setting of head and side lamps is not the best possible arrangement for the close foreground view of the kerb or dividing white line which will guide us in war time.

And while on the subject of white lines and kerbs, is it not amazing in these days of stress that the authorities still employ large gangs of painters to whiten these things by hand? A year or two ago I noticed on the Kingston by-pass two men painting a kerb by machine. They told me that it enabled them to do the work of ten or twelve men in a fraction of the time. And then very occasionally I have come across men using a machine for painting white dividing lines. Surely by this time hundreds of these simple machines should have been available. Instead, we encounter droves of painters armed with red flags, templates and brushes, obstructing traffic and a danger to themselves.

Another method of doing the job quickly, but not so neatly, comes to mind. In the days when motor reliability trials were popular and included miles and miles of twisting and difficult roads, the promoters of these events used to mark the course with a dye which was sprayed via a tap from a big tank fixed in a car. By this means they could lay the trail in red, yellow or white over 200 miles of intricate course in half a day. Why should not the same sort of thing in an improved form be used for marking our roads to-day?

The difficulty of night driving is certain to focus attention on the danger and inconvenience caused by cars stopping at all on the road. At one time I used to drive up and down Watling Street between Coventry and London at night and again and again nearly came to a sticky end by running into the badly-lighted backs of stationary lorries. Some of these lorries used to add to the inconvenience of the journey by parking with their head- and side-lights pointing forward on the wrong side of the road.

I believe now that things have been improved on this road and that lorries are only allowed to pull up off the highway. But in any case it should be made illegal to stop on the road and so, besides blocking on-coming traffic, become an entirely unnecessary source of danger to all other motorists. Obviously a rule such as this would not be applicable to built-up areas still unprovided with service side tracks.

Possibly in the distant future all main roads will be provided with sidings. Even to-day there are a few in existence, some of the best examples being found on the north Oxford by-pass which skirts Eynsham. One, I noticed the other day, sported a notice-board which proclaimed it a "lay-in." But on most roads the plan seems to be to make it as difficult as possible to draw off the track by the use of high and abruptly-sided kerbing.

I disagree with this for two reasons. For one thing if a car goes out of control and hits a high and upright kerb it stands a good chance of damaging its wheels, bursting its covers and overturning. If the kerb is bevelled as is done in many parts of France, the car can still overrun the road and come to a stop safely on the verge. The other point I object to is the shortsighted plan of building expensive and modern footpaths at a higher level than the main road alongside them. The footpath is protected by the kerb and the whole plan to my mind necessitates expensive alteration in the event of it being decided to widen the road at a later date. As road widening is the most essential part of modern highway planning, it seems to me that the often unnecessary footpath should be laid out with this development in view.

But the war will put a stop to new road construction. Not that it will matter much because the volume of traffic will be immensely reduced by the new regulations. And after the war there will probably be far fewer cars in use for a time. On the other hand, unless we have a bolstered-up boom, similar to the fantasy we lived in for a year or two after the last war, the unemployed may be put to work on new road construction. But all this, I fear, may be a long way off.

Of more immediate importance is the need to get our cars into a high state of efficiency. Even if they are to be laid up or used only occasionally they should be kept in good working order. They may be needed in an emergency and a car that fails to start promptly, runs erratically and needs the tyres blowing up, is not much use to anyone. So the wise owner will see that his battery and tyres are in good order, his brakes efficient and his tanks and sump full.

With the lighting restrictions in force he can save current by fitting headlamp bulbs of lower power, seven watts being the limit allowed at the moment. With winter and reduced temperatures at hand the oil sump should be drained of summer lubricant and replenished with the correct grade which will also reduce the strain on the starter. Some cars may have to wait for long periods in the open and for them an anti-freezing mixture may be added to the water.

The chassis, too, may need attention. Axle and gear-box should be topped up with lubricant, bearings should be lubricated and all worn or faulty parts replaced. The point to appreciate is that now is the time to do these things, whatever one intends to do with the car. In a short time neither the skilled labour nor the materials may be available, and even if they are they will certainly cost more. Even if the car is to be laid up it is better left in good condition. It will be worth more in the long run in good running order than in a semi-derelict condition.

For this reason the engine should be run up weekly to ensure that everything is working properly. The body, and especially the tyres, should be covered with a dust-sheet and if it is decided to drain the water system a label should be tied on to the radiator stating that it is empty. Finally, release the hand-brakes and place chocks behind the wheels.

ALTERNATIVE FUELS

THE last War showed us that there are ways in which the difficulty of obtaining petrol supplies for cars could be overcome. The emergency was met by petrol engines being run on ordinary towns gas, fed into the engine from a large balloon, usually carried on the roof of the vehicle; the only alteration required to the engine was the substitution of an air- and gas-mixing valve in place of the carburetter. The gas industry has been experimenting with the propulsion of vehicles on gas for some time, and the days of the gas balloon are definitely over. The modern method of using gas for a petrol engine is to store it in high-pressure cylinders attached to the chassis at a working pressure of roughly 3,000lb. per square inch. The only alterations required are the substitution of an air- and gas-mixing valve for the carburetter as before, and steel cylinders for the petrol tank.

The power output of a petrol engine is not seriously affected when gas is used as the working agent. One-and-a-quarter therms of gas, or 250 cubic feet, are equivalent to a gallon of the average motor spirit. A point worth noting is that the toxic effect of the exhaust of a vehicle running on compressed gas is negligible. Gas might be stored at high pressure, so that when a vehicle required re-charging the owner could take it to the works, where a pipe would be connected and the cylinders charged, the whole operation taking no longer than refilling with motor spirit at a petrol station.

Many people have heard of motor vehicles running on charcoal or wood chips. The motive power is producer gas, which is usually obtained from incomplete combustion of coke or charcoal in a current of air. In order to run a vehicle on producer gas a small furnace is required. It is usual to mount this on the car; an air- and gas-mixing valve, also, must be fitted to the engine. The furnace would be kindled in the normal manner, and when burning well the air supply shut down, so that the combustion of the fuel in the grate will be incomplete, or in other words, the product will be carbon monoxide. This gas is syphoned off the top of the furnace and transferred to the engine.

The theoretical composition of producer gas by volume is 35 per cent. carbon monoxide and 65 per cent. nitrogen. The actual gas obtained may differ greatly, for the composition depends upon the temperature, and size and nature of the fuel. The manufacture of this fuel is cheap and relatively easy and it is a potential war fuel.

To-day news come of a development which should be of the highest importance, in which the modern converted vehicle carries a small generator which manufactures a supply of "producer gas" as it goes along. The solid fuel from which this gas is generated is known as "progasite," a selected type of anthracite, specially prepared for gas-producer purposes. In the development of "progasite" commercial vehicle manufacturers have collaborated with the Welsh anthracite producers, and it is claimed that this makes an extremely rich gas which gives a higher mileage per pound than any other fuel previously tried. What is almost equally important, it yields a very small proportion of ash. Producer-gas vehicles using this fuel, it is stated, are now putting up performances comparable with those of ordinary oil-engined vehicles, and a West Country bus company ran a bus recently from Plymouth to Weston-super-Mare and back on 3cwt. of this fuel.

Possibly one of the most important forms of alternative fuels is that which can be produced from vegetation. Certain members of the alcohol group can be produced from potatoes and sugar beet, and some nations have insisted on a certain quantity of alcohol fuel being blended with their petrol.

Synthetic fuels can be obtained from coal by a special process known to the chemist as hydrogenation. This process produces hydrocarbons from which both petrol and fuel oils may be obtained. A diesel oil can be produced, also, from shale, which is a mineral found in Scotland.

I. B.

BRIDGE

PREPARED BIDS

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

EVERY bid made during the auction should be a prepared bid in the sense that the caller should be ready to deal with any response made by partner. With certain hands, however, the prepared bid is not the bid which would automatically be made by the average player. With

♠ A, K, 10, 6; ♡ A, Q, 8, 7, 5; ◇ 4, 2; ♣ 3, 2

a bid of One Heart would be made if one merely considered the relative length of the Spade and Heart suits. However, over the second call of Two Spades, partner must raise the contract to three if he wishes to show a preference for Hearts. Thus, the prepared bid would be One Spade, since after a response of Two Clubs or Diamonds a Two Heart call permits partner to show his preference at the two level. Of course, if the hand is sufficiently strong, say

♠ A, K, Q, 6; ♡ A, K, J, 9, 8; ◇ K, 2; ♣ 3, 2

the bidder will be only too pleased to indicate his strength by bidding the five card Heart suit before showing the Spades.

Before making any bid, the caller should consider the possible responses from his partner and whether he will be able to deal with them easily. Usually, the obvious bid on the hand will not involve the declarer in difficulties, but many hands containing one or more four card suits require special treatment.

As in the above case with a four card suit and a touching lower ranking five card suit (*e.g.* four Hearts and five Diamonds, or four Diamonds and five Clubs) it is better to bid the higher ranking suit first unless the hand is strong enough to justify a reversal. Having a four card Spade suit and a five card Club suit, the five card suit should be bid first, since the four card suit can be shown in the same round of bidding.

With two four card touching suits it will almost invariably be easier to bid the higher ranking suit first. With two non-touching four card suits (other than Spades and Clubs, in which case an initial Club bid saves a round) each hand should be considered on its merits.

♠ K, 6, 4
♡ 6, 3
◇ K, Q, J, 8, 7
♣ Q, 8, 7

♠ Q, J, 8
♡ K, 8, 7
◇ 10, 9, 6, 5
♣ J, 5, 3

Y / A B / Z

♠ A, 10, 9, 7
♡ 10, 9, 5, 4
◇ A, 3
♣ 10, 6, 4

♠ 5, 3, 2
♡ A, Q, J, 2
◇ 4, 2
♣ A, K, 9, 2

ROOM I.

Z	A	Y	B
One Heart	No bid	Two Diamonds	No bid
No bid	No bid		

ROOM II.

Z	A	Y	B
One Club	No bid	One Diamond	No bid
One Heart	No bid	Two Clubs	No bid
No bid			

In Room I the bid of One Heart meets with a response of Two Diamonds, for which Z is unprepared. Three Clubs is far too risky on his weak hand, and rebidding Hearts is, too, misleading. He therefore passes, and is probably one light. The prepared bid of One Club results in a makeable contract of two Clubs. Alternatively a One No Trump bid by Y, instead of Two Clubs, is passed by Z.

When holding a 4—4—4—1 distribution a very good general rule is to bid the suit below the singleton. Thus, with

♠ K, Q, 10, 2; ♡ K, J, 9, 7; ◇ 2; ♣ A, Q, J, 2

the best bid is One Club. If the Diamonds and Clubs are interchanged, the best bid is One Spade.

In many cases where bidding the biddable suit is likely to cause difficulty in the subsequent bidding; t will pay to bid a shaded suit. Occasionally a bid on a three card minor suit will give the best results. The last is, of course, not to be recommended as a general rule, but can sometimes be exceptionally useful. Holding

♠ K, Q, 6; ♡ A, 7, 6, 5; ◇ 7, 4, 3; ♣ A, Q, 2

a bid of One Club allows the opening bidder to give a single raise to a response of One Heart or One Spade and to bid One No Trump over a One Diamond response. Although many systems would consider this hand suitable for an opening No Trump bid, it will be obvious that the One Club bid gives considerably more latitude in the subsequent bidding.

Third or fourth hand, the bid on a three card suit should be restricted to hands of the above type where the caller has no biddable or nearly biddable suit and partner has passed. There is not so much necessity for a prepared bid, since the initial bidder will be quite ready to pass a suit response by partner. Moreover, since third hand bids are often defensive or lead directing, it is more important that a biddable suit be shown if possible.

THIS WEEK'S PROBLEM

The following problem was one of those set in the Second Waddington Par Contests:—

Y / A B / Z

♠ Q, 8, 6, 2
♡ K, Q, 9, 3, 2
◇ 7
♣ J, 9, 2

♠ 7, 4, 3
♡ 10, 6
◇ A, 8, 5, 4, 3
♣ K, Q, 10

The bidding is:—A, One Heart; B, Two Hearts; A, Two No Trump; B, Four Hearts; and Y leads the Jack of Diamonds. Playing Z, how do you defend the hand?

LAST WEEK'S PROBLEM

♠ K, 9, 7
♡ None
◇ A, 8, 2
♣ K, 6

♠ Q, J, 10
♡ None
◇ K, Q, J
♣ Q, J

Y / A B / Z

♠ 2
♡ Q, 6, 3
◇ 6, 3
♣ 5, 4

♠ 4
♡ A, K, 10, 4
◇ 4
♣ 3, 2

Hearts are Trumps. Z to lead and take all eight tricks.

SOLUTION

Z leads the Ace of Hearts and if A discards a Club Y discards a Spade or Diamond. The two Club tricks are then taken, the Ace of Diamonds led and a second Diamond ruffed and Y's hand entered with the King of Spades to lead through B's Queen of Hearts.

If A discards from one of his three card suits Y discards from the other three card suit. Thus assume A discards a Spade, then Y discards a Diamond, a Spade is led by Z and King and another Spade played by Y, Z ruffing or over-ruffing according to B's play. If B discards a Diamond a Diamond is played and the good Spade led from Y. B's best defence is to ruff, Z over-ruffs and leads the last trump, which squeezes A and establishes either Y's 8 of Diamonds, or the second Club. The play is similar if B discards a Club or ruffs at trick 3.

CHESS

CONGRESS AT BOURNEMOUTH

A game from the third round of the Premier Tournament.

(Queen's Gambit Declined.)

WHITE. Dr. Euwe.	BLACK. J. M. Aitken.	WHITE. Dr. Euwe.	BLACK. J. M. Aitken.
1. P to Q 4	Kt to K B 3	11. P to K 5	K Kt to Q 2
2. P to Q B 4	P to K 3	12. Kt to K 4(c)	R to K sq (d)
3. Kt to K B 3	P to Q 4	13. B to Kt 5 (*f*)	B to K 2
4. Kt to B 3	P to B 4	14. B takes B	K takes B
5. B to Kt 5	Q P takes P (a)	15. Castles	Kt to Q B 3
6. P to K 4	B to K 2	16. Kt to Q 6	Q Kt takes P (g)
7. P takes P	Castles	17. Kt takes Kt	Kt takes Kt
8. B takes P	Q takes Q, ch (b)	18. Kt to B 5	R to Q 2
9. R takes Q	B takes P	19. B takes R	B takes B
10. P to Q R 3(c)	P to Q R 4	White won (h)	

(a) This allows White to get an advantage in the centre. The usual line is 5. . . . B P takes P; 6. K Kt takes P, P to K 4.

(b) If 8. . . . B takes P, then 9. Q takes Q, R takes Q; 10. P to K 5, P to K R 3; 11. B to R 4, P to K Kt 4; 12. P takes Kt, P takes B; 13. Castles with the better game for White.

(c) Threatening 11. P to Q Kt 4, B to Kt 3; 12. P to K 5, K Kt to Q 2; 13. B to K 7, R to K sq; 14. B to Q 6.

(d) Threatening 13. Kt takes B, Kt takes Kt; 14. B to K 7.

(e) Not 12. . . . Kt to Q B 3, because of 13. R takes Kt, followed, if 13. . . . B takes R, by 14. Kt takes B, or, if 13. . . . B takes P, ch, by 14. K takes R.

(*f*) Threatening Kt takes B.

(*g*) This loses the exchange, but in any case Black has a very difficult game. His best move is P to R 3.

(*h*) The remaining moves were 20. K R to K sq, P to B 3; 21. P to B 4, B to K 5; 22. R to Q 4, Kt to B 3; 23. Kt to R 6, ch, P takes Kt; 24. R takes B, K to B 2; 25. R (R 6) to K 4, R to K sq; 26. R to Q sq, R to K 2; 27. R to Q 6, P to B 4; 28. R to K 3, P to R 5; 29. R to R 5, K to Kt 3; 30. R (Q 6) to Q 5, P to K 4 (if P to R 4, then R (Q 3) to Kt 3, ch, and the King's Rook's pawn falls); 31. R to Q 6, ch, K to Kt 2; 32. R (Q 6) takes P, P takes P; 33. R takes P, ch, K to B 3; 34. R (R 3) to R 6, ch, K to K 4; 35. R takes R, ch, Kt takes R; 36. R to Q Kt 6, Resigns.

A NEAT FINISH

The following game from a match between Germany and Hungary at Carlsbad last April, shows a neat finish by White.

(Indian Defence.)

WHITE. Gilg. (Germany).	BLACK. Dr. Vajda. (Hungary).	WHITE. Gilg. (Germany).	BLACK. Dr. Vajda. (Hungary).
1. P to Q 4	Kt to K B 3	18. Kt to Q 3 (g)	B takes B
2. Kt to K B 3	P to K 3	19. K takes B (*h*)	Kt to Kt 5
3. P to B 4	B to Kt 5, ch(a)	20. P to B 3	Kt to R 3
4. B to Q 2	B takes B, ch	21. P to B 4	P to K B 4 (*i*)
5. Q takes B	Q to K 2 (*b*)	22. B P takes P	Q P takes P(*j*)
6. Kt to B 3	P to Q 3	23. P to Kt 5 (*k*)	P takes P (*l*)
7. P to K Kt 3	Castles	24. Kt (B 3) takes P	Kt to K B 4(m)
8. B to Kt 2	Kt to B 3 (*c*)	25. Q to Q 2	Kt to Kt sq
9. Castles (K R)	P to K 4	26. P to Kt 4 (*n*)	Kt to R 5, ch
10. P to Q 5 (*d*)	Kt to Kt sq	27. K to Kt 3	R takes B
11. P to K 4	P to Q R 4	28. R takes R	Kt to Kt 3
12. Q to B 2	Kt to B 3	29. Kt takes P	Q to K 2 (*o*)
13. P to Q B 3	B to Kt 5 (*e*)	30. Kt (B 4) takes Kt, ch	P takes Kt
14. Q R to Kt sq	Q to Q 2	31. Q to Kt 5 (*p*)	R to R 6, ch
15. P to Kt 4	P takes P	32. K to R 2	R to R 7, ch
16. P takes P	K to R sq (*f*)	33. K to Kt sq	Resigns (*q*)
17. Kt to K sq	B to R 6		

(a) Bogoljubow's variation, not often seen nowadays.

(*b*) P to Q 4 is, perhaps, to be preferred.

(*c*) P to K 4 at once is better.

(*d*) 10. Kt to Q 5 is a very good alternative. If, in reply, 10. . . . Kt takes Kt, then 11. P takes Kt. Kt takes P; 12. Kt takes Kt, P takes Kt; 13. K R to K sq, B to Kt 5; 14. Q takes P, Q to Q 2; 15. Q R to B sq with the better game for White (Becker v. König, Vienna, 1926).

(*e*) If Kt to B 4, then P to Q Kt 4. Black's manœuvre with this Knight has failed.

(*f*) Loss of time. He should play B to R 6 at once.

(*g*) A very good post for the Knight.

(*h*) White has a very good game.

(*i*) This is not good. P takes P is preferable, although White would still have the superior position.

(*j*) 22. . . . B P takes P; 23. Kt takes P, P takes P; 24. P to Kt 5 transposes into the line actually played.

(*k*) If Kt takes P, then Q to K 2 followed, if Kt to B 3, by Kt takes P, or, if Kt to Q 3, by P takes P.

(*l*) If Kt to Q Kt sq, then Kt to B 5 followed by Kt to K 6.

(*m*) If 24. . . . K takes K, then 25. R takes R, Kt to Q Kt sq; 26. R to B 8, ch, Kt to Kt sq; 27. Kt takes P.

(*n*) Stronger than Kt takes P at once.

(*o*) Q to K sq is slightly better. White's reply is Kt takes Kt, ch, with Q to B 4 to follow.

(*p*) Very neat. If now (1) 31. . . . Q takes Kt, then 32. R to B 8, ch, K to R 2; 33. Q to B 4, mate; if (2) 31. . . . Q takes Q, then 32. R to B 8, ch, K to R 2; 33. Kt takes Q, ch, K to R 3; 34. Kt to B 7, ch, K to R 2; 35. K to R 8, mate; if (3) 31. . . . Kt to B 3, then 32. Q takes Q. Kt takes Q; 33. R to B 7, R to K sq; 34. P to Q 6 and wins; or, if (4) 31. . . . Q to K sq, then 32. Kt to B 5, P to Kt 3; 33. Kt to K 6, R to R 6, ch; 34. K to R 4, Kt to Q 2; 35. Kt takes B P with a winning game for White.

(*q*) If 33. . . . Q to K sq, then 34. Q to R 4, ch, K to Kt sq; 35. Kt to Kt 5, Q to K 6, ch; 36. K to R sq and wins.

PROBLEM No. 4032

By R. LANGE

WHITE (5 pieces): King at Q B 7, Queen at Q R 8, Rook at K B 5, Knight at K 5, Pawn at Q 6.

BLACK (7 pieces): King at K 3, Rook at K B 5, Bishops at K Kt 2 and K B 4, Pawns at K B 3, K Kt 3 and K 5.

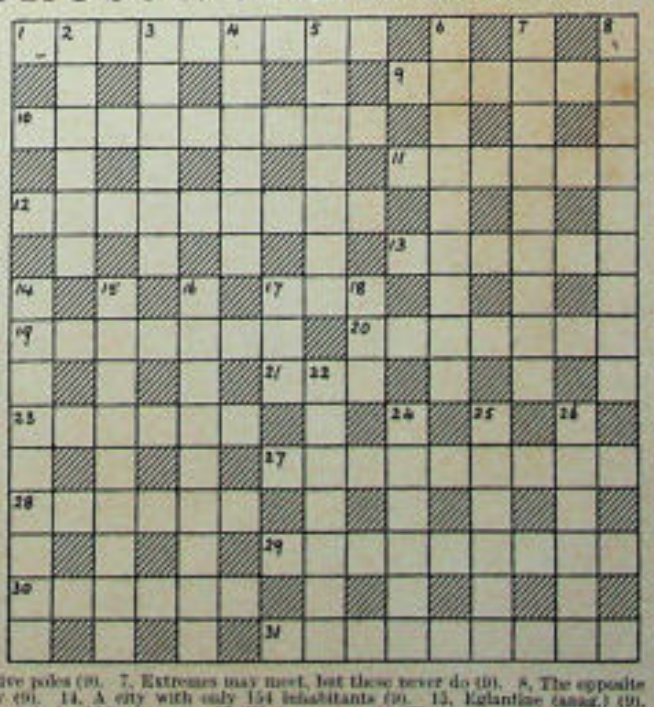
White to play and mate in two moves.

SOLUTION OF PROBLEM No. 4031

1. Kt to K 3. Any move; 2. Q or Kt mates.

THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 535



ACROSS.—1 and 9. Out of sight, out of mind (9, 6). 10. Bowlers do this when they deliver full-tosses (9). 11. Yorkshire and Lancashire are great ones (6). 12. What our armies were doing at the end of the Great War (9). 13. Amber-dust (6). 17. Many escaped but unfortunately some were drowned (hidden) (3). 19. Choral work (7). 20. The tendrils find it helpful (7). 21. This move is essential to the solution of a chess problem (3). 23. The arms of the Bourbons (6). 27. So rich, sir (anag.) (9). 28. Forcibleness (6). 29. Wedge-shaped (9). 30. What a kitten will make of a ball of wool (6). 31. This person is not necessarily methodical (9).

DOWN.—2. There are Siamese twins in this state (6). 3. Hostile incursion (6). 4. Permanent incapability of rational conduct (6). 5. This gives permission (7). 6. A tip in positive poles (9). 7. Extremes may meet, but these never do (9). 8. The opposite of proximity (9). 14. A city with only 154 inhabitants (9). 15. Eglantine (anag.) (9). 16. How all work should be done (9). 17. Tibetan ox (3). 18. His tyranny was undoubtedly the main cause of the revolution (hidden) (3). 22. Pure ice (anag.) (7). 24. Part of a gun (6). 25. Took off (6). 26. A form of cloud (6).

FARMING AND THE WAR

We print below the weekly farming bulletins from the Ministry of Agriculture and notices issued which are of special interest to farmers

THE war has come at a time of the year that gives farming the best possible opportunity to prepare for the great effort it must now make in the defence of our country. Harvest is nearly finished, and has turned out better than at one time seemed possible. Given reasonable weather, farmers will be able to push on with their normal early cultivations and supplement them with ploughing up even more land, for another 1,500,000 acres of land must be brought under the plough this coming year. It is an ambitious programme, for we are attempting in one year what we only achieved in four years in the last war.

But this time things are different. Plans are ready; food and feeding stuffs, fuel and other requisites are stored against such an emergency. We not only have 60,000 tractors in private hands, but also a reserve stock ready to be released. We enter the conflict in a far better position for ploughing up Britain than we were even at the end of 1918, when the last national effort had reached its height.

But although we have these reserve supplies and the country contains more wheat than ever it had before, we shall obviously have to nurse these stocks so that we may continue to enjoy the same feeling of confidence in any conceivable emergency that may arise out of the chances of war. The prudent producer of stock would do well to begin thinking at once about growing more of his own feeding stuffs, economising, and finding substitute rations.

BACK-END GRASS.—An effort can be made now to get live stock as far forward as possible upon the abundant grass and upon roots and green crops. A catch crop, such as rye or Italian rye grass, may still be possible on land not suited for autumn-sown corn. Surplus grass, aftermath, etc., may be made into silage even now, so can sugar beet tops. Silage is a substitute for hay, as well as for roots and straw, and there will be no great surplus of good hay next year. Cavings can be used for feeding more freely than at present.

HORSES.—Working horses should be fed to keep them fit for their work, but this can be done on a smaller allowance of concentrated food than is often used.

DAIRY CATTLE.—The milk supply must be maintained, but economies can be made by adjusting the ration to the yield and by regular checking of the ration. Particularly is this important when feeding concentrates to cows at grass. Cows should be fed as far as possible upon home-grown food such as grass, forage, crops, roots, hay, straw, oats and pulse.

OTHER CATTLE.—It is obvious that cattle with bloom will not be so numerous as in the past; in fact, to effect saving, strict economy is necessary if cake and concentrated foods are to be given to store cattle. Furthermore, the finish to which we are accustomed will not be possible in the present emergency.

SHEEP.—Sheep should be fattened as far as possible on food grown on the farm, with a minimum of cake or corn.

PIGS.—Pig-keepers might get their pigs accustomed more and more to green-stuffs, potatoes, roots, scraps and waste generally. Recent experiments have proved that a green food diet for pigs will make possible a great saving of meal.

POULTRY.—As the Minister of Agriculture pointed out in his recent broadcast appeal, the kitchen garden and allotment can provide much material unsuitable for human consumption that will help to feed poultry. But it must be properly prepared and supplemented with a properly balanced ration of mash and grain. Experiments indicate that cooked potatoes may be fed to laying hens up to at least one-sixth of their feed requirements.

GROWING VEGETABLES.—The allotment holder will be able to play an important part again in the present struggle. For the produce of an average allotment will keep a man, his wife and three children in potatoes and vegetables for 212 days out of the 365.

Local authorities are already beginning to consider extending their area of allotments, which have shrunk, unfortunately, from 1,330,000 plots in 1920 to under 900,000 in 1938.

Stockport County Borough, for example, have given a splendid lead through their parks department, which is arranging a series of demonstration vegetable plots in its parks and recreation grounds and for expert members of the Council's staff to give advice. The important thing will be to avoid a glut of vegetables in the summer and none in the winter. This is where expert advice is needed.

FUEL.—Farmers are reminded that they need fill up no special form when they need petrol or Diesel fuel for agricultural tractors, stationary engines or other machines used in farming during the present period of harvest and ploughing.

They must satisfy the supplier that they are genuinely engaged in agriculture and that the supply is needed only for farm work. Details will be required of the engines or vehicles for which the fuel is needed, and a receipt for the quantity bought will have to be signed by the purchaser.

This arrangement also covers vans and lorries operating on agricultural licence. It does not apply to farmers' private cars, or to farmers' lorries operating on carriers' licences, or permits issued by the Regional Transport Commissioners.

POTATO PRICES.—The Order, prescribing maximum prices for potatoes sold for human consumption does not apply to seed potatoes. The maximum prices are set out in detail in the schedule to the Order. It gives prices for the various varieties in each district with separate scales for sales by growers, wholesalers, and retailers respectively. With the exception of growing potatoes, potatoes must be sold by weight and in a reasonably clean condition

Examples of maximum retail prices are: In England (and in Dumfries and Kirkcudbright), 7lb. for 6d., or 1d. per lb. In Scotland (except Dumfries and Kirkcudbright), 7lb. for 5½d., or 3½lb. for 3d. The Order does not apply to Northern Ireland. The purchase and sale of potatoes should continue through the usual trade channels until further notice.

AGRICULTURAL AND ALLIED WORKERS.—Information reaching the Ministry of Agriculture and Fisheries shows that there is some uncertainty as to the position of workers in agriculture and allied industries in regard to military service. As the Minister said in his recent broadcast, those engaged in the production of food in this country have a task equally vital to national defence as that to be performed by our armed forces. By carrying on with their jobs they will be doing work of the utmost national importance.

A revised schedule of reserved occupations issued recently by the Ministry of Labour includes a very wide range of agricultural and allied workers. None of these workers if of or above the age specified in the schedule will be accepted for service in the armed forces. The schedule includes all those engaged, whether as principals or employees, in general farming, fruit farming, poultry farming, gardening, seed growing and nursery work, provided that they have reached the specified age. Generally speaking, the reservation applies to people of 21 or over. There are, however, certain exceptions in which the age of reservation is higher.

Under the general heading of horticulture, for example, working principals are reserved from the age of 21, but other categories such as workers on fruit farms and in hop gardens, foreman gardeners and general hands, jobbing gardeners, nurserymen and bulb growers, are reserved from the age of 25. In the case of ditchers, hedgers, hay cutters, trussers and similar workers, the minimum age for reservation is 30.

Among occupations allied to agriculture the schedule includes all workers other than labourers engaged in the manufacture of artificial manures and fertilisers, oil cakes and mixed animal feeding stuffs. In the fertiliser group the minimum age is 30, and in the feeding stuffs group it is 25. Similarly, those engaged in the production of agricultural machinery and implements are reserved at the ages appropriate to their several engineering occupations, as shown in the schedule. As already stated, agricultural and allied workers covered by the Ministry of Labour's schedule are reserved from service with the armed forces. It is in the national interest that they should carry on with their present jobs.

ANSWERS TO CORRESPONDENTS

Country House

Identification of Tree.—The specimen sent was from *Cryptomeria elegans*, a native of China and Japan, where it grows from 100ft. to 180ft., and is much used for timber. It was introduced to this country in 1842 and again in quantity by Fortune in 1844. We know of someone who has raised some hundreds of seedlings, some of which are now 40ft. high. One specimen tree in the same garden is over 70ft. in height. Thanks for good specimens.—*H. D. C., Weybridge.*

Identification of Trees.—1. *Aralia chinensis.* A very handsome foliage plant or small tree, sometimes 30ft. or more high. When grown as a shrub in rich ground the leaves are very large. It is a native of China and Japan, and was introduced in 1865. It is easily propagated from suckers. 2. *Juglans Sieboldiana.* This tree reaches a height of 50ft. or more. It is a native of Japan, and was introduced about 1860 by Siebold. In Japan the nuts are used as food. 3. *Pterocarya caucasica.* A handsome tree growing 20ft.–40ft. high, sometimes sold under the name of *P. fraxinifolia.* It is a native of the Caucasus, and grows freely under the same conditions as the walnuts. The trees sometimes sucker very freely.—*P. G. L., Abinsouth.*

Juniper Trees.—Junipers on downs, &c., have usually originated as seedlings, and have fewer and less fibrous roots than those which have been transplanted in a nursery. They are, therefore, less likely to withstand removal. The smaller plants from 1ft. to 2ft. high are the most likely to transplant successfully. In September label inconspicuously those you wish to remove to enable you to distinguish them a year hence, then cut the roots by pushing a sharp spade or grafter in on the slope at a reasonable distance from the plant—about 9in. away from the stem of a plant 12in. high. Continue until the plant is encircled, the cuts meeting under at a depth of 9in.—often less in stony or chalky ground. All coarse roots will now be severed. During the following year young roots will form and the plant can be successfully transplanted in early autumn.—*C. H., near Coventry.*

Garden

Hormones to Assist the Rooting of Cuttings.—Hormone A. is a new synthetic preparation for accelerating and stimulating root growth. It is prepared by the British Dyestuffs Corporation, Ltd., a subsidiary company of Imperial Chemical Industries, Ltd. You can obtain it from their sale office, 12, Dawson Street, Dublin, C.8. Follow the instructions closely and we do not think you will be disappointed in the result.—*I. R., Co. Tyrone.*

Hunting

Horse Breeding.—The following are the names and addresses of the horse-breeding societies for which you ask: The Arab Horse Society, Spring Hill, Capel St. Mary, Ipswich, Suffolk; Clydesdale Horse Society, 93, Hope Street, Glasgow, C.2; Fell Pony Society, Birkett Bank, Threlkeld, near Keswick; the National Pony Society, 12, Hanover Square, London, W.1; the Shetland Pony Stud Book Society, 3, Golden Square, Aberdeen; the Shire Horse Society, 12, Hanover Square, W.1; and the Welsh Pony and Cob Society, Queen Buildings, Queen Street, Wrexham.—*D. A., Northampton.*

Hunting in War.—At any rate for the first few months after the outbreak of war, there would, it is understood, be no official discouragement of hunting. The War Office has, it is believed, made arrangements to take over the greater number of hunters, but sufficient would be left to enable the majority of Hunts to carry on. These horses would be taken over only in the event of a long war and if the situation demanded them. It is not anticipated that, in the first few months, there will be any difficulty in securing sufficient supplies of hound feed. These are the present arrangements, but what would actually happen cannot be stated with any certainty.—*L. B., Durham.*

Kennel

Follicular Mange.—This is a stubborn complaint that is more often than not incurable. You might give a trial to the veterinary preparation of T.C.P., which is clean and easily applied. We have heard of a dog being cured by that.—*D. N. R., Chelmsford.*

Bullmastiff.—These dogs vary a good deal in disposition, and much depends upon the manner in which they are trained. They can be made intelligent and delightful companions, and they are usually good tempered with their owners. We have met some that are not over-dependable with strangers and other dogs, but that is often because they have not been properly trained when young. They are powerfully built and active for their weight, which is from 90lb. to 110lb. They run from 26in. to 28in. in height, and are squarely built with capacious ribs. Colour, fawn, red or brindle.—*C. R., N. Cornwall.*

Naturalist

Butterfly Identified.—The butterfly is the variety of the green-veined white, known as var. *brytonia*, an Alpine form of the female. Occasionally Irish specimens are similarly coloured.

Post-Mortem Examinations

Egg Peritonitis.—Rupture following upon obstruction of the egg duct proved fatal to two hens from different correspondents. In each case the birds were excessively fat. Laying stock should be kept lean and active. If kept in wired runs they should be provided with an abundance of straw and chaff as litter among which their grain feed is scattered. The scratching for their food keeps the birds active; sluggish birds are receiving too much food. Laying stock on free range should not be given so much sloppy food that they keep around the house instead of foraging over the field actively searching and scratching for insects and seeds.—*J. H. L., Somerset; D. M. A., Suffolk.*

Coccidiosis of Wild Rabbit.—A young wild rabbit which had been shot was emaciated and its liver was full of white spots, the result of the germ infection of the bowels and liver known as coccidiosis. This disease is spread through the droppings contaminating the ground. Our correspondent reported that most of his young rabbits when cut open show the same kind of livers, which his keeper suspects to be tuberculosis. Almost invariably the spotty liver of thin rabbits is due to coccidiosis, tuberculosis being a very uncommon disease of wild rabbits. The infected carcases should be burned. Our correspondent is advised to destroy all the rabbits on the infected part of the estate; to dig in their warrens; and to burn the ground about the warrens or dress it heavily with quicklime.—*R. L. B., Strathspey.*

Shooting

Use of Nitro Powders in Old Gun.—The various bulk nitro powders give similar ballistics, measure for measure, and unless your gun has been nitro proved it cannot be said that it is safe to use any such powders in it.—*A. M., Ryde.*

Long Barrels and Shooting Low.—In reply we would state that guns, irrespective of barrel length, are generally made to centre the shot charge on the point of aim at 40yds. In the case of 25in. barrelled weapons, there may, however, be a tendency to deliver the charge slightly higher. It is incorrect, therefore, to say that barrels of 30in. shoot low. What may be meant is that some persons, when using the longer barrels, shoot low through not extending their left arm sufficiently far forward. But this is not due to the weapon.—*R. H. H., Uxborough, Ivybridge, Devon.*

Cartridge Tests

Your No. 4 and No. 8 shot cartridges gave good regular results, pressure recoil and velocity being up to standard, they are certainly perfectly safe to use and should prove effective at all normal ranges. The ballistics of both lots were practically identical.—*L. A. W., Woodbridge.*

VOICES ON THE AIR

WITH the wireless operating in a land where no one may say what shall or shall not be heard from our sets there is opportunity to analyse the utterances of those who are working for or against us. First take the propagandist on the other side of the North Sea who, speaking with a cultured English accent, is so hard at it to undermine confidence in this country and influence foreigners who understand our tongue. He is not a very important person, for his views are so coloured that in his exuberance he defeats his own purpose. An overpainted picture ceases to be a work of art. Nothing but ridicule results from assuring listeners that Mr. Winston Churchill gave orders for the sinking of the Athenia or that the First Lord of the Admiralty engineered the plot to assassinate M. Calinescu. The emotional note was sounded last week by Countess Zeppelin and, as a writer in the *Sunday Times* observes, her concluding remark: "You have been listening to Countess Zeppelin, a name *which is familiar to you all*," might have been put more tactfully.

It is when we come to the leaders of Germany that interest increases. We have heard Hitler and Goering. The latter spoke with all the truculence of the Fuehrer we once knew in a Chamberlain Hymn of Hate and, as part of the campaign to separate France and England, brought out the now very much worn-out gibe that Britain would fight till the last Frenchman. M. Sauerwein quotes one section of the Goering speech in which he says that for the first time the German people were told the price of peace was—Hitler. "We want peace, but the price of peace our Leader is not to be thought of." The commentator draws a comparison with Mark Antony—"And Hitler is an honourable man." Goering's speech on the whole was what was expected from him and no one was surprised.

But the surprise was furnished by Hitler. The voice was not that to which we have been accustomed. True the scream was there on occasion, but in the main the tone was in a low key, almost inaudible at times. It was the voice of an old man, a man under strain, and it betokened uncertainty. The Ministry of Information is to be congratulated on the promptitude with which the misleading statements concerning Poland were nailed down by the recording of former speeches on relations with that country and also previous views Hitler had held on Russia. Quite apart from the political side of his speech there was underlying fear in Hitler's defensive attitude: fear of the prolongation of war once Germany's quick triumph over Poland had been achieved, if, in the light of later events, that can even be deemed a triumph. There was underlying fear, too, in the over-emphasis that the Germans had been so well drilled that they could not conceive any form of Government possible except that ordained by Hitler.

Were the Germans able to analyse events, and some of them may secretly be occupied in doing so, they would see the Dead Hand wherever Nazi-ism had cast its shadow. In the apprehension of free countries to be condemned to produce what Germany requires in exchange for whatever she likes to give them; in the killing of the traditional spirit of the Austrian people; in the rape of Czecho-Slovakia and the wholesale destruction of its many once flourishing enterprises.

As a relief from German hates and propaganda came President Roosevelt's virile voice from across the Atlantic urging the repeal of the Arms Embargo Act. While the President put forward a peace policy for the United States he showed clearly enough that he was opposed to "the forces which assault the foundations of civilisation" and of laws which might operate unevenly and unfairly, and actually give aid to an aggressor while denying it to the victim. There was no attempt to disguise benefits which the United States' vast army of unemployed might reap, but there was definite recognition of the rights of a naval Power. Under the Act, a land Power which threatened war, said the President, "could feel assured, assured in advance that any prospective sea-Power antagonist would be weakened through denial of its ancient right to bring anything anywhere." The measure four years ago began to give a definite advantage to one belligerent against another, not through his own strength or geographical position, but through an affirmative act on the part of the United States. To those who looked to America for a sign the President's voice held an inspiration which his words lack in cold print.

And now we come to the Home Front and Sir Samuel Hoare's delivery on this situation. We looked to it to clarify many problems and, without disloyalty, it may be said that his words borne over the air lacked the encouragement they were doubtless intended to convey. It seemed almost a speech of pious hope from a Minister out of touch with realities. No Briton needs to be told of the fortitude, courage and endurance required to face a struggle which may be of long duration. The British people have shown in the past and will show again that they can be counted upon to put forth the necessary effort to achieve victory. But they now need practical measures to cope with situations which have arisen. The meeting of the demands of rents, rates, taxes, mortgages and insurances are matters of vital importance which should engage the very earnest attention of the Government.

LEISURE HOURS

RELAXATION is of the utmost importance if we are to do our several jobs to the best of our ability. In normal times this country is very well catered for so far as amusements are concerned, both by day and by night. In war time relaxation and amusement—the two words should be synonymous—assume the proportions of a problem.

Cinemas, theatres, music-halls are open again (though not running at full pressure) more or less throughout the country. But not everyone wishes, particularly in these times of Stygian darkness, to go out at night—and few people wish to go to the cinema, few indeed, can afford to do so, more than once a week. The hours between 6 p.m., when work normally is ended for the day, and bedtime must be filled somehow. Walking is now almost impossible, and certainly dangerous. Restaurants—in the provinces at least—are not open. Dances are few and far between. In these circumstances the book publishers, if they seize the opportunity, should do a roaring trade, particularly with light fiction at a very moderate price. Books can be more than friends.

There remain for the general public the afternoons—early closing day, Saturday and Sunday afternoons. The long hours from 1 p.m. till bedtime. In peace time there was always football or cricket or speedway racing; always some competitive sport to draw its thousands. In war time, what?

There can still be football, both Association and Rugby. But it will necessarily have to be uncompetitive. The "friendly" game has never attracted crowds so far as professional football is concerned—and will not attract crowds, even in war time. It does not matter what sort of competition is arranged—area or regional—the real competitive spirit has gone. And with it the interest.

Something, however, must be done. A nation cannot work at top pressure day after day without some relaxation. Hours of leisure, if they are not adequately filled, become hours of danger.

In these circumstances may we again draw attention to the English countryside? There is still quite a lot of it left. It can provide, and does provide for those who seek it, quiet and relaxation, exercise and health. It is true that we are so urbanised as a nation that the majority of people have no knowledge of the countryside and the things and creatures that are in it. It is true, too, that the majority have absolutely no desire to learn about them.

But it is also true that we can all walk; that most of us appreciate beauty; that we all like fresh air when we can find it; that we all in our leisure hours want something to do. The countryside can provide all these things; and the countryside is cheap. Of recent years more and more of our young people have taken to "hiking" to riding incredible distances on bicycles, to walking when they cannot ride. Their activities have not always met with the approval of those who own land, but their activities have certainly been beneficial to them and, we think, to the country as a whole. Those young people will no doubt continue to find their amusement in the same way. Might not the movement be extended to those a little older? The railway companies and local 'bus services—even perhaps the Ministry of Information—could help enormously.

And the country would benefit.

NEWS FROM THE FRONT

We have heard a very great deal about the inadequacy of a war news service, and sympathies can be extended to a daily Press, which has to enlarge upon the stop press item of the day before yesterday in the late edition of the day after to-morrow. The military authorities are obviously keeping a tight hand on information, and the staff has distinct limitations when it comes into contact with civilian psychology. There are many of us who realise that little news can be expected from the Western front unless there is some major development, but there seems to be a good deal of propaganda from the German side as to the massing of troops and aeroplanes, and naturally there is an inclination on the part of the public to know what is being done about it. What many intelligent people require is a decent map mentioning the places described in an official report, and, with knowledge of the last war, they can work things out for themselves. What they do not want and what they will get is "our special correspondent's" elaborations and pen pictures. It is policy not to have spared us bad news, as suppression of any disaster leads to rumours and magnifications. We had an example in 1914 of the unfortunate effects of holding back the truth.

FOOD CONTROL OFFICIALS

Signs are not wanting that systems of food control will have to be organised by men who know their businesses, and the peculiar needs of the various retailers. It is too much to expect that everyone will be satisfied or that individual needs can be met, but the food is there and some sort of discrimination can be exercised in the way in which it is distributed. The attack on bureaucratic methods made in Parliament was not without justification, and the call for practical men to handle affairs which immediately concern them instead of civil servants who have no conception of the tasks before them is plain common sense. The fish distribution scheme was not inspired. We should have learnt from the last war the machinery required, and we should also have profited by errors. One thing that is demanded of an official who has to make direct contact with food providers is tact, courtesy and decision. Tradesmen who have little leisure to spare, should not be made to wait for many hours in queues, and then have to leave without satisfaction. The public, too, will have to be considered; they suffered needlessly at the hands of many little Jacks in Office during the last war.

A COUNTRYMAN'S JOURNAL

THE other day I read in the *Countryman* a proposal by Sir Daniel Hall to set up a "Commission" "on similar lines" to the Forestry Commission for the encouragement of "joint stock enterprise" in the "rehabilitation" of the land. Whatever criticism the Forestry Commission has received, he remarks, "it can point to the trees growing." Yes and what kinds of trees? As everybody knows, the vast majority are foreign conifers. The gloom of these forests, their deathly silence and their absence of life, their disharmony with the particular values of English country, the Teutonization of our wild places as though Black Forest regiments were in permanent occupation of it and forever drawn up in line upon its traditional acres, all lovers of our countryside are aware of this. It is doubtful whether they are so well aware of what these Teuton woods have done to the thriving sheep-farming of the Lake District, displacing 4,000 Herdwicks, the hardy sheep whose wool and mutton are of the finest, and threatening 2,000 more.

In his advocacy of "joint stock enterprise" to be applied to English land, Sir Daniel Hall adduces an even more unfortunate analogy for our admiration. "The structure of the industry," he writes, "would change insensibly as the single-man businesses became exchanged for the large-scale farmer-managers and their lieutenants. Just in the same way, handloom-weaving grew into small mills and then into great manufacturing corporations, all to the gain of efficiency and of the *general well-being of both masters and workers* (italics mine)"

Glance then at this, one of the first great victories of mechanical progress, as revealed in the pages of Ashley's *Early History of the English Woollen Industry* and Morris and Wood's *The Golden Fleece*. The wool trade that made England's fortune in the fourteenth century was controlled by craft-guilds in which masters, workers and shopkeepers were integral parts of a single fraternity. Selling prices were fixed not by supply and demand but by what was considered a fair price. Since the guild members were all brothers, there was no competition and no cornering ("engrossing"). It was not considered honourable to take advantage of another man's necessity by charging exorbitant prices, and the object of the guild was to produce honest work at a fair price for the good of all. There was no over-specialisation (since every man worked at all the processes of the craft) and no division between capital and labour.

This was mediæval economy and it was broken by the Tudor suppression of the guilds and by the enclosing of the common lands for grazing, so that two shepherds covered the same area of land as forty husbandmen. The great More has left immortal testimony of the evils this new system generated. The next step was that the middleman-weaver (Jack of Newbury is one example, Sir Giles Overreach another whose names have survived in literature) became the first factory-master, procuring his labour more and more exclusively by means of "hands" who (or perhaps I should say which) had lost their fields and sheep and had no interest in the product. In subsequent periods, these new tendencies were accelerated and nearly all the wool-workers became the units of a machine.

The Golden Age of Progress came to the throne in the Industrial Revolution when Blake's "dark Satanic mills" employed children in the factories working thirteen hours (some of them sixteen) a day for seven days a week at a wage of 6s. They were flogged by overseers when they fell asleep for weariness, all pride in craft was swept away, quantity replaced quality, the race for wealth challenged co-operative workmanship, and the profit of a few slave-drivers the cheerful livelihood and responsibility of the many.

This is the actual history of the transformation of handloom-weaving into great corporations "all to the gain of efficiency and of the general well-being of masters and workers." Sir Daniel Hall could scarcely have chosen an example more damning to his plea for controlling agriculture by "joint stock enterprise" ultimately protected by the State.

Are we to Teutonize our farming community as we have already done our forest lands? The most completely mechanised nations in Europe to-day are Germany and Russia—fit allies; let us beware lest in confronting the dragon of automatism our spirit is not scorched by its breath and withers. For that is the danger to all Europe, the mechanisation of the human spirit, and the spectacle of what degradation it can lead to is a lesson to be well learned.

H. J. MASSINGHAM.

WITHOUT COMMENT

From a Sunday newspaper:

"Mr. Jim Vincent—who is in charge of the sanctuary—and I are now trying to get back ruffs and reeves, eversetts and spoonbills."

SHOULD AUTUMN SALMON FISHING BE STOPPED?

IT is well within the knowledge of middle-aged and older anglers that autumn used to be the season when we looked for the greater part of our sport. But times have changed and, with the restricted number of districts where autumn salmon now run, opinion generally has also changed regarding salmon fishing of all kinds at this season. So much is this the case that one of the best-known and most respected men in the fishing world has recently written to the Press urging the immediate cessation of sport with a view to the preservation of the spawning stock and an increase in the number of salmon in future years. Thirty years ago such an appeal would have met with instant criticism and a great deal of condemnation; indeed, it probably would never have been made. At present it seems to have evoked little or no open comment.

Whether one agrees with the desirability or otherwise of curtailing fishing in the autumn would seem still to depend upon the river or rivers in which one may fish. One knows that in very many rivers—in fact, one may say in most rivers—only spring and summer salmon and grilse are now to be found; the number which enter from the sea after, say, the middle of August, is quite negligible. Nearly all the rivers of the North of Scotland, most of those in the West of Scotland and in England, Wales and Ireland fall into this category.

On the other hand, in spite of the changes which have occurred, autumn salmon have not disappeared from all rivers; they still exist in some, although it may be that even in these they are in very much reduced numbers. In many cases the position is met, or at least partially met, by a more or less suitably early end to the statutory season. In other cases the statutory season is a relic of the times when conditions were considerably removed from those which now obtain. In some districts the close time may commence at the end of September, in others at some date between then and the middle or even end of October.

The critics of autumn fishing, however, may, and indeed do, regard fishing even in September as undesirable and detrimental to the general interests of the river. Whether that opinion will be subscribed to by all anglers, and particularly by those accustomed to fish in rivers where autumn fish are still to be found, is very much open to doubt. In some cases there can, of course, be no two opinions as to the right course to pursue. In some rivers a few salmon may be spawning at, or very soon after, the end of September; in these rivers there may be no late fish and spawning may actually be finished in November. No sportsman wants to catch such fish in September, and indeed in August discrimination may be required between those which are landed and those which are killed.

In very many other rivers a corresponding state of affairs obtains in the upper waters where the early fish, now red, black, brown and green, are concentrated preparatory to laying their eggs. From these early-running and early-spawning fish there is, however, a gradation to the later-running and later-spawning creatures; among the grilse, for instance, those which arrived in June will be much more discoloured, much riper and much less fit for food, than those which did not leave the sea until August. In the old days in the Spey, grilse continued to arrive from salt water at least up to October and, pace the critics of autumn angling, it was difficult to distinguish some of these from the first of the following year's crop of spring salmon which were arriving in small numbers at practically the same time.

Unfortunately in these days the run of late grilse, and larger fish, too, into the Spey, as in so many other rivers, has practically disappeared. Consequently, with opportunities for seeing the real thing so much restricted, and with autumn angling replaced by spring fishing for so many anglers, very few fishermen now ever see a real autumn salmon: with others the memory of the autumn fish is prone to be a little blurred by time. Their very scarcity is apt to lead to the opinion and statement that real autumn salmon do not now exist. But in certain rivers, notably Tweed, Tay and some between Tay and Spey, they are still to be found, and, if weather and water be kind, are still to be caught by those willing to go out in search of them.

A genuine autumn salmon is a very different fish from a stale and ripe springer or grilse, and so, from its life history, it ought to be. While the spring fish have been maturing and fasting, the autumn salmon have been feeding and growing in the sea. Instead of living on their fat, they have been storing fat. While developing their genital organs (their date of maturity is perhaps three months later than that of the springers) the demands, it would appear, have been met directly from food intake and not from the body reserves. Consequently, since body growth and genitalia development have proceeded concurrently, and the date of spawning is delayed, the appearance of these fish and the condition of their fish is very different from that of the discoloured, almost ripe, fish in the river.

Here it should perhaps be mentioned that, prolonged drought may delay the ascent of summer fish; it is on record that their ascent into fresh water may be delayed even until September. But these ceased feeding before reaching the coast; while waiting they have degenerated as they would have degenerated in fresh water and for practical purposes they are still summer, and not genuine autumn, fish. The latter, when leaving the sea, are fully bright and silvery; they may be slightly more rotund than a spring fish, but otherwise it is exceedingly difficult, and in many cases may be almost impossible, to distinguish them without dissection from a real spring, or winter, fish taken at the same time and which will not spawn for a year.

For eating there is nothing wrong with an autumn salmon: it may be not quite so firm as a springer, but, when eaten close to the place of capture, as is normally the case, it is at least as good as the average salmon throughout the year from a fishmonger's shop. For sport it is as good as a fish at any other season. It perhaps suffers from the fact that, with falling temperature, one can afford to use heavy gear, but one also uses heavy gear in the early spring and heavy fish, among which many autumn salmon have to be classed, are never so lively or so active as the smaller-sized group. In fact, a good autumn fish is the equal of a good average fish of any other class, whether at the end of a line, in appearance or on the table.

Quite apart from other considerations such as whether autumn fish breed only autumn fish, is it desirable to restrict or abandon the catching of these fish in good condition, particularly at this time and in the immediately following years when it would appear that every available item of food may be of value?

The question is certainly complicated by the fact that if one goes fishing one's catch is unlikely to be restricted to this class alone, and that, unlike spring fishing, when there is a clear and unmistakable division between clean fish and kelts and rawners, there is, and cannot be, any definite line of demarcation between what is desirable and what is undesirable. There will be a gradation from one end of the scale to the other.

The decision as to what ought or ought not to be kept has to be left to the sportsman, although there must inevitably be a minority to whom a fish is a fish and some more who may be overruled by their gillies to whom the number in the bag is everything. In general, however, clean autumn fish and stale spring and summer fish are not found intermingled to any great extent. The former are in the lower and the latter in the upper half of the rivers. If late angling could be restricted to the part nearer the sea, objections would seem to be met almost completely, and the way open without harm to a very small, but desirable, addition to the food supply.

PISCATOR SENIOR.

"THERE THEY GO, THE BEAUTIES!"—THE V.W.H. (EARL BATHURST'S) AT KEMBLE WICK

THOUGHTS ON A CUB-HUNTING MORNING

By ROBERT COLVILLE

A FORTNIGHT ago we used to meet a vast number of people who maintained that the outbreak of war would mean the end of hunting in any shape or form in this country. Reports from widely-scattered hunts have now proved this gloomy forecast to be wrong, and have also shown the folly of dogmatic statement as to what is going to happen anywhere at any time during the present war.

But though hunting is to continue, there must clearly be many alterations and provisions for possible developments which it is impossible to foresee with any accuracy, and I must confess that it was with more than a purely sporting interest that I set out the other day for a cubbing appointment in Sussex.

The changed conditions met me at the stables where I hired my horse. A number of horses had been requisitioned, but sufficient had been left to enable the owner to carry on, and he was loud in his praises of the Remount Department's generosity.

It was quite dark when we set out over the Downs, and when the light did come it showed a sky across which large banks of cloud were being driven by a blustering wind. It was sufficiently cold to make a good scent improbable.

We got to the meet in time for some preliminary conversation, and I learnt that about half the pack had been put down. A number of the hunt horses had gone, but five had been left. One of the Joint Masters was on the point of leaving for France, but his colleague was carrying on. The general determination seemed to be to continue hunting as long as possible.

Then we moved off and forgot all about Hitler. The scent was non-existent and several covers were drawn blank. But hounds finally put up a cub and we went through the ritual of trotting up and down the cover for some half an hour until he was killed. Another covert near by held a cub, but scent was so bad that he was never caught, although he frequently ran past hounds about 2ft. from the leader.

All the time three foxes were on the move in an adjoining valley, and hounds were taken there, but without success. There were quite sufficient people out to watch the covers, and some very fine horses, some of which were being schooled to the job. One ran fourth in the Grand National a few years ago.

A most curious thing happened on the way home. We were crossing a rough field at the foot of the Downs, and about 50yds. from the main road, when we almost rode over a dog fox. What he was doing there at 12.30 p.m. I cannot imagine, as the nearest cover was at least a mile away.

The impressions which I gained during this morning's cubbing, coupled with information which correspondents have very kindly sent to the *Field*, make it quite certain that hunting will continue at all events for the greater part of this season. Last week we published an article showing how expenses could be cut down, and elsewhere in this issue appear the plans of various hunts by which they hope to be able to carry on.

Admittedly the war has not yet touched this country with sufficient closeness to enable us to judge its final effect. But I think that the attitude that every sporting activity is sure to come to an end is to be deprecated. After all, however much sections of the popular Press may express the hope that this war will see the end of hunting, the sport remains a national industry and is an important part of that national life which we have repeatedly been encouraged to carry on.

And equally important is it, I think, that hunting should go on from the point of view of the nation's morale. It will be interesting and instructive to find out how many of the men and women who are really doing things at the moment are distinguished in the hunting field. Certainly the knowledge that hunting is going on at home will have the most heartening effect on men serving abroad.

Nor does this, at the moment, seem to be impossible. The War Office is evidently determined to leave a sufficient number of hunt horses in each hunt, and even if hunting days have to be cut down, hunting can be continued after a fashion. There is, also, plenty of hound feed available, and now that the majority of hunts have halved their packs it should not be necessary to destroy many more.

Many Masters have, of course, already left their countries, and a great number of hunt servants are of military age, though they may not have been called up yet. No one has yet really any idea of the effect of the war, but it seems reasonable to hope that a sufficient number of people will be left to hunt hounds and to follow them. Each hunt must be guided by its local conditions.

The question of foxes is more difficult. From present information there seems to be many litters in most countries. If foxes have to be kept down by other measures it is very much to be hoped that a general massacre, carried out by unqualified persons, will not be permitted.

Sacrifice will be demanded from farmers, who will not be able, in most cases, to make further claims on poultry funds. They should, I think, be allowed to use their own judgment to a large extent, and certainly all those who are sufficiently fortunate to be able to hunt should do so with an extra care for farming interests.

There will, I am confident, be no serious difficulty about this. The co-operation between hunts and farmers is quite strong enough to overcome it. We are fighting to retain much of the English scene, and hunting in all its many senses and connections is an integral part of English life and tradition.

HOUNDS COMING OUT OF COVERT

The Bramham Moor, with their huntsman, T. Davies, at Scarcroft Woods

A HUNTING MEMORY OF 1918

By CHARLES C. DALLAS

ORDERS had been given that all hunting should cease early in March, and on the 2nd we had our last day. Hounds met in the village, the fixture being made to deal with some foxes that had become poultry fanciers.

Though there was bright sun the cold was intense, and so hard the ground at 9 o'clock, that it seemed doubtful if hunting would be possible. The sun, however, had got a bit of warmth in it, and by 11 o'clock the ground had thawed enough to make it quite rideable.

The acting Field Master was hunting hounds, and his daughter and a temporary whipper-in were helping to turn them. The very small field who met hounds at 11.30 were keen to have a good hunt for the finish. Besides the staff there were two members of the hunt present, three farmers and three ladies, but sad to relate everything seemed against us from the start. The first fox was lost in three fields, hounds coming to an unaccountable check when running well, and they were not able to recover the line or mark the fox to ground. Our second ran a ring round a big wood then crossed the railway, where some time was lost in going round to a bridge, and when we got to the pack we found them at fault and unable to carry on any further.

Then in the afternoon we found three, if not four, foxes in a big wood, and after hunting them round and round for some time, varied by two short excursions into the fields, we at last got away and everything looked as if we were in for a real good hunt.

It seemed, however, that nothing could go right on this day, for after running across a couple of fields the fox got up against some rabbit wire, and the pack being close after him, he was killed in less than ten minutes after leaving the wood. Having drawn two other places blank the Master blew his hounds out of covert, with that long winding note of the horn which denotes the end of the day.

There were only two of us left out, a farmer and myself, when hounds were drawn up at the cross roads and about to turn their heads for home.

"Well," said the Master, "I'm afraid that's the end of it, I've nowhere else to draw."

Then the farmer approached, he was one of the oldest followers of the hunt, a man who had watched the pack chase foxes under the same mastership for over fifty years. The old man had been very depressed all day and told me he feared this might be his last day's hunting, for we were all pretty well rattled during those strenuous days, and I knew he was very disappointed at not having had a better day for the finish.

"Sir," he said to the master, "this is the last day of the season, and it is quite possibly the last day any of us will hunt. The horses are fresh and hounds have not done much, and it's only just past 3 o'clock, do try again for I'd give anything just to hear them running once more."

The Master was pleased at his old friend's keenness and said, "I will try again with pleasure, Mr. S—, we will draw some of the hedgerows behind the village, and along the stream, and maybe we shall put up a fox somewhere."

So the whipper-in was sent well forward and the master turned into the grass meadow alongside the road and began to draw round the thick hedgerow that bounded it. Before he had gone half way down the first double fence there was a hollow on our left from a man driving some cows out of the adjoining field, and hounds were away to it like a flash.

An easy gap let us out and after them in quick time, and we saw the tail hounds disappearing through the opposite fence, with a cry that instantly dispelled every sad thought from the mind.

The Master was making for the fence through which the pack had just gone when there was a warning shout from the farmer.

"'Ware wire, come this way, Sir," and we made for a gate in the corner of the field leading into a lane and scuttled up it for all we were worth, the pack running along merrily on our right and, by the sound, turning our way.

"There he goes," said the Master, who had caught sight of the fox crossing the lane, and the whipper-in joined us further up it. Then we four, aided by a handy line of gates and another lane, followed the flying pack as hard as we could push our horses along, till the chase bore to the right and the fox left the vale and ran up on to the down beyond. Though we had ridden at top speed hounds were outpacing us, and when we reached the foot of the down, we saw the tail hounds just disappearing over a ridge on the sky line.

It was a stiff climb up that hill, which reduced our pace to a walk, and when we reached the top we found the pack had already crossed the hill, and we could hear them running in the vale the other side.

Then we caught sight of them crossing a newly ploughed field, and best of all heading our way. Presently the whipper-in spied the fox making for the hill again, and we watched him enter a hanging wood on the north side of it.

The Master, shouted to his whipper-in, "Get round it, Charlie, and give him a turn if you can."

So Charlie galloped off and got to the far side of the wood, where hounds were pushing their fox hard through the undergrowth, till we heard a ringing holloa, followed by a crack of the whip like a pistol shot. And now the fox met the pursuing pack and in another moment they were chasing him, probably in view, round the wood.

The Master just missed heading him as he left the wood, but the pack were close at his brush, chasing him over the open down, and gaining at every stride, till they fairly ran into him in a little hollow of the down, which tradition says was once a Roman encampment.

The hunt had lasted 30 minutes, and had been run at top speed without check or even hesitation, and four very happy men congratulated each other on the success of our final effort of the season. The last I saw of hounds they were wending their way homewards across the green down, the setting sun shining on their glossy sides and on the red coats of the Master and his whipper-in, making a picture that will never fade from my memory.

The hunt ended within a mile of my house, so I took the farmer in to give refreshment to man and horse.

On parting, I said, "Well, if this should prove to be our last hunt it has been a good one, and neither of us will ever forget it." "Don't talk of last hunts to me, young man (I am near 60 by the way)," he replied, "as long as England exists, such sport as foxhunting can never die."

Cub Hunting is thoroughly enjoyed by the children who get good practice in watching coverts

AN APPRECIATION OF THE CHUKOR

By MAJOR C. S. JARVIS

IN a recent number of the *Field* there was an interesting article on the chukor partridge in New Zealand, and in it the suggestion was made that the bird might possibly be introduced into Great Britain. With regard to this proposal, I think I shall be voicing the opinions of all those who know the chukor in condemning the idea emphatically. Those of us who have lived in the East, Near, Middle and Far, are all grateful to the chukor for the sport he has provided, and for his welcome appearance on the table as a substitute for the everlasting tough chicken of Egypt and India, but I think we shall all be agreed on the decision that he is at best only a passable substitute for the British partridge.

As the chukor is general all over Asia and in certain parts of Southern Europe, it is dangerous to generalise, for I may lay myself open to onslaught from an Eastern exile, who has been in contact with the chukor in some locality where he behaved as a partridge should behave, and where his meat from some accident of diet was superior to that of the British bird.

Generally speaking, however, the chukor is a confirmed runner rather than a flyer, and his flesh, though palatable, is not quite up to the standard of the English partridge. It is white and has the true partridge flavour, but unless the bird is very young and has been feeding on a variety of green stuff, with plenty of water available, it is apt to be slightly dry and tough. In making this statement I feel somewhat guilty as for fourteen years the chukor provided me with many excellent dinners when hot, and equally excellent breakfasts when cold, and the pursuit of him has made life worth while during the dull days of autumn. Nevertheless I think the British bird is superior in every respect, and there seems little point in trying to introduce the chukor to England even if it were possible.

At the risk of laying myself open to correction I would say that he is already here, though in diminishing numbers, for the red-legged or French partridge has precisely the same markings. As to the difference in colour, the general brown of his feathering as opposed to the sandy buff shot with mauve of the chukor may be merely the local pigmentation to suit the environment of fallow and plough instead of the rocky and sandy slopes of the East.

I do not think there are any two opinions about the red-legged in England. We give him full marks when we have nothing else, but we are all delighted if his numbers decrease and the British bird, instead of being what one might term a suppressed Sudeten minority, gets the upper hand.

There is not much that I learned about the chukor in the deserts of Egypt that is not already known, and I doubt if I can add anything to that which has already been written and said. First and foremost I would say that he is a nomad at heart and that his usual method of travelling is on foot. He flies quite as strongly and as fast as a British partridge, but he will not use his wings unless unduly pressed or suddenly surprised. I have seen coveys of chukor frequently trekking from one desert waterhole to the next, and they do it by walking along the recognised camel track, with the old cock in the van of the column and leading the march.

They are to be found always in the vicinity of wells, which are in use by the Arabs and by the side of which the birds can find a little water left in the stone drinking troughs. If there is rain-crop desert barley within reach this adds to the attraction of the site, and in Sinai they were particularly addicted to the camps of the Camel Corps, but those of the Police were not so popular. There was no question of class distinction over this; the explanation was quite simple, for the Camel Corps obtained their forage from the Government, but the Police had to find their own. While the plutocratic Camel Corps animals shoved their noses into plenty and sent the grain flying in all directions, the poor old Police camels, on much shorter rations, picked up every solitary grain with their prehensile lips.

In the article on the New Zealand chukor it is stated that they are possibly insectivorous, and this I think was proved in Sinai. Agricultural experiments here led to the damming of a small stream and some three hundred acres of irrigated corn lands in the heart of good chukor country. Here unlimited water, green herbage, and corn of all varieties were obtainable, and the chukor flocked into the valley, breeding in it, and making it their headquarters for nine months of the year.

When the autumn rains came, however, providing temporary waterholes all over the hill country, the chukor departed, and it would seem that there was only one possible explanation. As they left behind corn in plenty and a variety of green stuffs it could only be insects that they were seeking, and nine months' constant occupation by some two hundred birds of one small valley had probably denuded it of all insect life. An old cock-fighter I knew used to say that the ideal food for game fowl and all game birds was one-third grain or seed, one-third green stuff, and one-third meat or insects, and anyone who has noticed how busy ordinary poultry are in the fields just before dusk will realise what an important part insects play in their diet.

It may be of course that my chukor departed because, like the other denizens of the desert, the Arabs, they had the nomad urge, so that an annual trek of a hundred miles to fresh grounds was almost a migratory instinct. The Bedouin of to-day still do a regular journey in the autumn in search of grazing, whether they have any animals to graze or not. I knew one old man who regularly packed up and marched annually a hundred and fifty miles for the sake of one scraggy she-goat, worth about eight shillings, who looked as if she could thrive on a diet of old waterskins garnished with sand.

In that country of easy visibility, the chukor was not easy to shoot, as he always saw the guns before they saw him, and he went off at a steady four miles an hour up the nearest rocky hillside. There was seldom any hope of flushing a covey, and the procedure was for the guns to follow the birds at the same speed and to break into a spurt when the covey disappeared over a rise or went down into a gorge. The chukor never seemed to realise the fact that his pursuer would be unsporting enough to increase his speed when out of sight, but it was in this respect only that he showed lack of cunning and foresight.

In India I believe the chukor is driven with excellent results, but from what I know of the bird a successful drive would necessitate careful organisation, a large number of beaters and particularly active and intelligent flankers. The chukor is not a fool and an organised drive arouses his suspicions as to what may be waiting ahead.

On the few occasions when I attempted a drive, the birds either broke back over the beaters or streamed away to a flank. I can, however, imagine that it must be attractive sport if all goes well, for the chukor is fast and strong on the wing, and it is remarkable that a bird with such extraordinary flying powers should rely almost entirely on his legs.

One other point that I noticed about the chukor was that occasionally he roosted in trees. I must admit that the trees he selected were admirably suited for birds not adapted to perching, for they were a type of acacia, the Sunt, that grew in a dense mass at the top in umbrella shape. I have seen coveys at roosting time fly down from the hillsides and land on the tops of the trees. I cannot say that they made a normal habit of this and presume that they did it only when there had been raids by desert foxes and jackals.

In summing up, one may say that the chukor has his points. He is a most redoubtable bird and from the early days of the Empire he has played his small part in making the East seem something like home, but all the same I do not think that we require him here as a resident, unless our British partridge fails us.

CROSSING THE CANAL IN A SORT OF DECKED-IN WOODEN BATH

AN EGYPTIAN SHOOT

UP at 5.30 a.m. to dress and breakfast and it's out guns and waders and you are ready for a fifteen-mile drive to the Sweetwater Canal. Here you cross on a sort of decked-in wooden bath. There are four or five parties already at it, and while your escort and theirs are arguing, up gets a snipe and you all fire. Probably no one will manage to find it, but whichever one does wins, and the other parties withdraw until you find yourself beside them in a grand beat, or in front of them, when suddenly everything seems full of shot at once. However, this is life and five guns have had good enjoyment in getting 60 head, mostly jack snipe.

COUNTING UP THE BAG AT THE END OF THE DAY

ASPECTS OF DEER FORESTS TO-DAY

By FRANK WALLACE

DEER forests in wartime must be regarded from several different view points. It would, perhaps, be more correct to say, instead of "deer forests," the areas in which deer are found. The properly run deer forest, though hampered by war conditions, will continue on much the same lines as normally. The difficulties of getting stags and hinds into the larder will be increased, but, unless otherwise necessary, about the same number of stags and hinds will be killed.

These viewpoints may be roughly summarised under three separate headings: (1) Production; (2) Destruction; (3) Distribution.

PRODUCTION. Deer forests are a valuable source of food supply in time of war, and though so far as can be seen at present, venison is not likely to be rationed, it could furnish a very welcome addition to the ordinary meat provided for on a ration card. About 9000 to 10,000 stags are killed annually in Scotland in normal times, and though such figures might be amended under war conditions, one can safely assume that the quantity of meat, or meat represented by these figures, could be made available. A similar or larger number of hinds could be killed.

The difficulty at the moment lies in the fact that the stag shooting season is already so far advanced that the organisation necessary for rendering the whole of this supply of meat available has not yet had time to come into operation.

DESTRUCTION. Under this heading comes most of the deer producing area not properly deer forest. By deer forest, I mean land situated, generally speaking, at a comparatively high altitude which is unfit for anything but deer under present economic conditions. Such ground, if over stocked, causes an overflow on to surrounding lands, which eventually come to harbour a stock of deer. It is from this surplus stock that arise most of the complaints—often very much exaggerated—regarding damage to agricultural land. It is on these areas, if complaints arise, that reduction of deer herds should be made. It is from these areas, generally speaking, if additional supplies of venison are needed, that such a supply should come.

DISTRIBUTION. This, from a practical point of view, is possibly the most difficult problem with regard to deer forests in war time. It sounds so simple. You just go out and shoot a stag and send it in to wherever its going, and there you are!

It is quite simple up to a point. It is a fine day, a steady wind, a good light. The stalker is waiting. With him are three ponies. One for the rifle to ride. The other two for—presumably—two stags. Two gillies are waiting and a third is ready to look after the ponies when deer are seen. Off they go. Deer are seen. A stalk is made. A stag is killed. The gillie drags it down the hill to the path at the bottom of the glen, where the pony is waiting. The stalker and rifle with the other gillie repeat the performance.

Everything has gone beautifully. The rifle is back in the lodge, having a hot bath by 6.30, and the stags are skinned and hung up in the larder before dinner. That is the normal picture.

Supposing, even if it is peace time, that something goes wrong. The wind changes, mist blows up. It starts to rain. Someone over the march moves a herd of deer which alarms anything on his neighbour's ground (an unlikely supposition, I admit, but a possibility). The rifle might even miss. The day ends in failure. There are not two stags in the larder, but only a very disappointed, or bad tempered rifle, thinking up excuses as he dresses for dinner. It does not matter very much, the day has been blank and there the matter ends.

In war time, it may still be comparatively easy for a stag actually to be killed. There, the similarity with the peace-time picture ends.

Instead of a stalker, rifle, three gillies and ponies, there will more likely be the stalker, his aged father who has reappeared from well-earned retirement to lend what help he can, no gillie, a patriarchal pony and a rifle of uncertain age. A stag may be killed. The rifle and stalkers laboriously drag it to the pony—anyone who has ever dragged a stag over rough ground will appreciate what this means—and it is taken back to the larder. A dozen separate factors may render the killing of a second stag impossible.

Having got a stag to the larder what is to be done with it? Arrangements have to be made, if the venison is not distributed locally for it to be disposed of. The larder may be miles from a road or railway. Venison will not keep for ever. Petrol cannot be obtained. Plans will have to be made a long time ahead, involving a number of separate individuals, the whole of whose co-operation may be thrown out of gear by a shower of rain.

The chief problems to be faced are the lack of gillies, and ponies, and the difficulty in getting supplies of petrol. In the last war "to end wars," a Venison Supply Association came into being, the management of which was eventually undertaken entirely by the late Hon. Douglas Cairns. Unfortunately his records appear to have been destroyed and no details are available. The Duke of Portland, in his book *Fifty Years of Sport and Nine in Scotland*, gives some interesting figures. Out of a total of 67,438lbs. of venison killed at Langwell and Braemore during the war, 43,781 lbs. was available for human consumption, rather more than half being distributed locally and the remainder sold and the profits handed over to hospitals and charities.

The killing of deer in war-time is a very much more difficult matter than under normal conditions. It is no use giving even a good shot instructions to go out and kill a stag. Unless he knows the ground intimately he would have small chance of doing so. It is essential that deer should be killed as otherwise their already swollen numbers will increase, in certain districts, to such an extent that serious damage will be done to agricultural land. The difficulty will be to ensure that the right deer are killed, that such venison is not wasted, and that the deer killed are killed in those localities where their absence is right and proper. There are still, in spite of political propaganda, very large areas of land in Scotland which are not suited for the production of anything but deer. No doubt an increased stock of sheep can be maintained in certain areas, though whether on sound economic basis it is difficult to say.

The only part of Scotland with any sort of organisation for dealing with deer is at present Ross-shire, and the Deer Association here comprises nearly every proprietor in the county. They are to be congratulated on having had the foresight to create such an organisation.

At present the only action possible for owners and tenants of forests to take seems to be to carry on as far as is possible normally. To kill as nearly as possible the normal number of stags, distributing the venison locally or to whatever quarter it is usually sent.

The great problem to overcome, as I have said, is the whole system of distribution. It seems certain that some sort of scheme will have to be officially adopted for dealing with the serious aspects of the deer problem and that such action cannot have time to function with complete efficiency before the end of the present stalking season. Attempts have already been made and questionnaires sent to proprietors and tenants. There, pending official action, the matter stands. No doubt before the hind shooting season starts, the necessary arrangements will have been made as regards killing, distribution, cold storage, &c. If I, personally, owned a deer forest, I should concentrate on the killing of bad deer of both sexes and hope for better times.

On one point some owners seem apprehensive. That is the entry of duly authorised persons on to their land, with or without their consent for the purpose of killing deer. I do not think there is much ground for their alarm, nor do I think compulsion likely save in very exceptional cases. It seems to me that one of the few cases where compulsory powers might be useful is in the case of a forest where no owner or tenant is present and where no arrangements have been made for deer to be shot. Such ground would inevitably become a sanctuary for deer from all the surrounding forests where they might remain in safety for as long as they liked. No one who knows deer will imagine that they would do otherwise, nor that in a very short space of time they would discover where immunity could be enjoyed.

Most of my remarks in these notes refer to stags only. Hinds are a separate matter which will need a considerable amount of attention and thought.

"A STALK IS MADE. A STAG IS KILLED"

GIVE IT TO ME! THE HEN IS DETERMINED THAT SHE ALONE SHALL FEED THE YOUNGSTERS

SHE INVARIABLY HAS HER WAY, THE COCK BEING MERELY A SPECTATOR AT THE FEAST

SEE WHAT I'VE BROUGHT THIS TIME! SOMETHING REALLY GOOD

A BIRDLAND COMEDY

By GUY B. FARRAR

IT is seldom that one can obtain a set of photographs showing the female taking food from the male before giving it to the young, but at this particular nest of meadow pipits, the hen was quite determined that she alone should feed the chicks.

The cock, on the other hand, was obviously anxious to do his share, so a very amusing little comedy ensued.

Each time he arrived at the nest—his visits occurred every few minutes—he waited for his lady to move aside and allow him to feed the family. She, on her part, obstinately refused to budge and tried her hardest to take the insects or larvæ from him. In the end she invariably had her way, the cock being merely a spectator at the feast.

About mid-day she left the nest and, much to my surprise, indulged in a dust bath in a nearby patch of blown sand. This was the cock's opportunity.

But while he was feeding the nestlings the hen returned and, seeing what had happened, regarded him with the utmost suspicion, obviously having grave doubts as to his ability to minister to the young.

For the rest of the day she remained at the nest, never allowing him another chance of usurping her prerogative. The cock philosophically accepted the situation, resigning himself to the rôle of food provider.

THE SPIDER'S NEST IS SOON EATEN BY FOUR HUNGRY YOUNG MEADOW PIPITS

WHEN THE HEN IS AWAY THE COCK TAKES THE OPPORTUNITY OF FEEDING HIS FAMILY

ON HER RETURN THE HEN REGARDS HIM WITH SUSPICION, HAVING GRAVE DOUBTS AS TO HIS ABILITY TO MINISTER TO THE YOUNG

LETTERS TO YOUNG FLY FISHERS

XIV.—Coarse Fish as Fly Takers

MY DEAR BOB,—I am sorry to hear that the plan for transferring you to the Welsh border has fallen through. If you go to Huntingdonshire you will not get any grayling fishing; at all events I cannot remember at the moment any stream thereabouts where grayling thrive, though attempts are always being made to introduce them to new coarse-fishing waters. Still, you will find plenty of fishing, and if it were summer time plenty of fly fishing. Were you going to be there longer I should recommend you to obtain coarse-fishing rods and tackle, but a sojourn of such uncertain length, and your preference for the fly rod in more normal times, hardly justifies the outlay; so I think you had best do what you can with your trout-fishing tackle, which needs no alteration for the capture of coarse fish, except in the patterns of fly.

First to answer your question about the names of "coarse fish." This is a term which is applied nowadays to all freshwater fish other than salmon and trout. Whether it does or does not include grayling I must leave to the controversialists. A generation or so ago fish were divided into two categories, "game" and "coarse," and it caused endless argument over such fish as grayling and pike, which are certainly "game" fish in the popular sense of the term—a fish which fights gamely when hooked—but not in the original meaning of the name, which was, I believe, a fish protected by game laws. But, as far as you are concerned, the coarse fish in angler's language are: pike, perch, bream, carp, roach, rudd, dace, tench and barbel, with some small species such as gudgeon, bleak, minnows and so forth, which are only of interest to most anglers when used as bait.

Of these, only three are of much interest to the fly fisher—dace, chub and rudd—though some of the others will take a fly after a fashion.

Of the three the most persistent fly taker is the dace. You know what a roach looks like, I expect? Our national fish is usually known to anyone who has lived by a slow-flowing river as a boy. A dace is very much like a roach in a general way, but is much slimmer, has not the red fins or orange eye of a roach, and is not, as a rule, quite so silvery. It looks as if its silver had been washed over with some kind of anti-tarnish material.

These little chaps (they seldom exceed half-a-pound except in trout waters) are to be found in shoals on the shallows of most coarse-fishing rivers, and will take a fly readily at times. I remember a stretch of the Thames on the Isleworth shore opposite Kew Gardens, where very good dace fishing could be had on the last two hours of the ebb tide. It is a great many years since I fished there, but I have no doubt that the shoals of dace are still in the river.

One had to wade knee deep to get at the best runs, and as I say one could only get a couple of hours, or possibly three, hours fishing at any one tide (and a low spring tide at that), but I know of no place where one could pick up the technique of fly fishing for dace more readily than on that reach of the Thames, for the fish had all the day-to-day fancies of dace in more rural waters, and one had to find out quickly what they would take and how it should be presented before the tide turned and the fishing for that day was over.

This "day-to-day" fancy of the fish is the important point in dace fishing. It is very little use setting out with the intention of using a dry fly and sticking to it through thick and thin. If you do it will be a thin time that you will get, nine days out of ten. There is here, as you will find, a lesson to be learned about fly fishing in a coarse-fish river. The fish do not behave as they do in a trout stream where chub or dace are found bob-nobbing with trout. They behave very much as do the trout, taking up a position in the water and collecting flies from the surface or upper layer of water, and refusing to have anything to do with a fly which does not behave like the natural ones on which they are feeding. But in coarse-fish water it is otherwise. Such streams seldom produce anything very noticeable in the way of a hatch and such water-bred flies as the river holds are likely to be of the sedge variety, most species of which do not come up to hatch out on the surface, but crawl out by way of a reed stem and often enough (if they emerge a few yards from the bank) appear to struggle along its surface till they get there.

This may account for the apparent attraction which a moving fly has for coarse fish. In the case of dace: having located your shoal proceed first to to fish over it with a dry fly, just as you would do for trout. If that fails try letting the fly sink, but without moving it after the cast is made. Then try letting it drag, or giving the fly a jerk once or twice as it passes over the shoal. This is often very effective. It should be done by a small pull on the line, not by raising the rod tip, as any unnecessary movement of the rod is to be avoided for fear of scaring the shoal. Lastly put on two flies casting across and letting the current sweep them round; but I have rarely found this successful unless there is a good ripple on the water.

One of the troubles in dace fishing is that, after a certain amount of hammering, the shoal almost invariably moves away and you have to find it again or another one. And another is the difficulty of hooking the fish. Those little chaps rise like lightning and let go again almost instantly. In fishing a sunk fly, particularly, one gets half-a-dozen plucks for every fish fairly hooked, but a basket of a dozen or more is quite common in a couple of hours' fishing.

Dace, like grayling (except in trout waters) seem to prefer a "fancy" fly to one dressed to represent a natural insect, but I think on the whole I have had my best sport with a black fly—black gnat for example, or, better still, a small Zulu with a red ibis tag. The size has almost of necessity to be on the small side. No. 00 is probably the best, though on rare occasions one can pick out the best fish in a shoal by using something larger, say No. 1. One has to be prepared for a phenomenal number of abortive rises when using the larger size.

If it were earlier in the year you would get even better sport with chub. The contempt in which many men hold chub is quite unjustified. It comes, I believe, simply from their uselessness as a table fish. A catch of chub may, in fact, be a decided embarrassment, unless one can come across some town dweller who is too impressed with the size and dignified appearance of the fish to consider its latter end and will accept a present of it unsuspiciously—and also from the fact that many fly fishermen have been deluded by a chub into the belief that they had hooked the trout of their dreams; and the subsequent disappointment rankles.

But in a coarse-fishing river there is no fish available to the fly-fisherman which will put up such a fight when hooked, or which needs more care and ingenuity in approach, than a chub basking in the dappled shade of the willows. You will want some special flies for chub fishing; a larger palmer (a hairy-looking fly, reminding one a little of a caterpillar) red, or black is generally good, but it does not matter much what fly is used as long as it is big and husky. Size No. 4 is none too big and even bigger flies still may often be used to advantage.

To enjoy the sport of stalking chub to the full, one wants a hot, sunny day such as we had in early September this year, though July and August are better months, and a stream, deep and slow-flowing with a row of overhanging willows along one bank. Unless you have access to a boat (which must be moved very quietly by a paddle to avoid the vibration from oars in rowlocks), the stream must be of such a width that you can cover it with a cast. Best of all is the day when you can actually see the fish—half-a-dozen portly shadows moving ghost-like in the green depths, lazily cruising a few yards and as lazily rising to the surface to inspect some morsel which has fallen from the overhanging trees; then concealing yourself as best you may pitch a large fly to the edge of the shoal, and after a few seconds, if no notice is taken of it, pull it very slowly away an inch or so at a time.

It is when the moving fly catches the eye of a fish that the nerve-wracking seconds are counted out, as the chub slowly follows, and, if the luck holds, opens its capacious maw and sucks the palmer in. As it turns to go down again strike in no uncertain manner. Then the delicacy of your touch will tell, for you must strain the tackle almost to the breaking point to keep the great brute from diving into the willow roots where nothing can save your gut from inevitable fracture.

Once you have contrived to skull drag the fish from the vicinity of its halt, you can play it at your leisure for a hook once embedded in the gristle of a chub's mouth will seldom loose its hold, as you will realise when you try to extract it after the fish is in the net. But even when the chub cannot be seen you may be sure they are not far away from overhanging willows in any stream where chub abound, and as pleasant a day's sport as any man can want may be had by wandering along such bushed-over reaches of many a midland brook.

The other fish of the trio, the rudd (indistinguishable from a roach to the inexpert eye except for the position of the dorsal fin which is nearer the tail), is not likely to come into your fishing horizon unless you have access to some private pond, where they have been introduced at some time or other—as very often they seem to have been. The only effective way of taking them on a fly which I know is to wait until they visit the shallows, especially the kind of silted-up corner with a sparse crop of rushes growing in it. Here, on occasion, you will see bubbles rising which generally indicates a shoal of rudd rooting round the rushes. A boat is almost always necessary. It should be kept well away from the shoal and a long line and small fly cast to the point where the bubbles are seen—and then drawn gently away.

When other things fail, rudd can sometimes be brought on the feed by casting small cubes of dry bread among the rush stems, waiting for the fish to find them, and then offering a fly. Both for chub and rudd the addition of a maggot to the hook of the fly will often prove killing; but it requires a certain knack, not very easily acquired, to cast such a decorated fly without casting off the maggot.

Your affectionate uncle,

HARVEY.

PROVIDING FOOD FOR YOUR DOGS

By A. CROXTON SMITH

DOGS KEPT AS COMPANIONS MANAGE TO GET ALONG FAIRLY WELL

THE feeding of dogs in war-time is a problem that must cause a lot of anxiety and set owners the task of exercising their ingenuity. In the Great War the general run of people who simply kept dogs as companions managed to get along fairly well. Hounds, gundogs and show kennels were another matter, and it is these that will be most affected. Low-grade flours were released for meals and biscuits, though in limited quantities, as time went on, and those who were fortunate enough to live in the country often managed to get the flesh of cattle or sheep that had died. Old cow beef is at present much used in breeding kennels, and when I had a number of bloodhounds I fed them largely on horse flesh, which could then be had, unphysicked, in unlimited quantities. That supply, however, is now very restricted.

Various offals, unfitted for the consumption of human beings, will often keep body and soul together in dogs, solidified blood has its uses, and cod's head or the heads of other fish can be boiled until the bones are softened enough for being eaten with safety. Not an ideal food, perhaps, but it is better than nothing, and I know breeders who resort to it now for a change and for the sake of economy. The heads of poultry can also be boiled and eaten, but they are rather rich.

Some of my friends have taken in stocks of canned meat sold specially for dogs, and now I see that Spratt's are putting up biscuits in hermetically-sealed tins, which should remain good for a long time. I have kept biscuits under ordinary conditions for some months, but I believe this cannot be guaranteed as they are subject to the inroads of insects.

Bullocks' paunches are excellent, but I suppose they will be wanted for tripe. I do not know if sheep's paunches will be required for the same delicacy. If not, they do all right when properly cleaned and cooked. Unfortunately, dogs are not vegetarians, and it would be idle to pretend that they could subsist on things of this nature that have a place on the menus of men who object to meat as a diet. They are essentially carniverous, as anyone may see who examines their dentition, though under domestication they have adapted themselves very well to farinaceous foods. They could be kept alive on biscuits and meals if we could be assured of getting them in sufficient quantities, but can we?

At the moment no one knows what is going to be the future of dogs, but there is some hope in the fact that no drastic action was taken by the Government last time, although the food position then was not nearly as satisfactory as is it now. I suppose we shall have to reconcile ourselves to the idea of giving up breeding for the duration. If this happens, it will be a serious blow to those who have built up working or show strains with infinite labour in the course of the last twenty years.

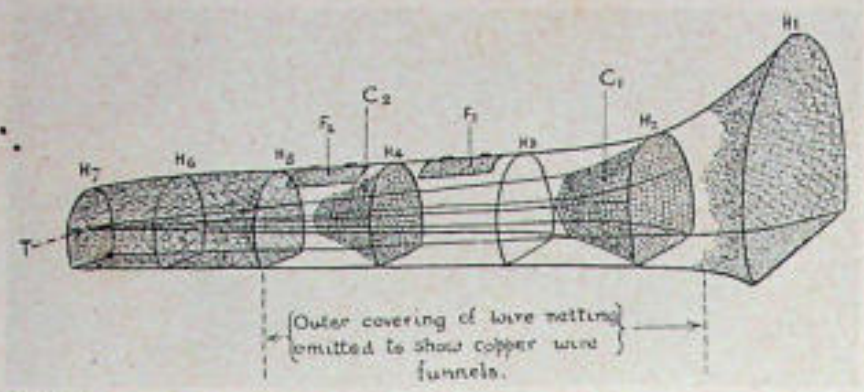
Economically, dogs are of considerable consequence, though they are not of use, with comparatively few exceptions, in the furtherance of hostilities. At the moment of writing I have not heard if it is the intention of the authorities to employ dogs at the front as they did before, but I imagine that this will be done, and it may be that the Police Dog Training School near Newbury will be taken as a nucleus.

Sentimentally, of course, they mean a tremendous lot to countless thousands, who would be prepared to make sacrifices on their behalf. We may rest assured that the Government will not be unmindful of this fact, and will do everything possible to allow people to retain their companions.

TWO KINDS OF MANGE

QUESTIONS have reached this paper, followed by some letters in the correspondence columns, about the possibility of curing follicular mange. One lady declared that it was extremely easy to cure, which is certainly contrary to the most acceptable veterinary opinion. I have never tried Odyline, the preparation that she suggested, but no doubt some of my readers will be induced to do so should one of their dogs be troubled by this distressing complaint. I have also heard good opinions of T.C.P.

Follicular mange is not very common, I should say. Friends whom I have consulted have never had a case, and I only had one dog (one that had been bought) affected out of hundreds. On the other hand, the sarcoptic variety, which is highly contagious, is not unusual, and unless scrapings are taken and subjected to a microscopical examination, it is possible to confuse the two kinds.



The acarus responsible for sarcoptic mange is nearly as broad as it is long; that of follicular is longish, something like a maggot, with what the unscientific may call four legs on each side of the body close to the head. The sarcoptic acari burrow close to the surface of the skin, setting up red spots from which acrid matter is exuded, that causes intense irritation. As a rule the head, round the eyes, the elbows and the ears are the first places attacked, and in a few weeks, unless checked, the ailment spreads all over the body and may easily be communicated to other dogs as well as human beings unless sanitary precautions are taken.

In follicular mange the parasite penetrates more deeply, particularly into the hair follicles or sebaceous glands. The first signs are usually, though not invariably, observed in the same places as those indicated for sarcoptic, but the affection is slow in spreading and is not easily communicable to other dogs, nor does it affect mankind. For the reasons explained, sarcoptic mange can be treated with success fairly easily, because whatever preparations are used can reach the parasites. A remark in Muller's *Diseases of the Dog* possibly explains how it is follicular mange is not frequently encountered. "It seems that to propagate the disease the animal must have a certain predisposition, the nature of which has not been satisfactorily explained."

Powdered sulphur and vegetable oil, one part of sulphur to approximately eight of the oil, is an old-fashioned remedy that is still recommended for sarcoptic mange. It is applied all over the body three or four times at intervals of several days, and the dog is then washed. Obviously, all bedding has to be burned, the kennel thoroughly disinfected, and every precaution taken to prevent reinfection. Mr. F. W. Cousens relates in the *Dog's Medical Dictionary* that he had had success in regard to the treatment of follicular mange with the Bayer method, which is costly and prolonged, taking sometimes a year to effect a cure.

The latest information on the subject that I have seen appeared in a paper by Dr. C. Gorovitz, of Palestine, published in a recent issue of the *Veterinary Record*. This gentleman, having read of the excellent results claimed in Russia for the use of sodium hyposulphite and hydrochloric acid, decided to make a trial. He employed a 60 per cent. solution of the sodium hyposulphite and a 6 per cent. solution of hydrochloric acid, repeating the course eight times at intervals of three days. In other cases he gave six dressings, and each time a cure followed. This treatment, the doctor wrote, was cheap, clean and convenient and did not harm the patient.

The Trap

AN EFFICIENT PIKE-TRAP

By G. O. CRAWFORD

THE usual method of removing pike from south country chalk streams with a long bamboo rod and a running wire noose requires considerable skill and takes up much time.

On a stretch of the Avon above Salisbury, however, a most ingenious type of trap is in use, for the details and description of which I am indebted to the courtesy of Major M. Rawlence, who has used several of them with great success.

The trap was originally introduced from France. In general, it consists of a tapering funnel of 1-in. mesh wire netting, about 18in. in diameter and 7ft. long, closed at the smaller end. This is built up round a framework (see diagram) of iron hoops, H_1–H_7, interconnected with long rods of the same material to give rigidity. The hoop H_1 at the entrance is made twice as large as the others.

Two jinged flaps F_1, F_2 are incorporated to facilitate the removal of the pike.

Now for the "bait." Attached to the second hoop H_2 and extending inwards for about 1ft., is a funnel-shaped piece of copper wire netting C_1 the inner end of which is about 6in. in diameter and is held in place by five copper wires fixed at T to the far end of the trap. Another similar copper wire funnel C_2 attached to the fourth hoop tapers to 4in. diameter at its inner end and is likewise held in place by the same five wires, as before.

Setting the trap merely entails dropping it into the river at the spot known to be favoured by a pike. It should of course lie with the entrance downstream, and must be secured to the bank with an iron stake and a length of stout wire.

All traps are visited once every 24 hours.

As yet I have been unable to ascertain precisely what induces pike to enter this contrivance, but that they do so is borne out by the success of the river watcher on the stretch of the Avon already referred to. Using five traps no less than sixty-two pike have been caught between January and July.

One obvious conclusion is that the copper element in the trap is at least part of the attraction, and it has been suggested that fish may try to rub against it in order to clean themselves of fungus. In support of this, it may be mentioned that large trout also are occasionally caught in the traps, but whether this theory is correct or not, the results most certainly justify the method.

BESIDE THE CLEAR COLN

By MARGARET WESTERLING

THE MILL POOL AT SYREFORD, NOW PART OF THE FISH-HATCHERIES

ALL the names of the Cotswold streams fall like music on the fisherman's ears, and perhaps none ring sweeter than those of the valley of the Coln. From its hesitant, marshy source near Charlton Abbotts, below the watershed, right down to Lechlade, it flows through villages as lovely as their names. Throughout the length of the valley, a stretch of no more than twenty-seven miles, leafy green woodland, rich pastures, and a wealth of flowers, mark its course.

In Brockhampton Park Dooneywell swells the rivulet to a brook. At Sevenhampton it waters the roots of a giant willow, below the church, where a brass plate on the north wall of the aisle records the gift of a parishioner, in 1776, wherein the name of the well occurs :—

> " He gave in his life time Twenty
> Shillings p' An' for ever to the poor
> Of this parish in bread, five of which
> Quarterly to be given out of the grou-
> nd called or known by Dunnywell "

Between Syreford and Withington, the stream is augmented by many springs, as it takes its course through Andoversford, and past the old Frog Mill, now an inn. At Syreford, the mill with its lovely mill-pool has become the first hatchery of the river ; its stews are full of surging speckled trout, their sides streaked with gold. From Shipton Oliffe and Shipton Sollars, with its secluded manor and little chapel, a nameless stream comes down to swell the waters.

Down to Withington the Coln runs through open meadows, enhancing the scent of the hay with that of meadow-sweet and water-mints. Below that village of fine Cotswold houses it leaves the marshy swamp beloved of naturalists, and runs under woods, taking on that still and secret course which it holds throughout much of its path, giving it an elusive beauty that haunts the thoughts of all who know it.

The river takes a sudden bend at Cassey Compton, and branches to encircle the house that holds a mystery within its stately walls and yew hedges. Here the waters from the Compton Abdale come to join it.

The two branches flow through the water-meadows below the tumulus of Chedworth Woods, where a disused quarry has become a wild garden full of colour, mulleins, St. John's wort and ragwort growing amongst great patches of mint, the gay pink flowers alternating with clumps of albino ones.

THE WHEELWRIGHT'S PLATFORM NEAR THE CHEDWORTH ROMAN VILLA

At the saw-mill near the magnificent Roman Villa, a blacksmith has his platform by the stream, where the cart-wheels are thrown for bonding on the strakes.

A little back from the river lies Yanworth, on the slopes of the valley, with a barn, a complex of weathered stone walls and roofs, a farm-house with pigeon-holes in two opposite gables, round the upper windows, and a little square-towered church. It lies away from the rest of the village, enclosed from view by the farm-house and a great barn, whose cart-porch has a round *œillet* window and a cupola on its roof. This sturdy chapel is a pleasant thing to find, sheltered within the walls of the farm buildings, and has much interesting detail, slit-windows, with exceptionally fine Early English work and some striking mural paintings.

The valley is rich in churches of unusual interest, for below Yanworth and the Stowell mill, after receiving the waters of the spring that rises near the Hangman's Stone, the river runs by Stowell Park, whose tiny chapel, close to the house, retains some remarkable twelfth century mural paintings. The present house has replaced an earlier building, owned by those wealthy woolstaplers, the Tames of Fairford. Later, it was held by the Howes and the Grubbs who also owned Cassey Compton.

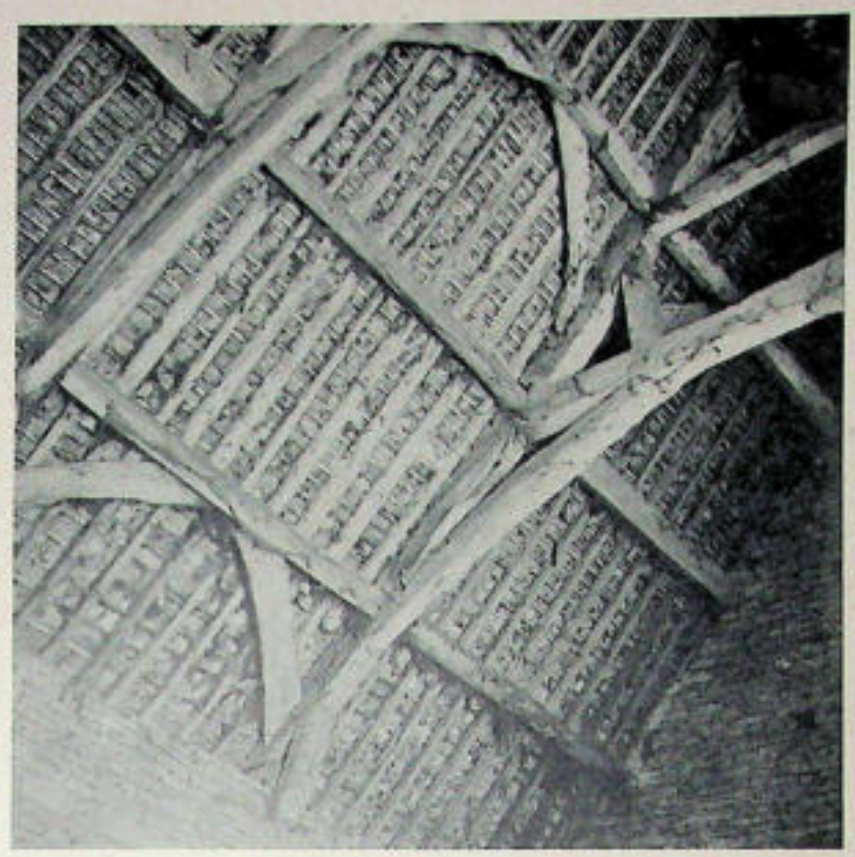
Chedworth sends a swift stream down from its many springs, to the Coln. By the church is a spring called the Holy Well, endowed with curative powers. Chedworth is a scattered village of old houses, with the new well-hidden, so that it seems smaller than its size. A fine tithe-barn graces the entry to the manor-house with pleasant detail of windows.

Twin roads enlace the upper course of the stream, circling to cross it, then rising above it again, not often holding it in view. The Roman Fosseway is carried across the two branches of the stream on an eighteenth century bridge, one of the longest, if not the straightest, on its course. Withies and beds of rushes hide and enclose the river from sight.

Coln St. Dennis lies in an angle of the stream, its squat, square-towered church rising insecurely on the water-meadows.

On the left bank, across the stream from Coln Rogers, the pigeon house is built steeply against the bank, looking as if it had once been a mill. The church, hidden away in orchards, retains Saxon walling and pilaster-strips. The village has a reserve in its grouping unusual in Cotswold hamlets, and the houses with their backs to the road conceal the stream.

Above the left bank, on open wold ground, more akin to the hills than to the river-valley, lies little Calcot, where the breast-plough is still used for potato-planting, and sometimes even for cutting the grass verge of the road. Here the Saltway crosses the river, coming down by Crickley Barrow, past barns with many pigeon-holes along their sides or in their gables.



Winson Green, some little way below the mill, is one of the most delightful small places on the river. The upper branch of the stream was canalized centuries back, to carry the water for Ablington Mill, and the old stream-bed, full of mint and rushes, coots and grebes, as well as the darting trout, flows silently under walnut trees, by old barns, and under plank bridges, seeming neglected and almost forgotten, though no fisherman could ever forget a stream so full of enchantment.

The lock at Ablington has a sharp fall, and the mill is one of the biggest above Bibury. The village is churchless, but has three fine barns and several houses of great beauty. The stream is wider now, a true trout stream, with sandy banks and patches of waterweed in the shallows, while deep pools, where the water shows green, hide big trout in their depths under the trees.

Bibury has changed since the days before the last war, when only fishermen came to stay at the little

PIGEON LOFT AT STOWELL PARK
A tiny chapel, close to the house, retains some remarkable 12th century paintings

BEAMS AND WIND BRACES IN A BARN AT ADLINGTON
The village is churchless, but has three fine barns

inn, that is now a big one, by the river, and the great hatcheries were only a small beginning. Now they cover the wide strip between the inn and the mill. I know no mill finer than this one, with its great buttresses, and the dark swift current swirling down through the mill-race. The village has become a little self-conscious, but nothing can spoil the clear, broad waters, or the old stone houses and cottages, those of Arlington Row being the oldest and most famous. Pigeon House Farm still has its ancient round dovecote, its interior somewhat defaced by an inserted flooring. There is another rectangular house, disguised as garage and garden room, near the church that has so many table tombs and such a high, narrow chancel arch.

Below Bibury Court, once the home of the Sackvilles, the Mill-farm stands back from the road, hiding the entrance to the field-path between Bibury and Coln St. Aldwyn. The valley here is wider and more open, the stream broad and shallow, perhaps too carefully tended for the beauty which haunts its banks in more neglected spots, where mimulus grows, and rushes shadow the water under the willows.

Though the mill is no longer working at Coln St. Aldwyn, the river turns a sawmill, and its waters are dyked and sluiced over the water-meadows above it, while beech trees chequer the swift flow of water by the weir with sunlight and shade. The village stands high above the river on a steep bank, the early, unspoilt manor house, containing a magnificent staircase, a fine square gabled dovecote, and the church, forming a splendid group dominating the village, which slopes away from them towards the encircling bend of the river.

Coln St. Aldwyn and Quenington lie close together, but before you enter the latter village, you should turn to the left, and from the bridge that crosses the river gaze into the water till you find the big trout that lies there in the shade, lazy and indifferent to passers-by, but very surely alert and wary when fishermen approach him.

Quenington itself is a jumble of architecture of every period, from the remains of the Priory and the two splendid Norman doorways and tympana of the church, the round mediæval dovecote and fine barns, the sixteenth and seventeenth century cottages and small plain Georgian houses, down to the fortunately well-hidden modern Council cottages beyond the village green. There are two mill-houses, one of them lying near the remains of the Priory, as does the dovecote, and the stream cuttings look as if they had once formed the moat.

From below the village down to the artificial waters of Fairford Park the river is unspoilt and lovely. It seems utterly lonely; not a house or a voice breaks its solitude and the fishing heron slips away so silently that you must be watchful to see him before he has gone. There is nothing here of the pruned orderliness of Bibury waters, but the river is full of trout.

The locks and waterfalls of Fairford Park that make the river audible, by the deep shady pools under clumps of beech, open into the broadened, lake-like waters that appealed to Pope's taste rather than to ours. A mill-house stands at the end of the park by the town of Fairford, the only town on the river. The weir has a long fall, and formerly this was the barrier above which the "coarse fish," spoken of by one of the early historians, Ruddier or Rudge, could not rise.

The river flows through open meadows below Fairford church with its magnificent early glass, where the green is such a resplendent colour. The church itself is all of a piece, built by that great woolstapler, John Tame, in the fifteenth century. The four curious statues, each with its coat of arms, surrounding the squat tower, give it an unusual appearance. The whole church has a curious air of vigour and determination, expressing perhaps the personality of its founder.

Below Fairford, the waters belong to the Bull Hotel, and have an air of publicity which gradually disappears as one leaves Fairford behind. Here, too, there are herons, and a solitary swan may find its way upstream from the Thames. The valley has opened out into flat water-meadows, and the river's course to Lechlade is now through open country. Still clearer it runs and every strand of weed is visible, great tufts under which the fish can hide.

The river passes behind Oreott, almost invisible from its banks, and takes its devious way to Whelford, where one branch passes under the mill that has become a turreted house. Below the bridge the two branches of the stream enclose a narrow strip of land, with outbuildings shading the right-hand bank, where cattle stand in the cool, the water lapping their hooves.

If you leave the stream at Whelford, you will come to a straight lane, straight as a Roman way, that leads to Dudgrove Farm, but not before the road forks, making two arms of the Y as straight as its stem. Then you come to the bridge across the river that carries on to the farm, and here, for me, is the best stretch of all—quiet, isolated and beautiful, hidden from sight by thick withy beds and an almost trackless jungle of undergrowth. Here you may catch sight of the kingfishers, and hear, if you do not see, the otters, that are no friends to fishermen.

Through this tranquil country, flat square fields bordered by high hedges full of spindle and dogwood, dyked for the flooding that was once part of the farming routine in this area, the river flows swiftly and evenly to its junction with the Thames. The round-house that stands by the end of the Thames and Severn canal will guide you to it. The canal is abandoned and overgrown, the great beams of the lock gates have mouldered away, a sight to cause regret for the passing of something that might at this time have proved its usefulness.

The mouth of the Coln is on a bend of the Thames, and just above it is the arched timber bridge leading to the cottage that was once a smithy, by the round-house. That side of the river is in Wiltshire, and the small church of Inglesham with its early woodwork, beloved of William Morris, is in Wiltshire too.

STILL CLEARER THE RIVER RUNS WHERE THE COURSE AT LECHLADE IS THROUGH OPEN COUNTRY

SOME FIND REINS TOO LONG—OTHERS FIND THEM TOO SHORT
BUT ALL AGREE THAT REINS—CANNOT BE TOO STRONG

By G. W. Allinson

HUNTING DURING THE WAR

Any further details of Hunts will be gladly received, and we shall be much obliged to secretaries if they will send us particulars for publication

WE are greatly indebted for the following information to the various Masters, Secretaries and Correspondents of the *Field*, who have sent it to us. It will be seen that in the vast majority of Hunts it has been found necessary to destroy a certain number of hounds, and a good many Hunt horses have been requisitioned by the Army authorities. What emerges from this information is the important fact that hunting will be able to continue, and to do so with the approval of the War Office and the Ministry of Agriculture. What the future may bring, in the event of a prolonged conflict, remains to be seen.

ATHERSTONE, SOUTH.—We are carrying on two days a week until the end of the cubhunting, when it will be decided what hunting will take place during the regular season. It will not be possible to keep the full pack we have at present. The old hounds, which would normally go at the end of the cubbing, have already been disposed of, but it is hoped to be able to retain 25 couples of the best hounds. All horses belonging to both the joint-Masters, and the Hunt horses which are suitable for military service, have been requisitioned. There are, however, enough horses left over to carry on with. Major R. G. Shaw and Major C. H. S. Townsend (the joint-Masters) have gone on service. A committee has taken over the management of the Hunt in their absence. C. Young, first whip and kennel huntsman, is hunting the hounds.

BEDALE.—At present hounds are carrying on hunting about two days a week, but with a skeleton pack, which has been reduced, *i.e.*, from two packs to one. Farmers and residents have been very good and are walking quite fifteen couples of old hounds. Many puppy walkers have taken back hounds they walked as puppies. This much reduces expenditure, so few hounds have up to date been put down. Some horses will be taken, others are at grass. Some six are kept fit for hunting. The Master, Mr. M. Barwick, has been called up, being in the R.A.F. Kilbourne is hunting hounds. The rest of the staff are still at kennels, but those of Army age are expected to go at any time. This will take away the first and second whips, and the staff will, of course, be much reduced in kennels and stables. Every effort is being made to keep the hunt in being, but steps to reduce expenditure have been and are being taken.

BERKELEY.—The Berkeley Hounds are continuing, for the present, their four days per week programme, and the joint-Masters intend to proceed with as little alteration as circumstances will permit. There will be, of course, fewer hounds and fewer hunt horses. So far, none of the staff has been called into national service, but it is too much to hope that things will continue on these smooth, normal lines for long. The only staff change is where Sam Wright, from the East Sussex, supplants Tom Cooper (gone back to the South Berks) as first whip. Captain R. G. Berkeley with Colonel C. E. Turner continues in the joint-Mastership. Colonel A. G. Murray resigned after five years, at the end of last season, when the vacancy was filled by Mr. G. A. Lister, who now becomes joint-Master with the two gentlemen aforementioned. The farmers are very loyal, the country is well foxed, and the joint-Masters will get every help in their endeavour to carry on.

BERKSHIRE, OLD.—Cubhunting has commenced. The Master, Major J. H. Walford, has been called up, but his colleague Mrs. G. Walton will, it is understood, be at home.

BICESTER AND WARDEN HILL.—The Hunt is carrying on during the coming season. The pack has had to be reduced, but it is hoped that 25 couples of bitches will be kept, and fifteen couples of dog-hounds. Twelve Hunt horses have been requisitioned so far. Mr. Field-Marsham is likely to be able to hunt hounds intermittently for a few months. Clarence Johnson will remain as huntsman, but both the first and second whips may be called upon at any time to serve. The Masters intend to try to hunt the whole country, Saturdays as usual in the Warden Hill country.

CATTISTOCK.—Captain Martyr, who was making his début as a huntsman, gave promise of being a success, and it must have been a great disappointment to him that the national emergency put a stop to his activities in the hunting field. He had only recently retired from the cavalry, but he was called up at once, and the hunting of hounds has devolved entirely on Gosden. The senior joint-Master, Major Batten, was out regularly during the first few weeks of cubhunting. At a recent meeting of the Cattistock Hunt Committee it was decided that hunting should be continued for the present on two days each week, and that the pack should be substantially reduced in numbers. It may be interesting to note here that Mr. W. V. C. Ruxton, late junior joint-Master of the Cattistock Hunt, is on his way to America, where he has gone for the purpose of raising funds to equip and maintain a complete Field Ambulance Unit, to be known as the American Foxhunters' Ambulance Unit.

COWDRAY.—This hunt is carrying on for as long as possible. Some hounds have been destroyed, and one horse has been requisitioned. Captain Michael Smiley (joint-Master) is on active service, but otherwise there are no changes. Another committee meeting is being held shortly.

CRAVEN.—It is proposed to carry on the Craven as long as possible during the coming season. Hounds are being destroyed, and the number reduced from 58 couples down to 30 couples. Two of the Hunt horses have been requisitioned, but nine are left. The acting Master, Mr. Stephen Player, is serving with the Yeomanry. Mr. J. C. Ainsworth, the Hunt secretary, has received his commission and has handed over the secretaryship to Mr R. Southby. Fred Roberts, the huntsman, was through the last war, and his services are unlikely to be called upon again for the army. The rest of the kennel staff is unchanged up to the present.

CRAWLEY AND HORSHAM.—This Hunt is carrying on. Twenty couples of hounds have been destroyed and some horses requisitioned. Major the Hon. Guy Cubitt is on active service and Mrs. H. C. Gregson is acting Master.

CROOME.—These hounds will carry on as long as possible this season, hunting two days a week. Some of the horses have been requisitioned. Mr. Marcus Stapleton-Martin joins the Earl of Coventry as joint-Master, and Joe Roberts succeeds Bert Stevens as second whipper-in.

DARTMOOR.—This Hunt is carrying on as long as possible during the coming season. We are going to keep the bitch pack and a few (if any) dog hounds. 40 per cent. of the Hunt horses have been requisitioned. The Master, Commander Davey, has rejoined the Navy, but the kennel huntsman, Piper, is going to hunt hounds and kill as many foxes as possible. The second whip, Arthur Piper, has joined up, and no one will be employed at the kennels who is required for military purposes.

DORSET, SOUTH.—Since the outbreak of hostilities the meets have been somewhat irregular, owing to the fact that the senior joint-Master, being on the Reserve of Officers, is momentarily expectant of a call to active duty. With everyone busy with war work of one sort or another, few "grown-ups" turn out regularly, though there have been a good many children in the field. The South Dorset have an especially good young entry, and it is heart-breaking to realise that the pack must be substantially reduced, and that some young hounds, as well as many old favourites, must go. The stables have been considerably reduced, and regular hunting must be carried on on a two-day-a-week basis. Will Jackson (the present first whipper-in and kennel huntsman) will hunt hounds. Miss Pamela Ismay, who has this year joined Captain and Mrs. Wellesley-Wesley in the Mastership of the pack, is, it is understood, moving to a cottage near the South Dorset kennels, and will be in the field in future.

DULVERTON (EAST ANSTEY).—The Hunt will carry on as long as circumstances permit, but is putting down about four couples of hounds. Half the horses have been requisitioned. No changes in personnel to report.

DURHAM, SOUTH.—All the younger men have been released from their engagements both in the kennel and Hunt stables. They have found employment doing work of national importance. The pack has been reduced in numbers, and only a skeleton staff remains. Cubhunting is being carried on under great difficulties, solely with a view to eliminating as many foxes as possible. The secretary of the Hunt wishes it to be known that any further compensation for damage done by foxes cannot be made. All concerned must take the necessary steps to protect their own poultry. Where foxes are doing damage it is hoped they will be destroyed as humanely as possible.

ERIDGE.—The Eridge will carry on with a reduced number of horses and hounds.

GARTH.—The Hunt is carrying on ; but 25 couples have already been destroyed, with a possibility of more to go. Eight horses have been requisitioned. The present joint-Masters, Lord Northesk and Miss Barker, have resigned and the committee have taken over the country and appointed Colonel and Miss Barker as acting Masters. It is hoped to hunt two days per week for as long as possible. Personnel is to be reduced.

GRAFTON.—The Hunt will carry on for as long as possible. Cubhunting is to continue four days a week. Regular hunting will be carried on on as many days as possible, with a very reduced staff, to lessen the number of foxes. The pack has already been considerably reduced. It is expected that a considerable number will be bought shortly. The Master has joined his regiment. During his absence Lord Hillingdon will act as his deputy whenever possible.

GROVE.—These hounds will carry on as long as possible. The number has been considerably reduced and some horses have been requisitioned. Mr. H. L. Farrer, the amateur huntsman, is away serving and hounds will be hunted in his absence by F. Luppage, the first whipper-in.

HAMBLEDON.—The Hunt will carry on, but has destroyed about 20 couples. We had 47 couples in kennel and would ordinarily have started the season proper with about 35 couples. Five out of ten horses have been requisitioned. Mr. J. P. Long is remaining as Master *pro tem.* or until called up. The staff has been reduced by half, all having been found immediate jobs. Owing to foot-and-mouth disease cubhunting was delayed, but young hounds will be fairly entered to fox, and then hunting will be continued as conditions permit.

HEYTHROP.—Lord Ashton, who is serving with his regiment, is prepared to complete cubhunting as usual, and after November 1st to hunt the country three days a week (Mondays, Wednesdays and Fridays) with a reduced establishment. Lady Ashton has kindly consented to act as his deputy, and to carry on the difficult and laborious work entailed by mastership under war conditions. The number of hounds in kennel and horses has been drastically reduced, and every possible economy will be exercised in carrying on the Hunt.

ISLE OF WIGHT.—The Hunt will carry on as long as possible for the coming season, if circumstances continue to permit. The farmers and landowners generally wish this to be done, with the main idea of keeping foxes down. Followers are few, but those that can get out do so. We have already put down five couples, and at the end of the cubhunting season there will be a further reduction. None of the Hunt horses has been requisitioned as yet. Mr. L. H. Preston, late Master of the Taunton Vale Harriers, is the new Master, and is carrying the horn himself, with Ted Parry as kennel huntsman. Carey is turning hounds as well as looking after the horses as head groom.

LLANGIBBY.—These hounds commenced cubhunting on July 31st, and up to date have done remarkably well. The country is very well foxed and hounds have killed above the average for the time of the year. It is hoped that it will be possible for the committee to carry on during the coming season. Hounds have been reduced to 24 couples, and some of the Hunt horses have been turned out. At the moment the Hunt staff is unchanged.

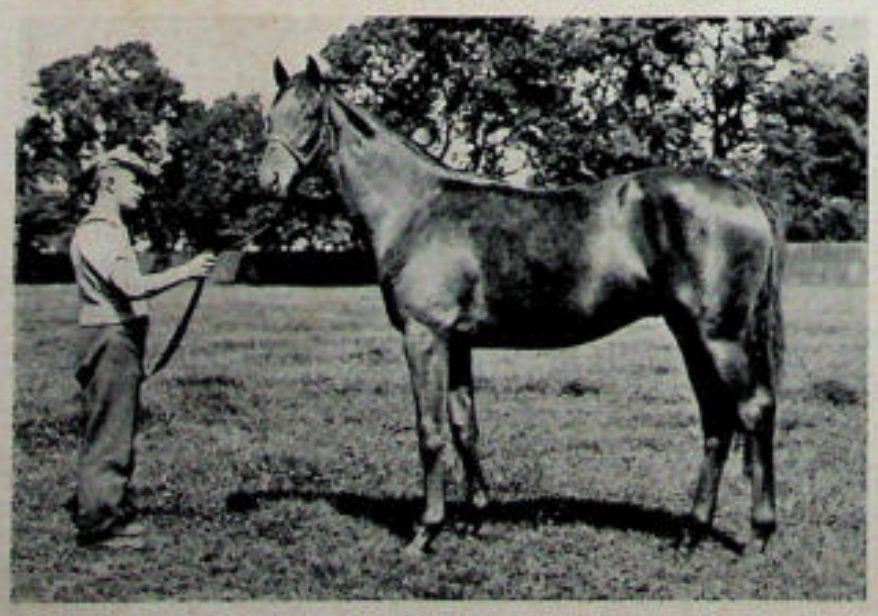
MIDDLETON.—It has been decided to carry on hunting with a reduced establishment as long as possible, and hounds have been reduced to 30 couples. We are keeping six horses, one huntsman and one whip-kennelman, and one boy and two grooms. An executive committee have taken over management from the Masters, both of whom are serving. No claims will be paid or wire removed. Hounds are to hunt two days a week.

MIDDLETON, EAST.—This Hunt is hoping to carry on two days a week. Some hounds have already been disposed of, and some horses requisitioned. There will be no radical changes in personnel, except in the kennel staff, which will be reduced.

NEWMARKET AND THURLOW.—The Hunt is carrying on in a small way. Ten-and-a-half couples of hounds have been already destroyed. One horse has been requisitioned. Mrs. Deacon has been appointed joint-Master, as her colleague has been called up. G. Samways (first whipper-in and kennel huntsman) will hunt hounds.

NOTTS (SOUTH.)—Major W. E. Seeley has been called up, but there is sufficient staff over military age to run the Hunt. We have put down eight couples of hounds and will eventually reduce down to about 20 couples. A few horses will be retained, and a committee of management set up.

(Continued on next page)



SLEDMERE YEARLINGS NOW AT DRUID'S LODGE

BAY COLT BY THOR—CURA

BAY COLT BY HYPERION—QUEEN CHRISTINA

BAY COLT BY FAIRWAY—ORTA

W. A. Rouch

CHESNUT COLT BY SOLARIO—MEADOW RHU

It is a comforting thought that the Grand National of 1940 is still being considered in the scheme of things. Ireland at the moment occupies the stage where Turf affairs are concerned, and it has been announced that the Munster National Steeplechase of three miles, and Tipperary Plate of three miles 60 yards, will count as qualifying races for the horses placed first, second and third in these events. Meanwhile Mr. J. V. Rank has prepared for events to come in buying six yearling colts of the Sledmere Stud. They are a bay colt by Thor—Cura, a bay colt by Hyperion—Queen Christina, a bay colt by Fairway—Orta, a chesnut colt by Solario—Meadow Rhu, a bay colt by Limelight—Jury, and a bay colt by Sandwich—Caledonia.

OAKLEY.—These hounds are carrying on, in a cubhunting manner, for as long as possible during the coming season, and are hunting two days a week instead of the usual four. A certain number of hounds have already been put down. The Hunt horses provided by a dealer have all gone back, and the staff are using lent horses. So far there is no change in the Hunt Mastership, the Hon. Peart Lawson-Johnson and Mr. W. Brunskill still being in command, the latter being unfit for active service.

QUORN.—The Ministry of Agriculture has asked Sir Harold Nutting to carry on cubbing, anyway up to the middle of November. There is no shortage of fodder or hound foods, although, of course, Sir Harold has reduced the number of hounds considerably. No horses have been requisitioned at the present time, but are almost certain to be.

SINNINGTON.—This Hunt is proposing to carry on as long as possible. Some hounds will have to be put down, and several Hunt horses are being requisitioned. No changes have been decided upon so far, but a decision will be made in the near future. Everything possible will be done to keep things going, if on a reduced scale.

STAFFORD, NORTH.—This Hunt intends to carry on as long as possible in the coming season, and hopes to hunt five days a fortnight instead of three a week. No wire will be taken down, and the activities will be solely directed towards the killing of foxes. The North Stafford hounds are already reduced to 32½ couples (instead of a nominal 45), and the Master is prepared to reduce the number further if necessary. Five horses have been requisitioned so far. The only contemplated change is that of Hunt secretary. In the event of Mr. Wyatt being accepted for military service, the late secretary, Mr. W. C. Jones, of Hatherton Lodge, Nantwich, Cheshire, will again become secretary. All the Hunt servants are of military age, but in the older classes; changes will be made as they become necessary.

SUSSEX, EAST.—A few couples of the older hounds have been destroyed and no horses have so far been requisitioned. Lord Burghley will not be able to hunt hounds as he is rejoining his regiment. C. Lavender (kennel huntsman) will carry the horn.

TIVERTON.—This Hunt is carrying on. Ten couples of hounds have been destroyed and two horses requisitioned.

V.W.H. (CRICKLADE).—Cubhunting has made a start, and a meeting is taking place shortly to make a further decision. The Master, Mr. D. E. C. Price, is serving, the joint-Master, Major Mitchell, intends to arrange cub-hunting meets whenever circumstances permit.

V.W.H. (EARL BATHURST).—Cubhunting has started. The joint-Master, Major Sir F. Meyrick, has been called up.

WARWICKSHIRE.—Eight or ten couples of hounds have been destroyed. We propose to keep 40 couples and hunt three days a week. Twelve horses have been requisitioned. It is proposed to mount the staff, allowing only one horse each. Both the Masters (Captain D. Forster and the Hon. R. M. Samuel) are absent on military services. It has been decided that Admiral Sir Walter Cowan shall act as Master for the present. So far there have been no changes in the personnel of the staff. The meets will probably be held at 10 o'clock in the regular season, in order to get back to kennel as early in the afternoon as possible.

WILTS, SOUTH AND WEST.—The South and West Wilts Hunt are proposing to carry on hunting as long as possible during the coming season. A certain number of hounds may have to be destroyed. Thirty-six couples are definitely to be kept, but the question of the surplus is not yet decided. Eleven Hunt horses have been requisitioned The only change is that Major K. P. Wallis is now sole hon. secretary of the Hunt, Mr. E. A. Wightwick having resigned owing to ill-health. The Master will be unable to hunt hounds this season, as he has joined his regiment. J. Cobby, the kennel huntsman, will take his place. The rest of the personnel remains as it was.

ZETLAND.—Some hounds have been destroyed, but no Hunt horses have been requisitioned so far. There are no changes in personnel.

"FIELD" PHOTOGRAPHIC COMPETITION

The Editor of the "Field" offers prizes of 3 guineas, 2 guineas and 1 guinea for the best photographs sent in by readers, of sport, games country life or of artistic value and general interest.

RULES.—1. The latest date of entry for the next of these competitions is Tuesday, Oct. 17th. Envelopes must be marked "Photographic Competition" and addressed to The Editor, The *Field* Newspaper, Field House, Bream's Buildings, Chancery Lane, London, E.C. 4. 2. Only amateur photographers are eligible to compete. 3. Photographs should be sent unmounted, and no prints will be returned. 4. No correspondence will be entered into concerning the competition, and the Editor's decision will be final. 5. Any photograph reproduced in the *Field*, apart from the winning entries, will be paid for at the rate of 10/6. 6. Description and name and address must be written on the back of each print, together with details of exposure, lens, and camera used.

Entries from abroad not arriving in time will be placed in the next of the series. Do not send negatives.

TRAINING FOR WORK ON THE LAND

Members of the Women's Land Army who are now receiving instruction at the South-East Agricultural College, Wye, Kent

THE KITCHEN GARDEN IN WAR TIME

By ELEANOUR SINCLAIR ROHDE

THE chief jobs at present are trenching, digging and manuring all ground as it falls vacant, clearing weeds, &c., and burning all rubbish of a woody nature. The days are shortening, and one has to get ahead as quickly as possible.

In the case of uncultivated ground to be put under vegetables it is best, if labour is short, first to strip off top-spit turf and stack it. It is sure to be full of wire worm and other pests, so it is little use to dig it in in the second spit. Stacked, and with lime sprinkled between the layers, it will be magnificent stuff in a year's time to spread on the surface soil. The next job is to dig the ground, but it is a fatal policy to dig in such a way that unfertile soil is brought to the surface. Consequently, it should be bastard dug, by which method all the soil is thoroughly aerated yet second spit soil is not brought to the surface.

First mark the line, and take out the top spit and wheel it to the end of the plot. Then take out the second spit and wheel that to the end of the plot, but keep it separate from the top spit. Then take the top spit from the next row and wheel this to the end of the plot. Fork over the bottom of row one and put into it the second spit from the second trench, and on top of this put the top spit from the third row to be trenched. On paper this sounds elaborate, but it is not so in practice.

Ridging soil and leaving it ridged for the winter is undoubtedly an ideal method of pulverising heavy soil by the action of frost, for it exposes a large area, and it is also an ideal method of ridding the soil of pests. But many experts are of opinion that ridging has its drawbacks and that it drains the soil of goodness. Ridging has to be done according to the lie of the ground, *i.e.*, in such a way that the ridges run the same way as the ground slopes, otherwise the water remains stagnant between the rows. In the case of level ground the ridges should run from north to south so that all the soil gets the maximum of sunlight.

The proper method of ridging is to divide up the plot into strips two spits wide, for wider ridging is a mistake. Start on the first strip and working backwards throw the soil up within the strip so that it forms a neat ridge. Then work the succeeding strips. The more all vacant ground in the kitchen garden is dug over the more fertile it will be, but heavy soil cannot be dug after autumn rains set in. The work has to be got through by the end of October, and then left well alone through the winter. Light soils on the other hand can be dug over continually during winter.

In the general enthusiasm for intensive vegetable cultivation fruit trees and small fruit should not be forgotten, particularly Raspberries, Blackberries, hybrid berries, such as the invaluable Veitchberry (to my thinking easily the best of all the hybrid berries). These small fruits provide the sweet course for many weeks, not merely without the use of flour, but the labour of cooking at all. In the event of a sugar shortage, they are sweet enough to eat plain, particularly the Veitchberry.

Most people gather Blackberries when they are merely black and before they are fully ripe. Unless the fruit comes off easily and with no pulling whatever, it is not ripe and consequently not sweet. Similarly with the Veitchberry, which even when it has darkened to a deep mulberry colour, is not ripe until it almost drops into the hand on the slightest touch.

Both these fruits are extremely productive and, unlike Raspberries, require no protection from birds. The essential for both is a well-drained soil. Blackberries have the reputation of growing anywhere, but this is true only up to a point. They are indifferent to shade and require the minimum of care, but on heavy soils they make poor growth and are apt to die out. Also the site must not be too enclosed. The richer the soil the larger the berries. If manure is incorporated it should not be put in the top spit, for if within too easy reach of the roots it makes for magnificent growth but not a prolific amount of fruit.

Plants should be bought only a year old, and it is unwise to obtain them from the hedgerows. There is no need to cut the canes at the time of planting. In the succeeding seasons canes that have fruited should be cut out and burnt.

Blackberries like Loganberries, Veitchberries, &c., are easily propagated by layering the tips in sandy soil, but this has to be done in August. The rooted tips are cut with 6in. of cane in spring and planted out in their permanent positions. Bedford Giant is a good variety. It is a strong grower and has very large fruits. Himalayan Giant makes such long growths that it has to be planted 12ft. apart. It is very prolific over a long season, but the fruits lack the characteristic Blackberry flavour.

The Veitchberry is treated in the same way as the Blackberry. Birds attack the first fruits when they begin to ripen, but, in my experience, they leave them alone the rest of the season. Unlike some of the hybrid berries, the Veitchberry is self-fertile. Loganberries are useful for jams, jellies, puddings, &c., but not sweet enough to eat without sugar. Loganberries are greedy feeders, and it is useless to put them in poor soil or to grow them against a wall or fence. Treated thus they produce fruits that are mostly pips. Rich soil and full sun are essential, for this hybrid hails from California, and like the Blackberry it is resentful of badly drained soil.

It is best to put in one-year-old plants as older ones transplant badly. Cut back to within a foot of the ground to encourage young shoots. Loganberry canes are extremely brittle, and the young growths need tying up. In spring the young growths should be thinned leaving not more than six to each stool. Nothing is gained by leaving more growths, and all the surplus growths should be removed as early in the spring as possible.

MORE ALLOTMENTS WANTED

A BIG drive has begun to increase the number of allotments in England and Wales by half a million. The Government is well aware that the last war brought into being a great movement of men and women plot-holders, who magnificently and efficiently responded to the call to grow food at a time of crisis.

An order now gives urban authorities wide powers to take possession of land for allotments.

The powers enable the local authorities to take possession of (*a*) unoccupied land—where it can be cultivated—without having to obtain any consents; (*b*) occupied land, by agreement with the owner and occupier; (*c*) common land, with the Minister's consent.

In particular, unoccupied land awaiting building development should be utilised. As a general rule, it is thought that a 10-rod plot will be enough for each person. Councils may arrange for cultivation either by an allotments society or by individuals, and they may do any necessary adapting and fencing.

The National Allotments Society is willing to help in any way possible in the formation of societies or individuals wishing to take up allotments. The society's address is Drayton House, Gordon Street, London, W.C. 1.

THE LAND GIRL WILL HAVE TO HANDLE HORSES IN HER WORK AS WELL AS MACHINES

WOMEN'S WORK ON THE LAND

By JOAN ROBESON

THIS country will not readily forget the important part played in home food production by the Women's Land Army during the war years, 1914–1918. To-day, 25 years later, faced with perhaps an even greater Armageddon, the call to the Home Front has come again. The response is sure.

The choice of Lady Denman as chairman of the whole of the Women's Land Army in Britain is certainly a happy one. Lady Denman possesses a considerable knowledge of the economies and "facts" of food production and farming, which will stand her in good stead in her new and onerous position.

The Women's Land Army already numbers several thousands of recruits. County organisers have been appointed and training centres established in different parts of the country. Enrolment may be made for whole or part time employment. The good offices of the county organisers extend beyond the mere enrolment of members, and the future welfare of each girl is not lost sight of.

Recruits have come forward in steadily increasing numbers and a feature has been the large number of applications received from girls whose homes are in the cities and big towns. In exchanging the work-bench and office stool for the out-of-doors life these girls should, in a short time, find the scales of health come heavily down on the credit side.

But the town and country girl alike will first consider the hours long, the work hard and often muscle searching. A few weeks, however, should suffice for the breaking-in period, and weariness will afterwards give place to a sense of physical fitness and happiness, which even the winds and rain of an English winter will fail to dispel.

The Government makes itself responsible for providing each recruit with a uniform, consisting, it is understood, of shoes, stockings, dungarees, pullover and felt hat. The Women's Land Army badge, which may be worn on all occasions whether in uniform or mufti, is a happy choice. The centre piece, set on a green background, depicts a sheaf of golden corn, reminding she who wears it that "bread is the staff of life." The badge is surmounted by a red crown.

Some of the recruits, already possessing a knowledge of farm work, are able to fix up their employment locally with a near-by farmer. The majority of the girls, however, are "raw" recruits, and their enrolment in the Women's Land Army is followed up by a fortnight's intensive training, whenever possible. For this purpose training centres have been inaugurated in different parts of the country. The Royal Agricultural College, Cirencester, Gloucestershire, for instance, is utilising its farms, at present held by the Governors, for this purpose, and the work of training the girls is proceeding smoothly.

It is obviously a practical impossibility to cover more than the mere elementary rudiments of farming in the short time available. The main essentials are divided under four heads: (1) The management of cows and pigs; (2) tractor driving; (3) field hand work; (4) the management and working of horses.

Field hand work naturally varies with the seasons, and while one batch of girls may receive instruction in haymaking, another will gain experience in harvesting, and so on. The normal routine of farm work, milking, stock-rearing, etc., is learnt by all. The girl possessed of initiative and determination can use this background of tuition to the best advantage when she takes her place as one of England's agricultural workers.

It might be questioned whether the Women's Land Army will be in such keen demand by the farmers as during the last war, as very few "key" men will be asked to exchange the ploughshare for the sword. On the other hand, it must be remembered that agriculture in this country has suffered a woeful decline in recent years, and has now to be pulled out of the mire, so to speak.

CARTING MANURE—EQUIPPED WITH GAS MASK!

It is not within the province of this article to criticise the agricultural policy of any particular Government, but it may safely be said that the decline in agricultural prosperity has had much to do with the so-termed "drift from the land" movement. Farm labourers are scarce; many farms are hopelessly under staffed, and here the value of the Women's Land Army will be most appreciated.

It is in the dairy, perhaps, more than anywhere else, that the land girl may show a marked superiority over the average farm labourer. In dairies where the good old-fashioned hand milking still persists, the cows will oftentimes give down their milk more freely for the quiet persuasion of a woman's voice and hands.

The recent announcement by the Ministry to aim at bringing a further 1,500,000 acres under the plough for next year's harvest must further popularise the use of the tractor plough. The horse plough may be largely supplanted but not altogether, and the land girl will be required to master the technique of both. So far as tractor ploughing is concerned, the girl who is already a car driver has the initial advantage over her less fortunate sister.

The advantage may, however, prove to be small, for between the mere ability to drive a tractor and the whole art of tractor work a great gulf is fixed!

It has been truly said that an army marches on its stomach, and it is no less certain that the whole morale of the peoples is dependent upon an adequate food supply. The work of the Women's Land Army is no less vital to the life of the Nation than many other spheres of Women's activities.

A LESSON IN TRACTOR DRIVING

GOLFERS WHO MANAGE *to* CARRY ON

By E. R. TIPPLE

NOW that the first few weeks of war have been experienced we are settling down to our new tasks and adjusting our lives in accordance with present-day requirements. If ordinary routine has been shattered, we are told that we can best assist the country by carrying on our normal activities just so far as we are able. Entertainments have been re-opened and plans are being prepared to carry on sports and games of all kinds. In times of stress some form of relaxation is essential and golf can play its part in enabling us to rid our minds, even for brief moments, of the appalling results of modern warfare.

On some courses play may not be possible for obvious reasons, but in any case where it is possible to make up the full round it can be made up by playing one loop of holes twice. Old golfers are not going to miss their games if they can help it! They have learned by past experiences to overcome the expected difficulties produced in troublesome times. A story was told in an evening newspaper of a golfer who replied to a lady who told him he would do better to be digging than carrying a bag of clubs around: "Madam, I am 71. I fought in the last war. I am now going to see my sick wife. I think it best to play golf and keep fit, rather than make myself a nuisance to others!"

Even if clubhouses have to be abandoned the courses are being left open to all. An important bag may even find its way into the kit of serving members while at home—a bag of golf clubs. Why not? Opportunity is a fine thing, and in the true Drake spirit they can polish up their game and finish their friendly battles before tackling more serious aggressors. Let it be said here that the majority of golf clubs have thrown open their courses and social amenities to all those in the Services. This generous invitation will be appreciated just as a similar concession was in 1914 to 1918.

A club's chief concern is the upkeep of its course. The majority of the green-keepers have been called up, and with the grass still growing quickly the problem of maintaining the fairways, tees and greens is a serious one. As many secretaries were on the reserve lists they had to leave at short notice, before they had time to draw up plans for meeting this situation. However, this is being done by some committees, professionals and ordinary members. At one London club the professional's shop is the clubhouse and he, as well as looking after internal arrangements and his own business, will take charge of the upkeep of the course. At many others members are volunteering their services and some have already taken over the care of certain greens.

It is a good idea for a group of golfers to act in this manner, for it will save time and unnecessary journeys from one part of the course to another. Rivalry as to the state of the particular greens is sure to result, and for a change they can only blame and grumble at themselves! I wonder if they will cut the holes in those fiendish spots beloved of so many greenkeepers, on top of humps or near the edges of bunkers? Somehow, I think they will choose easier sites—I know I would!

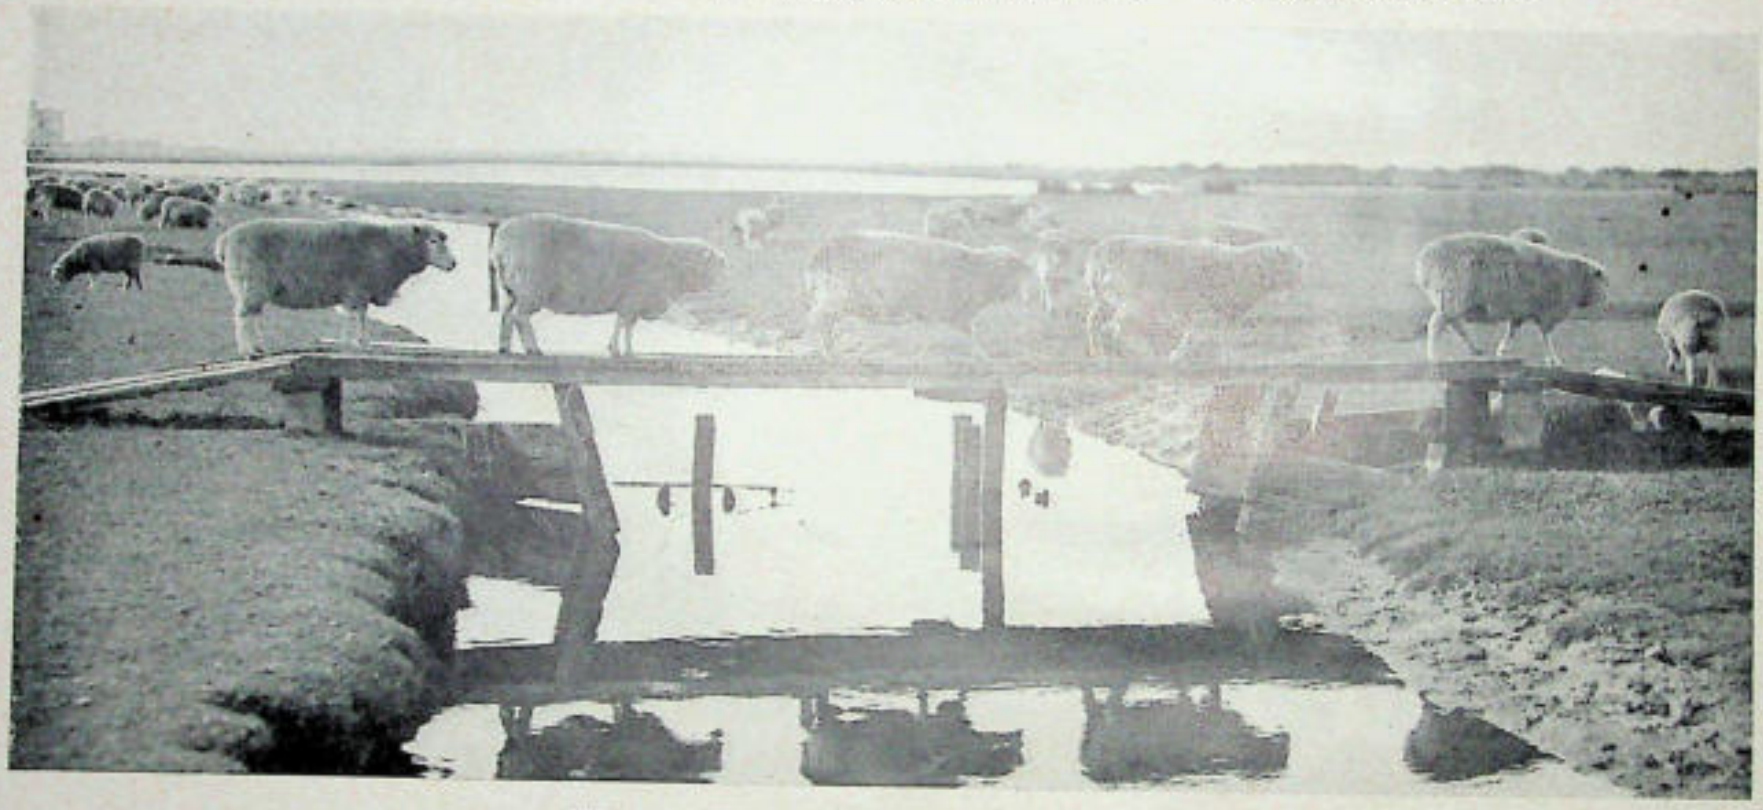
The question of petrol supplies for the motor tractors is awkward. Some people may be able to obtain rations, but the majority will have to cut down the rough and fairways whilst they still have supplies. Perhaps we shall see the old horse pulling an antiquated mower—a sight familiar only a few years ago—and cutting two or three fairways in one day. If horses and motor tractors are not available, then sheep may have to be requisitioned. Farmers would agree to this, as it would enable them to use their own land for other purposes. Come what may, and no matter how rough courses may be, golfers can enjoy their games then; then in doing so they will benefit mentally and physically.

British adaptability is indeed proverbial! If air raids do occur to upset the calm of our minds—and you never know what That Man will do, he is no respecter of etiquette—then we golfers have shelters at our disposal—those deep bunkers which we so despise and try to avoid in normal times.

Since the outbreak of hostilities all competitions have been cancelled. Important events such as the professional match play championship, the Ryder Cup match and the amateur international games will not take place. That is unavoidable, but in time club events could be resumed with the proceeds being devoted to charity. If this were to be done golfers would support them as much as possible. Some professionals have joined up in various units, others are waiting to see where they can be most useful.

Meanwhile Henry Cotton, who was to have captained this year's British Ryder Cup team, has suggested a series of exhibition games which will promote general interest as well as providing funds for charitable organisations, such as the British Red Cross and Order of St. John, who are in need of support. Cotton is prepared to play each of the seven members selected for the Ryder Cup team, and anyone else for that matter. He is to be admired for refusing any fees for his services, and naturally, his opponents will follow this commendable example.

As already announced, he will in the south play, in all probability, Rees, R. A. Whitcombe, Padgham, King and Compston. In the north, Burton, the Open Champion, and Adams. So plans are being prepared for interesting matches throughout the country, and the professional golfer's desire to assist in what way he can will be backed up by every player and enthusiast. Expenses will be kept as low as possible and admission charges for these games will probably be half-a-crown.



Even if national duties prevent the ordinary golfer playing a full round, a few holes will be worth while. Golf has this advantage over other games—you do not have to rely on several others before you can enjoy a game. Anyone can spend an hour or so pottering about a course by himself, getting the fresh air and concentrating on a game that calls for concentration. In no time at all you will find yourself trying to puzzle out why you are hooking with the irons when you were trying to slice. Having solved this problem—partially or completely—you will return to your serious duties refreshed and ready to do your bit more effectively for the break. So golfers are carrying on in company with all other sportsmen confident in the British tradition and what the future has in store for us all.

WAR TIME NOTICES

CEMENT AND CONCRETE ASSOCIATION.—This Association has moved to Lincoln Buildings, 15, Turl Street, Oxford (Telephone: Oxford 47952), and will continue to issue publications on the use of concrete in agriculture and A.R.P.

COMMONS, OPEN SPACES AND FOOTPATHS PRESERVATION SOCIETY.—The Society has now moved to The Hall, Southstoke, Bath, Somerset.

THE SMITHFIELD CLUB.—In consequence of the state of war and the Government restrictions resulting therefrom, the Special Emergency Committee appointed by the council, has decided that it is impossible to hold the Smithfield Club Show at Islington in December next.

THE GRASS-CUTTERS—SHEEP ON THE WESTWARD HO! COURSE

If horses and tractors are not available sheep may have to be requisitioned to deal with the grass

GROUSE REPORTS

We do not expect to receive further reports from moors, but the following have come to hand concerning past sport, and are of interest as records of a sadly interrupted season.

SCOTLAND

Inverness-shire

MEALMORE.—On August 22nd, Home Beat, 189¾ brace of grouse; on the 24th, Dalnagany Beat, 202¼ brace of grouse were killed by eight guns each day: Sir Theodore Brinckman, Mr. C. Ogden, and party. Second time over. With the exception of August 24th, birds showed up better than the first time over. Birds improving in condition. On September 6th, 133¾ brace of grouse were killed by seven guns: Sir Theodore Brinckman, Mr. C. Ogden, the Hon. A. Baillie, Major A. McKenzie, Major Barnard, Mr. R. Prelyman, and Miss Ogden. Combined day on Home Beat and Wester Lairgs Beat. Shooting has now finished here for the season. Birds are now in excellent condition, and all trace of disease seems to have disappeared. A good stock left. Total for season, 1,253¾ brace.

NAIRNSIDE.—On August 28th 82 brace of grouse were killed to eight guns: Sir Theodore Brinckman, Baroness Burton, the Hon. A. Baillie, Major Mellis, Major A. McKenzie, Captain J. Godman, Mr. G. Harrison, and Mr. C. Ogden. Second time over: plenty of birds, and all in splendid condition.

Perthshire

DALNACARDOCH.—On the 29th, 78¾ brace of grouse were killed by six guns: Colonel Prior, Captain Holdsworth, Captain J. W. D. Evans, Mr. R. A. Knight, Mr. R. Wiggin and Major H. P. Rushton.

LOCHAN LODGE, AMULREE.—On the 12th, 151 brace of grouse were killed, driving; on the 14th, 90¾ brace of grouse were killed, driving; on the 15th, 45 brace of grouse were killed, walking; on the 19th, 225¼ brace of grouse were killed, driving; on the 21st, 50¾ brace of grouse were killed (half-day owing to mist), driving by Mr. T. M. Burrell and party.

Ross and Cromarty

EDDERTON.—On August 22nd, 54¾ brace of grouse were killed by seven guns: Earl Temple, Mr. G. Bankes, Colonel H. G. Spencer, General Pollok McCall, Major Atkinson, Colonel Pollok Morris and Mr. Caillard. Weather fine, coveys numerous and well grown. No disease. On the 30th, 100¾ brace were killed by eight guns: Earl Temple, Colonel Spencer, Major Atkinson, General P. McCall, Pollok Morris, Mr. J. Bankes, K. Murray and Mr. R. Caillard. Weather good, no wind.

LETTERS TO THE EDITOR

THE PLOUGHING CAMPAIGN

SIR,—The Government is apparently going to take measures to have the grass lands of this country extensively ploughed up. We are also informed that every child in the kingdom must be liberally supplied with fresh milk daily. Before any sweeping measures are taken it would be well if the authorities would consider where the cows are going to be pastured and to remember the disastrous lessons of the last war, when the reckless ploughing up of valuable old meadow grass resulted in the complete ruin of vast tracts of pasture without any compensating increase in the nation's food.

People seem to imagine that farmers have only to plough up their grass and plant potatoes or corn. In many grass farms the acres ploughed up in the last war by Government orders produced nothing but charlock and wireworm, and the most horrible wilderness of weeds ever seen. It was impossible to cope with the charlock or to produce any useful crop. In some Sussex areas the ruin was so great that these fields have never recovered. It takes many years of care and attention and hard work and expenditure to produce good grazing, and we do not want all this work to be wasted.

Owing to the vast increase in building and the breaking up of park lands due to the Death Duties and the substitution of villas for grass our pastures are already too few, and if many more of these are put under the plough it will be disastrous to the country's milk production. We cannot have it both ways. Moreover, land cannot be forced to produce crops for which the soil is unfitted, and in attempting to put nature under rigid martial law more harm than good may result.

Yours faithfully,
Crabbet Park, WENTWORTH.
Crawley, Sussex.

PETROL RATIONING

SIR,—The following letter has been addressed by the Secretary of the R.A.C. to the Secretary of the Department of Mines:

"On behalf of the Royal Automobile Club, I desire to draw your urgent attention to the position which has been created by the extremely severe rationing of petrol for the use of private cars and motor cycles.

"The Royal Automobile Club is fully alive to the need for ensuring that adequate supplies of fuel are available for the fighting forces. It is also aware of the many factors which probably render necessary some restriction in supplies. There are probably other factors also of which the Club cannot be aware. Nevertheless, it is felt that the vital importance of transport to the commercial needs of the country renders essential some relaxation of the present scheme.

"No indication has yet been given as to the extent to which the permitted ration will be increased following application to the Divisional Petroleum Officers, but it would appear from reports which have been published in the Press that extra supplies are only likely to be granted in special circumstances. If this is so, and the large body of private car owners and motor cyclists are to be restricted to the quantity of fuel allotted each month under the existing scheme, then the result will be inevitably that a very large proportion of the private vehicles now in use will not be relicensed at the end of this quarter, or the end of the year, as the case may be, and will be laid up. Especially will this be so at the commencement of the new year when the increase in the horse-power tax will come into operation.

"The minimum distance covered by a private motorist is about 5,000 miles a year; 10,000 is the average figure, whilst 15,000 is not uncommon. Cars and motor cycles have now become a necessary part of the daily life of the community. They are used to enable business, professional, and working men to get to and from their work, to assist them in carrying out business appointments, for the collection of orders, inspection purposes; indeed, there is hardly a business, profession or occupation to-day which does not rely wholly or in part on motor transport for its successful continuance. The petrol ration will reduce the mileage which may be covered to one-tenth in the case of many cars, to one-quarter in the majority of cases, and even at the best, where a car is used only occasionally, to one-half. Such a reduction must inevitably have two results:

"1. Business and commerce will be interfered with to a degree that it is impossible to estimate.

"2. The estimate of £100,000,000 of revenue from motor taxation generally, including the yield from the fuel tax, made by the Chancellor of the Exchequer in his Budget statement in April last, will prove to be entirely illusory.

"Further, the retail section of the motor industry will be brought to the verge of bankruptcy by the disappearance of a very large proportion of its trade.

"The reaction to these results will be a serious reduction in the earning power of the country, and consequently in the taxation yield from industry generally. Added to the huge actual decrease in the amount collected from motor taxation there will be such a loss to the national revenue that, at a time when vast sums are required for the successful prosecution of the war, the most serious consequences may ensue. It is submitted that some review of the position so far as the petrol ration is concerned is therefore most urgent. The club suggests that as an experiment the quantity at present allocated should be doubled, without interfering with the existing right of appeal for an increase in this supply where circumstances render such an increase essential. Such a concession would remove a little of the hardship so far as business and commerce are concerned, and it would at the same time encourage all motorists to continue to use their cars, even to a limited extent, and so serve to maintain the national revenue at the highest possible level.

"In addition to the general question, which I have dealt with above, there are certain anomalies in the scale of supplies as at present laid down which require consideration. The flat rate of 10 gallons of petrol for all cars of 20 h.p. and over operates harshly, and the club suggests that cars over 20 h.p. and up to 25 h.p. should receive 12 units a month, and those over 25 h.p. 15 units a month. The allowance for motor cycles should be based on an engine capacity basis, the flat rate of 2 units a month operating most unfairly on machines with engines over 250 c.c. Allowance should also be made for the motor cycle to which a sidecar is attached.

"The rationing scheme came into operation last Saturday, but I trust that the earliest possible consideration will be given to the representations which the club has put forward on this matter.

"I have the honour to be, sir,
Your obedient servant,
F. P. ARMSTRONG,
Secretary."

THE HEAVY 20-BORE GUN

SIR,—The article by Captain Curtis in a recent issue about 20-bores of the heavy American type, was very interesting, as it focussed attention on the fact that those guns can be deadly at the full ranges at which so much duck shooting is done in that country. Practical sportsmen would not use them if they failed to do their business.

Such guns might be very popular for shooting in India and other places where many cartridges may be fired at a morning's shoot, and where heavier weapons may tell their tale in the way of fatigue. A pair of slender tubes, too, do appeal to some men for long-range alignment.

At the same time it should be pointed out that the main advantage of a 2-inch chambered 12-bore is that it can fire a serviceable charge and yet weigh under 5½lb. A 20-bore of the type mentioned will weigh at least 6lb. This really is the crux of the question and the reason why the 2in. 12 has made such headway. ¾oz. of shot, properly handled, will do some very effective execution.

Yours faithfully,
Northumberland. T. B. HUTTON.

THE KENDAL OTTERHOUNDS

SIR,—In the history of the Kendal and District Otterhounds in your issue of August 26th, it is stated that the pack was established nearly 40 years ago. Your historian, Mr. Robert Colville, is rather out of it in saying that a Mr. Bradshaw was the Master then, for if so he must indeed have been a very old man, considering the fact that he was actually the Master before 1807, or 132 years ago! In the *Lancaster Gazette* for July 10th, 1807, there is an account of how Mr. H. B. Bradshaw of Halton Hall, the Master, hunted Halton Water, finding an otter at Halton, and hunting downstream to the aqueduct killed him in deep water, after a three-and-a-half hours' hunt. In the '60's the Lune was hunted by Mr. R. Hill, and in the *Field* of the time is a long account of a hunt about Caton Bridge. About 40 years ago, Sir Henry Bromley, Bart., the father of the present Master, was Master of the Kendal, and before him, I believe, Mr. Wilson, also of Dallam Tower. The writer started with the Kendal pack, hunted by old Bobby Tregellon, over 50 years ago, and indeed served his apprenticeship with the K.O.H.

After Sir Henry Bromley gave up, a Mr. Carneby-Foster took the hounds for his step-daughter, Lady Molly Hamilton, to hunt, chiefly in Shropshire and on Arran. Later Captain Thompson hunted the district, when the hunt was called the Wharfedale. In the writer's early hunting days, the meets were in the early hours of the morning, 6 a.m., 6.30 a.m. or 7 a.m., or often earlier, and we had often finished at the time hounds now meet, round about 10 a.m.!

Yours faithfully,
Lancaster. H. W. ROBINSON.
Late Hon. Huntsman E.S.O.H.

THE CUCKOO AND ITS EGGS

SIR,—In reply to your correspondent "Ruby," who asks why the cuckoo destroyed all the eggs in the wagtail's nest, the reply is that the eggs being of no use to her to use because of their stage of incubation, she wished to make the birds start all over again, so that she could then lay her egg in the nest at a time more suitable to its convenience.

Yours faithfully,
H. W. ROBINSON.

MISS CLEGG-HILL'S BEAGLES

SIR,—Miss Clegg-Hill has offered her services and the loan of her beagles to the War Office for the purpose of providing recreation and outdoor exercise for officers convalescent after wounds received on Active Service. This offer has been gratefully accepted by the War Office, who will take the beagles "on the strength" in due course.

As, however, the site for the Officers' Convalescent Depot has not yet been fixed the authorities have asked for the pack to be maintained until they are ready to receive them.

May I, therefore, issue an urgent appeal for funds in order to preserve the pack to provide—in the words of the War Office letter—"untold benefit to officers posted to the depot during convalescence." To anyone who is unable to hunt owing to the War may I say, please send us your normal hunt subscription, just this once, as a donation. Cheques and donations, however small, will be gratefully acknowledged and should be addressed either to me or to Miss Clegg-Hill, Fernhill, Newport, Shropshire, and crossed Lloyds Bank Ltd., Stafford, Miss Clegg-Hill's Beagle A/C.

Yours faithfully,
E. H. C. D. LLOYD-DAVIES,
Brewood, (Hon. Secretary).
Staffordshire.

WHERE THERE ARE PEANUTS THERE AR I
(See letter "Aerial Gymnastics")

AERIAL GYMNASTICS

SIR,—The following incident may amuse some of your readers. In my garden I have a coconut suspended from the bird table and filled with peanuts. One day a squirrel appeared out of the surrounding woods and secured the nuts by the trapeze act depicted in the photograph.

I was lucky enough to be able to snap him in the act.

Yours faithfully,
Rickerby, J. H. D. JOHNSTON.
Lochanhead, Dumfries.

RABBITS IN WAR TIME

SIR,—In order to encourage the economic use of land in war time, it was found necessary in 1917 to introduce emergency legislation for the prevention of damage by rabbits. This was repealed in 1921, but the recent and far more satisfactory Prevention of Damage by Rabbits Act lays on occupiers of land the onus of keeping down rabbits.

In order to assist them to comply with this requirement, the promoters of the Act (the Universities' Federation for Animal Welfare) have published exhaustive and practical *Instructions for Dealing with Rabbits* (20 pages octavo). The pamphlet gives much detailed information about fumigation, long-netting, rabbit-proof fencing, ferrets and ferreting, shooting, catching with dazzle-light and dog, catching in enclosures, and so on, together with the text of the new Act and a brief and very clear summary of its provisions; the latter will be much appreciated by those who stumble over the rather complex wording of the Act.

Single copies of this booklet will be sent on receipt of a stamped quarto envelope, and larger quantities will be supplied at cost price (3d. each) by Ufaw, Gordon House, 29, Gordon Square, London, W.C. 1.

Yours faithfully,
M. A. CHALLEN.

A CURIOUS CHURCH CARVING
(See letter "Wrestlers on a Font")

REARED BY HAND
See letter "Three Blue Hares"

THREE BLUE HARES

SIR,—I should be interested to know if any of your readers have ever succeeded in rearing blue hares? The above photograph shows Lady Diana Hay with three tiny blue hares, which she reared with a medicine dropper. They were brought in by the keeper, who thought they were about two weeks old. They are now so tame that they drink milk out of a cup, and are delightful companions.

Yours faithfully,
Aikenway, SYBIL STEUART-MENZIES.
Craigellachie, Scotland.

WRESTLERS ON A FONT

SIR,—High up on the Yorkshire Wolds is the pretty little church of Cowlam. Inside is a magnificent font, which is elaborately carved, one of the finest in Yorkshire; and this is a county noted for its remarkable fonts.

These are the subjects carved on it: The Massacre of the Innocents, the Adoration of the Magi, the Temptation of Adam and Eve, a Bishop with his Crozier, and the very unusual sight of two men wrestling, shown in the photograph. The figures are crowned, and it is from this fact that the date of the font is established, as this was a feature not introduced before the twelfth century.

Yours faithfully,
Low Coniscliffe, Co. Durham. A. M.

SQUIDS IN NORTHUMBERLAND

SIR,—The squid figured in the photograph in your issue of Sept. 16th appears identical with some squids seen at Oban Pier a few years ago. A dense shoal of young herring was massed under the piles of the pier, and the squids were taking the young herring by sudden dashes into the thick of the shoal. The silvery little herring could be seen gleaming in the tentacles of individual squid which were retiring into deep water, after a successful raid.

North Sea trawlers catch numbers of this particular variety of squid, and to make sure of the variety, I asked a friend who lives in Edinburgh to ask the trawler men about the squids they caught, when he was shown specimens, and secured one, which he forwarded to me for identification. To the best of my belief this North Sea squid was identical with the red squids seen preying on herring at Oban Pier, and I believe that that variety of squid feeds mainly on baby herring in the summer season.

It might be that the squids seen by Mr. Conyngham Graham to ground and put to sea again after grounding had come too close in after young herring.

Woodview, Yours faithfully,
Comrie, Perthshire. DUGALD MACINTYRE.

A PET TOAD

SIR,—Mr. Eyre's "Tale of a Toad" in the August 19th issue of the *Field* tempts me to tell another: A friend told me that his old gardener's boy used to catch flies and take them into the hot-house, and Toby, his pet toad, used to come out from his favourite "sit" under the ivy-leaved geraniums, flick out his long tongue and take the flies one by one from the urchin's open hand.

Of course, I cannot vouch for the truth of this; my friend may have been gently pulling my somewhat elderly leg! It would be very interesting, however, if any fellow reader of the *Field* had ever seen anything of this sort and would write you about it.

Yours faithfully,
GEORGE I. WILLSON.
29, Julian Road, Folkestone.

THE ORIGINAL RIBSTON PIPPIN

SIR,—Many of your readers may be interested in the accompanying photograph of the hulk of the original Ribston Pippin, the ancestor of the famous variety of apple trees, which is to be seen in the grounds of Ribston Park, near Wetherby, Yorks.

Records indicate that in 1709 Sir Henry Goodriche planted some pips from apples grown in Rouen, France, and although three of them grew, only one was worth keeping. This became the original Ribston Pippin.

The trunk of the old tree was blown down during a fierce gale in 1828. A sucker from the old roots was preserved and can still be seen.

Yours faithfully,
Lindley, S. MOORHOUSE.
Huddersfield.

A FAMOUS ANCESTOR

New Books

AMERICAN TROPHIES

North American Big Game. Compiled by ALFRED ELY, H. E. ANTHONY and R. R. M. CARPENTER. (Scribner's, New York; $7.50.)

This is a book of the Boone & Crockett Club, published under the auspices of the National Collection of Heads and Horns of the New York Zoological Society. The work was conceived by the late Prentiss N. Gray, whose book entitled *Records of North American Big Game* was published in 1932. The latter created such interest that he decided to embark upon a fuller and more comprehensive volume. Unfortunately, he died before he was able to do so. But the Boone & Crockett Club appointed the committee which has carried through the project.

The result is a monumental work. The various authors are all experts in their own subjects, and a full range of subjects has been covered. There are, in fact, 24 chapters, and a set of tabulations of trophies which record details of a very large number of heads. The illustrations are excellent, and include some wonderful photographs by Grancel Fitz and drawings by Allan Brooks.

The chapters on Vanished Game and Conservation will at once bring to mind problems that are not confined to the North American Continent. Mention is made of the fact that the ordinary American citizen has been brought up to believe that free, or nearly free, hunting is a birthright inherited from pioneer ancestors. It is also pointed out that there is a type of politically-minded administrators of state game agencies who have for the most part been engaged in exploiting the sadly reduced game crops of their respective states, by selling as many licences as possible without any consideration for the number of animals that may safely be taken.

A feature of some of the chapters on the different species is the description of the mountain and other scenery concerned with various exciting anecdotes and adventures, which make light and attractive reading. Much information of technical value will be found in the chapters on Horns and Antlers, Rating of Trophies, Rifles and Ammunition and Photographing Big Game, &c.

This must be considered a standard work which should appeal to all who are in any way interested in the subject. It fills a necessary place in big game literature.

W. H. T. LOXG.

Around Golf. Edited by J. S. F. MORRISON. (Arthur Baker, Ltd.; 15/-.)

This is an interesting addition to the prodigious list of golf literature. Morrison chose the help of such recognised authorities as Lady Heathcoat-Amory, Bernard Darwin, C. J. H. Tolley, Ben Travers and several others to compile in one volume as many varying treatises on the game as possible. The result is a book that is very readable, containing a host of information without being at all technical. Indeed, for once the instructional side of golf has been omitted—a welcome change. No more need be said about Darwin's contribution than that it is one of his best. In his inimitable way he tells us how to watch golf and warns us that "We should watch on broad lines and not observe too closely some petty idiosyncrasy."

The chapters written by Lady Heathcoat-Amory and Cyril Tolley, in which they describe some of their thrilling matches, are of historic value. Her description of those great battles with Miss Cecil Leitch and his account of his victory in the Amateur Championship of 1920, when he was persuaded to enter at the last minute by Roger Wethered, make fascinating study.

Ben Travers justifies his great reputation in his description of his only appearance in an important competition—against Mr. Whistle, who was suffering from d.t.'s, in Malorca years ago. He debunks such people as the Big Match Steward—"that pompous gem of little brief authority . . . revelling in his hour as a big wig . . . festooned with rosettes of office." How near the truth he is I will leave to the imagination of the reader. With an excellent array of illustrations *Around Golf* will appeal to any player and is worth every penny of its apparently rather high price.

E. R. TIPPLE.

Life Class. By LUDWIG BEMELMANS. (John Lane; 8/6.)

The author was born in a small Bavarian town, and was translated, on the unanimous opinion of his relations as to his ability, to America. Here he became a waiter in various hotels and finished this part of his career as manager of the banquet department in one of the best hotels in New York. This book is the result of his experiences and reflections.

Head waiters, as a race, are the product of very peculiar circumstances. The more stylish the hotel or restaurant the less it really cares about its customers. This attitude is summed up in its head waiter, who is all attention to people he knows (which is the same thing as saying the people whose presence he thinks will do the place good), and who hurriedly delegates the other members and diners to obscure positions, where they may eat and drink unseen between a large pillar and a collection of service wagons.

This much everybody knows. What this book makes clear is that the happiness of the more obvious table is nearly of equal unconcern, so long as they are filled by the right people. Yet it is largely the public's own fault that this absurd situation has arisen, and we must put up with it. The only remedy is for people to recover the lost art of entertaining in their own homes.

But if the general situation be conceded, it must be confessed that this is a book well worth reading. Mr. Bemelmans was no ordinary waiter, and seems to be as much amused at himself as his customers—and it must always be remembered that it cannot fail to be very difficult for a waiter to retain any faith in human nature at all. Reckless and useless expenditure, whether in America or elsewhere, has never been the bedfellow of civic virtue.

ROBERT COLVILLE.

* * * *

The Last Days of Henri Quatre. By HEINRICH MANN. (Secker & Warburg; 9/6.)

Those who have read the two previous volumes of Heinrich Mann's brilliant trilogy—*King Wren* and *Henri Quatre*—will need little persuasion to obtain this final volume. Like its forerunners, the book shows the author's deep knowledge both of his character and of the contemporary scene.

Henri we have viewed as a lover, a statesman and a soldier. Tolerant and astute he has consolidated the various elements in his kingdom. Now, in his closing days, he longs for a united Europe. His struggle towards this end, aided by his friend and confidant, Sully, comes near to victory, and the story of this supreme effort is the theme of the third volume of the trilogy.

Here was a very human but large-hearted man who loved his people and was loved in return. "His heart did not beat solely for his people, but also for his privilege, for the greatness of France, and the peace of all the world. But his people came first, and they were nearest to his heart when they were poor."

Here is drama, philosophy and humour, and in his English translation Mr. Eric Sutton has done them justice.

LESLIE N. RADCLIFFE.

AN EXCESS OF GROUSE

WHILE grouse were patchy in parts of Scotland, yet certain areas—or an individual moor—had grouse in greater numbers than had been the case since 1920. One might quote Banffshire and the borders of Aberdeenshire as a good instance of this, like other, places where abnormal results were reported in the *Field* early in the season.

The European situation becoming acute by August 22nd, guns who were serving or reserve officers left, and others due to follow on telegraphed regrets. This left the owner or lessee with few guns, all his plans for the succession of good guns to follow until late September upset, and faced with more and more birds showing up daily, and no hope of guns to deal with the situation. And so lodges closed down.

The law laid down by the "Grouse Disease Inquiry" in 1905–9, that overstocking is the main factor in disease, holds good, and to-day many moors are left with three times the stock desirable and surplus to what would have been had not war come on us.

One such moor closed down with some 1,500 brace short of what the headkeeper wanted killed for safety of his moor when the season opened. Another moor closed down with at least 2,000 brace short of what might have been shot. Not far off a syndicate rented three moors, equally heavily stocked, and had to leave early. These instances alone total some thousands of grouse surplus in one localised area.

Any such moors run a greater risk, if within normal range of any area where disease existed in the past spring, when the weather becomes wild and packs move about. The Forfar—Aberdeenshire area suffered from disease. In the case of a moor having a heavy stock left while the moors around, from some cause, only had a normal season, the risk is less, as room for local expansion exists.

Owners or lessees would be well advised if their keepers were told to kill all the grouse possible by any means now before it becomes too late. The late fields of oats will be black with birds in spite of all efforts to keep them off, and where the stooks are carried the stubble will attract birds in numbers. Action is urgent if it is to be of some use, and there appears to be no time lost in making the attempt.

One knows many keepers have joined up, but some older ones remain.

The closing statement made in the Appendix of the Grouse Disease Inquiry on its last page is worth bearing in mind: "Grouse disease is one of the natural risks to which grouse are subject, and is to be found wherever grouse are numerous."

IN THE CITY

By OUR CITY EDITOR

EXPERIENCE in the stock markets since the end of August must have come particularly strange to those who have picked up the threads of City affairs during the last 20 years. There are now various regulations on dealings, including the reimposition of cash business.

Cash transactions have been instituted mainly to curb speculation. It cramps the style of dealers accustomed to fortnightly settlements. Dealers, in making a market, are now unable to take a chance of selling more securities than they actually hold, or adding to their books, on the probability of being able to square up their positions before the end of an account.

It is true that cash transactions have been the rule in British Government securities and other high-class stocks all along. There is, however, in normal times, a substantial turnover in the funds day by day. Besides which, dealers in the funds have behind them the Government broker as well as the banks and big financial organisations, who always have business to transact in Government stocks.

The position in other sections is more complicated. Dealers have to trust to a normal turnover on the part of the public. It follows that cash transactions, outside the funds, result in a small volume of business exerting an undue influence upon market values.

This has been clearly demonstrated in the last few weeks. There were many in the country following the outbreak of war compelled to turn securities into cash. They found the gilt-edged market frozen by the fixing of minimum prices. They had to turn to other securities in which there was some semblance of a market.

Buyers were, naturally, shy. It was recognised that sellers were insistent, and by waiting stocks and shares might be picked up on more attractive terms. The dealers on their part were unable to take the stock offered. The alternative was to reduce values until stocks became attractive to new buyers.

The drop in prices for leading equities has been most substantial. First-class industrials, such as General Electric, fell about 10/-; leading tobaccos were as much as 20/- lower than at the end of August; shares in popular stores, such as Woolworth and Marks & Spencer, suffered severely; while there was wholesale marking down of brewery securities and bank shares.

Dividend-paying Rand gold shares were no exception. They also come in for special liquidation by those forced to find cash. It is true that uncertainty concerning future taxation, and a heavy burden resulting from compulsory war risk insurance on goods, were contributing factors. The fact remains that forced liquidation, plus the inability of the market to take stock, were at the root of the sharp downward movement in values.

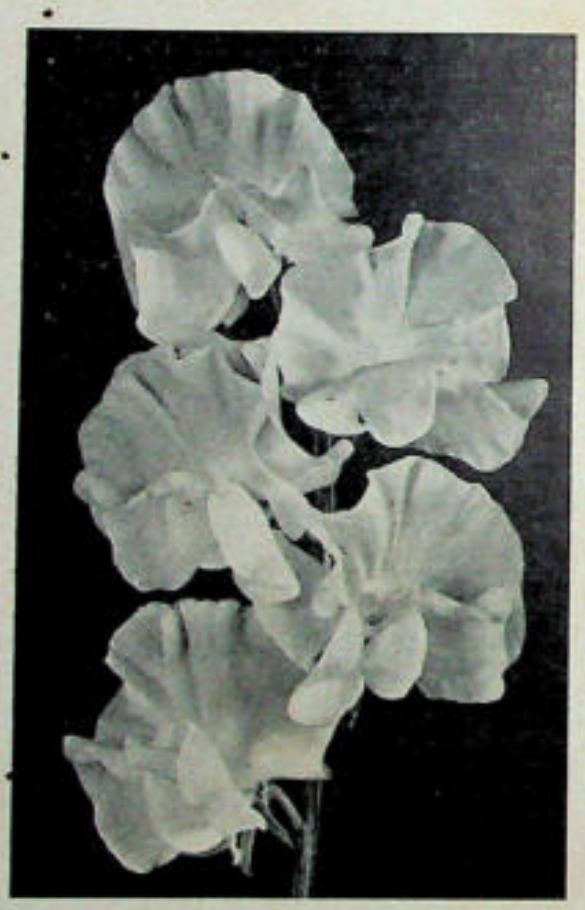
The fall in market values cannot be justified by anything that has happened to the companies concerned. Values in many instances have reached levels which entirely discount every likely contingency arising from war conditions. A slight change of sentiment would have the reverse effect.

When forced selling comes to an end it will certainly be found that supplies available to new buyers are negligible. Those who are not compelled by circumstances to turn securities into cash are well advised to retain their investments for the present. It may even be advisable for those with available resources carefully to examine markets with the object of making fresh purchases.

Motor shares which have fallen to particularly low levels should be carefully watched. It is probably true that there will be a great falling off in the purchase of new motor cars, but the companies can turn their attention to work of National importance.

Leading tobaccos, oils, shipping and securities, such as United Molasses ordinary, can give exceptionally good accounts of themselves, even under war conditions. There are opportunities in markets for those who follow a cautious policy.

NATIONAL RIFLE ASSOCIATION

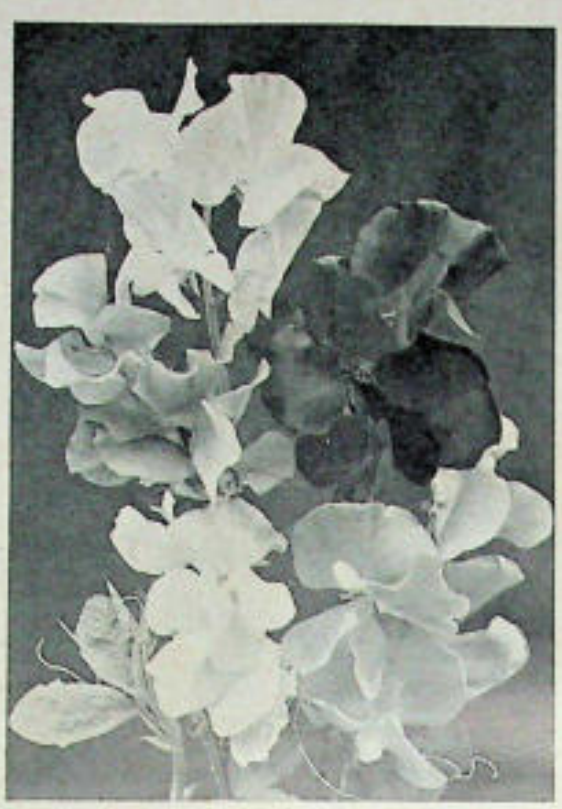


It is announced that Lord Cottesloe, chairman of the association since 1930, has now resigned that post and will be succeeded by Sir Philip Wigham Richardson, vice-chairman from 1920 to 1928 and from 1931. Major E. G. Monro, will be vice-chairman. Lord Cottesloe has rendered great service to the N.R.A., no one can claim more knowledge of match rifle shooting, and the thanks of all Bisley shots are due to him for the work he has accomplished. During the last war he was chief instructor of the N.R.A. School of Musketry.

AUTUMN SOWN SWEET PEAS

By ELEANOUR SINCLAIR ROHDE

IN many parts sweet peas did exceptionally badly this year, owing presumably to the exceptionally long spell of bleak weather in late spring and early summer. One of the chief points to bear in mind in regard to these annuals is that modern hybrids tend to become less and less hardy. And, unfortunately, the least hardy are those brilliant cerise and orange red shades that attract every eye at shows. When ordering for autumn sowing it is always advisable to ask for a list of those that are suitable for this purpose. There are so many hundreds of these reliable sorts now that it is impossible to give the names, and every grower has his own fancy names.



Sweet Peas planted in autumn bloom roughly a month earlier than those sown in spring, but apart from this seedlings that have gone through the winter either in the open or even in a cold frame make sturdier plants than those raised in heat. The last week in September or the first week in October is the right time for sowing, and in the south, especially on warm well-drained soils, it is well worth sowing half the seeds in the open in their permanent positions, for nothing equals sweet peas that have never been transplanted. The site should be chosen not so much with regard to where the plants will look picturesque as where they will do best. Sweet peas hate exposure to east winds, and soon show their resentment, for the leaves turn yellow and fail to make vigorous growth for a long time.

PINKIE, A FINE VARIETY OF DELICATE TONE

It is as well to sow fairly thickly, *i.e.* putting the seeds in only 2in. apart to allow for losses. They should not be sown more thickly than this however. The soil should have been thoroughly prepared earlier in the season, the ideal being trenching two spits deep, incorporating well decayed manure or hop manure liberally in the bottom spit, and if possible on light soils plenty of well-decayed green manure at the bottom of the trench. Plenty of wood ash and soot (both well spent and not fresh) can be incorporated in the top spit. If lime is lacking hydrated lime can be sprinkled very lightly along the top, so lightly that the ground looks as though there had been a very slight fall of snow not entirely hiding the soil. But very finely crushed mortar rubble liberally incorporated in the top spit seems much more to the liking of the plants.

It is a common and very bad blunder to sow seeds in loose soil. Amateurs frequently fork over soil just before planting, but experienced gardeners leave the ground out at least a fortnight to settle. The rhythm of the highly complicated life of the soil has been disturbed, and no good

SWEET PEAS PROVIDE THE MOST DELIGHTFUL COMBINATION OF COLOUR

comes of sowing seed until that rhythm has been resumed. Sweet Peas are particularly resentful of being either sown or transplanted into loose soil.

In districts where it is impossible to sow in the open, seed can be sown in pots or boxes filled with a compost of equal parts loam, leaf mould (or prepared peat), sand, and a little finely powdered mortar rubble. Pots are decidedly preferable because sweet peas make long roots, and where they are to be grown hedge fashion it is a good plan to sow three seeds in each pot so that they can be transplanted together, putting out the three seedlings *en bloc* a foot apart. This results in the minimum of root disturbance and involves less labour than planting each seed separately in a single pot. As it is advisable to secure quick germination the pots can be stood in a cool greenhouse till the plants are just about an inch high. Then they should be transferred to a cold frame, for undue coddling, even in slight artificial warmth, is harmful, especially as it seems likely we are in for a spell of long mild autumn. In the cold frame the pots should stand on at least an inch of ashes or sand, or even gravel. All through winter the frames should be closed only during severe weather and at night.

Sweet Peas sown in the open cannot be neglected during the winter. Aerating the soil along the rows is if anything even more important in winter than during the rest of the year, for damp is a far more serious enemy than frost, and in soil left in a stagnant condition the seedlings are bound to suffer badly. Once a fortnight is not too often to give them the necessary attention, using a hand fork carefully so as not to disturb the rows. Failing pea guards the strand of cotton sometimes needs renewing. On soils inclined to be heavy it is a good plan to spread sand half an inch deep along the rows, and before severe weather sets in it is very helpful to draw soil or sand up to the stems. Twiggy supports not merely prevent the plants flopping about, but they afford a good deal of protection from cutting winds.

Nothing is gained by putting out plants wintered in a cold frame too early. We usually have bitterly cold weather in April, and though theoretically the earlier in the month they are put out the better it is advisable to wait for a favourable spell. The plants should be "stopped" when they are 4in. high, and nipping off the tops with scissors is better than pinching them off. The main growths never produce satisfactory flowers.

SOWING IN BOXES FILLED WITH COMPOST

THE THINNING OF PLANTATIONS

By REGINALD DAVEY

A NEGLECTED larch plantation, if it is growing at all, may produce timber at the rate of 30 cubic feet per acre per annum. A similar plantation, if well tended, will increase at 100 cubic feet per acre per annum. Over a period of three years this will amount to an increased production of 210 cubic feet per acre. We do not know the total area of larch plantations in the country, but on 250,000 acres this increment would involve a total of 52½ million cubic feet, about double our peace time annual consumption of home grown conifers.

Apart from the national need for securing thinning of conifer plantations, particularly if hostilities be protracted, the benefit to the owner's purse will be substantial, in the region of 10 guineas per acre, or more than £500 if he is lucky enough to possess 50 acres of larch plantations. The same remarks apply to other conifers. For Scots pine the quantities are similar, though the value is less. For Douglas fir and spruce the quantities are much greater, but the price per cubic foot is lower.

It is not a question of immediate outlay to secure future returns. The operation of thinning will be well repaid by sale of the pit props which will result, and fair profit will be shown. In one recent case £125 was estimated to be received for props that cost £100 to cut, haul and stack.

The sizes usually accepted have a minimum top diameter of 3in. under bark, and a maximum diameter at breast height under bark of 7in. Some collieries will accept larger sizes, and in the present emergency owners need have no fear of disposal. In August the Forestry Commission were prepared to buy props from private estates situated anywhere, to act as a reserve. Whether this is to continue is not known, though now the matter will doubtless come under the Timber Control.

Before a plantation is thinned it is necessary to send a man to remove all the side branches as high as he can reach. This enables the stems to be seen and gives easy access to the wood. The next step will be to remove all dead and suppressed trees, and any huge specimens of bad shape that are crowding better trees. This is called cleaning. The wood is then ready for thinning. The person in charge will walk through and mark the trees to be removed. This is done by looking upwards and marking all trees that are slightly smaller and crowding the heads of the best specimens.

The heaviness of the thinning, that is the number of stems removed, depends chiefly on the fear of wind damage. In an exposed situation the outer two or three rows will be left intact, as a wind break, and no large gaps must be left in the canopy. The thinning will, therefore, be light. Particular care is called for in the case of Douglas fir, which is very liable to wind damage.

Some species benefit from heavy thinning giving plenty of elbow room. Chief among these are ash and larch, with oak and Scots pine rather more tolerant. The shade-enduring beech, spruce and Douglas fir are less affected than other species by neglect of thinning, and less stems per acre need be removed.

In a properly managed wood thinning will take place every five years, and for ash and larch can scarcely be too heavy. Larch grows at its optimum if the top third of the stem carries green leaves. More usually are seen trees with minute tops, obviously too small to manufacture the food needed for rapid trunk expansion. It is the size of the crowns that give the first indication of the need for thinning, bearing in mind that, for instance, a larch wood must show more daylight than a spruce plantation.

Another aim of thinning is to control height growth. If the site be fertile and the trees crowded together they will tend to grow rapidly upwards in their competition for light. Ultimately the wood will consist of a number of long spindly trees with small crowns an immense distance from the ground. To thin these will be of no material benefit.

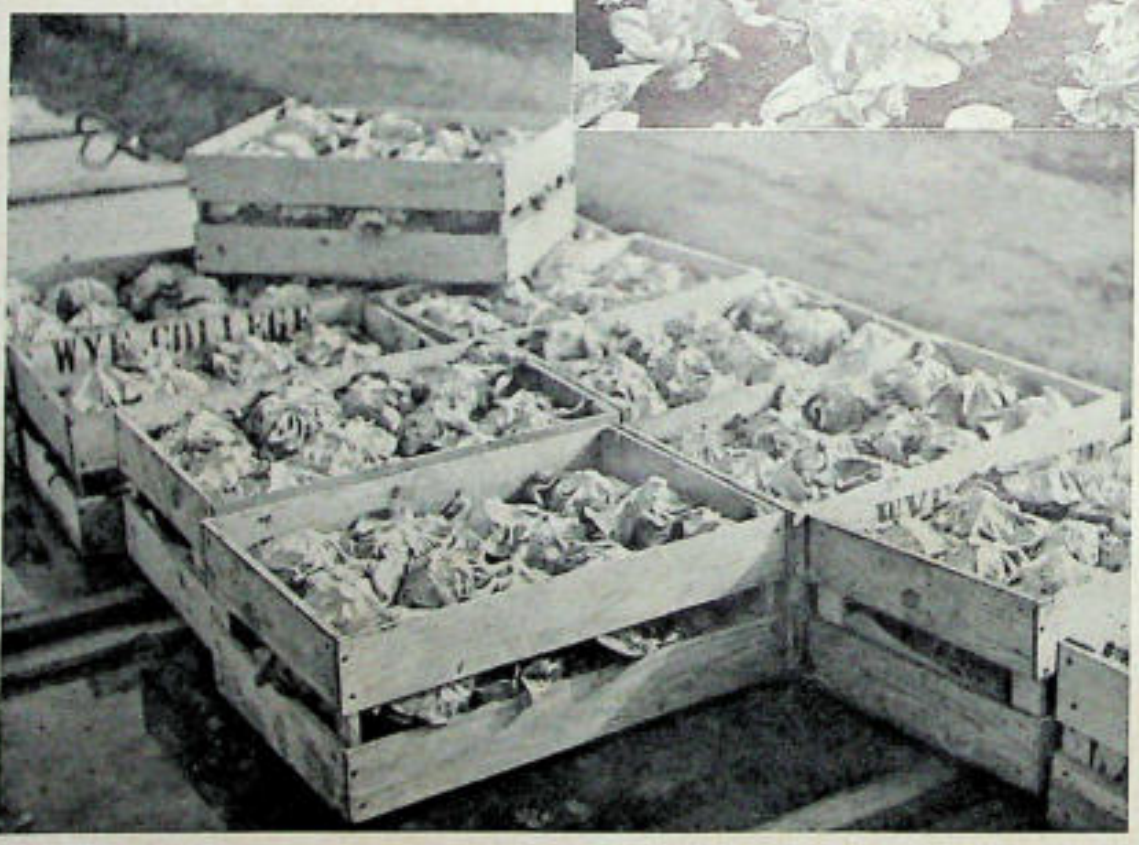
Whenever a plantation, which is growing strongly, has reached the maximum desirable height, this may be checked by thinning. What is a proper height is a matter of experience. For larch on a fertile site 58ft. at 30 years of age is a maximum. On poorer sites the height allowed should be 48ft., 40ft., or even 30ft.

Thinning is the most important operation in the woodland programme, and the most frequently neglected. It is not required until, between the twentieth and twenty-fifth year, the trees have grown together and killed the ground vegetation. By then extreme competition between the trees will have commenced, and thinning controls it and directs it to the ultimate good of the best specimens.

GLASSHOUSE LETTUCE PRODUCTION

By W. E. SHEWELL-COOPER, N.D.H., F.L.S., F.R.S.A.

FLOWER farmers and market gardeners are usually accustomed to use their glasshouses for chrysanthemum growing during the winter months. In a war it is necessary to change over to food production and, fortunately, there is a crop, like the lettuce, which may be grown for the Christmas market or for cutting and selling early next March. It is fortunate that the research stations have been able to introduce varieties of lettuce which, when grown under glass, produce a really large heart.



This salad crop may be grown both in heated and unheated houses. It is equally successful in permanent or temporary structures, providing there is plenty of ventilation and the maximum amount of light.

Perhaps the best soil for lettuce cultivation is a light loam, but there are growers who succeed in producing heavy crops of well-hearted produce on clay loam. Naturally, the finest tilth can be produced on the light loam, and as such a soil warms up quickly, root action is encouraged, and growth is, in consequence, rapid.

When preparing a light soil it is advisable to dig in peat-moss at the rate of 10 tons to the acre. This improves the water-holding capacity of the soil and helps in the aeration also. When the lettuce follows a well-manured tomato crop, there should be no need to give special dressings of artificials, though if the soil fertility is thought to be low hoof and horn meal should be applied at 2 cwts. per acre. Once the fertilisers have been added the surface of the soil should be got down fine by regular rakings. All lumps should be broken down and stones and other debris removed. There is less likelihood of the plants being attacked by fungus diseases if this is done.

It is convenient to raise the plants by sowing the seed in the ordinary tomato seed-box filled with the following compost: 2 parts by bulk of medium loam, 1 part by bulk of good moss-peat, 1 part by bulk of coarse sand, adding to each bushel of this mixture 1½oz. of superphosphate of lime, and 1oz. of ground limestone or chalk.

LETTUCES GROWN UNDER GLASS AND PACKED IN BOXES READY FOR TRANSPORT

Three hundred seeds should be spaced out evenly over the surface of such a compost after it has been pressed down firmly. A small quantity of the same compost should then be sifted over the top. After watering with the fine rose of a watering can, the boxes should be placed on the staging of the glasshouse at a temperature of about 55-60 deg. Fahr., fourteen to eighteen days later the young plants should be pricked out into further boxes 1in. apart. Four weeks later they may be ready for putting out into the border of the house.

Before planting it is advisable to flood the beds, but this should be done a fortnight beforehand, if possible, the idea being to try and build up a reserve supply of moisture which the roots of the lettuces can tap as they grow older. The boxes, too, should be moistened by being dipped into water at the same temperature as the house. Dipping does prevent the leaves and stems from being wetted, and so minimises the danger of "damping off." The boxes should be stood on the soil in the glasshouse for two days, and this ensures that the temperature of the roots of the plants is similar to that of the soil in which they are to be planted. Thus when planted they receive no check.

The best results are achieved when the lettuces are planted on little ridges drawn up specially for the purpose. Experiments conducted at Reading University indicated that such a procedure made a difference of seven days, and to the farmer if a crop turns in seven days before his neighbour's it makes all the difference to the profit. For the larger varieties, these ridges should be 12in. apart, for the medium sizes 10in. apart, and for the smaller types 9in. apart.

After planting, the temperature of the house should be kept at round about 50 deg. Fahr., plenty of ventilation being given whenever possible. During misty damp days the ventilators may have to be closed down somewhat, but during the bright spells they will be opened fully again. Watering should commence within a fortnight of planting. Care should be taken to apply the water round the plants and not on them. It is better to water in the morning than late in the afternoon, for late watering often encourages mildew.

Hoeing should be carried out regularly so as to keep down weeds and to conserve moisture. Narrow bladed Dutch hoes should be used, care being taken not to damage the plants. Every morning a youth should go over all the plants and remove any brown or diseased leaves seen. This work need not be started till the plants are about half grown. Green-fly may make itself a nuisance, but it is quite easily controlled if the house is fumigated with nicotine shreds from time to time.

Good varieties for growing under glass at this time of the year are Golden Ball, Gotte a Forcer, Little Black Gotte and Coucher a Graine Noire. These come in the small group, and may be planted 9in. by 7in. Though they are delicious for home use, being small, they are not so popular on the market. The most popular group is, perhaps, the medium-sized, which should be planted 10in. by 9in. Cheshunt Early Giant, which was produced at the Cheshunt Research Station, is undoubtedly the best, and if the seed is sown at the beginning of October, the plants are ready to put out late in November, and can usually be cut early in February. For Christmas marketing it is necessary to sow this variety about the second week of September. Early French Frame is another variety that falls into this group, but it does not mature as quickly.

In the North of England, in Lancashire and Cheshire the two favourite varieties are Blackpool and Loos Tennis Ball, both of which may be said to be large types, and need planting 12in. by 10in. If seed is sown at this time of the year, the lettuces should be fit to cut early in March.

Lettuces should never be marketed until they are fully hearted, though in the north it is possible to sell unhearted specimens profitably. The lettuce should be looked upon as a catch crop, and so should be cleared and sold in sufficient time for the borders to be prepared for the crop that is to follow.

SPLINTER PROTECTION

Where a house has no shelter or dug-out the question arises as to where is the best place in the event of a raid. In most houses there is some room or pantry which is protected by more than one wall on two or even three sides, and obviously this is the spot to select. Windows and doors may constitute a weakness, and Professor R. V. Southwell, writing in *The Times*, illustrates an ingenious and quickly constructed covering for these weak spots. It consists of a light timber framework strengthened by a strut across the centre and covered with wire-netting on either side. To keep front and back roughly uniform, the front and back faces of wire netting are connected by stays of light wire. The space between the front and back coverings of wire netting is 4in. wide, and this is filled with loose pebbles of roughly about an inch in diameter. The protection, described as a pebble mattress, is not guaranteed to stop a big projectile, but, at any rate, it is claimed as bullet proof, and gives a certain measure of security from flying pieces of steel.

Professor Southwell says: "In action, the front face of wire netting will be perforated (unless the splinter is very small), and all the stays will (and should) be ruptured; then the rear wire-netting being free to bulge, the splinter, in effect, will be opposed by a dense cloud of pebbles." All that it needs to repair a damaged frame is to empty it of pebbles and put in new stays and wire.

THE PLIGHT OF COUNTRY MOTORISTS

By W. T. McMINNIES

THE countryman's lot this winter will not be at all happy. He will have few public vehicles to take him about his business; his nearest railway station may be several miles distant, and his shopping centre and market town further away still. Driving at night is out of the question on narrow and overhung country lanes whose verges are indistinguishable from the muddy track. It is bad enough with white lines and white kerbstones on a main road, but in the country driving is almost impossible and it is much safer and nearly as quick to walk.

So many of us are buying bicycles and if the tradesman's van fails to bring our rations once a week we shall have to hitch a carrier or a trailer to the cycle and collect the goods ourselves.

All sorts of hints and tips on means for saving petrol have appeared in the Press, but the truth of the matter is that even if you carried out each one with meticulous care you would not add more than ten or fifteen per cent. to your monthly mileage. Which means that you would have an extra 20–25 miles to play with.

The best advice of all is to drive at your most economical speed, say 30–35 m.p.h., to accelerate and decelerate gently, use the brakes as little as possible and coast with switched-off engine wherever opportunity presents itself. For the benefit of the less expert, the safest way to get back into top gear after free-wheeling with a switched-off engine, is to restart with the electric starter, speed up the engine a bit and then with the clutch out engage top gear.

In the matter of petrol economy I am rather surprised that as far as I know no manufacturer's service department has sent out any useful suggestion to users of its cars. Surely the broadcasting of such advice should have been done by the trade, who are the people best qualified to say what can and what cannot be done.

For instance I should very much like to have heard what the Vauxhall experts had to say on the subject. The great Luton Company ran a country-wide petrol consumption test, for owners of Vauxhall cars this summer, and some extraordinary results were obtained. Off hand, I seem to remember some of their ten horse power cars clocking in with scores of 50 or 60 miles to the gallon. Well, how was it done and did such super-economy mean that the cars were unsuitable for every-day running? I mean was speed reduced to a crawl and were the starting-up and getting away qualities greatly handicapped?

Some people in the country were bitten with the hoarding germ the day before rationing was planned, but did not take effect. I was amazed to find queues of cars at petrol stations away out in the country. Their owners were not satisfied to have their tanks filled to the brim, but produced all kinds of receptacles in order to acquire extra supplies. Neither they nor the petrol station's owners realised that this extra filling up was illegal and could lead to a prosecution.

Some of the receptacles were unusual. There was the story of the woman with the dust-bin, for instance. Had she succeeded in having this filled with fuel her troubles would only just have started. For a dust-bin is designed to hold rubbish and not petrol, would have steadily leaked away and in so doing would have disseminated a dangerous mixture in the garage.

I happen to be rather an authority on dust-bins because I recently bought one wherein to store ten gallons of lubricating oil. I was forced to do this because all the standard five gallon Castrol and Shell oil drums had disappeared by magic. Possibly they had been bought up by those who wished to use them for hoarding petrol or paraffin. Anyway, there was a shortage and I had to make do with a dust-bin. Well, it's single seam seemed well-soldered but alas, after I had decanted my Castrol, the joint began to seep and I could see that in a few days' time my garage floor would resemble a slough of despond.

Insulating tape re-enforced with "Seccotine" was the first idea for stopping the leak, but this was only partly successful. So I tried "Plasticine" next and made a sort of bread poultice with the aid of more insulating tape. The effect was not one to be proud of, but it did reduce the oil drops to about one a minute.

It takes a national emergency to bring home to us how vital a part of our lives the motor car has become. Indeed many of us use it more often than such necessities as a watch, a bathroom, or even the electric light. Without it our efficiency is reduced to a staggering degree.

Here is an example, probably to be multiplied a million times up and down the country. A countryman has a business appointment in a city, 45–50 miles off, a matter of an hour's run in the car in ordinary circumstances. With the present petrol rationing he would use half his month's allowance, *i.e.*, 100 miles' worth, on this one day's out and home journey. So he decides to go by train.

His actual journey might be as follows. He walks or cycles two miles to his nearest railway station situated on a single line. He trains eight miles, away from his final objective, waits and changes. He then trains 25 miles and changes again after a due wait. The next stage takes him another 20 miles where he boards a motor bus to the city he seeks. Arriving there he has still three or four miles to negotiate by taxi, bus or tram and the job which in the ordinary way should have taken three or four hours may well be extended to two days, plus board and lodging at an hotel.

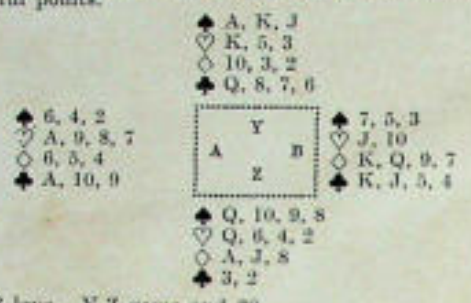
Do not think that motorists are complaining. They realise that it is far more important for aeroplanes to be kept in the air, tanks and transport on the go and ships at sea, than that they should be saved a little personal inconvenience and expense. But it does seem that the case of the country motorist is rather different from that of the man who lives in a town and whose interests, goings and comings are contained in a radius of a few miles.

Those who are still able to use the roads will find them practically deserted except for lorry traffic carrying essential supplies. But road repairs and re-designing are still in progress, though I remember reading some weeks ago that all this work had to stop or be completed instantly. That being the case, is it not curious that the making of concrete footpaths and banked turnings is still proceeding in certain parts of the country?

For instance, on the outskirts of Cheltenham men are now engaged in scragging up a perfectly good if unnecessary tar macadam footpath they laid a few months ago and fitting a gravel based concrete pavement in its place. Local motorists have watched for months the continuous outpouring of public funds on the Gloucestershire end of A.40. To them many of the features that have been incorporated in it are incomprehensible from a motoring point of view.

To name but two, there are the highly dangerous and restrictive curving of the road under the railway bridge at Andoversford and the building of miles and miles of concrete footpath over the Cotswolds, where one can motor for long distances without even seeing a cottage anywhere near the road. As it is the motorist who pays for these unwanted pavements, it is about time he knew who sanctions them and why.

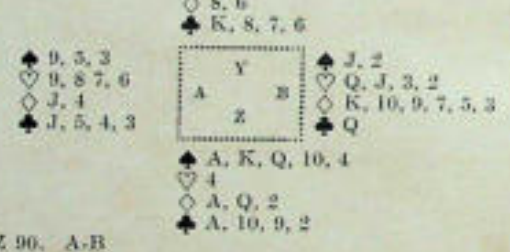
The war has given a strange twist to many enterprises directly or indirectly connected with life on the road. Take the case of reflecting advertisement signs, so popular for displaying the names and addresses of hotels and car agencies. The black-out regulations have reduced the pulling powers of these road signs to nil at night. Then there is the plight of the hotels themselves. It was announced in the Press recently that one thousand of them had been taken over by various authorities, and that the hoteliers considered the compensation allowed was so meagre that they were thinking of organising a general protest. Then finally one wonders if the combination of petrol rationing, winter time black-outs and a twenty-five shillings per horse-power tax will force so many motorists to give up motoring altogether that a large percentage of the eighty to a hundred million pounds they pay in direct or indirect taxation will be lost to the Exchequer. Naturally the authorities are alive to this possibility and it may be that the stoppage of all private motoring is a definite part of their policy.



IT IS THE COUNTRY MOTORIST WHO SUFFERS MOST AS OPPOSED TO THE MAN WHOSE COMINGS AND GOINGS ARE CONTAINED IN A RADIUS OF A FEW MILES

BRIDGE

By RALPH SWINGLER, B.Sc., A.F.R.Ae.S.

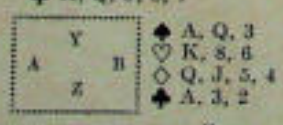


AS I write this, all the cinemas and theatres are closed and bridge is one of the few amusements left. However, when I arrived at a small club the other day, and had to pass through a series of screens before I could play, I was not surprised to find the bidding and play a little affected. I think the following two hands will be of interest, since, although the bidding is rather peculiar, the play shows two rather useful points.

A-B love. Y-Z game and 20.

Y	B	Z	A
One Club	No bid	One Spade	No bid
Two Spades	No bid	Two No Trumps	No bid
Three Spades	No bid	No bid	No bid

The fact that Y-Z were game and 20 helped to account for the rather strained bidding. A led the 6 of Diamonds and B's Queen was taken by Z's Ace of Diamonds, and Z proceeded to make the best of a bad job, with the help of the opponents. The 3 of Clubs was covered by A's 9 and Y ducked. A led the 5 of Diamonds, which B took with the King and returned a Diamond, taken by Z's Jack. The 2 of Clubs was played, taken by A's Ace, and the 10 of Clubs returned and ruffed with Z's 8 of Spades. Z now led the 2 of Hearts and A made the fatal mistake of putting on the Ace of Hearts and returning a Spade. Z took this in dummy, ruffed another Club with the Queen of Spades, entered dummy with a trump and led the third trump from dummy. Now he breathed a sigh of relief when the trumps broke evenly and made the ninth trick with the Queen of Hearts. It will be noted that in addition to having the assistance of the opponents, Z had to play the hand as a reversed dummy, ruff twice in his own hand *and* find the trumps break evenly. Still, *nil desperandum* is often a very good motto in bridge.

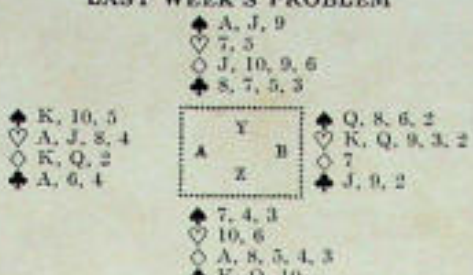


Y-Z 90. A-B

Y	B	Z	A
No bid	No bid	Two Spades	No bid
Four Spades	No bid	Six Spades	No bid
No bid	No bid		

After Y had passed on two-and-a-half honour tricks and Z had made a Two Spade call (Y-Z were playing the Two Club System), Y felt that something encouraging was indicated and produced the peculiar call of Four Spades. Z, not to be outdone, took a chance on the small slam.

A led the 9 of Spades and Z took three rounds of Spades, B discarding a Diamond on the third Spade. If the Clubs break 2—3 Z could see a Club loser and a possible Diamond loser. His first plan was, therefore, to try the Clubs, if they broke evenly, to lead three rounds of Hearts, ruffing the third and throwing the lead with a Club. If A took the lead he might be compelled to lead a Diamond; if not the 7 of Clubs could be used as an entry to finesse Diamonds. To preserve the entry in Y's hand, Z led the 10 of Clubs to Y's King of Clubs. The return of the 3 of Clubs found B void of the suit and therefore the 9 of Clubs was played. A took the trick and returned a Heart. Z now took the Ace King of Hearts, the Ace and 7 of Clubs, and finessed Diamonds to make the contract.



THIS WEEK'S PROBLEM

Y	Z
One Club	One Diamond
One Heart	Two No Trump
Three No Trump	No bid

A leads the 5 of Spades. How does B defend, and why?

LAST WEEK'S PROBLEM

The bidding is: A, One Heart; B, Two Hearts; A, Two No Trump; B, Four Hearts; and Y leads the Jack of Diamonds. Playing Z, how do you defend the hand?

SOLUTION

This week the complete deal is shown and the following solution is taken from the official hand analysis bulletin of the second Waddington Par Contest.

Y opens the Jack of Diamonds and Z has to make a very fine play on the first trick. The bidding and lead establish beyond doubt that declarer has K, Q of Diamonds, and Z should realise that if he plays his Ace these two cards will provide discards for two losing Clubs in Dummy. If he ducks to this Diamond trick, however, he will lose one trick in Diamonds, but will save two in Clubs. So he should play low and when Y wins the first Spade he must attack Clubs; two tricks in this suit are set up before the Spades are cleared, and against this defence A has to lose two Spades and two Clubs.

5. Kt to Q B 3	P to Q 3	30. P takes B	K R to B sq
6. P to K Kt 3 (a)	P to K Kt 3	31. P to B 3	Kt to Kt 3
7. K t takes Kt (b)	P takes Kt	32. B to K 2	K to B sq
8. Q to Q 2	B to Q 2	33. K to B 2 (j)	R to B sq
9. P to B 4	P to Kt 3	34. P to K Kt 4	R to B 7
10. B to K 3 (c)	B to Kt 2	35. R (B sq) takes Kt sq	Kt takes P
11. R to Kt 2 (d)	Q to B 1 (e)	36. P to Kt 4	R takes R
12. Castles	Castles (K R)	37. R takes R	Kt takes Q B P
13. P to K B 3	B to K 3	38. R to Q B 2	R to B 5
14. B to Q 4	B takes B, ch	39. R to B sq	R takes B P
15. Q takes B	Q to Kt 3	40. R to Q 3	Kt to Q 4
16. Q takes Q	P takes Q	41. K to Kt 2	R takes P
17. P to Q R 4	R to B 4	Resigns	

(a) The usual continuation is 6. B to K 2, P to K Kt 3; 7. B to K 3, B to Kt 2; 8. Castles, Castles (the Dragon variation).

(b) Best. If, instead, 7. Q to Q 3, then 7 . . . Kt takes Kt; 8. Q takes Kt, B to B 6, or, if 7. P to B 3, then 7 . . . Kt takes Kt. 8. P, takes B. Kt to B 3.

(c) If 10. B to Kt 2, B to Kt 2; 11. Castles, then 11 . . . Q to Kt 3, ch; 12. K to R sq. P to K R 4 with very good attacking chances for Black.

(d) If 11. P to K R 3, B to K 3; 12. P to B 5, then 12 . . . Kt to K 4.

(e) Preventing P to B 5.

(f) A good alternative is 18. P to Q Kt 4, B to B 2; 19. R to B 3, to be followed by K R to B sq, and P to B 5.

(g) An inferior move. He should, instead, play 19. R to B 3, guarding his Knight and threatening 20. P to Q Kt 4 followed by 21. P to B 5. Black's best reply would be 19 . . . P to B 4.

(h) Black now threatens K R to B sq, followed by P to Kt 5.

(i) This move has the disadvantage that White now gets a weak Queen's pawn.

(j) K to B 2 is preferable.

(k) 27. R (Q sq) to Q 2 is better, but after 27 . . . Kt to B 5; 28. R to Q B 2, R to R 8, threatening 29 . . . R to Q 8. White has a very bad game. The text-move is a mistake made under time-pressure.

A peculiar game from the tenth round of the Premier Tournament.

(Irregular Defence.)

WHITE. I. König.	BLACK. J. Mieses.	WHITE. I. König.	BLACK. J. Mieses.
1. P to Q 4	P to Q 3 (a)	14. P to Q R 4	Kt to B 3
2. P to K 4	Kt to Q B 3	15. B to Kt 5	Kt to Kt 5
3. P to Q 5	Kt to Kt sq	16. P to R 5	B to B 3
4. Kt to K 2	P to K 4	17. Kt takes B	Kt takes Kt
5. P takes P, e.p.	B takes P (b)	18. B to Q 4	K to Kt sq
6. Q Kt to B 3	Kt to Q B 3	19. P to R 6	P to Q Kt 3
7. Kt to B 4	Q to Q 2	20. P to B 3	P to R 4
8. B to K 2	Kt to B 3	21. Q R takes Kt	P takes R
9. Castles	Castles (c)	22. Kt to K 2 (g)	Q R to Kt sq
10. K Kt to Q 5	B to K 2	23. P to R 7, ch	K to Kt 2
11. P to Q Kt 4 (d)	Kt to Q Kt sq (e)	24. Kt to Q 4	B to R 6
12. B to K 3	Q R to K sq (f)	25. P to R 8—Q, ch	Resigns.
13. B takes P	B to Q sq		

(a) This move in conjunction with Kt to Q B 3 forms an irregular defence which Mieses has tried out during the past twelve months.

(b) Black should play P takes P in order to have a pawn guarding his Q 4.

(c) A very risky move. He should play B to K 2 and then Castles (K R).

(d) White, with his command of Black's Q 4, has a very good game and now starts an attack on the castled King.

(e) Black is already at a loss for a really satisfactory move. If, instead, 11. . . . B takes Kt; 12. P takes B, Kt takes Kt P, then 13. Q to Q 4, to be followed by 14. Q takes P with a winning game for White.

(f) If P to Q Kt 3 or P to Q R 3, then an advance of White's Queen's side pawns (P to Q R 4, &c.) soon forces an open file on that side and a winning game for White. With the text-move Black abandons his Queen's Rook's pawn in the hope of bringing about complications.

(g) Threatening P to R 7, ch followed by Kt to Q 4. Black is helpless.

A game from the ninth round of the Premier Tournament.

(Indian Defence.)

WHITE. P. N. Wallis.	BLACK. Dr. Euwe.	WHITE. P. N. Wallis.	BLACK. Dr. Euwe.
1. P to Q 4	Kt to K B 3	16. B to R 4 (f)	B to Kt 2
2. P to Q B 4	P to K Kt 3	17. B to B 4	Q R to B sq
3. Kt to Q B 3	B to Kt 2	18. B to Q Kt 3 (g)	B to Q R 3 (h)
4. P to K 4	Castles	19. Kt to K 4	P to K Kt 4
5. B to K 3	P to Q 3	20. R to K B 2	Kt to Q 6, ch
6. P to B 3	P to K 4	21. K to Q 2	Kt takes P (i)
7. P takes P (a)	P takes P	22. P to Q 6, ch	K to B sq
8. Q takes Q (b)	R takes Q	23. R to Q R sq	Kt to B 5, ch
9. Kt to Q 5	Kt takes Kt	24. B takes Kt	B takes B
10. R P takes Kt	P to Q B 3	25. R to B 3	P to B 4
11. B to Q sq (c)	P takes P	26. Kt takes P	R takes P, ch
12. P takes P (d)	P to Kt 3	27. K to B sq	P to K R 3
13. Kt to K 2	Kt to B 3	28. K to R 3	R (Q3) to Q B 3
14. Kt to B 3	Kt to Kt 5	29. P to R 3	R to B 8 (j)
15. B to K Kt 5 (e)	P to B 3	Resigns	

(a) A very tame and surprising move. The object of White's P to B 3 in this variation is to prepare to advance the King's side pawns after closing the centre by P to Q 5, but with the text-move White opens the centre.

(b) White is plotting for simplification.

(c) After this move White is left with an isolated Queen's pawn. He should, instead, play B to Q B 4.

(d) R takes P is, we think, to be preferred.

(e) K to Q 2 is better.

(f) White should play B to B sq to guard the Queen's Knight's pawn.

(g) In reply to 18. P to Q Kt 3 Black can play 18. . . . B to Q R 3 followed, if 19. B takes B, by 19. . . . R takes Kt; 20. B to B 4, R to B 7 (better than Kt takes P to which White can reply with R to B sq); 21. P to Q R 5, Kt to B 7, threatening Kt to B 6.

(h) A strong move, threatening Kt to Q 6, ch followed by Kt takes P. If now 19. K to Q 2, then 19. . . . Kt to Q 6, ch; 20. K to Q sq, Kt takes P; 21. R takes Kt, R takes Kt.

(i) Best. If, instead, 21. . . . P to B 4, then 22. P to Q 6, ch, K to B sq; 23. Kt takes P, R takes P (if 23. . . . Kt takes B, then 24. Kt to K 6, ch, K to Kt sq; 25. Kt takes R, ch); 24. Kt to K 6, ch.

(j) Finishing neatly. White has nothing better than R takes B, after which R takes R, ch wins the exchange.

PROBLEM No. 4033

By G. ANDERSSON.*

WHITE (8 pieces): King at K R sq, Queen at K R 5, Rooks at Q 7 and K 8, Bishop at Q R 4, Knight at K 4, Pawns at K B 4 and K 7.

BLACK (10 pieces): King at K 3, Queen at K B sq, Rooks at Q Kt sq and Q R 3, Bishop at Q Kt 2, Knights at K R 2 and Q 4, Pawns at K B 2, Q R 4 and Q B 6.

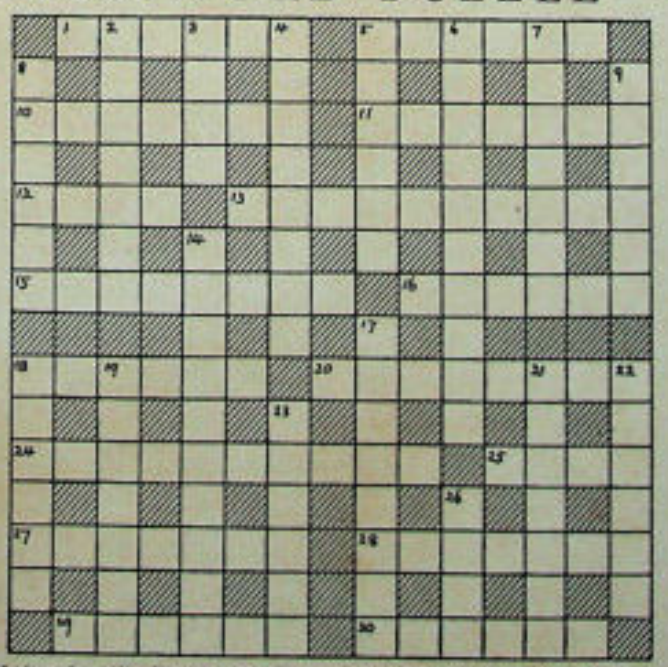
White to play and mate in two moves.

* First prize, *Fart Hem*, 1936.

SOLUTION OF PROBLEM No. 4032

1. Kt to B 3. Any move; 2. Q or Kt mates.

This problem was awarded the first prize in the *Svenska Nyaste Nackrichten* in 1937.



THE "FIELD" CROSSWORD PUZZLE

CLUES TO CROSSWORD No. 536

ACROSS.—1. A sailor meets her for preference (6). 5. He acts for others (6). 10. Nightmare (7). 11. Highly coloured vowel (7). 12. The men did not expect the irate old man to listen to reason (hidden) (4). 13. This type of employment is undesirable (5, 5). 15. Foretells (8). 16. Steel rope (6). 18. They pretend to have medical skill (6). 20. Wasteful (8). 24. Most astern (anag.) (10). 25. Bills for these are overhead charges (4). 27. Cheated (7). 28. Untried (anag.) (7). 29. Wing forwards do this (6). 30. This has an eye but no head (6).

DOWN.—2. A writer? (7). 3. To be found in all the best restaurants (4). 4. Determined (8). 5. The French end in a river (6). 6. Dr. Goebbels's department deals with this (10). 7. Filters (anag.) (7). 8. His map (anag.) (6). 9. Mark Twain's Tom (6). 14. A person with taking ways (10). 17. Marianne's nationality (8). 18. Silica sounding like liquid measures (6). 19. Confused tirades (7). 21. Step by step (7). 22. Time? (anag.) (6). 23. Caress (6). 26. The man Elsie loves has a nasty evil expression (hidden) (4).

A prize of one guinea is offered for any crossword puzzle dealing mainly with sport or the countryside, that is accepted for publication.

FARMING AND THE WAR

We print below the weekly farming bulletins from the Ministry of Agriculture and notices issued which are of special interest to farmers

IT is a strange new world in which farmers now find themselves, a world where prices for fat stock are fixed at the markets before the animals arrive there, where the same price per score is paid for pork pigs as for baconers, where all limitations upon output have been removed (except on hops); but where there is uncertainty as to what rations will be available for feeding even the present numbers of livestock.

No wonder the Ministry of Agriculture has received many inquiries for advice about cropping. But very little imagination is needed to realise how impossible it is to forecast exactly what the detailed agricultural requirements of the nation will be. These depend upon a number of factors that the future alone will reveal. It may prove necessary to modify the present number of livestock of various kinds either upwards or downwards, but that is entirely dependent upon future events, and it would be misleading to farmers to pretend otherwise.

But this, on very general lines, is how the Minister himself sees it. Wheat production must be increased, both on existing and newly ploughed land. But it should not be grown "at all costs." In most districts it should have first place among the cereals if a satisfactory crop can be expected, but a full yield of another crop would be preferable to a poor yield of wheat. Potatoes are another crop that we must increase, and all restrictions upon basic acreage have been removed.

Since there is no present suggestion for reducing the number of cattle and sheep, it becomes more than ever important to get existing grassland into the best possible condition, both for grazing and for use as hay and silage. No stock farmer will go wrong if he grows as much as possible of his own concentrated feeding stuffs, such as oats, barley, beans, peas, mixed corn or rye. If Britain is to be more self-supporting in food, each farm must become more self-supporting in feeding stuffs for its own livestock.

Bacon Production

Farmers will have noted that the same price per score has been fixed for porkers as for baconers. They are right in assuming that this means discouragement of pork in favour of bacon. The primary reasons for this are the need to be ready for difficulties regarding imports of bacon and of feeding stuffs, and the fact that home-grown foods, in the main, are better adapted for the production of bacon than of pork. But also the porker costs relatively more to produce, from the point of view of labour, overhead and weaner charges and provides the nation with a smaller quantity of meat. A pig of 200lb. dead weight would weigh 250lb. alive. This represents a killing loss of 20 per cent. A pork pig of 80lb. dead weight would weigh about 114lb. alive, a killing loss of at least 30 per cent.

The new problem that now confronts pig farmers is how to economise on pig feeding and use as little as possible of the food for them that might be used for human food. The old ways, whereby 6cwt. of meal were used to produce less than 1½cwt. of pig meat, are no longer possible in war-time. We could maintain our present pig population, and even increase it, and fulfil the above conditions if pigs were more widely spread over the holdings of this country, even down to those of one acre or groups of allotments. We used to keep our pigs like this before oil cake and other concentrates were known. The "plough-up" policy will produce more tail corn and more potatoes for pig feeding; the pig in return will give back invaluable "muck." The garden and kitchen, the food shops, dairies, camps, hotels and other dwelling-houses can all make a contribution of pig food that is now wasted. The refuse should be used while fresh and sweet, and it must be boiled or steamed before feeding. Swill or dish-water should not be used, as it contains soda or salt. It is important that vegetable food should form part of the diet at all seasons. It should be noted, however, that pigs must have meal in addition to this waste. Even steamed potatoes will not replace more than two-thirds of the cereals in a full meal ration.

Pig keepers with access to grazing or woodlands might well try outdoor feeding. It saves meal, produces hardier pigs, improves the pasture by pig-grazing and brings into use valuable material such as beech mast. With a few weeks of sty-feeding on concentrated food at the end of the grazing period prime bacon can be thus produced.

Seed Wheat

The threshing tackle is busy on many farms, encouraged by fine weather over most of England last week and by the official announcement of a free market in seed wheat. Those farmers able to offer good samples of seed wheat are finding a ready market at a premium of several shillings per quarter above the present price of 24/- per quarter for milling wheat. Since the bulk of this wheat ought to be distributed by mid-October, it is important that no time should now be lost in threshing and selling it.

The present arrangements for buying and selling fat stock in auction markets are only temporary. Very shortly the Government will be the only buyers. Farmers will then notify the auctioneer of the number of fat stock they want to sell, and when the animals reach the market they will be examined by Government graders, paid for at a fixed price according to their classification and sent to the slaughter-house.

Utilising Tractors

Many farmers, when their own ploughing is done, will be able to give a hand to a less fortunate neighbour who has been unable to get through the work so quickly, for tractors must be used to full capacity in the next few weeks. It should be noted that the ordinary 5/- licence is quite sufficient for a farm tractor to travel any distance on the public road to another farm, and to draw its own necessary gear, together with ploughs, cultivators, threshing appliances, and supplies of water or fuel needed for the vehicle itself or for agricultural purposes. In districts where existing tractors and horse teams cannot undertake the work, a ploughing contractor may solve the difficulty. In some cases the county committees will be able to call upon the reserve of Government tractors. These are being allotted with due regard to the numbers of tractors in each county and the acreage of grassland to be ploughed.

There will be no interference with petrol supplies needed by farmers for their tractors, stationery engines and other machinery used on the farm for at least the next five weeks. They can buy whatever they need for these purposes.

But this special concession to farmers, on which a strict check will be kept, does not apply to their private motor cars. In this respect they will rank as other members of the community. The supply for this purpose is rationed, although, of course, it is open for them to apply for an extra ration in special circumstances, just like anybody else; It is, therefore, essential that farmers economise on petrol they use in their cars as much as they possibly can. When a visit to the market town is essential, it is suggested that the petrol ration could be made to go further by arranging with a neighbour to take turns in using only one car.

Farmers' motor trucks or lorries that have an "F" licence—that is, those owned by a farmer and used only to carry his own goods—will not for the present be restricted for petrol. Other commercial motor transport will come under the national scheme whereby truck owners are associated into local groups for petrol rationing.

There are at present no restrictions on paraffin supplies. But farmers would be well advised to make provision for storing, say, 200–500 gallons, if they cannot do so already. For it would be rash to assume that the present rather extravagant system of frequent supplies of very small quantities could be continued in every conceivable circumstance. Already reports have been received of farming operations held up because the paraffin lorry was a couple of days late. If no special tanks are available, paraffin can be stored in 40-gallon drums, or even old cisterns or other containers that may be lying unused on the farm or in a junk merchant's dump.

Britain's 60,000 tractors are only being used to about half their full capacity during an ordinary working day. This estimate is made by the Ministry of Agriculture on the basis of total consumption of tractor fuel, and in a circular to the County Agricultural War Committees the Ministry point out that if the tractors were evenly distributed over the country, the whole of the extra 1,500,000 acres could easily be ploughed this year by the existing tractors.

But they are not evenly distributed—they are most dense in the eastern side of the country—and it is not considered desirable to adopt a national pooling system. The problem has been considered on a county basis and each county committee will be expected to organise its tractors so as to secure the fullest possible use. These are the lines that the Ministry suggests.

In the first place, it is expected that the farmer will make his own arrangements if he possibly can. If he has not sufficient horses or tractors and implements, he should make arrangements with a ploughing contractor, or with a neighbour who may be in a position to help him. If this proves impracticable, he should apply to his County War Committee, and they will help him either by arranging with a contractor or farmer to do the work, or by using Government tractors and implements for the purpose. The Government tractors, therefore, are a reserve, for use where local resources are deficient. All counties will be included in the first allotment of these tractors.

The Government tractors will not be loaned to individual farmers to carry out the work themselves. They will be worked on a contract system, under the control of the machinery officer that each county committee is empowered to appoint to organise tractors and other machinery in his area. It is suggested that economy in the number of implements used will be obtained by working them in groups of five. In organising assistance between one farmer and another, it is expected that the committees will have to do little more than get one farmer who can give help in touch with another who needs it, but in bad cases of unwillingness the Minister would be prepared to consider powers of requisition under Defence Regulations. The rates charged to farmers for ploughing and other cultivations will be comparable with the rates charged in the district by reputable contractors, provided those rates are reasonable.

ANSWERS TO CORRESPONDENTS

Country House

Identification of Trees.—1. *Carpinus Betulus* (common hornbeam). This tree grows from 50ft.–80ft. high. The leaves will sometimes hang during the winter, but it can hardly be described as an "evergreen," the foliage turning a beautiful yellow in autumn. It is a native of Europe and Asia Minor. It makes a most useful hedge plant, and by many is preferred to beech. 2. *Pyrus floribunda*. The leafy branch sent has neither flowers nor fruit to render identification certain, but there is not much doubt as to its name, your specimen has been compared with a living tree of the above. It was introduced from Japan about 1862. Flowers in April, when, if birds have not eaten the flower buds, it is one of the most floriferous of trees. There is a doubt as to its origin; it may not be a true wild species but a hybrid. —*L. H. W., Woodbridge.*

Garden

Oil of Lavender.—The oil of lavender is distilled from the flowers and short stalks, although a more expensive quality is obtained by using the flowers alone. That made from the stalks is much coarser. The spikes are cut about the beginning of August when the flowers are fully out. When cut, it should be protected from sun-scorch and either harvested or preferably placed in the still at once. A common pot still is generally used. It should be constructed of copper, and if made with two chambers, a false bottom can be placed between them to carry the lavender, the lower to be filled with water. When boiling, the steam from this passes through the upper chamber into the coil above. After oil begins to flow from the condenser the heat must be maintained for five or six hours before the operation is complete. A fair yield from an acre would be about 12lb. of oil. The oil is afterwards matured in the dark stored in blue glass jars. It deteriorates in three or four years. To own and work a still you will need an annual 10/- licence, from July 6th to July 5th; it can be obtained from your nearest collector, Customs & Excise. In your case this would be at Southampton. It is possible that they would require to visit you occasionally to see that you were not making an illegal use of the still. Making lavender water is almost a chemical operation, as other scents and sometimes spirit is combined with the oil.—*R. W., Brockenhurst.*

Kennel

Eczema Sores.—With regard to these it would be well to keep the dog clipped close to facilitate the application of the dressings, and to dab the sores three times a day with a lotion composed of: Prepared calamine, 1 drachm; oxide of zinc, 2 drachms; milk of sulphur, 2 drachms; extract of witch hazel, 2oz.; rosewater to make up to 8oz. Shake the mixture thoroughly each time before using. As internal treatment give him 5 grains each of bicarbonate of soda and powdered rhubarb with 2 grains of powdered ginger three times a day, either in tablet form or mixed up with a little water. Put him on to a plain meat diet, raw for preference, and cut down the dog biscuits and starchy foods to the very minimum.—*A. E. Laurence, Villa Obregon, D. F., Mexico.*

Distemper Fits.—The description of the condition of your spaniel suggests distemper fits. You did right to put her on to bromide and chloral. Four grains bromide of strontia in a little water three times a day is the usual prescription for one of her age and breed. If she has survived, and there is still any twitching, give her a course of Easton's Syrup—eight drops three times daily in water.—*W. A. S. B., Jamaica.*

Hunting Rabbits.—Could you not find a local gamekeeper or someone of that sort, who would take your Cairn terrier in hand? We do not know of a suitable place. Why not try what you can do yourself? Get a long check cord, such as is used for training retrievers not to run in. Take the dog among rabbits, and when he starts to chase, pull him back sharply, saying, "No! Heel!" We think you would be able to reform him.—*Jumbo, Dorset.*

Post-Mortem Examinations

Drake Worried by Rat.—A Carolina drake was found dead beside a pond containing a collection of apparently healthy waterfowl. The bird had died of internal haemorrhage from severe bite wounds around its vent and the region of the pelvis. The type of wounds was that recognised as due to the bites of rats, which commonly seize sleeping waterfowl in the region of the tail, whereas stoats usually seize them by the neck near its junction with the head. The drake's body was in prime condition, no disease was found. —*D. H. W., M., Oxon.*

Amputated Wing of a Grouse.—We received for examination the body of an old hen grouse which was in prime condition and revealed no evidence of disease. The bird had been picked up by a retriever. The end of the left wing below the elbow joint was missing, the stump being covered by skin. Probably the bird had collided in flight with wire, at least some twelve months previously. —*E. V. E., Inverness.*
